¹ The total energy delivered is the net generation for the data year. Values shown are the total system sales for each year, and were obtained from SCE's Financial Statistical Reports. Available:

² The percentages of energy from renewable sources for 2018, 2019, and 2020 were obtained from SCE's 2020 Sustainability Report. Available: <https://www.edison.com/content/dam/eix/documents/sustainability/eix-2020-sustainability-report.pdf>.

⁴ The emissions metric presented here is calculated based on the total CO₂e emissions divided by the energy delivered from non-renewable sources.

⁵ The intensity factors for default RPS assumption are estimated by multiplying the percentage of energy delivered from non-renewable energy by the CO₂e emissions per total non-renewable energy metric calculated above. The estimate provided here assumes that renewable energy sources do not result in any CO₂e emissions.

⁶ RPS for 2020 and 2026 based on California Senate Bill (SB) 100. RPS for 2025 determined by linearly interpolating between the 2020 RPS (33%) and the 2026 RPS (50%), as listed in SB 100. Available:

¹Mitigated construction emissions are obtained from CalEEMod® outputs in Appendix A.

²Segment 4 was proportioned into the two air jurisdictions based on the length of the rail alignment in each jurisdiction, with 55.5% in MDAQMD (Segment 4a) and 44.5% in SCAQMD (Segment 4b).

³GHG emissions use the Intergovernmental Panel on Climate Change Fourth Assessment Report global warming potentials of 1, 25, and 298 for carbon dioxide, methane, and nitrous oxide, respectively.

⁴Emissions for asphalt paving of parking lots and architectural coating use for parking areas are obtained from Table B-1 and Table B-2 respectively.
