Air Quality Improvements 42
Potential VMT Reduction 42

The Southern California Association of Governments (SCAG) is the nation's largest metropolitan planning organization (MPO) representing six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) and 191 cities. The 2012–2035 Regional Transportation Plan (RTP) and Sustainable Communities Strategy (SCS) seeks to develop a comprehensive and interconnected network of bicycle and pedestrian facilities throughout the region to increase transportation options, so that bicycling and walking become more practical and desirable choices for travel. Increasing bicycling and walking within the region will assist in reducing road congestion, enhancing public health, and improving air quality. The RTP supports Active Transportation through the development of bicycle and pedestrian policies.

Active Transportation refers to transportation such as walking or using a bicycle, tricycle, velomobile, wheelchair, scooter, skates, skateboard, push scooter, trailer, hand cart, shopping car, or similar electrical devices. For the purposes of this report, Active Transportation will generally refer to bicycling and walking, the two most common methods. Walking and bicycling are essential parts of the SCAG transportation system, are low cost, do not emit greenhouse gases, can help reduce roadway congestion, and increase health and the quality of life of residents. As the region works towards reducing congestion and air pollution, walking and bicycling will become more essential to meet the future needs of Californians

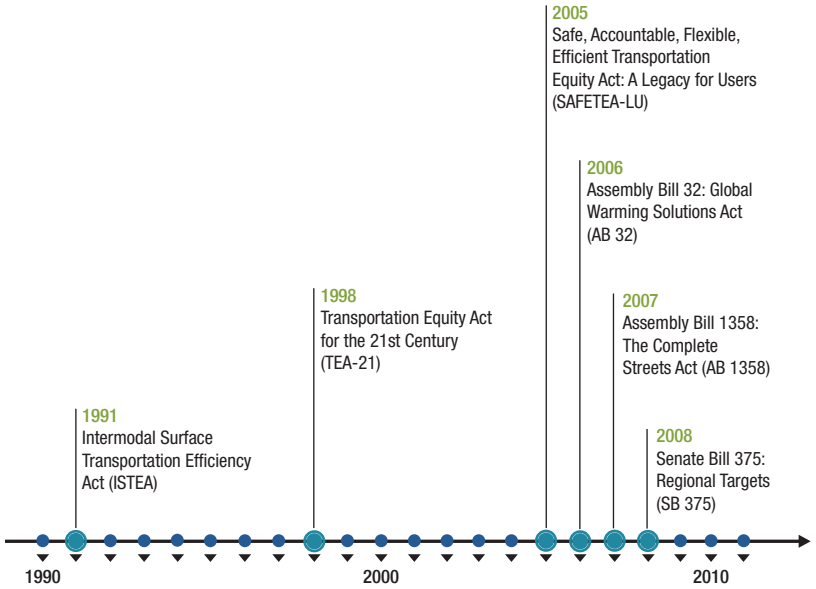
The strategies established by the Active Transportation Chapter will adhere to the following goals and objectives:

- **Goal 1:** Increase dedicated funding for bicycle and pedestrian infrastructure.
  - **Objective 1.1:** Develop a Constrained Plan that analyzes existing funding and provides quantitative support for future funding requirements.
  - **Objective 1.2:** Estimate the benefits of current investments to analyze future funding needs.
- **Goal 2:** Increase accommodation and planning for bicyclists and pedestrians.
  - **Objective 2.1:** Include a Strategic Plan that includes additional investments needed to develop a comprehensive and interconnected network of bicycle and pedestrian facilities throughout the region.
  - **Objective 2.2:** Estimate project costs associated with this vision.
  - **Objective 2.3:** Estimate the benefits of these investments.
  - **Objective 2.4:** Support local jurisdictions with the development of their local plans.
- **Goal 3:** Increase transportation options, particularly for trips less than three miles.
  - **Objective 3.1:** Increase linkages between bicycling and walking with transit.
  - **Objective 3.2:** Examine bicycling and walking as an integral part of a congestion/transportation management tool (e.g. Safe Routes to School).
- **Goal 4:** Significantly decrease bicycle and pedestrian fatalities and injuries.
  - **Objective 4.1:** Address actual and perceived safety/security concerns that prohibit biking and walking from being considered as viable mode choices.

The following sections will illustrate the existing conditions, identify potential opportunities and provide recommendations that may assist in achieving a more bicycle and pedestrian friendly region. The policies and recommendations established by this Active Transportation chapter can also assist local jurisdictions and agencies in the development of more comprehensive policies that improve public health, safety, and welfare.

Existing Conditions

Physical Setting



The climate in the SCAG region varies by location. The western Los Angeles Basin, Ventura County and western Orange County experience marine climates, cool ocean breezes and moderate average temperature variations. The inland areas within the region are comprised of more arid climates with more significant temperature variations throughout the day. Rainfall in the SCAG region typically averages only 30 days per year, which provides ideal conditions for walking and bicycling. The majority of the western portion of the region is highly developed with suburban areas, with some areas of dense urbanization. The inland areas of the region are becoming developed with significant suburbanization and pockets of urban development, but are primarily undeveloped or designated as national and state parkland.

Political Environment

Recent shifts in the political environment have increased support for Active Transportation (please see **FIGURE 1** Legislative Timeline). The Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) challenged officials to make "bicycles a more viable part of the transportation network." The Transportation Equity Act for the 21st Century (TEA-21) provided additional Federal funds for surface transportation, such as pedestrian

walkways, until 2003. The Act also extended the Disadvantaged Business Enterprises program and created new incentives for bicycle and pedestrian safety and educational programs. TEA-21 continued to research new transportation systems and "ensure[d] the consideration of bicyclists and pedestrians in the planning process and facility design." Safe, Accountable Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) increased funding for non-motorized transportation. SAFETEA-LU also established the Safe Routes to School (SRTS) program to "enable and encourage primary and secondary school children to walk and bicycle to school" and to support infrastructure-related and behavioral projects that are "geared toward providing a safe, appealing environment for walking and bicycling that will improve the quality of our children's lives and support national health objectives by reducing traffic, fuel consumption, and air pollution in the vicinity of schools."

FIGURE 1 Legislative Timeline

At the State level, Assembly Bill 32 (AB 32) and Senate Bill 375 (SB 375) were established to reduce greenhouse gas emissions. AB 32, enacted in 2006, directed the California Air Resource Board (CARB) to develop early actions to reduce greenhouse gases and to prepare a scoping plan to identify specific strategies to meet the 2020 limit. SB 375, enacted in 2008, focuses on reducing greenhouse gas (GHG) emissions generated by cars and light trucks and requires SCAG to develop a Sustainable Community Strategies (SCS) for the region. The new law also provides incentives for local jurisdictions and developers to implement new land use development strategies that would help reduce GHGs. Some of these strategies include non-motorized transportation strategies. The Complete Streets Act of 2008 (AB 1358) required cities and counties to incorporate the concept of Complete Streets in their general plan updates to ensure that transportation plans meet the needs of all users. SCAG has also adopted similar strategies in the 2012 RTP and has the opportunity to provide information and resources to support local cities and counties as they implement Complete Streets strategies within their jurisdictions.

Existing Plans

All six of the counties within the SCAG region have developed their own bicycle and pedestrian plans. All local bicycle/pedestrian plans finalized by September 30, 2011 are considered part of the SCAG Active Transportation Plan.

IMPERIAL COUNTY

In 2003, Imperial County developed a Bicycle Master Plan, which was adopted by its Board of Supervisors in 2007. The guiding vision of the plan is to "encourage and promote bicycling as a safe and convenient form of transportation and recreation achieved through engineering, education, enforcement, and encouragement." Imperial County is currently working on updating their Bicycle Master Plan, which is anticipated to be completed by the end of 2011. The proposed plan is anticipated to implement 374.4 miles of bikeways at an estimated cost of $6.4 million.

LOS ANGELES COUNTY

The Los Angeles County Metropolitan Transportation Authority (Metro) developed a Bicycle Transportation Strategic Plan (BTSP) in 2006 to be used by "the cities, the County of Los Angeles and transit agencies in planning bicycle facilities around transit and

setting priorities that contribute to regional improvements. The goal is to integrate bicycle use in transportation projects." In addition, Metro also created a Bicycle Transportation Account Compliance Document (BTA Document) to provide an "inventory and mapping of existing and proposed facilities, and an estimate of past and future expenditures for bicycle facilities."

The Los Angeles County Department of Public Works released a draft of their revised Bicycle Master Plan in February 2011, which was developed with the over arching goal of increasing "bicycling throughout the County of Los Angeles through the development and implementation of bicycle-friendly policies, programs, and infrastructure." The plan recommends the development of an interconnected network of bicycle corridors, with approximately 695 miles of bikeway facilities at a proposed cost of $284.8 million.

In addition Metro has developed a Long Range Transportation Plan that includes all of the regional bike trail projects that were identified in the BTSP as well as the Arroyo Seco Bike Trail, Compton Creek Bike Trail, Dominquez Channel Bike Trail, and the San Jose Creek Bike Trail Phase 2B.

ORANGE COUNTY

The 2009 Orange County Transportation Authority (OCTA) Commuter Bikeways Strategic Plan was developed "to encourage the enhancement of Orange County's regional bikeways network, in order to make bicycle commuting a more viable and attractive travel option." The plan identifies approximately 116 miles of priority bikeway projects, estimating $71.5 million; and is expected to be updated for 2014.

The strategic plan of the Orange County Long Range Transportation Plan also includes advanced active transportation treatments at key intersections within the Central County Major Investment Study (MIS) study area. On January 23, 2012, the OCTA Board of Directors directed staff to work with local agencies to develop the Orange County Bikeway program for strategic corridor planning, developing detailed development implementation plans, and construction of high priority projects. The goal of the program is to take advantage of grant funding opportunities by developing shelf'ready projects along regaionl bikeway corridors.

RIVERSIDE COUNTY

The Western Riverside Council of Governments (WRCOG) and the Coachella Valley Association of Governments (CVAG) have developed Non-Motorized Transportation Plans in 2010 for their respective jurisdictions covering most of Riverside County. WRCOG's 2010 Non-Motorized Transportation Plan proposes the development of over 440 miles of bikeways in order to provide a "regional backbone network of bicycle and pedestrian facilities to provide enhanced transportation mobility options." The 2010 CVAG Non-Motorized Transportation plan recognizes the "value of providing opportunities for local residents and visitors to bicycle for work and recreation, as well as to use off-road trails for hiking, equestrians and jogging."

One innovative project is Parkway 1e11, a proposed 54-mile grade separated bicycle / pedestrian / neighborhood electric vehicle path in the Coachella Valley connecting Desert Hot Springs to Palms Springs to Coachella and the cities in-between. The Parkway, in the preliminary planning stages, will provide an alternative transportation corridor to State Route 111. In addition, by the inclusion of neighborhood electric vehicles, it provides additional mobility as well as access to activities for active senior citizens. Once completed the parkway will become part of the regional bikeway Network alignment through the Coachella Valley.

SAN BERNARDINO COUNTY

The 2011 San Bernardino County Non-Motorized Transportation Plan's goals include: 1) improving pedestrian access to transit; 2) removing existing barriers to pedestrian travel; 3) developing regional trails and pathways, which provide improved pedestrian access to destinations; and 4) improving the pedestrian environment on major regional arterials and at regional activity centers.

VENTURA COUNTY

The 2007 Ventura County Bicycle Master Plan "provides a broad vision, strategies and actions for the improvement of bicycling" by maximizing funding sources for implementation; improving safety and encouraging cycling; expanding the network and support facilities; and enhancing the quality of life in Ventura County. The combined cost of the identified projects in the Ventura County Bicycle Master Plan is approximately $93.1 million

TABLE 1 County Active Transportation Plans

County	Plan	Adopted

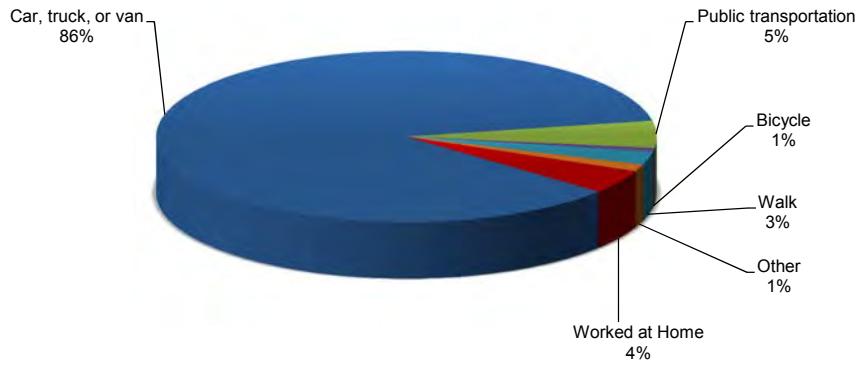
	WRCOG Non-Motorized Plan	2010
San Bernardino	2011 Non-Motorized Transportation Plan	2011
Ventura County	Bicycle Master Plan	2007



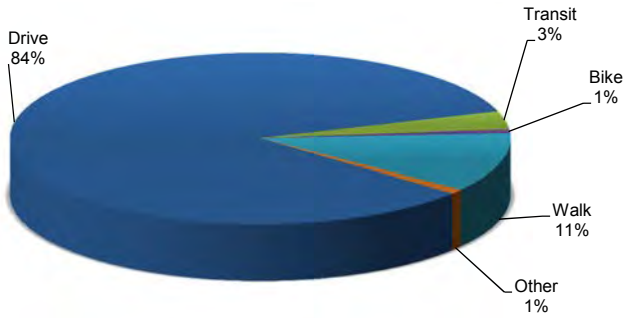
LOCAL JURISDICTIONS

In addition to county plans, many local jurisdictions have developed their own active transportation plans or include active transportation components in the Circulation Element of their General Plan. Many street enhancement projects or capital improvement projects include active transportation elements as well. For example, many street improvement projects may include the striping of bikeways or new developments may include sidewalk enhancements. By examining the annual budgets of the 20 most populous cities in the SCAG region and their expenditures associated with active transportation projects such as new sidewalks or bikeways we were able to estimate that on average cities spend $5.45 per capita on active transportation each year. Based on an average 1 percent annualized population growth and 3 percent adjustment for inflation, it is estimated that local jurisdictions would spend a total of $4.1 billion dollars between 2011 and 2035 on active transportation, which is not accounted for in the 2012–2035 RTP/SCS.

Bicycling and Walking Overview

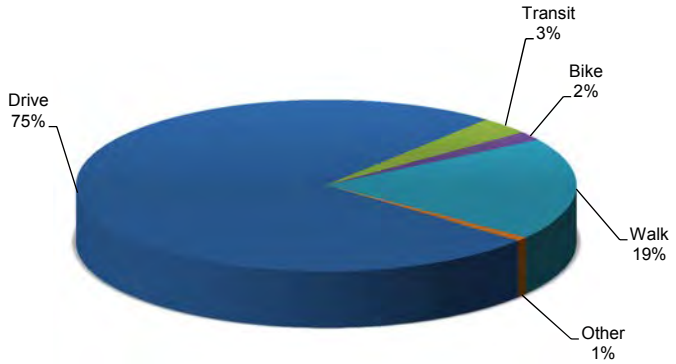
The majority of commuters within the SCAG region commute via car, truck or van. According to the American Community Survey in 2008, more than 85 percent of all commuters traveled to work by car, truck or van; and less than 4 percent traveled to work via an active transportation mode (0.7 percent bicycled and 2.5 percent walked). The 2012 RTP/SCS allocates approximately $6.7 billion for active transportation. This is an increase of more than 270 percent over the commitments made in the 2008 RTP. Aproximately $700 million was added to the allocation provided in the Draft 2012-2035 RTP/SCS, partly in response to the overwhelming support received for higher level of funding during the comment period. This amount primarily reflects regional commitments and does not include many of the locally funded projects associated with active transportation, nor does it include projects where bicycle/pedestrian facility construction is part of a larger project. So, when the local expenditures are considered, the region is expected to spend significantly more than $10 billion in active transportation over the period of the plan.

FIGURE 2 Commuter Mode Share in the SCAG Region (2008)



Source: American Community Survey, 2008

In 2009 the National Household Travel Survey California Travel Survey Add-On (NHTS-CA) data estimated that approximately 20.94 percent of all trips in 2009 were conducted by walking (19.24 percent) or bicycling (1.7 percent), this is an approximately 75 percent



increase from the 11.9 percent active transportation mode share in 2000. The 2009 NHTS data also showed that there was a decrease in driving from 83.9 percent to 75.0 percent; this was a 10.6 percent decrease from 2000.

FIGURE 3 Mode of Travel for Total Trips (2000)

Source: National Household Travel Survey, 2000

FIGURE 4 Mode of Travel for Total Trips (2009)

Source: National Household Travel Survey California Travel Survey Add-On, 2009

However, between 2005 and 2009, the percentage of commuters that traveled by car, truck or van has decreased while the percentage of bicycling and walking to work has increased. This increase in active transportation usage may have been attributed to changes in the economic climate or increases in gas prices. This steady increase in active transportation mode share may indicate a greater demand for active transportation infrastructure and planning.

TABLE 2 Commuter Mode Share in the SCAG Region

	Car, Truck, or Van	Public Transportation	Taxicab, Motorcycle, or other	Worked at Home	Bicycle	Walked	Total
2005	87.40%	4.50%	1.30%	4.10%	0.50%	2.10%	100.00%
2006	86.70%	4.90%	1.20%	4.20%	0.60%	2.40%	100.00%
2007	86.40%	4.80%	1.20%	4.50%	0.60%	2.40%	100.00%
2008	85.90%	5.10%	1.30%	4.50%	0.70%	2.50%	100.00%
2009	85.90%	5.00%	1.10%	4.80%	0.70%	2.50%	100.00%

Types of Bicyclists

Bicyclists have varying levels of riding experience and confidence, which influence their decision to bicycle. SCAG recognizes that there are a number of factors that motivate people to bicycle, and has identified the following three types of bicyclists:

TRANSPORTATION/COMMUTER

Individuals that use their bicycle as a form of transportation on a reasonably regular basis, particularly for traveling to work, are classified as bicycle commuters. These cyclists utilize cycling primarily for utilitarian travel, not recreation. Some riders in this group may choose to travel by bicycle in place of a car while others use bicycling because of a lack of other feasible options. Some individuals use bicycling as a method of transportation due to economic necessity or because they are restricted by law from operating a motor vehicle. These include the low income individuals, immigrants, and the young

adults. These individuals are often referred to as "invisible cyclists" and are often under counted in surveys. They may also lack proper equipment for nighttime riding, lack basic riding safety knowledge, and are more inclined to ride on sidewalks when there are no dedicated bikeways.

These riders typically fall into one of three categories: 1) adult employees, 2) students, and 3) shoppers. Transportation or commuter riders tend to travel during peak traffic hours and have increased exposure to vehicles. Routes leading to major businesses, shopping, education and other commercial areas of high importance to transportation cyclists. Transportation cyclist needs are consistent throughout the SCAG region and include: personal safety and security, safe and secure parking, infrastructure that accommodates riding in changes in weather and darkness, and fair treatment from law enforcement.

EXERCISE/RECREATION

Recreational cyclists include both competent, experienced individuals and beginner riders, including adults and children. Some weekend riders, mountain bikers, and other recreational cyclists may drive to other locations in order to ride their bicycles, and ride as a form of recreation rather than transportation.

Primary needs of recreational cyclists are similar to that of transportation cyclists except that their travel routes are less focused on access to business, shopping, and other commercial areas. They tend to travel in lower traffic and more scenic areas or seek out off-road paths and trails. Some experienced recreational cyclists may be interested in bicycling as transportation, but are concerned about safety, distances, sweat and body odor in the work environment.

SOCIAL GROUP

Social bicycle riders represent a growing group of riders, especially in Los Angeles County with its growing bicycle culture. The City of Los Angeles has been growing and supporting bicycling through a number of activities and advocacy efforts including informal and formal rides such as the Bicycle Kitchen and similar co-ops, Critical Mass, Midnight Ridazz, and C.I.C.L.E. (Cyclists Inciting Change through Live Exchange).[1]

[1] Although referencing various advocacy groups in this document, SCAG makes no endorsement of any external group's policies, goals or positions.

The State of California shows its commitment to active transportation in the following documents:

- Highway Design Manual
- Deputy Directive on Accommodating Non-motorized Transportation (DD64)
- Director's Policy on Context Sensitive Solutions (DP22)
- Main Streets: Flexibility in Design and Operations Assembly Concurrent Resolution 211
- California Supplement to the MUTCD
- California Blueprint for Bicycling and Walking
- California Bicycle Transportation Act
- California Vehicle Code
- California Streets and Highway Code
- California Access Compliance Reference Manual

Riding Styles

Just as there are different types of cyclists, there are different riding styles. While no one entirely fits into one category or another, it is an attempt to broadly explain riding styles to understand the needs of the various members of the bicycling community. The following "Four Types of Cyclists" categorization was first developed in 2005 by the City of Portland, Oregon as it began to consider what it would take to dramatically increase bicycle use in Portland. The definitions that follow have been expanded somewhat to more closely match the demographics in southern California.

FULLY CONFIDENT CYCLIST

Often called "Vehicular Cyclists," these cyclists ride their bicycles in the same manner that one would drive a motor vehicle. These individuals are confident in riding with motorized traffic in almost all conditions, and may forgo using dedicated bicycle facilities. These individuals are accustomed to riding in a variety of environments and can navigate in less space. Many of these individuals advocate for vehicular cycling because they are capable of operating their bicycles on the road in a visible, predictable manner, and follow the rules of the road, which may enable automobile drivers to be able to better predict how these bicyclists will act, and respond accordingly.

ENTHUSED AND CONFIDENT CYCLIST

These cyclists are as comfortable as the fully confident cyclists in sharing the roadway, but prefer using designated bicycle facilities. It is believed that enthused and confident cyclists comprise the majority of the tremendous growth in commuter cycling in Portland after investments were made in bicycling infrastructure.

INTERESTED BUT CONCERNED CYCLIST

Interested but concerned cyclists make up the majority of cyclists. They are curious about regular bicycling as a form of transportation, but may be inexperienced. Due to financial or immigration issues, they may also be unable to afford to own or operate a motor vehicle. Also, due to the graduated licensing program, older teenagers also fall into this group.

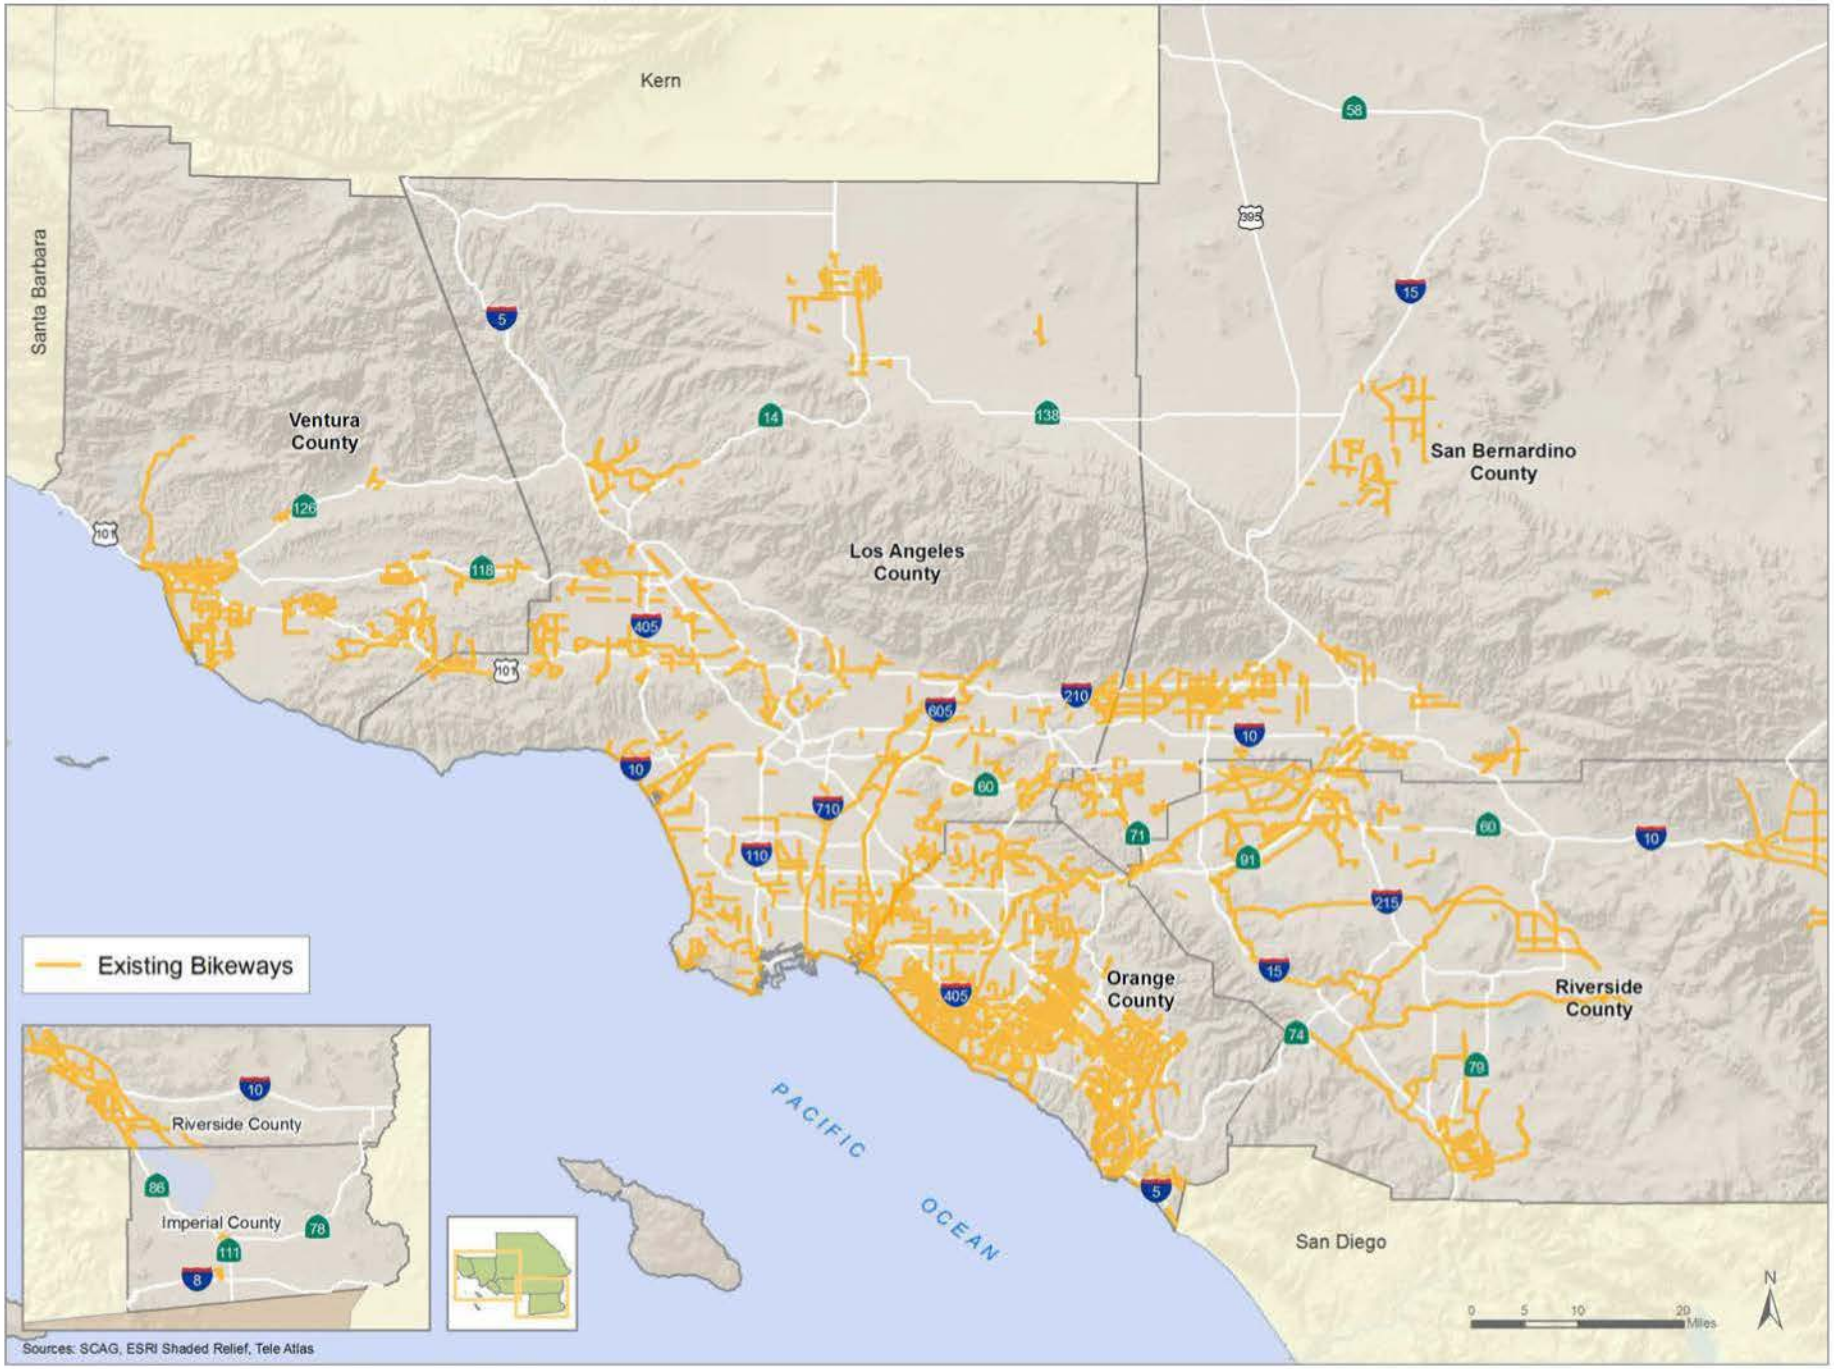
According to the "Four Types" categorization, those in the "Interested but Concerned" category like riding a bicycle, but they are afraid to ride. They would ride if they felt safer on the roadways, if cars were slower and less frequent, and if there were more quiet streets with few cars and paths without any cars at all.

Inexperienced cyclists tend to have minimal riding skill and little experience, and are not comfortable riding with traffic or within the roadway. These cyclists may lack confidence or knowledge of safe cycling practices and regulations. These riders tend to use sidewalks, school grounds, parks, bicycle lanes, and Class I bicycle paths as their preferred riding environments.

NO WAY, NO HOW

This group is not interested in bicycling for transportation. Some may not own a bicycle or ride at all. Others may ride for recreation only on off-road bikeways. This could be attributed to the distance between home and work, making bicycling too difficult or impossible. Shorter utilitarian trips are an option, but may also be considered difficult or impossible.

It is important to note that these are not clear cut definitions, and there is some overlap between categories, particularly as one's level of interest and confidence increases since this may shift the demand for bicycle facilities. The Portland report lists that less than one percent of bicyclists were fully confident, seven percent were enthused and confident, 60 percent were interested but concerned, and 33 percent were classified as no way, no how.



Types of Bicycle Facilities

A bicycle facility may include a variety of facilities, from bicycle lanes to bicycle parking facilities, and other related facilities. Varying types and groups of riders prefer different types of riding environments. The Caltrans Highway Design Manual currently classifies bicycle lanes, bicycle paths, and routes in the following method:

Class I Bikeways

Class I Bikeways are also known as bicycle paths, shared-use paths or bicycle trails. A Class I Bikeway provides a completely separated right-of-way designated for the exclusive use of bicycles and/or pedestrians with cross flows by motorists minimized.

EXHIBIT1 Existing Bikeways in the SCAG Region

Class II Bikeways

Often referred to as a bicycle lane, a Class II Bikeway provides a striped lane for one-way bicycle travel on a street or highway.

Class III Bikeways

Class III Bikeways are also known as bicycle routes and provide for shared use with pedestrians and/or motor vehicle traffic.

Cycletracks

Cycletracks are bicycle lanes on a street or highway physically separated from travel lanes occupied by vehicles.

Bicycle Boulevards

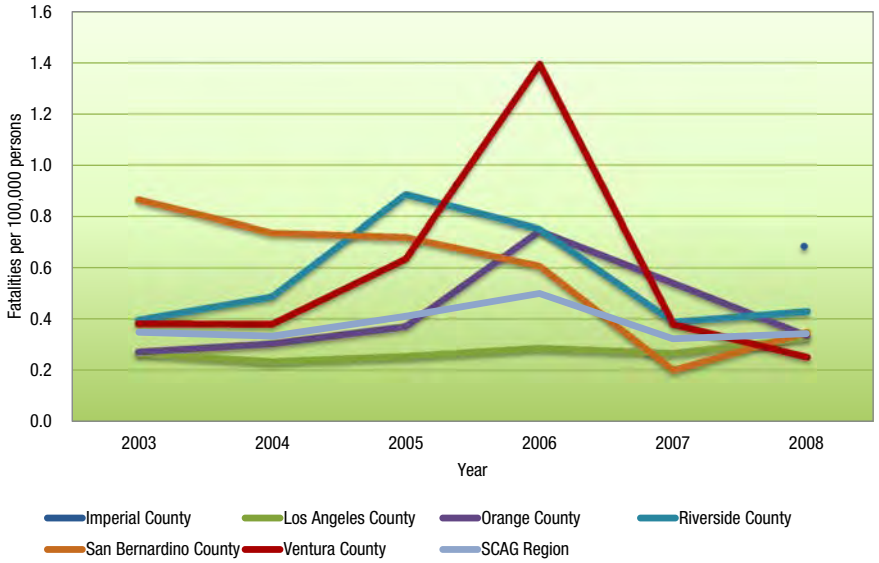
Bicycle Boulevards refer to low speed, mostly residential streets where bicycling and walking are considered the primary modes. Sometimes used for traffic calming, the installation of bicycle boulevards often includes discouragement of non-local vehicle traffic while allowing free flow of bicyclists. As an example, traffic diverters allow free flow for bicyclists and allow vehicle access to property for homeowners, but do not allow motorists to continue driving in the same direction. By reducing speeds and access, safety for bicyclists and pedestrians is increased.

The City of Long Beach has installed a bicycle boulevard on Vista Street in the Belmont Heights neighborhood. Methods used include traffic circles, a bicycle only signal, road narrowing and barriers forcing motorists to turn left or right while allowing bicyclists access.

TABLE 3 Existing Bikeways (in Miles)

	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura	Total Existing	% of Total
Class 1	2.9	264.0	204.9	925.1	77.4	56.5	1,530.8	35.5%
Class 2	4.4	484.6	638.5	235.7	275.8	203.1	1,842.1	42.7%
Class 3	38.1	518.2	102.4	103.6	116.7	62.9	941.9	21.8%
Total Existing	**45.4**	**1,266.9**	**945.8**	**1,264.3**	**469.9**	**322.5**	**4,314.8**	**100.0%**

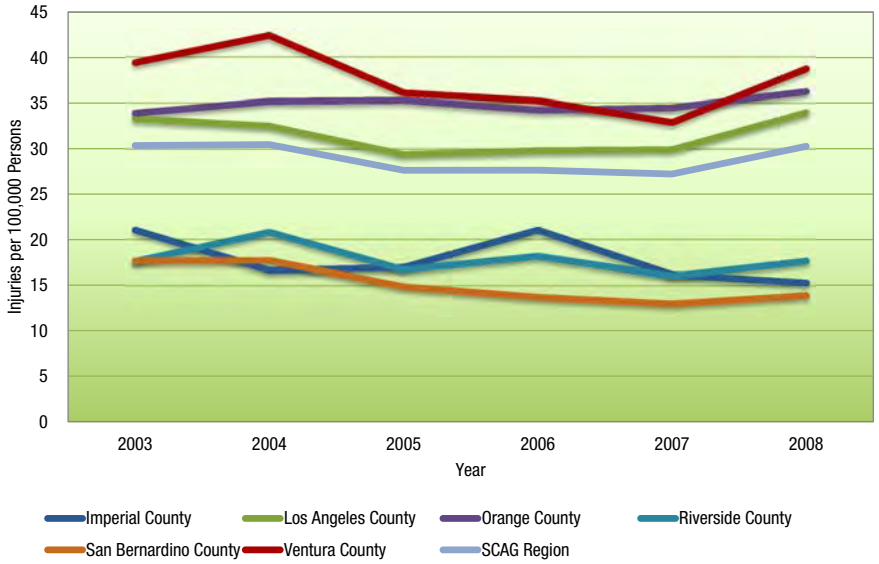
Bicycle Boulevards



Bicycle Boulevards are low speed streets optimized for bicycle travel over vehicle travel.

Like their auto-driving counterparts, most bicyclists will most often use the fastest or most convenient route to reach their destinations. Bicyclists are legally allowed to use any public roadway in California unless specifically prohibited by State law (e.g. Freeways). Therefore, while some roadways are not designated or classified as bikeways, motorists should expect and anticipate bicyclists to share the road.

Bicycle Safety



Based on data from the Statewide Integrated Traffic Records System (SWITRS), the majority of counties in the SCAG region have experienced an increase in the number of traffic-related bicyclist fatalities for every 100,000 persons between 2003 and 2006, followed by a decrease in the number of fatalities between 2006 and 2008. Most of the counties experienced a decrease in traffic-related bicycle injuries for every 100,000 persons between 2003 and 2007; followed by an increase between 2007 and 2008.

FIGURE 5 Number of Traffic Related Bicyclist Fatalities for Every 100,000 Persons

Source: State-Wide Integrated Traffic Records System (SWITRS), 2003-2008

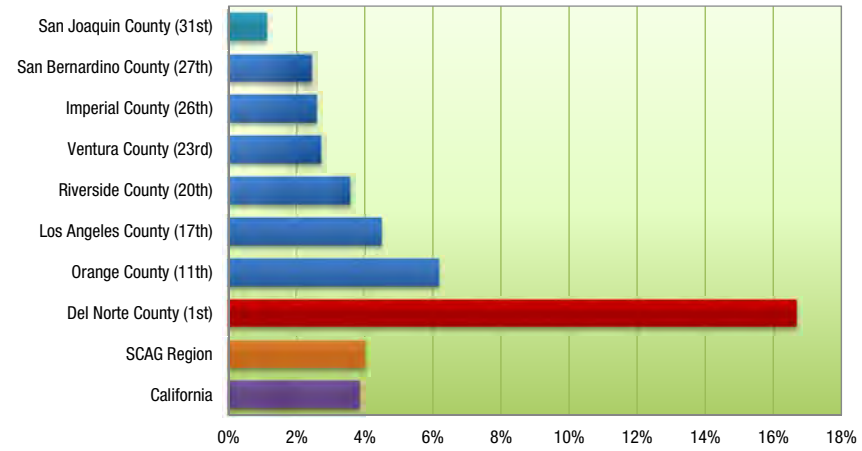


FIGURE 6 Number of Traffic Related Bicyclist Injuries for Every 100,000 Persons

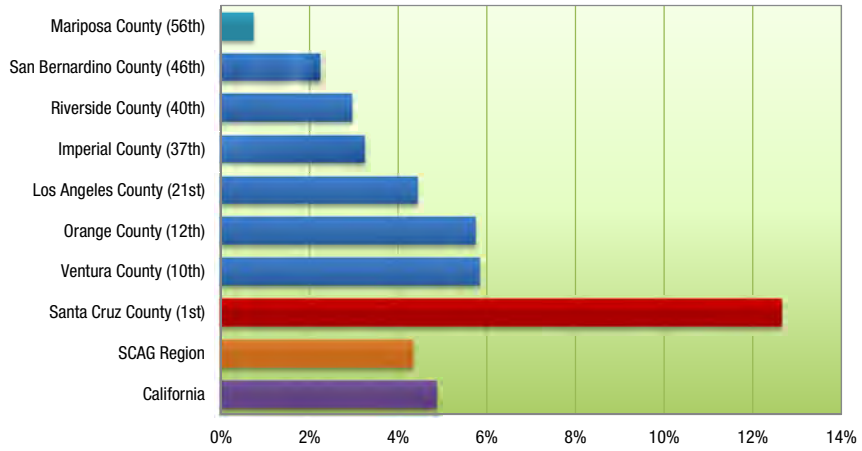
Source: State-Wide Integrated Traffic Records System (SWITRS), 2003-2008



In 2008, 3.98 percent of all traffic-related fatalities in our region involved bicyclists, and 4.31 percent of all traffic-related injuries involved bicyclists. Orange County had the highest percentage of traffic-related bicyclist fatalities (6.17 percent), and Ventura County had the highest percentage of traffic-related bicyclist injuries (5.83 percent) in the SCAG region in 2008.

FIGURE 7 Percentage of Traffic-Related Fatalities Involving Bicyclists

Source: State-Wide Integrated Traffic Records System (SWITRS), 2008

FIGURE 8 Percentage of Traffic-Related Injuries Involving Bicyclists

Source: State-Wide Integrated Traffic Records System (SWITRS), 2008

The SCAG region has seen a greater percentage of traffic-related fatalities involving bicyclists than the statewide average, but had a lower percentage of traffic-related injuries involving bicyclists. Los Angeles and Orange Counties were the only counties with a higher percentage than the statewide percentage of traffic-related bicycle fatalities. Orange and Ventura Counties were the only counties with a higher percentage than the statewide percentage of traffic-related bicycle injuries.

Pedestrian Oriented Design and Access Requirements

Americans with Disabilities Act (ADA)

The ADA was signed into law in 1990 and requires that all public facilities be accessible to people with disabilities. The impact of the ADA has been far-reaching. For example, multi-level facilities including transit stations must include elevators, sidewalks must have sloped surfaces at intersections and other crossings to allow wheelchair accessibility, buses must have lifts, and signage must include Braille for the blind.

SCAG estimates that $90 million is necessary annually to maintain the existing pedestrian infrastructure in usable condition and to maintain consistency with ADA requirements, assuming a sidewalk life expectancy of 35 years. A portion of the $6.7 billion dollars allocated toward Active Transportation in the 2012 RTP will be applied toward infrastructure improvements that will maintain and improve sidewalks to ADA standards.

Schools

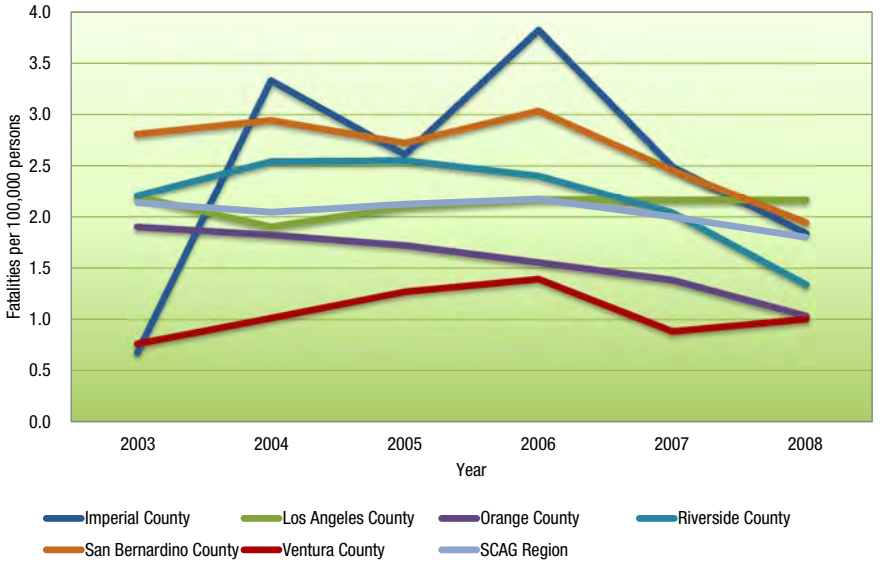
Pedestrian access between schools and nearby neighborhoods is a high safety priority. Clear crosswalks, signals adequately timed to allow children to cross streets, crossing guards, and school speed limit zones provide a safer environment for children on foot. Additionally, pathways and neighborhood parks can provide easier and safer access to schools by allowing children, both on foot and bicycle.

The Safe Routes to School (SRTS) program aims to increase the number of students walking or bicycling to school. Both the federal government and the State of California provide funding for SRTS programs.

Transit

Efficient and well-used public transit (busses, subway, light rail, commuter trains) contribute to improved mobility and air quality, and extends accessibility for active transportation. However, the effectiveness of transit is decreased if individuals are unable to easily access it in a safe manner. It is estimated that transit users will walk half a mile (Ohland, 2004) and bicycle two miles (Mineta Transportation Institute, 2002) to a transit stop. One of the barriers for commuters to take transit is the convenience to access transit or the distance between their starting point and final destination (first-mile/last-mile gap). Transit stations benefit from Park-and-Ride lots by expanding the pool of potential riders by bringing them to a central point. Yet, studies have shown that the effective distance for many Park-and-Ride users is 5 miles or less to these facilities. Placing adequate transit, pedestrian, and bicycle facilities within this radius may address the first-mile/last-mile gap and encourage ridership and active transportation.

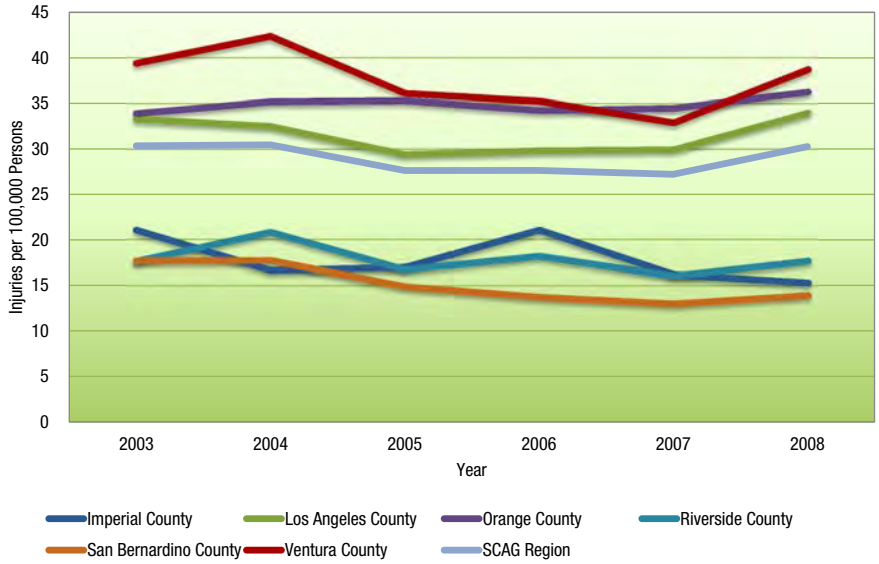
The SCAG region has already taken steps to address the first mile/last mile connectivity. Metro Rail has removed some seats on the Red/Purple lines allocating that space for bicycles. Metrolink has 12 dedicated bicycle cars on their commuter trains. The cars can hold up to 18 bicycles on the lower level.



Street Design and Access to Destinations

Buildings are often set further back from the street with a large parking lot between the entrance and the sidewalk, making them more accessible to visitors that arrive by car. This form of building design can act as a deterrent to bicyclists and pedestrians. Pedestrian and bicyclist access to retail and major activity centers is an integral part of a walkable community. Research on walkability has identified that the availability and distance of potential destinations, such as grocery stores, restaurants, cafes, public spaces, and retail stores are significant variables associated with walkability. Smaller blocks with more extensive sidewalk coverage along major streets with higher densities are positively associated with walkability. Similarly, the Complete Streets Act of 2008 (AB 1358) required cities and counties to accommodate and plan for all users.

Pedestrian Safety



Based on SWITRS data, in 2003, San Bernardino County had the highest number of traffic-related pedestrian fatalities for every 10,000 persons, and Imperial County had the lowest. Imperial County had the highest number of traffic-related pedestrian fatalities from 2004 to 2007, while Ventura County had the lowest. In 2008, Los Angeles County had the highest number of traffic-related pedestrian fatalities for every 10,000 persons, while Ventura County had the lowest. Los Angeles County has consistently had the highest number of traffic-related pedestrian injuries for every 10,000 persons. Riverside County had the lowest number of traffic-related pedestrian injuries for every 10,000 persons in 2003. San Bernardino County has had the lowest number of traffic-related bicyclist injuries for every 10,000 persons between 2004 and 2008.

FIGURE 9 Number of Pedestrian Fatalities for Every 100,000 Persons

Source: State-Wide Integrated Traffic Records System (SWITRS), 2003-2008

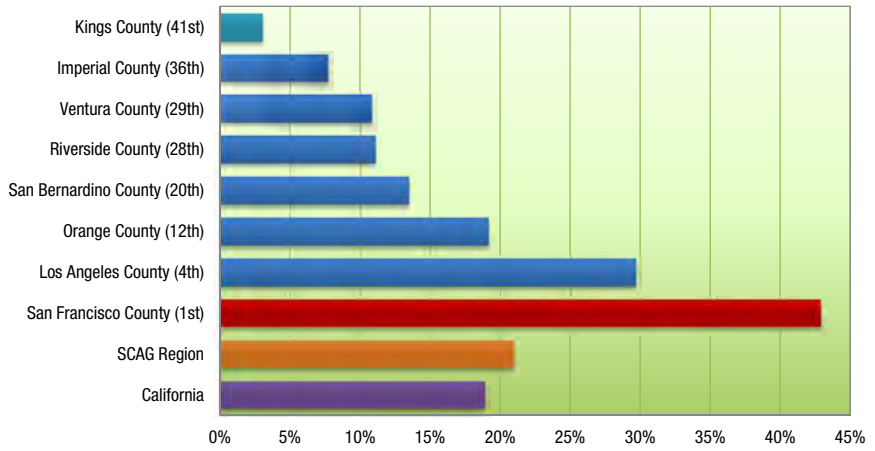


FIGURE 10 Number of Pedestrian Injuries for Every 100,000 Persons

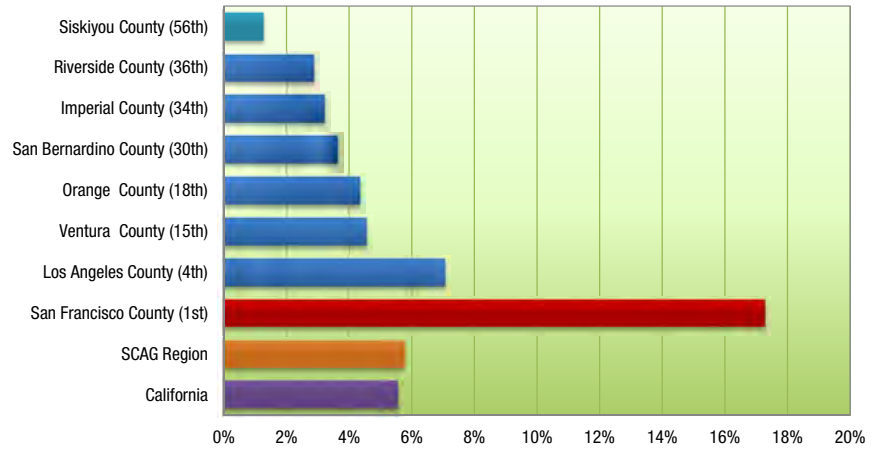
Source: State-Wide Integrated Traffic Records System (SWITRS), 2003–2008



While bicycle deaths and injuries are fairly low when compared to other modes of transportation, pedestrian deaths and injuries represent a much more significant percentage of all traffic-related incidents, particularly in urban areas. In 2008, 20.94 percent of all traffic-related fatalities in the SCAG region involved a pedestrian, and 5.74 percent of traffic-related injuries involved pedestrians. Los Angeles County had the highest percentage of traffic-related pedestrian fatalities (29.65 percent) and the highest percentage of pedestrian injuries (7.05 percent) within the SCAG region in 2008.

FIGURE 11 Percentage of Traffic-Related Fatalities Involving Pedestrians

Source: State-Wide Integrated Traffic Records System (SWITRS), 2008

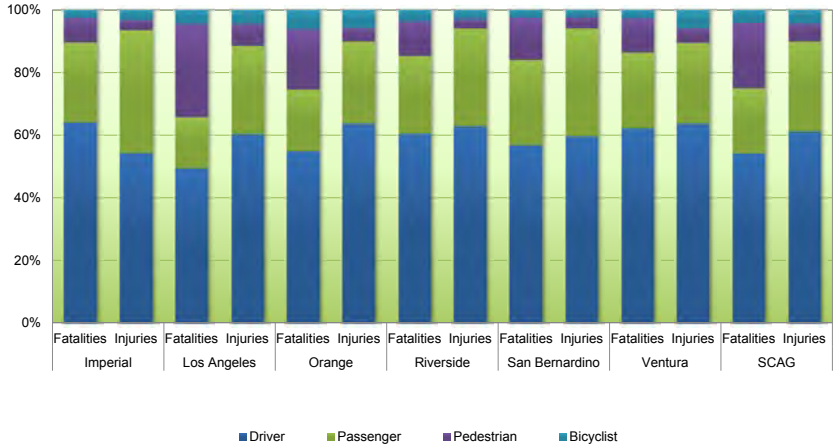


FIGURE 12 Percentage of Traffic-Related Injuries Involving Pedestrians

Source: State-Wide Integrated Traffic Records System (SWITRS), 2008

Most counties in the SCAG region have a smaller percentage of traffic-related pedestrian fatalities involving a pedestrian when compared to the statewide average; Los Angeles and Orange County were the only two counties to have a higher percentage of pedestrian-involved fatalities. Most counties also had a smaller percentage of traffic-related injuries involving a pedestrian versus the statewide average; Los Angeles County was the only county that had a higher percentage of pedestrian involved injuries.

Deficiencies and Needs Analysis

The existing active transportation infrastructure may provide access for many of the residents within the region but fails to accommodate the needs of the youth, elderly, and disabled. Added consideration must be given to these populations as any of them do not currently feel secure or able to utilize the existing active transportation facilities. The population within the SCAG region is expected to expand with an additional 4 million residents within the next 25 years. This growth in population will put added strain on the existing transportation infrastructure and contribute to more congestion if no improvements are made. In addition to the population increase, the average age of our population will increase, changing the characteristics and demand on travel. The aging population will place a greater demand on transit and active transportation modes.

Pedestrian Facility Deficiencies

The 1994 AASHTO Green Book describes pedestrian facilities as “sidewalks, crosswalks, traffic control features, special walkways found on some portions of freeway rights-of-way, curb cuts (depressions), and ramps for the older walkers and persons with mobility impairments. They are also parts of bus stops or other loading areas, grade separations, and the stairs or escalators related to these facilities.”

The coordination of local plans and county/regional policies is necessary to develop a regional interconnected network of bicycle facilities. Individuals base their travel decisions based on convenience, accessibility and safety. The need for a regional approach towards bicycle and pedestrian planning is attributed to the fact that travelers are not restricted to a single jurisdiction and often cross multiple jurisdictions during their trip. Existing facilities and infrastructure, and the planning for the infrastructure are often disjointed and do not provide easy accessibility for users.

Similarly, the dominance of motorized transportation has led to a disproportionate allocation of funding and adequate planning for pedestrian accessibility. Examples include areas that are not in compliance with the Americans with Disabilities Act (ADA); areas that have long blocks between intersections and high speed limits, which all can make active transportation more difficult. The California Highway Patrol (CHP) has identified in their 2008 SWITRS that 50 percent of all pedestrian fatalities in California occurred within the SCAG region. The high percentage of pedestrian fatalities demonstrates a need for change

EXHIBIT 2 Access to Public Transit in Imperial County

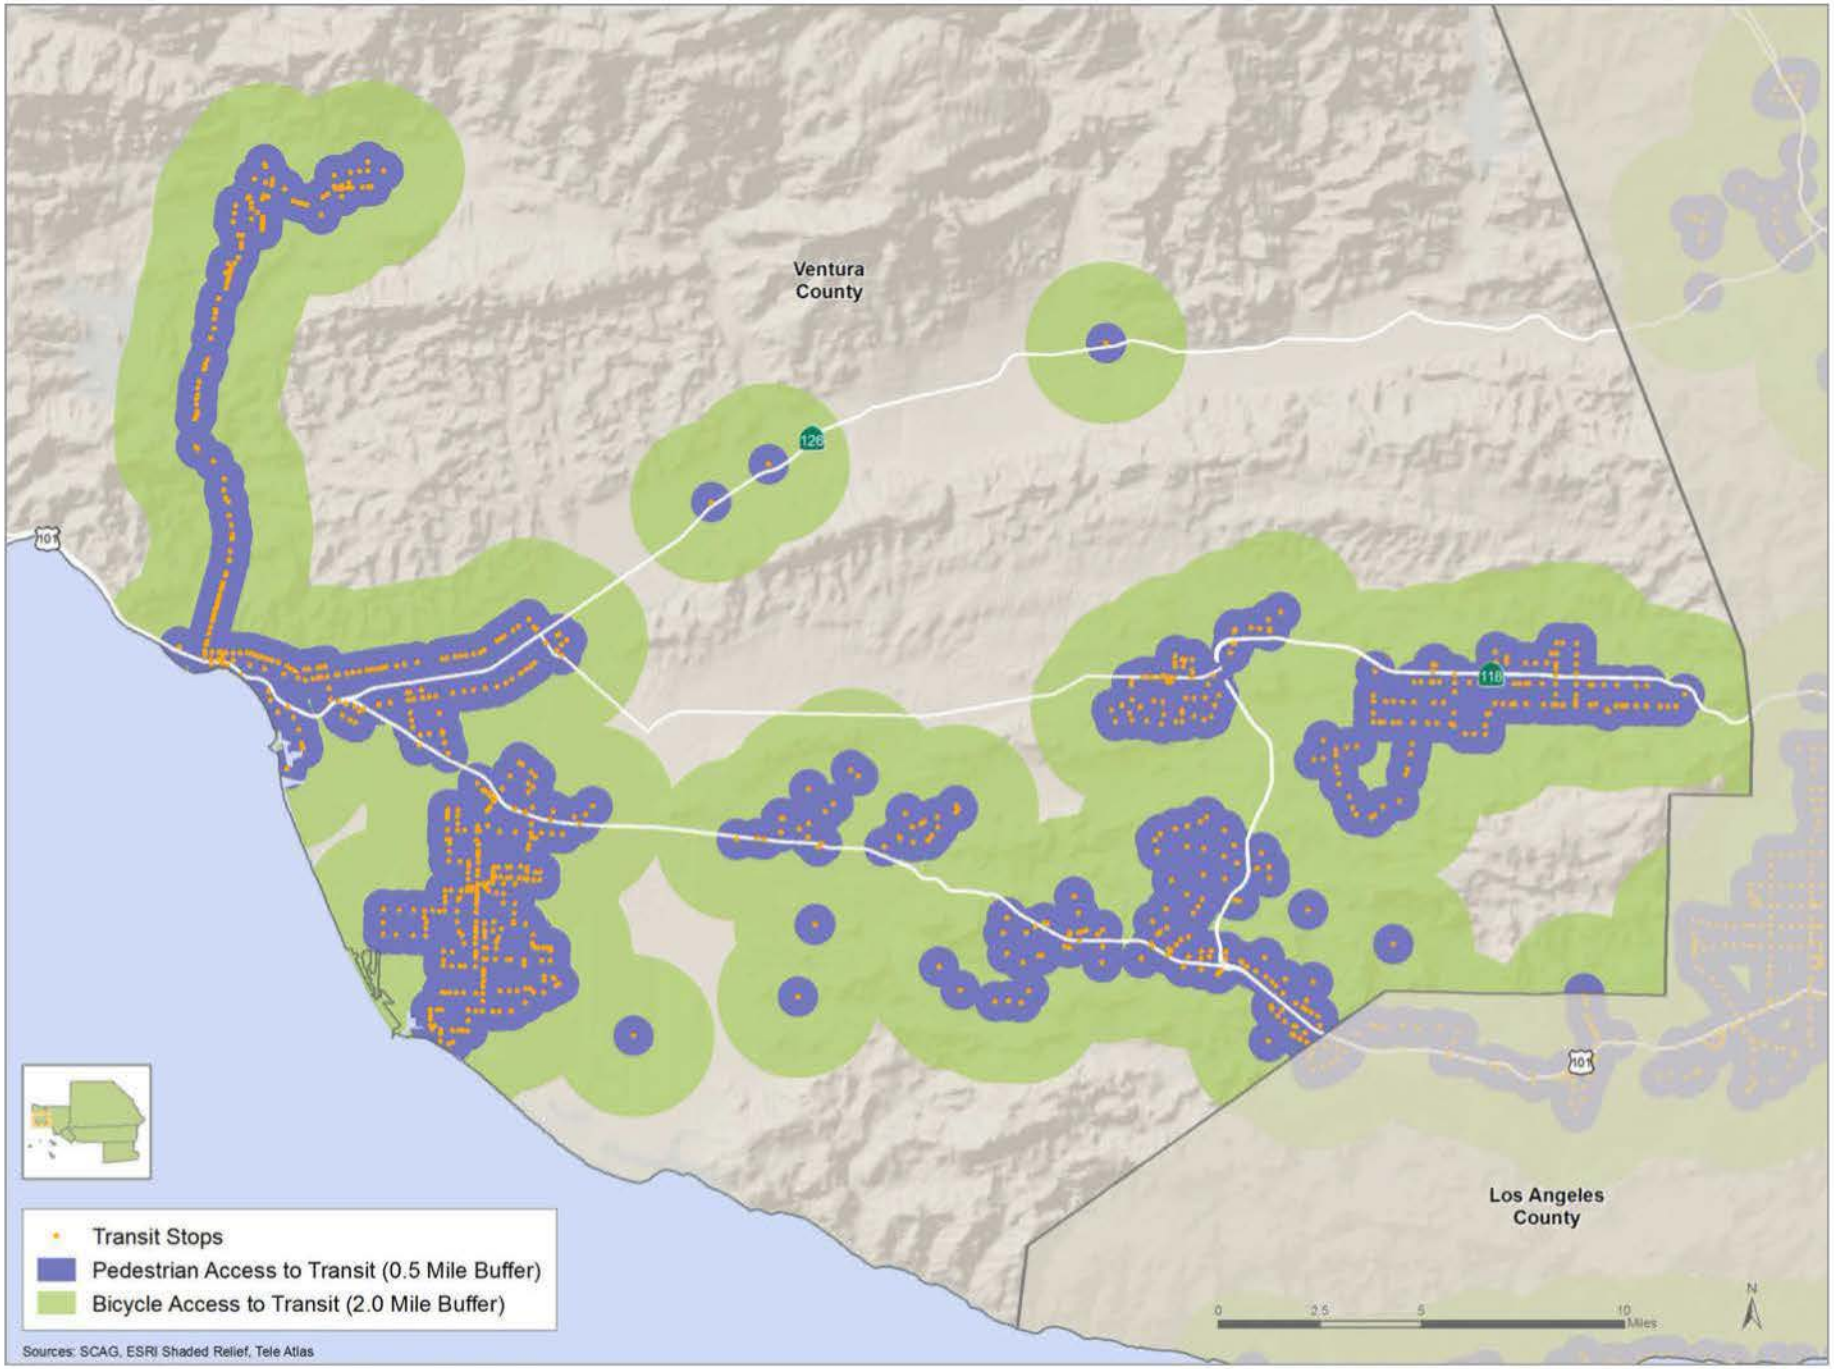

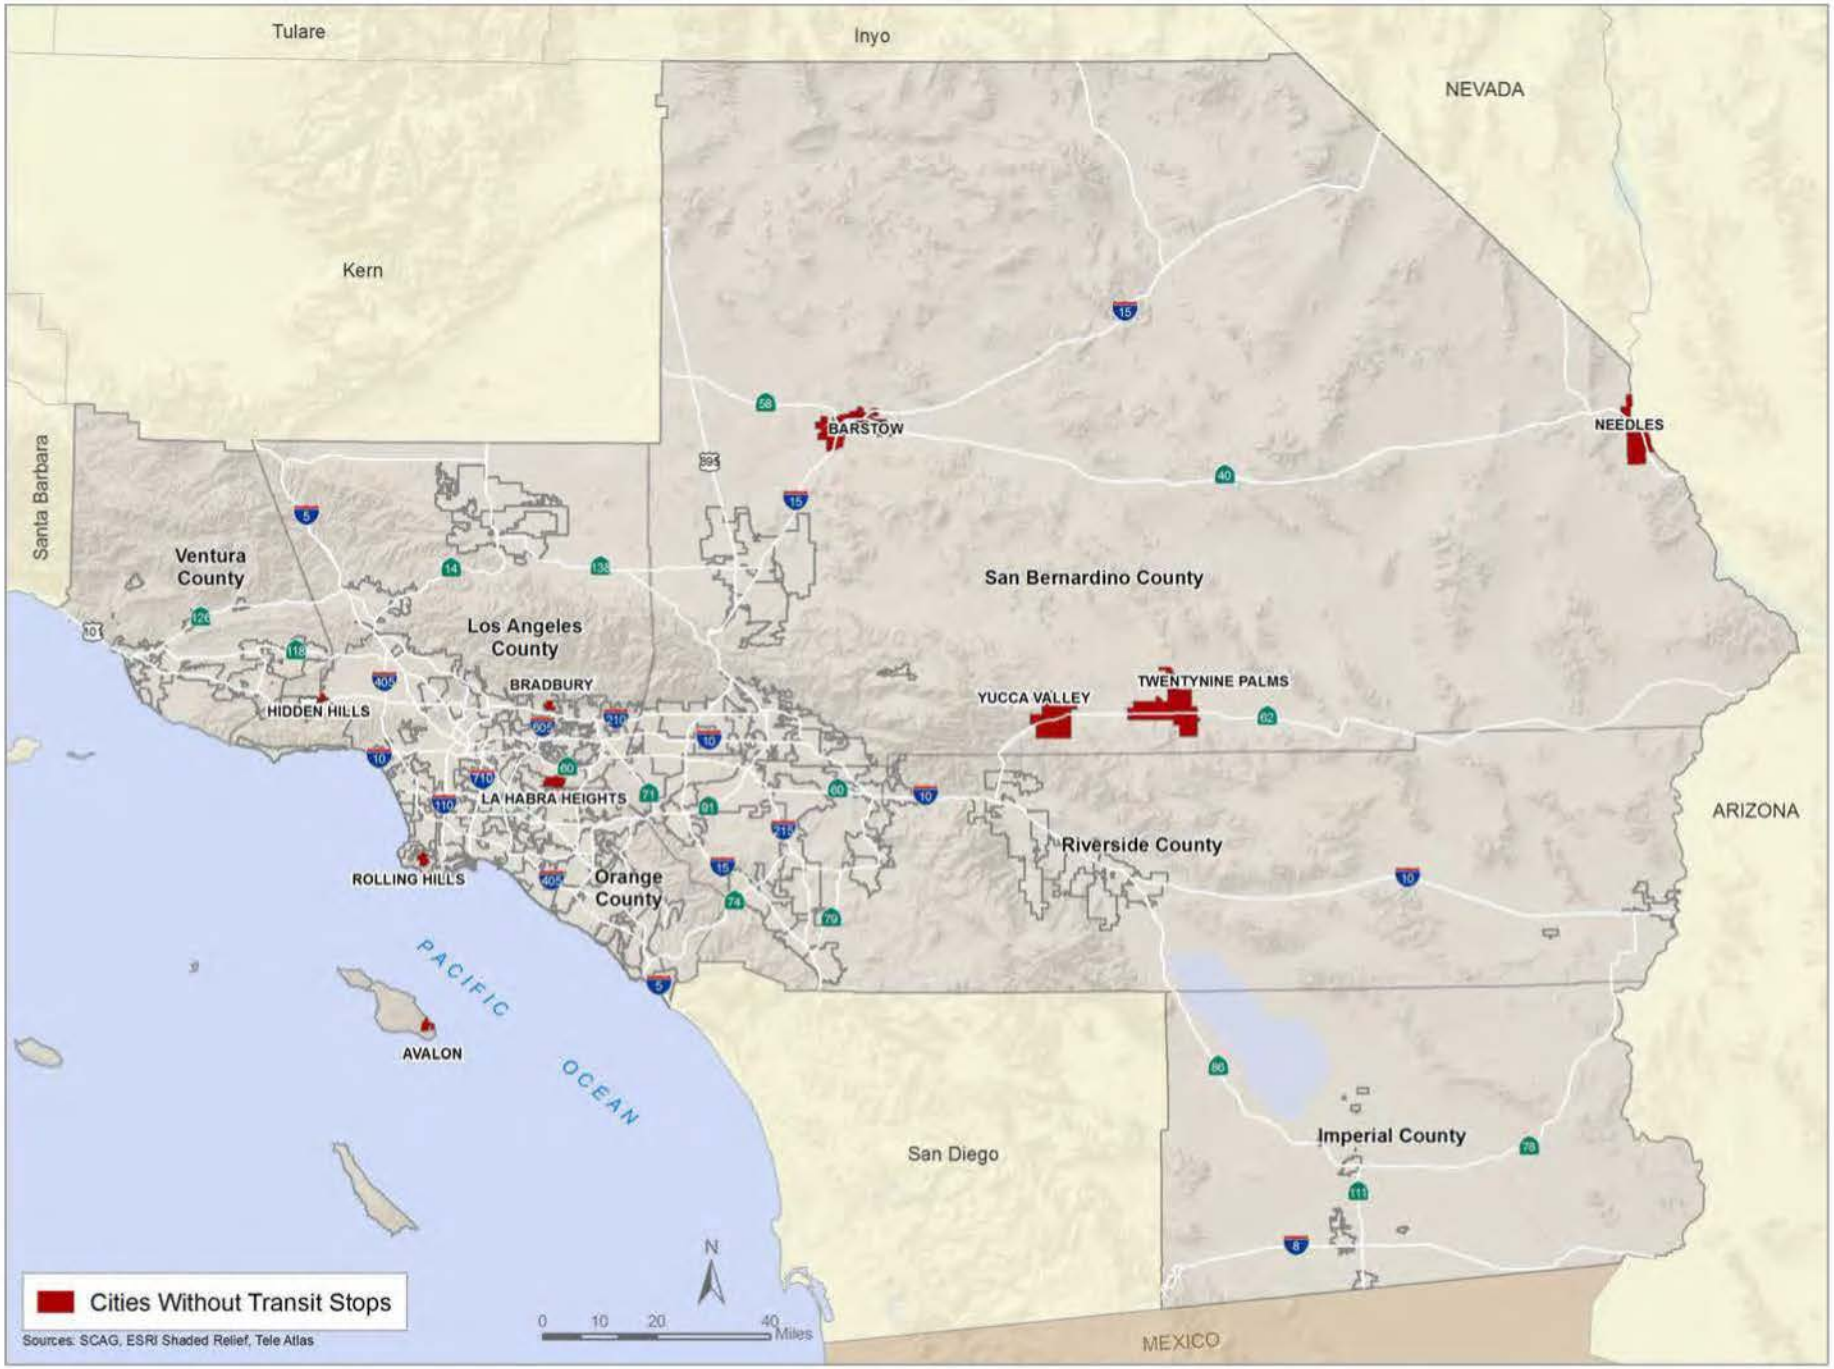

EXHIBIT 8 Cities Without Stops Within the SCAG Region

within the SCAG region. Existing facilities should be retrofitted to reduce or prevent bicycle and pedestrian accidents and new facilities should be designed to reduce known conditions that contribute to bicycle and pedestrian related accidents. Furthermore, streets should be designed to promote the use of alternative modes of transportation through the provision of bicycle parking, street landscaping and other amenities that would create a more inviting environment for all users.

Bicycle Access to Transit

Accessibility is one the primary performance measures used to evaluate active transportation. Accessibility measures how well the current infrastructure provides individuals with the opportunity to access facilities. The following provides a general analysis of the deficiencies and gaps with our region's current active transportation infrastructure.

Envisioning Neighborhoods with Transit-Oriented Development Potential (Mineta Transportation Institute, 2002) found that "bicycling distance, [is] usually approximated as less than 2 miles." By using a 2-mile buffer around the transit station, we found that the majority of residents in the SCAG region have access to transit by bicycle (97.0 percent), with Los Angeles County having the highest percentage of bicyclist access to transit (99.1 percent) and Imperial County having the lowest (87.5 percent).

TABLE 4 Percentage of Bicyclists with Access to Transit

County	Population Served	Total Population	Percentage Served
Imperial	155,254	177,448	87.50%
Los Angeles	10,243,811	10,341,602	99.10%
Orange	3,088,474	3,124,761	98.80%
Riverside	1,933,589	2,088,521	92.60%
San Bernardino	1,826,414	2,052,928	89.00%
Ventura	806,437	831,029	97.00%
SCAG Region	**18,053,980**	**18,616,290**	**97.00%**

Pedestrian Access to Transit

The New Transit Town: Best Practices in Transit-Oriented Development (Ohland, 2004) states that residents are willing to walk "between a quarter- and a half-mile" to access transit. By using a 0.5-mile buffer, we found that the majority of residents in the SCAG region have access to transit by walking (85.7 percent), with Los Angeles County having the highest percentage of pedestrian access to transit (93.5 percent) and Riverside County having the lowest (64.2 percent).

TABLE 5 Percentage of Pedestrians with Access to Transit

County	Population Served	Total Population	Percentage Served
Imperial	116,245	177,448	65.50%
Los Angeles	9,668,821	10,341,602	93.50%
Orange	2,781,863	3,124,761	89.00%
Riverside	1,341,002	2,088,521	64.20%
San Bernardino	1,417,039	2,052,928	69.00%
Ventura	628,540	831,029	75.60%
SCAG Region	**15,953,510**	**18,616,290**	**85.70%**

All 7 incorporated cities in Imperial County contain transit stops.

Of the 88 incorporated cities in Los Angeles County, 83 cities contain transit stops. The five cities that do not are Avalon, Bradbury, Hidden Hills, La Habra Heights, and Rolling Hills.

All 34 incorporated cities in Orange County contain transit stops

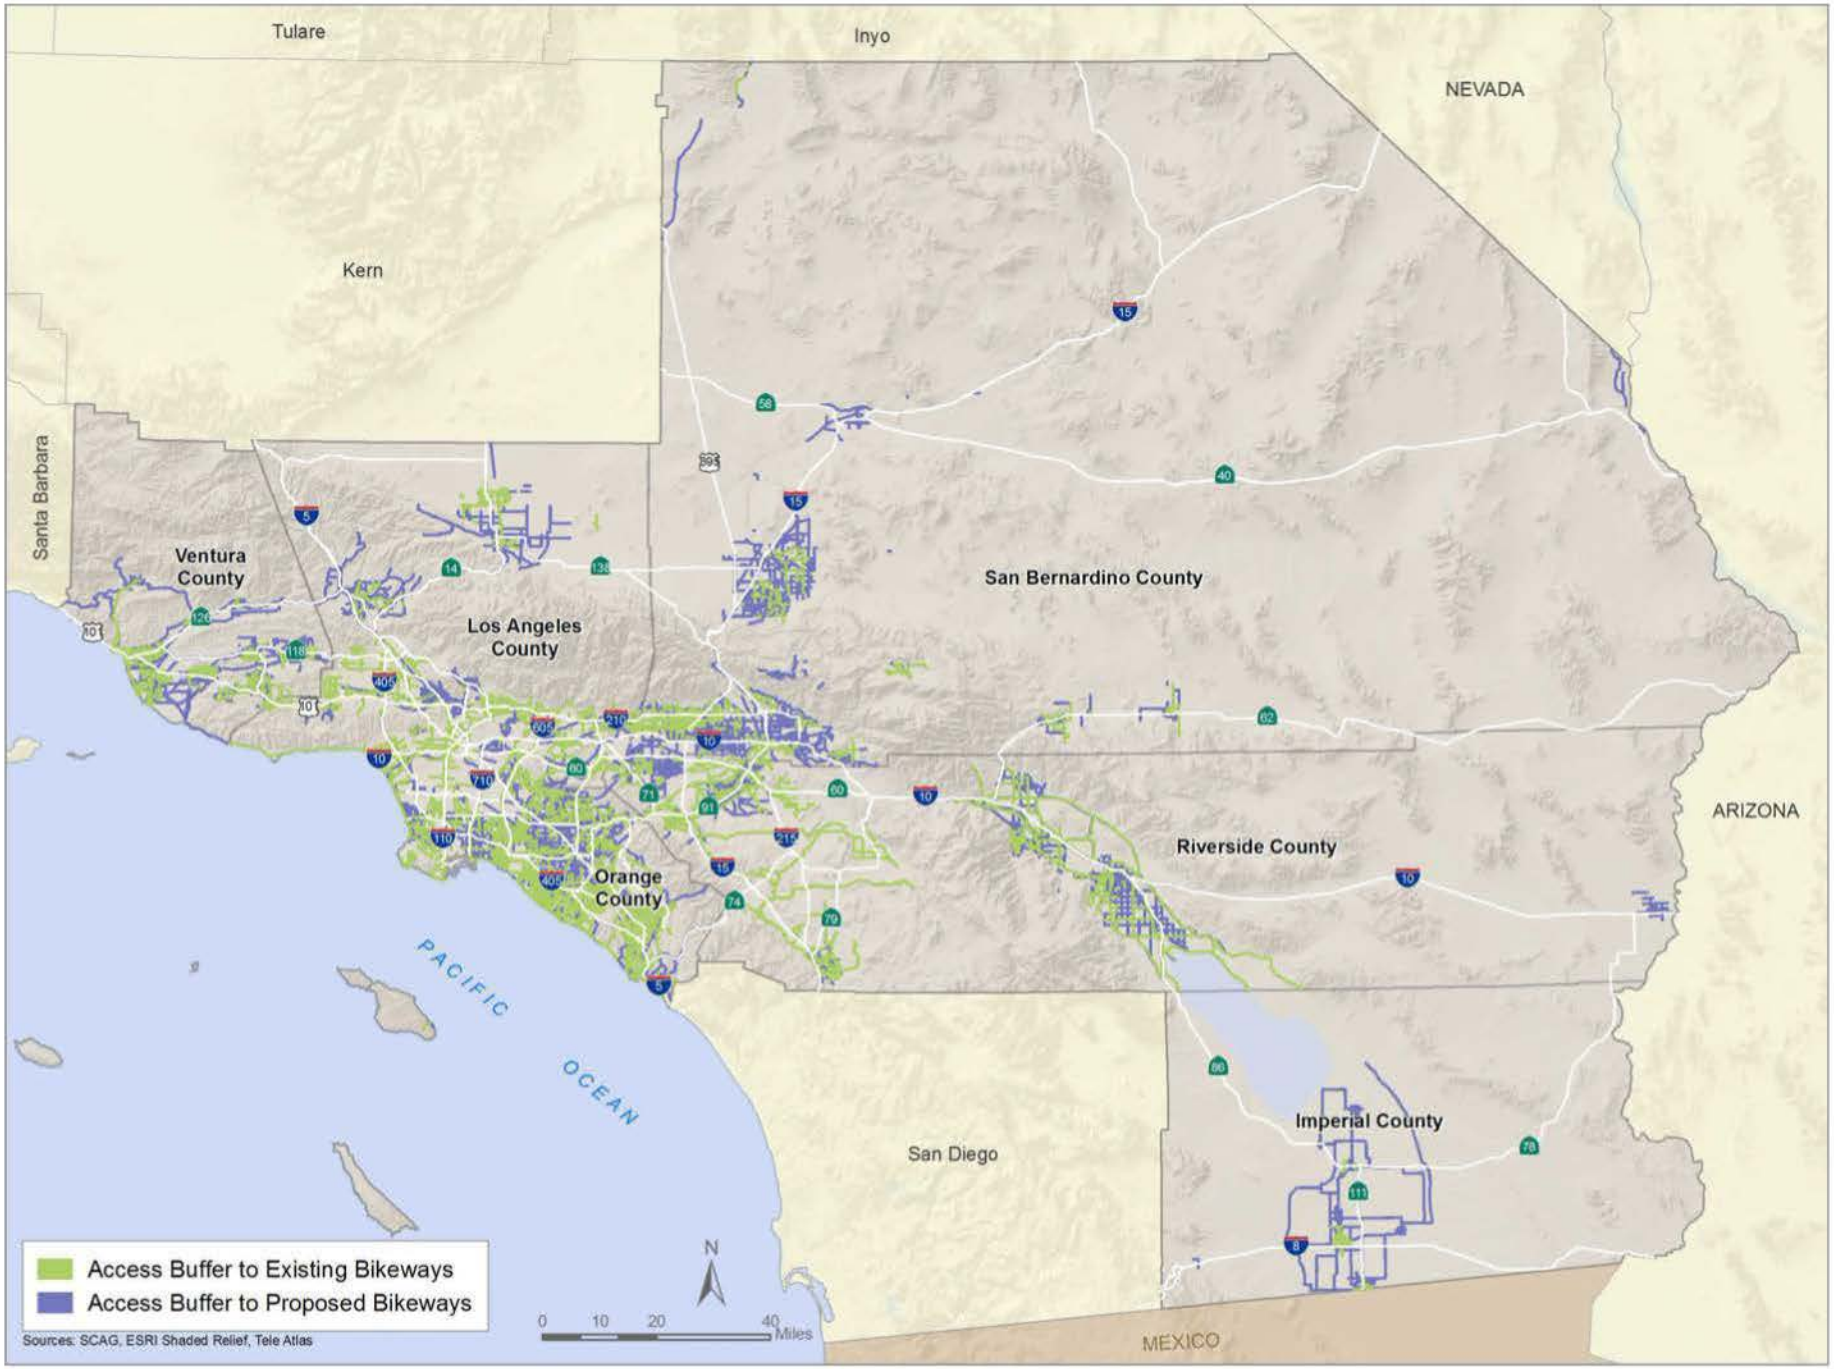
All 25 incorporated cities in Riverside County contain transit stops.

Of the 24 incorporated cities within San Bernardino County, 20 cities contain transit stops. The cities that do not are Barstow, Needles, Twenty-Nine Palms, and Yucca Valley.

All 10 of the incorporated cities in Ventura County contain transit stops.

Of the 181 member cities within the SCAG region in 2008, 172 contained transit stops. The remaining nine cities that do not contain transit stops are Avalon, Bradbury, Hidden

EXHIBIT 9 Bikeway Access in the SCAG Region



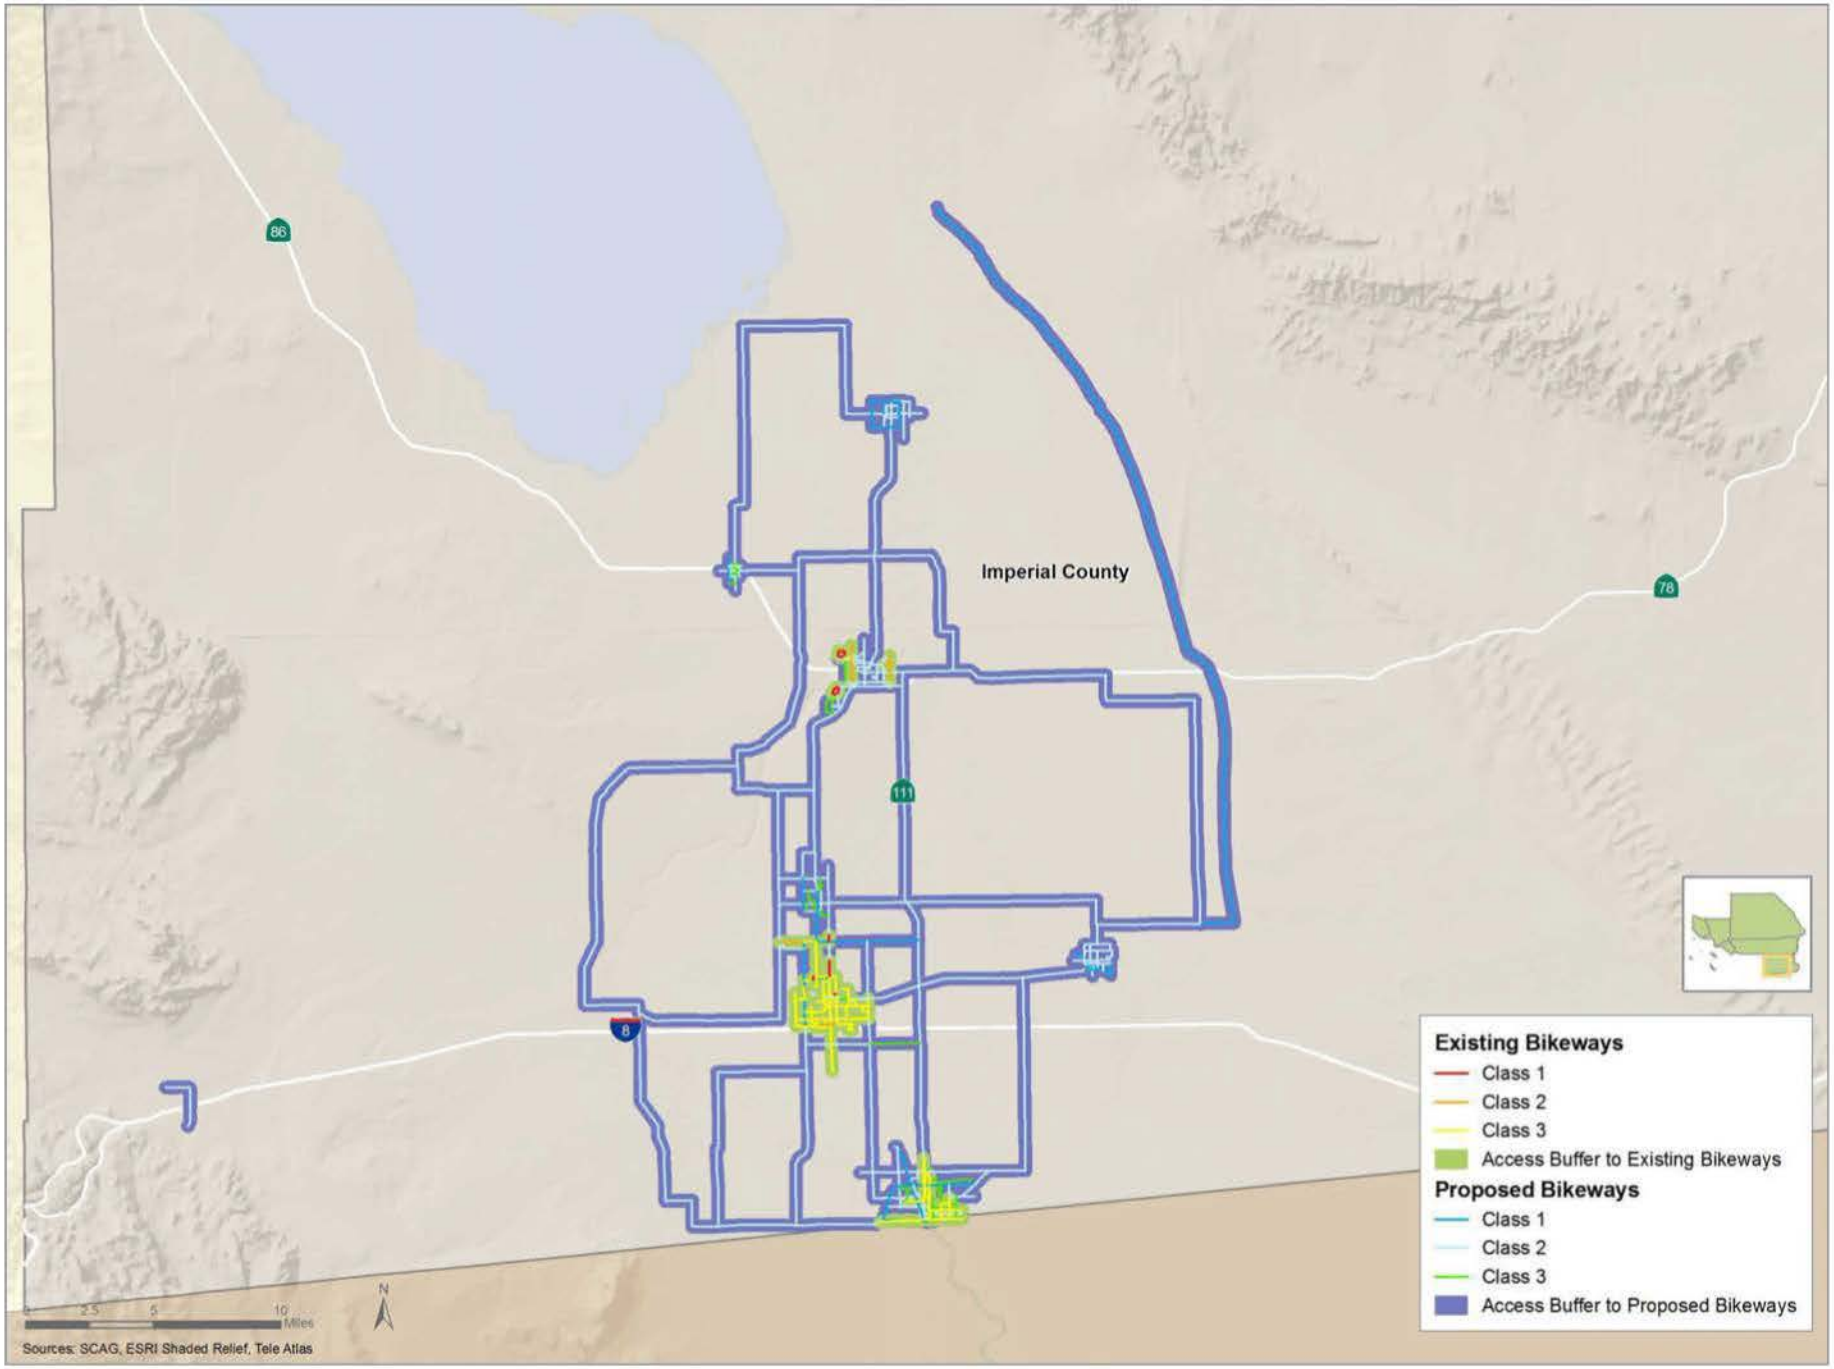


EXHIBIT 10 Existing and Proposed Bikeway Access in Imperial County

Hills, La Habra Heights, Rolling Hills, Barstow, Needles, Twenty-Nine Palms, and Yucca Valley.

While the majority of the population has access to the existing transit network, additional improvements are needed. Access to a transit stop does not ensure that individuals will utilize transit, since the transit stop that is near them may not provide them with access to their desired destination. Therefore, additional analysis is needed to ensure that individuals are being served with adequate access to transit by both walking and bicycling. Furthermore, additional analysis regarding access to the transit stops is required. This would include gaps in sidewalks, ADA compliance, and the transit network.

While access is a key topic of concern, bicycle and pedestrian facilities also need to be considered. Adequate bicycle facilities such as bicycle parking, lockers, or showers should also be evaluated in order to address the needs of bicyclists. Consideration for pedestrian access should also include adequate lighting, complete sidewalks, and ADA requirements in order to ensure the ease of access and improve pedestrian mode share.

Access to Bicycle Routes

According to a study conducted by the Oregon Transportation Research and Education Consortium (OTREC) in 2008, bicyclists would travel 0.27 miles to utilize a bikeway. By using a 0.27-mile buffer, we found that less than half of the SCAG region has access to bikeways (42.6 percent), with Ventura County having the highest percentage of residents with access to bikeways (64.0 percent) and Los Angeles County having the lowest (38.0 percent).

TABLE 6 Percentage of Population with Access to Existing Bikeways

County	Population Served	Total Population	Percentage Served	Commuter Bicyclist Mode Share
Imperial	80,170	177,448	45.2%	0.0%
Los Angeles	3,929,538	10,341,602	38.0%	0.8%
Orange	1,987,805	3,124,761	63.6%	0.9%
Riverside	832,429	2,088,521	39.9%	0.5%
San Bernardino	624,552	2,052,928	30.4%	0.4%
Ventura	531,515	831,029	64.0%	0.5%
SCAG Region	**7,933,592**	**18,616,290**	**42.6%**	**0.7%**

Source: American Community Survey, 2008

While a significant portion of the region has access to bikeways, only a small percentage utilizes the bikeways for their daily work commutes (less than 1 percent). The lack of bicycling commute trips may be attributed to the type of bikeways, confidence of the rider, adequate facilities at their destination (bicycle parking, showers, etc.) and accessibility to their desired destinations.

Once the locally proposed bikeways (projects identified by the local jurisdictions) are implemented, accessibility to bikeways will increase from 42.6 percent to 62.4 percent. Orange County would then have the highest percentage of bicyclists with access to bikeways (89.4 percent) and Riverside County would have the lowest (52.7 percent).

TABLE 7 Locally Proposed Bicycle Facilities (in Miles)

	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura	Total Proposed	% of Total

SCAG Region	**11,615,295**	**18,616,290**	**62.4%**

In 2008, 153 out of SCAG's 191 member cities contain bikeways. Of the 7 incorporated cities in Imperial County, 4 cities contained bikeways. Once the proposed bikeways have been developed, all 7 incorporated cities in Imperial County will contain bikeways.

Of the 88 incorporated cities in Los Angeles County, 79 cities contain bikeways. Once the proposed bikeways have been developed, only four will not contain bikeways.

All 34 incorporated cities in Orange County contain bikeways.

Of the 25 incorporated cities in Riverside County, 21 cities contain bikeways. The 4 cities that do not are Banning, Beaumont, Blythe, and Calimesa. Once the proposed bikeways have been developed, only four will not contain bikeways.

Half of the 24 incorporated cities within San Bernardino County contain bikeways.

All 10 of the incorporated cities in Ventura County contain bikeways.

In an effort to increase mobility for bicyclists in the SCAG region, a 2,012.2 mile SCAG Regional Bikeway Network (Network) has been developed. This network has identified specific regional corridors that may be used to increase bicyclist mobility and connectivity within the SCAG region. The Network includes 432.2 miles of existing bikeways. In addition, local jurisdictions have currently proposed an additional 752.5 miles of bikeways within their local plans that would contribute to the Network. As part of the 2012 Strategic Plan, SCAG has identified 827.5 miles of bikeways that may be developed to close gaps in the Network. Completion of the Network would provide approximately 570,000 additional individuals with access to bikeways.

TABLE 9 SCAG Regional Bikeway Network Route Lengths by County and Class Type

County	Class	Existing Network	Proposed Network	SCAG Corridors	Total
Imperial	Class 1	2.9	63.4	-	66.3
	Class 2	4.4	294.8	202.3	501.4
	Class 3	38.1	16.3	51.8	106.2

EXHIBIT 16 Existing, Proposed and SCAG Regional Bikeways

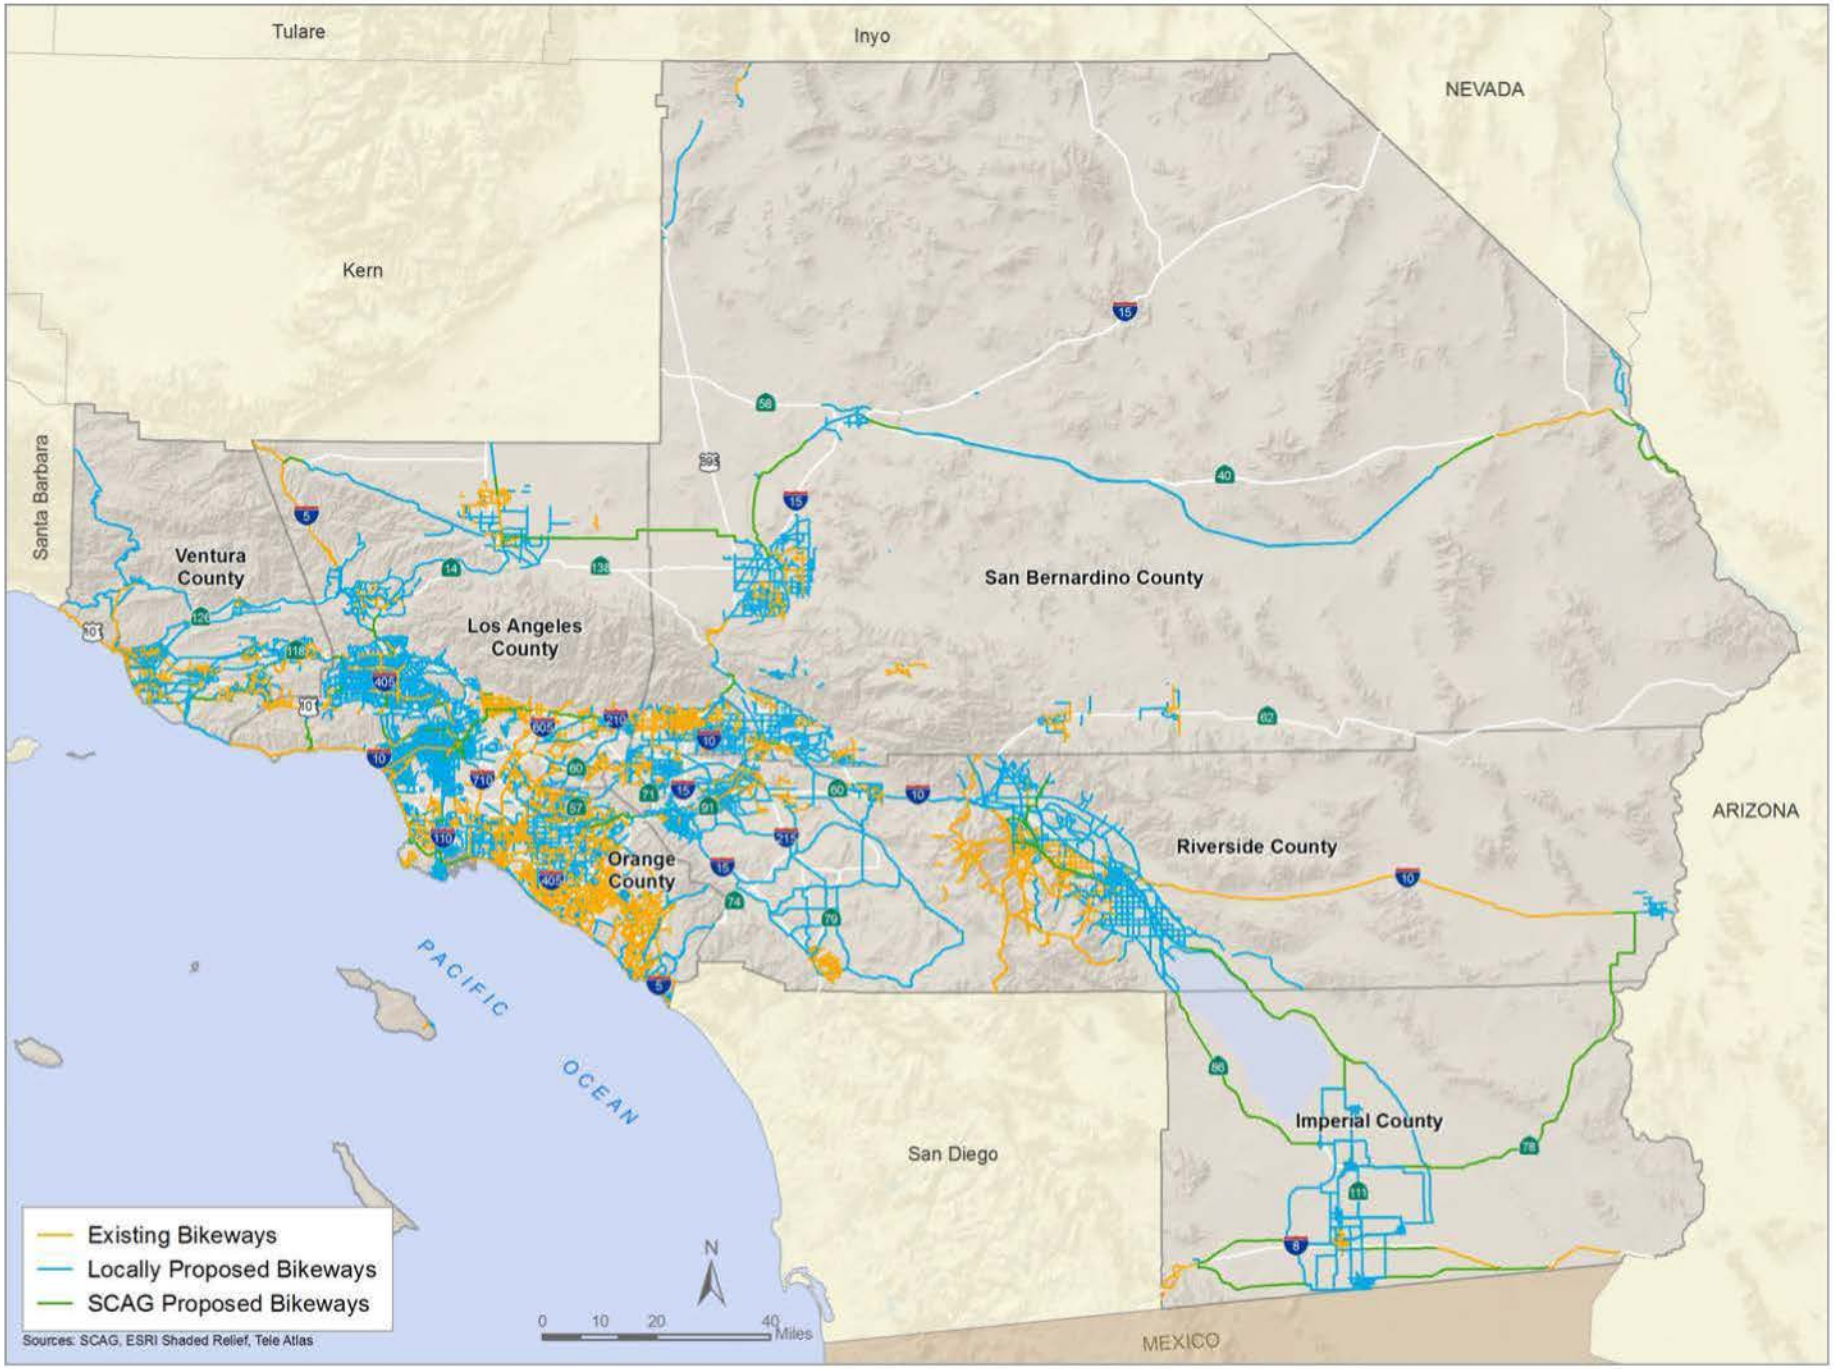

EXHIBIT 17 Existing SCAG Regional Bikeway Network

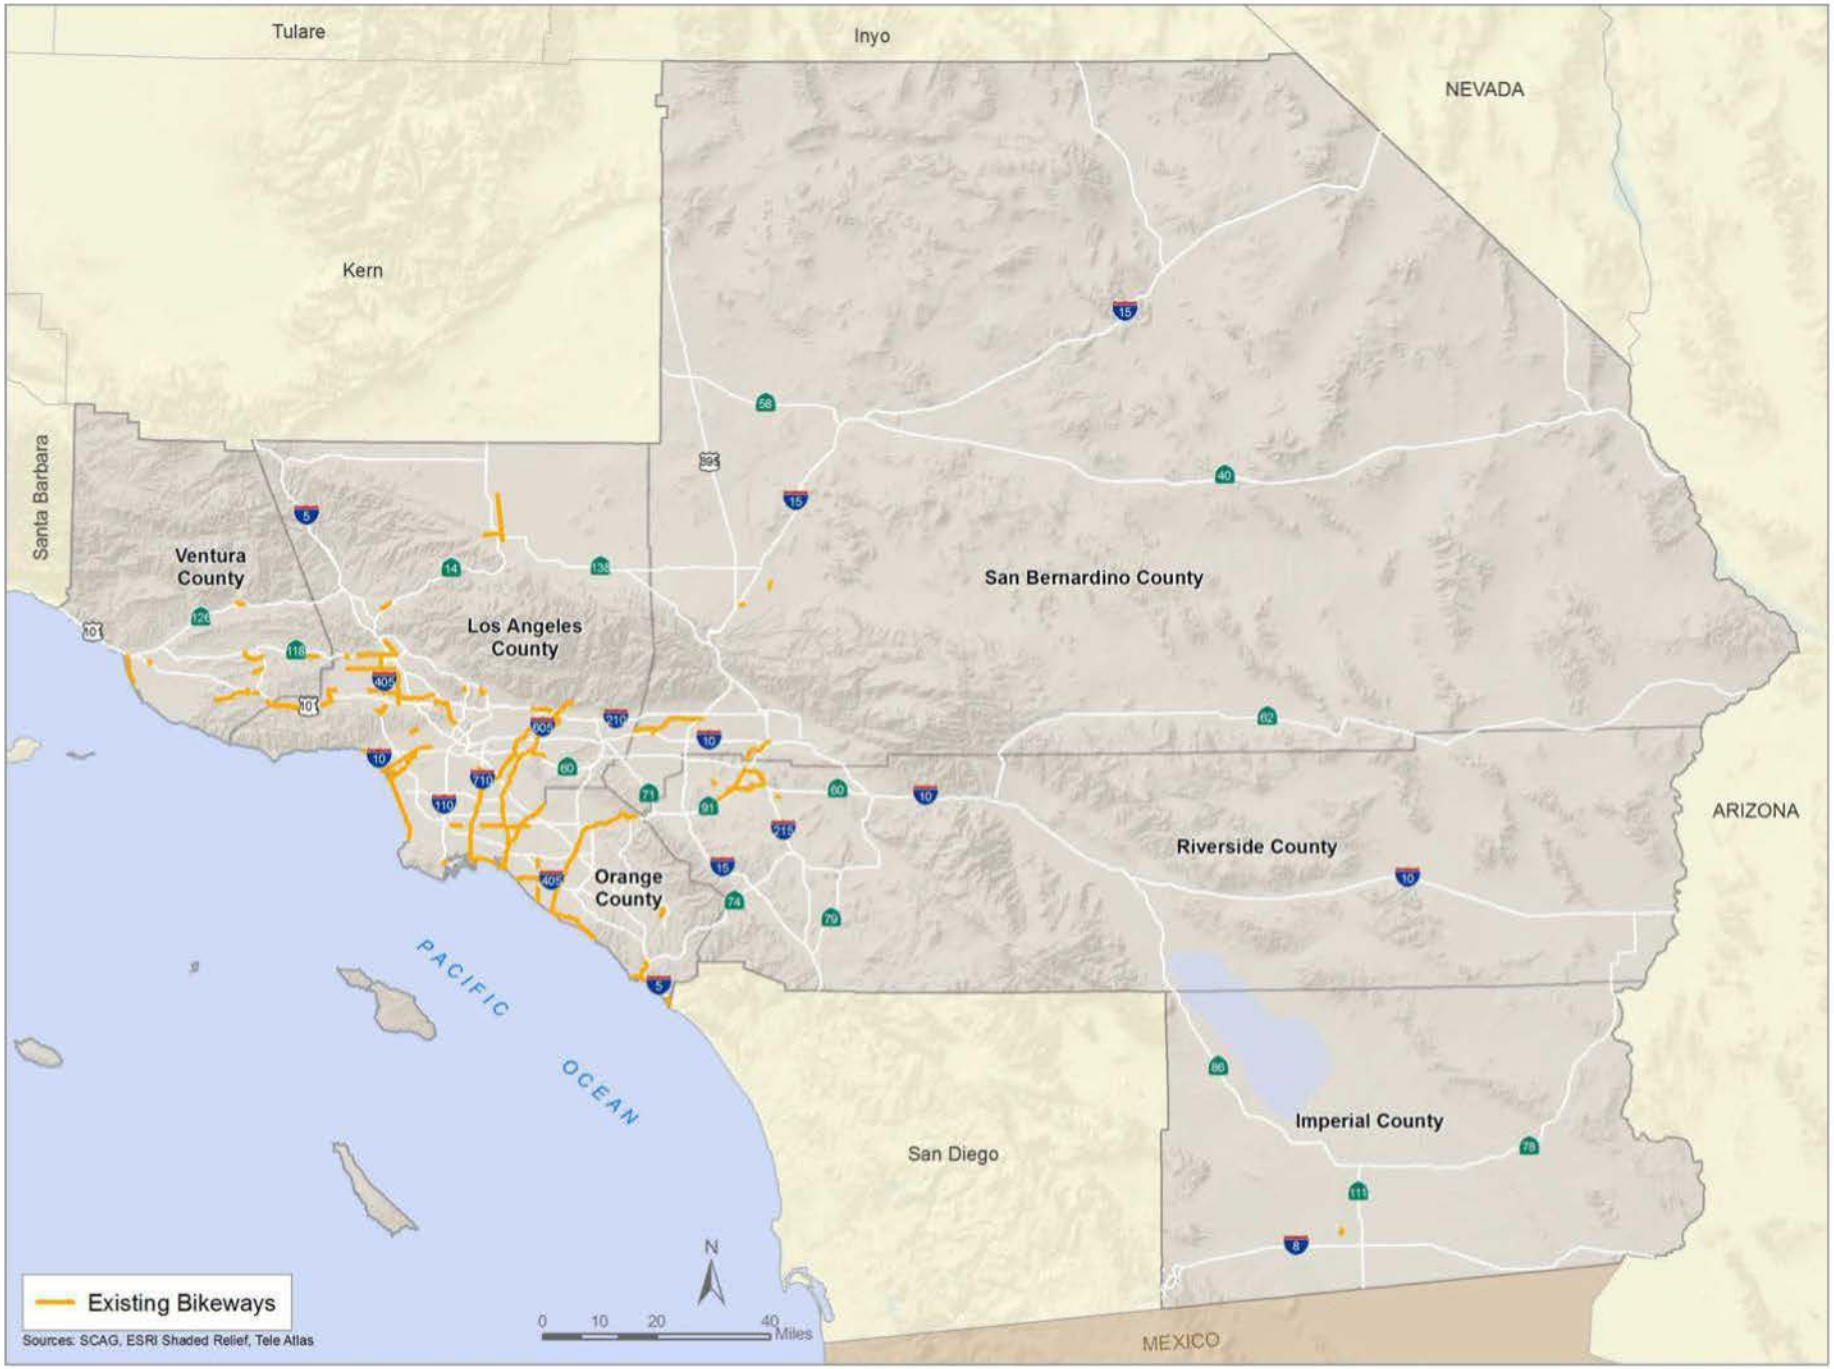

EXHIBIT 18 Proposed SCAG Regional Bikeway Network

Completion of the locally proposed projects would increase the bikeway network from 4,314.8 miles to 9,294.7 miles (4,979.9 mile increase). Completion of the Network would increase the total network system to 10,122.1 miles (an additional 827.4 mile increase).

TABLE 10 Population Served by the SCAG Regional Bikeway Network

Regional Network	Bikeway Miles	Population Served	Total Population	Percentage Served
Existing Bikeways	4,315	7,933,592	18,616,290	42.6%
Existing Bikeways + Locally Proposed Bikeways	8,439	11,615,295	18,616,290	62.4%
Existing Bikeways + SCAG Proposed Bikeways	4,286	8,225,263	18,616,290	44.2%
Existing Bikeways + Locally Proposed Bikeways + SCAG Regional Bikeway Network	**10,122**	**11,865,083**	**18,616,290**	**63.7%**

The completed system will include the existing bikeway facilities, facilities proposed by local jurisdictions (constrained plan), and the SCAG Regional Bikeway Network Projects (strategic plan).

The existing bikeways that belong to the SCAG Regional Bikeway Network are highlighted. The existing system currently includes 432.2 miles of existing bikeways.

The proposed bikeways that belong to the SCAG Regional Bikeway Network have been highlighted, of these proposed projects 752.5 miles have been proposed by local jurisdictions and 827.4 miles have been identified by SCAG as regional bikeway corridors. These corridors provide a network, linking cities and facilities throughout the SCAG region; which may provide an increase in the number of bicycle commuters as well as bicycle tourists and recreational riders.

The SCAG Regional Bikeway Network was developed using local existing and planned facilities to the greatest extent possible to develop an interconnected bikeway network that allows bicyclists to travel between multiple jurisdictions. The new corridor facilities are graphically shown to close the gaps between the existing and locally planned facilities and do not necessarily represent specific alignments or facilities. Further, analysis and collaboration with local jurisdictions is necessary to determine specific route structures. The $6.7 billion dollars allocated toward Active Transportation projects will significantly improve the existing bikeway network through the maintenance, improvement and expansion of the existing infrastructure.

California Coastal Trail

In addition to bikeways, local trails have been able to increase accessibility and provide opportunities for active transportation. Trails along the coast of California have been utilized as long as people have inhabited the region. In an effort to develop a "continuous public right-of-way along the California coastline; a trail designed to foster appreciate and stewardship of the scenic and natural resources of the coast through hiking and other complementary modes of non-motorized transportation" the California Coastal Trail (CCT) was established by Coastal Act of 1976.

The Coastal Initiative Collection (Proposition 20) of 1972 "created six regional commissions and one statewide commission to oversee the use and development of California's 1,000 mile coastline, and was designed to address the state legislature's failure to produce an acceptable compromise measure regarding coastal ecology, protection, and preservation." Four years later Costal Act established the California Coastal Trail. In 1999 the CCT was designated as California's Millennium Legacy Trail to encourage federal agencies to assist in its development. In 2001, Assembly Concurrent Resolution 20 declared the CCT an official State trail and Senate Bill 908 directed the Coastal Commission and State Parks Department to develop a plan to complete the CCT by 2008.

In 2003, the Coastal Conservancy developed the Completing the California Coastal Trail plan to provide a strategic blueprint to complete the CCT. The plan attempted to create a consistent, quality and connective trails throughout the length of the state by adhering to the following principles:

- Proximity – the CCT "should be within sight, sound or at least the scent of the sea."
- Connectivity – the CCT "should effectively link starting points to destinations."
- Integrity – the CCT "should be continuous and separated from motor traffic."
- Respect – the CCT should be "located and designed with a healthy regard for the protection of natural habitats, cultural and archaeological features, private property rights, neighborhoods, and agricultural operations along the way."

- Feasibility – the CCT alignment should identify "timely, tangible results with the resources that are available, both interim and long-term."

Government Code Section 65080.1 requires each MPO that includes a "portion of the California Coastal Trail, or property designated from the trail shall coordinate with the State Coastal Conservancy, the California Coastal Commission and Caltrans regarding the development of the trail. The trail must be identified in the RTP."

In 1976 the American Revolution Bicentennial Commission of California and the California Department of Transportation developed the "Pacific Coast Bicentennial Bike Route." The route began on Highway 101 at the California/Oregon State line, and ended near Interstate 5 at the Mexican border. This existing route is considered challenging and generally recommended for experienced bicyclists only. A pilot project to provide signage along the route in Caltrans District 1 included the installation of 19 bicycle guide signs in Mendocino County, providing cyclists with food, camping and directional information along the bikeway. This existing bikeway coincides with the CCT in some areas depending on the geographical characteristics of that area. While the CCT includes the use of all of forms of active transportation, the primary goal of the CCT is to provide hiking or pedestrian trails.

Los Angeles, Orange and Ventura County each contain a number of bikeways located along the coast, which may be contribute to the completion of the CCT. Ventura County currently contains approximately 322.5 miles of existing bikeways, roughly 23.1 miles are located along the coast. Los Angeles County currently contains approximately 1,266.9 miles of existing bikeways, roughly 63.9 miles are located along the coast. Orange County currently contains approximately 945.8 miles of existing bikeways, roughly 30.2 miles are located along the coast. Completion of the CCT in these areas will require coordination between local and state agencies. New development projects that require approval from the California Coastal Commission may include Conditions of Approvals that provide for enhancements or additions to the CCT.

Completion of the 1,200 mile trail would provide citizens with the SCAG region and the state to have increased access to the California coast through active transportation modes. Additional public benefits from completing the CCT would include:

- Economic Benefits – According to the American Hiking Society's factsheet, The Economic Benefits of Hiking, "Revenues generated from trail-related recreation and sports activities provide substantial income and employment opportunities."
- Environmental Protection and Enhancement – having an established, marked trail may help minimize human impacts on the environment by directing them away from environmentally sensitive areas or resources and encouraging the use of active transportation to reduce GHGs.
- Quality of Life Benefits – the trails may increase recreational activities by providing safe trails for hiking, and riding and may also increase accessibility to other recreational facilities such as the beach or camp grounds.
- Public Health Benefits – improved accessibility to trails may encourage individuals to participate in a more active lifestyle by utilizing active transportation for recreational or transportation purposes.

In addition to the policy initiatives, the following projects have been identified to complete significant portions of the CCT within Ventura, Los Angeles and Orange County.

VENTURA COUNTY

1. Assist Caltrans in evaluating and improving non-motorized access opportunities along the Highway 101 corridor between the County line and Mussel Shoals.
2. Design a recreational access trail along the Santa Clara River to encourage non-motorized access to the coast from inland cities.
3. Restore the pedestrian and bicycle pathway damaged by erosion at Surfers' Point (County Fairgrounds). Encourage the U.S. Navy to provide a shoreline public access connection on the Naval Construction Battalion Center, Port Hueneme, consistent with military security requirements.
4. Provide pedestrian and bicycle paths in conjunction with planning for restoration of the Ormond Beach wetlands, to connect with the trail in Port Hueneme.
5. Work with the City of Oxnard to design and construct recreational support facilities at the terminus of Arnold Road to improve beach access opportunities and avoid impacts to sensitive habitat areas.

LOS ANGELES COUNTY

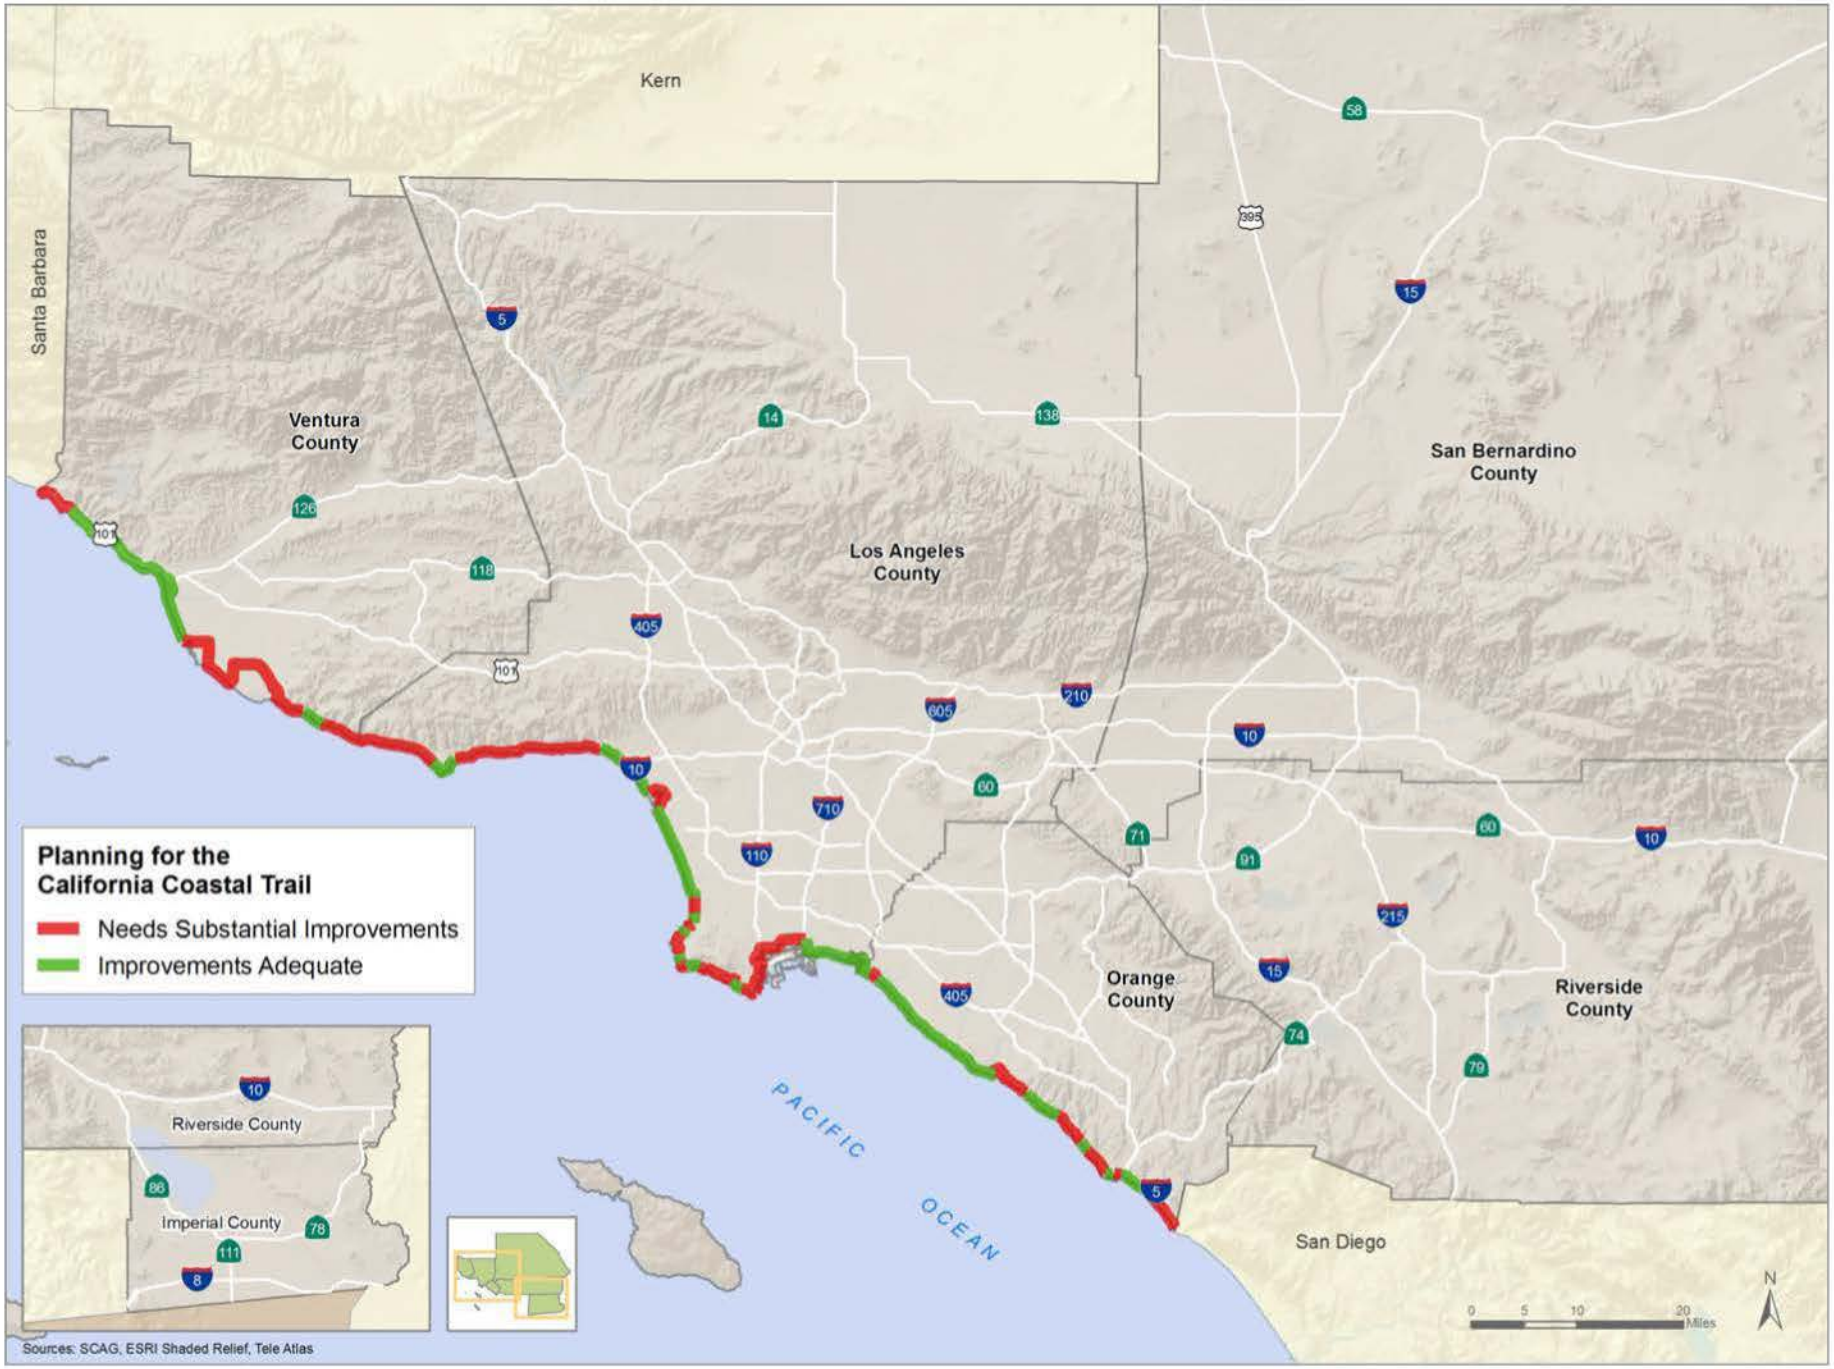
1. Assist Caltrans in evaluating and improving non-motorized access along State Highway 1 corridor from Leo Carrillo State Beach to the beginning of the South Bay Bicycle Path near Temescal Canyon. Encourage Caltrans and local agencies to extend bicycle and pedestrian improvements through Malibu.
2. Facilitate continuous lateral access along the Malibu shoreline from Leo Carrillo State Beach to the city limit.
3. Link the inland portions of the Santa Monica Mountains national Recreation Area with the coast by assisting the National Park Service, State Parks, the Santa Monica Mountains Conservancy, and the City of Malibu to acquire necessary rights-of-way and develop improvements to complete the Coastal Slope Trail.
4. Extend the pedestrian/bicycle path from Washington Street to the north jetty of Marina del Rey, and support the seasonal ferry service for pedestrians and cyclists across the channel to Playa del Rey.
5. Assist the Cities of Los Angeles and Long Beach in providing a continuous pedestrian and bicycle access across the replacements for the Vincent Thomas Bridge and Gerald Desmond Bridge linking San Pedro to Long Beach.

ORANGE COUNTY

1. Implement the planned State Highway 1 improvements between Seal Beach and Anderson Street in Huntington Beach to create a separated non-motorized trail.
2. Encourage local agency efforts to work with private landowners and acquire public access rights necessary to provide a trail connection to the coast from Aliso Creek Regional Park.
3. Encourage local agency land acquisitions, trail design, and development to provide a public access connection to the coast from Laguna Coast Wilderness Park.
4. Complete improvements of "missing links" to provide safe pedestrian and bicycle access adjacent to State Highway 1 between the cities of Laguna Beach and Dana Point.
5. Support the effort by the City of San Clemente to provide a safe pedestrian and bicycle trail along the railroad right-of-way west of State Highway 1.

It is estimated that the CCT in the SCAG region would be comprised of 183 miles. Approximately 87 miles are considered adequate and an additional 96 miles are still needed in terms of highway corridor improvements, acquisition and construction on private lands, and construction on public lands. Completion of the CCT in the SCAG region is estimated to cost approximately $41,860.

TABLE 11 Improvements Needed to Complete the Coastal Trail: Estimated Linear Miles by County



County	Highway Corridor Improvements	Acquisition/ Construction on Private Lands	Construction on Public Lands	Current Improvements Adequate	Total
Ventura	21	-	6	25	52
Los Angeles	22	5	25	34	86
Orange	11	3	3	28	45
SCAG Total	**54**	**8**	**34**	**87**	**183**
CCT Total	**245**	**269**	**245**	**548**	**1,307**

TABLE 12 Estimated Capital Outlay Costs to Complete the Coastal Trail

County	Highway Corridor Improvements	Acquisition of New Right-of-Way	Trail Construction			Total
			Hard Surface	Rural	Signing	
Ventura	$3,200	-	$2,400	-	$20	$5,620
Los Angeles	$3,400	$2,300	$20,600	$100	$100	$26,300
Orange	$1,600	$1,800	$6,700	-	$40	$9,940
Total	**$8,200**	**$4,100**	**$29,700**	**$100**	**$160**	**$41,860**
CCT Total	**$37,200**	**$121.40**	**$123,300**	**$38,450**	**$1,200**	**$321,550**

Completion of these projects would help increase bicycle and pedestrian accessibility to the coast and assist in the development of a regional bikeway network.

EXHIBIT 19 California Coastal Trail

Policy Recommendations

While SCAG is not an implementing agency SCAG may work with local jurisdictions to assist them with developing policies and projects that may improve active transportation.

Agencies, Groups and Individuals in Bicycle and Walking Planning

Federal and state regulations require SCAG to plan and accommodate for bicycle and walking transportation. As the region's MPO, SCAG develops regional planning strategies and encourages local jurisdictions to think about transportation at the regional level, since individual travel decisions are not bound by political boundaries and often transverse multiple jurisdictions. A regional approach towards transportation planning will provide increased connectivity and accessibility. The 2012 RTP has been developed in cooperation and collaboration with federal, state and local stakeholders. Each stakeholder plays a different role in the development and final adoption of the RTP.

FEDERAL GOVERNMENT

Federal statutes have mandated Metropolitan Planning Organizations (MPOs) to include pedestrian and bicycle facility strategies as part of their overall systematic approach in addressing current and future transportation demands.

STATE OF CALIFORNIA

The State of California and Caltrans has long supported active transportation planning, design policies and practices.

COUNTIES

Each county within the SCAG region has developed and maintained a bicycle and walking master plan to guide their active transportation development.

CITIES

Many of the cities within the SCAG region have developed and maintained a bicycle and/or walking plan as part of their circulation element or as a separate document. These plans are used to guide their transportation development and assist them with the implementation of their active transportation policies.

Performance Measures

In addition to the established goals and objectives the following performance measures have been identified in an effort to maximize the benefits of active transportation modes:

1. Change in Active Transportation mode share: Increase bicycling and walking in the SCAG region by creating and maintaining an active transportation system that includes well maintained bicycle and pedestrian facilities, easy access to transit facilities, and increased safety and security.
2. Change in the amount of Active Transportation facilities: Increase accommodation and planning for bicyclists and pedestrians (including persons with disabilities) for all transportation planning projects.
3. Change in the number of accidents involving Active Transportation users: Decrease bicyclist and pedestrian fatalities and injuries by increasing transportation safety.
4. Change in land use patterns and Active Transportation: Support local jurisdictions comply with the Complete Streets Act and the development of local active transportation plans. SCAG will also work with local jurisdictions in developing a regional active transportation plan.

Proposed Policies

The goals, objectives and policies in this report were derived from information gathered over the course of the planning process, including public input, review of bicycle and pedestrian master plans from local jurisdictions throughout the region.

GOAL 1: DECREASE BICYCLIST AND PEDESTRIAN FATALITIES AND INJURIES

- **Objective 1.1:** SCAG will work with local jurisdictions to support a safe transportation environment in the SCAG Region.
  - Policy 1.1.1: SCAG will work with local jurisdictions to provide comprehensive education for all road users.

- Policy 1.1.2: SCAG will work with local jurisdictions to direct enforcement agencies to focus on bicycling and walking safety to reduce multi-modal conflicts.
- Policy 1.1.3: SCAG will partner with local advocacy groups and bicycle related businesses to provide bicycle-safety curricula to the general public.

The 2006 Strategic Highway Safety Plan (SHSP) established goals to make walking and street crossing safer; and improve bicycle safety. The SHSP intended on achieving these goals by 2010, reducing the number of pedestrian fatalities attributed to vehicle collisions and the number of bicycle roadway fatalities by 25 percent from their 2000 level. These goals were established by the Legislature in the 2002 California Blueprint for Bicycling and Walking, and assumed that the Legislature's mobility goal of a 50 percent increase in bicycling and pedestrian trips by 2010 would also be achieved.

Improved data collection regarding pedestrian and bicycle trip characteristics, facility conditions and injuries and fatalities would provide local jurisdictions with a clearer understanding of the active transportation conditions within their jurisdictions. Analysis generated from this data would also provide decision makers with a better understanding of the deficiencies and needs within the existing active transportation system.

FIGURE 14 California Coastal Trail Timeline

GOAL 2: DEVELOP AN ACTIVE TRANSPORTATION FRIENDLY ENVIRONMENT THROUGHOUT THE SCAG REGION

- **Objective 2.1:** Produce a comprehensive regional active transportation plan
  - Policy 2.1.1: SCAG will work with local jurisdictions to adopt and implement the proposed SCAG Regional Bikeway Network
  - Policy 2.1.2: SCAG will work with local jurisdictions to connect all cities in the SCAG region via bicycle facilities
  - Policy 2.1.3: SCAG will work with local jurisdictions to complete the California Coastal Trail

The need for active transportation needs to be fully considered for all transportation planning projects. Increased accommodation for bicyclists and pedestrians requires increased funding, multi-modal planning, programming, and design. As planners increase accommodation for active transportation users, an increase in bicyclist and pedestrian safety should also occur.

Research by Dr. Jennifer Dill, Portland State University Associate Processor, and anecdotal evidence from New York City (NYC) indicate that increases in dedicated bicycle facilities (bicycle lanes and bicycle paths) in those cities have resulted in greater bicycle usage. In addition, in NYC, while bicycling use has doubled along with the number of bicycle facilities, bicycle fatalities have not grown, and injuries have actually declined in total. Collaborative efforts that are capable of integrating the needs of all commuters are essential to developing a safe and accessible transportation system for all users.

Adoption of the SCAG Regional Bikeway Network would increase bicycle facilities by 827.5 miles beyond existing local plans, and may further promote ridership in the SCAG region. In addition, SCAG may partner with local jurisdictions on grant opportunities such as the Caltrans Bicycle Transportation Account (BTA) or Safe Routes to School (SRTS) projects. SCAG may also provide local jurisdictions with assistance in the development of their local active transportation plans and by providing them with Pedestrian Safety Action Plan (PSAP) workshops. The SCAG Compass Blueprint program may further assist local jurisdictions with the development of innovative transportation and land-use planning projects.

Adoption of a Complete Streets Policy that would ensure that all streets are safe, comfortable, and convenient for travel for everyone, regardless of age or ability—motorists, pedestrians, bicyclists, and public transportation riders.

GOAL 3: INCREASE ACTIVE TRANSPORTATION USAGE IN THE SCAG REGION

- **Objective 3.1:** Adoption of a Safe Routes to School Policy
  - Policy 3.1.1: Enable and encourage children, including those with disabilities to walk and bicycle to school
  - Policy 3.1.2: Make bicycling and walking to school a safer and more appealing transportation method, thereby encouraging a healthy and active lifestyle from an early age
  - Policy 3.1.3: Facilitate the planning, development, and implementation of project and activities that will improve safety and reduce traffic, fuel consumption, and air pollution in the vicinity (approximately 2 miles) of primary and middle schools (Grade K-8)
- **Objective 3.2:** Adoption of a Complete Streets Policy
  - Policy 3.2.1: Encourage local jurisdictions to prioritize and implement projects/policies to comply with ADA requirements
  - Policy 3.2.2: Encourage local jurisdictions to develop and implement Complete Streets Policies.

Increasing bicycling and walking requires well maintained bicycle and pedestrian facilities, easy access to transit facilities, and increased safety and security. While pedestrian sidewalks are fairly well established in most areas, it is estimated that there are only 4,315 miles of dedicated bicycle facilities in the region, with an additional 7,154 miles planned.

Reliable data for planning is also needed to increase active transportation and investments. Active transportation data needs include, but are not limited to, comprehensive user statistics, user demographics, bicycle travel patterns/corridors, accident mapping, bikeway system characteristics, and sub-regional improvement projects and funding needs.

GOAL 4: ENCOURAGE THE DEVELOPMENT OF LOCAL ACTIVE TRANSPORTATION PLANS

- **Objective 4.1:** SCAG will assist local jurisdictions with the development and maintenance of their local active transportation plans
  - Policy 4.1.1: SCAG will work with local jurisdictions in the development of bicycle/pedestrian plans for all cities in the region
- **Objective 4.2:** Develop Pedestrian Safety Action Plans
  - Policy 4.2.1: SCAG will work with local jurisdictions in the development of PSAPs by conducting workshops
- **Objective 4.3:** Encourage the use of Intelligent Traffic Strategies
  - Policy 4.3.1: Encourage the use of Intelligent Traffic Signals that are able to detect slower pedestrians in signalized crosswalks and extend the signal time appropriately

SCAG will work with all member counties and cities to develop bicycle and walking plans and policies. Active transportation plans have been created or updated within the previous four years are eligible for BTA funds.

Air Quality Improvements

In addition to increased mobility for all users throughout the SCAG region, implementation of the 2012–2035 RTP/SCS will further improve the environment and congestion of the region through the reduction of vehicle miles traveled (VMT).

Potential VMT Reduction

As described previously, active transportation has grown dramatically in recent years. This trend is expected to continue into the foreseeable future aided by several factors. First, dramatic increase in the bicycle network, as demonstrated earlier, will result in improved access to bicycle network for the Region's residents by more than 50 percent. Second, more compact mixed use urban forms in the future will be much more conducive to biking and walking. Third, better coordination with other modes, primarily transit, will become an incentive for some to switch to biking or walking. Most importantly, a significant change in the culture that values a healthy lifestyle, bikeability and walkability will become a greater impetus in promoting active transportation as a viable means of accessing opportunities. Given this context and survey data that supports dramatic increase in bicycling and walking mode shares in recent years, it is reasonable to assume this trend will continue into the future. For example, according to the NHTS data, bicycle mode share increased for all trips from 0.8 percent in 2000 to over 1.7 percent in 2009. This is an increase of almost 9 percent on an annualized basis. The share of walk trips for all trip purposes increased by approximately 6 percent on an annualized basis during the same period.

So, if we assumed annualized increase of 9 percent in mode share of bicycle trips for all trips, the potential bicycle mode share could be as high as 4.4 percent in 2020 and as high as 16 percent in 2035. However, it is somewhat unrealistic to assume that 9 percent growth rate could be sustained over such a long period of time. On the other hand, given the significant investments proposed for active transportation and the current trends, it is reasonable to assume that at least 2/3 of all trips shorter than 3 miles or half of all trips that are 5 miles or less could be converted to active transportation by 2035.

As indicated earlier, based on NHTS-CA Survey for all trips, bicycling and walking mode share for all trips are approximately 1.7 percent and 19.24 percent respectively for 2009. This represents a little over 50 percent of all trips less than 3 miles. Assuming 2/3 of all trips under 3 miles or half of all trips under 5 miles as the upper limit of Active Transportation mode share in 2035, relative increase (from the base year of 2008) in bicycling and walking mode shares can be estimated as 1.7 percent and 3.1 percent in 2020, and 3.9 percent and 6.3 percent in 2035. Relative reduction in VMT resulting from these mode shifts are estimated at approximately 7.8 million miles and 20.4 million miles for 2020 and 2035 respectively.

Regional Air Passenger Demand Forecast Scenarios for 2012–2035 Regional Transportation Plan

Background

The SCAG Aviation Technical Advisory Committee (ATAC) approved three alternative 2035 regional air passenger demand forecast scenarios for commercial airports, to be considered for potential inclusion in SCAG's 2012–2035 Regional Transportation Plan (RTP). These include baseline/medium growth, low growth, and high growth scenarios. ATAC members agreed that the scenarios present a reasonable range of possible growth rates for commercial aviation in the region over the next 25 years. This report describes these forecast scenarios, including an allocation of 2035 passenger demand to individual commercial airports for each scenario. It also presents the recommendation made by ATAC at its September 22, 2011 meeting for the Baseline Scenario to serve as the Preferred Regional Air Passenger Demand Forecast for the 2012–2035 RTP, with several caveats.

I. Comparison of Regional Air Passenger Demand Forecasts with Other Recent Forecasts

Recent aviation industry air passenger demand forecasts have been reviewed for consistency with the 2035 baseline, the high and low growth regional air passenger demand forecast scenarios, all of which were approved by the ATAC for inclusion in the 2012–2035 RTP. Those recent forecasts include ones completed by the Federal Aviation Administration (FAA), Boeing, Airbus, the San Francisco Bay Area (Regional Airport System Plan Analysis) and San Diego County (Regional Aviation Strategic Plan). A comparison of the yearly (per annum) growth rates between these forecasts can be seen below. The combined commercial activity level served by the six air carrier airports in the region in 2010 was 81.48 million annual air passengers (MAP). This is up from the 79.08 MAP they served in 2009, but it is still significantly lower than the 90.06 MAP they served in 2007.

Average Annual Growth Rates of Alternative Passenger Forecast Scenarios

1. Baseline Scenario (145.9 MAP) 2.5% p.a.
2. Low Growth Scenario (130.0 MAP) 2.1% p.a.
3. High Growth Scenario (164.0 MAP) 3.0% p.a.

Average Annual Growth Rates of Recent Industry and Regional Passenger Forecasts

1. FAA Aerospace Forecast 3.2% p.a.
2. Boeing 3.2% p.a.
3. Airbus 2.7% p.a.
4. California regional studies 1.4% to 2.8% p.a.

In general, the annual growth rates of these air passenger forecast scenarios for the SCAG region (baseline/medium growth, high growth and low growth) are somewhat lower than growth rates in forecasts developed by the FAA, Boeing and Airbus, and are generally consistent with growth rates in forecasts developed by the other two regions in California. However, the Low Growth Scenario growth rate is not as low as the lowest growth rates recently considered by the other California regions. Strategically, the upper forecast in the High Growth Scenario is more important than the lower forecast, since the upper forecast determines whether or not the region may run out of airport capacity earlier than was anticipated if it is too low. If it is too high, the forecast can just be pushed farther out into the future when it is updated by the next RTP cycle.

At several ATAC meetings, members debated the reasonableness of the growth rates in the Baseline, High Growth and Low Growth scenarios. In general, the members thought they bracketed a reasonable a reasonable range of possible growth rates for commercial aviation in the region over the next 25 years, which is consistent with other recent forecasts (although the San Francisco Bay Area and San Diego have considered even lower yearly growth rates than what is reflected in the Low Growth Scenario).

II. Descriptions and Allocations for 2035 Baseline, Low Growth and High Growth Regional Air Passenger Demand Forecast Scenarios

1. BASELINE SCENARIO (145.9 MAP)

The 2035 Baseline Scenario is essentially the same as the 2035 Constrained/No Project Scenario that was modeled and evaluated as part of the 2008 RTP. The Constrained Scenario was characterized in the 2008 RTP as a very conservative vision for the regional airport system. It assumed no intra-regional maglev high-speed rail system, no market incentives, and very conservative behavior on the part of the airlines in adding flights at new and emerging airports (although all air carrier airports that desire commercial service were allocated some passenger demand even if they currently serve none). Like the other scenarios in the 2008 RTP, the Constrained Scenario respected existing legally-enforceable policy and physical capacity constraints at urban airports.

In 2003 the legally-enforceable Settlement Agreement at John Wayne Airport was amended to allow it to expand from 8.4 MAP to 10.8 MAP, so this new policy constraint was incorporated into the 2008 RTP Constrained Scenario. A more detailed evaluation of the runway capacity constraint at Ontario Airport raised its capacity constraint from 30.0 MAP to 31.6 MAP. The Bob Hope terminal gate constraint of 10.7 MAP that was used in the 2004 RTP was lowered to 9.4 MAP since Bob Hope Airport staff determined that the four remote aircraft parking gates assumed in the 2004 plan were no longer available for aviation uses. At the request of the March Joint Powers Commission, instead of assuming that March Inland Port was unconstrained, it was considered to be constrained by the 21,000 annual civilian operations allowed in the operative joint use agreement with the Air Force. A RADAM model capacity analysis determined that this constraint equates to 2.5 MAP at March Inland Port, compared to an 8.0 MAP 2030 unconstrained forecast for March in the 2004 RTP. A refined capacity analysis of San Bernardino International's one-runway system produced a runway capacity constraint of 8.7 MAP. Neither March nor San Bernardino reached their capacity constraints in the Constrained Scenario due to its conservative assumptions about future airline air service behavior.

The assumptions and parameters used to model the 2035 Constrained Scenario for the 2008 RTP are as follows:

- LAX: Settlement Agreement: 78.9 MAP
- Bob Hope: Existing terminal/gate capacity: 9.4 MAP
- Long Beach: Flight restriction of 41 air carrier flights/day: 3.2 MAP
- John Wayne: Revised Settlement Agreement: 10.8 MAP
- Ontario: Existing runway capacity: 31.6 MAP
- San Bernardino and Palmdale: Charter, corporate & commuter/short haul
- March and Southern California Logistics: Cargo, charter and corporate
- Oxnard and Imperial: Corporate, charter and commuter only
- Planned (2008 RTP) ground access improvements
- No market incentives
- No high-speed rail (intra-regional Maglev system)
- Doubling of aircraft fuel costs

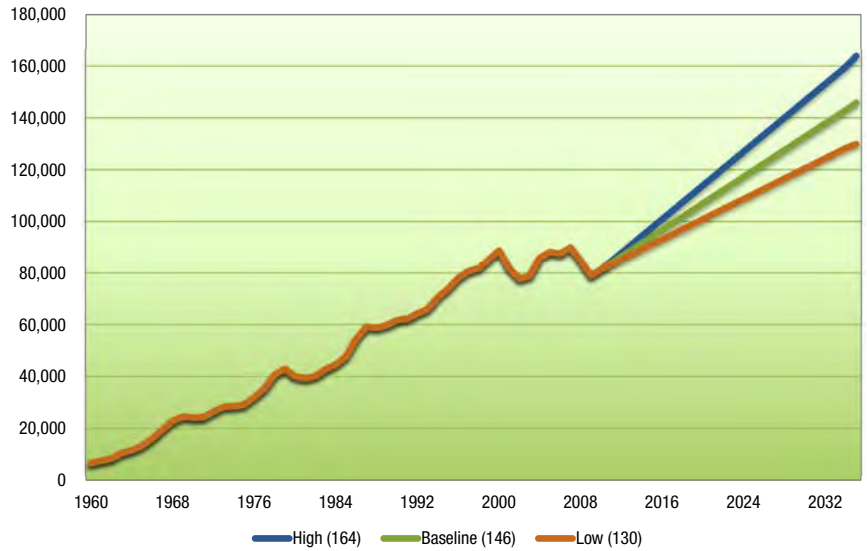
However, Long Beach Airport reached 3.0 MAP in 2010, and will likely exceed its estimated 3.2 MAP constraint in the near future since it still has most of its 25 available commuter slots yet to be filled. The Terminal Improvement EIR forecast for Long Beach Airport was 4.2 MAP, which was also the forecast for Long Beach Airport in the 2008 RTP adopted Preferred Scenario regional aviation forecast. Therefore, the allocation to Long Beach is increased to 4.2 MAP in the Baseline Scenario, and 1 MAP is subtracted from Ontario and San Bernardino airports on a proportional basis (to keep to the 145.9 MAP total). This is reasonable since the increased service at Long Beach will likely draw from the same Los Angeles County and Orange County markets that these airports would also draw from in 2035. Also, previous RADAM modeling showed that Ontario Airport barely reached its 31.6 MAP capacity constraint in the Constrained Scenario, and could easily fall below this number using different modeling assumptions. These adjustments result in a slight re-allocation of the forecast demand for the Baseline Scenario compared to the 2008 RTP Constrained Scenario.

2. LOW GROWTH SCENARIO (130 MAP)

The 130 MAP total assumed for the 2035 Low Growth scenario is not based on any past modeling, and is lower than any regional aviation scenario modeled for previous RTPs, including 2020 forecasts for the 1998 RTP. It was viewed by the ATAC as representing a reasonable low end of the range of possible regional aviation demand futures. The demand allocation for this scenario assumes that the constrained urban airports (LAX, Bob Hope, Long Beach and John Wayne) would still reach their capacity constraints, and allocation of the remaining passenger demand (26.7 MAP) to the other airports would be based on their proportional shares in the Baseline Scenario.

3. HIGH GROWTH SCENARIO (164 MAP)

The 2035 High Growth Scenario represents an extrapolation of the 2030 FAA Terminal Area Forecast (TAF) for air carrier airports in the region (3.0 percent growth rate per annum beyond 2030). The TAF is an unconstrained econometric forecast for established air carrier airports, based on historical trends as reported by the airports themselves. The 2030 TAF for LAX, Long Beach, Burbank and John Wayne airports exceeds their legally-enforceable or physical capacity constraints by significant margins. At 164 MAP, the High Growth Scenario is slightly below the 165.3 MAP forecast of the 2035 Preferred Scenario adopted for the 2008 RTP. Like all the other regional aviation demand scenarios modeled for the 2008 RTP, the Preferred Scenario respected legally-enforceable policy constraints and physical capacity constraints at the urban air carrier airports, as well as estimated capacity constraints at Ontario Airport (runway capacity) and March Inland Port (civilian operations allowed by the joint use agreement with the Air Force). It assumed much more willingness on the part of the airlines to invest in new flights at new and emerging airports than in the Constrained Scenario, and a package of market and ground access incentives. It also assumed an abbreviated version of a proposed intra-regional high-speed rail (maglev) system, running from West Los Angeles to Ontario Airport, and extending west to LAX and east to San Bernardino International. The airport demand allocations for the High Growth Scenario are not based on any modeling that incorporated these assumptions, but are based on an assumption that LAX, Bob Hope, Long Beach, John Wayne, Ontario and March will all reach their capacity constraints by 2035. The residual demand of the 164 MAP forecast (26.6 MAP) was allocated to the remaining airports based on their proportional shares in the Baseline Scenario.



The relative airport allocations between the Baseline/Medium Growth, High Growth and Low Growth scenarios are shown in **TABLE 1** below.

TABLE 1

	Low	Baseline	High
Bob Hope	9.4	9.4	9.4
John Wayne	10.8	10.8	10.8
LAX	78.9	78.9	78.9
Long Beach	4.2	4.2	4.2
March Inland Port	0.4	0.6	2.5
Ontario	19.2	30.7	31.6
Palmdale	1.6	2.6	6.1
Palm Springs	2.3	4.1	9.6
San Bernardino	1.8	2.8	6.7
SoCal Logistics	0.4	0.7	1.6
Imperial	0.6	0.9	2.1
Oxnard	0.1	0.2	0.5
Total	**130**	**146**	**164**

FIGURE 1 below shows the three forecast scenarios in relation to historical air passenger trends in the region since 1960.

FIGURE 1 Historic and Forecast Annual Passengers (Thousands)

ATAC Recommendation

At its September 22, 2011 meeting, the SCAG Aviation Technical Advisory Committee recommended the Baseline/Medium Growth Scenario to serve as the Preferred Regional Air Passenger Demand Forecast for the 2012–2035 RTP. However, it did so only after a spirited debate over the reasonableness and feasibility of the scenario, and only after attaching the following caveats to the recommendation:

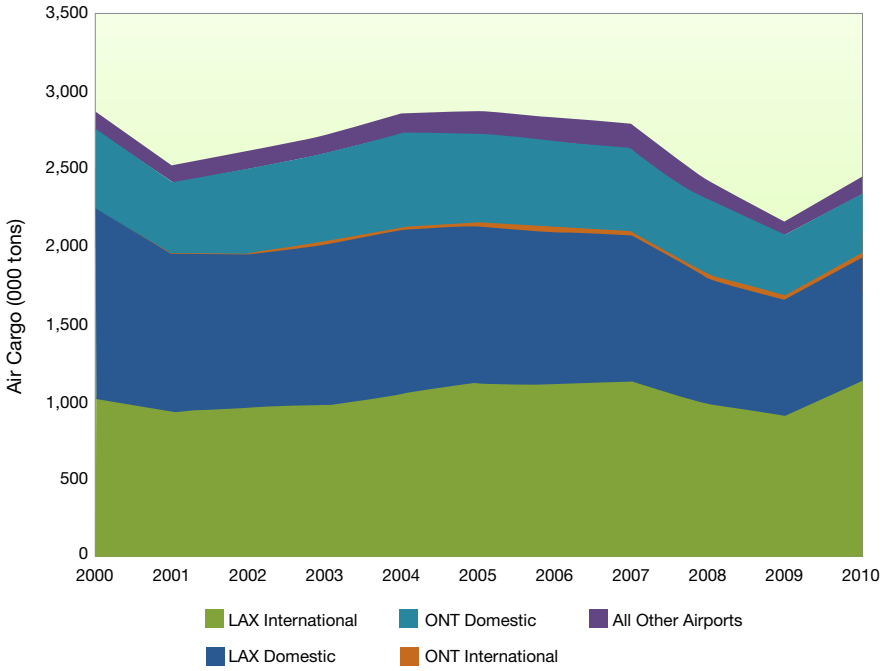
- The Baseline/Medium Growth Forecast seems to be reasonable in that it is consistent with the 2008 RTP Constrained Scenario, which is based on conservative assumptions that are consistent with recent trends. However, the forecast is based on a number of variables that history has shown can change significantly over time, and it is important to update the forecast on an ongoing basis, most importantly for the next (2016) RTP.
- The forecast does not consider the potential impacts of the California High-Speed Rail Project on future regional aviation demand generation and allocation to airports. Future forecast updates should incorporate these potential impacts if and when the project is underway, and has a reasonably achievable implementation schedule.
- The forecast recognizes defined legally-enforceable and physical capacity constraints at the constrained urban airports including LAX, Bob Hope, Long Beach and John Wayne. However, it does not recognize the fact that the settlement agreements at both LAX and John Wayne airports expire in the 2015–2020 time period. Relaxation or elimination of the settlement agreement constraints at these airports could significantly impact forecast allocations of aviation demand at other airports in the regional system. Future updates of the forecast, such as for the 2016 RTP, should incorporate any new information provided by local airport authorities on revised constraints at capacity-constrained airports.

The 2035 Baseline Scenario represents a continuation of repeated downward adjustments of annual growth rates underlying regional aviation demand forecasts prepared by SCAG over the last 14 years, in response to new and unfolding economic and market conditions. Below is a comparison of the 2035 Baseline Scenarios to adopted regional aviation demand forecasts in past SCAG RTPs.

- 1998 RTP—157.4 MAP in 2020
- 2001 RTP—167 MAP in 2025
- 2004 RTP—170 MAP in 2030
- 2008 RTP—165.3 MAP in 2035
- 2012–2035 RTP—145.9 MAP in 2035 (Baseline Scenario)

Regional Air Cargo Demand Forecast Scenarios for 2012–2035 RTP

Background



For every regional transportation plan since the 2001 RTP, SCAG has forecast regional air cargo demand in addition to regional air passenger demand. Similar to the process used to forecast air passenger demand, three alternative 2035 forecast scenarios for air cargo were considered by the SCAG Aviation Technical Advisory Committee (ATAC) for inclusion in the 2012–2035 RTP: baseline/medium growth, low growth and high growth scenarios. This report describes these forecast scenarios, including an allocation of 2035 passenger demand to individual commercial airports for each scenario. The information presented below is taken from a report prepared for SCAG by Aviation System Consulting, which developed a regional air cargo forecast methodology and allocation based on analytical work performed for SCAG by TranSystems. At its September 22, 2011 meeting, ATAC recommended that the Baseline Scenario serve as the Preferred Regional Air Cargo Demand Forecast for the 2012–2035 RTP. At 5.605 million tons in 2035, the new 2035 regional air cargo forecast is substantially lower than the adopted 2008 RTP forecast of 8.28 million tons in 2035, mainly because of a substantial downturn of regional air cargo demand over the last decade.

I. Regional Air Cargo Activity Trends

Prior to the past decade, regional growth in air cargo was extremely robust, more than tripling from 921,800 tons in 1979 to 2.87 million tons in 2000. However, there has been a downward trend since then for various reasons including the events of 9/11/2001, the steep economic recession beginning in 2007, and the increased diversion of domestic air cargo to electronic and ground transport modes. The trend in air cargo activity at the commercial service airports in the SCAG region over the past eleven years is shown in **FIGURE 2**. There are a number of aspects to the recent trend in air cargo in the region that are very apparent from the figure:

1. Overall, air cargo activity has been steadily declining over the past decade. While the declines in the 2001 and 2008/2009 recessions have been a major contributor to this, the general trend has still been downward. Following the drop in the 2001 recession, air cargo activity recovered slowly from 2001 to 2004, reaching a level slightly below that in 2000. It then slowly declined from 2004 to 2007, before dropping again in the 2008/2009 recession. However, the recovery in 2010 was stronger than that following the 2001 recession and it remains to be seen how long this continues.
2. The decline has been entirely confined to domestic air cargo. International air cargo reached a peak in 2007, declined in 2008 and 2009 with the recession, then recovered in 2010 to slightly below the 2007 peak (the difference is not apparent in the figure). It seems likely that international air cargo will continue to grow in the future, although the traffic for the first seven months of 2011 was about 3 percent below the level for the corresponding period in 2010.
3. Almost all international air cargo moves through Los Angeles International Airport (LAX). Ontario International Airport (ONT) handles a very small proportion (about 3 percent in 2010) and the other airports essentially none.
4. LAX and ONT between them handle almost all of the region's air cargo (96 percent in 2010), The share handled by the other airports combined increased slightly from 2004 to 2007, when DHL was operating a hub at March Inland Port, but has since declined to the level experienced in 2000. There is thus no evidence of a shift toward the smaller airports. In fact, the majority of the air cargo handled by the other airports moves through Bob Hope (2.1 percent in 2010), Long Beach (1.6 percent in 2010), and John Wayne (0.6 percent in 2010). The share handled by the remaining airports combined was significantly less than 0.1 percent in 2010.

FIGURE 2 Historical Air Cargo 2000–2010

Trend in Air Cargo Activity at SCAG Region Airports

The air cargo figures for the smaller secondary airports included in the top band in **FIGURE 1** are likely missing a very small amount of international cargo due to the source of the data used for those airports.

Not shown in the above figure is the extent to which the domestic air cargo at LAX and ONT is handled by the integrated carriers. At LAX, FedEx handled 46 percent of the domestic air cargo in 2010, ABX Air (which provides air service for DHL) handled 7 percent, and UPS handled 4 percent, for a 57 percent market share of the integrated carriers. At ONT, UPS handled 60 percent of the domestic air cargo in 2010 (market share data is only for January through October) and FedEx handled 32 percent, for a 92 percent market share by the integrated carriers.

Of the domestic air cargo at LAX not handled by the integrated carriers, the majority (27 percent of all domestic air cargo in 2010) was handled by five scheduled airlines: American, Continental, Delta, United and US Airways. A relatively small amount of the remainder was handled by other scheduled airlines (Alaska, Southwest, etc.).

FedEx and UPS handled a trivial share of the international air cargo at LAX in 2010 (a few tons), but UPS handled all the international air cargo at ONT, although this was fairly small as shown in **FIGURE 1**. It should be noted that the distinction between domestic and international cargo relates to the destination of the flight carrying that cargo, not the final destination of the shipment. For example, if FedEx put an international shipment on a flight from LAX to its hub at Oakland International Airport (say), where it was put on an international flight, that shipment would be counted as domestic cargo at LAX.

Over 82 percent of the international air cargo at LAX is handled by scheduled passenger airlines or their cargo divisions that operate freighter aircraft. Obviously, the cargo carried in the belly of passenger flights is not likely to be diverted to other airports, except to the extent that those airports attract additional international service. As a practical matter, the only airport where this is likely to occur to a significant extent is ONT. The other airports may be able to attract some limited international service, particularly to Mexico or Canada, but these flights are unlikely to attract much air cargo. Similarly, the cargo divisions of passenger airlines will want to serve the same airport as the passenger flights, since they share the same ground handling facilities.

Based on the air cargo activity over the past decade, the airport allocations of air cargo shown in the Preliminary 2012–2035 RTP forecasts prepared earlier in 2011 would appear to require a highly unlikely change from the current distribution pattern. There might be a small shift of international air cargo to ONT if the growth in passenger traffic there results in the addition of some long-haul international flights or if UPS expands its international service out of its ONT hub.

The bottom line is that unless FedEx or UPS decides to relocate one of their hubs, which appears quite unlikely, the only potential air cargo traffic that might be attracted to the smaller airports is that handled by the all-cargo and charter airlines. This was less than 18 percent of the international air cargo and less than 14 percent of the domestic air cargo at LAX in 2010. Obviously, not all of this is likely to be diverted to other airports.

II. TranSystems 2035 Forecast of Total Regional Air Cargo

Analysis of air cargo forecasts performed by TranSystems for the 2012–2035 RTP update suggests that the growth rates implied by the regional air cargo forecasts in the 2008 RTP are too high in light of recent trends in the industry. The 2035 forecast of regional totals for international and domestic air cargo recommended by TranSystems are shown in **TABLE 1**.

TABLE 1 Forecast Total Regional Air Cargo – 2035

	Forecast Scenario		
	Low	Baseline	High
International (000 metric tons)	1,695.40	2,302.90	2,751.20
Domestic (000 metric tons)	2,047.60	2,781.40	3,322.80
	3,743.00	**5,084.30**	**6,074.00**
International (000 tons)	1,869.10	2,538.90	3,033.20
Domestic (000 tons)	2,257.50	3,066.50	3,663.40
	4,126.60	**5,605.40**	**6,696.60**

III. Allocation of Regional Air Cargo to Airports

Air cargo handled by charter and all-cargo airlines accounted for a little over 17 percent of international cargo and about 13 percent of domestic cargo. While in principle this component of the traffic is "footloose" in the sense that it could use other airports, in practice the ability of this traffic to use other airports is limited by the presence of cargo connecting between domestic and international flights. An analysis of the tonnage of LAX air cargo handled by type of carrier in 2010 gave the following breakdown:

TABLE 2 LAX Air Cargo by Type of Carrier – 2010

	International Freight & Mail	Domestic Freight & Mail
Passenger Airlines	70.70%	29.80%
Cargo Divisions	11.90%	0.00%
Charter Airlines	0.40%	1.60%
Integrated Carriers	0.00%	57.10%
All-Cargo Airlines	17.00%	11.50%

Even if only some of the cargo on a domestic flight by an all-cargo or charter airline is connecting to or from an international flight, if the flight uses another airport that cargo would have to be trucked to or from LAX. Similarly, some of the international cargo on all-cargo or charter flights is connecting to or from domestic flights, and therefore those flights are likely to be primarily at LAX. Although all-cargo and charter airlines are cost-sensitive, any cost advantage of using a different airport would have to be offset against the cost of trucking the international cargo between the airports. Another constraint on the choice of airport by all-cargo and charter airlines is the location of freight forwarders, which tend to be concentrated in the vicinity of LAX for obvious reasons. In the case of international cargo moving on all-cargo or charter flights, there is also the constraint of needing to clear customs.

In the case of international air cargo on all-cargo or charter flights, a further consideration is that some of this cargo may be moved by truck or rail to or from locations outside the Southern California region. From cargo moving by truck or rail into or out of the region, secondary airports outside the urban core may have some advantages as a transshipment location.

Without more detailed analysis that is beyond the scope of the analysis undertaken for the 2012-2035 RTP/SCS update, it is unclear how much of the cargo on all-cargo or charter airlines that used LAX in 2010 could potentially be diverted to other airports, but the amount is likely to be fairly small for the foregoing reasons. It is also unclear to what extent the split of air cargo by type of carrier at LAX might change in the future. If air cargo grows faster than passenger traffic, the passenger airlines may not have sufficient belly cargo capacity, leading to an increased use of all-cargo and/or charter airlines.

On the other hand, the introduction of larger wide-body aircraft, such as the Airbus A-380, will increase the belly cargo capacity of passenger flights. It is also possible that the integrated carriers will expand their market share of international freight.

In the absence of any clear basis for assuming a change in the relative market share of different types of carrier, it is assumed that the market shares shown in **TABLE 2** remain in effect in 2035. It is also assumed that only 25 percent of the domestic cargo handled by all-cargo or charter airlines is potentially divertible to other airports and that in practice only half of the potentially divertible cargo is actually diverted. The basis for the assumption of 25 percent is that half the domestic cargo is assumed to be connecting to or from international flights and that half of the cargo that is not connecting to or from international flights is moving on flights that include connecting cargo. Because of the potential transshipment advantages of secondary airports outside the urban core for international air cargo, it is assumed that the proportion of international cargo handled by all-cargo or charter flights that is potentially divertible to other airports is somewhat higher than for domestic cargo and that 30 percent of this cargo is potentially divertible, with only half of this actually diverted.

Of the cargo traffic that is diverted to the smaller secondary airports outside the urban core, those closer to the urban core will have some advantages for cargo that has a shipment origin or destination within the urban area. San Bernardino International Airport (SBD) and March Inland Port (MIP) are sufficiently close to each other that neither appears likely to have a significant locational advantage over the other. However, Ontario International Airport is even closer to the urban core than either SBD or MIP and will have the further advantage for international cargo of a much larger number of domestic passenger flights for cargo connecting to domestic flights. Therefore the market shares shown in **TABLE 3** have been assumed for the cargo diverted from LAX:

Since the other airports in the region would already have attracted any air cargo that might be diverted from LAX, it is assumed that they would not attract any additional cargo from LAX. All three airports (Bob Hope, John Wayne, and Long Beach) have significant night noise constraints or curfews that would make them unattractive to air cargo operators. Palm Springs International Airport is too far from the urban area to attract any significant amount of cargo that might be diverted from LAX.

TABLE 3 Market Shares of Air Cargo Diverted from LAX – 2035

	International Cargo	Domestic Cargo
Ontario International	45%	35%
San Bernardino International	20%	25%
March Inland Port	20%	25%
Southern California Logistics	10%	10%
Palmdale Regional	5%	5%

IV. Revised 2035 Air Cargo Forecasts

Based on the revised projections of the total level of regional air cargo traffic and the assumed diversion of air cargo from LAX to ONT and the smaller secondary airports, the forecast level of air cargo activity at each airport has been revised as shown in **TABLE 4**.

TABLE 4 Revised Air Cargo Forecasts by Airport – 2035

(000 tons)	Scenario		
	Low Growth	Baseline	High Growth
Bob Hope	80	108	130
John Wayne	34	46	55

Regional General Aviation Forecast

Introduction

This report documents the results of the first phase of a two-phase study for the Southern California Association of Governments (SCAG) to prepare a regional general aviation demand forecast for the six-county Southern California region. The report reviews recent trends in the size and composition of the Southern California pilot community, the numbers of general aviation aircraft based in the region, and the numbers of general aviation and other aircraft operations at airports in the region, as well as prior studies that have examined changes in the size and composition of the pilot community and general aviation aircraft fleet. The report also reviews prior studies that have addressed techniques for forecasting future general aviation activity and presents the forecasting approach that has been used in the current study, as well as recent forecasts of general aviation activity by the Federal Aviation Administration. This is followed by a discussion of the analysis of likely future changes in the size and composition of the Southern California pilot community and the implications for future levels of general aviation activity, as well as changes in the general aviation fleet based at airports in the region. The report then describes the development of a set of alternative regional general aviation demand forecasts that take these factors into consideration and provide a range of potential future changes in the size of the Southern California pilot community, based aircraft fleet, and resulting levels of general aviation activity. Finally the report summarizes the conclusions from the current phase of the project and discusses the work to be undertaken in the remainder of the study.

THE SOUTHERN CALIFORNIA AIRPORT SYSTEM

The airport system serving the six counties of the Southern California region currently comprises 44 public use general aviation airports, nine air carrier airports, one of which is a joint use military airfield, and two airports that currently serve or recently served regional airline flights, often referred to as commuter airports, all of which accommodate general aviation operations. In addition there is one military airfield, Palmdale Regional Airport/U.S. Air Force Plant 42 that formerly allowed joint-use civilian operations and currently allows general aviation operations with prior permission, and a number of smaller private-use airports. Several of the smaller public-use airports are privately owned. One of these airports, Roy Williams Airport in the town of Joshua Tree, recently closed and is currently for sale. Another airport, Rialto Municipal Airport, is planned to be closed at some point in the future but is currently open. The 54 airports currently open for public-use general aviation activity represent the largest general aviation airport system of any metropolitan region in the United States (and in fact the world), both in terms of airports and the number of general aviation aircraft operations.

The locations of the airports that comprise the Southern California public-use airport system are shown in **FIGURE 1.1**, with the definition of the airport identifier codes for each airport assigned by the Federal Aviation Administration shown in the map given in **TABLE 1.1**. The airports are classified into four categories on the map based on the size of the largest aircraft that they can typically accommodate. Of the nine air carrier airports and Palmdale Regional Airport, all of which have runway facilities that can accommodate large commercial aircraft, six currently have scheduled airline service:

- Bob Hope Airport, Burbank (BUR)
- John Wayne Orange County Airport (SNA)
- Long Beach Airport (LGB)
- Los Angeles International Airport (LAX)
- Ontario International Airport (ONT)
- Palm Spring International Airport (PSP)

Of the other three airports capable of handling air carrier activity, San Bernardino International Airport (SBD), and Southern California Logistics Airport (VCV) currently handle a small amount of nonscheduled air cargo flights, as well as some general aviation activity. March Inland Port operates under a joint use agreement with March Air Reserve Base (RIV) and currently has no based general aviation aircraft apart from aircraft belonging to the March Field Aero Club and aircraft kept at the March Field Air Museum, located on the airfield. Other general aviation use of the airfield requires prior permission. The integrated air express operator DHL formerly maintained a sorting hub at the airport and generated a moderate volume of air cargo aircraft operations.

Of the two commuter airports, Imperial County Airport currently has regional airline service by United Express between the airport and LAX. Oxnard Airport also had service to LAX by United Express until June of 2010, when the service was discontinued. The airport currently only serves general aviation activity although the County of Ventura, which owns the airport, is hoping to attract regional airline service in the future.

EXHIBIT 1 Regional Airport System

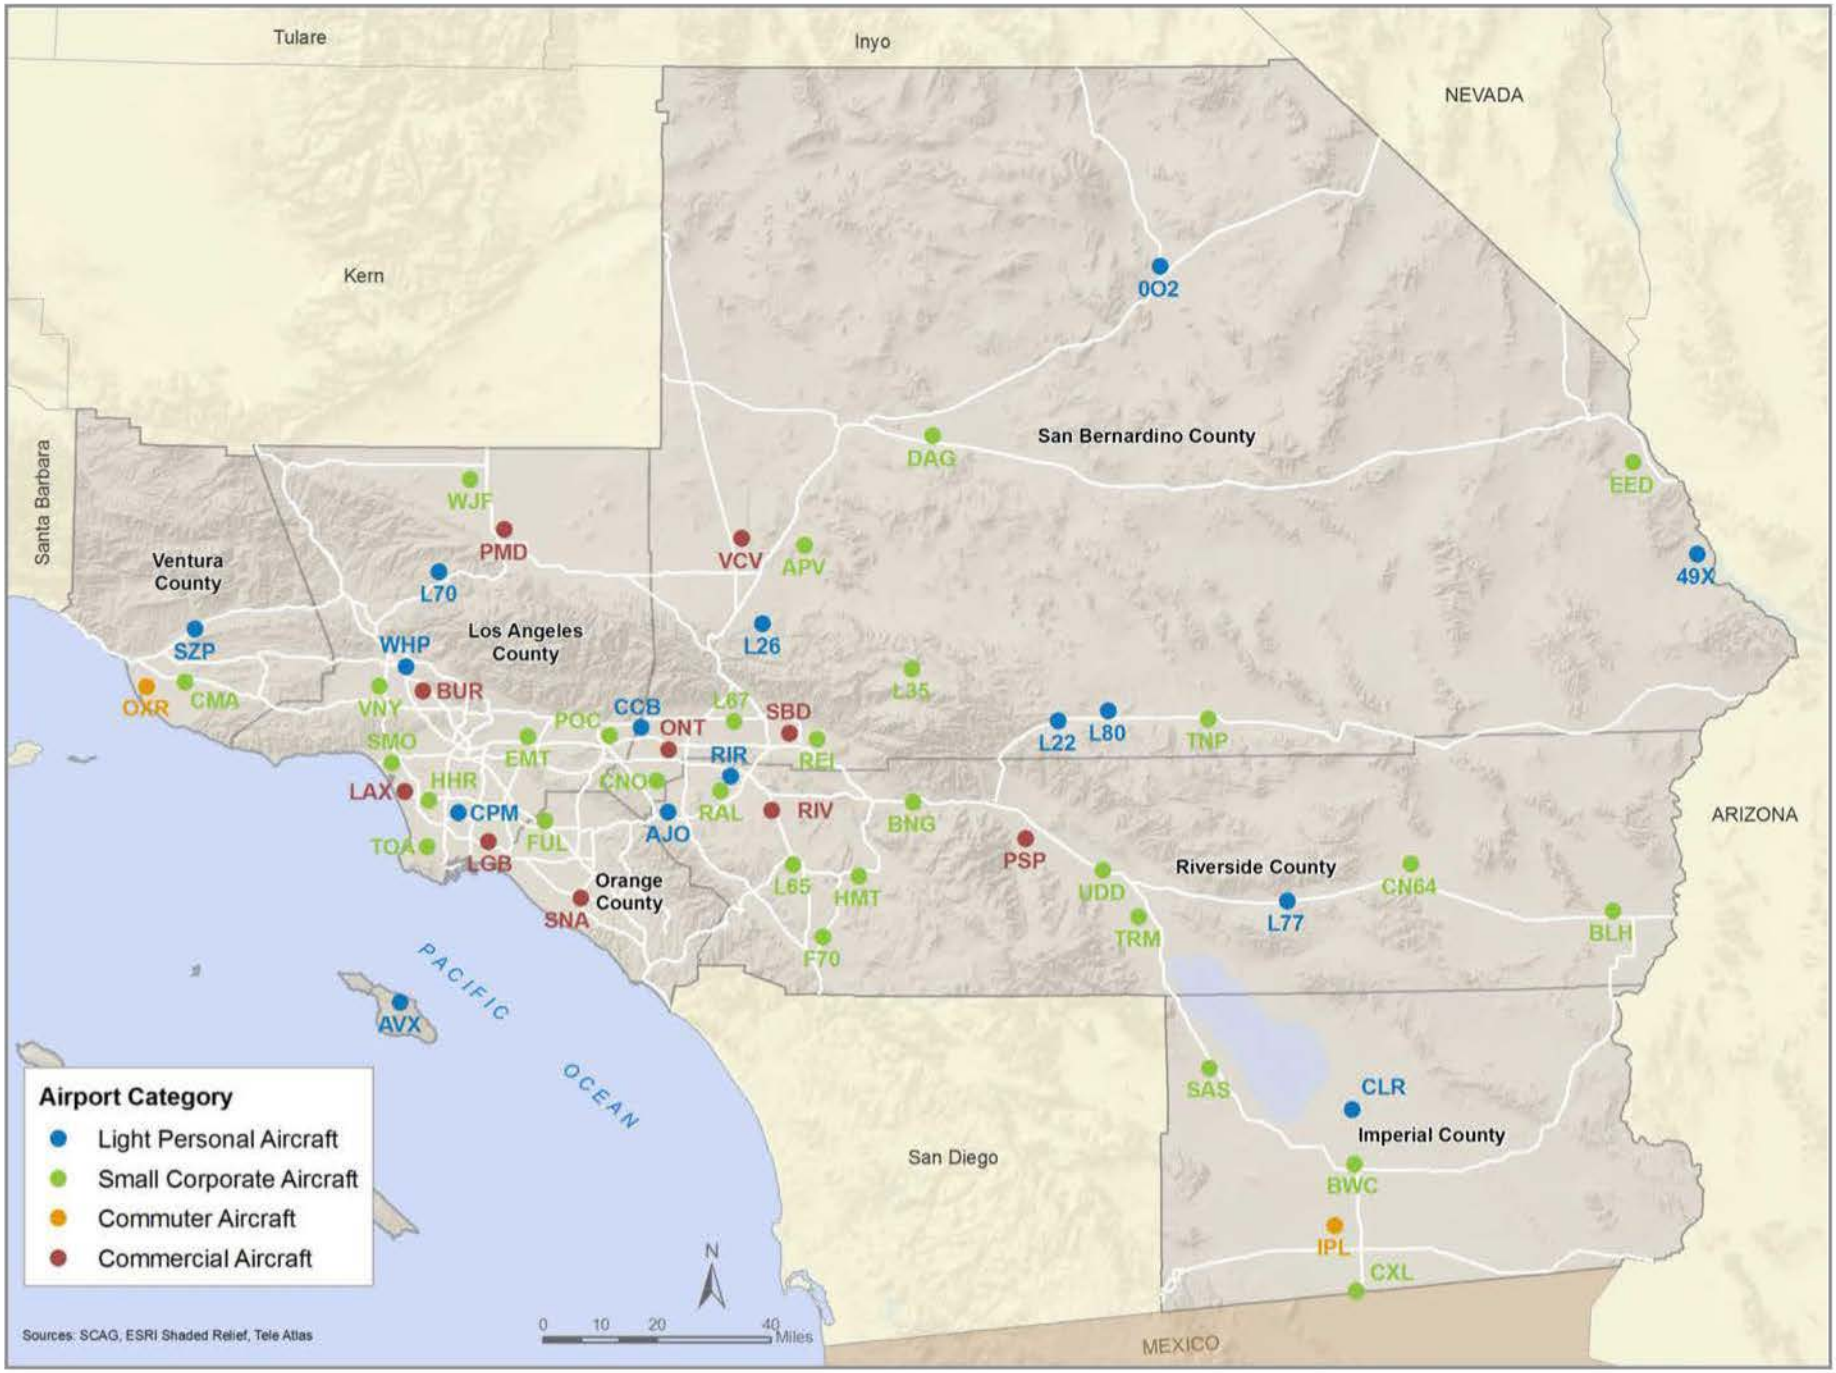

TABLE 1.1 Airport Identifier Codes

Identifier	Airport
002	Baker Airport
49X	Chemehuevi Valley Airport
AJO	Corona Municipal Airport
APV	Apple Valley Airport
AVX	Catalina Airport
BLH	Blythe Airport
BNG	Banning Municipal Airport
BUR	Bob Hope Airport, Burbank
BWC	Brawley Municipal Airport
CCB	Cable Airport
CLR	Cliff Hatfield Memorial Airport, Calipatria
CLX	Calexico International Airport
CMA	Camarillo Airport
CN64	Desert Center Airport, Palm Desert
CNO	Chino Airport
CPM	Compton/Woodley Airport
DAG	Barstow-Daggett Airport
EED	Needles Airport
EMT	El Monte Airport
F70	French Valley Airport
FUL	Fullerton Municipal Airport
HHR	Hawthorne Municipal Airport
HMT	Hemet-Ryan Airport
IPL	Imperial County Airport
L22	Yucca Valley Airport
L26	Hesperia Airport
L35	Big Bear City Airport
L65	Perris Valley Airport
L67	Rialto Municipal Airport
L70	Agua Dulce Airpark
L77	Chiriaco Summit Airport
L80	Roy Williams Airport, Joshua Tree
LAX	Los Angeles International Airport
LGB	Long Beach Airport
ONT	Ontario International Airport
OXR	Oxnard Airport
POC	Brackett Field, La Verne
PMD	Palmdale Regional Airport
PSP	Palm Springs International Airport
RAL	Riverside Municipal Airport
REI	Redlands Municipal Airport
RIR	FlaBob Airport, Riverside
RIV	March Air Reserve Base (March Inland Port)
SAS	Salton Sea Airport
SBD	Sam Bernardino International Airport
SMO	Santa Monica Airport
SNA	John Wayne Orange County Airport
SZP	Santa Paula Airport
TNP	Twenty Nine Palms Airport
TOA	Zamperini Field, Torrance
TRM	Jacqueline Cochran Regional Airport, Thermal
UDD	Bermuda Dunes Airport
VCV	Southern California Logistics Airport, Victorville
VNY	Van Nuys Airport
WHP	Whiteman Airport, Pacoima
WJF	General William J. Fox Airfield, Lancaster

COMPOSITION OF GENERAL AVIATION ACTIVITY

General aviation (GA) flight activity comprises a wide range of different types of flying including:

- Flight training
- Personal and recreational flying
- Business and corporate flying
- On-demand charter flying
- Aerial work, including observation, firefighting, agricultural spraying and other purposes

Historically, flight training has accounted for a large proportion of the aircraft operations at smaller airports due to the large number of takeoffs and landings involved in learning to fly. However, with the recent decline in the number of active student pilots, this segment of general aviation activity has become a smaller proportion of overall activity. At the same time, the introduction of new business models for corporate and business aviation, including fractional ownership and purchase of blocks of flight time from on-demand air charter operators such as Netjets, as well as the availability of smaller, less expensive jet aircraft, has resulted in business and corporate flying becoming a growing share of general aviation activity.

For the purposes of the regional general aviation demand forecast, the general aviation sector is considered to also include on-demand flight activity operated under Federal Aviation Regulations (FAR) Part 135, commonly referred to as air taxi operations, since these operations also use general aviation airports and for many purposes are often virtually indistinguishable from true general aviation operations, operating under FAR Part 91. The difference between the two types of operations is whether the operations are being performed "for hire." Thus if a corporation owns its own aircraft and employs the pilots, the aircraft would operate under Part 91, whereas if it charters an aircraft from an air taxi charter company, the aircraft would operate under Part 135. The introduction of fractional ownership has complicated this situation, but for statistical purposes the Federal Aviation Administration (FAA) counts such operations as part of general aviation. Unless indicated otherwise, the term "general aviation" in this working paper includes Part 135 operations.

Data on the range of activities that fall within the general aviation sector is available from the most recent FAA General Aviation and Part 135 Activity Survey, which covers operations in the United States in 2009, as shown in **TABLE 1.2**. This survey classifies GA and Part 135 activity into 14 different purposes, which clearly show the wide range of activities covered by the GA sector

TABLE 1.2 General Aviation and Part 135 Activity – United States 2009

	Primary Use	Actual Use		
Category of Aircraft Use	Active Aircraft	Hours Flown 000	Percent	Avg Hours Flown (see note)
General Aviation				
Personal	152,272	8,540	35.90%	56.1
Business	22,445	2,532	10.70%	112.8
Corporate	10,498	2,444	10.30%	232.8
Instructional	14,130	3,440	14.50%	243.4
Aerial application	3,161	960	4.00%	303.9
Aerial observation	5,288	1,211	5.10%	229.0
Aerial other	849	162	0.70%	190.7
External load	157	88	0.40%	562.3
Other work	1,177	222	0.90%	188.5
Sightseeing	849	119	0.50%	139.8
Air medical	486	174	0.70%	358.0
Other	4,005	970	4.10%	242.3
Total GA	**215,317**	**20,862**	**87.80%**	**96.9**
On Demand FAR Part 135				
Air taxi	6,992	2,198	9.20%	314.3
Air tours	367	223	0.90%	608.2
Air medical	1,200	480	2.00%	399.6
Total Part 135	**8,559**	**2,901**	**12.20%**	**338.9**
Total GA & Part 135	**223,876**	**23,763**	**100.00%**	**106.1**

The largest single type of activity is personal flying, which accounts for about 36 percent of all flight hours, followed by instructional activities, which account for about 15 percent of all flight hours. Operations under Part 135 account for about 12 percent of all flight hours, of which the largest proportion is air taxi operations, with air medical flights under Part 135 accounting for about 2 percent of all flight hours. Business and corporate flying under Part 91 together account for about 21 percent of all flight hours, divided approximately equally between the two purposes, which the FAA defines as follows:

- Business Transportation: Individual or group use for, or in the furtherance of, a business without a paid flight crew
- Corporate/Executive Transportation: Individual or group business transportation with a paid flight crew (includes fractional ownership)

TABLE 1.2 also shows the average number of hours flown per year by aircraft used for the different purposes. Because a given aircraft may be used for multiple purposes, this average may be somewhat misleading and is not strictly the average flight hours for aircraft primarily used for each purpose, but assumes that the flight hours for each purpose are all flown by the aircraft for which that purpose is the primary use. However, to the extent that many aircraft are in fact used mainly for a single purpose, this gives an indication of the differences in average use across the different purposes. Aircraft primarily used for personal flying have the lowest average utilization of 56 flight hours per year, while aircraft used primarily for air tours have the highest average utilization of about 608 flight hours per year, although this may be somewhat overstated since there are relatively few aircraft used primarily for air tours and many of the actual flight hours reported for air tours are likely performed by aircraft used primarily for other purposes. In general, aircraft used primarily for Part 135 operations are utilized for about 339 flight hours per year on average.

Aircraft used primarily for instructional flying have an average utilization of about 243 flight hours per year, while those used primarily for corporate transportation have an average utilization of about 233 flight hours per year. It may be worth noting that these utilization rates are considerably less than one hour per day. Clearly there is a wide range of utilization rates across the fleet, since many aircraft in these categories are far more heavily used than this. Aircraft primarily used for business transportation have an average utilization of only 113 flight hours per year although this may be somewhat understated since this category involves flying without a paid crew. In most cases this means flight operations by the owner of the aircraft, who most likely also uses the aircraft for personal flying. Thus the average utilization of aircraft used primarily for personal flying is probably overstated, since some of the actual flight hours for personal flying are performed in aircraft used primarily for business flying. Of course, the reverse is also true, with some business flying being performed in aircraft used primarily for personal flying. Whether these effects cancel each other out is unclear.

In any case, an average utilization of only 56 flight hours per year represents about one flight hour per week. As with business flying, there is clearly a wide range of utilization rates across the fleet, with some aircraft being used very infrequently.

While these are national average utilization rates, it is likely that the pattern of aircraft utilization in the Southern California region is not significantly different. As part of the second phase of this study, an effort will be undertaken to obtain more specific data from the FAA covering aircraft in the Southern California region to see how their utilization may differ from that for the United States in total.

RECENT TRENDS IN THE SOUTHERN CALIFORNIA PILOT COMMUNITY

In addition to the composition and utilization of the general aviation aircraft fleet, the other major factor that needs to be considered in developing forecasts of future aviation activity is the size and composition of the pilot community. **TABLE 1.3** shows the recent trend in the number of active pilots in the six-county SCAG region by type of pilot certificate, from airmen registration data obtained from the FAA. The distinctions between the various types of pilot certificate are discussed further below, but the names of the different types of certificate are generally self-explanatory.

Active pilots are defined as airmen holding a pilot certificate and a valid medical certificate where required (student pilots only require a medical certificate for solo flight, glider and balloon pilots do not require a medical certificate, and sport pilots do not require a medical certificate if they hold a valid driver's license). It can be seen from **TABLE 1.3** that there has been a slow decline in the total number of active pilots in the region over the past nine years, although an apparent increase in the number of student pilots, particularly since 2006 (however this appears to be an artifact of changes to the validity of student pilot medical certificates in July 2008) . The implications of this for the future pilot community in the region are discussed further below.

TABLE 1.3 Recent Trend in the Southern California Pilot Community

	Active Pilots as of December 31		
Type of Pilot Certificate	2001	2006	2010
Student pilot	3,642	4,106	5,093
Private pilot	11,272	11,050	9,970
Commercial pilot	4,906	5,254	5,119
Airline transport pilot	4,926	4,604	4,439
Recreational or sport pilot	1	12	70
Rotorcraft or glider	1,263		
Total	**26,010**	**25,026**	**24,691**

Source: FAA, Active Airmen Certificate Totals by Region, State, County, Airmen Certification Branch, Oklahoma City, OK, Personal communication.

Notes 1: Active airmen holding rotorcraft or glider certificates only were counted separately in 2001, but included in the other categories for 2006 and 2010.
Notes 2: The validity of student pilot certificates for pilots under 40 years of age was changed from 36 months to 60 months effective July 24, 2008.

The distribution of the active pilots among the six counties in the region is shown in **TABLE 1.4**.

