This report should be cited as: Huffman-Broadway Group, Inc. 2010. *Investigation of the Presence of Wetlands and Other Waters of the United States, DesertXpress Project, HUC 8 Mojave and Coyote - Cuddeback Lakes Watersheds, San Bernardino County, California*. Prepared for DesertXpress Enterprises, LLC, Las Vegas, Nevada. July. 39 pp. plus Exhibits.

1.0 INTRODUCTION

1.1 Project Purpose and Scope of Work

DesertXpress Enterprises, LLC (DXE) is proposing to construct and operate a dedicated two-tracked high speed passenger railway and associated operations and maintenance facilities between Victorville, California, and Las Vegas, Nevada (DesertXpress Project; Exhibit A, Figure 1). A Draft Environmental Impact Statement was issued for the project in March of 2009 and the Final EIS is nearing completion. A Supplemental Draft EIS has been prepared and will be issued shortly to address certain modifications to the proposed alignment and station locations made by the Applicant, DXE, in response to various comments made on the Draft. The U.S. Department of Transportation, Federal Railroad Administration (FRA) is the lead agency responsible for preparing the project Environmental Impact Statement (EIS).

In preparation for the permit phase of the project, DXE has retained Huffman-Broadway Group, Inc. (HBG) to investigate the presence of wetlands and other waters potentially subject to Corps and EPA regulation under Section 404 of the Clean Water Act (CWA) along the DesertXpress Project's preferred and alternative alignments and study areas for the stations and ancillary facilities.

For the purpose of the jurisdictional delineation study the proposed DesertXpress Project has been divided into six areas using the USGS HUC 8¹ level of watershed classification. The scope of this report is to evaluate the presence or absence of wetlands and waters potentially subject to Corps CWA jurisdiction within the proposed DesertXpress Project alignments and facilities located within the HUC 8 Mojave and Coyote - Cuddeback Lakes watersheds (Exhibit A, Figure 2).

This study was conducted in accordance with *Code of Federal Regulations* (CFR) definitions of jurisdictional waters, the Corps' 1987 *Wetlands Delineation Manual*, the Corps' 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)*, and supporting guidance documents. The remaining portions of Section 1.0 provide project contact information, describe the location of the Study Area and provide technical details regarding the general environmental conditions found within the Study Area, including relevant technical information from the Draft EIS regarding water resource data and biological and cultural resource information. Section 2.0 provides regulatory background information and details regarding the technical criteria and types of field indicators evaluated for during

¹ HUC = U.S. Geological Survey (USGS) Hydrologic Unit Code. The Hydrologic Unit system is a standardized watershed classification system developed by USGS in the mid 1970s. Hydrologic units are watershed boundaries organized in a nested hierarchy by size. They range in size from national regions, to the smaller cataloging units (HUCs), which are roughly equivalent to local watershed.

the study. Section 3.0 provides a detailed description of the methods used during this investigation. Section 4.0 provides a description of technical findings and Section 5.0 describes the types of areas found that potentially may be subject to Corps CWA jurisdiction. Section 6.0 is a Clean Water Act jurisdictional analysis using the Rapanos Guidance.

HBG is seeking, on behalf of DXE, a Preliminary Jurisdictional Determination pursuant to applicable Corps guidance documents.

1.3 Study Area

The Study Area for this investigation is defined as the area where potential ground disturbing components of the proposed project would occur based on the alternatives identified and analyzed in conjunction with the EIS and Supplemental EIS prepared for the DesertXpress Project. The Study Area extends approximately 105 miles eastward from the proposed Victorville station to the Halloran Summit east of the town of Baker (Exhibit A, Figure 3).

1.4 Environmental Setting

The Study Area encompasses those portions of the proposed DesertXpress Project alignments and facilities between Victorville, California, and Las Vegas, Nevada, that lie within the Mojave Watershed (HUC-8 18090208) in San Bernardino County. The alignment alternatives pass through, from west to east, the following HUC-12 watersheds:

- Bell Mountain Wash
- Brisbane Valley-Wild Wash
- Town of Lenwood-Mojave River
- Town of Johnstons Corner
- 180902081004
- City of Barstow- Mojave River
- Odessa Canyon
- Sunrise Canyon-Mojave River
- Lake Jodie-Mojave River
- Dolores Lake
- Manix Wash
- Wilhelm Wash-Mojave River
- Afton Canyon-Mojave River
- West Cronise Lake
- East Cronise Lake
- 180902082502
- 180902082504
- Oasis of Mara-Soda Lake
- Otto Mountain-Silver Lake
- Hytens Well
- Halloran Spring-Halloran Wash

Figure 4 in Exhibit A shows the boundaries of these HUC 12 watersheds. All the above HUC-12 watersheds are within the Mojave Watershed (HUC-8) exception for Dolores Lake: I-15 straddles the boundary between the Dolores Lake watershed, which lies within the Coyote-Cuddeback Lakes HUC-8 watershed, and the Lake Jodie-Mojave River HUC-12 watershed.

The Study Area includes segments of the proposed alignment alternatives and facilities described in the Draft and Supplemental Environmental Impact Statement as Segments 1 and 2 and part of Segment 3 Alternative 3B. Segment 1 is the portion of the alignment from Victorville through Barstow. Segment 2 extends from the east side of Barstow through Yermo. The part of Segment 3 Alternative 3B that is within the Mojave Watershed is the portion of the alignment from Yermo eastward through Baker to Halloran Summit (see Figure 1 in Exhibit A). The DesertXpress route through the Mojave Watershed generally follows the I-15 right of way.

The principal hydrologic feature in the study area is the Mojave River. From its headwaters in the San Bernardino Mountains, the Mojave River, via both surface and subsurface flow, crosses the watershed for approximately 120 miles before terminating at Silver Dry Lake near Baker (or Soda Lake, in drier years). Aside from intense storm events, the Mojave River channel is typically dry downstream of the Mojave Forks Dam east of Hesperia (about 18 miles south of Victorville) except where groundwater is forced to the surface by geologic structures.

1.4.1 Topography

The Study Area is within the Mojave Desert Geomorphic Province. The Mojave Desert Geomorphic Province is characterized by mountain ranges and hills of moderate relief that are partially buried and separated by broad alluviated basins. .

The DesertXpress Project alternatives and facilities through the Study Area begins at an approximate elevation of 3,000 feet msl in Victorville, before descending to Barstow at about 2,100 feet msl. From Barstow, the alignment extends through the Mojave River Valley, Cronise Valley, the Soda Mountains and Soda Lake to Baker at an elevation of about 920 feet msl, then climbs the Halloran Springs Valley to Halloran Summit at an elevation of approximately 4,100 feet msl.

1.4.2 Land Use

Except for an approximately 8-mile diversion near Yermo east of Barstow, the proposed DesertXpress Project alignment alternatives through the Mojave Watershed is in the I-15 right of way on the north side of the freeway. In much of the Study area, the DesertXpress Project preferred alignment is within the interstate I-15 right of way / transportation corridor. It extends from the station north of Victorville through the towns of Lenwood (a Barstow suburb), Barstow, Yermo, and Baker, primarily on the north side of I-15 to Halloran Summit.

1.4.3 Geology and Soils

This section taken from the Draft EIS describes the geology within each segment of the Study Area. Tables list the geologic unit type and the age and description of geologic units mapped within each segment.

Segment 1 – Victorville through Barstow

Segment 1 is underlain by both alluvial sediments and older Mesozoic age granitic, volcanic, and metavolcanic rocks. The alluvial deposits include younger Holocene wash sediments (Qw) and valley sediments (Q, Qa), older Pleistocene valley and fan sediments (Qo, Qoa, Qod), and alluvial fanglomerate deposits (Qof). Underlying these alluvial sediments at a relatively shallow depth (and exposed in some places) are granitic quartz monzonite, hornblende diorite-gabbro and granite (KJqm, Qm, Gqm, Hd) and porphyritic metavolcanic rock (Mzv, Lp, Pf).

Geologic Unit (Symbol[s])	Geologic Age	Description - Soils
Younger alluvial valley sediments (Q, Qa)	Holocene	Unconsolidated, poorly sorted alluvial silt, sand and gravel
Younger alluvial river/wash deposits (Qw)	Holocene	Alluvial wash deposits.
Older alluvial valley and fan sediments (Qo, Qoa, Qod)	Pleistocene	Weakly consolidated dissected alluvial gravel, sand, and silt derived mainly from granitic and metamorphic rocks of San Gabriel /San Bernardino Mtns.
Older alluvial fanglomerate (Qof)	Pleistocene	Cobble fanglomerate and gravel derived from metavolcanic rocks.
Quartz Monzonite (KJqm, Qm, Gqm, Hd)	Cretaceous - Late Jurassic	Intrusive igneous (Granitic) rock, quartz monzonite, hornblende diorite-gabbro, granite.
Metavolcanic rocks (Mzv, Lp, Pf)	Mesozoic	Porphyritic volcanic and metavolcanic rocks. Includes Sidewinder Volcanic Series (Bowen, 1954), and Oro Grande (Hershey, 1902)

Source: Ninyo & Moore, 2007.

Segment 2 – East of Barstow through Yermo

Segment 2 Alternative 2C is on the north side of I-15 near but not within the freeway right of way. Three geologic units that underlie the westernmost portion of this: 1) Mojave River sediments along the southeast and north banks of the river, 2) an exposure of sedimentary and volcanic rocks east of Barstow, and 3) valley alluvium sediments in the small drainage valley west of Yermo.

Just east of Barstow, Segment 2 would cross an area of exposed Tertiary age, volcanic and sedimentary rocks (Mc, Mi, Tt, Tat, Tls, Td, Ts, Tsl). In the small drainage valley east of this rock exposure, Segment 2 crosses alluvial deposits consisting of young fan and valley sediments (Q, Qa), and a clay unit deposited from a playa or small lake bed (Qc, Ql). Northeast of Yermo, soils are underlain by older alluvium (Qo, Qoa) and fan gravel (Qf) on the southeast flank of the Calico Mountains. This older alluvium and fan gravel mantles the formation Tertiary volcanic and sedimentary rock that comprises the

Calico Mountains.

Geologic Unit (Symbol[s])	Geologic Age	Description - Soils
Younger alluvial valley/fan sediments (Q, Qa)	Holocene	Unconsolidated, poorly sorted alluvial silt, sand, and gravel sediments.
Younger alluvial valley sediments (Ql, Qc)	Holocene	Lake deposits, clay of small playas.
Younger alluvial fan sediments (Qf)	Holocene	Fan gravel.
Older Alluvial Sediments (Qo, Qoa)	Pleistocene	Dissected alluvial fan material composed of gravel, sand, and some boulders.
Volcanic and Sedimentary Rocks (Mc, Mi, Tt, Tat, Tls, Td, Ts, Tsl)	Tertiary	Miocene continental deposits and intrusive rocks; tuff breccia; dacite .breccia; limestone, shale, and tuff; dacite; interbedded shale and sandstone

Source: Ninyo & Moore, 2007.

Segment 3 Alternative 3B– Yermo to Halloran Summit

Yermo to Baker: Southwest of Manix, soils are underlain primarily by younger alluvial valley and fan sediments (Q, Qa, Qal, Qf), and partially by older fanglomerate and gravel alluvium in (Qof, QT). Northeast of Manix, soils are underlain by Manix Lake sand and silt sediments (Qms, Qol), younger river sand (Qrs, Qw) from tributary channels of the Mojave River, and by an area of older alluvium. Further northeast, the alignment continues through the Mojave River Valley and is underlain by younger valley alluvial sediments (Qal) and lacustrine (lake) deposits (Ql).

At the northeast end of the river valley, soils are underlain by older Pliocene-Pleistocene sediments of varying composition (Qc, QP). To the east, on the south side of the Cronise Mountains, soils are primarily underlain by younger alluvial sediments (Qal) and partially by exposures of Tertiary-Mesozoic age granitic rocks (gr, gr-m, TKq). A concealed, potentially active, unnamed fault is located skew to the alignment in the Cronise Valley.

In the Soda Mountains area between the Cronise Valley and Baker, soils are underlain by younger valley and alluvial fan deposits (Qal), older Pliocene-Pleistocene sediments of varying composition (Qc, QP), and by Tertiary age volcanic and sedimentary rocks (Tv, Tc). Exposures of Tertiary-Mesozoic age granitic rocks (gr, TKq) are found on the southeast side of the proposed alignment. The geologic maps indicate that Segment 3 Alternative 3B crosses the potentially active Baker fault on the east side of the Soda Mountains approximately 6 miles southwest of Baker. In Baker, the segment is underlain by younger lacustrine Soda Lake Bed sediments (Ql).

Baker–Halloran Summit: From Baker, Segment 3 Alternative 3B ascends a broad, sloping alluvial fan that flanks the southwest side of the Halloran Summit. Between Baker and Halloran Springs, the segment is underlain by younger valley and alluvial fan deposits (Qal).

