CLASSIFICATION OF MATERIAL BASED ON STANDARD GRADE SIZE LIMITS

DIAGRAM SHOWING THE BASIS FOR ESTIMATES OF GRADE SIZE DISTRIBUTION USED IN DETERMINATION OF CLASS NAMES.

IF GRAVEL IS PRESENT IN APPRECIABLE AMOUNTS THE TERM "GRAVELLY" MAY BE ADDED TO THE CLASS NAME, VIZ. "GRAVELLY SAND". THE TERMS "COARSE", "MEDIUM" AND "FINE" WHEN USED TO DESCRIBE SAND, SILT AND GRAVEL REFER TO STANDARD GRADE SIZE LIMITS.

Classification of Material Based on Standard Grade Size Limits

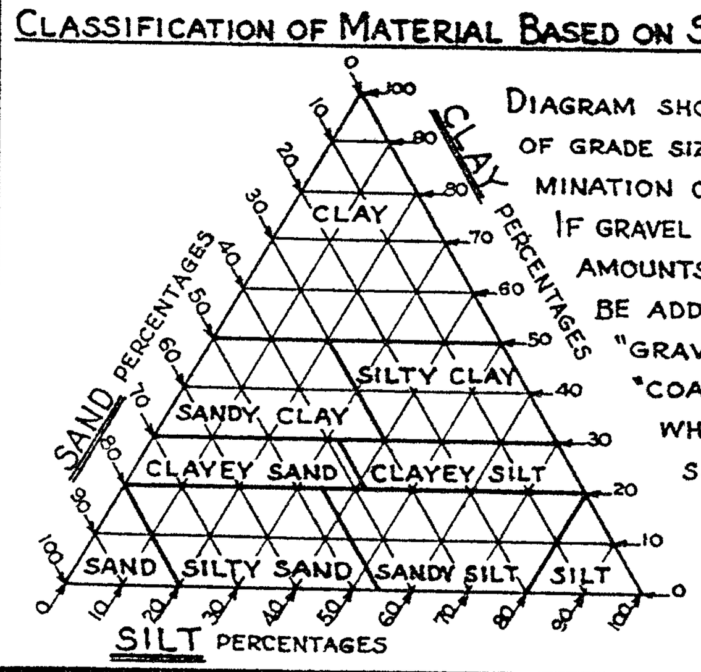

Diagram showing the basis for estimates of grade size distribution used in determination of class names. If gravel is present in appreciable amounts the term "gravelly" may be added to the class name, viz. "gravelly sand". The terms "coarse", "medium" and "fine" when used to describe sand, silt and gravel refer to standard grade size limits.

