5) In the SCS Background Documentation, the summary of the CEQA exemption (page 84) should include a description of a jurisdiction's discretion in certifying the environmental review for a project, regardless of eligibility for streamlining.

Thank you for this opportunity to provide comments. If you have any questions or would like additional information, please contact Naomi Guth at (213) 978-3307 or by email at Naomi.Guth@lacity.org.

Sincerely,

MICHAEL J. LOGRANDE
Director of Planning

City of Los Angeles Projects Requested to be added to Strategic Plan - 2012 RTP/SCS

Strategic Projects							
County	**System**	**Category**	**Route Name**	**From/At**	**To**	**Project Description**	**Lead Agency**
Los Angeles	Local Highway	Capacity	11th Street	Aviation Blvd	La Cienega Blvd	Widen and restripe to accommodate two through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Alameda Street	US-101 Fwy	I-10 Fwy	Widen to 70 ft and remove embedded rails and ties, install left turn channelization and widen curb returns to reduce congestion and improve truck movement	Los Angeles City
Los Angeles	Local Highway	Capacity	Alameda Street	I-10 Fwy	7th St	Alameda St. from I-10 to Seventh St. - project includes rehabilitation of the roadway, removing enbedded rails and ties, installing left turn channelization, spot widening where needed to accommodate truck traffic	Los Angeles City
Los Angeles	Local Highway	Capacity	Alhambra Avenue	Lowell Ave	City of Alhambra city limits	Realign Alhambra Ave. between Lowell Ave. and the City of Alhambra city limits to smooth out an existing sharp s-curve and to enhance traffic and capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Anaheim Street	Farragut Ave	Dominguez Channel	Widen Anaheim St. from 78' to 84' and restripe to accommodate an additional lane in each direction; this would improve the roadway from 4 lanes to 6 lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Aviation Boulevard	Arbor Vitae St	Imperial Hwy	Widen and restripe to accommodate three through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Balboa Boulevard	Devonshire St		Widen east side of Balboa Blvd. south of Devonshire St. for approximately 500 ft., and restripe the intersection to provide dual left-turn lanes for the northbound and southbound approaches.	Los Angeles City
Los Angeles	Local Highway	Capacity	Barham Boulevard	US-101 Fwy Bridge		Replace the existing bridge to increase traffic capacity and widen/restripe southbound US-101 off-ramp at Barham Blvd to provide southbound double left turn lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Barham Boulevard	Coral Dr		Widen west side of Barham Blvd. to provide a southbound right-turn only lane on Barham Blvd. and to improve access to Universal Studios and to the 101 NB on-ramp.	Los Angeles City
Los Angeles	Local Highway	Capacity	Beverly Glen Boulevard	Mulholland Dr		Widen south leg of Beverly Glen Blvd to create a right turn only lane; ROW acquisition needed	Los Angeles City
Los Angeles	Local Highway	Capacity	Brandford Street	Laurel Canyon Blvd	Amboy Ave	Widen north side of Brandford St. to provide an additional westbound lane.	Los Angeles City
Los Angeles	Local Highway	Capacity	Broad Avenue	Harry Bridges Blvd	Water St	Build grade-separated access to waterfront area from rail lines, extend Broad Ave to Water Street, and install bike lanes and sidewalks on both side of Broad Ave	Los Angeles City
Los Angeles	Local Highway	Capacity	Bundy Drive	I-10 Fwy ramps		Reduce congestion on Bundy by reconfiguring the I-10 WB ramps (consolidate to one ramp location accommodating both the on and off ramps with new signal)	Los Angeles City
Los Angeles	Local Highway	Capacity	Burbank Boulevard	Clybourne Ave	Vineland Ave	Widen Burbank Blvd. to a major highway standard (80-foot roadway width) on both sides of street to improve roadway capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Burbank Boulevard	US-101 Fwy WB		Widening to add second westbound through lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Canoga Avenue	US-101 WB off-ramp		Widen westbound off-ramp to prove a right turn only lane to Canoga Ave	Los Angeles City
Los Angeles	Local Highway	Capacity	Canoga Avenue	Burbank Blvd		Widening to add a second westbound left-turn lane and a dedicated northbound right-turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Transit	Canoga Avenue	Ventura Blvd	Canoga Orange Line Station	Purchase 20 new buses to add to a Local Circulator bus system between Ventura Boulevard adn Canoga Orange Line Station. Install new bus shelters and/or enhance the existing bus shelters along the route as required	Los Angeles City
Los Angeles	Local Highway	Capacity	Canoga Avenue	Saticoy St		Widening to add southbound through lane. Change sorthbound and eastbound phasing from left-turn permitted to protected.	Los Angeles City
Los Angeles	Local Highway	Capacity	Coldwater Canyon Boulevard	Ventura Blvd	Magnolia Blvd	Remove jut-outs to add one through lane in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Corbin Avenue	Victory Blvd		Widening to add eastbound and westbound through lanes and upgrade traffic signal	Los Angeles City

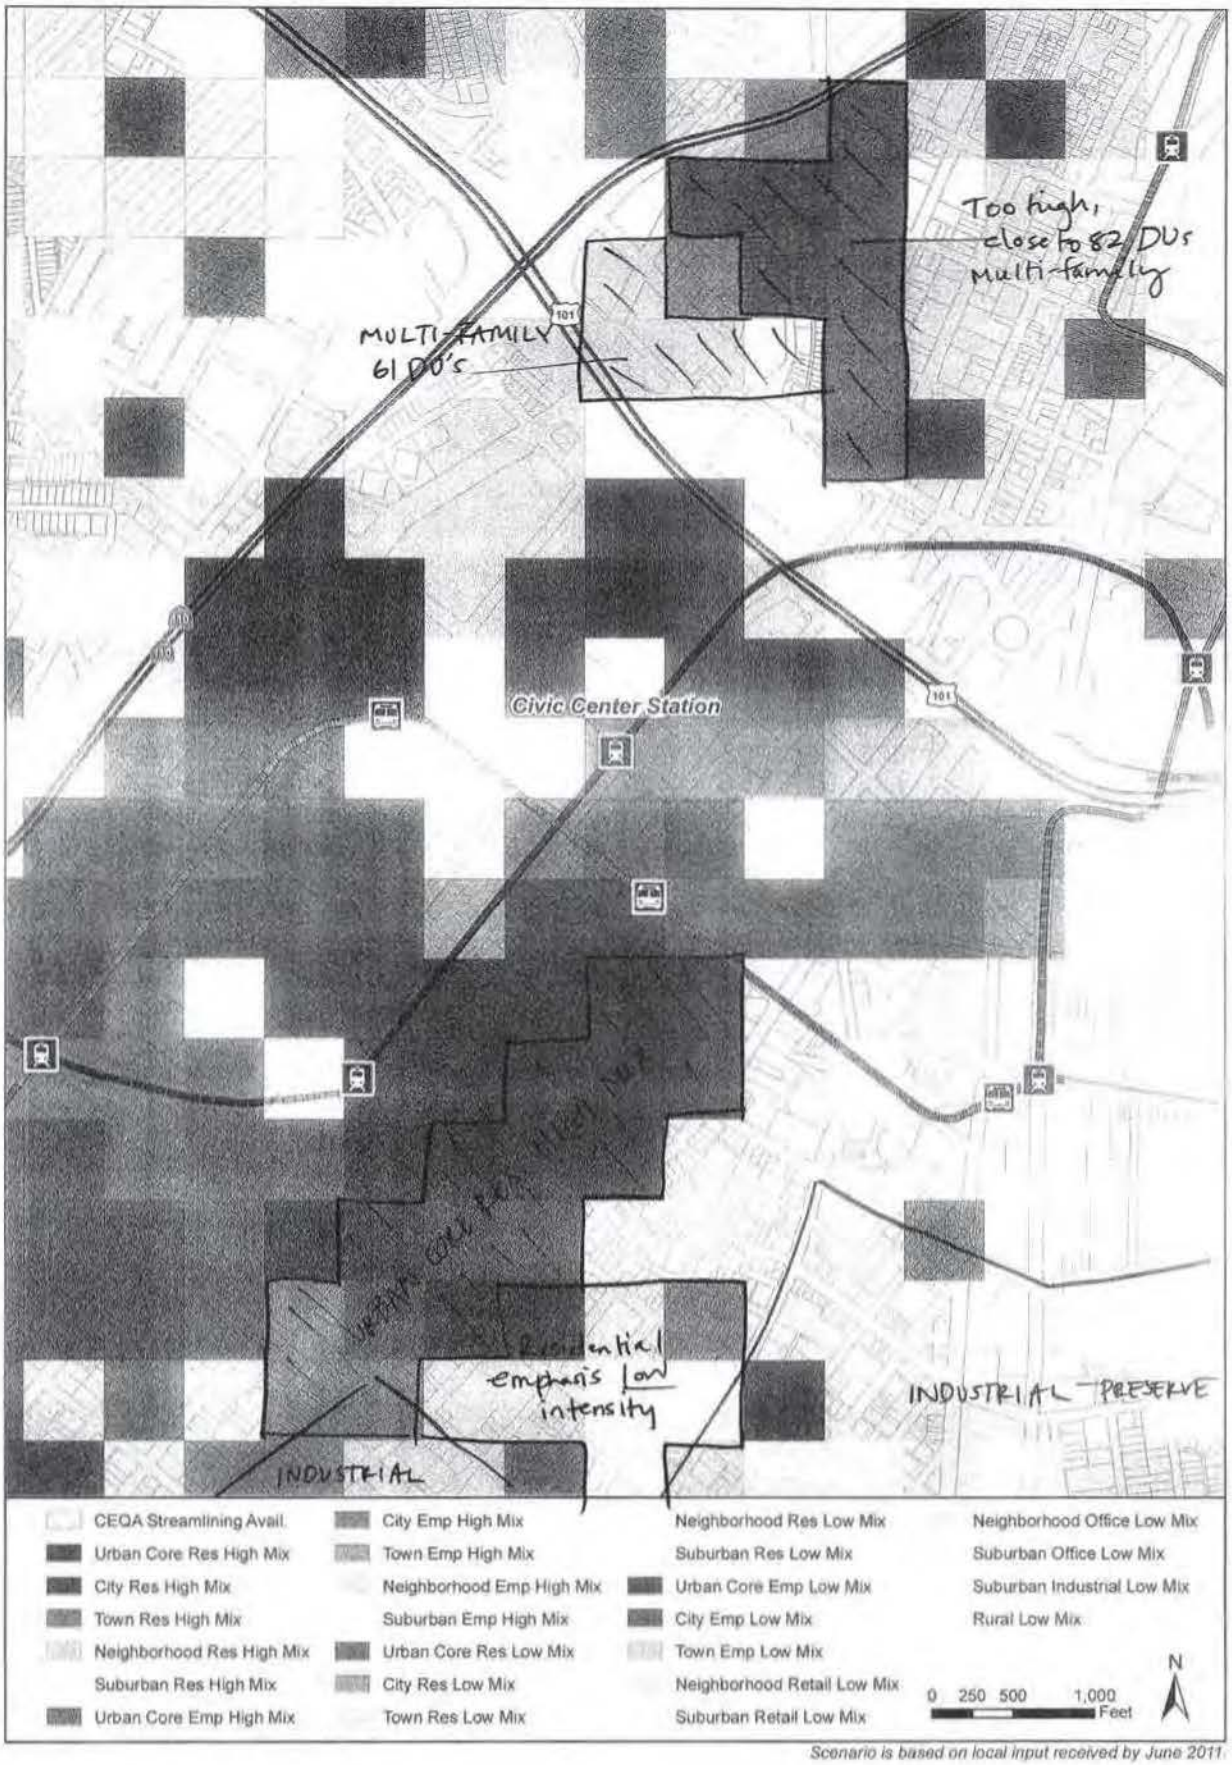
City of Los Angeles Projects Requested to be added to Strategic Plan - 2012 RTP/SCS



Strategic Projects							
County	System	Category	Route Name	From/At	To	Project Description	Lead Agency
Los Angeles	Local Highway	Capacity	Crenshaw Boulevard	I-10 WB on-ramp		Widen SB Crenshaw Blvd to provide a SB right-turn only lane and redesign the WB off-ramp to reduce congestion and improve intersection operation	Los Angeles City
Los Angeles	Local Highway	Capacity	Culver Boulevard	Centinela Ave	I-405 Fwy	Improve traffic flow along Culver Blvd between Centinela Ave and I-405 Freeway including providing left-turn lanes at key signalized intersections (including Inglewood Blvd)	Los Angeles City
Los Angeles	Local Highway	Capacity	De Soto Aveue	Ventura Blvd	Clark St	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	De Soto Aveue	Saticoy St		Widening to add eastbound and westbound right turn lanes and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	De Soto Street	Parthenia St		Widening to add dedicated eastbound westbound right turn lane and northbound phasing from left-turn permitted to protected.	Los Angeles City
Los Angeles	Local Highway	Capacity	De Soto Street	Califa St		Widening to add northbound and westbound right-turn lanes and install new traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Enterprise Street	Mateo St (near WB I-10 off-ramp)		Widen Enterprise St at Mateo St (near WB-10 off-ramp) to improve truck movement at curb returns	Los Angeles City
Los Angeles	Local Highway	Capacity	Fallbrook Avenue	Victory Blvd		Widening to add westbound right turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Figueroa Street	146th St	Redondo Beach Blvd	Widen Figueroa St to major highway standard from 62 ft to 80 ft to provide three lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Fletcher Street Bridge	LA River		Widen to increase capacity and improve access to I-5 Fwy; add bike lanes and sidewalks	Los Angeles City
Los Angeles	Local Highway	Capacity	Foothill Boulevard	Balboa Blvd		Widen north of Balboa Blvd over culvert and widen west leg of Foothill Blvd at Balboa Blvd. Upgrade traffic signal to improve intersection capacity	Los Angeles City
Los Angeles	Local Highway	Capacity	Forest Lawn Drive	near SR-134 Bridge	/LA River	Construct a new bridge with bike path (including equestrian trail) over LA River at LAEC. Re-align the SR-134 freeway on/off ramps at Forest Lawn Dr. to improve flow and capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Fountain Avenue	Sunset Blvd	Western Ave	Widen Fountain Ave to add a left-turn lane at each intersection-ROW acquisition needed	Los Angeles City
Los Angeles	Local Highway	Capacity	Glenoaks Boulevard	Suniand Blvd		Widen Glenoaks Blvd to provide an eastbound right-turn lane	Los Angeles City
Los Angeles	Local Highway	Capacity	Grand Avenue Bridge	Cesar Chavez Ave	Temple St	Widen bridge over US-101 Fwy to improve access to US-101, SR-110, future school and Grand Ave.	Los Angeles City
Los Angeles	Local Highway	Capacity	Grand Avenue Bridge	Over US 101 Fwy		Widen the Existing bridge to provide dual left-turn lane onto the 101 and 110 freeways on-ramps, includes, and add through lane and right-turn lane, and widen sidewalk.	Los Angeles City
Los Angeles	Local Highway	Capacity	Imperial Highway	Sepulveda Blvd	Pershing Dr	Widen to provide continuous three through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Irwin Street	Owensmouth Ave	De Soto St	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	La Cienega Boulevard	Arbor Vitae St	111th St	Widen and restripe to accommodate three through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	La Tijera Boulevard	Airport Blvd	La Cienega Blvd	Widen and restripe to provide continuous three through lanes in each direction	Los Angeles City
Los Angeles	Local Highway	Capacity	Laurel Canyon Boulevard	Mulholland Dr		Widen the west side of Laurel Canyon Blvd south of Mulholland Dr to carry two southbound lanes through the intersection	Los Angeles City
Los Angeles	Local Highway	Capacity	Lincoln Boulevard	Jefferson Blvd	Fiji Way	Partnering with Caltrans & LA County, improve Lincoln Blvd between Jefferson Blvd & Fiji Way including removing the existing bottleneck by replacing/widening the existing bridge to provide an add'l lane in each direction & on-street bike lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Maclay Street	Gladstone Ave		Remove jut-outs on Maclay at Gladstone and install a new traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Magnolia Boulevard	Cahuenga Blvd	Vineland Ave (north side)	Widen the north side of Magnolia Blvd. to provide an additional lane in the westbound direction.	Los Angeles City

City of Los Angeles Projects Requested to be added to Strategic Plan - 2012 RTP/SCS

Strategic Projects							
County	System	Category	Route Name	From/At	To	Project Description	Lead Agency
Los Angeles	Local Highway	Capacity	Mason Avenue	Saticoy St		Widening to add Exclusive right-turn lanes for all approaches and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Mission Road	Griffin Ave	Marengo St	Widen Mission Road to provide an additional through lane in each direction, and install new pedestrian signal at Sichel Street	Los Angeles City
Los Angeles	Local Highway	Capacity	Moorpark Avenue	Woodman Ave	Mammoth Ave	Widen Moorpark Ave. to increase capacity and install street lights, curb, and gutter.	Los Angeles City
Los Angeles	Local Highway	Capacity	North Main Street	Albion St		Grade seperate North Main Street over the exiting Metrolink and freight tracks; reduces delays for vehicles and transit riders traveling on Main Street	Los Angeles City
Los Angeles	Local Highway	Capacity	North Spring Street	Roundout St	Baker St	Widen N. Spring St. between Roundout St. to Baker St. from 44 ft. to an 80' roadway width and install landscaped medians	Los Angeles City
Los Angeles	Local Highway	Capacity	Olympic Boulevard	Soto St		Improvements to the intersection by increasing the curb return radius of all four corners and Olympic Blvd approaches. ROW required	Los Angeles City
Los Angeles	Local Highway	Capacity	Olympic Boulevard	Alameda St		Widen to improve truck movement (right-of-way required)	Los Angeles City
Los Angeles	Local Highway	Capacity	Olympic Boulevard	Santa Fe Ave		Widening curb retrun to improve truck movement through the intersection.	Los Angeles City
Los Angeles	Local Highway	Capacity	Owensmouth Avenue	Canyon Creek Dr (Private)		Widening to add southbound and eastbound right-turn lanes, add a northbound left-turn lane, and upgrade traffic signal.	Los Angeles City
Los Angeles	Local Highway	Capacity	Owensmouth Avenue	Saticoy St		Widening to add northbound left-turn and upgrade traffic signal.	Los Angeles City
Los Angeles	Local Highway	Capacity	Oxnard Street	White Oak Ave	Lindley Ave	[illegible] (Require additional ROW) to allow through lane in each	Los Angeles City
Los Angeles	Local Highway	Capacity	Oxnard Street	AMC Dwy	De Soto St	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Reseda Boulevard	Burbank Blvd	US-101 Fwy WB ramps	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Riverside Drive	SR-134 Fwy		Widen the bridge to improve the capacity and to add the bike lane	Los Angeles City
Los Angeles	Local Highway	Capacity	Robertson Avenue	National Blvd	/I-10 Fwy Interchange	Reconfigure existing ramps and construct new ramps to improve capacity	Los Angeles City
Los Angeles	Local Highway	Capacity	Roxford Street	Sepulveda Blvd		Realign Roxford St. at Sepulveda Blvd. by widening curb radius to enhance traffic flow.	Los Angeles City
Los Angeles	Local Highway	Capacity	San Fernando Road	Sierra Hwy	Roxford St	Install a center-reversible lane on the Old Road to provide extra capacity during peak hours along an approximately 3 mile segment.	Los Angeles City
Los Angeles	Local Highway	Capacity	Santa Fe Avenue	Porter St		Widening curb retrun to improve truck movement through the intersection.	Los Angeles City
Los Angeles	Local Highway	Capacity	Saticoy Street	Van Nuys Blvd	Woodman Ave	Construct grade seperation and extend roadway westerly from Woodman Ave to Van Nuys Blvd	Los Angeles City
Los Angeles	Local Highway	Capacity	Sepulveda Boulevard	National Blvd	Olympic Blvd	Widen to major highway standard and increase number of through lanes from two to three lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Sepulveda Boulevard Corridor	Wilshire Blvd	LAX	Partnering with Culver City & LA County, identify and implement ways of improving traffic flow, carrying capacity, and efficiency in the utilization of the Sepulveda Corridor from Wilshire to LAX	Los Angeles City
Los Angeles	Local Highway	Capacity	Sepulveda Tunnel	Mulholland Bridge		Widen existing tunnel to provide additional traffic lanes and bike lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Sherman Way Avenue	Jordan Ave	De Soto St	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Shoup Avenue	Irwin Ave		Widening to add northbound right turn lane and upgrade traffic signal to include northbound protected left-turn phasing	Los Angeles City

City of Los Angeles Projects Requested to be added to Strategic Plan - 2012 RTP/SCS

Strategic Projects							
County	System	Category	Route Name	From/At	To	Project Description	Lead Agency
Los Angeles	Local Highway	Capacity	Shoup Avenue	Oxnard St		Widening to add northbound right turn lane and upgrade traffic signal to include westbound and northbound protected left-turn phasings	Los Angeles City
Los Angeles	Local Highway	Capacity	Shoup Avenue	Vanowen St		Widening to add eastbound right turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Shoup Avenue	Sherman Way		Widening to add northbound right turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Slauson Avenue	110 Fwy	Alameda St	Design and construction of street improvements and signage for commercial vehicles	Los Angeles City
Los Angeles	Local Highway	Capacity	Topanga Canyon Boulevard	Mulholland Dr		Widening toadd a southbound right-turn lane and upgrade traffic signal to include southbound right-turn overlap phase	Los Angeles City
Los Angeles	Local Highway	Capacity	Topanga Canyon Boulevard	Roscoes Bvd		Widening to add northbound left-turn and southbound right-turn lanes and traffic signal upgrade.	Los Angeles City
Los Angeles	Local Highway	Capacity	Topanga Canyon Boulevard	Vanowen St	Ventura Blvd	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity. Install new signal at Topanga Canyon Blvd. and Califa St.	Los Angeles City
Los Angeles	Local Highway	Capacity	Vaiel Avenue	Kittridge St		Widening to add eastbound and westbound through lanes and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Valley Boulevard	San Pablo St	Boca Ave	Improve capacity and enhance traffic flow at railroad crossing by widening to add lanes, to improve curb, and to upgrade signal systems and rail road equipment along Valley Blvd.	Los Angeles City
Los Angeles	Local Highway	Capacity	Van Ness Avenue	US-101 Fwy SB off-ramp	Sunset Blvd	Widen both sides of Van Ness Ave. to accommodate one additional southbound lane.	Los Angeles City
Los Angeles	Local Highway	Capacity	Vanalden Avenue	US-101 Fwy EB ramps	/Ventura Blvd	Widening to add westbound through lane and upgrade traffic signal to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Vanowen Avenue	Owensmouth Ave	Mason Ave	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Transit	Variel Avenue	Oxnard St		Construction of a 4th Orange Line Station in Warner Center Area	Los Angeles City
Los Angeles	Local Highway	Capacity	Ventura Boulevard	Shoup Ave	US-101 SB ramps	Widen between Shoup Ave and US-101 freeway southbound ramps to provide double left-turn lanes	Los Angeles City
Los Angeles	Local Highway	Capacity	Vermont Avenue	Washington Blvd	I-10 Fwy WB off-ramp	Widen 10 ft. of east-side of Vermont Ave to provide left-turn lane	Los Angeles City
Los Angeles	Local Highway	Transit	Victory Boulevard	Owensmouth Ave to Oxnard	Variel Ave to Victory Blvd	Purchase 20 new buses to add to a Local Circulator bus system to operate from Victory to Owensmouth to Oxnard to Variel and back to Victory. Install new bus shelters and/or enhance the existing bus shelters along the route as required	Los Angeles City
Los Angeles	Local Highway	Capacity	Victory Boulevard	Owensmouth Ave	Winnetka Ave	Intersection widening to add through and/or turn lanes, and upgrade traffic signal to include new phasing as needed to improve intersection capacity.	Los Angeles City
Los Angeles	Local Highway	Capacity	Western Avenue	Florence Ave	80th St/Manchester Ave	Widen east side of Western Ave. to accomodate left-turn lanes at various intersections within the project limits.	Los Angeles City
Los Angeles	Local Highway	Capacity	Western Avenue	Exposition Blvd		Widen Western Blvd. to add northbound and southbound left-turn lanes at Exposition Blvd.	Los Angeles City
Los Angeles	Local Highway	Capacity	Wilshire Boulevard	San Vicente Blvd	Centinela Ave	Arterial widening to provide an additional lane in each direction.	Los Angeles City
Los Angeles	Local Highway	Capacity	Winnetka Avenue	Vanowen St		Widening to add northbound and southbound right-turn lanes and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Winnetka Avenue	Ventura Blvd		Change westbound right-turn lane to a shared through-right turn lane, add an eastbound left-turn lane, and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Winnetka Avenue	Oxnard St		Widening to add westbound right turn lane and upgrade traffic signal	Los Angeles City
Los Angeles	Local Highway	Capacity	Woodlake Avenue	Victory Blvd		Widening to add northbound shared-through right turn lane and upgrade traffic signal	Los Angeles City

COMMUNITY DEVELOPMENT DEPARTMENT

Planning Division

February 14, 2012

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

Dear Mr. Ikhrata:

The following comments are offered on the draft 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy (draft RTP/SCS) and the associated Appendices and draft Program Environmental Impact Report (draft PEIR).

We would like to commend SCAG and its staff who worked hard to prepare the draft RTP/SCS, the PEIR, and associated documents as this was a monumental task. We appreciate the continued cooperation of SCAG staff throughout this process and the many mentions throughout the document where the RTP/SCS expressly states that it incorporates the Orange County Sustainable Communities Strategy (OC SCS) into the RTP/SCS document.

The City of Newport Beach has reviewed the draft RTP/SCS and the draft PEIR. However, the length of the comment period was not adequate to allow for a comprehensive review and formulation of detailed comments.

We are aware of the review completed by the Orange County Council of Governments (OCCOG) and the concerns addressed in the letter from OCCOG are consistent with the City of Newport Beach's concerns.

It is requested that the adoption of the growth forecast numbers by the Regional Council and/or Joint Policy Committee be at the county level, consistent with past RTPs. Planning documents need to be flexible. As time passes, what is possible and feasible for any given project changes. These changes can be due to market conditions, new information or data, or infrastructure available that may shift when and where development is possible. Smaller geographic levels, such as at the subregional, city, census tract, TAZ, parcel, or grid cell would limit jurisdictional control over land use.

The OCCOG Board approved the update to the OCP-2010 dataset used in the OC SCS. OCP-2010 Modified was officially approved by the OCCOG Board on January 26, 2012, and is a data amendment to the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with

SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011, which should be incorporated into the 2012 RTP/SCS, PEIR, and related documents. To be consistent with the MOU on subregional delegation between OCTA, OCCOG, and SCAG, all documents, tables, maps, narratives, modeling runs, PEIR alternatives (including Alternate C/3/Envision 2), and datasets should be updated with the OCP-2010 Modified numbers.

As indicated in the PEIR on page 1-6, state law states that it is appropriate to indicate in mitigation measures that they "can and should" be implemented. Under the law, this is explained as the entity has the jurisdiction to implement the measures and, therefore, should implement it. However, due to the assertions throughout the PEIR that mitigation measures have been determined to be feasible, the term "can" could be interpreted to read that the measures are also feasible. In order to make it clear that the mitigation measures are a menu of options for which feasibility has not been established for any given project, it is requested that the "can and should" language be changed in all mitigation measures identifying entities other than SCAG to read "should consider where practical and feasible". It would be appropriate to identify on page 1-6 in the discussion of this language that for all mitigation measures it is assumed by the draft PEIR that the entities identified to implement the mitigation do have the authority to do so.

Again, we thank SCAG for all of the time and effort put into this process. If you have any questions, feel free to contact me at 949-644-3297 or bwisneski@newportbeachca.gov.

Sincerely,

Brenda Wisneski, Deputy Director
Community Development Department

RE: Comments on 2012 RTP/SCS and PEIR

Dear Mr. Ikhrata:

Thank you for allowing the City of Ontario the opportunity to review and comment on Southern California Association of Government's (SCAG's) draft 2012 Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS) and the draft Program Environmental Impact Report (PEIR). On behalf of the City of Ontario I would like to express our sincere appreciation to you and SCAG staff for their professionalism, inclusiveness, and dedication to the immense task of coordinating and creating the region's first RTP/SCS regional plan. We support approval of the RTP/SCS Plan with some level of clarification and/or changes described below.

Overall, a recurring theme of our concerns is that the documents need to make clear SCAG's philosophy and intent on maintaining local government's sole control of land use decision making, including the review and establishment of mitigation measures under CEQA. Under your leadership SCAG has forged collaborative efforts with county and local governments to discuss and plan for difficult, complex, regional issues. The success of your approach in recent years, in no small way, can be attributed to the recognition by SCAG of the land use authority of cities and counties within the region and of local home rule. We need to ensure that the RTP/SCS and PEIR reflect that basic understanding.

Specifically, our comments are:

1. We understand and have supported SCAG's efforts to incorporate city growth plans into the regional planning process. However, as in the past, we believe that the RTP/SCS growth forecasts

Printed on recycled paper.

should be adopted at the county level, not the city or sub-city (TAZ) level. This would allow more flexibility in dealing with inevitable changes in socio/economic trends within the region and sub-region.

2. We have questions regarding the use of TAZ level data in the CEQA Incentive program discussed on page 148. We are not convinced that the land use scenarios and development types created by SCAG for each TAZ are accurate. We also would like to clarify that the only use of TAZ level data to be used by SCAG in the future would be for the CEQA Incentive program and not for growth projections.
3. The draft PEIR is somewhat confusing and problematic. It is our understanding that the mitigation measures were supposed to be designed to be a menu of options available to lead agencies to consider when reviewing and approving local transportation and development projects, but not as mandatory or required. This is critical because specific environmental review of local projects is the appropriate and legal purview of local agencies. The Plan will be implemented over several years and circumstances involved with site specific development will inevitably change over time and must be taken into account by local agencies responsible for caring out CEQA laws. We recommend that SCAG amend language in the document to specifically and clearly state that the mitigation measures as proposed are intended to assist local agencies in their independent decision making process and are not considered mandatory. We also recommend that the Mitigation Monitoring Program be revised to reduce the burdensome nature of the reporting process.
4. In a separate letter (dated February 13, 2012 from Jerry L. Blum, Planning Director) we requested that two important projects for Ontario be included in the 2012 RTP. These projects were requested via SANBAG and SCAG's consultant previously.

We appreciate your consideration of our comments in the final RTP/SCS and PEIR and look forward to your responses. As always, we commend SCAG for its leadership in these regional activities and the transparent and collaborative manner in which you operate. We share your commitment to a stronger, more cohesive, and prosperous region as expressed in the 2012 RTP/SCS. If you have any questions regarding this matter please contact myself or Jerry L. Blum, Planning Director at 909-395-2199.

Sincerely,

Chris Hughes
City Manager

RE: Comments of the Draft 2012 RTP/SCS and Related Program EIR

Dear Mr. Ikhrata:

The City of Palmdale would like to thank the Southern California Association of Governments (SCAG) and its staff for preparation of the draft 2012 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) and related Program Environmental Impact Report (PEIR). Further, we appreciate the opportunity to review and comment on these draft documents and offer the following comments as discussed below.

1. The City worked diligently with SCAG to develop the growth projections for population, housing and employment data for the 2008 (existing), 2020, and 2035 years. These growth projections represent what we feel is a realistic growth rate projection based upon the information available to us as well as our understanding of City and Antelope Valley growth related issues. Further, these numbers also reflect our draft RHNA allocations. Therefore, it is our position that the adoption of the growth forecast numbers continue to be done at the local level and not at a larger sub-regional or county level.

2. The RTP does not mention the Palmdale Energy Action Plan (PEAP) and we feel that there should be some type of reference and/or acknowledgement of the City's efforts to address GHG reduction. This issue was mentioned at several sub-regional coordinator meetings in which SCAG indicated that they would include this in the document but did not.

Auxiliary aids provided for communication accessibility upon 72 hours' notice and request.

3. The City is concerned about the methods to be used by SCAG on implementing and monitoring proposed mitigation measures for the RTP/SCS as they apply to local agencies. The document should specify to what extent mitigation measures are to be complied with at the local level. On a project level, certain specific mitigation measures may not be applicable at all to a project or may only be applicable when the mitigation measure is achievable or reasonable. Further, it should be stipulated what the consequences are, if any, for the local governments non-compliance with the mitigation measures.

4. The RTP/SCS identifies strategies to reduce greenhouse gas emissions from cars and light duty trucks. The City has concerns related to the implementation of these proposed strategies. These strategies should not be required individually but with several discretionary options made available to the City to satisfy GHG emission reduction goals.

5. The SED disaggregation at the TIER II TAZ level does not correlate with the City's land use plan. Provide clarification on methodology used. How will our city be able to make the necessary consistency findings for projects that are eligible for CEQA streamlining benefits if the modeling results do not match our locally adopted General plan? This shall be clarified.

6. Page 156 of the Aviation and Airport Ground Access supplemental document should be updated to reflect the California High Speed Rail Authority's January 12, 2012, decision to discontinue the study of the Grapevine alignment and to continue the final study of an Antelope Valley alignment and station in the City of Palmdale.

We appreciate your review and consideration of the comments provided by the City and look forward to your responses on these items. The larger agencies and councils within the SCAG region will likely have a substantial amount of comments on the draft RTP/SCS plan and EIR. We have attempted to limit our comments to those issues having the greatest potential impact to the City of Palmdale.

Please feel free to contact me at (661) 267-5293 should you have any further questions.

Sincerely,

Richard Kite
Planning Manager

Re: Comments on the Draft 2012 Regional Transportation Plan

Dear Mr. Lieb:

Thank you for the opportunity for the City of Pasadena to provide comments on the Draft 2012 Regional Transportation Plan (RTP). The City of Pasadena's General Plan promotes the priority of non-auto trips and sets the tone for the Mobility Element with the Guiding Principle "Pasadena will be a city where people can circulate without cars." The Mobility Element relies upon an integrated and multi modal transportation system that provides choices for everyone living and working in the city. Implementing the projects and policies in the RTP will assist Pasadena in becoming a more livable city for the 21st Century.

I believe you are aware of the active role Pasadena has played over a long period regarding any freeway connection that traverses our community. The issue of the 710 North extension, albeit being a tunnel alternative as opposed to a surface freeway, continues to be a sensitive topic among our elected officials, neighborhood groups and city residents. We request that the RTP recognize the on-going environmental study for this facility and not presuppose the ongoing studies by defining a route for the 710 north extension project.

The City of Pasadena supports the policies included in the RTP to encourage the expansion of local transit service to serve as feeder systems to the regional transit network. However the RTP does not address the limited funding resources that local agencies have in providing these important transit services. We would like the RTP to identify additional funding resources to expand local transit services and include polices that expand the availability of funding for local transit providers.

100 North Garfield Avenue · Pasadena, CA 91109
(626) 744-4311 Fax (626) 744-3921

The City of Pasadena would like the regional transit connection between the North Hollywood Red Line/Orange Line Station and the Gold Line in Pasadena via Burbank and Glendale included in the RTP. This is an important transit project for our subregion and should be included in the RTP and should be considered for implementation using reasonably available funding sources described in the RTP Financial Plan.

Thank you for your consideration of this request.

Sincerely,

BILL BOGAARD
Mayor

Email: RTP@scag.ca.gov

SUBJECT: SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS' 2012-2035 DRAFT REGIONAL TRANSPORTATION PLAN/SUSTAINABLE COMMUNITIES STRATEGY

Dear Ms. Lin:

The City of Pico Rivera appreciates the opportunity to provide comments on the 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Associated Draft Environmental Impact Report (PEIR). The City of Pico Rivera respectfully submits comments on the proposals for the East-West Freight Corridor Program and the California High Speed Rail Program

East-West Freight Corridor Program

The City supports the proposal for the East-West Freight Corridor Program. The City agrees the Southern California regional freeway system represents one of the highest volume goods movement corridors in the United States and is of major importance to the distribution of consumer goods. We understand major freeways such as Interstate 605 and State Route 60, are impacted by high volumes of truck traffic and truck volumes that will increase through 2035 by 260% or more. For this reason, the City supports the East-West Freight Corridor Program as the solution to address the goods movement in the region.

We recognize that the RTP/SCS identifies and recommends a corridor concept that would connect to the north end of the I-710 freight corridor, roughly parallel the Union Pacific Railroad (Los Angeles Subdivision) before finally following a route adjacent to SR-60 just east of SR-57. This grade-separated concept considers the use of the Union Pacific Railroad Corridor (UPRR Corridor), between I-710 and I-605, through the City of Pico Rivera.

The RTP/SCS further states that the potential use of two non-roadway routes provides an opportunity to move the facility away from neighborhoods and closer to the industrial activities that it would serve. This could not be further from the truth, especially when considering the existing land uses adjacent to the UPRR Corridor within the City of Pico Rivera. Approximately 80% of the existing land use along said Corridor is residential. The statement that this alignment provides an opportunity to move the facility away from neighborhoods is erroneous as it relates to the City of Pico Rivera.

The proposed dedicated truck lanes, forecasted to carry from 58,000 to 70,000 trucks per day, will result in the rerouting of truck traffic from major freeways through the City of Pico Rivera. In effect, the program would build a new freeway through Pico Rivera dedicated to truck traffic (truck dedicated freeway).

The City of Pico Rivera opposes any corridor alignment that includes the segment of the UPRR Corridor between the 710 Freeway and the 605 Freeway. This proposal splits the City in half, requires significant residential, industrial, and commercial property acquisition, and has aesthetic impacts unacceptable to the City. This proposal is unacceptable to the city and we oppose it.

The City respectfully requests that potential routes for the East-West Freight Corridor be limited to freeway routes only, and the non freeway routes not be further considered. The subject UPRR Corridor segment can be supplanted with the segment of the State Route 60, between the Interstate 710 and the Interstate 605. SCAG should effectively evaluate the connection between the two freeways to make this option feasible.

As stated in the enclosed City Council Resolution approved on October 25, 2011, the City of Pico Rivera supports the East-West Freight Corridor Program and supports alternative regional goods movement plans that equitably distribute truck traffic between the Interstate 710 and Interstate 15 through the expansions of the existing freeway system. However, for the reasons stated above, the City of Pico Rivera opposes any SCAG proposal for dedicated truck lanes along the Union Pacific Railroad Corridor, in the City of Pico Rivera.

California High Speed Rail

The RTP/SCS includes options for high speed rail. The City is concerned about the feasibility of such a project in California. We understand that discussions are ongoing among SCAG, the County Transportation Commissions, and the California High Speed Rail Authority regarding levels of available funding for rail infrastructure improvements within the SCAG region. We look forward to further details about the specific investments that will be made in Southern California's rail infrastructure under the RTP/SCS, particularly those that affect the City of Pico Rivera.

At this time, the RTP/SCS proposes three Passenger Rail strategies that will provide additional travel options for long-distance travel within the region and to neighboring regions. The City understands these improvements to be to the Los Angeles-San Diego (LOSSAN) Corridor,

improvements to the existing Metrolink system, and the implementation of Phase I of the California High-Speed Train project. The City would support such improvements only if to enhance the existing rail system through Pico Rivera, and not add supplementary rail lines within new corridors that would require significant residential/industrial/commercial property acquisition.

Goldline Eastside Transit Corridor Phase II

The RTP/SCS estimates that the Goldline Eastside Transit Corridor will be completed by 2035. However, the need for mass transit in the eastside area is greatly underestimated and should be included as a high priority project. The Goldline Eastside Transit Corridor was also included as a project in the regional SCS as it will greatly help to reduce the effects of greenhouse gases. As such, the City of Pico Rivera requests that the Goldine Eastside Transit Corridor be a high priority project both in the RTP/SCS and in the biennial 2011 Federal Transportation Improvement (FTIP) update.

Financial Plan

Table 3.3, *New Revenue Sources and Innovative Financing Strategies* of the RTP/SCS Financial Plan lists Mileage-Based User Fee as a replacement to the gasoline tax. This is a new fee that may affect lower-income residents within the Gateway Council of Governments region. Please advise how the fees would be implemented and how they may affect lower income residents.

Thank you for your attention to this matter. Should you have any questions, please contact Art Cervantes, Director of Public Works/City Engineer, at (562) 801-4225.

Respectfully,

Ronald Bates, Ph.D.
City Manager

cc: Director of Public Works/City Engineer
Assistant City Engineer

Enclosure (Resolution No. 6646, adopted 10/25/11)

RESOLUTION NO. 6646

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF PICO RIVERA, CALIFORNIA - SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS - EAST-WEST FREIGHT CORRIDOR PROGRAM

WHEREAS, the Southern California regional freeway system represents one of the highest volume goods movement corridors in the United States and is of major importance to the distribution of consumer goods and in facilitating international trade; and

WHEREAS, an important part of the movement of goods within the region is accomplished through a complex system of transportation infrastructure; and

WHEREAS, the City Council of the City of Pico Rivera is generally supportive of regional transportation alternatives as long as they do not impact or interfere with the quality of life within the City of Pico Rivera; and

WHEREAS, the Southern California Association of Governments (SCAG) prepared an analysis to evaluate East-West freight corridor alignment alternatives between the Interstate 710 and west to the Interstate 15. Alignment alternatives were evaluated based on proximity to current and future freight markets, feasibility and right-of-way constraints, and corridor operational characteristics which considers truck traffic volumes and frequency of truck-involved accidents; and

WHEREAS, SCAG is proposing certain conceptual alignments that involve installing dedicated truck lanes along the Union Pacific Railroad (UPRR) Corridor, between the Interstate 710 and the Interstate 605, on at-grade or elevated structures. Such alignments involving the UPRR Corridor severely impact the City of Pico Rivera and require significant industrial/commercial and residential property acquisition; and

WHEREAS, the proposed UPRR alignment alternatives are forecasted to carry over 57,000 trucks per day. Any alignment involving the UPRR Corridor in the City of Pico Rivera would result in the rerouting of truck traffic from major freeways thru the City of Pico Rivera thereby severely impacting the City; and

WHEREAS, there is currently insufficient engineering and environmental review of any alignment involving the UPRR corridor to warrant the inclusion in any long-term transportation planning document, including the 2012 Regional Transportation Plan (RTP).

NOW, THEREFORE, BE IT RESOLVED that the Pico Rivera City Council does hereby find and determine as follows:

Section 1. That the City of Pico Rivera supports the East-West Freight Corridor Program.

Section 2. That the City of Pico Rivera supports alternative regional goods movement plans that equitably distribute truck traffic between the Interstate 710 and Interstate 15 through the expansions of the existing freeway system.

Section 3. That the City of Pico Rivera opposes any SCAG proposal for dedicated truck lanes along the Union Pacific Railroad Corridor.

Section 4. The City Clerk shall attest and certify to the passage and adoption of this Resolution and it shall become effective immediately upon its approval, with a certified copy of this Resolution being forwarded to the Southern California Association of Governments, Los Angeles County Board of Supervisors.

APPROVED AND ADOPTED this 25 day of October, 2011.

David W. Armenta, Mayor

Los Angeles, CA 90017

Subject: Comments on the 2012 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) and Program Environmental Impact Report (PEIR)

Dear Mr. Ikhrata:

The City of Rancho Santa Margarita appreciates the opportunity to review and provide comments on the draft 2012 RTP/SCS and the PEIR. The City has completed its review of these documents and provides the following general comments:

- **Concern with the timeline.** We recognize the immense efforts it took to prepare these documents. They are incredibly complex documents establishing important and far-reaching policy for the region. However, because of this importance and complexity, we would like to express concern about the timing of the release of the documents and hope that preparation of future RTP/SCS documents will take into account the need to accommodate adequate review, discussion and revision time for all of the documents. The timeline of document releases, public comment period, and time allowed for the response to comments results in an inability to have credible discussion regarding possible changes because the timeline does not allow for recirculation or full discussion of requested changes. The documents were released over the holiday season and included the release of draft PEIR document on December 30, 2011. The minimum 45-day public comment period closes on February 14, 2012. Only a few weeks are provided to prepare responses to comments and amend the documents to ensure that the Regional Council may consider the certification of the PEIR and the approval of the draft RTP/SCS on April 4, 2012.

- **It is requested that the adoption of the growth forecast numbers by the Regional Council and/or Joint Policy Committee be at the county level, consistent with past RTPs.** Planning documents need to be flexible. As time passes, what is possible and feasible for any given project changes. These changes can be due to market conditions, new information or data, or infrastructure available that may shift when and where development is possible. Smaller geographic levels, such as at the subregional, city, census tract, TAZ, parcel, or grid cell would limit jurisdictional control over land use.

- **Please define what is meant by various terms in the RTP/SCS and draft PEIR.** Because mitigation measures are intended to be implementable and measurable in order to evaluate the effectiveness of the measures, it is important for the measures to clearly indicate what actions are expected to be undertaken. These include, but are not limited to:
    - Urban Growth Boundary
    - Parking Cash Out
    - References to benchmarks
    - Smart growth principles
    - SCRIP
    - Active Transportation
    - Gentrification
    - Greenfield
    - Open space

- The OCCOG Board approved the update to the OCP-2010 dataset used in the OC SCS. OCP-2010 Modified was officially approved by the OCCOG Board on January 26, 2012 and is a data amendment to the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 and this is the formal notice of the update which should be incorporated into the 2012 RTP/SCS, PEIR, and related documents. To be consistent with the MOU on subregional delegation between OCTA, OCCOG, and SCAG, all documents, tables, maps, narratives, modeling runs, PEIR

alternatives (including Alternate C/3/Envision 2), and datasets should be updated with the OCP-2010 Modified numbers.

- Finally, the City has participated in providing comments through the OCCOG Technical Advisory Committee (TAC). Rather than incorporating those comments into this comment letter verbatim, the City requests that the comments provided by the OCCOG TAC be incorporated into the City's comments by reference.

The City plans to continue its active participation in the 2012 RTP/SCS approval process through OCCOG TAC; however, the City requests that SCAG continue to provide the City with any additional information on the project as it becomes available. Should you have any questions, please call me at (949) 635-1800 x6704.

Sincerely,

Nate Farnsworth

SUBJECT: NOTICE OF AVAILABILITY (NOA) OF DRAFT 2012-2035 REGIONAL TRANSPORTATION PLAN (RTP)/SUSTAINABLE COMMUNITIES STRATEGY (RTP/SCS) AND DRAFT 2011 FEDERAL TRANSPORTATION IMPROVEMENT PROGRAM AMENDMENT #11-24 (FTIP) AND DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT (PEIR) FOR THE 2012 – 2035 REGIONAL TRANSPORTATION PLAN AND SUSTAINABLE COMMUNITIES STRATEGY

Dear Ms. Lin and Mr. Lieb:

Thank you for the opportunity to comment on the two Notices of Availability (NOA) for the above noted projects. As a member organization of the Southern California Association of Governments (SCAG), the City of Riverside has been and continues to participate in the development of the RTP and SCS including reviewing and providing input on the documents and the Draft PEIR. City staff is aware of the hard work that has resulted in these two documents and commends SCAG for preparing a forward thinking plan for our region, where 1 in 17 Americans live and 40 percent of all shipping containers west of the Mississippi River enter the country through the ports of Los Angeles and Long Beach.

On February 8, 2012, SCAG staff graciously held a teleconference meeting with the Planning Directors Technical Advisory Committee of the Western Riverside Council of Governments (WRCOG). During the teleconference meeting, many of City staff's questions were answered. However, some unanswered questions remain and need to be addressed due to the importance of the RTP/SCS and the SCS's connection to Compass Blueprint funding and CEQA streamlining advantages, both stemming from SB 375 and SB 226 for cities whose general plans are consistent with the SCS.

For these reasons City staff has the following questions concerning the documents:

1. The SCS includes projected land use patterns for 2035 using High Quality Transportation Corridors. In the City of Riverside, this includes Bus Rapid Transit (BRT) and Metrolink Lines similar to the City's General Plan 2025. However, the land use patterns in the SCS were applied at the Transportation Analysis Zones (TAZ), which incorporate large areas of land that may contain drastically varying land uses or developable land. Using this map for consistency with the City's General Plan 2025 would be very problematic. For instance, maintaining land use consistency between the General Plan and the prescribed TAZ map along the Alessandro Boulevard BRT corridor would force the City to direct growth to areas such as the Sycamore Canyon Wilderness Park (a natural open space conserved by the County Multiple Species Habitat Conservation Plan) and along hillsides and arroyos, which have already been developed to their maximum density based upon their natural characteristics. The area near the La Sierra Metrolink Station is another part of the City where increasing density using the prescribed TAZ map would result in directing density into a protected area. The City's

Greenbelt, a protected agricultural area which lacks the infrastructure to support the proposed density, encompasses a large section of the City in this area and would be impacted by the proposed growth. Other specific comments related to the proposed TAZ map are as follows:

a. Generally, the SCS map is in conformance with the City's General Plan 2025 and its intent. However, using TAZ's rather than parcels and following the logistics of the City's natural characteristics causes some problems in creating General Plan consistency.

b. Page 148 of the RTP/SCS describes how consistency within a TAZ can be averaged. However, the projected growth in some of the TAZ's located within the City of Riverside is not feasible due to various constraints, including a lack of infrastructure, habitat conservation efforts, and topography. The City's General Plan accounts for these constraints and is consistent with the overall intent of the SCS, however it directs density to where it is appropriate along these same corridors. This is consistent with Smart Growth principles, which advocate for protecting sensitive open space areas and placing density in urban areas where infrastructure already exists.

c. The City aims to be consistent with the SCS but cannot achieve this at the TAZ level. Is there another option? Especially since the City's General Plan 2025 currently meets the overall intent of the SCS, but does so based upon the City's natural characteristics.

2. Socio-economic Data for Riverside County was revised by SCAG based upon the 2010 Census. These revisions were presented to the Executive Committee of WRCOG and approved in December of 2011. Will the plans and Draft PEIR be updated to reflect this new information?

3. Page 3.13-25 of the Draft PEIR, Table 3.13-6 incorrectly reflect data on the City of Riverside Wastewater Plant. This data should be updated to reflect that the City's Plant has a current flow of 34 mgd with a capacity flow of 40 mgd and will have a capacity flow of 52 mgd by 2035.

The City is deeply concerned about being able to meet consistency with the SCS in order to take advantage of Compass Blueprint Programs and CEQA streamlining provisions in the future. The current draft, unfortunately, creates conflicts with the City's existing land uses. SCAG's equal commitment to this goal for all cities would be deeply appreciated.

Should you have any questions regarding this letter, please contact Gus Gonzalez, Associate Planner, at (951) 826-5277 or by email at ggonzalez@riversideca.gov.

Subject: Comments on Draft 2012 SCAG RTP/SCS/PEIR

Dear Mr. Ikhrata,

Thank you for the opportunity to provide comments on the Draft 2012 Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the Draft Program Environmental Impact Report (DPEIR) for the 2012 SCAG RTP/SCS. The City of San Clemente requests a response to the following comments:

The City concurs with OCCOG and OCTA comments

The City of San Clemente concurs with the comments SCAG will receive from the Orange County Council of Governments (OCCOG) and Orange County Transportation Authority (OCTA). The City requests SCAG to respond all of their comments and to act upon any changes advocated by these agencies, of which the City is a member agency.

The General Plan and Zoning maps for the City are not accurate.

SCAG's website allows member agencies to review the maps that would be used for the Draft RTP/SCS and PEIR. We reviewed the latest map files and concluded they are not accurate. The City worked closely with SCAG staff on several occasions to ensure SCAG has accurate maps for the City of San Clemente. Please update the map files to reflect the comments we previously provided.

Growth forecast numbers should be at the county level consistent with previous RTPs.

The 2012 RTP-SCS, like other planning documents, has been written based on assumptions, market conditions, forecasts, projects lists, budgets, datasets, public opinion, and other information that can change after the 2012 RTP-SCS is adopted. Therefore, it is important for the 2012 RTP-SCS to project growth at the county level so cities and counties have the flexibility to respond to these changes when future land use decisions are made. If smaller geographic levels are used (e.g. subregions, cities, census tracts, Transportation Analysis Zones, parcels, or grid cells), it is less likely the 2012 RTP/SCS will forecast actual growth patterns. Therefore, please keep all growth forecast numbers at the county level. This has been the precedent for previous RTPs.

OCP-2010 modified numbers should be used

On January 26, 2012, the OCCOG Board of Directors approved an updated version of the OCP-2010 dataset for use in the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with SCAG's updated growth forecast dataset. The updated OCP-2010 dataset was provided to SCAG staff in December 2011. The City requests for all 2012 Draft RTP/SCS/PEIR documents, tables, maps, narratives, modeling runs, PEIR alternatives (including Alternate C/3/Envision 2), and datasets to be updated with the latest OCP-2010 numbers per the OCTA/OCCOG/SCAG Memorandum of Understanding (MOU) that established Orange County's subregional delegation.

The OC SCS should be fully integrated into the regional RTP/SCS

The RTP and appendices include numerous references to the OC SCS and SCAG's total use of the document. Yet numerous other references suggest SCAG may have modified elements of the OC SCS data. SCAG should include a statement, maps, tables, charts, and other information that is necessary to confirm all of the OC SCS land use, socioeconomic and transportation data was incorporated into the regional RTP/SCS without changes. SCAG staff told the OCCOG Board (at several meetings) the OC SCS data has not been and will not be altered. The OC SCS is to be integrated into the regional SCS without changes per the Memorandum of Understanding (MOU) between OCCOG and SCAG.

Mileage-based user fee

The draft RTP suggests $127.2 billion of the approximately $219.5 billion regional shortfall can be addressed through actions at either the state or federal level with a $0.15 gas tax increase between 2017 and 2024. After that, the draft RTP assumes the state or federal government would either replace the gas tax with an indexed mileage-based user fee of $0.05 per mile, beginning in 2025, or further increase fuel taxes to

generate revenues equivalent to the mileage-based user fee. The City of San Clemente cannot support an increase in fees, including the introduction of a mileage-based user fee, until further economic analysis is completed and presented to the City for discussion. In addition, when considering support for any kind of a new user-based fee program, an emphasis must be placed on the need for a return-to-source criteria, as well as a process for recognizing and rewarding areas which commit additional local revenues.

Draft Program Environmental Impact Report

- The Draft PEIR states that SCAG "has made a preliminary determination that the proposed mitigation measures are feasible and effective. Therefore, it is reasonable to expect that local governments will actually implement them." It is unclear how this determination was made. Was this studied? If so, please provide the analysis that was used to prove cities and counties have the ability, staffing, and financial resources to implement all of the mitigation measures.

- At the January 26, 2012 SCAG workshop, and at other meetings, SCAG explained that "**This PEIR offers a "toolbox" of mitigation measures** for future project-level environmental analyses." . . . It also includes suggested mitigation measures for local agencies to consider for implementation, if appropriate and feasible." The PEIR contains text that contradicts this. The document states local agencies *"can and should"* implement the mitigation measures SCAG proposes. The use of the words *"can and should"* implies local agencies have the feasibility and obligation to implement the mitigation measures. SB 375 is not to supersede local agencies' authority to regulate land uses. California Government Code section 65080(b)(2)(K) states ". . . Nothing in a sustainable communities strategy shall be interpreted as superseding the exercise of the land use authority of cities and counties within the region. . ." To address these inconsistencies, the "can and should" language should be changed in mitigation measures to read "~~can and~~ should consider where applicable and feasible" when local and regional agencies, other than SCAG, are identified. This will clarify SCAG's intent to make the mitigation measures a menu of options for local agencies to use when land use decisions are made on projects.

- Several of the mitigation measures that identify SCAG as the acting agency propose measures that appear to exceed the authority of SCAG.

- SCAG must be mindful and use great discretion when making commitments and/or suggesting policies and strategies that may impact and encroach upon local and county agencies' responsibilities. Any such changes should be evaluated and supported by local agencies. Commitments should not be made on behalf of local agencies without the consent of City Councils and County Supervisors.

- Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, thus not be approved. They also represent prescriptive means to accomplish the mitigation. It is requested that such measures be reworded to indicate that a new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. Also, please clarify whether it was assumed that these additional fees were considered feasible and if the new fees that are suggested were considered in the financial plan or economic analysis of the RTP.

Indicate local jurisdictions are not required to demonstrate compliance with the PEIR.

Please amend the text on page 1-5 of the draft PEIR to indicate that local jurisdictions are not required to demonstrate compliance with the PEIR. The document currently reads: "Lead agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring efforts, including SCAG's Intergovernmental Review (IGR) process."

The City of San Clemente appreciates SCAG's work on the RTP and PEIR. Again, thank you for the opportunity to comment on the planning documents. We look forward to the adoption of a complete and accurate 2012 RTP and PEIR in April. If you have further questions, please contact Jim Pechous at (949) 361-6195.

Sincerely,

George Scarborough

RE: Comment on the Draft 2012 Regional Transportation Plan and Program Environmental Impact Report (EIR)

Dear Mr. Ikhrata:

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) draft 2012 Regional Transportation Plan (RTP) and related Program Environmental Impact Report (EIR). We would like to also acknowledge the significant effort made by SCAG, in cooperation with the Orange County Council of Governments (OCCOG), in crafting the "first" SB 375 Sustainability Communities Strategy (SCS) for incorporation into the 2012 Regional Transportation Plan.

In review of the draft 2012 SCAG Regional Transportation Plan and Program EIR, the following are three key areas we would like bring to your attention:

1. The growth forecast numbers included the draft 2012 Regional Transportation Plan should allow for reasonable market flexibility. Thus, it is recommended that the growth projections be incorporated and adopted at a County level. Adoption of population, employment and housing growth projection at any smaller geography could introduce unnecessary and unintended challenges for cities and the development community to make reasonable adjustments to land use approvals; and potential inconsistency with the adopted Regional Transportation Plan.

2. The Orange County Projections (OCP) are developed every three to four years in cooperation with each individual jurisdictions in Orange County, to reflect the anticipated growth for our communities. We respectfully request that the Regional Transportation Plan be refined to include the latest "OCP 2010-Modified" version that incorporates the 2010 Census and more recent State employment data.

3. Several mitigation measures within the RTP Program Environmental Impact Report inappropriately uses the terms "will and shall" in describing the measures. For example, Mitigation Measure 76 (M-TR76) states, "Street standards will include provisions for bicycle parking within the public right of way." Given local policies and ordinances to support them are not in place at this time, stating "will include" in these mitigation measures in the Program EIR are not appropriate. It is suggested that this language in the measures be replaced with "can and should".

The City of Santa Ana appreciates the significant resources and collaborative effort required to develop the 2012 SCAG Regional Transportation Plan; particularly with the SB 375 requirement to incorporate a Sustainability Communities Strategy to integrate land use and transportation planning to promote sustainable communities. We appreciate the opportunity to comment on this landmark regional planning document. Should you needs any clarification regarding our comments, please feel free to contact Associate Planner Melanie McCann at 714.667.2746 mmccann@santa-ana.org.

Sincerely,

Jay M. Trevino

SUBJECT: 2012 DRAFT REGIONAL TRANSPORTATION PLAN

Dear Mr. Ikhrata:

On behalf of the Santa Clarita City Council, I am writing to request that the Orange Line Development Authority's Northern Corridor be included within Southern California Association of Governments' (SCAG) Regional Transportation Plan (RTP) Constrained Projects List.

The Orange Line Development Authority (OLDA), of which the City of Santa Clarita is a member, is committed to the development of a high speed, grade separated, environmentally friendly and energy efficient transportation system. In recent months, the OLDA Northern Corridor, from downtown Los Angeles to Santa Clarita, has been the focus of intense review and investment. These activities position OLDA's Northern Corridor to be placed within the Constrained Projects List, as opposed to the RTP's Strategic Plan.

Los Angeles County Metropolitan Transportation Authority (Metro) is currently conducting the Antelope Valley Line Infrastructure Improvement Strategic Plan. This plan anticipates the identification of specific projects, which can be undertaken in the corridor to enhance service and safety. This study will be completed in spring 2012.

The Regional Council's approval earlier this month of a Memorandum of Understanding (MOU) with the California High Speed Rail Authority and transportation commissions paves the way for placement of the statewide high speed rail project within the RTP Constrained Projects List, as the alignment for the high speed rail project falls within the OLDA Northern Corridor. Furthermore, the $1 Billion included within the Memorandum of Understanding contemplates expenditures within the OLDA Northern Corridor during the 2012 RTP horizon. It is also widely anticipated that some of the recommendations identified in the Antelope Valley Line study will also be incorporated into the project list that serves as the implementation of the MOU.

Finally, the Ground Access Study being conducted by the Burbank-Glendale-Pasadena Airport Authority and OLDA focuses on multi-modal transportation improvements that will enhance the linkage between the airport, the OLDA Northern Corridor, and communities, such as Santa Clarita, located within the corridor.

Clearly, the current study activity along the OLDA Northern Corridor, coupled with specific inclusion of the California High Speed Rail Authority's proposed project along the same corridor, demonstrates that the OLDA Northern Corridor meets the criteria for being included within the RTP Constrained Projects List. Within the foreseeable future, it is reasonable to conclude that significant investments will likely be made in the corridor, in conformance with SCAG's criteria for inclusion of projects within the Constrained Project List

On behalf of the Santa Clarita City Council, I encourage SCAG staff and the Regional Council to include the OLDA Northern Corridor within the 2012 RTP Constrained Projects List. Should you or your staff require additional information regarding this request, please contact me or the City of Santa Clarita Intergovernmental Relations Officer, Michael Murphy, at (661) 259-2489.

Sincerely

Laurie Ender

Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West 7th Street, 12th Floor
Los Angeles, CA 90017

Dear Mr. Ikhrata:

Subject: Comments Regarding the 2012 Draft Regional Transportation Plan and Regional Transportation Plan Program Environmental Impact Report

Thank you for the opportunity to provide comments on the Regional Transportation Plan (RTP) and the Program Environmental Impact Report (PEIR) for the Regional Transportation Plan. The City of Santa Clarita (City) has identified questions and comments in three chapters of the RTP and on several mitigation measures included in the PEIR. For ease of reference, comments and questions appear in *italics*.

The purpose of the RTP is to provide a blueprint for future transportation projects and strategies throughout the Southern California Association of Governments (SCAG) region through 2035. Included within the RTP is a financial plan that identifies funding available to support the region's transportation investments, including transit, highways, local road improvements, systems preservation, and demand management goals. Central to the financial plan is the identification of funding resources the RTP identifies as "reasonably available" for future projects. The City has prepared the following comment regarding the financial plan included within the RTP (Chapter 3):

> *Based on its identification as a "reasonably available" funding resource, the City requests additional information on increased gas taxes or mileage-based user fees as mandatory action items. Over 50 percent of commuters that live in the City work outside of the Santa Clarita Valley. As a result, an increase in gas tax or a mileage-based user fee could result in significant financial impacts on the local labor pool (Page 95, Table 3.3).*

As required by Assembly Bill 32 and Senate Bill 375, this cycle's RTP includes a Sustainable Communities Strategy (SCS). The SCS functions as a mechanism to ensure the SCAG region can achieve mandated greenhouse gas (GHG) reductions of 8 percent per capita by 2020 and 13 percent per capita by 2035. The draft SCS included in the RTP concludes these targets can be met through a specific land use scenario, called Scenario 2. The scenario was compiled using a variety of data inputs, including a series of workshops hosted by SCAG in a number of

communities throughout the region and by working directly with staff at local jurisdictions. The SCS then models GHG based on a variety of factors. Central to Scenario 2 is a shift from larger lot residential development to smaller lot residential development, including more emphasis on multifamily housing. In addition, the scenario assumes a much higher level of infill and mixed-use development than historical development patterns. The City has prepared the following questions and comments regarding the SCS (Chapter 4) of the RTP:

For clarity, the scenarios in the RTP should be titled in a consistent manner with the alternatives included in the Sustainable Communities Strategy (SCS) background documentation. The City assumes "Scenario 2" from the RTP is the same as "Alternative B" in the SCS Background documentation.

Throughout the chapter, the RTP refers to Appendix 19. SCAG staff has indicated Appendix 19 is now referred to as the "SCS Background Documentation," however, this is not reflected in the current draft (Page 112).

Whereas, Santa Clarita agrees with the assumptions contained in land use Scenario 2 for the region, it should be noted it is unlikely a similar pattern will occur in the Santa Clarita Valley. Although the City's new General Plan, adopted in June 2011, stresses mixed-use and transit-oriented development, significant green-field development is still contemplated within the time horizon of the RTP (Page 115, Figure 4.3).

It is unclear how the two areas identified in Ventura County can be considered "urban areas" on par with those identified in Los Angeles, Orange, Riverside, and San Bernardino counties. By comparison to those areas identified in Ventura County, the State Route 14 (SR-14) corridor between the cities of Santa Clarita, Palmdale, and Lancaster services a local population of over 700,000 residents and represents a substantial proportion of the new growth in Los Angeles County (Page 125, Exhibit 4.5).

One of the three High Quality Transit Areas referenced in the exhibit is the Downtown Newhall area. This area is defined by the Downtown Newhall Specific Plan and is the primary focus of the City's former Redevelopment area. However, given the uncertainty surrounding former redevelopment areas, it is unlikely this location will be able to provide the same type of transit-oriented development and infill contemplated by the Downtown Newhall Specific Plan (Page 134, Exhibit 4.9).

The RTP includes future projects in at least two sections: the Constrained List, which is comprised of projects that have identified funding, and the Strategic Plan, which is comprised of projects requiring more study and which lack identified funding. The City has prepared the following comment regarding projects included in the Strategic Plan and not included in the Constrained List (Chapter 7):

SCAG should consider including the Orangeline High-Speed Transit Project (Union Station to Santa Clarita) in the Constrained List rather than the Strategic Plan, due to the

fact the Los Angeles County Metropolitan Transportation Authority has recently accelerated the evaluation of rail improvements along the Antelope Valley Line (Page 196, Table 7.1.).

As part of our review, the list of Constrained Projects was compared to the schedule of projects included on page nine of the "Measure R Highway Program" report released in January 2012 by the Los Angeles County Metropolitan Transportation Authority (Metro). The City has identified two discrepancies between the two documents and is seeking clarification. The discrepancies are as follows:

Metro's list of highway projects indicates completion of Interstate 5 (I-5) truck lanes (Phase 1) from SR-14 to Pico Canyon Road by 2014, while the Financially-Constrained RTP Project List indicates completion of this same project by 2016 (RTP Technical Appendices, page 154).

Metro's list of highway projects indicates completion of I-5 truck lanes and HOV lanes (Phases 2 and 3) from SR-14 to Parker Road by 2025, while the Financially-Constrained RTP Project List indicates completion of this same project by 2017 (RTP Technical Appendices, page 155).

The PEIR evaluates potential environmental impacts associated with the adoption of the RTP. The PEIR is a first tier document for later CEQA review of individual projects included in the program. Included in the PEIR is a list of over 500 mitigation measures to help reduce identified impacts.

In general, the document is unclear regarding whether mitigation measures that impact local governments are mandatory or voluntary. It is also unclear which agency will be monitoring mitigation measures that impact local governments and what the process for local governments to demonstrate compliance will be. *As a result, the City seeks clarification on whether potential lack of compliance with mitigation measures impact local government's ability to receive future transportation funding.*

The City has prepared the following questions and comments regarding mitigation measures contained in the PEIR:

Mitigation Measure GHG9 identifies the need for member cities and counties to adopt Climate Action Plans (CAP) and outlines no fewer than 14 information items that should be included in the CAPs. The City is in the process of creating its own CAP with an anticipated completion date of summer 2012 and seeks clarification on the following points:

It is unclear if and/or how the City should link its current Climate Action Plan (CAP) process with this item and if the City is able to take credit for any GHG reductions included locally within the SCS.

Mitigation Measure LU84 states that local jurisdictions should provide incentive funding and other incentives to support desired projects. The City is requesting clarification on the following point:

The City seeks clarification on the definition of "desired land uses and projects."

Mitigation Measure LU85 calls for local governments to reduce street widths to Pre-World War II dimensions.

The City feels reducing street widths to Pre-World War II widths is impractical and not financially feasible.

Mitigation Measure PS78 calls for local governments to encourage green-building practices in development projects and encourages the use of Leadership in Energy and Environmental Design (LEED) standards as models. However, with California's adoption of the CalGreen Building Code in 2010, the LEED model has become largely obsolete. The City has prepared the following comment:

The City's preference would be for SCAG to incentivize cities to adopt Tier 1 or Tier 2 guidelines included in CalGreen rather than reference a variety of independent programs.

Understanding the RTP is a regional document encompassing six counties and nearly 200 cities, it is important to note not all of the identified mitigation measures can be applied to each of the member jurisdictions equally given their wide range of socioeconomic, urban, geographic, and demographic conditions. The City has prepared the following comment regarding three mitigation measures:

The City feels the following mitigation measures are more appropriate for dense, urban centers than for suburban and rural areas of the SCAG region: TR59, TR63, and TR83:

We look forward to working with you and your staff now and in the future on this and other projects. Should you have questions, please contact me at (661) 284-1429 or at rnewman@santa-clarita.com. I am available at your convenience.

Sincerely,

Robert Newman,
Director of Public Works

Mr. Jacob Lieb
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, California 90017-3435

Re: Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Program Environmental Impact Review (PEIR)

Dear Mr. Lieb:

On behalf of the City of South Pasadena, we ask you to please accept these comments on SCAG's 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and associated Transportation Conformity Report and Draft Program Environmental Impact Review (PEIR).

I. SCAG's welcome deletion of a surface SR-710 north extension should be accompanied by a land-use action to require State disposition of the hundreds of properties now surplus to the surface route.

The City expresses appreciation to the Southern California Association of Governments (SCAG) for ending the SR-710 as a surface project in its 2008 RTP and maintaining that standing in the proposed plan and draft PEIR. SCAG should now recognize the California Legislature's intervening repeal of Section 100.4 of the Streets and Highways Code, which deprived the SR-710 corridor cities of their right to disapprove of a street-closing surface freeway, and the attendant legislative findings that the surface route will likely never be built. Under these premises, the RTP's land-use actions and strategies should include a requirement—to attain SB 375 criteria by creating affordable and other housing in transit corridors—that the hundreds of State-owned properties acquired for the surface route be released to private ownership. This overlooked measure affords a rapid means of creating such housing, in a relatively high-density environment, within the Gold Line transit corridor.

II. SCAG should follow the State's designation of an unbuilt SR-710 project as an extension and not a gap closure.

In the 1974-1998 EIS/EIR documents on the surface route, the project was characterized as the extension of the 710 north of Valley Boulevard. LA METRO adopted that terminology when the project changed from surface to tunnel and was made a subject of Measure R. Both the Legislature and the Bureau of State Audits continue in 2011 to refer to the unbuilt SR-710 project as an "extension." SCAG however continues, as it did in 2008, to refer to the project as a "gap closure," presumably on the premise that part of the 710 freeway

was completed south of the I-210 interchange. The 1976 judicial order that allowed the freeway component between I-210 and Del Mar Boulevard to be opened to traffic, however, treated this constructed freeway component as part of the I-210 project, as its opening was funded by an I-210 contract, and traffic was allowed not on the (then) route 7 freeway, but instead in the "Route 7 Corridor." In the words of the court, "only the southern portion of the Long Beach Freeway has been completed and it now terminates at Valley Boulevard. . . ." North of Valley to the I-210 interchange is described as the "uncompleted northerly portion." (*City of South Pasadena v. Volpe* (C.D. Cal. 1976) 418 F.Supp. 854, 858.)

Moreover, opening of that freeway portion was conditioned on the premise that opening the freeway segment "will have no effect on the decision as to the ultimate freeway location and will not foreclose reasonable alternatives to the proposed ultimate Route 7 Freeway." (418 F.Supp. at 864.)

To label the uncompleted 710 as a route "gap closure" ignores the reality that the freeway construction north of Del Mar was never accomplished in compliance with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA), and *use* of that portion was only allowed by the court as part of the 210 interchange and not to be used to justify completing a 710 freeway. The term "gap closure," designed to create a sense of inevitability or priority for this project over competing ones, must be removed.

III. The Plan and DEIR do not meet the legal requirements of the Clean Air Act, the National Environmental Protection Act or Title 23 of U.S. Code.

SCAG is the federally designated metropolitan planning organization under U.S. Code Title 23 §134(d)(1) charged with creating the Metropolitan Transportation Plan (MTP). This plan (the RTP), and an affirmation of its conformity with the State Implementation Plan (SIP) for air quality, is required for the utilization of federal aid funding in the Los Angeles region. Regulations require that the plan be financially constrained, cover at least a 20-year horizon, and include all projects of "regional significance." The plan must be updated every 4 years and be responsibly modeled to determine that the proposed network meets air-quality conformity requirements. Based on our review, we do not believe this basic standard has been met.

Test 1: Financial Constraint[1]

Federal regulations require that the RTP be financially constrained and include specific financial strategies to ensure implementation of all phases of all projects included in the plan to achieve air-quality conformity.[1]

Projects for which the state or region cannot demonstrate adequate anticipated funding may not be included in the air-quality conformity model. To do so would result in incorrect and potentially unattainable air-quality forecasts, which could not rightfully be concluded to meet conformity requirements.

The extension of SR-710, incorrectly referenced as the "SR-710 Gap Closure" project, is included in the Draft RTP/SCS. The project is described as an 8-lane toll facility in a tunnel

[1] 23 CFR Part 450.

and reported to cost $5.64B projected for completion in 2030.[2] At present only $780M has been secured. Tolling authority has been raised as a potential revenue source. However, a robust financial strategy to fully close the $4.86B financial gap, as is required by federal standards, has yet to be produced.

The financial ability to implement the gap-closure project, as described and modeled in the Plan, is speculative at this point. Based on SCAG's own guidelines,[3] such projects are not eligible for inclusion in the constrained plan but may be maintained in a strategic plan.

The inclusion of speculative projects in the RTP does not meet the federal requirement for a fiscally constrained plan and results in the modeling of a questionable network, thus failing to meet federal or SCS requirements.

Test 2: Regional Emissions Analysis

The emissions generated by the proposed network must be demonstrated to meet the emissions budgets prescribed by the State Implementation Plan (SIP).[4] Additionally, SB 375 requires SCAG to prepare a Sustainable Communities Strategy that achieves (and maintains) greenhouse gas emission reductions of 8% per capita by 2020 and 13% per capita by 2035. A primary goal of SB 375 is to significantly reduce Vehicle Miles Traveled (VMT) as a tool for greenhouse gas emission reductions.

Questionable assumptions are made regarding the air-quality benefits and VMT reductions that may be achieved by a network, including the SR-710 highway expansion. The assumed results include congestion relief, reduced VMT, and lower greenhouse gas emissions. These assumptions are not borne out by recent research[5] and comparable peer regions. Research in California has concluded that a 10% increase in highway capacity leads to a 9% increase in VMT. [6] A recent and extensive study utilizing Federal Highway Administration (FHWA) data also concluded that new or expanded interstate facilities correlate with VMT increases nearly on a one for one percentage basis and that the increase is above and beyond VMT that shifts from alternative routes or other modes.[7] The new facility will attract additional drivers, additional trips, and convert some transit trips to drive trips, eliminating most assumed air-quality benefits.

[7] Duranton, Gilles, and Turner, Matthew A. "The Fundamental Law of Road Congestion: Evidence from US Cities." *American Economic Review*, Volume 101, No. 6, October 2011, 2616–52.

A comparable case in the Metropolitan Washington Council of Governments (MWCOG) region had just such a result with the 1991 widening of I-270. This project was included in the regional network and analyzed in the regional air-quality model, which assumed the added capacity would reduce congestion, improve mobility and provide air-quality benefits. It further assumed that the majority of trips on the new facility would be diverted from the smaller streets on the network and therefore assumed no change in VMT projections and no reduction in transit mode share. Within just 8 years of project completion, however, congestion levels had returned to previous levels—in some segments 10 years earlier than the model predicted. Dramatic residential development followed the facility expansion, despite regional modeling assumptions that local land-use plans could control such growth. The corridor paralleled the heavy rail transit "red line," and despite increases in population along the transit corridor, transit ridership dropped by more than 6% during the first three years after the additional lanes opened. The added cars and early congestion meant air-quality impacts were worse than the model had predicted. In 2001, 10 years after the widening opened, for the first time ever, the regional transportation plan for the Washington Region failed to meet federal Clean Air requirements and all planning had to be put on hold.[8]

Given this research and evidence, the plan has not demonstrated that the regional emissions analysis is reasonable and based on justified and demonstrated assumptions and cannot be concluded to meet air quality conformance standards.

IV. By erroneously specifying only one SR-710 extension alternative—a straight line tunnel—the Plan and DEIR threaten program-level conformity and unlawfully prejudice future project-level environmental analyses.

The draft PEIR should assess impacts of the proposed system as a whole. Although it does not isolate the impacts of individual projects nor differentiate their unique impacts or benefits to the system as a whole, regulations require consistency between the project described and analyzed at the program level and analysis at the project level.[ii]

A project design concept and scope must not have changed significantly from that included in the metropolitan transportation plan for which the determination of conformity was made, and projects must be described in sufficient detail to determine emissions.[9]

Once included in an approved plan, the lead agencies may include, by reference, the program level PEIR purpose and need in their project-level environmental clearance documents and may further use the PEIR as the basis for their regional and cumulative impacts analysis.

NEPA and CEQA regulations prescribe a rigorous and transparent process that explores and objectively evaluates a number of project alternatives capable of meeting the project purpose and need. This process for the SR-710 extension project remains in its early stages, and an agency-preferred alternative has not yet been determined or stated, as several viable alternatives are still under consideration. The proposed Plan includes the toll-tunnel alternative

---

[8] "Clean Air Issues Put Transportation Planning Process on Hold." *The Region,* National Capital Region Transportation Planning Board, Volume 41, 2002, 10-15.

[9] 42 USC §7506.

in the constrained plan while the transit and "tunnel alternative" options remain in the strategic plan.

According NEPA, "interim action prejudices the ultimate decision on the program when it tends to determine subsequent development or limit alternatives."[10]

Given the requirement for program-level conformity consistent with project-level analysis, inclusion of the SR-710 extension as portrayed as a straight-line tunnel route is not appropriate. LA METRO has yet to propose a specific tunnel alignment, or for that matter any preferred project in the corridor. Even if LA METRO does advance a tunnel, the straight-line route is likely not to emerge as the most favorable of the tunnel alternatives, and indeed, LA METRO's environmental review may end up rejecting the tunnel option entirely. A tunnel option that avoids the steep grade rising into Pasadena and that avoids the Raymond Fault could emerge as more favorable both environmentally and economically, and earn less community opposition, than the direct route. That routing should produce different traffic patterns and modeling outcomes than a project on the assumed direct route.

Therefore, SCAG's inclusion of a single alternative to the SR-710 project in its RTP and draft PEIR would prejudice the environmental review process. This circumstance additionally establishes why a specific SR-710 project cannot be included in the constrained plan at this time.

V. Even though the proposed RTP and its shift of truck traffic to the East-West Corridor vitiates the asserted need for an SR-710 tunnel, the plan and draft PEIR should emphasize elimination of non-local truck traffic in preference to a direct rail loading at the ports.

In promoting the SR-710 tunnel within the last decade, officials have emphasized the need for truck-borne freight to move out of the LA Basin, claiming that such freight haulers (as opposed to commuters or drivers of light trucks) would find the projected tolls acceptable. In light of the draft RTP's emphasis of moving heavy truck traffic originating in the San Pedro Bay ports *not* along the 710 corridor north of I-10, but instead by an East-West Corridor to the Inland Empire, the plan and draft EIR cannot consistently maintain that an SR-710 freeway extension deserves priority or even inclusion.

As beneficial as it may be, in comparison to existing conditions, to shift truck-borne freight traffic off the northern portions of I-710, the RTP and draft PEIR must consider and adopt an even more vigorous approach that is necessary to meet SB 375's mandate of greenhouse gas reduction. Specifically, the plan and PEIR must assess and include the benefits of loading containers onto rail cars directly off the ships at dockside, thereby eliminating even further the case for new highway construction to relieve truck-induced traffic congestion. As pointed out in a recent *The Economist* essay, to maintain their standing in the face of a widened and deepened Panama Canal, "California's ports must compete on speed. . . ." They cannot do so as long as the RTP and draft PEIR continue to "clog up stretches of the I-710 freeway. . . ." ("California Ports: The Fickle Asian Container." *The Economist* (Jan. 28, Feb. 3, 2012, 30.)

---

[10] 40 CFR §1506.

Conclusion

The City of South Pasadena requests that the SCAG RTP and PEIR remove the SR-710 north extension. With its inclusion, the Plan has not demonstrated that it can meet two of the four required tests of conformity—sufficient financial resources for the project have not been demonstrated, and assumptions regarding regional emissions are flawed. The reported impacts of the planned network are based on suspect assumptions. Inclusion of the project at this time will bias future project-level NEPA and CEQA review if and when an SR-710 tunnel alignment becomes LA METRO's preferred alternative. Finally, while the circulating draft RTP and PEIR vitiate the need for any SR-710 extension that will produce tolls and relieve congestion, SCAG must discard its emphasis on accommodating any truck traffic from the ports and redraw its plan and assessments to anticipate the direct ship-to-rail transport that enables air-quality conformity and successful port competition.

[i] 23 CFR § 450.322 (b) (11) [the Metropolitan Transportation Plan shall] "Include a financial plan that demonstrates the consistency of proposed transportation investments with already available and projected sources of revenue. The financial plan shall compare the estimated revenue from existing and proposed funding sources that can reasonably be expected to be available for transportation uses, and the estimated costs of constructing, maintaining and operating the total (existing plus planned) transportation system over the period of the plan. The estimated revenue by existing revenue source (local, State, and Federal and private) available for transportation projects shall be determined and any shortfalls identified. Proposed new revenues and/or revenue sources to cover shortfalls shall be identified, including strategies for ensuring their availability for proposed investments. Existing and proposed revenues shall cover all forecasted capital, operating, and maintenance costs. All cost and revenue projections shall be based on the data reflecting the existing situation and historical trends. *For nonattainment and maintenance areas, the financial plan shall address the specific financial strategies required to ensure the implementation of projects and programs to reach air quality compliance*." (emphasis added)

[ii] 42 USC §7506 Limitations on certain Federal assistance -- Clean Air Act Section 176(c)
Sec. 7506(c) (2) (C) a transportation project may be adopted or approved by a metropolitan planning organization… only if it meets… the following requirements--

(i) such a project comes from a conforming plan and program;
(ii) the design concept and scope of such project have not changed significantly since the conformity finding regarding the plan and program from which the project derived; and
(iii) the design concept and scope of such project at the time of the conformity determination for the program was adequate to determine emissions.

Mr. Hasan Ikhrata
Executive Director
Southern California Associataion of Governments (SCAG)
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

RE: Draft RTP/SCS and Draft PEIR

Dear Mr. Ikhrata:

The City of Stanton appreciates the opportunity to comment on the 2012-2035 Draft Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) and the Program Environmental Impact Report (PEIR) and associated appendices. As a member city of the Orange County Council of Governments (OCCOG), the City would like to extend its support of the OCCOG response letter regarding the subject documents in its entirety. In addition, the City would like to provide the following comments regarding the RTP/SCS and PEIR:

It is requested that SCAG continue to utilize growth projection data at the County level as it has done in previous RTP processes. The growth projections for the 2012 RTP identify population, housing and employment data for the six-county SCAG region, from 2008 (existing) to 2020 and 2035. These growth projections represent the best available information from local jurisdictions, the business community and landowners. However, as time passes, what is feasible for any given project can change. The triggers for change to adopted growth projections can range from factors such as market conditions, new information or data, infrastructure availability, changes in funding availability (such as the dissolution of redevelopment agencies statewide), and changes to jurisdictional boundaries resulting from future annexations and incorporations of previously-designated unincorporated territory. SCAG should continue to adopt the growth projections for the 2012 RTP at a countywide level, consistent with past approvals of Regional Transportation Plan growth forecasts. County level geography accommodates internal adjustments to changing conditions as described above, without compromising the integrity of the overall growth projections. However, approving the growth projections at any lower level of geography, such as at the city level, would be challenged with continual revisions and shifts to the total number of housing, population and employment within a city, among cities, and between cities and counties as a result of the factors described above. Adoption of the data at a level lower than the county

would limit jurisdictional control and create inflexibility in a regional planning document. In addition, the level of geography in which the RTP/SCS growth forecast is adopted should not be determined by other processes. For example, the RHNA allocations must be consistent with the RTP/SCS; state law does not require that they be identical. The RTP/SCS can be adopted at the county level and the RHNA process may proceed independently until it is completed after the appeals, trades, and transfers are completed. The RHNA allocations that were derived from the growth forecast can still be determined to be consistent with the RTP/SCS, even if changes are made to the city totals during the appeals, trades, and transfers process.

In regards to the Projection data utilized in the RTP/SCS and the PEIR, on January 26, 2012, the update to the Orange County Projection (OCP-2010) dataset known as "OCP-2010 Modified" was officially approved by the OCCOG Board of Directors and is a data amendment to the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2010 EDD Benchmark data, consistent with SCAG's updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 and this letter also serves as the formal notice of the update that should be incorporated into the 2012 RTP/SCS, PEIR, and related documents.

As part of the SCAG SCS, it was indicated that the OC SCS was incorporated in its entirety without modification. However, there are strategies in the Orange County SCS that are not included in the regional SCS. Similarly, there are some strategies in the regional SCS that are not consistent with the strategies in the OC SCS. This creates confusion and clarification is needed. Under SB 375 and only within the SCAG region, subregional councils of government were allowed to prepare subregional SCS's that SCAG is then required to incorporate into the regional SCS. In Orange County, the Orange County Council of Governments (OCCOG) and the Orange County Transportation Authority (OCTA) developed a countywide or subregional SCS (OC SCS) that was to be incorporated in whole into the SCAG SCS. SCAG has incorporated the OC SCS in its entirety into the regional SCS as an appendix to the regional SCS, but it is unclear what the standing is of the OC SCS. The OC SCS contains a set of strategies that were agreed upon by local governments, agencies and other stakeholders within Orange County and was accepted by SCAG and should represent the SCS that is applicable to the Orange County region. Please clarify the roll of the OC SCS in the regional SCS, and when there are inconsistencies in the regional SCS and the OC SCS, whether the OC SCS would be the prevailing document for the Orange County subregion.

In the Mitigation Monitoring Program, it is stated that "Lead Agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring efforts, including SCAG's Intergovernmental Review (IGR) process." However, it is unclear how SCAG intends to implement the Mitigation Monitoring Program with regard to the proposed mitigation measures, as may be implemented by local agencies. In addition, it is infeasible for SCAG to require local jurisdictions to report when such mitigation measures are considered for any project. Noting that the SCAG region includes 6 counties, 14 subregional entities and 191 cities, this reporting requirement would surely fall short of expectations. Given this identified infeasibility, please clarify what obligations local agencies may have regarding SCAG's mitigation monitoring efforts.

On pages 1-5 and 1-7 in the introduction of the PEIR, the language should reflect that Lead Agencies will determine the feasibility and applicability of measures and that the measures are intended to offer a menu of options available should a lead agency opt to utilize them. The PEIR makes the assertion on page 1-7 of the Project Description under the Transportation Project Mitigation and Land Use Planning and Development Project Mitigation sections that the draft PEIR has made a preliminary determination that all of the mitigation measures in it are considered feasible. SCAG has not identified any analysis that supports the feasibility of the mitigation measures that are to be undertaken by entities other than SCAG and SCAG staff has stated on numerous occasions that the mitigation measures were intended to be a menu of options for consideration by lead agencies.

As indicated in the PEIR on page 1-6, state law provides that it is appropriate to indicate in mitigation measures that they "can and should" be implemented where the authority to implement the measures rests with agencies other than SCAG. The language conveys to local agencies an affirmative obligation to address each mitigation measure, irrespective of whether such agencies deem the measures applicable to a particular project or duplicative of their own or other governmental agencies' regulatory measures. The City recognizes that SCAG's use of the words "can and should" are derived from CEQA, at Public Resources Code sections 21081 and 2155.2(b)(5)(B)(ii) and CEQA Guidelines, including section 15091(a)(2). Nevertheless, given the express limitations of SB 375 upon respective local agencies' land use authority, any language seemingly imposing affirmative obligations contrary to SB 375 is inappropriate. As such, the use of the language "can and should" for mitigation measures addressed to local agencies is inappropriate and should be modified to clearly reflect the mitigation measures as a menu or toolbox for implementation where determined feasible by the local agencies.

Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, thus not be approved. They also represent prescriptive means to accomplish the mitigation. As such, any mitigation measure that indicates local agencies should implement new fees should be reworded to indicate the imposing of fees is only an option as a way to implement the mitigation measure.

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g. CEQA review requirements). Under the California Environmental Quality Act, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact and the significance of the impact is after all existing regulation is applied. Therefore, mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigate the impact, and the mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA.

In regards to overall document consistency, the alternatives in the PEIR should be consistently named. Throughout the document, the alternatives are identified with numbers (e.g. Alternative 1, 2, or 3), with letters (e.g. Alternative A, B, or C), or specific names (e.g. Envision 2).

Finally, there are several mitigation measures proposed which may not be applicable to certain projects or local agencies. As such, for project specific mitigation measures, or mitigation measures assigned to local agencies, the mitigation measures should be reworded to include the wording "if applicable."

If you have any questions regarding this matter, please feel free to contact Kelly Hart of my staff at (714) 890-4228.

Sincerely,

Omar Dadabhoy
Community Development Director

Office of the City Council

Ms. Margaret Lin
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017

SUBJECT: REVIEW DRAFT 2012 SCAG RTP/SCS AND DRAFT PEIR

Dear Ms. Lin:

Thank you for the opportunity to provide comments on the Draft 2012 Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the Draft Program Environmental Impact Report (DPEIR) for the 2012 SCAG RTP/SCS.

The City of Tustin has prepared the following comments for your consideration at this time:

- Most of the proposed mitigation measures go above and beyond the strategies of the Orange County SCS and requirements of the RTP and Senate Bill 375. For example, Mitigation Measure "Greenhouse Gas Emissions 5" states that "SCAG shall assist ARB and air districts in efforts to implement the AB 32 Scoping Plan." Implementation of the AB 32 Scoping Plan goes above and beyond the scope of SB 375 and the RTP. Therefore, this mitigation measure, and others like it that exceed the scope of the RTP and SB 375, should be removed from the PEIR.

- Proposed mitigation measures are already required by State and Federal law or are regulated by other agencies such as the South Coast Air Quality Management District, California Department of Housing and Community Development, California Department of Fish and Game, and the Regional Water Quality Control Boards should be removed from the PEIR.

- Many of the proposed mitigation measures, including "Land Use 3," "Land Use 10" and "Land Use 42" are contrary to local control. Mitigation Measure "Land Use 10" is one of the most compelling examples. It reads "Local jurisdictions can and should provide for new housing consistent with the Regional Housing Needs Assessment (RHNA) to accommodate their share of the forecasted regional growth." This mitigation measure is problematic and should be removed or revised because State Law and the RHNA do not require local jurisdictions to ensure that housing units are actually built.

- Many of the proposed mitigation measures impose taxes or fees that are financially infeasible for local agencies to implement or impose an undue burden on the building industry. For example, Mitigation Measure "Transportation, Traffic and Security 60" states the following: "Transit and Multimodal Impact Fees: Local jurisdictions can and

should assess transit and multimodal impact fees on new developments to fund public transportation infrastructure, bicycle infrastructure, pedestrian infrastructure and other multimodal accommodations." A second example is Mitigation Measure "Transportation, Traffic and Security 37" which reads "Local jurisdictions and transit agencies can and should provide public transit incentives such as free or low-cost monthly transit passes to employees, or free ride areas to residents and customers." Requiring these types of fees and incentives will increase the cost of development and negatively impact the local economy. Therefore, all such measures should be removed from the PEIR.

- The use of the words "can and should" throughout the PEIR and the Draft RTP/SCS implies that the proposed mitigation measures are feasible, and that local jurisdictions are expected to implement them. The following statement from page 1-7 of the Introduction makes this intent clear: "Local governments routinely implement the types of mitigation measures identified in this Draft PEIR during project design, CEQA review, and/or project construction. This Draft PEIR has made a preliminary determination that these mitigation measures are feasible and effective. Therefore, it is reasonable to expect that local governments will actually implement them." There is no analysis in the Draft RTP/SCS to demonstrate that every local jurisdiction within the SCAG region has the ability, staffing, and financial resources to implement all of the mitigation measures. SCAG should replace the words "can and should" with "should" in all of the mitigation measures in the PEIR and throughout the SCS Chapter of the Draft RTP/SCS. This change in wording would be consistent with SCAG staff's representation at the Orange County Council of Governments January 26, 2012, Board meeting that the mitigation measures are intended to be a "tool box" of options.

- The Draft RTP/SCS assumes that the transportation projects outlined in the document have the potential to induce growth in certain parts of the region. This concept is evidenced by Mitigation Measure "Biological Resources and Open Space 47" which reads "Project sponsors can and should ensure that transportation systems proposed in the 2012-2035 RTP/SCS avoid or mitigate significant impacts to natural lands, community open space and important farmland, including cumulative impacts and open space impacts from growth associated with transportation projects and improvements." This measure is not consistent with the OCSCS and the approved growth projections and patterns embodied within the Orange County Projections 2010 Modified. Therefore, all references to induced growth should be removed from the PEIR.

- It is stated on page 80 of the Draft RTP/SCS that "the RTP has the ability to affect the distribution of that growth." This statement appears to contradict SCAG's agreement pursuant to the Memorandum of Understanding with the Orange County Council of Governments (OCCOG) that the strategies and local land use policies of the Orange County SCS will be respected. The RTP/SCS should acknowledge that the local land use plans in Orange County will not be changed through the RPT/SCS.

- Many of the mitigation measures in the Draft PEIR are draconian and need to removed and/or revised. One prime example is Mitigation Measure "Land Use 85." It reads in part "Local jurisdictions can and should reduce heat gain from pavement and other hardscaping including: Reduce street rights-of-way and pavement widths to pre-World War II widths (typically 22 to 34 feet for local streets, and 30 to 35 feet for collector streets, curb to curb)..." Although reduced street widths may be appropriate in some

cases and have been implemented in many jurisdictions, it is inappropriate and counterproductive to require reduced street widths as a mitigation measure in the PEIR. Reduced street widths, for example, generally do not provide space for on-street parking which may result in greater, additional paved areas provided in separate parking lots.

- The Draft RTP/SCS suggests that $127.2 billion of an approximately $219.5 billion regional shortfall can be addressed through actions at either the state or federal level with a $0.15 gas tax increase between 2017 and 2024. After that, the report assumes that the state or federal government would either replace the gas tax with an indexed mileage-based user fee of $0.05 per mile, beginning in 2025, or further increase fuel taxes to generate revenues equivalent to the mileage-based user fee.

  The City of Tustin cannot support an increase in fees, including the introduction of a mileage-based user fee, until further economic analysis is completed and until and unless there can be an explanation of the return to source principles which will be used for the distribution of funds collected thereunder. In addition, when considering support for any kind of a new user-based fee program, an emphasis must be placed on a process for recognizing and rewarding areas which commit additional revenues.

- The Draft RTP/SCS proposes a number of investments that affect Orange County and go beyond the Long-Range Transportation Plan (LRTP). The City will only consider additional investments after revenues are identified to account for these commitments. The regional strategies identified by SCAG do not have clear funding mechanisms, and it must be made clear that their inclusion in the RTP/SCS does not constitute a commitment to fund and/or implement the improvements.

- The Sustainable Communities Strategy ("SCS") is recognized as a key portion of the 2012 RTP/SCS, and serves to meet responsibilities associated with SB 375. It is clear the SCS "Goals and Benefits" involve significant local jurisdiction participation and efforts. It is critical for the RTP/SCS to recognize the need to sufficiently fund local agency efforts to assure successful outcomes.

- Tables 4.3 - 4.7 of the RTP/SCS identify "Action/Strategy" efforts related to the SCS, with local jurisdictions being identified as responsible parties for many of the tasks. Without proper funding for local jurisdiction efforts we believe the effectiveness of the "Action/Strategy" measures will be compromised.

- In general, current policies and goals of the RTP/SCS identify projects and funding necessary to successfully implement elements of the RTP/SCS. There are also RTP/SCS goals which essentially require development "from the ground up" at the local level. We agree the most efficient and effective efforts toward meeting these RTP/SCS goals will begin with the local jurisdictions.

  There needs to be sufficient levels of funding (which do not appear to be addressed in the current RTP/SCS draft) to allow local jurisdictions to adequately initiate these specialized efforts. From a practical perspective, this funding would be expected to yield some of the most immediate and timely results in meeting RTP/SCS goals. They would consider measures which could include, but not be limited to:

- Programs for improved use of public transit
- Responsiveness to demographic changes
- Improved management of existing transportation infrastructure and roadways
- Employer-based Transportation Management Plans
- Trip-reduction efforts including promotion of telecommuting
- Carpool/transit parking near transportation corridors
- Better "place marking" which includes an increase of walkable environments
- Support of bicycle programs including bicycle storage and bike lanes
- Bridging gaps between mass transit options and shipping and service centers
- Programs for new construction and reconstruction of non-motorized transportation paths

- Measures to reduce vehicle miles traveled will involve local jurisdictions and employers to implement many strategies which include but are not limited to measures such as:

  - Increasing rideshare and work-at-home
  - Investing in non-motorized transportation facilities
  - Developing appropriate land use strategies
  - Encouraging universal employee transit access passes
  - Synchronizing traffic signals
  - Using LED technology for new traffic signals and street lights
  - Allocating convenient parking areas, loading areas and larger parking spaces for vans and HOV
  - Creating ride-sharing programs and provide parking near public transportation
  - Enhancing safety and cleanliness at transit stations
  - Providing shuttles to transit
  - Providing incentives, education and publicity to encourage use of transit

  It will be necessary to provide funding to local jurisdictions for implementation and/or management of these and other associated measures.

- Table 3.6 shows that the 2012 RTP/SCS anticipates relatively low levels of funding for local streets and roads, including $1.1 billion for FY2011-FY2015, $1.1 billion for FY2016-FY2020, and $1.2 billion for FY2021-2025. Funding is increased to $7.9 billion for FY2026-FY2030 and $9.6 billion for FY2031-FY2035. However, local street and road improvements offer the best opportunity for quickly improving mobility and realizing RTP/SCS goals. They also provide economic benefits which could translate into additional funding in the future. Funding for these programs should be increased and accelerated in the near future.

- One City of Tustin project which has both local and regional significance does not appear to be included in the RTP/SCS. It is therefore requested that the following project be added to the RTP/SCS:

  - Tustin Ranch Road extension from Walnut Avenue to Warner Avenue, including a new grade separation over Edinger Avenue and the OCTA/SCRRA Railway.

- In addition, the RTP/SCS should identify the regional transportation infrastructure deficiencies broken down by county for purposes of transparency.

Again, thank you for the opportunity to review and comment on the Draft 2012 Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the Draft Program Environmental Impact Report (DPEIR) for the 2012 SCAG RTP/SCS. If you have any questions regarding the City's comments, please call Elizabeth Binsack, Community Development Director at (714) 573-3031.

Sincerely,

John Nielsen
Mayor

Clean Energy

February 14, 2012

Ms. Margaret Lin
Southern California Association of Governments
818 W. 7th Street, 12th Floor
Los Angeles, CA 90017-3435

Re: Clean Energy's Comments on the Southern California Association of Government's 2015-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

Dear Ms. Lin,

Clean Energy appreciates the opportunity to submit comments on the Southern California Association of Government's (SCAG) 2015-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Clean Energy considers itself a partner of SCAG in that we are a local company that provides a near-zero emissions solution to many transportation sectors that can have a direct and significant impact on the region's air quality. Specifically, we offer clean transportation solutions through the use of natural gas and renewable natural gas (i.e., biogas) for regional fleets that include: taxis, airport shuttles, local delivery fleets, refuse trucks, transit buses, and heavy-duty trucks in the goods movement sector. As you know, many of the aforementioned fleets made a shift over to natural gas either due to rules developed by the South Coast Air Quality Management District or as part other regional efforts to reduce air pollution such as the San Leandro Port's Clean Truck Program.

Upon review of the proposed RTP/SCS, we felt compelled to comment on the document in its current form as it appears to overemphasize electric and zero emission vehicle strategies without any apparent back up documentation regarding the cost-effectiveness and feasibility of such strategies. Clean Energy strongly recommends that SCAG meet with Clean Energy to discuss our experience within the Industry and share with you how we, as a company, intend to help SCAG reach regional air quality attainment.

ABOUT CLEAN ENERGY

Clean Energy (Nasdaq: CLNE) is a Southern California-based company and the largest provider of natural gas fuel for transportation in North America. We are also a global leader in the ever expanding natural gas vehicle market. It has operations in CNG and LNG vehicle fueling, construction and operation of CNG and LNG fueling stations, biomethane production, vehicle conversion and compressor technology.

Clean Energy fuels over 25,000 vehicles at 280 strategic locations across the United States and Canada with a broad customer base in the refuse, transit, trucking, shuttle, taxi, airport and municipal fleet markets. We are building "America's Natural Gas Highway," a network comprised initially of approximately 150 LNG truck fueling stations connecting major freight trucking corridors across the country.

We own (70%) and operate a landfill gas facility in Dallas, Texas, that produces renewable natural gas, or biomethane, for delivery in the nation's gas pipeline network, and we plan to build a second facility in Michigan. We own and operate LNG production plants in Willis, Texas and Boron, Calif. with combined capacity of 260,000 LNG gallons per day and that are designed to expand to 340,000 LNG gallons per day as demand increases. NorthStar, a wholly owned subsidiary, is the recognized leader in LNG/LCNG (liquefied to compressed natural gas) fueling system technologies and station

construction and operations. BAF Technologies, Inc., a wholly owned subsidiary, is a leading provider of natural gas vehicle systems and conversions for taxis, vans, pick-up trucks and shuttle buses. IMW Industries, Ltd., a wholly owned subsidiary based in Canada, is a leading supplier of compressed natural gas equipment for vehicle fueling and industrial applications with more than 1,200 installations in 24 countries. An Abundant and Economical Domestic Resource

Reliance on foreign oil exacts a high toll on the U.S. in terms of direct economic costs and indirect energy security costs. During the three-year period from 2008 through 2010, the U.S. spent nearly $700 billion on imported petroleum. More recently, the cost of imported oil has been much higher as oil prices have once again exceeded $100 per barrel. In the coming decade, the U.S. Energy Information Agency (EIA) forecasts total expenditures for petroleum imports to top $3.3 trillion dollars.[1] America's reliance on oil not only affects our trade balance but makes the U.S. vulnerable to price spikes and supply disruptions. And high oil prices results in a windfall for regimes that may not be friendly to the America

Fortunately, the U.S. has an unprecedented opportunity to displace petroleum with domestic natural gas. As President Obama recently declared, the U.S. is "the Saudi Arabia of natural gas." The EIA, the Potential Gas Committee and other expert bodies now estimate that the U.S. has up to a 100 year supply of natural gas. The Potential Gas Committee's 2011 bi-annual report indicates that the U.S. now has a total future supply of 2,170 trillion cubic feet of natural gas. This is 89 Tcf more than estimated in the 2009 report. As was the case with the 2009 report, the 2011 report includes the highest resource estimate in the Committee's history. The availability of this significant domestic resource provides an unprecedented opportunity to solve a number of pressing national objectives like transforming the transportation sector.

Increasing the use for natural gas in transportation will keep our economy growing by supporting new jobs and economic development. In 2008, U.S. production of 20 Tcf of natural gas supported nearly 3 million jobs.[2] In his State of the Union remarks before Congress, the President indicated that new development of natural gas could result in 600,000 new jobs in this decade alone. Thus, increasing demand for natural gas as a

transportation fuel will help put more people to work and ensure that we put this natural gas to good use.

Natural gas also benefits our economy because it is a low cost energy that helps businesses grow while at the same time controlling costs. Natural gas is priced much lower than petroleum. The two fuels no longer track one another -- and haven't for many years. The current contract price for natural gas (NYMEX) is trading at less than $3.00 per million Btu, and some analysts believe it could go below $2 per MMBtu. At $3.00 per MMBtu, the price of natural gas equates to a per-barrel of oil price of only $17.40 at a time when oil is trading near $100 a barrel. The low price of natural gas translates into significant savings for fleets and consumers who use natural gas to fuel their vehicles. In most areas of the country, natural gas sells at about a $1.50 discount compared to gasoline and diesel fuel. EIA's long-term forecast projects that differential between natural gas and petroleum fuels will remain as high as $2 per energy-equivalent unit.

Environmental Benefits

The same clean burning properties that make natural gas an excellent fuel for traditional applications like electricity generation, residential heating, and industrial applications, also make it an excellent fuel for transportation. Natural gas burns cleaner than gasoline and diesel fuel and most other transportation fuels as well. Not surprisingly, the first vehicles certified to the U.S. Environmental Protection Agency's (EPA) ultra-low emission, super-ultra low-emission and Tier 2/Bin 2 standards were NGVs. The natural gas-powered Honda Civic GX has won numerous awards for its outstanding environmental performance. In 2011, the Civic GX was rated the "Greenest Car in America" by the American Council for an Energy-Efficient Economy – for an amazing eight years in a row! It also was named the 2012 car of the year by the Green Car Journal. Compared to the gasoline Civic, the natural gas-powered Civic produces 95 percent fewer emissions of volatile organic compounds and 75 percent less emissions of nitrogen oxides – pollutants that contribute to ozone formation.

The environmental benefits of NGVs are expected to continue to improve as new automotive technologies become available. EPA's website describes natural gas as an inherently cleaner transportation fuel. That means that given the same amount of emissions control and technological advancement, natural gas should always produce lower emission than comparable gasoline and diesel-fueled vehicles. As long as the internal combustion engine is with us and as long as refinements to it are made, natural gas will be the cleanest transportation fuel to use in it. A National Academy of Science

Clean Energy®

(NAS) report[3] that analyzed vehicle technologies as of 2005 and expected by 2030, projected that, with further expected improvements in vehicle technology and fuel efficiency, natural gas powered vehicles will provide superior benefits in terms of criteria pollutant reductions compared to nearly all other types of vehicles, even electric and plug-in hybrid electric vehicles. The reason, in part, is due to the fact that the internal combustion engine will continue to get much more fuel-efficient and cleaner, and internal combustion engines can always use natural gas. Electric vehicles sometimes use electricity produced from cleaner natural gas but they will likely continue to use electricity produced from coal and increasingly natural gas, offsetting the benefits that otherwise would be provided by such vehicles. Electric vehicles also require more energy to produce them.

Natural gas vehicles will play a key role in reducing greenhouse gas emissions. Per unit of energy, natural gas contains less carbon than any other fossil fuel, and, therefore, produces lower carbon dioxide (CO2) emissions per vehicle mile traveled. While NGVs do emit methane, another principal greenhouse gas, the increase in methane emissions is more than offset by a substantial reduction in CO2 emissions compared to other fuels. The California Air Resources Board (CARB) has conducted extensive analyses on this issue, and has concluded that burning compressed natural gas produces about 22 percent less GHGs than burning diesel, and 29 percent less than burning gasoline.[4] The comparisons are based on well-to-wheels analyses, and include methane emissions. These reductions are equal to -- or better than -- some renewable liquid fuels. Most of the available studies show that given similar fuel efficiency, NGVs fueled by domestic natural gas will deliver about 20–30 percent improvement in GHG emissions. Another important benefit of NGVs is that, in addition to the tailpipe reductions, they also provide upstream emission reductions of greenhouse gases.

These are real greenhouse gas benefits and Clean Energy's California operations has allowed the company to capture more than 9 percent of the California Air Resources Board's Low Carbon Fuel Credits in the first quarter of 2011.

The Potential for Natural Gas Vehicles

The current market for NGVs here in the U.S. is relatively small. Today, NGVs (and electric vehicles) are not yet economic for most owners of light-duty vehicles. The primary reason is that these vehicles have higher initial purchase costs than

[3] National Research Council, *"Hidden Costs of Energy: Unpriced Consequences of Energy Production and Use."* Washington, DC: The National Academies Press, 2010.
[4] See California Low Carbon Fuel Standard; http://www.arb.ca.gov/fuels/lcfs/121409lcfs_lutables.pdf.

conventionally fueled vehicles, but are not driven enough miles or consume enough lower-cost fuel for the fuel cost savings that they offer to offset this higher purchase cost in a reasonable number of years. In fleet applications, however, where fuel consumption per vehicle is much greater, NGVs can be economically attractive to an increasing percentage of businesses and government agencies.

Recent events are clearly pointing to a viable domestic market for light-duty NGVs. We are particularly encouraged by the unprecedented Memorandum of Understanding (MOU) concerning NGVs that has now been signed by ten state governors. The MOU urges U.S. automakers to expand their offerings of NGVs and attempts to stimulate the market for such vehicles by signaling the intent of these states to purchase NGVs. As noted above, in just the past two years, GM and Chrysler have announced plans to produce NGVs for the U.S. market. Honda also has expanded its production capacity for the Honda NGV offering, and is now marketing the car to consumers as well as fleets. Another telling factor is the significant growth in the aftermarket offerings here in the U.S., where nearly a dozen manufacturers offer systems to retrofit light-duty vehicles to operate on natural gas. These offerings include systems for the Fusion, Focus, Impala, Malibu, Milan, Transit Connect, in addition to a variety of popular pickup truck offerings. Ford, while not offering a factory NGV, has been working closely with the aftermarket industry to ensure that aftermarket systems offered for its vehicles meet its demanding standards for quality. These activities clearly show that there is very strong interest in bringing more NGV products to the U.S. passenger car and light-duty segment.

Clean Energy believes that there could be a substantial market for NGVs in all applications, including the light-duty passenger car market. The most immediate opportunity for displacing petroleum and increasing the use of natural gas as transportation fuel lies with light-, medium- and heavy-duty fleets – especially trucks, buses and other heavier vehicles. America currently has a large selection of medium- and heavy-duty NGVs available in the U.S. and the market for natural gas trucks is beginning to ramp up. As a result, natural gas fueling infrastructure development is once again on the rise, recently exceeding 1,000 stations. More importantly, Clean Energy and other major industry partners are now laying the groundwork for a national fueling infrastructure connecting major transportation routes across the country. Furthermore, President Obama's Blueprint for Energy, announced on January 26th, now calls for development of additional natural gas corridors. In that announcement, the President also called upon the Energy Department and national laboratories to focus their energies on bringing about technological breakthroughs in the use of natural gas as a transportation fuel (transcript attached).

Clean Energy®

These efforts will directly benefit the NGV market since increased fueling infrastructure is one of the key factors limiting the market for NGVs. The economic outlook appears to be excellent. Lower natural gas prices and lower first cost premiums (brought about by mass production, economies of scale and more competition) mean that, in the future, even passenger cars could become economic. Adopting an RTP/SCS that encourage manufacturers to produce both NGVs and EVS are critically important.

Conclusion

We strongly urge SCAG to modify its current draft RTP/SES to specifically highlight natural gas vehicles, in addition to electric and hybrid options, amongst the near zero-emission to zero emission technologies that will help the region meet its criteria air emissions goals under the federal Clean Air Act and greenhouse gas emissions goals under the state's AB 32 – The Global Warming Solutions Act of 2006. Not only does Clean Energy believe that NGVs will continue to be some of the cleanest options, particularly for medium- and heavy-duty vehicles, on the road, they will most likely will also benefit from hybridized platforms, biomethane and hydrogen-blending, and other advancements that may come to market over the next 20 years. We would like to formerly offer an invitation to senior SCAG staff to visit our offices in an effort to better understand our plans to help the region meet its clean air and greenhouse gas goals prior to the finalization of the RTP/SES. Please do not hesitate to contact us directly at (562) 546-0338.

Sincerely,

Todd R. Campbell

THE WHITE HOUSE
Office of the Press Secretary

For Immediate Release January 26, 2012

REMARKS BY THE PRESIDENT
ON AMERICAN-MADE ENERGY

UPS Las Vegas South
Las Vegas, Nevada

10:11 A.M. PST

THE PRESIDENT: Hello, Nevada! (Applause.) It is great to be back in Las Vegas. (Applause.)

AUDIENCE MEMBER: I love you!

THE PRESIDENT: I love you back. (Laughter.) Although I always say, when we stay here for the night, I've got to watch my staff to make sure that they get on the plane when we leave. (Laughter.) Sometimes they conveniently miss the flight. (Laughter.)

But everybody please have a seat, have a seat. It is great to see you. Joe, thanks for the introduction. Scott, thank you and the folks at UPS for hosting us today. I want to thank all of the elected officials and the tribal leaders who took the time to join us.

Before I get into the core of my remarks, I just want to mention something that I said to Scott and I said to Joe, and that is that UPS I think deserves just extraordinary credit for being the best in its space, one of the best businesses we have in the United States. But the reason is because it's got such outstanding workers -- (applause) -- and the relationship between its workforce and management, cooperating, constantly figuring out how to make things better is just an outstanding organization. And so you guys all need to be congratulated for everything that you do. (Applause.)

Now, I'm here to talk a little more about what I talked about at the State of the Union on Tuesday night. And what I want to focus on is how we're going to restore the basic promise of America, something that folks at UPS understand, which is, if you work hard, if you do the right thing, you should be able to do well enough to raise a family and own a home and send your kids to college and put a little away for retirement. That's the American Dream. That's what most people are looking for.

They don't expect a handout. They don't expect anything to come easy. They do expect, if they're willing to work hard, to try to get ahead. If they're doing the right thing, then they can have a sense of security and dignity, and help make sure that their family is moving forward. That's what Americans are looking for. That's what Americans deserve.

And today, three years after the worst economic storm in three generations, our economy is growing again. Our businesses have created more than 3 million jobs. (Applause.) Last year, businesses created the most jobs since 2005. American manufacturers are hiring again and creating jobs for the first time since the 1990s.

Now, we've got more work to do. But what we can't do is go back to the very same policies that got us into a mess in the first place. We can't go backwards. We have to move forward. I said on Tuesday, and I will repeat today, we will not -- we cannot -- go back to an economy weakened by outsourcing and bad debt and phony financial profits. So on Tuesday, at the State of the Union, I laid out my vision for how we move forward. I laid a blueprint for an economy that's built to last, that has a firm foundation, where we're making stuff and selling stuff and moving it around and UPS drivers are dropping things off everywhere. (Applause.)

That's the economy we want, an economy built on American manufacturing with more good jobs and more products made here in the United States of America. (Applause.) An economy built on American energy, fueled by homegrown and alternative sources that make us more secure and less dependent on foreign oil. (Applause.) An economy built on the skills of American workers, getting people the education and the training they need to prepare for the jobs of today, but also to compete for the jobs of tomorrow. (Applause.)

And most importantly, I talked about an economy that's built on a renewal of American values -- hard work, responsibility, and the same set of rules for everybody, from Wall Street to Main Street. (Applause.) That has to be our future. That's how we restore that basic American promise.

Now, part of my blueprint and what I want to focus on a little bit today is for an economy built to last with American energy. That's why we're here. For decades, Americans have been talking about how do we decrease our dependence on foreign oil. Well, my administration has actually begun to do something about it.

Over the last three years, we negotiated the toughest new efficiency standards for cars and trucks in history. We've opened millions of new acres for oil and gas exploration. Right now, American oil production is the highest that it's been in eight years. Eight years. Last year, we relied less on foreign oil than in any of last 16 years. That hasn't gotten a lot of attention, but that's important. (Applause.) We're moving in the right direction when it comes to oil and gas production.

And today, I'm announcing that my administration will soon open up around 38 million acres in the Gulf of Mexico for additional exploration and development, which could result in a lot more production of domestic energy. (Applause.)

But as I said on Tuesday, and as the folks here at UPS understand, even with all this oil production, we only have about 2 percent of the world's oil reserves. So we got to have an all-out, all-in, all-of-the-above strategy that develops every source of American energy -- a strategy that is cleaner and cheaper and full of new jobs.

Now, a great place to start is with natural gas. Some of you may not have been following this, but because of new technologies, because we can now access natural

gas that we couldn't access before in an economic way, we've got a supply of natural gas under our feet that can last America nearly a hundred years. Nearly a hundred years. Now, when I say under our feet, I don't know that there's actually gas right here. (Laughter.) I mean in all the United States.

And developing it could power our cars and our homes and our factories in a cleaner and cheaper way. The experts believe it could support more than 600,000 jobs by the end of the decade. We, it turns out, are the Saudi Arabia of natural gas. (Applause.) We've got a lot of it. We've got a lot of it.

Now, removing that natural gas obviously has to be done carefully. And I know that there are families that are worried about the impact this could have on our environment and on the health of our communities. And I share that concern. So that's why I'm requiring -- for the first time ever -- that all companies drilling for gas on public lands disclose the chemicals they use. We want to make sure that this is done properly and safely. (Applause.) America will develop this resource without putting the health and safety of our citizens at risk.

But we've got to keep at it. We've got to take advantage of this incredible natural resource. And think about what could happen if we do. Think about an America where more cars and trucks are running on domestic natural gas than on foreign oil. Think about an America where our companies are leading the world in developing natural gas technology and creating a generation of new energy jobs; where our natural gas resources are helping make our manufacturers more competitive for decades. We can do this. And by the way, natural gas burns cleaner than oil does, so it's also potentially good for our environment as we make this shift.

So last April, we issued a challenge to shipping companies like UPS. We said if you upgrade your fleets to run on less oil or no oil at all, we're going to help you succeed. We want to help you with that experiment. So we started out with five companies that accepted the challenge. And of course, UPS was one of the first. That's how they roll. (Laughter and applause.)

So less than a year later, we've got 14 companies on board, and together they represent 1 million vehicles on the road. That's a lot of trucks.

We should do more, though. And that's why we're here today. First, let's get more of these natural gas vehicles on the road. Let's get more of them on the road. (Applause.) The federal fleet of cars is leading by example. Turns out the federal government has a lot of cars. (Laughter.) We buy a lot of cars. So we've got to help not only the federal government but also local governments upgrade their fleet. If more of these brown trucks are going green, more city buses should, too. There's no reason why buses can't go in the same direction.

Second, let's offer new tax incentives to help companies buy more clean trucks like these. (Applause.)

Third, let's make sure all these new trucks that are running on natural gas have places to refuel. That's one of the biggest impediments, is the technology. We know how to

make these trucks, but if they don't have a place to pull in and fill up, they got problems.

So we're going to keep working with the private sector to develop up to five natural gas corridors along our highways. These are highways that have natural gas fueling stations between cities, just like the one that folks at UPS, South Coast Air and Clean Energy Fuels are opening today between Los Angeles and Salt Lake City. That's a great start. (Applause.) So now one of these trucks can go from Long Beach all the way to Salt Lake City. And they're going to be able to refuel along the way.

And finally, to keep America on the cutting edge of clean energy technology, I want my Energy Secretary, Steven Chu, to launch a new competition that encourages our country's brightest scientists and engineers and entrepreneurs to discover new breakthroughs for natural gas vehicles.

So we're going to keep moving on American energy. We're going to keep boosting American manufacturing. We're going to keep training our workers for these new jobs. But an economy that's built to last also means a renewal of the values that made us who we are: hard work, fair play and shared responsibility.

Right now, that means, first of all, stopping a tax hike on 160 million working Americans at the end of next month. (Applause.) People cannot afford right now losing $40 out of each paycheck. Your voices convinced Congress to extend this middle-class tax cut before. I need your help to make sure they do it again. No drama, no delay. Let's just get this done for the American people and for our economy as a whole. (Applause.)

But we've got a longer-run issue -- Scott and I were talking about this before we came out -- and that is how do we get America's fiscal house in order. And we're going to have to make some choices. The reason that we've got these debts and deficit is because we're not making hard choices. Right now, we're supposed to spend nearly $1 trillion more on what was intended to be a temporary tax cut for the wealthiest 2 percent of Americans. Supposed to be temporary. Back in 2001. (Laughter.) That's a long time ago. (Laughter.) A quarter of all millionaires pay lower tax rates than millions of middle-class households. Warren Buffett pays a lower tax rate than his secretary. I know because she was at the State of the Union. (Laughter.) She told me.

Now, that's not fair. That doesn't make sense. And the reason it's important for us to recognize that is, if we're going to reduce our deficit, then we've got to have a balanced approach that has spending cuts -- and we've already agreed to $2 trillion worth of spending cuts. We've got to get rid of programs that don't work. We've got to make government more efficient. I have asked Congress for authority to consolidate some of these agencies to make them run better. We're going to have to be much more effective when it comes to government spending. We all acknowledge that and we're making progress on that front.

But that alone doesn't do it. So if we want to actually deal with the deficit, we've got to look at the other side of the ledger. Do we want to keep these tax cuts for the wealthiest Americans? Or do we want to keep investing in everything else -- like

education, like clean energy -- (applause) -- like a strong military, like caring for our veterans who are coming home from Iraq and Afghanistan? (Applause.) We can't do both. We can't do both.

So what I've said is let's follow the Buffett Rule: If you make more than a million dollars a year, you should pay a tax rate of at least 30 percent -- (applause) -- which, by the way, is lower than you would have been paying under Ronald Reagan. Nobody is talking about anything crazy here. On the other hand, if you make less than $250,000 a year, which 98 percent of all Americans do, then your taxes shouldn't go up. (Applause.) I think that's a fair approach.

And a lot of folks have been running around saying, well, that's class warfare. Asking a billionaire to pay at least as much as his secretary in taxes, that's just common sense. (Laughter.) And I promise you, if we make this change, Warren Buffett will be doing fine. (Laughter.) I will be doing fine. Scott will be doing fine. (Applause.) We don't need more tax breaks. You're the ones who have seen your wages and your incomes stall while the cost of everything from groceries to college to health care have been going up. You're the ones who deserve a break. (Applause.)

And I want to make one last point: We do not begrudge success in America. We aspire to it. We want everybody to succeed. We want everybody to be rich. We want everybody to be working hard, making their way, creating new products, creating new services, creating jobs -- that's the American way. We don't shy away from financial success. We don't apologize for it.

But what we do say is when this nation has done so much for us, shouldn't we be thinking about the country as a whole? When Americans talk about folks like me paying their fair share of taxes, it's not because they envy the rich. Just yesterday, Bill Gates said he agrees with me that Americans who can afford it should pay their fair share. I promise you, Bill Gates does not envy the rich. (Laughter.) He doesn't envy wealthy people.

This has nothing to do with envy. It has everything to do with math. It's what I talked about earlier. We've got to make choices. Americans understand if I get a tax break I don't need and a tax break the country can't afford, then one of two things are going to happen. Either it's going to add to our deficit or somebody else is going to have to make up the difference.

A senior suddenly is going to have to start paying more for their Medicare, or a student is going to have to pay more for their student loan, or a family that's trying to get by, they're going to have to do with less. And that's not right. That's not who we are. Each of us is only here because somebody somewhere felt a responsibility to each other and to our country and helped to create all this incredible opportunity that we call the United States of America.

Now, it's our turn to be responsible. And it's our turn to leave an America that is built to last for the next generation. That's our job and we can do it. (Applause.) We can do it. We can do it. And I know we can do it, because I've seen in states like Nevada and with people like you that I meet all across this country, you understand the history of this country, generations of Americans working together, looking out for each other,

living by the idea that we rise or fall together. Those are the values we have to return to.

I mentioned praise for our military at the State of the Union and the incredible work that they do. And the reason our military is so good, the reason why they're so admired is because they -- it's not like everybody in the military agrees on everything. You got Democrats in the military. You got Republicans in the military. You've got folks who are conservative or liberal -- different races, different religions, different backgrounds -- but they figure out how to focus on the mission. They figure out how to do their job.

And that sense of common purpose is what we're going to need to build an economy that lasts. And if we work together in common purpose, we can build that economy and we can meet the challenges of our times. And we'll remind the entire world once again just why it is that the United States is the greatest country on Earth.

Thank you, everybody. God bless you and God bless the United States of America. (Applause.)

END 10:33 A.M. PST

Memorandum of Understanding

This Memorandum of Understanding (MOU) describes a coordinated effort between the undersigned States (States) to attract automobile manufacturers in the U.S. to develop a functional and affordable original equipment manufacturer (OEM) fleet natural gas vehicle (NGV) that will also meet public demand. The States recognize the benefits and unique attributes of clean burning natural gas and understand the significant opportunity compressed natural gas (CNG) presents to save State and taxpayer dollars by encouraging an energy future that utilizes domestic energy resources to fuel our nation's transportation needs. Through the joint solicitation of a Multi-State Request for Proposal (Joint-RFP) that aggregates annual State fleet vehicle procurements, the States will endeavor to provide a demand base sufficient to support the design, manufacture, and sale of functional and affordable OEM NGVs by automotive manufacturers in the United States.

In anticipation of soliciting a Joint-RFP, the States will endeavor to coordinate with local agencies, municipalities, and companies to determine the number of NGVs each State can commit to purchase and the required specifications necessary to meet fleet needs. The Joint-RFP shall require that the ultimate cost of an OEM NGV should be comparably priced to an equivalent gasoline powered model and that warranty and reliability concerns are not compromised. Simultaneously, the States understand the need for continued development and expansion of CNG fueling infrastructure and should endeavor to encourage private investment, predicated on demonstrating an anticipated increase in State NGVs, to meet growing demand.

Pursuant to the terms of the Joint-RFP, to be executed at a later date, the States intend, where practical, to transition new fleet vehicle acquisitions, in committed volumes, to a resulting OEM NGV. Such future acquisitions should, when economically feasible, rely on traditional distribution channels that incorporate local businesses in procurement processes. In continued recognition of the benefits of CNG, the States should also endeavor to pursue fleet vehicle conversions to CNG, where economically compelling, based on a life-cycle cost analysis. The States will also reach out to fellow Governors to determine broader interest and participation in the principles and process outlined in this MOU.

This MOU embodies the principle understandings of the States but shall not create any legal relationship, rights, duties, or obligations binding or enforceable at law or in equity. Notwithstanding the foregoing, each State shall in good faith endeavor to reach a mutually agreeable and economically beneficial Joint-RFP, as contemplated herein. This MOU does not create additional state power, enhance existing state power, or interfere with federal authority or law. This MOU shall continue to demonstrate the States' understanding until execution of the Joint-RFP, or until otherwise discontinued by either State.

Los Angeles, CA 90017

Re: Draft Regional Transportation Plan/Sustainable Communities Strategy 2035 (RTP/SCS)

Dear President Pam O'Connor and Honorable Members of the SCAG Regional Council:

Congratulations on the successful completion of a draft Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS). This represents the culmination of three years of hard work by your staff, committees, and Regional Council to understand and merge together the land use and transportation plans of hundreds of local governments and agencies. This is a very significant effort that can substantially improve the quality of life, public health, long-term economic competitiveness, and environmental sustainability of the region. Southern California has made some impressive strides in this direction, as reflected in these successes of the plan:

- Meets the greenhouse gas reduction targets established by the California Air Resources Board
- Reduces overall traffic congestion and allows residents to spend less time in their cars
- Triples spending on bike and pedestrian projects and increases transit investments by 13%
- Meets the projected economic market demand by planning for a diversity of housing types, including a more adequate number of small-lot single family homes and dwellings in mixed-use, walkable neighborhoods
- Addresses habitat loss via planning for more cost-effective future environmental mitigation

As organizations that work across the state, we want to recognize and thank SCAG for the enormous progress that Southern California has made in recent years. This is a large and diverse region that has long lacked a transit system with regional reach. Yet Southern California is taking actions that can be a model for regions elsewhere in the state. For example, Los Angeles County's Measure R will generate up to $40 billion, most for transit, and an effort is now underway to accelerate those 30 years of spending into the early years, when jobs are most needed. SCAG has proactively engaged many communities to create a vision for smart growth, first through the Compass Blueprint program and now with the creation of this SCS. This regional plan builds on an innovative model program from Orange County that will address potential habitat impacts in a way that improves environmental benefits while reducing costs through careful, upfront planning. The success of this plan is built upon just these instances of great local and regional leadership.

717 K St., Suite 330 · Sacramento, CA 95814 · 916-441-0204 · info@climateplanca.org · www.climateplan.org

However, amidst this plan's successes, there are important ways that this plan can make additional strides. The plan as written reveals that on the current course, there are parts of the region making significant investments in transit, bicycle, and pedestrian infrastructure and thereby receiving great benefits, while other areas are making lesser investments, particularly those in Inland Empire counties. We believe SCAG should pursue additional strategies to expand transit and active transportation opportunities that could have great economic and health benefits for the entire region. We are also concerned that several vulnerabilities in this plan may cause it to not succeed at the level it intends.

I. Create greater opportunity for all Southern Californians

As noted above, the growth and investments in this plan have many benefits for the region as a whole. However, transit and active transportation investments are uneven, and as a result, not everyone in the region will receive the same opportunities and benefits. For instance, this plan reveals that per capita, residents in Los Angeles and Orange County will cut the time they spend driving by about 20%, while residents of Imperial, San Bernardino, and Riverside will receive reductions that are half that, or less. In addition, vulnerable populations across the region will face greater risks. Before finalizing the plan, we ask that the Regional Council and staff take some simple steps to allow the region to move forward together.

Expand transit service in key areas: This plan expands a network of transit choices, giving many people easier access to multiple transportation options, and taking cars off of the roads so that those who do drive spend less time stuck in traffic. Augmenting these with some additional transit investments would provide more options in currently less-served parts of the region.

Expanding bus service levels is the least expensive transit option, and well over 80 percent of those riding transit now do so on bus. The fast-growing Inland Empire counties could particularly benefit from this strategy. The plan shows that only 10% of Riverside County will be served by high-quality bus service (buses every 15 minutes during peak periods). But since about 40% of residents will live near bus lines with a slightly lower level of service (15-30 minute headways), increasing bus travel frequencies would be a relatively low-cost way to greatly expand the number of residents within walking distance of high-quality public transportation. This would not only help those who choose to take the bus, but it will also relieve traffic for those who still need to drive.

Rural parts of the region, such as the eastern Coachella Valley and the North Shore of the Salton Sea, have particularly low access to transit choices even as housing and jobs begin to move into those rural areas. Extending existing bus service to currently unserved rural areas of the Coachella Valley, or exploring options such as local circulators to meet unmet transit needs in rural areas, would also improve access to services and decrease vehicle miles traveled for farmworkers and other rural residents. Additionally, extending planned BRT from Indio to Coachella would make it possible to address the needs of a growing population to access health care, groceries, or good jobs via public transit.

Finally, enhancing and expanding the region's MetroLink system, as well as the BRT and bus system that connect to it, can bring to the full Southern California region the world-class transportation network that it deserves. Such enhancements could create greater economic

opportunity over the long run, more well-paying jobs during the transit construction, and additional opportunities for creating mixed-income walkable neighborhoods.

Expand funding and policies for bicycles and pedestrians: This plan could also take one step further toward providing residents with safe routes for walking and biking. While the plan does triple the previous expenditures, it still devotes less than 1.5% of its funds to safe streets, despite the fact that over 20% of all travel trips in the region are on foot or by bike. According to a poll of Southern California voters by Move LA, NRDC, and the American Lung Association last year, if given the choice, voters would spend significantly more of the region's transportation dollars on bicycle and pedestrian investments.

The L.A. Department of Public Health recently reported that the funding need could be as high as $40B, yet this plan currently devotes $6B and estimates another $4B is available. This gap should be reduced by increasing regional combined bike and pedestrian funding to at least $12B, in addition to the estimated additional $4B. These funds should create "first mile / last mile" linkages near transit, address safety problems in areas of high injury and fatality rates, provide sidewalks and bike lanes in places with lower car ownership rates or where basic infrastructure is currently lacking, and help children use Safe Routes to Schools.

In addition, we ask SCAG to commit to working with its local governments and agencies to embed a "complete streets" policy in local and regional transportation project planning, to systematize the inclusion of pedestrian and bicycle safety features in road construction and maintenance projects. Doing so will make cost-effective use of these limited funds.

Finally, we ask that SCAG undertake a regional bike/ped master planning effort, similar to the assessment of unmet road maintenance costs that SCAG currently manages. Before the next RTP, SCAG should work with partner agencies and jurisdictions to identify local needs, funding strategies, and revenue sources to create a completed network of safe routes for walking and biking.

Further study and aggressively address disparate exposure to air pollution and noise: While this plan would improve air quality in the region overall, we are greatly concerned that air pollution levels would still be highest in areas close to freeways, and that levels in some places could be higher than the "business as usual" or baseline scenario. The Environmental Justice Appendix to the Plan shows that 25% - 27% of households living within 500 feet of freeways could face greater exposures to CO and PM, with high concentrations of minority and low income residents disproportionately affected. The Appendix further highlights that all environmental justice populations except the elderly currently have higher risk of cancer and respiratory disease than the region as a whole, and that the "highest areas of respiratory risk are the segments that closely follow major freeways in the most urbanize portions of the region." Non-English-speaking, foreign born populations have the highest risk. Before finalizing this plan, SCAG needs to study where and how disproportionate impacts will occur, by providing a map showing where this will be happening, and then identify a complete suite of mitigations to ensure that air pollution and noise impacts do not get worse for the most vulnerable while getting better for others. One possible tool is the list of model "Health and Equity metrics,"

including a methodology for calculating those metrics, created by Human Impact Partners in partnership with other health experts and organizations.

Monitor the plan's impacts on key indicators of health and equity, and improve tools for future planning: Addressing inequalities requires understanding them. Particular trends that this plan has a limited ability to project and mitigate – such as the risk of gentrification and displacement near transit stations, injuries / fatalities to pedestrians and cyclists, asthma incidence and exacerbations due to NOx, and the balance of wages to housing costs – should be actively monitored.

To carry this out, SCAG should monitor these issues at a regional scale and also identify particular places to monitor, including areas near transit stations – where shifting demographics suggests that gentrification may already be underway – and also a selected group of areas known to have particularly vulnerable populations.

In addition to tracking this plan's performance, SCAG should commit to developing specific tools to project future plans' impact on critical issues, such as the fit between job wages and housing costs; physical activity; the health impacts of the physical activity and air quality created by the plan; and other measures from the "Health & Equity metrics" mentioned above.

II. Ensure the Regional Transportation Plan's Strengths Become Reality

This plan has much good news for the region, and the recommendations below are designed to help the plan's strengths become reality.