The Halloran Summit area is comprised of a large body of Tertiary-Mesozoic age granitic rock (gr, TKq) that is overlain by younger Pleistocene age volcanic basalt flows (Qpv, Qeb). The granitic rock body is intruded into an older, Precambrian metamorphic rock unit comprised of gneiss (ep€, p€g) on the west side of the Halloran Summit. Segment 3 Alternative 3B is underlain by the gneissic rock and younger alluvium (Qal) on the west side of the summit. Younger alluvium is mapped at the Halloran Summit pass but is underlain at relatively shallow depth by granitic and/or volcanic rock. The inactive Halloran fault runs parallel to I-15 in this area.

Geologic Unit (Symbol[s])	Geologic Age	Description - Soils
Younger alluvial valley and fan sediments (Q, Qa, Qal)	Holocene	Unconsolidated valley alluvial deposits of silt, sand, and gravel; alluvial fan deposits.
Younger alluvial river/wash sediments (Qw, Qrs)	Holocene	Alluvial wash sediments and river sand.
Younger alluvial fan sediments (Qf)	Holocene	Fan gravel.
Younger lacustrine deposits (Ql)	Holocene	Lake and playa sediments including clay, silt, and fine sand; Soda Lake bed sediments.
Older alluvial valley sediments (Qof, Qt)	Pleistocene	Fanglomerate and gravel (Qof); continental deposits of gravel, sand, silt, and clay (Qt).
Older lacustrine deposits (Qms, Qol)	Pleistocene	Manix Lake bed sediments (silt and fine sand)
Volcanic rocks (Qpv, Qeb)	Pleistocene	Undifferentiated volcanic basalt flows.
Older alluvial deposits (Qc, Qp, Qo, Qoa, Qt)	Pleistocene And Plio-Pleistocene	Dissected alluvial gravel, sand, and silt; continental terrace deposits of gravel, sand, silt, and clay.
Volcanic and sedimentary rocks (Tv, Tc)	Tertiary	Undivided continental sedimentary rocks and volcanic rhyolite flows.
Granitic rocks (Gr, Tkq)	Tertiary/ Mesozoic	Intrusive igneous rock; includes teutonia quartz monzonite of Hewett, 1956.
Granitic and metamorphic rock (Gr-M)	Mesozoic	Granitic and metamorphic rock.
Marine sedimentary and meta-sedimentary rocks (Cm)	Paleozoic - Mississippian	Limestone and dolomite; includes Monte Cristo limestone of Hewett, 1956.
Marine sedimentary and meta-sedimentary rocks (Ds, Dsv, Dsi)	Paleozoic – Devonian	Sultan limestone of Hewett, 1956, including Valentine limestone and ironside Dolomite members.
Marine sedimentary and meta-sedimentary rocks (Ip/Ls, Deg, Degu, Degb1)	Paleozoic – Cambrian And Devonian	Dolomite and Limestone with thin interbedded Shale and Sandstone; Goodsprings Dolomite and Carbonate Rocks including Breccia of Hewett, 1956.
Metamorphic rocks (Epc, Peg, Pega, Pegc Pegb)	Precambrian	Undifferentiated injection gneiss, schist, granitic gneiss, granite augen gneiss complex.
Granitic rocks (Pegr)	Precambrian	Undivided syenite, shonkite, granite stocks, and dikes, including carbonate veins and irregular bodies in Mountain Pass area.

1.4.4 Seismology

The three potentially active fault zones described below have had a dominant role in forming the present seismic environment of the region. The boundaries of earthquake fault zones are based on the presence of well-defined, active fault traces. Zone boundaries are typically 500 to 660 feet away from the fault traces and are positioned to accommodate imprecise locations of the faults and the possible existence of active branches. The alignment would cross only one of these fault zones, the Eastern California/Mojave Shear Zone.

Eastern California/Mojave Shear Zone

The Eastern California/Mojave Shear Zone (ECMSZ) is an approximate 50-mile-wide zone of tectonic deformation that crosses the central Mojave Desert and is characterized by numerous northwest trending, right lateral, strike-slip faults roughly centered on Barstow. The ECMSZ is estimated to accommodate between 9 and 23 percent of the relative motion between the Pacific and North American tectonic plates.² The alignment would cross the ECMSZ in Segments 1, 2, and 3, between Helendale and Manix, California. Several moderate to large earthquakes have ruptured faults within this region, including the M_{max} 7.3 Landers earthquake (6/28/1992), and the M_{max} 7.1 Hector Mine earthquake (10/16/1999). The Landers earthquake produced an approximate 53-mile-long surface rupture that averaged approximately 10 to 13 feet of slip and occurred along portions of the Johnson Valley, Landers, Homestead Valley, Emerson, and Camp Rock faults.³ These surface rupture areas occurred south of the Study Area.

On March 18, 1997, a M_{max} 5.3 earthquake occurred along the Calico fault approximately 12 miles east-northeast of Barstow. This earthquake was the last aftershock of the Landers earthquake of 1992 to reach M_{max} 5. Although there was no surface rupture attributed to this earthquake, the Calico fault had exhibited some triggered slip during the 1992 Landers event.⁴

San Andreas Fault Zone

The San Andreas Fault zone has long been recognized as the dominant seismotectonic feature in California. The fault is located approximately 21.3 miles southwest of the southwest end of the alignment. Two of California's three largest historic earthquakes occurred along the San Andreas: the 1906 San Francisco earthquake (approximately 400 miles from the study area) and the 1857 Fort Tejon earthquake (the closest surface rupture occurred in Wrightwood, approximately 60 miles from the southwest end of the alignment). The San Andreas is a right lateral strike-slip fault, capable of producing earthquakes in excess of M_{max} 7.5.

Geologists infer that the segment of the San Andreas closest to the study area is currently locked and is accumulating substantial amounts of strain in response to the stresses

2 Southern California Earthquake Center, 2007, Faults of Southern California: <http://www.scec.org/faultmap.html>.

3 County of San Bernardino, 2005d, Safety Background Report, General Plan, Sections 7.1-7.1.2.1

4 County of San Bernardino, 2005d, Safety Background Report, General Plan, Sections 7.1-7.1.2.1

generated by the relative movement between the Pacific and North American plates. The available geologic data indicate that this strain is released during infrequent major earthquakes (M_{max} 7 to 8+ events) rather than by more frequent smaller magnitude earthquakes.

Garlock Fault

The Garlock fault is a prominent fault in southern California and crosses the northern part of the Mojave Desert province. The east end of the fault is approximately 20 miles north-northwest of Segment 3 Alternative 3B. Although this fault has not produced large earthquakes in recorded history, geomorphic and stratigraphic evidence indicates such events occurred in earlier eras. A total of about 30 to 40 miles of left-lateral strike slip has been documented across this fault. The Garlock fault is considered capable of generating about a M_{max} 7.5 earthquake.

1.4.5 Biological Resources

Vegetation Community Types

Using reconnaissance-level surveys, ten vegetation communities were identified and mapped in the study area, following the Central Mojave Vegetation Database classification. This list is based on reconnaissance-level surveys preformed for the Draft and Supplemental EIS in consultation with USFWS.

Vegetation Community Type	Sensitive Community	Associated Species	Description	Occurrence in Study Area
Shrub-dominated communities				
Creosote Bush Shrubland	No	A group of alliances: creosote bush may be the only shrub, other alliances are characterized by shared dominance with white bursage and/or brittlebush; also desert holly, saltbush species, and many other shrubs may be present in low densities	Various substrates and settings, including: sandy substrates, alluvial fans, bajadas; may occur on disturbed sites; 0-1,700 meters	Very common
Desert Holly Shrubland	No	Creosote bush, other saltbush species, white bursage, brittlebush	The most drought-tolerant scrub, occurring on rocky slopes, bajadas, and playa edges; -75 – 1,400 meters	Uncommon
Saltbush Complex	No	Other saltbush species, creosote bush, white bursage, rabbitbrush	Includes several alliances dominated by different saltbush species; many substrates and settings: sandy soils, washes, playas, playa edges, often alkaline sites; -75 – 1,400 meters	Very common
Mesquite Shrubland (Intermittently Flooded)	Yes	Saltbush species, sandbar willow, iodinebush	Rarely flooded edges of washes, floodplains, playa edges; up to 1,100 meters	Rare; occurs at a few sites west of Mountain Pass

Vegetation Community Type	Sensitive Community	Associated Species	Description	Occurrence in Study Area
Other Land Cover Types				
Barren (disturbed, graded)	No	May have sparse growth of mostly non-native species, especially invasive annual grasses	Various substrates and settings	Common along the median and shoulders of Interstate 15
Agriculture (alfalfa, grazing)	No	Alfalfa, a variety of pasture grasses	Generally flat alluvial areas	Occurs at the western end of the alignment east of Victorville
Rural development	No	N/A	Usually flat to gently sloping sites, valley floors	Predominantly at the western end of the alignment east of Victorville
Urban	No	N/A	Usually flat to gently sloping sites, valley floors	Cities of Victorville, Baker, Barstow, including urbanized areas adjacent to these communities

Source: Jones and Stokes, 2008.

Segment 1 – Victorville through Barstow

Segment 1 crosses relatively undisturbed creosote bush scrub and saltbush scrub. The alignment lies within the I-15 right of way where vegetation is barren. Federal- and state-listed threatened and endangered species having the potential to occur in Segment 1 are identified in the table below:

Biological Resource	Status Federal/State	Description	Potential for Occurrence in Segment 1
Special-Status Wildlife Species			
Desert tortoise	T/T	California Natural Diversity Data Base (CNDDB) identified suitable habitat in the project study area and several tortoises were observed near project study area during 2007 surveys. Suitable habitat occurs in desert scrub habitats.	Yes
Least Bell's vireo	E/E	One CNDDB occurrence within 4 miles of project study area. No suitable nesting habitat within project study area.	No
Southwestern willow flycatcher	E/E	No suitable nesting habitat within project study area.	No
Western burrowing owl	--/T	Several occurrences within 10 miles of project study area and one owl pellet observed during desert tortoise surveys in 2007, though no owls observed. Suitable habitat occurs throughout project study area in desert scrub habitats.	Yes
Western yellow-billed cuckoo	C/E	No suitable nesting habitat within project study area.	No
Mohave ground squirrel	--/T	Several CNDDB occurrences within 10 miles of the project study area. Habitat assessment indicates suitable habitat occurs in project study area.	Yes

Segment 2 – East of Barstow through Yermo

Segment 2 would cross relatively undisturbed creosote bush and saltbush scrub habitats and a dry lakebed. Federal- and state-listed threatened and endangered species having the potential to occur in Segment 2 are identified in the table below:

Biological Resource	Status Federal/State	Description	Potential for Occurrence in Segment 2
Special-Status Wildlife Species			
Desert tortoise	T/T	Desert tortoises observed during 2007 surveys. Suitable habitat occurs throughout project study area.	Yes
Desert bighorn sheep	--/ FP	CNDDDB records indicate suitable habitat within 10 miles of project study area. Suitable habitat does not occur within project study area.	No
Mohave ground squirrel	--/T	Several CNDDDB occurrences within 10 miles of project study area. Habitat assessment indicates suitable habitat in areas with desert scrub.	Yes
Special Management Lands			
Desert Tortoise Critical Habitat		Superior-Cronise Unit	Yes

Segment 3 Alternative 3B– Yermo to Halloran Summit

Yermo to Baker: The alignment would cross disturbed habitats, creosote bush scrub, and saltbush scrub. Just south of Baker, the alignment would pass adjacent to Soda Dry Lake.

Baker to Halloran Summit: From Baker, Segment 3 Alternative 3B would ascend a broad, sloping alluvial fan that flanks the southwest side of the Halloran Summit, and would cross disturbed habitats, creosote bush scrub, and saltbush scrub.