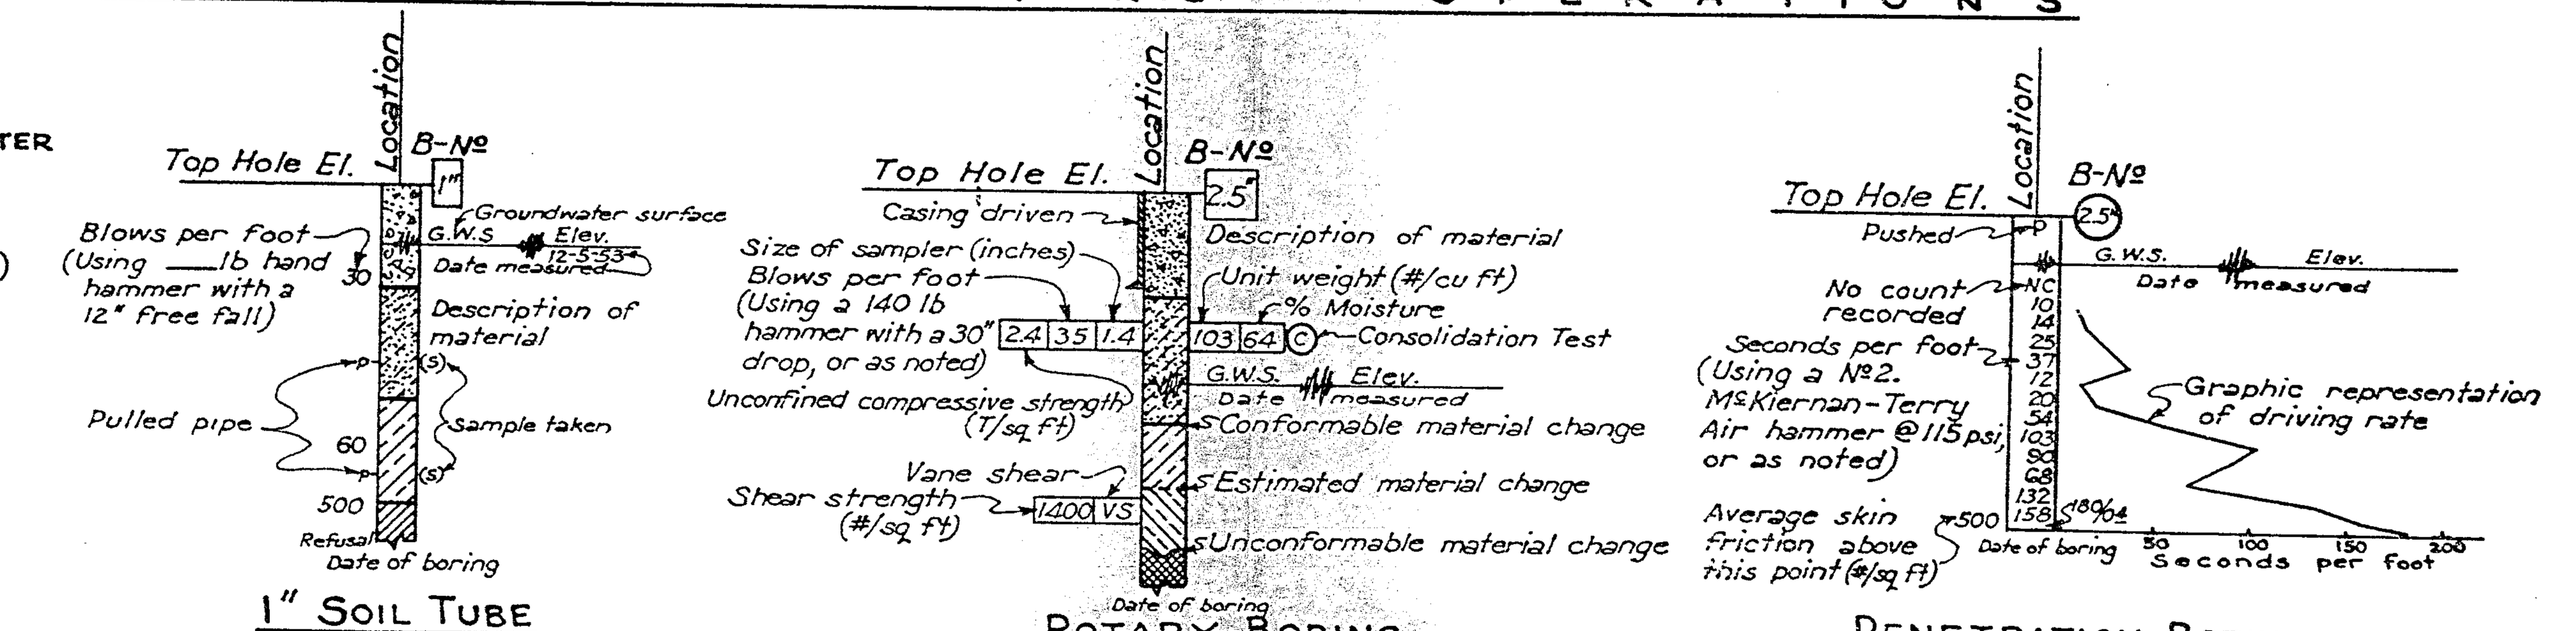
Legend of Earth Materials

- Gravel
- Sand
- Silt
- Clay
- Sandy Clay or Clayey Sand
- Sandy Silt or Silty Sand
- Silty Clay or Clayey Silt
- Peat and/or Organic Matter
- Fill Material
- Igneous Rock
- Sedimentary Rock
- Metamorphic Rock

Legend of Boring Operations

- Penetrometer
- 2¼" Cone Penetrometer
- Sampler boring (dry)
- Rotary boring (wet)
- Auger boring (dry)
- Jet boring
- Core boring
- Test pit



Note

Classification of earth material as shown on this sheet is based upon field inspection and is not to be construed to imply mechanical analysis.

NOTES

62mm samples were taken using a California split-barrel sampler with an inside diameter (I.D) of 62mm and an outside diameter (O.D) of 83mm.

A rope and cathead hammer system consisting of a hammer weight of 63.5KN falling a distance of 762mm was used to advance the drive sampler(s)

This LOTB sheet (Boring Record) was prepared in accordance with the Caltrans Soil and Rock Classification Logging, Classification and Presentation Manual (June 2007)

CONSISTENCY CLASSIFICATION FOR SOILS

According to the Standard Penetration Test ASTM Designation D1586-67

Penetration Resistance (Blows/Ft.)	Granular	Cohesive
0-5	Very loose	Very soft
5-10	Loose	Soft
10-20	Slightly compact	Stiff
20-35	Compact	Very stiff
35-70	Dense	Hard
>70	Very dense	Very hard

NOTE: Classification of earth material as shown on this sheet is based upon field inspection and is not to be construed to imply mechanical analysis.

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions	Group Symbols	Typical Names
Coarse grained Soils — Gravels — Clean gravels (little or no fines)	GW	Well graded gravels, gravel sand mixtures, little or no fines
	GP	Poorly graded gravels, gravel sand mixtures, little or no fines
Gravels with fines (Appreciable amount of fines)	GM	Silty gravels, gravel sand silt mixtures
	GC	Clayey gravels, gravel sand clay mixtures
Sands — Clean sands (little or no fines)	SW	Well graded sands, gravelly sands, little or no fines
	SP	Poorly graded sands, gravelly sands, little or no fines
Sands with fines (Appreciable amount of fines)	SM	Silty sands, sand silt mixtures
	SC	Clayey sands, sand clay mixtures
Fine grained Soils — Silts and Clays (Liquid limit less than 50)	ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity
	CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
	OL	Organic silts and organic silty clays of low plasticity
Silts and Clays (Liquid limit greater than 50)	MH	Inorganic silts, micaceous or diatomaceous fine sands or silts, elastic silts
	CH	Inorganic clays of high plasticity, fat clays
	OH	Organic clays of medium to high plasticity, organic silts
Highly Organic Soils	Pt	Peat and other highly organic soils

SAND: Brown, dry, slightly compact.
SAND: Fine grained, red brown, dry, slightly compact.
SAND: Fine to medium grained, red brown, slightly comapct.
SAND: Fine grained, with trace SILT, yellow tan, moist, dense.
SILT: Fine grained, thinly interbedded, with oxidation stains, orange, slightly moist dense to slightly compact.
SAND: Trace of fine grains, tan, dry, dense.
SILT: Tan, dry to slightly moist, dense to very dense, with some oxidation stains and interbedded fine grained sand.
SAND: Fine grained, poorly graded, tan, slightly moist, dense to very dense.
SILTY SAND: Very fine grained, poorly graded, green brown, very moist, dense, with caliche nodules (1/4" dia.) stringers, interbedded with clay.
SANDY SILT: Very fine grained, poorly graded, tan, slightly moist, dense, trace of oxidation stains.
SILT: Tan gray, moist, dense, trace oxidation staining.
SAND: Tan, dry, dense.