Ensure revenues materialize: Significant new resources are needed for the plan to come to fruition. We ask SCAG to take a leadership role in convening other agencies and jurisdictions to generate the revenues that this plan depends on for success. In developing this plan, the region was faced with a large funding shortfall. The Regional Council made the policy decision not to cut projects but to find additional revenue sources to pay for its infrastructure plans. The current plan assumes that these needed funds will come from state and federal governments, but as history shows, this is not guaranteed. We hope the region will focus on what it can do to raise money via a combination of regional and local fees or taxes. These new revenue sources should be chosen to avoid adverse impacts to the region's lower-income populations.

As funding gaps are likely to continue over the long run, we would also recommend that the region follow the example of other regions in considering how to systematically prioritize those expenditures that most contribute to a sustainable, healthy, and equitable region. Between now and the next SCS, SCAG and its partner agencies could develop a systematic method for prioritizing projects, such as the Project Performance Assessment conducted at the Bay Area's Metropolitan Transportation Commission.

Frontload and expand funds for transit and bike / pedestrian linkages, and for road and bridge safety projects: We ask that in collaboration with its partner agencies and jurisdictions, SCAG lead an effort to accelerate the transit, bike/ped, and road maintenance projects that are essential to meeting the region's goals into earlier years when revenue is more reliable. Making transportation investments in a

timely way ensures that they have maximum impact. Yet, this plan accelerates road construction projects while delaying essential investments in road maintenance, bike and pedestrian safety, and transit to the late years of this 24-year plan.

Delaying road repairs is a bad idea, because deferred maintenance leads to increasingly costly repair needs. Also, delay endangers road and bridge users – in a region where more drivers already cross structurally-deficient bridges than anywhere else in the United States.[1] Delaying projects that can create a multimodal network with a variety of transportation options also concerns us, because future revenues in this plan are less certain. Transportation investments that not only support driving but also create convenient public transit options and safe routes for walking and biking are essential for achieving the region's traffic reduction and air quality goals.

Help local governments plan the transit neighborhoods of the future: We ask that SCAG help local governments plan the diverse transit-oriented or transit-ready neighborhoods that this plan relies upon by making a firm commitment to funds for Compass Blueprint. The draft RTP/SCS assumes that many of the region's homes and jobs will grow as real estate market trends predict they will, in walkable neighborhoods surrounding transit corridors and light rail stations. But many cities are still in the process of updating land use plans to allow that kind of development. Without those plans in place, it is much more difficult for builders to get projects approved and begin construction. With local governments' planning funds at historic lows, funds to finish this planning may not exist. That makes it essential that the region expands its Compass Blueprint incentive grant program to help local governments plan the kind of neighborhoods that this plan needs to succeed. SCAG should make a clear financial commitment that this will happen.

In doing so, SCAG should use these grants first to fund those local governments that stand ready to create healthy, walkable neighborhoods for households at a range of income levels. SCAG should update its Compass Blueprint grant criteria to ensure that neighborhoods near present or future transit stations or corridors will have safe streets for walking and biking, and a mix of housing types to allow people of a range of incomes to live and work near transit. SCAG's environmental justice appendix shows that areas near transit are already losing low-income populations. Lower-income households are more likely to utilize transit services that are available to them, so building housing affordable to those households near transit will maximize the benefit of the region's infrastructure investments. As growth patterns become more compact, SCAG should also carefully monitor and seek resources that could ameliorate and improve rural housing stock.

Address gaps in the link between growth and transportation planning: The success of all regional Sustainable Communities Strategies depends on a well-coordinated link between where growth will happen and where transportation infrastructure will be provided. In places where this link remains weak, SCAG should host conversations between local governments and transportation agencies that will better align transit planning with future growth and housing. Where growth does occur as greenfield development, SCAG should make sure that this habitat and farmland loss is adequately mitigated by ensuring regional mitigation planning includes not only critical habitat and lands within Habitat Conservation Plan / Natural Communities Conservation Plan Areas but all important undeveloped lands, through an inclusive public process. Finally, to make sure the region's analysis

[1] October 2011. Transportation for America. The Fix We're In For: The State of Our Nation's Busiest Bridges. http://t4america.org/docs/bridgereport/bridgereport-metros.pdf

rests on a solid foundation, SCAG should ensure that its High Quality Transit Area calculations accurately includes only the geography around bus stops, not the entire corridor adjacent to a highway that a bus travels along.

Thank you very much for your consideration of these comments, designed to strengthen and support the success of your work in Southern California. We want to again express our appreciation and gratitude to SCAG's Regional Council, committees, and staff. Your efforts to implement SB 375 can help reduce climate change and ensure that future generations of Californians have cleaner air and water, healthier places to live, a stronger and more resilient economy; and greater opportunity for people across the economic spectrum.

Subject: CVAG and WRCOG Comments on the Draft 2012 Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS)

Dear Mr. Ikhrata:

On behalf of the Coachella Valley Association of Governments (CVAG) and the Western Riverside Council of Governments (WRCOG), we commend SCAG for its undertaking of an update to the Regional Transportation Plan (RTP), and for preparing the region's first Sustainable Communities Strategy (SCS) pursuant to SB 375. CVAG and WRCOG are taking this opportunity to express our collective comments on the Draft 2012 RTP/SCS, and on the future use of the SCS within Riverside County.

CVAG, WRCOG and our respective member jurisdictions worked with SCAG representatives to develop growth projections for the Coachella Valley and Western Riverside County subregions, and we appreciate SCAG's acceptance of our local input on these overall growth projections. These growth forecasts for population, housing, and employment in Riverside County underwent extensive review by both Agencies' members. Both the CVAG Executive Committee and the WRCOG Executive Committee adopted subregional growth forecasts at the jurisdictional (i.e. City and County) level. The Riverside County Board of Supervisors also approved growth forecasts for Riverside County at the jurisdictional level. Neither CVAG, WRCOG, nor the Board of Supervisors have endorsed or approved subregional growth projections at the TAZ level, nor were any more ambitious TAZ level plans made generally available to and generally accepted by the local planners in Riverside County.

We acknowledge SCAG's usage of TAZ-level data for scenario modeling purposes during the development of the Draft 2012 RTP/SCS. However, we did not anticipate the TAZ data that was recently released by SCAG; nor do we agree that they depict a realistic land use pattern that can or will be achieved in Riverside County by 2035. In most cases, the 2035 TAZ maps substantially deviate from our jurisdictions' adopted General Plans, and also deviate from other land use approvals.

We are also concerned that these maps were only recently made available to us for review. Due to the schedule of the Draft RTP/SCS public comment and review period, CVAG and WRCOG were not given substantial time to analyze this information and consult with our member jurisdictions regarding the potential implications of the growth projections depicted in the 2035 TAZ maps.

Accordingly, although CVAG and WRCOG support the use of the underlying projected population, household, and employment counts for policy purposes at jurisdictional levels, we do not support the

use of the counts reflected in the recently-disclosed TAZ maps as a basis for CEQA streamlining or SCS consistency review under CEQA. Nor do we support the use of these maps for purposes of determining future infrastructure planned in Riverside County. Furthermore, we do not support the use of this information for the purpose of land use regulation or regulatory purposes of any kind. Finally, CVAG and WRCOG do not support SCAG's use of the TAZ maps and supporting data for determining future allocation of Compass Blueprint Program funds or any other funding incentives administered by SCAG or others.

We strongly urge that SCAG clarify that the use of TAZ-level data is for SCS modeling purposes only, and remove any language and policy statements from the Draft 2012 RTP/SCS that otherwise strengthen the standing of these unapproved data.

Thank you very much for your time and consideration of these issues. Please do not hesitate to contact Tom Kirk, CVAG Executive Director at (760) 346-1127 or by email at tkirk@cvag.org, or Rick Bishop, WRCOG Executive Director, at (951) 955-8303 or by email at bishop@wrcog.cog.ca.us should you have any questions on this correspondence.

We look forward to hearing from you.

Sincerely,

Tom Kirk

Board of Supervisors
County of Los Angeles

MICHAEL D. ANTONOVICH
SUPERVISOR

February 28, 2012

The Honorable Alan Wapner
Chairman, Regional Transportation Plan Subcommittee
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Dear Chairman Wapner:

As a Los Angeles County Supervisor, Vice-Chair of the Los Angeles County Metropolitan Transportation Authority (MTA), and SCAG Board Director, it is my pleasure to request that this subcommittee recommend to the SCAG Regional Council the inclusion of a high speed rail study within the proposed High Desert Corridor project between Victorville and Palmdale as part of the Constrained Regional Transportation Plan.

The importance of the High Desert Corridor has been well-noted by the federal government, which designated the project as a "Corridor of National Significance" with its "E-220" designation in SAFETEA-LU. Support for this project started with the Counties of Los Angeles and San Bernardino partnering to create a Joint Powers Authority (JPA) to oversee the development of this corridor. Since this time the project has also been endorsed in the constrained portions of SCAG's Regional Transportation Plan, the Regional Transportation Improvement Plan, and the MTA Long Range Transportation Plan. The potential for this corridor to divert car and truck trips from the heavily-populated, congested and emissions-plagued Los Angeles and San Bernardino basins has gained national attention as a vital solution to the confluence of local, regional and national car and truck traffic within the region's current freeway system.

The High Desert Corridor JPA Board of Directors has always envisioned this corridor as a public-private partnership that would require multiple elements to create a multi-modal corridor that met the region's needs for car, truck and transit infrastructure improvement. Inclusion of a high-speed rail component within the right-of-way of the High Desert Corridor reflects the desire of the JPA Board of Directors to connect Palmdale and Victorville with at minimum an enhanced 110 mile-per-hour high speed Metrolink corridor, and potentially a 220 mile-per-hour high speed rail corridor compatible with both the California and DesertXpress High Speed Rail systems. Currently the JPA Board has not entered into any agreement with Metrolink, California High Speed Rail,

ROOM 869 KENNETH HAHN HALL OF ADMINISTRATION, 500 WEST TEMPLE STREET, LOS ANGELES, CALIFORNIA 90012
TELEPHONE (213) 974-5555 • FAX (213) 974-1010 • WEBSITE http://antonovich.co.la.ca.us/

Amtrak or DesertXpress to partner with the JPA in operating service on this high speed rail corridor. Rather, the JPA will remain partner-neutral until which time the Public-Private Partnership Request for Proposals process calls for a decision to be made by the High Desert Corridor JPA and its partners in MTA and SANBAG.

By combining the environmental study of this high speed rail component of the High Desert Corridor into the current environmental work for the highway portion of the project, the JPA Board strives to provide a cost-effective manner of implementing this transit aspect of the project as cost-effectively as possible while staying within SCAG's envelope of $8.2 billion in the proposed Regional Transportation Plan. By including a vital high speed rail component, the High Desert Corridor stands poised to become a model public-private partnership project which captures the multi-modal requirements of AB 32 and SB 375 while leveraging private capital and improving the national movement of truck freight as encouraged by federal transportation policy.

Thank you for your support of the inclusion of the High Desert Corridor, including the environmental study of a high speed rail component within its right-of-way, in the Constrained portion of SCAG's Regional Transportation Plan.

Sincerely,

MICHAEL D. ANTONOVICH
Supervisor

Pam O'Connor, President
Regional Council
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Dear President O'Connor:

We thank the leadership and staff of the Southern California Association of Governments and its Regional Council members for developing the agency's first-ever Sustainable Communities Strategy (SCS) and 2012 Regional Transportation Plan. This task was especially challenging given that it is the first time the region has put together an SCS.

The Department of Public Health supports many aspects of the RTP which will improve public health and air quality and lower greenhouse gas emissions by expanding public transit, promoting new development near transportation, and increasing investments for bicycle and pedestrian infrastructure.

The following recommendations are made to strengthen the RTP/SCS this year and in future years.

1. Target and increase investment for active transportation

We applaud SCAG's proposed increased investment in active transportation, from $1.8 billion in the 2008 RTP (less than .5 %) to $6 billion (1.3%) in the current draft plan. DPH strongly encourages that the final plan:

- Prioritize (i) first-mile/last-mile connections to transit stations which will help support the increased investment in the transit system; (ii) projects that close gaps in key bicycle and pedestrian corridors; and (iii) communities with high numbers of bicycle and pedestrian injuries and high rates of chronic disease.
- Front load active transportation funding so it is available to jurisdictions to build walkable and bikeable communities early on in the 25 year RTP period.
- Provide funding and technical assistance for cities to create bicycle and pedestrian plans and city-wide safe routes to school plans.
- Offer support to County Transportation Commissions (CTCs) and local jurisdictions to adopt a complete streets policy so that pedestrian and bicycle improvements can be made routinely and more economically when streets are improved or built.

In addition, the plan should include further investments in active transportation to create 1) basic bicycle and pedestrian infrastructure in key areas in every city in the SCAG region; 2) bikeable and walkable neighborhoods within ½ mile of all TODs, existing and planned; 3) complete routes to public schools throughout the region that children can walk and bike to; 4) sidewalks repair throughout the region; and 5) improved continuity in county bike networks.

This recommendation for additional investment is based on a recent DPH examination of cost data from local cities' bike and pedestrian plans and CalTrans Safe Routes to Schools grants in LA County, cost of sidewalk repairs in LA City, and costs for building pedestrian and bicycle improvements in Transit Oriented Districts. DPH used this data to estimate costs for needed bike and pedestrian improvements across the SCAG region.

Given that cities' bicycle and pedestrian master plans have a range of costs for proposed improvements, we present a range for the estimated amount of active transportation funding needed to generate these improvements across the region, from a low of $37 billion (7.1%) to a high of $60 billion (11.4%) over 25 years, adjusted for inflation. We recognize that there are many factors that must be considered in your resource allocation decisions and, therefore, do not provide these estimates as a recommendation for funding. However, given the region's long standing underinvestment in bike and pedestrian infrastructure, we feel this is an appropriate range of investment options for your consideration.

2. Build healthy neighborhoods around transit stations that protect existing low-income residents

The area around rail stations offers a unique opportunity to create safe access to transit and to address key community needs such as mixed-income housing and business/retail corridors within a walkable and bikeable community setting. However, without careful planning, the people in neighborhoods adjacent to rail stations can be displaced as real estate prices rise in response to new development, triggering corresponding increases in residential and commercial rents for low-income families and small business owners. DPH encourages that the plan:

- Prevent displacement of existing low-income residents, fund jurisdictions to create transit-oriented development (TOD) plans that include policies to preserve existing affordable housing and small business store fronts and to ensure the provision of affordable housing and small business store fronts in new developments.
- Whenever possible, locate housing, child care facilities, schools and other sensitive-use development far enough away from sources of pollution to decrease exposure that can negatively affect health.

3. Strengthen public health modeling and monitoring

We encourage SCAG to measure the public health impacts of transportation investments. For example, the RTP could be analyzed for its potential to reduce chronic diseases in the SCAG region, such as heart disease and breast cancer, based on increases in walking and biking, linked to active transportation scenarios. Specifically, DPH encourages SCAG to:

- Measure the health benefits of transportation plans by integrating health outcomes into SCAG's modeling approaches.
- Measure and report on additional public health indicators including but not limited to: bicycle and pedestrian injuries and collisions by geographic areas; percentage of households that can walk or bike within 10 minutes to reach their daily destinations, e.g. transit, schools, childcare, parks; percent of income consumed by housing and transportation costs.
- Conduct targeted analyses in neighborhoods adjacent to rail stations to determine if displacement of existing residents is occurring as development occurs.

We express our appreciation to the SCAG Regional Council and staff for your hard work to develop this RTP/SCS and to guide Southern California's land use and transportation investments wisely. We look forward to working with you to make our neighborhoods and our region healthier for existing and future residents.

Sincerely,

Paul Simon, M.D., M.P.H.

Re: Orange County Comments to the Draft 2012 Regional Transportation Plan/Sustainability Communities Strategy

Dear Mr. Ikhrata,

The County of Orange (County) has reviewed the 2012 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), and associated Program Environmental Impact Report (PEIR). SCAG staff should be commended for the effort put into these regionally significant documents that put forth goals, policies and strategies intended to meet the provisions of SB 375. The County appreciates the opportunity to provide comments and suggested revisions to these documents.

Upon review of these documents, the County has determined that there are a number of policies, strategies and measures within the draft RTP/SCS and PEIR that detrimentally affect the County's local land use control and future transportation funding, and that the documents are legally inadequate under CEQA, SB 375, and applicable law. The overarching issues are described below and specific technical details are provided in the attached matrices. The County requests that all of the following changes be made so that the RTP/SCS and PEIR conform to existing law and County land use policies, and that the RTP/SCS and PEIR be recirculated for public review and comment.[1]

Orange County Sustainable Communities Strategy

In 2010, the Orange County Council of Governments (OCCOG) requested delegation to develop a subregional Sustainable Communities Strategy (SCS) for Orange County. OCCOG entered into a Memorandum of Understanding (MOU) with SCAG that has allowed OCCOG to develop the Orange County Sustainable Communities Strategy (OC SCS) which will be incorporated into SCAG's 2012 RTP/SCS. The OC SCS, approved by the OCCOG Board of Directors on June 23, 2011, describes the policies and programs that Orange County local jurisdictions will

County Executive Office

Santa Ana, California
92701-4062

Tel: (714) 834-6201
Fax: (714) 834-3018
Web: www.ocgov.com

[1] This letter is not intended as an exhaustive discussion of the PEIR's compliance with State law, particularly the California Environmental Quality Act (CEQA) and SB 375. The County further adopts and supports the comments of other local agencies, such as the Cities of Irvine and Anaheim, OCTA, and others, to the extent those comments are consistent with this letter.

implement to reduce greenhouse gas (GHG) emissions to 2005 levels by the year 2035 and reflects current land uses, existing entitlements, proposed development (e.g., general plans, zoning maps, etc.) and forecasted population, housing and employment growth in Orange County (i.e., Orange County Projections [OCP] 2010 – Modified, January 2012).

Pursuant to the MOU between SCAG and OCCOG, the OC SCS is to be fully incorporated without change. Although there are several references to the OC SCS in both the RTP/SCS and PEIR, it remains unclear whether the data contained in the OC SCS has remained unchanged in each proposed alternative. Without the underlying data for each alternative available for review, this cannot be confirmed. It is requested that language, maps, tables, and charts be added to demonstrate that the underlying land use, socioeconomic, and transportation data for Orange County (OCP 2010 – Modified) has been incorporated into the regional RTP/SCS and each of its plan alternatives without alteration as agreed to in the MOU. It is also requested that the adoption of the growth forecast numbers by SCAG's Regional Council and/or Joint Policy Committee be at the county level, consistent with past RTPs.

A review of the policies and strategies contained in the RTP/SCS has revealed the potential for inconsistency with land use policies and/or County operations in the unincorporated area. The County requests that the RTP/SCS include language that acknowledges and incorporates the fifteen "OC SCS Sustainability Strategies A through O," contained in Chapter Three, and the "Sustainability Strategies," contained in Appendix F, of the OC SCS as specifically appropriate for the Orange County Subregion.

Land Use/Local Control

Several policies in the RTP/SCS and dozens of mitigation measures in the PEIR, appear to go beyond the requirements of SB 375 and extend SCAG's purview into local land use control, which under law is exclusively vested with the local jurisdiction in most cases. The police power vests a county or a city with local land use regulation and control to protect the public health, safety and welfare of its residents.[2] This is specifically set forth in the California Constitution Article XI, Section 7, which reads that "A county or a city may make and enforce within its limits all local police, sanitary and other ordinances and regulations not in conflict with general laws." Under this power a county is entitled to tailor regulations to suit the ever changing needs and interests of its population, which will be done through local ordinances and applicable CEQA processes (which are addressed below). Certain measures set forth in the PEIR will in effect usurp this local control that is enshrined in the California Constitution and preserved in SB 375.

The PEIR also contains measures that will affect County operations which are federally or state regulated. There are at least 180 mitigation measures related to existing federal and state regulations with which local jurisdictions must comply (see attached matrix).[3]

[2] *Berman v. Parker*, (1954) 348 U.S. 26, 32-33.

[3] The attached matrix contains the collective comments of all County agencies that are impacted by the RTP/SCS and PEIR. Although some comments recommend edits to the mitigation measures, it is the overriding contention of the County that certain mitigation measures be completely removed. Those measures include, but are not limited to, mitigation measures as to what other local agencies "can and

These mitigation measures contain the phrase "local jurisdictions can and should" which both assumes the local jurisdiction has the authority to implement the measure and is required to do so. Inconsistency between proposed mitigation measures and existing mandates is of great concern to the County. For example, there are five California Regional Water Quality Control Boards (RWQCB) in the SCAG region, including two in Orange County, that have issued individual and locally-specified water quality permits. Local jurisdictions, including the County, would be unable to implement several of the mitigation measures in PEIR section "3.13 Water Resources" due to their inconsistency with the requirements of their local water quality permit. The County requests that mitigation measures related to existing federal and state mandates be removed and language added to the beginning of each PEIR section that states that local jurisdictions must comply with existing applicable laws and regulations. Should SCAG not delete the measures that restate existing federal, state, and local laws and regulations, the County recommends a statement that the proposed mitigation measures would be superseded by such.

Several mitigation measures will impose both funding priorities and financial obligations upon local jurisdictions at a time when budgets are tight and some funding sources are no longer available. Other measures will shift the financial obligation to project sponsors and residents by proposing that new taxes and fees be levied to fund programs or projects that "support a shift from private passenger vehicles to transit and other modes of transportation." New taxes will require voter approval and new fees are subject to Proposition 26. This analysis is outside the scope of SB 375 and SCAG is unable to make that determination. If a tax is defeated, the local jurisdiction cannot implement it as a mitigation measure which could only have been implemented with a new funding source. Finally, the assessment of impact fees upon new development to fund these measures will result in an increase in the cost of housing and infrastructure and create an even more difficult environment for construction to resume, particularly for affordable housing throughout the region.

CEQA Considerations

The PEIR fails to comply with the fundamental requirements of CEQA, which must be corrected by SCAG and recirculated for additional public review and comment.[4] The timeframe for review of a document as large as the PEIR is inadequate considering that the SCS is one of the first documents of its kind and may be subject to considerable comment by impacted jurisdictions, legally necessitating another round of review.

---

should" do, project level mitigation measures, mitigation measures duplicating federal and state law, and those measures that are beyond SCAG's authority to analyze under SB 375.

[4] We acknowledge that some of the CEQA issues discussed herein are currently being litigated by SANDAG. The County believes that the SANDAG DEIR properly deferred many mitigation measures to local agencies and that it is reasonable and legally defensible to do so.

Project Description Is Inadequate

It is not possible from reading the Project Description section of the PEIR to determine what actions SCAG proposes to take that constitute the "project" as defined by CEQA.[5] The PEIR for the RTP/SCS is unreasonably broad, addressing both program level and project level mitigation measures, as well as subject areas beyond the scope of SB 375. This causes confusion as to what the actual "project" is under CEQA. Program level environmental documents by their nature consider initial broad policies for later projects or are designed to address a series of project approvals that will occur over time. By and large, it appears that the "project" here is something akin to adopting a range of policies to be imposed on activities of other entities that will promote compliance with SB 375 and other GHG reduction legislation. In any event, the project description is so uncertain that it cannot be determined what actions SCAG might take, and therefore, it cannot be determined what potential impacts the RTP/SCS might have on the physical environment. When future project development is unspecified and uncertain, as is noted throughout the PEIR, the project description should not supply extensive detail or ambiguity beyond that needed for evaluation and review of the environmental impact.[6]

Project Level Mitigation Measures Are Improper

The PEIR states that certain projects have not been specifically analyzed or that projects and project impacts are better addressed at the lead agency or local agency level. The PEIR also states that mitigation measures are drafted in less detail than those that would be part of a project EIR. However, the PEIR contains 550 detailed mitigation measures; nearly double that from the previously approved 2008 RTP PEIR. Of foremost concern are a broad array of proposed project level mitigation measures that SCAG asserts lead agencies "can and should" adopt. There are a number of legal and policy reasons in favor of deleting these mitigation measures from the PEIR, and instead, including them as an appendix of suggested project level considerations for a local agency in determining SCS consistency.

The use of the words "can and should" in the PEIR and SCS are being interpreted by many local agencies as mandates to be implemented at the local project approval level in order be consistent with the SCS. The PEIR is not clear about what "can and should" means. CEQA Guidelines section 15005 defines "must," "should" and "may" to indicate whether a particular subject in the CEQA Guidelines is mandatory, advisory or permissive, respectively. Section 15005(b) states that "should" identifies policy considerations under the Guidelines, legislative history of the statute and court decisions that public agencies are advised to follow in the absence of compelling, countervailing considerations. Common use of the word "can" is used to express ability or opportunity, although this term is not defined under CEQA or any case law. It is not clear what SCAG's intent is in using "can and should," and whether usage is intended to be mandatory, advisory or permissive. Based on a definitional interpretation of "can and should," the phrase appears in this context to mean that the lead agency is able to and recommended that the mitigation measures be imposed. Should this be SCAG's intent, the County notes that SCAG has no authority under any applicable law to prescribe or

[5] All references to "project" in parentheses mean SCAG's RTP/SCS program as it is a "project" defined by CEQA pursuant to Pub. Res. Code § 21065 and CEQA Guidelines § 15378.

[6] *County of Inyo v. City of Los Angeles* (1977) 71 Cal. App. 3d 185, 199; CEQA Guidelines § 15124.

enforce such mitigation measures. Furthermore, under CEQA, local agencies are not bound by the PEIR's mitigation measures as project level mitigation will be addressed by a lead agency at the time of project approval to the extent the mitigation is determined by that lead agency through the CEQA process to be feasible, effective and enforceable.

SCAG has stated at public meetings and workshops on the RTP/SCS that the mitigation measures are intended as a "toolbox" or "menu" of policy considerations from which lead agencies could choose in approving a project.[7] Even with this clarification in the PEIR, "can and should" is used inconsistently throughout the documents. On page 1-5 of the Introduction, the PEIR expressly states that mitigation measures can be implemented at the project level and that local lead agencies "shall be responsible for ensuring adherence to the mitigation measures . . ." The Introduction goes on to state that "it is reasonable to expect that other agencies will actually implement the mitigation measures assigned to them."

SCAG should not attempt to further define what "can and should" is intended to mean or even what it means in every instance, as the current meaning under CEQA and common use of the words indicate a mandate where there is not one under CEQA or SB 375. The applicable mitigation measures should be removed from the PEIR and added to an appendix to the SCS or other policy related document, making clear that they are permissive policy considerations that lead agencies could examine at the project level. The County's recommended reworking of the mitigation measures will avoid misinterpretation and be consistent with CEQA and SB 375's preservation of local control. Again, permissive or advisory policy considerations are not proper mitigation measures for an EIR where mitigation measures must be feasible, effective and enforceable. This would also remove those mitigation measures that are not specific and do not articulate the impacts that will be mitigated.[8]

SCAG states that it is required to find that other jurisdictions can and should implement mitigation measures since many changes and alterations to SCAG's "project" are within the responsibility and jurisdiction of other public agencies.[9] This argument is flawed. If SCAG is to clarify these mitigation measures are advisory or permissive policy considerations to be implemented by the local agency on a "toolbox" or "menu" basis, then the finding under section 15092(a)(2) has not been demonstrated because the measures will not in fact mitigate or avoid significant effects on the environment caused by SCAG's "project" since they are policy tools to be evaluated by local agencies. That is, SCAG should defer all mitigation measures associated with what local agencies "can and should" do to individual project level CEQA processes and only deal with program

[7] While the County generally supports SCAG's intent to clarify in the PEIR that mitigation measures associated with what a local agency "can and should" do are a "toolbox" of policy considerations to consider at the project level, we believe that under CEQA, the mitigation measures should be removed for the reasons stated herein.

[9] Introduction, page I-6, citing Pub. Res. Code § 21081(a)(2) and CEQA Guidelines § 15092(a)(2) as the basis of its use of "can and should."

level issues that are within SCAG's authority. This approach is consistent with SB 375's preservation of local control.

Mitigation Measures Have Not Been Demonstrated to be Feasible, Effective & Enforceable

As discussed above, the PEIR does not analyze specific projects and specific project impacts, yet attempts to implement a variety of project specific mitigation measures. The mitigation measures primarily consist of measures that SCAG thinks should be applied to future projects to be carried out by other entities. Such mitigation measures, of course, have no bearing on whatever "project" it is that SCAG is evaluating, and cannot be evaluated either for feasibility, effectiveness or enforceability since they would apply to as yet unidentified and indescribable future projects by other entities.

An EIR must describe and demonstrate the feasibility of mitigation measures that can minimize the project's significant environmental effects.[10] The PEIR has made a preliminary determination that these mitigation measures are feasible and effective, and therefore, it is reasonable to expect that local governments will actually implement them. The County believes, however, that it has not been demonstrated that each and every project specific measure is feasible, practical and effective, or even that local agencies "can and should" approve such measures. If this was the case, then the mitigation measures would not now be characterized as a "toolbox" or "menu." And despite recognition that the PEIR cannot analyze every future project and impact, the document contains an exhaustive list of mandated or suggested, as the case may be, project level mitigation measures that local agencies "can and should" implement. CEQA, though, does not require analysis of every imaginable mitigation measure unless such measures are feasible and effective.[11] By its own admission, the PEIR has not analyzed and cannot analyze every potential project or impact for which it is attempting to mitigate. Thus, the measures are larger than the program itself and cannot therefore be characterized as feasible and effective.

The County agrees that mitigation measures must be adopted for significant impacts recommended in an EIR unless a lead agency finds that the measure is infeasible. We believe, though, that it can be demonstrated that project level measures as to what local agencies "can and should" do are infeasible as it is outside SCAG's authority to mandate since most SCS determinations will actually be made at the project level. Mitigation measures that are adopted must be enforceable through conditions of approval, contracts or other means that are legally binding.[12] A lead agency is not required to adopt a mitigation measure when it has no ability to enforce the measure.[13] SB 375 is clear that a metropolitan planning organization (MPO) does not have authority to require compliance

---

[12] Pub. Res. Code § 21081.6(b); CEQA Guidelines § 15126.4(a)(2).

[13] *Tracy First v. City of Tracy* (2008) 177 CA4th 912.

with the SCS, and the legislation suggests that MPOs may have some ability to make determinations as to SCS consistency for purposes of prioritizing state transportation funding allocations. The County recognizes that CEQA allows program level mitigation measures to be incorporated into a policy or plan,[14] but it is beyond SCAG's authority, as it has done here, to approve project level mitigation measures that can only be considered by a lead agency at the project level as such measures are not enforceable by SCAG pursuant to SB 375.

All proposed mitigation measures are subject to the same standard of feasibility under CEQA whether the measure is proposed to be carried out by SCAG or another local agency. The standard does not change for measures outside of SCAG's control. Thus, SCAG's preliminary determination of feasibility as to those mitigation measures that another local agency "can and should" could raise the feasibility thresholds for future lead agencies that actually make those determinations.

Significant Impacts to the Environment Are Speculative

Since it cannot be determined from the Project Description exactly what the "project" is, it cannot be discerned what impacts the "project" might have, and therefore, it is impossible to determine whether project level mitigation measures will avoid or otherwise reduce the impacts of the RTP/SCS. Certainly, SCAG relies on the data submitted by all local agencies in its region, and it must take the data at face value and rely upon it as accurate. The PEIR, though, correctly notes that it cannot specifically identify all future projects and it cannot specifically analyze those projects that will later be approved by other lead agencies. Future development in many respects is unspecified and uncertain, and the PEIR is not required to include speculation about future environmental consequences of such development and how it should be mitigated.[15] "No purpose can be served by requiring an EIR to engage in sheer speculation as to future environmental consequences."[16] Project level mitigation measures as to what a local agency "can and should" do are inadequate as sheer speculation because there is no evidence that they will avoid or reduce the impacts of SCAG's program and do not relate to known, identifiable projects.

[14] CEQA Guidelines § 15126.4(a)(2).

[15] *Laurel Heights Improvement Assoc. v. Regents of the Univ. of Calif.* (1988) 47 Cal.3d 376, 395.

[16] *Christward Ministry v. Superior Court* (1986) 184 Cal. App. 3d 180, 193.

Mitigation Measures That Are Already Required by Law
Another reason to exclude project level mitigation measures is that many of them are already required by law. Although environmental documents often cite existing laws as mitigation measures for significant environmental impacts, this is often done at the project level where specific laws and regulations can be analyzed to determine whether the regulation or practice will actually mitigate the impact. SCAG's region lies across six large counties that have varying land use circumstances. For instance, the SCAG region encompasses five regional water boards with differing NPDES permit requirements, such as low impact development requirements that are implemented differently depending on geotechnical issues. The PEIR mitigation measures should not overly generalize or speculate as to which laws and regulations should be followed, which can only be determined by the actual regulating body on a specific basis.

SB 375 Considerations
The County is deeply concerned with the broadness of the PEIR and RTP/SCS. At a presentation held at the CEHD meeting on January 8, 2009, SCAG then interpreted SB 375 to only include VMT associated with vehicles and light trucks, and went on record that green buildings, energy efficiency, municipal operations, waste management, water and technology programs and measures were not within the purview of the SCS. The draft RTP/SCS and PEIR, however address all of these subject areas. We believe that SCAG's original 2009 interpretation is the legally correct one under SB 375 and that SCAG should amend the document to delete all references and measures to items outside of SB 375 that do not directly relate to VMT from vehicles and light trucks. The RTP/SCS and PEIR should not be used as an umbrella document for all things SCAG considers sustainable.

The legislative text of SB 375 states that state transportation funding will be prioritized and allocated to those local agencies that are consistent with an approved SCS. The actual SB 375 statutes do not specifically state how this will be done and what exact funding will be subject to SCS prioritization. There has been no follow-up legislation or other policy of which the County is aware that clarifies this issue. Due to this, SB 375 enforcement is unclear.

We believe that SCAG should clarify and elaborate on its understanding of this issue. Much more information is needed as to the process, if any, that SCAG will employ to make SCS consistency findings. Will SCAG make SCS consistency findings for individual programs and projects? Will a subregional delegate who has prepared its own SCS, like OCCOG has with the OC SCS, have the authority to make such findings? Will the local programs and projects within Orange County boundaries also be subject to consistency findings by SCAG under its approved SCS? What types of local programs and projects will be subject to a SCS consistency review? These questions and many other must be answered prior to effective implementation of the policies set forth in SB 375.

The PEIR states in one sentence that "Lead agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring

efforts, including SCAG's Intergovernmental Review (IGR) process."[17] However, SCAG's approved 2008 PEIR devotes several pages to what a RTP consistency process entails. SCAG also devotes a portion of its website to an overview of the IGR process, but this does not appear to incorporate SCS issues and has not been recently updated. The County encourages SCAG to revise the SCS/PEIR to specifically define such a process in enough detail and with sufficient public comment to ensure that any such oversight is consistent with SB 375 and is not arbitrary or capricious under State law. On this issue, the County recommends that there be consideration for a consistency process by the subregional delegate who has prepared its own SCS, like OCCOG.

In short, many of the mitigation measures appear to go beyond SB 375's focus on transportation and housing, and could potentially be outside the scope of SCAG's authority. Again, the SCS and its mitigation measures should not be a "kitchen sink" approach to sustainability, but should endeavor to examine actual programmatic ways to reduce GHG within SCAG's control. The County is very concerned with mitigation measures that state local agencies "can and should" pass new taxes and fees. Such measures are beyond the scope of SCAG's authority to examine under SB 375 and are infeasible mitigation measures under CEQA.

The County respectfully requests that Southern California Association of Governments review and incorporate our comments/responses into the final 2012 RTP/SCS and PEIR. Further, as a member of the OCCOG, the County actively participated in the development of and supports the comments submitted by the OCCOG Executive Director. If you have any questions regarding this matter please call Rick LeFeuvre at (714) 955-0124.

Sincerely,

Thomas G. Mauk

[17] Introduction, page I-5.

County of Orange
Review of Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Program Environmental Impact Report (PEIR)

AREA OF CONCERN: AIRPORT OPERATIONS	
Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy	
Chapter 2 – Transportation Investments Page 60-62	Information is presented on airport ground access and airport financial and marketing strategies. These strategies identify potential sources of funding such as: a) charging fees for private vehicles picking up and dropping off passengers at congested airports; b) a regional funding mechanism using revenues generated at congested airports to support facilities and development at alternate airports (requiring new legislation); and c) funding a region-wide marketing effort through sources such as airport parking and rental car transactions. Including these specific strategies in the RTP document may raise expectations that these strategies are supported by airports in the region. However, due to the competitive nature of most airports, it may be difficult to achieve such support. It may also be challenging to garner airline and FAA support. It is suggested that the airport strategies text be revised to recognize that any incentives or funding mechanisms that are proposed, and which affect other airports in the region, should be developed through regional consensus. Although many of the SCS "Airport Policies and Action Steps" suggest such an approach, this should be stated in the strategies text as well, and it should be clear that while these strategies may be explored, they may or may not be pursued. Additionally, SCAG should invite the FAA and airline representatives to be part of any discussions which address the concept of using revenues from one airport to benefit another.
Chapter 2 – Transportation Investments Page 61	A revision to the *Airport Ground Access Strategy* section (end of the first paragraph) is suggested as follows: "Potential sources of funding could include charging fees for private vehicles picking up and dropping off passengers at the congested airports. This ~~would not adversely impact existing airport revenues and would~~ could have a number of advantages….." This revision is proposed because, with respect to the third bullet, a case could be made that although there are advantages to passengers using public transportation, it is possible that parking revenues would be adversely impacted.
Chapter 2 – Transportation Investments Page 61	The *Airport Financial Strategy* section should be revised to avoid making inferences that an issue "should not be controversial," especially related to a strategy that identifies a requirement for legislative changes allowing funds from one airport to be used at another airport(s) not operated by the same entity. It should also be clarified that such legislative changes would be needed at both the state and federal levels.
Chapter 2 – Transportation Investments	The *Airport Marketing Strategy* section suggests that SCAG work with regional stakeholders to develop region-wide marketing efforts to promote alternatives to the use of congested airports. A variety of funding sources is suggested; however, airport parking and rental car transactions are specifically mentioned. These funding sources may or may not be supported by airports in the SCAG region and should be thoroughly

Page 62	discussed and, as stated in the document, a consensus of the region's airports should be developed before proceeding with such a strategy.
Chapter 2 – Transportation Investments Page 62	The *Airport Policies and Actions Steps* identify certain actions that are recommended by SCAG. The sub-section, *Airspace Planning and New Technologies*, identifies policies related to modifications to the regional airspace system, and airspace capacity and constraints. It is suggested that the wording, "in coordination with the FAA," be added to each of the bullet points in this section.

AREA OF CONCERN: PUBLIC HEALTH	
Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy	
Chapter 1 – Vision Page 15, Table 1.3	Note, via additional check, connection between "Safety and Health" and "Encourage land use and growth patterns that facilitate transit and non-motorized transportation."
Chapter 2 – Transportation Investments Page 53	The collection of additional data on active transportation, including greater specificity in destinations, geographic detail, and types of active transportation, is important in ensuring data driven transportation systems.
Chapter 2 – Transportation Investments Page 53	The proposed expansion of bikeways represents an exciting opportunity to facilitate active transportation, improve air quality, and reduce chronic disease risk. The connectivity of such an expanded bikeway network with transit systems, centers of employment, and residential areas, particularly those most likely to use and benefit from such assets, is also an important part of such a plan.
Chapter 2 – Transportation Investments Page 53	The improvement of sidewalk infrastructure proposed in the RTP/SCS is likely to facilitate walking as sidewalk quality can be a key factor affecting walkability.
Chapter 2 – Transportation Investments Page 54	Safe Routes to School: Besides their benefits in reducing congestion related to the drop-off and pick-up of students, Safe Routes to School initiatives can facilitate important daily incidental walking and biking, which can substantially increase the chances of children meeting daily physical activity recommendations. Though the draft RTP/SCS recognizes the importance of Safe Routes to School, it could better detail how Safe Routes to School programs, assets, and principles will be integrated into the plan.
Chapter 2 – Transportation Investments	SCAG's encouragement of Complete Streets is important to the local implementation of Complete Streets policies consistent with AB1358. Augmented and explicit support in the RTP/SCS for physical and engineering changes that facilitate safe multi-modal, multi-user roadway utilization may be beneficial. Consider increasing regional coordination in Complete Street policy implementation to facilitate continuity across

Page 54	local jurisdictions.
Chapter 4 – Sustainable Communities Strategy Page 150, Table 4.3	We would be excited to participate in the Action/Strategy, "Collaborate with the region's public health professionals to enhance how SCAG addresses public health issues in its regional planning, programming, and project development activities." The inclusion of "Local Jurisdictions" in the "Responsible Parties" field would further bolster local collaborations, including those with Public Health Departments.
Chapter 4 – Sustainable Communities Strategy Page 150, Table 4.3	The Action/Strategy "Consider developing healthy community or active design guidelines that promote physical activity and improved health" has considerable promise. The inclusion of "State" in "Responsible Parties" would bolster coordination, collaboration, and support in generating guidelines.
Chapter 4 – Sustainable Communities Strategy Page 150, Table 4.3	In reference to "Engage in a strategic planning process to determine the critical components and implementation steps for identifying and addressing open space resources," please consider including increasing / preserving park space, specifically in park-poor communities.
Chapter 4 – Sustainable Communities Strategy Page 150, Table 4.4	Perhaps the Action/Strategies "Encourage the implementation of a Complete Streets policy" and "Emphasize active transportation projects as part of complying with the Complete Streets Act (AB 1358)" could be tied together somehow given they will likely be implemented in concert.
Chapter 4 – Sustainable Communities Strategy Page 150, Table 4.4	The Action/Strategy "Develop infrastructure plans and educational programs to promote active transportation options" may benefit from engaging local public health departments, walking/biking coalitions, and/or Safe Routes to School initiatives, who may already have components of such educational programs in place.
Chapter 4 – Sustainable Communities Strategy Page 150, Table 4.4	We also had some additional suggested language. The additions are underlined: 1. Perform and support studies with the goal of identifying innovative transportation strategies that enhance mobility and air quality, and determine practical steps to pursue such strategies. <u>Engage local communities in planning and prioritization efforts.</u> 2. Continue to work with neighboring Metropolitan Planning Organizations to provide alternative modes for interregional travel, including Amtrak and other passenger

	rail services, and an enhanced bikeway network, such as on river trails. 3. Prioritize transportation investments to support compact infill development that includes a mix of land uses and housing options, including park space, where appropriate, to maximize the benefits for existing communities, especially vulnerable populations, and to minimize any negative impacts.
Chapter 4 – Sustainable Communities Strategy Page 152, Table 4.5	We also had some additional suggested language. The additions are underlined: Support work-based programs that encourage emission reduction strategies and incentivize active transportation commuting or ride-share modes.
Chapter 5 – Measuring Up Page 162, Table 5.1	Augment Safety and Health indicators within RTP performance measures. Consider measures of obesity, non-motorized commuting, walking and biking behavior, asthma hospitalization rates, etc.

AREA OF CONCERN: LAND USE POLICIES

Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy

Chapter 4 – Sustainable Communities Strategy Page 110	The goals and benefits of the SCS listed here go above and beyond the requirements of SB 375. The provisions of SB 375 require the development of a SCS that focuses on a reduction of vehicle miles traveled by cars and light trucks, and greenhouse gas emissions. A presentation made by SCAG in January 2009 indicated that "SB 375 is not about: green buildings, energy efficiency, municipal operations, waste management, water, technology." However, all of these items have been incorporated into the RTP/SCS and PEIR.
Chapter 4 – Sustainable Communities Strategy Page 119	SCAG indicates that the policies of its Compass Blueprint program will be used to determine consistency of private development and public infrastructure projects with the SCS. A statement should be added that will clarify whether or not a project that is determined to be inconsistent with the policies of the SCS (i.e, Compass Blueprint) will be deemed ineligible for transportation funding.
Chapter 4 – Sustainable Communities Strategy Page 148	Throughout the document the RTP is described as having "growth inducing impacts." In past iterations of the RTP, its purpose was to mitigate the impacts of growth. If transportation projects identified in the RTP are seen as inducing growth, then the lead agency may be required to mitigate the impacts of perceived subsequent related growth.
RTP/SCS and PEIR	There are several terms contained throughout the RTP/SCS and PEIR that need to be clearly defined including the following: • Urban Growth Boundary • Parking Cash Out

	• References to benchmarks • SCRIP • Gentrification • Open space • Smart growth principles • Active Transportation • Greenfield
RTP/SCS and PEIR	The alternatives discussed in the RTP/SCS, PEIR and SCS Background Document have been inconsistently named. The alternatives are labeled either: 1, 2 and 3, or A, B and C. The appropriate name should be determined for each and these documents revised to ensure consistency.
Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy Program Environmental Impact Report	
Introduction Page 1-5	The statement "Lead agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring efforts, including SCAG's Intergovernmental Review (IGR) process," gives the impression that these mitigation measures are mandatory and not merely a list of "menu options." This statement should be revised to reflect that these measures are advisory only.
Project Description Page 1-5, 1-7	The strategies listed in the Project Description section are not consistent with the strategies listed in Chapter 4 of the RTP/SCS. Specifically, the bulleted list on the page is stated to represent the land use strategies of the plan, however, the strategies listed are not specifically identified in the regional SCS. Including different language in the PEIR implies additional policy.
Executive Summary Pages ES-4 through ES-87	The PEIR indicates that the proposed mitigation measures have been determined to be feasible and local jurisdictions "can and should" implement them. However, SCAG staff has indicated that these measures are only advisory. Therefore, this language should be revised to reflect that it will be left to each local jurisdiction to determine the feasibility and applicability of each measure to future projects.
Executive Summary Pages ES-4 through ES-87	The PEIR contains mitigation measures that appear to expand SCAG's overall purview. Several also appear to extend into the purview of local jurisdictions. If so, this may lead to loss of local control over land use policies and/or operations.
Executive Summary Pages ES-4 through ES-87	The PEIR contains several mitigation measures that propose new funding sources including new fees, fines, taxes, incentives, etc., that would impose a financial burden on local jurisdictions and which could result in an increase in the cost of new housing and other development. New taxes or fees could be subject to the voter approval requirements of Proposition 218 as well as Proposition 26, and SCAG has no ability to determine the feasibility of this measure.
Executive Summary Pages ES-4 through ES-87	The PEIR contains 190 mitigation measures that provide very specific requirements in areas that are already regulated by local, state or federal agencies. To avoid the potential for conflicting requirements, the PEIR should only require compliance with existing regulations. Please see the attached matrix that identifies these specific mitigation measures.

Executive Summary Pages ES-4 through ES-87	The PEIR contains over 50 mitigation measures that either reflect SCAG policies or propose new policies intended to be adopted by local jurisdictions or other entities. It is inappropriate to use mitigation measures to adopt policy. Please see the attached matrix that identifies these specific mitigation measures.
Executive Summary Pages ES-4 through ES-87	In several mitigation measures references are made to existing guidance documents. Guidance documents are there as information sources for consideration and do not represent regulation or establish standards that are required to be achieved. For example, MM-AQ19 inappropriately indicates that project sponsors should comply with the CARB Air Quality and Land Use Handbook (June 2005) which is only a guidance document.

AREA OF CONCERN: STORMWATER RUNOFF

Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy

Chapter 4 – Sustainable Communities Strategy Page 82-83	The RTP/SCS describes the following measures contained in the "water resources mitigation program:" 1. "Utilizing advanced water capture and filtration techniques, showing a preference for naturalized systems and designs to control stormwater at the source;" 2. "Avoiding any new construction of impervious surfaces in non-urbanized areas, such as wetlands, habitat areas, parks and near river systems;" 3. "Avoiding any new construction that provides access to flood-prone areas, such as alluvial fans and slide zones;" and 4. "Expansion of (natural flood control systems, such as wetlands and riparian buffers) in areas where they do not currently exist". It is unclear how such measures would be implemented if they are included in this document. If they are to be viewed by local jurisdictions as either goals or suggested policies, they could be implemented on that basis to the extent they were deemed feasible in any given case. On the other hand, if listing such measures indicates they are deemed reasonable and feasible to be applied by municipalities in all new road projects, that is quite another matter and not supportable. For example, while it may be desirable to utilize advanced water capture and filtration techniques, there is little documented experience with engineered on-site capture and filtration to support a preference for "naturalized systems and designs" in every case. Similarly, the strongly worded measures against new construction in wetlands, habitat areas, parks, near river systems, and flood-prone areas may be desirable, but should not constitute an outright prohibition, with hundreds of vacant, older but long-established legal building sites situated in such settings. The word "any" should be removed from the mitigation measures to address these concerns. Finally, the suggested expansion of natural flood control systems, such as wetlands

	and riparian buffers, in areas where they do not currently exist is supportable, as long as it does not in any way mandate removal of existing engineered channel stretches as "mitigation" for road-building. In many cases, the only reason a new road can be built at all is that engineered channels have reduced flood hazards to that area.
Chapter 4 – Sustainable Communities Strategy Page 110	One of the "Benefits to Public Health and the Environment" regards municipal water and sewer systems. The statement "...concrete stormwater channels harm water quality and sprawl eats into open space" is misleading, and is subject to Regional Water Quality Control Board regulations that vary by region. The following alternative language is suggested: Public health and environmental protection have long been linked to the way our region is planned and the way public services are delivered. Municipal water and sewer systems, for example, ensure clean water. At the same time, ~~concrete stormwater runoff channels harm water quality~~ as areas become more urbanized and the percentage of impervious surface is increased, the hydrologic regime is dramatically altered. Drainage conveyances that once were natural and riparian are required to be engineered as hardened flood control channels to provide adequate protection of private property and public infrastructure from the increased frequency, duration, peak flow, and overall volume of stormwater runoff. With this armoring of once natural channels, water quality benefits from biofiltration are lost along with opportunities for infiltration and evapotranspiration, which can lead to hydromodifcation downstream in sections which are not yet engineered and hardened. Many strategies contained in the RTP/SCS will provide widespread benefits within the region for both public health and environmental protection.
Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy Program Environmental Impact Report	
Chapter 3.13 – Water Resources Pages 3.13-34 through 3.13-46	The PEIR includes 68 mitigation measures in the Water Resources section regarding water quality. At least 35 of these are related to stormwater runoff best management practices (BMPs) that are currently regulated through Municipal National Pollutant Discharge Elimination System (NPDES) Stormwater Permits issued by Regional Water Quality Control Boards. In the SCAG region there are five water quality control boards each with its own Municipal NPDES Stormwater Permit. The regulations and requirements contained in these permits vary from each other. By listing specific measures in the PEIR that are not included in a project's applicable Municipal NPDES Stormwater Permit, the PEIR creates conflicting compliance requirements. To eliminate potential conflict with existing regulations, the mitigation measures regarding specific BMPs should be removed and replaced with a single requirement that each project must comply with its applicable Municipal NPDES Stormwater Permit.
Chapter 3.13 – Water Resources Pages 3.13-34 through 3.13-46	There are no specified limits to how small a project has to be to require mitigation. Measures MM-W9, MM-W24, MM-W32 and MM-W61 all suggest local jurisdictions regulate and limit the installation of new impervious patios, paved courtyards, pools, spas, open stairways, and walkways in private back yards, minimizing these as "non-roof impervious surfaces around the building," or require "mitigation" such as restoring or expanding nearby wetlands or riparian buffer areas, upgrading nearby stormwater drainage facilities, or paying a "mitigation" fee for their related "impacts." However, no court has held that wetlands and riparian buffers are "utilities" for which such fees could

	be imposed without voter approval. MM-W11 further provides that "any areas disturbed along the riparian corridor should be replanted with mature native riparian vegetation." This measure lacks specificity as to the boundaries or width of a riparian corridor. In many cases, areas in Southern California along riparian corridors are infested with invasive periwinkle, and Department of Fish and Game biologists would prefer bare ground after removal so that natural recruitment from the remaining specimens of native groundcover may occur. It is in fact impossible to replace a "mature" native groundcover in a riparian area without further disturbing stream banks. It is also unreasonable to require the replacement of a tree that has been approved for removal by the California Department of Fish and Game.
	MM-W12 provides that roadway construction projects comply with the CalTrans stormwater discharge permit. MM-W20 suggests local road projects both comply with the CalTrans permit and incorporate median strips. Orange County's Municipal NPDES Stormwater Permits, as issued, contain entirely different and conflicting requirements for road projects. Specifically, the County is required to follow the EPA Greenstreets Handbook for road improvement projects. The EPA Greenstreets Handbook does not identify median strips as an option.
	MM-W13 provides that NPDES compliance requires a "Construction-Permit-Phase Stormwater Supplemental Form." MM-W13 further directs "non-landscape based stormwater treatment measures" be compared in each individual case to landscape-based treatment measures. Orange County's Municipal NPDES Stormwater Permit requirements for construction, new development and significant redevelopment, as issued, contain entirely different and conflicting requirements. The County's program utilizes customized forms, procedures, and means of assessment. MM-W17 suggests structural stormwater runoff treatment should be pursued where such treatment facilities will be operated by a municipality. Orange County's Municipal NPDES Stormwater Permit program focuses on the private sector operating all site specific treatment control facilities, unless they are regional in nature. MM-W30 requires filter fabrics over storm drain inlets for all site dewatering. If the approved volume of dewatering is large, it may not be possible to maintain a filter fabric over the inlet at all times. Reference to regional water board-approved general dewatering permits would represent superior language. MM-W48 requires the implementation of water conservation through many measures that are regulated under the Green Building Code.
	The following measures fail to make the critical distinction between regulating runoff from development sites and limiting changes to those sites. MM-W22 also speaks to hydrologic changes "induced" by flood plain encroachment. In fact, flood plain developments are engineered to survive storms of a given size, with protection that properly directs storm flows. There is no mechanism to assume standard flood engineering fails to prevent in-stream hydrologic changes, and then ask for more such engineering.

	MM-W29 requires that stormwater runoff never be increased to adjoining properties or a nearby creek. Engineered runoff flowing in a controlled manner to an adjoining property is almost always allowed, when the owner of that property gives consent. MM-W58 indicates that the purpose of low impact development is to maintain the existing hydrology of the site. LID, as currently practiced, replicates the pre-development runoff from a site by on-site retention, but does not mimic pre-development hydrology within a site.
	MM-W30 requires "replanting of the (graded) area with native vegetation as soon as possible." Replanting would occur with the approved plant palette, likely with drought-tolerant materials, but not necessarily native vegetation. MM-W48 establishes a minimum irrigation system distribution uniformity of 75%, which would basically prohibit the use of lower cost sprayheads, which rarely attain a "DU" greater than 50%. MM-W51 and MM-W55 provide that homeowners upgrading existing homes would be required to install automatic sprinkler systems and soil moisture controllers. MM-W66 appears to require existing homeowners seeking permits to improve their homes to cover over any area of exposed ground on their properties with mulch, or install edible materials for "local" consumption. All of these measures may go beyond the State Model Landscape Ordinance, absent a definition of significant redevelopment and, in the case of MM-W66, by covering all bare ground, actually prevent natural recruitment from specimens of native groundcover.
	MM-W65 appears to require local jurisdictions to "install forests." This requirement is extreme and unattainable, particularly in arid climates where forests never naturally existed.
AREA OF CONCERN: ROAD TRANSPORTATION Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy Highways and Arterials Supplemental Report	
Programmed Commitments Page 2, Table 1	With respect to Orange County, Sample Major Highway Projects listed in Table 1 for in the FTIP identify improvements to I-5 (HOV Lanes from South of Avenida Pico to South of Avenida Vista, completion year 2020) and I-405 (Mixed Flow Lanes from SR-73 to I-605, completion year 2018). It is presumed that Caltrans is lead on these projects and there is no local match/investment requirement.
Programmed Commitments Page 3, Table 2	In Table 2, additional county commitments are identified. Therein, there is reference to: 1. HOV Lanes - Reconfiguring the Avenida Pico Interchange at the I-5 in San Clemente – completion year 2014. 2. Toll Lanes - Constructing HOV/HOT connectors for SR-91/SR241 – completion year 2018. 3. Mixed Flow Lanes – Reconfiguring the interchanges at Avery Parkway and La Paz

	in Mission Viejo – completion year 2020. There is also mention of improving the interchange at SR-91/SR-55 and Lakeview Avenue in Anaheim – completion year 2023. It is presumed that Caltrans is lead on these projects and there is no local match/investment requirement. (These projects are not listed in OC Public Works/7-year Transportation Capital Improvement Program, BOS Approved on 6-28-2011.)

Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy
Project List Supplemental Report

Page 2, Federal Transportation Improvement Program (FTIP) Project List (Table)	1. FTIP ORA120357 - Orange County, Traffic signal Synchronization for Bus Rapid Transit Corridors, Route 0 • Is funding tied to OC Public Works/Road's Antonio Parkway Corridor Traffic Signal Synchronization programmed for FY 2012-13? Coordination between OCTA and OC Public Works/Road is recommended. 2. FTIP ORA120326 Route 5 and FTIP ORA000152, FTIP 120506 and ORA120507 on Route 74 • Comment/Question: Is funding tied to OC Public Works/Road's La Pata Avenue (Engineering) and La Pata Avenue NEPA (permitting) projects programmed for FY 2011-12, Pata Avenue Land Acquisition programmed for FY 2012-13 and La Pata Avenue (construction) programmed for FY 2013-14? 3. FTIP 2A0804 and ORA082401 Route 0, Cow Camp Road from FTC to Ortega • Is funding tied to OC Public Works/Road's Cow Camp Road Segment 1 (Engineering) programmed for FY 2011-12, Cow Camp Road – Segment 1 (Construction) and Cow Camp Road Segment II (Engineering) programmed for FY 2012-13, and Cow Camp Road – Segment II (Construction) programmed for FY 2013-14 4. FTIP ORA82406 Antonio Parkway Build Out between Ladera Planned Communities to Ortega Highway • Not shown listed in OC Public Works/7-year Transportation Capital Improvement Program, BOS Approved on 6-28-2011. 5. FTIP ORA120505 Alton Parkway Improvements - Irvine Blvd to Commercentre Drive • Not shown listed in OC Public Works/7-year Transportation Capital Improvement Program, BOS Approved on 6-28-2011. • Coordination with County required – Adjacent to James A Musick Branch Jail 6. FTIP ORA120523 on Route 0, Placentia – Richfied Ave. – Atwood Channel Bridge Widening • Coordination with OCFCD required. 7. FTIP ORA020826 on Route 0, Tustin Ave/rose Drive Grade Separation • Coordination with County and OCFCD required. 8. FTIP ORA100603 on Route 0, Santa Ana River Trail • Coordination with OCFCD required. 9. Financially-Constrained RTP Projects, 210 10. RTP ORA120357 Orange County Traffic signal Synchronization for Bus Rapid Transit Corridors – see FTIP Projects above 11. RTP ORA120326 Route 5 – see FTIP Projects above 12. RTP ORA120523 Richfield Avenue – see FTIP Projects above, completion FY 2012 13. RTP 2A0705 Signal Synchronization Program – see FTIP ORA120357 above,

	completion FY 2035 14. RTP 2L220 Non-motorized, completion FY 2035 • No projects are identified in OC Public Works/Road 7 year CIP. 15. RTP 2A0804 Cow Camp Road, completion FY 2018 – see FTIP Projects listed above Laguna Canyon Road Projects identified in OC Public Works 7 year CIP for FY 2011-12 (SR-73 to I-405 and SR-73 to El Toro Road) were not identified in the report nor was that for the El Toro Road widening from Glen Ranch Road to Live Oak Canyon currently programmed for FY 2014-15.

Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy

Program Environmental Impact Report

Chapter 3.12 – Transportation, Traffic, and Security Pages 3.12-30 through 3.12-43	Several of the mitigation measures include actions on the part of SCAG that appear to be outside of their purview or may result in the loss of local control: MM-TR4 – Emergency repairs are under the purview of local jurisdictions. May be outside of SCAG's purview. MM-TR5 – Is SCAG making a commitment to provide this technology to local jurisdictions? MM-TR6 – Is SCAG to become another reviewing entity with approval authority of grant funds such as Caltrans and OCTA? MM-TR7 – May be outside of SCAG's purview to plan for and respond to terrorist incidents and natural or human-caused disasters. MM-TR8 – May be outside of SCAG's purview to plan for and respond to terrorist incidents and natural or human-caused disasters. MM-TR9 – Purview of Federal and State authorities. MM-TR10 – Purview of Federal and State authorities. May be viewed as another layer of bureaucracy. MM-TR13 – May be outside of SCAG's purview to plan for regional emergencies. MM-TR17 – Implementing programs to reduce employee trips should be left to the local jurisdictions. MM-TR18 – Providing incentives for employee ride-sharing programs is problematic given the current economy and budget realities. MM-TR19 – Providing incentives for car sharing programs is problematic given the current economy and budget realities. MM-TR20 – Providing incentives for employee vanpool programs is problematic given the current economy and budget realities. MM-TR21 – Regional transportation plans tie inter-modal systems together. SCAG should support revisions to Master Plans of Arterial Highways for local jurisdictions. MM-TR28 – Measures relating to Transportation Demand Management plans are already carried out by local entities.

MM-TR29 – Measures relating to traffic management strategies are already carried out by local entities.

MM-TR33 – Traffic control plans required for encroachment permits are under the purview of local jurisdictions.

MM-TR34 – What will be the consequence of a local jurisdiction not meeting and identified transportation-related benchmark?

MM-TR35 – What will be the consequence of a local jurisdiction not establishing a parking policy that discourages private vehicle use? How would this be evaluated?

MM-TR55 – Under the purview of regional transportation agencies to conduct public outreach regarding transportation issues.

MM-TR60 – Impact fees on new development will increase the cost of housing.

MM-TR62 – Under the purview of regional transportation agencies to monitor congestion.

MM-TR66 – What will be the consequence of a local jurisdiction not limiting delivery hours for local business? May cause local businesses to relocate elsewhere.

MM-TR76 – Modifying development standards to accommodate bicycle use to this extent will increase costs to the local jurisdiction and increase costs of development.

MM-TR77 – Modifying development standards to accommodate bicycle use to this extent will increase costs to the local jurisdiction and increase costs of development.

MM-TR78 – Local jurisdictions may not have the funding to provide these types of multi-use trails.

MM-TR79 – May be outside of purview of local jurisdiction to provide bicycle safety training.

MM-TR80 – Impact fees on new development to fund bicycle facilities will increase the cost of housing.

MM-TR83 – What will be the consequence of a local jurisdiction not establishing a parking policy that discourages private vehicle use? How would this be evaluated?

MM-TR88 – Local jurisdictions may not have the resources to establish incentives to encourage the use of electric vehicles or to build outdoor wired facilities for these vehicles.

MM-TR92 – Local jurisdictions may not have the resources to purchase expensive electric or hybrid vehicles at the time replacements are needed.

MM-TR95 – Local jurisdictions may not have the resources to provide "bicycle stations" which may not be used by many residents.

MM-TR96 – What will be the consequence of a local jurisdiction not establishing a parking policy that discourages private vehicle use? How would this be evaluated?

MM-TR97 – Local jurisdictions cannot be held responsible for the air travel completed by employees of businesses in their jurisdictions.

AREA OF CONCERN: WASTE AND RECYCLING

Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy

Program Environmental Impact Report	
The decomposition of municipal solid waste produces landfill gas that can be converted into electricity due its high heating value. Capturing landfill gas reduces emissions into the atmosphere. In addition, generating electricity from landfill gas provides an indirect benefit by avoiding the need to use non–renewable resources such as coal, oil, or natural gas to produce the same amount of energy. The practice of electrical generation from biomass sources has been recognized by the State as a form of renewable energy, similar to solar, wind, and hydro-electric projects. With the passage of SBX1 2 in 2011, investor and publicly owned utility companies will be required to meet a renewable portfolio standard of 33% by 2020. As of 2010, most utility companies were well below 20%. The utilization of landfill gas to energy producing projects will play a prominent role for utility companies to achieve the State mandated renewable portfolio standard. In Orange County alone, the County's three active landfills generate 12 megawatts-hours of electricity, enough to power 9,000 homes. In addition, there are plans to increase that energy output to 64 megawatts-hours within the next few years.	
Page 3.11-22	California Integrated Waste Management Act, in 2011 the California Legislature passed and the Governor signed into law AB 341 which established a statewide policy goal of diverting 75% of all waste generated in the State by 2020. AB 341 builds upon AB 939 and establishes a nexus between recycling and AB 32, the Global Warming Solutions Act by reducing five million metric tons of CO2 equivalent by diverting approximately two million tons of solid waste per year. This will be achieved by requiring cities and counties to work with the business community and multi-family dwelling units to implement commercial recycling programs thereby avoiding the extraction of raw materials, preprocessing and manufacturing of virgin materials. In effect, this ensures that only residual waste that has no economic value will be landfilled. The policy implication of AB 341 is the development of new recycling programs and infrastructure while preserving the capacity of the landfills throughout the State.
Page 3.11-22	The agency name for the California Integrated Waste Management Board has changed to the California Department of Resources Recycling and Recovery (CalRecycle).
Page 3.11-24	Under the subsection "Orange County", CalRecycle approved Orange County's 5-year update of the Orange County CIWMP in January 2011. It should also be noted that there is now an operational materials recovery facility in south Orange County. The facility is located at the County's Prima Deshecha Landfill and is operated by CR&R Disposal. This facility accepts construction and demolition waste materials and has a mandatory diversion rate of 80 percent. It should also be noted that both the Frank R. Bowerman Landfill and the Olinda Alpha Landfill, which are both owned and operated by the County, have already received all necessary permits and entitlements for their expansions. As such, the closure date for the Olinda Alpha Landfill is in December 2021 and the closure date for the Frank R. Bowerman Landfill is in December 2053. It should also be noted that Orange County has sufficient solid waste disposal capacity throughout the RTP/planning period (2012-2035).
Page 3.11-25	Solid Waste Disposal and Transfer Facilities, it should be noted that Orange County can only accept imported solid waste materials from outside of Orange County under the specified terms and conditions of Orange County's bankruptcy recovery. Under the terms and conditions of the bankruptcy recovery, importation of solid waste materials will end in June 2016.

Page 3.11-26	Table 3.11-8: Permitted Active Solid Waste Landfills in the SCAG Region: the following information regarding the Orange County landfill system should be changed to the following: Frank R. Bowerman Landfill, closure date of December 31, 2053, maximum permitted daily tonnage of 11,500 tons per day, total landfill airspace capacity of 266,000,000 cubic yards as of June 30, 2011, remaining landfill airspace capacity of 198,000,000 cubic yards as of June 30, 2011; Olinda Alpha Landfill, total landfill airspace capacity of 148,800,000 cubic yards, remaining landfill airspace capacity of 47,700,000 cubic yards; Prima Deshecha Landfill, total landfill airspace capacity of 172,000,000 cubic yards, remaining landfill airspace capacity of 133,000,000 cubic yards.
Page 3.11-27	Waste Diversion and Recycling: This section appears outdated with the last diversion rate reported in 2002. It is therefore suggested that this section be updated with 2010 information which is available at CalRecycle's website at http://www.calrecycle.ca.gov/LGCentral/GoalMeasure/DisposalRate/MostRecent/default.htm. In 2010, California's statewide diversion rate was approximately 65% based on the per resident disposal rate.
Page 3.11-28	Impacts: The waste generation and disposal projections for the 2010-2035 timeframe within the SCAG region should be re-evaluated. According to CalRecycle, the amount of waste disposed in landfills for each resident on average was 4.5 pounds of waste per day. Given that the resident "equivalent diversion rate" in 2010 was about 65%, each resident threw away or generated 12.85 pounds per day of waste per day. This equates to Californians generating approximately 85 to 90 million tons of waste and disposing of approximately 30 million of waste in landfills. SCAG's RTP report appears to confuse the terms generation and disposal for purposes of estimating diversion rates and future waste projections. Similarly, the 2035 waste projection of 105.7 million pounds of waste per day within SCAG's region appears to be inflated. This value appears to have been calculated based on adding the 2010 residential and employee disposal rates. Adding these values together double counts the quantity of waste buried since each indicator represents the same waste stream. The residential and employee disposal rate established by CalRecycle was simply to normalize the data based on total statewide generation and disposal. Therefore, these parameters were meant to present different ways of looking at the same data but were not meant to be additive. The amount of waste generated and disposed in 2035 should be based on either parameter but not both.
Page 3.11-30	Mitigation Measure MM-PS37: OC Waste & Recycling does not support this SCAG mitigation measure which discourages the siting of new solid waste landfills. While no new public or private solid waste landfills in Orange County are planned at this time, the siting of public or private solid waste landfills within the SCAG planning area, in the long-term, would provide a beneficial increase in solid waste landfill capacity for those jurisdictions that have limited or no solid waste landfill capacity.
Page 3.11-30	Mitigation Measure MM-PS38: OC Waste & Recycling does not support this SCAG mitigation measure which discourages the exportation of locally generated waste outside of the SCAG region during the construction and implementation of projects. In the long-term, waste-by-rail landfills located outside of the SCAG region may be viable

	long-term options for jurisdictions that have limited or no solid waste landfill capacity.
Page 3.11-30	OC Waste & Recycling strongly disagrees with the portion of this mitigation measure that states: "Disposal within the county where the waste originates can and should be encouraged as much as possible." As stated above, Orange County currently receives imported solid waste materials from private solid waste hauling companies as part of Orange County's bankruptcy recovery. Importation of solid wastes into Orange County will continue until June 2016. OC Waste & Recycling therefore recommends that SCAG revise this mitigation measure.

RE: Comments to 2012 Regional Transportation Plan (RTP) Draft

Dear Ryan:

DesertXpress Enterprises, LLC appreciates the opportunity to provide comments to the 2012 RTP. Enclosed is a comment matrix indicating the volume, page number and suggested revision. Should you have any questions regarding the DesertXpress project or the comments provided, please feel free to contact me at (702) 739-2020.

Best Regards.

Andrew Mack
Chief Operating Officer
DesertXpress Enterprises, LLC

Encl. As stated

SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS ("SCAG")
2012 REGIONAL TRANSPORTATION PLAN - DRAFT
COMMENTS SUBMITTED BY DESERTXPRESS ENTERPRISES, LLC
FEBRUARY 14, 2012

DOCUMENT	PAGE #	SECTION	PROPOSED REVISION
Chapter 1: Vision	21	Passenger and High Speed Rail	Request adding a discussion of DesertXpress. Although included in the Strategic Plan, as a federally licensed and approved interstate passenger railroad, DesertXpress will help to achieve the vision for high speed passenger rail in Southern California.
Chapter 2: Transportation investments	44	Strategically Expanding Our System	Suggest adding language describing that by diverting automobiles, high speed rail increases the goods movement capacity of the freeway system.
Chapter 2: Transportation investments	50	Passenger and High Speed Rail	Request adding that a connection to the DesertXpress system between Victorville and Palmdale would effectively expand passenger rail service providing interstate high speed rail connectivity.
Chapter 2: Transportation investments	52	Rail Policies	Suggest adding language to explain that DesertXpress is committed to building an interoperable system and welcomes the support of SCAG in working with us to ensure that interoperability between systems is achieved. The MOU between SCAG, LAMETRO, CAHSRA, SANBAG, SANDAG etc. should be referenced.
Chapter 4: Sustainable Communities Strategy	106	Table 4.4: Transportation Network Actions and Strategies	Suggest including language in table to encourage connectivity with DesertXpress.
Chapter 7: Strategic Plan	201	Long-Term Emission Reduction...	Suggest adding electrified passenger rail in addition to freight rail as a strategy for emission reduction.

DOCUMENT	PAGE #	SECTION	PROPOSED REVISION
Chapter 7: Strategic Plan	204	Ultimate Vision for a High-Speed Rail System	Suggest adding more detail regarding DesertXpress. DesertXpress is a Federally approved and licensed high speed passenger railroad that connects Las Vegas with Southern California. With its Southern California station initially in Victorville, an extension of DesertXpress to Palmdale, 50 miles West, would provide for a cross platform connection to the Metrolink commuter rail system with station stops throughout Southern California. Fully interoperable high speed service would be achieved over the California high speed rail project or upgraded Metrolink system. Environmental work has already begun to analyze and clear the rail connection between Victorville and Palmdale as part of the High Desert Corridor project. The High Desert Corridor Joint Powers Authority (comprising San Bernardino County, Los Angeles County, City of Adelanto, City of Hesperia, City of Palmdale, and City of Victorville) passed resolutions of support for DesertXpress in May 2010 and June 2011. The DesertXpress project specific EIS is complete with the following Federal actions: July 8, 2011: Federal Railroad Administration Record of Decision (ROD) October 26, 2011: Surface Transportation Board issued Certificate of Public Convenience and Necessity. October 31, 2011: Bureau of Land Management ROD November 18, 2011: Federal Highway Administration ROD On December 7, 2011, DesertXpress executed a lease agreement with BLM for the alignment and facilities located on federal land. Application for a federal loan under the Railroad Rehabilitation and Improvement Financing program currently under review by US Department of Transportation.
Supplemental Report: Aviation and Airport Ground Access	112	2.3.2 Role of California High-Speed Rail System in Regional Airport Ground Access	Suggest adding discussion of potential for DesertXpress connection at the Palmdale Airport.

DOCUMENT	PAGE #	SECTION	PROPOSED REVISION
Supplemental Report: Passenger Rail	8	Table 2: High Speed Rail Matrix	Suggest revising as follows: PROJECT: DesertXpress PROJECT DESCRIPTION: Las Vegas to Victorville with no intermediate stops generally along I-15 corridor. Phase 2 would connect Victorville with Palmdale. Top speed of 150 MPH using Tier III compliant electric multiple unit trains. PROJECT READINESS: Project specific EIS is complete and federal interstate operating license has been issued. July 8, 2011: Federal Railroad Administration Record of Decision (ROD). October 26, 2011: Surface Transportation Board issued Certificate of Public Convenience and Necessity authorizing DesertXpress as an interstate railroad. October 31, 2011: Bureau of Land Management ROD. November 18, 2011: California and Nevada Federal Highway Administration RODs. December 7, 2011, DesertXpress executed a lease agreement with BLM for the alignment and facilities located on federal land. PROJECT CONSENSUS: High - as evidenced by the completed NEPA process, agreements in place with the State of California, Certificate of Public Convenience and Necessity from the Surface Transportation Board, support from Victorville, San Bernardino County, Los Angeles County, City of Adelanto, City of Hesperia, City of Palmdale, the Las Vegas Convention and Visitors Authority, and Clark County, NV. REGIONAL CONNECTIVITY: Good - initially with proximity to Amtrak station in Victorville. Connection to Palmdale would provide for a connection to Metrolink and ultimately to California High Speed Rail. RIDERSHIP POTENTIAL: Sufficient to cover all operating and capital costs. COST: $6.5 billion. FUNDING: Federal loan and private debt/equity. BUSINESS PLAN: Ridership and revenue report completed for loan application but not yet available. COMMUTER RAIL POTENTIAL: Extension to Palmdale would serve commuter market well. STAFF RECOMMENDATION: Include in Strategic Plan.

DOCUMENT	PAGE #	SECTION	PROPOSED REVISION
Supplemental Report: Passenger Rail	18	the Strategic Plan: Our Ultimate Vision for High Speed Rail	Suggest adding DesertXpress and connection to California High Speed Rail and upgraded Metrolink service as a key component of the Ultimate Vision for High Speed Rail.
Supplemental Report: Passenger Rail	19	Strategic Plan Projects	DesertXpress is a Federally approved and licensed high speed passenger railroad that connects Las Vegas with Southern California. Travelling between Las Vegas, NV and Victorville, CA at a top speed of 150 MPH, DesertXpress will use next generation steel wheel on steel rail fully electric high speed trains. There are no intermediate stops. The DesertXpress project specific EIS is complete: • July 8, 2011: Federal Railroad Administration Record of Decision (ROD) • October 26, 2011: Surface Transportation Board issued Certificate of Public Convenience and Necessity. • October 31, 2011: Bureau of Land Management ROD • November 18, 2011: Federal Highway Administration ROD • On December 7, 2011, DesertXpress executed a lease agreement with BLM for the alignment and facilities located on federal land. With its Southern California station initially in Victorville, an extension of DesertXpress to Palmdale, 50 miles West would provide for a cross platform connection to the Metrolink commuter rail system with station stops throughout Southern California. Fully interoperable high speed service would be achieved over the California high speed rail project or upgraded Metrolink system. Environmental work has already begun to analyze and clear the rail connection between Victorville and Palmdale as part of the High Desert Corridor project. The High Desert Corridor Joint Powers Authority (comprising San Bernardino County, Los Angeles County, City of Adelanto, City of Hesperia, City of Palmdale, and City of Victorville) passed resolutions of support for DesertXpress in May 2010 and June 2011. Application for a federal loan under the Railroad Rehabilitation and Improvement Financing program currently under review by US Department of Transportation.

Subject: EPA Comments on the 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the Draft Program Environmental Impact Report

Dear Ms. Lin:

The U.S. Environmental Protection Agency (EPA) appreciates the opportunity to provide feedback on the Draft 2012 Southern California Association of Governments (SCAG) 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the Draft Program Environmental Impact Report (PEIR) for the 2012-2035 RTP/SCS. EPA is committed to the goal of incorporating environmental and community considerations early in the transportation planning process. This early coordination results in greater opportunities to avoid sensitive resources and receptors and minimize impacts associated with future transportation projects.

Section 6001 Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) directs metropolitan planning organizations to consult with resource agencies while developing long-range transportation plans. It also states that long range transportation plans must include "a discussion of types of potential environmental mitigation activities and potential areas to carry out these activities, including activities that may have the greatest potential to restore and maintain the environmental functions affected by the plan." EPA provides the following comments in support of compliance with these requirements.

Comments on the Draft RTP/ SCS

Environmental Justice and Children's Health

The Draft RTP provides a summary of public involvement efforts and a thorough Environmental Justice Analysis including recommendations from the public outreach meetings. The Environmental Justice Analysis finds many potential disparate impacts on minority, low-income, and other sensitive communities. These impacts are a result of gentrification, air quality impacts, and noise. The Draft RTP provides evidence that environmental justice communities in the SCAG Region are already heavily burdened as a result of exposure to air pollution from transportation related activities. The communities will continue to be impacted with the many projects planned in the SCAG Region. Therefore, all impacts, even seemingly small ones, are important to consider and mitigate in order to offset the project-related impacts to the local communities. EPA is encouraged to see that, new to the 2012 RTP, the

Environmental Justice Analysis considers cancer and respiratory risks and air quality impacts along freeways and highly traveled corridors.

Children as Sensitive Age Group

The Environmental Justice Analysis includes one age variable: population 65 years old and older. Children are another sensitive age group that should be included in the Environmental Justice analysis. Environmental contaminants may harm children more than adults. Minority and low-income children may be exposed to more pollution and therefore, may face higher health risks from exposures. An important indicator in screening for potential environmental justice concerns is the percent of the population under five years old.[1,2] There is a growing body of evidence that environmental justice communities are disproportionately exposed and more vulnerable to pollution impacts than other communities.[3] As discussed in *EPA's Framework for Cumulative Risk,*[4] disadvantaged, underserved, and overburdened communities are likely to come to the table with pre-existing deficits of both a physical and social nature that make the effects of environmental pollution more, and in some cases, unacceptably, burdensome. Thus, certain subpopulations may be more likely to be adversely affected by a given stressor than is the general population.

- EPA recommends that the Environmental Justice Analysis in the Final RTP, and included health analyses, include percent of the population under five years old as a variable to elucidate how young children in environmental justice communities will be impacted by the proposed transportation plan.

Environmental Justice Mitgation Toolbox

The Draft RTP provides an Environmental Justice Mitigation Toolbox with recommended mitigations for noise impacts, air quality, rail related impacts, and road pricing mechanisms. The mitigations are recommendations and are not required through the Draft RTP. The Draft RTP uses the language that the project sponsors should "to the extent feasible and practicable" apply these mitigations to the project. The recommended mitigations are critical to protecting the health of the environmental justice communities in the SCAG region. EPA recognizes the importance of these mitigations and recommends that the project sponsors not only apply these mitigations but also seek out further recommendations from the affected community. The current mitigation toolbox provides a list of broad mitigations that are specific to project construction and implementation.

- Community identified mitigations could include more holistic approaches to protecting health including:
    - Fund proactive measures to improve air quality in neighboring homes, schools, and other sensitive receptors;

[2] The Environmental Justice Strategic Enforcement Assessment Tool (EJSEAT) is a tool for the EPA Office of Enforcement and Compliance Assurance to consistently identify areas with potentially disproportionately high and adverse environmental and public health burdens. More information is available at: http://www.epa.gov/compliance/ej/resources/policy/ej-seat.html.

[3] Symposium on the Science of Disproportionate Environmental Health Impacts, March 17 - 19, 2010, see the fourteen scientific reviews commissioned by EPA and published in the American Journal of Public Health at:http://www.epa.gov/compliance/ej/multimedialalbums/epa/disproportionate-impacts-symposium.html.

[4] Available at: http://cfpub.epa.ov/nceaJraf/recordisplav.cfm?deid=54944.

- Provide public education programs about environmental health impacts to better enable residents to make informed decisions about their health and community; and
- Engage in proactive measures to train and hire local residents for construction or operation of the project to improve their economic status and access to health care.

- EPA also recommends that the list of available air quality tools in the Environmental Justice Toolbox - Air Quality Impacts be revised to include near-term advanced technology deployment measures, such as:
  - zero emissions heavy-duty trucks (2013+);
  - Tier 4 marine engine repowers and replacements (2014+); and
  - Tier 4 and zero emissions railyard equipment (2015+).
  - See http://www.dieselnet.com/standards/us/marine.php and http://www.dieselnet.com/standards/us/loco.php .

Future Project-level Environmental Justice Analyses
Additionally, the Environmental Justice Appendix provides detail on how the Environmental Justice Analysis was performed, with the analysis conducted with input from the community.

- EPA recommends that the Final RTP acknowledge that project sponsors should provide a similar level of analysis to identify the Environmental Justice impacts of each project. With consistency in analysis and meaningful involvement from the affected community, mitigation measures can be identified to best address the project's impacts.

Sustainable Communities Strategy and Regional Zero Emissions Freight System
The Draft RTP recognizes that that SCAG region has substantial mobility and air quality challenges, with the most congested roadways in the nation and the worst air quality in the nation. The Draft RTP also identifies its region as the largest international trade gateway in the U.S., supported by marine ports, air cargo facilities, railroads, regional highways and state routes. SCAG has a great opportunity to face these challenges with planning efforts that are underway to establish a regional zero emission freight system and the RTP's inclusion of a Sustainable Community Strategy (SCS), intended to reduce greenhouse gas (GHG) emissions from automobiles and light trucks through integrated transportation, land use, housing and environmental planning.

- EPA encourages SCAG to use the current needs for efficient and cleaner freight movement as a catalyst for initiating the most advanced technological solutions to freight movement, including zero emissions technologies, in this transportation planning effort.

Part of SCAG's Regional Zero Emissions Freight System includes a system of truck-only lanes extending from the San Pedro Bay Ports to downtown Los Angeles along the I-710, connecting to an east-west segment, and finally reaching the I-15 in San Bernardino County. Truck-only lanes add capacity in congested corridors, improve truck operations and safety by separating trucks and autos, and would provide a platform for the introduction and adoption of zero-emission technologies. The 2012 RTP identifies an East-West Freight Corridor concept (Exhibit 2.9 Potential East-West Freight Corridor shows lanes along the I-710, SR 60, and I-15 to just north of I-10), carrying between 58,000 and 70,000 trucks per day, with trucks removed from adjacent general purpose lanes and local arterial roads.

SCAG's SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas in existing main streets, downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. EPA is pleased to see that the RTP provides a greater investment in transit projects and an allocation of over $6 billion for active transportation projects, a 200-percent increase from the 2008 RTP. EPA supports the investment of a greater share of transportation resources to promoting public transit and other alternative modes instead of facilitating single-occupant vehicle use. Efforts to expand transit service, increase rideshare, and integrate bicycle and transit nodes offer the opportunity to support the region's goal of reducing growth in vehicle miles traveled (VMT) and in turn, improve air quality. The emphasis on planning for additional housing and jobs near transit will also assist in decreasing VMT and related pollutant emissions.

While intended to relieve congestion, freeway capacity expansion projects such as truck-only lanes and HOV/Toll Lanes, may have initially beneficial congestion relief that erodes over time, potentially resulting in increased VMT and auto emissions.

- Since the RTP includes several projects that expand freeway capacity, EPA recommends that the Final RTP include a discussion of induced travel to ensure that these projects do not counter the very VMT and emission benefits expected from SCAG's SCS and Regional Zero Emissions Freight System.

Technologies for Transportation Investments

This section of the plan cites several compelling strategies, which presumably will result in significant emissions reduction. However, the Draft RTP does not clearly outline what the requisite technologies are in relation to emissions standards for the relevant source categories.

- EPA recommends including clearer descriptions of the technologies listed in the Transportation Investments section of the RTP.

Definition of "clean truck"

EPA suggests defining the term "clean truck" in relation to current vehicle emissions standards. This term is listed in the Vision and Transportation Investments sections of the RTP, as well as in the Goods Movement supplemental report. One option for defining this technology would be to compare its emissions to the EPA 2010 heavy-duty truck standard.

Measuring Environmental Results of the RTP

The Draft RTP has identified criteria pollutant and greenhouse gas emissions as its sole performance measure and indicator for environmental quality. Given that the region has experienced significant losses to species and habitat from development encroachment and transportation construction, EPA encourages SCAG to consider sensitive habitat as a performance standard and indicator for environmental quality when updating the RTP.

- EPA recommends SCAG consider demonstrating the RTP's effectiveness at protecting species, wildlife or wetland habitat, and/or open space. If additional performance standards are not possible during the 2012 RTP update given the already extensive efforts to develop the identified performance outcomes and measures, the Final RTP should describe if there are appropriate

performance standard surrogates, such as land consumption under Location Efficiency, to measure the RTP's success in protecting sensitive habitat.

RTP Environmental Mitigation Program

SAFETEA-LU Section 6001 requires long range transportation plans to include a discussion of potential environmental mitigation activities and potential areas to carry out these activities that may have the greatest potential to restore and maintain the environmental functions affected by the plan. The Draft RTP acknowledges that the PEIR includes three categories of mitigation measures (regional, local, and project-specific, as described on p.76); however the Draft RTP identifies a separate, broad strategy to link transportation planning to the environment, such as planning transportation routes to avoid and minimize a number of biological impacts and regional mitigation strategies such as mitigation banking, improving/ retaining habitat linkages, preserving wildlife corridors and wildlife crossings to minimize the impact of transportation projects on wildlife species and habitat fragmentation. The Draft RTP notes that maps of protected and unprotected areas, representing SCAG's open space infrastructure (from SCAG's 2008 Regional Comprehensive Plan), will be updated as a function of post-RTP planning efforts, that areas that are "unprotected" could be possible locations for mitigation, and that SCAG will continue to work with its regional partners to help facilitate conservation.

- While EPA is supportive of many of the broad mitigation strategies identified, EPA recommends that the environmental mitigation discussion in the Final RTP incorporate specific information from the Regional Comprehensive Plan that will inform regional avoidance and minimization strategies when planning regional transportation networks and possible locations for mitigation.

- The Final RTP should also provide additional information on post-RTP comprehensive and conservation planning efforts and describe how anticipated outcomes and products will be incorporated into long-term planning for transportation infrastructure.

Comments on the Draft PEIR for the RTP/SCS

Health Risk Assessment

EPA appreciates that SCAG's 2012-2035 Draft RTP PEIR includes a health risk assessment. During a February 9, 2012 call between SCAG and EPA staff, SCAG indicated that health risk will not be used to measure the RTP's performance.

- EPA recommends that the Final PEIR clarify how the HRA informed both decision-making among Plan alternatives and mitigation for impacts to sensitive populations.

- EPA also encourages SCAG to consider non-cancer risk, such as respiratory risk, in the PEIR HRA, in light of the fact that the RTP environmental justice analysis addressed both cancer and respiratory risks. The HRA could estimate non-cancer risk, or at a minimum, include a discussion on the relative contribution of these different effects, especially to sensitive receptors.

EPA acknowledges that SCAG selected eight segments of freeway corridors to generally represent major transportation corridors in each SCAG county (with two selected in L.A. and San Bernardino) and roadways with the highest total traffic and highest heavy-duty diesel truck traffic in the planning

area. Further, the modeling focused on freeway segments (versus the entire length of each freeway corridor) that exhibited highest daily total traffic volume to assess "probable worst case" risks. However, the HRA does not describe how its limited scope relates to the broader suite of proposed transportation projects in the SCAG region.

- EPA recommends that the HRA identify: 1) what percentage of RTP projects is represented by the selected segments used in the HRA analysis when compared to the total projects included in the RTP, 2) their relative locations to the broader scope of projects, and 3) relative timeframes for construction and implementation. We recommend clarifying if these represent a group of projects with the most impacts, estimating the percentage of the impact, and extrapolating how the examples could potentially inform risk for the broader scope of the RTP.

- EPA recommends that the RTP provide a brief summary of all the alternatives, the additional sources of emission considered in each of them, and the mitigation proposed in each of them. Explain how the examples of the eight operating freeways fit in with the alternatives in terms of source contribution.

- The RTP should identify how these "Highest Volume" Segments (page 4) integrate with the alternatives. EPA recommends providing a summary comparison by volume for the corresponding projects in the RTP, the eight selected operating freeways, and the "Highest Volume" segments in the eight selected freeways. Include a percentage contribution at each level to provide the background perspective of this limited analysis, and to allow an evaluation of the scope of all the projects in the RTP.

- EPA recommends that the data in Tables 5 and 5 (Pages 8 and 9) represent the "Highest Volume" emission for the corresponding segments in Table 4. If the results in Table 5 are for the same freeway fraction as shown in Table 4, they need to be clearly identified. Discuss whether these results are being used for the rest of the freeways as a conservative scenario estimate, then provide the entire length of all the corresponding freeways included in the projects in RTP, the estimated VMT/day for them, and the corresponding emission as shown in Table 5. Also provide similar information for each alternative. This will give a clear picture of the scope of the additional emission sources generated by these projects.

- SCAG should consider regularly revisiting project status of modeled projects for a selected time period (such as, every four years when RTP is updated, or two years when FTIP is updated). For example, at each new RTP update, provide a "reality check" against the previous 4 years of actual construction data impact, and update future RTP projections accordingly. This will also allow inclusion of any new projects.

- The impact of example projects in the HRA should be extrapolated to the entire RTP scope, so that a more systematic and comprehensive health impact can be evaluated at each RTP update for the whole region to allow appropriate consideration for cumulative impacts to sensitive receptors. These projects should be included in all future MATES analyses, which can provide the previously mentioned "reality check". Each RTP update can then revisit all the previous assumptions using the most recent MATES analysis, and provide the best estimates for the remaining projects.

Risk Emissions
It is not clear how Table 6 (page 10) relates to Tables 4 and 5 and the assumptions (Table 9) are not clearly described to support the results. Further, it is not clear how Table 14 (page 17) relates to Tables 9 and 11.

- EPA recommends providing a summary of the emissions for all the alternatives, which can be more useful than presenting the number of vehicles. This will provide the basis to move into the next Risk calculation.

- EPA recommends providing a summary of the assumptions used in each alternative for the estimation of the cancer risk.

- EPA recommends that even in a limited scope, SCAG should identify any potential cumulative impact of two or more projects that might intersect, and identify areas of dense population that might be subjected to this cumulative impact, as well as the impact on any potential sensitive population.

Mitigation Measures

Section 3.2 Air Quality Mitgation Measures

- *Mitigation Measure MM-AQ19 – Protecting Sensitive Receptors from Air Quality Impacts*
  EPA recommends the implementation of MM-AQ19 in plan-related projects. Given the current air quality conditions in the Southern California region, project sponsors should be strongly encouraged to reduce the air quality risk to sensitive receptors by implementing the strategies listed in this mitigation measure.

- *Mitigation Measure MM-AQ11*
  EPA suggests that this mitigation measure be revised to include the following:
  Project sponsors can and should ensure that all construction equipment meets or exceeds equivalent emissions performance to that of EPA Tier 3 standards for non-road engines. From January 1, 2015 onward, project sponsors should ensure that all construction equipment meets or exceeds equivalent emissions performance to that of EPA Tier 4 standards for non-road engines. See http://www.dieselnet.com/standards/us/nonroad.php.

- *Mitigation Measure MM-AQ15 - Also reflected in Mitigation Measures MM-TR49 and MM-TR89 (Section 3.12 Transportation, Traffic, & Security)*
  U.S. EPA suggests that this mitigation measure be revised to read as follows:
  Local jurisdictions can and should set and enforce limits on idling time for commercial vehicles, including delivery and construction vehicles, which prohibit vehicle and engine idling in excess of five minutes. See http://www.arb.ca.gov/msprog/truck-idling/truck-idling.htm.

Section 3.6 Greenhouse Gas Emissions Mitigation Measures

- *Mitigation Measures MM-GHG7 and MM-GHG8*
  EPA strongly supports the implementation of these mitigation measures as the related technologies will play a constructive role in reducing greenhouse gas and criteria pollutant emissions throughout the Southern California region.

- *Mitigation Measure MM-GHG10*
  EPA recommends that provision "b)" of this mitigation measure be revised to read as follows: "Solicit preference construction bids that use BACT, particularly those seeking to deploy zero emissions technologies".

Section 3.12 Transportation, Traffic & Security Mitigation Measures

- *Consumer Education – Mitigation Measures MM-TR44, MM-TR45, MM-TR46, and MM-TR87*
  U.S. EPA strongly supports the implementation of these measures by local jurisdictions as the related activities will play a constructive role in encouraging consumers to adopt transportation techniques, alternatives, and technologies that will significantly reduce criteria and GHG emissions in the Southern California region.

- *Advanced Vehicle & Fuel Technology Deployment – Mitigation Measures MM-TR47, MM-TR50, MM-TR51, MM-TR86, MM-TR88, and MM-TR92*
  U.S. EPA strongly supports the implementation of these measures by local jurisdictions as they will support the commercialization of advanced transportation technologies that will significantly reduce criteria and GHG emissions in the Southern California region.

EPA values the opportunity to be involved in the regional transportation planning process. We hope that this involvement will lead to more efficient project planning and improved environmental and public health outcomes. When the Final RTP/SCS and PEIR are available, please send a copy of each to the address above. If you have any questions about our comments, feel free to contact me at dunning.connell@epa.gov or by phone at 415-947-4161.

Sincerely,

Connell Dunning, Transportation Team Supervisor
Environmental Review Office
Communities and Ecosystems Division

Four Corners Coalition
LOS ANGELES, ORANGE, RIVERSIDE, AND SAN BERNARDINO COUNTIES

RE: SCAG's draft Regional Transportation Plan 2012-2035

February 14, 2012

Dear Ms. Lin,

The Four Corners Coalition has a 20 year history of supporting regional solutions to the transportation challenges that occur in the heart of Southern California. The jurisdictional coordination where four of your six counties come together can be a challenge. We are very pleased with the cooperation that has occurred in the region over the past several years and the continuing efforts that are represented in the Regional Transportation Plan (RTP). For example: the Universal Transit Fare Cards (Smart Cards)are the exact type of regional alignment that is necessary for increasing the overall effectiveness of our transportation system.

- We would suggest that the various TSM strategies capture the essence of this by adding such phrases as:
    - **Multi jurisdictional** traffic signal synchronization, and
    - **Region wide** advanced traveler information,
    - **Multi agency** improved data collection,

We also support the principles outlined by the Global land use and Economics committee of SCAG:

- Provides Positive Economic Impacts – Pro Economic Growth and Job Creation
- Provides Local Control:
    - Any new transportation revenues or fees collected must be under the control of the local transportation agency/authority
    - Cities, counties and local transportation agencies must maintain appropriate control and flexibility in managing decisions and resources related to land use and transportation
- Is CEQA Compliant and Defensible – The RTP/SCS is built to withstand a CEQA Challenge
- Is Balanced – The plan's call for New Revenue is balanced with Performance Measures, Reforms and Guarantees that assure the RTP is Effective, Efficient and Responsible

- Align the plan investments and policies with improving regional economic development and competitiveness. Avoid costly projects like a light rail desert connect that helps move money out of the southern California region to Nevada and does not address the immediate needs of the region's existing transportation needs.
- Maximize the productivity of our transportation system. Look at peak time pricing and transportation demand management (TDM) cost recovery approach.

- Encourage land use and growth patterns that facilitate transit and non motorized transportation. Efficient use of transit and transient oriented development will help balance the jobs/housing disparity among communities in the Four Corners Region.

We continue to support the improvements to those freeways that carry significant intra-county traffic flow:

- SR 71
- SR 57 up to and including the SR 60 / SR 57 intersection
- SR-91
- I-15
- I-10

- SR-71-Addition of one HOV lane in each direction from I-10 to SR-60
- SR-91-Addition of one HOV lane in each direction from Adams to SR-60/21
- I-10-Addition of one HOV lane in each direction from Haven to Ford
- Addition of HOT lanes on I-10
- SR-91-Convertion of HOV lanes to tolled express lanes and addition of direct connector
- SR-91-Addition of one eastbound mixed-flow lane from SR-91/55 connector to SR-241 and one westbound mixed-flow lane from SR-241 to Imperial Highway
- SR-91-Addition of one mixed-flow lane in each direction at various locations from SR-241 to Pierce Street
- I-15 Construction of New Schleisman Rd IC and ramps with a NB/SB Auxiliary lane between Schleisman Rd IC and Limonite Rd IC.
- SR-71- Pine Avenue connector from the SR-71 off-ramp to Pine/Schleisman Road for convertibility to the I-15, through Chino and Eastvale

If you have any questions regarding the comments, please feel free to contact me at any time.

Sincerely,

Gwenn Norton-Perry

Re: Comments on the Draft 2012 RTP/SCS and Draft PEIR

Dear Ms. Lin:

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) and Sustainable Community Strategy (SCS). Friends of Coyote Hills is based in Fullerton, and our mission is to permanently protect all 510 acres of West Coyote Hills, one of the last remaining natural open spaces in north Orange County, from development through acquisition, to ensure a lasting public park for recreation and enjoyment. Our organization includes support from 20,000 residents in Orange and Los Angeles Counties. We are writing to provide comments on the Draft 2012 RTP/SCS and the Draft Program Environmental Impact Report (PEIR).

We are so pleased to see an advanced mitigation component in the Draft 2012 RTP/SCS. This is a remarkable first step to creating a program that thoughtfully mitigates impacts to our natural environment from transportation projects. As you know, Orange County and San Diego have similar programs that have met great success. By incorporating this strategy into your policy document, the many benefits of this large-scale conservation approach will be realized. Thank you for your leadership.

Under the Endangered Species Act, the United States Fish and Wildlife Service have defined critical habitat as areas that support endangered or threatened species that are essential to the species' conservation. The description in the Conservation Planning Policy section (page 76 of the Draft 2012 RTP/SCS) states "large-scale acquisition and management of *critical habitat* to mitigate impacts related to future transportation projects" [emphasis added]. We believe there are other habitat areas in the SCAG region worth considering for acquisition and management and therefore SCAG should not limit the mitigation opportunities to only critical habitat. We suggest expanding the language to incorporate all "important habitat lands."

Because this program is directly tied to the implementation of transportation projects there is a clear connection to the County Transportation Commissions (CTCs). We do however, respectfully request that conservation-focused organizations and conservation focused state agencies, conservancies, and joint power authorities be included in the discussions regarding setting priority conservation areas. For example, Friends of Coyote Hills has specific knowledge about lands and linkages in and near West Coyote Hills. We offer our expertise to you during this process. In addition, we also believe targeted outreach efforts in each of the SCAG counties would create an open and transparent process for setting priorities. This recommendation also applies to the limited scope of "agencies" in the Resource Areas and Farmlands section (page 128 of the Draft 2012 RTP/SCS).

Locations for Mitigation (pg. 78 of the Draft 2012 RTP/SCS)
On page 78 of the Draft 2012 RTP/SCS , the document mentions the 2008 Regional Comprehensive Plan that inventoried protected and unprotected areas in relationship to wildlife linkages, linkage designation areas, park and recreation areas. We were pleased that SCAG completed this Plan showing what areas are protected and critical to maintaining functioning habitat reserves. We agree that the planning efforts SCAG undertakes in the future should

involve updating the maps, but recommend expanding the language in this section to include all forms of protected lands. By limiting the acquisition and management opportunities of conservation lands to just Natural Communities Conservation Plan (NCCP) or Habitat Conservation Plan (HCP) areas, decisions about priority conservation areas will be misinformed. In fact, it no longer demonstrates a comprehensive plan because of the limited scope (of pre-established mitigation sites, which are likely unrelated to transportation projects). Protected areas (e.g., National Forests, State Parks, Regional Parks, etc.) not in an NCCP/HCP are excluded from the big picture, yet they have extensive benefits to the entire open space system and often times link important habitat areas throughout the region. Consequently, we recommend having this updated map and mitigation site locations expanded to include more than just NCCP/HCP areas and instead include all levels of protected lands (federal, state, regional, and local).

We hope you utilize the experience and expertise of already-established programs in both Orange and San Diego Counties. The language, as it exists now ("achieved through already-established programs") implies no other transportation agency in the region can adopt or implement an advanced mitigation program. We recommend rephrasing this sentence to be more clear about the eligibility of transportation agencies and utilizing the experience existing regional programs.

On page 79 of the Draft 2012 RTP/SCS we were encouraged to see SCAG recognize the benefits of reducing transportation impacts to sensitive lands and encouraging smart land use decisions. We believe landscape level advanced mitigation will become a statewide planning policy. Planning future transportation projects with a comprehensive mitigation program ensures our open space infrastructure can continue to function and maintain viable habitats, linkages, and species populations in perpetuity. Unfortunately, we noticed the lack of inclusion of wildlife linkages in this section. Orange County's transportation measure language included wildlife linkages and we recommend SCAG include linkages as well.

Renewed Measure M in Orange County incorporated language that demonstrates a net environmental benefit in conjunction with a net benefit in the delivery of transportation improvement projects. Some of the environmental benefits include: landscape level acquisition, restoration, and management. Some of the transportation benefits include: streamlined permitting, involvement of the resource and permitting agencies, and reduced project delays. We believe there is an opportunity to incorporate similar "net environmental benefit/net benefit of transportation projects" language in the Draft 2012 RTP/SCS. To that end, we recommend the language from the Orange County Transportation Authority's Ordinance #3 Section 2, Item A.5.iii (page B-5) as a starting place.

We appreciate SCAG's effort to create a strategic planning process that would document important conservation lands in the region. We believe there is an important opportunity with this concept to also create a Southern California Greenprint. By completing a Greenprint a comprehensive view of our open space land attributes would be documented. Such attributes include: recreation priorities, agricultural lands, scenic values, historic preservation, and more. A Greenprint would give a more complete picture of both opportunities and challenges, while at the same time respecting property rights.

Thank you for reviewing our comments and we look forward to working with SCAG on the implementation of this policy. Should you need to contact me, I can be reached at 714-870-9777.

In addition, we request to be included on any notifications (electronic or otherwise) about this policy's creation and implementation, please send information to sgregg411@roadrunner.com

Re: Comments on the Draft 2012 RTP/SCS and Draft PEIR

Dear Ms. Lin:

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) and Sustainable Community Strategy (SCS). Friends of Harbors, Beaches, and Parks (FHBP) is based in Newport Beach and we work to protect the natural lands, waterways, and beaches of Orange County. Our organization includes support from more than 80 conservation and community groups in the regional and thousands of Orange County residents.

FHBP would like to applaud SCAG's efforts to include a regional advanced mitigation component in the RTP/SCS. This letter serves to offer suggestions mainly to strengthen this component, which closely links with the sustainability principle listed in the document's vision statement. We do, however, offer a few other suggestions as it relates to other projects we are interested in.

Active Transportation (p. 21 of the Draft 2012 RTP/SCS)
In 2011, FHBP completed a study documenting the Walk Score for the city hall of each Orange County city as well as the city-wide average. Walk Score measures how easy it is to live a car-lite lifestyle—not how pretty the area is for walking. According to its website, WalkScore.com uses Google maps to compute the distance between residential addresses and nearby destinations. The algorithm looks at 13 categories and awards points for each between ¼ to 1 mile. Amenities within ¼ mile receive maximum points, while no points are awarded for amenities further than one mile. The categories include, grocery store, coffee shop, movie theatre, park, bookstore, drug store, clothing and music store, restaurant, bar, school, library, fitness, and hardware store.[1] See attachment #1 for the results of this Walk Score study.

> **Recommendation #1**
> We recommend utilizing this tool as a measurement of how and where walkable, bikable communities may be most relevant. This information may serve SCAG well in determining or prioritizing funding for more active transportation opportunities. Of course, we understand that many factors are at play including site development, existing stable neighborhoods, transit areas and more, but including as a metric how communities are doing already is helpful information to have in the overall analysis.

Regional HOT Lane Network (p. 58 of the Draft 2012 RTP/SCS)
We disagree that the Toll Road Agencies proposed extension of the 241 South be included in the Regional HOT Lane Network. The RTP includes the proposed 16-mile Foothill-South Toll Road extension, which would run through the heart of San Onofre State Beach Park, a beloved and popular recreation spot in south Orange County that serves more than 2.4 million visitors each year. Both the California Coastal Commission and the U.S. Department of Commerce have rejected the Foothill-South project on the basis of its devastating projected impacts on coastal resources.

> **Recommendation #2**
> The continued inclusion of this unbuildable project as a baseline roadway changes the transportation modeling for southern Orange County transportation projects. The Foothill-South should be eliminated from the baseline scenario and removed from the RTP, especially since it is in the unconstrained plan of the Orange County Transportation Authority's Long Range Transportation Plan.

Conservation Planning Policy (p. 76 of the Draft 2012 RTP/SCS)
While we wholeheartedly support the concept of the conservation planning policy, which helps demonstrate progress and safety in SAFETEA-LU requirements, however we do not agree large-scale

[1] Walk Score. Retrieved 2 Feb 2012 from the WalkScore website: http://www.walkscore.com.

acquisition and management of *critical habitat* be the only type of mitigation opportunity utilized. We note however, this may simply be a word choice issue. According to the U.S. Fish and Wildlife Service: "when a species is proposed for listing as endangered or threatened under the Endangered Species Act (Act), we must consider whether there are areas of habitat we believe are essential to the species' conservation. Those areas may be proposed for designation as "critical habitat."[2] Essentially, we firmly believe there are other important natural lands deserving of conservation/preservation, but do not or may not contain a "critical habitat" designation (as defined by the Service).

Recommendation #3
With this in mind, we suggest changing the reference from critical habitat to important natural lands. This comment also applies to the Resource Area and Farmland section (pg. 128 of the Draft 2012 RTP/SCS).

Engage in a Strategic Planning Process
We would also like to offer that it may be an important first step to create a regional Greenprint in addition to a map of regional priority conservation areas. According to Oregon State University: "A Greenprint is a non-regulatory vision to help communities make informed decisions about land conservation, scenic values, and recreation priorities. Components include:

- A comprehensive overview of important natural resources, wildlife habitat, historic sites, scenic values, and potential/existing trail connections in the region
- Maps that highlight the ecological and recreation priorities of the region, while respecting property rights and creating awareness around public access
- An inclusive vision to foster discussion of the diverse conservation and recreation needs of the region."[3]

Recommendation #4
We request a region-wide Greenprint be conducted to document the natural, recreational, agricultural, and other resources in the SCAG jurisdiction as part of the conservation policy planning.

Identify Map Priority Conservation Areas and Engage Various Partners
While we understand the RTP is directly related to County Transportation Commissions (CTCs) we would respectfully request that conservation organizations and other related agencies, conservancies, and joint power authorities, like the Santa Monica Mountains Conservancy, Mountains Recreation and Conservation Authority, and the Wildlife Corridor Conservation Authority, be included in determining priority conservation areas and plan development. CTCs, with all due respect, do not tend to focus on conservation of natural lands.

As the Orange County Transportation Authority will confirm, it relied upon many sources for establishing its priority conservation areas under the Environmental Mitigation Program of Renewed Measure M. To that end, FHBP would like to offer its assistance with Orange County's potential conservation lands as we've created a county-wide map, the Green Vision Map, that documents important conservation lands and existing privately or publicly protected lands. In addition, we believe there are similar conservation non-profit organizations and entities throughout the SCAG region that could provide useful, beneficial, and relevant information about their on-the-ground priorities.

Recommendation #5
We recommend that SCAG incorporate public workshops and outreach to effectively gather information from conservation organizations and other related agencies on conservation priorities. This recommendation also applies to the limited scope of "agencies" in the Resource Areas and Farmlands section (pg. 128 of the Draft 2012 RTP/SCS).

Locations for Mitigation (pg. 78 of the Draft 2012 RTP/SCS)
We are pleased that SCAG has already inventoried the locations of the protected and unprotected areas in relationship to wildlife linkages, linkage designation areas, park, and recreation areas. We agree the maps should be updated as a function of the post-RTP planning efforts but qualify this statement with the caveat that not all of the protected, or undeveloped unprotected lands, in Southern California are within a Natural Communities Conservation Plan (NCCP) or Habitat Conservation Plan (HCP) area.

[2] United States Fish and Wildlife Service (USFWS). "Critical Habitat: What Is It?" Retrieved 1 Feb 2012 from the USFWS website: http://www.fs.fed.us/r9/wildlife/tes/docs/esa_references/critical_habitat.pdf.
[3] Oregon State University Libraries. "What is a Greenprint?" Retreived 1 Feb 2012 from the Deschutes Basin Explorer Natural Resources Digital Library website: http://oregonexplorer.info/deschutes/Greenprint/WhatisaGreenprint.

Recommendation #6
We recommend not only updating the maps to include more recent acquisitions in the NCCP/HCP areas, but also recommend including preserved lands not in the NCCP/HCP areas. For example, most of Chino Hills State Park is not included in an NCCP/HCP but this park offers more than 14,100 acres of natural lands to the inventory. To exclude non-NCCP/HCP lands would misinform decisions about conservation priorities and exclude an entire network of preserved lands outside of, but often times critical to the functioning of, our entire open space system.

In addition, the Orange County Transportation Authority has created a county-wide NCCP/HCP for its Environmental Mitigation Program. This new NCCP/HCP is above and beyond the existing NCCP/HCP areas (Central/Coastal and Southern). By limiting the view of where mitigation can occur (to only existing NCCP/HCP areas), SCAG is considerably reducing its potential mitigation sites especially in light of the broad and expansive nature of the RTP. Freeways crisscross the entire SCAG region and have impacts that cannot or may not be able to be mitigated in an existing NCCP/HCP, nor may SCAG or CTCs be able to add themselves as a partner this late in the NCCP/HCP process.

Recommendation #7
Instead of dictating the conservation mechanism or program to be used by the individual CTCs, we recommend allowing the implementing CTC determine the best conservation mechanism for its region with appropriate public input and guidance from the resource and permitting agencies.

We agree SCAG does not have the authority to purchase or manage these conservation lands, but disagree that the conservation areas will be "achieved through already-established programs." This statement limits the opportunities for conservation to just Orange County as it is the only transportation agency in the SCAG region to have an advanced mitigation component. Should you mean you will use already-established programs to build upon SCAG's efforts, we agree with this approach, but it is not clearly stated and should be revised.

Recommendation #8
We recommend augmenting the statement to include not only already-established programs, but also programs that may be developed in the future or created within existing transportation measures (where appropriate). Additionally, it may be a good exercise to understand what modifying existing transportation measures to incorporate a regional advanced mitigation program would entail.

Types of Mitigation Activities (pg. 79 of the Draft 2012 RTP/SCS)
By reducing transportation impacts to sensitive lands and encouraging smart land use decisions SCAG is moving in a direction that we believe will become the norm and an adopted policy at the statewide level–planning our transportation projects with a comprehensive mitigation program that ensures our open space infrastructure can continue to function and maintain viable habitats, linkages, and species populations in perpetuity.

Recommendation #9
We did notice the lack of mention of wildlife linkages in this section and based on our experiences in Orange County recommend their inclusion. Wildlife linkages are also an important conservation component to ensure the health of our open space areas.

We are pleased to say that the Renewed Measure M Ordinance defines Programmatic Mitigation as "permanent protection of areas of high ecological value, and associated restoration, management and monitoring, to comprehensively compensate for numerous, smaller impacts associated with individual transportation projects. Continued function of existing mitigation features, such as wildlife passages is not included."[4] In other words, if freeway projects impact existing wildlife corridors, funding to ensure its continued function may not come from the programmatic mitigation component. In addition, the program will establish an "accounting process for mitigation obligations and credits that will document *net environmental benefit* from regional, programmatic mitigation in exchange for *net benefit in the delivery of transportation improvements* through streamlined and timely approvals and permitting" [emphasis added].[5]

[4] Orange County Local Transportation Authority. "Ordinance No. 3." 24 July 2006. Section I, Item P, page B-2.
[5] Orange County Local Transportation Authority. "Ordinance No. 3." 24 July 2006. Section II Item A.5.iii, page B-5.

Recommendation #10
We do, therefore, recommend that maintaining existing and future wildlife corridors or linkages be included as a type of mitigation activity and that the advanced mitigation program incorporates language to ensure a *net* environmental benefit as there will be a *net* benefit in completing the transportation projects.

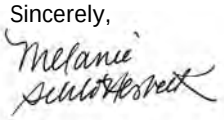
Recommendation #11
While we recognize there are many options to how the mitigation program gets developed, we do recommend that the summary language acknowledges that the list of types of measures is not exhaustive.

Farmland and Agricultural Resources
We urge you to consider adding farmland and other agricultural resources to the conservation policy. In comparing acreages of farmland in the SCAG region, there was a loss of nearly 64,000 farmland acres because of its conversion to urban uses between 2002 and 2008. There was also a 47,000 acre decline in prime statewide important and unique farmlands (as designated by the Farmland Mapping and Monitoring Program classification system).[6] Urban uses generally equate to additional greenhouse gas emissions due to auto-centric developments and therefore go against the mandate of SB 375.

We believe existing agricultural lands play into the larger network of open spaces. Farmlands, like natural lands, create opportunities for natural recharge of the groundwater, reduce the effects of urban heat islands, and provide refuge and foraging areas for wildlife. Of course, agricultural lands also provide food production (worth $4.6 billion per year in the SCAG region) and jobs (67,000 with an annual payroll of $800 million), while producing many times less greenhouse gases than the urban development that has been supplanting them.

General Mapping
It unfortunately seemed to be a trend that the maps in the RTP/SCS were illegible in both printed and digital form. It would be helpful to revise the maps contained within the documents so that the public can accurately read and understand what the maps are trying to show. We were particularly interested in the following maps but our comments are limited due to readability (pixelation) issues: the projected population growth (Exhibit 4.1), housing growth (Exhibit 4.2), employment growth (Exhibit 4.3), natural resource areas (Exhibit 4.6), open space (Exhibit 4.7), and farmland maps (Exhibit 4.8).

Forecasted Growth
We applaud your goal of the RTP/SCS to focus on (among other goals): A land use growth pattern that accommodates the region's future employment and housing needs, and protected sensitive habitat and natural resource areas. We agree land use, transportation AND habitat protection can all be achieved through innovative, smart and new programs like the proposed advanced mitigation policy.



We also appreciate that the land consumption of the greenfield areas consumes 408 square miles less than the baseline. And yes, we agree it is more expensive to develop in greenfield areas because of the lack of infrastructure and services. We are pleased to see SCAG promoting infill projects and protecting our remaining greenfields through compact development and improved land use planning. We believe these concepts are all moving in the right direction toward achieving our mutual goals and the goals outlined in the RTP/SCS for mobility, economy, and sustainability.

Rapid Fire Model
Rapid Fire Model Regional Scenarios Summary which outlines the results of the impacts of varying land use patterns, transportation investments, and policy directions on greenhouse gas emissions, air pollution, water and energy use, land consumption, and infrastructure cost is an excellent method to evaluate how decisions will impact the region. We are pleased to see SCAG utilizing this tool.

[6] U.S. Census of Agriculture; Cal Farmland Mapping & Monitoring Program.

Thank you for the opportunity to provide feedback on the Draft 2012 RTP/SCS and the PEIR. We look forward to working with you in the future on the SCS and the conservation policy.

Sincerely,

Melanie Schlotterbeck

cc: Jacob Lieb, SCAG

Orange County Walk Scores

Walkable Neighborhoods

Imagine living in a community that's design and layout allowed you to get to the bank, the grocer, and the post office without your car. Imagine not only asking your realtor about the number of bedrooms and baths, but also what the Walk Score is for the property.

"Walkable neighborhoods offer surprising benefits to the environment, our health, our finances, and our communities," according to Walk Score, a consortium of planners and environmental experts whose mission is to promote more walkable neighborhoods. It further explains that towns that have walkable neighborhoods experience reduced pollution, increased public health, higher property values, and more community involvement.

Walkable Neighborhood Features

- They have a "center," be it a main street or public space
- There are enough people to allow businesses to thrive and transit to operate frequently
- Mixed income and mixed uses are near businesses
- People have nearby places to recreate in
- Buildings are close to the street and parking is in the rear
- Residents can walk to work and school
- Streets accommodate bicyclists, walkers, and transit

ORANGE COUNTY'S TOP 3 MOST WALKABLE CITIES

1. Costa Mesa (76)
2. Stanton (74)
3. Cypress (70)

Orange County Walk Scores

For our purposes Friends of Harbors, Beaches, and Parks looked at the Walk Score for the city hall for each Orange County city because it is often in the "downtown." And then we looked at the average that was calculated by the Walk Score website. Interestingly, these numbers may be very different numbers. For each city's Walk Score (both city hall and the city's average) see the reverse side of this flyer.

Measuring Walk Scores

Walk Score measures how easy it is to live a car-lite lifestyle—not how pretty the area is for walking. "Walk Score uses Google maps to compute the distance between residential addresses and nearby destinations." The algorithm looks at 13 categories and awards points for each between ¼ to 1 mile. Amenities within ¼ mile receive maximum points, while no points are awarded for amenities further than one mile. The categories include, grocery store, coffee shop, movie theatre, park, bookstore, drug store, clothing and music store, restaurant, bar, school, library, fitness, and hardware store.

For a detailed description of the algorithm, please see the Walk Score Methodology white paper found at: *http://www.walkscore.com/professional/methodology.php.*

Friends of Harbors, Beaches, and Parks works to protect the natural lands, waterways, and beaches of Orange County.

GATEWAY CITIES
COUNCIL OF GOVERNMENTS

February 9, 2012

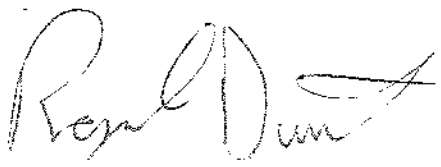
Mr. Hasan Ikhrata, Executive Director
Southern California Association of Governments
818 West 7th Street, 12th Floor
Los Angeles, CA 90017-3435

Dear Mr. Ikhrata:

Gateway Cities Comment to SCAG on Draft 2012 RTP/SCS

Thank you very much for the opportunity to review and comment on the Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and associated draft Program Environmental Impact Report (PEIR). It is clear that a great deal of hard work and successful stakeholder involvement have gone into creating these very impressive documents. SCAG has done an extraordinary job of meeting multiple planning requirements and has produced an innovative and visionary plan.

The Gateway Cities respectfully submits the following comments and questions for your consideration and response:



- Growth Forecast
  - We understand that SCAG staff is recommending that the growth forecast be adopted at the city level rather than at the county level, which has been the practice in the past. We request that SCAG continue the past practice of adopting the growth forecast at the county level to allow for much-needed flexibility as local jurisdictions implement their general plans.
- Financial Plan
  - The draft Financial Plan includes over $110 billion to come from new mileage-based user fees that would be implemented to replace and augment gasoline taxes. This is the largest single element of the overall new revenue sources anticipated for the RTP. We would like additional information on how these fees might affect lower-income residents of the SCAG region, particularly since many such residents are concentrated within the Gateway Cities.

  - The Financial Plan envisions a future split among local, state, and federal funding sources that is quite different from the current split, in which over 70% of all transportation funding is of local origin. In the future, the Plan shows 22% from federal and 25% from state, leaving only 53% from local sources. Can SCAG present a chart or plan showing how and when this transition would occur between 2012 and 2035?
  - Table 3.4.1 presents Core and Reasonably Available local sources of revenue and includes development mitigation fees for Orange and Riverside Counties. Does the revenue estimate include any assumption of funds from the potential adoption of a development fee in Los Angeles County?
- Major Highway Projects
  - Exhibit 2.1 and Exhibit 4.12 show major highway projects under the Regional Transportation Plan. Some major Gateway Cities projects – notably those along I-5 between I-605 and the County line – are not indicated on these exhibits. We understand that this is because the exhibits show only Plan projects and do not show projects in the current Federal Transportation Improvement Program (FTIP). We suggest that the exhibits be amended to include FTIP projects over a certain cost threshold so as to show a more complete picture of regional highway infrastructure investments.
- High-Speed Rail
  - We understand that discussions are ongoing among SCAG, the County Transportation Commissions, and the California High Speed Rail Authority regarding levels of available funding for rail infrastructure improvements within the SCAG region. We look forward to further details about the specific investments that will be made in Southern California's rail infrastructure under the 2012 RTP, particularly those that affect the Gateway Cities.
- Express/HOT Lane Network
  - Table 2.6 lists several potential routes for Express/HOT Lane development. Two of these run through the Gateway Cities: I-405 from I-5 to the LA/OC County line; and SR-91 from I-110 to SR-55. What is the anticipated timeframe or years of construction and completion for these projects? Will mixed-flow lanes be added or removed in order to provide the HOT lanes?
- Goods Movement
  - Exhibit 2.8 displays "rising truck volumes in the SCAG region." However, the assumptions underlying the data in this exhibit are not clear, and should be explained in the text. For example, how do these figures relate to the cargo forecast being projected by the San Pedro Bay Ports or the figures assumed in the I-710 Corridor and 91/605/405 Corridor processes? Are the figures in the exhibit based on SCAG's revised truck model? Also, would different truck volumes be found under different RTP alternatives?

  - To avoid local impacts to member cities, the Gateway Cities respectfully request that the potential routes for the East-West Freight Corridor be limited to freeway routes only, and that non-freeway routes not be further considered.
  - The tables relating to the proposed East-West Freight Corridor present a confusing picture of the plan for implementing reduced-emissions vehicles on the corridor. Table 2.8, Benefits of an East-West Corridor Strategy, mentions "50% clean truck utilization" under Environment, but also lists "Zero-emissions technology" under Community. Table 2.11, Environmental Benefits, shows an "East-West Freight Corridor with 100% Zero-Emission Vehicles." It would be helpful to clarify the timeline on which SCAG anticipates low- or zero-emission trucks would be phased in specifically on the East-West Freight Corridor. This implementation timeline should be the same on the East-West Corridor as on the I-710 Corridor through the Gateway Cities, and both should employ 100% zero-emission vehicles.
- Sustainable Communities Strategy
  - Page 79 of the SCS Background Documentation report states that "Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be respected and integrated into the alternatives (with possible revisions for Alternative C only)." Since the PEIR alternatives are designated by number (1, 2, 3) rather than by letter (A, B, C), please clarify whether this statement refers to Alternative 3, called the "Envision 2 Alternative" in the PEIR. Also, we would appreciate having specific information on where, if anywhere, revisions may have been made to the Gateway Cities' jurisdictional input as reflected in our subregional SCS.

We thank you again for the opportunity to review and comment on these draft documents. We also remain especially grateful to the SCAG staff for all the support they provided to the Gateway Cities as we developed our subregional SCS.

Sincerely,

Raymond Dunton, President, Board of Directors
Gateway Cities Council of Governments and
Council Member, City of Bellflower

Los Angeles, CA 90017-3435

RE: Global Land Use and Economic (GLUE) Council Comments to the Southern California Association of Governments (SCAG) Regional Council on the Draft 2012 Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS) and the Program Environmental Impact Report (PEIR).

Dear President O'Connor:

In April of 2009, the Global Land Use and Economic Council was formed to advise SCAG staff on the economic implications of SCAG's planning activities and to better engage key public and private stakeholders.

At its formation, the focus of the GLUE Council was centered on the implementation of SB 375 and how Southern California could reduce greenhouse gas (GhG) emissions and establish economic co-benefits through better planning for land use, transportation and housing throughout Southern California.

Nearly three years later, the GLUE Council's contributions have grown beyond SB 375 and the partnership has yielded some great success:

- In December 2009, partnering with the Southern California Leadership Council (SCLC) and SCAG, we successfully brought together key business leaders and public officials to voice Southern California's need for flexibility in SB 375 implementation.
- In September 2010, GLUE Council helped articulate to the California Air Resources Board the importance of linking GhG reduction targets for SB 375 to state commitments that will be critical to ensuring goals are met.
- In December 2010, the Southern California Road to Economic Recovery was a great success and the first public step in the development of Southern California's first Economic Growth Strategy.
- In May 2011, the Southern California Economic Recovery and Job Creation Strategy was unveiled and subsequently adopted with great support from GLUE Council.

As Southern California's top four industries are transportation dependent -- trade, technology, tourism and entertainment-- GLUE Council recognizes that investing in the region's transportation system is critical to its economic prosperity.

Over the last several months, GLUE Council has been actively engaged in the 2012-2035 RTP/SCS and applauds the tremendous effort SCAG has put into the process behind this Draft 2012 RTP/SCS & PEIR.

For almost three years, and including hundreds of meetings with its local government constituents and private sector stakeholders, SCAG has honored an inclusive approach to the development of this RTP/SCS.

GLUE Council Thoughts and Recommendations:
As a body representative of Southern California's broader business community, the GLUE Council recognizes the crucial roles that transportation and infrastructure play in maintaining this region's economy and quality of life. That is why throughout the RTP/SCS process the GLUE Council has focused on the plan's ability to deliver economic recovery, jobs recovery, and CEQA streamlining to the region.

The following key policies and principles are recommended by the GLUE Council for evaluating the plan as they represent the qualities of a good and sound RTP/SCS:

1. **Provides Positive Economic Impacts**
    - A plan that is pro economic growth and pro job creation – The RTP/SCS must undergo a true economic cost/benefit analysis so that economic impacts are understood and known by SCAG Regional Council members (and stakeholders) before making a final decision on the RTP/SCS.

2. **Provides Local Control**
    - Any new transportation revenues or fees collected must be under the control of the local transportation agency/authority in order to assure local accountability.
    - Cities, counties and local transportation agencies must maintain appropriate control and flexibility in managing decisions and resources related to land use and transportation.

3. **Assures Revenue Sources are Fair, Understandable and Good for the Economy**
    - Transportation revenue concepts within the RTP/SCS must undergo cost/benefit and other appropriate analysis to assure that they are good for a recovering economy and future growth. They must also be fair and understandable, meaning that an appropriate nexus exists between who/what is being taxed and what is being paid for to assure that new revenues are drawn fairly and proportionally from those who benefit from the related transportation infrastructure or improvement.

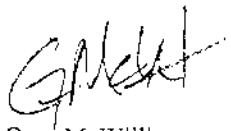
4. **Is Balanced and Accountable**
    - Revenues should be balanced with performance measures, reforms and guarantees that assure the RTP is effective, efficient and responsible to the citizens and taxpayers of Southern California.

5. **Is CEQA Compliant and Defensible**
    - The RTP/SCS is processed correctly from an environmental impact perspective, complies with appropriate legal requirements, and is able to withstand litigation challenges.
    - Provides for CEQA streamlining and protects against CEQA abuse

Economic Analysis – Throughout the RTP/SCS process, the GLUE Council has asked for and encouraged SCAG to focus on the plan's benefits and impacts on the regional economy and job creation. The GLUE Council has argued that, done right, the RTP/SCS can be a major catalyst for the region's economic and jobs recovery. Likewise, if not done right, the RTP/SCS could delay recovery or possibly even worsen the region's struggling economy. With this in mind, early on the GLUE Council called for a complete economic analysis of the RTP/SCS, inclusive of a true cost benefit analysis.

GLUE Council appreciates SCAG's dedicating resources to fully articulate the net economic benefits of the 2012-2035 RTP/SCS and supports the findings:

- Every $1 spent on infrastructure investments yields a return of $2.90
- The projected cost per day/per capita is less than $2.00
- The projected benefit per day/per capita exceeds $5.00
- The plan generates an average of 166,000 jobs per year from construction and maintenance expenditures
- Improved transportation benefits in commuting, accessibility and congestion relief yields 354,000 annual jobs



GLUE Council has reviewed the work of SCAG's economic team and their analysis of the RTP/SCS and finds that it does show the plan to be one that "provides positive economic impacts", which is one of GLUE Council's key qualities of a good plan.

Phase II of the Economic Recovery Strategy – As part of the adoption of the RTP/SCS, the GLUE Council recommends that the SCAG also adopt Phase II of the Economic Recovery Strategy. The adoption could happen simultaneously with the adoption of the RTP/SCS or at the adoption of the RTP/SCS, SCAG could commit to a subsequent adoption of the Phase II Strategy (within six months).

The Phase II Economic Strategy would be a way for SCAG to take business community concerns with the RTP and turn them into a positive partnership. Working together, SCAG, GLUE and other stakeholders could develop the Phase II Strategy as a way to focus SCAG and local government on critically necessary regulatory reforms and strategies for new out of the box financing, especially in light of the dissolution of redevelopment agencies. The Phase II Strategy would also give SCAG and GLUE a vehicle for establishing a true Regional Economic Plan to go along with SCAG's other regional plans such as the RTP, the SCS and RHNA.

Upon adoption of the RTP/SCS and the Phase II Economic Recovery Strategy, GLUE Council looks forward to partnering with SCAG on actions to encourage increased business investment in Southern California, in order to retain the current business base, to identify opportunities for expediting project delivery, to reduce costs and to realize accelerated plan benefits.

Respectfully,

Greg McWilliams
Chair, GLUE Council

STATE OF CALIFORNIA
GOVERNOR'S OFFICE *of* PLANNING AND RESEARCH

EDMUND G. BROWN JR.
GOVERNOR

KEN ALEX
DIRECTOR

February 14, 2012

Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Dear Mr. Ikhrata,

The Governor's Office of Planning and Research (OPR) appreciates this opportunity to provide input on the Southern California Association of Governments (SCAG) 2035 Draft Regional Transportation Plan (RTP). This letter highlights aspects of SCAG's RTP that we think could inform other Metropolitan Planning Organizations' (MPOs') RTPs, and includes some suggestions for possible improvement. Additionally, we enclose comments shared with us by the California Department of Public Health.

Our comments highlight a number of achievements of the plan, and point to some opportunities for further improvement. The plan is grounded in empirical data, using performance measures to guide investment. These metrics are based on transparent modeling, and are broad enough to capture a number of factors important to decision-making. We also point to some opportunities to calculate other important metrics that could be added to even better inform decision-making. The plan also proposes a VMT fee for revenue generation; we suggest that in future analysis SCAG broaden discussion of its benefits and impacts. By showing a path of regional growth in a smaller urban footprint, it makes possible substantial habitat preservation and emissions reduction. We commend SCAG for the extensive technical analysis, policy development, and public outreach process which informed this document, achieving a 16 percent reduction of greenhouse gas emission (GHG) reductions by 2035, among the largest of any MPO's over that timeframe. The RTP estimates a reduction in congestion and an increase in active mode share as well. We look forward to working with SCAG as it proceeds with implementation of this plan.

(916) 322-2318 FAX (916) 324-9936 www.opr.ca.gov

Performance Based Planning

We are encouraged by SCAG's efforts to develop a plan based on quantitative measures of projected outcomes, or "performance metrics". In this RTP, SCAG provides data and discussion that covers a broad range of stakeholder interests, enabling broadly informed decision-making. We encourage SCAG to continue to develop its capacity to employ sophisticated scenario modeling, and to use that information to enable even better-informed decision-making.

Models used in regional transportation planning are increasingly important in informing transportation and land use decisions. These decisions direct billions of dollars in infrastructure investments and influence regional and local growth patterns. Transparency of models is therefore a prerequisite to transparency in the planning process and decision-making. The 2010 California Regional Transportation Plan Guidelines require MPOs to "disseminate the methodology, results, and key assumptions of whichever models it uses in a way that would be useable and understandable to the public."

We encourage MPOs to display as much information as possible, including model inputs, to help members of both the lay and technical public understand and compare model assumptions and results. Similarly, the model code itself should also be made available to members of the technical public for analysis. Consistent with the Regional Transportation Plan Guidelines, SCAG has appropriately made its modeling work available for public review. We appreciate SCAG's efforts in providing this information.

Applying Performance Metrics to Inform Policy

SCAG's RTP also relies on and discusses useful metrics, and provides clear descriptions of their meaning. One example of a clearly portrayed and useful metric in the SCAG RTP is "reliability." Figure 5.8 and Table 5.2 (p. 172) along with the accompanying narrative convey clearly the concept of reliability and its importance to an efficient transportation system. To explain reliability, the table relates variability in travel time to the time one must leave for a trip in order to have confidence in reaching a destination on time. This demonstrates the time lost by users of an unreliable facility.

Another useful metric in SCAG's RTP is "lost productivity" which measures the reduction in throughput resulting from congested roadways (Figure 5.5, p. 170). Use of this metric allows consideration of the potential benefits to the transportation system of transportation demand management measures. This presents an opportunity to discuss the potential effect of a VMT fee on the transportation system.

We suggest that SCAG provide additional context when using some metrics. For example, death rate listed per VMT (p. 19, fig 1.2) captures factors such as roadway design, but masks the safety benefits of reducing VMT. Similarly, metrics of delay (pp. 164-165) do not distinguish between long and short trips. Such metrics can penalize a short commute in traffic as compared to a long commute on the open highway.

Congestion metrics therefore do not capture the benefits to the transportation system of land use planning strategies that shorten trip lengths. While we believe the RTP would benefit from inclusion of trip length in the metrics used to describe the functioning the transportation network, we note that the RTP captures these by using separate land use metrics.