Resources having federal or State of California special status are listed below:

Biological Resource	Status Federal/State	Description	Potential for Occurrence in Segment 3 Alternative 3B
Sensitive Plant Communities & Wetlands			
Mesquite bosque	--/S	Three occurrences mapped in the Mojave River Wash at Cronise Valley.	Yes
Special Status Wildlife Species			
Mojave tui chub	E/E	Known to occur in the Mojave River. Though not directly in the project study area, drainages flowing under I-15 could carry sediments and contaminants into the Mojave River.	Yes
Desert tortoise	T/T	Desert tortoises observed during 2007 surveys. Suitable habitat occurs in washes crossed by I-15.	Yes

Biological Resource	Status Federal/State	Description	Potential for Occurrence in Segment 3 Alternative 3B
Golden Eagle	PR/ FP	No CNDDB occurrences within 10 miles of project study area. Suitable nesting habitat in rocky habitat	Yes
Desert bighorn sheep	--/ FP	CNDDB records indicate suitable habitat within 10 miles of project study area. Suitable habitat does occur within project study area.	Yes
Special Management Lands			
BLM Area of Critical Environmental Concern		Cronise Basin	Yes
BLM Area of Critical Environmental Concern		Halloran Wash	Yes
Desert Tortoise Critical Habitat		Ivanpah Unit; Superior-Cronise Unit	Yes

1.4.6 Climate

The project is in an arid high desert region with average monthly temperatures ranging from the 30s to the 90s in Fahrenheit (°F). The area is characterized by short, mild winters and long, hot summers. Precipitation in the area is limited, which influences hydrology within the area. The Mojave Desert has an arid to semi-arid climate; the area is in the rain shadow of 5,000 to 11,000-foot high mountains west of the area. About 2/3 of average annual precipitation occurs between November and March, when winter storms move east from the Pacific Ocean. Precipitation amounts are higher in the mountains, ranging from about 4 inches annually in lower areas, with precipitation over 12 inches annually in the highest elevations. In the higher mountains, winter precipitation may occur as snow. Precipitation in the summer comes as short, intense, and localized thunderstorms; much of this rain is lost to evapotranspiration, particularly if the storm is a small one. The farther east in the Mojave, summer storms are more frequent, as they arrive from Arizona to the south (NPS 1999).

The Western Regional Climate Center (2008) provides climatological data summaries for weather stations throughout the western United States; data for the Victorville weather station from July 1948 through June 2007 are presented below:

Monthly Climate Summary for Victorville, CA (July 1948–June 2007)

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Average Max Temp (°F)	59	62	67	74	82	92	98	97	91	81	68	59	77
Average Min Temp (°F)	30	34	37	42	48	55	61	60	55	45	36	30	44
Average Precipitation (in)	1.0	1.0	0.8	0.3	0.2	0.1	0.2	0.2	0.3	0.3	0.5	0.7	5.5
Average Snowfall (in)	1.0	0.0	0.1	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.2	0.1	1.4

Average annual precipitation for towns in the Study Area is summarized below:

Rainfall Station Location	Rainfall Record - Years	Range Of Annual Rainfall Totals (Inches)
Victorville	1939 To 2006	1.23 To 15.98
Barstow	1960 To 2006	1.11 To 11.27
Yermo	1961 To 2006	0.36 To 8.03
Baker	1956 To 2006	0.40 To 7.52

1.4.7 Hydrology

Mojave Watershed

The following is excerpted from the Lahontan Regional Water Quality Control Board Watershed Management Initiative (2005), online at http://www.swrcb.ca.gov/rwqcb6/water_issues/programs/watershed_management:

The Mojave Watershed encompasses approximately 4,500 square miles and is located entirely within San Bernardino County. . . .

The primary geographic and hydrologic feature of the watershed is the Mojave River. The headwaters of the Mojave River are in the San Bernardino Mountains, which annually receives greater than 40 inches of precipitation at its highest elevations. Much of the winter precipitation in the San Bernardino Mountains falls in the form of snow that provides spring recharge to the Mojave River system. Historically, the annual recharge from the headwaters is approximately 75,000 acre-feet. The Mojave River channel, through both surface and subsurface flow, transects the watershed a linear distance of approximately 120 miles to its terminus at Silver Dry Lake near the Community of Baker. Aside from seasonal intense storm events, the Mojave River channel is typically dry downstream of the Mojave Forks Dam except in select locations where ground water is forced to the surface by geologic structures. . . .

Typical of southwestern arid environments, the Mojave Watershed has limited water resources. Surface water from the headwaters in the San Bernardino Mountains quickly percolates into the porous sands of the young Mojave River alluvium. Thus, ground water is the primary source of water supply in most of the watershed. . . .

Today, most of the Mojave River channel is dry downstream of Victorville except during flood events. Historically, some areas contained water surface water throughout most of the year. Former “watering holes” for the Mormon and Spanish Trails were located along the Mojave River, which

were primarily located where faults or other geologic structures force ground water to the surface. Due to years of overdraft conditions, the ground water table has been lowered to a point where most areas no longer contain surface water.

Construction of the I-15 diverted many of the natural drainages along the ROW to culverts under the highway.

Segment 1 – Victorville through Barstow

Water Resources: The major hydrological resource within the project study area for Segment 1 is the Mojave River, which is located near the south and north ends of this segment. Multiple small unnamed creeks and washes that drain into the Mojave River or end before reaching the river. Other than the Mojave River, the Bell Mountain Wash and Wild Wash are the two main drainages in Segment 1.

Groundwater Resources: Segment 1 is located in both the Upper Mojave and Middle Mojave River Valley Groundwater Basins.⁵ The total surface area of the Upper Basin (CDWR Basin 6-42) is 413,000 acres or 645 square miles. The Upper Basin is bounded by the San Bernardino Mountains on the south and follows the Mojave River through Victorville in Apple Valley, and ends near the community of Helendale. Natural groundwater recharge of the basin occurs from direct precipitation, ephemeral stream flow, infrequent surface flow of the Mojave River, and underflow of the Mojave River. The general groundwater level trend in the Upper Basin is declining. Published total storage capacity for the basin varies. However, the California Department of Water Resources (CDWR) estimates that the total groundwater storage capacity is 27,839,000 acre-feet (af).⁶

The Middle Mojave River Valley Groundwater Basin (CDWR 6-41) generally flows east starting near the town of Helendale and ends at the Waterman fault. The total surface area of the basin is 211,000 acres or 330 square miles. Natural recharge of the basin occurs through precipitation, ephemeral stream flow, infrequent surface flow of the Mojave River, and underflow of the Mojave River. Groundwater level trends tend to vary with the amount of rainfall.

Segment 2 – East of Barstow through Yermo

Water Resources: Segment 2 includes five unnamed drainages in addition to the Waterman Avenue Channel, Arrowhead Channel, and North Barstow Channel. The Daggett Wash drains north into the Mojave River on the south side of Yermo at the north end of Segment 2.

Groundwater Resources: Portions of Segment 2 are also located in the Middle Mojave

⁵ A map of statewide groundwater sub-basins can be accessed at http://www.dpla2.water.ca.gov/publications/groundwater/bulletin118/maps/correct_statewide_basin_map_V3_subbas.pdf

⁶ DWR, 2004.

River Valley Groundwater Basin. A discussion of the character and groundwater quality of this groundwater basin is provided in above relative to Segment 1. Other portions of Segment 2 are also located in the Lower Mojave River Valley Groundwater Basin (CDWR Basin 6-40). The Lower Mojave River Valley Groundwater Basin surface area is 286,000 acres or 447 square miles. The groundwater basin underlies an elongated east-west valley, flowing from the Waterman fault and exiting the valley to the east through Afton Canyon.⁷ The total groundwater storage capacity is estimated to be about 9,010,000 af.

Segment 3 Alternative 3B– Yermo to Halloran Summit

Water Resources: Multiple unnamed drainages meander down the Calico Mountains near the western half of Segment 3 Alternative 3B. North of I-15 are the West and East Cronise Lakes and to the south is the Mojave River Wash. In the eastern portion of Segment 3 Alternative 3B, the major waterbodies in the vicinity are Silver Lake to the north and Soda Dry Lake to the south. Silver Lake and Soda Dry Lake make up the remnants of Lake Mojave. These lakes are small round depressions in the surface of the ground that tend to fill with water when it rains. There are numerous washes and ditches in Segment 3 Alternative 3B, including West Manix Wash, East Manix Wash, Sheep Ditch, Mobi Ditch, Mojave River Wash, Halloran Wash, Valley Wells Ditch, and Windmill Ditch.,

Groundwater Resources: The western portions of Segment 3 Alternative 3B are located in the Caves Canyon Valley Groundwater Basin (Basin 6-38). This basin underlies a portion of the Lower Mojave River Valley in central San Bernardino County. The Caves Canyon basin is bound by non-water-bearing rocks of the Cady Mountains on the southeast, the Cronise Mountains on the east, the Cave Mountains on the northeast, low hills on the north, and the Alvord Mountains on the northeast.⁸ The estimated total groundwater storage capacity of the basin is 4,152,000 af.

The next groundwater basin that Segments 3 Alternative 3B travels over is the Soda Lake Valley Groundwater Basin (Basin 6-33). This basin underlies a northeast-trending valley in northeast San Bernardino County. The basin is bounded by non water-bearing rocks of the Marl and Kelso mountains to the east, the Bristol and Cady mountains to the south, and the Soda and Cave Mountains to the west. Recharge to the basin occurs primarily from Mojave River percolation and percolation of runoff from the alluvial fan deposits at the base of the surrounding mountains. Groundwater level trends have been relatively stable throughout the period of record. However, declining levels have been observed in a couple of wells, and the most fluctuation occurs in wells near the Mojave River Sink. The total estimated storage capacity of the basin is approximately 9,300,300 af.⁹

⁹ CDWR, 2004b.

1.4.8 FEMA Flood Zones

FEMA issues Flood Insurance Rate Maps (FIRMs) to assess the potential and affect of a 100-year storm event. At the south end of Segment 1 is the 100-year floodplain along the Mojave River and Bell Mountain Wash near Stoddard Wells Road.

The 100-year floodplain generally follows the Mojave River. The north end of Segment 1 is within one mile of the 100-year floodplain that encompasses the southwest corner of Lenwood along Sylvan Avenue. Although no floodplain is mapped along the river from Lenwood Road south to Indian Trail, a review of the FEMA FIRM maps suggests that this area would be within the 100-year floodplain if it were studied. There are additional floodplain areas within this segment south of the BNSF railroad tracks in Lenwood, west of the Old Highway 58 and I-15 interchange, and at the east end of the segment along the intermittent canal between Ghost Town Road and Yermo Road.

Within Segment 3 Alternative 3B, the 100-year floodplain of the Mojave River is just east of Yermo. North of I-15 in the community of Baker is the 100-year floodplain of Silver Lake. South of I-15 and Baker is the 100-year floodplain for Soda Dry Lake. Soda Dry Lake and Silver Lake are dry most of the time, but occasionally receive stormwater runoff, which evaporates and/or sinks into the ground, although capillary action draws some of the water back to the surface. Since the water evaporates, the salts that were contained in the water are left behind; giving the dry lake its crusty, white surface.

1.5 Disclaimer

Huffman-Broadway Group, Inc. has conducted a thorough historical review and site investigation and made a good-faith effort herein to thoroughly describe and document the presence of potential factors that the Corps may consider in determining jurisdiction under their CWA jurisdiction as part of the Corps jurisdictional verification / determination process, however, DXE reserves the right to challenge or seek revision to any areas over which the Corps may assert jurisdiction.

2.0 REGULATORY FRAMEWORK

2.1 Definition of Wetlands and Other Waters of the U.S.

Section 404 of the Federal Clean Water Act authorizes the Corps to regulate activities that discharge dredged or fill material to wetlands and other waters of the United States. As described by EPA's and the Corps' regulations (40 CFR § 230.3(s) and 33 CFR § 328.3(a), respectively), the term "waters of the United States" encompasses the following resources:

- (1) All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
- (2) All interstate waters including interstate wetlands;
- (3) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters:
 - (i) Which are or could be used by interstate or foreign travelers for recreational or other purposes; or
 - (ii) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
 - (iii) Which are used or could be used for industrial purpose by industries in interstate commerce
- (4) All impoundments of waters otherwise defined as waters of the United States under the definition;
- (5) Tributaries of waters identified in paragraphs (a) (1) through (4) of this section;
- (6) The territorial seas;
- (7) Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) (1) through (6) of this section.

EPA and the Corps define wetlands as:

...those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas. (EPA regulations at 40 CFR § 230.3(t); Corps regulations at 33 CFR § 328.3(b)).

2.2 Limits of Jurisdiction

The following provides the regulatory definitions and criteria followed in determining the geographic extent of potential EPA/Corps jurisdiction as applicable to inland waters.

The geographic limits of relevant federal jurisdiction for non-tidal waters of the U.S. are defined as follows at 33 CFR § 328.4(c):

Non-Tidal Waters of the United States: The limits of jurisdiction in non-tidal waters:

- (1) In the absence of adjacent wetlands, the jurisdiction extends to the ordinary high water mark.
- (2) When adjacent wetlands are present, the jurisdiction extends beyond the ordinary high water mark to the limit of the adjacent wetlands.
- (3) When the water of the United States consists only of wetlands the jurisdiction extends to the limit of the wetland.

The terms “adjacent” and “ordinary high water mark,” used in the above definition, are defined at 33 CFR § 328.3 as follows:

The term *adjacent* means bordering, contiguous, or neighboring.