Note:

1. The boring logs and related information represent the opinion of the geotechnical engineer as to the character of the materials at the locations shown. Soil conditions between adjacent test holes and at other locations may differ from those shown. Borings will be advanced using a truck-mounted drill rig, utilizing 200mm diameter hollow-stem augers.
2. Samples were taken using a Modified California split-barrel sampler with an inside diameter (I.D.) of 60 mm and an outside diameter (O.D.) of 75 mm, a standard penetration split-barrel sampler with an (I.D.) of 35 mm and an O.D. of 50 mm. Samplers will be driven using a 63.4 kg hammer falling 750 mm.
3. Test boring elevations and locations are based on a borehole survey performed by Associated Engineers Inc.
4. Visual classification of earth materials was based on field inspection and was confirmed or revised with laboratory test results.
5. Benchmark:

NOTES:

1. The descriptions and classifications of rock and/or soil, including consistency and relative density descriptors, used by the field and/or office personnel for the exploration boreholes shown on this sheet are based on the "Soil and Rock Logging Classification Manual (Field Guide)," Engineering Service Center, Office of Structural Foundations, August 1996.

2. Soil colors were determined by using Munsel Soil Color Charts (1994, Revised Edition). Rock colors were determined using Geological Society of America rock color charts (1995, 8th Printing).

3. Ground water was measured in borings B-4-01, B-5-01, and B-6-01. Please refer to those borings for ground water measurements. No attempt was made to measure ground water in borings B-7-01 through B-20-01. Those borings were backfilled immediately after completion of drilling.

4. The ground water levels indicated in the Log of Test Borings (LOBT) sheets reflect the measured ground water levels measurement in the boreholes on the specified dates. Ground water surface elevations are subject to seasonal fluctuations and will be encountered at higher or lower elevations depending on conditions at time of constructions.

5. Test boring B-1-01 utilized a safety hammer to advance the sampler using a 140 lb hammer with a 30" drop. Penetration index values shown are the actual blow counts recorded in the field. Soil descriptions shown on the LOTB sheets for those borings are based on these index values.

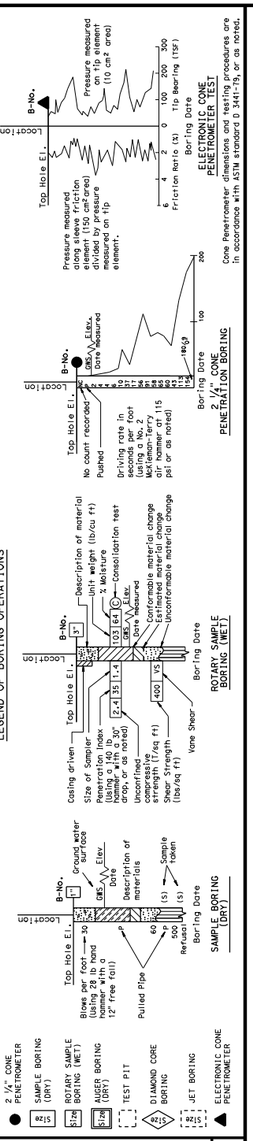
6. Test boring B-2-01 and B-4-01 through B-13-01utilized a Dietrich auto hammer to advance the sampler using a 140 lb hammer with a 30" drop. Penetration index values shown are the actual blow counts recorded in the field. Soil Consistency Classifications for those borings are based on a conversion factor of 1.5 times the blow count.

7. The boring B-3-01 utilized a safety hammer from the top of the down to Elev 2666.3′ and a Dietrich auto hammer from Elev 2666.3′ to the bottom of the boring, to advance the sampler using a 140 lb hammer with a 30" drop. Penetration index values shown are the actual blow counts recorded in the field. Soil consistency classifications shown on the LOTB sheet for boring B-3-01, from the top of the boring down to Elev 2666.3′, are based on the actual blow counts recorded on the field, and from Elev 2666.3′ to bottom of the boring are based on a conversion factors of 1.5 times the field blow count.

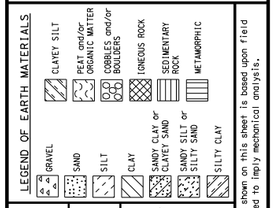
8. E= Blow count for 1′ penetration extrapolated from blow count for less than 1′ (due to change in material or hard driving).

9. Borings B-14-01 through B-20-01 were 2.24" diameter cone penetration borings, advanced using a Mobile 3000 hydraulic operated hoe ram. Due to the variability of the energy output of the Mobile 3000 rig, the rig was only used to estimate the depth to very dense earth material.

LEGEND OF BORING OPERATIONS



LEGEND OF EARTH MATERIALS



CONSISTENCY CLASSIFICATION FOR SOILS
According to the Standard Penetration Test

SPT N-Value (Blows/Foot)	Granular	SPT N-Value (Blows/Foot)	Cohesive

2690 — Well-graded SAND (SW), loose, gray, moist to wet, fine to coarse SAND.