TABLE 1.4 Recent Trend in the Southern California Pilot Community by County

	Active Pilots as of December 31		
County	2001	2006	2010
Imperial County	258	197	183
Los Angeles County	11,584	10,842	10,878
Orange County	5,981	5,495	5,303
Riverside County	3,011	3,458	3,447
San Bernardino County	2,788	2,744	2,632
Ventura County	2,388	2,290	2,248
Total	**26,010**	**25,026**	**24,691**

Source: FAA, Active Airmen Certificate Totals by Region, State, County, Airmen Certification Branch, Oklahoma City, OK, Personal communication.

It can be seen that Los Angeles County accounts for a little less than half the active pilots in the region (44 percent in 2010), with Orange County having the second highest proportion (22 percent in 2010). Riverside County has the third highest proportion (14 percent in 2010), followed by San Bernardino County (11 percent in 2010) and Ventura County (9 percent in 2010). The number of active pilots has declined from 2001 to 2010 in all counties except Riverside County, where it increased from 2001 to 2006, but declined slightly from 2006 to 2010. Los Angeles County showed a slight increase in active pilots from 2006 to 2010.

KEY ISSUES AND CONCERNS

The future level of general aviation activity in the Southern California region will depend on a large number of factors that cannot be known with any certainty, and the further into the future the activity is being forecast the less certain these factors are likely to become. The more critical factors include:

- The price and availability of aviation fuel, particularly how much longer leaded aviation gasoline (avgas) will be available.
- Future trends in the percentage of the population that decide to learn to fly, the proportion of student pilots that complete their flight training and obtain a private pilot certificate, how long they remain an active pilot, and how much flying they do while they are still active.
- The future demand for professional pilots, particularly airline pilots, since this has a major influence on how many people decide to pursue flying as a career.
- The long-term prospects for economic growth in the light of rising Federal and State deficits, a major trade imbalance, rising energy costs and the eventual need to address global warming, an aging population, and increasing costs of health care, since this affects corporate profits and individual disposable income, both of which will influence aircraft ownership and use, as well as how many people can afford to learn to fly or remain active.
- Persistent concerns and opposition by some surrounding communities to GA activities at local airports. These concerns arise primarily from aircraft noise, particularly from jet aircraft, a perceived health risk from aircraft emissions and aviation fuel, and the risk of accidents from aircraft over-flights. Some local municipalities have placed or attempted to place restrictions on flight operations and have also requested risk assessment studies to determine ways to address these issues. The

future demand for general aviation activity in the region and particularly how it is distributed among the airports in the region could be influenced by these concerns, to the extent that they affect the type and level of operations that can occur at various airports, or result in airports being closed.

- The airspace utilization in Southern California is also a consideration in the light of the conflict that sometimes exists between commercial and GA operations in parts of the SCAG region. The introduction of the FAA's Next Generation air traffic control system may also have an impact on how air traffic operates at many GA airports. The extent to which these factors could influence future general aviation demand in the region will require discussion with the FAA and SCAG staff to identify the constraints and opportunities for greater flexibility in the new air traffic control system.

While some insight into these issues may be obtained from an analysis of recent trends in general aviation activity, it is far from clear whether general aviation activity will recover from its recent decline as the economy continues to recover and if so, at what rate. Although it is likely that business and corporate flying will resume their growth as the economy recovers, changing recreational preferences and shifts in the distribution of household incomes could limit the number of people who decide to take up flying. This effect may be compounded by public concerns about global warming and the perception that general aviation flying consumes a large amount of fuel in relation to the distance flown. This may translate into a reduced number of people deciding to take up flying, as well as political pressure to limit the amount of general aviation flying or require general aviation users to purchase carbon offsets.

FORECAST METHODOLOGY

The methodology to be used in preparing the Regional General Aviation Demand Forecast for the Southern California region is based on the recognition that the general aviation sector comprises a range of different activities that are each influenced by different factors. Therefore, the development of the forecasts was based on a detailed analysis of the way in which these factors determine the growth (or decline) of each type of activity, as well as the interrelationships between them.

LITERATURE REVIEW ON FORECASTING GENERAL AVIATION ACTIVITY

In spite of the large number of general aviation airports in the United States and the recurring need to prepare forecasts of future general aviation activity as part of studies to update airport master plans, prepare statewide and regional airport system plans, and for other purposes, development of improved techniques for forecasting general aviation activity have received surprisingly little attention in the airport planning literature. None the less, a review of relevant recent literature was undertaken to identify prior studies addressing changes in the composition and activity levels of the pilot community and dynamics of the general aviation fleet, as well as forecasting approaches for general aviation activity more generally.

One of the earliest reviews of forecasting methodology for general aviation was undertaken by Gosling & Cao (1994) as part of a larger study of aviation forecasting techniques performed for the California Department of Transportation. A more recent report prepared for the FAA Office of Aviation Policy and Plans (GRA, 2001a) presented a summary of different methods for forecasting aviation activity by airport, including general aviation activity. However, the descriptions of the techniques are very general and some of the techniques are fairly simplistic (although widely used). The report mentions cohort analysis, although the term is used in a different sense from that used in the forecast approach used in the curent study, and a better term would have been market segmentation analysis. The following year a Transportation Research E-Circular (TRB, 2002) presented a survey of aviation demand forecasting methodologies, including those for general aviation. This included a description of a model for estimating general aviation operations at non-towered airports, discussed further below, and forecasting techniques for business jet and rotorcraft deliveries and fleet size. Although these techniques involve assessments of the demand for business jet or rotorcraft flying, the approaches to these assessments are only described in very broad terms due to the proprietary nature of the analysis. The description of one approach mentioned that a given year's production of business jets is generally fully retired from the aircraft fleet in about 40 years, with about 50 percent of the year's production retired from the fleet in about 33 years.

A subsequent synthesis report prepared for the Airport Cooperative Research Program (Spitz & Golaszewski, 2007) updated the information in the earlier report for the FAA

Office of Aviation Policy and Plans, although the description of airport activity forecasting methods is no more detailed and does not explicitly address general aviation activity apart from a reference to the earlier study that developed a model for estimating general aviation operations at non-towered airports.

General Industry Trends

The FAA and various industry organizations supporting general aviation produce annual statistical reports that examine changes in the general aviation sector over time. The FAA produces an annual summary of U.S. civil airmen statistics and an annual activity survey of general aviation and Part 135 (on-demand commercial operations) aircraft, as well as forecasts of future levels of pilot population and general aviation activity, which include time series data for past years. These FAA data are discussed in more detail in the section on Data Requirements and Sources below.

Summaries of industry trends are published by the Aircraft Owners and Pilots Association (AOPA, 2011), the General Aviation Manufacturers Association (GAMA, 2011), and the National Business Aviation Association (NBAA, 2011). While much of the data presented in these statistical reports is derived from FAA sources, it is typically presented in a more user-friendly format and combines the information from multiple sources into a single document. The GAMA General Aviation Statistical Databook & Industry Outlook provides data on general aviation shipments that is not available from other sources, while the NBAA Business Aviation Fact Book presents information on uses of business aircraft that is derived from surveys performed by the NBAA.

Pilot Population and Aircraft Fleet Composition

A number of studies have examined changes in the characteristics of the pilot population over time, although these have most commonly addressed the influence of pilot characteristics on accident risk (e.g. Li, Baker, et al., 2003; Rebok, Qiang, et al., 2009). A study in the early 1970s (Booze, 1972) examined pilot attrition by age and a more recent study (Rogers, Véronneau, et al., 2009) examined changes in the pilot population over time from 1983 to 2005 in order to examine the effect of changes in the regulations that raised the age limit for pilots to perform the duties of pilot or co-pilot of a commercial passenger or cargo aircraft with ten or more passenger seats or 7,500 payload-pounds of cargo capacity from age 60 to 65. The latter study showed that the average age of pilots has been steadily increasing, and with it the average number of flight hours experience.

A study in the mid-1970s (Rocks, 1976) examined the pattern of attrition of the general aviation aircraft fleet, but this issue does not appear to have been subject to more recent study, apart from analysis undertaken for the 1994 San Francisco Bay Area Regional Airport System Plan (MTC, 1994), discussed further below.

General Aviation Forecasting Studies

A study performed for the FAA and published in 2001 developed a model for estimating general aviation operations at non-towered airports (i.e. those without a control tower) (GRA, 2001b). However, because the model is based on data from a combination of towered and non-towered airports, it is equally applicable to smaller towered GA airports. The study assessed a number of alternative model formulations, but found that the best fit to the observed data was given by the following relationship:

OPS = -571 + 355 x BA - 0.46 BA2 - 40,510 x percentin100mi + 3,795 x VITFSnum

+ 0.001 x Pop100 - 8,587 x WACAORAK + 24,102 x Pop25/100

+ 13,674 x TOWDUM

where OPS = Annual general aviation operations

BA = Based aircraft

percentin100mi = Airport's percentage of all based aircraft within 100 miles

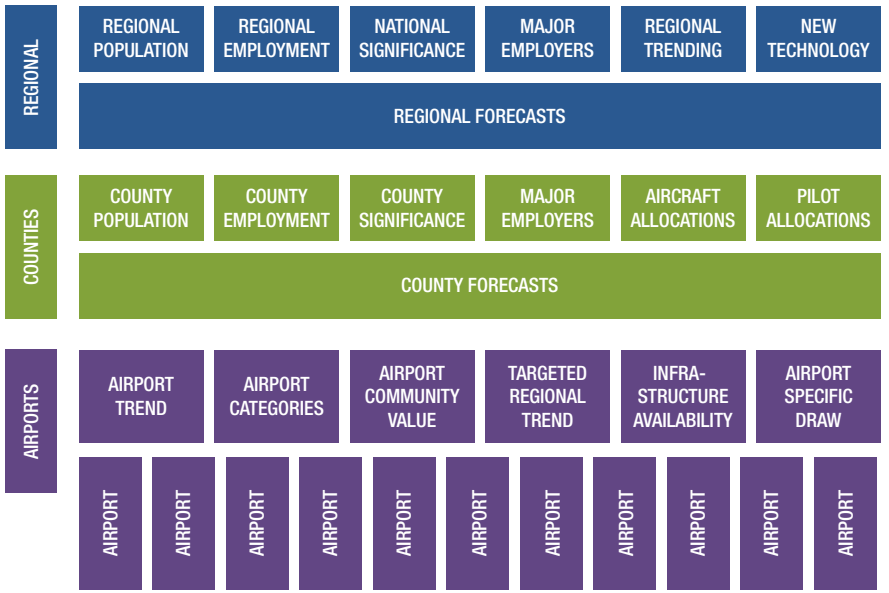
VITFSnum = Number of Part 141 certificated flight schools at airport

Pop100 = Population within 100 miles of airport

WACAORAK = Airport in CA, OR, WA, AK (1 = yes, 0 = no)

Pop25/100 = Ratio of population within 25 miles of airport to population within 100 miles

TOWDUM = Control tower at airport (1 = yes, 0 = no)



The estimated model coefficients show that a towered airport would have more GA operations that a non-towered airport, other things being equal, as expected (although the causality may flow the other way, in that busier airports are more likely to have towers than less busy airports). Since the number of based aircraft is included in the model, the population in the surrounding area presumably accounts primarily for operations by visiting aircraft. Even so, there is likely to be a high degree of correlation between population of the surrounding area and the number of based aircraft. The model does not explicitly distinguish between local and itinerant operations, although the number of flight schools at the airport will clearly influence the number of local operations.

As part of a study for the National Aeronautics and Space Administration to explore the potential demand for a conceptual Small Aircraft Transportation System (SATS) based on advanced technology general aviation aircraft, researchers at Virginia Tech university developed a sophisticated modeling system termed the Transportation Systems Analysis Model (TSAM) (Trani, Baik, et al., 2003; Baik, Ashiabor & Trani, 2006; Ashiabor, Baik & Trani, 2007; Baik, Trani, et al., 2008). This modeling system predicts passenger flows between counties in the U.S. and then performs a mode choice analysis that assigns the passenger flows to commercial airlines, air taxi, or automobile travel. Because the modeling system does not distinguish between true air taxi and general aviation more broadly, the model can be considered as predicting passenger flows by general aviation. Indeed the authors refer to this mode as general aviation in some of their papers. The modeling system includes an airport choice model that assigns the GA passenger trips to airports and estimates the resulting number of aircraft operations, divided into single-engine propeller, multi-engine propeller and turbojet aircraft.

About the same time, Rohacs (2006) was formulating a modeling framework to analyze the potential for advanced small aircraft flights in Europe. However, the model appears designed to predict system level values, rather than airport- or region-specific activity, and details of the implementation of the model are rather vague.

As part of preparing a Regional General Aviation and Heliport System Plan, the North Central Texas Council of Governments (the metropolitan planning organization for the Dallas/Fort Worth region) is in the process of developing a regional demand forecasting process that is broadly similar in scope to the planned approach for the current study. The proposed analysis approach for the NCTCOG study is documented in a white paper (NCTCOG, 2009) that describes three levels of analysis: regional demand, allocation of regional demand to counties, and allocation of county demand to airports, as illustrated in **FIGURE 2.1**. However, the details of how this analysis approach will be implemented do not appear to have been fully worked out yet.

FIGURE 2.1 Proposed Forecasting Approach for North Central Texas Region.

APPROACH TO FORECASTING REGIONAL GENERAL AVIATION ACTIVITY

The future demand for general aviation activity in the Southern California region will obviously depend on the size and composition of the pilot community, as well as the amount of flying done by the various categories of pilots. Pilots begin their flying career as student pilots. Some never progress beyond this stage but others gain their private pilot certificate and continue flying as private pilots. For many pilots the private pilot certificate may be the most advanced certificate they ever obtain, but others progress to hold commercial pilot or airline transport pilot certificates, where the commercial pilot certificate is a required step to obtaining an airline transport pilot (ATP) certificate. Generally, those

pilots progressing to holding commercial pilot or ATP certificates intend to seek employment as a pilot or flight instructor, although some pilots obtain their commercial pilot certificate for the satisfaction of achieving a higher level of certification without any intention of using their pilot certification for gainful employment.

Future Composition of the Pilot Community and Level of Flying Activity

Of course, as pilots gain flying experience and progress through the various levels of certification, they are also getting older. Therefore one can study the composition of the pilot community using techniques from demographic cohort analysis. Pilots take up flying at some point in their lives, progress through various certificates, and eventually cease flying. From data on the distribution of the age of pilots when they first take up flying and the time it takes them to reach the highest level of certification they achieve, projections of the future composition of the pilot community can be made based on assumptions about future levels of new pilot starts as a percentage of the population in the relevant age ranges.

Future levels of general aviation activity will depend not only on the number of pilots with each type of certificate but the amount of flying that these pilots do. This varies by the type of certificate held and the age of the pilot. It is also likely that the average number of hours flown per year by pilots with a given type of certificate and a given age will also change over time in response to general economic factors and the cost of flying, as well as such factors as restrictions on the use of airspace or changes in pilot certification requirements. In the case of business aviation and corporate flying, as distinct from flight training and personal flying, the level of flight activity is less a function of the number of pilots than the demand for this type of flying, which is largely determined by the state of the economy and the cost of owning and operating aircraft, which in turn is affected by such factors as the cost of aviation fuel, interest rates, and corporate tax rules. Indeed, the demand for professional pilots, and hence the amount of flying by those pilots, is determined by the level of business and corporate flying, rather than the other way round.

It should be clear from this discussion that the future size of the pilot community in the Southern California region and the amount of flying done by those pilots depends on many factors that cannot be known with any certainty. Developing a general aviation demand forecast based on a single set of highly conjectural assumptions is of limited value for aviation planning purposes and is almost certain to be wrong. What is much more useful is an assessment of the range within which future values of general aviation activity might lie and the likelihood that the values might exceed various levels. In short, rather than a single point forecast, what is needed is an assessment of the projected probability distribution of the forecast values. The development of such probability distributions is commonly referred to as risk analysis, and commercial computer simulation software exists to perform the necessary calculations to estimate the probability distributions (strictly these are likelihood distributions rather than probability distributions, but the distinction is not important for this study and therefore the more commonly understood term will be used). Although initially the regional general aviation demand forecast for 2035 was developed using a simpler approach based on defining a range of input assumptions reflecting alternative growth assumptions, the analysis approach will be designed so that future work could extend this to the use of a more formal risk analysis approach.

Future Based Aircraft Fleet

The second major consideration in developing a regional general aviation demand forecast is projecting the future number of aircraft based at airports in the region. While the number of aircraft is obviously influenced by the level of flying activity, this is not a simple relationship. Aircraft do not disappear when the level of flying reduces nor do new aircraft suddenly appear when the level of flying increases. Rather, the aircraft fleet evolves in an analogous way to the pilot community. New aircraft are purchased or imported into the region, while other aircraft are exported from the region or older aircraft are scrapped. The level of utilization of a given aircraft also changes as the aircraft gets older, since this is generally associated with higher maintenance costs and poorer fuel efficiency. When the level of flying increases, it can be expected that new aircraft purchases and imported aircraft will tend to exceed the number of aircraft exported or scrapped and the total fleet will grow. Conversely, if the level of flying decreases, under-utilized or unused aircraft will be retired from the fleet at a higher rate than new aircraft will be added and the total fleet will decline. However, the average levels of aircraft utilization will also change with changing levels of flying activity, and so the changes in the aircraft fleet will tend to lag behind the changes in flight activity. Furthermore these changes will not be uniform across the fleet, but will vary with the age and type of the aircraft.

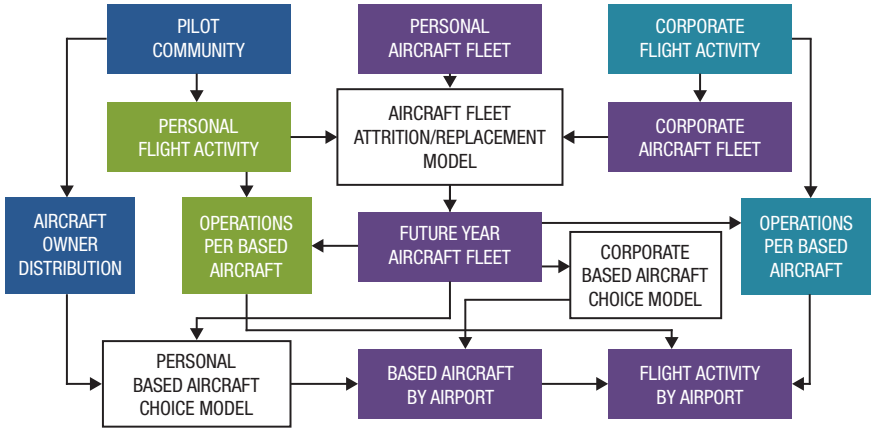
Cohort analysis can also be applied to projecting changes in the aircraft fleet in a similar way to the analysis of the pilot community discussed above. As aircraft get older, their

average level of utilization declines and they become more likely to be retired from the fleet by being exported or scrapped, unless they become so old that they become of historic interest or attractive to collectors and get restored to flying condition. However, this is a special case that typically only affects a few aircraft. It should also be noted that some aircraft are lost each year to flying accidents, although the improvement in general aviation safety has reduced this effect in recent years.

Projecting Future Levels of Airport Activity

Once the size and composition of the future aircraft fleet based in the region has been forecast, it is necessary to project the allocation of this fleet to airports in order to forecast the number of based aircraft and associated activity levels at each airport in the region. The decision by an aircraft owner of where to base the aircraft depends on a number of factors, including the proximity of alternative airports to the owner's residence or place of business, the facilities and services available at each airport, including whether the runway is long enough to accommodate the aircraft, and the availability and cost of hangar or tie-down space. Apart from the proximity of alternative airports, the other factors can change in the future, and indeed a major objective of the aviation system planning process is to determine future needs for such changes. Therefore the aircraft allocation process should be based on a formal model of the airport choice process by aircraft owners, referred to in the remainder of this section as the based-aircraft choice model.

Such a model can be estimated from existing data on the location of aircraft owners in the region and the airport where they base their aircraft and would be structured as a standard disaggregate behavioral choice model, analogous to a travel mode choice model in surface transportation planning. A common form for such a model is the multinomial logit model, which can incorporate utility functions for each airport that include variables describing the facilities and services available at each airport. This allows the based aircraft allocation process to be responsive to potential changes at each airport, as well as changes in the distribution of aircraft owners throughout the region due to changes in the regional distribution of the population and the locations of users of business or corporate aviation, as well as changes in the composition of the pilot community and the use of business or corporate aviation.



This use of a formal model to establish a logical and consistent basis for allocating the projected future regional based aircraft fleet to airports is necessary for several reasons. Perhaps the most important is to provide a means to study the effect of changing facilities and services at regional airports on the distribution of based aircraft. The second is that a large proportion of the aircraft fleet in 2035 (25 years hence) will be owned by different people from the current fleet and the locational distribution of those people is likely to be different from the current distribution of aircraft owners. Thirdly, to the extent that the demand for hangar or tie-down space at certain airports may exceed the available facilities, it can be expected that hangar space or tie-down rental rates will rise to balance demand with capacity and this will also affect the allocation. Finally, the allocation of regional based aircraft demand to airports is likely to be politically sensitive, particularly if some airports are forecast to experience increased numbers of based aircraft and levels of activity while others are forecast to experience a reduction in based aircraft and activity. It is therefore important that the allocation process is transparent and can be justified on the basis of empirical experience and agreed assumptions.

It should be recognized that just as forecasts of future levels of regional activity are subject to a wide range of uncertainties, so any process to allocate that activity to specific airports is also subject to similar, or even greater, uncertainties. There is no crystal ball that can predict what will happen at a given airport. Rather, the purpose of developing demand allocation models is to suggest what might happen under various assumptions and provide a tool to explore how changing those assumptions could change the resulting forecast activity levels at different airports.

ANALYSIS FRAMEWORK

The analysis approach used in developing the regional general aviation demand forecasts comprises a number of separate but interrelated components shown in **FIGURE 2.2**. These components distinguish between personal flight activity by individual pilots and owners of personal aircraft on the one hand and flight activity by corporately owned aircraft on the other, where the corporate aircraft fleet includes aircraft owned by government agencies, educational institutions, nonprofit organizations, and similar organizations that typically employ professional pilots to operate the aircraft.

FIGURE 2.2 Demand Forecast Analysis Approach

The analysis framework shown in **FIGURE 2.2** distinguishes between the composition and location of the pilot community and owners of personal aircraft (highlighted in dark blue), the associated personal flight activity (highlighted in green), business and corporate flight activity (highlighted in light blue), and the composition and activity of the aircraft fleet (highlighted in purple). Flight training is treated as a category of personal flight activity, since it is largely determined by the composition of the pilot community. Aerial work is treated as a category of corporate flight activity, since it is performed for corporate or governmental entities by professional pilots. The figure shows three key analytical modules, the aircraft fleet attrition and replacement model, the personal based-aircraft airport choice model, and the corporate based-aircraft airport choice model.

FIGURE 2.2 also shows that the number of operations per based aircraft is derived in the analysis from the forecast level of flight activity and the size and composition of the aircraft fleet, rather than being an input assumption. This avoids the difficulty inherent in basing general aviation activity forecasts on assumed future levels of operations per based aircraft, which are likely to vary with the composition of the pilot community, changes in the levels of flight activity by different categories of pilot, and changes in aircraft fleet, making estimates of future changes in the number of operations per based aircraft extremely challenging without undertaking the type of detailed analysis shown in **FIGURE 2.2**.

Each of the other analysis components shown in color in **FIGURE 2.2** utilize various analytical techniques to generate the projected future values of regional general aviation activity that form the inputs to the other components of the analytical framework. These components and their associated analytical techniques are described in the following sections.

PILOT COMMUNITY COHORT ANALYSIS

The future pilot community module utilizes a cohort analysis to forecast the future size and composition of the pilot community, and the associated level of flight activity. This projects the change in the number of pilots holding different levels of pilot certificate over time in five-year age cohorts, as pilots grow older and transition from student pilot to private pilot, from private pilot to commercial pilot, and from commercial pilot to airline transport pilot (ATP), or become inactive and drop out of the active pilot population. Obviously, not all pilots progress to a higher level of certificate, particularly to ATP. Some student pilots never complete their training and obtain a private pilot certificate.

The number of pilots in each age range holding each type of certificate in a given year is given by the following relationships:

$$Ns,a,y = Ns,a\text{-}5,y\text{-}5 \times (1 - As,a,y - Tsp,a,y) + Es,a\text{-}5,y\text{-}5$$

$$Np,a,y = Np,a\text{-}5,y\text{-}5 \times (1 - Ap,a,y - Tpc,a,y) + Ns,a\text{-}5,y\text{-}5 \times Tsp,a,y$$

$$Nc,a,y = Nc,a\text{-}5,y\text{-}5 \times (1 - Ac,a,y - Tct,a,y) + Np,a\text{-}5,y\text{-}5 \times Tpc,a,y$$

$$Nt,a,y = Nt,a\text{-}5,y\text{-}5 \times (1 - At,a,y) + Nc,a\text{-}5,y\text{-}5 \times Tct,a,y$$

where Ns,a,y = The number of student pilots in age group a in year y

Np,a,y = The number of private pilots in age group a in year y

Nc,a,y = The number of commercial pilots in age group a in year y

Nt,a,y = The number of airline transport pilots in age group a in year y

Es,a,y = The number of new student pilot starts in age group a over the five-year period starting in year y

As,a,y = The net attrition rate of student pilots in age group a in the five-year period ending in year y

Ap,a,y = The net attrition rate of private pilots in age group a in the five-year period ending in year y

Ac,a,y = The net attrition rate of commercial pilots in age group a in the five-year period ending in year y

At,a,y = The net attrition rate of airline transport pilots in age group a in the five-year period ending in year y

Tsp,a,y = The transition rate of student pilots in age group a to private pilots in the five-year period ending in year y

Tpc,a,y = The transition rate of private pilots in age group a to commercial pilots in the five-year period ending in year y

Tct,a,y = The transition rate of commercial pilots in age group a to airline transport pilots in the five-year period ending in year y

The net attrition rates for a given age group include those pilots moving out of the region (positive) and into the region (negative), as well as those pilots who become inactive. The definition of an inactive pilot requires some care, because pilots do not report their actual flying in a given year, only when they apply for a new medical certificate. In the case of private pilots under age 40, a medical certificate is valid for five years. A pilot holding a valid medical certificate is considered to be active, even if in fact that pilot has done no flying for several years. While the medical certificates for commercial and airline transport pilots have shorter validity periods, pilots can exercise the privileges of a lower class of medical certificate for the period that class of medical certificate would have been valid. Thus an airline transport pilot with an expired first-class medical certificate (which is valid for 6 months for pilots age 40 and over) can continue to fly as a private pilot for the period that a third-class medical certificate would have been valid.

It is of course quite likely that some pilots make the transition through more than one certificate level in a five-year period. For example, a student pilot may gain both the private pilot certificate and commercial pilot certificate within five years. This is covered by the combination of the attrition rate and transition rate. Such a pilot would be included in the transition rate from student to private pilot and the transition rate from private pilot to commercial pilot, but also in the attrition rate for private pilots, in order to ensure the correct number of private pilots at the end of the five-year period. It would also be possible to account for multiple transitions in a five-year period in the above formulae, but given the limitations of the data and the granularity of the analysis (five-year increments), such a refinement does not appear to be worth making.

The foregoing analysis does not consider pilots holding recreational and sport pilot certificates. Given the relatively small number of pilots in these categories, the type of cohort analysis discussed above would not be supported by the data, nor would it make much difference to the resulting estimate of the size of the pilot population. Instead, these pilot categories can be included by a separate analysis based on the current trend in the number of such pilot certificates issued.

The above equations allow for pilot attrition and transition rates to vary over time. While the available data on the composition of the pilot community may not allow a detailed analysis of how these rates have varied in the past, allowing these rates to vary in the cohort analysis provides a way to reflect projected changes from current rates in the future, as discussed below in the section on Key Assumptions.

Once the number of pilots in each age group with a given level of pilot certificate has been calculated, the total number of flight hours per year performed by those pilots can be calculated from the average number of flight hours per pilot for a pilot in that age and certificate category. Estimates of the average number of flight hours per year for pilots in a given age group and certificate category can be derived from the number of flight hours reported by pilots when they renew their medical certificates or from pilot surveys, as discussed further below in the section on Data Requirements and Sources.

In the case of airline transport pilots, their reported flight hours include all types of flying, the majority of which is likely to be airline flying. Indeed many airline pilots may not do any GA flying at all. Since they do not report flight hours for GA flying separately, it will be necessary to estimate the proportion of their flight hours spent in GA flying from pilot survey data or other sources.

AIRCRAFT OWNER DISTRIBUTION

The current geographic distribution of aircraft owners in the region can be determined from the aircraft ownership data maintained by the County Assessors. These data provide

the registered address of the aircraft owner, allowing the distribution of aircraft owners by zip code to be determined. In the case of some corporately owned aircraft, the registered address may be outside the region, such as a corporate head office. In these cases, it will be necessary to determine the location of the local office of the aircraft owner, which in some cases may be the airport where the aircraft is based.

As the composition of the aircraft fleet ownership changes over time, the distribution of the aircraft owners may change, reflecting the geographic locations of new owners and relocation of existing owners. An ownership distribution model will be developed from the current ownership pattern that predicts the proportion of the regional aircraft owners located in each zip code area. Separate models will need to be developed for personally owned aircraft and corporately owned aircraft. In the case of personally-owned aircraft, the distribution of owner locations is likely to be most influenced by the number of high-income households in a zip code area, but the influence of other variables will be explored as part of the model estimation.

The geographic distribution of owners of corporately-owned aircraft is likely to reflect the distribution of the types of businesses owning aircraft. As a general rule larger firms are more likely to own aircraft, so employment by different industry sectors may be the most appropriate explanatory variables. Exploratory analysis will be performed to identify those sectors that account for the greatest proportion of aircraft ownership and to select the most appropriate explanatory variables to predict the distribution of aircraft owners. This may require some compromise between the extent to which a given variable accounts for the current distribution of aircraft owners and the availability of forecasts of that variable for future years.

PERSONAL FLIGHT ACTIVITY

The number of flight hours by different categories of pilot certificate has been discussed above. In order to translate these estimates into forecasts of personal flight activity, it is necessary to determine the proportion of flight hours devoted to personal flight activity (personal and recreational flying, flight training, and business flying by individual aircraft owners). This can be done based on an analysis of FAA survey data of annual general aviation flight hours by aircraft type (FAA, 2011c). Since there is generally only one pilot in an aircraft being used for most personal flying, there is a one-to-one correspondence between pilot hours and aircraft hours. The one exception to this is dual flight instruction, in which both the student pilot and the flight instructor will be counting the flight time. It will therefore be necessary to estimate the proportion of instructional flight time that is spent in dual instruction and the proportion where the student pilot is solo. In general, for most student pilots this is approximately equal over the course of their flight training.

The data on aircraft flight hours by purpose does not of course indicate the type of certificate held by the pilot, and while student and private pilots are precluded from serving as pilots for corporate flying and other flight activity where the flight crew is paid, pilots holding commercial and airline transport certificates can and do engage in personal flying. It will therefore be necessary to estimate the amount of compensated flying from the aircraft survey data for different use categories, and hence estimate the proportion of flight time by commercial and airline transport pilots that is spent in personal flight activity.

CORPORATE FLIGHT ACTIVITY

In contrast to personal flight activity, the level of corporate flight activity is not determined by the size and composition of the regional pilot community but by the need for transportation or other aviation activity by the organizations generating the corporate flight activity, whether through the use of their own aircraft or by chartering aircraft operated by others. As shown by the various categories of aircraft use shown in **TABLE 1.2** above and the descriptions of the different categories in Appendix A, corporate flight activity encompasses a wide range of flight purposes, including:

- Corporate/executive transportation
- Aerial application or observation
- Other aerial work and external load activity
- Sight-seeing under FAR Part 91
- Air medical services (under both FAR Part 91 and Part 135)
- Air taxi services
- Air tours.

Some activities under Other Work Use or Other use (e.g. aerial advertising, positioning flights, and proficiency flights) could also be most appropriately considered part of corporate flight activity. In the Southern California region, some categories of aircraft use, such

as aerial application, external load, sightseeing and air tours, are likely to occur extremely infrequently relative to other categories and can be combined into a single category of Other use.

Since the aircraft involved in corporate flight activity are generally quite different from those used for personal flying, the estimates of flight hours for these purposes by different types of aircraft can be applied to the data on the composition of the Southern California based aircraft fleet to estimate the amount of corporate flying by that fleet.

Accounting for Fractional Ownership

The recent growth in fractional ownership plans requires an adjustment to the analysis approach. From an operational standpoint, fractional ownership is no different from an air taxi charter. It is only the way that the service is paid for that differs. However, because the user has purchased a share of the ownership of the aircraft rather than chartering the aircraft for a specific flight, this activity is counted as part of general aviation corporate flight activity rather than as a Part 135 air taxi flight. Because aircraft used in fractional ownership plans are likely to achieve higher utilization that those operated exclusively by the aircraft owner, adjustments to the average number of flight hours per aircraft are likely to be required, for both aircraft used in fractional ownership plans and those operated exclusively by the aircraft owners.

The FAA survey data of annual general aviation flight hours by aircraft type (FAA, 2011c) includes estimates of the annual hours flown in fractional ownership by aircraft type. These data can be used to estimate the proportion of corporate GA flying that should be classified as fractional ownership activity and used to adjust the average flight hours per aircraft assumed for aircraft used in fractional ownership. Unfortunately the published results of the FAA survey do not include an estimate of the number of aircraft involved in fractional ownership plans. Therefore this number will need to be estimated from other sources (e.g. J.P. Morgan's Business Jet Monthly newsletter (J.P. Morgan, 2011)).

OPERATIONS PER BASED AIRCRAFT

The number of operations per based aircraft is a metric that is commonly used in forecasting general aviation activity at airports, primarily because it is easily calculated from aircraft operations counts and based aircraft counts, both of which are routinely collected or estimated at all airports. However, in the aggregate this measure fails to capture the effects of the widely different level of utilization of different types of aircraft used for different purposes. It also assumes that the ratio of operations by visiting aircraft to those by based aircraft remains constant. If the composition of the aircraft fleet at a given airport or the level of activity by visiting aircraft relative to that of based aircraft changes over time, it can be expected that the number of operations per based aircraft will also change.

Therefore what is needed instead is a way to determine the number of operations by based aircraft as a function of the level of flight activity by the owners of those aircraft, which can then be combined with an estimate of the number of operations by visiting aircraft determined in a separate step. Given the number of flight hours for personal and corporate flight activity as discussed in the previous sections, these can be translated into aircraft operations based on estimates of the number of landings per flight hour and the proportion of those landings that occur at the airport where the aircraft is based. The average number of landings per flight hour for different aircraft types is available from FAA survey data of annual general aviation flight activity by aircraft type (FAA, 2011c). The average for each aircraft type covers all purposes for which that aircraft type is used, so some adjustments will be required to reflect the different uses of each type of aircraft. For example, flight training will generate far more landings per flight hour than recreational flying, although both flight purposes may use similar aircraft types.

These adjustments can be made on the basis of data for aircraft types that are typically not used extensively for flight training, although an attempt will be made to obtain more detailed data from the FAA general aviation activity survey to perform a more explicit analysis of these differences.

Estimates of the proportion of landings that are performed at the airport where the aircraft is based requires assumptions about the proportion of flight hours involved in local operations (those where the aircraft remains in the traffic pattern or returns to the airport without landing elsewhere), the average number of landings per flight hour for local operations compared to itinerant operations, and the average number of flight segments for an itinerant trip. This information can be obtained for a representative set of flights from surveys of airport users, such as the 1990 FAA General Aviation Pilot and Aircraft Activity Survey (Executive Resource Associates, 1991). Although this survey is now over 20 years old, the underlying patterns of general aviation activity are not anticipated to have changed all that much, although of course the total level of activity has.

AIRCRAFT FLEET ATTRITION/REPLACEMENT MODEL

This model component is designed to predict the changes in the general aviation aircraft fleet based in the region over time in order to generate a projected future year (2035) aircraft fleet. The model considers the attrition of the current aircraft fleet as aircraft age and become uneconomical to maintain in airworthy condition or are lost due to accidents, together with replacement due to new aircraft purchases and net imports of aircraft to the region less exports of aircraft from the region. From the perspective of the regional based aircraft fleet, the only difference between new aircraft purchases and imports is the age of the new aircraft being added to the regional based aircraft fleet.

The model is based on a Markov process, in which the probability of an aircraft of type i and age a in the regional fleet in year t being lost to the fleet (whether through attrition or export) in year t+1 is given by Pi(a). As a practical matter, aircraft are grouped into a limited number of similar types (e.g. single-engine piston, multi-engine piston, etc.) in order to calculate the probabilities Pi(a) from national aircraft fleet data. The total number of registered aircraft of a given type and age at the national level over time provides the probability of attrition, while the corresponding number of registered aircraft of a given type and age in the region, after adjusting for attrition, provides the probability of net export (exports less imports).

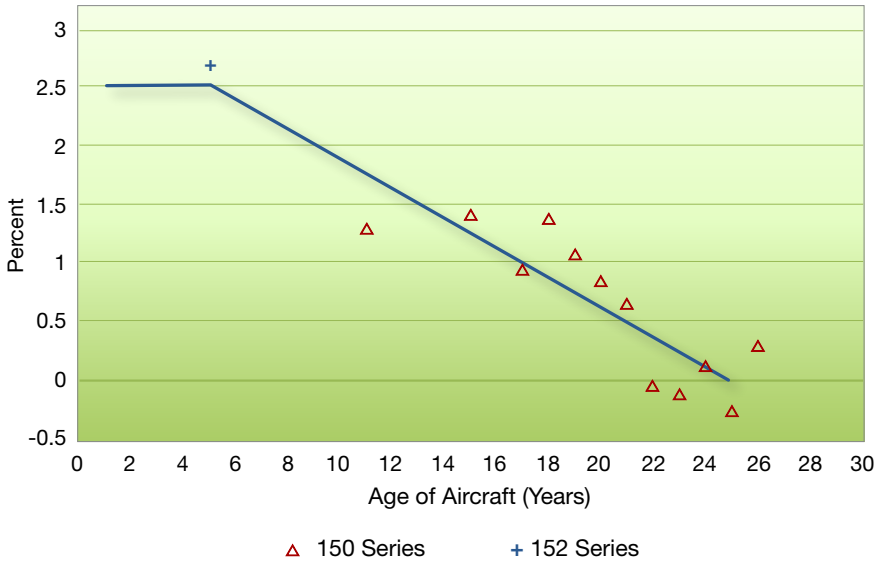
Since the analysis is only attempting to predict the size of the fleet by aircraft type, and not track individual aircraft, only net exports (or net imports) matter. There is a national market for used aircraft (indeed even an international market), so if a specific aircraft based in the Southern California region is sold to a purchaser outside the region but another aircraft of the same type that is based outside the region is purchased by a buyer in Southern California and moved to the region, there is no net change in the regional based aircraft fleet (although of course the location of the owners within the region has most likely changed).

Accounting for new aircraft purchases is complicated since the decision to purchase a new aircraft depends not only on the available fleet of used aircraft, but the overall demand for aircraft. Therefore, a separate sub-model can be developed based on recent trends in national data for new aircraft sales by type. Since someone choosing between purchasing a new aircraft and a used aircraft is only likely to consider relatively new used aircraft, the number of new aircraft added to the Southern California aircraft fleet in a given year will depend on the overall level of general aviation activity in the region and the size of the existing aircraft fleet that is relatively new (perhaps up to five years old). The exact age criterion is probably not all that important, although of course the relationship between the number of new aircraft purchased in a given year and the size of the existing fleet that is considered relatively new will vary with the age criterion used. An analysis of the age profile of aircraft in Southern California over recent years can be undertaken to identify the most suitable criterion.

Although the approach is based on an analysis of the composition of the registered aircraft fleet over time, there is no guarantee that the historical rates of attrition and new aircraft acquisition will persist in the future, particularly over a period as long as 25-years. Therefore the resulting attrition and acquisition rates should be reviewed with the Aviation Technical Advisory Committee and adjusted as necessary to reflect Committee input on factors that appear likely to modify those rates in the future.

Aircraft Data Considerations

An analysis of aircraft attrition and new aircraft acquisition rates can be undertaken based on the national data on the registered aircraft fleet maintained by the Federal Aviation Administration, although potential difficulties could arise from inaccuracies in the registered aircraft data. Because aircraft registrations do not currently need to be renewed on an annual basis (in the way that automobile registrations do), there is a concern that the current registered aircraft database includes a large number of aircraft that are no longer active or whose owners may have moved, although efforts are currently underway within the FAA to improve the accuracy of the aircraft registration database. However, California County Assessors also maintain databases of aircraft based within the county for tax purposes. These data are likely to be reasonably accurate because aircraft owners will notify the County Assessor if their aircraft have been disposed of. By basing the attrition analysis on the County Assessor data, it should be possible to obtain a reasonably accurate picture of the evolution of the aircraft fleet in the Southern California region.



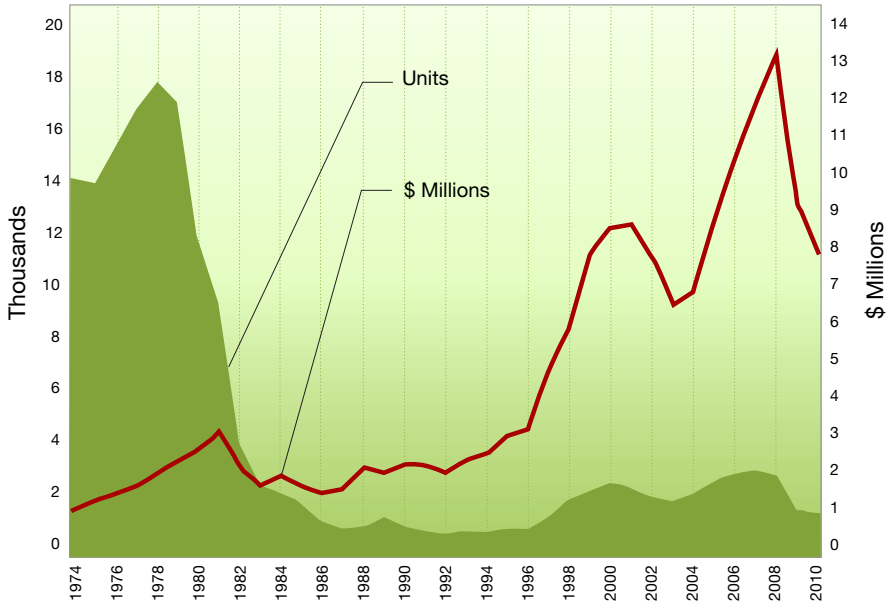
Aircraft Fleet Attrition Models

An early model of attrition in the general aviation fleet was developed by Rocks (1976). Although the data on which this study is based is now quite dated, the underlying

relationship between the age of an aircraft and the likelihood that it will cease to be used or scrapped that is described by the model may not have changed all that much over the past three and a half decades. Aircraft have very long lives if properly maintained and much of the existing general aviation aircraft fleet is not significantly different from the fleet studied by Rocks. Indeed, many of the aircraft in the current fleet were already in the fleet that was studied by Rocks.

A representative aircraft fleet attrition model was developed for the 1994 update of the San Francisco Bay Area Regional Airport System Plan (MTC, 1994). Using data for the Cessna 150/152 series aircraft, it was found that the annual fleet attrition rate declined from about 2.5 percent per year for relatively new aircraft to around zero for aircraft 25 years old or older, as shown in **FIGURE 2.3**. Negative attrition rates beyond 20 years observed in the data could be due to data errors or inactive aircraft being returned to operation.

FIGURE 2.3 Representative General Aviation Fleet Attrition Rates (Cessna 150/152 Series)



Source: MTC, Regional Airport System Plan Update – San Francisco Bay Area, Oakland, Calif., Nov. 1994, Exhibit 5-64.

It was found at the time that new aircraft were being added to the fleet at a rate of only about 0.2 percent per year. This is likely to have changed significantly in recent years, particularly for turbojet aircraft. **FIGURE 2.4** shows the trend in GA aircraft shipments over the past 37 years. In recent years shipments of new aircraft have been running at about 2,000 units per year, although this has declined sharply since the onset of the recession in 2008. Even so, the average rate over the previous 10 years was still only about one percent of the active GA fleet per year, well under the average attrition rate. Furthermore, many of the U.S. manufactured aircraft are exported.

FIGURE 2.4 also shows the total value of the new aircraft shipments. It is clear that the average value per unit shipped has increased significantly since the late 1970s. In 1975, when over 14,000 units were shipped, the average sale price per aircraft was around $73,000. By 2007, when about 3.300 units were shipped, the highest number in recent years, the average sale price per aircraft had increased to about $3.6 million. By 2010, when the number of units shipped had declined to about 1,300, the average sale price had increased to $5.9 million. Clearly, not only has the number of GA aircraft produced declined significantly, but the nature of the aircraft entering the fleet has also changed. This has profound implications for the long-term composition of the aircraft fleet and the type of flying that is done, as the number of older, less expensive aircraft declines, and these aircraft are replaced by more modern, more capable, and much more expensive aircraft.

FIGURE 2.4 Shipments of General Aviation Airplanes Manufactured in the U.S. (1974–2010)

Source: GAMA

The analysis performed for the Bay Area Regional Airport System Plan (RASP) analysis did not consider the net effect of imports and exports to and from the region, although it noted that these are likely to be fairly small in relation to the size of the total fleet and will tend to offset each other. A more explicit accounting of net exports will be undertaken as part of the project, as discussed above.

The attrition pattern developed for the Bay Area RASP is now over 15 years old, and will need to be updated and expanded for the current study. The literature review has not identified any more recent application of a formal general aviation fleet attrition model, although the FAA includes assumptions about GA fleet attrition in its annual forecasts of the future GA fleet.

Aircraft Owner Distribution

In addition to the size of the future regional based aircraft fleet, it is also necessary to consider whether the geographic distribution of aircraft owners will change in the future. Although this is not part of the Aircraft Fleet Attrition/Replacement Model, it is a necessary step before allocating the projected future aircraft fleet to airports within the region. Data on the current distribution of aircraft owners by zip code can be obtained from the registered address of the aircraft owner and aggregated to suitable sub-regional analysis zones that are selected to contain a similar number of current aircraft owners.

In the case of corporately owned aircraft, it may be necessary to make adjustments to the registered location, since the aircraft registration may use the address of a corporate office that bears little relationship to the operating units using the aircraft, and may even be outside the region. For example, an aircraft may be registered using the address of a corporate flight department that is located at the airport where the aircraft is based, although the choice of airport at which to locate the flight department was influenced by the location of the principal corporate offices in the region.

Rather than simply assume that the geographic distribution of aircraft owners will remain unchanged, an aircraft owner distribution model will need to be developed using analysis techniques such as linear regression. In the case of personally owned aircraft, the independent variables that are most likely to provide a reasonable fit to the data are population and average household income, although other socioeconomic factors can also be explored. Identifying suitable independent variables in the case of corporately owned aircraft is likely to be more difficult and will require some exploratory analysis. The challenge is not so much identifying measures of business activity that are correlated with aircraft ownership but selecting measures for which long-term forecasts are available at a sub-regional level. It may therefore be necessary to use a more general measure of business activity, such as employment, for which forecasts are available but is not particularly well correlated with aircraft ownership and then apply sub-regional adjustment factors that reflect the current distribution of aircraft owners. This will at least ensure that projected future regional changes in the distribution of employment will be reflected in the forecast distribution of aircraft owners.

Although the resulting regression models will not necessarily produce the correct number of aircraft owners for a future year based on the projected size of the aircraft fleet, since

aircraft ownership levels may change over time due to factors other than changes in household income or business activity, this is not a major concern since all that is needed is the geographic distribution of those owners, so the model projections can be factored to give the correct totals.

The other major advantage of developing aircraft owner distribution models of this type is that they provide a means to allocate the forecast number of aircraft owners to smaller geographic zones (such as regional travel analysis zones), in a consistent way. This becomes important in applying the based airport choice models, since the relative proximity to alternative airports is a major consideration in the choice of airport and the analysis zones for this need to be relatively small in order to properly account for differences in airport proximity.

PERSONALLY OWNED AIRCRAFT BASED AIRPORT CHOICE MODEL

This model (referred to in **FIGURE 2.1** as the Personal Based Aircraft Choice Model for brevity) predicts the choice of airport at which to base a personally owned aircraft, considering the geographic distribution of aircraft owners and the facilities and services available at the different airports in the region. The general form of the model is a multinominal logit discrete choice model that predicts the probability of a given aircraft owner k choosing airport j as a function of the proximity of each of the set of N alternative airports and the facilities and services at those airports. The number of based aircraft at each airport, as well as the geographic distribution of their owners, is them obtained by summing up the probabilities for each aircraft in the regional fleet.

Mathematically, the model takes the following form:

$$P_k(j) = U_k(j) \Big/ \sum_{i=1}^{N} U_k(i)$$

where the perceived utility Uk(i) provided by airport i is given by:

$$U_k(i) = a_0 + a_1 * d_{ki} + \sum_{l=1}^{L} a_{l+1} * x_{li}$$

and dki = distance from location of owner k to airport i

xli = value of airport-specific variable l for airport i

a's = estimated coefficients

The airport-specific variables for each airport can be continuous (e.g. hangar rental rates) or dummy variables (e.g. the presence of a control tower). Exploratory model development will be required to determine which variables are statistically significant. It is likely that owners of different types of aircraft may value airport facilities and services differently. For example, owners of larger aircraft that are used primarily for business may be more concerned that an airport has a control tower and an instrument landing system than owners of aircraft used primarily for recreation. Therefore it may be possible to obtain a better fit to the data by estimating separate models for different classes of aircraft. Although the primary use of the aircraft may be most important determining factor, this information is not generally available at the level of specific aircraft. It will therefore be necessary to use aircraft type as a surrogate criterion for primary use. In any case, the forecast of the future GA fleet only provides information on aircraft type, so future levels of primary use have to be assigned to the aircraft fleet anyway based on the current pattern of use by aircraft type.

One important consideration in airport choice is the limitation imposed on owners of larger aircraft by runway length or other airfield design criteria at particular airports. Rather than attempt to account for this through the independent variables in the choice model, it is simpler and more reliable to restrict the choice set of alternative airports available to those owners.

A related consideration is the large number of GA airports in the region, many of which will be so far from a given aircraft owner that they are not likely to enter into the choice set. In order to avoid having too many alternatives for a given owner, which will tend to place too much reliance on the distance variable to avoid unrealistic choices, it is likely that restricting the choice set on the basis of some distance criterion will produce more reliable model estimations. An analysis of the current geographic distribution of aircraft owners for each airport can be undertaken to identify a suitable distance threshold for different aircraft categories.

CORPORATELY OWNED AIRCRAFT BASED AIRPORT CHOICE MODEL

This model (referred to in **FIGURE 2.1** as the Corporate Based Aircraft Choice Model for brevity) predicts the choice of airport at which to base a corporately owned aircraft, considering the geographic distribution of the primary aircraft users and the facilities and services available at the different airports in the region. The general form of the model is the same as that for personally owned aircraft, although the model coefficients will most likely be different and some independent variables for airport facilities and services that are not found to be statistically significant for personally owned aircraft may turn out to be important for corporately owned aircraft. For example, the presence of a control tower may not be an important factor in airport choice for personally owned aircraft but may be very important for corporately owned aircraft.

Because many of the facilities and services are necessarily represented by dummy variables (either an airport has a control tower or it does not) and many are likely to be highly correlated across different airports (e.g. all airports with instrument landing systems also have control towers), it may not be possible to identify different coefficients for some airport variables that it would appear reasonable to assume would influence the choice of airport. This does not affect the reliability of the model, since the effect of the omitted variable is accounted for by the coefficient of the correlated variable that this included in the model, unless a situation arises in the future in which an airport has one feature but not the other (e.g. an instrument landing system is installed at an airport without a control tower). This situation can be handled through the inclusion of an additional variable, with the coefficient value of the correlated variable included in the estimated model split between the two variables on the basis of judgment or separate analysis (e.g. past surveys of aircraft owners on the relative importance of different factors in their choice of airport).

FLIGHT ACTIVITY BY AIRPORT

The number of aircraft operations at a given airport result from activity by based aircraft and itinerant operations by transient (or visiting) aircraft that are based elsewhere. The aircraft operations by based aircraft can be estimated from the forecast number of flight hours and the number of operations per flight hour. These parameters are likely to vary considerably by aircraft type and can be estimated from survey data on aircraft activity levels.

Local operations largely result from flight training activities and some proficiency flights, as well as aerial activity and observation. There may also be a fairly small number of local operations by visiting aircraft. Thus the number of local and itinerant operations can be projected by estimating a relationship between the tower count data and the operations estimates derived from the flight hour analysis. The coefficients of this relationship perform two functions. First they adjust the number of operations derived from the flight hour analysis to achieve consistency with the tower count data. Second, they account for the varying split between local and itinerant operations by different aircraft uses.

Itinerant Operations by Transient Aircraft

Projecting itinerant operations by transient aircraft needs to utilize a different approach, since the number of such operations is not directly related to the number of based aircraft. Rather these operations can be expected to increase from current levels at each airport in proportion to the growth in the regional total of itinerant operations by based aircraft, reflecting the changes in the underlying factors driving the demand for general aviation activity. This assumes that these factors change elsewhere in the country in the same way that they do in Southern California. Since many of these factors, such as the price of aviation fuel, the general state of the economy, and corporate tax policies, are largely determined at a national level anyway, this does not seem an unreasonable

assumption. Even if the Southern California economy is assumed to grow at a different rate from the national economy, to reflect that difference in the relative growth of itinerant operations by based aircraft and visiting aircraft would require a model of the demand for itinerant operations that incorporates separate measures of economic activity at both the origin and destination end of the trip.

The only known example of such a model is the Virginia Tech Transportation Systems Analysis Model. However, this model forecasts total person-trips on a county-to-county basis divided into five household income groups, where the highest income group has a household income greater than $150,000 in 2000 dollars. While different economic growth assumptions in different regions of the country would change the number of households in this income category, this is likely to be a fairly poor measure of the effect on the use of general aviation. In the first place, most users of general aviation for business or corporate travel are likely to have a household income significantly higher than $150,000, so changes in the number of households in this category do not necessarily reflect changes in the number of trips made by travelers likely to consider using general aviation rather than commercial airlines. Secondly, most such travel decisions to use general aviation are made by businesses or government agencies, rather than individual travelers, and the number of households in the highest income category does not really reflect the considerations that would lead to decisions to use general aviation for specific trips.

Thus, while the planned approach ignores the effect of possible factors that could change the ratio of the number of itinerant operations by visiting aircraft to Southern California airports to the number of itinerant operations by based aircraft, a more detailed analysis of the pattern of itinerant GA operations to and from the region is beyond the resources of the current study.

DATA REQUIREMENTS AND SOURCES

Implementation of the forecasting approach described in this section required extensive data on:

- Pilot population and flight activity
- Based aircraft and aircraft ownership
- Airport characteristics and fees
- Airport activity by based and transient aircraft
- Regional socioeconomic data

These data requirements and available data sources are discussed in more detail in the remainder of this sub-section. While much of the required data is available from FAA and other government sources, information on the flight hours of individual pilots is not publicly available (the FAA collects this information when pilots renew their medical certificates, but it is not releasable for privacy reasons). Furthermore, without identifiable data on individual pilots, it is not possible to link the flight activity of the pilot community to the flight activity of the aircraft fleet, obtained from aircraft activity surveys. In order to address this missing link in the data, a survey of AOPA members was undertaken as part of the current study, as described in more detail below.

Pilot Population and Activity

Statistical data on the U.S. pilot population is available from the annual FAA U.S. Civil Airmen Statistics (FAA, 2011e). Data on individual pilots from the FAA Airmen Registration Database, including their address, pilot certificates, and date of their most recent medical certificate, can be downloaded from the FAA website (FAA, 2011d). However these data do not include the pilot's age or flight experience and exclude the records of airmen who have requested that their address not be released. Totals of active airmen by county (including those who have requested their address not be released) are also available online (FAA, 2011f). Unfortunately, the FAA updates the downloadable data monthly and does not formally archive these data. Only the most recent version is shown on the FAA website, although prior versions remain on the server for some time and can still be accessed by entering the correct URL for the files. However the data available in this way only goes back about two years. Luckily, an earlier version from October 2004 was found on a web archive (http://www.archive.org). The totals of active airmen by county are presented in a PDF report that is generated by an application program from the underlying data tables that are updated even more frequently than the downloadable data. Thus these totals can change continuously and there is no way to access the data for a prior date.

However the FAA Airmen Certification Branch maintains internal reports on past totals of active airmen by county, and the relevant pages of these reports for California counties were obtained from the Branch staff for a selection of prior years.

The FAA active airman registry does not contain data on the flight time experience of each airman. However, pilots are required to provide their total flight hours to date and the flight hours in the prior six months on their application form to obtain or renew their medical certificate. The flight experience data is maintained in a separate database by the FAA Civil Aerospace Medical Institute (Peterman, Rogers, et al., 2008) and has been used in a recent study of U.S. pilot characteristics (Rogers, Véronneau, et al., 2009). However, an attempt to gain access to these data for use in the current study has thus far proved unsuccessful. Failing this, the change in average flight hours for holders of different classes of medical certificate over time is given by Rogers Véronneau, et al. (2009) and these data can be combined with data on the changing age distribution of the pilot population from the U.S. Civil Airmen Statistics to estimate the average annual flight hours for different age groups and class of pilot certificate. In addition, data on pilot flight experience can be obtained from the survey of AOPA members discussed below.

The AOPA Member Survey

With the assistance of the Aircraft Owners and Pilots Association an online survey was performed of the California AOPA membership by SCAG and the California Department of Transportation (Caltrans) Division of Aeronautics. The AOPA agreed to invite its California members to participate in the survey and provide them with the web address of the survey website where they could complete the survey. Survey respondents were not asked to provide identifying information, but they were asked to provide their zip code of residence and (if they are an aircraft owner) the airport where they base their aircraft. They were also asked to provide the following information:

- Whether they have flown general aviation aircraft in the past six months
- How long ago they last flew as a general aviation pilot (if no longer active)
- The highest level of pilot certificate that they currently hold (or have held)
- Their total flight hours in all types of aircraft
- Their flight hours in general aviation aircraft in the past year
- Whether they are a current or former aircraft owner
- The type(s) of aircraft that they own (or owned), if any
- Their age range (in ten year intervals)

In addition, the survey asked a number of questions about services that the respondents have used or would like to see at airports that they use, as well as issues that they believe should be addressed at the airport where they base their aircraft or use most frequently, or that should be considered in developing a general aviation demand forecast.

The findings of the survey thus provide a more detailed profile of the pilot population in the SCAG region than can be obtained from the more aggregate data available from the FAA.

Aircraft Ownership and Based Airport

Detailed data on the composition and ownership of the current aircraft fleet is available from the aircraft registration data maintained by the County Assessors. These data provide the registered location of the aircraft owners by zip code, the type and age of each aircraft, and in most cases the airport where the aircraft is based. In general it is possible to determine whether an aircraft is owned by one or more individuals, a business, a government agency, an educational institution, or some other type of organization, such as a nonprofit association, from the name of the registered owner. In the case of aircraft owned by businesses, it is also necessary to classify the business by industry sector for use in developing the aircraft owner distribution models discussed above. In some cases this is obvious from the name of the owner. In other cases, some research will be needed to classify the owner into the appropriate industry sector.

Data on the total number of based aircraft at each airport is available from the FAA Form 5010, available online for each airport on the Caltrans Division of Aeronautics website, as well as other online aviation data sources, such as AirNav.com (http://www.airnav.com). While the FAA Form 5010 data is updated each year and the online sources do not provide historical data, the Caltrans Division of Aeronautics maintains an historical data file of based aircraft counts for every airport in the state.

Airport Characteristics and Fees

Airport facilities and fees are likely to be factors in the decisions of aircraft owners on where to base their aircraft. Information on airport facilities, such as runway length and the presence of a control tower, is available from the FAA Form 5010. Additional information on airport businesses, including fuel prices, is available online from AirNav.com.

Hangar and tiedown rental rates are available for some airports on the airport websites. In other cases it may be necessary to survey airport managers to determine current fees.

Airport Activity by Based and Transient Aircraft

Airport operations counts for towered airports are available from the FAA Air Traffic Activity Data System (ATADS) at http://aspm.faa.gov. This provides daily, monthly, and annual traffic counts, distinguishing between air carrier, air taxi, general aviation, and military operations, with separate counts for local and itinerant operations, Estimates of annual operations at non-towered airports are available from the FAA Form 5010 data, separated into air carrier, air taxi, GA local ,GA itinerant, and military operations.

However, these airport activity counts do not distinguish between itinerant operations by based aircraft and transient (visiting) aircraft. In some cases, airport management may be able to provide an indication of the amount of activity by transient aircraft from records such as fuel sales receipts, overnight aircraft parking fees, or airport noise monitoring systems (which can generate reports of airport operations by tail number). As part of the current study, a survey of airport managers has been undertaken to identify the availability of information on activity by transient aircraft at each airport.

Data on average flight hours for different purposes by different types of aircraft are available from annual FAA General Aviation Activity and Part 135 Activity Surveys (FAA, 2011c). While these are national data, the utilization rates for different aircraft types can be applied to the aircraft fleet in the Southern California region. Some adjustment factors may be necessary to generate a level of activity that is consistent with the airport operations counts after making allowances for operations by visiting aircraft and the number of landings made outside the region by aircraft based at Southern California airports.

Regional Socioeconomic Data

SCAG has developed forecasts of households, population and employment at the travel analysis zone (TAZ) level. These forecasts give the number of households in four income ranges (less than $25,000, $25,000 to $49,999, $50,000 to $99,999, and $100,000 and over, in 1999 dollars) and the total population in the zone, as well as the number of households with no children, one child, two children, and three or more children. The employment forecasts give the total employment in the zone in three income ranges (less than $25,000, $25,000 to $49,999, and $50,000 and over, also in 1999 dollars), as well as the total employment in 13 industry sectors, based on the two-digit North American Industry Classification System (NAICS) codes.

Although the SCAG data on employment by industry sector does not include information on the number of businesses in a given zone, the current distributions of businesses by industry sector and size are available at the zip code level from the U.S. Census Bureau data on County Business Patterns. These data provide the number of businesses in each zip code by industry sector and size, expressed in terms of number of establishments by employment size ranges, using the NAICS codes.

KEY ASSUMPTIONS

Although the forecasting approach described in this section is based on an analysis of current trends in the pilot population, the composition and use of the general aviation fleet, and patterns of aircraft ownership, there are a number of key assumptions that will drive the forecasts.

The most significant of these is the future rate at which student pilots take up flying. This has a profound effect on the size of future pilot cohorts. While recent trends in the number of student pilot certificates issued can give an indication of the likely future rate of new pilot starts, these trends have changed over time and will most likely do so again. Thus establishing the assumptions for the future trend in new student pilot certificates issued involves a judgment about how many people will decide to take up flying in the future. This is likely to be influenced in part by the demand for airline and commercial pilots, as well as the general state of the economy and the cost of flying relative to other recreational pursuits or means of transportation.

A second set of key assumptions involves the rates at which pilots transition to higher levels of certificates, or become inactive, as well as the average number of hours that they fly each year at different stages of their life-cycle as a pilot. While data exists on the recent trends in these rates, there is an open question how long these trends will continue or how they will change in the future. Therefore assumptions must be made about how these rates will change over the forecast period.

Because aircraft have quite long operational lives and the average utilization in flight hours per year is quite low for a large part of the fleet, the aircraft fleet can continue to grow for a time, even if the level of flying activity is reducing. However, eventually older

aircraft will be scrapped or sold outside the region and not replaced. Therefore assumptions are needed on how the current trends in both aircraft attrition and new aircraft acquisition are likely to evolve in the future.

Since the level of activity by corporately-owned aircraft is driven by the transportation or operational needs of the aircraft owners or customers, rather than being determined by the size of the pilot population, assumptions are also needed on how the use of general aviation by businesses may change in the future. The introduction of fractional ownership has made the use of general aviation more affordable to a range of companies, which may eventually decide to acquire their own aircraft. Thus it will also be necessary to make assumptions about future trends in the use of general aviation by different types of businesses in response to changing economic conditions, including those that currently operate aircraft directly or use chartered aircraft as well as those that do not currently make use of general aviation.

These key assumptions have been documented and reviewed with the SCAG Aviation Technical Advisory Committee for suggested changes prior to being used to develop the Regional General Aviation Demand Forecast.

SUMMARY AND IMPLEMENTATION

The forecast approach adopted for this study is based on an analysis of the underlying factors that will influence the future levels of aircraft ownership and general aviation activity, including changes in the composition and activity of the pilot population, attrition of the current aircraft fleet based in the region and addition of new aircraft to the fleet, and the future level of general aviation activity by businesses and other organizations in the region. The planned approach considers the geographical distributions of aircraft owners and the factors that influence where those aircraft owners choose to base their aircraft. The approach is thus sensitive to a range of assumptions about how these factors may change in the future and by varying these assumptions can generate alternative scenarios for the future size and composition of the general aviation fleet and activity in the region, and how that activity is likely to be distributed among the counties and airports in the region.

The analytical framework to support this forecasting approach has been implemented through a series of linked worksheets in a Microsoft Excel workbook. An input and control worksheet provides a dashboard approach to varying the model assumptions and displaying a summary of the forecast results for the current scenario. Additional sheets display more detailed results and provide a “drill-down” capability to examine the changes in forecast activity at a county and airport level. The various analytical modules are implemented in additional linked worksheets. While it is not anticipated that users will modify the way that the calculations are performed on these sheets, they will provide users with the ability to examine how the analytical modules function and review the intermediate calculations, thus providing a high level of transparency to the forecast process.

Federal Aviation Forecasts of General Aviation Activity

The Federal Aviation Administration (FAA) prepares two annual forecasts that address future levels of general aviation (GA) activity: the FAA Aerospace Forecast, which provides projections of future GA activity at a national level, and the FAA Terminal Area Forecast, which provides projections of GA activity at the level of individual airports, from which projections of future GA activity in the Southern California region can be derived.

FAA NATIONAL AEROSPACE FORECAST

The FAA Aerospace Forecast is updated annually and provides projections for a wide range of aviation system metrics at a national level, for both commercial and general aviation. The most recent forecast (FAA, 2011a) provides projections to 2031, using a base year of 2010. The forecast includes the following metrics for the GA system:

- Active GA and air taxi aircraft by category of aircraft
- Active GA and air taxi hours flown by category of aircraft
- Active pilots by type of certificate
- GA aircraft fuel consumption by category of aircraft
- GA aircraft operations at FAA and contract control towers
- GA operations at Terminal Radar Approach Control (TRACON) facilities
- Instrument flight rules (IFR aircraft handles at FAA Air Route Traffic
- Control Centers

The forecast report includes a brief discussion of recent trends in the GA sector, with particular reference to the effect of the most recent recession on shipments of new GA

aircraft and the decade-long declining trend in GA aircraft operations at FAA and contract control towers. However, it noted that GA activity at TRACONs in fiscal year 2010 declined by less than the decline at the control towers, while GA aircraft handled at en route centers (Air Route Traffic Control Centers) rose by 3.4 percent. This appears to reflect the continuing growth in the number of higher-end GA aircraft (business jet aircraft), which tend to make much greater use of en route and terminal control facilities than smaller GA aircraft. Higher-end GA aircraft typically operate under an FAA flight plan, which requires then to be under the control of TRACONs and en route centers, while much of the smaller GA aircraft activity operates under visual flight rules (VFR), and only uses control tower facilities.

The forecast report mentions that the forecasts of GA activity are primarily based on information from the FAA General Aviation and Part 135 Activity Survey (FAA, 2011c), which has been significantly improved and expanded in recent years. The survey results are used as a baseline to which assumed growth rates are applied. There is no discussion in the report of the source or justification of these assumed growth rates. Although the survey results distinguish between activity by aircraft in GA and air taxi (Federal Aviation Regulations Part 135) operations, the forecast projections combine these categories for both active aircraft and hours flown by category of aircraft.

Outlook for General Aviation Activity

The FAA projections show the recent decline in the number of active single-engine piston aircraft (the largest category of GA aircraft) continuing until about 2018, with a slow growth thereafter. This category of aircraft experienced an average annual decline of about 0.7 percent from 2000 to 2010. The projections indicate that the number of active aircraft will further decline by about 2 percent from 2010 to 2018 (an average annual rate of about 0.1 percent per year), with an average annual growth rate from 2018 to 2031 of about 0.6 percent per year. The combined effect results in a projected increase in the number of active aircraft in this category of about 6 percent from 2010 to 2031. Given the recent trend in the number of active aircraft in this category, this projection appears rather optimistic. The projection implies a net increase in the active U.S. single-engine piston aircraft fleet over the 21-year period between 2010 and 2031 of about 8,000 aircraft. Given the average age of this segment of the U.S. GA aircraft fleet and the likely attrition rates over the next two decades, an increase of this size implies a significant increase in production over current levels. Over the past decade U.S. aircraft manufacturers have produced about 12,300 single-engine piston aircraft, net of exports. During this period the active single-engine aircraft fleet declined by about 9,400 aircraft, giving an overall attrition (net of imports) of about 21,700 aircraft. Thus an increase of 8,000 aircraft over the next 20 years implies more than a doubling of production compared to the past decade.

The number of multi-engine piston aircraft is projected to continue its recent decline through 2031, as this category of aircraft is becoming superseded by turboprop and turbojet aircraft, with a further decline in active aircraft of about 17 percent from 2010 to 2031.

In contrast, the number of active turboprop and turbojet aircraft has been increasing at an average annual growth rate of about 5 percent per year from 2000 to 2010. This growth rate is projected to slow considerably to an average annual rate of about 3 percent per year from 2010 to 2020, increasing slightly thereafter to an average annual rate of 3.1 percent per year from 2020 to 2031. The number of active rotorcraft has also been increasing steadily in recent years, with piston-powered rotorcraft increasing at an average annual rate of 2.9 percent per year from 2000 to 2010 and turbine-powered rotorcraft increasing at a higher average annual rate of 4.0 percent per year over the same period. The growth rate for turbine-powered rotorcraft is projected to slow over the forecast period, to an annual average rate of about 2.4 percent per year, while that for piston-powered rotorcraft is projected to increase slightly over the period 2010 to 2020 and slow thereafter, giving an average annual growth rate from 2010 to 2031 of about the same as the past ten years.

The numbers of both experimental and sport aircraft are projected to continue their recent growth, with the number of active experimental aircraft increasing at an average growth rate of 1.4 percent per year between 2010 and 2031 and the number of active sport aircraft increasing at a higher average annual rate of about 3.3 percent per year.

The number of hours flown by single-engine piston aircraft are projected to decline more rapidly between 2010 and 2018 than the decline in the number active aircraft, at an average annual rate of 0.5 percent per year, and increase thereafter at a higher rate than the number of active aircraft, at an average annual rate from 2018 to 2031 of 1.8 percent per year. The combined effect is to increase the number of hours flow by this category of aircraft between 2010 and 2031 by about 19 percent. The number of hours flown by turbojet aircraft and rotorcraft are projected to increase faster than the projected increase in

active aircraft, implying an increase in aircraft utilization. Hours flown by turbojet aircraft are projected to almost triple from 2010 to 2031 (an increase of 195 percent), while hours flown by rotorcraft over the same period are projected to increase by about 85 percent.

The number of active student pilots are projected to decline by about eight percent from 2010 to 2016 before growing slowly to return to slightly above the 2010 level in 2031. The numbers of active private and commercial pilots are projected to follow a similar trend, with the number of private pilots ending up in 2031 about 6 percent above the 2010 level and the number of commercial pilots increasing by about 10 percent from 2010 to 20131. This of course implies that a higher proportion of student pilot progress to obtain private and commercial pilot certificates. The number of active airline transport pilots is projected to steadily increase from 2010 to 2031, ending up about 15 percent above the 2010 level by 2031. While most flying by airline transport pilots is not general aviation, training the increased numbers of airline pilots does involve general aviation, and of course some airline pilots do engage in general aviation flying as well as airline flying.

Although the number of active student, private, and commercial pilots are projected to decline from 2010 to 2016, this is not reflected in the projected numbers of hours flown by different categories of aircraft or the associated projections of GA aircraft operations handled by FAA and contract control towers, TRACONs, or en route centers, most of which increase steadily from 2010 (or 2011 in the case of the control towers). While the number of hours flown by single-engine piston aircraft is projected to decline by about 6 percent from 2010 to 2017, the number of active student pilots is projected to decline by about 8 percent over the same period, while the number of active private pilots is projected to decline by about 7 percent. While these differences are not large, they imply a small increase in the average number of hours flown per pilot at a time when the number of active pilots is declining.

FAA TERMINAL AREA FORECAST

The 2011 FAA Terminal Area Forecast (TAF) provides projections at the airport level for the period from 2010 to 2030 using a base year of 2009 for the following general aviation metrics:

- Itinerant aircraft operations
  - Air taxi
  - General aviation
  - Military
- Local aircraft operations
  - Civil (general aviation)
  - Military
- Based aircraft:
  - Single-engine propeller fixed wing
  - Multi-engine propeller fixed wing
  - Jet fixed wing
  - Helicopters
  - Other

The category of air taxi operations is ambiguous, because in the case of commercial service airports it includes regional airline (also termed commuter airline) operations, as well as true air taxi (Part 135) operations.

The forecast covers 42 of the 54 airports in the region that are currently available for public use, as well as Palmdale Regional Airport, which is currently operating as a military airfield and may only be used by civilian flights on a pre-arranged basis. The following airports are not included in the TAF data:

Imperial County
- Cliff Hatfield Memorial Airport, Calipatria (CLR)
- Holtville Airport (L04) (closed)
- Salton Sea Airport, Salton City (SAS)

Los Angeles County
- Agua Dulce Airpark (L70)
- Catalina Airport, Avalon (AVX)

Riverside County
- Bermuda Dunes Airport (UDD)
- Chiriaco Summit Airport (L77)
- Desert Center Airport, Palm Desert (CN64)
- FlaBob Airport, Riverside (RIR)
- Perris Valley Airport, Perris (L65)

San Bernardino County

Baker Airport (0O2)
Hesperia Airport (L26)
Roy Williams Airport, Joshua Tree (L80) (closed)
Yucca Valley Airport (L22)

Ventura County
Santa Paula Airport (SZP)

The forecast general aviation activity for each county and the region as a whole for 2010 and 2030 is shown in **TABLE 3.1**.

TABLE 3.1 Forecast Aircraft Operations – FAA Terminal Area Forecast

County		Itinerant Operations				Local Operations

	2030	283,229	1,671,980	40,676	1,995,885	1,566,376	20,178	1,586,554
	Growth	35.2%	16.1%	-0.5%	18.1%	10.0%	0.0%	9.9%

The projected growth in itinerant and local GA operations at a regional level (16 percent and 10 percent respectively) are somewhat lower than the forecast growth in total hours flown by single-engine piston aircraft in the national FAA Aerospace Forecasts, which are projected to grow by 19 percent between 2010 and 2031. Since this category of aircraft accounts for the majority of local operations, this suggests that either that the FAA is projecting future growth in general aviation activity in the Southern California region to be well below the national average or that there is a significant disconnect between the TAF projections and the FAA Aerospace Forecast projections.

While the projected growth in itinerant GA operations at a regional level is somewhat higher, these operations include almost all the activity by jet aircraft, the flight hours for which are projected to almost triple between 2010 and 2031 in the FAA national Aerospace Forecast. Although the FAA airport operations counts do not distinguish between operations by piston aircraft and those by jet aircraft, the hours flown by turbine aircraft in 2010 are about half those flown by piston aircraft, according to the data presented in the FAA Aerospace Forecast. If the average flight duration of turbine aircraft is twice that of piston aircraft, this suggests that turbine aircraft account for about 20 percent of airport itinerant GA operations in 2010. Thus a tripling of flight hours by turbine aircraft, assuming that average flight duration remains about the same, would increase the total number of itinerant operations by about 55 percent, or about three times the increase in flight hours projected for single-engine piston aircraft.

The results for each county shown in **TABLE 3.1** suggest that growth rates vary widely across the counties, with Orange County having by far the highest growth in GA aircraft operations for both itinerant and local operations, followed by Los Angeles County, with the airports in Imperial County projected to have no growth in aircraft operations at all. This is largely a consequence of the fact that none of the airports in Imperial County have a control tower, and the TAF forecast methodology generally assumes no growth at airports without a control tower.

The forecast growth in the number of based aircraft at a regional level is shown in **TABLE 3.2**. Generally the number of based aircraft increases by more than the number of GA itinerant and local aircraft operations, which implies a reduction in aircraft utilization. While this could occur if new aircraft are added to the fleet without replacing the older ones, which then experience a dramatic reduction in utilization and pull down the fleet average utilization, this is also inconsistent with the national forecasts of aircraft flight hours. In particular, the 18 percent increase in the number of jet aircraft based in the region is entirely inconsistent with the forecast tripling of aircraft flight hours.

TABLE 3.2 Forecast Based Aircraft – FAA Terminal Area Forecast

RECENT TRENDS IN BASED AIRCRAFT AND AIRCRAFT OPERATIONS IN SOUTHERN CALIFORNIA

In order to put the FAA forecasts into context, it is worth considering the trends in the number of based aircraft and GA aircraft operations at airports in the Southern California region over the past ten years.

Data on the number of general aviation aircraft based at each airport are given on the FAA Form 5010 Airport Master Record, divided into the following categories:

- Single-engine propeller aircraft
- Multi-engine propeller aircraft
- Jet aircraft
- Helicopters
- Gliders
- Ultra-light aircraft
- Military aircraft

Although the FAA Form 5010 only provides the most recent count of based aircraft at each airport, the Caltrans Division of Aeronautics (DOA) maintains a database of historical data from the FAA Form 5010 for each airport in the state. Using the Caltrans database, the based aircraft counts for each airport were assembled for the period 2001 to 2010, and the total for the Southern California region calculated, as shown in **TABLE 3.3**.

TABLE 3.3 Trend in Based Aircraft – Southern California Region

Year	Single Engine Propeller	Multi Engine Propeller	Heli-copter	Glider	Jet	Military	Ultra-light	Total
2001	8,752	1,068	216	138	329	35	149	10,687
2002	8,649	1,227	248	134	631	44	149	11,082
2003	8,668	1,227	248	134	362	44	147	10,830
2004	8,668	1,227	248	134	362	44	147	10,830
2005	8,669	1,230	248	134	362	44	147	10,834
2006	8,778	1,090	276	102	449	63	156	10,914
2007	8,757	1,055	267	103	549	64	154	10,949
2008	8,463	1,062	269	104	623	64	152	10,737
2009	8,116	993	286	101	627	45	150	10,318
2010	7,919	935	314	103	776	47	178	10,272

The total number of based aircraft in the region increased from 2001 to 2002 then remained fairly stable until 2007, since when it has declined steadily to a level in 2010 about 6 percent below that of 2007. However, this overall trend conceals significant differences among the various categories of aircraft. Over the ten year period the number of based jet aircraft and helicopters has increased significantly, by 136 percent and 45 percent respectively, while the numbers of single-engine and multi-engine propeller aircraft have declined. The number of single-engine propeller aircraft, which comprised 82 percent of the fleet in 2001, has declined by about 10 percent over the ten-year period and by 2010 comprised only about 77 percent of the fleet, while the number of multi-engine propeller aircraft has declined by about 12 percent over the period. The number of gliders has declined by about 25 percent over the ten-year period, while the number of ultra light aircraft has increased by about 20 percent.

Data on the number of general aviation aircraft operations at each airport are available from two different sources. Airport operations counts for towered airports (those with a control tower) are available from the FAA Air Traffic Activity Data System (ATADS) and are summarized in the TAF database, together with estimates of operations at non-towered airports included in the TAF that are derived from FAA Form 5010 data. Estimates of annual operations at airports not included in the TAF (typically non-towered airports) are also available from the FAA Form 5010 data, separated into air carrier, air taxi, GA local, GA itinerant, and military operations.

Aircraft operations counts for each airport were obtained from the TAF database, supplemented with data from the Caltrans DOA Form 5010 database for airports not included in the TAF database or where the TAF database was missing data for particular years. The resulting counts for each airport were summed to give the regional totals shown in **TABLE 3.4**.

TABLE 3.4 Trend in Aircraft Operations – Southern California Region

	Itinerant Operations					Local Operations		
Year	Air Carrier	Air Taxi	General Aviation	Military	Total Itinerant	General Aviation	Military	Total Operations
2001	816,749	378,194	2,064,481	47,643	3,307,067	1,836,982	22,174	5,166,223
2002	706,603	351,509	2,101,140	46,248	3,205,500	1,841,830	17,283	5,064,613
2003	709,012	351,419	2,064,131	46,004	3,170,566	1,810,344	16,771	4,997,681
2004	733,320	367,024	1,999,926	47,094	3,147,364	1,783,320	21,003	4,951,687
2005	730,556	385,531	1,978,467	48,070	3,142,624	1,774,894	22,024	4,939,542
2006	735,023	367,870	1,895,914	46,066	3,044,873	1,669,023	30,417	4,744,313
2007	747,948	381,418	1,844,919	43,464	3,017,749	1,695,764	30,123	4,743,636
2008	734,353	363,596	1,692,746	41,269	2,831,964	1,644,991	23,650	4,500,605
2009	687,430	243,001	1,551,533	40,778	2,522,742	1,574,560	21,127	4,118,429
2010	697,089	219,693	1,551,208	40,968	2,508,958	1,571,944	20,178	4,101,080

Overall, total operations, including air carrier and air taxi, have declined by about 21 percent from 2001 to 2010. This decline has occurred in all categories of operation, but the decline in general aviation (GA) and air taxi has been steeper than for air carrier operations. While air carrier operations declined by about 15 percent over the period, air taxi operations declined by over 40 percent. However, the decline in air taxi operations has occurred mostly in the two-year period from 2008 to 2010. Over the ten-year period, GA itinerant operations declined by about 25 percent and GA local operations declined by about 16 percent.

Therefore, in contrast to the growth projected in the TAF for airports in the Southern California region, the number of based aircraft has been fairly stable until recent years, when it has started to decline, while the number of aircraft operations has been declining steadily for the past decade.

Pilot Cohort Analysis

A key element of the forecast approach is an analysis of expected future changes in the composition of the pilot community in Southern California and the implications for the amount and type of flying that this pilot community will perform.

This section summarizes previous studies into characteristics of the general aviation pilot community and recent trends in the composition and activity levels of the GA pilot community, available data on the composition and activity levels of the GA pilot community, and the results of the analysis of those data undertaken as part of the current study. In addition the section presents the relevant findings from the results of a survey of members of the Aircraft Owners and Pilots Association (AOPA) that was conducted by SCAG and the California Department of Transportation (Caltrans) Division of Aeronautics with the support of the AOPA.

PREVIOUS STUDIES

In spite of the large amount of general aviation activity and the number of general aviation airports in the United States and the recurring need to prepare forecasts of future general aviation activity as part of studies to update airport master plans, prepare statewide and regional airport system plans, and for other purposes, recent trends in the composition of the GA pilot community and the flying activity undertaken by those pilots has received surprisingly little attention in the aviation planning literature.

A small number of studies have examined changes in the characteristics of the pilot population over time, although these have most commonly addressed the influence of pilot characteristics on accident risk (e.g. Li, Baker, et al., 2003; Rebok, Qiang, et al., 2009). A study in the early 1970s (Booze, 1972) examined pilot attrition by age and a more recent study (Rogers, Véronneau, et al., 2009) examined changes in the pilot population over time from 1983 to 2005. The latter study was undertaken in order to examine the effect of changes in the regulations that raised the age limit for pilots to perform the duties of pilot or co-pilot of a commercial passenger or cargo aircraft with ten or more passenger seats or 7,500 payload-pounds of cargo capacity from age 60 to 65, although the analysis in the study addressed broader trends. This study showed that the average age of pilots has been steadily increasing, and with it the average number of flight hours experience.

Pilot Attrition

Pilot attrition refers to the percentage of active pilots holding a given pilot certificate who stop flying for whatever reason. Reasons for a pilot to become inactive include age, medical reasons, loss of interest, or financial limitations. Pilots report the number of hours they have flown in the previous six months as well as their total flight time to date when they apply to renew their medical certificate. If a pilot fails to renew his or her medical certificate when it expires, the FAA classifies that pilot as inactive until such time as the pilot again applies for a medical certificate. In July 2008 the FAA extended the validity of a third class medical certificate (required for pilots holding a private pilot or recreational pilot certificate, or for student pilots flying solo) for pilots under age 40 from three years to five years from the date of issue. A third class medical certificate for pilots age 40 and over is valid for two years from the date of issue. Thus the first indication in the FAA pilot registration database that a student, private or recreational pilot under age 40 is no longer active is five years after their most recent medical certificate was issued, although of course they could have stopped flying well before that. This is particularly true for student pilots, who may have effectively given up learning to fly fairly soon after receiving their medical certificate.

In spite of the obvious importance of the extent of and trends in pilot attrition to the future size and composition of the GA pilot community, a review of the literature on the composition of the GA pilot community failed to identify any studies on recent trends in pilot attrition. Indeed the only formal study on the topic by Booze (1972) is now very dated, although the basic pattern of the attrition rates found in that study may still be reasonably valid. Although the study by Booze was primarily intended to explore the effect of the occurrence of medical problems on attrition from active airman status, it found that these only accounted for less than one percent of the overall attrition rate of active airmen, which Booze stated amounted to approximately 17 percent annually (although the data presented in the report suggest a somewhat higher figure of about 21 percent annually).

At the time of the study, a third class medical certificate was valid for 24 months. The study classified all airmen who obtained a medical certificate of any class in 1968 but did not hold a valid medical certificate 24 months later in 1970 to have become inactive. These airmen were termed the “attrition group,” which comprised 151,917 airmen. The report presents a breakdown of the attrition group by age (in five-year increments) and class of medical certificate. The report gives the total active airman population at the end of 1970, but does not show the age breakdown or how this was divided among the various levels of pilot certificate. Although the report refers to “airmen” throughout, the data for the population of active airmen indicates that the study only considered those holding pilot certificates, and not those holding non-pilot airman certificates. The report does provide the average age for the active airman population holding the various classes of medical certificate, as well as the corresponding average ages for the attrition group. The report also provides data on the total flight time and flight time in the six months prior to the last medical examination for the attrition group, but not for the population.

The average age for airmen in the attrition group and the active airman population holding each class of medical certificate is shown in **TABLE 4.1**.

TABLE 4.1 Average Age of Active Airmen Population and the 1970 Attrition Group

	Class of Medical Certificate		
	Third	Second	First
Airmen Population	35.4	35.1	35.1
Attrition Group	34	35.2	30.9

Source: Booze, 1972.

The average age for airmen in the attrition group holding a third class medical certificate is somewhat lower than for the corresponding population of active airmen, as could be expected since attrition is likely to be higher among younger airmen, particularly student pilots who do not progress to a private pilot certificate or become inactive soon after gaining their private pilot certificate. The average age for airmen in the attrition group holding a second class medical certificate is almost the same as the corresponding population of active airmen (actually slightly higher), suggesting that the attrition rate in this category of airmen is fairly constant across the different age ranges. The average age for airmen in the attrition group holding a first class medical certificate is significantly lower than the average age of the corresponding population of active airmen, again as could be expected due to younger pilots obtaining a first class medical certificate in the hope of pursuing a career as an airline pilot but giving up for a variety of reasons.

The number of airmen in the attrition group by age, class of medical certificate, and whether they had a previous medical examination to the one for the certificate that had just expired is shown in **TABLE 4.2**.

>84	3					
Total	**39,882**	**62,754**	**27,455**	**13,978**	**4,816**	**3,032**

Airmen with no previous medical examination can be assumed to be mostly student pilots, although it would be possible for a fairly determined student pilot to advance to private pilot or even commercial pilot within the 24-month validity period of the initial medical certificate. The number of pilots holding a second-class or first-class medical certificate with no previous medical examination is initially surprising, although this could result from student pilots who intended to progress to a commercial or airline transport pilot certificate and obtained the appropriate medical certificate on their first medical examination.

As could be expected, the largest component of the attrition group is airmen holding a third class medical certificate with no previous medical examination, since this group largely comprises student pilots who become inactive within the first two years of their initial medical certificate. The age distribution of airmen holding a first class medical certificate who become inactive is surprising for the relatively small number of this group who become inactive at age 60. At the time of the study, airmen holding an airline transport pilot certificate (which requires a first-class medical certificate) could no longer exercise the privileges of that certificate after they reached age 60. They could continue to fly as a private or commercial pilot as long as they held a valid medical certificate appropriate for the type of flying they were doing, so it is possible that many airline pilots continued to maintain a valid medical certificate after they reached age 60, and therefore were not included in the attrition group.

Although the report by Booze does not provide a comparable age distribution of the active airmen population, a copy of the 1969 U.S. Civil Airmen Statistics (FAA, 1970) was located in the library of the Institute of Transportation Studies at the University of California, Berkeley, which included the age distribution of active pilots by type of pilot certificate, as shown in **TABLE 4.3**.

TABLE 4.3 Active U.S. Pilots by Age Group, 1969

	Active Pilots, as of December 31, 1969				
Age Group	Student	Private (Note 1)	Commercial (Note 2)	Airline Transport	Total
<20	24,995	7,508	627		33,130
20–24	50,498	33,036	15,662	164	99,360
25–29	42,490	42,693	38,057	1,712	124,952
30–34	28,157	42,076	29,309	3,735	103,277
35–39	21,675	44,767	26,155	5,480	98,077
40–44	16,139	49,387	18,559	5,030	89,115

Notes 1 Includes Gliders (only)
Notes 2 Includes Helicopters (only) and other

Because the data on the age distribution of the attrition group were expressed in terms of medical certificate held while the data on active pilots were expressed in terms of the pilot certificate, it was necessary to make a number of assumptions in order to relate the two datasets:

- All pilots in the attrition group with no previous medical examination were assumed to be student pilots
- All pilots in the attrition group holding a third-class medical certificate with a previous medical examination were assumed to hold a private pilot certificate
- All pilots in the attrition group holding a second-class medical certificate with a previous medical examination were assumed to hold a commercial pilot certificate

- The attrition rate for pilots holding a first-class medical certificate with a previous medical examination and between the ages of 20 and 34 was assumed to be the same for pilots holding a commercial pilot certificate or an airline transport certificate
- All pilots in the attrition group holding a first-class medical certificate with a previous medical examination and aged 45 or above were assumed to hold an airline transport certificate.

The fourth assumption shown above implies that the number of pilots in the attrition group holding a first-class medical certificate with a previous medical examination and holding either a commercial pilot or an airline transport pilot certificate was proportional to the number of active pilots holding those pilot certificates. The fifth assumption shown above is based on the underlying assumptions that pilots holding a commercial pilot certificate with the intention of becoming an airline pilot or taking a job that requires an airline transport pilot certificate will have done so by age 45 and that since the first-class medical certificate requires more frequent medical examinations (every six months), a pilot holding a commercial pilot certificate who does not require a first-class medical certificate will choose to obtain a second-class medical certificate instead. In addition, it was assumed that the attrition rate for pilots holding an airline transport pilot certificate aged 35 to 44 is the same as for those aged 30 to 34.

These assumptions allow the number of pilots in the attrition group in each age range holding the different classes of medical certificate to be assigned to an assumed type of pilot certificate and the resulting attrition rate by age group and type of pilot certificate calculated, as shown in **TABLE 4.4**. Since the attrition group was defined as the number of pilots who obtained a medical certificate in 1968 but did not hold a valid medical certificate two years later, the annual attrition rates are approximately half those shown in **TABLE 4.4**.

TABLE 4.4 Two-Year Attrition Rates of Active U.S. Pilots by Age Group, 1968–1970

	Attrition Rate by Pilot Certificate			
Age Group	Student	Private	Commercial	Airline Transport
<20	21.0%	0.9%	5.7%	
20–24	42.6%	10.2%	20.1%	4.6%
25–29	45.0%	11.4%	16.8%	3.5%
30–34	40.0%	12.6%	19.0%	3.5%
35–39	37.5%	12.9%	18.3%	3.5%
40–44	37.8%	14.3%	17.8%	3.5%
45–49	44.8%	15.2%	12.9%	3.8%
50–54	44.3%	15.7%	15.7%	4.9%
55–59	37.5%	17.7%	15.5%	5.8%
60+	31.7%	20.3%	15.3%	13.6%
Total	**39.2%**	**13.2%**	**16.9%**	**4.1%**

Source: Author calculations as discussed in text.

As can be expected, the estimated attrition rates for student pilots are significantly higher than for the other types of pilot certificate, although apart from those student pilots under 20 do not vary greatly with age. Attrition rates for student pilots increase through their twenties, then decline through their thirties, increase again through their forties, then decline thereafter. In contrast, attrition rates for private pilots increase steadily with age. Attrition rates for commercial pilots also do not vary greatly with age, being highest in their early twenties, as could be expected as those initially seeking a career as a commercial pilot are unable to find a job or find the career less attractive than they had expected and give up. The attrition rate drops slightly in their late twenties before rising again in their early thirties, then declining until their late forties and remaining fairly constant from their early fifties on. Attrition rates for airline transport pilots remain fairly

low until their mid-forties then increase steadily until their sixties, when airline transport pilots (at the time) were no longer allowed to fly airline aircraft.

While the variation of these estimated attrition rates by age seem inherently plausible, they should be viewed with some caution due to the assumptions required to combine the data on the size of the attrition group by class of medical certificate with the number of active pilots by type of pilot certificate.

Weighting the attrition rates for each type of pilot certificate by the number of active pilots holding that type of certificate gives an overall attrition rate over two years of 21.1 percent of all active pilots, or an average attrition rate per year of about 10.5 percent.

Since the number of active pilots in each age range holding a given type of pilot certificate changes from year to year, reflecting the number of new pilot certificates issued as well as those pilots becoming inactive, the estimated annual attrition rates are only approximate. However, the growth in the size of the pilot population during the period of the study was slowing fairly rapidly, as shown in **TABLE 4.5**, increasing by only about one percent from 1969 to 1970, suggesting that attrition rates based on the active pilot population at the end of 1969 (two thirds of the way through the attrition period used in the study) provide a reasonable estimate of the average attrition rate.

TABLE 4.5 U.S. Active Pilot Population, 1968–1970

	Active Pilot Population	
	as of December 31	Growth
1967	617,931	
1968	691,695	11.90%
1969	720,028	4.10%
1970	727,430	1.00%

Recent Trends in the Pilot Community

The recent study of the U.S. pilot population by the FAA Civil Aerospace Medical Institute (Rogers, Véronneau, et al., 2009) combined data on the number of pilot certificates held and airmen medical certificates issued to analyze changes in the size and composition of the pilot community as well as the average flight hours reported by pilots at the time of their most recent medical examination (pilots report their total flight hours to date on the application form for a medical examination). Although the authors frequently refer to "active airmen" in the report, the description of the study makes it clear that the analysis only considered active pilots and not non-pilot airmen (such as flight engineers).

The study showed that the number of active pilots has been steadily declining each year since 1983, as shown in **FIGURE 4.1**, although with some apparent short-term increases in several years.

FIGURE 4.1 Number of Active Pilots per Year

Source: Rogers, Véronneau, et al., 2009

The authors note that the apparent drop in the number of active pilots in 1990 is a data anomaly due to a technical problem in the entry of the results of medical examinations conducted in 1989 into the electronic records at the time that resulted in data for a large number of the medical examinations being omitted from the electronic records. This impacted the estimate of the number of active pilots for 1989 and the following two years, because those pilots whose medical examination results were omitted from the electronic records were erroneously counted as having become inactive until the results of their next medical examination caused them to be counted as active again. This effect persisted for two years because third class medical certificates at the time were valid for 24 months, so even pilots who had a first-class medical certificate, which was only valid for six months, were considered active for two years from the date of their last medical since they could continue to exercise the privileges of a third-class medical certificate for two years.

The authors also note that the drop in the number of active pilots in 1986 and 1987, and again in 1993 and 1994, were due to unexplained missing records for medical examinations in 1986 and 1993, which resulted in a number of pilots being incorrectly classified as inactive for up to two years.

A change in the rules governing the validity of medical certificates in September 1996 contributed to the apparent increase in active pilots in 1999 and 2000. The rule change extended the validity of third-class medical certificates for pilots under the age of 40 at the time of their medical examination to three years. This resulted in pilots who would otherwise have been counted as inactive two years later being counted as active for an additional year.

The number of active pilots shown in **FIGURE 4.1** for a given year is significantly higher than the number reported in the annual FAA U.S. Civil Airmen Statistics (FAA, 2011e) for the same year. The report does not comment on or explain this discrepancy, but it appears to result from a different way of counting active pilots for a given year. The U.S. Civil Airmen Statistics counts active airmen for a given year as those holding a valid medical certificate as of December 31 of that year. The authors mention that for each pilot in their database they calculate a variable called "months contributed" which measures the number of months in the year that the pilot held a valid medical certificate. Although the report does not state how the number of active pilots in a given year is determined, it seems plausible that pilots who become inactive during the year are counted as a fraction of an active pilot based on the number of months they were considered active (since otherwise there would be no reason to calculate the variable "months contributed"). This would give a higher total of active pilots for a given year than the U.S. Civil Airmen Statistics, since pilots becoming inactive during the year are not counted in the total for that year using the approach adopted in the U.S. Civil Airmen Statistics.

Assuming this to be the case, this has an interesting side effect that the difference between the number of active pilots for a given year given in the report and that given in the U.S. Civil Airmen Statistics provides a direct measure of the attrition rate for that year. Unfortunately, since the more detailed data on active pilots in the report are presented in terms of the class of medical certificate held, while the data in the U.S. Civil Airmen Statistics are presented in terms of the type of pilot certificate held, estimating differences in attrition rate by type of pilot certificate, which as suggested by the earlier study by Booze (1972) are likely to be significant, would require assumptions about the proportion of active pilots holding a given class of medical certificate who also hold a given type of pilot certificate. Furthermore, the authors only present the results of their analysis graphically in the report, and do not provide the underlying numerical data, so it is necessary to measure the values from the figures, which introduces some inaccuracy in any analysis.

Even so, the resulting estimates of the overall attrition rate of active pilots shown in **TABLE 4.6** provide a useful check on the earlier estimates by Booze (1972), as well as providing an indication of the extent to which attrition rates appear to have been changing over time.

The calculated attrition rates vary from 9 percent per year to about 21 percent per year, and appear to have been declining from 2001 to 2005, the last year of data in the study. No attrition rate could be calculated for 1990 due to the data anomaly in 1990 discussed above, and the attrition rates for 1989 and 1991 appear to be unreasonably low, possibly for reasons related to the 1990 data anomaly. Excluding these three years, the average attrition rate for the period from 1998 to 2005 is 14.5 percent per year. This rate is somewhat higher than the average annual attrition rate across all active pilots of 10.8 percent found by Booze (1972), but not greatly so and the average value found by Booze lies within the range of values estimated from the data in the study.

Based on the total number of active pilots in each year, the authors developed a regression model of the total number of active pilots in each year that includes a dummy

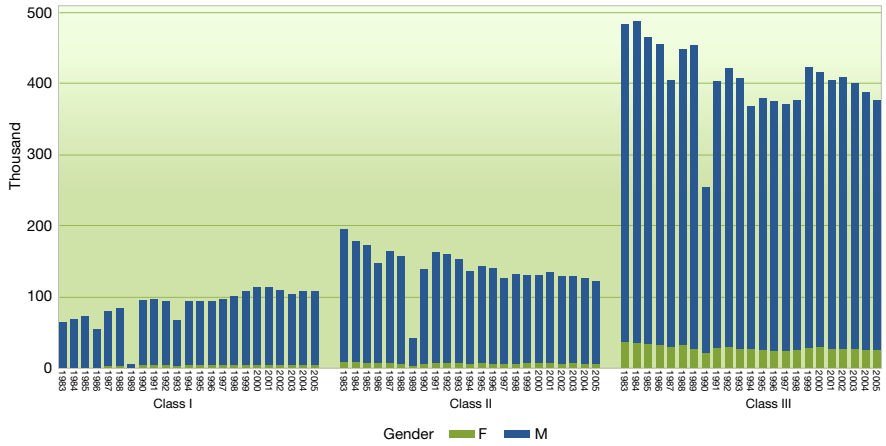
variable to account for the change in duration of the validity of third-class medical certificates in 1996, but otherwise assumes a linear decline in the total number of active pilots over time. The dummy variable was applied to years from 1999 on, assuming that the effect of the rule change did not appear in the estimated number of active pilots until 1999.

This gave the following regression equation:

$$P = 25{,}136{,}097 - 12{,}238.38 \times Y + 85{,}691 \times D$$

where P = the total number of active pilots in a year

Y = the year



D = a dummy variable set to 1 for years from 1999 on, 0 otherwise

This model suggests that if the trend over the period from 1983 to 2005 continues, the total number of active pilots will decline by about 12,200 per year. This would give an estimated number of active pilots in 2010 of 622,646. In fact the number of active pilots at the end of 2010 according to the U.S. Civil Airmen Statistics was 627,588. However, the regression model is based on the definition of active pilots used in the study, which gives a higher estimate of active pilots than that given by the U.S. Civil Airmen Statistics by about 15 percent, for the reasons discussed above, as shown in **TABLE 4.6**. In addition, a further change in the rules governing the duration of the validity of medical certificates in July 2008 increased the duration of the validity of third-class medical certificates for pilots under age 40 to five years, which would have the effect of increasing the number of pilots considered to be active. From 2009 to 2010 the number of active student pilots reported in the U.S. Civil Airmen Statistics increased by about 47,000 (or about 7 percent of all active pilots in 2010) at a time when the number of active pilots holding most other categories of pilot certificates declined. The combined effect of these two factors suggests that the decline in the number of active pilots since 2005 has been somewhat slower than predicted by the regression model.

In addition to the total number of active pilots, the report provides a breakdown of the number of active pilots by the class of the medical certificate held at the end of each year, as well as by gender, as shown in **FIGURE 4.2**. As expected, the data is dominated by the number of pilots holding a third-class medical certificate (student and private pilots). The decline in the number of active pilots over time occurred for pilots holding a second-class medical certificate (primarily those holding a commercial pilot certificate) as well as a third-class medical certificate. The data in **FIGURE 4.2** for active pilots holding a third-class medical certificate clearly shows the increase in the number of active pilots in 1999 due to the change in the validity of a third-class medical certificate for pilots under age 40 that became effective in September 1996 and extended the period of validity from two to three years. This did not begin to affect the number of active pilots until late 1998 when pilots who would otherwise have been considered inactive if they had not renewed their medical certificate were not now counted as inactive for another year.

In contrast to the declining trend for pilots holding a third-class or second-class medical certificate, the number of active pilots holding a first-class medical certificate (primarily those holding an airline transport pilot certificate) shows an increasing trend until 2001, followed by a decline through 2003 and a modest recovery in 2004 and 2005. The changes since 2001 would appear to reflect the contraction of the airline industry in the aftermath of the 9/11 terrorist attacks in 2001, followed by the modest recovery beginning in 2004. As airlines reduced capacity and furloughed pilots after September 2001, this would have had two effects on the number of active airline pilots. First, some furloughed pilots may have decided not to renew their medical certificate when it expired until it became clear whether they would be able to return to flying, and some may have decided to give up flying permanently. The second effect would have been a significant drop in the number of commercial pilots seeking positions as airline pilots, since with a large number of furloughed pilots there were very few entry-level positions available. As older airline pilots were forced to stop flying by their age, they were not being replaced by younger pilots transitioning from jobs as a commercial pilot, resulting in a decline the number of pilots holding a first-class medical certificate.

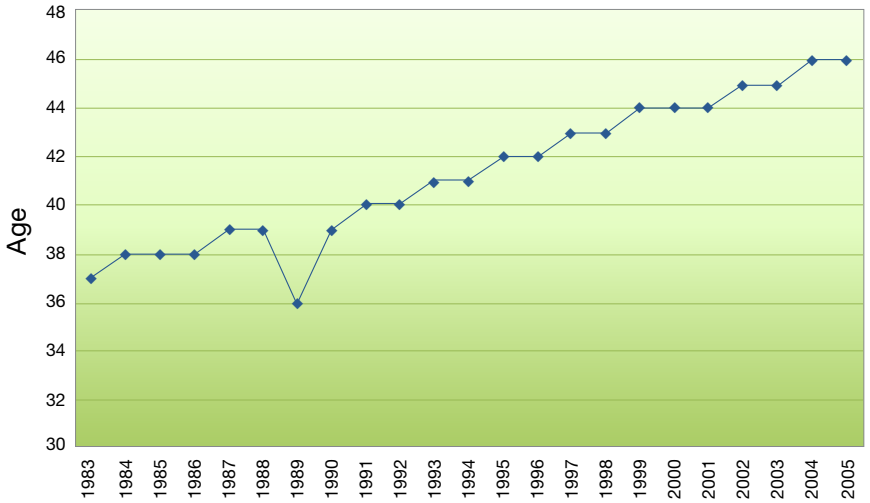


FIGURE 4.2 Number of Active Pilots by Medical Class and Gender

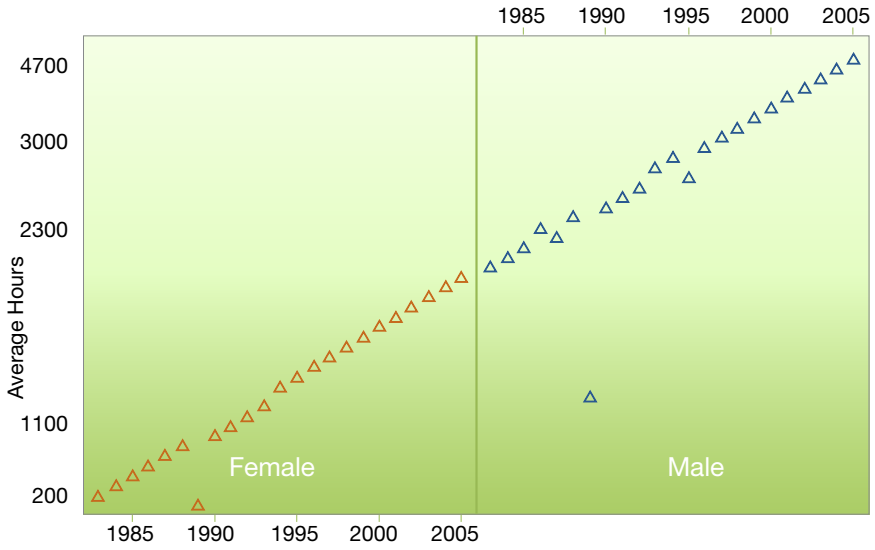
Source: Rogers, Véronneau, et al., 2009



As the number of new pilot starts declined, the median age of active pilots steadily increased, apart from the 1989 data anomaly, as shown in **FIGURE 4.3**. Since pilots accumulate more flight time as they get older, the average total hours flown reported by applicants for a medical examination increased steadily from 1983 to 2005, as shown in **FIGURE 4.4**, in which the left panel shows the average total flight hours for female pilots and the right panel shows the average total flight hours for male pilots.

FIGURE 4.3 Median Age of Pilots Who Received a Medical Examination.

Source: Rogers, Véronneau, et al., 2009

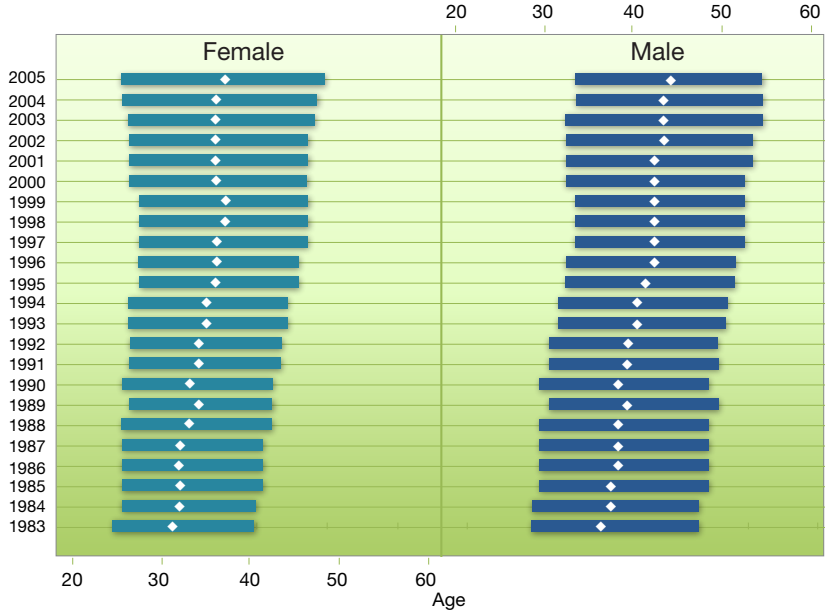


FIGURE 4.4 Average Hours Flown Reported by Pilots at Time of Medical Examination

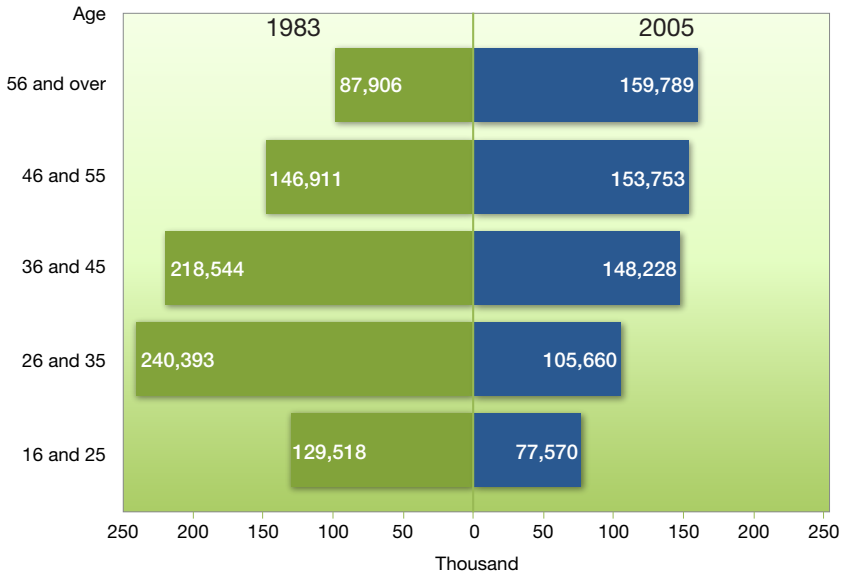
Source: Rogers, Véronneau, et al., 2009

As can be seen from **FIGURE 4.4**, the average total hours flown by female pilots are significantly lower than those of male pilots, as can be expected since the age distribution of female pilots is somewhat younger than that of male pilots, as shown by **FIGURE 4.5**. In addition a smaller proportion of female pilots hold commercial pilot or airline transport pilot certificates than male pilots, pilot categories that generally have much higher levels of flight experience.

FIGURE 4.5 Median Age of Active Airmen by Gender

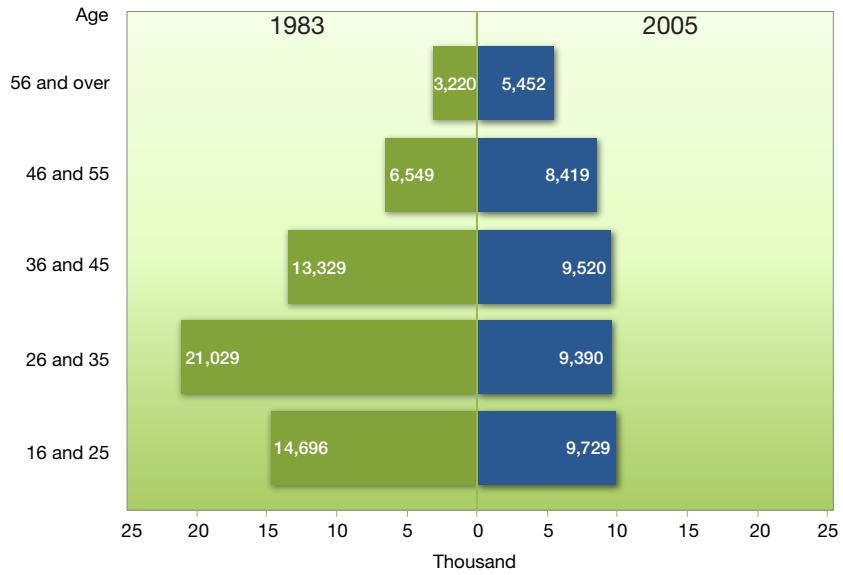
Source: Rogers, Véronneau, et al., 2009



The report provides similar figures for the average flight experience of pilots holding third-class, second-class and first-class medical certificates. These generally show a similar pattern, although the average number of total hours flown for a given year differs between the classes of medical certificates, as could be expected, with holders of first-class medical certificates reporting the highest average flight experience for a given year, followed by the holders of second-class medical certificates. The average number of hours flown by holders of first-class medical certificates also shows the greatest amount of variability from year to year, for reasons that are not entirely clear.

While the report shows the change in average hours flown over time, it does not provide a breakdown of the average hours flown per year by pilots in a given age group, nor numerical values for the average flight hours shown in the figures. In addition, it is clear

from **FIGURE 4.4** (and from the other figures in the report for the average flight hours for different classes of medical certificate) that the vertical scale on the figures is non-linear (or the values shown on the vertical axis of the figures are wrong). Either way, this makes it effectively impossible to measure the values from the figures.



The report also presents the data on the age distribution for male and female pilots as population pyramids, as shown in **FIGURES 4.6** and **4.7**. The shift in age distribution of male pilots (by far the largest proportion of the pilot community, as shown in **FIGURE 4.2**) between 1983 and 2005 is striking. It is clear that as those pilots aged 36 and above in 2005 move into older age cohorts and become inactive they will not be replaced by younger pilots, because there simply are not enough of them in the younger age cohorts. The inevitable conclusion is that the population of active pilots in the U.S. is almost certain to collapse over the next 20 years.

FIGURE 4.6 Age Pyramid of Active Male Airmen

Source: Rogers, Véronneau, et al., 2009

FIGURE 4.7 Age Pyramid of Active Female Airmen

Although the age pyramid of female pilots in 2005 does not show a similar decline in the proportion of younger pilots that is shown in **FIGURE 4.6** for male pilots, it also does not show the high proportion of active pilots in the age cohort from 26 to 25 shown in the data for 1983. Given the inevitable attrition that is likely to occur in the number of active female pilots as they move into older age cohorts, the number of active female pilots in the age cohorts aged 26 and younger is not sufficient to sustain the existing female pilot population in the older age cohorts.

Thus while the decline in active female pilots over the next 20 years is not likely to be as severe as for male pilots, it too will decline.

Data on Pilot Characteristics

As discussed in Section 2, statistical data on the U.S. pilot population is available from the annual FAA U.S. Civil Airmen Statistics (FAA, 2011e), while data on individual pilots can be downloaded from the FAA Airmen Registration Database (FAA, 2011d), including

their address, pilot certificates, and date of their most recent medical certificate, although these data do not include the pilot's age or flight experience and exclude the records of airmen who have requested that their address not be released. Although the FAA updates the downloadable data monthly and does not formally archive these data, prior versions remain on the server for about two years and can still be accessed by entering the correct URL for the files and an earlier version from October 2004 was found on a web archive (http://www.archive.org).

As discussed in Section 2, the FAA Airmen Certification Branch maintains internal reports on past totals of active airmen by county, and the relevant pages of these reports for California counties were obtained from the Branch staff for a selection of prior years. In addition, in response to a special data request the Airmen Certification Branch staff performed an analysis run that generated the number of active pilots by California county and age range as of December 31, 2010.

COMPOSITION OF THE SOUTHERN CALIFORNIA PILOT COMMUNITY

Based on the data on the number of active airmen by California county from the FAA Airmen Certification Branch, the recent trend in the number of active pilots resident in the six-county Southern California region is shown in **TABLE 4.6**.

The total number of active pilots shows a steady decline from 2001 to 2009. The apparent increase in the number of active pilots holding a student or commercial pilot certificate from 2001 to 2006 is most likely an artifact of the change in the way that pilots holding rotorcraft or glider certificates only were counted in 2001 compared to 2006. The increase in the total number of active pilots from 2009 to 2010 is attributable to the apparent increase in active student pilots. This resulted from a change in the duration of the validity of third-class medical certificates on July 24, 2008 from three to five years for pilots under age 40, as discussed above. The FAA Airman Certification Branch began to reflect the effect of this change in the way that active student pilots are counted by changing the validity of student pilot certificates from 36 to 60 months on July 1, 2010. This increased the assumed number of active student pilots on December 31, 2010 since some pilots whose medical certificate would have expired between July and December under the former rules were still considered active.

It should be noted that the change in validity of a third-class medical certificate from 36 to 60 months with effect from July 2008 also affects private and recreational pilots under age 40 who hold a third-class medicate certificate (the majority of such pilots), although this does not appear to have been taken into account in the FAA data for active airmen as of December 31, 2010.

Because of the changes in the way that FAA counted rotorcraft and glider pilots between 2001 and 2006 and counted active student pilots in 2010, the changes in the number of active pilots between 2006 and 2009 provide the best indication of recent trends in the number of active pilots. The changes in the number of active pilots with each type of certificate over the three-year period are shown in **TABLE 4.6**. In the case of pilots holding private, commercial and airline transport certificates, for whom the FAA did not change the way that active pilots were counted, the changes in the number of active pilots from 2009 to 2010 are also shown in **TABLE 4.6**.

Over the three year period from 2006 to 2009, the number of active student pilots declined by about 25 percent, while the number of active private pilots declined by about 5 percent and the number of active airline transport pilots declined by 0.8 percent. However, the number of active private and airline transport pilots increased slightly from 2006 to 2008, with a correspondingly greater decrease from 2008 to 2009. While the number of active commercial pilots increased by 0.5 percent from 2006 to 2009, this was the result of a 2.2 percent increase from 2006 to 2008, followed by a decrease in the each of the following two years. The large percentage increases in the number of sport pilots, particularly from 2006 to 2008, resulted from the small number of such pilots in 2006. The sport pilot certificate was created in September 2004 and by December 2006 there were only 11 such pilots in Southern California. By December 2010 there were only 70 sport pilots in the whole region.

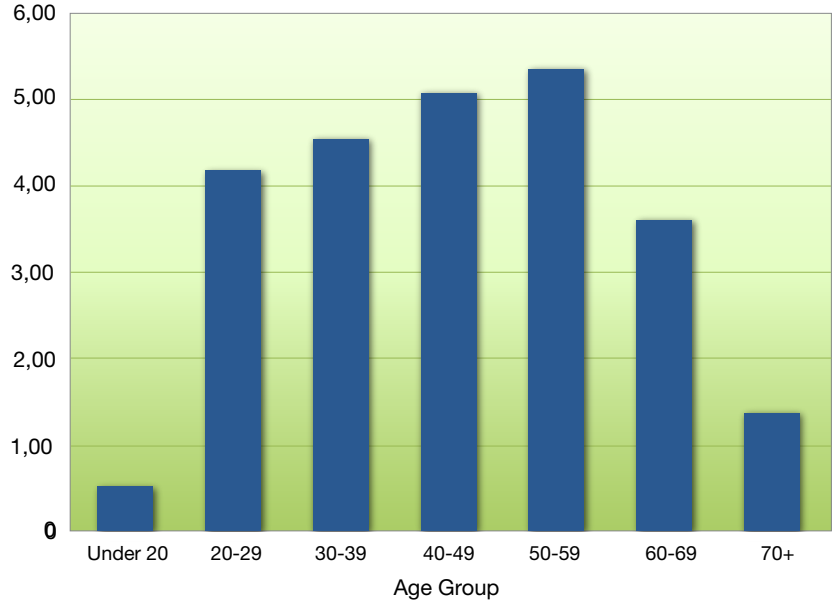
The data provided by the FAA Airmen Certification Branch also included the number of active pilots in each of the six Southern California counties by type of pilot certificate held and age group as of December 31, 2010. The totals for the six-county region are shown in **TABLE 4.7** and **FIGURE 4.8**.

TABLE 4.6 Recent Changes in the Southern California Pilot Community

Type of Certificate	Change 2006–09	2006–08	2008–09	2009–10
Student pilot	-25.30%	-11.00%	-16.10%	(note 1)
Private pilot	-5.00%	0.60%	-5.60%	-5.00%
Commercial pilot	0.50%	2.20%	-1.60%	-3.10%
Airline transport pilot	-0.80%	0.40%	-1.20%	-2.80%
Recreational pilot	(note 2)	(note 2)	(note 2)	(note 2)
Sport pilot	491%	336%	35.40%	7.70%
Total	**-6.20%**	**-0.90%**	**-5.40%**	**(note 1)**

Source: Author analysis based on FAA, Active Airmen Certificate Totals by Region, State, County, Airmen Certification Branch, Oklahoma City, OK.

Notes: 1 Percentage change distorted by change in validity of third-class medical certificates for pilots under age 40.
Notes: 2 Insufficient data for meaningful measure of percent change..



Generally the age profile of active pilots shows a somewhat higher proportion of active pilots in the younger age cohorts than the national data for male pilots in 2005 shown in **FIGURE 4.6**. However, it should be noted that the effect of the change in validity of a third-class medical certificate for pilots under age 40 in 2008 would increase the number of pilots in this category counted as active by the FAA, distorting the comparison. The age distribution of active student and private pilots is shown in **FIGURE 4.9**. This shows that the majority of student pilots are in the age range between 20 and 39. Although there appear to be to more active student pilots in the age range 29 and below than active private pilots, there is a significant attrition of student pilots who never progress to gaining their private pilot certificate. In addition, the number of active student pilots below age 40 is likely inflated by the change in validity of third-class medical certificate, as discussed above.

TABLE 4.7 Active Pilots in Southern California by Age Group

Age	Student Pilot	Recre-ational or Sport Pilot	Private Pilot	Commercial Pilot	Airline Transport Pilot	Total
Under 20	407	0	127	8	0	542
20–29	1,907	4	1,262	896	110	4,179
30–39	1,388	2	1,466	1,013	677	4,546
40–49	825	19	1,902	939	1,389	5,074
50–59	397	26	2,674	954	1,305	5,356
60–69	131	15	1,833	901	736	3,616

Source: FAA, Active Airmen Certificate Totals by Region, State, County, Airmen Certification Branch, Oklahoma City, OK, Personal communication

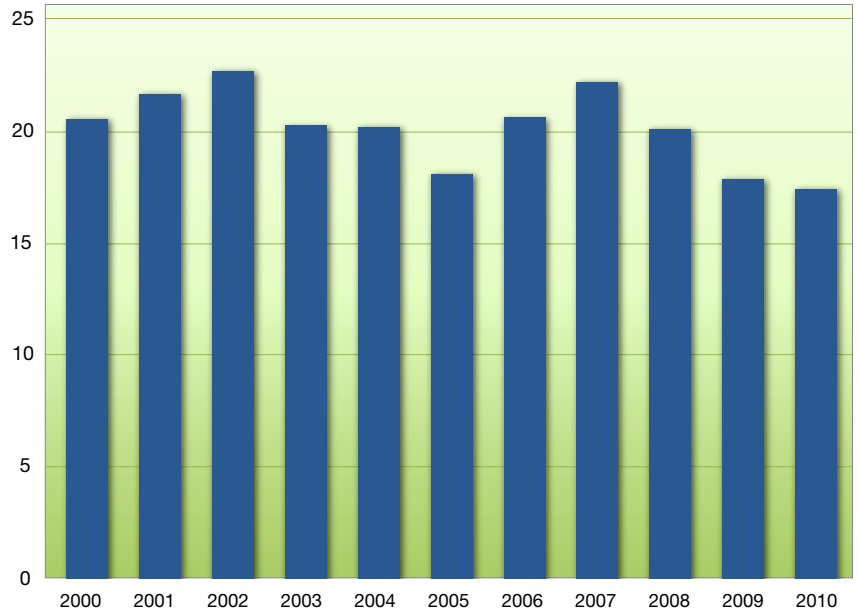
However, the implications for the future numbers of active private pilots in the region is complicated by several other factors, including the time that a student pilot takes to obtain his or her private pilot certificate and the number of student pilots who progress beyond the private pilot certificate to become commercial pilots or airline transport pilots. Therefore a more detailed cohort analysis is required that takes these factors into account in order to predict the likely number of active pilots in the region in future years. What is clear from **FIGURE 4.9** is that the largest age cohort of active private pilots is in the age group from 50 to 59 and the younger age cohorts of active private pilots are significantly smaller. Unless the number of student pilots in those younger age cohorts who become private pilots is large enough to not only offset the attrition in the private

pilot community but to make up the difference between the number of active private pilots in the 50 to 59 age group and that in the age group 40 to 49, the total number of active private pilots will decline rapidly once those in the age group from 50 to 59 start to experience the attrition shown in **FIGURE 4.9** for the older age cohorts.

Recent Trends in New Pilot Starts

A key factor in the future composition of the Southern California pilot community is the number of new pilots who take up flying for the first time, commonly referred to as new pilot starts. This can be measured by the number of student pilot certificates issued. While the FAA reports the number of new student pilot certificates issued each year in the U.S. Civil Airmen Statistics (FAA, 2011e), what matters more than the recent trend is the future numbers of new student pilot certificates issued. This is likely to be influenced by a variety of factors, the most important of which are likely to comprise:

- The general state of the economy
- The demand for professional pilots
- The cost of flying
- The ease or difficulty of flying as a GA pilot in the regional airspace environment.



The latter consideration is likely to be of particular concern in the Southern California region, much of which consists on an extremely complex airspace environment, with a large number of commercial service airports and their associated flight arrival and departure routes, even more GA airports, often challenging visibility conditions in the central part of the Los Angeles basin, and high surrounding terrain. Apart from the difficulties that these factors pose to those learning to fly, they also restrict the ease with which GA pilots can take advantages of their ability to exercise their flying privileges. It is increasingly common for those who are seeking a future career as a professional pilot to attend one of the universities and colleges that offer an aviation curriculum that includes flight training. For understandable reasons, these tend not to be located in dense urban areas with complex airspace. Thus someone growing up in Southern California who decides to attend a college or university aviation program with the goal of pursuing a career as a professional pilot is quite likely to enroll in a program elsewhere in the country. Of the 97 U.S. member institutions of the University Aviation Association (the industry association of collegiate aviation), only one is located in the SCAG region, Mount San Antonio College in Walnut, a two-year college with approximately 600 students enrolled in aeronautics courses (http://www.mtsac.edu/instruction/tech-health/aeronautics/). However, not all these students are learning to fly as part of their program.

At a national level, the changes in the number of new student pilot certificates issued per 100,000 population are shown in **TABLE 4.8** and **FIGURE 4.10**.

TABLE 4.8 Number of Student Pilot Certificates Issued per 100,000 Population

Year	Student Pilot Certificates Issued	U.S. Population (000)	New Student Pilots per 100,000 Population	Real Gross Domestic Product (b 2005$)	GDP per Capita (2005$)
2000	58,042	282,166	20.6	11,226.00	39,785
2001	61,897	285,050	21.7	11,347.20	39,808
2002	65,421	287,746	22.7	11,553.00	40,150
2003	58,842	290,242	20.3	11,840.70	40,796
2004	59,202	292,936	20.2	12,263.80	41,865
2005	53,576	295,618	18.1	12,638.40	42,752

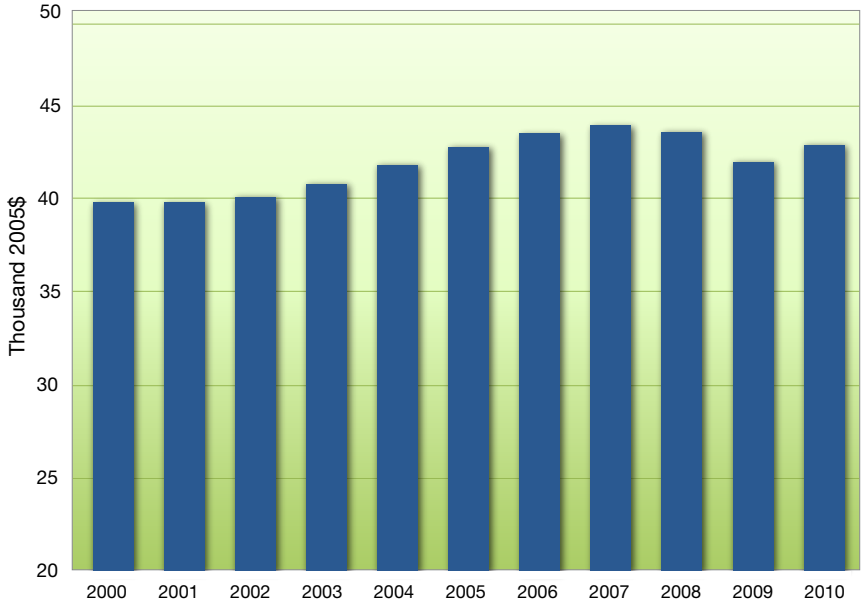

FIGURE 4.10 U.S. Student Pilot Certificates Issued per 100,000 Population

Source: See Table 4.8

The number of new pilot starts shows both a cyclical fluctuation with a slowly declining overall trend. The cyclical changes do not appear to be particularly correlated with the overall level of the economy, which grew steadily from 2002 to 2007 as shown in **FIGURE 4.11**, suggesting that the fluctuations in the number of new pilot starts appear to be mainly driven by other factors.

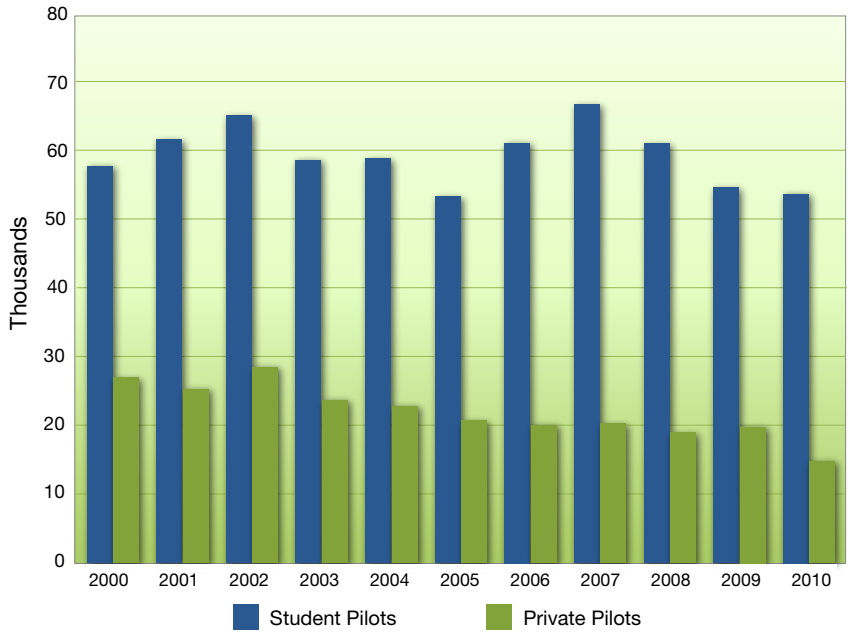

FIGURE 4.11 Gross Domestic Product Per Capita

Source: See Table 4.8

FIGURE 4.12 shows the number of new student pilot certificates issued each year compared to the number of new private pilot certificates issued with an airplane rating (this does not count those private pilot certificates issued with only a glider or rotorcraft rating). It can be seen that the cyclical fluctuation in new student pilot certificates does not appear to be reflected in the number of new private pilot certificates, which shows a generally declining trend from 2000 to 2010, apart from a short-lived increase from 2001 to 2002 and a small increase from 2008 to 2009. Those fluctuations do not appear to be related to the cyclical fluctuations in the number of new student pilot certificates issued in any obvious way. While the number of new student pilot certificates issued also increased from 2001 to 2002, it increased by approximately the same amount from 2000 to 2001, when the number of new private pilot certificates issued declined.

FIGURE 4.12 New Student Pilot and Private Pilot Certificates Issued per Year

Similarly, the small increase from 2008 to 2009 in new private pilot certificates issued occurred during a period when the number of new student pilot certificates issued was declining steeply.

The data on new student pilot and private pilot certificates issued each year shown in **FIGURE 4.12** indicate that by 2010 only about a third of new student pilots progress to earn a private pilot certificate with an airplane rating. While some student pilots take longer than a year to obtain their private pilot certificates, those obtaining their private pilot certificates in subsequent years are offset by those obtaining their private pilot certificate in the current year who received their student pilot certificate in prior years. For the three-year period from 2008 to 2010 the number of private pilot certificates with an airplane rating that were issued was about 32 percent of the number of student pilot certificates issued.

Some student pilots progress to obtain a private pilot certificate with only a glider rating or only a rotorcraft rating. The count of new certificates issues with only a glider or rotorcraft rating in the U.S. Civil Airman Statistics does not distinguish between whether those certificates were for private, commercial or airline transport pilots. Presumably the majority of new certificates with only a glider rating were for private pilots (the only reason for someone who only flies gliders to obtain a commercial pilot certificate would be if they planned to work as a flight instructor and such a pilot would first have to obtain a private pilot certificate). The number of new certificates issued with only a glider rating in the period from 2008 to 2010 was only about 0.4 percent of new student pilot certificates issued in the same period.

Considerably more new certificates are issued each year with only a rotorcraft rating. Presumably, the majority of these pilots intend to progress to a commercial pilot certificate, since there are relatively few helicopters used for private flying, although some pilots undoubtedly obtain their private pilot certificate but then give up flying before obtaining their commercial pilot certificate. There are relatively few situations in which FAA regulations require a pilot who is only flying rotorcraft to obtain an airline transport pilot certificate, since there are very few, if any, helicopters flown in scheduled airline service (which requires an airline transport pilot certificate). However, a helicopter operator may require its pilots to hold an airline transport pilot certificate because of the greater level of training and experience required for such a certificate. If 20 percent of pilots who obtain their private pilot certificate with only a rotorcraft rating do not progress to obtain their commercial pilot certificate, and 10 percent of those obtaining a commercial pilot certificate with only a rotorcraft rating subsequently obtain an airline transport pilot certificate, then about 53 percent of the new pilot certificates with only a rotorcraft rating are private pilot certificates and the remainder are either commercial pilot certificates or airline transport pilot certificates. During the three-year period from 2008 to 2010, the number of new pilot certificates issued with only a rotorcraft rating was about 5.9 percent of the number of new student pilot certificates issued. This suggests that about 3 percent of student pilots progress to holding a private pilot certificate with only a rotorcraft rating. Thus in total, only about 35 percent of all student pilots eventually obtain a private pilot certificate.

California Data on New Pilot Starts

In addition to national statistics, data on the number of new pilot certificates issued to California pilots for the past three years were obtained from the FAA Airmen Certification Branch staff, as shown in **TABLE 4.9**.

TABLE 4.9 Number of New Pilot Certificates Issued per 100,000 Population – California

	Original Certificates Issued			per 100,000 Population		
Type of Certificate	2008	2009	2010	2008	2009	2010
Student pilot	191	205	176	0.52	0.55	0.47
Recreational pilot	2	0	1			
Sport pilot	49	53	42	0.13	0.14	0.11
Airplane						
Private pilot	1,834	1,788	1,496	4.98	4.82	4.00
Commercial pilot	824	763	611	2.24	2.06	1.63
Airline transport pilot	349	207	209	0.95	0.56	0.56
Rotorcraft (only)	405	318	237	1.1	0.86	0.63
Glider (only)	15	37	33	0.04	0.1	0.09
	3,669	**3,371**	**2,805**			
Calif. Population (000)	36,856	37,077	37,371			

Source: FAA, Original Airmen Certificates Issued by Category – California, Airmen Certification Branch, Oklahoma City, OK, Personal communication, California Department of Finance, Population Estimates and Components of Change by County – July 1, 1999–2010, Series E-6, August 2011

Unfortunately, the data on new student pilot starts are not comparable to the national data because the California data excludes student pilot certificates issued by the Civil Aerospace Medical Institute as part of issuing the initial medical certificate, which accounts for the majority of new student pilot certificates issued in a given year. However, the data for new private pilot, commercial pilot, and airline transport pilot certificates with an airplane rating, new sport pilot certificates, as well as new pilot certificates with only a rotorcraft or glider rating, can be compared to the national data when adjusted for the difference in population.

The number of pilot certificates issued in California relative to population is generally lower than for the U.S. in total. The difference varies from year to year and also by type of pilot certificate, as shown in **TABLE 4.10**. The ratios for new student pilot certificates are omitted due to the missing data and those for new recreational pilot certificates have not been calculation due to the small number of such certificates.

TABLE 4.10 New Pilot Certificates Issued per 100,000 Population – California Relative to the U.S. in Total

	Percent of U.S. Ratio			
Type of Certificate	2008	2009	2010	Average
Sport pilot	64%	64%	67%	65%
Airplane				
Private pilot	79%	74%	83%	79%
Commercial pilot	64%	56%	63%	61%
Airline transport pilot	55%	55%	56%	56%
Rotorcraft (only)	92%	72%	73%	79%
Glider (only)	61%	123%	123%	102%

Author calculations from Tables 4.8 and 4.9 and FAA, U.S. Civil Airmen Statistics, 2010.

On average across the three years, the number of new private pilot certificates issued per 100,000 population is about 79 percent of the national ratio. This proportion declines for new commercial pilot certificates to 61 percent of the national ratio and decreases further for new airline transport pilot certificates to 56 percent of the national ratio. The number of new pilot certificates with only a rotorcraft rating per 100,000 population relative to the national ratio is similar to that for private pilots, although the variation from year to year is greater.

Therefore it appears that not only is California producing fewer new private pilots relative to its population than the national ratio but fewer of those pilots progress to holding a commercial pilot certificate and even fewer progress to holding an airline transport pilot certificate. Thus transition rates between categories of pilot certificate calculated from national data will have to be adjusted to reflect the lower transition rates in California.

Unfortunately, the missing data for new student pilot certificates issued to California pilots mentioned above prevents calculation of the corresponding proportion of the national ratio for new student pilot certificates per 100,000 population. However, it seems reasonable to assume that the California proportion of the national ratio for new student pilot certificates would be similar to that for new private pilot certificates. This is somewhat higher than the California proportion of the national ratio for new sport pilot certificates, which seems reasonable given that the complex airspace environment in the larger metropolitan regions in the state is likely to make flying with a sport pilot certificate rather more limiting than in many other areas of the country.

Projecting Future Student Pilot Starts

It is clear from the trend shown on **FIGURE 4.10** that the number of new student pilot starts per 100,000 population has been tending to decline for the past ten years. In order to quantify this trend and provide a basis for forecasting future new student pilot starts, the following regression model was estimated from the data shown in **TABLE 4.8**:

S = (0.542 – 0.01192 x Y) x GDP/Cap (28.2) (-3.7)

where S = New student pilot certificates issued per 100,000 population

GDP/Cap = U.S. Gross Domestic Product per capita (000 2005 $)

Y = Years after 2000

t-statistics shown in parentheses

Adjusted R square = 0.88

The coefficients of the regression model are highly statistically significant and the fit of the model to the data (as measured by the adjusted R square) is quite good, although the model does not fully reflect the cyclical variation in the data, as would be expected from **FIGURES 4.8** and **4.9**. The signs of the terms are intuitively reasonable, with the number of new student pilot certificates issued increasing with real Gross Domestic Product (GDP) per capita, as would be expected, and giving a decreasing trend with time, as the data shows.

An initial version of this model included a term that expressed the new student pilot rate as a constant times the real GDP per capita and a second term that decreased the new student pilot rate linearly by year. This model fitted the general trend in new student pilot starts for the period from 2000 to 2010 fairly well. However, it became apparent that reducing the new student pilot rate by a constant amount per year, irrespective of the value of predicted new student pilot rate, would tend to overestimate the reduction for areas with lower student pilot rates and underestimate the reduction for areas with higher rates. Therefore the model was modified to reduce the coefficient of the GDP per capita term by a constant rate per year, rather than the new student pilot rate itself, as shown above. This resulted in a reduction that was proportional to the value of the new student pilot rate, which resolved the problem.

A comparison was made between the number of active student pilots in California per 100,000 population and the national data for the years 2008 to 2010. The new student pilot model was applied to California population and GDP and the projected new student pilot rate given by the model was compared to the number of new student pilots in California per 100,000 population, assuming that the California rate of new student pilots relative to the national rate is proportional to the ratio of active student pilots per 100,000 population in California to the active student pilots per 100,000 population for the United States. This suggested that the new student pilot rate in California, after controlling for differences in real GDP per capita, is about 80 percent of the national rate, and this adjustment was applied to the model in developing the forecast.

If the GDP per capita remains constant in real terms at the 2010 level, the annual number of new student pilot certificates issued per 100,000 population would decline from 17.5 in 2010 to 5.4 in 2035. However, if the real GDP per capita grows at an average rate of 1.5 percent per year over the period, the predicted annual number of new student pilot certificates issued per 100,000 population would only decline to 7.8 in 2035. Even if the real GDP per capita grows at an average rate of 3 percent per year over the period, the predicted annual number of new student pilot certificates issued per 100,000 population given by the relationship would still decline significantly to 11.2 in 2035. Thus while the future strength of the economy will have a major influence on the number of new pilot

starts, assuming that the relationship between the changes in the economy over the past ten years and the changes in the number of student pilot certificates issued continue into the future, the effect of the declining trend in new pilot starts per 100,000 population is not likely to be reversed by any plausible future growth in the strength of the economy. Of course, there are undoubtedly other factors not included in the model such as the cost of flying or the demand for commercial pilots that will also have an important influence.

The AOPA Member Survey

In order to provide more detailed information on the characteristics and flying activity of general aviation pilots in Southern California, an online survey of California members of the Aircraft Owners and Pilots Association (AOPA) was performed by SCAG and the California Department of Transportation (Caltrans) Division of Aeronautics with the assistance of the AOPA, as discussed in an earlier section.

In addition to information on respondents' general aviation flying and aircraft ownership, the survey asked a number of questions about services that respondents have used or would like to see at airports that they use, as well as issues that they believe should be addressed at the airport where they base their aircraft or use most frequently, or that should be considered in developing a general aviation demand forecast. Since these issues are not germane to the analysis of the composition and activity levels of the pilot community, they are not addressed further in this report, but will be reported in a separate document.

It should be noted that the definition of an active GA pilot used in the survey is considerably narrower than the definition of an active pilot used by the FAA. The FAA defines an active pilot by whether a pilot has a valid medical certificate, not by when they have last flown. Since medical certificates can be valid for as long as five years (in the case of a student or private pilot under age 40), pilots can be counted as active by the FAA long after they have in fact stopped flying. In addition, the FAA does not distinguish between the types of flying performed. In the case of active pilots holding an airline transport pilot certificate, they may or may not engage in general aviation flying.

In invitation to participate in the survey was distributed by e-mail to potential respondents on June 6, 2011 and 1,991 responses were obtained by June 19, at which point the survey website was closed to further responses. Of the 1,991 responses, 1,901 reported GA flight activity in the past six months.

An analysis was preformed of the zip code of residence reported by survey respondents in order to identify those respondents resident in Southern California. A certain amount of data cleaning of the reported zip codes was required to resolve invalid zip codes or zip codes outside of California that on examination of the responses to other questions were most likely typographic errors. After correcting the errors in the data 1,831 responses (96 percent) had valid zip codes, of which 764 (42 percent) were residents of the six-county Southern California region.

Findings from the AOPA Member Survey

The distribution of the type of pilot certificate held by active GA pilot respondents in the six Southern California counties is shown in **TABLE 4.11**, together with the corresponding distribution of active pilots holding each type of certificate in the region.

It can be seen that the survey tended to oversample pilots holding private pilot and commercial pilot certificates, under-sample those holding airline transport pilot certificates and significantly under-sample student pilots. This is entirely to be expected, since student pilots are much less likely to be AOPA members until they obtain at least their private pilot certificate.

TABLE 4.11 Southern California AOPA Survey Respondents by Pilot Certificate

	Highest Level of Pilot Certificate Held

Source: Author analysis of AOPA member survey results

Similarly, not all airline transport pilots are involved in general aviation flying and are thus less likely to be AOPA members than private or commercial pilots. It follows that if student and airline transport pilots are under-sampled, the other categories must be oversampled. It also seems reasonable that private pilots would be oversampled to a greater extent than commercial pilots, since many pilots holding commercial pilot certificates are flying for firms or other organizations that own the aircraft and thus may be less inclined to be members of the AOPA.

It is also possible that AOPA members who hold private pilot certificates had a greater interest in the issues addressed by the survey and thus the high response rate of these pilots relative to the pilot population as a whole is more a reflection of their willingness to participate in the survey rather than a reflection of the composition of the AOPA membership.

Respondents holding sport pilot or recreational pilot certificates were also oversampled by about the same amount as those holding private pilot certificates. However, due to the small number of respondents in this category, this result is quite possibly coincidental.

The number of active GA pilot survey respondents in Southern California by county compared to the population of active pilots in each county from FAA pilot certificate data is shown in **TABLE 4.12**. Generally the geographic distribution of survey respondents corresponds to the distribution of active pilots. Pilots in Riverside County are somewhat oversampled while those in Los Angeles County are under-sampled by a similar amount, although the difference in each case is only about 3 percent of regional pilots. Other differences are well within normal sampling error.

Source: Author analysis of AOPA member survey results

Perhaps not surprisingly, survey respondents are somewhat older than the active pilot community in general. This could reflect a number of factors. It is likely that the AOPA membership tends to be somewhat older than the pilot community in general, since younger pilots are less likely to be able to afford to own an aircraft. While the AOPA membership includes pilots who do not own aircraft, aircraft owners are more likely to perceive a benefit in being a member of the association. In addition, older pilots have generally been flying longer and thus have had greater opportunity to decide to join the AOPA. It is also possible that older members had greater opportunity to respond to the survey, although the level of survey participation was not noticeably higher for those respondents in an age range where they are likely to be retired.

The most applicable findings from the survey for the pilot cohort analysis relate to the average hours flown per year in general aviation activity, and how this varies by type of pilot certificate and age, since this information is not readily available from data published by the FAA. **TABLE 4.15** shows the average number of GA flight hours in the past year reported by survey respondents.

TABLE 4.15 Average GA Flight Hours per Year by Southern California AOPA Survey Respondents by Pilot Certificate and Age Range

Source: Author analysis of AOPA member survey results

Some caution is warranted for the data for student and sport or recreational pilots, private pilots below age 20, and airline transport pilots below age 30, due to the small sample size in those categories as shown in **TABLE 4.13**. In other categories, the change in average flight hours between different categories of pilot certificate and age ranges seems reasonable. On average student pilots fly about 30 hours per year, which suggest that it would take between one and two years to obtain a private pilot certificate. On average private pilots fly slightly more than twice the number of hours per year than student pilots, while commercial pilots and airline transport pilots fly between two and three times the number of GA hours per year than private pilots, not surprisingly since many of the pilots holding commercial or airline transport certificates are flying professionally.

The survey also asked in which year respondents holding a student or sport/recreational pilot certificate were issued their student pilot certificate or respondents holding higher levels of pilot certificate obtained their private pilot certificate. The average number of years since respondents obtained their student or private pilot certificate (as the case may be) is shown in **TABLE 4.15**. As expected, older respondents holding private, commercial or airline transport pilot certificates have been flying longer. However, the interesting finding is the average number of years that older pilots holding a student pilot certificate have been flying since obtaining that certificate. This suggests that many older student pilots remain student pilots for a long time before finally obtaining their private pilot certificate, if they ever do.

TABLE 4.15 Average Years Since Obtaining a Student/Private Pilot Certificate

	Highest Level of Pilot Certificate Held					
Age Group	Student	Sport or Recre-ational	Private	Commer-cial	Airline Transport	All Pilots

ANALYSIS OF PILOT COHORT CHARACTERISTICS

An analysis of pilot age cohort attrition and transition to higher levels of pilot certificate was performed using two different data sources: statistical data on national totals of active pilots by age group and number of original pilot certificates issued each year from the annual U.S. Civil Airmen Statistics (FAA, 2011e) and detailed data from the Airmen Registration Database (FAA, 2011d) for selected years. While the U.S. Civil Airmen Statistics provide data on totals by age group, the Airmen Registration Database does not

provide the age of the individual pilots, although since this is disaggregate data, it allows more detailed analysis.

In the course of this analysis it became clear that there are a number of apparent inconsistencies in the U.S. Civil Airmen Statistics data that will require further research to resolve. Some of these inconsistencies may arise from the way that the FAA Airmen Registry staff accounted for the change in the validity of third-class medical certificates that occurred in July 2008. Because the only way that the FAA knows when pilots are no longer active is when they fail to renew their medical certificate, this change distorted the way that active student pilots were counted.

Based on data for California pilots for 2004 and 2010 from the Airmen Registration Database, the six-year attrition and transition rates shown in **TABLE 4.14** were calculated. These rates express the percent of active pilots holding a given pilot certificate at the start of the period who were either no longer active at the end of the period (attrition) or had progressed to a higher level of pilot certificate (transition).

TABLE 4.16 California Pilot Attrition and Transition Rates – 2004 to 2010

	Pilot Certificate Held at Start of Period			
Pilot Certificate Held at End of Period	**Student**	**Private**	**Commercial**	**Airline Transport**
Student	5.10	0.0%	0.0%	0.0%
Private	14.9%	47.5%	0.0%	0.0%
Commercial	4.0%	3.8%	50.1%	0.0%
Airline Transport	0.1%	0.3%	6.9%	66.9%
Recreational	0.0%	0.0%	0.0%	0.0%
Sport	0.1%	0.0%	0.0%	0.0%
Attrition	75.8%	48.5%	43.0%	33.0%
	100%	**100%**	**100%**	**100%**

Source: Author analysis of FAA Airman Registration Database records.

The above transition and attrition rates suggest that of the pilots holding student pilot certificates at the start of the six-year period, about 5 percent were still active student pilots (or at least still holding a valid medical certificate) at the end of the period. Some 15 percent had progressed to hold a private pilot certificate by the end of the six year period, while only about 4 percent held a commercial pilot certificate at the end of the period. About 76 percent had become inactive.

The attrition rates shown in **TABLE 4.16** are surprisingly high, particularly for pilots holding a private, commercial, or airline transport certificate. It would be surprising if a third of those holding an airline transport certificate became inactive every six years. Therefore more detailed analysis of the underlying data was undertaken to determine the reason for these apparently high attrition rates. One factor that affects the apparent attrition rates is pilots who move from California during the six-year period and change their registered address. These would be counted as becoming inactive, since they would have been dropped from the California records. However, on the other hand, those who move to California during the period would appear in the data at the end of the period but not the beginning. Therefore an analysis of individual pilot data for California was undertaken to quantify the extent of these effects on the attrition and transition rates.

Summary and Conclusions

The trends in the size and composition of the pilot community over the past decade, as indicated by previous studies and the analysis undertaken as part of the current study, suggest that not only is pilot community getting steadily older on average, but the number of new student pilots who are taking up flying is not enough to maintain the size of the overall pilot community as the older pilots reach an age where they no longer fly or significantly reduce the amount of flying that they do. This in turn has important implications for the number of hours that are flown each year and the associated number of aircraft operations.

The detailed attrition and transition rates for pilots in a given age cohort is not a straightforward issue, since these rates not only vary by age, but also by the time that a given pilot has held his or her current pilot certificate. Many student pilots obtain their private pilot certificate within a year of taking up flying. Others take many years to do so. The transition rate from student to private pilot for student pilots in their first year since

starting flying is likely to be significantly different from that for pilots who have been learning to fly for several years.

Similarly, when looking at transition rates over a period as long as six years, these will include pilots who have progressed through several levels of pilot certificate, such as from student pilot to commercial pilot or even airline transport pilot. While this does not matter from the perspective of performing a pilot cohort analysis over a comparable period of time (say in five year steps), it does make it difficult to compare the resulting transition and attrition rates with those obtained from annual data, such as the U.S. Civil Airmen Statistics.

Therefore more detailed analysis of the registered airmen data should be undertaken in the future to better understand and quantify the pilot attrition and transition rates for use in improving the application of the pilot cohort model to general aviation demand forecasts.

Forecasts of Active Pilots, Hours Flown and Aircraft Operations

The FAA Terminal Area Forecast for future general aviation activity at airports in the Southern California region described previously represents a fairly optimistic scenario of likely future trends in general aviation demand in the region in the light of recent trends. For some purposes, such as determining whether the current airport system provides sufficient capacity to handle potential future demand, it may be appropriate to consider a forecast based on fairly optimistic assumptions regarding the factors that will shape future demand for GA activity. However, for other purposes, such as considering whether there will be sufficient future demand for GA activity to allow the large number of airports in the region to remain financially viable, it is necessary to consider a number of alternate scenarios that are based on less optimistic assumptions. These assumptions include such factors as the number of new student pilots who decide to take up flying, the rate at which they transition to higher levels of pilot certificate, the attrition rates of pilots holding different types of certificate in different age groups, the average number of GA flight hours per year by pilots holding different types of certificate in different age groups, the attrition rates of the current based aircraft fleet, and the rate at which new aircraft are purchased. The forecast approach provides a framework to consider these factors in a structured way and work through their implications for the resulting forecasts of regional GA activity.

This sub-section presents three alternative forecasts of active pilots, hours flown and aircraft operations by county and for the Southern California region as a whole. These forecasts differ in the assumed relationship between new student pilot starts and the change in the economy, expressed in terms of real Gross Domestic Product (GDP) per capita.

- The Baseline Forecast assumes a continuation of the relationship observed over the past ten years, in which this relationship has shown a steady decline in the number of new student pilots per 100,000 population after accounting for the change in the real GDP per capita.
- The Reduced Decline Forecast assumes that the decline in this relationship observed over the past ten years slows between 2010 and 2025, with the relationship remaining constant thereafter.
- The Arrested Decline Forecast assumes that the decline in the relationship observed over the past ten years ceases after 2010.

Baseline Forecast

Applying the pilot cohort model with the baseline assumptions gives the forecast for active pilots by county shown in **TABLE 5.1**.

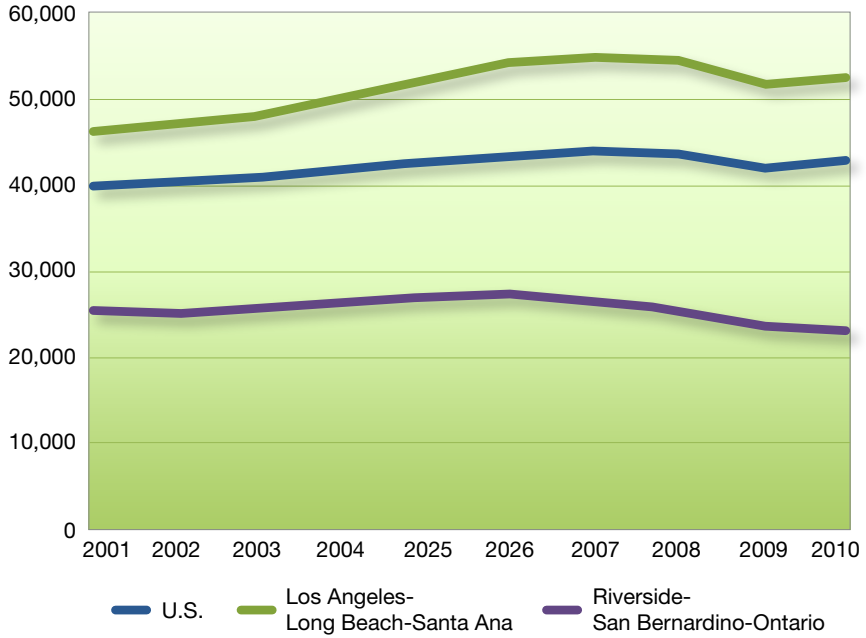
Note 1. Includes pilots holding a Sport Pilot certificate

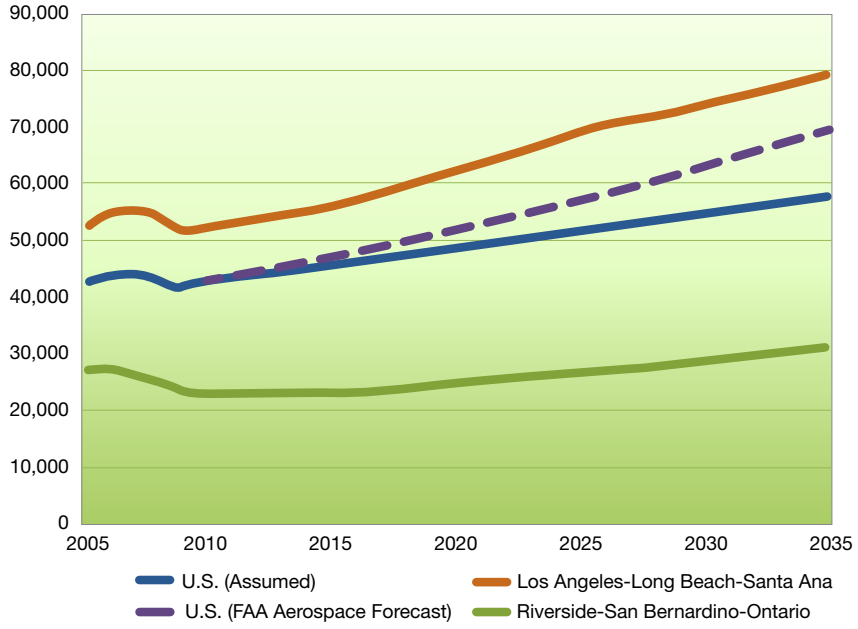
The pilot cohort model is based on the model of new student pilot starts each year together with five-year transition relationships between different classes of pilot certificate derived from the analysis of a large sample of individual pilot data for California obtained from the Federal Aviation Administration (FAA) Airmen Registry.



Since the new student pilot starts model predicts the number of new student pilots in terms of population and GDP per capita, it can be applied to smaller geographic areas, such as counties.

In order to apply the model to generate a forecast of future new student pilots, it was necessary to make assumptions about the future growth in real GDP per capita in each of the six counties in the Southern California region. An analysis was undertaken of the trend in real GDP per capita in the Los Angeles-Long Beach-Santa Ana and Riverside-San Bernardino-Ontario Standard Metropolitan Statistical Areas (SMSAs), using data from the U.S. Bureau of Economic Analysis for the period 2001 to 2010. Based on this trend the future growth in real GDP per capita in each of the two SMSAs was assumed. The GDP for each SMSA in 2009 was allocated to the two counties that comprise each SMSA on the basis of the total personal income of the counties, and the ratio of the real GDP per capita in each county to the real GDP per capita for the SMSA was estimated. This allowed different values of future real GDP per capita to be projected for each county. Since Imperial County and Ventura County are not included in the two SMSAs, the GDP for those counties was estimated on the basis of the total personal income in each county relative to that in the closest SMSA (Riverside-San Bernardino-Ontario in the case of Imperial County and Los Angeles-Long Beach-Santa Ana in the case of Ventura County).

The trend in the real GDP per capita for the two SMSAs over the past ten years is shown in **FIGURE 5.1**. It is clear than the real GDP per capita in the Riverside-San



Bernardino-Ontario SMSA is not only significantly lower than in the Los Angeles-Long Beach-Santa Ana, but that the decline during the recent recession started earlier and the recovery had not yet begun by the end of 2010, although the rate of decline had slowed.

FIGURE 5.1 GDP Per Capita (2005$)

The assumed growth in real GDP per capita in each of the two SMSAs is shown in **FIGURE 5.2**, compared to two assumptions for the U.S. economy overall. The first assumption for the future growth in the U.S. real GDP per capita for the U.S. was based on the average of the relatively high average annual growth rate experienced during the period from 2001 to 2007 and the lower average annual growth rate experienced from 2001 to 2010, which included the latest recession. This avoids biasing the assumed growth rate by choosing a period that ends in the immediate aftermath of a fairly deep recession. This gave an assumed average annual growth in real GDP per capita of 1.2 percent. **FIGURE 5.2** also shows the assumed future growth implied by the economic assumptions in the latest national FAA Aerospace Forecast. This assumed an average annual growth in real GDP per capita of about 1.9 percent, somewhat higher than the average annual growth during the most recent expansion period from 2001 to 2007.

FIGURE 5.2 Assumed GDP Per Capita (2005$

It was assumed that the annual growth rate of real GDP per capita for the Los Angeles-Long Beach-Santa Ana SMSA would continue the average annual growth rate of 1.4 percent experienced from 2001 to 2010 until 2015, then would increase to the average of the relatively high average annual growth rate experienced from 2001 to 2007 and the average over the period 2001 to 2010, which gave an annual growth rate of 2.1 percent. From 2025 to 2035 it was assumed that the annual growth rate would drop back to the average annual growth rate experienced from 2001 to 2010.

In the case of the Riverside-San Bernardino-Ontario SMSA, it was assumed that the decline in the real GDP per capita would end in 2010 and the real GDP per capita would

remain constant until 2015, when the annual growth rate would increase to the average annual growth rate of 1.5 percent experienced during the last expansion period from 2001 to 2006.

The transition relationships between different categories of pilot certificate that form the second key component of the pilot cohort model were estimated from the disaggregate data for individual California pilots from the FAA Airman Registry for May 2010 and May 2011. This gave one-year transition percentages, from which five-year transition rates were calculated assuming that the one-year transition rates apply to each year of the five-year period. Unfortunately, the individual pilot data does not include the pilot's age, due to privacy reasons. However, it is possible to classify each pilot as either under age 40 or age 40 and over on the basis of the validity of the pilot's medical certificate, which is included in the data, since medical certificates have different validity periods for pilots under age 40 from those for pilots age 40 and over. It was determined that pilots in the two age groups have different transition rates. The corresponding rate was then applied to each of the five-year age ranges used in the cohort analysis.

Although of course these transition rates and the relationship incorporated in the new student pilot model could change in the future, it was assumed that the current relationships would remain in effect for the entire forecast period.

Pilot Hours Flown

Once the number of active student pilots in each age range have been projected for each future year, it is fairly straightforward to calculate the number of hours flown per year by those pilots from data on the average number of hours flown per year by pilots holding a given certificate in a given age range, obtained from the survey of Aircraft Owners and Pilots Association members performed earlier this year as part of the current project. The results of this calculation are shown in **TABLE 5.2**

TABLE 5.2 Baseline Forecast of Hours Flown by County

	2010	2015	2020	2025	2030	2035
Imperial County	16,459	12,100	9,321	7,661	6,382	5,655
Los Angeles County	1,047,596	1,090,087	937,680	814,885	691,948	555,120
Orange County	549,943	495,865	396,978	327,876	267,401	207,685
Riverside County	342,418	234,899	163,751	121,288	94,621	73,458
San Bernardino County	254,018	185,154	132,030	98,733	78,155	61,396
Ventura County	230,658	176,000	125,738	96,223	75,213	57,684
Regional Total	2,441,092	2,194,105	1,765,498	1,466,666	1,213,720	960,998

It should be noted that the number of hours flown for each county is the total flight time for pilots resident in that county, which is not necessarily the county in which the flying takes place. Obviously many of the flight hours in question involve flights to and from airports outside the county in which the flight originates, and in many cases outside Southern California.

It should also be noted that the flight hours by pilots holding an airline transport pilot certificate only includes general aviation flight hours and not flight time in airline operations.

Aircraft Operations

Finally, the forecast of general aviation aircraft operations for each county was projected from the number of aircraft operations at airports in each county for 2010 on the basis of the change in flight hours by pilots resident in the county. Separate forecasts were made for local and itinerant operations, with local operations being projected on the basis of the change in flight hours by student and private pilots, while itinerant operations were projected on the basis of the change in flight hours by commercial and airline transport pilots. While student and private pilots also make itinerant flights, and pilots holding commercial and airline transport pilot certificates also make local flights, the majority of local aircraft operations are made by student and private pilots, while a high proportion of itinerant flights involve the use of professional pilots and are thus are most likely made by pilots holding a commercial or airline transport pilot certificate. Unfortunately, there is very little information readily available on the composition of the general aviation activity at each airport in terms of the pilot certificate held by the pilot operating the aircraft.

The resulting forecast of general aviation operations is shown in **TABLE 5.3**. With the exception of Los Angeles County from 2010 to 2015, the number of aircraft operations in each county shows a steady decline, with the total number of general aviation operations in the region in 2035 projected to have declined to only 42 percent of the 2010 level.

REDUCED DECLINE FORECAST

This forecast assumes that the annual decline in the coefficient of the new student pilot relationship remains the same as that observed over the past ten years until 2015, then slows to half the annual rate of decline until 2025, then remains constant until 2035.

The resulting forecast of active pilots by county is shown in **TABLE 5.4**.

Note 1. Includes pilots holding a Sport Pilot certificate

The revised assumptions result in a doubling in the number of active student pilots in Los Angeles and Orange Counties by 2035, with a more modest growth in Ventura County. Active student pilots in Riverside and San Bernardino Counties decline from 2010 to 2020, then increase to levels in 2035 slightly below those of 2010. There is a modest increase in active private pilots in Los Angeles County from 2010 to 2035, but otherwise active private, commercial and airline transport pilots decline in all counties.

The effect of this is to give an increase in total active pilots in Los Angeles County from 2010 to 2035, with a decline in all the other counties. For the region as a whole, total active pilots decline by about 7.5 percent from 2010 to 2035.

Pilot Hours Flown

The corresponding forecast for pilot hours flown is shown in **TABLE 5.5**.

Aircraft Operations

The resulting forecast of aircraft operations is shown in **TABLE 5.6**. The revised assumptions result in a decline in the number of aircraft operations in all counties from 2010 to 2035 by about 30 percent. The decline is obviously less in Los Angeles County, due to the greater increase in active student pilots, where aircraft operations decline by only about 3 percent from 2010 to 2035.

ARRESTED DECLINE FORECAST

This forecast assumes that the annual decline in the coefficient of the new student pilot relationship ends in 2010 and the relationship between new student pilots per 100,000 population and real GDP per capita remains constant until 2035. While this is obviously a more optimistic scenario than the other two, since it will generate more student pilots, and eventually other categories of pilot as those student pilots transition to higher levels of certificate, it begs the question what would cause the decline in the new student pilot relationship to suddenly flatten out. The resulting forecast of active pilots by county is shown in **TABLE 5.7**.

Note 1. Includes pilots holding a Sport Pilot certificate

This forecast gives an increase in active student pilots in all counties, with a higher growth of active private pilots in Los Angeles County, and a growth of active private pilots in Orange County and active commercial pilots in Los Angeles and Orange Counties. Active private and commercial pilots decline in all other counties and active airline transport pilots decline in all counties. The net effect gives an overall increase in total active pilots in the region of about 26 percent from 2010 to 2035.

Pilot Hours Flown

The corresponding forecast for pilot hours flown is shown in **TABLE 5.8**.

Aircraft Operations

The resulting forecast of aircraft operations is shown in **TABLE 5.9**. Aircraft operations increase from 2010 to 2035 in Los Angeles County from 2010 to 2035 by about 33 percent. For the region as a whole, aircraft operations decline from 2010 to 2025 then increase thereafter to reach a level on 2035 about 4 percent below the level in 2010.

	2,862,970	2,873,924	2,987,596	3,108,888	3,238,356	/2

Note: 1 Excludes non-TAF airports
Note: 2 Latest Terminal Area Forecast only extends to 2030

Under the Baseline Forecast, total aircraft operations decline to 42 percent of 2010 levels by 2035. However, the projected decline is greater for itinerant operations, which are projected to decline to only 29 percent of 2010 levels by 2035. Local operations are projected to decline to 55 percent of 2010 levels by 2035, reflecting the larger share of student and private pilots in the pilot community by 2035, as the inflow of new student pilots transitioning to higher levels of certificate are not sufficient to replace the numbers of older commercial and airline transport pilots becoming inactive. The number of total aircraft operations in the Baseline Forecast for 2030 is only 50 percent of that projected in the FAA Terminal Area Forecast (TAF) for that year. However, the TAF projects a slight increase in the proportion of itinerant operations from 50 percent 2010 to 52 percent in 2030. Because of the slower decline in local operations than itinerant operations in the Baseline Forecast the number of local operations in 2030 only declines to 67 percent of the number forecast in the TAF while the number of itinerant operations declines to 35 percent of the number forecast in the TAF.

Under the Reduced Decline Forecast, total aircraft operations decline to 70 percent of 2010 levels by 2035. Itinerant operations are projected to decline to 46 percent of 2010 levels by 2035, while due to the assumed greater inflow of student pilots than in the Baseline Forecast local operations are projected to decline to only 70 percent of 2010 levels by 2035. The number of total aircraft operations in the Reduced Decline Forecast for 2030 is 65 percent of that projected in the TAF for that year, with the number of local operations only declining to 94 percent of the number forecast in the TAF while the number of itinerant operations is projected to decline to 46 percent of the number forecast in the TAF.

Under the more aggressive Arrested Decline Forecast, total aircraft operations only decline to 96 percent of 2010 levels by 2035. Itinerant operations are projected to decline to 62 percent of 2010 levels by 2035, while the even greater assumed inflow of student pilots compared to the Baseline Forecast results in an increase in local operations to 129 percent of 2010 levels by 2035. The number of total aircraft operations in the Arrested Decline Forecast for 2030 is 86 percent of that projected in the TAF for that year, with the number of local operations 18 percent higher than the number forecast in the TAF and the number of itinerant operations projected to decline to 56 percent of the number forecast in the TAF.

It should be noted that the greater decline in forecast itinerant operations compared to local operations in all three forecast scenarios is a consequence of the interaction of two effects:

- The more rapid forecast decline in the number of active commercial and airline transport pilots compared to student and private pilots
- The assumption that the change in the number of local operations is proportional to the change in hours flown by student and private pilots, while the change in the number of itinerant operations is proportional to the change in the hours flown by commercial and airline transport pilots.

However the first result could change if the demand for commercial pilots in the general aviation sector (some of whom are required by their employers to hold an airline transport pilot certificate) causes a higher proportion of student and private pilots to transition to higher levels of pilot certificate. A shortage of commercial pilots could also cause those commercial pilots who are active to fly more, leading to an increase in flight hours by commercial and airline transport pilots and the associated aircraft operations.

Since student and private pilots do perform itinerant operation as well as local operations, although typically not as many, an increase in the proportion of student and private pilots relative to commercial and airline transport pilots should contribute to an increase in the number of itinerant operations, rather than these being determined solely by the change in the number of flight hours by commercial and airline transport pilots. Further research is needed to better understand the relative proportions of local and itinerant operations flown by pilots holding different levels of pilot certificate, as well as any trends in these proportions over time.

Forecasts of Based Aircraft and Associated Aircraft Operations

The forecasts of active pilots in Southern California and the hours flown by those pilots provides one perspective on the future levels of general aviation activity in the region. However, the size and composition of the based aircraft fleet is only indirectly related to the level of flying activity. Aircraft do not disappear when the amount of flying declines; rather they tend to be flown less and the percentage of the fleet that is inactive increases. Even so, some new aircraft will be added to the fleet each year and some aircraft will be sold and relocated outside the region, or even outside the country. Eventually older aircraft that are no longer airworthy or no longer economic to maintain and operate will be sold or scrapped. From the perspective of the Southern California based aircraft fleet, it does not matter whether an aircraft is sold to a new owner located outside the region or scrapped. In any year there will of course be some used aircraft that are purchased by new owners in Southern California and imported into the region. Therefore what matters is the net attrition of aircraft of a given age due to the balance between those aircraft that are sold and exported from the region or scrapped and the addition of used aircraft that are imported in to the region from elsewhere.

Thus a forecast of the potential size and composition of the future based aircraft fleet in the region can be developed by considering the net attrition rate of the current aircraft fleet and the future addition of newly manufactured aircraft to the fleet.

APPROACH

The based aircraft forecast is based on the list of registered aircraft in each county for 2010 prepared by the County Assessor and obtained from the California Department of Transportation, Division of Aeronautics. The County Assessor record for each aircraft includes the Federal Aviation Administration (FAA) aircraft registration number (tail number) and in principle includes the year of manufacture and the aircraft make and model. However, the year of manufacture is missing for many records and the terminology used for the aircraft make and model is not standardized, making it extremely difficult to classify each aircraft into a consistent set of aircraft categories. Therefore additional data for each aircraft was obtained from the FAA Aircraft Registration Database using the aircraft tail number to search for the aircraft in the FAA data. The additional data included the aircraft type (fixed-wing, rotorcraft, etc.), number of engines, and type of engines, as well as the year of manufacture.

This allowed each aircraft in the County Assessor data to be classified into the following categories:

- Single-engine piston (SEP)
- Single-engine turboprop (SET)
- Multi-engine piston (MEP)
- Multi-engine turboprop (MET)
- Jet aircraft (JET)
- Helicopter (HELI)
- Glider (GLI)
- Balloon (BAL)
- Other (OTH)

In addition, missing data on the year of manufacture in the County Assessor records was filled in where possible from the FAA aircraft registration data. Many of the FAA records are also missing the year of manufacture, but with some effort this could be determined in many cases from other data in the FAA aircraft registration record, such as the airworthiness date, the date when the aircraft was first certificated, or the serial number of the aircraft. Aircraft manufacturers generally assign serial numbers for each aircraft model sequentially, so the year of manufacture can be determined from that for other aircraft of the same model with adjacent serial numbers for which the year of manufacture is given.

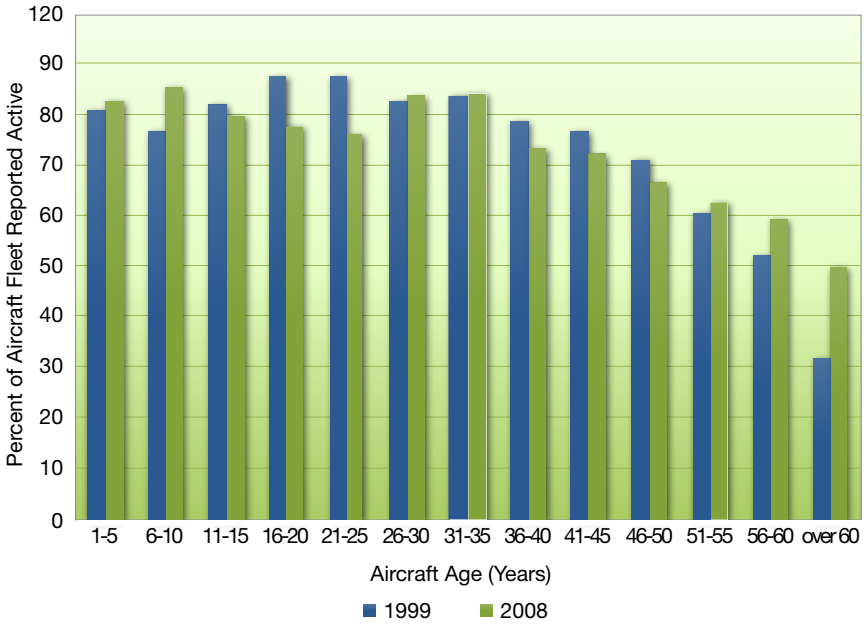
A number of aircraft records in the County Assessor data turned out to be duplicate entries for the same aircraft, such as cases where an aircraft had been assigned a new tail number after a sale. Quite a few of the aircraft in the County Assessor data did not appear in the FAA database of currently registered aircraft. Further investigation established that these were often explained by the following situations:

- The aircraft had been exported or sold to a new owner who had registered the aircraft under a different tail number
- The aircraft owner had cancelled the registration, presumably because the aircraft was no longer being used

- The aircraft tail number had been issued to an owner who was building a homebuilt aircraft which had not yet been registered (presumably because it was still under construction)

Based Aircraft Forecast Methodology

The forecast of based aircraft needs to consider two effects. The first is the attrition of the current (2010) based aircraft fleet over time. The second is the addition of new aircraft to the fleet in the future. Those aircraft will also experience attrition over the period of the forecast. Therefore the forecast requires two sets of assumptions:



1. An attrition function that predicts the percentage of aircraft in the based aircraft fleet in a given year that will remain in the fleet one year later.
2. The number of aircraft of each type that will enter the fleet in each future year.

Given these two sets of assumptions, it is a fairly simple matter to calculate the change in the size of the based aircraft fleet over time. However, neither assumption is a simple matter, since both the attrition rate and the rate of new aircraft entering the fleet are likely to change over time in response to changing conditions in the general aviation sector.

For the purposes of the current forecasts, the aircraft fleet attrition relationship developed in a study for the FAA by Optimum Computer Systems, Inc. (OCS) in the mid 1970s (Rocks, 1976) has been adopted. While this study is now somewhat dated, the underlying factors that determine the rate at which aircraft are withdrawn from the aircraft fleet may not have changed that much over the past 35 years, although this is a subject that is deserving of future research. The attrition relationship developed in the OCS report expresses the attrition rate per year as a function of the age of the aircraft. This attrition rate initially increases as the aircraft becomes older, reaching a maximum of 2.7 percent per year at 18 years, then declines in subsequent years to a rate of 1.75 percent per year at 25 years. Unfortunately, the OCS study did not analyze the change in attrition rates for aircraft older than 25 years, but simply grouped all aircraft older than 25 years into a single category, for which they suggested an attrition rate of 1.0 percent per year.

This is potentially problematical for developing forecasts of the based aircraft fleet from 2010 to 2035, since a large proportion of the aircraft fleet is already well over 30 years old, and by 2035 the majority of these aircraft (if they are still in service) will be over 60 years old. However, the annual FAA General Aviation and Part 135 Activity Survey (FAA, 2011c) provides estimates of the number of registered and active aircraft in five-year age ranges for aircraft 60 years old or less, with older aircraft grouped into a single category. It is apparent from these data that attrition of older aircraft from the fleet does indeed occur at about 1 percent per year. However, the percent of the registered aircraft fleet that was reported as being actively flown reduces steadily with age, as shown in **FIGURE 6.1**. The trend shown in **FIGURE 6.1** points out the need to distinguish between registered aircraft and active aircraft in forecasting based aircraft, since registered aircraft determine the size of the based aircraft fleet, while the number of active aircraft determines how much flying those aircraft do.

FIGURE 6.1 Change in Aircraft Utilization with Age – 1999 and 2008

The analysis of the FAA survey data shown in **FIGURE 6.1** used the data from the 1999 and 2008 surveys because the aircraft age ranges used in those two surveys gave the number of registered and active aircraft grouped by aircraft manufactured in the same

five-year periods. This therefore allowed a direct measure of the attrition of aircraft by age. For example, the aircraft in the age range 36 to 40 years old in the 1999 survey are the same aircraft in the age range 46 to 50 years old in 2008. Therefore the change in the number of aircraft in this cohort from 1999 to 2008 measures the net attrition over the nine-year period, from which the annual attrition rate can be derived.

It was found that for aircraft over about 25 years old, the attrition rate of registered aircraft was around 1 percent per year, which is consistent with the value estimated in the earlier OCS study. An attrition rate of 1 percent per year is relatively slow and implies that about 78 percent of the aircraft that were more than 25 years old in 2010 will still be in the fleet in 2035. However, the percentage of this fleet that is actively flown also declines with the age of the aircraft, as shown in **FIGURE 6.1**, which indicates than less than half the aircraft in the fleet that are over 60 years old are still actively flown.

Obviously aircraft cannot continue to be flown forever, although many of the older aircraft that are still in the based aircraft fleet have been restored and in effect given a new lease of life. This is particularly true for what have come to be viewed as vintage aircraft dating from the 1930's and 1940's. It remains to be seen what percentage of aircraft built between the late 1960's and the early 1980's, that forms by far the largest proportion of the current aircraft fleet, will eventually be restored. The number of such aircraft and their relative lack of historic interest to collectors suggests that the majority will probably be scrapped when they reach an age where it is no longer economic to continue to keep them in flying condition.

Furthermore, it is unclear from the FAA aircraft activity survey data whether the attrition rates observed for aircraft aged between 25 and 60 years continue to apply to aircraft significantly older than 60 years, since the results of the aircraft activity surveys group aircraft over 60 years old into a single age group. While this was less important in the past, since a relatively small proportion of the aircraft fleet was over 60 years old, this will change over the coming 25 years. By 2035 aircraft built between 1965 and 1975 that are still in the aircraft fleet will be between 60 and 70 years old. In the absence of more detailed information about the attrition rates of aircraft older than 60 years, it was assumed that the average attrition rate for aircraft over 60 years old calculated from the results of the FAA activity survey remains constant for all aircraft older than 60 years.

Examination of changes in the composition of the based aircraft fleet in Southern California over the past ten years has shown that the rates at which different aircraft types have been entering the fleet has varied widely, with the numbers of jet aircraft and helicopters growing significantly over the period, while the number of single-engine propeller aircraft has remained fairly static and the number of multi-engine propeller aircraft has declined. In the absence of any formal models of the rates at which different aircraft types are likely to be added to the based aircraft fleet in the future, assumed values for these rates can be based on an analysis of recent trends in the fleet composition and size, as discussed in the next sub-section.

CURRENT COMPOSITION OF THE BASED AIRCRAFT FLEET

Los Angeles County contains the largest number of based aircraft of any of the six counties in the Southern California region, accounting for about 46 percent of the total based aircraft in the region. The next two counties with the largest numbers of based aircraft are Riverside County with 17 percent of the total based aircraft in the region and San Bernardino County with 15 percent of the regional based aircraft fleet. The following discussion compares the composition of Los Angeles County aircraft fleet given by the County Assessor data to that given by the based aircraft counts in the FAA Form 5010 Airport Master Record data for the same year. While these comparisons differ somewhat from county to county, the pattern observed in Los Angeles County is generally true for the other counties.

After the data cleaning, the 4,370 aircraft records in the County Assessor database for Los Angeles County were classified as follows:

- 4,296 valid records with a year of manufacture and aircraft type
- 28 records missing the year of manufacture, mostly homebuilt single-engine piston aircraft (possibly still under construction)
- 28 aircraft destroyed, exported or transferred out of the county
- 6 records with an invalid tail number and insufficient information to identify the aircraft
- 2 tail numbers reserved with no aircraft information
- 10 duplicate entries

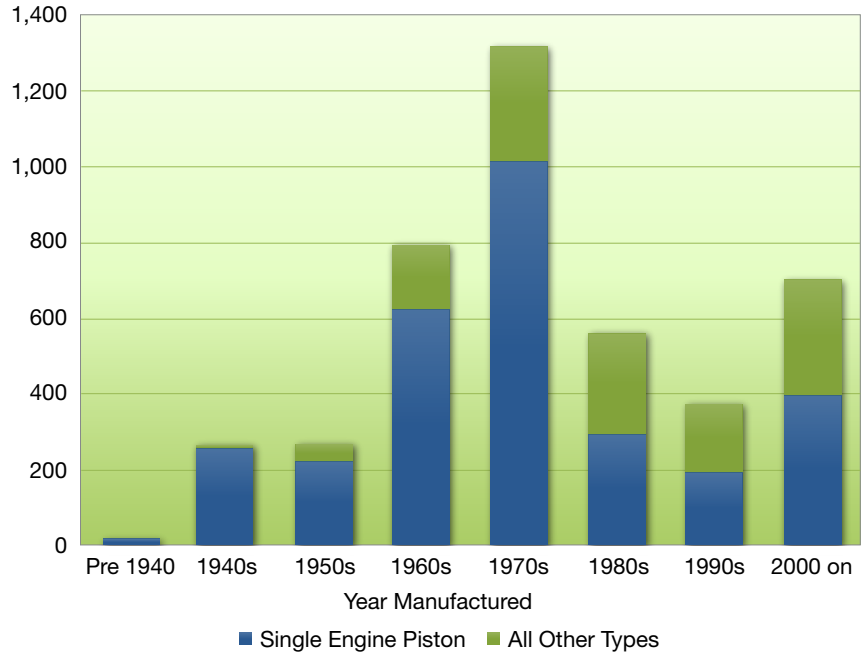
The number of aircraft of each type in the valid records with year of manufacture and aircraft type, together with the corresponding FAA Form 5010 based aircraft data for Los Angeles County airports for 2010 are shown in **TABLE 6.1**. Compared to the County

Assessor data, the FAA Form 5010 counts overstate single-engine propeller aircraft by about 6.5 percent, or some 200 aircraft. For the other aircraft types, the Form 5010 counts are considerably less than the County Assessor data. Jet aircraft are understated by about 9 percent, the multi-engine propeller aircraft are understated by about 12 percent, and helicopters are understated by about 35 percent. The low number of helicopters in the Form 5010 data could be due to a large number of helicopters being kept at locations other than the airports included in the FAA 5010 data.

TABLE 6.1 Comparison of County Assessor Data with FAA 5010 Based Aircraft Counts for Los Angeles County

Aircraft Type	County Assessor Data	FAA Form 5010 Counts	Percent Difference
Single-engine Piston	3,011		
Single-engine Turboprop	59		
	3,070	**3,269**	**106.5%**
Multi-engine Piston	362		
Multi-engine Turboprop	67		
	429	**376**	**87.6%**
Jet Aircraft	418	381	91.1%
Helicopter	284	185	65.1%
Glider	70	7	10.0%
Balloon	17		0.0%
Other	8		0.0%
	4,296	**4,218**	**98.2%**

The low number of gliders and the absence of balloons and other aircraft in the FAA Form 5010 counts is not surprising, since many gliders, balloons and ultralight aircraft are typically stored at locations other than airports. In addition some of the gliders and ultralight aircraft in the county may be stored at private airports that are not included in the FAA Form 5010 data.



The lower number of single-engine propeller aircraft in the County Assessor data may partly be accounted for by those aircraft that did not have a year of manufacture identified, and were omitted from the data shown in **TABLE 6.1**. However, this would only account for about 25 of the 199 aircraft difference. It is clear from the FAA Form 5010 data for individual airports that these data are not always updated on an annual basis, particularly at smaller airports. Therefore the counts may tend to lag behind the decline in the actual number of single-engine propeller aircraft. Conversely, in the case of jet aircraft and helicopters, where the fleet has been growing in recent years, the counts may lag behind this growth.

However, notwithstanding these differences, the County Assessor data and the FAA Form 5010 data are broadly consistent, and it appears that the County Assessor data provides a reasonable basis for developing forecasts of based aircraft, particularly given the inherent uncertainty involved in such forecasts over more than a few years.

AGE PROFILE OF THE CURRENT AIRCRAFT FLEET

FIGURE 6.2 shows the age profile of the current aircraft fleet in Los Angeles County, distinguishing between single-engine piston aircraft and other aircraft types. Single-engine piston aircraft constitute the largest fraction of the fleet, but this proportion has been dropping over time, largely due to the high proportion of single-engine piston aircraft among aircraft older than 30 years.