Wetlands separated from other waters of the United States by man-made dikes or barriers, natural river berms, beach dunes and the like are “adjacent wetlands.” (33 CFR § 328.3(c))

The term *ordinary high water mark* means that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas. (33 CFR § 328.3(e))

A site must meet certain water, soil, and vegetation criteria to qualify as a jurisdictional wetland. The Corps’ 1987 *Wetlands Delineation Manual* and various regional supplements describe these criteria and the methods used to determine whether they are met and the geographic extent of wetland areas identified in the field.

2.3 Identification of Ordinary High Water Marks (OHWM)

The Corps definition of Ordinary High Water Mark (OHWM) provides the criterion by which the OHWM line can be identified which consists of “*that line on the shore established by fluctuations of water and indirect physical characteristics*” (33 CFR § 328.3(e)). The Corps has developed a delineation manual for the identification of OHWMs within the Arid West Region, entitled *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States, A Delineation Manual* (Lichvar and McColley 2008). Tables 1a and 1b, below provide a summarized listing from the manual of indicators associated with areas that become flood or ponded, but are not dominated by wetland vegetation and the duration of

flooding, ponding and/or near surface soil saturation (≤ 12 inches) is not sufficient to cause hydric soils to form or wetland hydrology conditions to occur.

Table 1a. Potential Geomorphic Indicators of Ordinary High Water Marks for the Arid West *		
Potential Geomorphic OHWM Indicators

2.4 Wetlands Delineation Criteria

The Corps' 1987 *Wetlands Delineation Manual* identifies the key diagnostic criteria for determining the presence of wetlands. These include:

1. Wetland Hydrology: Inundation or saturation to the surface during the growing season.
2. Hydric Soils: Soils classified as hydric or that possess characteristics associated with reducing soil conditions.
3. Predominance of Wetland Vegetation: Vegetation classified as facultative, facultative wet, or obligate according to its tolerance of saturated (i.e., anaerobic) soil conditions.

Specific criteria used to determine the presence or absence of wetland hydrology, soil, and vegetation conditions are described in the sections below.

2.4.1 Wetland Hydrology

The 1987 Corps *Manual* states that wetland hydrology conditions occur when a “site is inundated either permanently or periodically at mean water depths less than or equal to 6.6 feet, or the soil is saturated to the surface at some time during the growing season of the prevalent vegetation.” Whether a site meets either of these criteria is determined by the presence of diagnostic indicators of wetland hydrology, which include those listed in Table 2.

Table 2. Wetland Hydrology Indicators (Based on 1987 Corps Manual and Corps Guidance Documents)	
Primary Indicators	Secondary Indicators
Watermarks	Oxidized Rhizospheres Associated with Living Roots
Drift Lines	Water-Stained Leaves
Water-Borne Sediment Deposits	FAC-Neutral Test
Drainage Patterns Within Wetlands	Local Soil Survey Data

A March 8, 1992 Corps memorandum entitled *Clarification and Interpretation of the 1987 Manual* provides further clarification:

Areas which are seasonally inundated and/or saturated to the surface for a consecutive number of days for more than 12.5 percent of the growing season are wetlands, provided the soil and vegetation parameters are met. Areas wet between 5 percent and 12.5 percent of the growing season in most years may or may not be wetlands. Sites saturated to the surface for less than 5 percent of the growing season are non-wetlands.

Wetland hydrology indicators have also been further defined and described in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (Corps 2008). These indicators are similar to the indicators listed above from the 1987 Corps *Manual* and are presented in Table 3.

Table 3. Wetland Hydrology Indicators for the Arid West
 (Based on Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, Version 2.0)

	Primary Indicators (<i>any one indicator is sufficient to make a determination that wetland hydrology is present</i>)	Secondary Indicators (<i>two or more indicators are required to make a determination that wetland hydrology is present</i>)

2.4.2 Hydric Soils

The 1987 Corps *Manual* states that the diagnostic environmental characteristics indicative of wetland soil conditions are met when "soils are present and have been classified as hydric, or they possess characteristics that are associated with reducing soil conditions." According to the Manual, indicators of soils developed under reducing conditions may include:

1. Organic soils (Histosols);
2. Histic epipedons;
3. Sulfidic material;
4. Aquic or peraqueic moisture regime;
5. Reducing soil conditions;
6. Soil colors (chroma of 2 or less);
7. Soil appearing on hydric soils list; and
8. Iron and manganese concretions.

A February 20, 1992, Corps memorandum entitled *Regional Interpretation of the 1987 Manual* states that the most recent version of National Technical Committee for Hydric Soils (NTCHS) hydric soil criteria will be used (to make hydric soil determinations). These soil criteria specify at least 15 consecutive days of saturation or 7 days of inundation (flooding or ponding) during the growing season in most years.

The concept of hydric soils includes soils developed under sufficiently wet conditions to support the growth and regeneration of hydrophytic vegetation. Soils that are sufficiently wet because of artificial measures are included in the concept of hydric soils. Also, soils in which the hydrology has been artificially modified are hydric if the soil, in an unaltered state, was hydric. Some series, designated as hydric, have phases that are not hydric depending on water table, flooding, and ponding characteristics. As indicated above, like the NRCS, the Corps has typically accepted guidance for the identification of hydric soils developed by the National Technical Committee for Hydric Soils (NTCHS). The

NTCHS, a working group organized by NRCS, has developed criteria for identifying and mapping hydric soils throughout the United States and defines a hydric soil as “a soil that formed under conditions of saturation, flooding or ponding long enough during the growing season to develop anaerobic conditions in the upper part [of the soil profile]” (<http://soils.usda.gov/use/hydric/intro.html>). The most recent (2000) version of the NTCHS hydric soils criteria identifies those soils that are likely to meet this definition. These criteria, which are accepted by most state and federal agencies, are as follows (<http://soils.usda.gov/use/hydric/criteria.html>):

1. All Histels except Folistels and Histosols except Folists, or
2. Soils in Aquic suborders, great groups, or subgroups, Albolls suborder, Historthels great group, Histoturbels great group, Andic, Vitrandic, and Pachic subgroups, or Cumulic subgroups that are:
 - a. Somewhat poorly drained with a water table equal to 0.0 foot (ft) from the surface during the growing season, or
 - b. poorly drained or very poorly drained and have either:
 - (i.) water table equal to 0.0 ft during the growing season if textures are coarse sand, sand, or fine sand in all layers within 20 inches (in), or for other soils,
 - (ii.) water table at less than or equal to 0.5 ft from the surface during the growing season if permeability is equal to or greater than 6.0 in/hour (h) in all layers within 20 in, or
 - (iii.) water table at less than or equal to 1.0 ft from the surface during the growing season if permeability is less than 6.0 in/h in any layer within 20 in, or
3. Soils that are frequently ponded for a long duration or a very long duration (7 to 30 days) during the growing season, or
4. Soils that are frequently flooded for a long duration or a very long duration (7 to 30 days) during the growing season.

On the basis of computer database searches for soils meeting the second criterion, NRCS has developed hydric soils lists for many parts of the country. Although they are useful for determining whether a particular soil series *has the potential to support current hydric soil conditions*, caution should be used when using these lists for site-specific hydric soil determinations. Many soils on the lists have ranges in water table depths and other characteristics that allow them to be either hydric or nonhydric depending on landscape position and other site-specific factors (e.g., soil clay content, depth to bedrock). Accordingly, hydric soils lists are good ancillary tools to facilitate wetland determinations, but are not a substitute for onsite investigations.

Field indicators of hydric soils are morphological properties known to be associated with soils that meet the definition of a hydric soil. Presence of one or more field indicators suggests that processes associated with hydric soil formation have taken place on the site being observed. The field indicators are essential for hydric soil identification because

once formed, they persist in the soil during both wet and dry seasonal periods. However, few hydric soil indicators identify soils at a site as being currently hydric in accordance with the NTCHS hydric soils criteria described above. Field indicators of hydric soil conditions are listed in Table 4:

Table 4. Field Indicators of Hydric Soil Conditions (Based on 1987 Corps Manual and Corps Guidance Documents)	
1. Indicators of Historical Hydric Soil Conditions:	2. Indicators of Current Hydric Soil Conditions:
a. Histosols b. Histic epipedons; c. Soil colors (e.g., gleyed or low-chroma colors, soils with bright mottles (Redoximorphic features) and/or depleted soil matrix d. High organic content in surface of sandy soils e. Organic streaking in sandy soils f. Iron and manganese concretions g. Soil listed on county hydric soils list	a. Aquic or peraqueic moisture regime (inundation and/or soil saturation for ≥ 7 continuous days) b. Reducing soil conditions (inundation and/or soil saturation for ≥ 7 continuous days) c. Sulfidic material (rotten egg smell)

The presence of one or more of the field indicators in “1 a, b, c, and/or d” above suggests that historical processes associated with hydric soil development have taken place at a given site. These indicators are useful in determining if soils at a site were historically formed under hydric soil conditions because the indicators persist in soils during both wet and dry periods and may remain for decades and even centuries after changes in site conditions occur that inhibit subsequent wetland development, such as the elimination of wetland hydrology (NRCS 1995). However, only the presence of field indicators “2 a, b, and/or c” confirms that hydric soils occur at a site during the period of observation.

Hydric soil indicators have also been further defined and described in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (Corps 2008). These indicators are similar to those listed above from the 1987 Corps *Manual* and are presented below in Table 5.

Table 5. Hydric Soil Indicators for the Arid West

(Based on Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, Version 2.0)

All Soils	Hydric Soil Indicators		Hydric Soil Indicators for Problem Soils**
	Sandy Soils	Loamy & Clayey Soils	
A1* – Histosol	S1 – Sandy Mucky Mineral	F1 – Loamy Mucky Mineral	A9 – 1 cm Muck
A2 – Histic Epipedon	S4 – Sandy Gleyed Matrix	F2 – Loamy Gleyed Matrix	A10 – 2 cm Muck
A3 – Black Histic	S5 – Sandy Redox	F3 – Depleted Matrix	F18 – Reduced Vertic
A4 – Hydrogen Sulfide	S6 – Stripped Matrix	F6 – Redox Dark Surface	TF2 – Red Parent Material
A5 – Stratified Layers	--	F7 – Depleted Dark Surface	Other (See Section 5 of the Regional Supplement, Version 2.0)--

A11 – Depleted Below Dark Surface	--	F9 – Vernal Pools	--
A12 – Thick Dark Surface	--	--	--

* Denotes number of hydric soil indicator described in detail in *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)*.
** Indicators of hydrophytic vegetation and wetland hydrology must be present.

It should also be noted for problematic areas that the 2008 Corps Regional Supplement specifies 14 days continuous ponding as an acceptable indicator of problematic hydric soils (USACE 2008, p. 101).

2.4.3 Prevalence of Wetland Vegetation

Species Classifications

Species classifications (e.g., tolerance of anaerobic soil conditions) are determined by consulting the *National List of Plant Species that Occur in Wetlands* (Reed 1988) and the relevant regional lists, which are published by FWS' National Wetlands Inventory (NWI). Regional Interagency Review Panels develop the lists by determining species' estimated probability of occurrence in wetlands vs. non-wetlands. Classifications are made by unanimous agreement of the Panel. If the Panel is unable to reach a unanimous decision on the status of a species, "no agreement" (NA) is recorded. If insufficient information exists to determine the status of a species, "no indicator" (NI) is recorded. Species that are not included in the NWI list are assigned a "not listed" (NL) designation in this report.

The resulting NWI lists include plants that grow in a range of soil conditions from permanently wet to dry. Species are divided into the following "indicator categories":

1. “**Obligate wetland**” (**OBL**) species, which, under natural conditions, occur almost always in wetlands (estimated probability >99 percent);
2. “**Facultative wetland**” (**FACW**) species, which usually occur in wetlands (estimated probability 67 – 99 percent), but are occasionally found in non-wetlands;
3. “**Facultative**” (**FAC**) species, which are equally likely to occur in wetlands or non-wetlands (estimated probability 34 – 66 percent);
4. “**Facultative upland**” (**FACU**) species, which sometimes occur in wetlands (estimated probability 1 – 33 percent), but more often occur in non-wetlands; and
5. “**Obligate upland**” (**UPL**) species, which occur in wetlands in other regions, but, under natural conditions, occur almost always in non-wetlands in the region specified (estimated probability >99 percent).

Species that have an indicator status of OBL, FACW, and FAC are typically considered to be adapted for life in anaerobic soil conditions (Corps 1987) and are used as evidence of hydrophytic vegetation when they dominate plant community composition or cover. Despite widespread use of the lists for wetland delineations, it is important to note that wetland indicator species assignments are not based on the results of a statistical analysis of species occurrence. The indicator assignments are approximations of wetland affinity based on a synthesis of submitted review comments, published botanical literature, and the field experience of the members of the Interagency Review Panel. For this reason and because many plants have properties that enable them to occur in a range of microhabitats (i.e., wetlands and non-wetlands), the presence of wetland indicator species is not unequivocal evidence of the presence of wetland hydrology and hydric soils. A positive indicator or indicators of wetlands should be emphasized, such as an assemblage of plants that can only be considered “hydrophytes” when they are growing in water or partly drained hydric soils (not effectively drained hydric soils) (Corps 1987). From the FWS perspective, all species on the NWI plant lists are hydrophytes at one time or another and the wetland indicator status (OBL, FACW, FAC, or FACU) reflects the likelihood that a given individual of a species is a hydrophyte or a certain population of these plants is hydrophytic. While OBL and FACW species are the most reliable plant indicators of wetlands, FAC and FACU species also contain populations of hydrophytes (Tiner 2006).