2680 — Poorly-graded SAND (SP), loose, dark gray, moist to wet, predominantly fine grained with some medium grained SAND. Well-graded SAND (SW), medium dense, gray, moist to wet, fine to coarse SAND with trace fine to coarse GRAVELS.

2670 — Becomes dense at Elev 2665.6′.

2660 — Poorly-graded SAND (SP), medium dense, dark greenish gray, wet, predominantly fine to medium grained with trace coarse SAND. Minor amount of SILT content at Elev 2655.6′.

2650 — Becomes very dense at Elev 2645.6′, trace coarse GRAVEL.

2640 — Becomes dense at Elev 2640.6′.

2630 — Color changes to dark yellowish brown at Elev 2629.6′. Becomes very dense at Elev 2625.6′.

2620 — Well-graded SAND (SW), dense, yellowish brown, moist to wet, fine to coarse SAND, trace fine GRAVELS.

2610 — Poorly-graded SAND (SP), medium dense, yellowish brown, moist to wet, predominantly fine to medium grained. Becomes dense at Elev 2610.6′.

2600 — Trace fine GRAVELS at Elev 2604.1′.

2590

188+00

2690 — Well-graded SAND (SW), very loose, gray, moist to wet, fine to coarse grained SAND with scattered fine GRAVELS. Becomes medium dense, color changes to dark gray at Elev 2684.4′.

2680 — Poorly-graded SAND (SP), medium dense, gray, moist to wet, fine to medium grained SAND. A single coarse granitic GRAVEL piece at Elev 2673.9′.

2670 — Well-graded SAND with GRAVEL (SW), dense, gray, moist to wet, fine to coarse SAND and GRAVELS. Poorly-graded SAND (SP), medium dense, gray, moist to wet, fine grained SAND, trace fine to coarse GRAVEL.

2660 — Contains minor SILT between Elev 2659.9′ and 2658.9′, color changes to dark greenish gray at Elev 2659.9′, no GRAVELS. Becomes dense at Elev 2654.9′, minor SILT.

2650 — Slightly increase in grain size between Elev 2647.9′ and 2646.4′. Becomes medium dense at Elev 2644.9′.

2640 — Becomes very dense at Elev 2639.9′, trace fine GRAVELS. Trace yellowish brown mottling at Elev 2634.9′

2630 — Well-graded SAND (SW), very dense, dark yellowish brown, moist to wet, fine to medium SAND with trace fine to coarse GRAVELS. Color changes to yellowish brown at Elev 2623.4′.

2620 — Becomes dense at Elev 2614.9′.

2610 — Coarse granitic GRAVELS at Elev 2610.2′ to 2609.9′. One 0.03" coarse GRAVEL piece at Elev 2607.9′. Becomes very dense at Elev 2604.9′.

2600 — Becomes dense at Elev 2599.9′.