The RTP also uses safety and health metrics, such as collision rates by severity and by mode and tons of air pollutants emitted. The document provides important information by monetizing potential health benefits of air quality improvement (p. 30). We encourage SCAG to include another key metric, health benefits resulting from active transportation, such as walking and bicycling, in the evaluation. Please see the section "Quantify the Benefits of Active Transportation" below for further discussion.

SCAG's RTP appropriately describes several key co-benefits in the RTP (pp. 175-176). Further, the RTP also quantifies and monetizes those benefits so that they can be considered in cost benefit analyses. We encourage SCAG to clarify how those co-benefits are factored into the decision-making process, and also to expand the scope of co-benefit analyses in its future planning processes.

A Vehicle Miles Traveled Fee: a Funding Source with Potential Additional Benefits

The SCAG region has been a pioneer in the use of roadway tolling in California. Studies suggest that roadway tolling can provide a combination of revenue enhancement, system performance enhancement, human health benefit and environmental benefit. We appreciate SCAG's efforts in modeling and evaluating a VMT Fee as part of the RTP-SCS analysis.

As described in the RTP-SCS (p. 170), overloading a roadway substantially reduces vehicle flow. This in turn reduces the capacity of the roadway at exactly the time that capacity is most needed. One short-run solution is to build additional capacity, but building capacity is costly and the congestion relief is usually temporary. SCAG's consideration of effects of a well-administered VMT fee, including reducing congestion, and possible co-benefits to human health and the environment (e.g. reducing GHG emissions, improving air quality, and reducing collisions), is beneficial for decision-makers and the public. We appreciate SCAG's work in this area.

Quantify the Benefits of Active Transportation

In a letter commenting on RTP-SCS development, the California Department of Public Health points out that "...the potential for reducing chronic disease and greenhouse gases appears to be large on an absolute scale, and far larger than co-benefits from fine particulate matter reductions, which are a traditional focus of health effects" (letter enclosed).

We note that the RTP highlights the link between active transportation and human health (p.30). We recommend that future planning efforts quantify health benefits of

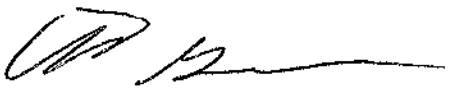
active transportation, so those benefits can be more specifically factored into the transportation planning process. We note that the RTP includes discussions delineating active mode share and accident/fatality rate for cyclists and pedestrians, and elsewhere in the document the expenditure share on active transportation. We recommend that these factors be considered together with active mode health benefits for a comprehensive analysis of this component of transportation plan.

System Preservation

In an era of dwindling transportation budgets, some agencies are deferring roadway maintenance. But doing so leads to more serious wear and damage, and the repairs that are needed as a result are much more expensive than proactive maintenance would have been. For long-run fiscal health, it makes sense to fund full upkeep of existing roadway and highway infrastructure before building more capacity. In this light, we appreciate SCAG's commitment of $217 Billion (nearly half of total expenditures) to system preservation, maintenance, and operation.

Protecting the Natural Environment

The RTP discusses the direct impact of roadway construction and operation on sensitive species via road wildlife strikes (p. 78). We note that the development that will be served by these roads could have a much greater geographic footprint than the roads themselves. As a result, the RTP should consider the potential the indirect impact roadway construction can have on land development, and in turn the impact of development on habitat. We encourage SCAG's continued engagement and facilitation in implementation of regional conservation plans.



On page 174, the RTP presents the following definition of sustainability: "A transportation system is sustainable if it maintains its overall performance over time with the same costs for its users." The RTP should use a broader definition of sustainability that encompasses the environmental, social and economic metrics used elsewhere in the plan.

Implementation Monitoring Tracks Results of the Planning Process

The RTP anticipates substantial achievement that will be measured by a number of metrics. In order to determine whether these anticipated achievements occur, we suggest SCAG employ an implementation-monitoring program. Such a program would assess the extent to which local jurisdictions within SCAG approve development in accordance with the plan. It would test the assumptions used in the planning process, allowing for corrections to the plan so that it can continue to track a course towards stated targets. Also, it would check the assumptions made in the planning process, allowing calibration with empirical results.

OPR again commends SCAG for developing a high quality RTP-SCS. We hope that our comments are helpful. We appreciate the opportunity to submit these comments, and to offer our assistance in RTP-SCS development and implementation. If you have any questions, please do not hesitate to contact me at 916-324-9236 or chris.ganson@opr.ca.gov.

Attached: Comments by the California Department of Public Health on the Sustainable Community Strategies (SCS) Process and Plan Content

State of California—Health and Human Services Agency
California Department of Public Health

RON CHAPMAN, MD, MPH
Director & State Health Officer

EDMUND G. BROWN JR.
Governor

January 19, 2012

Christopher P. Ganson, Senior Planner
Office of Planning and Research
1400 Tenth Street
Sacramento, CA 95814

Dear Mr. Ganson,

We welcome the opportunity to comment on the Sustainable Community Strategies (SCS) that have recently been presented in draft or final formats by the large Metropolitan Planning Organizations. Although the California Department of Public Health does not have a regulatory role in the SB375 process, there are a number of compelling public health interests in the SCSs because of the documented health impacts of housing and transportation in combination with economic development, education, and their interactions to create healthy community environments. As the convener of the Strategic Growth Council's Health in All Policies Task Force, CDPH is working with other State agencies to optimize opportunities to improve public health and sustainability. CDPH staff has also played an educational and technical advisory role in some MPOs' discussions of performance targets and methodologies to assess project performance. CDPH also routinely interacts with local public health departments around the state, many of whom have become involved in regional SCS planning.

Our general and specific comments are detailed in the attached pages. We do note, however, that there are several health issues that fall outside of the current framework of SCSs but are concerns CDPH believes needs more attention. Although greenhouse gas reduction is a goal of the SCSs, climate change will increase risks from higher temperatures on the backdrop of an increasingly urbanized California. We feel there is a critical need to integrate urban heat island (UHI) mitigation strategies into regional and local plans that will implement transit oriented development (TOD) and in-fill development so that UHI risks are reduced as new development takes place. Access to health-promoting features of the built environment, including food systems, parks, and green space also should be integrated into planning.

Please do not hesitate to contact me if you have any questions or comments.

Sincerely,

Linda Rudolph, M.D., M.P.H

Comments by the California Department of Public Health on the Sustainable Community Strategies (SCS) Process and Plan Content

General Comments

Health is a critical component of sustainable communities. The California Department of Public Health encourages regional planning organizations to embrace the concepts outlined in the Healthy Community framework developed by the Strategic Growth Council's Health in All Policies Task Force.[1,p21] Many strategies that increase community sustainability can also support improved health outcomes. For example, policies that support active transportation help Californians incorporate more health-promoting physical activity into their lives, while also advancing goals to achieve greenhouse gas emission reductions. Infill development can help to reduce urban sprawl, reduce greenhouse gas emissions, and support location-efficient housing that promotes active transportation and allows workers to reap both economic and health benefits. Good health is critical for economic sustainability, increasing workforce participation and productivity, and slowing the ongoing rise in medical care expenditures, which diverts resources from other State priorities such as education or investments in green energy.

CDPH staff has reviewed the drafts and final versions of SCSs updates to the Regional Transportation Plans of the 4 large MPOs and the following comments represent a high level synthesis. First, we must laud the MPOs for the diligent work that has gone into these documents, and each represents an improvement from the original RTPs. We note an increasing number of performance measures that go beyond the traditional health focus on traffic injuries and air pollution. We refer to physical activity from active modes of travel, including bicycling, walking, and public transit that includes active transport from and to transit destinations. Noise and other physical hazards are also getting more attention as health performance measures. We also note that discussions of equity increasingly recognize that health inequities are caused and exacerbated by built environment factors and the uneven distribution of community resources. We are supportive of these developments which will deepen the appreciation of how public health is embodied in the many actions outside the field of health or health care.

Specific Recommendations

We have several recommendations that are based on existing trends in the SCSs and recent scientific developments in the transportation and public health fields.

1. Activity time in active transport (walking, bicycling, etc.) is indispensable as a health-related transportation performance measure (e.g., mean daily minutes per person of walking and bicycling). Health co-benefits of active transport in one of the large MPOs (Metropolitan Transportation Commission, MTC) has recently been quantified[2] and the potential for reducing chronic disease and greenhouse gases appears to be large on an absolute scale and far larger than co-benefits from fine particulate matter reductions, which are a traditional focus of health effects. These findings are consistent with emerging evidence from studies of other regions of the United States, London, Barcelona, and the Netherlands.[3-7] Attempts to monetize health co-benefits from active transport suggest savings of billions of dollars in health care costs and the value of statistical lives saved.[5]

2. MPOs should consider new tools that have recently become available to quantify the health co-benefits of active transport in SCS scenarios and projects. This fills a gap in project performance assessment at most MPOs. One such tool co-developed by the CDPH, MTC, the Bay Area Air Quality Management District and other researchers is called the Integrated Transport and Health Impacts Model (ITHIM), which was used to quantify the health co-benefits of active transport and low carbon driving in the San Francisco Bay Area. This tool could function as a post processor to travel demand models that generate miles traveled and activity times by mode. Modelers at several large MPOs are already exploring how it can be used to complement their methods for project performance assessment.

3. As tools such as ITHIM become available to MPOs, health co-benefits can be used as a criterion for a unique project category that *a priori* could get a high priority score in the project assessment methodologies used by MPOs.

4. Likewise, using these tools, health co-benefits can be used as a criterion to screen projects for cost-benefit and other in-depth analysis. In some MPOs current practice is to screen projects based on cost, so that only high cost projects get quantitative assessment. This would allow projects with large health co-benefits to also get additional scrutiny in cost-benefit analyses.

5. Equity/inequity in RTPS is currently framed using title VI of the Civil Rights Act, concepts of "no disparate impacts" and "increase access (to affordable housing/transit) to poor people", participation of communities of concern, environmental justice. In the development of SCSs some MPOs have been exposed to a health-based approach which explicitly calls for ways to narrow existing differences in health status and of determinants of health. The Sustainable Transportation Council (LEED-like approach to rating transportation systems) is considering a goal area in its transportation rating system that explicitly considers reducing health disparities.[8] This is a promising approach that deserves more attention.

6. Local health departments are highly interested and would benefit from mechanisms that enhance their participation in SCS development and follow-up. We noted with interest that SANDAG has a standing Public Health Advisory Committee in which the San Diego County Health Department is a partner, and our staff was able to attend one of their meetings. National organizations like the Transportation Research Board have recently created standing health subcommittees with an expanded focus. It is worth exploring ways local health departments and others interested in public health and equity can stay engaged on an on-going basis.

   This is particularly germane to a multidisciplinary approach to address the multiple health issues and the complexity of health impacts. In this setting expertise could be leveraged to explore the potential consequences of different scenarios and SCSs in the context of health risks and benefits, addressing air quality, physical activity, access to health promoting resources (e.g., transportation, food, employment, education), noise, injuries, social networks, etc. for the regional population and vulnerable subgroups.

TO: Margaret Lin
Southern California Association of Governments (SCAG)
818 W. 7th Street, 12th Floor
Los Angeles, CA 90017

RE: Official Public Comments made to the 2012-2035 RTP addressing; concerns involving conventional freeway/intermodal/port expansion projects related to goods movement emanating from the San Pedro Bay Ports Complexes.

Greetings,
I am a native Southern Californian and have had a professional background in commercial logistics for over 20 years, 7 of which involved the tri-modal (vessel, container yard, and on-dock) operations involving container terminals.

In the span of my experience and research seeking solutions to great challenges involving goods movement, the first and most profound discovery emerging obvious and opportune is that over decades of industrial growth, container logistics is no longer "port centric".

Rather today, goods movement has shifted to become "region centric". That is to say logistics activity at consolidated warehousing, use of freeway networks and surface freight rail has exploded to support the volumes (in millions of containers each year) emanating from the Ports of Los Angeles and Long Beach. The region now bears the brunt of goods movement and with this brunt comes negative environmental impacts.

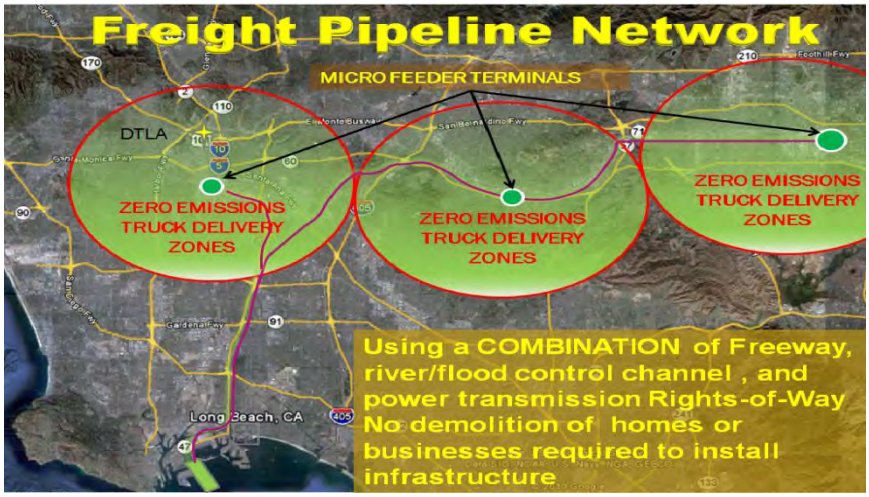
This image on the previous page was taken from page 3 (exhibit 1) from the SCAG Goods Movement Supplemental Report illustrating warehousing locations (in blue dots). We have added the 15 mile radius red rings to illustrate where the vast majority of local truck deliveries emanate from the ports. Ideally, if containers could be delivered in a new method of freight transmission to the center of these areas of delivery density, the freeway trucking component could be completely eliminated decongesting freeway traffic measured in the millions of truck trips and in the hundreds of millions in truck vehicle miles travelled (VMT). The idea of a 100% freight dedicated right of way connecting the ports to the Inland regions is the core motivation of the proposed GRID Freight Pipeline system and transportation network.

Among the 2012-2035 Regional Transportation Plan's (RTP), by far, the most ambitious proposed projects specific to goods transportation is the proposed elevated or double decked, East West Freight Corridor. This project calls for a freeway network dedicated to truck drayage from the 710fwy connecting to the IH-15 ultimately linking to areas in the Inland Empire where a high density of container deliveries to consolidated freight service (CFS) warehousing and intermodal yards.

This image on the previous page justifies the central argument for the critical need for a freight dedicated corridor crossing the region through the areas where the highest frequency of port truck deliveries are occurring by the thousands every day here and now. Therefore, this public comment is to agree and concur with SCAG's determination that an east west freight corridor is critical to reduce traffic congestion on surface freeways where our commuter cars use our freeway network.

However, the proposed conventional project solution, connecting forty miles, estimated to cost $15B, is to build an entirely new freeway network for the purpose of decongesting another parallel freeway network. To some elected officials this project proposal leaves causes for concern. In fact, this proposed mega-project has already received pushback from elected officials whose cities run through these proposed new freeway routes.

To begin, fifteen billion dollars to fund this single project in an RTP involving literally thousands of projects represents 10% of the $155B dollars SCAG proposes to raise revenues in the form of a future gas tax increases at $0.30 per gallon or impose a vehicle miles travelled (VMT) tax. These gas tax increases will fill the current gap of budgeting within the RTP's total $450B plan. The certainty that passage of a national gas tax or VMT is imminent as a solution is considered by some to be somewhat optimistic. The following link referencing these specific issues is an article from the San Gabriel Valley Tribune. LINK: http://www.sgvtribune.com/news/ci_19327611



Another significant issue that rapidly growing concern and in some cases firm opposition from elected and city staff officials of cities, especially those positioned within or nearing the route to the proposed surface solution that describes the proposed design of the E/W Freight Corridor. The following link describes the aligning opposition beginning with

the cities of Diamond Bar, Walnut, West Covina, Chino Hills, Montebello, South El Monte, and Pico Rivera. Article from the Whittier Daily News.
LINK: http://www.whittierdailynews.com/news/ci_19261687

The central motivation of this public comment is to reach out to SCAG strongly urging staff to take bold forward thinking steps, shifting its regional plan with focus to gravitate towards environmentally superior alternatives that actually have superior efficiency and platforms using 21st Century thinking to solutions specific to streamlining, even potentially undergrounding the transmission of millions of containers from the 5th largest container trade gateway on planet earth significantly decongesting freeway networks on our urban surfaces where human multi-modal transportation is given precious space.

The GRID Project is now participating in its 3rd public comments on proposed major transportation infrastructure where one project replaces not one, rather multiple projects. Among the most appealing facets of GRID is that the project pays for itself (economically sustainable). The first three projects GRID has addressed in comment are;

1. Public Comment on the Port of Long Beach Pier S DEIR/DEIS where the SuperDock makes this billion dollar project obsolete
2. The BNSF Southern California International Gateway (SCIG) Project DEIR/DEIS making this controversial development having significant community and environmental justice group and NRDC opposition (saving railroad companies $500M) with a superior operating facility called GRID SuperDock).
3. The SCAG 2012-2035 RTP where GRID proposes a "Freight Pipeline" connecting the ports to inland areas where containers would emerge from this network of freight tunnels emerging at the center of where the highest concentration of containers are delivered.

Referencing the earlier SCAG image on page 1, the pipeline follows a route were freight warehouse volume density is most concentrated. To date, the GRID Project has been presented to SCAG senior staff. Also GRID proposers were recently invited to present at

the Arroyo-Verdugo SCAG Subregion meeting where the central agenda involved issues pertaining to the 2012-2035 RTP.

We submit for SCAG and committee members consideration a conclusion from a recent CARB/CEPA sponsored study entitled; *"Development of a California Geospatial Intermodal Freight Transport Model with Cargo Flow Analysis"* Contract no: 07-314 (PDF available on CARB website). The Conclusion of the report states the following;

"The Case Study provides two primary insights. First, the Case Study quantifies port-related intermodal goods movement through the state of California and beyond. Second, the idealized use of least-CO_2 routing constraints illustrates how emissions savings can be achieved through modal shifts. ***In terms of savings in emissions, it is estimated that a total of ~60% reduction in CO_2 emissions is achievable by a modal switch from road to rail****. Both of these insights have relevance for consideration of system-wide improvements that may achieve energy savings, CO_2 reductions, and associated benefits for air quality".*

We urge committee members to please consider ensuring that SCAG staff will agree to draft language within the E/W Freight Corridor section in the 2012-2035 Regional Transportation Plan clearly communicate that the East/West Freight Corridor description within the RTP;

> **1) <u>Consist of *other* design alternatives</u>** beyond those of only truck with road and freeway expanding solutions.
> **2)** Include rail guideway systems infrastructure to carry freight from the same point to point destinations that define the East/West Freight Corridor even in the form of superior environmental alternative.
> **3)** Include rail guideway systems having an underground component consisting of tunneling and/or "freight pipeline" networks included in the RTP language.
> **4)** Include design alternatives that appear to have superior environmental alternatives to consider as required by CEQA and NEPA legislation as expressed under section 101 of the National Environmental Policy Act.

In this most perfect storm of economic, environmental, and political drive to create new jobs and industries, SCAG can create a Goods Movement RTP squarely focused on sustainable alternatives both green and economic. We hope that leaders in the region will join other leaders in further investigating the GRID project and grow inspired to its purpose in redefining transportation, smart urban use and economic benefits to the region.

Always Looking Forward,
Dave Alba

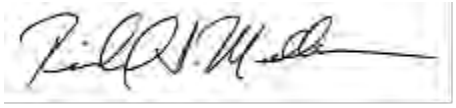
Subject: Constructability of Proposed GRID "SuperDock" and Freight Pipeline

Dear Mr. Alba:

I have been involved in the design, manufacture, installation, operation and maintenance of pipelines made of steel, concrete, and fiberglass, and of diameters from 10" to 252" in diameter. I have been involved in the development of pipelines systems for transfer of solid freight for more than two decades. I was also involved in the design and installation of rail siding and rail loading systems for rail delivery of the wind towers which Ameron International Corporation fabricates at our plant in Fontana, California.



I have discussed the GRID proposal with many of my engineer colleagues, both regarding basic constructability and particularly in regard to maintaining system reliability while crossing southern California's seismic faults even in the event of substantial differential ground movement. Based upon my background and evaluation, and that of the pipe and rail experts with whom I have discussed the GRID project, it is our determination that the GRID freight pipeline is buildable using current technologies.

Ameron International Corporation is now a wholly owned subsidiary of National Oilwell Varco, (NOV). NOV also owns AmClyde, a designer and manufacturer of the most demanding crane systems, including those used for stevedoring. AmClyde engineers have reviewed the proposed design concept for the GRID "SuperDock" and agree it can be designed and built to function as intended for the GRID system.

These engineers and I look forward to building this project for the benefit of southern California and for the reduction of transportation costs for and environmental impact from all freight moved through the ports at San Pedro Bay.

Sincerely,

Ameron International Corporation
Water Transmission Group

Highgrove Metrolink comments over the last eight years!

Please look at the dates of the following statements:

Excerpts prepared Jan. 14, 2010 (Not in sequence)

Ann Mayer, current Executive Director RCTC: (Press Enterprise, Feb. 15, 2009)
"*We have to put stops where they will serve the most people*".

Marion Ashley, Riverside County Supervisor: (Letter, Oct. 14, 2009)
"Over the course of more than a decade, the Riverside County Transportation Commission has considered and repeatedly rejected the request of Highgrove residents for Metrolink service."

Bob Buster, Riverside County Supervisor: (Statement Oct. 11, 2006)
"Highgrove is at the fulcrum, the pivot point of transportation between the 2 counties. You can not ignore the geographic reality that both the freeway and major rail lines and there is available land that will soon be snapped up for other uses. This is a key sight for the future of the Inland Empire"

Bob Buster, Riverside County Supervisor: (Letter July 17, 2006)
"Highgrove is the right place for a regional, intermodal station, at the junction of the main lines and the 215 freeway. Highgrove still has ample land and the community and Grand Terrace want the station".

Mary Crayton, RCTC Commissioner from Canyon Lake: (RCTC meeting Feb. 11, 2009)
Stated that she "*was not satisfied why Highgrove has not been considered and that they never went to Highgrove to look at the property".* She stated: *"they should consider the property in Highgrove".*

Roger Berg, RCTC Commissioner from Beaumont: (RCTC meeting Feb. 11, 2009)
"The Highgrove station may have some merit, more parking is needed and gridlock will only get worse".

James Potts, RCTC Commissioner from San Jacinto: (RCTC meeting Feb. 11, 2009)
"It is the right project for the right time and it would open up other areas where seniors could go instead of just driving locally".

Robin Low, RCTC Commissioner from Hemet: (RCTC meeting Feb. 11, 2009)
"Recognized the amount of work that has been done on this project and said they need to revisit this idea".

Jeff Stone, Riverside County Supervisor: (RCTC meeting Feb. 11, 2009)
Was sympathetic to the concerns of those living near the track and said that the I-215 is reaching capacity and that people need to get out of their cars, onto the tracks and to their destinations.

Bill Emmerson. California State Assembly- Dist. 63: (Letter Aug. 14, 2006)
"I am very supportive of bringing a Metrolink Station to Highgrove because I agree that it is an appropriate location to help solve traffic congestion for this fast growing area".

Mark Hanson, UCR Professor (emeritus): (Letter Feb. 22, 2009)
"For us the "no brainer" aspect of the sitting decision comes down to which station could provide the greatest service to commuters of the region when the Metrolink trains come on line. That has to be Highgrove where one station could serve in three directions: San Bernardino, Riverside and the PVL".

University Neighborhood Association: (Letter Oct. 21, 2005)
"Our meeting was standing room only and by a unanimous show of hands, we voted to support a train stop in Highgrove".

(Four years later)

University Neighborhood Association: (Letter Nov. 17, 2009)
"Our community continues to support this concept because that location seems to offer greater overall flexibility. In addition to servicing Metrolink traffic from the PVL, the Highgrove station establishes services to existing Riverside and San Bernardino traffic, and opens opportunities to increase the number of potential riders through the expanded capacity and the flexibility to serve them".

Riverside Land Conservancy: (Letter Oct. 18, 2005)
"At this time we see no objection to development of this parcel for such a Metrolink Station, but want you to be aware early on, that the development and any crossing of the Springbrook Arroyo should provide reasonable protection for the natural habitat and an undercrossing for the Regional Trail as well as habitat usage".

City of Loma Linda: (Letter Jan. 24, 2002)
"This is to advise that the City Council at the regular meeting of Jan 22, unanimously supported your efforts and the Riverside County Service Area 126 Advisory Board's recommendation to the Riverside County Transportation Commission to site a Metrolink station stop in Highgrove".

San Bernardino Sun Newspaper: (Article Dec. 31, 2006)
"San Bernardino County Supervisor Dennis Hasnsberger believes there is enough demand for a Metrolink station in the Highgrove area. "It's a very worthwhile objective", Hansberger said. "Unfortunately, the people in Riverside County who have jurisdiction have not shown a lot of interest. But we are willing to try to get that discussion going".

City of Grand Terrace Resolution: (Passed unanimously Dec. 13, 2001)
"NOW, THEREFORE, BE IT RESOLVED that the City Council of the City of Grand Terrace, does hereby recommend that the Riverside County Transportation Commission grant a Metrolink Station stop at Highgrove when planning for future track upgrading for Metrolink service on the San Jacinto Industrial Spur".

(Eight years later)

City of Grand Terrace: (Letter Dec. 29. 2009)
"The City of Grand Terrace continues to believe that a Metrolink stop in Highgrove would benefit the city and its residents".

Tony Petta, First Mayor of Grand Terrace 1978: (Letter June 23, 2006)
"I encourage you and your staff to seriously consider building a Metrolink Station in Highgrove".

Tony Petta, Retired Grand Terrace Mayor: (Public comments Dec. 11, 2009)
"It's absolutely favorable to our community"

Hugh J. Grant: Former Chairman San Bernardino L. A. F. C. O., Former S. A. N. B. A. G. and Omnitrans Boards: (Letter June 21, 2006)
"I have become aware of the important need to situate a Metrolink stop in our neighboring community of Highgrove, in Riverside County. Due to the fact that the nearest stops at this time are in San Bernardino and Riverside, servicing the transportation needs for the large population in between, with valid predictions of sizable increases in the near future, seem to me to be self-evident".

Southern California Association of Governments (S. C. A. G.): (Aug. 30, 2007)
"In the latest State of the Region Report, Southern California received an "F" for transportation mobility. The region has been the most congested in the country for the past two decades".

JoAnn Johnson Manager Grand Terrace Senior Center: (Letter Feb. 23, 2009)
"I strongly support a Metrolink Station in Highgrove and I know that many others in Grand Terrace do also".

William A. Shopoff, The Shopoff Group: (letter Feb. 23, 2009)
"Since Highgrove is a natural railroad junction point where two railroad lines meet between Riverside and San Bernardino, a commuter train stop in Highgrove would benefit the entire region. This location is only ½ mile east of the congested I-215 Freeway that has exits at Center Street. It is also only about one mile northeast of the new $381 million dollar 60/91/215 interchange that was just completed, and about 3 miles south of the I-215/I-10 interchange. Both major interchanges are between Riverside and San Bernardino and the Highgrove location is also between Riverside and San Bernardino".

Anthony Mize, Builder: (Letter Feb. 24, 2009)
"It is our opinion that the junction point of the Metrolink train traffic between the City of Riverside and the City of San Bernardino and the Perris Valley Line is a very logical location for a new station. In this day of "NIMBY" on just about everything, it would seem to us that if a community wants to work together to revitalize itself by embracing something like this then RCTC should give it careful, thoughtful consideration".

Kirk Wallace, Builder: (Letter Oct. 21, 2009)
"We feel this station would be very beneficial to the community not only because of the established residents but with the future development that will impact the area of Highgrove".

Bobbie Kay Forbes, Terra Loma Real Estate: (Letter Feb. 25, 2009)
"As a local Realtor I believe the area would benefit having a Metrolink Station in Highgrove. There are many people in our community that use the Metrolink a few times a week to get to LA for work. When I am showing property to people from out of the area they will ask about the location of Metrolink stations. And as more people in the area are financially stressed by the economy and the price of commuting they will be more encouraged to use Metrolink if it is closer to home".

Byron Matteson 14 year Mayor of Grand Terrace: (Letter June 23, 2006)
"I think the commuter trains will gain even more popularity in the near future as our area continues to experience rapid growth and our freeway systems become more and more congested. Proper planning is essential in being able to handle these future transportation needs and I hope the new Highgrove Station will be approved soon, to help alleviate some of these ongoing traffic problems".

Highgrove CSA 126 Resolution: (Nov. 27, 2001)
"Highgrove community adopted a 15 point resolution outlining the benefits of a Metrolink station stop in Highgrove".

Highgrove Project Area Committee: (Petition Jan. 8, 2002)
"The Project Area Committee (P. A. C.), for the redevelopment of the Highgrove area, hereby submits this recommendation that a Metrolink Station stop be implemented at Highgrove when the tracks are upgraded for commuter service on the San Jacinto branch".

Robert and Nancy Rice, Retired Highgrove residents: (Letter Feb. 20, 2009)
"We are in our Seventies, and don't like to drive very far. With a station near home, we could go, go, go, and not have to worry about traffic".

George Saunders, commuter from Grand Terrace to Orange County for 7 years: (Letter Feb. 20, 2009.
"With the ever expanding usage of the train it has become increasingly difficult to get to, and to find parking at Downtown Riverside station. An additional stop on the route between Riverside and San Bernardino would be helpful".

William H. Addington, Civil Engineer since 1975-Retired: (Public comments Dec. 11, 2009)
"It is really important to Grand Terrace, Loma Linda and Highgrove to have a station. The opportunity is there now and if passed by, it won't be available. The site is well located and the problems could be mitigated with good engineering. This is the time to act!"

We also have additional letters of support from:

Terry and Lori Carlstrom, G. T.	2-23-2009
James Lasby, Highland	2-20-2009
Ron and Cynthia Cruz, Highgrove	2-26-2009
Melanie Zimmermann, Highgrove	2-23-2009
Barbara McCoy, Highgrove	2-23-1009
Ardie Barnett, Highgrove	2-26-2009
Ron and Geri Barnett, G. T.	

The above information does not include residents who have signed the circulated petition for a Highgrove station nor does it include names of those who signed the on-line petition on the web site: www.highgrovehappenings.net

Our requests consist of 3 items:

1. Build a Metrolink station stop next to the BNSF main line at Highgrove.

2. Build the Highgrove station first.

3. Name the station "Highgrove".

County of Riverside

SUPERVISOR MARION ASHLEY
FIFTH DISTRICT

October 14, 2009

The Honorable Bob Magee,
Chairman Riverside County Transportation Commission
4080 Lemon St., 3rd Floor
Riverside, CA 92520

Dear Chairman Magee:

I am enclosing recent correspondence which I have received from a number of residents in the Highgrove community regarding RCTC's future Metrolink plans.

Over the course of more than a decade, the Riverside County Transportation Commission has considered and repeatedly rejected the request of Highgrove residents for Metrolink service... Most recently, the Commission spent considerable amounts of time and money to identify potential hurdles to constructing a station in the area.

My goal is to ensure that the residents of Highgrove's receive a fair hearing and careful consideration of their desire for infrastructure investment in their community and the provision of public transit service.

I am requesting that the Perris Valley Line Ad Hoc Committee schedule a meeting within the next few months to review the history of the Commission's actions regarding Highgrove from the day it was first mentioned. During the past few years we have seen new members join RCTC and some of the decisions predate my tenure as a County Supervisor.

As we embark on the investment of the Perris Valley Line, I want to ensure that we are making prudent investments with Measure A and federal dollars. While I believe that the Commission has made wise decisions up to this point, we need to continue to challenge ourselves to accomplish more and improve.

With that thinking in mind, I hope that we can revisit Highgrove's issues once again. If we can't provide a station and direct rail service to the community, I want our Commissioners to clearly understand the reasons which will only make our project better. On the other hand, if there is way to provide additional transit (either bus or rail) service to Highgrove, this could be an important opportunity to consider it.

Most importantly, I want to come away from this effort with a cooperative relationship with the Highgrove community. I would hope that Mr. Barnett could attend the ad hoc meeting with a few of his neighbors so they can interact with our committee members and staff, express their interests and concerns, and then accurately report on the matter with the rest of the community.

Thank you for your consideration of this request.

Very truly yours,

Marion Ashley
Riverside County Supervisor, 5th District

Cc: Bob Buster, Vice-Chari, Riverside County Transportation Commission:
Barney Barnett, Chairman, Highgrove Community Council

R. A. Barnett, Chairman
Highgrove Area Redevelopment
474 Prospect Avenue
Highgrove, CA 92507

Re: Metrolink Station in Highgrove

Dear Mr. Barnett:

Thank you for the opportunity to review your proposed Metrolink station stop in Highgrove. The Transit Coalition (TTC) is an organization that works to improve public transportation and mobility in conjunction with land use planning in Southern California.

We have noted that it is within the coalition's interest and mission that a station stop be placed in the Highgrove area given the local support.

We have posted a conceptual rendering of the Highgrove Metrolink station with a link to your video presentation to the Riverside County Transportation Commission on our "A Better Inland Empire" Project Web Site:

http://www.thetransitcoalition.us/a_better_inland_empire/images/pdf/PVL-Rail-highgrove.pdf
http://www.thetransitcoalition.us/a_better_inland_empire/proj_coachellatrainssta.html

As an organization that works to improve public transportation and mobility in conjunction with land use planning, we appreciate your advocacy for better public transportation in Highgrove and thank you for your support. Please feel free to use our maps as part of your work. Please keep us updated of the status of your campaign.

Sincerely,

Nicholas Ventrone,
Community Engagement Director
The Transit Coalition
www.transitcoalition.org

RESOLUTION NO. 2001- 28

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF GRAND TERRACE, CALIFORNIA, RECOMMENDING THAT THE RIVERSIDE COUNTY TRANSPORTATION COMMISSION GRANT A METROLINK STATION STOP AT HIGHGROVE

WHEREAS, Highgrove needs a Metrolink Station Stop; and

WHEREAS, Highgrove is already a railroad junction point connected to the BNSF Main line; and

WHEREAS, a railroad signal bridge is already functional to allow trains to enter or depart from the San Jacinto Industrial Spur onto the BNSF railroad that already has Metrolink service; and

WHEREAS, the track and right of way are already owned by the Riverside County Transportation Commission between San Jacinto and Highgrove; and

WHEREAS, the distance of the- existing track between Marlborough Ave. and Highgrove is only one and one half miles of straight track; and

WHEREAS, track upgrading would be more, economical to go from Marlborough Ave. to Highgrove rather than from Marlborough onto the SP/UP Railroad and then to Riverside and

WHEREAS, the Riverside County Transportation Commission would have to purchase the SP/UP track instead of using track they already own; and

WHEREAS, the SP/UP track is also in need of upgrading and has many more curves than going straight to Highgrove; and

WHEREAS, Metrolink trains coming into Highgrove could proceed eastward to San Bernardino without going into Riverside and

WHEREAS, the San Bernardino Metrolink Station currently has commuter service into the greater Los Angeles area; and

WHEREAS, westward trains could also proceed from Highgrove into Riverside and points beyond; and

WHEREAS, the San Bernardino and Riverside Metrolink parking lots are near capacity and

WHEREAS, Highgrove is approximately half way between San Bernardino and Riverside; and

WHEREAS, vacant land adjacent to the track is already owned by the Riverside County Transportation Commission and could be used for parking at Highgrove; and

WHEREAS, a Metrolink stop in Highgrove would also be the closest access for commuters from Grand Terrace, Loma Linda and the 1520 new homes to be constructed in Pigeon pass plus other proposed residential development;

NOW. THEREFORE, BE IT RESOLVED that the City Council of the City of Grand Terrace, does hereby recommend that the Riverside County Transportation Commission grant a Metrolink Station stop at Highgrove when planning for future track upgrading for Metrolink service on the San Jacinto Industrial Spur.

PASSED. APPROVED AND ADOPTED this 13th day of December, 2001.

Mayor of the City of Grand Terrace

ATTEST:

City Clerk of the City of Grand Terrace

I BRENDA STANFILL, City Clerk of the City of Grand Terrace, do hereby certify that Resolution No. 2001-28 was introduced and adopted at a regular meeting of the City Council of the City of Grand Terrace held on the 13th day of December, 2001, by the following vote:

AYES: Councilmember's, Hilkey, Larkin and Ferre: Mayor Pro Tem Garcia and Mayer Buchanan

NOES: None

ABSENT: None

ABSTAIN: None

Brenda Stanfill, City Clerk

Approved as to form:

City Attorney

PETITION

- The Project Area Committee (P.A.C.) for the redevelopment of the Highgrove area, hereby submits this recommendation that a Metrolink station stop be implemented at Highgrove when the tracks are upgraded for commuter service on the San Jacinto branch.
- The PAC believes the Metrolink stop in Highgrove is necessary to ensure adequate transportation to accommodate future growth within our redevelopment boundaries that presently is turning our former citrus groves into residential and industrial properties.

Dear Mr. Barnett:

Subject: MetroLink Station Stop In Highgrove

This is to advise that the City Council, at the regular meeting of January 22, unanimously supported your efforts and the Riverside County Service Area 126 Advisory Board's recommendation to the Riverside County Transportation Commission to site a Metrolink station stop in Highgrove.

Councilman Christman serves as president of the SANBAG Board and noted that Board's interest in a station stop in Highgrove.

Please keep us apprised of the status of the project.

Sincerely,

Pamela Byrnes-O'Camb

Dear Mr. Barnett:

I want to thank you for providing me with information on the Highgrove Metrolink Station. I am very supportive of bringing a Metrolink Station to Highgrove because I agree that it is an appropriate location to help solve traffic congestion for this fast growing area.

I appreciate all of your efforts in this matter. Please contact me at my District or Capitol office to advise me on how I may assist you to ensure that this Metrolink Station is built.

Sincerely,

BILL EMMERSON
Assemblyman, 63rd District

From: Buster, Bob [BBUSTER@rcbos.org]
Sent: Monday, July 17, 2006 3:13 PM
To: Robert Phillips
Subject: RE: METROLINK

Mr. Phillips:

The second part of my proposal, which I will spell out in another op-ed soon, is to provide Perris-Riverside commuter service for the next five to ten years by Bus Rapid Transit or BRT. These are the high-tech, high-speed, attractive coaches that are jammed with commuters now on Wilshire and Ventura boulevards in L.A. and San Fernando Valley. Separate lanes next to the median on the 215 Freeway here are already planned to be constructed, which BRT can use. BRT is completely flexible as to routes and schedules and operates at less than half the cost of Metrolink trains. BRT improvements on a Perris Line cost only $10 million. BRT obviously has minimal noise or safety problems for existing communities. If BRT takes University Ave. or Martin Luther King off the freeway to go to the Downtown Metrolink Station, it will serve UCR much better.

Train service on the Perris Line should not be started until grade separations are in place in the highest priority Riverside and all grade crossing in the University and Hunter Park areas. Indeed, this line should be completely rethought as a San Bernardino-Riverside-Perris (with side service to Hemet-San Jacinto)-Temecula mass transit corridor. BRT can serve it best first. Train service would commence only when, hopefully, two-way ridership justifies it and grade separations and other noise reduction and safety improvements are in place. Rather than luring future residents to live in the mid-county and attempt 100 minute to 130 minute commutes each way to Orange County and L.A., we should be reinforcing our own inland area transportation to provide closer local trips to work.

That would also cancel any need for stations in the already cramped University and Hunter Park areas, where impacts on existing neighborhoods will be severe. Highgrove is the right place for a regional, intermodal station, at the junction of the main rail lines and 215 Freeway. Highgrove still has ample land and the community and Grand Terrace want the station.

I've been meeting with every City of Riverside Councilmember, the Chambers of Commerce, UC Riverside reps. from the Chancellor's Office, and our State Assemblymen and Senators about my proposal. I've still got a few left to talk to, but, so far, everyone is very favorable. Getting Mayor Loveridge and Supervisors Tavaglione and Ashley "on board" is important. I think it's possible to build enough support to turn Mr. Haley around and then go and lobby our Congressional reps. (Calvert mainly) to make some sense of how ample federal transportation dollars are spent here.

Your writing the Mayor, both Supervisors, and Cong. Calvert to tell them what you told me will help a great deal.

Bob Buster, Supv., 1st District

Supervisor Bob Buster's comments 10-11-2006

"A defacto decision has been made here apparently that has not been discussed by the commission and we are the policy body".

"Highgrove is at the fulcrum, the pivot point of transportation between the 2 counties. You can not ignore the geographic reality that both the freeway and major rail lines and there is available land that will soon be snapped up for other uses".

"This is a key sight for the future of the Inland Empire"

Supervisor Marion Ashley's comments 10-11-2006

"Logically there should be a Metrolink stop in the Highgrove area for a lot of reasons but it is not just that simple. That doesn't mean that the residents can't continue to pursue this until we come up with some solution that will please as many people as possible but we need the cooperation of San Bernardino County in order to do this.
Direct staff to arrange a tour of the Perris Valley Line and look at the Highgrove sight"

Eric Haley's comments 10-11-2006

"Recognize that it (a Highgrove station) would trigger an $85 million dollar obligation to build the Colton crossing".

"There are complicated legal issues, complicated timing issues very complicated cost negotiations that have never been seriously addressed by our San Bernardino neighbors"

THIS MESSAGE IS BEING SENT ON BEHALF OF ERIC HALEY.
A hard copy of this letter will be included with your agenda packet.

Dear Commissioners:

During our September retreat in La Quinta, staff was directed to set up a tour of the proposed Perris Valley Line project. The tour would give Commissioners an opportunity to see the proposed line on a first-hand basis and to also visit the locations of proposed stations.

The best way to travel the rail line is through a Hy-Rail vehicle, which is an SUV that is equipped with steel wheels that allows it to travel on the actual rail line. By traveling in this type of vehicle, you will be able to travel the line much like a Metrolink car would.

Hy-Rail vehicles are owned by the railroads and Metrolink and obtain access to one takes time to reserve. After a few weeks of working with the railroad, staff has been able to secure the availability of two Hy-Rail vehicles for Tuesday, November 28. The tour will begin with breakfast and a brief presentation at RCTC's offices at 8:15 a.m. We will then drive to the Highgrove area for the Hy-Rail part of the tour.

Space is limited so please call Jennifer Harmon to reserve a place on the tour as quickly as possible. We are also aware that this last week of November is an especially busy one with Committee meetings scheduled for the 27th and our special workshop on the 30th. For that reason, we will also schedule another Hy-Rail tour in the future, but thought it would be important to offer this one as soon as the vehicles were made available
Thank you for your interest in the Perris Valley Line project. Please contact me if you have any questions regarding the tour.

Sincerely,
Eric Haley Executive Director

Wanted: New **Metrolink station**

Stephen Wall, Staff Writer

R.A. "Barney" Barnett thinks he has a solution to clear up some of the traffic mess on local freeways. The 68-year-old is leading an effort to build a **Metrolink station** just south of Grand Terrace.

Barnett is pushing transportation officials in San Bernardino and Riverside counties to make the project a priority.

The biggest obstacle, he says, is finding someone to buy about 35 acres of vacant land to build the **station**.

More than 2,000 homes are slated to be built starting next spring in Highgrove, an unincorporated Riverside County area bordering Grand Terrace that Barnett has called home since 1947.

"All this development is going to bring a lot of traffic to Highgrove," said Barnett, who publishes the Highgrove Happenings monthly newspaper with his wife, Ardie. "If we don't do something, the whole area is going to be jammed."

But Riverside County transportation authorities question if there would be enough riders to warrant a **station**.

"We're doing a thorough analysis to determine if it's feasible," said John Standiford, spokesman for the Riverside County Transportation Commission. "If only a few people are going to ride it, it's not worth the investment."

The commission on Jan. 10 is scheduled to hear a report on the feasibility of a **station**.

In addition, San Bernardino Associated Governments' Commuter Rail Committee is expected to discuss the project on Jan. 18.

Barnett said there are now 48 **Metrolink** trains a week that pass through Highgrove between Riverside and San Bernardino on the Inland Empire-Orange County line.

The proposed stop is seven miles from the **Metrolink station** in San Bernardino and 3.5 miles from the Riverside **station**, he said.

Standiford said he doesn't know if the land proposed by Barnett is for sale. The pie-shaped parcel, which is owned by a land trust, is bordered on two sides by different sets of railroad tracks.

Barnett said the site is large enough for shops and restaurants to serve rail commuters getting on and off trains. Bus riders would have close access to the **station** from a route that goes through Highgrove between Riverside and Loma Linda, he said.

Barnett has received support from elected officials in Grand Terrace and Loma Linda. Both cities have passed resolutions in favor of the **station**.

"If it does anything to alleviate traffic on the freeways, I think that's a good thing," said Grand Terrace Mayor Maryetta Ferre.

San Bernardino County Supervisor Dennis Hansberger believes there is enough demand for a **Metrolink station** in the Highgrove area.

"It's a very worthwhile objective," Hansberger said. "Unfortunately, the people in Riverside County who have jurisdiction have not shown a lot of interest. But we're willing to try to get that discussion going."

Eric Haley, General Manager
Riverside County Transportation Commission
P.O. Box 12008
Riverside, CA 92502

Dear Mr. Haley,

The Riverside Land Conservancy (RLC) is aware that there is interest and discussions on potential development of a Highgrove/Metrolink station on a 35 acre triangular parcel of open land just north of Citrus Street, within the Riverside City limits, adjacent to the community of Highgrove. This parcel is bisected by the Springbrook Wash Arroyo; any development for this purpose would almost certainly require crossings of the arroyo with a rail spur, pedestrian crossing from a parking area, and/or new street access.

We are writing to make you aware of extensive planning and coordination efforts the RLC has been doing with the City of Riverside, Riverside County, the Department of Fish and Game, and others in preserving the Springbrook Arroyo for long term Open Space Habitat and Regional Trail uses.

At this time, we see no objection to development of this parcel for such a Metrolink Station, but want you to be aware early on, that the development and any crossings of the Springbrook Arroyo should provide reasonable protection of the natural habitat and an under-crossing for the Regional Trail as well as for habitat usage.

Thank you for your consideration.

Sincerely,

Robert A. Nelson

San Bernardino, CA
Attn: Chairman Dennis Hansburger

Dear Gentlemen:

I WOULD LIKE TO HAVE REPRESENTATION

·I attended my first Riverside County Transportation Commission meeting on November 9, 2006 and I was so impressed will how really large the board was. It shows how large of a ~county Riverside is. And how many people live here, with just one person to represent all the cities they really have a big reasonability.

As I was waiting for my time to address the Riverside County Transportation Commission on the subject of supporting a Metro Link Station in Highgrove I was able to observe them in action. Very interesting, but I have some concerns that "with some of the commissioners, they were not listening to our voice. My biggest concern was with Mr. Eric Hayley. I have never met this man or even heard him speak but he made me think, why is he .so against this? Is he mad at someone, or something? It seemed like he wants to shut this idea down with out even trying to view the possibilities.

I know I sound like a broken record, but this Metro Link Station is just too big of a good idea just to toss out. We all know its going to cost a lot of money and why worry about who owns the land at this point. It really need5 to be looked into 5etiously and with out bias.. Riverside and San Bernardino are growing too much to fa5t and jU5t putting this on the back burner and let this pass by will not help the public transportation issues.

The out come of this issue was that the Riverside County Transportation Commission will meet with the San Bernardino Associated Governments. To represent the people from Riverside County on this matter is to be Eric Hayley, after hearing him speak, seeing his actions I'm afraid that he is not informed enough to present this issue unbiased and will not speak seriously about it.

So I am asking that you please invite Mr. Barney Barnett of Highgrove, to speak about the Highgrove Metro Link Station to the San Bernardino Associated Government when they meet with the Riverside County Transportation Commission and to all future meeting. By doing this Mr. Barney Barnett can answer questions and keep other supportive groups informed.

Sincerely,

Melanie R. Zimmermann

Memo To: Riverside County Transportation Commission, Riverside County Supervisors, Riverside City Council, City Manager and Planning Director, all other interested parties

From: Wendy Eads, UNA Co-Chair Wendy Eads

Re: Location of proposed new Metro Link Station in Ward One of Riverside, for Perris Valley Line Project

This is to again inform you that the membership of the University Neighborhood Association, acting upon the greatly researched recommendation of it's standing advisory committee on trains, has by an overwhelming majority vote decided to officially oppose the placement of either of the two proposed new Metro Link stations in our residential University Heights/University Hills neighborhood, at either proposed location, on the corner of Spruce Street and Watkins Drive , or on Watkins Drive at Valentia Hill. In addition, we wish to inform you that we instead support placing the location of a new Metro Link Station in Highgrove (if one should be ever be built anywhere nearby our neighborhood), to serve UCR, and the surrounding area comprising both wards one and two, and the city's sphere of influence in nearby locations. Barney Barnett has identified a prime site on a roughly 35 acre parcel that is already appropriately zoned, and is developable land without the multitude of insurmountable obstacles that exist in our neighborhood. UCR can run it's Highlander Hauler the roughly two miles to and from the site daily, as it currently does to the downtown Metro Link station, and "claim" the station as its own. Call it the UCR-North Riverside Station. Barney Barnett, a member of UNA train Committee, has been appointed our official representative on this issue of potential new station location, as he is an expert on it, and has full awareness and understanding of our overwhelming concerns and opposition to placement of a station anywhere in our neighborhd. He is our spokesman to all offical parties on the subject of the proposed new Metro Link Station location in Highgrove, which we support. Please give his plan and his suggestions your full attention and all due consideration. This letter does not in any way imply any support by our membership of the Metro Link Perris Valley Line Extension Project.

Barney Has already spoken to most of you, but you may reach him by phone at (951) 683-4494, by FAX at (951) 683-7258, and by email at highgrovenews@adelphia.net

RE: Perris Valley Line

Dear Mr. Standiford:

I am writing to update you on the results of a discussion about Metrolink at our October 13th meeting. As you know, there is a great deal of interest about the locations of the Metrolink train stops planned for our area.

While there is great community support for high quality public mass transit, there is also a growing resistance to having a stop at UCR on Watkins Dr.

We believe a better location for a second stop would be in Highgrove where there is more room for parking and would provide a significantly smaller impact to existing residential areas.

Our meeting was standing room only and by a unanimous show of hands, we voted to support a train stop in Highgrove. We remain committed to the Perris Valley Line setting the standard for a workable transportation solution and to enhancing our community's assets. I offer this feedback for your consideration.

Sincerely,

Gurumantra Khalsa

Supervisor Marion Ashley
Chairman
Riverside County Transportation Commission
4080 Lemon St.
Riverside, Ca. 92502

Dear Supervisor Ashley,

Renewed interest in a Highgrove Metrolink station has again come to our attention here in Grand Terrace. It has been several years since our Grand Terrace City Council first endorsed the location in Highgrove for a station stop and the new week-end trains are a very welcome addition.

A Metrolink stop in Highgrove would prevent us from having to drive to San Bernardino or Riverside to board the commuter trains and the idea of being able to ride to San Bernardino for additional destinations between San Bernardino and Los Angeles or to Riverside, Orange County, or the beach, from nearby Highgrove, is a benefit that will be appreciated by many of the residents of our city. It would also help alleviate some of the anticipated traffic problems through Grand Terrace associated with the new homes to be built in the Spring Mountain Ranch Project.

I have been very active in the City of Grand Terrace and first served as Mayor Pro-Tem in 1980 and 1981. In 1982 I was elected Mayor of Grand Terrace and served consecutive terms as Mayor for the next 14 years until 1996.

I think the commuter trains will gain even more popularity in the near future as our area continues to experience rapid growth and our freeway systems become more and more congested. Proper planning is essential in being able to handle these future transportation needs and I hope the new Highgrove Station will be approved soon, to help alleviate some of these ongoing traffic problems.

Sincerely yours,

Byron Matteson

Ref: Highgrove Metrolink Station

Dear Mr. Haley,

As the first Mayor in the City of Grand Terrace back in 1978 I have seen a lot of changes and I have watched our city grow and continue to be a desirable residential community.
With all of the growth that has happened since then, we too are feeling the impact of more vehicle traffic on our busy streets.

The idea of having Metrolink service nearby will be a great asset to the residents of Grand Terrace. There is an ideal location nearby in Highgrove that would accommodate riders from Grand Terrace, the current Highgrove residents, and the future ones coming in the new housing developments.

We were also happy to hear that there will be additional week end trains added next month but commuter trains that pass by this location each day without stopping is not in the best interest of the residents of the entire area who want this service.

I encourage you and your staff to seriously consider building a Metrolink Station in Highgrove.

Thank you very much,

Eric Haley
Executive Director
Riverside County Transportation Commission
4080 Lemon Street
Riverside, CA 92502-2208

Dear Eric:

You may or may not remember me from the distant past, so I will re-introduce myself. I am Hugh J. Grant, a resident of Grand Terrace, California. I served on the City Council of our Community, beginning as a Charter member, for fourteen years, from 1978 to 1992, with four years tucked in there as Mayor, from 1980 to 1984. I finally decided to retire from the Council at the completion of my final term, due to the location of my new employment position. I represented Grand Terrace on the SanBag and Omnitrans Boards for many years, as well as San Bernardino County LAFCO as the Chairman.

I have become aware of the important need to situate a Metrolink stop in our neighboring community of Highgrove, in Riverside County. Due to the fact that the nearest stops at this time are in San Bernardino and Riverside, servicing the transportation needs for the large population in between, with valid predictions of sizable increases in the near future, seem to me to be self-evident.

I therefore respectfully request that you and the Riverside County Transportation Commission seriously consider a viable solution to the transportation needs of the people of Highgrove, Grand Terrace, Loma Linda, and the surrounding areas, a Metrolink Station stop in Highgrove, California.

Sincerely,

Hugh J. Grant

Mr. R.A. "Barney" Arnett
474 Prospect Ave.
Highgrove, CA 92507

May 28, 2001

Dear Mr. Arnett,

We spoke by phone a few weeks ago, and you suggested that I write a letter to you regarding my thoughts on the proposed Metrolink Park and Ride stop in Highgrove which I was delighted to read about in your column in the Highgrove Happenings Newsletter for May.

I work in North Hollywood. My commute is as follows: I drive from my home in Grand Terrace to the Metrolink Station in Riverside (sometimes to San Bernardino). I ride to Los Angeles and then transfer to the Metro Red Line to the North Hollywood terminus where I then transfer to a bus to complete my journey. The time spent commuting is usually 2 - 2.5 hours.

A Metrolink Station in Highgrove would certainly ease my commute. I have a few suggestions regarding it:

1. It should be a courtesy service extension of the Riverside and San Bernardino lines. That is, much like the "feeder" service to Glendale and Burbank from Los Angeles, it should not be a separate fee from the ticket / pass purchased to ride those lines.

2. Metrolink should consider working with the San Bernardino and Riverside County Transportation Authorities to market the addition as new service between the two cities. As such, I would suggest adding a station stop in the Colton shopping area too.

3. Service needs to be as frequent as possible; not just tied to the Inland Empire - Orange County Line Schedule. A train that can shuttle in - between would be ideal, perhaps running once an hour..

Done properly, this would not only be great for those of us living in the Highgrove area, but for others who live and work in the greater Riverside - San Bernardino "central" corridor.

Thank You,

Dear Sirs:

It is my understanding that the issue of a Metro Link Station in Highgrove is on the Agenda for the Board of Supervisors meeting on November 8th at 10 o'clock. I am not able to attend that meeting, but I do want to go on record as supporting this issue.

I am with the Senior Center in Grand Terrace. Speaking for myself and for some others, I want you to know how much a Metro Link Station in Highgrove or Grand Terrace would help greatly. For seniors who are not comfortable driving out of town as well as for commuters, I personally think a Station in our area would be a definite plus.

Please consider very carefully.

Most Sincerely,

JoAnn Johnson

Chas McDaniel
I actually did very much want the station.

Re: Highgrove Area Transportation Plan Proposal

Dear Barney,

This letter is in support of your efforts to assist in the creation of a Metrolink station to serve the Highgrove area. A Metrolink station would benefit our property by providing a nearby alternative to automotive transportation and may ease traffic on the 215 freeway.

Bixby Land Company would also be supportive of the East-West road connecting Spring Street to the proposed Metrolink station location you pictured in the December 2005 issue of *Highgrove Happenings*. This route could also ease traffic along Center Street.

From our discussions, we agreed that if a North-South road were determined to be necessary and feasible to connect the Hunter Park tech area through to Highgrove, that we would not object to an alignment along the California Street right-of-way, currently a dirt road. However we would not support an alignment through the middle of the 65 acres of land we are in the process of developing.

Thank you for your efforts to improve the Highgrove area. It takes involved citizens to ensure the best results are achieved for all the owners and residents of Highgrove.

Sincerely,

Mark L. Bixby

To Sanbag, c/o Barney Barnett

I would like to write in support of two new metro stations being placed in Highgrove as opposed to any metro station being placed on Watkins Drive in Riverside.

The site in Highgrove has plenty of room for parking, etc. and future expansion. The proposed site on Watkins Drive does not have enough room to house a station, not to mention, room for expansion. In addition, Watkins Drive now turns into a virtual parking lot during morning and evening rush hours as commuters use it as a short cut from the 60 freeway to the 215/91 freeways in the morning and vice versa in the evening.

Even to discuss the addition of metro traffic (which would certainly peak at the same rush hours) to an already over-congested residential street indicates that decisions are being made without regard to the real world conditions and consequences.

Sincerely,
Carol Williams Kisch

To: highgrovenews@adelphia.net
Subject: Metro link station in Highgrove

SANBAG
c/o Barney Barnett

To Whom It May Concern:

I am in favor of the Metro Station being located in Highgrove where there is adequaate space for the station and parking and any expansion at a later date. Metro stations on Watkins Drive in Riverside would be located near two elementary and one middle school, and several child care facilities. These trains would add particulates to the air and this would be harmful to the children and to senior citizens living in the area. If a transit village is constructed in this area, homes would be taken for the space required to build such a facility.

Sincerely,

Clifford and Margaret Berger

Riverside City Council Member March 21, 2006

Dear Dom Betro,

Please set aside the 35 acres shown on the accompanying map for a future Metrolink Station and Transportation Center. This location is in the Hunter Business Park area between the BNSF railroad main line that runs between Riverside and San Bernardino, and the Perris Valley Line that runs between Highgrove and San Jacinto.
This important location is ideal because the west side of the property is bordered by railroad tracks that currently have 8 commuter trains that go past this location without stopping because there is no station, and the east side of the property that is bordered by railroad tracks already owned by the Riverside County Transportation Commission for the Perris Valley Line.
If the City of Riverside is planning for the year 2025, it is important to realize now that this city owned property should be reserved for future transportation uses instead of allowing more large buildings to be built. A Metrolink station, park and ride and bus service and a new road is needed to accommodate the future growth of the area where grading is currently underway for 2,100 new homes. In addition, other developers are planning new construction of businesses and homes where citrus groves used to flourish.
There are resolutions of support from Highgrove, Grand Terrace and Loma Linda for a Metrolink station in Highgrove. Also, the members of the University Neighborhood Association in Canyon Crest agree that they do not want a station stop at UCR or Spruce and Watkins in their community but prefer a station in Highgrove.
The boundaries of the Hunter Park location mentioned above are: Villa St. on the north, Citrus St. on the south, the Perris Valley Line Railroad on the east and the BNSF Railroad on the west.
Please include this area as a Metrolink Station and Transportation Center in the 2025 General Plan.

Thank you,

R. A. Barnett

The City of Loma Linda has supported the Highgrove Metrolink Station for 10 years. Their first letter of support was dated Jan. 24, 2002.

It is unfortunate that the Highgrove location continues to be downplayed for such a long period of time. For over 10 years, surrounding cities, civic organizations and local residents have requested a Metrolink station at Highgrove. But city resolutions, letters, and the public comments made at the RCTC meetings continue to be ignored.

RCTC now owns the property at Highgrove and according to Ann Mayer, Executive Director of the Riverside County Transportation Commission, RCTC bought the 17.22 acres of vacant land to enable the Perris Valley Line railroad track to connect to the BNSF main line track.

The excess land that RCTC does not need would be an ideal location for the SCAG **Regional Transportation Plan** for commuters between San Bernardino County and Riverside County.

On Jan.18, 2012 I spoke at the SCAG **Regional Transportation Plan** meeting in San Bernardino under public comments and submitted written documentation that contained 29 items that included a colored map, city resolutions and letters of support from elected officials and local residents. Some of these items date back to 2001. This information was given to Justine Block who is SCAG's Deputy Legal Council in Los Angeles.

Copies of the above e-mail have been sent to SCAG, prior to the Feb. 14, 2012 deadline for public input for their Regional Transportation Plan. The above list is also being sent to RCTC and SANBAG representatives.

Please look at the new map and the related information on: www.highgrovehappenings.net that shows the Highgrove Metrolink Station north of the proposed curved track. RCTC's property at Highgrove should be use for the SCAG Regional Transportation Plan due to the ideal location, existing commuter trains, and growth potential due to hundreds of acres of nearby lots ready for homes. This location is way too important to continue to be ignored!

Dear Mr. Barnett:

Subject: Metrolink Station Stop In Highgrove

This is to advise that the City Council, at the regular meeting of January 22, unanimously supported your efforts and the Riverside County Service Area 126 Advisory Board's recommendation to the Riverside County Transportation Commission to site a Metrolink station stop in Highgrove.

Councilman Christman serves as president of the SANBAG Board and noted that Board's interest in a station stop in Highgrove.

Please keep us apprised of the status of the project.

Sincerely,

Pamela Byrnes-O'Camb
City Clerk

Subject: Metrolink Station Stop In Highgrove

Dear Mr. Barnett:

Thank you for providing the City Council with an update on not only the Spring Mountain Ranch Housing Project, but also the potential for a Metrolink station stop in Highgrove.

The Loma Linda City Council reaffirms its previous support of your efforts and the Municipal Advisory Council's recommendation to the Riverside County Transportation Commission to site a Metrolink station stop in Highgrove.

Please keep us apprised of the status of the project.

Sincerely,

R L Rigsby

With the traffic jams all over the freeways it would be a perfect place to get off and park and get on the train and leave the driving to the hoghead. Also you'll be more rested at the other end since your not a jumble of nerves from the drive. Also coming from Palm Springs or San Diego area it would be a break to just take a train the rest of the way and know your not going to be stuck in traffic for several hrs. Bobbie Benson

WE WANT A HIGHGROVE METROLINK STATION!

As guardians of taxpayer transportation funds, SCAG must consider the BEST POSSIBLE usage of those funds for the community they serve. As clearly explained numerous times by Mr. Barnett and other members of this and the surrounding communities, a Metrolink Station in Highgrove, where there is ALREADY existing railroad tracks, existing Metrolink trains, existing acreage suitable for construction of the station and parking accommodations, and hundreds of up and coming home sites (Spring Mountain Ranch), it is imperative that the members of this agency decide WISELY to construct the METROLINK STATION IN HIGHGROVE.

Highgrove is a perfect location because it already has the existing railroad tracks, existing Metrolink trains 7 days a week, plenty of room for parking, and hundreds of acres of former orange groves have been converted into pads for future homes.

To the responsible board or person,

I have followed the many discussions in regards to the Metrolink rail from Riverside to Perris. There is no way I can understand any reason to not have a station in Highgrove. I have seen many resolutions from varies cities and requests from residents asking for this station. If I understand all of this correctly this station will be very convenient for many residents in both Riverside and San Beranardino counties who can use the Metrolink service form the Highgrove station but would essentially have very little use of this service from the Hunter Park proposal. I believe us tax payers funding this project deserve the route that will serve the most people. Thank you for any consideration for us tax payers in your decision regarding this project.

Subject: Metro Link Station

Gentlemen,

this email is concerning a Metro Link Station in Highgrove, CA. It would be nice to have this station

because it would cut traveling for the citizen of Grand Terrace and other local communities to easer San Bernardino or Riverside.

The train is already going thru there, why can't it stop.

Thank you for your consideration in this matter.

Gary & Bunga Laesser=

est in knowing how the state's prisons operate, without any official filtering of information. Inmate interviews provide crucial insights into the workings of the criminal justice system. Such scrutiny is essential to providing public accountability for the corrections system and the officials in charge of it.

And taxpayers have a legitimate need to keep close watch on the state's prisons. The Legislature's long history of negligence and irresponsibility let prison ills fester, with dismal public consequences.

Corrections costs accelerated over the past 15 years, adding to state budget woes. California will spend about $9 billion on corrections this fiscal year — more than the state general fund will contribute to the University of California

should avoid glamorizing criminals. That argument was always flimsy, mindlessly equating news reports with public relations.

The media restrictions are more likely an effort to control negative publicity. Corrections officials instituted the regulations in 1996, after reports of excessive violence and abuses at Pelican Bay State Prison. The reporting grew out of a 1995 federal court ruling that ordered sweeping reforms at the maximum security facility.

Prison policy should have a higher goal than avoiding unflattering news reports. Blocking media coverage deprives the public of a clear understanding of prison issues — which is the worst possible approach for a system in crisis. Public safety should not mean protecting the public from an honest picture of the corrections system.

Votes add up to 'same old'

Dennis Mackey rightly condemns the California Legislature's outrageous salaries, perks and per diems, and its cuts in aid to the old, disabled and poor ("Vote all of them out," Your Views, Jan. 13).

It's easy to see that this state's lawmakers are incompetent. In the past few years, I've read countless letters and editorials calling for their removal by the voters.

But people complain about government, then vote in the same politicians and complain some more. Are the lawmakers the only ones who are incompetent?

PAUL HEARD
Moreno Valley

Direct democracy works

In his letter, Keith Richards writes, "Our elected officials don't represent us" ("Make voting mandatory," Your Views, Jan. 15).

In fact, they go to the highest bidder. The framers of the Constitution could not foresee the appearance of huge transnational corporations that are concerned only with profit and do not care about the countries in which they conduct business. What was supposed to be a democratic republic has devolved into a commercial republic. Corporate money buys elections and politicians.

We need to continue the direct democratic procedures that came into being in the last century: initiative, referendum and recall. This could be done through the Internet, backed up by a paper vote. Then you'll see a 90 percent turnout.

ART KOERTZ
Riverside

Left steers us onto rocks

Kudos to Fred Zerkle for his new word ("Behold an 'ineptocracy,'" Your Views, Jan. 12), which perfectly describes the far-left secular movement that has infected our country.

The Obama administration is the standard bearer for this movement, which shows nothing but disdain for achievement, success, personal accountability, family values and national security.

The wealthy left, including President Barack Obama, George Soros, the Hollywood elite and many others, are destroying the system that allowed them to garner such wealth.

It doesn't figure. One would think these people would be big supporters of capitalism, free enterprise and democracy. Instead, they are doing their best to turn this once-great nation into a cesspool of entitlements, government control, high taxes and redistribution of wealth.

How much of their wealth are they willing to redistribute?

CHUCK R. BOLTON
San Jacinto

OK Highgrove rail station

Hasan Ikhrata, executive director of the Southern California Association of Governments, describes SCAG's 2012-2035 plan for infrastructure investments in transportation that will cost $500 billion over the next 23 years ("Transportation upgrades can fuel growth engine," Perspective, Jan. 8).

But I'm reminded of the request by Grand Terrace more than 10 years ago for a Metrolink station in Highgrove that would benefit Grand Terrace, Highgrove and surrounding communities on both sides of the Riverside/San Bernardino county line.

Ikhrata writes that investing in transportation infrastructure is one of the fuels needed to rebuild our economy. Very little investment is needed for the Highgrove location because commuter trains have been operating past this location for 10 years. If movement of people is part of SCAG's plan as mentioned, what happened to the Metrolink station in Highgrove?

We have a ready customer base for the Highgrove station.

PHIL TURNER

Riverside Press 1-23-12

Points made at SCAG public hearing in San Bernardino on Jan. 18, 2012 by R. A. "Barney" Barnett:

1. **Location efficiency:** The Highgrove Metrolink Station will be an ideal and efficient location for SCAG's Regional Transportation Plan for commuters between Riverside and San Bernardino counties and beyond.
2. **Land use:** The vacant 17.22 acre property at Highgrove is already owned by the Riverside County Transportation Commission.
3. **New Station Location:** The request for a station platform has been moved north of the proposed curved track that will connect the Perris Valley Line to the BNSF main line. This location is still on the same property owned by RCTC and will not interfere with their plan to run future trains between Riverside and Perris.
4. **Vacant 1,555 acres:** Highgrove has 1,555 acres of vacant buildable land for future homes and businesses including the Spring Mountain Ranch project.
5. **$250 Million:** One mile east of the Highgrove Metrolink station location is the Spring Mountain Ranch housing project where $250 Million dollars have already been spent on infrastructure for 2,500 new homes.
6. **Existing residents:** Even before any new homes are built in the Spring Mountain Ranch area there are already 30,777 residents within a 2 mile radius of the Highgrove location that could have been using the existing Metrolink trains. (Riverside EDA figures)
7. **Existing trains:** On July 15, 2006 Metrolink trains through Highgrove went from 5 days a week to 7 days a week. Each year 3,224 commuter trains pass through Highgrove without stopping. All that is needed is to have parking on RCTC's property next to these existing trains and a station platform to buy tickets. The construction of the Colton Flyover will allow even more future commuter trains through Highgrove but RCTC has no plan to stop any of the existing or future trains at Highgrove!
8. **Location:** The Highgrove location is ½ mile from the Center St. exit of the I-215 freeway and ¼ mile south of the Riverside/San Bernardino county line.
9. **Website:** Please look at our website: highgrovehappenings.net
   There is a map and 10 years of written support for a Metrolink Station at Highgrove but this location has been opposed by RCTC for 10 years.

HILLS FOR EVERYONE

Southern California comes together at the Puente - Chino Hills

Los Angeles County
Orange County
Riverside County
San Bernardino County

February 10, 2012

Margaret Lin
Southern California Association of Governments (SCAG)
818 W. Seventh Street 12th floor
Los Angeles, CA 90017
RTP@scag.ca.gov

Re: Comments on the Draft RTP/SCS and Draft PEIR

Dear Ms. Lin,

Thank you for the opportunity to comment on the Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the Draft Program Environmental Impact Report (PEIR). Hills For Everyone (HFE) is a 34 year old non-profit organization that established Chino Hills State Park and is still working to conserve the remaining natural lands in the Puente-Chino Hills Wildlife Corridor at the juncture of Los Angeles, Orange, San Bernardino and Riverside Counties. We have extensive experience in land use, land preservation, fire history and wildlife corridors and therefore offer our comments to strengthen the RTP/SCS and Draft PEIR.

Adaptation (pg. 31 of the Draft 2012 RTP/SCS)
HFE agrees Southern California will be faced with extremes in precipitation and temperature, increased storm frequency, and intensity and sea-level rise. However, we feel it is critical to include the impact of fire, especially as more people and roads come to the region. Much of California is facing significant and extended fire seasons, which have tremendous impacts on both the natural environment and the developments nearby. In essence, we have planned our entire infrastructure system (e.g., flood plains, water networks, transportation methods) on the climate being a certain way and now that climate baseline is changing.

Since 1986 the number of major forest fires in California has quadrupled due to more days with summer-like and generally hotter temperatures.[1] This increase in fires has numerous implications, including but not limited to: increased firefighting costs, increased danger to residents near the wildland urban interface, and a transition of habitat types to more flammable vegetation due to increased fire frequency.[2]

[1] California Energy Commission. "Public Interest Energy Research Climate Change Program." Retrieved 2 Feb 2012 from the California Energy Commission website: http://www.energy.ca.gov/2009publications/CEC-500-2009-092/CEC-500-2009-092.PDF
[2] Department of Justice. "Global Warming Impacts in California." Retrieved 2 Feb 2012 from the California Attorney General's website: http://www.ag.ca.gov/globalwarming/impact.php

Recommendation #1
We recommend that as a part of the SCS in the Adaptation section of the document, SCAG provide examples of how it and local jurisdictions plan to adapt to these new risks, especially in regard to wildland fires, through better land use choices. For example as it relates to fires, fire officials, planners, developers, transportation agencies, and others must shift the focus from primarily a reactionary fire plan (i.e., fighting fires when they occur) to a preventative fire plan (e.g., creating buffers between communities and natural lands). What other steps will SCAG be taking to adapt to climate change and to ensure public health, economic livelihoods, the financial sector, the insurance industry, individual comfort, natural lands and recreation areas will be protected?

Safety and Security First (pg. 37 of the Draft 2012 RTP/SCS)
We applaud your efforts to ensure Southern California's residents are both safe and secure on the region's transportation system. We were also pleased to see one of your two main goals for safety and security is to "prevent, protect, respond to, and recover from major human-caused or natural events in order to minimize the threat and impact to lives, property, the transportation network and the regional economy" (p. 37). HFE has just completed a near 100 year analysis of fires in the four-county area surrounding Chino Hills State Park. See Attachment 1, which documents the fire frequency of the Chino Hills. What we've found is that proximity of roads to natural lands directly increases the likelihood for fires to ignite and burn both habitat and homes.

For example, as it relates to the 91 Freeway at the juncture of Riverside and Orange Counties, we have provided to you an analysis of the fire perimeters and points of origin for fires that burned in and near Chino Hills State Park. Along this freeway alone, there are 48 separate fires that ignited/burned. From 1914 – 1963 (49 years), 1963 being when the freeway opened, we have records of six fires. Since 1963 – 2012 (49 years), after the freeway opened, there were nearly seven times as many fires recorded (41). The average fire size for recorded fires was 6,263 acres. It is clear to us that the safety and security of residents along this one transportation corridor are being significantly impacted because of 91 Freeway, not to mention disruption of mobility due to road closures because of fires and evacuations.

Recommendation #2
With additional roadway and other projects planned in and around the Puente-Chino Hills Wildlife Corridor on the 57, 91 and 71 Freeways, we ask that SCAG analyze potential fire prevention measures along freeways that bisect natural lands. For example, one fire prevention measure would be the creation of hardscape along the roadway edges so that dry brush cannot ignite when transportation-related fires begin. Reducing the fire frequency and duration not only protects habitat, but also allows continued and uninterrupted operation of the major transportation corridors and, importantly, protects life and property of local residents.

Biological Resources and Open Space (pg. 79 of the Draft 2012 RTP/SCS)
We reiterate the importance of acknowledging the impact of wildland fire with a transportation-generated point of origin on our natural lands. Though wildlife fatalities, habitat fragmentation, and other habitat impacts are important—if the habitat can no longer regenerate in its natural and native state due to excessive fire frequency the long term preservation of the land has been lost.

Recommendation #3
As previously mentioned, we recommend incorporating fire prevention strategies along natural areas bisected by major transportation corridors. For example, the 91, 57, 71 Freeways all

bisect natural lands and not only inhibit natural migration and movement of large animal species, they become areas prone to fire ignition and therefore habitat destruction.

Growth in the SCAG Region (2035) (Exhibits 4.1, 4.2 and 4.3)
We appreciate that SCAG has included a projected population, employment, and housing growth maps as exhibits, but are dismayed that the maps are illegible. In order to appropriately comment on this map it must be readable.

From what we can decipher, the area of the Puente-Chino Hills Wildlife Corridor, known as the Missing Middle, is shown as adding 2000 – 3500 people per square mile. This area is designated as a Significant Ecological Area (SEA) in the Los Angeles County General Plan, thereby acknowledging its significant natural resource values. The owner, Aera Energy, has attempted to achieve entitlements on this property twice without success because of the SEA designation.

Ironically, this particular development proposal's population, employment, and housing growth areas contradict the goals of SB 375 and its requirement for reduced vehicle miles traveled (VMT) since the location of the development is no where near transit; does not include a major employment center but instead focuses on large single family residential units; encourages dependency on the automobile and will, when combined, increase VMTs, not reduce them.

In addition, related to Exhibit 4.2, there are no employment centers approved or proposed on the Aera Energy property in Los Angeles County. As noted in your Integrated Growth Forecast (p. 111) the "RTP/SCS depends heavily on accurate and credible forecast for future growth in population, housing and employment." It is therefore misleading to show growth when residential units are the only documented development feature. And likewise it is inaccurate to show such a large population growth in an area protected under the County's own SEA program.

Advanced Mitigation Policy
While we understand the RTP is directly related to County Transportation Commissions (CTCs) we would respectfully request that conservation organizations, like HFE, and other related agencies, conservancies, and joint power authority's (e.g., the Santa Monica Mountains Conservancy, Mountains Recreation and Conservation Authority, and the Wildlife Corridor Conservation Authority) be included in determining priority conservation areas and plan development. CTCs, with all due respect, do not tend to focus on nor do they specialize in conservation of natural lands.

As the Orange County Transportation Authority will confirm, it relied upon many sources for establishing its priority conservation areas under the Environmental Mitigation Program of Renewed Measure M. To that end, HFE would like to offer its assistance with potential conservation areas in the four-county region. In addition, we believe there are similar conservation non-profit organizations and entities throughout the SCAG region that could provide useful, beneficial, and relevant information about their on-the-ground priorities.

Recommendation #5
We recommend that SCAG incorporate public workshops and outreach to effectively gather information from conservation organizations and other related agencies on conservation priorities. This recommendation also applies to the limited scope of "agencies" in the Resource Areas and Farmlands section (pg. 128 of the Draft 2012 RTP/SCS).

Additionally, we also believe there are conservation opportunities above and beyond the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) areas to acquire, protect, and preserve land in perpetuity.

Recommendation #6
We recommend that SCAG expand the possible mitigation sites to include any undeveloped natural lands in its inventory as this would be a more inclusive list than just focusing on NCCP/HCP lands, which by their very nature are limited to particular areas of each county (where established) and related to specific residential developments, not transportation projects (the Orange County Transportation Authority's NCCP/HCP is the exception).

Mitigation Measures: Biological and Open Space (Section 3.3 of the PEIR)
In addition, we have comments that we hope strengthen the mitigation measures proposed in the draft PEIR.

First, as it relates to MM-BIO/OS2 (replanting disturbed areas with native vegetation), we agree avoidance should be the first approach and use of native high quality vegetation should be installed. However, in working with the Orange County Transportation Authority, we believe there is an opportunity to ensure a better functioning ecosystem pre- and post-construction activity. Specifically, the Measure M2 Ordinance states its program will establish an "accounting process for mitigation obligations and credits that will document *net environmental benefit* from regional, programmatic mitigation in exchange for *net benefit in the delivery of transportation improvements* through streamlined and timely approvals and permitting" [emphasis added].[3] With SCAG's potential adoption and promising opportunity for early implementation of the advanced mitigation program, inclusion of net environmental benefit language would improve program and the delivery of freeway projects at a minimum in terms of construction, timing, and budget.

Recommendation #7
Therefore, we recommend ensuring that, after the impacts and restoration, the affected natural habitat realizes a *net* environmental benefit.

Second, as it relates to MM-BIO/OS36 (assessment of habitat linkages) we agree habitat linkages should be preserved and improved, but also believe utilizing existing data when evaluating habitat linkages will aid in the evaluation process. It is critical that the integrity and functionality of the wildlife corridor(s) be preserved *before* construction begins and if alternative linkages are needed those be established and studied prior to construction commencement.

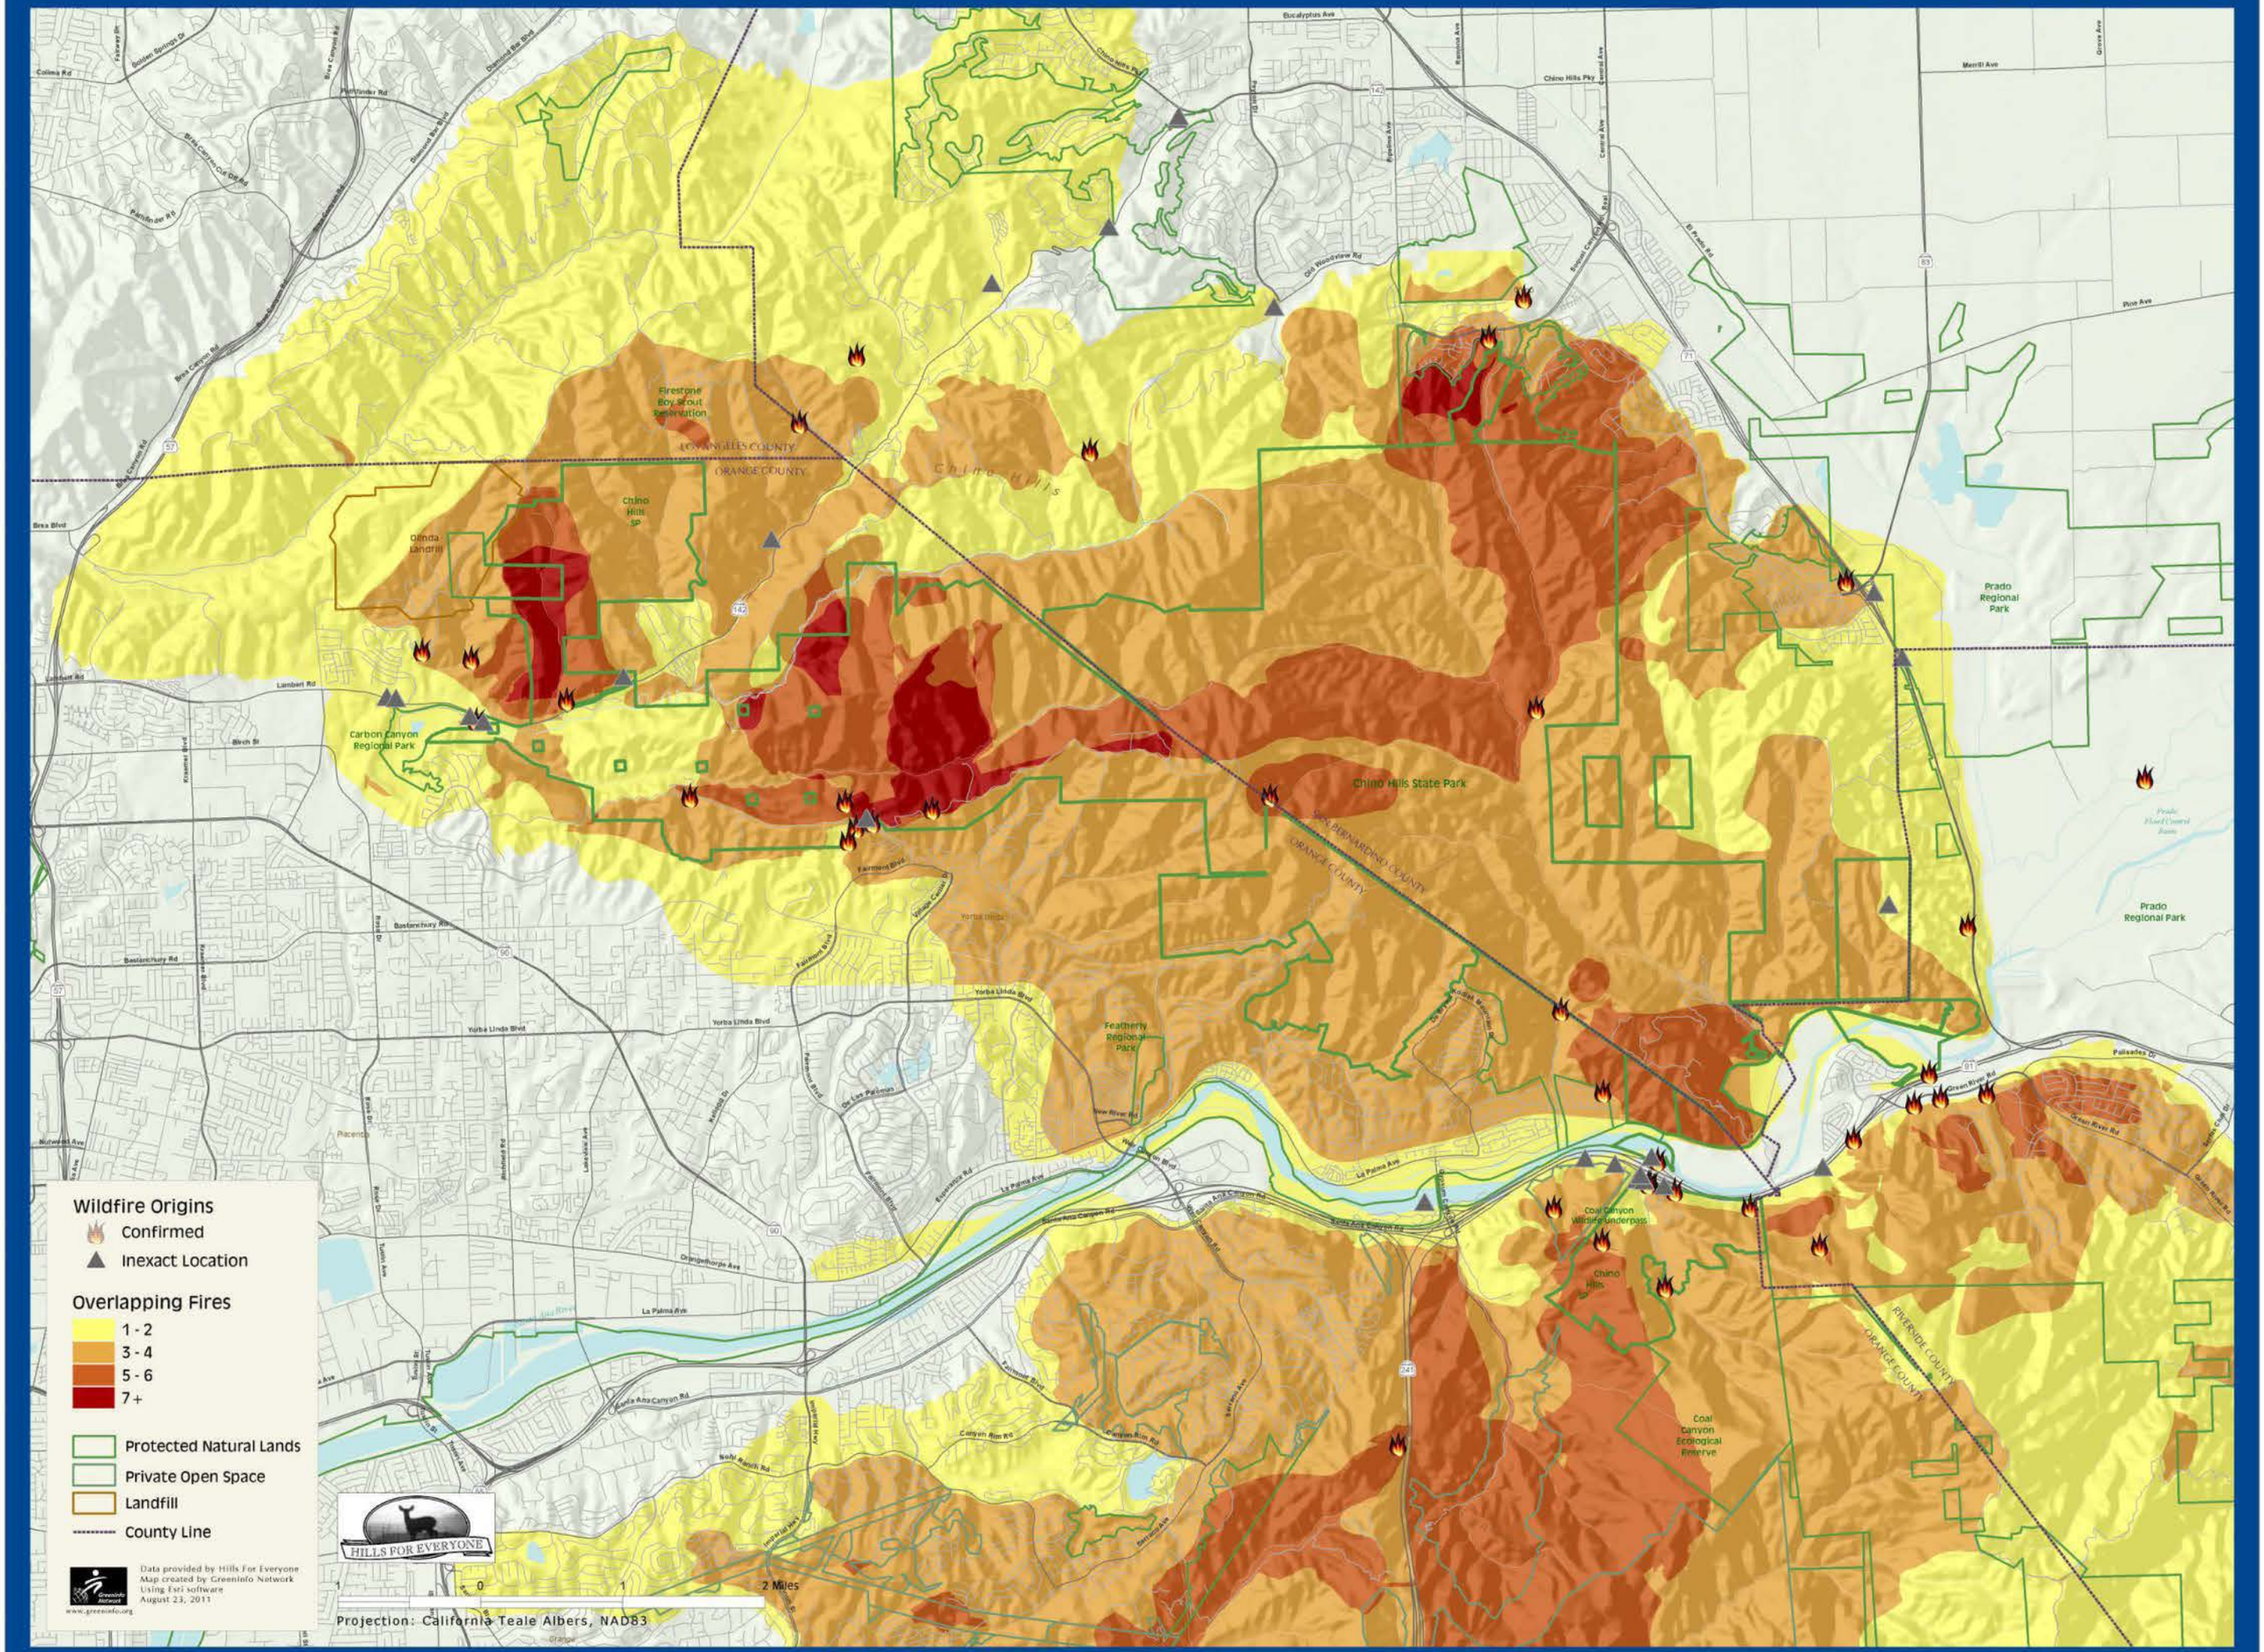
Recommendation #8
Therefore, we recommend utilizing existing data and research conducted by agencies (e.g., US Geological Survey, California Department of Parks and Recreation) and qualified biologists on assessment of habitat linkages and their function and/or risk of habitat fragmentation, encroachment, and urban edge effects. In addition, during construction the wildlife corridor should maintain its functionality and again, if the linkage is compromised the mitigation measures for alternative linkages should come *before* the construction activities begin.

Third, MM-BIO/OS38 (analysis of wildlife corridors, impacts avoided or minimized) provides a good place to start in analyzing wildlife movement corridors, but can be expanded to include

[3] Orange County Local Transportation Authority. "Ordinance No. 3." 24 July 2006. Section II Item A.5.iii, page B-5.

determining locations where wildlife are crossing roadways that do not yet have established culverts, undercrossings, etc.

Recommendation #6
We recommend using roadkill data and surveys to determine where additional linkages and/or culverts/undercrossings are needed, but not yet installed. This pre-construction, pre-design activity can yield important information during the project planning phase so that connectivity can be improved during project implementation.



Thank you for the opportunity to provide feedback on the Draft 2012 RTP/SCS and the PEIR. We look forward to working with you in the future on the SCS and the conservation policy.
Regards,

Claire Schlotterbeck

Wildfire Origins and Overlapping Fires near Chino Hills State Park

Hills For Everyone Fire Research Project
Fire Statistics for the 91 Freeway (Perimeters)

Fire Location
Of the 37 separate fire perimeters that burned along the 91 freeway

- 13 fire burned along the freeway
- 18 fires within a ¼ mile of the freeway
- 6 fires within a ½ mile of the freeway

Fires before/after Freeway Opened (1963)

- 6 fires burned before the freeway opened (48 years of fire data, 1914-1963)
- 29 fires burned after the freeway opened (48 years of fire data, 1963-2011)

Adjacency to Chino Hills State Park
Of the 37 separate fires perimeters that burned along the 91 freeway

- 16 burned in Chino Hills State Park
- 2 burned adjacent to Chino Hills State Park (shared a border)
- 19 burned outside Chino Hills State Park (close enough to cause concern)

Fire Size
Of the 37 separate fire perimeters that burned along the 91 freeway

- Largest Fire – 41,285.2 acres (Green River Fire – November 1948)
- Smallest Fire – 0.1 acres (Coal Canyon – July 2003)
- Average Fire Size – 6,263 acres

Fire Date
Of the 37 separate fire perimeters that burned along the 91 freeway, July was the predominant month when fires burned.

MONTH	No Data	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
# of Fires			2	1	1		1	8	4	2	4	4	

Weather Conditions
Known weather conditions for all the fires (since 1979)

WEATHER CONDITIONS	Temperature (Daytime Highest)	Temperature (Daytime Lowest	Temperature (Daytime Average)	Wind Gusts (Highest)	Wind Gusts (Average)	Most Common Wind Direction
Stats	102°F	70°F	86°F	29 MPH	20 MPH	SW

Corresponding Data
Of the 37 separate fires that burned along the 91 freeway

- 22 had no known point of origin
- 15 had a point of origin

Hills For Everyone Fire Research Project
Fire Statistics for the 91 Freeway (Points of Origin)

Fire Location
Of the 18 separate fire points of origin that ignited along the 91 freeway

- 3 fire ignited at the Coal Canyon exit
- 15 fires ignited along the 91 freeway

Fires ignited before/after Freeway Opened (1963)

- 0 fires ignited before the freeway opened (48 years of fire data, 1914-1963)
- 18 fires ignited burned after the freeway opened(48 years of fire data, 1963-2011)

Fire ignition causes
Of the 18 separate fires points of origin that burned along the 91 freeway

- 0 were natural
- 18 were human-caused

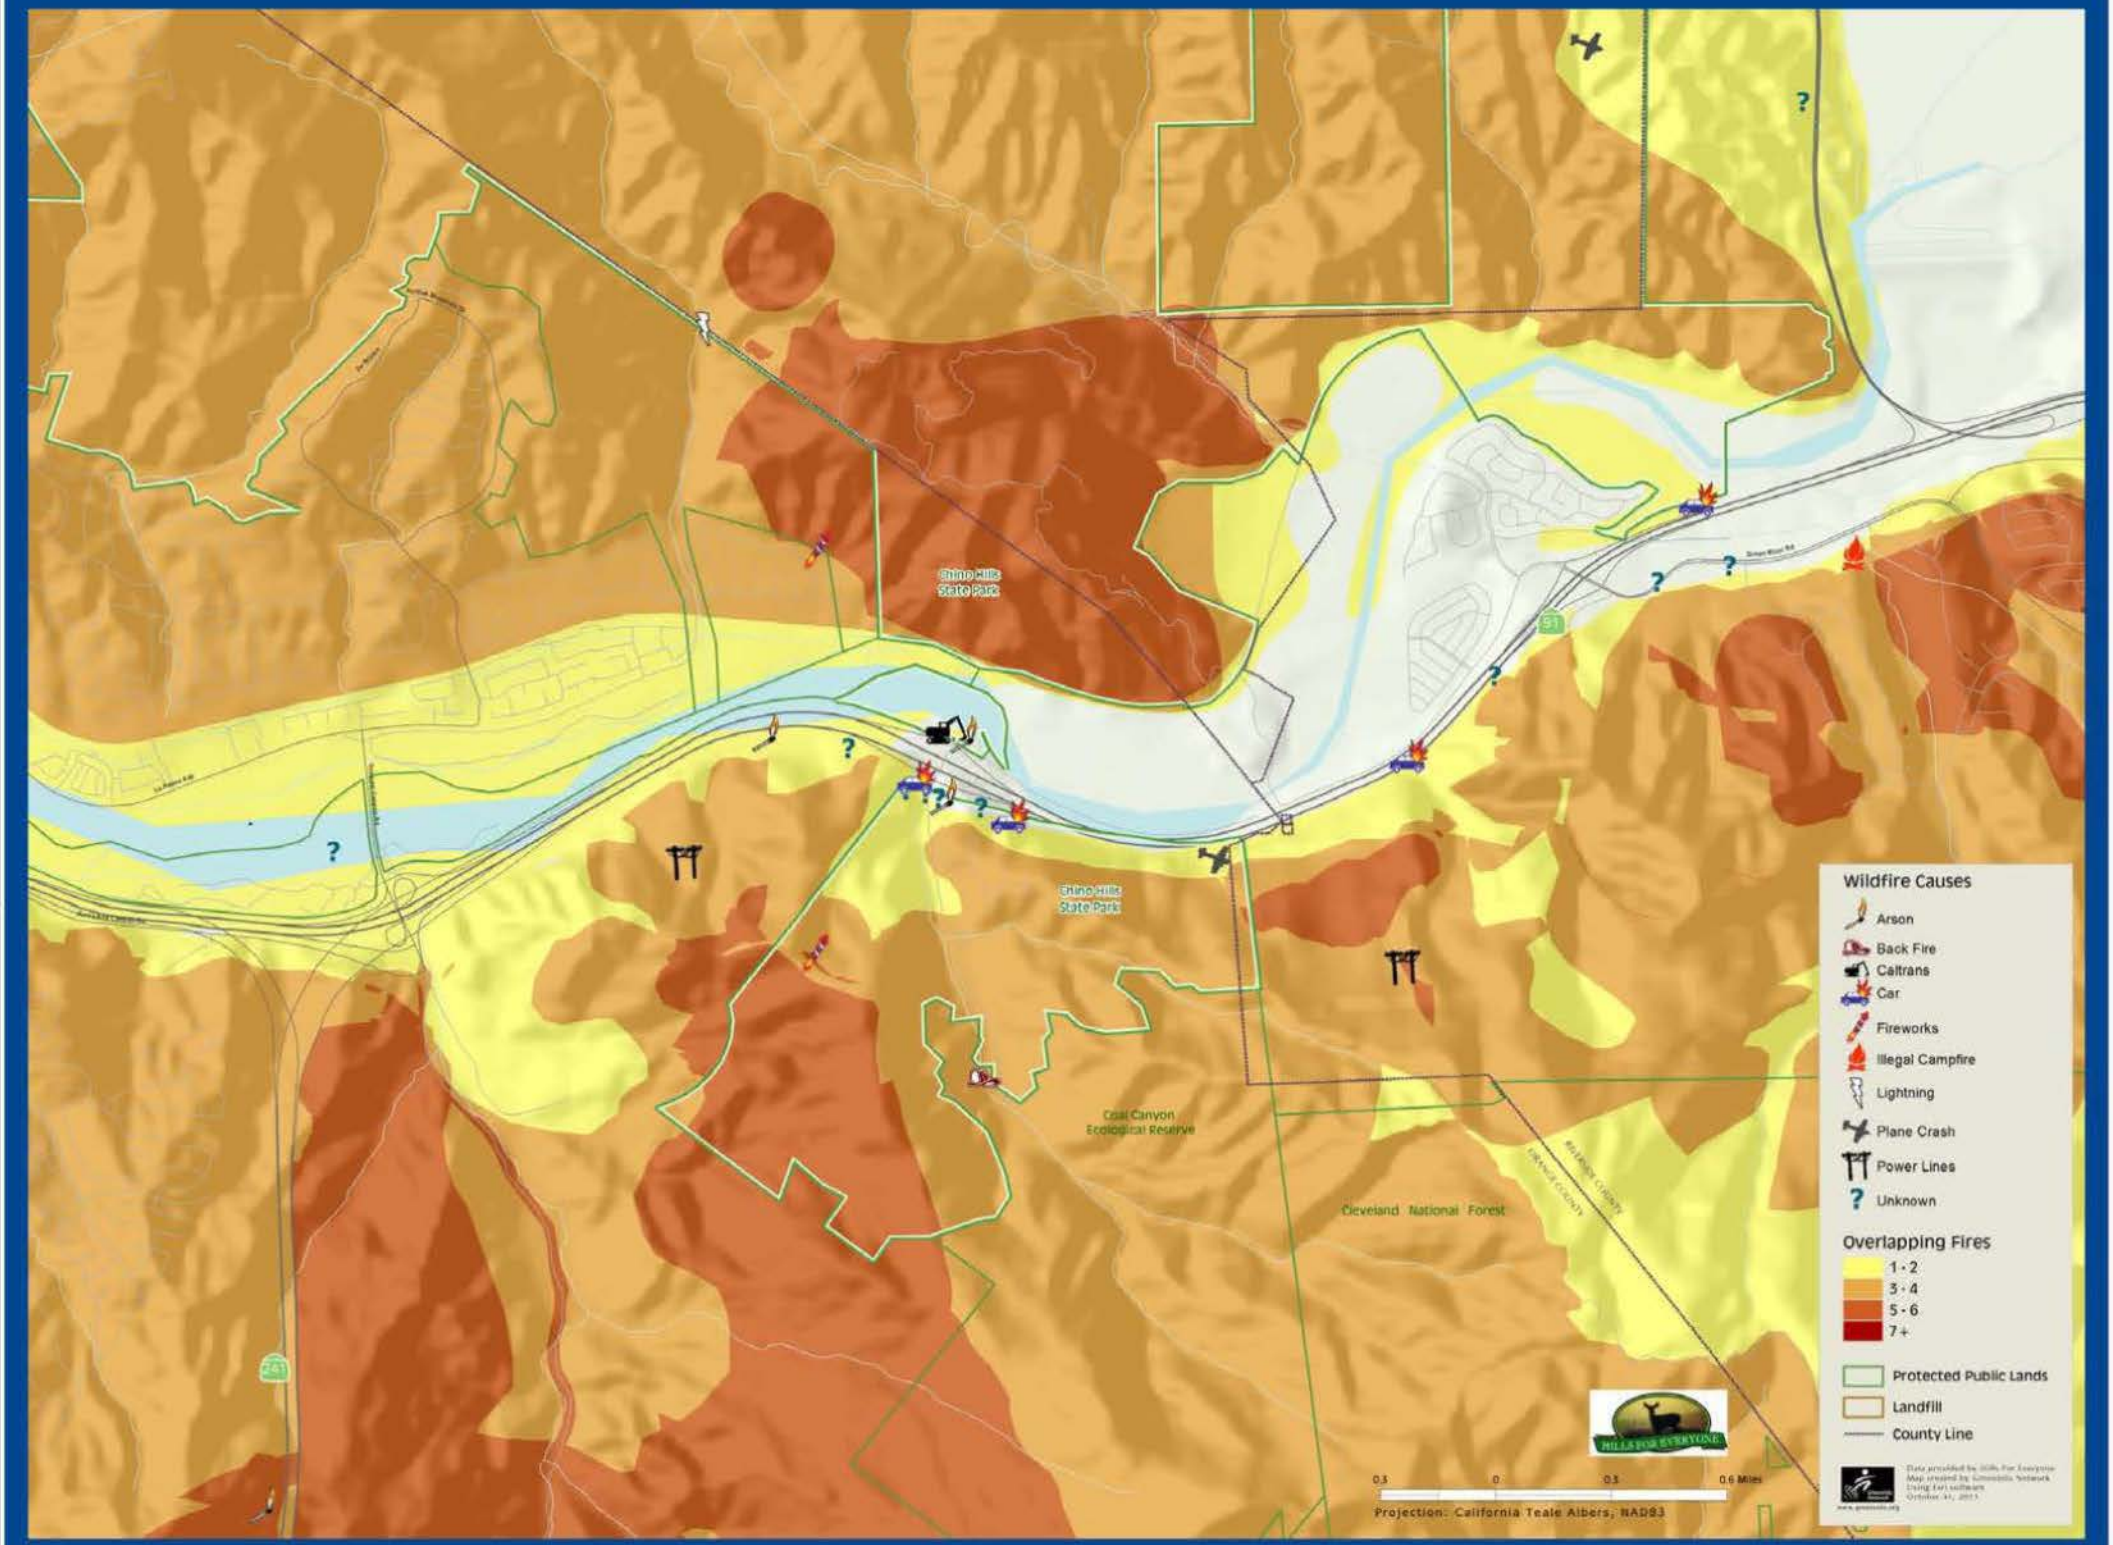
CAUSE	Unknown	Vehicle Fire/Crash	Arson	Downed Powerlines	Caltrans Machinery	Incendiary Device	Prescribed Burn Reignited
# of Fires	8	4	2	1	1	1	1

Corresponding Data
Of the 18 separate fires that burned along the 91 freeway

- 11 have no matching fire perimeter
- 7 have a matching fire perimeter

Hills For Everyone Fire Research Project
Fire Statistics for the 91 Freeway (Points of Origin and Perimeters)

Number of Fires
There was recorded data for 37 perimeters and 18 points of origin. In some cases the data set was complete and included both a perimeter and a point of origin. In other cases, we had only one or the other (a perimeter and no point of origin, or a point of origin with no perimeter). To provide an accurate count of actual fires we only included a single record of any given fire. Therefore there are 48 separate fires that ignited/burned along the 91 freeway.



Fires ignited before/after Freeway Opened (1963)
Of the 48 separate fire perimeters and/or points of origin

- 1 unknown date
- 6 fires ignited or burned before the freeway opened (48 years of fire data, 1914-1963)
- 41 fires ignited or burned after the freeway opened (48 years of fire data, 1963-2011)

Fire Date
Of the 48 separate fire perimeters and points of origin that burned along the 91 freeway, July was the predominant month when fires were ignited or burned.

91 Freeway - Wildfire Causes and Perimeters (1914 - 2011)

Tuesday, Feb. 14, 2012

Hasan Ikhrata, Executive Director
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Dear Hasan:

On behalf of the American Lung Association in California and Human Impact Partners, we would like thank you and your staff for your leadership to improve the health and equity benefits of the Sustainable Community Strategy/Regional Transportation Plan. We appreciate the hard work and broad community and stakeholder outreach that you and your staff have undertaken and congratulate you on developing a plan that meets the 2020 and exceeds the 2050 greenhouse gas reduction targets as well as reduces air pollution and vehicles miles traveled.

A broad-based coalition of health, transportation, academic, environmental, environmental justice and housing advocates participated in the development of recommendations for health and equity performance measures that should be incorporated in the development of RTP/SCS plans. While we are pleased that SCAG has incorporated some of those metrics, there are many others that we continue to urge you to include in future SCS/RTPs.

To aid SCAG in measuring and monitoring these health and equity targets and determinants, we have attached the original Health and Equity Metrics for Sustainable Communities Strategies and a commentary table specifically addressing the performance measures that SCAG has included in the 2012 RTP/SCS.

We look forward to working with you to support a truly health protective, equitable and sustainable plan for Southern California, and urge you to consider these additional measures to best achieve this goal.

Signed,

Bonnie Holmes Gen
Executive Director for Air Quality and Public Health
American Lung Association in California

Kim Gilhuly
Project Director
Human Impact Partners

Health and Equity commentary on SCAG 2012 RTP/SCS performance measures and Environmental Justice performance measures

A broad-based coalition of health, transportation, academic, environmental, environmental justice and housing advocates spearheaded by Human Impact Partners participated in the development of recommendations for health and equity metrics that should be incorporated in the development of RTP/SCS plans. The chart below provides a commentary of how SCAG's performance measures compare to the Health and Equity Metrics:

SCAG RTP/SCS 2012 Performance Measure	Health and Equity commentary
Asthma incidence and exacerbation	We were glad to see this included but believe the data point could be strengthened by using NOx as an exposure measurement to better tie this outcome to vehicle emissions and monitor over time. SCAG is currently measuring exposure to NOx and has an accepted methodology to enable this analysis and quantification.
Analysis of percent of environmental justice households living within 500 feet from high-volume roadways.	We request analysis of the percent of environmental justice households and potential health outcomes within 1,000 feet to better reflect research demonstrating health impacts within that area, particularly in environmental justice communities. Protocols for addressing impacts are also needed. We also would request a measure of how many households are below market rate (BMR) vs. market rate (MR), as with the analysis in the EJ appendix.
Premature deaths due to PM 2.5	Thank you for including this performance measure.
SCAG 2012 RTP/SCS Environmental Justice Performance Measure	Health and Equity commentary
Jobs-housing imbalance	SCAG was responsive to stakeholders in measuring a jobs-housing imbalance, but the measurement could be improved by using methodology that UC-Davis and the Sacramento Council of Governments has developed. Theirs is a relatively simple methodology to do a jobs-housing fit by creating a 4-to-5-mile buffer zone around major job centers, and comparing wages provided by those jobs to cost of housing within the buffer zone to see if there is a good fit. UC-Davis is developing this tool to be able to project the jobs-housing fit into the future, which would enable SCAG to show how the Plan will impact this performance measure.
Gentrification & displacement	We applaud this measure and request ongoing monitoring and development of mitigation measures. SCAG's analysis indicates that with ongoing concentration of new housing in High Quality Transit Areas (HQTA), gentrification and displacement will happen. While this can be discerned from the analysis of what has happened with the indicators historically, they do not project change with these indicators. It would strengthen this EJ analysis to see how many market-rate vs. below-market rate units are planned for each TAZ, and the EJ Toolbox could be strengthened by suggesting displacement

	mitigation measures.
Access to employment and services (45-minute auto access)	Kudos for measuring this, but we would like to see measurements for walking and biking access and recommend using a 30-minute walking or biking travel time. An alternative method would be to map ½ mile access to employment and services for walking and cycling. The cut-off choice of 45- minute auto access time does not show, from a health lens, how people could be more likely to use active transport methods to access jobs and services.
Access to parks	Similar comments to access to employment and services, above. It is not clear for either measure what "average" access is.
RTP project investment share	This analysis does not detail what kinds of investments are targeted for each quintile, i.e., will there be more rail investment in higher or lower income quintiles, for example. This analysis was a step in the right direction but more detail would help determine if the type of investment is targeted for the mode usage of each income level and/or ability/disability.
Air pollution and noise exposure	The analysis showed clearly that risks are higher for EJ populations, and that more current and future housing near freeways and busy roadways is targeted for lower-income residents and minorities. We were pleased to see that a mitigation measure in SCAG's toolbox is to do a corridor-level analysis for proposed projects in areas where roadway air quality impacts are concentrated among EJ communities. We request more indicators that measure actual health outcomes. Respiratory risk was not well-defined. Also, mapping in smaller geographies would be useful as the maps were unable to show much at the regional level. With regard to noise, we see that highway noise reductions will not benefit EJ communities as much as non-EJ communities. We appreciate the noise mitigations suggested in the Toolbox.
Share of household and employment growth in High Quality Transit Areas (HQTA)	Would like to see household growth, job growth, and population growth. Would also like to see how many large (3-4 bdr) units, how much senior housing, and below market rate (BMR) units projected for HQTA.

SCAG stated that the following recommended metrics would be targeted for a future RTP/SCS if data became available. We would encourage SCAG to continue researching ways to measure and report out these indicators earlier than in the next RTP/SCS.

SCAG 2012 RTP/SCS Performance Measure	Health and Equity commentary
Percent of households with walk access to neighborhood services	SCAG states further research is needed. SANDAG has pioneered mapping strategies for this, and SCAG has laid the groundwork for this analysis in the Environmental Justice appendix.
Percent of existing and new BMR rental housing units in TOD areas	SCAG states further research needed, yet has measured a similar indicator above as "Share of growth in High Quality Transit Areas".
Percent of jobs within 15	SCAG states that this is pending available data, but it is unclear why

minute walk of transit	this is not included since they are measuring growth of jobs and households in high quality transit areas. Also we are interested in proportion of jobs and households within ¼ mile of *local public transit* (bus and rail) and within ½ mile of *regional public transit*.
Percent of population within ½ mile of high frequency transit stop	SCAG states that this is pending available data, but we note that SCAG has assigned this task to their GIS team, which is a great sign. It is unclear what data is needed beyond what SCAG has access to since they have measured the share of household and employment growth in high quality transit areas.
Percent of residents within ½ mile walk to parks and open space (pending available data) (new research measure)	SCAG states this is pending available data but did perform a distance to parks analysis in the EJ appendix, so it appears this data is available.
Percent of households living with >65 decibels of noise	SCAG states that further research is needed, but this data is collected for the EJ appendix and appears to be available.

We encourage SCAG to incorporate these additional performance measures, which were not included.

SCAG 2012 RTP/SCS Performance Measure	Health and Equity commentary
Daily amount (in minutes) of work and non-work trip related physical activity	Methodology exists to predict this as the MTC has done.
Chronic disease resulting from changes in physical activity due to transportation project expenditures	Methodology exists to predict this via the California Department of Public Health.
SCAG 2012 RTP/SCS Environmental Justice Performance Measure	**Health and Equity commentary**
Injuries and fatalities from motor vehicle collisions, including from trucks, for pedestrians, bicyclists, as well as motor vehicle operators	While this is measured for performance measures, there is no EJ analysis.
Premature mortality from PM2.5 emissions from mobile sources, for EJ communities	SCAG looks at air quality and some EJ respiratory health issues, but the health effects of changes in air quality due to transportation expenditures would be clearer if premature mortality were measured and reported specifically in environmental justice communities. SCAG measures particulate matter, and so could do the calculation to attribute premature mortality to mobile sources of PM2.5.
Physical activity gained from active transport for EJ communities.	SCAG considers accessibility to parks, employment and services, which all tie into why someone would walk/bike/take public transit to get to these services. We request that the health benefits from transportation decisions be made explicit by measuring them.

SB375 Health & Equity Metrics

SB375: Sustainable Communities Strategies for Regional Transportation Planning

With the goal of reducing greenhouse gas emissions, SB375 requires that California's Metropolitan Planning Organizations (MPOs) prepare a Sustainable Communities Strategy (SCS) as part of their Regional Transportation Plan (RTP). The SCS process is an opportunity to improve the health of all communities in the state, truly ensuring our sustainability.

Performance Metrics and Planning

MPOs use a variety of performance measures to assess different scenarios for land use and transportation changes. As we have seen in the past, if those metrics don't include health and equity measures, it is unlikely that the final selected plan will lead to healthy and equitable outcomes. For example, if MPOs use the indicator "Automobile Level of Service (LOS) on Roadways," their decisions will focus on making driving easier, which might not be the best for health given the many ways driving can harm health. If instead they use "Premature Death due to Traffic-Related Pollution," then their plans are more likely to decrease traffic-related pollution by promoting alternate forms of transportation. Our goal is to provide MPOs a set of metrics that will promote health and equity as well as sustainability.

SB375 & Health

As California continues to grow over the coming years, we will need to accommodate **millions of new households** and **jobs**.

Currently, the **cars and trucks** we drive account for almost **40% of our greenhouse gas emissions**. How will **further growth** impact our **climate**?

Transportation and land use decisions impact our health by changing air quality, noise levels, physical activity rates, pedestrian and bicycle injury rates, and access to the goods and services we need to live healthy lives.

Children born today are expected to have a shorter life span than their parents due to obesity and respiratory illnesses. How will **further growth** impact our **health**?

Developing the Health and Equity Performance Metrics

To develop a list of health and equity metrics, Human Impact Partners, an Oakland-based non-profit that strives to transform the policies and places people need to live healthy lives, received funding from the Resources Legacy Fund and worked in collaboration with:

- American Lung Association in California
- Bay Area Regional Health Inequities Initiative
- Climate Plan
- Fehr & Peers
- Healthy Places Coalition
- Move LA
- Nelson & Nygaard
- PolicyLink
- Public Health Institute
- Prevention Institute
- Public Advocates
- Public Health Departments in Shasta, Marin, San Mateo, & Los Angeles
- Public Health Law & Policy
- Public Law Center
- Public Policy Institute of California
- Raimi & Associates
- Reconnecting America
- Safe Routes to Schools
- TransForm

Starting with metrics proposed by many organizations and agencies, we developed a final list of 13 metrics. For each proposed metric, we also provide a review of its links to health and a description of how it can be measured.

HUMAN IMPACT PARTNERS

The Health and Equity Metrics

SAFETY

1. Map annual number of pedestrian and bicycle collisions (and severity of injury/fatality): per capita, per geographic area, by daytime population.
2. Total number of vehicle, bike and pedestrian collisions per capita, broken down by injury type: fatalities and injuries.

ACCESS TO GOODS, JOBS & SERVICES

3. Proportion of households that can walk or bike (10 minutes) to meet at least 50% of their daily needs. Public daily needs defined as: schools, parks, healthcare institutions and transit. Private daily needs defined as: restaurants, grocery stores, food markets and childcare.
4. Proportion of households and proportion of jobs within 1/4 mile of local public transit (including both bus and rail) or 1/2 mile of a regional public transit, that has less than 15 minute frequencies.
5. Proportion of daily trips less than 3 miles and less than 1 mile by mode (walking/biking/transit (bus and rail)/driving).

GENERAL TRANSPORTATION

6. Daily amount (in minutes) of work-trip and non-work trip related physical activity.
7. Work and non-work trip mode share (including biking, walking, transit (bus and train), carpooling and SOV)- Both at peak times and all day.

FUTURE GROWTH

8. a) Share of housing growth in transit priority areas, targeting measures of how many large (3-4) bedroom units, senior housing, low-income units will be built;
   b) Proportion of projected population growth located in transit priority areas;
   c) Proportion of projected jobs in transit priority transit areas.

ECONOMIC

9. a) Percent of household income consumed by housing and transportation combined;
   b) Percent of income going towards housing costs;
   c) Percent of income going towards transportation costs.

ENVIRONMENTAL POLLUTION

10. For all daily trips, per capita miles traveled by mode (walking, biking, transit, vehicle).

11. Working with a local public health department, university or air quality management district: Estimate pre-mature mortality attributed to traffic related ambient PM 2.5, and estimate asthma incidence and asthma exacerbations attributed to traffic related NO2.

12. Proposed housing near busy roadways will require:
    a) Assessment by local air district or public health department of the need for environmental/health impact analysis when housing is proposed near (within 1,000 feet) busy roadways (over 100,000 Average Annual Daily Traffic (AADT) or other significant pollution sources (e.g., rail yards, port terminals, refineries, power plants, etc); and
    b) Best practice mitigation requirements by local governments when the above assessment determines that environmental quality is below standard for such proposed housing, and if such housing is determined to be safe by local air districts and public health departments with identified mitigation.

For MPO representing highly urban regions, we suggest an alternate metric due to the ongoing concern about the lack of developable land, the need for housing, and equity concerns about placing low-income residents near polluting emissions of cars and trucks.

Alternate Metric 12: Working with a local public health department, university and/or air quality management district:

a) Estimate the number of sensitive sites (homes, schools daycares, parks, etc.) within 1,000 feet of freeways and other major pollution sources, based on standards such as Bay Area Air Quality Management District's.
b) Estimate proportion of affordable housing units vs. market rate units within above identified areas.

EQUITY

13. Measure and stratify all indicators by race/ethnicity; income; geography (neighborhood, Census block or tract level, or Community of Concern); age; disability.

Ways You Can Advocate for Health and Equity

Through letters to and meetings with MPO staff and Board, through testimony at public meetings, and in letters to local press, **you can advocate that health and equity be considered** when your MPO is:

- ✓ Developing performance metrics to assess proposed growth scenarios.
- ✓ Proposing scenarios about future transportation and land use.
- ✓ Conducting its Environmental Impact Review (EIR), which technically requires an analysis of health impacts, but often doesn't. You can do this when the agency announces that it is starting the EIR at the Notice of Preparation stage, when it is Scoping the EIR, and/or as comments on the Draft EIR.

AIR POLLUTION CONTROL DISTRICT

February 14, 2012

Margaret Lin
Southern California Association of Governments
818 W. 7th Street, 12th Floor
Los Angeles, CA 90017

RE: Comments on Draft 2012-2035 Regional Transportation Plan – Sustainable Communities Strategy & the Draft Program Environmental Impact Report

Dear Mrs. Lin:

The Imperial County Air Pollution Control District (Air District) has finalized the review of the Draft 2012-2035 Regional Transportation Plan (RTP) – Sustainable Communities Strategy and its Draft Program Environmental Impact Report (Draft PEIR) and is here by providing its comments.

RTP

Section: Executive Summary

- The list of transportation investment projects found in page 5 and 6, calls for many beneficial projects within the SCAG region which would ultimately reduce VMT, traffic congestion and vehicle emissions. On top of the priority list and one of the most expensive projects is the passenger high speed rail system which is schedule to provide services to most of the SCAG region with the exception of Imperial County. As indicated in Table 1.7 found on page 28 of the RTP, the Imperial County is currently classified non-attainment for 2008 8-hour Ozone standard, as well as non-attainment for the PM10 and PM2.5 standards which is why it is very important and crucial that projects such as the high speed rail system are built and tied into the Imperial County to alleviate the same issues other SCAG regions are having and expect to have in future years. As it stands, the Air District will not benefit from the emission reductions a high speed rail system can provide. For this reason, the Air District would like to request a cost-feasibility analysis and/or a detailed explanation which demonstrates why tying a high speeds rail system to the Imperial County is not beneficial.

- The current financial plan found on page 7 calls for an estimated $110.3 billion revenue source from a proposed mileage-based user fee beginning in 2025. If this revenue source is ultimately approved and implemented, Imperial County residents will be at an

enormous disadvantage and end up paying more into this funding source due to the county's geographical location and lack of transportation resources available in the area (currently high-speed rail not proposed). Even though the Imperial County's population has continued to grow at a fast rate during the last couple of years (page 17), it still continues to heavily rely on goods and services that are mainly provided in metropolitan areas such as San Diego, Riverside and L.A. Counties. As mentioned in the first comment, the Air District is in desperate need of transportation improvements that will not only allow easier, faster and safer services to other SCAG regions but that it will also reduce air emissions in the Imperial County region.

Section: 02 – Transportation Investments

- The Air Quality section on page 79 provides several measures that are necessary to address air emissions necessary to achieve RTP goals. One of the measures is to have "ARB measures that set new on-road and off-road engine standards and accelerate turnover of higher emitting engines from the in-use fleet" among others. It is important for SCAG to continue working with the California Air Resources Board (CARB) and to discuss these types of measures in a consistent basis to ensure new engine standards and the turnover of higher emitting engines will be feasible for both the private and public sector in the upcoming years. In 2008, CARB adopted the Truck and Bus regulation which requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Heavier trucks must be retrofitted with PM filters beginning January 1, 2012, and older trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. Ultimately, the Air District would like to know if the emission reductions found on Table 3.2: Criteria Pollutant Emission By County – Existing Conditions (2012) VS Plan (2035) have been approved by CARB and will be included in their emissions inventory.

DPEIR

- On Page 3.2-12, it is stated that the entire portion of the Imperial County is maintenance for 8 hour ozone. This statement is incorrect, the Imperial County is in attainment of the 1997 8-hour ozone standard however it is in non-attainment of the 2008 8-hour ozone standard.

As stated on the DEIR, it is important to note that future projects within the Imperial County geographical area will be required to comply with local rules and regulations to minimize construction and operational emissions. The Imperial County *CEQA Air Quality Handbook* provides guidelines which assist in identifying when an air quality analysis is necessary, the type of analysis that should be performed, the level of significance of the impacts predicted by the analysis, and the mitigation measures needed to eliminate or reduce the overall air quality impacts. The CEQA Handbook also provides emission thresholds for both project construction and operations which assist in determining whether the project may have a significant air quality impact.

In conclusion, the Air District looks forward to working with SCAG and other regions to ensure the current and proposed transportation plans four our region not only improves mobility, the economy and provides sustainability but that it also commits to reducing emissions from transportation sources as well as construction sources ultimately improving air quality in the entire region.

Respectfully

Brad Poiriez

Re: Comments on Draft 2012-2035 Draft RTP/SCS

Dear Ms. Lin:

Thank you for the opportunity to comment on SCAG's Draft 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy ("Draft RTP/SCS" or "SCS"). We understand that this is an enormous undertaking and appreciate SCAG's efforts in this process. We look forward to playing a constructive role in the further development of the SCS.

As explained below, we are concerned that the draft RTP/SCS as proposed would result in an inappropriate use of the regional growth forecast planning effort to encroach on local land use authority and jurisdiction. We therefore request that SCAG (1) extend the comment period and make transportation analysis zone (TAZ) data available for public review and comment; (2) correct the TAZ data and maps to accurately reflect current local planning decisions including entitled projects; and (3) revise the SCS so that consistency determinations are made not at the small-scale scale level of a TAZ, but at the jurisdictional level to allow reasonable flexibility and appropriate land use decision making authority at the local level.

1. The SCS does not appear to account for projects already in process

Kohl Ranch owns over 2,200 acres of land in Southern California. However, we are concerned that the SCS process has not fully accounted for projects that are already in process. Regent has several projects in the area that are fully entitled and approved for build-out, as well as proposed projects with pending applications that represent a substantial investment of resources to design, plan and communicate with the community and responsible agencies. While the SCS itself states that it was created with input from local jurisdictions (see, for example, Draft RTP/SCS p. 111), we are concerned that the growth projections contained in the SCS and Land Use Pattern Maps do not in fact reflect the land use decisions that have been made by local jurisdictions. More specifically, while the Draft RTP/SCS indicates that it has shifted projected densities from less developed areas to the urbanized core, nowhere does the SCS clearly state that those shifts in density take into account development projects that are either already approved or that are reasonably foreseeable projects which local jurisdictions have already spent considerable resources processing.

2. Underlying TAZ data must be released to allow meaningful public comment

Moreover, the SCS's treatment of approved projects is impossible to determine from the information that SCAG has made available to the public. The 2035 Land Use Pattern Maps, which are intended to depict projected density and land use, are at such a large scale, with such slight color gradations, that they cannot be interpreted in any meaningful way. The SCS itself does not seem to contemplate that these maps will be important to future transportation and land use decisions. Instead, the SCS focuses on the projected density contained in the data that underlies the maps -- data that SCAG has not released to the public. The SCS states that the land use projections contained in the SCS are based on the distribution of growth forecast data to transportation analysis zones. (RTP/SCS, p. 122.) According to the SCS, the TAZ data contains forecasted housing, population, and employment data, which the SCS used to create "Community Types" and more refined "Development Types" that contain average use designations, densities, and building intensities. The SCS states that a Development Type, including an average residential density, has been assigned to each TAZ for purposes of creating the SCS. (Draft RTP/SCS, p. 123.) However, it cannot be determined whether this assignment was made in a manner that takes existing conditions (including approved and reasonably foreseeable projects) as a baseline for these projections, nor can it be determined how the forecasting was done or how it was distributed across the TAZ.

Despite the critical role of the TAZ data in developing the SCS, we are not aware that SCAG has made this data available for public review and comment in any meaningful way. We were able to obtain partial data, showing housing densities only, from other agencies involved in the SCS process. These data do not contain employment or population forecasts, and do not contain any Community Type or Development Type designations which, according to the SCS, have been assigned to each TAZ. It is not possible for the public to provide meaningful comment on the SCS without access to the underlying data on which density and land use projections are based. In the absence of the underlying data and modeling supporting the proposed plan, we are substantially impaired in our ability to provide meaningful public comment on the technical and legal adequacy of the plan. In particular, we cannot assess whether the underlying data adequately reflects all developments as approved. Under the federal (5 U.S.C. § 500 *et. seq.*) and California Administrative Procedures Acts (Gov. Code §§11340 *et seq.*, including § 11346.2(b)(6)), the opportunity for public comment must include disclosure of the data and technical studies in time to provide meaningful public comment. *See, e.g. Solite Corp. v. EPA*, 952 F.2d 473, 484 (D.C.Cir.1991) (per curiam).

While we are not confident that the data is either accurate or complete, we have reviewed what data we were able to obtain. Based on our review we conclude that the forecasted housing densities do need to be corrected, as the numbers clearly do not reflect either existing entitlements or pending, reasonably foreseeable projects.

3. Implications of consistency with underlying TAZ data

The importance of the TAZ data is not limited to understanding how the SCS was created. In addition to being the basis for creation of the SCS land use projections, according to the SCS, the TAZ data is to be relied on in future determinations as to whether a project is consistent with the SCS. The SCS states:

"SCAG suggests that utilizing community types at the TAZ level of geography (which an average size of 160 square acres) offers local jurisdictions adequate information and flexibility to make appropriate consistency findings for projects to be eligible to receive CEQA streamlining benefits." (Draft RTP/SCS p. 122.)

"One way of determining consistency [with the SCS] is if a proposed residential/mixed use or TPP [Transit Priority Project] conforms with the Development Type designated for a TAZ." (Draft RTP/SCS, page 148.)

Despite these explicit statements that the existing TAZ data will be critically important to future decisions affecting projects, SCAG has not provided the public the opportunity to review and comment on the TAZ data in any meaningful way.

Significantly, a project's consistency with the SCS -- which is to be determined at the TAZ level according to the SCS -- affects not only the availability of CEQA streamlining incentives, but can have adverse consequences for the availability of federal funds for transit improvements that would serve the project. Transit improvement projects relying on federal funding must be consistent with an approved RTP, and with the adoption of SB 375, that includes consistency with the Sustainable Communities Strategy portion of the RTP as well. (40 CFR 93.102; 42 U.S.C. 7506.) Thus, if the Draft RTP/SCS has shifted density away from approved or pending projects, those projects stand to lose critical transit improvements. The loss of transit improvements could impair project feasibility, or create new unmitigated impacts if traffic mitigations become unfunded, which could result in an unlawful taking of private vested property rights for those projects that have already been approved by local jurisdictions. In many cases, approved projects also involve executed development agreements, which means that violation of contractual rights could also result, causing difficult situations for developers and local jurisdictions.

We are concerned that a project's inconsistency with the growth projections contained in the SCS may have broader implications as well. Local jurisdictions will be under considerable pressure to conform their general plans to the density, intensity, and land uses contained in the SCS, or risk losing transportation funding throughout their jurisdictions. While all the implications of a project's inconsistency with the SCS have yet to be determined, we are concerned that by shifting density away from locally approved and pending projects, the SCS is creating land use policy in violation of SB 375's mandate that the SCS must not supersede the land use authority of cities and counties. (Gov't Code 65080(b)(2)(J).)

4. RTP/SCS consistency should be determined at the jurisdictional level.

The TAZ maps are a modeling tool for engaging in a regional planning and evaluation process. The feasibility of achieving the precise results in any particular TAZ area has not been evaluated or confirmed by any city council or board of supervisors, and as explained above it appears that the TAZ data and maps for 2035 do deviate from general plans and vested entitlements that have been approved by these elected officials. While we understand elected bodies or senior administrative staffs of local jurisdictions may have approved local input for the overall population and household numbers within their respective jurisdictions, we believe they have not approved the TAZ data or maps. Accordingly, requiring consistency determinations

concerning use designations, density, and building intensity at the small scale of each TAZ would be inappropriate and overly-prescriptive.

Again, SB 375 specifically precludes SCAG from interfering with local land use decisions.[1] SB 375 requires that an SCS "identify the *general* location of uses, residential densities, and building intensities *within the region*...." Calif. Government Code § 65080(b)(2)(B)(i) (emphasis added). Thus there is no legislative mandate that SCAG identify the location of land uses, densities and building intensities within the region more precisely down to a TAZ level. Instead, SCAG should appropriately identify these characteristics at a level consistent with the need for reasonable flexibility and local control. At the lowest, the level of comparison should be at a jurisdictional level – particularly given that there are nearly 200 jurisdictions within the SCAG region. Accordingly, we urge SCAG to identify such characteristics at no finer a scale than at the lesser of (i) the jurisdiction, and (ii) the sub-region (i.e., where unincorporated county land is divided into sub-regions).

Despite SB 375's mandate that the SCS not regulate land use, the draft RTP/SCS "shifts" households "from the periphery into the urbanized core" stating that much of this shift "will occur naturally in the marketplace," and that this "shift" was done "per consultation with the local jurisdictions." (Draft RTP/SCS p. 128.) However, this shift does not "occur naturally," nor through a "consultation" process between agency staff that excludes the public. Instead, such a shift can only occur, if at all, as part of a separate and lengthy discretionary development application process involving requests to local land use jurisdictions to amend their general plans, specific plans, areas plans, and zoning. In short, there is no "shift" to high-density housing in some local jurisdictions, and away from housing density already approved by other jurisdictions, unless and until the local land use jurisdictions adopt the requested discretionary approvals.

---

[1] SB 375 provides in pertinent part:

- "Neither a sustainable communities strategy nor an alternative planning strategy regulates the use of land . . . "
- "Nothing in this section shall be interpreted as superseding the exercise of the land use authorities of cities and counties within the region."
- "Nothing in this section shall be interpreted to authorize the abrogation of any vested right whether created by statute or by common law."
- "Nothing in this section shall require a city's or county's land use policies and regulations, including its general plan, to be consistent with the regional transportation plan . . . ." (Gov't Code section 65080(b)(2)(J)

4. Conclusion

The draft RTP/SCS represents a substantial and important regional planning effort. We believe the current draft needs to be corrected to reflect current local land use planning decisions, and to ensure that the regional growth projection process is not implemented in a manner that infringes on either vested property rights or the land use authority of local jurisdictions. We appreciate SCAG's consideration of the comments provided in this letter and look forward to your responses. If you should have any questions, please do not hesitate to contact me.

President Pam O'Connor and Members
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Dear President O'Connor and Regional Council Members:

We thank the Southern California Association of Governments (SCAG) and its staff for the hard work on the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Latino Health Access is particularly pleased to see that important health and equity indicators were included in the strategy positively impacting the health of our community.

The high levels of air pollution and health problems experienced in the Southern California region require strong action to transform transportation and land use planning. The Los Angeles region continues to be rated as the most polluted area for ozone in the country by the American Lung Association and the public health toll remains high.