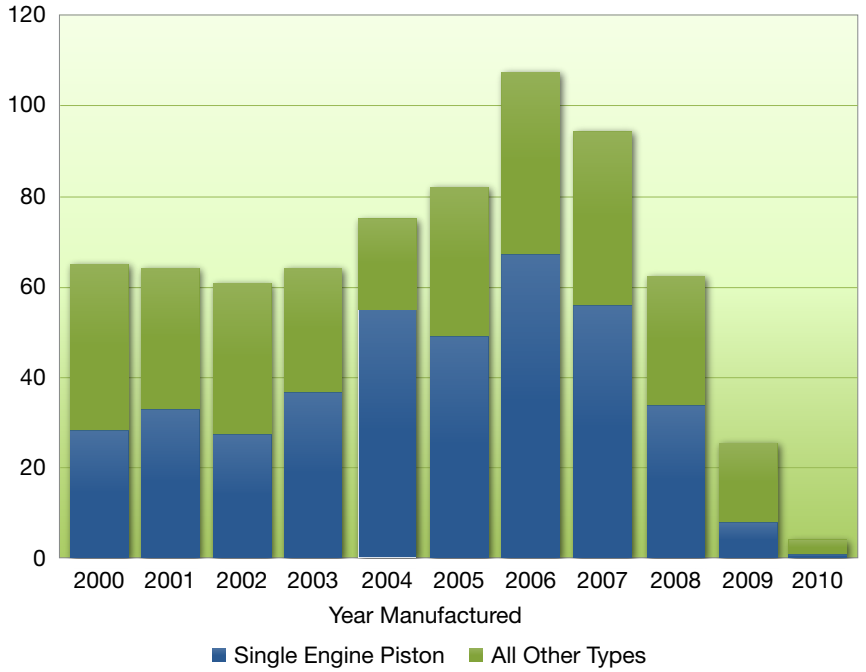


FIGURE 6.2 Age Profile of 2010 Based Aircraft Fleet in Los Angeles County

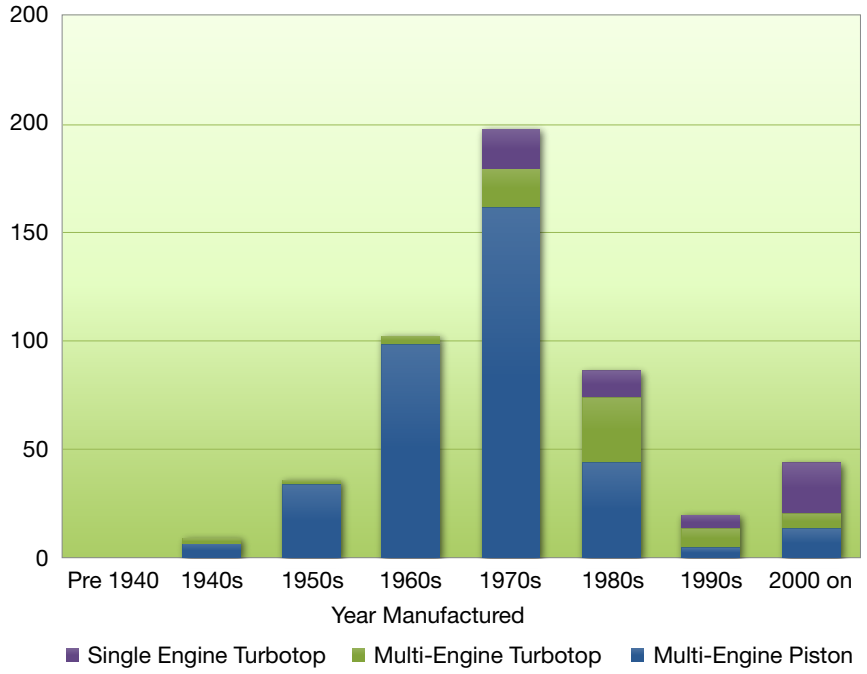
Aircraft manufactured during the 1970's constitute the largest age cohort of the fleet, accounting for 31 percent of all aircraft, followed by those manufactured during the 1960s, which account for 19 percent of the fleet. The newest aircraft, those manufactured during the past 10 years, form the third highest age cohort, accounting for 16 percent of the fleet. Of these relatively new aircraft, single-engine piston aircraft comprise 56 percent of the aircraft in this age cohort, due in large part to the growing number of homebuilt aircraft.

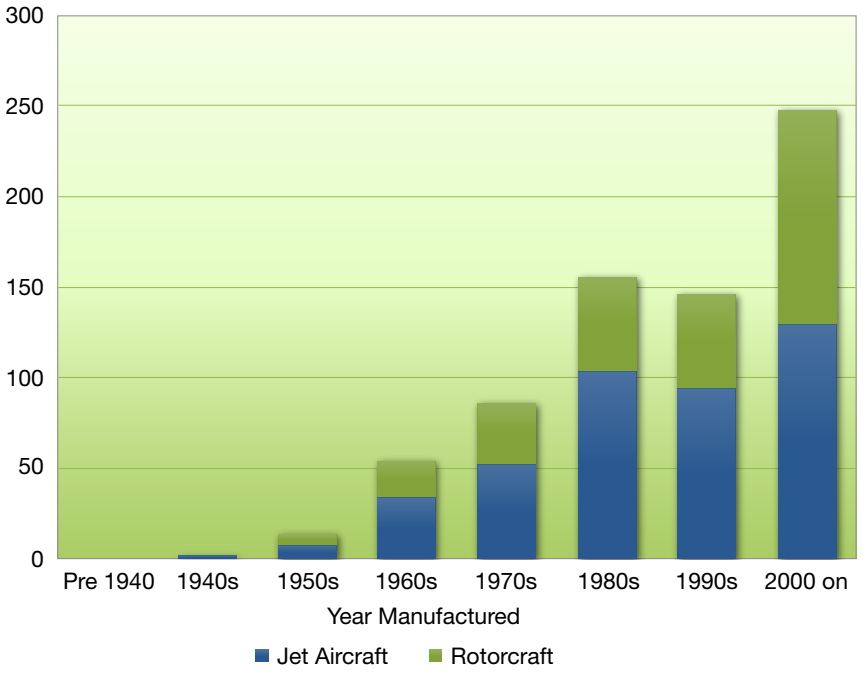
The age profile of aircraft manufactured since 2000 is shown in **FIGURE 6.3**. Since there has been relatively low attrition of these aircraft (the OCS study cited above found that 93 percent of the aircraft manufactured in a given year are still registered 10 years later, with correspondingly higher proportions for newer aircraft), the number of the aircraft manufactured in each year gives a good indication of the rate at which new aircraft have been added to the fleet. As can be seen, this was fairly constant from 2000 to 2003 then rose steadily to 2006, since when it has declined sharply.

FIGURE 6.3 Age Profile of 2010 Based Aircraft Fleet in Los Angeles County Manufactured Since 2000



The data for 2010 should be viewed with caution, since the County Assessor data was assembled during the year and so almost certainly have missed aircraft added to the fleet later in the year. Even so, the decline in new aircraft being added to the fleet since 2006 is dramatic.

The age profile of the single-engine turboprop and multi-engine piston and turboprop aircraft in the fleet is shown in **FIGURE 6.4**. This shows that the great majority of these aircraft are over 30 years old, while the proportion of turboprop aircraft relative to multi-engine piston aircraft has increased steadily over time, as has the proportion of



single-engine turboprop aircraft. Indeed, over the past 10 years more single-engine turboprop aircraft were added to the fleet than multi-engine turboprop and piston aircraft combined. The decline in the numbers of multi-engine turboprop and piston aircraft added to the fleet over the past 30 years in part reflects a shift to jet aircraft for corporate and business flying.

FIGURE 6.4 Age Profile of 2010 Based Aircraft Fleet – Turboprop and Multi-Engine Piston Aircraft in Los Angeles County

The corresponding age profile for rotorcraft and jet aircraft is shown in **FIGURE 6.5**. In contrast to the age profile of piston and turboprop aircraft shown in **FIGURES 6.2** and **6.4**, the number of both rotorcraft and jet aircraft added to the fleet has increased steadily over time, with those manufactured over the past 10 years comprising the largest age cohort and accounting for 42 percent of the rotorcraft fleet and 31 percent of the jet aircraft fleet.

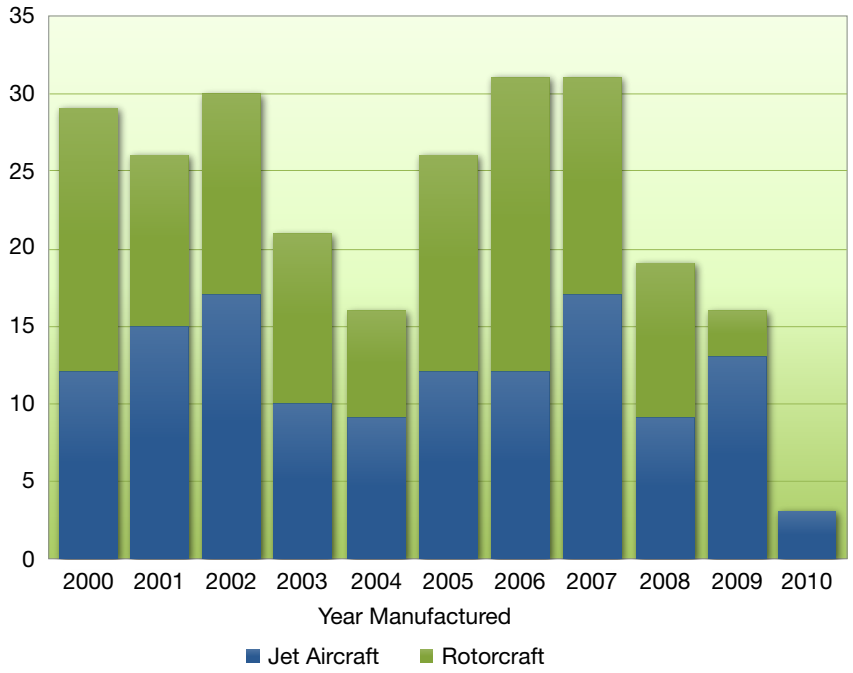


FIGURE 6.5 Age Profile of 2010 Based Aircraft Fleet – Rotorcraft and Jet Aircraft in Los Angeles County

The age profile for rotorcraft and jet aircraft manufactured since 2000 is shown in **FIGURE 6.6**. The steady increase in the number of such aircraft added to the fleet in each decade shown in **FIGURE 6.5** appears to have leveled out, with marked fluctuations over the decade. Following a sharp decline in the number of both types of aircraft added to the fleet from 2002 to 2004, there was a strong growth to 2006 in rotorcraft added to the fleet and to 2007 in jet aircraft added to the fleet. This was followed by a steady decline in the number of rotorcraft added to the fleet from 2006 to 2009 and a similar decline in jet aircraft added to the fleet from 2007 to 2008, followed by a modest growth to 2009.

However, it should be noted that the differences from year to year are typically less than five aircraft and never more than seven aircraft, so year to year fluctuations are likely to be heavily influenced by the timing on individual owner decisions on aircraft acquisition.

FIGURE 6.6 Age Profile of 2010 Based Aircraft Fleet in Los Angeles County – Rotorcraft and Jet Aircraft Manufactured Since 2000

It is very likely that the decline in the addition of new rotorcraft and jet aircraft to the fleet from 2007 to 2009 was heavily influenced by the recession that started in 2007 as well as subsequent restrictions on the availability of business credit that occurred. As the economy recovers from the recession, it is seems likely that acquisition of new rotorcraft and jet aircraft will return to pre-recession levels.

FORECAST ASSUMPTIONS FOR FUTURE ADDITIONS TO THE FLEET

Based on the previous analysis, it seems reasonable to assume as a baseline case that over the next 25 years, additions of rotorcraft and jet aircraft to the fleet will correspond to the average rate experienced during the period from 2000 to 2009. In the case of Los Angeles County this implies net additions of about 12 new rotorcraft and 13 new jet aircraft per year. These additions do not count imports to and exports from the region of older aircraft. It is assumed that the net effect of these imports and exports is accounted for in the assumed attrition rates for aircraft of a given age and the current age profile of aircraft of a given type. Of course, attrition rates calculated on national data (as rates estimated in the OCS study were) do not consider movement of aircraft between different regions of the country, although they do account for exports from and imports to the United States. Thus the use of national fleet attrition data assumes that for a given region, such as Southern California, sales of aircraft to new owners outside the region are balanced by purchases of aircraft of a similar age that are moved to the region (although not generally by the same owners).

The number of single-engine piston aircraft added to the fleet each year during the past decade in Los Angeles County showed an increasing trend from 2000 to 2006, followed by a rapid decline to 2009, as shown in **FIGURE 6.3**. It is assumed that these trends reflect the general economic growth prior to 2006 and the effect of the 2007 recession, although the decline from 2006 to 2009 is so great that there may be other factors involved. Therefore as a baseline case it seems reasonable to assume that future additions of new single-engine piston aircraft to the aircraft fleet each year will correspond to the average rate in each county over the period from 2000 to 2009, or about 39 aircraft per year in the case of Los Angeles County. This implicitly assumes that future changes in various factors that are likely to influence aircraft owner decisions to purchase a new aircraft or construct a homebuilt aircraft offset each other. These factors are likely to include:

- An increase in real disposable income due to improvement in the economy, which would tend to increase the rate at which new aircraft are acquired or older aircraft are replaced by new aircraft
- A decline in the number of active private pilots as the private pilot community ages, which would reduce the overall demand for aircraft and put more used aircraft on the market, reducing the demand for new aircraft

- Increases in the cost of flying, particularly fuel costs, which would discourage potential new aircraft owners from acquiring new or used aircraft
- Changes in the number of new student pilots, which would affect aircraft acquisition decisions by flying schools and other flight training programs

The combined effect of these factors is likely to be quite complex and difficult to predict, although developing a better understanding of their influence on aircraft purchase decisions would be a very useful topic for future research.

Recent trends in the addition of other aircraft types to the based aircraft fleet are less clear, due to the relatively small number of such aircraft that have been added to the fleet over the past decade. The average numbers of aircraft added to the fleet in Los Angeles County each year from 2000 to 2009 are as follows:

- 2.3 single-engine turboprop
- 0.6 multi-engine turboprop
- 1.4 multi-engine piston
- 1.2 gliders
- 0.5 balloons and other aircraft

Given the small number of aircraft involved, the number of each type of aircraft added to the fleet in each year varied widely (in an extreme case, six of the 14 multi-engine piston aircraft added to the fleet from 2000 to 2009 were manufactured in 2007). Therefore as a baseline case it seems reasonable to assume that future additions of each of these aircraft types in a given year in each county will correspond to the average rate over the period 2000 to 2009 for that county.

The resulting assumptions for annual additions to the based aircraft fleet in each county are shown in **TABLE 6.2**.

TABLE 6.2 Assumed Annual Additions to the Based Aircraft Fleet by County

Aircraft Type	Imperial County	Los Angeles County	Orange County	Riverside County	San Bernardino County	Ventura County
Single-engine Piston	0.4	39.3	11.8	16.4	9.9	8.4
Single-engine Turboprop		2.3	0.4	0.7	0.4	0.4
	0.4	**41.6**	**12.2**	**17.1**	**10.3**	**8.8**
Multi-engine Piston		1.4	0.2		0.1	0.5
Multi-engine Turboprop	0.1	0.6	0.2	0.2	0.1	0.4
	0.1	**2.0**	**0.4**	**0.2**	**0.2**	**0.9**
Jet Aircraft		12.6	3.0	0.8	1.4	1.2
Helicopter	0.2	11.9	1.2	1.0	1.1	0.9
Glider		1.2		0.3	0.1	0.1
Balloon		0.1		1.8	0.2	
Other		0.4		0.6	0.2	
	0.7	**69.8**	**16.8**	**21.8**	**13.5**	**11.9**

BASELINE FORECAST

Using the assumptions discussed above for fleet attrition rates and addition of new aircraft to the fleet, the attrition of the current (2010) aircraft fleet was projected to 2035. To this was added the projected number of new aircraft that are assumed would be added to the fleet each year from 2011 through 2035, with appropriate adjustments for attrition between the year they are added to the fleet and 2035. This gave the based aircraft forecasts for each county presented in the following sections.

It should be noted that the Balloon/Other category are not strictly based aircraft, since they are typically not stored at airports, as noted above.

In addition to the forecast of based aircraft for each county, forecasts were prepared of active aircraft and hours flown by the active aircraft, based on national data for average utilization for aircraft of a given category and age obtained from the FAA General Aviation and Part 135 Activity Survey (FAA, 2011c).

One important caveat that should be noted when considering the forecast based aircraft fleet for different aircraft types is that the same attrition relationship was assumed for each aircraft type. The OCS study for the FAA from which this relationship was obtained did not develop separate relationships for different aircraft types. At the time the relationship was developed, single-engine piston aircraft accounted for the great majority of the aircraft fleet, so it would have been difficult to develop attrition relationships for different aircraft types. In addition, the factors that influence future changes in the number of new aircraft added to the fleet per year for different aircraft types are also likely to differ by aircraft type. Thus while future additions of some aircraft types may continue at the average rate observed during the period from 2000 to 2009, the rates for other aircraft types may change.

However, in the absence of any basis for projecting different attrition rates for different aircraft types, applying the same rate to each aircraft type seems reasonable. Since the assumed rates at which new aircraft are added to the fleet are based on the average observed rates over the period from 2000 to 2009, alternative scenarios could easily be defined if there was any agreed basis for doing so.

Imperial County

The forecast of based aircraft in Imperial County in 2035 is shown in **TABLE 6.3**.

TABLE 6.3 Baseline Forecast of Based Aircraft in 2035 – Imperial County

Aircraft Type	Current 2010 Fleet	Remaining Aircraft from Current Fleet 2035	New Aircraft Additions to Fleet 2035	Forecast Based Aircraft Fleet 2035
Single-engine Piston	116	89	9	98
Single-engine Turboprop	1	1	0	1
	117	**90**	**9**	**99**
Multi-engine Piston	6	5	0	5
Multi-engine Turboprop	2	1	2	3
	8	**6**	**2**	**8**
Jet Aircraft	0	0	0	0
Helicopter	4	3	4	7
Glider	1	1	0	1
Balloon/Other				
	130	**100**	**15**	**115**

The total based aircraft fleet is forecast to decline by 12 percent from 2010 levels. The number of single-engine piston aircraft is projected to decline by 15 percent, with the number of single-engine turboprop and multi-engine propeller aircraft projected to remain unchanged from 2010 levels. The number of helicopters is projected to increase from 4 to 7 aircraft. The one glider in the 2010 County Assessor data is projected to remain in the based aircraft fleet with no additions. There were no jet aircraft in the 2010 County Assessor data, so the forecast approach did not generate any additions of jet aircraft to the 2035 based aircraft fleet.

The associated forecast of active aircraft in Imperial County in 2035 and the hours flown by those aircraft is shown in **TABLE 6.4**. By 2035 only 44 percent of the based aircraft fleet is projected to be actively flown and these aircraft are projected to be flown for a total of about 4,900 hours per year. The relatively low percentage of active aircraft is a consequence of the increase in the average age of the aircraft fleet as new aircraft additions do not keep up with attrition. The low number of flight hours by the active aircraft fleet is partly a result of the average age of the fleet and partly due to the low proportion of higher-end aircraft in the fleet, in particular the absence of jet aircraft, which are flown significantly more hours per year than single-engine piston aircraft.

TABLE 6.4 Baseline Forecast of Based Aircraft Activity in 2035 – Imperial County

Aircraft Type	Forecast Based Aircraft Fleet 2035	Forecast Active Aircraft 2035	Percent of Aircraft Fleet Active 2035	Forecast Hours Flown 2035
Single-engine Piston	98	43	43.5%	2,368
Single-engine Turboprop	1	0	0.0%	72
	99	43	43.1%	2,439
Multi-engine Piston	5	0	0.0%	42
Multi-engine Turboprop	3	3	88.5%	701
	8	3	37.40	743
Jet Aircraft	0	0		
Helicopter	7	5	76.4%	1,719
Glider	1	0	0.0%	6
Balloon/Other				
	115	**51**	**44.4%**	**4,907**

Los Angeles County

The forecast of based aircraft in Los Angeles County in 2035 is shown in **TABLE 6.5**. The total based aircraft fleet is forecast to increase by 10 percent from 2010 levels, due principally to the additions of higher-end aircraft to the fleet between 2010 and 2035. The number of single-engine turboprop aircraft is projected to increase by 56 percent, with the number of helicopters increasing by 61 percent, and the number of jet aircraft increasing by 36 percent. The number of single-engine piston aircraft is projected to increase by just 4 percent, with the number of multi-engine turboprop aircraft projected to decline by 5 percent and the number of multi-engine piston aircraft projected to decline by 14 percent. The number of gliders is projected to increase by 11 percent, with the number of balloons and other aircraft types projected to increase by 17 percent.

TABLE 6.5 Baseline Forecast of Based Aircraft in 2035 – Los Angeles County

Aircraft Type	Current –2010 Fleet	Remaining Aircraft from Current Fleet 2035	New Aircraft Additions to Fleet 2035	Forecast Based Aircraft Fleet 2035
Single-engine Piston	3,011	2,265	854	3,119
Single-engine Turboprop	59	42	50	92
	3,070	**2,307**	**904**	**3,211**
Multi-engine Piston	362	280	30	310
Multi-engine Turboprop	67	50	13	63
	429	**330**	**43**	**373**
Jet Aircraft	418	296	274	570
Helicopter	284	198	259	457
Glider	70	52	26	78
Balloon/Other	25	18	11	29
	4,296	**3,200**	**1,517**	**4,717**

The associated forecast of active aircraft in Los Angeles County in 2035 and the hours flown by those aircraft are shown in **TABLE 6.6**. By 2035 61 percent of the based aircraft fleet is projected to be actively flown and these aircraft will be flown for a total of about 394,000 hours per year. Jet aircraft and helicopters are projected to account for the majority of the hours flown, 28 percent and 27 percent respectively. However, single-engine propeller aircraft are projected to account for 39 percent of the hours flown, the majority of which (34 percent of the total hours flown) is accounted for by single-engine piston aircraft.

TABLE 6.6 Baseline Forecast of Based Aircraft Activity in 2035 – Los Angeles County

Aircraft Type	Forecast Based Aircraft Fleet	Forecast Active Aircraft 2035	Percent of Aircraft Fleet Active 2035	Forecast Hours Flown 2035
Single-engine Piston	3,119	1,814	58.1%	134,687
Single-engine Turboprop	92	76	82.9%	19,791
	3,211	1,890	58.8%	154,477
Multi-engine Piston	310	117	37.7%	11,980
Multi-engine Turboprop	63	39	61.5%	8,153
	373	156	41.8%	20,134
Jet Aircraft	570	432	75.8%	111,823

Balloon/Other	29	14	49.4%	476
	4,717	**2,867**	**60.8%**	**394,223**

Orange County

The total based aircraft fleet is forecast to increase by 15 percent from 2010 levels, due principally to the additions of higher-end aircraft to the fleet between 2010 and 2035. he forecast of based aircraft in Orange County in 2035 is shown in **TABLE 6.7**

TABLE 6.7 Baseline Forecast of Based Aircraft in 2035 – Orange County

Aircraft Type	Current 2010 Fleet	Remaining Aircraft from Current Fleet 2035	New Aircraft Additions to Fleet 2035	Forecast Based Aircraft Fleet 2035

The number of jet aircraft is projected to increase by 70 percent, while the number of helicopters is projected to increase by 44 percent. The number of single-engine piston aircraft is projected to increase by 14 percent, with a small increase in the number of single-engine turboprop aircraft from 16 to 20 aircraft. The number of multi-engine piston and turboprop aircraft is projected to decline by 17 percent and 16 percent respectively. The number of gliders is projected to decrease slightly due to attrition from the fleet, with

no additions of new aircraft. There were no balloons or other aircraft types in the 2010 County Assessor data, and no additions of these aircraft types have been projected.

The associated forecast of active aircraft in Orange County in 2035 and the hours flown by those aircraft are shown in **TABLE 6.8**. By 2035 65 percent of the based aircraft fleet is projected to be actively flown and these aircraft will be flown for a total of about 83,400 hours per year. Jet aircraft and helicopters combined are projected to account for slightly less flight activity than single-engine piston aircraft, which are projected to account for 45 percent of the hours flown. Jet aircraft and helicopters are projected to account for 30 percent and 14 percent of the total hours flown respectively.

TABLE 6.8 Baseline Forecast of Based Aircraft Activity in 2035 – Orange County

Aircraft Type	Forecast Based Aircraft Fleet	Forecast Active Aircraft 2035	Percent of Aircraft Fleet Active 2035	Forecast Hours Flown 2035

Riverside County

The forecast of based aircraft in Riverside County in 2035 is shown in **TABLE 6.9**. The total based aircraft fleet is forecast to increase by 6 percent from 2010 levels, due principally to the additions of jet aircraft and helicopters to the fleet between 2010 and 2035, the numbers of which are projected to increase by 33 percent and 25 percent respectively. The number of single-engine piston aircraft is projected to increase by 5 percent, with a small increase in the number of single-engine turboprop aircraft from 13 to 24 aircraft. The numbers of multi-engine piston and turboprop aircraft are projected to decline by 21 percent and 6 percent respectively. The number of gliders is projected to decrease by about 6 aircraft, while the number of balloons and other aircraft types is projected to increase by 75 percent.

TABLE 6.9 Baseline Forecast of Based Aircraft in 2035 – Riverside County

The associated forecast of active aircraft in Riverside County in 2035 and the hours flown by those aircraft are shown in **TABLE 6.10**. By 2035 54 percent of the based aircraft fleet is projected to be actively flown and these aircraft will be flown for a total of about

81,500 hours per year. Single-engine piston aircraft are projected to account for 65 percent of the hours flown, with helicopters and jet aircraft accounting for 12 percent and 8 percent of the total hours flown respectively and single-engine turboprop aircraft accounting for 7 percent of the hours flown.

San Bernardino County

The forecast of based aircraft in San Bernardino County in 2035 is shown in **TABLE 6.11**. The total based aircraft fleet is forecast to decline by 2 percent from 2010 levels, due to a 4 percent decline in single-engine piston aircraft, which accounted for 83 percent of the total aircraft fleet in 2010, despite an increase in the jet aircraft and helicopter fleets between 2010 and 2035, the numbers of which are projected to increase by 30 percent and 38 percent respectively.. The number of single-engine turboprop aircraft is projected to increase slightly from 10 to 16 aircraft, while the numbers of multi-engine piston and turboprop aircraft are projected to decline by 11 and one aircraft respectively. The number of gliders is projected to decrease by about 7 aircraft, while the number of balloons and other aircraft types is projected to increase by about 4 aircraft.

Ventura County

The forecast of based aircraft in Ventura County in 2035 is shown in **TABLE 6.13**. The total based aircraft fleet is forecast to increase by 1 percent from 2010 levels, due primarily to increasing numbers of jet aircraft and helicopters, which are projected to increase by 81 percent and 27 percent respectively and largely offset a projected decline in the number of single-engine piston aircraft of 2 percent. The number of single-engine turboprop aircraft is projected to increase slightly from 17 to 21 aircraft, with the number of multi-engine turboprop aircraft projected to increase from 15 to 20 aircraft. These increases almost exactly offset a projected decline in the number of multi-engine piston aircraft from 80 to 73 aircraft. The number of gliders is projected to remain constant, while the number of balloons and other aircraft types is projected to decline slightly from 6 to 4 aircraft.

TABLE 6.13 Baseline Forecast of Based Aircraft in 2035 – Ventura County

Aircraft Type	Current 2010 Fleet	Remaining Aircraft from Current Fleet 2035	New Aircraft Additions to Fleet 2035	Forecast Based Aircraft Fleet 2035

Regional Total

The forecast regional total of based aircraft in 2035 is shown in **TABLE 6.15**. he total based aircraft fleet in the region is forecast to increase by about 7 percent from 2010 levels, due primarily to increasing numbers of jet aircraft and helicopters, which are projected to increase by 41 percent and 51 percent respectively. The size of the based single-engine piston aircraft fleet is projected to increase slightly by about 2 percent, as new additions to the fleet offset attrition, while the number of single-engine turboprop aircraft is projected to increase by 50 percent. However, the number of multi-engine piston aircraft is projected to decline by 15 percent, with the number of multi-engine turboprop aircraft declining by 4 percent. The number of gliders is projected to decline slightly by about 7 aircraft, while the number of balloons and other aircraft types is projected to increase by 86 percent.

TABLE 6.15 Baseline Forecast of Based Aircraft Activity in 2035 – SCAG Region

Aircraft Type	Current 2010 Fleet	Remaining Aircraft from Current Fleet 2035	New Aircraft Additions to Fleet 2035	Forecast Based Aircraft Fleet 2035

TThe associated regional forecast of active aircraft in 2035 and the hours flown by those aircraft are shown in **TABLE 6.16**. By 2035 58 percent of the based aircraft fleet is projected to be actively flown and these aircraft will be flown for a total of about 691,000 hours per year. Single-engine piston aircraft are projected to account for 43 percent of the hours flown, with jet aircraft and helicopters accounting for 24 percent and 21 percent of the total hours flown respectively. Single-engine turboprop aircraft are projected to account for about 5 percent of the total hours flown, while multi-engine turboprop aircraft and multi-engine piston aircraft each account for a similar proportion of the hours flown, about 3 percent of the total hours flown.

TABLE 6.16 Baseline Forecast of Based Aircraft Activity in 2035 – SCAG Region

Aircraft Type	Forecast Based Aircraft Fleet	Forecast Active Aircraft 2035	Percent of Aircraft Fleet Active 2035	Forecast Hours Flown 2035

	9,952	**5,720**	**57.5%**	**690,761**

The Baseline forecast of the total hours flown in 2035 by the based aircraft fleet is broadly consistent with the Baseline forecast of annual hours flown by active pilots in Southern California presented in Section 5 and shown in **TABLE 5.2**, which gave a regional total of about 961,000 hours per year. While this is some 39 percent higher than the forecast of aircraft hours flown, many commercial flight operations require two pilots and of course dual instructional flying involves two pilots (the student and the instructor). In these cases both pilots will count the flight time. The higher number of pilot flight hours implies that about 39 percent of the flights involve two pilots, which does not appear an unreasonable amount given the proportion of total pilot flight hours accounted for by student pilots and the proportion of the higher-end aircraft flight hours flown by jet aircraft, which typically require two pilots.

Summary and Conclusions

This section of the report has presented a review of recent trends in the size and composition of the pilot community in Southern California, as well as changes in the size and composition of the based aircraft fleet and aircraft operations at airports in the region, together with alternative forecasts of how these measures of general aviation activity may evolve in the future. The size of the active pilot community has been slowly declining over the past ten years, and if current trends continue it appears that the number of new student pilots who progress to higher levels of pilot certificate and continue as active pilots will not be sufficient to offset the natural attrition of the existing active pilot community, which is largely comprised of older pilots. At the same time, the size of the based aircraft fleet at airports in the region, which has been fairly stable for most of the past decade, has recently also started to show signs of declining. However, the apparent stability in the size of the aircraft fleet for most of the decade concealed a pattern of changes in the composition of the fleet, in which the number of jet aircraft and helicopters has been increasing, while the number of single-engine propeller aircraft, which comprise the majority of the based aircraft fleet, has been steadily declining. In recent years the number of multi-engine propeller aircraft, which had grown somewhat during the first part of the past decade has also begun to decrease.

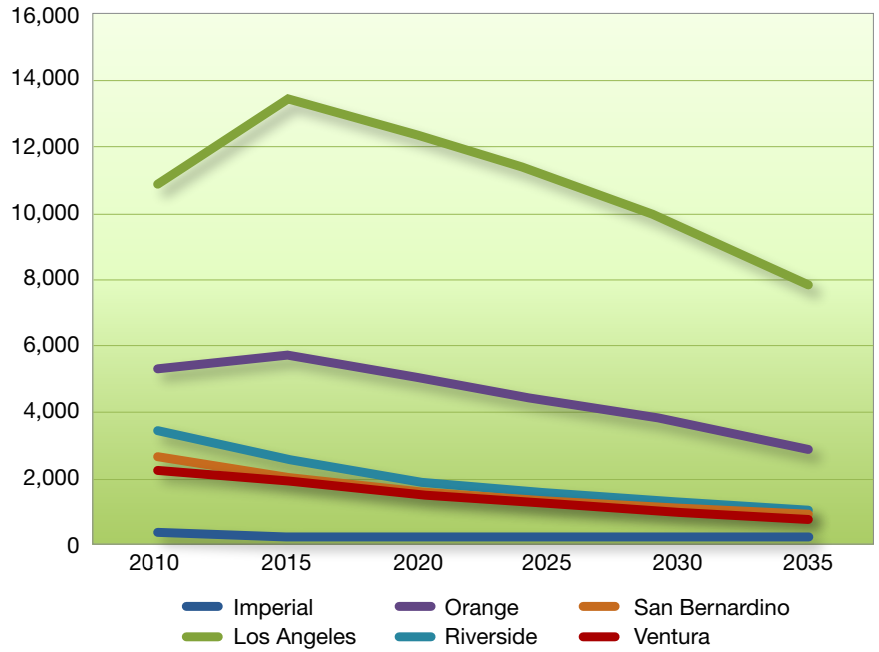
While the total size of the based aircraft fleet has been fairly stable until the past few years, the number of total aircraft operations across all airports in the Southern California region has been declining steadily throughout the past decade. This decline has been greatest for air taxi and itinerant general aviation operations, but has also occurred for general aviation local operations and even air carrier operations. The fact that the decline in general aviation aircraft operations has been greater than that for the number of active pilots in the region or for the number of based aircraft suggests that not only is the number of active pilots declining, but that those pilot are flying less and the average utilization of the based aircraft fleet is also declining. Since the composition of the based aircraft

fleet has also been changing, with the number of jet aircraft and helicopters, which are generally used more intensively than single-engine propeller aircraft, increasing and the number of single-engine propeller aircraft declining more slowly that general aviation aircraft operations, this suggests that the average utilization of single-engine propeller aircraft has been declining quite steeply.

These findings are broadly consistent with the results of recent FAA surveys of general aviation aircraft owners that have collected data on aircraft utilization. These data show quite clearly that average aircraft utilization declines with the age of the aircraft, both in terms of the percent of the registered aircraft fleet that is actively flown and the average number of hours flown per year by active aircraft. Furthermore there is some evidence from the survey data that in addition to the decline in average utilization as the average age of the aircraft fleet is increasing, the average utilization of aircraft of a given age is also declining.

In contrast to the recent decline in the size of the pilot community and general aviation aircraft operations in the Southern California region, the most recent FAA forecast for general aviation activity at the airports in the region projects that this decline in GA activity will reverse in 2012 and be followed by a steady growth to 2030, increasing the number of GA itinerant operations by 16 percent above 2010 levels and the number of GA local operations by 10 percent above 2010 levels. The FAA forecast also projects that based aircraft in the region will increase by 21 percent from 2010 to 2030. Surprisingly, the forecast projects that the number of single-engine and multi-engine propeller aircraft based in the region will increase more rapidly than the number of jet aircraft and helicopters, whereas the trend over the past decade has been quite the reverse, with the numbers of jet aircraft and helicopters increasing, while the numbers of propeller aircraft have declined.

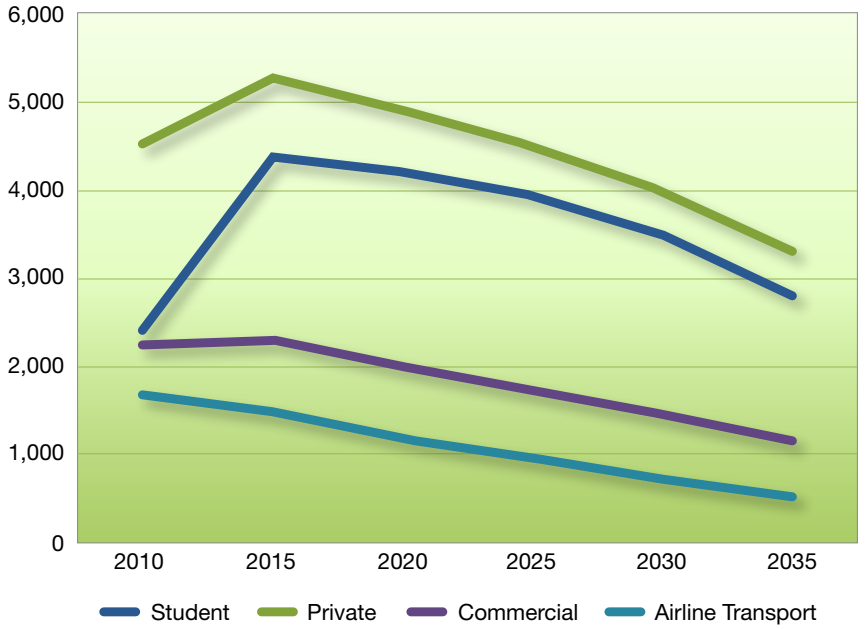
This fairly rosy view of the future of general aviation activity in the Southern California region is not supported by recent studies of the demographics of the pilot community, or the pilot cohort analysis undertaken as part of the current study. Of course, the future is inherently unknown, and there may well be factors that cause the recent trends in new student pilot starts to reverse and the size of the pilot community to begin to grow again, and with it the number of aircraft operations and new aircraft purchases. However, against this has to be set possible future trends in such factors as the cost of flying and the potential demand for airline and commercial pilots, which is likely to influence the number of people who decide to take up flying as a career.



In order to provide a counterpoint to the FAA forecast of future GA activity in Southern California, this study has prepared a set of alternative forecasts based on the application of the forecast approach described in this section, using a range of assumptions addressing such factors as the number of new pilot starts, the rate at which pilots transition to higher levels of pilot certificates, the average number of flight hours per year by pilots with different levels of pilot certificate in different age ranges, the number of new aircraft purchases and the average attrition rates of the current general aviation aircraft fleet.

FORECAST RESULTS

The application of the pilot cohort analysis described in Chapter 4 to the Baseline Forecast assumptions regarding future trends in new pilot starts and rates of pilot attrition and transition to higher levels of certificate gave the results shown in **FIGURE 7.1** for pilots resident in each of the six counties within the Southern California region.



The increase in projected active pilots in Los Angeles and Orange Counties from 2010 to 2015 results from a transition from the FAA data for active pilots in 2010 to a forecast of active pilots in 2015 based on the trend in the relationship between new pilot starts and socioeconomic factors over the period from 2000 to 2010. The number of active student pilots in 2010 in both counties appeared to be depressed below the long-term trend by the current economic conditions, which it was assumed would have improved by 2015. However, beyond 2015, the assumed growth in population and the economy were not enough to offset the declining trend in the historical relationship between new pilot starts and socioeconomic factors. With an insufficient number of new student pilots taking up flying to replace the attrition of older pilots as they age, the size of the total pilot community is projected to steadily decline in the future. This effect is apparent in all six counties, as shown in **FIGURE 7.1**.

FIGURE 7.1 Baseline Forecast of Active Pilots

A more detailed perspective on the changes in the pilot community is provided by **FIGURE 7.2**, which shows the forecast trend in the number of pilots holding different levels of pilot certificate for the Baseline Forecast scenario. The increase in student pilots from 2010 to 2015 leads to an initial increase in private pilots and even a slight increase in commercial pilots as some of those student pilots transition to higher levels of pilot certificate. However, although the number of active student pilots each year remains above 4,000 until almost 2025, this is not sufficient to prevent the number of pilots holding other categories of pilot certificate from declining steadily.

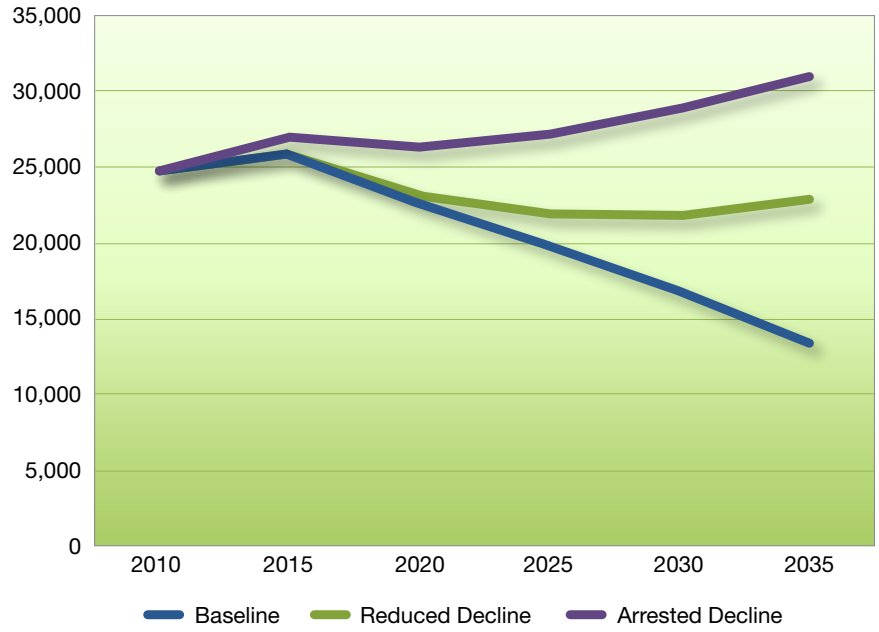


FIGURE 7.2 Baseline Forecast of Active Pilots – Los Angeles County

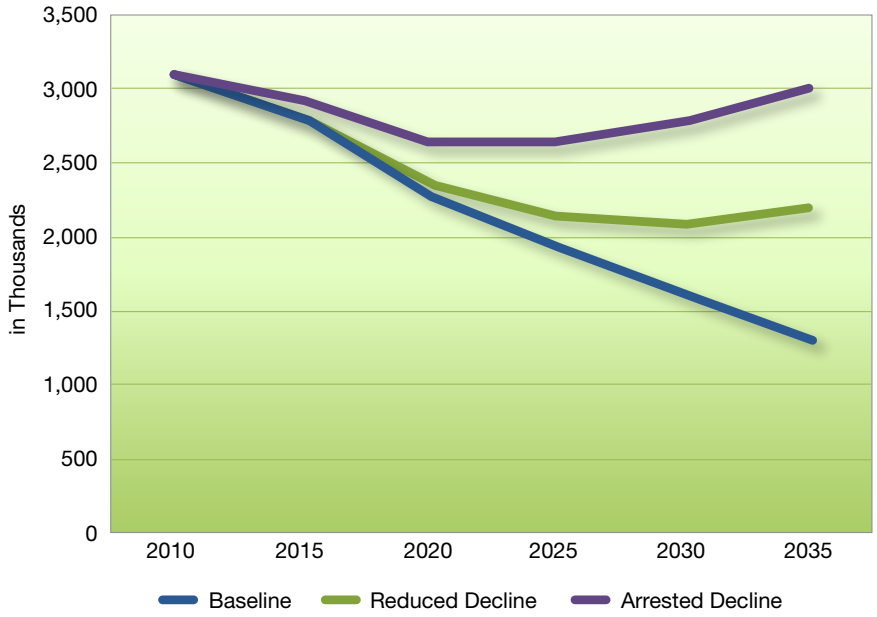
In order to explore the potential effect of factors that might cause a change in the historical declining trend in the number of new pilot starts, two additional forecast scenarios were defined. The Reduced Decline Forecast scenario assumed that the declining relationship between the number of new student pilot starts and the underlying socioeconomic factors observed over the past ten years reduces to half the historical rate of decline from 2015 to 2025 then remains constant thereafter. This results in a higher number of new student pilots each year that in turn reduces the rate of decline of the number of pilots holding higher categories of pilot certificate. A more aggressive Arrested Decline Forecast scenario assumes that the decline in the relationship between the number of new student pilot starts and the underlying socioeconomic factors ceases after 2010 and the relationship remains constant thereafter. It is unclear what policies or actions could cause this to occur, but the purpose of the scenario is to provide a more optimistic forecast scenario that might correspond more closely to the expectations of the FAA regarding future growth of the general aviation sector.



The projected number of active pilots in Southern California under each of the three forecast scenarios is shown in **FIGURE 7.3**. The Reduced Decline scenario results in the historical decline in the number of active pilots in the region being forecast to stabilize around 2025 with a modest growth after 2030. The Arrested Decline scenario results in a progressively increasing number of active pilots in the region forecast for the period from 2020 to 2035.

FIGURE 7.3 Alternative Forecasts of Active Pilots in Southern California

In addition to projecting the number of active pilots, the cohort analysis also estimates the number of annual hours flown by those pilots and the resulting change in aircraft operations in the region. The estimated number of aircraft operations for each of the three alternative forecast scenarios is shown in **FIGURE 7.4**. Not surprisingly, this broadly reflects the number of active pilots in the region, with some minor differences from the pattern shown in **FIGURE 7.3** due to the changing composition of the pilot community and the implications for the average number of hours flown per pilot across the pilot community.

FIGURE 7.4 Alternative Forecasts of Aircraft Operations in Southern California

Under the Arrested Decline Forecast scenario aircraft operations decline from 2010 to 2020, remain relatively constant until 2025, then grow to a level just below the level in 2010. The other two scenarios project a significant decline in the number of aircraft operations in the region from 2010 to 2035, particularly in the Baseline Forecast, with the Reduced Decline Forecast showing the decline in the number of aircraft operations ending by 2030 with a modest growth in operations from 2030 to 2035.

Forecast of Based Aircraft

In addition to the forecast of active pilots and pilot flight activity developed using the pilot cohort analysis, a separate forecast of based aircraft in the region was prepared by

applying an aircraft attrition model to the existing aircraft fleet and making assumptions about the number of new aircraft added to the fleet each year in the future. For the based aircraft forecast described in this section, termed the Baseline Forecast since the underlying assumptions reflect those adopted in the Baseline Forecast of active pilots and pilot activity, the average rate at which new aircraft have been added to the aircraft fleet over the past ten years was assumed to continue in the future. The attrition rates at which existing aircraft leave the fleet in any year were based on an the findings of an aircraft fleet attrition study prepared for the FAA in the mid 1970s, supplemented with an analysis of recent data from a survey of aircraft owners performed every year by the FAA.

This analysis suggested that the region's based aircraft fleet might grow by about 7 percent between 2010 and 2035, as newer aircraft are added to the fleet somewhat faster than older aircraft are retired. While the number of single-engine piston aircraft is projected to grow by about 2 percent, the numbers of jet aircraft and helicopters are projected to grow by 41 percent and 51 percent respectively. However, while the number of based aircraft may increase over time, assuming that the recent rate at which new aircraft have been added to the fleet continues unabated until 2035, the number of active aircraft will tend to drop as much of the current fleet grows progressively older. By 2035 the forecast suggests that only about 58 percent of the based aircraft fleet will still be actively flown.

The based aircraft forecast also used data on the average utilization of the current aircraft fleet given by FAA surveys of general aviation aircraft owners to make estimates of the number of hours flown per year in 2035 by the based aircraft fleet. These projections are broadly consistent with the estimates of annual flight hours by the region's pilot community, after making an allowance for the proportion of flight activity that is performed with two pilots on board.

Implications of the Forecast Results

Two of the three alternative forecasts for active pilots and pilot flight activity imply a significant reduction in general aviation activity in the region by 2035, while the third scenario is based on a premise that there is no obvious way to implement. Any such reduction in general aviation activity is likely to have significant consequences for the region's general aviation airports that derive the majority of their operating revenue from activity-related fees. The combination of declining flight activity and a slowly growing based aircraft fleet will result in a significant reduction in average aircraft utilization, particularly for single-engine piston aircraft.

As average aircraft utilization reduces, some aircraft owners may decide that it is simply too expensive to maintain their aircraft in an airworthy conditions if they are not being flown much, if at all. However, whether they are able to sell their aircraft on the used aircraft market will depend on the overall demand for used aircraft nationally and abroad. Since the decline in the number of active pilots and associated general aviation activity is a national phenomenon, other regions are likely to also experience a growing pool of underutilized aircraft, reducing the opportunities to sell aircraft that are no longer needed by their current owners. In any case, from the perspective of the size of the regional based aircraft fleet it does not really matter whether an unused aircraft is scrapped or sold and exported outside the region. In either case it disappears from the fleet.

The other important implication for regional airport system planning is the increasing role in regional general aviation activity of higher-end aircraft, particularly jet aircraft and helicopters. These aircraft tend to be based at a limited number of airports in the region and consume much larger quantities of fuel than single-engine piston aircraft, both because they burn more fuel per flight hour and tend to fly more hours per year. Therefore those airports where these aircraft are based are likely to be in fairly good shape financially, and may even find that demand for aircraft storage facilities exceeds the available resources. However, those airports that predominantly serve smaller general aviation aircraft and support flight training activity may find that they become the home to an increasing pool of inactive aircraft and experience a steady decline in airport revenues that derive from flight activity.

Sources of Uncertainty in the Forecasts

As with any forecast, there are many aspects that can influence future levels of general aviation activity and the likely size of the based aircraft fleet that cannot be known with any certainty or may change in unexpected ways due to unforeseen occurrences or factors. One example of such factors is the future availability of leaded aviation gasoline (avgas). At present the majority of general aviation aircraft engines use leaded avgas. However, there are growing concerns about the air quality impacts of continued use of leaded fuel for aircraft and the U.S. Environmental Protection Agency has begun moves to prohibit the use of this fuel in the future. In response the FAA has convened a national

working group to examine options to replace leaded avgas. If any replacement fuel requires relatively expensive modifications to aircraft engines or costs more per gallon, this may cause a large number of owners of older aircraft to decide that these aircraft are not worth modifying or continuing to operate, with implications for the aircraft fleet attrition rates.

In the other direction, a growing demand for airline pilots as many current airline pilots approach retirement could stimulate a renewed interest in careers as a professional pilot, leading to a surge in new student pilots taking up flying. Continued growth in business aviation could exacerbate the demand for commercial pilots as many of the current commercial pilots also approach retirement or are unable to maintain their medical certificate as they grow older.

Beyond these larger trends that may affect the underlying dynamics of the industry, there are other sources of uncertainty that arise from limitations of current data sources and a lack of recent studies that have examined underlying issues in any detail. A good example of this is that fact that most recent formal study of aircraft attrition rates was performed in the mid-1970s when the general aviation sector was very different. There have been no studies that have looked at how aircraft attrition rates vary across different categories of aircraft, such as between single-engine piston aircraft, jet aircraft, and helicopters. Similarly, data on the average number of hours flown per year by pilots of difference ages and holding different types of pilot certificate, or even the type of flying that they do, is extremely limited. For example, while the FAA provides detailed data on the certificates held by individual pilots on its website, the data contain no information on the number of hours those pilots fly or the type of flying that they do. While the FAA knows the age of every pilot, for privacy reasons this information is not made public.

It is thus unclear how many pilots holding a commercial pilot or airline transport pilot certificate are in fact working as a profession pilot or flight instructor, or obtained the certificate with the intention of working as a professional pilot but are not currently doing so. Similarly it is not clear how many individuals holding a student pilot certificate are actively progressing to obtaining a private pilot certificate and how many have long since given up learning to fly or are keeping the medical certificate valid in the hope of one day resuming their flight training but are not currently actively doing so.

NEXT STEPS

The regional general aviation demand forecasts presented in this report complete the first phase of a two-phase study for the Southern California Association of Governments. The second phase, not currently funded, is intended to develop a based airport choice model that can be used to examine how the forecast regional demand is likely to be distributed among the airports in each county and how this allocation of general aviation activity may be influenced by actions that SCAG or others could take.

As part of this modeling work, the second phase of the study could revisit some of the issues identified in the analysis performed to date and refine the assumptions used in the pilot cohort analysis and the based aircraft forecast. These issues could include a more detailed study of general aviation aircraft attrition rates using the data from the FAA general aviation aircraft activity surveys and further analysis of pilot attrition rates and transition to higher levels of pilot certificate.

A large amount of data has been assembled in the course of the current phase of the study and a number of extremely complex spreadsheet models have been developed to implement the pilot cohort analysis and the based aircraft forecast model. It would be highly desirable for SCAG to devote some resources to organizing and documenting these data and models so that they can be easily updated and reused in the future without having to invest a large amount of money and time reinventing this particular wheel.

Regional Aviation Policies and Action Steps

Recommended by the SCAG Aviation Technical Advisory Committee for the 2012 Regional Transportation Plan.

Background

The SCAG Aviation Technical Advisory Committee (ATAC) participated in a series of round table discussions over a six month period to identify regional aviation policy issues that merited further evaluation for inclusion in the 2012 Regional Transportation Plan (RTP). The end result of these discussions and debates was a recommended list of high-priority regional aviation policies and implementing action steps for inclusion in the 2012–2035 RTP. The intent of these policies and action steps is to set a future agenda for the SCAG Aviation Program, to be used in supporting new aviation-related legislation and identifying and carrying out new projects for future RTPs. The recommended regional aviation policies and action steps are listed below, grouped in four categories: (1) Regional Aviation Demand, Airport Infrastructure and Airport Ground Access; (2) Airport Economics, Finance and Funding; (3) Airport Land Use Compatibility and Environmental Impacts; and (4) Airspace Planning and New Technologies.

I. REGIONAL AVIATION DEMAND, AIRPORT INFRASTRUCTURE AND AIRPORT GROUND ACCESS

A. Policies

- The capability of uncongested secondary airports in the region to accommodate future aviation demand, where such growth is desired, should be preserved during periods of declining or stagnant air traffic
- Uncongested secondary airports in the region, where additional activity is desired, should be supported through appropriate incentives, marketing, and projects that enhance their capacity and regional accessibility
- The factors that most influence the growth in demand for air travel and the composition of the market should be identified
- A regional consensus should be developed on how best to support the development of new air services at uncongested secondary airports, where such growth is desired
- State-of-the-art aviation demand forecast methodologies should be employed to accurately forecast future aviation demand in the region's complex multi-airport system, and regional aviation demand forecasts should be regularly updated to address changing conditions
- Existing and planned regional highway and high-occupancy transit improvements should be leveraged to the extent possible to increase the regional accessibility of uncongested secondary airports, where traffic is desired, while minimizing improvement needs

B. Action Steps

- SCAG should work with the region's airport operators to conduct a region-wide air passenger survey on an ongoing basis, designed to enhance and inform regional aviation demand forecasting and airport marketing efforts
- SCAG should develop an in-house aviation demand forecasting model that can support the development of future forecasts and allocation of forecast demand to airports in a complex multi-airport regional system. The model should be fully integrated with SCAG's regional transportation model, and should have airport ground access modeling capabilities
- SCAG should work with the region's airport operators and business community to define a region-wide marketing effort to promote alternatives to increased use of congested urban airports, consistent with the policy directions of airport operators
- SCAG should identify and define incentives that airports can effectively use to encourage airlines to provide new air service
- SCAG should establish a Regional Airport Ground Access Task Force to define potential projects and programs to improve airport accessibility to secondary airports, and reduce vehicular traffic generated by the large urban airports. The Task Force would help plan and promote rail and express bus service improvements and extensions to airports in the region, as well as an integrated regional system of remote air terminals ("FlyAways")

II. AIRPORT ECONOMICS, FINANCE AND FUNDING

A. Policies

- New funding mechanisms should be identified for implementing regional infrastructure and airport ground access improvements
- Efforts by airport operators to develop strategic financial plans and explore non-aeronautical revenue-generating use of underutilized airport property should be supported
- Strategies that enhance the economic contribution of aviation to the regional economy should be identified and implemented

B. Action Steps

- SCAG should sponsor and support new legislation that allows for more flexible use of airport revenues for off-airport ground access projects when requested by airport operators
- The Airport Ground Access Task Force should explore and develop potential new funding sources to support specific projects they have identified for improving regional airport accessibility
- SCAG should coordinate with the region's County Transportation Commissions and other transportation agencies to include joint funding of airport ground access projects identified in SCAG's Regional Transportation Plan in those agencies' plans
- SCAG should sponsor new legislation to allow for underutilized airport property to be used for revenue-generating non-aeronautical uses, and should coordinate with the Federal Aviation Administration to make appropriate changes in their guidelines concerning non-aeronautical uses
- SCAG should conduct regional aviation economic impact studies that identify the economic benefits to the region of different types and levels of regional aviation activity, and the likely economic impacts of implementing alternative strategies for serving future regional aviation demand

III. AIRPORT LAND USE COMPATIBILITY AND ENVIRONMENTAL IMPACTS

A. Policies

- Increased coordination between airport planning and land use planning on both regional and local levels should be promoted
- Regional support and coordination should be extended to the region's Airport Land Use Commissions
- Information on aviation environmental "best practices" should be shared and disseminated on a regional level
- Mechanisms for promoting cleaner and quieter aircraft at the region's airports should be identified and supported

B. Action Steps

- SCAG should continue to conduct airport "smart growth" projects, using the Airport Smart Growth Framework developed for the Chino Airport Smart Growth Demonstration Project and applying it to different airport settings
- SCAG should incorporate airport "smart growth" land use principles in land use forecasts used by future regional transportation plans
- SCAG should periodically conduct information sharing forums for the region's Airport Land Use Commissions in cooperation with the Caltrans Division Aeronautics on "best practices" for airport land use compatibility planning
- SCAG should serve as a clearinghouse for information on aviation environmental "best practices" by airports for mitigating air, noise and water pollution and reducing greenhouse gas emissions
- SCAG should sponsor and support new legislation for creating substantial incentives for airlines to upgrade their aircraft fleets to cleaner, quieter aircraft and NextGen-compatible aircraft

IV. AIRSPACE PLANNING AND NEW TECHNOLOGIES

A. Policies

- Modifications to the regional airspace system that reduce potential airspace conflicts, increase passenger safety, reduce costs to airlines, and reduce noise and air quality impacts should be identified and promoted
- Opportunities should be pursued for increasingly the region's airspace capacity, reducing potential future airspace conflicts and increasing airline efficiencies through new navigation and air traffic control technologies
- Existing and potential future airspace constraints should be incorporated into regional aviation planning

B. Action Steps

- SCAG should continue to coordinate and provide input to the FAA's Optimization of Airspace and Procedures in the Metroplex (OAPM) Program for Southern California, and similar airspace modernization activities, including updated operational forecasts
- The SCAG Aviation Technical Advisory Committee (ATAC) should continue and enhance its coordination with the Southern California Airspace Users Working Group (SCAUWG) on airspace issues of regional importance
- SCAG should continue to advocate that the region should serve as an early "test bed" for the phased implementation of new airspace technologies, including new satellite-based NextGen technologies developed by the FAA, that have the potential to reduce airspace conflicts and reduce noise and air quality impacts on local communities
- SCAG should explore how new navigation and air traffic control technologies can contribute to the region's airspace capacity, and should incorporate potential airspace constraints in aviation demand forecasts developed for future regional transportation plans.

Airport Ground Access Report

Objective of the Study

This report has been prepared for the Southern California Association of Governments (SCAG) in support of the 2012 update of Regional Transportation Plan for Southern California. The report reviews the ground access and egress system serving the region's commercial service airports and identifies highway, arterial, local street and public transportation projects that have the potential to improve airport ground access and egress in the region. Although the report generally refers to airport ground access for simplicity, this should be understood to include egress travel from airports as well as access trips.

FIGURE 1.1 Regional Commercial Service Airports

The SCAG region supports the nation's largest regional airport system in terms of number of airports and aircraft operations, operating in a very complex airspace environment.

The system has six established air carrier airports including Los Angeles International (LAX), Bob Hope (formerly Burbank), John Wayne, Long Beach, Ontario and Palm Springs. There are also four new and emerging air carrier airports in the Inland Empire and North Los Angeles County. These include San Bernardino International Airport (formerly Norton AFB), March Inland Port (joint use with March Air Reserve Base), Southern California Logistics Airport (formerly George AFB) and Palmdale Regional Airport (joint use with Air Force Plant 42). **FIGURE 1.1** shows the SCAG regional air carrier airport system. The regional system also includes 45 general aviation airports and two commuter airports, for a total of 57 public use airports.

Southern California airports play a crucial role in international trade, particularly with Pacific Rim countries, and to the regional economy. The value of airborne commodity exports out of the Los Angeles Customs District are about equal to waterborne exports, and airborne export values would be significantly greater if service exports, including impacts from tourism, were added to total export values.

A minimal amount of high occupancy public transportation connections to airports were included in the airport ground access projects in the 2008 RTP because a high speed regional transportation system was assumed to provide connections to airports and between airports. Because this system is no longer being considered for the 2012–2035 RTP, one objective of this report is to identify planned or conceptual new high occupancy public transportation projects serving airports that have the potential to influence the ground access mode share distribution of air passengers and airport employees, thereby reducing vehicle trips to airports, and to assess the impact on airport traffic of identified high occupancy public transportation projects.

The following airports are included in the ground access analysis:

BUR – Burbank/Bob Hope Airport
SNA – John Wayne-Orange County Airport
LAX – Los Angeles International Airport
LGB – Long Beach Airport
MIP – March Inland Port/Air Reserve Base (IATA Code RIV)
ONT – Ontario International Airport
PMD –Palmdale Regional Airport
PSP – Palm Springs International Airport
SBD – San Bernardino International Airport
SCL – Southern California Logistics Airport (IATA Code VCV)

Evolution of the RTP Airport Ground Access Element

The latest regional aviation demand forecasts and policies developed for the 2012–2035 RTP represent an evolution and refinement of aviation planning work that SCAG has conducted over the last two decades. They also reflect a regional consensus that has developed around key regional aviation issues.

2.1 2008 REGIONAL TRANSPORTATION PLAN

Two different 2035 regional aviation demand forecast scenarios for air passengers and cargo at commercial airports in the regional aviation system were developed for the 2008 RTP (constrained plan) and the 2008 Strategic Plan. The adopted regional aviation demand forecasts for the 2008 RTP were 165.3 MAP and 8.28 million tons of air cargo, while the regional demand forecasts for the 2008 Strategic Plan were 173 MAP and 8.31 million tons of air cargo. Several variations of the 2035 Preferred regional aviation demand scenarios that were modeled varied by the different configurations of the planned High Speed Regional Transport (HSRT) system that were assumed. The regional aviation demand forecasts for the 2008 RTP and 2008 Strategic Plan assumed differences in the HSRT systems that were assumed to be included in these plans. For the 2008 RTP, the 2035 regional aviation demand forecast was based on a Preferred Scenario that assumed the extended Initial Operating Segment (IOS) of the HSRT system, and for the 2008 Strategic Plan the forecast was based on a Preferred Scenario that assumed the full HSRT system.

Airport ground access projects were identified for each of the commercial airports based on a number of considerations. However, the overriding goal of these projects was to improve airport access to the greatest degree possible to improve the efficiency of the proposed 2035 decentralized airport system and its competitiveness with airports outside of the SCAG region.

Traffic flows generated by the various passenger and cargo trips were used individually and cumulatively to identify roadway capacity deficiencies. Baseline projects that were already funded were included in the 2035 roadway system. The identified improvement projects were in addition to the HSRT system assumed in the Preferred Aviation Plan.

Projects were based on standard traffic engineering methods and criteria including intersection capacity utilization (ICU), mid-block volume/capacity ratios (as generated the SCAG Transportation Model), freeway weaving area analysis, interchange ramp analysis, passenger-car-equivalents for truck traffic as well as refined (level of service) airport parking demand analysis. Essentially, all these techniques examined the relationship between the forecast traffic volumes and nominal roadway capacities. The capacities for different roadway categories used in the modeling were consistent with SCAG's regional transportation model.

Efforts were also made to mitigate congestion in the vicinity of airports by providing alternate routes for background and through traffic. The development of projects for the ten commercial service airports was facilitated by the synchronized modeling of airports, flight schedules and HSRT in conjunction with conventional ground access. In synchronized modeling of several airports in the system, ground access times were an important factor affecting airport forecasts in terms of air passenger and cargo demand. Consequently, major ground access improvements could reduce travel times to certain airports and make them more attractive to passengers and cargo. This would result in increased forecasts for airports with substantially improved ground access and reduced forecasts for the remaining airports with fewer ground access improvements. Since the Aviation Task Force adopted specific airport forecasts, as well as the regional total of 165.3 MAP, the improvement projects were balanced to achieve consistency with these forecasts and the regional total in the Preferred Aviation Plan.

Improvement projects were developed based on (a) severity of capacity deficiency as expressed by volume/capacity ratios; (b) effectiveness in alleviating congestion on principal ground routes; (c) ability to relieve background and through traffic to free up capacity for air passenger and air cargo truck traffic; and (d) ability to forestall the loss or diversion of passengers and cargo to other competing regions.

The airport ground access project list in the 2008 RTP was very similar to the list in the 2004 RTP since their demand forecasts were also very similar. The main difference was that several airports required fewer projects to alleviate forecast congestion because of lower demand forecasts and airport-related ground access congestion. Major projects that were deleted from the 2008 RTP ground access project list because they had been initiated or completed since the 2004 RTP was issued, or were no longer needed.

2.2 REGIONAL AVIATION DEMAND MODELING

The 1998, 2004 and 2008 Aviation element of the RTP updates all utilized the Regional Aviation Demand Allocation Model (RADAM) to forecast vehicular traffic on the roadway network serving the airports. These results were one of the major tools used to identify the ground access projects identified in the RTP updates, generally based on volume to capacity ratios of roadway links.

The model integrates forecasts for airport operations and the regional roadway and transit networks. As explained in the 2008 RTP report:

The modeling of the Preferred Aviation Plan was based on a complex airport system and an intricate set of behavioral assumptions, which could not be addressed by statistically based models. Therefore, the ground access modeling utilized a model that integrates all aspects of airport operations from arriving aircraft (by aircraft type, engine type, seating and load factor), through the airport runways, gates and terminals, all the way to the nearest cross-streets comprising the passenger's final destination. In essence, this modeling combined airport passenger and truck forecasts with behavioral aspects of passengers, truck surveys, SCAG demographic and background traffic forecasts, and airport portfolios and flight schedules, to generate the resulting airport ground access impacts.

One of the advantages of this integrated methodology is its high sensitivity for testing of projects from different perspectives. For example, modeling can quantify how a minor change in a load factor on a single flight, or a change in the ratio of business-to-non-business passengers on the same flight will individually and cumulatively affect traffic at a particular intersection at a given time. Or, conversely, how many passengers will be delayed by congestion at a certain intersection on their way to a specific flight and how that will affect the airplane's departure time and load factor. This sensitivity was highly useful for generating a realistic evaluation and ranking of improvement projects for all airports under the Preferred Aviation Plan.

In order to achieve consistency with SCAG's transportation planning, total regional traffic (combined airport and background traffic) was imported from the SCAG's regional model into the regional demand model for the year 2035. Airport trips were deducted from total traffic in the SCAG model to yield background or ambient traffic. This background traffic was then combined in the regional demand model with airport traffic stemming from the Preferred Aviation Plan.

The regional demand model factored in a number of conditions specifically tied to the planned high speed regional transport (HSRT) system. These include:

- Availability of high-speed, reliable service to and from airports would result in more connecting passengers leaving the airport by HSRT and then returning for their scheduled departures.
- The HSRT system was expected to significantly impact land use and development, with transit oriented development assumed to occur in proximity to stations. The model has land use modeling capabilities. However, the socioeconomic data inputs used for modeling the Preferred Aviation Plan for the Aviation element of the RTP did not specifically address land uses in the vicinity of HSRT stations.

2.3 2012 REGIONAL TRANSPORTATION PLAN PROCESS

The 2012–2035 RTP Ground Access analysis, as well as the airport forecasts, did not include as extensive data analysis and modeling as the recent previous updates. However, this update does build upon the analysis and recommendations performed in those previous updates. In addition, this update relied heavily on a review of available transportation study elements prepared by the airports and surrounding communities as well as input from the airport staff and local agencies.

2.3.1 Airport and Local Agency Input

Contacts were made with all of the airports as well as some of the local agencies surrounding the airports. Appendix I shows a list of the agencies contacted. Where a specific contact is listed, feedback on airport ground access needs was received. For the other contacts, information on the RTP projects was provided, but no specific ground access needs were indicated by staff. These are generally communities in the vicinity of the airports but not the city in which the airport is located. In some cases, the airport is operated by the city in which it is located, so combined feedback from the airport and city was provided. The California Department of Transportation (Caltrans) was also contacted regarding current planning around the airports.

2.3.2 Role of California High-Speed Rail System in Regional Airport Ground Access

The planned California HSR system that is currently being developed by the California High-Speed Rail Authority (CHSRA) is intended to serve both intra-regional and longer-distance inter-regional travel. As such, it may serve airport ground access trips to and from those airports that are connected to adjacent or nearby HSR stations by other transportation links. Even if a HSR station is located adjacent to an airport, engineering constraints will in most cases preclude locating the station within walking distance of the airport terminal itself and therefore some form of transportation link, such as a shuttle bus or a moving walkway, will be required between the HSR station and the airport.

The second consideration that arises in considering the use of the HSR system for airport access or egress trips is that travelers will have to get to or from the HSR station at the non-airport end of their trip. Since there will be relatively few HSR stations in the region, most potential users of the HSR system for airport access or egress trips will need to use another form of transportation to get to or from the HSR station. Although HSR stations are likely to be reasonably well-served by public transportation and provide parking facilities for HSR users, the relative attractiveness of the HSR service to airport travelers compared to other ground access and egress options will depend on the HSR fare as well as the cost of parking at the HSR station relative to the cost of parking at the airport.

The current plans for the California HSR system, as documented in the CHSRA's California High Speed Rail Program Draft 2012 Business Plan (November 1, 2011), envisage the system being developed in multiple phases. The first phase will consist of investment in an Initial Construction Segment (ICS) within the Central Valley. This will be further developed into an Initial Operating Segment (IOS), thought this step may involve linking the ICS with either San Jose or the San Fernando Valley. Initial operations will then be extended to a "Bay to Basin' scenario, where high speed trains will operate between San Jose and the San Fernando Valley. The eventual completion of Phase I of the program will involve extending High Speed Rail Service between San Francisco and Anaheim. The second phase will include a link from Merced to Sacramento and from Union Station to San Diego via the Inland Empire. Several alternative routes are currently under consideration for both phases, although it is envisaged that all the alternative routes between the Central Valley and Union Station would include a station in the vicinity of Bob Hope Airport and all the alternative routes between Union Station and San Diego would include a station in the vicinity of Ontario International Airport. None of the alternative routes go anywhere near Los Angeles International Airport (LAX), although there is already a FlyAway express bus service between Union Station and LAX.

The CHSRA intends to complete the ICS by 2017, and to begin IOS operations by 2022. The Bay to Basin section is intended to be complete by 2027, and the full completion of Phase I by 2034. The funding to complete these segments is by no means assured at the present time and there are a number of environmental and engineering challenges that are not yet resolved and that could well delay completion of the first phase. The second phase will be operational well after 2035, and the planning horizon of the 2012–2035 RTP.

More details on the potential contribution of the planned California HSR system to ground access and egress at the region's airports are discussed in Appendix II.

2.3.3 Approach to High Occupancy Public Transportation Projects

Public transportation systems in the United States have often been developed to accommodate commuters with traditional work schedules from Monday through Friday between 8 a.m. and 6 p.m. Public transportation hours of operation and frequency of service are built around peak departure and arrival times, with lower frequencies in the middle of the day and before and after peak commuting times, and typically with minimal or no service for a period of time after midnight and before the start of peak morning service. Weekend service typically operates at lesser frequencies and for shorter hours of operation. Furthermore, more public transportation options are available to accommodate travel to concentrated employment centers, such as the downtown area. This is true for the public transportation system in Southern California.

Because one objective of this report is to identify high occupancy public transportation projects that have the potential to influence the air passenger and airport employee mode shares for their airport trips, it is important to understand the factors that are important to air passengers and airport employees when they make decisions on how to travel to and from an airport. Appendix III presents a discussion of the characteristics of air passengers and airport employees that influence their airport ground access choices and the service characteristics of high occupancy public transportation services that make them viable choices for each customer group. In addition to their role in changing air passenger

mode use for travel to and from airports, high occupancy public transportation services can play a role in the choice of airport selected by an air passenger.

Considering the characteristics and ground transportation needs of airport users, a list of high occupancy public transportation projects was developed for each airport by reviewing documents and having conversations with staff at SCAG, the airports and transit agencies. In addition to projects identified in planning documents or discussions with agency staff, other projects were identified based on the knowledge and experience of the consultant team that appear worth being considered for analysis to determine their potential for shifting air passengers and airport employees from low occupancy modes to high occupancy public transportation.

To provide a comprehensive picture of high occupancy public transportation services that have the potential to influence ground access mode choice to the airport, the high occupancy public transportation projects listed in section IV are categorized into existing projects anticipated to be operating in 2035, funded projects for the strategic plan, and projects suggested for analysis to determine their potential to influence airport ground access mode choice.

2.3.4 Highway, Arterial and Local Street Projects

For highway, arterial and local street projects, the 2012–2035 RTP Ground Access analysis, as well as the airport forecasts, did not include as extensive of data analysis and modeling as the recent previous updates. However, this update does build upon the analysis and recommendations performed in those previous updates. In addition, this update relied heavily on review of available transportation study elements prepared by the airports and surrounding communities as well as input from the airport staff and local agencies.

Updated Airport Demand Forecasts

3.1 SUMMARY OF AIRPORT FORECASTS

3.1.1 Passenger Forecasts

The SCAG Aviation Technical Advisory Committee (ATAC) has reviewed three alternative 2035 regional air passenger demand forecast scenarios for commercial airports, for potential inclusion in SCAG's 2012 Regional Transportation Plan (RTP). These include baseline/medium growth, low growth, and high growth forecast scenarios, at 145.9 million annual air passengers (MAP), 130 MAP, and 164 MAP, respectively. ATAC members agreed that the scenarios present a reasonable range of possible growth rates for commercial aviation in the region over the next 25 years. At its September 22, 2011 meeting, ATAC recommended the Baseline Scenario to serve as the Preferred Regional Air Passenger Demand Forecast for the 2012–2035 RTP, with several caveats. These caveats include:

- The Baseline/Medium Growth Forecast seems to be reasonable in that it is consistent with the 2008 RTP Constrained Scenario, which is based on conservative assumptions that are consistent with recent trends. However, the forecast is based on a number of variables that history has shown can change significantly over time, and it is important to update the forecast on an ongoing basis, most importantly for the next (2016) RTP.
- The forecast does not consider the potential impacts of the California High-Speed Rail Project on future regional aviation demand generation and allocation to airports. Future forecast updates should incorporate these potential impacts if and when the project is underway, and has a reasonably achievable implementation schedule.
- The forecast recognizes defined legally-enforceable and physical capacity constraints at the constrained urban airports including LAX, Bob Hope, Long Beach and John Wayne. However, it does not recognize the fact that the settlement agreements at both LAX and John Wayne airports expire in the 2015–2020 time period. Relaxation or elimination of the settlement agreement constraints at these airports could significantly impact forecast allocations of aviation demand at other airport in the regional system. Future updates of the forecast, such as for the 2016 RTP, should incorporate any new information provided by local airport authorities on revised constraints at capacity-constrained airports.

The recommended 2035 Baseline Forecast is essentially the same as the 2035 Constrained/No Project Scenario that was modeled and evaluated by the 2008 RTP. In the 2008 RTP the Constrained Scenario was characterized as a very conservative vision of the regional airport system. It assumed no intra-regional high-speed rail system, no market incentives, and very conservative behavior on the part of the airlines in adding flights at new and emerging airports (although all air carrier airports that desire commercial

service were allocated some passenger demand even if they currently serve none, which in reality is unlikely, but this scenario did not seek to choose winners and losers). Like the other scenarios in the 2008 RTP, the Constrained Scenario respected existing legally-enforceable policy and physical capacity constraints at urban airports. The approved Baseline Forecast is summarized in **TABLE 3.1** and compared with forecast scenarios modeled for the 2004 and 2008 RTPs.

Source: SCAG 2011

The forecasts adopted for the 2004 and 2008 RTPs assumed much higher annual passenger growth rates than the Baseline Forecast, and also assumed an intra-regional high speed rail system that effectively decentralized demand to outlying/secondary airports. As noted in Section 2 of this report, the configuration of the high-speed rail system envisaged for the region in 2035 is based on the proposed California High-Speed Rail Project. It is no longer focused on providing intra-regional service between airports, and provides no high-speed rail service to LAX. However, the extensive modeling of airport demand included in previous RTP updates was not performed for this update so there was no analytical basis to reallocate the demand between airports to reflect these changes in assumptions.

Because of constraints at many of the urban airports where demand is high, growth in passenger traffic at those airports is capped. Therefore, in order to accommodate the regional demand, most of the growth has to be allocated to the outlying airports regardless of whether there would be demand at those airports if the capacity constrained airports were able to continue to accommodate the growth in passenger demand. This also assumes that airlines will be willing to add service to additional airports in the region. A shift of demand to outlying airports will require extensive ground access improvements including new transit initiatives to implement the decentralization of demand to the underutilized suburban airports inherent in the forecast.

3.1.2 Air Cargo Forecasts

Air cargo forecasts for 2035 have been significantly reduced for the 2012–2035 RTP compared to the 2008 forecasts, from 8.1 million tons annually (an average annual growth rate of 3.7 percent from 2.8 million tons in the 2006 base year) to around 5.6 million tons (an average annual growth rate of 2.4 percent). This downward revision is based on the actual performance of air cargo since the 2008 RTP base year (2006) and the economic outlook to 2035.

International air cargo is expected to grow relative to domestic traffic, but export/import data for the U.S. and Southern California indicate that since the 2006 base year air cargo growth has been anemic relative to economic growth and the Southern California share has fallen. Between 2006 and 2010, total U.S. international air cargo increased only 4.5 percent, or an average growth rate of 1.11 percent per year. All of this growth has come from exports, up 12.5 percent. By contrast, imports declined by 1.5 percent, despite a growth in U.S. real disposable income over this 4-year period of 6.2 percent. The growth of Southern California international air cargo from 2006 to 2010 was even lower: up 8.1 percent percent for exports and down 9.3 percent for imports. At these rates of growth in relation to domestic economic growth or world economic growth since the 2008 RTP forecast, there is little likelihood that Southern California air cargo will reach the growth path for air cargo implied in the 2008 RTP projected rates. **TABLE 3.2** shows the previous and current forecasts.

TABLE 3.2 Air Cargo Forecasts (000 tons)

Source: TranSystems 2011

Compared with the airport-specific projections in the 2008 RTP, the "outer" airports—March Inland Port, Palmdale Regional, San Bernardino International, and Southern California Logistics—have significantly less share of the total and bear the brunt of the reduction in the overall projections. It is assumed that these airports only begin to handle a significant amount of cargo after the major airports, LAX and ONT, start to experience capacity constraints.

3.1.3 Forecast Impacts on Ground Access

There are a number of ways to evaluate the impact of future passenger growth at the airports on ground access. These include the impact that the added vehicular traffic the airports will generate on the surrounding street network, and conversely, the impact that congestion on the surrounding street network has on the ability of passengers to get to the airport (or on their decision of which airport to use).

3.1.4 Air Passenger Access/Egress Traffic

While detailed traffic modeling was not performed for this update of the RTP, some general assumptions can be used to show the relative impact of the projected passenger traffic increases on the roadways surrounding the airports. **TABLE 3.3** shows an approximate amount of traffic generated by each airport based on the recent and forecast levels of air passenger traffic.

TABLE 3.3 Traffic Volume Forecasts

Airport	Passenger Traffic (MAP)		Approximate Daily Vehicle Trips Generated		
	2009 Existing	2035 Baseline	2009 Existing	2035 Baseline	Growth
BUR	4.6	9.4	15,000	31,000	16,000

SCL	-	0.7	-	3,000	3,000
Total	**79.1**	**144.8**	**379,000**	**716,000**	**337,000**

Source: Air passenger survey data for SCAG region airports, Transit Cooperative Research Program Reports 62 and 83, LAX Master Plan EIR/EIS, and Airport Cooperative Research Program Report 40: Airport Curbside and Terminal Area Roadway Operations

These estimates are based on a number of assumptions listed below the table. One of the key assumptions is that 3 percent of the passengers use high occupancy public transportation modes to travel to and from the airport. High occupancy modes such as large busses or rail transit generate relatively few vehicle trips, so almost all passengers using these modes can be deducted from the traffic generation. ACRP Report 40 indicates that currently about 4 percent of LAX passengers use high occupancy modes; it is likely substantially less at many of the other area airports.

To put these traffic estimates into perspective, a two lane roadway has a capacity of about 12,000 vehicle trips per day. So for most of the airports in the region, two additional lanes of roadway would serve the projected growth. Note that some of this growth can be accommodated by unused capacity on existing roadway and that, for the most

part, the demand would be spread out over the many roadways that serve the airports. Many of the capacity improvements around these airports are likely to be "spot" improvements—adding turn lanes at intersections, grade separations at railroad crossings, access management along key roadways, etc.

However, for the high growth airports such as LAX and Ontario, the forecast increase in passenger traffic may result in over 100,000 additional vehicle trips per day on the adjacent roads. If concentrated onto one roadway, this would require a new eight to ten-lane road. It may be difficult to add this level of capacity to the surrounding roads (as well as the capacity to accommodate growth in non-airport related traffic on these roads). Therefore, it is essential that increased public transportation service be provided at these airports.

3.1.5 Freight Traffic

As with passenger traffic, a simplified estimation process was used to gauge the magnitude of the impact of projected freight traffic on the roadways surrounding the airports. Based on 2009 freight truck data available for six of the airports in the region (BUR, SNA, LAX, LGB, MIP and ONT), truck trip generation rates were developed as shown in **TABLE 3.4**.

The data showed about 0.5 daily truck trips per 1,000 annual tons of air cargo at LAX and 0.6 at ONT and MIP. At the other airports, the rate was higher, at about 1.6 truck trips per 1,000 tons. This is due to the fact that much more of the cargo at the high freight airports is either "through" freight being transferred from one aircraft to another (and thus never onto a truck) or moved using larger trucks (some semi-trailer trucks versus small trucks or vans).

TABLE 3.4 Air Cargo Truck Volume Forecasts

Cargo (000 tons)		Approximate Daily Truck Trips Generated		
2009 Existing	2035 Baseline	2009 Existing	2035 Baseline	Growth
47	108	75	173	98
15	46	24	74	50
1,664	3,647	832	1,824	992
27	94	43	150	107
1	147	1	88	88
391	1,314	235	788	554
-	34	-	54	54
-	-	-	-	-
-	146	-	234	234
-	68	-	109	109
2,144	5,605	1,210	3,494	2,284

Source: TranSystems 2011

Assumptions: 0.5 daily trips per 1,000 tons at LAX, 0.6 trips/1,000 tons at ONT and MAFB, 1.6 trips/1,000 tons at other airports, 312 days/year (6 days/week).
Assumptions derived from data in "Air Cargo Mode Choice and Demand Study – Final Report" CalTrans (prepared by TranSystems Corp.), July 2, 2010, page 7, Table 1.2

The resulting calculations show that the forecast increase in cargo traffic will generally result in between 100 and 600 new truck trips per day at each airport. As with the passenger vehicle traffic estimates, the same capacity rules apply for roadways—a two lane road accommodates about 12,000 passenger vehicles per day. From a roadway capacity standpoint, a truck is equivalent to between about 1.5 and 3.0 passenger vehicles, depending on the size of the truck (e.g. panel van versus semi-trailer truck) and roadway characteristics (width, grade, etc.). Therefore, the projected increase in truck traffic due to air cargo operations has an impact of generally less than about 1,000 passenger vehicles per day. This level of impact typically would not require construction of new roadways or major roadway widening projects. Instead, it would likely require spot improvements near freight access points to the airports—e.g. intersection improvements or added gate capacity at entrances to the airport cargo areas.

3.1.6 Forecast Change Impacts on Ground Access Needs

Based on these projections, the level of evaluation needed for the ground access needs can generally be placed into three categories: airports with a high passenger/freight forecast of vehicle trips and a significant forecast change; airports with a high passenger/freight forecast of vehicle trips but similar to the 2008 RTP projections; and airports with a low passenger/freight forecast of vehicle trips. Those airports with high traffic and a significant projected change in vehicle trips versus the 2008 RTP would require a more detailed analysis of ground access needs. However, this was not the case with any of the airports. The high passenger traffic airports, LAX, ONT, SNA and BUR all have similar MAP projections in this RTP as in the 2008 RTP. With regard to freight projections at the high freight volume airports, the forecast increased about 40 percent at LAX, decreased about 40 percent at ONT and decreased by more than 85 percent at MIP, PMD and SBD, but these changes are not expected to have a major impact on ground access needs. Therefore, in general, the long term ground access needs for these airports remain similar as to 2008.

For the lower volume airports, in terms of passenger traffic, none of the airports showed an increase in 2035 projections in this RTP versus the 2008 RTP. Several showed a significant decrease—MIP, PMD and SCL. For air cargo, the forecasts at all of these airports either stayed about the same in this RTP or showed significant decline. While the declining forecasts would decrease the need for ground access improvements at these airports, generally the projects identified are to support basic airport operations such as terminal roadways, or are projects to improve general accessibility to the airport, so significant changes in the ground access recommendations are not expected.

3.2 IMPLICATIONS OF AIRPORT FORECASTS FOR AIRPORT GROUND ACCESS

The forecasts of air passenger demand at the region's commercial service airports in 2035 shown in **TABLE 3.1** imply a significant increase in the number of regional airport ground access trips compared to 2009 air passenger activity levels. However, the growth in air passenger demand is not forecast to occur at an equal rate at each airport in the region. The four primary airports that serve the urban core of the region, Bob Hope Airport in Burbank (BUR), John Wayne Airport in Orange County (SNA), Long Beach Airport (LGB), and Los Angeles International Airport (LAX), have policy or physical capacity constraints that restrict the growth in passenger traffic that they can handle. As a result, the more outlying or suburban airports are forecast to handle an increasing share of the regional passenger traffic, as shown on **TABLE 3.1**.

Changes in the distribution of the regional air passenger demand among the airports in the region are likely to affect the composition of the air passenger traffic at each airport, and hence the relationship between air passenger volumes and the number of ground access trips generated by that activity. However, the approach to allocating the regional air passenger demand to airports taken in this RTP precludes a detailed analysis of this effect. Therefore it is been assumed that the level of ground access trips generated at each airport varies in proportion to the air passenger activity at each airport.

3.2.1 Constrained Urban Airports

Although each of the four constrained urban commercial service airports will experience an increase in airport ground access traffic by 2035, the increase in air passenger activity over 2009 levels varies from 1.3 million annual passengers (MAP) at LGB to 22.4 MAP at LAX. Air passenger activity at SNA will increase by 2.1 MAP, while that at BUR will increase by 4.8 MAP. As a percent of 2009 activity, the air passenger traffic is projected to increase by about 24 percent at SNA and more than double at BUR (an increase of about 105 percent). The percentage increase at LAX is about 40 percent, while that at LGB is about 44 percent.

Clearly, increases of these magnitudes will have significant implications for ground access vehicle traffic at all airports, although the increases at BUR and LAX are likely to have the greatest impacts, at BUR because of the large proportional increase and at LAX because of the absolute magnitude of the increase. However, it should be noted that all four airports have experienced higher passenger activity levels prior to 2009, so the projected increases over the highest air passenger activity levels experienced to date are somewhat lower. Compared to the highest passenger activity levels experienced in recent years, the forecast air passenger growth at BUR is about 59 percent, while that at LAX is about 26 percent. The forecast growth at SNA compared to the highest passenger activity levels experienced in recent years is only about 8 percent, while that at LGB is about 38 percent.

3.2.2 Unconstrained Suburban Airports

As can be seen from **TABLE 3.1**, the constraints at the urban airports will result in significant growth in passenger activity at the outlying unconstrained suburban airports, several of which do not currently have commercial air service. The greatest growth is projected to occur at Ontario International Airport (ONT), for which the passenger traffic is projected to increase to more than five times the 2009 level from 2009 to 2035 under the current forecast, an increase of 25.8 MAP, or about 527 percent. Palm Springs International Airport (PSP) is projected to experience an increase in passenger activity to nearly three times its 2009 level, an increase of 2.6 MAP, or about 173 percent. Two of the suburban airports that do not currently have commercial air service are projected to experience a combined level of passenger activity by 2035 under the forecast that is similar to the current passenger activity at ONT (4.9 MAP in 2009). San Bernardino International Airport (SBD) is projected to handle 2.8 MAP, while Palmdale Regional Airport is projected to handle 2.6 MAP. March Inland Port (MIP) and Southern California Logistics Airport (SCL) are projected to handle somewhat lower levels of passenger traffic by 2035. Under the 2035 forecast, MIP is projected to handle only 0.6 MAP, while SCL is projected to handle 0.7 MAP.

Other than ONT, none of the suburban airports are projected to experience levels of passenger activity that could not be handled by the existing arterial and street system, with some local improvements.

3.2.3 Regional Airline and General Aviation Airports

Until recently, two smaller airports in the region, Imperial County Airport (IPL) and Oxnard Airport (OXR), had regional airline service by United Express to LAX. The service from OXR was discontinued in June 2010 but United Express continues to operate two flights a day each way between IPL and LAX. The air passenger demand forecast assumes that limited service would be restored to OXR by 2035, while air service at IPL would expand significantly. Under the approved forecast, IPL is projected to handle 0.9 MAP in 2035 and OXR, 0.2 MAP. These activity levels could easily be handled by the existing arterial and street system.

In addition to the airports with current and projected future commercial air service, there are currently 44 public use general aviation airports in the region. None of these airports have a level of aviation activity that would generate a volume of ground access traffic that cannot be adequately handled by the existing arterial and street system serving the airport.

Summary of Projects by Airport

4.1 BOB HOPE AIRPORT/BURBANK (BUR)

Bob Hope Airport in Burbank, California is a very convenient airport for its local service area comprising the cities of Burbank, Glendale and Pasadena, with good access to and from Los Angeles and the San Fernando Valley. Service is provided by Alaska, American, Delta Connection, JetBlue, Southwest, United Express, and US Airways, with frequent schedules along the West Coast and connecting flights across the entire country.

Passenger and Cargo Trends and Constraints: Air passenger and cargo activity are expected to increase steadily, with air passenger traffic growing from 4.6 MAP to 9.4 MAP prior to 2035. The airport is contractually limited to 14 gates, which has been estimated by SCAG to limit passenger capacity to 9.4 MAP. Bob Hope Airport does not handle a significant amount of cargo traffic and is not projected to carry a substantial amount in the future (86,000 annual tons).

Studies and Major Planned Projects: Ground Access Study – A 1987 $4.3M STURAA grant remains active and is available for a Bob Hope Airport Ground Access Study. Including the local match totals $5.5 million that is available for the study. The Airport Authority has retained the Orangeline Development Authority (OLDA) as its Project Manager for this study, planned to begin in 2012. Three fundamental objectives have been established by the Airport Authority for this study: Develop linkages to Santa Clarita to Union Station Corridor; reduce north/south traffic on Hollywood Way; evaluate the feasibility of an airport rail station along the Antelope Valley Line in the vicinity of Hollywood Way; and explore east/west connectivity to Pasadena. Results from this study are likely to identify new projects for inclusion in future Airport RTPs.

RITC – The Airport Authority will initiate construction in May/June of 2012 of a new Regional Intermodal Transportation Center (RITC) northwest of the intersection of Hollywood Way and Empire Ave. The RITC will include additional parking, a consolidated car rental facility, an enclosed pedestrian linkage between the adjacent train station and parking facilities, and a moving sidewalk connection to the airport terminal. Another element of the RITC will be intermodal bus layover center to enhance destination bus service

to the airport and facilitate bus passenger linkage to the terminal. The Environmental Assessment for Proposed Construction of a Regional Intermodal Transportation Center and Runway 33 Runway Safety Area Restoration was completed in December 2010. As is typical with an environmental assessment, this report had a horizon year of 2012 focusing on the impacts of the planned improvements only, so it did not look at long term ground access needs. **FIGURE 4.1** *shows the RITC.*

FIGURE 4.1 Bob Hope Airport

Source: Bob Hope Airport Authority 2011

Empire Interchange – This project, identified in prior RTP's, includes reconfigured access to I-5 at the Empire Avenue interchange and the Burbank Boulevard interchange as well as railroad grade separation project at Buena Vista/San Fernando all of which will facilitate improved access to the airport. This project is scheduled to begin construction in 2012.

High Speed Rail – The California High Speed Rail Commission is studying potential station locations along the San Fernando Road/Metrolink Line at either Hollywood Way or Buena Vista Street that would be in close proximity to the airport and include potential direct linkages to the airport and the Empire Avenue Metrolink Line. This would be part of the Palmdale-Los Angeles High Speed Rail segment. It should be noted that the Los Angeles County Transportation Authority (Metro) is studying improvements to the rail service along the Antelope Valley Metrolink Line, including the construction of a Bob Hope Airport Station in the vicinity of Hollywood Way. Construction of these improvements may be feasible many years in advance of the High Speed Rail Project.

Orange Line Extension – a project is planned to extend the MTA Orange Line from its current terminus at the North Hollywood Red Line station to either the Bob Hope Metrolink station or the RITC.

4.1.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Three projects from the 2008 RTP list were deleted, as they have been completed.

- BUR-01 Upgrade internal BUR terminal area circulation system including ingress/egress to parking facilities.
- BUR-04 Upgrade capacity of Hollywood/Alameda intersection (additional turning lanes and storage).
- BUR-12 Burbank Transit Station project. Improve access, parking and platforms at BUR Metrolink Station. Provide better linkage to the Empire Area Transit Center (Combined with BUR-05).

Another project was deleted from the 2008 RTP list since it has been supplanted by a new project with a similar function and location, the Regional Intermodal Transportation Center (RITC) previously described. The deleted project is:

- BUR-5 Empire Transit Center – construct a multi-modal bus transit center in the vicinity of Empire Ave. and Hollywood Way adjacent to the BUR Metrolink/Amtrak station.

The description of project BUR-10 was modified based on input from the City of Burbank and the description of project BUR-05 was modified to incorporate deleted project

BUR-12 since both of these projects are part of the Regional Intermodal Transportation Center (RITC).

In addition, one project was added (BUR-12) as identified in the Environmental Assessment for Proposed Construction of a Regional Intermodal Transportation Center and Runway 33 Runway Safety Area Restoration, December 2010 (page C-37).

Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access

Element are summarized below in **TABLE 4.1**.

TABLE 4.1 BUR Highway, Arterial and Local Street Projects

Project (Year Added)	Description
BUR-03 (08)	Add 1 additional lane in each direction on Hollywood Way (from San Fernando to Empire).
BUR-05 (08)	Empire Area Transit Center: Construct a multi-modal bus transfer center in the vicinity of Empire Ave and Hollywood Way adjacent to BUR Metrolink/Amtrak station. Improve access, parking and platforms at Metrolink Station. Provide better linkage between airport and Transit Center.
BUR-06 (08)	Construct a Clybourn Ave. Grade Separation west of BUR to directly connect Vanowen St. to Empire Ave. (to provide and continuous arterial from SR-5 and the new Empire Ave. interchange to North Hollywood and improve east-west access in the Golden State area of Burbank.
BUR-07 (04)	Construct a modified interchange at Empire Ave. and I-5 interchange. Add N/B and S/B (auxiliary) lanes at I-5/Empire (from Burbank Bl. To Empire).
BUR-08 (04)	Add auxiliary lanes on I-5 (from Burbank Blvd. To Buena Vista).
BUR-09 (04)	Add HOV lanes (from 8-10 lane configuration) on I-5 (from SR-134 to SR-170).
BUR-10 (08)	Intersection flarings at 35 major intersections for additional turn lanes. Includes Hollywood Way, Buena Vista St., Victory Blvd., Empire Ave., and Vanowen St. (No widening of Hollywood Way south of Empire).
BUR-11 (04)	Construct HOV lanes on I-5 (between SR-110 and SR-14). HOV lanes from SR-134 to SR-170 only included as part of the SR-5 HOV/Empire Ave. Interchange project.
BUR-14 (12)	Install signal at North Avon St. & Empire Ave.

4.1.2 Public Transportation Projects

TABLE 4.2 shows the projects anticipated to be in place by 2035, or recommended for inclusion in the strategic plan, that have the potential to influence the air passenger and employee mode share distribution to BUR.

The potential for the first three projects will be analyzed as part of the Bob Hope Airport Ground Access Plan that will begin in the fall of 2011. The study will include extensive data collection to understand the travel patterns of air passengers and employees using Bob Hope Airport, as well as modeling various transportation alternatives. The study will provide better information for the 2016 RTP.

TABLE 4.2 Potential High Occupancy Public Transportation Projects Serving BUR, 2035

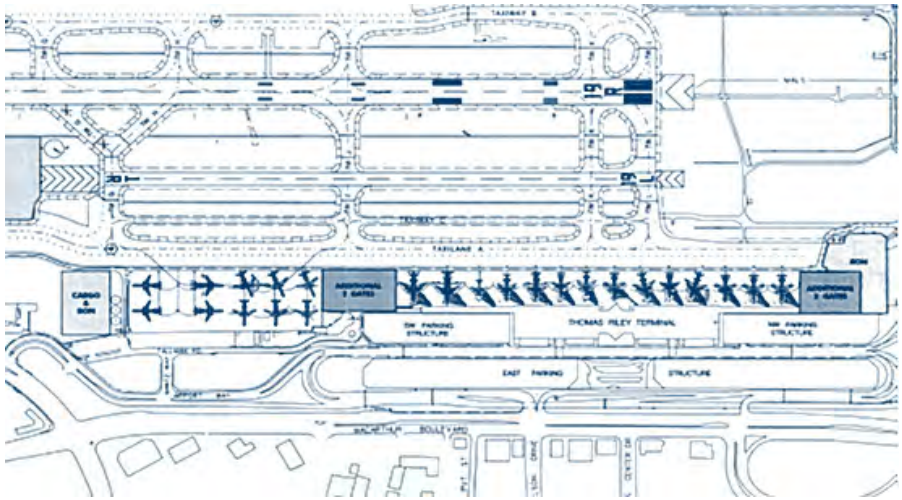
Status	Project	Source	Notes
Funded	Regional Intermodal Transit Center (RITC)	Bob Hope Airport Authority	Groundbreaking anticipated in May/June 2012
Funded	Extend fixed guideway rapid transit from North Hollywood Red Line Station to the Bob Hope Airport RITC and a proposed high-speed rail station to the north of the airport	1. 2008 RTP, LA County Metro Strategic Plan Projects	To be studied as part of the two-year Bob Hope Airport Ground Access Study to begin in the fall of 2011
		2. Conversation with Bob Hope Airport and OLDA Staff, June 2011	
For Consideration in Strategic Plan	Antelope Valley Metrolink Line: construction of new station north of Bob Hope Airport station in the vicinity of Hollywood Way and San Fernando Road, with transit connections to the airport, nearby Red Line stations, the Orangeline, and the California High-Speed Rail Project	Conversation with Bob Hope Airport and OLDA Staff, June 2011 and November 2011	To be studied as part of the two-year Bob Hope Airport Ground Access Study to begin in the fall of 2011. Improvements along the Antelope Valley Metrolink line will be identified in an ongoing Los Angeles Metro sponsored study

Amtrak and Metrolink service is provided between Bob Hope Airport, downtown Burbank, Glendale and Union Station at frequent intervals in the morning until about 10:00 a.m. and in the late afternoon/early evening from Monday through Friday. Two early morning trips were recently added to better accommodate airport customers. The service is not included in the table because it does not provide sufficient midday service, and no service is provided on Saturdays and Sundays. Staff at Bob Hope Airport and the Orange Line Development Authority would like to see more service added throughout the day.

It should be noted that the Bob Hope Airport Authority has placed a high priority on actions to improve access and linkage to the regional transportation system, which will be the focus of the Authority's Airport Ground Access Study. Consistent with this priority, the Airport Authority supports SCAG's inclusion in the Draft RTP of significant improvements to the Los Angeles-San Diego-San Luis Obispo Rail Corridor (LOSSAN), as well as to the Metrolink system, to achieve higher speed operations.

4.2 JOHN WAYNE AIRPORT (SNA)

John Wayne Airport is operated by the County of Orange and is the only commercial airport in Orange County. The service area includes 3 million people within the 34 cities and unincorporated areas of Orange County. In addition, it is only one of two airports in Orange County to accommodate general aviation. The airport is served by two fixed-based operators and is home to more than 500 general aviation aircraft.



Passenger and Cargo Trends and Constraints: John Wayne Airport served 8.7 MAP in 2009, but is limited to 10.8 MAP by agreements (see below), so only modest additional growth is expected at the airport. Service is currently provided by Alaska, American, Continental, Delta, Frontier, Southwest, United, US Airways and WestJet Airlines. Cargo traffic is not significant at the airport, with existing and future projected activity to remain below 50,000 tons per year.

A Federal court settlement was signed in 1985 by the County of Orange, the City of Newport Beach, the Airport Working Group (AWG), and Stop Polluting Our Newport (SPON) to formalize the consensus reached between the County of Orange and the local communities on the nature and extent of airport improvements and defined operational and capacity limitations on those improvements. The 2003 Amendments of the 1985 Agreement allow John Wayne Airport to increase passenger levels to 10.3 MAP (through 12/31/10) then to 10.8 MAP (through 12/31/15) with a maximum of 85 flights per day. In addition, the amendment allowed for the addition of new Jet bridges (not to exceed 20 total).

The Orange County General Aviation Noise Ordinance (GANO) establishes single event noise limits and other restrictions for aircraft operating at SNA.

Studies and Major Planned Projects: The Final Environmental Impact Report 582 – John Wayne Airport Settlement Agreement (November 2001) and amendment (December 2002) evaluated the impact of various operating alternatives on environmental conditions, including ground access traffic (Appendix E, November 2001) and is the basis for the current 10.8 MAP operating level through 2015. Roadway improvements related to the EIR are summarized on **TABLE 3.2–14** on page 3.2–19 of the EIR (Scenario 2). **FIGURE 4.2** shows the conceptual plan. As is typical with an EIR, this report had a horizon year of 2006 focusing on the impacts of the planned improvements only, so did not look at long term ground access needs.

FIGURE 4.2 EIR Conceptual Plan, Scenario 2 (Exhibit 2.4 from EIR)

Passenger Terminal – In November 2011, a new terminal building south of existing Terminal A and B was completed that provides six new passenger-loading bridges. Two of the six new passenger-loading bridges are equipped to allow Federal Inspection Services (FIS), including Customs. The combined SNA terminal facility now provides 20 commercial aircraft passenger-loading gates and two commuter facilities accommodating a total of six commuter aircraft with ground-level boarding. The footprint of the entire terminal complex comprises approximately 730,505 feet.

Parking Structure – Phase I of a new multi-story parking structure also opened in November 2011, replacing a parking structure previously located in the new Terminal C footprint. The new parking structure provides up to 2,200 additional parking spaces. The second phase of this parking structure will occur after 2012, based on demand and funding availability, and would provide an additional 1,000 spaces.

Campus Drive and Bristol Street North Intersection – Provision of an additional right-turn lane on westbound Campus Drive to Bristol Street North, as required with Mitigation Measure T-1 in Final Program EIR 582. This turn lane would increase the number of turn lanes on Campus Drive to a total of three. The turn lane addition would be approximately

250 feet long and 15 feet wide. This improvement would require the relocation of the existing airport maintenance building, from the southeast corner of the Airport to an undeveloped parcel on the west side of the Airport in the vicinity of the existing airport administration building. The proposed maintenance facility is proposed to be located on a 2.4-acre site west of Aircraft Rescue and Fire Fighting (ARFF) Station 33.

4.2.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Recommended changes to the ground access project list include the following:

Three projects from the 2008 RTP list were deleted.

- SNA-01 Improve capacity of SNA terminal internal circulation system. Upgrade SNA-ingress at Michelson/MacArthur intersection. While the airport plans to proceed with this project, it is not included in the SNA EIR and thus the airport requested its removal from the RTP.
- SNA-03 Add 1 lane in each direction on MacArthur (from I-405 to Michelson). This project was deleted at the request of the City of Irvine.
- SNA-04 Add 1 lane in each direction on Michelson (from MacArthur to Von Karman). This project was deleted at the request of the City of Irvine.
- SNA-10 Upgrade the Sand Canyon/I-405 interchange (add 1 lane to each on- and off-ramp). This project was related to access for the long-range Maglev system that is no longer being considered.
- SNA-13 Widen Von Karman overcrossing by 1 lane in each direction. This project was deleted at the request of the City of Irvine.

In addition, eight projects (SNA-17–SNA-24) were added as identified in EIR Report 582 for Scenario 2.

Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access Element are summarized below in **TABLE 4.3**.

TABLE 4.3 SNA Highway, Arterial and Local Street Projects

Project (Year Added)	Description
SNA-02 (04)	Construct an internal HSR station roadway system at the Irvine Spectrum (to accommodate 1,510 peak hour vehicle trips).
SNA-05 (04)	Add 1 lane in each direction on I-405 (from Bristol to SR-133); Add auxiliary lane (from MacArthur to Culver).
SNA-06 (04)	Upgrade the Bristol/I-405 interchange (add 1 lane to all on and off-ramps)
SNA-07 (04)	Add 1 lane in each direction on SR-55 (from SR-73 IC to I-405 IC);
SNA-08 (04)	Add S/B auxiliary lane (from MacArthur on-ramp to Jamboree Bl. interchange to Culver Dr. off-ramp.
SNA-09 (04)	Add 1 lane in each direction on SR-73 (from Jamboree to SR-55); Add auxiliary N/B auxiliary lane to SR-73 (from Birch to SR-55).
SNA-10 (04)	Upgrade the Sand Canyon/I-405 interchange (add 1 lane to each on and off-ramp).
SNA-11 (04)	Add 1 lane to the southbound off-ramp and the north-bound on-ramp at Irvine Center Dr./I-405 interchange.
SNA-12 (04)	Add 1 N/B ramp and W/B right-turn lane on Paularino at SR-55.
SNA-14 (04)	Add HOV lanes in each direction near SR-55 interchange (98 STIP).
SNA-15 (04)	I-405/SR-55 interchange south Transitway existing 4 MF 1 HOV on SR-55 and I-405 existing 5 MF and 1 HOV, add HOV direct Transitway from SR-55 to I-405.
SNA-16 (04)	SJHC, 15 mile Toll Road I-5 (in San Juan Capistrano and SR-73 in Irvine, existing 3 MF each direction, add 1 MF in each direction, plus auxiliary and PCE traffic climbing lanes (reference: SCAG/TCA MOU 4/5/01).
SNA-17 (12)	Campus & Bristol North. Add 3rd Southbound Right-Turn Lane.
SNA-18 (12)	I-405 at MacArthur NB On-Ramp. Add 2nd Lane to On-Ramp (including Mainline Auxiliary Lane).

Project (Year Added)	Description
SNA-19 (12)	I-405 at MacArthur SB On-Ramp. Add 2nd Mixed Flow Lane at Meter (Transition to 1 Lane before Mainline).
SNA-20 (12)	I-405 at MacArthur NB Off-Ramp. Add 2nd Lane to Off-Ramp (w/o 2nd Mainline Auxiliary Lane).
SNA-21 (12)	SR-73 at Campus/Irvine NB On-Ramp. Add 2nd Lane to On-Ramp (including Mainline Auxiliary Lane).
SNA-22 (12)	SR-73 at Campus/Irvine SB On-Ramp. Add 2nd Auxiliary Lane on Mainline (for existing 2nd Off-Ramp Lane.

4.2.2 Public Transportation Projects

OCTA has expanded the track capacity between Fullerton and Laguna Niguel to allow for increased Metrolink headways. There is single track capacity south of Laguna Niguel since they cannot expand at Laguna Niguel or San Clemente. OCTA anticipates a significant increase in Metrolink service by 2035. There are two Metrolink lines that serve the Tustin Station, the Inland Empire/Orange County Line that travels between Riverside and Irvine, and the Orange County Line, which travels between Oceanside and Union Station in Los Angeles. The Tustin Metrolink station is located approximately seven miles from John Wayne Airport, and the Irvine Transportation Center is located approximately nine miles away.

TABLE 4.4 shows a project anticipated to be in place by 2035 that may influence mode share with an added connection to the airport, and another project that is recommended for study.

TABLE 4.4 Potential High Occupancy Public Transportation Projects Serving SNA, 2035

Status	Project	Source	Notes
1. Funded	Increased Metrolink Service to Tustin Station	1. OCTA Staff Summer 2011 Telephone Conversation	1. By 2030, weekday trains serving Tustin station anticipated to increase from 39 to 70, and there could be 20 trains per day serving Tustin on weekend days.
2. Recommended for Analysis		2. Consultant Recommendation for Study	2. A good shuttle connection between Tustin Station and SNA could attract air passengers and employees
Recommended for Analysis	Express bus service, ARTIC/Anaheim to John Wayne Airport	Consultant Recommendation	ARTIC Concept allows for this connection.

The City of Irvine operates two shuttle routes called The i Shuttle. The i Shuttle has been in operation for approximately three years. It operates from Monday through Friday, and travels between the Tustin Metrolink station and major employment sites. Route A travels between the Tustin Station and John Wayne Airport. The trips are timed to Metrolink train service during peak commuting hours. The trip to the airport takes approximately a half hour, and the shuttle route was not designed to meet airport needs.

Since The i Shuttle is not a connection that is attractive to airport customers, it is recommended that an analysis should be conducted to determine the potential for operating a non-stop shuttle between either the Tustin or the Irvine Transportation Center, to estimate the level of ridership that might be attracted, and to determine which station makes the most sense for provision of a shuttle. Amtrak serves the Irvine Transportation Center, but not the Tustin Station, however the Tustin station is slightly closer to the airport.

A study is recommended to determine the potential for a frequent bus link between John Wayne and ARTIC with no stops or limited stops. ARTIC will accommodate regional and local bus and rail connections, and will include parking for autos. It has a projected opening date of 2014. ARTIC will include space for a bus connection to SNA in anticipation of a service being provided in the future, although no agency or company has made a commitment to do so. Since it is also anticipated that there will be a fixed guideway connection by 2018, called the Anaheim Rapid Connection, between ARTIC, Disneyland, the hotels in the Disneyland area, and the Anaheim Convention center, it is a logical boarding point for non-resident air travelers who are destined for Anaheim. Residents and airport employees can access ARTIC to make the airport trip by driving and parking or using the various transportation connections that will be offered at ARTIC.

At the time this study was conducted, neither the County of Orange, which operates the airport, nor OCTA had plans to provide the type of high occupancy public transportation service to John Wayne Airport that has the potential to influence air passenger or employee mode choice to the airport. OCTA has included the Bristol Street/State College Blvd. BRT line in their 2010 LRTP. It is described as a 28 mile fixed route BRT which will travel between the Brea Mall and the Irvine Transportation Center, but it is unclear what level of service will be provided, and if it will travel into the airport terminal area

4.3 LONG BEACH AIRPORT (LGB)

LGB offers direct flights throughout the U.S. with convenient domestic and international connections. LGB offers easy access to the surrounding business centers and massive consumer markets. LGB is one of the world's busiest general aviation airports that serve privately-owned aircraft. With substantial general aviation activity LGB is an important reliever airport for LAX. Very strict noise regulations on commercial air operations have been put into place at LGB to protect the surrounding residential land uses. Boeing Co. builds C-17 military airlifter aircraft at LGB and Gulfstream has a completion/service center at LGB.

Passenger and Cargo Trends and Constraints: Commercial passenger service is currently provided by Jet Blue, US Airways, Delta and Alaska Airlines with almost 50 departures per day to 14 cities. The airport served about 2.8 MAP in 2009 and 3.0 MAP in 2010. According to the LGB Terminal Improvement EIR, terminal area improvements are being designed to accommodate 41 airline flights and 25 commuter flights per day. This flight level is anticipated to result in approximately 4.2 million annual passengers (MAP) being served at the Airport. There are provisions in the Airport Noise Compatibility Ordinance allowing the number of flights to be increased if the air carrier flights and commuter flights operate below their respective Community Noise Equivalent Level ("CNEL") limits, however, the 4.2 MAP limit has been used in the growth forecasts.

Air cargo forecasts show an increase from 40,000 tons in 2009 to a still modest level of 109,000 tons in 2035. This level is not expected to have a significant impact on ground access needs.

Studies and Major Planned Projects: *Long Beach Airport Terminal Area Improvement Project Draft Environmental Impact Report No. 37-03, November 2005.* The proposed projects provides improvements to the existing Airport Terminal Building and related facilities at the Airport in order to accommodate recent increases in flight activity at the Airport consistent with operational limitations of the Airport Noise Compatibility Ordinance and the 1995 Settlement Agreement. The Proposed Project includes construction of, or alteration to, the terminal building, vehicular parking and traffic and pedestrian circulation at the airport as shown on **FIGURE 4.3**. The Terminal Area Improvement Projects are included for reference only and are not part of the RTP.

FIGURE 4.3 Long Beach Airport Terminal Area Improvement Project (DEIR Exhibit 2.4)

The Proposed improvements are summarized below.

- The provision of a new parking structure that would ultimately accommodate 4,000 vehicles.
- With the construction of the parking structure, existing surface parking would be displaced.
- The extension of the south side of the Donald Douglas Drive loop to exit onto Lakewood Boulevard, with eastbound right turn only to southbound access on to Lakewood Boulevard.
- In conjunction with the allocation of additional flights in accordance with the Airport Noise Compatibility Noise Ordinance, when average daily peak month passenger levels reach 12,700, the Airport Manager shall develop a traffic monitoring program. The traffic monitoring program shall evaluate the LOS at the Spring Street and Lakewood Boulevard and the Willow Street and Lakewood Boulevard intersections.

In conjunction with the allocation of additional flights in accordance with the Airport Noise Compatibility Ordinance, when the annual passenger levels reach 4.2 MAP, the Airport Manager shall identify and develop additional on-site parking opportunities.

4.3.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Recommended changes to the ground access project list include the following:

Three projects from the 2008 RTP list were deleted.

- LGB-01 Widen Lakewood by 1 lane in each direction (from I-405 to Carson) has been completed.
- LGB-02 Upgrade capacity of Lakewood/Wardlow intersection has been completed.
- LGB-05 was modified to delete the portion referring to upgrading Spring Street as requested by the airport since they felt it did not impact airport traffic.
- LGB-06 Capacity improvements to I-405 including HOV lanes was deleted since it is a repeat of project LAX-18.

Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access Element are summarized below in **TABLE 4.5**.

TABLE 4.5 LGB Highway, Arterial and Local Street Projects

Project (Year Added)	Description
LGB-03 (04)	Upgrade ramps at I-405 interchange/Lakewood interchange (Add 1 lane to the S/B Lakewood to N/B Rte.405 on-ramp; Add 1 lane to S/B I-405 to Lakewood Off-ramp).
LGB-04 (04)	Widen Wardlow by 1 lane in each direction (from Lakewood to Bellflower).
LGB-05 (12)	Upgrade Spring/Lakewood intersection.

4.3.2 Public Transportation Projects

The City of Long Beach is served by the Metro Rail Blue Line, with service between the Long Beach Transit Mall in downtown Long Beach, and 7th Street/Metro Center in downtown Los Angeles. Blue Line customers may transfer at the Long Beach Transit Mall to Long Beach Transit Line 111, and make the 30 to 40 minute trip to Long Beach Airport between 5 a.m. and 12:30 a.m., 7 days per week. The bus runs at 40 minute intervals for most of the schedule, with some service also provided in 30 minute and 60 minute intervals. The Long Beach Transit mall is served by additional bus routes provided by Long Beach Transit and other public transportation providers.

The Blue Line Willow station is served by Long Beach Transit routes 102/104, which allows customers to make the 20 minute trip to Long Beach Airport from Monday through Friday between 6 a.m. and 8 p.m. at 30 minute intervals. Willow station is served by additional bus routes provided by Long Beach Transit and Metro.

In the future, depending on the distribution of air passenger origins in the vicinity of the Blue Line, consideration should be given to offering higher frequencies on routes 102/104 and 111, and providing Saturday and Sunday service on routes 102/104.

4.4 LOS ANGELES INTERNATIONAL AIRPORT (LAX)

LAX is the sixth busiest airport worldwide in terms of passengers and 13th worldwide in air cargo tonnage, and is served by approximately 80 passenger airlines and 20 cargo airlines. LAX handles 70 percent of the passengers, 75 percent of the air cargo, and 95 percent of the international passengers and cargo traffic in the surrounding five counties. According to recent economic impact studies prepared for the Los Angeles World Airports (LAWA), LAX contributes more than $60 billion annually to the Southern California economy and approximately 408,000 jobs, or one in twenty jobs in Southern California, are attributed to LAX operations.

Passenger and Cargo Trends and Constraints: In 2010, 59.1 million passengers traveled through LAX. A passenger limit of 78.9 MAP was established as the “practical capacity” of LAX in a Settlement Agreement between Los Angeles World Airports and surrounding communities and other parties arising from lawsuits over the latest update of the LAX Master Plan, and is used for planning purposes in related studies. The passenger demand at LAX is expected to grow to the 78.9 MAP planning limit prior to 2035.

Once the 78.9 MAP limit is reached, a significant portion of additional growth in regional demand is projected to spill over to other airports in the region. LAX has the highest rate of connecting passengers of all airports in the region, so on a per passenger basis, its impact on ground traffic is reduced. However, as noted in section 3.1, the projected growth of around 19 MAP will create significant demands on the ground access system and will likely require a greater emphasis on high-occupancy modes (e.g. transit) for airport access and egress travel.

LAX is also a major cargo center with 1,000 daily cargo flights linking Los Angeles with the world. Its cargo handling facilities include the 98-acre Century Cargo complex, the 57.4-acre Imperial Cargo complex, the Imperial Cargo Center and a number of terminals on the south side of the airport. In 2009, the airport handled 1.66 million tons of air cargo, down from a peak of 2.14 million tons in 2005. However, long term growth is forecast to pick up with around 2.8 million tons in the 2035 projection. A large portion of the air cargo at LAX is “pass through”, being shifted from one airplane to another, thus the “per ton” impact of air cargo in terms of truck traffic on the adjacent street network is lower than at the other airports in the region.

Studies and Major Planned Projects: Several major studies have been completed over the past 10 years focusing on terminal expansion and the related ground access improvements needed to support this expansion. On-Airport improvement projects/plans are included for reference only and are not considered part of the RTP.

Initial plans for a new “West Terminal” would have included a new major access point to the airport from the west side, off Pershing Drive. Many of the highway and street improvements associated with this plan were included in the 2008 RTP. However, the 2005 LAX Master Plan EIS/EIR added “Alternative D”, which would maintain terminal access from the east, supplemented by a variety of ground access improvements. This became the preferred alternative of LAWA. Subsequent studies have focused on variations of this general concept, including the 2009 Bradley West Project Draft EIR (DEIR) and the on-going Specific Plan Amendment Study (SPAS).

Final Environmental Impact Statement, Los Angeles International Airport Proposed Master Plan Improvements, January, 2005: According to the EIS, the purpose of the LAX Master Plan is to help provide a level of airport passenger and freight improvements that will support the future economic growth and vitality of the five-county Los Angeles region. Master Plan project objectives are to:

- Respond to local and regional demand for air transportation during the period 2000–2015, taking into consideration the amount, type, location, and timing of such demand.
- Ensure that new investments in airport capacity are efficient and cost-effective, maximizing the return on existing infrastructure capital.
- Sustain and advance the international trade component of the regional economy and the international commercial gateway role of the City of Los Angeles.

As noted above, this study included three alternatives with primary ground access from a new entrance on Pershing Blvd. on the west side of the airport. The fourth, and preferred, alternative maintained access to the terminals from the east side, but eliminated all private vehicle access from the main terminal area, and instead included new major transportation facilities between the airport and I-405 including a multimodal transportation center with bus and rail access, a consolidated car rental facility, and parking garages. All access to the terminals would be via a people mover.

Draft Environmental Impact Report (DEIR), Los Angeles Airport Bradley West Project, May 2009. As one of the airfield improvements included in the LAX Master Plan, the "Bradley West Project," provides for the addition of aircraft gates along the west side of the Tom Bradley International Terminal, which will reduce the existing need for, and use of, remote aircraft gates located at the west end of the airport. New gates include several gates specifically designed to accommodate new generation aircraft such as the Airbus A380, Boeing 747-8, and Boeing 787. The central core of the terminal would also be modified to provide additional floor area and improvements to better serve existing and future passengers at terminal.

As a result of lawsuits challenging the Master Plan, a settlement was reached that requires LAWA to proceed with a Specific Plan Amendment Study (SPAS) to identify potential alternative designs, technologies, and configurations for the Master Plan that would provide solutions to the problems that certain controversial projects (designated as "Yellow Light Projects") were designed to address. Yellow Light Projects included many of the ground access elements in the Master Plan such as a Ground Transportation Center and an automated people mover to link ground transportation facilities to the passenger terminals. While the SPAS is being undertaken, LAWA may continue to process and develop projects that are not Yellow Light Projects, such as the Bradley West Project.

The traffic analysis for the Bradley West DEIS used the year 2013 for future planning. It assumed that traffic generation would be essentially the same for both the build and no build conditions, only the peaking conditions would change. The study looked at on-airport traffic circulation and operations as well as at 71 off-site intersections. The study assumed a number of planned improvements in the area would also be completed by others as listed on **TABLE 4.6** below. Many of these projects were included in the 2008 Airport RTP and many have been completed.

TABLE 4.6 Major Transportation Network Improvements in Study Area of the Bradley West DEIR

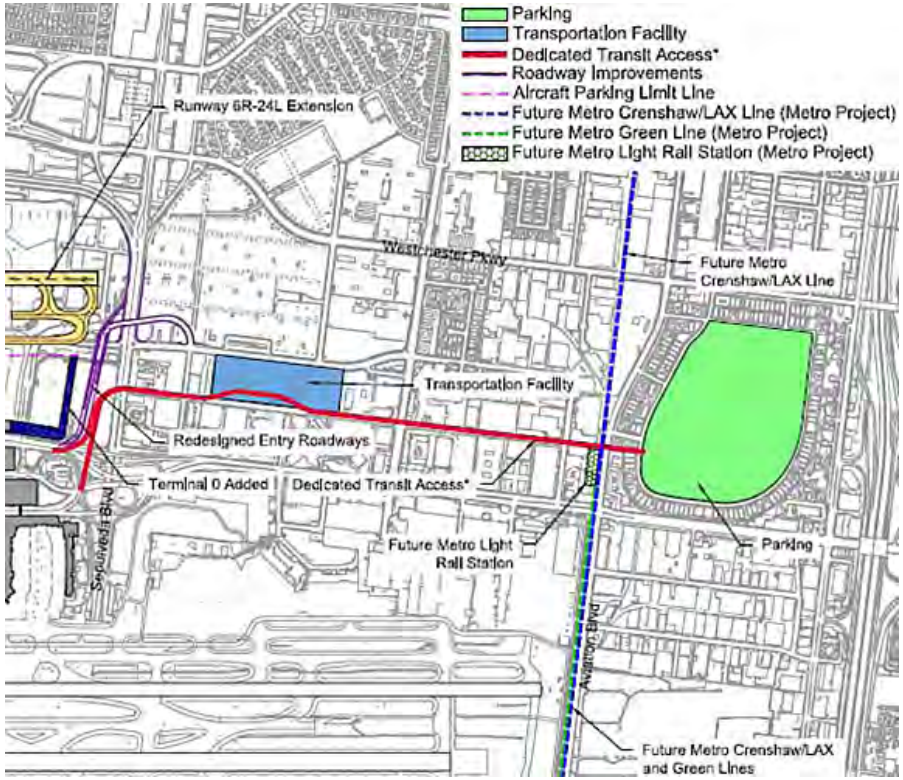
Street/Freeway	Limits	Improvement
Arbor Vitae St [2]	Airport Blvd to La Cienega Blvd	Widen to provide continuous left-turn channelization
Culver Blvd [1]	At Sawtelle Blvd and al Sepulveda Blvd	Intersectional improvements
Douglas St [1]	Imperial Highway to El Segundo Blvd	Convert from one-way to two-way; 3 lanes in each direction
La Cienega Blvd [2]	At Centinela Avenue	Add second northbound left-turn lane
La Tijera Boulevard	At I-405 Freeway	Widen the bridge structure over the freeway and add double left-turn lanes on La Tijera Blvd at the on-ramps
Lincoln Blvd. [2]	La Tijera Blvd to LMU Dr	Widen to 7 total lanes (4 NB, 3 SB)
Lincoln Blvd.[2]	LMU Dr to Jefferson Blvd.	Widen to 4 lanes in each direction
Lincoln Blvd.[2]	Ballona Creek Bridge to Fiji Way	Widen to 3 lanes in each direction
Nash St. [2]	Imperial Highway to El Segundo Blvd	Convert to two-way traffic; 2 lanes in each direction
Sepulveda Blvd. [2]	Manchester Avenue to Lincoln Blvd	Widen to provide 3 full-time lanes NB and SB
Sepulveda Blvd.	Jefferson/Playa to Green Valley Circle	Widen to provide third southbound lane
I-105 [1]	WB off-ramp at NB Sepulveda Blvd	Widen to provide three lanes on off-ramp
I-405 [1]	SR-90 to I-10	HOV
I-405 [2]	I-10 to SR-101 NB; portion of SB	HOV

Source: Table 4.2–4 from Bradley West DEIR

[1] Completed since project notice of preparation in 2008
[2] Under construction as of January 2012

The study identified improvements needed to mitigate impacts relative to the Bradley West terminal project at 19 intersections; however, it found that 13 of them were infeasible, leaving 6 mitigation projects. The improvements are tied to MAP increases at the airport, with all improvements being required at the 5 MAP increase level. These have been added to the 2012 Airport RTP project list and are outlined in the recommended projects section below.

Los Angeles Airport Specific Plan Amendment Study (SPAS): As discussed above regarding the Bradley West DEIS, a number of controversial projects in the Master Plan were identified for additional study. These projects are commonly referred to as the "Yellow Light Projects," and include the following:



- Ground Transportation Center (GTC);
- Automated People Mover (APM) from the GTC to the Central Terminal Area (CTA);
- Demolition of CTA Terminals 1,2, and 3;
- North Runway re-configuration, including center taxiways; and
- On-site road improvements associated with the GTC and APM.

The LAX Specific Plan Amendment Study (SPAS) is to identify potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address, consistent with a practical capacity of LAX at 78.9 million annual passengers.

Several alternatives have been formulated for possible consideration in the SPAS EIR. The alternatives represent a reasonable range of how the various options might be combined to form complete potential scenarios for consideration in the EIR. The EIR will also evaluate whether there are other alternatives that could avoid or substantially reduce significant impacts identified in the EIR analysis.

The improvement alternatives have evolved over time through the study process. A presentation to the Airport Board of Commissioners in May 2011 provided two alternatives. While these two alternatives had different variations of runway and taxiway improvements, the ground access elements appear the same in both and are shown on **FIGURE 4.4**.

FIGURE 4.4 Ground Access Elements of SPAS Alternatives 1 and 2

Source: LAX Specific Plan Amendment Study Update, Board of Airport Commissioners, May 2, 2011

Note that these are just possible alternatives to the existing adopted plan that LAWA is studying. Alternative D in the LAX Master Plan EIS/EIR is currently still the official preferred alternative.

4.4.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Based on input from LAWA staff, many of the projects in the 2008 RTP project list were not carried forward to the 2012–2035 RTP project list for a variety of reasons.

The following projects were deleted since they have been completed:

- LAX-01 (04) Widen Sepulveda (from Manchester to Lincoln) to 5 lanes in each direction plus left-turn lanes except for the Sepulveda Tunnel. (More likely should read 3 lanes in each direction, reflecting recently completed City of Los Angeles project)
- LAX-04 (04) Construct I-105 westbound to Sepulveda northbound off-ramp to 3 lanes plus an emergency lane configuration.
- LAX-18 (04) Add Northbound HOV Lane (over Sepulveda Pass from I-10 US-101. (South-bound HOV from I-101 to Waterford Opened in Feb., 2002; Southbound HOV from Waterford to I-10 is in the Baseline Project ID# LA195900).
- LAX-22 (04) Near Marina Del Rey at Culver Blvd. - Overcrossing Demolish Existing Over-crossing & Replace with New 6-Lane Overcrossing with Longer Span - Widen from 4 to 6 Lanes.
- LAX-27 (08) Grade Separation on Douglas (between El Segundo and Rosecrans for Green Line)

The following projects were deleted since they related to the west airport access in previous Master Plans (LAX-06, LAX-07, LAX-17)

- LAX-06 (04) Construct major intersection at Imperial and Pershing with 3-lane turning lanes in each direction.
- LAX-07 (04) Construct Pershing to new West Terminal interchange to a major arterial standard with 3 lanes in each direction and dual turning lanes.
- LAX-17 (08) Construct Pershing to new West Terminal interchange to a major arterial standard with 3 lanes in each direction and dual turning lanes.

The following projects were deleted at the request of LAWA staff as they are inconsistent with the capacity of adjacent roadway section or their construction appears impractical due to physical constraints or public opposition.

- LAX-03 (04) Widen Imperial (from Del Mar to I-405 interchange) from 3 to 4 lanes in each direction.
- LAX-05 (04) Reconfigure Pershing to a divided major arterial standard with 4 lanes in each direction and turning lanes (from Imperial to Manchester).

- LAX-10 (04) Widen Aviation (from Arbor Vitae to Century) to 4 lanes in each direction. Widen Aviation from Century to Manhattan Beach Blvd. to 3 lanes in each direction.

The following projects were deleted in response to comments from LAWA staff. The location of LAX-08 does not exist. LAX-25 does not appear related to LAX traffic. LAX-28 appears to be a duplicate of LAX-26.

- LAX-08 (08) Improve intersection at Aviation Bl. And Airport Blvd.
- LAX-25 (04) Alameda Street from SR-1 to Henry Ford, Widen from 4 to 6 Lanes (CAT2, CFP 2144).
- LAX–28 (08) Additional left-turn lanes on La Cienega (Northbound) and Centinela (Southbound)

Project LAX-19 in the 2008 RTP project list was modified to clarify that the project is on Lincoln Blvd. and to change the southern limits from Hughes Blvd. to Jefferson Blvd. as the section between these intersections is complete.

Ground access improvements to be included in the 2012–2035 RTP Airport Ground Access Element are summarized below in **TABLE 4.7**.

TABLE 4.7 LAX Highway, Arterial and Local Street Projects

Project (Year Added)	Description
LAX-10 (04)	Widen Aviation Blvd (from Century Blvd to Manhattan Beach Blvd) to 3 lanes in each direction.
LAX-11 (04)	Upgrade Florence/I-405 interchange. Add 2 lanes to each on- and off-ramp.
LAX-12 (04)	Widen Arbor Vitae (from I-405 to Sepulveda) to 3 lanes in each direction.
LAX-13 (04)	Upgrade La Tijera/Sepulveda intersection. Add 1 additional turning lane from southbound La Tijera to southbound Sepulveda and from northbound Sepulveda to northbound La Tijera.
LAX-14 (04)	Reconstruct I-405 southbound off-ramp to La Cienega southbound to a major arterial 4-lane standard.
LAX-15 (04)	Widen La Cienega from Arbor Vitae to Century Blvd. to 3 lanes in each direction.
LAX-16 (04)	In Inglewood construct south half of I-405 interchange at Arbor Vitae.
LAX-26 (08)	Add a 2nd left-turn lane northbound and southbound at Centinela Ave.
LAX-29 (12)	Airport Blvd. & Manchester Ave. intersection. Restripe eastbound approach to provide one left-turn lane, two through lanes and a through/right lane.
LAX-30 (12)	Arbor Vitae St. & Aviation Blvd. intersection. Widen eastbound approach to provide one left-turn, two through lanes and a right-turn lane.
LAX-31 (12)	Imperial Hwy. & Sepulveda Blvd. intersection. Restripe northbound approach to provide one left-turn lane, three through lanes and two right-turn lanes.
LAX-32 (12)	La Cienega Blvd & I-405 ramps north of Century Blvd. Widen northbound approach to provide two left-turn lanes ant two through lanes.
LAX-33 (12)	La Tijera Blvd. & Sepulveda Blvd. intersection. Restripe westbound approach and modify signal to provide two left-turn lanes, on through lane and a through/right lane.
LAX-34 (12)	La Tijera Blvd. & Sepulveda Blvd. intersection. Restripe eastbound approach to provide two left-turn lanes, a through/left lane and one right-turn lane.

4.4.2 Public Transportation Projects

TABLE 4.8 shows the public transportation projects anticipated to be in place by 2035, recommended for inclusion in the strategic plan, or recommended for study, that have the potential to influence the air passenger and employee mode share distribution to LAX.

The Union Station FlyAway and the Van Nuys FlyAway buses, sponsored by LAWA have been very successful in attracting air passengers and airport employees away from lower occupancy ground access modes. The Westwood and Irvine FlyAways are not included in the project list because they have attracted low ridership and therefore do not meet the criteria for inclusion. The LAWA Board of Airport Commissioners recently considered discontinuing the Westwood service, although it continues to operate. LAWA is currently studying the potential for partnerships on some existing publicly and privately operated bus routes serving LAX, with LAWA including these in the FlyAway Program, and providing FlyAway branding and promotion to boost ridership.

There is currently a privately operated bus that provides non-stop hourly service between Disneyland and LAX. Customers are picked up and dropped off at Disneyland by a shuttle that serves the area hotels. The bus is primarily used by non-resident air passengers because resident air passengers do not have a place to park their autos to use the bus, reducing the accessibility of the boarding point.

Data from the 2006 air passenger survey indicated that there are quite a few resident air passengers in the Anaheim market area, although there may not be enough to justify a new express bus service. LAWA is not currently considering operating a service between Anaheim and LAX because it would compete with the privately operated service. It is recommending that this market be studied further to determine the options for a bus service that would better accommodate both resident and non-resident air passengers, as well as any airport employees in the market area. An air passenger survey is currently being conducted at LAX, so fresh data for such an analysis would likely be available by the end of 2011. Potentially the existing non-stop bus service could be modified by the private operator, or a partnership could be formed between the private operator and LAWA or the private operator and another public entity.

The Anaheim Regional Transportation Intermodal Center (ARTIC) will accommodate regional and local bus and rail connections, and will include parking for autos. It has a projected opening date of 2014. ARTIC will include space for a bus connection to LAX in anticipation of a service being provided in the future. Since it is also anticipated that by 2018 there will be a fixed guideway connection, called the Anaheim Rapid Connection, between ARTIC, Disneyland, the hotels in the Disneyland area, and the Anaheim Convention Center, ARTIC should be considered in any market analysis as a potential boarding point for a future express bus service that would accommodate resident and non-resident air passengers and airport employees.

The funded transit projects in **TABLE 4.8** should collectively improve the transit mode share to LAX. However, ridership forecasts are not currently available to determine how the individual projects or the combination of projects will improve the transit mode share and reduce the air passenger and airport employee trip generation rate.

TABLE 4.8 Potential High Occupancy Public Transportation Projects Serving LAX, 2035

Status	Project	Source	Notes
Existing	Union Station FlyAway	Sponsored by LAWA	Ridership may improve with High Speed Rail Connections to Union Station
Existing	Van Nuys FlyAway	Sponsored by LAWA	
Existing	Silver Line, El Monte to Union Station		Frequent Connection for Union Station FlyAway
Existing	Green Line serving Aviation Station, connecting to LAX Shuttle		
Being Studied by LAWA	Long Beach FlyAway	LAWA Staff, and Report to LAWA BOAC 5/16/11	May be Implemented in near future
Funded	Exposition Light Rail Phase I	Under Construction	1. 2011 Opening
			2. Will share a station with Crenshaw Line

Status	Project	Source	Notes
Funded	Exposition Light Rail Phase II	2008 RTP, 2008 RTIP, 2009 Metro LRTP, Measure R Project	1. Planned for 2015
			2. Will extend Exposition Light Rail Phase I
Funded	Crenshaw/LAX Transit Corridor	2009 Metro LRTP, Measure R Project	Planned for 2018
Funded	Regional Connector	2009 Metro LRTP, Measure R Project	Will reduce number of light rail transfers in downtown Los Angeles. Planned for 2019.
Partially Funded	Green Line Extension to LAX	2009 Metro LRTP, Measure R Project	Metro study underway in Spring 2011. Anticipated 2028 opening depending on LAWA contribution.
Funded	South Bay Metro Green Line Extension	2009 Metro LRTP, Measure R Project	1. Redondo Beach Blvd. to South Bay Corridor
			2. Planned for 2035
Partially Funded	Metro Green Line Extension between Norwalk and Metrolink Station	2009 Metro LRTP - Strategic Unfunded	
Strategic Plan	Green Line from LAX to Santa Monica	2009 Metro LRTP - Strategic Unfunded; 2008 SCAG RTP - LA County Strategic Plan Projects	
Recommended for Analysis	Express Bus Service, ARTIC/ Anaheim Arctic to LAX	Consultant recommendation	1. Potentially from ARTIC
			2. Potential enhancement of an existing privately operated service
Strategic Plan	Slausen Light Rail, Crenshaw Corridor to Metro Blue Line - Slausen Station	2009 Metro LRTP Strategic Unfunded; 2008 SCAG RTP - LA County Strategic Plan Projects	1. Planned for 2035

4.5 MARCH AIR FORCE BASE/MARCH INLAND PORT (MIP)

MARB currently accommodates military operations by the Air Force, Air Force Reserve, Air National Guard and other governmental-related entities. MIP currently operates limited civilian operations on a prior approval basis including domestic and international air cargo services. Upon announcement in 1993 by BRAC of realignment of March AFB to an air reserve base, the adjoining jurisdictions formed the March Joint Powers Authority (JPA) to address base reuse at March AFB. The March JPA, in addition to being designated as the federally recognized reuse authority for the former active duty base, has also assumed other responsibilities. These responsibilities are carried out by governing bodies under the governance umbrella of the March JPA and include:

- The March Joint Powers Redevelopment Agency – responsible for the redevelopment of 6,500 acres of the former active base and approximately 450 acres adjacent to the base in the industrial area of the City of Moreno Valley.
- A streamlined development process with the transferred of land use authority to March JPA from the County of Riverside.
- The establishment of building codes and standards by the March JPA.
- Management of airport development and operation through March Inland Port Airport Authority (MIPAA).

Passenger and Cargo Trends and Constraints: The Joint Use Agreement between the U.S. Air Force and the March JPA, signed in May, 1997, limits the joint use airport to 21,000 annual civil operations and 51,426 annual military operations. In 2008, cargo users accounted for approximately 5,000 of the 21,000 allowable annual civilian operations.

March Inland Port has over 600,000 square footage of future ramp area planned for construction. All planned facilities will be engineered to meet or exceed load requirements and to be fully stressed to accommodate aircraft up to 900,000 pounds. The airport is currently not accommodating commercial passenger operations. However, general aviation (GA) support facilities are planned for 2013. In 2008, the joint use agreement was amended and restrictions on GA operations were removed. Environment studies are expected to be complete in 2012 and if the GA project is approved, construction could begin in late 2012. The 2035 forecast for this RTP forecasts a small amount of passenger traffic for MIP–0.6 MAP.

DHL is a major cargo carrier that began operations at MIP in 2005. However, they discontinued service out of MIP in 2009. MIP is positioning itself as a diversified airport, with cargo, maintenance, charter service and general aviation activities. The 2012–2035 RTP cargo forecast for 2035 is 244,000 tons. At this level, MIP might become the third largest cargo airport in the region behind LAX (2.8m tons) and ONT (1.4m tons) in 2035.

Studies and Major Planned Projects: The General Plan of the March Joint Powers Authority is a long range comprehensive plan, completed in 1999, designed to outline and delineate use and development of a Planning Area known formerly as March AFB, prior to the base realignment in April 1996 to March ARB. The General Plan defines reuse and development opportunities of the Planning Area, while preserving the environmental quality. The General Plan contains goals, policies, and programs to guide future development and change in the Planning Area. The goals and policies of the General Plan serve as the constitutional framework for March JPA, provide planning direction for JPA operations and programs and function as guidelines for all decision-making concerning use and development of the area.

The plan includes a transportation element that includes goals and specific recommendations to accommodate traffic growth generated by the former Air Force base site through the year 2030. Projects identified to support background traffic growth around the base (excluding traffic generated by the base development) included:

- Widening Alessandro Blvd. to six lanes west of I-215 (complete)
- Widening Van Buren Blvd. to six lanes from Barton Street westerly.
- Reconstructing the Van Buren Boulevard interchange with I-215.
- Widening Barton Street south of Van Buren Blvd.
- Widening the intersection of Barton Street with Van Buren Blvd.
- Widening Nandina Ave. and extending it easterly to connect with the Oleander interchange on I-215.
- Widening Harley Knox Blvd. to four lanes east of I-215 and extending it easterly.
- Widening existing ramps at the I-215 interchanges with Alessandro Blvd. and Cactus Ave.

In addition to these needed improvements in the vicinity of the March JPA Planning Area, I-215/SR-60 was projected to be significantly over capacity between Riverside and Moreno Valley even with the HOV and truck climbing lane improvements implemented as part of Measure A.

The traffic forecasting model was subsequently used to identify additional roadway improvements needed to accommodate the planned development of the March JPA Planning Area. The analysis determined that the following improvements would be needed in addition to those identified above:

- Widening Cactus Ave. to, six lanes from I-215 to Graham St. (consistent with the Moreno Valley General Plan).
- Widening Van Buren to six lanes from I-215 to Banon St.
- Additional widening of the Van Buren bridge over I-215.
- Construction or widening of internal March JPA Planning Area roads.
- Widening of several key intersections to provide additional turn lanes.

Note that many of these improvements are related to the overall redevelopment of the Base and are not specific to airport operations.

Vision 2030: March JPA General Plan, March 2010 Draft: Per the plan, “Changing economic, social, and natural environment factors have made it apparent that it is time to update the current General Plan and EIR, to fine-tune the direction of development within its jurisdiction, and in short, to implement the Vision that has been set forth by the

public and the March JPA decision-makers." The vision of the 2030 plan includes creating 38,000 jobs through development of the Planning Area, and reducing inter-regional traffic through utilizing the planned Metrolink station and land use decisions that promote the development of a multi-modal passenger facility.

While Vision 2030 provides mostly general goals related to improving traffic circulation, there are some specific transportation related needs identified:

- Support development of limited-access roadway facilities and other regional traffic improvements such as the Mid-County Parkway or the Cajalco/Ramona Corridor.
- Work with the County of Riverside to identify and develop a north-south arterial roadway linking Van Buren Blvd. and Cajalco Corridor on the west side of the Planning Area.
- The March JPA shall support and participate in the creation of adequate regional transportation systems and linkages and promote mass transit and alternative transportation modes.
- Work with the City of Perris to plan for an arterial roadway on the east frontage of I-215 between Van Buren Blvd. and Harley Knox Blvd., tying in with existing street improvements at Western Way, in order to preserve future options for developing aviation facilities on the west side of the runway.
- Incorporate a traffic circle/round-about near the convergence of the Van Buren extension and Western Way to control traffic, encourage safe street speeds and provide a safe transition.
- Work closely with Caltrans to implement the freeway ramp/arterial roadway interchange improvements at Van Buren Blvd., Cactus Ave. and Harley Knox Blvd. while minimizing the short-term impacts associated with construction.
- Work with RCTC to expedite the development of the proposed Metrolink line and station that will serve as an intra- and inter-county public transportation system.

As with the original General Plan, many of these improvements are related to the overall redevelopment of the Base and are not specific to airport operations.

Meridian Specific Plan Amendment (SP-5), July 2010 – This plan amendment relates to the industrial park development on a portion of the base west of I-215 and in the northeast corner of the base and not the airport itself, although due to the size of the development (up to 15 million square feet of industrial and commercial development), it impacts many of the same roadways and interchanges that will be utilized by airport traffic. These include improvements to the I-215 interchanges at Alessandro Blvd., Cactus Ave. and Van Buren Blvd.

4.5.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Recommended changes to the ground access project list include the following:

Five projects from the 2008 RTP list were deleted at the request of the airport. Projects MIP-06 and MIP-07 were mistakenly included in the 2008 RTP for MIP, and are therefore being deleted from this section. MIP-02 is essentially the same as MIP-01 so it has been deleted. Other deleted projects include:

- MIP-08 (04) Upgrade I-215/Cactus interchange (additional turning lane from W/B Cactus to S/B Rte. 215)
- MIP-12 (04) Improve Cactus (add 1 lane in each direction from I-215/Cactus IC to Perris Bl.)

MIP-08 has been completed. MIP-12, Cactus Ave., is identified as needing widening to 3 lanes in each direction in the Meridian SPA traffic study. However, this is related to industrial and commercial development and not airport-related traffic.

The Airport also requested the following changes:

- The description of MIP-01 was revised to change the name of the development and to specify 2 lanes in each direction, plus turning lanes. This project will begin construction in 2013.
- The description of MIP-04 was modified to remove references to numbers of lanes on the freeway ramps. This project has been designed and is scheduled to be constructed in 2012.

Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access Element are summarized below in **TABLE 4.9**.

TABLE 4.9 MIP Highway, Arterial and Local Street Projects

Project (Year Added)	Description
MIP-01 (04)	Construct connector road from I-215/Van Buren interchange east to new March Inland Port Civil Development Parcel D-2 (Divided major arterial configuration, 2 lanes in each direction, plus turning lane, emergency shoulder).
MIP-03 (04)	Construct internal air cargo terminal 6-lane roadway system including truck parking and ramp access facilities for higher PCE truck traffic movements.
MIP-04 (04)	Reconstruct the I-215/Van Buren interchange.
MIP-09 (04)	Construct connector between I-215/Harley Knox (Oleander) interchange and new air cargo terminal at MIP (major arterial, capable of higher PCE truck traffic, 2 lanes in each direction).
MIP-10 (04)	Add 2 lanes in each direction on Harley Knox (from I-215 to Perris).
MIP-15 (04)	Improve SR-60 (Caltrans: add 2 lanes from 215/60 interchange to Redlands).

4.5.2 Public Transportation Projects

The Riverside County Transportation Commission (RCTC) owns the San Jacinto Branchline, which is a lightly used rail freight line that parallels the I-215 and runs approximately 19 miles from Riverside to Perris and Romoland via March Air Reserve Base. RCTC purchased the San Jacinto Branchline from Burlington Northern Santa Fe (BNSF) in 1993, recognizing its potential to alleviate growing congestion in the corridor, with the possible provision of Metrolink service at a future date. As part of the agreement, BNSF retained operating rights on the San Jacinto Branchline, but future Metrolink service would receive priority. In 2002, RCTC began the process of evaluating potential transportation solutions in the I-215/San Jacinto Branchline Corridor, referred to as the Perris Valley Line project, with the intent of providing Metrolink service as an extension of the Metrolink 91 Line. The Metrolink 91 Line provides service between Riverside and downtown Los Angeles via Fullerton. As a result of subsequent studies and community meetings, a locally preferred alternative was selected. The proposed Perris Valley Metrolink Line would provide six round trips per day, with proposed stations in Riverside, Moreno Valley/March Field, downtown Perris and South Perris. If commercial air service is provided at March in the future, the six trips per day on the Metrolink Perris Valley Line may serve some of the air passenger and employee demand in the corridor.

4.6 ONTARIO INTERNATIONAL AIRPORT (ONT)

ONT is well situated to serve the future aviation needs of the Inland Empire and the Southern California Region for both cargo and passengers. Demand for air transportation will be created by the Inland Empire's rapid population growth; as well as its growth as a manufacturing and distribution center and the limited potential for expansion at LAX and other regional airports. The airport is the centerpiece of one of the fastest-growing transportation regions in the U.S. ONT is a medium-hub, full-service airport with commercial jet service to major U.S. cities and through service to many international destinations.

According to the Notice of Preparation for the airport master plan update, ONT currently consists of about 1,700 acres. The airport has two parallel runways with a 700 foot separation. The runways can handle simultaneous arrivals during visual meteorological conditions, but they are too closely spaced to permit independent aircraft arrivals during instrument meteorological conditions. The airport has two 265,000 square foot passenger terminals with a total of 26 aircraft gates available, and 8,775 available public parking spaces. LA/ONT has approximately 96,000 square feet of cargo building and office space to support all-cargo, airline belly cargo and air mail. United Parcel Service (UPS) also has a 156-acre West Coast Distribution Center adjacent to the airport with access to the LA/ONT airfield. Property is available for passenger terminal development or redevelopment between and adjacent to the existing terminals. Developable property is also available on the south side of the airport and on the east side of the airport across Haven Ave. A 94 acre site in the northwest corner of the airport is proposed for an air cargo development.

Passenger and Cargo Trends and Constraints: ONT offers over 380 daily flights to cities across the U.S. In the early 2000's the airport experienced significant growth in passenger traffic, peaking at 7.2 MAP in 2005. However, with the downturn in the economy, passenger traffic has dropped off, with a level of 4.8 MAP in 2010. The 2035 forecast still envisions significant growth at 30.7 MAP. Note that SCAG has estimated that two runway configuration at the airport to have a physical capacity of 31.6 MAP. As discussed in section 3.1, a major contributing factor to the growth at Ontario is the limitations at the

urban airports in the region. Ontario is expected to pick up a large portion of the spillover traffic once these airports reach capacity as it currently has operations for many of the major airlines. However, growth at Ontario could be limited if growth at the urban airports is slower than anticipated.

Ontario is the second busiest airport in terms of freight traffic in the region, with 455,000 tons handled in 2009. LAX and ONT carry a combined 95 percent of the cargo in the region, with Ontario representing about 20 percent of the total. Freight flows have been fairly constant at the airport since 2000, ranging between 455,000 and 600,000 tons per year. ONT is projected to see major growth in air cargo, growing to around 1.4m tons by 2035

Studies and Major Planned Projects: Planned facility and ground access improvements around the airport include:

- When passenger traffic at ONT reaches 10 MAP in two consecutive years, a third terminal will be constructed.
- Planned grade separations at North Grove and San Antonio
- Planned interchange improvements at I-10 and Grove, Vineyard and Euclid, and SR 60 at Mountain, Archibald, Euclid and Haven
- Planned extension of Metro Gold Line to airport

Notice of Preparation of a Draft Environmental Impact Report, LA/Ontario International Airport Master Plan, August 2007 – The description of the proposed project in the Notice is as follows:

The proposed Project includes airside, landside and roadway improvements at LA/ONT. The improvements would be built in phases keyed to passenger and cargo growth. It is assumed that all improvements will be in place by 2030. Project phases may include demolition of existing facilities, site preparation, and construction of new facilities. Reasonable and feasible mitigation measures may be phased to correspond to the phases of project development. The proposed Project includes the following elements.

- Linear expansion of existing passenger terminals and aircraft apron (gates) on the north side of the airport.
- Relocation of both runways to the south and east to create additional area for aircraft movement in the passenger terminal area.
- Separation of the runways and construction of a center taxiway between north and south runways to improve airfield efficiency and safety.
- Construction of a new apron pushback taxilane.
- Construction of a new apron edge taxiway.
- Relocation of existing parallel taxiways.
- Construction/relocation of connector taxiways.
- Taxiway/Runway improvements to accommodate New Large Aircraft.
- Construction of terminal area structured auto parking lots.
- Construction/expansion of terminal access roads.
- Relocation and/or expansion of the existing ground transportation center (rental car facility).
- Construction of additional economy parking lots.
- Relocation and/or expansion of employee parking lot.
- Expansion and/or relocation of general aviation facilities.
- Expansion and/or relocation of airport maintenance area.
- Relocation and/or expansion of an airport administration facility.
- Expansion/construction/relocation of the aircraft rescue and firefighting (ARFF) facility.
- Impact to some existing south side facilities.
- An airport people mover (APM) system may be constructed.
- Land acquisition of approximately 35 acres for the Runway Protection Zones as a result of relocating and reconfiguring the runway and taxiway system.

(On-Airport improvement plans/projects are included in this report are for reference purposes only)

The Project may also include surface transportation improvements in addition to the improvements to immediate airport access. Analysis completed for the Master Plan indicates that the roadway system in proximity to LA/ONT will require enhancement due to regional growth with or without the Project's proposed improvements. The impacts of airport expansion on the highway and arterial system serving LA/ONT will be considered

as part of the EIR and a Transportation Improvement Mitigation Plan will be developed to be included in the Master Plan.

The Ontario Plan Environmental Impact Report, July 2009 – The City of Ontario completed a city-wide master plan/EIR which includes an element on transportation. The Plan addresses both the potential for high-speed rail access at the airport and transportation needs around the airport.

With regard to the airport, the Report notes "LAWA is in the process of developing a new airport master plan for ONT, which would support an annual passenger activity level of 32 MAP, as well as a high volume of air freight service. The associated economic activity represents a major potential economic boon for the City, but the ground access study for the airport master plan found that the circulation improvements that would be needed to support the region's growth and the airport's growth would be extensive and very costly, and at best would only keep up with current congestion levels. The potential growth of the airport and the region necessitates visionary solutions for future transportation in Ontario and the surrounding region (see discussion below). To facilitate circulation around a major airport and surrounding activity center, the City should develop a high volume non-automobile circulation/distribution system (for example, a frequent minibus shuttle or an automated people mover) for the airport area."

4.6.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Four projects from the 2008 RTP list were deleted at the request of the City. ONT-11, ONT-14a and ONT-19 have been completed. ONT-20 was removed from the City's general plan.

- ONT-11 Grade Separation North Milliken Ave. at Airport Dr. (UPRR Alhambra Line).
- ONT-14 Add 1 lane in each direction on Guasti Rd. (east of Haven) and on Euclid (at SR-83).
- ONT-19 South Milliken Ave. Railroad Grade Separation at Mission.
- ONT-20 State St. Railroad Grade Separation at Bon View.

The descriptions of the following projects were modified at the request of the City:

- ONT-02 changed from roadways related to HSRT station to the planned multi-modal transit center.
- ONT-06 the crossing is on the LA line, not the Alhambra line.
- ONT-09 changed limits of the project from between Airport and I-10 to between Holt and I-10.
- ONT-14b revised project description.
- ONT-18 revised project description.
- ONT-24 deleted "Airport and Airport Dr." interchange, this location does not exist.

Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access Element are summarized below in **TABLE 4.10**.

TABLE 4.10 ONT Highway, Arterial and Local Street Projects

Project (Year Added)	Description
ONT-01 (04)	Upgrade ONT internal circulation system to accommodate 30 MAP, curbside, parking ingress/egress inclusive.
ONT-02 (04)	Construct multi-modal transit center and supporting roadways at a site generally located between the I-10 Fry, Archibald Ave, UPRR Alhambra Line and Holt Blvd to include BRT, CHSRA, Metro Gold Line and/or Metrolink.
ONT-05 (04)	Add 2 lanes to on-, off-ramps at I-10/Archibald interchange.
ONT-06 (08)	Construct a Grade Separation at Milliken/Union Pacific LA Line.
ONT-07 (08)	Upgrade SR-60: Grove interchange to 6 lanes.
ONT-08 (08)	Widen Holt by 2 lanes in each direction (from I-10 ramps west City Limits).
ONT-09 (04)	Widen Vineyard by 2 lanes in each direction (from Holt to I-10 interchange).
ONT-10 (08)	Widen Grove by 1 lane in each direction, including turning lanes, (from I-10 to Holt Blvd. Add W/B and E/B off-ramps on I-10 at Grove. Configure all ramps to 3-lane configuration.
ONT-12 (08)	Grade Separation North Grove Ave. and Holt intersection widening (UPRR Alhambra Line).
ONT-13 (08)	Add 1 lane in each direction on Mission (from Grove to Archibald) and from Archibald to Haven.

Project (Year Added)	Description
ONT-14b (08)	Widen Euclid Ave. (SR-83) from 4 to 8 lanes, SR-60 to Merrill Ave.
ONT-15 (04)	Add 1 lane in each direction on I-15 (from Rte. 60 to I-10).
ONT-17 (08)	SR-60: Upgrade Vineyard interchange, widen Vineyard from 4 to 6 lanes.
ONT-18 (08)	San Antonio Ave. Railroad Grade Separation (UPRR LA and Alhambra Lines).
ONT-21 (08)	Campus Ave. Railroad Grade Separation at State (UPRR LA and Alhambra Lines).
ONT-22 (08)	North Vineyard Ave. Railroad Grade Separation at Holt (UPRR Alhambra Line).
ONT-23 (08)	South Archibald Ave. Railroad Grade Separation at Mission (UPRR LA Line).
ONT-24 (08)	Interchange Upgrades at Sr-60 and Mountain; I-10 at Vineyard Ave.; SR-60 at Archibald and at Euclid; I-10 at Euclid.
ONT-25 (08)	Airport Dr. improvements: Rochester Ave. to Wineville Ave., signalization of Kettering/Airport Dr.

4.6.2 Public Transportation Projects

TABLE 4.11 shows the projects anticipated to be in place by 2035, recommended for inclusion in the strategic plan, or recommended for study that has the potential to influence the air passenger and employee mode share distribution to ONT.

TABLE 4.11 Potential High Occupancy Public Transportation Projects Serving ONT, 2035

Status	Project	Source	Notes
Funded	Gold Line Foothill Extension Phase 2a: Pasadena to Azusa	2009 Metro LRTP, Measure R Project, 2008 RTP, 2008 SCAG RTIP - LA County Transit Projects (Amendments to 54)	Pasadena to Azusa (Phase 2A) under construction. Scheduled to open in 2015.
Strategic Plan	Gold Line Foothill Extension Phase 2b: Azusa to Montclair	2008 RTP, 2008 SCAG RTIP - LA County Transit Projects (Amendments to 54)	Project is in environmental review
Strategic Plan	Gold Line Foothill Extension Phase 2c: Montclair to ONT	2008 RTP Regional Strategic Plan Projects, 2009 LRTP Long Range Strategic Plan Supplement 1	
Strategic Plan	CA High Speed Rail: Los Angeles to San Diego via the Inland Empire with Stop at ONT	2009 LRTP Long Range Strategic Plan; www.cahighspeedrail.ca.gov	Included in Phase 2, currently unfunded; Corridor between San Bernardino County and San Diego not yet determined.
Recommended for Analysis	Express Bus Service , East of ONT: I-10 /I-215	Recommendation for Study	+/- 18 miles from ONT. Market analysis required.
Recommended for Analysis	Express Bus Service, West of ONT: I-10 /SR-57	Recommendation for Study	+/- 15 miles from ONT. Market analysis required.
Recommended for Analysis	Express Bus Service, Anaheim/ ARTIC to ONT	Recommendation for Study	1. Service has not been planned 2. ARTIC Concept allows for this connection.

It is unclear if and when the Gold Line Foothill Extension will be extended to ONT. Depending on when it is extended to Montclair in relation to air passenger growth at ONT, an analyses should be conducted to determine the potential for a non-stop or limited stop bus service that travels between the Gold Line and ONT, to accommodate the demand for airport travel until the Gold Line serves ONT, or to accommodate the demand for airport travel in place of the Gold Line connection to ONT.

The consultant recommends that analyses is conducted to determine the potential for non-stop express bus service between ONT and the general locations along the I-10 listed in **TABLE 5.5**, and to ARTIC. This will require information on the distribution of air passenger origins by resident status at the demand levels assumed in this study. In general, for a non-stop frequent airport bus service to be economically viable, the airport should serve a minimum of 20 million origin and destination air passengers. Details are provided in Appendix III, Characteristics of Successful Airport Express Buses.

4.7 PALM SPRINGS AIRPORT (PSP)

Palm Springs Airport is expected to continue growing in relation to the forecasted growth in the Coachella Valley. The PSP market is somewhat isolated geographically and unique because of its seasonality during the winter months. As the Coachella Valley population continues to grow, it is anticipated that PSP will play an integral part in the local and regional aviation demands.

Passenger and Cargo Trends and Constraints: Palm Springs Airport carried 1.5 MAP in 2009 and is projected to grow to 4.1 MAP by 2035, although, as with the other smaller airports in the region, this is tied in some part to spillover from the major airports when they reach capacity in addition to handling growth in its own subregion.

Airlines serving the airport include Virgin America (seasonal) Allegiant Air, Alaska, U.S. Airways, American, Delta/Delta Connection, Horizon Air, Sun Country (seasonal), United/United Express, WestJet, Continental (seasonal) and Frontier (seasonal) with a total of about 50 flights per day.

Cargo traffic is modest at the airport, with 27,000 tons in 2006. The 2035 projection is less than 100,000 tons.

Studies and Major Planned Projects: Planned facility and ground access improvements include:

- New FAA control tower, construction underway, expected completion 2013
- New consolidated rental car facility expected to be completed in the next three years
- Terminal expansion of the baggage claim and ticketing areas as supported by the new 2012 Master Plan Update
- Landside public parking and rental car ready lot expansion

(On-Airport improvement plans/projects are included in this report are for reference purposes only)

The Master Plan Update is complete and is not yet in the environmental analysis phase. The final document is due sometime in mid-2012.

City of Palm Springs General Plan, 2007: Specifically referring to airport transportation, the plan states “Currently, SunLine Route 24 provides public transportation service to the airport. In addition, several resorts and hotels offer courtesy shuttle service to the airport. Additional transportation services including limousine, taxi, shuttle, and disabled and senior services are available at the airport. As the airport expands to satisfy air passenger demands, additional public transportation services should be considered to serve resident and visitor air passengers. Additional courtesy shuttles could be considered or integrated to provide efficient service to popular destinations, such as the Downtown area.” One of the planning goals related to aviation is to “Establish multimodal circulation linkages (busses, trams, bicycle infrastructure, etc.) to and from the airport to relieve parking and traffic loads at the airport.”

4.7.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Recommended changes to the ground access project list include the following:

- PSP-04 (04) Add 1 lane in each direction on Farrell (from Ramon Rd. to Vista Chino).
- PSP-05 (04) Upgrade intersection of Indian Canyon and Tahquitz Canyon Rd.
- PSP-07 (04) Add 1 additional left and right turning lanes from Tahquitz to Palm Canyon.
- PSP-08 (04) Upgrade I-10/Gene Autry Trail interchange ramps to a 2-lane configuration. Modify Gene Autry Trail from 2 to 6 lanes (from I-10 interchange to Salvia Rd.).

- PSP-10 (04) Modify Gene Autry Trail from Salvia Rd. to Vista Chino to a 6-lane configuration.

In addition, PSP-11 (04) was modified to delete the Bridge over the UPRR as it is currently under construction.

Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access Element are summarized below in **TABLE 4.12**.

TABLE 4.12 PSP Highway, Arterial and Local Street Projects

Project (Year Added)	Description
PSP-01 (04)	Upgrade internal PSP terminal area circulation system including parking facilities (to accommodate 3.2 MAP). Upgrade terminal area ingress/egress from Tahquitz Canyon.
PSP-02 (04)	Add 1 lane in each direction on Ramon Rd (from Sunrise to El Cielo) to a continuous 4-lane major arterial configuration.
PSP-03 (04)	Upgrade El Cielo/Ramon Rd. intersection for air cargo truck traffic.
PSP-06 (04)	Upgrade I-10/Date Palm interchange ramps to a 2-lane configuration.
PSP-11b (04)	Construct bridge on Gene Autry Trail at Whitewater River.
PSP-12 (04)	Widen Indian Canyon Drive to a 6-lane configuration (from Union Pacific Rail Road to I-10).

4.8 PALMDALE AIRPORT (PMD)

PMD is located in the Antelope Valley, in the northeast portion of the city of Palmdale, on a 60-acre site within the 5,800 acre United States Air Force Plant 42. PMD is approximately 60 miles northeast of Downtown Los Angeles off State Highway 14. The airport has two 12,000 foot runways.

PMD was one of four airports owned and operated by Los Angeles World Airports (LAWA), a City of Los Angeles department which also owns and operates Los Angeles International, Ontario International and Van Nuys. The City of Los Angeles also acquired approximately 17,500 acres of land east and south of the airport with the goal of providing a regional alternative to LAX. However, demand for passenger service has not developed and in 2011 operation of the airport was transferred back to the City of Palmdale. The City of Los Angeles retains the land it owns adjacent to the airport. The airport terminal, on the Plant 42 leasehold, has direct public access from Avenue P and is in a newly expanded redevelopment area.

The City of Palmdale formed a Palmdale Airport Authority on May 6, 2009 that is currently functioning. The Airport Authority is responsible for the transfer of the airport from LAWA. The lease with the Department of Defense for the leasehold terminal is in the process of being assigned to the Palmdale Airport Authority for ownership and operation of Palmdale Airport, which will be completed next year. The airport has been operationally relinquished by LAWA and is no longer part of the LAWA system. However, the joint use agreement with the Air Force is still operative and includes LAWA since it allows for the access and use of Plant 42 runways by Palmdale Airport and by LAWA as a weather diversion for LAX.

Passenger and Cargo Trends and Constraints: Regional Jet (RJ) Service to San Francisco International began in June, 2007, but was terminated in 2009 and there is currently no commercial service at the airport. The 2035 projection for the airport is 2.6 MAP, however, as discussed previously, this is in part due to the lack of capacity at the urban airports to meet regional demand, so the assumption has been made that spillover will be distributed to the other regional airports.

LAWA's Joint Use Agreement with the Air Force allowed up to 50 commercial operations per day but provides for a process to increase that limit to as high as 400 operations per day with the permission of the military.

Palmdale does not currently support any cargo service. The 2035 projection is 115,000 tons. Similar to with passenger service, cargo service at the airport may be contingent on drawing a large cargo carrier.

Studies and Major Planned Projects: Space is available on the 61.75 acre leased site for expansion of the passenger terminal facility and for development of future cargo facilities. There is also land available to the south of the terminal area to expand the leasehold with Air Force approval. The Joint Use Agreement with the U.S. Air Force (USAF) sets forth procedures for the use of AF Plant 42 as a joint military/civilian use airport, defines the

level of commercial operations that can take place by domestic civilian operators, and specifies guidelines for the use of the acreage owned by LAWA. The USAF has determined that at least 50 civilian commercial operations per day can be accommodated without detriment to the military mission of AF Plant 42. The JUA allows for incremental growth of operations levels up to 400 civilian operations per day with the approval of the USAF. The lease site itself can be expanded to accommodate at least the 1 Million Annual Passengers forecasted to use the facility in 2030. Prior to transfer of operation of the airport operations back to the City, LAWA was working with the City of Palmdale, the MTA and Caltrans to identify needed ground access improvements. These considered enhanced Metrolink service to the airport.

Airport Master Plan: LAWA started a master plan update for the airport, but terminated it when control was transferred back to the City of Palmdale.

Three alternative improvement concepts were developed to expand PMD facilities to meet the forecasted demand. All alternatives assumed that PMD continues to share the AF Plant 42 airfield, but propose expansion of passenger and cargo facilities on and off AF Plant 42. All alternatives also included airside, landside and roadway improvements built in phases keyed to passenger and cargo growth. Improvements would have included passenger terminal expansion; additional aircraft gates for passenger and cargo operations; expansion of airside facilities such as aprons and taxiways; expansion of automobile parking lots; construction or expansion of access roads; construction of air cargo facilities; and construction of support facilities.

Alternative 1, the Proposed Action, included expansion of the terminal and apron within the existing terminal area on AF Plant 42 and development or expansion of additional facilities on AF Plant 42 outside the current leasehold. Alternative 2 included development of a terminal building, apron and cargo facilities within an area on LAWA property called Site 9, with a connecting taxiway to the AF Plant 42 airfield. Alternative 3 included development of a terminal building, apron and cargo facilities east of AF Plant 42, entirely on vacant LAWA property. All alternatives included a commercial/ industrial development on LAWA property south of Avenue P. Commercial development of non-aviation property would help finance future infrastructure development.

LAWA was also developing a long-range strategic plan for PMD to show how the airport would accommodate passenger demand beyond 2030 or demand generated by the development of a high-speed rail system to PMD as suggested in the SCAG Aviation Plan in the 2008 RTP. The plan proposed a phased move to LAWA property as passenger volumes approached about 3 MAP. At that point, further investment in expansion on the Plant 42 leasehold would not be cost effective. Phased development of a new airport on LAWA owned property would be initiated, beginning with passenger terminal development. At build-out, the strategic plan would have proposed an airport that can handle at least the 12.8 MAP suggested by the 2008 SCAG plan, with two runways developed on LAWA property and connections to the AF Plant 42 airfield for additional capacity.

(On-Airport improvement plans/projects are included in this report are for reference purposes only

City of Palmdale Master Plan: The City's current master plan includes stakeholder comments regarding expansion of PMD to encourage more travelers from the Santa Clarita and San Fernando Valleys to use the airport and for development of the High Desert Corridor to promote development and use of the airport. Transportation related goals in the master plan include:

- Coordinate and collaborate with Caltrans and Metro to promote the design and construction of the High Desert Corridor. Completing of the project will require the preparation of an Environmental Impact Report (EIR), design of the project, funding the project, obtaining right-of-way (R/W), preparation of the Project a study and Estimate (PS&E), and construction.
- Continue to support air service at LA/Palmdale Regional Airport

Both are identified as high priority items.

High Desert Corridor: Access to the rest of the Los Angeles region is currently restricted to one primary route, SR 14 shown in **FIGURE 4.5**. The High Desert Corridor would open up a route from Palmdale to the east to Victorville and I-15. The alignment would pass along the south side of the airport and terminate at a new interchange on SR 14. The Environmental Impact Statement is being prepared for the project and is expected to be completed in 2013. There is currently no funding for construction.

FIGURE 4.5 High Desert Corridor Alignment Alternatives

4.8.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: The projects below from the 2008 RTP list were deleted at the direction of the City. PMD-01 was combined with PMD-02 and the reference to Ave. P removed since the location and circulation layout for the proposed terminal is not known. PMD-04 and PMD-05 were deleted as the SR-14/Avenue P interchange will be removed when the High Desert Corridor interchange is constructed on St. Route 14.

- PMD-01 (04) Construct airport terminal connector road from Ave P to the new PMD passenger terminal.
- PMD-04 (04) Add on-ramps from W/B Ave P to N/B St. Route 14 (2-lane on-ramps with shoulder) capable of carrying higher PCE truck traffic.
- PMD-05 (04) Add S/B off-ramp from SR-14 to Ave P (2-lane off-ramp with shoulder) capable of higher PCE truck traffic.
- Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access Element are summarized below in **TABLE 4.13**.

TABLE 4.13 PMD Highway, Arterial and Local Street Projects

Project (Year Added)	Description
PMD-02 (04)	Construct internal airport circulation system based on an 8-lane configuration (with shoulders and emergency lanes) including internal parking facilities). Provide connector roads to the adjacent regional arterial roadway network.
PMD-03 (04)	Widen Ave. P to 4 lanes in each direction including turning lanes (from St. Route. 14 to 50th St. East, east of PMD). Configure Ave. P as a major arterial capable of high volume truck traffic .
	Improve Ave. P intersection capacity at 8th St. East, 10th St. East, 15th St. East, 20th St. East, 25th St East., 30th St East, 50th St. East and Sierra Highway, by adding two turning lanes in each direction.
PMD-08 (04)	Add 1 lane in each direction on Sierra Highway (between Palmdale Blvd. and Ave. M).
PMD-09 (04)	Add 1 lane in each direction on Ave. M including turning lanes (from St. Route 14 to 50th St. East).
PMD-10 (04)	Widen 50th St. East by 2 lanes in each direction (from Ave. M to Ave. R); improve 50th St. East/Ave. R intersection capacity.
PMD-11 (04)	Widen 30th St. East (from Palmdale Bl. to Ave P) including 2-lane turning lanes at Ave. P.
PMD-12 (04)	Add 2 lanes in each direction on St. Route. 14 from Pearblossom Hwy to Ave. M including HOV lanes (heavy directional AM/PM traffic volumes hampering peak period airport access from LA Basin).
PMD-13 (07)	Rancho Vista Blvd. (Ave. P) grade separation at Sierra Highway/ Railroad tracks (Union Pacific & Metrolink) 7th Ranking out of 120 projects by LA County.
PMD-14 (08)	Construct a connector from PMD to Palmdale Transportation Center at Clock Tower Plaza Dr. near Sierra Hwy, or Rancho Vista Blvd./Ave. P and Division St. (which can serve as a future HSRT station).

4.9 SAN BERNARDINO INTERNATIONAL AIRPORT (SBD)

SBD provides an optimal location for air cargo and logistics management for companies conducting businesses in Los Angeles, Southern California, Mexico and the US inter-mountain regions of Denver, Salt Lake City, Las Vegas and Phoenix. Centrally located just 60 miles east of the Los Angeles International Airport (LAX), SBD is surrounded by major interstate freeways (I-10, I-215 and SR-330/SR-210), enjoys an excellent local surface transportation access, is in a congestion-free air corridor and is located within two miles of a major intermodal BNSF Railway facility. SBD is well positioned as a consolidation/ distribution center for both air cargo and ground shipments.

The San Bernardino International Airport Authority (SBIAA) is a joint powers authority comprised of the County of San Bernardino and the Cities of San Bernardino, Colton, Loma Linda and Highland. Formed in 1992, the SBIAA Commission oversees the aviation portion of the former Norton Air Force Base of approximately 1300 acres.

The Inland Valley Development Agency (IVDA) is a joint powers authority comprised of the County of San Bernardino and the Cities of San Bernardino, Colton and Loma Linda. Formed in 1990, the IVDA is responsible for the redevelopment of the non-aviation portion of the former Norton Air Force Base. In addition to the approximately 600 acres on the former base, the IVDA also has a redevelopment project area of approximately 13,000 acres of surrounding properties. The land use designations within the project area include: light and heavy industrial, office, commercial and residential.

Passenger and Cargo Trends and Constraints: SBD does not currently provide commercial passenger service; however, the airport has an existing passenger terminal that can be utilized if air carriers can be attracted to the airport. The 2035 projection for the airport is 2.8 MAP, however, as discussed previously, this is in part due to the lack of capacity at the constrained urban airports to meet regional demand, so the assumption has been made that spillover will be distributed to the other regional airports including SBD.

Although the airport does not currently handle a significant amount of cargo, SBD is aggressively marketing itself as a cargo facility and can offer expedited Customs clearance, abundant aircraft ramp space, ample room for new development opportunities and expansion potential in a secure and modern business environment, including Foreign Trade Zone and LAMBRA tax incentives. With a newly reconstructed 10,000' x 200' runway and available hangar facilities, SBD claims the region's lowest airport user fees and has the ability to accommodate Stage 2 aircraft. The 2035 projection is 166,000 tons of cargo, which would be 4th highest in the region.

Studies and Major Planned Projects: Planned facility and ground access improvements include: (On-Airport improvement plans/projects are included in this report are for reference purposes only

- There is no near term plan by the San Bernardino Airport Authority for constructing a passenger terminal on the north end of the airfield--the existing terminal is being expanded and refurbished. The cargo terminal construction is listed on the Airport Capital Improvement Plan, but funding has not been programmed.
- 40 new small hangars and several large hangars on the runway's east side are to be constructed.

4.9.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Three projects from the 2008 RTP list were deleted since the Airport indicated they are complete.

- SBI-01 (04) Upgrade internal circulation system to the SBI passenger terminal at Leland Norton Way and Rialto. Construct 6-lane major arterial configuration with double turning lanes and emergency lanes.
- SBI-08 (04) Upgrade Harry Sheppard Blvd. (from Leland Norton Way to Tippecanoe).
- SBI-09 (04) Upgrade the I-215/Mill interchange (add 1 lane to each on-, and off-ramp designed for higher PCE truck traffic).

The descriptions of three projects were revised based on input from the Airport.

- SBI-03, SBI-06 and SBI-07 were changed to reflect a different number of lanes for widening.
- SBI-07 was also modified to change the project limits

In addition, three projects (SBI-11 – SBI-13) were added at the request of the Airport.

Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access Element are summarized below in **TABLE 4.14**.

TABLE 4.14 SBI Highway, Arterial and Local Street Projects

Project (Year Added)	Description
SBI-02 (04)	Construct a truck traffic access road (4-lane major arterial configuration with shoulder) to the SBI Air Cargo Terminal at Perimeter Road. Upgrade Perimeter Road-3rd Street/Leland Norton Way for high PCE truck traffic.
SBI-03 (04)	Add 1 lane in each direction on Waterman (from 9th St. to Rialto and from Vanderbilt to Redlands Blvd. through the I-10 interchange).
SBI-04 (04)	Upgrade Rialto to a continuous, divided 6-lane configuration (from Waterman to I-215).
SBI-05 (04)	Upgrade the I-10/Waterman interchange (add 1 additional on-, and off-ramp in each direction designed for higher PCE truck traffic).
SBI-06 (04)	Add 1 lane in each direction on 3rd Street (from Waterman to Alabama/Palm) to a 4-lane configuration; Construct diagonal 2-lane connection form 3rd St. to 5th St. east of Alabama.
SBI-07 (04)	Upgrade 5th St. to a 4-lane major arterial configuration with turning lanes and improved capacity intersections at 3rd Street diagonal connector and all intersections with cross streets.
SBI-10 (08)	New Gateway to SBD project: Construct a 4-lane bridge on Mountain View over the Santa Ana River (extension of Mountain View from Central Ave. to I-10).
SBI-11 (12)	Widen Tippecanoe Bridge over Santa Ana River from four lanes to six lanes by constructing bridge structure on west side of existing bridge.
SBI-12 (12)	Construct new interchange on SR-210 at Victoria Avenue with two lanes each ramp and modifications to existing Arden Avenue interchange.
SBI-13 (12)	Upgrade Del Rose Dr. from 2-lane configuration to 4-lane configuration.

4.9.2 Public Transportation Projects

If commercial air service is provided in the future, the consultant recommends conducting an analysis to determine the potential for providing a transportation connection between SBD and the proposed San Bernardino Intermodal Transit Center at E St. and Rialto in downtown San Bernardino. Potential services for the transit center include a light rail line, and a Metrolink extension from the Santa Fe Depot in San Bernardino.

4.10 Southern California Logistics Airport (SCL)

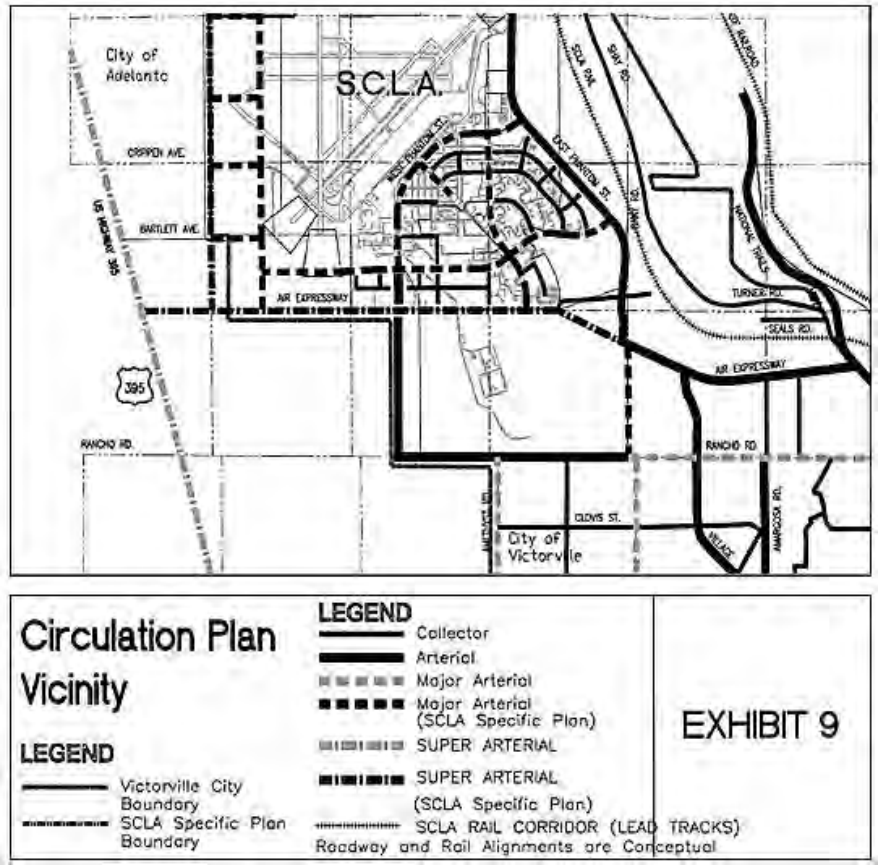
The Southern California Logistics Airport specializes in goods movement and is a potential world class facility for serving international and domestic air cargo needs. The airport provides ground, air and rail transportation for the "fastest-to-market" delivery. The airport is capable of accommodating both military and commercial aircraft. The Southern California Logistics Airport facility features two intercontinental runways including a 15,050 foot runway, allowing the heaviest aircraft direct, non-stop access to any destination in the world and a 10,000 foot runway. The air control tower operates 24 hours a day and has emergency response capabilities that are comparable to the world's largest airports.

Passenger and Cargo Trends and Constraints: Recent passenger and cargo trends a. PAX (military personnel for the National Training Center (NTC) and Twenty Nine Palms) board aircraft on the open ramp through the NTC leasehold.

Carriers such as Cargolux, Federal Express, ASB Air, Atlas Air, MK International and the U.S. Armed Services have utilized SCL facility for timely, cost-effective goods movement. From 1999 to present, SCL has received more than 15,310 tons of air cargo, around 1,000 tons per year.

Studies and Major Planned Projects: The circulation element of the General Plan has a section on the airport and refers most of the transportation elements for the area around the airport to the SCLA Specific Plan:

"SCLA is located in the northwest corner of the City of Victorville and is within 30–40 minutes of driving from the Ontario International Airport. It is planned to be a domestic and international air cargo facility, with a 4,740-acre business complex integrating manufacturing, industrial multimodal and office facilities. The SCLA Specific Plan was adopted by the City to provide a planning tool for implementing the reuse plan established by the



Victor Valley Economic Development Authority (VVEDA) pursuant to the Base Closure Realignment Act (BCRA), and to implement related policies of the General Plan Land Use, Noise and Safety Elements. The SCLA Specific Plan is designed to accommodate airport and aviation uses as well as industrial and commercial land uses. Its circulation plan includes establishing a mass transit system to serve the site; designating Phantom Road as a minimum six-lane Super Arterial to connect to Air Expressway; introducing a new north/south road, 'Perimeter Road' which will connect future Colusa Road from the north to Phantom East Street to the South; and upgrading several roads to arterials, which will eventually connect Phantom East and West Street to the rest of the site."

SCLA Specific Plan, 2004 – The circulation element of the Specific Plan states:

National Trails Highway and Village Drive, which currently connect Air Expressway to I-15 are also designated Arterials. Rancho Road and El Evado Road to the site will be four-lane major Arterials. Air Expressway, which traverses and is off-site of the property is also planned as a minimum four-lane major arterial from U.S. Highway 395 to its connection to Rancho Road. Given the regional nature of the Specific Plan and increased traffic levels, the City will work with the Victor Valley Transit Authority and private developments/users on-site to establish a mass transit system to serve the site and connect it to population and employment centers in the Victor Valley (See Figure below).

Anticipated traffic levels will necessitate improvements on existing roads on-site. Phantom Road is proposed as a minimum four-lane Super Arterial to connect to Air Expressway. A new north/south road will be introduced, "Perimeter Road", which will connect future Colusa Road from the north to Phantom East Street to the south. Several roads connecting Phantom East and West Street to the rest of the site will be upgraded to Arterials. These include Cory Boulevard, Mustang Street, Sabre Boulevard, Starfighter Street and Nevada Street. Additional on-base roadways have been introduced to improve traffic distribution on the base. **FIGURE 4.6** shows the existing and proposed on-base roadways along with their roadway designation. They have been added to the City's General Plan Circulation Plan to ensure consistency between the SCLA Specific Plan and the General Plan.

FIGURE 4.6 SCLA Specific Plan Roadway Classifications

Source: SCLA, Specific Plan 2004

Initial Study for US-395 Realignment Right-of-Way Preservation, 2007 – This study for SANBAG looks at potential alignments for a new US 395 facility between I-15 and Purple Sage Street. An Environmental Impact Statement is also being prepared by Caltrans.

4.10.1 Highway, Arterial, and Local Street Projects

Recommended Ground Access Projects: Five projects from the 2008 RTP list were deleted as the City indicated they are complete.

- SCL-01 (04) Construct airport terminal connector road from Air Base to terminal building (along Cory to Phantom); Construct connector road from Air Base to air cargo terminal in the southwest corner of the base.
- SCL-02/03 (04) Improve and upgrade existing internal circulation system (Cory from base to Phantom; Cory segment from Starfighter to Sabre; intersection Worley/ Phantom) including access to on-site HSRT terminal.
- SCL-04 (04) Widen Air Base (add 2 lanes in each direction from US-395 to National Trails intersection).
- SCL-07 (04) Improve National Trails/Air Base intersection in conjunction with National Trails/ Rancho intersection (part of Construction of Rancho extension project from Adelanto to National Trails)
- SCL-09 (04) Widen National Trails/RR underpass (approx. 3.49 mi north of Air Base) to 2 lanes in each direction.

Ground access improvements included in the 2012–2035 RTP Airport Vicinity Ground Access Element are summarized below in **TABLE 4.15**.

TABLE 4.15 SCL Highway, Arterial and Local Street Projects

Project (Year Added)	Description
SCL-05 (04)	Add 2 lanes to southbound on-ramps and northbound off-ramps at I-15/National Trails IC. Add 1 additional lane to southbound off-ramps and northbound on-ramps at I-15/National Trails IC.
SCL-06 (04)	Add 2 additional turning lanes in each direction on National Trails at I-15.
SCL-08 (04)	Add 1 lane in each direction to National Trains from I-15 to Barstow.
SCL-10 (04)	Add N/B mixed flow lane w. aux lane (from N/) Mojave Dr. IC to Stoddard Wells Rd.
SCL-11 (04)	Relocate US-395 as a 6 lane freeway from the I-15 junction to SR-18/Palmdale Road plus a 4 lane expressway from SR-18 to Purple Sage Rd.
SCL-12 (04)	Widen El Evado Rd, Palmdale Rd to Air Base Rd., Palmdale to Hopland, Hopland to Air Base (from 2 to 4 lanes with LT lanes)

V. Challenges to Implementing High Occupancy Public Transportation Projects

This section provides a summary of the challenges encountered and the efforts undertaken to develop high occupancy public transportation at major airports in the SCAG region. The LAX Master Plan program has identified a number of high occupancy public transportation options some which have been funded. These included Flyways service between LAX and Downtown Los Angeles and the Westside. In the case of Bob Hope Airport, as part of their ground access program, they have identified major transit projects that are currently being studied. Further discussion is presented in Appendix II which describes the California High Speed Rail development program and Appendix III which describes the challenges in implementing express bus services at major airports. Some of the challenges to implement high occupancy public transportation projects are discussed below.

5.1 SPONSORSHIP AND FUNDING OF EXPRESS BUSES

If the analyses recommended in this study are undertaken and show there will be a need for airport express buses from ARTIC to serve Southern California airports, or from various areas in the ONT market area, sponsorship and funding of the services are issues that will need to be addressed.

It is not typical for an airport operator to sponsor an airport express bus or system of express buses to accommodate the ground access trip of the airport user, since the airport operator is primarily concerned with operating the airport safely and efficiently, and the airport operator is not a public transportation operator. The airport operator is concerned with maintaining and improving the airport, and keeping fees reasonable for the airlines, compared to fees being assessed at comparable airports. The two airport express bus systems sponsored by airport operators in the United States are the FlyAway network serving LAX, sponsored by Los Angeles World Airports, and the Logan Express, a system of non-stop buses sponsored by the Massachusetts Port Authority, serving Boston Logan International Airport.

Transit operators are currently struggling with maintaining existing levels of service due to funding cuts. In addition, the transit operator is concerned with serving the entire population and may have difficulty justifying the provision of service that the airport customer needs at the exclusion of the rest of the population. The transit operator often feels the airport operator should provide such service and the airport operator believes it is the responsibility of the transit operator.