For the reasons stated above, the 1987 Corps *Manual* does not solely rely on the presence of hydrophytic vegetation to make wetland determinations.

Hydrophytic Vegetation Definitions

The Corps’ 1987 *Manual* states that the wetland vegetation conditions are met when the prevalent vegetation (i.e., more than 50 percent of vegetation cover or tree basal area) consists of macrophytes that are typically adapted to sites having wetland hydrologic and soil conditions (e.g., periodic or continuous inundation or soil saturation). Hydrophytic vegetation is defined as “plant life growing in water or on a substrate that is at least periodically deficient in oxygen as a result of excessive water content” (Cowardin *et al.*

1979). Hydrophytic vegetative species, due to morphological, physiological, and/or reproductive adaptation(s), have the ability to grow, effectively compete, reproduce, and/or persist in anaerobic soil conditions. Positive indicators of the presence of hydrophytic vegetation include:

1. More than 50 percent of the dominant species are rated as Obligate ("OBL"), Facultative Wet ("FACW"), or Facultative ("FAC") on lists of plant species that occur in wetlands (see Reed 1988 for California);
2. Visual observations of plant species growing in sites of prolonged inundation or soil saturation; and
3. Reports in the technical literature indicating the prevalent vegetation is commonly found in saturated soils.

Hydrophytic vegetation indicators have been further defined and described in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (Corps 2008). These indicators include:

1. Dominance Test. More than 50 percent of the dominant plant species across all strata are rated OBL, FACW, or FAC.
2. Prevalence Index. The prevalence index is 3.0 or less with indicators of hydric soils and wetland hydrology being present.
3. Morphological Adaptations. The plant community passes either the dominance test or the prevalence index after reconsideration of the indicator status of certain plant species that exhibit morphological adaptations for life in wetlands.

3.0 DELINEATION METHOD

This study was conducted in accordance with Code of Federal Regulations (CFR) definitions of jurisdictional waters, the Corps' 1987 *Wetlands Delineation Manual*, the Corps' 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0), A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States, A Delineation Manual*, and supporting guidance documents. The following provides an overview of the objective of the delineation approach, how the Study Area is defined, and the methods used to identify and map (delineate) areas potentially subject to Corps jurisdiction under Section 404 of the CWA.

3.1 Objective and Establishment of Study Area Boundary

The objective of this investigation is to identify and map areas potentially meeting the Clean Water Act definition of wetlands and Other Waters of the United States within the potential impact footprint of the DesertXpress Project. This impact footprint, which is encompassed within the Study Area, includes the proposed alignment and any alternative alignment and support facilities such as passenger stations and operations and maintenance facilities (e.g., maintenance yard, power substations, and transmission lines).

Temporary construction areas for equipment and materials laydown, new access roads, and borrow areas are also included within the Study Area. The boundary of the Study Area also represents a slightly larger area (increased alignment and facility ROW width by an average of 200 feet) to accommodate potential minor changes in the impact footprint.

3.2 Study Area Reconnaissance

Prior to initiating detailed field survey work, existing land forms within the Study Area that may potentially contain wetlands or other waters of the United States were identified by conducting vehicle and pedestrian on-site reconnaissance inspections during the month of April 2010 in conjunction with review of the following information:

- Aerial photography and satellite imagery of the area;
- USGS topographic mapping;
- NRCS soils mapping;
- Engineer scale topographic mapping of segment alternatives
- USGS National Hydrology Dataset; and
- Preliminary level vegetation mapping and wetland / OHWM data collection efforts conducted during February and March 2008 and September and October 2009 as part of an on-going Federal EIS process by the FRA's EIS contractor.

The above efforts led to the development, in coordination with Corps regulatory staff, and use of the project-specific methods described below.

3.3 Wetlands Identification and Delineation

Field surveys designed to identify the presence or absence of field indicators of wetland

vegetation, soils and hydrology conditions were conducted within low-lying landscape features where wetlands could potentially occur. These field surveys were conducted during the months of April, May, and June 2010.

3.3.1 Dominance of Wetland Vegetation

Presence or absence of a dominance of wetland vegetation / hydrophytes within the Study Area was evaluated using the methodology described in Sections 2.2 and 2.4.3. Indicator status of plants was confirmed by referring to the *National List of Plant Species that Occur in Wetlands: 1988 National Summary* (Reed). Plant cover data were collected for individual species associated within and immediately adjacent to the landscape features identified during the site reconnaissance survey as having the potential to meet the Corps' technical criteria for wetlands. Plant cover was visually estimated within 3-foot diameter plots at each soil sample location and was recorded on a Corps Wetland Determination Data Form – Arid West Region. Copies of completed data forms are provided in Exhibit B2. Subsequently, field data were analyzed to assess whether 50 percent or greater of the dominant species within the area sampled are hydrophytes. Sites that are depressional landforms that do not have a dominance of wetland vegetation forming at least 5 percent cover were not considered to be dominated by hydrophytes and were classified as a potential “other water of the United States” following the methodology described in Section 3.4, below, except if conditions for problematic vegetation were met as described in the Corps’ 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0).

3.3.2 Presence of Hydric Soil Indicators

The presence or absence of hydric soil field indicators was evaluated following the methodology described in Section 2.3.2 using the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Corps 2008). At each potential wetland sampling location within the Study Area, hand-dug soil pits were excavated to a minimum of 20 inches or until a limiting layer or standing water is reached. The presence or absence of hydric soil indicators found at each soil pit location was recorded on a Corps Wetland Determination Data Form – Arid West Region. Copies of completed data forms are provided in Exhibit B2. For sampling locations where the possibility of problematic hydric soils is found, procedures for the identification of problematic hydric soils as defined by the above described publication were followed.

3.3.3 Presence of Wetland Hydrology Indicators

The presence or absence of wetland hydrology field indicators were assessed following the methodology described in Section 2.3.1 using the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0) (Corps 2008). The presence or absence of wetland hydrology indicators at each soil pit location was recorded on a Corps Wetland Determination Data Form – Arid West Region. Copies of completed data forms are provided in Exhibit B2. For sampling locations where the possibility of problematic hydrology indicators was found, procedures for the identification of problematic hydrology indicators, as defined by the above-described publication, were followed.

3.4 Identification and Delineation of Other Waters

Field surveys designed to identify the presence or absence of field indicators of an ordinary high water mark (OHWM) were conducted within low-lying landscape features where other waters of the United States could potentially occur. These field surveys were conducted during the months of April, May, and June 2010 after the detailed methodology was reviewed and approved by Corps staff during May 2010.

HBG identified drainages within each watershed that potentially met the Corps technical criteria for Other Waters of the United States (presence of field indicators of active surface water flow and associated Ordinary High Water Mark [OHWM]) using the following approach based on *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States, A Delineation Manual*.

Initial efforts involved identification of all drainages within the Study Area having the potential for active surface flow. This was accomplished through field reconnaissance and imagery interpretation. Detailed sampling was then conducted to identify and delineated active drainages with an OHWM. This was accomplished by randomly sampling the identified drainages in a stratified manner by geographically dividing the Study Area into HUC 12 watershed units.

Field sampling within each HUC 12 watershed consisted of gathering OHWM data, including the measured width of the OHWM, for 3 to 5 main drainages (> 3 feet), if present, selected at random; and 6 to 10 (depending on watershed size) random samples of minor drainages (≤ 3 feet), if present. Each of the HCC 12 watersheds located within the Study Area was divided into approximate thirds. Then a minimum of one major drainage and two minor drainages, if present, was sampled within each third of a watershed. Where the length of the watershed along the project alignment alternatives was less than 5 miles, the watershed was divided into approximate halves instead. If the minor drainages (≤ 3 feet) occurring within each one-third watershed varied in OHWM width by more than 33 percent, sampling was increased in that third of the watershed.

Drainage data for each of the watershed drainages sampled were collected on a standardized field data sheet (Exhibit B2). Exhibit A, Figures 5-12 provide examples of the types of field indicators observed within various drainages along the DesertXpress Project alternative alignments. Each field sampling point was memorialized using a handheld GPS unit with submeter accuracy. Where stormwater flows originated upslope of the side of I-15 opposite the alignment, those drainages were hydrologically cut off by the freeway during construction and channeled into detention basins and / or manmade drainages on that side of I-15. As a consequence, drainages on the proposed alignment side of I-15 were hydrologically cut off from their sources and no longer technically meet the Corps OHWM criterion. This condition was noted on the field data sheets. Detailed OHWM indicator data for these historical drainage features were not collected.

All drainage data (field and photointerpreted drainage data) are summarized by HUC 12 watershed on the required Los Angeles District Excel JD Summary Data Sheet (see Exhibit B1). Widths for active drainages identified through photointerpretation are based on an average width calculated from field data. The length of each drainage is based on photointerpretation. Standardized field data sheets are provided in Exhibit B2. Representative photographs of various drainage features are presented in Exhibit A on Figures 13 – 33. The field data collected from each watershed were used to aid in the imagery interpretation process described in Section 3.5, below.

3.5 Mapping

Wetland indicator data sample locations and the locations of areas identified during field surveys that are potentially Other Waters of the United States due to the presence of an OHWM were mapped using a hand-held Trimble XT global positioning system (GPS) unit with sub-meter accuracy. This GPS data was incorporated into a Geographic Information System (GIS) and geo-referenced in overlay fashion onto digital orthorectified satellite imagery and/or high resolution aerial photograph depending on availability. Overlays were used to assist in analysis, identification, and digitization of the location and geographic extent of areas that could potentially qualify as waters of the United States. The imagery interpretation process involved the combined use of available imagery, field data, engineer level topographic mapping, field verification of mapped features and best professional judgment to map the geographic extent of areas potentially subject to Corps CWA jurisdiction. Exhibit C comprises detailed 1"=200' scale mapping of the Study Area with field sampling points and delineated active linear drainage features. Labeling indicating their average OHWM width was overlain on orthorectified digital imagery. The maps are provided in digital PDF format due to the extensive numbers of maps required to show such detail.

4.0 TECHNICAL FINDINGS

The following sections describe the landscape features and field indicators found within the Study Area that provide a technical basis for (a) determining the presence or absence of a potential water of the United States; and (b) defining the geographic extent of any potential water of the United States identified. Two types of landscape features were found that potentially contain waters of the United States. These include:

1. Natural drainages
2. Manmade drainages

4.1 Field Indicators of Hydric Soils

Based on field observations within the Study Area soil indicators were not found that meet the hydric soils criteria defined by current Corps' regulatory guidance, including the *2008 Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0). Onsite observations of surface conditions, including road and channel bank cuts, and interpretation of aerial photography revealed two primary soil types, desert pavement and more active wash sediments. Onsite examination revealed that soils or substrates within both natural drainages and manmade drainages consist of alluvial materials primarily made up of sorted sands and gravel, and are well drained, ranging from moderately well drained to excessively well drained.

4.2 Field Indicators of Wetland Hydrology Conditions

Based on field observations within the Study Area wetland hydrology indicators were not found that meet the wetland hydrology criteria defined by current Corps' regulatory guidance, including the *2008 Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0). Onsite observations revealed evidence of flooding within the low-lying natural and manmade drainages. These observations also showed that there was no evidence of ponding and soil saturation for long to very long periods of time. The lack of ponding and soil saturation conditions meeting the wetland hydrology criteria is a direct result of the moderately well drained to excessively well drained alluvial soils.

Although wetland hydrology conditions were not found within the Study Area, the field indicators of active surface water flow or flooding found within natural and manmade drainages were sufficient enough to form Ordinary High Water Marks (OHWM). As indicated in Section 2.0, an OHWM provides a technical basis for (a) determining the presence a potential water of the United States; and (b) defining the geographic extent of potential water of the United States.

The natural and manmade drainages within the Study Area found with an OHWM exhibited the following characteristics which are discussed in detail in the following subsections:

1. identifiable field indicators of surface flow
2. identifiable landscape features that supports surface flow
3. identifiable landscape features with a recognizable OHWM

Exhibit A, Figures 5-12 provides typical examples of field indicators of active surface water flow and OHWMs found within ephemeral drainages occurring within the DesertXpress Project Study Area. Exhibit A, Figures 13-33 provide photographs of various types of drainages observed within the HUC 8 Mojave watershed.