We trust and rely on the research by the American Lung Association in California. The agency quantified the respiratory health benefits of smart growth strategies in the Southern California region. Their analysis showed that the ***six-county Southern California region could avoid over $16 billion in cumulative health and societal costs*** through smart growth strategies that reduce the growth in the region's vehicle trips by 20 percent by 2035. While large, these benefits may represent a small fraction of the greater benefits that accrue with more physically active transportation options, as envisioned and quantified by the California Department of Public Health's I-THIM modeling project. Understanding the potential benefits of given planning scenarios will help to identify plans that provide the greatest reductions in harmful emissions and chronic illnesses.

As an agency we see firsthand the effects that obesity and diabetes has on the lives on our clients and recognized the need for greater focus on a shift to active transportation modes like walking, cycling and transit that reduce pollution emissions and gets people out of their cars and into a more physically active lifestyle.

We join the American Lung Association in offering the following comments and recommendations to ensure that the Sustainable Communities Strategy and future

transportation investments place sufficient emphasis on promoting active transportation modes and transit oriented development, measuring and improving health progress, and ensuring that health and equity are imbedded in the decision making process for this plan and future planning efforts.

Key Health Recommendations for SCAG SCS

- **Increase active transportation investments to more than $12 billion a year**. While we appreciate the increase in active transportation funding included in the draft SCS, we believe more funding is needed. A recent study by the Los Angeles County of Public Health estimated that up to $40 billion could be needed to build out all of the current bicycle and pedestrian projects in Los Angeles County alone. SCAG, in coordination with health departments and organizations, should conduct a Comprehensive Needs Assessment for the Southern California region to determine the infrastructure needs to develop a network of bicycle and pedestrian pathways and transit connections. Analysis is also needed of how SCAG's bicycle and pedestrian per capita investment compares with other regions.
- **Improve Assessment of health benefits through new modeling approaches**. Utilize the new California Department of Public Health I-THIM screening tool to analyze the potential chronic disease reductions that can be achieved in the SCAG region based on increased transportation-related physical activity such as walking and biking. This model was used in the San Francisco Bay Area region to determine reductions in heart and respiratory disease, breast cancer and other health effects linked to active transportation scenarios. We urge SCAG to incorporate this tool in regional planning and decision making for transportation investments.
- **Include the attached list of 13 health and equity metrics in the SCS and monitor over time, including expanded public health targets.** In addition to monitoring premature mortality, SCAG should also assess reductions in asthma incidence and exacerbations due to traffic related pollution (NOX) and other targets through collaboration with local health departments, the South Coast Air Quality Management District, academic researchers and community based organizations. Improvements to the targets should be monitored and reported to the public every two years. *Additional comments on the targets already included by SCAG in the SCS will be sent in a separate comment letter.*
- **Focus investments on completing transit systems** and building out transit infrastructure, rather than highway expansion, including the following:
    - Doubling Metrolink ridership by 2020 and double it again by 2035
    - Expanding Bus Rapid Transit and regional bus service
    - Enhancing TOD planning and 1st-mile-last-mile investments near Metrolink stations
    - Doubling the bicycle network to 24,000 miles and improving pedestrian environment
- **Front load active transportation funding.** SCAG should commit to a higher amount of transportation funding for bike and pedestrian infrastructure, especially in the early years of the 25-year RTP process. SCAG should work with local transportation agencies

to prioritize bicycle and pedestrian projects and ensure the majority of funds are spent prior to 2020.

- **Increase investments in zero emission freight transportation** in order to reduce diesel emissions and exposures in communities near freight corridors and rail yards. Ensure that funding mechanisms are in place to expedite the implementation of the zero and near-zero emission freight and truck strategies and infrastructure. Prioritize spending on projects that deliver maximum health benefits for residents of the region, especially those living along the freight corridor.
- **Evaluate the number and type of new developments** that could be located in close proximity to freeways and high traffic roadways in the SCAG region under the new RTP. Work with air district, health departments and universities to develop and implement best practice policies for developments located near heavy traffic areas to reduce exposures to air pollution.

As health and medical organizations and professionals, we recognize that strong government policies to control harmful emissions and that dramatically increase options for active transportation are critical to improving public health and quality of life in Southern California. We stand ready to assist you in implementing a truly health protective, equitable and sustainable plan for Orange County and all of Southern California.

Signed,

Dolores Gonzalez-Hayes

Los Angeles, CA 90017

RE: Draft Regional Transportation Plan comment letter

Dear Mr Ikhrata:

Thank you for the opportunity to comment on the 2012 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). We have specific concerns regarding statements and recommendations made in the document regarding how transportation improvements can increase economic competitiveness in the SCAG region.

LAANE is an advocacy organization dedicated to building a new economy for all. Combining dynamic research, innovative public policy and the organizing of broad alliances, LAANE promotes a new economic approach based on good jobs, thriving communities and a healthy environment.

We strongly believe that infrastructure investment is crucial to our region's economic recovery and to increase mobility options for workers. However, at the same time families should earn middle-class wages, with health and pension benefits, as it also essential to stimulating our economy. Solid infrastructure investment and good jobs go hand-in-hand in being able to maximize public investment.

We find it very troubling that an agency, such as SCAG, would recommend or suggest that lowering workers' wages would make the region more economically competitive, as stated in the Economic and Job Creation Analysis Appendix. Public investment that is tied to increasing worker standards; workforce training programs and targeting communities disproportionately affected by poverty and unemployment will make us more economically competitive. SCAG should look towards models already existing, for example in Los Angeles County, to guarantee efficiency in infrastructure projects and put people back to work.

Draft Analysis Comments

1. On page 8, the draft Economic and Job Creation analysis states:

"The RTP can boost employment in two ways---providing jobs for persons in highway and rail construction, operation, and maintenance, and boosting the economic competitiveness of the SCAG region by making it a more attractive place to do business."

SCAG could take this recommendation one step forward by identifying strategies which ensure the creation of good-middle class job creation and project delivery. One such tool are Project Labor Agreements (PLAs), in which public agencies can use to attract a highly-skilled workforce to complete construction projects on-time and on-budget. PLAs, used in both the public and private sector, are pre-bid, collective-bargaining agreements between a developer (or agency) and the construction trade unions to set out wages, standards and benefits for workers on a construction project. In exchange, both parties agree to refrain from strikes or lock-outs. Because they are traditionally used on large-scale, multi-year projects, they provide excellent opportunities to develop jobs programs for communities.

LAANE has pushed for a more comprehensive approach by advocating for Construction Careers Policies, which combine a PLA and a targeted hire program, which requires contractors to set aside a percentage of construction jobs to individuals who live in communities most affected by high unemployment and poverty, and with barriers to employment.

PLA are an increasingly popular project delivery tool in the SCAG region. Construction Careers policies have been approved at the following agencies:

- City of Los Angeles Community Redevelopment Agency (CRA-LA)
- City of Los Angeles Department of Public Works
- Port of Los Angeles

Recently, Construction Careers Policies have been applied to transportation-related construction projects. In March 2011, the Exposition Line Construction Authority passed such a policy for Phase II of the light rail project. In January 2012, the Los Angeles County Metropolitan Transportation Authority (Metro) Board of Directors unanimously approved an agency-wide policy that includes a PLA and targeted hire program for projects greater than $2.5 million, which includes many projects funded by Measure R. Metro is the first transit agency in the country to approve such a policy. This approach can serve as a valuable tool for transit agencies throughout the SCAG region that are dealing with the twin problems of congestion and unemployment. In February 2011, the Federal Transit Administration (FTA) approved the use of targeted hire on projects receiving federal dollars. The FTA approval sets a national precedent for targeting disadvantaged workers on transit projects.

2. "How Transportation Improves Economic Competitiveness" Section (P. 8)

This section of the draft analysis "outlines five paths through which transportation improvements can increase regional economic competitiveness." We find it troubling that SCAG suggests that, under number 3, "Reduced Congestion Reduces Employees' Asking (or Reservation) Wage." It states, "Metropolitan areas, all else equal, lure more migrants into the region due the amenity value of lower traffic congestion. This increases the supply of available labor, *driving wages down.*"

These statements suggest that congestion reduction alone would encourage people to move into the SCAG region, as opposed to other more essential factors such as major industries that are rooted in the local economy---goods movement, tourism,

construction, entertainment, etc. We should be looking to strengthen industries that are vital to our economy, not creating low-road career options for residents.

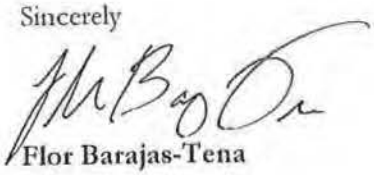
It is also highly problematic to have as a policy objective to *lower wages* when the SCAG region has high levels of poverty, unemployment, sluggish growth, and high levels of income inequality. SCAG has provided an analysis that essentially implies that lowering wages are a benefit to the region, and that the agency can help achieve that through the 2012 RTP congestion reduction interventions, projects and policies.

For example, the SCAG Region:[1]

- Ranked last in average wage per job at about $44,379 among the nine largest metropolitan areas
- Has the highest poverty rate among the nine largest metropolitan regions in the nation
- In 2006, had the highest housing cost burden among the nine largest metropolitan regions in the nation, with 53 percent of owner households paying 30 percent or more of their incomes on housing

The seven counties that are part of the SCAG region are grappling with significant challenges that have been further exacerbated by the recession. When workers spend less on transportation costs, a benefit of reduced congestion, they are able to spend their earnings in other ways, stimulating the regional economy. Given that housing prices in the SCAG region, especially in Los Angeles County, are very high, congestion reduction alone will not address affordability and supply, and how current income earnings play a role in where workers choose to live.

We suggest the following recommendations be considered in revising the RTP:



- Delete language in the 2012 RTP/SCS or appendices that suggest that lower wage rates in the SCAG region are a benefit of the congestion reduction strategies included in the plan;
- Include tools, such as project labor agreements with targeted hire, that allow government agencies to ensure that investment in transportation infrastructure also creates middle-class careers, especially in construction;
- Include an analysis on what the economic benefits of congestion reduction in improving the quality of life of workers in the SCAG region, which includes how the diversion of earnings from transportation costs to other vital services and industries can help stimulate our economy.

We hope that the agency takes these recommendations seriously and develops a blueprint for the region that improves the quality of life of working families through effective infrastructure investment and the creation of good middle-class career opportunities. If you have any questions or would like to discuss please feel free to call us at 213-977-9400.

Attn: Honorable Pam O'Connor, President of SCAG and Regional Council members
Southern California Association of Governments (SCAG)
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

RE: Active Transportation in SCAG's 2012 Regional Transportation Plan (RTP)

Dear Honorable O'Connor, Regional Council members and Policy Committee members:

On behalf of the Southern California Safe Routes to School Network and the Los Angeles County Bicycle Coalition and the many other organizations and individuals who have signed this letter, we would like to thank SCAG staff, Regional Council and Policy Committee members for all their hard work to date, we recognize the multitude of efforts that go into developing a long range plan of this magnitude.

As SCAG prepares to release the draft 2012 RTP in December 2011, which is a 25 year plan allocating $450 Billion in transportation funds throughout six counties in Southern California, and the region's first Sustainable Communities Strategy (SCS) as outlined under SB 375, we would like to share our rationale, observations and comments to the SCAG Board and policy committees on how the draft plan can better address public health and active transportation.

It is critical that the 2012 RTP set tangible and measurable goals to improve the safety of all community members, especially our most vulnerable road users, those walking and bicycling. We are concerned that the SCAG staff report to the Regional Council and Policy Committees, dated October 20th, failed to provide measurable goals in regards to Safety and Active Transportation. We encourage SCAG to be specific as to how the 2012 RTP/SCS will improve the safety of people walking and bicycling and how SCAG and the six County Transportation Commissions (SCAG Region CTC's: Imperial County Transportation Commission , Los Angeles Metro, Orange County Transportation Authority, Ventura County Transportation Commission, Riverside County Transportation Commission, San Bernardino County Association of Governments) can work to address and achieve policies listed such as: "making transit more bike friendly" and how to "encourage implementation of a Completes Streets policy across the region," (as stated on page 11 of 10/20 staff report).

Creating a more multi-modal transportation network in the SCAG region requires the RTP to be specific about how investments in active transportation will be funded, planned, prioritized, measured and developed in collaboration with partners and interested stakeholders. With those key principles in mind, we respectfully submit the following recommendations for your consideration:

1. Fund: Increase Funding Levels for Bicycle and Pedestrian Infrastructure: Currently close to 21 percent of all trips in the SCAG Region are done via walking and bicycling (2009 National Household Travel Survey) and 25 percent of all SCAG roadway injuries and fatalities are pedestrian and bicyclists (2008 SWITRS). The Region's last RTP, adopted in 2008,

allocated only 0.46 percent of its total funding for these modes. We respectfully request that the 2012 RTP includes strategies to significantly increase the proportion of funds allocated to active transportation so that over time, such funding reflects the proportion of trips made by walking and biking. We recommend the following:

- Preliminary estimates show a funding need in the range of $22B to $36B throughout the life of the 2012 RTP to fund the build-out of high priority pedestrian and bicycle investments as identified by local jurisdictions. Given the mode split, safety and collision trends, public health concerns and many other co-benefits we recommend that 5-8 percent of the 2012 RTP fund active transportation projects. (For a $450B plan, 5 percent equals $22B and 8 percent equals $36B.)
- All future SCAG Regional Transportation funding strategies (i.e. congestion pricing, cordon pricing, VMT fees) should allocate 10 percent of all revenue towards walking and biking improvements and investments to help meet the unmet funding gap for active transportation.
- Recommend the formation of a Active Transportation Funding Committee to assist in next six months while the RTP continues its development and scheduled adoption in May 2012. We recognize going from 0.46% to 5%-8% is a significant jump in investments, however we maintain that there is a tremendous unfunded need to make our streets safer and usable for all users. Many from around the region would be interested in assisting with identifying strategies for the unmet active transportation funding needs, as we would be happy to play a leadership role in this Committee.

2. Plan and Economics: Integrate Bicycle and Pedestrian Improvements into all Transportation System Preservation Projects: Road maintenance and the first and last mile connections to transit are crucial for creating a connected and sustainable transportation system. System preservation is inherently important to people walking, biking, and connecting to transit; there needs to be enhancements for complete streets - ensuring that when maintenance opportunities arise or are scheduled, that the region is leveraging its limited resources to enhance our multi-modal transportation network. Currently the potential benefits to of the Transportation System Preservation category fail to address how these investments will improve the safety and access of people walking and biking - it only outlines benefits to drivers. Therefore we recommend:

- Embed a Complete Streets Policy within the Transportation System Preservation category that requires any investments into system preservation on surface streets include improvements for pedestrians and bicyclists, and those accessing transit.
    - Funding for Transportation System Preservation of highways needs to include bicycle and pedestrian safety improvements at on/off ramps to ensure greater safety of people using those modes on surface streets that connect with ramps and help knit communities, that have been adversely impacted by freeway on and off ramps, back together.
- Adopt a Complete Streets checklist that requires County Transportation Commissions to demonstrate how each project is addressing all modes. This checklist should be included in the 2012 RTP to be implemented in 2014. This will assist in prioritizing projects that are critical in achieving regional goals.

3. Plan: Do Bicycle and Pedestrian Planning: Improving the walking and biking environments in our region cannot be done without adequate planning at the local level. Unfortunately, many SCAG cities do not have bicycle or pedestrian master plans; in Los

Angeles County, for example, only approximately 11 of 88 cities have bicycle master plans and four cities have pedestrian plans. Additionally, current station area plans fail to take into account the first and last mile of transit trips, which are usually done on foot or by bicycle. This lack of planning is a significant impediment to improving infrastructure for people who rely on bicycling and walking to connect to transit, work, school, and their daily needs. As such we recommend:

- Expand the Compass Blueprint program to support SCAG cities in the development of bicycle, pedestrian, Safe Routes to Schools, Safe Routes to Transit, and ADA Transition plans.
    - It is estimated that it would require approximately $200,000 per city to develop these plans (95 cities at $200,000). Identify and secure funding sources in order to set aside at least $19M in the 2012 RTP to support these planning efforts.
    - Establish a goal of 50 percent of SCAG cities having completed at least one plan by 2016 in order to prepare for the 2016 RTP.

4. Prioritize: Safety and Equity: Bicyclists and pedestrians account for 25% of all roadway fatalities and injuries in the SCAG Region (2008 SWITRS), yet these modes are currently receiving less than 0.46% of all available funding (2008 SCAG RTP). Studies also show that a disproportionate amount of those injuries and fatalities occur in low-income communities (Traffic Injury Prevention 09/11). It is critical that we are doing all we can to ensure safety for all community members, regardless of where they live or how they travel. Earlier this month, the Los Angeles Times wrote a compelling article on 3 young girls walking to school who were severely injured when a car struck them, it is imperative that our transportation plans are doing all they can to make sure these tragedies, and the high number in which they occur in the SCAG region, end. For these reasons, we recommend that the RTP take the following steps to increase safety and equity:

- Analyze bicycle and pedestrian collision data to understand where high rates of collisions in the six-county region are happening and if collision rates are increasing or decreasing each year. SCAG staff should present a yearly report to the SCAG Board to help inform the public and Board on the state of walking and bicycling safety, and Safe Routes to School programs in the region. Many of the counties (San Bernardino, Riverside, Los Angeles) in the SCAG region are working to support local efforts and investments - these projects are increasing safety and improving the mode split, and addressing community concerns.
    - The RTP should set a goal of working towards zero deaths and should prioritize improving the safety of all transportation modes.
    - Utilize Transportation Injury Mapping System (TIMS) in the 2012 RTP. TIMS is a suite of Web-based tools created by researchers at the UC Berkeley Safe Transportation Research and Education Center (SafeTREC). The system is free and open to the public. Users can select collisions based on numerous criteria, as well as map each collision. The two most comprehensive TIMS tools are based on the California Statewide Integrated Traffic Records System (SWITRS) database of serious and fatal collisions. Currently, TIMS has SWITRS data from 2000-2008. Newer data will be added as it becomes available.
- Allocate greater resources to cities with little or no bicycle/pedestrian infrastructure and/or plans, high rates of collisions (using TIMS data), and significant populations of low-income residents. Identify these communities in the 2012 RTP in order to allocate resources for technical assistance and prioritize planning and infrastructure resources.
- Expand the “Toolbox Tuesdays” program to include bicycle safety design, pedestrian safety design, ADA design, and training on how to use the TIMS program for staff from

the 190 SCAG cities, to expand understanding of where collisions are happening, how to improve the safety for people walking and bicycling, and enhance local jurisdiction HSIP, SRTS, and other grant opportunity applications.

5. Measure: Conduct Pedestrian & Bicycle Usage Counts: We must increase documentation of bicycle and pedestrian usage and demand by regularly assessing numbers of people walking and biking. Without such figures, it is difficult to forecast usage or measure the positive benefits of investments in these modes.

- Create and fund a regional bicycle and pedestrian count program at SCAG establishing yearly usage counts at key locations in cities throughout the SCAG region. Use the data collected to establish trends, set goals, evaluate fund requests for facility improvements, prioritize improvements, and show the impacts of recent improvements. Set aside funds in SCAG's 2012/2013 OWP to create and maintain this program in future years. (*See link:* Nashville Metropolitan Planning Organization's program, Technical Memorandum on Regional Pedestrian and Bicycle Count Procedures)
- The RTP should set a target for increasing the amount of all trips made by bicycle and the amount of walking to transit trips (measuring the 1st/last mile).

6. Collaborate: Review Local Input, Provide Opportunities for Stakeholders to Engage and Incorporate Feedback: There are growing voices all over the six county SCAG region in support of safe walkable and bikeable neighborhoods for users of all ages and abilities. Safe Routes to School programs and investments is an example of a broad-spectrum program that while focusing on improvements to ensure the safety of our youth, ultimately benefits the whole neighborhood. Many of these individuals, community members, professionals - and more, have concerns about the fundamental change needed in our region. SCAG conducted valuable and well run workshops this summer, and we commend those efforts, however we are concerned there has not been a report compiled and presented on the feedback received in those workshops. We understand SCAG staff is working on this. We urge these finding to be shared in a timely manner with the Board, so that they may understand their constituents. We ask that the staff to report on what was heard and how these comments are addressed in the draft 2012 RTP.

- We recognize there is a significant increased level of investments and policies outlined in this document, this is built on the demand, interest and support for active transportation happening all over the SCAG region. With increased opportunities for stakeholders to weigh in on the Region's Transportation plan, we believe this will strengthen the RTP and its ability to be successfully implemented over the coming years.

We recognize SCAG is not the implementer for transportation improvement projects, but SCAG does have the ability to do better planning, monitoring, collaboration, and evaluating to provide support and insight to counties, cities and communities on how to address our transportation opportunities and challenges and move towards safer and more usable streets for the region - regardless of choice of travel mode - all the while maximizing our limited resources in which to do so.

Thank you for considering our comments and concerns.

RE: Comments on the Drafts of the 2012 Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS) and the Program Environmental Impact Report (PEIR)

Dear Mr. Ikhrata:

For the past three years, business and industry representatives from throughout Southern California have participated in the Southern California Association of Government's extensive process used to develop the region's Draft 2012 Regional Transportation Plan (RTP), which includes an inaugural Sustainable Communities Strategy (SCS). Our interest in this process has been particularly keen given both the significant economic challenges currently facing our region's economy and the fact that the inaugural SCS could – if not considered from many viewpoints – have unforeseen negative consequences.

In light of our ongoing participation and understanding, we appreciate the tremendous effort that SCAG's staff and leaders have put into the process that led to the Draft 2012 RTP/SCS & PEIR. The development of this RTP/SCS followed an inclusive approach with SCAG holding hundreds of meetings with SCAG's public and private stakeholders. We also appreciate the extensive economic analysis that SCAG has performed on the Draft RTP/SCS in order to provide all stakeholders and SCAG's Regional Councilmembers with an understanding of the financial impacts of the plan.

As representatives of Southern California's broader business community, we recognize the crucial roles that transportation and infrastructure have in maintaining our region's economy and quality of life. Accordingly, through this letter, we join together to provide SCAG with general comments regarding remaining significant concerns about the contents of both (i) the Draft 2012 RTP/SCS, and (ii) the Draft Program Environmental Impact Report (PEIR).

From the beginning, representatives of businesses and industries have agreed upon the qualities of a good RTP/SCS. Those qualities can be summarized as follows. The RTP/SCS should:

- Foster economic growth and job creation in a balanced and accountable manner and in recognition of foreseeable regional population growth;
- Utilize all revenue sources very efficiently, and utilize new revenue sources only if they are economically sound and equitable;
- Honor the prerogatives that local governments – as the level of government with the greatest understanding of and sensitivity to community interests and context – should continue to enjoy concerning land use and community development;
- Comply with the California Environmental Quality Act (CEQA) and federal environmental laws and regulations (e.g., federal Clean Air Act conformity); and
- Allow for expeditious review and approval of projects that are consistent with a sound and reasonably accommodating RTP/SCS.

Despite our overall appreciation for the work put in by SCAG's staff, there are important aspects of the Draft 2012 RTP/SCS and Draft PEIR which, we believe, require much more consideration and correction or clarification before SCAG approves the 2012 RTP/SCS and the Final PEIR. Corrections – or at least substantial clarifications – are needed in order to bring the Final 2012 RTP/SCS and PEIR back into line with the principles set forth above.

Stated here in the most general terms, SCAG's staff and ultimately its Regional Council should address the following concerns and correct the final 2012 RTP/SCS and the accompanying PEIR.

1) The Draft PEIR is unduly prescriptive and imposes mitigation requirements that are not suitable for mandatory consideration at the individual project level. Simply put, many of the prescribed mitigation measures address matters at too small a scale for a regional transportation and land use strategy. The Draft PEIR lists more than 500 discrete mitigation measures that cover a broad range of topics; and it asserts that SCAG has preliminarily found that all such mitigation measures are feasible and "can and should" apply to all future projects in the region. Many of these mitigation measures were drawn from "model policies" that were drafted in 2009 and were intended for consideration only at a jurisdictional planning level – not an individual project level. Many of the mitigation measures listed are not reasonably considerable – let alone feasible – generally at a project level throughout Southern California.

2) Many of the mitigation measures set forth in the Draft PEIR have no relationship to the RTP/SCS or its impacts. For example, the Draft PEIR invokes mitigation measures ranging from low-flow toilets to green roofs. Such mitigation measures have nothing to do with the regional dispersion of future development and redevelopment or its indirect effects on emissions from vehicular use (which is the proper focus of the RTP/SCS).

3) The Draft PEIR attempts to etch in stone the project-level consideration and potential incorporation of mitigation measures that conflict with, or inevitably will conflict with, highly-evolved and dynamic subject-matter regulations. For example, the Draft PEIR would prescribe mitigation requirements concerning matters ranging from storm water management to energy efficiency standards to fire protection to landscaping to water supply analyses – all matters that are highly regulated and subject to dynamic standards that either are now or are bound to be at odds with the PEIR.

In light of the above-stated problems with the Draft PEIR, we believe that it needs to be substantially rewritten to clarify what we understand was intended by SCAG's staff and leaders – that the PEIR should not subtract from or interfere with local governments' reasonable prerogatives under CEQA. As the Draft PEIR now stands, the environmental analysis and suggested mitigation requirements would likely lead to more CEQA litigation rather than to CEQA streamlining as California Senate Bill 375 (2008) promised.

Turning to the substance of the RTP/SCS as a policy matter, we have the following additional general comments:

4) The RTP/SCS is undergirded by analysis which shows the dispersion of populations and employment shown and categorized at the level of sub-jurisdictional "transportation analysis zones" (TAZs). The TAZ level of detail is, we believe, too small and precise a level at which to prescribe the spatial dispersion of development and redevelopment, particularly in light of the regional nature of the RTP/SCS. Page 148 of the SCS should therefore be clarified to indicate that questions of consistency with the RTP/SCS should be substantively measured and determined at a jurisdictional or sub-regional level, not at a TAZ level.

5) The RTP/SCS should aim to reflect and accommodate both the short-term future of the SCAG region and its long-term future. For example, the RTP should better anticipate the need for and reasonable likelihood of a gradual transition in the region's overall vehicle fleet (e.g., gradually towards alternative fuels) and the ongoing need for enhancements to vehicular mobility even as more mass transit comes to fruition.

6) More detail, clarity and explanation are needed concerning the new revenue sources that are outlined within the plan document. New revenues account for $219.5 billion out of the total $524.7 billion needed for the transportation plan, yet there is very little detail explaining these significant new fees and impositions (see page 95 & 96 of the Draft RTP/SCS).
To fully and fairly evaluate these proposals, the business community and all stakeholders need the benefit of additional detail and explanation. In particular, we need clarity and assurance regarding the following:

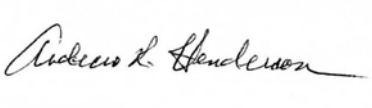
   a. The new revenue concepts assumed within the RTP/SCS must be fair, equitable and economically sound, meaning that an appropriate nexus exists to assure that new revenues are drawn fairly and proportionally from those who benefit from the related transportation infrastructure or improvement.

   b. The new revenue sources within the RTP must be effectively allocated, meaning the plan should clearly articulate how resources will be efficiently and responsibly allocated so that there is the best possible return on investment for the expenditure of these new transportation funds. SCAG needs to show that it will be a responsible, accountable and innovative steward of the new revenues that it is proposing.

7) New revenues from fees on businesses operating in the SCAG region – and particularly the "Freight Fee/National Freight Program" listed on page 96 of the Draft RTP – need to be developed and implemented at the federal level, not the local and regional level. Unless such fees are imposed on a national scale, the region's competiveness will be compromised.

8) In the RTP, SCAG should identify and highlight the significant economic contributions of the goods movement sector to the regional and state economy. Specifically, the RTP should acknowledge that, as business stakeholders work with regulatory agencies to further reduce emissions in the SCAG region, any technology introduced must not compromise the safety, velocity, cargo throughput, economic competitiveness, or reliability of the goods movement system. It would be helpful for SCAG to state clearly in the RTP that, to date, stakeholders have not reached consensus on technologies, timing, funding, or emissions impacts of the various options that SCAG examined in the RTP. For example, SCAG discusses long-term steps towards a "Zero Emissions Container Movement System" (ZECMS). If SCAG chooses to pursue such a fundamental shift in new technology, it would need to work with all goods movement stakeholders to clearly establish whether and, if so, when and where within the transportation infrastructure a ZECMS option could be demonstrated and evaluated without negatively effecting the velocity and throughput of the system.

9) With the recent elimination of redevelopment agencies, the ability of local jurisdictions to meet the densification of urban centers in the near term is challenged, given the costs related to aging or inadequate infrastructure capacity and high development costs for higher density projects. The elimination of redevelopment agencies also threatens the availability of sufficient housing options necessary to meet the needs of a dynamic workforce. In fact, since the passage of SB 375, the State of California has stripped local governments of funds that were previously available for



transit, transportation and redevelopment. This follows many years in which the state diverted revenues from gasoline, sales, income and other taxes needed for local government programs. Local governments cannot help to fulfill the 2012 RTP/SCS without increased, not decreased, state support. SCAG should emphasize the need for the state to restore support for planning, transit, transportation and redevelopment or other necessary funding to pre-SB 375 levels in order to speed the attainment of mandated goals.

While we find many very positive aspects in the plan, especially related to principles and direction, these significant issues need to be addressed. The short list of general concerns set forth above is not meant to be exhaustive. Many of the organizations that subscribe to the above-stated comments will be commenting more robustly in separate writings. We join here, however, to express our unity in finding the Draft 2012 RTP/SCS and PEIR to be in need of significant clarification and correction. We are also jointly committed to completing this process and, over the remaining weeks, working closely with SCAG to develop and adopt a smart, flexible, accountable, and economically sound RTP/SCS.

Los Angeles, CA 90017

Dear Mr. Ikhrata:

We want to commend you and your staff for the years of hard work in preparing the Draft 2012 RTP/SCS for the region. As we are undergoing a General Plan Update for the unincorporated areas of Los Angeles County, it is an exciting time to be coordinating our local land use planning efforts with SCAG's regional efforts to meet our State climate change goals.

The Department of Regional Planning has worked with your staff to provide the County's local input for the growth forecast for the unincorporated areas of Los Angeles County. The County's recommendations have been largely been based on policies from the existing General Plan, knowledge of the unincorporated areas, alternative projections prepared by the County's Urban Research section, and proposed policies in the General Plan Update.

We are concerned that the Draft RTP/SCS states that the growth forecast is based on local input. The Overall Land Use Pattern Maps for Los Angeles County (Part A of the SCS Background Documentation appendix of the Sustainable Communities Strategy Chapter) reflect land use patterns that are not part of the County's local input. In particular, the land use pattern for the northwest corner of the unincorporated Antelope Valley reflects significant growth by 2020. A review of the TAZ-level socioeconomic data for that area shows projections of over 10,000 new households by 2020, and over 22,000 new households by 2035. The area is a greenfield designated Non-Urban by the Antelope Valley Area Plan. The area also consists of environmental and hazard constraints. Another concern is the land use pattern in unincorporated Rowland Heights and unincorporated South Diamond Bar along SR-57, particularly the designation of this area as a High Quality Transportation Area by 2035. This area is vacant, designated Open Space or low density, and also consists of hazard and environmental constraints.

It is our understanding that SCAG assumed growth within these areas based on knowledge of pending large-scale projects through the CEQA Intergovernmental Review (IGR) process. The assumption of growth based on pending individual projects is not explicitly described in the Draft RTP/SCS as part of SCAG's growth forecast

methodology. In addition, assuming growth based on individual and pending projects is of concern given the uncertainty of projects that have not been considered by a decision-making body and the public, and the significant time and complex issues entailed in processing large-scale projects. The projects mentioned above will require legislative acts by the Los Angeles County Board of Supervisors and this action should not be assumed. In addition, assuming a pending project in the growth forecast puts local governments in a difficult position and causes confusion when the project is actually considered for public hearing. Furthermore, as large-scale projects are often built in phases, assuming full build-out for an individual project within the horizon of the RTP may not always be appropriate—in particular, assuming over 10,000 new households by 2020 and over 22,000 new households by 2035 in one particular TAZ. These projections are not consistent with historical data. The Antelope Valley absorbs less than 200 new units per year. Even if 100% of the growth were in this one area, these projections would far exceed historic patterns.

Given the outlined concerns, we recommend the following amendments to the Draft 2012 RTP/SCS:

- Amend the Overall Land Use Pattern maps and adjust the associated TAZ-level socioeconomic data to redistribute the growth assumed to occur due to pending large-scale IGR projects to areas where the County encourages growth in the General Plan Update, such as Transit Oriented Districts; and
- As an alternative to using pending large-scale IGR projects to inform growth distributions in the Draft RTP/SCS, add a separate section to the Draft RTP/SCS that acknowledges pending large-scale IGR projects throughout the SCAG region and their potential to impact future growth forecasts upon approval and adoption by the local jurisdiction.

Consistency between the General Plan Update and Draft RTP/SCS is an important part of advancing the goals of the RTP/SCS at the local level. We acknowledge that several large projects are in the entitlement process, and at the time projects are approved it would be appropriate to amend the RTP/SCS. We look forward to continuing to work with you to realize our shared vision to create a socially, economically, and environmentally sustainable region.

Sincerely,

Richard J. Bruckner

Dear Mr. Ikhrata:

Thank you for the opportunity to comment on the Southern California Association of Governments' (SCAG) Draft 2012 Regional Transportation Plan (RTP/SCS).

We would also like to compliment SCAG on the immense stakeholder outreach process that was undertaken to develop the RTP/SCS in conjunction with the Sustainable Communities Strategy (SCS), in order to develop this draft RTP/SCS. We find the document to be well-written in identifying many of the key challenges our region faces.

Attached for your consideration are our comments on the Draft 2012 RTP/SCS.

Again, SCAG has made an exceptional document from a challenging set of requirements, and we commend you.

Sincerely,

for Arthur T. Leahy
Chief Executive Officer

Attachments

Comments on Draft 2012 Regional Transportation Plan

- We commend SCAG for the significant and unprecedented outreach to MTA, sub-regional agencies, and the public in the development of the Draft 2012 RTP/SCS. We also acknowledge the extensive and dedicated effort on the part of SCAG to craft a Southern California approach to the new SCS requirements of SB 375. We are pleased that the Draft 2012 RTP/SCS has been able to meet both the air quality conformity requirements of the federal Clean Air Act, and green house gas emission (GHGe) reduction requirements necessary to comply with SB 375.

- We appreciate the working relationship between SCAG and MTA staff necessary to integrate our 2009 Long Range Transportation Plan (LRTP) projects, programs, and financial assumptions into the Draft 2012 RTP. It appears that the Draft 2012 RTP includes all projects and programs funded by MTA in the 2009 LRTP. We note that SCAG has identified a number of projects and programs that are beyond funding levels of the LRTP. We assume that these projects and programs will be funded through new or innovative funding programs that SCAG has identified in the Draft 2012 RTP as "reasonably available" funding sources over the life of the RTP. Examples of projects beyond the funded LRTP include:

    - East-West Freight Corridor between the I-710 and the I-15.

    - Phase I of the California High Speed Rail Authority (CHSRA), pending an agreement between CHSRA, Metrolink and LOSSAN to identify funds to bring local systems up to high speed (110+ MPH) where possible.

    - A regional Express/HOT Lane Network that expands our Fast Lanes pilot project to include the I-405 and SR-91.

    - Various modal programs, including bus and rail expansion, TDM, TSM, bicycle, pedestrian, and operations and maintenance.

- MTA has proposed and is advocating a program known as America Fast Forward (formerly known as the 30/10 Initiative) to look at federal loan and bonding mechanisms which could accelerate the completion of 12 transit projects in 10 years instead of 30 years. We believe that such a program is beneficial to Southern California counties that have a tradition of self-help local sales tax mechanisms, and that those self-help traditions should be rewarded through new federal bonding or loan assistance programs. Clearly this program would assist the region in the earlier attainment of federal and state air quality conformity and GHGe reduction requirements. We would recommend that a section be included in the Draft 2012 RTP regarding America Fast Forward, and that this section include SCAG policies and actions to partner with MTA and other county transportation commissions to support and advocate for federal enactment of this program.

Additional Technical Comments on SCAG Draft 2012 RTP/SCS

- We note that page 50, paragraph 3 states that "our region has virtually no bus lanes, especially compared to other major metropolitan areas." We would suggest that this reference be revised to acknowledge that MTA has opened the highly successful Orange Line busway, has federal approval of a Very Small Start Grant to implement bus lanes on Wilshire Boulevard, and that the MTA Board has recently directed staff to conduct a countywide transit study to identify a minimum of five additional bus lane candidate projects. Additionally, we have been operating dedicated bus services for some time on the El Monte Busway and on the Harbor Transitway.

- The Transit Policies on page 50 and the SCS chapter make reference to High Quality Transit Opportunity Areas (HQTAs). We would encourage SCAG to identify in the Draft 2012 RTP the specific areas that will be designated as HQTAs and the benefit of this designation.

- On page 66, in the paragraph on "Logistics activities – including warehouse and distribution facilities", we would suggest adding that warehouses and distribution centers also perform value-added services to prepare goods for retail sale, such as packaging and adding of accessories. These services also create jobs for the SCAG region.

- On page 67, in the section "Components of the Regional Goods Movement System", we would encourage SCAG to add rail intermodal facilities (ICTF, Hobart, etc.) as a separate bullet point for two reasons. First, they play a significant role in the goods movement system, while also generating traffic and environmental impacts. Second, they are mentioned as a component of the rail improvement strategy (ICTF and SCIG are specifically mentioned).

- On page 71, it should clarify in the text that even though the specific alignment has yet to be determined, the east-west freight corridor would generally parallel the UP Los Angeles subdivision/SR-60 between the I-710 and I-605, San Jose Creek/SR-60 between the I-605 and SR-57, and the SR-60 east of the SR-57.

- On page 71, the text states the benefits of an east-west corridor, but SCAG may also want to state why this corridor was selected over the 210, 91, and 10 using information contained in the Comprehensive Goods Movement Study.

- On page 71, SCAG may want to highlight that the east-west freight corridor is envisioned to be a clean freight corridor similar to that which would be built on the I-710.

- On page 72, we suggest that the bottleneck relief strategy report should be included in the technical appendix and footnoted in the "Bottleneck Relief Strategy" section.

- On page 72, SCAG may want to add another paragraph on smaller-scale, near-term goods movement improvements, such as truck climbing lanes on the I-5 and arterial improvements throughout the region.

- On page 74, under Key Rail Projects in the Draft 2012 RTP, we encourage SCAG to highlight the ACE San Gabriel Trench, as it is the largest and most significant ACE grade separation project ($498 million).

- We concur that the Orangeline High-Speed Transit corridor improvement from Union Station to Palmdale is in the Strategic (unfunded) portion of the Draft 2012 RTP/SCS.

- On page 207 of the main RTP/SCS document, in the last paragraph, that refers to America Fast Forward, please add "and 14 highway projects" in the third sentence after the phrase "to build 12 key mass transit projects".

Passenger and High Speed Rail Comments Starting on Page 51

- We suggest that SCAG add a definition of the acronym "LOSSAN".

- To clarify which draft CA HSR Business Plan is being referred to, SCAG may want to add the 2012 date.

- SCAG may want to indicate that the CA HSR is estimated to reach our region with the Initial Operating Segment (IOS) in 2021, and the Bay to Basin phase in 2026. Furthermore, it should be clarified in other locations in the document, that the IOS will connect to southern California's network in 2021.

- Since the actual speeds for the system will vary by location, SCAG may want to remove the reference to the definition of 110 MPH for the CA HSR system.

- On page 51, subsection "Implementation of Phase 1 of the California High-Speed Train (HST) Project", SCAG may want to define which "Authority" is being discussed.

- We request that SCAG clarify that Prop. 1A will allocate $9.95 billion in funding for the project (the current Draft reads almost $1 billion less: "$9 billion").

- We suggest that SCAG state that the $950 million in funding needs to be allocated by the State. Furthermore, a Memorandum of Understanding is anticipated between the CAHSRA and southern California agencies to identify funds for the region for advance investment in high speed rail corridors and connections.

- On page 52, we suggest that SCAG provide a definition or description of "grade closures".

- We suggest a source of where the LOSSAN strategies are from, to provide clarity.

- Starting at the bottom of page 52, in the section "Improvements to the Existing Metrolink System", we note that positive train control is not a "strategy", it is mandated by Federal law. SCAG may want to add that Metrolink will incorporate this developing technology two to three years ahead of the rest of the nation's passenger railroads.

- The term "speed capacity improvements" needs to be clarified: either it is a "speed improvement" or a "capacity improvement".

- The second paragraph on page 53 suggests that Metrolink will be connected in 2035 when the HST reaches the Central Valley. We suggest rewording the paragraph to be in accordance with Metrolink's operational area and the California High Speed Rail Authority's Business Plan.

- Furthermore, the final sentence in this paragraph implies that it is known what would be needed for travel times of one hour. This is under study regarding the feasibility for Metrolink operations. We ask that SCAG state that there may be significant costs and impacts of such an option.

Addendum to Comments on the Draft 2012 RTP/SCS
Comments on the Technical Appendices

- It appears that all strategic projects from the Supplement #1 Strategic Plan to the 2009 LRTP were added, but the original strategic projects from the 2009 LRTP were not added. Please add the 2009 Strategic Projects on pages 31 and 37.

- In the Transportation Safety Appendix, we suggest using the term "people [or persons] with disabilities" for describing members of the public for whom the Americans with Disabilities Act applies.

- The Sustainable Communities Strategies (SCS) Background Technical Appendix should include the methodology for calculating GHG emission reductions associated with the RTP/SCS alternatives, including assumptions and discussion of off-modeling analysis.

- The SCS Background Technical Appendix should provide some discussion of the relative benefit of various transportation and land-use strategies toward reducing regional greenhouse gas emissions. For example, how much of the reduction is attributable to the VMT fee, TDM measures, TSM measures, etc. Moving forward, this information would be useful for cities and other agencies seeking to reduce GHGs in local Climate Action Plans and transportation planning efforts.

- In the Aviation and Ground Access Technical Appendix: on page 126, on Table 4-8, under the Exposition Light Rail Phase II, the description currently reads that it will "connect" to the Exposition Light Rail Phase I, and it should be corrected to say that it will "extend the Exposition Light Rail Phase I"; and, the same Table 4-8 should include the Slauson Light Rail: Crenshaw Corridor to Metro Blue Line Slauson Station (RTP # 1120003) because it provides additional access to LAX.

- On page 7 of the Executive Summary, and on pages 95 and 100 of the Draft 2012 RTP/SCS, we request that SCAG replace the word "tunnel" and replace it with "transportation improvement options".

- In the Project List Appendix please make the following changes:

    - On page 27, delete the description for the 13th entry and replace it with, "Route 710: Study to evaluate transportation improvement options and prepare alternatives analyses, engineering and environmental studies" (EA #187901 and PPNO# 2215).

- On page 162, delete the description for the fifth entry and replace it with, "Route 710: Study to evaluate transportation improvement options and prepare alternatives analyses, engineering and environmental studies" (EA #187901 and PPNO# 2215).

- On page 163, in the first entry, delete the description and replace it with, "Develop transportation improvement options".

- On page 430, the fifth entry, delete the alternatives to the SR-710 tunnel option and replace it with, "SR-710 transportation improvement options".

- On page 432, the sixth entry, delete the description and replace it with, "SR-710 transportation improvement options".

- In the Highways and Arterial Appendix, on page 3, the first entry under Toll Lanes heading, delete the description and replace it with "Develop transportation improvement options".

- Regarding the Passenger Rail Appendix:

  - On Page 1, reference is made to Amtrak service. It should be stated that all Amtrak service other than the Pacific Surfliner are intercity and long distance routes that connect Los Angeles County and adjoining counties with destinations throughout California and the United States. Also, the Antelope Valley Line is part of the LOSSAN Corridor between Burbank Junction and Los Angeles Union Station.

  - The Passenger Rail document should eliminate reference to Maglev and the SCAG HSRT as this creates confusion and appears to indicate that the technology and the proposed corridor are still under consideration. As written, it appears as if the Maglev technology and the California High Speed Rail program are in competition with each other. It is unclear why this is heavily covered in this document when the conclusion is that the project is no longer planned.

  - The vision for rail service in the Southern California region should provide a stronger emphasis on intermodal linkages at the three regional airports that will be physically or temporally linked to the California High Speed Rail. These airports include Palmdale, Bob Hope and Ontario. Each of these airports already has passenger rail accessibility, but this will be strengthened as a result of current planning and system development efforts.

  - The document should amplify on the role of regional rail integration and service/operating improvements in meeting regional greenhouse gas reduction and vehicle miles traveled/vehicle trip reduction goals. Further, the document should identify the passenger rail station areas

as candidate locations for land use intensification that address the regional jobs/housing imbalances.

- The discussion of the statewide HST system and what it means for southern California is fragmented. There should be a clearer definition of the technology, routes, and what it means for regional connectivity.

- The document should make clearer the desired effect of the Early Infrastructure Investment initiative both to develop the way for High Speed Rail and to incrementally upgrade existing infrastructure to support higher speed, more efficient and safer passenger rail service linking the region to the High Speed Rail system. This could include reference to the use of shared corridors and shared corridor/shared track scenarios that will help improve existing passenger service and enhance service integration across the region.

- The discussion of the Pacific Surfliner should refer to the recent efforts to develop the business plan for the corridor and the addressing of short term improvements. Also, the discussion should include the efforts to create synergy in the corridor and the efforts to move towards local governance. The discussion should include the advantages of this.

- The discussion of Metrolink should include capital studies in Los Angeles County that are underway. Specifically it should include:

    - Antelope Valley Line Study - this is a comprehensive study of the Antelope Valley Line (AVL) for capital improvements and enhancements to the overall safety. The study will address capacity and travel time issues as well as grade crossing upgrades and grade separations. The proposed improvements will be modeled and from that a prioritization and funding strategy will be developed for implementation of the improvements.

    - CP Raymer to CP Bernson Double Track - this is Preliminary Engineering and Environmental work (PE/NEPA) to double track this segment of the Ventura Line. This project will complete the double tracking of the LOSSAN Corridor from Chatsworth to Orange County. Metro received an ARRA grant for this work and is partnering with Metrolink to complete it. Metro is pursuing funding for construction.

    - Van Nuys Station - The Van Nuys station on the LOSSAN Corridor is used by Amtrak and Metrolink. This is a single platform station that is an operational bottleneck in the system.

Metro received an ARRA grant to perform PE/NEPA work for a second platform at this station.

- Strategic Studies - Metro is moving forward with strategic studies of the other Metrolink lines in Los Angeles County. Metro will be working with the other member agencies on shared lines to develop overall strategic priorities.

- On Page 15, regarding the discussion of decision points after construction of the Initial Construction Segment (ICS); there will not be a decision to continue the project. That will be an ongoing discussion prior to that. Prior to the completion of that segment there will be discussion regarding proceeding north or south. The document should not discuss decision points for the system. This will be an ongoing process for the CHSRA and will be based on business models and funding opportunities. Also, on this page the various stages should use the term "extend" rather than "build".

- Note that the CHSRA has decided to move forward with a Palmdale station and not move forward with the I-5/Grapevine alternative. This should be mentioned and the discussion should include what this means for the Palmdale area.

- Page 17 refers to the "Authority's draft 2011 Business Plan". This may be the California High Speed Rail Authority but it is noted within the Metrolink discussion and can confuse the reader. We suggest stating the specific Authority involved.

Re: Comments on the Draft 2012 Regional Transportation Plan

Dear Mr. Ikhrata:

Los Angeles World Airports (LAWA) appreciates the opportunity to comment on the Draft 2012 Regional Transportation Plan (RTP), and is committed to working with all levels of government to address the future transportation needs of Southern California. As the operator of two of the region's commercial airports, Los Angeles International (LAX) and Ontario International (ONT), and operator of Van Nuys General Aviation Airport (VNY), LAWA plays an important role in meeting the region's demands for air travel and goods movement.

LAWA, as a proprietary department of the City of Los Angeles, is responsible for operating its airports in a safe, efficient, and fiscally responsible manner on behalf of our passengers and the citizens of each market service area. Furthermore, we must operate within the constraints placed upon our resources by federal law and regulation, along with our contractual obligations to our tenants and partner agencies. It is in this context that LAWA provides the following comments to the Aviation and Airport Ground Access portion of the RTP:

1. Use of Airport Funds

LAWA's first priority is to maintain safe and efficient airports. Our revenues and expenditures are used to support that effort and fulfill our commitment to supporting the national airspace system. All airports have a tremendous demand for capital improvements.

As such, most airports depend on financial support from the FAA via grant funds for eligible construction and noise mitigation projects. In return for federal grant monies, the FAA includes grant assurances that limit use of airport revenue solely for aviation-related uses on airport property. Using airport funds for non-airport functions violates federal law and jeopardizes the airport's ability to receive federal grants.

1 World Way Los Angeles California 90045-5803 Mail P.O. Box 92216 Los Angeles California 90009-2216 Telephone 310 646 5252 Internet www.lawa.com

Nevertheless, LAWA seeks to partner with SCAG to find solutions to support ground access improvements to airports, other primary transportation facilities, and "secondary" airports in the region.

2. Use of Airport Express Buses

The RTP includes an "Action Step" which would plan and promote a regional system of airport express buses, modeled in part on the FlyAway® service currently operating at LAX. LAWA agrees that express buses are a promising solution to certain ground access problems. However, it has been LAWA's experience that express buses are most effective at airports with high passenger demand and in cities with concentrated populations of passengers and employees. Even then, high fares or significant subsidies have been required to maintain an effective level of service.

LAWA has spent a great deal of resources carefully studying the feasibility of establishing new FlyAway® routes to serve LAX. However, even for LAX, with its extensive market area and passenger base, it has been a challenge to find station locations that are both viable and successful. LAWA invites SCAG to continue examining ways to bring similar projects to other airports, but cautions that these services, by themselves, may not be effective in increasing passenger demand at "secondary" airports.

3. Aviation Activity Constraints

LAWA agrees that the aviation activity constraints in the region, and potential dispersion of that activity at other airports, should be re-examined in subsequent regional plans.

4. Additional Technical Clarifications

LAWA also wants to offer the following technical clarifications and comments to the RTP:

- SCAG has reported a number of vehicle trips to LAX under existing conditions as well as under a future forecast for 2035, citing the LAX Master Plan EIR/EIS as a justification for those trip numbers. However, the numbers reported do not correspond to data that LAWA has previously reported or used in any environmental analysis. LAWA requests clarification of those data points.

- LAWA recommends the following changes to Tables 4-6 and 4-7 in the Aviation and Airport Ground Access sections of the RTP:

    - In Table 4-6, the following projects should be included in the list of projects completed since the project notice of preparation in 2008 (footnote 1): Douglas St., La Cienega Blvd., Lincoln Blvd. (all), Nash St.,

Sepulveda Blvd. (both), the I-105 westbound off-ramp at Sepulveda Blvd., and the I-405 at SR-90.

- Two other projects on Table 4-6, Arbor Vitae St., and the I-405 from I-10 to SR-101, are under construction as of January 2012.

- In Table 4-7, Project LAX-19, which includes Lincoln Blvd. improvements, has already been completed.

- LAWA recommends that SCAG include in the RTP a portion of the project referred to as LAX-10, widening Aviation Blvd. from Century Blvd. to Manhattan Beach Blvd. to 3 lanes in each direction.

5. 2011 Air Passenger Survey

Lastly, the 2006 LAX Air Passenger Survey was used to create several data points within this section of the RTP. LAWA is hoping to unveil the results of its 2011 Air Passenger Survey in February of this year. SCAG should consider updating its Appendix with this new data as it finalizes the RTP. LAWA will post the results of this survey on our website (http://www.lawa.org) once the report is completed.

Thank you for the opportunity to review the 2012 Draft RTP. We hope that these comments will be helpful in developing a successful plan for the region. If you have any questions regarding these comments, please contact Diego Alvarez, Regional Transportation Coordinator, at 424-646-5179 or dalvarez@lawa.org.

Sincerely,

Michael D. Feldman
Deputy Executive Director

MARCH JOINT POWERS AUTHORITY

February 14, 2012

Margaret Lin
SCAG
818 W. 7th Street, 12th Floor
Los Angeles, CA 90017

SUBJECT: COMMENTS ON THE DRAFT RTP/SCS

Dear Ms. Lin:

The March Joint Powers Authority (JPA) is pleased to submit comments on the 2012-2035 Draft RTP/SCS. We recognize that SCAG has put a significant amount of time and energy into the creation of this document. March JPA has the following comments after reviewing the Draft document:

1) Chapter 4 – Sustainable Communities Strategy: Exhibit 4.18, Land Use Pattern Riverside County (2035) identifies a "High Quality Transit Opportunity Area" located along Alessandro Boulevard in proximity to Interstate 215, within the City of Riverside, City of Moreno Valley, unincorporated Riverside County and March Joint Powers Authority. The concentration of high density residential and/or high intensity commercial uses along portions of the Alessandro corridor would conflict with the airport Accident Potential Zones as defined in the 2005 March Air Reserve Base Air Installation Compatibility Use Zone (AICUZ) study, and further conflict with the recommended airport compatibility provisions identified in the draft Joint Land Use Study currently undergoing environmental review by the Riverside County Airport Land Use Commission. While transit is encouraged by these plans, the proposed increase in densities/intensities in this area of high noise and airport safety concerns necessitates detailed analysis, best performed by the Riverside County Airport Land Use Commission and March Air Reserve Base.

Again, we thank you for the opportunity to provide comments. Should you have any questions please contact me at (951) 656-7000.

Sincerely,

Dan Fairbanks, AICP

Mobility 21
THE SOUTHERN CALIFORNIA TRANSPORTATION COALITION
One Region. One Voice. One Future.

February 13, 2012

The Honorable Pam O'Connor
President
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Subject: SCAG 2012 Regional Transportation Plan

Dear President O'Connor:

Mobility 21, Southern California's transportation advocacy coalition, respectfully submits these comments as part of the ongoing efforts of Southern California Association of Governments (SCAG) to produce a comprehensive 2012 Regional Transportation Plan (RTP). Mobility 21, being comprised of both business and government entities is uniquely positioned to provide insight into the RTP process. We recognize SCAG staff's diligence in crafting an RTP that will meet the requirements of the federal process and of the newly-required SB375 legislation. Mobility 21 also appreciates the open process and intensive outreach SCAG has undertaken during the development of the 2012 RTP. Nevertheless, we share these ideas regarding the RTP as currently laid out and thoughts on reforming the RTP process for future success.

First and foremost, our goal is to assist SCAG with ensuring the final adopted RTP is both comprehensive and defensible, provides flexibility to the county transportation agencies responsible for delivering projects under the program, and supports a strong private sector economic engine. We have five recommendations to provide to SCAG at this time:

Protect Locally-Approved Sales Tax Measures
The program of projects submitted to SCAG by the county transportation commissions consist in part of projects promised to voters as part of locally-approved sales tax measures. Mobility 21 reminds SCAG that these projects individually and together constitute a contract with the taxpayers that must be respected and implemented as voters approved. Local taxpayers have prioritized the distribution of funds in their respective sales tax measures to a complete, multi-modal program of projects to meet local needs. Changes cannot and should not be made without taxpayer approval. The RTP should strengthen and enhance the ability of the counties to deliver these projects, while at the same time supporting their efforts to deliver non-sales tax projects that will provide greater mobility, congestion relief, and air quality benefits. The RTP needs to bolster the efforts of local transportation agencies, and the business community that supports them, to protect this essential covenant with voters and taxpayers. Failure to do so will make approval of future funding measures nearly impossible.

COALITION PARTNERS

Automobile Club of Southern California

Riverside County Transportation Commission

San Bernardino Associated Governments

Southern California Association of Governments

Ventura County Transportation Commission

Thorough Economic Analysis
As yet, the impact of the elimination of redevelopment agencies is unknown in terms of the delivery of transportation projects. Some business groups have also expressed concern over the feasibility of several of the proposed financial options and mitigations included in the RTP. Mobility 21 strongly urges SCAG to incorporate a thorough economic analysis into the development and approval of the RTP so that all elements of the final approved plan support the economic growth of this region.

Locally Sensitive Context
This RTP is the first of its kind. SCAG has done a yeoman's job of working to produce Sustainable Community Strategies, housing analysis and transportation projections in the RTP. However, Mobility 21 remains concerned that intensifying development in the urban core may impact future housing availability, choices and affordability. Recommendations regarding land-use should take into account the region's disparate communities, geographies, market forces, and take a flexible approach to protect the diversity of the region.

Protect Region's Economic Competitiveness
A large share of our regional economy is dependent upon the flow of goods from our ports, through the counties and to the rest of our nation. Infrastructure improvements related to goods movement are vital for Southern California to remain economically competitive. As other options become available both nationally and globally for cargo movement, Mobility 21 is concerned that components of the RTP could put the region at a disadvantage, such as implementing new technologies before they are feasible or imposing fees on businesses operating in the SCAG region. New revenue sources should be developed and implemented at the federal level, not the local and regional level.

Reform the Process
Mobility 21 recognizes that federal and state transportation planning processes are imperfect and that SCAG must work within the proscriptive requirements of existing laws and regulations. We therefore propose to identify systemic weaknesses in the process and work to reform the flaws in the RTP process that consume substantial resources, but add little or no value. Our intent is to help reduce the time and cost expended on the process and to remove regulatory hurdles that inhibit the development and delivery of effective, efficient, and timely transportation projects and services. Specifically, Mobility 21 encourages changes in state legislation that would enable MPO's to use low and no-cost alternatives to reach out to the public in lieu of resource-heavy public meetings. Additionally, since 83% of the funding for projects in the RTP comes from non-federal sources, Mobility 21 believes that empowering the federal government to veto a locally-approved financially constrained RTP unnecessarily jeopardizes federal funding needed to complete projects. Mobility 21 therefore will seek modifications to federal legislation that would enable MPO's with over 75% local funding to self-certify that an RTP is financially constrained.

Again, Mobility 21 applauds SCAG for the open and transparent process used to develop the 2012 RTP. We look forward to working with SCAG staff in the final stages of RTP implementation to ensure the strongest possible document is delivered to the Regional Council in April. If you have any questions or would like to follow up on any of our comments, please contact me at mprimmer@mobility 21.com or 949-288-6884.

Pam O'Connor, President
Regional Council
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Dear President O'Connor,

We congratulate the leadership and staff of the Southern California Association of Governments and its Regional Council members on the agency's first-ever Sustainable Communities Strategy and Regional Transportation Plan that meets the 2020 and exceeds the 2035 greenhouse gas reduction targets, achieves Clean Air Act conformity, and reduces vehicle miles traveled and traffic congestion—despite projected population growth of about four million residents by 2035.

We applaud SCAG staff for their leadership and for their collaboration with local governments, county transportation commissions and a wide range of non-governmental organizations. This effort was particularly challenging given it is the first time anyone in the region has put together an SCS. In the spirit of creating a stronger RTP/SCS this year and in future years we offer these recommendations.

Key changes to strengthen the RTP/SCS

Although the draft RTP/SCS meets the SB375 targets, changes in four key areas would make the plan even stronger in terms of moving the region closer to sustainability.

1. Ensure adequate, achievable funding to carry out the RTP/SCS
2. Expand funding for transit, Metrolink, bus rapid transit, bicycling, pedestrian travel.
3. Make a tighter link between transit and land use throughout the region.
4. Take greater measures to reduce GHG and other emissions from freight.
5. Improve public health monitoring and benefits, especially in environmental justice communities.

1. Ensure adequate funding to carry out the RTP/SCS.

We applaud SCAG's goal of bringing all roads to a "state of good repair," and understand the policy decision to look for new revenue sources rather than to eliminate transportation projects in order to address the RTP's projected $200 billion shortfall. We understand that it may be more politically palatable for the Regional Council at this time to project reliance upon expanded federal sources, such as indexed gas tax or a transition to an equivalent VMT fee, but that does not make it more achievable.

a. Emphasis should be on more achievable revenue sources such as local voter approved fees or taxes rather than more speculative federal sources

The recent history of voter response to county-based transportation funding measures in the SCAG region suggests a more promising local direction. The experience with Measure R in LA County and the recent extension of sales tax measures in other SCAG counties demonstrates to us that regional voters are not as tax-averse as some believe, especially when voting on measures to fund well defined local transportation investment, if they have confidence in the agencies and are clear about investment priorities. Voters in Los Angeles County approved sales tax measures by 54% in 1980, 50.4% in 1990, and 67.8% in 2008. This suggests an increased willingness, not reluctance, to support transportation investments by LA County voters. In San Bernardino, Riverside and Orange sales tax extensions were easily approved: Riverside voters approved Measure A in 2002 with 69% of the vote; San Bernardino County approved Measure I in 2004 with 80% of the vote; and Orange County approved a sales tax extension in 2006 with almost 70% of the vote. In each case the original sales taxes had been originally approved with narrow majorities.

The point is that, with the exception of Ventura County, voters throughout the SCAG region have consistently voted to approve new or extended sales tax measures for transportation improvements by substantial and increasing majorities in excess of 2/3. If a county or the region needs more funds for transportation investments, local voters seem a more promising opportunity of first resort than a contentious State Legislature or the Congress.

We urge SCAG to work to challenge its member transportation commissions to go to voters in the near future for local and regional funding solutions instead of "punting" this problem of a regional funding shortfall to the federal government. In other words, let's make the funding of regional planning more achievable, and thus more real.

b. Recommendation: Develop regional revenue sources to fund regional projects.

There are a number of transportation systems that are vital to the welfare of the Southern California region as a whole, rather than specific counties. This includes the 450-plus-mile regional commuter rail system operated by Metrolink and the regional goods movement system. Region-wide investments in each of these systems could yield enormous economic, environmental, and equity benefits. We urge SCAG and its Regional Council to consider taking a truly regional approach to an investment strategy for each of these regional systems by including in the RTP projected additional revenue from a region wide revenue source.

We recommend a broad-based uniform regional tax or fee increase, such as a 1/8 – 1/4 cent increase in sales tax or equivalent parcel tax, that can raise between $15- $30 billion over the 25 year life of the plan to invest specifically in regional transportation needs such as meeting the needs of our goods movement infrastructure, modernizing and electrifying the regional commuter rail system, providing expanded BRT and bus service as well as first-mile-last-mile bike-pedestrian infrastructure that would connect to that regional commuter system.

We would pledge to work with you to build support for such a funding measure.

c. Recommendation: Develop strategies to provide adequate funding to modernize freight transportation projects.

The goods movement industry is a vital component to the Southern California economy but is also a major reason for our poor air quality and various health impacts affecting the region. Developing and investing in both the zero and near-zero emission goods movement technology and the operational efficacy of the goods movement infrastructure would significantly benefit the region and the many communities of concern that are directly affected by emissions and congestion from transportation and rail activity. Estimates of the regional investment needed could be up to $25 billion over the life of the plan.

Ensuring that funding mechanisms are in place to expedite the implementation of the zero and near-zero emission freight and truck strategies as well as the infrastructure needed for operational efficacy should be a central component of the regional strategy.

For these reasons, we recommend that SCAG include the following strategies:

- Develop a clear assessment of funding options available, including various models of public-private partnerships that could make zero-emission and near-zero emission freight technology options possible and ensure an efficient goods movement system in the region.
- Recommend pursuing legislation seeking a $30 per twenty-foot container fee for moving either into or out of the ports. This strategy could generate as much as $441 million in revenue from loaded containers in its first full year of implementation, when applied equally to imports and exports and more in subsequent years as cargo activity grows at our ports. Such a program could generate over $10 billion over the life of the plan.[1] Previous legislative efforts have created a broad coalition to support this measure. Such legislation has been approved twice by both houses of the state legislature only to be vetoed by the previous governor.
- As previously stated, we recommend a broad-based uniform regional tax or fee increase, such as a 1/8 – 1/4 cent increase in sales tax or equivalent parcel tax that could raise between $15-$30 billion over the 25 year life of the plan to invest specifically in regional transportation needs such as goods movement infrastructure needs, as well as modernizing and electrifying the regional commuter rail system and related infrastructure.
- Prioritize spending on projects that deliver maximum health benefits for residents of the region.
- Include public health as an overarching priority and goal in the $2.1 billion annual freight program included in the Environment and Public Works Committee.

d. Support national efforts to create a strategic plan for the freight system.

- Encourage SCAG to include language that clarifies the current federal funding restraints and alter the RTP to reflect that these revenues are assumed but not assured and are contingent upon passage of the MAP-21 program on page 95 and 100. As a revenue source the inclusion of this funding is still in doubt as the current iteration of the House American Energy and Infrastructure Jobs Act does not include a national freight program or any dedicated freight funding. The establishment of this program is contingent upon a freight program making its way into the final federal transportation reauthorization and that legislation passing through both Chambers.

[1] Haveman, Jon, and Thornber, Christopher, Container Fees and Commercial Benefits of Improved Waterborne Goods Movement Infrastructure in California. Beacon Economics, August 2007.
http://www.coalitionforcleanair.org/images/stories/Haveman_Report_Final_Aug2007.pdf

- Actively support the passage of a federal freight program that would deliver these revenues and clearly establish improving public health on the freight network and adjacent communities as an overarching priority and goal of the federal freight program.
- Support the inclusion of Senator Lautenberg's Freight Act of 2011 in the final federal transportation reauthorization with the competitive grant program and the goals and objectives as written.

e. Champion increased Compass Blueprint funding to help local governments update their general plans to implement the SCS.

While the RTP/SCS shows a significant shift in household growth toward HQTAs, this will in most cases require changes in General Plans and community plans — and ensuring that this will happen is likely to require incentives and other resources. SCAG's Compass Blueprint program was successful in helping many communities move in the direction of smart growth and urban infill years before SB 375. With additional funding, the Compass Blueprint Demonstration Project Program could fund the SCS implementation and ensure that growth happens in an equitable way with minimal displacement, in addition to updating plans. SCAG should also work with the other MPOs to advocate for a statewide "infill first" package of incentives to promote development near transit. SCAG should also consider working with the CTCs to find sources of funding for land use planning in HQTAs.

2. Expand proposed funding for transit, Metrolink, bus rapid transit, bicycling, and pedestrian travel into the RTP constrained plan.

We need increased investment for bus and rail transit, bicycle and pedestrian systems. This is especially true in the Inland Empire where over-dependence on a spreading highway infrastructure and dispersed land use pattern has made residents in these counties very vulnerable to just the kind of economic calamity witnessed in the 2008 – 2012 Great Recession.

In addition, residents of agricultural areas, especially in the eastern Coachella Valley, the North Shore of the Salton Sea and similar communities, remain disproportionately underserved by transit, which makes it very difficult for residents without a car to access health care, groceries, or good jobs. Improvements to bus headways, especially in these areas, could create new HQTAs.

Building transit infrastructure is one of the best ways to create good, "green" jobs that enhance the health and wealth of the region and its residents. Construction work can provide a career path to middle-income jobs through apprenticeship programs that provide young workers with formal training. Agencies that adopt project labor agreements and requirements ensuring that jobs will go to local workers — and/or those who live in areas with high unemployment — help make the local economy more robust because workers' earnings will be spent at local businesses, creating additional jobs and local tax revenues.

a. Move enhanced Metrolink investments into the Constrained Plan.

The Metrolink commuter rail system is a regional gem that could become a major source of VMT reduction, congestion relief and economic development. It links many communities in every county in the region.

We recommend moving into the Final Plan (the Constrained Plan) the upgrading of the Metrolink commuter rail system region-wide to make a planned transition to an all-electric system capable of providing zero-emission high-speed service (up to 110 mph) and enabling expanded express service in select corridors with double tracking, grade separations and other modifications needed. Such an upgrade may cost the region as much as $8 to $10 billion, but would be well worth the investment in terms of congestion relief, emission reductions and economic opportunity created. This RTP Constrained Plan enhancement could be funded by new resources, such as the regional sales tax proposed above.

Specifically, we want to highlight opportunities for enhanced investments on several key lines that we believe will create exceptional regional connectivity.

- **The Antelope Valley Line**, which is the focus of current planning efforts to dramatically reduce the time it takes to travel over 76 miles from Lancaster to Union Station by more than fifty percent - from nearly two-hours to about one-hour.
- **The San Bernardino Line**'s success with limited express service from downtown San Bernardino to Union Station indicate express service on a regular basis is possible, especially if a direct link into Ontario Airport is created.
- **The Ventura County Line** and **the Orange County Line** present the possibility of a continuous, high speed, electric express system from Ventura to Union Station to Orange County to San Diego.
- **LA Union Station Run-Through Tracks** project would significantly enhance regional trip potential of all Metrolink corridors serving Union Station by improving efficiency and throughput capacity.
- We recommend additional corridor infrastructure enhancements and improvements in Appendix A.

Each of these Metrolink corridors and projects, if funded and enhanced, will create opportunities for new BRT and enhanced bus service, as well as smart growth infill with first-mile-last-mile bicycle and pedestrian infrastructure in multiple communities and will create enhanced access to the jobs corridors throughout the region.

b. Expand Bus Rapid Transit and provide more frequent bus service on high-performing routes linked to Metrolink to give more people alternatives to driving alone.

Well over 80 percent of transit ridership in the region now uses bus service. While our rail transit system is expanding dramatically, we should expect that heavy reliance on bus service is likely to continue as far out as 2035.

However, while there is a lot of growth projected for the Inland Empire, much of it will not be near existing or planned bus or rail service. For example, in Riverside County, about 40% of residents live near bus lines with some service (15-30 minute headways) but presently only 10 percent of the population is served by high-quality transit (with 15-minute headways). By expanding the Bus Rapid Transit (BRT) system in the Inland Empire, especially where proposed lines would connect with the potentially enhanced Metrolink lines and by bringing up service on select higher

performing lines to 15- minute headways we could increase high-quality transit at a much lower cost.

Our recommendations in Appendix A are limited to improvements to investment in Bus Rapid Transit infrastructure (BRT) and enhanced bus service with connections to the Metrolink Regional Rail network or regional airports. Each of these Metrolink corridors and projects, if enhanced, will create opportunities for new smart growth infill and TOD investment in multiple communities. These corridors could be served as well as by first-mile-last-mile bicycle and pedestrian infrastructure opportunities, and will help create enhanced access to jobs throughout the region.

See Appendix A below.

c. Increase funding for active transportation to at least $12 billion for bicycling and pedestrian improvements.

SCAG has received an outpouring of support for increased investment in bicycle and pedestrian infrastructure and projects at workshops and hearings across the region, as well from members of SCAG's Regional Council. As was often repeated at the hearings, according to the 2009 National Household Travel Survey of California, 14 percent of all trips in the region are pedestrian while 6 percent are on bikes, and 25 percent of all roadway injuries and fatalities affect pedestrians and bicyclists, yet only 1 percent of the regional investment is identified as going to non-motorized modes. A poll of Southern California voters sponsored by Move LA, NRDC and the American Lung Association late last year found that voters would make bicycle and pedestrian investments a much higher priority.

While we applaud the SCAG staff for recommending that funding for active transportation be increased from $1.8 billion to $6 billion, we believe funding should be at least $12 billion. We believe investments should prioritize first-mile/last-mile connections to transit stations, which will help support the increased investment in the transit system. Investments should also be prioritized for areas of disproportionate high injury and fatality rates and in areas with lower car ownership rates.

Safe Routes to School strategies and investments to improve the safety of students as they walk and bike to school should also be promoted because statewide cuts in school transportation budgets make getting to and from school more difficult for K-12 kids — especially in rural areas where there are no sidewalks or safe bike routes.

We recommend SCAG work with the CTCs to identify funding sources that are flexible and that could be used to prioritize accelerated transit, bike, pedestrian and other traffic-reducing projects. It is our judgment that one appropriate source of funding for this program could be the regional sales (or parcel) tax we have suggested earlier.

d. Encourage CTCs and local jurisdictions to adopt "complete streets" policies.

We believe that SCAG should encourage CTCs and local jurisdictions each to adopt a complete streets policy so that bike and pedestrian improvements can be made routinely and more economically when streets are improved or built. For example, counties in the SCAG region, especially outside of LA County, often include funding for arterial capacity enhancements for streets which largely run between and through community centers. These stretches of boulevards

seem very good opportunities for implementation of "Complete Streets" programs. We recommend that SCAG identify such opportunities and call them out for special programming efforts.

e. Work with CTCs to develop a methodology for quantifying the unmet need for bicycle and pedestrian investments to improve safety and increase active transportation.

SCAG should work with the CTCs to develop a methodology for quantifying the unmet needs, particularly safety needs, for cyclists and walkers. Because concerns about safety may discourage people from walking and biking entirely, surveys may be required, especially in rural areas, to accurately assess the needs of residents. We recommend that SCAG work with the CTCs to develop active transportation budgets and to identify existing and potential local and regional funding sources. One idea, for example, would be to create guidance that would be used to allocate funding in each CTC's Call for Projects.

f. Work with CTCs to ensure full participation of all counties in the funding and implementation of regionally significant transit and goods movements systems that achieve regional objectives like cleaner air, reduced greenhouse gases, expanded access to high quality transit, and mode shift away from driving alone.

SCAG should encourage county transportation commissions to place a higher priority on investment in transit services and active transportation projects and seek to ensure a fair share investment in these projects among counties either by identifying new revenues locally, shifting funds out of other programmed projects, or participating in the creation of regional revenue sources, and encouraging infill development strategies that keep our momentum toward a higher regional sustainability strong.

3. Create a tighter link between transit and land use throughout the region.

The draft SCS takes into account changes underway in the regional real estate market including the shift in new housing development away from the construction of single family homes on large lots and toward the development of multifamily housing -- apartments, townhomes and condominiums -- in more urban environments with easier access to jobs, service and transit systems. The fact that half of all new homes and new jobs will be located near transit under the plan will be a boon to the region's efficiency, economy and sustainability.

The demographic and real estate trends, more transit opportunities and healthier, active lifestyles, portend a new, and better, version of the American Dream in Southern California. By focusing development in transit areas and downtowns, the draft SCS plan would consume 408 square miles less "greenfield" land than in the 2035 Baseline, which assumes current land use trends.

a. SCAG should identify to local jurisdictions adjustments in land use policy that would ensure each county is contributing its fair share to meeting regional goals of cleaner air, reduced greenhouse gas emissions, expanded access to high quality transit, and mode shift away from driving alone.

Although the region as a whole will achieve reductions in vehicle miles traveled sufficient to meet the targets for reducing greenhouse gas emissions, the reductions are not evenly distributed across the region. These outcomes are the result of both past decisions and future actions

reflected in this draft SCS and RTP. The maps in the RTP/SCS suggest that in some areas, especially Riverside County, significant growth is projected in areas with little or no transit investment.

b. Limit High Quality Transit Areas, especially along freeways in low-density areas, to within a 1/2 mile of the stop with frequent services, as opposed to including the entire corridor.

It is unclear how SCAG defines high-quality transit areas. Under SB 375, a HQTA is a place that has bus service with headways of 15 minutes or less during commute hours. Several freeway corridors are designated as HQTAs presumably because they have express bus service. But, there is not currently frequent bus service along the I-10 east of I-215, I-15 north of I-10, I-15 south of the 61, and the 33 (Ventura County) which are all designated as HQTAs. Only the area within ½ mile of the stop should be regarded as an HQTA.

c. Include a snapshot of the current jobs-housing fit and develop a methodology for projecting the jobs-housing fit as a result of transportation investments and land use changes for the 2016 RTP/SCS.

The current mismatch between the location of jobs and housing is at the root of our transportation problems. SCAG should set a baseline for a jobs-housing fit by taking a "snap shot" of 4-to-5-mile buffer zones around major job centers, and then comparing the wages provided by those jobs to cost of housing within the buffer zone to see if there is a good fit. UC-Davis and the Sacramento Council of Governments have developed a relatively simple methodology to do a jobs-housing fit, and are now developing a tool to project the jobs-housing fit into the future. Continuing to monitor the jobs/housing fit over successive RTP/SCSs will be an important tool for transportation planning in rural, urban and suburban areas.

d. Strengthen Conservation Planning Policy

We commend SCAG for including an advanced mitigation strategy for land conservation. This strategy is an important step forward. We recommend the following changes to strengthen the Conservation Planning Policy section:

- change "critical habitat" to important natural lands because of its limitation to the federal designation and its relationship to endangered and threatened species;
- create an inclusive process for agencies, conservancies, and non-profits to help map and prioritize priority conservation lands;
- include all unprotected undeveloped lands in the inventory of potential mitigation location sites instead of limiting opportunities to just Natural Communities Conservation Plan and Habitat Conservation Plan areas;
- expand the conservation activities to include existing and/or future programs instead of simply already-established programs; and
- Advocate for the advanced mitigation policy to result in the environment ending up better than it started as opposed to no gain (a net environmental benefit) from the standpoint of natural resource lands after construction activities.

4. Take greater measures to reduce greenhouse gases and other emissions from freight.
We are deeply concerned that the projected increase in freight volumes and traffic will undermine the gains of the RTP in other areas. In particular, CO2 emissions from trucks would increase at least 30% by 2023 and at least 60% by 2035. Even more dramatically, CO2 emissions from rail would increase at least 50% by 2023 and at least 123% by 2035. To mitigate goods movement related emissions, we recommend that SCAG take the necessary steps to:

a. Ensure the ports augment the Clean Air Action Plan by creating GHG reduction plans.

b. *Devise a set of strategies that account for the differences among local freight service and that of port origin/destination.* Similarly, the sector of medium duty trucks may be targeted for technology improvements, given that it is the sector's 2nd largest emitter of NOx.

c. *SCAG should identify and promote a sequence of projects* that maximizes on-dock rail and that reduces constraints on the expansion of on-dock capacity in advance of projects that expand off-dock capacity. Without appropriate sequencing, efficiencies could be lost.

d. *Clean up existing freight corridors, not just the proposed new projects*.
While we welcome zero emission technology by the year 2035, more short term gains should be implemented. SCAG should further analyze what can be done until a majority of truck traffic is zero or near zero emissions and consider using currently available technology while working to demonstrate future technology applications (such as maglev technology).

5. Improve public health monitoring and benefits, especially in environmental justice communities.
We applaud SCAG for adopting a number of performance "outcomes" — in particular, those measuring public health and affordability — that will be monitored during RTP/SCS plan implementation. We believe that these additional performance metrics should be reported to the Regional Council as a way to help encourage implementation of the RTP/SCS. While we understand that SCAG has no authority over local land use or county transportation planning and funding, we do believe that it's critical that SCAG find ways to incentivize RTP/SCS implementation.

a. Evaluate the impact by geography of RTP/SCS investments on environmental justice communities by increasing monitoring over successive RTP/SCSs.

The disparate impacts of transportation investments and land use planning — especially noise and pollution — on lower-income communities is lost in the county-wide or region-wide averaging that SCAG uses. It would also be informative if SCAG monitored a number of geographic areas where environmental justice populations are overrepresented. The Metropolitan Transportation Commission in the Bay Area, for example, does "snapshot" analyses of 44 geographic communities to focus on key transportation-related indicators such as transit service frequency, walkability, access to essential destinations by a 30-minute transit trip, housing and transportation affordability, bike and pedestrian collisions, diesel PM2.5 emissions, etc. For example, the EJ appendix reports that air quality will be worse for 23-29% of the population with no indication of where they live, making it difficult to design and evaluate the effectiveness of mitigation measures.

SCAG is planning to track characteristics in 125 transit stations. We recommend instead that SCAG analyze 125 places where environmental justice populations are overrepresented. The analysis could be used to monitor progress over successive RTP/SCSs, and goals could be set and strategies identified to reduce disparate impacts. Where there are disparities, SCAG should propose mitigations and work with the CTCs to improve conditions.

Because the EJ analysis also suggests that low-income people are being displaced from station areas, we also recommend that rail and possibly BRT stations be monitored for the impacts of gentrification — by checking income levels, housing costs, transit usage and car ownership, etc. SCAG could also develop a toolbox of policies, implementation measures and funding sources that could be used to help low-income people continue to live near stations.

b. Improve the discussion around performance outcomes and alternatives analyses.

One of the best ways that SCAG can do this is to help make the outcomes of land use planning and transportation investment choices clearer to Regional Council members and the general public — through reporting on performance outcomes. While the Alternatives 1, 2, 3 & 4 presented at the summer workshops illustrated the impacts of particular policy choices, the Alternatives A, B, C & D were different in ways that were hard to understand. We recommend that in the next RTP/SCS, SCAG should give stakeholders more time and more information to evaluate the different scenarios. We also recommend that SCAG set targets for performance measures and outcomes, and to evaluate the scenarios against these targets early and continuously in the planning process.

c. Develop new tools for measuring health & equity impacts in future RTP/SCSs.

We also believe that SCAG should develop new tools for measuring health and equity impacts in future RTP/SCSs. In particular:

- SCAG should enhance efforts to measure the daily amounts of walking and biking related to work and non-work trips.
- SCAG should also measure chronic disease rate changes based on transportation decisions and resulting physical activity (based on the work of Neil Maizlish of the California Department of Public Health's work with the MTC in the Bay Area and ongoing work with MPOs across the state).
- SCAG will monitor premature mortality due to PM2.5, which is important since the region contributes 53 percent of premature deaths in the state of California due to PM2.5. We recommend SCAG report improvements every two years, and develop a more precise goal in collaboration with the LA County Department of Public Health and the American Lung Association in California.
- SCAG should monitor asthma incidence and exacerbations due to NOx (an emission that is being measured) in collaboration with the California Department of Public Health, the South Coast Air Quality Management District, academic institutions, and others who are focusing on communities most impacted by air pollution, as well as communities located near high volume roadways.

We want to express our appreciation to the SCAG Regional Council and staff for all your efforts in putting together this ambitious plan to make Southern California a better place to live for present and future generations.

APPENDIX A

Metrolink, bus rapid transit and bus corridors proposed to be enhanced and considered for inclusion in the RTP Constrained Plan.

1. METROLINK

Specifically, we want to highlight opportunities for enhanced investments on several existing lines that will create exceptional regional connectivity:

- **The Antelope Valley Line**, which is the focus of current planning efforts to dramatically reduce the time it takes to travel over 76 miles from Lancaster to Union Station by more than fifty percent - from nearly two-hours to about one-hour. Projects to improve its speed and efficiency and avoid unnecessary delays in service, including eliminating unnecessary curves, providing grade separations and double tracking where needed, will make this goal possible.
- **The San Bernardino Line** has already shown great success with limited express service from downtown San Bernardino to Union Station in Los Angeles. Investments to provide double-tracking for some segments of the line, grade separations could enable this line to provide express service on a much more regular basis. A direct link into Ontario Airport would create an exceptional economic development opportunity. Imagine the enhanced investment interest there would be for any community east of LA if it had high-speed express access to Ontario Airport and to Downtown LA via Union Station.
- **The Ventura County Line** also offers the opportunity for high speed express access from Ventura through the North San Fernando Valley with links to the Orange Line at Chatsworth, Northridge and Van Nuys, potentially connecting directly to Burbank Airport, Glendale, on to Union Station.
- **Orange County Line** continues from Union Station to Norwalk, Fullerton, Anaheim, Irvine and beyond to San Diego County. Together with the Ventura County Line it presents the possibility of a continuous, high speed, electric express system serving 25 stations from Ventura to Union Station to Orange County to San Diego, connecting to 4 other Metrolink lines and the entirety of the LA Metro Rail system at Union Station.
- **LA Union Station Run-Through Tracks** project that would significantly enhance regional trip potential of all Metrolink corridors serving Union Station by improving efficiency and throughput capacity, enabling more frequent regional service within LA County.

In addition to the existing corridor infrastructure enhancements and improvements we recommend:

- **Extension of 91 Line** from Riverside to Palm Springs/Coachella Valley, connecting the resort communities in Palm Desert to LA and Inland Empire.
- **Extension of San Bernardino Line** to Redlands and San Bernardino Airport.
- **Harbor Subdivision Service** from Union Station to South Bay Region via LAX, utilizing existing Railroad Right-of-ways to provide Commuter Rail service to an underserved transit region.
- **Additional infill stations** along Metrolink Corridors to support activity centers such as Universities and Major Employment Centers such as Perris Valley Line - UC Riverside Station; San Bernardino Line – Ontario Airport Station branch; San Bernardino Line – LAC/USC Medical Center; Riverside Line - Cal Poly Pomona Station.

2. ORANGE COUNTY

Proposed BRT Enhancements in Orange County

Proposed BRT	Link to Metrolink, Activity Center or Airport	Peak Headway	Off-Peak Headway

NAIOP
COMMERCIAL REAL ESTATE DEVELOPMENT ASSOCIATION
SoCAL CHAPTER

February 14, 2012

Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street 12th Floor
Los Angeles, CA 90017

Re: Comments on the Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy, and Program Environmental Impact Report

Dear Mr. Ikhrata:

NAIOP, the Commercial Real Estate Development Association, is the leading organization of developers, owners, and related professionals in office, industrial and mixed use real estate. The over 900 members of the NAIOP SoCal Chapter serve Los Angeles and Orange Counties, and is the premier commercial real estate organization in Southern California. We have been actively involved in the development of the 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), along with the review of the just released Program Environmental Impact Report (PEIR).

NAIOP SoCal fully understands the enormity of the undertaking to create the RTP, particularly with the newly required SCS being added to the effort. We commend SCAG for its efforts to make the RTP/SCS as much of a bottoms-up process as possible. We particularly thank SCAG for incorporating the Orange County LRTP and SCS developed by the Orange County Transportation Authority (OCTA) and the Orange County Council of Governments (OCCOG) respectively. NAIOP believes that is a model for all SCAG subregions to embrace in any future RTP/SCS. We fully support what OCTA and the OCCOG have submitted, and also incorporate by reference as though fully set forth herein their comments on the RTP/SCS and PEIR. That same broad participatory process and effort should also have been made in the drafting of the PEIR, but was not. Hopefully that can be changed in the future so as to avoid many of the issues that have arisen.

Our major concerns surround the PEIR. The 642 page complex document with approximately 550 supposed mitigation measures was released the afternoon of Friday December 30, 2011, right before the New Year's holiday weekend. Thus, no one really could look at it until January 3, 2012, losing 3 days of the brief 45-day review period. A tremendous effort, and cost, has been undertaken to try to meet the February14 end of comment period. It is very obvious the comment period for the PEIR is not sufficient to allow for a thorough, thoughtful analysis of the very belatedly released PEIR. Unfortunately, SCAG has repeatedly

NAIOP SoCAL EXECUTIVE STAFF
Cynthia G. Fusco, Executive Director
Vickie Talley, Director of Legislative Affairs

indicated they would not extend the comment period. NAIOP does request that the comment period be extended.

To compound the problem, the PEIR is going to be rushed to approval. NAIOP has worked closely with many organizations throughout Southern California, and it is very apparent SCAG will be receiving numerous comments. Yet, the schedule is to hold a joint Policy Committee hearing on March 21 to gain their recommendation that the RTP/SCS and PEIR be approved, which is 5 days before the response to comments will be released on March 26. Then, the Regional Council is supposed to approve all the documents on April 4. SCAG has, again unfortunately, ruled out any delay in this schedule as well as specifically saying they will not make any changes to the PEIR that would require a recirculation. This incredibly rushed schedule with predetermined lines in the sand as to the length of the comment period and timing of the actual approval does not provide the time for the appropriate review of these complex documents, any real analysis of the comments that will be supplied, and specifically eliminates any valid modification to the RTP/SCS or PEIR. It leads one to question whether there has been a legally questionable predetermined outcome.

Turning to the substance of the documents. There is a blanket statement that all the mitigation measures are feasible and effective. Yet, there is no discussion or analysis to support such a statement. Furthermore, SCAG goes on to claim that local jurisdictions and project sponsors "can and should" perform the mitigation measures. While SCAG has claimed the mitigation measures are supposed to be a "tool-box" to choose from, the actual verbiage of the documents does not so indicate. The statement of the feasibility, efficiency, and "can and should" language should be deleted. Furthermore, SCAG should at a minimum clearly state that the PEIR sets forth a menu of options for the local jurisdictions and project sponsors to choose from, and that it is up to the local jurisdictions and project sponsors to determine what is feasible and efficient. This could effectively be done by separating all the mitigation measures that are applicable to SCAG, and put all the "tool-box" suggestions into a separate document indicating the above so SCAG's stated intention is clear to all.

Next, there are nearly 200 "mitigation measures" that are incomplete references to Federal, State, and Local law, and various regulatory measures. These are matters that project sponsors are already legally required to perform. Once all of the legal requirements are performed, then the CEQA process analyzes if there are any environmental impacts that need to be mitigated. Thus, the legal requirements are actually in the baseline, and are not used as mitigation measures. By trying to reword the legal requirements and call them mitigation measures can cause great confusion and legal concerns. Since the legal requirements are already in the project, do these so-called "mitigation measures" in the PEIR refer to something different, something new, something additional? All references to legal and regulatory requirements should be deleted. If SCAG feels there is some need to remind local jurisdictions and project sponsors to comply with the law, this can easily be done with one statement in the RTP, not the PEIR, indicating they should comply with all applicable laws and regulations.

NAIOP appreciates SCAG's interest in being a forum for discussion of issues that may be impacting the Southern California area. Forum discussions can lead to ideas that can be fully analyzed by the appropriate agencies. But, SCAG does not need to try to be the one to implement or oversee such ideas. There are many governmental agencies and regulatory bodies that already have the authority to cover a variety of issues, and SCAG should not intervene in matters already under the purview of other governmental agencies. SCAG, as all MPOs, is a federally created organization whose focus is on transportation efforts. Congress wanted MPOs to ensure that federal transportation funds were utilized through a cooperative and comprehensive planning process. The core function of MPOs is to evaluate the transportation issues in a region, and develop realistic options. Involving the public, MPOs are to

develop long range transportation plans and transportation improvement programs that promote a multi-modal transportation system. The RTP should solely be focused on that objective, and the SCS is only to fit the requirements of SB 375. Yet, the documents go in to things such as paleontology, wastewater, utilities, and many other areas that are beyond SCAG's scope. There are numerous areas in the PEIR where SCAG claims it will "ensure" certain outcomes. This is not SCAG's role, and the entire issue of not intervening in other agencies domains is needs to be addressed in any final RTP/SCS and PEIR.

The funding for the RTP is also of great concern. Federal law does require that the plans be fiscally constrained such that any funding is available or reasonably expected to become available. Yet, the draft RTP claims to be an approximate $524 billion program, but has a shortfall of $219 billion in revenues; nearly half. There is a reference to about $127 billion of the shortfall being reliant on major State and/or Federal actions, which seem awfully speculative. NAIOP has a major concern over the numerous references in the documents to pushing local jurisdictions to adopt new fees or taxes. The commercial/industrial development industry is already heavily burdened with fees from many, many regulatory agencies and jurisdictions. We often hear that some new fee is not that big, or is for a great cause. Yet, the net effect is a mountain of "little fees". Sort of a death by a thousand fees. To make up billions and billions of revenue shortfall would necessitate extensive new fees and taxes. This would clearly be a huge hinderance, if not paralyze, any type of economic recovery in the regions. NAIOP did not see any type of analysis in the documents that would lead one to believe such fee and tax increases are reasonably possible, especially in light of Proposition 22, nor an analysis of the economic impacts. Such analyses are needed before any of the documents are finalized.

The RTP/SCS and PEIR are incredibly complex documents that are very important and far-reaching. NAIOP SoCal has made on effort to evaluate the very voluminous materials. Yet, in the compressed timeline, it has been impossible to touch on every area of concern. The above highlights some of the major issues. We will continue to evaluate the material and follow the efforts to revise the RTP/SCS and PEIR so that the final product is credible and truly benefits all of Southern California. NAIOP SoCal looks forward to SCAG's responses to the above comments and the request to extend the comment period. We request to be included in any conversations regarding the necessary revisions to the RTP/SCS and PEIR.

Sincerely,

James V. Camp

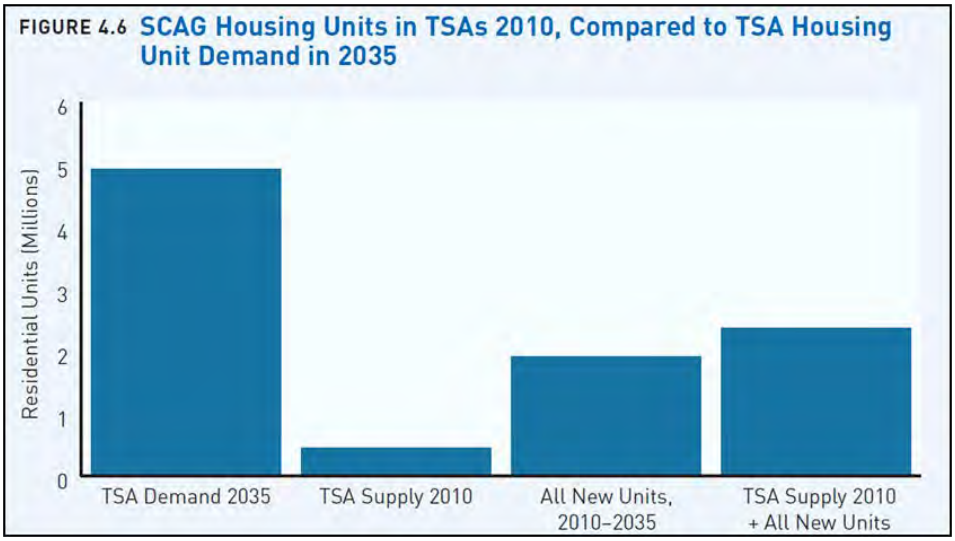
RE: Comments on the 2035 RTP/SCS and Project Environmental Impact Report

Dear President O'Connor:



On behalf of Endangered Habitats League ("EHL") and the Natural Resources Defense Council ("NRDC") we thank you for the opportunity to comment on the Southern California Association of Governments' ("SCAG") regional transportation plan and its attendant environmental impact report.

Your staff has worked tirelessly to engage 197separate local jurisdictions in the creation of the first ever Sustainable Communities Strategy in the SCAG region under SB 375, and should be commended for their hard work. The plan achieves some important early accomplishments, including:

- Responding to the growing market demand for walkable communities, the plan will house 68% of new development in multi-family housing, as opposed to 39% in the last 25 years.[i] The chart below from the Urban Land Institute's recently published report *The New California Dream* confirms the strong demand for multi-family and small lot single family housing, as well as a projected surplus of large-lot single family homes;

- By planning for new homes near transit, and bringing new transit to existing communities, the plan achieves the equivalent of locating 94% of all new development near transit. This is also sound planning, as the ULI study referenced above also finds that even if all new development now to 2035 was built near transit, the region will still fall short of its 2035 demand for this type of housing;

- Through an emphasis on walkable communities, the plan reduces open space consumption by 400 square miles, and;
- The plan achieves its 2020 and 2035 state assigned SB 375 GHG reduction targets.

In the spirit of collaboration, we offer the following comments with the aim of improving the plan:

I. Commit to the Creation of a Sustainable Transportation Network

While SCAG has received much praise for the land use assumptions in its Sustainable Communities Strategy, it is unclear whether the transportation system has been adjusted to support this land use pattern. While we recognize that SCAG must use input from its six County Transportation Commissions (CTCs) as the starting point for SB 375 scenario planning, we had hoped that the evaluation process would not end there. The problem, in our view, with the limited approach SCAG has adopted is the inconsistency between the varied land use projected across several scenarios and a transportation system that has been kept relatively constant. Such an approach ignores the evidence that land use patterns and transportation systems are frequently mutually reinforcing. The walkable compact development patterns SCAG calls for are less likely to materialize without adjustments to its transportation network, particularly in the Inland Empire. Similarly, compact land use patterns need to be serviced with real transportation choices if they are to be viable. We seek a commitment from SCAG, through its next SCS process in

four years, to evaluate scenarios which consider what environmental achievements may be possible with a transportation system that is more varied across those scenarios.

In particular, we find the emphasis on arterial widenings to be of concern. SCAG's EIR claims that it will spend $22 billion on "local arterial improvements". A review of the SCAG project list indicates that by improve, the clear intent is to widen, or as some engineers describe it, to "rationalize" the system. Throughout the RTP project list, the verb widen is one of the most commonly found. And yet, the empirical literature on induced demand and induced growth makes clear that widening roads does not solve traffic congestion, and, as a recent poll demonstrates, the voters agree[ii].[iii] The futility of attempting to remedy congestion through arterial widening alone is perhaps best elucidated in Riverside County, where, despite an investment of more than six billion in arterial improvements, the County's residents can expect no marked improvement in hours of delay. Instead, the County projects an increase in hours of delay. While some of these arterial widenings may be represented in sales tax measures, County Transportation Commissions have significant latitude with respect to the phasing and prioritization of investments in their regions.

Before continuing to our specific recommendations, we would like to note the absence of certain data which would have been valuable in further scenario analysis. The transit and active transport appendices of the plan contain a wealth of data, categorized by county, concerning the current availability of transit and active transportation elements. What is lacking, however, are projections of how the current plan improves (or does not, as the case may be) access to transit and active transportation facilities for the residents of the various SCAG counties by 2035. We have submitted a request for the data to SCAG staff. We note that SCAG staff has been both helpful and responsive, but, as we were informed by staff, the data could not be made available in time for analysis in this comment letter.

Our recommendations for improving the transportation network are as follows:

1. Accelerate funding for Metrolink to provide badly needed regional commuting options

   The Metrolink commuter rail system, which links numerous communities in all SCAG area counties, is already a critical component of SCAG's transportation system, and, with improvements, could become a major source of VMT reduction, congestion relief and economic development. The Draft Plan includes a Strategic Plan section with projects deemed important by the region, but for which funding does not currently exist. We strongly recommend moving the upgrading of the Metrolink commuter rail system into the Constrained Plan. The upgrade project would provide double tracking, grade separations and other modifications where needed to enable expanded express service, while making a planned transition to an all-electric system capable of providing zero-

emission high-speed service (up to 110 mph) in select corridors. Such an upgrade could provide significant returns in the form of congestion relief, emission reductions, and economic opportunity created, as well as create enhanced opportunities for transit-oriented development.

2. Explore bus and bus rapid transit expansions to provide high quality, cost-effective transit to a majority of residents

Eighty percent of transit ridership in the region takes the form of bus travel. Considering the long lead times involved with capital expansion projects, expanded bus service may present the most immediate and cost-effective strategy to provide alternatives to driving for millions of SCAG residents. And yet in Riverside County, projected to house another 1.1 million residents over the life of the RTP (second only to Los Angeles County in growth projections), only 10% of the population is currently served by high quality bus service (less than 15 minute headways). Currently 40% of residents have access to 15-30 minute headway service. SCAG should identify potential service frequency upgrades which could provide a significantly higher proportion of the population access to high quality transit service.

SCAG should identify strategic investments to increase ridership in light of the new revenues which may be available through the AB 32 cap and trade revenue. In fact, we would like to urge SCAG's Regional Council to adopt a policy commitment that any new revenues received through the cap and trade program be prioritized for efficient transit operations. The public transportation literature indicates that for every 1 percent increase in transit service frequency, ridership increases up to 0.5 percent and a similar increase in vehicle miles or vehicle hours of service can increase ridership up to a range of 0.6 to 1% (Evans, 2004)[iv]. The highest-performing lines could be candidates for upgrade to Bus Rapid Transit, which could, in turn, serve to anchor development along now low-density transportation corridors. SCAG and its CTCs should examine the highest-performing lines, and potentially recommend them for upgrade to fixed guideway systems in this RTP.

3. Commit funds for bicycling and walking commensurate to the share of trips these modes accommodate

SCAG has increased bicycle and pedestrian funding from $1.8 billion to $6 billion in this plan. While this is more than a 200% increase, for which staff should be commended, it still accounts for just over 1% of the plan's total funds. This is hardly commensurate with the 20% of total trips taken on foot or by bike. The recent poll of SCAG region voters conducted by NRDC, Move LA and ALAC found that, by strong

contrast, voters believe 14% of RTP funds should go to making walking and biking safer. SCAG should continue to examine the balance of funds which constitute the $524 billion regional transportation plan, and investigate whether there are ways to free up additional funding for these most sustainable forms of transportation.

For example, SCAG proposes to spend $22 billion widening arterials in the six county region. If some of these funds were instead directed to ensuring that these roads are "complete streets" – safe for walking and bicycling, the region would be taking real steps towards encouraging sustainable transportation. SCAG should encourage CTCs and local jurisdictions to adopt complete streets policies so that bicycle and pedestrian improvements can be made routinely and more economically when streets are improved or built. Widening arterials will neither encourage other modes nor solve traffic congestion. We believe committing $6 billion to bicycle infrastructure and $6 billion to pedestrian safety improvements is actually a very reasonable request, and would still represent just 2.3% of total plan revenues for these modes.

4. Commit to collaborating with County Transportation Commissions to Prioritize Projects which help to reduce VMT and GHG Emissions

While SCAG does not make final decisions about transportation projects – its CTCs do—SCAG does play an important role analyzing the social and environmental impacts of alternative investment decisions. In its upcoming TIP process, as well as the next SCS/RTP, we recommend that SCAG adopt a process similar to the Bay Area Metropolitan Transportation Commission's to evaluate whether individual projects help to achieve regional goals[v]. In partnership with its County Transportation Commissions, SCAG should engage in a project performance analysis to determine whether its proposed investments help the region achieve its intended outcomes of improved air quality and health, location efficiency, improved mobility for its residents and reduced household transportation costs. Such an analysis assists decision makers in determining which projects are consistent with SCS goals.

The recently conducted poll of Southern California voters found that voters think building new roads and widening existing roads are by far the *least* effective strategies to reduce congestion and improve air quality. Instead, voters would rather see the region focus on smarter land use and prioritize investments in transit, bicycle, and pedestrian infrastructure. It is well known that SCAG is facing a significant funding shortfall for this RTP and makes some fairly ambitious assumptions about the availability of new

revenues. Perhaps a project performance assessment process could help to encourage SCAG's CTCs to adjust project priorities to contribute to overall SCS goals[1].

II. The RTP Must Include More Detail on Making Clean Freight Movement a Reality in the SCAG Region

As the RTP highlights, the movement of freight creates significant economic productivity in the SCAG region, but these financial benefits come at immense costs to the health and welfare of residents throughout the region, including the primarily low income communities of color nearest our freight hubs. Accordingly, any work to expand the freight movement system must concurrently push the cleanest technologies. In addition, resources must be allocated to cleaning up the already unacceptable high levels of pollution from the existing infrastructure. There is consensus amongst all regulatory air quality agencies that in order for the SCAG region to meet federal and state clean air standards on time, it must shift the freight movement system from a diesel-dominated industry to a near zero or zero emissions systems. To turn the rhetoric of moving to a cleaner freight system into a reality the RTP must be modified to include more detail.

In order to achieve the long-term, speculative projects of electric freight corridors on the I-710 and I-60, we need short-term projects. The notion was eloquently put in the 2006 Clean Air Action Plan ("CAAP"), adopted unanimously by both Boards of Harbor Commissioners for the Ports of Los Angeles and Long Beach, in which the commitment was made to the develop and implement a zero emissions container movement system. In pertinent part it reads:

> This component of the program is focused on finding the next generation of transport solutions for goods movement. The ultimate goal is a 21st century electric powered system that will move cargo from our docks to the destinations within 200 miles that today are moved by truck. It may (sic) take 20 years to complete such a system, but it will always be 20 years away unless in the next five years we build and test a demonstration prototype and perfect a detailed plan for widespread construction.[vi]

This prototype project will serve as the path towards actual achievement of the projects along the I-710 and I-60.

Other forward looking projects should also be included in the RTP. A catenary system along the Terminal Island Freeway serving to connect the Port of Long Beach to the Union Pacific Intermodal Container Transfer Facility ("ICTF") merits inclusion. In the same vein, the RTP should also include a catenary system along Alameda Street. These projects must be

[1] Given the recent *Association of Irritated Residents vs. Environmental Protection Agency* case, the region needs to adopt enforceable Transportation Control Measures (TCMs). The measures identified in this section and others are prime candidates for inclusion in a list of TCMs.

pushed forward in the near-term (e.g. next two years). Finally, the catenary system should be incorporated as an enforceable measure in the State Implementation Plan. This type of strategy provides an ideal Transportation Control Measure. *See* 42 U.S.C. § 7408(f)(v), (vi); *see also* 42 U.S.C. § 7511A(e)(4). We would be delighted to collaborate with staff in determining how these projects should be included in both the constrained plan and the State Implementation Plan as enforceable measures to push progress towards a true zero emissions system.

III. Ensure Projects Meet a Robust Definition of SCS Consistency in order to Qualify for SB 375 California Environmental Quality Act Streamlining

SCAG's EIR sets too low a bar for compliance with the SCS in order to achieve SB375's contemplated CEQA. Specifically, the EIR states that:

> "In other words, the SCS was not developed with the intent that each project to be located within any given TAZ must exactly equal the density and relative use designations that are indicated by the SCS Development Type in order for the project to be found consistent with the SCS's use designation, density, building intensity and applicable policies. Instead, any given project, having satisfied all of the statutory requirements of either a residential/mixed-use project or TPP as described above, may be deemed by the lead agency to be consistent with the SCS **so long as the project does not prevent achieving the estimated average use designations, densities and building intensities indicated by the Development Type within the TAZ, assuming that the TAZ will be built-out under reasonable local planning and zoning assumptions**."

We are particularly concerned that the standard established by this EIR--specifically the meager requirement that a project merely not prevent the achievement of a designated density for a certain development type--leaves it open to easy manipulation. It would seem to be quite easy for an individual project, of substantially lower density than that which is envisioned in the SCS, to justify its consistency with the SCS simply on the grounds that higher density projects are imagined in the future.

We strongly recommend that SCAG adopt a more stringent standard for consistency with the SCS in order to achieve the SB 375 CEQA benefits. At a minimum, we suggest the following language as an alternate standard:

> so long as the project ***promotes*** achieving the estimated average use designations, densities and building intensities indicated by the Development Type within the TAZ, assuming that the TAZ will be built-out under reasonable local planning and zoning assumptions.

IV. Commit to increased Compass Blueprint funding to ensure Local Governments have adequate resources to implement the Sustainable Communities Strategy

Working in close partnership with its local jurisdictions, SCAG has identified a future growth pattern which manages to save 400 square miles of open space from development. This is a highly impressive accomplishment, and it will take the sustained partnership of SCAG's local governments to follow through on the promise of this plan. To recognize their critical role as essential partners in implementation, SCAG should commit—in this plan—to an increased funding level for the Compass Blueprint program. SCAG may want to consider future revenues from the AB 32 cap and trade program as a potential funding source for this investment. Funds should be prioritized to local governments who plan and zone for growth consistent with the SCS.

V. Conformity

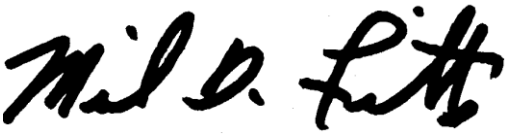
We have reviewed SCAG's conformity demonstration for the 2012 RTP, and have identified the conformity finding for PM 2.5 in the 2014 milestone year as potentially problematic. According to the report, the PM 2.5 budget for that year is 35 tons, while estimated emissions are calculated at 34.5 tons a difference of just one half ton. (Transportation Conformity Report at p. 20.) This means that the integrity of the conformity finding will be fatally compromised by even small errors in future estimates of emissions.

There is an even chance that this half-ton difference is illusory. According to ARB's June 20, 2011 revisions to the PM 2.5 transportation conformity budget, included with this letter, the 35 ton 2014 PM 2.5 budget is rounded *up* to the nearest ton.[vii] (See Table C-3 at p. C-10.) Because estimated emissions for that year are 34.5 tons*, there is a 50% chance that the rounding error exceeds the difference between the 2014 budget and estimated emissions.* Use of a "rounding up to the nearest ton" method of establishing the emissions budgets, when the difference between emissions and the budget is half a ton, means that the conformity finding is random; there is a 50% chance that emissions *exceed* the budget. This is logically indefensible and manifestly arbitrary and capricious.

We believe that the aforementioned improvements to the regional transportation system work toward amelioration of this problem. We also urge staff to commit to modeling alternative transit scenarios in the next SCS/RTP process in order to fully ascertain the potential environmental benefits.

VI. Conclusion

SCAG staff has taken significant strides with this SCS to set the region on a more direct path to sustainability. In particular, the land use pattern shows a substantial deviation from years



past in its attempt to provide opportunities for Southern California residents to live in walkable communities with affordable, convenient transportation options. We feel more work is necessary to adjust the priorities in the transportation system to ensure it is worthy of the ambitious changes to the land use pattern SCAG envisions. We have been honored to work so closely with your excellent staff through the process of creating this plan, and we look forward to the critical implementation phase in the years to come.

COALITION FOR CLEAN AIR

February 14, 2012

Pam O'Connor, President
Southern California Association of Governments
818 W. 7th Street, 12th Floor
Los Angeles, CA 90017

RE: Comments on the 2012-2035 RTP/SCS—Need for Amendments to Freight Element

Dear President O'Connor:

On behalf of the Natural Resources Defense Council and the Coalition for Clean Air, we write regarding the need for a near-term clean freight project in the Regional Transportation Plan ("RTP"). Specifically, we are concerned that there is not an emphasis in the RTP on near term projects that will help the region achieve its technology goals of creating a zero or near zero emission freight movement system. Accordingly, we respectfully ask that the RTP be amended to include short term projects in the constrained plan that will help advance cleaner technologies in the short-term.

In the 2006 Clean Air Action Plan ("CAAP"), adopted unanimously by both Boards of Harbor Commissioners for the Ports of Los Angeles and Long Beach, the ports committed to develop and implement a zero emissions container movement system. In pertinent part, the Port boards declared that —

> This component of the program is focused on finding the next generation of transport solutions for goods movement. The ultimate goal is a 21st century electric powered system that will move cargo from our docks to the destinations within 200 miles that today are moved by truck. It may take 20 years to complete such a system but it will always be 20 years away unless in the next five years we build and test a demonstration prototype and perfect a detailed plan for widespread construction.[1]

Here we are six years later, and we are no closer to actual implementation of a zero emissions system. While there are a lot of discussions about these technologies, there is an imperative need for SCAG to be leaders on this issue. In that vein, SCAG needs to provide more support for this concept in the near-term.

[1] San Pedro Bay Ports, 2006 Clean Air Action Plan, 141 (November 2006) *available at* *http://www.polb.com/civica/filebank/blobdload.asp?BlobID=3451*.

Los Angeles, CA 90017
TEL 213-630-1192 FAX 310-446-4362

The RTP should be amended to include a project or projects that will help spur technology. A catenary system along the Terminal Island Freeway serving to connect the Port of Long Beach to the Union Pacific Intermodal Container Transfer Facility ("ICTF") merits inclusion in the constrained portions in the plan. In the same vein, the RTP could also include other similar projects, including a catenary system along Alameda Street in the harbor area. At least one of these projects must be pushed forward in the near-term (e.g. next two years). The cost of such a system is estimated to be between 5 and 6 million dollars per mile on the high end. Furthermore, dollars should be allocated to procure trucks that can use this system. Accordingly, we recommend an initial allocation of 35 million for the entire project with the creation of a plan to increase the percentage of trucks that use this facility. Funding for this project could come from some combination of the ports, agencies responsible for clean air locally and statewide, and private industry. The key is to develop and implement the catenary system in the short term to help progress in actually achieving zero emissions goals. Finally, the catenary system should be incorporated as an enforceable measure in the State Implementation Plan. This type of strategy provides an ideal Transportation Control Measure. *See* 42 U.S.C. § 7408(f)(v), (vi); *see also* 42 U.S.C. § 7511A(e)(4). We would be delighted to collaborate with staff in determining how these projects should be included in both the constrained plan and the State Implementation Plan as an enforceable measure to push progress towards a true zero emissions system.

Please do not hesitate to contact us if you have questions about this recommendation.

Sincerely,

Adriano L. Martinez

Subject: Comments on SCAG DRAFT 2012 RTP

Who We Are
The No 710 Action Committee is a grassroots organization with members from the northeast area of Los Angeles and surrounding communities, including Alhambra, Eagle Rock, El Sereno, Highland Park, Glassell Park, Glendale, La Crescenta, La Canada, Los Angeles, Pasadena, and South Pasadena. Our group is comprised of residents as well as business and health professionals from diverse backgrounds and communities who are committed to improving transportation modes across and within the County. Our members include community organizers and activists, engineers, elected officials, scientists, economists, physicians and other health care professionals. Cities, neighborhood councils and groups that have taken official positions against the SR-710 extension represent over 500,000 people.

Through decades of involvement in 710-related issues, we have exhaustively researched multiple aspects of our region's transportation issues including pollution and health concerns, contemporary advances in freight movement, mass transit, traffic calming strategies and more. We support projects that are environmentally responsible and financially prudent, projects that will have benefit for the entire region. Since the proposed SR-710 Extension Toll Tunnels would not improve our regional mobility and air quality, but would actually worsen them, we recommend alternative solutions.

Objections to the RTP
We urge SCAG policymakers to **remove from the RTP all line items associated with expanding and extending the 710 freeway**, and remove from the RTP all items associated with expanding and increasing *existing* infrastructure and technology for goods movement in the region.

In addition, the No 710 Action Committee notes that SCAG must move the proposed SR-710 Extension Toll Tunnels from the Constrained Plan to the Strategic Unfunded Plan in the 2012 RTP because there are no committed, available, or reasonably available funds as required by federal law to include them in the Constrained Plan.

We oppose SCAG RTP items associated with proposed SR-710 Toll Tunnels because **they will increase pollution, truck traffic, congestion, accidents, health impacts and environmental risks in our communities and throughout the region.** We oppose related plan items which have the goals of increasing conventional roadway and rail yard capacity for the same reasons. The Programmatic Draft Environmental Report for the Plan is inadequate, as is stated in an addendum to this letter. These approaches are outdated, inefficient, and harmful to the region. **Better, zero-emission proposals for goods movement are available now – we should not wait another 20 years.**

Air Quality and Congestion
Goods movement proposals in the Draft Plan are inconsistent with regional, state, and federal air quality and congestion targets stated in the plan. The plan states that to attain federal ozone standards, the region will need broad deployment of zero and near-zero emission transportation technologies in the 2023 to 2035 timeframe (p.74). It also acknowledges that conventional goods movement practices contribute to excess ozone and poor air quality (p. 68), yet allocates billions of dollars to expanding existing systems, with no requirement that new technology be implemented.

The plan says that “truck-only freight corridors are effective as they add capacity in congested corridors, improve truck operations and safety..and provide a platform for the introduction and adoption of zero-emission technologies.” However, the plan does not require zero-emission technology (which truck operators will be reluctant to invest in because of the added expense), assumes and accommodates more trucks on the road en route to proposed freight corridors, and allocates billions to construction of these corridors instead of electrified rail freight movement projects which would eliminate many trucks from inner-city traffic altogether.

Health Impacts and Environmental Justice
The plan acknowledges environmental justice legislation at the federal and state level in detail and pledges SCAG’s compliance with the spirit of these laws. It proposes to address freight movement and rail emissions-related impacts, but it avoids mention of significant and sustained community opposition to the BNSF SCIG, which is on the Project List. The No 710 Action Committee opposes the SCIG in solidarity with the Coalition for a Safe Environment and other community groups that have repeatedly presented their comments and concerns related to environmental justice. These communities experience far higher than average freight truck traffic and host undesirable intermodal freight facilities. The resulting higher than average health, quality of life, life expectancy and safety problems are well documented. However, the existence of their concerns and specific objections to the SCIG are completely ignored and not mentioned in this Draft Plan or its appendix on Environmental Justice. The No 710 Action Committee repeats that SCIG and related Draft Plan components are part of an overall framework which favors conventional goods movement activities that cause significant pollution and negative impacts in neighboring communities and throughout the region.

Jobs
Job creation and retention goals in this Draft Plan represent "mission creep" and tilt towards requiring more trucks, more freeways, more traditional rail infrastructure, and more conventional port transfer and loading. We oppose this direction because it is part of a conceptual framework that includes the proposed SR-710 Toll Tunnels and the associated negative impacts mentioned above: pollution, truck traffic, congestion, accidents, health and environmental risks. The Port Working Group, a community coalition, has noted that the SCIG plan claims to add 400 permanent jobs, but existing businesses at the proposed site provide more than 1,200 permanent jobs, resulting in an overall reduction. Further, many of the construction jobs are not permanent, and not guaranteed to be awarded locally.

The No 710 Action Committee urges regional mobilization focusing on multi-modal transit and goods movement projects using electrified rail and zero emission technology. These will also create jobs, but the approach is forward-looking in terms of job and skills training and future infrastructure needs. In addition, more efficient, lower-cost goods movement technology will allow the Southern California region to attract jobs and new investment, competing effectively with other international and eastern seaboard ports' expansion and modernization.

Zero Emission Technology
The plan refers to zero emission electrified rail technology as a long-term goal in sections of the report covering goods movement, congestion, air quality, transportation investments, and truck transport. It proposes a long-term, bureaucratic study. It does not acknowledge that specific patents, plans and technologies are currently being proposed and discussed by several parties. The Draft Plan indirectly and incorrectly implies that such technology cannot be implemented on an accelerated timetable. This is a matter of political will and private investment, not feasibility. The No 710 Action Committee objects to the Plan's time-delay in funding and implementing zero emission strategies, because the near-term alternatives proposed in the Draft Plan include extension and expansion of freeways (such as the 710) and traditional rail yards and goods movement infrastructure which will result in added pollution, truck traffic, congestion, accidents, health and environmental risks in the region.

Funding
We question the revenue projections in the Draft RTP. The profitability of regional toll ways hasn't been demonstrated, and the exact uses of the proposed SR-710 Toll Tunnels haven't been determined (car only, truck only, both?) yet the SCAG RTP assumes a combined $22.3 billion in revenues for the tunnels and other toll ways.

On the expense side, funding should be reallocated. The billions of dollars for freeway expansion, near-term dedicated truck lanes, the East-West Corridor, and conventional rail yard / truck loading should be spent on accelerated implementation of zero emission electrified rail freight movement and other multi-modal and active transportation projects.

The plan gives lip service to a modernized, zero emission freight movement system from ports to electrified rail, but allocates no funding for this important step that will dramatically reduce truck traffic and congestion, improve air quality and health/environmental impacts, and position this region as an efficient, low-cost, high-tech goods movement magnet.

The plan also admits that increased population, and a growing aging population, will need alternative forms of transportation as roads become more crowded in the region. More funding should be directed proportionally to active transportation: walking, biking, transit, and multi-modal planning. The No 710 Action Committee proposes that the SCAG RTP allocate a share of funding proportional to the anticipated users of and established needs for active transportation to foster

livable, sustainable neighborhoods throughout the region and meet AB32 and SB375 greenhouse gas emission goals.

Vision
Mobility, economy, and sustainability can all be advanced with the priorities and funding we propose. We urge SCAG to remove the SR-710 Tunnel from its Draft Plan, reject goods movement proposals that extend the last century's polluting and inefficient practices, and invest instead in forward-looking plans that will enhance the region's quality of life and economic prospects.

Postscript and Addendum:

PEIR
Additional comments regarding the Draft Programmatic Environmental Impact Report (D-PEIR) shall be submitted separately and provide more detailed citations and comments which will demonstrate that the RTP as Project Description, Alternatives, and Mitigation sections of the PEIR, and the PEIR itself, are grossly inadequate and incomplete with regard to issues summarized below:

Summary Issues for 2035 RTP and RTP-Draft PEIR

1. Inadequate/Incomplete Project Description/Assessment for a Transportation Plan

Both the RTP and the PEIR are incomplete and totally inadequate as only selective forecasted 2035 traffic flows are provided in the main chapters and appendices which do not allow the public to fully review and evaluate the assessment of impacts. This is especially important for the evaluation of Freight Movements within corridors between the San Pedro Ports and the High Desert Corridor and Colton/Inland Empire Logistics Areas. Specifically more than 15 values for 2035 freight flows are missing from the I-710, I-5, and I-210 segments in Figure 2.7 and Goods Movements Appendix. Similarly no freight movement values are provide for connectors to the High Desert Corridor via I-15, SR-14, SR-138, and I-15.

Without these values the Projects listed for 2035 (e.g., SR-710 North Extension, East-West Freight Way (SR-60), SR-14, SR-138, etc.) cannot be properly confirmed, impacts assessed, and tolls-revenue generation evaluated.

Truck traffic is a major congestion factor on all RTP freeways in central LA County and must be modeled and results provided for independent assessment.

The High Desert Corridor truck destination/origins are not provided as little or no employment or housing or other land use parameters are not provided for such a large project.

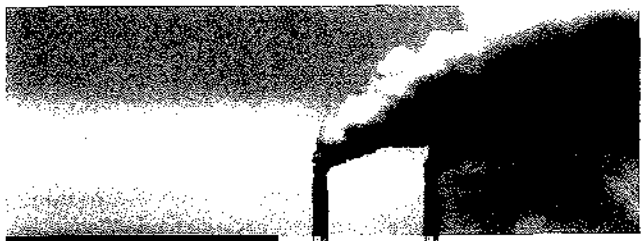
2. SR-710 North Extension Project

The SCAG 2035 RTP assumes a route of the SR-710 along the old surface freeway route from the I-10 to the I-210, although Caltrans and MTA and the Technical Advisory Committee for the Project have already delineated a 150 sq mi study area which could easily change the entire basis for traffic modeling of freight movements through the central Los Angeles County road system. Such changes would have significant effect on modeled freight traffic levels.

Similarly the SR-710 TAC are conducting traffic modeling which specifically is different from results show in the RTP and have commented that the SCAG-RTP Traffic Model does not appropriately model the SR-710 conditions for 2035 and before.

3. Inadequate and Incomplete Port and Rail Facilities Descriptions and Alternatives

The 2035 RTP remains totally focused on road truck movement of freight between the San Pedro Ports and the High Desert Corridor and Inland Empire Logistics Areas. Alternatives are being submitted to both Ports of Long Beach and Los Angeles for a major increase of direct Ship<>Rail – on-dock/in-port transfer facilities with rapid turnarounds of ships and unit trains between the Ports and Logistics Areas which will promote a rapid increase in the Alameda Corridor, Alameda Corridor East, and the new Alameda Corridor North to the High Desert Corridor Logistics Area. Estimated 10+ unit trains/hr (3 lines x 24 x 10 = 720 unit trains/day) would travel from Ports to the two Logistics Areas.



The RTP and PEIR have an unstated assumption that transfer facilities near the Ports are required to transfer freight from sea containers or 40 ft to US rail/truck containers of 53 ft. However, ships are already being refitted for the longer US containers for both West Coast Ports and for Panama shipping. Such project changes would largely eliminate any transfers in the Port region or the Logistics Areas.

Other issues will address in comments directly for the PEIR. As they stand now, both the 2035 RTP and PEIR are inadequate, incomplete, in error, and unsupported by information accessible to the Public and perhaps between Caltrans/MTA and SCAG regarding the SR-710 and its role in the RTP from Los Angeles County.

4. PEIR Jobs/Employment
Time and Totals
High Desert Corridor and Logistics Employees

5. Social Economics – Tolls/ETC. Revenue Generation and Costs
Constrained v. No Funding

RE: Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Program Environmental Impact Report (PEIR)

Dear Mr. Lieb and Ms. Lin:

The No 710 Action Committee welcomes the opportunity to provide information that we believe is missing from the Draft PEIR and to identify in some cases where the information can be found.

Air Quality and Health Consequences

SCAG RTP modeling is seriously out of date. Most of the SCAG region is classified as a non-attainment area for some criteria pollutants and an extreme non-attainment area for Ozone. SCAQMD, as the regional air regulator, has 36 air quality sensors across Southern California (Map 3.2-1) but they don't monitor pollution next to busy freeways. While the sensors may give a big picture view in accordance with federal law, "without the (freeway) monitors, there's a "glaring hole" in air pollution planning that ignores the health of more than a million people who live within 1000 feet of freeways in the AQMD's region, according to Adrian Martinez, an attorney for the Natural Resources Defense Council."1 Baseline data compiled from freeway monitors would allow us to stop the current modeling impulse to "average" pollution throughout the region, to look at health risks more accurately in nearby populations, and not claim unfounded benefits from basically shifting the pollution elsewhere without eliminating it. Current traffic

modeling appears to be out of date and inadequate, as witnessed by the delay of release of the preliminary DEIR on the lower I-710 due to inaccurate truck numbers. Without considering induced demand, the true costs of building, and maintenance and operations of highways the model doesn't build adequate and accurate evidence for decision making. It leaves open to unsupported speculation that more freeways or tunnels will lessen congestion and improve air quality. There is no uncongested freeway in LA and car and truck volumes are projected to increase as the inborn population increases. The volume of traffic and their attendant pollutants will inevitable increase and move us towards a progressively unhealthy place to live.

On the **Executive Summary- page 3** the statement is made that "based on the analysis contained in this Draft PEIR, the following were found to result in a **less-than-significant impact or no impact**: Air Quality (Change in Risk Levels Adjacent to the Freeway and Increased Population)." The RTP conclusion is invalidated by the statement on page **ES-2** regarding **Significant and Unavoidable Impacts**: Air Quality (Criteria Pollutants Emissions and Construction Emissions) and more specifically throughout the 3.2 Air Quality Section that cites many studies and their results:

> **pg. 3.2-23** A review of air pollution studies by the California Air Resources Board (CARB) indicates that residing close to freeways or busy roadways may result in adverse health effects beyond those typically found in urban areas. Several studies found an association between adverse non-cancer health effects (e.g., asthma) and living or attending school near heavily traveled urban roadways; however, these studies also found that the roadway and truck traffic densities were key factors affecting the strength of association with adverse health impacts. For urban roadways, the association of traffic-related emissions with adverse health impacts was generally strongest between 300 and 1,000 **feet.** (Dr. Rob McConnell and colleagues at USC published data showing concerning health effects at 500 to 1500 **METERS** from a freeway).
>
> CARB reports that Diesel Particulate Matter (DPM) represents about 70 percent of the potential cancer risk from vehicle travel on a typical urban freeway. As shown in **Table 3.2-4,** exhaust from heavy-duty trucks is **anticipated to decrease** in all areas of the region as compared to today; thus DPM associated with freeways will also decrease as compared to today.

Since the ARB identified diesel emissions as toxic air contaminants that are carcinogenic (TACs) in August, 1998 and 14 years (3 RTPs) have passed, it would seem unlikely that the above conjecture will come true any time soon, especially with America's oil dependency.

- *Mobile Sources Contribute to Serious Health Impacts.*
  Mobile sources such as trucks, locomotives and automobiles create the vast majority of air pollution in the South Coast Air Basin. One type of pollutant, fine particulates, is estimated to cause **6,200 premature deaths** in the Basin *every year*. The **average reduction in life span** for such persons is estimated by the

California Air Resources Board and the U.S. Environmental Protection Agency to be **14 years.** (California Air Resources Board, 2008 (mean estimate) 2

- *Health Risks Near Transportation Facilities.*
  The AQMD *Multiple Air Toxics Exposure Study* (MATES III) shows that diesel particulate matter is the overwhelming contributor to regional cancer risks from air pollution which average 1,200 in a million. This is hundreds of times higher than risk levels allowed for stationary sources under AQMD rules (between 1 and 25 in a million). The highest risks from air pollution are found near highways and other transportation facilities such as the I-710, because of heavy reliance on diesel-powered mobile sources. Persons in highly polluted portions of the basin, and persons near transportation facilities anywhere, also suffer greater risks of reduced lung function and many other serious health effects. (SCAG Mates III analysis, 2008) 3

The above is of particular concern to the No 710 Action Committee because of the overwhelming emphasis on goods movement and single occupancy vehicles in the RTP. The lower I-710 is listed on the projects list and proposes 4 truck lanes from the Ports of LA-Long Beach to the rail yards and 10 general lanes from the Ports to SR-60. While the upper I-710 is listed as a study (EIR/EIS) at a cost of $87,454 million, (2-27) the projects do not stand alone without consideration of the impact of the other, basically a conduit for port truck traffic into residential areas.

The I-710 North project is also described as an 8 lane toll facility in a tunnel (2-13). While new schools cannot be built within 500 feet of a major highway or freeway, the reverse is not regulated. A freeway or tunnel can be built within that distance, which would result in at least 37 schools that are within 1000 feet of the extension and the 210 from South Pasadena and Pasadena to Sylmar being subjected to toxins from an additional 30,000 vehicles and 2,500 more trucks daily. 4

Tunnels concentrate pollution up to 1000 times. An Australian school district will not allow their school busses to traverse a 2 mile tunnel that is considerably shorter than that planned for the I-710 extension. 5

Health Risk Assessments (HRA) and Health Impact Assessments (HIA)

The RTP must consider formal Health Risk Assessment and Health Impact Assessments for all of the I-710 corridor communities and Hot Spot analysis for sensitive receptor community sites such as schools, daycare centers, hospitals, convalescent centers, senior centers, parks and recreation centers, athletic fields and residential areas. Health professionals must be included in the analyses.

- Coalition for Clean Air - Transportation Facts

Port of Los Angeles, Port of Long Beach

The Ports of Long Beach and Los Angeles are the single largest source of air pollution in the South Coast Air Basin.
The AQMD stated in its February 17, 2009 letter regarding I-710 Project Alternatives that "In sum, **this region needs every possible emission reduction from goods movement and other mobile sources.** This must include zero-emission technologies wherever possible." The agency continued by mentioning electrified rail, maglev, the Alameda Corridor Electrification, electric trucks, fixed-guideway systems, and zero emission technologies that have been available for decades with photos of electrified freight transport systems in England, France, Russia, Italy, etc. In concluding, the agency stated "**we wish to caution against any unnecessary "phasing" of the evaluation of zero-emission alternatives which could result in other portions of the I-710 project (i.e. lane expansion)** proceeding to project level analysis, possible approval and construction, prior to full evaluation and potential decision regarding the zero-emission alternative." 6

The 12/6/2010 "Development of a California Geospatial Intermodal Freight Transport Model with Cargo Flow Analysis" commissioned by CARB and CEPA states in its conclusion section "First, the Case Study quantifies port-related intermodal goods movement through the state of California and beyond. Second, the idealized use of least-CO2 routing constraints illustrates how emissions savings can be achieved through modal shifts. **In terms of savings in emissions, it is estimated that a total of 60% reduction in CO2 emissions is achievable by a modal switch from road to rail."** 7

We need no more long-term goals or bureaucratic studies as stated in the plan.
The technology is available now, the studies have been done, commercial projects and lower polluting alternatives have been suggested in the I-710 DEIR, the benefits are region wide.

Goods movement versus people movement, by way of forms of mass transit.

For Los Angeles to become truly a world-class city more mass transit by way of light rail, busses, subways or streetcar connections must be planned and implemented. Los Angeles has been the laboratory for Detroit for the last 100 years and has only been catching up with other major U.S. cities for the last 20 years.

The Move L.A. " survey completed by Fairbank, Maslin, Maullin, Metz and Associates, shows that voters in the six county region served by the Southern California Association of Governments (SCAG) overwhelmingly support expanding and investing in transit over investing in highways. Even when voters backed highway spending, there was more support for a "Fix It First" approach than funneling more money into mammoth road expansion projects. Voters prioritized expanding public transportation as the most effective means of reducing traffic congestion and air pollution, said Denny Zane, executive director of Move L.A."8

The I-710 North EIR Scoping letters ran overwhelmingly against expansion of the freeway/tunnel. Preferences are for mass transit projects that would relieve congestion, clear the air, make commutes more agreeable and efficient and put more people into one vehicle rather than single occupancy vehicles.

The RTP is "front loaded" with highway projects and "back loaded" with transit. To meet our State mandates, it would make sense to move the transit projects up in the timeline and build them sooner than later.

Health in all public policies

Health and health equity issues do not appear prominently enough in your overall planning. Please reference www.sgc.ca.gov/workgroups/hiap.html. Community engagement is not demanding you build more and they are the ultimate stakeholders and the ones who bear the costs and health burdens.

Funding an Undefined Project

We are distressed to see the enormous dollars that might go to a new infrastructure project such as the I-710 north tunnels (11.8 billion, 2007 SCAG figure). **No project** is actually defined yet. The EIR/EIS process is just underway and is considering multiple routes, not just one. In fact, the Technical Advisory Committee has only had 2 meetings and is dealing first with a purpose and need evaluation. Our scarce transportation dollars could be much better used in transit projects to make a healthier and sustainable region. This should not be in the **constrained** list of projects but rather removed to the **strategic** list. The cost estimates are way below the building costs and there are many specialized issues in concentrating pollution in tunnels. The toll revenues may not come to pass, as many municipalities have found. It is not revenue you can reliably build into the current plan. Due to no foreseeable funding in sight to complete an undefined project, **the RTP must reflect reality and move the potential project from the constrained to the strategic unfunded list.**

We need to move to congestion pricing, reduced parking availability, higher parking costs and other incentive taxes to move us away from choosing individual mobility options.

Thank you for your attention to our issues. The public is very interested in transportation as it affects our daily lives. We look forward to seeing the revised plan.

Sincerely,

NO 710 ACTION COMMITTEE:

SCOPING COMMENTS ON HEALTH AND AIR POLLUTION 710 TUNNELS PROJECT

Ron Kosinski
Deputy Director
Division of Environmental Planning
Caltrans District 7
100 S. Main street, MS 16A
Los Angeles, CA 90012

Dear Mr. Kosinski,

RE: SR-710 Environmental Impact Report/ Scoping Request.

We are requesting a "hot spot analysis" for the following types of locations related to all the corridors under consideration for the proposed 710 tunnels project:

- Schools
- Daycare center
- Hospitals
- Convalescent centers
- Senior centers
- Parks and recreation centers and athletic fields
- Residential areas

These listed locations should be designated as "sensitive receptor community sites."

The Hot Spot analysis and modeling analysis should include harmful products e.g.,:

Particulate matter PM to include all sized particles including ultrafine particles (<100nm) and nano particles (<50 nm), carbon black (organic carbon and elemental carbon), and degradation of road products and tires and brake linings and diesel catalyst decay products (including but not limited to metal particulate emissions, strontium, and a variety of organic compounds)

- Nitrogen oxides (NOx) and nitrogen dioxide (NO_2)
- Ozone
- Carbon monoxide (CO)

We are also requesting "Health Impact Assessments and Health Risk Assessments" at the above named sites.