In addition to airport operators and transit agencies not having funds available for high occupancy public transportation modes serving the airport customer, or not considering it a priority compared to other projects, there are funding regulations for airport operators and transit operators that can make it difficult to justify operating such a service. Airport operators are concerned with complying with the revenue diversion regulation, as well adhering to the allowable uses of various sources of revenue, such as Passenger Facility Charges (PFCs) and Airport Improvement Program (AIP) funds. Transit operators are concerned with complying with the federal charter regulations. In certain circumstances, a bus service tailored to the airport customer could be construed as a charter service, and the FTA prohibits transit agencies that accept federal funds from operating charter service because it is considered to be in competition with the private sector .

5.2 INSUFFICIENT DATA

Ridership forecasts of airport customers were generally not available for the high occupancy public transportation services identified in this study. Up to date air passenger origin destination survey data was also not available for BUR, LAX, ONT and SNA. A 2011 air passenger origin destination survey is currently being conducted at LAX by LAWA, and the data should be available toward the end of 2011.

5.3 COMMUNITY RESISTANCE

In some instances, the community surrounding an airport may be opposed to new high occupancy public transportation services to the airport, because they are concerned the services will attract more customers to the airport. This seems to be the case at John Wayne Airport.

VI. Recommendations to Assist Future RTP Updates

The review of proposed and potential airport ground access projects and analysis of airport ground access needs undertaken as part of the current update of Airport Ground Access Element of the Regional Transportation Plan has identified a number of areas where additional information or analysis capabilities would be helpful for future updates of the RTP. The following recommendations address future work or studies that SCAG could undertake or encourage airports or other agencies to undertake.

6.1 PERFORM AIRPORT SPECIFIC GROUND ACCESS STUDIES

While the existing regional modeling approach to identifying needed ground access projects or services provides critical information about the impact of vehicle traffic generated by the airports in the region on traffic flows around the airports, it is not always “fine grained” enough to fully identify either the need for or the potential contribution of specific ground access projects at some airports. In particular, for those where major growth is forecast, it is recommended that supplemental ground access studies be performed that provide more detail on the needs around the airports.

While existing environmental studies and airport master plans can provide some of the information needed for the RTP, in many cases they either don’t fully address ground

access needs at the level of detail needed for the RTP or were performed long enough ago that the information they contain is now out of date. In particular:

- Many airport master plans focus only on needs within the airport property. Typically many of the ground access needs are on the surrounding roadways outside of airport property.
- Environmental impact studies and reports have a lot of detailed information and analysis but focus only on the impacts of the specific project being evaluated, so may not consider all of the transportation needs and issues around the airport. In addition, the horizon of these studies tends to be at the completion of the project, often 5 to 10 years out. This is not sufficient to do long-term ground access planning for the airports.
- General Plans prepared for the surrounding municipalities can also provide valuable information on identifying ground access needs. However, for most airports, particularly those not operated by the surrounding city, airport ground access is not the focus of the study and analysis of the transportation needs and priorities around the airports is limited.

Therefore, it would greatly aid the process of updating the ground access element of the RTP if detailed ground access studies were prepared for high growth airports such as LAX and ONT.. These studies would include the following:

- Evaluation of all modes of transportation to and from the airports.
- A study area including major roadways into and out of the airport. At a minimum this would include roadways around the airports extending out to major highways/interstates that feed the airport.
- A horizon year of 20 to 30 years
- Intersection and peak hour specific traffic data collection and analysis.
- Identification of projects needed to facilitate all areas of ground access, including terminal roadways and circulation, parking facilities, entrance gates and facilities, transit and shuttle access, pedestrian linkages between transit and parking facilities and terminal areas, air cargo access, etc.
- Prioritization of project needs.

Because such studies extend beyond the boundaries of the airports, this effort may need to be a combined pursuit of the airport, surrounding communities and other relevant agencies, such as transit providers.

These studies would not be a replacement for the regional planning and analysis that has been done for past airport ground access elements of the RTP. Regional aviation modeling built on robust airport origin-destination data must also continue.

6.2 DEVELOP REGION-WIDE AIR PASSENGER SURVEY

There is a critical need to develop and conduct a regionwide air passenger survey to cover users of all commercial service airports in the region on a consistent and comparable basis that would provide SCAG and the airports with information on the area from which their passenger traffic originates.. This is something that the airports may be willing to contribute toward, if they could add questions of interest to them (perhaps on an airport-specific basis). Where airports are planning to perform their own surveys anyway (as LAWA does from time to time at LAX), SCAG could work with those airports to make sure that questions of interest to SCAG are included and get asked in a way that allows the results to be compared with data from other airports.

6.3 PERFORM A REGION-WIDE STUDY OF AIRPORT EMPLOYEE TRIPS

Analysis of airport employee trips is generally included as part of airport master planning studies and airport ground access planning studies, although the level of detail of those studies varies widely and the results from different airports are difficult to compare due to differences in the timing of the studies. The volume, timing, and mode use of airport employee trips are usually of great interest to the airports and local transportation agencies to determine the impact of employee trips on local streets in the airport environs. Aside from their use for the airport ground access planning, SCAG needs to better understand airport employee travel in order to address this in the regional transportation model. In order to integrate the available data from individual airports and provide a basis for projecting future airport employee travel resulting from projected future changes in airport activity, it would be helpful for SCAG to undertake a region-wide study of airport employee trips.

6.4 DEVELOP NEW REGIONAL AIRPORT GROUND ACCESS MODEL

There is a need for the development of an airport ground access modeling capability that can be integrated with SCAG's regional transportation model. While the regional aviation demand allocation model used in previous RTP updates models airport ground access trips, exactly how it does so is unclear and anyway SCAG does not have access to the model unless it retains the model developers to run the model for it. Therefore SCAG needs to develop its own in-house modeling capability. Exactly what this modeling capability would involve needs further thought, as does the level of resolution that would be practical. For example, a model that can produce peak-period volume/capacity ratios at the intersection level will require a very different level of data and model resolution than one that simply estimates mode splits on an average day basis.

6.5 ANALYSIS OF POTENTIAL FOR AIRPORT EXPRESS BUS SERVICES

The airport ground access project list for the current update of the RTP has identified a number of potential airport express bus services which could benefit from a more detailed analysis of likely ridership, financial feasibility and implementation issues. One such analysis would examine the potential for non-stop airport express buses to serve ONT air passengers, including service between ONT and 1) a station on the Metro Goldline Foothill Extension, 2) a location along the I-10 at least 15 miles east of the airport, 3) a location along the I-10 at least 15 miles west of the airport, and 4) the Anaheim Regional Transportation Intermodal Center (ARTIC). A second study would analyze the potential for a non-stop airport express bus service between ARTIC and LAX. Alternatives for consideration would include exploring how the existing privately operated express bus service between LAX and Anaheim, which primarily serves non-resident air travelers, could be enhanced to serve resident air passengers. A third study would undertake a market analysis of the potential for high occupancy public transportation options to serve SNA customers, including the exploration of bus links between SNA and 1) the Irvine Transportation Center or Tustin Metrolink Station to serve as a connection between Metrolink service, Amtrak service and the airport, and 2) a bus service between SNA and ARTIC. The foregoing studies will require origin destination air passenger survey data for ONT and SNA, or a comprehensive survey of air passenger travel patterns in the region.

6.6 AIRPORT CHOICE ANALYSIS

There is a need to better understand how passengers in Southern California make airport choices and how these choices might change with capacity constraints at the smaller airports or availability of additional high occupancy public transportation services for the airport user. Furthermore, to understand the relationship and overlap between the market areas of the commercial airports serving Southern California, ideally comparable survey data for air passengers with trip origins or destinations in the region would be collected for all of the airports during the same time frame. SCAG would be the most appropriate agency for sponsoring a study of air passenger airport choice behavior, since each airport operator is generally only concerned with the characteristics and travel patterns of its own customers.

6.7 ANALYSIS OF FUNDING OPPORTUNITIES AND CONSTRAINTS

There is a need for further study of the funding constraints and regulatory barriers that limit the provision of high occupancy public transportation services designed to accommodate the airport customer, and how these constraints can be overcome in the Southern California region through different sponsorship models, such as public-private partnerships, partnerships among public agencies, or a regional body.

APPENDIX I: Airport and Agency Contacts

TABLE I.1 Highway, Arterial and Local Street Projects

Airport	Agency	Contact	Title
BUR	Burbank/Glendale/ Pasadena Airport	Mark Hardyment	Director, Environmental Programs
	City of Burbank	David Kriske	Community Development
	City of Glendale	Jano Baghdanian	Traffic Engineer
	City of Pasadena	Bill Trimble	Planner
JWA	John Wayne Airport	Kari Rigoni	Planning Manager
	City of Irvine	Tran Tran	Engineer
	City of Newport Beach	Patrick Alford	Planning Manager
		Fern Nueno	Assistant Planner
	City of Santa Ana	Karen Haluza	Planning Manager
		Melanie McCann	Assistant Planner
LAX	LAWA	Pat Tomcheck	Senior Transportation Engineer
	LAWA	Diego Alvarez	Regional Transportation Coordinator
LGB	Long Beach Airport	Jeff Sedlak	Senior Civil Engineer
MIP	MAFB Airport	Gary Gosliga	Airport Director
	MAFB Airport/March JPA	Dan Fairbanks	Planning Director
	Riverside County TLMA	John Marcinek	NO INFO
	City of Riverside	NO CONTACT	
	City of Moreno Valley	Eric Lewis	City Traffic Engineer
	City of Perris	NO CONTACT	
	March Global Port	Matt Denham	Director of Land Use Services
ONT	LAWA	Kim Ellis	Assistant Airports Manager
	City of Ontario	Tom Danna	Traffic/Transportation Manager
PMD	City of Palmdale	Mike Behen	NO INFO
PSP	PS Int'l Airport/City of Palm Springs	Tom Nolan	Executive Director
	City of Palm Springs	George Farago	Associate Civil Engineer
SBI	SBD Airport	Bill Ingraham	Aviation Director
SCL	City of Victorville	Victor Fajardo	Traffic

Also contacted Damon Davis, Planning, Caltrans D12 and Ty Schuiling, Director of Planning, SANBAG, but no input received.

TABLE I.2 High Occupancy Public Transportation

	▪ Stephen Fox

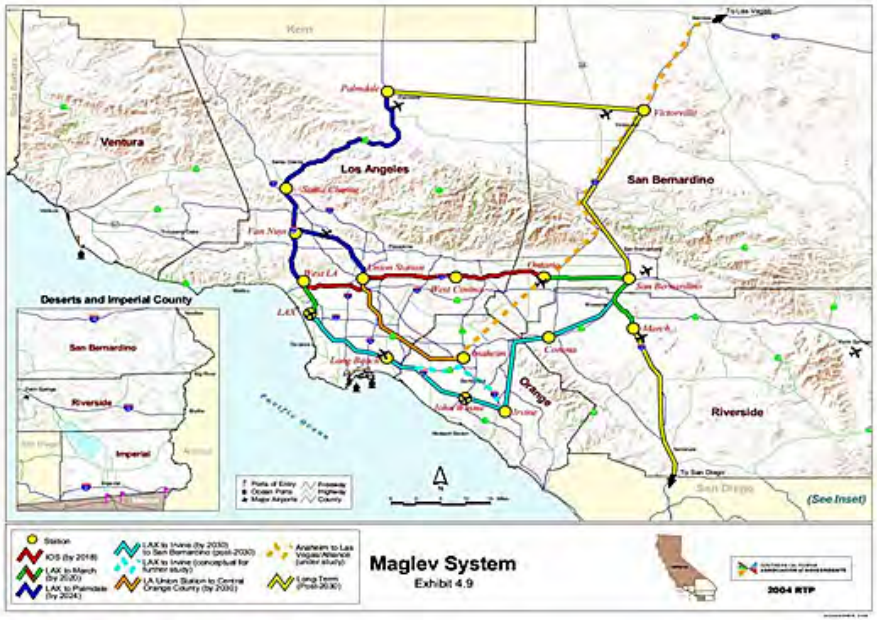
Airport plans, community general plans and major project environmental studies were also collected for each of the airports and are discussed with each of the airports in Section IV.

APPENDIX II: High Occupancy Public Transportation and High Speed Rail

II.1 High Speed Regional Transport System

A high speed regional transport system has been a consideration in a number of the recent RTP updates, although the details of the proposed system have evolved over time. In the 2004 RTP a regional magnetic levitation (Maglev) high-speed transportation system was envisioned, with one of its primary goals being to provide interconnectivity between the regional airports, allowing passengers to make connections between the airports or to more effectively use an airport that might not be the closest airport to their home or destination. The 2008 RTP included a similar system, although designated High Speed Regional Transport (HSRT) instead of Maglev. The network was essentially the same. This proposed system has since been dropped from consideration.

The state of California is now planning a statewide high-speed rail (HSR) system. While it includes some of the same segments, the focus is more on long-distance travel and the number of stops would be limited. In addition, Los Angeles International Airport (LAX) is not directly served. While planning for the statewide system is ongoing, funding has only been identified for the Fresno to Bakersfield segment, with no current funding for extension into the Los Angeles area.



It should be noted that in both the 2004 and 2008 RTPs, the Maglev and HSRT systems were not assumed to occur in the low air travel demand growth scenarios; only the high air travel demand growth scenarios envisioned the development of such a system.

2004 MAGLEV SYSTEM

According to the 2004 RTP, the planned Maglev system was included as a component of the transportation network, in part to "facilitate the development of a regional airport system, and connect to major activity and multi-modal transportation centers in Los Angeles, Riverside, San Bernardino, and Orange Counties. Without a regional airport in El Toro, the Region needs to further decentralize its future growth in air passenger traffic and air cargo to its regional airports in the northern and eastern portions of the Region. Therefore, the Maglev system becomes more important and critical to the success of SCAG's decentralized regional aviation system."

The Maglev system was to be an elevated monorail system operating at speeds up to 310 mph and included an extensive network within the region as depicted on **FIGURE II.1** below.

FIGURE II.1 2004 RTP Maglev System

Source: SCAG, 2004 RTP

2008 HSRT SYSTEM

In the 2008 RTP, the term High Speed Regional Transport (HSRT) was used in lieu of Maglev, but the network maintained many of the same characteristics and goals, including decentralization of airport demand. The Initial Operating Segment (IOS) was envisaged to extend from West Los Angeles to Ontario International Airport, with subsequent extensions to LAX and March Inland Port.

CURRENT HIGH-SPEED RAIL PLANNING

Although the proposed HSRT system is no longer being pursued by SCAG, planning efforts are currently in progress by the California High-Speed Rail Authority (CHSRA) to develop a statewide high-speed rail system that would include segments in the SCAG region. Following the completion of a Program Environmental Impact Report/Environmental Impact Statement (EIR/EIS) in August 2005, a series of Alternatives Analysis studies have been prepared that have explored the various segments of the planned statewide network in more detail. The proposed segments in Southern California broadly follow some of the corridors proposed for the HSRT, including lines from Palmdale to Los Angeles, from Los Angeles to Anaheim, and from Los Angeles to Murrieta via Ontario and Riverside, as shown in **FIGURE II.2**. However, the other regional HSRT routes are no longer under consideration as part of the HSR network.

FIGURE II.2 Alternative Alignments for the California High-Speed Rail System in Southern California

Source: California High Speed Rail Authority Website

The Palmdale to Los Angeles line would serve the following airports:

- Palmdale Regional Airport – The HSR station would be approximately four miles from the airport, near the Palmdale Transportation Center, or slightly closer at Palmdale West Station, but could be accessed from the airport by a transit connector route proposed in the 2008 Airport RTP (PMD-14-08).
- Burbank/Bob Hope Airport – The HSR line would stop at the Burbank Buena Vista Station adjacent to the airport.
- The segment would terminate at Union Station in downtown Los Angeles and would not connect directly to LAX, approximately 12 miles southwest of downtown (or about 20 miles via the freeway system). Other public transportation services, including FlyAway busses operated by Los Angeles World Airports, currently provide service between LAX and Union Station.

The Los Angeles to Anaheim segment would originate at Union Station and extend to the proposed Anaheim Regional Transportation Intermodal Center (ARTIC) in Anaheim. This line was originally planned to extend to Irvine, but the current (July 2010) Supplemental Alternatives Analysis Report shows the line ending in Anaheim. No airports would be directly served but indirect access could be provided by connector service to the following airports:

- John Wayne Airport-Orange County – Located about 10 miles south of ARTIC. A connector service could be provided to ARTIC.
- Long Beach Airport – Located about 8 miles southwest of the planned Norwalk station on the Los Angeles to Anaheim segment. A connector service would be required to serve the airport.

The Los Angeles to San Diego segment has a number of alternative alignments through the SCAG region. There are a variety of alternative routes between Union Station and Ontario International Airport, but all would converge near the Ontario Airport. Between Ontario and San Diego, there are also multiple alternatives, generally following either I-15 or I-215. One of the I-215 sub-alternatives loops into San Bernardino, the other remains on the I-10 and I-215 alignments. Airports served along these alignments include:

- Ontario Airport – An HSR station would be provided immediately adjacent to the airport in all of the alternatives.

- San Bernardino Airport – One alignment swings east near the airport, with a station located about 2 miles west of the airport adjacent to I-215. The I-10/I-215 alignment would have a station about 10 miles west of the airport on I-10. Either of these would require some sort of connector service.
- March Inland Port – The I-215 alignment would have a station near the south side of the present March Air Reserve Base, but not directly adjacent to the planned passenger terminal area at MIP. The I-15 alignment would not provide access to MIP.

The planned California High Speed Rail network would not provide service in the proximity of the Southern California Logistics Airport or Palm Springs Airport.

Further details of the planned HSR system in the SCAG region are provided in Section 2.3 below.

II.2 High Occupancy Public Transportation

When the term high occupancy transportation is used in the airport environment, it sometimes includes transportation services that do not operate on a schedule, such as shared ride van or high occupancy limousine. For the purposes of this report, the term high occupancy public transportation service refers to scheduled bus, rail and light rail services.

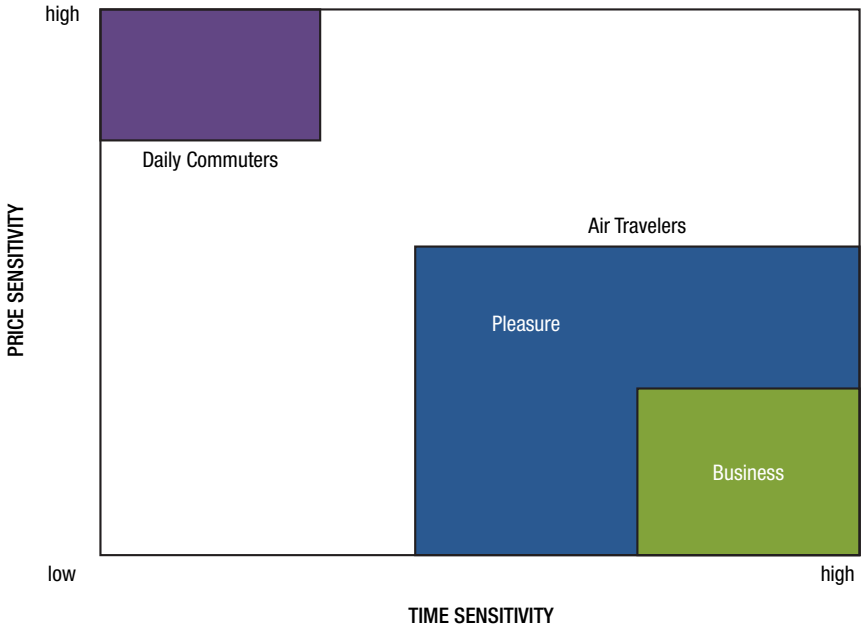
For the airport user to consider using a high occupancy public transportation service to travel to and from the airport instead of their preferred mode, it must be available, accessible, and offer competitive travel times. At most airports, the majority of air passengers use modes that provide door to door service when the air passenger is ready to make the ground access trip. **TABLE II.1** shows the mode share for resident air passengers at LAX and ONT using door to door unscheduled (on-demand) ground transportation modes to travel to the airport.

TABLE II.1 Resident Air Passenger Mode Choice, Door to Door On-Demand Ground Transportation Options

Mode	ONT (2001)	LAX (2006)
Auto	92%	71%
Taxi/Limousine	1%	11%
Total	93%	82%

Source: LAWA: 2001 Ontario Passenger Survey Report, Table 44, Page 43; 2006 LAX Air Passenger Survey Report, Figure 20, Page 30.

This section begins by discussing the travel characteristics of air passengers by customer group, and the characteristics of airport employees. It is followed by a presentation of the most important service characteristics for a high occupancy public transportation service that has the potential to attract air passengers and airport employees.



II.2.1 CUSTOMER GROUPS

II.2.1.1 Air Passengers

The ground transportation trip to the airport is a means to an end; the passenger is concerned with arriving at the airport with enough of time to check luggage (if necessary), be processed through the security line, and board the flight. The air passenger will make a decision on how to travel to and from the airport based on available ground transportation options, travel time tolerances, and budget. In general, the purpose for the air travel and the resident status of the air passenger in relation to the airport market area will influence the ground access decision.

Trip Purpose: Often the air traveler who is traveling primarily for business will be reimbursed for travel by their employer. In general the business traveler will be less price sensitive and more time sensitive when developing a trip itinerary, including the choice of ground transportation mode to and from the airport, compared to the non-business traveler, who will be more cost conscious and less concerned about total travel time. Both travel groups will be more time sensitive and less price sensitive when choosing a ground transportation mode to the airport than a commuter who is selecting a mode to travel to work on a regular basis. **FIGURE II.3** illustrates sensitivity to ground transportation travel times by customer group.

FIGURE II.3 Time and Price Sensitivity to Ground Transportation by Customer Group

Source: DMR Consulting, August 2011

Resident Status in Relation to Airport Market Area: An air passenger who resides in the market area of the airport will typically have a better understanding of the available ground transportation options to the airport than a traveler who is visiting the region. If the resident air traveler owns an auto, then driving to the airport and parking the auto at or in the vicinity of the airport for the duration of the air trip is one of the ground transportation options the air traveler may choose from. The non-resident air traveler would not park an auto at the airport because any auto that could be parked would be located in the region where the traveler resides. A rental car is one of the ground transportation options that the non-resident air traveler may choose from, while this is an unlikely choice for a resident air passenger. **TABLE II.2** provides the generic airport ground transportation choices for the resident and non-resident air passenger.

II.2.1.2 Airport Employees

Airport employees staff the airport continuously during airport operating hours. For most large and medium hub commercial airports, the airport is open 365 days per year, and for at least 18 to 20 hours per day. For functions that require providing service to air passengers or the processing of air cargo, employees must be at the airport to fulfill their duties from the first through the last flight, which means some employees must arrive at the airport earlier than the first customer and depart later than the last customer. Employee commuting options will be based on what is available to accommodate their work schedule that will get them to their place of employment at the airport. Work schedules and workplace location will vary depending on airport employee categories.

TABLE II.2 Generic Airport Ground Transportation Options by Residence Status

Mode	Airport Market Area	
	Resident	Non-Resident
Private Auto: Pickup and Dropoff	√	√
Private Auto: Park for Duration of Air Trip	√	
Rental Car		√
Taxicab	√	√
Limousine	√	√
Shared Ride Van	√	√
Scheduled Bus	√	√
Light Rail, Subway, Heavy Rail	√	√

Source: DMR Consulting, August 2011

Employees at the airport consist of flight crews, administrative workers, and shift workers that work for a variety of agencies and companies including the airport operator, the Transportation Security Administration (TSA), the Federal Aviation Administration (FAA), airlines, concessions, rental car companies, and cargo companies. An airport operator typically employs less than ten percent of the employees working at an airport. Shift workers may be subject to unscheduled overtime, based on circumstances such as delayed flights.

Flight crews, which consist of airline pilots and flight attendants, exhibit airport ground access travel behavior that is similar to air passengers. Although some commute to and from the airport on the same day when they are working on flights of short duration, many have work schedules, called tours of duty, that require them to be away from the region where they live for one or more nights. This, combined with a limitation on the number of work hours per month means that flight crew members do not commute to the airport as often as an administrative employee or a shift worker.

Employees who report to work in the vicinity of the terminal area will typically have more high occupancy public transportation options for commuting than employees who work in other areas of the airport. For example, the Los Angeles World Airports office facilities at LAX are located in the terminal area (Administration East), and on the west side of the airport (Administration West). It is approximately a ten to fifteen minute drive to get from the terminal area to the Administration West building. The transit options that are available between the two buildings often add thirty minutes or more to the one way commute time, which makes high occupancy public transportation options unattractive compared to the single occupant commute by auto to the airport.

Airport employees will factor the cost of their commute options into their decision similarly to how commuters with traditional work schedules do.

II.2.1.3 Key Service Characteristics for High Occupancy Public Transportation to Airports

This section presents the service characteristics of high occupancy public transportation services that make them viable choices for each customer group.

Flight Schedule: The high occupancy public transportation service must offer sufficient frequency and hours of operation to accommodate the majority of the flight schedule. An air passenger requires transportation that will offer a departure time at the terminus point that accommodates the airport arrival time necessary to be processed for the enplaning flight, and a departure time at the airport that will allow for the time necessary to board the high occupancy public transportation service after the flight lands. If the high occupancy public transportation service does not accommodate both trip ends, the air passenger is not likely to use it. For a large hub airport, the air passenger may need to arrive at the airport 90 to 120 minutes prior to the flight departure time, and may not be available to leave the airport for 30 to 90 minutes after the flight lands, depending on the level of activity in the terminal, if the passenger has checked luggage, and whether the flight is domestic or international.

In general, a service that will be attractive to airport users will operate seven days per week, and offer early morning and late evening service, with frequencies that consider the time sensitivity of both air passengers and airport employees. Some airport employees must be at the airport earlier than the first group of departing air passengers and later than the last group of arriving air passengers, and this must be considered if the high occupancy public transportation service is also meant to accommodate airport employees.

An example of a high occupancy public transportation service that does not accommodate the flight schedule is the Metrolink Riverside line that operates between downtown Los Angeles and Riverside. For a passenger that needs to travel between Riverside and Ontario International Airport, the service only operates between Riverside and East Ontario from Monday through Friday, and offers five trips departing Riverside between 4:42 a.m. and 8:15 a.m., and a sixth and final trip at 3:07 p.m. Even if a shuttle service was provided between the East Ontario Metrolink Station and the airline terminals at Ontario International Airport, the rail service on the Riverside Metrolink Line does not accommodate the flight schedule.

An example of a high occupancy public transportation service that does accommodate the flight schedule, and has been very successful in serving both air passengers and airport employees is the Union Station FlyAway that travels non-stop between Union Station in downtown Los Angeles and all of the terminals at LAX. It operates 365 days per year and 24 hours per day. It offers hourly service from 1 a.m. to 5 a.m. and half hourly service for the rest of the 24 hour period.

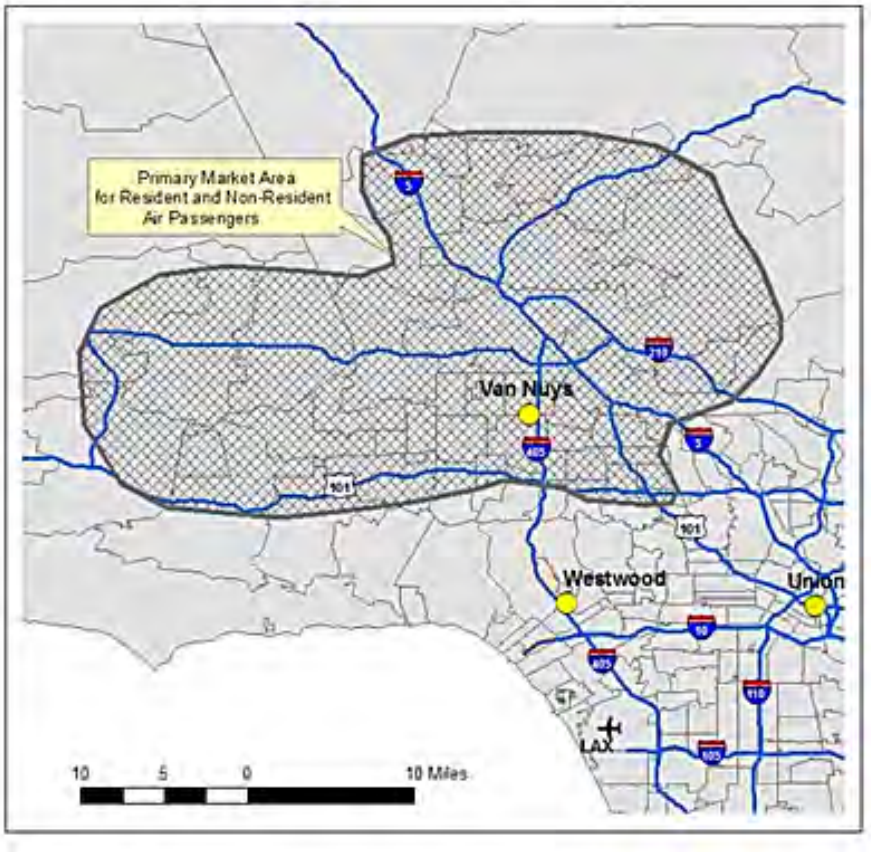
Competitive Travel Times: The high occupancy public transportation service must offer competitive travel times compared to the more commonly used modes, when considering the departure time from the point of origin and the arrival time at the airport. Service frequency, number of transfers and number of stops along the route all impact total ground access travel time. The travel route taken by the public transportation service will also impact travel time. A service traveling along a fixed guideway or a high occupancy vehicle lane will generally be quicker, or be perceived to be quicker, than a service that is sharing the road with the more commonly used modes.

An example of a high occupancy public transportation service that does not offer competitive travel times compared to commonly used modes is Metrorail service between Union Station in downtown Los Angeles and LAX. It requires two transfers between light rail lines and a transfer to a shuttle bus for a total of three transfers, and also makes multiple stops along the route.

An example of a high occupancy public transportation service that offers competitive travel times compared to more commonly used modes is the Union Station FlyAway that travels non-stop between Union Station in downtown Los Angeles and all of the terminals at LAX, with 24 hour service, at hourly intervals from 1 a.m. to 5 a.m. and half hourly intervals for the rest of the 24 hour period.

Location of Boarding Point: The location of the boarding point for the high occupancy public transportation service should be along a traditional travel route to the airport. Air Passengers in the market area of the high occupancy public transportation service are more likely to use their preferred mode to the airport along the travel route they are accustomed to taking, rather than divert to a different route or travel away from the airport (backtrack) along their traditional route if it adds more than a few minutes to their travel time.

FIGURE II.4 shows a map of the primary air passenger market area for the Van Nuys FlyAway serving LAX. This is the geographic area from which the majority of LAX air passengers using the Van Nuys FlyAway begin or end their ground access trip. A small proportion of Van Nuys FlyAway passengers originate in areas that require them to travel in the opposite direction from LAX to begin the FlyAway trip.



Airport employees may be willing to backtrack a little farther than air passengers if there are other reasons for doing so such as reduced fares on the high occupancy public transportation service that are attractive compared to the price of fuel and parking, or being dropped off and picked up closer to the place of employment compared to the location of the employee parking supply at the airport.

Access to Boarding Point: Air passengers and airport employees must be able to get to and from the boarding point of the high occupancy public transportation service to utilize it. A sufficient supply of overnight parking should be provided for air passengers that wish to park their auto for the duration of their trip, with parking rates that are perceived to be attractive compared to parking rates in the vicinity of the airport. Airport employee parking should be segregated from air passenger parking to ensure there is sufficient parking for air passengers.

II.2.1.4 The Role of High Occupancy Public Transportation in Airport Choice

There should be an area that is convenient for air passengers being dropped off or picked up in a private auto or taxi, including sufficient short duration parking near the boarding point of the high occupancy public transportation service. If the market area of the high occupancy public transportation service is located in an area with good public transportation connections, the connections should serve the location of the boarding point. This will be particularly useful for airport employees and for some non-resident air passengers who may prefer public transportation options when they travel.

FIGURE II.4 Van Nuys FlyAway Primary Market Area

Source: MarketSense Consulting, based on the 2006 LAX Air Passenger Survey and the 2008 Van Nuys FlyAway Survey.

The availability of high occupancy public transportation choices that are tailored to airport users increases the likelihood that an air passenger will choose high occupancy transportation over lower occupancy modes to access the airport, but this decision typically happens after the air passenger has chosen the airport. The decision to use one airport over another in a region is typically driven by the characteristics of the flights offered at each airport – availability, frequency, non-stop flights and the price of the flight, with the importance of each factor varying with the individual traveler and their specific trip.

One recent study, ACRP Report 34, A Handbook to Address Constrained Parking at Airports, explored why air passengers choose an airport in a region with multiple airports to determine if passengers are more likely to choose a competing airport with a sufficient parking supply over an airport that consistently has an insufficient parking supply to accommodate some or all customers. The study included nine airports that are located in a region with multiple airports. Representatives of the airport operator were asked if they thought the constrained parking situation at their airport was causing some of their passengers to choose competing airports. Most of them indicated that they believe constrained parking does not influence an air passenger's choice of airport, and that it was the characteristics of the flight or a customer's proximity to the airport that was more important.

An online stated preference survey was conducted, sampling resident air passengers in eight of the regions with multiple airports to determine how air passengers traveled to the airport for their most recent flight, and how they would choose their mode of access to the airport under constrained parking conditions. A question was asked about the factors air passengers take into consideration when choosing an airport, and more passengers ranked the various characteristics of the flight as being an important factor in airport choice than those who ranked the availability of public transportation or parking at the airport. This is shown in **TABLE II.3**.

TABLE II.3 Factors Influencing Airport Choice of the Resident Air Passenger in a Multi Airport System

Factor	High Influence Ranking[2]
Price of Airline Ticket	89%
Available Direct Flights	84%
Total Travel Time	79%
Frequent Flights	73%
Flights with Preferred Airline	72%
Wide Selection of Airlines	60%
Familiarity with Airport	57%
Ease Getting through Airport Security	55%
Reliable Transit to/from Airport	48%
Ground Transportation to/from Airport	46%
Available Parking at Airport	40%
Variety of Restaurants/Shops	14%

Source: ACRP 10-06, Final Report, March 2010, Appendix E, Table 11.

[1]413 total responses from resident air passengers using BOS, CMH, HSV, IAD, MIA, OAK, SAT, TUL
[2]Percentage of answers rated 4 or 5 to question "What influences your decision when choosing which airport to fly from on a trip?", with 1 being "no influence at all", and 5 being "very high influence."

Nearly 50 percent of respondents did indicate that reliable transit to/from an airport had a high influence on airport choice, so one could draw the conclusion that if the characteristics of flights between competing airports are about the same, the availability of high occupancy public transportation options that accommodate airport users would influence airport choice.

Southern California residents were not included in the survey. A survey of Southern California resident air passengers is worth considering to determine if they choose airports with emphasis on the same or different criteria.

II.3 CALIFORNIA HIGH-SPEED RAIL SYSTEM

The general configuration of the planned California HSR system is shown in **FIGURE II.5**. The CHSRA is currently in the process of preparing a project-level Environmental Impact Report/ Environmental Impact Statement (EIR/EIS) and has divided the system into the eight segments shown in Figure II.5, for each of which an Alternatives Analysis has been completed that has studied alternative route alignments and station locations and selected those to be carried forward to the EIS/EIR. From the perspective of airport ground access in Southern California, the three key segments are:

- Palmdale to Los Angeles Union Station
- Los Angeles Union Station to Anaheim
- Los Angeles Union Station to San Diego

FIGURE II.5 Planned California High-Speed Rail Network

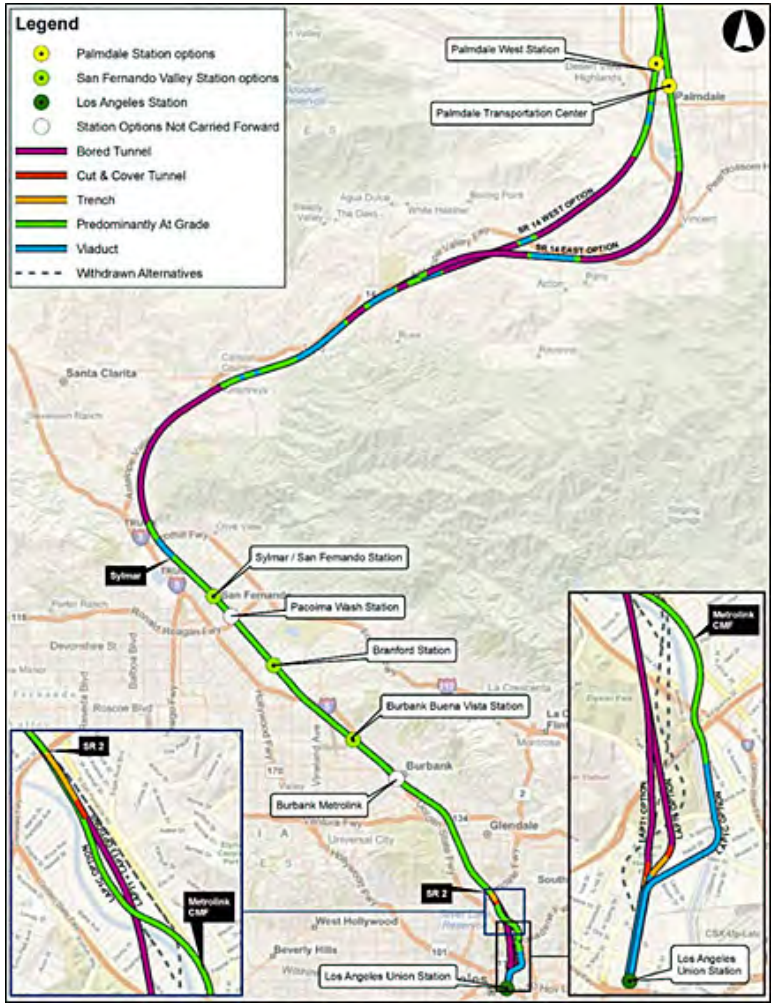
Source: CHSRA, Report to the Legislature, December 2009.

The Palmdale to Union Station segment includes a station adjacent to Bob Hope Airport, the Union Station to Anaheim segments will end at the planned Anaheim Regional Transportation Intermodal Center (ARTIC), from which a transportation connection could be provided to John Wayne Airport. In addition, the Palmdale to Union Station segment could provide access to Palmdale Regional Airport if commercial air service were to resume there. Both the Palmdale to Union Station and the Union Station to Anaheim segments are part of the Phase 1 system.

The Union Station to San Diego segment is planned to comprise one of the Phase 2 extensions of the system and will include a station adjacent to Ontario International Airport, while some of the alternative routes being considered for this segment could include stations near San Bernardino International Airport or March Inland Port.

II.3.1 Palmdale to Union Station

The currently proposed alternative alignments and station locations for the Palmdale to Union Station segment of the planned California HSR system are shown in Figure II.6. The alignment alternatives only affect the route between Palmdale and Sylmar and the route into Union Station.



All alignment alternatives for this segment include the planned Burbank Buena Vista station adjacent to Bob Hope Airport (BUR), as shown in **FIGURE II.7**. Although details of the transportation link between the station and the airport have not been defined, it seems likely that the airport would provide a shuttle bus connection to the station.

The station would provide access to BUR from downtown Los Angeles via Union Station, as well as communities in the Santa Clarita and Antelope Valleys via planned HSR stations at Sylmar and Palmdale. However, the planned Sylmar/San Fernando station is sufficiently close to BUR that it is unlikely to attract many airport trips from communities in the Santa Clarita Valley, since by the time an airport traveler has accessed the HSR station, it would not take that much longer to reach the airport.

Access to BUR from Union Station, which itself has good transit connections from communities to the east and south of downtown Los Angeles, could expand the potential market area served by BUR.

The station would also provide access to BUR from communities in the Central Valley, although given the future capacity constraints at BUR resulting from a settlement agreement between the airport authority and the City of Burbank, using limited airport capacity to serve passengers from outside the region may not be viewed as a positive development.

FIGURE II.6 Proposed Alignment Alternatives and Station Locations for the HSR Segment from Palmdale to Union Station

Source: CHSRA, Palmdale to Los Angeles Section – Supplemental Alternatives Analysis Report, Volume 1, March 2011, Figure 2.0-1.

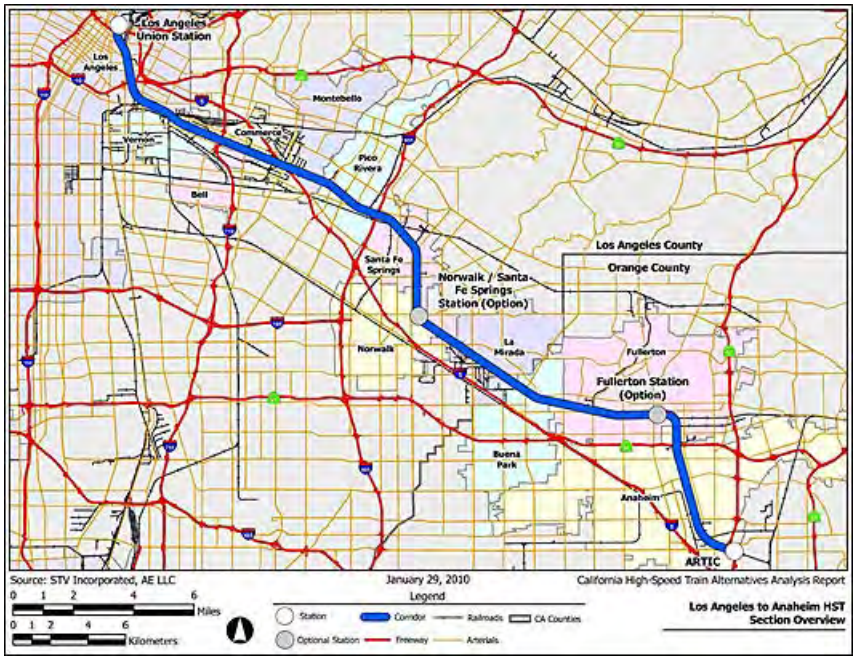
FIGURE II.7 Proposed Location for the Burbank Buena Vista Station

Source: CHSRA, Palmdale to Los Angeles Section – Preliminary Alternatives Analysis Report, Volume 1, July 2010, Figure 4.5-7.

Two station location options have been defined for the Palmdale station, depending on the route alignment alternative selected, as shown in **FIGURE II.8**. Both options are some way from the Palmdale Regional Airport, which is located on 20th Street East north of East Avenue P, at the top right corner of **FIGURE II.8**. The more southerly of the two locations (shown as Option 1 in **FIGURE II.8**) is described as being adjacent to the Palmdale Transportation Center, although there is no discussion of services anticipated to be provided at this facility in either the Preliminary Alternative Analysis Report or the Supplementary Alternatives Analysis Report.

Although details of the transportation link between the station and the airport have not been defined, it seems likely that the airport would provide a shuttle bus connection to the station.

FIGURE II.8 Proposed Location Options for the Palmdale Station

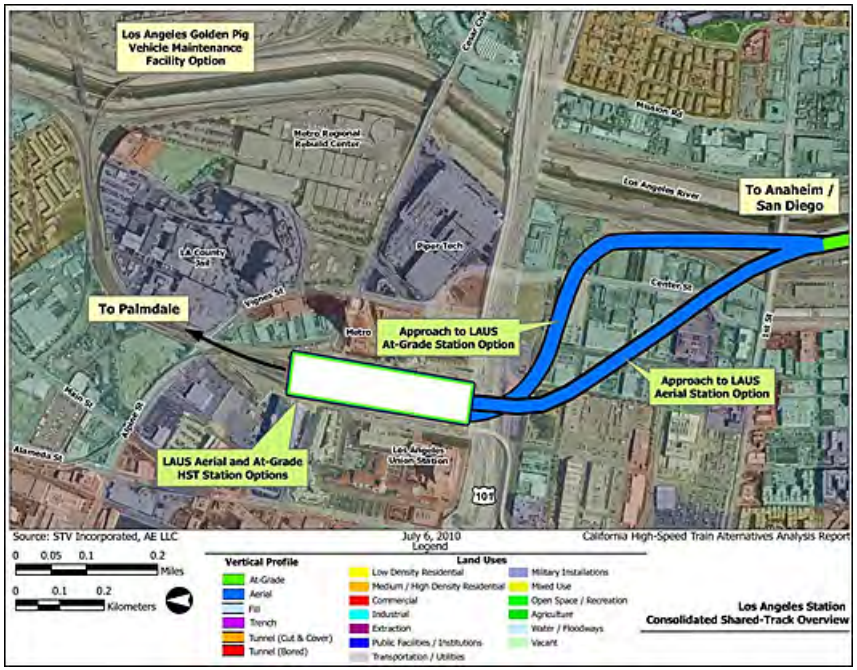


Source: HSRA, Palmdale to Los Angeles Section – Preliminary Alternatives Analysis Report, Volume 1, July 2010, Figure 4.6-7.

II.3.2 UNION STATION TO ANAHEIM

The currently proposed alternative alignments and stations locations for the Union Station to Anaheim segment of the planned California HSR system are shown on **FIGURE II.09**. This segment has relatively limited alignment alternatives that are largely restricted to the route into Union Station from the south. At present Union Station does not have any through tracks and trains arrive from and depart to the north to a major junction at the Los Angeles River. The segment alignment between Union Station and Anaheim generally follows existing railroad right-of-way (ROW) on the so-called LOSSAN corridor (Los Angeles to San Diego), with alternatives addressing how the HSR tracks will share the ROW with tracks carrying freight and Metrolink trains and address street crossings.

FIGURE II.09 Proposed Alignment Alternatives and Station Locations for the HSR Segment from Union Station to Anaheim



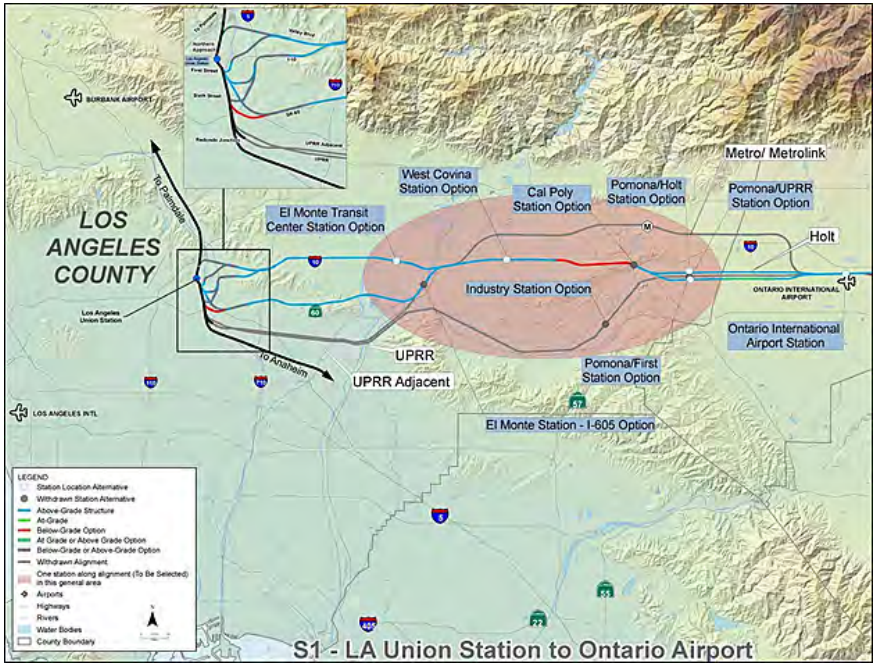
Source: CHSRA, Los Angeles to Anaheim Section – Supplemental Alternatives Analysis Report, July 2010, Figure 1.3-1.

Five alternatives for locating HSR tracks and platforms at Union Station were evaluated in the Supplemental Alternatives Analysis Report, of which two were selected to be carried forward to the Draft EIR/EIS, as shown in **FIGURE II.10**. One option places the HSR platforms at grade in the area currently occupied by existing platforms. The other option places the platforms on an aerial structure above the existing platform. The at-grade option would relocate the platforms serving Amtrak and Metrolink trains to the east and locate the HSR platforms between those new platforms and the Metro Gold Line tracks

adjacent to the main station building. Both options involve aerial structures to connect the station to the existing railroad ROW along the Los Angeles River to the south. The aerial approach structure for the at-grade option would involve a sharper curve to minimize disruption to the Arts District buildings to the south of the station. The approach structure for the aerial station options, being higher, could take a more direct route.

FIGURE II.10 Proposed Alignment Alternatives for HSR Tracks at Union Station

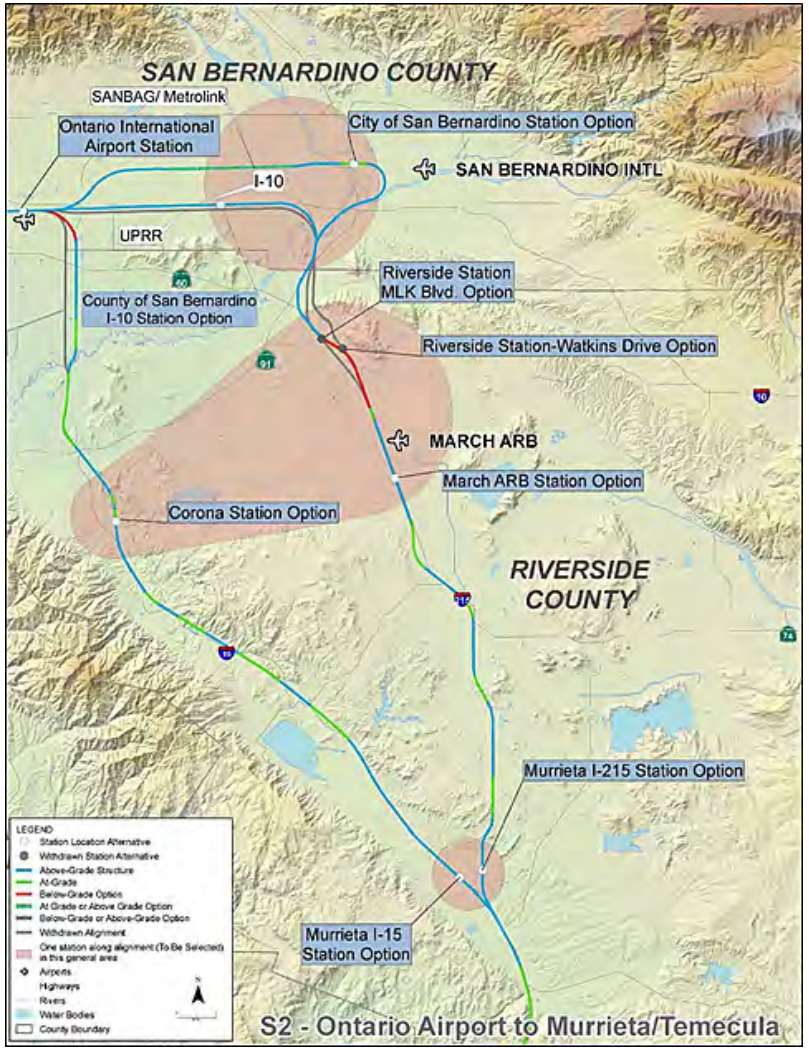
Source: CHSRA, Los Angeles to Anaheim Section – Supplemental Alternatives Analysis Report, July 2010, Figure 5.1-1.



There are no alternative alignments or station configuration issues being considered for the HSR station at the Anaheim Regional Transportation Intermodal Center (ARTIC). Since some trains from the ARTIC station would run through Union Station and stop at Burbank Buena Vista station, this could significantly improve access to Bob Hope Airport from Orange County. While air travelers to and from Orange County are not likely to find BUR an attractive option as long as capacity is available at John Wayne Airport (SNA), if SNA begins to reaches capacity before BUR, some air passengers may be able to find sufficiently less expensive flights at BUR to justify the cost and travel time involved in using the HSR to access BUR.

Transportation links between ARTIC and SNA will also serve Metrolink and Amtrak trains at ARTIC and are addressed in the sections of this report on high-occupancy public transportation.

II.3.3 Union Station to San Diego



The segment of the California HSR system from Los Angeles Union Station to San Diego will not be constructed until Phase 2 of the planned system development. As a consequence, the planning for this segment is not as advanced as for the segments between Palmdale and Anaheim, and currently several alternative alignments are under consideration for the part of the segment from Union Station through the Inland Empire (San Bernardino and Riverside counties), as shown in **FIGURES II.11** and **II.12**.

FIGURE II.11 Proposed Alignment Alternatives and Station Locations for the HSR Segment from Los Angeles to San Diego – Subsection 1

Source: CHSRA, Los Angeles to San Diego via the Inland Empire Section – Preliminary Alternatives Analysis Report, March 3, 2011, Figure ES-1.

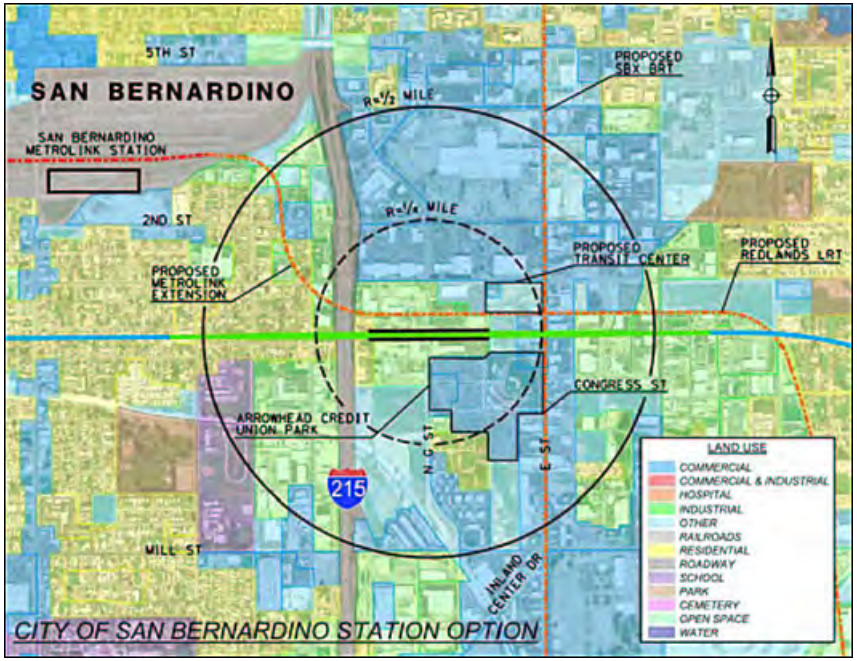
FIGURE II.12 Proposed Alignment Alternatives and Station Locations for the HSR Segment from Los Angeles to San Diego – Subsection 2

Source: CHSRA, Los Angeles to San Diego via the Inland Empire Section – Preliminary Alternatives Analysis Report, March 3, 2011, Figure ES-2.

Several alternative alignments have been analyzed between Union Station and Ontario International Airport (ONT), with variations on the route from Union Station to the Interstate 10 (I-10) or State Route 60 (SR 60) corridors to the east of downtown Los Angeles. A more southerly route following the Union Pacific Railroad (UPRR) tracks via the City of Industry was subsequently withdrawn from further consideration. Similarly, a more northerly route following the Metrolink and planned Gold Line route was also withdrawn, leaving a single route from El Monte to Pomona. From Pomona to ONT the route follows the UPRR corridor with two alternative alignments: to the north of the UPRR ROW along Holt Blvd. and to the south of the UPRR ROW along First Street and State Street, that run adjacent to the railroad tracks.

The location of the planned ONT station relative to the airport passenger terminal is shown in **FIGURE II.13**.

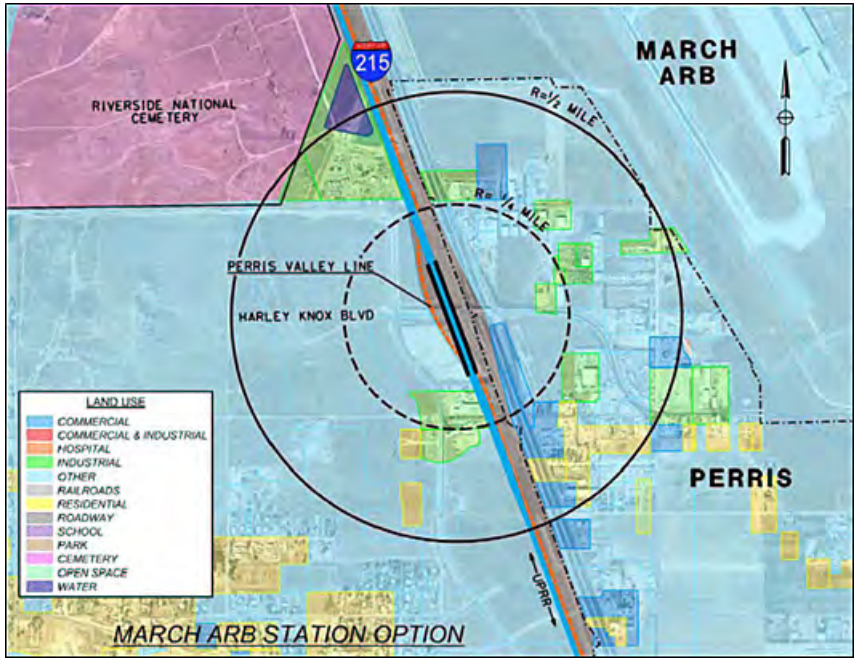
FIGURE II.13 Proposed Location for the Ontario Airport Station



Source: HSRA, Los Angeles to San Diego via the Inland Empire Section – Preliminary Alternatives Analysis Report, March 3, 2011, Figure 3-78.

The HSR alignment follows Airport Drive to the south of the UPRR tracks and separated from the passenger terminals by the airport parking lots. The station is only about 500 feet from the western domestic passenger terminal curb (Terminal 2), a feasible walk. However, the passenger terminals extend for about 3,000 feet along Terminal Way so a shuttle bus or people-mover will be needed for passengers to access the other terminals.

From ONT to Murrieta in southern Riverside County the alternative alignments follow the I-15 corridor via Corona or the I-215 corridor via the City of Riverside and March Air Reserve Base (ARB), with a number of route options through the City of San Bernardino and the City of Riverside. The more northerly alignment option through the City of San Bernardino provides a station in the city center to the west of San Bernardino International Airport, while the southerly option follows the I-10 corridor with a station in an unincorporated area of San Bernardino County between the cities of Fontana and San Bernardino.



The location of the potential City of San Bernardino station is shown in **FIGURE II.14**. The station is located adjacent to a proposed transit center and the intersection of a proposed bus rapid transit line and a light rail transit line, together with an extension of the Metrolink line to the transit center. However, San Bernardino International Airport (SBD) is about two miles east of the HSR station and is not planned to be served by any of these transit lines. Thus access to the airport would need to be by shuttle bus from the transit center.

FIGURE II.14 Proposed Location for the City of San Bernardino Station

Source: HSRA, Los Angeles to San Diego via the Inland Empire Section – Preliminary Alternatives Analysis Report, March 3, 2011, Figure 3-79.

FIGURE II.15 Proposed Location for the March ARB Station

Source: CHSRA, Los Angeles to San Diego via the Inland Empire Section – Preliminary Alternatives Analysis Report, March 3, 2011, Figure 3-79.

The March ARB station is located on the west side of I-215 at the Harley Knox Blvd. interchange adjacent to March Inland Port (MIP), as shown in **FIGURE II.15**. The distance from the station to potential sites for a future airline passenger terminal at MIP will depend where this is located on the facility, although in all cases access to the passenger terminal from the station would be far enough to require a shuttle bus ride.

FIGURE II.15 also shows the proposed extension of Metrolink to serve the Perris Valley. This extension would use the existing San Jacinto Branchline tracks that run parallel to I-215 from Riverside to South Perris, as shown in **FIGURE II.16**. If an HSR station is located at MIP, it is quite likely that this would be combined with a Metrolink station to take advantage of common facilities. However, the nature of the two services are quite different and there would not be much, if any, interchange between Metrolink and HSR passengers.

FIGURE II.16 Planned Route of Perris Valley Metrolink Line

Source: Riverside County Transportation Commission, Perris Valley Line (website), http://perrisvalleyline.info/index.asp.

One constraint on the ability of the planned HSR system to serve SBD and MIP is the number of stations that it is feasible to serve with HSR. Trains cannot stop frequently or they will not be high-speed. Aside from operational considerations, a system-wide limit on the number of stations was established in the ballot measure that authorized the initial round of state bonds that has provided a large part of the funding to develop the system that has been identified to date.

In addition to limitations on the number of stations, in order to achieve desired targets for running times between the major metropolitan areas not all trains will stop at every station. Although the details of the operational schedule will no doubt evolve as the system moves closer to beginning operations, the CHSRA currently envisages a mix of super-fast trains, that will run nonstop between the primary stations in the system, semi-fast trains that will make one or two stops between primary stations, and local trains that will stop at every station. Thus depending on the level of ridership that is attracted to the system, the frequency of local trains that will stop at secondary stations such as the City of San Bernardino and MIP stations may be quite limited, perhaps as infrequent as one an hour. This will reduce the likely use of the system for airport access trips, since many air passengers will find it quicker to drive to the airport after taking into account the schedule delay involved in having to catch a train that arrives at the airport earlier than they would prefer, while arriving air passengers may have to wait for up to the full headway for a train.

However, it is likely that both semi-fast and local trains will stop at ONT, providing the airport with reasonably frequent service, particularly from primary stations. In addition to fairly frequent service from Union Station, ONT will also be served by semi-fast and local trains from stations in San Diego County. Even if the chosen alignment includes stations at the City of San Bernardino and MIP, the level of traffic from San Diego County to those stations is not likely to be sufficient to justify stopping semi-fast trains there in addition to ONT, resulting in those stations only being served by less frequent local trains. Thus while Phase 2 of the HSR system may help attract some air passengers with trip ends in San Diego County to using ONT, particularly since by the time Phase 2 is built San Diego International Airport is likely to be experiencing capacity constraints, it is not likely to attract significant numbers of air passengers with trip ends in San Diego County to either MIP or SBD, even if the I-215 corridor alignment is selected.

APPENDIX III: Characteristics of a Successful Airport Express Bus

III.1 Introduction

Appendix II of this report discusses the characteristics of high occupancy public transportation services that have the potential for attracting air passengers, thereby shifting some away from preferred lower-occupancy modes. The preferred lower-occupancy modes, private auto, taxi and limousine, offer direct, non-stop service to the air passenger, and depart when the air passenger is ready to make the ground access trip.

Applying the characteristics of high occupancy public transportation services to airport express bus services, the airport express bus service that is most likely to be successful in attracting a sufficient level of air passengers to financially sustain the service and reduce the airport trip generation rate by air passengers and possibly airport employees will:

- Be located in a market area with a sufficient number of resident air passengers. Of the three potential airport user groups that may use such a service, resident air passengers, non-resident air passengers and airport employees, resident air passengers are most likely to use the service and exhibit a higher willingness to pay the market value for such a service than airport employees. As a rule of thumb, the primary market area should have a minimum of 1,200 Average Annual Daily Enplaning resident air passenger trip origins/destinations . This is explained further in the next section, Air Passenger Threshold for Airport Express Bus Service.
- Be located along a traditional travel route to the airport. Air Passengers in the market area of the high occupancy public transportation service are more likely to use their preferred mode to the airport along the travel route they are accustomed to taking, rather than divert to a different route or travel away from the airport (backtrack) along their traditional route if it adds more than a few minutes to their travel time.
- Offer a sufficient supply of overnight parking for air passengers that wish to park their auto for the duration of their trip, with parking rates that are perceived to be attractive compared to parking rates in the vicinity of the airport. There should be an area that is convenient for air passengers being dropped off or picked up in a private auto or taxi, including sufficient short duration parking near the boarding point of the high occupancy public transportation service.
- Be located in an area with good public transportation connections, if possible, particularly if the parking supply is limited.
- Provide sufficient coverage to serve arriving and departing passengers on the majority of flights, including the first major bank of departing flights in the morning.
- Provide a trip frequency of every 30 minutes for most of the flight schedule for distances to the airport of between 15 and 25 to 30 miles from the airport. For distances above 25 to 30 miles from the airport, hourly frequencies may be sufficient. The air passenger will not want to wait longer to board the bus than the travel time to the airport. For locations in the region that are closer than 10 to 15 miles to an airport, an airport express bus may not make sense, due to the perception that it is a quick trip to the airport, and the potential for a wider range of competing modes and routes to the airport.
- For a boarding point located 15 to 25 to 30 miles from the airport, a non-stop service will attract the greatest number of air passengers. For distances with the boarding point location greater than 25 to 30 miles, a service with one interim boarding point may be acceptable.

III.2 Air Passenger Threshold for Airport Express Bus Service

The previous section provided the most important characteristics for an airport express bus service to attract a level of ridership with the potential for a financially sustainable service and the potential to reduce the air passenger airport trip generation rate. As a general rule of thumb the primary market area, defined as the geographic area from which 70 percent to 85 percent of the express bus ridership is drawn from, will have a minimum of 1,200 average annual daily enplaning resident air passenger trip origin/destinations. The source of this information is data on enplaning air passenger origins from an origin and destination air passenger survey. Because the Anaheim area is such a prominent air passenger destination in Orange County, it makes sense to determine the number of resident and non-resident air passengers in the Anaheim market area to evaluate the options for high occupancy public transportation service between the Anaheim Regional Transportation Intermodal Center (ARTIC) and John Wayne Airport (SNA).

In general, airports serving a minimum of 18 million to 20 million annual origin and destination air passengers will have at least one market area with a minimum of 1,200 average daily enplaning resident air passengers beginning or ending their ground access trip in the market area. Based on 2035 air passenger forecasts, the two airports where it may make sense to offer non-stop express bus services are Los Angeles International Airport (LAX) and Ontario International Airport (ONT).

III.2.1 EXAMPLES OF NON-STOP AIRPORT EXPRESS BUS SERVICE OPERATED BY AIRPORT OPERATOR

The only two examples of non-stop airport express bus service being sponsored by an airport operator are the FlyAway network serving LAX, sponsored by Los Angeles World Airports, and the Logan Express, a system of non-stop buses sponsored by the Massachusetts Port Authority that serve Boston Logan International Airport (BOS). Each airport served more than 20 million origin and destination air passengers in 2010. The ridership served by each non-stop express bus route shown in **TABLE III.1** served the equivalent of from one percent to two percent of air passengers. Each of the buses shown in the table has operating characteristics as described earlier in this appendix.

TABLE III.1 2010 Bus Ridership, Airport Operated Non-Stop Express Bus Systems

Express Bus Route	Million Annual Passengers	Million O&D Passengers1	Bus Ridership2	Equivalent % of O&D Passengers
LAX: Van Nuys FlyAway	58.9	38.9	807,485	2.1%
LAX: Union Station FlyAway	58.9	38.9	413,975	1.1%
BOS: Braintree Logan Express	27.4	25.5	482,269	1.9%
BOS: Framingham Logan Express	27.4	25.5	328,818	1.3%
BOS: Woburn Logan Express	27.4	25.5	242,311	1.0%

III.2.2 EXAMPLES OF NON-STOP AIRPORT EXPRESS BUS SERVICE OPERATED BY OTHER ENTITIES

Two other services provide good examples of non-stop airport express bus service. One is operated by a private transportation operator, and the other is operated by a public transportation operator. Each is located in an area where customers are able to make a connection to the regional transit system.

The Washington Flyer is operated by a private company under a concession agreement with the Metropolitan Washington Airports Authority (MWAA). The Washington Flyer was operated by MWAA until approximately 2006, when MWAA put the route out to bid and awarded the route as a concession contract, shifting the financial responsibility for operating the service to the concessionaire. The boarding point is located at the West Falls Church Metrorail subway station, located approximately 20 miles away from Dulles International Airport. The Metrorail system offers service throughout the Metropolitan Washington D.C. area. In 2010, Dulles International Airport processed 23.6 million annual air passengers. **FIGURE III.1** shows a map of the Washington Flyer route.

FIGURE III.1 Washington Flyer Route Map

Source: http://www.washfly.com/flyer_bus_map.htm, May, 2011.

Source: http://www.ridemetro.org/services/airport_direct.aspx, August, 2011

The Metro Airport Direct is operated by the Metropolitan Transit Authority of Harris County in Houston, Texas, and operates between five locations in downtown Houston and George Bush Intercontinental Airport. The boarding locations in downtown Houston include a METRORail Station, the convention center, hotels and a medical center. The trip between the convention center and the airport is non-stop and is approximately 23 miles. In 2010, George Bush Intercontinental Airport processed approximately 40.5 million annual air passengers.

FIGURE III.2 shows a map of the Metro Airport Direct route.

A. Overall Land Use Pattern Maps

Given the number of square miles the SCAG region encompasses, SCAG developed a simplified series of Community Types to represent the dominant themes taken from the region's many General Plans. This was developed in order to facilitate regional modeling of land use information from nearly 200 distinct jurisdictions.

The Community Types employed in the RTP/SCS are not intended to represent detailed land use policies, but are used to describe the general conditions likely to occur within a specific area if recently emerging trends, such as transit-oriented development, were to continue in concert with the implementation of the 2012–2035 RTP/SCS. These land use maps are shown by county and subregion.

B. 2012–2035 RTP/SCS Scenarios for Public Outreach Workshops

The Rapid Fire Model

The four scenarios presented at the 2012–2035 RTP/SCS Public Outreach Workshops were produced using the Rapid Fire scenario modeling tool developed by Berkeley, CA-based planning and design firm Calthorpe Associates. The model is a user-friendly, spreadsheet-based tool that produces and evaluates scenarios at the national, state, regional, and county scales across a range of critical metrics. It constitutes a single framework into which data and research-based assumptions about the future can be loaded to test the impacts of varying land use patterns.

The Rapid Fire model emerged out of the near-term need for a comprehensive modeling tool that could inform state, regional, and local agencies and policy makers in evaluating climate, land use, and infrastructure investment policies. The model produces results for a range of metrics including:

- GHG (CO_2e) emissions from cars and buildings
- Air pollution and public health impacts
- Fuel use and cost
- Building energy and water use, and cost
- Land consumption
- Fiscal impacts, including capital infrastructure costs, operations and maintenance costs, and local revenues

Results are summarized so that users can compare the impacts of different scenarios. All assumptions are clearly identified and can be easily modified to test varying land use and policy choices. A detailed description of the Rapid Fire model can be found in the Section D. Rapid Fire Technical Summary.

The Scenarios

The scenarios were designed to explore and clearly convey the impact of both where the 6-county SCAG region grows over the next 25 years—to what extent growth is focused within existing cities and towns; and how it grows—the shape and style of the neighborhoods and transportation systems that will shape growth over the period. These scenarios were precursors to the 2012–2035 RTP/SCS alternatives. The scenarios facilitated public dialogue and feedback, which in turn allowed SCAG to develop substantially more detailed and refined Plan alternatives. In addition, the 2012–2035 RTP/SCS scenarios also helped to refine the California Environmental Quality Act (CEQA) alternatives considered in the Program Environmental Impact Report (PEIR). These Plan alternatives were extensively analyzed in the 2012–2035 RTP/SCS and the potential impacts of the 2012–2035 RTP/SCS Plan alternative were evaluated in the PEIR. Note that the 2012–2035 RTP/SCS Plan alternatives are separate and distinct from the scenarios discussed here.

The scenarios vary in their land use programs and in the package of transportation investments that support the quality and location of growth in the scenarios. The range of the scenarios can be described by how they address the following key elements:

- Development Location (Dispersed Growth vs. Focused Development): The four scenarios vary in the proportion of growth accommodated at the edges of cities and the region's urbanized areas versus that located in and around existing cities and towns, particularly in the region's designated High-Quality Transit Areas (HQTAs). An HQTA is generally a walkable transit village or corridor, consistent with the adopted RTP/SCS, and is within one half-mile of a well-serviced transit stop or corridor with 15-minute or less service frequency during peak commute hours. This is represented by the proportion of Greenfield versus Refill (infill and redevelopment) growth in each of the scenarios.
- Community/Neighborhood Design (Auto-Oriented vs. Walkable): The shape and quality of growth in the scenarios vary, from a focus on walkable and transit-oriented places where most daily needs are within walking, biking, or short driving distance from homes, to a future in which most new communities are centered around the car as the dominant form of transportation for nearly all trips. This is represented across the four scenarios by the proportion of Standard Suburban, Mixed-Use/Walkable, and Urban Infill development in each of the scenarios.

- Housing Options and Mix (Single-Family Subdivisions vs. Multifamily Focus): The four workshop scenarios varied future housing mix in order to depict the impacts of meeting (or not meeting) measured housing demand and the changing demographics and preferences of current and future southern Californians. Trend-based housing programs that focus more on larger-lot (>5,500 SF) single-family options are compared to varying mixes of single-family, townhome, and multifamily options. Housing demand profiles are informed by the recent work of A.C. Nelson and other state and national studies which connect changing demographic and economic conditions with housing demand.
- Transportation Investments (Road/Highway vs. Transit/Non-Auto Strategies): While all scenarios are supported by a range of transportation options, they vary in the proportion of new investments that are focused on transit and non-auto modes versus highway and roadway improvements that facilitate local and regional automobile travel. These transportation 'packages' are informed by past and present RTPs and incorporate a range of transit emphasis up to and including the recent Measure R and 30/10 Initiative. Each scenario's land use pattern and specific mix of place and location types are matched to a generalized transportation package that supports the pattern and quality of growth. The scenarios were designed to capture a range of potential strategies and investments under consideration for the RTP/SCS by considering the relative emphasis on investment by mode, or the inclusion of policy mechanisms such as TDM or congestion pricing. The scenarios do not consider or evaluate specific transportation networks, or individual projects.

The scenarios illustrate different 'themes' for how the region can grow, and the transport system that supports that growth. Each theme mixes a unique combination of the above factors and in turn varies in its impact on critical fiscal, environmental, and transportation challenges facing the region.

Scenario 1. This scenario is based on the General Plans prepared by cities and compiled by SCAG, with assistance from local planners, using the Local Sustainability Planning Tool (LSPT). It includes a significant proportion of suburban, auto-oriented development, but also recognizes the recent trend of increased growth in existing urban areas and around transit. New housing is mostly single-family (58 percent), with an increase in smaller-lot single-family homes, as well as an increase in multifamily homes (42 percent). The transportation system is based on the package of improvements in the 2008 RTP. While these investments tend to favor automobile infrastructure, they also support new transit lines and other non-auto strategies and improvements.

Scenario 2. This scenario focuses more growth in walkable, mixed-use communities and in existing and planned high-quality transit areas. Under this scenario, there would be an increase in investments in transit and non-auto modes as compared to the 2008 RTP. Employment growth is focused in urban centers, around transit. Fewer new homes (29 percent) are single-family homes, as this scenario comes closer to meeting demand for a broader range of housing types, with new housing weighted less toward large-lot (>5,500) single-family homes (two percent) and more towards smaller-lot single-family homes (27 percent), and multifamily condos, townhomes and apartments (70 percent).

Scenario 3. This scenario builds on the walkable, mixed-use focus of the growth in Scenario 2, and also aims to improve fiscal and environmental performance by shifting even more of the region's growth into areas that are closer to transit, and less auto-centric. Like Scenario 2, this scenario, aims to meet demand for a broader range of housing types, with new housing weighted towards smaller-lot single-family homes, townhomes, multifamily condos and apartments. In terms of percentage, the mix of housing types is very similar to Scenario 2, but the location of the growth within the region is shifted more toward transit-rich locations. Also like Scenario 2, transportation system investments would be more weighted towards transit investments, TDM, and non-auto strategies, which would support the move away from more auto-oriented development patterns.

Scenario 4. This scenario maximizes growth in urban and mixed-use configurations in already developed areas, and around existing and planned transit investments. To support this shift, transportation system investments are heavily weighted towards transit infrastructure and operational improvements (i.e., higher frequencies and more transit feeder service), as well as improvements to bicycle and pedestrian infrastructure. In order to maximize the transit investments and accommodate population in already developed areas, the vast majority of new housing (96 percent) is multifamily, while four percent is single-family development.

Pricing and Vehicle Policy Assumptions

The scenarios were designed to highlight the impacts of land use and transportation infrastructure options within the SCAG region. Transportation system pricing, vehicle and fuels technology, and power generation policies will also play a role in meeting the region's fiscal, climate, mobility, and public health goals. Pricing and technology components were held constant in order to more clearly communicate the impacts of land use and infrastructure policy options.

PRICING ASSUMPTIONS

Each of the scenarios presented at the 2012–2035 RTP/SCS Workshops assumed a hypothetical two-cent per mile VMT charge, which on average, results in a two percent reduction in VMT. More detailed pricing schemes and analyses are being developed to support refined scenarios and detailed 2012–2035 RTP/SCS options.

VEHICLE AND FUEL POLICY

Meeting greenhouse gas (GHG), pollutant emissions, and energy goals will include a suite of strategies and policies. In addition to the land use and transportation strategies explored in these first 2012–2035 RTP/SCS scenarios, the efficiency of cars and the fuels used to power them will also play a role, as will energy and water conservation measures for homes and businesses. While these first scenarios focus on the impact of land use and transportation investments and strategies in meeting VMT, GHG, pollution, and energy challenges, subsequent analysis will explore the impacts of emerging vehicle technologies, renewable power generation, building measures, and a host of state, regional, and local environmental and energy policies.

Scenario Outcomes

Variations among the scenarios highlight the impacts of land use and transportation infrastructure options within the SCAG region. The Rapid Fire model was used to estimate a broad set of fiscal, environmental, and transportation impacts in order to facilitate comparison among the scenarios.

LAND CONSUMPTION – NEW LAND CONSUMED

The amount of land consumed to accommodate new population growth varies substantially among the 2012–2035 RTP/SCS scenarios. New land consumption includes all land that will be newly urbanized, including residential and employment areas, roadways, open space, and public lands. Through infill, redevelopment, and more efficient use of new "greenfield" land (lands, including agricultural areas, not previously developed for urban uses) to accommodate new growth, scenarios with a greater share of Urban Infill and Mixed-Use Walkable (Compact) development consume less land overall. By contrast, scenarios that place a greater share of new growth in dispersed Standard development patterns, consume more land.

Scenario 1, which is based on the General Plans prepared by cities, consumes 251 square miles of greenfield land—nearly twice as much as Scenario 2, which consumes 127 square miles—to accommodate growth to 2035. Scenario 3 consumes 84 square miles, and Scenario 4, which maximizes growth in urban and mixed-use configurations in already developed areas, brings that number down to 46 square miles.

FISCAL IMPACTS – LOCAL INFRASTRUCTURE CAPITAL AND OPERATIONS AND MAINTENANCE COSTS

Increased land consumption can lead to higher costs for local and sub-regional infrastructure, as new greenfield development requires significant capital investments to extend or build new local roads, water and sewer systems, and parks. Conversely, growth focused in existing urban areas takes advantage of existing infrastructure and capitalizes on the efficiencies of providing service to higher concentrations of jobs and housing. This cost variation amplifies when operations and maintenance (O&M) costs are taken into account. O&M costs include the ongoing city expenditures required to operate and maintain the infrastructure serving new residential growth. Engineering and public works costs are strongly linked to the physical form of infrastructure. More dispersed development, which entails greater lengths of roads and sewer pipes, incur higher O&M costs to local jurisdictions than more compact development, which capitalizes on the economic efficiencies of shared infrastructure capacity.

The 2012–2035 RTP/SCS scenarios show that growth in urban and mixed-use configurations in already developed areas can reduce costs significantly, as demonstrated by

adding up capital infrastructure and ongoing O&M costs to 2035 for each scenario. As compared to Scenario 1, following the development pattern of Scenario 2 would save $3.3 billion; Scenario 3 would save $3.7 billion; and Scenario 4 would save $6.7 billion—an average savings of $4,500 per new home, or over 25 percent less on the whole than Scenario 1.

Note that the capital infrastructure and O&M costs detailed here represent those associated with residential growth only. It is expected that the inclusion of non-residential fiscal impacts would compound the cost and revenue differences that have been evidenced between dispersed and compact development patterns.

FISCAL IMPACTS – LOCAL REVENUES

The Rapid Fire model estimates potential revenues from property and property transfer taxes, sales taxes, and vehicle license fees generated by new households. Due to the price premiums of higher-intensity locations, more compact development can generate higher local revenues than more dispersed development. This relationship is clear particularly on a per-acre basis—by 2035, Scenario 2 generates $18,500 more, Scenario 3 generates $23,500 more, and Scenario 4 generates nearly $27,000 more per acre per year than Scenario 1. On a per-unit basis, results vary: the cumulative revenues through 2035 of Scenario 2 are $2.9 billion lower than Scenario 1, and those of Scenario 4 are $12 billion lower. Scenario 3, on the other hand, yields $2.7 billion more in revenues—demonstrating the magnitude of the benefits that result from a strategic nexus between compact development patterns and housing mix.

TRANSPORTATION

Transportation system impacts—including vehicle miles traveled (VMT), fuel use and cost, and greenhouse gas (GHG) and air pollutant emissions—vary significantly across the 2012–2035 RTP/SCS scenarios. The different land use patterns of the scenarios result in different rates of passenger auto use, measured as vehicle miles traveled, or VMT, which then impact fuel consumption, fuel cost, and emissions.

VEHICLE MILES TRAVELED

Scenario results for VMT indicate a wide variation in passenger vehicle use related to the form of new growth. Scenario 1, which accommodates 41 percent of new growth in more auto-oriented Standard Suburban development, results in an annual VMT of 153 billion miles by 2035. This is almost 17 billion miles more than Scenario 2, 20 billion miles more than Scenario 3, and 21 billion miles, or 14 percent, more than Scenario 4. Scenario 1 averages 20,920 miles driven per household, per year; Scenario 4 averages 17,990 miles.

AUTOMOBILE FUEL USE AND COST OF DRIVING

Variations in passenger VMT lead to differences in the amount of gas (or equivalent) used. These differences will vary depending on how efficient cars become. Assuming the same modest vehicle fuel economy improvements (in line with California's "Pavley 1" Clean Car Standards) for all scenarios, there would be substantial differences in fuel use due to land use-related VMT variations. By 2035, Scenario 1 would require 5.5 billion gallons of fuel annually. Scenario 2 would require 600 million gallons less, Scenario 3 would require more than 700 million gallons less, and Scenario 4 would require 800 million fewer gallons per year. 800 million gallons of gas is equivalent to 1.1 percent of the oil imported to the entire United States in 2008.

Reduced VMT and fuel use leads to lower costs for all households in Southern California. When compared to Scenario 1, Scenario 2 saves the average Southern California household more than $1,380 per year in driving costs in 2035 (including auto ownership, maintenance, and other driving-related costs); Scenario 3 saves $1,600; and Scenario 4 saves $1,770—significant savings that could be applied to housing and other essentials. For the entire SCAG region, the savings total as much as $12.9 billion per year in Scenario 4.

GHG emissions from passenger vehicles are determined by VMT (related to land use patterns), vehicle fuel economy, and the carbon intensity of automobile fuel. Assuming the same modest improvements in fuel emissions (in line with California's Low Carbon Fuel Standard) for all scenarios, there would be substantial differences in CO2e emissions (carbon dioxide equivalent, which includes the main forms of greenhouse gases). The land use-related variations in GHG are directly proportional to VMT and fuel use.

AIR POLLUTANT EMISSIONS FROM PASSENGER VEHICLES

Differences in VMT lead to different levels of air pollutants (including nitrogen oxides, carbon monoxide, sulfur dioxide, volatile organic compounds, and particulate matter) among the 2012–2035 RTP/SCS scenarios. Accounting for vehicle technology improvements, Scenario 1, with higher VMT, sees 2035 passenger-vehicle pollutant emissions that are

11 percent higher than emissions in Scenario 2, 13 percent higher than Scenario 3, and 14 percent higher than Scenario 4. These results translate to significant public health impacts, as described in the following section.

HEALTH INCIDENCES AND COSTS

Auto-related air pollution results in a spectrum of health incidences, including cases of chronic bronchitis; acute myocardial infarction; respiratory and cardiovascular hospitalizations; respiratory-related ER visits; acute bronchitis; work loss days; premature mortality; asthma exacerbation; and acute, lower, and upper respiratory symptoms. Health incidences, and their related costs, are reduced along with miles driven (VMT). Using research-based rates and valuations produced by the American Lung Association, the Rapid Fire model estimates savings (rather than absolute totals) in health incidences and costs to 2035.

Relative to a status quo scenario, the 2012–2035 RTP/SCS scenarios show reductions in health incidences and costs. In 2035, Scenario 1 results in a 20 percent reduction; Scenario 2 results in a 29 percent reduction; Scenario 3 results in a 30 percent reduction; and, Scenario 4 results in a 31 percent reduction. In terms of costs, Scenarios 1, 2, 3, and 4 save $648 million, $932 million, $980 million, and $1.01 billion per year, respectively.

BUILDING ENERGY USE

The 2012–2035 RTP/SCS scenarios vary in their building energy use profiles due to their different mixes of housing types, and the proportion of development in more or less temperate climate zones in the SCAG region. Scenarios that contain more Mixed-Use/Walkable and Urban Infill development accommodate a higher proportion of growth in more energy-efficient housing types like townhomes, apartments, and smaller single-family homes, as well as more compact commercial building types. By contrast, a large proportion of Standard development leads to a higher proportion of larger single-family homes, which are typically less energy-efficient. Location also comes into play—buildings in the warmer areas at the edges of the region and beyond use more energy each year, in part because they require more energy to cool during the summer months.

Variations in land use patterns lead to substantial differences in the amount of electricity and natural gas used. These differences will vary depending on policies regulating how efficient buildings become. Assuming the same efficiency standards for all scenarios, there would be marked differences in energy use due to land use-related variations. Compared to Scenario 1, Scenario 2 uses 7 percent less energy per year; Scenario 3 uses 9 percent less; and Scenario 4 uses 11 percent less.

The overall energy savings that come from developing more compactly translate to meaningful savings in residential energy bills. On average, Scenario 2 saves $700 million per year in total by 2035, or about $100 per household; Scenario 3 saves $900 million, or $120 per household; and Scenario 4 saves $1.2 billion, or $170 per household. Note that these estimates assume only modest, trend-based rises in energy prices—if energy prices climb higher, the savings will be even more substantial.

Conserving energy also reduces GHG emissions. The progressively more compact land uses of Scenarios 2, 3, and 4 would reduce emissions in proportion to energy use as compared to Scenario 1. When combined with the effects of more stringent clean energy policies, which would reduce the amount of GHG emissions for every kilowatt-hour of electricity used, building energy emissions can be reduced even further.

RESIDENTIAL WATER USE

Variations in land use patterns and their related building profiles also lead to substantial differences in residential water use and cost. Residential water use is a function of both indoor and outdoor water needs, with outdoor use (landscape irrigation) accounting for the majority of the difference among housing types. Because homes with larger yards require more water for landscape irrigation, lot size is generally correlated with a household's overall water consumption. Thus, scenarios with a greater proportion of the Standard development, which includes more large-lot (5,500 SF and above) single-family homes, require more water than scenarios with a greater proportion of Mixed-Use/Walkable and Urban Infill development, which include more attached and multifamily homes. And, as is the case for energy use, the location of new development has a significant bearing on water use—homes in warmer areas use more water to maintain lawns and other landscaping.

Water use will vary based on efficiency and conservation policies, which will be increasingly important as California faces future constraints to water supply. Assuming the same modest improvements for all scenarios, we can see the potential savings attributable to land use patterns alone. Compared to Scenario 1, which uses 996 billion gallons of water

per year by 2035, Scenario 2 uses 47 billion gallons, or 4.7 percent, less; Scenario 3 uses 51 billion gallons, or 5.1 percent, less; and Scenario 4 uses 63 billion gallons, or 6.3 percent, less. These savings are equivalent to the average new home using 6,400 fewer gallons per year in Scenario 2; 6,900 fewer gallons in Scenario 3; and 8,700 fewer gallons in Scenario 4.

Saving water also saves on residential water costs. On the whole, Scenario 2 saves $176 million per year in total by 2035; Scenario 3 saves $191 million; and Scenario 4 saves $239 million. These estimates assume trend-based rises in water costs; if water prices rise higher, the cost differences will be greater.

HOUSEHOLD COSTS

Breaking scenario costs down to the household level exposes the impact of land use and policy choices on Southern California households: by 2035, Scenario 1 would cost the average household $15,100 in costs associated with driving and residential energy and water use (2009 dollars). By comparison, Scenario 2 would cost $1,500 less; Scenario 3 would cost $1,750 less; and Scenario 4 would cost nearly $2,000 less. Over time, the differences in annual expenditures would amount to a significant sum for each household—money that could instead be applied to a home mortgage or other living expenses. This difference is further exacerbated if considering the effect of local infrastructure cost burdens, which are typically passed on to homeowners and renters in the form of taxes, fees, home prices, and assessments.

GREENHOUSE GAS (GHG) EMISSIONS FROM PASSENGER VEHICLES AND BUILDINGS

Combined transportation and building sector impacts provide the most complete picture of the greenhouse gas emissions and fiscal implications of the futures presented by the 2012–2035 RTP/SCS scenarios. Passenger vehicle transportation, along with residential and commercial building energy use, currently account for over half of total carbon emissions in California. Land use and transportation planning at the regional level, in conjunction with statewide policies in regulating energy emissions and efficiency, will be crucial to meeting the state's goals for GHG reductions, as well as its fiscal health.

Total GHG emissions—including those from passenger vehicles, and emissions associated with residential and commercial building energy consumption—vary across the 2012–2035 RTP/SCS scenarios due to their differences in land use patterns. In 2035, Scenario 1, with the highest proportion of growth occurring as Standard development, would produce 96 MMT of annual GHG emissions from buildings and passenger vehicle transportation. Emissions decrease as land use patterns become more compact: in comparison to Scenario 1, Scenario 2 results in 8 percent lower emissions; Scenario 3 results in 10 percent lower emissions, and Scenario 4 results in nearly 12 percent lower emissions.

C. Rapid Fire Model Technical Summary

RAPID FIRE MODEL

Technical Summary
Model Version 2.0

CALTHORPE ASSOCIATES
URBAN DESIGNERS. PLANNERS. ARCHITECTS

Revised: Jan 2011

INTRODUCTION and RAPID FIRE MODEL OVERVIEW

This technical summary provides an overview of the key features and functionality of the *Rapid Fire* model developed by Calthorpe Associates. The Rapid Fire model is designed to produce and evaluate statewide, regional, and/or county-level scenarios across a range of metrics. This document is intended to impart a fundamental understanding of how Rapid Fire scenarios are formulated and analyzed. A more detailed description of the model, including a step-by-step tour through the model's user interface and technical information about all model calculations and assumptions, is available in the *Rapid Fire White Paper and Technical Guide*.

The Rapid Fire Modeling Framework

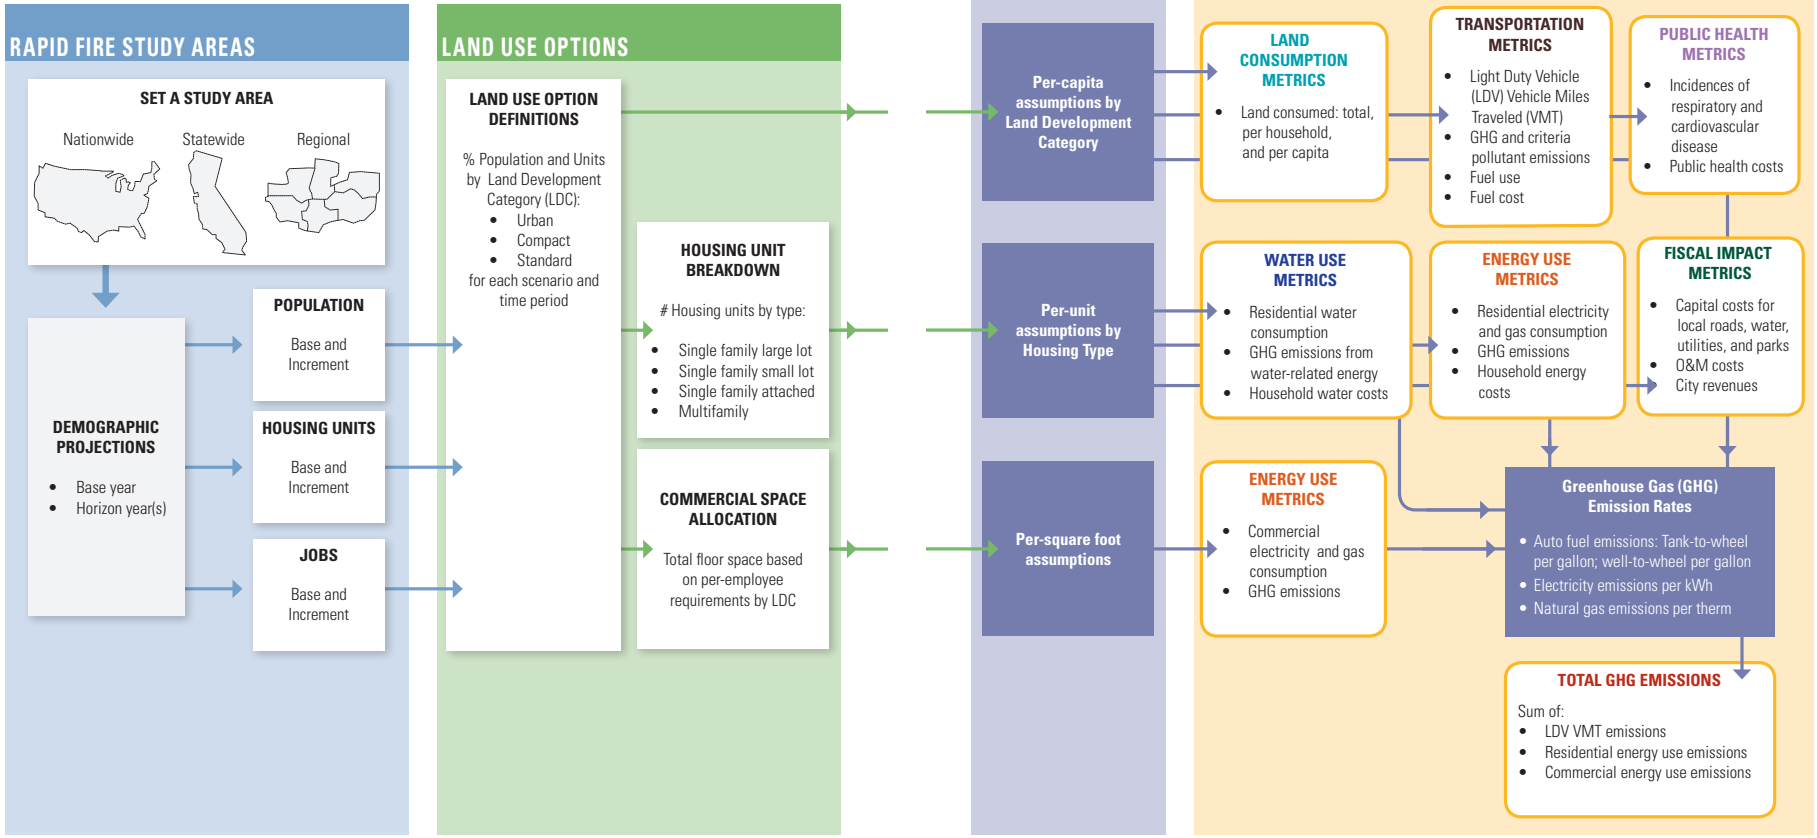
The Rapid Fire model emerged out of the near-term need for a comprehensive modeling tool that could inform state, regional, and local agencies and policy makers in evaluating climate, land use, and infrastructure investment policies. Results are calculated using empirical data and the latest research on the role of land use and transportation systems on automobile travel; emissions; public health; infrastrucutre cost; city revenues; and land, energy, and water consumption. The model constitutes a single framework into which these research-based assumptions can be loaded to test the impacts of varying land use patterns. The transparency of the model's structure of input assumptions makes it readily adaptable to different study areas, as well as responsive to data emerging from ongoing technical analyses by state, regional, and local agencies.

The model allows users to create scenarios at the national, statewide, or regional scales. Results are produced for a range of metrics, including:

- GHG (CO_2e) emissions from cars and buildings
- Air pollution
- Fuel use and cost
- Building energy use and cost
- Residential water use and cost
- Land consumption
- Fiscal impacts (local capital infrastructure and O&M costs; city revenues)
- City revenues
- Public health impacts

The Rapid Fire model is not meant to replace more complex travel models or map-based models; rather, it is designed to fill a timely need for defensible comparative analysis that can inform land use and climate policy development and provide a credible and flexible sounding board for state and regional entities as they review and analyze plans and policies. More information about model results and the Vision California process can be found at *www.visioncallifornia.org* and at *www.calthorpe.com/vision-california*.

This document starts with an overview of the operational flow of the model, continues with an explanation of how study areas are set and how scenarios are composed, and finally describes how assumptions are applied to calculate results in each metrics category.



Technical Requirements. *The Rapid Fire model is a user-friendly, spreadsheet-based tool that allows for efficient testing of different combinations of compact, urban, and more sprawling growth. The model, which runs in Microsoft Excel, is designed to be flexible and transparent. All assumptions are clear and can be easily modified or customized.*

RAPID FIRE OPERATIONAL FLOW

From Input Assumptions to Output Metrics

The Rapid Fire model uses a full range of inputs, from demographic projections to travel behavior projections to technical factors for fuel and energy emissions, to calculate output metrics that demonstrate the relative effects of different land use scenarios and policy options. The following chart gives an overview of the operational flow of the model, starting from the selection of a study area, through the application of land use options and policy packages, to the final stage of metrics output. The chart generally categorizes the input assumptions by type; all assumptions are discussed in greater detail in the later sections of this paper.

CALTHORPE ASSOCIATES
URBAN DESIGNERS. PLANNERS. ARCHITECTS

RAPID FIRE STUDY AREAS

Study areas can range in size, from the local to the national scale, so long as data are available. Study areas are defined by baseline demographic and performance data for an initial base year, and demographic projections for three horizon years. By default, the model uses a base year of 2005 and horizon years of 2020, 2035, and 2050, though these can be modified.

At a minimum, the following key assumptions (as listed in the table) are required to define a study area. These inputs are all geographically dependent – they vary according to study area rather than according to policy or other methodological assumptions.

Demographics	***Transportation***	***Building Energy***	***Water***
• *Baseline and projected population*	• *Average per-capita vehicle miles traveled (VMT)*	• *Baseline average energy use per existing residential unit and commercial square foot (can be derived from total residential and commercial energy use)*	• *Baseline residential water use per existing unit (can be derived from total water use)*
• *Baseline and projected households*	• *Average LDV fuel economy*	• *Baseline energy use by residential building type and commercial square foot*	• *Baseline per-capita water use*
• *Baseline and projected jobs*	• *Baseline GHG emissions per gallon of fuel*	• *GHG emissions per kilowatt-hour (kWh) of electricity*	
	• *Baseline auto ownership and maintenance costs per mile*	• *GHG emissions per therm of natural gas*	
		• *Baseline energy costs per kWh and therm*	

Study Area Selection Sheet. *Input data are entered, stored, and loaded from the Study Area Selection sheet.*

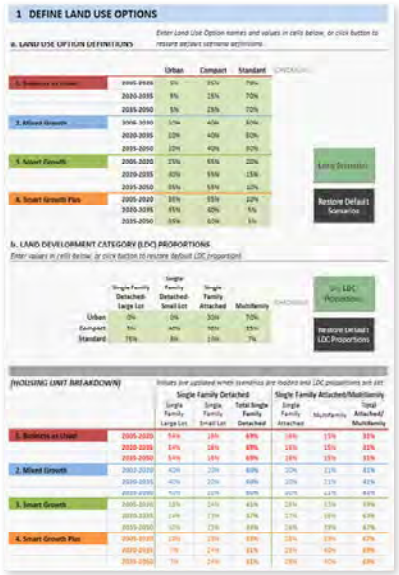
Single Family Attached	4,745 kWh	378 thm			9,240 kWh	680 thm		

LAND USE OPTIONS



The Rapid Fire model analyzes up to four scenarios at a time. Each scenario consists of two components: a *land use option* and a *policy package*. The land use options vary the patterns of new growth, while the policy packages vary standards for automobile technology and fuel composition; building energy and water efficiency; and energy generation.

Land Use Options

The land use options all accommodate the same amount of projected population and job growth, but differ in how that growth is allocated. The user defines a land use option by varying the proportions of growth in each of three *Land Development Categories (LDCs)* – Urban, Compact, and Standard. The LDCs represent distinct forms of land use, ranging from dense, walkable, mixed-use urban areas that are well served by transit, to lower-intensity, less walkable places where land uses are segregated and most trips are made via automobile. Each LDC is associated with different travel behaviors and a different mix of housing types and commercial space profiles, as described generally on the next page.

The Rapid Fire model is loaded with four default land use options – ***Business as Usual, Mixed Growth, Smart Growth, and Smart Growth Plus*** – all which can be modified by the user. The figure at right shows the area of the Scenario Definition sheet in which land use options and the housing unit mixes of each LDC are defined. The definition and resulting housing type mix of an example land use option is outlined in the diagram on page 9.

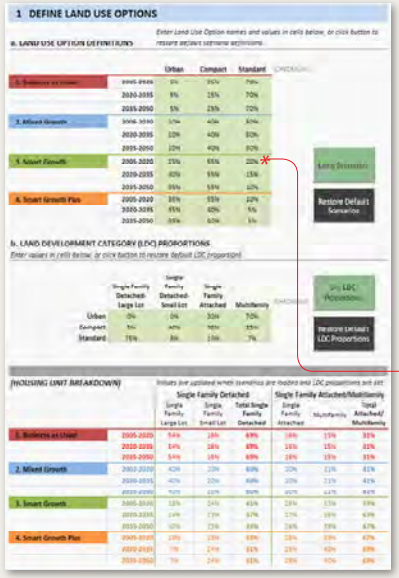
Land Use Option Section of Scenario Definition Sheet. *Proportions for land use options and LDCs are set in the Land Use Option section of the Scenario Definition sheet.*

LAND USE OPTIONS

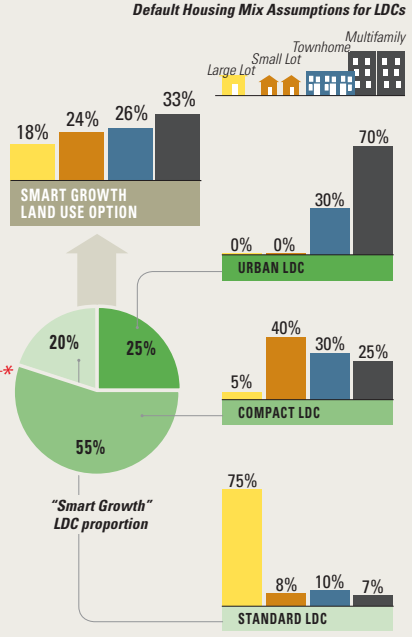
Land Development Categories

The Urban, Compact, and Standard LDCs represent distinct forms of land use. Their general land use characteristics and transportation infrastructure are described below. These characteristics are all determined by model inputs that can be entered or adjusted by the user.

	Land Use Characteristics	Transportation Infrastructure
URBAN	Most intense and most mixed LDC, often found within and directly adjacent to moderate and high density urban centers. Virtually all 'Urban' growth would be considered infill or redevelopment. The majority of housing in Urban areas is multifamily and attached single family (townhome). These housing types tend to consume less water and energy than the larger single family types found in greater proportion in less urban locations.	Supported by high levels of regional and local transit service. Well-connected street networks and the mix and intensity of uses result in a highly walkable environment and relatively low dependence on the automobile for many trips. **Per-capita VMT range: ~ 1,500 to 4,000 per year.**
COMPACT	Less intense than Urban LDC, but highly walkable with rich mix of retail, commercial, residential, and civic uses. The Compact form is most likely to occur as new growth on the urban edge or large-scale redevelopment. Rich mix of housing, from multifamily and attached single family (townhome) to small- and medium-lot single family homes. Housing types in Compact areas tend to consume less energy and water than the larger types found in the Standard LDC.	Well served by regional and local transit service, but may not benefit from as much service as Urban growth, and is less likely to occur around major multimodal hubs. Streets are well connected and walkable, and destinations such as schools, shopping, and entertainment areas can typically be reached via a walk, bike, transit, or short auto trip. **Per-capita VMT range: ~ 4,000 to 7,500 per year.**
STANDARD	Represents the majority of separate-use auto-oriented development that has dominated the American suburban landscape over the past decades. Densities tend to be lower than Compact LDC, and are generally not highly mixed or organized to facilitate walking, biking, or transit service. Can contain a wide variety of housing types, though medium- and larger-lot single family homes comprise the majority of this development form; these larger single family tend to consume more energy and water than those in the Urban or Compact LDCs.	Not well served by regional transit service (typically), with most trips made via automobile. **Per-capita VMT range: ~ 9,500 to 18,000 per year.**



Housing Unit Mix

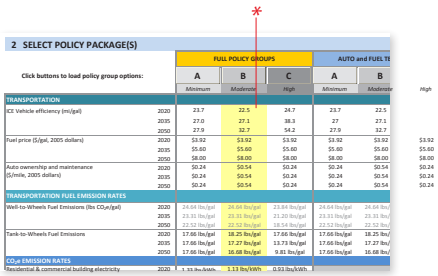


The housing mix assumptions for the three LDCs lead to an overall mix of housing units for each land use option and time period. The default housing mix assumptions for the LDCs are intended to reflect existing land use patterns and policies, and thus remain constant for each LDC over time. Housing unit mix assumptions can be changed to represent shifts in housing demand over time, or to represent different market conditions among land use options.

Urban areas are comprised of multifamily and attached single family units. Compact areas contain the widest range of housing types, from multifamily and attached single family to small-lot single family units, with a small proportion of large-lot single family units. Standard development is dominated by large-lot single family units, with small proportions of other housing types. The LDC and housing unit mix assumptions for the default "Smart Growth" land use option are shown below.

Assumptions by Land Development Category

The housing unit mix assumptions are applied to the housing growth projected for each LDC (determined by the proportion of population growth allocated to the LDC within a scenario/time period) to produce housing counts by type.



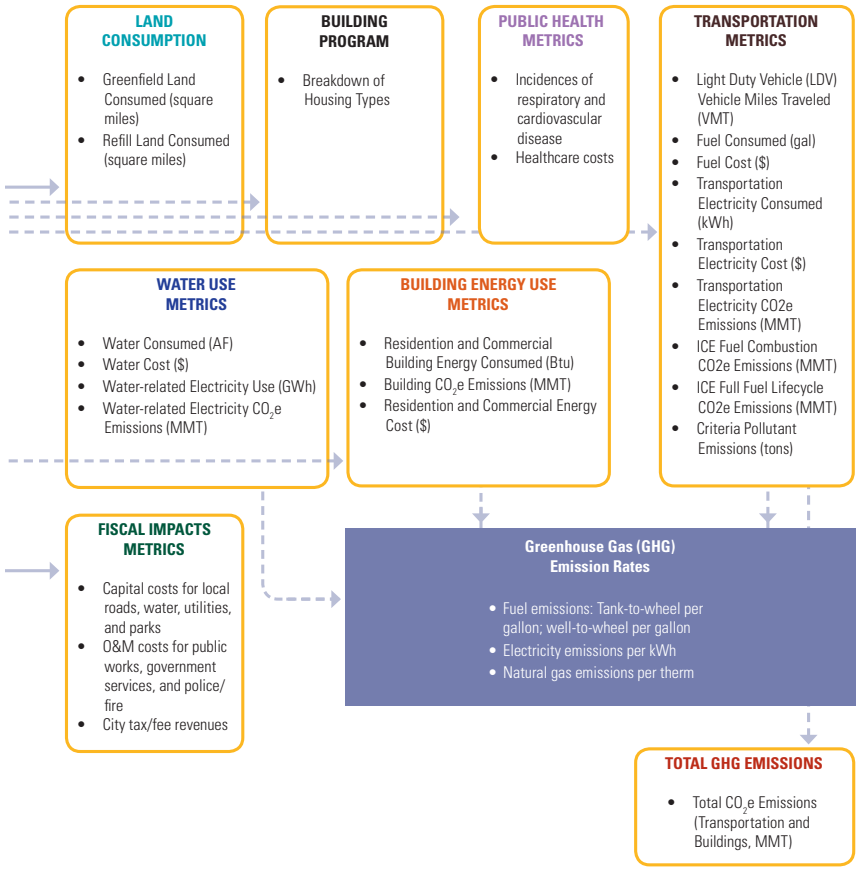
POLICY PACKAGE ASSUMPTIONS

Rapid Fire policy packages vary standards for automobile technology and fuel composition, building energy and water efficiency, and energy generation. *Auto and Fuel Technology* assumptions include those that guide vehicle efficiency, fuel emissions, and costs; *Building Efficiency* assumptions include building energy and water use standards as well as utility costs; and *Utility Portfolio* assumptions drive the carbon intensity of the power generation sector.

Policy-based input assumptions are grouped to represent different levels of improvement in each of these categories. While users can enter any combination of input assumptions, the policy packages allow users to instantly activate and switch between sets of assumptions to compare results. The components of the policy package categories are outlined in the table below.

As with the land use options, the policy packages can reflect a range of futures, from a business-as-usual case that continues current trends, to a progressive case that represents significant policy action. Users can enter values to define up to three alternate policy packages in each category.

Policy Package Selection Section of Scenario Definition Sheet. *The policy packages are organized in sections on the 'Scenario Definition' sheet as shown below. Clicking on the buttons labeled A, B, and C at the top of each column loads input values to the 'Active Scenario' column located at the right of the 'Utility Portfolio' section (not shown). Users can select a 'Full Policy Group' of minimum, moderate, or high options, or they can select an option for each individual policy group. Once selected, the cells containing the active input values are highlighted in yellow (*). *In this sample view, the 'moderate' level full policy group is selected.*



Auto and Fuel Technology	*Building Efficiency*	*Utility Portfolio*
• *Internal combustion engine (ICE) vehicle fuel efficiency (miles per gallon)* • *Fuel price ($ per gallon)* • *Well-to-wheels GHG emissions from fuel (lbs CO2e per gallon)* • *Tank-to-wheels GHG emissions from fuel (lbs CO2e per gallon)* • *Percent alternative/electric vehicles* • *Battery electric vehicle efficiency (miles/kWh)* • *Plug-in hybrid electric vehicle efficiency (miles/kWh)*	• *New residential energy efficiency (% reduction from 2005 baseline use)* • *New commercial energy efficiency (% reduction from 2005 baseline use)* • *New residential water efficiency (% reduction from 2005)* • *Energy efficiency/conservation improvements for base/existing residential building stock (year-upon-year % reduction)* • *Energy efficiency/conservation improvements for base/existing commercial space (year-upon-year % reduction)* • *Percent of base/existing residential buildings replaced each year* • *Percent of base/existing commercial floorspace replaced each year* • *Electricity price ($ per kWh)* • *Natural gas price ($ per kWh)* • *Water price ($ per acre foot)*	• *Residential & commercial building electricity emissions (lbs CO_2e per kWh)* • *Residential & commercial building natural gas emissions (lbs CO_2e per therm)*

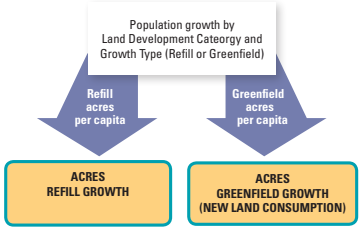
OUTPUT METRICS

The following sections describe how the model uses input assumptions to calculate results in each of the metrics categories. The categories of output metrics are summarized below.



LAND CONSUMPTION

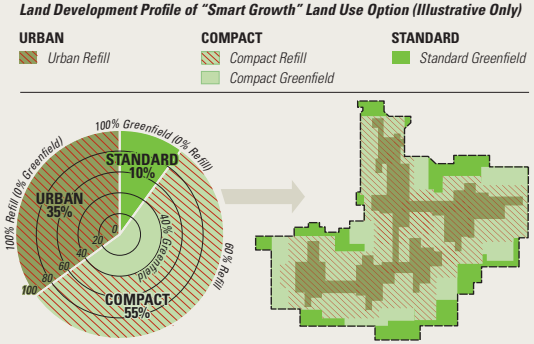
Land consumption includes all land that will be developed to accommodate population and job growth, including residential and employment areas, transportation alignments, open space, and public lands. The Rapid Fire model estimates land consumption using per-capita rates of land consumption, which vary by Land Development Category and the distribution of growth into greenfield or refill development. Default rates are based on studies of existing and planned development, and can be adjusted by the user.

Land consumption includes both refill and greenfield growth. Refill growth includes all development that may occur within the bounds of already-developed, urbanized areas, including infill, redevelopment, and greyfield and brownfield development. Greenfield growth refers to development that occurs on land that has not previously been developed or otherwise impacted, including agricultural land, forest land, desert land and other virgin sites. Only greenfield growth is counted towards the "new land consumption" of a scenario. The default land consumption characteristics for the three LDCs are as follows:

Urban: Comprised entirely of infill, redevelopment, greyfield, and brownfield growth, the Urban LDC consumes no greenfield acreage per capita.

Compact: Representing a combination of smart mixed-use growth in and around the urban edge (greenfield growth) as well as larger-scale greyfield growth within urban areas, the Compact LDC consumes a moderate acreage per capita. The land consumption rate for Compact growth is determined in part by the proportion of growth allocated to refill versus greenfield sites.

Standard: Generally consisting of lower-density, auto-oriented residential and commercial development, the Standard LDC consumes the highest acreage per capita since most, if not all, growth occurs on greenfield land. The new land consumption of a scenario is largely dictated by its proportion of Standard development.



The specific allocation of growth to either refill or greenfield land in each LDC and time period can vary by land use option. By setting assumptions for the proportion of refill growth and greenfield land consumption, as well as the intensity of greenfield growth in terms of acres consumed per capita, users can model a range of land-use policy options, from business-as-usual growth, to the application of urban growth boundaries, to a restriction of growth to refill parcels and sites only.

A land development profile resulting from the LDC mix of the Rapid Fire default "Smart Growth" land use option is illustrated in the figure below.

Refill Growth and Greenfield Land Consumption

The LDCs differ significantly in the population allocated to either refill growth or greenfield land. The assumed proportions for Urban and Standard are straightforward: all Urban development takes place as refill growth, while virtually all Standard development takes place on greenfield land. These characteristics are elemental to the Urban and Standard LDC definitions. The land consumption characteristics of Compact development, however, can vary significantly over time, by scenario, and by geographic area. The incremental land consumption rate of the Compact LDC is largely dependent on the assumed proportion of refill growth vs. development on new land.

Land Development Profile of "Smart Growth" Land Use Option (Illustrative Only)

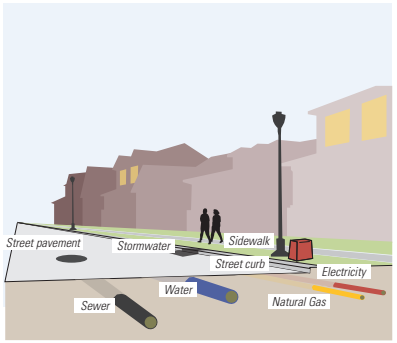
URBAN DESIGNERS, PLANNERS, ARCHITECTS

FISCAL IMPACTS

The Rapid Fire model's fiscal impacts analysis module allows users to compare the cost and budget implications of varying scenarios and forms of development. The Rapid Fire model incorporates cost and revenue data from a number of local, regional, state, and utility sources to derive infrastructure cost factors on a per-housing unit basis according to land use option and development condition (refill or greenfield). Estimates are made for capital infrastructure costs, operations and maintenance costs, and city revenues from taxes and fees.

Capital costs for the following infrastructure elements are included:

- City costs for streets and transportation
- Water supply
- Sewage and wastewater
- Local parks

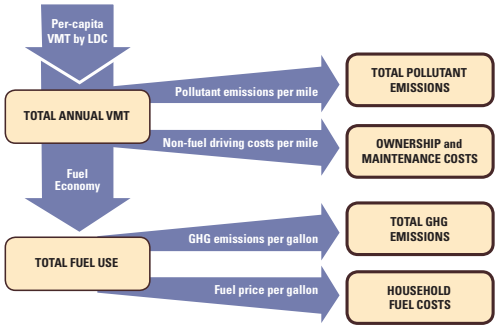


Operations and maintenance (O&M) costs estimates include the following categories of general fund spending:

- Public works functions
- General government services
- Public safety (police and fire)
- Community services

Jurisdictional revenues are estimated from the following tax and fee types:

- Property tax
- Property transfer tax
- Vehicle license fees



Calthorpe Associates worked with the firm Strategic Economics to develop the assumptions that drive infrastructure cost estimates and jurisdictional revenues. Assumptions are sensitive to development type and condition, including cost and revenue variations for both refill (infill and redevelopment) and greenfield locations. Note that the current version of the model estimates the impacts of variations in residential development unit types and patterns; future versions will incorporate the fiscal impacts due to commercial development variations.

TRANSPORTATION

All transportation metrics in the Rapid Fire model are calculated on the basis of light-duty/ passenger vehicle miles traveled (VMT). From VMT, the model estimates fuel use, greenhouse gas (GHG) and criteria pollutant emissions, and fuel and other driving costs.

Criteria pollutant emissions and non-fuel driving costs are calculated by applying per-mile assumptions to VMT. Fuel use is calculated according to vehicle fuel economy assumptions. In turn, GHG emissions are calculated based on per-gallon emission rates. All metrics are calculated on a total annual basis for every year leading up to the final horizon year. Per-capita and per-household averages are derived from annual and cumulative totals.

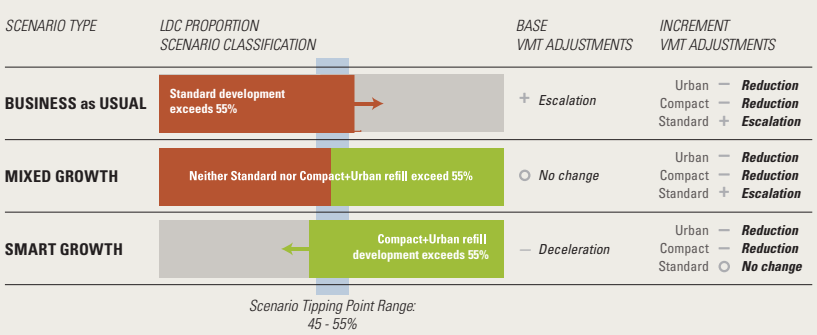
Vehicle Miles Traveled

The Rapid Fire model calculates VMT by applying assumptions about per-capita annual VMT to population growth. These assumptions, which differ by Land Development Category, are based on research and empirical evidence that per-capita VMT of both incremental (new) population and base year (existing) population vary based on the form of new growth.[1] Moreover, this variation is expected to change over time as areas become either more urban or compact, or more sprawling (determined on the proportions of LDCs in a scenario).

Variations in VMT across the scenarios is a result of year-by-year variation in per capita VMT by form of new growth (Urban, Compact, or Standard), and also the impact of new growth on the travel behavior of those already living in the study area in the base year (2005). For example, if one is living in an area 20 years from now that has seen increased transit service and/or new retail development in close proximity to their home or workplace, it is likely that they will drive less (and walk, bike, or take transit more) because daily destinations and services are closer.

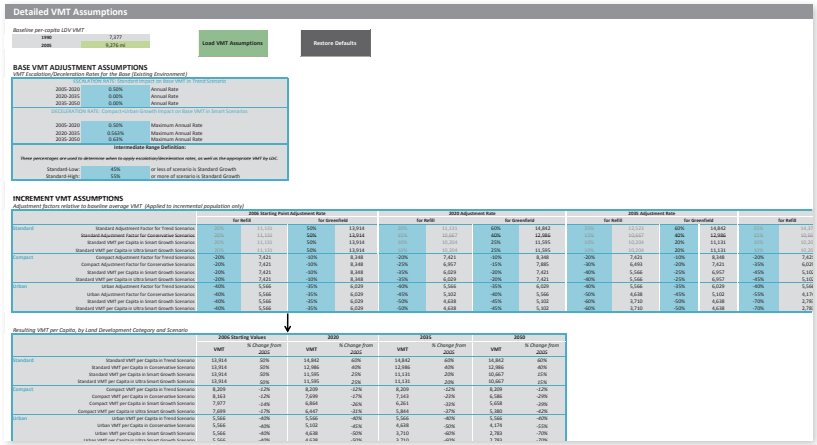
It is an a priori assumption of the Rapid Fire model that requisite transportation investments go hand in hand with growth patterns, such that scenarios with a greater focus on Compact and Urban development would see increased transit, bicycle, pedestrian, streetscape, and livability investments. Conversely, scenarios dominated by Standard development would see large budget outlays to highway and road expansion.

Base and Increment VMT Rates



The Rapid Fire VMT assumptions are applied as adjustment factors to both incremental growth and the base year (existing) population. The user defines specific percentage increases or reductions from a baseline average VMT rate (which is specific to a study area).

For the growth increment, adjustment factors for each LDC within a land use option are applied to the baseline per-capita VMT rate. For the base population, adjustment factors are applied to total base year VMT. Varying factors are applied depending on the mix of LDCs in a specific scenario, and the amount of growth that occurs on refill or greenfield land (see the Land Consumption section for more information about refill and greenfield growth). The figure on the next page summarizes the relationship between scenario mix and the application of VMT adjustment factors.



All VMT assumptions can be readily changed in the Rapid Fire model to test alternative hypotheses, integrate new empirical data, or calibrate to regional travel or other model outputs. For more detailed information about specific assumptions and their application, please refer to the *Rapid Fire Model White Paper and Technical Guide.*

TRANSPORTATION

Base and Increment VMT Adjustment Factors by Scenario Type. *If a scenario is more oriented towards Standard development, then VMT is calculated to increase at a greater rate than if a scenario is more focused towards Urban and Compact growth. Overall scenario orientation is determined using a "tipping point" range. If Standard development falls below the range, adjustment factors reflective of progressively decreasing VMT are applied; conversely, if Standard development surpasses the range, factors reflective of increasing VMT are applied. If Standard development falls within the tipping point range, then driving behavior does not change further beyond the default rates.*

Detailed VMT Assumptions Sheet. *Inputs are entered, stored, and loaded from the Study Area Selection sheet.*

TRANSPORTATION

The Rapid Fire model calculates transportation fuel use, GHG and criteria pollutant emissions, and costs by applying policy-based assumptions to output VMT. Each metric is calculated on a total annual basis for all years in the model.

Fuel Use

LDV fuel consumption is determined by applying on-road average fuel economy assumptions (miles per gallon of gasoline equivalent[2], or MPG) to VMT in each year for each scenario. Fuel economy changes year upon year according to horizon-year projections. Policy-based projections significantly affect fuel consumption, and thus GHG emission and fuel cost results. Users can easily input and test alternate assumptions, such as compliance with California's Pavley Clean Car Standards or the federal CAFE standard, either in isolation or in combination with fuel carbon intensity assumptions.

Electric and other low-emission vehicles will play an important role in reducing GHG emissions. The Rapid Fire model can reflect their impacts in either of two ways: through the use of fuel economy and emission assumptions that implicitly capture the effects of their inclusion in the fleet[3], or through the use of separate assumptions for electric and conventional (internal combustion engine) vehicles. More information about how the model estimates electric and alternative vehicle impacts can be found in the *Rapid Fire Model White Paper and Technical Guide.*

GHG Emissions

Transportation GHG emissions are calculated by applying carbon intensity assumptions, expressed in pounds of carbon dioxide equivalent (CO_2e) per gallon, to fuel consumption. Carbon intensity changes year upon year according to horizon-year projections. Projections can represent a range of standards, from a trend future in which carbon intensity remains constant or sees limited improvement, to a more aggressive policy-based future in which the carbon intensity of fuel declines significantly as low-carbon fuels, such as cellulosic ethanol and renewable biodiesel, comprise a higher proportion of fuel use.

The Rapid Fire model was designed to calculate emissions that occur upon fuel combustion ("tank-to-wheel" emissions), as well as those emitted during the full fuel lifecycle, from extraction and processing to transport and storage ("well-to-wheel" emissions). Users can look to either or both; typically, emission inventories compare tank-to-wheel emissions, although full well-to-wheel assessments are critical to developing climate change mitigation strategies. The Rapid Fire model is able to calculate both types of emission rates based on fuel mix assumptions, enabling an analysis of the role of fuel carbon intensity standards in meeting GHG reduction goals. More often, though, users will opt to model tank-to-wheel emissions on the basis of a baseline carbon intensity factor and projected reductions from it to each horizon year.

Fuel and other Driving Costs

The Rapid Fire model estimates three components of transportation costs, including fuel, auto ownership, and tires and maintenance. These costs are calculated separately using different assumptions. Fuel costs are calculated by multiplying fuel consumed by fuel price per gallon. Auto ownership and tire and maintenance costs are each calculated by multiplying VMT by an average price-per-mile factor. All per-gallon and per-mile prices change year upon year according to horizon-year projections.

Pricing Effects

Because fuel price, along with other driving costs, have been shown to have both short- and long-term effects on driving decisions, the Rapid Fire model allows users the option to "turn on" sensitivity to changes in per-mile driving costs to estimate changes in VMT due to pricing. Research into historic patterns has quantified relationships among the interrelated factors of VMT and automobile fuel economy with costs including fuel price and taxes; automobile ownership, insurance, and maintenance costs; and parking, toll, and congestion charges. The results, expressed as an "elasticity" of change in one factor with respect to change in another, can be used to estimate the effects of specific policy- or program-based assumptions on VMT.

RESIDENTIAL and COMMERCIAL BUILDING ENERGY

The Rapid Fire model calculates residential and commercial building energy use for both new and existing buildings. Scenarios vary in their building energy use profiles due to their building program and policy-based assumptions about improvements in energy efficiency.

Residential Energy Consumption

Residential energy use in the Rapid Fire model is calculated as a function of three basic sets of assumptions: a) average base-year energy use for existing units; b) base-year (2005) energy use for new units by building type; and c) reductions in building energy use resulting from advances in building energy efficiency policy and technology.

Energy Use of Base/Existing Buildings

Average per-household energy use for existing units is derived from total residential sector electricity and gas use and number of housing units in the baseline year (2005). The energy used by the population of existing units is expected to decline over time, as buildings are replaced, retrofitted, or upgraded. The extent of future energy savings due to each of these conditions are determined by user-specified rates.

Energy Use of New Buildings

Energy use for new units is calculated using per-unit factors for annual electricity and gas use. Reductions are applied to the baseline factors to reflect the assumption that, year-upon-year, new construction will be built to meet higher efficiency standards. It is also expected that new buildings can see further improvement over the time span of the model (for instance, a building built in 2011 may be retrofit by 2035 to meet even higher standards). The application of the energy use reduction assumptions applied to both new and existing units is shown in the flow chart on the following page.

Commercial Energy Consumption

As for residential energy use, commercial energy use in the Rapid Fire model is calculated as a function of three basic sets of assumptions: a) per-employee floorspace factors, b) baseline (2005) energy intensity factors, and c) reductions in building energy use resulting from advances in building energy efficiency policy and technology.

Energy Use of Base/Existing Buildings

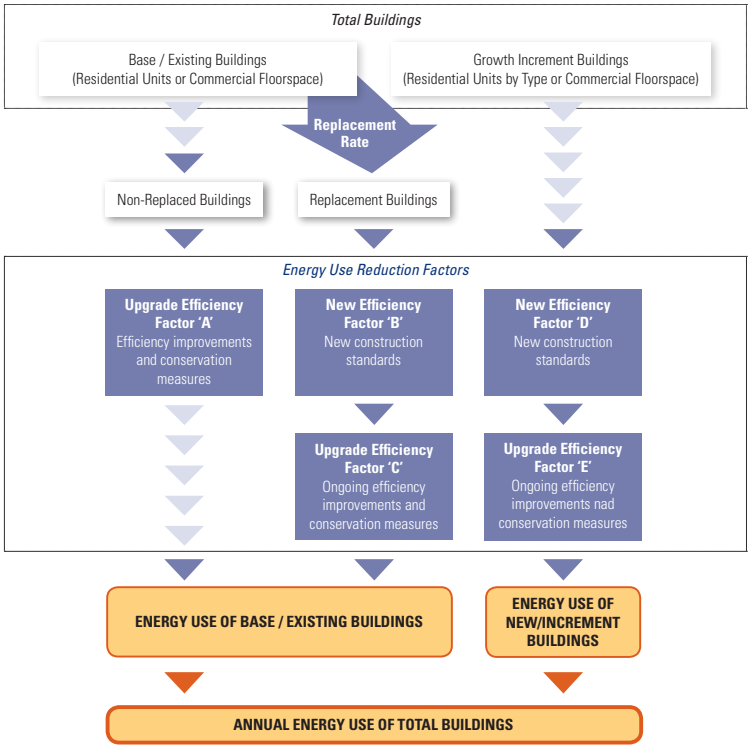
Average per-square foot energy use for existing commercial buildings is derived from total commercial sector electricity and gas use and a floorspace estimate for the baseline year (2005). The energy used by existing buildings is expected to decline over time, as buildings are replaced, retrofitted, or upgraded. The extent of future energy savings due to each of these conditions are determined by user-specified rates.

Energy Use of New Buildings

Energy use for new commercial floorspace is calculated using per-square foot energy intensity factors for annual electricity and gas use. Reductions are applied to the baseline factors to reflect the assumption that, year-upon-year, new construction will be built to meet higher efficiency standards. It is also expected that new buildings can see further improvement over the time span of the model (for instance, a building built in 2011 may be retrofit by 2035 to meet even higher standards). The application of the energy use reduction assumptions applied to both new and existing units is shown in the flow chart on the following page.

The amount of new commercial space in each scenario is calculated using assumptions about the number of employees by commercial space type (office, retail, or warehouse), and the amount of floorspace required per employee in each of the three Land Development Categories. Floorspace requirements are highest in the Standard LDC, and lowest in the Urban LDC. The number of employees by type, which is held constant for all scenarios, is projected based on demographic assumption inputs.

Baseline Annual Household Energy Use by Building Type*



Large Lot Single Family	Small Lot Single Family	Attached Single Family	Multifamily
100 million Btu	71 million Btu	54 million Btu	38 million Btu

** California averages, including residential electricity and natural gas use. Derived from the California Energy Commission Statewide Residential Appliance Saturation Survey (RASS), 2004.*

Baseline Residential Energy Use. *Because larger homes require more energy to heat and cool, home size is generally correlated with a household's overall energy consumption. Scenarios with a greater proportion of the Standard Land Development Category, which include primarily single-family detached homes, will require more energy – and produce more GHG emissions – than scenarios with a greater proportion of Compact or Urban areas, which include more attached and multifamily homes. Energy use also varies by climate zone, which can be reflected in the Rapid Fire model.*

RESIDENTIAL and COMMERCIAL BUILDING ENERGY

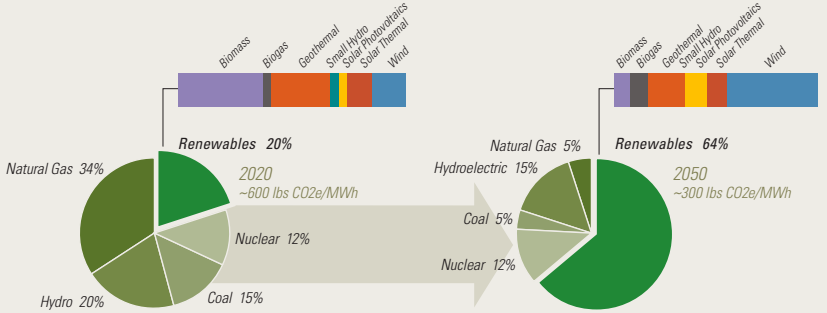
RESIDENTIAL and COMMERCIAL BUILDING ENERGY

Greenhouse Gas Emissions

Building GHG emissions include total emissions from residential and commercial electricity and natural gas use. Emission results are calculated based on energy consumption and emission rates, which are assumed to vary according to the mix of resources used to generate energy. The baseline and projected emission rates are measured per unit of energy consumed (kilowatt-hour or therm), and include carbon dioxide, methane, and nitrous oxide emissions in units of carbon dioxide equivalent (CO_2e). The same emission rates are applied to the energy used by residential and commercial buildings.

Emission Rate Assumptions

Projections are made for the horizon years of 2020, 2035, and 2050, with rates following a straight-line trend in between. The emission rate for electricity generation can be expected to decline over time, while that for natural gas use can be expected to remain constant. As with all Rapid Fire assumptions, users can enter different inputs to test the results of different policy-based projections, for instance comparing the effects of achieving California's 33% Renewables Portfolio Standard (RPS) by 2020, or by a later date.



When available, absolute projections based on analyses specific to a state or region should be used. Because emissions from electricity are subject to a number of interrelated variables that can affect resource mix and emission rates into the future – including fuel price and availability, generation costs, energy use efficiency, the market penetration of renewable energy technologies, and the amount of electricity imported from other areas – rates are technically challenging to estimate. In the absence of such projections, users can enter emission rate projections calculated as simple percentage reductions from the baseline emission rate. For a detailed discussion of energy emission rate assumptions and their application in the model, please refer to the *Rapid Fire Model White Paper and Technical Guide*.

Energy Costs

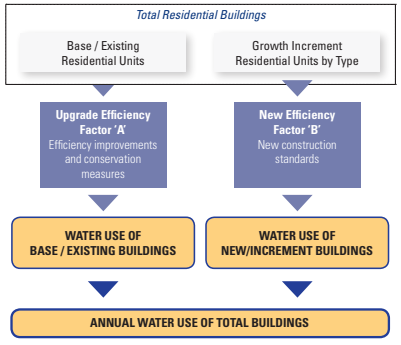
Residential and commercial energy costs are calculated on the basis of energy use and price assumptions. The model applies separate retail price factors to residential and commercial electricity and natural gas use. Price projection assumptions are expressed in constant dollars, and like all assumptions are entered for the horizon years of 2020, 2035, and 2050. Between horizon years, prices are assumed to follow a straight-line trend.

Electricity prices are expected to increase over time, in response to changes in the portfolio mix and other factors such as the cost of electricity generation resources, various infrastructure costs, overall supply and demand, and potential regulations. Electricity price projections can be estimated to correspond generally with the portfolio mix inherent to the chosen GHG emission rate assumptions, or estimated as simple percentage increases over the baseline price. Natural gas price projections can be estimated similarly.

Resource Mix and Emission Rates. *Electricity greenhouse gas (CO_2e) emissions vary based on the mix of resources used. As the share of clean and renewable energy sources in the electricity generation portfolio is increased, the average electricity emission rate will decrease. Electricity emissions are estimated based on assumed rates in 2020, 2035, and 2050. The diagram below illustrates a hypothetical move toward a cleaner portfolio and lower emission rate.*

RESIDENTIAL WATER USE

Water Consumption



Residential water use in the Rapid Fire model is calculated as a function of three basic sets of assumptions: a) average base-year water use for existing units; b) base-year (2005) water use for new units by building type; and c) reductions in building water use resulting from advances in water efficiency policy and technology.

Water Use of Base/Existing Buildings

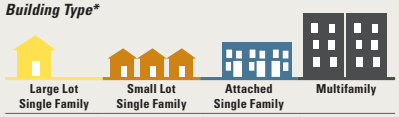
Average per-household water use for existing units is derived from total residential sector water use and housing units for the baseline year (2005). The energy used by the population of existing units is expected to decline over time, as water-saving measures are implemented. The extent of future energy savings due to each of these conditions are determined by user-specified rates – expressed as percentage reductions from baseline use – to each horizon year.

Water Use of New Buildings

Water use for new units is calculated using annual per-unit usage factors, which vary by building type. Reductions are applied to the baseline factors to reflect the assumption that, year-upon-year, new homes will be built with the technology to meet higher efficiency standards. It is also expected that new buildings can see further improvement over the time span of the model (for instance, a building built in 2011 may be upgraded by 2035 to meet even higher standards). The application of the water use reduction assumptions applied to both new and existing units is represented in the flow chart below.

Water Costs

Residential water costs are calculated on the basis of water use and retail water price assumptions. Water price projections are expressed in constant dollars per acre-foot, and like all assumptions are made for the horizon years of 2020, 2035, and 2050. Between horizon years, prices are assumed to follow a straight-line trend.



Water prices are expected to increase over time in response to limited supply and the potential application of pricing strategies to promote water conservation. Users can make absolute price assumptions based on specific policies, or assume a year-upon-year rate of increase.

GHG Emissions from Water-Related Energy Use

Water-related GHG emissions result from two main categories of energy use: a) system uses, including the transport, treatment, and distribution of water consumed; and b) end uses, including all uses of water that occur within homes (e.g., water heating).[22] The Rapid Fire model calculates energy use and emissions for system uses, while emissions resulting from end uses are accounted for as a component of residential and commercial building energy emissions.

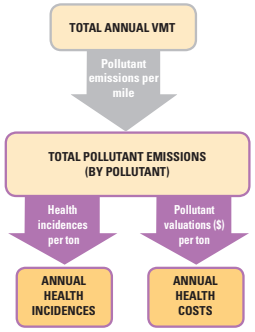
Baseline Water Use. *Because larger homes with larger yards require more water for landscape irrigation, lot size is generally correlated with a household's overall water consumption. Scenarios with a greater proportion of the Standard Land Development Category, which include primarily single-family detached homes, will require more water – and produce more GHG emissions – than scenarios with a greater proportion of Compact or Urban areas, which include more attached and multifamily homes. Outdoor water needs also vary with climate. For California, the Rapid Fire model estimates outdoor water needs according to reference evapotranspiration (climate-based irrigation factors) for different geographic areas.*

2005 Annual Household Water Use by Building Type*

Large Lot Single Family	Small Lot Single Family	Attached Single Family	Multifamily
194,000 gal	125,000 gal	93,000 gal	89,000 gal

** California statewide baseline average consumption figures include indoor and outdoor water use. Indoor use is based on per-capita averages; outdoor use is based on generalized assumptions about landscape area and irrigation requirements.*

PUBLIC HEALTH



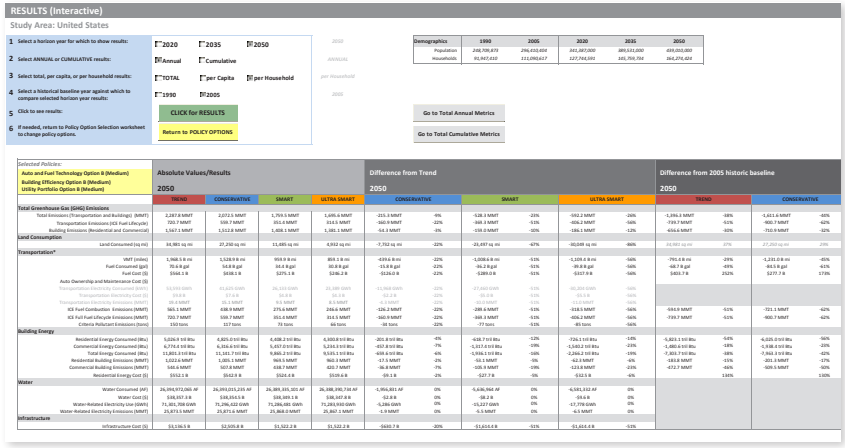
The Rapid Fire model calculates the public health impacts of automobile transportation-related air pollution. The number of health incidences, and their related costs, are calculated on the basis of criteria air pollutant emissions (measured in tons).[4] Note that these metrics express differences among scenarios, rather than as measurements of total health incidences or costs.

Health Incidences

Health incidences include cases of: premature mortality; chronic bronchitis; acute myocardial infarction; respiratory and cardiovascular hospitalizations; respiratory-related ER visits; acute bronchitis; work loss days; asthma exacerbation; and acute, lower, and upper respiratory symptoms. Per-ton assumptions for each of these incidences are individually applied to emissions of the following criteria pollutants: PM2.5, SOx, NOx, and VOC. The incidences are then totaled.

Health Costs

Health costs are based on per-ton valuations of emissions of the following pollutants: PM2.5, SOx, NOx, CO, VOC, and indirect PM from NOx, SOx, and VOC. As for health incidences, these valuations are applied to emissions of individual pollutants, and then totaled.



MODEL RESULTS

Viewing Model Results

Users can view model outputs through the model's static results summary (the "Results" sheet) or the automated interface of the "Interactive Results" sheet. The automated interface allows users to customize the results display according to the following parameters:

- Horizon year (2020, 2035, or 2050)
- Annual (single-year) or cumulative (multiple-year leading up to horizon year) metrics
- Total, per capita, or per household basis for metrics
- Comparison of annual metrics against historic baseline year (1990 or 2005)

Below is a sample view of the "Interactive Results" sheet.

Interactive Results Sheet. *Results are automatically displayed according to the parameters selected.*

THE VISION CALIFORNIA PROCESS

The development and application of the Rapid Fire model is part of the Vision California process, an unprecedented effort to explore the role of land use and transportation investments in meeting the environmental, fiscal, and public health challenges facing California over the coming decades. Funded by the California High Speed Rail Authority (*cahighspeedrail.ca.gov*) and the California Strategic Growth Council (*www.sgc.ca.gov*), Vision California will:

- Highlight the unique opportunity presented by California's planned High Speed Rail network in shaping growth and other investments.
- Frame California's development issues in a comprehensive manner, illustrating the role of land use in meeting greenhouse gas (GHG) reduction targets through robust analysis.
- Illustrate the connections between land use and other major challenges, including water and energy use, housing affordability, public health, farmland preservation, infrastructure provision, and economic development.
- Clearly link land use and infrastructure priorities to mandated targets as set forth by AB 32, SB 375, and the California Air Resources Board (CARB).
- Produce scalable tools, for use by state agencies, regions, local governments, and the non-profit community, which can defensibly measure the impacts of land use and transportation investment scenarios.
- Build upon Blueprints and other regional plans to produce statewide growth scenarios that go beyond regional boundaries and assess the combined impact of these plans.
- Connect state and national goals for energy independence, energy efficiency, and green job creation to land use and transportation investments.

Vision California is driven in part by the challenges set forth by the 2006 passage of the California Global Warming Solutions Act (AB 32), which sets aggressive targets for the reduction of greenhouse gas emissions (GHGs). The project is designed to provide critical context for the implementation of Senate Bill 375 (SB 375) and land use-related GHG-reduction targets for local governments, as it will illustrate and comprehensively measure the role of land use and SB 375-mandated regional "Sustainable Communities Strategies" in meeting AB 32 GHG targets.

Two new scenario development and analysis tools are being used to compare physical growth alternatives – the Rapid Fire model, and the 'Urban Footprint' map-based model. These related tools serve distinct purposes: while the spreadsheet-based Rapid Fire model quickly produces metrics that bracket the range of potential impacts, the map-based Urban Footprint model produces a more refined analysis that is greatly sensitive to land use and demographic characteristics.

The Urban Footprint Map-Based Model. *Currently under development, the Urban Footprint model uses geographic information system (GIS) technology to create and evaluate physical land use-transportation investment scenarios. Scenarios are defined through the application of 'Place Types' to the environment. The model's suite of Place Types represents a complete range of development types and patterns, from higher density mixed-use centers, to separated-use residential and commercial areas, to institutional and industrial areas. The physical and demographic characteristics associated with the Place Types are used to calculate the impacts of each scenario. Output metrics will include: land consumption; infrastructure cost (capital as well as operations and maintenance); building energy and water consumption, cost, and associated CO_2 emissions; public health impacts; vehicle miles traveled and all related fuel, GHG, and pollutant emissions; and non-auto travel mode share and other related travel metrics.*

BACKGROUND

Rapid Fire Model Output Metrics and Input Assumptions

Summary of Output Metrics

Land Consumption
- Land Consumed (square miles)
- Non-Residential Land Consumed (square miles)

Infrastructure Cost
- Capital Costs for Roads and Wet and Dry Utility Provision ($)
- Operations and Maintenance Costs ($)
- City Revenues from Residential Development ($)

Transportation System Impacts and Emissions
- Vehicle Miles Traveled (VMT) (miles)
- Fuel Consumed (gal)
- Fuel Cost ($)
- Transportation Electricity Consumed (kWh)
- Transportation Electricity Cost ($)
- Transportation Electricity CO_2e Emissions (MMT)
- ICE Fuel Combustion CO_2e Emissions (MMT)
- ICE Full Fuel Lifecycle CO_2e Emissions (MMT)
- Criteria Pollutant Emissions (tons)

Public Health Impacts Related to Transportation Emissions
- Respiratory and Cardiovascular Health Incidences (#)
- Health Costs associated with Health Incidences ($)

Building Energy, Cost, and Emissions
- Residential Energy Consumed (Btu)
- Commercial Energy Consumed (Btu)
- Total Energy Consumed (Btu)
- Residential Building CO_2e Emissions (MMT)
- Commercial Building CO_2e Emissions (MMT)
- Residential Energy Cost ($)
- Building Water Use, Cost, and Emissions
- Water Consumed (AF)
- Water Cost ($)
- Water-Related Electricity Use (GWh)
- Water-Related Electricity CO_2e Emissions (MMT)

Total Greenhouse Gas (GHG) Emissions
- Total CO_2e Emissions (Transportation & Buildings, MMT)

Building Program
- Housing type mix (# and %)

Summary of Input Assumptions

Demographics
- Baseline population and population growth
- Baseline households and household growth
- Baseline housing units and housing unit growth
- Baseline non-farm jobs and job growth

Scenarios
- Land Development Category (LDC) proportions for each scenario and time period
- Housing unit composition for each LDC

Infrastructure Cost
- Per-unit capital cost assumptions for roads and wet and dry utility provision by building type and Land Development Category (LDC)
- Per-unit operations and maintenance cost assumptions for roads, utilities, and public services by building type and LDC
- Per-unit revenue assumptions by building type and LDC

Land Consumption
- Percent greenfield vs. infill/greyfield/brownfield growth for each land development category, scenario, and time period
- Acres per capita required for greenfield development in each land development category, scenario, and time period

Vehicle Miles Traveled (VMT)
- Baseline Per Capita Light Duty Vehicle (LDV) VMT
- VMT adjustment factors by LDC and scenario for growth increment population
- VMT escalation and deceleration rates for the baseline environment population
- Elasticity of VMT with respect to driving costs per mile*

Vehicle Fuel Economy and Cost
- Baseline fuel economy for total fleet, internal combustion engine vehicles alone, and alternative/electric vehicles alone
- Fuel economy in horizon years for total fleet, internal combustion engine vehicles alone, and alternative/electric vehicles alone
- Elasticity of fuel economy with respect to fuel cost

Transportation Emissions
- Baseline fuel emissions, full lifecycle (well-to-wheel) for total fleet, internal combustion engine vehicles alone, and alternative/electric vehicles alone
- Baseline fuel emissions, combustion (tank-to-wheel) for total fleet, internal combustion engine vehicles alone, and alternative/electric vehicles alone
- Percent gasoline vs. diesel in liquid fuel mix
- Composition of gasoline and diesel fuel mix
- Criteria pollutant emissions per mile traveled

Public Health Impacts Related to Transportation Emissions
- Health incidences per ton of pollutant
- Health costs per ton of pollutant

Building Energy Emissions
- Electricity generation emissions (lbs/kWh)
- Natural gas combustion emissions (lbs/therm)
- Electricity generation emissions in horizon years (lbs/kWh)
- Natural gas combustion emissions in horizon years (lbs/therm)

Residential Building Energy Use & Price
- Baselineline average annual energy use per unit for base/existing population
- Annual energy use by building type
- Housing unit replacement rate for base/existing housing stock
- Upgrade efficiency reduction factor 'A' for base/existing housing stock
- New efficiency reduction factor 'B' for replacement units of base/existing housing stock
- Upgrade efficiency reduction factor 'C' for replacement units of base/existing housing stock
- New efficiency factor 'D' for new units of the growth increment
- Upgrade efficiency factor 'E' for new units of the growth increment
- Baseline residential electricity and gas prices
- Residential electricity and gas prices in horizon years

Commercial Building Energy Use & Price
- Non-farm job proportion by floorspace-type category
- Floorspace per employee by category for each LDC
- Commercial space replacement rate for base/existing housing stock
- Baseline average annual energy use per square foot for base/existing commercial space
- Annual baseline energy use for new commercial space
- Replacement rate for base/existing commercial space
- Upgrade efficiency reduction factor for base/existing commercial space
- New efficiency reduction factor for replacement commercial space
- Upgrade efficiency reduction factor for replacement commercial space
- New efficiency factor for new floorspace of the growth increment
- Upgrade efficiency factor for new floorspace of the growth increment
- Baseline commercial electricity and gas prices
- Commercial electricity and gas price in horizon years

Residential Building Water Use
- Baseline per capita indoor water demand by building type
- Baseline per-unit outdoor water demand by building type
- New residential water efficiency (% reduction from 2005)
- Baseline water price ($/acre foot)
- Water price in horizon years ($/acre foot)

Residential Water-Related Energy Use and Emissions
- Average water energy proxy (electricity required per million gallons water used)

D. Technical Methodology for 2012–2035 RTP/SCS Land Use Development Pattern

2012–2035 RTP/SCS Alternatives Creation Process

Using the public dialogue and feedback from the analysis of the 2012–2035 RTP/SCS Scenarios, SCAG developed the 2012–2035 RTP/SCS Plan alternatives. These land use alternatives tested the influence of future land use changes on a variety of metrics, including travel behavior and associated greenhouse gas emissions. A side-by-side comparison of alternative visions of the future is provided, which is helpful for weighing the costs and benefits of different policy choices.

The following steps were undertaken before the alternative creation process could proceed:

1. Implemented a public outreach process;
2. Using public input, determined the range of alternatives, and the associated parameters, policies and controls to be tested; and
3. Defined the appropriate building blocks for the alternatives, knows as Community and Development Types.

The Alternatives and Parameters

FOUR ALTERNATIVES

Four alternatives were modeled as part of the alternative creation process. The alternatives were modeled to the years 2020 and 2035. The first alternative was a trend-based alternative called No Project Alternative. The second alternative, Alternative A, was based on the adopted regional RTP growth forecast and local General Plans. The Plan Alternative (B) maintains city-level growth forecasts, but makes shifts within cities to focus future growth around existing and planned High-Quality Transit Areas (HQTAs) and other opportunity areas. The fourth alternative, Alternative C, has the fewest fixed parameters and shifts a substantial amount of regional growth from suburban areas not well served by transit into compact communities clustered around transit.

No Project Alternative

The No Project Alternative represents a future in which growth continues based on past trends. The alternative includes significant growth in suburban areas not well served by transit. New housing growth in this alternative is predominately in single-family subdivisions. Housing and jobs continue to be built separate from one another. The overwhelming majority of travel around the region continues to be made by car with relatively few new opportunities for walking or biking.

Alternative A

Alternative A is a combination of the adopted RTP Forecast and local General Plans. The alternative is controlled to the TAZ-level RTP forecast in terms of single-family and multi-family housing, and retail, office and industrial employment. These detailed forecasts are accommodated in accordance with the local General Plans. The alternative represents the most likely future for the region assuming the implementation of local General Plans. For this alternative, no adjustments were made to the land use, socioeconomic, and transportation data of the two delegated subregions (GCCOG and OCCOG).

Plan Alternative (B)

The Plan Alternative is driven by two main policy objectives: focusing more regional growth around High-Quality Transit Areas (HQTAs) and accommodating future housing market demand. The alternative maintains city-level forecast control totals for both population, households, and jobs, however, within city boundaries, shifts are made to focus a much larger share of future growth in more compact communities around HQTAs. Future housing market demand is expected to shift significantly to small lot single-family, townhomes and multifamily housing. Again, for this alternative, no adjustments were made to the land use, socioeconomic, and transportation data of the two delegated subregions (GCCOG and OCCOG).

Alternative C

Alternative C has the fewest growth parameters and controls. The alternative assumes that all growth is accommodated according to where HQTAs are located. As a result very suburban communities may not experience new housing or employment growth, while some urban areas with very good access to regional transit may experience significant increases in housing and/or employment growth. Any revisions contemplated within Alternative C will be identified and discussed with GCCOG and OCCOG as stated in the Memoranda of Understanding, and Framework and Guidelines for Subregional SCSs.

Alternatives should be clearly distinguished from one another while also being plausible visions of the future. Establishing clear parameters for an alternative is important in order to understand the impact of a specific policy on the outcome of an alternative. The 2012–2035 RTP/SCS process resulted in four alternatives that each capture a unique vision for how future growth can be accommodated and the associated impacts to the region.

While each alternative is distinctive, a number of parameters remained constant across each alternative: the regional 2012–2035 RTP/SCS forecast total for population, households, and jobs; the detailed Tier 2 Transportation Analysis Zone (TAZ) boundaries that include jurisdiction boundaries (aligned to city boundaries to ensure that no TAZs are split between multiple cities); and the exclusion of regional parks and open space from the developable lands used in the alternatives.

The parameters that varied across the alternatives were:

- Detailed forecast- the detailed distribution of population, households, and jobs across the region;
- Housing profile- the mix of single-family and multifamily housing;
- Transit network- the transit network varied from planned to enhanced;
- High Quality Transit Areas (HQTA)- the HQTAs varied based on the variations in the transit network; and
- General Plans- the local General Plans were used to varying degree across the alternatives.

TABLE D1 Alternative Parameters[1]

Parameters	Alternatives			
	No Project Alternative	Alternative A	Plan Alternative (B)	Alternative C
Parks and Open Space	Excluded from Developable Land Capacity			
Regional Forecast Totals	Fixed			
Detailed Forecast	Trend-based for both 2020 and 2035	Adopted RTP Forecast: Controlled at TAZ level for both 2020 and 2035	Controlled to TAZ-based RTP/SCS Forecast for 2020; Controlled to city-level RTP/SCS Forecast for 2020–2035	Regional Totals Only
Transit Network	Plan Network	Plan Network	Enhanced Cost Constrained Network	Enhanced Cost Constrained Network
High Quality Transit Areas (HQTAs)	Based on Plan Network	Based on Plan Network	Based on Enhanced Cost Constrained Network	Based on Enhanced Cost Constrained Network
General Plans	Based on growth trends, not necessarily General Plans	Based on local General Plans	General Plans considered, but intensity exceeded in some transit-accessible areas	General Plans considered, but growth intensity significantly exceeded in transit-accessible areas and General Plan growth areas with no transit access receive no growth

[1] For Alternatives A and B, no adjustments were made to the land use, socioeconomic, and transportation data of the two delegated subregions (GCCOG and OCCOG) per their subregional SCS delegation agreements.

POLICIES TESTED BY EACH ALTERNATIVE

Each alternative represents a plausible future for the region based on a different set of policy options. The 2012–2035 RTP/SCS public outreach process helped identify and prioritize the policies that should be tested as part of the process. The first policy focuses on improving the pattern of recent growth by shifting dispersed single-use development into a more compact, walkable and mixed-use development pattern. The second policy is aimed at improving transit access through land use changes. Specifically, this policy option is meant to test where land uses can be intensified around transit facilities in order to improve access and mobility. The third policy tested is an attempt to match future housing market demand through land use changes. Future demographic shifts, such as an aging population, increasing immigrant population and changes in young people's housing preferences, are shifting the demand for housing away from traditional and large-lot (>5,500 SF) single-family homes to smaller single-family, townhome and multifamily housing products. The fourth policy objective is to improve the jobs-housing balance in the region.

The policies tested in each alternative are as follows:

- Growth Pattern- focus growth into more compact, walkable, mixed-use development patterns;
- Transit Access- improve regional transportation efficiency by focusing growth around transit facilities;
- Housing Profile- match future housing market demand through land use changes; and
- Jobs-Housing Balance- integrate land uses together and adjacent to one another to reduce the amount of regional auto travel and improve quality of life.

TABLE D2 Alternative Policies[2]

Policies	Existing (2008)	Alternatives			
		No Project Alternative	Alternative A	Plan Alternative (B)	Alternative C
Growth Pattern	Current development patterns include a diversity of places; growth in recent decades has been predominantly separated and single-use, however	Continues growth trends of the past 20 years; predominantly single-use growth on vacant land	Growth pattern follows local General Plans	Growth controlled at city level, however, focused almost exclusively around existing or planned transit	No city or subregional growth controls; all new growth focused around HQTA transit facilities
Transit Access	Currently 39 percent of houses have access to regional transit	Transit access declines to 36 percent of households with access to regional transit	General Plans result in an improvement in transit access; 43 percent of households have access	Over half of the region's households have access to regional transit at 50 percent	Focusing all new growth in transit areas results in 62 percent of houses having access to regional transit
Housing Profile	45 percent of all housing is multifamily and 55 percent is single-family	47 percent multifamily No significant shift in total housing profile 52 percent of new housing growth is multifamily	47 percent multifamily Slight shift in housing profile 54 percent of new housing growth is multifamily	50 percent multifamily Shift in housing profile to match future housing demand 68 percent of new housing growth is multifamily	50 percent multifamily Significant shift in housing towards multifamily as a result of focusing growth around transit 71 percent of new housing growth is multifamily
Jobs-Housing Balance		No significant subregional improvement in jobs-housing balance or increase in mixed-use development	Many General Plans include expanded areas of mixed-use; while others contain large areas planned for separated, single-use growth	In cities with transit facilities, new population, households, and jobs were located near each other to reduce the need for auto trips; however, there are still significant areas, particularly in unincorporated areas, with significant growth forecast but limited or no transit facilities	All new population, households, and jobs were located together, in mixed-use districts, near regional transit

2 For Alternatives A and B, no adjustments were made to the land use, socioeconomic, and transportation data of the two delegated subregions (GCCOG and OCCOG) per their subregional SCS delegation agreements.

Summary of Methodology and Process

The Plan Alternative was created using a three-tiered process for locating new growth from 2020 to 2035. The purpose of the Plan Alternative was to test the potential regional transportation benefits that could be accrued from a policy of focused growth near High Quality Transit Areas (HQTA). In addition to this policy objective (which represents the first tier of the process), the scenario also optimized areas served by local transit (not designated as HQTA) in communities with limited or no HQTA. This represents the second tier of the process. The final tier of the process involved allocating new growth in areas where no transit exists, nor is being planned. In those instances, the relative distribution from Alternative A was observed. Exhibit 53 illustrates the different areas where additional housing and jobs from 2020 to 2035 will be located in the Los Angeles Basin. At each point in the process, existing land use patterns, local General Plans and an understanding of regional variations in the market feasibility of different new development patterns served as additional design constraints.

STEP ONE: OPTIMIZE REGIONAL TRANSIT AREAS

The starting point for the Plan Alternative was Alternative A at year 2020, which reflected local General Plans. The first step in creating the Plan Alternative was to reallocate a portion, or in some cases all, of the 2020-2035 growth increment to TAZs well served by regional transit (with 25 percent or more of their land area within an HQTA boundary). These TAZs were designated as "HQTA TAZs."

In highly urbanized cities, where large portions are well served by regional transit, most, if not all, of their 2020-2035 growth increment could be accommodated within HQTAs. Suburban communities and unincorporated areas often had limited areas served by HQTA facilities, and thus very little of their growth increment could reasonably be accommodated in these areas.

The reallocation process attempted to balance the policy goal of optimizing growth within HQTAs with an understanding of variations in both acceptance for and market feasibility of certain levels of development intensity across the region. For instance, cities like Lancaster and Palmdale have HQTAs but allocating their entire 2020-2035 growth increment into these areas would result in development patterns that are not market feasible, and likely exceed local General Plans with regard to development intensity.

The expectation is that there is a market for Development Types such as Town Center or Town Neighborhood around transit facilities within these types of suburban communities, whereas, Urban Center and even City Center would likely not be the predominant new land use type. Conversely, urban centers such as Los Angeles, Long Beach, Anaheim and others, have significant regional transit service and significant market demand for more intense land use patterns.

STEP TWO: OPTIMIZE LOCAL TRANSIT AREAS

Nearly half of the region's transit trips occur on local transit. While the development potential around this system is not assumed to be as extensive as in areas near HQTAs, there are certainly opportunities to increase development intensity along some of these corridors.

In many instances, the amount of new growth forecast for a jurisdiction could not be reasonably accommodated within the TAZs near HQTAs, such as the following example of Palmdale. In these jurisdictions, areas adjacent to local transit facilities served as the second tier location for focusing growth.

In suburban communities with limited or no HQTA facilities, organizing growth near local transit facilities was a key strategy for achieving higher transportation efficiencies across the region than would have otherwise been achieved.

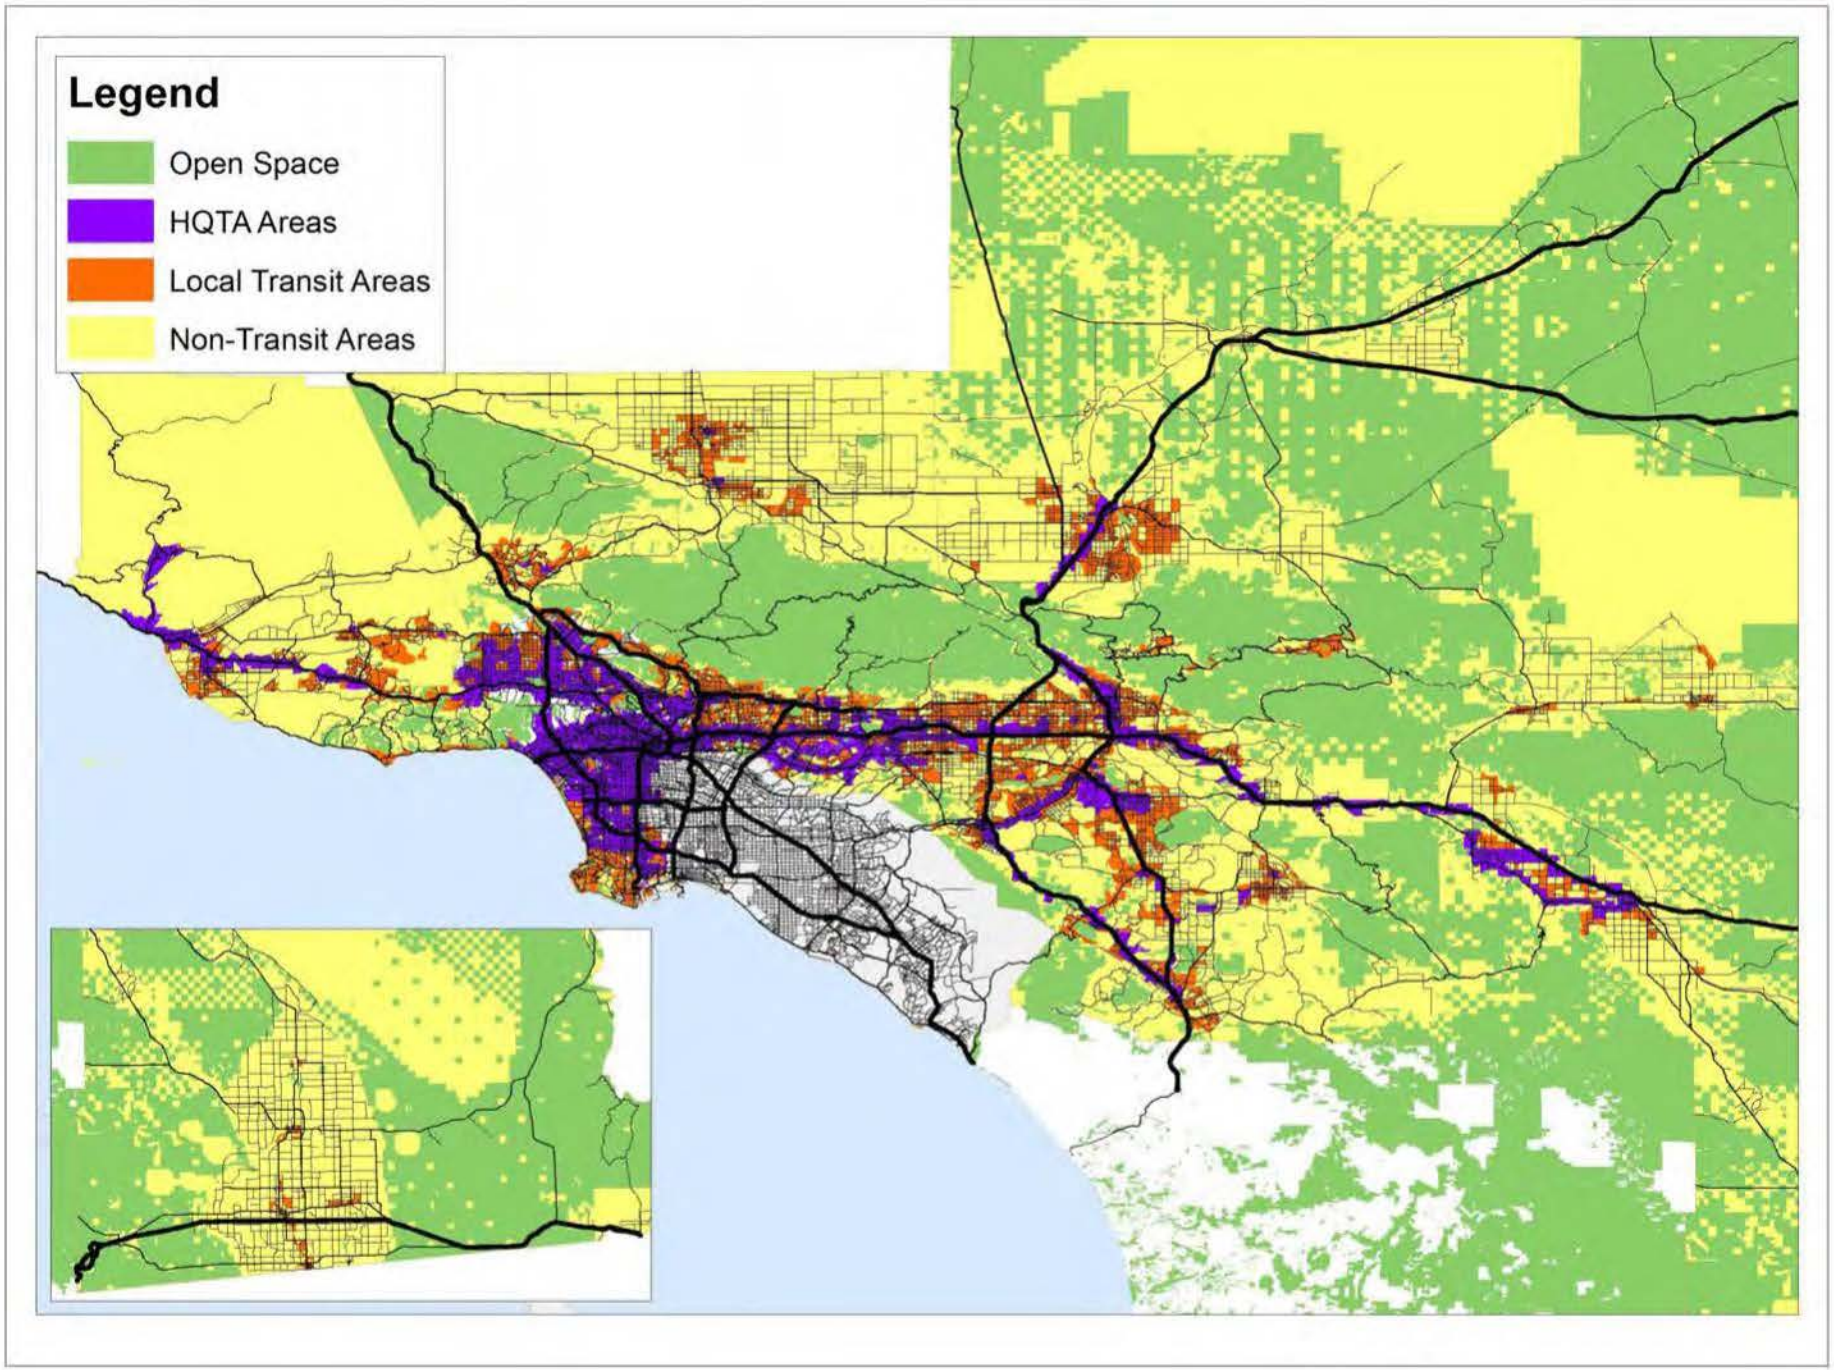
STEP THREE: ALLOCATION FOR AREAS NOT SERVED BY TRANSIT

In areas not served by transit or with very limited transit service, the growth pattern from Alternative A was assumed to remain. In areas with no transit service, the growth patterns in Alternative A were mirrored. In areas with limited transit, the area around the transit was optimized but, in most instances, could not reasonably accommodate the full growth increment. In these instances, the remaining growth was allocated proportionately based on the distribution in Alternative A.

Example Process: Palmdale

Palmdale is a suburban community located north of the City of Los Angeles, across the San Gabriel Mountains. Palmdale, along with the other cities in the Antelope Valley, have

EXHIBIT 53 Los Angeles – Three Tier Areas



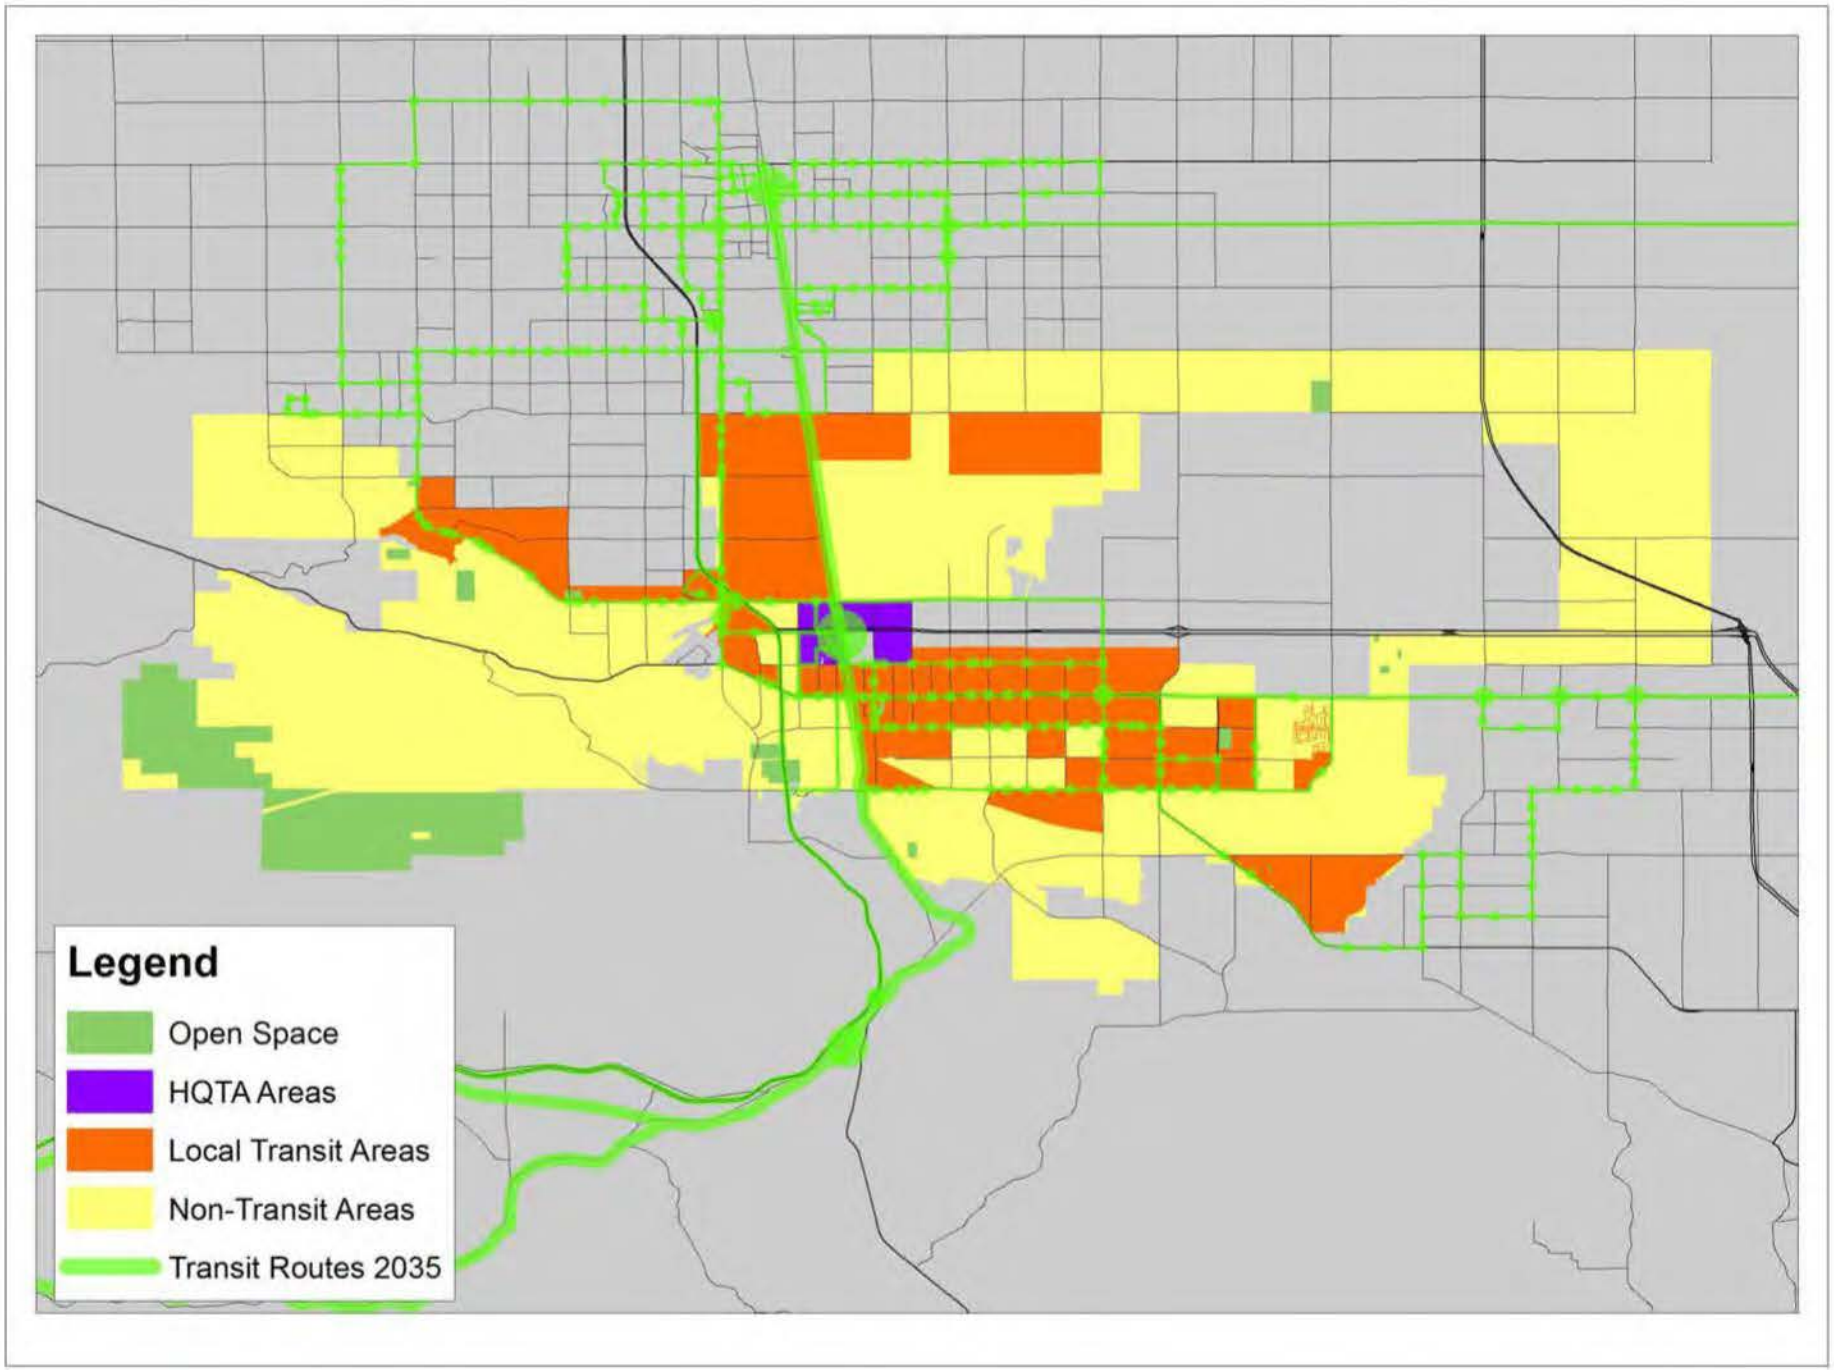


EXHIBIT 54 Palmdale – Areas for Additional Housing and Job Growth (2020 to 2035)

been, until the recent housing downturn, one of the fastest growing areas of the SCAG region. In fact, Palmdale was the fastest growing city in Los Angeles County in 2010.

Between 2020 and 2035, Palmdale is forecast to add an additional 7,500 new households. This represents a 15 percent increase over the 51,273 total households forecast in 2020. Palmdale has a single Metrolink commuter rail station and several bus lines serving the city. As a result the HQTA is quite small compared to the vacant land available at the urban fringe, as illustrated in **EXHIBIT 54**. While the HQTA is relatively small, there are over 500 acres of vacant land within the three HQTA TAZs adjacent to the Metrolink station.

It seems reasonable to expect a low- to moderate-intensity center to emerge surrounding the Metrolink station area in Palmdale by the year 2035. However, it would be unreasonable to assume that the entire growth increment could be accommodated within the HQTA. As a result, a mix of Suburban Center and Town Center were applied to the Metrolink station area.

Table D3 shows that Alternative A allocates only 52 new households on this land between 2020 and 2035, which is less than one percent of the city's housing forecast. The Plan Alternative, by contrast, envisions the HQTA becoming a low- to moderate-scale center with a mix of single-family, townhomes, and some apartments, with integrated employment and services. The resulting change would add 1,900 new households in the HQTA, representing 26 percent of the forecast for 2020 to 2035. In a suburban community like Palmdale, there is virtually no market for the very intense building types one would expect farther south in the City of Los Angeles. However, there is market demand for less expensive compact single-family, townhomes and even moderate density multifamily units.

Palmdale has a local bus network that covers a sizeable portion of the city, primarily southeast of the Metrolink station area. Local transit carries nearly half of all transit trips regionally every day. Focusing growth within walking distance of these facilities is a key strategy for reducing regional greenhouse gas emissions, particularly in areas with limited HQTAs.

The HQTA in Palmdale is not able to absorb all of the new growth for the City. However, there is significant vacant and underutilized land along several of the local transit routes. The Plan Alternative adds additional small lot single-family and townhomes onto vacant land adjacent to these transit routes. The changes are so modest that the additional households do not increase the overall density of the TAZs enough to alter the Development Type designation in most cases. With these modest changes in development intensity, the Plan Alternative was able to increase the housing capture for areas served by local transit to 62 percent—up from 48 percent in Alternative A.

The combined impact of creating a modest density center surrounding the Metrolink station and adding a broader range of housing types within a short distance of local bus service resulted in a significant reduction of housing growth in areas not served by transit. Over half of all new households allocated in Alternative A from 2020 to 2035 are in areas not served by transit. In contrast, only 12 percent of new households in the Plan Alternative are in areas not served by transit. Through relatively modest changes in density, the land use pattern in Palmdale can become much more transportation efficient.

TABLE D3 Palmdale – Household Distribution by Area

Scenario	HQTA		Local Transit Area		Non-Transit Area	
Alternative A	52	1%	3,600	48%	3,851	51%
Plan Alternative	1,926	26%	4,665	62%	910	12%

Example Process: San Bernardino

In urban areas, the process of scenario design was the same, however, in many instances the HQTAs were able to absorb a significantly higher share of new growth. The market for higher intensity buildings exists in many urban areas in the region, particularly those with higher achievable rents and places well served by regional and local transit.

The City of San Bernardino is one such example. The majority of the City is within HQTA TAZs, and most of the areas outside of the HQTAs are served by local transit, as illustrated by Exhibit 55. Through strategic increases in density in areas immediately adjacent to the station areas, the HQTAs could capture over three-quarters of the new housing growth in the Plan Alternative compared to just over one-third in Alternative A, as shown in **TABLE D4**.

EXHIBIT 55 San Bernardino – Areas for Additional Housing and Job Growth (2020 to 2035)

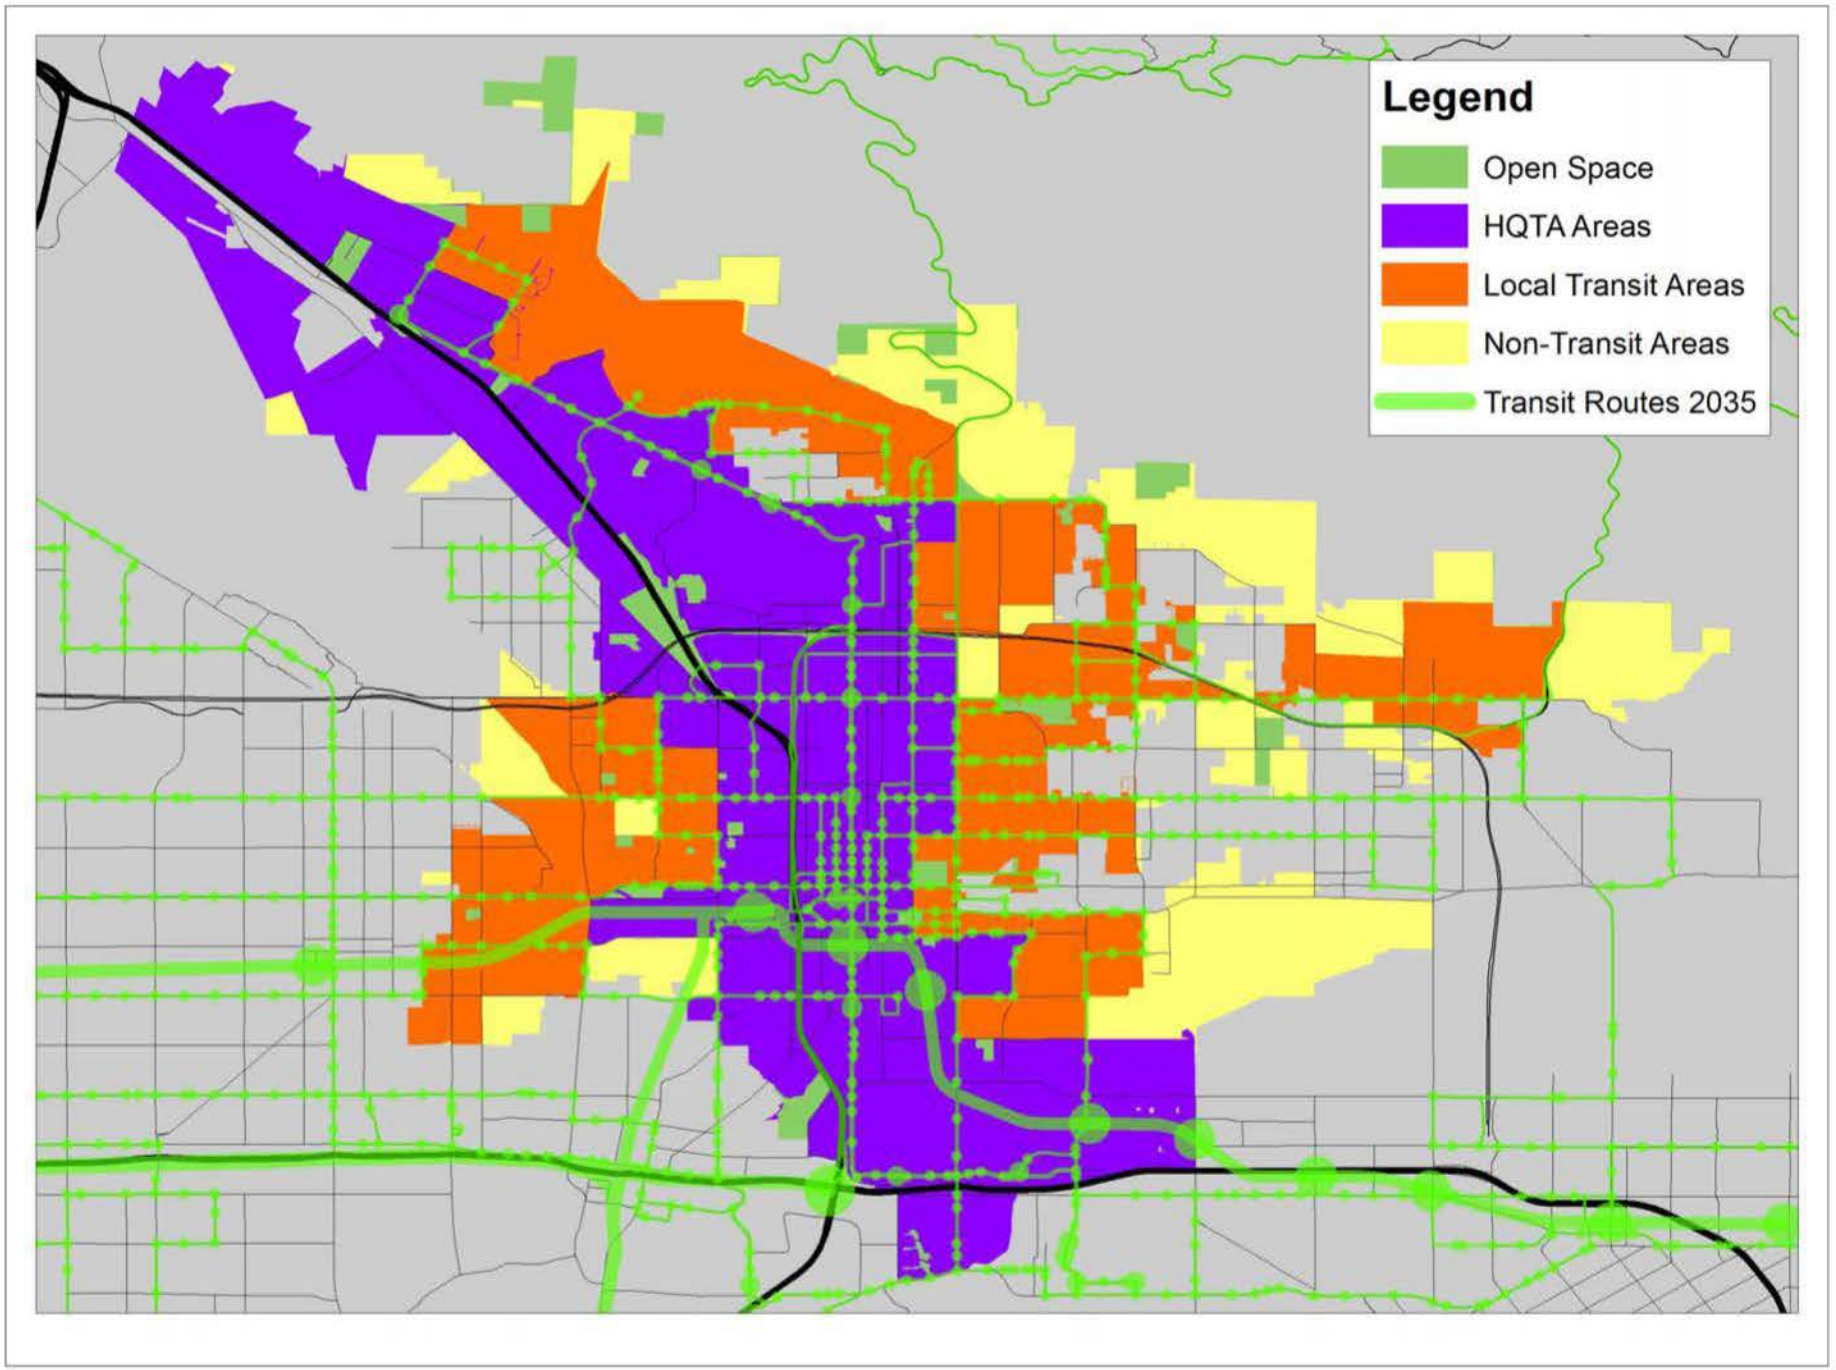

TABLE D4 San Bernardino – Household Distribution by Area

Scenario	HQTA		Local Transit Area		Non-Transit Area	
Alternative A	6,750	38%	8,400	47%	2,700	15%
Plan Alternative	13,800	77%	3,200	18%	800	5%

THE SCENARIO: ONE OUTCOME WITH MULTIPLE PATHS

The scenario planning process involves experimenting with policy options to measure potential regional costs or benefits associated with a variety of different choices. This scenario planning exercise attempted to quantify the regional benefits from improving land use efficiency around transit facilities. Undoubtedly there are multiple ways to achieve these efficiencies at the local level.