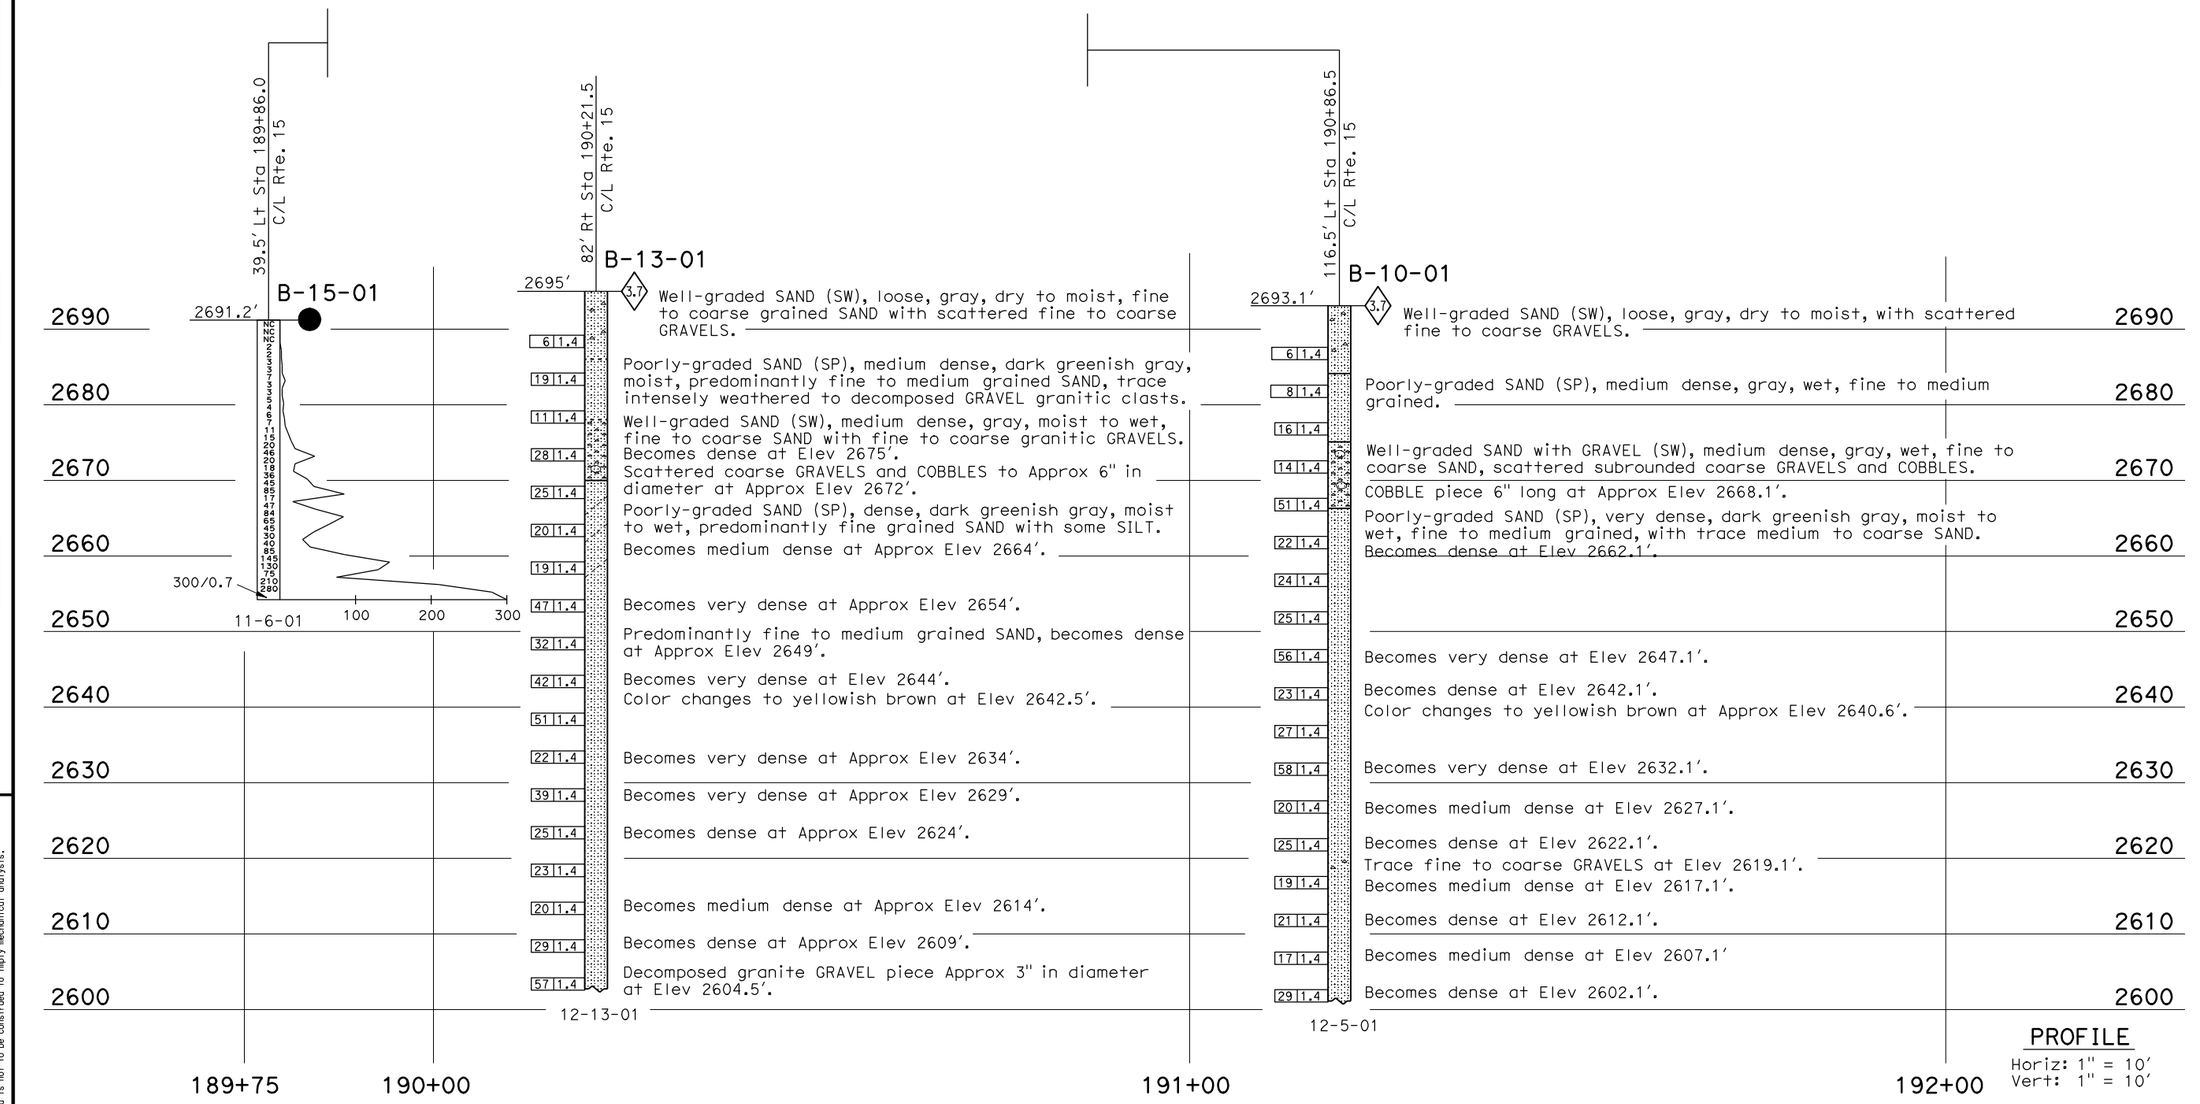
NOTE: Classification of earth material as shown on this sheet is based upon field inspection and is not to be construed to imply mechanical analysis.