In addition to the specified sensitive receptor community sites, the hot spot analysis should also include analyses of the **tunnels themselves** with investigation of concentrations of all the above pollutants at peak traffic hours with congestion modeling, within the tunnels, at the portals and at ventilation shafts. Information about the ventilation shaft air cleaning should be provided consistent with the highest level of available technology and its cost. The modeling should include port truck traffic and be based on the current percentage of fossil fuel dependent vehicles. Time in tunnel at congestion speeds should be modeled for individuals who use the tunnel for regular commuting. Models should be created to look at what might happen at community sites if the traffic chooses to use the surface streets instead of the toll tunnel, which has been seen at various sites around the world.

The hot spot analysis should seek **peak** values for all measurements so as not to underestimate the effect on human health. The impact of various temperatures and day and night changes and local wind patterns should be included in model analyses.

Discussion:

Air pollution in our region is significantly influenced by fossil fuel emissions from transportation. Human health is significantly impacted by the air pollutants produced by fossil fuel combustion regionally and locally. Key pollutants that are recognized as having adverse health effects include particulate matter (PM) of various sizes with increasing concerns about ultrafine particles and carbon black, ozone (O_3), Nitrous Oxide (NO_X), and Nitrogen Dioxide (NO_2) as well as acid and organic vapors.

Health studies of air traffic pollution have shown an association with increased cancer risk, increased cardiovascular events and death, and lung inflammation with worsening of asthma and lung function.

Children are particularly sensitive to regional and local air pollution, leading to permanently decreased lung function and increased incidence of or worsening of asthma.

> Children in more polluted communities are almost 5 times as likely to have clinically abnormally lung function compared to those in less polluted communities. As alarming as this is, the greatest effect of pollution-related deficits may occur later in life, since reduced lung function is a strong risk factor for complications and death during adulthood.(NEJM Sept 9, 2004 vol 351: 1057-67 Gauderman)

Inability to get enough exercise because of poor air quality and asthma attacks can impair quality of life, and increase the risk of obesity and associated health problems. Later, societal health care costs could be significantly adversely impacted.

Proximity to a freeway or busy roadway increases many health risks. Wind can be a factor how far the pollution is distributed, up to 1.5 miles in some scientific literature.

Diesel emissions, predominantly from trucks, are major contributors to air pollution. Proximity to truck diesel traffic increases health risks. Diesel particulate emissions are labeled as cancer causing toxic air contaminants. The particles may penetrate deeply into lung and vascular tissues and stay there for a long time. Diesel particulate is responsible for 70% of total cancer risk from all toxic air pollution according to AQMD. Diesel gaseous compounds are also hazardous.

We are very concerned about the project proposal and the health impacts of increased truck and other highway traffic in our neighborhoods. We want livable, healthy neighborhoods, not more freeways.

http://coalitionforcleanair.org/air-pollution-10facts.html
http://coalitionforcleanair.org/our-programs-transportation-facts.html

APPENDIX A

Attached please find an extensive bibliography of health effects from traffic pollution that the community has collected. We have sorted them into a number of different categories for ease of use with their active links. The EIR should actively study All these health concerns and weigh them against the various transportation benefits. The externalities of health impacts of certain projects may significantly diminish any transportation benefits, making certain alternatives unacceptable. Community health and cohesiveness is of critical importance to those in the path of the proposed tunnel. We are demanding a balanced look at the issues, that will stand up to scientific scrutiny and evolVing health and transportation policies. Mitigation of health effects can be difficult, prohibitively expensive, or inadequate so we want honest and full disclosure. We are asking for SMART GROWTH and MOBILITY MANAGEMENT. We know the old solutions are not safe and sustainable.

APPENDIX B

OUTLINE of health concerns for 710 Tunnels Scoping

Tunnel Safety

Traffic accidents--specific dangers of a tunnel accident with fires

Major hazards: earthquakes, floods, terrorist attacks

What will be the typical time in tunnel with current congestion patterns?

Rescue and safety capability within the tunnel; escape routes; handicap escapes

Tunnel and Health

Monitor pollutants - tunnels concentrate pollutants:

Specify PM including ultrafine, carbon black, ozone, Nitrogen dioxide, NO_2, CO_2

Brake and tire lining emissions; tire rubber, fine organic aerosols

Temperature and seasonal impacts/day and night impacts/ wind impacts on pollutants

What are the health effects in a tunnel with stopped traffic? Noise, pollution, psychological

HIA, HRA should cover the following tests and analyses:

Concentrations in proximity to portals and ventilation shafts

Concentrations at sensitive sites including schools, hospitals, residences

Effect on asthma

Effect on lung disease

Possible effect on diabetes, breast cancer

Neurotoxin effect on brain cancers and cognitive dysfunction

Cardiovascular -mortality, cardiovascular events, vascular inflammation, stroke, BP

Miscellaneous: appendicitis, pneumonia

Children:

lung development, asthma, autism, fetal brain development

Women:

Differential effect on women: lungs, premature births, fetal brain development, increased abortion rates

Continuum of effect-no threshold (important for mitigation)

Diesel specific health data

Duration of exposure with regular commuters

Comparison with smoking risk

Distance from freeway/tunnel/ventilation shafts modeling 500 feet up to 1.5 miles

Other health externalities: missed school, missed work, increased health expenses, increased stress/worry

Tunnel Construction

Workers safety

Dust displacement into air; coccidioidomycosis

Disruption of underground water supplies

Tunnel finances

Cost estimates don't take into consideration **health externalities**

PPP responsibility to health and communities

Ultimately liability for health impact

Tunnel Impact on Quality of Life

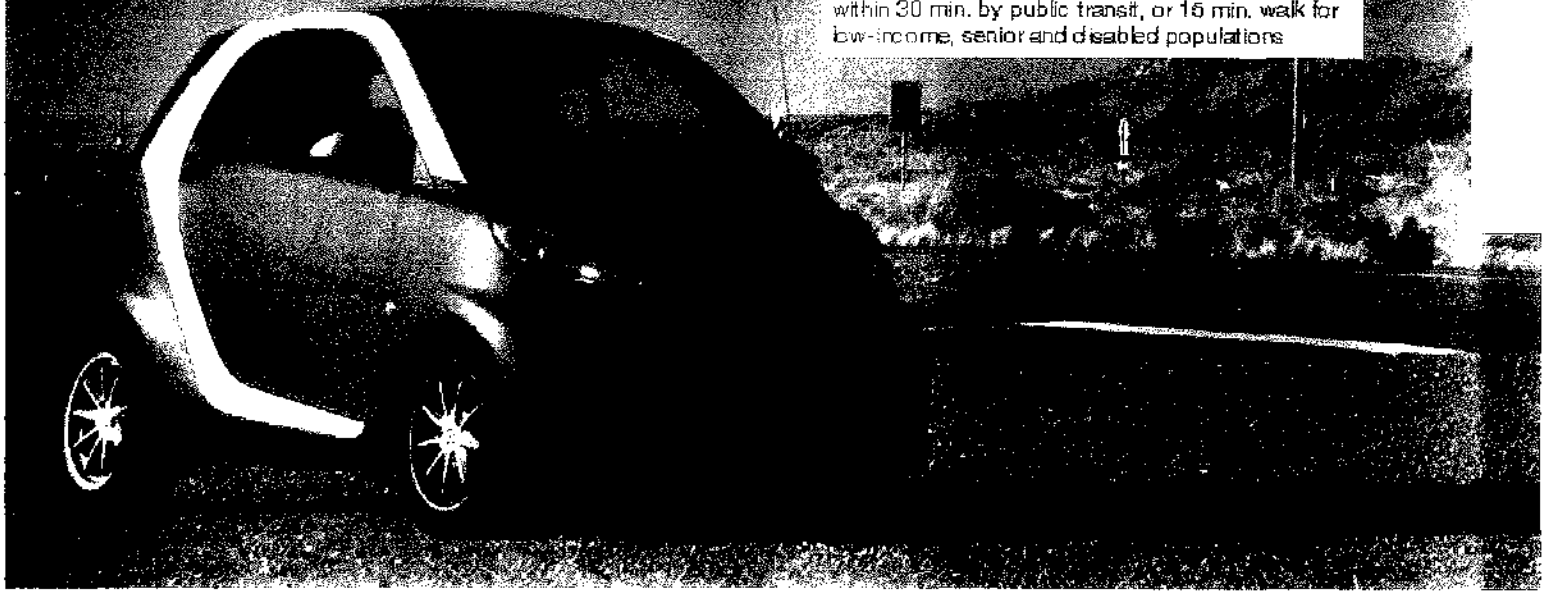
Alignment with transportation needs and goals to make livable, equitable communities

Alignment with regional climate and air quality goals/guidelines/standards

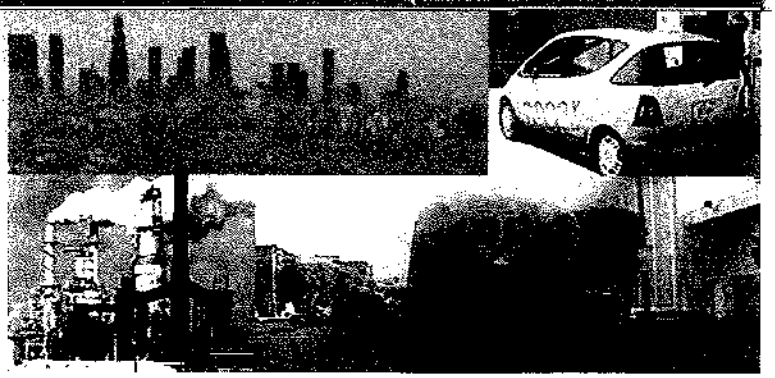
Alignment with complete roads concepts

Impact on regional air quality

APPENDIX C



Selected Health, Economic & Community Impacts - Freight Transportation



REGIONAL AIR POLLUTION	Particulate matter	Elevated levels of PM2.5 in the air	Cardiovascular disease, COPD (e.g., emphysema)
	PM and elemental carbon (EC)	In vehicle exhaust; EC is a marker for diesel	Chronic exposure leads to reduction lung function in children
	Ultrafine particles (UFPs)	In vehicle exhaust; considered very toxic	When lab animals breathe UFPs, some end up in the brain; UFPs can cause artery hardening in lab animals
	Nitrogen dioxide -- precursor to ozone	Diesel emissions contains high levels of NO_2	Increase in school absences is linked to increases in ozone levels
LIVING NEAR TRAFFIC-RELATED AIR POLLUTION	Living close to highways	Children	Increased asthma; exacerbation of asthma (e.g., wheezing) and use of more asthma medication
	Living or going to school near a busy road	Children	More likely to develop new cases of asthma
	Living near busy roads	Pregnant women	More likely to have premature or low birth weight babies or miscarriages, or develop preeclampsia
	Living near a freeway	Adults	Thickening of the artery walls that can lead to heart disease and stroke
	Living within 50 meters of a busy road with more than 15,000 vehicles/day	Women	More likely to develop mild cognitive decline as they age
	Living near busy roadways	Women	More likely to develop new cases of diabetes
	Living near busy roads	Men and women	More likely to develop stroke and new cases of heart disease
HIGH NOISE LEVELS	Community noise pollution	At risk: those living near busy highways, marine terminals, airports, rail yards, and train tracks, and/or construction of the above	Residents near airports and highways show (for adults) an increase in cardiovascular disease and stroke, sleep difficulties and anxiety; and (for children) problems with school behavior and anxiety
	Elevated levels of noise in workplaces	At risk: dock workers, railroad workers and truck drivers	Long term exposure can cause hearing loss, stress and high blood pressure
LABOR ISSUES: WORKER HEALTH AND SAFETY	Contingent employment - e.g., warehouse workers	Workers often hired by agencies as temporary workers with low-pay and no benefits	Stressful, insecure jobs without benefits
	Misclassification as independent contractors rather than employees	Port truck drivers	Lack of basic worker protections, such as hourly wage, overtime, health insurance, unemployment benefits, right to organize - and OSHA protections
	Diesel exhaust	Dock workers, railroad workers, truck drivers and workers at trucking operations	Increase in lung cancer in all three occupations; increase in COPD (e.g., emphysema) among railroad workers
	Heat	Lack of air conditioning in cabs of trucks and locomotives and inside huge distribution centers	If outdoor temperatures are extremely high and there is no relief or mitigation, workers can suffer from heat stress illnesses
	Injuries/fatalities	Some parts of the freight transportation industry are considered "high hazard"	E.g. The 2009-2010 California OSHA highest hazard industry list included warehousing and truck transportation
COMMUNITY IMPACTS	Industrial blight	Empty containers in lots near homes; views of industrial cranes	Decreases home values and quality of life
	Traffic Congestion	Cars must travel with big-rig trucks; expanding number of heavy duty trucks hauling containers; truck driving schools operating in neighborhoods	Stress from congestion; increased commuting time means longer times on the road breathing air pollution in exhaust from cars and trucks
	Cars traveling in same lanes and on same highways	Expanding number of heavy duty trucks hauling	Injuries and fatalities in car-truck accidents.
	24-hour lighting	Lights shine in windows	Difficulty sleeping at night
	Road repairs	Highways, truck routes, residential streets near rail yards, ports and warehouses	High cost to local and state taxpayers to repair the roads and highways from big-rig truck damage
	Eminent domain	Exerts the right of railroads or governments to appropriate private property (e.g., to build a highway)	Community residents can lose their homes

National Transportation Objectives & Targets

2010-2030

Objectives	Performance Targets
Improve Economic Competitiveness, Transportation System Efficiency and Workforce Development Opportunities	Reduce per capita vehicle miles traveled by 16%
Improve Transportation System Conditions and Connectivity	Triple walking, biking and public transportation usage
Promote Energy Efficiency and Achieve Energy Security	Reduce transportation-generated carbon dioxide levels by 40%
Ensure Environmental Protection, Restore Climate Stability and Resolve Persistent Environmental Justice Issues	Reduce delay per capita by 10%
Ensure Safety for All Transportation Users and Improve Public Health Outcomes	Increase proportion of freight transportation provided by railroad and intermodal services by 20%
Provide Equal and Equitable Access to Transportation Options in Urban, Suburban and Rural Communities	Achieve zero percent population exposure to at-risk levels of air pollution
	Improve public safety and lower congestion costs by reducing traffic crashes by 50%
	Increase share of major highways, regional transit fleets and facilities, and bicycling/pedestrian infrastructure in good state of condition by 20%
	Reduce average household combined housing + transportation costs 25% (use 2000 as base year)
	Increase by 50% essential destinations accessible within 30 min. by public transit, or 15 min. walk for low-income, senior and disabled populations

The Coalition for Clean Air is dedicated to restoring clean, healthful air to California by advocating responsible public policy, providing technical and educational expertise, and promoting broad-based community involvement

Top 10 facts Californians should know about air pollution and health

1. Breathing air in polluted metropolitan areas such as Los Angeles or Riverside can reduce your life expectancy by 2 to 3 years.

2. Motor vehicles and other air pollution sources that move, such as ships, trucks, trains, buses and even lawnmowers, account for about 90% of the cancer risk in the greater-Los Angeles region – with stationary sources such as power plants and factories accounting for only about 10%.

3. Diesel exhaust from trucks, ships, trains and buses has been declared to contain over 40 substances listed as hazardous air pollutants by the U.S. EPA.

4. When you drive in bumper-to-bumper traffic, pollutants outside can seep into your car, making the air you breathe inside your car up to 10 times more polluted than typical city air.

5. Every day that a ship sits at dock unloading its cargo, it releases an entire ton of smog-forming and toxic pollutants.

6. If you live, work or go to school near freeways, high-traffic roads, seaports, and rail yards, you are generally at greater risk for cancer and decreased lung function, studies show, because these places contain more concentrated levels of air pollution.

7. For your child, toxic air pollution is an even bigger problem, in part because children breathe much more quickly than adults.

8. Asthma is a leading cause of school absenteeism, according to the California Department of Education.

9. Even if you don't smoke cigarettes at all, your lungs or heart may be similarly damaged simply from exposure to ozone and particulate matter. The American Heart Association recently declared, "[Air pollution's] impact on cardiovascular disease ... represents a serious public health problem."

10. Health impacts from diesel pollution exposure, such as premature death, heart disease, asthma and bronchitis, cost some $22 billion statewide in 2004, not including impacts such as lost work and school days.

The Coalition for Clean Air is dedicated to restoring clean, healthful air to California by advocating responsible public policy, providing technical and educational expertise, and promoting broad-based community involvement.

Pollutants & Health Effects

-- Select Topic or Scroll Down --

Particulate Matter (PM)

Particulate matter or PM consists of soot and dust particles that are smaller than the diameter of a human hair. There are two classifications for particulate matter, PM10 and PM2.5. All particles smaller than 10 microns in diameter are classified as PM10, or coarse size particles. Fine size particles, or PM2.5, are those particles less than or equal to 2.5 microns in diameter. Particles that are smaller 2.5 microns are smaller than 1/8th the diameter of a human hair. Sources of PM include diesel exhaust, soil dust, tire wear, and soot. These particles penetrate deeply into the lungs and are captured by lung tissue. A major contributor to the PM pollution problem is exhaust from diesel vehicles, which produce 79% of the particulate emissions from mobile sources. The most dangerous aspect of PM pollution from diesel vehicles is the hundreds of different chemicals that are adsorbed to the particle. Exposure to PM pollution has been associated with respiratory and cardiac problems, infections, asthma attacks, lung cancer and decreased life expectancy. The World Health Organization has estimated that 500,000 premature deaths each year may be associated with PM pollution. Fine particulate air pollution (<2.5 microns) is thought to be more dangerous because of its ability to penetrate deeper into lung tissue. A recent study found that even a small increase in PM2.5 can result in a significant increase in mortality. In fact, The American Lung Association believes that PM2.5 represents the most serious threat to our health. Segments of the population that are more susceptible to PM pollution include children, athletes, senior citizens, and people with pre-existing respiratory problems.

Ozone

Ozone forms when hydrocarbons combine with nitrogen oxides and chemically react in sunlight. Hydrocarbons and nitrogen oxides are primarily produced by motor vehicles and various industrial practices. Ozone is a highly reactive oxidizing agent that breaks-down organic materials. Ozone is the primary component of smog, which has plagued Los Angeles for many years. A natural phenomenon called an "inversion layer" traps these gases and prevents them from dissipating into the atmosphere. The result is a serious smog problem in the valleys and basins of Southern California. Smog and the related high ozone levels are not just a California problem; Texas City, Texas recorded the highest one-day ozone level in the country for 1999. As populations grow, ozone and smog are becoming problems for large

cities throughout the country. Symptoms of ozone exposure are coughing, shortness of breath, wheezing, fatigue, throat dryness, chest pain, headache and nausea. Ozone has been shown to cause inflammation of lung tissue and reduced lung capacity. Development of asthma, increased lung cancer mortality rates, and accelerated lung aging have all been linked to ozone exposure. Lung damage from long-term exposure to ozone can be permanent, while short-term exposure appears to be reversible. Ozone reduces the respiratory system's ability to fight infection and remove foreign particles such as particulate matter. Segments of the population that are more susceptible to ozone pollution include children, athletes, senior citizens, and people with pre-existing respiratory problems.

Hydrocarbons

Hydrocarbons are a class of reactive organic gases or ROG, which are formed solely of hydrogen and carbon. Hydrocarbons contribute to the formation of ozone and the resulting smog problem. Carcinogenic forms of hydrocarbons are considered hazardous air pollutants, or air toxics. The incomplete burning of any organic matter such as oil, wood, or rubber produces hydrocarbons. Combustion engine exhaust, oil refineries, and oil-fueled power plants are the primary sources of hydrocarbons. Another source of hydrocarbons is evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint. The primary health effect of hydrocarbons results from the formation of ozone and its related health effects. High levels of hydrocarbons in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement.

Nitrogen Oxides (NOx)

Nitrogen monoxide (NO) and nitrogen dioxide (NO2) are the two forms of nitrogen oxide found in the atmosphere. Nitrogen oxides contribute to the formation of ozone, production of particulate matter pollution, and acid deposition. The presence of nitrogen oxides gives smog its brown appearance. Factories, motor vehicles and power plants that burn fossil fuels produce nitrogen oxides. Diesel engines produce a disproportionately large amount of NOx when compared to gasoline engines because of their high temperature combustion process. Nitrogen dioxide has been shown to irritate lung tissue, cause bronchitis and pneumonia, and reduce resistance to respiratory infections. The presence of NO2 in the atmosphere can have synergistic effects with other forms of air pollution. The health effects of ozone are magnified in the presence of nitrogen dioxide. Frequent or long-term exposure to high levels of nitrogen oxides can increase the incidence of acute respiratory illness in children.

Carbon Monoxide (CO)

Carbon monoxide is a colorless, odorless gas that is produced by burning organic matter such as oil, natural gas, fuel, wood, and charcoal. Motor vehicles produce 67% of the man-made CO that is released into the atmosphere. Carbon monoxide displaces oxygen in red blood cells, which reduces the amount of oxygen that human cells need for respiration. Exposure to CO can result in fatigue, angina, reduced visual perception, reduced dexterity, and death. The elderly, young children, and people with pre-existing respiratory conditions are particularly sensitive to carbon monoxide pollution. Carbon monoxide is extremely deadly in an enclosed space, such as a garage or bedroom.

Sulfur Dioxide (SO2)

Sulfur dioxide is a colorless gas produced by motor vehicles, refineries, and power plants that burn fossil fuels. Fossil fuels like coal and oil vary in sulfur concentrations and as a result the amount of sulfur dioxide they produce when burned. A high level of sulfur dioxide in exhaust gas can interfere with emission control mechanisms for other pollutants. Sulfur dioxide reduces respiratory volume, and increases breathing resistance in those exposed, especially asthmatics. Studies have also shown that sulfur dioxide increases nasal airway resistance. Other research has shown that daily mortality rates are consistently associated with sulfur dioxide and ozone levels.

Air Toxics

Air toxics, which are also known as hazardous air pollutants, are 188 toxic and potentially toxic compounds listed by the Federal Clean Air Act. Air toxics are generally organic chemicals, including some hydrocarbons that are highly evaporative in nature. Sources for air toxics are motor vehicles, chemical plants, paint, and any other operation that uses organic compounds. Benzene, formaldehyde, acetaldehyde, 1,3-butadiene, and acrolein are typical examples of air toxics. Air toxics are pollutants that cause or are suspected of causing cancer in those exposed to them. Cancer is the primary health effect studied due to the low exposure concentrations of these air toxics such as benzene, and formaldehyde. Benzene has been shown to cause aplastic anemia and acute myelogenous leukemia in occupational studies of workers exposed to it. Known health concerns related to aldehydes include cancer, asthma, and respiratory tract irritation. It is also believed that these air toxics have impacts on the reproductive system by causing chromosomal aberrations or mutations. The nature of air toxics still poses many uncertainties about their true health effects. These chemical compounds have many different forms and metabolites as they are broken down, and little is known about how they interact with the body. The health effects of particulate matter from diesel exhaust are thought to be attributable to the many air toxics that are adsorbed to the particles. These small particles penetrate deeply into the lungs, and are the perfect vehicle for delivering air toxics into the body.

Transportation Facts

-- Select Topic or Scroll Down --

General

- California population (2003): 36,363,502
- Registered cars and trucks in California: 24 million
- Miles driven every day in California: 825 million
- Miles driven daily by the average driver: 36
- Gallons of fuel burned every day in California: 47 million
- Pounds of pollutants created daily: 5.4 million

Diesel

- Diesel exhaust is known to cause cancer, asthma, and other respiratory diseases.
- The health risk from diesel exposure is greatest for children and the elderly. The proximity of a child's residence and school to major roads is linked to asthma occurrence.
- Asthma limits children's ability to participate in sports, and is the most common cause of children's absence from school due to hospitalization.
- The State of California decided that there is enough evidence to list the particulate matter in diesel exhaust as a toxic air contaminant.
- Exhaust from heavy-duty diesel engines contains between 100-200 times more small particles than gasoline engine exhaust.
- California's Scientific Review Panel estimates that 16,000 Californians will develop lung cancer over a lifetime of diesel exhaust exposure.
- Only 2 percent of the vehicles on California's roads run on diesel. Yet they account for 31 percent of smog-forming nitrogen oxides, and for 79 percent of particular matter emissions from on-road vehicles.
- Cleaner alternatives to diesel are available, such as liquefied natural gas, compressed natural gas, or propane. Electric or fuel-cell engines are being enhanced to provide future alternatives.

Special Groups

- Children breathe at a rate twice that of adults, and are thus more susceptible to the

toxicity of airborne diesel particles, vapors and gases.
- Some diesel exhaust causes pollutes the inside of buses when entering the cabin.
- There is a continuing need to replace older, dirtier buses with cleaner, newer buses to reduce children's exposure to vehicle related pollutants.
- The average diesel school bus is 223.5 times more toxic than a new compressed natural gas (CNG) school bus.
- Although a clean school bus powered with compressed natural gas costs about $30,000 more than a diesel bus, it is cheaper in maintenance.

Alternative Fuel Vehicles

- Electric vehicles (EV's) are the only true zero-emissions vehicles on the road.
- The only emissions from electric vehicles are from upstream power plants providing electricity.
- Upstream emissions for gasoline vehicles are more than 14 times higher than fo electric vehicles.
- Electric vehicles run on electricity provided by on-board batteries, and can be recharged at any of the many recharging stations around the state.
- As of March 2002, there were more than 4,000 electric vehicles on the road in the U.S., most of them in California.
- Hybrid vehicles offer 2-3 times the energy efficiency of a comparable gasoline-only car, and have ranges of about 600 miles on a tank of gas.
- The most widely available hybrid vehicles are the Honda Insight and the Toyota Prius, which have retail prices of about $20,000. The Ford Escape Hybrid will be launched late summer 2004, at a retail price of around $27,000.
- Comprehensive data of vehicles' fuel economy and emissions is provided by the Environmental Protection Agency's "Green Vehicle Guide": http://www.epa.gov/greenvehicles.

Light Trucks and SUV's

- By federal law, light trucks and SUV's do NOT have to meet the strict emission standards placed on passenger cars.
- Light trucks and SUV's now account to almost half of all auto sales in the United States.
- Many Light Trucks and SUV's run on diesel, which severely increases the danger of lung diseases.
- In average, light trucks and SUV's of the 2004 model year achieve only about 70 percent of the fuel economy of average cars.
- With advanced technology, such as gasoline-electric hybrid motors, auto manufacturers could ensure that SUV's and light trucks meet the same emission standards as cars.

Ports

- The Ports of Los Angeles and Long Beach are the largest fixed source of air pollution in the South Coast Air Basin. Communities neighboring these ports suffer from some of the highest cancer risk due to air pollution in our region.
- The number of cargo containers entering these ports is expected to as much as quadruple in the next 20 years.
- A container ship that idles at dock emits about as much diesel pollution as a diesel truck traveling 70,000 miles – the approximate distance of three trips around our earth. These ships can produce more than 1 ton of smog-forming compounds during a 24 hour period at the dock.
- Shoreside power allows ships to turnoff their dirty auxiliary engines – virtually eliminating pollution at the dock.
- This technology has been used by the Navy for decades. The technology has also been proven successful for cruise ships and other harbor craft.
- The first container terminal with dockside power capability opened in 2004 as a result of a settlement between the Port of Los Angeles, NRDC, the Coalition for Clean Air and local community groups. A container ship with dockside power capability has already docked twice and ran on electric power.

Airports

- Los Angeles International Airport is the second largest industrial smog source in the Los Angeles Area.
- Air pollution from airports is exempt from many rules that other industrial polluters must follow.
- Air travel is expected to double within the next two decades. It is the fastest growing mode of travel in the United States.
- One 747 arriving and departing from JFK airport in New York City produces as much smog as a car driven over 5,600 miles, and as much polluting nitrogen oxides as a car driven nearly 26,500 miles.
- Airplanes can save a lot of fuel if they have the ability to move on ground with just one engine running.
- The United States is one of only 3 countries opposing a worldwide standard that would reduce the impact of aircraft emissions in the atmosphere.

Re: Draft 2012 Regional Transportation Plan and Program Environmental Impact Report

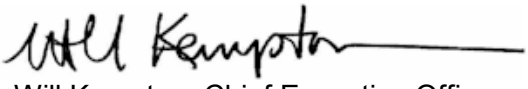
Dear Mr. Ikhrata:

The Orange County Transportation Authority, Transportation Corridor Agencies, Orange County Council of Governments, Association of California Cities - Orange County, County of Orange, Orange County Business Council, and undersigned organizations representing local agencies thank you for the opportunity to comment on the Southern California Association of Governments' (SCAG's) Draft 2012 Regional Transportation Plan (RTP) and associated Program Environmental Impact Report (PEIR). We acknowledge SCAG's effort to deliver the draft documents, and your commitments to incorporate the Orange County Sustainable Communities Strategy (OC SCS) and Long-Range Transportation Plan (LRTP) as presented to you.

Each of our agencies has prepared individual comment letters; however, this letter emphasizes some issues of common concern raised through our collaborative review.

- Induced growth discussions incorrectly imply a lack of coordination between land-use and transportation planning agencies and are contrary to the balanced plans provided through the LRTP and OC SCS collaboration process. Please state that land-use plans and transportation projects identified in the OC SCS and LRTP are balanced and, if necessary, clarify under what circumstances "induced growth" may occur.

- The preliminary determination that all of the mitigation measures are feasible is not supported within the draft documents. Moreover, the "can and should" language incorrectly implies that mitigation measures are feasible for the identified agencies. SCAG should provide a clear statement that all mitigation measure recommendations are advisory and replace the "can and should" phrase with "may" when referencing mitigation measures.



- Multiple mitigation measures appear to exceed SCAG's authority and responsibilities for implementation. These mitigation measures should be restated or removed as appropriate.

- New revenue sources and innovative financing strategies used to demonstrate financial constraint can have significant impacts on businesses and the economy that must be clearly understood before advancing. In fact, the RTP

vision statement recognizes the linkages between economy and the regional transportation system. Specifically, details on how any new user fees would be further defined, evaluated, and advanced must be evaluated through a full economic analysis prior to final adoption of the RTP. In addition, this analysis should demonstrate, by county, the need for new revenues, how the new revenues are proposed to be invested, and how a county-level return to source mechanism can be ensured.

We encourage SCAG to pay particular attention to these issues and the specific comments submitted by the respective agencies and ensure that they are appropriately addressed in the RTP and PEIR revisions.

RE: Draft 2012 Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS) and the Program Environmental Impact Report (PEIR) - COMMENT

Dear Mr. Ikhrata:

Based in America's sixth largest county, Orange County Business Council represents the largest and most innovative employers who comprise the economic engine of Southern California. We advance Orange County's economic prosperity while protecting a high quality of life.

We appreciate the monumental task of compiling the RTP/SCS and the PEIR and commend SCAG on its concerted effort to engage with the community and local jurisdictions in development of these mandated documents. In particular, SCAG has worked closely with Orange County to ensure that our own SCS met requirements while also addressing the needs of the community. We recognize the difficult position SCAG is in to do the same on a regional basis – meeting federal and state laws while also addressing the needs of very disparate communities in a geographically and socio-economically large and diverse region. However, in the effort to be all things to all groups, both documents suffer.

From the business community's perspective, the documents inadequately address the role of goods movement as part of the comprehensive transportation plan for a healthy and thriving region, as well as constrain opportunities to provide adequate housing options. In addition, the recognition of existing regulatory authority or local control is muted through the seemingly misplaced authority delivered in the mitigation measures. The following highlights some of these areas of concern.

RTP/SCS

- There are repeated references throughout the RTP/SCS that transportation projects "induce growth" which incorrectly implies a lack of coordination between land-use and transportation planning agencies and that there was insufficient effort in the planning process to accommodate for anticipated, organic, population growth. The RTP/SCS and the PEIR should differentiate between balanced, planned growth identified by local jurisdictions, and growth that is inconsistent with what is already being planned for at the local level.

- SCAG should identify in the plan the economic contribution of the goods movement sector to the regional and state economy and elevate the importance of the east-west corridor as critical to the future of California's position in the global economy.

- The RTP should explicitly state how any new user fees would be further defined, evaluated (both for economic and feasibility impacts), and advanced. In particular, the analysis should demonstrate the need for new revenues and how the new revenues are proposed to be invested, while also protecting existing transportation plans as identified by local transportation entities. <u>Voter-approved projects funded by local sales tax measures must be protected.</u>

- With the elimination of redevelopment agencies, the ability of local jurisdictions to meet the densification of urban centers in the near term is highly problematic and ignores issues related to aging or inadequate infrastructure capacity and high development costs for higher density projects. It also threatens the availability of sufficient housing options necessary to meet the needs of a dynamic workforce. Recommendations regarding land-use should take into account the region's unique communities, market forces, and take a flexible not proscriptive approach to protect regional diversity.

- Finally, since passage of SB 375, the State of California has de-funded transit, transportation and redevelopment support for local government. This continues years of state diversion of revenues from gasoline, sales, income and other taxes needed for local government programs. Local government cannot achieve these mandated changes without increased, not decreased, state support. SCAG should explicitly state the imperative for state support for planning, transit, transportation and redevelopment or other necessary funding to pre-SB 375 levels in order to achieve mandated goals.

PEIR

- With over 500 mitigation measures, half of them being proposed for the first time in a SCAG RTP, the PEIR raises significant concerns for the regulated community. Although SCAG has expressed in community meetings that the PEIR mitigation measures merely offer a "toolbox of possible solutions", history shows that there are no such things as good intentions when it comes to the tortured CEQA process. The PEIR needs a clear explanation that lead agencies should select those measures that apply to a specific project. The final PEIR should not block the intent of SB 375 to provide CEQA streamlining for certain types of advantageous projects.

- The wording of the mitigation measures utilizing "can and should" incorrectly implies that mitigation measures are feasible for the identified agencies. SCAG should provide a clear statement that all mitigation measure recommendations are advisory and replace the "can and should" phrase with "may" when referencing mitigation measures.

- Multiple mitigation measures appear to exceed SCAG's authority and responsibilities for implementation and have nothing to do with the RTP/SCS or its impacts. Further, many of these mitigations could create conflict with existing regulations. For example, the requirement for local jurisdictions to implement individual "climate action plans" is contradictory to the regional planning undertaken in the SCS. These mitigation measures that have nothing to do with the regional planning for future development or emissions from vehicular use should be restated or removed as appropriate.

- Perhaps to further clarify the intent, all mitigation measures not directly controlled by SCAG should be moved out of the PEIR document and into an appendix, which can be referenced as the "tool box" resource for consideration by other entities (a local jurisdiction, project sponsor, or other). However, this appendix would need to specifically state that no determination of feasibility on the measures has been made and that they are not intended to supersede any existing law or regulation.

We look forward to our continue partnership with SCAG and other business, housing and transportation entities as we all work to enhance the economic prosperity of the region and ensure a high quality of life. We respectfully ask SCAG to consider and address our comments in the RTP and PEIR revisions.

Sincerely,

Kate Klimow

February 14, 2012

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

Dear Hasan,

On behalf of the Orange County Council of Governments (OCCOG), I would like to commend the Southern California Association of Governments (SCAG) and its staff who worked hard to prepare the draft Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS), the Program Environmental Impact Report (PEIR), and associated documents. This effort was monumental and unprecedented in our history and throughout the process collaboration between SCAG and Orange County stakeholders has been exceptional.

The 34 Orange County local jurisdictions and six special districts that comprise OCCOG thank you for the opportunity to comment on the Draft 2012 RTP and associated PEIR.

As you know, Orange County took upon itself the task of developing a subregional SCS. The continued cooperation of SCAG staff and the numerous references throughout the document where the RTP/SCS expressly states that it incorporates the Orange County Sustainable Communities Strategy (OC SCS) into the RTP/SCS document is greatly appreciated.

The OCCOG Technical Advisory Committee (OCCOG TAC), made up of member agency planning staff, created an ad hoc committee dedicated to the review of the Draft RTP/SCS and PEIR. This committee met four times since January 3, 2012, and has collectively spent hundreds of hours since reviewing the draft plan and documents. The OCCOG TAC review and analysis was considered in late January by the OCCOG Board and serves as the basis for OCCOG's comments.

The following general comments and recommendations are offered by OCCOG on the draft 2012-2035 RTP and SCS (draft RTP/SCS) and associated Appendices and draft PEIR (draft PEIR). OCCOG requests that this letter and its attachments be included in the public record as our collective comments on the draft RTP/SCS, PEIR and associated documents.

1. GROWTH FORECASTS

Issue: Growth Projections: The 2012 growth projections identify population, housing and employment data for the six-county SCAG region, from 2008 (existing) to 2020 and 2035. These growth projections represent the best available information from local jurisdictions, the business community, and landowners. However, as time passes, what is feasible for any given project can change. The triggers for change to adopted growth projections can range from factors such as market conditions, new information or data, infrastructure availability, changes in funding availability (such as the dissolution of redevelopment agencies statewide), and changes to jurisdictional boundaries resulting from future annexations and incorporations of previously designated unincorporated territory. SCAG should continue to adopt the 2012 growth projections at a countywide level, consistent with past approvals of the RTP growth forecasts.

A county level of geography accommodates internal adjustments to changing conditions as described above, without compromising the integrity of the overall growth projections. However, approving the growth projections at any lower level of geography, such as at the city level, would be challenged with continual revisions and shifts to the total number of housing, population and employment within a city, among cities, and between cities and counties as a result of the factors described above. Adoption of the data at a level lower than the county would limit jurisdictional control and create inflexibility in a regional planning document. In addition, the level of geography in which RTP/SCS growth forecast is adopted should not be determined by other processes. For example, the Regional Housing Needs Allocation (RHNA) allocations must be consistent with the RTP/SCS; state law does not require that they be identical. The RTP/SCS can be adopted at the county level and the RHNA process may proceed independently until it is completed after the appeals, trades, and transfers are completed. The RHNA allocations that were derived from the growth forecast can still be determined to be consistent with the RTP/SCS, even if changes are made to the city totals during the appeals, trades, and transfers process.

Growth Projections Recommendation: SCAG's adoption of the growth forecast numbers should be at the county level, consistent with past RTPs, and not at a smaller level of geography such as city, census tract, or traffic analysis level.

Issue: Orange County Projections (OCP)-2010 Modified: On January 26, 2012, the update to the OCP-2010 dataset known as “OCP-2010 Modified” was officially approved by the OCCOG Board of Directors and is a data amendment to the OC SCS. The dataset includes the 2010 Census population and housing data, along with the 2010 Employment Development Department Benchmark data, consistent with SCAG’s updated growth forecast dataset. The dataset was provided to SCAG staff in December 2011 and this letter also serves as the formal notice of the update that should be incorporated into the 2012 RTP/SCS, PEIR, and related documents.

OCP-2010 Modified Recommendation: All documents, tables, maps, narrative, modeling runs, PEIR Alternatives (including Alternate C/3/Envision 2) referencing

the Orange County growth forecasts should be updated with the Orange County Projections-2010 Modified Growth Projections, as adopted by the OCCOG Board of Directors and consistent with the subregional delegation Memorandum of Understanding (MOU) between OCCOG, OCTA and SCAG.

2. DRAFT RTP/SCS

Issue: 2012 Draft RTP/SCS: The RTP/SCS identifies strategies to reduce greenhouse gas (GHG) emissions from cars and light duty trucks. Because counties, jurisdictions and agencies have different needs and feasibility of implementation, we believe these strategies should be clearly identified as a menu of options that can be used to achieve the goal of reduced GHG emissions. However, the document can be construed to suggest that each of the strategies listed in the table on pages 150-153 are necessary to successfully implement the SCS, many of which are beyond SCAG's purview or control. It is requested that the language be clear that it is permissive.

2012 Draft RTP/SCS Requests:

1. **Revise language on page 149: "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which that help ~~can and should undertake in order~~ to successfully implement the SCS."**

2. **Please provide SCAG analysis supporting the strategies in the Draft RTP/SCS Chapter 4.**

3. **Please describe what municipal obligations are anticipated as a result of adopting these strategies as a list to be accomplished rather than a menu of options.**

Issue: OC SCS Strategies: There are strategies in the OC SCS that are not included in the regional SCS. Similarly, there are some strategies in the regional SCS that are not consistent with the strategies in the OC SCS. This creates confusion and clarification is needed.

Under SB 375 and only within the SCAG region, subregional councils of government were allowed to prepare subregional plans that SCAG is then required to incorporate into the regional SCS. In Orange County, the OCCOG and the Orange County Transportation Authority (OCTA) developed a countywide or subregional OC SCS that was to be incorporated in whole into the SCAG SCS. Local agencies in Orange County developed the OC SCS and approved it in June 2011. SCAG has incorporated the OC SCS in its entirety into the regional SCS as an appendix to the regional SCS, but it is unclear what the standing is of the OC SCS. The OC SCS contains a set of strategies that were agreed upon by local governments, agencies and other stakeholders within

Orange County and was accepted by SCAG and should represent the SCS that is applicable to the Orange County region.

OC SCS Strategies Recommendation: Please revise the text in the last paragraph on page 106 to state: "These subregional SCS documents are incorporated into the regional SCS and represent the SCS for each of these subregions."

3. DRAFT PEIR

Issue: Mitigation Monitoring Program Intent: It is unclear how SCAG intends to implement the Mitigation Monitoring Program with regard to the proposed mitigation measures, as may be implemented by local agencies. Section 1-5 of the PEIR specifically provides that "Lead agencies shall provide SCAG with documentation of compliance with mitigation measures through SCAG's monitoring efforts, including SCAG's Intergovernmental Review (IGR) process." It is infeasible for SCAG to require local jurisdictions to report when such mitigation measures are considered for any project. Noting that the SCAG region includes 6 counties, 14 subregional entities and 191 cities, this reporting requirement would surely fall short of expectations. Given this identified infeasibility, please clarify what obligations local agencies may have regarding SCAG's mitigation monitoring efforts.

Mitigation Monitoring Program Intent Requests/Recommendations:

1. **Does SCAG intend to require all jurisdictions that avail themselves of the mitigation measures to report to SCAG when such measures are considered for any project?**

2. **SCAG's approval of the PEIR needs to clearly state the intent and applicability of the mitigation measures and the PEIR reflective of our comments below and that mitigation measures do not supersede regulations under the jurisdiction of other regulatory agencies.**

3. **Add language to Executive Summary and Introduction: "Mitigation measures do not supersede regulations under the jurisdiction of other regulatory agencies."**

4. Feasibility and Applicability

On pages 1-5 and 1-7, the language should reflect that Lead agencies will determine the feasibility and applicability of measures and that the measures are intended to offer a menu of options available should a lead agency opt to utilize them. The PEIR makes the assertion on page 1-7 of the Project Description under Transportation Project Mitigation and Land Use Planning and Development Project Mitigation sections that the draft PEIR has made a preliminary determination that all of the mitigation measures in it are considered feasible. SCAG has not identified any analysis that supports the feasibility of the mitigation measures that are to be undertaken by entities other than

SCAG and SCAG staff has stated on numerous occasions that the mitigation measures were intended to be a menu of options for consideration by lead agencies.

Issue: Mitigation Measures Impose Obligations Beyond Scope of SB 375. Given the combination of the RTP and the SCS processes, as mandated by SB 375, we recognize that SCAG must undertake the difficult task of balancing the goal of having a coordinated regional transportation system with land use strategies that encourage a more compact use of land. However, a key principle of SB 375 is that it is not intended to supersede local agencies' authority to regulate land uses. Specifically, Government Code section 65080(b)(2)(K) provides, in relevant part that ". . . .Nothing in a sustainable communities strategy shall be interpreted as superseding the exercise of the land use authority of cities and counties within the region. . ."

In light of the limitation expressed at Government Code Section 65080(b)(2)(K), we find language in the PEIR, and specifically the mitigation measures therein, imposing affirmative obligations on local agencies within the SCAG region to be inappropriate and contrary to law. The proposed language as recommended below would remedy the legal conflict with Section 65080(b)(2)(K), yet achieve SCAG's recognition that project-specific environmental review is the appropriate level of review for projects that have their own unique, site-specific circumstances.

The revisions are further consistent with OCCOG's understanding that SCAG intended to provide the mitigation measures as a "toolbox" to local agencies for use within their discretion if and when appropriate for projects within their respective jurisdictions. Indeed, from materials presented by SCAG, including the January 26, 2012 workshop held at the City of Anaheim Council Chambers, SCAG explained that "**This PEIR offers a "toolbox" of mitigation measures** for future project-level environmental analyses. . . It also includes suggested mitigation measures for local agencies to consider for implementation, if appropriate and feasible (phrased as "can and should"). This language is permissive and not mandatory upon local agencies."

Mitigation Measures Impose Obligations Beyond Scope of SB 375 Recommendations:

1. **Please provide SCAG analysis supporting the feasibility of mitigation measures in the PEIR.**

2. **Change language on page 1-7 found in 2 places under MITIGATION MEASURES, subheadings Transportation Project Mitigation and Land Use Planning and Development Project Mitigation: "This Draft PEIR has made a preliminary determination that the proposed mitigation measures are feasible and effective. Therefore, it is reasonable to expect that these agencies will actually implement them where, in the agencies' independent discretion, the measures are deemed applicable in light specific circumstances at the project level."**

3. **Change language on page 1-5, first paragraph: "Mitigation Measures proposed in this PEIR <u>are available as tools for implementing agencies and local lead agencies to use as they deem applicable</u>. The implementing agencies and local lead agencies <u>are</u> responsible for ensuring adherence to the mitigation measures as 2012-2035 RTP/SCS projects are considered for approval over time."**

4. **Please make similar text amendments to other sections, including the Executive Summary, of the PEIR that reference how the mitigation measures are to be used by lead agencies.**

5. <u>"Can and Should"</u>

As indicated in the PEIR on page 1-6, state law provides that it is appropriate to indicate in mitigation measures that they "can and should" be implemented where the authority to implement the measures rests with agencies other than SCAG. The language conveys to local agencies an affirmative obligation to address each mitigation measure, irrespective of whether such agencies deem the measures applicable to a particular project or duplicative of their own or other governmental agencies' regulatory measures (as discussed in Section 14). OCCOG recognizes that SCAG's use of the words "can and should" are derived from California Environmental Quality Act (CEQA), at Public Resources Code sections 21081 and 2155.2(b)(5)(B)(ii) and CEQA Guidelines, including section 15091(a)(2). Nevertheless, given the express limitation of SB 375 upon respective local agencies' land use authority, OCCOG deems any language seemingly imposing affirmative obligations contrary to SB 375 inappropriate. As such, the use of the language "can and should" for mitigation measures addressed to local agencies is inappropriate.

<u>"Can and Should" Recommendations:</u> Change language in all mitigation measures identifying entities other than SCAG to read "~~can and~~ should <u>consider where applicable and feasible</u>." To clarify the intent that the mitigation measures are a menu of options for which feasibility has not been established for any given project, the "can and should" language should be changed in all mitigation measures identifying entities other than SCAG to read "should consider where applicable and feasible."

6. <u>CEQA Streamlining:</u>

One of the key components of SB 375 was the inclusion of incentives that provided CEQA streamlining for projects consistent with the objectives of the bill as well as consistent with the SCS. As identified on pages 1-10 through 1-12, for projects to qualify for these incentives, mitigation measures from the applicable environmental document must be incorporated into the project. It is not clear, however, which measures would need to be incorporated into a project for it to qualify, particularly in light of the intent of SCAG for the measures to be a toolbox.

CEQA Streamlining Recommendations: Please clarify how the "menu of mitigation measures" from this PEIR is expected to be used by a lead agency as well as which ones lead agencies should address in order for a project to qualify the use of the CEQA streamlining provisions of SB375.

7. RTP/SCS Policies

Please ensure that the discussion of the policies represented by the RTP/SCS in the draft PEIR is consistent with the policies actually in the RTP/SCS. In particular, the bullet list on the page 2-3 is stated to represent the land use strategies of the plan; however, the strategies listed are not specifically identified in the regional SCS. Including different language in the PEIR implies additional policy.

RTP/SCS Policies Recommendation: Amend the land use strategies identified on page 2-3 of the Project Description, under the section Purpose and Need for Action to reflect the strategies included in the SCS chapter of the RTP.

8. PEIR Mitigation Measures

By far the most concerning portion of the Draft 2012 RTP/SCS to OCCOG members is the PEIR. Specifically, the proposed mitigation measures included in the PEIR extend to and impact a broad spectrum of technical and policy areas. Many examples of these concerns are included on Attachments 1 and 2 of this letter. In sum, the concerns are that the mitigation measures:

- Appear to go above and beyond the requirements of the Regional Transportation Plan and Senate Bill 375;
- Are measures already required by State and Federal law or are regulated by other agencies such as the South Coast Air Quality Management District, California Department of Housing and Community Development, Fish and Game, and the Regional Water Control Boards;
- Appear to run counter to local control; and
- Are financially infeasible for the agencies responsible for implementation.

PEIR Mitigation Measures Recommendations.

1. **In order for the mitigation measures to truly be considered a toolbox of options for consideration by various entities in the SCAG region as intended, all mitigation measures in the PEIR intended for entities other than SCAG should be moved into an appendix to the PEIR and renamed "Sustainability Strategies". These strategies could then be identified for consideration by lead agencies as mitigation for future projects should**

a lead agency choose to do so and deem them applicable and feasible. The PEIR would only retain mitigation measures applicable to SCAG. This action would also require that the Executive Summary, Introduction, and Project Description be updated to reflect the nature of the new appendix of Sustainability Strategies.

2. **Remove language within mitigation measures that establishes policies not included in the RTP/SCS or modifies the measure to specify a policy or endorses specific technology which would limit agency authority.**

3. **In the draft PEIR, please replace text in all mitigation measures that identify policy for either SCAG or other entities with language that reflects either adopted SCAG policies or are policies that are included in the RTP and SCS. Mitigation measures should not be used to establish new policy for the region.**

For example:

- MM-TR 17: "SCAG shall (for its employees) and local jurisdictions ~~can and~~ should institute where applicable and feasible teleconferencing, telecommute, and/or flexible work hour programs ~~to reduce unnecessary employee transportation~~.

- MM-TR 23: "Local jurisdictions should consider when applicable and feasible coordinated and controlled intersections so that traffic passes more efficiently through congested areas. Where traffic signals or streetlights are installed, require the use of a feasible, energy efficient ~~Light Emitting Diode (LED)~~ technology."

- MM-TR 35: "Local jurisdictions should consider where applicable and feasible the adoption of a comprehensive parking policy that ~~discourages private vehicle use and~~ encourages the use of alternative transportation."

9. SCAG Authority

Several mitigation measures identify actions that SCAG shall undertake to mitigate impacts of the plan. Many appropriately direct SCAG to provide a discussion forum or serve as a central data repository for a broad range of topics that affect the region as a whole. However, many measures inappropriately direct SCAG to establish practices, standards, or policy in areas unrelated to what SCAG has purview over. Further, the measures often appear to be directed at policy implementation that is unrelated to the plan itself, such as implementing AB 32. Such measures will essentially require SCAG to establish policy in areas for which it has no authority. Additionally, it is not clear how SCAG would fund the work efforts because they are not directly related to its mission and, therefore, do not have funding. For example, MM-PS 118 states: "SCAG shall continue to develop energy efficiency and green building guidance to provide direction on specific approaches and models and to specify levels of performance for regionally

significant projects to be consistent with regional plans." Green building practices and energy efficiency measures are already addressed by various state and federal agencies, as well as by other local organizations. Further, SCAG does not have the authority to specify levels of performance for land use or buildings.

SCAG Authority Recommendation: Remove the following mitigation measures for SCAG which it does not have purview for under the law or directed to do by the Regional Council through policy direction. List may not be exhaustive.

MM-BIO/OS 44	MM-LU 42	MM-LU 77	MM-PS 68
MM-BIO/OS 45	MM-LU 47	MM-LU 80	MM-PS 71
MM-BIO/OS 46	MM-LU 48	MM-LU 81	MM-PS 95
MM-BIO/OS 48	MM-LU 51	MM-LU 82	MM-PS 121
MM-GHG 3	MM-LU 53	MM-LU 83	MM-TR 17
MM-GHG 8	MM-LU 56	MM-NO 12	MM-TR 23
MM-GHG 11	MM-LU 57	MM-NO 16	MM-TR 28
MM-LU 9	MM-LU 60	MM-POP 1	MM-TR 35
MM-LU 21	MM-LU 61	MM-PS 3	MM-TR 83
MM-LU 22	MM-LU 64	MM-PS 14	MM-TR 85
MM-LU 24	MM-LU 65	MM-PS 25	MM-TR 96
MM-LU 26	MM-LU 69	MM-PS 37	MM-W 34
MM-LU 32	MM-LU 71	MM-PS 39	MM-W 59
MM-LU 34	MM-LU 74	MM-PS 41	MM-W 60
MM-LU 41	MM-LU 75	MM-PS 67	MM-W 65

10. SCAG Mitigation Measures

It would be helpful to understand how SCAG will implement the mitigation measures that it is assigned to do. Many of the mitigation measures will expand SCAG's role into areas that are not currently under its purview and are under the jurisdiction of other entities. Many also constitute significant work efforts.

SCAG Mitigation Measures Request: Please explain how the actions and programs required by the measures SCAG is assigned to do would be funded to ensure that they are truly feasible for SCAG to undertake.

11. Ensuring Outcomes

SCAG has limited authority in many of the areas included in the measures and will not be able to ensure impacts are mitigated and that the outcomes identified do actually occur. SCAG can assist, offer information, educate, and provide discussion forums for topics outside its area of jurisdiction; however, it is not possible to "ensure" that outcomes are achieved for things that are outside of its purview.

Ensuring Outcomes Recommendation: **Remove all references within mitigation measures that SCAG will "ensure" or "shall minimize impacts" that result from a mitigation measures.**

> **Example:**
> **MM-CUL17: "~~Impacts to cultural resources shall be minimized through cooperation, information sharing, and~~ SCAG's shall, through cooperation, information sharing and ongoing regional planning efforts such as web-based planning tools for local government including CA lots, and direct technical assistance efforts such as Compass Blueprint's Toolbox Tuesday series, provide information and assistance to local agencies to help them avoid impacts to cultural resources. Resource agencies, such as the Office of Historic Preservation, shall be consulted during this process."**

12. Fees and Taxes

Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, thus not be approved. They also represent prescriptive means to accomplish the mitigation.

Fees and Taxes Recommendations:

1. **Reword measures to indicate that a new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. The following list may not be exhaustive.**

MM-BIO/OS55	MM-PS15	MM-TR30	MM-TR88
MM-LU29	MM-PS63	MM-TR37	MM-TR94
MM-LU53	MM-PS75	MM-TR47	MM-TR96
MM-LU54	MM-PS76	MM-TR52	MM-W6
MM-LU80	MM-PS78	MM-TR60	MM-W32
MM-LU81	MM-PS92	MM-TR69	MM-W52
MM-LU82	MM-PS106	MM-TR74	MM-W58
MM-LU83	MM-PS107	MM-TR75	
MM-POP4	MM-PS113	MM-TR80	
MM-PS12	MM-TR28	MM-TR84	

2. **Please clarify whether it was assumed that these additional fees were considered feasible and if the new fees that are suggested were considered in the financial plan or economic analysis of the RTP.**

13. Guidance Documents

Guidance documents are there as information sources for consideration; however, they do not represent regulation or establish standards that are required to be achieved. For example, MM-AQ19 inappropriately indicates that project sponsors should comply with the CARB Air Quality and Land Use Handbook (June 2005) which is only a guidance document.

Guidance Documents Recommendation: Remove references that indicate a compliance with guidance documents from mitigation measures.

14. Duplicative/Existing Regulations

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g. CEQA review requirements). Under the CEQA, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact and the significance of the impact is after all existing regulation is applied. Therefore, mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigate the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and the regulation. It has become common practice to state that existing regulation will be implemented. When this is done, it is common practice when compliance is used as a mitigation measure to simply state that the responsible entity will simply comply with the regulation. If mitigation measures that restate existing regulation are not removed, then it is requested that the wording of the measures be restated to simply read that compliance with all applicable laws and regulations will be undertaken. Language that could be used is: "Local jurisdictions, agencies, and project sponsors shall comply, as applicable, with existing federal, state, and local laws and regulations." Similar language is included in some mitigation measures. It is offered that MM-PS 13 is a good example of the type of appropriate language and reads "Project sponsors can and should ensure that projects are consistent with federal, state, and local plans that preserve open space."

The water section provides another example. The PEIR includes 68 mitigation measures in the Water Resources section regarding water quality. At least 35 of these are related to storm water runoff best management practices (BMPs) that are currently regulated through Municipal National Pollutant Discharge Elimination System (NPDES) Storm Water Permits issued by Regional Water Quality Control Boards. In the SCAG region, there are five water quality control boards each with its own Municipal NPDES Storm Water Permit. The regulations and requirements contained in these permits vary from each other. By listing specific measures in the PEIR that are not included in a project's applicable Municipal NPDES Storm Water Permit, the PEIR creates conflicting compliance requirements. To eliminate potential conflict with existing regulations, the

mitigation measures regarding specific BMPs should be removed and replaced with a single requirement that each project must comply with its applicable Municipal NPDES Storm Water Permit.

Duplicative/Existing Regulations Recommendations:

1. **Please remove all mitigation measures listed in Attachment 1 which are duplicative of existing regulations administered by or under the jurisdiction of other agencies. The list may not be exhaustive.**

2. **For each impact, please add the following language: "Local jurisdictions, agencies, and project sponsors should comply, as applicable, with existing federal, state, and local laws and regulations."**

15. Draconian Mitigation Measures

Many of the mitigation measures in the Draft PEIR are draconian and need to be removed. One prime example is MM-LU 85. It reads in part "Local jurisdictions can and should reduce heat gain from pavement and other hardscaping including: Reduce street rights-of-way and pavement widths to World War II widths (typically 22 to 34 feet for local streets and 30 to 35 feet for collector streets curb to curb)…" Although reduced street widths may be appropriate in some cases and have been implemented in many jurisdictions, it is inappropriate and counterproductive to require reduced street widths as a mitigation measure in the PEIR. Reduced street widths, for example, generally do not provide space for on-street parking which may result in greater, additional paved areas provided in separate parking lots. A second example is MM-LU15: "Project sponsors can and should ensure that at least one acre of unprotected open space is permanently conserved for each acre of open space developed as a result of transportation projects/improvements." Measures should support the SCAG Energy and Environment Committee which recommended that the programs build upon existing open space land acquisition and open space programs in the region, tailoring programs to each individual county in the region. These include, but are not limited to, OCTA's Measure M Mitigation Program, and Transportation Corridor Agency's open space mitigation program, which has protected 2,200 acres in perpetuity to date. Open space conservation should be pursued in a voluntary manner, working with willing private sector landowners and not be overly prescriptive and specific.

Draconian Mitigation Measures Recommendations: Remove mitigation measures that are very prescriptive, such as reducing street widths to WW II widths or specifying preferred technology.

In addition to the above comments, detailed technical comments, language changes, and questions on the RTP/SCS, Appendices, and PEIR documents are included in Attachment 2.

Conclusion

We recognize the immense efforts it took to prepare these documents. They represent incredibly complex technical work and have important and far-reaching policy impacts for our region. However, because of this importance and complexity, we would like to express concern about the timing of the release of the documents and hope that preparation of future RTP/SCS documents will take into account the need to accommodate adequate review, discussion and revision time for all of the documents. The current timeline of document releases, public comment period, and time allowed for the response to comments results in an inability to have credible discussion regarding possible changes because the timeline does not allow for recirculation or full discussion of requested changes. The documents were released over the holiday season and included the release of the draft PEIR document on December 30, 2011. The minimum 45-day public comment period closes on February 14, 2012. Only a few weeks are provided to prepare responses to comments and amend the documents to ensure that the Regional Council may consider the certification of the PEIR and the approval of the draft RTP/SCS on April 4, 2012.

We appreciate your consideration of all of the comments provided in this letter and its attachments and look forward to your responses. It is a shared goal to have an RTP/SCS adopted that is credible and defensible on all levels. If you have any questions, please do not hesitate to contact me or Dave Simpson, OCCOG's Executive Director.

Sincerely,

Peter Herzog
Chairman

Attachment 2: Additional Technical Clarifications on documents are also offered as follows:

2012 RTP/SCS

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
1	General Comment	all	*All chapter headings should include the Chapter number on each page for ease of reference.*
2	Clarification	1, left column	"The 2012 RTP/SCS includes a strong commitment to reduce emissions from transportation sources to comply with SB 375, ~~both~~ improve public health, and meet the National Ambient Air Quality Standards as set forth by the federal Clean Air Act. As
3	Clarification	4, right column	"This region needs a long-term, sustainable funding plan that ensures the region receives its fair share of funding, supports an efficient and effective transportation system that grows the economy, provides mobility choices, and improves our quality of life."
4	Clarification	page 7- Table 2 and page 95- Table 3.3	*Is additional $0.15 gas tax the sum total of both state and federal taxes or $0.15 each?*
5	Clarification	40, left column	"Strategic investments, put forth by the private sector, that would remove barriers associated with telecommuting are expected…"
6	Correction	page 42- Table 2.2	241 toll road completion year is 2030
7	Please define in the text and add to a glossary	50, left column	"scrip"
8	Clarification	54, right column	"Express/HO T Lane Network Despite our concerted effort to reduce traffic congestion through years of infrastructure investment, the region's system demands continue to exceed available capacity during peak periods."
9	Clarification	70, 78	Greenhouse Gases and Air Quality SCAG seems to rely on CEQA to achieve the "maximum feasible" reductions in emissions from transportation. However, this is not consistent with the intent of SB 375's goal of achieving specific thresholds of 8% by 2020 and 13% by 2035 through a sustainable communities strategy plan.

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			Please provide clarification to this section indicating if the air quality and greenhouse gas CEQA mitigation measures obligate regional agencies and project developers to undertake more strategies, programs and mandates beyond those included in the OC SCS.
10	Clarification	78, right column	"Greenhouse Gases On road emissions (from passenger vehicles and heavy duty trucks) constitute 93 percent of the transportation sector total. Emissions from passenger vehicles, which are the subject of SB 375 and this RTP/SCS, constitute ___% of the transportation sector's greenhouse gas emissions total."
11	Clarification	80, left column	Statements are made, such as the following, "the RTP has the ability to affect the distribution of that growth" (in population in the region). These statements could be interpreted to be contrary to SCAG's obligation under the Memorandum of Understanding with OCCOG to respect the strategies and local land use policies in the OC SCS. *Please clarify how it is in SCAG's ability to affect local change when the OC SCS is consistent with acceptance of local land use plans and planned population and employment distribution?* *Recommended text change:* "Transportation projects including new and expanded infrastructure are necessary to improve travel time and can enhance quality of life for those traveling throughout the region. However, these projects also have the potential to ~~induce~~ attract more of the regional population growth in certain areas of the region. This means that although ~~Although~~ SCAG does not anticipate that the RTP would affect the total growth in population in the region, the RTP has the ability to affect the distribution of that growth." "~~In addition to induced population growth,~~ transportation projects in the RTP also have the potential to divide established communities, primarily through acquisition of rights-of-way."

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
		82, right column	Text indicates that the RTP and projects in the RTP/SCS as "inducing" growth. It is noted that use of the term "induced growth" has a negative connotation and implies growth above and beyond what would occur naturally. However, it is stated in the RTP that the population, housing, and employment growth totals are fixed and only the distributions may change based on the plan. This means there will not be "new" growth and that the RTP and SCS may simply influence and shift the growth anticipated for the region. This moving of growth is the result of changes in distribution that are due to changes in land use or densities. Because of this, it is requested that references to "induced growth" be reworded to reflect the shifting of growth in the region. *Recommended text change:* "Cumulative impacts from the projected growth ~~induced by the RTP~~ include increased impervious surfaces;…"
12	Clarification	Chapter 3	SCAG's Financial Plan includes a significant portion of "New Revenue Sources and Innovative Financing Strategies" that are not currently in place or available. While some of the proposed revenues are within the control of SCAG or MPOs and County Transportation Commissions, the majority of the revenues (in terms of dollars) require either state or federal action to implement. *Please explain what the implications are if these new revenue sources and innovative financing strategies do not become available?*
13	Clarification	page 95- Table 3.3	~~"Mileage-based user fees would be implemented to replace gas tax and augment- estimated at about $0.05 (2011$) per mile and indexed to maintain purchasing power starting 2025."~~ Suggested language is from page 31 of Growth Forecast Appendix: "Current gasoline tax, estimated at about $0.05 (2011$) per mile will increase through 2025, then in 2026 it would be replaced with a mileage-based user fee indexed to maintain purchasing power."

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
14	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw land available in the region ~~left to accommodate additional growth~~."
15	Clarification	105, right column	"While the region was once known worldwide as the "capital of sprawl," the region today is projecting growth on only a small fraction of the ~~has little~~ raw land available in the region ~~left to accommodate additional growth~~."
16	Clarification	106	SCAG indicates that the OC SCS has been incorporated into the regional SCS. OCCOG was one of two subregions that undertook the arduous task and obligation of preparing an SCS. *Please add clarifying text that these subregional SCSs, including the OC SCS, represent the Sustainable Communities Strategies applicable to those subregions.*
17	Clarification	110, right column	"Municipal water and sewer systems, for example, ensure clean water. At the same time, ~~concrete stormwater runoff channels harm water quality~~ and ~~sprawl eats into open space~~ as areas become more urbanized and the percentage of impervious surface is increased, the hydrologic regime is dramatically altered. Drainage conveyances that once were natural and riparian are required to be engineered as hardened flood control channels to provide adequate protection of private property and public infrastructure from the increased frequency, duration, peak flow, and overall volume of stormwater runoff. With this armoring of once natural channels, water quality benefits from biofiltration are lost along with opportunities for infiltration and evapotranspiration, which can lead to hydromodifcation downstream in sections which are not yet engineered and hardened. Many strategies…"
18	Clarification	112, 117	The SCS documents the development of four scenarios to explore basic aspects of future growth. These scenarios were used in public outreach and the SCS and the associated Appendix states that "Using the public dialogue and feedback from the analysis of the SCS Scenarios, SCAG developed

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			the 2012 RTP/SCS Plan alternatives." (Similar references are also include at RTP/SCS p. 117, and SCS Background Documentation p. 71). The RTP/SCS and Appendix then describes a process that led to the Plan alternatives. Neither the RTP/SCS, Appendix or PEIR expressly state or illustrate the fundamental land use and socioeconomic foundation for the SCS. *In order to confirm consistency with the OC SCS, it is requested that SCAG include appropriate tables, graphics and maps that provide the detail that confirm this consistency.*
19	Clarification	113, 122	The regional SCS states that the scenarios/alternatives were developed using the Local Sustainability Planning Tool (LSPT). The LSPT is a sketch planning tool that flattens geographical areas to a 5-acre grid cell. The OC SCS land use data was provided at much greater level of detail in that specific parcel data and detail were provided by each jurisdiction. A cursory review of some LSPT data reveals inconsistencies regarding interpretation of Orange County land uses. It is acknowledged that the regional SCS states, "Land use inputs for OCCOG SCS were unchanged". Yet use of the LSPT and SCAG Development and Community Types presented in the SCS leave open the question as to whether the OC SCS was altered, as noted above. *Please provide confirmation that the underlying OC SCS land use data was used without significant alteration and LSPT flattening and interpretation in the development of the regional SCS Plan and alternatives.*
2017	Add to glossary	127, right column	"Gentrification"
21	Clarification	128, left column	"Thus, this adjustment allowed the land use pattern to conform more closely to local ~~expectations~~ <u>general plans</u>, while reducing the amount of vehicle miles traveled." *Whose/What are "local expectations?"*

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
22	Clarification	149, right column	*Revise language to clarify that SCAG intends policies, strategies, and measures are a menu of options.* "The following tables list specific implementation strategies that local governments, SCAG, and other stakeholders may use or consider while preparing specific projects which would help ~~can and should undertake in order~~ to successfully implement the SCS."
23	Clarification	150-152	The OC SCS was accepted by SCAG and represents the set of strategies and the growth distribution that outlines the best approach for how the requirements of SB 375 would be met within the subregion. Specifically, the OC SCS included 15 specific Sustainability Strategies, reflecting a menu of 222 practices and actions that OC agencies have agreed to pursue (or continue to pursue) to achieve GHG reductions that support SB 375. *Why doesn't the regional SCS specifically acknowledge these 15 strategies yet include other strategies and performance measures not included in the OC SCS (e.g., Locational Efficiency)?*
24	Add to glossary	166, right column	"Greenfield"
25	Clarification	194, right column	"In addition to these targeted outreach efforts, all regular and special meetings of the RTP task forces, the Transportation Committee (TC), the CEHD, the EEC, and the SCAG Regional Council are publicly noticed and …"
26	Clarification	201	*Please clarify whether the text stating "Long-term emission reduction for rail, with a goal of zero-emissions rail system" is intended to reflect a zero-emissions freight rail system, or whether this goal also applies to passenger rail.*
27	Clarification	202, 203- Table 7.1	Unfunded operational improvements, of which several are listed on page 203, Table 7.1, include transit station improvements in Irvine, Fullerton, and Santa Ana, bus rapid transit (BRT) in Orange County, and high speed rail (HSR) Phase II. *Please confirm that these are consistent with the OC SCS.*

#	TOPIC/ REQUEST	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
28	Clarification	207	Strategic Finance *Please explain what will happen if reasonably foreseeable revenue sources of approximately $200 million do not become available?*
29	Add to glossary	205	"Active transportation"

GROWTH FORECAST APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Updated growth forecast numbers	23, Table 13	In December 2011, Orange County provided SCAG with the revised growth forecast dataset, OCP-2010 Modified, per the OC SCS MOU (official OCCOG Board action 1/26/2012). *Please incorporate revised Orange County numbers (i.e. OCP-2010 Modified) into all reports, tables, exhibits, alternatives, maps, and modeling runs for final RTP.*

PERFORMANCE MEASURES APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Clarification	1	The document states, "The performance measures are used to evaluate how well the RTP/SCS addresses the adopted goals and performance outcomes." *Is there any formal role for the performance measures?* ARB will evaluate for SB 375 compliance not based on these measures but based on ARB process. *Please include language clarifying that this is a requirement to demonstrate compliance with federal requirements and not for the obligations under SB 375.*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
2	Clarification	1, end of first paragraph	Add statement: "Performance measures and expected outcomes will be used to monitor the RTP/SCS at the regional level; these measures and outcomes are not proposed for use at the subregional or project-specific level."
3	Clarification	1, column 2	The document states, "The Regional Council will formally adopt the goals and outcomes as part of the final 2012 RTP/SCS." *Does this bring any formal obligation to meet goals? Goals are general, flexible, and aspirational rather than specific, as on p.1.*
4	Clarification	13, Table 8	The RTP/SCS claims an extra 2% CO2e emissions reduction in 2035 from the NHTS post-processing analysis. While the RTP/SCS meets the ARB SB375 goal without the extra 2%, we would like to note that the extra 2% could be important if the attorney general raises concerns about backsliding. Consequently, the reliability of the extra 2% reduction should be checked. Questions on the NHTS model are below. It would be useful to know the answers to better judge the quality, although we do note that the report does look like it meets the standards or best practice.
5	Clarification	9	NHTS Model Documentation Report *Are the auto and bus accessibility variables included in the regression models for 30-mile rings?* *In "Number of trips" model – is number of cars, included as an independent variable, the actual or predicted value?* *The same question applies to other models.*
6	Clarification	23, Table 10	NHTS Model Documentation Report *Were the elasticities for the SCAG NHTS study calculated at sample means, or for each observation and then averaged for the sample?*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
7	Clarification	24, Test 3	NHTS Model Documentation Report (Compare Trip-Based and NHTS Model): The final test was to compare the results of the Trip-Based Model and the NHTS Model for the same scenarios. *Please describe the scenarios tested.*

TRANSPORTATION FINANCE APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Clarification	General	*What are the implications if revenues other than core revenues do not become available?* *Please describe any implications to the ability of the region to meet SB 375 GHG emission reduction targets or the federally required air quality conformity?*

SCS BACKGROUND DOCUMENTATION APPENDIX

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	Please define	53, right column	Housing Options and Mix: Define Larger-lot single family in text
2	Clarification	71-74, 80-83	Alternatives naming: A, B, C Names of Alternatives differ than those listed in the PEIR on pages ES-3 and 1-4. *Please be consistent with naming protocol for alternatives between two/all documents.*

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
3	Revise language to clarify	71, right column	"Plan Alternative (B) … The alternative maintains city-level forecast control totals for both households and jobs, however, within city boundaries shifts are made to focus a much larger share of future growth in a more compact way around HQTAs, except in Gateway and Orange County COG subregions per their SCS delegation agreements. Future housing market demand is expected to shift significantly to small lot single-family, townhomes and multi-family ~~hosuing~~ housing."
4	Please define	71, right column	Plan Alternative (B) Define small lot single family in text
5	Revise language to clarify	71, right column	Plan Alternative (C) "As a result very suburban communities may experience no new housing or employment growth, while some urban areas with very good access to regional transit may experience significant increases in housing or employment growth."
6	Revise language to clarify	72, left column	"While each alternative is distinctive, a number of parameters remained constant across each alternative: the regional RTP/SCS forecast total for population, households and jobs;…" "Detailed forecast: the detailed distribution of population, households, and jobs across the region…"
7	Revise language to clarify	72, Table D1	Alternatives A & B: "Controlled to TAZ-based RTP/SCS Forecast for 2020; Controlled to city-level RTP/SCS Forecast for 2020-2035, except in Gateway and Orange County COG subregions per their SCS delegation agreements." Add statement to table notes: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
8	Revise language to clarify	74, Table D2	Alternatives A & B: Add statement: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
9	Clarification	75, right column	"Development Types The alternatives are built on, and provides data at, the level of the TAZ, which includes housing units and employment." *Please clarify if TAZ is Tier 1, Tier 2, or both.*
10	Revise language to clarify	79, right column	"Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be ~~respected~~ unchanged and integrated into the alternatives (with possible revisions for Alternative C only)."
11	Clarification	79	The section includes the following language: "Subregional SCSs submitted by the Gateway Cities Council of Governments (GCCOG) and the Orange County Council of Governments (OCCOG) will be respected and integrated into the alternatives (with possible revisions for Alternative C only)." *Please clearly indicate what the "possible revisions" are and what process would be used to coordinate with Orange County should changes to the socioeconomic data contained in the OC SCS be proposed?*
12	Revise language to clarify	80	Alternative A Add statement: Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
13	Revise language to clarify	81	Alternative B It is not clear whether Alternative B is the SCS land use plan. If it is, statements in the appendix lead one to believe the OC SCS foundation has been altered. For example, adjustments made to land uses to locate proximate to High Quality Transportation Areas (HQTA) and intensification of residential and employment development in HQTA that diverge from local General Plans as well as implementation of a vehicle user fee are not part of the OC SCS. *Is Alternative B the SCS land use plan?* *Add statement:* Gateway and Orange County COG subregions' local input data will not be changed per their SCS delegation agreements.
14	Clarification	115, left column	Transit Zoning Code Santa Ana 2011 *Is this a duplicate of the 2010 Santa Ana project?*

PEIR

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
1	Revise language to clarify	ES-2	ES contains matrix of mitigation measures which reference project sponsors, local agency, and project implementation agency without definitions. Add definitions into ES at end of ES.1: In general, the terms "local agency," "project sponsor" and "project implementing agency" are used throughout this PEIR to identify agencies, organizations, companies and individuals that will act as lead agencies or project applicants for different types of individual projects. Individual projects that are anticipated to occur pursuant to the 2012-2035 RTP/SCS consist of planning projects (general plans, specific plans, climate action plans, etc.), development projects (including Transit Priority Projects (TPPs) and other similar projects), and transportation projects. In general, "local agency" is used to refer to a public agency that would propose a planning project or a public infrastructure project and/or an agency that would be lead agency for individual projects. "Project sponsor" is typically used to refer to an applicant (that could be public or private, an organization or an individual) that proposes a project. "Project implementing agency" is used to refer to an agency responsible for implementing a project. In this document, project-implementing agencies are those that are responsible for carrying out (reviewing, approving, constructing) transportation projects.
2	Clarification	ES-3, 1-4, Chapter 4	Alternatives' Naming: No Project Alternative, Modified 2008 RTP Alternative, Envision 2 Alternative; Alternatives 1, 2, 3 Names of Alternatives differ than those listed in the SCS Background Documentation appendix on pages 71-74 and 80-83. *Please be consistent with naming protocol for alternatives between all documents.*

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
3	Fix numbering	ES-31	Duplicate naming of GHG11 and GHG12
4	Please define	ES-42	LU63- What are the smart growth principles?
5	Please define	ES-42	LU64- What are the benchmarks for smart growth?
6	Fix numbering	ES-51	PS17 & PS18 are missing
7	Fix numbering	ES-53	Duplicate naming of PS36 & PS37
8	Please define	ES-67	TR 34- what are the identified transportation benchmarks?
9	Please define	ES-83, 3.13-42 MM-W43	Define climate change hydrology
10	Please define	ES-40, 3.8-21 MM-LU42	Define urban growth boundary
11	Please define	ES-57, 3.11-49 MM-PS68 & ES-74, 3.12-43 MM-TR96	Define parking cash out program/ cashouts
12	Clarification	1-5	*Besides IGR, what other monitoring efforts is SCAG in charge of? (that would require lead agencies to provide SCAG with documentation of compliance with mitigation measures)*
13	Language correction	1-6, paragraph 3	Language correction: "The ~~latter~~ **former** finding…"
14	Language correction	2-5	Sustainability section should be separated. Language correction: **Sustainability**. The 2012-2035 RTP/SCS is subject to specific requirements for environmental performance. **New paragraph:** "Beyond simply meeting these requirements, a …"
15	Language correction	2-5, Table 2-2	"Align the plan investments and policies ~~with~~ **while** improving…"
16	Please define	2-14	Define "scrip"

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
17	Narrative	2-21	AB 32 is global warming solutions act. SB 375 was determined to be stand-alone legislation. RTP document is not forum to address global climate change and references distract from RTP goal and purpose. "Global warming" and "global climate change" are not interchangeable phrases. References should be removed or, where appropriate, language should be changed to "global warming". ~~Goods movement is also a major source of GHG emissions that contribute to global climate change.~~
18	Clarification	2-27 paragraph 4	Not in SCAG's authority, nor funding available. Delete sentence: ~~SCAG will work with local jurisdictions and community stakeholders to seek resources and provide assistance to address any possible gentrification effects of new development on existing communities and vulnerable populations.~~
19	Clarification	2-27 paragraph 5	"The 2012-2035 RTP/SCS land use development pattern accommodates over 50 percent of new housing and employment growth in HQTAs, while keeping jurisdictional totals consistent with local input." *Please confirm that there are no changes to the local land use inputs provided by Orange County.*

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
20	Clarification	2-29	"For purposes of SCAG's SCS, a Development Type reflects an estimated average density of 22 residential units per acre. However, it is important to note that the designation is a potential ultimate average for the TAZ—and is not an absolute project-specific requirement that must be met in order to determine consistency with the SCS. In other words, the SCS was not developed with the intent that each project to be located within any given TAZ must exactly equal the density and relative use designations that are indicated by the SCS Development Type in order for the project to be found consistent with the SCS's use designation, density, building intensity and applicable policies. Instead, any given project, having satisfied all of the statutory requirements of either a residential/mixed-use project or TPP, may be deemed by the lead agency to be consistent with the SCS so long as the project does not prevent achieving the estimated average use designations, densities and building intensities indicated by the Development Type within the TAZ, assuming that the TAZ will be built-out under reasonable local planning and zoning assumptions." *Does the above PEIR language create a requirement for average TAZ density levels in 2035 and a requirement that each local project not preclude those density levels?* *Additionally, please clarify whether in HQTAs, these densities could be exceeded as well as implications of an area that is already fully developed not redeveloping such that it ever achieves the identified densities.*
21	Please define	3.8-5 paragraph 3,	Define "open space"

#	TOPIC	PAGE REFERENCE	PEIR NARRATIVE, COMMENT & RECOMMENDATION
22	Revise language to clarify	4-39	Envision 2 alternative contains growth projections that would place housing in flight paths, locate housing on sites for which housing is not allowed due to environmental contamination, would significantly impact existing industrial operations necessary to maintain quality jobs in the region, and does not include development projects that are legally allowed due to having existing entitlement for development. Because this alternative does not consider the existing health and safety of future residents nor the existing legal approvals of development in the region, it is not possible to determine if the alternative is actually superior to other alternatives. It is simply another alternative for consideration. *Please remove references to the Envision 2 (or any other name of this alternative) as being environmentally superior.* ~~ENVIRONMENTALLY SUPERIOR~~ ENVISION 2 ALTERNATIVE
23	Revise language to clarify	4-40	"Of the three alternatives, the Envision 2 Alternative would be considered by State CEQA guidelines as the environmentally superior alternative because it does not allow further use of land for single-family development…"

OCTA

February 14, 2012

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

Re: Comments on the Draft 2012 Regional Transportation Plan and Program Environmental Impact Report

Dear Mr. Ikhrata:

Thank you for the opportunity to comment on the Southern California Association of Governments' (SCAG) draft 2012 Regional Transportation Plan (RTP) and associated Program Environmental Impact Report (PEIR). The 2012 RTP and PEIR are comprehensive documents that reflect the transportation and funding challenges the region will face in the coming years, in addition to the program level impacts and mitigation options. These documents are critical to the region's ability to operate, maintain, and improve the transportation system.

The Orange County Transportation Authority (OCTA) appreciates that SCAG has included the commitments identified in OCTA's 2010 Long-Range Transportation Plan, *Destination 2035*, as well as the demographic forecasts and land-use data submitted through the 2010 Orange County Sustainable Communities Strategy. In addition, OCTA appreciates the hard work and cooperation of SCAG staff throughout the RTP and PEIR development process.

OCTA has coordinated with Orange County's local jurisdictions to identify policy and technical issues related to the draft 2012 RTP and PEIR that are of concern to Orange County. The issues that were identified through this effort, and that are of particular concern to OCTA, are discussed below. Some of these issues were previously transmitted to SCAG in a letter dated October 7, 2011. Since a response to the October letter was never received from SCAG, OCTA strongly urges SCAG to carefully review the issues below and provide specific and detailed responses.

Innovative Financing and New Revenue Sources

The draft RTP suggests that $127.2 billion of the approximately $219.5 billion regional shortfall can be addressed through actions at either the state or federal level with a $0.15 gas tax increase between 2017 and 2024. After that, the draft RTP assumes that the state or federal government would either replace the gas tax with an indexed mileage-based user fee of $0.05 per mile,

beginning in 2025, or further increase fuel taxes to generate revenues equivalent to the mileage-based user fee.

OCTA cannot support an increase in fees, including the introduction of a mileage-based user fee, until a comprehensive economic impact study is completed and presented to the OCTA Board of Directors (Board) for discussion. In addition, when considering support for any kind of a new user-based fee program, an emphasis must be placed on the need for a return-to-source criteria that guarantees funds generated within Orange County are reinvested in Orange County. Finally, there should also be a process for recognizing and rewarding areas that keep the transportation system in a state of good repair.

California High-Speed Rail

The draft RTP identifies Phase I of the California High-Speed Rail Authority (CHSRA) Project as a potential solution for improving interregional and intercity ground transportation. As described in the RTP, the project is planned to connect San Francisco with Los Angeles and Anaheim. This also assumes improvements to increase speeds along the Los Angeles-San Diego-San Louis Obispo (LOSSAN) corridor and the Metrolink Antelope Valley Line.

This project description is consistent with the draft CHSRA Business Plan, which OCTA has reviewed and provided comments on (Attachment A). OCTA would like SCAG to take these comments into consideration as the RTP is refined for adoption in April. In summary, these comments focused on the following:

- OCTA supports the phased delivery approach, which includes early investment in the existing LOSSAN and Metrolink infrastructure
- Rather than initially investing in the central segment, OCTA believes it is more prudent to begin implementation at the "bookends" of the system
- Extending the implementation of Phase I by 13 years may jeopardize existing funding due to timely use criteria
- The updated schedule should account for potential contingencies, and the associated potential cost increases should be addressed through contingency planning
- The project's dependency on public funds could place CHSRA in direct competition for funding with existing transit service providers and local transportation agencies

- It is questionable whether the funding plan truly complies with the requirements set out in Proposition 1A, specifically Section 2704.08(c)(2), items A through K

- The operating assumption of "up to nine trains per hour" will likely result in an unnecessary level of service, and the projected operating surplus of $1 billion per year is too optimistic
- The $171 billion alternative investment in airports and roadways does not account for the airport and roadway investments that will be required both with and without the high-speed rail project

In addition, OCTA recommends that SCAG provide regular updates to the Transportation Committee and Regional Council regarding the CHSRA business plan, financial status, implementation progress, and any changes in assumptions by the CHSRA; particularly with respect to the status of the memorandum of understanding that better defines CHSRA's commitments to near-term speed improvements for the LOSSAN and Metrolink services.

Regional High-Occupancy Toll Lane Network

The draft RTP includes the implementation of a regional high-occupancy toll (HOT) lane network. This network appears to utilize existing and planned high-occupancy vehicle lanes to generate new revenues by selling excess capacity to single-occupancy drivers. The proposed regional HOT lane network assumes that Orange County would include HOT lanes on Interstate 5 (I-5) between the San Diego County border and the southern end of State Route 73 (SR-73); along I-405 between the northern end of SR-73 and the Los Angeles County border; and along State Route 91 (SR-91) extending the Express Lanes west to the Los Angeles County border.

On December 12, 2011, the OCTA Board approved the Express Lane Planning and Implementation Principles (Attachment B). OCTA requests that these principles be incorporated into the assumptions for segments of the regional HOT lane network that are within Orange County. Furthemore, the proposed HOT lane improvements to I-5, and SR-91 should be subject to further study to evaluate right-of-way impacts, community issues, and overall feasibility, prior to inclusion in the constrained plan.

East-West Freight Corridor

Due to continuing growth at the ports of Long Beach and Los Angeles, and increasing congestion on freeways throughout the SCAG region, the draft RTP

highlights the need for a zero emission East-West Freight Corridor. The corridor would aid the movement of goods between the ports and warehousing facilities located inland. This reflects the findings from the Comprehensive Regional Goods Movement Plan and Implementation Strategy.

Several other corridors were examined, including the SR-91, through Orange County and Interstate 10. After considerable study, the State Route 60 corridor was selected for further study based on its proximity to current and future markets, feasibility and right-of-way constraints, future truck volumes, and potential for reducing truck-involved accidents. The SR-91 was not selected primarily due to right-of-way constraints throughout the corridor, and lack of good access to warehousing locations.

OCTA supports the East-West Corridor as it appears in the Draft 2012 RTP. OCTA believes that the findings from the Comprehensive Regional Goods Movement Plan and Implementation Strategy are accurate, and OCTA encourages SCAG to build on the progress of the East-West Corridor based on these findings.

Other Regional Strategies

SCAG proposes a number of other investments within the draft RTP that affect Orange County, and go beyond the Long-Range Transportation Plan (LRTP). OCTA recognizes that it is within SCAG's purview to plan for regional strategies that enhance transportation, such as the ones discussed below. It should be noted that OCTA is committed to delivering the projects within the LRTP. OCTA will only consider additional investments after revenues are identified to account for these commitments. The regional strategies identified by SCAG do not have clear funding mechanisms, and it must be made clear that their inclusion in the RTP does not constitute a commitment to fund and/or implement the improvements.

Examples of regional strategies include the congestion management projects identified by the California Department of Transportation. In Orange County, these corridors include State Route 57, State Route 22, Interstate 605, SR-91, and I-405. The improvements consist of relatively low-cost operational improvements such as ramp metering, auxilary lanes, and other ramp and interchange enhancements. These are in addition to what was already submitted to SCAG by the county transportation commissions (CTCs) such as OCTA, and rely on funding sources beyond those identified in the LRTP.

The draft RTP also proposes additional transit enhancements throughout the region. The key transit investments that go beyond what the CTCs have committed include expanding local bus service, additional bus rapid transit, and new express bus service. These improvements are not specified in the draft RTP, but the additional cost to the region for these services is estimated at about $2.6 billion. These additional costs are are covered by SCAG's assumed transportation funding levels, which are beyond the available and committed resources identified in the LRTP.

An additional emphasis is also placed on walking and bicycling, which is referred to as "active transportation." The draft RTP proposes to increase the regional investment in active transportation by about $4.5 billion. When the committed investments submitted by the CTCs are accounted for, the total active transportation investment is approximately $6 billion for the SCAG region. Again, this additional investment is over and above resources identified in the LRTP, and the improvements are addressed only at the regional level.

Transportation Induced Growth

Throughout the draft RTP and PEIR, there are references to transportation projects inducing growth and influencing land-use development and demand. One such instance is on page 80 of the draft RTP, which states the following:

> "Transportation projects including new and expanded infrastructure are necessary to improve travel time and can enhance quality of life for those traveling throughout the region. However, these projects also have the potential to induce population growth in certain areas of the region. Although SCAG does not anticipate that the RTP would affect the total growth in population in the region, the RTP has the ability to affect the distribution of that growth."

These types of statements are misleading for a number of reasons. For example, the excerpt quoted above states that the "RTP has the ability to affect the distribution of growth." This can be understood to imply that SCAG has the ability to influence growth through the development of the RTP. OCTA trusts that this is not SCAG's intent. OCTA recommends that such references be clarified, as land use decisions are within the purview of local agencies.

Moreover, and more importantly, statements such as the above excerpt imply a lack of coordination between land-use and transportation agencies, especially

in the light of the recent efforts to develop the Sustainable Communities Strategies at the subregional and regional levels. There should be an emphasis in the RTP on the fact that land-use and transportation agencies are coordinating better now than ever before. OCTA recommends that SCAG clarify the negative implication of the statements regarding induced growth, and highlight the elevated level of coordination occurring today.

Draft Program Environmental Impact Report

The Draft PEIR is a program level document that is intended to serve as an informational document, disclosing all potential environmental impacts and possible mitigation measures. OCTA has coordinated with a number of agencies throughout Orange County who have expressed interest in reviewing and commenting on the draft 2012 RTP and PEIR (Attachment C). These agencies have identified a variety of concerns during their review of the documents, in particular with the list of 549 mitigation measures within the PEIR. The key concerns that have been identified include:

- The Draft PEIR states that it "has made a preliminary determination that the proposed mitigation measures are feasible and effective." It is unclear how this determination was made, and this assumption could prove to be inaccurate if and when these mitigation measures are considered at a project level. Therefore, any feasibility determinations in the PEIR must clearly state that they only apply at the program level.
- Several of the mitigation measures that identify SCAG as the acting agency propose measures that appear to exceed the purview of SCAG. SCAG must be mindful of local and county land-use and transportation authorities, and use great discretion when making commitments and/or suggesting policies and strategies that may impact and encroach upon local and county agencies' responsibilities.
- The PEIR includes mitigation measures that restate existing requirements enforced by other agencies and, therefore, do not need to be repeated in this list of mitigation measures.

Additionally, OCTA understands that only those mitigation measures that state that "SCAG shall" are required to be carried forward. Any mitigation measure that identifies an agency other than SCAG can be considered at the discretion of the appropriate agency; however, such consideration is not required unless the agency chooses to use the PEIR in order to tier when performing project level environmental analysis.

OCTA understands the term "can and should" to mean that the agency identified by SCAG in a mitigation measure has the authority to implement the mitigation measure, and that SCAG encourages the agency to do so. The term is not intended to imply that the measures are feasible nor required.

Finally, SCAG's current Intergovernmental Review ("IGR") policy "encourages" the use of the mitigation measures identified in the 2008 RTP PEIR to "aid with demonstrating consistency with regional plans and polices." SCAG will most likely update the IGR policy to refer to the 2012 RTP PEIR mitigation measures. As explained above, and as already recognized by SCAG, compliance with the RTP PEIR mitigation measures is mandatory for SCAG only. These mitigation measures, therefore, should not be considered in any way during the IGR process to determine consistency with regional plans and policies.

While OCTA shares many of the concerns raised by partner agencies and stakeholders in Orange County, such as those described above, the attached list of comments on the PEIR (Attachment C) focuses on the issues within OCTA's purview that were identified through the coordination efforts. Please provide responses and clarifications with regard to these comments.

OCTA appreciates SCAG's work on the RTP and PEIR to date and looks forward to the adoption of a complete and accurate 2012 RTP and PEIR in April. If you have further questions, please contact Gregory Nord, Senior Transportation Analyst, at (714) 560-5885.

Sincerely,

Paul G. Glaab

Chief Executive Officer

December 22, 2011

Chairman Thomas J. Umberg
Board of Directors
California High-Speed Rail Authority
770 L Street, Suite 800
Sacramento, CA 95814

Dear Chairman Umberg:

On behalf of the Orange County Transportation Authority (OCTA), we appreciate the opportunity to review and comment on the California High-Speed Rail Draft 2012 Business Plan (Plan). As the only public agency to provide a financial contribution to the environmental clearance effort, OCTA has a vested interest in the California High-Speed Rail (CHSR) project, especially since the designated southern terminus for Phase 1 of the CHSR project is in Orange County.

The Plan is a marked improvement over the 2009 Plan and attempts to address many of the previous areas of concern raised by the Legislature, the Peer Review Group, the Legislative Analyst's Office (LAO), and affected communities. We are pleased that the Plan includes the blended approach as requested by OCTA and Los Angeles County Metropolitan Transportation Authority (Metro) in spring 2010. The plan recognizes the importance of existing passenger rail service providers and the need to link those systems with the CHSR project. We believe this is the key to the successful implementation of CHSR in Southern California, and the retention of federal support for this project. Linking into the existing successful rail services will provide the needed connectivity to regional transit systems to enable the full potential of the CHSR system.

While the Plan represents a more realistic assessment of the CHSR project, there remain areas of serious concern that should be addressed prior to submission to the Legislature and certainly prior to implementation. Below is a summary of our comments/ concerns:

- **Phased Delivery Approach:** We are pleased with the introduction of the phased delivery approach as it represents a more realistic delivery model and includes the blended operations approach as requested by OCTA and LA Metro; however, this approach begins with construction in the Central Valley instead of the Anaheim to San Fernando Valley and San Francisco to San Jose segments, often referred to as the bookends

of the system, which show much higher ridership and revenue, as well as providing connectivity to the most urbanized areas of the state. While there may be requirements which justify initial expenditures on the Central Valley, we believe it more prudent for the California High-Speed Rail Authority (CHSRA) to begin with project implementation at the bookends of the system. This approach will maximize the investment of the scarce state and federal funds and provide critical connections to the existing passenger rail systems in southern and northern California. If new track is constructed outside of the bookends in southern and northern California, it should be added between the San Fernando Valley and Bakersfield to connect the Pacific Surfliner and San Joaquin intercity rail corridors. This important infrastructure would fill the gap in passenger rail service which now exists between Los Angeles and Bakersfield.

- **Project Schedule:** We understand that the updated schedule aligns with the phased delivery approach, adding 13 years to the full Phase 1 project. Unfortunately, this change in schedule leads to significant cost increases due to inflation and escalation and it puts the existing funding sources in jeopardy due to timely use. Additionally, the updated schedule includes no contingency for project delay that may be caused by environmental clearance, legal challenges, gaps in funding, or limited availability of construction materials and qualified technical resources.

- **Cost Increase:** While we are aware that the previous cost estimate was in base year dollars and the updated cost estimate now includes normal escalation and inflation, the cost increase is significant. As stated in the business plan, the increased cost also does not address worst case scenarios for mitigations that may be required through the environmental process nor is it based on the high end of the range presented in 2010 dollars. These potential cost changes could be significant and should be addressed through contingency planning.

- **Funding/Financial Plan:** The funding plan is largely speculative and lacks any firm commitment of funding beyond the initial construction section. The current secured funding is not adequate to build either of the Initial Operating Sections, which the Plan states are the driving force behind attracting any private funding and future public funds. Additionally, the Plan relies heavily on scarce public funds on the front end of the project and could place the CHSRA in direct competition with existing rail service providers given the identified potential fund sources. This is of great concern to OCTA as it will directly impact existing and future planned programs. Specifically we are very concerned about the

assumptions on the use of federal Congestion Mitigation and Air Quality and Regional Surface Transportation Program funds that OCTA utilizes for highway and transit projects. In addition, the use of federal New Starts funds for the high-speed rail (HSR) program presents direct competition to OCTA and other local transportation agencies that rely on this program for the development of new fixed-guideway projects.

- **Compliance with Proposition 1A**: Proposition 1A Section 2704.08(c)(2) specifically states that any funding plan submitted to the Legislature "shall include ... all of the following," and items A through K are listed. Subdivision H requires that, "The corridor or usable segment thereof would be suitable and ready for high-speed train operation." "Corridor" is specifically defined in Section 2704.01 and refers to a "high-speed train system," which is defined in Subsection (e) of 2704.01 as a "system with high-speed trains and includes ... power system, rolling stock..." among other items. Additionally, Subsection K of 2704.08(c)(2) requires that, "The Authority has completed all necessary project-level environmental clearances necessary to proceed to construction." As noted by the LAO's November 29, 2011 report on the Plan, it would appear that there are serious questions that need to be fully analyzed as to whether the funding plan truly complies with the requirements set out in Proposition 1A.

- **Operational Assumptions:** The operating assumptions include some very aggressive service levels of up to nine trains per hour. This is likely to result in unnecessary frequency. The projected operating surplus of over $1 billion per year is also speculative and based on an optimum number of trains; in our view, it is simply too optimistic.

- **Cost Comparisons:** The cost comparisons made in the Plan are based on a theoretical maximum of HSR capacity. More concerning is that the Plan does not include a build vs. no-build option for HSR and ignores existing capacity and other tools for managing congestion; in addition, the Plan compares a $98 billion investment in HSR to a $171 billion future investment in airports/roadways for equivalent capacity, but does not account for the roadway/airport work investment that will be required both with and without HSR.

The CHSR project represents the single largest public works project in California history, requiring extensive coordination and investment. OCTA is pleased to see the enhanced level of coordination between the CHSRA and existing service providers and railroad owners. However, we have grave

concern over what appears to be missing elements and unrealistic components of the Plan. We also urge the CHSRA to address the serious concerns regarding the Plan raised by the LAO prior to submission of this Plan to the Legislature. OCTA would further appreciate adequate responses to the issue raised in the letter. This project has the potential to provide significant improvements to California's transportation infrastructure, but must be done with prudent planning and judicious use of public funds.

Sincerely,

Patricia Bates
Chairman

PB:jlb

Executive Staff

Express Lane Planning and Implementation Principles

User Experience

1. Express lane projects shall be designed and implemented to provide safe, reliable, and predictable travel times.

2. Express lanes shall be planned and implemented to support improved regional connectivity.

3. Design and management of the interface of express lane facilities with existing freeway, high-occupancy vehicle, and express facilities shall seek to achieve a consistent, seamless user experience.

Existing System

4. Express lane projects shall not be implemented to replace committed projects to be funded with local transportation sales tax revenues.

5. Although Caltrans and Federal Highway Administration control highway operations, OCTA does not intend to replace existing mixed-flow freeway lanes with express lanes.

6. Existing high-occupancy vehicle lanes may be functionally encompassed within an express lane project, provided:
    a. The total number of lanes is increased by the project; and
    b. Both vehicle throughput and average vehicle occupancy levels can be maintained and/or improved.

Operations

7. Express lane operations policies shall:
    a. Assure coverage of capital and operations costs as well as maintenance responsibilities.
    b. Maximize overall corridor throughput and efficiency through congestion pricing.
    c. Promote increased average vehicle occupancy, including incentives for carpools, vanpools, and transit services.

Revenues

8. Any express lane project revenues in excess of what is needed for annual debt payments, financing requirements, and operations responsibilities shall be used for congestion relief projects and expanded transit options in the same corridor area.

9. Continued operations of express lanes, beyond bond retirement dates, shall be subject to demonstrated congestion relief measured by vehicle throughput and average vehicle occupancy levels in the corridor.

OCTA

Comments on the Draft 2012 Regional Transportation Plan – Program Environmental Impact Report

OCTA Comment #1

MM-AQ1 – This mitigation measure states that SCAG shall implement Transportation Control Measures (TCMs). However, page 26 of the Transportation Conformity supplemental report to the draft 2012 RTP states that "Although project implementation remains an enforceable commitment by project sponsor agencies, SCAG is responsible for assuring the timely implementation of TCMs." OCTA recommends modifying this mitigation measure to describe SCAG's role as being limited to monitoring the timely implementation of TCMs, consistent with the language from the Transportation Conformity supplemental report.

MM-AQ1	TCMs shall be implemented as appropriate by SCAG and can and should be implemented by local agencies and project sponsors as appropriate. TCMs included in the Plan are identified in the Transportation Conformity Appendix to the 2012-2035 RTP/SCS (starting on page 26). CAA Section 108(f)(1)(A) lists the following sixteen measures as illustrative of TCMs: I. Programs for improved use of public transit; II. Restriction of certain roads or lanes to, or construction of such roads or lanes for use by, passenger buses or HOV; III. Employer-based transportation management plans, including incentives; IV. Trip-reduction ordinances; V. Traffic flow improvement programs that achieve emission reductions; VI. Fringe and transportation corridor parking facilities, serving multiple occupancy vehicle programs or transit service; VII. Programs to limit or restrict vehicle use in downtown areas or other areas of emission concentration, particularly during periods of peak use; VIII. Programs for the provision of all forms of high-occupancy, shared-ride services, such as the pooled use of vans; IX. Programs to limit portions of road surfaces or certain sections of the metropolitan area to the use of non-motorized vehicles or pedestrian use, both as to time and place; X. Programs for secure bicycle storage facilities and other facilities, including bicycle lanes, for the convenience and protection of bicyclists, in both public and private areas; XI. Programs to control extended idling of vehicles; XII. Programs to reduce motor vehicle emissions, consistent with Title II of the CAA, which are caused by extreme cold start conditions; XIII. Employer-sponsored programs to permit flexible work schedules; XIV. Programs and ordinances to facilitate non-automobile travel, provision and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts of a locality, including programs and ordinances applicable to new shopping centers, special events, and other centers of vehicle activity; XV. Programs for new construction and major reconstruction of paths, tracks or areas solely for the use by pedestrian or other non-motorized means of transportation, when economically feasible and in the public interest; and XVI. Programs to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks. The Plan has been prepared to facilitate implementation of TCMs and they also serve as air quality mitigation measures for the purposes of the PEIR.

OCTA Comment #2
MM-BIO/OS45 – OCTA recommends revising this mitigation measure to indicate that SCAG will accept CTC adopted conservation and mitigation strategies for determining priority conservation areas and in developing regional mitigation policies.

MM-BIO/OS45	SCAG shall develop a conservation strategy in coordination with local jurisdictions and agencies including CTCs to determine priority conservation areas and develop regional mitigation policies. SCAG shall produce and maintain a list/map of potential conservation opportunity areas based on most recent land use data. These conservation opportunity areas may be used by local jurisdictions and project sponsors as priority areas for mitigating impacts to open space resources. SCAG's forthcoming regional conservation planning policy will include additional information on conservation opportunity areas.

OCTA Comment #3
MM-LU9 – SCAG has no land-use authority to implement this mitigation measure. OCTA recommends removing any reference to SCAG implementing the coordinated mitigation programs.

MM-LU9	SCAG shall develop and implement coordinated mitigation programs for regional projects, with an emphasis on regional transportation projects.

OCTA Comment #4
MM-PS34 – This mitigation measure is unclear regarding the specific funding opportunities and programs that would be affected. Any new requirements implied through this mitigation measure that affect funding for transportation projects are not supported by OCTA.

MM-PS34	SCAG shall consider consistency with ongoing regional open space planning in funding opportunities and programs administered by SCAG.

OCTA Comment #5
MM-PS118 – OCTA recommends revising the language in this mitigation measure to read as follows:

"SCAG shall continue to develop energy efficiency and green building guidance to provide direction on specific approaches, models, and levels of performance for regionally significant projects to be consistent with regional plans."

MM-PS118	SCAG shall continue to develop energy efficiency and green building guidance to provide direction on specific approaches and models and to specify levels of performance for regionally significant projects to be consistent with regional plans.

OCTA Comment #6
MM-TR6 – OCTA recommends revising this mitigation measure to indicate that SCAG will defer to the CTCs to plan and coordinate at the project level.

MM-TR6	SCAG shall establish transportation infrastructure practices that promote and enhance security. SCAG shall work with transportation operators to plan and coordinate transportation projects, as appropriate, with DHS grant projects, to enhance the regional transit security strategy (RTSS). SCAG shall establish transportation infrastructure practices that identify and prioritize the design, retrofit, hardening, and stabilization of critical transportation infrastructure to prevent failure, to minimize loss of life and property, injuries, and avoid long term economic disruption. SCAG shall establish a Transportation Security Working Group (TSWG) with goals of 2012-2035 RTP/SCS consistency with RTSS, and to find ways SCAG programs can enhance RTSS.

OCTA Comment #7
MM-TR15 – OCTA recommends revising the language to indicate that SCAG will coordinate closely with CTCs and local agencies when developing advocacy strategies regarding congestion pricing.

MM-TR15	Congestion Pricing: SCAG shall advocate for a regional, market-based system to price or charge for auto trips during peak hours.

OCTA Comment #8
MM-TR21 – SCAG has no authority to "ensure that new developments incorporate both local and regional transit measures into the project design that promote the use of alternative modes of transportation." Please modify the language to remove the "SCAG shall", and to state that "Local agencies can and should ensure" this effort "to the extent feasible".

MM-TR21	Transportation Planning: SCAG shall and local jurisdictions can and should ensure that new developments incorporate both local and regional transit measures into the project design that promote the use of alternative modes of transportation.

Re: DRAFT Regional Transportation Plan and the OLDA Northern Corridor

Mr. Ikhrata:

On January 11, 2012, the Orangeline Development Authority (OLDA) Board of Directors voted to communicate to you its support for including the OLDA Northern Corridor in the Constrained Projects List for the 2012 Regional Transportation Plan. This addition provides connectivity necessary for the success of the OLDA Southern Corridor (West Santa Ana Branch), which is in the constrained list. The OLDA Northern Corridor coincides with much of the list of improvements being studied by Metro as the Antelope Valley Line Infrastructure Improvement Strategic Plan and the currently planned alignment of the California High Speed Rail project. The likelihood that funds would be available for these set of improvements are enhanced by the Memorandum of Understanding (MOU) being negotiated for use of Proposition 1A (High Speed Rail) funds.

The Orangeline Development Authority (OLDA) is a joint powers authority consisting of 14 members connecting the West Santa Ana Branch and Antelope Valley Line from the City of Cerritos to the City of Santa Clarita. It includes members in the Gateway Cities Council of Governments and San Fernando Valley Council of Governments.

OLDA is committed to the development of a high speed, grade separated, environmentally friendly and energy efficient transit **system**. Currently, OLDA Southern Corridor is in the constrained plan (West Santa Ana Branch).

Recent events and planning efforts have focused attention on the OLDA Northern Corridor from Downtown Los Angeles to Santa Clarita. Based upon these efforts, OLDA would like to suggest that the OLDA Northern Corridor be included in the constrained plan (Antelope Valley Line). Specific planning efforts in the corridor include:

- ***Bob Hope Airport*** – The Burbank Glendale Pasadena Airport Authority and OLDA are conducting a $5.4 million Ground Access Study. The grant provides planning and construction funds for improvements on the Antelope Valley Line and has become a catalyst for OLDA Northern Corridor improvements. The study focuses on multimodal transportation improvements linking to the regional system, including the feasibility of a new North Station on the Antelope Valley Line at Hollywood Way and San Fernando Road. The study has led to additional planning efforts that can lead to significant improvements linking Santa Clarita to Downtown Los Angeles. Further, the Airport is going to break ground on a Regional Intermodal Transportation Center (RITC). More details are in the SCAG RTP appendix entitled "Aviation and Airport Ground Access."

- ***Antelope Valley Line Infrastructure Improvement Strategic Plan*** - Metro is conducting a study to upgrade the Antelope Valley Line. The 75 mile corridor runs at-grade from Los Angeles Union Station to Lancaster and includes plans for several capital improvements. The Antelope Valley Line Study is providing the plan to create a shared corridor involving not only current Metrolink service but also part of the High Speed Train system. Results of this study should be available in March 2012 and are expected to include recommendations that meet many of the OLDA goals and objectives.

- ***Memorandum of Understanding*** - In January, 2012, a Memorandum of Understanding has been developed between the California High Speed Rail Authority, Southern California Association of Governments, Los Angeles County Metropolitan Transportation Authority, Southern California Regional Rail Authority and many other local transportation agencies. The MOU addresses advance investment of up to $1 billion in Southern California as part of the CHSRA's commitment to a "Blended Approach" to the construction of the high speed train (HST) system in California. As you are aware, this MOU is a significant document that allows for this work to now be included in the Constrained portion of the Draft Regional Transportation Plan (RTP). This can lead to the planning and funding necessary to include OLDA's Northern Corridor in the Constrained portion of the RTP.

Re: Comments on Regional Transportation Plan

To Whom It May Concern,

The Pasadena Chamber of Commerce has reviewed the Regional Transportation Plan and appreciates the time, effort, thought and work that went into the document. While we appreciate that a regional approach to traffic management, transportation and goods movement we also want to be sure that plans and implementations are truly regional and economics and impacts to local economies are given due consideration.

For example, we would be very concerned about user-based fee proposals to fund transportation projects. For us, we could not support any program or plan that would put the Pasadena area at a competitive disadvantage economically. Traffic, transportation, goods movement and customers need to be able to access Pasadena as easily, simply and cost-effectively as our neighbors in the region. Plans for programs that will charge vehicle drivers a fee to get to Pasadena should be implemented region-wide, not piecemeal, and certainly not in the San Gabriel Valley first. If, for example, congestion pricing schemes or toll roads are proposed, we would want those implemented region-wide, not in a way that puts our area at a disadvantage economically as increased costs to travel to, through or past Pasadena that do not exist in other places, put Pasadena at a competitive disadvantage compared to those places in the area that would not see those same programs implemented and those additional costs imposed.

Likewise, any program or plan to assess fees to mitigate development impacts need to be approved by the local government and funds generated need to be used by those local governments to reduce impacts in their area and existing local fees should exempt businesses within those jurisdictions from any additional costs.

We are also concerned that an agency with little understanding of the Pasadena economy, our local business community or community needs is proscribing programs, mitigations and measures that may be inappropriate or unworkable in our local jurisdiction. It is certainly prudent for SCAG, through the RTP, to set goals for everything from pollutants in the air to the time it should take to travel between cities in the region, but SCAG should not be determining what programs will achieve those goals, not what local costs will be to achieve them.

We also appreciate the linking of land use policies with transportation planning, however, we do not see how many local jurisdictions could achieve the goals, especially given the elimination of redevelopment agencies by the State of California. Quite simply, there is no mechanism for localities to support development of any kind, especially not more dense development in our downtowns that would likely require consolidation of properties. How is that to be accomplished when there is no mechanism to capitalize such endeavors?

In fact, we are very concerned that the funding mechanisms identified to finance projects will be very short of anticipated levels, and that some of these mechanisms may never be available as they are not currently implemented in California.

We are also concerned that, while it is important to move goods, vehicles and persons easily through the region, we should be very mindful of impacts to local streets and local economies. Putting in a freeway does no good if the resulting overflow traffic stifles local streets and strangles local business districts.

Finally, the Pasadena Chamber of Commerce cannot stress enough the importance of our local economies. Transportation planning, like every other government endeavor, needs to fully, accurately and appropriately take impacts to the local, regional and state economy into consideration. The best transportation plan imaginable is worthless of it stifles job and economic growth and puts our region, and its cities, at a competitive disadvantage.

Thank you for the opportunity to comment.

Paul Little

Los Angeles, CA 90017

Re: 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy

Dear President O'Connor and Southern California Association of Governments Regional Council Members:

The undersigned appreciate the dedication and efforts of the staff at Southern California Association of Governments (SCAG) in completing the Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (2012 RTP/SCS). We are encouraged by the recommendations in the plan that moves the region towards an improved transportation system while improving public health and air quality.

The 2012 RTP/SCS includes many smart growth strategies that will increase mobility, public health and environmental health standards. As advocates for improving public health and equity, we are encouraged to see SCAG's recommendations to:

- *Increase investment in active transportation strategies.*
- *Acknowledge that a regional zero emission freight system is needed in the region.*
- *Discuss gentrification issues as part of Environmental Justice.*
- *Monitor premature mortality due to PM2.5.*

Though SCAG has shown commitment to improving the region's *mobility, economy and sustainability* by including public health analysis in transportation planning policies, more can still be done to improve air quality, increase equity and improve our goods movement system.

The SCAG region faces immense public health and environmental challenges, and the RTP/SCS must be enhanced to address these issues. The SCAG region continues to have the worst air quality in the nation and contains "14 non-attainment and maintenance areas in four air

basins"[1]. Additionally, SCAG recognizes that 25% to 27% of the population "within the freeway adjacent areas are projected to see increases in their emission exposures to CO and PM"[2]. According to Figure 46 in the Environmental Justice Appendix, close to 60% of the population residing within 500 feet from the buffer area are Hispanic and in Quintile 1 (The Lowest Income Household). The issues of air pollution are even more acute in the SCAG region given the rampant prevalence of diesel equipment used in the freight industry. Residents in close proximity to highways, particularly those with high levels of diesel trucks, will experience increased rates of cardiovascular and respiratory disease, premature mortality, increased lung cancer incidence, decreased life expectancy, reproductive health problems, and increased asthma symptoms [3] [4] [5] [6]. While we recognize that the goods movement sector is an economic driving force in the region, we cannot sit by idly and allow the immense damage to the health of our most vulnerable communities persist.

Given these challenges, we recommend several improvements that must be made to improve the RTP/SCS.

I. The RTP/SCS Must Do More To Promote Public Health Protections, Active Transportation and Equity.

The RTP/SCS is the blueprint for years to come. As such, it must be designed to promote public health through choosing better transportation alternatives and making sure we spread the benefits of these investments to all residents in the region, regardless of race, income, or other social status. Moreover, we must make sure we minimize exposure to environmental harms.

II. The RTP/SCS Must Invest and Include Healthy and Equitable Policies.

Implementing this recommendation requires addressing the following critical public health issues:

A. Mitigate PM and CO exposure in high quality transit areas.

The 2012 RTP/SCS will redirect 51% of new housing near High Quality Transit Areas (HQTA) providing an opportunity for healthy communities. Redirecting the growth of new housing closer to busy roads and freeways could violate the California Air Resources Board's recommended 500 feet freeway buffer, and potentially increase CO and PM exposure and noise impacts. SCAG has acknowledged that 25% to 27% households living within freeway adjacent areas will see increases in their emission exposure to CO and PM. In addition to monitoring these areas for PM and CO, we recommend that SCAG also project and map out the areas that may be impacted as a result of the redirected growth up to the year 2035. We also recommend for SCAG to include current mitigation strategies in the EJ Toolkit and work with the local communities, health advocates and stakeholders to continue developing policies that will be included as part of the mitigation strategies for HQTA.

Arden, Pope C III, PhD et al., JAMA 2002; 287; 1132–1141.

B. Mitigate highway noise areas in communities of concern.

Highway noise areas are also disproportionate to environmental justice communities with 22% of the affected population residing within roadway noise areas and 14% of the households below the poverty line[7]. Noise impacts have been associated with hearing impairment, hypertension and ischemic heart disease annoyance and sleep disturbance[8]. Further noise impact mitigation studies should be utilized in future 2012 RTP/SCS plans.

C. Monitor and develop tools to avoid gentrification and displacement in TODs.

SCAG's current analysis of 125 HQTA around rail stations found that the demographics of HQTA/TOC are changing. Poverty rates are declining in these areas when compared to the rest of the region[9]. These results show that displacement and gentrification may be occurring in these areas. As such, gentrification should be acknowledged and policies need to be put in place to avoid this from happening. In addition to tracking the 125 rail stations, SCAG should:

1. Track commute time by race and income in Communities of Concern (COCs) and compare it to the region.
2. Set a baseline for jobs-housing fit by taking a "snap shot" of 4-to-5-mile buffer zone around major job centers, and compare the wages provided by those jobs to cost of housing within the buffer zone to see if there is a good jobs-housing fit. Continuing to monitor the jobs/housing fit over successive RTP/SCSs will be an important tool for transportation planning in rural, urban and suburban areas.
3. Use the Compass Blueprint Program to advance a policy toolkit that highlights and recommends anti-displacement and anti-gentrification policy options in TOD areas, as an eligible subject for a Compass Blueprint grant proposal.

III. The RTP/SCS Must Ensure That the Region has a Complete Network of Transportation Strategies that Connect Travelers to a Wider Range of Transportation Options.

This entails implementation of the following recommendations:

*A. Increase investment in <u>active</u> transportation***.**

In order to achieve true walkable and healthy communities we recommend for SCAG to increase its investments in Active Transportation strategies beyond the $6 billion currently recommended.

B. Increase investment in <u>public</u> transportation.

Prioritize investment in bus rapid transit and taking existing infrastructure to include bus-only lanes instead of expanding highway to accommodate for additional capacity.

C. Access, mobility and safety.

In order to better connect the region that depends on non-motorized modes of transportation, first-mile/last-mile strategies should also include close-the-gap strategies that integrate active modes of transportation to allow for accessibility to employment and services. To better do this, SCAG should identify geographic areas with high concentrations of communities of concern and track their transportation access, cost, mobility, rent, and gentrification and displacement patterns

[7] Pg. 127, EJ APPENDIX
[8] Passchier-Vermeer, W. and Paschier F.,W. Noise Exposure and Public Health. *Environmental Health Perspectives, Environmental Health Perspectives* 108(1):123-131, March 2000.
[9] Page 93, EJ APPENDIX

(using the seven indicators to track early signs of displacement or gentrification) [10]. The data can be used in future RTP/SCS and determine where close-the-gap strategies would best serve the region and address any adverse impacts that transportation projects can cause to communities of concern. SCAG should also use the data to determine what communities are underserved by transportation projects and connect those underserved communities to high opportunity areas.

IV. SCAG Must Support Federal Policies That Benefit Active Transportation.

Given the current state of the federal transportation bill and efforts to strip dedicated funding from MAP-21 in the Senate and the House American Energy and Infrastructure Jobs Act in the House, we are concerned that expected federal revenues for bicycle and pedestrian enhancements may not materialize.

To this end we request that SCAG fully support an amendment offered by Senator Lautenberg in the EPW Committee to ensure that total funds available in the "additional activities" reserve fund in MAP-21 for Recreational Trails, Safe Routes to School, and bicycle and pedestrian investments are equal to those currently in SAFETEA-LU. Additionally, this amendment would ensure that regions within states are able to have direct and first access to these funds so that cities throughout the SCAG region are able to directly apply for and receive funding for important bicycle and pedestrian projects. As the Senate bill progresses to the floor there will be opportunities for Senator Boxer to incorporate these provisions into the final bill and it is important for SCAG to make clear it supports them.

V. The Freight Strategies in the RTP/SCS Must Be Improved.

We remain deeply concerned about the freight elements of the RTP/SCS. While the plan acknowledges the need to move to zero emissions technologies, it provides little substance on how it will actually happen. The RTP must be more rigorous. To support this, we suggest the following improvements to the freight elements of the plan.

A. The RTP/SCS must actually require creation of a zero-emission truck and freight goods movement for the region.

Several issues must be addressed in the 2012 RTP/SCS before it is adopted with regard to how freight is moved through the year 2035. Goods movement strategies must ensure that the South Coast Air Basin meet federal air quality standards set forth in the Clean Air Act. Currently, the plan provides little detail on this issue, including how black box reductions will be achieved from the substantial portion of emissions from freight. While we agree with the many experts who "question the long-term viability of continued reliance on fossil fuels," the RTP/SCS lacks details on how best to actually achieve this goal[11]. The "uncertainty of a petroleum-based future" needs to be at the forefront of the 2012 RTP/SCS where any expansion plans that increase a petroleum-based roadway system and raise Vehicle Miles Travel (VMT) must be curtailed[12]. The RTP/SCS needs to do more than just put words on paper about the need for this system. Future projects must be required to incorporate these technologies or they should not be built.

Financing these cleaner technologies is an important consideration for SCAG. Ensuring that funding mechanisms are in place to expedite the implementation of the zero and near-zero

[10] Pg. 93, EJ APPENDIX
[11] Pg. 29, DRAFT 2012 RTP/SCS
[12] Pg. 29, DRAFT 2012 RTP/SCS

emission freight and truck strategies should be a central component of the strategy. For these reasons, we recommend that SCAG consider including the following funding strategies:

1. Develop a clear assessment of various financing options including various models of public-private partnerships that could make zero-emission technology options possible. Recommend a $30 per twenty-foot container fee for moving either into or out of the ports. This strategy could generate as much as $441 million in revenue from loaded containers in its first full year of implementation, when applied equally to imports and exports[13].
2. Use currently available clean truck technology and incentivize it through funding and or by way of preferential access lanes at terminals.
3. Reinstitute the diesel truck fee to incentivize clean, alternative fuel trucks.
4. Improve fee structure to give preference to clean alternative fuel trucks.

B. The RTP/SCS must implement near-term solutions to reduce greenhouse gas emissions from freight.

We are deeply concerned that the projected increase in freight volumes and traffic will undermine the gains of the 2012 RTP/SCS in other areas. In particular, CO2 emissions from trucks would increase at least 30% by 2023 and at least 60% by 2035. Even more dramatically, CO2 emissions from rail would increase at least 50% by 2023 and at least 123% by 2035[14].

Given that "This RTP Goods Movement Environmental Strategy was developed to address community concerns, federal attainment requirements, *and climate change issues*," it is problematic that near-term solutions are not more fully articulated[15]. Near-term strategies to clean up goods movement must be fully integrated into the 2012 RTP/SCS. We would like to work with you before the final version of the 2012 RTP/SCS to resolve this deficiency. Indeed as stated "For trucks, an aggressive program to bring more currently available, clean fuel trucks and hybrid trucks into service represents the best near-term strategy" [16]. Yet no such program is identified for either trucks or rail.

The ports of Los Angeles and Long Beach have left a gaping hole in clean air planning by not establishing targets and reduction plans for greenhouse gases (GHGs). SCAG and the 2012 RTP/SCS should demand that the Clean Air Action Plan be augmented with GHG reduction plans. Both ports have in the past promised to have such plans but neither has released one[17]. Such plans should complement and accelerate SCAG's vision for increased efficiencies and the deployment of cleaner technologies.

While we commend the steps to evaluate and seek funding for longer-term zero and near-zero emissions technologies, the severity of the pollution and congestion from freight activities merits additional attention in the near-term. And while the 2012 RTP/SCS rightly considers heavy-duty trucks and rail emissions, it would be worth devising a set of strategies that account for the differences among local freight service and that of port origin/destination. Similarly, the sector of medium duty trucks may be targeted for technology improvements, given that it is the sector's 2nd largest emitter of NOx[18].

[15] pg. 33, GOODS MOVEMENT APPENDIX, emphasis added
[16] Pg. 39, GOODS MOVEMENT APPENDIX
[17] POLB has initiated a GHG mitigation fund to attempt to offset some of its increased emissions
[18] Pg. 32, Figure 8, GOODS MOVEMENT APPENDIX

In the section On-Dock/Near-Dock Rail Capacity Enhancements, the 2012 RTP/SCS appropriately expresses preference for on-dock rail "By allowing more on-dock rail, truck traffic between the San Pedro Bay Ports and distant rail yards can be reduced. Use of on-dock rail eliminates truck vehicle miles of travel (VMT) and associated emissions"[19]. SCAG should demand a sequencing of projects that maximizes on-dock rail and that reduces constraints on the expansion of on-dock capacity in advance of projects that expand off-dock capacity. Without appropriate sequencing, efficiencies could be lost.

VI. The RTP/SCS Must Remove the East-West Corridor Route Project.

Recommending to build an east-west corridor without analyzing the health, housing and demographic impacts of the project on the neighboring communities can have severe environmental, health and justice implications for the region and particularly for local communities of concern (COC). Additionally, if the east-west corridor project goes forward, an increase in truck traffic per day (from 58,000-78,000) could increase noise pollution and air pollution[20].

The Goods Movement Environmental Strategy and Action Plan schedules full operational deployment of zero and near zero-emissions for trucks in 2018[21]. This plan prematurely predicts that the infrastructure, market and technology will be available for use without taking into consideration funding shortfalls and without putting in place earlier interventions. In the meantime, east-west corridor adjacent communities will be adversely impacted by displacement, or over-burden suffering from adverse health and quality of life impacts associated with the construction of the project and the trucks that will eventually utilize the route. SCAG must go beyond investing in research and guarantee that all lanes classified as zero-emission truck-only lanes only be used by zero-emission trucks.

Before considering adding this project to the RTP/SCS, SCAG must address the following:

1. Provide health and community demographic data on impact on the east-west corridor project. Specifically data that shows potential neighborhoods which may be displaced, noise and air quality impacts on surrounding communities, race, class, socio-economic status of the communities that will be impacted and how many of them are COCs.
2. Develop an analysis of the local roadway systems that trucks will utilize once they have reached their destination.
3. Develop an analysis of the total number of on-ramps and off-ramps planned for the east-west corridor, an approximation of where they will be (i.e. which streets will be used for entering and exiting the east-west corridor), and the configuration/style of each on-ramp and off-ramp.
4. Define the performance measures that would outline how success would be measured for the proposed east-west corridor, including anticipated truck traffic counts.
5. Set outreach and communication guidelines that allow for greater public participation from the general public and pertinent partners and timely feedback to questions asked.
6. Include an outreach and engagement plan that includes impacted COCs, stakeholders and health advocates, as part of the Goods Movement and Environmental Strategy Action Plan.

[19] Pg. 27, GOODS MOVEMENT APPENDIX
[20] Pg. 20, GOODS MOVEMENT APPENDIX
[21] Pg. 21, GOODS MOVEMENT APPENDIX

VII. SCAG Must Support National Efforts to Create a Strategic Plan for the Freight System.

Given the limitations with funding our goods movement and particularly the zero emissions and near zero emissions freight strategy, we encourage SCAG to include language that clarifies the current federal funding constraints and alter the 2012 RTP/SCS to reflect that these revenues are assumed but not assured and are contingent upon passage of the MAP-21 program on page 95 and 100. As a revenue source the inclusion of this funding is still in doubt as the current iteration of the House American Energy and Infrastructure Jobs Act does not include a national freight program or any dedicated freight funding and the establishment of this program is contingent upon a freight program making its way into the final federal transportation reauthorization and that legislation passing through both Senate and House.

SCAG should actively support the passage of a federal freight program that would deliver these revenues and clearly establish improving public health on the freight network and adjacent communities as an overarching priority and goal of the federal freight program, and support the inclusion of Senator Lautenberg's Freight Act of 2011 in the final federal transportation reauthorization with the competitive grant program and the goals and objectives as written. We support the addition of this language as offered by Senator Lautenberg and the inclusion of Senator Lautenberg's FREIGHT Act of 2011(Focusing Resources, Economic Investment, and Guidance to Help Transportation) in the Commerce Committee bill S. 1950 the Commercial Motor Vehicle Safety Enhancement Act of 2011 which would create a national strategic plan for the freight system, a competitive grant program, and establish clear goals and objectives including reducing emissions, improving safety and efficiency, enhancing economic competitiveness, use of innovative technologies, and improving the state of repair of existing infrastructure.

VIII. The RTP/SCS Must Focus Attention on Cleaning Up Existing Freight Corridors, Not Just the Proposed New Projects.

While we welcome zero emission technology by the year 2035, more short term gains must be implemented. SCAG should incorporate what can be done until a majority of truck traffic is zero or near zero emissions and consider using currently available technology while working to demonstrate future technology applications (such as maglev technology). Additionally, SCAG member governments must include a zero emission corridor from the ports to the ICTF or along Alameda Street and strengthen specific requirements in new projects beyond "bare minimum" standards used in current projects.

IX. The RTP/SCS Must Include Public Health as an Overarching Goal of the Goods Movement Element.

More and more research is associating air pollution with asthma prevalence, poor lung function and a series of other health impacts. The California Air Resources Board states that the "prevalence of asthma in the U.S. has increased by more than 75% since 1980" [22]. Furthermore results from the USC Children's Health Study, a ten year study, show that children in Southern California's more polluted communities "suffer reduced growth of lung function, asthma exacerbations, more school absences, and new onset asthma"[23]. The public health evidence is growing. Our built environment plays a direct impact to our health and the transportation sector must take into consideration the public health implications to the region, and not just the region's economic growth. SCAG must:

[22] California Air Resources Board. Asthma and Air Pollution. http://www.arb.ca.gov/research/asthma/asthma.htm, May 25, 2010.
[23] Hricko, Andrea M. Road to An Unhealthy Future for Southern California's Children. *University of Southern California Urban Initiative, Urban Policy Brief*, 2004.

1. Include public health as an overarching goal in the Goods Movement Element and include performance standards to measure improvements.
2. Include public health as an overarching and priority and goal in the $2.1 billion annual freight program included in the Environment and Public Works Committee.
3. Prioritize spending on projects that deliver maximum health benefits for residents of the region, especially in low income communities of color overburdened by air pollution and higher rates of uninsured residents.

X. Public Participation Failures Must Be Remedied.

Outreach and education to the public, especially on the onset on this process, was not sufficient to ensure that an adequate representation of members from impacted communities participate and give meaningful input. There were not enough public meetings or an adequate outreach strategy to ensure that there was more community involvement in this important process. Furthermore, a Goods Movement Steering Committee was established under SCAG to provide guidance and recommendations to SCAG's 2012 RTP/SCS, however, no formal process was established to receive formal recommendations from this group on the 2012 RTP/SCS.

We commend SCAG for completing the first Sustainable Community Strategy for the region and look forward to working with SCAG to ensure that it truly is a successful SCS by prioritizing health and equity.

If you have any questions about our recommendations, please do not hesitate to contact Patty Ochoa at 213-689-9170 or via email at pochoa@psr-la.org.

The Port of LONG BEACH

February 3, 2012

Ms. Margaret Lin
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

Re: Comments on the Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy

Dear Ms. Lin:

On behalf of the Port of Long Beach, thank you for the opportunity to review and comment on the draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), including the Goods Movement Report contained within the RTP/SCS and the draft Program Environmental Impact Report. In general, we find these reports are well-written and accurate with respect to maritime activities. We would like to offer one minor correction.

Maritime Ports

The statistic for the Ports of Long Beach and Los Angeles in the second paragraph, second sentence of the PEIR on page 3.12-15 is incorrect. The ports of Long Beach and Los Angeles combined are the world's sixth-busiest port complex in 2011 (15.8 million total TEU), after Singapore (23.2 million TEU), Hong Kong (22.4 million), Shanghai (18.1 million) and Shenzhen, China (16.2 million).

As noted in the PEIR, 34% of the jobs in the region depend on the goods movement industry. However, our region, with a combined population over 18 million residents, is bearing the brunt of traffic congestion, safety and air quality impacts. The Port of Long Beach is committed to developing programs that will support the anticipated growth in trade activities with minimum impact on the region's environment. The Port cannot do it alone –

and we stand ready to work with you in implementing programs envisioned in the Regional Transportation Plan/Sustainable Communities Strategy.

Should you have any questions, please feel free to contact me at (562) 283-7180.

Sincerely,

Eric C. Shen, P.E., PTP

Re: Additional Comment on the Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy

Dear Ms. Lin:

In addition to the comment that the Port of Long Beach provided dated February 3, 2012, the Port has one additional comment on the draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

California Coastal Trail

Please revise the map shown as Exhibit 19 to reflect the Coastal Trail route connecting San Pedro and Long Beach via Terminal Island. This is consistent with recent plans to include a Class 1 Bike Path as part of the Gerald Desmond Bridge Replacement Project, including Coastal Commission's condition of approval on the Harbor Development Permit for the project. The Class 1 Bike Path is also consistent with both the cities of Los Angeles and Long Beach Bicycle Master Plans.

Thank you for your consideration of this comment.

Should you have any questions, please feel free to contact me at (562) 283-7180.

Sincerely,

Eric C. Shen, P.E., PTP

Re: Comments on the Draft 2012 RTP/SCS and Draft PEIR

Dear Ms. Lin:

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) and Sustainable Community Strategy (SCS). The Puente-Chino Hills Task Force of the Sierra Club is based in Brea but our members come from the four counties that touch the Puente-Chino Hills. We offer hikes, sponsor educational events and provide input on projects that threaten the biological and recreational integrity of this important region. We are writing to provide comments on the Draft 2012 RTP/SCS and the Draft Program Environmental Impact Report (PEIR).

We are so pleased to see an advanced mitigation component in the Draft 2012 RTP/SCS. This is a remarkable first step to creating a program that thoughtfully mitigates impacts to our natural environment from transportation projects. As you know, Orange County and San Diego have similar programs that have met great success. By incorporating this strategy into your policy document, the many benefits of this large-scale conservation approach will be realized. Thank you for your leadership.

Under the Endangered Species Act, the United States Fish and Wildlife Service have defined critical habitat as areas that support endangered or threatened species that are essential to the species' conservation. The description in the Conservation Planning Policy section (page 76 of the Draft 2012 RTP/SCS) states "large-scale acquisition and management of *critical habitat* to mitigate impacts related to future transportation projects" [emphasis added]. We believe there are other habitat areas in the SCAG region worth considering for acquisition and management and therefore SCAG should not limit the mitigation opportunities to only critical habitat. We suggest expanding the language to incorporate all "important habitat lands."

On page 79 of the Draft 2012 RTP/SCS we were encouraged to see SCAG recognize the benefits of reducing transportation impacts to sensitive lands and encouraging smart land use decisions.

We believe landscape level advanced mitigation will become a statewide planning policy. Planning future transportation projects with a comprehensive mitigation program ensures our open space infrastructure can continue to function and maintain viable habitats, linkages, and species populations in perpetuity. Unfortunately, we noticed the lack of inclusion of wildlife linkages in this section. Orange County's transportation measure language included wildlife linkages and we recommend SCAG include linkages as well.