While the Plan Alternative shifted the distribution of development intensity within city boundaries, the overall city forecasts did not change. As a result of this three-tiered approach to growth location, the Plan Alternative may exceed growth expectations in some locations.

The process of creating Development Type-based regional forecasts and scenarios allows for local jurisdictions to experiment with different land use patterns at the local level that produce the same regional transportation and greenhouse gas benefits. This process allows for that level of local input to be incorporated quickly and modeled ensuring equivalent regional efficiency. A framework that allows for this local input and regional dialogue is of critical importance in the ultimate implementation of the regional policy objectives.

Community and Development Types

The Local Sustainability Planning Tool (LSPT) employs a series of Community and Development Types to describe the different types of land uses in the region. These Community and Development Types are comprised of a mix of different types of buildings along with assumptions about characteristics such as the amount of land devoted to streets, parks, and civic areas. There are two levels of detail. The first level, Community Types, is a simplified classification intended for conveying land use alternative and maps to the broader public. At a more detailed level, the Development Types are intended for modeling purposes at the Split TAZ level.

DEVELOPMENT TYPES

The Development Types were virtually painted onto the map of the region using the LSPT. Each Development Type carries with it values that describe the characteristics of the place it represents. It was important to establish a set of Development Types that represent the full range of development patterns and forms that make up the region today and into the future. In addition, these Development Types must be easy to communicate to the public and key policy decision makers. The Development Types contain a large amount of information relating to the characteristics of the landscape, including jobs and housing density, urban design and mix of land uses, and lend themselves to clear communication through photo-simulations and other types of renderings.

Through use of the LSPT, Development Types are the foundation of the land use alternatives. The LSPT uses the typologies to calculate results for a range of evaluation criteria, in advance of the four-step travel demand model including housing and job mix, densities and VMT. The alternatives are built upon, and provide data at the TAZ level including households and employment. This represents the data that is fed into the regional transportation model to determine how the potential land use pattern impacts travel behavior.

When assembling the Development Types within the sketch planning tool, SCAG began with Compass Blueprint Development Types. These Development Types were previously employed at a scale of roughly five acres through an artificial raster or ‘grid’ draped onto the virtual landscape. For the Plan Alternative, the Development Types were re-calibrated to fit the appropriate scale represented by the region’s TAZ map. The calibration was done by modifying the proportions of buildings within each Development Type to best represent the types of places represented by the scale of the TAZ within the Southern California landscape. The purpose was not to create a category to match every jurisdiction’s comprehensive plan category, but rather a description of all of the places that exist today, and those that may exist in the future.

Within the LSPT, Development Types were assigned a mix of building types, each having an associated job and housing density. Examples of building types include: mixed-use residential four stories, garden apartment, compact single-family home, office, main street retail, business flex and many others. Because Development Types make it possible

to measure evaluation criteria that rely on information tied directly to individual buildings and uses, many of the assumptions are built into the individual building spreadsheets (called prototype buildings) that were then grouped together to form Development Types.

STEPS FOR CREATING DEVELOPMENT TYPES

1. Developed prototype buildings
a. Devised a list or selection buildings that match or represent the current and potential future characteristics of the SCAG region.
b. Populated the prototype building spreadsheets with data relating to the physical form, intensity and mix of uses and financial attributes .
2. Assembled prototype buildings into Development Types
a. Selected a set or mix of buildings that would likely be found in each building block. Some Development Types are fairly homogenous. For example, a typical lower density Suburban Residential is comprised of four or fewer prototype buildings. Other Development Types, such as Town Center, require a mix of more than one dozen types of buildings to adequately represent the range of uses today, and those that will likely occur in 2035.
b. Assigned each building a percentage to indicate the portion of the Development Type that is comprised of each prototype building.
c. Added in net land reductions to account for streets, civic space and parks. The values for these reductions can usually be found in any previous land use capacity developed by the jurisdictions.

Development Types are primarily used in the sketch planning tools to perform land use analysis. The Development Types themselves do not include transportation network information, but are intended to match or complement specific transportation investments included in the scenario. Using the LSPT, the Development Types were applied to the TAZs within the SCAG region for places where growth could be located. The transportation design and assumptions served as a guide so that placement of Development Types is consistent with, and takes advantage of, planned transportation improvements and programs. For example, it may not have been highly effective to locate auto-oriented low-density Development Types in areas with existing or planned transit investments. Conversely, it would have been effective to place high-density and mixed-use Development Types in areas along transit lines and with well-connected streets.

Following is a list of the Development Types employed in the 2012–2035 RTP/SCS Plan Alternative.

Urban Center

(82–120+ housing units/acre; 260–320+ jobs/acre)

Urban Centers are the highest intensity areas. The best examples would be places such as Downtown Los Angeles or high intensity corridors such as Wilshire Boulevard. These centrally-located areas are jobs rich with significant amounts of employment, typically located in high-rise office buildings. Housing is also typically located in multi-story buildings located in more urbanized neighborhoods. These areas are well-served by transit and typically represent the convergence of a number of high capacity transit facilities. The Urban Center development type can be used in several parts of the region to signify high density land uses, mixing of uses and a saturation of non-auto transport options.

City Center

(48–82 housing units/acre: 120–260 jobs/acre)

City Centers are similar to Urban Centers. The mix of jobs to housing is similar as they too are significant employment centers. They are on average roughly one-half the intensity of urban centers. They share similar levels of transit and other non-auto infrastructure. They are likely home to one or two high capacity transit facilities and a number of bus routes. The City of Pasadena provides a relevant reference for the City Center development type.

Town Center

(16–48 housing units/acre; 30–120 jobs/acre)

Town Centers are another highly mixed-use development type. They are roughly one-third the level of intensity as found in the City Centers. They are employment centric but also provide housing opportunities that are located very close to daily services and jobs, but in a smaller town type of setting. Cities such as Ventura or Santa Monica are examples of Town Centers. Buildings are generally less than six stories on average. Sidewalks and bike facilities are plentiful and the areas typically benefit from one high capacity transit facility and local buses.

Suburban Center

(Up to 16 housing units/acre; Up to 30 jobs/acre)

Suburban Centers can contain a mix of uses, but may alternately have a focus towards either jobs or housing with very little mix. These areas are predominately served by automobiles, but likely have bus service or in some cases commuter rail. Buildings are typically one or two stories, but in some cases will go higher when surrounded by ample landscaping. These areas do provide some travel choice, but not at the scale of the Town or City Centers.

Urban Residential

(At least 60 housing units/acre; Up to 10 jobs/acre)

Urban residential areas represent high density concentrations of housing, typically in residential high-rise buildings. Because of the high number of residents, these areas provide a large number of customers for business districts located nearby. Within the district there may also be pockets of shopping, restaurants and some professional services. These neighborhoods benefit from excellent transit service, and are typically situated along or near at least one high capacity transit corridor.

City Residential

(30–60 housing units/acre; 4–10 jobs/acre)

These are relatively high density residential areas. They are typified by pre-war development patterns containing a mix of single- and multifamily housing. Buildings range from one- and two-story bungalows to five- or ten-story apartments and condos. Major streets in and near the neighborhood have high frequency bus service. Jobs in these areas are limited to some home offices and small, local-serving shops and restaurants. Residents in these areas have quick access to a range of activities and job locations using multiple modes of transportation.

Town Residential

(14–30 housing units/acre; 2–4 jobs/acre)

This typology is characterized by common prewar neighborhoods of single-family homes on modest lots, with the some garden apartments located near commercial streets. Townhomes, duplexes and accessory dwelling units will be interspersed, likely on corners or between apartments and single-family homes. The streets in these neighborhoods are generally low volume and include full sidewalk coverage and parking on the street. They are easily navigable via car, bike or on foot, with transit service often located within one-quarter- to half-mile of homes.

Suburban Residential

(Up to 14 housing units/acre; Up to 2 jobs/acre)

These neighborhoods have been the dominant form of housing in the region for the last several decades. These areas are the least dense form of development typified by homes with larger lots and are separated from active commercial and service areas. Utilizing transit often requires residents to drive to nearby park-and-ride facilities.

Urban Employment

(Up to 10 housing units/acre; At least 180 jobs/acre)

The Urban Employment development type is focused on jobs. Buildings are typically high-rise with parking in multi-level structures or underground. These districts are typically located in the center of an urban core and served by multiple high capacity transit lines. These districts will draw their employees from throughout the region.

City Employment

(Up to 10 housing units/acre; 90–180 jobs/acre)

This development type represents the employment core of a city. Jobs are typically in high-rise structures with a mix of surface and structured parking. These areas are often served by one or more high capacity transit lines. They will draw workers from nearby neighborhoods and cities.

Town Employment

(Up to 6 housing units/acre; 30–90 jobs/acre)

This development type represents the employment core of a smaller town, or an independent job node. Jobs are typically in low- to mid-rise structures with mostly surface parking. These areas are often served by one high capacity transit line, or frequent bus service. They will draw workers from nearby neighborhoods and some from adjacent cities.

Suburban Employment

(Up to 2 housing units/acre; 6–30 jobs/acre)

This development type represents job nodes that are typically situated along major arterials or near interchanges. The job density is low and likely to take the form of retail, restaurants or personal services. Jobs are typically in one-story structures with surface parking. These areas are served primarily by automobiles, but may have bus access or be located near commuter rail facilities.

Rural

(Up to 2 housing units/acre; Up to 6 jobs/acre)

This development type is more diverse. While it includes both jobs and housing, the two are rarely found together. Housing is typically in acreage lots or ranchettes, often far from services or jobs. Jobs are likely to be located in isolated nodes such as rural cross-roads or highway service areas. These areas are rarely served by transit, and the few people who occupy these areas greatly rely on their automobiles.

COMMUNITY TYPES

As previously mentioned, the future land use pattern of the region also employs a series of Community Types, which serve as a simplified classification used to describe the general conditions likely to occur within a specific area. These Community Types are aggregations of the thirteen Development Types used for modeling purposes. Following is a listing of the Community Types employed in the 2012–2035 RTP/SCS Plan Alternative.

Urban

Urban areas are the highest intensity Community Type. These centrally located districts have significant amounts of employment and corresponding residential uses and retail, typically located in a dense cluster of multi-story buildings and high-rise buildings. Urban areas are also typically located at the convergence of a number of high capacity transit facilities complemented by non-auto infrastructure that also provide access and connectivity.

City

The City community type is on average one-half the intensity of the Urban community type. These areas contain significant employment centers and a mix of medium- and high-density housing, supported by retail and daily services. One to two high capacity transit facilities, a number of bus routes, and non-auto infrastructure provide access and connectivity to a range of activities and locations.

Town

The Town community type provides low- to medium-density housing opportunities that are located close to local-serving retail and daily services. These areas are characterized by an employment core or an independent job center in low- to mid-rise structures. Sidewalks and bike facilities are adequate and the areas benefit from one high capacity transit facility and local buses.

Suburban

Suburban areas contain a mix of uses, but often have one predominant use, such as residential or office. Residential areas are typically low-density with larger lots and are separated from retail and other daily service uses. Though these areas are predominantly served by automobiles, bus service and commuter rail may also operate in certain neighborhoods.

Rural

Rural areas include both jobs and housing, though these two uses are rarely found in close proximity to each other. Housing is characterized by acreage lots and ranches, and is often far from commercial and employment activities, which occur in isolated nodes located on rural cross-roads and highway services zones. Transit and non-auto facilities rarely serve these areas, making automobile use the most frequent mode of travel.

E. 2012–2035 RTP/SCS Alternatives

Alternatives Analysis Framework

The alternatives analysis framework recognizes that this region is fortunate to have its citizens approve all the half-cent sales tax measures presented to the voters to date (three in Los Angeles; one in Riverside, San Bernardino, Orange, and Imperial counties). These and other local funds account for 71 percent of available transportation funding in the region. Together with state and federal funding, the region has over $300 billion available moving forward. These funds will allow for transit expansion, maintenance of the highway system, some congestion relief improvements, bikeway improvements, non-motorized enhancements, and several community mitigation investments. As a result, the $300 billion transportation investment will lead to improved mobility and accessibility, cleaner air, more jobs, and a more competitive regional economy.

In order to provide the kind of 2035 future Southern California deserves and needs in transportation and overall quality of life opportunities, additional investments should be considered by policy leaders to ensure a safe, reliable, and state of good repair for the transportation network. The alternatives developed for the 2012–2035 RTP/SCS address these challenges by assuming funding from various pricing strategies.

It should be noted that significant progress has been made throughout the region over the past decade towards sustainable growth. Such positive trends are largely reflected in the locally supported socio-economic data (growth forecast) through 2035 that serve as the foundation for each of the alternatives.

The discussion regarding alternatives began at the Plans and Programs Technical Advisory Committee (P&P TAC) with an initial set of three preliminary scenarios that used varying land use scenarios with progressively higher levels of investments on non-auto strategies including transit, bike and pedestrian improvements, and TDM and TSM strategies. Subsequently, these scenarios were further refined and analyzed using the Rapid Fire Model. Results from this effort were utilized to create refined scenarios for the 18 2012–2035 RTP/SCS workshops SCAG conducted through the months of July and August throughout the region. Information gathered through this process has helped further refine and shape the alternatives.

Each of the alternatives will be defined by its components. Key components associated with each of the alternatives are as follows:

- Growth Forecast/Socio-Economic Data (SED)/Land Use;
- Transportation Network (highways and arterials, light and heavy rail, commuter rail, inter-city rail, bus rapid transit, fixed route buses, high speed rail);
- Transportation System Preservation Investment level;
- Pricing Strategies (user fee, HOT Network, cordon pricing);
- Bicycle and Pedestrian Investments;
- Transportation Demand Management (TDM) Investments;
- Transportation Systems Management (TSM) Investments; and
- Planning and Policy assumptions (transit fares, tolls, auto operating costs, etc.).

The guiding principles that keep the 2012–2035 RTP/SCS alternatives grounded in reality are as follows:

- Alternatives should strongly consider regional economic competitiveness and overall economic development to help the region recover and prosper.
- Transportation investment commitments made by the CTCs through their sales tax expenditure plans, adopted long-range plans, and board-adopted resolutions will be fully respected.
- Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be unchanged and integrated into the alternatives (with possible revisions for Alternative C only). Any revisions contemplated within Alternative C will be identified and discussed with GCCOG and OCCOG as stated in the Memoranda of Understanding, and Framework and Guidelines for Subregional SCSs.
- New investment strategies proposed over and beyond the county submitted commitments will only be funded through new funding sources identified and approved by the Regional Council.
- Ensuring an appropriate level of funding for system preservation will be given a priority.
- Each of the alternatives will be evaluated using a set of accepted performance measures.

Based on these considerations, three alternatives are defined and refined for detailed analysis. A fourth alternative is recommended simply to test the sensitivity of a dramatic increase in the price of gas, however, it is not viewed as a true alternative in the same sense as the first three alternatives. These alternatives address the issues and challenges discussed earlier in different ways. To be consistent with the principle of respecting county decisions, all four alternatives include all projects and strategies committed by the CTCs in their long-range transportation plans. The description of the four alternatives will therefore focus only on policies and investments over and beyond these existing long-range transportation plans.

In addition, each alternative will be compared to a "No Project Baseline." This Baseline only includes projects that are fully programmed in the current 2011 Federal Transportation Improvement Program (2011 FTIP) and that have already received full environmental clearance. In other words, it only includes projects that are already under way. Moreover, this Baseline reflects historical trends of the land use that currently exist. It does not reflect land use changes already approved by local agencies for the future to increase densities, create mixed-use neighborhoods, create transit-oriented developments, and improve jobs/housing balance.

Alternatives

ALTERNATIVE A

This alternative evaluates how the region's transportation system will perform in the future with only currently committed policies and investments included, as embodied in the current six county transportation commissions' adopted long-range transportation plans. Funding for bicycle/pedestrian improvements, TDM and TSM projects, and strategies were based on currently funding trends. So, the investments represent "business-as-usual" levels and do not add any additional transportation strategies and investments. However, it should be noted that this alternative does include significant transit investments already committed by the CTCs. Some of these transit investments include:

- Purple Line Extension to Westwood
- Gold Line Extension to Glendora
- Metrolink San Jacinto and Temecula Extensions
- High-frequency Metrolink service from Laguna Niguel to Los Angeles

- Rail feeder service in Orange County
- Anaheim Rapid Connection
- New BRT services in Orange County
- Redlands Rail
- E-Street Corridor

This alternative represents commitments in the 2008 RTP updated with the latest information submitted by the CTCs and includes almost 3,000 separate transportation projects.

Alternative A includes updated land use and socio-economic forecasts based on 2012–2035 RTP/SCS local jurisdiction input. This growth input was developed through an extensive bottom-up process dating back to May 2009. The population, household and employment totals for cities and counties are based on information from the most up-to-date local General Plans. The distribution of land uses within cities and counties reflects not only the local input on growth forecasts, but also the specific distribution of those land uses as currently reflected in those General Plans. For this alternative, no adjustments were made to the land use, socioeconomic, and transportation data of the two delegated subregions (GCCOG and OCCOG).

The resulting land use pattern shows some departure from the historical suburban development pattern toward a greater emphasis on infill and redevelopment in many parts of the region. This is due to a decreasing amount of greenfields available for development within local juridictions in the future. This shift follows an emerging trend of a certain level of transit-oriented developments located near existing and planned transit stations in the core metro area, as well as in established cities in the region's periphery. The land use pattern provides an improved mix of uses within close proximity to each other to make transit, walking and bicycling increasingly viable travel choices for many activities.

This alternative shows significant performance improvements over the Baseline since it incorporates more progressive land use as well as county transportation investments of more than $300 billion.

ALTERNATIVE A: HOW IT DIFFERS FROM THE BASELINE

- Land Use- Local input as opposed to historic land use trend
- Investments- All committed county projects are included as opposed to only projects fully programmed in the 2011 FTIP

ALTERNATIVE B

Alternative B is the 2012–2035 RTP/SCS Plan Alternative. This alternative addresses many of the unfunded needs over and beyond Alternative A. Specifically, it dedicates significant funding to system preservation, non-motorized transportation, TDM, the East-West freight corridor, and grade separation projects. It also includes the cost of developing a regional High Occupancy Toll (HOT) lane network building on components already considered by the transportation commissions in Los Angeles, Orange, Riverside, and San Bernardino Counties.

Some of the specific transportation strategies included in this alternative over and beyond what is already included in Alternative A are as follows:

- Implementation of LA Metro's 30/10 initiative that would accelerate the completion of 12 major transit projects in LA County
- Implementation of the East-West Clean Freight Corridor
- Implementation of the Strategic HOT Network
- Consideration of Cordon Pricing in Downtown LA
- More than doubling of funding for Active Transportation to ensure expansion of bike/pedestrian network from the current 4,300 miles to 10,200 miles
- Significant increase in funding for TDM and TSM programs and strategies, including "First Mile/Last Mile" strategies that would enhance connectivity with existing and planned transit services
- Targeted expansion of existing and planned fixed guideway system to close the gaps
- Add BRT services on targeted corridors
- Add express bus services on proposed HOT Network

Additional funding needed to implement this alternative will be derived from revenues generated from the HOT lane network, from a cordon pricing implementation around Downtown Los Angeles, and a user fee to replace existing gas tax revenues enacted by the state legislature and Congress by 2020. This user fee will be proportional to system

use (e.g. proportional to vehicle miles traveled or VMT) and would not diminish over time due to improved fuel efficiency or the adoption of electric vehicles.

Regarding land use, Alternative B expands upon the Growth Forecast in Alternative A. It continues to respect local growth input for both 2020 and 2035. Adjustments have been made to the expected location of growth within cities to improve transportation performance and regional sustainability by assuming that many of the recent development trends within jurisdictions of locating growth nearer to current or future transit hubs will continue. In come cases, jurisdictions have agreed to increase or decrease their projected household growth to reflect the adequacy of infrastructure expected to accommodate this new growth. For this alternative, no adjustments were made to the land use, socioeconomic, and transportation data of the two delegated subregions (GCCOG and OCCOG).

Therefore, for 2035, the resulting land use pattern intensifies both residential and employment development in High-Quality Transit Areas (HQTAs) within cities and counties that will have such areas, while keeping the jurisdictional growth totals consistent with local input. It moves the region towards more walkable, mixed-use development leading to significant VMT reductions and other benefits due to higher walk/bike mode share, more transit use and shorter auto trips. This alternative strives to meet demand for a broader range of housing types, with new housing focused towards the development of smaller-lot single-family homes, townhomes, and multifamily condominiums and apartments.

Finally, Alternative B also includes Phase I of the state High Speed Rail (HSR) initiative as well as enhancements to the LOSSAN corridor and Metrolink services to upgrade them to support higher speeds.

ALTERNATIVE B: HOW IT DIFFERS FROM BASELINE

- Land Use – Local input and additional changes agreed to by locals as opposed to technical trends. Allocation of growth within cities to more emphasize HQTAs and other transit hubs and corridors, per recent development trends within jurisdictions.
- Investments – All committed county projects, plus increased preservation funding, implementation of HOT lane network, E-W freight corridor, HSR Phase I, LOSSAN corridor rail improvement, expanded regional bicycle network, and TDM investments, are included as opposed to only projects fully programmed in the 2011 FTIP
- Incremental Revenues – HOT lane, Cordon Pricing, and user fee revenues

ALTERNATIVE C

This final alternative is similar to Alternative B except for these key aspects:

- More aggressive growth in fixed guideway transit-oriented development (TOD) districts
- More aggressive transit and transportation funding to be consistent with the additional land use changes

Land use for this alternative shifts growth across jurisdictional boundaries in a manner that would be different from local input and different from both Alternatives A and B. This alternative adjusts densities and infill rates in order to present a more aggressive land use strategy within Southern California. In Alternative C, a small percentage of new growth is located on previously undeveloped greenfield land, with the significant majority occurring as infill or redevelopment. The growth redistributions that shape Alternative C consist of shifting future growth from areas with typically long commutes to transit station-adjacent areas with development potential and to employment centers with existing capacity to an extent even greater that Alternative B. Any revisions contemplated within Alternative C will be identified and discussed with GCCOG and OCCOG as stated in the Memoranda of Understanding, and Framework and Guidelines for Subregional SCSs.

Additional transportation investments for this alternative over and beyond Alternative B would include:

- Additional investments in Active Transportation (Non-motorized transportation), TDMs and TSMs
- Further expanded Metrolink services
- Additional transit services on the most utilized transit corridors
- Consider additional express bus services in key corridors featuring headways less than 15 minutes
- Phased implementation of the 5 percent of major arterials to have dedicated bus lanes
- Full implementation of point-to-point bus network
- Additional targeted expansion of fixed guideway system to close gaps

ALTERNATIVE C: HOW IT DIFFERS FROM BASELINE

- Land Use – Local input and additional changes agreed to by locals as opposed to technical trends. In addition, further changes from the trend and will reflect additional shifts of population, households, and jobs across jurisdictions to achieve a better jobs/housing balance and additional growth in fixed guideway transit oriented development (TOD) districts.
- Investments – All committed county projects, plus increased preservation funding (although less than Alternative B), implementation of HOT lane network, E-W freight corridor, HSR Phase I, LOSSAN corridor rail improvement, expanded regional bicycle network, TDM investments, and increased transit funding, are included as opposed to only projects fully programmed in the 2011 FTIP
- Incremental Revenues – HOT lane revenues, Cordon Pricing, and user fee revenues

ALTERNATIVE D

This alternative is identical to Alternative A except that it takes into consideration the possible (if not likely) increase in fuel prices. Since 2002, fuel prices in American cities have increased by more than 150 percent reflecting an average annual increase of almost 10 percent.[3] During that same time period, inflation, as captured by the Consumer Price Index (CPI) grew by only 30 percent reflecting an average increase of 2.6 percent annually.[4]

Therefore this alternative reflects similar increases going forward. However, using the same trend would lead to almost unbelievable costs. For instance, net of inflation, this previous trend starting in 2002 would translate into a cost of $40 per gallon (in 2011 dollars) by 2035. Instead of assuming such an ominous scenario that would undoubtedly alter transportation drastically (a 20 gallon tank would cost $800 in today's dollars), staff recommends using an $8 per gallon cost for fuel in 2011 dollars. This would approximately correspond to fuel costs growing at twice the aforementioned rate of inflation of 2.6 percent.

This alternative is likely to reduce overall travel to some extent due to cost increases. In addition, there should be an increase in transit use, a reduction in congestion, and a reduction in pollution and GHG emissions. SCAG utilized the regional travel demand model to quantify these impacts. Though SCAG does not anticipate assuming these price increases in the 2012–2035 RTP/SCS, it does believe that the 2012–2035 RTP/SCS should discuss the ramifications of such developments and potential strategic changes to be considered if this scenario becomes reality.

ALTERNATIVE D: HOW IT DIFFERS FROM BASELINE

- Land Use – Local input as opposed to technical trend
- Investments – All committed county projects are included as opposed to only projects fully programmed in the 2011 FTIP
- Incremental Revenues – Gas tax increase to address funding gap between base revenues and committed costs
- Energy Costs – Increase in fuel costs to $8 per gallon in 2011 dollars

F. Methodology for Calculating SB 375 CO2 Emissions per Capita for 2012 RTP/SCS

The methodology for calculating the SB 375 CO2 emissions per capita includes the following five steps.

STEP 1. PERFORM REGIONAL TRAVEL DEMAND MODEL RUNS FOR 2005, 2020, AND 2035

SCAG's Regional Travel Demand Model represents the current state-of-the-practice regional transportation modeling tool. The Regional Travel Demand Model produces detailed link-level attributes including VMT by vehicle class, speed, and time period.

STEP 2. CREATE 2005, 2020, AND 2035 INPUT FILES TO ARB'S EMFAC2007 MODEL

EMFAC2007 is the official emissions model developed by ARB. The detailed link-level 2005, 2020, and 2035 VMT data from SCAG's Regional Travel Demand Model is converted into EMFAC2007 input files. The EMFAC2007 input file contains sub-air basin level VMT by speed and time period.

STEP 3. RUN EMFAC2007 FOR 2005, 2020, AND 2035

EMFAC2007 emissions model runs were performed for 2005, 2020, and 2035 with the input files from Step 2. The EMFAC2007 model runs produce sub-air basin level CO2 emissions by vehicle classification.

STEP 4. CALCULATE 2005, 2020, AND 2035 CO2 EMISSIONS PER CAPITA FROM REGIONAL TRAVEL DEMAND MODEL

The sub-air basin level CO2 emissions for light- and medium-duty vehicles were aggregated to the regional total CO2 emissions for 2005, 2020, and 2035. The regional total CO2 emissions are divided by the corresponding resident population to derive the 2005, 2020, and 2035 CO2 emissions per capita.

STEP 5. CALCULATE ADDITIONAL 2035 CO2 EMISSIONS REDUCTION PER CAPITA FROM NHTS (4-D) MODEL

CO2 emission reductions per capita for 2035 in addition to that derived from Regional Travel Demand Model are based on the 2035 modeling results of SCAG's NHTS Model. The NHTS Model provides additional VMT reductions not accounted for in the Regional Travel Demand Model. CO2 emission reductions associated with these VMT reductions are then calculated based on the ratio of VMT per capita reduction to CO2 emissions reduction per capita derived from Steps 1 - 4.

STEP 6. CALCULATE FINAL 2035 CO2 EMISSIONS REDUCTION PER CAPITA

The final 2035 CO2 emission reductions per capita is a sum of the 2035 CO2 emission reductions per capita from Step 4 and Step 5.

G. CEQA Exemption Criteria

SB 375 amends CEQA to add Chapter 4.2 Implementation of the Sustainable Communities Strategy, which allows for CEQA exemption for certain projects, as well as reduced CEQA analysis. Lead agencies (including local jurisdictions) maintain the discretion and will be solely responsible for determining consistency of any future project with the SCS. Cities and counties maintain their existing authority over local planning and land use decisions, including discretion in certifying the environmental review for a project, regardless of eligibility for streamlining. SCAG staff may provide a lead agency at the time of its request readily available data and documentation to help support its finding upon request. In addition to a project's consistency with the SCS, below are additional criteria for CEQA streamlining eligibility.

Types of CEQA Streamlining

CEQA EXEMPTION

A full CEQA exemption is provided for a special class of Transit Priority Project (TPP) determined to be a Sustainable Communities Project (SCP) (§21155.1 (a)). As a threshold matter, to qualify as a TPP, a project must be consistent with the general use designation, density, building intensity, and applicable policies in an approved SCS or APS. The TPP must also:

- Be at least 50 percent residential use based on area;
- Be at least 20 units/acre; and
- Be within ½ mile of a major transit stop or high-quality transit corridor included in the RTP/SCS (a high-quality transit corridor is defined as one with 15-minute frequencies during peak commute hours)

Consequently, a Sustainable Communities Project (SCP) is a TPP that is consistent with the SCS or APS and meets additional criteria including numerous land use and environmental standards, such as being 15 percent more efficient than Title 24 standards and using 25 percent less water than the regional average household. In addition, the site cannot be more than eight acres or contain more than 200 units. The proposed project must be located within ½ mile of rail transit station or ferry terminal included in RTP/SCS or ¼ mile from a high quality transit corridor. Lastly, the project must meet additional requirements for the provision of affordable housing and open space. After a public hearing where a legislative body finds that a TPP meets all the requirements, a project can be declared to be an SCP and be exempted from CEQA.

SUSTAINABLE COMMUNITIES ENVIRONMENTAL ASSESSMENT (SCEA)/LIMITED EIR

CEQA relief is provided for TPPs that incorporate all feasible mitigation measures, performance standards, or criteria set forth in the prior applicable environmental impact reports and adopted in findings as described in (§21155.2 (a), (b), and (c)). This type of streamlining applies to initial studies that meet the following criteria:

- Avoids or mitigates impacts to a level of less than significant;
- Incorporates all feasible mitigation measures, performance standards, or criteria set forth in applicable EIRs; and
- Identifies all significant/potentially significant impacts and identify adequately addressed cumulative effects in prior applicable certified EIRs

An SCEA is not required to reference, describe, or discuss growth-inducing impacts; project-specific impacts; and cumulative impacts from cars and light duty truck trips generated by the project. If a lead agency determines that a cumulative effect has been adequately addressed and mitigated, that cumulative effect shall not be treated as cumulatively considerable, and the SCEA will be reviewed under the substantial evidence standard. The lead agency is required to circulate the document for a 30-day comment period, consider all comments received, conduct a public hearing, and make findings that the project has fully mitigated impacts.

If a TPP requires an EIR, certain CEQA relief also applies for projects that incorporate all feasible mitigation measures, identify all significant and potentially significant impacts, and identify adequately addressed cumulative effects in prior applicable certified EIRs. The streamlined EIR is not required to analyze off-site alternatives to the TPP or discuss a reduced residential density alternative to address the effects of car and light duty truck trips generated by the project. Furthermore, the EIR is not required to include an analysis of growth inducing impacts or any project specific or cumulative impacts from cars and light duty truck trips generated by the project on global warming or the regional transportation network. The initial study must identify any cumulative effects that have been

adequately addressed and mitigated in prior applicable certified EIRs and these cumulative effects are not to be treated as cumulatively considerable in the EIR. As with the SCEA, the Streamlined EIR will be reviewed under the substantial evidence standard. The certification process is consistent with CEQA Guidelines Section 15090.

LIMITED ANALYSIS FOR RESIDENTIAL/MIXED-USE PROJECTS

SB 375 also provides for general CEQA streamlining for residential and mixed-use residential projects as well as TPPs pursuant to Section 21159.28 of the Public Resources Code. Projects that meet the following requirements can be eligible for streamlined CEQA review:

- A residential or mixed-use residential project (or a TPP) consistent with the designation, density, building intensity, and applicable policies specified for the project area in an accepted SCS or APS (a residential or mixed-use residential project where at least 75 percent of the total building square footage consists of residential use or a project that is a transit priority project)
- A residential or mixed-use project that incorporates the mitigation measures required by an applicable prior environmental document
- If a project meets these requirements, any exemptions, negative declarations, mitigated negative declarations, SCEA, EIR or addenda prepared for the projects shall not be required to reference, describe, or discuss:
- Growth inducing impact;
- Any project specific or cumulative impacts from cars and light duty truck trips generated by the project on global warming or the regional transportation network; and
- A reduced density alternative (EIRs only)

TRAFFIC MITIGATION MEASURES

Pursuant to Section 21155.3, a legislative body or a local jurisdiction may adopt traffic mitigation measures that would only apply to TPPs which may include requirements for the installation of traffic control improvements, street or road improvements, and contributions to road improvement or transit funds, transit passes for future residents, or other measures that will avoid or mitigate traffic impacts of TPPs. A TPP does not need to comply with any additional mitigation measures for the traffic impacts of that project on streets, highways, intersections, or mass transit if the local jurisdiction has adopted these traffic mitigation measures. The traffic mitigation measures must be updated at least every five years.

H. SCAG Regional Housing Needs Allocation (RHNA) from HCD

STATE OF CALIFORNIA -BUSINESS, TRANSPORTATION AND HOUSING AGENCY EDMUND G. BROWN JR., *Governor*

DEPARTMENT OF HOUSING AND COMMUNITY DEVELOPMENT
DIVISION OF HOUSING POLICY DEVELOPMENT
1800 Third Street, Suite 430

August 17, 2011

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

Dear Mr. Ikhrata:

RE: Regional Housing Need Assessment Determination

This letter provides the Southern California Association of Governments (SCAG) its Regional Housing Need Assessment Determination (RHNA Determination) for the projection period beginning January 2014 and ending October 2021. Pursuant to State housing element law (Government Code Section 65584, et seq.), the Department of Housing and Community Development (Department) is required to determine SCAG's existing and projected housing need.

As you know, Chapter 728, Statutes of 2008 (SB 375) strengthened coordination of housing and transportation planning and requires Metropolitan Planning Organizations (MPOs) to develop a new sustainable communities strategy (SCS) in the regional transportation plan (RTP) to achieve greenhouse gas emission reductions and ensure the SCS accommodates the RHNA Determination. Amendments to the law included revisions to the Department's RHNA schedule and methodology and also definitions addressing the RHNA projection period, housing element planning period, and coordination with updating the RTP. For SCAG, the Department's RHNA Determination is made on the basis of partial demographic data available at this time from Census 2010 complemented by the American Community Survey (ACS) data. In assessing SCAG's regional housing need, the Department considered the critical role housing plays in developing sustainable communities and supporting employment growth.

The Department has determined a range of housing need (409,060 – 438,030 units) for the period 2014-2021. This range considered the extraordinary uncertainty regarding national, State, and local economies and housing markets. For this RHNA cycle only, the Department made an adjustment to account for abnormally high vacancies and unique market conditions due to prolonged recessionary conditions, high unemployment, and unprecedented foreclosures.

The RHNA low range (409,060) reflects the Department's acceptance of SCAG's projections and assumptions as the minimum need after evaluating the reasonableness of data, assumptions and support documentation submitted by SCAG. This figure considers household growth for the projection period derived from using the 2005-2007 ACS household formation rates and includes an adjustment for projected household growth on tribal land, and for existing high unit vacancies resulting from the unusual turmoil in housing markets. The RHNA high range (438,030) considered SCAG's strong socio-economic assets and demographic trends to grow, become more diverse, and generate increased housing demand, particularly among older age groups.

SCAG's plan to distribute its RHNA must equal or exceed the minimum of the range shown in Attachment 1 for the Total and for Very-Low, Low, and Moderate income categories. The Department encourages planning for housing need above the minimum of the range, in which case the income category percentages applicable to very-low, low, and moderate households remain the same. The regional housing need to be allocated to each jurisdiction represents the minimum amount of residential development capacity to zone for and is not to be used within local general plans as the maximum amount of residential development to plan for or approve.

In assessing the RHNA for the SCAG region, the Department applied methodology and assumptions that considered all of the factors specified in Government Code Section 65584.01(c)(1). In addition, the Department consulted with SCAG and Department of Finance (DOF) staff as required by statute. A meeting with Mary Heim, DOF Chief Demographer, occurred in late February 2011 and was attended by SCAG representatives Frank Wen, Manager, Simon Choi, Chief Demographer, and Joe Carreras, Housing Project Manager. Subsequent consultation meetings, as well as correspondence, included Doug Williford, Deputy Executive Director, Huasha Liu, Director of Planning, and Joann Africa, Legal Counsel. Also consulted was Stephen Levy, Director for the Center for Continuing Study of the California Economy (CCSCE), who prepared employment, population, and household projections for SCAG.

The data, assumptions, and descriptive information provided by SCAG and CCSCE, included DOF's population estimates for 2011, American Community Survey household formation rates controlled for the 2010 Census data, and SCAG population projections. Information provided and/or discussed also included the region's relationship between jobs and housing, including information about inter- and intra-regional commute patterns, and assumptions about the rate with which existing "for sale" and "for rent" housing units will be absorbed by the beginning of the projection period in 2014.

The Attachments to this letter describe the RHNA methodology used by the Department and the income category distribution to be used by SCAG in allocating among all local governments within the region at least the minimum total RHNA and minimum amounts for very-low, low, and moderate income categories. The projection period (also described in the Attachments) was determined pursuant to Government Code Section 65588(e)(6), to coordinate housing and transportation planning based on notification from SCAG of its *estimated* RTP adoption date of April 5, 2012. As you know, if the actual RTP adoption date significantly differs from the estimated date, the RHNA determination and projection period will not change, however the housing element due date, and implicitly the planning period, would change.

Mr. Hasan Ikhrata
Page 3

SCAG is responsible for developing a RHNA distribution methodology and adopting a RHNA Plan for the period beginning January 1, 2014 and ending October 1, 2021. Housing element law (Section 65584, et.seq.) requires SCAG's methodology and RHNA Plan be consistent with the following objectives:

(1) increasing the housing supply and mix of housing types, tenure, and affordability;
(2) promoting infill development and socioeconomic equity, protecting environmental and agricultural resources, and encouraging efficient development patterns;
(3) promoting an improved intraregional relationship between jobs and housing;
(4) balancing the distribution of households by income category.

Pursuant to Government Code Section 65584.05(h), within three days of adopting the Plan, SCAG is required to submit its RHNA Plan to the Department for approval. Once the Department has approved the RHNA Plan, local governments must be notified of their share of the regional housing need, by income category, for use in updating the housing element for the *planning* period, anticipated to be from October 2013 until October 2021. In updating their housing elements, local governments may credit units permitted since the January 1, 2014 start date of the RHNA projection period. The element must describe the methodology for crediting units to different income categories such as based on the actual or projected sale price or rent level.

The Department commends SCAG for its leadership and efforts in fulfilling its important role in advancing the State's housing, transportation, and environmental goals. SCAG's successful Compass Blueprint has played a tremendous role in leading local organizations to improve community planning to expand housing and transportation choices.

The Department especially thanks Doug Williford, Huasha Liu, Frank Wen, and Simon Choi for their efforts and assistance. The Department looks forward to its continued partnership with SCAG and its member jurisdictions and assisting SCAG in its planning efforts to accommodate the region's share of housing need. If the Department can provide any assistance, or answer any questions, please contact me or Anda Draghici, Senior Housing Policy Specialist, at (916) 445-4728.

Sincerely,

Glen A. Campora

Glen A. Campora
Assistant Deputy Director

Enclosures

ATTACHMENT 1

HCD REGIONAL HOUSING NEED DETERMINATION: SCAG

Projection Period: January 1, 2014 through October 1, 2021

Income Category	Percentage	Range of Housing Unit Need (Rounded) (1)		(2)
Very-Low	24.4%	99,810	-	106,880
Low	15.8%	64,630	-	69,210
Moderate	17.5%	71,590	-	76,650
Above-Moderate	42.3%	173,030	-	185,290
Total	**100.0%**	**409,060**	-	**438,030**

[1] The 409,060 low end of the range (see Attachment 2) reflects SCAG's projected minimum housing need (rounded), using 2005-2007 household formation rates from the American Community Survey (ACS) controlled for 2010 census household population. This column represents the rounded minimum housing need that SCAG's RHNA Plan must address in total and the minimum percentage and amount for very-low, low, and moderate income categories.

[2] The 438,030 high end of the range (see Attachment 3) reflects HCD's determined higher housing need (rounded), using the 2005-2007 ACS household formation rates controlled for 2010 Census household population and applied to SCAG's population projections. In planning for RHNA above the low range, income category percentages for very-low, low, and moderate income households remain the same.

[3] The income category percentages reflect the minimum percentage to apply against the total RHNA chosen by SCAG (at or above the minimum range) in determining housing need for very-low, low, and moderate income households.

[4] For this RHNA cycle only (due to unique conditions not expected to recur to impact future RHNA cycles), two downward adjustments were made: (1) projected households were adjusted (-2,810) for household growth on tribal land as tribal housing data had not been requested by Department of Finance in its annual survey to local jurisdictions regarding housing unit change, and (2) housing need was adjusted by -75,390 units at the low range (Attachment 2) and by -25,130 units at the high range (Attachment 3) to account for different absorption estimates for unprecedented high vacancies in existing stock due to extraordinary conditions including high foreclosures and recession uncertainties.

Notes:

Housing Need Determination

Refer to Attachments 2 and 3 for a description and explanation of methodology.

The Department and SCAG staff acknowledge important differences between the "projection" methodology specified in statute to determine housing need and the methodology SCAG uses in developing its Integrated Forecast for purposes of its Regional Transportation Plan and Sustainable Community Strategy. The statutory planning objective of the RHNA is to accommodate housing "capacity" for projected household growth.

Income Categories

Each category is defined by Health and Safety Code (Section 50093, et seq.). Percentages are derived from Census-reported household income brackets, from the 2005-2009 American Community Survey's number of households by income over 12 months, by County. Housing unit need under each income category is derived from multiplying the portion of households per income category against the total RHNA determination.

	HH Growth (New Unit Need)	254,869	213,726	468,595	
	Vacancy Rate (SCAG)	1.50%	4.50%		
	Vacancy Allowance	3,825	9,620	13,445	13,445
9	**Replacement Allowance (minimum)**	0.50%		482,040	2,410
10	*less: Adjustment for Absorption of Existing Excess Vacant Units*				
	Estimate 10% Absorbed, 90% Not Absorbed by 2014	Effective Vacant Units	Healthy Market Units	Differential	
	Derived (2010 Census, HH Growth, & Vacancy Rate)	(252,023)	175,240	-76,783	
	Total 2011 Housing Stock	6,348,741			
	Existing Vacant Unit (Others) Adjustment	1.39%	1.28%		
	Total Adjusted Existing Vacant Units (Others)	(88,247)	81,264	-6,984	
	Estimated Units (Others) Not Absorbed by 2014	90%		-83,766	-75,390
	FINAL REGIONAL HOUSING NEED DETERMINATION (Low Range of New Housing Unit Need)				**409,060**

Explanation and Data Sources

1. **Population:** Population reflects SCAG's October 2021 projection. Pursuant to Government Code 65584.01(b), SCAG's 2021 population projection was compared to the 2021 population derived from Department of Finance (DOF) 2011 Interim Projections P3 for 2020 and DOF's E5 estimate for 2011. Based on SCAG's population projection being within 3% of the DOF Population Interim projections and consultation with SCAG, SCAG's population projection was used in determining housing need for the region. As such, this number reflects SCAG's October 2021 population projection.

2. **Group Quarter Population:** Figure is SCAG's estimate of persons residing in group home / institution / military / dormitory quarters that is 1.76% of total population (DOF estimate for 2010 was 1.78%) in which proportion is maintained constant throughout the projection period. As this population doesn't constitute a "household" population generating demand for a housing unit, the group quarter population is excluded from the calculation of the household population, and is not included in the housing need.

3. **Household (HH) Population:** The population projected to reside in housing units after subtracting the group quarter population from total projected population.

ATTACHMENT 2

HCD REGIONAL HOUSING NEED DETERMINATION (LOW RANGE): SCAG (continued)

4. **Projected Households (HHs):** Calculated by applying (to the 2021 HH population) SCAG's HH formation rates from DOF rates per 2005-2007 American Community Survey (ACS) controlled for the 2010 Census household population. HH formation rates were evaluated for reasonableness in conjunction with ACS HH formation rates for the region provided by DOF and with the vacancy assumptions as described below.

5. **Households at Beginning of Projection Period:** For the first time since inception of RHNA, the baseline number of households at the beginning of the projection period (January 2014) must be projected, as a direct effect of amendment to Section 65588(e)(6), specifying the new projection period to start on either June 30 or December 31 whichever date most closely precedes the end of the current housing element period (June 30, 2014 for SCAG). As such, the January 1, 2014 household number was calculated as an interpolation between the DOF E5 Estimate for 2011 and the projected 2021 number of households.

6. **Household Growth on Tribal Land:** For this RHNA cycle only, an adjustment (-2,810) was made for household growth on tribal land as tribal housing data had not been requested by Department of Finance in its annual survey to local jurisdictions regarding housing unit change. Calculated based on 2000 and 2010 Census and SCAG's Draft 2012 RTP Growth forecast.

7. **Household (HH) Growth:** This figure reflects projected HH growth and need for new units.

8. **Vacancy Allowance:** An allowance (unit increase) is made to facilitate availability and mobility among owner and renter units. Owner/Renter % is based on Census 2010 data. A smaller rate is applied to owner units due to less mobility than for renter households. Information from a variety of authoritative sources supports an acceptable range of 1 to 4% for owner units and 4 to 8% for renter units depending on market conditions.

9. **Replacement Allowance:** Rate (0.5%) reflects housing losses that localities annually reported to DOF each January for years 2000-2010, or 0.5%, whichever is higher.

10. **Adjustment for Absorption of Existing Excess Vacant Units:** For this RHNA cycle only (due to extraordinary uncertainty regarding conditions impacting the economy and housing market not expected to similarly impact future RHNA cycles), a new 1-time adjustment was made to account for unprecedented high vacancies in existing stock, due to unusual conditions including high foreclosures and recession uncertainties. A slow absorption rate of 10% of existing excess vacant units is assumed to occur in shrinking current excess vacant units before the start of 2014 RHNA projection period resulting in applying a 90% adjustment to account for units not absorbed that decreases new housing need by -75,390 units. Existing housing stock consists of two components: (1) housing units for sale and rent in existing housing stock that are above the housing units required to maintain the healthy market condition, calculated as the number
of units in housing stock (for sale+for rent+sold, not occupied+rented, not occupied + occupied units), (2) housing units in the "vacant units others" category of existing housing stock above the simple average of 1.28% calculated based on Census data from 1980 to 2010. To evaluate the reasonableness of vacancy adjustments proposed by SCAG to account for the unprecedented economic downturn, the Department used 2010 Census Demographic profile data (DP-1) and desirable "normal" vacancy rates by tenure, in conjunction with the region's household growth and proposed household formation rates. The proposed vacancy adjustment is limited to not exceed the differential between the 2010 Census vacant units and the healthy market vacant units rate associated with the region's annual household growth. As the adjustment was below the differential, the vacancy adjustment was applied in calculating the low RHNA range.

RHNA Projection Period January 1, 2014 to October 1, 2021: Per SB 375, the start of the *projection* period (in effect January 1, 2014) was determined pursuant to GC 65588(e)(6), which requires the new projection period to start on June 30 or December 31 whichever date most closely precedes the end of the current housing element period, which for SCAG region is June 30, 2014. The end of the projection period was determined pursuant to GC 65588(e)(5 to be the end of the housing element planning period**.** *Note: For projection purposes the end of the projection period is rounded to the nearest start/end of the month.*

Housing Element Planning Period October 1, 2013 to October 1, 2021: Per SB 375, the start of the *planning* period was determined pursuant to GC 65588(e)(5),18 months from the estimated adoption date of the SCAG's Regional Transportation Plan per SCAG's notice to the Department (April 5, 2012) with the date rounded to the nearest start/end of month for projection purposes. The end of the planning period was calculated pursuant to GC 65588(e)(3)(A), 18 months after the adoption of the second RTP, provided that it is not later than eight years from the adoption of the previous housing element. If the actual RTP adoption date differs from the estimated date, the RHNA determination and the projection period will not change, however the housing element due date, and implicitly, the planning period would change.

	Estimated Units (Others) Not Absorbed by 2014	30%		-83,766	-25,130
	FINAL REGIONAL HOUSING NEED DETERMINATION (High Range of New Housing Unit Need)				**438,030**

Explanation and Data Sources

1. **Population:** Pursuant to Government Code Section 65584.01(b), SCAG's 2021 population projection was compared to the 2021 population derived from Department of Finance (DOF) 2011 Interim Projections P3 for 2020 and DOF's E5 estimate for 2011. Based on SCAG's population projection being within 3% of the DOF Population Interim projections and consultation with SCAG, SCAG's population projection was used in determining housing need for the region. As such, this number reflects SCAG's October 2021 population projection.

2. **Group Quarter Population:** Figure is SCAG's estimate of persons residing in group home / institution / military / dormitory quarters that is 1.76% of total population (DOF estimate for 2010 was 1.71%) in which proportion is maintained constant throughout the projection period. As this population doesn't constitute a "household" population generating demand for a housing unit, the group quarter population is excluded from the calculation of the household population and is not included in housing need.

3. **Household (HH) Population:** The portion of population projected to reside in housing units after subtracting the group quarter population from total projected population.

ATTACHMENT 3

HCD REGIONAL HOUSING NEED DETERMINATION (HIGH RANGE): SCAG (continued)

4. **Projected 2021 Households (HHs):** Projected HHs are derived by applying (to 2021 HH population) the regional 2005-2009 American Community Survey (ACS) household formation rates as provided by DOF controlled for the 2010 household population. HH formation or headship rates reflect the propensity of different population groups (age, racial and ethnic) to form households.

5. **Households at Beginning of Projection Period:** For the first time since inception of RHNA, the baseline number of households at the beginning of the projection period (January 2014) must be projected, as a direct effect of amendment to Section 65588(e)(6) specifying the new projection period to start on either June 30 or December 31 whichever date most closely precedes the end of the current housing element period (June 30, 2014 for SCAG). As such, the January 1, 2014 household number was calculated as an interpolation between the DOF E5 Estimate for 2011 and the projected 2021 number of households.

6. **Household Growth on Tribal Land:** For this RHNA cycle only, an adjustment (-2,810) was made for household growth on tribal land as tribal housing data had not been requested by Department of Finance in its annual survey to local jurisdictions regarding housing unit change. Calculated based on 2000 and 2010 Census and SCAG's Draft 2012 RTP Growth Forecast.

7. **Household (HH) Growth:** This figure reflects projected HH growth and need for new units.

8. **Vacancy Allowance:** An allowance (unit increase) is made to facilitate availability and mobility among owner and renter units. Owner/Renter % is based on Census 2010 data. A smaller rate is applied to owner units due to less frequent mobility than for renter households. Information from a variety of authoritative sources supports an acceptable range of 1 to 4% for owner units and 4 to 8% for renter units depending on market conditions.

9. **Replacement Allowance:** Rate (0.5%) reflects the housing losses that localities annually reported to DOF each January for years 2000-2010, or 0.5%, whichever is higher.

10. **Adjustment for Absorption of Existing Excess Vacant Units:** For this RHNA cycle only (due to extraordinary uncertainty regarding conditions impacting the economy and housing market not expected to similarly impact future RHNA cycles), a new 1-time adjustment was made to account for unprecedented high vacancies in existing stock due to unusual conditions including high foreclosures and recession uncertainties. A fast absorption rate of 70% of existing excess vacant units is assumed to occur in shrinking current excess vacant units before start of 2014 RHNA projection period resulting in applying a 30% adjustment to account for units not absorbed that decreases new housing need by -25,130 units. Existing housing stock consists of two components: (1) housing units for sale and rent in existing housing stock that are above the housing units required to maintain the healthy market condition, calculated as the number of units in housing stock (for sale+for rent+sold, not occupied+rented, not occupied + occupied units), (2) housing units in the "vacant units others" category of existing housing stock above the simple average of 1.28% calculated based on Census data from 1980 to 2010. To evaluate the reasonableness of vacancy adjustments proposed by SCAG to account for the unprecedented economic downturn, the Department used 2010 Census Demographic profile data (DP-1) and desirable "normal" vacancy rates by tenure, in conjunction with the region's household growth and proposed household formation rates. The proposed vacancy adjustment is limited to not exceed the differential between the 2010 Census vacant units and the healthy market vacant units rate associated with the region's annual household growth. As the adjustment was below the differential, the adjustment was applied in calculating the high RHNA range.

RHNA Projection Period January 1, 2014 to October 1, 2021: Per SB 375, the start of the *projection* period (in effect January 1, 2014) was determined pursuant to GC 65588(e)(6), which requires the new projection period to start on June 30 or December 31 that most closely precedes the end of the current housing element period, which for SCAG region is June 30, 2014. The end of the projection period was determined pursuant to GC 65588(e)(5 to be the end of the housing element planning period. *Note: For projection purposes the end of the projection period is rounded to the nearest start/end of the month.*

Housing Element Planning Period October 1, 2013 to October 1, 2021: Per SB 375, the start of the *planning* period was determined pursuant to GC 65588(e)(5),18 months from the estimated adoption date of the SCAG's Regional Transportation Plan per SCAG's notice to the Department (April 5, 2012) with the date rounded to the nearest start/end of month for projection purposes. The end of the planning period was calculated pursuant to GC 65588(e)(3)(A), 18 months after the adoption of the second RTP, provided that it is not later than eight years from the adoption of the previous housing element. If the actual RTP adoption date differs from the estimated date, the RHNA determination and the projection period will not change, however the housing element due date, and implicitly, the planning period would change.

I. SCAG RHNA Allocation to Jurisdictions and Related Reports

Final RHNA Allocation to Jurisdictions is anticipated for release in October 2012.

J. Compass Blueprint Program

The Southern California Association of Governments (SCAG) is the largest regional planning agency in the country; encompassing over 38,000 square miles, and serving a population of 19 million people. SCAG Compass Blueprint policies reflect deep engagement between SCAG, as the regional MPO and regional planning agency, and its member jurisdictions and agencies. The Compass Blueprint Growth Vision for the region is based on four guiding principles: mobility, livability, prosperity, and sustainability.

Compass Blueprint Demonstration Projects

SCAG offers direct funding of innovative planning initiatives for member agencies through the Compass Blueprint Demonstration Projects. SCAG manages all of the funding and administrative duties, enabling the municipalities to craft forward-thinking planning efforts.

Since 2005, the program has grown rapidly from nine projects in the first year to 49 projects funded for the 2011-2012 fiscal year. Projects have been approved or are currently underway in over 50 percent of the cities in the SCAG region. In addition to local municipalities, SCAG has worked in collaboration with county planning departments, County Transportation Commissions, as well as sub-regional Councils of Governments.

TOD & Station Area Planning

One of the earliest Compass Blueprint Demonstration Projects comprised of a collection of discrete projects to assist the Western Riverside Council of Governments, a regional partner, in studying the planned Metrolink Perris extension transportation corridors. SCAG provided WRCOG with station area planning around existing and planned Metrolink stations, and a Bus Transit Station in the City of Temecula. SCAG has continued to work with regional Councils of Governments, and other coalitions of cities to provide regional context, and corridor level planning assistance.

Since then, SCAG has continued to assist cities, transportation agencies, and coalitions of agencies in planning for higher density, mixed-use, and transit supportive land uses within station areas. An important evolution in planning for transit-supportive activity has been to expand the definition of Transit Oriented Development (TOD). Originally, TOD referred to building higher density housing adjacent to stations. However, due to the diversity of characteristics of stations in the region, from populated urban centers to suburban sending stations, regional planners are now focusing on holistic visions for the entire ½ mile radius in and around the station. In addition planners are focusing on employment and light industrial around stations, as employment preservation and office TOD become more important in the region.

WRCOG METROLINK PERRIS LINE EXTENSION VISION PLANNING

Corona Metrolink Station

This study was conducted on the Corona Metrolink Station in order to guide the transition of the area from a stand-alone train station to a vibrant transit village.

Hemet Metrolink Station Area Plan

This Demonstration Project enabled City of Hemet to envision a plan for a new transit village that would connect new development to the regional transit system.

March AFB/Moreno Valley Metrolink Station Concepts

The City of Moreno Valley and the March Air Force Base redevelopment authority teamed up with the Western Riverside Council of Governments and Compass Blueprint to plan for integrated development around their new Metrolink station.

Riverside Metrolink Station Area Plan

The City of Riverside, the Western Riverside Council of Governments and Compass Blueprint teamed up to plan a development vision around the existing Downtown Riverside Metrolink Station area.

Perris Metrolink Station Area Plan

The Perris Station Demonstration Project analyzed the existing conditions and the development potential of the project site.

Temecula Transit Station

The City of Temecula, the Western Riverside Council of Governments and Compass Blueprint teamed up to look at development options and opportunities around a proposed Bus transit station.

TRANSIT ORIENTED DESIGN & STATION AREA PLANNING

South Pasadena Mission Street Gold Line Station

The Gold Line light rail came to South Pasadena in 2003. This station represents a major public investment, and rail station areas are of strategic importance to the region. This feasibility study serves as a model for local communities to calculate return on investment and transit-conducive design in conjunction.

Montclair North Montclair Parking Analysis

The City of Montclair worked with Compass Blueprint to analyze key development and logistical issues for the North Montclair Specific Plan, including, shared and reduced parking requirements.

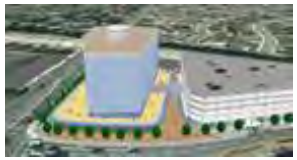
San Bernardino E Street Station Plan

A New Public Transit station being built in downtown San Bernardino opens up the opportunity to create new, retail and mixed-use development.

SANBAG Transportation Land Use Integration

The San Bernardino Associated Governments (SANBAG) worked with six cities to identify sites near potential transit station locations for transit-oriented development (TOD). This study represented an innovative approach to TOD by preparing TOD proformas to better plan for the type of density that could be expected in a traditionally dispersed area.

Los Angeles Expo Light Rail Station Areas



In 2007 The City of Los Angeles Planning Department and Compass Blueprint prepared a vision report for the proposed station areas in order to visualize TOD, terms of scale and mass of new transit supportive development.

NORTH ORANGE COUNTY CITIES COALITION PROJECTS

This next set of projects, completed in 2008, represented an important innovation in Compass Blueprint Demonstration projects. Like the earlier WRCOG Metrolink stations, these were all part of one demonstration. These four cities established an informal coalition in order to pursue OCTA Go Local, transportation funding. They leveraged this relationship and secured funding for four separate, different approaches to what TOD means at the local level. Examining Industrial, arterial corridor and station placement.

Brea Bus Rapid Transit Concepts

This project received grant funding to explore opportunities for transit-oriented development surrounding proposed Bus Rapid Transit (BRT) stations near the Brea Mall.

Fullerton Southeast Industrial Area

This project explored opportunities for transit-oriented development around an emerging high-capacity transit system in the Southeast Industrial Area (SIA) in the City of Fullerton.

Placentia Metrolink Concepts

Compass Blueprint provided the City of Placentia with urban design concepts and strategies for a proposed Metrolink station in the Placita Santa Fe district.

La Habra Boulevard Corridor

This Demonstration Project provided design concepts and policy recommendations to improve the economic performance, functionality, and identity of the La Habra Boulevard corridor.

TOD DISTRICTS & STATION AREA PLANNING

Azusa Citrus Station TOD Concepts

The intent of this demonstration project was to examine the potential market demand for commercial development around the Citrus Station and identify the most appropriate mix of uses.

Culver City Washington/National Catalytic Projects

The project assisted Culver City to analyze a study area that includes specific catalytic project sites and commercial corridors adjacent to the future Exposition Light Rail Transit Line.

Los Angeles La Cienega / Jefferson Station Area TOD

In 2007, Compass Blueprint partnered with the City of Los Angeles to develop the first ever comprehensive Transit-Oriented District (TOD) plan for the City.

Laguna Niguel Gateway Specific Plan

Compass Blueprint assisted the City of Laguna Niguel with an update to the Specific Plan for the area around Laguna Niguel's Metrolink station.

Long Beach Boulevard Corridor Study

Long Beach has a long-term goal of developing more mixed-use and transit oriented neighborhoods in growing areas of the City.

Fontana Downtown Overlay District

This project conducted an opportunities analysis for TOD redevelopment in the Downtown Overlay District to capitalize on Downtown Fontana's Metrolink commuter rail station.

Los Angeles Tarzana Crossing

This Demonstration Project provided site analysis, open space and connectivity design opportunities, development prototypes, and parking and market analysis to create a transit oriented development district.

Santa Clarita North Newhall Specific Plan

This project will assist in developing a Specific Plan focused on transit-oriented and mixed-use development, walkable and bike-friendly land use, and economic and redevelopment opportunities.

Los Angeles Sustainable Transit Communities

This report describes and rates the key principles for creating successful Sustainable Transit Communities (STCs) in the City of Los Angeles.

SR-60 Coalition of Cities Gold Line Corridor Study

The SR-60 Coalition, made up of the cities of Monterey Park, Montebello, Rosemead, El Monte, South El Monte, and the City of Industry, initiated a study of potential freeway adjacent TOD Districts.

General Land Use & Suburban Retrofits

The following projects include early-stage vision plans, as well as land use plans in process of adoption, that reflect a desire on the part of these communities to facilitate density, encourage infill, and link to nearby transit networks. The following projects are grouped into four broad categories: Vision Studies & Scenario Planning, Land Use Studies & Plans, Visualizations & Graphical Tools, and Economic Development & Feasibility Studies. In this section, Vision Studies & Scenario Planning refer to public outreach efforts, and design charrettes intended to foster a publicly supported vision for local and sub-regional communities. They often arrive at policy recommendations to be taken forward for further study and official adoption. Land Use Studies & Plans refer to official planning documents such as Specific Plans, overlay districts, and other planning and zoning tools. These plans are generally adopted by local elected officials, and may require environmental compliance provided by the local agency.

This section also contains innovative uses of photo-simulations and graphical visualization tools. Compass Blueprint projects usually produce visualizations. The selected projects in this section highlight uniquely innovative approaches to using visualizations. These tools can be used to provide laypersons with a more understandable picture of what these plans may produce. However, these visualizations are more than pretty pictures, they serve to test concepts, and give local leaders a sense of design needs. Finally this section contains economic development and economic feasibility studies aimed at further testing and refining communities' abilities to realize their visions.

VISION STUDIES AND SCENARIO PLANNING

Inland Empire ULI Visioning Workshop

In 2006, the Western Riverside Council of Governments, the Urban Land Institute and Compass Blueprint held a visioning workshop and Inland Empire residents came together to share a vision of future growth.

Compton General Plan Update and Small-Area Visioning

The Compass Blueprint Program facilitated a visioning process for the City of Compton that engaged residents, community leaders and other stakeholders to outline priorities for the City's future. The study identified community vetted funding priority areas in the city.

Coachella Sphere of Influence Sustainability Project

Once a small farming town, Coachella is currently the sixth fastest growing city in California. This study studied the implications of various settlement patterns for areas that will eventually be incorporated into the city. The study helped identify sustainable connectivity needs in the study area.

Los Angeles County Florence Firestone (Phase 1)

In 2009, hundreds of residents, businesses, and other stakeholders in Florence-Firestone came together to develop a comprehensive, long-term vision for their community.

WRCOG I-15 Smart Growth Concept Map

This Compass Blueprint project developed land use and transit planning factors that support smart growth opportunities centered on the I-15 and I-215 freeway corridors. The study produced a set of land use characteristics and related them to relevant transit services and investments.

Desert Hot Springs Citywest Visioning Plan

The project provided a plan to develop the CityWest Area within Desert Hot Springs to responsibly accommodate anticipated growth in both housing and employment.

Los Angeles County Vision Lennox

This project created a Vision Plan for the unincorporated community of Lennox to help guide the changes and improvements sought by the people who live and work in the area.

Ventura County Compact for a Sustainable Ventura County (Phase 1 & 2)

Ventura County is a region that has always valued preserving its natural heritage and maintaining livability. Residents, community leaders, local officials, and public agency staff met and developed a coherent vision of sustainable growth for the region.

SBCCOG Shared Vision for a Sustainable South Bay

The purpose of this project was to assist the SBCCOG with a series of workshops to refine, present and build local government support for a “Sustainable South Bay Strategy.” There are many components to sustainability, and the process of developing the vision was based on the values and needs of the unique area. The resulting Neighborhood Oriented Design model is one relevant to 2nd generation suburbs based on the extended arterial grid.

Alhambra Vision 2035

This current project will provide the City of Alhambra with a shared vision that will help guide the city’s future growth and related policies.

LAND USE STUDIES, PLANS AND CODES

Ontario New Model Colony

This demonstration project analyzed several future scenarios for the New Model Colony (NMC) General Plan Amendment.

Burbank Downtown Development Standards

This project evaluated the potential for revised zoning to accommodate residential, mixed-use, and live-work development in commercial and light industrial areas in Downtown Burbank and along two corridors in the downtown.

Rolling Hills Estates Peninsula Village Specific Plan

Through the demonstration project, a study was done to test the application, feasibility and appropriateness of the proposed Peninsula Village Overlay Zone.

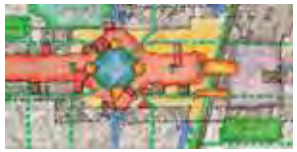
Chino Focus Area Revitalization Strategy

This project quantified the feasibility of redeveloping six opportunity sites under the envisioned mixed-use development standards provided in the current General Plan update.

Holtville Economic Development and Master Plan

Compass Blueprint worked with the City of Holtville to assess the historic downtown district's economic viability and develop a master plan to guide the future of Holtville and its downtown.

Banning Paseo San Gorgonio



This Demonstration Project provided technical planning services for codifying and implementing the policies in the Paseo San Gorgonio Specific Plan and the City's General Plan policies.

Coachella Pueblo Viejo Revitalization

This Coachella Pueblo Viejo project assisted in the revitalization of the "heart" of the City's downtown in concert with the city-wide General Plan update underway. The city used the results to secure and implement downtown façade renovation program funding.

Brawley Downtown Overlay District

This Demonstration Project enabled the development of a Downtown Brawley Specific Plan that evaluates development options in the City's new Downtown Overlay District.

Los Angeles County Florence Firestone (Phase 2)

The strategies identified in the Florence Firestone Vision Study process were further developed to create the Florence-Firestone Community Plan which will guide the future development of the area.

Grand Terrace Business Corridor Specific Plan

This Demonstration Project served to update the Barton Road Specific Plan with a focus on economic development in order to reduce congestion and improve the jobs-housing balance in south western San Bernardino.

Redlands Transferring Development from Greenfields to Infill

The City of Redlands is faced with a series of choices about how it will grow in terms of population, housing and employment.

Los Angeles County Antelope Valley Area Plan Update

This Demonstration Project assisted in the development of a rural smart growth and preservation strategy through new land use designations in the Antelope Valley Area Plan update.

Bellflower Alondra Mixed-Use Overlay Zone

The City of Bellflower developed a clear vision and set of development standards aimed at attracting and managing growth in this underserved area adjacent to the downtown area and the West Santa Ana Branch transit station.

VISUALIZATIONS AND GRAPHICAL TOOLS

El Centro Project SHAPE Downtown

El Centro, a fast growing town near the Mexican border and the hub of the agriculturally rich Imperial Valley, prepared a plan to draw investment into its historic downtown. Using dramatic visualizations to envision a much higher density than has been traditional, the city discovered wide acceptance for the images in the community.

Fullerton Downtown 3D Model & Database

This Demonstration Project provided funding for the creation of a three-dimensional digital model and database of the Downtown Fullerton area. The three dimensional model will help the city with a wide range of analyses and scenario planning for the burgeoning downtown.

San Gabriel Visualizations and Tipping Point Analysis

Compass Blueprint provided the City of San Gabriel with an analysis of the financial feasibility of various development scenarios at a site in the City's mission District. The project produced high quality visualizations of the kind of development that would be feasible and desirable.

Lake Elsinore Key to Downtown Design Guidelines

The City of Lake Elsinore to created design standards and visualization products for the planned development of a new Civic Center and focal point for a larger downtown revitalization master plan.

Calexico Gateway to Mexico

The Calexico demonstration project helped the City to prepare a Master Plan that assesses the historic downtown district's economic viability. As in El Centro, the visualization helped residents imagine a much denser historic core in keeping with existing architectural styles.

ECONOMIC DEVELOPMENT AND FEASIBILITY STUDIES

Upland Downtown Infill Study

The Downtown Upland Infill Study provided Tipping Point/ROI analysis, visualizations, site planning and parking analysis focused on two city-owned downtown parking lots, in close proximity to established civic uses and the Metrolink station.

Los Angeles HACLA Jordan Downs Specific Plan

This project assisted in the development of the Jordan Downs Specific Plan, and provided sustainability strategies for green building and GHG reductions.

Fillmore Business Park Feasibility Study

Compass Blueprint worked with the City of Fillmore to analyze the financial feasibility of a potential business park proposed to achieve more balanced employment and housing opportunities.

Upland College Heights Economic Development Strategy

The City of Upland is developing a sustainable economic development strategy for this recently fully incorporated area that will address job and industry creation awareness in the sub-regional market.

Corona Downtown Redevelopment

This Demonstration Project analyzed land use conditions and the market feasibility for specific redevelopment project sites within Downtown Corona.

El Monte Economic Development Plan

This Demonstration Project created a plan that enables the City to foster compact development, enabling a more synergistic approach to the future of El Monte.

Transportation Network Integration

Since the beginning of the Demonstration Program in 2005, integrating land use and the transportation network has been an important aspect of planning according the Compass Blueprint principles of Mobility, Livability, Sustainability, and Prosperity. As was noted above, the definition of Transit Oriented Development has expanded to include the wider community beyond the station. Local cities and agency have become concerned with improving livability and reducing vehicle miles traveled (VMT) throughout the region, including areas not service by rail transit. Finally, local agencies have become interested in solving the so-called "First mile/ Last mile" problem. This refers to how people, in a disperse region such as Southern California, access the local and regional transit systems. All of these subjects are being studied in communities throughout our region as part of the Compass Blueprint Demonstration Project Program.

The following projects are grouped in the following sub categories: Freeway Trench Capping Projects, Multi-Mobility & Living Streets Planning, and Suburban Arterial Retrofitting. Freeway Capping Projects are local visions for transforming urban areas by providing new urban park spaces, and reconnecting communities divided by freeways decades ago. The vision is to improve freeways where the right of way is in trench, cover the trench and create park space and developable land in return. Multi-Mobility Planning refers to planning for all the other modes of travel besides single-occupant vehicle (SOV). These include bike and pedestrian planning, Bus Rapid Transit, and local neighborhood electric vehicles. Finally, a number of projects can best be categorized as suburban retrofitting. Understanding that many people choose to live in traditional suburban settings, these communities are studying how to retrofit an arterial roadway network designed for the automobile to allow for more mixed land uses and types of transportation.

FREEWAY TRENCH CAPPING PROJECTS

Los Angeles Hollywood Freeway Central Park

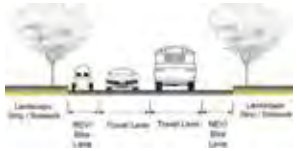
This project evaluated the potential for a public park that would be built on a deck constructed over the below-grade portion of the Hollywood Freeway (US-101) from Bronson Avenue to Wilton Place.

Ventura Freeway Cap Project

The City of Ventura is a beautiful coastal city in Ventura County that is developing a plan to make the downtown area more livable and prosperous by connecting the downtown and the waterfront area.

Los Angeles PARK101 (Phase 1 & 2)

This project assesses the feasibility of "capping" the US-101 freeway as it passes through downtown Los Angeles.



MULTI-MOBILITY AND LIVING STREETS PLANNING

El Centro Project SHAPE Parking and Circulation Plan

El Centro, a fast growing town near the Mexican border and the hub of the agriculturally rich Imperial Valley, needed a plan to draw investment into its historic downtown. The second part of this project was a park-once strategy, and pedestrian friendly circulation vision for the downtown area.

WRCOG Neighborhood Electric Vehicles Plan

This project assisted in a plan for a network of 35 mph speed limit streets suitable for the deployment of Neighborhood Electric Vehicles (NEV) in the cities of Riverside, Corona, Norco and Moreno Valley.

Los Angeles Sunset Junction Streetscape Vision

This project helped the Los Angeles County Metropolitan Transportation Authority identify streetscape improvements for the Sunset Junction area. This vision was awarded Metro Call for Projects funding, and will be implemented in 2012.

WRCOG Bus Rapid Transit Plan

This report provided a conceptual analysis of Bus Rapid Transit (BRT) services for potential corridors within Western Riverside.

Victorville Non-Motorized Transportation Plan

This project assisted in creating a Non-motorized Transportation Plan for the City of Victorville to provide connectivity for residents and visitors to public facilities.

Palm Springs Airport to Downtown Shuttle

This Palm Springs Airport-Downtown Shuttle project evaluated a new Shuttle service that would serve visitors to Palm Springs Hotels via the International Airport.

WRCOG Non-Motorized Transportation Plan

This Compass Blueprint project enabled the development of a Non-Motorized Transportation Plan (NMTP) to support a regional network of bicycle and pedestrian

facilities throughout the WRCOG region. The study identified facilities for both commuter and recreation use.

Anaheim Outdoors Master Plan

The City of Anaheim wishes to develop a network of green corridors within the Platinum Triangle that will provide non-motorized linkages between transit and the places where people live, work, shop, and play.

Calimesa Creek Riverwalk Master Plan

The City of Calimesa project will develop a vision and master plan to create a pedestrian-oriented Riverwalk to repair, revitalize, and leverage the place-making qualities of a storm water channel.

SUBURBAN ARTERIAL RETROFITTING

San Gabriel Valley Arrow Highway Corridor

This demonstration project allowed for collaborative planning between multiple jurisdictions situated along the Arrow Highway corridor. The study produced a vision for development nodes along the corridor which will enable cities to collaborate on supportive improvements to the corridor.

Indio Highway 99 / Indio Boulevard Study

Compass Blueprint worked with the City of Indio to prepare a revitalization plan for Indio Boulevard, based on the vision the City has for downtown of offering new mixed-use developments.

Calimesa Boulevard Downtown Revitalization Project

The City of Calimesa project provided development codes and design guidelines to create a pedestrian-oriented atmosphere consistent with traditional Southern California architectural styles.

Cathedral City Date Palm Drive Connector Plan (Phase 1 & 2)

This Demonstration Project served to provide direction for future Cathedral City public investments, private development, and community action. Phase 2 codified the improvements and developed implementation strategies for the vision.

La Mirada Imperial Highway Corridor Specific Plan

The Imperial Highway Specific Plan established comprehensive policy and a regulatory guidance document for all properties within the Imperial Highway Specific Plan area.

Moreno Valley Alessandro Boulevard Corridor Vision

This project evaluated the potential for transit-oriented development around a proposed Metrolink station at Alessandro Boulevard, and the revitalization of the corridor area. Phase 2 codified the vision in a corridor specific plan, a mixed-use designation, and more specific recommendations for the roadway right of way.

Los Alamitos Commercial Corridors Plan

This Demonstration Project provided the City of Los Alamitos with funding to assess the revitalization potential of the intersection of Katella and Los Alamitos corridors.

K. Compass Blueprint Recognition Awards

The annual Compass Blueprint Recognition Awards serves as an important forum for showcasing smart growth planning practices, attended by elected officials and planning staff from across the 191 member cities. Excellence and achievement awards are granted in four categories: mobility, livability, prosperity, and sustainability along with an award for overall excellence.

TABLE K1 Compass Blueprint Awards

Project Name	City	Year	County
General Plan Update Small Area Visioning	Compton	2007	Los Angeles
Downtown Specific Plan and Mobility Study	Glendale	2007	Los Angeles

L. 2012–2035 RTP/SCS Supportive Local Model Planning/Development Projects

The following table lists other projects within the SCAG region that support the goals and objectives of the 2012–2035 RTP/SCS. The projects identified focus on economic feasibility studies, sustainable design, small-lot housing, mixed-use commercial and residential development, Transit Oriented Development (TOD), parks and community space, all modes of non-automobile transportation, parking systems management, transportation demand management (TDM), transportation systems management (TSM), and other innovative practices.

These projects demonstrate the breadth and depth of sustainable communities supportive planning, and development that has been occurring in Southern California. These projects demonstrate the market demand, and public sector responsiveness for strategies that involve reducing per capita GHG emissions across all parts of the SCAG region.

TABLE L1 2012–2035 RTP/SCS Supportive Non-Compass Projects

Project Name	City	Year	County
Regional Integration of Paratransit Resources	Access Services	2007	Los Angeles
Arcadia Arterial ITS Development Project	Arcadia	2007	Los Angeles
South Street Pedestrian, Bikeway and Transit Improvement	Artesia	2007	Los Angeles
Country Club Drive Bikeway Improvement Project	Avalon	2007	Los Angeles
Baldwin Park Metrolink Pedestrian Overcrossing	Baldwin Park	2007	Los Angeles
Baldwin Park Metrolink Transit Center	Baldwin Park	2007	Los Angeles

Attn: Honorable Pam O'Connor, President of SCAG and Regional Council members
Southern California Association of Governments (SCAG)
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

RE: Active Transportation in SCAG's 2012 Regional Transportation Plan (RTP)

Dear Honorable O'Connor, Regional Council members and Policy Committee members:

On behalf of the Alliance for a Healthy Orange County, we would like to thank Southern California Association of Governments (SCAG) staff, Regional Council and Policy Committee members for the opportunity to participate in the 2012 Regional Transportation Plan (RTP). We recognize the multitude of efforts required to develop the long range plan and are appreciative of all of the hard work that has already been done.

The Alliance for a Healthy Orange County is a county-wide collaborative of health care organizations, community-based organizations and universities whose mission is to champion policy strategies and leverage funding opportunities that result in enhanced health outcomes and reduced health disparities for Orange County residents.

The Alliance urges SCAG to consider the important health impacts of the RTP and place increased emphasis on projects that will promote active transportation. The region does not need a plan that allocates $22 billion on road widening and only $6 billion on active transportation. It is critical to change funding allocations to improve safety and public health throughout our region.

We request that SCAG amend the Draft RTP/SCS to include the following:

1. Increase the overall percentage of RTP funds dedicated to active transportation from 1.3 percent of the 2012 RTP to 5-8 percent of the total 2012 plan.
2. Prioritize active transportation funding and distribute these funds evenly over the 25 year period of the plan so that the benefits of active transportation are brought to Orange County sooner.

3. Incorporate the development of an Active Transportation Finance Strategic Plan by 2014 that identifies how each CTC is spending funds and the opportunities available to increase funding for active transportation.

4. Allocate funding for bicycle and pedestrian planning and usage counts.

5. Set aside funding in the RTP to support SCAG cities in developing bicycle and pedestrian master plans, safe route to school pans and ADA transition plans. Establish a goal that 50% of SCAG cities shall develop these plans by 2016.

6. Adopt a Regional Complete Streets Plan by 2014: This plan will incorporate input from local jurisdictions to prioritize complete streets projects in programming efforts and dedicate a portion of system preservation and maintenance funding for improving the road conditions of all users.

7. Adopt Safe Routes to School Regional Strategic Plan by 2014.

8. School Siting and Joint Use Policies should be incorporated as land use elements of the SCS.

9. Set measurable safety and health goals for all users: Goals are set for the reduction of green house gases in the draft 2012 RTP/SCS. Active transportation plays a pivotal role in the reduction of these green house gasses. Similar measurable goals should be set for reducing crash rates for active transportation and for reducing the health impacts of obesity. These could include a report on the number of children walking and bicycling to school across the entire region as well as a report detailing access to parks, open spaces and quality active transportation networks.

10. Monitoring detailed population data and metrics in environmental justice communities.
The lack of active transportation funding disproportionally affects immigrant, lower-income, and minority populations because these neighborhoods have greater barriers to physical activity and transit access, higher numbers of busy regional arterial, poor pedestrian and bicycle infrastructure, unsafe neighborhoods, and lack of safe storage for bicycles and safe crossings. Thus, these neighborhoods would benefit from an increase in funding allocations (in order for SCAG to meet its Title VI obligations) and from a detailed strategic plan.

Compliance with the SCS requirement of SB 375 and the well-being, safety, and health of citizens within the SCAG region will depend on the future development of our multi-modal transportation network, jobs, housing, education and healthy environments for families to live in.

We sincerely appreciate this opportunity to provide feedback for the 2012-2035 draft RTP/SCS. Please feel free to contact us with any questions or concerns; our contact information is listed below.

Respectfully Submitted,

Barry Ross

Barry Ross
Chairman

Tuesday, Feb. 14, 2012

President Pam O'Connor and Members
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Dear President O'Connor and Regional Council Members:

The health and medical community wishes to thank the Southern California Association of Governments (SCAG) staff for their hard work on the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and for recognizing that the decisions made in the planning process ultimately affect public health and air quality. We are especially pleased to see the inclusion of some of the health and equity indicators that we championed in our comment letters (May 6 and Aug 26) captured in SCAG's performance measures. While we believe the draft plan under review has many positive elements, we also believe strengthening measures are needed to assure that strong public health benefits are achieved through the plan.

The serious air pollution and health problems experienced in the Southern California region require strong action to transform transportation and land use planning. The Los Angeles region continues to be rated as the most polluted area for ozone in the country by the American Lung Association and the public health toll remains high. The Inland Empire continues to bear the brunt of this pollution due to weather patterns that concentrate pollution in the area leading to more severe health impacts.

Research by the American Lung Association in California quantified the respiratory health benefits of smart growth strategies in the Southern California region. This analysis showed that the ***six-county Southern California region could avoid over $16 billion in cumulative health and societal costs*** through smart growth strategies that reduce the growth in the region's vehicle trips by 20 percent by 2035. While large, these benefits may represent a small fraction of the greater benefits that accrue with more physically active transportation options, as envisioned and quantified by the California Department of Public Health's I-THIM modeling

project. Understanding the potential benefits of given planning scenarios will help to identify plans that provide the greatest reductions in harmful emissions and chronic illnesses.

Health experts have continued to speak out through workshops, hearings, joint letters and the media about the devastating toll of respiratory illness, obesity, diabetes, and heart disease caused by our car-dependent community designs throughout the Southern California region and about the need for greater focus on a shift to active transportation modes like walking, cycling and transit that reduce pollution emissions and gets people out of their cars and into a more physically active lifestyle.

We offer the following comments and recommendations to ensure that the Sustainable Communities Strategy and future transportation investments place sufficient emphasis on promoting active transportation modes and transit oriented development, measuring and improving health progress, and ensuring that health and equity are imbedded in the decision making process for this plan and future planning efforts.

Key Health Recommendations for SCAG SCS

- **Increase active transportation investments to more than $12 billion a year**. While we appreciate the increase in active transportation funding included in the draft SCS, we believe more funding is needed. A recent study by the Los Angeles County of Public Health estimated that up to $40 billion could be needed to build out all of the current bicycle and pedestrian projects in Los Angeles County alone. SCAG, in coordination with health departments and organizations, should conduct a comprehensive needs assessment for the Southern California region to determine the infrastructure needs to develop a network of bicycle and pedestrian pathways and transit connections. Analysis is also needed of how SCAG's bicycle and pedestrian per capita investment compares with other regions.
- **Improve Assessment of health benefits through new modeling approaches**. Utilize the new California Department of Public Health I-THIM screening tool to analyze the potential chronic disease reductions that can be achieved in the SCAG region based on increased transportation-related physical activity such as walking and biking. This model was used in the San Francisco Bay Area region to determine reductions in heart and respiratory disease, breast cancer and other health effects linked to active transportation scenarios. We urge SCAG to incorporate this tool in regional planning and decision making for transportation investments.
- **Include the attached list of 13 health and equity metrics in the SCS and monitor over time, including expanded public health targets.** In addition to monitoring premature mortality, SCAG should also assess reductions in asthma incidence and exacerbations due to traffic related pollution (NOX) and other targets through collaboration with local health departments, the South Coast Air Quality Management District, academic researchers and community based organizations. Improvements to the targets should be monitored and reported to the public every two years. *Additional comments on the targets already included by SCAG in the SCS will be sent in a separate comment letter.*

- **Focus investments on completing transit systems** and building out transit infrastructure, rather than highway expansion, including the following:.
    - Doubling Metrolink ridership by 2020 and double it again by 2035
    - Expanding Bus Rapid Transit and regional bus service
    - Enhancing TOD planning and 1st-mile-last-mile investments near Metrolink stations
    - Doubling the bicycle network to 24,000 miles and improving pedestrian environment
- **Increase transit and transit oriented planning in Inland Empire.** Because so much of the planned growth in the Inland Empire is relatively low density and remote from transit, SCAG should work closely with Inland Empire governments to accelerate expansion and frequency of transit and rail to the area and focus more growth around transit corridors. A recent health forum hosted by the American Lung Association in California in Riverside highlighted the dramatic rates of respiratory illness, heart disease and obesity in the region associated with poor land use and sprawl development.
- **Front load active transportation funding.** SCAG should commit to a higher amount of transportation funding for bike and pedestrian infrastructure, especially in the early years of the 25-year RTP process. SCAG should work with local transportation agencies to prioritize bicycle and pedestrian projects and ensure the majority of funds are spent prior to 2020.
- **Increase investments in zero emission freight transportation** in order to reduce diesel emissions and exposures in communities near freight corridors and rail yards. Ensure that funding mechanisms are in place to expedite the implementation of the zero and near-zero emission freight and truck strategies and infrastructure. Prioritize spending on projects that deliver maximum health benefits for residents of the region, especially those living along freeways and freight corridors.
- **Evaluate the number and type of new developments** that could be located in close proximity to freeways and high traffic roadways in the SCAG region under the new RTP and potential pollution exposures. The Environmental Justice Appendix to the Plan shows that approximately 25% - 27% of households living within 500 feet of freeways could face greater exposures to CO and PM than under the base case, with high concentrations of minority and low income residents disproportionately affected. Work with air district, health departments and universities to develop and implement best practice policies for developments located near heavy traffic areas to reduce exposures to air pollution.

As health and medical organizations and professionals, we recognize that strong government policies to control harmful emissions and that dramatically increase options for active transportation are critical to improving public health and quality of life in Southern California. We stand ready to assist you in implementing a truly health protective, equitable and sustainable plan for Southern California.

Comments on December 2012 draft of
SCAG 2012 Regional Transportation Plan

The Southern California Association of Governments' (SCAG) 2012 Regional Transportation Plan (Plan) is an excellent planning document based on 2005 technology. It lacks only an update for the digital technology of 2010 and an infusion of hope amid the many challenges. You can accomplish that update by inserting the Arial font text at the appropriate locations in the Plan. Any text not in Arial font is supporting logic and documentation. SCAG may choose to insert the non-Arial font or use it to prepare an alternate revenue-expense model.

SCAG is a sufficiently large economy to drive more applications of digital technology for transportation safety and convenience. If SCAG does not drive digital applications, the digital applications will drive SCAG. For example:

- In response to youth surveys, General Motors is applying digital technology. For example; small self-driving taxis and cars which will park themselves a mile or more from their passenger drop off or pick up locations.[1, 2] Today's tech-savvy 0-15-year olds will be the transportation consumers responding (or not) to SCAG's Transportation Demand Management (TDM) as the 18-38-year olds of 2030.
- Drivers are ever more distracted by their digital devices, so much so the National Highway Traffic Safety Administration recommends banning all use of digital devices, even hands free phones.[3] Increasingly distracted drivers are more likely to kill pedestrians and bicyclists, with more adverse impacts on TDM and safety.[4]
- Pedestrians and bicyclists are distracted reading their digital device and oblivious to outside sounds wearing earphones.[5]
- As of 2009, anyone with a smart phone had access to real-time (and very distracting) visual indications of traffic conditions on their alternate routes.

[1] Self-parking is described in News Briefs, page 36, *Civil Engineering*, December 2011 (*Civil Engineering* is the magazine of the American Society of Civil Engineers). The POD car is described at http://theweek.com/article/index/217867/gms-new-self-driving-pod-car.

[2] General Motors is responding to numerous surveys, "Young buyers want cars that are safe, affordable, compatible with the latest high-tech gadgetry, and good for the environment." In 1983, 80% of 18 year olds had driver's licenses, in 2008 only 67%. http://www.vcstar.com/news/2012/jan/12/editorial-job-1-is-getting-teens-interested-in/

[3] Associated Press, December 17 & 18, 2011 based on NHTSA campaign http://distraction.gov/

[4] Individual car safety/convenience features (adaptive cruise control, self-parking, stability control, out-of-lane warning, etc.) are less likely to sense pedestrians while giving drivers a false sense of safety while distracted.

[5] Editorial in Ventura County Star, December 29, 2011 mentioning the National Transportation Safety Board, the American College of Emergency Physicians, the San Francisco Municipal Transportation Agency, and AAA Texas.

The American Society of Civil Engineers, Los Angeles Section, Sustainability Committee encourages SCAG to drive digital applications for transportation because digital applications allow tremendous improvements in mobility, safety, and air quality with relatively little use of the Earth's natural resources.

Further, motor vehicles manufacturers are implementing digital applications in an uncoordinated fashion motivated to sell more vehicles: adaptive cruise control, stability control, self-parking, voice recognition, collision warning, General Motors' OnStar, etc. While these systems help protect the vehicle occupants, they are likely to increase the rate of bicyclist and pedestrian deaths above 21%.[6] Our committee includes regular bicycle commuters who often get unsolicited comments about the dangers involved. It would seem the perception of danger is discouraging bicycle and pedestrian transportation. It follows that an increase in perceived safety is essential for increasing active transportation.

Executive Summary

After the Mobility, Safety, Air Quality, and Financial Challenges of Executive Summary pages 2 and 3, add:

DIGITAL OPPORTUNITIES

Our electronic systems continue to improve in reliability, performance, and cost. 2035 is as far in the future as 1986 is in the past. In 1986, mobile phones were the size of small vacuum cleaners and anti-lock brakes were standard on a few luxury cars. Personal computers were the size of a desk drawer with the power to handle word processing and simple spreadsheets. In 2010, smart phones are smaller than a deck of cards, are a tenth the cost of a 1986 personal computer, and possess the power of a 1986 super-computer. Full drive-by-wire stability control systems are standard on most cars. The global positioning system (GPS) was not fully operational with civilian accuracy of about 30 feet until 1994. In 2010, smart phones have GPS which can be integrated with the smart phone's accelerometers for precision of a few inches at highway speeds.[7]

Our vision includes pushing the connectivity and computing power of 2010 to address the transportation challenges of 2020, 2030, and beyond.

[6] The December 2011 draft 2012-2035 Plan, page 2.

[7] Differential, Wide Area Augmentation, Local Area Augmentation, and multiple signals increase accuracy. The differential GPS position accuracy of an object which is still for minutes is fractions of an inch. The accelerometers allow moving objects to integrate GPS signals over time to achieve accuracy within several inches and to cover areas with spotty GPS signal reception.

At the end of the Financial Plan Executive Summary pages 7 and 8, add:

REDUCED INSURANCE COSTS

Drivers and businesses in the SCAG region paid about $25 billion in 2010 for vehicle insurance.[8] By pushing digital systems to address transportation safety challenges, SCAG can decrease collisions from about 83,000 per year in 2010 to less than 500 per year in 2035.[9] Digital systems would save drivers and businesses about $240 billion on insurance premiums over the twenty years between 2015 and 2035.[10] Also, by pushing digital systems to address transportation mobility challenges, SCAG can reduce the regional person-hours of traffic delay below 1 million hours per year.[11] The insurance and time savings more than justify the increased gas tax[12] and mileage-based user fee suggested in Table 2 with directly offsetting savings for drivers and business.[13]

[8] An estimate based on proportionality of population SCAG may want to verify.

[9] The modest drop in collisions per year shown in Figure 2.2, page 38 may be due as much to the economy and the increased prevalence of stability control systems than California's Strategic Highway Safety Plans. Extending digital systems beyond drive-by-wire stability control promises near-zero collisions.

[10] It is possible for 99% of vehicles to have digital zero-collision systems by 2035. A linear ramp-down of accidents and insurance costs starting in 2015 would extend over twenty years with an average saving (predicted for 2025) of $12 billion per year.

[11] The December 2011 draft Plan's Figure 6.1 on page 164 indicates essentially no change from 2008's time lost to traffic delays for the Plans' 2035 projection of about 4 million hours/yr. Because digital systems are super-polite (the cars are informing each other of moves well within digital reaction times) merging is smoother and per-lane capacity at speed is easily doubled. The smooth merging feature should be effective eliminating traffic delays even beyond the effective doubling or tripling the number of lanes. While actually doubling lanes or buses or trains is not fiscally possible, virtually doubling them is as inexpensive as $200 per vehicle per a 2005 estimate by General Motors engineers.

[12] Overall sustainability would be better by either 1) shifting the per-mile fee to fuel tax or 2) implement the per-mile fee as a function of vehicle weight. As a commuting bicyclist I might pay 1/20th the rate of a Smart Car, who would pay ¼ the rate of an SUV, who would pay 1/6th the rate of a loaded semi-truck. Bicyclists and pedestrians could pay toward a lottery-type incentive system as combination virtual force field and bicycle computer device logs commuting miles.

[13] The December draft Plan indicates substantial new revenue to preserve essentially the same traffic delay and a modest decrease in vehicle insurance costs. "Same as 2008" will not keep the Ports of Los Angeles and Long Beach competitive with a widened Panama Canal or help the SCAG region attract other businesses while other regions improve their transportation and drop their expenses applying digital systems.

Vision

Change the title and add the following to pages 27 and 28:

INTEGRATED LAND USE AND DIGITALLY ENHANCED TRANSPORTATION

Digitally enhanced transportation is the application of technology allowing:

- Transit users to keep shopping, working, or playing until they receive an alarm that they have just enough time to get to the bus stop.
- Bus drivers to vary their routes and stops in real time to optimize service, revenue, and expense.
- Cities to organize all the possible parking spots (street, schools, churches, business, and individual residences) for public-private coordinated time-of-use and membership-based tolls and space sharing.[14]
- Private drivers and passengers to share rides on-the-fly as a decentralized neighbor-helping-neighbor form of transit.
- Pedestrians and bicyclists to be protected from motor vehicles by a virtual force field using a $50 device which informs motor vehicles of their location, velocity, and accelerations. The same device can offer tips on safe bicycling and safe walking.[15]
- Motor vehicles to be protected by the same virtual force field. The virtual force field not only prevents accidents, it negates the perceived safety of larger vehicles.[16]
- More gamification[17] in traffic management, such as speed camera lottery.
- Safely doubling road capacity while maintaining the speed limit (no congestion delays) by applying the same virtual force field to make vehicles super-polite.
- Rental of bicycles, traditional cars, or self-driving vehicles by the minute.[18]
- Cargo-pooling for mail, hardcopy messages, tools, equipment, food, etc.[19]

---

[14] (We may find excess parking spaces to convert into mini-parks or weekly/seasonal business locations.)

[15] (Bicycle on the right! *Spanish translations welcome.* Stop for red light! Cross curbs at right angles.)

[16] The perception of safety in small vehicles allows the proliferation of Smart Car sized vehicles and even freeway capable human-electric hybrids.

[17] Gamification is applying games to life (transportation, education, government, etc.). Gamification and speed camera lottery are explained at: http://www.aol.com/video/youve-got-gabe-zichermann/517241772/?icid=maing-grid7%7Cmain5%7Cvideo-module%7Csec3_lnk1%7C125198.

[18] Many cities already have bicycle rentals by the minute from a multitude of locations spread around the city, one example: http://www.bcycle.com/. General Motors is developing two-person self-driving, self-parking, digitally summoned electric vehicles: http://theweek.com/article/index/217867/gms-new-self-driving-pod-car. Private companies are offering hourly car rentals, one example: http://www.zipcar.com/.

[19] With convenient communications and radio ID tags, a U.S. Postal Service tractor could connect with a preloaded trailer full of store-assembled boxes of groceries, and deliver each box to the apartment which ordered those groceries. See http://www.prweb.com/releases/2011/10/prweb8844077.htm

Background information on decentralized transit and parking

Smart phone-transit[20] is by far the most business like way to reduce vehicle miles. With smart phone-transit, everyone can elect to participate public transit, which is as time conserving as hailing a taxi and as energy and cost conserving as carpooling. That is, the public transit via smart phone is super-convenient relative to buses or trains. There are many examples. This software for i-phones is a ridesharing focused explanation of smart phone-transit: www.avego.com/ui/index.action. This app can work on any smart phone.

Cellphone-parking[21] guides people to empty parking spaces and enhances many other strategies for increasing ridership on traditional and new forms of public transit.

Two non-profits have included smart phone-transit in their documents. Santa Barbara's Community Environmental Council describes it as dynamic ridesharing coordinated with smart phones in their 2007 Transportation Plan for their Fossil Free by 2033 Program. Sierra Club California mentions making transportation information available with smart phones in their November 19, 2008 comment on the California Air Resources Board's (CARB) scoping plan for California's Global Warming Solutions Act of 2006.

Motivation

The author's research for the Santa Barbara Community Environmental Council's Fossil Free by 2033 Transportation Plan (Free by 2033 Plan) confirmed a strong preference for convenience when selecting transportation. The Free by 2033 Plan[22] concludes increased ridesharing can reduce vehicle miles by 20% much quicker and less expensively than can increased use of traditional public transit. Convenience and cost factors strongly favor ridesharing.

These general facts from the Legislative Analyst's Office[23] concerning carpool lanes confirm a need to increase timesaving and convenience aspects of public transportation:

- High Occupancy Vehicle (HOV) lanes are underused in the off-peak direction or during off-peak hours, because there is little timesavings incentive to carpool when traffic is flowing.

[20] Cellphone-transit uses the GPS, computer, and communications capabilities of cellphones to produce public transit by connecting people to share the empty seats in their cars.
[21] Cellphone-parking can have a sensor on each parking spot, or use individual's cellphones, or use the car's digital safety system as the sensor. In any case, the digital system would send information for billing, payment, guiding drivers to empty (non-reserved) spots, and gathering information on parking supply and demand.
[22] http://www.communityenvironmentalcouncil.org/Programs/EP/PDFs/Transportation_Nov08/CEC_transportation_Nov08_final.pdf
[23] Legislative Analyst's Office, "HOV Lanes in California: Are They Achieving Their Goals," January 2000

- HOV lanes are most effective when they provide timesaving. HOV lanes do not increase carpooling, unless there is traffic slowing congestion.

The summer 2008 high fuel costs followed by the fall 2008 low fuel costs provide a price-based example. High fuel costs increased bus and train ridership and prompted calls for more convenient buses and trains. At least in Los Angeles, new summer 2008 riders generally abandoned buses and trains when fuel prices dropped.

Further, consider how rapidly people abandon bicycles, buses, and trains when they can barely afford a private motor vehicle in developing countries. Witness the switch away from bicycles in China and India.

All this implies that transit riding must become as convenient as single occupancy vehicles if transit riding is to increase significantly. Rather than allowing traffic congestion to drag on the economy, make transit more convenient. The best transit riding increasing strategy will be super-convenient. The inexpensive super-convenience of digital applications extends to low income people unlike traditional public transit (which is not convenient) or single occupancy vehicle tolls (which are expensive). SCAG's implementation of smart phone-transit would make SCAG's transit system more sophisticated and 21st Century than New York, San Francisco, London or Paris.

Smart phone-transit & Smart phone-parking

Smart phones can coordinate and improve all our existing transportation equipment with:

- Convenient access to bus and train schedules and next-bus or next-train arrival times, even while you are standing at the curb;
- Automatic payment for train, bus, carpool, taxi, or rideshare (with demand-driven price adjustments honing in on the best price for minimum vehicle-miles);
- The convenient access to several modes of transportation makes traditional public transit more acceptable due to the easy on-the-fly availability of other modes to meet the unexpected.
- Carpools or rideshares scheduled weeks, days, hours, or minutes ahead, or even when a car is parked, or when a car with an empty seat is driving by;
- The smart phone warns you, routinely minutes before arrival, that a bus, train, or parking lot will be full. The warning could be days in advance when people are reserving for special events.
- Real-time ridesharing buddy selection (sometimes you want professional peers, sometimes church buddies, sometimes teammates);
- Navigation guidance to empty parking spots, paying the parking meter, parking meter rates that vary with time of day and number of people in the car;
- Rewarding with parking spots near the "in" restaurant for past public transit use, because the smart phone reliably documents time and distance spent commuting via public transit (or rideshare, or bicycle or walking);

- Businesses, churches, schools, employees, and individual citizen parking space owners could share parking spots with time-of-use metering and the rate communicated through and paid through the smart phone; and
- The smart phones may communicate using UC Berkeley developed software to direct individual drivers around traffic congestion. Again, the congestion can be predicted and prevented hours or even days in advance with sufficient people scheduling transportation on smart phone-transit.

Any smart phone with GPS (global positioning system) and modest computation power can have software more comprehensive than the i-phone application announced by Avego in November 2008. Other phone companies have been a little slower to acquire 3rd party transportation applications. However, the Blackberry Storm, the T-Mobile G1, the Samsung Instinct, and the LG Dare are all smartphones with touchscreens. They should be able to run smart phone-transit software.

The smart parking meters, most using Zigbee radio protocol, are already installed in several communities. San Francisco's SFPark project installed 6,000 meters in summer 2008.[24] Each meter is about the size of a deck of cards, is glued to the pavement, and has several years of battery life. The smart parking meters relay information to each other sometimes via similarly equipped electric, gas, and water meters. The communication allows car navigation to empty parking spaces and rate adjustment from a central office. The internal computer allows parking rates to vary for the convenience of the owner of the parking space and as a means to reduce vehicle-miles.

For example, a school could adjust the parking rate depending on location, time of day, how many students arrive in that vehicle on that day, how often that student has used other public transit or bicycled. A restaurant adjacent to the school could "rent" evening parking hours from the school with automatic payment validation when the people spend more than 20 minutes in the restaurant. Churches could "rent" parking spots for major sports events or nearby Christmas shopping because the parking rate for non-members would be exceptionally high during church events. One side effect of this coordinated parking is the opportunity to convert seldom-used parking into parks or bicycle lanes.

Other solvers will offer many strategies which are greatly enhanced by smart phone-transit and smart phone-parking: wireless web on buses and trains, rewarding employees to abstain from using a parking spot, subsidized bus passes, carpool lanes, time-of-use road tolls, emergency ride home, designated park&ride areas on every block, etc. You can find a great list of such ideas in the Santa Barbara Community Environmental Council's Transportation Plan[3].

[24] See website at SFPark.org. Check comments at http://pressabout.us/sfpark.org.

Economics

As Avego proves, the only cost of providing smart phone-transit in the SCAG area is the cost of encouraging it's use and perhaps assisting Apple and other manufacturers to provide compatibility between smart phones and apps. The cost of smart phone parking is in establishing and maintaining a data base for the smart phones to interact with. Again, private companies can provide this service in exchange for a share of the parking fees. Consumers seeking the conveniences of smart phone-transit and smart phone-parking will force smart phone manufacturers and service providers into larger investments in order to protect or increase market share.

Potential incomes from providing smart phone-transit and smart phone-parking include:

- When each train, bus, or rideshare rider pays the driver, the smart phone-transit service is paid two cents per mile. One billion miles a year would provide $70 million per year.
- The smart phone service provider pays $1 of their monthly Internet service fee to start and maintain the smart phone-transit and smart phone-parking service. Five million smart phone owners generate $60 million a year.
- SCAG might pay the smart phone-transit service a fee to obtain ridership data for adjusting routes and fares to minimize both vehicle-miles and passenger-miles-per-gallon.
- Businesses, schools, churches, and governments could pay for special (picture, music, or video) listing in the service so that people can identify them, find how to travel to them, and gather data on what draws customers, voters, students, and members.
- The smart phone-parking service provider may be paid from a portion of the parking fees (as is often done for traffic-light-running-ticketing cameras).
- Parking space owners can sell parking spaces at the time-of-use rate that fits the owner.

Individuals bear the cost of buying smart phones and services. Because individuals obtain smart phones for so many other reasons, the individual's incremental cost is small. Small is relative and flexible. Phones can be a provided at a nominal cost and profits made on the service. This low initial price is followed by higher operating fees is like obtaining a loan and using the phone purchase to pay for itself with the personal savings on transportation costs.

SCAG can trigger the smart phone market share race, advertise the program, and contribute to economic opportunity with contests and promotions. $1 million would buy about 5,000 smartphones wholesale. The smartphones can be rewards for idea contests, student essay contests, or a recruiting contest. In a recruiting contest, contestants sign up regular customers at regular customer rates. The new customers' transit use is summed (aggregate manner to avoid privacy issues) for the contest period. The contestants whose

customers accumulated the most transit miles win the smartphones and year of service. The summed miles can be displayed on a website with hourly updates to create excitement. Note that a bus or taxi driver with a smartphone and the service creates a participating bus or taxi with automatic payment option and data transfer to the agency.

Charities can participate as receivers of rider's payments, by recycling smartphones, and by subsidizing service fees. Americans are more generous then fugal. That suggests past efforts to encourage more car-pooling were hindered because the $2 fee for giving someone a 5 mile ride wasn't worth the time required to set-up a pool. However, generous Americans will hunt for passengers, if the fees are automatically transmitted to their favorite charity.

Business and government can save money and gain clients by providing employees who attend off-site meetings with the smartphones and service. Businesses doing so gain a marketing edge because their potential clients will want to be associated with such smart and energy efficient service providers.

Future

Consider adding the parking meters as a smart phone feature gradually starting in 2013. The phones will need more accurate GPS, which can be provided using inertial navigation to improve satellite fixes, or by providing more GPS channels within the phone, or by providing more satellite repeaters. The accurate within-a-yard phone would link to the city's GIS (geographic information system) whenever the car stops in any mapped parking spot. Ergo, the smart phone becomes the parking meter.

Background information on zero-congestion, zero-collision vehicles

Motor vehicles can use digital technology to avoid crashing into each other. Commercial aircraft already use this electronics to safely increase landings and take-offs in less time. It's called the Automatic Dependent Surveillance Broadcast System[25] and started coordinating 9,000 helicopter flights a day over the Gulf of Mexico in January 2010. The electronics is robust and keeps getting better. For example, the U.S. Air Force is developing tiny quantum-mechanical devices that improve your car keeping track of itself even if it loses its Global Positioning System signals.[26]

[25] One of many possible descriptions: http://www.rescuecom.com/blog/index.php/computer-support/flight-made-cool-and-safe-ads-b-is-coming/
[26] http://www.scientificamerican.com/article.cfm?id=getting-gps-out-of-a-jam

Electronics is way cheaper than car insurance. In 2005, General Motors engineers estimated $200 per car to upgrade OnStar to zero-crash, zero-congestion.[27] Of course, most other cars would have to be similarly outfitted for this low-cost approach.

Example actions

Allow, beginning January 1, 2013, single driver cars with zero-crash and zero-congestion technology to use car-pool lanes.

Announce such technology will be required for the "fast" lane of 3^{+} lane freeways starting January 1, 2016.

Announce such technology will be required for all but the slow lane of every freeway in SCAG member jurisdictions starting January 1, 2020.

Announce a lottery which bicyclists and pedestrians enter by logging miles with their zero-crash technology equipped smart-phone, bicycle computer, or pedometer.

[27] 2005 quote no longer available, low cost can be inferred from the Vehicle-to-Vehicle portion of http://www.traffictechnologytoday.com/opinion.php?BlogID=45

Subject: Official Comment on the 2012-2035 Regional Transportation Plan/EIR; Recommendation to Include an Underground, Automated Alternate to the East West Freight Corridor

Ladies and Gentlemen:

For the past two years I have been involved with the refinement and promotion of a freight transportation concept we call "Green Rail Intelligent Development", or GRID. GRID is composed of three major components, as follows.

1) A "SuperDock" to provide highly automated transfer of container freight directly between ships and trains. Two types of trains would be served by the "SuperDock", Class 1 trains for BNSF and Union Pacific to travel through the Alameda Corridor, and drone container trains to and from points in southern California.
2) A freight pipeline, essentially a tunnel for the drone trains to travel between warehouse districts in the Los Angeles region and the Ports.
3) Loading/unloading terminals to feed and receive drone trains into and from the freight pipeline/tunnel. These terminals would be strategically located near concentrations of warehouses in downtown Los Angeles, the City of Commerce, Rowland Heights, and Fontana.

The freight pipeline would essentially provide an unobtrusive, nearly noise-free, electrically powered alternative to the East West Corridor proposed in the RTP.

Initial indications are that the efficiency of the "SuperDock" and freight pipeline system could generate a sufficient cash flow for the system to pay for itself using current freight costs and without any tax increases. This system has received a specific endorsement from the Angeles Chapter of the Sierra Club.

I recognize there is insufficient time for the study of GRID that would be required for GRID to be included as an alternative in the current RTP. However, as soon as the draft RTP is finalized, I encourage SCAG to participate in an investigation of GRID to determine its viability. GRID provides an opportunity for a true paradigm shift in freight transportation within southern California that could significantly reduce highway congestion and make freight transportation to and through southern California competitive with that anywhere in the world.

Sincerely,

Ameron International Corporation

Re: Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Program Environmental Impact Report (PEIR)

Sent: Via e-mail (rtp@scag.ca.gov and 2012PEIR@scag.ca.gov) and via 1st Class Mail

Dear Mr. Lieb and Ms. Lin:

On behalf of the Arroyo Verdugo Subregion, please accept these comments regarding the SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and associated Transportation Conformity Report and Draft Program Environmental Impact Report (PEIR), which were approved at the Arroyo Verdugo Steering Committee Meeting of February 6, 2012. It is important to state, out of respect for all of my colleagues on the Steering Committee, that the cities of Burbank and Pasadena abstained from all of these comments. However, the majority of the cities (Glendale, La Cañada Flintridge and South Pasadena) did approve these comments to be forwarded to you for review.

Our comments are as follows:

1. **PURSUANT TO FEDERAL REGULATIONS, PROJECTS SHOULD NOT BE INCLUDED IN THE RTP/SCS CONSTRAINED PLAN, WHICH HAVE ONLY SECURED A SMALL PORTION OF THE REQUIRED FUNDING NEEDED TO COMPLETE THE PROJECT:**

   The RTP/SCS, according to federal regulations, in "nonattainment and maintenance areas," (which includes the area covered by the RTP/RCS) must "address the specific financial strategies required to ensure the implementation of projects and programs to reach air quality compliance" (23 CFR § 450.322 (b) (11) (part)). Projects which only have secured a small portion of the needed funding, and which rely on speculative funding, such as potential and/or possible tolling authority, should not be included in the RTP/SCS, since this inclusion does not meet the federal requirements for a fiscally constrained plan.

Burbank • Glendale • La Cañada Flintridge • Pasadena • South Pasadena
1327 Foothill Boulevard • La Cañada Flintridge, CA 91011
Phone: 818-790-8880 • Fax: 818-790-7536 • Email: awilson@lcf.ca.gov

2. **LANGUAGE SHOULD BE INCLUDED IN THE RTP/SCS REQUIRING A FULL COST/BENEFIT ANALYSIS FOR ALL PROJECTS IN THE CONSTRAINED PLAN:**

Language should be included in the RTP/SCS that clearly states that a full cost/benefit analysis shall be completed for each project contained in the RTP/SCS constrained plan.

3. **SCAG SHOULD VIGOROUSLY PURSUE PROJECTS WHICH WOULD PROVIDE ENVIRONMENTALLY SUPERIOR ALTERNATIVES TO THOSE CURRENTLY IN THE PLAN IN ORDER TO BEST COMPLY WITH EXISTING ENVIRONMENTAL LEGISLATION:**

The PEIR states that: (1) *"Re-entrained roadway dust would increase proportionate to VMT. This would be a significant impact;"* (2) *"Impacts related to total GHG (Greenhouse Gas) emissions were determined to be significant even after mitigation.;"* (3) the PM10 Emissions Exhaust Only for Heavy Duty Trucks will increase (Table 3.2-4).; and (4) the *"Plan would result in a significant and unavoidable impact related to heavy-duty truck VHD [Vehicle Hours Driven], among other impacts."*

SCAG should vigorously pursue projects under CEQA, the Clean Air Act, SB375 and AB 32 which would provide environmentally superior alternatives to those currently in the Plan, such as freight to rail mixed with additional transit. Additionally, sensitive receptors, such as schools and residences, must have adequate mitigation measures that satisfy these legal requirements.

4. **MAJOR HIGHWAY EXPANSION PROJECTS SHOULD NOT BE FRONTLOADED IN THE RTP/SCS:**

The RTP/SCS frontloads highway modalities by disproportionately allocating funding and anticipated completion dates. This is evidenced by comparing Table 2.2 - *Major Highway Completion Project* against Table 2.5, *Major Transit Projects,* in chapter 2 of the RTP/SCS. Transit projects are built in segments with the final project not being completed until 2030-2035. Expanding highways induces VMT and therefore frontloading major highway completion before transit projects does not comply with the tenets of SB 375 and AB 32 to reduce greenhouse gas emissions by reducing VMT. Additionally it is well documented that land uses adjacent to freeways are prone to increased toxins which cause negative health impacts.

According to SCAG staff, highway projects may be more easily financed than transit projects by borrowing against future toll revenues. They state that this is the reason the highway projects are frontloaded. This financial reasoning does not justify sacrificing environmental concerns by building the highway projects prior to transit projects.

5. **THE TERM "SR-710 GAP CLOSURE" USED IN THE PLAN SHOULD BE SUBSTITUTED WITH "710 NORTH EXTENSION":**

The "SR 710 Gap Closure" language, already in the 2008 RTP, should be modified to consistency with Metro's stated intent, which should serve to ease, if not eliminate, the current polarizing language. The shift in title from "710 North Extension" to "710 Gap

Closure" is invalid, since there is no gap. SR-710 terminates at Valley Boulevard. There is no northerly extension to connect to, since the portion of the 210 interchange including Del Mar Boulevard was built conditioned upon the fact that it "would have no effect on the decision as to the ultimate freeway location and will not foreclose alternatives to the proposed ultimate …Freeway." This title seems to create a sense of inevitability or priority for this project over competing ones and cannot be justified.

6. **SCAG ASSUMPTIONS REGARDING THE "SR-710 GAP CLOSURE" PROJECT PRODUCING CONGESTION RELIEF AND LOWER GREENHOUSE GAS EMISSIONS ARE FLAWED, BASED UPON EMPIRICAL RESEARCH ON OTHER HIGHWAY PROJECTS THAT HAVE BEEN BUILT:**

   The PEIR states that "The Plan would increase VMT when compared to existing conditions." (SCAG RTP/SCS p. 3.2-25). Specifically, decreasing VMT is the goal of SB 375 and should also be the goal of the RTP/SCS. The increase in VMT is the Plan's reliance on freeway (whether tunnel freeway or above ground freeway) expansion to meet the region's mobility needs. Notably, the RTP/SCS describes the SR-710 tunnel as a tunnel with 4 lanes in each direction. This is a major highway expansion being introduced into the region. To the extent that this causes the widening of other freeways (such as the I-210), it will further expand the freeway system. The region would be better served with an alternate project which is not highway oriented and which would potentially decrease VMT, rather than increasing it.

   SCAG assumes that the SR-710 extension will produce congestion relief and lower greenhouse gas emissions. These assumptions are not borne out by recent research, and there are a host of other previous studies showing that an increase in highway capacity increases VMT and that once the project is built, congestion, within a few years, returns. These SCAG assumptions are flawed.

7. **THE DEFINITION OF THE SR-710 GAP CLOSURE PROJECT FROM ONE PRECISE POINT TO ANOTHER THREATENS PROGRAM-LEVEL CONFORMITY IN THE PLAN AND PREJUDICES FUTURE ENVIRONMENTAL ANALYSES:**

   The Plan has modeled the SR-710 extension from one precise point north to another. Unfortunately, this assumption removes the low-build or multi-modal solution to the congestion problem. Under federal regulations, because of this specificity, the Plan and the PEIR threaten program-level conformity and prejudice future project-level environmental analyses.

Thank you for your careful consideration of our comments.

Sincerely,

David A Spence

Re: Draft 2012 Regional Transportation Plan and Program Environmental Impact Report

Dear Mr. Ikhrata:

The Association of California Cities – Orange County (ACC-OC) is grateful for the opportunity to provide its comments on the Southern California Association of Government's 2012 Regional Transportation Plan/Sustainable Communities Strategy draft Program Environmental Impact Report. By way of background, the ACC-OC recently joined a coalition of local governments, business community and non-profits to provide its comments and concerns on several key issues where the coalition agreed upon, including:

- Induced growth
- Financial feasibility and responsibility for the implementation of proposed mitigations
- Funding assumptions, especially as it relates to conceptual "mileage-based" user fees
- Mitigation measures that exceed SCAG's authority and responsibilities for implementation of the RTP.

In supplement to these issues, the ACC-OC respectfully submits a series of additional concerns that we believe should be addressed to ensure the RTP/SCS can meet its objectives without unnecessarily burdening cities across Southern California. These issues include:

- **In general, the RTP infringes upon local control**: The 2012 RTP assumes an inability of local agencies to balance the societal and cultural costs associated with plan objectives and instead requires that they assume the objectives stated in the plan, which may or may not be shared local objectives. Matters such as reducing vehicle miles traveled, eliminating the consumption of fossil fuels in favor of zero or near zero emission vehicles, installing infrastructure necessary to support

zero emission vehicles (such as charging stations), reducing obesity, environmental justice impacts, anticipating extreme weather and related events, increasing development densities, and the likelihood of the adoption of active transportation methods or the practicality of necessary infrastructure improvements are matters of intense local debate and are not appropriate subjects for regional determination. The RTP should be based less upon behavior management of both the public and public agencies and more upon accurate predictions of population patterns and future transportation requirements.

- **The RTP takes aggressive steps to force cities to adopt costly programs in a time when cities are facing record budget shortfalls and loss of revenues**: Many cities continue to struggle with the loss of revenue into general funds. Additionally, with the loss of redevelopment funds – a staggering $550 million in Orange County alone – cities face difficult choices on whether or not they can afford to pursue beneficial programs, including blight removal, transportation-oriented development projects, and the greening of cities. While these may be meritorious projects, cities will now be forced to chose between these and core services, including public safety. Mitigation measures, a sample of which is included below, exacerbate the difficulty of these choices.

    - **Urban Growth Boundaries: MM-LU42** – *"Local jurisdictions or agencies can and should establish an urban growth boundary (UBG) with related ordinances or programs to limit suburban sprawl; local jurisdictions or agencies can and should restrict urban development beyond the UGB and streamline entitlement processes within the UGB for consistent projects."*
    - **Climate Action Plans: MM-GHG9** - *SCAG member cities and the county governments can and should adopt and implement Climate Actions Plans (CAPS, also known as Plans for the Reduction of Greenhouse Gas Emissions as described in CEQA Guidelines Section 15183.5 Tiering and Streamlining the Analysis of Greenhouse Gas Emissions)*
    - **Energy Audits: MM-PS91** - *Local jurisdictions can and should require the performance of energy audits for residential and commercial buildings prior to completion of sale, and that audit results and information about opportunities for energy efficiency improvements be presented to the buyer.*
    - **Parking Management Plans MM-TR96** – *"Local jurisdictions can and should implement a Parking Management Program to discourage private vehicle use..."*

Moreover, these mitigation measures deal mostly with SB 375's Greenhouse Gas Reduction targets. However, Orange County completed its own SCS (included in the RTP as an appendix) to ensure it can achieve these goals. Therefore, any SB 375 and/or SCS mitigations should also be included as an appendix and for the consideration of each sub-region, including Orange County.

ASSOCIATION OF CALIFORNIA CITIES
ORANGE COUNTY

600 South Main Street, #940, Orange, CA 92868 | P: 714.953.1300 | F: 714.953.1302 | www.ACCOC.org

- **SCAG has significantly over-reached on the implementation language of these (and other) mitigation measures.** The aforementioned measures, as well as numerous others, utilize troublesome "can and should" language in context of the implementation of mitigation measures. This broadly assumes that **a)** cities have the ability to enforce and impose these measures and **2)** that there is funding to ensure the application. In many instances, neither is accurate. This is a fundamental problem with the RTP and must be remedied by replacing "can and should" with "should" or "may."

  Orange County went to great lengths to produce its own SCS that met CARB's GHG reduction targets. However, the draft RTP/SCS proposed mitigation measures go well beyond what the Orange County-level SCS found to be effective tools to reach these targets. To assume that Orange County cities "can and should" implement these draconian mitigation measures is to discount the extraordinary effort to develop an effective SCS for the unique cities in Orange County.

- **Funding mechanisms for the RTP need much more economic analysis**. Specifically, the identification of more than $110 billion through the implementation of a "mileage-based" fee is conceptual at best; even an "adjusted gas tax alternative" is not guaranteed. Developing a $500 billion transportation plan with approximately 20 percent of the budget attached to a concept requires a significant local, regional, state and federal vetting process. We encourage SCAG to include alternative methods of funding should such a mileage-based fee be deemed infeasible.

Thank you again for the opportunity to comment on this important document. We strongly advise SCAG to incorporate these comments into the next draft of the RTP/SCS PEIR and look forward to working with SCAG on its improvement.

Respectfully submitted,

Lacy Kelly

Subject: 2012 RTP

Dear Mr. Ikhrata:

For more than a century the Automobile Club of Southern California, with six million members, has advocated for better mobility, traffic safety, quality of life, and economic opportunity. We support policies and projects to achieve these objectives and reasonable and fair ways to pay for them.

Development and approval of an effective and achievable Regional Transportation Plan (RTP) is crucial to a more mobile and stronger economic future. The Auto Club commends the Southern California Association of Governments (SCAG) for its work on the draft RTP, for highlighting and addressing important issues, and for including needed strategies ranging from expanded road, transit, and goods movement capacity to system preservation. The following are comments and recommendations to strengthen the RTP and ensure its implementation delivers promised benefits.

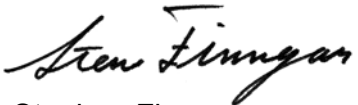
Government, business, and user stakeholders need to work together to implement realistic and appropriate new revenues. The RTP assumes $220 billion in new taxes and fees (mostly levied on motorists) and financing over the next 20+ years. Some of these assumptions are not realistic and will not likely happen. And other funding options, not now in the plan, might be implemented. The region needs to work together to identify and advance the best, most appropriate funding options to provide needed financing for RTP priorities.

The RTP must protect and uphold the transportation priorities approved by voters through various local transportation sales tax measures. Voters in five counties approved sales tax measures to fund specific highway and transit projects. The RTP must include and support all of these priorities and help deliver what voters were promised and what voters approved. Failure to do so will make approval of future funding measures nearly impossible.

The 15¢ gas tax increase assumed through 2024 is reasonable if it is paired with state and national reforms to ensure funds will be spent efficiently on effective projects. Gas tax rates

have not changed in almost 20 years. This user tax has been the backbone of transportation funding for decades and it will continue to be an important resource for years to come.

The final draft RTP clearly rules out a previously considered regional gas tax or gas "fee." This is an important improvement that should be maintained in the final plan. Gas taxes have been implemented at the state and national level for decades. Attempting to extend such authority to local or regional government is not realistic and will hamper other efforts to fund transportation. Re-labeling the gas tax as a "fee" does not change the fact that it is a tax protected by the State Constitution and numerous voter-approved measures. For these reasons the Auto Club strongly opposes any attempt to impose local gas taxes or any form of a "fee" on gasoline.



The Vehicle Miles Traveled (VMT) charge included in the RTP should be studied further as a long-term replacement for the gas tax. However, the amount of the proposed VMT is significant, it will not be accepted by many people, and it needs to include assurances regarding how the funds will be spent. The proposed VMT fee is projected to generate $110 billion (half of the RTP's funding shortfall). To generate this amount, the proposed VMT charge is equivalent to a tripling of the gas tax in addition to new tolls and other user fees. Such a large tax increase places a significant burden on motorists without assurances of an equivalent or proportionate benefit.

Tolls can be an important financing tool for new general purpose highway lanes and for allowing more vehicles to use existing HOV lanes by making them HOT lanes. Tolls should not be imposed on existing general purpose lanes. The user-pay, user-benefit principle is an important cornerstone of transportation funding. Charging tolls for new lanes or to allow more vehicles to access HOT lanes provides both needed funding for the new facilities and inherent value to users paying the toll. However, there is no assurance that motorists will adequately benefit from tolls or congestion fees imposed on existing freeway lanes or surface streets. New taxes and fees are only successful when the public understands and sees a clear benefit for paying them.

The RTP needs to recognize that the most realistic and effective way to achieve desired emissions reductions has been and will continue to be through technology advancements and not through sweeping attempts to fundamentally alter lifestyles and economic, geographic, and demographic patterns. Although SB 375 and its Sustainable Community Strategy are required elements of the RTP, they are not likely to significantly reduce GHG emissions. Improving and encouraging transit, bicycling, and walking are appropriate and good objectives for the RTP. However, emissions reductions from these efforts will be very small compared to those that can and will be achieved through other means. These other means include improving automobile technologies, alternative fuel and energy sources, and better system preservation and management to improve traffic flow and safety.

Thank you for this opportunity to share our thoughts on the draft RTP. The Auto Club looks forward to continuing our work with SCAG and other transportation and business partners to productively, realistically, and meaningfully address Southern California's mobility and financial challenges. Please feel free to contact me at 714-885-2307 or finnegan.steve@aaa-calif.com.

Sincerely,

Stephen Finnegan
Manager, Government Affairs and Public Policy

Re: Comments on Draft 2012-2035 Draft RTP/SCS

Dear Ms. Lin:

Thank you for the opportunity to comment on SCAG's Draft 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy ("Draft RTP/SCS" or "SCS"). We understand that this is an enormous undertaking and appreciate SCAG's efforts in this process. We look forward to playing a constructive role in the further development of the SCS.

As explained below, we are concerned that the draft RTP/SCS as proposed would result in an inappropriate use of the regional growth forecast planning effort to encroach on local land use authority and jurisdiction. We therefore request that SCAG (1) extend the comment period and make transportation analysis zone (TAZ) data available for public review and comment; (2) correct the TAZ data and maps to accurately reflect current local planning decisions including entitled projects; and (3) revise the SCS so that consistency determinations are made not at the small-scale scale level of a TAZ, but at the jurisdictional level to allow reasonable flexibility and appropriate land use decision making authority at the local level.

1. The SCS does not appear to account for projects already in process

Brooks Street represents the owners of thousands acres of property in southern California, and has a long history of top-quality developments in the SCAG region. However, we are concerned that the SCS process has not fully accounted for projects that are already in process. Brooks Street has projects in southern California that are fully entitled and approved for build-out, as well as proposed projects with pending applications that represent a substantial investment of resources to design, plan and communicate with the community and responsible agencies. While the SCS itself states that it was created with input from local jurisdictions (see, for example, Draft RTP/SCS p. 111), we are concerned that the growth projections contained in the SCS and Land Use Pattern Maps do not in fact reflect the land use decisions that have been made by local jurisdictions. More specifically, while the Draft RTP/SCS indicates that it has shifted projected densities from less developed areas to the urbanized core, nowhere does the SCS clearly state that those shifts in density take into account development projects that are either already approved or that are reasonably foreseeable projects which local jurisdictions have already spent considerable resources processing.

2. Underlying TAZ data must be released to allow meaningful public comment

Moreover, the SCS's treatment of approved projects is impossible to determine from the information that SCAG has made available to the public. The 2035 Land Use Pattern Maps, which are intended to depict projected density and land use, are at such a large scale, with such slight color gradations, that they cannot be interpreted in any meaningful way. The SCS itself does not seem to contemplate that these maps will be important to future transportation and land use decisions. Instead, the SCS focuses on the projected density contained in the data that underlies the maps -- data that SCAG has not released to the public. The SCS states that the land use projections contained in the SCS are based on the distribution of growth forecast data to transportation analysis zones. (RTP/SCS, p. 122.) According to the SCS, the TAZ data contains forecasted housing, population, and employment data, which the SCS used to create "Community Types" and more refined "Development Types" that contain average use designations, densities, and building intensities. The SCS states that a Development Type, including an average residential density, has been assigned to each TAZ for purposes of creating the SCS. (Draft RTP/SCS, p. 123.) However, it cannot be determined whether this assignment was made in a manner that takes existing conditions (including approved and reasonably foreseeable projects) as a baseline for these projections, nor can it be determined how the forecasting was done or how it was distributed across the TAZ.

Despite the critical role of the TAZ data in developing the SCS, we are not aware that SCAG has made this data available for public review and comment in any meaningful way. We were able to obtain partial data, showing housing densities only, from other agencies involved in the SCS process. These data do not contain employment or population forecasts, and do not contain any Community Type or Development Type designations which, according to the SCS, have been assigned to each TAZ. It is not possible for the public to provide meaningful comment on the SCS without access to the underlying data on which density and land use projections are based. In the absence of the underlying data and modeling supporting the proposed plan, we are substantially impaired in our ability to provide meaningful public comment on the technical and legal adequacy of the plan. In particular, we cannot assess whether the underlying data adequately reflects all developments as approved. Under the federal (5 U.S.C. § 500 *et. seq.)* and California Administrative Procedures Acts (Gov. Code §§11340 *et seq*., including § 11346.2(b)(6)), the opportunity for public comment must include disclosure of the data and technical studies in time to provide meaningful public comment. *See, e.g. Solite Corp. v. EPA,* 952 F.2d 473, 484 (D.C.Cir.1991) (per curiam).

While we are not confident that the data is either accurate or complete, we have reviewed what data we were able to obtain. Based on our review we conclude that the forecasted housing densities do need to be corrected, as the numbers clearly do not reflect either existing entitlements or pending, reasonably foreseeable projects.

3. Implications of consistency with underlying TAZ data

The importance of the TAZ data is not limited to understanding how the SCS was created. In addition to being the basis for creation of the SCS land use projections, according to the SCS, the TAZ data is to be relied on in future determinations as to whether a project is consistent with the SCS. The SCS states:

> "SCAG suggests that utilizing community types at the TAZ level of geography (which an average size of 160 square acres) offers local jurisdictions adequate information and flexibility to make appropriate consistency findings for projects to be eligible to receive CEQA streamlining benefits." (Draft RTP/SCS p. 122.)

> "One way of determining consistency [with the SCS] is if a proposed residential/mixed use or TPP [Transit Priority Project] conforms with the Development Type designated for a TAZ." (Draft RTP/SCS, page 148.)

Despite these explicit statements that the existing TAZ data will be critically important to future decisions affecting projects, SCAG has not provided the public the opportunity to review and comment on the TAZ data in any meaningful way.

Significantly, a project's consistency with the SCS -- which is to be determined at the TAZ level according to the SCS -- affects not only the availability of CEQA streamlining incentives, but can have adverse consequences for the availability of federal funds for transit improvements that would serve the project. Transit improvement projects relying on federal funding must be consistent with an approved RTP, and with the adoption of SB 375, that includes consistency with the Sustainable Communities Strategy portion of the RTP as well. (40 CFR 93.102; 42 U.S.C. 7506.) Thus, if the Draft RTP/SCS has shifted density away from approved or pending projects, those projects stand to lose critical transit improvements. The loss of transit improvements could impair project feasibility, or create new unmitigated impacts if traffic mitigations become unfunded, which could result in an unlawful taking of private vested property rights for those projects that have already been approved by local jurisdictions. In many cases, approved projects also involve executed development agreements, which means that violation of contractual rights could also result, causing difficult situations for developers and local jurisdictions.

We are concerned that a project's inconsistency with the growth projections contained in the SCS may have broader implications as well. Local jurisdictions will be under considerable pressure to conform their general plans to the density, intensity, and land uses contained in the SCS, or risk losing transportation funding throughout their jurisdictions. While all the implications of a project's inconsistency with the SCS have yet to be determined, we are concerned that by shifting density away from locally approved and pending projects, the SCS is creating land use policy in violation of SB 375's mandate that the SCS must not supersede the land use authority of cities and counties. (Gov't Code 65080(b)(2)(J).)

4. RTP/SCS consistency should be determined at the jurisdictional level

The TAZ maps are a modeling tool for engaging in a regional planning and evaluation process. The feasibility of achieving the precise results in any particular TAZ area has not been evaluated or confirmed by any city council or board of supervisors, and as explained above it appears that the TAZ data and maps for 2035 do deviate from general plans and vested entitlements that have been approved by these elected officials. While we understand elected bodies or senior administrative staffs of local jurisdictions may have approved local input for the overall population and household numbers within their respective jurisdictions, we believe they have not approved the TAZ data or maps. Accordingly, requiring consistency determinations concerning use designations, density, and building intensity at the small scale of each TAZ would be inappropriate and overly-prescriptive.

Again, SB 375 specifically precludes SCAG from interfering with local land use decisions.[1] SB 375 requires that an SCS "identify the ***general*** location of uses, residential densities, and building intensities ***within the region***…." Calif. Government Code § 65080(b)(2)(B)(i) (emphasis added). Thus there is no legislative mandate that SCAG identify the location of land uses, densities and building intensities within the region more precisely down to a TAZ level. Instead, SCAG should appropriately identify these characteristics at a level consistent with the need for reasonable flexibility and local control. At the lowest, the level of comparison should be at a jurisdictional level – particularly given that there are nearly 200 jurisdictions within the SCAG region. Accordingly, we urge SCAG to identify such characteristics at no finer a scale than at the lesser of (i) the jurisdiction, and (ii) the sub-region (i.e., where unincorporated county land is divided into sub-regions).

[1] SB 375 provides in pertinent part:

- "Neither a sustainable communities strategy nor an alternative planning strategy regulates the use of land . . . "
- "Nothing in this section shall be interpreted as superseding the exercise of the land use authorities of cities and counties within the region."
- "Nothing in this section shall be interpreted to authorize the abrogation of any vested right whether created by statute or by common law."
- "Nothing in this section shall require a city's or county's land use policies and regulations, including its general plan, to be consistent with the regional transportation plan . . . ." (Gov't Code section 65080(b)(2)(J)

Despite SB 375's mandate that the SCS not regulate land use, the draft RTP/SCS "shifts" households "from the periphery into the urbanized core" stating that much of this shift "will occur naturally in the marketplace," and that this "shift" was done "per consultation with the local jurisdictions." (Draft RTP/SCS p. 128.) However, this shift does not "occur naturally," nor through a "consultation" process between agency staff that excludes the public. Instead, such a shift can only occur, if at all, as part of a separate and lengthy discretionary development application process involving requests to local land use jurisdictions to amend their general plans, specific plans, areas plans, and zoning. In short, there is no "shift" to high-density housing in some local jurisdictions, and away from housing density already approved by other jurisdictions, unless and until the local land use jurisdictions adopt the requested discretionary approvals.

4. Conclusion

The draft RTP/SCS represents a substantial and important regional planning effort. We believe the current draft needs to be corrected to reflect current local land use planning decisions, and to ensure that the regional growth projection process is not implemented in a manner that infringes on either vested property rights or the land use authority of local jurisdictions. We appreciate SCAG's consideration of the comments provided in this letter and look forward to your responses. If you should have any questions, please do not hesitate to contact me.

Sincerely,

Scott Goldie

Re: Building Industry Association of Southern California, Inc.'s Comments on the Drafts of the 2012 Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS) and the Program Environmental Impact Report (PEIR)

Dear Mr. Lieb:

Building Industry Association of Southern California, Inc. (BIASC) is a regional trade association that represents more than 1,000 member companies. Together, BIASC's members build most of the homes and communities throughout the same six-county region in which Southern California Association of Governments (SCAG) is the metropolitan planning organization. Naturally, therefore, BIASC is profoundly interested in SCAG's role in land use regulations and all regional planning for development and redevelopment.

Given our strong interest in the subject, BIASC is grateful for this opportunity to provide comments concerning both (i) SCAG's Draft 2012 Regional Transportation Plan (RTP) – which includes an inaugural Sustainable Communities Strategy (SCS), and (ii) the draft of the Program Environmental Impact Report (PEIR), in which the environmental impacts of the 2012 RTP/SCS are discussed.

First, BIASC appreciates SCAG's staff's professionalism and extremely hard work up to this point. In 2008, when the California Legislature enacted Senate Bill 375 (SB 375) and thus mandated the creation of a regional land use plan, the Legislature assigned SCAG's staff daunting new challenges. Throughout SCAG's process of developing the SCS, BIASC has enjoyed a positive working relationship with SCAG's staff professionals; and we look forward to continuing that working relationship.

Second, BIASC brings to the SCS development process an ingrained, institutional philosophy about how land-use decision-making should be undertaken. We believe that sound land-use decisions are best made by the persons who best understand the local contexts in which development and redevelopment take place. Given our philosophical predisposition, BIASC has worried from the start that an SCS for SCAG's region, if not thoughtfully considered and fashioned, can harm our vitally important industry, our regional economy, and our society.

In addition, BIASC is well aware that attempts made elsewhere to adopt and implement "top-down" regional land-use strategies have fared quite poorly. For example, in July 2010, the British Government abolished its "regional spatial strategies" (RSS) law – six years after its enactment. In announcing the RSS law's abolishment, Britain's Planning Minister explained:

> "[T]hese controversial [regional spatial] strategies have proved that top-down targets do not build homes. All they have produced is the lowest peace time house building rates since 1924 and fuelled resentment in the planning process that has slowed everything down."[1]

Because of both (i) BIASC's longstanding preference for local land use decision-making, and (ii) our concerns about the consequences of an ill-conceived SCS, BIASC has participated very actively in the public processes that led up to the draft documents on which we now comment. BIASC's principles and preferences have been expressed many times to SCAG's staff, leaders, committees and regional council members in many forums. Notwithstanding our consistent participation and urging, however, we must now respectfully point out our remaining concerns about the Draft RTP/SCS and the Draft PEIR.

In terms of the sheer quantity of concerns, most of them relate to the Draft PEIR. BIASC's specific comments on the Draft PEIR are so numerous that a lengthy appendix accompanies this letter, in which our concerns are expressed in some detail. BIASC respectfully asks SCAG to respond, in accordance with CEQA and prior to consideration of the final PEIR for certification and approval by SCAG's Regional Council, to each issue presented in the appendix.

To briefly summarize BIASC's Draft PEIR concerns here, though, they are threefold. First, the Draft PEIR indicates that hundreds of specific mitigation measures would need to be analyzed and incorporated to the extent feasible in every future project throughout the SCAG region. Importantly, many of the listed mitigation measures were never before assembled for presumptive application to individual projects. Instead, many of them were drawn from "model policies" that were intended for consideration *only* at a jurisdictional planning level – *not* an individual project level. *See* Model Policies for Greenhouse Gases in General Plans, June 2009, at p. i (disclaimer), found at http://www.capcoa.org/wp-content/uploads/downloads/2010/05/CAPCOA-ModelPolicies-6-12-09-915am.pdf and incorporated herein by reference.

Second, many of the mitigation measures set forth in the Draft PEIR have no relationship to the RTP/SCS or its impacts (e.g., mitigation measures ranging from low-flow toilets to green roofs). Other mitigation measures are quite far-fetched, such as the requirement to remove obstacles to "edible landscaping" at all projects throughout SCAG's six-county region.

---

[1] See http://www.dlpconsultants.co.uk/pdfs/client_briefing/42%20Client%20Briefing%20Abolition%20of%20RSS%20&%20SoS%20Statement.pdf

Most worrisome about the Draft PEIR, however, is this: If the Draft PEIR were finalized as presently drafted, SCAG would mandate the application of project mitigation measures that already conflict with, or will quickly conflict with, evolving and dynamic regulations covering a variety of topics. For example, the Draft PEIR prescribes mitigation requirements concerning matters that involve storm water management, home energy efficiency standards, fire protection, landscaping, water supply analyses, and municipal sewage treatment facilities – all of which are matters and activities that are subject to evolving standards.

For these reasons and those more thoroughly explained in the accompanying appendix, BIASC respectfully urges SCAG to clarify and cull the Draft PEIR.

Concerning the actual policy documents at issue (i.e., the Draft RTP and the Draft SCS themselves), BIASC has one fundamental concern: Page 148 of the Draft SCS suggests that local governments should look to "transportation analysis zone" (TAZ) maps to determine whether a particular project is consistent with the land use designation, density, and building intensity of the SCS. BIASC believes that this section needs to be revised for three distinct reasons.

First, BIASC is informed that the TAZ maps break land masses up into relatively small-scale areas averaging perhaps only about 150 acres in size (and even smaller in more densely populated areas). Requiring determinations about the consistency of future land uses to the SCS – concerning use designations, density, building intensity and the applicable SCS policies – at that fine a scale would be overly-prescriptive. SCAG need not be nearly so prescriptive because SB 375 requires only that an SCS "identify the *general* location of uses, residential densities, and building intensities *within the region*…." Calif. Government Code § 65080(b)(2)(B)(i) (emphasis added). Given this legislative mandate, there is no reason for SCAG to measure and compare land-use characteristics within the region at the very fine TAZ level vis-à-vis policy determinations.

Instead, the final RTP/SCS should permit local agencies to measure and compare land use characteristics with the regional strategy at a level consistent with the need for reasonable ongoing flexibility in local land use control. Therefore, the level of comparison should be, at the finest, at a city jurisdictional level (including any sphere of influence) – given that there are nearly 200 separate jurisdictions within the SCAG region. BIASC specifically urges SCAG to identify and compare such land use characteristics at no finer a scale than (i) the cities (including their respective adjoining spheres of interest), and (ii) concerning the unincorporated areas outside of local spheres of interest, by comparison to the rough-scale map that indicates generally the locations of building intensification shown in the SCS. *See* Exhibit 2 to the Draft SCS Background Documentation, found at http://rtpscs.scag.ca.gov/Documents/2012/draft/SR/2012dRTP_SCSBackgroundDocumentation.pdf.

Second, BIASC is concerned that any prescriptive use of TAZ maps for policy purposes could have negative consequences vis-à-vis the pending process for a required federal

conformity determination. Under the federal laws that relate to the federal funding of regional transportation infrastructure, an RTP must be constructed using "the latest planning assumptions." "Using the 'latest' planning assumptions means that the conformity determination is based on *the most current information that is available to state and local planners*…." U.S. E.P.A. Guidance for the Use of Latest Planning Assumptions in Transportation Conformity Determinations (EPA420-B-08-901, December 2008), ¶ 2.2 (emphasis in the original), found at: http://www.epa.gov/otaq/stateresources/transconf/policy/420b08901.pdf and incorporated herein by reference. If and to the extent that SCAG's TAZ-level maps and the data reflected in them are unacceptable to local planners and were not available to them when the RTP was developed, then fine-scale data based upon the TAZ maps should not be incorporated into the RTP via the SCS. They would instead need to be separated out from the RTP and – at most – made part of an "alternative planning scenario" (APS) under California Government Code section 65080(b)(2)(H). We believe that any conflict between the federally-mandated RTP approach and the SCS TAZ-level maps can be avoided by making all relevant policy determinations based on comparisons viewed at the city level (including any sphere of influence) and by reference to the generalized locations depicted for intensification in unincorporated county areas (for example, in Exhibit 2 to the *Background Documentation* as noted above).

Third, no TAZ-level maps were provided to the public as part of either the Draft RTP/SCS or the Draft PEIR, nor were they included in any of the appendices that SCAG provided to the public. Hopefully, the omission reflects SCAG's pre-publication determination to forgo the use of any TAZ-level maps for policy purposes. If this were the case, then it appears that SCAG's staff inadvertently failed to revise page 148 of the Draft SCS prior to its publication for comment; and SCAG should now revise that page to reflect a more appropriate approach (the jurisdictional approach suggested above). If, however, SCAG actually intended the policy prescription that is suggested on page 148 of the Draft SCS, then SCAG must be faulted for having failed to disclose an essential component of the RTP/SCS, which is the new level of policy prescription that such TAZ-level maps would impose or induce through the implementation of SB 375.

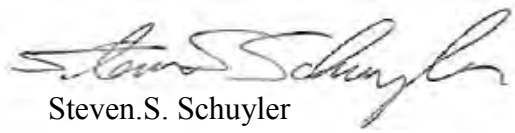
Under judicial precedents decided pursuant to the California Environmental Quality Act (CEQA), SCAG's public disclosures in the Draft RTP/SCS and the Draft PEIR would be inadequate if they failed to disclose TAZ-level policy prescriptions affecting the region's population distributions and concentrations:

> The detail [of draft disclosure concerning changes induced in population distribution, population concentration, and the human use of the land] required in any particular case necessarily depends on a multitude of factors, including, but not limited to, *the nature of the project, the directness or indirectness of the contemplated impact and the ability to forecast the actual effects the project will have* on the physical environment.

Napa Citizens for Honest Government v. Napa County Bd. of Supervisors (2001) 91 Cal.App.4th 342, 369 (emphasis added).

In short, if SCAG were planning to utilize the TAZ-level maps as actual policy drivers (as page 148 of the Draft SCS may suggest), then SCAG needed to disclose the details of those TAZ maps; and SCAG did not. *See* CEQA Guidelines, Tit. 14, § 15144 ("an agency must use its best efforts to disclose all that it can"). SCAG would also need to have analyzed environmental impacts in much more detail than presented in the Draft PEIR, including the thousands of direct conflicts between TAZ maps for established communities and CEQA thresholds relating to General Plan compliance, Quimby Act compliance, impacts to protected greenbelts and historic resources, local congestion and traffic safety impacts, impacts to schools and other public services. Therefore, BIASC respectfully asks SCAG to revise page 148 of the SCS to avoid the insinuation that TAZ-level maps should be utilized for any future regulatory or policy purpose.

As a final additional comment on the draft policy documents, we note that two of SCAG's brethren metropolitan planning organizations (one in the San Diego area another in the Sacramento area) have each included a 2050 planning year horizon in their respective RTP/SCS documentation. Such a long-term perspective seems appropriate to consider because land use and transportation patterns evolve relatively slowly; and they are subject to numerous variables (e.g., the economy, and the allocation of federal funding for regional transportation projects). Accordingly, SCAG's ambitious vision for higher density development patterns along transit corridors may not be realized for many decades.



In the nearer term (2020 and 2035), the statewide targets for GHG reductions which were established pursuant to Assembly Bill 32 (2006) may be more feasibly be realized through other measures such as renewable energy, cleaner cars and cleaner fuels, and stationary source controls, as the California Air Resources Board's AB 32 Scoping Plan explains. It is possible that, in light of analytical constraints prescribed by CARB, the SCAG region cannot realistically attain the 2020 and 2035 GHG emission reduction targets established by CARB, in which case an APS may be appropriate. Therefore, SCAG's consideration of a longer-term, 2050 planning horizon may be a useful framework for informing local agencies and other interested stakeholders about a more feasible, longer-term regional planning effort.

To conclude, BIASC wishes to once again commend SCAG's staff for its willingness to be open and frank with BIASC's representatives about a whole range of points of views concerning the RTP/SCS and its potential impacts. BIASC looks forward to working with SCAG's staff through the completion of this challenging process and beyond as the final RTP takes shape and ultimately takes effect.

Respectfully,

Andrew R. Henderson
Vice President and General Counsel

Steven.S. Schuyler
Vice President Government Affairs

Attachment (appendix)

Appendix to the February 14, 2012 Comment Letter from Building Industry Association of Southern California, Inc. to Southern California Association of Governments

Detailed Comments on the Draft PEIR on the Draft 2012 RTP/SCS

In furtherance of the comments set forth in the accompanying letter, Building Industry Association of Southern California, Inc. respectfully submits the additional, detailed comments set forth below for SCAG's consideration and response:

To preface, the Draft RTP/SCS and Draft PEIR are both comprehensive in nature; but -- like all draft documents – they require clarification, correction, and revision as SCAG works to prepare the final versions of the RTP/SCS and PEIR for the SCAG Regional Council's possible certification and approval. This appendix, therefore, provides a number of specific comments on the draft documents; in accordance with CEQA (see, *e.g.*, CEQA Guidelines, § 15088). BIASC respectfully requests that responses to each of these comments be included in the Final PEIR.

As background, the Draft RTP reflects a long-range plan that includes transportation projects, policies, and a financial plan to create a blueprint for the region's multimodal transportation system through 2035. The RTP improvements include transportation investments in projects to close critical gaps in the network that hinder access to certain parts of the region, and to strategically enhance the region's transportation system to increase mobility for the region's residents and economy.

The SCS -- a component of the RTP -- is a strategy required by SB 375 (Chap. 728, Statutes 2008), also known as the Sustainable Communities and Climate Protection Act of 2008. SB 375 directs the California Air Resources Board (CARB) to set regional targets for the reduction of greenhouse gas (GHG) emissions, consistent with AB 32, California's Global Warming Solutions Act of 2006. The RTP's SCS component contains strategies to reduce GHG emissions from passenger vehicles by eight percent per capita by 2020 and 13 percent per capita by 2035, compared to 2005, as set by CARB.

Among other things, the SCS is a growth strategy for the region which, in combination with transportation policies and programs, strives to reduce GHG emissions from passenger vehicles and, if feasible, help meet CARB's reduction targets. (Gov. Code, § 65080(b)(2)(B).) This growth strategy is implemented when the SCS "sets forth a forecasted development pattern" for the region. (*Id.*) It is important to emphasize that that this development pattern must comply with federal law, which requires that any pattern be based upon "current planning assumptions" that include the information in local general plans and adopted sphere of influence boundaries. (Gov. Code, § 65080(b)(2)(B), (G).) Local jurisdictions (*i.e.*, cities and counties) are full partners in this process and retain full local land use decision-making and zoning authority. (Gov. Code, § 65080(b)(2)(K).)

The Draft PEIR represents a public disclosure and information document to be prepared in accordance with CEQA and the State CEQA Guidelines. The Draft PEIR is required to describe the proposed RTP/SCS project, its potential significant environmental impacts, alternatives to the proposed project, and the proposed mitigation measures to avoid or minimize the identified significant environmental effects.

BIASC's Specific Comments on the Draft PEIR

1. The Draft PEIR, Section 1.0, Introduction, page 1-5, should be revised to delete the sentence stating that proposed mitigation measures "can be incorporated as policies in the final 2012-2035 RTP/SCS and will help ensure that feasible mitigation measures are implemented at the project level." Similarly, page 149 of the Draft RTP/SCS should be revised to eliminate the "mandate" language and instead state: "The following tables list specific implementation strategies that local governments, SCAG and other stakeholders may use or consider while preparing specific projects that help ~~can and should undertake in order~~ to successfully implement the SCS."

Explanation: First, there is no legal requirement for the Draft PEIR's proposed mitigation measures to be incorporated as policies in the Final RTP/SCS. Second, SCAG's Regional Council, as its decision-making body, retains the discretion to determine whether the Draft PEIR's proposed mitigation measures are actually feasible and this determination is made as part of the Regional Council's findings adopted in compliance with CEQA. The Draft PEIR should not limit or constrain the Regional Council's discretion to make mitigation feasibility determinations required by CEQA. Indeed, the Draft PEIR exceeds its authority under CEQA by appearing to dictate "feasible" mitigation measures -- a decision reserved for the Regional Council as part of its final, deliberative decision-making process.

2. The Draft PEIR, Section 1.0, Introduction, page 1-5, should be revised to delete the following text:

> "The implementing agencies and local lead agencies shall be responsible for ensuring adherence to the mitigation measures as 2012-2035 RTP/SCS projects are considered for approval over time. Lead agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring efforts, including SCAG's Intergovernmental Review (IGR) process."

Explanation: First, SCAG has no jurisdiction or legal authority to require "implementing agencies and local lead agencies" to ensure adherence to the mitigation measures found in the Draft PEIR or those measures ultimately adopted by the Regional Council. Second, no "implementing agencies or local lead agencies" are required by law to consider the Final PEIR mitigation measures unless the agency decides to "tier" from SCAG's Final PEIR in preparing project-level environmental analysis. Finally, based on staff's statements during workshops and other public processes, SCAG's original intent was never to impose such requirements on implementing agencies and local lead agencies. Therefore, the text should be deleted to clarify it was never SCAG's intent to prescribe mitigation upon implementing agencies, local lead agencies, or project sponsors.

3. The Draft PEIR, Section 1.0, Introduction, page 1-6, should be revised to delete the following text:

> "CEQA provides that an EIR can include feasible mitigation measures that are within the responsibility and jurisdiction of another agency. The appropriate CEQA finding in such instances is that such mitigation measures have been or "can and should be" adopted. (Pub. Resources Code, § 21081(a)(2); CEQA Guidelines §15092(a)(2).) When this finding is made, there is no further requirement that SCAG find that mitigation measures that are within the responsibility and jurisdiction of another agency have been incorporated into the project. That latter finding is reserved for mitigation measures within SCAG's responsibility and jurisdiction."

Explanation: First, CEQA does not provide that an EIR can include feasible mitigation measures within the responsibility and jurisdiction of another agency. Instead, CEQA (Pub. Resources Code, § 21081(a)) allows, but does not require, a lead agency to adopt the "can and should" finding provided it has no jurisdiction to address the identified significant impacts with mitigation measures that it can enforce through permit conditions, agreements, or other measures. (See CEQA Guidelines, § 15091(c), (d).) Further, the "can and should" finding is only "one or more" of the findings specified in section 21081(a) that needs to be adopted.

Second, when making the findings in Public Resources Code section 21080(a)(2) -- *i.e.*, the "can and should" findings--SCAG, in any case, is not required to adopt such "can and should" measures in its Mitigation Monitoring and Reporting Plan (MMRP). (See CEQA Guidelines § 15091(d), which only requires the lead agencies' mitigation measures to be part of the MMRP.)

Third, the Draft PEIR's "can and should" measures are not required to be considered or adopted by implementing agencies, local agencies, or project sponsors, unless they decide to "tier" from SCAG's Final PEIR when preparing project specific environmental analysis. Further, as explained in paragraph 12, below, the Draft PEIR's "can and should" measures are beyond SCAG's jurisdiction and legal authority; they are inconsistent with policy considerations that the SCAG Regional Council should consider before certifying the Final PEIR and approving the RTP/SCS; and, they are duplicative of existing federal, state, regional, and local regulatory frameworks with their own, separate NEPA or CEQA compliance requirements.

4. The Draft PEIR, Section 1.0, Introduction, page 1-6, must be revised to delete the following text:

> "Nevertheless, it is reasonable to expect that the other agencies will actually implement the mitigation measures assigned to them (see discussions below of transportation and land use planning and development projects)."

Explanation: This statement was made in connection with the Draft PEIR's "can and should" mitigation measures. However, SCAG has no jurisdiction or legal authority to "assign"

mitigation measures to implementing agencies, lead agencies, or project sponsors, nor is there any evidence in the record to support SCAG's statement that it is "reasonable to expect that other agencies will actually implement" the "can and should" measures identified in the Draft PEIR. As stated above, no agency or project sponsor is required to consider any of the "can and should" mitigation measures in the PEIR, unless the agency decides to "tier" from SCAG's Final PEIR in preparing project-level environmental analysis.

5. The Draft PEIR, Section 1.0, Introduction, page 1-7, must be clarified as shown below:

"**Transportation Project Mitigation**

SCAG has limited authority to approve individual second-tier transportation network improvement projects in the RTP. Most individual transportation projects in the RTP will be implemented by Caltrans, county transportation commissions, local transit agencies, and local governments. ~~These agencies routinely implement the types of mitigation measures identified in this Draft PEIR during project design, CEQA review, and/or project construction. This Draft PEIR has made a preliminary determination that the proposed mitigation measures are feasible and effective. Therefore, it is reasonable to expect that these agencies will actually implement them.~~

Land Use Planning and Development Project Mitigation

SCAG has no authority to adopt local land use plans or approve local land use projects that will implement the SCS. As described in the section below, SB 375 specifically provides that nothing in SB 375 supersedes the land use authority of cities and counties. In addition, cities and counties are not required to change their land use plans and policies, including general plans, to be consistent with an RTP/SCS. (Government Code §65080(b)(2)(K). Local governments are the main agencies responsible for mitigation of the impacts of land use plans and projects that implement the RTP/SCS, and SCAG has no concurrent authority to mitigate the impacts of land use plans and projects. ~~Local governments routinely implement the types of mitigation measures identified in this Draft PEIR during project design, CEQA review, and/or project construction. This Draft PEIR has made a preliminary determination that these mitigation measures are feasible and effective. Therefore, it is reasonable to expect that local governments will actually implement them.~~"

Explanation: First, SCAG's record does not support the Draft PEIR's statement that implementing agencies, local agencies, or project sponsors "routinely implement" the types of mitigation measures identified in the Draft PEIR. In fact, there is no "routine" or "formula" associated with the identification and ultimate adoption of mitigation measures. Instead, such measures are identified in response to a specific project's significant environmental impacts and those impacts depend upon the project's unique characteristics, location, topography, relation to other development, and numerous other unique site conditions. Further, once an EIR identifies

proposed mitigation measures specific to the project and its conditions, the lead agency retains ultimate discretion to adopt such measures or reject them on infeasibility grounds. (Pub. Resources Code, § 21081(a)(3); CEQA Guidelines, § 15091(a)(3).)

Second, the Draft PEIR asserts that it made a "preliminary determination that these mitigation measures are feasible and effective." Again, however, the Draft PEIR's statement is not supported by any evidence or analysis contained in the record. Finally, nothing in the Draft PEIR or record supports the statement that it is "reasonable to expect that local governments will actually implement" SCAG's "can and should" mitigation measures.

6. The Draft PEIR, Section 1.0, Introduction, page 1-12, should be clarified as follows:

"**CEQA Incentive**

As previously discussed, SB 375 provides incentives in the form of CEQA streamlining to encourage community design that supports reduction in per capita GHG emissions. The land use input for SCAG's SCS was created with the use of Traffic Analysis Zones (TAZ) and Development Types. "Development Types" were made at the TAZ level of geography (with an average size of 160 acres) to offer local jurisdictions ~~adequate~~ information ~~and flexibility~~ to make ~~appropriate~~ consistency findings for projects eligible to receive CEQA streamlining benefits.

The Development Types used in the SCS do not represent detailed, parcel-level land use designations such as those found within a local jurisdiction's General Plan, but rather represent the aggregation of multiple land uses, densities and intensities that are expected to preponderate at the jurisdictional level ~~or average out within a neighborhood-sized area~~ by 2035. Each Development Type is comprised of various characteristics related to employment and housing density, urban design, mix of land uses, and transportation options. Details describing the characteristics contained within each Development Type are available in Appendix: SCS Background Documentation. The lead agency, not SCAG, will be responsible for making the determination of consistency for CEQA streamlining purposes, pursuant to the provisions of SB 375, for any given proposed project. See Govt. Code § 65080(b)(2). ~~One way of determining consistency is if a proposed residential/mixed use or TPP conforms to the Development Type designated for a TAZ.~~

The Development Types are expressed in terms of use designations, densities and building intensities; and, for any given type, there is one residential density indicated. For example, the "Town Center" Development Type reflects an estimated average density of 22 residential units per acre. However, it is important to note that the designation is a potential ultimate average for the TAZ -- and is not an absolute project-specific requirement that must be met in order to determine consistency with the SCS. In other words, the SCS was not developed with the intent that each project to be located within any given TAZ must exactly

equal the density and relative use designations that are indicated by the SCS Development Type in order for the project to be found consistent with the SCS's use designation, density, building intensity and applicable policies. Instead, any given project, having satisfied all of the statutory requirements of either a residential/mixed-use project or TPP as described above, may be deemed by the lead agency to be consistent with the SCS so long as the project achieves consistency at the jurisdictional level, considering the ~~does not prevent achieving the estimated average~~ use designations, densities and building intensities indicated by the Development Type within the TAZ, assuming that the TAZ will be built-out under reasonable local planning and zoning assumptions.

SCAG's growth projection data is available on its website for lead agencies to use to determine whether projects are consistent with the SCS."

Explanation: The above clarifications are required to ensure that the SCS consistency determination is made by the local land use agencies, not SCAG, and that CARB's assessment of that consistency will be evaluated at the broader jurisdictional/regional level, as anticipated by CARB in its July 2011 "Description of Methodology for ARB Staff Review of Greenhouse Gas Reductions from Sustainable Communities Strategies (SCS) Pursuant to SB 375," which is incorporated by this reference.

Additionally, this jurisdictional (*i.e.*, city/county) level is more appropriate when compared to smaller geographic levels, such as Traffic Analysis Zones (TAZs) or parcel assessments that would limit cities and counties' control over land use. While the SCS sets forth forecasted development patterns that may differ from those envisioned in various general plans, those patterns, nonetheless, still must be consistent with "current planning assumptions" and those assumptions must be grounded in the local general plans and sphere of influence boundaries. (See Gov. Code, § 65080(b)(2)(B).)

Please also revise/clarify all same/similar text found in the Draft PEIR, Section 2.0, Project Description (see, for example, page 2-29).

7. The Draft PEIR, Section 2.0, Project Description, page 2-2, should be revised to clarify the summary of the required "contents" of the SCS. Currently, the Draft PEIR states:

"According to Section 65080 of the California Government Code, in summary the SCS must:

- Identify existing land use;
- Identify areas to accommodate long-term housing needs;
- Identify areas to accommodate an eight-year projection of regional housing needs;
- Identify transportation needs and the planned transportation network;
- Consider resource areas and farmland;

- Consider state housing goals and objectives;
- Set forth a forecasted growth and development pattern; and
- Comply with federal law for developing an RTP."

Explanation: The above text must be revised and clarified. The SCS is a growth strategy for the region which, in combination with transportation policies and programs, strives to reduce GHG emissions and, if it is feasible, help meet CARB's emission targets for the region. Specifically, a SCS must:

(a) Identify the general location of uses, residential densities, and building intensities with the region;

(b) Identify areas with the region sufficient to house *all* the population of the region, including all economic segments of the population, over the course of the RTP's planning horizon;

(c) Identify areas within the region sufficient to house an eight-year projection of the regional housing need of the region;

(d) Identify a transportation network to service the transportation needs of the regions;

(e) Gather and consider the best practically available scientific information regarding resource areas and farmland in the region;

(f) Consider the state housing goals;

(g) Set forth a forecasted development pattern for the region, which, in combination with the transportation network and other transportation policies, will reduce the GHG emissions from passenger vehicles, if it is feasible, and help meet CARB's emission targets in the region; and

(h) Quantify the reductions in GHG emissions the SCS is projected to achieve and any shortfall in reaching the regional target.

(See Gov. Code, § 65080(b)(2)(B), (H).)

It is important to disclose that the SCS's "forecasted development pattern" must comply with federal law, which requires that any pattern be based upon "current planning assumptions" that include the information in local general plans and sphere of influence boundaries. (Gov. Code, § 65080(b)(2)(B), (G).)

Please revise the Draft PEIR or incorporate the above text into the Final PEIR. Additionally, the same text (quoted above) is repeated in Draft PEIR, Section 2.0, Project Description, on page 2-25, and that text also requires the same revisions/clarifications specified above.

8. The Draft PEIR, Section 2.0, Project Description, page 2-2, should be revised as follows:

"SCAG's SCS demonstrates the region's ability to attain the GHG emissions reduction targets set forth by the ARB. The SCS outlines SCAG's ~~plan~~ strategy for integrating the transportation network ~~and related strategies~~ with an overall land use pattern that ~~responds to projected~~ predicts or forecasts growth, housing needs and changing demographics, and transportation demands. However, neither the SCS nor an alternative planning strategy will supersede a city's or county's general plan or other planning policies or authorities. Nor must a local agency's planning policies, including the general plan, be consistent with either strategy."

Explanation: The above revisions are required to clarify that the SCS is a growth strategy based on a forecasted development pattern of growth for the region and that the SCS does not supersede a city's or county's general plan or other planning policies or authorities.[1] Further, a local agency's land use policies, including its general plan, need not be consistent with the RTP's SCS. (See Gov. Code, § 65080(b)(K).)

Please also see Draft PEIR, Section 2.0, Project Description, at page 2-25. The same text (quoted above) is presented on page 2-25, and also requires the same revisions/clarifications specified above.

9. The Draft PEIR, Section 2.0, Project Description, page 2-25, states:

"In accordance with Government Code Section 65080(b)(2)(B)(vii), the 2012-2035 RTP/SCS will achieve GHG emission reductions of eight percent per capita in 2020 (meeting the target for 2020) and 16 percent per capita in 2035 (surpassing the 13 percent reduction target for 2035)."

Comment: Government Code section 65080(b)(2)(B)(vii) states that the SCS must set forth a "forecasted development pattern for the region," which, in combination with the transportation network and other transportation policies, will reduce GHG emissions from passenger vehicles to achieve, if feasible, the CARB's GHG emission reduction targets. Section 65080 does not call for exceeding CARB's targets. While perhaps laudable, it also reflects that SCAG went beyond the legal requirements set forth in that section.

Please explain the legal basis for exceeding those legal requirements. Additionally, please clarify and confirm that any consistency determinations will be based on CARB's reduction targets for the region (eight percent per capita reduction in 2020 and 13 percent per capita reduction in 2035), and *not* on the SCS projection of 16 percent per capita reduction in 2035.

10. The Draft PEIR, Section 2.0, Project Description, page 2-27, sets forth a description of the SCS's forecasted development patterns, which should be revised as follows:

[1] The Institute for Local Government emphasizes this point in its write-up of "The Basics of SB 375: Transportation, Housing and Greenhouse Gases," which is found at http://www.ca-ilg.org/SB375Basics and incorporated by this reference.

Land Use Development Pattern. The land use development pattern of the 2012-2035 RTP/SCS, which assumes a significant increase in small-lot single-family and multi-family housing will mostly occur in infill locations near transit infrastructure, in so-called HQTAs [High-Quality Transit Areas]. In some cases, the land use pattern assumes that more of these housing types will be built than is currently anticipated in local general plans, and in most cases, this shift in housing type -- especially the switch from large-lot to small-lot single-family homes—will occur only if local land use jurisdictions exercise their discretion in approving such shifts from large-lot to small-lot development and amend their zoning and general plans, specific plans, areas plans, etc., to reflect such approvals. ~~naturally in the marketplace as developers shift to products in high demand.~~

. . .

The 2012-2035 RTP/SCS land use development pattern accommodates over 50 percent of new housing and employment growth in HQTAs, while keeping jurisdictional totals consistent with local input. It moves the region towards more compact, mixed-use development leading to more opportunities for walking and biking, more transit use, and shorter auto trips. The 2012-2035 RTP/SCS ~~allocates~~ forecasts growth according to five community types that are further subdivided into 13 development types. The 13 development types, provide for a broad range of housing types, including smaller-lot single family homes, townhomes, and multifamily condominiums and apartments. In forecasting the SCS development land use pattern, SCAG recognizes the RTP/SCS is not to directly regulate the use of land or affect the land use authority of cities and counties within a given region. (Government Code §65080(b)(2)(K).) Further, SCAG acknowledges that the law (i.e., SB 375) does not require that a local general plan, specific plan, or zoning be "consistent" with the RTP/SCS. (Ibid.) Finally, SCAG recognizes the authority of local jurisdictions to regulate land use through their police powers as authorized by California law and that nothing in the RTP/SCS supersedes the local jurisdictions' exercise of their land use authority.

Explanation: At least two reasons justify revisions to the above quoted text in order to be consistent with applicable law (*i.e.*, SB 375). (Gov. Code, § 65080.) First, according to the Draft PEIR, the forecasted land use development pattern in the SCS, in some cases, assumes that *more* high-density housing will be built than is currently anticipated in the local general plans of the affected counties and cities. However, SB 375 requires the contemplated land use development pattern in the SCS -- a component part of the RTP -- to utilize "the most recent planning assumptions considering local general plans and other factors." (Gov. Code, § 65080(b)(2)(B).) Unfortunately, SCAG has deviated substantially from the locally adopted general plans, and has made its own land use assumptions that are in conflict with the land use plans of adopted general plans within the region.

Second, the draft SCS and associated Draft PEIR both blur the line between regional planning (*i.e.*, preparing the required SCS forecasted land use development pattern) and local land use authority and jurisdiction. The SCS is not to directly regulate the use of land or affect the land use authority of cities and counties within a given region. (Gov. Code, §

65080(b)(2)(K).) Additionally, the law (*i.e.*, SB 375) does not require that a local general plan, specific plan, or zoning be "consistent" with the SCS. (*Ibid*.) Despite these legal limitations, SCAG has made a "shift" in housing types -- deviating from the most recent planning assumptions in the locally adopted general plans -- stating that the shift or "switch" will "occur naturally" in the marketplace due to shifting demands. However, this shift does not "occur naturally." Instead, such a shift can only occur, if at all, as part of a separate and lengthy discretionary development application process involving requests to local land use jurisdictions to amend their general plans, specific plans, areas plans, and zoning. In short, there is no "shift" to high-density housing, unless and until the local land use jurisdictions adopt the requested discretionary approvals.

Please revise/clarify all same or similar text in the Draft PEIR (see, for example, page 2-30).

11. The Draft PEIR, Section 2.0, Project Description, page 2-35, should be revised as follows:

> SCAG will use this PEIR as part of its review and approval of the 2012-2035 RTP/SCS. The lead agencies for individual projects may use this PEIR as the basis of their regional and cumulative impacts analysis. ~~In addition, for projects that may be eligible for CEQA Streamlining, applicable mitigation measures from this EIR shall be incorporated into those projects as appropriate. It is the intent of SCAG that member agencies and others use the information contained within the PEIR in order to "tier" subsequent environmental documentation of projects in the region.~~ Information from this document may also be incorporated in future County Congestion Management Programs and associated environmental documents, as applicable.

Explanation: The deleted text is stricken, above, to clarify SCAG's likely original intent. First, as to projects that may be eligible for CEQA streamlining under SB 375, the local agencies (*i.e.*, cities/counties) ultimately will be responsible for the project-level environmental analysis and no law or regulation requires that analysis to "incorporate" the PEIR's mitigation measures into those projects. The local agencies retain that discretion, based on the project-level environmental analysis conducted and the mitigation measures to reduce or avoid the identified significant impacts. Second, member agencies, project sponsors, and others are not required to use the information contained in the PEIR, unless their project-level environmental analysis "tiers" from SCAG's Final PEIR.

12. The Draft PEIR, Section 3.0, Environmental Setting, Impacts & Mitigation Measures, sets forth over 500 proposed mitigation measures. The Draft PEIR's Executive Summary also identifies each measure. In general, the Draft PEIR's proposed "can and should" mitigation measures must either be rejected on infeasibility grounds or revised substantially for the following reasons:

(a) SCAG has no authority/jurisdiction to require other agencies to implement project-specific mitigation measures;

(b) SCAG has no authority/jurisdiction to monitor mitigation compliance and to incorporate the mitigation as "policies" in the RTP/SCS;

(c) SCAG has provided no evidence or analysis substantiating its belief that the identified measures are "feasible;"

(d) Member agencies, project sponsors, and others retain the discretion to determine which measures are feasible for any given project at subsequent project-specific stages;

(e) Several of the Draft PEIR's proposed mitigation measures are outside of SCAG's jurisdiction and authority;

(f) Many of the Draft PEIR's proposed mitigation measures are not desirable based on policy considerations; and

(g) Numerous Draft PEIR's proposed mitigation measures are duplicative of existing federal, state, regional, and local statutory or regulatory frameworks that require their own NEPA or CEQA compliance; and, therefore, are unnecessary.

Notably, the Draft RTP/SCS, page 75, includes the "2012 RTP Environmental Mitigation" program, which is based on the proposed mitigation measures listed in the Draft PEIR. The Draft RTP/SCS, page 75, states that the list of all the mitigation measures included in the PEIR also will be included in the "Environmental Mitigation Report" of the Final RTP/SCS. On pages 76-84, the draft plan then summarizes the Draft PEIR's proposed mitigation measures for all 13 environmental categories addressed in that document. Many of the RTP/SCS summaries repeat the mandates (*i.e.*, "require") and the outcome-determinative provisions (*i.e.*, "ensure") set forth in the proposed mitigation measures contained in the Draft PEIR. This discussion needs to be revised in a manner that is consistent with the content of the Final PEIR. Additionally, the Draft RTP/SCS's "Environmental Mitigation Program," pages 75-84, must be revised, consistent with SCAG's revisions and clarifications that are required to be made to the "can and should" mitigation measures set forth in the Draft PEIR. Absent revisions to this section of the Draft RTP/SCS, there will be a serious inconsistency between the plan and the PEIR.

13. The Draft PEIR contains several proposed mitigation measures that mimic comprehensive, existing statutory or regulatory requirements; and, therefore, they (and numerous other measures) should be rejected or revised substantially in order to eliminate needless regulatory duplication. The following Draft PEIR mitigation measures are cited as examples:

> **MM-BIO/OS17:** Project sponsors can and should replace any disturbed wetland, riparian or aquatic habitat, either on-site or at a suitable off-site location at ratios to ensure no net loss. See **MM-BIO/OS1** through **MM-BIO/OS14**.

MM-BIO/OS18: Project sponsors can and should ensure that when individual projects include unavoidable losses of riparian or aquatic habitat, adjacent or nearby riparian or aquatic habitat should be enhanced (e.g., through removal of non-native invasive wetland species and replacement with more ecologically valuable native species).

MM-BIO/OS50: For projects adjacent to natural watercourses, project sponsors can and should submit a vegetation management plan for review and approval by the Lead Agency that includes, as deemed appropriate, the following measures:

- Identify and do not disturb a 20-foot buffer from the top of the natural watercourse. If the top of bank cannot be identified, leave a 50-foot buffer from the centerline of the watercourse or as wide a buffer as possible between the watercourse centerline and the proposed site development.
- Identify and leave" islands" of vegetation in order to prevent erosion and landslides and protect nesting habitat.
- Leave at least 6 inches of vegetation on the site.
- Trim tree branches from the ground up (climbing up) and leave tree canopy intact.
- Leave stumps and roots from cut down trees to prevent erosion.
- Plant fire-appropriate, drought-tolerant, preferably native vegetation.
- Err on the side of caution; if a plant, tree or area is sensitive, obtain a second opinion before cutting.
- Provide erosion and sediment control protection if cutting vegetation on a steep slope.
- Leave tall shrubbery at least 3-feet high.
- Fence off sensitive plant habitats and creek areas to protect from animal grazing as appropriate and necessary.
- Do not clear-cut vegetation. This can lead to erosion and severe water quality problems and destroy important habitat.
- Do not remove vegetation within 20-feet of the top of bank. If the top of bank cannot be identified, do not cut within 50-feet of the centerline of the natural watercourse or as wide a buffer as possible between the natural watercourse centerline and the proposed site development.
- Do not trim/prune branches that are larger than 4 inches in diameter.
- Do not remove tree canopy.
- Do not dump cut vegetation in a creek.
- Do not cut tall shrubbery to less than 3-feet high.
- Do not cut of short vegetation (grasses, ground-cover) to less than 6-inches high.

These measures (and several others) are unnecessarily duplicative of the comprehensive wetlands/riparian/aquatic habitat regulatory scheme that is already in place at the federal level through the Clean Water Act section 404 permitting process overseen by U.S. Army Corps of Engineers, and at the state level through the California Department of Fish and Game's section

1600 streambed alteration program. This regulatory/jurisdictional scheme comprehensively addresses significant impacts to wetlands, riparian, and aquatic habitat and associated resources. The regulatory/jurisdictional scheme also requires its own NEPA and/or CEQA compliance. Therefore, such measures should be rejected, particularly when project-specific conditions and other factors are unknown.

14. Other examples of Draft PEIR mitigation measures that are duplicative of existing statutory or regulatory frameworks with their own environmental requirements are provided below:

> **MM-BIO/OS20:** If specific project area trees are designated as "Landmark Trees" or "Heritage Trees", then approval for removals can and should be obtained through the appropriate entity, and appropriate mitigation measures can and should be developed at that time, to ensure that the trees are replaced. Mitigation trees can and should be locally-collected native species.
>
> **MM-BIO/OS21**: Retention of trees on-site can and should be prioritized consistent with local regulations. Adequate protection can and should be provided during the construction period for any trees that are to remain standing, including the following, plus any recommendations of an arborist:
>
> a. Before the start of any clearing, excavation, construction or other work on the site, every protected tree deemed to be potentially endangered by said site work, can and should be securely fenced off. Such fences can and should remain in place for duration of all such work. All trees to be removed can and should be clearly marked. A scheme can and should be established for the removal and disposal of logs, brush, earth and other debris that will avoid injury to any protected tree.
>
> b. Where proposed development or other site work could encroach upon the protected perimeter of any protected tree, special measures can and should be incorporated to allow the roots to breathe and obtain water and nutrients. Any excavation, cutting, filing, or compaction of the existing ground surface within the protected perimeter should be minimized. No change in existing ground level should occur from the base of any protected tree at any time. No burning or use of equipment with an open flame should occur near or within the protected perimeter of any protected tree.
>
> c. No storage or dumping of oil, gas, chemicals, or other substances that may be harmful to trees should occur from the base of any protected trees, or any other location on the site from which such substances might enter the protected perimeter. No heavy construction equipment or construction materials should be operated or stored within a distance from the base of any protected trees. Wires, ropes, or other devices should not be attached to any protected tree, except as needed for support of the tree. No sign,

other than a tag showing the botanical classification, should be attached to any protected tree.

d. Periodically during construction, the leaves of protected trees can and should be thoroughly sprayed with water to prevent buildup of dust and other pollution that would inhibit leaf transpiration.

e. If any damage to a protected tree should occur during or as a result of work on the site, the project sponsor can and should immediately notify the appropriate local agency of such damage. If, such tree cannot be preserved in a healthy state, the local agency can and should require replacement of any tree removed with another tree or trees on the same site deemed adequate by the local agency to compensate for the loss of the tree that is removed.

f. All debris created as a result of any tree removal work can and should be removed by the project sponsor from the property within two weeks of debris creation, and such debris can and should be properly disposed of by the project sponsor in accordance with all applicable laws, ordinances, and regulations.

These measures also unnecessarily intrude into local agency (*i.e.*, cities and counties) jurisdiction, which comprehensively regulates designated trees for avoidance, minimization, and mitigation of significant impacts to such sensitive resources. For example, Los Angeles County already has in place the "County of Los Angeles Oak Tree Ordinance," which is a comprehensive permit process regulating significant impacts to oak trees, which are recognized as significant historical, aesthetic, and ecological resources within Los Angeles County. The Los Angeles County Ordinance applies to all unincorporated areas of the County. Cities within Los Angeles County either have adopted the County ordinance or their own ordinance, which may be more stringent. Additionally, the County of Ventura has implemented its "Tree Protection Ordinance," which applies to all unincorporated areas of Ventura County. Likewise, the County of Orange enforces the County's "Tree Code," which requires a permit before almost all tree removal within the County. The County of Riverside has adopted "Oak Tree Management Guidelines;" and San Bernardino County has adopted the Plant Protection Ordinance, which protects trees and calls for replacement when authorized to be removed pursuant to a tree removal permit.

15. Other Draft PEIR mitigation measures exceed SCAG's jurisdiction and authority. Specifically, SCAG's jurisdiction and authority is limited by its structure. More specifically, SCAG is a public agency and voluntary association of counties and cities established in 1965 by a "joint powers agreement" among its members, pursuant to California Government Code section 6500, et seq.[2] SCAG is not an agency with land use, taxing, or regulatory powers,[3] nor is it a special district. As such, it is not "another layer of government." (*Id.*)

[2] Title I, Division 7, Chapter 5, of the Government Code authorizes two or more public agencies to enter into a joint powers agreement.

Instead, SCAG's purpose is to provide a forum for discussion, study, and development of recommendations on regional issues of mutual interest and concern to its member agencies regarding the orderly physical development of the southern California region.[4] According to SCAG's overall work program (May 2010), SCAG's primary responsibilities include development of the RTP/SCS, the Federal Transportation Improvement Program (FTIP), the annual Overall Work Program, and transportation-related portions of local air quality management plans.[5] According to SCAG, under the federal Clean Air Act, SCAG is responsible for determining whether the transportation plans and programs are in conformity with state air quality plans.[6] SCAG's additional functions include intergovernmental review of regionally significant development projects,[7] periodic preparation of a Regional Housing Needs Assessment (RHNA), and serving as the area-wide wastewater treatment management planning agency under the federal Clean Water Act.

Because SCAG's jurisdiction/authority is limited by its structure, purpose, and powers, SCAG cannot impose "can and should" mitigation measures on local land use jurisdictions/project sponsors. Examples of measures that fall far beyond SCAG's jurisdiction and authority are provided below, and should either be rejected or revised substantially:

> **MM-BIO/OS40:** Project sponsors can and should avoid siting new 2012-2035 RTP/SCS transportation facilities within areas not presently exposed to impacts from transportation facilities. If avoidance is infeasible, the project should minimize vehicular accessibility to areas beyond the actual transportation surface. This can be accomplished through fencing and signage. Additionally, the area of native habitats to be lost to proximity to a transportation facility should be assessed and habitat at a quality of equal or superior value can and should be secured and protected in perpetuity.
>
> **MM-BIO/OS47:** Project sponsors can and should ensure that transportation systems proposed in the 2012-2035 RTP/SCS avoid or mitigate significant impacts to natural lands, community open space and important farmland, including cumulative impacts and open space impacts from the growth associated with transportation projects and improvements.

---

[3] See "Questions and Answers about the Southern California Association of Governments," prepared by SCAG, p. 1-2.

[4] See, SCAG's Joint Powers Agreement, file number 113.

[5] See, *e.g.*, SCAG's Overall Work Program, Fiscal Year 2010-2011, May 2010, p. 1.

[6] SCAG's Overall Work Program, Fiscal Year 2010-2011, May 2010, p. 1.

[7] In this capacity, federal and state laws have required SCAG to review and comment on the consistency of regionally-significant projects with adopted regional plans. If a regional project is determined to be inconsistent, SCAG may suggest adjustments so that the City or County can approve the project, but SCAG has no jurisdiction or authority to "reject" such projects.

MM-BIO/OS49: Project sponsors can and should include into project design, to the maximum extent practicable, mitigation measures and recommended best practices aimed at minimizing or avoiding impacts to natural lands, including, but not limited to FHWA's Critter Crossings, Ventura County Mitigation Guidelines, CDFG's Wildlife Action Plan and any applicable conservation plans.

MM-BIO/OS54: Local jurisdictions or agencies can and should establish policies and programs to restore, protect, manage and preserve conservation areas, including forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, and groundwater recharge areas, that remove and sequester carbon from the atmosphere.

MM-BIO/OS55: Conservation Area Development: Local jurisdictions or agencies can and should establish programs and funding mechanisms to create protected conservation areas, including:

- Imposing mitigation fees for development on lands that would otherwise be conservation areas, and use the funds generated to protect other areas from development;

- Proposing for voter approval a small tax increment (e.g., a quarter cent sales tax, perhaps for a finite time period that could be renewed) to fund the purchase of development rights in conservation areas, or purchase of the land outright.

MM-BIO/OS56: Conservation Area Preservation: Local jurisdictions or agencies can and should establish policies to preserve existing conservation areas, and to discourage development in those areas.

MM-BIO/OS59: Local jurisdictions or agencies can and should evaluate existing landscaping and options to convert reflective and impervious surfaces to landscaping, and install or replace vegetation with drought-tolerant, low-maintenance native species or edible landscaping that can also provide shade and reduce heat-island effects.

16. Several of the biology-related Draft PEIR mitigation measures also prescribe specific mitigation ratios. Such measures should be revised. For example, MM-BIO/OS19 should be revised, as follows:

MM-BIO/OS19: For projects near water resources project sponsors can and should implement Best Management Practices (BMPs) at construction sites to minimize erosion and sediment transport from the area. BMPs include encouraging growth of vegetation in disturbed areas, using straw bales or other silt-catching devices, and using settling basins to minimize soil transport. (See also Water Resources Mitigation Measures.) ~~Mitigation for occupied habitat impacted is likely to be compensatory off-site acquisition or protection of similar~~

~~habitats at a ratio of 3:1 (compensation acres to that impacted) or other similar ratio with the approval of the USFWS.~~

Explanation: The above measure should be revised to ensure that SCAG does not exceed its authority in an area (*i.e.*, biology) that falls outside of its jurisdiction. In short, the project sponsors, in consultation with the applicable resource agency (*e.g.*, CDFG), have the discretion to arrive at mitigation ratios or not, based on project-specific considerations and other factors that are not known to SCAG at this time. The same rationale applies with equal force to all of the Draft PEIR measures that prescribe mitigation ratios (*e.g.*, MM-BIO/OS19, 22-23, 25-28, 30, 32-34).

17. The Draft PEIR, Section 3.8, Land Use & Agricultural Resources, contains numerous mitigation measures that exceed SCAG's jurisdiction and authority, particularly where, as here, SB 375 does not allow SCAG to regulate the use of land or affect the land use authority of cities and counties within its region. The land use-related measures that fall into this category are: MM-LU15-20, 23-27, 33-34, 41-46, 58-64, and 80-81. More specifically, the following measures are illustrative:

> **MM-LU42:** Local jurisdictions or agencies can and should establish an urban growth boundary (UBG) with related ordinances or programs to limit suburban sprawl; local jurisdictions or agencies can and should restrict urban development beyond the UGB and streamline entitlement processes within the UGB for consistent projects.
>
> **MM-LU43:** Urban development can and should occur only where urban public facilities and services exist or can be reasonably made available.
>
> **MM-LU44:** The improvement and expansion of one urban public facility or service can and should not stimulate development that significantly precedes the local jurisdiction's ability to provide all other necessary urban public facilities and services at adequate levels.
>
> **MM-LU45:** Local jurisdictions can and should redirect new growth into existing city/urban reserve areas
>
> **MM-LU46:** Local jurisdictions can and should maintain a one dwelling unit per 10-acre minimum lot size or lower density in areas outside designated urban service lines.