4.2.1 Field Indicators of Surface Flow

Review of topographic mapping (USGS and Engineer scale) and imagery of the Study Area provided visual indication of the presence of curvilinear depressional land surface features where focused surface water flow could potentially be directed. Linear drainage features associated with road drainage and flood control were also found. Field investigations confirmed the presence of surface flow within a number of these channels or drainages while others lacked evidence / field indicators of active ephemeral surface water flow. No drainages were found to contain evidence of perennial or intermittent surface water flow, and no evidence of subsurface flow was found in the form of spring discharges, artesian flows or indicia of a high groundwater table. Observation of active natural and manmade ephemeral drainages revealed evidence of surface water / hydrologic connectivity with other active drainages within and outside the Study Area. These ephemeral drainages are locally referred to as “desert dry washes.” The manmade drainages served to redirect surface flow from altered natural drainages. Indicators of drainages having active surface water flow paths included (1) water marks defined by linear deposits of fine-grained sediment, minerals and/or plant debris; (2) bank scour, erosion, and/or shelving; (3) deposits of sorted alluvial materials; and (4) flow-deposited woody and soft tissue plant debris (Exhibit B2).

Flow-deposited woody and soft tissue plant debris were typically absent in drainages that did not have active surface flow. If woody debris was present, the pieces observed were relatively thick (i.e., greater than $\frac{1}{4}$ inch) weathered limb or root material or milled posts or lumber. The wood pieces found were randomly placed and were not part of a collective flow line of deposited woody and/or soft tissue plant debris, which would be indicative of an active channel. The historical drainages were found to possess one or more of the same type of indicators found in active drainages, but the indicators found were considerably weathered. Surface flow indicators such as bank scour, erosion, and shelving areas had rounded edges in contrast to those found in active drainages having angular edges. Water marks defined by linear deposits of fine-grained sediment and minerals, and sorted alluvial materials such as gravels, cobbles and boulders were etched or varnished from weathering. The historical drainages were found to consist of the historical remains of channel drainages that were abandoned due to upslope changes in drainage due to either channel down-cutting or the channel becoming abandoned as the surface drainage became redirected or changed course due to deposition of alluvial material damming the channel flow path. The historical drainages were found to lack

indicators of active flow.

Surface water flow patterns were also found within various portions of the landscape that were relatively flat. These surface flow areas were defined by flow-deposited fine grained sediment or soft tissue plant debris. The visible surface flow pattern at these locations would continue for several feet then disappear either on a relatively flat soil surface or localized depression.

Based on the above technical findings and as documented in Exhibits B and C, drainages were found with indicators of active surface water flows within the Study Area.

4.2.2 *Landscape Features that Support Surface Flow*

Detailed field surveys identified land surface features that have the potential to convey surface flows. These features included a bed or channel and abutting banks. These physical features were found associated with both active flow areas and historical drainages. These drainage types can be summarized as follows:

1. Active drainage channel and abutting banks containing evidence of recent surface flows as indicated by the presence of unweathered sediment material (sand, gravel, cobbles, etc.) with unweathered surfaces, and the presence of flow deposited woody debris and/or soft tissue plant debris.
2. Active drainage channel and abutting banks containing evidence of historical surface flows as indicated by the presence of unweathered sediment material (sand, gravel, cobbles, etc.) with unweathered surfaces, but lacked the presence of flow deposited woody debris and/or soft tissue plant debris.
3. Historical drainage channels and abutting banks having no evidence of recent surface flow as indicated by weathered sedimentary gravel, cobbles, boulders, erosional or depositional deposits, and the lack of flow deposited woody debris and/ or soft tissue plant debris.

The frequency interval of flow events within drainages with observable plant debris (1 above) and unweathered sediment material is estimated to be within the 1 to 15 year range. Strojan, et al. (1987) found that surface litter decomposition rates for creosote bush and burro bush in the Mojave Desert were 42.5% and 58.4%, respectively over a 54-week period of study. Kemp, et al. (2003) reported a similar one year decomposition rate for creosote bush and a 74% loss within a 41-month period. This lends support to qualitative observations made by one of the preparers of this report, Dr. Terry Huffman, who has observed over 20 + years of delineating wetlands within arid environments that soft plant tissue (i.e., pieces of plant leaves and thin bark) will decompose in arid drainage environments within a 2 to 3 year period. In addition, field observations over these years indicated that small woody stems (<1/4 inch) decompose over many more years, perhaps 10 + years. For older drainages where the surfaces of the sediment material (e.g., sand, gravel, cobbles, etc.) is no longer smoothed by the interaction of surface water flow and transport, but weathered, and lacks flow deposited woody and thin tissue plant debris, the frequency interval likely ranges to well over a decade in shallower

channels to prehistoric times for deeply incised channels (i.e. > 6 feet in desert pavement areas).

The land surface of the Study Area is characterized by the presence of active and inactive alluvial fan systems. Ephemeral drainage channels are found on both types of these alluvial fan types. The majority of the ephemeral channels supporting active surface water flow were narrow, with an average width of less than 3 feet. Active alluvial fans were characterized by sandy soils, a uniform vegetation type, and evidence by surface flow patterns indicative of surface water sheetflow. Narrow channels within these areas were both weakly expressed and discontinuous. This discontinuity indicated that new channels could be formed with each major flood event resulting in the current channels being bypassed and blocked off. Channels >3 feet wide were also found. These channels were considerably deeper than the narrow channels found and were less common when considering the landscape as a whole in relationship to the Study Area. Evidence was found within both of these channel types where previously bypassed cutoff channels were becoming filled with sediment. The specific conditions varied within the Study Area.

Based on the above technical findings, drainages with active surface flow were found within the Study Area with physical features that allow for the conveyance of surface flows.

4.2.3 Landscape Features with a Recognizable OHWM

The desert dry washes with active flow were found to have identifiable features which represented the geographic reach of lateral surface water. These features included channels or beds with evidence of active flow and abutting banks which demarcated the lateral reach or extent of flow. Field indicators of the extent of active flow along the banks included water marks defined by linear deposits of fine grained sediment and/or minerals, bank scour, erosion, and/or shelving, and flow deposited woody and soft tissue plant debris (Exhibit B2).

Based on the above technical findings, the active drainages, described in the above subsections, have recognizable landscape features from which the lateral extent of surface water flow can be geographically delineated. Field indicators of this surface water flow were used to identify the OHWM. The maps in Exhibit C show the locations of these active ephemeral drainages.

4.3 Field Indicators of Wetland Vegetation

On the basis of field observations within the Study Area, a dominance of wetland plant species or hydrophytes was not found. Based on this result, the criteria defined by current Corps' regulatory guidance, including the *2008 Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0) for wetland vegetation were not met.

4.4. Presence of Wetland Vegetation within Natural and Manmade Drainages

Based on field observations within the Study Area a dominance of wetland plant species or hydrophytes was not found within natural or manmade drainages within the Study Area where active ephemeral drainages were found.

5.0 AREAS POTENTIALLY SUBJECT TO JURISDICTION

This section presents the findings of this delineation with respect to the identification and geographic extent of areas found that could potentially be regulated by the Corps and the EPA as wetlands or other waters of the United States under Section 404 of the Clean Water Act.

5.1 Wetlands

No areas meeting the Corps technical criteria for wetlands were identified within the Study Area. These findings are based on the absence of hydric soil, wetland hydrology, and / or wetland vegetation indicators as required by the Corps' *1987 Manual, the Arid West Regional Supplement*, guidance documents, and regulations.

5.2 Other Waters of the U.S.

Ephemeral drainages or desert dry washes were found within the Study Area that meet the technical criteria to potentially be subject to CWA Section 404 jurisdiction as Other Waters of the United States (Exhibit C). This finding is based on the presence of an OHWM as required by Corps regulations. Length and width measurements of the ephemeral drainages found to contain an observable OHWM are provided in Exhibit B1.

* = J.S.A. probably made a typographical error for this species.

**Using JSA taxonomy (*S. tragus*) we determined that in 1988, when the wetland manual was produced, this species could have been either *S. kali* (FACU*) or *S. pestifer* (FACU) (Region O), or FACU for both in Region 8.

NI = Not Indicated.

NL = Not Listed in NWI 1988.

(HUC 18090208)**

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Desert Xpress City/County: San Bernardino Sampling Date: 3/31/08
 Applicant/Owner: Circle Point State: CA Sampling Point: 13-1
 Investigator(s): M.W. Dawson, C. Voigt Section, Township, Range:
 Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): none Slope (%):
 Subregion (LRR): D Lat: N 34.595 Long: W 117.259 Datum: NAD 83
 Soil Map Unit Name: Nebona - cudeback Complex Z to 90/6 S/3as NWI classification: N/A ZONE 11
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)
 Are Vegetation N, Soil N, or Hydrology N significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____
 Are Vegetation N, Soil N, or Hydrology N naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <u> </u> No <u>✓</u>	Is the Sampled Area within a Wetland?	Yes <u> </u> No <u>✓</u>
Hydric Soil Present?	Yes <u> </u> No <u>✓</u>		
Wetland Hydrology Present?	Yes <u> </u> No <u>✓</u>		
Remarks:	OHWM <u>4</u> ft wide Photos "3.31.08 4-1 <u>0.5</u> ft height 012 Facing W <u>2:1</u> bank slope 013 " E		

VEGETATION

HYDROLOGY

Wetland Hydrology Indicators:		Secondary Indicators (2 or more required)
Primary Indicators (any one indicator is sufficient)		
<input type="checkbox"/> Surface Water (A1)	<input type="checkbox"/> Salt Crust (B11)	<input type="checkbox"/> Water Marks (B1) (Riverine)
<input type="checkbox"/> High Water Table (A2)	<input type="checkbox"/> Biofilm Crust (B12)	<input type="checkbox"/> Sediment Deposits (B2) (Riverine)
<input type="checkbox"/> Saturation (A3)	<input type="checkbox"/> Aquatic Invertebrates (B13)	<input type="checkbox"/> Drift Deposits (B3) (Riverine)
<input type="checkbox"/> Water Marks (B1) (Nonriverine)	<input type="checkbox"/> Hydrogen Sulfide Odor (C1)	<input type="checkbox"/> Drainage Patterns (B10)
<input type="checkbox"/> Sediment Deposits (B2) (Nonriverine)	<input type="checkbox"/> Oxidized Rhizospheres along Living Roots (C3)	<input type="checkbox"/> Dry-Season Water Table (C2)
<input type="checkbox"/> Drift Deposits (B3) (Nonriverine)	<input type="checkbox"/> Presence of Reduced Iron (C4)	<input type="checkbox"/> Thin Muck Surface (C7)
<input type="checkbox"/> Surface Soil Cracks (B6)	<input type="checkbox"/> Recent Iron Reduction in Plowed Soils (C6)	<input type="checkbox"/> Crayfish Burrows (C8)
<input type="checkbox"/> Inundation Visible on Aerial Imagery (B7)	<input type="checkbox"/> Other (Explain in Remarks)	<input type="checkbox"/> Saturation Visible on Aerial Imagery (C9)
<input type="checkbox"/> Water-Stained Leaves (B9)		<input type="checkbox"/> Shallow Aquitard (D3)
		<input type="checkbox"/> FAC-Neutral Test (D5)
Field Observations:		
Surface Water Present?	Yes <input type="checkbox"/>	No <input checked="" type="checkbox"/> Depth (inches): <u>MORE</u>
Water Table Present?	Yes <input type="checkbox"/>	No <input checked="" type="checkbox"/> Depth (inches): <u>> 12</u>
Saturation Present? (includes capillary fringe)	Yes <input type="checkbox"/>	No <input checked="" type="checkbox"/> Depth (inches): <u>> 12</u>
		Wetland Hydrology Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:		

Remarks: Pipeline road crosses drainage & affects waterflow, resulting in a braided channel below road. Offwm are weak.

OHWM Indicators: ss, sh, sc, fc

Substrate: Sand, gravel

Remarks:

soil

Sampling Point: V-5-2

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, RC=Root Channel, M=Matrix

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histsol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleyed Matrix (S4)

- Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleyed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F1B)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present?