We appreciate SCAG's effort to create a strategic planning process that would document important conservation lands in the region. We believe there is an important opportunity with this concept to also create a Southern California Greenprint. By completing a Greenprint a comprehensive view of our open space land attributes would be documented. Such attributes include: recreation priorities, agricultural lands, scenic values, historic preservation, and more. A Greenprint would give a more complete picture of both opportunities and challenges, while at the same time respecting property rights.

Thank you for reviewing our comments and we look forward to working with SCAG on the implementation of this policy. Should you need to contact me, I can be reached at (714) 524-7763. In addition, we request to be included on any notifications (electronic or otherwise) about this policy's creation and implementation, please send information to ericsj@mindspring.com.

Sincerely,

Eric Johnson, Chair
Puente-Chino Hills Task Force of the Sierra Club

REALTORS® *Committee on Air Quality*

Carol Banner, Chairman

4101 Sea View Avenue
Los Angeles, CA 90065
323/342-9373

February 13, 2012

Hasan Ikhrata, Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA

Subject: Comment on Draft RTP/SCS and PEIR

Dear Mr. Ikhrata:

The REALTORS Committee on Air Quality is a voluntary coalition of Associations of REALTORS throughout the South Coast Air Basin. On behalf of property owners and the communities we serve, REALTORS are vitally interested in air quality and quality of life issues addressed in the Draft RTP/SCS. To this end, we have reviewed the Draft RTP/SCS and the accompanying Draft Program Environmental Impact Report.

We strenuously oppose SCAG's proposed PEIR mitigation measures PS-91 and PS-92 that would require REALTORS® and escrow officers to enforce energy audits and appliance change-out at the point of sale. These proposals ignore the existing Home Energy Rating System (HERS) program to encourage and incentivize energy efficiency in all homes. Further, we believe that mandating this approach will price many buyers out of home ownership, and will not achieve the desired energy use reductions until long past the Plan horizon of 2035. Our attached comments present information supporting our position, and recommend alternative approaches to upgrading energy features and appliances.

Mitgation Measure Clarification: Two proposed mitigation measures require clarification before the final PEIR is certified in order to insure the most efficient and least economically burdensome approach to improving energy efficiency of existing homes.

Mitigation Measure PS-91 instructs cities and counties to require energy audits when homes are sold. Further, Mitigation Measure PS-92 tells cities and counties to adopt an ordinance requiring energy upgrades at time of property sale. Unfortunately, these measures are not informed by the best information available on motivating the public to

implement energy efficiency features in their homes. California's Home Energy Rating Standards already allow buyers to request an energy audit as part of their home inspection, and energy efficient mortgages provide incentives for such audits. In fact, mandatory point-of-sale programs are the least efficient and least accelerated way to accomplish the goal of energy efficiency, and impose the greatest costs on home owners and home buyers at the most vulnerable point in the transaction.

> **MM-PS91:** Local jurisdictions can and should require the performance of energy audits for residential and commercial buildings prior to completion of sale, and that audit results and information about opportunities for energy efficiency improvements be presented to the buyer.
>
> **MM-PS92:** Local jurisdictions can and should create an outreach and incentive program to promote energy efficiency and conservation in the community, including:
> - Launch an "energy efficiency challenge" campaign for community residents;
> - Implement a low-income weatherization assistance program;
> - Implement conservation campaigns specifically targeted to residents, and separately to businesses;
> - Promote the purchase of Energy Star® appliances, including, where feasible, incentive grants and vouchers;
> - Promote participation in the local "Green Business" program;
> - Distribute free CFL bulbs or other efficiency fixtures to community members;
> - Offer exchange programs for high-energy-use items, such as halogen torchiere lamps;
> - Adopt an ordinance requiring energy upgrades at time of property sale.

Realtors support improving energy efficiency in homes, but we strongly object to this approach for the following reasons:

- **Too Slow.** Point of sale enforcement of energy audits can take more than 25 years to achieve the goal of more efficient homes, given that only a small percentage of existing homes is sold each year – and only if each and every jurisdiction selects this mitigation measure. In an extended slow market like the current one, properties change hands less frequently, which will further delay implementation of energy efficiency through property transfers. Programs that incentize all homes, not just those being sold, to upgrade will be far more effective.

- **Too Late.** Enforcing energy upgrades as part of the escrow process comes too late in the property transfer to introduce a significant appliance removal and replacement or other energy efficiency upgrade. Energy upgrades can cost thousands of dollars, and are not comparable to the most common type of point-of sale improvement: toilet retrofits that cost $100 apiece.

- **Inappropriately Shifts Responsibility.** Point of sale enforcement shifts the responsibility for enforcement to real estate professionals. REALTORS®,

brokers, escrow officers, home inspectors, appraisers and others in the real estate industry are not accountable to local jurisdictions, and have no certification in energy efficiency or appliance operation or installation. If carried out as proposed, local point of sale ordinances and enforcement could impose new legal liabilities on real estate industry professionals that to do not relate to their expertise or function in property sales.

- **Incomplete Coverage.** Positioning REALTORS® as gatekeepers for energy audits and appliance upgrades would not reach all home sales or property transfers. In the first place, not all lead agencies may select this mitigation measure. Even if selected, not all homes buyers opt for a home inspection. Further, not all property sales or transfers are handled by REALTORS® or real estate licensees.

- **Increased Home Prices Disqualify Potential Home Buyers.** Increased home costs due to energy upgrades at the point of sale will price more households out of affording a home. These well-intentioned but misguided measures could prevent thousands of home buyers from completing a home purchase.

Recommended Revision: For all these reasons, PS-91 and PS-92 should be revised to implement energy audits and appliance upgrades on a broad, ongoing basis through utility incentives, subsidies, tax credits and other proven mechanisms effective in motivating property owners to accomplish energy upgrades. If these measures remain in the document, we recommend the following language for the final PEIR:

MM-PS91: Local jurisdictions can and should work with utilities to incentivize ~~require~~ the performance of energy audits for residential and commercial buildings ~~prior to completon of sale, and that audit results and information about opportunities for energy efficiency improvements be presented to the buyer.~~

MM-PS92: Local jurisdictions can and should create an outreach and incentive program to promote energy efficiency and conservation in the community, including:

- Launch an "energy efficiency challenge" campaign for community residents;
- Implement a low-income weatherization assistance program;
- Implement conservation campaigns specifically targeted to residents, and separately to businesses;
- Promote the purchase of Energy Star® appliances, including, where feasible, incentive grants and vouchers;
- Promote participation in the local "Green Business" program;
- Distribute free CFL bulbs or other efficiency fixtures to community members;
- Offer exchange programs for high-energy-use items, such as halogen torchiere lamps;
- ~~Adopt an ordinance requiring energy upgrades at time of property sale.~~

Separate Mitigation from Advice. We also note that the voluminous mitigation measures aimed at local jurisdictions and project sponsors – both outside SCAG's authority – place a counterproductive burden on new housing needed to expand and

refresh our housing supply. The measures will reduce housing opportunities because they impose significant new implementation costs that will be passed on to homebuyers; impose new fees and taxes above and beyond the cost of the plan identified in the Draft RTP/SCS; and are so numerous that an individual project cannot feasibly address all of them even though the PEIR deems them "feasible."

Recommended Revision: We urge SCAG to remedy these problems by restricting mitigation measures to those things that SCAG itself can implement. All other advice to cities, counties and project sponsors on best practices should be labeled as such.

Comments on the Draft RTP/SCS. The RCAQ finds that the Draft Plan does not discuss or quantify the impact of the Plan on the affordability and availability of housing in the region. This information is of the utmost importance to the public and to elected officials in order to understand the consequences of increased infill development, density, open space preservation and other proposals in the Draft Plan that will change the size, type, cost and distribution of housing in the region. The impact that these strategies will have on housing affordability, and home ownership rates must be explained. At present, the Draft Plan discusses the changing population composition and a shift to multifamily housing in only the most general terms. The Scenario Outcomes on page 116 look at energy costs and water cost – but fail to examine housing costs. The Economic Impact Technical Report is silent on the housing cost and affordability impacts of the proposed major shifts in the housing supply.

Recommended Revision: We request that the final Plan include a discussion in the SCS chapter that both qualitatively and quantitatively summarizes the proposed plan's impact on housing cost and affordability.

Thank you for clarifying these matters in the PEIR and the Plan prior to certification and adoption. We are available to answer any questions you may have regarding these requested revisions. Please contact me at carolabanner@gmail.com.

Sincerely,

Carol Banner

Re: Comments on Draft 2012-2035 Draft RTP/SCS

Dear Ms. Lin:

Thank you for the opportunity to comment on SCAG's Draft 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy ("Draft RTP/SCS" or "SCS"). We understand that this is an enormous undertaking and appreciate SCAG's efforts in this process. We look forward to playing a constructive role in the further development of the SCS.

As explained below, we are concerned that the draft RTP/SCS as proposed would result in an inappropriate use of the regional growth forecast planning effort to encroach on local land use authority and jurisdiction. We therefore request that SCAG (1) extend the comment period and make transportation analysis zone (TAZ) data available for public review and comment; (2) correct the TAZ data and maps to accurately reflect current local planning decisions including entitled projects; and (3) revise the SCS so that consistency determinations are made not at the small-scale scale level of a TAZ, but at the jurisdictional level to allow reasonable flexibility and appropriate land use decision making authority at the local level.

1. The SCS does not appear to account for projects already in process

Regent Properties owns over 1,000 acres of land in Southern California and controls an additional 2,500 acres of land in Southern California and has a long history of quality developments in the SCAG region. However, we are concerned that the SCS process has not fully accounted for projects that are already in process. Regent has several projects in the area that are fully entitled and approved for build-out, as well as proposed projects with pending applications that represent a substantial investment of resources to design, plan and communicate with the community and responsible agencies. While the SCS itself states that it was created with input from local jurisdictions (see, for example, Draft RTP/SCS p. 111), we are concerned that the growth projections contained in the SCS and Land Use Pattern Maps do not in fact reflect the land use decisions that have been made by local jurisdictions. More specifically, while the Draft RTP/SCS indicates that it has shifted projected densities from less developed areas to the urbanized core, nowhere does the SCS clearly state that those shifts in density take into account development projects that are either already approved or that are reasonably foreseeable projects which local jurisdictions have already spent considerable resources processing.

11990 San Vicente Boulevard · Suite 200 · Los Angeles CA 90049 · 310.806.9888 · Fax 310.806.9801 · E-mail JeffDinkin@regentproperties.com

2. Underlying TAZ data must be released to allow meaningful public comment

Moreover, the SCS's treatment of approved projects is impossible to determine from the information that SCAG has made available to the public. The 2035 Land Use Pattern Maps, which are intended to depict projected density and land use, are at such a large scale, with such slight color gradations, that they cannot be interpreted in any meaningful way. The SCS itself does not seem to contemplate that these maps will be important to future transportation and land use decisions. Instead, the SCS focuses on the projected density contained in the data that underlies the maps -- data that SCAG has not released to the public. The SCS states that the land use projections contained in the SCS are based on the distribution of growth forecast data to transportation analysis zones. (RTP/SCS, p. 122.) According to the SCS, the TAZ data contains forecasted housing, population, and employment data, which the SCS used to create "Community Types" and more refined "Development Types" that contain average use designations, densities, and building intensities. The SCS states that a Development Type, including an average residential density, has been assigned to each TAZ for purposes of creating the SCS. (Draft RTP/SCS, p. 123.) However, it cannot be determined whether this assignment was made in a manner that takes existing conditions (including approved and reasonably foreseeable projects) as a baseline for these projections, nor can it be determined how the forecasting was done or how it was distributed across the TAZ.

Despite the critical role of the TAZ data in developing the SCS, we are not aware that SCAG has made this data available for public review and comment in any meaningful way. We were able to obtain partial data, showing housing densities only, from other agencies involved in the SCS process. These data do not contain employment or population forecasts, and do not contain any Community Type or Development Type designations which, according to the SCS, have been assigned to each TAZ. It is not possible for the public to provide meaningful comment on the SCS without access to the underlying data on which density and land use projections are based. In the absence of the underlying data and modeling supporting the proposed plan, we are substantially impaired in our ability to provide meaningful public comment on the technical and legal adequacy of the plan. In particular, we cannot assess whether the underlying data adequately reflects all developments as approved. Under the federal (5 U.S.C. § 500 *et. seq.*) and California Administrative Procedures Acts (Gov. Code §§11340 *et seq.*, including § 11346.2(b)(6)), the opportunity for public comment must include disclosure of the data and technical studies in time to provide meaningful public comment. *See, e.g. Solite Corp. v. EPA*, 952 F.2d 473, 484 (D.C.Cir.1991) (per curiam).

While we are not confident that the data is either accurate or complete, we have reviewed what data we were able to obtain. Based on our review we conclude that the forecasted housing densities do need to be corrected, as the numbers clearly do not reflect either existing entitlements or pending, reasonably foreseeable projects.

3. Implications of consistency with underlying TAZ data

The importance of the TAZ data is not limited to understanding how the SCS was created. In addition to being the basis for creation of the SCS land use projections, according to the SCS, the TAZ data is to be relied on in future determinations as to whether a project is consistent with the SCS. The SCS states:

"SCAG suggests that utilizing community types at the TAZ level of geography (which an average size of 160 square acres) offers local jurisdictions adequate information and flexibility to make appropriate consistency findings for projects to be eligible to receive CEQA streamlining benefits." (Draft RTP/SCS p. 122.)

"One way of determining consistency [with the SCS] is if a proposed residential/mixed use or TPP [Transit Priority Project] conforms with the Development Type designated for a TAZ." (Draft RTP/SCS, page 148.)

Despite these explicit statements that the existing TAZ data will be critically important to future decisions affecting projects, SCAG has not provided the public the opportunity to review and comment on the TAZ data in any meaningful way.

Significantly, a project's consistency with the SCS -- which is to be determined at the TAZ level according to the SCS -- affects not only the availability of CEQA streamlining incentives, but can have adverse consequences for the availability of federal funds for transit improvements that would serve the project. Transit improvement projects relying on federal funding must be consistent with an approved RTP, and with the adoption of SB 375, that includes consistency with the Sustainable Communities Strategy portion of the RTP as well. (40 CFR 93.102; 42 U.S.C. 7506.) Thus, if the Draft RTP/SCS has shifted density away from approved or pending projects, those projects stand to lose critical transit improvements. The loss of transit improvements could impair project feasibility, or create new unmitigated impacts if traffic mitigations become unfunded, which could result in an unlawful taking of private vested property rights for those projects that have already been approved by local jurisdictions. In many cases, approved projects also involve executed development agreements, which means that violation of contractual rights could also result, causing difficult situations for developers and local jurisdictions.

We are concerned that a project's inconsistency with the growth projections contained in the SCS may have broader implications as well. Local jurisdictions will be under considerable pressure to conform their general plans to the density, intensity, and land uses contained in the SCS, or risk losing transportation funding throughout their jurisdictions. While all the implications of a project's inconsistency with the SCS have yet to be determined, we are concerned that by shifting density away from locally approved and pending projects, the SCS is creating land use policy in violation of SB 375's mandate that the SCS must not supersede the land use authority of cities and counties. (Gov't Code 65080(b)(2)(J).)

4. RTP/SCS consistency should be determined at the jurisdictional level.

The TAZ maps are a modeling tool for engaging in a regional planning and evaluation process. The feasibility of achieving the precise results in any particular TAZ area has not been evaluated or confirmed by any city council or board of supervisors, and as explained above it appears that the TAZ data and maps for 2035 do deviate from general plans and vested entitlements that have been approved by these elected officials. While we understand elected bodies or senior administrative staffs of local jurisdictions may have approved local input for the overall population and household numbers within their respective jurisdictions, we believe they have not approved the TAZ data or maps. Accordingly, requiring consistency determinations

concerning use designations, density, and building intensity at the small scale of each TAZ would be inappropriate and overly-prescriptive.

Again, SB 375 specifically precludes SCAG from interfering with local land use decisions.[1] SB 375 requires that an SCS "identify the *general* location of uses, residential densities, and building intensities *within the region*...." Calif. Government Code § 65080(b)(2)(B)(i) (emphasis added). Thus there is no legislative mandate that SCAG identify the location of land uses, densities and building intensities within the region more precisely down to a TAZ level. Instead, SCAG should appropriately identify these characteristics at a level consistent with the need for reasonable flexibility and local control. At the lowest, the level of comparison should be at a jurisdictional level – particularly given that there are nearly 200 jurisdictions within the SCAG region. Accordingly, we urge SCAG to identify such characteristics at no finer a scale than at the lesser of (i) the jurisdiction, and (ii) the sub-region (i.e., where unincorporated county land is divided into sub-regions).

Despite SB 375's mandate that the SCS not regulate land use, the draft RTP/SCS "shifts" households "from the periphery into the urbanized core" stating that much of this shift "will occur naturally in the marketplace," and that this "shift" was done "per consultation with the local jurisdictions." (Draft RTP/SCS p. 128.) However, this shift does not "occur naturally," nor through a "consultation" process between agency staff that excludes the public. Instead, such a shift can only occur, if at all, as part of a separate and lengthy discretionary development application process involving requests to local land use jurisdictions to amend their general plans, specific plans, areas plans, and zoning. In short, there is no "shift" to high-density housing in some local jurisdictions, and away from housing density already approved by other jurisdictions, unless and until the local land use jurisdictions adopt the requested discretionary approvals.

4. Conclusion

The draft RTP/SCS represents a substantial and important regional planning effort. We believe the current draft needs to be corrected to reflect current local land use planning decisions,

---

[1] SB 375 provides in pertinent part:

- "Neither a sustainable communities strategy nor an alternative planning strategy regulates the use of land . . . "
- "Nothing in this section shall be interpreted as superseding the exercise of the land use authorities of cities and counties within the region."
- "Nothing in this section shall be interpreted to authorize the abrogation of any vested right whether created by statute or by common law."
- "Nothing in this section shall require a city's or county's land use policies and regulations, including its general plan, to be consistent with the regional transportation plan . . . ." (Gov't Code section 65080(b)(2)(J)

and to ensure that the regional growth projection process is not implemented in a manner that infringes on either vested property rights or the land use authority of local jurisdictions. We appreciate SCAG's consideration of the comments provided in this letter and look forward to your responses. If you should have any questions, please do not hesitate to contact me.

Sincerely,

Regent Properties, LLC

Riverside County
Community Health Agency
Department of Public Health

Susan D. Harrington, M.S., R.D.
Director

February 14, 2012

President Pam O'Connor and Members
Southern California Association of Governments
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Dear President O'Connor and Regional Council Members:

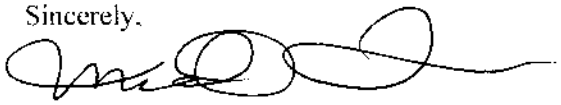
The Riverside County Department of Public Health thanks the Southern California Association of Governments (SCAG) staff for their hard work on the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and for recognizing that the decisions made in the planning process ultimately affect Public Health. While we believe the draft plan under review has many positive elements, we also believe strengthening measures are needed to assure that strong public health benefits are achieved through the plan.

The serious air pollution and health problems experienced in the Southern California region require strong action to transform transportation and land use planning. The Los Angeles region continues to be rated as the most polluted area for ozone in the country by the American Lung Association and the public health toll remains high. The Inland Empire continues to bear the brunt of this pollution due to weather patterns that concentrate pollution in the area leading to more severe health impacts.

The research by the American Lung Association in California shows that the six-county Southern California region could avoid over $16 billion in cumulative health and societal costs through smart growth strategies that reduce the growth in the region's vehicle trips by 20 percent by 2035.

We offer the following comments and recommendations to ensure that the Sustainable Communities Strategy and future transportation investments place sufficient emphasis on promoting active transportation modes and transit oriented development, measuring and improving health progress, and ensuring that health and equity are imbedded in the decision making process for this plan and future planning efforts.

Key Health Recommendations for SCAG SCS



- **Improve Assessment of health benefits through new modeling approaches.** Utilize the new California Department of Public Health I-THIM screening tool to analyze the potential chronic disease reductions that can be achieved in the SCAG region based on increased transportation-related physical activity such as walking and biking. This model was used in the San Francisco Bay Area region to determine reductions in heart and respiratory disease, breast cancer and other health effects linked to active transportation scenarios. We urge SCAG to incorporate this tool in regional planning and decision making for transportation investments.
- In addition to monitoring premature mortality, SCAG should also assess reductions in asthma incidence and exacerbations due to traffic related pollution (NOX) and other targets through collaboration with local health departments, the South Coast Air Quality

Management District, academic researchers and community based organizations. Improvements to the targets should be monitored and reported to the public every two years.

- **Focus investments on completing transit systems** and building out transit infrastructure, rather than highway expansion, including the following:
    - Doubling Metrolink ridership by 2020 and double it again by 2035
    - Expanding Bus Rapid Transit and regional bus service
    - Enhancing TOD planning and 1st-mile-last-mile investments near Metrolink stations
    - Doubling the bicycle network to 24,000 miles and improving pedestrian environment
- **Increase transit and transit oriented planning in Inland Empire.** Because so much of the planned growth in the Inland Empire is relatively low density and remote from transit, SCAG should work closely with Inland Empire governments to accelerate expansion and frequency of transit and rail to the area and focus more growth around transit corridors.
- **Front load active transportation funding.** SCAG should commit to a higher amount of transportation funding for bike and pedestrian infrastructure, especially in the early years of the 25-year RTP process. SCAG should work with local transportation agencies to prioritize bicycle and pedestrian projects and ensure the majority of funds are spent prior to 2020.
- **Increase investments in zero emission freight transportation** in order to reduce diesel emissions and exposures in communities near freight corridors and rail yards. Ensure that funding mechanisms are in place to expedite the implementation of the zero and near-zero emission freight and truck strategies and infrastructure. Prioritize spending on projects that deliver maximum health benefits for residents of the region, especially those living along the freight corridor.
- **Evaluate the number and type of new developments** that could be located in close proximity to freeways and high traffic roadways in the SCAG region under the new RTP. Work with air district, health departments and universities to develop and implement best practice policies for developments located near heavy traffic areas to reduce exposures to air pollution.

We appreciate the opportunity to be part of the RTP/SCS process and look forward to working with SCAG in the future. If you have any questions regarding this letter, please contact me at 951-358-5074 or email mosur@rivcocha.org

Sincerely,

Michael Osur,
Deputy Director of Public Health

Mr. Jacob Lieb
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

RE: Southern California Association of Governments (SCAG) – Draft Regional Transportation Plan/Sustainable Communities Strategy 2012-2035 (RTP/SCS 2012) and Draft Program Environmental Impact Report (PEIR) (SCH# 2011051018)

The County of Riverside Planning Department ("Planning Department") appreciates the opportunity to comment on the draft 2012 RTP/SCS and the associated draft PEIR. The Planning Department supports the approach of resolving future challenges based on the economy, transportation, and land use. We recognize and understand the challenges that the region has been facing and will continue to face in regard to growth and development.

SCAG is already home to 18 million people, and it is anticipated that the region will add 4 million people by 2035. From the County's perspective, it is important to note that the trend of such tremendous growth did not and will not occur evenly across the SCAG region. Much of the recent growth has occurred and projected growth will occur within the Inland Empire area, especially in Riverside County. According to the latest census, Riverside County was the fastest growing county in California between 2000 and 2010 both in absolute numbers (644,254) and in percentages (41.7%). This accounts for almost 20 percent of total growth in California. Similarly, over 20 percent of the regions household growth between 2014 and 2021 is projected to occur in Riverside County.

Nevertheless, many of the strategies and mitigation measures identified in the plan as well as in the PEIR should be refined to meet the individual needs of the counties within the SCAG region and account for the growth trends of the region. Because SCAG is a regional entity, Riverside County understands the difficulty of tailoring the proposed mitigations and policies to be specific to certain geographic locations, but having many blanket implementation measures without consideration of each local jurisdiction also leaves the assurance of the document implementation to be much desired when feasibility is concerned.

The Planning Department has the following comments:

1. Land Use

One of the biggest changes in the RTP/SCS 2012 is its emphasis on higher density residential development and its concentration within the High Quality Transit Areas (HQTA) to accommodate the changing demand in types of housing. To a certain extent, this is true on a regional level; however, the trend is not necessarily mutual when each area is separated out of the SCAG region. Inland counties

still see the demand for single family housing, and when the economy rebounds, the County of Riverside still plans on managing the growth of the single family housing market through its General Plan. SCAG should address the fact that growth is still occurring in the Inland counties as evidenced by the recent census. Table 4, 8, 10, and 11 of the RTP Growth Forecast shows the past, current and forecasted trends for each county in the region.

> Example: Riverside County's share of regional population in 1990 was 8%, in 2000 it grew to be 9.4%, and then 12.1% in 2010. Even with SCAG assumptions shown in Table 8 of the Growth Forecast, the share of the population for Riverside County grows to 15% by 2035 equaling that of Orange County. In contrast, the share of population in Los Angeles County diminishes to 51% from 54% and employment to 51% from 57% by 2035. Riverside County would like to compare the projection numbers of 2020 and 2035 with SCAG's growth forecasts. Riverside County population projections of 2010 is 2,153,189 and 2035 is 3,396,287.

Using the example above, an inferred conclusion can be made that SCAG's HQTA designations for 2035 (Exhibit 4.13 to 4.19) do not accurately reflect the population and employment trends shown in Table 8. It appears that HQTAs were designated based on existing Transit or Transportation corridors without considering the actual existing and proposed population centers of each jurisdiction in Riverside County. When HQTAs are compared together amongst all six counties, as in Exhibit 4.13, the share of HQTAs clearly do not show the 15% population share that Riverside County represents in 2035. Also, questions can be raised as to why Riverside County HQTAs do not connect to any of the surrounding counties such as San Diego County.

In addition, when city boundaries are overlaid on top of Exhibit 4.18 (see handout 1), the unincorporated section of the County contains only one corridor with an HQTA on I-15 in Temescal Canyon. Currently, the unincorporated County has 355,718 people (excluding Jurupa Valley and Eastvale) and expects a population growth of 704,253 people by 2035, almost doubling the current number. Considering the County forecast and the historical growth trend of Riverside County, SCAG's placements of HQTAs become more questionable. How was SCAG able to redistribute 51 percent of the new residential growth in the unincorporated Riverside County? From Riverside County's perspective, the placements of the HQTAs are perceived to just be relocation of growth rather than managing growth. Riverside County would benefit greatly if the details of the land use and projection data analysis were shared with the local jurisdictions. Currently, based on the plan and the PEIR, the land use analysis and local inputs on the data incorporations are not clearly outlined.

> Example: PEIR 2.25 states, "The SCS focuses the majority of new housing and job growth in High Quality Transit Areas (HQTA) and other opportunity areas in existing main streets, downtowns, and commercial corridors, resulting in an **improved jobs-housing balance and more opportunity for TOD**." Again, looking at the HQTAs on a macro level, the jobs-housing balance goal may have been achieved based on the provided locations of the HQTAs, but if the HQTAs are separated out by counties, jobs-housing balance cannot be achieved in the Inland Empire region. As stated, "The 2012-2035 RTP/SCS assumes that **51 percent** of new housing developed between 2008 and 2035 will be within HQTAs, along with 53 percent

of new employment growth (compared with 39 and 48 percent, respectively in 2008)." (PEIR p.2-31). As indicated above, if most of the growth is still projected to occur in the Inland Empire region, achieving the goal of locating 51 percent of the new growths in the limited HQTAs in the Inland Empire is not feasible. Creating more urban centers within suburban counties achieve far greater jobs-housing balance than having the employment concentration heavily depend on Orange and Los Angeles Counties.

2. Public Outreach and Data Usage (Land Use and Projections)

Both of the SCAG documents have stated that the outreach efforts have allowed the organization to collect land use data from the local jurisdictions in developing the SCS, especially in Orange County and Los Angeles County (Gateway Cities COG). Riverside County also appreciates many opportunities and discussions on various levels of data sharing with SCAG. In the past, Riverside County has provided SCAG with General Plan Land Use data, Demographics/Socioeconomic data, and Growth Projections data with maps and comment letters on a TAZ level basis. All of these great efforts cannot be recognized if SCAG does not detail how they have incorporated the local jurisdiction inputs into the RTP/SCS and PEIR. Some projection data from SCAG was shared, but the discrepancies between SCAG and Riverside County data was not explained. (see attachment)

Example: SCAG RTP/SCS and PEIR state, "SCAG shall encourage cities and counties in the region to provide SCAG with electronic versions of their most recent general plan (and associated environmental document) and any updates as they are produced" (MM-LU1), and "…Lead and responsible agencies can and should then make any necessary adjustments to the applicable General Plan. Any such identified adjustment shall be communicated to SCAG" (MM-PS11 and PS56). "As a result of this comprehensive and integrated approach, the transportation projects and strategies included in the 2012-2035 RTP/SCS are generally consistent with the county and regional level general plan data available to SCAG." (PEIR 3.8-13) SCAG should work with local jurisdictions to explain how the data provided by various agencies were used in the RTP/SCS, and SCAG also should ask local jurisdictions for interpretation of the provided land use data.

3. Greenhouse Gas (GHG)

In light of recent updates and litigations on the GHG topic, it is a challenge to provide definitive comments. However, one comment is on the analysis conducted by SCAG (Calthorpe) on a per capita basis to meet the less than significant threshold outlined by the SB375. As the PEIR states in p.3.6-19, "…the Plan alone is not intended to meet the AB32 target. By meeting the SB375 targets, the Plan has successfully contributed its share of meeting the objectives of AB32". SCAG's PEIR does not quantify or attempt to meet the AB32 Scoping Plan challenges that most of the local jurisdictions face with their General Plan update processes and development of Climate Action Plans (CAP). Although SCAG correctly concludes Impacts 3.6-1 and 3.6-2 to be significant and unavoidable, as the regional MPO, more efforts should have been made to address the GHG issues outlined in AB32 Scoping Plan through quantifications to assist the local jurisdictions who are struggling with AB32 compliance.

4. Use of Words "should and can" in the PEIR

The PEIR of the RTP/SCS mitigation measures contain the phrase "…should and can…". Such terms are not typically used in EIR documents to implement mitigation measures, especially when the measures are directed at another project proponents like the local jurisdictions. SCAG should provide more accurate information on the intent of the phrase "…should and can…" usage as well as obtaining opinion on its legal meaning. Currently, as it stands, it is perceived to convey a message that local jurisdictions are able to deliver on the implementation of the measures and that it must be completed as noted in the PEIR.

> Example: RTP p.81 "Encourage cities and counties to update their general plans and provide the most recent plans to SCAG" vs. PEIR p.ES-37 "**MM-LU16:** Local jurisdictions can and should seek funding to prepare specific plans and related environmental documents to facilitate mixed-use development at selected sites, and to allow these areas to serve as receiver sites for transfer of development rights away from environmentally sensitive lands and rural areas outside established urban growth boundaries."

In MM-LU16, SCAG does not have the enforcement ability to direct local jurisdictions to seek funding for mixed-use planning and development, especially when the measure is directing the implementing agencies to implement a planning concept that is exceptionally difficult to implement in areas such as Riverside County. ("transfer of development rights" (TDRs) and "urban growth boundaries") Measures identified in the PEIR must be appropriate, feasible, enforceable, and implementable by the suggested responsible agencies. It is recommended that the words "…should and can…" be replaced with language that suggests that the mitigation measures should be considered where appropriate and possible. If this language is not changed, then it is suggested that SCAG seek legal opinion on whether effected entities are legally obligated to implement the mitigation measures.

5. Geographic Feasibility

While producing the RTP/SCS and PEIR is a massive effort due to the sheer size of the region that SCAG covers (38,000 sq. mi.), some geographically specific details should be available to the local jurisdictions that it impacts. In fact, because of the size and diversity of the region, SCAG should detail some aspects of the plan, analysis, and mitigation measures to target specific locations. It is correct that CEQA Guidelines 15152(c) does state that lead agency can defer the project-specific CEQA analysis for large plans like General Plans and RTPs (PEIR p.1-2); however, some sub-regional categorical analysis and mitigation measures are clearly necessary due to the "very complicated and highly diverse" nature of the region. (PEIR p.1-2) SCAG, as a regional entity, should not be oversimplifying the plan that leaves the local implementing agencies questioning details.

6. Growth Forecast

Growth forecasts at the jurisdictional level were approved by the Riverside County Board of Supervisors, the CVAG and WRCOG Executive Committees and were transmitted to SCAG in 2010. Subsequent to these policy level actions, County staff provided SCAG staff detailed growth forecast at the TAZ level. WRCOG did approve revised forecasts for the jurisdictions within its subregion and

SCAG staff did adjust the forecasts for the Cities of Hemet, Menifee, and San Jacinto. The growth distribution of households and employment utilized in the RTP/SCS are not consistent with the TAZ level data provided to SCAG staff. It is therefore recommended that the growth forecasts are not approved at the TAZ level. It is further recommended that no findings of consistency and conformity, recommendations on the placement of infrastructure, or recommended funding be based on the TAZ level forecast used in the RTP/SCS plan. From the perspective of local jurisdiction, it is alarming and disconcerting to find that the data provided to SCAG can be modified without adequate methodologies or explanations.

7. Financial Plans

"One of the most critical elements of the RTP/SCS is the financial plan. The RTP is required to be financially constrained, meaning that project costs must be matched with "reasonably available" revenues." Riverside County agrees with other COG comments on the Financial Plans of the RTP/SCS. There are some innovative funding mechanisms identified in the plan (Table 3.3 and 3.4.4), however, once again, the feasibility of the revenue identified in the RTP is questionable. In fact, it is very unlikely that much of the new supplemental revenues identified in the plan will materialize. There are no other alternatives identified in the plan that would replace or augment the loss in revenue if the new funding measures fail. Implementation measures on the funding items should be more clearly outlined and planned for the local jurisdictions.

> Examples: 15c per gallon in addition to 18c per gallon current California State gas tax is almost doubling the tax rate. A mileage-based user fees are also identified in the plan that estimates about 5c per mile starting 2025 replacing current gas tax. In addition, the plan identifies E-Commerce Tax, Highway Tolls, and Special Districts.

8. Minor Edits:

> a. RTP p.54: Complete Streets Discussion: "Encourage local jurisdictions to adopt and implement the proposed SCAG Regional Bikeway Network." Riverside County continuously implements and updates its own trails network to create connectivity and accessibility. We would like to find out how SCAG's *Exhibit 2.5 Regional Bicycle Network* was developed before relying on the map provided in the regional plan. Such process should be a "bottom-up" process and not a "top-down" approach.
>
> b. Mitigation measures in the PEIR should not reiterate current existing laws or regulations. Already mandated items cannot be used to further mitigate an impact. e.g. "**MM-CUL5:** As part of the appropriate project/environmental review of individual projects, project sponsors can and should consult with the Native American Heritage Commission (NAHC) to determine whether known sacred sites are in the project area, and identify the Native American(s) to contact to obtain information about the project site." "**MM-HM11:** If asbestos-containing materials (ACM) are found to be present in building materials to be removed project sponsors can and should submit specifications signed by a certified asbestos consultant for the removal, encapsulation, or enclosure of the identified ACM in accordance with all applicable laws and

regulations, including but not necessarily limited to: California Code of Regulations, Title 8; Business and Professions Code; Division 3; California Health & Safety Code Section 25915-25919.7; and other local regulations as applicable." "**MM-TR89:** Vehicle Idling: Local jurisdictions can and should enforce State idling laws for commercial vehicles, including delivery and construction vehicles."

c. *PEIR 3.6 Greenhouse Gas Emissions* (p.3.6-7): "Green Riverside, Green Action Plan" is a plan within the City of Riverside and is not related to what the County is doing on GHG topic. Riverside County is in the process of developing its Climate Action Plan (CAP) and has finished the initial greenhouse gas inventory. Accordingly, County has finished the draft update of the Air Quality Element with draft implementation measures.

d. *PEIR 2.0 Project Description* (p.2-3): Table 2-1 should be showing 2035 projections for population, households, and employment in relation to "project" and "no project", but the actual numbers are identical. It looks like a table formatting mistake.

The Planning Department formally request, pursuant to Public Resources Code Section 21092.5, to continue to be notified and be involved in the CEQA review process of the above referenced project until the adoption of the Final EIR. Further, Riverside County staff is available to work with SCAG to address issues and questions outlined in the comment letter. If you have any questions, please contact Josh Lee at **951-955-6864** or via email at **jlee@rctlma.org**.

Subject: Comments on the Draft 2012 Regional Transportation Plan

Dear Mr. Ikhrata:

Thank you for the opportunity to comment on the Draft 2012 Regional Transportation Plan (RTP) for the Southern California Association of Governments (SCAG) region. This long range transportation plan reflects multimodal transportation projects and programs throughout the vast six county SCAG region including land use, demographic, environmental, and health considerations. The Riverside County Transportation Commission (RCTC) appreciates SCAG's effort in developing this comprehensive document using a bottom-up approach and broadening the public participation opportunities that were made available in developing the Draft 2012 RTP. RCTC also thanks SCAG for supporting county sales tax measure programs and projects in the RTP as this demonstrates a commitment to the voters that our measure programs will be implemented in accordance with the respective county measure ordinances.

RCTC is submitting its formal comments on the RTP and will submit minor comments/clarifications, including changes to the project lists, to reflect the most accurate information via the SCAG website as RCTC was informed the website has been set up specifically to accommodate project list corrections.

RCTC's formal comments are as follows:

Chapter 2, Transportation Investments

Page 41, Congestion Management System

The 2012 RTP Sustainable Communities Strategy (SCS) addresses federal requirements for the Congestion Management System (CMS). Specifically, the RTP SCS component contains Transportation Demand Management strategies, which is a required element for County Congestion Management Programs (CMP) to meet federal CMS guidance. The individual county CMPs, Caltrans CSMPs, and the SCS give the entire picture of the region's TDM efforts. Therefore, RCTC requests the following be removed:

"First, SCAG will incorporate a requirement in the FTIP guidelines that calls for submittal of documentation by the sponsoring agencies associated with significant roadway capacity projects (greater than $50 million) to ensure documentation of all the alternatives considered in defining the project as well as identifying appropriate mitigation that would be implemented in conjunction with the project."

This requirement should also be removed from the FTIP guidelines since a comprehensive view of the regions' TDM projects and programs is clearly highlighted in county CMPs, Caltrans CSMPs, and the RTP SCS.

Page 43, Completing Our System

Table 2.2 Major Highway Completion Projects includes one to two projects per county emphasizing "critical gaps in the network that hinder access to certain parts of the region." The project identified in Riverside County is "CETAP Intercounty Corridor A." RCTC requests that this project be removed from the list and be replaced with the SR-79 realignment (RTP ID# RIV62024), and the I-215 widening project from Scott to Nuevo (RTP ID# RIV070309).

Page 44, Completing Our System

Table 2.3 identifies Major HOV Projects for each county. The I-215 Bi-county project is listed under San Bernardino County from Spruce Street to Orange Show Road. This project is also in Riverside County. RCTC requests that SCAG clarify that the project is in San Bernardino, from Orange Show Road to the Riverside-San Bernardino County line, and in Riverside County from the Riverside-San Bernardino County line to Spruce Street.

Table 2.3 does not include the SR-91 HOV lane project (RTP ID# 010212). RCTC requests that SCAG add this project to the table as it is a major highway project that will begin construction this year and, together with the I-215 Bi-county project, will provide a continuous HOV system from Orange County to San Bernardino County along the SR-91/I-215 corridor.

Page 46, Strategically Expanding Our System

Exhibit 2.1 Major Highway Project - This map highlights highway improvement projects to be implemented by 2035. RCTC requests that the Mid County Parkway (RTP ID# RIV031218) and SR-79 realignment (RTP ID# 62024) be added to the map.

Page 76 – 79, Environmental Mitigation

This section discusses Conservation Planning, Biological Resources and Open Space, Locations for Mitigation, etc. RCTC requests that SCAG include Riverside County's Multiple Species Habitat Conservation Plan (MSHCP) efforts in Western County and Coachella Valley in this section as an example of what counties are doing to mitigate environmental impacts. Information on the Western County MSHCP is available at http://www.wrc-rca.org. Information on the Coachella Valley MSHCP is available at http://www.cvmshcp.org.

Pages 78 - 84, Summary of the Environmental Mitigation Program

This section describes various mitigation programs for: Biological Resources and Open Space, Green House Gas, Air Quality, Transportation and Safety, Population and Housing, Land Use, Aesthetics, Public Services and Utilities, Geology, Soils, and Seismicity, Cultural Resources, Water Resources, Hazardous Materials, and Noise. Under each of these programs is a list of measures using action words such as "coordinating", "minimizing", "identifying", "work with", "encourage", etc. But some of the programs have measures that say "require the project implementation agencies to...." Examples of "require" statements for the public services and utilities program are below:

- Require the project implementation agencies to identify police protection, fire service, emergency medical service, waste collection, and public school needs and coordinate with local officials to ensure that the existing public services would be able to handle the increase in demand for their services; and
- Require the project implementation agencies to identify the locations of existing utility lines, and avoid all known utility lines during construction.

RCTC suggests that SCAG replace the word "require" in each mitigation section with either "encourage" or "support" as SCAG does not have the authority to "require" mitigation measures by agencies outside of its purview. Additionally, this section and the PEIR include mitigation measures that restate existing requirements enforced by other agencies. Therefore, RCTC suggests that such measures do not need to be repeated in this list of mitigation measures. Moreover, mitigation measures in the RTP should be programmatic in nature and not specific to individual projects. Individual project efforts at the local level are already required to comply with all state and federal environmental laws; providing specific mitigation actions in the RTP are redundant and could result in conflicts with project specific environmental approvals for voter approved and other transportation projects.

Chapter 4, Sustainable Communities Strategy

Page 128, Resource Areas and Farmland

This section talks about areas to be protected from development including parklands, open space, natural resource areas, and farmland. It says that "SCAG is also developing a natural lands acquisition and open space conservation strategy to encourage large-scale acquisition and management of critical habitat to mitigate impacts…." RCTC also requests that SCAG mention Riverside County's MSHCP accomplishments in this section.

Page 151, Table 4.4 Transportation Network Actions and Strategies

Another action/strategy listed is "Cooperate with stakeholders, particularly county transportation commissions and Caltrans, to prioritize funding sources for preservation and maintenance of the existing transportation network." RCTC agrees that there is insufficient funding for System Preservation. Each county transportation commission established projects and programs with various ways to fund and implement them. Funding is limited and it would be more beneficial to work with stakeholders in identifying a new funding source or increased funding levels instead of competing with very limited existing fund sources. RCTC suggests that SCAG revise the wording to "…to ~~prioritize~~ **identify new** funding sources **and/or increased funding levels** for preservation and maintenance….. " This recommended change should also be reflected in Chapter 2, Page 39, under System Preservation.

RCTC thanks SCAG staff for their efforts in developing the 2012 Draft RTP for one of the largest areas with the highest population and diverse demographics in the state and nation. The challenges this region faces are plentiful; however, working cooperatively with our transportation partners will allow us to fully meet those challenges.

Sincerely,

Anne Mayer
Executive Director

Per our correspondence to Mr. Ikhrata dated 2/14/2011 regarding the Draft 2012 Regional Transportation Plan (RTP), we would like to request modifications to the draft RTP project list for the following projects:

Page	Agency	RTP ID	Requested Change
Page 238	RCTC	3CR0702	Revise project description to remove PVL station at Hemet Airport and replace with station near new SR-79 alignment and Stetson Rd.
Page 239	RTA	3TC04TR6	Change the project description to "Construct new Hemet Transit Center (with approximately 4 bus bays) in the vicinity of State St and Devonshire Ave near the future courthouse location. Change the project location from Menifee to Hemet. Change the completion year from 2027 to 2015, and update the total project cost from $5,926 to $1,442.
Page 240	RCTC	3C01MA03	Change project description to "CETAP – Riverside County to Orange County – Construct new intercounty transportation Corridor A – 2 toll each dir on new facility parallel to SR-91, from from SR-241 to I-15, with IC at SR-241, SR-71, I-15". Network year remains 2035. Update total project cost to $2,720,000. Move balance of project description "CETAP – Corridor B – 2 toll each dir on new facility from I-15/Mid-County Pkwy to SR-241/SR-133" to Strategic Projects Section.
Page 266	Coachella	3A07094	This is currently programmed as FTIP ID RIV071246. Network year should remain 2018 (previously requested to change to 2020). Update total project cost from $4,853 to $22,290.
New Project	RTA		Regional transit center for mass transit service in central western Riverside County along I-215 corridor. Network year is 2030 and the total project cost is $10M.

We would like to request modifications to the project list that we have submitted to SCAG staff through the standard RTP long-range project list modification and FTIP database update processes:

Major project modifications have been submitted for the following RTP projects:

3A07262	3A01CV068	3TR04C

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

Subject: Comments on the Draft 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy

Dear Mr. Ikhrata:

Thank you for the opportunity to comment on the Draft 2012-2035 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) for the Southern California Association of Governments (SCAG) region. The Riverside Transit Agency (RTA) is submitting formal comments on the Draft RTP/SCS as follows:

- Transportation Investments, Chapter 2, Pages 49 and 50, under Transit Policies, RTA supports the need for increases in state and federal funding for sustaining the operation of transit services and infrastructure including future bus rapid transit and express bus service projects as included in the Draft RTP/SCS. In addition, as our region's population continues to age, increased operational funding support to provide paratransit services will be a continued need moving forward.

- Transportation Investments, Chapter 2, Pages 50 and 51, under Passenger and High-Speed Rail, the RTA requests that short term commuter rail service improvements be made in Riverside County. At this time of record ridership growth on RTA's services, these near term improvements would promote further bus and rail integration resulting in region-wide reductions in congestion due to reduced automobile traffic.

- Transportation Investments, Chapter 2, Page 41, under Transportation Systems Management, the RTA suggests that more emphasis be placed on developing a wider variety of capital funding sources to support and maintain Transit Automatic Vehicle Location (AVL) and Advanced Traveler Information systems. In this time of social media applications, this is highly important in attracting and retaining revenue to support the transit system.

SCAG
FEB 15 2012
MAIL RECEIVED

- With school districts continuing to lose state transportation funding, the RTA will be expected to provide additional service to schools throughout western Riverside County without the provision of additional operating funds. The RTA desires to work closely with SCAG and other regional agencies to develop funding solutions to accommodate this growing trend.

- Ensure modeled RTA transit projects included in the Draft RTP/SCS are accurately depicted based on system-wide high ridership results in 2011, continued reductions in unemployment within western Riverside County and forecasted gas price changes.

The RTA thanks and appreciates SCAG staff for their efforts in coordinating and conducting extensive public outreach meetings while developing the six-county comprehensive Draft RTP/SCS.

Sincerely,

Larry Rubio
Chief Executive Officer

Los Angeles, CA 90017

RE: Active Transportation in SCAG's 2012 Regional Transportation Plan (RTP)

Dear Honorable O'Connor, Regional Council members and Policy Committee members:

On behalf of the Southern California Safe Routes to School Network and the signatory organizations and individuals to this letter, we would like to thank Southern California Association of Governments (SCAG) staff, Regional Council and Policy Committee members for the opportunity to participate in the 2012 Regional Transportation Plan (RTP). We recognize the multitude of efforts required to develop the long range plan and are appreciative of all of the hard work that has already been done.

The Safe Routes to School National Partnership is a national advocacy group representing over 500 organizations and professional groups that works to improve conditions for children to walk and bicycle to school.

Per 2009 National Household Travel Survey, 21 percent of all trips in the SCAG region are currently being done via walking and bicycling. And tragically, per SCAG 2012 Draft RTP, 25 percent of all roadway fatalities in the SCAG region are pedestrians and bicyclists. These are critical and dangerous trends that require our regional leaders to change the way transportation planning has been done for decades in Southern California. We encourage all regional leaders to implement this change starting with the 2012 RTP. The region does not need a plan that allocates $22 billion on road widening and only $6 billion on active transportation. It is imperative to change funding allocations to improve safety and public health throughout our region.

We ask that SCAG amend the Draft RTP/SCS to include the following:

1. Increase the overall percentage of RTP funds dedicated to active transportation from 1.3 percent of the 2012 RTP to 5-8 percent of the total 2012 plan. The request for 5-8 percent reflects the region's current mode split, collision trends, community interest and support, as well as current bicycle and pedestrian planning and implementation requirements, based on projections by the Los Angeles County Department of Public Health (LAC DPH) Methodology (released 12/2011). The LAC DPH determined in a rigorous study that the unmet regional funding need for a walkable and bikeable SCAG Region was close to $40 billion. This represents roughly 8 percent of the total RTP budget, which is significantly larger than SCAG's proposed $6B to address regional needs.

   As local governments contribute resources to the construction of active transportation projects, all other funding sources for active transportation, such as the amount of RTP local (county sales taxes and other local revenues included in the 2012 RTP), state, and federal programing dollars, should be increased to aid these efforts. Additional state and federal funding will help cities do more with their local dollars, especially since often local funding is tied into federal funds.

   As it stands in the draft 2012 RTP, eighty percent of the SCAG funds dedicated to active transportation investments in the 2012 RTP are not programmed until after 2026. Between 2016-2025, the funding for active transportation will be only one-half of the current annual 2012 budget. We encourage SCAG to prioritize active transportation funding and distribute these funds evenly over the 25 year period, which will bring the benefits of active transportation to fruition sooner for all communities.

   While we encourage SCAG to increase funds to support Active Transportation, we recognize the constraints and importance of working with County Transportation Commissions (CTC's) to fast-track active transportation funding. We request the 2012 RTP include development of an Active Transportation Finance Strategic Plan by 2014 that identifies how each CTC is spending funds and the opportunities available for increasing funding for active transportation in each county during the next ten years. This plan ideally is developed by convening a *Regional Active Transportation Early Action Transportation Program* in which SCAG brings together each County Transportation Commission (CTC), elected officials and other stakeholders to discuss and prioritize what each County is doing regarding active transportation and funding areas which may be leveraged for the needed funding, for walking and bicycling and first mile/last mile projects, in the earlier stages of the 2012 RTP. We request that this Early Action Program have be adopted and include a 2014 implementation plan.

   We have seen tremendous - and still growing - support and action from throughout the six-county region calling for policy makers to support and build walkable and bikeable neighborhoods. We encourage SCAG leaders to respond by supporting the impressive efforts underway throughout the region to create healthy and active communities for all.

2. Allocate Funding for Bicycle and Pedestrian Planning and Usage Counts: Improving the walking and biking environments in our region cannot be done without adequate planning at the local level. Unfortunately, many SCAG cities do not have bicycle or pedestrian master plans and project lists; in Los Angeles County, for example, only approximately 11 of 88 cities have bicycle master plans and only 4 cities have pedestrian plans. This lack of planning is a grievous impediment to improving infrastructure for cyclists and pedestrians. In addition, we must increase documentation of bicycle and pedestrian travel usage and demand by regularly assessing numbers of people walking and biking. Without such figures, it is difficult to forecast mode share and usage or measure the positive benefits of investments in these modes.
    - Identify funding sources in order to set aside at least $19M in the 2012 RTP to support SCAG cities in developing bicycle and pedestrian master plans, safe routes to school plans and required, but overdue ADA transition plans. It is estimated that approximately $200,000 per city is required to develop these plans (95 cities at $200,000). Establish a goal of 50 percent of SCAG cities having completed at least one plan by 2016 in order to prepare for the 2016 RTP.
    - Create and fund a regional bicycle and pedestrian count program at SCAG establishing yearly usage counts at key locations in cities throughout the SCAG region. Use the data collected to establish trends, set performance goals, evaluate fund requests for facility improvements, prioritize improvements, and show the impacts of recent improvements. Set aside funds in SCAG's 2012/2013 OWP to create program and maintain this program in future years. (*See links:* Nashville Metropolitan Planning Organization's program, Technical Memorandum on Regional Pedestrian and Bicycle Count Procedures)

3. Adopt a Regional Complete Streets Plan by 2014: This plan will incorporate input from local jurisdictions to prioritize complete streets projects in programing efforts and dedicate a portion of system preservation and maintenance funding for improving the road conditions of all users.

4. Adopt a Safe Routes to School Regional Strategic Plan by 2014: Such a plan would be similar to the plan currently being adopted by SANDAG. In our region 14 percent of all morning congestion is caused by private car drop off at schools (*Traffic Injury Prevention*, August 2011). It is critical that transportation agencies look at the needs of the entire network when planning resource investments. SANDAG's Regional Safe Routes to School Strategic Plan works to establish a critical needs assessment for their Region on how students and their families currently go to and from school, creates data standards and guidelines, considers school siting and closures as possible land use strategies, bridges the gap between transportation planning agencies and school districts, and works to provide much needed technical assistance to local jurisdictions - with skill sets such as how to obligate federal Safe Routes to School funds in a timely manner.

5. School Siting and Joint Use Policies as land use elements of the SCS: School siting can often determine whether or not it is possible for children to walk and bicycle to school.

When schools are placed on the outskirts of urban areas it becomes necessary for children to be driven to school. As noted above, 14 percent of all morning congestion is caused by private car drop off at schools (*Traffic Injury Prevention*, August 2011). Therefore schools should be located within residential neighborhoods whenever possible and equitable to reduce congestion and increase opportunities for bicycling and walking.

Joint Use Policies allow school facilities such as playgrounds and recreational facilities to be used by the community when schools are not in session. This can open up recreational activities in neighborhoods that lack parks and open spaces. When schools are located within neighborhoods, community members can access these locations without the use of a private automobile which can lead to further reductions in congestion.

6. Set measurable safety and health goals for all users: Goals are set for the reduction of green house gases in the draft 2012 RTP/SCS. Active transportation plays a pivotal role in the reduction of these green house gasses. Similar measurable goals should be set for reducing crash rates for active transportation and for reducing the health impacts of obesity. These could include a report on the number of children walking and bicycling to school across the entire region as well as a report detailing access to parks, open spaces and quality active transportation networks.

7. Monitoring detailed population data and metrics in environmental justice communities: The analysis conducted by SCAG in the Environmental Justice Supplementary Report ("EJ Supp. Report") provides detail on existing inequities in all modes of transit, housing, employment, environmental impacts, and health risks. The historical analysis in the Environmental Justice Supplementary Report confirms the challenges faced by the environmental justice population, as defined by SCAG:
    - longer commute times and distances than average,
    - vulnerability to gentrification and displacement from high quality transit areas (HQTA) or transit oriented communities (TOC),
    - higher proportional use of non-automobile travel, such as bus, rail, walk, and bicycle, and growth patterns concentrated within geographies of poor quality transit, lower housing costs, and fewer employment opportunities.

    Concerns arise in the inconsistencies of the environmental justice analysis. SCAG's analysis of travel time and travel distance savings shows "fairly similar and close" rates for all ethnic groups, including non-white Hispanics. Yet, the increase of transportation and infrastructure projects in HQTA/TOC will increase gentrification and displacement of environmental justice populations. The forecasted benefits for environmental justice populations are likely negated or overridden by predicted geographical shifts.

    In order for SCAG to properly mitigate disparities in transportation, housing, and land use impacts in low-income and minority communities, it must monitor population changes by more detailed population segments (i.e. neighborhoods, census tract)

because root factors of inequities play out at these population segments. It is difficult to illustrate short-term impacts and long-term benefits on the environmental justice population without such details. For example, the continued poor job housing fit and balance in the SCAG region leave lower-income populations with no public or active transportation options in their daily commute. Metrics need to demonstrate immediate changes to transportation usage from ticket pricing, placement of rapid bus transit stops in high concentrations of lower-income and elderly groups, and safety programs for walking and bicycling. (see *link*: Health Equity and Prevention Primer, Prevention Institute)

Additionally, SCAG should provide the tools and policies for local jurisdictions to develop strategies to reduce commute distances and relieve sedentary lifestyles for lower income and communities of color. Healthy, sustainable, and accessible place-making is crucial to the environmental justice population because geography and socioeconomic structure are influential predictors of obesity in the United States. Environmental justice populations must be ensured the opportunity to go to school, live, work, and play in all neighborhoods through land use strategies, incentives for businesses and developers, infrastructure and non-infrastructure programming, such as Complete Streets, first/last mile to transit, density bonus, parking reductions, safe and secure bicycle parking and street crossings, and affordable and work force housing in HQTA/TOC. (see *link*: Why Place & Race Matters, Policy Link)

SCAG does not adequately link RTP/SCS active transportation funding to its environmental justice obligations. The lack of active transportation funding disproportionally affects immigrant, lower-income, and minority populations because these neighborhoods have greater barriers to physical activity and transit access, higher numbers of busy regional arterial, poor pedestrian and bicycle infrastructure, unsafe neighborhoods, and lack of safe storage for bicycles and safe crossings. Thus, these neighborhoods would benefit from an increase in funding allocations (in order for SCAG to meet its Title VI obligations) and from a detailed strategic plan. (see *links*: Do All Children Have Places to Be Active, Active Living Research; Low Income Resource Guide, Safe Routes to School National Partnership)

Our policy requests are important commitments for creating robust networks for bicycles and pedestrians in the SCAG region, where walking and bicycling can be enjoyed by all with safety and ease irregardless of age or ability. Compliance with the SCS requirement of SB 375 and the well-being, safety, and health of citizens within the SCAG region will depend on the future development of our multi-modal transportation network, jobs, housing, education and healthy environments for families to live in.

We sincerely appreciate this opportunity to provide feedback for the 2012-2035 draft RTP/SCS. Please feel free to contact us with any questions or concerns; our contact information is listed below.

TRANSPORTATION MEASURE I

- San Bernardino County Transportation Commission
- San Bernardino County Transportation Authority
- San Bernardino County Congestion Management Agency
- Service Authority for Freeway Emergencies

February 14, 2012

Mr. Hasan Ikhrata
Southern California Association of Governments
818 West 7th Street, 12th Floor
Los Angeles, CA 90017-3435

Dear Mr. Ikhrata:

This letter transmits San Bernardino Associated Governments' (SANBAG's) comments on the Southern California Association of Governments' (SCAG's) draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and associated draft Program Environmental Impact Report (PEIR). This is pursuant to SCAG's request for comments, with a closing date of February 14, 2012.

SANBAG recognizes and appreciates the extensive effort and deliberations that went into the RTP/SCS by SCAG staff and policy committees. We recognize that the RTP/SCS has been developed in the context of the largest and most geographically and demographically diverse metropolitan area in the United States, involving a great number of complex and challenging issues. SANBAG commends the efforts of SCAG staff and supports approval of the Plan by the April deadline, with some suggested clarifications. Our comments on the draft RTP/SCS and PEIR are as follows:

1. The RTP/SCS growth forecasts should be adopted at the County-level, not at the city or transportation analysis zone (TAZ) level. SANBAG needs the ability to adapt the forecasts to development trends and new information that will inevitably come to light at the small-area level over the next 4-year RTP/SCS cycle. This is consistent with SCAG's approvals in the past.

2. The growth distribution at the transportation analysis zone (TAZ) level needs to be adjusted to be consistent with the distribution of growth for households and employment being submitted by SANBAG in parallel with the comment letter. The growth distribution is based on the distribution of households and employment previously submitted by SANBAG, together with adjustments for the Plan Alternative of the RTP/SCS. No change is being suggested in the city-level distribution of growth.

3. Please confirm that the East-West Freight Corridor (dedicated truck lanes) will continue from SR-60 northerly on the I-15 and terminate just to the north of I-10, with appropriate connector ramps to and from I-10 east of I-15. This is stated in the text of the draft RTP/SCS, but some of the maps and the transportation model networks are not yet consistent with this.

4. The Program EIR uses the phrase "local jurisdictions can and should..." or "project sponsors can and should..." in most of the local-level and project-level mitigation measures referenced in the EIR. SANBAG's understanding is that the mitigation measures are designed to provide local jurisdictions and project sponsors with choices, not requirements, as they seek to implement local transportation and development projects in the context of the RTP/SCS goals and objectives. However, CEQA also requires that mitigation measures be feasible and enforceable (CEQA Guidelines Section 15126.4). As drafted with the language "local jurisdictions can and should," the mitigation measures are implied to be feasible and enforceable. Therefore, SANBAG requests the mitigation measures be revised to clarify their intent. SANBAG suggests replacing the wording "local jurisdictions can and should..." or "project sponsors can and should..." with "SCAG shall encourage local jurisdictions to ...." SCAG should continue to play a role of facilitation for local jurisdictions and subregional agencies to build technical expertise, provide grant funds, disseminate information, and coordinate responses to regional issues. These are actions that are under the control of SCAG, the responsible party under CEQA, and can be monitored and enforced.

5. SANBAG recommends that those mitigation measures that are either the same as or similar to an existing regulation simply reference the regulation without restating the contents of the regulation. Local jurisdictions and project sponsors are already responsible for complying with regulations, and restating or paraphrasing a regulation in the PEIR could cause confusion in the future as regulations are modified. A summary of the regulation can be provided as information, but a restatement of the regulation in the PEIR with the "can and should" language may be counterproductive. The PEIR should also be careful to distinguish between guidelines and regulations. These changes will avoid potential future conflicts between a PEIR mitigation measure and an adopted regulation.

We would also like to request the following modifications to the project list, as submitted to SCAG staff through the standard RTP long-range project list modification and FTIP database update processes. These changes have been previously communicated to SCAG staff subsequent to the release of the Draft RTP and are being confirmed below.

Major project modifications include:

- 1830 – I-10 Cedar interchange – Schedule Change
- SBD41339 – I-10 Pepper interchange- Schedule Change
- 200152 – I-15 Arrow Rte. Interchange - Schedule Change
- 0H1300 – I-15 Duncan Canyon Interchange - Schedule Change
- 20061201 – I-15/215 Devore Interchange- Schedule Change
- SBD031279 – I-15 Ranchero Interchange - Schedule Change
- 35556 – I-15 VV-Barstow - Schedule Change
- 200451 – US 395 from I-15 to 1.8 Miles S. of Desert Flower Road – Interim Widening from 2-4 lanes
- 34040 – US 395 Expressway – Widen from 2-4 lanes from High Desert Corridor to Farmington Road
- 981118 – Omnitrans Bus Service - Schedule Change
- 20040804 – Needles – I-40 Connector – Downscope project

Major project deletions/completions include:

- SBD31808 – I-10 Riverside – Completed Project
- 0H930 – I-10 Waterman – Completed Project
- 43320 – I-10 Live Oak – Completed Project
- 47221 – I-15 Etiwanda (rehab. SHOPP) – Completed Project
- 34041 and 34042 – US 395 New Expressway – Deleted Combined Projects
- 4G0117-LR – Safety Upgrade – Milliken Ave. – Delete Project
- 4A07039-LR – Valley from Cherry to Alder (2-4 lanes) – Delete Project
- 4H01011-LR – HOV Connector (I-10/I-15 North to West) – Delete Project
- 4H01010-LR – HOV Connector (I-10/I-15 South to West) – Delete Project
- 4H01009-LR – HOV Connector (I-10/I-215 South to East) – Delete Project

We look forward to a productive discussion of all the comments in the coming weeks and the approval of the RTP/SCS in April.

Sincerely,

Larry McCallon

Re: Comments on the Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy

Dear Director Ikhrata:

SCAG is to be congratulated on the production of this unprecedented draft document that does laudable job of combining a Regional Transportation Plan and the inaugural "Sustainable Communities Strategy."

The San Fernando Valley Council of Governments represents the San Fernando and Santa Clarita valleys, a metropolitan region of over two million—more populous than 15 states, and one of the largest unified regions in the United States. Until now, we have not always had the opportunity to fully participate in SCAG planning activities as a region. We welcome this opportunity.

Because of the shortness of time, we will be unable to submit a full and substantive reply by the end of the public comment period on February 14, 2012. We note that SCAG's regional transportation modeling area covers the Counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. This modeling area is divided into 11,267 Transportation Analysis Zones (TAZs). Unfortunately, the TAZ maps were only made available on January 26th of this year. There has been very little time for meaningful analysis.

The City of Los Angeles and other respondents have noted that the plans tend to be inconsistent with existing Community Plans and General Plans. This could result in confusion, cost and needless litigation. We would like to reserve the opportunity to comment further as the process continues to unfold.

Substantive points have been raised by several credible groups. Given the significance of the RTP/SCS, we must approach this task with care, and the issues raised by SCLC, OCBC and the City of Los Angeles, inter alia, certainly bear further, and more detailed discussion.

Further consideration is needed on "Policies and Principles of a Sound RTP/SCS" as stated:

1. Provides Positive Economic Impacts … A Plan that is pro economic growth and job creation

2. Provides Local Control … A Plan that honors local control and flexibility over land use and transportation

3. Assures New Revenue Sources are Fair, Equitable and Economically Sound

4. Is Balanced and Accountable

5. Is CEQA Compliant and Defensible

6. Provides for CEQA Streamlining and Protects Against CEQA Abuse

As a matter of process, it is recommended as follows:

- Extend the public comment period to allow a more full and fair discussion of the issues.

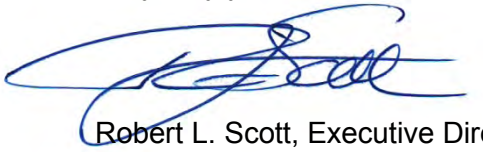
- Create an Issue Matrix of all recommendations to allow easier reference, for discussion and resolution.

- Share the Issue Matrix, including pros and cons with all subregions, COGs, stakeholders and the Regional Council.

- Highlight controversial issues for detailed discussion and consensus building.

- Seek strategies that emphasize empowerment and incentives rather than compliance and regulation.

- Set forth overarching disclaimers [local jurisdictions' reservation of rights] to clarify what the RTP/SCS is not. Focus on the legal implications of the RTP/SCS and PEIR.



- Reconcile reduction in greenhouse gases (GHG) with loss of gas tax revenues.

- Provide outreach and public information that contains standardized references, metrics and common denominators—materials that can be readily understood by local leaders, constituents and the consuming public.

- Emphasize the economic realities of existing transportation systems, and explain the need for, and alternatives for future improvements.

Thank you for the opportunity to provide input on this important process.

Very truly yours,

Robert L. Scott, Executive Director
San Fernando Valley Council of Governments

Re: Draft SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy
San Fernando Valley Green Team Comments

Dear Ms. Lin,

This letter presents our comments on the Draft SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy. The San Fernando Valley Green Team is a non-profit organization made up of business, academic, legal, regulatory, financial, marketing, and government experts and community leaders committed to bringing green practices, jobs and business opportunities to the region. We strongly support the overarching goal of the SCAG 2012-2035 RTP/SCS to reduce Greenhouse Gas (GHG) emissions through transportation and land use planning. We also support strategies that meet this goal while improving regional conditions and quality of life.

It is apparent that a great deal of time and effort have gone into the preparation of the Draft 2012-2035 RTP/SCS and the interactive version provided on the website provides an excellent format for the community to access and comment on the plan. That being said, this is the first time that we are seeing all of this work pulled together and we believe that the public needs more time to effectively comment on the plan. We strongly recommend extending the comment period by 30-60 days.

The following are our initial comments regarding the Draft 2012-2035 RTP/SCS. A more thorough analysis and response will be prepared if the comment period is extended.

1. Increase investment in and give higher priority to mass transit projects, especially local projects that improve the accessibility, frequency, and convenience of public transportation for getting around within and between local cities. As can be seen from the Orange and Red Lines, people will use public transportation that meets these standards. We need more projects that reach more locations. We need to increase the capacity of existing projects, such as the Orange Line, to meet growing demand. And we need to improve access to other projects such as the Red Line.

2. Focus funding for highways and streets on maintenance rather than expansion. It is better to reach our goals through reductions in vehicle miles traveled (VMT) than through expansion of vehicle access. We don't even have enough money to maintain our existing streets and

highways. Why would we add more lane miles to these conditions? Let's focus on improving what we have before building more.

3. Integrate transit stops and bicycle racks/storage with local communities. Consider multi-use parking facilities that accommodate complementary parking needs, such as transit and high density residential. Enhance linkages between transit stops and nearby commercial districts. Considered preferred parking at rail stations for carpool and/or vanpool.

4. Develop tourism and entertainment oriented transit. Provide rail service between cities and tourism destinations with weekend schedules that enable day and weekend trips (i.e., early morning and evening service). Configure bus routes and transit schedules on weekends to connect restaurant and entertainment districts in the City of Los Angeles and enhance these linkages with shuttle and pedicab services between transit stops and entertainment districts, such as between the North Hollywood transit station and the nearby North Hollywood commercial district.

5. Change the mileage based fee for vehicles to a GHG based fee collected as part of the vehicle registration process. Paying this fee as part of registration rather than as fuel taxes, raises individual awareness of vehicle related GHG emissions and the fee can be tiered to further incentivize fuel efficiency and reduced VMT. The fee can be based on vehicle miles traveled times the miles per gallon rating of the vehicle to determine GHG emissions. For many automobiles the actual gas usage is already available in their navigation systems. For others, vehicle mileage can be reported annually and trued up at time of sale.

6. Increase funding for Active Transportation, First Mile/Last Mile, and Transportation Systems Management.

7. Determine the cost effectiveness of high-speed rail relative to GHG reduction, congestion reduction and number of passengers served and compare to the cost-effectiveness of other transit projects. Set a standard for cost-effectiveness and design projects to meet this standard or withhold funding.

8. Set a goal to reduce vehicle miles traveled within the region rather than facilitating driving.

9. Plan for the retention and expansion of manufacturing capabilities in the region. Local manufacturing is a critical component of sustainability. It is essential to providing good paying jobs for skilled workers and supports the regional economy by retaining capital in the community and contributing to a more stable tax base, it reduces GHG emissions resulting from transportation related to importing goods from overseas, it showcases the resources and skills of the region, and it stimulates innovation by providing an outlet for new ideas. The purchase of regional materials/labor is good for the economy and good for the environment. Encourage this type of development by enhancing rail transit to and from local manufacturing centers, protecting industrial areas from encroachment of incompatible land uses and developing strategies to facilitate the growth of sustainable local manufacturing.

The San Fernando Valley Green Team is committed to the economic and environmental sustainability of the region and is looking forward to actively participating in the implementation of the final plan. Thank you for this opportunity to comment.

RE: SCAG's Draft 2012 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS)

Dear Mr. Ikhrata,

At its Governing Board meeting on February 16th, the San Gabriel Valley Council of Governments (SGVCOG) Governing Board adopted a position of "support" for the above mentioned alternative for the SCAG Draft 2012 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS).

The draft RTP/SCS includes four alternatives. The San Gabriel Valley Council of Governments supports Alternative B as this Alternative best addresses future transportation needs and anticipated changes associated with future growth.

Should you have any questions, please contact Nicholas Conway at (626) 457-1800.

Thank you for your consideration.

Sincerely,

Angel Carrillo
President

SAN GABRIEL VALLEY
ECONOMIC PARTNERSHIP

Fostering the success of business to enrich the quality of life in the greater San Gabriel Valley

San Gabriel Valley Economic Partnership Regional Transportation Plan Comments

December 1, 2011

SGVEP applauds the ongoing leadership of the Southern California Association of Governments and the Regional Transportation Plan.

The San Gabriel Valley Economic Partnership would like to make the following comments on the Draft RTP Alternative B.

- The Partnership supports the Gold Line Foothill Extension the Montclair as a part of the RTP constrained plan.

- The Partnership supports the completion of the Alameda Corridor East in the constrained plan.

- America Fast Forward (30/10 initiative) addresses the need for improving the Los Angeles County transportation infrastructure quickly. Specifically, projects that the Partnership continues to support that are included in the 30/10 initiative are the Goldline Eastside Extension SR 60 alignment as well as the Goldline Foothill Extension, and the Regional Connector. We support leveraging the voter approved Measure R funds to complete the above projects in an expedited manner.

- Adding express bus service as a part of the proposed High Occupancy Toll Lanes network is imperative if the project is to be successful. Additionally, we ask SCAG to evaluate the Metro Express Lanes Project before committing to a regional High Occupancy Toll network.

- Addressing increased east west truck traffic in the San Gabriel is important. However, the East West Freight Corridor proposed in the RPT has not had sufficient public input. Many of our member cities are opposed to the project as they understand it today. We ask that SCAG take the time necessary to consult with the community before moving forward.

- The Partnership recognizes that declining gas tax will impact the maintenance of our highway system unless alternative revenue sources are available. We support studying evaluating other revenue options including one based on vehicle miles traveled to replace gas tax. However, we are aware that other agencies are evaluating new transportation fees as well such as the traffic mitigation fee proposed by METRO.

4900 Rivergrade Road, Suite B130, Irwindale, CA 91706 | Phone (626) 856-3400 Fax (626) 856-5115
www.valleyconnect.com | www.VisitSanGabrielValley.com

During these difficult economic times, any new tax or fee could result in additional job loss. Economic impacts need to be considered before asking voters for any additional transportation funding.

- The Partnership supports SCAG evaluating the impact of using funds earmarked for High Speed Rail to improve the current regional Metrolink service.

- Highway 71 in Pomona is a bottle neck point in the San Gabriel Valley. The Partnership supports SCAG in their plan to change the highway from an expressway to a full freeway between I-10 and SR-60 with the addition of 1 mixed flow lane and 1 HOV lane in each direction as part of the constrained plan.

- The Partnership recommends the RTP include carpool lanes on the I-10 Freeway from Route 57 to downtown Los Angeles.

Re: Comments on the Draft 2012 RTP/SCS and Draft PEIR

Dear Ms. Lin:

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) and Sustainable Community Strategy (SCS). The San Gorgonio Chapter – Sierra Club is based in Riverside, California.

Our mission is: To explore, enjoy, and protect the wild places of the earth; To practice and promote the responsible use of the earth's ecosystems and resources;
To educate and enlist humanity to protect and restore the quality of the natural and human environment; and to use all lawful means to carry out these objectives.

Our organization represents approximately 5000 member/residents in San Bernardino and Riverside Counties. We are writing to provide comments on the Draft 2012 RTP/SCS and the Draft Program Environmental Impact Report (PEIR).

We are pleased to see an advanced mitigation component in the Draft 2012 RTP/SCS. This is an excellent first step to creating a program that thoughtfully mitigates impacts to our natural environment from transportation projects. As you know, Orange County and San Diego have similar programs that have met great success. By incorporating this strategy into your policy document, the many benefits of this large-scale conservation approach will be realized. Thank you for your leadership.

Under the Endangered Species Act, the United States Fish and Wildlife Service have defined critical habitat as areas that support endangered or threatened species that are essential to the species' conservation. The description in the Conservation Planning Policy section (page 76 of the Draft 2012 RTP/SCS) states "large-scale acquisition and management of *critical habitat* to mitigate impacts related to future transportation projects" [emphasis added]. We believe there are other habitat areas in the SCAG region worth considering for acquisition and management and therefore SCAG should not limit the mitigation opportunities to only critical habitat. We suggest expanding the language to incorporate all "important habitat lands."

On page 78 of the Draft 2012 RTP/SCS, the document mentions the 2008 Regional Comprehensive Plan that inventoried protected and unprotected areas in relationship to wildlife linkages, linkage designation areas, park and recreation areas. We were pleased that SCAG completed this Plan showing what areas are protected and critical to maintaining functioning habitat reserves. We agree that the planning efforts SCAG undertakes in the future should involve updating the maps, but recommend expanding the language in this section to include all forms of protected lands. By limiting the acquisition and management opportunities of conservation lands to just Natural Communities Conservation Plan (NCCP) or Habitat Conservation Plan (HCP) areas, decisions about priority conservation areas will be misinformed. In fact, it no longer demonstrates a comprehensive plan because of the limited scope (of pre-established mitigation sites, which are likely unrelated to transportation projects). Protected areas (e.g., National Forests, State Parks, Regional Parks, etc.) not in an NCCP/HCP are excluded from the big picture, yet they have extensive benefits to the entire open space system and often times link important habitat areas throughout the region. Consequently, we recommend having this updated map and mitigation site locations expanded to include more than just NCCP/HCP areas and instead include all levels of protected lands (federal, state, regional, and local).

On page 79 of the Draft 2012 RTP/SCS, we were encouraged to see SCAG recognize the benefits of reducing transportation impacts to sensitive lands and encouraging smart land use decisions. We believe landscape level advanced mitigation will become a statewide planning policy. Planning future transportation projects with a comprehensive mitigation program ensures our open space infrastructure can continue to function and maintain viable habitats, linkages, and species populations in perpetuity. Unfortunately, we noticed the lack of inclusion of wildlife linkages in this section. Orange County's transportation measure language included wildlife linkages and we recommend SCAG include linkages as well.

We appreciate SCAG's effort to create a strategic planning process that would document important conservation lands in the region. We believe there is an important opportunity with this concept to also create a Southern California Greenprint. By completing a Greenprint a comprehensive view of our open space land attributes would be documented. Such attributes include: recreation priorities, agricultural lands, scenic values, historic preservation, and more. A Greenprint would give a more complete picture of both opportunities and challenges, while at the same time respecting property rights.

Thank you for reviewing our comments and we look forward to working with SCAG on the implementation of this policy. In addition, we request to be included on any notifications (electronic or otherwise) about this policy's creation and implementation, please send information to kimffloyd@fastmail.fm .

Sincerely,

Kim F. Floyd

Los Angeles, CA 90017

Re: San Manuel Band of Mission Indians – Comments to Draft SCAG 2012-2035 Regional Transportation Plan Sustainable Communities Plan and associated Preliminary Environmental Impact Report

Dear Mr. Lieb:

The San Manuel of Band of Mission Indians ("Tribe"), a federally recognized Tribe, wishes to express its appreciation to the Southern California Association of Governments (SCAG) and Mr. Arnold San Miguel for the February 8, 2012 briefing on the Draft SCAG 2012-2035 Regional Transportation Plan Sustainable Communities Plan (RTP/SCP) and associated Preliminary Environmental Impact Report (PEIR). The Tribe appreciates the opportunity to comment on SCAG's Regional Transportation Plan as San Manuel actively participates in and supports community and regional economic and social initiatives. The Tribe supports long range planning that employs a sustainable-community approach to transportation projects and in land use, open space and preservation of biological and cultural resources. As a Serrano people whose ancestors inhabited a large area of San Bernardino County, the Tribe maintains a close spiritual relationship to many important cultural places in the landscape and feels a keen stewardship for the protection and preservation of these places. It is with this obligation in mind that the Tribe actively engages in consultation and preservation efforts for cultural resources throughout San Bernardino and other Southern California counties.

The Tribe believes that it is essential that SCAG and other regional agencies establish a meaningful and timely consultation process with the Tribe in accordance with the unique legal relationship existing between the United States and Indian Tribal governments set forth in the Constitution of the United States, treaties, statutes, Executive Orders and court decisions and the trust relationship of the United States and Indian tribes. The Tribe looks forward to working with SCAG in order to implement this consultation.

The Tribe's experience has shown that regular and meaningful consultation, including a meaningful and timely process for seeking, discussing and considering carefully the views of others and seeking agreement when possible in a manner that is cognizant of the cultural values and legal rights of all parties is most effective. Moreover, whenever appropriate, the use of "certified Native American monitors" (persons who are certified by a recognized institution to

26569 Community Center Drive • Highland, CA 92346 • Office: (909) 864-8933 • FAX: (909) 864-3370

monitor archaeological resources with specific knowledge in local ancestral California Native American village sites and cultural practices), may prevent costly delays and offer unique opportunities to contribute to all parties' efforts to preserve and promote an important part of cultural history.

The Tribe offers the following comments and language to the 2012-2035 RTP/SCS Draft PEIR 3.4-22 Mitigation Measures, which strengthen the processes for protection of cultural resources:

MM-CUL5. Language added as follows: ....NAHC to determine whether known sacred sites are in the project area and identify the Native American(s) and *Native American tribes (added)* to contact to obtain information about the project site. Add: *It is strongly recommended that federal and state lead agencies and cities and counties require that a check of the NAHC sacred lands files be undertaken in all projects and that the Native American tribes or individuals identified by the NAHC*[G1][AM2] *be contacted by project proponent for further information and consultation on the project.*

MM-CUL6. Add: *It is strongly recommended that state and federal lead agencies and cities and counties require that a qualified archaeologist conduct a record search at the appropriate Information Center in all projects.*

MM-CUL7. *Add: It is strongly recommended that state and federal agencies and cities and counties conduct a phase 1 archaeological or historic architectural survey for all projects that have not been previously surveyed or have been surveyed within the last 10 years.*

MM-CUL-8. Add: *It is strongly recommended that state and federal lead agencies and cities and counties require that a certified Native American monitor be employed by the project proponent or tribe to monitor the subsurface operations or any earth movement in all projects. It is also strongly recommended that a pre-excavation agreement be implemented with culturally affiliated tribes.*

MM-CUL9. *Add: Avoidance is the preferred alternative. If avoidance is not feasible, it is strongly recommended that state and federal lead agencies and cities and counties require that the project sponsors consult with culturally affiliated Native American Tribes in the determination of importance of the resource.*

MM-CUL10. *Add: It is strongly recommended that state and federal lead agencies and cities and counties require that the project sponsors consult with culturally affiliated Native American Tribes in the determination of importance of the resource.*

MM-CUL17: Add: *SCAG shall engage in government-to-government consultation with Indian tribes in development of the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy, per the laws set out in 3.4.-1 – 3.4-5, California Senate Bill 18 (Government Code 65300 et seq) and in accord with the unique legal relationship existing between the United States and Indian Tribal governments set forth in the Constitution of the United States, treaties,*

statutes, Executive Orders and court decisions and the trust relationship of the United States and Indian tribes.

The Tribe appreciates your consideration of the proposed policy language as presented above as well as the opportunity to continue the government-to-government dialogue. Please do not hesitate to contact me if you have any questions.

Very truly yours,

SAN MANUEL BAND OF MISSION INDIANS

Jerry J. Paresa

2012-2035 Regional Transportation Plan and Sustainable Communities Strategy Draft Environmental Impact Report, SCH # 2011051018

Dear Mr. Lieb:

The Santa Monica Mountains Conservancy (Conservancy) is the principal State open space planning agency in Los Angeles and eastern Ventura Counties, comprising a substantial portion of the Southern California Association of Governments (SCAG) region in both land area and population. The Conservancy is primarily concerned with habitat loss resulting from many past decades of urban expansion and therefore promotes compact growth in existing urban areas to minimize future resource loss. Thus, the Conservancy shares many of SCAG's newfound regional objectives and looks forward to shaping growth in Southern California in a more sustainable and land-efficient direction.

The Conservancy's secondary interest is in creating an interconnected network of visitor-serving parkland that provides access to natural areas for all residents within the Conservancy Zone. As such, the Conservancy has a particular focus on multi-benefit projects such as river parkways that serve recreation, transportation, health, and economic development objectives while improving quality of life. The Conservancy is a major funder of revitalization efforts along the Los Angeles River and Ballona Creek. These river and trail corridors deserve a prominent place in regional transportation and land use plans in accordance with their multiple benefits.

The Conservancy has reviewed the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Draft Program Environmental Impact Report (PEIR) and offers the following comments in relation to our planning jurisdiction.

Avoidance of Growth in Resource Areas

The RTP/SCS generally steers growth toward more compact forms in already urbanized areas, making efficient use of existing infrastructure and reducing impacts to resource lands. The policy decisions contained within the SCS are projected to save 408 square miles of nonurban land over the life of the plan. If realized, these gains are certainly an achievement, although there is no projection of where this growth will not occur and what mechanisms will preserve the land in perpetuity.

The lack of specificity makes it difficult for the Conservancy to evaluate the impacts of the proposed plan. While the projections are intended to be a meta-analysis of regional economic trends rather than a location-specific analysis of growth patterns, SCAG is clearly making assumptions about where development on resource lands is and is not appropriate. This process is not transparent. For example, the Regional Housing Needs Assessment (RHNA) assigns population targets for different subareas of the region, which are then used to justify additional development whether or not it is consistent with stated goals to encourage compact development within existing urban areas. Newhall Ranch has used the RHNA targets as the basis for its massive expansion into open space areas west of Santa Clarita, resulting in unmitigable habitat and connectivity loss. At least Newhall Ranch is contiguous with the existing Santa Clarita urban area. SCAG appears to endorse the proposed Centennial development at Tejon Ranch by projecting housing demand in the area--no doubt a self-fulfilling prophecy--despite flagrant inconsistency with SCS objectives. These decisions serve as the basis for urbanization of resource lands, yet are not made in consultation with resource agencies. With the understanding that land use authority belongs to local jurisdictions, a truly comprehensive regional plan would transparently set growth parameters in concert with resource conservation goals to eliminate these apparent contradictions. Projecting growth in resource areas sets in motion policies that induce that growth; therefore great care must be taken to ensure such growth meets regional objectives.

Wildlife Crossings of Transportation Facilities

The Conservancy appreciates SCAG's recognition of the impact that linear transportation facilities have on natural areas and the need for well-designed wildlife crossings to partially mitigate these effects. Wildlife crossings serve two distinct purposes: reducing mortality and preserving genetic connectivity. Roads are the leading direct source of human-caused mortality for most species in Southern California and the entire country. They can become a population sink if a significant fraction of a local species is killed, affecting broader population distribution across the landscape. Additionally, for highly mobile predators,

individuals crossing roads are frequently dispersing from their home range in search of new territory and mates, a vital population dynamic that is devastating if interrupted. National Park Service research has documented significant genetic differences among carnivore populations on either side of the 101 Freeway in the Santa Monica Mountains.

Wildlife crossings need to be discussed in the context of habitat connectivity, which is the broader ecological goal for conservation areas. Wildlife crossings are but one critical tool to ensure that indicator species are able to safely move about their environment. The Conservancy has partnered extensively with the National Parks Service, U.S. Geological Survey, and UCLA to research movement corridors in Southern California, with an emphasis on our core jurisdiction in the Santa Monica Mountains, Simi Hills, Santa Susana Mountains, San Gabriel Mountains, and Verdugo Mountains. While much has been learned about movement patterns in these areas and the way in which key transportation facilities create genetic barriers to connectivity, the measures that might mitigate these impacts have not been thoroughly researched. Wildlife corridor design is a field in its infancy with few scientifically verified best practices for crossing dimensions and landscape features. Given that this research is needed to properly mitigate transportation impacts, SCAG should invest in connectivity research with a program specifically designed to establish measures that can be incorporated into the 2016 RTP revision. Such a program would aggregate existing research, propose new study areas, and develop design best practices specifically tailored to the Southern California eco-region.

Environmental Mitigation Program

SCAG has identified the need for a regional Natural Lands Acquisition and Open Space Conservation Strategy to protect remaining resource lands and mitigate for impacts from transportation improvements. The Conservancy looks forward to working with SCAG on the development of such a strategy. In addition to mitigation banking, transfer of development rights, and payment of in-lieu fees, the Conservancy recognizes conservation easements as a powerful preservation tool for habitat areas. Conservation easements should be listed in the plan alongside the other preservation mechanisms.

The Conservancy has supported the establishment of transfer of development rights (TDR) programs in multiple updated general plans as a potentially useful market-based preservation mechanism that supports regional density goals. SCAG should take a leadership role in setting guidelines and best practices for these new county and municipal programs as well as explore the creation of a regionally unified TDR program.

High Quality Transit Areas and CEQA Streamlining

SB 375 provides that developments that are consistent with the Sustainable Communities Strategy be rewarded with a streamlined CEQA process in order to incentivize dense developments in appropriate locations near transit. While the Conservancy is generally wary of processes that weaken CEQA protections, the law's narrow provisions are appropriate in this instance. However, SCAG's designated High Quality Transit Areas (HQTA) are overly broad with a low threshold of minimum transit service (15-minute frequency only during weekday peak) to qualify for the exemption. This threshold is not sufficient to attract significant mode share that would justify the CEQA exemption, as the off-peak headways in most of these "high quality" areas are likely not adequate to facilitate a car-light lifestyle in most of the designated HQTA corridors.

Of greater concern to the Conservancy, judging from the available HQTA maps, SCAG's methodology appears to reward proximity to transit lines rather than transit stops or stations. This creates absurd outcomes where properties are given an incentive to densify even if they are not serviced by transit or topographically suitable for urban development. Many of the "high quality" lines are actually point-to-point express buses run on the freeways. Within the Conservancy's area of interest, the Sepulveda Pass, Cahuenga Pass, and Conejo Grade corridors fit this description. This methodological problem could be corrected by excluding freeway service (which is not favorable for transit-oriented development anyway) from HQTA designation and by determining the quality of transit based on off-peak frequency, which is a better indicator of whether it supports the intended urban lifestyle.

River Parkways and Active Transportation

As mentioned previously, the Conservancy is interested in urban river projects for their multiple recreational, environmental, and transportation benefits. The RTP/SCS should fully fund build-out of these active transportation corridors throughout the region. When well designed, these facilities serve as "bicycle freeways" connecting various parts of the region with uninterrupted travel for nonmotorized users. For this reason, the Los Angeles River trail featured prominently in the "Carmageddon" race between Jet Blue and a group of elite bicyclists from Burbank to Long Beach. Separated from traffic, such facilities are also inviting for bicyclists of all ages and abilities, which is necessary to attract substantial mode share away from automobiles. The draft Los Angeles County Bicycle Master Plan, among others, calls for build-out of the river trail system and includes preliminary cost estimates.

The RTP/SCS calls for $6 billion over the next two decades for active transportation investments, which seems low when compared to the identified need in local bike and pedestrian plans. Given the central role active transportation plays in meeting regional planning objectives, funding levels should be set based on full build-out of local bicycle and pedestrian plans, with an appropriate amount projected for those jurisdictions that have not yet completed such plans. The currently proposed funding level does not appear to be rooted in such a need-based assessment. It is not adequate to simply compare the proposed expenditures with past levels independent of a needs assessment.

In addition to the total funding level, the proposed timing of active transportation investment is inadequate. Only 20 percent of the proposed expenditures would occur during the first 15 years of the 25-year planning period, leaving the vast majority of expenditures for the highly speculative future and of little use to current residents. Transit and transportation demand management are similarly back-loaded with only highway-related investments receiving funding priority in the near term. These non-highway investments are the ones most likely to generate greenhouse gas emissions savings, among other benefits, and the earlier they are made the longer the benefits can accumulate. The proposed expenditure plan runs directly counter to the stated emphasis of the SCS.

Active transportation projects, including the river parkways, are suffering for lack of funding. The most visionary plans, such as the City's Los Angeles River Revitalization Master Plan, require extensive funding to come to fruition and provide their multiple benefits. Planning is well underway, but capital dollars are in short supply for these projects. Furthermore, achieving greenhouse gas reduction and air quality goals requires early mode shift to maximize cumulative benefits over the life of the plan. The Conservancy suggests that the plan's funding priorities be reversed to immediately fund active transportation investments at a sufficient level to achieve build-out of the region's bicycle and pedestrian networks in the near and medium term. Such a change would make the RTP more consistent with the land use and mode share objectives outlined by the SCS, the intent of SB 375.

Environmental Justice and Public Health

Like SCAG, the Conservancy takes its commitment to environmental justice seriously as a State agency. The Conservancy is therefore delighted to see equal access to parks, one of its core missions, considered as a performance measure for environmental justice. The SCAG model does not currently include programs intended to ameliorate these access issues, such as the Mountains Recreation and Conservation Authority's (MRCA) Transit to Trails

program. Given the inherent remoteness of open space parkland, it is likely infeasible to run regular transit service to most parks. The highly successful Transit to Trails fills this gap, but is perpetually underfunded in comparison to the access demand. Funding for such programs from SCAG transportation funds would be appropriate mitigation for impacts to environmental justice populations.

Part of embracing environmental justice as a core mission includes looking holistically at issues that affect the community. Poor air quality is not the only impact from a transportation system that is overly reliant on cars. Obesity and related illnesses are a direct result from community design that does not allow for safe opportunities to walk and bike for everyday transportation. The RTP/SCS should therefore include obesity-related health outcomes as a performance measure for the regional transportation system. The currently unequal health outcomes will require targeted investments in disadvantaged communities to create active transportation networks that provide access to services, jobs, schools, and parks. River parkways directly address this need by providing bikeways through many of the poorest communities in the region.

Additionally, the safety performance measure appears to discount the health benefits of active transportation while overstating risks. SCAG methodology rewards shifts to "safer" modes, but uses datasets that penalize pedestrians and bicyclists for being hit by cars. This methodology would discourage investments that increase active transportation when it is precisely these investments that address the safety issues faced by those bicycling and walking on public streets. The methodology further does not include the well-documented "safety in numbers" phenomenon that decreases risk for active modes the more people utilize them. Likewise, it does not consider improved public health outcomes that have been calculated to more than offset risk. The poor safety performance of walking and bicycling modes is justification for increasing investment in active transportation, particularly separated facilities for bicyclists.

Comments on Proposed PEIR Mitigation Measures

Biological Resources and Open Space

The PEIR includes many mitigation measures for potential impacts to biological resources. Overall, these measures are comprehensive and based on sound practice. Inclusion of the proposed mitigation measures in project selection and design will greatly improve ecological outcomes in the SCAG region compared to a baseline scenario. The specific measures

calling for minimum mitigation ratios reflect current accepted practices without limiting the discretion of resource agencies to require greater mitigation if warranted.

The proposed measures addressing habitat fragmentation and connectivity are thorough and appropriate (MM-BIO/OS36 through MM-BIO/OS40). These impacts have been all too often unmitigated for transportation projects in the past.

The Conservancy looks forward to collaboration on regional conservation planning policy to address cumulative impacts to biological resources (MM-BIO/OS45). The Conservancy's joint powers partner MRCA administers highly successful restoration and preservation mitigation programs in close coordination with state and federal resource agencies. SCAG's planning and funding expertise is a welcome addition to ongoing efforts. The Conservancy requests an invitation to participate in this process.

The primary impact from transportation facilities is often the indirect and cumulative impact from growth induced by new improvements. As projects increase access and reduce commute times from remote areas, these resource lands become economic to develop. The Conservancy is therefore pleased to see SCAG recognize these impacts and call for their mitigation (MM-BIO/OS47). Without appropriate growth management along transportation corridors, wildlife crossings cannot mitigate connectivity impacts from expanding development footprints. Furthermore, induced growth along new corridors often negates the benefits of new transportation capacity, prompting even greater impacts from future facility expansion. SCAG should develop best practices that would be applicable to new transportation corridors such as the High Desert Corridor to prevent new development from extending into resource lands.

Land Use and Agriculture Resources

As stated previously, the Conservancy is encouraged to see transfer of development rights programs included in the RTP/SCS (MM-LU16). Los Angeles County and several municipalities in the Conservancy's jurisdiction are including programs in their respective general plan updates. SCAG should provide technical assistance and facilitate interjurisdictional transfer programs among member governments as appropriate.

The Conservancy is pleased to see strategic planning that encourages recreational access to natural lands be coupled with efficient land use strategies to preserve these lands (MM-LU25 and 26). Location-efficient and compact development is better for the economy and

environment by reducing infrastructure costs, increasing tax revenues per acre, and reducing consumption of agricultural land and habitat.

Urban growth and service boundaries are a critical tool local jurisdictions have to protect resource areas within greenbelts (MM-LU42). The Conservancy strongly supports efforts by local jurisdictions to establish such policies. SCAG should promote best practices in greenbelt planning and facilitate interjurisdictional collaboration to protect resource areas that separate discrete urban communities. The Conservancy notes that effective policies restrict densities to no more than one dwelling unit per ten acres outside of urban growth boundaries. Densities above this threshold begin to affect resource values, particularly habitat connectivity and sensitive species. One unit per ten acres is an appropriate maximum density to reduce the proliferation of "ranchette" developments that highly fragment habitat in rural areas.

The Conservancy supports using variable development fees as an economic incentive to direct growth to desired areas. In particular, increasing impact fees for development in greenfield areas would recognize the resource impacts of such developments while rewarding new developments that minimize the burden on public infrastructure by locating in existing urban areas (MM-LU81). Such fees would need to be considerable to actually have an effect on land economics at the regional scale. SCAG should undertake an economic analysis to determine what level of fees would be required to achieve regional growth objectives.

Public Services and Utilities

The PEIR lacks a public safety mitigation measure that promotes project design that minimizes urban-wildland interface, which is the source of wildfire risk to persons and property. Past development patterns include long, meandering urban edges with high risk exposure to catastrophic events, causing great strain on local and State firefighting resources largely subsidized by those living in lower risk locations. A mitigation measure should include two components addressing both project location and project design. First, development that extends into high fire hazard areas should be discouraged. Second, there should be an emphasis on utilizing project design strategies to reduce risk, such as building within compact and defensible footprints and minimizing perimeter length. Projects should be sited in order to reduce impacts of required brush clearance on native habitat areas, including adequate buffers to protect sensitive resources from brush clearance impacts. The draft Los Angeles County Significant Ecological Area Ordinance contains model language to this effect.

The Conservancy concurs that project sponsors and local jurisdictions should work to increase public access to open space (MM-PS21 and 26). River parkways and other urban natural parks serve a vital purpose in connecting urban residents to natural parkland (MM-PS22). The City and County of Los Angeles have both recognized these projects in master plans for their respective river corridors. While planning for these projects is the responsibility of local jurisdictions and partners, SCAG has a critical responsibility for funding by including bikeway projects in the RTP.

Regional partnerships are necessary to achieve open space conservation objectives (MM-PS29). The City of Santa Clarita partnered with the Conservancy to form the joint powers Santa Clarita Watershed Recreation and Conservation Authority, an example of the kind of local partnership that should be encouraged throughout the region. The City of Santa Clarita brought to the table a local assessment that can be used for open space acquisitions outside the City boundaries to establish a continuous greenbelt for its residents to enjoy. As previously mentioned, the Conservancy welcomes SCAG's assistance with planning and identifying funding sources for open space acquisition (MM-PS31 and 34). SCAG's participation in coordinating regionally significant trail networks is also appreciated, however the greatest contribution SCAG could make to these efforts would be including those greenways that serve transportation functions, such as the river parkways, in the RTP so that they can be fully developed in the short and medium-term (MM-PS33). SCAG should focus on projects that close gaps in regional networks, such as the bikeway gap from Riverside Drive to Vernon along the Los Angeles River through dowtown, and projects that provide connectivity across jurisdictional boundaries.

Regarding renewable energy development projects in open space areas, the Conservancy concurs that it should be allowable, but with careful attention paid to biological and visual resources to ensure compatibility and minimal impacts (MM-PS98). The constraints analysis approach outlined is an appropriate framework for renewable energy decisions (MM-PS97).

Transportation

As previously mentioned, the Conservancy plays an active role in developing bicycle and pedestrian trails that access parks and open space (MM-TR42). The Conservancy looks forward to SCAG support and urges that ample funding be provided for full build-out of the planned river parkway system, combining transportation and recreation functions to improve the quality of life for Southern California residents. These parkways often connect with schools, parks, libraries, and other community facilities (MM-TR43). Such connections should be enhanced through regular transportation improvements and the development of

regional and local networks of multi-use trails with adequate end-of-trip facilities (MM-TR78).

Water Resources

The Conservancy believes that preservation of remaining riparian resources should be the highest priority at both the regional and project level, followed by restoration of previously impacted areas (MM-W1 and 9). To the extent feasible, natural methods for stormwater control, water quality improvements, and infiltration should be encouraged.

SCAG sets an appropriate standard that new projects should not cause or contribute to conditions that degrade the physical integrity or ecological function of any downstream receiving waters (MM-W22). When evaluating projects during the environmental review process, SCAG should identify regionally significant projects that may impact downstream waters and include comments to that effect in NOP and EIR responses. This is a critical issue wherever natural rivers interact with urban areas, such as the Santa Clarita Valley in the Conservancy's area of interest. Recent approval of the Landmark Village of Newhall Ranch did not meet this standard of ecological sustainability, threatening the natural hydrogeomorphology of the Santa Clara River by elevating the 100-year flood plain and armoring the natural banks along the development's edge. SCAG should participate in the development of models of natural processes for the remaining natural rivers in the SCAG region to ensure that environmental review can comprehensively evaluate project impacts based on the best available information.

Thank you for your consideration of these comments. If you have any questions, please contact Paul Edelman of our staff at (310) 589-3200, ext. 128.

Sincerely,

Elizabeth A. Cheadle

Comments: Telecommuting in the 2012 RTP

Despite its relative low capital cost and high cost-effectiveness, telecommuting remains in 2012 a marginal strategy for reducing GHG emissions and congestion.

The 2012 RTP could lay out the path by which telecommuting could reach its potential, particularly in an RTP with such a gigantic revenue shortfall. But it doesn't.

Table 4.5 of the SCS lists only one specific telecommuting action/strategy, and it will do nothing to change the marginal role of telecommuting over the next 4 years. "Encourage the development of telecommuting programs by employers through review and revision of policies that may discourage alternative work options."

The discussion of Telecommuting/Work-at-Home in the TDM Appendix is equally unhelpful, focusing on barriers to telecommuting and mentioning a few policies to overcome those barriers, none innovative nor likely to make a difference.

One of the basic problems with telecommuting in the 2012 RTP (and previous RTPs) is that the strategy is treated as a member of the TDM family of policies.

However, among all the TDM options, only telecommuting mimics land use. Telecommuting, like other network applications associated with "distributed organizations" (such as tele-medicine, e-retail, distance education, etc), can affect the location of destinations. For example, portions of auto-oriented employment centers can be strategically re-located into walking neighborhoods. In other words, telecommuting can impact the spatial distribution of functionality. It is really a way of implementing "location efficiency."

Beyond that conceptual revision, there are a number of strategic options that should be added to the 2012 RTP.

Goal should be for every employee except for those involving physical materials-handling or other hands-on activity (like truck driving) to expect some to be offered some telecommuting option; with every employer expected to authorize an alternative work site within 4 miles of every eligible employee's home. This is consistent with

existing travel patterns to other destinations; is compatible with short-range electric vehicles; and will reinforce the “neighborhood oriented development” (NOD) strategy.

Four initiatives are required to reach that goal.

1. Regional Telework Facilitator

Public agencies trying to encourage the telework strategy tend to do so through corporate demonstration programs. The AQMD recently funded such a program which is in process today. Demonstration programs have been repeatedly found to produce short term but not long term results. When the funding goes away, the active teleworkers begin to decline back to pre-demonstration levels.

Establishing the institutional infrastructure that will support telework in the long run is the most effective step that could be taken. Similar to the old “Commuter-Computer” for ride sharing, this regional organization would market the telework option (in all of its varieties – home based, satellite, shared work center, network access center, etc.) to employers. Other tasks include maintaining best practices, offering first line technical assistance, and making referrals to implementation consultants.

A five year public commitment would be best, giving the organization the opportunity to develop a business plan in order to continue operating with a minimal public subsidy. Technology firms with products used in telework are good candidates to serve as private partners.

2. Opinion Leaders

Elected officials, public sector executives plus leading private CEOs committing their own organizations to an aggressive telework program is also essential. The organizations and their commitments should have a high profile. The practice should also include the full range of distributed applications such as distance education, telemedicine, e-retail, etc. The Regional Telework Facilitator should organize and maintain this public-private leadership council.

3. Telework Facilities Exchange

The Telework Facilities Exchange (TFX) was a work-station sharing program for government employees that I designed and implement in the mid-1990s, sponsored by the League of California Cities and funded by the SCAQMD. Government employees (city, county, state, federal) were matched to a vacant work station in another government building near their residence. It was, at the time, the largest multi-

jurisdictional telework program in the nation. The planning and advocacy function of the project was the prototype Regional Telework Facilitator.

4. Network Access Centers

Network Access Centers (NAC) are a new type of public facility that will contribute to transportation access, economic development, and education. A NAC is a multi-function, multi-user facility that provides technical assistance, fast network connections, information technology, work stations, meeting space, and special programs that include distance education classes, tele-medicine consultations and so forth. A NAC is essentially a programmable building whose functionality can be changed hour by hour, day by day to satisfy community need for travel.

NACs should be added to transit stops (especially multi-mobility hubs), public schools, public libraries, neighborhood centers, and downtown districts.

The Blue Line TeleVillage in Compton, funded by Metro in the late 1990s, established proof of concept in LA County. Yet it was not replicated.

With institutional infrastructure like the Regional Telework Facilitator, physical infrastructure like NACs, and programs such as the TFX, telework will become a significant employment option throughout the region.

SANDAG Board of Directors

Via E-mail: pjo@sandag.org (Phillip Johnston)

Re: California Air Resources Board (CARB) Greenhouse Gas (GHG) Reduction Targets, Issued to SANDAG, in Accordance with SB 375, for the Year 2035

SANDAG Board Chair Jerome Stocks and Members of the Board:

I appreciate the opportunity to communicate with you concerning this important topic.

The subject targets were issued on September 30th of 2010. On September 20th, I sent a letter to CARB[1] asking them to issue targets that would uphold the Executive Order S-3-05[2] GHG reduction trajectory, for cars and light-duty trucks. CARB's Scoping Plan gives no reason to not apply the straight-line trajectory, implied by the S-3-05 reductions, to the GHG emissions from cars and light-duty trucks. S-3-05 names CARB as one of the agencies that must create plans and progress reports to ensure that the reductions in S-3-05 are achieved.

Unfortunately, CARB gave you (SANDAG) the Year 2035 reduction that you (SANDAG) requested, which is only a 13% reduction, for year 2035.

"GHG" is really "VMT" and Other Important Details on the Reductions

These reductions are per capita, with respect to *driving* in 2005. This can be understood by carefully considering the following two items:

1.) Page 8, of http://arb.ca.gov/cc/sb375/staffreport_sb375080910.pdf, which says, "The RTAC recommended that targets be expressed as a percent reduction in per-capita greenhouse gas emissions from a 2005 base year"; and

2.) The first footnote in the table of CARB calculations, http://arb.ca.gov/cc/sb375/mpo.co2.reduction.calc.pdf, which says: "The CO2 emissions presented in this table do not include reductions from Pavley and LCFS regulations."

"Greenhouse gas (GHG)" emissions are used as equivalent to the more accurate "C02 emissions." In the second item, "Pavley" (named after Senator Fran Pavley) refers to a lowered average C02 per mile driven. Also in the second item, "LCFS" refers to the "Low Carbon Fuel Standard". Both "Pavley" and the "LCFS" reduce the emissions per mile driven. Since these reductions are not being counted, the reductions shown come only from per capita, percent reductions in driving, or "vehicle miles travelled", VMT. Therefore the so-called GHG reductions are really VMT reductions.

[2] S-30-05 is shown in Reference 2, listed at the bottom and attached in the email with this letter.

More Background Information

In 2007, you (SANDAG) adopted your current Regional Transportation Plan (RTP). It includes a 38% increase in the total number of freeway-lane miles, in San Diego County. My job as Transportation Chair for the Sierra Club is to stop all freeway expansions, as specified in our National Policy. Our Chapter has commented extensively on the I-5 expansion Draft Environmental Impact Report. As you know, it would add either 4 or 6 lanes, to an eight-lane freeway, over a length of 27 miles.

You (SANDAG) are now in the process of approving a new RTP, with even more freeway expansions. However, your staff now claims that by Year 2035, they will reduce GHG (really VMT, as explained above) from cars and light-duty trucks by 19%. You (the SANDAG Board) and staff can therefore claim, correctly, that you are going to exceed your CARB target, for Year 2035.

However, the GHG reductions of S-3-05 must be achieved by mankind, if we are to have any reasonable chance of stabilizing our climate. A destabilization will likely have disastrous environmental and human consequences.

The purpose of this letter is to show you that the GHG (really VMT) reduction achieved must be at least 35%, not the 13% given by CARB and not the 19% that your staff now claims they can achieve by 2035.

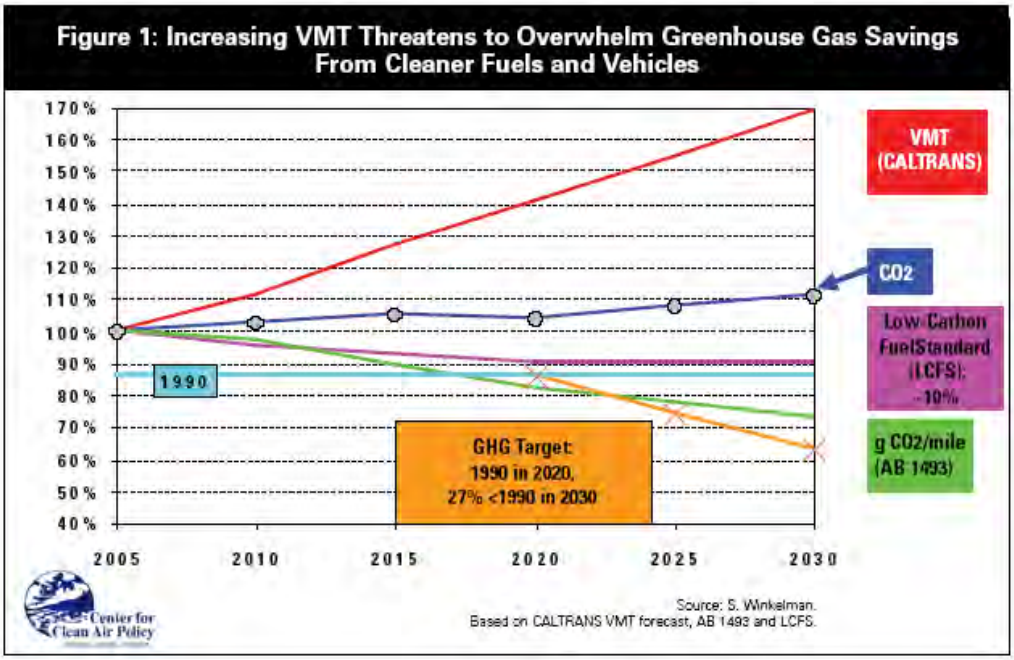
Overview of Relationships and Derivation of Key Formula

The S-3-05 net reduction in GHG emissions, from cars and light-duty trucks, expressed as a fraction of 2005 emissions, is obtain by multiplying four factors together. The definitions of Table 1 apply.

Table 1 **Factor Definitions, with Respect to Year 2005**

Factor Definitions	
All are for for the year of interest, with respect to year 2005 values. Except for Population, all are for cars and light-duty trucks.	
f	**net factor of the emissions of Greenhouse Gas**
f_Pavley	**factor of the average statewide mileage**
f_Fuel	**factor of the reduction of GHG due to fuels that burn less carbon**
f_Population	**factor of the population in the region of interest**
f_PerCapitaVMT	**factor of per capita driving**

The following equations apply.



Eq. 1 f = F_Pavley **x** f_Fuel **x** f_Population **x** f_PerCapitaVMT

Eq. 2 is derived from Eq. 1.

Eq. 2 f_PerCapitaVMT = f / **(** F_Pavley **x** f_Fuel **x** f_Population **)**

Figure 1 is from http://www.nrdc.org/globalWarming/sb375/files/sb375.pdf, a widely-respected report on SB-375. Note that all of its values are in the units of factors (same as fraction) of their values in year 2005. Figure 1 will supply all of the needed values, except for the factor of population. (Neither the red line nor the blue line are used.) Its gold line is the S-3-05 trajectory that CARB ignored when it issued the driving reduction values for year 2035.

Figure 1 GHG Reductions from Pavley (AB 1493, in Green); the Low Carbon Fuel Standard (in Purple); the Predicted Driving (VMT, in Red); the Net Result of GHG (C02, in Blue); and & the S-3-05 Trajectory (in Gold)

Getting the Net Factor of the Emissions of Greenhouse Gas in 2035, with Respect to 2005 Values

To get the net factor of the emissions of GHG, for year 2035, and with respect to year 2005, it is necessary to extrapolate the Governor's Executive Order target values (the gold line of Figure 1), out to year 2035. The gold line shows that this factor is 0.87 in 2020 and is 0.64 in 2030. Therefore, in year 2035, the factor will be

$$0.64 + [(.64 - .87) / (2030-2020)] * (2035-2030) = 0.525$$

Getting the Factor of the Average Statewide Mileage in 2035, with Respect to the 2005 Value

To get the Pavley reduction factor, for Year 2035, it is necessary to extrapolate the average statewide mileage factor data, which is Figure 1's green line, out to Year 2035. It is 0.82 in 2020 and it is 0.73 in 2030. Therefore, in year 2035 the statewide mileage factor data will be

$$0.73 + [(.73 - .82) / (2030-2020)] * (2035-2030) = 0.685$$

Pavley 1 ends in Year 2017. It is widely assumed that it will be replaced by what is often called "Pavley 2". The extrapolation computed here is based on the assumption made by the author of

Figure 1, as shown in the slope of the green line from year 2020 to 2030. Based on the authoritative credentials of the authors of Figure 1, this is the best assumption that can be made. Assuming that the California fleet will continually get more efficient, in terms of C02 per mile driven, relies on an assumption that a significant fraction of our car owners will be able to purchase newer-model cars.

Getting the Factor of the Reduction of GHG Due to Fuels that Burn Less Carbon

Looking at the purple line of Figure 1, it is clear that this factor will be 0.9 in 2035.

Getting the Factor of the Increase in Population

The factor for population in San Diego County is computed using the populations estimated in CARB's http://arb.ca.gov/cc/sb375/mpo.co2.reduction.calc.pdf, namely 3,034,388 people in 2005 and 3,984,753 people in 2035. So the factor, from 2005 to 2035 is 3,984,753/3,034,388 = 1.313.

Computing the Required Driving Reduction, for 2035

The 4 values computed above are used in Eq. 2 to compute the required factor.

Eq. 2 f_PerCapitaVMT = .525 / **(** .685 **x** 0.9 **x** 1.313 **)**

Therefore, f_PerCapitaVMT = .649. **This corresponds to a 35.1% reduction in per-capita driving, in year 2035.**

In Conclusion

You must not conspire with CARB to violate S-3-05. Your RTP must achieve a 35% reduction. Reference 1 shows how this can be done. You have a responsibility to get CARB and SANDAG back on a path of moral and responsible leadership. The current 2035 targets undermine S-3-05.

Respectfully submitted,

Mike Bullock, 760-754-8025
Chair of the Sierra Club San Diego Transportation Committee

Sierra Club Toiyabe Chapter/Southern Nevada Group
Motion for Support Environmentally-Sound Road-Use Fees
DRAFT May 2 with Oct. 4th, 16th, Nov. 9 & Jan21, 2011 Revisions

Chapter Leads: Mike Bullock, San Diego Transportation Chair (assigned by Jane Feldman) and Energy Task Force Chair Joe Johnson **Sponsor (if not SNG)**: **Topic Area**: Conservation, Transportation **Desired Effective Date**: March 2011, if possible **Time Sensitive: ASAP, due to global warming** **Reason for Time Sensitivity**: NDOT wants comments **Approved by Conservation Committee**: Date	**Brief Description of Proposed Position**: Support for an Equitable and Environmentally-Sound Road-Use Fee Pricing and Payout System, to be submitted to our state of Nevada, as it considers what NDOT is currently calling a "VMT" fee.

Resolution

WHEREAS, unchecked Green House Gas (GHG) emissions will destabilize our earth's climate, causing a human catastrophe; 27% of Nevada's GHG emissions are caused by on-road transportation; in order to keep GHG levels below 450 PPM, it will be necessary for the world to reduce emissions to 1990 levels by 2020 and 80% below 1990 levels by 2050; to obtain these reductions in on-road emissions, Nevada must significantly reduce driving; and

WHEREAS, the current gas tax cannot provide the money needed for road repairs; Nevada has not raised its gas tax in 18 years and there is no known significant support for such an action; the gas tax is effectively our only road-use fee; better mileage and more electric vehicles will reduce gas tax revenue; a gas tax cannot account for time, place, driver's income, vehicle weight, vehicle pollution levels, vehicle noise levels, or roadway congestion level; Sierra Club national policy opposes subsidized road use, even for battery-powered cars; and

WHEREAS, road expansions are promoted using fear of current or predicted congestion; the Toiyabe Chapter currently has no viable, low-cost, short-term strategy to alleviate congestion; reducing driving through full-cost pricing and congestion pricing is a proven, short-term, free-market strategy to alleviate congestion; the under pricing of road use contributes significantly to air pollution, congestion, sprawl, and GHG emissions; revenue from taxes that are unrelated to driving are used to support roads; on July 11, 2009, the California Nevada Regional Conservation Committee of the Sierra Club passed a resolution supporting a "comprehensive road-use fee pricing system"; the Nevada DOT is accepting comments on a "VMT Fee" proposal; Article 9, Section 5 of the Nevada constitution requires that any charge, with respect to the operation of any motor vehicle, be used exclusively for the construction, maintenance, and repair of the public highways of the State; and, finally, while sprawl-supporting schemes, consisting of in-project road building and "development fees" to widen existing access roads, are better than subsidies from the general public, they are still a hidden and unfair subsidy to driving, that increases driving, because the ultimate payers of these costs pay an amount (for example in the cost of a home or in the cost of some other consumer item or service) or at a rate (for example a reduced wage or increased rent), which is unaffected by how often they personally chose to drive on the constructed, in-project roads or added lanes on access roads.

THEREFORE LET IT BE RESOLVED, that the Sierra Club Toiyabe Chapter/Southern Nevada Group supports a comprehensive road-use fee pricing and payout system, along with the required amendment to the Nevada constitution, provided that the pricing and payout system (1) would pay for all road-use costs, including the environmental and health costs caused by driving; (2) would pay out to cover all costs and repay all those losing money because of such things as road construction and operation; (3) could still include a fuel tax or fee; (4) would have a vmt fee (price-per-mile) that would vary by such things as the weight (to account for road wear), pollution level, noise level, and safety record of the vehicle (to reduce insurance rates, if it is shown that such payments are needed, as described in Item (2) of this paragraph; (5) would have a vmt fee (price-per-mile) that would vary by such things as road, road segment, date, and time of day; (6) would include instantaneous congestion pricing when that

technology becomes feasible; (7) would keep the per-mile price incentive to drive energy-efficient cars at least as large as it is with today's fuel excise tax; (8) could be accompanied by tax reductions sized to achieve either net-revenue neutrality or near-net-revenue neutrality; (9) would adjust the green-field development road-building and development-fee-assessment scheme so that a fair share of road-use revenue is paid to those that lost or are losing money, due to the scheme; 10) may be used to fund such things as bicycle facilities, bicycle education, bus pullouts, bus stops, sidewalks, and landscaping; 11) would mitigate impacts on low-income users by, for example, giving low-income drivers price reductions, especially for necessary driving; 12) would have ACLU-approved privacy protections that would include a prohibition of government access without court approval and would also include periodic and random software and hardware checks by ACLU-approved experts, to prevent the creation of infrastructure for routine surveillance.

THEREFORE LET IT BE ALSO RESOLVED, that the Sierra Club Toiyabe Chapter/Southern Nevada Group will communicate this position to the Nevada Department of Transportation (vmtfeestudy@vmtfeenv.com), the Governor, the state legislative bodies, our federal representatives for use in climate protection legislation, the media, our local government officials, other interested environmental and/or civic-minded groups, all interested political parties, and our membership through website and newsletter communication, as our limited resources will permit.

Supporting Data

- National Sierra Club policy on transportation, http://sierraclub.org/policy/conservation/trans.aspx, is opposed to all subsidies to road use, saying, "These subsidies should be publicly scrutinized and eliminated".
- According to a State website, http://www.vmtfeenv.com/questions.html, "The current federal and state fuel taxes were last increased in 1992. During the last 18 years, inflation has eroded the purchasing power of fuel taxes by approximately 52%. Whereas, during the same time, construction costs have gone up significantly."
- Also (same website), "Vehicle fuel efficiency increased from an average of 11.8 miles per gallon in 1970 to nearly 20 today. Fuel-efficient vehicles now entering the marketplace will further increase the average miles per gallon. While beneficial from an environmental and energy conservation perspective, and something the state wants to encourage and reward, fuel-efficient vehicles alter the ability to fund the maintenance, preservation and modernization of our roads."
- Also (same website), "If a VMT fee were to become law, the legislature could determine a per-mile rate. The rate could be flat, treating everyone the same, or it could be varied to consider other state policies like environmental issues, time of day and congested roads, type of vehicles, or urban/rural issues. Options might include charging a lower rate-per-mile for vehicles that achieve a certain level of fuel efficiency, for motorists that avoid rush hour zones, or for those making other environmentally-friendly decisions."
- According to Table ES-1 of the *Nevada GHG Inventory and Reference Case Projections*, 1990-2020 (http://www.wrapair.org/ClimateChange/NV_GHG_I&F_Report_WRAP_08-20-07.pdf) the MMT C02e fraction of emissions due to on-road transportation, of the gross total emissions, is 14.4/53.7 = 26.8%.
- The CNRCC Resolution of July 11th, 2009, in support of a "comprehensive road-use fee pricing system", and its "Reference Document" are attached.

Supporting References

- Club's internal site http://clubhouse.sierraclub.org/login.aspx?ReturnUrl=%2fca%2fcnrcc%2findex.asp, then, after typing in the password and getting the home page of the CNRCC, within the "Records and Archives" box, seen on the left side after scrolling down; select the "Resolutions Archives" and then the "July 2009" link to see both the Resolution and the "Reference Document" for all of the background information. (Dr. Stewart will make this final link active.)

- The other references are given above in the "Supporting Data" section

Description of Club Policy (or references)

These are given in the Resolution, Supporting Data, and Supporting References sections.

Counter-Arguments and Response

1.) We can meet our responsibility to oppose subsidized driving by simply being in favor of increasing the gas tax, even though this does subsidize cars that are electric and there is no discussion of this option currently.

2.) Talking about the cost of driving will make us unpopular, or, in more sophisticated language, this will "spend our political capital" that we need for more important battles.

3.) If we send a letter to the Nevada DOT, they will misuse our support to claim we support a flat-fee VMT charge regardless of weight, mileage and so on.

Chapter Commitment Required Resources (time, money, etc)

a. This resolution will be meaningful if the only action is an email to the Nevada DOT. Since all actions can be accomplished by email, the only resource needed is volunteer time. b. The second "Therefore let it also be resolved" lists the actions in the approximate order in which they should be taken. However, the actual order will also depend on volunteer choice.

Next Steps

Upon approval, begin work on a letter to the Nevada DOT.

Campaign Planning Matrix

If we want to educate our members and get them to also send emails of support, this could be done.

From the Sierra Club's publication Grassroots Organizing Training Manual, 1999

Available at http://clubhouse.sierraclub.org/leaders/training/training_manual/index.htm

1. Issue focus

What's the environmental problem you are seeking to address?

This work seeks to address our climate crisis and all the other impacts from automobiles.

How does it relate to the Club's national conservation priorities?

This work advances the Club's national policy goals regarding transportation, land use, and climate change.

2. Campaign goals

Increase community respect by submitting constructive principles into an important, on-going debate. The goal is to make a better environmental outcome more likely. This work will increase our profile and may therefore increase our membership and funding. This will establish working relationships into government that currently do not exist.

Conservation goals

Reduced driving and a more sophisticated understanding of economics and how it drives environmental outcomes.

Organizational goals

A functioning Transportation Committee to respond to all stages of relevant decision making in Nevada.

3. Lay of the Land

Nevada citizens are opposed to a VMT fee. They worry about privacy. They underestimate the danger of climate change. The Nevada DOT website on this issue however shows a rational approach to a serious funding and political problem.

Organizational Strengths and Weaknesses

The chapter has leaders that are open-minded, dedicated, and frankly brilliant. They know the important environmental issues in their area and are in touch with Nevada politics. However, it has no one with a long-standing interest in the economics of transportation.

Allies and Opponents

The Universities should appreciate our help. There will be a considerable amount of interesting mathematical work to achieve all goals. The University may come to see a different aspect of Sierra Club concerns. Elements within the Nevada DOT may appreciate our efforts. Those who benefit from ever-increasing VMTs and sprawl may be opposed to this work. All citizens that understand global warming will want to help us. This may include some religious groups, Unitarian Universalists, for example. Groups that fear government and change may oppose this effort.

4. Strategy

As communications go out, it would be best, if time permits, to schedule meetings and establish as many long-lasting relationships as possible.

Strategic vehicle

Targets

Decision makers (primary targets): DOT

Decision makers (secondary targets): elected officials

Public groups: civic, political (Democrats, Republicans, Greens, Etc) and including our own membership

5. Campaign communication

Message and slogan: start with resolution title “Equitable and Environmentally-Sound Road Use”

Story: start with resolution

Media outlets: use chapter members that have experience with media.

6. Tactics and timeline

The Nevada DOT needs input this year. Start there and work down the list as time permits.

7. Resource management

Budget: none

Donors/fundraising: none needed

Volunteer recruitment and stewardship: Transportation Committee Membership and others as needed

A Plan to Efficiently and Conveniently Unbundle Car Parking Costs

Paper 2010-A-554-AWMA

Mike R. Bullock
Retired Satellite Systems Engineer (36 years), 1800 Bayberry Drive, Oceanside, CA 92054
Jim R. Stewart, PhD
University of the West, 1409 N. Walnut Grove Avenue, Rosemead, CA 91770

ABSTRACT

The *Introduction* shows documented driving reductions due to the pricing of parking. It notes that although the benefits of priced and shared parking are known, such parking has not been widely implemented, due to various concerns. It states that a solution, called "*Intelligent Parking*," will overcome some of these concerns, because it is easy to use and naturally transparent. It asserts that this description will support a "Request for Proposal" (RFP) process. Eight background information items are provided, including how priced parking would help California achieve greenhouse gas reduction targets. A story demonstrates some of the key features of *Intelligent Parking*. Arguments for less parking, shared parking, and priced parking are made. Barriers to progress are identified. The fair pricing of parking is described. New ways to characterize transportation demand management are presented. Seven goals of *Intelligent Parking* are listed. Eleven definitions and concepts, that together define *Intelligent Parking*, are described. This includes a method to compute a baseline price of parking and how to adjust that price instantaneously to keep the vacancy above 15% ("Congestion Pricing"). An implementation strategy is described.

INTRODUCTION:

It has been well established that appropriately priced parking will significantly reduce driving[1]. Most case studies presented in Table 1 are evaluations of the most general type of "car-parking cash-out": *a program that pays employees extra money each time they get to work without driving*. They show that a price differential between using parking and not using parking will significantly reduce driving, even when transit is described as poor. Since driving *must* be reduced[2], the pricing of parking is desirable.

Shared parking is also recognized as desirable because it can sometimes result in less parking being needed.

Although the advantages of pricing and sharing parking have been recognized for many years, these practices are still rare. This paper identifies some of the reasons for this lack of progress. The pricing and sharing method of this paper has a natural transparency and ease of use that would reduce many of the concerns. This paper also suggests that those governments that have the necessary resources can take the lead role in developing and implementing the described systems. These governments will recover their investments, over time.

This paper describes how parking facilities could be tied together and operated in an optimum system, named *Intelligent Parking*. The description of *Intelligent Parking* is sufficient to support a "Request for Proposal" process, leading to full implementation.

There are two distinct parts to *Intelligent Parking*. The first is how to set the price. The second is how to distribute the earnings. Briefly, the earnings go to the individuals in the group for whom the parking is built.

Table 1 Eleven Cases of Pricing Impact on Parking Demand

Location	Number of Workers @ Number of Firms	1995 $'s Per Mo.	Parking Use Decrease
Group A: Areas with poor public transportation			
West Los Angeles	3500 @ 100+	$81	15%
Cornell University, Ithaca, NY	9000 Faculty & Staff	$34	26%
San Fernando Valley, Los Angeles	850 @ 1	$37	30%
Costa Mesa, CA	Not Shown	$37	22%
Average for Group		**$47**	**23%**
Group B: Areas with fair public transportation			
Los Angeles Civic Center	10,000+ @ "Several"	$125	36%
Mid-Wilshire Blvd, Los Angeles	1 "Mid-Size" Firm	$89	38%
Washington DC Suburbs	5,500 @ 3	$68	26%
Downtown Los Angeles	5,000 @ 118	$126	25%
Average for Group		**$102**	**31%**
Group C: Areas with good public transportation			
U. of Washington, Seattle, WA	50,000 employees, students	$18	24%
Downtown Ottawa, Canada	3,500 government staff	$72	18%
Bellevue, WA	430 @ 1	$54	39%*
Average for Group, except Bellevue, WA Case*		**$45**	**21%**
Overall Average, Excluding Bellevue, WA Case*			**25%**

* Bellevue, WA case was not used in the averages because its walk/bike facilities also improved and those improvements could have caused part of the decrease in driving.

PERTINENT BACKGROUND INFORMATION

- Vehicle miles traveled (VMT) are a major cause of global warming and pollution[2, 3].
- California's Metropolitan Planning Organizations (MPOs) will need to adopt strategies that reduce vehicle miles traveled (VMT), in order to meet SB375 GHG reduction targets, to be issued by the California Air Resources Board in late 2010, for years 2020 and 2035[2].
- The appropriate pricing of parking is one of the least costly documented tools to reduce VMT.
- New technologies, such as sensors feeding computer-generated billing, offer the potential to efficiently bill drivers for parking and alert law enforcement of trespassers.
- Reformed parking policies can increase fairness, so that, for example, people who use transit or walk do not have to pay higher prices or suffer reduced wages, due to parking.

- Methods to unbundle parking cost are inefficient unless they support the spontaneous sharing of parking spaces. Shared parking with unbundled cost would ultimately allow cities to require significantly less parking.
- Typical systems of timed parking and metered parking are far from ideal. Parking has no automated record keeping, so it is difficult to know where there is too much or too little.
- Good policies will eventually let cities turn parking minimums into parking maximums.

A GLIMPSE INTO A POSSIBLE FUTURE

Jason is driving to work for the first time in several years. He has decided to save money by carrying home a new 3-D, big-screen computer, which he plans to purchase at a store near his office after work. He wanted to avoid paying delivery charges.

Things have been changing around his office development since they unbundled the cost of parking at the near-by train station. Many people who caught the early trains and lived close to the station stopped driving and parking in the best parking spaces; demand for housing close to the station went up; and wealthy riders, who insisted on driving, did so, confidant that they could always find parking as close to the platform as their schedules required, due to congestion pricing. Who would have guessed how much those people were willing to pay? It was shocking. Parking-lot earnings, paid to round-trip train riders, meant that the net cost to ride the train went significantly down. Ridership and neighborhood vitality both went significantly up. All Jason knew was that the price to park at his office had been going up yearly because of increased land values. His parking-lot earnings from his office had been increasing almost every month, due to the ripple effect of train riders parking off-site at cheaper parking. Some of them were using his office parking.

As he pulls out of his driveway, he tells his GPS navigation unit his work hours (it already knew his office location), the location of the store where he plans to buy the computer, and his estimated arrival and departure times at the store. He tells the GPS unit he wants to park once, park no more than 1 block from the store, walk no more than 1 mile total, and pay no more than an average of $2 per hour to park. He is not surprised to hear the GPS tell him that his request is impossible. He tells the GPS he will pay an average of $3 per hour and learns that the GPS has located parking.

It guides him into a church parking lot. He hopes the church will use his money wisely. The GPS tells him the location of a bus stop he could use to get to work and the bus‟s next arrival time at the stop. With automatic passenger identification and billing, the bus has become easy to use, except that it is often crowded. Jason gets out of the car and walks to work, with no action required regarding the parking.

Three weeks later, when Jason gets his monthly statement for his charges and income for automotive road use, transit use, parking charges, and parking earnings, he finds that the day‟s parking did indeed cost about $30 for the 10 total hours that he parked. He notes that the parking-lot earnings for his office parking averaged about $10 per day that month. He then notices the parking lot earnings from the store, where he spent about $1000 dollars. He sees that the parking-lot earnings percent for the store that month was 1.7%, giving him about $17. So for the day, Jason only spent a net of about $3 on parking. Then he realized that he should have had the computer delivered after all. If he would have bicycled that day, as he usually did, he would have still gotten the $27 earnings from the two parking facilities and he would have paid nothing

for parking. So the choice to drive cost him $30. He remembers that the delivery would have only been $25 dollars. Oh well. He enjoyed his before-work and after-work walks.

THE CASE FOR LESS PARKING

Less parking will support more compact development.[1] This makes walking and biking more enjoyable and less time consuming. There would certainly be less "dead space", which is how parking lots feel to people, whether they arrive by car or not, after they become pedestrians.

Since parking can be expensive, less parking can reduce overhead costs significantly, such as leasing expense and parking-lot maintenance cost. Less overhead means more profit and less expense for everyone. A need for less parking can create redevelopment opportunities at existing developments and reduce project cost at new developments.

At new developments, car-parking costs could prevent a project from getting built.[2]

THE CASE FOR SHARED PARKING

Shared parking for mixed uses means that less parking is needed. For example, shared parking could be used mostly by employees during the day and mostly by residents at night.

Fully shared parking means that very little parking would be off limits to anyone. In a central business district with shared parking, drivers would be more likely to park one time per visit, even when going to several locations. Pedestrian activity adds vitality to any area.

THE CASE FOR APPROPRIATELY-PRICED PARKING

To Reduce Driving Relative to Zero Pricing

Traditional Charging or Paying Cash-out Payments

As shown in the Introduction, this relationship (pricing parking reduces driving) is not new.[3]

Using results like Table 1, at least one study[4] has used an assumption of widespread pricing to show how driving reductions could help meet greenhouse gas (GHG) target reductions. Dr. Silva Send of EPIC http://www.sandiego.edu/epic/ghgpolicy/ assumes that all work locations with 100 employees or more in San Diego County will implement cash-out, to result in 12% less driving to work. Currently, almost all employees in San Diego County "park for free", unless they happen to work in a downtown core area.

---

[1] This is especially true of surface parking, which only accommodates 120 cars per acre.

[2] On September 23, 2008, a panel of developers reviewed the Oceanside, Ca. "Coast Highway Vision" http://www.ci.oceanside.ca.us/pdf/chv_finalvisionstrategicplan.pdf. Parts of this plan were described as smart growth.

At the review, developer Tom Wiegel said, "Parking is the number 1 reason to do nothing," where "do nothing" meant "build no project." The other developers at the meeting agreed.

[3] For many years the Victoria Transport Policy Institute (VTPI) has been recognized as a source of reliable information on "Transportation Demand Management", or TDM.

From http://www.vtpi.org/tdm/tdm72.htm#_Price_Parking:

> Even a relatively small parking fee can cause significant travel impacts and provide significant TDM benefits.