Well-graded SAND (SW), loose, gray, dry to moist, fine to coarse grained SAND with scattered fine to coarse GRAVELS.

Poorly-graded SAND (SP), medium dense, dark greenish gray, moist, predominantly fine to medium grained SAND, trace intensely weathered to decomposed GRAVEL granitic clasts.

Well-graded SAND (SW), medium dense, gray, moist to wet, fine to coarse SAND with fine to coarse granitic GRAVELS. Becomes dense at Elev 2675′.

Scattered coarse GRAVELS and COBBLES to Approx 6" in diameter at Approx Elev 2672′.

Poorly-graded SAND (SP), dense, dark greenish gray, moist to wet, predominantly fine grained SAND with some SILT.

Becomes medium dense at Approx Elev 2664′.

Becomes very dense at Approx Elev 2654′.

Predominantly fine to medium grained SAND, becomes dense at Approx Elev 2649′.

Becomes very dense at Elev 2644′.
Color changes to yellowish brown at Elev 2642.5′.

Becomes very dense at Approx Elev 2634′.

Becomes very dense at Approx Elev 2629′.

Becomes dense at Approx Elev 2624′.

Becomes medium dense at Approx Elev 2614′.

Becomes dense at Approx Elev 2609′.

Decomposed granite GRAVEL piece Approx 3" in diameter at Elev 2604.5′.

Well-graded SAND (SW), loose, gray, dry to moist, with scattered fine to coarse GRAVELS.

Poorly-graded SAND (SP), medium dense, gray, wet, fine to medium grained.

Well-graded SAND with GRAVEL (SW), medium dense, gray, wet, fine to coarse SAND, scattered subrounded coarse GRAVELS and COBBLES.

COBBLE piece 6" long at Approx Elev 2668.1′.

Poorly-graded SAND (SP), very dense, dark greenish gray, moist to wet, fine to medium grained, with trace medium to coarse SAND. Becomes dense at Elev 2662.1′.

Becomes very dense at Elev 2647.1′.

Becomes dense at Elev 2642.1′.
Color changes to yellowish brown at Approx Elev 2640.6′.

Becomes very dense at Elev 2632.1′.

Becomes medium dense at Elev 2627.1′.

Becomes dense at Elev 2622.1′.
Trace fine to coarse GRAVELS at Elev 2619.1′.
Becomes medium dense at Elev 2617.1′.

Becomes dense at Elev 2612.1′.

Becomes medium dense at Elev 2607.1′

Becomes dense at Elev 2602.1′.

PLAN
1:200

Notes:

1. Ground Water was not encountered during field investigation.
2. The descriptions and classifications of rock and/or soil, including consistency and relative density descriptors, used by the field and/or office personnel for the exploroton boreholes shown on this sheet are based on the "Soil and Rock Logging Classification Manual (Field Guide)". Engineering Service Center, Office of Structural Foundations, August 1996.
3. Soil colors were determined by using Munsel Soil Color Charts (1994, Revised Edition). Rock colors were determined using USGS rock color charts (1995, revised text).
4. Test boring 01-1, 01-2 utilized a safety hammer to advance the sampler using 63.5 kg hammer with a 760 mm drop. Penetration index values shown are the actual blow counts recorded in the field.
5. E= Blow count for 0.3 m penetration extrapolated from blow count for less than 0.3 m penetration (due to change in material or hard driving).

Notes:

1. No attempt was made to measure ground water in any borings except for boring 01-3 during the 2001 field investigation.
2. Ground water was not encountered in borings 01-3 during the 2001 field investigation.
3. The descriptions and classifications of rock and/or soil, including consistency and relative density descriptors, used by the field and/or office personnel for the exploration boreholes shown on this sheet are based on the "Soil and Rock Logging Classification Manual (Field Guide)". Engineering ServiceCenter, Office of Structural Foundations, August 1996.
4. Soil colors were determined by using Munsel Soil Color Charts (1994, Revised Edition). Rock colors were determined using USGS rock color charts (1995, revised text).
5. Test boring B-1-00 was advanced using a combination of tungsten-carbide drill bits and wireline diamond coring methods.
6. Test borings 01-2, 01-4, 01-5, 01-18 utilized a safety hammer to advance the sampler using a 63.5 kg hammer with a 760 mm drop. Penetration index values shown are the actual blow counts recorded in the field.
7. Test borings 01-1, 01-3, 01-6 utilized a Deldrich automatic hammer to advance the sampler. Penetration index values shown on the LOTB sheets were the actual blow counts recorded in the field.
8. Soil consistency classifications for test borings 01-1, 01-3, 01-6 are based on a conversion factor of 1.5 times the uncorrected blow count.
9. E=Blow count for 0.3 m penetration extrapolated from blow count for less than 0.3 m penetration (due to change in material or hard driving).
10. Penetration index value designated "Ref" means sampler refusal.
11. Refusal in earth material is defined as severely limited or halted penetration (less than 60 mm penetration in 50 blow counts) of the Standard Penetration Test (SPT) sampler due to the presence of GRAVEL, COBBLES, BOULDERS or ROCK formation materials.

WEATHERING DESCRIPTORS

Modified from United States Bureau of Reclamation, Engineering Geology Field Manual.