Yes No

Parks: sand.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- | | |
|---|---|
| Surface Water (A1) | Salt Crust (B11) |
| High Water Table (A2) | Biotic Crust (B12) |
| Saturation (A3) | Aquatic Invertebrates (B13) |
| Water Marks (B1) (Nonriverine) | Hydrogen Sulfide Odor (C1) |
| Sediment Deposits (B2) (Nonriverine) | Oxidized Rhizospheres along Living Roots (C3) |
| Drift Deposits (B3) (Nonriverine) | Presence of Reduced Iron (C4) |
| Surface Soil Cracks (B6) | Recent Iron Reduction in Plowed Soils (C6) |
| Inundation Visible on Aerial Imagery (B7) | Tin Muck Surface (C7) |
| Water-Stained Leaves (B9) | Other (Explain in Remarks) |

- Secondary Indicators (2 or more required)

 - Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No ✓ Depth (inches): _____

Water table Present? Yes _____ No _____ Depth (inches): _____

Saturation Present? Yes No Depth (inches): _____

(includes capillary fringe)

Wetland Hydrology Present? Yes No

(includes capillary rings) Describe Recorded Data (stream gauge monitoring well, aerial photos, previous inspections), if available:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverline)
 - Sediment Deposits (B2) (Riverline)
 - Drift Deposits (B3) (Riverline)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____

Water Table Present? Yes _____ No Depth (inches): _____

Saturation Present? Yes No Depth (inches): _____

Wetland Hydrology Present? Yes _____ No

Saturation Present? Yes _____ No _____ (includes capillary fringe) _____ previous inspections), if available:

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available.

Remarks: 2 4' dia culverts under I-15

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Desert Xpress City/County: San Bernardino Sampling Date: 4-1 - 2008
 Applicant/Owner: Circle Point State: CA Sampling Point: 18-4

Investigator(s): CV, MW, MB Section, Township, Range: _____

Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): None Slope (%): _____

Subregion (LRR): D Lat: N 34° 17.192 Long: N 117° 24.724 Datum: NAD 83

Soil Map Unit Name: Cajon-Ariza Complex 2 to 15% Slopes NWI classification: N/A ZONE: 11

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No _____ (If no, explain in Remarks.)

Are Vegetation N, Soil N, or Hydrology N significantly disturbed? Are "Normal Circumstances" present? Yes No _____

Are Vegetation N, Soil N, or Hydrology N naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Is the Sampled Area within a Wetland?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Hydric Soil Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>		
Wetland Hydrology Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>

SOIL

SOIL (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix. ²Location: PL=Pore Lining, RC=Root Channel, M=Matrix. Indicators for Problematic

Utility Self-Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Hydric Soil Indicators:** (Appendix 1)

 - Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleyed Matrix (S4)
 - Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleyed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

- ### Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Hydric Soil Present? Yes No

Depth (inches):

Remarks: moisture @ 4"

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriversine)
 - Sediment Deposits (B2) (Nonriversine)
 - Drift Deposits (B3) (Nonriversine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)
 - Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches): none

Water Table Present? Yes No Depth (inches): 320

Saturation Present? Yes No Depth (inches): >20

What Hydrology Present? Yes No

(includes capillary fringe) *(attach all serial photos, previous inspections), if available:*

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous maps, etc.)

Remarks: 7 concrete 4' x 10' culverts, flow partially blocked

OHWM Indicators: SH, SD (distant past)

Substrate: gravel

Comment Number	Comment
1	Cut berms under highway. Dissociation works present just beyond and offset within a grable of braiding features. Both undercut berms the downcut stream end of a deflation basin on the south side of the road.
2	Drainages between cut berms are inactive drainages blocked by backwash terrace of the highway.
3	Drainages at the north end of Basin 5 near the Holga winter change are active drainages.

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Types: C=Concentration, D=Depletion, RM=Reduced Matrix.

²Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Module Self-Indicators: (Applicable to all LBRs, unless otherwise noted.)

Indicators for Problematic Hydric Soils³:

- Hydric Soil Indicators:** (Applicable to all LRRs, unless otherwise indicated)

 - Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleyed Matrix (S4)
 - Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleyed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

Restrictive Layer (if present):

² Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix. Location:
Location: (Applicable to all LRRs, unless otherwise noted.)

Indicators for Problematic Hydric Soils³:

- | | |
|-------------------------------------|------------------------------|
| — Histosol (A1) | — Sandy Redox (S5) |
| — Histic Epipedon (A2) | — Stripped Matrix (S6) |
| — Black Histic (A3) | — Loamy Mucky Mineral (F1) |
| — Hydrogen Sulfide (A4) | — Loamy Gleayed Matrix (F2) |
| — Stratified Layers (A5) (LRR C) | — Depleted Matrix (F3) |
| — 1 cm Muck (A9) (LRR D) | — Redox Dark Surface (F6) |
| — Depleted Below Dark Surface (A11) | — Depleted Dark Surface (F7) |
| — Thick Dark Surface (A12) | — Redox Depressions (F8) |
| — Sandy Mucky Mineral (S1) | — Vernal Pools (F9) |
| — Sandy Gleayed Matrix (S4) | |

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes No

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

- Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches): none

Water Table Present? Yes No Depth (inches): > 20

Water Table Present? Yes _____ No Depth (inches): > 20
Saturation Present? Yes No

Wetland Hydrology Present? Yes No

(includes capillary fringe) _____
Saturation Present? _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available.

Remarks: Railroad crosses wash on bridge 100' long

OHWM Indicators: cl. sky, PC, SS

Substrate: Sand, gravel

Exhibit B2

DesertXpress Field Data For Mojave Watershed (HUC 18090208)

Contents:

HBG Watershed Number	HUC 12 Watershed Name	HBG Field Data	ICF Jones & Stokes Field Data	Comments
1	Burkhardt Lake – Mojave River	Yes	Yes	Not in current preferred route. Former Victorville station location in this watershed
2	Bell Mountain Wash	Yes	Yes	
3	Brisbane Valley-Wild Wash	Yes	Yes

²Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Type: C=Concentration, D=Depletion, RM=Reduced Matrix. **Location:** _____
Notes: _____

Indicators for Problematic Hydric Soils³:

- Hydric Soil Indicators:** (Applicable to all LRRs, unless otherwise noted)

 - Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleved Matrix (S4)
 - Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleved Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Hydric Soil Present? Yes _____ No X

Depth (inches): _____

Remarks: Moisture @ 4"

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)
 - Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - EAC-Neutral Test (D5)

Field Observations:

Surficial Water Present? Yes No Depth (inches): _____

Surface Water Present? _____ Water Table Present? Yes _____ No Depth (Inches): _____

Water Table Result: _____
Saturation Present? Yes _____ No Depth (inches): _____
(includes capillary fringe)

Wetland Hydrology Present? Yes No

Previously Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

OHWM Indicators: PC, Sd, Ss, Sc, Sh.

Substrate: cobbley gravel, sand,

Sampling Point: 29.5

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)
 - Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____

Water Table Present? Yes No Depth (inches):

Water Table Present? Yes _____ No _____
Saturation Present? Yes _____ No Depth (inches): _____
~~Saturation = capillary fringe~~

Wetland Hydrology Present? Yes X No

Recorded Date (stream gauge monitoring well, aerial photos, previous inspections), if available:

Remarks:

OHWM Indicators: Scl, Ss, Sc, Sh
Substrate: gravel, cobbles, SAND, boulders

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)
 - Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

- Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverline)
 - Sediment Deposits (B2) (Riverline)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

SOIL

Soil *(Brief Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)*

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix. ²Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Health Self-Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Hydric Soil Indicators:** (Applicable to all LRRs, unless otherwise indicated)

 - Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleayed Matrix (S4)
 - Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleayed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

- ### Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Hydric Soil Present? Yes No

Depth (inches): _____

Depth (inches): _____
remarks: Shovel refusal @ 13" due to gravel & cobble, moisture @ 6"

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

Secondary Indicators (2 or more required)

¹Indicators of hydric soil and wetland hydrology must be present.

SOIL

Sampling Point: 22.2

SOIL Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix. ²Location: PL=Pore Lining, RC=Root Channel, M=Matrix. Indicators for Problematic

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Hydro Soil Indicators: (A1-A12)

 - Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen-Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleyed Matrix (S4)
 - Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleyed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

- ### Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: rock/gravel

Depth (inches): 18

Hydric Soil Present? Yes _____ No

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____

Water Table Present? Yes No Depth (inches):

Saturation Present? Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

(includes capillary fringe) "bring well", aerial photos, previous inspections), if available:

Potential Geomorphic OHWM Indicators

(A) Below OHW	(B) At OHW	(C) Above OHW
1) In-stream dunes 2) Crested ripples 3) Flaser bedding 4) Harrow marks 5) Gravel sheets to rippled sands 6) Meander bars 7) Sand tongues 8) Muddy point bars 9) Long gravel bars 10) Cobble bars behind obstructions 11) Scour holes downstream of obstructions 12) Obstacle marks 13) Stepped-bed morphology in gravel 14) Narrow berms and levees 15) Streaming lineations 16) Desiccation/mud cracks 17) Armored mud balls 18) Knick Points	1) Valley flat 2) Active floodplain 3) Benches: low, mid, most prominent 4) Highest surface of channel bars 5) Top of point bars 6) Break in bank slope 7) Upper limit of sand-sized particles 8) Change in particle size distribution 9) Staining of rocks 10) Exposed root hairs below intact soil layer 11) Silt deposits 12) Litter (organic debris, small twigs and leaves) 13) Drift (organic debris, larger than twigs)	1) Desert pavement 2) Rock varnish 3) Clast weathering 4) Salt splitting 5) Carbonate etching 6) Depositional topography 7) Caliche rubble 8) Soil development 9) Surface color/tone 10) Drainage development 11) Surface relief 12) Surface rounding

Potential Vegetation OHWM Indicators

	(D) Below OHW	(E) At OHW	(F) Above OHW
Hydroriparian indicators	1) Herbaceous marsh species 2) Pioneer tree seedlings 3) Sparse, low vegetation 4) Annual herbs, hydromesic ruderals 5) Perennial herbs, hydromesic clonals	1) Annual herbs, hydromesic ruderals 2) Perennial herbs, hydromesic clonals 3) Pioneer tree seedlings 4) Pioneer tree saplings	1) Annual herbs, xeric ruderals 2) Perennial herbs, non-clonal 3) Perennial herbs, clonal and non-clonal co-dominant 4) Mature pioneer trees, no young trees 5) Mature pioneer trees w/upland species 6) Late-successional species
Mesoriparian indicators	6) Pioneer tree seedlings 7) Sparse, low vegetation 8) Pioneer tree saplings 9) Xeroriparian species	5) Sparse, low vegetation Annual herbs, hydromesic 6) Ruderals 7) Perennial herbs, hydromesic clonals 8) Pioneer tree seedlings 9) Pioneer tree saplings 10) Xeroriparian species 11) Annual herbs, xeric ruderals	7) Xeroriparian species 8) Annual herbs, xeric ruderals 9) Perennial herbs, non-clonal 10) Perennial herbs, clonal and non-clonal codominant 11) Mature pioneer trees, no young trees 12) Mature pioneer trees, xeric understory 13) Mature pioneer trees w/upland species 14) Late-successional species 15) Upland species
Xeroriparian indicators	10) Sparse, low vegetation 11) Xeroriparian species 12) Annual herbs, xeric ruderals	12) Sparse, low vegetation 13) Xeroriparian species 14) Annual herbs, xeric ruderals	16) Annual herbs, xeric ruderals 17) Mature pioneer trees w/upland species 18) Upland species

DesertXpress Field Data For Mojave Watershed (HUC 18090208)

Contents:

HBG Watershed Number	HUC 12 Watershed Name	HBG Field Data	ICF Jones & Stokes Field Data	Comments
1	Burkhardt Lake – Mojave River	Yes	Yes	Not in current preferred route. Former Victorville station location in this watershed
2	Bell Mountain Wash	Yes	Yes	
3	Brisbane Valley-Wild Wash	Yes	Yes	
4	Town of Lenwood-Mojave River	Yes	Yes	
5	Town of Johnstons Corner	Yes	Yes	
6	180902081004	Yes	No	
7	City of Barstow- Mojave River	Yes	Yes	
8	Odessa Canyon	Yes	Yes	
9	Sunrise Canyon-Mojave River	Yes	Yes	
10	Lake Jodie-Mojave River	Yes	Yes	
11	Dolores Lake	Yes	No	In Coyote-Cuddeback Lakes HUC 8 watershed, not Mojave Watershed
12	Manix Wash	Yes	Yes	
13	Wilhelm Wash-Mojave River	Yes	Yes	
14	Afton Canyon-Mojave River	Yes	Yes	
15	West Cronise Lake	Yes	Yes	
16	East Cronise Lake	Yes	Yes	
17	180902082502	Yes	Yes	
18	180902082504	Yes	Yes	
19	Oasis of Mara-Soda Lake	Yes	Yes	
20	Otto Mountain-Silver Lake	Yes	Yes	
21	Hytens Well	Yes	Yes	
22	Halloran Spring-Halloran Wash	Yes	Yes

SOIL

SOIL Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix.

²⁾ location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Indicators for Problematic Hydric Soils³:

Hydro Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR C)
- 1 cm Muck (A9) (LRR D)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- Sandy Gleved Matrix (S4)

- Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleyed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Depth (inches):

Hydric Soil Present? Yes _____ No

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

- Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C5)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required):

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches):

Surface Water Present? Yes No Depth (inches): _____

Water Table Present? _____ Yes _____ No _____ Depth (inches): _____

"Serial photos previous inspections), if available:

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if any.