"TDM Benefits" refers to the many public and private benefits of having fewer people choosing to drive.

Current, Best-Practice "Unbundling"

The "best-practice" use of the phrase, "unbundled parking cost", is to describe the case where either the cost of parking, for the case of a condominium, or the rent for parking, for the case of an apartment, is separated from either the purchase price and common fees or the rent of the dwelling unit.

This gives the resident families the choice of selecting the number of parking spaces they would like to rent or buy, including the choice of zero. This would tend to reduce the average number of cars owned per dwelling unit and, in this way, would also tend to reduce driving. Its major drawback is that this method does not encourage sharing.

To Increase Fairness and Protect the US Economy

It is stated above that almost all employees in San Diego County "park for free". Of course there is really no such thing as "parking for free". So-called "free parking" always reduces wages or increases costs. At a work site, it reduces everyone"s wage, even those employees that never drive. At an apartment complex, so-called "free parking" increases the rent. Therefore, "free parking" at work or at apartments violates the fundamental rule of the free market, which is that people should pay for what they use and not be forced to pay for what they do not use. Parking should at least be priced to achieve fairness to non-drivers.

The US economy would also benefit. Reductions in driving would lead to reductions in oil imports, which would reduce the US trade deficit.[4]

BARRIERS TO PROGRESS

Given all this, it might seem that the widespread pricing of parking should have happened by now. However there are barriers. In 2007, a majority of the City Council of Cupertino, Ca. indicated that they wanted their City Manger to negotiate reduced parking requirements with any company that would agree to pay sufficient cash-out payments. To this date, no company, including Apple Inc., has expressed an interest. Most companies probably perceive cash-out as expensive. Even if they realize they could get a reduced parking requirement in exchange for paying sufficient cash-out amounts and even if the economics worked in support of this action (quite possible where land is expensive), they want to stay focused on their core business, instead of getting involved in new approaches to parking, real estate, and redevelopment.

On the other hand, simply charging for parking and then giving all the employees a pay raise is probably going to run into opposition from the employees, who will feel that they would be losing a useful benefit.

In addition, neighbors fear the intrusion of parked cars on their streets. Permit parking, which could offer protection, is not always embraced. City Council members know that a sizable fraction of voting citizens believe that there can actually never be too much "free parking",

---

[4] From http://en.wikipedia.org/wiki/Balance_of_trade#Warren_Buffett_on_trade_deficits, Warren Buffet wrote in 2006,

> "The U.S. trade deficit is a bigger threat to the domestic economy than either the federal budget deficit or consumer debt and could lead to political turmoil. Right now, the rest of the world owns $3 trillion more of us than we own of them."

Professor Shoup"s famous book[5] notwithstanding. Some Council members probably feel that way themselves.

It doesn"t help that current methods of charging for downtown parking are often very inefficient.[5] For example, downtown Oceanside, California has parking meters that will only accept coins. Besides this, all their on-street, downtown parking is timed, with maximums from 10 minutes to 4 hours. These time limits are enforced by a city employee, who applies chalk from a tire to the street and then records the time. However, by watching the time and moving their car soon enough, drivers can avoid getting a ticket. Of course, they could instead drive to the mall and not have to worry about having coins or elapsed time since parking. It is not surprising that downtown merchants often object to charging for parking.

In summary, those that resist charging for parking, *based on their perceptions*, include

- Companies, *who fear the complexity and expense of paying cash-out payments*;
- Employees, *who fear of losing a current benefit*;
- City leaders, *who fear the political repercussions*;
- Downtown patrons, *who dislike the inconvenience and worry*;
- Downtown business owners, *who fear that it will drive away customers*.

THE COST, VALUE, AND FAIR PRICE OF PARKING

Estimated and Actual Capital Cost

Surface Parking

One acre of surface parking will accommodate 120 cars. Land zoned for mixed use is sometimes expensive. At $1.2 million per acre, the land for a single parking space costs $10,000. Construction cost should be added to this to get the actual, as-built cost of each parking space. Estimated cost can be determined by using appraised land value and construction estimates. For new developments, after the parking is constructed, it is important to note the actual, as-built cost.

Parking-Garage Parking

One acre of parking-garage will accommodate considerably more than 120 cars. The construction cost of the garage and the value of its land can be added together to get the total cost. Dividing that total cost by the number of parking spaces yields the total, as-built cost of each parking space. Adding levels to a parking garage may seem like a way to cut the cost of each parking space, for the case of expensive land. However, there is a limit to the usefulness of this strategy because the taller the parking garage, the more massive the supporting structural members must be on the lower levels, which increases total cost. Parking-garage parking spaces are often said to cost between $20,000 and $40,000. The actual costs should be noted.

Underground Parking

In order to compute an estimate for the cost of a parking space that is under a building, it is necessary to get an estimate of the building cost with and without the underground parking. The difference, divided by the number of parking spaces, yields the cost of each parking space. The

---

[5] According to Bern Grush, Chief Scientist of Skymeter Corporation http://www.skymetercorp.com/cms/index.php, often two-thirds of the money collected from parking meters is used for collection and enforcement costs.

cost or value of land plays no role in the cost of this parking. However, it does not follow that this parking is cheap. Underground parking spaces are often said to cost between $60,000 and $90,000 dollars each. Although there will be an "as built" cost of the building with the parking, there will never be an "as built" cost of the building without the parking. However, after the construction is done, the estimate for the cost of the underground parking should be reconsidered and re-estimated if that is needed. The final, best-estimate cost should be noted.

Value

Initially, value and cost are the same. For surface parking and parking-garage parking, the value would initially be the same as the as-built cost. For underground parking, the value would initially be the same as the best-estimate cost. However, over time, the value must be updated. Both construction costs and land-value costs will change. The value assigned to a parking place should always be based on the current conditions.

Fair Pricing

Parking space "values", as described above, must first be converted to a yearly price by using a reasonable conversion factor. This conversion factor could be based on either the "cost of money" or the "earnings potential of money". It is expected that this conversion factor would be 2% to 5% during times of low interest rates and slow growth; but could be over 10% during times of high-interest and high growth. For example, if the surface parking value is $12,000 and it is agreed upon to use 5% as the conversion factor, then each parking spot should generate $600 per year, just to cover capital costs. The amount needed for operations, collection, maintenance, depreciation, and any special applicable tax is then added to the amount that covers capital cost. This sum is the amount that needs to be generated in a year, by the parking space.

The yearly amount of money to cover capital cost needs to be re-calculated every year or so, since both the value and the conversion factor will, in general, change each year. The cost of operations, collection, maintenance, depreciation, and any special applicable tax will also need to be reconsidered.

Once the amount generated per year is known, the base price, per unit year, can be computed by dividing it (the amount generated per year) by the estimated fraction of time that the space will be occupied, over a year. For example, if a parking space needs to generate $900 per year but it will only be occupied 50% of the time, the time rate charge is $1800 per year. This charge rate per year can then be converted to an hourly or even a per-minute rate. The estimated fraction of time that the parking is occupied over a year will need to be reconsidered at least yearly.

NEW DEFINITIONS TO PROMOTE AN OBJECTIVE VIEW OF PRICING

- The "fair price" means the price that accounts for all costs.
- The "baseline amount of driving" means the driving that results from the application of the fair price.
- "Zero transportation demand management" ("zero TDM") is the amount of demand management that results when the fair price is used. It will result in the baseline amount of driving.
- "Negative TDM" refers to the case where the price is set below the fair price. This will cause driving to exceed the baseline amount. Since TDM is commonly thought to be an action that reduces driving, it follows that negative TDM would have the opposite effect.
- "Positive TDM" refers to the case where the price is set above the fair price. This would cause the amount of driving to fall below the baseline amount.

Clearly, so-called "free parking" is an extreme case of negative TDM. The only way to further encourage driving would be to have a system that pays a driver for the time their car is parked.

THE GOALS OF *INTELLIGENT PARKING*

- There is only one agency operating all parking. ("All parking" does not include driveways and garages in single-family homes.) *Intelligent Parking* is designed and installed by regional or state government, using low-bid contractors, with design and start-up costs covered by the overhead portion of collection fees.
- Nearly all parking is shared. Almost always, anyone can park anywhere. Those who want exclusive rights to parking will pay "24/7" (all day, every day).
- Parking is operated so that the potential users of parking will escape the expense of parking by choosing to not use the parking. This characteristic is named "unbundled" because the cost of parking is effectively unbundled from other costs.
- Parking is priced and marketed to eliminate the need to drive around looking for parking.
- Parking at any desired price is made as easy as possible to find and use.
- Records of the use of each parking space are kept, to facilitate decisions to either add or subtract parking spaces.
- The special needs of disabled drivers, the privacy of all drivers, and, if desired, the economic interests of low-income drivers are protected.

DEFINITIONS & CONCEPTS OF *INTELLIGENT PARKING*

Parking Beneficiary Groups

There are at least 7 types of beneficiary groups. Note that in all cases, members of beneficiary groups must be old enough to drive.

1.) People who have already paid for the capital cost of parking. An example of this type of beneficiary group would be the owners of condominiums, where parking has been built and the cost is included in the price of the condominium. Note that although they have technically already paid for the parking, if they borrowed money to pay for some portion of the price, the cost is built into their monthly payment. This illustrates why the value of parking and the cost of borrowing money (rate of return on money) are key input variables to use to compute the appropriate base, hourly charge for parking.

2.) People who are incurring on-going costs of parking. An example of this type of beneficiary group is a set of office workers, where the cost of „their" parking is contained in either the building lease or the cost of the building. Either way, the parking costs are reducing the wages that can be paid to these employees.[6]

3.) People who are purchasing or renting something where the cost of the parking is included in the price. Examples of this beneficiary group are people that rent hotel rooms, rent an apartment, buy items, or dine in establishments that have parking.

---

[6] Such parking is often said to be "for the benefit of the employees". Defining this beneficiary group will tend to make this statement true, as opposed to the common situation where the employees benefit only in proportion to their use of the parking.

4.) People who own off-street parking as a business. They could be the individual investors or could be a government or government-formed entity.

5.) People who are said to benefit from parking, even though the money for the parking has been supplied by a source that may have very little relationship to those that are said to benefit. An example of this group would be train riders that make round trips from a station which has parking that is said to be "for riders". Students at a school with parking would be another example.

6.) People who are considered by many to be the logical beneficiaries of on-street parking. Owners of single-family homes are the beneficiaries of the parking that is along the boundaries of their property. The same status is given to residents of multi-family housing.

7.) Governments. Since they build and maintain the streets, they should get a significant benefit from on-street parking.

Unbundled Cost and Spontaneous Sharing

"Unbundled cost" means those who use the parking can see exactly what it costs and those who don"t use the parking will either avoid its cost entirely or will get earnings to make up for the hidden parking cost they had to pay. This conforms to the usual rule of the free market where a person only pays for what they choose to use. Unbundled cost is fair.

"Spontaneous sharing" means that anyone can park anywhere at any time and for any length of time. Proper pricing makes this feasible.

How to Unbundle

The method of unbundling can be simply stated, using the concept of "beneficiary group" as discussed above. First, the fair price for the parking is charged. The resulting earnings[7] amount is given to the members of the beneficiary group in a manner that is fair to each member. Methods are described below.

Why this Supports Sharing

Members of a beneficiary group benefit financially when "their" parking is used. They will appreciate users increasing their earnings. They are also not obligated to park in "their" parking. If there is less-expensive parking within a reasonable distance, they might park there, to save money. This is fine, because all parking is included in the *Intelligent Parking* system.

Computing the Earnings for Individuals

Intelligent Parking must be rigorous in paying out earnings[7]. For a mixed use, the total number of parking spaces must first be allocated to the various beneficiary groups. For example in an office/housing complex, 63.5% of the parking might have been sold with the office. If so, the housing portion must be paying for the other 36.5%. For this case, it would follow that the first step is to allocate 63.5% of the earnings to the workers and 36.5% to the residents.

---

[7] The earnings amount is the revenue collected minus the collection cost and any other costs that will have to be paid due to the implementation of *Intelligent Parking*. The costs associated with the parking, paid *before* the implementation of *Intelligent Parking*, should *not* be subtracted from the revenue because they will continue to be paid as they were before the implementation of *Intelligent Parking*. Therefore, these costs will continue to reduce wages and increase the prices of goods and services.

How the monthly earnings are divided up among the members of the beneficiary group depends on the beneficiary group type. For each member, the group‟s total monthly earnings amount is always multiplied by a quantity and divided by the sum (the sum is the denominator) of that quantity, for all members.

For example, for each employee, the multiplier is the number of hours that the employee worked over the month while the denominator is the total number of hours worked by all employees over the month. At a school, for each student, the numerator is the total time spent at the school, over the month, while the denominator is the sum of the same quantity, for all the students.

For a train station with parking being supplied for passengers that ride on round trips of one day or less, the numerator is the passenger‟s monthly hours spent on such round trips, over the month; while the denominator is the total number of hours spent by all passengers on such round trips, over the month. Radio Frequency Identification (RFID) units on passengers could support an automated calculation of monthly charges for fares, as well as monthly hours on round trips.

At a shopping center, the numerator is the sum of the money spent by the shopper, over the month, while the denominator is the total amount of money spent by all shoppers over the month.

At a condominium, the numerator is the number of parking places that were paid for (directly or indirectly) by the resident family and the denominator is the total number of parking places at the condominium project; similarly, for apartment complexes.

Where Earnings Are Low

The goal is that if someone doesn‟t park, they don‟t pay, either directly or indirectly, because the earnings that they get will balance out their losses (like reduced wages, for example). However, charging for parking that few want to use will not sufficiently compensate the people that have been forced, or are being forced, to pay for such parking. The only remedy in this case is to redevelop the parking or lease the parking in some other way, for storage, for example. The earnings from the new use should go to those that are in the beneficiary group that was associated with the low-performing parking.

Why This Method of Unbundling Will Feel Familiar to Leaders

Developers will still be required to provide parking and will still pass this cost on, as has been discussed. There will be no need to force an owner of an exiting office with parking to break his single business into two separate businesses (office and parking).

Parking beneficiaries are identified that conform to traditional ideas about who should benefit from parking.[8]

Unbundling the Cost of On-Street Parking

The revenue from on-street parking in front of businesses will be split evenly between the city and the business‟s parking beneficiaries. All of the earnings from on-street parking in front of apartments or single-family homes will be given to the resident families.[9]

---

[8] Showing exactly where parking earnings go will reduce the political difficulties of adopting pay parking in a democracy where the high cost of parking is often hidden and rarely discussed.

[9] Although governments own the streets, often, back in history, developers paid for them and this cost became embedded in property values. Admittedly, how to allocate on-street parking earnings is somewhat arbitrary. With

Special Considerations for Condominiums

Unbundling for a condominium owner means that, although their allocated amount of parking has added to their initial cost, their allocated amount of parking also earns money for them. Unbundling for a condominium could also mean that an owner can choose to have control over a single or several parking places. Such parking spaces could be equipped with a red light and a green light. If the red light is lit, this will mean that the space is not available for parking, except for the person who is controlling the spot. If the green light is lit, it will mean that the space is available to anyone. A space that is being reserved with a red light is charged at the full price to the condominium owner that has control over the space. The owner that controls these spaces can change the state of the parking space (available or not available) by either a phone call, on line, or at any pay station system that might be in use for the system. After condominium owners experience the cost of reserving a space for themselves, they might give up on the idea of having their own, personal, unshared parking space; especially since *Intelligent Parking* will give most owners and their guests all the flexibility they need in terms of parking their cars.

Some people think that condominium parking should be gated, for security reasons. However, parking within parking garages needs to be patrolled at the same frequency level as on-street parking, which is enough to ensure that crime around either type of parking is very rare. Cameras can help make parking garages that are open to the public safe from criminal activity.

Special Considerations for Renters

Unbundling for renters means that, although their allocated amount of parking increases their rent, their allocated amount of parking also earns money for them. Therefore, their traditional rent (includes parking) is effectively reduced by the money earned by those parking spaces allocated to them. Renters will be motivated to either not own a car or to park in a cheaper location. Parking in a cheaper location is not a problem because all parking is part of the *Intelligent Parking* system. Renters will welcome anyone to park in "their" parking, because it will increase their earnings.

Special Considerations for Employers

At first, companies may want the option of offering "free parking" to their employees so as to be able to compete with traditional job sites. This means giving employees that drive every single day an "add-in" amount of pay so that the sum of the add-in and their parking-lot earnings equals their charge, for any given monthly statement. The operator of the parking, which sends out statements, can pay out the "add in" amount, in accordance with the company"s instruction. The company will then be billed for these amounts. There could be no requirement for the company to provide any such "add-in" amount to the employees that don"t drive every day. This would allow the company to treat its every-day drivers better than other employees and so this would be a negative TDM. However, this economic discrimination would be substantially less than the current, status-quo, economic discrimination, where drivers get "free" parking and non-drivers get nothing.

Clusters of Parking

Clusters are a contiguous set of parking spaces that are nearly equal in desirability and thus can be assigned the same price. They should probably consist of from 20 to 40 spaces. For off-street

---

congestion pricing and efficient methods, governments may earn significantly more than they are under current practices.

parking, they could be on either side of the access lane to the parking spaces, so that an observer could see the 20 to 40 cars, and get a feel for the vacancy rate. At a train station, clusters will normally be organized so that their parking spaces are approximately an equal distance from the boarding area. On-street clusters would normally conform to our current understanding of what a block is, which is to say from one cross street to the next cross street. The width of the street and the length of the block should be taken into account in defining on-street clusters of parking and in deciding if the parking on either side of the street should or should not be in the same cluster of parking spaces.

Examples of Good and Bad Technology

Parking Meters or Pay Stations

Parking meters are a relic of an earlier period, before computers. Pay stations do not add enough usefulness to merit their inclusion in *Intelligent Parking*, except as a bridge technology. Once good systems are set up, pay stations should cost additional money to use because of their expense. It would be best to devise an implementation strategy that will minimize their use when the system is first put into effect and will take them out of service as soon as possible.

Radio Frequency Identification Backed Up by Video-Based "Car Present" and License Recognition

Government will eventually enter into an RFID (Radio Frequency Identification) age. Organizers of large athletic events already have. Organizers that put on large open-water swims, foot races, and bike rides have routinely used RFID for many years.[10] An RFID vendor in San Diego[11] states that passive RFID units cost less than $5, are reliable, are durable, and they could be used to identify cars as well as people. He also sees no problem in implementing most of the features of *Intelligent Parking*.[12]

Automatic Data Collection and Sending Out Statements

Note that the "back end database" of Dr. Carta‟s written statement[12] refers to the ability to send statements of earnings and billing to students.[13]

---

[10] For example, over 20,000 people ran the 2008 Bay-to-Breakers foot race in San Francisco. Each runner had a "chip" in their shoe lace. Each runner‟s start time and finish time were recorded and all results were available as soon as the last runner crossed the finish line.

[11] David R. Carta, PhD, CEO Telaeris Inc., 858-449-3454

[12] Concerning a Final Environmental Impact Report-approved and funded new high school in Carlsbad, California, where the School Board has signed a *Settlement Agreement* to consider "*unbundled parking*", "*cash-out*", and "*pricing*", Dr. Carta wrote, in a January 13th, 2010 written statement to the Board,

> I wanted to send a quick note discussing the technical feasibility of tracking cars into a lot without impacting students or requiring the need for gates. Mike Bullock and I have discussed this project; it can be accomplished straightforwardly by utilizing Radio Frequency Identification and/or Video Cameras integrated with automated license recognition systems. The cars would need to register with the system at the start, but it would be fairly painless for the users after the initial installation. The back end database system can also be implemented both straightforwardly and at a reasonable price.
>
> This is not necessarily a recommendation of the proposal for unbundled parking. Rather it is strictly an unbiased view of the technical feasibility of the proposal to easily and unobtrusively track cars, both registered and unregistered, into a fixed lot.

[13] In an earlier email on this subject, Dr. Carta wrote,

Putting it Together

Certainly, government, and in particular transit agencies and parking agencies, could use RFID-based technology. For example, when a person with an RFID unit which is tied to a billable address or a credit card with an open account gets on a bus or a train, they should not have to pay at that time, visit a pay station, or "swipe a card" that has a positive balance. Utility customers that pay their bills are not required to pre-pay. The same courtesy should be extended to transit riders, people that drive on roads, people that get parking-lot earnings, and people that park cars. There should be one monthly bill or statement, for all four activities.

Global Positioning Systems GPS

An alternative model is to have GPS systems in cars that would detect the car"s parking location, that location"s current charge rate, and would perform all of the charging functions in the car. The only information the parking-lot-enforcement system would need is whether or not a car being parked is owned by a bill-paying owner. The car owner"s responsibility would be to pay the bills indicated by the box in the car. The box would need to process a signal that a bill had been paid. It would also need to process pricing signals.

Not Picking Winners

The purpose of this report is to describe what an ideal system would do, *not* how it is done. How a proposed system works is left to the systems, software, and hardware engineers that work together to submit a proposal based on this description of what an ideal system does.

Privacy

Privacy means that no one can see where someone has parked, without a search warrant. Also, the level of the detail of information that appears on a bill is selected by the customer.[14]

Ease of Use for Drivers

For credit-worthy drivers that have followed the rules of the system, pay parking will not require any actions other than parking. Paying for all parking fees over a month is then done in response to a monthly billing statement. Parking will feel to the consumer like a service provided by a municipality, such as water, energy, or garbage. One important difference is that users belonging to a "beneficiary group" will get an earnings amount in their monthly statement. Those that earn more than what they are charged will receive a check for the difference. This ease of use will make all parking less stressful.

Base Price

Off-Street

This is not too tough - we probably would integrate with a service that already sends physical mail from an electronic submission instead of re-inventing this wheel.

[14] License plates that have no RFID tags fail to use the best technology to accomplish the primary purpose of license plates, which is to identify and help intercept cars used in a crime. Identifying cars is a legitimate government goal. Protecting privacy is also a legitimate goal. Both goals can be realized with good laws, good enforcement, and good systems engineering.

Off-street parking is priced so that even if demand does not threaten to fill the parking beyond 85%, the money generated will at least equate to an agreed-upon return on the parking value and pay all yearly costs. Equation 1 shows the calculation of the hourly rate.

$$r_{BaselineHourly} = \frac{(r_{Investment} \times v_{Parking}) + c_{YOPD}}{(n_{HoursPerYear} \times f_{TO})} \quad \textbf{(Eq. 1)}$$

where:

$r_{BaselineHourly}$	=	the computed baseline hourly rate to park
$r_{Investment}$	=	yearly return on investment, such as .06
$v_{Parking}$	=	value of a parking space, such as (parking garage) $40,000
c_{YOPD}	=	yearly operations[15] plus depreciation, per space, such as $100
$n_{HoursPerYear}$	=	number of hours per year, 24 x 365 = 8760 Hours per Year
f_{TO}	=	fraction of time occupied, such as 0.55.

For the example values given, the base hourly rate of parking, to cover the cost of the investment, operations[15], and depreciation is $0.519 per hour. This could be rounded up to $0.52 per hour. This price could also be increased to result in positive TDM, to reduce driving more than the fair-price, zero-TDM amount.

On-Street

If on-street parking is located within walking distance (one-quarter mile) of off-street parking, its base price is set equal to the closest off-street parking"s base price. Otherwise, it is set to some agreed-upon value, like fifty cents per hour. However, on-street parking has a special meaning for downtown merchants and for neighborhoods, two powerful political forces in any city. Merchants that have few cars parking on their street, even though it is permitted, are probably failing in their businesses. They would like free parking to help draw visitors to their store front. Neighborhoods that are not impacted by parking would probably prefer no pricing. For these reasons, for any on-street parking cluster, no price is charged until the cluster occupancy reaches 50%. (Time of day is irrelevant.)

Congestion Pricing

The time-rate price of parking is dynamically set on each cluster of parking, to prevent the occupancy rate from exceeding 85% (to reduce the need to drive around looking for parking). An 85% occupancy rate (15% vacancy) results in just over one vacant parking space per city block[5]. If the vacancy rate is above 30%, the price is left at the baseline hourly rate. If vacancies fall below 30%, the price can be calculated in a stair-step method, such as shown in Table 2.

Equation 2 is an alternative method.

In either case, the total charge is time parked, multiplied by the time-averaged, time-rate price. The base multiplier would be adjusted to be just large enough to keep the vacancy rate from falling below a desired level, such as 15%, so it is always easy to find parking.

[15] This includes money for policing, cleaning, maintenance, any applicable parking tax, and all collection costs. Collection costs will need to include an amount to recover the development and installation costs of *Intelligent Parking*.

Table 2 Hourly Rates for 2 Base Multipliers and a Baseline Hourly Rate of $0.52

Vacancy Rate	Base Multiplier = 2			Base Multiplier = 2.5		
	Multiplication		Hourly Rate	Multiplication		Hourly Rate
	Formula	Value		Formula	Value	
Above 30%	2^0	1	$0.52	2.5^0	1	$0.52
25% to 30%	2^1	2	$1.04	2.5^1	2.5	$1.30
20% to 25%	2^2	4	$2.08	2.5^2	6.25	$3.25
15% to 20%	2^3	8	$4.16	2.5^3	15.625	$8.13
10% to 15%	2^4	16	$8.32	2.5^4	39.0625	$20.31
5% to 10%	2^5	32	$16.64	2.5^5	97.6563	$50.78
Below 5%	2^6	64	$33.28	2.5^6	244.1406	$126.95

$$r_{HourlyRate} = r_{BaselineHourly} \times \left(B^{(30-V)/5}\right), for\ V < 30;\ r_{BaslineHourly}, otherwise \quad \textbf{(Eq. 2)}$$

where:

$r_{HourlyRate}$ = the congestion-priced hourly rate to park

$r_{BaselineHourly}$ = the baseline hourly rate to park, such as $0.52 per hour (taken from from Eq. 1.

B = the base of the multiplier being computed, such as 2.50

V = the vacancy rate percent, such as 17.5, for 7 vacancies in a cluster of 40 spaces, 100*(7/40) = 17.5

For the example values given, the hourly rate of parking would be $9.88 per hour.

Pricing Predictions and Notifications

Drivers will develop strategies for their routine trips. The computer system that keeps records of parking use will also provide help for users. The *Intelligent Parking* website will direct a user to an appropriate cluster of parking if the user provides the destination location or locations, the time and date, and the hourly rate they wish to pay. If the walk is going to be long, the website could suggest using transit to get from the cheaply-priced parking to the destination. In such cases, the website may also suggest using transit for the entire trip.

Another user option is to specify the time, location, and the distance the user is willing to walk. In this case, the computer would give the cheapest cluster of parking available at the specified walk distance. The price prediction would be provided.

All price predictions would also have a probability of correctness associated with them. If a user can show that a computer has predicted a much lower price than what actually occurred, with a sufficiently high probability, it would be reasonable to charge the user the predicted price rather than the actual price.

Websites could routinely inform viewers when occupancy rates are expected to be unusually high, due to a special event (for example, a sporting event). The parking system website will always give current and predicted hourly rates for all locations. The hourly rates of parking will also be available at a phone number and possibly at pay stations. The base-price hourly rate, for any parking cluster, would be stable and could therefore be shown on signs. Parking garage entrances could have large video screens showing both predicted and existing price. Users will also learn to look at parking and judge whether congestion pricing applies, or could apply, while

their car is parked. It would not be long before these capabilities are added into GPS navigation systems.

Prepaid RFID

To be inclusive, pay stations or convenience stores will offer a pre-paid RFID that can be set on the dashboard of a car. This will support drivers with poor credit or drivers who have not obtained the necessary equipment to support the normal, trouble-free methods. This will also work for drivers that do not trust the system to protect their privacy for a certain trip (by removing or disabling the permanent RFID) or for all trips. No billing would occur.

Enforcement

The system would notify the appropriate law enforcement agency if an unauthorized car was parked. Authorized cars would need either a pre-paid RFID or equipment indicating that their owners had *Intelligent Parking* accounts and were sufficiently paid up on their bills.

IMPLEMENTATION

This description of *Intelligent Parking* will help to implement efficient parking systems. Parking at train stations, schools, and government buildings could introduce many of these concepts. This description of *Intelligent Parking* is sufficient to support a "Request for Proposal" process, which could lead to full implementation. Widespread installation should be done by a government agency, to minimize actions required on the part of the private sector. Laws would simply require the cooperation of all private-sector and government entities.

SUMMARY

A parking plan, *Intelligent Parking* has been described.

1. Technology will make it easy to use for most drivers.
2. Its parking is almost always shared, to support mixed uses.
3. It unbundles cost by charging and having earnings go to the parking beneficiaries.
4. Traditional groups, such as single-family home owners, employees, tenants, train riders, and students benefit from parking. The benefit is equal for drivers and non-drivers.
5. Baseline prices are computed primarily from the value of the parking and an agreed-upon rate of return. On-street parking is free until it is half full, at which time its base price often matches that of the closest off-street parking.
6. For all parking, price is dynamically increased to guarantee availability. Earnings are therefore only limited by what people are willing to pay.
7. Technology helps drivers find parking and decide if they want to drive or use transit.
8. Prepaid RFIDs provide service to those who have poor credit or don"t want to be billed.
9. Disabled and perhaps low-income drivers will have accounts that allow them to park at reduced prices and perhaps avoid congestion pricing. Specially designated spots might also be required for disabled drivers.
10. The system will provide reports showing where additional parking would be a good investment and where it would be wise to convert existing parking to some other use.

11. Privacy will be protected. Law enforcement officials would need a search warrant to see where someone"s car has been parked. The level of detail on billing would be selected by the car"s owner.

12. Implementations could begin in carefully selected locations and expand.

Global warming, air pollution, trade deficits, and fairness are some of the significant reasons that governments have a responsibility to implement *Intelligent Parking*.

ACKNOWLEGEMENTS

The following people have offered encouragement, specific information, and/or special insights.

Dr. Dennis Martinek, Oceanside Planning Commissioner; Sandra Goldberg, California Deputy Attorney General; Jerry Kern, Oceanside, City Council; Amy Volzke, Principal Planner, City of Oceanside; Dr. Nilmini Silva-Send, Senior Policy Analyst of the Energy Policy Initiative Center; Diane Nygaard, Director of Preserve Calavera and founder of Nelson Nygaard, Consulting Associates; Lisa Rodman, Trustee, Carlsbad Unified School District; Dr. Michael McQuary, President, La Jolla Democratic Club; Joan Bullock; Judy Jones, San Diego County Central Committee, California Democratic Party; Patrick Siegman, Principal and Shareholder, Nelson Nygaard; Andy Hamilton, San Diego Air Pollution Control District; Renee Owens, Conservation Chair, San Diego Sierra Club; Caroline Chase, Executive Committee Chair, San Diego Sierra Club; Ed Mainland, Co-Chair, Energy-Climate Committee, Sierra Club California; Bern Grush, Chief Scientist, Skymeter Corporation; and the following San Diego Area Government (SANDAG) employees: Susan Baldwin, Senior Regional Planner; Bob Leiter, former Director of Land Use and Transportation Planning; Coleen Clementson, Principle Planner; and Stephan Vance, Senior Regional Planner.

RECEIVED
FEB 15 2012
SOUTHERN CALIFORNIA ASS'N.
OF GOVERNMENTS

February 13, 2012

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

Dear Hasan,

On behalf of the South Bay Cities Council of Governments (SBCCOG), I would like to congratulate you and your staff for the excellent work preparing the complex 2012 RTP including the region's initial SCS, associated Appendices and Program Environmental Impact Report (PEIR). Thank you for this opportunity to comment on the draft documents.

The SBCCOG lacks the resources to comprehensively review and comment on the RTP and PEIR. We have reviewed the comments being submitted by the Orange County and Gateway Cities Councils of Governments and are in general support them.

In particular, we want to reinforce the following:

- Gateway COG's question regarding the Financial Plan - Table 3.4.1 which presents Core and Reasonably Available local sources of revenue and includes development mitigation fees for Orange and Riverside Counties. Does the revenue estimate include any assumption of funds from the potential adoption of a development fee in Los Angeles County?
- OCCOG's request regarding the Mitigation Monitoring Program mentioned in the PEIR to clarify what obligations local agencies may have regarding SCAG's mitigation monitoring efforts.
- OCCOG's request that SCAG provide the mitigation measures as a "toolbox" to local agencies for use within their discretion if and when appropriate for projects within their respective jurisdictions.
- OCCOG's request that SCAG adopt growth forecast numbers at the county level rather than lower geographical levels such as city or census tract.

Our focus was on the SCS portion of the RTP. Our comments address strategies included in Tables 4.3 and 4.4 and we request the following changes:

Land Use Actions and Strategies, Table 4.3

Add the following new options:
Update local zoning codes, General Plans and other regulatory policies and pursue opportunities to develop appropriately scaled mixed office-retail commercial centers within walking distance of residential neighborhoods
Responsible parties: Local jurisdictions

Update local zoning codes, General Plan and other regulatory policies to accelerate adoption of land use strategies that will over time convert auto oriented intersections of major arterials into mixed office-retail commercial centers.
Responsible parties: Local jurisdictions

Expand Compass Blueprint priorities to support member cities and sub-regional COGs adopting neighborhood oriented development as a land use strategy and range-limited electric vehicles as a mobility strategy.
Responsible parties: Local jurisdictions, COGs, SCAG

Amend the following existing options (as indicated in italics):
Update local zoning codes, General Plans, and other regulatory policies to accelerate adoption of land use strategies included in the RTP/SCS Alternative, *or that have been formally adopted by any sub-regional COG that is consistent with regional goals.*
Responsible parties: Local jurisdictions

Pursue joint development opportunities to encourage the development of housing and mixed-use projects around existing and planned rail stations, along high-frequency bus corridors, in transit oriented development *and in neighborhood oriented development.*
Responsible parties: Local jurisdictions, CTCs

Support projects, programs, policies and regulations to protect resource areas, such as natural habitats and farmland from future development; and *support project, programs, policies, and regulations that lead to development of "complete communities" on greenfields. (*A diversity of housing choices and educational opportunities; jobs for a variety of skills and education; recreation and culture; a full-range of shopping, entertainment and services; all within a relatively short distance)
Responsible parties: Local jurisdictions, SCAG

Transportation Network Actions and Strategies, Table 4.4
Add the following new options:
Promote the use of range-limited battery electric vehicles through land use policies that bring origins and destinations closer together such as the neighborhood oriented development strategy; and through transportation infrastructure such as complete streets (designed to accommodate slow speed electric vehicles) and EVSE deployment in homes and in public parking lots.
Responsible parties: Local jurisdictions, COGs, SCAG, and CTCs

Encourage the development of new, short haul, cost-effective transit services such as DASH and demand responsive (DRT) in order to both serve and encourage development of compact neighborhood centers.
Responsible parties: CTCs and municipal transit operators

Ensure every sub-region has multiple access points to the regional high speed transit network with at least one of them being a candidate for development into a multi-mobility hub (MMH).
Responsible parties: CTCs and local jurisdictions

Lobby the state to provide funding for complete streets planning and implementation in support of reaching SB 375 goals.
Responsible parties: SCAG, State

Amend the following existing options (as indicated in italics):
Explore and implement innovative strategies and projects that enhance mobility and air quality, including those that increase the walkability of communities, accessibility to transit via non-auto modes *and ZEV modes, and accessibility via ZEV modes.*
Responsible parties: Local jurisdictions, COGs, SCAG, and CTCs

Collaborate with local jurisdictions to plan and develop residential and employment development around current and planned transit stations *and neighborhood commercial centers.*
Responsible parties: Local jurisdictions, SCAG

Collaborate with local jurisdictions to provide a network of local community circulators that serve new TOD, HQTAs, and *neighborhood commercial centers* providing an incentive for residents and employees to make trips on transit *and/or stay in the local communities.*
Responsible parties: Local jurisdictions, SCAG, and CTCs

Develop first mile/last mile strategies on a local level to provide an incentive for making trips by transit, bicycling, walking or *driving neighborhood electric vehicles or other ZEV options.*
Responsible parties: Local jurisdictions, COGs, SCAG, and CTCs

Encourage the development of a Complete Streets policy, *explicitly accommodating slow speed and other ZEVs.*
Responsible parties: Local jurisdictions, COGs, SCAG, and CTCs

Develop infrastructure plans and educational programs to promote active transportation *and ZEV* options.
Responsible parties: Local jurisdictions, COGs, SCAG, and CTCs

Emphasize active transportation projects *and slow speed ZEV modes* as part of complying with the Complete Streets Act
Responsible parties: Local jurisdictions, COGs, SCAG, and CTCs

Collaborate with local jurisdictions *and sub-regional COGs* to develop regional policies regarding TSM
Responsible parties: Local jurisdictions, COGs, SCAG,

Collaborate with local jurisdictions *and sub-regional COGs* to update the ITS inventory.
Responsible parties: Local jurisdictions, COGs, SCAG

Collaborate with the State and Federal Government *and sub-regional COGs* to examine potential innovative TDM strategies
Responsible parties: SCAG, State and COGs

In addition, the 2012 RTP should include a preliminary cost estimate for implementing the Regional PEV Readiness Plan and the sub-regional strategies to develop infrastructure and supportive land uses mentioned in Table 4.7. The completed PEV Readiness Plan will provide such an estimate however that will occur after RTP adoption so that an estimate as place holder should be added in this plan.

Once again, thank you for the opportunity to respond.

Sincerely,

Ellen Perkins, SBCCOG Chair
Councilmember, City of Palos Verdes Estates

Los Angeles, CA 90017-3435

Comments on the Draft 2012-2035 Regional Transportation Plan, Sustainable Communities Strategy, and Draft Program Environmental Impact Report

The South Coast Air Quality Management (AQMD) staff appreciates the opportunity to comment on the Draft Program Environmental Impact Report (Draft PEIR) and the Draft 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy (Draft RTP/SCS). AQMD staff appreciates the inclusion of strategies in the Draft RTP that will reduce vehicle miles travelled (VMT). These strategies are a fundamental aspect of the plan and are needed to achieve transportation conformity requirements under the federal Clean Air Act. However, additional pollutant reductions beyond transportation conformity requirements must be found for the South Coast Air Basin (SCAB) to achieve National Ambient Air Quality Standards (NAAQS). Pursuant to the Clean Air Act, if the SCAB does not meet NAAQS on time, the region could lose federal transportation funding. This loss of funding could hinder achieving the goals of the Draft RTP/SCS. In addition, new tools and funding sources for SCS implementation will be required to overcome the additional hurdles that local jurisdictions face with the recent loss of redevelopment agencies. Therefore, we look forward to SCAG's continued significant involvement in the development of the 2012 Air Quality Management Plan in order to ensure that the transportation system contributes its fair share of pollutant reductions in our basin.

Transportation and Goods Movement Strategy

The AQMD staff appreciates that the lead agency has worked with our staff and the California Air Resources Board staff to develop an aggressive plan containing transportation policies that promote zero emission technologies. These policies and projects will provide regional and local air quality benefits. For example, as a part of the plan's goods movement strategy, the lead agency has included full deployment of zero emission transport for all container drayage between the ports and near-dock rail yards by 2020 (Goods Movement Appendix to RTP, page 34). Further, the Draft RTP has included zero emission freight corridors that could yield significant regional emission reductions and reduce near roadway emissions exposure in a timely

manner. AQMD staff looks forward to our joint efforts with SCAG staff on future demonstration and deployment of these important technologies, including a zero emission on-road demonstration project within the next one to three years. Further information in the Final EIR and RTP about the following strategies would be helpful to provide clarity in how these aspects of the plan impact air quality.

- Although zero emission technologies are described in the Draft RTP, it is not clear to what extent the emission reductions from these projects have been included in the constrained plan (e.g., RTP Table 2.11). The Final RTP/SCS and PEIR should include specific details about how much of the emission reduction benefits of the I-710 corridor project, East-West freight corridor project, and zero emission deployment from the ports to near dock rail yards are included in the 2035 emission calculations.

- SCAG should work with local transportation agencies, the ports, and other private and public stakeholders to identify funding in the constrained plan for zero-emission technology demonstrations (or initial deployments) in the port to near dock rail yard corridor. These should involve multiple technologies, including technologies with potential for regional application, and should involve major truck manufacturers. Such demonstrations can and should be initiated by no later than 2013 and should include testing and evaluation of wayside power (e.g., catenary trucks), battery electric trucks, and fuel cell trucks. AQMD will partner in supporting this measure (e.g., funding, seeking funding partners, and developing other support).

- The Draft RTP/SCS includes several key port-related projects such as the Southern California International Gateway (SCIG) and Modernization of the Intermodal Container Transfer Facility (ICTF) that are considered critical to the regional goods movement system and will have serious air quality implications for the basin and substantial impact on the heavy duty truck distribution in the region. Specifically, the Draft RTP/SCS indicates these projects are needed to address an overall growth volume at the San Pedro Bay Ports of up to 43 million containers by 2035 - more than tripling current levels. In addition, this significant growth in heavy duty truck traffic calls for the need to develop zero and near-zero emission goods movement technologies.

Freeway Impacts to Sensitive Receptors

The Draft PEIR indicates that the proposed project will place an additional 200,000 people within 500 feet of freeways in the SCAG Region. Areas within 500 feet of a freeway typically experience significantly elevated levels of mobile source pollution compared to areas outside this buffer zone. The AQMD staff recognizes that the placement of concentrated populations next to freeways is in response to the SCS policies that encourage growth adjacent to transit and other transportation facilities, however, it is not clear how SCAG determines that the potential impacts to future residents in these areas are insignificant.

Specifically, page 3.2-31 in the Draft RTP/SCS PEIR states that Mitigation Measure-AQ19 (MM-AQ19) will reduce this impact to a less than significant level. MM-AQ19 describes requirements that lead agencies should implement for conducting Health Risk Assessments, maintaining buffer zones from some pollution sources, and installing particulate filters in building ventilation systems to reduce particulate exposure. However, it is not clear how this

mitigation measure will be implemented. Because the Draft RTP includes substantial growth in population in these freeway proximate areas, SCAG should commit to researching the effectiveness of mitigation to reduce pollutant exposures in these areas and working with other state and local agencies on further policy development to reduce near freeway exposure.

Implementation Monitoring and Tracking

SCS Performance Measures

One of the primary goals of the SCS is to decrease per-capita greenhouse gas emissions from passenger vehicles and light duty trucks. These greenhouse gas reductions will have the co-benefit of reducing emissions of criteria pollutants. Because the SCS is an integral part of the RTP and therefore the AQMP, timely implementation of the SCS goals is relied upon to meet air quality standards. As a result, the AQMD staff requests that the plan be revised to include a periodic tracking and reporting element for the SCS that would occur more frequently than the regular RTP cycle. Specifically, staff requests that the tracking process not be limited to policy review of the SCS, but also include identification of revenue sources (see Funding comments below), and other metrics deemed appropriate by SCAG. These reported metrics should be made available to the public to ensure that our basin remains on track to meet AQMP goals.

Funding of the RTP

As required by federal regulation, SCAG has included a financial plan to demonstrate how the transportation plan can be implemented [23 C.F.R. §450.322(f)(10)]. The plan includes financial resources that are "reasonably expected to be available" to carry out the plan [§450.322(f)(10)(ii)]. However, about $219.5 billion out of a total of $524.7 billion in costs of the proposed 2012 RTP are expected to be funded by "new" sources of funds that are not currently available ("core" funds). This means that over 40% of the total cost of the plan is dependent on future new funding. Federal regulation provides that in the case of new funding sources, "strategies for ensuring their availability shall be included." [450.322(f)(10)(iii)]. A review of the "new" funding sources indicates that most would require further action by the state legislature, Congress, and/or a vote of the people. Moreover, federal regulations require the financial plan to "address the specific financial strategies required to ensure the implementation of TCMs in the applicable SIP." [§450.322(f)(1)(vi)]. We are concerned that these strategies are not sufficiently identified and assured of implementation.

State law also requires the RTP to include a financial element, which must summarize "the cost of plan implementation constrained by a realistic projection of available revenues." [Government Code §65080(b)(4)(A)]. The financial element may recommend the development of specified new sources of revenue. However, in describing the requirement for "financial constraint," the treatise *California Transportation Law* (Solano Press, 2000; March, Jeremy) provides at page 139 that the plan should:

- "Explain the consequences of living with existing revenues only, including what parts of the plan would not be achievable (without new revenues).

- Indicate alternative policy directions if proposed revenues are not realized, and the time frame when the change in policy direction should be undertaken if proposed revenues are not forthcoming."

The RTP does not currently present sufficient information to demonstrate why the "new" funding sources must actually become available. Moreover, it does not identify which measures or projects are to be funded by "core" revenues (those already available or committed) and which are to be funded by "new" sources. In order for the public and policymakers to have a clear understanding of why the "new" funding sources must become available, and thus to implement the needed steps for this to occur, the RTP should clearly identify the consequences if the plan were forced to depend only on "core" funding.

Transportation Control Measures

AQMD staff initially requested that SCAG prepare an analysis in the Final RTP/SCS of what transportation control measures would be needed to offset growth in emissions due to growth in VMT, if the decision in *AIR v. EPA* were to become final [632 F.3d 584 (9th Cir. 2011)]. The conformity section of the Draft RTP acknowledged in a footnote that the RTP would not be sufficient, but did not explain what would be required. On January 27, 2012, the Ninth Circuit Court of Appeals denied EPA's petition for rehearing in that case. As a result, AQMD staff is now requesting a scenario analysis that includes the incremental emission impact in the SCAB due to VMT growth. This scenario analysis would use the difference between 2035 VMT and the VMT from years 1997, 2008, and 2012, and applicable vehicle emission rates in 2035. The Draft EIR compares today's emissions with future emissions, and compares emissions with the project compared to emissions without the project. We request that SCAG analyze the emissions impact of growth in VMT. For illustration purposes, staff reiterates its request that the RTP also include an analysis of what additional Transportation Control Measures (TCMs) it would take to comply with this decision.

Public Availability of SCS Details

In order to provide certainty and transparency to the public, the details regarding the planning assumptions in the RTP/SCS (such as housing density, distribution of employment, etc.) should be made publicly available upon approval of the Final RTP/SCS. Because the RTP/SCS will be used to determine whether future projects can utilize new CEQA streamlining procedures, stakeholders need to have a readily available data source that describes what planning assumptions are included in the SCS. This final SCS planning scenario at the local level should be published and available to the public, and any future changes/amendments should also be made available for review so that all stakeholders can evaluate the consistency of future projects with the SCS.

Economic Analysis

The AQMD staff appreciates SCAG's participation at the February 1, 2012 study session on the economic impact of the Draft RTP/SCS. At that meeting SCAG acknowledged and clarified the limitations of the Draft RTP/SCS economic analysis released in December of 2011 and presented the results from additional analyses. Based on our understanding of the economic analysis from

that meeting, we request that SCAG provide further clarification on its methods in assessing RTP employment impacts. This information is crucial because the AQMP heavily relies upon employment figures generated by the RTP for emission projections. For example, the Draft RTP assumes that employment will be the same with and without the plan (Table 3.10-10 of the Draft EIR). Any additional analysis conducted after the draft document on job impacts should be released prior to approving the Final RTP and should provide more detailed description on the analysis assumptions and proper interpretation of the results. Also, the AQMD staff recommends inclusion of the financing component of operation and maintenance expenditures in the job impact assessment of the RTP/SCS.

Contact Information

The inclusion of these items coupled with a continued emphasis on zero and near zero emission transportation technologies in the region could formulate a plan that provides a path for sustainable communities, achieving regional air quality goals, and reducing public health impacts from future transportation infrastructure. The AQMD staff looks forward to continuing to work with SCAG in pursuit of air quality standards in the region and improve air quality for all residents in the South Coast Air Basin. Please contact me at (909) 396-3186 should you have any questions regarding these comments.

Sincerely,

Elaine Chang, DrPH

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

RE: Comments on the Drafts of the 2012 Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS) and the Program Environmental Impact Report (PEIR)

Dear Mr. Ikhrata:

For the past three years, business and industry representatives from throughout Southern California have participated in the Southern California Association of Government's extensive process used to develop the region's Draft 2012 Regional Transportation Plan (RTP), which includes an inaugural Sustainable Communities Strategy (SCS). Our interest in this process has been particularly keen given both the significant economic challenges currently facing our region's economy and the fact that the inaugural SCS could – if not considered from many viewpoints – have unforeseen negative consequences.

In light of our ongoing participation and understanding, we appreciate the tremendous effort that SCAG's staff and leaders have put into the process that led to the Draft 2012 RTP/SCS & PEIR. The development of this RTP/SCS followed an inclusive approach with SCAG holding hundreds of meetings with SCAG's public and private stakeholders. We also appreciate the extensive economic analysis that SCAG has performed on the Draft RTP/SCS in order to provide all stakeholders and SCAG's Regional Councilmembers with an understanding of the financial impacts of the plan.

As representatives of Southern California's broader business community, we recognize the crucial roles that transportation and infrastructure have in maintaining our region's economy and quality of life. Accordingly, through this letter, we join together to provide SCAG with general comments regarding remaining significant concerns about the contents of both (i) the Draft 2012 RTP/SCS, and (ii) the Draft Program Environmental Impact Report (PEIR).

From the beginning, representatives of businesses and industries have agreed upon the qualities of a good RTP/SCS. Those qualities can be summarized as follows. The RTP/SCS should:

- Foster economic growth and job creation in a balanced and accountable manner and in recognition of foreseeable regional population growth;
- Utilize all revenue sources very efficiently, and utilize new revenue sources only if they are economically sound and equitable;
- Honor the prerogatives that local governments – as the level of government with the greatest understanding of and sensitivity to community interests and context – should continue to enjoy concerning land use and community development;
- Comply with the California Environmental Quality Act (CEQA) and federal environmental laws and regulations (e.g., federal Clean Air Act conformity); and
- Allow for expeditious review and approval of projects that are consistent with a sound and reasonably accommodating RTP/SCS.

Despite our overall appreciation for the work put in by SCAG's staff, there are important aspects of the Draft 2012 RTP/SCS and Draft PEIR which, we believe, require much more consideration and correction or clarification before SCAG approves the 2012 RTP/SCS and the Final PEIR. Corrections or at least substantial clarifications – are needed in order to bring the Final 2012 RTP/SCS and PEIR back into line with the principles set forth above.

Stated here in the most general terms, SCAG's staff and ultimately its Regional Council should address the following concerns and correct the final 2012 RTP/SCS and the accompanying PEIR.

1) The Draft PEIR is unduly prescriptive and imposes mitigation requirements that are not suitable for mandatory consideration at the individual project level. Simply put, many of the prescribed mitigation measures address matters at too small a scale for a regional transportation and land use strategy. The Draft PEIR lists more than 500 discrete mitigation measures that cover a broad range of topics; and it asserts that SCAG has preliminarily found that all such mitigation measures are feasible and "can and should" apply to all future projects in the region. Many of these mitigation measures were drawn from "model policies" that were drafted in 2009 and were intended for consideration only at a jurisdictional planning level – not an individual project level. Many of the mitigation measures listed are not reasonably considerable let alone feasible generally at a project level throughout Southern California.

2) Many of the mitigation measures set forth in the Draft PEIR have no relationship to the RTP/SCS or its impacts. For example, the Draft PEIR invokes mitigation measures ranging from low-flow toilets to green roofs. Such mitigation measures have nothing to do with the regional dispersion of future development and redevelopment or its indirect effects on emissions from vehicular use (which is the proper focus of the RTP/SCS).

3) The Draft PEIR attempts to etch in stone the project-level consideration and potential incorporation of mitigation measures that conflict with, or inevitably will conflict with, highly-evolved and dynamic subject-matter regulations. For example, the Draft PEIR would prescribe mitigation requirements concerning matters ranging from storm water management to energy efficiency standards to fire protection to landscaping to water supply analyses all matters that are highly regulated and subject to dynamic standards that either are now or are bound to be at odds with the PEIR.

In light of the above-stated problems with the Draft PEIR, we believe that it needs to be substantially rewritten to clarify what we understand was intended by SCAG's staff and leaders – that the PEIR should not subtract from or interfere with local governments' reasonable prerogatives under CEQA. As the Draft PEIR now stands, the environmental analysis and suggested mitigation requirements would likely lead to more CEQA litigation rather than to CEQA streamlining as California Senate Bill 375 (2008) promised.

Turning to the substance of the RTP/SCS as a policy matter, we have the following additional general comments:

4) The RTP/SCS is undergirded by analysis which shows the dispersion of populations and employment shown and categorized at the level of sub-jurisdictional "transportation analysis zones" (TAZs). The TAZ level of detail is, we believe, too small and precise a level at which to prescribe the spatial dispersion of development and redevelopment, particularly in light of the regional nature of the RTP/SCS. Page 148 of the SCS should therefore be clarified to indicate that questions of consistency with the RTP/SCS should be substantively measured and determined at a jurisdictional or sub-regional level, not at a TAZ level.

5) The RTP/SCS should aim to reflect and accommodate both the short-term future of the SCAG region and its long-term future. For example, the RTP should better anticipate the need for and reasonable likelihood of a gradual transition in the region's overall vehicle fleet (e.g., gradually towards alternative fuels) and the ongoing need for enhancements to vehicular mobility even as more mass transit comes to fruition.

6) More detail, clarity and explanation are needed concerning the new revenue sources that are outlined within the plan document. New revenues account for $219.5 billion out of the total $524.7 billion needed for the transportation plan, yet there is very little detail explaining these significant new fees and impositions (see page 95 & 96 of the Draft RTP/SCS).
To fully and fairly evaluate these proposals, the business community and all stakeholders need the benefit of additional detail and explanation. In particular, we need clarity and assurance regarding the following:

   a. The new revenue concepts assumed within the RTP/SCS must be fair, equitable and economically sound, meaning that an appropriate nexus exists to assure that new revenues are drawn fairly and proportionally from those who benefit from the related transportation infrastructure or improvement.

   b. The new revenue sources within the RTP must be effectively allocated, meaning the plan should clearly articulate how resources will be efficiently and responsibly allocated so that there is the best possible return on investment for the expenditure of these new transportation funds. SCAG needs to show that it will be a responsible, accountable and innovative steward of the new revenues that it is proposing.

7) New revenues from fees on businesses operating in the SCAG region – and particularly the "Freight Fee/National Freight Program" listed on page 96 of the Draft RTP – need to be developed and implemented at the federal level, not the local and regional level. Unless such fees are imposed on a national scale, the region's competiveness will be compromised.

8) In the RTP, SCAG should identify and highlight the significant economic contributions of the goods movement sector to the regional and state economy. Specifically, the RTP should acknowledge that, as business stakeholders work with regulatory agencies to further reduce emissions in the SCAG region, any technology introduced must not compromise the safety, velocity, cargo throughput, economic competitiveness, or reliability of the goods movement system. It would be helpful for SCAG to state clearly in the RTP that, to date, stakeholders have not reached consensus on technologies, timing, funding, or emissions impacts of the various options that SCAG examined in the RTP. For example, SCAG discusses long-term steps towards a "Zero Emissions Container Movement System" (ZECMS). If SCAG chooses to pursue such a fundamental shift in new technology, it would need to work with all goods movement stakeholders to clearly establish whether and, if so, when and where within the transportation infrastructure a ZECMS option could be demonstrated and evaluated without negatively effecting the velocity and throughput of the system.

9) With the recent elimination of redevelopment agencies, the ability of local jurisdictions to meet the densification of urban centers in the near term is challenged, given the costs related to aging or inadequate infrastructure capacity and high development costs for higher density projects. The elimination of redevelopment agencies also threatens the availability of sufficient housing options necessary to meet the needs of a dynamic workforce. In fact, since the passage of SB 375, the State of California has stripped local governments of funds that were previously available for

transit, transportation and redevelopment. This follows many years in which the state diverted revenues from gasoline, sales, income and other taxes needed for local government programs. Local governments cannot help to fulfill the 2012 RTP/SCS without increased, not decreased, state support. SCAG should emphasize the need for the state to restore support for planning, transit, transportation and redevelopment or other necessary funding to pre-SB 375 levels in order to speed the attainment of mandated goals.

While we find many very positive aspects in the plan, especially related to principles and direction, these significant issues need to be addressed. The short list of general concerns set forth above is not meant to be exhaustive. Many of the organizations that subscribe to the above-stated comments will be commenting more robustly in separate writings. We join here, however, to express our unity in finding the Draft 2012 RTP/SCS and PEIR to be in need of significant clarification and correction. We are also jointly committed to completing this process and, over the remaining weeks, working closely with SCAG to develop and adopt a smart, flexible, accountable, and economically sound RTP/SCS.

Respectfully,

SCAG Main Office, 818 W. 7th Street, 12th Floor
Los Angeles, CA 90017

RE: Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS)

Mr. Ikhrata:

On behalf of the Southern California Contractors Association's (SCCA), more than 300 union contractors, crane operators and industry suppliers engaged in heavy civil construction in southern California, I write you today provide comments on the Southern California Association of Governments' (SCAG) Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS). SCCA has served the union heavy construction industry since 1974, including contractors' signatory with the Operating Engineers, Laborers, Cement Masons, Ironworkers, Carpenters and Construction Teamsters.

Thank you to SCAG for the hard work and forward thinking that has gone into the RTP/SCS planning process. Thank you also for the opportunity to provide comments on behalf of SCCA.

SCCA appreciates SCAG's goals of optimizing system performance (including preservation and maintenance), investing in completing transportation system gaps and strategic investments to expand the system as the population grows.

As you know, not only is southern California's population expected to grow dramatically over the next 25 years, but according to the American Road & Transportation Builders Association freight movement is projected to double. Protecting our existing transportation infrastructure and making strategic investments to expand infrastructure will be key to safely moving people and goods for decades to come.

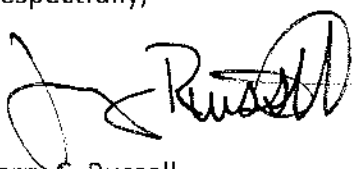
According to the Construction Industry Research Board, based in Burbank, total construction in California dropped from $98 billion in 2005 down to $42.4 billion in 2010. This represents a 57 percent reduction in total construction activity in the state. The market low was 2009 with total construction at $39 billion.

California construction employment has a direct correlation with total construction activity. According to the California Employment Development Department, Labor Market

ARTBA American Road & Transportation Builders Association
Operators Group
Southern California Construction Group

Information Division, California construction employment dropped from 933,700 in 2006 to 559,800 in 2010. That represents a 40 percent reduction in construction employment over a five year period.

The RTP calls for $524.7B in infrastructure investment which will significantly boost construction activity in southern California. The SCCA supports this plan. However, we echo the concerns voiced at the February 2 Public Input Hearing by the Southern California Leadership Council and we would like to see more clarity on the $219.5B in new revenue sources outlined in the plan.



According to the American Road & Transportation Builders Association in Washington, D.C., "Greenfield" infrastructure projects can take up to 19 years from concept to construction due to the National Environmental Policy Act and California Environmental Quality Act processes.

Therefore, SCCA has concerns with the number of mitigation measures in the PIER. We encourage SCAG to further examine the economic impacts of mandates on local governments and contractors, and the potential for project delays and future litigation.

SCCA supports a balanced approach to providing multi-modal transportation alternatives to southern California. We encourage SCAG to ensure a truly balanced approach that balances transit, highway, freight rail, bridge and roadway improvements with smart land use strategies that encourage walking, biking and other transportation options.

Again, thank you for all of your hard work in developing the RTP and SCS. We look forward to continuing to work with you on sustainable solutions that work for everyone.

Respectfully,

Larry C. Russell
Executive Vice President

Re: Comments on the Drafts of the 2012 Southern California Association of Governments (SCAG) Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS) and the Program Environmental Impact Report (PEIR)

Dear Mr. Ikhrata:

Southern California Edison (SCE) values the opportunity to provide comments on the PEIR and RTP/SCS. As an electric utility and infrastructure provider, SCE understands the importance of long-term planning to ensure safe, reliable and affordable service. SCE recognizes SCAG's immense effort in working with multiple stakeholders within the region to develop this plan and appreciates having been included in this process.

The RTP/SCS sets out long-term goals to meet mobility, housing, sustainability and economic needs of Southern California, which are accomplished by transportation agencies and stakeholders. Similarly, SCE will be constructing transmission and distribution projects to maintain and expand its electric system, ensuring long-term reliability and delivering a 33% renewable energy mix for the same growing population. Further, SCAG will play a critical planning role as transportation systems incorporate zero and near-zero emissions technologies, which it has already begun to demonstrate through its leadership on regional electric vehicle infrastructure planning. SCE looks forward to continuing its collaboration with SCAG and other stakeholders to ensure that the land-use, economic and other requirements of sustaining a safe, reliable and affordable electric system are taken into consideration in this and future regional planning initiatives.

Attached are specific comments on the Public Services and Utilities, Air Quality, Green House Gas and Aesthetics sections of the PEIR. Please feel free to contact me at (626) 302-3819 should you have any questions regarding SCE's comments. Once again, SCE appreciates the opportunity to comment on the 2012-2035 RTP/SCS and PEIR and looks forward to its continued partnership with SCAG in building a more sustainable transportation system.

Sincerely,

Alexander Pugh
Senior Project Manager

CC: Chairwoman Pam O'Connor
Jacob Lieb
Margaret Lin

Comments on Section 3.11 Public Services and Utilities:

Local Energy Partnerships

Please update page 38 to include all of the active local energy partnerships within the SCAG subregions. In addition to the San Gabriel Valley Energy Efficiency Partnership noted in this section, other partnerships exist with the South Bay Cities COG, Coachella Valley Area Governments, Ventura County, and Cities (Ventura County Regional Energy Alliance) and with the County of Los Angeles.

Growth in the Use of Electric Vehicles

Assumptions about the number of battery and hybrid plug-in electric vehicles (PEV) in Southern California between now and 2035 may be higher than accounted for within the RTP/SCS and PEIR. Currently, SCE is planning for three scenarios for PEV growth within its service territory by 2020: low - 175,000; medium - 450,000; and High – 1,000,000. In January, the California Air Resources Board passed the Advanced Clean Car Initiative calling for more than one million PEVs in California by 2025. Additionally, planners and researchers in Southern California, including SCAG and the UCLA Luskin Center, are conducting research to guide the build-out of publically accessible charging stations region-wide. This too may further support the growth of the PEV market.

Electric Vehicles Description and Charging

On page 43-44, please update the description of the status of electric vehicles and charging stations. In 2011, almost 20,000 units of Chevrolet Volt and the Nissan Leaf were sold nationwide according to Automotive News. The US Department of Energy (www.fueleconomy.gov) indicates that more than a dozen PEV models are slated to come on the market in the next two years. In regards to charging infrastructure, great strides have been made in Southern California to update the older 1990's paddle chargers to the new J1772 standard. Moreover, there are a number of charging station installers and equipment manufactures in Southern California, which means both a direct positive environmental and economic impact comes from electric vehicle growth.

Renewable Energy

Please note on page 44 in the renewable energy discussion that SCE is investing in hundreds of megawatts of distributed solar generation through a reverse auction mechanism for photovoltaic systems up to 10MW. This is one of many programs that SCE offers to distributed renewables. A more complete listing of SCE incentives can be found on the SCE website: http://www.sce.com/PowerandEnvironment/Renewables/Solar/default.htm

Thresholds of Significant Impacts to Utilities

On page 45, the range of significant impacts to a utility should also include major relocations caused by the any of the projects in the PEIR. Similarly, under the impacts section on page 46, please mention utility relocations caused by projects covered in the PEIR. In addition, please indicate in comparison with the "No Project Alternative" where there would be significant utility relocation impacts.

Energy Consumption Projections

With regards to future energy consumption projections, there are several factors that may increase future electric load growth, including the electrification of transportation systems, which are considered in the RTP itself. Three broad transportation categories that are likely to use more electricity in the study period include light-duty passenger vehicles, bus and rail transit, and multiple modes of goods movement. As an illustration, the PEIR includes projects from Metro's Measure R building campaign, which include twelve new electric light rail and subway projects during the study period. Eight of these are in SCE's territory. The PEIR and the RTP/SCS also indicate greater adoption of electric technology within the goods movement sector. The RTP includes zero-emission truck corridors on the I-710 and expansion to an east-west alignment as well as electrification of rail yards operations and routes throughout the region. SCE will work closely with transportation providers to better understand energy needs and air quality benefits of these projects as they come online. However, it is worth noting in the PEIR that these changing conditions will impact long-term demand.

SCE Facilities, Rights-of-way and Easements

The RTP references use of utility right-of-way for open space and transportation improvements. As stated in SCE's comment letter on the RTP/SCS, SCE will need to coordinate with SCAG and other transportation stakeholders to ensure impacts to SCE's critical facilities are addressed in order to meet CPUC mandates and to meet the core mission of providing safe, reliable and affordable electricity service to customers within its 50,000- square-mile service territory. Also, the RTP must underscore that the "tiering" provisions of this PEIR does not preclude the requirement that local land use planning decisions be coordinated with SCE to prevent direct and indirect encroachment of residential, commercial and industrial uses with SCE facilities.

Good long-term coordination is critical to building and maintaining functional public services. SCAG, SCE and other service providers throughout the region could benefit greatly by working together on joint corridor planning.

Public Service and Utilities Section 3.11 Mitigation Measures

While it is important for project sponsors to consider energy efficiency, renewable generation, and coordination with utilities during construction, SCE strongly recommends SCAG to direct project proponents to comply with existing regulations and best practices set by regulatory agencies. In the utility sector, these agencies include the Public Utilities Commission (PUC), California Energy Commission (CEC), Southern California Joint Pole Committee (SCJPC), and

many others. Any additional mitigation measures should be provided as optional. It should also be noted that many of the individual project EIRs already include many of the mitigations described in this and other sections. Our specific suggestions include:

MM-PS33 –SCE's primary responsibility is to provide safe, reliable and affordable service to customers. Trails, parks, and other open space may not be compatible with SCE's operating requirements or land rights. SCE asks that this mitigation be removed or amended to say, "Coordinate with utilities based on the compatibility of future use."

MM-PS57 –It is important to coordinate utility relocations to reduce impacts to city streets and other public property and right-of-way. Project proponents should consult impacted utilities early in the planning process and coordinate the environmental review and construction timing of such impacts with the utilities.

MM-PS60 – Prior to considering any renewable energy investments, SCE recommends that project sponsors maximize energy efficiency upgrades.

MM-PS61 – For any of the mitigation measures related to implementing energy efficiency measures, project sponsors should check with their utility to learn about up-to-date best practices and any incentive programs that might be offered. Further, SCE recommends that project sponsors comply with any existing building codes, ordinances, and standards on the best ways to conserve energy.

MM-PS65 – Local jurisdictions should also consider EV readiness education for residents and businesses. There are also several best practices for inclusion of EV readiness building codes for new construction and major remodels, such as those laid out in the California Green Building Standard Codes.

MM-PS70 – Similar to PS61, before installing renewable energy generating equipment, project proponents should maximize energy efficiency upgrades.

MM-PS112 – For all mitigation measures related to local jurisdiction energy efficiency planning, SCE encourages participation in municipal energy efficiency partnerships as mentioned in PS122.

MM-PS120 – SCE encourages SCAG to expand this mitigation to pursue infrastructure planning for PEVs throughout the region in partnership with stakeholders in the private sector, local government, and with planning and regulatory agencies.

Section 3.2 Air Quality and 3.6 Green House Gas Emissions

As stated in the previous section, SCE urges SCAG to consider the net positive impact of electric vehicles to air quality and greenhouse gas emissions in the region. According to the CEC and CARB Alternative Fuels Plan from December 2007, electric cars have a dramatically better well-to-wheels emissions profile than conventional fossil fuel internal combustion engine vehicles;

Carbon dioxide emissions are 72% lower and criteria pollutant emissions are 99% lower. When charging is shifted to off-peak evening hours (more than 80% of SCE EV customers charge off peak), new load from PEVs benefits both the environment and ratepayers. Similar comparisons can be drawn for heavy-duty vehicle use.

SCE comments on specific mitigations in these two sections are as follows:

MM-AQ1 – An additional Transportation Control Measure that should be included from the South Coast Air Quality Management district Rule 2202 is the installation of workplace PEV charging stations.

MM-TR86 – If local jurisdictions are requiring new construction to provide prioritized parking for electric vehicles, they should also include requirements to install EV infrastructure such as appropriate access to electrical outlets. Rolling Hills Estates has developed such an ordinance that can serve as a template.

MM-TR88 –The siting of locations for PEV and other alternative fueling stations should be coordinated with regional infrastructure plans.

Section 3.1 Aesthetics

SCE may have to develop new generation, transmission and distribution facilities to support RTP/SCS goals and future transportation needs. Therefore, SCE urges SCAG to encourage collaboration between affected stakeholders including Caltrans, transit agencies, railroad companies and the ports when planning decisions for these projects are contemplated. Such collaboration will minimize potential conflicts with identified viewshed, and further land use compatibility goals.

Southern California Gas Company

A Sempra Energy utility®

Hector Madariaga
Director
Environmental Affairs
555 W 5th St
Los Angeles, CA 90013

February 10, 2012

Ms. Margaret Lin
Southern California Association of Governments
818 W. 7th Street, 12th Floor
Los Angeles, California 90017-3435

Dear Ms. Lin:

Southern California Gas Company (SoCalGas) respectfully submits these comments regarding the Southern California Association of Governments' (SCAG) 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

SoCalGas, a regulated utility of Sempra Energy has been delivering clean, safe and reliable natural gas to its customers for more than 140 years. It is the nation's largest natural gas distribution utility, providing service to 20.9 million consumers connected through nearly 5.8 million gas meters in more than 500 communities. SoCalGas's service territory encompasses approximately 20,000 square miles throughout Central and Southern California, from Visalia to the Mexican border. These comments address those portions of the RTP/SCS related to use of natural gas fuel in SCAG's region.

Our overarching concern and comment is that the RTP/SCS is not balanced in terms of options presented for alternative vehicle fuels. There is an obvious and inexplicable predisposition towards electric and zero-emission vehicles (ZEVs) without apparent backup documentation regarding the cost-effectiveness and feasibility of such an "all" electric strategy. We respectfully request that SCAG produce a more balanced and pragmatic RTP/SCS that truly considers both the short-term and long-term future of the region, by incorporating options for cost-effective, practical, and immediately available, alternative-fuel motor vehicles such as natural gas-fueled vehicles (NGVs).

Having a broad array of clean-fuel options makes sense for your member agencies given the diversity of your six counties and 191 cities. Many of your members have already made significant commitments to NGVs powered by clean, compressed natural gas (CNG), in terms of infrastructure, training and vehicle purchases. For example, as recently as last year, the LA County Metropolitan Transportation Authority retired its last diesel bus and now operates 2221 CNG-powered buses serving the communities comprising the County of Los Angeles. This important decision was made within the context of financially constrained budgets, especially given the order of magnitude higher cost for purchasing, operating and maintaining electric and

fuel-cell transit buses. Furthermore, since affordable near-zero vehicle technology is developing faster than fuel-cell and electric vehicle technology, it is imperative that more-effective, readily available, alternative-fuel options are included in the RTP/SCS as possibilities for all of your member agencies. SoCalGas would like to share data with SCAG staff on cost-effective, readily available near-zero vehicle technologies, such as NGVs.

In the spirit of assisting SCAG in developing the most comprehensive and legally defensible RTP/SCS, the discussion below provides support for why SCAG should incorporate options for cost-effective, practical, and immediately available alternative-fuel motor vehicles such as NGVs, in its RTP/SCS.

1. SB 375 (Steinberg, 2008) - Addressing Greenhouse Gas Emissions from the Transportation Sector via Regional Transportation Plans

The RTP/SCS needs to incorporate the use of other alternative-fuel vehicles, such as NGVs in order to fully meet all of SB 375's requirements. This is because SB 375 requires plans such as the RTP/SCS to be *"balanced"* and *"pragmatic,"* and to consider *"both the short-term and long-term future."* Consequently, the RTP/SCS should incorporate cost-effective, practical, and immediately accessible alternative-fuel motor vehicles such as NGVs. The planning and infrastructure necessary for deploying electric and fuel-cell vehicles is an extremely resource-intensive and long-term process. Indeed, if the RTP/SCS were to mandate solely electric and fuel-cell vehicles, then SCAG would be making the same mistakes that CARB made when it implemented its Zero Emission Bus (Z-Bus) program ten years ago.

CARB adopted the Z-Bus program in 2000 as part of its Transit Fleet Rule which basically requires transit-bus fleets (with over 200 buses) to have by 2010, 15% of their new bus purchases be Z-Buses, such as battery-electric or fuel-cell buses, or electric trolleys. Over the last ten years, however, a number of demonstration projects conducted by a number of large transit agencies showed that these Z-Buses were very expensive, performed poorly, were unreliable, and its key components (batteries, fuel-cells) were extremely expensive to replace with a very short life span, e.g., a fuel-cell has a life span of 5,000 hours and costs over $1 million to replace.

In September 2010, Foothill Transit took delivery of three battery-electric powered Z-Buses, costing $1 million each. Each bus had a 30-mile range requiring a 10-minute recharge period. Worse, the recharging periods for these electric buses would occur during peak-electric periods when electricity is at highest cost and potentially overloading already strained California power grids. As a result, CARB is in the process of revising the Z-Bus rule to allow for greater flexibility and to give the bus-transit agencies more time.

Therefore, in order for the RTP/SCS to succeed in meeting the requirements of SB 375, it must take note of what CARB learned from its Z-Bus program and broaden its scope beyond just fuel-cell and electric vehicles, to include other alternative-fuel vehicles such as NGVs.

In addition, the RTP/SCS's current limitation of alternative-fuel vehicles to just fuel-cell and electric vehicles belies a narrow focus solely on tailpipe emissions. While it is true that ZEVs

have zero tailpipe emissions compared to near-zero or low-emission vehicles (LEVs) such as NGVs, it would not be accurate to say that ZEVs generate zero emissions overall compared to low-emission vehicles. For example, electric vehicles receive their power from generating facilities that also generate combustion emissions. Emissions are also generated by the processes used to manufacture the special batteries needed for such vehicles. These emissions cannot be ignored nor discounted, particularly with respect to attainment of the National Ambient Air Quality Standard for ozone, or contributing to any new *"or existing violation of any standard in any area."*

Furthermore, there is efficiency loss using electrical power rather than directly using natural gas to power vehicles. Indeed, in the course of producing useful electric energy in the U.S., "we waste or discard about 70 percent of the initial raw energy found in coal or most other fuel sources.[1]" It is more energy efficient, therefore, less wasteful and less polluting to directly use natural gas to power vehicles rather than generating electricity transmitted long distances over power lines and then used to power an electric vehicle. Therefore, energy efficiency should be taken into account to fulfill the SB 375 requirement for "a balanced" and "pragmatic," RTP/SCS.

2. AB 32 (Núñez 2006) - Global Warming Solutions Act

The RTP/SCS needs to broaden its scope beyond electric vehicles and incorporate the use of alternative-fuel motor vehicles such as NGVs in order to be fully consistent with the policy objectives of AB 32, which is an overall reduction of California's greenhouse gases (GHG) emissions. As discussed above, energy is wasted when natural gas is used to generate electricity for electric vehicles, compared to natural gas used directly to power NGVs. In addition to this, using natural gas to generate electricity for electric vehicles creates more GHG emissions compared to natural gas used directly to power NGVs. This point is illustrated in a recent study which found that if you compared an electric-resistance water heater to a natural-gas water heater on a full fuel-cycle basis, the natural-gas water heater emits over 50 percent less CO_2 equivalent emissions annually.[2]

Furthermore, the RTP/SCS also needs to be consistent with the goals of AB 32's low-carbon fuel standard (LCFS). The LCFS is designed to ensure the use of low-carbon transportation fuels in order to achieve the lower GHG levels intended by AB 32. This is achieved through the development of a carbon-intensity index which is measure of a transportation fuel's GHG emissions generated through its life cycle, i.e., GHG emissions generated from obtaining the fuel's raw materials, manufacturing the fuel, transporting the fuel from the producer to the ultimate consumer, and using the fuel. Electricity as a transportation fuel has a carbon-intensity index, as well as CNG, hydrogen, gasoline, and other transportation fuels.

If the RTP/SCS solely focuses on fuel-cell and electric vehicles, and excludes other alternate-fuel vehicles, such as NGVs that have lower carbon-intensity index values, it would be inconsistent

[1] Cooper, Roger. (2011; p.6) *Natural Gas Reconsidered.* Progressive Policy Institute.

[2] American Gas Association. (2009; p. 16) *A Comparison of Energy Use, Operating Costs, and Carbon Dioxide Emissions of Home Appliances.* Policy Analysis Group.

with the broader GHG reduction goals of AB 32, which is the law that forms the very foundation for SB 375 and the SCS requirement.

3. AB 118(Núñez 2007), amended by AB 109 (Núñez 2008) - Alternative and Renewable Fuel and Vehicle Technology Program

Assembly Bill 118 created and authorized the California Energy Commission (CEC) to *"develop and deploy innovative technologies that transform California's fuel and vehicle types to help attain the state's climate change policies."* With an annual budget of $100 million, the CEC must accomplish this goal by, among other things, funding projects that provide for *"a measurable transition from the nearly exclusive use of petroleum fuels to a diverse portfolio of alternative fuels"* (emphasis added). Over the last three years, the CEC has allocated AB 118 funding to a variety of projects including, but not limited to, installing electric vehicle-charging stations, installing CNG dispensing facilities, deploying the use of heavy-duty natural-gas vehicles and promoting biofuels such as biomethane. For 2012-13, CEC is planning to spend $2.5 million on new CNG refueling facilities, $12 million for NGV incentives and $20 million towards the production of biomethane.

In order not to undermine the gains made by AB 118 and devalue the substantial investments made by the CEC in CNG refueling infrastructure, NGVs, and biomethane, SCAG should incorporate a diversity of alternative-fuel motor vehicles into the RTP/SCS, including NGVs. It would be a sad waste of public funds and resources if the RTP/SCS did not become more diverse and better align its goals with those of AB 118.

4. CEQA - RTP/SCS Draft Program Environmental Impact Report (Draft PEIR)

SoCalGas appreciates the time and effort that SCAG has put forth in preparing the Draft PEIR for the RTP/SCS. SoCalGas nonetheless notes that SCAG's focus on fuel-cell and electric vehicles in the RTP/SCS continues through in the Draft PEIR. For example, Section 2, Table 2-12 of the Draft PEIR contains a summary of the various modes of freight-movement strategies (taken from the RTP/SCS), together with the analysis which determine that significant emissions benefits could be achieved from the implementation of these different strategies. However, this modeling does not appear to take into account whether such savings could similarly be achieved with the inclusion of NGV's. SoCalGas recommends that the analysis of the Draft PEIR be reconsidered and modified to the extent necessarily to include NGV's as part of its implementation strategy. Additionally, SoCalGas recommends that SCAG's revisions to the Draft PEIR give meaningful consideration to the cumulative impacts to air quality caused by the generation of the massive amounts of electricity that will used to power the ZEVs as contemplated in the Project Description. Finally, SoCalGas recommends that the mitigation measures set forth in the Traffic, Safety and Security element of the Draft PEIR (Section 3.12) make clear that NGV's should be included in any mitigation measure or strategy that includes a call for LEVs or ZEVs. Doing so would help ensure that mitigation measures are entirely feasible and capable of real impact minimization.

SoCalGas commits to assisting SCAG to include additional fuel options in the RTP/SCS, as we are similarly committed to protecting and conserving the environment for our employees, our customers and the diverse communities in which we operate and provide service. We look forward to additional discussion and sharing data with your agency on the topics discussed above.

Sincerely,

Hector Madariaga
Director Environmental Affairs

RE: Southern California Leadership Council Comments on the Draft 2012 Regional Transportation Plan & Sustainable Communities Strategy (RTP/SCS) and the Draft Program Environmental Impact Report (PEIR)

Dear Hasan,

On behalf of the Southern California Leadership Council (SCLC), we would like to acknowledge the Southern California Association of Governments (SCAG) and both its staff and leadership who have worked diligently to prepare the Draft 2012 Regional Transportation Plan (RTP), Sustainable Communities Strategy (SCS) Program Environmental Impact Report (PEIR), and associated documents. This first of its kind effort, as called for under SB 375, has taken over three years and involved an unprecedented level of collaboration between SCAG and its public and private sector stakeholders from throughout the region. The degree of outreach and engagement is exceptional and SCAG should be applauded for its efforts.

As you know, the Southern California Leadership Council is a non-partisan, non-profit, business-led public policy partnership. The Leadership Council exerts strong leadership on issues of regional significance, providing a common voice on major public policies critical to economic vitality, job growth and quality of life in Southern California. The Leadership Council unites business and community leaders from throughout the seven-county region into one effective leadership organization whose membership includes three former California governors and two dozen presidents and CEO's of top Southern California companies.

SCLC appreciates its strong working relationship with SCAG and its ability to provide business and industry input into SCAG policies and initiatives. In particular, SCLC has been an active participant in the over three year long process of crafting and developing the RTP/SCS. Based on this extensive involvement, SCLC offers the following general comments and recommendations on the draft plan and requests that this letter be included in public record as our collective comments on the Draft RTP/SCS, PEIR and associated documents.

SCLC's Position – SCLC supports a 2012 RTP/SCS that recognizes the critical importance of transportation and infrastructure to economic vitality, job creation and the quality of life for all Southern Californians. We also support an RTP/SCS that honors market forces, local control and flexibility as it works to secure an integrated approach to land use, transportation, housing and environmental planning in order to achieve GHG emission reductions under the SCS.

In evaluating SCAG's Draft 2012 RTP/SCS to determine if it is such a plan, from early on SCLC has applied a consistent set of policies and principles related to good planning, to assure that the RTP/SCS is a smart, feasible, flexible, accountable plan that is CEQA compliant, economically sound and preserves existing employment and enhances job creation.

The following is the specific set of key policies and principles that SCLC and others in the business community have applied in evaluating the plan; and we believe that they represent the qualities of a good and sound RTP/SCS.

- **Provides Positive Economic Impacts … A Plan that is Pro Economic Growth and Job Creation –** The RTP/SCS must undergo a true economic cost/benefit analysis so that economic impacts are understood and known by both SCAG Regional Council members and stakeholders well before making a final decision on the RTP/SCS.

- **Provides Local Control:**
  - Any new transportation revenues or fees collected must be under the control of the local transportation agency/authority.
  - Cities, counties and local transportation agencies must maintain appropriate control and flexibility in managing decisions and resources related to land use, transportation and community development.

- **Assures New Revenue Sources are Fair, Equitable and Economically Sound** – New transportation revenue concepts within the RTP/SCS must undergo cost/benefit and other appropriate analysis to assure that they are economically sound. They must also be fair and equitable, meaning that an appropriate nexus exists to assure that new revenues are drawn fairly and proportionally from those who benefit from the related transportation infrastructure or improvement.

- **Is Balanced and Accountable** – The plan's call for new revenue is balanced with performance measures, reforms and guarantees that assure the RTP/SCS is effective, efficient and responsible to the citizens and taxpayers of Southern California.

- **Is CEQA Compliant and Defensible** – The RTP/SCS is processed correctly from an environmental impact perspective and built to withstand a CEQA Challenge.

- **Provides for CEQA Streamlining and Protects Against CEQA Abuse** – The plan is crafted so as to capture and make feasible all available CEQA benefits, especially streamlining, while also anticipating and limiting opportunities for CEQA abuse.

SCLC's Comments and Recommendations – In measuring the draft plan against these key policies and principles, we find many very positive aspects of the RTP/SCS – especially those related to the plan's core principles, approach and direction. Likewise, we find a number of other aspects of the Draft 2012 RTP/SCS in need of much more consideration, correction and clarification before SCAG finalizes and approves the plan. Most notable among our concerns is the Draft PEIR, which we believe is in need of significant amendment in order to be more in-line with the same core principles, approach and direction reflected in the Draft RTP/SCS.

Outlined below, in very general terms, are SCLC's comments and recommendations related to specific aspects of the Draft RTP/SCS and PEIR that we believe need to be addressed and corrected in the final plan documents.

1. **PEIR** – The Draft PEIR document, unlike the Draft RTP/SCS, does not feel like it honors the same principles of local control and local flexibility that SCAG has employed throughout the RTP/SCS process. Instead, the PEIR feels like a "top-down", prescriptive, "one-size-fits-all" imposition by SCAG. That is because the PEIR contains a huge litany of mitigation measures that will be imposed mainly upon local government, business and private project proponents. The more than 500 mitigation measures outlined are highly prescriptive and many promote and/or mandate policies which will have no effect in reducing GHG. Additionally, a significant percentage of the measures are redundant to or supersede the regulatory requirements of other agencies that are themselves vested with the authority to oversee such issues (i.e. Regional Water Quality Control Boards, Air Quality Management Districts, US Fish and Wildlife, etc.). Ultimately, a review of the PEIR leaves one feeling that the document is fundamentally inconsistent with the Draft RTP/SCS.

   SCLC's specific concerns and recommendation regarding the PEIR are as follows:

   a. **Correct the PEIR's "blanket determination" of feasibility** – The introductory section of the PEIR includes what amounts to an overarching determination that all of the over 500 mitigation measures in the PEIR are feasible for application to all future projects throughout SCAG's region. By making such a statement (which cannot possibly be based on sound evidence) SCAG would impose at least crushing procedural costs on every plan and project throughout the region. Effectively eliminating local flexibility and local authority to determine feasibility on a project by project basis. This blanket finding of feasibility must be removed from the final PEIR.

   b. **Prevent the loss of appropriate project-level flexibility** – The Draft PEIR uses the phrases "local jurisdictions can and should" and "project proponents can and should" require or incorporate a whole host of suggested mitigation measures. Thus, the Draft PEIR seems to pre-determine the anecdotal consideration and possible feasibility of these measures, which could ultimately force local governments and project proponents to "rule out" each and every mitigation measure listed. The use of "can and should" needs to be corrected within the final PEIR.

c. **Substantially reduce the volume of Mitigation Measures** – The huge litany of mitigation measures that will be imposed mainly upon local government and business needs to be closely looked at and culled in the final PEIR. Especially when you consider the apparent redundancy of many of the measures.

d. **Craft the PEIR so as to foster CEQA streamlining and limit CEQA abuse** – SCAG should not forget that the main reason many stakeholders supported SB 375 and the SCS process is that it promised to deliver a number of opportunities for CEQA streamlining and facilitate reasonable progress. The PEIR, with its volume of mitigation measures, makes it more likely that project applicants and local jurisdictions will see added cost and delay (if not litigation) in the CEQA process; and few projects, if any, are likely to achieve a streamlined CEQA approval. This issue needs to be addressed and corrected within the final PEIR.

e. **Assure that the PEIR honors Local Control** – With its high level of prescription and regional imposition, the PEIR runs counter to the principles of local control and local flexibility that SCAG has employed throughout the RTP/SCS process. By incorporating the recommendations offered above, the final PEIR will become more consistent with the Draft RTP/SCS in its recognition and support for local control.

2. **Transportation Analysis Zones (TAZs)** –The Draft RTP/SCS suggests (on page 148 of the draft SCS particularly) that future policy conformity determinations should be made by comparing projects with some undisclosed data set related to the projected dispersion of populations and employment, shown and categorized at the level of sub-jurisdictional "transportation analysis zones." The TAZ level of detail is, we believe, too small and precise a level at which to prescribe policy outcomes concerning the spatial dispersion of development and redevelopment, particularly in light of the regional nature of the RTP/SCS. The SCS should, therefore, be clarified to indicate that questions of consistency with the RTP/SCS should be substantively measured and determined at a jurisdictional or sub-regional level, not at a TAZ level.

3. **New Revenue Sources** – The Draft RTP/SCS needs to provide more detail, clarity and explanation concerning the new revenue sources that are outlined within the plan document. New revenues account for $219.5 billion out of the total $524.7 billion needed for the transportation plan, yet there is very little detail explaining these significant new fees and impositions (see page 95 & 96 of the Draft RTP/SCS). To evaluate these proposals fully and fairly, the business community and all stakeholders need the benefit of additional detail and explanation. In particular, we need clarity and assurance regarding the following:

   a. The new revenue concepts assumed within the RTP/SCS must be fair, equitable and economically sound, meaning that an appropriate nexus exists to assure that new revenues are drawn fairly and proportionally from those who benefit from the related transportation infrastructure or improvement.

b. The new revenue sources within the RTP/SCS must be effectively allocated, meaning the plan should clearly articulate how resources will be efficiently and responsibly allocated so that there is the best possible return on investment for the expenditure of these new transportation funds. SCAG needs to show that it will be a responsible, accountable and innovative steward of the new revenues that it is proposing.

4. **Federal Level Fee Imposition** – New revenues from fees on businesses operating in the SCAG region – and particularly the "Freight Fee/National Freight Program" listed on page 96 of the Draft RTP/SCS – need to be developed and implemented at the federal level, not the local and regional level. Unless such fees are imposed on a national scale, the region's competiveness will be compromised.

5. **Goods Movement** – In the RTP/SCS, SCAG should identify and highlight the significant economic contributions of the goods movement sector to the regional and state economy. Specifically, the RTP should acknowledge that, as business stakeholders work with regulatory agencies to further reduce emissions in the SCAG region, any technology introduced must not compromise the safety, velocity, cargo throughput, economic competitiveness, or reliability of the goods movement system.

6. **Economic Analysis of the Draft RTP/SCS** – Throughout the process of developing the RTP/SCS and especially in the last few months leading up to the release of the Draft Plan, SCLC regularly called for a valid economic analysis of the plan – one which would provide a true cost benefit analysis. It should be noted that SCLC was not the only one concerned about the plan's potential economic impact. In fact, this past summer, when SCAG conducted a series of 18 RTP/SCS Public Outreach Workshops, a majority of participants indicated that the economy was the most important priority for the region – finishing ahead of transportation and the environment.

   As a result of this and the clear linkage between the RTP/SCS and the economy, SCAG deployed a team of outside economists to do a complete economic impact analysis of the Draft RTP/SCS. SCLC applauds SCAG's commitment to providing thorough economic analysis, including an evaluation of the plans impact on jobs and job creation. With the work of the economists now mostly complete, their impact analysis of the plan has produced some extremely positive data, showing the costs of the plan to be far exceeded by the benefits the RTP/SCS will provide in the way of job creation and economic growth in our region. SCLC strongly encourages SCAG to widely communicate this economic data and to be sure and include all appropriate new economic data sets and analysis in the final RTP/SCS.

7. **Phase II Economic Recovery Strategy** – SCLC agrees with SCAG's GLUE Council, that if SCAG utilizes the work done last year to develop and adopt SCAG's first ever regional Economic Recovery Strategy and couples this with the outstanding economic analysis conducted by SCAG in support of the RTP/SCS, SCAG is well positioned to develop a Phase II Economic Recovery Strategy as a companion measure for adoption in conjunction with (or shortly thereafter) the final RTP/SCS.

The Phase II Economic Strategy would be a way for SCAG, its GLUE Council, local government the business community and other stakeholders to come together and support critically necessary regulatory reforms and strategies to help reinvigorate the region's economy and support the full implementation of the RTP/SCS. The Phase II Strategy would also give SCAG and GLUE a vehicle for establishing a true Regional Economic Plan to go along with SCAG's other regional plans such as the RTP, the SCS and RHNA.

Conclusion – While SCLC finds a number of very positive aspects in the plan, especially related to principles and direction, there is still work to be done, significant issues to be addressed, and details to be developed. With this in mind, SCLC is committed to completing this process and working closely with SCAG.

Just as it has done over the multi-year process that has lead up to the Draft RTP/SCS and PEIR, SCLC will remain very active and engaged on this issue throughout the remainder of the process as we work together to finalize and approve a 2012 RTP/SCS and PEIR for our region that is business friendly, economically viable, promotes job creation and enhances the quality of life for all Southern Californians.

Respectfully submitted,

Billie Greer

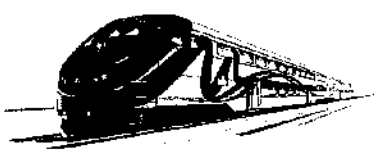
February 14, 2012

Mr. Hasan Ikhrata
Executive Director
Southern California Association of Governments
818 West 7th Street, 12th floor
Los Angeles, CA 90017

Dear Mr. Ikhrata,

Subject: Southern California Regional Rail Authority Comments on the Draft 2012 RTP

Southern California Regional Rail Authority (SCRRA) appreciates the opportunity to comment on the 2010 Draft Regional Transportation Plan (RTP) prepared by the Southern California Association of Governments (SCAG). The document identifies key challenges facing the region, and underscores the need for continued investment in our transportation infrastructure. We would also like to commend SCAG for its extensive stakeholder outreach, and thank SCAG staff for their cooperation and assistance during the RTP preparation process.



The attached table contains SCRRA's comments on the draft RTP. If you have any questions, please contact Karen Sakoda at (213) 452-0264, or sakodak@scrra.net.

Sincerely,

W. GRAY CRARY
Chief Strategy Officer
Southern California Regional Rail Authority

SCRRA Comments on the Draft 2012 Regional Transportation Plan (RTP)

Document	Page	Comment
RTP	5	We understand that Metrolink's list of constrained projects is included in the $3.9 billion Transportation Investment cost for Commuter Rail, along with other commuter rail projects submitted by the County Transportation Agencies.
RTP	21	In addition to the four routes mentioned that share portions with the LOSSAN corridor, the Antelope Valley Line shares a segment between Los Angeles Union Station and Burbank Junction. We also recommend removing the reference to the Dodger trains, and replacing the team name with a more general reference to trains for sporting events, and other special events.
RTP	51	Recommend modifying wording that states existing rail service will eventually meet 110 mph. Speeds will vary considerably depending on track configuration and geography, and 110 mph may be attained where safely possible.
RTP	53	Improvements to the LOSSAN Corridor section contains a sentence "...AVL travel time between Palmdale and LAUS can be shortened by 33% simply by skipping less used station stops." Recommend revising AVL express train wording to state, "travel time could be shortened by 25% by skipping selected station stops..."
RTP	73	Goods Movement Rail Strategy - We support expansion of the rail system to accommodate anticipated increases to freight and passenger rail services. Funding capacity expansion, safety improvements and grade separation projects will be crucial to meeting regional goals.
RTP	84	For new projects that result from implementation of the RTP, noise mitigation measures should be addressed through associated project environmental reviews.
RTP	184	Environmental Justice Mitigation Toolbox - Rail Related Impact mitigations pose some challenges. We cannot support the recommendation that rail operators improve the acoustical insulation of dwelling units where setbacks and sound barriers do not sufficiently reduce noise. Also, recommending speed limits and limits on hours of operation to mitigate noise inhibits Metrolink's ability to operate and expand.

Document	Page	Comment
RTP	197	Greater Vision for our Commuter Rail System – Text states that Metrolink operates 164 trips on weekdays. Currently, Metrolink operates 163 trips per weekday. Also, the document states, "With the investments proposed within the Constrained Plan, we expect to achieve more than double the ridership by 2035." Recommend adding investments proposed in the Strategic Plan which are also necessary to achieve the stated ridership growth.
Passenger Rail	5	Text states that Metrolink operates 164 trips on weekdays. Currently, Metrolink operates 163 trips per weekday.
Passenger Rail	10	Recommend clarifying which "Authority" is being discussed. It is sometimes not clear whether the Authority is the HSR Authority, or SCRRA.
Passenger Rail	20	Recommend adding wording to include investments in the Constrained Plan and the Strategic Plan to achieve a doubling of ridership by 2035.

Subject: **DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR) FOR REDLANDS CROSSING CENTER (SC# 2007081111), dated 11/21/11**

Dear Mr. Dalquest:

The following comments are offered herewith, pertaining to the subject document, reserving the right, however, to make additional comments in writing, or during the public hearing process, when the project and associated entitlement applications are presented to the Redlands Planning Commission and City Council:

1. The project description as published with the original Notice of Availability (NOA) refers to applications for associated documents that have not been made available to the public for review at this time, and in conjunction with a review of the project DEIR; to include, but not be limited to: Super WalMart Conditional Use Permit (CUP) and Tentative Parcel Map. CEQA requires all associated entitlement applications needed for project approval be processed concurrently, and not to be processed in a piecemeal fashion.
2. The project with the proposed mitigation measures identified in the DEIR, is not compatible or consistent with the 2008 Regional Transportation Plan (RTP), the Draft 2012-2035 Regional Transportation Plan (RTP)/ Sustainable Communities Strategy (SCS) and Program Environmental Impact Report (PEIR), or the San Bernardino County Congestion Management Plan (CMP) and RTIP. Especially troubling is the response letter to the 2007 Project NOA from the Southern California Association of Governments (SCAG), dated September 11, 2007 indicating, "We have reviewed the Redlands Crossing, and have determined that the proposed project **is not regionally significant** per SCAG Intergovernmental Review (IGR) Criteria and California Environmental Quality Act (CEQA) Guidelines (Section 15206)."

3. The traffic study in the appendix, as prepared by Urban Crossroads for Michael Bradman Associates, is technically deficient and has not been properly prepared pursuant to the San Bernardino County Congestion Management Plan (CMP) Traffic Impact Analysis (TIA) standards and guidelines. See the attached "Exhibit A" listing regarding specific shortcomings and concerns. Especially troubling is the wording contained on page 17, under Analysis Overview: "It should be noted that consistent with the requirements of Measure "I", formal compliance with the CMP traffic impact analysis guidelines is no longer required with the City's adoption of a development impact fee (DIF)."

Exhibit A

The following clarifications are requested pertaining to the Traffic Impact Analysis (TIA) prepared by Urban Crossroads for the Redlands Crossing Center:

1) Reason why AM peak analysis was not completed (esp. considering proximity to Citrus Valley High School).

2) Tennessee St / Lugonia Avenue - disagree that there is room for WB right turn lane as the lane is only 20' wide for about 2 car lengths

3) Alabama Street / San Bernardino Avenue- disagree that there are 2 EB through lanes as the receiving lanes merge less than 125' from the intersection

4) Many of these intersections are close together. Was a coordinated analysis done to see if the traffic from one intersection would back up into another intersection?

5) Exhibit 3-1 The number of existing lanes on Lugonia Avenue is wrong in several locations. It nears to 1 lane eastbound in several places. Nowhere is it 4 lanes in each direction as noted between Alabama Street and Tennessee Street. If the author meant 4 lanes total, then it has 4 lanes in several locations that are shown on the exhibit as 2.

6) Table 3-2 It looks like the number of mainline freeway lanes includes auxiliary lanes and ramp lanes and they should not be included. The auxiliary lanes and ramps should be analyzed separately. Miles between the segments were not included so the density calculation could not be checked.

7) The traffic level of service on San Bernardino Ave. between Alabama Street and New York Street does not operate properly today. The project TIA should analyze how the 210 ramp/ San Bernardino Avenue signalized intersection area could be enhanced in order to operate appropriately with project traffic.

8) Did the improvements at the SR-210 and the San Bernardino Avenue Interchange area take into consideration the Caltrans 210 PSR dated April 2008? Both construction alternatives include realigning Tennessee Street between San Bernardino Avenue and Lugonia Avenue, and ramp improvements that impact the subject development project site.

9) Did the cumulative projects include the major development proposed in Highland east of Wabash Avenue?

10) Did the traffic study include any improvements anticipated under the Congestion Management Plan NEXUS program?

11) Page 6-1 indicates that the methods used for the 2013 traffic forecasts are discussed in Section 6. Where in Section 6 are they discussed?

12) Is East Valley Traffic Model the correct model to model this area? With number of project trips, why wasn't a model prepared for this project TIA. Since the 2030 without project volumes are based on 2030 model volumes less the project trips, this would assume the project was included in the 2030 EVTM. Was the Redlands Crossing (incl. Super WalMart) included in that model?

13) Who is reviewing the traffic study on behalf of the City of Redlands?

14) Is the choice of 2030 for the future year scenario appropriate? Should the analysis instead be based upon 2010 (current) traffic data and a future year scenario for 2035 (at least 20 years past proposed opening year 2013)?

SUBJECT:

FEDERAL TRANSPORTATION IMPROVEMENT PROGRAM (FTIP) PROPOSED AMENDMENT #11-24, 20 FOR DRAFT 2012-2035 REGIONAL TRANSPORTATION PLAN/ SUSTAINABLE COMMUNITIES STRATEGY (RTP/SCS) PROGRAM ENVIRONMENTAL IMPACT REPORT (PEIR)

Dear Ms. Lin:

Thank you and SCAG for this opportunity to provide written public comments pertaining to the subject Draft PEIR document for the 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy (RTP/ SCS) document, dated December 2011, and Federal Transportation Improvement Program (FTIP) Proposed Amendment # 's 11-24, -20:

The following highway projects in the City of Redlands area of San Bernardino County, have been mistakenly left out of the identified FTIP projects lists and associated RTP/SCS documents:

1. Redlands Boulevard/ Colton Ave./ Alabama St./ RR-X's (SanBAG) Intersection(s) reconstruction
2. San Bernardino Avenue/ I-210 Freeway Interchange Upgrade (impacting proposed Redlands Crossing (super WalMart) development (see comment letter pertaining to Redlands Crossing Draft Environmental Impact Report, attached.)
3. Alabama Street/ I-10 Freeway Interchange Upgrade

SUBJECT: DRAFT 2012-2035 REGIONAL TRANSPORTATION PLAN/ SUSTAINABLE COMMUNITIES STRATEGY (RTP/SCS) PROGRAM ENVIRONMENTAL IMPACT REPORT (PEIR)

Dear Ms. Lin:

Thank you and SCAG for this opportunity to provide written public comments pertaining to the subject Draft PEIR document for the 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy (RTP/ SCS) document, dated December 2011. The following additional mitigation measures and sustainable community strategies are proposed for SCAG's consideration and inclusion in the Final Program Environmental Impact Report (PEIR), as appropriate:

1. The ***Friendly Communities*** program is being developed as a private-public partnership, to focus on the needs and quality of life issues unique to residents of unincorporated area communities, and other communities of special interest. This program could be replicated statewide/ nationwide.
2. A Countywide ***Vehicle Asset Management Plant Program (VAMPP)*** should be considered for strategic location along major routes within the regional highway network, to improve the implementation of standardized maintenance programs for governmental, transit and private fleet asset services management. This program could be replicated statewide/ nationwide.
3. Technological advances in vehicle, truck and heavy equipment lubrication, translating into significant emissions reductions and extended oil service drain intervals, can be realized by the use of ***Synthetic Lubricants*** and fleet conversion to bypass filtration. In a recent study, reported December 2011,***Amsoil Synthetic Lubricants Increased Fuel Economy 6.54 %*** in diesel trucking applications.

Southern California Association of Governments (SCAG)
818 W. Seventh Street, 12th Floor
Los Angeles, CA 90017

Re: Draft 2012 – 2035 Regional Transportation Plan/Sustainable Communities Strategy

Dear President Pam O'Connor and Honorable Members of the SCAG Regional Council:

On behalf of the Los Angeles chapter of the American Institute of Architects (AIA|LA), I am writing to express our thoughts on the draft 2012 – 2035 Regional Transportation Plan/ Sustainable Communities Strategy (RTP). With great respect for the process to draft such a comprehensive plan, we commend you on the progress made so far.

As AIA|LA supports smart growth policies that facilitate infill development projects and concentrate our investments in areas that sustain the vibrancy of the urban core, we encourage you to adopt Alternative 3 (Envision 2 Alternative) of the draft plan**.** This option will foster smart growth land use and housing patterns to achieve superior environmental results in air quality, aesthetics, open space and farmland preservation, water conservation, greenhouse gas emissions reductions, mobility, and land use.

Transit projects and active transportation investments should take precedent over highway expansion projects. Infill development and transit-first policies are natural allies of each other. Accelerating transit infrastructure and associated joint-use, mixed-income development also helps our region achieve its social, economic and cultural development goals.

AIA|LA is concerned that the current draft plan provides for a disproportionate share of funds towards highway capacity improvement that will facilitate greenfield development. The consequence of additional freeway lanes will be more VMT and more sprawl, with the associated air quality and infrastructure maintenance requirements. Environmentally and economically, facilitating more compact urban development and design conserves our natural resources and our tax dollars. In short, adopting the Envision 2 Alternative Plan will help S.C.A.G. emphasize its leadership role to shape emerging land-use and transportation plans.

Moving forward we invite the S.C.A.G. Board of Directors and staff to work with AIA|LA to shape an environmentally healthy and economically compelling vision for the future of Southern California.

Very truly yours,

Will Wright
Director, Government & Public Affairs

Re: 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy

President O'Connor and Southern California Association of Governments Regional Council Members:

The Center for Community Action and Environmental Justice appreciates the efforts of the Southern California Association of Governments (SCAG) in completing the Draft 2012 Regional Transportation Plan/Sustainable Communities Strategy (2012 RTP/SCS). We are encouraged by the concerted efforts put forth in the draft towards improving the transportation system which also includes some measures to address Public Health and Air Quality in our region.
We have joined with other concerned organizations to outline comments on the plan and incorporate those comments with ours, however we do have some specific concerns which we feel will directly impact our communities in the City of Jurupa Valley (formerly known as unincorporated Mira Loma community in Riverside County) and the City of San Bernardino Westside communities.

The communities in the Jurupa area have for many years seen an influx of warehousing slowly encroaching into our neighborhoods. Many of these projects are at the fence line of homes and schools. Residents in close proximity to highways, and busy streets with high levels of diesel truck traffic, will experience increased incidents of asthma, cancer risks, cardiovascular and respiratory disease, premature mortality, decreased life expectancy, reproductive health problems.

Components of the Regional Goods Movement System
SCAG has addressed the fact that the Inland Valley is already home to (2008) about 837 million square feet of warehousing space with another 185 million square feet in developable land. An estimated 15 percent of the occupied warehouse space served port-related uses while the remaining 85 percent supported domestic shippers. National and regional distribution facilities tend to be located in the Inland Valley and concentrated in the Jurupa Valley/Fontana area. The impacts to the surrounding communities from the diesel spewing trucks drawn to these warehouses create severe health outcomes and disruption of the quality of life for local families. SCAG must address these impacts in a significant manner as to minimize to the furthest extent possible the environmental and health risks posed from exposure to diesel exhaust.

The implementation of specific truck routes to keep truck traffic away from communities of concern as project specific strategies tend not to address specific impacts to these communities. Other measures such as establishment of green zone/buffer area between diesel sources and residents of at least 1000 feet are necessary to be protective of residents in close proximity. Additional mitigation measures of trees and foliage that help to trap many of the ultra fine particles to lessen the impacts to communities

of concern, sound walls to lessen the noise pollution from residential areas that are too close to freeways and heavily traveled thoroughfares.

Regional Clean Freight Corridor System

The truck corridor that SCAG has proposed will heavily impact the inland valley communities as SCAG has indicated the increase of truck traffic to our area will grow from 58,000 to 70,000 trucks per day although these trucks would be removed from general purpose lanes when they get to Interstate 15 and State highway 60. That traffic will then be dumped into our communities at a rate that will create an even greater health crisis for our communities. The disregard for the impacts of the plan upon the Inland Valley communities south of the 15/60 interchange must be addressed. The residents can't wait until 2035 for a solution to this huge impact. Goods movement strategies must ensure that the South Coast air basin meet federal air quality standards set forth in the Clean Air Act. The technologies mentioned must be required for future projects and incorporate these technologies or they should not be built. The RTP/SCS must remove the East-West Corridor Route Project.

Recommending building an east-west corridor without analyzing the health, housing and demographic impacts of the project on the neighboring communities can have severe environmental, health and justice implications for the entire region, and particularly for local communities of concern as previously stated.

Communities like the City of San Bernardino Westside are an example of one of the worst impacted by the BNSF Intermodal Railyard which after a health risk assessment conducted in 2008 found that residents living in close proximity faced an increased cancer risk from diesel emissions as much as 15 times higher than the Union Pacific Railyard UP in Colton and 3 times higher than any other railyard in the region. To these residents the point of maximum impact is 3,300 people in a million are at greatest risk.

The RTP/SCS must focus attention on cleaning up existing freight corridors. Rail companies should not expand until rail yards like San Bernardino's BNSF Facility implement zero emissions technology. These communities with the highest health risk cannot wait until 2030 for solutions. As freight transport increases, SCAG must encourage the incorporation of evolving technologies to specific high risk areas first and not just for proposed new projects. SCAG should use the highest polluting facilities for testing and evaluation, as well as for the use of advanced technology locomotive demonstrations.

The public health evidence is insurmountable to deny. Our built environment plays a direct impact to our health and the transportation sector must take into consideration the public health implications to the region, as well as those communities of concern and not just the region's economic growth.

RE: Comments on SCAG's Draft 2012 RTP/ SCS

Dear Honorable O'Connor,

The Kennedy Commission (the Commission) is a broad based coalition of community organizations and advocates that focus on building sustainable communities through the creation of affordable home opportunities for families earning less than $20,000 annually in Orange County.

The Commission would like to acknowledge the extensive work that the Regional Council and staff of the Southern California Association of Governments (SCAG) have done to embark on the development of a first-ever Sustainable Community Strategy (SCS) in the 2012 Regional Transportation Plan (RTP). The RTP/SCS is moving in the right direction as it provides land-use, transportation and housing strategies that will achieve and exceed the greenhouse gas emission reduction targets set by the California Air Resources Board (CARB).

The implementation of the RTP/SCS will create more sustainable and healthier communities in the SCAG region, however, the Commission believes the strategies linking housing and transportation can be strengthened to facilitate the development of affordable homes. Locating homes, specifically affordable homes, near accessible public transportation, job centers and neighborhood amenities will allow individuals to afford to live in the same community in which they work in. This type of planning will effectively address the goals of SB 375 and decrease long distance commutes, vehicle miles traveled (VMT) and highway congestion that all leads to greenhouse gas emissions.

The Commission would like to comment on the following:

Integrating Affordable Homes Near Job Centers and Transportation Hubs

The RTP/SCS identified High-Quality Transit Areas (HQTA) in the region as opportunity planning areas for the majority of future housing and employment growth. It is projected that by the year 2035, 51 percent of new homes and 53 percent of new employment growth will be developed in HQTA.[1] While the HQTA encourages higher density and compact development near and around job centers and transit amenities, this type of development does not necessarily

[1] Regional Transportation Plan 2012 RTP Sustainable Communities Strategy Towards a Sustainable Future, p. 128, December 2011.

facilitate the development of affordable homes throughout the SCAG region. While there are several jurisdictions that have initiated urban infill or transit-oriented developments, many of these housing developments have been planned or developed to provide housing opportunities affordable to higher income households. These developments lack mixed-income housing opportunities that would be available to many working families, especially lower income families, who want to live and work in the City.

While future growth in HQTA reflects the emerging demographic trends and is the recommended major land use scenario, the RTP/SCS acknowledges that there are potential impacts of displacement of lower income households and gentrification resulting from new transit oriented developments that attract affluent residents in the neighborhood. The Commission recommends that SCAG closely analyze, monitor and mitigate any potential impacts or environmental justice inequalities stemming from future development. In addition, the Commission strongly supports SCAG's land use and housing mitigation measures to help reduce these impacts:

- **MM-LU11:** Significant adverse impacts to community cohesion resulting from the displacement of residences or businesses can and should be mitigated with specific relocation measures as dictated by local, state or federal requirements on a project-by project basis. Such measures include assistance in finding a new location, assistance with moving, or compensation for losses. Where it has been determined that displacement is necessary and displaced individuals are eligible, a relocation assistance program consistent with the State Uniform Location Assistance and Real Properties Acquisition Policies Act provides compensation and assistance in finding new residence for displaced individuals.[2]

- **MM-LU53:** SCAG shall promote infill, mixed-use, and higher density development, and provide incentives to support the creation of affordable housing in mixed use zones.[3]

- **MM-LU61:** Local jurisdictions can and should mix affordable housing units with market rate units as opposed to building segregated affordable housing developments.[4]

- **MM-LU73:** Local jurisdictions can and should locate affordable housing in transit-oriented development whenever feasible.[5]

---

[3] Draft Program Environmental Impact Report, 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy, p. 3.8-21, December 2011.
[4] Draft Program Environmental Impact Report, 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy, p. 3.8-22, December 2011.
[5] Draft Program Environmental Impact Report, 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy, p. 3.8-23, December 2011.

- **MM-POP4:** Project sponsors shall mitigate impacts to affordable housing as feasible through construction of affordable units (deed restricted to remain affordable for an appropriate period of time) or payment of any fee established to address loss of affordable housing.[6]

Jobs-Housing Fit Performance Measure

On the June 30, 2011 SCAG Environmental Workshop, participants commented on the need for a performance measure such as a jobs-housing fit analysis in the RTP/SCS.[7] This analysis would evaluate the types of jobs being created in the community to the housing types and affordability levels of homes being developed. The RTP/SCS has instead provided a performance measure on jobs-housing imbalance or jobs-housing mismatch that analyzes the socio-economic profiles of long distance commuters.[8] This is a small step towards the right direction but the Commission recommends there needs to be more research and thorough analysis, specifically on the jobs-housing fit, to provide a better understanding of how we can strengthen the link between jobs and housing development for all economic segments of the community.

The Kennedy Commission looks forward to working with SCAG Regional Council and staff to achieve our mutually beneficially goals in creating more sustainable, healthier and equitable communities. Specifically, the Commission welcomes the opportunity to continue our dialogue that will result in the production of new homes affordable to extremely low, very low and low-income households throughout the region.

If you have any questions, please feel free to contact me at (949) 250-0909 or cesarc@kennedycommission.org.

Sincerely,

Cesar Covarrubias
Executive Director

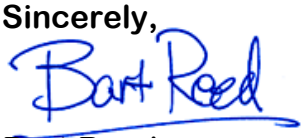
Los Angeles, CA 90017-3435

RE: Comments on SCAG DRAFT 2012 RTP and the Plan EIR

Dear Ms. Lin:

We wish to express our concerns on elements of the draft SCAG RTP, as we don't see the AB32 and SB375 goals being achieved, without some modifications to the document, as our comments outline.

Identify the Measure R Van Nuys and Sepulveda Pass transit projects as corridors rather than designating them as 'busways,' which could improperly preempt and prejudice the environmental clearance process. Note that neither Measure R nor Metro have chosen the mode for either corridor; "Rapidways" describe rapid transit corridors regardless of mode.



Converting existing High Occupancy Vehicle (HOV) carpool lanes to High Occupancy Toll (HOT) must allow carpools to have access to these lanes free of charge and without mandatory transponders. Otherwise, the intent of the RTP/SCS will be undermined and its outcome will underperform the potential of these lanes due to a reduction in both the number of carpools and the average number of passengers per vehicle.

Converting loading and unloading activities at the ports to direct ship to rail (excluding any intermediate truck sorting steps) will enable greater capacity at lower cost and environmental impact. Creation of a freight pipeline from the Ports to the Inland Empire with an underground alternative to the 60 Truck Freightway should be an alternative.

In addition to a regional gas tax for transportation, SCAG should implement a diesel fuel tax that accounts for both the wear and tear on roadways as well as pollution. Receipts from both taxes should be kept together in a regional transportation matching fund.

We recommend that you include these modifications in the RTP.

Sincerely,

RE: Comments on the Draft 2012 Regional Transportation Plan/
Sustainable Communities Strategy and Program Environmental Impact Report

Dear Mr. Ikhrata:

The Foothill/Eastern Transportation Corridor Agency and the San Joaquin Hills Transportation Agency (TCA) appreciates the opportunity to review and provide comments on the Draft 2012-2035 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) and associated Draft Program Environmental Impact Report (PEIR). TCA commends the SCAG staff for the tremendous amount of work and effort in putting these documents together. TCA also recognizes and supports the timely adoption of the RTP/SCS to enable the Southern California region to proceed with the planning and implementation of regionally significant transportation projects. Further, TCA recognizes that the SCS is particularly important for the region to meet its state mandated greenhouse gas (GHG) emissions reduction targets for 2020 and 2035.

Please find below TCA's specific comments on both the draft RTP/SCS and PEIR.

DRAFT 2012-2035 RTP/SCS

Page 23, Vision, Transportation Demand Management
Transportation pricing is not identified as part of the RTP/SCS "vision" either as a transportation demand management method or as a financing tool, even though it is clearly a component of the transportation plan and financial plan for implementation. The Orange County SCS includes a description of the current and planned priced transportation network that should be adapted to address the entire region.

Recommended Clarification:
Add information from the Orange County SCS (pages 126 and 127 of the Subregional Sustainable Community Strategies Technical Appendix) that describes the existing and

planned inter-operable priced transportation network in the region, including toll roads, express lanes and high occupancy toll (HOT) lanes. The text can be expanded to address HOT lanes, toll2 facilities, express lanes and tolled truck lanes in the region as a whole, and should include the following points:

- Tolled centerline miles in the region will increase from 61 in 2008, to 408 in 2035, including toll roads, express lanes, HOT lanes, and tolled truck lanes.

- Priced lanes provide flexibility and options as part of the congestion relief toolbox of measures designed to help meet sustainability and emission reduction goals related to SB 375 and other state and federal mandates.

- "Priced facilities are an especially important tool for providing intra-county, inter-county and interregional capacity."

- "The existing priced transportation network serves the locations where major employment and housing growth are projected to occur."

- "Toll roads and express lanes charge users a fee for travel, but typically offer less congested traffic lanes than nearby freeways and roadways. Reduced congestion provides improved and more efficient mobility with fewer air pollutants and greenhouse gas (GHG) emissions caused by congestion."

- "The toll road system is designed to interrelate with transit service. The toll roads can accommodate Bus Rapid Transit and express bus service, and toll road medians are sized and reserved to provide the flexibility for future transit, if appropriate."

- Priced facilities such as the Orange County toll roads are privately funded. This insures that these facilities can relieve congestion and associated air pollution and GHG emissions without further stressing limited state, federal and local transportation funding resources.

Page 42, Major Highway Completion Projects, Table 2.2
SR-241 (ORA052) is identified in Table 2.2 as a major highway completion project. However, the completion year is listed as 2020-2030. Although widening will occur in the 2020 to 2030 timeframe, the official project description identifies the completion date as 2030.

Recommended Clarification:

- In Table 2.2, we request that the completion date for SR 241 be clarified as 2030, consistent with the project description for ORA052.

- In the interest of establishing that some major highway projects in Table 2.2 provide emissions reduction benefits without burdening limited federal, state and local

funding resources, we request the following clarifying footnote: *SR 241 is a privately funded Transportation Control Measure.*

Page 56, Express/HOT Lane Network
This appears to be the only "priced transportation" discussion in the transportation investments chapter. It does not identify how many miles of priced lanes exist now, or how much that network will be expanded in the plan. Toll roads are included in the priced transportation network, along with express lanes, and HOT lanes, but are not included in the discussion. However, TCA's Toll Roads are depicted in Exhibit 2.6, Regional HOT Lane Network. The terminology should be clarified.

Recommended Clarification:

- Retitle this section, "Express Lanes, HOT Lanes and Toll Roads: The Priced Transportation Network."

- Table 2.6 should be retitled "Express Lanes, HOT Lanes and Toll Roads"

- The text should provide brief definitions of each type of facility that makes up the priced transportation network, as Express Lanes, Toll Roads and HOT Lanes each operate differently.

- The discussion should include that express lanes, HOT lanes and toll roads generate user fees that pay for construction and operation of their facilities.

- The text should discuss that all priced facilities in the SCAG region insure inter-operability by using a common technology, FasTrak, to collect user fees.

- The text should establish the congestion reducing goal of priced transportation, and the associated criteria pollutants and GHG emissions benefits of providing free flow capacity that avoids emissions generated by idling. In addition, user fees provide an economic incentive for cost-sharing that promotes ridesharing, which is beneficial to reduced criteria pollutants and GHG emissions reductions.

Page 76, Conservation Planning Policy
The description of this policy requires clarification to express the intent of SCAG's Energy and Environment Policy Committee and the coalition of more than 20 public, non-profit and private sector interests, including TCA that urged SCAG to include it.

Recommended Clarification*:*
Add a paragraph that explains why the conservation program benefits GHG emissions and other criteria pollutants reductions. Specifically, in addition to meeting Safe, Accountable, Flexible, Efficient Transportation Equity Act: A legacy for Users (SAFETEA-LU) requirements, the open space lands conservation program would use natural land acquisition to sequester (store) carbon, avoid GHG emissions, and reduce

vehicle miles traveled (VMT). This proposed program allows for early implementation and mitigation opportunities. Jurisdictions would have the option to invest early in this open space strategy which offers immediate GHG emissions avoidance benefits, while simultaneously proceeding with the longer term and planning intensive projects to build transportation centers near existing residential areas, or employment centers near transit stations, etc.

Suggested steps to develop a regional conservation planning policy should be expanded to include the following key points supported by SCAG's Energy and Environment Committee and the coalition that recommended this program:

- Build upon existing open space land acquisition and open space programs in the region, tailoring programs to each individual county in the region. These include, but are not limited to, OCTA's Measure M Mitigation Program, and TCA's open space mitigation program, which has protected 2,200 acres in perpetuity to date.

- Pursue open space conservation in a voluntary manner, working with willing private sector landowners.

Page 78, Greenhouse Gases
The draft document states that "The transportation sector, primarily, cars and trucks that move goods and people, is the largest contributor [to greenhouse gas (GHG) emissions] with 36.5 percent of the State's total GHG emissions in 2008. On road emissions (from passenger vehicles and heavy duty trucks) constitute 93 percent of the transportation sector total." This statement covers only part of the transportation system's GHG emissions role. The text must recognize projects that reduce transportation network GHG emissions by relieving congestion and insuring free-flow conditions.

Because GHG emissions from vehicles increase in stop-and-go traffic, congestion relief projects that eliminate bottlenecks and maintain free-flow conditions actually reduce transportation network GHG emissions, much as Transportation Control Measures are transportation projects that reduce criteria pollutants. Further, the SB 375 Regional Targets Advisory Committee (RTAC) recommends tracking the performance of such strategies "to smooth extreme congestion to more carbon-friendly speeds" in its final report to the California Air Resources Board.

Recommended Clarification:
Insert the following statements on page 78:

- Congestion relief projects reduce transportation network GHG emissions, which otherwise result from idling.

- Consistent with the SB 375 RTAC's recommendation in its final report to the California Air Resources Board, the RTP/SCS includes projects and strategies designed "to smooth extreme congestion to more carbon-friendly speeds."

- A subset of projects included in the Draft RTP/SCS reduce GHG emissions by providing relief of existing and projected congestion. These include toll roads, express lanes, HOT lanes, high occupancy vehicle (HOV) lanes, and dedicated truck toll lanes.
- Congestion pricing is a powerful transportation demand management tool incorporated in the Draft RTP/SCS for reducing GHG emissions. SCAG has launched a two-year study of congestion pricing strategies that can provide needed transportation facilities while reducing the region's GHG emissions associated with vehicle trips.

- Orange County's toll road network is a prime example of priced congestion relief projects. The toll roads have variable pricing incentives that spread out vehicle use to limit peak-hour congestion that leads to increased GHG emissions.

- Other examples of projects that reduce GHG emissions on the regional transportation network include express lanes, HOT lanes, HOV lanes and dedicated truck toll lanes for goods movement.

Page 79, Air Quality
Transportation Control Measures (TCMs) are mentioned as mitigation measures, but are not defined or illustrated. The importance of TCMs needs to be clarified and expanded to clearly communicate their air quality role in the RTP.

Recommended Clarification:
- Provide a brief description of projects that qualify as TCMs.

- Explain the role of TCMs in reducing emissions.

- Provide a reference to the list of TCMs contained in the Conformity Technical Report.

Page 86, Financial Plan, Introduction
The draft document states that "We have successfully implemented toll systems in the past with the Transportation Corridor Agencies' network of toll roads and the SR-91 Express Lanes in Orange County. This kind of innovation in transportation continues as neighboring counties within our region consider a broader network of toll systems." However, the statement needs to clarify the financial planning importance of privately funded toll facilities.

Recommended Clarification:
Priced transportation facilities also provide the opportunity for financial innovation. The Orange County toll roads (SR 73, SR 133, SR 241, and SR 261) are privately funded. They provide congestion relief and associated air pollution and GHG emissions reduction without further stressing limited federal, state, and local transportation funding.

Page 92, Core Revenues, Regional Revenues
Table 3.6, Regional Revenues, identified federal, state and local sources of transportation funding for the plan. Nowhere in the document is the private sector funding contribution assumed for the plan described, although toll road widenings, expansions, and new tolled facilities that are privately funded are included in the plan and in the total cost of the plan.

Accurately describing the extent of private funding is an important public disclosure, and an important element of the financial plan that relieves the burden on limited federal, state and local transportation funding.

Recommended Clarification:

- Clarify in the text the percentage of total funding contributed by private sources. This sum should include the privately funded Orange County toll roads (SR 73, SR 133, SR 241, and SR 261).

- A companion pie-chart, similar to Table 3.6, showing the split between public and private funding would also clarify this point.

Page 103, Table 3.5 2012 RTP Revenues (in Nominal Dollars, Billions)
Until such time that the TCA Board reviews, considers, and/or approves a VMT-based user fee; TCA is not in a position to support an increase in fees as proposed in the draft Plan. Furthermore, the draft does not clarify how the cost of a proposed new VMT fee, increased gas tax fee, tolls and user fees would layer over each other. It appears that they would accumulate for individual drivers, with a potentially significant economic impact on drivers and households. Drivers paying to use toll roads, express lanes and HOT lanes would be paying twice for the same mileage.

Page 145, Exhibit 4.17, Land Use Pattern Orange County (2035)
The southerly portion of SR 241 (ORA052), from Oso Parkway to the San Diego County border, has been inadvertently left off this map.

Recommended Clarification:

- Please show the SR 241 alignment on Exhibit 4.17 consistent with the project modeling list and other transportation network maps in the Draft RTP/SCS.

Page 161, Performance Outcomes
This text should clearly state that performance measures and outcomes are not intended to apply to individual areas or projects, but rather to the region as a whole.

Recommended Clarification:
We recommend that the following clarification be inserted:

- Performance measures and expected outcomes will be used to monitor the RTP/SCS at the regional level; these measures and outcomes are not proposed for use at the subregional or project-specific level.

Page 207, Strategic Plan
SCAG assumes $100 billion will be available from a future VMT fee starting in 2025, but funding for mileage-based user fee demonstration projects and implementation strategies are not included in the constrained RTP/SCS; they are listed in the unfunded Strategic Plan. The TCA Board has made no decision on the use of VMT fees and until such time is unable to support its use in the proposed in the draft Plan.

Highways and Arterials Technical Report

Page 15, Express/ High Occupancy Toll (HOT) Lane Network.
As with the comment on page 57 of the main RTP/SCS document, the technical report should clearly include toll facilities in the description of projects included in this category. Orange County toll roads are not categorized as express or HOT lanes, but collect tolls as a means of insuring low-emission free-flow capacity and funding the construction and operation of the facility. Toll roads integrate with express lane and HOT lane facilities via the common FasTrak technology that allows inter-operability and convenience for drivers.

Recommended Clarification:

- Retitle this section, "Express Lanes, HOT Lanes and Toll Roads: The Priced Transportation Network."

- Table 2.6 should be retitled "Express Lanes, HOT Lanes and Toll Roads"

- The text should provide brief definitions of each type of facility that makes up the priced transportation network, as express lanes, toll roads and HOT lanes each operate differently.

- The text should discuss that all priced facilities in the SCAG region ensure inter-operability by using a common technology, FasTrak, to collect user fees.

- The discussion should include that express lanes, HOT lanes and toll roads generate user fees that pay for construction and operation of their facilities.

- The text should establish the congestion reducing goal of priced transportation, and the associated criteria pollutants and GHG emissions benefits of providing free flow capacity that avoids emissions generated by idling. In addition, user fees provide an economic incentive for cost-sharing that promotes ridesharing which is beneficial to reduced criteria and GHG emissions reductions.

Performance Measures Technical Report

Page 2, discussion of types of performance measures.
As with the comment on page 160 of the main RTP/SCS document, the text must make clear that the performance indicators are intended to be applied to the RTP/SCS at the regional level and are not proposed for project-specific application.

Recommended Clarification:
We recommend that the following clarification be inserted:

- Performance measures and expected outcomes will be used to monitor the RTP/SCS at the regional level; these measures and outcomes are not proposed for use at the subregional or project-specific level.

SCS Background Documentation

Pages 36 and 37, Land Use Pattern Maps for 2020 and 2035.
Both of these maps are inconsistent with transportation network maps in the document and do not include SR 241 (ORA052), specifically called out in the RTP as a TCM and priced transportation project in southern Orange County.

Recommended Clarification:
Please show the SR 241 alignment on the Land Use Pattern Maps for 2020 and 2035 consistent with the project modeling list and other transportation network maps in the Draft RTP/SCS.

Page 54, Pricing and Vehicle Policy Assumptions.
This discussion only refers to a 2-cent per mile VMT fee; the Plan proposes a 5-cent per mile fee. This inconsistency should be eliminated.

Recommended Clarification:

- Amend the reference to a 2-cent VMT fee to a 5-cent per mile VMT fee starting in 2025, consistent with the RTP/SCS main document.

Add the following sentence:

- Toll roads, express lanes and HOT lanes charge varying tolls per mile for use of their facilities. Tolls are project-specific and typically vary by time of day and day of the week. Tolls collected for existing toll roads in Orange County are dedicated to operational expenses and retiring the bonds issued for construction.

Transportation Conformity Technical Report

Page 14, Toll Roads
The discussion of toll road assumptions specifically mentions express lanes and HOT lanes, but not tolled facilities such as existing toll roads SR 73, SR 241, SR 133 and SR 261 in Orange County.

Recommended Clarification:
- SR 241 should be added to Table 6 as a tolled facility and the effect of the toll charges on it should be incorporated into the highway assignment procedure.

- Table 6 should be retitled appropriately to include "Express Lane, HOT Lane and Toll Road Networks." This change should also be made in the main RTP/SCS document.

Transportation Security Technical Report

General
This report addresses the need for the transportation system to enhance emergency preparedness, and transportation security and preparedness. Projects that enhance the region's security are not identified.

Recommended Clarification:
Provide illustrations of transportation projects needed in the RTP/SCS to improve transportation security. For example, the southerly extension of SR 241 provides an alternative route connecting the SCAG and San Diego Association of Governments coastal regions, which have very high current and projected travel volumes. This route will ease future projected congestion to ensure critical capacity for access and evacuation in times of environmental or other emergencies, such as earthquakes, wildfires, traffic accidents, and potential nuclear threats at the San Onofre plant. The need for an alternative route was recently illustrated by the lack of evacuation capacity from the 2007 North San Diego County wildfires.

DRAFT PROGRAM EIR

General
The Draft PEIR sets forth 500 mitigation measures that SCAG states are "feasible" and reasonable to assume that they will be implemented. Further, it is difficult to sort through these voluminous mitigation measures to identify those that are mandatory vs. advisory and those that apply to transportation projects as opposed to other types of developments. This can be improved by reformatting and clarifying the proposed mitigation measures as follows:

Recommended Clarifications:
- Provide a clear statement to the following effect: All mitigation measure recommendations to project sponsors and agencies are advisory. Lead agencies are

responsible for identifying and addressing those measures they deem practical and feasible, or applicable to specific projects.

- Sort out mitigation measures so that those that are mandatory upon SCAG appear first in each category and can be easily distinguished from Best Management Practices or Best Available Control Measures that SCAG is recommending to project sponsors and other agencies.

- For mitigation measures that simply restate existing regulatory agency requirements or recommendations, e.g. California Department of Fish and Game survey protocols and mitigation requirements, reference the specific regulation and include in the description "or successor regulation or guideline" so that as time moves forward the measure does not recommend out of date regulations or guidance.

Page 3.6-15 and 17 Greenhouse Gas Emissions, Transportation Network Improvements.
On page 3.6-15, the Draft PEIR states that the transportation sector is a major source of California's greenhouse gases. Further, on page 3.6-18, the discussion cites information on the GHG emissions from new vehicle trips. However, in both places, the document does not clarify that certain transportation projects reduce greenhouse gases by virtue of their design, location and operation. Similar to the way that Transportation Control Measures reduce precursors to ozone, projects that reduce congestion and idling reduce GHG emissions from the regional transportation network. The PEIR must explain the relationship between GHG emissions and congestion relief, and the components of the RTP that provide congestion and idling relief on the regional network.

Recommended Clarification:
Consistent with our recommended clarification for page 78 of the Draft RTP/SCS document, the PEIR text should state the following on pages 3.6-15 and 3.6-18:

- Congestion relief projects reduce transportation network GHG emissions due to idling.

- Consistent with the SB 375 RTAC's recommendation in its final report to the California Air Resources Board, the RTP/SCS includes projects and strategies designed "to smooth extreme congestion to more carbon-friendly speeds."

- A subset of projects included in the Draft RTP/SCS reduce GHG emissions by providing relief of existing and projected congestion. These include toll roads, express lanes, HOT lanes, HOV lanes, and dedicated truck toll lanes.

- Congestion pricing is a powerful transportation demand management tool incorporated in the Draft RTP/SCS for reducing GHG emissions. SCAG has launched a two-year study of congestion pricing strategies that can provide needed

transportation facilities, while reducing the region's GHG emissions associated with vehicle trips.

- Orange County's toll road network is a prime example of priced congestion relief projects. The toll roads have variable pricing incentives that spread out vehicle use to limit peak-hour congestion that leads to increased GHG emissions.

- Other examples of projects that reduce GHG emissions on the regional transportation network include express lanes, HOT lanes, HOV lanes and dedicated truck toll lanes for goods movement.

Maps 2, Project Description

General, SR 241 Missing from 2035 Base Maps
Please ensure that all 2035 base maps include the southerly extension of SR 241, For example, Map 2.13, 2035 Grade Separation Projects, does not show SR 241, which will be completed by 2030, on the base map, while it is depicted on Map 2.6 an 2.8. Map 2.19, Land Use Pattern in Orange County, does not depict SR 241; this is accurate only if the map is intended to show 2008 land use; SR 241 should be included in all maps for 2020 and 2035.

Recommended Clarifications:
Consistent with the transportation modeling network and TCM timely implementation report, show SR 241 as part of the 2035 base map for all transportation maps in the PEIR. Specifically, add SR 241 to Map 2.13 and Map 2.19.