Each measure intrudes into the local land use authority and jurisdiction of SCAG's member agencies, project sponsors, and other agencies; and such measures fall well beyond SCAG's limited jurisdiction and authority. The law (*i.e.*, SB 375) makes clear that the RTP/SCS is not to directly regulate the use of land or affect the land use authority of cities and counties within a given region. (Gov. Code, §65080(b)(2)(K).) Additionally, the law does not require that a local general plan, specific plan, or zoning be "consistent" with the RTP/SCS. (*Ibid*.) SCAG also has recognized and respected the authority of agencies to regulate land use through

their broad police powers as authorized by California law. SCAG has recognized that nothing in the RTP/SCS supercedes its member agencies' exercise of their land use authority. By rejecting all such measures, SCAG will have clarified its original intent, and the PEIR will be consistent with applicable law (*i.e.*, SB 375).

In addition, the above measures call for the creation of urban growth boundaries, city/urban reserve areas, and designated urban service lines. However, all such concepts are ordinarily part of a local jurisdiction's growth control measures that are accompanied by local voter approval before enactment; as such, such measures are not appropriate for inclusion in a program EIR.

Please confirm SCAG's limited jurisdiction and authority, and ensure that the Final PEIR expressly acknowledges that limited jurisdiction and authority and only employs a mitigation construct that is consistent with it. Also, please confirm SCAG's recognition of the legal limitations set forth in SB 375.

18. The Draft PEIR also contains proposed mitigation measures that fall far outside SCAG's limited jurisdiction and authority in other environmental categories aside from biology/open space and land use/agricultural resources. While the list is not exhaustive, each of the following greenhouse gas, noise, population/housing, public services, traffic, and water mitigation measures either should be rejected by the SCAG Regional Council, or revised substantially: MM-GHG3, 8, 11; MM-NO12, 16; MM-POP1; MM-PS3, 14, 25, 37, 39, 41, 67-68, 71, 95, and 121; and MM-TR17, 23, 28, 35, 83, 85, and 96; and MM-W59-60 and 65.

19. Still other Draft PEIR proposed mitigation measures would cause one or more significant effects; however, those effects are not discussed in the PEIR. This omission is particularly troublesome. CEQA Guidelines section 15126.4(a)(1)(D) requires that if SCAG is to adopt such measures and if the measures would cause one or more significant effects, then the PEIR must disclose and discuss such effects. Below are just two examples of such measures:

> **MM-LU50:** Local jurisdictions can and should reduce required road width standards whenever feasible to calm traffic and encourage alternative modes of transportation.
>
> **MM-LU85:** Local jurisdictions can and should reduce heat gain from pavement and other hardscaping, including:
>
> - Reinstate the use of parkway strips to allow shading of streets by trees;
> - Include shade trees on south- and west-facing sides of structures;
> - Include low-water landscaping in place of hardscaping around transportation infrastructure and in parking areas;
> - Install cool roofs, green roofs, and use cool paving for pathways, parking, and other roadway surfaces;
> - Establish standards that provide for pervious pavement options:
> - Remove obstacles to xeriscaping, edible landscaping and low-water landscaping.

These measures call for reduced street rights-of-way and road pavement widths, which may compromise the "levels of service" traffic standards applicable to street segments, which oftentimes are used as significance criteria in evaluating a project's traffic impacts. For example, in downtown areas, reduced street widths may be recommended to enhance pedestrian accessibility, but, in doing so, the road segment can no longer operate at the required "level of service," without creating significant traffic impacts (*e.g.*, congestion, delay). The Draft PEIR did not disclose these potentially significant impacts prior to public circulation. Because such measures are beyond SCAG's limited jurisdiction and authority, and because the Draft PEIR did not disclose impacts associated with such mitigation measures, the SCAG Regional Council should reject such measures on infeasibility grounds.

20. Also, other Draft PEIR proposed mitigation measures state that local jurisdictions, project sponsors, or other agencies will "ensure" that certain environmental outcomes are achieved, or "shall minimize impacts" to various environmental conditions. In fact, the Draft PEIR contains about 100 measures directing that such agencies "ensure" or minimize various environmental minimization measures (see, for example, MM-AV11-12; MM-AQ3-13; MM-BIO-9, 11, 13-14, 17-18, 20, 29-31, 35, 47; MM-CUL12-13; MM-GEO1-9; MM-HM5, 7-8, 14; MM-LU15, 23, 58, 63, 67, 70, 75, 79; MM-NO10-11; MM-PS1-3, 12-13, 36, 55, 70, 77; MM-TR21, 33, 41, 56-57, 81; and MM-W5, 9, 15-16, 18, 26, 29, 31, 36, 46, 47, 60, 62, and 65). The problem, however, is that SCAG lacks the jurisdiction and legal authority to be able to "ensure" impacts are mitigated or minimized. SCAG can offer assistance; it can be a forum for cooperative decision-making by its member agencies; and it can encourage mitigation/ minimization; but, SCAG lacks the jurisdiction or legal authority to direct or mandate the outcome of many of the mitigation proposed in the Draft PEIR.

21. Although the above comments relative to mitigation measures are critical of the proposed mitigation measures in the Draft PEIR, it does not mean that SCAG is completely constrained from adopting appropriate and feasible mitigation measures. For example, an appropriate mitigation relative to the water quality impacts identified in the Draft PEIR may be as follows:

> "The implementing agency should conduct or require project-specific hydrology studies for projects proposed to be constructed within floodplains to demonstrate compliance with applicable federal, state, and local agency flood-control regulations. These studies should identify project design features or mitigation measures that reduce impacts to either floodplains or flood flows to a less than significant level. For the purposes of this mitigation, less than significant means consistent with federal, state, and local regulations and laws related to development in the floodplain."

This measure was taken from the Sacramento Area Council of Governments (SACOG) Draft PEIR for the SACOG 2035 proposed Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) for the SACOG region, which is found at http://www.sacog.org/2035/2011/11/draft-environmental-impact-review-released/ and incorporated by this reference. Unlike SCAG's Draft PEIR proposed mitigation measures, the measure taken from the SACOG Program EIR appropriately defers to the implementing agency with jurisdiction; it

contains performance standards based on compliance with applicable federal, state, and local agency flood-control regulations; and it recommends project design features or mitigation measures to reduce impacts to floodplains or flood flows to less-than-significant levels. It does so without SACOG exceeding its jurisdiction or mandating outcomes without the legal authority to do so. These SACOG mitigation measures should be considered in lieu of all of the proposed "can and should" mitigation measures contained in SCAG's Draft PEIR.

22. In both the Executive Summary and Section 4.0, Alternatives, the Draft PEIR summarizes and evaluates three alternatives to the proposed project. These comments focus on "Alternative 3," also called the "Envision 2 Alternative." In summary, according to the Draft PEIR, the Envision 2 Alternative "includes far more aggressive densities than the 2012-2035 RTP/SCS, especially around High Quality Transit Areas (HQTAs), increases mobility, reduces emissions, and limits the development of single-family housing that would be built in the region. The Envision 2 transportation network is similar to the Plan network with minor changes to goods movement and transit projects. The growth network associated with Envision 2 maximizes urban centers, TODs [transit-oriented development] and HQTAs; it also includes a more progressive jobs/housing distribution optimized for TOD and infill." (Draft PEIR, p. ES-3.)

First, the Draft PEIR made a preliminary determination that this alternative was "feasible" for evaluation purposes. However, the SCAG Regional Council retains the discretionary authority to reject the alternative as infeasible based on legal and policy considerations, and because it does not meet the proposed project's objectives. We ask that the SCAG Regional Council adopt such findings.

Second, the Draft PEIR states that the Envision 2 Alternative includes "far more aggressive densities" than the proposed project. Please clarify whether the alternative includes "far more aggressive densities" than those found in SCAG's member agencies' adopted general plans. We ask for this clarification because it appears that the alternative, in fact, proposes "far more aggressive" densities and intensities than found in the local general plans or cities and counties within the region. If so, then the alternative conflicts with those adopted general plans, which is a permissible factor in rejecting the alternative.

Third, because SCAG does not have any legal jurisdiction to govern the land use decisions of its member cities and counties (see Gov. Code, § 65080(b)(2)(K)), SCAG lacks the legal authority to require the elected decisionmakers of cities and counties to adopt or amend their respective land use policies, including their general plans and zoning ordinances, which would be required to implement the alternative's forecasted land use patterns. Accordingly, SCAG lacks the jurisdiction and legal authority to implement the alternative's "aggressive" development pattern. This ground also is a permissible basis for the SCAG Regional Council to reject the Envision 2 Alternative.

Fourth, the Envision 2 Alternative increases densities and intensities in developed or previously-developed urbanized areas within the region. The increased densities/intensities are "especially around" high quality transit areas, urban centers, transportation corridors, and transit-oriented developments. More specifically, the alternative, if adopted, would increase

population adjacent to transportation/transit facilities when compared to the proposed project. Please confirm.

Finally, the Envision 2 Alternative proposes to eliminate single-family development. We encourage the SCAG Regional Council to reject this alternative because the elimination of single-family development is both beyond SCAG's legal jurisdiction and not desirable from a policy perspective as it would eliminate an important part of the mix of housing to be provided by the adopted general plans within the region.

23. The Draft PEIR fails to adequately address the environmental impacts attributable to the densification and intensification of land use development. For example, Section 4.0, Alternatives, of the Draft PEIR does not accurately or fully capture the environmental impacts of the Envision 2 Alternative.

While not described in the Draft PEIR, increased density and intensity often can tax existing public services infrastructure and trigger the need to upsize water mains, sewer lines, etc. -- such activities can result in significant environmental impacts. Also, as compared to the proposed project, the Envision 2 Alternative would appear to result in higher cancer risks for 4 of the 8 corridor segments modeled in the Draft PEIR, not "2 of the 8 corridor segments modeled. (See Draft PEIR, p. 4-31 and compare to Table 4-16, which suggests that the cancer risk based on residential exposure to vehicle operation under Envision 2 is greater for I-8 in Imperial; SR-91 in Riverside; U.S. 101 in Ventura; and I-15 in San Bernardino).) Similarly, please confirm whether Envision 2's residential densities in closer proximity to transportation/transit facilities give rise to greater air quality impacts, including cancer risks and other health concerns, when compared to the proposed project.

In summary, the Draft PEIR needs to be revised to reflect the impacts of densification and intensification.

Los Angeles, CA 90017

Re: Draft 2012 Regional Transportation Plan

Dear Mr. Ikhrata:

On behalf of the Burbank-Glendale-Pasadena Airport Authority (Authority) let me first state that we greatly appreciated the opportunity to work directly with members of your staff in the development of the Aviation and Airport Ground Access element of the Draft Regional Transportation Plan (RTP). We have been active members of the Aviation Technical Advisory Committee and provided both technical and policy comments during development of the RTP. We are pleased that many of our comments we have provided during development of the RTP have been incorporated into the RTP technical attachment entitled: "Aviation and Airport Ground Access."

An important concern with the "Aviation and Airport Ground Access" report is the assumption that the projected annual passenger demand for Bob Hope Airport (BUR) would be 9.4 million annual passengers (MAP) by the year 2035. In the November 9, 2011 response written by Mike Armstrong to our October 4, 2011 letter (attached), SCAG took exception to our belief that the more realistic assumption would be passenger demand of 8 MAP or less for Bob Hope Airport in 2035.

SCAG cites the assumed "constraint" of a 78.9 MAP Settlement Agreement at LAX as the driver for this additional passenger demand at BUR. We do not concur with that assumption. Specifically, the passenger cap at LAX is not a legally-enforceable access restriction. Instead, it is a trigger for LAWA to reduce the number of available air carrier gates. The carriers have shown that they have the capability to increase operational efficiencies utilizing aircraft fleet mix, scheduling, and available gate capacity. As such, if a reduction in the number of gates did occur, carriers could process more than 78.9 million passengers annually.

2627 Hollywood Way • Burbank, California 91505 • (818) 840-8840 • Fax: (818) 848-1173

While the carriers at BUR primarily handle domestic flights now and will continue to do so in the future, it is reasonable to expect that the carriers at LAX will structure their operations and alliances in such a way as to accommodate the transfer of a continually-increasing number of international passengers, regardless of the gate constraints they may face.

The Authority is currently underway with a new Part 150 Study, in which a new forecast of passenger demand will be prepared. We believe that this study will validate our earlier assumption that passenger demand in 2035 will be less than 8 MAP. That forecast will be based on the econometrics of forecasted population growth, business growth, and per capita income within the BUR catchment area, and within the larger region as a whole. That forecast will not be based on assumptions about constraints at LAX. We ask that this change in assumption be also reflected in the RTP.

During this process we also worked closely with OLDA in addressing the designation of the Northern Corridor as a part of the "Constrained Project" list in the RTP.Recently, OLDA transmitted a letter to you dated February 7, 2012 signed by Mr. Frank J. Quintero, Chairman of the OLDA Board and a member of the Airport Authority Board of Directors. We would like to affirm our support for the comments contained in the February 7th communication. We strongly agree that the adoption by the SCAG Regional Council and the Metro Board of Directors of the high speed rail project-related Memorandum of Understanding with the California High Speed Rail Authority is a significant policy development which should be reflected in the RTP adopted by the Regional Council. We also support Metro's Antelope Valley Line Infrastructure Improvement Strategic Plan and hope preliminary results from the study can be incorporated into the RTP.

We appreciate your help in the Authority's effort to improve regional connectivity to the Bob Hope Airport.

Very truly yours,

Dan Feger
Executive Director

Attachment, October 4, 2011 letter to SCAG

October 4, 2011

Mike Armstrong

Re: Bob Hope Airport

Dear Mike:

This letter follows up on the SCAG Aviation Technical Advisory Committee Meeting on September 22nd at the Bob Hope Airport. At that meeting, the committee discussed, among other topics, SCAG's preliminary projection for passengers likely to use the Bob Hope Airport through the year 2035. SCAG's projection for the Bob Airport is 9.4 MAP.[1]

The problem with SCAG's preliminary projection for the Bob Hope Airport is that it fails to adequately take into account the fundamental economic change that has occurred in the Bob Hope Airport catchment areas in recent years and thereby dramatically over estimates future use. Plainly stated, the level of passengers using the Bob Hope Airport has fallen back to 1993 levels (roughly 4.3 MAP). Any projection that assumes a return to the growth rate of the bubble economy is we believe misleading. Instead, the Bob Hope Airport believes that for a more reliable metric of future growth is the historical growth rate the Airport has experienced fairly consistently over the past 50 years. That growth rate, approximately 1.8% per year, results in a projected passenger level for the Airport in 2035 of roughly 8 MAP, not the 9.4 MAP in SCAG's current projection. We would request that this adjustment be made.

Sincerely,

Mark Hardyment

cc: Tom Ryan

DM_US 30320115-1.019424.0010

[1] SCAG's 2035 projection for the Bob Hope Airport is the same under both its low growth (130 MAP for Southern California Aviation) and high growth (164 MAP for Southern California) projections.

Re: Bob Hope Airport Air Passenger Demand Forecast

Dear Mark:

We very much appreciate your letter of October 2, 2011 commenting on SCAG's 9.4 million air passenger (MAP) demand forecast for Bob Hope Airport in 2035. This forecast was adopted for SCAG's 2008 Regional Transportation Plan (RTP) and has been recommended by the SCAG Aviation Technical Advisory Committee (ATAC) for SCAG's 2012 RTP. It is based on a capacity analysis of Bob Hope Airports 14 aircraft gates/parking positions. We recognize that, like most other airports in the regional system, Bob Hope Airport has seen stagnant or declining passenger growth over the last several years, mainly as a result of the severe economic recession and restructuring of the airline industry. Our recommended regional air passenger demand forecast does not assume that these conditions will persist; nevertheless, at 145.9 MAP in 2035, with a 2.5% annual growth rate, it is considerably more conservative than the 165.3 MAP forecast adopted for SCAG's 2008 RTP. It is also more conservative than the FAA's most recent National Aerospace Forecast (3.2% annual air passenger growth rate) or most recent Terminal Area Forecast for air carrier airports in the region (3.0% annual air passenger growth rate).

It is very important to recognize that the fundamental driver that causes Bob Hope Airport to reach its estimated 9.4 MAP capacity constraint by 2035 is the 78.9 MAP Settlement Agreement passenger constrained at LAX that is assumed by the forecast. With LAX held at that level, and with Long Beach Airport also held to its legally-enforceable 4.2 MAP constraint, Bob Hope Airport becomes a superior and convenient airport alternative for serving future domestic air passenger demand in Los Angeles County within its 9.4 MAP capacity constraint. This reflects a fundamental problem of our regional aviation system, which has a relatively large number of airports serving demand in urban centers of Los Angeles and Orange Counties, but which are all relatively small, highly encroached and ultimately capacity-constrained. Meeting the 145.9 MAP forecast will require Ontario Airport to reverse its steep passenger decline and grow from its current 4.2 MAP to 30.7 MAP over the next 25 years. This will present significant ground access challenges in allowing un-served air passengers in Los Angeles and Orange counties to access available airport capacity at Ontario Airport and other airports in the Inland Empire.

At its last meeting on October 27, ATAC approved the 145.9 MAP air passenger demand forecast with its allocation of 9.4 MAP to Bob Hope Airport, but only with a number of caveats. These include the caveat that the forecast is based on a number

of variables that history has shown can change significantly over time, and it is important to update the forecast on an ongoing basis, most importantly for the next (2016) RTP. Also, that the relaxation or elimination of the settlement agreement constraints at LAX and John Wayne airports could significantly impact forecast allocations of aviation demand at other airports in the regional system, and future updates of the forecast should incorporate any new information provided by local airport authorities on revised constraints at capacity-constrained airports.

I hope that the above information addresses your concerns about the 9.4 MAP air passenger forecast for Bob Hope Airport that has been recommended for SCAG's 2012 RTP. Please let me know if you have any other comments or questions about this issue.

Best regards,

Michael Armstrong

Re: 2012-2035 Draft Regional Transportation Plan and Sustainable Communities Strategy and Draft Program Environmental Impact Report (SCH# 2011051018)

Dear Mr. Lieb:

We appreciate the opportunity to comment on the above-mentioned project. We look forward to any necessary coordination and remain committed to working with you to successfully implement your project.

State Parks is a Trustee Agency as defined by the California Environmental Quality Act (CEQA). State Parks is also a Responsible Agency as defined by CEQA because the proposed project would occur within and require permanent use of Chino Hills State Park. State Parks' mission in part is to provide for the health, inspiration, and education of the people of California by preserving the state's extraordinary biodiversity and creating opportunities for high quality outdoor recreation.

Environmental Mitigation Program
We appreciate the advanced mitigation component in the RTP/SCS. Orange County's Renewed Measure M has had great success with a similar program. Programs such as these have many benefits including streamlined permitting, preservation of important natural lands, improved relationships and collaboration with resource and permitting agencies.

We offer the following suggestions regarding the Conservation Policy:

1. Ensuring State conservancies and joint powers authorities with a conservation focus are included in the mapping and prioritization of conservation lands. Specifically, we recommend including the Wildlife Corridor Conservation Authority, Puente Hills Habitat Preservation Authority, San Gabriel & Lower Los Angeles Rivers and Mountains Conservancy, Mountains Recreation and Conservation Authority (MRCA), and Santa Monica Mountains Conservancy (SMMC) among the entities upon whose expertise can be tapped.

2. Extending the inventory of protected lands to include all protected lands – Federal, State, regional and local natural lands – instead of narrowly limiting the inventory to simply Natural Communities Conservation Plan and Habitat Conservation Plan areas.

3. Ensuring existing wildlife corridors and habitat linkages and highway/roadway undercrossings are protected and enhanced during the evaluation of habitat lands and during construction of roadway projects.

4. Advocating that the advanced mitigation policy result is a net environmental benefit for the natural resource lands after construction activities are completed.

Also, large-scale acquisition and management of lands must not be limited to "critical habitat," (RTP, p. 76, 128) as this can be confused with the legal term used by U.S. Fish and Wildlife Service for some federally endangered and threatened species. To clarify, this should be replaced by text reflecting the intent, i.e., the best available natural lands with valuable environmental resources deserving of conservation/preservation. State Parks looks forward to working with Southern California Association of Governments (SCAG) on the development of the Natural Lands Acquisition and Open Space Conservation Strategy. This will protect remaining resource lands and mitigate for impacts from transportation improvements. In addition to mitigation banking, transfer of development rights (TDR), and payment of in-lieu fees, State Parks recognizes conservation easements as a powerful preservation tool for habitat areas. Conservation easements, and fee title transfers to open space park agencies, should be listed in the plan alongside the other preservation mechanisms.

Wildlife Crossings of Transportation Facilities
State Parks appreciates SCAG's recognition of the impact that linear transportation facilities have on natural areas and the need for well-designed wildlife crossings to partially mitigate these effects. Wildlife crossings serve two distinct purposes: reducing mortality and preserving genetic connectivity. Roads are the leading direct source of human-caused mortality for most species in southern California and the entire country. They can become a population sink if a significant fraction of a local species is killed, affecting broader population distribution across the landscape. Additionally, for highly mobile predators, individuals crossing roads are frequently dispersing from their home range in search of new territory and mates, a vital population dynamic that is devastating if interrupted. National Park Service research has documented significant genetic differences among carnivore populations on either side of the 101 Freeway in the Santa Monica Mountains.

Wildlife crossings need to be discussed in the context of habitat connectivity, which is the broader ecological goal for conservation areas. Wildlife crossings are but one critical tool to ensure that indicator species are able to safely move about their environment. While much has been learned about movement patterns and the way in which key transportation facilities create genetic barriers to connectivity, the measures that might mitigate these impacts have not been thoroughly researched. Wildlife corridor design is a field in its infancy with few scientifically verified best practices for crossing dimensions and landscape features. Given that this research is needed to properly mitigate transportation impacts, SCAG should invest in connectivity research with a program specifically designed to establish measures that can be incorporated into the 2016 RTP revision. Such a program would aggregate existing research, propose new study areas, and develop design best practices specifically tailored to the Southern California eco-region.

Comments on Proposed PEIR Mitigation Measures
Biological Resources and Open Space
The PEIR includes many mitigation measures for potential impacts to biological resources. Overall, these measures are comprehensive and based on sound practice. Inclusion of the proposed mitigation measures in project selection and design will greatly improve ecological

outcomes in the SCAG region compared to a baseline scenario. The specific measures calling for minimum mitigation ratios reflect current accepted practices without limiting the discretion of resource agencies to require greater mitigation if warranted. The proposed measures addressing habitat fragmentation and connectivity are thorough and appropriate (MM-BIO/OS36 through MM-BIO/OS40). These impacts have been all too often unmitigated for transportation projects in the past.

State Parks looks forward to collaboration on regional conservation planning policy to address cumulative impacts to biological resources (MM-BIO/OS45). MRCA is one agency in the SCAG region that administers a highly successful restoration and preservation in-lieu-fee mitigation programs in close coordination with state and federal resource agencies. SCAG's planning and funding expertise is a welcome addition to ongoing efforts. State Parks recommends that other agencies with expertise in the region, such as WCCA, MRCA, SMMC, and Puente Hills Habitat Preservation Authority be invited to participate in this process.

The primary impact from transportation facilities is often the indirect and cumulative impact from growth induced by new improvements. As projects increase access and reduce commute times from remote areas, these resource lands become economical to develop. State Parks is therefore pleased to see SCAG recognize these impacts and call for their mitigation (MM-BIO/OS47). Without appropriate growth management along transportation corridors, wildlife crossings cannot mitigate connectivity impacts from expanding development footprints. Furthermore, induced growth along new corridors often negates the benefits of new transportation capacity, prompting even greater impacts from future facility expansion. SCAG should develop best practices that would be applicable to new transportation corridors to prevent new development from extending into resource lands. The PEIR biology mitigation measures should be clarified to delete reference to relocating active nests (MM-BIO/OS35), as this is likely in conflict with the Migratory Bird Treaty Act. Instead, construction buffers to active nests should be established, as proposed.

Public Services and Utilities
The PEIR lacks a public safety mitigation measure that promotes project design that minimizes urban-wildland interface, which is the source of wildfire risk to persons and property. Past development patterns include long, meandering urban edges with high risk exposure to catastrophic events, causing great strain on local and State firefighting resources largely subsidized by those living in lower risk locations. A mitigation measure should include two components addressing both project location and project design. First, development that extends into high fire hazard areas should be discouraged. Second, there should be an emphasis on utilizing project design strategies to reduce risk, such as building within compact and defensible footprints and minimizing perimeter length. Projects should be sited in order to reduce impacts of required brush clearance on native habitat areas, including adequate buffers to protect sensitive resources from brush clearance impacts.

State Parks concurs that project sponsors and local jurisdictions should work to increase public access to open space (MM-PS21 and 26). River parkways and other urban natural parks serve a vital purpose in connecting urban residents to natural parkland (MMM-PS22). The City and County of Los Angeles have both recognized these projects in master plans for their respective river corridors. While planning for these projects is the responsibility of local jurisdictions and partners, SCAG has a critical responsibility for funding by including bikeway projects in the RTP

area. Regional partnerships are necessary to achieve open space conservation objectives (MMPS29). State Parks welcomes SCAG's assistance with planning and identifying funding sources for open space acquisition (MM-PS31 and 34). SCAG's participation in coordinating regionally significant trail networks is also appreciated, however the greatest contribution SCAG could make to these efforts would be including those greenways that serve transportation functions, such as the river parkways, in the RTP so that they can be fully developed in the short and medium-term (MM-PS33).

Water Resources
State Parks also believes that preservation of remaining riparian resources should be the highest priority at both the regional and project level, followed by restoration of previously impacted areas (MM-W1 and 9). To the extent feasible, natural methods for stormwater control, water quality improvements, and infiltration should be encouraged. SCAG sets an appropriate standard that new projects should not cause or contribute to conditions that degrade the physical integrity or ecological function of any downstream receiving waters (MM-W22). When evaluating projects during the environmental review process, SCAG should identify regionally significant projects that may impact downstream waters and include comments to that effect in Notice of Preparation and Environmental Impact Report responses. This is a critical issue wherever natural rivers interact with urban areas. SCAG should participate in the development of models of natural processes for the remaining natural rivers in the SCAG region to ensure that environmental review can comprehensively evaluate project impacts based on the best available information.

Thank you again for considering our comments. Please keep our agency on your email/mailing lists for this project. For further discussion, please contact me or Enrique Arroyo at (951) 453-6848.

Sincerely,

Ron Krueper

January 19, 2012

Christopher P. Ganson, Senior Planner
Office of Planning and Research
1400 Tenth Street
Sacramento, CA 95814

Dear Mr. Ganson,

We welcome the opportunity to comment on the Sustainable Community Strategies (SCS) that have recently been presented in draft or final formats by the large Metropolitan Planning Organizations. Although the California Department of Public Health does not have a regulatory role in the SB375 process, there are a number of compelling public health interests in the SCSs because of the documented health impacts of housing and transportation in combination with economic development, education, and their interactions to create healthy community environments. As the convener of the Strategic Growth Council's Health in All Policies Task Force, CDPH is working with other State agencies to optimize opportunities to improve public health and sustainability. CDPH staff has also played an educational and technical advisory role in some MPOs' discussions of performance targets and methodologies to assess project performance. CDPH also routinely interacts with local public health departments around the state, many of whom have become involved in regional SCS planning.

Our general and specific comments are detailed in the attached pages. We do note, however, that there are several health issues that fall outside of the current framework of SCSs but are concerns CDPH believes needs more attention. Although greenhouse gas reduction is a goal of the SCSs, climate change will increase risks from higher temperatures on the backdrop of an increasingly urbanized California. We feel there is a critical need to integrate urban heat island (UHI) mitigation strategies into regional and local plans that will implement transit oriented development (TOD) and in-fill development so that UHI risks are reduced as new development takes place. Access to health-promoting features of the built environment, including food systems, parks, and green space also should be integrated into planning.

Please do not hesitate to contact me if you have any questions or comments.

Sincerely,

Linda Rudolph, M.D., M.P.H

Comments by the California Department of Public Health on the Sustainable Community Strategies (SCS) Process and Plan Content

General Comments

Health is a critical component of sustainable communities. The California Department of Public Health encourages regional planning organizations to embrace the concepts outlined in the Healthy Community framework developed by the Strategic Growth Council's Health in All Policies Task Force.[1,p21] Many strategies that increase community sustainability can also support improved health outcomes. For example, policies that support active transportation help Californians incorporate more health-promoting physical activity into their lives, while also advancing goals to achieve greenhouse gas emission reductions. Infill development can help to reduce urban sprawl, reduce greenhouse gas emissions, and support location-efficient housing that promotes active transportation and allows workers to reap both economic and health benefits. Good health is critical for economic sustainability, increasing workforce participation and productivity, and slowing the ongoing rise in medical care expenditures, which diverts resources from other State priorities such as education or investments in green energy.

CDPH staff has reviewed the drafts and final versions of SCSs updates to the Regional Transportation Plans of the 4 large MPOs and the following comments represent a high level synthesis. First, we must laud the MPOs for the diligent work that has gone into these documents, and each represents an improvement from the original RTPs. We note an increasing number of performance measures that go beyond the traditional health focus on traffic injuries and air pollution. We refer to physical activity from active modes of travel, including bicycling, walking, and public transit that includes active transport from and to transit destinations. Noise and other physical hazards are also getting more attention as health performance measures. We also note that discussions of equity increasingly recognize that health inequities are caused and exacerbated by built environment factors and the uneven distribution of community resources. We are supportive of these developments which will deepen the appreciation of how public health is embodied in the many actions outside the field of health or health care.

Specific Recommendations

We have several recommendations that are based on existing trends in the SCSs and recent scientific developments in the transportation and public health fields.

1. Activity time in active transport (walking, bicycling, etc.) is indispensable as a health-related transportation performance measure (e.g., mean daily minutes per person of walking and bicycling). Health co-benefits of active transport in one of the large MPOs (Metropolitan Transportation Commission, MTC) has recently been quantified[2] and the potential for reducing chronic disease and greenhouse gases appears to be large on an absolute scale and far larger than co-benefits from fine particulate matter reductions, which are a traditional focus of health effects. These findings are consistent with emerging evidence from studies of other regions of the United States, London, Barcelona, and the Netherlands.[3-7] Attempts to monetize health co-benefits from active transport suggest savings of billions of dollars in health care costs and the value of statistical lives saved.[5]

2. MPOs should consider new tools that have recently become available to quantify the health co-benefits of active transport in SCS scenarios and projects. This fills a gap in project performance assessment at most MPOs. One such tool co-developed by the CDPH, MTC, the Bay Area Air Quality Management District and other researchers is called the Integrated Transport and Health Impacts Model (ITHIM), which was used to quantify the health co-benefits of active transport and low carbon driving in the San Francisco Bay Area. This tool could function as a post processor to travel demand models that generate miles traveled and activity times by mode. Modelers at several large MPOs are already exploring how it can be used to complement their methods for project performance assessment.

3. As tools such as ITHIM become available to MPOs, health co-benefits can be used as a criterion for a unique project category that *a priori* could get a high priority score in the project assessment methodologies used by MPOs.

4. Likewise, using these tools, health co-benefits can be used as a criterion to screen projects for cost-benefit and other in-depth analysis. In some MPOs current practice is to screen projects based on cost, so that only high cost projects get quantitative assessment. This would allow projects with large health co-benefits to also get additional scrutiny in cost-benefit analyses.

5. Equity/inequity in RTPS is currently framed using title VI of the Civil Rights Act, concepts of "no disparate impacts" and "increase access (to affordable housing/transit) to poor people", participation of communities of concern, environmental justice. In the development of SCSs some MPOs have been exposed to a health-based approach which explicitly calls for ways to narrow existing differences in health status and of determinants of health. The Sustainable Transportation Council (LEED-like approach to rating transportation systems) is considering a goal area in its transportation rating system that explicitly considers reducing health disparities.[8] This is a promising approach that deserves more attention.

6. Local health departments are highly interested and would benefit from mechanisms that enhance their participation in SCS development and follow-up. We noted with interest that SANDAG has a standing Public Health Advisory Committee in which the San Diego County Health Department is a partner, and our staff was able to attend one of their meetings. National organizations like the Transportation Research Board have recently created standing health subcommittees with an expanded focus. It is worth exploring ways local health departments and others interested in public health and equity can stay engaged on an on-going basis.

   This is particularly germane to a multidisciplinary approach to address the multiple health issues and the complexity of health impacts. In this setting expertise could be leveraged to explore the potential consequences of different scenarios and SCSs in the context of health risks and benefits, addressing air quality, physical activity, access to health promoting resources (e.g., transportation, food, employment, education), noise, injuries, social networks, etc. for the regional population and vulnerable subgroups.

Mr. Hasan Ikhrata, Executive Director
Southern California Association of Governments
818 W. 7th Street 12th Floor
Los Angeles, California 90017-3435

RE: Draft FY 2012 RTP/SCS AND DRAFT PEIR
SCH # 2011051018

Dear Mr. Ikhrata:

The California Department of Transportation (Department) wishes to thank the Southern California Association of Governments (SCAG) for the opportunity to review and comment on the Draft 2012 RTP/SCS and Draft PEIR. The Caltrans' review has found that the RTP/SCS has fulfilled all the requirements of the Caltrans' 2010 RTP Guidelines, pursuant to California Government Code Section 14522.

The Department commends SCAG for reaching out and engaging the State, regional, and local agencies and the public in extensive outreach efforts and for developing a comprehensive planning process that included Departmental staff on several committees.

The 2012 Draft RTP/SCS was distributed to the Department Divisions in Sacramento and Districts 7 (Los Angeles and Ventura Counties), 8 (San Bernardino and Riverside Counties), 11 (Imperial County) and 12 (Orange County). The offices within each Division and District were given the opportunity to review and comment on the document according to the California Regional Transportation Guidelines.

Caltrans compliments SCAG on developing strategies that will allow the region to not just meet but to actually exceed the GHG emission reduction goals mandated under SB 375. This Draft RTP/SCS is commendable for its broad vision, which, while recognizing mobility as a primary goal, also encompasses sustainability, the economy, employment, air quality, greenhouse gas (GHG) emission reduction, safety, public health, and integrated planning.

The Department offers the following comments for your consideration:

REGIONAL PLANNING

- Page 7 Table 2: **New Revenue Sources and Innovative Financing Strategies** – The region's budget over the next 25 years totals an estimated $524.7 billion. We encourage SCAG to continue close collaboration and consensus-building with Federal, State and Local partners as these strategies and funding sources are pursued.

- Page 27 **Integrating Land Use and Transportation** – The RTP/SCS states that SCAG has incorporated the sub-regional SCS strategies of OCCOG and GCCOG into the regional SCS. It would be helpful if the RTP explained exactly how those strategies were incorporated. .

- Page 30 **Public Health** – The RTP/SCS recognizes the impact that transportation and land-use decisions have on the health of the region's residents. SCAG should be commended for including studies and a discussion on this topic in the RTP/SCS which identifies a 200% overall investment increase over the 2008 RTP.

- Pages 33-34 **Alternatives Development and Evaluation** – The chosen alternative should be clearly identified in the RTP, with supporting information explaining the rationale for its selection.

- Pages 112-116 **Creation of Land Use Scenarios** – Chapter 4 explains and describes the four land use scenarios that were developed and presented at the regional public workshops for inclusion in the RTP/SCS however it is not clear how the preferred alternative was chosen.

SYSTEM PLANNING/GOODS MOVEMENT

- Page 23 - **Aviation and Ground Access** - the second paragraph alludes to air cargo by stating that "Southern California airports play a crucial role in international trade..," but the text does not elaborate. If the regional roadway system becomes increasingly congested please describe the impacts to air cargo ground access or capacity, being that the last mile is typically transported by truck.

- Page 65 - **International Trade** - recommend changing the sentence to read, "In the same year, $10.4 billion worth of trade passed through the Calexico East International Port of Entry (POE) between the U.S. and Mexico in Imperial County." Note: of the three land POE's in the county, only Calexico East handles commercial traffic.

- Page 65 - **Local Goods Movement** - Dependent Industry Support - recommend adding agriculture as one of the supported industry sectors. Agricultural production in the SCAG region is significant, amounting to nearly $7 billion in 2010. http://www.cfbf.com/counties/index.cfm

- Page 66 - **Land Ports** - recommend changing the sentence to read, "The Calexico East International POE in Imperial County is the sixth busiest commercial crossing along the U.S./Mexico border, with over 600,000 annual commercial vehicle crossings in 2010, and a

combined import/export value of over $10 billion. The primary economic drivers of cross border trade to Imperial County are the movement of agricultural products and the maquiladora trade industry."

- Pages 71 and 72. **Regional Clean Freight Corridor System**. The discussion indicates that a dedicated truck-only freight corridor could serve as a "platform for the introduction and adoption of zero-emission technologies;" however, the connections between the East-West Freight Corridor and clean trucks could be stronger, and the introduction of clean trucks could be related to the timeframe in Table 2.8 (page 72).

TRANSIT

- Trip Planners: Please consider incorporating future updates of transit route data in trip planning tools such as *Google Transit* or *Go511.com.*

- Page 3 - the following sentence needs to be corrected: "Currently, SCRRA operates seven routes including five from downtown Los Angeles to Ventura, Lancaster, San Bernardino, Riverside, Orange and Oceanside, from San Bernardino to Oceanside, and from Riverside via Fullerton or City of Industry to downtown Los Angeles." The word in this sentence "five" should read "six" instead. One route is missing in the list. Please add "Orange" after Riverside.

- Page 31- Connectivity measures need to include a high degree of reliability (on-time performance to meet connections with other modes).

- The transit supplemental report should include how gas prices affect the fares and ridership. Gas price is a major operating expense in bus operations. It should also include such variables as inflation rate, CPI, unemployment rate, to see how they are related to fares and ridership.

SUSTAINABLE COMMUNITY STRATEGY (SCS)

- It should be noted that Caltrans has not done an analysis of the transportation travel model work utilized with the SCS. We would expect the California Air Resources Board to make any comments on that topic: http://www.arb.ca.gov/research/aaqs/aaqs2.pdf

- In order to see the Greenhouse Gas (GHG) emission reduction compliance table for the SCAG RTP/SCS, the reader has to find it on page 3.6-20 of the PEIR. This data table should be included in the SCS Section of the RTP as well as in the PEIR.

- Caltrans supports SCAG's RTP/SCS mitigation measures aiming at reducing VMT and the associated GHG emissions, encouraging sustainable land use development, and the development and implementation of the use of multi-modal transportation options.

- As the owner and operator of the State Highway System (SHS) the Department's main objective is to

protect the mobility and operational safety of the SHS. To ensure operational safety and consistency with the Department's policies, we encourage early consultation and coordination with local jurisdictions and project proponents on all development projects that may have an impact on state facilities.

- To encourage collaboration among all stakeholders we recommend the following comment to be incorporated in the policies of the Transportation, Traffic, and Security Mitigation Measures:

  Local jurisdictions and development project proponents should and are encouraged to coordinate and consult early with the Caltrans District Planning offices of Local Development Intergovernmental Review on any land use proposal that would be located within 500 feet of state transportation facilities to enable consideration of the site specific access and operational safety impacts.

PROJECT LIST

- On the Project List for Orange County there is no mention of extending the planned High Occupancy Vehicle (HOV) lane from Avenida Pico to the Orange/San Diego County Line in both directions.

- Project List for Los Angeles County - on page 157 the Route High Occupancy Vehicle (HOV) project, Citrus to Route 57/210, it should be noted that the portion of Route 210 between Route 10 and Route 210 has been re-named Route 57. This was done to address confusion between Interstate 210 west of Route 57 and State Route 210 east of Route 57. New signage has been recently added.

- Also on the Project List for Los Angeles County - please delete the following project on page 161: Route 405 in Inglewood at Arbor Vitae which is pertaining to constructing the south half of the interchange. The Interstate 405 Arbor Vitae Half Interchange Project in Inglewood has been shelved per FHWA due to a required design exception issue.

HIGHWAYS AND ARTERIALS

- Page 15 - Caltrans encourages SCAG to coordinate with Caltrans Districts and regional partners to ensure consistency with interregional system development and operational strategies. Examples could include project phasing and integration, the development of HOV/HOT /Managed Lane policies, and the alignment of on-system transit service support strategies.

- Page 3 - under OR SR-71 should read SR-73 and where it says SB SR-210 should be I-210.

GENERAL COMMENTS

SB 391 and the California Interregional Blueprint should be mentioned among related initiatives.

COMMENTS ON THE DRAFT PEIR

- Page 3.2-5 – "USEPA also extracted a subset of these 21 MSAT compounds that it now labels as the six priority MSATs: benzene, formaldehyde, acetaldehyde, diesel particulate matter/diesel exhaust organic gases, acrolein, and 1,3-butadiene." We recommend mentioning Naphthalene and Polycyclic Organic Matter (POM), and updating the text to reflect the additional air toxins. Furthermore, state that until the Air Resource Board develops the speciation factors for Naphthalene and POM, an analysis cannot be performed.

- (Pg) 3.2-10 -TABLE 3.2-1: **STATE AND NATIONAL AMBIENT AIR QUALITY STANDARDS** - Vinyl Chloride for the state standard (24 hour) has been changed from 0.03 ppm (42 ug/m3) to 0.01 ppm (26 ug/m3). We recommend using the table published by the California Air Resources Board (CARB) located at: http://www.arb.ca.gov/research/aaqs/aaqs2.pdf

Caltrans commends SCAG for considering some of the health risks associated with the RTP. The Health Risk Assessment in Appendix J only analyzed emissions, cancer risk impacts associated with Air Quality, and was only focused on several corridors in the region. Caltrans recommends that Health Risk/Impacts should first be addressed at the policy level and analyze the potential health risks associated with Air Quality, Noise, Hazardous Waste and Community Impacts for the complete RTP, considering all the projects included in the plan.

In an effort to be more efficient and minimize confusion in the future, Caltrans requests that SCAG only forward the PEIR to the following two locations:

California Department of Transportation
Division of Planning - Office of Community Planning
Local Development - Intergovernmental Review
P.O. Box 942874, M.S. 32
Sacramento, CA 94274-0001
Attention: Terri Pencovic, Statewide Program Manager

California Department of Transportation
District 7 - Office of Regional Planning IGR/CEQA Branch
100 S. Main Street, M.S. 16
Los Angeles, CA 90012
Attention: DiAnna Watson, IGR/CEQA Branch Chief

District 7 will be responsible for circulating the PEIR document and coordinating comments on behalf of the California Department of Transportation.

If you should have any questions in regard to the above comments, please do not hesitate to contact Melissa Joshi of my staff at (213) 897-1347.

Sincerely,

JAMES J. McCARTHY
Deputy District Director
Division of Planning, Public Transportation and
Local Assistance

Re: Railroad comments on *Draft 2012 Regional Transportation Plan and Sustainable Communities Strategy*

Dear Mr. Ikhrata:

On behalf of Union Pacific Railroad (UP), BNSF Railway (BNSF), and the Association of American Railroads (AAR), collectively "the Railroads", we want to thank the Southern California Association of Governments (SCAG) for the opportunity to comment on the draft Regional Transportation Plan (RTP) and Sustainable Communities Strategy (SCS). The Railroads look forward to continuing to work with SCAG staff as it refines the 2012 RTP in the coming months. The Railroads comments are organized by the various documents in the 2012 RTP: the draft 2012 RTP, the Environmental Justice appendix, the Goods Movement appendix, the Project List appendix, and the Passenger Rail appendix. Each comment follows a quote from these documents (in *italics*). In some instances comments apply to multiple sections. Additionally, the Railroads have submitted a second comment letter on the draft PEIR.

These comments should not be construed as the Railroads' agreement or a validation of the RTP, SCS, or other long term planning conclusions. The Railroads provide these comments in an effort to make SCAG's analyses more reflective of actual railroad operational and business needs. However, because railroad operations often change due to circumstances beyond their control and/or to better serve their customers' needs, it is critical that the Railroads preserve the flexibility to maintain fluid and responsive operations.

As an overall comment, many sections of the current draft RTP identify possible elements of the strategy without providing consistent information about: (1) who would fund each measure, (2) under what authority each measure would be undertaken, and (3) in what timeframe each measure would be implemented. The Railroads believe it is important to furnish that information so that all stakeholders get an accurate perspective of the overall plan (See Table 1 below). At a minimum, the RTP should note that these issues are unresolved.

Table 1: Possible Program Elements Requiring More Specificity

Program Element (Page #)	Implementing agency identified?	Funding identified?	Timeframe identified?	Authority to implement identified?
Further study/demonstration of electrification (Page 201 RTP)	No	No	No	No
Upgrading switcher locomotives (Page 74 RTP)	No	No	No	No
Phased implementation of a "near-zero or zero emission freight system" (Page 74 RTP)	No	No	Yes (see comments below)	No
Recommended mitigation for rail related impacts (Page 148 Environmental Justice appendix)	No	No	No	No
2012 RTP proposes electrification (Page 145 Environmental Justice appendix)	No	No	No	No

Comments on the draft 2012 RTP/SCS

The draft 2012 RTP proposes a goods movement environmental strategy that includes, "a two-pronged approach for achieving an efficient freight system that reduces environmental impacts."[1] These strategies include a number of "zero or near-zero"[2] emission rail technologies that require varying degrees of additional research and development. Thus far, SCAG has failed to clearly identify the multitude of issues associated with these potential technologies. The Railroads believe SCAG has not answered the Railroads' questions submitted in September 2011 concerning basic operational requirements.[3]

Page 201 RTP (also on Page 21 of Passenger Rail appendix):

> *Freight rail activity emits five percent of regional NOx, and four percent of regional PM goods movement emissions. Mitigation of rail emissions is currently underway with agreement to upgrade engine and reduce idling at certain rail yards, but more must be done to improve regional air quality, help meet federal requirements and reduce health impacts for communities near rail activity. There are several options for a zero emission rail system including electrification, battery-hybrid systems and fuel cells. Since 2008, SCAG has worked carefully with representatives from major rail lines, the AQMD and the ARB to carefully evaluate potential zero emissions options for freight rail. In particular, three forms of electrification were analyzed in great detail.*
>
> - *Electric catenary rail systems – These are perhaps the most technologically ready, however, construction for an electrified rail system in Southern California would be a major undertaking in terms of labor, timeline, and cost for the SCAG region, and would require large public investment as well as cooperation and investment by the BNSF and UP railways.*
> - *Dual mode locomotives – These are also under development and have the ability to operate both, on a catenary, or with traditional diesel power. The ability to operate in both modes could potentially reduce operational difficulties associated with electrification and would save time, reducing the need to remove the engine at the end of the electrified system.*
> - *Linear synchronous motors – This technology propels rail cars by creating an electromagnetic field from motors embedded in the railway. One advantage of LSM is that overhead electric lines would not be needed allowing the electric rail system to*

[1] SCAG, draft 2012 RTP/SCS, page 74, December 2011.
[2] The railroads question the use of "zero or near-zero" terminology. The technologies discussed to date at best address tailpipe emissions and not total emissions. Electrification technologies merely export emissions to other areas.
[3] September 16, 2011 comment letter to SCAG on the Freight Rail Electrification Analysis; October 14, 2011 comment letter to SCAG on the *Environmental Mitigation Strategies Task 10.2 Report*

extend further into ports and rail yards. LSM technology is in its early stages and costs cannot be estimated, however demonstration projects are underway.

- *The 2012 RTP specifies further study of these technologies to resolve operational challenges and to better quantify the costs of implementation and potential savings or cost increases of eliminating diesel fuel. In addition, several other technologies such as hybrid diesel-electric locomotives and battery electric tender cars will be considered. We also suggest and plan to participate in regional efforts to develop prototypes and demonstration of these technologies. Please see the goods movement appendix of the RTP and the SCAG Rail Electrification Study for more information about these technologies and next steps for development and deployment.*

Rail Comment: The RTP does not clearly state the issues that remain unresolved with these technologies. For example, SCAG needs to clarify if funds for such studies are already available. If not, the RTP should make clear that participation in further study and possible demonstration of these technologies will only be undertaken if funds become available for such activities in the future. SCAG should also clarify that these actions must be voluntarily undertaken by all stakeholders. Neither SCAG, nor other local, regional, and state agencies have the authority to require the Railroads to participate in or to provide funds for any study of electrification or any other technology. SCAG should also clarify that the "several options for a zero emission rail system" are not currently available, but could be pursued in the future if additional funding, research, development, and testing to confirm their applicability were completed. SCAG needs to clearly specify a timeframe for the continued study of these technologies. Lastly, the Railroads question why the recommendations on freight rail environmental mitigation are repeated in the passenger rail section of the RTP.

Catenary Electric

The Draft RTP identifies electric catenary lines, dual mode locomotives, and linear synchronous motors (LSM) as potential technologies for future study. Even though electric catenary systems are the most proven of the technologies identified by SCAG, there are unresolved, major operational concerns with a catenary system, in addition to the labor, cost, and timing issues noted in the draft RTP. Catenary electrification would fragment the national goods movement system and would require a major expansion of railyards at any intermediate, locomotive exchange points. At several such locations, no adjacent land is available for such an expansion. Exchanging locomotives would also result in significant, nation-wide delays in the goods movement system. (For more information on timing and operational issues with an electric catenary system, please see the two issue briefs, entitled *Timeline for Freight Rail Electrification in Southern California* and *Defining the Scope of an Electrified Freight Rail Project in Southern California,* which are attached.)

Dual Mode Locomotives

As the Railroads have discussed at various technical working groups with SCAG, there are no existing dual mode locomotives for freight rail operations that could meet the U.S EPA's Tier 4 emissions standards, and there may never be such locomotives due to operational size limitations. Thus the above statement in the draft document "*Dual mode locomotives – These are also under development…"* is misleading to readers.

Even if a dual mode locomotive could be built to meet the required size and emissions limitations, locomotive exchange points would have to be constructed throughout the SCAG region. In some instances there is insufficient land available and in all instances these exchange points would make the Los Angeles freight system less competitive, due to the additional delays and costs of equipment change outs.

Additionally, one diesel locomotive would still be needed at the locomotive exchange points for every dual mode locomotive in order to meet the needs of the national goods movement system. For additional information on dual mode locomotives, please see the attached issue brief, entitled *Dual Mode Freight Locomotives*.

Linear Synchronous Motors (LSM)

Given the uncertainties about whether LSM technology can provide sufficient traction to safely move a 10,000 ton train up and down grades, and given the additional costs attributable to the extra lifts of containers necessitated by an LSM-enabled guideway, even some of the strongest proponents of the LSM technology do not believe this technology could ever be a systems-level propulsion technology for all or most rail-based container movements. This technology has never been proven in a rail application. Whether and how an LSM technology could pull a 10,000 ton train from sea level to an elevation of 3,800 feet on a 1.5-2.5 % grade, as well as provide adequate braking for such a train on a 2-3% grade moving in the other direction, are unanswered questions which present fundamental safety concerns. These are major questions still unanswered by both the potential LSM manufacturers (no systems are in operation today) and SCAG. As SCAG notes in Table 1.1 on page 13 of the Goods Movement Appendix, one of the goals of the RTP is to, "Ensure travel safety and reliability for all people and goods in the region,"[4] The Railroads believe that pursuing these technologies prematurely will have the opposite effect.

In a previous submission to SCAG[5], the Railroads outlined other questions which remain unanswered:

[4] SCAG, draft 2012 RTP/SCS, Goods Movement appendix, page 12, Table 1.1, December 2011.
[5] September 16, 2011 comment letter to SCAG on the Freight Rail Electrification Analysis

- Has SCAG obtained any engineering plans from General Atomics or another LSM proponent that describe the LSM cars with any level of specificity?
- Does SCAG assume that the Railroads' mainline tracks could handle LSM trains as well as conventional rail traffic, including Amtrak and Southern California Regional Rail Authority (Metrolink) passenger trains?
- Would railcars need to be retrofitted with LSM reactor plates? Rail cars have a diversity of ownership. How will the railcar retrofits be conducted and coordinated across owners? Does SCAG anticipate that all railcars, nationally, would be retrofitted with these plates? If not, how could rail carriers be assured that all railcars destined for Southern California are equipped with the requisite technology?
- How will the Right-of-Way be maintained (for undercutting, surfacing, alignment, etc.) if motors and/or magnets are attached to the ties or between the rails?
- How would the need for, the consequences of, and the costs of locomotive exchange points be addressed, if at all, with an LSM system? What are the embedded assumptions about the operational impacts of the time required to switch LSM helper-cars in or out of a transcontinental train?
- Have prospective LSM manufacturers suggested how they would install magnets or motors at switch points in between tracks (e.g. from a mainline to a spur)?

Page 74 RTP:

For the near-term, the regional strategy supports the deployment of commercially-available, low-emission trucks and locomotives while centering on continued investment into improved system efficiencies. For example, upgrading switcher locomotive engines could reduce 1 to 3 percent of regional rail emissions.

Rail Comment: As noted in Table 1, SCAG needs to clarify which stakeholder(s) would pursue this strategy and where funding would come from. SCAG needs to be clear that upgrading switcher locomotive engines is not in the resource-constrained plan and will only be pursued if stakeholders identify funds. Any participation by the Railroads to upgrade switcher engines would be voluntary. The Railroads believe that neither SCAG, nor any local or regional agencies, have the authority to require the Railroads to deploy newer switcher locomotives.

Furthermore, the Railroads have made significant environmental investments in the SCAG region over the last decade or more. The progress made over the years has been documented by the Air Resources Board (ARB) in numerous public meetings. For example, in 2005, the

Railroads signed a MOU with ARB that was estimated to reduce PM emissions by 20% by 2008 at rail yards statewide. In 2009, ARB determined that the Railroads had fully complied with all requirements of the 2005 MOU. In 2010, the 1998 Fleet Average Agreement was implemented. ARB has said that the 1998 Fleet Average provided "locomotive fleet benefits in southern California 20 years earlier than the rest of the country."[6]

Page 74 RTP:

In the longer term, the strategy focuses on a more fundamental shift in technology – taking critical steps toward gradual implementation of a zero-emission or near zero-emission freight system.

Rail Comment: As the Railroads work with other stakeholders to further reduce rail emissions in the SCAG region, it is important that any technology introduced does not compromise the safety, velocity, cargo throughput, economic competitiveness, or reliability of the goods movement system. It would be helpful to point out that to date, stakeholders have not reached consensus on technologies, timing, funding, or emissions impacts of the various options SCAG examined in the RTP. Prior to proposing a fundamental shift in implementing new technology, SCAG and all goods movement stakeholders need to clearly establish if and where within the existing rail system, such "*critical steps toward gradual implementation of a zero-emission or near zero-emission freight system"* could be implemented.

Page 75 RTP:

*As summarized in Table 2.11, the zero-emission East-West Freight Corridor would eliminate 4.7 tons of NOx, 0.16 tons of $PM_{2.5}$, and 4,000 tons of CO_2 emissions daily. Full electrification of the rail system, though still a concept at this point, would remove comparable amounts of NOx, $PM_{2.5}$, and CO_2. *Rail electrification is shown here for illustrative purposes only. Further research and development is required to determine if this is a reasonable option for implementation.*

Rail Comment: SCAG should clarify the methodology used to estimate emissions reductions from an electrified system. SCAG needs to explain how it accounted for the additional emissions produced as a result of the electricity required for such a system and if it has not accounted for them, SCAG should do so in the final version of the RTP. These emissions have real environmental impacts and should be addressed in any reference to

[6] California Air Resources Board, *Statewide Strategies to Reduce Locomotive and Associated Rail Yard Emissions,* December 2006. http://www.arb.ca.gov/msprog/offroad/loco/121406ryloco_strtgy.pdf

electrification of a freight rail system or the associated emission reductions. Please refer to the attached issue briefs for more information on electrification.

Page 70 RTP:

In past RTPs, SCAG has envisioned a system of truck-only lanes extending from the San Pedro Bay Ports to downtown Los Angeles along the I-710, connecting to an east-west segment, and finally reaching the I-15 in San Bernardino County…The East-West Freight Corridor would carry between 58,000 and 70,000 trucks per day – trucks that would be removed from adjacent general purpose lands and local arterial roads.

Rail Comment: One of the alternatives of the East-West Freight Corridor for trucks is proposed to be directly adjacent to a UP mainline track. As UP has stated in discussions with SCAG staff, although off of UP privately-owned right-of-way, construction of such corridor could limit future opportunities for businesses to become rail served.

Comments on Environmental Justice Appendix

The Railroads' comments on the Environmental Justice appendix are organized according to the following primary issues:

- Unequal characterization between rail and highway impacts
- Different methods of evaluating rail impacts and highway impacts
- Inconsistencies with the rest of the RTP

While the Railroads understand the need to assess the impacts of the RTP/SCS on communities across the region, SCAG's approach to this analysis with respect to rail is flawed and misleading in several respects. SCAG's treatment of rail-related impacts in the Environmental Justice appendix implies that rail operations are a very significant contributor to air quality impacts in the region.

While SCAG does not explicitly compare highway impacts to rail impacts, the tone and context with which SCAG presents rail-related impacts could leave the reader with the misimpression that rail impacts are equal to, or more severe than, the impacts from highways and other mobile sources. This theme is unfortunately repeated elsewhere in the Environmental Justice appendix, as exemplified in Table 2, below. Of the greatest concern is the drastic difference between the information presented in Exhibit 26, a map which shows modeled regional cancer risk, and Exhibit 34, a map which purports to show the health impacts related to rail lines, while only displaying regional cancer risk data and a map overlay of rail lines.

Table 2: Comparison of evaluation of impacts of rail versus impacts of highway and arterials

	Buffer for demographic analysis	**Compares baseline vs. plan scenarios?**	**Overlays cancer risk with source?**	**Identifies changes in pollutant exposure?**
Highway Impacts Section	* Areas within 500 feet of major corridors * Roads with daily trips >100,000; rural roads w/ daily trips >50,000	Yes	No - mapped region-wide only.	"Similar to the results of the regional emission analysis…the 2012 RTP/SCS will reduce both CO and PM for most places along the freeway adjacent areas…" Pg. 122
Rail Impacts Section	* Areas within various distance of any rail line or rail facility: *1/4 mile; 1/2 mile; 1 mile; 2 miles (grade separations only)	No	Yes	No discussion

The Railroads would like to understand how SCAG intends to harmonize the Environmental Justice appendix with the draft RTP to resolve the inconsistencies between the two. Specifically:

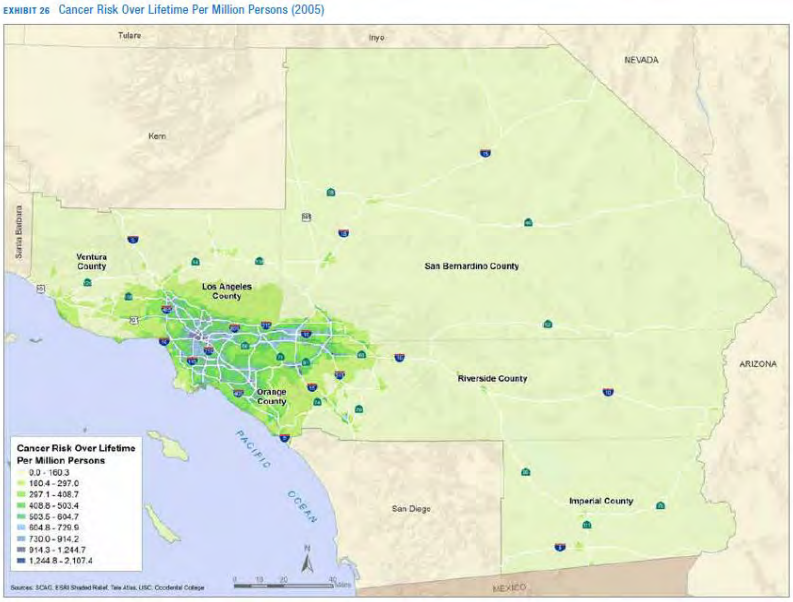
1) Why does SCAG conduct the evaluation of environmental impacts from rail so differently than its evaluation of impacts from roadways?
    a. Why do the buffer distances differ?
    b. Why does SCAG evaluate baseline versus plan scenarios for the road and highway portions of the RTP, but not for rail?
    c. Why does SCAG state that rail operations result in significant emissions while failing to quantify emissions from either rail or highways in the appendix?
    d. Why does SCAG present a map of the regional cancer risk levels co-located with rail lines, without presenting the parallel display of cancer risk levels co-located with highways and arterials?
2) How will SCAG resolve the inconsistency between the recommended environmental mitigations in the RTP, Goods Movement appendix, Environmental Justice appendix, and PEIR?

a. Will any of the recommended mitigation options in the Environmental Justice Appendix be placed in the Goods Movement appendix or main document of the RTP?
b. Are any of the mitigation recommendations in the Environmental Justice appendix in the resource constrained plan or strategic plan of the RTP?
    i. If so, how will they be paid for?
    ii. If so, how does SCAG plan to implement them?

Unequal characterization between rail and highway impacts

Page 136 Environmental Justice appendix:

> *Exhibit 34 illustrates areas adjacent to railroads overlaid with areas of high cancer risk. As shown in the maps below, a large portion of areas adjacent to railroads [are] similar to areas of high cancer risk. These observations suggest that emissions from locomotives, rail yard and other rail facilities could result in an increased cancer risk in the neighboring low-income and minority communities.* (See referenced Exhibit 34 further below)
>
> **Rail comment:** Both Exhibit 34 and SCAG's conclusion referencing it are fundamentally flawed; the conclusions presented are unfounded and SCAG does not provide supporting factual data.
>
> First, SCAG does not clearly define how the cancer risk shown on the map was determined, what emissions or other environmental factors the map is intended to reflect, or what sources (e.g. mobile or stationary or other) the cancer risk derives from. They list as the source for the map, "SCAG, ESRI shaded relief, train atlas." This reference does not provide any information that would shed light on the critical assumptions that go into creating this analysis. ESRI is a GIS software developer, and therefore provides no information on the data inputs themselves. Additionally, the data presented in the environmental justice section is not consistent with, or supported by, any data in the PEIR's Health Risk Assessment, which only modeled certain representative highway segments and did not model rail.
>
> Second, SCAG vaguely describes this map as an "overlay." If the data reflecting the areas of high cancer risk on the map in Exhibit 34 is the same data used to generate the regional cancer risk map in Exhibit 26, then the cancer risk was generated at the regional level, and is therefore not directly attributable to rail emissions. The map in Exhibit 34 illustrates the co-location of rail lines in areas where there are elevated cancer risks as a result of multiple sources of air pollution: it does not provide any data to show correlation or causation between rail lines, specifically, and cancer risk in the area. Additionally, the exhibit is misleadingly titled "Rail-related health risk impacts" when it presents regional data that is not based on rail emissions.



The major highways and arterials traversing the SCAG region cover the same areas where there are confluences of rail lines. The map presented in Exhibit 26 shows that the network of highways is co-located with the geographic area that is identified as having the highest cancer risk, but it does not emphasize the highways in the same manner that Exhibit 34 emphasizes rail lines. By overlaying the rail lines on the map in Exhibit 34 with a 1-mile buffer and then including the statement that "emissions from locomotives, rail yards and other rail facilities could result in an increased cancer risk in the neighboring low income and minority communities," SCAG unfairly points to the potential impacts of rail, while failing to provide a comparable evaluation of the impacts from highways and arterials. All sources need to be treated with equal attention and assigned fair attribution.

For comparison, Exhibit 34 on page 137 and Exhibit 26 on page 104 of the Environmental Justice appendix are presented below. Both Exhibit 26 and Exhibit 34 appear to be derived from similar data for regional cancer risk, however they are displayed with very troubling differences. Whereas Exhibit 26 is presented in the more neutral colors of greens and blues, Exhibit 34 is in reds and purples, strengthening the intensity of the message about the negative health impacts of rail. Secondly, the two maps have different scales: Exhibit 26 is 40 miles-per-inch, and Exhibit 34 is 20 miles-per-inch. This makes the area of high cancer risk appear twice as large on the rail map as it does on the region-wide map. Finally, while the highway system appears on both maps, it is overpowered by the bright purple rail lines on Exhibit 34, making the highways barely noticeable. All of these factors leave the reader with the impression that rail causes more severe impacts than highways in the region, even though this conclusion is not supported by the data that SCAG presents. SCAG does not include a similar map highlighting the areas within 500-feet of a highway, to show corollary "highway related health risk impacts." In fact, rail is the only source for which SCAG chose to do a map overlay of this type.

Figure 1: Exhibit 34 from SCAG EJ Appendix

Figure 2: Exhibit 26 from SCAG EJ Appendix

SCAG must either remove Exhibit 34 and misleading discussion language, or substantially revise it and provide the source data. If SCAG decides to keep Exhibit 34, it must present identical maps and analyses for arterials, highways, and other transportation sources discussed in the plan, such as airports. Further, SCAG should ensure that maps for each

source are presented in the same manner: at the same scale, with the same color scheme, and utilizing the same buffer distances.

While SCAG's maps demonstrate co-location of rail lines and highways or arterials with areas of regionally high cancer risk, it is crucial to point out that proximity does not equal risk. SCAG's presentation of a map which overlays the rail lines on top of a separately generated, regional cancer risk map to support observations about increased risk makes an inaccurate assumption that proximity to one source is equivalent to risk of exposure. Mere proximity to a source should not be used as a determinant for exposure in risk assessment analysis because it fails to identify the chemicals involved, the dose of exposure (including the dispersion of pollutants), the duration of the exposure, or the toxicity of the chemicals in question. SCAG should: (1) either remove the map entirely or (2) revise the maps as requested above and, in addition, revise the statements on page 136 of the Environmental Justice appendix as suggested below:

> *Exhibit 34 illustrates areas adjacent to railroads overlaid with the modeled regional cancer risk from all sources ~~areas of high cancer risk~~. As shown in the maps below, a large portion of areas adjacent to railroads are co-located in ~~to~~ areas of existing high regional cancer risk. ~~These observations suggest that emissions from locomotives, rail yard and other rail facilities could result in an increased cancer risk in the neighboring low-income and minority communities.~~*

Furthermore, it should be noted that the Railroads, as well as other sources, have made significant improvements to their equipment and operations since 2005, the data year for the regional cancer risk map.[7]

Different methods in evaluating rail impacts and highway impacts

Rail comment: SCAG rail impacts and highway impacts are handled differently by SCAG, both in discussion text and in how tables and figures are organized and displayed.

First, when analyzing the data on potentially impacted areas, SCAG uses shorter distances to create the geographic buffers around the highways and arterials than it does around the rail lines . Although the railroads do not endorse a particular buffer for demographic analysis, we believe the areas chosen by SCAG are unreasonably arbitrary. This arbitrary selection affects not only the evaluation of local impacts from rail, but also the assessment of whether

[7] Six years of progress has been made and documented by the Air Resources Board (ARB) in numerous public meetings. For example, in 2005, the Railroads signed a MOU with ARB estimated to reduce PM emissions by 20% by 2008 at rail yards statewide. In 2009, ARB determined that the Railroads had fully complied with all requirements of the 2005 MOU. In 2010, the 1998 fleet average agreement was implemented and is estimated to reduce NOx by 67% from uncontrolled levels. ARB staff estimates that the railroads have reduced emissions at rail yards statewide by 50% since 2008.

the impacted communities are in fact environmental justice communities. We would like to see more information on how SCAG reached its conclusions that rail disproportionately impacts environmental justice communities versus non-environmental justice communities. SCAG does not show a rational basis for these conclusions.

The analysis buffer for highways is 500 feet, but the analysis buffer for rail lines is ¼ mile, ½ mile, and 1 mile. SCAG uses buffers to evaluate demographic trends or potential environmental justice areas (Table 47 on pages 134-35), and to generate the map for geographic overlay with regional cancer risk. SCAG does not provide any justification for the difference between the buffer distances around rail versus highways and arterials used in the analyses. ARB's Land Use Handbook cautions against locating sensitive land uses within 500 feet of a freeway, or 1000 feet of a rail yard (roughly .2 miles), and does not include recommendations for rail lines. SCAG should either justify the difference between the buffers or make them the same.

In the discussion of highway and arterial impacts, SCAG compares the impacts from on-road sources as a result of implementing the RTP to the impacts of a no-plan scenario. However, this comparison is not completed for rail impacts.

The approach SCAG staff took in characterizing the "Rail-Related Impacts" creates the potential for an inaccurate interpretation of rail's contribution to the region's air quality. For example, on page 136, SCAG states, "these observations suggest that emissions from locomotives, rail yard and other rail facilities could result in an increased cancer risk in the neighboring low-income and minority communities." However, in the section on highway and arterial impacts, SCAG does not discuss the potential for increased cancer risk from freeway emissions, but notes in the *regional section* that areas of high cancer risk are located near freeways (page 96). Additionally, in the introduction to the rail-related impacts section, SCAG states, "these observations suggest that rail-related environmental burdens, such as air pollution and noise from locomotives, rail yard and other rail facility, are relatively higher to low-income and minority communities than regional average" (page 131), but SCAG does not quantify the emissions generated by rail anywhere in the Environmental Justice appendix.

Further, although SCAG broadly states that rail emissions are significant on page 131 of the Environmental Justice Appendix, SCAG does not quantify actual emissions. Quantification of rail emissions and the comparison between the emissions from trucks on highways and rail emissions in the region is critical to understanding freight transportation tradeoffs, the context under which investments in rail are made, and the potential shifts between transportation modes. One train can carry enough cargo to take 280 trucks off the road, and rail is three or more times as efficient as trucks on a ton-per-mile basis. Therefore increased rail traffic can decrease overall emissions for communities in the region.

Inconsistencies with the rest of the RTP

The Environmental Justice appendix includes a set of environmental strategies for freight rail, called the "Recommended Mitigation for Rail Related Impacts," that is completely different from that which is presented in the rest of the RTP. It is unclear who would implement these strategies, where the funds would come from, in what timeframe these mitigation measures would be pursued, and under what authority. SCAG does not state if any of these mitigation measures are a part of the resource-constrained plan or the strategic plan. Additionally, these strategies are not consistent with the strategies outlined in the RTP or the Goods Movement appendix.

Table 3: Comparison of mitigation measures in EJ appendix as compared to the Draft RTP

***Recommended Mitigation for Rail Related Impacts,* Environmental Justice appendix (Page 148)**	***Goods Movement Environmental Strategy,* RTP (Page 74)**
• *Accelerated Introduction of Cleaner Line-Haul Units* • *Construct sound reducing barriers between noise sources and noise-sensitive land uses* • *Improve the acoustical insulation of dwelling units where setbacks and sound barriers do not sufficiently reduce noise* • *Implement, to the extent feasible and practicable, speed limits and limits on hours of operation of rail and transit systems, where such limits may reduce noise impacts.*	Near Term • *Upgrading switcher locomotive engines* • *Continued investments into improved system efficiencies* Long Term • *Critical steps toward phased implementation of a zero-emission or near zero-emission freight system*

Rail Comment: SCAG needs to clearly state whether the rail mitigation measures in the Environmental Justice appendix are a part of the resource-constrained plan or a part of the strategic plan. As stated earlier, SCAG also needs to clarify who would be responsible for pursuing these mitigation measures, where the funding would come from, in what timeframe the measures would be implemented, and under what authority. Neither SCAG nor other local, regional, or state agencies have the authority to require the Railroads to pursue any of these measures.

First, SCAG recommends the acceleration of cleaner line-haul locomotives. Tier 4 technology will not be commercially available until 2015, at the earliest. The development

of Tier 4 locomotives under the US EPA regulatory timeline is a significant challenge for locomotive and aftertreatment manufacturers. A revolutionary leap in both engine and aftertreatment technologies is required in order for line haul locomotives to meet Tier 4 emissions requirements. At this time, these new technologies are untested and unproven in line haul locomotive applications.

Historically, the development of new, effective locomotive technology has taken an average of about seven to eight years to achieve reliability goals (and some changes have taken more than a decade). However, the 2008 US EPA regulation (a technology-forcing regulation) allows locomotive manufacturers just six and a half years to conduct Tier 4 research and development, complete design and reliability field testing, and begin full-scale production. Since locomotive manufacturers are accomplishing a major technological change in an abbreviated timeframe, there are development risks associated with Tier 4 technology. These risks include the potential for in-use locomotive failures that would cause train delays and interruptions across the goods movement system. Therefore, the Railroads, while optimistic, are appropriately cautious at this time.

Second, the Environmental Justice appendix recommends the installation of sound barriers and acoustical insulation. The Railroads are not responsible for these improvements, nor can local jurisdictions require the Railroads to implement these measures. Again, SCAG needs to be clear about whether the RTP requires these measures to be implemented, or if they are only recommended actions for future consideration that do not currently have funding identified. SCAG also needs to clarify whether the installation of sound barriers would be on the Railroads' property and if there would be any potential for interruption to railroad operations.

Finally, in response to the recommended strategy to reduce speed or hours of operation, SCAG should note that the Railroads operate 24 hours a day, seven days a week. Limiting hours of operation would have nation-wide effects and could ultimately result in higher emissions in the SCAG region if containers were shifted to truck transport. Additionally, train speeds are dictated by track conditions and regulated by the Federal Railroad Administration[8] and therefore fall outside of the authority of SCAG. Accordingly, this strategy should be removed from the Environmental Justice appendix.

Page 145 Environmental Justice appendix:

Additionally, the 2012 RTP proposes railroad electrification, which would significantly reduce rail-related emissions throughout the region, and especially for in low-income and

[8] FRA's Track Safety Standards establish track structure and track geometry requirements for nine separate classes of track. They can be found at **49 CFR Part 213**, **(Sec. 213.9** and **Sec. 213.307**). See also http://www.fra.dot.gov/Pages/1234.shtml

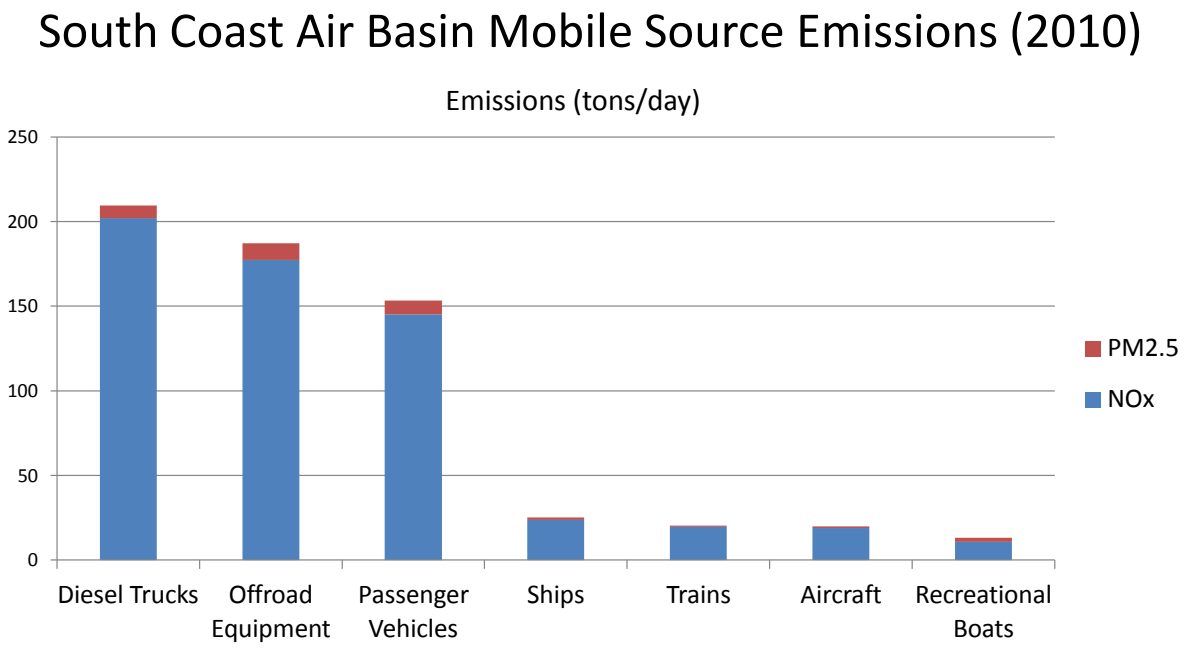
minority communities adjacent to railroads. Further study and demonstrations are needed to broadly deploy near zero and zero emission rail technologies that would significantly reduce environmental impacts from locomotives and rail-related facilities. Please refer to the Goods Movement Technical Appendix to review the 2012 RTP Goods Movement Environmental Strategy and Action Plan for Technology Advancement.

Rail comment: According to the Goods Movement appendix and the RTP, SCAG is not proposing to implement electrification, but rather to continue study of electrification and other ultra-low emission strategies in the future, if additional funds become available. Therefore, SCAG should remove the sentence that claims "the 2012 RTP proposes railroad electrification" and revise this section to be consistent with the Goods Movement appendix and the RTP. SCAG, and other local, regional and state agencies, do not have the authority to require the Railroads to pursue electrification. Additionally, please refer to the attached issue briefs for more information on electrification.

Page 131 Environmental Justice appendix:

Environmental pollution from locomotives, rail yards and other rail facilities is a major public health concern at the national, regional and community level. The movement of goods by rail involves diesel-powered locomotives and equipment, resulting in significant emissions of particulate matter (PM), nitrogen oxides (NOx), hydrocarbons, and other air toxins throughout the process.

Rail comment: SCAG does not specify what types of rail it is referring to in the impacts assessment. Is SCAG including freight and passenger rail? If passenger rail is included, are commuter lines and urban lines accounted for?



In 2010, ARB estimates locomotives contributed less than one percent of $PM_{2.5}$ emissions and less than three percent of NOx emissions in the South Coast Air Basin (see Figure 4 below). As a point of comparison, other mobile sources such as passenger vehicles, off-road equipment (e.g. farm and construction), and diesel trucks in the South Coast Air Basin contribute roughly 20%, 24%, and 27% of NOx, and 8%, 10%, and 7% of $PM_{2.5}$, respectively.[9] Despite this, SCAG portrays rail emissions as regionally significant in the Environmental Justice appendix.

Finally, the Railroads disagree with SCAG's statement that locomotive emissions are a national "major public health concern." The air quality and mix of emissions sources in the SCAG region are unique, and perhaps uniquely challenging due to the geographic and meteorological conditions. As SCAG notes, 33% of all freight containers in the U.S. move

[9] ARB - Almanac Emission Projection Data (Updated in 2009); Passenger Vehicles - LDV, LDT, LDT 2. Diesel Trucks - LHDV1, LHDV2, MHDV, HHDV

through the Southern California Ports.[10] Many of these goods travel on rail, and yet, rail is less than 3% of NOx and 1% of PM emissions in the South Coast Air Basin.

Figure 3: South Coast Air Basin Mobile Source Emissions (2010)

Page 145 Environmental Justice appendix:

The train traffic index of each railroad segment is calculated by using average daily train volume multiplied by daily total gate down time of two grade crossings located at both ends of the segment. The following map illustrates the train traffic index of railroad segments adjacent to the grade separation projects... As shown in the map below, San Bernardino County and Riverside County have higher train traffic index values than other counties. As

[10] SCAG, draft 2012 RTP/SCS, Goods Movement appendix, page 6, December 2011.

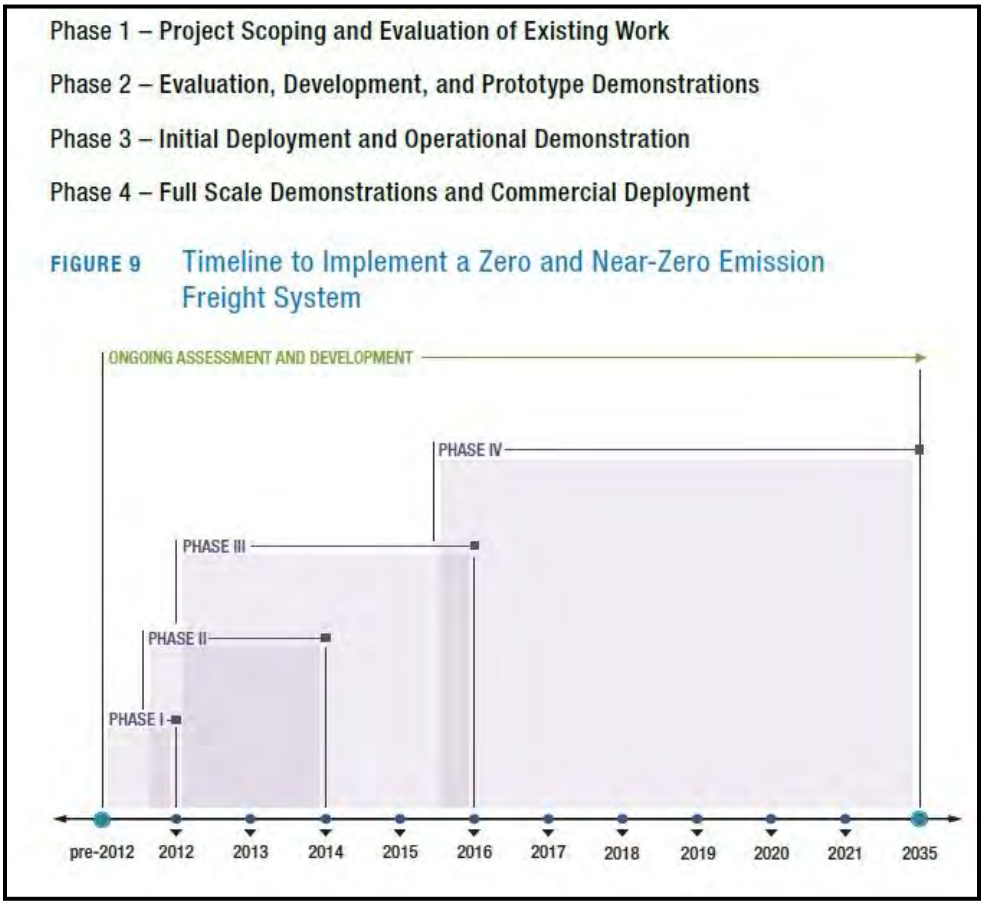
railroad emissions and noise are greater where there is a large amount of train traffic volume, these observations suggest that the rail-related environmental impacts could be greater in San Bernardino County and Riverside County than other counties. And, based upon the analysis of Environmental Justice categories above, the low-income and minority communities adjacent to railroads and grade-crossings in San Bernardino County and Riverside County can be more affected by rail-related impacts, such as emissions, noise, accidents, traffic delay, etc. than other population groups.

Figure 4: Exhibit 36 Train Traffic Index

Rail comment: SCAG uses the results of the train traffic index analysis to suggest the relative level of impact on different rail segments. Did SCAG include passenger trains in this index? SCAG should state whether the above map reflects both passenger rail and freight rail or just one or the other. SCAG's assertions about the correlation between "accidents" and "traffic delays" on such segments are purely speculative and should be noted as such.

Also, there should be a discussion of the planned improvements scheduled for these areas, through existing commitments for grade separations and capacity improvements, such as the Colton Crossing. In addition, SCAG fails to include a comparison of the improvements in train traffic index over the lifespan of the RTP. SCAG should clarify that the index provided is simply a snapshot in time for 2010. Given that Colton Crossing is a committed and funded project,[11] SCAG should show relative improvement gained through completion of Colton Crossing and other near-term grade separations.

[11] SCAG, draft 2012 RTP/SCS, Project List appendix, page 313, December 2011.



Furthermore, SCAG provides no information that the "total gate down time of two grade crossings located at both ends of the segments" has been correlated to traffic counts on the streets with the gates down. Without the traffic counts or the time of day data, SCAG can draw no conclusions about the correlation between gates being down and the impacts to human populations.

Comments on Goods Movement appendix

As pointed out earlier in this letter, participation of the Railroads and other stakeholders in any of the strategies identified by SCAG in the Goods Movement appendix must be a collaborative and voluntary process. Despite the best efforts of the SCAG staff, many of these strategies are vague and potentially misleading. For example, SCAG provides a specific timeframe for the study and demonstration of various ultra-low emission technologies presented in a way that appears to be applicable for all of the technology options. In fact, the stage of development for each technology varies widely. Likewise, the timeline for the development and demonstration of each technology will vary greatly. One size does not fit all. The approach that SCAG has laid out in the Goods Movement appendix is of little utility to the stakeholders involved in the SCAG region and should be revised substantially or even removed.

Page 34 Goods Movement appendix:

Figure 5: Timeline to Implement a Zero and Near-Zero Emission Freight System

Rail Comment: SCAG needs to be clear about which specific activities associated with the phases of development listed in Figure 9 are in the resource-constrained plan, which have funds currently available, and which activities do not have funds available. This will help clarify which activities will only be implemented when, and if, additional funds become available. If there is funding currently available, SCAG needs to state that it plans to carry out the timeline presented for the technology demonstration and potential implementation of new freight movement technologies. If not, it should point out that such a project could not be implemented until or unless funding becomes available. Additionally, it is worth noting that any full scale demonstration and/or commercial deployment would need the full support of the Railroads, and potentially other governmental agencies, to move forward. SCAG should also include a provision that the Railroads will be involved in the design of the parameters for a full-scale demonstration.

In Figure 9, it appears that Phase 1 is already complete and consisted of the work done to develop the draft 2012 RTP. If this is true, SCAG should clarify that point.

The timeframe for Phase 2 will vary substantially depending on which technology is studied further. Electric catenary systems present some serious operational, safety, and funding issues; however, these systems are better understood and appear to be more developed than the linear synchronous motor system or the hybrid locomotive with an advance battery/ tender car technology. SCAG should specify the technologies that would be evaluated in Phase 2 and provide specific timeframes for each. In any event, the timeframe identified by SCAG for Phase 2 is far too short for the evaluation, development, completion of the environmental review process and demonstration of an electrified system. For example, even demonstration of a catenary electric system would require the development of electric locomotives and the adaptation of those locomotives to western freight operations. Because most other ultra-low emission systems are only conceptual at this point, the timeframe for Phase 2 would be even longer.

The desired accomplishments in Phase 3 are unrealistic for the short time allocated. The timeline should be revised so that any deployment or operational demonstration would come after sufficient time has been allocated to resolve all technical, operational, and safety issues identified for the various low emission system options. As SCAG notes on page 35 of the Goods Movement appendix, past studies by the Ports of Los Angeles and Long Beach, *"highlight the difficult challenges associated with this sector, especially with regard to operational needs, integration of the technologies into the national rail system, federal safety requirements, and costs."*[12]

Additionally, the timeline for Phase 4 is unrealistic and should be lengthened to give adequate time for zero-emission technologies to mature and undergo sufficient testing. An inadequate or insufficient demonstration program or premature adoption could lead to serious disruptions to the national goods movement system. Please refer to the attached issue brief, entitled *Timeline for Freight Rail Electrification in Southern California* and the *Roadmap for Moving Forward with Zero Emission Technologies at the Ports of Long Beach and Los Angeles*[13] for more information on the timeline to implement an electrified freight rail system in Southern California.

[12] SCAG, draft 2012 RTP/SCS, Goods Movement appendix, page 35, December 2011.
[13] Port of Long Beach & Port of Los Angeles, "Roadmap for Moving Forward with Zero Emission Technologies at the Ports of Long Beach and Los Angeles" Technical Report, Updated August 2011. http://longbeach.granicus.com/MediaPlayer.php?view_id=18&clip_id=4942

Page 36 Goods Movement appendix:

Phase 2 also includes initial proof of concept and testing of several types of zero-emission locomotive technologies and supporting infrastructure. Demonstration would include technology optimization along prescribed routes under conditions applicable to goods movement activities. An initial step would entail creating a test track to allow for the demonstration of various technologies to move containers. For rail prototypes basic performance requirements include, but are not limited to: sufficient tractive power to haul a double-stacked railcar, adequate braking capability and other parameters to support safe operation, and the ability to operate in zero-emission mode.

For rail, uncertainties associated with new technologies would be addressed through a rail operational assessment study that evaluates the potential operational impacts of a zero or near zero-emission rail system both within the Basin and on the larger national freight railroad system. This study would build on the work of SCAG's Rail Electrification Study, 2011. Because overhead catenary systems have already been proven for passenger and some freight applications, this study would also evaluate the practicability of utilizing existing technologies for rail service in the South Coast Air Basin.

Rail Comment: SCAG should clarify under what circumstance this phase will be undertaken. The draft RTP implies that it would only take place if future funds are collected from the VMT tax, but it is unclear. If Phase 2 is undertaken, the Railroads believe that SCAG needs to explicitly outline on what right-of-way and for what purposes such a system could be deployed. Additionally, part of Phase 2 should include an evaluation to estimate the total capital and operating costs for such a system, how those costs might be passed through to customers, and if the magnitude of the costs might cause cargo to shift either between modes or to a different port.

Page 39 Goods Movement appendix:

Figure 6: Locomotive/Rail: Agency Major Implementation Actions

TABLE 16 Locomotive/Rail: Agency Major Implementation Actions

Year(s)	Agency	Agency Action
2012	SCAG	• Incorporate "footprint" and planning for wayside power into expansion of rail lines in financially constrained 2012 RTP • Incorporate funding to support rail evaluation and demonstration efforts into financially constrained 2012 RTP • Implement plan of advocacy to secure action by federal or other governments where required to implement any related elements of the SIP or RTP; include evaluation of impacts of zero-emission technologies on national priorities, (e.g. energy security, energy cost certainty, interstate transportation, climate protection)
2012–2014	SCAG, with AQMD/ARB on SIP	• Evaluate and determine practicability of applying existing electrified rail technologies to region (by 2013) • Evaluate potential funding and implementation mechanisms for zero and near zero emission locomotives, and wayside power, including: • Private (railroads); federal, state, local government; public-private partnerships; electric utility
2015–2016	SCAG, with AQMD/ARB on SIP	• If existing electrified rail technologies are determined practicable for the region, identify technologies, infrastructure, and implementation mechanisms in RTP amendment and next major SIP

2018–2020	SCAG, with AQMD/ARB on SIP	• If existing electrified rail technologies were determined to not be practicable for the region, resolve need for wayside power for new rail technologies; decision would be based upon whether new technologies can achieve sufficient zero-emission range without wayside power
		• If wayside power is needed, incorporate "footprint" and planning for wayside power into rail lines into 2020 RTP and next major SIP
		• Incorporate recommendations regarding type of funding and implementation mechanisms into constrained RTP and next major SIP, including:
		  ▪ Strategy description and timeframe for any rules
		  ▪ Strategy description, potential funding sources and timeframe for any incentives.

Rail Comment: It would appear from the simple language in Table 16 that the actions listed are included in the resource constrained portion of the RTP. However, SCAG has yet to identify what funding source would be used, and in what timeframe the 'agency action' would occur. Specifically, SCAG should clarify whether there is funding available for the incorporation of a 'footprint' and planning for wayside power into rail lines and/or whether there is funding identified to support rail evaluation and demonstration efforts. If there is not money available for such efforts, the Railroads believe that these measures would more appropriately be placed in the strategic plan. In any case, the timeframe for implementing these actions (2012) is unrealistic given the lack of funding identified to date.

It is not clear how SCAG, AQMD and/or ARB will determine if electrified rail technologies are feasible. The Railroads should participate in the development of design criteria to make this determination. SCAG also needs to clarify what is meant by 'incorporate' in the 2012 Agency Action section. Specifically, the Railroads have the following questions:

- What processes would occur should any of these elements be 'incorporated' into the RTP?
- Would this incorporation involve a formal amendment process?
- Would the Railroads have an opportunity to comment if SCAG, AQMD, and/or ARB were to pursue any of these implementation actions, based on the RTP?

Page 42 Goods Movement appendix:

Because of the cost and potential operational challenges associated with mainline electrification, such a strategy should be considered a longer term initiative, requiring further studies as well as proof of concept and prototype testing of zero-emission locomotive technologies which have the potential to minimize cost and operational impacts, as discussed under the phased implementation section of this appendix……Construction of any electrified rail system in Southern California would require a large investment, as well as cooperation by the BNSF and UP railways.

Rail Comment: SCAG staff has explicitly stated at various public meetings that mainline electrification is not part of the resource constrained plan or the strategic plan. Please confirm that this is the case. Additionally, SCAG should explain what is meant in the above paragraph by the statement that SCAG would require the "cooperation by the BNSF and UP railways."

Page 42 Goods Movement appendix:

Two promising technologies that are under development include hybrid diesel-electric locomotives and battery electric tender cars. Each requires additional development and a more thorough understanding of operational considerations. Fuel savings would allow for a small fuel storage tank and provide space for storage of the necessary batteries on individual locomotives. The locomotives would therefore switch between Tier-4 diesel electric and battery modes. The batteries would recharge as the locomotive is operating in diesel-electric mode. Also, battery electric tender car technology could be used with current locomotives. Battery tender cars would be placed behind diesel-electric locomotives, and would carry batteries that could power locomotives through the environmentally sensitive areas. Such a system could have many of the same advantages as the hybrid diesel-electric locomotives, including zero-emission operation, but would also have the added benefit of being applicable with current locomotives and reducing or eliminating the need for wayside power such as from overhead catenary wires.

Rail Comment: SCAG should explain that neither the hybrid diesel-electric locomotive nor the battery electric tender car technologies are currently available and are not part of the resource constrained or strategic plan. Each technology would need to be designed, developed, and tested prior to implementation, which is a process that historically has taken between five to ten years.

Page 27 of the RTP (referring to the Goods Movement appendix):

> *The RTP goods movement strategy ensures that investments in transportation infrastructure and associated transportation programs contribute to achievement of the region's air quality goals. Efforts are already underway, as the San Pedro Bay Ports have invested heavily in deploying clean trucks over the last several years. Additionally, planning efforts are underway to establish a regional zero emission freight system.*
>
> **Rail Comment:** SCAG needs to clarify what is meant by the "planning efforts" for a "regional zero emission freight system." These planning efforts will be, as the Railroads understand, the continued study and evaluation of technology, operational issues, and costs associated with various electricity-based options. While these technologies will likely offer some localized emissions reductions, as cleaner diesel locomotives are introduced into the region, including Tier 4 locomotives, the magnitude of emission reductions will be significantly reduced. SCAG identifies a similar trend in the potential for emissions reductions from passenger transportation strategies on page 28 of the RTP, stating that as, "*passenger vehicles have become cleaner, the positive air quality impacts of transportation strategies that reduce vehicle use or change congestion conditions (i.e., non-fuel or engine-based strategies) have been significantly diminished."*[14] SCAG should also note that the magnitude of the benefits associated with electrification activity would be diminished with the introduction of cleaner locomotives.

Page 41 Goods Movement appendix:

> *Switcher locomotives contribute only a small share of total locomotive emissions; however, their activity is concentrated in rail yards and greatly impacts surrounding communities. Nevertheless, low-emission technologies are available and have relatively low costs. To reduce emissions from switcher locomotives, one option is to replace remaining Tier 0+ switchers with new Tier 4 switchers. Although there are only projected to be 29 Tier 0+ switchers in the Basin in 2023, they have high emission rates. NOx and $PM_{2.5}$ emission rates from a Tier 4 switcher would be approximately 10–15 times lower than a Tier 0+ engines. Another option is to rebuild existing GenSet switchers with engines that meet the U.S. EPA Tier 4 non-road emission standards, which could cut Nox and $PM_{2.5}$ emissions by a factor of 10. The emission reductions of these strategies could reduce emissions for switcher engines between 27 and 53 percent. However, since switchers are a small part of the overall fleet, these two switcher strategies would reduce total freight locomotive Nox and $PM_{2.5}$ emissions by 1–3 percent.*

[14] SCAG, draft 2012 RTP/SCS, page 28, December 2011.

Rail Comment: The RTP should note that SCAG, and all other local, regional, and state agencies, do not have the authority to require the retrofit or replacement of Tier 0 or Tier 0+ locomotives. SCAG should clarify that this strategy can only be implemented on a voluntary basis, is not in the resource-constrained portion of the RTP, and will only be implemented if stakeholders can fund the replacement of older switcher locomotives.

Tier 4 locomotives are not in production yet, and are not expected to become commercially available until 2015. Therefore, it is illogical to include a strategy to repower switcher locomotives with Tier 4 engines as they do not currently exist. Moreover, this is not a cost effective strategy to reduce emissions as switcher engines burn far less fuel than line-haul units. The Railroads have used public/private partnerships in the past to help reduce emissions from switcher locomotives as opportunities arise, but future projections out to 2023 regarding the repower of switcher engines to Tier 4 are not realistic.

Page 35 Goods Movement appendix:

> *Additionally, significant effort has gone into analyzing the options for a zero-emission rail system in the Basin. These include recent efforts by the Ports of Los Angeles and Long Beach in their Roadmap study and by SCAG in the freight rail electrification report. Each of these efforts highlights the technical opportunities and the need to pursue a zero-emission freight transportation system for the future. However, they also highlight the difficult challenges associated with this sector, especially with regard to operational needs, integration of the technologies into the national rail system, federal safety requirements, and costs.*
>
> **Rail Comment:** SCAG should note that when the Ports' presented their evaluation of "zero emission" options in mid-2011, they concluded that, "none of the proposals were sufficiently mature to commit to a full-scale operational deployment or demonstrated they could deliver a reliable and financially sustainable system…"[15]

Comments on Project List appendix

The Project List appendix includes a funding measure for over $3.7 billion for further research and development of goods movement system improvements. It is unclear where the money will come from and for what specific improvements it will be used. SCAG needs to clarify the source of these funds, the specific priority of measures for which the funds will be used, and in what timeframe they will occur.

[15] Port of Long Beach & Port of Los Angeles, "Roadmap for Moving Forward with Zero Emission Technologies at the Ports of Long Beach and Los Angeles" Technical Report, Updated August 2011, page 10. http://longbeach.granicus.com/MediaPlayer.php?view_id=18&clip_id=4942

Page 422 of Project List appendix:

VARIOUS	RRC0703	OTHER		GOODS MOVEMENT RESEARCH AND DEVELOPMENT	REGIONWIDE		GOODS MOVEMENT RESEARCH AND DEVELOPMENT	2035	$3,771,002

Rail Comment: SCAG identifies $3,771,002,000 for 'goods movement research and development' as a part of the resource constrained plan in measure RRC0703. This language is vague and potentially misleading. The funding source is unclear, and is not mentioned in the Goods Movement appendix or in the RTP. SCAG needs to clearly identify the source of funds and their specific use.

- What technologies would 'goods movement research and development' cover?
- Why does the RTP ID begin with RRC – is that indicative of the intention to use these funds for rail technology development?
- Where could a reader find the write-up of RRC0703?

This vague placeholder for goods movement research and development has the potential to be interpreted differently by various stakeholders and needs to be clarified to avoid future conflict.

Comments on Passenger Rail appendix

The following comments pertain to various strategies and passages that concern the Railroads right-of-way (ROW) throughout the draft 2012 RTP and appendices. Prior to moving forward with some of SCAG's passenger rail and goods movement environmental strategies, SCAG should ensure that issues will not arise with sharing ROWs. Failure to address these issues early on could result in increased congestion and emissions in the SCAG region.

Page 16 Passenger Rail appendix:

> *In the SCAG Region, this plan will be complicated by drive issues. While the Authority's HSTs will be electric drive, and powered by direct-overhead contact lines (often called catenaries), Amtrak and Metrolink currently operate diesel-electric locomotives, as do UP and BNSF. Moving forward, the region will have to reconcile the use of electric and diesel-electric locomotives in the same corridor; and resolve whether these two types of locomotives can share facilities. Blended operations may not be possible until these conflicts are resolved.*
>
> **Rail Comment:** Before moving forward with this part of the passenger rail development, SCAG and/or the High Speed Rail Authority need to address whether the overhead catenary lines will interfere with freight railroad operations. Failure to reconcile this issue could result in major operational issues in the SCAG region and result in economic and environmental harm. SCAG should identify if funding has been allocated to study the potential issues with shared ROWs and what agency would decide if and how facilities can be shared. The Railroads should be included in all conversations and studies that address using rail facilities as to not adversely affect the goods movement system.

Page 21 Passenger Rail appendix:

> *Currently, rail service between downtown L.A. and the Coachella Valley is only provided three days a week with an unattractive schedule as part of Amtrak's interstate services. Union Pacific Railroad owns this rail corridor east of Colton and is opposed to implementing additional passenger service without large capital improvements. However, Amtrak retains the right to operate passenger service on freight-owned railroads and there is a process in place to resolve freight opposition, although Amtrak and other partners such as Caltrans DOR and RCTC may be required to fund capital projects to mitigate potential financial damages to Union Pacific. A 2010 RCTC study estimates $75 million in station costs, $40 million in equipment costs, and $11.4 million in yearly operating costs to start this service. These figures do not include any capital costs required to mitigate service disruptions incurred by Union Pacific.*
>
> **Rail Comment:** UP has entered into an agreement with SCAG member agencies to study the possibility of service to the Coachella Valley that would be served by whatever Amtrak service is currently provided in the region. There would be lost freight capacity to UP in providing such service that would have to be mitigated in some manner.

Page 19 Passenger Rail appendix:

> *Phase II is from Madera to Sacramento and in our region from L.A. Union Station to San Diego through the San Gabriel Valley and Inland Empire. Phase II is in the Supplemental Alternatives Analysis phase and includes some alternative alignments in our region: either I-10 or SR 60 through the San Gabriel Valley, and either I-15 or I-215 from the Inland Empire to the San Diego County line. There is currently no funding for Phase II.*
>
> **Rail Comment:** A portion of this analysis impacts UP owned ROWs. UP's position on this subject was best stated in its November 23, 2009 letter to the California High Speed Rail Authority providing scoping comments for the Los Angeles to San Diego via Inland Empire EIR/EIS.
>
> UP owns the Los Angeles, Alhambra, and Yuma subdivisions ROWs in fee simple between central Los Angeles and the Colton – San Bernardino urban complex. UP controls the operation and maintenance of these subdivisions. No other carrier or government agency has the right to permit other railroads or rail operators to use any part of this ROW. These CTC-dispatched main lines, primarily single-track but with some segments of double track, form the western end of the vital Sunset Route and are the main conduits for movement of Pacific Rim containers out of the ports of Los Angeles and Long Beach. The importance of these subdivisions to the efficient movement of containers and other freight traffic cannot be overstated. Confirming prior statements, both written and oral, UP will not voluntarily make any part of these subdivisions available for the high-speed rail alignment.

The Railroads thank SCAG for their consideration of these issues and look forward to reviewing the final 2012 RTP/SCS. Please contact Max Pike at 415.421.4213 ex. 26 or Sarah Weldon at 415.421.4213 ex. 34 at any time should you have questions.

Sincerely,

Kirk Marckwald
Principal, California Environmental Associates
On behalf of Union Pacific Railroad, BNSF Railway and the Association of American Railroads

Re: Draft Electrification Briefing Papers

Attached are draft issue briefs covering four important aspects of a potential Southern California freight rail electrification:

1. Timeline to Construct for Freight Rail Electrification in Southern California Pgs. 1-2
2. Defining the Scope of an Electrified Freight Rail Project in Southern California Pgs. 3-8
3. Dual Mode Freight Locomotives Pgs. 9-14
4. Similarities between Existing Electrified Rail Systems and a Possible System in Southern California Pgs. 15-20

These issue briefs have been prepared by California Environmental Associates on behalf of Union Pacific Railroad, BNSF Railway, and the Association of American Railroads (the Railroads) to help evaluate the costs, challenges, and benefits of electrifying freight rail mainline operations in Southern California.

These are the first in a series of briefs covering possible emission reductions strategies aimed at achieving zero or near zero emissions from various components of the goods movement system in Southern California. They are not intended to promote or to discourage the electrification of freight rail operations. Rather, this analysis will help inform various stakeholders of the environmental, operational, and economic implications of such a system and provide a thorough compendium of the most complete information currently available for each of several issue areas.

These briefs serve as an initial draft for each topic covered. The Railroads encourage other stakeholders to review the analyses and suggest improvements and other data sources that should be considered and incorporated. As more and better information becomes available, the Railroads will periodically update information and findings.

Timeline for Freight Rail Electrification in Southern California

To accurately evaluate the merits of freight rail electrification in Southern California, it is essential to understand the time required to implement an electrified system. The 1992 Southern California Regional Rail Authority (SCRRA) report provided an estimated timeline for complete electrification (conceptual design, preliminary engineering, environmental review, final design, bidding process, construction, and final testing for the three rail lines that carry the majority of the freight rail traffic in Southern California).[1] The 1992 SCRRA estimated timeline for each of these rail lines is shown in Table 1.

Table 1: 1992 SCRRA Estimate: Years to Complete Electrification of Three Rail Lines

Route	Conceptual Design	Preliminary Engineering/ Environmental Review	Final Design	Advertise, Bid & Award	Construction	Functional Testing/ Start up	Total
Barstow	0.5	1.75	1.5	0.25	5	0.5	9.5
Yermo	0.5	1.75	1.5	0.25	5	0.5	9.5
Yuma	0.5	2	2	0.25	8.25	0.5	13.5

The Railroads believe that the timelines from the SCRRA report may have been reasonable at the time the report was prepared, but are unrealistic and not achievable in the current regulatory and litigation climate, especially with regard to the period needed for environmental review. For instance, each Railroad is in the CEQA environmental review process in Southern California for the expansion or construction of additional intermodal facilities near the Ports. These environmental reviews are entering their seventh year, and may take up to two more years to complete. In contrast, the SCRRA estimated that the studies could be completed and certified in just two years. Given that a freight rail electrification project would have a much broader scope and larger impacts than these intermodal railyard construction projects, the estimated timeframe of 1.75 to 2 years for the preliminary engineering and environmental review process used in the original SCRRA report is far too short.

Table 2 adjusts the SCRRA timetable to reflect the Railroads' real world experience. This analysis assumes the three mainlines (see Figure 2 in the "Defining the Scope" brief) would be constructed concurrently to achieve maximum emissions reductions in the shortest possible period of time, at the lowest cost, and with the fewest disruptions to existing rail operations.

[1] Southern California Regional Rail Authority, *Southern California Accelerated Rail Electrification Program*, February 1992. Report Executive Summary, p ES-6, Exhibit ES-3.

Table 2: Revised time line for Southern California Rail Electrification

Route	Project Definition, Conceptual Design, Railroad and Utility Agreements, Access Rights, Regulatory Approvals, Funding Plan & Funding Commitments[2]	Environmental Studies & Documentation	Final Design, Bid & Award	Construction Time & Final Testing	Total
Railroads' 2011 Projection for all 3 Rail Lines	3[3]	7	2.25	8.75-9.75	21-22
SCRRA's 1992 Projection for Yuma (longest rail line studied)	0.5	2	2.25	8.75	13.5

Under the Railroads' updated timeline and with an assumed program start date of 2012, the earliest date that construction and final testing of all three rail lines to Barstow, Yermo, and Yuma could be completed is 2033[4] and the projected emissions reduction benefits would not be realized until that date.

[2] While such a timeframe is theoretically plausible, for each year that the funding plan is not completed the entire project would shift as well. Construction should not start until 100% of the funding is secured.

[3] If funding commitments are not achieved by the third year, the project will slip a corresponding number of years.

[4] This is in comparison to the SCRRA assumption for the final design, bid, and award, construction time, and final testing for the Yuma line which is estimated to take 11 years. Southern California Regional Rail Authority, *Southern California Accelerated Rail Electrification Program*, February 1992. Report Executive Summary, p ES-6, Exhibit ES-3.

Defining the Scope of an Electrified Freight Rail Project in Southern California

Proponents of freight rail line electrification are assessing the potential of electrification in Southern California to reduce regional air emissions from the goods movement system. However, since North American Railroads operate a transcontinental system, with locomotives traversing the continent (see Figure 1), the merits of partial electrification of the system has several drawbacks.

Figure 1: 60-Day Movement of One Class 1 Line-haul Locomotive in the U.S.

Prepared by California Environmental Associates

A national electrification program would be the most logical and least disruptive way to electrify the Railroads' high tonnage mainlines. A national program would avoid the fragmentation between diesel and electrified segments that is inherent in a regional system. However, given the enormous amount of capital required (likely hundreds of billions of dollars), the necessary coordination among all of the states and Class 1 Railroads, and the geographic scale of such a retrofit, the Railroads believe a national scheme to electrify freight rail operations is not feasible in the foreseeable future.

While a national electrification project may be too large in scope, some electrification proposals under consideration in Southern California appear to be too narrow in their approach. One proposal being considered by the Southern California Association of Governments (SCAG) has suggested that an electrification could be phased in sequentially over three rail segments: the first from the Ports of Los Angeles and Long Beach ("the Ports") via the Alameda Corridor to the

City of Commerce, the second from the City of Commerce to Colton/San Bernardino, and the third from Colton/San Bernardino to Barstow, Indio, or other major railyards at the edge or outside of the South Coast Air Basin (SCAB) (see Figure 2).[5]

Figure 2: SCAG's Sequential Electrification Proposal

Source: Cambridge Systematics, Inc.

This concept to sequentially electrify line segments is flawed and unrealistic for the following reasons.

First, a sequential approach would create temporary, intermediate locomotive exchange points where diesel locomotives would be swapped for electric locomotives (and vice versa). When the next line segment was electrified, these locomotive exchange points would become obsolete and new locomotive exchange points would need to be constructed at the next railyard along the route. At each locomotive exchange point, the Railroads would have to: (1) repurpose work space in the yard, thereby reducing the existing rail operations to accommodate electrified operations, or (2) acquire new real estate and build new tracks to exchange locomotives before trains could travel into or out of the electrified system.

Additionally, sequential construction would be more expensive than a non-phased system approach. Significant disruptions to current rail operations, and the requirement of additional

[5] Southern California Association of Governments, *Rail Electrification Methodology Overview*, May 2011, p. 6. SCAG's initial proposal for freight rail electrification suggested electrifying operations from the Intermodal Container Transfer Facility (ICTF) through the Alameda Corridor. Their current proposal creates a second stage to electrify operations through West Colton and San Bernardino and the last phase would aim to electrify operations from the San Pedro Ports to Barstow, Indio, Chatsworth, and San Fernando.

land and/or reduced throughput at the intermediate railyards would increase capital costs and the time required to complete a fully electrified system in Southern California. Furthermore, as discussed in more detail below, delays and increased costs would probably cause diversion of time-sensitive freight from rail to truck.

Activities at the Locomotive Exchange Points

At each locomotive exchange point, every eastbound and westbound train would have their locomotives exchanged, either electric units for diesel units or vice versa. Increasingly, trains to and from Southern California utilize "distributed power," which locates locomotives throughout the train, i.e., all locomotives may not be located together at the front of the train. Changing out these distributed power locomotives would cause significant delays and make operations at the locomotive exchange points more complex than if locomotives were only located at the front of the train.

In addition, when the locomotives were exchanged, air brake tests and other safety tests would be required before the train could continue. Under the best case scenario, and with extra labor, the Railroads estimate the total time required would be over three and a half hours for a single train.[6] The complete locomotive exchange process is detailed in Table 1.

Table 1: Breakdown of Locomotive Exchange Best Case Scenario

Power change element	Time	Total Elapsed Time
Pull train into railyard	20 minutes	20 minutes
Remove the front locomotives, replace with alternative power locomotive (either diesel to electric, or vice versa)	30 minutes	50 minutes
Uncouple the train in front of the center locomotive(s), pull front of train forward, remove middle locomotive(s), replace with alternative power locomotive(s) (either diesel to electric, or vice versa)	1 hour	1 hour 50 minutes
Remove the rear locomotives, replace with alternative power locomotive (either diesel to electric, or vice versa)	30 minutes	2 hours 20 minutes
Reassemble the train, perform air brake test	1 hour	3 hours 20 minutes
Train departs from railyard	20 minutes	**3 hours 40 minutes**

In contrast, freight trains currently move into and out of the SCAB without stopping. Therefore, introducing the locomotive exchange points would result in a minimum delay of at least three

[6] Interview with Michael Iden, General Director Car & Locomotive Engineering, Union Pacific Railroad, July 2011.

and a half hours per train in the goods movement pipeline. For time sensitive products, such as perishable agricultural products or items carried for a package delivery company with a hard delivery date, this delay would be unacceptable, causing some customers to ship their freight by other, higher-emitting modes.

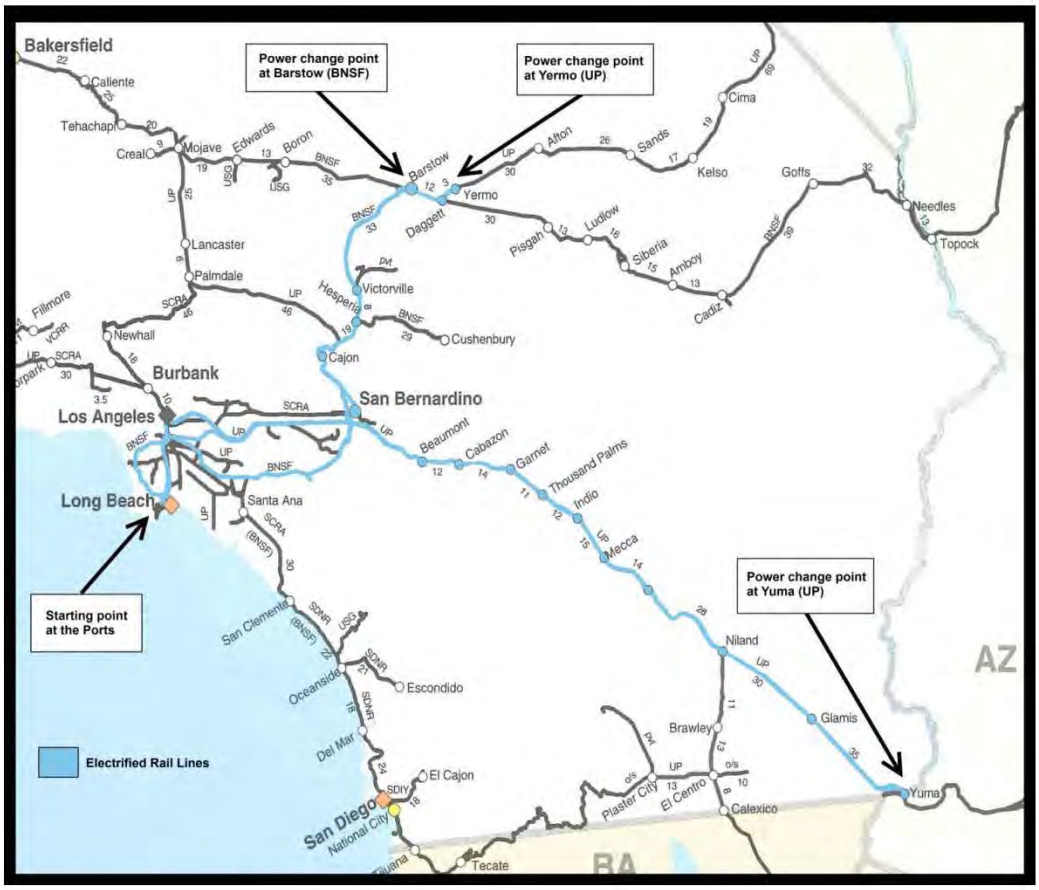
There are significant costs and operational issues associated with a three and a half hour delay at any locomotive exchange point, be that an intermediate point of a sequentially built system or at the terminus of the electrified system. These costs will be described more fully in a subsequent issue brief, but for certain types of freight moves and destinations such a delay would cause trains to be about 20-25% less time competitive than trucks. This means freight that is currently moved on trains will be drawn to trucks. Also, depending on how the costs of a potential electrified system were to be borne, the need to build or modify one of more locomotive exchange points might cause the Railroads to raise their rates to shippers, thereby adding further pressures for shippers to consider a modal shift or a port of entry shift. Finally, were the region to decide to sequentially develop the system, such an approach would triple the cost of creating locomotive exchange points and these significant additional costs would far outweigh the potential earlier air quality benefits that such a sequential system might achieve.

Requirements for Locomotive Exchange Points

Each locomotive exchange point, whether a temporary intermediate point or a permanent point at the electrified system terminus, would require a major reworking of an existing railyard(s) or construction of whole new yards to handle the additional operations necessary to switch between electric and diesel power. To ensure that there is sufficient space to handle trains with both diesel and electric locomotives, and to support the associated breakdown and rebuilding of trains, the Railroads would need to: (1) acquire new land to substantially increase the size of the yard, (2) build a new railyard, or (3) reduce the throughput at an existing yard. Each locomotive exchange point would require eight tracks to exchange locomotives for four trains at a time. This type of expansion is not feasible at any of the facilities proposed by SCAG because there is no developable land adjacent to the existing yards and because disrupting current housing or industrial activities on adjacent lands could never be considered. The alternative—reduced throughput—would cause further detrimental downstream effects by requiring increased activity at other yards, thereby pressuring freight rail customers to switch to other, higher-emitting transportation modes and/or causing shippers to switch to other ports of entry.

In the sequential system, the Railroads would also need to relocate or add diesel and electric locomotive facilities to the intermediate exchange points to maintain both diesel and electric locomotives. If these facilities were not relocated to the locomotive exchange points, the diesel locomotives would be required to travel into the electrified zone for service on tracks with an already high level of traffic. These additional diesel trips would also create emissions in the electrified zone, offsetting a portion of the emission reductions gained by electrification. Alternatively, the Railroads could use electric locomotives to transport the diesel locomotives

through the electrified zone, avoiding some of the extra emissions, but resulting in higher costs given the need for additional electric locomotives and the loss of track time for more productive operations.



In summary, even though there could modest air quality benefits that could be achieved earlier from a sequential development approach, such an approach creates a number of significant operational and economic hurdles, including the need for additional land, additional ready tracks, intermediate locomotive exchange facilities, and construction of new electric and additional diesel locomotive maintenance facilities. Furthermore, such a disruption to the goods movement system under such an approach could lead to the counterproductive shift of cargo from rail to less fuel efficient modes.

Conclusion

The Railroads believe that short of achieving a national electrification system, the only regional system that should be studied and evaluated is one that would: (1) establish a logical and coherent framework for the region, (2) minimize construction disruptions to the current rail system to minimize loss of traffic to highway transportation or to other ports, (3) make full use of current rail facilities, and (4) assure that all routes of the system were funded and built simultaneously, not sequentially.

Such a study would be focused on the electrification of the mainlines from the Ports through the SCAB to the most logical terminals at Yermo, Yuma, and Barstow (see Figure 3). These lines carry a high percentage of the freight rail traffic in the SCAB. By evaluating a coherent and logical electrified system to these terminals, the project would avoid the costs of four intermediate power change points, would have far fewer operational challenges, lower costs, and would avoid the additional dilemma not having sufficient funds to complete the desired system.

Figure 3: Proper Study Area for Electrified Lines in Southern California[7]

[7] Base map from Professional Railroad Atlas of North America.

Dual Mode Freight Locomotives

Introduction

Some proponents of electrification have suggested that an alternative to the traditional catenary system with dedicated electrified locomotives could be the use of "dual-mode" locomotives. Dual-mode locomotives could operate either on the electrified system (drawing power from the overhead catenary line) or function as independent diesel locomotives (deriving power from an onboard diesel engine), thereby eliminating the need to break down a train and swap electric locomotives for diesels or vice versa. However, such apparent flexibility from dual power locomotives evaporates when the capabilities and limitations of such units are carefully evaluated. For the reasons outlined below, the Railroads believe dual-mode locomotives could not and would not meet the freight rail operational requirements in Southern California.

The starting point for evaluating the suitability of a dual-mode freight locomotive must be based on the performance features of contemporary diesel freight locomotives used by the Class 1 U.S. freight railroads. Such a locomotive would need:

- Sufficient speed (70 mph) and sufficient pulling force, or tractive effort (185,000 pounds) from a single diesel engine
- Enough fuel capacity to travel approximately 1,600 miles without refueling
- Six traction motors (axles)
- Weigh less than 434,000 lbs
- Fit on a standard locomotive platform (less than 80 feet long)
- Include enough room for diesel aftertreatment equipment required to meet Tier 4 emission standards (see Figure 1)

Currently, there are no dual-mode locomotives proven to handle the power and other requirements for U.S. freight locomotives (i.e., reliability, life cycle costs, and federally-mandated safety directives).

There are two distinguishing performance characteristics of any locomotive: horsepower and pulling force.

1. Horsepower is required for speed.
2. Pulling force (technically known as "tractive effort" and measured in pounds) is required for moving heavy trains at low speeds over grades or hills.

Passenger locomotives are designed to meet only one performance characteristic: to move relatively lightweight passenger trains at high speeds (79-to-110 mph). While passenger locomotives may have high horsepower engines for speed, they do not necessitate engines that

can produce high levels of pulling force. Existing dual-mode commuter locomotives are capable of meeting the light-weight, high speed needs of passenger railroads, but they are not capable of meeting the needs of U.S. freight railroads.

Comparison of Passenger and Freight Locomotive Operating Requirements

Requiring a freight railroad to use dual-mode commuter locomotives would be infeasible, uneconomical, and disruptive of time-sensitive freight train operations. The dual-mode commuter locomotives being considered for freight rail operations in Southern California are technologically inferior and inappropriate for the following reasons:

1. The 4-axle dual-mode design is grossly inadequate for western freight railroads which encounter heavy mountain grades (insufficient pulling force).
2. Dual-mode locomotives provide 1/12 the pulling force per dollar as compared to current Tier 2 line haul diesel locomotives. Therefore, to get equivalent pulling force, the Railroads would need to make 12 times the capital investment to run an electric line haul locomotive.
3. Excessively small fuel tanks, as a result of limited space on the locomotive platform, would reduce a dual-mode locomotives operating range between refuelings by approximately 75%.
4. Diesel engines in the dual-mode commuter locomotives are built for the passenger, not the more severe freight duty cycle and would therefore likely wear out much quicker, greatly increasing maintenance expenses for engine overhauls.
5. The dual-mode commuter locomotive, as currently designed, appears unlikely to be produced after 2014 because of its structural inability to accommodate the EPA exhaust aftertreatment required by Tier 4 regulation (see discussion and Figure 1 below).

The largest available dual-mode locomotive is the Bombardier ALP45DP, which generates 4,200 hp during diesel operations.[8] While this is roughly equivalent to the 4,400 hp rating of the modern freight locomotives operating in the U.S., other factors such as pulling force limit its use in freight operations. Table 1 below shows the characteristics needed by a locomotive for reliable and efficient freight rail service, and compares these specifications to those of the dual-mode Bombardier ALP45DP and the traditional Tier 2 diesel locomotives.

[8] http://www.bombardier.com/en/transportation/products-services/rail-vehicles/locomotives/other-projects/alp-45dp---canada--usa?docID=0901260d80165898#

Table 1: Comparison of Bombardier Dual Mode ALP45DP and Traditional Tier 2 Locomotives[9]

Parameter	Traditional Diesel (Tier 2)[10]	Dual mode (ALP45DP)[11] (Tier 2)
Length (ft)	72-74	71.5
Width (ft)	10.9	10.9
Max Speed (mph)	70-75	130
Power Rating (hp)	4,400	4,200 (diesel) 5,367 (electric)
Weight (lbs)	416,000	288,000
Pulling Force or Tractive Effort (lbs)	185,000 (at start)	71,000 (at start)
Starting Capability on 2% Grade (such as Cajon, Beaumont, etc.)	~4,170	~1,600
Dynamic Braking (lbs)	117,000 (at 12 mph)	~34,000 (at 20 mph)
Fuel Tank Capacity (gal)	5,000	1,800
Fuel Range (miles)	1,600	~500
Operating Range	Transcontinental	Urban short-haul, multi-stop trips and return
Number of Traction Motors (axles)	6	4
Number of Diesel Engine(s)	1	2 high speed engines (max. 1,800 rpm)

[9] This table is a truncated version of a more extensive comparison between Tier 2 diesel freight locomotives and the ALP45DP. To request a copy of the complete table, please contact Max Pike at max@ceaconsulting.com.

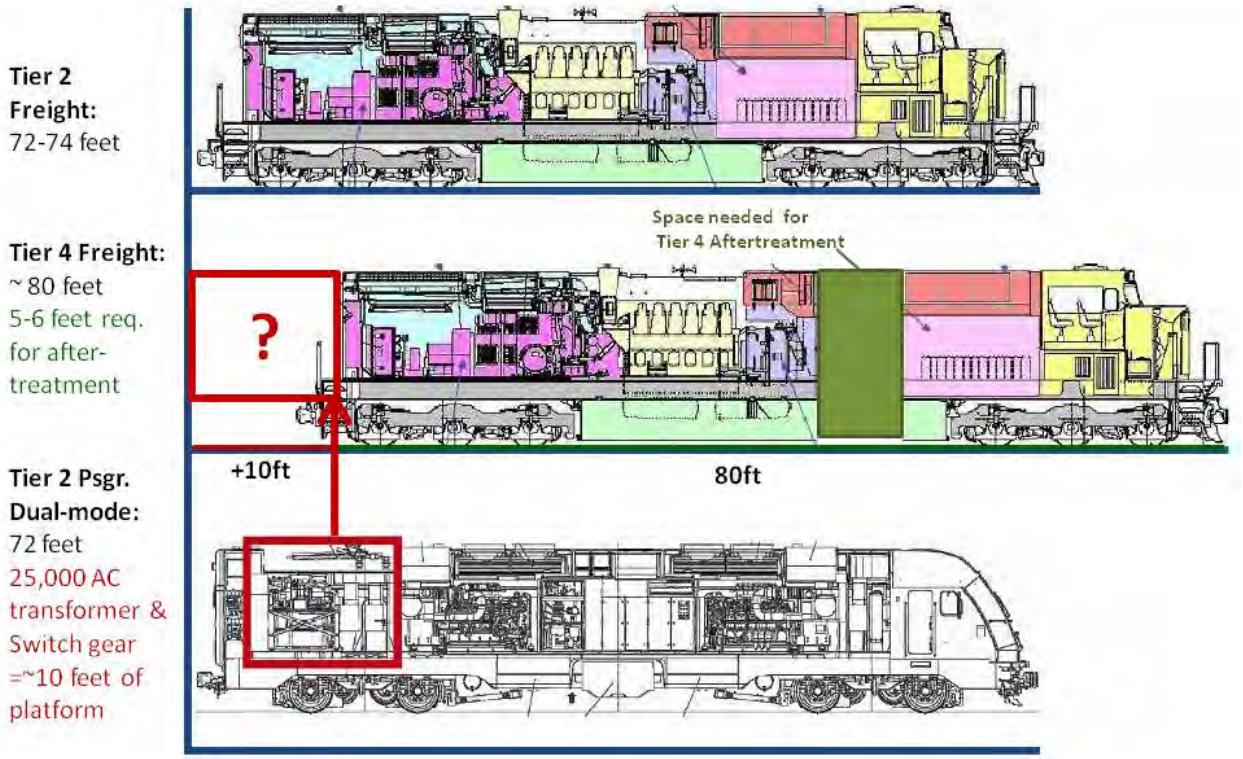
[11] http://www.bombardier.com/en/transportation/products-services/rail-vehicles/locomotives/other-projects/alp-45dp---canada--usa?docID=0901260d80165898# & http://www.railwayage.com/in-this-issue/alp-45dp-two-locomotives-in-one-june-2011-3228.html & http://www.railwaygazette.com/nc/news/single-view/view/alp-45dp-electro-diesel-locomotive-debut.html

Comparison of Passenger and Freight Locomotive Chassis Design

As shown in Table 1, while the ALP45DP may have a relatively high horsepower rating to achieve high speeds, it does not have sufficient pulling force or dynamic braking for use in freight service. The engineers who built the ALP45DP made a number of design compromises to fit all of the necessary equipment onto the 4-axle car body. Although the power rating of the dual-mode locomotive is comparable to that required for freight service, the ALP45DP achieves that power output using two lighter, smaller, high-speed, off-road diesel engines which are much less durable than the medium-speed engines used in freight locomotives. While light-weight diesel engine technology has proven successful in certain switch locomotive applications (e.g., using GenSets), line haul locomotives operate on a much more severe duty cycle, and the lighter weight, high-speed engines have proven to be unreliable.

Using smaller engines would be similar to replacing a passenger vehicle engine with multiple lawnmower engines: they might work for a short period of time, but the demand on the engine would be so great that any advantages of the smaller size would be more than offset by the need for constant maintenance or replacement. An article in International Railway concluded that, "a high-speed (1,800 rpm) diesel [engine] is much lighter yet just as powerful, but its components will have a much higher wear rate."[12] Replacing the two lightweight engines in the dual-mode passenger locomotive with a single, more robust engine would create further challenges with respect to size constraints when attempting to configure a Tier-4 compliant, freight-duty dual-mode locomotive.



The second compromise may be in the step-down transformer used in the ALP45DP, which is much smaller and lighter than comparable transformers (of similar voltage and power rating) used in Amtrak electric locomotives. This dual-mode transformer operates at a higher cooling oil temperature in order to minimize the size and weight. It is unknown how these transformers would perform over time in long haul, heavy duty freight operations in terms of reliability and maintainability.

Lastly, it is not clear that a dual-mode locomotive could even be built within the current federally mandated freight locomotive "footprint" (length, weight, and height). In order to operate in freight service, the dual-mode locomotive would need to be reconfigured to accommodate six axles to provide adequate pulling force for transporting heavy freight loads. The dual-mode locomotive would also need a step down transformer and switch gear to operate on the overhead catenary system. Finally, to meet Tier 4 emission standards, it is expected that an additional five to six feet of length will be needed on a locomotive platform to accommodate the exhaust aftertreatment technology for the diesel engine. It is unclear how a manufacturer could also fit all of the required elements for a Tier 4 locomotive, along with the transformer and switch gear, within this same platform, while staying below the required size limits. Locomotive platforms cannot be extended beyond 80 feet, as day-to-day operations require that locomotives be able to turn within a fixed radius. Extending locomotives to 90 or

[12] Vantuono, William. *American operator look to dual-mode traction*. July, 2006. International Railway Journal.

100 feet in length would preclude dual-mode locomotives from operating throughout the national railroad network, adversely affecting railroad operations by geographically constraining certain locomotives to certain track networks. The space constraints are graphically illustrated in Figure 1.

Figure 1: Platform Issues with Dual-Mode Locomotives

The space constraints discussed above also limit the size of the locomotive fuel tanks. A traditional diesel locomotive can carry approximately 5,000 gallons of fuel, allowing the locomotive to travel approximately 1,600 miles before refueling.[13] In comparison, the fuel tanks on most dual-mode locomotives have a capacity of around 1,800 gallons, greatly reducing the operating range of the units on the non-electrified track segments. In order for the dual-mode locomotives to be used throughout the national rail network, construction of additional fueling facilities would be required. Also, additional delays would be created due to additional refueling stops.

Conclusion

Dual-mode locomotives are not a new technology. A small number of dual-mode locomotives have existed since the 1920s; however, they have only been designed for switch locomotive

[13] Interview with Michael Iden, General Director Car & Locomotive Engineering, Union Pacific Railroad, August, 2011.

operations or lighter passenger trains designed for higher speeds.[14] While newer, "high powered" (i.e., greater than 4,000 hp) dual-mode locomotives are available today,[15] these units have only been used for passenger service, which does not require the same level of locomotive durability as freight service. A manufacturer might eventually be able to build a freight dual-mode locomotive, but it would entail a lengthy design and engineering process.

The ALP45DP acquisition process took six years and is detailed below.[16]

2006	Specifications developed, reviewed, and approved
2007	Request for proposals advertised, and locomotive manufacturer selected
2008	Notice to proceed issued
2009	Design engineering
2010	Production design finalized and approved
2011	First locomotive prototype assembled, tested, and revenue service started
2012	Production completed

Locomotives in commuter rail service generally operate fewer than 18 hours per day over relatively short distances and over consistent and unvaried terrain. Unlike commuter trains, freight locomotives operate for extended periods over longer distances. For example, a freight train between Chicago and Los Angeles will travel approximately 2,200 miles over a two-to-three-day period. In addition, locomotives operating in freight service must have the power and durability to handle steep grades and extreme changes in ambient temperatures, such as the elevated temperatures found in desert environments and tunnels which can be longer than two miles. It is unlikely that the dual-mode locomotives available today could meet these demands.

In addition, the cost of existing dual-mode locomotives is $12.2 million compared to $2.4 million for a Tier 2 unit. To put that in perspective for the scale of freight operations in Southern California, 100 dual-mode units would cost the Railroads $1.22 billion compared to $24 million for the same number of Tier 2 units, if the dual-mode locomotives cost the same as the ALP45DP. However, it is likely that the additional requirements necessitated by freight rail operations in Southern California would drive the cost of each unit even higher. For all of these reasons, dual-mode locomotives are not a viable solution to address electrification of mainline freight operations in Southern California.

[14] CBS Local, New York, *NJ Transit Unveils New Dual-Mode Locomotive*, May 11, 2011. http://newyork.cbslocal.com/2011/05/11/nj-transit-to-unveil-new-dual-mode-train/

[15] .These newer dual-mode passenger locomotives are currently being delivered to and used in New Jersey and Montreal.

Similarities between Existing Electrified Rail Systems and a Possible System in Southern California

Both in the United States and in other countries, there are a handful of electrified freight rail systems, either shortlines or as segments of larger networks. Proponents of electrifying freight rail operations in the South Coast Air Basin (SCAB) often point to these systems as proof that electrification of rail can easily be implemented in Southern California. However, any application of this technology must meet the specific demands of the geographic locale and operating characteristics of the rail system under consideration. Unless the operational and technical specifications are substantially similar, it is difficult, if not impossible to predict the success of a future system. Also, other factors, such as the political, economic, and environmental drivers must be evaluated for compatibility, as well.

Criteria for comparing electric rail systems

The following design characteristics must be considered and matched before concluding that an existing electrification system provides an appropriate comparison to a proposed system:

- Service: passenger, freight, or both
- Materials transported: bulk or intermodal or both
- Common carrier or single industry service
- Terrain: mountains, hills, rivers, etc.
- Horsepower requirements
- Gross tons pulled
- Dedicated service or locomotive exchange points or connections to a larger rail network
- Sufficient existing or new infrastructure to meet energy and capacity demand
- Retrofitting an existing diesel line or construction of a new electrified system
- Source of project funding: private investors, taxpayers, or a combination
- Operating subsidies: initial or ongoing public operating subsidies

Several frequently cited electrified rail systems are described below. The QR National and the Trans-Siberian Railway (TSR) were retrofit to diesel systems. The Caltrain Commuter Rail Electrification proposal, were it to be built, would be a retrofit, as well.

The Black Mesa & Lake Powell Railroad (BMLP) and Deseret Power Railroad (DPR) are short industrial operation rail lines (i.e., not common carriers) that were built as rail line dedicated to serving electric utilities.

QR National

QR National is the largest private freight hauler in Australia and is located in Queensland. Generally, QR National's operations are focused on large, heavy freight operations such as coal, iron ore, agricultural products, and containers. QR National operates the Central Queensland

Coal Network which consists of approximately 1,400 miles of freight rail infrastructure. Immediately following an oil crisis in the 1980s, QR National, under government operation at the time,[17] decided that projected oil prices justified the electrification of existing coal rail lines. QR National installed a 25 kV overhead catenary system on approximately 500 miles of their Blackwater network that began operation in 1986,[18] and on approximately 530 miles of the Goonyella system that began operations in 1985.[19]

Over time, however, the actual price trends in diesel fuel and electricity made the difference in operating costs between electric and diesel smaller than originally anticipated. QR National was unable to secure full cost recovery on the electric overhead infrastructure for the Blackwater rail line as of 2008.[20] Since it was electrified in the mid-1980s, the Blackwater system has been extended as more mines have become active in the region. However, further investment in electrification necessitated rate increases for QR National's other lines, with some lines witnessing a 28% increase.[21]

The justification for these increases has been debated and has prompted QR National's major customers to threaten to build their own rail lines. Recently, BHP Billiton, a major global mining company that accounts for 40% of QR National's business, has indicated that it plans to build its own rail line in response to the steep cost increases of QR National.[22] The high costs tied to the capital expenses and increased operational costs of running an electrified system demonstrate the potential impacts of electrification on the greater goods movement system.

The Trans-Siberian Railway

The Trans-Siberian Railway (TSR) is a government funded and operated rail line in Russia that was built between 1891 and 1916. Stretching some 5,750 miles, it is the longest continuous mainline railway in the world. The TSR handles passenger and freight service—the principal

[17] In July 2010 QR National was privatized and is now listed on the Australian Stock Exchange. QR National operates the Central Queensland Coal Network under a 99 year lease with the Australian government. http://www.qrnational.com.au/Corporate/Pages/AboutQRNational.aspx

[18] The Blackwater rail network in Central Queensland consists of approximately 612 miles of total track; about 500 miles of the track are electrified. The Blackwater system connects 12 coal mines in the Bowen Basin coal area to two export terminals at the Port of Gladstone and also serves a number of domestic users including a power plant, cement plant, and refinery.
http://www.qrnational.com.au/NetworkServices/RailNetwork/Pages/BlackwaterSystem.aspx

[19] The Goonyella rail network is located in Central Queensland and consists of approximately 530 miles of track, all of which are electrified. The Goonyella systems connect 22 coal mines in the Bowen Basin coal region to the Hay Point Coal Terminal and Dalrymple Bay Coal Terminal. This network also transports products to other destinations by way of connections to the North Coast Line and the Central Line.

commodities are coal, oil and oil products, and wood products.[23] The TSR was electrified over a 74-year period; electrification was completed in 2002. Both 25kv AC and 3kv DC overhead lines were installed at varying times and locations during the many decades-long construction period.

The electrification of the TSR rail system allowed average train weights to be doubled from 3,300 tons to 6,600 tons, producing reductions energy (and perhaps emissions) *per ton-mile* of freight hauled. Such a reduction, however, would not be realized were a freight line in the United States to be electrified, given the fact that the average western U.S. freight train currently is at least 9,900 tons. [24]

The Black Mesa & Lake Powell Railroad (BMLP) and the Deseret Power Railroad (DPR)

The BMLP and the DPR railroads are privately owned utility rail lines used specifically to haul a single commodity—coal—to each utility's power plant. Each is an industrial short line railway consisting of a short single-track with loops on both ends. They were built by the utilities as electric railway systems (BMLP began operations in 1973; DPR in 1984). The rail lines use a 50 kV overhead catenary system and each railroad operates one train at a time that makes two to three round trips per day. Neither the BMLP nor the DPR interchange with any other railroads and rail ways, and they are completely isolated from the national rail network. Both use multiple 6,000-horsepower electric locomotives to haul less than 10,000 tons of coal three times daily over a distance of 35 miles (DPR) to 78 miles (BMLP).[25]

An electrified industrial short line railway faces none of the challenges that common carrier railroads operating on a network system would. Since BMLP and DPR are single purpose industrial shortlines that have short and simple tracks, they are able to use high-powered electric locomotives to complete their primary objective: speedy, short, round-trip cycles. There is little variability in the weight pulled by BMLP and DPR from trip to trip; the trips follow a regular schedule; there is only one point of loading and one point of unloading; and thus, no locomotive exchange points are required.

In contrast, the freight rail *system* in Southern California is much more complex than either of these small-scale operations. First, the primary objective of the Railroads in Southern California is to maintain throughput, fluidity and reliability for their customers across the system, not just within Southern California. A partial electrification of the Railroads' national system would interfere with all of these functions by creating locomotive exchange points where electric locomotives would need to be swapped out for diesel locomotives. Second, the Railroads' systems are not a single track, with loops at each end, but are connected to national networks

[24] Interview with Mike Iden of Union Pacific Railroad, July 2011.

[25] Black Mesa & Lake Powell Railroad is owned by the Salt River Project and the co-owners of the Navajo Generating Station; Desert Power Railroad is owned by Deseret Generation & Transmission Company.

that span much of the United States.[26] Lastly, the variability in weight pulled from trip to trip is much greater for common carrier operations, as is the variability in times of travel.[27]

The technical attributes (a captive, single commodity, electrified loop rail operation) have no applicability to helping assess the feasibility of a complex freight rail operation in Southern California. The scale, scope, ownership, and purpose of each of these systems have virtually no overlap. .

Caltrain Commuter Electrification Project

Some agencies have suggested that Caltrain's proposed Commuter Electrification Project to electrify a 52-mile passenger rail line between San Francisco and San Jose could be used to estimate the costs of and operational implications of the electrification of freight operations in Southern California.[28] However, as is the case with the other global examples described above, the Caltrain commuter electrification project does not provide a good basis for assessing the costs or operating challenges of a regional freight rail electrification project in Southern California. There are several fundamental differences between this project and an effort to electrify freight rail in Southern California.

In particular the Caltrain commuter electrification project would electrify the entire 52 mile Caltrain system. No locomotive exchange points would be required to interface with non-electrified portions of the system, and there would be no assembling and breaking down trains to deal with distributed power. Additionally, passenger rail lines have more consistent weight (and hence power requirements) per train, and consistent schedules, thus greatly simplifying the interaction between the rail electrification loads and the power grid.

Caltrain commuter rail has regular daytime operations with occasional freight trains during off-peak hours. This operating regime will allow construction to occur mostly at night and not interfere with the principal mission for the line. How disruptions in freight service during the 13 year construction period for a regional electrified freight system in Southern California would be significantly more complex than for Caltrain and has remained an unaddressed issue in any earlier analyses.

Funding for Electrification Projects

In all of the examples discussed above, the electrification of the lines was either government financed or financed by a utility that could recoup its investments directly from its ratepayers. Given the enormous cost of electrifying Southern California freight rail lines, the vast majority

[26] BNSF operates in 23 states and UP operates in 28 states.

[27] The times at which freight locomotives travel in an electrified system is important because of the interaction between the substantial electrical loads and the timing of electrical energy supplies, and other electrical loads, on the regional electric grid.

[28] Caltrain 2025 Electrification. http://www.caltrain.com/projectsplans/Projects/peninsularailprogram/Caltrain_2025__Electrification_.html

of the construction costs would have to be borne by government entities. Thus far, given the depleted nature of both state and federal treasuries, the likelihood over such a public commitment is speculative at best.

Planning & Evaluation Timeframe

None of the railways discussed above were electrified under a set of governmental regulations similar to existing California requirements. The extended time required for assessment, review, and approval in California would increase both the cost and duration of the planning and construction processes.

Conclusion

The Railroads believe the examples above demonstrate that existing electrified rail lines do not demonstrate the feasibility of other proposed electrification projects. Each rail application is unique and that many variables affect the technical and economic feasibility of a given rail electrification project. An evaluation of rail electrification in the SCAB must examine the true l financial and other implications of an electrification project in Southern California. Proponents of such a system cannot assume that an electrified system operating under its specific circumstances in Russia or Australia is an indicator that electrification could succeed in Southern California.

As shown in Table 1 below, these existing electrified railways operate under very different conditions, and have different objectives, than the Southern California freight rail system. None of the examples discussed above match Southern California's unique technical, economic, political, and environmental climates, so their utility in making the case for an electrification project in the Southern California region is marginal, at best.

Table 1: Comparison of Other Electrified Freight Railways to the Southern California Freight System

Assessing Similarity to a Southern California Scenario						
Issue	**Southern CA (645 miles)**	**TSR (5,753 miles)**	**QR National (>1,000 miles)**	**DPR (35 miles)**	**BMLP (78 miles)**	**CalTrain (52 miles) Proposed system**
Public subsidies: initial or ongoing public funding	None proposed to date	Publically funded	Publically funded	Utility reimbursed by ratepayers	Utility reimbursed by ratepayers	Public funding
Ownership: private or public when electrified?	Private	Public	Public	Private Utility	Private Utility	Public
Retrofitting an existing diesel line vs. construction of a new electric system	Retrofit	Retrofit	Retrofit	New	New	Retrofit
Locomotive exchange at connection to larger rail network	Yes, multiple	Yes, multiple (change in voltage)	Yes	No	No	No
Type of materials transported	Intermodal goods Manifest and Bulk	Bulk and Manifest	Bulk and Manifest	Coal Only	Coal only	People only

Los Angeles, California 90017-3435

Re: SCAG's 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy

Dear Ms. Lin:

I am writing on behalf of the California Natural Gas Vehicle Coalition to provide comments on the Southern California Association of Governments' (SCAG) 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

The California Natural Gas Vehicle Coalition (CNGVC) is an association of natural gas vehicle and engine manufacturers, utilities, fuel providers and fleet operators serving the state. We work with legislators and regulators to develop policies that will increase alternative fuel and vehicle use, support new initiatives and provide up-to-date information on NGV technology and market developments.

Our primary concern is that the draft plan largely ignores natural gas as a transportation fuel and its potential to be a significant part of the solution for the region's transportation, air quality, and sustainability goals. By focusing almost entirely on "zero-emission" vehicles we believe SCAG is missing the opportunity to develop a strategy that achieves the same benefits in a shorter time frame and for significantly less cost.

Over the last two decades we have seen in California that it is very difficult to predict which technology will succeed and even more difficult to say when they will achieve significant market penetration. That is why more agencies and companies are taking a portfolio approach to developing and deploying clean transportation technologies.

California Natural Gas Vehicle Coalition • 1029 K Street, Suite 24 • Sacramento, CA 95814
Phone: (916) 448-0015 • Fax: (916) 448-7176

Natural gas should be an integral part of your Regional Transportation Plan. Natural gas is a very clean fuel, available today for half the price of diesel, and it is abundant in North America. This is why the medium- and heavy-duty vehicle markets in particular are embracing natural gas like never before. Many public and private fleets are investing in natural gas vehicles. Transit agencies, taxi fleets and private companies such as Waste Management; United Parcel Service, AT&T, and Verizon have purchased thousands of small, medium, and large natural gas vehicles.

The heavy duty vehicle sector seems to show the greatest promise for natural gas because of the fuel cost savings over diesel and the lack of other viable alternatives to diesel. Recently Swift Transportation, one of the largest trucking companies in the country, said they would be investing heavily in natural gas trucks and could reach 30%-40% penetration in their fleet in 3-4 years.

Be careful about "zero-emission". The term is used a bit too freely these days. Using life cycle emissions analysis California has found that zero-emissions at the tailpipe are only part of the picture. It is important to consider the whole picture including upstream emissions from production and transportation of fuels. Some are trying to draw a bright line between "ZEV fuels and technologies" and "non-ZEV fuels and technologies". We do not see a bright line now and to the extent that there is a line we see it fading over time. Natural gas vehicles are near-zero emissions today and are getting cleaner with each generation of engines. Biomethane (aka renewable natural gas) has been identified as one of the cleanest transportation fuels by the California Air Resources Board. Renewable Natural Gas has 90% less carbon emissions than gasoline. Sources include landfills, agricultural operations like dairies, and waste water treatment plants. Whether it is used on its own or blended with conventionally natural gas it is likely to be one of the cleanest fuels in transportation over the next couple of decades.

For these reasons we ask you to revise your plan to include natural gas as a meaningful part of the solution.

Thank you for considering our comments.

Sincerely,

Tim Carmichael
President

Re: Comments on Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy

Dear Sir or Madam:

California Rural Legal Assistance, Inc. (CRLA) submits the following comments on the Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) on behalf of José Saldívar, a farmworker who has lived and worked in the Eastern Coachella Valley for almost forty years, and other low-income residents of the Eastern Coachella Valley. CRLA is a non-profit legal services organization that provides legal representation to low-income residents of rural California, including in many communities comprised primarily of farmworkers and their families. Within the SCAG region, CRLA provides services in the Eastern Coachella Valley, Imperial County, and Ventura County.

Promotores Comunitarios del Desierto (PCD) is a community-based organization working with residents of the Eastern Coachella Valley to empower them to voice their concerns in issues such as health access, infrastructure, and environmental justice, serving as a bridge between agencies and residents.

El Sol (El Sol) Neighborhood Educational Center is a non-profit agency serving San Bernardino and Riverside Counties since 1991. El Sol provides prevention and early intervention services in the areas of mental health, nutrition, and post-partum depression, as well as offering classes in computer literacy and English as a Second Language. El Sol works in the "Promotores de Salud" model, utilizing different strategies of community outreach such as community organizing and popular education.

Pueblo Unido Community Development Corporation (PUCDC) is a non-profit organization that responds to the needs and concerns of underrepresented rural communities of the Eastern Coachella Valley through actively engaging and fostering collaborative efforts among residents and other stakeholders to find viable solutions, leverage critical resources, and bring new opportunities to improve the quality of life for residents.

Comité Cívico del Valle (CCV) is a non-profit organization serving Imperial County and the Eastern Coachella Valley. CCV's mission is to improve the living conditions of its communities through education, capacity-building, and civic participation with the vision of living in healthy, prosperous, and informed communities.

We commend SCAG for the detailed preparation and analysis evident in the draft RTP/SCS and accompanying documents. Transportation planning for a region of SCAG's size and diversity is a challenging endeavor. The draft RTP/SCS shows an impressive commitment not only to addressing the region's transportation needs but also to fulfilling the new requirements of SB 375. However, we have some concern that the draft RTP/SCS does not make adequate provision for the unique circumstances of rural communities in the SCAG region, particularly the low-income rural communities that house the region's agricultural workforce. We offer the following comments in an effort to ensure that SCAG will adopt a final RTP/SCS that addresses the needs of low-income rural and farmworker communities.

<u>We recommend that SCAG add an RTP goal focused on equitable distribution of the benefits and burdens of the RTP/SCS.</u>

The draft RTP/SCS includes a list of RTP Goals, set forth on p. 13 and correlated with performance measures as described on p. 15. The RTP Goals address a number of key concerns such as safety, air quality, goods movement, and facilitation of transit and active transportation. However, the RTP Goals included in the draft RTP/SCS fail to address issues of equity, either on a socioeconomic axis (equitable distribution of burdens and benefits across socioeconomic categories) or on a geographic axis (equitable distribution of burdens and benefits throughout the diverse communities of the SCAG region). Given the size and diversity of the SCAG region, it is unlikely that such equity will be achievable unless it is made a primary goal of the RTP/SCS and explicitly considered at each step of the RTP/SCS development process. We recommend that SCAG add an RTP Goal incorporating these two axes of equity. The majority of our remaining recommendations would support the incorporation of such a goal into the fabric of the entire RTP/SCS.

<u>We recommend that SCAG further the farmland preservation goal of SB 375 by actively planning for the transportation and housing needs of the region's agricultural workforce.</u>

As acknowledged on p. 128 and in Exhibit 4.8 of the draft RTP/SCS, SB 375 requires SCAG to include in the SCS a consideration of resource areas and farmland. <u>See</u> Cal. Gov't Code § 65080 (b)(2)(B)(v). The preservation of productive farmland will necessarily require providing for the

needs of the region's agricultural workforce, including the need for the creation of appropriately sited decent affordable housing – generally at levels affordable to extremely low-income (ELI) households – and transportation options, including transit, that facilitate farmworkers' access not only to their agricultural workplaces but also to human services, children's schools, medical facilities, retail (including full-service grocery stores), non-agricultural jobs for other adult members of farmworker households, and other amenities. In the interest of preserving the region's farmlands, we recommend that SCAG incorporate the consideration of these needs as a component of the consideration required by SB 375.

This recommendation will also further SB 375's broader goal of greenhouse gas reduction by increasing transit accessibility to rural populations, resulting in a reduction of vehicle miles traveled. Like many rural areas in the SCAG region, the Eastern Coachella Valley is severely underserved by transit. Bus service is utterly nonexistent for large portions of the Eastern Coachella Valley population. A few communities in the Eastern Coachella Valley receive bus service, but its utility is significantly diminished by long headways and inconvenient transfers. In order to access the educational and work opportunities of the Western Coachella Valley – where housing costs are unaffordable to the low-income farmworker households of the Eastern Coachella Valley – rural residents must budget up to four hours per day for bus commuting. This level of service creates tremendous obstacles to the use of transit by rural residents, perpetuating a reliance on personal vehicles and excluding residents who cannot afford to use personal vehicles for lengthy commutes. Bus service to such underserved communities should be expanded and improved in the interest of equity, environmental justice, and greenhouse gas reduction.

We specifically recommend that SCAG consider the following strategies:

- Regularly convene planning staff and governmental decision-makers from jurisdictions containing farmland to focus on meeting unmet housing and transportation needs of agricultural workers; ensure that such convenings are informed by input from agricultural workers and/or from community-based organizations familiar with the transportation and planning needs of the agricultural workforce and other rural residents
- Provide technical assistance to member jurisdictions by conducting feasibility analyses of creative transit strategies, such as local circulators in rural communities, to address the unmet transit needs of farmworker families and other rural residents
- Encourage the implementation of farmworker, student, and commuter vanpools in rural areas; provide technical assistance on vanpools by maintaining a library of resources on such topics as project development, financing, outreach, and project administration
- Explore the feasibility of vanpools or similar programs for non-work-related transportation needs such as access to medical facilities, retail, and other services
- Conduct outreach to governmental decision-makers and community groups regarding funding opportunities for expansion and improvement of transit in rural areas

<u>In the interest of mitigating the impacts of gentrification and providing adequate services to</u>

agricultural workers and other low-income rural residents, we recommend that certain of the benefits proposed for HQTAs be made more widely available.

We commend SCAG for its innovative proposals to incentivize growth in high-quality transit areas (HQTAs). However, as is noted at various points throughout the draft RTP/SCS and the draft Environmental Justice Supplemental Report, there are as-of-yet unanswered concerns about the likelihood of gentrification in HQTAs, as lower-income households find themselves priced out of increasingly desirable housing markets. Thus, certain HQTA-related incentives, such as transit fare discounts, would likely provide greater benefits to higher-income households than to the lower-income households who need such fare relief. Furthermore, certain sectors of the SCAG region's population – such as agricultural workers – do not realistically have the option of living in an HQTA; HQTA incentives should not exclude such households, whose contribution to the region's economy and character are recognized in SB 375's prioritization of farmland resources. In order to enhance the equity of the HQTA incentives proposed in the draft RTP/SCS, we recommend that SCAG consider the following augmentations of those incentives:

- Provide local circulator services in non-HQTAs that are unserved by existing transit services, including rural agricultural communities
- Consider household income, and not solely HQTA residence status, in structuring any transit fare discount(s)

In addition, we note that certain land use and transportation policies could result in the development of more HQTAs than are contemplated in the draft RTP/SCS. This is particularly true in the inland counties of Riverside, San Bernardino, and Imperial, where very low percentages of the population currently have access to high-quality transit but where slight decreases in bus headways could bring existing bus routes within the definition of high-quality transit. Furthermore, we note that some of the HQTAs designated in the draft RTP/SCS appear to be along routes with extremely limited accessibility, such as Interstate 10 serving the Western Coachella Valley. Although such short-headway bus routes are likely to provide high-quality transit to people living at designated stops along the route, it seems highly unlikely that all persons living within the Interstate 10 corridor will realistically enjoy such access. We recommend that the utility and accessibility of HQTAs be extended via the following measures:

- Prioritization of the extension of HQTA status to more communities by decreasing bus headways, particularly in the inland counties of Riverside, San Bernardino, and Imperial
- Close collaboration with community-based groups and with county-level planning staff and governmental decision-makers to increase the feasibility of developing affordable housing in rural areas at a density of twenty dwelling units per acre (for example, through modifying local zoning ordinances to allow densities of twenty units per acre in mobilehome parks located on land zoned for agricultural use), such that these areas could be eligible for HQTA incentives
- Adopt a more flexible density standard for HQTAs in agricultural areas in order to make it feasible for mobilehome parks, which constitute the vast majority of affordable housing in the Eastern Coachella Valley and frequently occur in dense clusters along major thoroughfares, to qualify for incentives such as local circulators and transit fare

discounts
- Ensuring the utility and transparency of the HQTA designation by defining HQTAs based on residents' access to transit stops, rather than solely by proximity to a high-quality transit route

We recommend that SCAG take a leadership role in developing non-regressive funding mechanisms for transportation development.

We applaud SCAG for taking on the difficult question of transportation funding and the ongoing wisdom of relying on existing federal and state gas tax structures, including excise taxes. However, some of the funding mechanisms on which the draft RTP/SCS relies are likely to have regressive and/or inequitable impacts, causing low-income households and communities to bear a disproportionate share of the cost of the region's transportation system. Point-of-sale revenue sources – such as sales taxes, gasoline taxes, and farebox recoveries – indisputably have a regressive impact on households least able to afford them. The projected Vehicle Miles Traveled (VMT) tax seems likely to further the goals of SB 375 by creating incentives for people to live in transit-rich areas close to jobs, services, and retail opportunities. However, given the very real risk of gentrification in such neighborhoods, the VMT is likely to have a disproportionate impact on lower-income households who cannot afford the higher housing costs of desirable urban neighborhoods. Furthermore, as discussed above, SB 375 encourages MPOs to prioritize the preservation of farmland resources. A VMT could undermine this goal by creating an unaffordable burden on farmworker families, who face lengthy commutes not only to the fields and packing houses in which they work but also to medical care, grocery and other retail outlets, schools, human services, and other amenities. Residents of agricultural areas have little access to any form of transportation other than personal vehicles, and the draft RTP/SCS does not propose expanding transit to reduce this burden. Farmworker households should not be penalized for failing to use transit when transit has not been made available to them.

We recommend that SCAG apply its considerable technical expertise to devising and advocating for more equitable mechanisms of transportation funding at the local, state, and federal levels. One possibility might be a VMT tax structured to allow tax credits for lower-income households and/or for other households that are unable to access housing in transit-rich neighborhoods, such as farmworker households. Because a VMT tax cannot be assessed at the point of sale, it is likely to be far more flexible than a traditional gas tax and can therefore be made more responsive to equity concerns.

We recommend that data on the environmental justice impacts of the draft RTP/SCS be disaggregated in order to facilitate analysis of the impacts on disadvantaged communities within the SCAG region.

Significant portions of the draft RTP/SCS, particularly the draft Environmental Justice Supplemental Report (draft EJ Report), analyze data at the regional level. For example, the draft EJ Report summarizes the following data based on its region-wide impacts on specific

income quintiles and racial or ethnic groups: distribution of savings in travel time and distance; accessibility to employment and services; accessibility to parks; exposure to emissions and consequent health risks; and exposure to noise impacts. However, the maps presented in Exhibits 1-14 of the draft EJ Report demonstrate that environmental justice (EJ) populations are not distributed evenly throughout the region; rather, there are pockets where certain EJ variables are extremely concentrated, with disproportionately high percentages of poverty, minority population, foreign-born population, non-English-speakers, and populations without a high school diploma concentrated in communities of extreme disenfranchisement. Such communities include not only urban pockets in and near Los Angeles, but also the agricultural communities of the Eastern Coachella Valley and much of Imperial County. An analysis that examines, for example, emissions exposure encountered by the entire Latino population of the SCAG region fails to address the ways in which burdens of the draft RTP/SCS might or might not be disproportionately visited on localities that struggle under the weight of multiple categories of disadvantage.

In particular, the Eastern Coachella Valley – the population of which is over 97% Latino – appears to realize few benefits under the draft RTP/SCS, giving rise to an appearance of denial of service in this area and perpetuation of historic exclusion. Based on the level of analysis made available by SCAG in the draft EJ Report, it is impossible to determine whether the Eastern Coachella Valley is expected to bear a disproportionate share of the burdens of the draft RTP/SCS, such as increased exposure to emissions and/or noise impacts.

Furthermore, we note that the Environmental Justice Mitigation Toolbox on pp. 147-48 of the draft EJ Report does little to address the specific risks confronted by local EJ communities. While the Toolbox provides a number of suggestions to reduce RTP/SCS-related impacts throughout the SCAG region, its recommendations do not acknowledge the heightened level of exposure to environmental risks that is all-too-frequently visited upon communities of concentrated disadvantage.

In order to minimize the chances that localities of extreme disenfranchisement will disproportionately bear the burdens of – and be deprived of the benefits of – the draft RTP/SCS, we recommend that SCAG take the following steps:

- Use the geographic data in Exhibits 1-14 of the draft EJ Report to identify local EJ communities that are subject to two or more of the categories of disadvantage highlighted in the Exhibits
- Conduct a Performance Area Analysis (similar to the 11-factor Performance Area Analysis set forth in pp. 34-146 of the draft EJ Report) with respect to each of the local EJ communities thus identified
- Monitor implementation of the RTP/SCS to quantify actual impacts on local EJ communities

<u>We recommend that SCAG utilize a more broadly accepted measure of economic disadvantage in conducting its environmental justice analysis.</u>

Throughout the Performance Areas Analysis of the draft EJ Report, SCAG relies on income quintile as a measure of economic disadvantage. However, as indicated on the income quintile table on p. 6 of the draft EJ Report, this measurement is not defined in a way that accounts for differences in household size; a one-person household with an income of $45,000/year falls into the same quintile as a seven-person household with an income of $45,000/year, although these two households face vastly different financial prospects. An analysis conducted on this basis will not yield an accurate measure of economic need.

We recommend that SCAG instead use the measures of Extremely Low-Income, Very Low-Income, Low-Income, Moderate Income, and Above Moderate Income established annually by the California Department of Housing and Community Development based on data provided by the United States Department of Housing and Urban Development. These figures are a broadly accepted measure of a household's relative economic need and are already easily available to SCAG due to its obligations related to the calculation of the Regional Housing Need Allocation (RHNA). An EJ analysis based on these figures will yield a far more accurate portrait of the impacts of the draft RTP/SCS on households of various levels of economic need or privilege.

<u>We recommend that SCAG provide more detailed analysis regarding the expected distribution of air quality impacts of the draft RTP/SCS.</u>

Although we commend SCAG for developing a draft RTP/SCS that will improve overall air quality in the region, we are very concerned to learn that 23-29% of SCAG-region residents are expected to experience worse air quality. The draft RTP/SCS and Supplemental Reports do not clarify which portions of the region are expected to realize the greatest air quality benefits and which will suffer the expected declines in air quality. We recommend that SCAG provide a detailed geographic analysis of the draft RTP/SCS's projected air quality impacts and include this analysis in the EJ Performance Areas Analysis, subject to the revisions of the Performance Areas Analysis recommended above.

We further wish to call to SCAG's attention that rural areas of the Eastern Coachella Valley are currently not subject to adequate air quality monitoring. The air quality monitors maintained by the South Coast Air Quality Management District (SCAQMD) for the Coachella Valley are in urbanized areas of the Valley and do not reflect the air quality of the rural and agricultural areas of the Eastern Coachella Valley, which suffer from high levels of blowing dust (including from traffic over unpaved roads), pesticide sprays, smoke from agricultural burning (often in close proximity to residential areas), and particulates from the drying Salton Sea. We recommend that SCAG aggressively pursue the spirit of transportation conformity by advocating for expansion of air quality monitoring to the Eastern Coachella Valley and to other areas that are subject to unique air quality stressors not detected by SCAQMD's air quality monitors as currently distributed.

California Trucking Association Comments
Southern California Association of Governments (SCAG)
2012 Regional Transportation Plan

To Whom It May Concern:

On behalf of the members of the California Trucking Association, we thank you for allowing us to submit our comments on the 2012 SCAG Regional Transportation Plan.

The California Trucking Association (CTA) is a non-profit trade organization representing over 4,000 individual trucking companies and suppliers. Members of our association range from single truck owner-operators to large Fortune 500 companies, and we are the largest state trucking organization in the country.

The bulk of our membership is either headquartered in the SCAG area of influence, or has terminal operations in the region in order to move their goods throughout Southern California. Our membership is heavily invested in how the transportation system in Southern California is planned, funded, operated, and maintained. We seek to be partners with SCAG in planning for the region's infrastructure future so that goods can continue to move efficiently and economic growth continues to take place.

As your Goods Movement Appendix indicates, goods movement dependent industries employ almost 3 million people in the region, and contribute over $250 billion to the region's GDP on an annual basis (Goods Movement Appendix, Page 10). Trucks are the very backbone of the economic power of these industries. However, our Association is well aware that in order for Southern California to keep this economic strength and to stay competitive in the global marketplace, policy makers and industry groups will have to work together in order to secure stable and robust funding sources for all segments of the region's transportation system.

We also seek to be a partner with SCAG in promoting policies that balance economic growth with clean air and environmental sustainability concerns. Over the past decade, our members have invested billions of dollars in new technologies and equipment that will ensure that the citizens of the SCAG region will breathe cleaner air well into the future.

Below are our comments on the 2012 Regional Transportation Plan. We hope that these comments will help SCAG promote an environment where trucking companies can continue to operate and thrive in Southern California. If you should have any questions or concerns in regards to our comments, or if there are resources we can provide for you, please do not hesitate to contact us.

Sincerely,

RJ Cervantes
Transportation Policy Coordinator

California Trucking Association (CTA) Comments
Southern California Association of Governments (SCAG)
2012 Regional Transportation Plan

Transportation Finance:

The California Trucking Association is concerned about some of the assumptions made for the "Reasonably Available Revenues" projections. SCAG has identified $219.5 billion in additional revenues that according to the RTP are "...likely to materialize within the RTP time frame" (SCAG 2012 RTP, Page 7).

- A substantial portion of the $219.5 billion that has been indentified is the $110.3 billion that would be generated from a "Mileage-Based User Fee" set at $0.05 per mile and commencing in 2025 (2012 SCAG RTP *Transportation Finance Appendix*, Pages 15, 16). Although SCAG notes that they've projected the fee to commence in 2025, substantial amount of study is needed on the feasibility of implementing such a system on commercial motor carriers. To date, there has been little to no study done on how a system would be administrated, or what the financial burden would be for motor carriers and ultimately consumers.

- Although SCAG has also indicated that the revenues projected from a mileage based user fee will be generated on a national level, the California Trucking Association will note that it strongly opposes the implementation of a mileage based user fee on local or regional levels (2012 CTA Federal Transportation Policy Guideline).

- SCAG has also $4.2 billion in projected revenue generation from a "Free Fee/National Freight Program" (2012 SCAG RTP *Transportation Finance Appendix*, Page 7). The California Trucking Association has supported the inclusion of the National Freight Program in the Senate Environment & Public Works Committee Map-21 legislation. However, we have not endorsed specific strategies to fund any expenditures made through the program other than the existing Highway Trust Fund sources (2012 CTA Federal Transportation Policy Guideline).

- The California Trucking Association also strongly opposes local, regional or statewide freight fee proposals that would compromise the competitiveness of California's shipping, warehousing and commercial trucking industry. Such a system must be explored, developed, and implemented on a national level only.

- SCAG has also projected $22.3 billion in revenue generation for the region through the tolling facilities associated with the I-710 Freight Corridor, the East-West Freight Corridor, the High Desert Corridor, and the SR-710 tunnel (2012 SCAG RTP Transportation Finance Appendix, Pages 34, 35). In general, the California Trucking Association opposes tolling as a means for revenue generation due to the high overhead costs associated with running tolling facilities and programs, the potential for increased congestion around tolling facilities, and the disproportionate financial burden that is placed on the trucking industry.

- In addition, the California Trucking Association is very concerned about the toll revenue estimates that have been associated with the East-West Freight Corridor and the I-710 Freight Corridor. If these projects are planned as zero-emission corridors as a part of the Goods Movement Environmental Strategy and Action Plan as outlined by the RTP, the near term revenues generated from these tolling facilities will not meet the estimated projections that have been provided due to an overestimate of zero emission technology penetration rates.

Project List:

In general, The California Trucking Association's analysis of the Project List Appendix has been positive. We are encouraged that SCAG continues to be concerned about the degradation of our roadway system, and is planning to invest significant amounts of capital in maintaining our current roadway infrastructure. We firmly believe that such efforts will improve goods movement efficiency, reduce congestion, improve regional economic productivity, and reduce pollution. However, we do wish to address our concerns with a few projects listed in the Financially Constrained RTP List:

- SCAG includes $3,771,002,000 for 'goods movement research and development' as a part of the resource constrained plan in measure RRC0703 (2012 SCAG RTP *Project List Appendix*, Page 422). We believe that this allocation is not mentioned in the Goods Movement appendix or in the RTP. To avoid confusion or conflict, SCAG needs to clearly identify where these funds would come from, and specifically, what they would be used for. What technologies and sectors would 'goods movement research and development' cover? Where could we find the description of RRC0703?

- Also, identified in the list is a $5 billion allocation for a "Goods Movement Bottleneck Relief Strategy" (2012 SCAG RTP *Project List Appendix*, Page 422). The California Trucking Association is supportive of indentifying and improving bottleneck choke points that restrict the ability to move goods efficiently by trucks. Moving forward, we urge SCAG to include industry stakeholders in any discussions so that input can be given on the locations which are restrictive to motor carriers.

- The California Trucking Association has not taken a position on whether or not to endorse the East-West Freight Corridor (2012 SCAG RTP *Project List Appendix*, Page 422). We hope to continue having discussions with SCAG in regards to the project's costs, access abilities, and design concepts. However, we urge SCAG to immediately inform any and all property owners along the project alternative alignments about the potential for future eminent domain issues. SCAG should account for funds that will be needed to fairly compensate property owners that could potentially be affected.

Goods Movement:

The members of the California Trucking Association are dedicated to working with policy makers in order to enhance the quality of life of all Californians through environmental protection measures that are based on sound science and that are balanced with the realities of the economic market place. In the past decade, the trucking industry has gone through transformative changes due to regulatory mandates and voluntary competitive measures in order to get cleaner trucks on the road. SCAG's Goods Movement Environmental Strategy and Action Plan are of great interest and concern to our members that have made substantial investments in new technologies at dramatic costs to their companies. Below are our specific concerns related to this program:

- SCAG should acknowledge that participation of goods movement stakeholders in any of the strategies identified by SCAG in the Goods Movement appendix would be a voluntary process and not mandatory. Mandating specific technologies undermines the investments our members have made in response to the Air Resources Board's (ARB) Truck & Bus Rule. The California Trucking Association would strongly oppose any and all efforts to impose a new timeline for truck turnover that would differentiate from the ARB regulations.

- SCAG provides a specific timeframe for the study and demonstration of various zero or near-zero emission technologies. (2012 SCAG RTP *Goods Movement Appendix*, Page 34). The information is presented in a way that might be applicable for all of the technology options and all fleets. In fact, there is significant variation in the different technologies' stages of development. Not all technologies have been created equal due to implementation concerns and market readiness. SCAG should account for this reality.

- In order to introduce zero or near-zero emission technologies in private fleets, SCAG would need to work with regional company owners by providing significant amounts of capital to meet the goals laid out in the plan. The upfront incremental costs for these vehicles vary from $20,000 - $100,000+ over comparable diesel powertrains. These figures do not encompass the significant infrastructure investments and loss of operational flexibility associated with zero and near-zero emission technologies. Which activities have funds currently available and have been accounted for in the RTP's fiscally constrained plan? SCAG needs to help identify where the funding will come from in order to meet these new goals.

- If there is funding currently available, SCAG needs to state that they plan to carry out the timeline presented for the implementation of a zero and near-zero emission freight system. If not, it should be pointed out that such a project could not be implemented until or unless funding becomes available.

- Additionally, SCAG should note that any full scale demonstration and/or commercial deployment would need the full support of the involved stakeholders to move forward. SCAG should also include a provision that the business stakeholders will be involved in the design of the parameters for a full-scale demonstration.

- Furthermore, the final stages in the timeline are unrealistic and should be lengthened to give adequate time for zero-emissions technologies to mature and undergo sufficient testing. An inadequate or insufficient demonstration program could result in premature adoption and could lead to serious disruptions to the goods movement system and thus unintended consequences from significant job loss and economic impacts to the region.

- As trucking companies work together with regulatory agencies to further reduce emissions in the SCAG region, any technology introduced must not compromise the safety, velocity, cargo throughput, economic competitiveness, or reliability of the vehicle.

- SCAG should clearly state in the RTP that to date, stakeholders have not reached consensus on technologies, timing, funding, or emissions impacts of possible the various options SCAG examined in the Goods Movement Environmental Strategy and Action Plan.

- It would be unwise to commit funding to large scale infrastructure projects to support zero emission transportation technologies until these technologies mature. Certain early approaches may quickly become obsolete as heavy duty partial hybrid electric and battery electric vehicles reach commercialization.

- SCAG should not oversell its timeline for zero emission technology implementation. SCAG does not have control over technology penetration rates nor can it predict how this market, just barely in its infancy, will perform in the coming years. Arbitrary timelines are not a substitute for the kind of analysis that produces good public policy and efficient government expenditure.

I-710/East-West Freight Corridors

- We agree with SCAG's observation that the zero and near-zero emission heavy duty vehicle market has yet to develop a fully market ready technology as of the authoring of the 2012 RTP.

- SCAG should approach the role of the Freight Corridors in nurturing this emerging market realistically. While exemption from tolls or other privileges granted zero and near-zero emission heavy duty vehicles will play a role in incentivizing accelerated adoption, these technologies will face significant implementation challenges out of SCAG's control.

- Facility restrictions that prevent National Network terminal access for reasons other than safety are currently prohibited by federal law.

Re: Comments on the Draft 2012 RTP/SCS and Draft PEIR

Dear Ms. Lin:

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) and Sustainable Community Strategy (SCS). The Canyon Land Conservation Fund is based in Silverado, Calif. and our mission is to conserve the last natural wildland in and adjacent to the Cleveland National Forest. Our organization includes support from 1, 500 residents in Orange County communites of Silverado, Modjeska and Trabuco Canyons. We are writing to provide comments on the Draft 2012 RTP/SCS and the Draft Program Environmental Impact Report (PEIR).

Under the Endangered Species Act, the United States Fish and Wildlife Service have defined critical habitat as areas that support endangered or threatened species that are essential to the species' conservation. The description in the Conservation Planning Policy section (page 76 of the Draft 2012 RTP/SCS) states "large-scale acquisition and management of *critical habitat* to mitigate impacts related to future transportation projects" [emphasis added]. We believe there are other habitat areas in the SCAG region worth considering for acquisition and management and therefore SCAG should not limit the mitigation opportunities to only critical habitat. We suggest expanding the language to incorporate all "important habitat lands."

Thank you for reviewing our comments and we look forward to working with SCAG on the implementation of this policy. Should you need to contact me, I can be reached at 714-228-7900 #1148. In addition, we request to be included on any notifications (electronic or otherwise) about this policy's creation and implementation, please send information to eamador@pacificexcess.com

Sincerely,

Ed Amador/Chay Peterson

February 14, 2012

Re: Draft 2012 Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS)
Draft Program Environmental Impact Report (PEIR)

Dear Mr. Ikhrata:

Thank you for the opportunity to comment on the draft 2012 RTP/SCS and associated PEIR. We want to recognize the tremendous efforts put forth by you and your staff to create this incredibly complex document while keeping the public informed and welcoming stakeholder input every step of the way.

The application for the proposed sustainable new town of Centennial, located at the intersection of I-5 and SR-138 in North Los Angeles County, was deemed complete by the County of Los Angeles in 2008. The proposed $9.5 billion direct investment in this region over 20 years will provide 23,000 homes, approximately 27,500 construction jobs and over 30,000 permanent jobs for Los Angeles County. By providing a pedestrian-oriented, sustainable community design with a balance of jobs and housing and the necessary density to support public and community services for the entire region, Centennial will complement the infill, TOD developments being proposed in the urban cores, achieving long-term emissions reductions as mandated by SB 375.

After careful review of the PEIR, we respectfully request that you consider the attached list of technical corrections to various exhibits contained in the RTP/SCS and PEIR. Please note that these exhibit corrections have already been conveyed to Jacob Lieb, Manager of Environmental Planning, in person. Should you have any questions or require further clarification, please do not hesitate to contact me.

Sincerely,

Centennial Founders LLC

Carlene Matchniff

CENTENNIAL FOUNDERS LLC

SCAG RTP/SCS and PEIR corrections – TAZs 20280.100, and 20281.100, County of Los Angeles

1) RTP/SCS Exhibit 4.13, Land Use Pattern Map SCAG Region 2035, correct Growth Pattern shading to reflect Centennial
2) RTP/SCS Exhibit 4.15 Land Use Pattern Los Angeles County 2035, correct Growth Pattern shading to reflect Centennial
3) PEIR Exhibit 2.18, Project Description, Land Use Pattern in L.A. County, correct Growth Pattern shading to reflect Centennial
4) PEIR Exhibit 3.3-5, Special Status Natural Communities in the SCAG Region, correct Terr. Comm. (specific) vegetation category for Centennial to grassland community and should not go into Kern County as not in RTP/SCS
5) PEIR Exhibit 3.8-1, Regional Distribution of Important Farmlands and Grazing Lands; need to clarify the difference in similar colors on the legend. Centennial is Grazing Land and should be reflected as such. Recommend the map distinguish the colors on the legend for Grazing Lands and Non-irrigated Farmlands as they are difficult to distinguish as currently presented
6) PEIR Exhibit 3.8-9, Household Density by Census Tract, correct to correspond to the household TAZs for the area and change exhibit to the 901-1,500 category
7) PEIR Exhibit 3.8-10 Employment Density by Census Tract, correct to correspond to the employment TAZs for the area and change exhibit to the 1,001-1,500 category

SUBJECT: COMMENTS ON THE DRAFT 2012 REGIONAL TRANSPORTATION PLAN, APPENDICES, AND GROWTH FORECAST DATASETS

Dear Ms. Lin:

The Center for Demographic Research at Cal State Fullerton has reviewed the Draft 2012 Regional Transportation Plan/Sustainable Communities Strategies, its associated appendices, and the growth forecast datasets. We greatly appreciate the opportunity to do so and for all of the work SCAG staff has done to produce these reports and work with local agencies during the development process.

First, we would like to express support of recommendations by the Orange County Council of Governments, the Orange County Transportation Authority, the Transportation Corridor Agencies, and other Orange County agencies whose comments also request the inclusion of the updated Orange County growth forecast, the 2010 Orange County Projections Modified, in the RTP/SCS plan and alternatives.

Our comments are grouped as follows:

1. Incorporate the Orange County Projections-2010 Modified Growth Projections, as adopted by the OCCOG Board of Directors, into all RTP/SCS/PEIR documents, appendices, tables, maps, narrative, modeling runs, PEIR Alternatives (including Alternate C/3/Envision 2 referencing the Orange County growth forecasts) consistent with the subregional delegation MOU between OCCOG, OCTA and SCAG.
2. SCAG's adoption of the growth forecast numbers should be at the county level, consistent with past RTPs, and not at a smaller level of geography such as city, census tract, or traffic analysis level.
3. Other Comments on the Draft 2012 RTP documents in Tables 1, 2, and 3.

1. <u>Incorporate the Orange County Projections-2010 Modified Growth Projections, as adopted by the OCCOG Board of Directors, into all documents, tables, maps, narrative, modeling runs, and PEIR Alternatives (including Alternate C/3/Envision 2) referencing the Orange County growth forecasts consistent with the subregional delegation MOU between OCCOG, OCTA and SCAG.</u>

On January 26, 2012, the update to the OCP-2010 dataset, known as OCP-2010 Modified, was officially approved by the OCCOG Board of Directors and is a data amendment to the Orange County Sustainable Communities Strategy. The dataset includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 and this is the formal notice of the update which should be incorporated into the 2012 RTP/SCS, PEIR, and related documents.

2. SCAG's adoption of the growth forecast numbers should be at the county level, consistent with past RTPs, and not at a smaller level of geography such as city, census tract, or traffic analysis level.

The 2012 growth projections identify population, housing and employment data for the six-county SCAG region, from 2008 (Existing) to 2020 and 2035. These growth projections represent the best available information from local jurisdictions, the business community and landowners. However, as time passes, what is feasible for any given project can change. The triggers for change to adopted growth projections can range from factors such as market conditions, new information or data, infrastructure availability, changes in funding availability (such as the dissolution of redevelopment agencies statewide), and changes to jurisdictional boundaries resulting from future annexations and incorporations of previously-designated unincorporated territory. SCAG should continue to adopt the 2012 growth projections at a countywide level, consistent with past approvals of Regional Transportation plan growth forecasts. A county level of geography accommodates internal adjustments to changing conditions as described above, without compromising the integrity of the overall growth projections. However, approving the growth projections at any lower level of geography, such as at the city level, would be challenged with continual revisions and shifts to the total number of housing, population and employment within a city, among cities, and between cities and counties as a result of the factors described above. Adoption of the data at a level lower than the county would limit jurisdictional control and create inflexibility in a regional planning document. In addition, the level of geography in which RTP/SCS growth forecast is adopted should not be determined by other processes. For example, the RHNA allocations must be consistent with the RTP/SCS; state law does not require that they be identical. The RTP/SCS can be adopted at the county level and the RHNA process may proceed independently until it is completed after the appeals, trades, and transfers are completed. The RHNA allocations that were derived from the growth forecast can still be determined to be consistent with the RTP/SCS, even if changes are made to the city totals during the appeals, trades, and transfers process.

3. Other Comments on the Draft 2012 RTP documents in Tables 1, 2, and 3:

Table 1. 2012 RTP/SCS COMMENTS

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
1	General Comment	all	*All chapter headings should include the Chapter number on each page for ease of reference.*
2	Clarification	1, left column	"The 2012 RTP/SCS includes a strong commitment to reduce emissions from transportation sources to comply with SB 375, ~~both~~ improve public health, and meet the National Ambient Air Quality Standards as set forth by the federal Clean Air Act. As
3	Clarification	4, right column	"This region needs a long-term, sustainable funding plan that ensures the region receives its fair share of funding, supports an efficient and effective transportation system that grows the economy, provides mobility choices, and improves our quality of life."
4	Clarification	page 7-Table 2 and page 95-Table 3.3	*Is additional $0.15 gas tax the sum total of both state and federal taxes or $0.15 each?*
5	Clarification	12, right column	"It also demonstrates how we can transition from things we know to be unsustainable over the long term and beyond the term of this RTP—such as reliance on fossil fuels—to new technologies for the future."

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
6	Clarification	30, 31, 73	AB 32 is global warming solutions act. SB 375 was determined to be stand-alone legislation. RTP document is not forum to address global climate change and references are unnecessary, off topic, and distract from RTP goal and purpose. "Global warming" and "global climate change" / "climate change" are not interchangeable phrases. References should be removed or, where appropriate, language should be changed to "global warming".
		30, right column	"The RTP/SCS includes the following actions to address energy uncertainty ~~and reduce the region's contribution to global climate change~~:"
		31, right column	"Adaptation ~~Climate change~~ global warming mitigation means reducing or sequestering greenhouse gases, whereas adaptation is preparing for known impacts of ~~climate change~~ global warming. Over the coming century, some ~~climate change~~ studies project that Southern California will be expected to manage extremes of precipitation and temperature, increased storm frequency and intensity, and sea-level rise. These climate changes ~~will~~ would impact streamflow, flooding, water supply, sea level, and soil water content. These impacts ~~will~~ would affect agriculture, stormwater, wastewater treatment, wildfire risk, roads, forest health, and biodiversity. These impacts ~~will~~ would also have consequences for public health, economic livelihoods, the financial sector, the insurance industry, individual comfort, and recreation. In practice, these impacts ~~will~~ would mean coping with…"
		73, right column	"Goods movement is also a major source of greenhouse gas (GHG) emissions that contribute to global ~~climate change~~ warming."
7	Clarification	40, left column	"Strategic investments, put forth by the private sector, that would remove barriers associated with telecommuting are expected…"
8	Correction	page 42- Table 2.2	241 toll road completion year is 2030
9	Define in text and add to glossary	50, left column	"scrip"
10	Clarification	54, right column	"Express/HO T Lane Network Despite our concerted effort to reduce traffic congestion through years of infrastructure investment, the region's system demands continue to exceed available capacity during peak periods."

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
11	Clarification	78, right column	"Greenhouse Gases On road emissions (from passenger vehicles and heavy duty trucks) constitute 93 percent of the transportation sector total. Emissions from passenger vehicles, which are the subject of SB 375 and this RTP/SCS, constitute ___% of the transportation sector's greenhouse gas emissions total."
12	Clarification	80, left column	Statements are made, such as the following, "the RTP has the ability to affect the distribution of that growth" (in population in the region). These statements could be interpreted to be contrary to SCAG's obligation under the Memorandum of Understanding with OCCOG to respect the strategies and local land use policies in the OC SCS. *Please clarify how it is in SCAG's ability to affect local change when the OC SCS is consistent with acceptance of local land use plans and planned population and employment distribution?* *Recommended text change:* "Transportation projects including new and expanded infrastructure are necessary to improve travel time and can enhance quality of life for those traveling throughout the region. However, these projects also have the potential to ~~induce~~ attract more of the regional population growth in certain areas of the region. This means that although ~~Although~~ SCAG does not anticipate that the RTP would affect the total growth in population in the region, the RTP has the ability to affect the distribution of that growth." "~~In addition to induced population growth,~~ transportation projects in the RTP also have the potential to divide established communities, primarily through acquisition of rights-of-way."
		82, right column	Text indicates that the RTP and projects in the RTP/SCS as "inducing" growth. It is noted that use of the term "induced growth" has a negative connotation and implies growth above and beyond what would occur naturally. However, it is stated in the RTP that the population, housing, and employment growth totals are fixed and only the distributions may change based on the plan. This means there will not be "new" growth and that the RTP and SCS may simply influence and shift the growth anticipated for the region. This moving of growth is the result of changes in distribution that are due to changes in land use or densities. Because of this, it is requested that references to "induced growth" be reworded to reflect the shifting of growth in the region. *Recommended text change:* "Cumulative impacts from the projected growth ~~induced by the RTP~~ include increased impervious surfaces;…"

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
13	Clarification	page 95- Table 3.3	~~"Mileage-based user fees would be implemented to replace gas tax and augment – estimated at about $0.05 (2011$) per mile and indexed to maintain purchasing power starting 2025."~~ Suggested language is from page 31 of Growth Forecast Appendix: Current gasoline tax, estimated at about $0.05 (2011$) per mile will increase through 2025, then in 2026 it would be replaced with a mileage-based user fee indexed to maintain purchasing power
14	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw land available in the region ~~left to accommodate additional growth~~."
15	Clarification	106, last paragraph	Please revise the text in the last paragraph on page 106 to state: "These subregional SCS documents are incorporated into the regional SCS and represent the SCS for each of these subregions."
16	Clarification	110, right column	"Municipal water and sewer systems, for example, ensure clean water. At the same time, ~~concrete stormwater runoff channels harm water quality~~ ~~and sprawl eats into open space~~ as areas become more urbanized and the percentage of impervious surface is increased, the hydrologic regime is dramatically altered. Drainage conveyances that once were natural and riparian are required to be engineered as hardened flood control channels to provide adequate protection of private property and public infrastructure from the increased frequency, duration, peak flow, and overall volume of stormwater runoff. With this armoring of once natural channels, water quality benefits from biofiltration are lost along with opportunities for infiltration and evapotranspiration, which can lead to hydromodifcation downstream in sections which are not yet engineered and hardened. Many strategies…"
17	Add to glossary	127, right column	"Gentrification"
18	Please clarify	128, left column	"Thus, this adjustment allowed the land use pattern to conform more closely to local ~~expectations~~ general plans, while reducing the amount of vehicle miles traveled." *Whose/What are "local expectations?"*
19	Revise language to clarify	149, right column	Revise language to clarify that SCAG intends policies, strategies, and measures are a menu of options. "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which would help ~~can and should undertake in order~~ to successfully implement the SCS."