Wetland Hydrology Present? Yes _____ No _____

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

- Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches):

Water Table Present? Yes No , Depth (inches):

Saturation Present? Yes No Depth (inches): _____

Saturation present
(includes capillary fringe)

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available.

WETLAND DETERMINATION DATA FORM – Arid West Region

Object/Site: D5X City/County: San Bernardino Sampling Date: 3/20/09
 Applicant/Owner: Circle Point State: CA Sampling Point: 38-2
 Investigator(s): JH, JW, AD Section, Township, Range: _____
 Landform (hillslope, terrace, etc.): Valley Floor Local relief (concave, convex, none): none Slope (%): 2%
 Subregion (LRR): D Lat: 34° 16' 54.7541" Long: N 35.005346 Datum: NAD 83
 Soil Map Unit Name: N/A NWI classification: N/A ZONE II

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No _____ (If no, explain in Remarks.)
 Are Vegetation No, Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No _____
 (If needed, explain any answers in Remarks.)
 Are Vegetation No, Soil , or Hydrology naturally problematic?

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Is the Sampled Area within a Wetland?
Hydric Soil Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Wetland Hydrology Present?	Yes <input type="checkbox"/> No <input type="checkbox"/>

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: OKX City/County: Santa Barbara Co. Sampling Date: 3/12/08
 Applicant/Owner: Circle Point State: CA Sampling Point: 39-1

Investigator(s): JH, JW, AD Section, Township, Range: _____
 Landform (hillslope, terrace, etc.): Valley floor Local relief (concave, convex, none): Concave Slope (%): 2%

Subregion (LRR): D Lat: 34° 11' 45" N Long: 116° 45' 35" W Datum: NAD 83

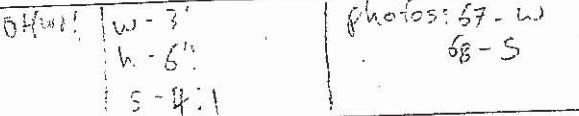

Soil Map Unit Name: 14-10A NWI classification: NA ZONE 11

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No _____ (If no, explain in Remarks.)

Are Vegetation No, Soil Yes, or Hydrology Yes significantly disturbed? Are "Normal Circumstances" present? Yes No _____

Are Vegetation No, Soil Yes, or Hydrology Yes naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Is the Sampled Area within a Wetland?
Hydric Soil Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Wetland Hydrology Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: DSX

City/County: Searcy, Arkansas Sampling Date: 3/19/08

Applicant/Owner: Creek Point

State: AR Sampling Point: 40-1

Investigator(s): JH JW AD

Section, Township, Range:

Landform (hillslope, terrace, etc.): Valley Floor

Local relief (concave, convex, none): Concave Slope (%): 5%

Subregion (LRR): D

Lat W: 116.441731 Long: N 35.051907 Datum: NAD 83

Soil Map Unit Name: H/A

NWI classification: A ZONE 11

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)

Are Vegetation No, Soil , or Hydrology significantly disturbed?

Are "Normal Circumstances" present? Yes No

Are Vegetation No, Soil , or Hydrology naturally problematic?

(If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Is the Sampled Area
Hydric Soil Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	within a Wetland?
Wetland Hydrology Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>

SOIL

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix. ²Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleayed Matrix (S4)
 - Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleayed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

- ### Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____.

Depth (inches): _____

Hydric Soil Present? Yes _____ No _____

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

- Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____

Water Table Present? Yes No / Depth (inches): _____

Water Table Present: _____

Saturation Present?
(includes capillary fringe)

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

SOIL Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix. ²Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

Indicators for Problematic Hydric Soils³:

- Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleyed Matrix (S4)
 - Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleyed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: grave / cobble

Depth (inches): 10

Hydric Soil Present? Yes _____ No

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

- Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: DSX City/County: Sear Bernardino Sampling Date: 3/19/08
 State: CA Sampling Point: 45-1

Applicant/Owner: Circle Point

Investigator(s): JHAD

Landform (hillslope, terrace, etc.): Valley Floor

Subregion (LRR): D

Soil Map Unit Name: NIA

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No _____ (If no, explain in Remarks.)

Are Vegetation No, Soil , or Hydrology significantly disturbed?

Are Vegetation No, Soil , or Hydrology naturally problematic?

Section, Township, Range:

Local relief (concave, convex, none): Concave Slope (%): 2%

Lat (N) -116.250497 long (N) 35.169762 Datum: NAD 83

NWI classification: D1A Zone: 11

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Is the Sampled Area within a Wetland?
Hydric Soil Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Wetland Hydrology Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>

Potential Geomorphic OHWM Indicators

(A) Below OHW	(B) At OHW	(C) Above OHW
1) In-stream dunes 2) Crested ripples 3) Flaser bedding 4) Harrow marks 5) Gravel sheets to rippled sands 6) Meander bars 7) Sand tongues 8) Muddy point bars 9) Long gravel bars 10) Cobble bars behind obstructions 11) Scour holes downstream of obstructions 12) Obstacle marks 13) Stepped-bed morphology in gravel 14) Narrow berms and levees 15) Streaming lineations 16) Dessication/mud cracks 17) Armored mud balls 18) Knick Points	1) Valley flat 2) Active floodplain 3) Benches: low, mid, most prominent 4) Highest surface of channel bars 5) Top of point bars 6) Break in bank slope 7) Upper limit of sand-sized particles 8) Change in particle size distribution 9) Staining of rocks 10) Exposed root hairs below intact soil layer 11) Silt deposits 12) Litter (organic debris, small twigs and leaves) 13) Drift (organic debris, larger than twigs)	1) Desert pavement 2) Rock varnish 3) Clast weathering 4) Salt splitting 5) Carbonate etching 6) Depositional topography 7) Caliche rubble 8) Soil development 9) Surface color/tone 10) Drainage development 11) Surface relief 12) Surface rounding

Potential Vegetation OHWM Indicators

	(D) Below OHW	(E) At OHW	(F) Above OHW
Hydoriparian indicators	1) Herbaceous marsh species 2) Pioneer tree seedlings 3) Sparse, low vegetation 4) Annual herbs, hydromesic ruderals 5) Perennial herbs, hydromesic clonals	1) Annual herbs, hydromesic ruderals 2) Perennial herbs, hydromesic clonals 3) Pioneer tree seedlings 4) Pioneer tree saplings	1) Annual herbs, xeric ruderals 2) Perennial herbs, non-clonal 3) Perennial herbs, clonal and non-clonal co-dominant 4) Mature pioneer trees, no young trees 5) Mature pioneer trees w/upland species 6) Late-successional species
Mesoriparian indicators	6) Pioneer tree seedlings 7) Sparse, low vegetation 8) Pioneer tree saplings 9) Xeroriparian species	5) Sparse, low vegetation Annual herbs, hydromesic 6) Ruderals 7) Perennial herbs, hydromesic clonals 8) Pioneer tree seedlings 9) Pioneer tree saplings 10) Xeroriparian species 11) Annual herbs, xeric ruderals	7) Xeroriparian species 8) Annual herbs, xeric ruderals 9) Perennial herbs, non-clonal 10) Perennial herbs, clonal and non-clonal codominant 11) Mature pioneer trees, no young trees 12) Mature pioneer trees, xeric understory 13) Mature pioneer trees w/upland species 14) Late-successional species 15) Upland species
Xeroriparian indicators	10) Sparse, low vegetation 11) Xeroriparian species 12) Annual herbs, xeric ruderals	12) Sparse, low vegetation 13) Xeroriparian species 14) Annual herbs, xeric ruderals	16) Annual herbs, xeric ruderals 17) Mature pioneer trees w/upland species 18) Upland species

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: D5X

City/County: San Bernardino Sampling Date: 3/17/88

Applicant/Owner: Circle Point

State: CA Sampling Point: 46-1

Investigator(s): SH, JW, AD

Section, Township, Range: _____

Landform (hillslope, terrace, etc.): Valley Floor

Local relief (concave, convex, none): convex Slope (%): 2%

Subregion (LRR): D

Lat: N 35°11'6.207367 long: N 116.139029 Datum: NAD 83

Soil Map Unit Name: N/A

NWI classification: N/A ZONE H

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation No, Soil Soil, or Hydrology Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation No, Soil Soil, or Hydrology Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <u> </u> No <u>✓</u>	Is the Sampled Area within a Wetland?
Hydric Soil Present?	Yes <u> </u> No <u>✓</u>	Yes <u> </u> No <u>X</u>
Wetland Hydrology Present?	Yes <u> </u> No <u>✓</u>	
Remarks:		OHWM $\frac{W-X}{W-B} = 5'$ $S-3:1$ Photos: 8993-E 8994-W

SOIL

SOIL _____
Soil Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix. ²Location: PL=Pore Lining, RC=Root Channel, M=Matrix. Indicators for Problem

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Hydric Soil Indicators:** (Applicable to all LRRs, unless otherwise indicated)

 - Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C)
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleayed Matrix (S4)
 - Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleayed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

- ### Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: gravel / cobble

Depth (inches): 14

Hydric Soil Present? Yes _____ No ✓

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient).

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches):

Water Table Present? Yes No Depth (inches): _____

Saturation Present? Yes No Depth (inches): _____

(includes capillary fringe) _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available.

Wetland Hydrology Present? Yes No

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

1100-1150-1100-1150

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____

Water Table Present? Yes No Depth (inches): _____

Saturation Present?
(includes capillary fringe) Yes _____ No _____ Depth (inches): _____

Wetland Hydrology Present? Yes _____ No

(includes Capillary fringe) Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)

- Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (inches): None

Water Table Present? Yes No Depth (inches): 216

Saturation Present? Yes No Depth (inches): 215

Wetland Hydrology Present? Yes No

(Includes capillary fringe) _____

Remarks: Wash has been partially diverted by levee. That parallels freeway & wash - main flow (A) now on NORTH side of levee, with smaller flow (B) on S

QW/M Indicators (use abbreviations): A: SE-693, S: SS

B: SS, SC

OHWM Indicators (use abbreviations); M, SC, Sh, etc.

SOIL

Sampling Point: 60 - 1

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix.

²Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
 - Histic Epipedon (A2)
 - Black Histic (A3)
 - Hydrogen Sulfide (A4)
 - Stratified Layers (A5) (LRR C) **NOT D**
 - 1 cm Muck (A9) (LRR D)
 - Depleted Below Dark Surface (A11)
 - Thick Dark Surface (A12)
 - Sandy Mucky Mineral (S1)
 - Sandy Gleyed Matrix (S4)

- Sandy Redox (S5)
 - Stripped Matrix (S6)
 - Loamy Mucky Mineral (F1)
 - Loamy Gleyed Matrix (F2)
 - Depleted Matrix (F3)
 - Redox Dark Surface (F6)
 - Depleted Dark Surface (F7)
 - Redox Depressions (F8)
 - Vernal Pools (F9)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR C)
 - 2 cm Muck (A10) (LRR B)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____.

Depth (inches):

Hydric Soil Present? Yes No

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
 - High Water Table (A2)
 - Saturation (A3)
 - Water Marks (B1) (Nonriverine)
 - Sediment Deposits (B2) (Nonriverine)
 - Drift Deposits (B3) (Nonriverine)
 - Surface Soil Cracks (B6)
 - Inundation Visible on Aerial Imagery (B7)
 - Water-Stained Leaves (B9)
 - Salt Crust (B11)
 - Biotic Crust (B12)
 - Aquatic Invertebrates (B13)
 - Hydrogen Sulfide Odor (C1)
 - Oxidized Rhizospheres along Living Roots (C3)
 - Presence of Reduced Iron (C4)
 - Recent Iron Reduction in Plowed Soils (C6)
 - Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water Marks (B1) (Riverine)
 - Sediment Deposits (B2) (Riverine)
 - Drift Deposits (B3) (Riverine)
 - Drainage Patterns (B10)
 - Dry-Season Water Table (C2)
 - Thin Muck Surface (C7)
 - Crayfish Burrows (C8)
 - Saturation Visible on Aerial Imagery (C9)
 - Shallow Aquitard (D3)
 - FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes No Depth (Inches): none

Water Table Present? Yes No Depth (inches): 34

Saturation Present? Yes No Depth (inches): 214

Wetland Hydrology Present? Yes No

(Includes capillary fringe) Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous Inspections), if available:

Remarks:

CHWM Indicators (use abbreviations): d, S1.6-506, PC,

Primary tributary substrate composition (use abbreviations): Sand, gravel

				CALIFORNIA	CA

* = J.S.A. probably made a typographical error for this species.

**Using JSIA taxonomy (*S. tragus*) we determined that in 1988, when the wetland manual was produced, this species could have been either *S. kali* (FACU*) or *S. pestifer* (FACU) (Region O), or FACU for both in Region 8.

NI = Not Indicated.

NL = Not Listed in NWI 1988.