Descriptors		Diagnostic features					General characteristics (strength, excavation, etc.)[§]
		Chemical weathering-Discoloration and/or oxidation		Mechanical weathering-Grain boundary conditions (disaggregation) primarily for granitics and some coarse-grained sediments	Texture and solutioning		
Alphanumeric descriptor	Descriptive term	Body of rock	Fracture surfaces[†]		Texture	Solutioning	
W1	Fresh	No discoloration, not oxidized.	No discoloration or oxidation.	No separation, intact (tight).	No change.	No solutioning.	Hammer rings when crystalline rocks are struck. Almost always rock excavation except for naturally weak or weakly cemented rocks such as siltstones or shales.
W2	Slightly weathered to fresh°						
W3	Slightly weathered	Discoloration or oxidation is limited to surface of, or short distance from, fractures; some feldspar crystals are dull.	Minor to complete discoloration or oxidation of most surfaces.	No visible separation, intact (tight).	Preserved.	Minor leaching of some soluble minerals may be noted.	Hammer rings when crystalline rocks are struck. Body of rock not weakened. With few exceptions, such as siltstones or shales, classified as rock excavation.
W4	Moderately to slightly weathered°						
W5	Moderately weathered	Discoloration or oxidation extends from fractures usually throughout; Fe-Mg minerals are "rusty," feldspar crystals are "cloudy."	All fracture surfaces are discolored or oxidized.	Partial separation of boundaries visible.	Generally preserved.	Soluble minerals may be mostly leached.	Hammer does not ring when rock is struck. Body of rock is slightly weakened. Depending on fracturing, usually is rock excavation except in naturally weak rocks such as siltstones or shales.
W6	Intensely to moderately weathered°						
W7	Intensely weathered	Discoloration or oxidation throughout; all feldspars and Fe-Mg minerals are altered to clay to some extent; or chemical alteration produces in-situ disaggregation, see grain boundary conditions.	All fracture surfaces are discolored or oxidized, surfaces friable.	Partial separation, rock is friable; in semiarid conditions granitics are disaggregated.	Texture altered by chemical disintegration (hydration, argillation).	Leaching of soluble minerals may be complete.	Dull sound when struck with hammer, usually can be broken with moderate to heavy manual pressure or by light hammer blow without reference to planes of weakness such as incipient or hairline fractures, or veinlets. Rock is significantly weakened. Usually common excavation.
W8	Very intensely weathered						
W9	Decomposed	Discolored or oxidized throughout, but resistant minerals such as quartz may be unaltered; all feldspars and Fe-Mg minerals are completely altered to clay.		Complete separation of grain boundaries (disaggregated).	Resembles a soil, partial or complete remnant rock structure may be preserved; leaching of soluble minerals usually complete.		Can be granulated by hand. Always common excavation. Resistant minerals such as quartz may be present as "stringers" or "dikes."

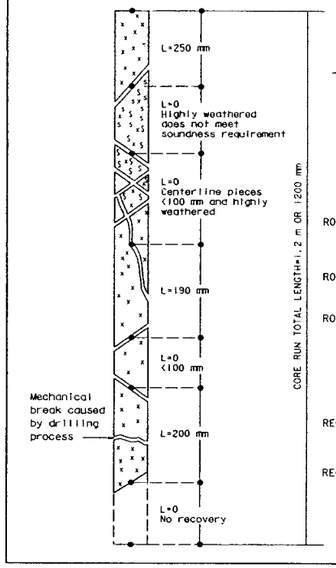
Note: This chart and its horizontal categories are more readily applied to rocks with feldspars and mafic minerals. Weathering in various sedimentary rocks, particularly limestones and poorly indurated sediments, will not always fit the categories established. This chart and weathering categories may have to be modified for particular site conditions or alteration such as hydrothermal effects; however, the basic framework and similar descriptors are to be used.

° Combination descriptors are permissible where equal distribution of both weathering characteristics are present over significant intervals or where characteristics present are "in between" the diagnostic feature. However, dual descriptors should not be used where significant, identifiable zones can be delineated. When given as a range only two adjacent terms may be combined. "Decomposed to slightly weathered." or "moderately weathered to fresh" are not acceptable.

† Does not include directional weathering along shears or faults and their associated features. For example, a shear zone that carried weathering to great depths into a fresh rock mass would not require the rock mass to be classified as weathered.

§ These are generalizations and should not be used as diagnostic features for weathering or excavation classification. These characteristics vary to a large extent based on naturally weak materials or cementation and type of excavation.

ROCK QUALITY DESIGNATION (RQD) & PERCENT RECOVERY (REC) LOGGING



RQD (ROCK QUALITY DESIGNATION)	DESCRIPTION OF ROCK QUALITY
0 - 25%	VERY POOR
25 - 50%	POOR
50 - 75%	FAIR
75 - 90%	GOOD
90 - 100%	EXCELLENT

$$RQD = \frac{\sum \text{Length of sound core pieces} \geq 100\text{ mm}}{\text{Total core run length}}$$

$$RQD = \frac{250+190+200}{1200} \times 100\%$$

RQD = 53% (fair)

REC = Percent Care Recovery

$$REC = \frac{\sum \text{Length of all care pieces}}{\text{Total core run length}}$$

(No Scale)
After Deere & Deere, 1989

FRACTURE DENSITY

Modified from United States Bureau of Reclamation, Engineering Geology Field Manual.

FRACTURE DENSITY- Based on the spacing of all natural fractures in an exposure or core recovery lengths in boreholes; excludes mechanical breaks, shears, and shear zones; however, shear-disturbed zones (fracturing outside the shear) are included. Descriptors for fracture density apply to all rock exposures such as tunnel walls, dozer trenches, outcrops, or foundation cut slopes and inverts, as well as boreholes. Descriptive criteria presented below are based on borehole cores where lengths are measured along the core axis, for other exposures the criteria is distance measured between fractures (size of blocks).