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
20	Revise language to clarify	153, right column	"Evaluation and Revision SCAG will also track its <u>own</u> progress in implementing its RTP/SCS strategies in conjunction with the preparation and adoption of its Overall Work Program and Annual Budget." *Clarify if "its progress" is SCAG's progress or the region's progress.*
21	Add to glossary	166, right column	"Greenfield"
22	Correct language	193, right column	RC adopted revised PPP in January 2012
23	Revise language to clarify	194, right column	"In addition to these targeted outreach efforts, all regular and special meetings of the RTP task forces, the Transportation Committee (TC)<u>, the CEHD, the EEC,</u> and the SCAG Regional Council are publicly noticed and …"
24	Please clarify	203, right column	"…including Los Angeles Ontario Airport, the March Inland Port…" *Should LAX and Ontario airports be named separately?*
25	Add to glossary	205	"Active transportation"

Table 1. GROWTH FORECAST APPENDIX COMMENTS

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Update growth forecast numbers	23, Table 13	In December 2011, Orange County provided SCAG with the revised growth forecast dataset, OCP-2010 Modified, per the OC SCS MOU (official OCCOG Board action 1/26/2012). *Please incorporate OCP-2010 Modified into all reports, tables, exhibits, alternatives, maps, and modeling runs for final RTP.*

Dear Ms. O'Connor:

RE: RTP and SCAG Land Use Planning – An Open Letter

Please note that many of our members recently attended what was one of many so called, "Visioning" sessions. This one was geared to our local elected officials and held at the Camarillo Public Library on January 19, 2012. Please note that very little public notice was given for the session. We were only made aware of it through a third party. At the beginning of this session we were subjected to a film clip that was little more than "touchy feely" propaganda. Adorable young tykes extolled the virtues of "walkable" communities and public transportation. The presentation was halted half way through due to questions from citizens who took umbrage to a plan that is, in truth, a one size fits all blueprint. These citizens are well aware that, "sustainable community strategies" is a marketing term crafted to pull the proverbial wool over the public's eyes. That it is, in fact, a move toward regional governance which will further distance voters from those who they have entrusted to safeguard their interests. Further we do believe 84 elected officials, from various cities and counties, can do what is in the best interest of their citizens when crafting policies for the over 18,000,000 residents residing within SCAG's boundaries.

We understand that more of these sessions are planned but that Ventura County has already had its allotted two in January. Yet, really, how much of the public were made aware of what you are planning? How many know that SCAG, once tasked to plan for future growth, has now morphed into a regional government that will alter our lifestyles and erode our freedom. How many of the taxpaying citizens of our county would agree to having so much of their transportation dollars funneled into transit and away from road expansion? How many would agree to plans for denser, pack and stack, development in what are suburban communities?

Citizens Alliance for Property Rights (CAPR), Ventura County, wishes to go on record opposing the implementation of your proposed sustainable strategies. Your plans have already damaged our communities, hampered our valuable agricultural industry, and caused further waste of precious taxpayer funds. Denser development makes sense for Santa Monica, the area you represent, Ms. O'Connor. However it makes no sense whatsoever in communities like Thousand Oaks and Simi Valley where people have moved to raise their families and enjoy a suburban lifestyle.

In closing, be aware we are watching you, know what a sham the Compass Blueprint is and how your efforts are shackling the very people you have, as elected officials, been sworn to serve.

Sincerely,
The Board of Directors
Citizens Alliance for Property Rights, Ventura County

RE: City Comments on the Draft SCAG 2012 Regional Transportation Plan (RTP) and Sustainable Communities Strategy and Program Environmental Impact Report; Support for RTP Project List and the 710N Gap Closure Project

Dear Mr. Ikhrata,

We are pleased to join with METRO in complimenting SCAG not only for its fine work on this far reaching document, but for its unprecedented outreach process. Both lend themselves to the success of the RTP.

We note that METRO, in its written communication to SCAG, stated that all of its projects which are in the Los Angeles County Long Range Plan (LRP) are also in the SCAG RTP. We acknowledge and support the LRP, and now the RTP, which includes all the Measure "R" transit and highway projects, with identified funding sources for each.

We further join with and support the complimentary comments of the City of Los Angeles which state, in its communication to you that, with a few minor exceptions, that the RTP is satisfactory to the City.

All of us are grateful for the Los Angeles County voter mandate known as Measure "R", now passed into law and being actively implemented. It is safe to say that without "Measure R" most all of our sorely needed transportation projects may not have seen a shovel raised to move the first piece of dirt.

"Measure R" provided certain amounts of money for specific projects. The 710N Gap Closure Project was named in the law and was allocated over 700 million dollars. We concur with SCAG and our other regional and city partners that the 710N Gap Closure Project is appropriately designated a "constrained project" in the 2012 RTP Constrained Plan and, further, that the 710N Gap Closure Project has met all the federal requirements for inclusion in said Plan. Attempts to say otherwise will be vigorously refuted by all parties.

Measure R was a mandate of the voters of Los Angeles County to fix the traffic problems and to clean up the air. The 710N Gap Closure was a significant part of the voter mandate, and efforts are now underway to fulfill that mandate. In fact, METRO is engaged in an EIR/EIS process right now at the project level. Any and all outstanding gap closure issues and the environmental impacts of which

transportation mode type (or combination of modes) should be used to close the gap will be answered within the next 30 months.

Two things are clear from the many 710N Gap studies prior to the current EIR/EIS effort: there is no proposed project in the SCAG region which reduces traffic congestion more than the completion of the 710 Gap, and there is no proposed project in the SCAG region which reduces air pollution more than the 710 Gap. The project is vital to many more than those who live in the area. It is vital to the conformity issue between the Transportation Plan and the Air Quality Plan.

We continue to join with those who have supported the Completion of the 710 Gap at METRO and as proponents of the closure of the Gap: US Congressperson Judy Chu, Senator Bob Huff, Assemblyman Cedillo, Assemblyman Mike Eng, SCAG, Independent Cities, San Gabriel Valley Council of Governments, Pasadena (by virtue of an imitative ordinance requiring support of the completion of the Gap), San Gabriel Valley Economic Partnership, 710 Freeway Coalition, Polling data: 710 completion, Supporters of the completion of the Gap, the vote of the CTC Public Infrastructure Advisory Committee supporting the project, the City of Rosemead, the City of San Gabriel, the City of San Marino the city of Monterey Park, El Serreno, and the City of Glendale among others. Support runs as high as 7 to 1.

While it may be tempting to trace the history of the project (actually going back as far as 1933), surely most everyone involved knows that history. The injustice occasioned on many is known; less recognized is why the injustice occurred and how our entire region has truly suffered over such a long period of time. The few still seem to believe that it is all right to harm the many.

In conclusion, the City of Alhambra joins with the voters of Los Angeles County and all our partners in looking forward to the day in the foreseeable future when the 710N Gap Closure will be a reality. We are proud to be a part of the Southern California Region and thank SCAG for producing an RTP we can all be proud of.

Sincerely,

Leland C. Dolley

RE: DRAFT 2012-2035 REGIONAL TRANSPORTATION PLAN, SUSTAINABLE COMMUNITIES STRATEGY, AND DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT

Dear Mr. Ikhrata:

Thank you for the opportunity to submit comments on the Southern California Association of Governments (SCAG) Draft 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) and its associated Draft Program Environmental Impact Report (PEIR). City staff recognizes the monumental efforts undertaken by SCAG to prepare these extremely important regional documents.

The City of Anaheim is a recognized leader in the region for establishing creative and innovative new, infill and refill development strategies that support many of SCAG's objectives, particularly as they relate to transportation infrastructure, urban growth, and sustainability. The City has also taken a proactive role in reducing regulations and promoting incentive based approaches to encourage business and development growth, preserve existing neighborhoods and help foster a freedom friendly regulatory environment. Our comments below are based on the extensive experience the City has in proactively supporting infill and refill development and reflect the City policies of reducing regulations and promoting incentive based approaches instead of increasing regulation. It is important that the RTP/SCS and PEIR documents do not contain provisions that restrict the City's flexibility to develop the policies, strategies and programs that will work best for our community while meeting regional goals.

Staff has also reviewed and concurs with comments from the Orange County Transportation Authority (OCTA) and the Orange County Council of Governments (OCCOG). Some of these OCTA and OCCOG comments are restated and highlighted in the comments below.

Comments on the RTP and SCS

Expanded High Occupancy Toll (HOT) Lanes System – Staff concurs with the OCTA comments identifying a need for additional information on the HOT Lane network included in the RTP. An expansion of toll facilities in the region that is not

200 South Anaheim Boulevard
P.O. Box 3222
Anaheim, California 92803
TEL (714) 765-5139
www.anaheim.net

consistent with the Long Range Transportation Plan (LRTP) prepared by the OCTA has been included in the RTP. Specifically, the RTP/SCS identifies a program to allow extra capacity in High Occupancy Vehicle lanes (HOV lanes or carpool lanes) to be sold to single-occupant drivers, thus converting these facilities into High Occupancy Toll (HOT) lanes. This change is shown along the SR-91 from the Orange/Los Angeles County border and connecting with the existing SR-91 toll facilities. Several miles of this facility are within or are partially within the City of Anaheim and are bounded by residential neighborhoods. Because the facility is not currently funded through the OCTA LRTP and does not have the capacity to support a toll system, more information is necessary to evaluate the project's feasibility.

Request:

1. *Please include text in the RTP stating that any expansion of the HOT lanes is tentative and would require additional study to determine right-of-way impacts, community issues, and overall feasibility.*

California High-Speed Rail Authority (CHSRA) Project – Staff concurs with the OCTA comments supporting a phased delivery approach, which includes early investment in the existing LOSSAN and Metrolink infrastructure, and indicating it is more prudent to begin implementation at the "bookends" of the system. City staff also submitted a letter to the CHSRA regarding the Draft 2012 Business Plan (see Attachment 1), indicating that implementing this "bookend" approach in the most urbanized regions of the State at the onset of the project is needed to enhance the passenger experience, reduce travel times, improve safety and provide critical connections to the existing passenger rail systems in these regions. It would also maximize the investment of State and Federal funds so that these critical improvements will be implemented.

Sustainable Communities Strategy – Under SB 375 and only within the SCAG region, subregional councils of government were allowed to prepare subregional SCSs that SCAG is then required to incorporate into the regional SCS. In Orange County, OCCOG and OCTA developed a countywide SCS (OC SCS) to be included as the County's contribution to the SCAG regional SCS. SCAG notes in the RTP/SCS that it has incorporated the OC SCS in its entirety into the regional SCS as an appendix to the document, but it is unclear what the standing of the OC SCS is. The OC SCS contains a set of strategies agreed upon by local governments, agencies and other stakeholders within Orange County and should represent the SCS that is applicable to the Orange County region.

Request:

2. *Please revise the text in the last paragraph on page 106 to state: "These subregional SCS documents are incorporated into the regional SCS and represent the SCS for each of these subregions."*

References to the RTP inducing growth – Several sections of the RTP/SCS state that it has the ability to affect the distribution of growth as well as induce growth (see page 80 under Population and Housing as an example). This is inconsistent with the "bottoms-up" approach SCAG undertook in the development of the documents wherein SCAG staff stated that they

would accept and use growth forecast data provided by local jurisdictions. The RTP/SCS is intended to incorporate the planned land use pattern that is expected to accommodate the projected future growth of this region as well as the planned transportation system that supports that growth. Therefore, growth is not induced, it is planned for. The document inaccurately implies a lack of coordination between land use and transportation entities.

Request:

3. *Please amend text within the RTP/SCS, including the language on page 80, to remove the reference to the RTP and SCS inducing growth and replace it with language that acknowledges that the document reflects a land use pattern that accommodates the forecast growth for the region.*

Comments on the Draft PEIR

Intent of the PEIR to Serve as a Menu of Options – The draft PEIR includes mitigation and direction to the region that appears to overstep the requirements of SB 375 related to land use planning and applies a prescriptive set of mitigation measures to local agencies, project sponsors and other entities. A key principle of SB 375 is that it is not intended to supersede local agencies' authority to regulate land uses. Specifically, Government Code section 65080(b)(2)(K) states that ". . . .Nothing in a sustainable communities strategy shall be interpreted as superseding the exercise of the land use authority of cities and counties within the region. . . ." However, the language used in the PEIR appears to impose obligations on local agencies within the SCAG region, which is inconsistent with this law. It also appears to be inconsistent with SCAG staff's explanation that the PEIR and its mitigation measures are intended to provide a "toolbox" or menu of potential options for local agencies to use at their discretion.

Specifically, the draft PEIR on page 1-7 asserts that mitigation measures have been determined to be feasible and states that entities "can and should" implement the measures. These statements, in addition to the use of "can and should" in mitigation measures addressed at local agencies and project sponsors, imply that local agencies are obligated to implement and address the measures regardless of whether they deem the measures are feasible and applicable to a particular project. It is recognized that the "can and should" language is derived from CEQA; however, given the express limitation of SB 375 upon local agencies' land use authority, the language is inappropriate. Further, SCAG did not complete the Climate and Economic Development Project (CEDP) that was intended to analyze and provide documentation related to the feasibility and effectiveness certain strategies would have on the region. Because of the lack of information supporting the determinations of feasibility, it is inappropriate for the PEIR to make such an assertion.

Requests:

4. *In order for the mitigation measures to truly be considered a toolbox of options for consideration by various entities in the SCAG region as intended, it is offered that all mitigation measures in the PEIR intended for entities other than SCAG be moved into an appendix to the PEIR and be renamed as sustainability strategies. These strategies could then be identified for consideration by lead agencies as mitigation for future projects*

should a lead agency choose to do so and deem them applicable and feasible. The PEIR should only retain mitigation measures applicable to SCAG. The PEIR should not make any determination of the feasibility of the measures applicable to other entities, as this will be made by a lead agency. The Executive Summary, Introduction, and Project Description must also be updated to reflect the nature of the new appendix of sustainability strategies.

Regardless of SCAG's acceptance of Request #4 above, the following comments are also provided:

5. *Due to the size of the SCAG region, it is not feasible for all potential projects undertaken within the SCAG region to be required to report to SCAG when mitigation measures in this PEIR are considered. Nor does it seem feasible for SCAG to accurately track the information in a meaningful way. Please clarify the obligations local agencies may have regarding SCAG's monitoring efforts. Specifically, clarify on Page 1-5 what the responsibilities of lead agencies are in regards to reporting to SCAG either use of or compliance with mitigation measures contained in the document.*
6. *Please provide the feasibility analysis on the mitigation measures included in the PEIR and incorporate as an appendix to the document.*
7. *Please amend the language in the first paragraph on page 1-5 to state: "Mitigation Measures proposed in this PEIR are available as tools for implementing agencies and local lead agencies to use, as they deem applicable. ~~can be incorporated as policies in the Final 2012-2035 RTP/SCS to help ensure that feasible mitigation measures are implemented at the project level.~~"*
8. *Please include language in the Executive Summary and in the certifying resolution for the PEIR explaining that the PEIR is intended to represent a menu of options available for consideration by local agencies and other entities at their discretion.*
9. *Please amend the language on page 1-7 under Mitigation Measures subheadings Transportation Project Mitigation and Land Use Planning and Development Project Mitigation to read: "The Draft PEIR includes a menu of possible mitigation measures that local jurisdictions, project sponsors, and other entities may implement as applicable and feasible. It is reasonable to assume that lead agencies, in their independent discretion, will implement measures which they determine to be applicable and feasible."*
10. *Please amend language in all mitigation measures identifying entities other than SCAG to state "~~can and~~ should consider where applicable and feasible."*

Policy Statements in the PEIR – The PEIR should not establish policy that has not been vetted in open and public forums. Most directly, page 2-3 of the Project Description, under the section Purpose and Need for Action, includes a bulleted list of policies that are not consistent with those included in the RTP/SCS. Additionally, many mitigation measures throughout the PEIR include an action and then, to give the action a direction, a policy statement follows that is inconsistent with or extends the policies in the RTP and SCS. For example, MM-TR 35 states: "Local jurisdictions can and should adopt a comprehensive parking policy that discourages private vehicle use and encourages the use of alternative transportation." While the policy to "encourage the use of alternative transportation" is directly linked to the policies of both the RTP

and specifically, the SCS chapter, the policy statement to "discourage private vehicle use" is not and would establish additional policy.

Requests:

11. *Please amend the bulleted list on page 2-3 to accurately reflect the actual policies and strategies included in the RTP and SCS as opposed to identifying new ones.*
12. *Please delete or amend all mitigation measures that include policy statements that would establish policy not contained in the RTP/SCS. If policy statements are amended as opposed to being deleted, please ensure that the policy statements are consistent with stated policies in the RTP/SCS. For example, in MM-TR35, please amend the text to state: "Local jurisdictions ~~can and~~ should, where applicable and feasible, adopt a comprehensive parking policy that ~~discourages private vehicle use and~~ encourages the use of alternative transportation." Attachment 2 identifies mitigation measures to delete or amend per this request. This list may not be exhaustive.*

CEQA Streamlining – One of the key components of SB 375 was the inclusion of incentives that provided CEQA streamlining for projects consistent with the objectives of the bill as well as consistent with the SCS. As identified on pages 1-10 through 1-12, for projects to qualify for these incentives, mitigation measures from the applicable environmental document must be incorporated into the project. It is not clear, however, which measures would need to be incorporated into a project for it to qualify, particularly in light of the intent of SCAG for the measures to be a toolbox.

Request:

13. *Please clarify how the "menu of mitigation measures" from this PEIR is expected to be used by a lead agency or a project to qualify for the use of the CEQA streamlining provisions of SB 375.*

SCAG Authority – Several mitigation measures, listed in Attachment 3, identify actions that SCAG shall undertake to mitigate impacts of the plan. Many appropriately direct SCAG to provide a discussion forum or serve as a central data repository for a broad range of topics that affect the region as a whole. However, many others inappropriately direct SCAG to establish practices, standards, or policy in areas unrelated to SCAG purview within the RTP. SCAG's authority is established by state and federal requirements regarding the RTP and its preparation. In recent years, its authority has been expanded by new state requirements contained in SB 375 that direct SCAG to consider the interaction between land uses and the transportation system in order to identify strategies that help meet state goals of reducing the cost of transportation infrastructure and reducing emissions of greenhouse gases from automobiles and light duty trucks that specifically result from the configuration of land uses. SCAG even stated in a Special Meeting of the Community, Economic and Human Development Committee on January 8, 2009, that SB 375 does not address green buildings, energy efficiency, municipal operation, waste management, water or technology of vehicles. The measures often appear to be directed at policy implementation that is under these other topics and is unrelated to the plan itself, such as implementing AB 32. Such measures will essentially require SCAG to establish policy in areas for which it has no authority.

Additionally, it is not clear how SCAG would fund the work efforts because they are not directly related to its mission and, therefore, do not have established funding. For example, MM-PS 118 states: "SCAG shall continue to develop energy efficiency and green building guidance to provide direction on specific approaches and models and to specify levels of performance for regionally significant projects to be consistent with regional plans." Green building practices and energy efficiency measures are already addressed by various state and federal agencies, as well as by other local and regional organizations, and are not related to regional transportation planning or requirements under SB 375. Further, SCAG does not have the authority to specify levels of performance for land use or buildings.

SCAG's development of such policies could have significant effect on the region and its growth and development if they become adopted due to changes in CEQA and other state laws that require consideration of adopted regional plans. Policies that could have such an impact should not be established without sufficient means to develop and maintain them reflective of new laws, regulations, and data. Without authority and a permanent funding source to maintain such offsets of policies, it would not be efficient or effective for SCAG to develop them.

Requests:

14. *Please limit mitigation measures that are applicable to SCAG to those areas for which SCAG has purview.*
15. *Please clarify how the actions and programs required by the measures SCAG is tasked with would be funded to ensure that they are feasible for SCAG to undertake.*
16. *Please remove the mitigation measures listed in Attachment 3 that are applicable to SCAG and for which it does not have purview for under the law. Please note that this list may not be exhaustive.*

SCAG's Ability to Accomplish Mitigation Measures – SCAG has limited authority in many of the areas included in measures it will be required to undertake. As such, it will not be able to ensure impacts are mitigated and that the outcomes identified do actually occur. SCAG can assist, offer information, educate, and provide discussion forums for topics outside its area of jurisdiction; however, it is not possible to "ensure" that outcomes are achieved for projects and development that are outside of its authority.

Request:

17. *In order for mitigation measures to be achievable by SCAG, it is recommended that all references within mitigation measures indicating that SCAG will "ensure" or "shall minimize impacts" be removed or amended. The following is an example of the recommended changes:MM-CUL17: "~~Impacts to cultural resources shall be minimized through cooperation, information sharing, and~~ SCAG~~'s~~ shall, through cooperation, information sharing and ongoing regional planning efforts such as web-based planning tools for local government including CA lots, and direct technical assistance efforts such as Compass Blueprint's Toolbox Tuesday series, provide information and assistance to local agencies to help them avoid impacts to cultural resources. Resource agencies, such as the Office of Historic Preservation, shall be consulted during this process."*

Measures Suggesting New Fees or Taxes – Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation, provision of transit and more. Increases to fees or taxes are issues that could require voter approval may not be approved. It is more appropriate to include such actions as options to implement measures and that such options would be at the discretion and consideration of the lead agency.

Request:

18. *Please indicate in measures that any new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. Additionally, no assertion that these options are feasible should be made in the PEIR.*

Measures Duplicative of Existing Law – Many of the mitigation measures are duplicative of existing regulation or processes (e.g. CEQA review requirements). Under the California Environmental Quality Act, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact and the significance of the impact after all existing regulation is applied. Therefore, mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigate the impact.

Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and the regulation. Attachment 4 presents a list of many of the mitigation measures that reflect existing regulations.

Request:

19. *Please remove all mitigation measures which are duplicative of existing regulations administered by or under the jurisdiction of other agencies. Attachment 4 includes a list of such measures; however, the list may not be exhaustive.*

Prescriptive and Specific Mitigation in Measures – Many mitigation measures identify specific technologies or prescriptive actions to be undertaken, such as specifying use of Light Emitting Diode (LED) technology for streetlights or specifying setback standards. Because the PEIR covers a large region for a several year period, specifying such technology or a specific regulation could create future conflict if more energy efficient technology becomes available or if better strategies are identified. It would be more appropriate for the PEIR to use broader definitions in what should be included in the implementation of mitigation and provide lead agencies with more latitude in determining what is appropriate for each project.

Requests:

20. *Please delete or amend all mitigation measures that include specific technology or specify prescriptive actions that are under the purview of local agencies. For example, in MM-TR 23, it is recommended that the measure be amended to state: "Local jurisdictions ~~can and~~ should, where applicable and feasible, coordinate controlled*

intersections so that traffic passes more efficiently through congested areas. Where traffic signals or streetlights are installed, local jurisdictions should, as applicable and feasible, require the use of a feasible, energy efficient ~~Light-Emitting-Diode (LED)~~ technology."

21. *Please delete mitigation measures or text within measures that is prescriptive, such as identifying the reduction of street widths to WWII widths or specifying building setbacks.*

Growth Forecast and Mapping
(Comments in this section are applicable to both the RTP/SCS and the PEIR.)

The City of Anaheim actively participates and works with SCAG, OCCOG, OCTA, and the Center for Demographic Research (CDR) at Cal State Fullerton to ensure that GIS and socio-economic growth forecast data intended for use in regional planning, including the RTP/SCS accurately reflects the City's land use pattern and expected growth.

Accuracy in all of these data sets is essential because these data are used throughout the region for a variety of transportation, growth, and air quality modeling that, in turn, is used to determine compliance with State and Federal regulation. With the passage of SB 375, these data carry the increased responsibility of demonstrating compliance the State goals to reduce greenhouse gas (GHG) emissions as well as directly linking the growth projections to State mandates relative to the Regional Housing Needs Assessment (RHNA). Because of the importance of these data, it is necessary for SCAG to utilize the most current and accurate data in the RTP/SCS and PEIR.

Requests:

22. *Please update all documents, tables, maps, narratives, modeling runs, and PEIR Alternatives (including the alternate referenced in the documents, including the PEIR, as C, 3, and Envision 2) that reference the Orange County growth forecasts with the Orange County Projections-2010 Modified Growth Projections, as adopted by the OCCOG Board of Directors and consistent with the subregional delegation Memorandum of Understanding between OCCOG, OCTA and SCAG.*
23. *Please ensure that all maps included in the adopted RTP/SCS and PEIR accurately reflect the City of Anaheim's data, as submitted to SCAG between 2008 and 2011, for 2008 existing land use, zoning, general plan land uses, and the growth forecast.*

There is also a need to ensure that these data remain flexible. Because the RTP/SCS is adopted and in standing for 4 years, it is important to ensure that flexibility is built into the land use and growth forecast data so that it can accommodate the large number of land use changes that will occur in the SCAG region in each cycle. It is particularly important for those cities making land use changes consistent with the goals and policies of the RTP/SCS that are not consistent with the growth forecast at a small scale. To ensure this flexibility, the growth forecast should not be adopted at a small geographic scale such as at a city level or census tract.

Request:

24. *To ensure flexibility and reduce potential conflicts with local control in land use matters, it is requested that SCAG adopt the growth forecast data set at the county level and not at*

a smaller geography such as a subregion, city, census tract, traffic analysis zone or other smaller geography.

We would again like to thank you for the opportunity to comment on these documents. Please forward any subsequent public notices and/or environmental documents regarding the projects discussed in the RTP/SCS and/or the PEIR to Tracy Sato, AICP, Senior Planner at the address listed at the bottom of the first page of this letter. If you have any questions regarding these comments, please do not hesitate to contact me at (714) 765-5010.

Sincerely,

Sheri Vander Dussen, AICP
Planning Director

Natalie Meeks
Public Works Director

City of Anaheim
DEPARTMENT OF PUBLIC WORKS

January 12, 2012

Chairman Thomas J. Umberg
Board of Directors
California High-Speed Rail Authority
770 L Street, Suite 800
Sacramento, California 95814

Subject: California High-Speed Rail - Draft 2012 Business Plan

Dear Chairman:

Thank you for the opportunity to review and comment on the Draft 2012 Business Plan for the California High-Speed Rail Project.

Attached to this letter are our comments on the Plan. Of particular interest is the proposed phased delivery approach for constructing the project, including the implementation of a blended approach allowing for existing rail service providers such as Amtrak, Metrolink, and Caltrain to provide much needed connectivity to the backbone of the high-speed rail system by sharing facilities and tracks. Implementing this approach in the most urbanized regions of the State (the Northern and Southern California "bookends" of the project) at the onset of the project, instead of the later phasing indicated in the Plan, is needed to enhance the passenger experience, reduce travel times, improve safety and provide critical connections to the existing passenger rail systems in these regions. It would also maximize the investment of State and Federal funds and ensure these critical improvements will be implemented. We therefore request your consideration of revising the project schedule to start this work at the onset of the project.

Thank you for your consideration of our comments. Should you have any questions, please contact me at 714-765-4530 or NMeeks@anaheim.net.

Sincerely,

Natalie Meeks
Public Works Director

C: Bob Wingenroth, Interim City Manager

California High Speed Rail
Comments on the Draft 2012 Business Plan

Comment Number	Location in Document	Comments
1	Page 2-2 Exhibit 2-1	Exhibit 2-1. Full high-speed rail systems with connections – There will be Intercity Bus services at the Anaheim Regional Transportation Intermodal Center (ARTIC). Please add the Intercity Bus symbol to Anaheim on the exhibit.
2	Page 2-19	Blended operations to Los Angeles and Anaheim – Please modify the second to the last sentence in this paragraph as follows (**bold** shows new word): "Anaheim **has** ~~will also have~~ connections to Amtrak's Surfliners and the Metrolink commuter rail service."
3	Page 3-5	San Francisco to Los Angeles/Anaheim (Phase 1) – Please change the end of the first sentence as follows: "and the **Anaheim** Regional Transportation **Intermodal** Center **(ARTIC).** ~~in Anaheim.~~"
4	Page 8-10	The Plan discusses potential local agency contributions including cost-sharing, contribution of right-of-way and cooperative funding arrangements or revenues from innovative use of right-of-way/system facilities/equipment. Have discussions with the local agencies been conducted to ascertain the level of interest in these types of programs?
5	Page 10-19	Please revise this section as follows (words requested to be removed shown in ~~strikeout,~~ additional words in **bold**): "Anaheim – The Anaheim Station ~~(ARTIC intermodal station)is planned as part of the 20-plus million square feet Platinum Triangle redevelopment project, which~~ **is planned as an expansion of the Anaheim Regional Intermodal Transportation Center (ARTIC) located between Angel Stadium and Honda Center within the 820-acre Platinum Triangle. This area, located north of the confluence of Interstate 5 and State Route 57, is planned for development of nearly 19,000 residential units; 5 million square feet of commercial development; and, 14.5 million square feet of office development.** Currently, 15 projects are at or past the design stage totaling more than 8,000 residential units, 600,000 square feet of commercial space and 130 hotel rooms. The 17-acre portion of the Platinum Triangle in the ARTIC ~~zone~~ **Mixed Use District** is expected to be office-oriented with some retail and residential space, specifically allowing for 520 residential units, 2.2 million square feet of office space, and 360,000 square feet of retail. ~~Overall, the Platinum Triangle has momentum and is expected to continue regardless of HSR access.~~ One major attribute that the Anaheim Station and HSR ridership will benefit from is the concentration of recreational **and convention** destinations within close proximity to the station, including Disneyland **Park, Disney's California Adventure and the Anaheim Convention Center in The Anaheim Resort** and ~~Angeles~~**the Angel** Stadium, Honda Center **and the City National Grove of Anaheim in the Platinum Triangle. The City of Anaheim is also working cooperatively with the Orange County Transportation Authority as part of the Go Local Program on a proposed fixed-guideway project which would connect ARTIC with destinations in the Platinum Triangle and The Anaheim Resort."**
6	General Comment	Please consider revising the project schedule to implement the blended approach at the project "bookends" at the onset. This will ensure that available funding is maximized to complete critical connections in the most urbanized areas of the State at the earliest point.
7	General Comment	It is unclear whether the Project costs include the cost of improvements at ARTIC to accommodate high-speed rail services. It is also unclear whether the costs of all mitigation measures needed to implement the project are incorporated since the environmental document is still underway.
8	General Comment	Do the project costs reflect increases in electricity costs that could occur with implementation of AB32?

City of Brea

February 13, 2012

sent via email: RTP@scag.ca.gov

Margaret Lin
Southern California Association of Governments (SCAG)
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

SUBJECT: COMMENTS ON THE DRAFT 2012 REGIONAL TRANSPORTATION PLAN AND SUSTAINABLE COMMUNITIES STRAGETY (2012 RTP/SCS)

Dear Margaret:

I am writing this letter to provide you with the City of Brea's comments on the 2012 RTP/SCS. We view the proposed RTP/SCS of critical importance to Brea and the region and we congratulate SCAG staff on its preparation which is truly a monumental achievement!

Brea values the dialog we have historically enjoyed with SCAG on regional issues. We have a solid track record and commitment to providing land use and transportation policies which are consistent with the existing and planned regional transportation system. We appreciate that the draft RTP/SCS encompasses three principals: Mobility, Economy, and Sustainability, that collectively work to significantly improve existing transportation and air quality challenges for the region. The inclusion of active transportation goals and funding at the regional level is one which Brea is extremely interested in for our "Tracks at Brea" trail program to increase non-motorized transportation in our community. The plan also indentifies the future bus rapid transit connection planned near the Brea Mall that will connect Breans to additional alternative transportation modes. We further note that our General Plan has numerous land use and transportation goals and policies already in place that align us well with the proposed 2012 Regional Transportation Plan and Sustainable Community Strategy.

We appreciate this opportunity to comment on the draft RTP/SCS. Our comments are primarily at the policy/implementation level although we have included one technical comment on the use of the revised OCP 2010 data set (which are also included within our comment letter to SCAG regarding the Program EIR). Our comments for the draft RTP/SCS are provided below:

City Council **Don Schweitzer** *Mayor* | **Brett Murdock** *Mayor Pro Tem* | **Ron Garcia** *Council Member* | **Roy Moore** *Council Member* | **Marty Simonoff** *Council Member*

Civic & Cultural Center • 1 Civic Center Circle • Brea, California 92821-5732 • 714/990-7600 • FAX 714/990-2258 • www.cityofbrea.net

Recycled

1. At what project threshold and how will SCAG review the performance of Brea and other local jurisdictions for consistency with the 2012 RTP/SCS through the life of the plan?

2. Can you explain further how SCAG envisions directing new housing and employment growth to High Quality Transit Areas (HQTA) in Brea and Orange County? Are there any consequences if agencies find it inappropriate to put growth in these areas, but are achieving the Plan's goals in other areas of our City?

3. Public Health is a concern of our residents. Does SCAG see a conflict in placing a majority of our future housing growth for Brea adjacent to high traffic roadways (57 Freeway) and the potential for public health impacts (e.g. air quality) associated with such areas?

4. The City supports the RTP/SCS goals for including valuable open space land preservation within its mitigation strategies as discussed in the Transportation Investments chapter (page 78) of the plan. This approach is consistent with the value placed on open space within the City's General Plan and is a key component of a balanced land use approach for the region. Lands within and surrounding Brea have the potential to provide for such mitigation approaches thus assisting with GHG reductions for the region. We welcome discussion with SCAG on this implementation as specific projects are submitted in the future.

5. The Plan includes a significant portion of "New Revenue Sources and Innovative Financing Strategies" that are not currently in place or available. While some of the proposed revenues are within the control of SCAG or MPOs and County Transportation Commissions, the majority of the revenues (in terms of dollars) require either state or federal action to implement. What might the implications be if these new revenue sources and innovative financing strategies do not become available, for both SB 375/ SCS compliance and/or air quality conformity?

6. Several goals of the plan are implemented through mitigation measures that indicate Brea or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, thus are speculative. They also represent prescriptive means to accomplish the mitigation. It is requested that such measures be reworded to indicate that a new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. Also, please clarify whether it was assumed that these additional fees were considered feasible and if the new fees that are suggested were considered in the financial plan or economic analysis of the RTP.

7. On page 149, it is stated that "The following tables list specific implementation strategies that local governments, SCAG and other stakeholders **can and should** undertake in order to successfully implement the SCS." Please indicate whether SCAG has conducted any feasibility analyses to determine if all of these strategies are feasible and what the implications are if not all are implemented. Also, please describe what Brea's obligations are anticipated to be as a result of adopting these strategies as a list to be accomplished

rather than a menu of options. It is requested that the language in the sentence be clear that it is permissive and at a minimum, change the text "can and should" to "may."

8. We request that internal consistency of the Land Use Pattern map for Orange County be confirmed between the plan document (page 145) and the technical reports or appendices. Specifically, the Land Use Pattern Map for Orange County (Exhibit 4.17 enclosed) shows a significant urban village designated for northeastern Brea. This area appears to be the location of the Olinda Landfill. Future residential development in this area cannot occur due to its current use. We believe this is simply an oversight as we have provided this input to SCAG in 2009 for the CLUS project. We note that the SCS Background Documentation Appendix does include an accurate map (enclosed) for Orange County which should be revised in the final document for Regional Council review and approval.

9. We request that the adoption of the final growth forecast numbers by the Regional Council and/or Joint Policy Committee be at the county level consistent with past RTPs and that these numbers be reflected in the 2012 RTP/SCS. The use of smaller geographic levels, such as at the subregional, city, census tract, TAZ, parcel, or grid cell could limit flexibility and a jurisdiction's local control over land use decisions. The final growth forecast numbers are a dataset which includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 by CDR and its use would provide consistency with the MOU on sub regional delegation between OCTA, OCCOG, and SCAG. All documents, tables, maps, narratives, modeling runs, PEIR alternatives (including Alternate C/3/Envision 2), and datasets should be updated with the OCP-2010 Modified numbers.

10. We suggest that the final document should reference the chapter number of each section of the plan in the header to assist the reader in cross-referencing the document.

11. We suggest adding to the glossary a definition for Active Transportation.

The City of Brea appreciates the opportunity to provide these comments. We recognize that plan goals can be successfully achieved through many different routes determined by local control and we are ready to work together with SCAG to implement them in Brea. Additionally, we have submitted a separate comment letter on the Draft Program EIR to Mr. Jacob Lieb. Please feel free to reach me at (714) 671-4421 or David Crabtree, Deputy Director/City Planner at (714) 990-7674 if you should have any questions about the comments.

Sincerely,

Eric Nicoll

Re: Comments on 2012-2035 Regional Transportation Plan / Sustainable Communities Strategy and Draft Program Environmental Impact Report

Dear Mr. Lieb:

The City of Burbank has reviewed the Draft 2012-2035 Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS) and the related Draft Program Environmental Impact Report (PEIR) and respectfully submits the following comments. The Burbank City Council reviewed and endorsed the content of this letter at its February 7, 2012 meeting.

Aviation Forecast

The City of Burbank has submitted comments on prior RTPs regarding the aviation forecast. As we have asserted in prior years, the City of Burbank continues to believe that the forecast of 9.4 million annual passengers (MAP) for the Bob Hope Airport is unreasonably high. Two of the primary constraints to passenger volume at the Airport are the number of passenger gates and the capacity of streets serving the Airport. The City believes that neither the existing streets nor the existing 14 gate terminal building could accommodate 9.4 MAP. The City and Airport Authority are engaging in a joint public outreach process to discuss the future of the airport, which may include a new terminal building. However, it is unlikely that anything other than a replacement terminal with the same number of passenger gates as the current terminal would be acceptable to the residents of Burbank who must ultimately vote on whether to approve any new terminal facility.

Based on the passenger volume trend since the airport opened in 1930, the City Council and City staff believe that 8.0 MAP is a more reasonable number for 2035. The City is using this number in our own forecasts, including our 2035 General Plan update and related EIR. This number is also consistent with the Airport Authority's own passenger forecast.

Transportation Projects

Project Funding

The 2012 RTP Financial Plan identifies two broad categories of revenue sources to fund projects identified in the plan. Core revenues, in the amount of $305 billion, are identified as committed or historically-available funding across the six-county region. Reasonably-available revenues, in the

amount of an additional $226 billion, are identified as new transportation funding likely to materialize during the plan period. These additional funds include revenues from adjustments to state and federal gas taxes, vehicle-miles-traveled user fees, tolling, private funding, and freight fees.

The plan assumes that these reasonably-available revenues will materialize to fund projects in the RTP Financially-Constrained Plan and are necessary to meet the region's greenhouse gas and air quality reduction mandates. However, many of these reasonably-available funding sources may in fact not materialize, especially given the controversial nature of some of the proposals. In particular, it may not be prudent to expect that VMT or mileage-based fees are politically feasible to implement, especially if these types of funding sources are relied upon to implement necessary projects in the Financially Constrained Plan. Further, the City is unaware of any VMT fee proposal being currently discussed at the regional or state level.

The City believes that SCAG should consider an alternative in the PEIR that does not assume the reasonably-available revenues identified the current draft become available during the plan period. This alternative would then modify the list of projects to include only those that are funded under the core revenues and assess the air quality and greenhouse gas impacts from this reduced plan. The City especially notes the significant uncertainty related to funding of the California High Speed Rail system.

Local Transit Service

The Transit and Rail policies in Section 2 - Transportation Investments, include emphasis on encouraging local transit operators to expand local transit services to serve as neighborhood circulators and "last-mile" transit connections between regional transit systems and major residential and employment centers. The City supports policies to encourage expansion of local transit service; however, the plan does not address the significant difficulty local agencies currently have in funding these types of services with the operating funds currently available to local jurisdictions within the region. The Plan should more specifically identify the additional funding necessary to implement expanded local transit, and should bolster policies and objectives that expand the availability of operations funding to local transit agencies.

Regional Transit Projects

The City believes that there are a number of regional transit projects in the Arroyo Verdugo Cities subregion of Los Angeles County that should be included in the 2012 RTP, especially if additional funding sources are identified over the next 25 years. These projects are identified in other long-range planning documents and, specifically, are called out in Metro's Long Range Transportation Plan adopted in 2009 as "Strategic Unfunded Projects." These important projects would improve transit mobility in and around the Arroyo Verdugo Cities region, and would especially improve east-west travel between the San Fernando and San Gabriel Valleys. The City believes that the following projects should be considered for implementation using additional reasonably-available funding sources as described in the Financial Plan:

a. Regional transit connection between the North Hollywood Red Line / Orange Line Station and the Gold Line in Pasadena via Burbank and Glendale
b. Extension of the Orange Line and/or Red Line to Bob Hope Airport
c. Bus Rapid Transit (BRT) or other regional transit connection between Downtown Burbank and Hollywood via Universal City.

d. Burbank-Glendale Light Rail (implemented as light rail, BRT, heavy-rail DMU, or other technology)

High Speed Rail

The plan identifies the California High Speed Rail system as influencing regional and intercity travel in the SCAG region, but does not specifically identify how this planned transportation improvement will integrate with regional and local systems. Integration of any intercity transit system with existing and planned transit services is critical to ensuring the effectiveness of this major transportation investment. The 2012 RTP should include stronger policies that support development of regional and local connections to High Speed Rail, including identification of future regional projects and funding needs that support High Speed Rail connections to the local network.

Land Use Policies

Regarding the variety of land use policies discussed in the RTP/SCS, the City provides a general comment that for these policies to be effective, land use control must remain at the local level. The RTP/SCS provides blanket policies that apply generally to the entire SCAG region and may not be appropriate in every situation. For example, the RTP/SCS associates Transit Oriented Development with higher residential densities and multifamily or mixed-use housing products. However, the City of Burbank contains many single family residential neighborhoods that are located within walking distance of transit centers and corridors, and within walking distance of commercial districts. The City is pleased that the RTP/SCS was developed based on existing local General Plans and local input, and that cities will continue to have sole authority over local land use decisions.

The City of Burbank appreciates the opportunity to comment on the RTP/SCS and PEIR and looks forward to continuing to work with SCAG on the issues addressed herein.

Sincerely,
Community Development Department

Mr. Jacob Lieb
Southern California Association of Governments (SCAG)
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017

RE: Draft Program Environmental Impact Report (PEIR), SCH# 2011051018 for the 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy

Dear Mr. Lieb,

Thank you for the opportunity to review and comment on the Draft Program Environmental Impact Report (PEIR), SCH# 2011051018, for the 2012-2035 Regional Transportation Plan (RTP) and Sustainable Communities Strategy (SCS).

Consistent with concerns raised by SANBAG, the City of Chino requests clarification on the legal meaning of the phrase "local jurisdictions can and should...," which was used in many of the mitigation measures. It may be the case, as demonstrated in our land use comments below, that local jurisdictions "cannot" comply with some mitigation measures as they are currently written, because they lack the legal authority. Therefore, the word "can" should be removed from the mitigation measures.

Land Use

Mitigation Measure LU48, page 3.8-21, says "Local jurisdictions can and should increase densities in urban core areas to support public transit." While the City's General Plan identifies certain areas in the City where future growth would be appropriate, the authority to approve density increases rests with our voters. The voters of the City adopted an amendment to the General Plan known as "Measure M" on November 8, 1988, codified as Chapter 20.15 of the Chino Municipal Code, which prohibits the City Council from increasing the density of any land designated for a residential use within the City as of November 8, 1988. Mitigation Measure LU48 assumes that we as a local jurisdiction can increase densities, when in fact the City does not have that authority apart from voter authorization.

Transportation, Traffic & Security

The City of Chino is in support of the Goods Movement Truck Route proposal. However, the City has concerns with the freeway's proposed cross section and its affect on current and future projects.

13220 Central Avenue, Chino, California 91710
Mailing Address: P.O. Box 667, Chino, California 91708-0667
(909) 627-7577 • (909) 591-6829 Fax
Web Site: www.cityofchino.org

The following is a list of five affected projects within the City of Chino contained in the "Project List" Supplemental Report:

1. RTP ID No. 4M07017-201133 SR 60 at Euclid Avenue - Widen W/B exit ramp from 2-3 lanes.

2. RTP ID No. 4M07008 SR-60 Ramona Avenue IC to SB I-15 Connector - Widen auxiliary lanes in each direction, widen connector from SB-15 to WB-60 and EB-60 to NB/SB-15, widen ramps from one lane to two lanes.

3. RTP ID No. 4M04050 SR 60 at Central Avenue - Add auxiliary lanes and widen ramps, construct entrance loop ramp.

4. RTP ID No. 4PL07019 SR 60 at Mountain Avenue - Reconstruct interchange SR-60 at Mountain Avenue.

5. RTP No. 4120202 SR-60 at Ramona Avenue - Reconstruct Interchange SR-60 at Ramona Avenue.

Close coordination between the State, County, City, and other affected jurisdictions should be required for any project proposal to ensure compatibility of design, including any interchange or regional arterial highway project along a proposed freeway route that is included in the SANBAG Development Mitigation Nexus Study. The Development Mitigation Nexus Study identifies fair-share contributions from new developments for regional transportation improvements in the San Bernardino Valley and Victor Valley. Please add a mitigation measure to the PEIR specifically requiring coordination with affected jurisdictions for projects falling within the SANBAG Development Mitigation Nexus Study area.

Water Resources

Mitigation Measure W39, page 3.13-42, should be revised to read as follows:

> Local water agencies can and should continue to evaluate future water demands and establish the necessary supply and infrastructure to meet that demand, as documented in their Urban Water Management Plans **and Facilities Master Plans.**

Thank you again for the opportunity to review and comment on the Draft PEIR for the RTP/SCS. Should you have any questions, please feel free to contact me at (909) 464-8310.

Sincerely,

Mike Kellison, AICP
Senior Planner

Re: SCAG RTP 2012-2035

Dear Ms. Lin:

We have reviewed the draft Regional Transportation Plan (RTP) for the 2012–2035 planning period. The City of Chino Hills supports SCAG's efforts toward increasing mobility, sustainability and quality of life for all cities within the region.

Specifically, Chino Hills supports inclusion of the following improvements that are included in the RTP Project List:

- Improvement of Eucalyptus Drive from Peyton Drive to the Chino Hills Community Park entrance;
- Improvement of Peyton Drive from English Road to Eucalyptus Drive, consisting of the widening of Peyton from 4-6 lanes with marked bike lanes in each direction; and,
- Improvement of Peyton Drive from Eucalyptus Drive to SR 142, consisting of the widening of Peyton to 2-4 lanes with marked bike lanes in each direction.

As previously indicated in our October 11, 2011, resolution to SCAG, the City of Chino Hills is reserving its support of the proposed dedicated truck lane along the SR-60 freeway corridor until such time as substantial study has been completed and provided to potentially effected cities, including Chino Hills.

Please do not hesitate to contact me at (909) 364-2610 if you have any questions.

Sincerely,

Michael S. Fleager
City Manager

CITY OF COLTON
INTEROFFICE MEMORANDUM

TO:	**MARK TOMICH, DIRECTOR OF DEVELOPMENT SERVICES**
FROM:	**AMER JAKHER, P.E., DIRECTOR OF PUBLIC WORKS AND UTILITY SERVICES DEPARTMENT** AJ
SUBJECT:	**RTP EIR REVIEW COMMENTS**
DATE:	**FEBRUARY 14, 2012**

In response to your e-mail dated 2/13/12 for the RTP EIR review/workshop, Public Works offers the following comments:

1. The City of Colton strongly recommends that a feasibility study be conducted to explore the possibility of locating a commuter rail station in the City of Colton. The potential locations are South La Cadena Dr. north of Fogg St. and within the downtown area, on the existing BNSF tracks. The City is an ideal location for the rail station because of several compelling reasons. First the locations being proposed are almost exactly at the midpoint from existing San Bernardino and Downtown Riverside stations, making it an ideal spot for a rail station. Secondly there are two major freeways that traverse Colton (I-10 and I-215) in east/west and north/south directions providing convenient and ample access. And finally the communities of Colton, Grand Terrace and other adjacent areas have no reasonable point of access to existing rail facilities in San Bernardino and Riverside Counties. Residents must travel long distance to access these facilities, hence making them less apt to use commuter rails. Finally he rail station will help to revitalize the downtown and adjacent areas of Colton that are impacted by the rail roads and the freeways, including the impact of Colton Crossing, that will allow additional trains on the existing rail lines.

2. Attached is the list of RTP that was submitted to SANBAG. The critical element on that list are as follow:

    a. Reche Canyon Road – Multi jurisdictional project. (Colton, County of San Bernardino, County of Riverside and city of Moreno Valley) Completion of design and environmental phase and securing funding for right of way acquisition and construction.
    b. Washington Street Extension – multi jurisdiction project. (Colton and Grand Terrace), Completion of design and environmental phase and securing funding for right of way acquisition and construction. This project will also require construction of a rail road grade separation on BNSF rail tracks.

c. Pepper Avenue Extension – This project is stalled due to Delhi Sand Loving Fly (an endangered species) habitat within the proposed project limits.

Most of the other projects listed are street widening and/or addition of lanes; the challenges for these projects are mostly right of way acquisition and funding.

Los Angeles, CA 90017-3435

Subject: OCCOG Letter of February 14, 2012

Dear Mr. Ikhrata:

On behalf of the Cypress City Council, I am contacting you to urge adoption of the comments made by OCCOG in their February 14, 2012 letter (attached) regarding the current RTP/SCS process and its corresponding/associated PEIR.

The work done by OCCOG was exhaustive, well considered and clearly demonstrates the commitment made by the member agencies to meaningfully participate in the preparation and review of a supportable and balanced RTP/SCS.

We are all aware of the scope and long term importance of these documents. The incorporation of the attached comments will contribute greatly to the viability of SCAG's efforts in this area and will result in an enhanced final product.

Thank you for coordinating this effort. The City of Cypress looks forward to a final document that incorporates these comments.

Sincerely,

Doug Bailey
Mayor

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

Dear Hasan,

On behalf of the Orange County Council of Governments (OCCOG), I would like to commend the Southern California Association of Governments (SCAG) and its staff who worked hard to prepare the draft Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS), the Program Environmental Impact Report (PEIR), and associated documents. This effort was monumental and unprecedented in our history and throughout the process collaboration between SCAG and Orange County stakeholders has been exceptional.

The 34 Orange County local jurisdictions and six special districts that comprise OCCOG thank you for the opportunity to comment on the Draft 2012 RTP and associated PEIR.

As you know, Orange County took upon itself the task of developing a subregional SCS. The continued cooperation of SCAG staff and the numerous references throughout the document where the RTP/SCS expressly states that it incorporates the Orange County Sustainable Communities Strategy (OC SCS) into the RTP/SCS document is greatly appreciated.

The OCCOG Technical Advisory Committee (OCCOG TAC), made up of member agency planning staff, created an ad hoc committee dedicated to the review of the Draft RTP/SCS and PEIR. This committee met four times since January 3, 2012, and has collectively spent hundreds of hours since reviewing the draft plan and documents. The OCCOG TAC review and analysis was considered in late January by the OCCOG Board and serves as the basis for OCCOG's comments.

The following general comments and recommendations are offered by OCCOG on the draft 2012-2035 RTP and SCS (draft RTP/SCS) and associated Appendices and draft PEIR (draft PEIR). OCCOG requests that this letter and its attachments be included in the public record as our collective comments on the draft RTP/SCS, PEIR and associated documents.

1. GROWTH FORECASTS

Issue: Growth Projections: The 2012 growth projections identify population, housing and employment data for the six-county SCAG region, from 2008 (existing) to 2020 and 2035. These growth projections represent the best available information from local jurisdictions, the business community, and landowners. However, as time passes, what is feasible for any given project can change. The triggers for change to adopted growth projections can range from factors such as market conditions, new information or data, infrastructure availability, changes in funding availability (such as the dissolution of redevelopment agencies statewide), and changes to jurisdictional boundaries resulting from future annexations and incorporations of previously designated unincorporated territory. SCAG should continue to adopt the 2012 growth projections at a countywide level, consistent with past approvals of the RTP growth forecasts.

A county level of geography accommodates internal adjustments to changing conditions as described above, without compromising the integrity of the overall growth projections. However, approving the growth projections at any lower level of geography, such as at the city level, would be challenged with continual revisions and shifts to the total number of housing, population and employment within a city, among cities, and between cities and counties as a result of the factors described above. Adoption of the data at a level lower than the county would limit jurisdictional control and create inflexibility in a regional planning document. In addition, the level of geography in which RTP/SCS growth forecast is adopted should not be determined by other processes. For example, the Regional Housing Needs Allocation (RHNA) allocations must be consistent with the RTP/SCS; state law does not require that they be identical. The RTP/SCS can be adopted at the county level and the RHNA process may proceed independently until it is completed after the appeals, trades, and transfers are completed. The RHNA allocations that were derived from the growth forecast can still be determined to be consistent with the RTP/SCS, even if changes are made to the city totals during the appeals, trades, and transfers process.

Growth Projections Recommendation: SCAG's adoption of the growth forecast numbers should be at the county level, consistent with past RTPs, and not at a smaller level of geography such as city, census tract, or traffic analysis level.

Issue: Orange County Projections (OCP)-2010 Modified: On January 26, 2012, the update to the OCP-2010 dataset known as "OCP-2010 Modified" was officially approved by the OCCOG Board of Directors and is a data amendment to the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2010 Employment Development Department Benchmark data, consistent with SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 and this letter also serves as the formal notice of the update that should be incorporated into the 2012 RTP/SCS, PEIR, and related documents.

OCP-2010 Modified Recommendation: All documents, tables, maps, narrative, modeling runs, PEIR Alternatives (including Alternate C/3/Envision 2) referencing

the Orange County growth forecasts should be updated with the Orange County Projections-2010 Modified Growth Projections, as adopted by the OCCOG Board of Directors and consistent with the subregional delegation Memorandum of Understanding (MOU) between OCCOG, OCTA and SCAG.

2. DRAFT RTP/SCS

Issue: 2012 Draft RTP/SCS: The RTP/SCS identifies strategies to reduce greenhouse gas (GHG) emissions from cars and light duty trucks. Because counties, jurisdictions and agencies have different needs and feasibility of implementation, we believe these strategies should be clearly identified as a menu of options that can be used to achieve the goal of reduced GHG emissions. However, the document can be construed to suggest that each of the strategies listed in the table on pages 150-153 are necessary to successfully implement the SCS, many of which are beyond SCAG's purview or control. It is requested that the language be clear that it is permissive.

2012 Draft RTP/SCS Requests:

1. **Revise language on page 149: "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which ~~that help can and should undertake in order~~ to successfully implement the SCS."**

2. **Please provide SCAG analysis supporting the strategies in the Draft RTP/SCS Chapter 4.**

3. **Please describe what municipal obligations are anticipated as a result of adopting these strategies as a list to be accomplished rather than a menu of options.**

Issue: OC SCS Strategies: There are strategies in the OC SCS that are not included in the regional SCS. Similarly, there are some strategies in the regional SCS that are not consistent with the strategies in the OC SCS. This creates confusion and clarification is needed.

Under SB 375 and only within the SCAG region, subregional councils of government were allowed to prepare subregional plans that SCAG is then required to incorporate into the regional SCS. In Orange County, the OCCOG and the Orange County Transportation Authority (OCTA) developed a countywide or subregional OC SCS that was to be incorporated in whole into the SCAG SCS. Local agencies in Orange County developed the OC SCS and approved it in June 2011. SCAG has incorporated the OC SCS in its entirety into the regional SCS as an appendix to the regional SCS, but it is unclear what the standing is of the OC SCS. The OC SCS contains a set of strategies that were agreed upon by local governments, agencies and other stakeholders within

Orange County and was accepted by SCAG and should represent the SCS that is applicable to the Orange County region.

OC SCS Strategies Recommendation: Please revise the text in the last paragraph on page 106 to state: "These subregional SCS documents are incorporated into the regional SCS and represent the SCS for each of these subregions."

3. DRAFT PEIR

Issue: Mitigation Monitoring Program Intent: It is unclear how SCAG intends to implement the Mitigation Monitoring Program with regard to the proposed mitigation measures, as may be implemented by local agencies. Section 1-5 of the PEIR specifically provides that "Lead agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring efforts, including SCAG's Intergovernmental Review (IGR) process." It is infeasible for SCAG to require local jurisdictions to report when such mitigation measures are considered for any project. Noting that the SCAG region includes 6 counties, 14 subregional entities and 191 cities, this reporting requirement would surely fall short of expectations. Given this identified infeasibility, please clarify what obligations local agencies may have regarding SCAG's mitigation monitoring efforts.

Mitigation Monitoring Program Intent Requests/Recommendations:

1. **Does SCAG intend to require all jurisdictions that avail themselves of the mitigation measures to report to SCAG when such measures are considered for any project?**

2. **SCAG's approval of the PEIR needs to clearly state the intent and applicability of the mitigation measures and the PEIR reflective of our comments below and that mitigation measures do not supersede regulations under the jurisdiction of other regulatory agencies.**

3. **Add language to Executive Summary and Introduction: "Mitigation measures do not supersede regulations under the jurisdiction of other regulatory agencies."**

4. Feasibility and Applicability

On pages 1-5 and 1-7, the language should reflect that Lead agencies will determine the feasibility and applicability of measures and that the measures are intended to offer a menu of options available should a lead agency opt to utilize them. The PEIR makes the assertion on page 1-7 of the Project Description under Transportation Project Mitigation and Land Use Planning and Development Project Mitigation sections that the draft PEIR has made a preliminary determination that all of the mitigation measures in it are considered feasible. SCAG has not identified any analysis that supports the feasibility of the mitigation measures that are to be undertaken by entities other than

SCAG and SCAG staff has stated on numerous occasions that the mitigation measures were intended to be a menu of options for consideration by lead agencies.

Issue: Mitigation Measures Impose Obligations Beyond Scope of SB 375. Given the combination of the RTP and the SCS processes, as mandated by SB 375, we recognize that SCAG must undertake the difficult task of balancing the goal of having a coordinated regional transportation system with land use strategies that encourage a more compact use of land. However, a key principle of SB 375 is that it is not intended to supersede local agencies' authority to regulate land uses. Specifically, Government Code section 65080(b)(2)(K) provides, in relevant part that ". . . .Nothing in a sustainable communities strategy shall be interpreted as superseding the exercise of the land use authority of cities and counties within the region. . ."

In light of the limitation expressed at Government Code Section 65080(b)(2)(K), we find language in the PEIR, and specifically the mitigation measures therein, imposing affirmative obligations on local agencies within the SCAG region to be inappropriate and contrary to law. The proposed language as recommended below would remedy the legal conflict with Section 65080(b)(2)(K), yet achieve SCAG's recognition that project-specific environmental review is the appropriate level of review for projects that have their own unique, site-specific circumstances.

The revisions are further consistent with OCCOG's understanding that SCAG intended to provide the mitigation measures as a "toolbox" to local agencies for use within their discretion if and when appropriate for projects within their respective jurisdictions. Indeed, from materials presented by SCAG, including the January 26, 2012 workshop held at the City of Anaheim Council Chambers, SCAG explained that "**This PEIR offers a "toolbox" of mitigation measures** for future project-level environmental analyses. . . It also includes suggested mitigation measures for local agencies to consider for implementation, if appropriate and feasible (phrased as "can and should"). This language is permissive and not mandatory upon local agencies."

Mitigation Measures Impose Obligations Beyond Scope of SB 375 Recommendations:

1. **Please provide SCAG analysis supporting the feasibility of mitigation measures in the PEIR.**

2. **Change language on page 1-7 found in 2 places under MITIGATION MEASURES, subheadings Transportation Project Mitigation and Land Use Planning and Development Project Mitigation: "This Draft PEIR has made a preliminary determination that the proposed mitigation measures are feasible and effective. Therefore, it is reasonable to expect that these agencies will actually implement them where, in the agencies' independent discretion, the measures are deemed applicable in light specific circumstances at the project level."**

3. **Change language on page 1-5, first paragraph: "Mitigation Measures proposed in this PEIR <u>are available as tools for implementing agencies and local lead agencies to use as they deem applicable</u>. The implementing agencies and local lead agencies <u>are</u> responsible for ensuring adherence to the mitigation measures as 2012-2035 RTP/SCS projects are considered for approval over time."**

4. **Please make similar text amendments to other sections, including the Executive Summary, of the PEIR that reference how the mitigation measures are to be used by lead agencies.**

5. <u>"Can and Should"</u>

As indicated in the PEIR on page 1-6, state law provides that it is appropriate to indicate in mitigation measures that they "can and should" be implemented where the authority to implement the measures rests with agencies other than SCAG. The language conveys to local agencies an affirmative obligation to address each mitigation measure, irrespective of whether such agencies deem the measures applicable to a particular project or duplicative of their own or other governmental agencies' regulatory measures (as discussed in Section 14). OCCOG recognizes that SCAG's use of the words "can and should" are derived from California Environmental Quality Act (CEQA), at Public Resources Code sections 21081 and 2155.2(b)(5)(B)(ii) and CEQA Guidelines, including section 15091(a)(2). Nevertheless, given the express limitation of SB 375 upon respective local agencies' land use authority, OCCOG deems any language seemingly imposing affirmative obligations contrary to SB 375 inappropriate. As such, the use of the language "can and should" for mitigation measures addressed to local agencies is inappropriate.

<u>"Can and Should" Recommendations:</u> Change language in all mitigation measures identifying entities other than SCAG to read "~~can and~~ should <u>consider where applicable and feasible</u>." To clarify the intent that the mitigation measures are a menu of options for which feasibility has not been established for any given project, the "can and should" language should be changed in all mitigation measures identifying entities other than SCAG to read "should consider where applicable and feasible."

6. <u>CEQA Streamlining:</u>

One of the key components of SB 375 was the inclusion of incentives that provided CEQA streamlining for projects consistent with the objectives of the bill as well as consistent with the SCS. As identified on pages 1-10 through 1-12, for projects to qualify for these incentives, mitigation measures from the applicable environmental document must be incorporated into the project. It is not clear, however, which measures would need to be incorporated into a project for it to qualify, particularly in light of the intent of SCAG for the measures to be a toolbox.

CEQA Streamlining Recommendations: Please clarify how the "menu of mitigation measures" from this PEIR is expected to be used by a lead agency as well as which ones lead agencies should address in order for a project to qualify the use of the CEQA streamlining provisions of SB375.

7. RTP/SCS Policies

Please ensure that the discussion of the policies represented by the RTP/SCS in the draft PEIR is consistent with the policies actually in the RTP/SCS. In particular, the bullet list on the page 2-3 is stated to represent the land use strategies of the plan; however, the strategies listed are not specifically identified in the regional SCS. Including different language in the PEIR implies additional policy.

RTP/SCS Policies Recommendation: Amend the land use strategies identified on page 2-3 of the Project Description, under the section Purpose and Need for Action to reflect the strategies included in the SCS chapter of the RTP.

8. PEIR Mitigation Measures

By far the most concerning portion of the Draft 2012 RTP/SCS to OCCOG members is the PEIR. Specifically, the proposed mitigation measures included in the PEIR extend to and impact a broad spectrum of technical and policy areas. Many examples of these concerns are included on Attachments 1 and 2 of this letter. In sum, the concerns are that the mitigation measures:

- Appear to go above and beyond the requirements of the Regional Transportation Plan and Senate Bill 375;
- Are measures already required by State and Federal law or are regulated by other agencies such as the South Coast Air Quality Management District, California Department of Housing and Community Development, Fish and Game, and the Regional Water Control Boards;
- Appear to run counter to local control; and
- Are financially infeasible for the agencies responsible for implementation.

PEIR Mitigation Measures Recommendations.

1. **In order for the mitigation measures to truly be considered a toolbox of options for consideration by various entities in the SCAG region as intended, all mitigation measures in the PEIR intended for entities other than SCAG should be moved into an appendix to the PEIR and renamed "Sustainability Strategies". These strategies could then be identified for consideration by lead agencies as mitigation for future projects should**

a lead agency choose to do so and deem them applicable and feasible. The PEIR would only retain mitigation measures applicable to SCAG. This action would also require that the Executive Summary, Introduction, and Project Description be updated to reflect the nature of the new appendix of Sustainability Strategies.

2. **Remove language within mitigation measures that establishes policies not included in the RTP/SCS or modifies the measure to specify a policy or endorses specific technology which would limit agency authority.**

3. **In the draft PEIR, please replace text in all mitigation measures that identify policy for either SCAG or other entities with language that reflects either adopted SCAG policies or are policies that are included in the RTP and SCS. Mitigation measures should not be used to establish new policy for the region.**

For example:

- MM-TR 17: "SCAG shall (for its employees) and local jurisdictions ~~can and~~ should institute where applicable and feasible teleconferencing, telecommute, and/or flexible work hour programs ~~to reduce unnecessary employee transportation~~.

- MM-TR 23: "Local jurisdictions should consider when applicable and feasible coordinated and controlled intersections so that traffic passes more efficiently through congested areas. Where traffic signals or streetlights are installed, require the use of a feasible, energy efficient ~~Light Emitting Diode (LED)~~ technology."

- MM-TR 35: "Local jurisdictions should consider where applicable and feasible the adoption of a comprehensive parking policy that ~~discourages private vehicle use and~~ encourages the use of alternative transportation."

9. SCAG Authority

Several mitigation measures identify actions that SCAG shall undertake to mitigate impacts of the plan. Many appropriately direct SCAG to provide a discussion forum or serve as a central data repository for a broad range of topics that affect the region as a whole. However, many measures inappropriately direct SCAG to establish practices, standards, or policy in areas unrelated to what SCAG has purview over. Further, the measures often appear to be directed at policy implementation that is unrelated to the plan itself, such as implementing AB 32. Such measures will essentially require SCAG to establish policy in areas for which it has no authority. Additionally, it is not clear how SCAG would fund the work efforts because they are not directly related to its mission and, therefore, do not have funding. For example, MM-PS 118 states: "SCAG shall continue to develop energy efficiency and green building guidance to provide direction on specific approaches and models and to specify levels of performance for regionally

significant projects to be consistent with regional plans." Green building practices and energy efficiency measures are already addressed by various state and federal agencies, as well as by other local organizations. Further, SCAG does not have the authority to specify levels of performance for land use or buildings.

SCAG Authority Recommendation: Remove the following mitigation measures for SCAG which it does not have purview for under the law or directed to do by the Regional Council through policy direction. List may not be exhaustive.

MM-BIO/OS 44	MM-LU 42	MM-LU 77	MM-PS 68
MM-BIO/OS 45	MM-LU 47	MM-LU 80	MM-PS 71
MM-BIO/OS 46	MM-LU 48	MM-LU 81	MM-PS 95
MM-BIO/OS 48	MM-LU 51	MM-LU 82	MM-PS 121
MM-GHG 3	MM-LU 53	MM-LU 83	MM-TR 17
MM-GHG 8	MM-LU 56	MM-NO 12	MM-TR 23
MM-GHG 11	MM-LU 57	MM-NO 16	MM-TR 28
MM-LU 9	MM-LU 60	MM-POP 1	MM-TR 35
MM-LU 21	MM-LU 61	MM-PS 3	MM-TR 83
MM-LU 22	MM-LU 64	MM-PS 14	MM-TR 85
MM-LU 24	MM-LU 65	MM-PS 25	MM-TR 96
MM-LU 26	MM-LU 69	MM-PS 37	MM-W 34
MM-LU 32	MM-LU 71	MM-PS 39	MM-W 59
MM-LU 34	MM-LU 74	MM-PS 41	MM-W 60
MM-LU 41	MM-LU 75	MM-PS 67	MM-W 65

10. SCAG Mitigation Measures

It would be helpful to understand how SCAG will implement the mitigation measures that it is assigned to do. Many of the mitigation measures will expand SCAG's role into areas that are not currently under its purview and are under the jurisdiction of other entities. Many also constitute significant work efforts.

SCAG Mitigation Measures Request: Please explain how the actions and programs required by the measures SCAG is assigned to do would be funded to ensure that they are truly feasible for SCAG to undertake.

11. Ensuring Outcomes

SCAG has limited authority in many of the areas included in the measures and will not be able to ensure impacts are mitigated and that the outcomes identified do actually occur. SCAG can assist, offer information, educate, and provide discussion forums for topics outside its area of jurisdiction; however, it is not possible to "ensure" that outcomes are achieved for things that are outside of its purview.

Ensuring Outcomes Recommendation: **Remove all references within mitigation measures that SCAG will "ensure" or "shall minimize impacts" that result from a mitigation measures.**

Example:
MM-CUL17: "~~Impacts to cultural resources shall be minimized through cooperation, information sharing, and~~ SCAG's shall, through cooperation, information sharing and ongoing regional planning efforts such as web-based planning tools for local government including CA lots, and direct technical assistance efforts such as Compass Blueprint's Toolbox Tuesday series, provide information and assistance to local agencies to help them avoid impacts to cultural resources. Resource agencies, such as the Office of Historic Preservation, shall be consulted during this process."

12. Fees and Taxes

Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, thus not be approved. They also represent prescriptive means to accomplish the mitigation.

Fees and Taxes Recommendations:

1. **Reword measures to indicate that a new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. The following list may not be exhaustive.**

MM-BIO/OS55	MM-PS15	MM-TR30	MM-TR88
MM-LU29	MM-PS63	MM-TR37	MM-TR94
MM-LU53	MM-PS75	MM-TR47	MM-TR96
MM-LU54	MM-PS76	MM-TR52	MM-W6
MM-LU80	MM-PS78	MM-TR60	MM-W32
MM-LU81	MM-PS92	MM-TR69	MM-W52
MM-LU82	MM-PS106	MM-TR74	MM-W58
MM-LU83	MM-PS107	MM-TR75	
MM-POP4	MM-PS113	MM-TR80	
MM-PS12	MM-TR28	MM-TR84	

2. **Please clarify whether it was assumed that these additional fees were considered feasible and if the new fees that are suggested were considered in the financial plan or economic analysis of the RTP.**

13. Guidance Documents

Guidance documents are there as information sources for consideration; however, they do not represent regulation or establish standards that are required to be achieved. For example, MM-AQ19 inappropriately indicates that project sponsors should comply with the CARB Air Quality and Land Use Handbook (June 2005) which is only a guidance document.

Guidance Documents Recommendation: Remove references that indicate a compliance with guidance documents from mitigation measures.

14. Duplicative/Existing Regulations

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g. CEQA review requirements). Under the CEQA, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact and the significance of the impact is after all existing regulation is applied. Therefore, mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigate the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and the regulation. It has become common practice to state that existing regulation will be implemented. When this is done, it is common practice when compliance is used as a mitigation measure to simply state that the responsible entity will simply comply with the regulation. If mitigation measures that restate existing regulation are not removed, then it is requested that the wording of the measures be restated to simply read that compliance with all applicable laws and regulations will be undertaken. Language that could be used is: "Local jurisdictions, agencies, and project sponsors shall comply, as applicable, with existing federal, state, and local laws and regulations." Similar language is included in some mitigation measures. It is offered that MM-PS 13 is a good example of the type of appropriate language and reads "Project sponsors can and should ensure that projects are consistent with federal, state, and local plans that preserve open space."

The water section provides another example. The PEIR includes 68 mitigation measures in the Water Resources section regarding water quality. At least 35 of these are related to storm water runoff best management practices (BMPs) that are currently regulated through Municipal National Pollutant Discharge Elimination System (NPDES) Storm Water Permits issued by Regional Water Quality Control Boards. In the SCAG region, there are five water quality control boards each with its own Municipal NPDES Storm Water Permit. The regulations and requirements contained in these permits vary from each other. By listing specific measures in the PEIR that are not included in a project's applicable Municipal NPDES Storm Water Permit, the PEIR creates conflicting compliance requirements. To eliminate potential conflict with existing regulations, the

mitigation measures regarding specific BMPs should be removed and replaced with a single requirement that each project must comply with its applicable Municipal NPDES Storm Water Permit.

Duplicative/Existing Regulations Recommendations:

1. **Please remove all mitigation measures listed in Attachment 1 which are duplicative of existing regulations administered by or under the jurisdiction of other agencies. The list may not be exhaustive.**

2. **For each impact, please add the following language: "Local jurisdictions, agencies, and project sponsors should comply, as applicable, with existing federal, state, and local laws and regulations."**

15. Draconian Mitigation Measures

Many of the mitigation measures in the Draft PEIR are draconian and need to be removed. One prime example is MM-LU 85. It reads in part "Local jurisdictions can and should reduce heat gain from pavement and other hardscaping including: Reduce street rights-of-way and pavement widths to World War II widths (typically 22 to 34 feet for local streets and 30 to 35 feet for collector streets curb to curb)..." Although reduced street widths may be appropriate in some cases and have been implemented in many jurisdictions, it is inappropriate and counterproductive to require reduced street widths as a mitigation measure in the PEIR. Reduced street widths, for example, generally do not provide space for on-street parking which may result in greater, additional paved areas provided in separate parking lots. A second example is MM-LU15: "Project sponsors can and should ensure that at least one acre of unprotected open space is permanently conserved for each acre of open space developed as a result of transportation projects/improvements." Measures should support the SCAG Energy and Environment Committee which recommended that the programs build upon existing open space land acquisition and open space programs in the region, tailoring programs to each individual county in the region. These include, but are not limited to, OCTA's Measure M Mitigation Program, and Transportation Corridor Agency's open space mitigation program, which has protected 2,200 acres in perpetuity to date. Open space conservation should be pursued in a voluntary manner, working with willing private sector landowners and not be overly prescriptive and specific.

Draconian Mitigation Measures Recommendations: Remove mitigation measures that are very prescriptive, such as reducing street widths to WW II widths or specifying preferred technology.

In addition to the above comments, detailed technical comments, language changes, and questions on the RTP/SCS, Appendices, and PEIR documents are included in Attachment 2.

Conclusion

We recognize the immense efforts it took to prepare these documents. They represent incredibly complex technical work and have important and far-reaching policy impacts for our region. However, because of this importance and complexity, we would like to express concern about the timing of the release of the documents and hope that preparation of future RTP/SCS documents will take into account the need to accommodate adequate review, discussion and revision time for all of the documents. The current timeline of document releases, public comment period, and time allowed for the response to comments results in an inability to have credible discussion regarding possible changes because the timeline does not allow for recirculation or full discussion of requested changes. The documents were released over the holiday season and included the release of the draft PEIR document on December 30, 2011. The minimum 45-day public comment period closes on February 14, 2012. Only a few weeks are provided to prepare responses to comments and amend the documents to ensure that the Regional Council may consider the certification of the PEIR and the approval of the draft RTP/SCS on April 4, 2012.

We appreciate your consideration of all of the comments provided in this letter and its attachments and look forward to your responses. It is a shared goal to have an RTP/SCS adopted that is credible and defensible on all levels. If you have any questions, please do not hesitate to contact me or Dave Simpson, OCCOG's Executive Director.

Sincerely,

Peter Herzog
Chairman

1	General Comment	all	*All chapter headings should include the Chapter number on each page for ease of reference.*
2	Clarification	1, left column	"The 2012 RTP/SCS includes a strong commitment to reduce emissions from transportation sources to comply with SB 375, ~~both~~ improve public health, and meet the National Ambient Air Quality Standards as set forth by the federal Clean Air Act. As
3	Clarification	4, right column	"This region needs a long-term, sustainable funding plan that ensures the region receives its fair share of funding, supports an efficient and effective transportation system that grows the economy, provides mobility choices, and improves our quality of life."
4	Clarification	page 7- Table 2 and page 95- Table 3.3	*Is additional $0.15 gas tax the sum total of both state and federal taxes or $0.15 each?*
5	Clarification	40, left column	"Strategic investments, put forth by the private sector, that would remove barriers associated with telecommuting are expected..."
6	Correction	page 42- Table 2.2	241 toll road completion year is 2030
7	Please define in the text and add to a glossary	50, left column	"scrip"
8	Clarification	54, right column	"Express/HO T Lane Network Despite our concerted effort to reduce traffic congestion through years of infrastructure investment, the region's system demands continue to exceed available capacity during peak periods."
9	Clarification	70, 78	Greenhouse Gases and Air Quality SCAG seems to rely on CEQA to achieve the "maximum feasible" reductions in emissions from transportation. However, this is not consistent with the intent of SB 375's goal of achieving specific thresholds of 8% by 2020 and 13% by 2035 through a sustainable communities strategy plan.

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			Please provide clarification to this section indicating if the air quality and greenhouse gas CEQA mitigation measures obligate regional agencies and project developers to undertake more strategies, programs and mandates beyond those included in the OC SCS.
10	Clarification	78, right column	"Greenhouse Gases On road emissions (from passenger vehicles and heavy duty trucks) constitute 93 percent of the transportation sector total. Emissions from passenger vehicles, which are the subject of SB 375 and this RTP/SCS, constitute % of the transportation sector's greenhouse gas emissions total."
11	Clarification	80, left column	Statements are made, such as the following, "the RTP has the ability to affect the distribution of that growth" (in population in the region). These statements could be interpreted to be contrary to SCAG's obligation under the Memorandum of Understanding with OCCOG to respect the strategies and local land use policies in the OC SCS. *Please clarify how it is in SCAG's ability to affect local change when the OC SCS is consistent with acceptance of local land use plans and planned population and employment distribution?* *Recommended text change:* "Transportation projects including new and expanded infrastructure are necessary to improve travel time and can enhance quality of life for those traveling throughout the region. However, these projects also have the potential to ~~induce~~ attract more of the regional population growth in certain areas of the region. This means that although ~~Although~~ SCAG does not anticipate that the RTP would affect the total growth in population in the region, the RTP has the ability to affect the distribution of that growth." "~~In addition to induced population growth,~~ transportation projects in the RTP also have the potential to divide established communities, primarily through acquisition of rights-of-way."

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
		82, right column	Text indicates that the RTP and projects in the RTP/SCS as "inducing" growth. It is noted that use of the term "induced growth" has a negative connotation and implies growth above and beyond what would occur naturally. However, it is stated in the RTP that the population, housing, and employment growth totals are fixed and only the distributions may change based on the plan. This means there will not be "new" growth and that the RTP and SCS may simply influence and shift the growth anticipated for the region. This moving of growth is the result of changes in distribution that are due to changes in land use or densities. Because of this, it is requested that references to "induced growth" be reworded to reflect the shifting of growth in the region. *Recommended text change:* "Cumulative impacts from the projected growth ~~induced by the RTP~~ include increased impervious surfaces;..."
12	Clarification	Chapter 3	SCAG's Financial Plan includes a significant portion of "New Revenue Sources and Innovative Financing Strategies" that are not currently in place or available. While some of the proposed revenues are within the control of SCAG or MPOs and County Transportation Commissions, the majority of the revenues (in terms of dollars) require either state or federal action to implement. *Please explain what the implications are if these new revenue sources and innovative financing strategies do not become available?*
13	Clarification	page 95- Table 3.3	~~"Mileage-based user fees would be implemented to replace gas tax and augment - estimated at about $0.05 (2011$) per mile and indexed to maintain purchasing power starting 2025."~~ Suggested language is from page 31 of Growth Forecast Appendix: "Current gasoline tax, estimated at about $0.05 (2011$) per mile will increase through 2025, then in 2026 it would be replaced with a mileage-based user fee indexed to maintain purchasing power."

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
14	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw land available in the region ~~left to accommodate additional growth~~."
15	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw land available in the region ~~left to accommodate additional growth~~."
16	Clarification	106	SCAG indicates that the OC SCS has been incorporated into the regional SCS. OCCOG was one of two subregions that undertook the arduous task and obligation of preparing an SCS. *Please add clarifying text that these subregional SCSs, including the OC SCS, represent the Sustainable Communities Strategies applicable to those subregions.*
17	Clarification	110, right column	"Municipal water and sewer systems, for example, ensure clean water. At the same time, ~~concrete stormwater runoff channels harm water quality~~ ~~and sprawl eats into open space~~ as areas become more urbanized and the percentage of impervious surface is increased, the hydrologic regime is dramatically altered. Drainage conveyances that once were natural and riparian are required to be engineered as hardened flood control channels to provide adequate protection of private property and public infrastructure from the increased frequency, duration, peak flow, and overall volume of stormwater runoff. With this armoring of once natural channels, water quality benefits from biofiltration are lost along with opportunities for infiltration and evapotranspiration, which can lead to hydromodifcation downstream in sections which are not yet engineered and hardened. Many strategies…"
18	Clarification	112, 117	The SCS documents the development of four scenarios to explore basic aspects of future growth. These scenarios were used in public outreach and the SCS and the associated Appendix states that "Using the public dialogue and feedback from the analysis of the SCS Scenarios, SCAG developed

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			the 2012 RTP/SCS Plan alternatives." (Similar references are also include at RTP/SCS p. 117, and SCS Background Documentation p. 71). The RTP/SCS and Appendix then describes a process that led to the Plan alternatives. Neither the RTP/SCS, Appendix or PEIR expressly state or illustrate the fundamental land use and socioeconomic foundation for the SCS. *In order to confirm consistency with the OC SCS, it is requested that SCAG include appropriate tables, graphics and maps that provide the detail that confirm this consistency.*
19	Clarification	113, 122	The regional SCS states that the scenarios/alternatives were developed using the Local Sustainability Planning Tool (LSPT). The LSPT is a sketch planning tool that flattens geographical areas to a 5-acre grid cell. The OC SCS land use data was provided at much greater level of detail in that specific parcel data and detail were provided by each jurisdiction. A cursory review of some LSPT data reveals inconsistencies regarding interpretation of Orange County land uses. It is acknowledged that the regional SCS states, "Land use inputs for OCCOG SCS were unchanged". Yet use of the LSPT and SCAG Development and Community Types presented in the SCS leave open the question as to whether the OC SCS was altered, as noted above. *Please provide confirmation that the underlying OC SCS land use data was used without significant alteration and LSPT flattening and interpretation in the development of the regional SCS Plan and alternatives.*
20 17	Add to glossary	127, right column	"Gentrification"
21	Clarification	128, left column	"Thus, this adjustment allowed the land use pattern to conform more closely to local ~~expectations~~ general plans, while reducing the amount of vehicle miles traveled." *Whose/What are "local expectations?"*

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
22	Clarification	149, right column	*Revise language to clarify that SCAG intends policies, strategies, and measures are a menu of options.* "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which would help ~~can and should undertake in order~~ to successfully implement the SCS."
23	Clarification	150-152	The OC SCS was accepted by SCAG and represents the set of strategies and the growth distribution that outlines the best approach for how the requirements of SB 375 would be met within the subregion. Specifically, the OC SCS included 15 specific Sustainability Strategies, reflecting a menu of 222 practices and actions that OC agencies have agreed to pursue (or continue to pursue) to achieve GHG reductions that support SB 375. *Why doesn't the regional SCS specifically acknowledge these 15 strategies yet include other strategies and performance measures not included in the OC SCS (e.g., Locational Efficiency)?*
24	Add to glossary	166, right column	"Greenfield"
25	Clarification	194, right column	"In addition to these targeted outreach efforts, all regular and special meetings of the RTP task forces, the Transportation Committee (TC), the CEHD, the EEC, and the SCAG Regional Council are publicly noticed and …"
26	Clarification	201	*Please clarify whether the text stating "Long-term emission reduction for rail, with a goal of zero-emissions rail system" is intended to reflect a zero-emissions freight rail system, or whether this goal also applies to passenger rail.*
27	Clarification	202, 203- Table 7.1	Unfunded operational improvements, of which several are listed on page 203, Table 7.1, include transit station improvements in Irvine, Fullerton, and Santa Ana, bus rapid transit (BRT) in Orange County, and high speed rail (HSR) Phase II. *Please confirm that these are consistent with the OC SCS.*

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
28	Clarification	207	Strategic Finance *Please explain what will happen if reasonably foreseeable revenue sources of approximately $200 million do not become available?*
29	Add to glossary	205	"Active transportation"

GROWTH FORECAST APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Updated growth forecast numbers	23, Table 13	In December 2011, Orange County provided SCAG with the revised growth forecast dataset, OCP-2010 Modified, per the OC SCS MOU (official OCCOG Board action 1/26/2012). *Please incorporate revised Orange County numbers (i.e. OCP-2010 Modified) into all reports, tables, exhibits, alternatives, maps, and modeling runs for final RTP.*

PERFORMANCE MEASURES APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Clarification	1	The document states, "The performance measures are used to evaluate how well the RTP/SCS addresses the adopted goals and performance outcomes." *Is there any formal role for the performance measures?* ARB will evaluate for SB 375 compliance not based on these measures but based on ARB process. *Please include language clarifying that this is a requirement to demonstrate compliance with federal requirements and not for the obligations under SB 375.*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
2	Clarification	1, end of first paragraph	Add statement: "Performance measures and expected outcomes will be used to monitor the RTP/SCS at the regional level; these measures and outcomes are not proposed for use at the subregional or project-specific level."
3	Clarification	1, column 2	The document states, "The Regional Council will formally adopt the goals and outcomes as part of the final 2012 RTP/SCS." *Does this bring any formal obligation to meet goals? Goals are general, flexible, and aspirational rather than specific, as on p.1.*
4	Clarification	13, Table 8	The RTP/SCS claims an extra 2% CO2e emissions reduction in 2035 from the NHTS post-processing analysis. While the RTP/SCS meets the ARB SB375 goal without the extra 2%, we would like to note that the extra 2% could be important if the attorney general raises concerns about backsliding. Consequently, the reliability of the extra 2% reduction should be checked. Questions on the NHTS model are below. It would be useful to know the answers to better judge the quality, although we do note that the report does look like it meets the standards or best practice.
5	Clarification	9	NHTS Model Documentation Report *Are the auto and bus accessibility variables included in the regression models for 30-mile rings?* *In "Number of trips" model – is number of cars, included as an independent variable, the actual or predicted value?* *The same question applies to other models.*
6	Clarification	23, Table 10	NHTS Model Documentation Report *Were the elasticities for the SCAG NHTS study calculated at sample means, or for each observation and then averaged for the sample?*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
7	Clarification	24, Test 3	NHTS Model Documentation Report (Compare Trip-Based and NHTS Model): The final test was to compare the results of the Trip-Based Model and the NHTS Model for the same scenarios. *Please describe the scenarios tested.*

TRANSPORTATION FINANCE APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Clarification	General	*What are the implications if revenues other than core revenues do not become available?* *Please describe any implications to the ability of the region to meet SB 375 GHG emission reduction targets or the federally required air quality conformity?*

SCS BACKGROUND DOCUMENTATION APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Please define	53, right column	Housing Options and Mix: Define Larger-lot single family in text
2	Clarification	71-74, 80-83	Alternatives naming: A, B, C Names of Alternatives differ than those listed in the PEIR on pages ES-3 and 1-4. *Please be consistent with naming protocol for alternatives between two/all documents.*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
3	Revise language to clarify	71, right column	"Plan Alternative (B) ... The alternative maintains city-level forecast control totals for both households and jobs, however, within city boundaries shifts are made to focus a much larger share of future growth in a more compact way around HQTAs, except in Gateway and Orange County COG subregions per their SCS delegation agreements. Future housing market demand is expected to shift significantly to small lot single-family, townhomes and multi-family ~~hosuing~~ housing."
4	Please define	71, right column	Plan Alternative (B) Define small lot single family in text
5	Revise language to clarify	71, right column	Plan Alternative (C) "As a result very suburban communities may experience no new housing or employment growth, while some urban areas with very good access to regional transit may experience significant increases in housing or employment growth."
6	Revise language to clarify	72, left column	"While each alternative is distinctive, a number of parameters remained constant across each alternative: the regional RTP/SCS forecast total for population, households and jobs;..." "Detailed forecast: the detailed distribution of population, households, and jobs across the region..."
7	Revise language to clarify	72, Table D1	Alternatives A & B: "Controlled to TAZ-based RTP/SCS Forecast for 2020; Controlled to city-level RTP/SCS Forecast for 2020-2035, except in Gateway and Orange County COG subregions per their SCS delegation agreements." Add statement to table notes: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
8	Revise language to clarify	74, Table D2	Alternatives A & B: Add statement: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
9	Clarification	75, right column	"Development Types The alternatives are built on, and provides data at, the level of the TAZ, which includes housing units and employment." *Please clarify if TAZ is Tier 1, Tier 2, or both.*
10	Revise language to clarify	79, right column	"Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be ~~respected~~ unchanged and integrated into the alternatives (with possible revisions for Alternative C only)."
11	Clarification	79	The section includes the following language: "Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be respected and integrated into the alternatives (with possible revisions for Alternative C only)." *Please clearly indicate what the "possible revisions" are and what process would be used to coordinate with Orange County should changes to the socioeconomic data contained in the OC SCS be proposed?*
12	Revise language to clarify	80	Alternative A Add statement: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
13	Revise language to clarify	81	Alternative B It is not clear whether Alternative B is the SCS land use plan. If it is, statements in the appendix lead one to believe the OC SCS foundation has been altered. For example, adjustments made to land uses to locate proximate to High Quality Transportation Areas (HQTA) and intensification of residential and employment development in HQTA that diverge from local General Plans as well as implementation of a vehicle user fee are not part of the OC SCS. *Is Alternative B the SCS land use plan?* *Add statement:* Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
14	Clarification	115, left column	Transit Zoning Code Santa Ana 2011 *Is this a duplicate of the 2010 Santa Ana project?*

PEIR

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
1	Revise language to clarify	ES-2	ES contains matrix of mitigation measures which reference project sponsors, local agency, and project implementation agency without definitions. Add definitions into ES at end of ES.1: In general, the terms "local agency," "project sponsor" and "project implementing agency" are used throughout this PEIR to identify agencies, organizations, companies and individuals that will act as lead agencies or project applicants for different types of individual projects. Individual projects that are anticipated to occur pursuant to the 2012-2035 RTP/SCS consist of planning projects (general plans, specific plans, climate action plans, etc.), development projects (including Transit Priority Projects (TPPs) and other similar projects), and transportation projects. In general, "local agency" is used to refer to a public agency that would propose a planning project or a public infrastructure project and/or an agency that would be lead agency for individual projects. "Project sponsor" is typically used to refer to an applicant (that could be public or private, an organization or an individual) that proposes a project. "Project implementing agency" is used to refer to an agency responsible for implementing a project. In this document, project-implementing agencies are those that are responsible for carrying out (reviewing, approving, constructing) transportation projects.
2	Clarification	ES-3, 1-4, Chapter 4	Alternatives' Naming: No Project Alternative, Modified 2008 RTP Alternative, Envision 2 Alternative; Alternatives 1, 2, 3 Names of Alternatives differ than those listed in the SCS Background Documentation appendix on pages 71-74 and 80-83. *Please be consistent with naming protocol for alternatives between all documents.*

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
3	Fix numbering	ES-31	Duplicate naming of GHG11 and GHG12
4	Please define	ES-42	LU63- What are the smart growth principles?
5	Please define	ES-42	LU64- What are the benchmarks for smart growth?
6	Fix numbering	ES-51	PS17 & PS18 are missing
7	Fix numbering	ES-53	Duplicate naming of PS36 & PS37
8	Please define	ES-67	TR 34- what are the identified transportation benchmarks?
9	Please define	ES-83, 3.13-42 MM-W43	Define climate change hydrology
10	Please define	ES-40, 3.8-21 MM-LU42	Define urban growth boundary
11	Please define	ES-57, 3.11-49 MM-PS68 & ES-74, 3.12-43 MM-TR96	Define parking cash out program/ cashouts
12	Clarification	1-5	*Besides IGR, what other monitoring efforts is SCAG in charge of? (that would require lead agencies to provide SCAG with documentation of compliance with mitigation measures)*
13	Language correction	1-6, paragraph 3	Language correction: "The ~~latter~~ **former** finding…"
14	Language correction	2-5	Sustainability section should be separated. Language correction: **Sustainability**. The 2012-2035 RTP/SCS is subject to specific requirements for environmental performance. **New paragraph:** "Beyond simply meeting these requirements, a …"
15	Language correction	2-5, Table 2-2	"Align the plan investments and policies ~~with~~ **while** improving…"
16	Please define	2-14	Define "scrip"

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
17	Narrative	2-21	AB 32 is global warming solutions act. SB 375 was determined to be stand-alone legislation. RTP document is not forum to address global climate change and references distract from RTP goal and purpose. "Global warming" and "global climate change" are not interchangeable phrases. References should be removed or, where appropriate, language should be changed to "global warming". ~~Goods movement is also a major source of GHG emissions that contribute to global climate change.~~
18	Clarification	2-27 paragraph 4	Not in SCAG's authority, nor funding available. Delete sentence: ~~SCAG will work with local jurisdictions and community stakeholders to seek resources and provide assistance to address any possible gentrification effects of new development on existing communities and vulnerable populations.~~
19	Clarification	2-27 paragraph 5	"The 2012-2035 RTP/SCS land use development pattern accommodates over 50 percent of new housing and employment growth in HQTAs, while keeping jurisdictional totals consistent with local input." *Please confirm that there are no changes to the local land use inputs provided by Orange County.*

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
20	Clarification	2-29	"For purposes of SCAG's SCS, a Development Type reflects an estimated average density of 22 residential units per acre. However, it is important to note that the designation is a potential ultimate average for the TAZ—and is not an absolute project-specific requirement that must be met in order to determine consistency with the SCS. In other words, the SCS was not developed with the intent that each project to be located within any given TAZ must exactly equal the density and relative use designations that are indicated by the SCS Development Type in order for the project to be found consistent with the SCS's use designation, density, building intensity and applicable policies. Instead, any given project, having satisfied all of the statutory requirements of either a residential/mixed-use project or TPP, may be deemed by the lead agency to be consistent with the SCS so long as the project does not prevent achieving the estimated average use designations, densities and building intensities indicated by the Development Type within the TAZ, assuming that the TAZ will be built-out under reasonable local planning and zoning assumptions." *Does the above PEIR language create a requirement for average TAZ density levels in 2035 and a requirement that each local project not preclude those density levels?* *Additionally, please clarify whether in HQTAs, these densities could be exceeded as well as implications of an area that is already fully developed not redeveloping such that it ever achieves the identified densities.*
21	Please define	3.8-5 paragraph 3,	Define "open space"

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
22	Revise language to clarify	4-39	Envision 2 alternative contains growth projections that would place housing in flight paths, locate housing on sites for which housing is not allowed due to environmental contamination, would significantly impact existing industrial operations necessary to maintain quality jobs in the region, and does not include development projects that are legally allowed due to having existing entitlement for development. Because this alternative does not consider the existing health and safety of future residents nor the existing legal approvals of development in the region, it is not possible to determine if the alternative is actually superior to other alternatives. It is simply another alternative for consideration. *Please remove references to the Envision 2 (or any other name of this alternative) as being environmentally superior.* ~~ENVIRONMENTALLY SUPERIOR~~ ENVISION 2 ALTERNATIVE
23	Revise language to clarify	4-40	"Of the three alternatives, the Envision 2 Alternative would be considered by State CEQA guidelines as the environmentally superior alternative because it does not allow further use of land for single-family development..."

Re: Draft Program Environmental Impact Report for the 2012-2035 Regional Transportation Plan and Sustainable Communities Plan (SCH# 2011051018)

Dear Ms. Lin:

The City of Diamond Bar recognizes the importance of the Southern California Association of Governments ("SCAG") Draft 2012 Regional Transportation Plan ("2012 RTP") and Draft Program Environmental Impact Report ("PEIR"). The City is supportive of strategies that improve the regional transportation system within the SCAG region.

Steve Tye
Council Member

While the overall goal to reduce both the congestion impacts and environmental impacts is admirable, we continue to have significant concerns regarding the component of the 2012 RTP to designate only the Pomona (SR 60) Freeway as an East-West Freight Corridor ("Corridor") and the continued focus on the placement of 4 lanes of truck traffic within the San Jose Creek Wash ("SJC") which is located immediately adjacent to homes and business of many cities, including Diamond Bar. We have provided numerous comments to SCAG over the many months of discussion regarding the 2012 RTP public discussion outlining our concerns. Copies of our three most recent letters (dated September 29, 2011, October 28, 2011 and November 14, 2011) are attached describing our concerns in more detail. In addition, numerous cities along the SR-60 corridor have protested the proposal with their adoption of resolutions in opposition to the plan.

We believe it is pre-mature to identify the State Route 60 and the San Jose Creek Wash alignments as a viable East-West Freight Corridor Project in the 2012 RTP. We have the following specific concerns:

- No studies have been conducted regarding the localized air, noise, vibration, or visual impacts of an elevated facility along the Corridor.

Such studies may conclude that the impacts are significant, resulting in objections from surrounding communities and the need for costly mitigation (including ROW acquisition).

- While the SR-60 and the SJC are identified as "preferred" alignments, further studies may find it more practical/beneficial to select another alignment. There are pros/cons to each alignment, but selecting a final alignment will need to consider the results of the detailed studies for SR-60 and SJC, which have not yet been performed. Many of the possible routes were rejected in the planning process due to excessive ROW impacts. Further studies may find that the ROW impacts along SR-60 and the SJC (due to air, noise, vibration and/or visual) are as great or greater than other corridors.

- The desired electric technology does not have any large-scale application to verify that it is feasible for this vision. Even if it did exist, it is not clear what would motivate truck owners/operators to convert? SCAG's East-West Freight Corridor planning documents acknowledge that most of the truck traffic in this corridor is not going to/from the ports, so it is hard to believe that all of the independent truck owners would elect to convert. Furthermore, does the RTP specifically allow use of the truck-only freight corridor, from day one and thereafter, by only new technology, zero emission, "clean" trucks?

Given the above facts regarding the significant unknowns and that further studies are needed, it is our assertion that SCAG has under-stated the environmental impacts of the RTP by:

1. Inappropriately including the East-West Freight Corridor in the financially-constrained plan. Given the huge uncertainties in its actual cost, **it is not reasonable to assume the Corridor can be afforded within the constrained monies**. The RTP guidelines were changed several years ago to prevent agencies from including projects that could not reasonably be afforded in the planning horizon. The "constrained" plan should only include projects that, in aggregate, can be demonstrated as affordable within the available revenues. The costs of the Corridor cannot be estimated with any credibility, given the lack of technical studies and corresponding

lack of knowledge regarding right-of-way or mitigation costs. How the proposed Corridor connects to the SR 57/60 interchange is also undefined, which has potentially enormous cost. Much of the segment east of SR-57, within the SR-60 corridor, is severely constrained. It is not clear how the truck lane would be accommodated in this stretch; therefore, no reasonable estimate of cost can be derived. *The following citations support the above claim and are from the 2010 RTP Guidelines, California Transportation Commission*:

- Page 98- "Fiscal constraint is the demonstration of sufficient funding (Federal, State, local and private) to operate and maintain transportation facilities and services and to implement planned and programmed transportation system improvements."

- Page 100 - "If FHWA and FTA find an RTP or FTIP to be fiscally constrained and the planned/programmed projects are included based on outdated or invalid cost estimates, then FHWA/FTA will not make funding or environmental approval actions for the listed project(s)....."

- Page 101 – ".....costs of future transportation projects must use "year of expenditure dollars" rather than "constant dollars" in cost and revenue estimates to better reflect the time-based value of money."

2. The PEIR air quality analysis assumes that all trucks using the proposed east/west facility will be zero-emissions. **This is too speculative, given the discussion above, to take as fact in evaluating the air quality impacts of the RTP. Consequently, the emissions are understated in the PEIR**. The California Attorney General's office and other parties have filed suit challenging the legitimacy of the draft SANDAG RTP for the same reasons – namely, overly optimistic assumptions regarding the air quality analysis.

Attempts to focus truck lanes on the SR-60 and the San Jose Creek are not new. This type of proposal has been previously pursued. The City of Diamond Bar and other cities and communities along the proposed

Corridor are concerned about being put in another adversarial position. Based on past actions our constituents have been strongly opposed to proposals that require the SR-60 and the SJC "shoulder the burden" of east-west truck movements and have been willing to "go the distance" in our efforts against such proposal.

We respectfully request the 2012 RTP and PEIR to consider all possible routes to serve the ever-increasing demands of the east-west goods movement between I-710 and I-15. It is unreasonable to designate the SR-60 and the San Jose Creek as the singular east-west route.

Thank you in advance for your attention to our concerns. Should you have any questions regarding this letter, please contact Mr. David G. Liu, Director of Public Works/City Engineer at (909) 839-7041.

Sincerely,

for James DeStefano
City Manager

c: City Council
David G. Liu, Director of Public Works/City Engineer

RE: Opposition To SCAG's Proposed East West Freight/Truck Lane Corridor

Dear SCAG Regional Council Members:

The Southern California Association of Governments (SCAG) is tasked with many conflicting mandates, often requiring very extensive and painstaking processes that often put member agencies and individual regional transportation proposals at odds. The City of Diamond Bar applauds the efforts of SCAG to meet its clean air mandates, but unfortunately we cannot sit idle while the Proposed East West Freight/Truck Lane Corridor is steamrolled into the 2012 Draft Regional Transportation Plan (RTP), with implications for not only Diamond Bar residents, but the millions of Southern California residents living along the proposed corridor.

The City of Diamond Bar has previously mentioned several concerns with regard to the SCAG proposed East-West Freight Corridor, which will run adjacent to the Union Pacific Railroad (UPRR) from I-710 to I-605, transitioning to a 50 foot elevated four lane structure along San Jose Creek to the SR-57/60 Interchange, and merging into the SR-60 with a terminus at I-15. The proposal is missing detailed engineering for the specific location of the proposed corridor and connectors, and will certainly impact the available right of way for previously approved Metro and SCAG/SGVCOG sponsored transportation projects that include the 57/60 Confluence Project, missing connectors between SR-60 and SR-57, SR-57 HOV lanes, I-605/SR-60 Mixed Flow and HOV direct connectors, and the Gold Line light rail extension from East Los Angeles to South El Monte near I-605. These are high priority projects that will be realized in the coming decades and are essential to all residents and businesses in Southern California that utilize public infrastructure on a daily basis.

I sincerely hope that the SCAG Transportation Committee and Regional Council exclude the proposal from the 2012 Draft Regional Transportation Plan. To interfere with even one approved project for a proposed freight corridor that will cost unforeseen billions of dollars at a time of economic uncertainty and without comprehensive review from agencies such as LA County Public Works and the Army Corps of Engineers is irresponsible.

Thank you for your attention to our concerns. I have also attached copies of Resolutions in opposition to the proposal adopted by the directly impacted Cities of Diamond Bar, South El Monte and Walnut. If you have any questions, please contact City Manager James DeStefano at (909) 839-7010 or email at jdestefano@diamondbarca.gov.

Sincerely,

Steve Tye, Mayor

RE: Opposition To SCAG's Proposed East West Freight/Truck Lane Corridor

Dear SCAG Regional Council Members:

On behalf of the City of Diamond Bar and the cities along the SR-60 Adjacent Freight Corridor, I urge the Southern California Association of Governments (SCAG) Regional Council to amend the Draft 2012 Regional Transportation Plan (RTP) to include all East-West corridors from I-710 to I-15 as a comprehensive Zero Emission Freight Corridor Network.

The proposed SR-60 Adjacent Freight Corridor would be an enormous undertaking, spanning from I-710 near the Hobart Rail Lines to the SR-60/I-15 Interchange. Although a portion of the corridor would be on the SR-60 freeway east of the SR-57/60 Interchange to I-15, the largest section would be on a 50 foot four lane elevated highway along the San Jose Creek and UPRR that bisects residential communities within a dozen cities and unincorporated areas. Additionally, the proposed corridor could potentially conflict with vital transportation projects that include the SR-57/60 Confluence Project, missing connectors between SR-60 and SR-57, SR-57 HOV lanes, I-605/SR-60 Mixed Flow and HOV direct connectors, and the Gold Line light rail extension from East Los Angeles to South El Monte near I-605.

Many cities along the proposed corridor have expressed concerns with the RTP process and have been unable to meet with SCAG prior to the release of the Draft RTP. As officials representing the public good for the entire region, it is imperative that the RTP process remain open and transparent. By incorporating the expanded East-West Freight Corridor Network into the Draft RTP, many of the concerns expressed by corridor cities could be ameliorated.

Lastly, with comment from Los Angeles County Public Works and the U.S. Army Corps of Engineers still pending, it would be ill advised for the Regional Council to move forward with releasing the Draft RTP if these agencies that own and operate a significant portion of the corridor were to object to the proposal. Amending the Draft RTP to incorporate all East-West freight corridors into an expanded Freight Corridor Network could prevent future confusion or EIR challenge if the proposal were to be found infeasible.

Thank you in advance for your consideration. If you have any questions, please contact City Manager James DeStefano at (909) 839-7010 or email at jdestefano@diamondbarca.gov.

Sincerely,

Steve Tye, Mayor

RE: Opposition To SCAG's Proposed East West Freight/Truck Lane Corridor

Dear SCAG Transportation Committee Members:

On behalf of the City of Diamond Bar and the cities along the SR-60 Adjacent Freight Corridor, I urge the Southern California Association of Governments (SCAG) Regional Council to amend the Draft 2012 Regional Transportation Plan (RTP) to include all East-West corridors from I-710 to I-15 as a comprehensive Zero Emission Freight Corridor Network.

The proposed SR-60 Adjacent Freight Corridor would be an enormous undertaking, spanning from I-710 near the Hobart Rail Lines to the SR-60/I-15 Interchange. Although a portion of the corridor would be on the SR-60 freeway east of the SR-57/60 Interchange to I-15, the largest section would be on a 50 foot four lane elevated highway along the San Jose Creek and UPRR that bisects residential communities within a dozen cities and unincorporated areas. Additionally, the proposed corridor could potentially conflict with vital transportation projects that include the SR-57/60 Confluence Project, missing connectors between SR-60 and SR-57, SR-57 HOV lanes, I-605/SR-60 Mixed Flow and HOV direct connectors, and the Gold Line light rail extension from East Los Angeles to South El Monte near I-605.

Many cities along the proposed corridor have expressed concerns with the RTP process and have been unable to meet with SCAG prior to the release of the Draft RTP. As officials representing the public good for the entire region, it is imperative that the RTP process remain open and transparent. By incorporating the expanded East-West Freight Corridor Network into the Draft RTP, many of the concerns expressed by corridor cities could be ameliorated.

Lastly, with comment from Los Angeles County Public Works and the U.S. Army Corps of Engineers still pending, it would be ill advised for the Regional Council to move forward with releasing the Draft RTP if these agencies that own and operate a significant portion of the corridor were to object to the proposal. Amending the Draft RTP to incorporate all East-West freight corridors into an expanded Freight Corridor Network could prevent future confusion or EIR challenge if the proposal were to be found infeasible.

Thank you in advance for your consideration. If you have any questions, please contact City Manager James DeStefano at (909) 839-7010 or email at jdestefano@diamondbarca.gov.

Sincerely,

Steve Tye, Mayor

RE: Opposition To SCAG's Proposed East West Freight/Truck Lane Corridor

Dear SGVCOG Governing Board:

The San Gabriel Valley Council of Governments (SGVCOG) has long partnered with regional planning entities such as the Southern California Association of Governments (SCAG) to spearhead regional transportation projects. The City of Diamond Bar, like many cities that are part of the SGVCOG, have benefitted from this partnership.

However, on behalf of the City of Diamond Bar and many cities in the region, I want to bring to your attention several concerns regarding the SCAG Draft 2012 Regional Transportation Plan (RTP). Specifically, the RTP includes a proposed East-West Freight Corridor that would span from I-710 to I-15. While a portion of the corridor would be on the SR-60 freeway east of the SR-57/60 Interchange to I-15, the largest section would be on a 50-foot four lane elevated highway adjacent to the freeway along the San Jose Creek and UPRR that bisects residential communities within a dozen cities and unincorporated areas.

SCAG's presentation at the November 17 SGVCOG meeting will likely state the proposed East-West Freight Corridor will not impact SGVCOG priority transportation projects that include the SR-57/60 Interchange, missing connectors between SR-60 and SR-57, SR 57 HOV lanes, I-605/SR-60 Mixed Flow and HOV direct connectors, and the Gold Line light rail extension from East Los Angeles to South El Monte near I-605. However, without the actual engineering and environmental analysis it is difficult to visualize how all the projects can work in such confined and limited rights of way.

The City of Diamond Bar has proposed to SCAG that a comprehensive Freight Corridor Network consisting of all corridors from I-710 to I-15 should be considered. The City's proposal is consistent with the SGVCOG's official current position. I ask that before you take any action on the SCAG Draft 2012 RTP, that the Governing Board and all Committees and TAC's take adequate time to review the SCAG materials and postpone action until a later date when SGVCOG can thoroughly discuss the impacts to SGVCOG transportation priorities.

Lastly, the City of Diamond Bar, along with the cities of Chino Hills, Commerce, Montebello, Pico Rivera, South El Monte, Walnut, and West Covina have adopted resolutions in opposition to the SCAG SR-60/San Jose Creek proposal. When also considering the attached written response from Los Angeles County Public Works regarding the San Jose Creek East-West Freight Corridor Feasibility Study, adequate analysis is necessary before taking action on the proposal.

I sincerely request that you take adequate time to review the SCAG information before making a departure from the SGVCOG's current position and supporting a regional proposal that would have a disproportionate impact on SGVCOG cities.

Thank you in advance for your consideration. If you have any questions, please contact City Manager James DeStefano at (909) 839-7010 or email at jdestefano@diamondbarca.gov.

Sincerely,

Steve Tye, Mayor

Re: Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Program Environmental Impact Report (PEIR).

Dear Mr. Lieb:

The City of Glendale respectfully submits the following comments on the Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Program Environmental Impact Report (PEIR).

1. Under the Transit and Rail policies the RTP encourages local transit operators to expand and provide connections to planned rail and regional transit services as well as the major employment centers. While the City of Glendale supports such a policy, the plan fails to recognize the additional funding that will be necessary to fund such services by local agencies. Local transit operators currently provide key connection to the existing commuter rail, light rail, and BRT services using local transit funds. Any further expansion of these services although important in improving mobility, will create a hardship on local agencies.
2. Under Los Angeles Metro's 2009 Long Range Plan, the following projects were included as "Strategic Unfunded Projects" :
    a. Extension of the Orange line and Red Line to Bob Hope Airport.
    b. East-West Connector between North Hollywood Red Line/Orange Line and the Pasadena Gold Line via Burbank and Glendale to provide a "missing link" between San Fernando Valley and San Gabriel valley.
    c. Burbank – Glendale Light rail to Union Station or expansion/enhancement of the Metrolink service.

The above key transit projects should also be considered for implementation by using the "reasonably-available" revenues similar to RTP Financially Constrained Plan.

3. The California High Speed Rail (CHSR) in the RTP is included as currently being planned. However, the RTP fails to again address the impact of such a system on the local transit system such as the Beeline Service and the lack of funding for service connections to the High Speed Rail stations. Considering the tremendous capital and operating cost of the CHSR, we recommend implementation of alternatives such as increasing interregional connectivity of the existing systems (commuter rail, light rail and bus rapid transit) to improve mobility in the sub-regions at a lower cost and more immediate before the CHSR is constructed.

4. The RTP only allocates a little more than 1% of the funding to Active Transportation. We believe that that SCAG should consider increasing the funding for Active Transportation to between 5%-8% of the total funding in the RTP.

WE RECYCLE

5. The 2012 RTP Financial Plan assumes that the "core revenues" and the "reasonably- available revenues" will fund the RTP's Financially Constrained Plan. The following are key issues that need to be addressed in the Financial Plan:
    a. As stated above, there are no provisions for funding local transit services as a result of planned expansion of rail and commuter services.
    b. The "reasonably-available revenues" category in the amount of 226 billion dollars is in our opinion optimistic as to the possible adjustment to state and federal gas taxes, revenues from TOLL roads, and freight fees. There are no details about the controversial "vehicle mile user fees" that regional and local agencies have to enact to raise funding.
    c. Highway projects are front loaded as they are easiest to finance in comparison to transit projects by borrowing against future toll revenues. Highway project increase in Vehicle Miles Traveled (VMT) consequently raises compliance issues with SB375 to reduce greenhouse gas emissions. It is our recommendation that transit (bus and rail), bicycle and pedestrian projects take priority over highway projects as they can improve mobility and reduce emissions as well.
    d. It is recommended that the RTP/SCS Financial Plan include a full benefit/cost ration analysis and a Performance Criteria for major highway and rail projects contained in the "Constrained Financial" Plan.

Overall, we are concerned that the RTP's assumption regarding the "reasonably- available revenues" is optimistic and the PEIR should consider alternatives in the draft plan that identifies only projects that can be funded as part of the "core revenues" to make the plan more realistic with priority given to transit projects.

Lastly, as cited on p. 3.12-25 of the DEIR , "Locally-developed county transportation plans have identified projects to close these (highway network) gaps and complete the system , and they are included in the Plan .These projects include …the SR710 Gap Closure in Los Angeles County…". The position of the City of Glendale remains consistent with Resolution No. 09-111 approved by the Glendale City Council on July 28, 2009, which addresses both the tunnel "gap closure" alternative as well as the general subject of "gap closure" alternatives for the SR-710 freeway between the I-10 and SR-134/I-210 freeways. On behalf of City Council and the citizens of Glendale, I wish to reiterate our opposition to any "gap closure" alternative that has or could be developed. In addition, I wish to express our opposition to the continued effort and expenditure of tax-payer monies in exploring, studying, and developing any means to facilitate this "gap closure". It is Glendale's belief and desire that efforts instead be directed to the development of alternatives that more effectively and more thoroughly address the concerns of mobility, congestion, and the movement of goods in the SR-710 corridor, particularly from our ports. Such alternatives should expand mass transit systems, improve existing infrastructure, and limit the long-distance movement of cargo/freight from the ports to rail. The City of Glendale has opposed this project and recommends the development of a multi-modal solution in lieu of further consideration of this project.

The City of Glendale looks forward to working with SCAG to address issues listed above. We appreciate the opportunity to comment on the RTP/SCS and the PEIR.

Sincerely,

Scott Ochoa
City Manager

Mr. Hasan Ikhrata
Executive Director RTP@scag.ca.gov
SCAG
818 W. 7th Street, 12th Floor
Los Angeles, CA 90017

SUBJECT: City of Hemet Response to Draft 2012-2035 RTP/SCS

Dear Mr. Ikhrata:

The City of Hemet appreciates the opportunity to respond to the Draft RTP/SCS. Overall, we commend you on the comprehensiveness of the document and recognize the complexity of the task to update the RTP in concert with the region's first Sustainable Communities Strategy in compliance with SB 375. We also appreciate the time and effort that SCAG has taken to outreach and obtain input from the local agencies in the preparation of the RTP/SCS, and specifically in meeting with the City of Hemet staff regarding revisions to the growth and housing projections. The City of Hemet sincerely thanks you for accommodating our previous comments in the preparation of the Growth Forecast and draft RHNA numbers.

The City of Hemet has had an opportunity to review the Draft RTP/SCS document, and offers the following comments for your consideration.

Draft Regional Transportation Plan:

1. The two highway projects of major interest to the City of Hemet are the realignment and widening of SR 79 from Domenigoni Pkwy to Gilman Springs Road (FTIP ID RIV62024) and the completion of the Mid-County Parkway (FTIP ID RIV031218). The City's long-term growth projections, employment base, housing conditions, and overall economic health depend in large part upon the completion of these two thoroughfares. Specifically, our comments on the RTP regarding highways are noted below:

   a. Exhibit 2.1 Major Highway Improvements (2035) does not show the realigned SR 79 through the Hemet area and connecting to major east-west corridors to the north, or the Mid-County Pkwy. The City requests that these critical roadway improvements be included on Exhibit 2.1.

   b. Table 2.2 shows a list of Major Highway Projects in the region. For Riverside County, the CETAP Intercounty Corridor A is noted, however our understanding is the planning for that corridor is delayed. We suggest that Table 2.2 be updated to reflect more essential projects that are a higher priority for Riverside County, such as the Mid-County Pkwy and the SR 79 Realignment project noted above.

c. In the Highways & Arterials Report, Exhibit 4 and Exhibit 9 should be corrected to include the SR 79 and Mid-County Pkwy road projects, as noted above. In addition, Exhibits 11 and A16 also do not appear to include these critical roadways, although the scale of the map makes it difficult to determine if these roadways are included, or if the map reflects improvements to existing local arterials in the area. Please verify the highway improvements included on these Exhibits and update the exhibits as needed to address these roadways.

d. In the Financially-Constrained RTP list of projects, Warren Road from Domenigoni Pkwy to Esplanade Ave (ID Riv 3A01WT041), should be shown as widening from 2 lanes to 6 lanes, consistent with the City of Hemet's updated General Plan Circulation Element.

2. The City strongly supports the extension of a commuter rail line to Hemet. It will reduce vehicle miles traveled considerably and help spur residential and economic growth in the valley. However, the proposed Perris Valley Line (RTP ID 3CR0702) does not indicate a station in Downtown Hemet. Our recently adopted General Plan 2030 includes a high-density transit-oriented development strategy based upon the siting of a Metrolink station in the downtown area. In addition, SCAG previously prepared a Compass Blueprint Project for a Transit Village surrounding a future Metrolink station in Downtown Hemet. We request consideration of adding a station to this project in Downtown Hemet.

3. In addition, as noted in the RTP (ID 3CR0702), a station is proposed at the Hemet-Ryan Airport. The locations immediately around the airport are constrained by existing development and environmental factors. The City requests that the "Hemet Airport; Sanderson Ave @ Stetson Rd" location be replaced with "West Hemet @ Stetson Rd". This location is consistent with the recently adopted update to the City of Hemet's General Plan that anticipates transit-oriented development and mixed-use residential, commercial, and business park uses in the West Hemet area, adjacent to the Perris Valley Line.

4. The City would like to co-locate a bus transit center with the Hemet Downtown Metrolink station. FTIP ID RIV041030 on page 75 of the FTIP Project List indicates the location of the transit center at 700 Scaramella Circle. This is the site of the RTA bus yard and not appropriate for passenger use. Please reference "in the vicinity of State Street and Devonshire Avenue" as the location for the new Hemet Transit Center in the FTIP. The City is currently working with RTA on locating a transit center at this location in Hemet's Downtown area which would be adjacent to a future Metrolink Station, as well as a proposed Courthouse facility and mixed-use Transit Village.

Draft Sustainable Communities Strategy:

5. The City is committed to the SCS tenets and concepts. We recently updated our General Plan and incorporated many sustainability and mixed-use development measures in accordance with these principles. However, it appears that the only way to determine ongoing consistency with the SCS is to use the Local Sustainability Planning Tool (LSPT), which is not practical for us. Our jurisdiction does not have the resources to access or use the tool, although we did submit our comments and revisions to the map during the local input process. We are not able to completely ascertain whether our comments have been integrated into the SCS land use model and mapping, based upon the regional scale of the maps provided to date in the SCS.

6. We are also unclear as to whether consistency with the SCS is determined on the basis of the revised city-wide Growth Forecast numbers submitted and approved by Hemet and the WRCOG's member jurisdictions, or a land use distribution pattern that has been aggregated and shown in the SCS in very broad terms? We have only recently become aware of growth maps based on TAZ data that has not been confirmed by the City of Hemet or other WRCOG jurisdictions, and have concerns regarding the land use accuracy and future application of these maps in determining consistency with the SCS or our adopted General Plan. The City of Hemet concurs with and supports the comments submitted by WRCOG in their comment letter dated February 13, 2012 regarding the use of TAZ data and mapping for anything other than scenario modeling purposes. Please provide a clarification as to the use of the TAZ data and additional review time to analyze the recently released maps at a scale that we can determine consistency with our existing and future land use patterns.

7. Thank you for recognizing that Hemet and other cities on the region's periphery have less housing capacity than the original forecast assumptions. We sincerely appreciate SCAG's effort to revise the Growth Forecast numbers and continue to support the Revised Growth Forecast for the City of Hemet, as adopted by WRCOG, and the 2035 build-out projections.

8. Per the comments noted above for the locations of Metrolink and Transit Stations in the City of Hemet, Exhibit 4.9 of the SCS needs to be updated to reflect the appropriate transit locations. In addition, it appears that the HQTA nodes shown do not align with the actual rail line locations. Again, it is difficult to determine at the scale of the map provided in the SCS.

The City of Hemet is committed to the RTP/SCS plan and process and sincerely appreciates the outreach SCAG has provided to local government to participate in this important regional plan. The City has been impressed with the level of cooperation and consideration that SCAG has made to the concerns raised by the City of Hemet and the Western Riverside County region in the development of the many components of the plan. We recognize that well-designed and well-functioning transportation systems aligned with sustainable land use policies are imperative to our future growth and development. We respectfully request that you consider the comments noted above as you prepare the final RTP/SCS for adoption, and request that we be informed as to future hearing dates regarding the Plan.

Sincerely,

Deanna Elliano

Subject: Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and associated draft Program Environmental Impact Report (DEIR) Comments

Dear Mr. Ikhrata:
This letter is to officially inform you that the City of Highland is in support of SANBAG's comments concerning the subject Draft RTP/SCS and DEIR as outlined in their February 14, 2012 letter (see attached).

In addition, the City respectfully request SCAG make additional adjustments to the City's Growth Distribution as presented by SANBAG and illustrated on the attached Table. Adjustments are highlighted in "**Bold**". No adjustments to the City's Growth Forecast is requested, only the "distribution" of Growth.

Should you have any questions please contact me at (909) 864-8732, Ext. 213, or Mr. Lawrence Mainez, City Planner at Ext. 215.

Sincerely,

John Jaquess
Community Development Director

February 14, 2012

Mr. Hasan Ikhrata
Southern California Association of Governments
818 West 7th Street, 12th Floor
Los Angeles, CA 90017-3435

Dear Mr. Ikhrata:

This letter transmits San Bernardino Associated Governments' (SANBAG's) comments on the Southern California Association of Governments' (SCAG's) draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and associated draft Program Environmental Impact Report (PEIR). This is pursuant to SCAG's request for comments, with a closing date of February 14, 2012.

SANBAG recognizes and appreciates the extensive effort and deliberations that went into the RTP/SCS by SCAG staff and policy committees. We recognize that the RTP/SCS has been developed in the context of the largest and most geographically and demographically diverse metropolitan area in the United States, involving a great number of complex and challenging issues. SANBAG commends the efforts of SCAG staff and supports approval of the Plan by the April deadline, with some suggested clarifications. Our comments on the draft RTP/SCS and PEIR are as follows:

1. The RTP/SCS growth forecasts should be adopted at the County-level, not at the city or transportation analysis zone (TAZ) level. SANBAG needs the ability to adapt the forecasts to development trends and new information that will inevitably come to light at the small-area level over the next 4-year RTP/SCS cycle. This is consistent with SCAG's approvals in the past.

2. The growth distribution at the transportation analysis zone (TAZ) level needs to be adjusted to be consistent with the distribution of growth for households and employment being submitted by SANBAG in parallel with the comment letter. The growth distribution is based on the distribution of households and employment previously submitted by SANBAG, together with adjustments for the Plan Alternative of the RTP/SCS. No change is being suggested in the city-level distribution of growth.

Cities of: Adelanto, Barstow, Big Bear Lake, Chino, Chino Hills, Colton, Fontana, Grand Terrace, Hesperia, Highland, Loma Linda, Montclair, Needles, Ontario, Rancho Cucamonga, Redlands, Rialto, San Bernardino, Twentynine Palms, Upland, Victorville, Yucaipa
Towns of: Apple Valley, Yucca Valley County of San Bernardino

3. Please confirm that the East-West Freight Corridor (dedicated truck lanes) will continue from SR-60 northerly on the I-15 and terminate just to the north of I-10, with appropriate connector ramps to and from I-10 east of I-15. This is stated in the text of the draft RTP/SCS, but some of the maps and the transportation model networks are not yet consistent with this.

4. The Program EIR uses the phrase "local jurisdictions can and should..." or "project sponsors can and should..." in most of the local-level and project-level mitigation measures referenced in the EIR. SANBAG's understanding is that the mitigation measures are designed to provide local jurisdictions and project sponsors with choices, not requirements, as they seek to implement local transportation and development projects in the context of the RTP/SCS goals and objectives. However, CEQA also requires that mitigation measures be feasible and enforceable (CEQA Guidelines Section 15126.4). As drafted with the language "local jurisdictions can and should," the mitigation measures are implied to be feasible and enforceable. Therefore, SANBAG requests the mitigation measures be revised to clarify their intent. SANBAG suggests replacing the wording "local jurisdictions can and should..." or "project sponsors can and should..." with "SCAG shall encourage local jurisdictions to ...." SCAG should continue to play a role of facilitation for local jurisdictions and subregional agencies to build technical expertise, provide grant funds, disseminate information, and coordinate responses to regional issues. These are actions that are under the control of SCAG, the responsible party under CEQA, and can be monitored and enforced.

5. SANBAG recommends that those mitigation measures that are either the same as or similar to an existing regulation simply reference the regulation without restating the contents of the regulation. Local jurisdictions and project sponsors are already responsible for complying with regulations, and restating or paraphrasing a regulation in the PEIR could cause confusion in the future as regulations are modified. A summary of the regulation can be provided as information, but a restatement of the regulation in the PEIR with the "can and should" language may be counterproductive. The PEIR should also be careful to distinguish between guidelines and regulations. These changes will avoid potential future conflicts between a PEIR mitigation measure and an adopted regulation.

We would also like to request the following modifications to the project list, as submitted to SCAG staff through the standard RTP long-range project list modification and FTIP database update processes. These changes have been previously communicated to SCAG staff subsequent to the release of the Draft RTP and are being confirmed below.

Major project modifications include:

- 1830 – I-10 Cedar interchange – Schedule Change
- SBD41339 – I-10 Pepper interchange- Schedule Change
- 200152 – I-15 Arrow Rte. Interchange - Schedule Change
- 0H1300 – I-15 Duncan Canyon Interchange - Schedule Change
- 20061201 – I-15/215 Devore Interchange- Schedule Change
- SBD031279 – I-15 Ranchero Interchange - Schedule Change
- 35556 – I-15 VV-Barstow - Schedule Change
- 200451 – US 395 from I-15 to 1.8 Miles S. of Desert Flower Road – Interim Widening from 2-4 lanes
- 34040 – US 395 Expressway – Widen from 2-4 lanes from High Desert Corridor to Farmington Road
- 981118 – Omnitrans Bus Service - Schedule Change
- 20040804 – Needles – I-40 Connector – Downscope project

Major project deletions/completions include:

- SBD31808 – I-10 Riverside – Completed Project
- 0H930 – I-10 Waterman – Completed Project
- 43320 – I-10 Live Oak – Completed Project
- 47221 – I-15 Etiwanda (rehab. SHOPP) – Completed Project
- 34041 and 34042 – US 395 New Expressway – Deleted Combined Projects
- 4G0117-LR – Safety Upgrade – Milliken Ave. – Delete Project
- 4A07039-LR – Valley from Cherry to Alder (2-4 lanes) – Delete Project
- 4H01011-LR – HOV Connector (I-10/I-15 North to West) – Delete Project
- 4H01010-LR – HOV Connector (I-10/I-15 South to West) – Delete Project
- 4H01009-LR – HOV Connector (I-10/I-215 South to East) – Delete Project

We look forward to a productive discussion of all the comments in the coming weeks and the approval of the RTP/SCS in April.

Sincerely,

Larry McCallon

Los Angeles, California 90017-3435

RE: Comments on the Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy and Program Environmental Impact Report

Dear Mr. Ikhrata:

The City of Irvine appreciates the opportunity to review and provide comments on the Draft 2012-2035 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) and Program Environmental Impact Report (PEIR). The City of Irvine commends the Southern California Association of Governments (SCAG) staff for the tremendous amount of work and effort in preparing these documents. The following general comments and recommendations are offered by the City of Irvine on the Draft 2012-2035 RTP/SCS, associated appendices, and the Draft PEIR. In support of this letter, please find attached more specific detailed comments from the City of Irvine related to the PEIR (Attachment 1) and technical comments from Orange County Council of Governments (OCCOG) (Attachment 2). The City of Irvine requests that this letter and all of its attachments be included in the public record as our collective comments on the Draft RTP/SCS, PEIR, associated documents, and online inventory of maps.

- **The City of Irvine concurs with the Orange County Council of Governments (OCCOG) and Orange County Transportation Authority comments.**

  The City of Irvine concurs with the comments SCAG will receive from the OCCOG and the Orange County Transportation Authority (OCTA). The City requests that SCAG respond to all of the comments detailed in the OCCOG and OCTA letters and to act upon any changes advocated by OCCOG, of which the City is a member agency.

PRINTED ON RECYCLED PAPER

- **SCAG's adoption of the growth forecast numbers should be at the county level, consistent with past RTPs, not at a smaller level of geography such as city, census tract, or traffic analysis zone level.**

  The growth projections provided to SCAG represent the best available information from local jurisdictions, the business community, and landowners. However, as time passes, what is feasible for any given project can change. A county level of geography accommodates internal adjustments to changing conditions, without compromising the integrity of the overall growth projections. Approving the growth projections at any lower level of geography, such as the city level, would be challenged with continual revisions and shifts to the total number of housing, population, and employment within a city, among cities, and between cities and counties. Adoption of the data at a level lower than the county would also limit local jurisdictional control and create inflexibility in a regional planning document.

- **The Orange County Sustainable Communities Strategy (OC SCS) should be fully integrated into the regional RTP/SCS. Language should be incorporated into the document that indicates the OC SCS represents the SCS for the Orange County subregion.**

  The RTP and appendices include numerous references to the OC SCS and SCAG's total use of the document in the regional RTP/SCS. Yet numerous other references suggest SCAG may have modified elements of the OC SCS data. SCAG shall include a statement and should document all maps, tables, charts, and other information that is necessary to confirm all of the OC SCS land use, socioeconomic, and transportation data was incorporated into the regional RTP/SCS without changes. This would be consistent with statements made by SCAG staff to the OCCOG Board of Directors and at the 2012 RTP Workshops that the OC SCS data has not been and will not be altered. Furthermore, there should be a statement indicating that the OC SCS represents the SCS for the Orange County subregion in total and that anything to the contrary in the regional 2012 RTP/SCS shall have no standing for Orange County.

- **One City of Irvine project, which has both local and regional significance, does not appear to be included in the RTP/SCS. This project is identified in the Long Range Transportation Plan (LRTP) for Orange County with the Orange County Transportation Authority (OCTA) as lead agency. It is, therefore, requested that the following project be added to the RTP/SCS: Sand Canyon Grade Separation Project.**

- **All documents, tables, maps, narrative, modeling runs, and PEIR Alternatives (including Alternative C/3/Envision 2 referencing the Orange County growth forecasts) should be updated with Orange County**

County growth forecasts) should be updated with Orange County Projections 2010 Modified Growth Projections (OCP-2010 Modified), as adopted by the OCCOG Board of Directors and consistent with the subregional delegation MOU between OCCOG, OCTA, and SCAG.

Orange County Projections 2010 Modified (OCP-2010 Modified) was approved by the OCCOG Board of Directors on January 26, 2012 and is a data amendment to the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2012 Employment Development Department Benchmark data, consistent with SCAG's updated growth forecast dataset.

- **SCAG does not have the purview to implement or require mitigation for local jurisdictions, other agencies, and project sponsors. SCAG should remove all mitigation measures outside their purview and consider moving these "mitigation measures" to an appendix of the RTP/SCS that can be used by local jurisdictions, local agencies, and project sponsors as a menu of options or a toolbox of sustainability strategies. Please also see Attachment 1, City of Irvine Comments on Draft PEIR.**

  SCAG staff has stated on numerous occasions at the OCCOG Board of Directors meeting and at the RTP 2012 Workshops that it was their intent to have the mitigation measures serve as a tool box or menu of options that could be used by local jurisdictions, local agencies, and project sponsors. However, inclusion of these strategies as mitigation measures in the PEIR negates the ability of the local jurisdictions, local agencies, and project sponsors to use the strategies in that manner. The PEIR should contain only those mitigation measures SCAG has the purview to implement and monitor.

- **SCAG should remove all mitigation measures that are duplicative of existing regulations administered by or under the jurisdiction of other agencies. For each impact, SCAG could add the language "Local jurisdictions, agencies, and project sponsors should comply, as applicable, with existing federal, state, and local laws and regulations." Please also see Attachment 1, City of Irvine Comments on Draft PEIR.**

  Many of the mitigation measures in the PEIR are duplicative of existing regulation or processes. Under the California Environmental Quality Act (CEQA), it is intended that measures be identified that will mitigate the impacts of the projects. Existing regulations are assumed to be abided by in the evaluation of the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between stated mitigation and the regulation.

- **The Draft 2012 RTP/SCS and PEIR indicate SCAG has determined the strategies and mitigation measures to be feasible. Where SCAG deems a mitigation measure is feasible, SCAG shall provide documentation of this feasibility. Please also see Attachment 1, City of Irvine Comments on Draft PEIR.**

  SCAG staff has not identified any analysis that supports the feasibility of the mitigation measures in the PEIR and the strategies in the Draft 2012 RTP/SCS that are to be undertaken by entities other than SCAG.

The City of Irvine appreciates your consideration of all the comments provided in this letter and its attachments and looks forward to your responses. It is a shared goal to have a Regional Transportation Plan and Sustainable Communities Strategy adopted on April 4, 2012 that represents the best in regional planning developed collaboratively with local jurisdictions and stakeholders in a manner that is credible and defensible on all levels. If you have any questions, please do not hesitate to contact me.

Sincerely,

Sean Joyce
City Manager

Attachment 1: City of Irvine Comments on the PEIR

I. INTRODUCTORY COMMENTS

This document provides comments, on behalf of the City of Irvine ("Irvine"), on the Draft Program Environmental Impact Report ("PEIR") prepared by the Southern California Association of Governments ("SCAG") for the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy ("2012-2035 RTP/SCS" and/or "Plan"). As explained below, the PEIR can and should be revised and clarified, so that it can (i) comply with the requirements of the California Environmental Quality Act ("CEQA") (Pub. Resources Code, § 21000, *et seq.*) and the CEQA Guidelines (Cal. Code Regs., Tit. 14, Ch. 3, § 15000, *et seq.*), and (ii) prove a useful tool in connection with the evaluation of future local and regional projects.

1. Useability of PEIR in Connection With Later Environmental Analyses

Irvine's most pressing concern with the PEIR is that the environmental document will create unnecessary confusion as to the content and requirements of future local level environmental analyses. The PEIR is replete with mitigation measures that SCAG claims "can and should" be implemented by local agencies. And, even with the implementation of those measures assumed, the PEIR concludes that "significant and unavoidable" impacts will exist on almost every environmental dimension.

That approach threatens to unnecessarily complicate future environmental analyses for local agencies, including Irvine. What if measures that are deemed "feasible" by SCAG at a program level prove infeasible at a project level? Even if those measures are implemented at a project level, will the local agency have to repeat SCAG's finding that impacts nevertheless remain significant and unavoidable? Even though SCAG's RTP/SCS may not be consistent with local jurisdictions' general plans and/or cumulative growth assumptions, will local agencies (at least for regionally significant projects have to annex the PEIR's forecast of near-universal "significant and unavoidable" impacts into the cumulative impact analyses of project-level EIRs? If so, will that require repeated local-agency statements of overriding considerations?

To assist local agencies that will have to wrestle with these issues, we suggest that the PEIR acknowledge in the Executive Summary section that while it "includes mitigation measures designed to help avoid or minimize significant environmental impacts," those measures were selected without the ability to evaluate each project that could occur as a result of the Plan. Further, the PEIR should note that many impacts were noted as "significant and unavoidable" *even though* they could be mitigated to "less than significant at the project-level," once such a project-level analysis is done. Finally, and consistent with the foregoing, the PEIR should acknowledge (as it does in Chapter 3) that "[p]roject specific environmental documents may adjust [the mitigation measures listed] as necessary to respond to site-specific conditions." (*See, e.g.*, Page 3.2-35, Page 3.3-45, Page 3.4-22, Page 3.12-30.)

2. Mitigation Measures

The PEIR's approach to mitigation suffers from a series of recurring flaws. First, the PEIR relies upon dozens of mitigation measures that the PEIR claims "can and should be implemented" by local jurisdictions or project sponsors. Unfortunately, for most of those mitigation measures, there is little if any data concerning the actual feasibility of implementation. Thus, the notion that measures either "can" or "should" be implemented is not supported by evidence in the record. That lack of information is important because CEQA only allows the imposition of "feasible" mitigation; if a measure is infeasible, then CEQA requires either (i) an identification of an alternative measure that *is* feasible, or (ii) the acknowledgment that the "post-mitigation" environmental impact will be more significant than if the (infeasible) mitigation were implemented.

Second, in most chapters, there is no clear means of gauging the effectiveness of the proposed mitigation measures. Most of the environmental analyses of anticipated "with project, without mitigation" conditions are so general that one cannot tell the severity of an identified impact with any certainty. Absent that information, it is difficult to discern whether and to what extent a mitigation measure would, if feasible and implemented, reduce the forecasted impacts. Consistent with this observation, most section of the PEIR do not include any clear explanation of how and to what extent identified mitigation measures reduce impacts that would occur but for the imposition of mitigation.

Third, in almost every case, the mitigation measures do not provide specific, articulable standards by which their efficacy may be determined. That approach results in measures that have uncertain application, and even more uncertain effectiveness. As one court put it, "[i]f, as so many courts have said, the EIR is the heart of CEQA, then to continue the anatomical metaphor, mitigation is the teeth of the EIR." (*Envtl. Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1018, 1039.) To have legally sufficient "teeth," mitigation measures must have definitive performance standards. (*Endangered Habitats League v. County of Orange* (2005) 131 Cal.App.4th 777, 794; *Gray v. County of Madera* (2007) 167 Cal.App.4th 1099, 1119, 1126.)

Fourth, the PEIR appears to confuse "existing regulations" with mitigation measures. Many existing regulatory requirements are characterized as "mitigation" even though those requirements would have to be honored with or without the approval of the PEIR. Proceeding in that manner tends to overstate impacts in the "with project, without mitigation" scenarios. Put another way, assuming compliance with existing regulations in the "with project, without mitigation" scenarios provides a more accurate forecast of the project's baseline impacts.

Fifth, the PEIR also appears to confuse "the project" with its mitigation measures. Indeed, many of the "mitigation measures" are framed as policy statements to be performed in the implementation of the project. As such, those actions should be re-framed and assumed as "part of the project" rather than mitigation for the project.

Sixth, the PEIR's reliance on measures that "can and should" be implemented by local jurisdictions has an unclear application. It appears that even though SCAG cannot ensure implementation of such measures, it nevertheless *assumes* that those measures will be implemented in the environmental analysis. A superior approach, used by many jurisdictions, is to identify measures that "can and should" be implemented by other jurisdictions, then adopt a

Statement of Overriding Considerations for the corresponding impact; thereby recognizing that the certifying agency (SCAG) has no power to compel implementation of the identified mitigation. While the PEIR ultimately finds almost every studied impact to be "significant and unavoidable" those determinations are made assuming that those measures that "can and should" be implemented will in fact be implemented.

All of the foregoing issues contribute to an overriding concern for Irvine: Once the PEIR is certified, it will be difficult (if not impossible) to either rely on the analysis in the PEIR or to prepare a tiered environmental document from the PEIR. The detail and structure of the environmental analysis is too general; the relationship between mitigation measures, existing regulations, and project components is too unclear; and the standards by which mitigation efficacy is to be judged are too vague to meaningfully build upon the first level, programmatic, discussion in the PEIR.

More detail on our concerns with the mitigation measures in the PEIR is provided in Attachment A.

II. CHAPTER-SPECIFIC PEIR COMMENTS

1. Section 1.0 Introduction

Item 1: At Page 1-1, second full paragraph of the Summary Section, the PEIR states that "Individual transportation projects are preliminarily identified in the 2012-2035 RTP/SCS; however, this PEIR analyzes potential environmental impacts from a regional perspective and is programmatic in nature. As such, it does not specifically analyze these individual projects," choosing instead to defer that analysis to a later time, stating: "Project-specific analysis will be undertaken by the appropriate implementing agency prior to individual projects being considered for adoption." Thus, the PEIR recognizes that individual transportation projects will require project-specific analysis. That recognition conflicts, however, with Page 1-7, at Transportation Project Mitigation, where the PEIR states, (emphasis added), "*This Draft PEIR has made a preliminary determination that the proposed mitigation measures are feasible and effective.* Therefore, it is reasonable to expect that these agencies will actually implement them." Please modify the PEIR to clarify that statements concerning the feasibility and effectiveness of mitigation are based on programmatic assumptions, not project-specific determinations, and that the ultimate determination of project level feasibility lies with local agencies.

2. Section 3.1 Aesthetics

Item 1: The mitigation measures listed in the Aesthetics and Views Impact section do not provide specific articulable standards by which their efficacy may be judged. Measures MM-AV1 through MM-AV12 provide guidelines and platitudes, but no measure of effectiveness. As an example, MM-AV8 states in general: "Project sponsors can and should design projects to minimize contrasts in scale and massing between the project and surrounding natural forms of development." This measure is posed as "mitigation" for the following impact: "Potential to create significant contrasts with the overall visual character of the existing landscape setting or add urban visual elements to an existing natural, rural, and open space area." As is apparent, the "mitigation measure" is functionally just a restatement of the "impact"; it has no "bite" in reality.

While the Plan is a programmatic one, and aims to address impacts at the program level, such that Mitigation Measures were not as detailed as if at the project level, the measures must still have a standard by which to determine efficacy so as to distinguish them from a mere suggestion (or restatement of the "impact" that they seek to mitigate).

Additionally, each of the impacts to Aesthetics listed in Section 3.1, assume performance of the mitigation, and even in such performance, concludes the impact is "significant and unavoidable." Unlike subsequent sections, this Section, in listing out its Mitigation Measures at Page 3.1-15, *does not note* that such Mitigation Measures can be modified or adjusted as necessary to respond to project-specific conditions. This conflicts with the PEIR's stated recognition of the need for project-specific analysis, and that "significant and unavoidable" conclusions as to Impact mitigation was determined due to the programmatic nature of the PEIR, and can change at the project-specific level. Please explain the differential treatment of impacts in this section.

3. Section 3.2 Air Quality

Item 1: In analyzing Impact 3.2-1, the PEIR states: "Mobile source emissions of ROG, NOx, CO, PM 10, PM 2.5, and SOx would stay approximately the same or decrease (often substantially) when compared to existing conditions. This is considered to be a beneficial impact. Re-entrained roadway dust would increase proportionate to VMT. This would be a significant impact." The PEIR further states that roadway construction activity would contribute to regional dust levels, and "re-entrained roadway dust" would be expected to increase under the Plan as compared to existing conditions. The PEIR also states that "[t]hese construction emissions, although unavoidable, would be partially controlled by air districts fugitive dust rules." The applicable "fugitive dust rules" are not clearly identified and explained in the PEIR. Please clarify and provide examples of such "fugitive dust rules," and explain how those rules would effectively deal with increased regional dust.

Item 2: At page 3.2-30, the PEIR states there is the "[p]otential to increase population within 500 feet of transportation facilities that could expose residents (schools and other sensitive receptors) to elevated (as compared to average) cancer and other health risks." The PEIR then recommends mitigation measure MM-AQ19 to reduce this impact to a less-than-significant level. MM-AQ19 requires compliance with the California Air Resources Board Air Quality and Land Use Handbook (June 2005) to achieve an acceptable interior air quality level for sensitive receptors. MM-AQ19 further suggests that project sponsors "can and should" incorporate "appropriate measures" into project building design.

This mitigation measure elevates the voluntary guidance from the California Air Resources Board Air Quality and Land Use Handbook to mandatory compliance on the part of project sponsors. Please explain and justify that approach. Furthermore, please explain how such compliance would achieve "acceptable interior air quality level for sensitive receptors."

Item 3: At page 3.2-32, the PEIR states "[m]itigation measures to reduce air quality impacts would be established in project-specific environmental documents," and that such impacts should be addressed at the project level analysis. Following that, the PEIR states that the overall impact of the 2012-2035 RTP/SCS Plan would create substantial emissions and that "Implementation of Mitigation Measures MM-AQ1 through MM-AQ18 would reduce criteria pollutant impacts;

however, impacts would remain significant." There is potentially a conflict between conducting project-specific environmental analysis and further having to implement MM-AQ1 through MM-AQ18 to reduce criteria pollutant impacts. This can likely be clarified by noting that the mitigation measures are subject to project-specific feasibility and effectiveness determinations by the project sponsor or agency with jurisdiction over the project, and that such project sponsor or agency has the authority to implement such measures as appropriate given project-specific analysis that is undertaken.

Item 4: At page 3.2-39 the PEIR states that "[t]ables 3.2-4 and 3.2-5 show the residential and workplace cancer risk, respectively." This should be changed to Tables 3.2-7 and 3.2-8."

Further, in the same paragraph, the PEIR states "[i]t is estimated that the Plan would result in 293,633 annual health incidences leading to $4,952,996,222 spent on healthcare. This is a 24 percent reduction when compared to the No Project Alternative." Please explain where the number of annual health incidences is derived and the associated costs as the tables do not indicate these numerical values, both in the amount spent in healthcare costs and the percentage decrease.

4. Section 3.3 Biological Resources & Open Space

Item 1: At page 3.3-45 the PEIR states that Mitigation Measures BIO/OS46 through BIO/OS49 and BIO/OS54 "would reduce open space/rangelands impacts." Please discuss how the concept of "induced growth" under MM-BIO/OS47 does not conflict with Measure M2.

Item 2: At page 3.3-45, "Cumulative Impacts 3.3-10" is noted as the "[p]otential to contribute to a cumulatively considerable loss of habitat and biological resources." The PEIR further states that implementation of Mitigation Measures BIO/OS1 through BIO/OS59 would reduce cumulative impacts; however, impacts would remain significant." As to MM-BIO/O55, the mitigation measure states that local agencies "can and should" establish *programs and funding mechanisms* to create protected conservation areas. This Mitigation Measure should include a standard to determine how effective imposition of additional taxes and fees in creating programs and funding to create conservation plans would reduce the negative impact or loss of habitat and biological resources.

5. Section 3.4 Cultural Resources

Item 1: Beginning at Page 3.4-22, MM-CUL1 and MM-CUL2 indicate that "the appropriate Information Center" should be contacted to determine whether a project-area has been previously surveyed and whether historic resources are identified, and if indicated as such, then a "qualified architectural historian" should be obtained by the project sponsors to "conduct historic architectural surveys as recommended by the Information Center." And that further, the "Information Center," in the event that no survey has been conducted, "will make a recommendation on whether a survey is warranted based on the sensitivity of the project area for historical resources within 1,000 feet of the project." Additionally, MM-CUL7, also references an "Information Center" that should be consulted to conduct proper surveys. Please clarify which "Information Center" MM-CUL1, MM-CUL2, and MM-CUL7 is referring to. For

example, MM-CUL6 notes it is the "Information Center of the California Archaeological Inventory" to be consulted to conduct the appropriate surveys.

6. Section 3.5 Geology, Soils & Mineral Resources

Item 1: At Page 3.5-23 the PEIR states that a "greater amount of transportation projects in the Plan would increase the amount of transportation infrastructure that would be subject to risk as a result of surface rupture, ground-shaking liquefaction, and landsliding and other risks associated with seismic events." Additionally, the "No Project Alternative would result in the construction of approximately 68,040 new lane miles compared with over 74,297 new lane miles in the 2012-2035 RTP/SCS," thereby drawing the conclusion that "Impacts related to geologic and seismic resources would be similar to the Plan under the No Project Alternative because the population would be the same and the entire region is subject to seismic risk."

This conclusion seems questionable if under the Plan, a greater number of transportation projects would be built, resulting in the 74,297 new lane miles, that would be subject to risk associated with seismic events. The conclusion appears to be drawn because the total population will be the same under both the No Project and the Plan, and that the region as a whole would be subject to seismic risk—however, the increase in transportation infrastructure and projects itself is at risk due to seismic events, and the increase of such infrastructure in comparison to a No Project scenario, would seem to conclude that there be a greater impact under the Plan than under the No Project alternative. Because there would be the same population increase and the region would be subject to seismic risk, does not preclude greater impacts under the Plan due to increases in transportation infrastructure.

7. Section 3.6 Greenhouse Gas Emissions

Item 1: At page 3.6-6 the paragraph on Assembly Bill 811 appears to be incomplete.

Item 2: Page 3.6-15, last paragraph on the page explains that Table 3.6-3 shows Greenhouse Gas Emissions by County. Second sentence states "Baseline (2005) emissions are estimated to be 142 million metric tons (MMT) of CO_{2e} compared to an estimated 144 MMT of CO_{2e} under existing (2011) conditions." According to Table 3.6-3, the total estimate for Baseline (2005) CO_{2e} emissions in MMT is 132, and the estimate for Existing (2011) CO_{2e} emissions in MMT is 130. Please explain the calculation reflected on Page 3.6-15 as opposed to the table numbers on Page 3.6-16.

8. Section 3.7 Hazardous Materials

Item 1: At pages 3.7-9 through 3.7-11, Impact 3.7-1 is discussed, which is the "Potential to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials." Within the discussion of Impact 3.7-1, on Page 3.7-10, first full paragraph, the PEIR states (emphasis added) "*In general*, it is anticipated that the increase in transport of hazardous materials would result in a *less-than-significant hazard* to the public and/or the environment, because handling and transport of hazardous materials and wastes are subject to numerous laws, regulations, and health and safety standards set forth by federal, State, and local authorities that regulate the proper handling of such materials and their containers." Further on Page 3.7-10, the PEIR notes that the "2012-2035 RTP/SCS directs growth adjacent to transit and transportation facilities, and with this increased growth, there would be greater potential for exposure of sensitive receptors as well as other uses to risks associated with

hazardous material transport" and that such a greater potential impact "would be analyzed on a case-by-case basis." Finally, on Page 3.7-11, the section concludes that "[a]lthough individual projects would be required to comply with all existing regulations, due to the volume of projects (transportation and development) contained within the RTP/SCS, *it is possible that significant impacts could occur*. Therefore, without Mitigation Measures MM-HM1 through MM-HM3, *impacts could be significant*."

Based on the above, the PEIR notes "in general" the increase in transport of hazardous materials is anticipated to result in a less-than-significant hazard, but that projects would have to be analyzed on a case-by-case basis, such that it is "possible" significant impacts could occur, and that without MM-HM1 through MM-HM3, impact could be significant. There does not appear to be a conclusion, however, that Impact 3.7-1 would be "significant and unavoidable," even with the undertaking of the mitigation measures. This is somewhat conflicting, given the general notion that it is anticipated the increase in transport of hazardous materials would result in less-than-significant hazard to the public and/or environment. This is further in conflict with the Executive Summary table, in which Impact 3.7-1 is listed on Page ES-33 as being "significant and unavoidable" after mitigation despite the statement at Page 3.7-11, that impacts "could" be significant, rather than "impacts would remain significant."

Item 2: Page 3.7-13, MM-HM1 and MM-HM2 both state that "SCAG shall encourage" the United States Department of Transportation, the Office of Emergency Service, the California Department of Transportation, and the California Highway Patrol to continue to take certain actions, such as conducting driver safety or enforcing speed limits." These mitigation measures only seek to "encourage" other departments to continue carrying out regulations currently enforced, and provides no determination of how to determine if such measures serve to mitigate Impact 3.7-1 and Impact 3.7-4, for which it is listed, and its effectiveness as a mitigation measure.

9. Section 3.8 Land Use & Agricultural Resources

Item 1: Page 3.8-12 to 3.8-13, the PEIR recognizes that despite attempts to work with local jurisdictions, including, counties, subregions and local city planners, it is likely that the 2012-2035 RTP/SCS has relied on general plans that are not current and the implementation of RTP/SCS transportation projects and resulting growth will be inconsistent with general plans, and therefore the RTP/SCS includes the "policy to continue public outreach efforts and incorporate local input" to develop a more accurate forecast in future RTP/SCSs.

The PEIR subsequently notes that SCAG "has no authority to adopt local land use plans or approve local land use projects that will implement the SCS" because "SB 375 specifically provides that nothing in the law supersedes the land use authority of cities and counties. In addition, cities and counties are not required to change their land use plans and policies, including general plans, to be consistent with an RTP/SCS. However, local jurisdictions are encourage by SCAG to consider the [methods discussed in Chapter 4 and Chapter 2]." In other words, SCAG encourages local jurisdictions to adopt and update general plans that are consistent with the 2012-2035 RTP/SCS in order to accomplish the goals of SB 375. To this end, implementation of Mitigation Measures MM-LU1 through MM-LU10 would reduce impacts

related to potential conflicts with an applicable land use plan, policy, or regulation of any agency with jurisdiction over the project; however, impacts would remain significant.

There appears to be an inconsistency with this recognition on Pages 3.8-12 to 3.8-13 that SCAG can only *encourage* local jurisdictions to adopt plans that would reduce the impact of inconsistent local land use plans and policies with the RTP/SCS, consistent with SB 375's protection of ultimate land use authority of cities and counties, with the actual Mitigation Measures listed, namely MM-LU3, MM-LU8, and MM-LU10.

a. MM-LU3 states "SCAG shall work with its member cities and counties to ensure that transportation projects and growth are consistent with the RTP and general plans." This mitigation measure seems to require that the project sponsors in fact comply with the RTP, when such projects and growth falls within the protection of SB 375 and is a local land use control issue, within the local jurisdiction's purview.

b. MM-LU8 states "SCAG shall use its Intergovernmental Review Process to provide review and comment on large development projects regarding their consistency with the RTP and other regional planning efforts." This proposed mitigation measure seems inconsistent with SB 375 and SCAG's role to encourage consistency.

c. MM-LU10 states "Local jurisdictions can and should provide for new housing consistent with the Regional Housing Needs Assessment (RHNA) to accommodate their share of the forecasted regional growth." This proposed mitigation measure is problematic because local jurisdictions are not required to provide housing, and thus such measure conflicts with local authority. This may be remedied by revising the language of MM-LU10 to reflect compliance with state law with regard to housing to accommodate forecasted regional growth.

Item 2: At page 3.8-15, the PEIR states that "substantial disturbance and/or loss of forestlands, prime farmlands and/or grazing lands, throughout the six-county SCAG region" is mitigated by MM-LU15, which states "Project sponsors can and should ensure that at least one acre of unprotected open space is permanently conserved for each acre of open space developed as a result of transportation projects/improvements." This proposed mitigation, however, could constitute a "taking" of property and mitigates for "induced growth." Furthermore, MM-LU16 through MM-LU35, suggested to mitigate Impact 3.8-3, are insufficient in that they state local jurisdictions or project sponsors "can and should" take on various measures without noting how such measures will be evaluated for effectiveness in mitigating Impact 3.8-3. For example, MM-LU26, states "Project sponsors and local jurisdictions can and should promote infill development and redevelopment to encourage the efficient use of land and minimize the development of agricultural and open space lands" is again seemingly not a measure that can be meaningfully evaluated and/or quantified in determining efficacy.

Item 3: At Pages 3.8-15 through 3.8-16, the PEIR discusses the "[p]otential to influence the pattern of urbanization in the region such that land use incompatibilities could occur," and MM-LU36 through MM-LU85 are recommended to reduce land use impacts and again are insufficient insofar as they claim that local jurisdictions "can and should" take on various measures without noting how such measures will be evaluated for effectiveness in mitigating

Impact 3.8-3. For example, MM-LU44 states "The improvement and expansion of one urban public facility or service can and should not stimulate development that significantly precedes the local jurisdiction's ability to provide all other necessary urban public facilities and services at adequate levels." It is unclear how to determine when one urban public facility or service will cause a significant impact on a local jurisdiction's ability to provide all other necessary urban public facilities and services at "adequate levels," given that such "adequate levels" are not identified.

Item 4: Page 3.8-21, MM-LU53 states "SCAG shall promote infill, mixed-use, and higher density development, and provide incentives to support the creation of affordable housing in mixed use zone." Please describe how SCAG will seek to provide such incentives to support the creation of affordable housing in mixed use zones.

Item 5: Page 3.8-23, MM-LU69 states "Local jurisdictions can and should promote greater linkage between land uses and transit, as well as other modes of transportation." This Mitigation Measures is vague in that it does not provide what "greater linkage" measures would include, and how its effectiveness to minimize the impact of incompatible land uses would be determined.

Item 6: Page 3.8-25, MM-LU84 states "Local jurisdictions can and should give preference for infrastructure improvements that support or enhance desired land uses and projects." It is unclear what are the "desired land uses and projects" in MM-LU84, and how local jurisdictions are to give preference to such infrastructure improvement such as how it should be determined that such improvements actually enhance a desired land use and project, to be implemented by a local jurisdiction, and what measures of effectiveness should be applied.

Item 7: Page 3.8-25, MM-LU85 states "Local jurisdictions can and should reduce heat gain from pavement and other hardscaping, including . . . Reduce street rights-of-way and pavement widths to pre-World War II widths (typically 22 to 34 feet for local streets, and 30 to 35 feet for collector streets, curb to curb), unless landscape medians or parkway strips are allowed in the center of roadways." Please explain how reducing streets to pre-World War II widths will not conflict with local fire department required street access. Further, please explain how to measure the effectiveness of MM-LU85 in reducing Impact 3.8-4.

10. Section 3.11 Public Services and Utilities

Item 1: At page 3.11-6, the PEIR indicates that the Plan has the potential to increase exposure to wildfires and hazards due to new or expanded infrastructure. Additionally, at Page 3.11-9, in the PEIR's analysis of Direct Impacts, in comparing the Plan with the No Project Alternative, the PEIR notes that "under the No Project Alternative, it is anticipated that 83,990 households would be exposed to extreme wildfire threats; whereas under the 2012-2035 RTP/SCS, the number would be reduced to 71,553. This would be a 14 percent decrease in households exposed to extreme wildfire threats, as measures to reduce wildfire threats are implemented with planned 2012-2035 RTP/SCS projects." The PEIR notes what the expected number of households exposed to wildfire threats would be in 2035 under a No Project scenario, and notes the decrease by 14 percent in relation to the number of households exposed under the Plan, however the PEIR

does not note the current number of households exposed, to reflect a corresponding potential increase under the Plan.

Item 2: At page 3.11-47, just above Table 3.11-11, the PEIR states that the Table reflects that "urban development and growth that would be accommodated by the transportation investments in the 2012-2035 RTP/SCS would result in less overall use of energy resources in 2035 than in 2011." The total use of electricity and natural gas consumption as reflected in Table 3.11-11 is *actually higher* compared from 2035 under the Plan to the current 2011 energy consumption. What the Table reflects is a less overall use of energy resources in 2035 as between a No Project scenario and the Plan scenario. Thus, the statement that the "urban development and growth that would be accommodated by the transportation investments in the 2012-2035 RTP/SCS would *result in less overall use of energy resources in 2035 than in 2011*" should be amended accordingly.

Item 3: At page 3.11-49, MM-PS64 states "[s]tate and federal lawmakers and regulatory agencies can and should pursue the design of programs to either require or incentivize the expanded availability including the expansion of alternative fuel filling stations and use of alternative-fuel vehicles to reduce the impact of shifts in petroleum fuel supply and price." This mitigation is assigned to State and Federal agencies and lawmakers, who are outside of SCAG's purview.

Item 4: At pages 3.11-51 through 3.11-52, MM-PS91 and MM-PS92 require local jurisdictions to take on mitigation measures that will likely directly increase the cost of housing, but do not include measures by which to determine the effectiveness of requiring energy audits in achieving mitigation of Impact 3.11-11.

Item 5: At page 3.11-53, mitigation measure MM-PS106 states "[l]ocal jurisdictions can and should provide, where feasible, creative financing for renewable energy projects, including subsidized or other low-interest loans, and the option to pay for system installation through long-term assessments on individual property tax bills." This mitigation measure is currently a voluntary program, and should be made clear that it will remain voluntary for local jurisdictions, to determine when such programs are "feasible" in accordance with the project-specific analysis that will be conducted at the project level.

11. Section 3.12 Transportation, Traffic, and Security

Item 1: MM-TR1 serves as an example of a mitigation measure that provides no articulable standard by which to determine its efficacy. MM-TR1 states, "SCAG shall establish a forum where policy-makers can be educated and can develop consensus on regional transportation safety and security policies." It is unclear how exactly such requirement shall be measured for effectiveness and how such measure will mitigate the impacts discussed in Section 3.12.

Item 2: At page 3.12-33, MM-TR26 and MM-TR27 both note that "SCAG shall encourage local agencies to fully implement these policies and projects." It appears that both mitigation measures are more of a suggestion that local agencies fully implement the measures included in the Plan, but has no measure of effectiveness if such measures are adopted or that such measures must be implemented.

Item 3: At page 3.12-36, MM-TR34 states "[l]ocal jurisdictions can and should meet an identified transportation-related benchmark." Please explain what would be an "identified transportation-related benchmark" and who would determine such benchmark, and the standards by which the effectiveness of meeting such a benchmark would achieve in mitigating Impact 3.12-1.

Item 4: At page 3.12-36, MM-TR37 states "[l]ocal jurisdictions and transit agencies can and should provide public transit incentives such as free or low-cost monthly transit passes to employees, or free ride areas to residents and customers." Please describe or explain how the subsidies are to be provided for by local jurisdictions and transit agencies in accordance with this proposed mitigation measure.

Item 5: At page 3.12-37, MM-TR52 states"[l]ocal jurisdictions can and should reduce VMT-related emissions by encouraging the use of public transit through adoption of new development standards that would require improvements to the transit system and infrastructure, increase safety and accessibility, and provide other incentives." Please describe or explain how local jurisdictions are to determine these "new development standards" and how the effectiveness of such standards will be measured to determine effectiveness of such a mitigation measure.

Item 6: At page 3.12-37, MM-TR56 deals with System Interconnectivity, stating that "Local jurisdictions can and should create an interconnected transportation system that allows a shift in travel from private passenger vehicles to alternative modes, including public transit, ride sharing, car sharing, bicycling and walking, by incorporating the following . . ." which includes (i) "study the feasibility of providing free transit to areas with residential densities of 15 dwelling units per acre or more, including options such as removing service from less, dense underutilized areas to do so" and (ii) "use park-and-ride facilities to access transit stations only at ends of regional transitways or where adequate feeder bus service is not feasible." Please explain how this measure was determined, that free transit be provided to areas with residential densities of 15 dwelling units per acre or more.

Item 7: At page 3.12-38, MM-TR59 states that local jurisdictions "can and should prioritize transportation funding to support a shift from private passenger vehicles to transit and other modes of transportation" and sets forth two methods to do so, including "Give funding preference to improvements in public transit over other new infrastructure for private automobile traffic" and "before funding transportation improvements that increase roadway capacity and VMT, evaluate the feasibility and effectiveness of funding projects that support alternative modes of transportation and reduce VMT, including transit, and bicycle and pedestrian access." Please explain how this mitigation measure does not conflict with all local transportation measures already in place, including Measure M2 and Measure R in Los Angeles County.

Item 8: Page 3.12-40, MM-TR74: "Low- and No- Travel Employment Opportunities: Local jurisdictions can and should facilitate employment opportunities that minimize the need for private vehicle trips, including" the measure that local jurisdictions "encourage telecommuting options with new and existing employers, through project review and incentives, as appropriate." Please describe or explain how the telecommuting networks will be implemented and whether such incentives would mean the need for new taxpayer funded subsidies.

Item 9: At page 3.12-43, MM-TR97 states "Travel Mitigation: Local jurisdictions can and should mitigate business-related travel, especially air travel, through the annual purchase of verified carbon offsets." This measure requires that local jurisdictions purchase carbon offsets, without setting forth benchmarks or standards to determine the effectiveness of such a measure in reducing Impact 3.12-1 and 3.12-3.

Item 15: At page 3.12-43, MM-TR98 states "Transit Access to Municipal Facilities: Local jurisdiction and agency facilities can and should be located on major transit corridors, unless their use is plainly incompatible with other uses located along major transit corridors." Please explain locating municipal facilities in a "major transit corridor" will effectively mitigate Impact 3.12-1 and 3.12-3.

Item 16: Page 3.12-30: Impact 3.14-6 should read Impact 3.12-6.

12. Section 3.13 Water Resources

Item 1: At page 3.13-39, MM-WR26imposes more regulations than the current National Pollutant Discharge Elimination System (NPDES) permit requirements, regulated by the State Water Resources Control Board as delegated by the U.S. Environmental Protection Agency, and would require mitigation on project sites smaller than one acre in size. Please explain and justify that approach.

13. Section 4.0 Alternatives

Item 1: While an EIR need not include an in depth discussion of the alternatives that were not considered feasible, according to CEQA Guidelines, section 15126.6(c), it should briefly identify alternatives rejected as infeasible and explain why they were rejected. It does not appear that this PEIR does so.

Item 2: Page 4-4 lists brief descriptions of the Alternative 2 and Alternative 3 projects. Alternative 2 only describes Modified 2008 RTP Alternative as an "update of the adopted 2008 RTP to reflect the most recent growth estimates and transportation planning decisions and assumptions" and goes on to say that the alternatives "does not include urban form strategies included within the SCS, but includes all of the modifications and projects in the 2008 RTP through RTP Amendment 4. The growth scenario for the Modified 2008 RTP Alternative is a combination of local input and existing general plan and land use date provided by local jurisdictions."

This does not include enough description of Alternative 2 to verify that the conclusions made as to the comparative effects of that Alternative for each of the Impacts discussed in turn from Pages 4-22 through 4-30. The analysis of each Impact under the Modified 2008 RTP Alternative as compared to the Plan explains the difference in Impact, but without explanation of how such a conclusion were formulated/achieved.

For example, under Hazardous Materials at Page 4-27, it states "The Modified 2008 RTP Alternative would have similar impacts related to the accidental release of hazardous materials as compared to the Plan." The reasoning behind that conclusion should be provided, and would be

supported by a more thorough description of what the Modified 2008 RTP Alternative plan would entail.

14. Section 5.0 Long Term Effects

Item 1: Page 5-3, the PEIR states "Resources that would be permanently and continually consumed by the proposed project's implementation include water, electricity, natural gas, fossil fuels, and aggregate resources; however, the amount and rate of consumption of these resources would not result in significant environmental impacts related to the unnecessary, inefficient, or wasteful use of resources." To better understand how it was determined there would not be unnecessary, inefficient, or wasteful use of resources, resulting in irreversible, significant environmental effects, the reasoning behind such a conclusion should be provided.

III. Conclusion

For all of the foregoing reasons, Irvine respectfully believes the PEIR should be revised to clarify the PEIR's approach to mitigation, reflecting that feasibility and effectiveness of the Mitigation Measures were determined at a programmatic level, and that project-specific analysis will amend or adopt such Measures as appropriate upon further analysis, allowing for measures to be bypassed by local jurisdictions when project level analyses find the measures either infeasible or unnecessary. Additionally, the Mitigation Measures should be amended to include articulable standards by which to determine their efficacy in mitigating their corresponding Impacts recognized by the PEIR. A consensus should be reached as to how to conduct future Cumulative Impacts determinations upon local jurisdictional undertaking of project-specific analysis, given the findings of "significant and unavoidable" impacts at a programmatic, but not project-specific level.

Thank you for considering these comments.

Attachment 2: OCCOG Technical Comments on the Draft 2012-2035 RTP/SCS and PEIR

1. GROWTH FORECASTS

Issue: Growth Projections: The 2012 growth projections identify population, housing and employment data for the six-county SCAG region, from 2008 (existing) to 2020 and 2035. These growth projections represent the best available information from local jurisdictions, the business community and landowners. However, as time passes, what is feasible for any given project can change. The triggers for change to adopted growth projections can range from factors such as market conditions, new information or data, infrastructure availability, changes in funding availability (such as the dissolution of redevelopment agencies statewide), and changes to jurisdictional boundaries resulting from future annexations and incorporations of previously-designated unincorporated territory. SCAG should continue to adopt the 2012 growth projections at a countywide level, consistent with past approvals of Regional Transportation plan growth forecasts. A county level of geography accommodates internal adjustments to changing conditions as described above, without compromising the integrity of the overall growth projections. However, approving the growth projections at any lower level of geography, such as at the city level, would be challenged with continual revisions and shifts to the total number of housing, population and employment within a city, among cities, and between cities and counties as a result of the factors described above. Adoption of the data at a level lower than the county would limit jurisdictional control and create inflexibility in a regional planning document. In addition, the level of geography in which RTP/SCS growth forecast is adopted should not be determined by other processes. For example, the RHNA allocations must be consistent with the RTP/SCS; state law does not require that they be identical. The RTP/SCS can be adopted at the county level and the RHNA process may proceed independently until it is completed after the appeals, trades, and transfers are completed. The RHNA allocations that were derived from the growth forecast can still be determined to be consistent with the RTP/SCS, even if changes are made to the city totals during the appeals, trades, and transfers process.

Growth Projections Recommendation: SCAG's adoption of the growth forecast numbers should be at the county level, consistent with past RTPs, and not at a smaller level of geography such as city, census tract, or traffic analysis level.

Issue: OCP-2010 Modified: On January 26, 2012, the update to the OCP-2010 dataset known as "OCP-2010 Modified" was officially approved by the OCCOG Board of Directors and is a data amendment to the OC SCS. The dataset

includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 and this letter also serves as the formal notice of the update that should be incorporated into the 2012 RTP/SCS, PEIR, and related documents.

OCP-2010 Modified Recommendation: All documents, tables, maps, narrative, modeling runs, PEIR Alternatives (including Alternate C/3/Envision 2 referencing the Orange County growth forecasts) should be updated with the Orange County Projections-2010 Modified Growth Projections, as adopted by the OCCOG Board of Directors and consistent with the subregional delegation MOU between OCCOG, OCTA and SCAG.

2. DRAFT RTP/SCS

Issue: 2012 Draft RTP/SCS: The RTP/SCS identifies strategies to reduce greenhouse gas emissions from cars and light duty trucks. Because counties, jurisdictions and agencies have different needs and feasibility of implementation, we believe these strategies should be clearly identified as a menu of options that can be used to achieve the goal of reduced GHG emissions. However, the document can be construed to suggest that each of the strategies listed in the table on pages 150-153 are necessary to successfully implement the SCS, many of which are beyond SCAG's purview or control. It is requested that the language be clear that it is permissive.

2012 Draft RTP/SCS Requests:

1. **Revise language on page 149: "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which that help ~~can and should undertake in order~~ to successfully implement the SCS."**

2. **Please provide SCAG analysis supporting the strategies in the Draft RTP/SCS Chapter 4.**

3. **Please describe what municipal obligations are anticipated as a result of adopting these strategies as a list to be accomplished rather than a menu of options.**

Issue: OC SCS Strategies: There are strategies in the Orange County SCS that are not included in the regional SCS. Similarly, there are some strategies in the regional SCS that are not consistent with the strategies in the OC SCS. This creates confusion and clarification is needed.

Under SB 375 and only within the SCAG region, subregional councils of government were allowed to prepare subregional SCS's that SCAG is then required to incorporate into the regional SCS. In Orange County, the Orange County Council of Governments (OCCOG) and the Orange County Transportation Authority (OCTA) developed a countywide or subregional SCS (OC SCS) that was to be incorporated in whole into the SCAG SCS. Local agencies in Orange County developed the OC SCS and approved it in June 2011. SCAG has incorporated the OC SCS in its entirety into the regional SCS as an appendix to the regional SCS, but it is unclear what the standing is of the OC SCS. The OC SCS contains a set of strategies that were agreed upon by local governments, agencies and other stakeholders within Orange County and was accepted by SCAG and should represent the SCS that is applicable to the Orange County region.

OC SCS Strategies Recommendation: Please revise the text in the last paragraph on page 106 to state: "These subregional SCS documents are incorporated into the regional SCS and represent the SCS for each of these subregions."

3. **DRAFT PEIR**

Issue: Mitigation Monitoring Program Intent: It is unclear how SCAG intends to implement the Mitigation Monitoring Program with regard to the proposed mitigation measures, as may be implemented by local agencies. Section 1-5 of the PEIR specifically provides that "Lead agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring efforts, including SCAG's Intergovernmental Review (IGR) process." It is infeasible for SCAG to require local jurisdictions to report when such mitigation measures are considered for any project. Noting that the SCAG region includes 6 counties, 14 subregional entities and 191 cities, this reporting requirement would surely fall short of expectations. Given this identified infeasibility, please clarify what obligations local agencies may have regarding SCAG's mitigation monitoring efforts.

Mitigation Monitoring Program Intent Requests/Recommendations:

1. **Does SCAG intend to require all jurisdictions that avail themselves of the mitigation measures to report to SCAG when such measures are considered for any project?**

2. **SCAG's approval of the PEIR needs to clearly state the intent and applicability of the mitigation measures and the PEIR reflective of our comments below and that mitigation measures do not supersede regulations under the jurisdiction of other regulatory agencies.**

3. **Add language to Executive Summary and Introduction: "Mitigation measures do not supersede regulations under the jurisdiction of other regulatory agencies."**

4. **Feasibility and Applicability**

On pages 1-5 and 1-7, the language should reflect that Lead agencies will determine the feasibility and applicability of measures and that the measures are intended to offer a menu of options available should a lead agency opt to utilize them. The PEIR makes the assertion on page 1-7 of the Project Description under Transportation Project Mitigation and Land Use Planning and Development Project Mitigation sections that the draft PEIR has made a preliminary determination that all of the mitigation measures in it are considered feasible. SCAG has not identified any analysis that supports the feasibility of the mitigation measures that are to be undertaken by entities other than SCAG and SCAG staff has stated on numerous occasions that the mitigation measures were intended to be a menu of options for consideration by lead agencies.

Issue: Mitigation Measures Impose Obligations Beyond Scope of SB 375. Given the combination of the RTP and the SCS processes, as mandated by SB 375, we recognize that SCAG must undertake the difficult task of balancing the goal of having a coordinated regional transportation system with land use strategies that encourage a more compact use of land. However, a key principle of SB 375 is that it is not intended to supersede local agencies' authority to regulate land uses. Specifically, Government Code section 65080(b)(2)(K) provides, in relevant part that ". . . .Nothing in a sustainable communities strategy shall be interpreted as superseding the exercise of the land use authority of cities and counties within the region. . ."

In light of the limitation expressed at Government Code sec. 65080(b)(2)(K), we find language in the PEIR, and specifically the mitigation measures therein, imposing affirmative obligations on local agencies within the SCAG region to be inappropriate and contrary to law. The proposed language as recommended below would remedy the legal conflict with Section 65080(b)(2)(K), yet achieve SCAG's recognition that project-specific environmental review is the appropriate level of review for projects that that have their own unique, site-specific circumstances.

The revisions are further consistent with OCCOG's understanding that SCAG intended to provide the mitigation measures as a "toolbox" to local agencies for use within their discretion if and when appropriate for projects within their respective jurisdictions. Indeed, from materials presented by SCAG, including the January 26, 2012 workshop held at the City of Anaheim Council Chambers, SCAG explained that "**This PEIR offers a "toolbox" of mitigation measures** for future project-level environmental analyses. . . . It also includes suggested mitigation measures for local agencies to consider for implementation, if

appropriate and feasible (phrased as "can and should"). This language is permissive and not mandatory upon local agencies."

Mitigation Measures Impose Obligations Beyond Scope of SB 375 Recommendations:

1. **Please provide SCAG analysis supporting the feasibility of mitigation measures in the PEIR.**

2. **Change language on page 1-7 found in 2 places under MITIGATION MEASURES, subheadings Transportation Project Mitigation and Land Use Planning and Development Project Mitigation: "This Draft PEIR has made a preliminary determination that the proposed mitigation measures are feasible and effective. Therefore, it is reasonable to expect that these agencies will actually implement them where, in the agencies' independent discretion, the measures are deemed applicable in light specific circumstances at the project level.**

3. **Change language on page 1-5, first paragraph: "Mitigation Measures proposed in this PEIR are available as tools for implementing agencies and local lead agencies to use as they deem applicable. The implementing agencies and local lead agencies are responsible for ensuring adherence to the mitigation measures as 2012-2035 RTP/SCS projects are considered for approval over time."**

4. **Please make similar text amendments to other sections, including the Executive Summary, of the PEIR that reference how the mitigation measures are to be used by lead agencies, including the Executive Summary.**

5. **"Can and Should"**

As indicated in the PEIR on page 1-6, state law provides that it is appropriate to indicate in mitigation measures that they "can and should" be implemented where the authority to implement the measures rests with agencies other than SCAG. The language conveys to local agencies an affirmative obligation to address each mitigation measure, irrespective of whether such agencies deem the measures applicable to a particular project or duplicative of their own or other governmental agencies' regulatory measures. OCCOG recognizes that SCAG's use of the words "can and should" are derived from CEQA, at Public Resources Code sections 21081 and 2155.2(b)(5)(B)(ii) and CEQA Guidelines, including section 15091(a)(2). Nevertheless, given the express limitation of SB 375 upon respective local agencies' land use authority, OCCOG deems any language seemingly imposing affirmative obligations contrary to SB 375 inappropriate. As

such, the use of the language "can and should" for mitigation measures addressed to local agencies is inappropriate.

"Can and Should" Recommendations: Change language in all mitigation measures identifying entities other than SCAG to read "~~can and~~ should consider where applicable and feasible." To clarify the intent that the mitigation measures are a menu of options for which feasibility has not been established for any given project, the "can and should" language should be changed in all mitigation measures identifying entities other than SCAG to read "should consider where applicable and feasible."

6. **CEQA Streamlining:**

Pages 1-10 through 1-12 describe requirements for the CEQA streamlining offered under SB 375. In each section, it is indicated, consistent with SB 375, for projects to qualify for the CEQA streamlining, mitigation measures from the applicable environmental document must be incorporated into the project. Further, CEQA streamlining relative to the infill exemption under CEQA is also being developed pursuant to SB 226 passed last year.

CEQA Streamlining Recommendations: Please clarify how the "menu of mitigation measures" is expected from this PEIR for project to qualify for CEQA streamlining under SB 375 and, if possible, the regulations being developed under SB 224.

7. **RTP/SCS Policies**

Please ensure that the discussion of the policies represented by the RTP/SCS in the draft PEIR is consistent with the policies actually in the RTP/SCS. In particular, the bullet list on the page 2-3 is stated to represent the land use strategies of the plan; however, the strategies listed are not specifically identified in the regional SCS. Including different language in the PEIR implies additional policy.

RTP/SCS Policies Recommendation: Amend the land use strategies identified on page 2-3 of the Project Description, under the section Purpose and Need for Action to reflect the strategies included in the SCS chapter of the RTP.

8. **PEIR Mitigation Measures**

By far the most concerning portion of the Draft 2012 RTP/SCS to OCCOG members is the Draft Program Environmental Impact Report (PEIR). Specifically, the proposed mitigation measures included in the PEIR extend to and impact a broad spectrum of technical and policy areas. Many examples of these concerns

are included on Attachments 1 and 2 of this letter. In sum, the concerns are that the mitigation measures:

- Appear to go above and beyond the requirements of the Regional Transportation Plan and Senate Bill 375;

- Are measures already required by State and Federal law or are regulated by other agencies such as the South Coast Air Quality Management District, California Department of Housing and Community Development, Fish and Game, and the Regional Water Control Boards;
- Appear to run counter to local control; and

- Are financially infeasible for the agencies responsible for implementation.

PEIR Mitigation Measures Recommendations.

1. **In order for the mitigation measures to truly be considered a toolbox of options for consideration by various entities in the SCAG region as intended, all mitigation measures in the PEIR intended for entities other than SCAG be moved into an appendix to the PEIR and renamed "Sustainability Strategies". These strategies could then be identified for consideration by lead agencies as mitigation for future projects should a lead agency choose to do so and deem them applicable and feasible. The PEIR would only retain mitigation measures applicable to SCAG. This action would also require that the Executive Summary, Introduction, and Project Description be updated to reflect the nature of the new appendix of Sustainability Strategies.**

2. **Remove language within mitigation measures that establishes policies not included in the RTP/SCS or modifies the measure to specify a policy or endorses specific technology which would limit agency authority.**

3. **In the draft PEIR, please replace text in all mitigation measures that identify policy for either SCAG or other entities with language that reflects either adopted SCAG policies or are policies that are included in the RTP and SCS. Mitigation measures should not be used to establish new policy for the region.**

For example:

- MM-TR 17: "SCAG shall (for its employees) and local jurisdictions ~~can and~~ should institute where applicable and feasible teleconferencing, telecommute, and/or flexible work hour programs ~~to reduce unnecessary employee transportation~~.

- MM-TR 23: "Local jurisdictions should consider when applicable and feasible coordinated and controlled intersections so that traffic passes more efficiently through congested areas. Where traffic signals or streetlights are installed, require the use of a feasible, energy efficient ~~Light Emitting Diode (LED)~~ technology."

- MM-TR 35: "Local jurisdictions should consider where applicable and feasible the adoption of a comprehensive parking policy that ~~discourages private vehicle use and~~ encourages the use of alternative transportation."

9. SCAG Authority

Several mitigation measures identify actions that SCAG shall undertake to mitigate impacts of the plan. Many appropriately direct SCAG to provide a discussion forum or serve as a central data repository for a broad range of topics that affect the region as a whole. However, many measures inappropriately direct SCAG to establish practices, standards, or policy in areas unrelated to what SCAG has purview over. Further, the measures often appear to be directed at policy implementation that is unrelated to the plan itself, such as implementing AB 32. Such measures will essentially require SCAG to establish policy in areas for which it has no authority. Additionally, it is not clear how SCAG would fund the work efforts because they are not directly related to its mission and, therefore, do not have funding. For example, MM-PS 118 states: "SCAG shall continue to develop energy efficiency and green building guidance to provide direction on specific approaches and models and to specify levels of performance for regionally significant projects to be consistent with regional plans." Green building practices and energy efficiency measures are already addressed by various state and federal agencies, as well as by other local organizations. Further, SCAG does not have the authority to specify levels of performance for land use or buildings.

SCAG Authority Recommendation: Remove the following mitigation measures for SCAG which it does not have purview for under the law or directed to do by the Regional Council through policy direction. List may not be exhaustive.

MM-BIO/OS 44	MM-LU 42	MM-LU 77	MM-PS 68
MM-BIO/OS 45	MM-LU 47	MM-LU 80	MM-PS 71
MM-BIO/OS 46	MM-LU 48	MM-LU 81	MM-PS 95
MM-BIO/OS 48	MM-LU 51	MM-LU 82	MM-PS 121
MM-GHG 3	MM-LU 53	MM-LU 83	MM-TR 17
MM-GHG 8	MM-LU 56	MM-NO 12	MM-TR 23
MM-GHG 11	MM-LU 57	MM-NO 16	MM-TR 28
MM-LU 9	MM-LU 60	MM-POP 1	MM-TR 35

MM-LU 21	MM-LU 61	MM-PS 3	MM-TR 83
MM-LU 22	MM-LU 64	MM-PS 14	MM-TR 85
MM-LU 24	MM-LU 65	MM-PS 25	MM-TR 96
MM-LU 26	MM-LU 69	MM-PS 37	MM-W 34
MM-LU 32	MM-LU 71	MM-PS 39	MM-W 59
MM-LU 34	MM-LU 74	MM-PS 41	MM-W 60
MM-LU 41	MM-LU 75	MM-PS 67	MM-W 65

10. SCAG Mitigation Measures

It would be helpful to understand how SCAG will implement the mitigation measures that it is assigned to do. Many of the mitigation measures will expand SCAG's role into areas that are not currently under its purview and are under the jurisdiction of other entities. Many also constitute significant work efforts.

SCAG Mitigation Measures Request: Please explain how the actions and programs required by the measures SCAG is assigned to do would be funded to ensure that they are truly feasible for SCAG to undertake.

11. Ensuring Outcomes

SCAG has limited authority in many of the areas included in the measures and will not be able to ensure impacts are mitigated and that the outcomes identified do actually occur. SCAG can assist, offer information, educate, and provide discussion forums for topics outside its area of jurisdiction; however, it is not possible to "ensure" that outcomes are achieved for things that are outside of its purview.

Ensuring Outcomes Recommendation: Remove all references within mitigation measures that SCAG will "ensure" or "shall minimize impacts" that result from a mitigation measures.

Example:
MM-CUL17: "~~Impacts to cultural resources shall be minimized through cooperation, information sharing, and~~ SCAG's shall, through cooperation, information sharing and ongoing regional planning efforts such as web-based planning tools for local government including CA lots, and direct technical assistance efforts such as Compass Blueprint's Toolbox Tuesday series, provide information and assistance to local agencies to help them avoid impacts to cultural resources. Resource agencies, such as the Office of Historic Preservation, shall be consulted during this process."

12. **Fees and Taxes**

Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, thus not be approved. They also represent prescriptive means to accomplish the mitigation.

Fees and Taxes Recommendations:

1. **Reword measures to indicate that a new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. The following list may not be exhaustive.**

MM-BIO/OS55	MM-PS15	MM-TR30	MM-TR88
MM-LU29	MM-PS63	MM-TR37	MM-TR94
MM-LU53	MM-PS75	MM-TR47	MM-TR96
MM-LU54	MM-PS76	MM-TR52	MM-W6
MM-LU80	MM-PS78	MM-TR60	MM-W32
MM-LU81	MM-PS92	MM-TR69	MM-W52
MM-LU82	MM-PS106	MM-TR74	MM-W58
MM-LU83	MM-PS107	MM-TR75	
MM-POP4	MM-PS113	MM-TR80	
MM-PS12	MM-TR28	MM-TR84	

2. **Please clarify whether it was assumed that these additional fees were considered feasible and if the new fees that are suggested were considered in the financial plan or economic analysis of the RTP.**

13. **Guidance Documents**

Guidance documents are there as information sources for consideration; however, they do not represent regulation or establish standards that are required to be achieved. For example, MM-AQ19 inappropriately indicates that project sponsors should comply with the CARB Air Quality and Land Use Handbook (June 2005) which is only a guidance document.

Guidance Documents Recommendation: Remove references that indicate a compliance with guidance documents from mitigation measures.

14. **Duplicative/Existing Regulations**

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g. CEQA review requirements). Under the California

Environmental Quality Act, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact and the significance of the impact is after all existing regulation is applied. Therefore, mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigation the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and the regulation. It has become common practice to state that existing regulation will be implemented. When this is done, it is common practice when compliance is used as a mitigation measure to simply state that the responsible entity will simply comply with the regulation. If mitigation measures that restate existing regulation are not removed, then it is requested that the wording of the measures be restated to simply read that compliance with all applicable laws and regulations will be undertaken. Language that could be used is: "Local jurisdictions, agencies, and project sponsors shall comply, as applicable, with existing federal, state law, and local laws and regulations." Similar language is included in some mitigation measures. It is offered that MM-PS 13 is a good example of the type of appropriate language and reads "Project sponsors can and should ensure that projects are consistent with federal, state, and local plans that preserve open space."

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g. CEQA review requirements). Under the California Environmental Quality Act, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact and the significance of the impact is after all existing regulation is applied. Therefore, mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigation the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and the regulation. It has become common practice to state that existing regulation will be implemented. When this is done, it is common practice when compliance is used as a mitigation measure to simply state that the responsible entity will simply comply with the regulation. If mitigation measures that restate existing regulation are not removed, then it is requested that the wording of the measures be restated to simply read that compliance with all applicable laws and regulations will be undertaken. Language that could be used is: "Local jurisdictions, agencies, and project sponsors shall comply, as applicable, with existing federal, state law, and local laws and regulations." Similar language is included in some mitigation measures. It is offered that MM-PS 13 is a good example of the type of

appropriate language and reads "Project sponsors can and should ensure that projects are consistent with federal, state, and local plans that preserve open space." The water section provides another example. The PEIR includes 68 mitigation measures in the Water Resources section regarding water quality. At least 35 of these are related to stormwater runoff best management practices (BMPs) that are currently regulated through Municipal National Pollutant Discharge Elimination System (NPDES) Stormwater Permits issued by Regional Water Quality Control Boards. In the SCAG region there are five water quality control boards each with its own Municipal NPDES Stormwater Permit. The regulations and requirements contained in these permits vary from each other. By listing specific measures in the PEIR that are not included in a project's applicable Municipal NPDES Stormwater Permit, the PEIR creates conflicting compliance requirements. To eliminate potential conflict with existing regulations, the mitigation measures regarding specific BMPs should be removed and replaced with a single requirement that each project must comply with its applicable Municipal NPDES Stormwater Permit.

Duplicative/Existing Regulations Recommendations:

1. **Please remove all mitigation measures listed in Attachment 1 which are duplicative of existing regulations administered by or under the jurisdiction of other agencies. The list may not be exhaustive.**

2. **For each impact, please add the following language: "Local jurisdictions, agencies, and project sponsors should comply, as applicable, with existing federal, state, and local laws and regulations."**

15. Draconian Mitigation Measures

Many of the mitigation measures in the Draft PEIR are draconian and need to be removed. One prime example is MM-LU 85. It reads in part "Local jurisdictions can and should reduce heat gain from pavement and other hardscaping including: Reduce street rights-of-way and pavement widths to World War II widths (typically 22 to 34 feet for local streets and 30 to 35 feet for collector streets curb to curb)..." Although reduced street widths may be appropriate in some cases and have been implemented in many jurisdictions, it is inappropriate and counterproductive to require reduced street widths as a mitigation measure in the PEIR. Reduced street widths, for example, generally do not provide space for on-street parking which may result in greater, additional paved areas provided in separate parking lots. A second example is MM-LU15: "Project sponsors can and should ensure that at least one acre of unprotected open space is permanently conserved for each acre of open space developed as a result of transportation projects/improvements." Measures should support the SCAG Energy and Environment Committee which recommended that the programs

build upon existing open space land acquisition and open space programs in the region, tailoring programs to each individual county in the region. These include, but are not limited to, OCTA's Measure M Mitigation Program, and TCA's open space mitigation program, which has protected 2,200 acres in perpetuity to date. Open space conservation should be pursued in a voluntary manner, working with willing private sector landowners and not overly prescriptive and specific.

Draconian Mitigation Measures Recommendations: Remove mitigation measures that are very prescriptive, such reducing street widths to WWII widths or specifying preferred technology.

Mitigation Measures Duplicative of Existing Regulation

Additional Technical Clarifications on documents are also offered as follows:

2012 RTP/SCS

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
1	General Comment	all	*All chapter headings should include the Chapter number on each page for ease of reference.*
2	Clarification	1, left column	"The 2012 RTP/SCS includes a strong commitment to reduce emissions from transportation sources to comply with SB 375, ~~both~~ improve public health, and meet the National Ambient Air Quality Standards as set forth by the federal Clean Air Act. As
3	Clarification	4, right column	"This region needs a long-term, sustainable funding plan that ensures the region receives its fair share of funding, supports an efficient and effective transportation system that grows the economy, provides mobility choices, and improves our quality of life."
4	Clarification	page 7- Table 2 and page 95- Table 3.3	*Is additional $0.15 gas tax the sum total of both state and federal taxes or $0.15 each?*
5	Clarification	40, left column	"Strategic investments, put forth by the private sector, that would remove barriers associated with telecommuting are expected..."
6	Correction	page 42- Table 2.2	241 toll road completion year is 2030
7	Please define in the text and add to a glossary	50, left column	"scrip"
8	Clarification	54, right column	"Express/HO T Lane Network Despite our concerted effort to reduce traffic congestion through years of infrastructure investment, the region's system demands continue to exceed available capacity during peak periods."
9	Clarification	70, 78	Greenhouse Gases and Air Quality SCAG seems to rely on CEQA to achieve the "maximum feasible" reductions in emissions from transportation. However, this is not consistent with the intent of SB 375's goal of achieving specific thresholds of 8% by 2020 and 13% by 2035 through a sustainable communities strategy plan.

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			Please provide clarification to this section indicating if the air quality and greenhouse gas CEQA mitigation measures obligate regional agencies and project developers to undertake more strategies, programs and mandates beyond those included in the OC SCS.
10	Clarification	78, right column	"Greenhouse Gases On road emissions (from passenger vehicles and heavy duty trucks) constitute 93 percent of the transportation sector total. Emissions from passenger vehicles, which are the subject of SB 375 and this RTP/SCS, constitute ___% of the transportation sector's greenhouse gas emissions total."
11	Clarification	80, left column	Statements are made, such as the following, "the RTP has the ability to affect the distribution of that growth" (in population in the region). These statements could be interpreted to be contrary to SCAG's obligation under the Memorandum of Understanding with OCCOG to respect the strategies and local land use policies in the OC SCS. *Please clarify how it is in SCAG's ability to affect local change when the OC SCS is consistent with acceptance of local land use plans and planned population and employment distribution?* *Recommended text change:* "Transportation projects including new and expanded infrastructure are necessary to improve travel time and can enhance quality of life for those traveling throughout the region. However, these projects also have the potential to ~~induce~~ attract more of the regional population growth in certain areas of the region. This means that although ~~Although~~ SCAG does not anticipate that the RTP would affect the total growth in population in the region, the RTP has the ability to affect the distribution of that growth." "~~In addition to induced population growth,~~ transportation projects in the RTP also have the potential to divide established communities, primarily through acquisition of rights-of-way."
		82, right	

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
		column	Text indicates that the RTP and projects in the RTP/SCS as "inducing" growth. It is noted that use of the term "induced growth" has a negative connotation and implies growth above and beyond what would occur naturally. However, it is stated in the RTP that the population, housing, and employment growth totals are fixed and only the distributions may change based on the plan. This means there will not be "new" growth and that the RTP and SCS may simply influence and shift the growth anticipated for the region. This moving of growth is the result of changes in distribution that are due to changes in land use or densities. Because of this, it is requested that references to "induced growth" be reworded to reflect the shifting of growth in the region. *Recommended text change:* "Cumulative impacts from the projected growth ~~induced by the RTP~~ include increased impervious surfaces;..."
12	Clarification	Chapter 3	SCAG's Financial Plan includes a significant portion of "New Revenue Sources and Innovative Financing Strategies" that are not currently in place or available. While some of the proposed revenues are within the control of SCAG or MPOs and County Transportation Commissions, the majority of the revenues (in terms of dollars) require either state or federal action to implement. *Please explain what the implications are if these new revenue sources and innovative financing strategies do not become available?*
13	Clarification	page 95-Table 3.3	~~"Mileage-based user fees would be implemented to replace gas tax and augment estimated at about $0.05 (2011$) per mile and indexed to maintain purchasing power starting 2025."~~ Suggested language is from page 31 of Growth Forecast Appendix: "Current gasoline tax, estimated at about $0.05 (2011$) per mile will increase through 2025, then in 2026 it would be replaced with a mileage-based user fee indexed to maintain purchasing power."

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
14	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw land available in the region ~~left to accommodate additional growth~~."
15	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw land available in the region ~~left to accommodate additional growth~~."
16	Clarification	106	SCAG indicates that the OC SCS has been incorporated into the regional SCS. OCCOG was one of two subregions that undertook the arduous task and obligation of preparing an SCS. *Please add clarifying text that these subregional SCSs, including the OC SCS, represent the Sustainable Communities Strategies applicable to those subregions.*
17	Clarification	110, right column	"Municipal water and sewer systems, for example, ensure clean water. At the same time, ~~concrete stormwater runoff channels harm water quality~~ and ~~sprawl eats into open space~~ as areas become more urbanized and the percentage of impervious surface is increased, the hydrologic regime is dramatically altered. Drainage conveyances that once were natural and riparian are required to be engineered as hardened flood control channels to provide adequate protection of private property and public infrastructure from the increased frequency, duration, peak flow, and overall volume of stormwater runoff. With this armoring of once natural channels, water quality benefits from biofiltration are lost along with opportunities for infiltration and evapotranspiration, which can lead to hydromodifcation downstream in sections which are not yet engineered and hardened. Many strategies
18	Clarification	112. 117	The SCS documents the development of four scenarios to explore basic aspects of future growth. These scenarios were used in public outreach and the SCS and the associated Appendix states that "Using the public dialogue and feedback from the analysis of the SCS Scenarios, SCAG developed

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			the 2012 RTP/SCS Plan alternatives." (Similar references are also include at RTP/SCS p. 117, and SCS Background Documentation p. 71). The RTP/SCS and Appendix then describes a process that led to the Plan alternatives. Neither the RTP/SCS, Appendix or PEIR expressly state or illustrate the fundamental land use and socioeconomic foundation for the SCS. *In order to confirm consistency with the OC SCS, it is requested that SCAG include appropriate tables, graphics and maps that provide the detail that confirm this consistency.*
19	Clarification	113, 122	The regional SCS states that the scenarios/alternatives were developed using the Local Sustainability Planning Tool (LSPT). The LSPT is a sketch planning tool that flattens geographical areas to a 5-acre grid cell. The OC SCS land use data was provided at much greater level of detail in that specific parcel data and detail were provided by each jurisdiction. A cursory review of some LSPT data reveals inconsistencies regarding interpretation of Orange County land uses. It is acknowledged that the regional SCS states, "Land use inputs for OCCOG SCS were unchanged". Yet use of the LSPT and SCAG Development and Community Types presented in the SCS leave open the question as to whether the OC SCS was altered, as noted above. *Please provide confirmation that the underlying OC SCS land use data was used without significant alteration and LSPT flattening and interpretation in the development of the regional SCS Plan and alternatives.*
20 17	Add to glossary	127. right column	"Gentrification"
21	Clarification	128. left column	"Thus, this adjustment allowed the land use pattern to conform more closely to local ~~expectations~~ general plans, while reducing the amount of vehicle miles traveled."

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			Whose/What are "local expectations?"
22	Clarification	149, right column	*Revise language to clarify that SCAG intends policies, strategies, and measures are a menu of options.* "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which would help ~~can and should undertake in order~~ to successfully implement the SCS."
23	Clarification	150-152	The OC SCS was accepted by SCAG and represents the set of strategies and the growth distribution that outlines the best approach for how the requirements of SB 375 would be met within the subregion. Specifically, the OC SCS included 15 specific Sustainability Strategies, reflecting a menu of 222 practices and actions that OC agencies have agreed to pursue (or continue to pursue) to achieve GHG reductions that support SB 375. *Why doesn't the regional SCS specifically acknowledge these 15 strategies yet include other strategies and performance measures not included in the OC SCS (e.g., Locational Efficiency)?*
24	Add to glossary	166, right column	"Greenfield"
25	Clarification	194, right column	"In addition to these targeted outreach efforts, all regular and special meetings of the RTP task forces, the Transportation Committee (TC), the CEHD, the EEC, and the SCAG Regional Council are publicly noticed and ..."
26	Clarification	201	*Please clarify whether the text stating "Long-term emission reduction for rail, with a goal of zero-emissions rail system" is intended to reflect a zero-emissions freight rail system, or whether this goal also applies to passenger rail.*
27	Clarification	202, 203- Table 7.1	Unfunded operational improvements, of which several are listed on page 203, Table 7.1, include transit station improvements in Irvine, Fullerton, and Santa Ana, bus rapid transit (BRT) in Orange County, and high speed rail (HSR) Phase II. *Please confirm that these are consistent with the*

			OC SCS.
28	Clarification	207	Strategic Finance *Please explain what will happen if reasonably foreseeable revenue sources of approximately $200 million do not become available?*
29	Add to glossary	205	"Active transportation"

GROWTH FORECAST APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Updated growth forecast numbers	23, Table 13	In December 2011, Orange County provided SCAG with the revised growth forecast dataset, OCP-2010 Modified, per the OC SCS MOU (official OCCOG Board action 1/26/2012). *Please incorporate revised Orange County numbers (i.e. OCP-2010 Modified) into all reports, tables, exhibits, alternatives, maps, and modeling runs for final RTP.*

PERFORMANCE MEASURES APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Clarification	1	The document states, "The performance measures are used to evaluate how well the RTP/SCS addresses the adopted goals and performance outcomes." *Is there any formal role for the performance measures?* ARB will evaluate for SB 375 compliance not based on these measures but based on ARB process. *Please include language clarifying that this is a requirement to demonstrate compliance with federal requirements and not for the obligations under SB 375.*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
2	Clarification	1, end of first paragraph	Add statement: "Performance measures and expected outcomes will be used to monitor the RTP/SCS at the regional level; these measures and outcomes are not proposed for use at the subregional or project-specific level."
3	Clarification	1, column 2	The document states, "The Regional Council will formally adopt the goals and outcomes as part of the final 2012 RTP/SCS." *Does this bring any formal obligation to meet goals? Goals are general, flexible, and aspirational rather than specific, as on p.1.*
4	Clarification	13, Table 8	The RTP/SCS claims an extra 2% CO2e emissions reduction in 2035 from the NHTS post-processing analysis. While the RTP/SCS meets the ARB SB375 goal without the extra 2%, we would like to note that the extra 2% could be important if the attorney general raises concerns about backsliding. Consequently, the reliability of the extra 2% reduction should be checked. Questions on the NHTS model are below. It would be useful to know the answers to better judge the quality, although we do note that the report does look like it meets the standards or best practice.
5	Clarification	9	NHTS Model Documentation Report *Are the auto and bus accessibility variables included in the regression models for 30-mile rings?* *In "Number of trips" model – is number of cars, included as an independent variable, the actual or predicted value?* *The same question applies to other models.*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
6	Clarification	23, Table 10	NHTS Model Documentation Report *Were the elasticities for the SCAG NHTS study calculated at sample means, or for each observation and then averaged for the sample?*
7	Clarification	24, Test 3	NHTS Model Documentation Report (Compare Trip-Based and NHTS Model): The final test was to compare the results of the Trip-Based Model and the NHTS Model for the same scenarios. *Please describe the scenarios tested.*

TRANSPORTATION FINANCE APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Clarification	General	*What are the implications if revenues other than core revenues do not become available?* *Please describe any implications to the ability of the region to meet SB 375 GHG emission reduction targets or the federally required air quality conformity?*

SCS BACKGROUND DOCUMENTATION APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Please define	53, right column	Housing Options and Mix: Define Larger-lot single family in text
2	Clarification	71-74, 80-83	Alternatives naming: A, B, C Names of Alternatives differ than those listed in the PEIR on pages ES-3 and 1-4. *Please be consistent with naming protocol for alternatives between two/all documents.*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
3	Revise language to clarify	71, right column	"Plan Alternative (B) … The alternative maintains city-level forecast control totals for both households and jobs, however, within city boundaries shifts are made to focus a much larger share of future growth in a more compact way around HQTAs, except in Gateway and Orange County COG subregions per their SCS delegation agreements. Future housing market demand is expected to shift significantly to small lot single-family, townhomes and multi-family ~~hosuing~~ housing."
4	Please define	71, right column	Plan Alternative (B) Define small lot single family in text
5	Revise language to clarify	71, right column	Plan Alternative (C) "As a result very suburban communities may experience no new housing or employment growth, while some urban areas with very good access to regional transit may experience significant increases in housing or employment growth."
6	Revise language to clarify	72, left column	"While each alternative is distinctive, a number of parameters remained constant across each alternative: the regional RTP/SCS forecast total for population, households and jobs;…" "Detailed forecast: the detailed distribution of population, households, and jobs across the region…"
7	Revise language to clarify	72, Table D1	Alternatives A & B: "Controlled to TAZ-based RTP/SCS Forecast for 2020; Controlled to city-level RTP/SCS Forecast for 2020-2035, except in Gateway and Orange County COG subregions per their SCS delegation agreements." Add statement to table notes: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
8	Revise language to clarify	74, Table D2	Alternatives A & B: Add statement: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
9	Clarification	75, right column	"Development Types The alternatives are built on, and provides data at, the level of the TAZ, which includes housing units and employment." *Please clarify if TAZ is Tier 1, Tier 2, or both.*
10	Revise language to clarify	79, right column	"Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be ~~respected~~ unchanged and integrated into the alternatives (with possible revisions for Alternative C only)."
11	Clarification	79	The section includes the following language: "Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be respected and integrated into the alternatives (with possible revisions for Alternative C only)." *Please clearly indicate what the "possible revisions" are and what process would be used to coordinate with Orange County should changes to the socioeconomic data contained in the OC SCS be proposed?*
12	Revise language to clarify	80	Alternative A Add statement: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
13	Revise language to clarify	81	Alternative B It is not clear whether Alternative B is the SCS land use plan. If it is, statements in the appendix lead one to believe the OC SCS foundation has been altered. For example, adjustments made to land uses to locate proximate to High Quality Transportation Areas (HQTA) and intensification of residential and employment development in HQTA that diverge from local General Plans as well as implementation of a vehicle user fee are not part of the OC SCS. *Is Alternative B the SCS land use plan?* *Add statement:* Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
14	Clarification	115, left column	Transit Zoning Code Santa Ana 2011 *Is this a duplicate of the 2010 Santa Ana project?*

PEIR

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
1	Revise language to clarify	ES-2	ES contains matrix of mitigation measures which reference project sponsors, local agency, and project implementation agency without definitions. Add definitions into ES at end of ES.1: In general, the terms "local agency," "project sponsor" and "project implementing agency" are used throughout this PEIR to identify agencies, organizations, companies and individuals that will act as lead agencies or project applicants for different types of individual projects. Individual projects that are anticipated to occur pursuant to the 2012-2035 RTP/SCS consist of planning projects (general plans, specific plans, climate action plans, etc.), development projects (including Transit Priority Projects (TPPs) and other similar projects), and transportation projects. In general, "local agency" is used to refer to a public agency that would propose a planning project or a public infrastructure project and/or an agency that would be lead agency for individual projects. "Project sponsor" is typically used to refer to an applicant (that could be public or private, an organization or an individual) that proposes a project. "Project implementing agency" is used to refer to an agency responsible for implementing a project. In this document, project-implementing agencies are those that are responsible for carrying out (reviewing, approving, constructing) transportation projects.

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
2	Clarification	ES-3, 1-4, Chapter 4	Alternatives' Naming: No Project Alternative, Modified 2008 RTP Alternative, Envision 2 Alternative; Alternatives 1, 2, 3 Names of Alternatives differ than those listed in the SCS Background Documentation appendix on pages 71-74 and 80-83. *Please be consistent with naming protocol for alternatives between all documents.*
3	Fix numbering	ES-31	Duplicate naming of GHG11 and GHG12
4	Please define	ES-42	LU63- What are the smart growth principles?
5	Please define	ES-42	LU64- What are the benchmarks for smart growth?
6	Fix numbering	ES-51	PS17 & PS18 are missing
7	Fix numbering	ES-53	Duplicate naming of PS36 & PS37
8	Please define	ES-67	TR 34- what are the identified transportation benchmarks?
9	Please define	ES-83, 3.13-42 MM-W43	Define climate change hydrology
10	Please define	ES-40, 3.8-21 MM-LU42	Define urban growth boundary
11	Please define	ES-57, 3.11-49 MM-PS68 & ES-74, 3.12-43 MM-TR96	Define parking cash out program/ cashouts
12	Clarification	1-5	*Besides IGR, what other monitoring efforts is SCAG in charge of? (that would require lead agencies to provide SCAG with documentation of compliance with mitigation measures)*
13	Language correction	1-6, paragraph 3	Language correction: "The ~~latter~~ **former** finding…"

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
14	Language correction	2-5	Sustainability section should be separated. Language correction: **Sustainability**. The 2012-2035 RTP/SCS is subject to specific requirements for environmental performance. **New paragraph:** "Beyond simply meeting these requirements, a ..."
15	Language correction	2-5, Table 2-2	"Align the plan investments and policies ~~with~~ **while** improving..."
16	Please define	2-14	Define "scrip"
17	Narrative	2-21	AB 32 is global warming solutions act. SB 375 was determined to be stand-alone legislation. RTP document is not forum to address global climate change and references distract from RTP goal and purpose. "Global warming" and "global climate change" are not interchangeable phrases. References should be removed or, where appropriate, language should be changed to "global warming". ~~Goods movement is also a major source of GHG emissions that contribute to global climate change~~.
18	Clarification	2-27 paragraph 4	Not in SCAG's authority, nor funding available. Delete sentence: ~~SCAG will work with local jurisdictions and community stakeholders to seek resources and provide assistance to address any possible gentrification effects of new development on existing communities and vulnerable populations.~~
19	Clarification	2-27 paragraph 5	"The 2012-2035 RTP/SCS land use development pattern accommodates over 50 percent of new housing and employment growth in HQTAs, while keeping jurisdictional totals consistent with local input." *Please confirm that there are no changes to the local land use inputs provided by Orange County.*

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
20	Clarification	2-29	"For purposes of SCAG's SCS, a Development Type reflects an estimated average density of 22 residential units per acre. However, it is important to note that the designation is a potential ultimate average for the TAZ—and is not an absolute project-specific requirement that must be met in order to determine consistency with the SCS. In other words, the SCS was not developed with the intent that each project to be located within any given TAZ must exactly equal the density and relative use designations that are indicated by the SCS Development Type in order for the project to be found consistent with the SCS's use designation, density, building intensity and applicable policies. Instead, any given project, having satisfied all of the statutory requirements of either a residential/mixed-use project or TPP, may be deemed by the lead agency to be consistent with the SCS so long as the project does not prevent achieving the estimated average use designations, densities and building intensities indicated by the Development Type within the TAZ, assuming that the TAZ will be built-out under reasonable local planning and zoning assumptions." *Does the above PEIR language create a requirement for average TAZ density levels in 2035 and a requirement that each local project not preclude those density levels?* *Additionally, please clarify whether in HQTAs, these densities could be exceeded as well as implications of an area that is already fully developed not redeveloping such that it ever achieves the identified densities.*
21	Please define	3.8-5 paragraph 3,	Define "open space"

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
22	Revise language to clarify	4-39	Envision 2 alternative contains growth projections that would place housing in flight paths, locate housing on sites for which housing is not allowed due to environmental contamination, would significantly impact existing industrial operations necessary to maintain quality jobs in the region, and does not include development projects that are legally allowed due to having existing entitlement for development. Because this alternative does not consider the existing health and safety of future residents nor the existing legal approvals of development in the region, it is not possible to determine if the alternative is actually superior to other alternatives. It is simply another alternative for consideration. *Please remove references to the Envision 2 (or any other name of this alternative) as being environmentally superior.* ~~ENVIRONMENTALLY SUPERIOR~~ ENVISION 2 ALTERNATIVE
23	Revise language to clarify	4-40	"Of the three alternatives, the Envision 2 Alternative would be considered by State CEQA guidelines as the environmentally superior alternative because it does not allow further use of land for single-family development..."

Re: Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Program Environmental Impact Report (PEIR)

Sent: Via e-mail (rtp@scag.ca.gov and 2012PEIR@scag.ca.gov) and via 1st Class Mail

Dear Mr. Lieb and Ms. Lin:

On behalf of the City Council of the City of La Cañada Flintridge, please accept these comments regarding the SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and associated Transportation Conformity Report and Draft Program Environmental Impact Report (PEIR).

The City's comments are as follows:

1. **PURSUANT TO FEDERAL REGULATIONS, PROJECTS SHOULD NOT BE INCLUDED IN THE RTP/SCS CONSTRAINED PLAN WHICH HAVE ONLY SECURED A SMALL PORTION OF THE REQUIRED FUNDING NEEDED TO COMPLETE THE PROJECT:**

   The RTP/SCS, according to federal regulations, in "nonattainment and maintenance areas," (which includes the area covered by the RTP/RCS) must "address the specific financial strategies required to ensure the implementation of projects and programs to reach air quality compliance" (23 CFR § 450.322 (b) (11) (part)). Projects which only have secured a small portion of the needed funding, and which rely on speculative funding, such as potential and/or possible tolling authority, should not be included in the RTP/SCS, since this inclusion does not meet the federal requirements for a fiscally constrained plan.

2. LANGUAGE SHOULD BE INCLUDED IN THE RTP/SCS REQUIRING A FULL COST/BENEFIT ANALYSIS FOR ALL PROJECTS IN THE CONSTRAINED PLAN:

Language should be included in the RTP/SCS that clearly states that a full cost/benefit analysis shall be completed for each project contained in the RTP/SCS constrained plan. These cost benefit analyses should then be used, in an era of limited financial resources, to prioritize projects. A model for the cost/benefit analysis of every project in the RTP/SCS should be built and put into the Plan. The RTP/SCS should reflect this process and model in its language.

3. SCAG SHOULD VIGOROUSLY PURSUE PROJECTS WHICH WOULD PROVIDE ENVIRONMENTALLY SUPERIOR ALTERNATIVES TO THOSE CURRENTLY IN THE PLAN IN ORDER TO BEST COMPLY WITH EXISTING ENVIRONMENTAL LEGISLATION:

The PEIR states that: (1) *"Re-entrained roadway dust would increase proportionate to VMT. This would be a significant impact;"* (2) *"Impacts related to total GHG (Greenhouse Gas) emissions were determined to be significant even after mitigation.;"* (3) the PM10 Emissions Exhaust Only for Heavy Duty Trucks will increase (Table 3.2-4).; and (4) the *"Plan would result in a significant and unavoidable impact related to heavy-duty truck VHD [Vehicle Hours Driven], among other impacts."*

SCAG should vigorously pursue projects under CEQA, the Clean Air Act, SB375 and AB 32 which would provide environmentally superior alternatives to those currently in the Plan, such as freight to rail mixed with additional transit. Additionally, sensitive receptors, such as schools and residences, must have adequate mitigation measures that, at a minimum, satisfy or exceed these legal requirements.

4. MAJOR HIGHWAY EXPANSION PROJECTS SHOULD NOT BE FRONTLOADED IN THE RTP/SCS:

The RTP/SCS frontloads highway modalities by disproportionately allocating funding and anticipated completion dates. This is evidenced by comparing Table 2.2 - *Major Highway Completion Project* against Table 2.5, *Major Transit Projects,* in chapter 2 of the RTP/SCS. Transit projects are built in segments with the final project not being completed until 2030-2035. Expanding highways induces VMT and therefore frontloading major highway completion before transit projects does not comply with the tenets of SB 375 and AB 32 to reduce greenhouse gas emissions by reducing VMT. Additionally, it is well documented that land uses adjacent to freeways are prone to increased toxins which cause negative health impacts.

According to SCAG staff, highway projects may be more easily financed than transit projects by borrowing against future toll revenues. They state that this is the reason that the highway projects are frontloaded. This financial reasoning does not justify sacrificing environmental concerns by building the highway projects prior to transit projects.

5. **THE TERM "SR-710 GAP CLOSURE" USED IN THE PLAN SHOULD BE SUBSTITUTED WITH "710 NORTH EXTENSION":**

The "SR 710 Gap Closure" language, already in the 2008 RTP, should be modified to consistency with Metro's stated intent, which should serve to ease, if not eliminate, the current polarizing language. The shift in title from "710 North Extension" to "710 Gap Closure" is invalid, since there is no gap. SR-710 terminates at Valley Boulevard. There is no northerly extension to connect to, since the portion of the 210 interchange including Del Mar Boulevard was built conditioned upon the fact that it "would have no effect on the decision as to the ultimate freeway location and will not foreclose alternatives to the proposed ultimate ...Freeway." This title seems to create a sense of inevitability or priority for this project over competing ones and cannot be justified.

6. **SCAG ASSUMPTIONS REGARDING THE "SR-710 GAP CLOSURE" PROJECT PRODUCING CONGESTION RELIEF AND LOWER GREENHOUSE GAS EMISSIONS ARE FLAWED, BASED UPON EMPIRICAL RESEARCH ON OTHER HIGHWAY PROJECTS THAT HAVE BEEN BUILT:**

The PEIR states that "The Plan would increase VMT when compared to existing conditions." (SCAG RTP/SCS p. 3.2-25). Specifically, decreasing VMT is the goal of SB 375 and should also be the goal of the RTP/SCS. The increase in VMT is the Plan's reliance on freeway (whether tunnel freeway or above ground freeway) expansion to meet the region's mobility needs. Notably, the RTP/SCS describes the SR-710 tunnel as a tunnel with 4 lanes in each direction. This is a major highway expansion being introduced into the region. To the extent that this causes the widening of other freeways (such as the I-210), it will further expand the freeway system. The region would be better served with an alternate project which is not highway oriented and which would potentially decrease VMT, rather than increasing it.

SCAG assumes that the SR-710 extension will produce congestion relief and lower greenhouse gas emissions. These assumptions are not borne out by recent research, and there are a host of other previous studies showing that an increase in highway capacity increases VMT and that once the project is built, congestion, within a few years returns. These SCAG assumptions are flawed.

7. **THE DEFINITION OF THE SR-710 GAP CLOSURE PROJECT FROM ONE PRECISE POINT TO ANOTHER THREATENS PROGRAM-LEVEL CONFORMITY IN THE PLAN AND PREJUDICES FUTURE ENVIRONMENTAL ANALYSES:**

The Plan has modeled the SR-710 extension from one precise point north to another. Unfortunately, this assumption removes the low-build or multi-modal solution to the congestion problem. Under federal regulations, because of this specificity, the Plan and the PEIR threaten program-level conformity and prejudice future project-level environmental analyses.

In addition, this definition differs significantly from that used by the Los Angeles County Metropolitan Transportation Authority, which is currently conducting the EIR for the project and is the lead agency for the project. Metro says, *"We are beginning with a fresh perspective to initiate an environmental review process that will focus on a range of solutions to specifically evaluate the effects of the SR 710 gap. This process involves an education and public involvement program to seek both regional and community-based solutions that are suggested by you, your friends and family, your neighbors, and everyone else in your community. As our public involvement program name (SR-710 Conversations) suggests, the process for identifying these solutions will be through dialogue and conversation. These solutions from you can come in any possible form – from maintaining the status quo to considering new infrastructure, from single-modal to multi-modal approaches."*

This project should not be characterized as a single solution. The solution to the congestion problem in the area of the proposed project should be multi-fold. It could include the Green Rail Intelligent Development (GRID) project, for example, along with better bus service, a multi-modal approach, a low-build option, better traffic light synchronization, a better intersection of the SR-710 and the I-10, or other projects.

The SCAG "project" should reflect the same process being currently used by Metro.

8. THE SR-710 "GAP CLOURE PROJECT" SHOULD BE TAKEN OUT OF THE RTP/SCS ALTOGETHER DUE TO EMPIRICAL EVIDENCE OF HEALTH IMPACTS ON CHILDREN AND ADULTS ONCE THE PROJECT IS CONSTRUCTED:

Dr. Rob McConnell, representing the USC Keck School of Medicine stated, "The increase in truck and automobile traffic on the I-210 freeway resulting from the proposed SR-710 extension would increase the exposure of surrounding communities to vehicular pollutants that may cause asthma and other respiratory diseases." Supported by empirical research, USC has also stated that there is an "emerging scientific consensus that residential or school proximity to major traffic corridors is associated with respiratory impairment in children and in adults." Further, it has been shown, in a 12-community Southern California study that a group of pollutants associated with residential proximity is a strong predictor of "debilitating lung disease and mortality in later life."

The City of La Cañada Flintridge has twelve schools in close proximity to the I-210, which would likely be impacted by the "SR-710 Gap Closure" project. These schools existed prior to the freeway being constructed and would be adversely impacted in the worst possible way by increased vehicular pollutants.

The Preliminary Final Draft of a SCAG study, done for the Arroyo Verdugo Region, called the "SR-710 Missing Link Truck Study," conducted by Iteris, Inc. Traffic Engineers, showed that there would be a 25% increase in daily traffic volumes on the I-210, that 30,000 incremental vehicles would go through the communities of La Cañada Flintridge, Pasadena, La Crescenta and Glendale, and that 2,500 of these would be heavy

duty trucks in peak hours (an incremental truck every four seconds). It can also be concluded from that study that 75% of local streets in the region, such as Fair Oaks Avenue, Fremont Avenue, Los Robles Avenue and Atlantic Boulevard would still be over capacity, as well as twelve arterial streets which would actually experience higher traffic volumes regionally as a result of the project. Additionally, the study showed that there would be more delay, gas consumption and air pollution as a result of the study (regionally). It can also be concluded as a result of the study that the system-wide, regional benefit would only be an increase of .6 miles per hour. Importantly, the study showed that motorists would still be driving farther and spending more time on the road if the tunnel is built.

Regionally, a Metro study concluded that "in the peak (northbound) direction, the gap closure is projected to operate at LOS F..." This means gridlock in the proposed tunnel and idling at the portals, where congestion and air pollution already exist and should be alleviated rather than exacerbated.

The previously discussed SCAG conclusions that there would be lower greenhouse gas emissions and that congestion relief would be produced appear to lack foundation, in the face of one of its own studies, along with the others cited.

The City of La Cañada Flintridge wants to see the regional congestion problem resolved in a way that is the best solution for all stakeholders. We believe that this all-stakeholder congestion relief is possible, if you implement our comments, and particularly if you eliminate the "SR-710 Gap Closure" as the primary (if not the only) alternative in this particular region for congestion relief. Congressman Adam Schiff said, *"I believe the next logical step should be to consider a broad range of transportation options that might provide the same congestion relief and improvement in the quality of life for residents of the region at a cost equal to or lower than the amount Metro estimates it would take to build one of the five tunnel alternatives."* We concur with this statement.

Thank you for your consideration of our comments.

Sincerely,

David A. Spence

MAIL RECEIVED

Re: SCAG Draft RTP/SCS and PEIR

Dear Mr. Ikhrata,

On behalf of the City of La Habra I would like to commend the Southern California Association of Governments (SCAG) and its staff who worked hard to prepare the draft Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) the Program Environmental Impact Report (PEIR), and associated documents. This effort was monumental and unprecedented in our history and throughout the process collaboration between SCAG and Orange County stakeholders has been exceptional.

As you are aware, Orange County took upon itself the task of developing a subregional SCS. The continued cooperation of SCAG staff and the numerous references throughout the document where the RTP/SCS expressly states that it incorporates the Orange County Sustainable Communities Strategy (OC SCS) into the RTP/SCS document is greatly appreciated.

The OCCOG Technical Advisory Committee (OCCOG TAC), of which the City of La Habra is an active member, created an ad hoc committee dedicated to the review of the Draft RTP/SCS.

The following general comments and recommendations are offered by the City of La Habra in conjunction with the OCCOG on the draft 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy (draft RTP/SCS) and associated Appendices and draft Program Environmental Impact Report (draft PEIR). The City of La Habra requests that this letter and its attachments be included in public record as our collective comments on the draft RTP/SCS, PEIR and associated documents.

1. GROWTH FORECASTS

Issue: Growth Projections: The 2012 growth projections identify population, housing and employment data for the six-county SCAG region, from 2008 (existing) to 2020 and 2035. These growth projections represent the best available information from local

jurisdictions, the business community and landowners. However, as time passes, what is feasible for any given project can change. The triggers for change to adopted growth projections can range from factors such as market conditions, new information or data, infrastructure availability, changes in funding availability (such as the dissolution of redevelopment agencies statewide), and changes to jurisdictional boundaries resulting from future annexations and incorporations of previously-designated unincorporated territory. SCAG should continue to adopt the 2012 growth projections at a countywide level, consistent with past approvals of Regional Transportation plan growth forecasts. A county level of geography accommodates internal adjustments to changing conditions as described above, without compromising the integrity of the overall growth projections. However, approving the growth projections at any lower level of geography, such as at the city level, would be challenged with continual revisions and shifts to the total number of housing, population and employment within a city, among cities, and between cities and counties as a result of the factors described above. Adoption of the data at a level lower than the county would limit jurisdictional control and create inflexibility in a regional planning document. In addition, the level of geography in which RTP/SCS growth forecast is adopted should not be determined by other processes. For example, the RHNA allocations must be consistent with the RTP/SCS; state law does not require that they be identical. The RTP/SCS can be adopted at the county level and the RHNA process may proceed independently until it is completed after the appeals, trades, and transfers are completed. The RHNA allocations that were derived from the growth forecast can still be determined to be consistent with the RTP/SCS, even if changes are made to the city totals during the appeals, trades, and transfers process.

Growth Projections Recommendation: SCAG's adoption of the growth forecast numbers should be at the county level, consistent with past RTPs, and not at a smaller level of geography such as city, census tract, or traffic analysis level.

Issue: OCP-2010 Modified: On January 26, 2012, the update to the OCP-2010 dataset known as "OCP-2010 Modified" was officially approved by the OCCOG Board of Directors and is a data amendment to the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 and this letter also serves as the formal notice of the update that should be incorporated into the 2012 RTP/SCS, PEIR, and related documents.

OCP-2010 Modified Recommendation: All documents, tables, maps, narrative, modeling runs, PEIR Alternatives (including Alternate C/3/Envision 2 referencing the Orange County growth forecasts) should be updated with the Orange County Projections-2010 Modified Growth Projections, as adopted by the OCCOG Board of Directors and consistent with the subregional delegation MOU between OCCOG, OCTA and SCAG.

2. DRAFT RTP/SCS

Issue: 2012 Draft RTP/SCS: The RTP/SCS identifies strategies to reduce greenhouse gas emissions from cars and light duty trucks. Because counties, jurisdictions and agencies have different needs and feasibility of implementation, we believe these

strategies should be clearly identified as a menu of options that can be used to achieve the goal of reduced GHG emissions. However, the document can be construed to suggest that each of the strategies listed in the table on pages 150-153 are necessary to successfully implement the SCS, many of which are beyond SCAG's purview or control. It is requested that the language be clear that it is permissive.

2012 Draft RTP/SCS Requests:

1. **Revise language on page 149: "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which that help can and should undertake in order to successfully implement the SCS."**

2. **Please provide SCAG analysis supporting the strategies in the Draft RTP/SCS Chapter 4.**

3. **Please describe what municipal obligations are anticipated as a result of adopting these strategies as a list to be accomplished rather than a menu of options.**

Issue: OC SCS Strategies: There are strategies in the Orange County SCS that are not included in the regional SCS. Similarly, there are some strategies in the regional SCS that are not consistent with the strategies in the OC SCS. This creates confusion and clarification is needed.

Under SB 375 and only within the SCAG region, subregional councils of government were allowed to prepare subregional SCS's that SCAG is then required to incorporate into the regional SCS. In Orange County, the Orange County Council of Governments (OCCOG) and the Orange County Transportation Authority (OCTA) developed a countywide or subregional SCS (OC SCS) that was to be incorporated in whole into the SCAG SCS. Local agencies in Orange County developed the OC SCS and approved it in June 2011. SCAG has incorporated the OC SCS in its entirety into the regional SCS as an appendix to the regional SCS, but it is unclear what the standing is of the OC SCS. The OC SCS contains a set of strategies that were agreed upon by local governments, agencies and other stakeholders within Orange County and was accepted by SCAG and should represent the SCS that is applicable to the Orange County region.

On Page 8 discussion is provided regarding the Sustainable communities strategy 2012-2035 plans to SB 375 integrate the transportation network with new development but minimal discussion is provided as to how that will be achieved and how it will be funded.

Discussion of the need for cities to dramatically increase the reach of transit in our communities is provided on Page 13 but no definition of what "dramatically" means is provided. La Habra has no transit centers.

High speed rail is discussed on Page 21 but no approved alignment has been reached. It is very likely the BNSF right-of-way will be utilized. This being the case, very little benefit will be forthcoming to the City of La Habra due to the distance to the rail line.

The RTP suggests planning for electrification of the vehicle fleet and supporting new automobile technology on Page 30 but no discussion is provided as to how the improvements will be funded.

On page 53 there is discussion of making deficient sidewalks accessible to all. The City supports such action but minimal funds are made available to accomplish the task.

The RTP notes on page 80 that the transportation and safety mitigation program includes: increasing ride share and work at home opportunities, invest in land use transportation connection projects, investments to reduce heaving duty truck delays, enhance transportation infrastructure practices to enhance security and working to enhance emergency preparedness. There is no discussion as to how the improvements will be funded.

The City of La Habra is limited to bus service as a means of regional transportation. Alternative modes of transportation, as per page 81, to communities like La Habra need to be discussed further and how those improvements will be funded.

State or County agencies should be mandated to publish lists of contaminated properties where new development would disturb contaminants and provide them on a yearly basis to cities as suggested on Page 83.

A discussion of Measure M in Orange County should be included on page 133.

Page 139 discusses bringing the majority of sidewalks and intersections into compliance with ADA. The City of La Habra continues to make improvements to intersections when street improvements are proposed. What presents a challenge to the City are continued changes to the accessibility requirements which make recently completed improvements obsolete. The plan also suggests improved traffic signal synchronization projects but how those improvements will be funded are not discussed.

The City is limited to regional bus transportation. The land use growth strategies discussed on page 149 revolve around transportation centers typically associated with rail lines. Should the gold line be extended to Whittier, the proposed line could be extended into La Habra and onto Fullerton where it could connect to the Fullerton transit center then making it possible for a transit center in La Habra.

The conversion of the City's fleet to electric or other zero-emission transportation technologies as noted on page 153 could be possible if funds were made available for the construction of the infrastructure and vehicles themselves.

OC SCS Strategies Recommendation: Please revise the text in the last paragraph on page 106 to state: "These subregional SCS documents are incorporated into the regional SCS and represent the SCS for each of these subregions."

3. **DRAFT PEIR**

Issue: Mitigation Monitoring Program Intent: It is unclear how SCAG intends to implement the Mitigation Monitoring Program with regard to the proposed mitigation measures, as may be implemented by local agencies. Section 1-5 of the PEIR specifically provides that "Lead agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring efforts, including SCAG's Intergovernmental Review (IGR) process." It is infeasible for SCAG to require local jurisdictions to report when such mitigation measures are considered for any project. Noting that the SCAG region includes 6 counties, 14 subregional entities and 191 cities, this reporting requirement would surely fall short of expectations. Given this identified infeasibility, please clarify what obligations local agencies may have regarding SCAG's mitigation monitoring efforts.

Mitigation Monitoring Program Intent Requests/Recommendations:

1. **Does SCAG intend to require all jurisdictions that avail themselves of the mitigation measures to report to SCAG when such measures are considered for any project?**

2. **SCAG's approval of the PEIR needs to clearly state the intent and applicability of the mitigation measures and the PEIR reflective of our comments below and that mitigation measures do not supersede regulations under the jurisdiction of other regulatory agencies.**

3. **Add language to Executive Summary and Introduction: "Mitigation measures do not supersede regulations under the jurisdiction of other regulatory agencies."**

4. **Feasibility and Applicability**

On pages 1-5 and 1-7, the language should reflect that Lead agencies will determine the feasibility and applicability of measures and that the measures are intended to offer a menu of options available should a lead agency opt to utilize them. The PEIR makes the assertion on page 1-7 of the Project Description under Transportation Project Mitigation and Land Use Planning and Development Project Mitigation sections that the draft PEIR has made a preliminary determination that all of the mitigation measures in it are considered feasible. SCAG has not identified any analysis that supports the feasibility of the mitigation measures that are to be undertaken by entities other than SCAG and SCAG staff has stated on numerous occasions that the mitigation measures were intended to be a menu of options for consideration by lead agencies.

Issue: Mitigation Measures Impose Obligations Beyond Scope of SB 375. Given the combination of the RTP and the SCS processes, as mandated by SB 375, we recognize that SCAG must undertake the difficult task of balancing the goal of having a coordinated regional transportation system with land use strategies that encourage a more compact use of land. However, a key principle of SB 375 is that it is not intended to supersede local agencies' authority to regulate land uses. Specifically, Government Code section 65080(b)(2)(K) provides, in relevant part that ". . . .Nothing in a

sustainable communities strategy shall be interpreted as superseding the exercise of the land use authority of cities and counties within the region. . ."

In light of the limitation expressed at Government Code sec. 65080(b)(2)(K), we find language in the PEIR, and specifically the mitigation measures therein, imposing affirmative obligations on local agencies within the SCAG region to be inappropriate and contrary to law. The proposed language as recommended below would remedy the legal conflict with Section 65080(b)(2)(K), yet achieve SCAG's recognition that project-specific environmental review is the appropriate level of review for projects that that have their own unique, site-specific circumstances.

The revisions are further consistent with OCCOG's understanding that SCAG intended to provide the mitigation measures as a "toolbox" to local agencies for use within their discretion if and when appropriate for projects within their respective jurisdictions. Indeed, from materials presented by SCAG, including the January 26, 2012 workshop held at the City of Anaheim Council Chambers, SCAG explained that "**This PEIR offers a "toolbox" of mitigation measures** for future project-level environmental analyses. . . . It also includes suggested mitigation measures for local agencies to consider for implementation, if appropriate and feasible (phrased as "can and should"). This language is permissive and not mandatory upon local agencies."

Mitigation Measures Impose Obligations Beyond Scope of SB 375 Recommendations:

1. **Please provide SCAG analysis supporting the feasibility of mitigation measures in the PEIR.**

2. **Change language on page 1-7 found in 2 places under MITIGATION MEASURES, subheadings Transportation Project Mitigation and Land Use Planning and Development Project Mitigation: "This Draft PEIR has made a preliminary determination that the proposed mitigation measures are feasible and effective. Therefore, it is reasonable to expect that these agencies will actually implement them where, in the agencies' independent discretion, the measures are deemed applicable in light specific circumstances at the project level.**

3. **Change language on page 1-5, first paragraph: "Mitigation Measures proposed in this PEIR are available as tools for implementing agencies and local lead agencies to use as they deem applicable. The implementing agencies and local lead agencies are responsible for ensuring adherence to the mitigation measures as 2012-2035 RTP/SCS projects are considered for approval over time."**

4. **Please make similar text amendments to other sections, including the Executive Summary, of the PEIR that reference how the mitigation measures are to be used by lead agencies, including the Executive Summary.**

5. **"Can and Should"**

As indicated in the PEIR on page 1-6, state law provides that it is appropriate to indicate in mitigation measures that they "can and should" be implemented where the authority to implement the measures rests with agencies other than SCAG. The language conveys to local agencies an affirmative obligation to address each mitigation measure, irrespective of whether such agencies deem the measures applicable to a particular project or duplicative of their own or other governmental agencies' regulatory measures (as discussed in Recommendation below). OCCOG recognizes that SCAG's use of the words "can and should" are derived from CEQA, at Public Resources Code sections 21081 and 2155.2(b)(5)(B)(ii) and CEQA Guidelines, including section 15091(a)(2). Nevertheless, given the express limitation of SB 375 upon respective local agencies' land use authority, OCCOG deems any language seemingly imposing affirmative obligations contrary to SB 375 inappropriate. As such, the use of the language "can and should" for mitigation measures addressed to local agencies is inappropriate.

"Can and Should" Recommendations: Change language in all mitigation measures identifying entities other than SCAG to read "~~can and~~ should consider where applicable and feasible." To clarify the intent that the mitigation measures are a menu of options for which feasibility has not been established for any given project, the "can and should" language should be changed in all mitigation measures identifying entities other than SCAG to read "should consider where applicable and feasible."

6. **CEQA Streamlining:**

Pages 1-10 through 1-12 describe requirements for the CEQA streamlining offered under SB 375. In each section, it is indicated, consistent with SB 375, for projects to qualify for the CEQA streamlining, mitigation measures from the applicable environmental document must be incorporated into the project. Further, CEQA streamlining relative to the infill exemption under CEQA is also being developed pursuant to SB 226 passed last year.

CEQA Streamlining Recommendations: Please clarify how the "menu of mitigation measures" is expected from this PEIR for project to qualify for CEQA streamlining under SB 375 and, if possible, the regulations being developed under SB 226.

7. **RTP/SCS Policies**

Please ensure that the discussion of the policies represented by the RTP/SCS in the draft PEIR is consistent with the policies actually in the RTP/SCS. In particular, the bullet list on the page 2-3 is stated to represent the land use strategies of the plan; however, the strategies listed are not specifically identified in the regional SCS. Including different language in the PEIR implies additional policy.

RTP/SCS Policies Recommendation: Amend the land use strategies identified on page 2-3 of the Project Description, under the section Purpose and Need for Action to reflect the strategies included in the SCS chapter of the RTP.

8. **PEIR Mitigation Measures**

By far the most concerning portion of the Draft 2012 RTP/SCS to OCCOG members is the Draft Program Environmental Impact Report (PEIR). Specifically, the proposed mitigation measures included in the PEIR extend to and impact a broad spectrum of technical and policy areas. Many examples of these concerns are included on Attachments 1 and 2 of this letter. In sum, the concerns are that the mitigation measures:

- Appear to go above and beyond the requirements of the Regional Transportation Plan and Senate Bill 375;

- Are measures already required by State and Federal law or are regulated by other agencies such as the South Coast Air Quality Management District, California Department of Housing and Community Development, Fish and Game, and the Regional Water Control Boards;
- Appear to run counter to local control; and

- Are financially infeasible for the agencies responsible for implementation.

PEIR Mitigation Measures Recommendations.

1. **In order for the mitigation measures to truly be considered a toolbox of options for consideration by various entities in the SCAG region as intended, all mitigation measures in the PEIR intended for entities other than SCAG be moved into an appendix to the PEIR and renamed "Sustainability Strategies". These strategies could then be identified for consideration by lead agencies as mitigation for future projects should a lead agency choose to do so and deem them applicable and feasible. The PEIR would only retain mitigation measures applicable to SCAG. This action would also require that the Executive Summary, Introduction, and Project Description be updated to reflect the nature of the new appendix of Sustainability Strategies.**

2. **Remove language within mitigation measures that establishes policies not included in the RTP/SCS or modifies the measure to specify a policy or endorses specific technology which would limit agency authority.**

3. **In the draft PEIR, please replace text in all mitigation measures that identify policy for either SCAG or other entities with language that reflects either adopted SCAG policies or are policies that are included in the RTP and SCS. Mitigation measures should not be used to establish new policy for the region.**

For example:

- MM-TR 17: "SCAG shall (for its employees) and local jurisdictions ~~can and~~ should institute where applicable and feasible teleconferencing, telecommute, and/or flexible work hour programs ~~to reduce unnecessary employee transportation~~.

- MM-TR 23: "Local jurisdictions should consider when applicable and feasible coordinated and controlled intersections so that traffic passes more efficiently through congested areas. Where traffic signals or streetlights are installed, require the use of a feasible, energy efficient ~~Light Emitting Diode (LED)~~ technology."

- MM-TR 35: "Local jurisdictions should consider where applicable and feasible the adoption of a comprehensive parking policy that ~~discourages private vehicle use and~~ encourages the use of alternative transportation."

9. SCAG Authority

Several mitigation measures identify actions that SCAG shall undertake to mitigate impacts of the plan. Many appropriately direct SCAG to provide a discussion forum or serve as a central data repository for a broad range of topics that affect the region as a whole. However, many measures inappropriately direct SCAG to establish practices, standards, or policy in areas unrelated to what SCAG has purview over. Further, the measures often appear to be directed at policy implementation that is unrelated to the plan itself, such as implementing AB 32. Such measures will essentially require SCAG to establish policy in areas for which it has no authority. Additionally, it is not clear how SCAG would fund the work efforts because they are not directly related to its mission and, therefore, do not have funding. For example, MM-PS 118 states: "SCAG shall continue to develop energy efficiency and green building guidance to provide direction on specific approaches and models and to specify levels of performance for regionally significant projects to be consistent with regional plans." Green building practices and energy efficiency measures are already addressed by various state and federal agencies, as well as by other local organizations. Further, SCAG does not have the authority to specify levels of performance for land use or buildings.

SCAG Authority Recommendation: Remove the following mitigation measures for SCAG which it does not have purview for under the law or directed to do by the Regional Council through policy direction. List may not be exhaustive.

MM-BIO/OS 44	MM-LU 42	MM-LU 77	MM-PS 68
MM-BIO/OS 45	MM-LU 47	MM-LU 80	MM-PS 71
MM-BIO/OS 46	MM-LU 48	MM-LU 81	MM-PS 95
MM-BIO/OS 48	MM-LU 51	MM-LU 82	MM-PS 121
MM-GHG 3	MM-LU 53	MM-LU 83	MM-TR 17
MM-GHG 8	MM-LU 56	MM-NO 12	MM-TR 23
MM-GHG 11	MM-LU 57	MM-NO 16	MM-TR 28
MM-LU 9	MM-LU 60	MM-POP 1	MM-TR 35
MM-LU 21	MM-LU 61	MM-PS 3	MM-TR 83
MM-LU 22	MM-LU 64	MM-PS 14	MM-TR 85
MM-LU 24	MM-LU 65	MM-PS 25	MM-TR 96
MM-LU 26	MM-LU 69	MM-PS 37	MM-W 34
MM-LU 32	MM-LU 71	MM-PS 39	MM-W 59

MM-LU 34	MM-LU 74	MM-PS 41	MM-W 60
MM-LU 41	MM-LU 75	MM-PS 67	MM-W 65

10. SCAG Mitigation Measures

It would be helpful to understand how SCAG will implement the mitigation measures that it is assigned to do. Many of the mitigation measures will expand SCAG's role into areas that are not currently under its purview and are under the jurisdiction of other entities. Many also constitute significant work efforts.

SCAG Mitigation Measures Request: Please explain how the actions and programs required by the measures SCAG is assigned to do would be funded to ensure that they are truly feasible for SCAG to undertake.

11. Ensuring Outcomes

SCAG has limited authority in many of the areas included in the measures and will not be able to ensure impacts are mitigated and that the outcomes identified do actually occur. SCAG can assist, offer information, educate, and provide discussion forums for topics outside its area of jurisdiction; however, it is not possible to "ensure" that outcomes are achieved for things that are outside of its purview.

Ensuring Outcomes Recommendation: Remove all references within mitigation measures that SCAG will "ensure" or "shall minimize impacts" that result from a mitigation measures.

> **Example:**
> **MM-CUL17: "~~Impacts to cultural resources shall be minimized through cooperation, information sharing, and~~ SCAG's shall, through cooperation, information sharing and ongoing regional planning efforts such as web-based planning tools for local government including CA lots, and direct technical assistance efforts such as Compass Blueprint's Toolbox Tuesday series, provide information and assistance to local agencies to help them avoid impacts to cultural resources. Resource agencies, such as the Office of Historic Preservation, shall be consulted during this process."**

12. Fees and Taxes

Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, thus not be approved. They also represent prescriptive means to accomplish the mitigation.

Fees and Taxes Recommendations:

1. **Reword measures to indicate that a new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. The following list may not be exhaustive.**

MM-BIO/OS55	MM-PS15	MM-TR30	MM-TR88
MM-LU29	MM-PS63	MM-TR37	MM-TR94
MM-LU53	MM-PS75	MM-TR47	MM-TR96
MM-LU54	MM-PS76	MM-TR52	MM-W6
MM-LU80	MM-PS78	MM-TR60	MM-W32
MM-LU81	MM-PS92	MM-TR69	MM-W52
MM-LU82	MM-PS106	MM-TR74	MM-W58
MM-LU83	MM-PS107	MM-TR75	
MM-POP4	MM-PS113	MM-TR80	
MM-PS12	MM-TR28	MM-TR84	

2. **Please clarify whether it was assumed that these additional fees were considered feasible and if the new fees that are suggested were considered in the financial plan or economic analysis of the RTP.**

13. **Guidance Documents**

Guidance documents are there as information sources for consideration; however, they do not represent regulation or establish standards that are required to be achieved. For example, MM-AQ19 inappropriately indicates that project sponsors should comply with the CARB Air Quality and Land Use Handbook (June 2005) which is only a guidance document.

Guidance Documents Recommendation: Remove references that indicate a compliance with guidance documents from mitigation measures.

14. **Duplicative/Existing Regulations**

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g. CEQA review requirements). Under the California Environmental Quality Act, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact and the significance of the impact is after all existing regulation is applied. Therefore, mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigation the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and the regulation. It has become common practice to state that existing regulation will be implemented. When this is done, it is common practice when compliance is used as a mitigation measure to simply state that the responsible entity will simply comply with the regulation. If mitigation measures that

restate existing regulation are not removed, then it is requested that the wording of the measures be restated to simply read that compliance with all applicable laws and regulations will be undertaken. Language that could be used is: "Local jurisdictions, agencies, and project sponsors shall comply, as applicable, with existing federal, state law, and local laws and regulations." Similar language is included in some mitigation measures. It is offered that MM-PS 13 is a good example of the type of appropriate language and reads "Project sponsors can and should ensure that projects are consistent with federal, state, and local plans that preserve open space."

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g. CEQA review requirements). Under the California Environmental Quality Act, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact and the significance of the impact is after all existing regulation is applied. Therefore, mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigation the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and the regulation. It has become common practice to state that existing regulation will be implemented. When this is done, it is common practice when compliance is used as a mitigation measure to simply state that the responsible entity will simply comply with the regulation. If mitigation measures that restate existing regulation are not removed, then it is requested that the wording of the measures be restated to simply read that compliance with all applicable laws and regulations will be undertaken. Language that could be used is: "Local jurisdictions, agencies, and project sponsors shall comply, as applicable, with existing federal, state law, and local laws and regulations." Similar language is included in some mitigation measures. It is offered that MM-PS 13 is a good example of the type of appropriate language and reads "Project sponsors can and should ensure that projects are consistent with federal, state, and local plans that preserve open space." The water section provides another example. The PEIR includes 68 mitigation measures in the Water Resources section regarding water quality. At least 35 of these are related to stormwater runoff best management practices (BMPs) that are currently regulated through Municipal National Pollutant Discharge Elimination System (NPDES) Stormwater Permits issued by Regional Water Quality Control Boards. In the SCAG region there are five water quality control boards each with its own Municipal NPDES Stormwater Permit. The regulations and requirements contained in these permits vary from each other. By listing specific measures in the PEIR that are not included in a project's applicable Municipal NPDES Stormwater Permit, the PEIR creates conflicting compliance requirements. To eliminate potential conflict with existing regulations, the mitigation measures regarding specific BMPs should be removed and replaced with a single requirement that each project must comply with its applicable Municipal NPDES Stormwater Permit.

Duplicative/Existing Regulations Recommendations:

1. **Please remove all mitigation measures listed in Attachment 1 which are duplicative of existing regulations administered by or under the jurisdiction of other agencies. The list may not be exhaustive.**

2. **For each impact, please add the following language: "Local jurisdictions, agencies, and project sponsors should comply, as applicable, with existing federal, state, and local laws and regulations."**

15. **Draconian Mitigation Measures**

Many of the mitigation measures in the Draft PEIR are draconian and need to be removed. One prime example is MM-LU 85. It reads in part "Local jurisdictions can and should reduce heat gain from pavement and other hardscaping including: Reduce street rights-of-way and pavement widths to World War II widths (typically 22 to 34 feet for local streets and 30 to 35 feet for collector streets curb to curb)..." Although reduced street widths may be appropriate in some cases and have been implemented in many jurisdictions, it is inappropriate and counterproductive to require reduced street widths as a mitigation measure in the PEIR. Reduced street widths, for example, generally do not provide space for on-street parking which may result in greater, additional paved areas provided in separate parking lots. A second example is MM-LU15: "Project sponsors can and should ensure that at least one acre of unprotected open space is permanently conserved for each acre of open space developed as a result of transportation projects/improvements." Measures should support the SCAG Energy and Environment Committee which recommended that the programs build upon existing open space land acquisition and open space programs in the region, tailoring programs to each individual county in the region. These include, but are not limited to, OCTA's Measure M Mitigation Program, and TCA's open space mitigation program, which has protected 2,200 acres in perpetuity to date. Open space conservation should be pursued in a voluntary manner, working with willing private sector landowners and not overly prescriptive and specific.

Draconian Mitigation Measures Recommendations: Remove mitigation measures that are very prescriptive, such reducing street widths to WWII widths or specifying preferred technology.

In addition to the above comments, detailed technical comments, language changes, and questions on the RTP/SCS, Appendices, and PEIR documents are included in Attachment 2.

Conclusion

We recognize the immense efforts it took to prepare these documents. They are incredibly complex documents establishing important and far-reaching policy for the region. However, because of this importance and complexity, we would like to express concern about the timing of the release of the documents and hope that preparation of future RTP/SCS documents will take into account the need to accommodate adequate review, discussion and revision time for all of the documents. The timeline of document releases, public comment period, and time allowed for the response to comments results in an inability to have credible discussion regarding possible changes because

the timeline does not allow for recirculation or full discussion of requested changes. The documents were released over the holiday season and included the release of draft PEIR document on December 30, 2011. The minimum 45-day public comment period closes on February 14, 2012. Only a few weeks are provided to prepare responses to comments and amend the documents to ensure that the Regional Council may consider the certification of the PEIR and the approval of the draft RTP/SCS on April 4, 2012.

We appreciate your consideration of all of the comments provided in this letter and its attachments and look forward to your responses. It is a shared goal to have an RTP/SCS adopted that is credible and defensible on all levels. .

Sincerely,

Carlos Jaramillo
Deputy Director of Community Development

Attachment 2: Additional Technical Clarifications on documents are also offered as follows:

2012 RTP/SCS

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
1	General Comment	all	*All chapter headings should include the Chapter number on each page for ease of reference.*
2	Clarification	1, left column	"The 2012 RTP/SCS includes a strong commitment to reduce emissions from transportation sources to comply with SB 375, ~~both~~ improve public health, and meet the National Ambient Air Quality Standards as set forth by the federal Clean Air Act. As
3	Clarification	4, right column	"This region needs a long-term, sustainable funding plan that ensures the region receives its fair share of funding, supports an efficient and effective transportation system that grows the economy, provides mobility choices, and improves our quality of life."
4	Clarification	page 7- Table 2 and page 95- Table 3.3	*Is additional $0.15 gas tax the sum total of both state and federal taxes or $0.15 each?*
5	Clarification	40, left column	"Strategic investments, put forth by the private sector, that would remove barriers associated with telecommuting are expected…"
6	Correction	page 42- Table 2.2	241 toll road completion year is 2030
7	Please define in the text and add to a glossary	50, left column	"scrip"
8	Clarification	54, right column	"Express/HO T Lane Network Despite our concerted effort to reduce traffic congestion through years of infrastructure investment, the region's system demands continue to exceed available capacity during peak periods."
9	Clarification	70, 78	Greenhouse Gases and Air Quality SCAG seems to rely on CEQA to achieve the "maximum feasible" reductions in emissions from transportation. However, this is not consistent with the intent of SB 375's goal of achieving specific thresholds of 8% by 2020 and 13% by 2035 through a sustainable communities strategy plan. *Please provide clarification to this section indicating if the air quality and greenhouse gas CEQA*

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			mitigation measures obligate regional agencies and project developers to undertake more strategies, programs and mandates beyond those included in the OC SCS.
10	Clarification	78, right column	"Greenhouse Gases On road emissions (from passenger vehicles and heavy duty trucks) constitute 93 percent of the transportation sector total. Emissions from passenger vehicles, which are the subject of SB 375 and this RTP/SCS, constitute ___% of the transportation sector's greenhouse gas emissions total."
11	Clarification	80, left column	Statements are made, such as the following, "the RTP has the ability to affect the distribution of that growth" (in population in the region). These statements could be interpreted to be contrary to SCAG's obligation under the Memorandum of Understanding with OCCOG to respect the strategies and local land use policies in the OC SCS. *Please clarify how it is in SCAG's ability to affect local change when the OC SCS is consistent with acceptance of local land use plans and planned population and employment distribution?* *Recommended text change:* "Transportation projects including new and expanded infrastructure are necessary to improve travel time and can enhance quality of life for those traveling throughout the region. However, these projects also have the potential to ~~induce~~ attract more of the regional population growth in certain areas of the region. This means that although ~~Although~~ SCAG does not anticipate that the RTP would affect the total growth in population in the region, the RTP has the ability to affect the distribution of that growth."
		82, right column	"~~In addition to induced population growth,~~ transportation projects in the RTP also have the potential to divide established communities, primarily through acquisition of rights-of-way." Text indicates that the RTP and projects in the RTP/SCS as "inducing" growth. It is noted that use of the term "induced growth" has a negative connotation and implies growth above and beyond

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			what would occur naturally. ~~However~~, it is stated in the RTP that the population, housing, and employment growth totals are fixed and only the distributions may change based on the plan. This means there will not be "new" growth and that the RTP and SCS may simply influence and shift the growth anticipated for the region. This moving of growth is the result of changes in distribution that are due to changes in land use or densities. Because of this, it is requested that references to "induced growth" be reworded to reflect the shifting of growth in the region. *Recommended text change:* "Cumulative impacts from the projected growth ~~induced by the RTP~~ include increased impervious surfaces;..."
12	Clarification	Chapter 3	SCAG's Financial Plan includes a significant portion of "New Revenue Sources and Innovative Financing Strategies" that are not currently in place or available. While some of the proposed revenues are within the control of SCAG or MPOs and County Transportation Commissions, the majority of the revenues (in terms of dollars) require either state or federal action to implement. *Please explain what the implications are if these new revenue sources and innovative financing strategies do not become available?*
13	Clarification	page 95-Table 3.3	~~"Mileage-based user fees would be implemented to replace gas tax and augment – estimated at about $0.05 (2011$) per mile and indexed to maintain purchasing power starting 2025."~~ Suggested language is from page 31 of Growth Forecast Appendix: "Current gasoline tax, estimated at about $0.05 (2011$) per mile will increase through 2025, then in 2026 it would be replaced with a mileage-based user fee indexed to maintain purchasing power."
14	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw land available in the region ~~left to accommodate additional growth~~."
15	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			land available in the region ~~left to accommodate additional growth~~."
16	Clarification	106	SCAG indicates that the OC SCS has been incorporated into the regional SCS. OCCOG was one of two subregions that undertook the arduous task and obligation of preparing an SCS. *Please add clarifying text that these subregional SCSs, including the OC SCS, represent the Sustainable Communities Strategies applicable to those subregions.*
17	Clarification	110, right column	"Municipal water and sewer systems, for example, ensure clean water. At the same time, ~~concrete stormwater runoff channels harm water quality~~ and ~~sprawl eats into open space~~ as areas become more urbanized and the percentage of impervious surface is increased, the hydrologic regime is dramatically altered. Drainage conveyances that once were natural and riparian are required to be engineered as hardened flood control channels to provide adequate protection of private property and public infrastructure from the increased frequency, duration, peak flow, and overall volume of stormwater runoff. With this armoring of once natural channels, water quality benefits from biofiltration are lost along with opportunities for infiltration and evapotranspiration, which can lead to hydromodifcation downstream in sections which are not yet engineered and hardened. Many strategies…"
18	Clarification	112, 117	The SCS documents the development of four scenarios to explore basic aspects of future growth. These scenarios were used in public outreach and the SCS and the associated Appendix states that "Using the public dialogue and feedback from the analysis of the SCS Scenarios, SCAG developed the 2012 RTP/SCS Plan alternatives." (Similar references are also include at RTP/SCS p. 117, and SCS Background Documentation p. 71). The RTP/SCS and Appendix then describes a process that led to the Plan alternatives. Neither the RTP/SCS, Appendix or PEIR expressly state or illustrate the fundamental land use and socioeconomic foundation for the SCS. *In order to confirm consistency with the OC SCS, it is requested that SCAG include appropriate tables,*

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			graphics and maps that provide the detail that confirm this consistency.
19	Clarification	113, 122	The regional SCS states that the scenarios/alternatives were developed using the Local Sustainability Planning Tool (LSPT). The LSPT is a sketch planning tool that flattens geographical areas to a 5-acre grid cell. The OC SCS land use data was provided at much greater level of detail in that specific parcel data and detail were provided by each jurisdiction. A cursory review of some LSPT data reveals inconsistencies regarding interpretation of Orange County land uses. It is acknowledged that the regional SCS states, "Land use inputs for OCCOG SCS were unchanged". Yet use of the LSPT and SCAG Development and Community Types presented in the SCS leave open the question as to whether the OC SCS was altered, as noted above. *Please provide confirmation that the underlying OC SCS land use data was used without significant alteration and LSPT flattening and interpretation in the development of the regional SCS Plan and alternatives.*
20 17	Add to glossary	127, right column	"Gentrification"
21	Clarification	128, left column	"Thus, this adjustment allowed the land use pattern to conform more closely to local ~~expectations~~ general plans, while reducing the amount of vehicle miles traveled." *Whose/What are "local expectations?"*
22	Clarification	149, right column	*Revise language to clarify that SCAG intends policies, strategies, and measures are a menu of options.* "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which would help ~~can and should undertake in order~~ to successfully implement the SCS."
23	Clarification	150-152	The OC SCS was accepted by SCAG and represents the set of strategies and the growth distribution that outlines the best approach for how

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			the requirements of SB 375 would be met within the subregion. Specifically, the OC SCS included 15 specific Sustainability Strategies, reflecting a menu of 222 practices and actions that OC agencies have agreed to pursue (or continue to pursue) to achieve GHG reductions that support SB 375. *Why doesn't the regional SCS specifically acknowledge these 15 strategies yet include other strategies and performance measures not included in the OC SCS (e.g., Locational Efficiency)?*
24	Add to glossary	166, right column	"Greenfield"
25	Clarification	194, right column	"In addition to these targeted outreach efforts, all regular and special meetings of the RTP task forces, the Transportation Committee (TC), the CEHD, the EEC, and the SCAG Regional Council are publicly noticed and …"
26	Clarification	201	*Please clarify whether the text stating "Long-term emission reduction for rail, with a goal of zero-emissions rail system" is intended to reflect a zero-emissions freight rail system, or whether this goal also applies to passenger rail.*
27	Clarification	202, 203- Table 7.1	Unfunded operational improvements, of which several are listed on page 203, Table 7.1, include transit station improvements in Irvine, Fullerton, and Santa Ana, bus rapid transit (BRT) in Orange County, and high speed rail (HSR) Phase II. *Please confirm that these are consistent with the OC SCS.*
28	Clarification	207	Strategic Finance *Please explain what will happen if reasonably foreseeable revenue sources of approximately $200 million do not become available?*
29	Add to glossary	205	"Active transportation"

GROWTH FORECAST APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Updated growth forecast numbers	23, Table 13	In December 2011, Orange County provided SCAG with the revised growth forecast dataset, OCP-2010 Modified, per the OC SCS MOU (official OCCOG Board action 1/26/2012).

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
			Please incorporate revised Orange County numbers (i.e. OCP-2010 Modified) into all reports, tables, exhibits, alternatives, maps, and modeling runs for final RTP.

PERFORMANCE MEASURES APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Clarification	1	The document states, "The performance measures are used to evaluate how well the RTP/SCS addresses the adopted goals and performance outcomes." *Is there any formal role for the performance measures?* ARB will evaluate for SB 375 compliance not based on these measures but based on ARB process. *Please include language clarifying that this is a requirement to demonstrate compliance with federal requirements and not for the obligations under SB 375.*
2	Clarification	1, end of first paragraph	Add statement: "Performance measures and expected outcomes will be used to monitor the RTP/SCS at the regional level; these measures and outcomes are not proposed for use at the subregional or project-specific level."
3	Clarification	1, column 2	The document states, "The Regional Council will formally adopt the goals and outcomes as part of the final 2012 RTP/SCS." *Does this bring any formal obligation to meet goals? Goals are general, flexible, and aspirational rather than specific, as on p.1.*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
4	Clarification	13, Table 8	The RTP/SCS claims an extra 2% CO2e emissions reduction in 2035 from the NHTS post-processing analysis. While the RTP/SCS meets the ARB SB375 goal without the extra 2%, we would like to note that the extra 2% could be important if the attorney general raises concerns about backsliding. Consequently, the reliability of the extra 2% reduction should be checked. Questions on the NHTS model are below. It would be useful to know the answers to better judge the quality, although we do note that the report does look like it meets the standards or best practice.
5	Clarification	9	NHTS Model Documentation Report *Are the auto and bus accessibility variables included in the regression models for 30-mile rings?* *In "Number of trips" model – is number of cars, included as an independent variable, the actual or predicted value?* *The same question applies to other models.*
6	Clarification	23, Table 10	NHTS Model Documentation Report *Were the elasticities for the SCAG NHTS study calculated at sample means, or for each observation and then averaged for the sample?*
7	Clarification	24, Test 3	NHTS Model Documentation Report (Compare Trip-Based and NHTS Model): The final test was to compare the results of the Trip-Based Model and the NHTS Model for the same scenarios. *Please describe the scenarios tested.*

TRANSPORTATION FINANCE APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Clarification	General	*What are the implications if revenues other than core revenues do not become available?* *Please describe any implications to the ability of the region to meet SB 375 GHG emission reduction targets or the federally required air quality*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
			conformity?

SCS BACKGROUND DOCUMENTATION APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Please define	53, right column	Housing Options and Mix: Define Larger-lot single family in text
2	Clarification	71-74, 80-83	Alternatives naming: A, B, C Names of Alternatives differ than those listed in the PEIR on pages ES-3 and 1-4. *Please be consistent with naming protocol for alternatives between two/all documents.*
3	Revise language to clarify	71, right column	"Plan Alternative (B) … The alternative maintains city-level forecast control totals for both households and jobs, however, within city boundaries shifts are made to focus a much larger share of future growth in a more compact way around HQTAs, except in Gateway and Orange County COG subregions per their SCS delegation agreements. Future housing market demand is expected to shift significantly to small lot single-family, townhomes and multi-family ~~hosuing~~ housing."
4	Please define	71, right column	Plan Alternative (B) Define small lot single family in text
5	Revise language to clarify	71, right column	Plan Alternative (C) "As a result very suburban communities may experience no new housing or employment growth, while some urban areas with very good access to regional transit may experience significant increases in housing or employment growth."
6	Revise language to clarify	72, left column	"While each alternative is distinctive, a number of parameters remained constant across each alternative: the regional RTP/SCS forecast total for population, households and jobs;…" "Detailed forecast: the detailed distribution of population, households, and jobs across the region…"

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
7	Revise language to clarify	72, Table D1	Alternatives A & B: "Controlled to TAZ-based RTP/SCS Forecast for 2020; Controlled to city-level RTP/SCS Forecast for 2020-2035, except in Gateway and Orange County COG subregions per their SCS delegation agreements." Add statement to table notes: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
8	Revise language to clarify	74, Table D2	Alternatives A & B: Add statement: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
9	Clarification	75, right column	"Development Types The alternatives are built on, and provides data at, the level of the TAZ, which includes housing units and employment." *Please clarify if TAZ is Tier 1, Tier 2, or both.*
10	Revise language to clarify	79, right column	"Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be ~~respected~~ unchanged and integrated into the alternatives (with possible revisions for Alternative C only)."
11	Clarification	79	The section includes the following language: "Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be respected and integrated into the alternatives (with possible revisions for Alternative C only)." *Please clearly indicate what the "possible revisions" are and what process would be used to coordinate with Orange County should changes to the socioeconomic data contained in the OC SCS be proposed?*
12	Revise language to clarify	80	Alternative A Add statement: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
13	Revise language to clarify	81	Alternative B It is not clear whether Alternative B is the SCS land use plan. If it is, statements in the appendix lead one to believe the OC SCS foundation has been altered. For example, adjustments made to land uses to locate proximate to High Quality Transportation Areas (HQTA) and intensification of residential and employment development in HQTA that diverge from local General Plans as well as implementation of a vehicle user fee are not part of the OC SCS. *Is Alternative B the SCS land use plan?* *Add statement:* Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
14	Clarification	115, left column	Transit Zoning Code Santa Ana 2011 *Is this a duplicate of the 2010 Santa Ana project?*

PEIR

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
1	Revise language to clarify	ES-2	ES contains matrix of mitigation measures which reference project sponsors, local agency, and project implementation agency without definitions. Add definitions into ES at end of ES.1: In general, the terms "local agency," "project sponsor" and "project implementing agency" are used throughout this PEIR to identify agencies, organizations, companies and individuals that will act as lead agencies or project applicants for different types of individual projects. Individual projects that are anticipated to occur pursuant to the 2012-2035 RTP/SCS consist of planning projects (general plans, specific plans, climate action plans, etc.), development projects (including Transit Priority Projects (TPPs) and other similar projects), and transportation projects. In general, "local agency" is used to refer to a public agency that would propose a planning project or a public infrastructure project and/or an agency that would be lead agency for individual projects. "Project sponsor" is typically used to refer to an applicant (that could be public or private, an organization or an individual) that proposes a project. "Project implementing agency" is used to refer to an agency responsible for implementing a project. In this document, project-implementing agencies are those that are responsible for carrying out (reviewing, approving, constructing) transportation projects.
2	Clarification	ES-3, 1-4, Chapter 4	Alternatives' Naming: No Project Alternative, Modified 2008 RTP Alternative, Envision 2 Alternative; Alternatives 1, 2, 3 Names of Alternatives differ than those listed in the SCS Background Documentation appendix on pages 71-74 and 80-83. *Please be consistent with naming protocol for alternatives between all documents.*
3	Fix numbering	ES-31	Duplicate naming of GHG11 and GHG12
4	Please define	ES-42	LU63- What are the smart growth principles?

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
5	Please define	ES-42	LU64- What are the benchmarks for smart growth?
6	Fix numbering	ES-51	PS17 & PS18 are missing
7	Fix numbering	ES-53	Duplicate naming of PS36 & PS37
8	Please define	ES-67	TR 34- what are the identified transportation benchmarks?
9	Please define	ES-83, 3.13-42 MM-W43	Define climate change hydrology
10	Please define	ES-40, 3.8-21 MM-LU42	Define urban growth boundary
11	Please define	ES-57, 3.11-49 MM-PS68 & ES-74, 3.12-43 MM-TR96	Define parking cash out program/ cashouts
12	Clarification	1-5	*Besides IGR, what other monitoring efforts is SCAG in charge of? (that would require lead agencies to provide SCAG with documentation of compliance with mitigation measures)*
13	Language correction	1-6, paragraph 3	Language correction: "The ~~latter~~ **former** finding…"
14	Language correction	2-5	Sustainability section should be separated. Language correction: **Sustainability.** The 2012-2035 RTP/SCS is subject to specific requirements for environmental performance. **New paragraph:** "Beyond simply meeting these requirements, a …"
15	Language correction	2-5, Table 2-2	"Align the plan investments and policies ~~with~~ **while** improving…"
16	Please define	2-14	Define "scrip"

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
17	Narrative	2-21	AB 32 is global warming solutions act. SB 375 was determined to be stand-alone legislation. RTP document is not forum to address global climate change and references distract from RTP goal and purpose. "Global warming" and "global climate change" are not interchangeable phrases. References should be removed or, where appropriate, language should be changed to "global warming". ~~Goods movement is also a major source of GHG emissions that contribute to global climate change.~~
18	Clarification	2-27 paragraph 4	Not in SCAG's authority, nor funding available. Delete sentence: ~~SCAG will work with local jurisdictions and community stakeholders to seek resources and provide assistance to address any possible gentrification effects of new development on existing communities and vulnerable populations.~~
19	Clarification	2-27 paragraph 5	"The 2012-2035 RTP/SCS land use development pattern accommodates over 50 percent of new housing and employment growth in HQTAs, while keeping jurisdictional totals consistent with local input." *Please confirm that there are no changes to the local land use inputs provided by Orange County.*

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
20	Clarification	2-29	"For purposes of SCAG's SCS, a Development Type reflects an estimated average density of 22 residential units per acre. However, it is important to note that the designation is a potential ultimate average for the TAZ—and is not an absolute project-specific requirement that must be met in order to determine consistency with the SCS. In other words, the SCS was not developed with the intent that each project to be located within any given TAZ must exactly equal the density and relative use designations that are indicated by the SCS Development Type in order for the project to be found consistent with the SCS's use designation, density, building intensity and applicable policies. Instead, any given project, having satisfied all of the statutory requirements of either a residential/mixed-use project or TPP, may be deemed by the lead agency to be consistent with the SCS so long as the project does not prevent achieving the estimated average use designations, densities and building intensities indicated by the Development Type within the TAZ, assuming that the TAZ will be built-out under reasonable local planning and zoning assumptions." *Does the above PEIR language create a requirement for average TAZ density levels in 2035 and a requirement that each local project not preclude those density levels?* *Additionally, please clarify whether in HQTAs, these densities could be exceeded as well as implications of an area that is already fully developed not redeveloping such that it ever achieves the identified densities.*
21	Please define	3.8-5 paragraph 3,	Define "open space"

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
22	Revise language to clarify	4-39	Envision 2 alternative contains growth projections that would place housing in flight paths, locate housing on sites for which housing is not allowed due to environmental contamination, would significantly impact existing industrial operations necessary to maintain quality jobs in the region, and does not include development projects that are legally allowed due to having existing entitlement for development. Because this alternative does not consider the existing health and safety of future residents nor the existing legal approvals of development in the region, it is not possible to determine if the alternative is actually superior to other alternatives. It is simply another alternative for consideration. *Please remove references to the Envision 2 (or any other name of this alternative) as being environmentally superior.* ~~ENVIRONMENTALLY SUPERIOR~~ ENVISION 2 ALTERNATIVE
23	Revise language to clarify	4-40	"Of the three alternatives, the Envision 2 Alternative would be considered by State CEQA guidelines as the environmentally superior alternative because it does not allow further use of land for single-family development..."

Subject: Comments on the Draft PEIR for the 2012-2035 RTP/SCS

Dear Mr. Leib:

Thank you for the opportunity to comment on the Draft Program EIR for the 2012-2035 RTP/SCS. City of Lake Forest Staff has been involved with the review of the documents as facilitated by the Orange County Council of Governments (OCCOG) Technical Advisory Committee (TAC) and would like to express our sincere support and agreement with the comments submitted by the OCCOG Board. In addition to the comments of the OCCOG, the following comments are offered on the Draft 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy (draft RTP/SCS) and the associated Appendices and draft Program Environmental Impact Report (draft PEIR).

General Comments

- Concern with the timeline. We recognize the immense efforts it took to prepare these documents. They are incredibly complex documents establishing important and far-reaching policy for the region. However, because of this importance and complexity, we would like to express concern about the timing of the release of the documents. The timeline of document release, public comment period, and time allowed for the response to comments results in an inability to have credible discussion regarding possible changes because the timeline does not allow for recirculation or full discussion of requested changes. The documents were released over the holiday season and included the release of draft PEIR document on December 30, 2011. The minimum 45-day public comment period closes on February 14, 2012. Only a few weeks are provided to prepare responses to comments and amend the documents to ensure that the Regional Council may consider the certification of the PEIR and the approval of the draft RTP/SCS on April 4, 2012.

- Growth Forecasts. It is requested that the adoption of the growth forecast numbers by the Regional Council and/or Joint Policy Committee be at the county level, consistent with past RTPs. Planning documents need to be flexible. Smaller geographic levels, such as at the subregional, city, census tract, TAZ, parcel, or grid cell would limit jurisdictional control over land use.

- Growth Forecasts. The OCCOG Board approved the update to the OCP-2010 dataset used in the OC SCS. OCP-2010 Modified was officially approved by the OCCOG Board on January 26, 2012 and is a data amendment to the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 and this is the formal notice of the update which should be incorporated into the 2012 RTP/SCS, PEIR, and related documents. To be consistent with the MOU on subregional delegation between OCTA, OCCOG, and SCAG, all documents, tables, maps, narratives, modeling runs, PEIR alternatives (including Alternate C/3/Envision 2), and datasets should be updated with the OCP-2010 Modified numbers.

- Intended Use of the PEIR. The applicability of the PEIR and its 550 mitigation measures to projects throughout the region should be clarified. Specifically, additional language is needed to reflect that lead agencies will determine the feasibility and applicability of measures to specific projects under local jurisdiction.

- PEIR Mitigation Measures. SCAG Staff has indicated that the mitigation measures in the PEIR are intended to represent a menu of options for implementation with projects, as determined appropriate and feasible. However, the concept of a menu of options is not clear in the PEIR. We request added language to clarify the applicability of the mitigation measures to projects undertaken or approved by local government.

- PEIR Mitigation Measures. Hundreds of mitigation measures in the PEIR use the language "can and should". For example – "Local jurisdictions can and should meet recognized 'smart growth' benchmarks." We are concerned that the word "can" indicates that the measure has already been determined to be feasible. Additionally, we are concerned that this language does not support the use of the mitigation measures as a menu of options for local use. We recommend that the words "can and" be removed in all instances, leaving the language "should" as clearly optional.

- PEIR Mitigation Measures. Many mitigation measures have been identified which appear to expand SCAG's purview. Specifically, the OCCOG Board's letter identifies in its attachments proposed mitigation measures which extend to a broad spectrum of technical and policy areas. We echo the concerns of the OCCOG Board and affirm that mitigation measures should not be used to establish policy for the region.

Should you have any questions regarding this letter, please contact Cheryl Kuta, Planning Manager at (949) 461-3479 or via email at ckuta@lakeforestca.gov.

Sincerely,
CITY OF LAKE FOREST

Re: Draft 2012 Regional Transportation Plan / Sustainable Communities Strategy

Dear Mr. Ikhrata:

The City of Los Angeles appreciates the opportunity to review and comment on the Southern California Association of Governments' (SCAG) Draft 2012 Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS). SCAG is to be commended for an unprecedented multi-year effort to develop the 2012 RTP/SCS, which included extensive outreach. In particular, the City appreciates the exceptional effort on the part of SCAG staff to prepare the first Sustainable Communities Strategy, as required by SB 375.

After careful review of the draft RTP/SCS, the departments of Transportation, Airports and City Planning have provided comments that clarify the City's position regarding, and request modifications to, certain areas of the RTP/SCS. Accordingly, the Los Angeles Department of Transportation (LADOT) prepared the attached report to the City Council that includes comments on the draft 2012 RTP/SCS by all three City departments. The Los Angeles City Council, on February 10, 2012, adopted the attached report as the City's comments on the Draft 2012 RTP/SCS.

Included in the City's comments is a list of projects that the City requests be added to the Strategic Plan of the RTP/SCS. Moreover, as indicated in the attached report, the City requests that the City's adopted Bicycle Plan and Mobility Hubs initiative be included in the Strategic Plan, if not already included in the Constrained Plan.

We look forward to working with SCAG staff to substantially incorporate into the RTP/SCS those elements of the City's comments that are directed to the content of the

2012 RTP/SCS. After review of the attached comments, please contact Tom Carranza or Miles Mitchell of my staff for further discussions regarding LADOT's comments, and Ken Bernstein or Naomi Guth regarding comments from the Department of City Planning. We look forward to a continued mutually beneficial collaboration between the City and SCAG as we address future regional challenges and opportunities.

Sincerely,

Jaime de la Vega
General Manager

FORM GEN. 160 (Rev. 6-80)

CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

Date: February 6, 2012 (Revised Report)

To: The Honorable City Council, City of Los Angeles
c/o City Clerk, Room 395
Attention: Honorable Bill Rosendahl, Chair, Transportation Committee
Attention: Honorable Ed Reyes, Chair, PLUM Committee

From: Jaime de la Vega, General Manager
Department of Transportation

Subject: **Draft 2012 Regional Transportation Plan / Sustainable Communities Strategy (CF 11-1223)**

Summary

This report recommends that the Council authorize the Los Angeles Department of Transportation (LADOT) to submit additional comments on behalf of the City of Los Angeles to the Southern California Association of Governments (SCAG) on the draft 2012 Regional Transportation Plan /Sustainable Communities Strategy (RTP/SCS).

Recommendations

1) APROVE the comments provided in this report as the City of Los Angeles' comments related to transportation in the SCAG draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

2) DIRECT LADOT to transmit comments to SCAG that are substantially consistent with those contained in this report, including the attached comments from other departments.

3) DIRECT LADOT to work with SCAG to incorporate the comments into the final RTP/SCS and related Program Environmental Impact Report (PEIR).

Background

Every four years the Southern California Association of Governments (SCAG) prepares a Regional Transportation Plan (RTP) for the six-county region. The 2012 RTP/SCS includes planned transportation projects and demographic assumptions through the year 2035. The plan presents a strategy for the investment of $524.7 billion in the region's transportation system between 2012 and 2035 and, for the first time, a Sustainable Communities Strategy (SCS) for the six-county region.

The SCS, required by SB 375, focuses on reducing greenhouse gas emissions (GHGe)

from cars and light trucks by means of several strategies, including integration of land use and transportation planning, transit system expansion, and transportation demand management (TDM). The California Air Resources Board (CARB) established regional GHGe reduction goals of eight percent per capita by 2020 and thirteen percent per capita by 2035, compared with 2005 levels. SCAG's analysis indicates that the draft RTP/SCS would achieve the 2020 target, and would exceed the 2035 target with a GHGe reduction of sixteen percent.

According to SCAG's analysis and modeling, the draft RTP/SCS also meets the federal conformity requirements for air quality. It is important to note that reducing GHGe is not required for achieving air quality conformity. Therefore, although many of the strategies that achieve air quality conformity also assist with GHGe reductions, the two analyses are generally independent of each other.

A Regional Transportation Plan (RTP) also requires that there be reasonably available funding sources. The RTP proposes expenditures of $524.7 billion, and SCAG states that without new revenue sources the RTP faces a funding shortfall of approximately $219.5 billion. Various means to make up the shortfall are set forth. The RTP suggests that $127.5 billion of the shortfall could be addressed by action at the State or Federal level to increase the gas tax $0.15 per gallon between 2017 and 2024. The RTP states the State and Federal government could then replace the gas tax with an indexed mileage-user fee of $0.05 per mile beginning in 2025. If the mileage-based fee was not implemented, then there would be a need to further increase the gas tax to generate the revenues that would have been created by the mileage-based user fee. Although these proposals depend primarily on State and/or Federal action, they deserve further discussion within the City as the implementation year of 2017 approaches.

SCAG is to be commended for a multi-year effort to develop the 2012 RTP/SCS, including an unprecedented outreach effort. In particular, the passage of SB 375 required an extensive public education campaign including outreach to cities, environmental, public health and business groups. SCAG conducted a series of periodic workshops across the region, which included preparation of in-depth graphic and narrative presentation materials. The City appreciates the outstanding outreach effort, both to the City itself and across the region.

Pursuant to the Council action of October 5, 2011, and in accordance with past practice, LADOT has reviewed the draft 2012 RTP/SCS and compiled proposed comments to SCAG. In addition, LADOT has coordinated the preparation of these comments on the RTP/SCS with other City departments that are most impacted by the RTP. LADOT very much appreciates the cooperation of the departments of Los Angeles World Airports (LAWA) and City Planning each of which have provided comments. The Port of LA has indicated that it does not have formal comments at this time. The Metro staff report on the RTP/SCS is attached as Attachment B.

Report to City Council, dated September 21, 2011
On October 5, 2011, the City Council adopted a joint report (Attachment A) by the Departments of City Planning and Transportation entitled "Alternatives Proposed by SCAG for the 2012 Regional Transportation Plan / Sustainable Communities Strategy" (CF 11-1223). This report, dated September 21, 2011, provided comments on four draft scenarios for the RTP/SCS, released by SCAG in July 2011. Specifically, Attachment A of the report identified proposed RTP/SCS strategies that City staff believed would, if adopted, have a potential impact on the City. For purposes of the report, "impact" was defined as a significant change from adopted City policy. Staff believes that the report, dated September 21, 2011, continues to reflect City policy with regard to many of the strategies presently included in the draft RTP/SCS.

One of the objectives of the report was for the City's comments to be incorporated into the RTP/SCS. We are pleased to report that to a large extent the City's comments appear to have been acknowledged by SCAG and therefore the RTP/SCS does not include several of the specific proposals of concern. Specifically, three of the concerns raised, and the status of the strategy in the draft RTP/SCS, are as follows:

1) Phased implementation of 5% of major arterials to have dedicated bus lanes. As requested by the City, the RTP does not include a specific percentage for implementation. As explained in the September 21st report, the City supports careful and selected implementation of bus lanes, but does not want to commit to implementing a specific percentage of bus lanes on City arterials.

2) 10% of primary and secondary arterials to include bike facilities. As requested by the City, the RTP does not include a specific percentage for implementation. As explained in the September 21st report, the City supports careful and selected implementation of bike lanes, but does not want to commit to implementing a specific percentage of bike lanes on City arterials. Rather, the City supports the specific implementation of its adopted Bicycle Plan.

3) Cordon pricing around key activity centers – initial pilot projects in downtown Los Angeles and potentially LAX complex. As requested by the City, this project has been included in the Strategic Plan portion of the RTP/SCS, which acknowledges that the project still requires further study and has not been officially approved by the City.

Discussion of Policy Concerns and Comments

Although most of the concerns raised in the September 21, 2011 report appear to have been addressed, LADOT has identified additional areas of concern with regard to the draft 2012 RTP/SCS, which was released for public comment on December 20, 2011.

LADOT has comments and concerns in the following areas:

Project List for RTP/SCS

The RTP includes an extensive project list. As stated in the Project List appendix, the list is divided into three sections, as follows: 1) The Federal Transportation Improvement Program (FTIP), which forms the foundation of the RTP project investment strategy and represents the first six years of already committed funding; 2) the Financially Constrained list of projects not included in the FTIP but which have "reasonably available" funding; and 3) the Strategic Plan representing an unconstrained list of potential projects that the region would pursue given additional funding and commitment.

As with past RTP cycles, LADOT has reviewed all three project lists. The FTIP and Constrained project lists appear to include, with one exception, all City of Los Angeles projects with either committed or reasonably available funding. These lists are developed through ongoing coordination between City, Metro and SCAG staff. The one project that should be added to the FTIP list is a Transit Bureau project as follows:

> TIP ID LAF5427 – DASH Clean Fuel - Five Higher Capacity Vehicles (Purchase five 35-foot CNG clean-fuel buses to replace five 30-foot propane vehicles). SCAG is aware that this project needs to be added to the FTIP project list, and it is pending to be added to the list.

Regarding the Strategic Plan list, in an effort to expedite many as yet unfunded City projects, LADOT has prepared the attached list (Attachment E) of approximately ninety projects that the City is requesting to be added to the Strategic Plan.

Additionally, LADOT wishes to draw attention to both the Los Angeles Bicycle Plan and Mobility Hubs initiatives (a First Mile/Last Mile strategy). These efforts support both the Active Transportation and Transportation Demand Management strategies of the RTP. The RTP includes numerous references to expanded bicycle facilities and other First Mile/Last Mile strategies, and therefore these strategies are presumably included with likely funding in the Financially Constrained plan. However, to the extent these initiatives are not included in the Constrained plan they should be added to the Strategic Plan.

Importantly, Metro staff has also reviewed the RTP and found that it includes all the projects and programs in the Metro 2009 Long Range Transportation Plan (LRTP). A copy of the Metro staff report, dated January 18, 2012, is attached for reference. The RTP does not model the 30/10 (Fast Forward) proposal for Measure R projects, because the proposal has not yet been approved by the Metro Board, and still requires federal approvals. However, SCAG is supportive of the 30/10 proposal and will likely amend the RTP if the proposal secures additional approvals.

The Metro report also highlights key projects, within Los Angeles County, included in the RTP which are not included in Metro's 2009 LRTP. These key projects include:

- East-West Freight Corridor will be studied along a five mile band generally following the SR-60 corridor between the I-710 and the I-15.

- Phase I of the California High Speed Rail Authority (CHSRA) is in the draft 2012 RTP in the Constrained Plan, pending an agreement between the CHSRA and Metrolink to identify funds to bring local systems up to higher speeds (110+ mph) where possible.

- A regional Express/HOT Lane Network that expands Metro's Fast Lanes pilot project to include the I-405 and SR-91. This goes beyond the federally funded pilot studies on the I-10 and I-110 freeways.

As an overall comment, the City wishes to emphasize that, for future RTP/SCS project lists, the City, Metro and SCAG need to continue the effort to improve connectivity between various transit systems. For example, in South Los Angeles County, there needs to be greater emphasis placed on the development of feeder systems to connect and support the Blue, Green, Expo and Crenshaw lines. These systems would include, but not be limited to, expanded Bus Rapid Transit and improved bicycle and pedestrian linkages.

Recommendation:

As described above, the City should request that SCAG include the attached list of projects to the Strategic Plan. Additionally, to the extent the Los Angeles Bicycle Plan and Mobility Hubs are not included in the Constrained Plan, they should be added to the Strategic Plan.

CEQA Streamlining

The adopted September 21, 2011 City report, prepared by the Planning and Transportation departments, included the following comments:

> "The Sustainable Communities Strategy will include land use maps which will facilitate CEQA streamlining of development projects. According to SCAG staff, the CEQA relief provided by SB 375 is substantial. Therefore, the City should carefully review the draft SCS land use maps to ensure the maps are consistent with adopted City land use plans.
>
> SB 375 allows for CEQA streamlining provided a proposed project qualifies as follows:
>
> 1) The project must be consistent with the land use designation contained in

the land use maps included in the Sustainable Communities Strategy. The maps will describe land use densities and types according to SCAG's Land Development Categories (LDC's).

2) The project qualifies as a Transit Priority Project (TPP), as defined by SB 375. To qualify as a TPP, a project must meet certain minimum density requirements and must be located within ½ mile of either a "major transit stop or high-quality transit corridor" (SB 375 - Section 21155). According to SCAG staff, most of the City qualifies as a TPP area because of existing transit stations and corridors.

CEQA streamlining, according to information provided by SCAG, will allow many projects meeting the above two criteria to receive the equivalent of a "mitigated negative declaration" in the development review process. This could impact development review by several departments, including Planning and Transportation.

The City requests that SCAG provide copies of the draft SCS land use maps for review by the Planning and Transportation departments, and the Council and Mayor, prior to SCS adoption."

Because the SCS will emphasize increased development within ½ mile of either a "major transit stop or high-quality transit corridor" there may be an increased need for transportation infrastructure in these areas. LADOT is concerned that CEQA streamlining could allow development to occur with impacts on transportation infrastructure.

Recommendation:

LADOT staff has consulted with staff of DCP and the City Attorney regarding the impact of CEQA streamlining on the City's development review process. Input received from these sources indicates that although CEQA streamlining of various types will occur following adoption of the RTP/SCS, the City may retain some degree of "discretionary approval" authority over development projects that are subject to CEQA streamlining. LADOT believes that this area deserves further study. This is a complex and important subject, and the City should carefully evaluate and prepare for the impact of CEQA streamlining following adoption of the RTP/SCS.

Comments from Other City Departments

Los Angeles World Airports (LAWA):

- LAWA emphasizes that its first priority is to "maintain safe and efficient airports." Like most airports, LAWA receives grant funds from the FAA for eligible

construction and noise mitigation projects. In return for federal grant monies, the FAA includes grant assurances that limit use of airport revenue solely for aviation-related uses on airport property.

- The RTP includes a proposal to promote a regional system of airport express buses, modeled in part on the FlyAway service currently operating at LAX. Although express buses are a "promising solution" to certain ground access problems, LAWA advises that express buses are most effective at airports with high passenger demand and in cities with concentrated populations of passengers and employees. Even then, high fares or significant subsidies have been required to maintain an effective level of service. LAWA cautions that its experience and studies have shown that the expansion of the express bus system at LAX will be challenging. Moreover, the expansion of express bus service, by itself, may not be effective in increasing passenger demand at "secondary" airports.
- LAWA agrees that "the aviation constraints in the region, and potential dispersion of that activity at other airports, should be re-examined in subsequent regional plans."
- LAWA requests that, if possible, SCAG utilize the 2011 Air Passenger Survey, most likely to be released in February, to update various data points in the Aviation and Airport Ground Access appendix.
- LAWA's comments are provided in Attachment C.

Department of City Planning (DCP):
The Department of City Planning has provided important comments which are highly technical and lengthy, hence they are attached to this report as Attachment D.

Conclusion

The draft 2012 RTP/SCS and PEIR, released by SCAG on December 20, 2011, represent an outstanding effort to meet both State and Federal planning requirements, as well as provide for the multifaceted needs of the region. As described in this report, including comments from other departments, City staff has provided comments in the areas of transportation and land use. City staff has provided recommended comments to SCAG for City Council and Mayor review regarding these proposals.

Fiscal Impact

This report contains comments regarding proposed policies and projects included in the draft 2012 RTP/SCS and related PEIR. The comments to be transmitted to SCAG will not impact the City's General Fund.

TO THE COUNCIL OF THE
CITY OF LOS ANGELES

Your PLANNING AND LAND USE MANAGEMENT COMMITTEE
and
TRANSPORTATION COMMITTEE

report as follows:

PLANNING AND LAND USE MANAGEMENT and TRANSPORTATION COMMITTEES' REPORT relative to Southern California Association of Governments (SCAG) proposed alternatives for the 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

Recommendations for Council action:

1. AUTHORIZE the Los Angeles Department of Transportation (LADOT) and City Planning Department (Planning) to:

    a. Submit to SCAG the comments contained in Attachment A of the joint LADOT and Planning report dated September 21, 2011 (contained in the Council file), inasmuch as the strategies identified therein may have a potential impact on the City.

    b. Convey the comments to SCAG requesting that they be incorporated into the 2012 RTP/SCS with the understanding that the comments may be modified and supplemented by the City, with Council and Mayor approval, as the RTP/SCS is further developed.

2. REQUEST SCAG to provide copies of the draft SCS land use maps for review by the LADOT and Planning, Council, and Mayor prior to SCS adoption, inasmuch as the maps will identify geographical areas of the City where projects can be eligible for California Environmental Quality Act streamlining and thereby potentially allow development projects to receive mitigated negative declarations in the development review process and thereby impact growth in the City.

Fiscal Impact Statement: The LADOT and Planning Departments report the potential fiscal impact to the City has not been determined. Further review and evaluation is necessary as more information on the ultimate preferred alternative is presented by SCAG.

Community Impact Statement: None submitted.

SUMMARY

At a joint meeting held on September 27, 2011, the Planning and Land Use Management and Transportation Committees considered a joint LADOT and Planning Departments report relative to Southern California Association of Governments proposed alternatives for the 2012 Regional Transportation Plan/Sustainable Communities Strategy. Representatives from the LADOT and Planning gave the Committees background information on the matter. The Committees requested SCAG to provide copies of the draft SCS land use maps for review by the LADOT and Planning Departments, Council and Mayor prior to SCS adoption.

After an opportunity for public comment was held, the Committees recommended Council approve the recommendations contained in the joint report as amended. This matter is now forwarded to the Council for its consideration.

Respectfully submitted,

PLANNING AND LAND USE MANAGEMENT COMMITTEE

REVISED
PLANNING AND PROGRAMMING COMMITTEE
JANUARY 18, 2012

SUBJECT: SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS' DRAFT 2012 REGIONAL TRANSPORTATION PLAN / SUSTAINABLE COMMUNITIES STRATEGY

ACTION: APPROVE COMMENT LETTER

RECOMMENDATION

Approve our comment letter on the Southern California Association of Governments' (SCAG) Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

ISSUE

In December 2011, SCAG released the Draft 2012 RTP/SCS for public comment. The RTP/SCS identifies regional transportation priorities for the six-county region through 2035. All 2009 Long Range Transportation Plan (LRTP) projects and priorities must be included in SCAG's RTP/SCS to be eligible for federal funds. We have reviewed the Draft 2012 RTP/SCS and Board authorization is being requested to transmit our comments to SCAG in time for their February 14, 2012 deadline.

DISCUSSION

As part of SCAG's role as a regional planning agency, they are responsible for addressing regional issues in the six-county area of Southern California. The 2012 RTP/SCS is the vehicle to provide solutions to regional mobility and land-use issues. For better integration of land-use and transportation, it must also demonstrate reduction of Greenhouse Gas Emissions (GHGe) from passenger vehicles. Per the requirements of SB 375, the Draft 2012 RTP/SCS includes Southern California's first SCS. The SCS is required to analyze how the collective impact of transportation policies, transportation investments and land-use policies affect the GHGe based on population projections in 2020 and 2035. Transportation issues are primarily addressed in the RTP portion of the Draft, and the SCS portion of the Draft presents strategies to meet GHGe targets.

SB 375 compelled SCAG to conduct a more extensive outreach process than has been historically required for RTP development. This process yielded unprecedented levels of public participation and engagement, particularly among environmental and public health advocates championing increased funding for active transportation to reduce GHGe and provide great opportunities for physical activity. The Los Angeles County Department of Public Health was a leading voice in this advocacy.

Regional Transportation Plan

In general, the Draft 2012 RTP/SCS is a well-written document that properly identifies many of the key transportation issues that the region is facing. It includes all of the projects and programs in our 2009 LRTP. SCAG has proposed new and innovative sources of funding beyond our LRTP program. These funds are for additional projects, regional maintenance of highway and transit facilities, and meeting Federal Clean Air Act conformity requirements.

There are new transportation projects proposed in the Draft 2012 RTP/SCS, within Los Angeles County, which are beyond revenues that the 2009 LRTP assumes to be available from traditional sources. Some of these projects are listed in the Key Projects subsection below. SCAG is assuming that these new projects are funded with a combination of innovative funding (e.g., container fees and public private partnerships) and increased revenues (e.g. gas tax changes and user-fee per mile).

The Draft 2012 RTP/SCS proposes targeted improvements in the transit network and increases in funding for Transportation Demand Management (TDM), Transportation System Management (TSM), and Active Transportation beyond the levels included in the six county transportation commissions' plans, including our 2009 LRTP.

Funding for these improvements is anticipated from a $0.15 per gallon increase in the gas tax starting in 2017 and ending entirely in 2024. After the gas tax phase-out in 2024, a proposed user-tax of $0.05 per mile driven, will be phased-in starting in 2025. The goal of the incremental phase-in is so that consumers will not have any large increases of taxes, yet also allow for an indexing to cover the increasing maintenance costs, due to the gas taxes not being indexed to inflation and not increasing with costs.

Key Projects beyond the LRTP

The following lists Los Angeles County projects identified in the Draft RTP that are not identified in the 2009 LRTP

- East-West Freight Corridor will be studied along a five mile band generally following the SR-60 corridor between the I-710 and the I-15.
- Phase I of the California High Speed Rail Authority (CHSRA) is in the Draft 2012 RTP/SCS in the Constrained Plan, pending an agreement between CHSRA,

Metrolink and LOSSAN to identify funds to bring local systems up to high speed (110+ MPH) where possible.

- A regional Express/HOT Lane Network that expands our Fast Lanes pilot project to include the I-405 and SR-91. This is beyond the federally funded pilot studies on I-10 and the I-110. The Board is on record supporting these two pilot projects, as well as studying the feasibility of a HOT lane on the I-405 from the Orange County Line to LAX.

Key Issues

There are several emerging issues that the Draft 2012 RTP/SCS addresses:

- A cordon pricing pilot project feasibility study to be developed with the City of Los Angeles that is included under TDM Measures, and Major Strategic Projects.
- Decreased funding available from federal and state sources and the need to identify new revenue sources is a key RTP concern. SCAG proposes to index the gas tax and to incrementally phase-in user-fees to replace the gas tax starting in 2025.
- The exponential cost of deferred maintenance on highway and transit systems, the need to maintain the regional system in a state of good repair, and the need for additional operations and maintenance funding, is also a key RTP concern.
- The region is anticipated to experience increasing energy costs – residential energy and water use is forecasted as $19,000 a year in 2035, and the strategies in the SCS reduce it to $16,000.

Sustainable Communities Strategy

The Draft 2012 RTP/SCS demonstrates that the region will achieve the GHGe reduction targets established for the region by the State of California Air Resources Board (ARB), as a requirement of California's Sustainable Communities and Climate Change Protection Act, or Senate Bill (SB) 375.

In addition to the transportation elements of the Draft 2012 RTP/SCS, the plan includes a land-use element that was developed in coordination with local jurisdictions. The land-use element responds to the region's changing demographics and housing market demand. It recommends a growth scenario that will more than double the share of households living in corridors that have frequent transit service by 2035. This land-use element is projected to increase the competitiveness of transit service and reduce vehicle miles travelled.

The land-use element in combination with transportation policies, such as the user tax per mile fee, and transportation investments (such as TDM, TSM and active

transportation), support the region in achieving the mandated ARB targets. The Draft 2012 RTP/SCS provides a projected 8% reduction in GHGe by 2020 and a 16% reduction in GHGe by 2035.

The SCS portion includes policies to increase the number of near-zero and zero emission vehicles operating within the region to reduce GHGe, improve air quality and lessen the region's dependency on fossil fuels.

The Draft 2012 RTP/SCS includes $6 billion for active transportation, a significant increase from $1.8 billion in the 2008 RTP. It acknowledges that additional analysis regarding active transportation needs to be conducted in order to develop a better understanding of the users and their needs (bicyclists and pedestrians). In cooperation with SCAG, we have initiated a joint study to develop a strategy to address first-last mile connections to transit in Los Angeles County.

The technical appendices to the Draft 2012 RTP were not available for staff review at the time of the writing of this Board report. Additional technical comments on these appendices may be added to the draft letter.

DETERMINATION OF SAFETY IMPACT

The comment letter on the Draft 2012 RTP/SCS will not have any adverse safety impacts for our employees and patrons.

FINANCIAL IMPACT

There is no impact on the FY 2012 budget, as we are only submitting a comment letter to SCAG on their Draft 2012 RTP/SCS.

ALTERNATIVES CONSIDERED

The Board can modify or choose not to release a formal comment letter. The alternative of not sending a letter is not recommended, as we would lose the opportunity to provide SCAG with comments to enhance the 2012 RTP/SCS document.

NEXT STEPS

Upon Board approval, the comment letter will be transmitted to SCAG for their consideration in developing their Final 2012 RTP/SCS. SCAG is scheduled to adopt their Final 2012 RTP/SCS at their April 2012 General Assembly meeting.

Re: Comments on the Draft 2012 Regional Transportation Plan

Dear Mr. Ikhrata:

Los Angeles World Airports (LAWA) appreciates the opportunity to comment on the Draft 2012 Regional Transportation Plan (RTP), and is committed to working with all levels of government to address the future transportation needs of Southern California. As the operator of two of the region's commercial airports, Los Angeles International (LAX) and Ontario International (ONT), and operator of Van Nuys General Aviation Airport (VNY), LAWA plays an important role in meeting the region's demands for air travel and goods movement.

LAWA, as a proprietary department of the City of Los Angeles, is responsible for operating its airports in a safe, efficient, and fiscally responsible manner on behalf of our passengers and the citizens of each market service area. Furthermore, we must operate within the constraints placed upon our resources by federal law and regulation, along with our contractual obligations to our tenants and partner agencies. It is in this context that LAWA provides the following comments to the Aviation and Airport Ground Access portion of the RTP:

1. Use of Airport Funds

LAWA's first priority is to maintain safe and efficient airports. Our revenues and expenditures are used to support that effort and fulfill our commitment to supporting the national airspace system. All airports have a tremendous demand for capital improvements.

As such, most airports depend on financial support from the FAA via grant funds for eligible construction and noise mitigation projects. In return for federal grant monies, the FAA includes grant assurances that limit use of airport revenue solely for aviation-related uses on airport property. Using airport funds for non-airport functions violates federal law and jeopardizes the airport's ability to receive federal grants.

1 World Way Los Angeles California 90045-5803 Mail P.O. Box 92216 Los Angeles California 90009-2216 Telephone 310 646 5252 Internet www.lawa.com

Nevertheless, LAWA seeks to partner with SCAG to find solutions to support ground access improvements to airports, other primary transportation facilities, and "secondary" airports in the region.

2. Use of Airport Express Buses

The RTP includes an "Action Step" which would plan and promote a regional system of airport express buses, modeled in part on the FlyAway® service currently operating at LAX. LAWA agrees that express buses are a promising solution to certain ground access problems. However, it has been LAWA's experience that express buses are most effective at airports with high passenger demand and in cities with concentrated populations of passengers and employees. Even then, high fares or significant subsidies have been required to maintain an effective level of service.

LAWA has spent a great deal of resources carefully studying the feasibility of establishing new FlyAway® routes to serve LAX. However, even for LAX, with its extensive market area and passenger base, it has been a challenge to find station locations that are both viable and successful. LAWA invites SCAG to continue examining ways to bring similar projects to other airports, but cautions that these services, by themselves, may not be effective in increasing passenger demand at "secondary" airports.

3. Aviation Activity Constraints

LAWA agrees that the aviation activity constraints in the region, and potential dispersion of that activity at other airports, should be re-examined in subsequent regional plans.

4. Additional Technical Clarifications

LAWA also wants to offer the following technical clarifications and comments to the RTP:

- SCAG has reported a number of vehicle trips to LAX under existing conditions as well as under a future forecast for 2035, citing the LAX Master Plan EIR/EIS as a justification for those trip numbers. However, the numbers reported do not correspond to data that LAWA has previously reported or used in any environmental analysis. LAWA requests clarification of those data points.

- LAWA recommends the following changes to Tables 4-6 and 4-7 in the Aviation and Airport Ground Access sections of the RTP:

    - In Table 4-6, the following projects should be included in the list of projects completed since the project notice of preparation in 2008 (footnote 1): Douglas St., La Cienega Blvd., Lincoln Blvd. (all), Nash St.,

Sepulveda Blvd. (both), the I-105 westbound off-ramp at Sepulveda Blvd., and the I-405 at SR-90.

- Two other projects on Table 4-8, Arbor Vitae St., and the I-405 from I-10 to SR-101, are under construction as of January 2012.
- In Table 4-7, Project LAX-19, which includes Lincoln Blvd. improvements, has already been completed.

- LAWA recommends that SCAG include in the RTP a portion of the project referred to as LAX-10, widening Aviation Blvd. from Century Blvd. to Manhattan Beach Blvd. to 3 lanes in each direction.

5. 2011 Air Passenger Survey

Lastly, the 2006 LAX Air Passenger Survey was used to create several data points within this section of the RTP. LAWA is hoping to unveil the results of its 2011 Air Passenger Survey in February of this year. SCAG should consider updating its Appendix with this new data as it finalizes the RTP. LAWA will post the results of this survey on our website (http://www.lawa.org) once the report is completed.

Thank you for the opportunity to review the 2012 Draft RTP. We hope that these comments will be helpful in developing a successful plan for the region. If you have any questions regarding these comments, please contact Diego Alvarez, Regional Transportation Coordinator, at 424-646-5179 or dalvarez@lawa.org.

Sincerely,

Michael D. Feldman
Deputy Executive Director

The Honorable City Council
City of Los Angeles
Room 395, City Hall

Dear Honorable Members:

DRAFT 2012-2035 REGIONAL TRANSPORTATION PLAN/SUSTAINABLE COMMUNITIES STRATEGY

The Department of City Planning (DCP) has reviewed and prepared comments for your consideration regarding the Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) prepared by the Southern California Association of Governments (SCAG).

The 2012-2035 RTP/SCS includes land use strategies for addressing the region's mobility needs and desires for healthy, sustainable communities. DCP has worked with SCAG to ensure that the City's land use plans and programs are incorporated and the City's interests addressed in this long-range regional plan. This work has included collaboration with SCAG over the past two years to prepare the population, household and employment growth forecast for the City, ensure that this anticipated growth is consistent with the capacity reflected in City's land use plans, and ensure that this long-term growth is located according to the City's land use plans.

DCP staff has identified five issues related to land use, and recommends changes to the 2012-2035 RTP/SCS to better support the City's interests and role in the regional plan, presented in the draft letter to SCAG attached to this report. These include:

A. Clarify the definition of "High Quality Transit Areas" where growth is focused;
B. Clarify the definition of "Urban Centers" where growth is focused;
C. Correct inaccurate representations of land uses and potential growth around station areas;
D. Incorporate the 1,684 miles of bicycle facilities identified in the City's 2010 Bicycle Plan; and,
E. Clarify the role of recently enacted streamlining provisions under the California Environmental Quality Act.

RECOMMENDATIONS

1) **Approve** DCP staff recommendations regarding the Draft 2012-2035 RTP/SCS.
2) **Direct** DCP staff to forward recommendations to SCAG.

FISCAL IMPACT

The proposed recommendations will have no fiscal impact on the General Fund.

Ms. Margaret Lin
Southern California Association of Governments
818 W. Seventh St., 12th Floor
Los Angeles, CA 90017

Dear Ms. Lin:

DRAFT 2012-2035 REGIONAL TRANSPORTATION PLAN/SUSTAINABLE COMMUNITIES STRATEGY

The purpose of this letter is to provide comments from the City of Los Angeles Department of City Planning (DCP) regarding the Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). DCP appreciates the collaborative relationship with SCAG in developing this plan, which has included working together on the integrated growth forecast and understanding the City's land use plans and programs.

The following addresses five land use issues and recommends changes to the 2012-2035 RTP/SCS in order to better address the City's land use plans and projected growth. This includes:

A. Clarify the definition of "High Quality Transit Areas" where growth is focused;
B. Clarify the definition of "Urban Centers" where growth is focused;
C. Correct inaccurate representations of land uses and potential growth around station areas;
D. Incorporate the 1,684 miles of bicycle facilities identified in the City's 2010 Bicycle Plan; and,
E. Clarify the role of recently enacted streamlining provisions under the California Environmental Quality Act.

A. High Quality Transit Areas and Growth Patterns

The SCS frames growth patterns, in part, in terms of being within or outside of "High Quality Transit Areas (HQTAs)." An HQTA is defined as, "generally a walkable transit village or corridor, consistent with the adopted RTP/SCS , that has a minimum density of 20 dwelling units per acre and is within a ½ mile of a well-serviced transit stop with 15-minute or less service frequency during peak commute hours." HQTA boundaries are graphically portrayed in exhibits throughout the SCS. For the City of Los Angeles, the vast majority of the City's land area falls within HQTA boundaries, as seen in the following Exhibits: 4.4, 4.9, 4.13, 4.15, and Exhibits 19, 20 and 21 in the SCS Background Documentation (see Attachment).

These HQTA boundaries encompass all neighborhoods within a ½ mile radius and appear to indicate that growth will take place throughout the area, including low density single-family

neighborhoods and industrial districts. In fact, the City is far more discriminating, and adopted land use plans reflect carefully studied areas where growth can be absorbed. Generally, land use changes to accommodate growth are typically at transit stops and on parcels fronting transit corridors. Single-family neighborhoods are generally preserved.

Recommendation: The City recommends that additional explanation be included on pages 112-113 to better describe where growth is accommodated, as indicated by the following underlined text:

> "A HQTA is generally a walkable transit village or corridor, consistent with the adopted RTP/SCS , that has a minimum density of 20 dwelling units per acre and is within a ½ mile of a well-serviced transit stop with 15-minute or less service frequency during peak commute hours. This was represented by the proportion of Greenfield versus Refill (infill and redevelopment) growth in each of the scenarios. Within these boundaries, growth within a given jurisdiction is consistent with the integrated growth forecast for that jurisdiction and is distributed according to the jurisdiction's land use plans. Thus, while areas within ½ mile of a transit stop or corridor are walkable in relation to transit, not all such areas are targeted for growth and/or land use changes."

B. Urban Centers and Growth Patterns

The SCS frames the overall land use pattern across the SCAG region around six factors. The HQTAs, discussed above, are one factor. Another factor is the region's urbanized core versus peripheral areas. Urbanized core areas, or "core centers," are defined in the SCS as, "areas where strategies such as compact community design, mixed-use development, redevelopment of aging retail areas, greater housing variety, and additional transit service are more likely to succeed." Exhibit 4.5, Urban Centers SCAG Region (see Attachment), depicts the locations of these urban centers. However, these urban centers do not appear to align with the urban centers identified in Exhibit 4.15 for areas within the City of Los Angeles.

Recommendation: The City recommends that the relationship between Exhibit 4.5 and Exhibit 4.15 be clearly described. If the two exhibits are intended to illustrate the same urbanized areas, staff recommends that the color scheme used in Exhibit 4.15 also be used in Exhibit 4.5.

C. Land Uses around Station Areas

The SCS projects higher density in urban centers, and anticipates growth in transit rich areas throughout the City of Los Angeles in order to demonstrate a decrease in GHG emissions by 2035. DCP staff compared the city's General Plan Land Use to the SCS Land Use Pattern Maps and has found that in general the SCS is consistent with the City's land use density and land use designations. However, in closely examining 76 rail and bus transit station areas, DCP staff has found instances of inflated density, which inaccurately reflects the General Plan distribution of growth.

Exhibit 21 Land Use Pattern Map 2035 (see Attachment) identifies urban centers with densities that are not consistent the community plans for these areas. Such centers would have residential densities ranging from 82 to 120 housing units or more per acre. This density is typical in the Central City and some adjacent neighborhoods, and is proposed for the Warner Center, but it is generally not appropriate throughout the rest of the city.

In addition, the following issues were found in multiple station areas.

- Multi-Family neighborhoods
  - Densities up to 178, 145, or 61 units/acre that are too high for many sites
  - Densities too high in areas adjacent to single-family neighborhoods
- Single-Family neighborhoods
  - Increase in density in strictly single-family areas that are stable and where no growth is anticipated
  - Parcels and Corridors in Historic Preservation Overlay Zones reflect density designations that are too high; these areas are stable with no projected change
  - Residential uses reflected as commercial
- Commercial Corridors
  - Density projections are too high
- Industrial Land Use
  - Industrial areas that are to be preserved as industrial are inaccurately represented as commercial or retail
  - Industrial areas that show residential designations are an inaccurate reflection as these sites are preserved
- Public Facilities
  - Land use changes at school sites that are not projected to change
  - High residential densities or commercial uses projected on public facilities such as along freeways, county jail, open space

Recommendation: The City recommends that more appropriate representations of land use around station areas be made, which can be identified on detailed annotated maps of the station areas and provided under separate cover.

D. Proposed Bikeways

The SCS emphasizes the importance of active transportation options in meeting the mobility needs of the SCAG region, including walking and biking. While SCAG has proposed a regional bikeway network, the SCS includes the contributions of localities in developing bicycle networks within the locality and linking to other transit modes, reflected in Exhibit 4.11 Proposed Bikeway Network SCAG Region (see Attachment). However, it appears that the City of Los Angeles' recently adopted 2010 Bicycle Plan for 1,684 miles of bike facilities across Los Angeles is not included in this Exhibit. Some segments of this bicycle network are in development and have been identified for funding, and are therefore included in the 2012 RTP list of transportation investments. Including the full proposed bicycle network will support the long-term commitment to pursue resources for development of the network.

Recommendation: The City recommends that the SCS include the bicycle facilities identified in the City's 2010 Bicycle Plan.

E. CEQA Streamlining Incentives for Sustainable Land Use Patterns

The 2012-2035 RTP/SCS directly addresses the opportunity for relief under the California Environmental Quality Act (CEQA). Under Senate Bill 375, the requirement to prepare a Sustainable Communities Strategy (SCS) was coupled with incentives to encourage sustainable development and implementation of an SCS. The incentives are comprised of relief under CEQA, such as streamlined documentation or exemption from environmental review requirements, for specific development types in specific locations, as long as such development is consistent with the land use reflected in the SCS. As any proposed development is considered by local jurisdictions, this CEQA relief is at the discretion of local jurisdictions. However, as written, the 2012-2035 RTP/SCS can be construed to indicate that CEQA relief is part of the land use plan and is available by right to all development that meets the qualifications.

Recommendation: The City recommends that the 2012-2035 RTP/SCS better reflect the opportunity for CEQA streamlining incentives through the following changes:

1) In the discussion of the mandate to prepare an SCS (page 106 of the 2012-2035 RTP/SCS), amend the last sentence of the second to last paragraph:
"In addition, some projects consistent with the SCS ~~are~~ may be eligible for streamlined environmental review."

2) In Exhibits 4.1, 4.2 and 4.3 regarding population, employment and household growth, respectively (see Attachment), remove the depiction of Transit Priority Project (TPP) areas. A TPP is one particular type of development that qualifies for CEQA streamlining. Depicting this in these exhibits is confusing because a TPP is not defined. Furthermore, the depiction of TPP boundaries detracts from the purpose of the exhibits, which is to show where growth is directed over the planning period of the 2012-2035 RTP/SCS.

3) In the discussion of Transportation Analysis Zones (TAZs) and Development Types (page 122 of the 2012-2035 RTP/SCS), remove the brief discussion regarding CEQA streamlining and the adequacy of TAZ-level land use information. First, this point is difficult to understand as presented and requires further explanation. Second, this point pertains to incentives available to jurisdictions and developers, not to the modeling analysis. Lastly, this point detracts from the purpose of the section, which is to describe the approach to modeling land use and transportation information. This paragraph would thus read:

> "To conduct required modeling analysis for the RTP/SCS, SCAG distributes the growth forecast data to transportation analysis zones (TAZs) to capture localized effects of the interaction of land use and transportation. ~~Additionally, SB 375 offers local governments potential CEQA relief for qualified development projects consistent with an~~

~~adopted SCS. SCAG suggests that utilizing community types at the TAZ level of geography (with an average size of 160 square acres) offers local jurisdictions adequate information and flexibility to make appropriate consistency findings for projects to be eligible to receive CEQA streamlining benefits.~~
To further facilitate regional modeling of land use information from nearly 200 separate jurisdictions, SCAG developed a simplified series of Community Types to represent the land use categories taken from the region's many general plans..."

4) A reference to the summary of the CEQA incentive (page 148 of the 2012-2035 RTP/SCS) should be included under the section "RTP/SCS Next Steps" and the summary should be moved to follow this because the incentive can be used to encourage and facilitate implementation of the SCS and is therefore better understood as a "next step." In addition, the summary should include a discussion regarding a jurisdiction's discretion in certifying the environmental review for a project, regardless of eligibility for streamlining.

5) In the SCS Background Documentation, the summary of the CEQA exemption (page 84) should include a description of a jurisdiction's discretion in certifying the environmental review for a project, regardless of eligibility for streamlining.

Thank you for this opportunity to provide comments. If you have any questions or would like additional information, please contact Naomi Guth at (213) 978-3307 or by email at Naomi.Guth@lacity.org.

City of Los Angeles Projects Requested to be added to Strategic Plan - 2012 RTP/SCS (Attachment E)

Strategic Projects							
County	System	Category	Route Name	From/At	To	Project Description	Lead Agency
Los Angeles	Local Highway	Capacity	11th Street	Aviation Blvd	La Cienega Blvd	Widen and restripe to accommodate two through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Alameda Street	US-101 Fwy	I-10 Fwy	Widen to 70 ft and remove embedded rails and ties, install left turn channelization and widen curb returns to reduce congestion and improve truck movement	Los Angeles City
Los Angeles	Local Highway	Capacity	Alameda Street	I-10 Fwy	7th St	Alameda St. from I-10 to Seventh St. - project includes rehabilitation of the roadway, removing enbedded rails and ties, installing left turn channelization, spot widening where needed to accommodate truck traffic	Los Angeles City
Los Angeles	Local Highway	Capacity	Alhambra Avenue	Lowell Ave	City of Alhambra city limits	Realign Alhambra Ave. between Lowell Ave. and the City of Alhambra city limits to smooth out an existing sharp s-curve and to enhance traffic and capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Anaheim Street	Farragut Ave	Dominguez Channel	Widen Anaheim St. from 78' to 84' and restripe to accommodate an additional lane in each direction; this would improve the roadway from 4 lanes to 6 lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Aviation Boulevard	Arbor Vitae St	Imperial Hwy	Widen and restripe to accommodate three through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Balboa Boulevard	Devonshire St		Widen east side of Balboa Blvd. south of Devonshire St. for approximately 500 ft., and restripe the intersection to provide dual left-turn lanes for the northbound and southbound approaches.	Los Angeles City
Los Angeles	Local Highway	Capacity	Barham Boulevard	US-101 Fwy Bridge		Replace the existing bridge to increase traffic capacity and widen/restripe southbound US-101 off-ramp at Barham Blvd to provide southbound double left turn lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Barham Boulevard	Coral Dr		Widen west side of Barham Blvd. to provide a southbound right-turn only lane on Barham Blvd. and to improve access to Universal Studios and to the 101 NB on-ramp.	Los Angeles City
Los Angeles	Local Highway	Capacity	Beverly Glen Boulevard	Mulholland Dr		Widen south leg of Beverly Glen Blvd to create a right turn only lane; ROW acquisition needed	Los Angeles City
Los Angeles	Local Highway	Capacity	Brandford Street	Laurel Canyon Blvd	Amboy Ave	Widen north side of Brandford St. to provide an additional westbound lane.	Los Angeles City
Los Angeles	Local Highway	Capacity	Broad Avenue	Harry Bridges Blvd	Water St	Build grade-separated access to waterfront area from rail lines, extend Broad Ave to Water Street, and install bike lanes and sidewalks on both side of Broad Ave	Los Angeles City
Los Angeles	Local Highway	Capacity	Bundy Drive	I-10 Fwy ramps		Reduce congestion on Bundy by reconfiguring the I-10 WB ramps (consolidate to one ramp location accommodating both the on and off ramps with new signal)	Los Angeles City
Los Angeles	Local Highway	Capacity	Burbank Boulevard	Clybourne Ave	Vineland Ave	Widen Burbank Blvd. to a major highway standard (80-foot roadway width) on both sides of street to improve roadway capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Burbank Boulevard	US-101 Fwy WB		Widening to add second westbound through lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Canoga Avenue	US-101 WB off-ramp		Widen westbound off-ramp to prove a right turn only lane to Canoga Ave	Los Angeles City
Los Angeles	Local Highway	Capacity	Canoga Avenue	Burbank Blvd		Widening to add a second westbound left-turn lane and a dedicated northbound right-turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Transit	Canoga Avenue	Ventura Blvd	Canoga Orange Line Station	Purchase 20 new buses to add to a Local Circulator bus system between Ventura Boulevard adn Canoga Orange Line Station. Install new bus shelters and/or enhance the existing bus shelters along the route as required	Los Angeles City
Los Angeles	Local Highway	Capacity	Canoga Avenue	Saticoy St		Widening to add southbound through lane. Change sorthbound and eastbound phasing from left-turn permitted to protected.	Los Angeles City
Los Angeles	Local Highway	Capacity	Coldwater Canyon Boulevard	Ventura Blvd	Magnolia Blvd	Remove jut-outs to add one through lane in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Corbin Avenue	Victory Blvd		Widening to add eastbound and westbound through lanes and upgrade traffic signal	Los Angeles City

City of Los Angeles Projects Requested to be added to Strategic Plan - 2012 RTP/SCS (Attachment E)

Strategic Projects

County	System	Category	Route Name	From/At	To	Project Description	Lead Agency
Los Angeles	Local Highway	Capacity	Crenshaw Boulevard	I-10 WB on-ramp		Widen SB Crenshaw Blvd to provide a SB right-turn only lane and redesign the WB off-ramp to reduce congestion and improve intersection operation	Los Angeles City
Los Angeles	Local Highway	Capacity	Culver Boulevard	Centinela Ave	I-405 Fwy	Improve traffic flow along Culver Blvd between Centinela Ave and I-405 Freeway including providing left-turn lanes at key signalized intersections (including Inglewood Blvd)	Los Angeles City
Los Angeles	Local Highway	Capacity	De Soto Aveue	Ventura Blvd	Clark St	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	De Soto Aveue	Saticoy St		Widening to add eastbound and westbound right turn lanes and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	De Soto Street	Parthenia St		Widening to add dedicated eastbound westbound right turn lane and northbound phasing from left-turn permitted to protected.	Los Angeles City
Los Angeles	Local Highway	Capacity	De Soto Street	Califa St		Widening to add northbound and westbound right-turn lanes and install new traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Enterprise Street	Mateo St (near WB I-10 off-ramp)		Widen Enterprise St at Mateo St (near WB-10 off-ramp) to improve truck movement at curb returns	Los Angeles City
Los Angeles	Local Highway	Capacity	Fallbrook Avenue	Victory Blvd		Widening to add westbound right turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Figueroa Street	146th St	Redondo Beach Blvd	Widen Figueroa St to major highway standard from 62 ft to 80 ft to provide three lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Fletcher Street Bridge	LA River		Widen to increase capacity and improve access to I-5 Fwy; add bike lanes and sidewalks	Los Angeles City
Los Angeles	Local Highway	Capacity	Foothill Boulevard	Balboa Blvd		Widen north of Balboa Blvd over culvert and widen west leg of Foothill Blvd at Balboa Blvd. Upgrade traffic signal to improve intersection capacity	Los Angeles City
Los Angeles	Local Highway	Capacity	Forest Lawn Drive	near SR-134 Bridge	/LA River	Construct a new bridge with bike path (including equestrian trail) over LA River at LAEC. Re-aligh the SR-134 freeway on/off ramps at Forest Lawn Dr. to improve flow and capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Fountain Avenue	Sunset Blvd	Western Ave	Widen Fountain Ave to add a left-turn lane at each intersection-ROW acquisition needed	Los Angeles City
Los Angeles	Local Highway	Capacity	Glenoaks Boulevard	Sunland Blvd		Widen Glenoaks Blvd to provide an eastbound right-turn lane	Los Angeles City
Los Angeles	Local Highway	Capacity	Grand Avenue Bridge	Cesar Chavez Ave	Temple St	Widen bridge over US-101 Fwy to improve access to US-101, SR-110, future school and Grand Ave.	Los Angeles City
Los Angeles	Local Highway	Capacity	Grand Avenue Bridge	Over US 101 Fwy		Widen the Existing bridge to provide dual left-turn lane onto the 101 and 110 freeways on-ramps, includes, and add through lane and right-turn lane, and widen sidewalk.	Los Angeles City
Los Angeles	Local Highway	Capacity	Imperial Highway	Sepulveda Blvd	Pershing Dr	Widen to provide continuous three through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Irwin Street	Owensmouth Ave	De Soto St	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	La Cienega Boulevard	Arbor Vitae St	111th St	Widen and restripe to accommodate three through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	La Tijera Boulevard	Airport Blvd	La Cienega Blvd	Widen and restripe to provide continuous three through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Laurel Canyon Boulevard	Mulholland Dr		Widen the west side of Laurel Canyon Blvd south of Mulholland Dr to carry two southbound lanes through the intersection	Los Angeles City
Los Angeles	Local Highway	Capacity	Lincoln Boulevard	Jefferson Blvd	Fiji Way	Partnering with Caltrans & LA County, improve Lincoln Blvd between Jefferson Blvd & Fiji Way including removing the existing bottleneck by replacing/widening the existing bridge to provide an add'l lane in each direction & on-street bike lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Maclay Street	Gladstone Ave		Remove jut-outs on Maclay at Gladstone and install a new traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Magnolia Boulevard	Cahuenga Blvd	Vineland Ave (north side)	Widen the north side of Magnolia Blvd. to provide an additional lane in the westbound direction.	Los Angeles City

City of Los Angeles Projects Requested to be added to Strategic Plan - 2012 RTP/SCS (Attachment E)

Strategic Projects							
County	System	Category	Route Name	From/At	To	Project Description	Lead Agency
Los Angeles	Local Highway	Capacity	Mason Avenue	Saticoy St		Widening to add Exclusive right-turn lanes for all approaches and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Mission Road	Griffin Ave	Marengo St	Widen Mission Road to provide an additional through lane in each direction, and install new pedestrian signal at Sichel Street	Los Angeles City
Los Angeles	Local Highway	Capacity	Moorpark Avenue	Woodman Ave	Mammoth Ave	Widen Moorpark Ave. to increase capacity and install street lights, curb, and gutter.	Los Angeles City
Los Angeles	Local Highway	Capacity	North Main Street	Albion St		Grade seperate North Main Street over the exiting Metrolink and freight tracks; reduces delays for vehicles and transit riders traveling on Main Street	Los Angeles City
Los Angeles	Local Highway	Capacity	North Spring Street	Roundout St	Baker St	Widen N. Spring St. between Roundout St. to Baker St. from 44 ft. to an 80' roadway width and install landscaped medians	Los Angeles City
Los Angeles	Local Highway	Capacity	Olympic Boulevard	Soto St		Improvements to the intersection by increasing the curb return radius of all four corners and Olympic Blvd approaches. ROW required	Los Angeles City
Los Angeles	Local Highway	Capacity	Olympic Boulevard	Alameda St		Widen to improve truck movement (right-of-way required)	Los Angeles City
Los Angeles	Local Highway	Capacity	Olympic Boulevard	Santa Fe Ave		Widening curb retrun to improve truck movement through the intersection	Los Angeles City
Los Angeles	Local Highway	Capacity	Owensmouth Avenue	Canyon Creek Dr (Private)		Widening to add southbound and eastbound right-turn lanes, add a northbound left-turn lane, and upgrade traffic signal.	Los Angeles City
Los Angeles	Local Highway	Capacity	Owensmouth Avenue	Saticoy St		Widening to add northbound left-turn and upgrade traffic signal.	Los Angeles City
Los Angeles	Local Highway	Capacity	Oxnard Street	White Oak Ave	Lindley Ave	Oxnard Street widening from 75 ft. exiting ROW to 100 ft. (Require additional ROW) to allow through lane in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Oxnard Street	AMC Dwy	De Soto St	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Reseda Boulevard	Burbank Blvd	US-101 Fwy WB ramps	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Riverside Drive	SR-134 Fwy		Widen the bridge to improve the capacity and to add the bike lane	Los Angeles City
Los Angeles	Local Highway	Capacity	Robertson Avenue	National Blvd	/I-10 Fwy Interchange	Reconfigure existing ramps and construct new ramps to improve capacity	Los Angeles City
Los Angeles	Local Highway	Capacity	Roxford Street	Sepulveda Blvd		Realign Roxford St. at Sepulveda Blvd. by widening curb radius to enhance traffic flow.	Los Angeles City
Los Angeles	Local Highway	Capacity	San Fernando Road	Sierra Hwy	Roxford St	Install a center-reversible lane on the Old Road to provide extra capacity during peak hours along an approximately 3 mile segment	Los Angeles City
Los Angeles	Local Highway	Capacity	Santa Fe Avenue	Porter St		Widening curb retrun to improve truck movement through the intersection.	Los Angeles City
Los Angeles	Local Highway	Capacity	Saticoy Street	Van Nuys Blvd	Woodman Ave	Construct grade seperation and extend roadway westerly from Woodman Ave to Van Nuys Blvd	Los Angeles City
Los Angeles	Local Highway	Capacity	Sepulveda Boulevard	National Blvd	Olympic Blvd	Widen to major highway standard and increase number of through lanes from two to three lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Sepulveda Boulevard Corridor	Wilshire Blvd	LAX	Partnering with Culver City & LA County, identify and implement ways of improving traffic flow, carrying capacity, and efficiency in the utilization of the Sepulveda Corridor from Wilshire to LAX.	Los Angeles City
Los Angeles	Local Highway	Capacity	Sepulveda Tunnel	Mulholland Bridge		Widen existing tunnel to provide additional traffic lanes and bike lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Sherman Way Avenue	Jordan Ave	De Soto St	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Shoup Avenue	Irwin Ave		Widening to add northbound right turn lane and upgrade traffic signal to include northbound protected left-turn phasing	Los Angeles City

City of Los Angeles Projects Requested to be added to Strategic Plan - 2012 RTP/SCS (Attachment E)

Strategic Projects							
County	System	Category	Route Name	From/At	To	Project Description	Lead Agency
Los Angeles	Local Highway	Capacity	Shoup Avenue	Oxnard St		Widening to add northbound right turn lane and upgrade traffic signal to include westbound and northbound protected left-turn phasings	Los Angeles City
Los Angeles	Local Highway	Capacity	Shoup Avenue	Vanowen St		Widening to add eastbound right turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Shoup Avenue	Sherman Way		Widening to add northbound right turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Slauson Avenue	Crenshaw Blvd	Alameda St	Design and construction of street improvements and signage for local and regional traffic.	Los Angeles City
Los Angeles	Local Highway	Capacity	Topanga Canyon Boulevard	Mulhollland Dr		Widening toadd a southbound right-turn lane and upgrade traffic signal to include southbound right-turn overlap phase	Los Angeles City
Los Angeles	Local Highway	Capacity	Topanga Canyon Boulevard	Roscoes Bvd		Widening to add northbound left-turn and southbound right-turn lanes and traffic signal upgrade.	Los Angeles City
Los Angeles	Local Highway	Capacity	Topanga Canyon Boulevard	Vanowen St	Ventura Blvd	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity. Install new signal at Topanga Canyon Blvd. and Califa St.	Los Angeles City
Los Angeles	Local Highway	Capacity	Vaiel Avenue	Kittridge St		Widening to add eastbound and westbound through lanes and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Valley Boulevard	San Pablo St	Boca Ave	Improve capacity and enhance traffic flow at railroad crossing by widening to add lanes, to improve curb, and to upgrade signal systems and rail road equipment along Valley Blvd.	Los Angeles City
Los Angeles	Local Highway	Capacity	Van Ness Avenue	US-101 Fwy SB off-ramp	Sunset Blvd	Widen both sides of Van Ness Ave. to accommodate one additional southbound lane.	Los Angeles City
Los Angeles	Local Highway	Capacity	Vanalden Avenue	US-101 Fwy EB ramps	/Ventura Blvd	Widening to add westbound through lane and upgrade traffic signal to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Vanowen Avenue	Owensmouth Ave	Mason Ave	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Transit	Variel Avenue	Oxnard St		Construction of a 4th Orange Line Station in Warner Center Area	Los Angeles City
Los Angeles	Local Highway	Capacity	Ventura Boulevard	Shoup Ave	US-101 SB ramps	Widen between Shoup Ave and US-101 freeway southbound ramps to provide double left-turn lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Vermont Avenue	Washington Blvd	I-10 Fwy WB off-ramp	Widen 10 ft. of east-side of Vermont Ave to provide left-turn lane	Los Angeles City
Los Angeles	Local Highway	Transit	Victory Boulevard	Owensmouth Ave to Oxnard	Variel Ave to Victory Blvd	Purchase 20 new buses to add to a Local Circulator bus system to operate from Victory to Owensmouth to Oxnard to Variel and back to Victory. Install new bus shelters and/or enhance the existing bus shelters along the route as required	Los Angeles City
Los Angeles	Local Highway	Capacity	Victory Boulevard	Owensmouth Ave	Winnetka Ave	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Western Avenue	Florence Ave	80th St/Manchester Ave	Widen east side of Western Ave. to accomodate left-turn lanes at various intersections within the project limits.	Los Angeles City
Los Angeles	Local Highway	Capacity	Western Avenue	Exposition Blvd		Widen Western Blvd. to add northbound and southbound left-turn lanes at Exposition Blvd.	Los Angeles City
Los Angeles	Local Highway	Capacity	Wilshire Boulevard	San Vicente Blvd	Centinela Ave	Arterial widening to provide an additional lane in each direction.	Los Angeles City
Los Angeles	Local Highway	Capacity	Winnetka Avenue	Vanowen St		Widening to add northbound and southbound right-turn lanes and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Winnetka Avenue	Ventura Blvd		Change westbound right-turn lane to a shared through-right turn lane, add an eastbound left-turn lane, and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Winnetka Avenue	Oxnard St		Widening to add westbound right turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Woodlake Avenue	Victory Blvd		Widening to add northbound shared-through right turn lane and upgrade traffic signal	Los Angeles City

FORM GEN. 160 (Rev. 6-80)

CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

Date: January 30, 2012

To: The Honorable City Council, City of Los Angeles
c/o City Clerk, Room 395
Attention: Honorable Bill Rosendahl, Chair, Transportation Committee
Attention: Honorable Ed Reyes, Chair, PLUM Committee

From: Jaime de la Vega, General Manager
Department of Transportation

Subject: **Draft 2012 Regional Transportation Plan / Sustainable Communities Strategy (CF 11-1223)**

This report provides additional comments regarding the draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), being prepared by the Southern California Association of Governments (SCAG). These comments supplement those comments approved by Council and the Mayor as indicated in the attached Council action of October 5, 2011.

Recommendations

1) Approve the comments provided in this report as City of Los Angeles comments to SCAG on the 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Following the submittal of these comments to SCAG, the Department of Transportation will continue to collaborate with SCAG in an effort to have the City's comments substantially incorporated into the RTP/SCS and related Program Environmental Impact Report (PEIR).

2) Authorize the Department of Transportation to transmit comments to SCAG that are substantially consistent with those contained in this report, including the attached comments from other departments.

Summary

Every four years the Southern California Association of Governments (SCAG) prepares a Regional Transportation Plan (RTP) for the six-county region. The 2012 RTP/SCS includes planned transportation projects and demographic assumptions through the year 2035. The plan presents a strategy for the investment of $524.7 billion in the region's transportation system between 2012 and 2035 and, for the first time, a Sustainable Communities Strategy (SCS) for the six-county region.

The SCS, required by SB 375, focuses on reducing greenhouse gas emissions (GHGe)

from cars and light trucks by means of several strategies, including integration of land use and transportation planning, transit system expansion, and transportation demand management (TDM). The California Air Resources Board (CARB) established regional GHGe reduction goals of eight percent per capita by 2020 and thirteen percent per capita by 2035, compared with 2005 levels. SCAG's analysis indicates that the draft RTP/SCS would achieve the 2020 target, and would exceed the 2035 target with a GHGe reduction of sixteen percent.

According to SCAG's analysis and modeling, the draft RTP/SCS also meets the federal conformity requirements for air quality. It is important to note that reducing GHGe is not required for achieving air quality conformity. Therefore, although many of the strategies that achieve air quality conformity also assist with GHGe reductions, the two analyses are generally independent of each other.

A Regional Transportation Plan (RTP) also requires that there be reasonably available funding sources. The RTP proposes expenditures of $524.7 billion, and SCAG states that without new revenue sources the RTP faces a funding shortfall of approximately $219.5 billion. Various means to make up the shortfall are set forth. The RTP suggests that $127.5 billion of the shortfall could be addressed by action at the State or Federal level to increase the gas tax $0.15 per gallon between 2017 and 2024. The RTP states the State and Federal government could then replace the gas tax with an indexed mileage-user fee of $0.05 per mile beginning in 2025. If the mileage-based fee was not implemented, then there would be a need to further increase the gas tax to generate the revenues that would have been created by the mileage-based user fee. Although these proposals depend primarily on State and/or Federal action, they deserve further discussion within the City as the implementation year of 2017 approaches.

SCAG is to be commended for a multi-year effort to develop the 2012 RTP/SCS, including an unprecedented outreach effort. In particular, the passage of SB 375 required an extensive public education campaign including outreach to cities, environmental, public health and business groups. SCAG conducted a series of periodic workshops across the region, which included preparation of in-depth graphic and narrative presentation materials. The City appreciates the outstanding outreach effort, both to the City itself and across the region.

Pursuant to the Council action of October 5, 2011, and in accordance with past practice, LADOT has reviewed the draft 2012 RTP/SCS and compiled proposed comments to SCAG. In addition, LADOT has coordinated the preparation of these comments on the RTP/SCS with other City departments that are most impacted by the RTP. LADOT very much appreciates the cooperation of the departments of Los Angeles World Airports (LAWA) and City Planning each of which have provided comments. The Port of LA has indicated that it does not have formal comments at this time. In addition, the Metro staff report on the RTP/SCS is also attached for reference.

Report to City Council, dated September 21, 2011
On October 5, 2011, the City Council adopted a joint report by the Departments of City Planning and Transportation entitled "Alternatives Proposed by SCAG for the 2012 Regional Transportation Plan / Sustainable Communities Strategy" (CF 11-1223). This report, dated September 21, 2011, provided comments on four draft scenarios for the RTP/SCS, released by SCAG in July 2011. Specifically, Attachment A of the report identified proposed RTP/SCS strategies that City staff believed would, if adopted, have a potential impact on the City. For purposes of the report, "impact" was defined as a significant change from adopted City policy. Staff believes that the report, dated September 21, 2011, continues to reflect City policy with regard to many of the strategies presently included in the draft RTP/SCS.

One of the objectives of the report was for the City's comments to be incorporated into the RTP/SCS. We are pleased to report that to a large extent the City's comments appear to have been acknowledged by SCAG and therefore the RTP/SCS does not include several of the specific proposals of concern. Specifically, three of the concerns raised, and the status of the strategy in the draft RTP/SCS, are as follows:

1) Phased implementation of 5% of major arterials to have dedicated bus lanes. As requested by the City, the RTP does not include a specific percentage for implementation. As explained in the September 21st report, the City supports careful and selected implementation of bus lanes, but does not want to commit to implementing a specific percentage of bus lanes on City arterials.

2) 10% of primary and secondary arterials to include bike facilities. As requested by the City, the RTP does not include a specific percentage for implementation. As explained in the September 21st report, the City supports careful and selected implementation of bike lanes, but does not want to commit to implementing a specific percentage of bike lanes on City arterials. Rather, the City supports the specific implementation of its adopted Bicycle Plan.

3) Cordon pricing around key activity centers – initial pilot projects in downtown Los Angeles and potentially LAX complex. As requested by the City, this project has been included in the Strategic Plan portion of the RTP/SCS, which acknowledges that the project still requires further study and has not been officially approved by the City.

Discussion of Policy Concerns and Comments

Although most of the concerns raised in the September 21, 2011 report appear to have been addressed, LADOT has identified additional areas of concern with regard to the draft 2012 RTP/SCS, which was released for public comment on December 20, 2011.

LADOT has comments and concerns in the following areas:

Project List for RTP/SCS

The RTP includes an extensive project list. As stated in the Project List appendix, the list is divided into three sections, as follows: 1) The Federal Transportation Improvement Program (FTIP), which forms the foundation of the RTP project investment strategy and represents the first six years of already committed funding; 2) the Financially Constrained list of projects not included in the FTIP but which have "reasonably available" funding; and 3) the Strategic Plan representing an unconstrained list of potential projects that the region would pursue given additional funding and commitment.

As with past RTP cycles, LADOT has reviewed all three project lists. The FTIP and Constrained project lists appear to include, with one exception, all City of Los Angeles projects with either committed or reasonably available funding. These lists are developed through ongoing coordination between City, Metro and SCAG staff. The one project that should be added to the FTIP list is a Transit Bureau project as follows:

> TIP ID LAF5427 – DASH Clean Fuel - Five Higher Capacity Vehicles (Purchase five 35-foot CNG clean-fuel buses to replace five 30-foot propane vehicles). SCAG is aware that this project needs to be added to the FTIP project list, and it is pending to be added to the list.

Regarding the Strategic Plan list, in an effort to expedite many as yet unfunded City projects, LADOT has prepared the attached list of approximately ninety projects that the City is requesting to be added to the Strategic Plan.

Additionally, LADOT wishes to draw attention to both the Los Angeles Bicycle Plan and Mobility Hubs initiatives (a First Mile/Last Mile strategy). These efforts support both the Active Transportation and Transportation Demand Management strategies of the RTP. The RTP includes numerous references to expanded bicycle facilities and other First Mile/Last Mile strategies, and therefore these strategies are presumably included with likely funding in the Financially Constrained plan. However, to the extent these initiatives are not included in the Constrained plan they should be added to the Strategic Plan.

Importantly, Metro staff has also reviewed the RTP and found that it includes all the projects and programs in the Metro 2009 Long Range Transportation Plan (LRTP). A copy of the Metro staff report, dated January 18, 2012, is attached for reference. The RTP does not model the 30/10 (Fast Forward) proposal for Measure R projects, because the proposal has not yet been approved by the Metro Board, and still requires federal approvals. However, SCAG is supportive of the 30/10 proposal and will likely amend the RTP if the proposal secures additional approvals.

The Metro report also highlights key projects, within Los Angeles County, included in the RTP which are not included in Metro's 2009 LRTP. These key projects include:

- East-West Freight Corridor will be studied along a five mile band generally following the SR-60 corridor between the I-710 and the I-15.

- Phase I of the California High Speed Rail Authority (CHSRA) is in the draft 2012 RTP in the Constrained Plan, pending an agreement between the CHSRA and Metrolink to identify funds to bring local systems up to higher speeds (110+ mph) where possible.

- A regional Express/HOT Lane Network that expands Metro's Fast Lanes pilot project to include the I-405 and SR-91. This goes beyond the federally funded pilot studies on the I-10 and I-110 freeways.

As an overall comment, the City wishes to emphasize that, for future RTP/SCS project lists, the City, Metro and SCAG need to continue the effort to improve connectivity between various transit systems. For example, in South Los Angeles County, there needs to be greater emphasis placed on the development of feeder systems to connect and support the Blue, Green, Expo and Crenshaw lines. These systems would include, but not be limited to, expanded Bus Rapid Transit and improved bicycle and pedestrian linkages.

Recommendation:

As described above, the City should request that SCAG include the attached list of projects to the Strategic Plan. Additionally, to the extent the Los Angeles Bicycle Plan and Mobility Hubs are not included in the Constrained Plan, they should be added to the Strategic Plan.

Land Use Strategy and Sustainable Communities Strategy Map for 2035

As stated in the SCS Background Documentation appendix, page 110, one of the goals of the SCS is "to identify strategies that can reduce per capita vehicles miles traveled (VMT) over the next twenty-five years." Among other strategies such as Transportation Demand Management, Transit etc., one of the key strategies for reducing VMT is the land use strategy. Essentially, this strategy involves reducing VMT through the gradual implementation of smart growth policies, including Transit Oriented Development, whereby new development is focused near transit stations and high quality transit corridors. The City is supportive of smart growth policies and has been working for many years to advance smart growth planning in a variety of ways.

LADOT realizes that the Department of City Planning has a major role in the review of the land use strategy of the SCS. However, because the land use strategy involves

residential density increases near transit stops and transit corridors, the strategy, if implemented, will impact the City's transportation infrastructure needs by 2035. Accordingly, LADOT has reviewed the SCS land use strategy.

The 2012 SCS includes Land Use Pattern Maps for each SCAG subregion, based upon five Community Types (Urban, City, Town, Suburban and Rural). The maps show the development pattern, according to SCAG, that is "likely to occur" by 2020 and 2035. However, the maps utilizing Community Types are at a "macro" level. The five Community Types actually include thirteen Development Types which give a more detailed picture of the land use pattern that the SCS proposes.

Because LADOT wished to examine more closely SCAG's desired and projected land use pattern for the City, LADOT requested that SCAG provide a map of the City for 2035 in which development patterns are shown by the thirteen Development Types. Accordingly, SCAG provided a map entitled "City of Los Angeles Year 2035 Preferred Scenario by Development Type," dated November 7, 2011 (SCS map for 2035). The SCS map for 2035 represents what SCAG desires and believes is "likely to occur" by 2035, categorized by SCAG's thirteen Development Types. It therefore represents a developed, rather than merely a planned, environment.

LADOT has compared the SCS map for 2035 with many of the maps for the City's adopted 35 community plans, which are found on the Department of City Planning website. It is evident that the SCS Map for 2035 is not consistent with many of the Community Plan maps, and shows a level of residential density considerably higher than shown on the adopted Community Plan maps. In particular, the SCS Map appears to show much fewer single family neighborhoods, defined as approximately seven units per acre. Because the SCS map for 2035 shows residential densities that are different than shown in the adopted Community Plan maps, if implemented, the map would impact land use patterns and the need for transportation infrastructure.

It is true that the SCS states, and SB 375 provides, that the SCS does not supersede local land use policies (see page 158 of the RTP/SCS main document). Therefore, revising the City's land use policies to be generally consistent with the SCS map would be voluntary. However, although voluntary, the concern is that, unless the City indicates otherwise, the adoption of the RTP/SCS by the SCAG Regional Council may imply to SCAG and other parties that the City supports the implementation of the land use pattern described in the map. Moreover, the SCS states in Table 4.3 (page 150) that local jurisdictions should "Update local zoning codes, General Plans, and other regulatory policies to accelerate adoption of land use strategies included in the RTP/SCS Plan Alternative."

Recommendation:

The City should clarify that it is the City that determines its own land use policy, and the adoption of the RTP/SCS, including the land use strategy and maps, does not imply

that the City will implement the development pattern described in the land use strategy.

The City should indicate to SCAG that the SCS Map for 2035 appears to be inconsistent with many adopted Community Plan maps. Further, changes to adopted land use policies and plans must go through an established City process, subject to Mayor and Council approval. This process includes an extensive and robust community outreach effort. The SCS Map for 2035 represents SCAG's "vision" of the City's developed land use pattern for 2035. However, the City may or may not implement the land use pattern described on the SCS Map for 2035.

CEQA Streamlining

The adopted September 21, 2011 City report, prepared by the Planning and Transportation departments, included the following comments:

> "The Sustainable Communities Strategy will include land use maps which will facilitate CEQA streamlining of development projects. According to SCAG staff, the CEQA relief provided by SB 375 is substantial. Therefore, the City should carefully review the draft SCS land use maps to ensure the maps are consistent with adopted City land use plans.
>
> SB 375 allows for CEQA streamlining provided a proposed project qualifies as follows:
>
> 1) The project must be consistent with the land use designation contained in the land use maps included in the Sustainable Communities Strategy. The maps will describe land use densities and types according to SCAG's Land Development Categories (LDC's).
>
> 2) The project qualifies as a Transit Priority Project (TPP), as defined by SB 375. To qualify as a TPP, a project must meet certain minimum density requirements and must be located within ½ mile of either a "major transit stop or high-quality transit corridor" (SB 375 - Section 21155). According to SCAG staff, most of the City qualifies as a TPP area because of existing transit stations and corridors.
>
> CEQA streamlining, according to information provided by SCAG, will allow many projects meeting the above two criteria to receive the equivalent of a "mitigated negative declaration" in the development review process. This could impact development review by several departments, including Planning and Transportation.
>
> The City requests that SCAG provide copies of the draft SCS land use maps for review by the Planning and Transportation departments, and the Council and Mayor, prior to SCS adoption."

The above comments provide an overview of CEQA streamlining. A more complete description is provided on pages 84 and 85 of the SCS Background Documentation appendix for the draft 2012 RTP/SCS. This section begins by stating: "SB 375 amends CEQA (the California Environmental Quality Act) to add Chapter 4.2 Implementation of the Sustainable Communities Strategy, which allows for CEQA exemption for certain projects, as well as reduced CEQA analysis."

LADOT is concerned regarding the impact of CEQA streamlining if it is based, in part, on the SCS Map of 2035. As described in the Land Use Strategy and SCS Map section above, it appears that the SCS Map is not consistent with many of the land use maps of the adopted Community Plans. Accordingly, the concern is that CEQA streamlining could allow development to occur that is not consistent with adopted City plans, with related impacts on transportation infrastructure.

Recommendation:

LADOT staff has consulted with staff of DCP and the City Attorney regarding the impact of CEQA streamlining on the City's development review process. Input received from these sources indicates that although CEQA streamlining of various types will probably occur following adoption of the RTP/SCS, the City may retain some degree of "discretionary approval" authority over development projects that are subject to CEQA streamlining. Although this interpretation may be correct, LADOT believes that this area deserves further study. This is a complex and important subject, and the City should carefully evaluate and prepare for the impact of CEQA streamlining following adoption of the RTP/SCS. To the extent possible, the City's authority over its land use should be preserved.

Program Environmental Impact Report (PEIR) for 2012 RTP/SCS

The draft PEIR evaluates the potential environmental impacts associated with the adoption of the 2012-2035 RTP/SCS by SCAG. As stated in the PEIR, "The PEIR for the 2012-2035 RTP/SCS serves as an informational document to inform decision-makers and the public of the potential environmental consequences of approving the proposed Plan. The PEIR includes mitigation measures designed to help avoid or minimize significant environmental impacts." The PEIR is a program level document, generally followed by project-specific CEQA reviews which focus on project-specific impacts and mitigation measures.

The PEIR is over six hundred pages in length, and includes an Executive Summary (of 87 pages). The Executive Summary lists and describes mitigation measures in many areas, including, but not limited to: Air Quality, Biological Resources and Open Space, Greenhouse Gas Emissions, Land Use and Agricultural Resources, Public Services and Utilities, Transportation, Traffic and Security, and Water Resources. There are

over 500 mitigation measures listed, including 85 Land Use mitigation measures.

Concerns have been raised among various SCAG subregions regarding the extent and legal impact of the mitigation measures included in the PEIR. The mitigation measures extend to and impact a broad spectrum of technical and policy areas. A specific concern is with the use of the wording "can and should" throughout the PEIR. Two examples are as follows:

- "Transportation, Traffic and Security 35: Local jurisdictions can and should (emphasis added) adopt a comprehensive parking policy that discourages private vehicle use and encourages the use of alternative transportation."

- "Transportation, Traffic and Security 37: Local jurisdictions and transit agencies can and should (emphasis added) provide public transit incentives such as free or low-cost monthly transit passes to employees, or free ride areas to residents and customers."

While these measures may have merit, the concern is to what extent does the "can and should" language imply feasibility and create an expectation or requirement for these measures, as well as other mitigation measures in the draft PEIR, to be implemented by the City. In addition to the local control concern, some of the measures may actually not be financially feasible for the City.

Recommendation:

Throughout the SCAG region, the PEIR is still being studied. The City should continue to review the PEIR as well as gather input from staff of other SCAG subregions. It is recommended that the PEIR be revised to indicate that not all of the mitigation measures will apply to each city in the region (including the City of Los Angeles). Rather the mitigation measures should represent a kind of "menu" of measures for consideration by each SCAG member agency. It is also recommended that SCAG remove the "can and" from the "can and should" language in the mitigation measures as well as the SCS Chapter of the draft RTP/SCS.

Comments from Other City Departments

Los Angeles World Airports (LAWA):

- LAWA emphasizes that its first priority is to "maintain safe and efficient airports." Like most airports, LAWA receives grant funds from the FAA for eligible construction and noise mitigation projects. In return for federal grant monies, the FAA includes grant assurances that limit use of airport revenue solely for aviation-related uses on airport property.
- The RTP includes a proposal to promote a regional system of airport express buses, modeled in part on the FlyAway service currently operating at LAX.

Although express buses are a "promising solution" to certain ground access problems, LAWA advises that express buses are most effective at airports with high passenger demand and in cities with concentrated populations of passengers and employees. Even then, high fares or significant subsidies have been required to maintain an effective level of service. LAWA cautions that its experience and studies have shown that the expansion of the express bus system at LAX will be challenging. Moreover, the expansion of express bus service, by itself, may not be effective in increasing passenger demand at "secondary" airports.

- LAWA agrees that "the aviation constraints in the region, and potential dispersion of that activity at other airports, should be re-examined in subsequent regional plans."
- LAWA requests that, if possible, SCAG utilize the 2011 Air Passenger Survey, most likely to be released in February, to update various data points in the Aviation and Airport Ground Access appendix.

Department of City Planning (DCP):
The Department of City Planning has provided important comments which are highly technical and lengthy, hence they are attached to this report as Attachment D.

Conclusion

The draft 2012 RTP/SCS and PEIR, released by SCAG on December 20, 2011, represent an outstanding effort to meet both State and Federal planning requirements, as well as provide for the multifaceted needs of the region. However, as described in this report, City staff has identified several areas of concern related to potential impacts on land use and transportation planning in Los Angeles. City staff has provided recommended comments to SCAG for City Council and Mayor review regarding these proposals.

Fiscal Impact

This report contains comments regarding proposed policies and projects included in the draft 2012 RTP/SCS and related PEIR. The comments to be transmitted to SCAG will not impact the City's General Fund.

To All Interested Parties:

The City Council adopted the action(s), as attached, under Council File No. 11-1223, at its meeting held October 5, 2011.

June Lagmay

City Clerk
srb

10/5/11

#23

File No. 11-1223

TO THE COUNCIL OF THE
CITY OF LOS ANGELES

Your PLANNING AND LAND USE MANAGEMENT COMMITTEE
and
TRANSPORTATION COMMITTEE

report as follows:

PLANNING AND LAND USE MANAGEMENT and TRANSPORTATION COMMITTEES' REPORT relative to Southern California Association of Governments (SCAG) proposed alternatives for the 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

Recommendations for Council action:

1. AUTHORIZE the Los Angeles Department of Transportation (LADOT) and City Planning Department (Planning) to:

    a. Submit to SCAG the comments contained in Attachment A of the joint LADOT and Planning report dated September 21, 2011 (contained in the Council file), inasmuch as the strategies identified therein may have a potential impact on the City.

    b. Convey the comments to SCAG requesting that they be incorporated into the 2012 RTP/SCS with the understanding that the comments may be modified and supplemented by the City, with Council and Mayor approval, as the RTP/SCS is further developed.

2. REQUEST SCAG to provide copies of the draft SCS land use maps for review by the LADOT and Planning, Council, and Mayor prior to SCS adoption, inasmuch as the maps will identify geographical areas of the City where projects can be eligible for California Environmental Quality Act streamlining and thereby potentially allow development projects to receive mitigated negative declarations in the development review process and thereby impact growth in the City.

Fiscal Impact Statement: The LADOT and Planning Departments report the potential fiscal impact to the City has not been determined. Further review and evaluation is necessary as more information on the ultimate preferred alternative is presented by SCAG.

Community Impact Statement: None submitted.

SUMMARY

At a joint meeting held on September 27, 2011, the Planning and Land Use Management and Transportation Committees considered a joint LADOT and Planning Departments report relative to Southern California Association of Governments proposed alternatives for the 2012 Regional Transportation Plan/Sustainable Communities Strategy. Representatives from the LADOT and Planning gave the Committees background information on the matter. The Committees requested SCAG to provide copies of the draft SCS land use maps for review by the LADOT and Planning Departments, Council and Mayor prior to SCS adoption.

After an opportunity for public comment was held, the Committees recommended Council approve the recommendations contained in the joint report as amended. This matter is now forwarded to the Council for its consideration.

Respectfully submitted,

PLANNING AND LAND USE MANAGEMENT COMMITTEE

REVISED
PLANNING AND PROGRAMMING COMMITTEE
JANUARY 18, 2012

SUBJECT: SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS' DRAFT 2012 REGIONAL TRANSPORTATION PLAN / SUSTAINABLE COMMUNITIES STRATEGY

ACTION: APPROVE COMMENT LETTER

RECOMMENDATION

Approve our comment letter on the Southern California Association of Governments' (SCAG) Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

ISSUE

In December 2011, SCAG released the Draft 2012 RTP/SCS for public comment. The RTP/SCS identifies regional transportation priorities for the six-county region through 2035. All 2009 Long Range Transportation Plan (LRTP) projects and priorities must be included in SCAG's RTP/SCS to be eligible for federal funds. We have reviewed the Draft 2012 RTP/SCS and Board authorization is being requested to transmit our comments to SCAG in time for their February 14, 2012 deadline.

DISCUSSION

As part of SCAG's role as a regional planning agency, they are responsible for addressing regional issues in the six-county area of Southern California. The 2012 RTP/SCS is the vehicle to provide solutions to regional mobility and land-use issues. For better integration of land-use and transportation, it must also demonstrate reduction of Greenhouse Gas Emissions (GHGe) from passenger vehicles. Per the requirements of SB 375, the Draft 2012 RTP/SCS includes Southern California's first SCS. The SCS is required to analyze how the collective impact of transportation policies, transportation investments and land-use policies affect the GHGe based on population projections in 2020 and 2035. Transportation issues are primarily addressed in the RTP portion of the Draft, and the SCS portion of the Draft presents strategies to meet GHGe targets.

SB 375 compelled SCAG to conduct a more extensive outreach process than has been historically required for RTP development. This process yielded unprecedented levels of public participation and engagement, particularly among environmental and public health advocates championing increased funding for active transportation to reduce GHGe and provide great opportunities for physical activity. The Los Angeles County Department of Public Health was a leading voice in this advocacy.

Regional Transportation Plan

In general, the Draft 2012 RTP/SCS is a well-written document that properly identifies many of the key transportation issues that the region is facing. It includes all of the projects and programs in our 2009 LRTP. SCAG has proposed new and innovative sources of funding beyond our LRTP program. These funds are for additional projects, regional maintenance of highway and transit facilities, and meeting Federal Clean Air Act conformity requirements.

There are new transportation projects proposed in the Draft 2012 RTP/SCS, within Los Angeles County, which are beyond revenues that the 2009 LRTP assumes to be available from traditional sources. Some of these projects are listed in the Key Projects subsection below. SCAG is assuming that these new projects are funded with a combination of innovative funding (e.g., container fees and public private partnerships) and increased revenues (e.g. gas tax changes and user-fee per mile).

The Draft 2012 RTP/SCS proposes targeted improvements in the transit network and increases in funding for Transportation Demand Management (TDM), Transportation System Management (TSM), and Active Transportation beyond the levels included in the six county transportation commissions' plans, including our 2009 LRTP.

Funding for these improvements is anticipated from a $0.15 per gallon increase in the gas tax starting in 2017 and ending entirely in 2024. After the gas tax phase-out in 2024, a proposed user-tax of $0.05 per mile driven, will be phased-in starting in 2025. The goal of the incremental phase-in is so that consumers will not have any large increases of taxes, yet also allow for an indexing to cover the increasing maintenance costs, due to the gas taxes not being indexed to inflation and not increasing with costs.

Key Projects beyond the LRTP

The following lists Los Angeles County projects identified in the Draft RTP that are not identified in the 2009 LRTP

- East-West Freight Corridor will be studied along a five mile band generally following the SR-60 corridor between the I-710 and the I-15.
- Phase I of the California High Speed Rail Authority (CHSRA) is in the Draft 2012 RTP/SCS in the Constrained Plan, pending an agreement between CHSRA,

Metrolink and LOSSAN to identify funds to bring local systems up to high speed (110+ MPH) where possible.

- A regional Express/HOT Lane Network that expands our Fast Lanes pilot project to include the I-405 and SR-91. This is beyond the federally funded pilot studies on I-10 and the I-110. The Board is on record supporting these two pilot projects, as well as studying the feasibility of a HOT lane on the I-405 from the Orange County Line to LAX.

Key Issues

There are several emerging issues that the Draft 2012 RTP/SCS addresses:

- A cordon pricing pilot project feasibility study to be developed with the City of Los Angeles that is included under TDM Measures, and Major Strategic Projects.
- Decreased funding available from federal and state sources and the need to identify new revenue sources is a key RTP concern. SCAG proposes to index the gas tax and to incrementally phase-in user-fees to replace the gas tax starting in 2025.
- The exponential cost of deferred maintenance on highway and transit systems, the need to maintain the regional system in a state of good repair, and the need for additional operations and maintenance funding, is also a key RTP concern.
- The region is anticipated to experience increasing energy costs – residential energy and water use is forecasted as $19,000 a year in 2035, and the strategies in the SCS reduce it to $16,000.

Sustainable Communities Strategy

The Draft 2012 RTP/SCS demonstrates that the region will achieve the GHGe reduction targets established for the region by the State of California Air Resources Board (ARB), as a requirement of California's Sustainable Communities and Climate Change Protection Act, or Senate Bill (SB) 375.

In addition to the transportation elements of the Draft 2012 RTP/SCS, the plan includes a land-use element that was developed in coordination with local jurisdictions. The land-use element responds to the region's changing demographics and housing market demand. It recommends a growth scenario that will more than double the share of households living in corridors that have frequent transit service by 2035. This land-use element is projected to increase the competitiveness of transit service and reduce vehicle miles travelled.

The land-use element in combination with transportation policies, such as the user tax per mile fee, and transportation investments (such as TDM, TSM and active

transportation), support the region in achieving the mandated ARB targets. The Draft 2012 RTP/SCS provides a projected 8% reduction in GHGe by 2020 and a 16% reduction in GHGe by 2035.

The SCS portion includes policies to increase the number of near-zero and zero emission vehicles operating within the region to reduce GHGe, improve air quality and lessen the region's dependency on fossil fuels.

The Draft 2012 RTP/SCS includes $6 billion for active transportation, a significant increase from $1.8 billion in the 2008 RTP. It acknowledges that additional analysis regarding active transportation needs to be conducted in order to develop a better understanding of the users and their needs (bicyclists and pedestrians). In cooperation with SCAG, we have initiated a joint study to develop a strategy to address first-last mile connections to transit in Los Angeles County.

The technical appendices to the Draft 2012 RTP were not available for staff review at the time of the writing of this Board report. Additional technical comments on these appendices may be added to the draft letter.

DETERMINATION OF SAFETY IMPACT

The comment letter on the Draft 2012 RTP/SCS will not have any adverse safety impacts for our employees and patrons.

FINANCIAL IMPACT

There is no impact on the FY 2012 budget, as we are only submitting a comment letter to SCAG on their Draft 2012 RTP/SCS.

ALTERNATIVES CONSIDERED

The Board can modify or choose not to release a formal comment letter. The alternative of not sending a letter is not recommended, as we would lose the opportunity to provide SCAG with comments to enhance the 2012 RTP/SCS document.

NEXT STEPS

Upon Board approval, the comment letter will be transmitted to SCAG for their consideration in developing their Final 2012 RTP/SCS. SCAG is scheduled to adopt their Final 2012 RTP/SCS at their April 2012 General Assembly meeting.

Re: Comments on the Draft 2012 Regional Transportation Plan

Dear Mr. Ikhrata:

Los Angeles World Airports (LAWA) appreciates the opportunity to comment on the Draft 2012 Regional Transportation Plan (RTP), and is committed to working with all levels of government to address the future transportation needs of Southern California. As the operator of two of the region's commercial airports, Los Angeles International (LAX) and Ontario International (ONT), and operator of Van Nuys General Aviation Airport (VNY), LAWA plays an important role in meeting the region's demands for air travel and goods movement.

LAWA, as a proprietary department of the City of Los Angeles, is responsible for operating its airports in a safe, efficient, and fiscally responsible manner on behalf of our passengers and the citizens of each market service area. Furthermore, we must operate within the constraints placed upon our resources by federal law and regulation, along with our contractual obligations to our tenants and partner agencies. It is in this context that LAWA provides the following comments to the Aviation and Airport Ground Access portion of the RTP:

1. Use of Airport Funds

LAWA's first priority is to maintain safe and efficient airports. Our revenues and expenditures are used to support that effort and fulfill our commitment to supporting the national airspace system. All airports have a tremendous demand for capital improvements.

As such, most airports depend on financial support from the FAA via grant funds for eligible construction and noise mitigation projects. In return for federal grant monies, the FAA includes grant assurances that limit use of airport revenue solely for aviation-related uses on airport property. Using airport funds for non-airport functions violates federal law and jeopardizes the airport's ability to receive federal grants.

1 World Way Los Angeles California 90045-5803 Mail P.O. Box 92216 Los Angeles California 90009-2216 Telephone 310 646 5252 Internet www.lawa.aero

Nevertheless, LAWA seeks to partner with SCAG to find solutions to support ground access improvements to airports, other primary transportation facilities, and "secondary" airports in the region.

2. Use of Airport Express Buses

The RTP includes an "Action Step" which would plan and promote a regional system of airport express buses, modeled in part on the FlyAway® service currently operating at LAX. LAWA agrees that express buses are a promising solution to certain ground access problems. However, it has been LAWA's experience that express buses are most effective at airports with high passenger demand and in cities with concentrated populations of passengers and employees. Even then, high fares or significant subsidies have been required to maintain an effective level of service.

LAWA has spent a great deal of resources carefully studying the feasibility of establishing new FlyAway® routes to serve LAX. However, even for LAX, with its extensive market area and passenger base, it has been a challenge to find station locations that are both viable and successful. LAWA invites SCAG to continue examining ways to bring similar projects to other airports, but cautions that these services, by themselves, may not be effective in increasing passenger demand at "secondary" airports.

3. Aviation Activity Constraints

LAWA agrees that the aviation activity constraints in the region, and potential dispersion of that activity at other airports, should be re-examined in subsequent regional plans.

4. Additional Technical Clarifications

LAWA also wants to offer the following technical clarifications and comments to the RTP:

- SCAG has reported a number of vehicle trips to LAX under existing conditions as well as under a future forecast for 2035, citing the LAX Master Plan EIR/EIS as a justification for those trip numbers. However, the numbers reported do not correspond to data that LAWA has previously reported or used in any environmental analysis. LAWA requests clarification of those data points.

- LAWA recommends the following changes to Tables 4-6 and 4-7 in the Aviation and Airport Ground Access sections of the RTP:

    - In Table 4-6, the following projects should be included in the list of projects completed since the project notice of preparation in 2008 (footnote 1): Douglas St., La Cienega Blvd., Lincoln Blvd. (all), Nash St.,

Sepulveda Blvd. (both), the I-105 westbound off-ramp at Sepulveda Blvd., and the I-405 at SR-90.

- Two other projects on Table 4-6, Arbor Vitae St., and the I-405 from I-10 to SR-101, are under construction as of January 2012.
- In Table 4-7, Project LAX-19, which includes Lincoln Blvd. improvements, has already been completed.

- LAWA recommends that SCAG include in the RTP a portion of the project referred to as LAX-10, widening Aviation Blvd. from Century Blvd. to Manhattan Beach Blvd. to 3 lanes in each direction.

5. 2011 Air Passenger Survey

Lastly, the 2006 LAX Air Passenger Survey was used to create several data points within this section of the RTP. LAWA is hoping to unveil the results of its 2011 Air Passenger Survey in February of this year. SCAG should consider updating its Appendix with this new data as it finalizes the RTP. LAWA will post the results of this survey on our website (http://www.lawa.org) once the report is completed.

Thank you for the opportunity to review the 2012 Draft RTP. We hope that these comments will be helpful in developing a successful plan for the region. If you have any questions regarding these comments, please contact Diego Alvarez, Regional Transportation Coordinator, at 424-646-5179 or dalvarez@lawa.org.

Sincerely,

Michael D. Feldman
Deputy Executive Director

The Honorable City Council
City of Los Angeles
Room 395, City Hall

Dear Honorable Members:

DRAFT 2012-2035 REGIONAL TRANSPORTATION PLAN/SUSTAINABLE COMMUNITIES STRATEGY

The Department of City Planning (DCP) has reviewed and prepared comments for your consideration regarding the Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) prepared by the Southern California Association of Governments (SCAG).

The 2012-2035 RTP/SCS includes land use strategies for addressing the region's mobility needs and desires for healthy, sustainable communities. DCP has worked with SCAG to ensure that the City's land use plans and programs are incorporated and the City's interests addressed in this long-range regional plan. This work has included collaboration with SCAG over the past two years to prepare the population, household and employment growth forecast for the City, ensure that this anticipated growth is consistent with the capacity reflected in City's land use plans, and ensure that this long-term growth is located according to the City's land use plans.

DCP staff has identified five issues related to land use, and recommends changes to the 2012-2035 RTP/SCS to better support the City's interests and role in the regional plan, presented in the draft letter to SCAG attached to this report. These include:

A. Clarify the definition of "High Quality Transit Areas" where growth is focused;
B. Clarify the definition of "Urban Centers" where growth is focused;
C. Correct inaccurate representations of land uses and potential growth around station areas;
D. Incorporate the 1,684 miles of bicycle facilities identified in the City's 2010 Bicycle Plan; and,
E. Clarify the role of recently enacted streamlining provisions under the California Environmental Quality Act.

RECOMMENDATIONS

1) **Approve** DCP staff recommendations regarding the Draft 2012-2035 RTP/SCS.
2) **Direct** DCP staff to forward recommendations to SCAG.

FISCAL IMPACT

The proposed recommendations will have no fiscal impact on the General Fund.

[Date]

Ms. Margaret Lin
Southern California Association of Governments
818 W. Seventh St., 12th Floor
Los Angeles, CA 90017

Dear Ms. Lin:

DRAFT 2012-2035 REGIONAL TRANSPORTATION PLAN/SUSTAINABLE COMMUNITIES STRATEGY

The purpose of this letter is to provide comments from the City of Los Angeles Department of City Planning (DCP) regarding the Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). DCP appreciates the collaborative relationship with SCAG in developing this plan, which has included working together on the integrated growth forecast and understanding the City's land use plans and programs.

The following addresses five land use issues and recommends changes to the 2012-2035 RTP/SCS in order to better address the City's land use plans and projected growth. This includes:

A. Clarify the definition of "High Quality Transit Areas" where growth is focused;
B. Clarify the definition of "Urban Centers" where growth is focused;
C. Correct inaccurate representations of land uses and potential growth around station areas;
D. Incorporate the 1,684 miles of bicycle facilities identified in the City's 2010 Bicycle Plan; and,
E. Clarify the role of recently enacted streamlining provisions under the California Environmental Quality Act.

A. High Quality Transit Areas and Growth Patterns

The SCS frames growth patterns, in part, in terms of being within or outside of "High Quality Transit Areas (HQTAs)." An HQTA is defined as, "generally a walkable transit village or corridor, consistent with the adopted RTP/SCS , that has a minimum density of 20 dwelling units per acre and is within a ½ mile of a well-serviced transit stop with 15-minute or less service frequency during peak commute hours." HQTA boundaries are graphically portrayed in exhibits throughout the SCS. For the City of Los Angeles, the vast majority of the City's land area falls within HQTA boundaries, as seen in the following Exhibits: 4.4, 4.9, 4.13, 4.15, and Exhibits 19, 20 and 21 in the SCS Background Documentation (see Attachment).

These HQTA boundaries encompass all neighborhoods within a ½ mile radius and appear to indicate that growth will take place throughout the area, including low density single-family

neighborhoods and industrial districts. In fact, the City is far more discriminating, and adopted land use plans reflect carefully studied areas where growth can be absorbed. Generally, land use changes to accommodate growth are typically at transit stops and on parcels fronting transit corridors. Single-family neighborhoods are generally preserved.

Recommendation: The City recommends that additional explanation be included on pages 112-113 to better describe where growth is accommodated, as indicated by the following underlined text:

> "A HQTA is generally a walkable transit village or corridor, consistent with the adopted RTP/SCS , that has a minimum density of 20 dwelling units per acre and is within a ½ mile of a well-serviced transit stop with 15-minute or less service frequency during peak commute hours. This was represented by the proportion of Greenfield versus Refill (infill and redevelopment) growth in each of the scenarios. Within these boundaries, growth within a given jurisdiction is consistent with the integrated growth forecast for that jurisdiction and is distributed according to the jurisdiction's land use plans. Thus, while areas within ½ mile of a transit stop or corridor are walkable in relation to transit, not all such areas are targeted for growth and/or land use changes."

B. Urban Centers and Growth Patterns

The SCS frames the overall land use pattern across the SCAG region around six factors. The HQTAs, discussed above, are one factor. Another factor is the region's urbanized core versus peripheral areas. Urbanized core areas, or "core centers," are defined in the SCS as, "areas where strategies such as compact community design, mixed-use development, redevelopment of aging retail areas, greater housing variety, and additional transit service are more likely to succeed." Exhibit 4.5, Urban Centers SCAG Region (see Attachment), depicts the locations of these urban centers. However, these urban centers do not appear to align with the urban centers identified in Exhibit 4.15 for areas within the City of Los Angeles.

Recommendation: The City recommends that the relationship between Exhibit 4.5 and Exhibit 4.15 be clearly described. If the two exhibits are intended to illustrate the same urbanized areas, staff recommends that the color scheme used in Exhibit 4.15 also be used in Exhibit 4.5.

C. Land Uses around Station Areas

The SCS projects higher density in urban centers, and anticipates growth in transit rich areas throughout the City of Los Angeles in order to demonstrate a decrease in GHG emissions by 2035. DCP staff compared the city's General Plan Land Use to the SCS Land Use Pattern Maps and has found that in general the SCS is consistent with the City's land use density and land use designations. However, in closely examining 76 rail and bus transit station areas, DCP staff has found instances of inflated density, which inaccurately reflects the General Plan distribution of growth.

Exhibit 21 Land Use Pattern Map 2035 (see Attachment) identifies urban centers with densities that are not consistent the community plans for these areas. Such centers would have residential densities ranging from 82 to 120 housing units or more per acre. This density is typical in the Central City and some adjacent neighborhoods, and is proposed for the Warner Center, but it is generally not appropriate throughout the rest of the city.

In addition, the following issues were found in multiple station areas.

- Multi-Family neighborhoods
  - Densities up to 178, 145, or 61 units/acre that are too high for many sites
  - Densities too high in areas adjacent to single-family neighborhoods
- Single-Family neighborhoods
  - Increase in density in strictly single-family areas that are stable and where no growth is anticipated
  - Parcels and Corridors in Historic Preservation Overlay Zones reflect density designations that are too high; these areas are stable with no projected change
  - Residential uses reflected as commercial
- Commercial Corridors
  - Density projections are too high
- Industrial Land Use
  - Industrial areas that are to be preserved as industrial are inaccurately represented as commercial or retail
  - Industrial areas that show residential designations are an inaccurate reflection as these sites are preserved
- Public Facilities
  - Land use changes at school sites that are not projected to change
  - High residential densities or commercial uses projected on public facilities such as along freeways, county jail, open space

Recommendation: The City recommends that more appropriate representations of land use around station areas be made, which can be identified on detailed annotated maps of the station areas and provided under separate cover.

D. Proposed Bikeways

The SCS emphasizes the importance of active transportation options in meeting the mobility needs of the SCAG region, including walking and biking. While SCAG has proposed a regional bikeway network, the SCS includes the contributions of localities in developing bicycle networks within the locality and linking to other transit modes, reflected in Exhibit 4.11 Proposed Bikeway Network SCAG Region (see Attachment). However, it appears that the City of Los Angeles' recently adopted 2010 Bicycle Plan for 1,684 miles of bike facilities across Los Angeles is not included in this Exhibit. Some segments of this bicycle network are in development and have been identified for funding, and are therefore included in the 2012 RTP list of transportation investments. Including the full proposed bicycle network will support the long-term commitment to pursue resources for development of the network.

Recommendation: The City recommends that the SCS include the bicycle facilities identified in the City's 2010 Bicycle Plan.

E. CEQA Streamlining Incentives for Sustainable Land Use Patterns

The 2012-2035 RTP/SCS directly addresses the opportunity for relief under the California Environmental Quality Act (CEQA). Under Senate Bill 375, the requirement to prepare a Sustainable Communities Strategy (SCS) was coupled with incentives to encourage sustainable development and implementation of an SCS. The incentives are comprised of relief under CEQA, such as streamlined documentation or exemption from environmental review requirements, for specific development types in specific locations, as long as such development is consistent with the land use reflected in the SCS. As any proposed development is considered by local jurisdictions, this CEQA relief is at the discretion of local jurisdictions. However, as written, the 2012-2035 RTP/SCS can be construed to indicate that CEQA relief is part of the land use plan and is available by right to all development that meets the qualifications.

Recommendation: The City recommends that the 2012-2035 RTP/SCS better reflect the opportunity for CEQA streamlining incentives through the following changes:

1) In the discussion of the mandate to prepare an SCS (page 106 of the 2012-2035 RTP/SCS), amend the last sentence of the second to last paragraph:
"In addition, some projects consistent with the SCS ~~are~~ may be eligible for streamlined environmental review."

2) In Exhibits 4.1, 4.2 and 4.3 regarding population, employment and household growth, respectively (see Attachment), remove the depiction of Transit Priority Project (TPP) areas. A TPP is one particular type of development that qualifies for CEQA streamlining. Depicting this in these exhibits is confusing because a TPP is not defined. Furthermore, the depiction of TPP boundaries detracts from the purpose of the exhibits, which is to show where growth is directed over the planning period of the 2012-2035 RTP/SCS.

3) In the discussion of Transportation Analysis Zones (TAZs) and Development Types (page 122 of the 2012-2035 RTP/SCS), remove the brief discussion regarding CEQA streamlining and the adequacy of TAZ-level land use information. First, this point is difficult to understand as presented and requires further explanation. Second, this point pertains to incentives available to jurisdictions and developers, not to the modeling analysis. Lastly, this point detracts from the purpose of the section, which is to describe the approach to modeling land use and transportation information. This paragraph would thus read:

> "To conduct required modeling analysis for the RTP/SCS, SCAG distributes the growth forecast data to transportation analysis zones (TAZs) to capture localized effects of the interaction of land use and transportation. ~~Additionally, SB 375 offers local governments potential CEQA relief for qualified development projects consistent with an~~

~~adopted SCS. SCAG suggests that utilizing community types at the TAZ level of geography (with an average size of 160 square acres) offers local jurisdictions adequate information and flexibility to make appropriate consistency findings for projects to be eligible to receive CEQA streamlining benefits.~~
To further facilitate regional modeling of land use information from nearly 200 separate jurisdictions, SCAG developed a simplified series of Community Types to represent the land use categories taken from the region's many general plans..."

4) A reference to the summary of the CEQA incentive (page 148 of the 2012-2035 RTP/SCS) should be included under the section "RTP/SCS Next Steps" and the summary should be moved to follow this because the incentive can be used to encourage and facilitate implementation of the SCS and is therefore better understood as a "next step." In addition, the summary should include a discussion regarding a jurisdiction's discretion in certifying the environmental review for a project, regardless of eligibility for streamlining.