UNFRACTURED (FD0): No fractures.

VERY SLIGHTLY FRACTURED (FD1): Core recovered mostly in lengths greater than 1 m.

SLIGHTLY TO VERY SLIGHTLY FRACTURED (FD2)*

SLIGHTLY FRACTURED (FD3): Core recovered mostly in lengths from 300 to 1000 mm, with few scattered lengths less than 300 mm or greater than 1000 mm.

MODERATELY TO SLIGHTLY FRACTURED (FD4)*

MODERATELY FRACTURED (FD5): Core recovered mostly in 100 to 300 mm lengths with most lengths about 200 mm.

INTENSELY TO MODERATELY FRACTURED (FD6)*

INTENSELY FRACTURED (FD7): Lengths average from 30 to 100 mm with scattered fragmented intervals. Core recovered mostly in lengths less than 100 mm.

VERY INTENSELY TO INTENSELY FRACTURED (FD8)*

VERY INTENSELY FRACTURED (FD9): Core recovered mostly as chips and fragments with a few scattered short core lengths.

* Combinations of fracture densities (e.g. very intensely to intensely fractured, or moderately to slightly fractured) are used where equal distribution of both fracture density characteristics are present over a significant interval or exposure, or where characteristics are "in between" the descriptor definitions.

ROCK HARDNESS DESCRIPTORS

Alphanumeric Descriptor	Descriptor	Criteria
H1	Extremely hard	Core, fragment, or exposure cannot be scratched with knife or sharp pick; can only be chipped with repeated heavy hammer blows.
H2	Very hard	Cannot be scratched with knife of sharp pick. Core or fragment breaks with repeated heavy hammer blows.
H3	Hard	Can be scratched with knife or sharp pick with difficulty (heavy pressure). Heavy hammer blow required to break specimen.
H4	Moderately hard	Can be scratched with knife or sharp pick with light or moderate pressure. Core or fragment breaks with moderate hammer blow.
H5	Moderately soft	Can be grooved 2 mm deep by knife or sharp pick with moderate or heavy pressure. Core or fragment breaks with light hammer blow or heavy manual pressure.
H6	Soft	Can be grooved or gouged easily by knife or sharp pick with light pressure, can be scratched with fingernail. Breaks with light to moderate manual pressure.
H7	Very soft	Can be readily indented, grooved or gouged with fingernail, or carved with a knife. Breaks with light manual pressure.

Any bedrock unit softer than H7, very soft, is to be described using ASTM D-2488 consistency descriptors.

Note: Although "sharp pick" is included in these definitions, descriptions of ability to be scratched, grooved or gouged by a knife is the preferred criteria.

Modified from United States Bureau of Reclamation, Engineering Geology Field Manual.

BEDDING, FOLIATION, OR FLOW TEXTURE DESCRIPTORS

Descriptors	Thickness / Spacing
Massive	Greater than 3 m
Very thickly (bedded, foliated, or banded)	1 to 3 m
Thickly	300 mm to 1 m
Moderately	100 to 300 mm
Thinly	30 to 100 mm
Very thinly	10 to 30 mm
Laminated (intensely folioted or banded)	Less than 10 mm

Modified from United States Bureau of Reclamation, Engineering Geology Field Manual.

943.46	114 mm	CLAYEY SAND (SC) with fine to coarse GRAVEL (10%), medium dense, brown & strong brown, moist.
	19 B5	
	72 B5	SILTY SAND (SM) with scattered GRAVEL (5-10%), very dense, strong brown, moist, primarily fine to medium grained SAND.
	E100 B5	
	E167 B5	
	58 B5	Poorly graded SAND (SP), with fine to coarse GRAVEL (10%), very dense and dense, strong brown and yellowish brown, moist.
	44 B5	
	E125 B5	
	E167 B5	
	E108 B5	
	64 B5	SILTY SAND (SM) with trace fine GRAVEL (5%), very dense, light yellowish brown, moist.
	E100 B5	Poorly graded SAND (SP), with scattered fine GRAVEL (10%), very dense yellowish brown, moist.
	49 B5	SILTY SAND (SM) with scattered fine GRAVEL (5-10%), dense to very dense, strong brown and yellowish brown, moist, primarily fine grained SAND.
	E116 B5	
	E167 B5	
	E160 B5	SANDY SILT (ML) with trace fine GRAVEL (<5%), very dense, yellowish brown, moist.

3-8-01

3+50

NOTES:

1. Ground water was not measured in Borings B-1-01 and B-2-01.
2. Ground water was not encountered in Boring B-3-01.
3. The descriptions and classifications of rock and/or soil, including consistency and relative density descriptors, used by the field and/or office personnel for the exploration boreholes shown on this sheet are based on the "Soil and Rock Logging Classification Manual (Field Guide)," Engineering Service Center, Office of Structural Foundations, August 1996.
4. Soil colors were determined by using Munsel Soil Color Charts (1994, Revised Edition). Rock colors were deterined using USGS rock color charts (1995, revised text).
5. Test borings B-1-01, B-2-01, and B-3-01, utilized a safety hammer to advance the sampler using a 63.5 kg hammer with a 760 mm drop. Penetration index values shown are the actual blow counts recorded in the field.
6. E = Blow count for 0.3 m penetration extrapolated from blow count for less than 0.3 m penetration (due to change in material or hard driving).