TCA thanks you in anticipation of your written responses to these comments. We look forward to the amendments in the final 2012-2035 RTP/SCS and PEIR to incorporate the recommended changes. Should you have any questions or require any clarification regarding these comments, please feel free to contact Ms. Valarie McFall, Director, Environmental Services at 949.754.3475 or via email: vmcfall@thetollroads.com.

Sincerely,

Scott Schoeffel, Chair
San Joaquin Hills Transportation Corridor Agency

Urban & Environmental Policy Institute
OCCIDENTAL COLLEGE

February 14, 2012

Attn: President Pamela O'Connor
Southern California Association of Governments
818 W. 7th Street, 12th Floor
Los Angeles, CA 90017
Re: 2012-2035 Draft Regional Transportation Plan/Sustainable Communities Strategy

Dear President O'Connor and Southern California Association of Governments Regional Council Members. Thank you for seeking public input on the draft Regional Transportation Plan and Sustainable Communities Strategy. The Urban and Environmental Policy Institute at Occidental College supports transportation and land use policies and spending to make the region more just, green, and livable. We are pleased that the draft RTP and SCS have a number of positive elements expanding clean transportation, encouraging more sustainable land uses, and reducing greenhouse gas emissions:

- The planning process took account of the relationship between transportation, land use, sustainability, environmental justice and economic development.
- The draft plan calls for significant investments in transit construction, operations and maintenance.
- The draft plan increases investments in active transportation compared to previous RTPs.
- The draft plan anticipates that vehicle miles traveled will increase less than population growth.
- The sustainable communities strategy quantifies how different forms of growth will have very different impacts on sprawl, energy and water use and other sustainability indicators.
- The draft plan anticipates adoption of zero emission technologies towards the end of the plan time frame.
- The draft plan supports high speed rail.
- The draft plan anticipates a reduction in greenhouse gas emissions from transportation in line with the goals of SB 375.
- The single largest anticipated funding source in the draft plan is implementation of a fee on driving or an increase in the gas tax, either of which would discourage driving.
- Much of the new highway space proposed in the draft plan is toll roads, HOV lanes, or HOT lanes (open to HOV or Tolls) and therefore may lead to less new, induced driving than the provision of free, multiuse lanes.

We however believe that the plans can do more and need to do more to expand alternatives to driving; price car and truck traffic to reflect their negative externalities; reduce the amount of space given to cars, trucks and parking; create good places rather than sprawl; and clean up the goods movement industry.

Recommendations

A. Rapidly create a more balanced transportation system. The SCAG region has 21,638 center-line miles of road (55,890 lane miles of roads), 4315 miles of bikeways of varied quality (almost zero of it protected lanes on streets), and 470 miles of passenger trains (only 80 miles of which is light rail/subway, the rest metrolink). Opportunities and infrastructure to walk, bike, and take transit should be rapidly expanded so residents have choices for how to get around.

1. Significantly increase investments in active transportation from the $6 billion budgeted. The Los Angeles County Department of Public Health calculates that $40 billion is needed to fix sidewalks, implement jurisdictions' bike plans; and invest in last mile infrastructure near transit stations. http://saferoutescalifornia.files.wordpress.com/2011/11/dph-cost-methodology-presentation_dec14_2-11_notes.pdf
    - Streets are our most important public spaces so we should reconfigure them to be vibrant, safe, healthy places rather than spaces designed to move as many cars as possible without regards for impacts on adjacent activities. Active transportation funding should convert existing arterials and local streets to be world class living and complete streets. SCAG should encourage jurisdictions to follow the street design standards contained in the Model Design Manual for Living Streets http://www.modelstreetdesignmanual.com/ recently developed with funding from the Los Angeles County Department of Public Health.
    - Most cities in the SCAG area have not developed bike or pedestrian plans so part of this funding should go towards assisting these cities in developing plans early in the implementation years.
    - Most people will not ride bicycles in traffic (or separated from traffic by a painted line). In the developed world, every nation with high rates of cycling has separated bike facilities while every nation with low cycling rates lacks this infrastructure. http://www.ta.org.br/site/Banco/7manuais/VTPIpuchertq.pdf Let's start creating a network of protected bike lanes/ cycletracks in all urbanized areas of Southern California, like the Dutch did beginning in the mid 1970s. http://www.youtube.com/watch?v=XuBdf9jYj7o Budget at least $1 billion for the construction of 1000-2000 miles of protected bike lines to increase rates of cycling among non traditional cyclists (protected lanes recently constructed in Long Beach http://www.bikelongbeach.org/News/Read.aspx?ArticleId=85 cost approximately $580,000 per mile).
2. Expand and accelerate transit investments so all planned transit projects in the RTP are constructed by 2022. Existing and new transit services should be funded so as to be affordable with frequent service. Rapid buses should serve all major streets in urban areas so that buses become the default motorized transportation choice. http://www.humantransit.org/2010/11/los-angeles-some-thoughts-on-the-challenge-for-the-source.html

B. Pay for additional active transportation and transit investments by defunding harmful highway projects and by identifying local revenue sources that tax harmful transportation. Moving people by cars and materials by trucks and diesel trains and separating where we live from where we work and shop produces fatal collisions, http://map.itoworld.com/road-casualties-usa cancer and heart disease, http://hydra.usc.edu/scehsc/web/Resources/Key%20Research%20Studies/Resources-%20Key%20Research%20Studies.html obesity and diabetes http://designinghealthycommunities.org/ and climate change http://www.pnas.org/content/early/2010/02/02/0906548107.full.pdf?with-ds=yes , with a disparate impact on residents of low income neighborhoods bisected by highways and living near ports, warehouses, railyards and intermodal facilities. SCAG should projects that increase harmful transportation and tax driving and freight transport to pay for clean transportation.

1. Cancel highway expansion projects to pay for more active transportation and transit. Among the dozen most expensive road expansion projects in the RTP are: east west freight corridor ($15.2 billion), Riverside to Orange County CETAP ($13 billion), high desert corridor ($6.9 billion), 710 corridor expansion ($6.1 billion), 710 gap closure ($5.6 billion), 5 north capacity enhancements ($5.3 billion), 241 expansion ($2.7 billion), mid county parkway ($2.3 billion), 15 widening ($ 1.7 billion), 405 widening in Orange County ($1.7 billion), 5 widening ($1.6 billion), and 79 expansion ($1.4 billion). Building these highways projects will expand driving (and, if built in areas with predominately rural or suburban land uses, also expand sprawl). Cancelling them can allow the $63.5 billion budgeted for these projects to be spent on active transportation and transit.
2. Support local revenue sources that price driving, parking, and freight transport to reflect the externalities of motorized transportation. There are a variety of methods for increasing the price of driving, some of which are contemplated in the RTP's financial plan. http://rtpscs.scag.ca.gov/Documents/2012/draft/2012dRTP_03_Financial.pdf higher gas taxes, carbon taxes, charges based on miles driven, appropriately and dynamically priced parking http://sfpark.org/ , and congestion charges aimed at commuters entering central city areas http://www.tfl.gov.uk/roadusers/congestioncharging/ are all useful policies.

C. Reduce rather than increase the space granted to cars and trucks in order to reduce driving. Roads and parking currently take up too much of our land, which encourages car-based transportation and all the problems that accompany it. Driving increases when roads are constructed, lengthened or widened.

1. Do not add any lane miles of highways or major arterials. The SCAG region currently (base year 2008) has 21,638 miles of road and 55,890 lane miles of roads. The draft RTP anticipates adding 948 centerline miles/ 7419 lanes miles which would be a 4.4%/ 11.1% increase. As Duranton and Turner have shown, "For interstate highways in the densest parts of metropolitan areas we

find that vkt increases in exact proportion to highways, confirming the 'fundamental law of highway congestion' suggested by Downs (1962, 1992). This relationship also approximately holds for other important roads in dense areas and for interstate highways in less dense parts of metropolitan areas." http://ideas.repec.org/p/tor/tecipa/tecipa-370.html Converting mixed flow lanes to toll, HOV or HOT lanes or converting HOV lanes to toll or HOT lanes would still be acceptable.

2. Set a target to reduce vehicle miles travelled from the baseline year of 2008. Vehicle Miles travelled in the baseline year 2008 was 445,844 daily, approximately half on freeways, half on arterial roads. SCAG calculates that this number will rise to 546,806 daily by 2035 without any changes to roads (a 22.6 % increase). Under their plan, VMT will still rise, to 516,990 (16% increase). They also anticipate that VMT for trucks will grow even faster, expanding from 30,201 to 53,431 under their 2035 plan (a 76.9% increase). http://rtpscs.scag.ca.gov/Documents/2012/draft/SR/2012dRTP_Highways_and_Arterials.pdf Instead of planning for this increase, set a target for a reduction in VMT.
3. Plan for highway removal or modification. Learning from cities removing highways http://www.cnu.org/highways/freewayswithoutfutures2012 , agencies and municipalities should plan to remove, cover or alter and reclassify as arterials highways that divide communities, negatively impact valuable natural resources such as rivers and coasts, or channel excessive traffic into neighborhoods. Freeway stubs such as the 710 N above the 10 or the 2 as it approaches Silverlake are ripe for removal or conversion and the 101 through downtown Los Angeles has been the subject of advocacy for capping for a park. http://www.park101.org/

D. Pursue stronger sustainable communities strategies to create good places rather than sprawl. People are drawn to diversity http://www.amazon.com/Life-Between-Buildings-Using-Public/dp/1597268275/ref=sr_1_1?ie=UTF8&qid=1328728803&sr=8-1 in the built environment http://www.amazon.com/American-Cities-Anniversary-Modern-Library/dp/0679644334/ref=sr_1_2?s=books&ie=UTF8&qid=1328728897&sr=1-2 , so municipalities should increase interesting, mixed-use neighborhoods by focusing growth near transit and altering zoning rules that restrict mixed use development to a small fraction of cities' land area.

1. Adopt alternative 3 (the envision 2 alternative) smart growth land use and housing patterns) rather than the planned project. http://rtpscs.scag.ca.gov/Documents/peir/2012/draft/2012dPEIR_4_0_Alternatives.pdf This alternative version of the plan relies on smart growth land use and housing patterns to achieve superior environmental results in air quality, aesthetics, open space and farmland preservation, water conservation, greenhouse gas emissions reductions, mobility, and land use.
2. Fund local jurisdictions to allow them to update their general plans and zoning codes to reflect sustainable community and smart growth principles.

3. Encourage sensitive densification of existing single family zoned areas by encouraging municipalities to allow cottage housing, duplexes, accessory dwellings, and small lot subdivisions in R-1 zones.
4. Encourage all jurisdictions to eliminate mandatory parking minimums for existing and new buildings. http://shoup.bol.ucla.edu/ProblemsWithParkingRequirementsInZoningOrdinances.pdf

E. Clean up goods movement industry before planning to expand it. Do not invest in goods movement roads and rail expansion in the hopes that zero emission technologies will emerge decades later. Invest more in zero emissions trucks and locomotives now as a precondition before expanding freight infrastructure. Otherwise impacted communities will continue to suffer disproportionately from pollution from good movement. http://departments.oxy.edu/uepi/publications/GlobalTrade.pdf

1. Require widespread adoption of zero emissions trucks and rail in the region as a precondition for funding any expansion of goods movement infrastructure.
2. Recommend a $30 per twenty-foot container fee for moving either into or out of the ports to help pay for mitigation of existing environmental impacts and to help pay for research into zero emission alternatives. This strategy could generate as much as $441 million in revenue from loaded containers in its first full year of implementation, when applied equally to imports and exports.
3. Require maximum development of on dock rail before funding any off dock projects.

We look forward to working with you to improve the plan and create a more just, green and livable region.

SUBJECT: 2012-2035 Regional Transportation Plan

Dear Ms. Lin,

On behalf of the Valley Industry and Commerce Association (VICA), thank you for your commitment to the transportation needs of Southern California.

While we appreciate the inclusion of a handful of major San Fernando Valley-centered projects in the Regional Transportation Plan (RTP), we are disappointed by the insufficient appropriations for these projects and the lack of investment overall in the San Fernando Valley. Specifically, no funding is directed to renovations of I-101 between downtown Los Angeles and the city of Calabasas or improvements to I-405 north of the I-101 interchange. Furthermore, I-134, I-170, and the major arterials of the Valley receive minimal investment.

Despite $40 billion in financing secured for Measure R projects in the greater San Fernando Valley, the only Valley projects in the Federal Transportation Improvement Plan (FTIP) are the renovation of the Interstate-101 off-ramp at Van Nuys Boulevard; the freeway connector at the I-101 and I-405 interchange; the I-405 Corridor Mass Transit project through the Sepulveda Pass; the studies of the Van Nuys corridor and Burbank-Glendale-Pasadena Airport intermodal ground access; and expansion of transit centers at Pierce and Mission Colleges. These projects are of vital regional significance to the Valley, but they are only the tip of the iceberg.

Key sections of the I-101 freeway need to be renovated to relieve bottlenecks and increase roadway safety between the Valley and downtown Los Angeles. These sections include the I-101 interchanges with the I-170 and I-134, which connect commuters and clients with the north, east and west San Fernando Valley. The roadway degradation along this I-101 corridor requires immediate attention and should be included in the RTP.

The north and west Valley also depend heavily on I-405. To reduce traffic and enable quicker, more efficient transportation between the Valley and West Los Angeles, mass transit solutions are necessary. The I-405 Mass Transit project through the Sepulveda Pass is the first step. A planning process and full financing must be put into place without delay.

While renovation of I-101 and I-405 are pressing, their effective use will not be possible without proper maintenance of the transportation system that serves these freeways. While the Financially-Constrained RTP Projects and Strategic Plan lists contain a few projects along major Valley arterials,

this system requires immediate restoration and improvement. Van Nuys Boulevard, Sepulveda Boulevard, Riverside Boulevard, Ventura Boulevard, Mulholland Drive, Laurel Canyon Boulevard, Victory Boulevard, Sherman Way, Burbank Boulevard, Reseda Boulevard, Topanga Canyon Boulevard, De Soto Avenue, Vineland Boulevard, Hollywood Way, Canoga Avenue, Vanowen Street, Nordhoff Street and Lankershim Boulevard are just a few of the several roadways critical for employees and clients to access the Valley using I-101 and I-405. The City of Los Angeles recently submitted a list of additional "Local Highway" projects, the majority of which target major Valley arterials. We ask that you review this list and include several—if not all—of the identified projects in the Strategic Plan.

The sections of I-170, I-134 and I-5 freeways connecting the east San Fernando Valley cities of Burbank and Glendale to the rest of Los Angeles County also receive only minor attention in the RTP. Roadway repair and mass transit options along these routes are necessary for Bob Hope Airport access and mobility into and within these east Valley cities. We ask that you increase investment in the Burbank-Glendale-Pasadena Airport intermodal ground access study and add renovations of the East Valley arterials to the Strategic Plan.

Thank you for considering our recommendations. We look forward to full funding of the San Fernando Valley projects on the Federal Transportation Investment Plan and Financially-Constrained RTP Projects lists, as well as expansion of the Strategic Plan to include critical Valley projects.

Sincerely,

David Adelman

Subject: Signatures supporting increased funding for Active Transportation

Dear SCAG and Margaret,

I am the executive of a Ventura local non-profit started in 2007 that works to reduce climate change. VCCool (Ventura Climate Care Options Organized Locally), can be found at www.vccool.org.

First thank you for all you've done to engage the community in the RTP and SCS effort for 2012. I especially appreciate the 18 Workshops in the SCAG region because that help our organization to learn of SCAG and the critical effort of the Regional Transportation Plan. We would also like to thank the Safe Routes to School Partnership for helping us to become engaged.

Our concern is that a large body of the population is not currently represented in your 2012 RTP draft. These are the people who bicycle, who walk, or who would like to use Active Transportation but are too afraid because of the real threat of them or their children being killed or injured inadvertently by people in automobiles.

To this end we have collected 1,241 signatures from people across the SCAG region urging you to reconsider the small, and delayed funding for a clean, green, economical form of transportation who is now receiving 25% of traffic fatalities in the SCAG region. Our on-line petition and video can be found out www.active-transit.org

We will post the signature files to Drop Box so you can download them.

Here is the break down, and what you will find in our SCAG dropbox folder:

- 775 online signatures, including name, zip, e-mail, plus comments from many of the signers
- 355 paper petition signatures including name, zip, and e-mail address
- 111 youth/student signatures – including name of student.

Concerning files, I am including:

- The composite of the online signatures,
- Jpg files of scanned adult signatures that came in on paper
- A letter explaining the youth signatures from one of the teachers.
- An excel with the unique signatures. (The kids signed multiple times for emphasis, so we went through and typed a list of the unique names, deleting any duplicates.

I would also like to include this link to a front page article in our county-wide newspaper. It was on the front page of the Ventura County Star, with the printed version headline "Bicyclists Demand Respect."
http://www.vcstar.com/news/2012/feb/12/petition-drive-for-more-bicycle-safety-in-scag/

We urge you to rethink the delay in funds for Active Transportation, and we urge you to increase funds budgeted in the RTP. Please do not hesitate to call me if you would like to meet, or if you have any questions about our petition, our effort, or anything else.

To find the actual petition information please go to www.dropbox.com in VCCool's SCAG RTP Petition 12, and download the files therein.

Warmly Yours,

Rachel Morris
VCCool Executive Director

PETITION: to Increase Funding for Safe Bicycling and Walking in Southern California*

Please sign Today!! – www.active-transit.org

- Whereas 25% of roadway injuries and fatalities in the SCAG Region are bicyclists and pedestrians.
- Whereas childhood obesity and diabetes in our communities have reached epidemic levels.
- Whereas public roadways must be accessible to all people, including those who cannot afford the skyrocketing prices of gasoline.
- Whereas bicycle infrastructure costs for lanes, wear and tear on roads, and parking space are exponentially lower than those for cars and buses, at a time when State funding for cities and counties has been drastically cut.
- Whereas a large portion of people living in Southern California do not own a drivers license, including all people under the age of 16.
- Where 10% of the households in the SCAG Region do not own cars.
- Whereas California Senator Barbara Boxer, Chairman of the Senate Environment and Public Works Committee in her December 7th, 2011 press conference stated that climate change is an "...urgent threat facing the globe."
- Whereas State law AB 32 requires California to lower greenhouse gas emissions to 1990 levels by 2020, the equivalent of taking approximately 28 million cars off State roads.
- Whereas 40% of all trips people make are 2 miles or less. (National Household Travel Survey.)

I therefore respectfully petition the Southern California Association of Governments to amend the 2012 Regional Transportation Plan, increasing the amount for Active Transportation to 5%-8%.

**Includes Counties of: Ventura, L.A., Orange, San Bernardino, Riverside, and Imperial*

(The current budget has only 1.3% for biking and walking combin[redacted]

PETITION: to Increase Funding for Safe Bicycling and Walking in Southern California*

Please sign Today!! – www.active-transit.org

- Whereas 25% of roadway injuries and fatalities in the SCAG Region are bicyclists and pedestrians.
- Whereas childhood obesity and diabetes in our communities have reached epidemic levels.
- Whereas public roadways must be accessible to all people, including those who cannot afford the skyrocketing prices of gasoline.
- Whereas bicycle infrastructure costs for lanes, wear and tear on roads, and parking space are exponentially lower than those for cars and buses, at a time when State funding for cities and counties has been drastically cut.
- Whereas a large portion of people living in Southern California do not own a drivers license, including all people under the age of 16.
- Where 10% of the households in the SCAG Region do not own cars.
- Whereas California Senator Barbara Boxer, Chairman of the Senate Environment and Public Works Committee in her December 7th, 2011 press conference stated that climate change is an "...urgent threat facing the globe."
- Whereas State law AB 32 requires California to lower greenhouse gas emissions to 1990 levels by 2020, the equivalent of taking approximately 28 million cars off State roads.
- Whereas 40% of all trips people make are 2 miles or less. (National Household Travel Survey.)

I therefore respectfully petition the Southern California Association of Governments to amend the 2012 Regional Transportation Plan, increasing the amount for Active Transportation to 5%-8%.

Western States Petroleum Association

Credible Solutions • Responsive Service • Since 1907

Patty Senecal
Manager, Southern California Region and Infrastructure Issues

February 14, 2012
VIA Electronic Mail

Ms. Margaret Lin
Southern California Association of Governments
818 W. 7th Street, 12th Floor
Los Angeles, CA90017

Re: **Comments on the Draft 2012 Regional Transportation Plan (RTP) /Sustainable Communities Strategy (SCS)**

Dear Ms. Lin:

The Western States Petroleum Association (WSPA) is a non-profit trade association that represents twenty-six companies that explore for, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California and five other western states. WSPA has been an active participant in air quality planning issues for nearly 30 years and helped pioneer the first use of atmospheric modeling in the mid-1980's. WSPA members have extensive facilities in the Southern California region and will be directly affected by the Regional Transportation Plan particularly as it provides inputs to the Air Quality Management Plan (AQMP) being prepared by the South Coast Air Quality Management District (SCAQMD).

WSPA recognizes the importance of the RTP/SCS and the AQMP as planning documents that will directly affect the future of industry and residents in Southern California. We understand that the primary stated goal of the RTP/SCS is to increase mobility for residents of the Southern California region. Generally, the RTP/SCS should recognize that while there will likely be a gradual transition towards alternative fuels use in the basin there will also continue to be prominent use of conventional low emission fuels and vehicles as well as hybrids.

The RTP/SCS is also a key component of the AQMP for Southern California which is especially important given the role that transportation plays in the region's air emission inventory. For this reason, our comments are focused on those policy proposals and assumptions in the RTP/SCS. For each issue, we provide a recommendation that will help the Southern California Association of Governments (SCAG) and the SCAQMD as they incorporate stakeholder input.

An accurate and defensible goods movement growth forecast is a critical element of the RTP/SCS and AQMP; SCAG should consider a range of outcomes to better communicate potential economic and environmental impacts from this sector.

The draft RTP/SCS pays considerable attention to economic and environmental impacts from goods movement. The plan reports that five major sectors contributed the majority of freight demand (i.e., manufacturing, retail trade, wholesale trade, construction and transportation and warehousing) and those sectors comprised $253 billion, or 34% of the regional Gross Domestic Product (GDP). The RTP/SCS then reports that Southern California cargo throughput will increase from 14 million twenty-foot-equivalent-units (TEU) (2010 actual) to over 43 million TEU by 2035; an increase of over 200%[1]. The impact of that change on the regional economy would be very large given that SCAG is predicting overall regional GDP growth over the same period will be closer to 25%.

The goods movement forecast used in the draft RTP/SCS assumes little market impact from competition and, in particular, the expanded Panama Canal which is scheduled to open in 2014. Logistics and market forces which drive supply chain shipping decisions are variable and complex and while numerous studies have attempted to predict the impacts of an expanded Panama Canal on U.S. marine ports, there is no consensus as to how much market share (if any) might be lost by the San Pedro Bay Ports. The RTP appears to represent a "best case" scenario as the only scenario. If that estimate proves optimistic, then the plan will have overstated goods movement impacts on infrastructure, the environment (i.e., air pollution emissions) and the revenue generation potential (i.e., use fees) needed to pay for the expensive infrastructure and technology improvements envisioned under the plan. And regional economic benefits will also have been overstated.

Recommendation: The RTP/SCS should consider a range of possible growth factors for the goods movement sector (e.g., high, low). This "bounding exercise" would help decision makers and the public better understand how sensitive economic and environmental factors are to goods movement sector growth. Also, given that we are informed that ship emissions are temporally variable, the "bounding exercise" should also inform the AQMP emissions inventory and consequent air quality modeling. *It is especially important that SCAG validate the emissions baseline (e.g., the 2009-2011 actual emissions) so that the growth projections are based on "real" emissions rather than theoretical or modeled emissions from past exercises. This is made even more important because the initial "in-year" emissions are the basis for building future-year emission projections.*

[1] Forecast is based on the 2009 San Pedro Bay Container Forecast Update commissioned by the Port of Los Angeles and the Port of Long Beach

Proposal for zero/near-zero emission transportation technologies is ambitious; SCAG should clearly communicate assumptions used in the quantitative analyses. Again, the RTP and the AQMP should consider the implications of these assumptions on the growth (or decrease) of vehicle emissions.

The draft RTP/SCS contains several "big" ideas, the most significant of which calls for regional commitment for the broad deployment of zero and near-zero emission transportation technologies. The plan states that the "*development of a world class zero emission freight transportation system is necessary to maintain economic growth in the region, to sustain quality of life and to meet federal air quality requirements*."[2] The RTP/SCS outlines an aggressive strategy for technology development and deployment to meet this objective "*in the 2023-2035 timeframe*," but the detailed assumptions concerning timing are not explained.[3] The draft RTP/SCS acknowledges several challenges which will confront this plan including "*operational needs, integration of the technologies into the national rail system, federal safety requirements, and costs*." But those are just the beginning given the myriad commercial, political, jurisdictional, planning and technology factors involved. Despite those challenges, SCAG proposes for Phases I, II and III to be completed in the next three years. Phase IV timing is then far less specific and stretches across several AQMP milestone years. Given the ambitiousness of this initiative and its importance to the AQMP attainment demonstration, stakeholders need to better understand SCAG's assumptions concerning the implementation schedule for these technologies. Critical review of the RTP/SCS in the context of the AQMP is not possible without this information.

Recommendation: SCAG should publish the technical assumptions used in the draft RTP/SCS concerning assumed rates of deployment for: (a) zero emission transport for container drayage; (b) zero and near zero-emission trucks for regional transport; (c) electrified rail technologies; and (d) zero or near zero emission rail technology. The timing for these assumptions is critical to the AQMP attainment demonstration. In addition, the RTP should provide information on daily, monthly, or seasonal activity associated with these actions. Again, as stated previously, this information is critical to input into the emissions inventory and the air quality modeling.

RTP/SCS as proposed will have significant impacts on the electricity sector; SCAG needs to consider those impacts.

The draft RTP/SCS as proposed would radically change how transportation energy is delivered and used in Southern California with much of the regional transportation system being electrified. Trucks, trains, and numerous other pieces of the goods movement system would be electrified starting as early as 2016. Yet the draft RTP/SCS contains almost no discussion of the massive infrastructure needs, implementation challenges or environmental impacts, including emissions projections, which would result from this policy. The plan is actually dismissive of these issues:

[2]Draft RTP/SCS Executive Summary, page 1.

[3]Draft RTP/SCS Goods Movement Appendix p. 33, Goods Movement Environmental Strategy and Action Plan.

> *"Although some emissions would still be produced in electricity generation, power plants are highly regulated and release less emissions. Furthermore, all power plants in the SCAB are natural gas powered, and also release fewer emissions. Most power plants are located outside the SCAB and therefore emissions from these sources will be further from population centers."*[4]

That statement may have been partially accurate in the past, but it will not necessarily hold in the future as utilities consider how to meet significant new energy demands in a reliable and safe manner. The electricity sector is a highly complex system in technical and commercial terms and it simply may not be able to deliver the quantities of electricity on the timetables presumed in the RTP/SCS.

California's electric utilities find themselves at a crossroads in terms of how utilities operate and are already having to revamp their power generation, transmission and distribution portfolios to accommodate a variety of environmental mandates including AB 32. Those mandates present numerous environmental, commercial, engineering and infrastructure demands. The issues and potential economic and environmental impacts need to be disclosed to decision makers and the public.

Recommendation: The RTP/SCS needs to fully consider the electricity sector infrastructure needs, implementation challenges and emissions impacts that would result from the policy recommendations contained in the draft plan. These emission impacts will be significant in scale and may impact the feasibility of RTP/SCS measures, particularly the schedules. These data are essential to proper development of the AQMP and the air quality modeling used by the SCAQMD.

Please contact me at 310-808-2144 or psenecal@wspa.com if you would like to discuss or need additional information.

Sincerely,

Patty Senecal

Manager, Southern California Region and Infrastructure Issues

Comments on 2012-2035 Draft Regional Transportation Plan and Sustainable Communities Strategy and Draft Program Environmental Impact Report (SCH# 2011051018)

Dear Mr. Lieb:

The Wildlife Corridor Conservation Authority (WCCA) provides the following comments on 2012-2035 Draft Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) and Draft Program Environmental Impact Report (PEIR; SCH# 2011051018). WCCA was created to provide for the proper planning, conservation, environmental protection and maintenance of the habitat and wildlife corridor between the Whittier-Puente Hills, Chino Hills, and the Cleveland National Forest in the Santa Ana Mountains.

Environmental Mitigation Program

We are pleased to see the inclusion of an advanced mitigation component in the RTP/SCS. This concept has seen great success in Orange County's Renewed Measure M and in fact, is viewed as a model for comprehensively mitigating transportation project impacts with meaningful acquisition and restoration projects. Last year alone, the Orange County Environmental Mitigation Program acquired nearly 950 acres of important natural lands and has funded five restoration projects. Advanced mitigation has many benefits including: streamlined permitting, preservation of important natural lands, improved relationships and collaboration with resource and permitting agencies, to name a few.

We do, however have several suggestions for modification of the Conservation Policy including:

1. Ensuring State conservancies and joint powers authorities with a conservation focus are included in the mapping and prioritization of conservation lands. Specifically, we recommend including WCCA, Puente Hills Habitat Preservation Authority, San Gabriel & Lower Los Angeles Rivers and Mountains Conservancy, Mountains Recreation and Conservation Authority (MRCA), and

Santa Monica Mountains Conservancy (SMMC) among the entities upon whose expertise can be tapped.

2. Extending the inventory of protected lands to include all protected lands – Federal, State, regional and local natural lands – instead of narrowly limiting the inventory to simply Natural Communities Conservation Plan and Habitat Conservation Plan areas.

3. Ensuring existing wildlife corridors and habitat linkages and highway/roadway undercrossings are protected and enhanced during the evaluation of habitat lands and during construction of roadway projects.

4. Advocating that the advanced mitigation policy result in a net environmental benefit for the natural resource lands after construction activities are completed.

Also, large-scale acquisition and management of lands must not be limited to "critical habitat," (RTP, p. 76, 128) as this can be confused with the legal term used by U.S. Fish and Wildlife Service for some federally endangered and threatened species. To clarify, this should be replaced by text reflecting the intent, i.e., the best available natural lands with valuable environmental resources deserving of conservation/preservation.

WCCA looks forward to working with Southern California Association of Governments (SCAG) on the development of the Natural Lands Acquisition and Open Space Conservation Strategy. This will protect remaining resource lands and mitigate for impacts from transportation improvements. In addition to mitigation banking, transfer of development rights (TDR), and payment of in-lieu fees, WCCA recognizes conservation easements as a powerful preservation tool for habitat areas. Conservation easements, and fee title transfers to open space park agencies, should be listed in the plan alongside the other preservation mechanisms.

Transfer of development rights is a potentially useful market-based preservation mechanism that supports regional density goals. SCAG should take a leadership role in setting guidelines and best practices for these new county and municipal programs as well as explore the creation of a regionally unified TDR program. This method should not only be limited to agricultural lands, but also include other open space lands.

Avoidance of Growth in Resource Areas

The RTP/SCS generally steers growth toward more compact forms in already urbanized areas, making efficient use of existing infrastructure and reducing impacts to resource lands. The policy decisions contained within the SCS are projected to save 408 square miles of nonurban land over the life of the plan. If realized, these gains are certainly an

achievement, although there is no projection of where this growth will not occur and what mechanisms will preserve the land in perpetuity.

The lack of specificity makes it difficult for WCCA to evaluate the impacts of the proposed plan. While the projections are intended to be a meta-analysis of regional economic trends rather than a location-specific analysis of growth patterns, SCAG is clearly making assumptions about where development on resource lands is and is not appropriate. This process is not transparent.

For example, the large undeveloped privately-owned property known as the Aera property in the middle of the Puente Chino Hills wildlife corridor[1], has been identified on Exhibit 4.1 as population growth of 2,001-3,500 persons per square mile. In fact, much of this property has been identified as a proposed Significant Ecological Area in Los Angeles County's most recent draft General Plan.

Ironically, this particular development proposal's population, employment and housing growth areas contradict the goals of Senate Bill (SB) 375 and its requirement for reduced vehicle miles traveled (VMT). The location of the development is nowhere near public transit, does not include a major employment center but instead focuses on large single family residential units, requires dependency on the automobile, and will increase VMTs, not reduce them.

With the understanding that land use authority belongs to local jurisdictions, a truly comprehensive regional plan would transparently set growth parameters in concert with resource conservation goals to eliminate these apparent contradictions. Projecting growth in resource areas sets in motion policies that induce that growth; therefore great care must be taken to ensure such growth meets regional objectives.

Wildlife Crossings of Transportation Facilities

WCCA appreciates SCAG's recognition of the impact that linear transportation facilities have on natural areas and the need for well-designed wildlife crossings to partially mitigate these effects. Wildlife crossings serve two distinct purposes: reducing mortality and preserving genetic connectivity. Roads are the leading direct source of human-caused mortality for most species in southern California and the entire country. They can become a population sink if a significant fraction of a local species is killed, affecting broader population distribution across the landscape. Additionally, for highly mobile predators,

---

[1]The 2,925-acre Aera property is located in the middle of the Puente Chino Hills wildlife corridor, primarily west of State Route [SR] 57 in Los Angeles County, but also occurring east of SR-57, and also in Orange County.

individuals crossing roads are frequently dispersing from their home range in search of new territory and mates, a vital population dynamic that is devastating if interrupted. National Park Service research has documented significant genetic differences among carnivore populations on either side of the 101 Freeway in the Santa Monica Mountains.

Wildlife crossings need to be discussed in the context of habitat connectivity, which is the broader ecological goal for conservation areas. Wildlife crossings are but one critical tool to ensure that indicator species are able to safely move about their environment. While much has been learned about movement patterns and the way in which key transportation facilities create genetic barriers to connectivity, the measures that might mitigate these impacts have not been thoroughly researched. Wildlife corridor design is a field in its infancy with few scientifically verified best practices for crossing dimensions and landscape features. Given that this research is needed to properly mitigate transportation impacts, SCAG should invest in connectivity research with a program specifically designed to establish measures that can be incorporated into the 2016 RTP revision. Such a program would aggregate existing research, propose new study areas, and develop design best practices specifically tailored to the Southern California eco-region.

River Parkways and Active Transportation

WCCA is interested in urban river projects for their multiple recreational, environmental, and transportation benefits. The RTP/SCS should fully fund build-out of these active transportation corridors throughout the region. When well designed, these facilities serve as "bicycle freeways" connecting various parts of the region with uninterrupted travel for nonmotorized users. Separated from traffic, such facilities are also inviting for bicyclists of all ages and abilities, which is necessary to attract substantial mode share away from automobiles.

The RTP/SCS calls for $6 billion over the next two decades for active transportation investments, which seems low when compared to the identified need in local bike and pedestrian plans. Given the central role active transportation plays in meeting regional planning objectives, funding levels should be set based on full build-out of local bicycle and pedestrian plans, with an appropriate amount projected for those jurisdictions that have not yet completed such plans. The currently proposed funding level does not appear to be rooted in such a need-based assessment. It is not adequate to simply compare the proposed expenditures with past levels independent of a needs assessment.

In addition to the total funding level, the proposed timing of active transportation investment is inadequate. Only 20 percent of the proposed expenditures would occur during the first 15 years of the 25-year planning period, leaving the vast majority of expenditures for the highly speculative future and of little use to current residents. Transit and transportation demand management are similarly back-loaded with only highway-related investments

receiving funding priority in the near term. These non-highway investments are the ones most likely to generate greenhouse gas emissions savings, among other benefits, and the earlier they are made the longer the benefits can accumulate. The proposed expenditure plan runs directly counter to the stated emphasis of the SCS.

Active transportation projects, including the river parkways, are suffering for lack of funding. The most visionary plans require extensive funding to come to fruition and provide their multiple benefits. Planning is well underway, but capital dollars are in short supply for these projects. Furthermore, achieving greenhouse gas reduction and air quality goals requires early mode shift to maximize cumulative benefits over the life of the plan. WCCA suggests that the plan's funding priorities be reversed to immediately fund active transportation investments at a sufficient level to achieve build-out of the region's bicycle and pedestrian networks in the near and medium term. Such a change would make the RTP more consistent with the land use and mode share objectives outlined by the SCS, the intent of SB 375.

For example, WCCA encourages SCAG to evaluate the feasibility and to develop a greenway corridor that can be used for active transportation (e.g., bicycle trail) along San Jose Creek, connecting to the San Gabriel River (by Whittier Narrows) and further west. This San Jose Creek bikeway is an east-west route that parallels the State Route 60 freeway. It is an important commuter route, where a viable bikeway could relieve some freeway traffic. Maintaining and enhancing an open creek channel for wildlife use (e.g., birds) and recreational use (bicycles) would be a valuable amenity in this area. It would be beneficial to investigate and implement other bicycle routes in the area, including a connection between the LARIO trail along the Rio Hondo from its end at Peck Road Water Conservation Park to the San Gabriel River. Another valuable connection would be between the Whittier Greenway Trail to the San Gabriel River at its west end and from its east end to Coyote Creek. These trails are pieces in the larger planned bikeway trail network throughout the region.

Comments on Proposed PEIR Mitigation Measures

Biological Resources and Open Space

The PEIR includes many mitigation measures for potential impacts to biological resources. Overall, these measures are comprehensive and based on sound practice. Inclusion of the proposed mitigation measures in project selection and design will greatly improve ecological outcomes in the SCAG region compared to a baseline scenario. The specific measures calling for minimum mitigation ratios reflect current accepted practices without limiting the discretion of resource agencies to require greater mitigation if warranted.

The proposed measures addressing habitat fragmentation and connectivity are thorough and appropriate (MM-BIO/OS36 through MM-BIO/OS40). These impacts have been all too often unmitigated for transportation projects in the past.

WCCA looks forward to collaboration on regional conservation planning policy to address cumulative impacts to biological resources (MM-BIO/OS45). MRCA is one agency in the SCAG region that administers a highly successful restoration and preservation in-lieu-fee mitigation program in close coordination with State and Federal resource agencies. SCAG's planning and funding expertise is a welcome addition to ongoing efforts. WCCA recommends that other agencies with expertise in the region, such as MRCA, SMMC, Puente Hills Habitat Preservation Authority, and WCCA be invited to participate in this process.

The primary impact from transportation facilities is often the indirect and cumulative impact from growth induced by new improvements. As projects increase access and reduce commute times from remote areas, these resource lands become economical to develop. The Conservancy is therefore pleased to see SCAG recognize these impacts and call for their mitigation (MM-BIO/OS47). Without appropriate growth management along transportation corridors, wildlife crossings cannot mitigate connectivity impacts from expanding development footprints. Furthermore, induced growth along new corridors often negates the benefits of new transportation capacity, prompting even greater impacts from future facility expansion. SCAG should develop best practices that would be applicable to new transportation corridors to prevent new development from extending into resource lands.

The PEIR biology mitigation measures should be clarified to delete reference to relocating active nests (MM-BIO/OS35), as this is likely in conflict with the Migratory Bird Treaty Act. Instead, construction buffers to active nests should be established, as proposed.

Land Use and Agriculture Resources

As stated previously, WCCA is encouraged to see transfer of development rights (TDR) programs included in the RTP/SCS (MM-LU16). Los Angeles County is including a TDR program in its general plan update. SCAG should provide technical assistance and facilitate interjurisdictional transfer programs among member governments as appropriate.

WCCA is pleased to see strategic planning that encourages recreational access to natural lands be coupled with efficient land use strategies to preserve these lands (MM-LU25 and 26). Location-efficient and compact development is better for the economy and environment by reducing infrastructure costs, increasing tax revenues per acre, and reducing consumption of agricultural land and habitat.

Urban growth and service boundaries are a critical tool local jurisdictions have to protect resource areas within greenbelts (MM-LU42). WCCA strongly supports efforts by local jurisdictions to establish such policies. SCAG should promote best practices in greenbelt planning and facilitate interjurisdictional collaboration to protect resource areas that separate discrete urban communities. WCCA notes that effective policies restrict densities to no more than one dwelling unit per ten acres outside of urban growth boundaries. Densities above this threshold begin to affect resource values, particularly habitat connectivity and sensitive species. One unit per ten acres is an appropriate maximum density to reduce the proliferation of "ranchette" developments that highly fragment habitat in rural areas.

WCCA supports local jurisdictions using variable development fees as an economic incentive to direct growth to desired areas. In particular, increasing impact fees for development in greenfield areas would recognize the resource impacts of such developments while rewarding new developments that minimize the burden on public infrastructure by locating in existing urban areas (MM-LU81). Such fees would need to be considerable to actually have an effect on land economics at the regional scale. SCAG should undertake an economic analysis to determine what level of fees would be required to achieve regional growth objectives.

Public Services and Utilities

The PEIR lacks a public safety mitigation measure that promotes project design that minimizes urban-wildland interface, which is the source of wildfire risk to persons and property. Past development patterns include long, meandering urban edges with high risk exposure to catastrophic events, causing great strain on local and State firefighting resources largely subsidized by those living in lower risk locations. A mitigation measure should include two components addressing both project location and project design. First, development that extends into high fire hazard areas should be discouraged. Second, there should be an emphasis on utilizing project design strategies to reduce risk, such as building within compact and defensible footprints and minimizing perimeter length. Projects should be sited in order to reduce impacts of required brush clearance on native habitat areas, including adequate buffers to protect sensitive resources from brush clearance impacts. The draft Los Angeles County Significant Ecological Area Ordinance contains model language to this effect.

WCCA concurs that project sponsors and local jurisdictions should work to increase public access to open space (MM-PS21 and 26). River parkways and other urban natural parks serve a vital purpose in connecting urban residents to natural parkland (MM-PS22). The City of Los Angeles and County of Los Angeles have both recognized these projects in master plans for their respective river corridors. While planning for these projects is the

responsibility of local jurisdictions and partners, SCAG has a critical responsibility for funding by including bikeway projects in the RTP area.

Regional partnerships are necessary to achieve open space conservation objectives (MM-PS29). As previously mentioned, WCCA welcomes SCAG's assistance with planning and identifying funding sources for open space acquisition (MM-PS31 and 34). SCAG's participation in coordinating regionally significant trail networks is also appreciated, however the greatest contribution SCAG could make to these efforts would be including those greenways that serve transportation functions, such as the river parkways, in the RTP so that they can be fully developed in the short and medium-term (MM-PS33).

Transportation

WCCA looks forward to SCAG support and urges that ample funding be provided for full build-out of the river parkway systems, combining transportation and recreation functions to improve the quality of life for southern California residents. These parkways often connect with schools, parks, libraries, and other community facilities (MM-TR43). Such connections should be enhanced through regular transportation improvements and the development of regional and local networks of multi-use trails with adequate end-of-trip facilities (MM-TR78).

Water Resources

WCCA believes that preservation of remaining riparian resources should be the highest priority at both the regional and project level, followed by restoration of previously impacted areas (MM-W1 and 9). To the extent feasible, natural methods for stormwater control, water quality improvements, and infiltration should be encouraged.

SCAG sets an appropriate standard that new projects should not cause or contribute to conditions that degrade the physical integrity or ecological function of any downstream receiving waters (MM-W22). When evaluating projects during the environmental review process, SCAG should identify regionally significant projects that may impact downstream waters and include comments to that effect in Notice of Preparation and Environmental Impact Report responses. This is a critical issue wherever natural rivers interact with urban areas. SCAG should participate in the development of models of natural processes for the remaining natural rivers in the SCAG region to ensure that environmental review can comprehensively evaluate project impacts based on the best available information.

We appreciate your consideration of these comments. Please continue to maintain our agency on your email/mailing lists for this project. If you have any questions, please contact Judi Tamasi of our staff by phone at (310) 589-3230, ext. 121, or by email at judi.tamasi@mrca.ca.gov.

Sincerely,

for Glenn Parker

Southern California Association of Governments
Attention: Margaret Lin
818 West 7th Street, 12th Floor
Los Angeles, Ca 90017

Sent via email lin@scag.ca.gov

Dear Ms. Lin,

Thank you for the comprehensive SCAG RTP currently in draft format. I have viewed your video and attended one of your public meetings. Many of the comments offered in the public forum reflected interest in the **active transportation elements** and **delayed funding** for implementing these concepts which I am sure you took note of and which reflect my own priorities. Having **individual mobility on freeways as a key objective is not sustainable** and we should shift away from that as a priority.

I am a physician deeply interested in the environment and in the impact of our environment (built and natural) on our health. **TRANSPORTATION IS HEALTH**. I am delighted with the Health in All Policies document put in place for the state by our former governor, but feel its careful recommendations are not being given adequate prioritization in your thinking. www.sgc.ca.gov/workgroups/hiap.html

I am new to southern California, having moved here from the east coast. The area is captivating and we need to protect it—not pave over more of it and not continue to building polluting solutions.

I would like to see to health risk and health impact assessments as part of your standard operating plan development. The externalities of health and environmental impact must be known because they affect long costs and benefits, which is your responsibility in these long term plans.

A very nice and recent example of integrating public health objectives in transportation planning can be seen in an independent research report from the Victoria Transport Policy Institute (www.vtpi.org) (http://www.vtpi.org/health.pdf accessed March 27, 2011).

I know that cargo movement is an essential part of your plan. Investing now in better options that are zero emission is key to the region's long term success. We could implement the "greenest" port in the world, helping our region, our citizens' health and demonstrating leadership for the world. There is concern about whether trucking is an appropriate choice for cargo transport and inappropriately subsidized by not accounting fully for externalities. The new GAO Report GAO-11-134 showed that " on average, additional freight service provided by trucks generated significantly more costs that are not passed on to consumers of that service than the same amount of freight service provided by either rail or water." This report puts an additional burden on SCAG to consider alternatives such as rail and appropriately include consideration of all externalities.
(Full report at http://www.gao.gov/new.items/d11134.pdf

d11134high.pdf

The tunnel proposal is of special concern to me since I live in Northeast LA. We will be bringing a corridor of damaging health effects up this way instead of solving the problem in the south 710 region. We see increasing proof of adverse health effects of ultrafine particles and no means to remove them in tunnel exhausting. We also need to see a robust model of costs of running tunnel ventilation which is very expensive. I have many additional references on tunnels and how they concentrate pollutants if you need them. The large ventilation shafts in residential areas are visually and from a health perspective undesirable. We also attract trucks to our roads which are not held to the same pollution standards---from Mexico and in construction. I would like you to directly address these issues in your RTP.

We are all concerned about jobs. The link provided is by a highly respected transportation expert and deals with questions of jobs http://www.uctc.net/access/38/access38_transportation_growth.shtml.

You have a difficult job, but it is clear that you can never build your way out of the terminal congestion we have on our freeways. There is no uncongested freeway in the area. The models that are often used do not consider adequately induced demands and changing patterns and many secondary variables. We need to provide alternatives and shift incentives to reduce demand on the freeways for individual and truck mobility so our current freeways can function efficiently most of the time. We need to coordinate smart land use with transportation. There are a lot of creative thinkers and voices.
Let's work together to come up with the best solutions!

January 2011

SURFACE FREIGHT TRANSPORTATION

A Comparison of the Costs of Road, Rail, and Waterways Freight Shipments That Are Not Passed on to Consumers

GAO Accountability • Integrity • Reliability

Highlights

Highlights of GAO-11-134, a report to the Subcommittee on Select Revenue Measures, Committee on Ways and Means, House of Representatives

Why GAO Did This Study

Road, rail, and waterway freight transportation is vital to the nation's economy. Government tax, regulatory, and infrastructure investment policies can affect the costs that shippers pass on to their customers. If government policy gives one mode a cost advantage over another, by, for example, not recouping all the costs of that mode's use of infrastructure, then shipping prices and customers' use of freight modes can be distorted, reducing the overall efficiency of the nation's economy.

As requested, this report (1) describes how government policies can affect competition and efficiency within the surface freight transportation sector, (2) determines what is known about the extent to which all costs are borne by surface freight customers, and (3) discusses the use of the findings when making future surface freight transportation policy. GAO reviewed the transportation literature and analyzed financial and technical data from the Department of Transportation (DOT), the Army Corps of Engineers (Corps), and the Environmental Protection Agency to make cross-modal comparisons at a national level. Data limitations and assumptions inherent in an aggregate national comparison are noted in the report.

GAO is not making recommendations in this report. GAO provided a draft of this report to DOT and the Corps. DOT provided technical suggestions and corrections, which were incorporated as appropriate. The Corps had no comments.

View GAO-11-134 or key components. For more information, contact Phillip R. Herr at (202) 512-2834 or herrp@gao.gov, or James R. White at (202) 512-9110 or whitej@gao.gov.

What GAO Found

Public spending, tax, and regulatory policies can promote economic efficiency in the freight transportation sector when they result in prices that reflect all marginal costs (the cost to society of one additional unit of service). These costs include private costs; public costs, such as infrastructure maintenance; and external costs, such as congestion, pollution, and accidents. When prices do not reflect all these costs, one mode may have a cost advantage over the others that distorts competition. As a consequence, the nation could devote more resources than needed to higher cost freight modes, an inefficient outcome that lowers economic well-being. Inefficient public investment decisions can result when all construction and other fixed costs are not passed on to the beneficiaries of that investment.

GAO's analysis shows that on average, additional freight service provided by trucks generated significantly more costs that are not passed on to consumers of that service than the same amount of freight service provided by either rail or water. GAO estimates that freight trucking costs that were not passed on to consumers were at least 6 times greater than rail costs and at least 9 times greater than waterways costs per million ton miles of freight transport. Most of these costs were external costs imposed on society. Marginal public infrastructure costs were significant only for trucking. Given limitations in the highway, rail, and waterway economic, financial, technical, and environmental data available for the analysis, GAO presents conservative estimates.

While freight costs are not fully passed on to consumers across all modes, a number of issues are important for decision makers to consider when proposing policy changes to align prices with marginal costs or reduce the difference between government fixed costs and revenues. Costs can vary widely based on the specific characteristics of an individual shipment, such as the geography and population density of the shipment's route, and the fuel-efficiency of the specific vehicle carrying it. Policy changes that align prices with marginal costs on a shipment-by-shipment basis would provide the greatest economic benefit, but precisely targeted policy changes can result in high administrative costs. By contrast, less targeted changes—such as charging user fees based on average costs, subsidizing more efficient alternatives, or broadly applying safety or emissions regulations—can change the overall distribution of freight across modes, but may provide fewer benefits. Although the current configuration of transportation infrastructure can limit the shifting of freight among modes, price changes can prompt other economic responses. Over the longer term, there is greater potential for responses that will shape the overall distribution and use of freight services.

Response to SCAG

Greetings SCAG, Cyrus Hojjaty here and I arrived at your meeting and voiced my concern over the 2035 General Plan and SB 375. Despite the fact that it is true that some people enjoy living in mixed-use buildings, take mass transit, and walk to their daily needs, this plan not only does not meet the needs effectively of those individuals, but does not meet the demands of others. Many of these plans are costly, unnecessary, and invade peoples lifestyles whether they choose to change or not.

It seems understandable that many of the policies that SCAG is trying to implement are trying to reverse the policies that were created by the coded car-dependent cities since the 1930s. It is true that many of these urban policies have understandable concerns, however at least the most important benefit is that many people are able to get single-family homes and some free-flowing traffic. We must preserve these benefits instead. What is so depressing that even though SCAG criticizes the car-dependent lifestyle we currently have, it was heavy intervention that created the system in the first place! As a matter of fact, many of these areas involving strip malls, collector roads, housing subdivisions, etc… were heavily manipulated by codes, regulations, and subsidies.

So basically the association does not want to admit that the system was caused by heavy intervention and yet they act like as the "saviors" to this problem to bring even more intervention. Sadly, many do not understand because of the different "buzzwords" and looks of the project. Give me a break! We are not mice! We are humans! We are not supposed to be treated in lab experiments whether it is a car-dependent landscape or a high-density packed environment!

What is deceptive and problematic, is that events are used to manipulate the decisions of the citizens. People are wrongfully being concerned over resource-depletion and man-made climate change. These concepts have heavily been debunked by many scientists and yet the temperatures have even rising in other planets as well! Do we really have to trample down on people over a belief that is heavily flawed? This does not sound like improving the lives of the many to me! Besides, we so much land available left in Southern California. With so much vast miles vacant land, why can't alternative town complex get built instead that COMPETES with what we have instead of monopolizing? I mean even if the 2035 was a wonderful approach, there is no need for monopolies. Urban planning is not a natural monopoly. In fact, during the meeting I display an alternative plan that does instead compete. SCAG should probably learn from a 19 year old, who has not even been to school to study urban planning!

Many of your projects in SCAG listed for Orange County are quite concerns yet some necessary. For land-use, let the developers and the marketplace decide if the mixed-use designs are necessary. Loosen up zoning codes to let people decide whether it will be strip malls, attached homes, office strips, or mixed-use. Of course you do in some areas want to restrict development like industry, toxic waste dumps, etc… For goodness sake, do not add any regulations, codes, get huge subsidies, and threat public and private property. My suggestions for the highway improvements and upgrades are letting construction occur when the REAL unemployment rate (Not CPI junk) for Orange County dips below 8.5%. I defiantly opposed to unnecessary projects like the high speed rails, road tolling, smart streets, rapid connectors, and the high-frequency Metrolink (unless if the ridership is high.)

Thank you for letting me to deliver my comments and suggestions. Hope to see SCAG associates soon in person.

-Cyrus Hojjaty

Long live Cyrus Planning! Oh yeah!

NOTICE

THIS CITY IS A MEMBER OF ICLEI---

INTERNATIONAL COUNCIL ON LOCAL ENVIRONMENTAL INITIATIVES

ICLEI is a United Nations-sponsored group which designs and writes policy for your area on land use, energy goals and measurement, and water usage. ICLEI is a paid consultant and/or receives dues from your taxes. ICLEI was formed after the United States (George Bush, Sr.) and 178 other nations met at the UN Rio Earth Summit in 1992 and agreed to use certain principles as their guidelines. Those guidelines include major reductions in energy and water usage, and huge increases in the number of living units in city centers. This is called UN Agenda 21-Sustainable Development.

In 1993 President Clinton formed the President's Council on Sustainable Development and gave a multi-million dollar grant to the American Planning Association to write Growing Smart: A Legislative Guidebook to bring UN Agenda 21 to the United States. Smart Growth was the result. Multi-story condos or apartments over small retail with little parking, crammed in your town center. Some people like that, but many of us should not be manipulated to live there. The reason for this style of construction is that, as UN Secretary General Maurice Strong said, 'the affluence of Americans is a threat to the planet.' Single family homes are a threat. Most of us love and can afford to maintain detached homes.

Across the nation, in large cities and small towns, like this one, identical programs are being rolled out. Land use restrictions, ordinances reducing energy usage, Smart Meters, school programs, & candidate trainings, are designed and implemented without your vote. You may be invited to city visioning meetings, but the outcome is decided before you enter the room.

Using ICLEI greenhouse gas emissions goals, your local government is in the process of controlling where and how you live, what you eat, what your children learn, and what laws you will live under. With the cover of 'environmental concern' your personal rights are being restricted. Soon, you will lose the right to travel freely without being asked for your ID. Lose the right to water your garden. Lose the right to refuse a Smart Meter. Lose the right to live in a rural area. Lose the right to drive a private vehicle. Under the guise of 'Sustainable Development' your property and civil rights are being systematically eliminated.

KICK ICLEI OUT.

HOW COME NOBODY ASKED ME IF I WANTED TO PAY DUES TO ICLEI?

They didn't have to. That's right. When your city or county (or both) became a member of the International Council on Local Environmental Initiatives-Sustainable Development there was no need to ask for your permission.

Is your town a member?

http://www.freedomadvocates.org/images/pdf/iclei_usa_easy%20read_050511.pdf

But remember—even if you don't see your community on that list you are still being influenced by standardized programs, grants, training and plans funded and designed by ICLEI to influence and change government policies to bring them into compliance with United Nations Agenda 21. They call it the Agenda for the 21st Century. This is a plan for global governance. That means that you and your community will be required to meet arbitrary goals set by an unelected body—one that you have never heard of, but that your city pays dues to, and that claims to speak for you and over 590 million people worldwide.

Across the nation hundreds of cities and counties are dues-paying members of ICLEI. Your property tax, income tax, and transportation tax dollars are paying for trainings, seminars, and sample legislation/ordinances. These policies are being enforced in your town. This is a whole life plan involving your educational system, your energy system, your government, your food production, your transportation, and your health. You are considered a threat to the planet and your life choices must be restricted.

- Do we support conservation? Yes.
- Do we support loss of civil rights to achieve environmental goals? NO.
- ICLEI is the implementation arm of UN Agenda 21
- ICLEI fuels the fear
- ICLEI pressures the community
- ICLEI sets the goals for greenhouse gas reduction
- ICLEI monitors the progress
- ICLEI directs your land use planning
- ICLEI controls your transportation dollars
- ICLEI is an unelected private group that your government belongs to.
- ICLEI operates secretly
- ICLEI is changing your life NOW
- KICK ICLEI OUT!

Subject: Comments on SCAG DRAFT 2012 RTP and the Plan EIR

SCAG's draft 2012 RTP and its EIR are both flawed, do not meet AB32 and SB 375 goals, and will not move this region toward better mobility, an improved economy, or sustainability.

The plan advocates expanding and extending urban highways, building a dedicated truck route for freight movement, and creating more conventional goods movement platforms such as the BNSF SCIG project. According to the EIR, these have "significant and unavoidable impacts." **The plan's slate of projects will worsen air quality, increase congestion and safety risks on roadways, pose threats to public health, and degrade the environment overall and specifically of those communities adjacent to such infrastructure.**

The RTP places emphasis on goods movement, and argues that conventional roadway expansion is necessary for goods movement. The Plan EIR, however, only considers **residential development** alternatives ("with minor changes to goods movement and transit projects"), and does not consider goods movement alternatives. This is contrary to the spirit of CEQA requirements.

The EIR is flawed and incomplete as it does NOT evaluate the alternative of electrified rail infrastructure for goods movement from the ports, which has the potential to:

- improve air quality
- decrease congestion and safety risks on roadways
- reduce threats to public health
- integrate rail infrastructure into environmental renewal projects
- create transit corridors that link communities within the region

Specific zero-emission, electrified rail freight options such as the GRID project have been proposed and discussed. The concept of such a system is placed in the "for future study," unfunded section of the plan, when it belongs as a viable alternative analyzed in the EIR.

The EIR should have offered a direct comparison between the impacts of all conventional goods movement expansion projects in the current draft plan, and a fast-tracked, zero-emission, electrified rail system for goods movement.

Elise Kalfayan

Postscript re the Plan's Jobs Section:
As economic leaders in this region are aware, the Panama Canal and other ports are working aggressively to capture a larger share of cargo traffic. The draft RTP's goods movement priorities – conventional highway expansion and more trucks now, electrified rail later – allocates billions in public funds to **projects that will not keep this region competitive**. Money should instead be allocated to cutting-edge freight movement technology, putting the region's ports in a competitive stance while contributing to AB32 and SB375 goals.

February 14, 2011

President Pam O'Conner
Board of Directors
SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS
818 w. Seventh Street, 12 Floor
Los Angeles, CA 90017

RTP@scag.gov

Re: Draft Regional Transportation Plan / Sustainable Community Strategy 2035
Draft Program Environmental Impact Report

Dear President O'Conner:

The comments in this letter are submitted to you on behalf of residents living in urban and suburban areas of the SCAG region for consideration by the Honorable Members of the SCAG Regional Council.

The extensive work by SCAG and its dedicated competent staff is commendable and reflects great leadership for its member jurisdictions and regional councils throughout California and the nation, as they grip with common challenges. It is for this reason as well that concerns inherent in the Draft RTP/SCS and Draft PEIR are expressed in these comments.

Public Participation

The work of SCAG is challenging and must address extensive policies, programs and laws on local, state and federal levels.

One requirement that was noticeably absent throughout the Draft RTP/SCS process was compliance with the requirements of the Environmental Justice Order of the U.S. Department of Transportation (DOT). The order can be found in 62 Federal Register at 18380. The public participation required in the DOT Order is much more extensive than what was afforded in SCAG public participation efforts, as described in the Draft RTP/SCS and experienced by the undersigned. The Order required a marked elevation of public participation by communities of concern as stated "during the planning and development" of the Draft RTP/SCS rather than providing for a passive audience to occasional presentations by SCAG staff with limited time given for contemporaneous comment.

The non-compliant efforts were not without adverse consequence in providing for environmental justice; a great deal more work remains to be done, as more fully set forth in comments by *Climate Plan* and its partner coalition. It is feared that without addressing those concerns, the environmental impacts on the SCAG region will be significant and wide spread.

A draft RTP/SCS that is responsive to all residents of the region would address the needs of the entire economic spectrum of the region, not for political acceptance but as the best policy for dealing with growth, regional management and environmental impacts.

Environmental Impacts

If the economy of the region is well served by this planning, and significant growth is encouraged, transportation demands by the entire economic spectrum of the region will be greatly increased. The demands on the currently overloaded transportation system of the region which we have all experienced will itself be greatly increased into an unresolvable gridlock.

Persons from communities reflecting the entire economic spectrum of the region commute daily and without adequately providing for them, as discussed by the coalition, transportation disaster in the not too distant future is certain.

Without incorporation of responsive planning, through those efforts described in the coalition comments and through full compliance with the DOT Order, the Draft RTP/SCS and its related Draft PEIR are fundamentally not certifiable.

Request is respectfully made that SCAG charge its staff with pursuing responsive planning, as recommended, so that all communities of the SCAG region and so that the region itself may benefit from these dedicated efforts.

Thanks you.

Very truly yours,

Ezequiel Gutierrez, Jr.
Attorney at Law

RTP@scag.ca.gov

Re: Southern California Association of Governments 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy December 2011

Thank you for the opportunity to comment on the *SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy*. The Plan states as its goal "improving the quality of fife for our residents',

> ***The 2012 RTP/SCS will transform the region, serving as a blueprint for improving quality of life for our residents by provoking more choices for where they will live, work and play and how they will move around around, The 20 12 RT/SCS proposes investing over $500 billion over the next 25 years to improve the quality of life of the region's residents by enhancing our transportation system.***

While I agree that improving the quality of life for the residents is an admirable goal, the Plan as indicated by the SCS City maps, will denigrate the quality of life for the residents of San Marino. My comments regarding the 2012-2035 RTP are limited to where I live, Oak Knoll Avenue in San Marino, and the adjacent area

While reviewing the Resources> SCS Map Tool from the SCAG web site,

http//tpscs.scag.ca.gov/pages/scs-maps-Tool.aspx, I was shocked to discover that Oak Knoll Avenue in San Marino has been designated a **High quality Transit Corridor**.

The SCAG RTP Plan indicates that

> *A HQTA (High Quality Transit Area) is generally a walkable transit village, consistent with the adopted SC5 that has a minimum density of 20 dwelling units per acre and is within a 1/2 mile of a well serviced transit stop, and includes transit corridors with minimum 15 minutes or less service frequency during peak commute hours.*

Oak Knoll Avenue in San Marino is a 72 feet narrow, two lane street fronted exclusively by single family homes where children live and play. The homes, built between 1920 and 1950, and the set back is close to the street The posted speed limit is 30 mph, the posted weight limit is three tons, and truck traffic is prohibited. The City of San Marino General Plan, classifies Oak Knoll Avenue as a residential collector street. The street carries an unusually high volume of cut-through traffic, exceeding the capacity of a two lane residential street.

How then, was Oak Knoll Avenue in San Marino designated a HQTC? This question was posed to both the City of San Marino staff and City Council. They were unaware of this designation in the proposed RTP.

As Stephanie Johnson mentioned in her email directed to you dated February 11, 2012 regarding Los Robles the same applies to Oak Knoll Avenue in San Marino.

Oak Knoll Avenue in San Marino does not meet the definition of HQTC.
Regional traffic should not be directed toward Oak Knoll Avenue, exacerbating the existing cut-through traffic and its resulting negative impacts upon the residents.

Sincerely,

Ghassan Roumani

Memo To: Margaret Lin

From: Greg Adams

Date: February 14, 2012

Subject: Comments on the 2012 RTP

Earlier, I attempted to use your interactive website to send these comments but I could not move on to Step 2 for some reason hence I am sending them in this memo format.

To begin, staff is to be congratulated on a thorough analysis and simplified presentation of a complicated strategy.

Executive Summary

Page 5: Kudos on your recognition of the problems associated with "first mile/last mile" logistics. In and of itself this aspect of a travel decision can be so expensive and burdensome that a well-meaning commuter must choose to drive the entire route despite public transportation availability along most of the route. I suggest you expand on this aspect of the plan. More bike racks on buses may not cut it; local shuttles by cities and park and ride pool vehicles to transportation hubs might help.

Page 7: I may have missed it but "Nominal dollars" in Table 2 (and in many other locations of the document) should be defined early in the report.

Chapter 1-Vision

Page 12: Increasingly today one hears very inflated claims about job creation resulting from a particular project which are largely unsubstantiated. Perhaps there should be a down-to-earth , simplified discussion of what is to unfold jobwise, not relying on REMI algorithms but a common sense explanation of why 150,000-180,000 jobs per year will be *created* (and presumably sustained)as a result of the RTP implementation. Please avoid what has occurred in the world of green technology, for example. If one were to total all the job creation claims from all the alternatives seeking funding, there would be no unemployment in the United States. The role of lower education levels on the created jobs in the region needs more explanation.

Page 24: More explanation is needed as to the long term trend of declining commute trip carpool rates. It seems counterintuitive especially lately given rising gasoline prices. Does this corroborate with rideshare data reported to the SCAQMD?

Page 25 and 28: Improved fuel efficiency, alternative-fuel vehicle penetration, lack of inflation adjustors-all have contributed to gas tax shortfalls. Passenger vehicles becoming increasingly cleaner have diminished the benefits of reduced vehicle use and congestion management strategies thereby making conformity determinations more difficult. Both of these areas may be worthy of pursuing changes to the federal Clean Air Act or at least the regulations implementing the provisions of the Clean Air Act. This, added to the statement on Page 29 that emissions forecasted from just three sources-ships, trains and

aircraft ("federal sources") that alone would lead to ozone levels near the federal standard, might be additional ammunition and support for selective changes to the CAA.

Chapter 2 Transportation Investments

Page 40- Transportation Demand Management: First mile/last mile strategies need more discussion per my remarks on Page 5 above.

Page 41-Congestion Management System: Non-recurring congestion accounts for almost 50 percent of all congestion on our roadway system. One suggestion is for SCAG to strike an agreement with CalTrans prohibiting road repair contracts from proceeding during daylight hours where the work of repair can cause enormous traffic jams. This past Sunday, on the I-10 freeway heading west into Banning, traffic was delayed 3 full hours, backing up all the way to Whitewater , for very minor road repairs that caused two of the four lanes to be cordoned off. Highway Patrol did not appear until an hour and a half into the action which suggests there might be better coordination of their activities from a congestion management standpoint.

Page 43-Corridor System Management Plans: Enhanced incident management must include the above recommendation. The California Highway Patrol (CHP) and CalTrans need to better coordinate. In the case of accidents, the CHP needs to develop expedited procedures and physical screening techniques to minimize the impacts of rubbernecking and the slowdowns that result.

Pages 51 and 53-Passenger and High-Speed Rail: The SCAG planning region will not be connected to the HSR network until 2033, 23 years into this plan. The HSR Authority's 2009 Business Plan posits that passengers will travel between Los Angeles and San Francisco in less than three hours, for about 80% of comparable airfare. Given that first mile/last mile considerations also exist, why would one choose such a means of travel? Do I presume correctly that the 80% airfare figure is the one-way plane fare in the 2033 timeframe? Given the astronomical cost of the project, might not those resources be better employed on more local and cheaper alternatives such as in-city rapid rail?

Page 71-Regional Clean Freight Corridor System: While truck-only lanes handling 58,000-70,000 trucks per day would be a challenge of the highest degree to implement, non-freeway alignments handling the same traffic flow would be an even greater hurdle, even with 100% ZEVs.

Page 86-The economic Outlook: The inability of existing excise taxes to keep pace with increasing transportation needs and the detrimental effects of increasing fuel economy on traditional revenue sources needs to be the primary focus of a SCAG lobbying effort in Congress at least to escalate the excise tax at the CPI rate.

Chapter 4- Sustainable Communities Strategy

Page 105- The plan's goal to seek to change the region from being known worldwide as the "capital of sprawl" results in a "densification" of the existing inner cities, to my way of thinking. Associated with that densification are costly infrastructure changes. Has a cost analysis of this consequence been performed? It is very difficult, as you are well aware, to plan for such effects of densification given the

countering aspects of the recent RDA court decision and the re-distribution of funds to the cities that will result.

Page 123-Changing Demographics and Housing Market Demand

The impacts of the recent RDA decision should be addressed in this chapter, even if the results are somewhat speculative. SB 375 combines transportation and housing planning by integrating the Regional Housing Needs Assessment (RHNA) process with the RTP/SCS. How will this nexus be impacted by the RDA decision? Would the example communities that are illustrated on pages 126 and 138, for example, been constructed in the first place without RDA assistance?

Chapter 5-Measuring Up

Page 173- Table 5.3- Total Employment Impact

Please provide an explanation as to how goods movement, logistics and distribution will be impacted by an expanded Panama Canal and a shift of some traffic to the Gulf Coast ports of the United States.

Thank you for the opportunity to comment. The staff should be congratulated on a thorough and ambitious plan and a job well done.

To: 2012 PEIR
Subject: 2012 PEIR comments

Dear Mr. Lieb:

I have the following comments on the SCAG RTP PEIR. The following comments are made in my own capacity and do not represent the views of any agency or organization I am affiliated with.

With regard to freight movement strategies, in the past SCAG has considered making the truck only lanes "green lanes" for clean fuel and low emission trucks. This should be considered in any studies. Also, electrification of freight rail, while currently not funded in the short term, is a strategic long term improvement that should be strongly considered for implementation. This has the potential of eliminating a significant amount of emissions from diesel locomotives. Implementation of "inland ports" with freight rail connections to truck facilities in the Antelope Valley and the Inland Empire have a potential of bringing jobs into these economically hard hit areas.

On air quality, the PEIR correctly notes that denser development will result in more individuals living near freeways and other sources of emissions. Increasing the population near transportation improvements and closer to businesses has the potential of greatly reducing region-wide emission levels, but with an impact to personal health. However, SCAG has no power to ensure that the mitigation measures listed in MM-AQ19 are adopted by the local agencies approving these developments. Please identify what steps SCAG will take, either through State legislation or through advocacy, to ensure that local agencies comply with these measures.

Part of historic resources is also recognizing the land use impacts of denser development on historic residential and commercial districts. The SCAG region has several commercial and residential neighborhoods which are on the National Register of Historic Places. Many of these districts are near transit-friendly areas which are slated for denser development under the RTP. In the development approval process, local jurisdictions should recognize those impacts and mitigate appropriately.

With respect to the Mitigation Measures for Transportation, I am happy to see that SCAG is taking a leadership role in transportation security. With a denser environment come more security risks. Concentration of individuals at key transit hubs provide an inviting target to terrorists; however large scale security checks have the potential of delaying passengers and discouraging activity in dense population centers. In addition, bomb threats and hoaxes can also disrupt passenger traffic substantially and increase the climate of fear that discourages people from living and working in denser environments. SCAG should work with existing interagency law enforcement groups to coordinate sharing of information and best practices among local jurisdictions. Design of transit facilities should incorporate modern design features that enhance security without creating a prison-like environment. (MM-TR6 to MM-TR12).

I support SCAG's support for congestion pricing but this statement should emanate from the Regional Council and not from the staff level. There should be regional consensus on value pricing as a means not necessarily only to raise revenue, but to improve efficiencies in transportation (MM-TR15). In addition, SCAG should work with its member transportation commissions to develop a regional smart card transit system, similar to ORCA in Seattle or Clipper in the San Francisco Bay Area. Currently LACMTA is implementing their Transit Access Pass (TAP) system, and although there are bugs the system is supposed to be deployed to all of the large transit

operators in the County within the next five years. This system, or a compatible system, should be expanded throughout the SCAG region. (MM-TR16).

Overall, SCAG should emphasize the improvements of this plan over doing nothing ("no project alternative"), while working with elected leaders and its Regional Council to inform residents of the benefits and costs of this RTP.

Sincerely,

Hank Fung, P.E.

To Whom it May Concern:

These signatures represent just some of the children in the Oxnard Elementary School District; actually, they are from just one school. They were gathered by these same children during their recess time. For me they have a significance beyond the number 100 plus because the children responded from their heart for the fifth grader who was killed two years ago at a crosswalk near the school.

Tragically, it would have been such a simple matter to have allocated more funds to have had a crossing guard on duty at an earlier time or to have had an illuminated and sounding crosswalk by their school. To now try to pay tribute to this young girl's passing by creating safer crosswalks and bike lanes, at or near school crossings, would be the most fitting act to remember her by, an act to prevent further tragedies like this from ocurring.

Thank you,

Jon Portera, MA
Oxnard Elementary School District

Re: draft SCAG 2012-2035 regional transportation plan/ SCS and PEIR

The SCAG PEIR / RTP is flawed in the same way as the SANDAG RTP / EIR – they are inadequate under CEQA law.

The joining motion filed by the Attorney General of the State of California in the lawsuit against the San Diego Association of Governments (SANDAG) Regional Transportation Plan states that the Environmental Impact Report (EIR) prepared for the plan does not adequately analyze or prevent air pollution and climate concerns, and prioritizes expanding freeways while delaying public transit projects.

The SCAG is similarly flawed and will not stand up to CEQA challenge.

I oppose all items in the draft RTP that recommend the expansion or extension of highways, for the following reasons:

The fundamental law of highway congestion (Anthony Downs, 1962, 2004, 1992; and confirmed most recently by Gilles Duranton and Matthew Turner of the University of Toronto) states that the travel speed of an expanded highway reverts to its previous level before the capacity expansion and that the extension of interstate highways is met with a proportional increase in traffic in the U.S.

SCAG's assumption that highway expansion reduces congestion and improves pollution levels is grossly inaccurate. The traffic modeling fails to fully account for generated and induced traffic. And therefore exaggerates the benefits of expansion and the does not reflect the severity of future congestion problems.

The draft RTP anticipates adding 948 centerline miles and 7419 lanes miles which would be a 4.4% and 11.1% increase respectively.

The SCAG RTP will increase pollution, truck traffic, congestion, accidents, health impacts and environmental risks throughout the Southern California region.

I oppose the 710 gap closure project as it is un-defined and is not eligible to be on the Constrained Plan.

The proposed SR-710 Extension Toll Tunnels, at $5.6 BILLION already underfunded by at least 50%, must be moved from the Constrained Plan to the Strategic Unfunded Plan in the 2012 RTP because there are no committed, available, or reasonably available funds as required by federal law for inclusion in the Constrained Plan.

There is enormous internal inconsistency with the SCAG's six possible construction zones yet all actual estimates based only the previously defined Meridian Route alignment.

I oppose plan items in the draft RTP that recommend increased conventional roadway and rail yard capacity for goods movement. The RTP should instead include existing zero-emission goods movement alternatives.

Goods movement must be accomplished via electrified freight rail not trucks.

Goods movement proposals in the draft RTP are inconsistent with regional, state, and federal air quality and congestion targets stated in the plan.

The plan states that to attain federal ozone standards, the region will need broad deployment of zero and near-zero emission transportation technologies in the 2023 to 2035 timeframe (p.74). It also acknowledges that conventional goods movement practices contribute to excess ozone and poor air quality (p. 68) and negative impacts in neighboring communities and throughout the region.

However, the plan allocates billions of dollars to expanding conventional goods movement, saying “truck-only freight corridors are effective as they add capacity in congested corridors, improve truck operations and safety.and provide a platform for the introduction and adoption of zero-emission technologies.”

Yet the plan does not require zero-emission technology.

Regards,

Judy Bergstresser

Subject: 2012 PEIR SCAG COMMENTS; Re: SR 710 TUNNEL

Peter A. Orona
[redacted]
Los Angeles, CA [redacted]
February 5, 2012

SCAG/2012 PEIR/SR 710 TUNNEL/EIR QUESTIONS/COMMENTS/CONCERNS
ATTN: JACOB LIEB
818 W. 7TH STREET, 12TH FLOOR
LOS ANGELES, CA 90017

The proposed 710 Tunnel raises serious moral questions about public/private transportation issues. We did not choose to live near a freeway, connector road, or tunnel. Currently, productive residents living within the Meridian Corridor do so without any complex technologies adding to our health risks. For children, it brings an increased risk of asthma, according to researchers at the Keck School of Medicine of the University of Southern California. "It's one of a host of breathing problems that can plague teens living and learning near L.A.'s vast network of freeways – and these problems can follow them throughout life. With traffic cris-crossing into every corner of SoCal, few families in any part of town are immune to the risk (LA Parent March 15, 2011 Issue) http://www.reportingonhealth.org/fellowships/projects/air-teenage-lungs-1 ." Freeway pollution and noise increase the risk of developing asthma, cancer, hearing loss, and stress related diseases. Those of us who live in this neighborhood can only look forward to a future filled with illness.
Today there is no 710 Surface Freeway Route, Valley Blvd.-Alhambra Connector Road, or 710 Tunnel; consequently, the risk emanating from such concepts are zero. To all Federal, State, County, and Local governments who profess accountability when maintaining modern commercial productivity, it is your duty to find a balance between an individual's right to exist, and urbanization. Anything short of this is a

travesty to the democratic process, and an abatement of our humanity. As elected officials, it is your responsibility in making sure that our communities are not abused. Our communities are holding you accountable. As honorable civil servants of our communities, we respectfully request the following items be addressed rigorously, competently, and judiciously.

1. What would it take to construct the southern portal between the 60 Frwy (Pomona), and the 10 Frwy (San Bernardino)? Can Freeway Interchanges be reconfigured? If yes, then would it be possible for the southern portal to begin just before the 10 Frwy. Can a tunnel be constructed to go underneath the San Bernardino Frwy?

2. In regards to Electrostatic precipitators (ESP), or Electrostatic air cleaners: What data is there on the effectiveness of ESP/Scrubbers on ambient outside air? Are there a list of contaminants that scrubbers will remove and a list that the scrubbers will not remove? Which companies will be contracted to build the ESP's? Japan uses removal technologies in high-density areas, what is going to be done in El Sereno? What kind of containment tunnel management will be used; "dispersion containment", or removal containment"? How many tons of waste will a "scrubber tower" hold prior to maintenance? Can a "scrubber tower" implode? If a "scrubber tower" fails or is destroyed, is there a back-up system, or replacement procedure in place? Where is the waste from the scrubber pollution going? Can the same, or better "scrubber" technology utilized in nuclear submarines and spacecraft be applied to 710 Tunnel Scrubber Towers? How will 710 Tunnel Environmental Authorities continuously regulate/monitor the atmospheric conditions inside and outside the tunnel region? As scrubber technology improves, can scrubber towers be upgraded?

3. Provide information on studies done to measure simultaneously Particulate Matter contamination emanating at both portals (i.e., same weather/seasons/day/hour). How will the Air Quality Descriptor for PM 2.5 and PM10 be articulated in relation to the 710 Tunnel? Will PM 2.5 and PM 10 particles be eliminated in the process of being scrubbed? What contaminants will be left over and breathed by citizens? Where will the tunnel portals begin? Allen? Concord? Valley Blvd.? Del Mar? How will mitigation measures be addressed at the portal entrances, and tower sites when the technology to control pollution is not proven, or does not exist? How much toxins/noxious gases/CO2/PM2.5/PM10 particles will cars and trucks release inside the 710 Tunnel per hour? Please provide low and high estimates. Will authorities shut down the tunnel when too many hazardous PM2.5 and PM10 particles are detected on any given day? How much smog will the 710 Tunnel's portals, and scrubber towers contribute to the local existing pollution? For example, how will this new source of smog affect the smog inversions that the communities of La Canada/Flintridge/Tujunga experience? How many tons of air pollution will the proposed scrubbers capture? How often will the proposed scrubbers need to be cleaned? Provide low and high estimates.

4. How would authorities mitigate the noise pollution during the construction of the 710 Tunnel? How will you recapture, and recycle water from any tunnel excavation

encounters? Will authorities monitor noise levels, and pollution levels during construction? If levels exceed allowed limits, or the community's concern will they halt work for the day?
5. How will the Valley Blvd.-Alhambra Ave. Connector Road (part of the Low-Multi-Build Alternatives) benefit El Sereno? Compare and contrast the efficiency and effectiveness between the Valley Blvd.-Alhambra Ave. Connector Road, a 710 Surface Freeway Route, and the 710 Tunnel. Provide all information on any and all environmental studies, or reports that have been done and completed near, and around the proposed 710 Tunnel. Indicate what efforts have been made to provide this information to the community of El Sereno. Provide any tangent plans that are being considered in conjunction to the 710 Tunnel in order to mitigate LA County traffic problems. For example, will a commuter train station be constructed in El Sereno between Alhambra Ave., and Valley Blvd.?
6. What formulas/strategies are being used to measure risk acceptability in relation to the 710 Tunnel? Provide all information on how safety, and risk assessments of the proposed 710 Tunnel figure into human and environmental degradation within the affected local communities? How many additional lives will be lost prematurely due to the 710 Tunnel pollution and traffic accidents? What are all the cost-benefit ratios? Is the risk of implementing the 710 Tunnel not greater than the level of pollution output currently used in modes of transportation?
7. Provide a number estimate of traffic that will move from the beginning southern part of the proposed 710 Tunnel to the exit in Pasadena. The number should include projected number of cars, commercial trucks, and other vehicles. Will truck traffic in the tunnel be limited? What will be the vehicle capacity for the 710 Tunnel? How many cars would be able to fit within the 710 Tunnel during bumper-to-bumper traffic? Approximately, how many trucks will fit inside the 710 Tunnel? What kind of hazardous materials will be allowed to travel through the 710 Tunnel? For example, will commercial trucks be allowed to carry tankers with acids and flammable liquids through the 710 Tunnel?
8. Describe the potential biohazards that both tunnel construction, and usage bring. How is the construction company going to prevent Valley Fever from affecting people when digging, and clearing soil debris? Will there be limited hours of construction? What are the current local industry's hazardous emissions around the proposed 710 Tunnel? How can these materials interact with the new air pollution that the 710 Tunnel will bring? How will they mitigate truck pollution during construction? For example, will pavements be used during tunnel construction to prevent excess dust? Where will all the trucks for hauling out debris be parked? How many trucks will be used to haul away dirt? Where will the excavated dirt be dumped? Again, can the dirt contain Valley Fever materials? Will the train system be used to haul out construction debris? How do authorities intend to mitigate, or address the noise problem caused by the train during the day, and night?
9. How will the 710 Tunnel benefit the community of El Sereno? How many scrubber towers will be located in El Sereno, and what will be their locations? How many

Construction staging areas will be located in El Sereno, and what are the locations of the staging areas?
10. How will a fire inside the 710 Tunnel be mitigated? Where there is fire there is smoke. How will untested scrubber towers filter all the hazardous smoke from inside a 710 Tunnel fire? Will the toxic smoke be allowed to escape through the scrubber towers, vents, emergency exits, and portals? Should fire-fighting foam be used to combat fire inside the tunnel? Can powerful fans be used to redirect the smoke above ground? Will there be double jeopardy during a fire? What kind of endangerment will inhabitants above ground face during a catastrophic fire within the 710 Tunnel? Will there be a sprinkler system installed inside the 710 Tunnel in order to mitigate fires?
11. Will homeowners who live directly over/adjacent to the 710 Tunnel have to relinquish their mineral rights?

12. Can Caltrans buy/build two tunnel boring machines? Having the boring machines simultaneously working at both ends could cut tunnel construction time in half. Why can't the boring machines be designed, and built by Americans within the United States?
13. After tunnel construction and cost, how many years will it take to break even? When will Los Angeles County start making its profits?
14. Will authorities compensate the community, and individuals for any illnesses related to PM2.5 and PM10 particles that would have originated from the 710 Tunnel site? Will they be given health insurance, or monetary benefits?
15. Will MTA provide medical experts to begin a comprehensive health study around the local communities that will be affected by the 710 Tunnel? Will an unbiased environmental overseer be hired to protect, and monitor the community's health and safety concerns during, and after construction?
16. What kind of security will merit monitoring the entire 710 Tunnel facilities? How will terrorist concerns be addressed? What will be done to safeguard the occupants in, and around the 710 Tunnel?
17. How much green space will be needed to offset the pollution that will be generated by the 710 Tunnel? How many fully mature trees will be needed to absorb vehicle exhaust emanating from both the portals, and scrubber towers?
18. How much will a toll road system cost to implement, and maintain?
19. Are current modes of production changing to prevent the harmful effects of pollution? Provide information that the Market Place will create alternative-affordable modes of transportation, and fuels by the time the 710 Tunnel is completed? For example, when will Fuel Cell Vehicles (FCV's) be readily available on a mass transit scale?
20. Will the 710 Tunnel engineers learn from all the errors that previous tunnel mishaps demonstrate? For example, people living around tunnel portals in Australia are suffering, and dying. The Big Dig in Boston is a fiasco. Will an independent panel of environmental experts review the 710 Tunnel EIR? Will a contact telephone number for all agencies, and government officials be provided to voice concerns and complaints during construction?

21. Logistically, would it be possible to evenly spread the amount of freight tonnage along the Pacific Rim harbors (San Diego, Long Beach, San Pedro, San Francisco, and Seattle). What would it take to ensure that a more efficient and effective On Time Delivery System be implemented? Would an upgraded of our national railway system help prevent unnecessary truck traffic through the counties of LA/Riverside/Ventura/ San Bernardino/San Luis Obispo, etc.? For example, can the coordination of freight goods that make their way towards the Midwest, or Northwest be dropped off at any of the northern bays rather than being distributed from the ports of Los Angeles or Long Beach?

22. Are the 710 Tunnel scrubber towers, and emergency exits going to be equidistant from each other? Indicate tower and exit locations. Can tower and exit locations be situated where there are no existing domiciles? If a scrubber tower is warranted in a residential neighborhood, can a four-block radius of green space circumscribe the scrubber tower?

23. How many people concerned about the 710 Tunnel have read ADVICE & PLANNING by Martin H. Krieger?

Comments on the SCAG 2012 PEIR

Phillip Jon Brown, Architect
[redacted]
Beverly Hills, Calif. [redacted]
[redacted]

Southern California Association of Governments February 14, 2012
Email address; RTP@scag.ca.gov
Subject; draft RTP/CSC Comments

These comments are on the draft 2012-2035 RTP/SCS and will use the basic sequence of the SCAG interactive comment issues, but after an introductory statement regarding the Flow Boulevard concept is made.

Overall Comment

Rather than overly focused, commuter driven centralizing of trips via expensive rail more planning and building should be made to provide for increased population density and job creation to reduce travel and commuting with shorter trips; think “Centers Concept” in sub-regional aggregations. In that manner extensive low cost medium capacity transportation and land use in patterns and corridors will provide a much more Southern California like growth and compatibility with what exists.

The specific overall comment to be made is that SCAG needs to include the Flow Boulevard concept in its planning vision formation, criteria and plan recommendations for the Regional Transportation Plan. It may be better said that SCAG being the lead agency should see that County agencies like the Los Angeles County Metropolitan Transportation Authority be directed to enlarge its forms of transportation improvement to include well crafted land use and transportation improvement forms such as the Flow Boulevard technique.

A Flow Boulevard is a combined transportation and land use improvement technique which has a semi–limited access configuration and includes what are known as Intelligent Transportation System (ITS) technologies. In that it combines strategies for land use development a Flow Boulevard (FB) can also be included in the Smart Growth category. The combined planning elements then can become a smart growth transportation corridor or if used in already dense urban areas, a way to “fix what is broken” regarding congestion or desperate land use conditions.

The transportation capacity and the land use density range can be said to be “medium” on both counts. The first stage FB transportation capacity is in the 150,000 person trip range per day and the land use would generally be a mix of R-2, and R-3 residential, as well as C-1 and C-2 commercial densities in the corridor.

The Flow Boulevard corridors evolve from selected existing urban street right of ways (ROW) without widening. The use of ITS strategies brings about the increased capacity over existing street usage. The corridors can be thought of as in-fill structures that follow the SB 375 mandate to improve and combine land use densities and transit while reducing vehicular miles traveled (VMT) in the consolidating communities and cities in Southern California. The corridors are so selected to as well "protect" existing residential communities from excessive traffic. There is a website dedicated to the development of the transportation and land use concepts at www.FlowBoulevardPlan.com. In the comments below specific examples will be referred to using URL links as best as can be arranged or named call outs.

A Brief Definition of Flow Boulevards

A Flow Boulevard (FB) is based upon the utilization of a pair of one-way streets separated by a city block or several and includes synchronized traffic signals to allow vehicles to flow with the objective of not stopping to create higher capacities and higher average travel speeds along the corridor in both directions. Flow Boulevards are not to be utilized in "downtown like grid patterns" but are to be used in "corridor" configurations which typically will have lower density adjacent development. The highly accessible blocks between the one-way paired streets, as well as land use directly adjacent out side of the paired streets are intended to be developed with higher density land uses than that are typically found in Southern California "sprawl development". The Flow Boulevard form can be a "growth corridor" accepting higher density while providing increased transportation capacity.

Local streets perpendicular to the FB are not allowed to cross each of the one-way streets but local traffic is made to turn into the one-way flow or if FB traffic is exiting into the adjacent local street, it is made with a right turn. The streets between the one-way pair and connecting them are typically made to be one-way streets so that reversal of direction can be made or to go around the block and continue in the original direction. For more explicit operation diagrams and further discussion on the website at www.flowboulevardplan.com click on the menu title "How the Boulevard Works".

Regarding the first stage FB where pedestrian and vehicular cross traffic occurs at the same grade as the FB; the variables of signal spacing, vehicular arterial street crossing demand, speed of travel (typically 40 mph) and the length of signal cycle time is dealt with to optimize green time for the FB "pack" of flowing vehicles. A reasonable objective is to obtain 1200 vehicles/lane/hour that will give accommodating cross traffic and pedestrian crossing time intervals at approximate 2000 foot intervals (1/3 mile). Each FB direction is timed separately to guarantee capacity and flow. In a 4 lane FB, in each direction, where the fourth lane is a Rapid Bus Transit lane combined with HOV use, the daily capacity for the corridor can be approximately 150,000 person trips per day.

Briefly, the 2nd stage of the FB is involved with developing grade separated circulation for pedestrians to bring increased green time for lengthening "the pack" that flows therefore the hourly per lane and daily capacity of the FB. Similar coordination of grade separation for cross vehicular traffic will be necessary for the maintaining of the FB green signal time

intervals. The third stage of the FB is when there is complete elevated pedestrian circulation and open space provided by adjacent land use development and there is complete grade separation for major arterial vehicular cross traffic in that segment of the FB. It should be noted that there would be different stage FB development along the corridor going from the no FB condition all the way through 1st, 2nd and 3rd stage segments.
The time increment of evolution is basically "from here on out". For Los Angeles in fifty years there is potential for a forty percent increase in population or more and certainly much more than that in corridor developments. Flow Boulevard corridors are three dimensionally organized dense environments that can happen and probably must happen to allow Los Angeles to solve its traffic problems and preserve its character and lifestyle. Selected areas of land use density allows construction of grade separated vehicular crossings to be made as well as elevated pedestrian and bikeway circulation to cross the FB providing continuity of urban fabric across the FB corridor. It is anticipated that a relative few number of these corridors are needed to solve the problems that have developed in Los Angeles. Since they grow out of the existing street network they respond to need and can evolve in density and capacity to it.

The capacity of the 3rd stage FB with continuous flow traffic is in the 2400 vehicle lane/hour range giving 280,000 person trips/ day for the total eight lanes with conventional spacing between vehicles and would not be expected to evolve to that capacity for maybe 60 years or more. Computerized controlled spacing of one or two lanes in each direction opens a whole expanded realm of additional capacity is even further off. That the FB becomes a guideway in segments accepting evolved technologies as time goes on is important and a relevant transportation and land use element able to work "from here on out".

Example Applications of Flow Boulevards

Adding capacity to corridors "to fix what is broken": In this actual proposed application, a FB is to be added as a frontage road to the 405 corridor on the Los Angeles Westside to eliminate congestion to make that segment of the 405 work without failing, along with its interchange with the I-10 which can make it work without failing and the net result of making these corridors have adequate capacity for the commuter to West LA is to be able to take enough traffic out of the West LA arterial grid so as to eliminate the current traffic gridlock. See Exhibit A at the end of this comment text for more description.

Add transportation capacity and land use development to mend two communities and their common edges: In this instance there are two differing communities where there has been traditionally a major travel corridor between them that now has broken down due to a travel demand overload into congested traffic. This puts additional travel in the form as "cut through traffic" into the community to the north (Hollywood) which has become gridlocked exceeding the ATSAC usage limits. Both communities (north and south) of the major travel corridor are becoming blighted due to traffic invasion and a mix of dissimilar land uses that resist compatible interactions. The FB application would provide the needed increased capacity to restore the traditional major travel corridor of through traffic so that "over flow" traffic does not invade either adjacent community. It would then be an urban design task to

employ land use development as a part of the FB development to provide appropriate north-south circulation and land uses to mend, bring attractions and compatibility between the two communities. A preliminary corridor is laid out on the FB website and can be reached by link www.flowblvd.com/basinplan2.html or by clicking on the menu title "LA Basin FB Loop and Transportation Corridor Study", then when that comes up click on the Page 2 link (in blue) to get to the "Santa Monica Flow Boulevard Corridor" which is a preliminary study. Scroll down to the Hollywood segment.

Protect adjacent land use and entire communities from unnecessary traffic: The configuration of a LA Basin Loop is intended to reduce traffic invasion of the extensive single and multi family residential communities of the Basin as well as to provide a way to circulate within the Basin and to accept part of the multi-modal commuter travel to Basin employment centers. The configuration would provide the additional transportation modes as back-up to the subway and rail network being built in the Basin. The extensive central form of residential communities surrounded by work centers and geographic features is unique in world city form organizations. It would be a great loss to have traffic gridlock claim yet more square miles of Los Angeles. There is further discussion on this subject regarding the alternative locations of the Westside Subway Extension at two different websites 1/ www.flowblvd.com/subwayextension.html or by clicking the website menu on Subway Extension and 2/ at www.flowblvd.com/basinstudy.html or by clicking the website menu on Basin Loop/Corridor Study (it's page one).

In this discussion is revealed that there is the traffic problem of attracting too many trips to an inadequate transportation infrastructure but there is the additional problem that the existing boulevard structure has "built-in" bottleneck configurations which cannot be dealt with unless the entire central residential community form is involved with congestion and "cut-through" traffic.

Use as the necessary multi-modal back-up component to a Subway Corridor: As part of the Westside Subway Extension study in the LA Basin area it became evident that the subway and the development around stations would attract a percentage of vehicular trips in the corridor. It might be a fairly high percentage of trips depending on the amount of regional trip attractions that would be built. There is a fair amount of discussion on the matter located at the link www.flowblvd.com/subwayextension.html.

Sub Regional Consolidation Being Structured with Growth Corridors: Being that Flow Boulevards increase transportation capacity and provide advantageous land use relationships as density is developed, it is logical to structure additional growth in the low density existing settings of Southern California by the FB technique. The examples referred to in the before mentioned website are in the Los Angeles County sub region and within geographical subdivisions of it, essentially the San Fernando Valley, East LA areas, South Bay, and the LA Basin area. Whereas the LA Basin area needs transportation improvement to stabilize the relationships between transportation infrastructure and land use, it does not need growth in the Westside area particularly but it does need renewal growth in the eastern area towards downtown Los Angeles.

Outside of the Basin the low density areas of residential, commercial and industrial land use are a particular opportunity, if not necessity, for corridor growth development. Given the low density existing sprawl where the majority of trip mileage is generated and performed, growth corridors are necessary given by the recognition of energy security to reduce VMT, as well as the need to increase economic development productivity for both existing and the future increased population to sustain an acceptable standard of living. "Growth is necessary" to adapt the urban form. It is imperative that growth be directed to make the necessary improvement to functional and spatial relationships to bring about the efficiencies that will allow affordable, sustainable and desirable city environment.

While accepting greater population, VMT must be reduced by the proximity of needed land uses. The area where the greatest amount of VMT can be reduced while conforming to affordable, sustainable and desirable objectives is in the existing low density suburban areas. The average trip length in LA County is almost 16 miles long. The length must be reduced and a general transformation to non fossil fuel energy in small truck and automobiles needs to take place while increasing transit options as well. In transit the greatest cost benefit comes from bus usage. The cost of five miles of light rail construction (ROW, hardware and typical occasional grade separations) can pay for 100 miles of Flow Boulevard which is fully outfitted including hybrid articulated buses at generally 10 minute intervals (local bus costs reducing time intervals further have not been included). In addition to the greater amount of transit coverage there are approximately 16 times the amount of patron transit miles developed (volume of users). On a typical FB paired street, whether two or three lanes of auto and truck flowing lanes are used, there would always be the BRT/HOV lane provided in each direction of the Flow Boulevard.

A preliminary allocation study at www.flowboulevardplan.com/lafbnetwork.html has been made. It should be pointed out that since that study was made it is recognized that it is very likely that the flow boulevards seen in that plan would be discontinuous not really long connected corridors. That is because a problem solving FB would be in response to a specific location, town or city. Maybe in the future continuous connection may be built up however.

Use of the Interactive Comment Sequence

Generally I will be commenting on these issues from the viewpoint that I understand from being familiar with the Los Angeles County and its MTA. I would think that the same kind of comments would apply elsewhere. I am trying to be more specific with examples and applications to actual places and peoples. I find little wrong with SCAG criteria but it strikes me as being abstract. I realize SCAG can't design for all six counties. But more specific examples of how multiple criteria and objectives are put together in plans, urban forms, transportation corridors and programs would be an improvement. So in my comments I will refer to both the policies, objectives and strategies that SCAG is developing but I will also respond with reference to the Flow Boulevard concept as it reflects and incorporates the criteria and objectives that SCAG seeks to make a part of plans for the RTP/SCS.

01 OUR VISION

Towards a Sustainable Future

Mobility, Economy, Sustainability; Realize the Vision

In LA County the MTA (Metro) has a major emphasis on expansion of the rail network. My general impression is that there is too much emphasis on rail to the fault of being unbalanced in multi modal considerations as it relates to comprehensive planning and sound economics. This emphasis brings about the speculative dimension of proceeding with a narrow view of what and how things should be. This brings in the dimension of risk and the realm of making very large misallocations of resources.

It's not that their proposed system is too big, it is that it is too expensive to be realized in a short amount of time and that over time there may be much needed revisions and additions such as Flow Boulevard networks to the plan. Metro rarely refers to serving population and land use patterns. And the talk of accelerated financing by borrowing from the future and of laying an even greater burden on the public is frightful. It is as though another "bubble" is in the talking stages of being made; a transportation bubble and how disastrous a thought!

On the Westside of LA, having a notorious level of congestion, the inclination is not so much to solve the communities' problem but to simply find a way to build rail transit and if there are major deficiencies with continued problems then there is no budget to actually solve the traffic problems. That appears to be the direction of their approach overall.

The SCAG objectives of Mobility, Economy and Sustainability falls through the cracks in the kind of planning the MTA and the City of LA is performing. This problem is showing up in countywide instances as well as in City Community Plans. Mobility is not being achieved in City Community Plans, and congestion persists countywide. Much of the MTA response to the event of recession is essentially that of trying to re-inflate past trends that were heavily dependent on speculative real estate ventures. That is not an approach to obtain sustainability with. Growth based on assemblage of businesses that provide jobs and sustained productivity will produce better results.

There is some room for "recovery" by supporting real business with access and the solving of problems of congestion. The larger question however is how we obtain new growth in our economy to provide future employment for the young and replace jobs that have fallen away with past trends. This area of planning should be of great importance in securing the economic future that is needed in Southern California and I think extensive Flow Boulevard "growth corridor development" can provide the necessary structure and place to make it happen. This kind of growth related to transportation improvement seems to be absolutely missing in Metro's planning elements.

The Setting

Economic Recession, Population Growth

Fixing real transportation problems while developing a new and expanding economy is needed. As stated in the above section dealing with Sub Regional Consolidation, the suburbs are where the majority of the additional 2 million people in LA County will be located over the next twenty five years. Extensive low cost transportation improvement and low cost land use development that is able to bring opportunities for starting new businesses are the kinds of policies and programs that should be identified and made apart of the denser consolidation that is to occur within existing communities and work centers. Flow Boulevards as growth corridors would be instrumental in bringing that about.

In addition to using a transportation form that targets reduction of VMT it is necessary to bringing about programs and policies that promote the attraction of businesses that will help form a new relevant economy. A concerted effort to attract new businesses and manufacturers from other counties, states and countries by providing the attraction of affordable start-up, connectivity, idea environ, affordable housing, technical support, access to needed materials and generally friendly government should be a part of growth corridors. These programs should be coordinated city wide if not countywide.

In LA County the radial patterned commuter rail plan that is focused on the LA Basin and is so expensive to develop will carry only an approximate 2 and 1/2% of the travel miles made in LA County on the rail system. That leaves a remainder of 16% in vehicular commuter modes to the LA Basin. I'm speaking about the percentage of total travel miles in LA County. That leaves more than 90% of travel (including the 16%) in vehicular modes mainly circulating in suburban locations. This 90% of travel is the area to target for reduction of VMT by making those areas more self sufficient in land uses that allow shorter trips. This responds to the fact that LA needs growth to adapt to an urban form that supports energy security by reducing energy usage. This also secures economic stability and growth through low cost transportation development in areas that can and desire to receive development in low land cost areas.

Safety, Multi-Modal System

The Flow Boulevard system separates vehicles from pedestrian and bikeway circulation over time. This allows safe and aesthetic crossing of the FB corridors as well as the direct connection to the high density land use areas and open space centered in the FB corridors. While each corridor would have different characters given their density and location, example images of such integrated environments in model form can be seen on the FB website. By clicking the menu on "Elements and Travel Demand" photo images of a model environment are presented. There are two portions of images showing development of such environments separated by a potion of the study dealing with travel dement. Just keep scrolling from one end to the other. The link is www.flowblvd.com/elements.html.

Transportation System Management

Flow Boulevard characteristics of TSM and ITS are pretty well expressed in the FB descriptions above. What has not been stated is how the "medium capacity" FB system can relieve the freeway network of much of the local and medium length travel that crowds our present freeways. This would allow freeways to specialize more into long trip facilities and thereby extend their life and performance as a system that will not see many more miles added to it in the LA County area.

Challenges and Opportunities

Transportation Finance, System Preservation, Goods Movement

The Flow Boulevard system looks to increase the tax and service fee base to produce more revenues. The FB system is a "money maker" not a facility that needs subsidies such as rail transit. Built up corridors throw off revenues way in excess of their cost and maintenance. In about 20 years a typical mile of FB would likely throw off $150,000 million in discretionary monies that can be used elsewhere. With 100 miles of FB that is $15 billion annually to put elsewhere. For more discussion on this subject click on the link of www.flowblvd.com/basinstudy.html, that's page one. Scroll down until a City of LA Chart in green named "Where the Money Comes From" appears. After the charts begin reading the discussion titled "Flow Boulevards Pay Their Own Way".

System preservation occurs by using the existing street system and settlement pattern to the advantage of integral growth, land use up dating and transportation improvement. And of course people and goods movement is provided with the FB system. Remember as well the points made above where the FB can help protect (preserve) communities and the aspect of extending the life of the freeway system. That is being done by the FB system taking on the burden of local and medium length trips. And finally this shows how the FB transportation system helps preserve the entire system by the use of the excess revenue being "thrown off" by the money maker Flow Boulevards.

Integrated Land Use and Transportation

The Flow Boulevard concept could be the "poster image" of representing the mandate of SB 375 integration of land use and transportation. Over time, with programs that help transform vehicular movement to electric (or non fossil-fuel) power integrally, comfortably and economically; then that is the objective is it not?

Air Quality, Energy, Adaptation

From what I know, natural gas will afford a step in the right direction for air quality over coal and oil; coal in producing electricity and oil in propelling vehicles. Unconventional natural gas resources seem to be cheap and abundant, with low NOX emissions and can be counted upon 24/7. With shorter trips, less energy used in vehicles, greater public transit use in extensive BRT networks, use of walking environments with "proximity" and a transformation to electricity instead of gasoline all seem to add up well in the kind of land use and transportation patterns provided by Flow Boulevards.

Adaptation must be made affordable by an economy that has the resources available to be applied to the cost of that adaptation. I can't see where large expensive rail networks that are supposedly justified by the need to commute large distances should be embraced with so much enthusiasm. There should be ways to communicate and produce more without so much commuting. More money will be needed for adaptation, which the growth corridors provided by the Flow Boulevard concept make available and in turn "throw off" revenues. Better conserving architecture fits in this model as well.

Plan Overview

Detroit Michigan lost half its population between 1980 and 2002 because the car companies could not compete with other manufacturers in the world market. Will Southern California lose half its population due to excessive population dispersal, over use of natural resources, of not developing a more efficient urban form, of making expensive transportation systems, not transferring to less expensive and cleaner energy and having an over reliance on commuting?

TRANSPORTATION INVESTMENTS

I have used the first chapter of "Vision", to focus comments on the respective issues in a kind of combined conceptual way. By this I mean that considerations of Investments, Funding and Future Land Patterns are combined with the Vision issue response. As an architect I tend to think using an integrated concept rather than what seems to me as overly abstracted when broken down so much. I will however generally respond to issues posed in these subsequent chapters with general overview comments referring to some of the issues.

Getting the Most Out of Our System: The major point is to maintain the basic existing street and land use system while evolving segments so as to improve the relationships and achieve new levels of population growth (in some areas) and transportation capacity within corridors. By the use of the right mix of land uses, more sustainable neighborhoods and communities are obtained by way of those proximities, shorter vehicular trips and to divert trips from SOV by the inclusion of transit. In this setting the SOV use can in effect "shrink".

As pointed out in the "Vision" comments, congestion should not be allowed to develop as it has in the LA Basin. Those bottlenecks and inefficiencies are not a strategy to make a better

city with. It is a failure and in due course will be corrected; possibly with some help by SCAG as well as others.

By using the existing street system to greater advantage there is less need for expensive long distance rail trip development. In the Measure R list of projects there are basically no TSM and ITS projects to take care of the mounting congestion in the LA Basin. And the City of Los Angeles DOT does not seem to be able to cope with the condition either. I am very concerned that with the impacts being made on the function and standard of living in Los Angeles communities. Appropriate policies and transportation improvement must be employed to eliminate congestion.

Transit Policies: By expanding the BRT network it is appropriate to lessen time and trip length that is commensurate with making communities self sufficient and reduces VMT. This is the most effective way to increase transit use in LA County and the most direct way of going after and reducing the length of the 90% of SOV trips. Point to point BRT trips would basically be at 40mph speeds for really reducing bus travel times.

Active Transportation: Pedestrian circulation, bikeways and open space are an integral part of Flow Boulevard development. By developing its circulation separately from the street its development becomes the condition to which greater capacity is obtained from the roadway itself. This is a unique relationship where building pedestrian elevated circulation and open space creates increased vehicular capacity in Flow Boulevards.

The term “complete streets” tends to imply that most all arterial streets should accommodate all modes of travel. This of course would make major conflicts on many streets. The better view is to accommodate all modes of travel within a community plan that respects the character, purpose and safety of each mode and give it the necessary spaces, routes and function that allows that mode to perform its given task. On the FB website at www.flowblvd.com/elements.html one can see highly developed environs with separate modal circulation systems interrelated.

03 FINANCIAL PLAN Generalized Comments

Trimming project expenses and making more affordable budgets: There is still a great deal of underutilized capacity in most roadways. There should be more thought in utilizing the unused capacity because it is so less expensive to provide for the mobility of existing and future growth. It is also a way to up-date the mix of housing stock and community services, retail and work locations to respond to changes in demographics and the economy.

There is generally great risk in over designing a transportation plan that cannot be achieved without taking funds from other social costs that are more important. It would appear to me that the Metro ambitious and self serving rail plans have that budget busting, excessive social burden look to them. They seem narrowly conceived by not having comprehensive planning attached to them. And now there has been a realization that we have been living through an era of very fortunate economic circumstances for the last 40 years and that those

conditions have changed. Proceeding with caution, flexible plans and not getting over extended would be prudent if not absolutely necessary. And please refer to the above linked discussion regarding “Flow Boulevards Pay Their Own Way” in the” Challenges and Opportunities section for an alternative approach to providing growth and transportation improvement.

Primarily use “Pay-Go” (pay as you go): By using land use development in combination with transportation improvement in growth corridors, transportation improvement costs can be tied directly to the cost of the increased land use density developments. In this manner much of the transportation improvement pays for itself and then continues to do so out of property taxes and fees generating revenues for the governing jurisdiction. The generation of continuing excess revenues is a source for paying for additional infrastructure improvements and maintenance that towns and cities are faced with.

The large commuter rail system that Metro has planned and want to build at an accelerated pace also has that risky burdensome look to it. After it would be built at an accelerated pace would it really be used? And then what happens to that under funded period to transportation improvement that follows the accelerated building period when debt is being paid off? That is when really difficult problems can arise and there is the lack of funding to deal with them.

It is also quite unbelievable that Southern California will attach themselves to a mobility form that requires so much transferring and great distances to be traversed to carry out normal daily living. With inexpensive electricity for electric vehicles and more compact communities with shorter trips to connect daily tasks, why would people submit to a hodgepodge of inconvenient disconnected trips? Southern California society should be given the chance to decide these issues; we need full disclosure that the fullness of time affords.

04 SUSTAINABLE COMMUNITIES

Sustainable Communities Strategy: Sustainable communities are necessary for Southern California to sustain itself, and growth is necessary to bring about adaptation of existing communities to become sustainable. One such approach refers to the case I have been building for the use of Flow Boulevards to bring about that adaptation of existing community urban form through land use growth and transportation improvement in corridors. The FB form also targets the majority of areas where trip generation is made and brings Intelligent Transportation System technologies to bear on the issues of SB 375 including that of GHG emissions. There is an incredible existing investment in the sprawl that persists throughout Southern California and this investment must be made to become efficient in terms of preservation, energy, job creation, productivity, lifestyle achievement, environmental and air quality. Whereas some might think it is becoming crowded, it really does not have to seem that way by moving up pedestrian circulation and places over the improving street transportation below with the use of architecture in order to enjoy the view and open space.

This is a natural and very affordable adaptation to low density existing development. Examples of this kind of organization can be seen in parts and whole already in Los Angeles. And by connecting the growth corridors to existing towns, work centers and cities it can reduce VMT by both proximity and improved energy utilization. The FB concept is also able to improve more densely built existing urban areas as found in the LA Basin. These opportunities may employ land use growth along with transportation improvement techniques or may use one or the other, land use or transportation improvement to solve an urban condition. As indicated below (Westside LA, Exhibit A), there are instances where the transportation improvement ability of FB can be used without land use growth to solve "out of control" congestion issues inexpensively. However the land use growth component can be a dynamic element in creating both walking "place" environments and with eliminating congestion in the urban context generally.

With the congestion that the City of Los Angeles and the County MTA has allowed to continue by not employing ITS strategies, it would seem that more pollution is now being made by inefficient vehicular movement than is being saved by rail transit usage. This is beyond the loss of "productivity time" and the loss of livability in impacted communities both residential and commercial.

Exhibit A;

A Plan to Eliminate Westside Congestion

The real prospect of eliminating congestion on the Westside is nearing a reality as existing approved projects (405/HOV lane and Expo line) and potential proposed projects are combined with them. The basic approach to eliminate the existing traffic congestion, since it primarily comes into the Westside from the north and south, is to add additional capacity to the 405 corridor and then as well to the I-10 corridor to connect to the City of Santa Monica. By that capacity improvement the Westside arterial network can be relieved of traffic and therefore the gridlock now experienced on both sides of these freeway corridors as well as the freeways themselves.

The weakest link in these corridors to be improved is the interchange connecting the 405 and the I-10. The freeway interchange traffic is constricted both in its flow-through capacity and turning movement capacity. From there the freeways are further constricted by merging movements on and off the freeways at the very high collection and distribution ramp movements affecting the freeways and adjacent arterial street flows.

The key to eliminating Westside congestion is by adding needed capacity in order to relieve the interchange, the freeways and the ramping operations by the addition of a one-way pair (three regular flowing lanes along with an exclusive BRT/HOV lane in each direction) Flow Boulevard (FB) as a frontage road to the 405 (proposed in a study found at www.flowblvd.com/index3.html). This improves the operations of the freeway and arterial network and is focused on balancing travel demand with infrastructure to essentially "fix what

is now broken". The intension is to limit the improvement to between the Sepulveda pass and Culver City and not to provide additional improved access to the Westside that might be a basis for yet more traffic attracting development that would put the Westside back into yet more congestion. At this time, the objective is to bring balance between existing land use attraction and Westside infrastructure and then maintain that balance through a strictly enforceable Community Plan.

Sepulveda Boulevard would provide the north flowing side of the FB. South of Pico, Sawtelle would provide the south flowing side of the FB. North of Pico, there are two alternative streets to provide southern flow between Wilshire and Pico. The Cotner Street alternative (east of the 405) as developed in the study and Beloit Avenue (west of the 405) the alternative simply mentioned in the study. As an up-date to the study, the Beloit alternative now has political pull since the VA potential subway station has been identified. The prior difficulty was to obtain right of way through the VA property. Now that there is desire to provide some kind of future connection to the east- west rail lines, which would include the VA subway station; political and economic "pull", could make the Beloit alternative the likely choice. North of Wilshire the FB would flow into the Metro "Sepulveda Pass" project, whatever that may work out to be. Note that the quick and low cost improvements being discusses here are more short term problem solving plans and do not involve the ambitious 10's of billions dollar price tags that Metro envisions for later projects.

Adding up the improved capacities in the 405 corridor would be 30,000 person trips (pt) with the new 405 HOV lane and with a Beloit FB connection (where no through connection exists between the Pico and Wilshire areas) it provides 80,000 pt of improvement at this area of the corridor. This would total an increased capacity of 110,000 person trips to be distributed to reduce congestion on the freeway, through the interchange, in the ramp use and out of the arterial network in the north-south direction. South of the interchange the increased capacity to the Sepulveda-Sawtelle pair would be about 38,000 pt/day due to BRT lanes and the synchronized vehicular flow in general. In the east-west direction the Expo Line would add approximately 35,000 pt, the I-10 improvements 60,000 pt and three sets of BRT (Wilshire, SMB and Olympic) giving an additional 20,000 pt totaling 115,000 pt of increased capacity to reduce congestion with.

The key to making the interchange work adequately is the reduced 405 through traffic volume and the potential to make direct connections from the freeways to the FB to reduce turning movement demand (such trips would be headed to or from the FB). This allows greater provision of freeway to freeway turning movement capacity by having two full lanes to turn with and not being merged into one lane going into and out of the turn ramps. This additional lane continuity allows about a doubling of turning movement capacity in the critical turns connecting the 405 and the I-10.

Operation of the FB requires priority signalization separate from the cross streets of the arterial grid. This priority is "earned" by the fact that the FB accommodates a higher volume of vehicles than an intersecting arterial would have, has the greater length of travel, presents the fact that the FB makes the freeway system work without failing, provides additional north-south to east-west turning opportunities between crossing arterials with the 405 and also takes travel

demand out of the arterial grid so it does not gridlock. While the north bound side of the FB needs to have synchronized signals, with for example one minute vehicle packs and one minute gaps between them (for cross traffic signal periods), likewise the south bound needs the same for continuous flow of the vehicle pack without stopping. The phasing of each side of the FB may be coincident at an intersection (both having green signal periods) or out of phase with each other in any amount that may be of some benefit to the crossing arterial. What cannot be allowed is the breaking of the flow of signal synchronization on either street of the FB pair. With a travel speed of approximately 40mph, this means that the automobile travel time between Wilshire and Culver is about 7 minutes on the FB and the BRT bus can take about 14 minutes using prepaid platform boarding and alighting techniques by staying at less than 1 minute at each arterial bus stop.

- Eliminating congestion is the first step in being able to remove ambiguity so as to stabilize the Westside and make Community Plans for improvements like livable boulevards and needed land uses that allows developers and residents to fully support.
- BRT bus transit works well with the Westside by having lines to and from the FB by connecting with the destinations of Westwood, Century City, Santa Monica, etcetera, without transfers; as well as connections to the future rail stations of the Expo Line, the LAX and the VA Station. And the BRT facilities can be up and running in just a few years.
- By stabilizing the land use and transportation balance, it would then be prudent to insist that City and County planning departments make comprehensive plans for the expected two million additional residents in the next 25 years. In other words, plan for additional development and population in other areas and not to allow excessive Westside development which yet again brings unbearable congestion.

Re: Southern California Association of Governments
2012-2035 Regional Transportation Plan/Sustainable Communities Strategy
December 2011

Thank you for the opportunity to comment on the *SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy.* The Plan states as its goal "improving the quality of life for our residents".

> *The 2012 RTP/SCS will transform the region, serving as a blueprint for **improving quality of life for our residents** by providing more choices for where they will live, work, and play, and how they will move around.*

> *The 2012 RTP/SCS proposes investing over $500 billion over the next 25 years to **improve the quality of life of the region's residents** by enhancing our transportation system.*

While I agree that improving the quality of life for the residents is an admirable goal, the Plan as indicated by the SCS City maps, will denigrate the quality of life for the residents of San Marino. My comments regarding the 2012-2035 RTP are limited to where I live, Los Robles Avenue in San Marino, and the adjacent area.

While reviewing the Resources > SCS Map Tool from the SCAG web site, http://rtpscs.scag.ca.gov/Pages/SCS-Maps-Tool.aspx, I was shocked to discover that Los Robles Avenue in San Marino has been designated a **High Quality Transit Corridor**.

The SCAG RTP Plan indicates that:

> *A HQTA (High Quality Transit Area) is generally a walkable transit village, consistent with the adopted SCS that has a minimum density of 20 dwelling units per acre and is within a ½ mile of a well serviced transit stop, and includes transit corridors with minimum 15 minutes or less service frequency during peak commute hours.*

Los Robles Avenue in San Marino is a 7/8 of a mile, two lane narrow street fronted exclusively by single family homes where children live and play. The homes, built between 1920 and 1950, and the set back is close to the street. The posted speed limit is 30 mph., the posted weight limit is three tons, and truck traffic is prohibited. The City of San Marino General Plan, classifies Los Robles Avenue as a residential collector street. The street carries an unusually high volume of cut-through traffic, exceeding the capacity of a two lane residential street. There is no bus service.

How then, was Los Robles Avenue in San Marino designated a HQTC? I posed this question to both the City of San Marino staff and City Council. They were unaware of this designation in the proposed RTP

Plan. I also made inquiries of SCAG staff and was told that the Map for San Marino was incorrect with regard to bus stops, because no bus route is planned for the street.

RE: Records Request - SCAG 2012 RTP project

From: **Christopher Tzeng** (tzeng@scag.ca.gov)
Sent: Thu 1/12/12 4:16 PM
To: Stephanie Johnson [redacted]

Hi Ms. Johnson,

Per your inquiry, we have looked into planned bus routes along Los Robles in the City of San Marino for the 2012-2035 Regional Transportation Plan (RTP).

We checked our 2035 transit network that has been developed for the 2012-2035 RTP and there are not any proposed transit services on Los Robles Avenue in the City of San Marino in the 2035 constrained plan network. Therefore, the bus route should not appear in the SCS Maps Tool viewer you were utilizing. Thank you for bringing this to our attention.

The maps you are able to view on the Maps Tool use data from SCAG's Regional Transportation Demand Model. This is utilized to predict the impact of travel growth and evaluating potential transportation improvements for all cities within the SCAG region, which consists of 191 cities, six counties and more than 18 million residents. The Transportation Demand Model comprises a large number of data files in order to represent the many facets of the transportation environment.

Please let me know if you have any questions. Again, thanks for bringing this to our attention.

Regards,

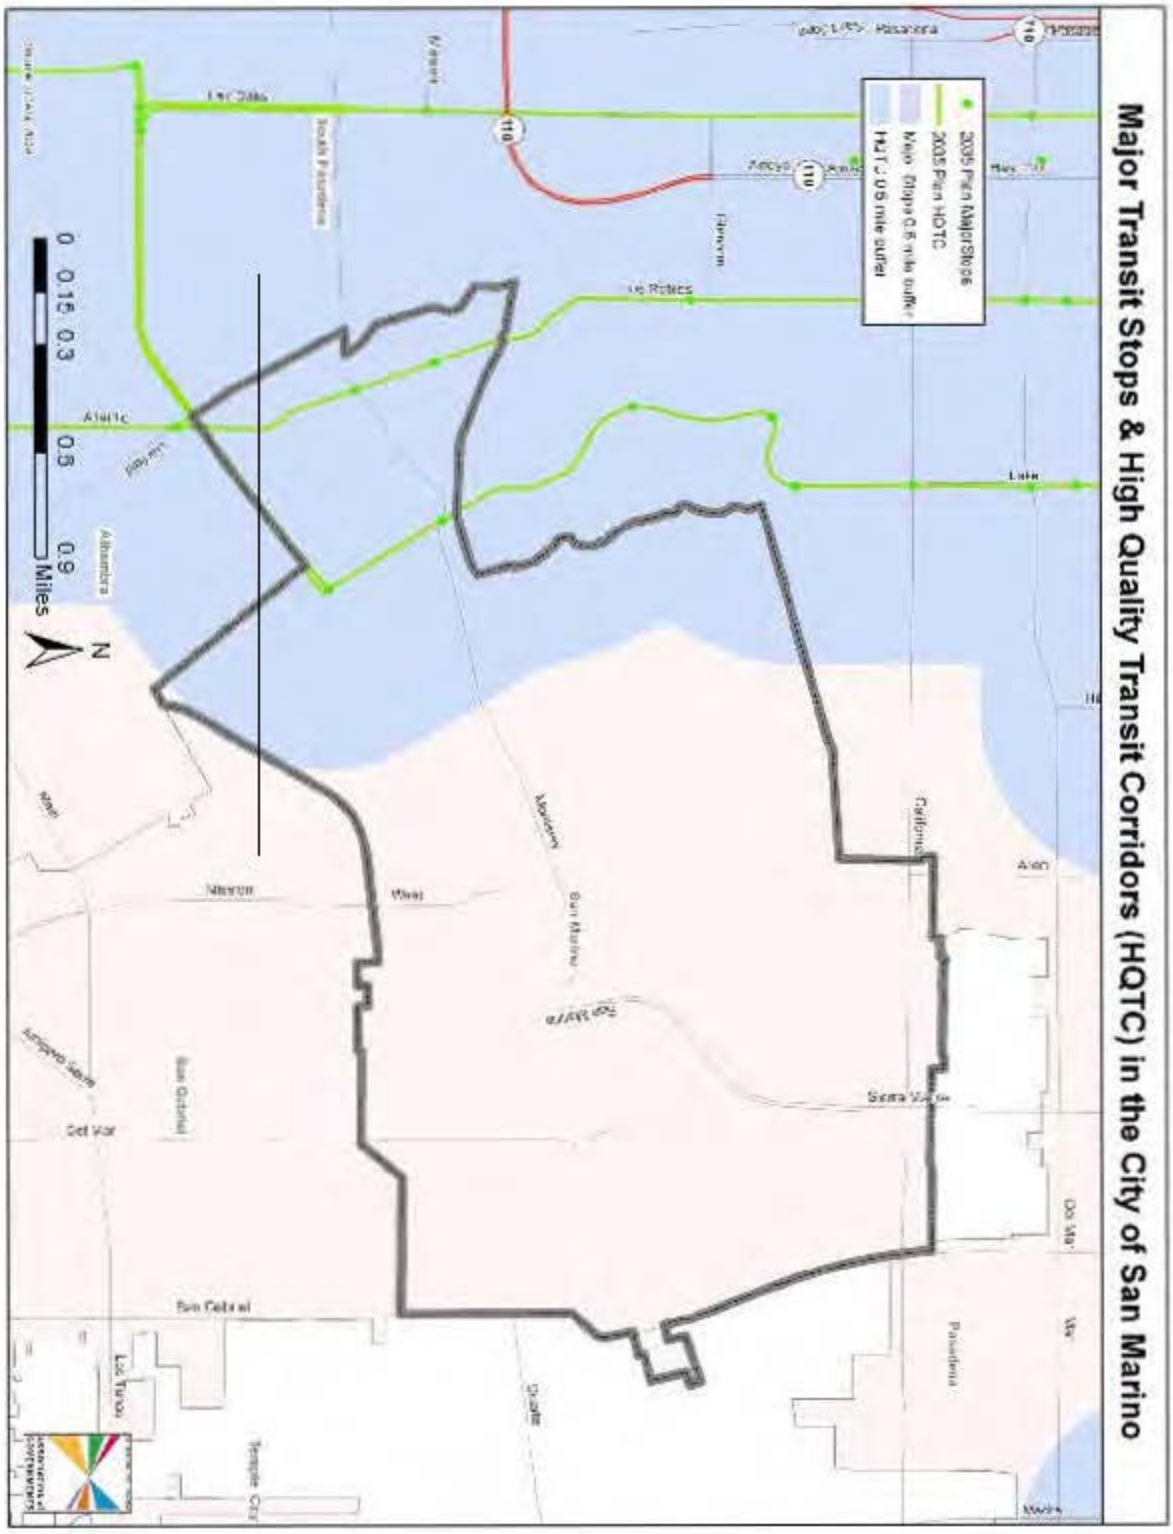
Chris

RE: SCAG RTP2012 - plans for bus routes in San Marino and Pasadena

From: **Abrishami, Lori** [redacted]
Sent: Fri 9/02/11 3:58 PM
To: 'Stephanie Johnson' [redacted]

Ms. Johnson,

I am sorry, but when I log in, I do not get the same map as you. Can you please tell me what a HQTC is? I believe that the SCAG definition of High Quality Transit Corridor, as well as some agreement in the transportation planning profession, means an area within ½ mile of transit service that runs every 15 minute or more often. If you are within ½ mile of Colorado Blvd, or the Lake Ave. Gold Line Station, then that is within an HQTC.

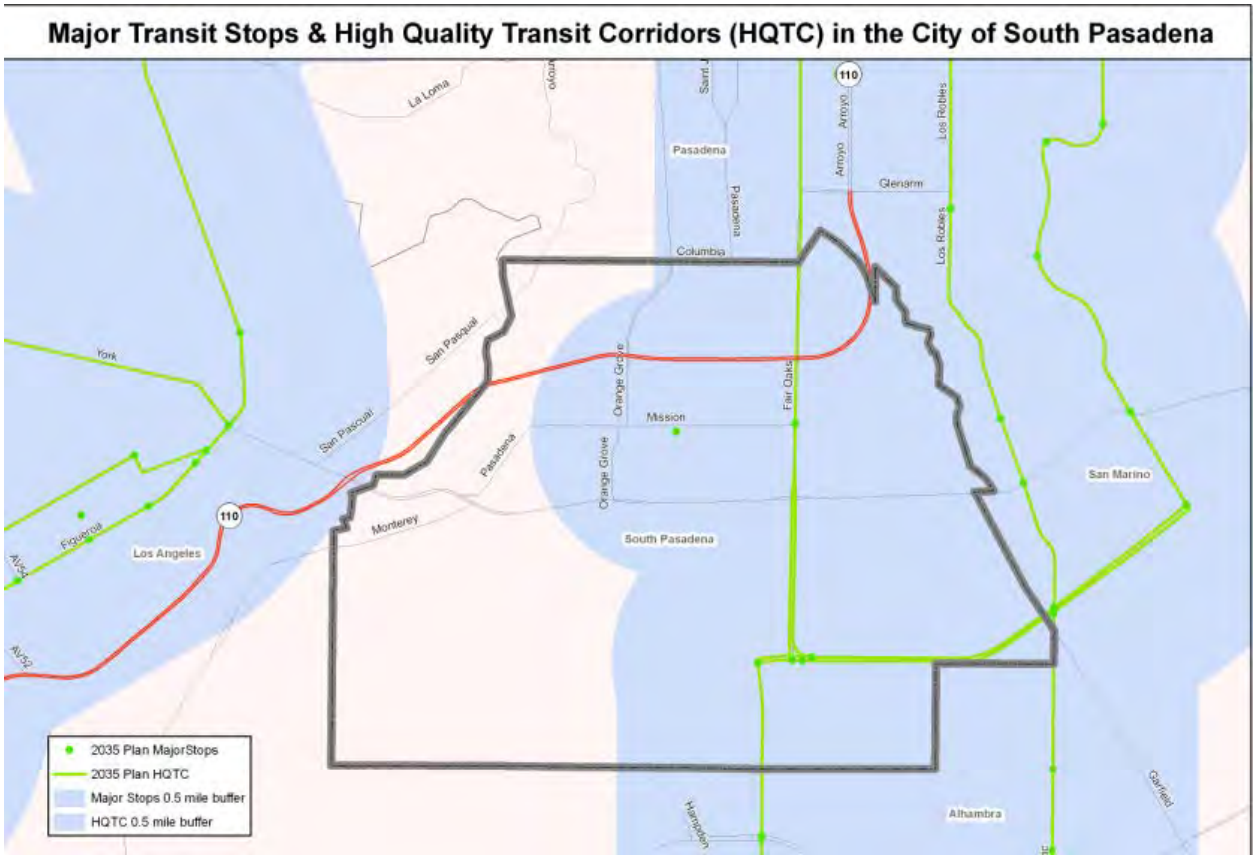


Since the online map on my screen is not showing the bus route detail that yours shows, please tell me the route number of the bus route shown on Los Robles. As you know, we do not have one, and the data that our modelers sent to SCAG modelers only has our current routes on it. So, the bus route is not ours. I would not want to request that it be removed, since it may be the City of Pasadena or other nearby municipal operator.

Lori Abrishami

Below are copies of the SCAG SCS Maps for San Marino, Alhambra, South Pasadena and Pasadena. It is not clear why certain streets have been designated HQTC and others have not.

SCAG Map for San Marino – High Quality Transit Corridors (HQTC)

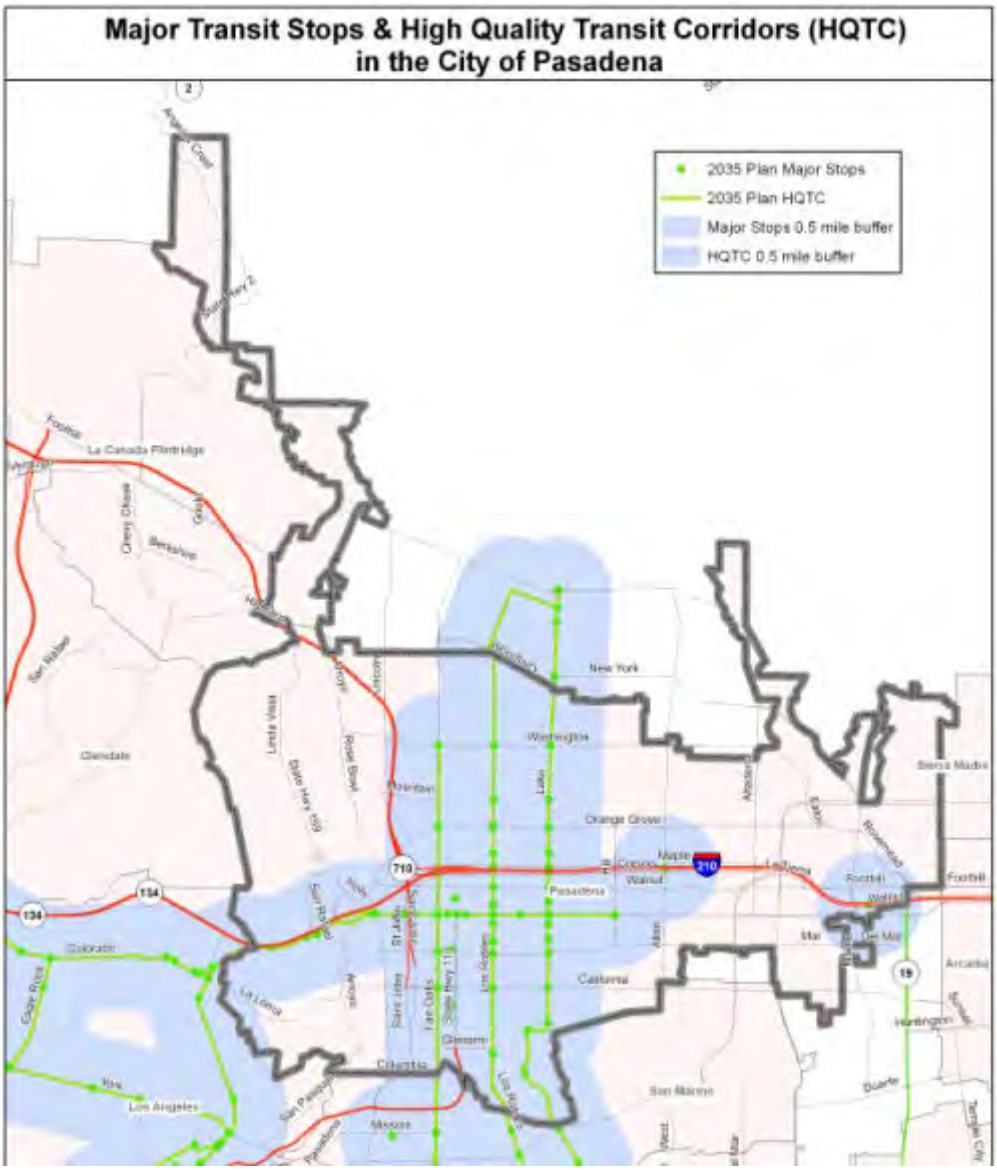


This map indicates that Los Robles is a HQTC with bus stops.

South Pasadena

Note that although Fremont Avenue is designated a HQTC in Alhambra, it is not in South Pasadena, although the street merges into S. Pasadena Avenue that is the freeway entrance to the 210 and 134 freeways in Pasadena.

Garfield Avenue has a METRO bus route that extends through South Pasadena that stops at the Gold Line Mission Street station.

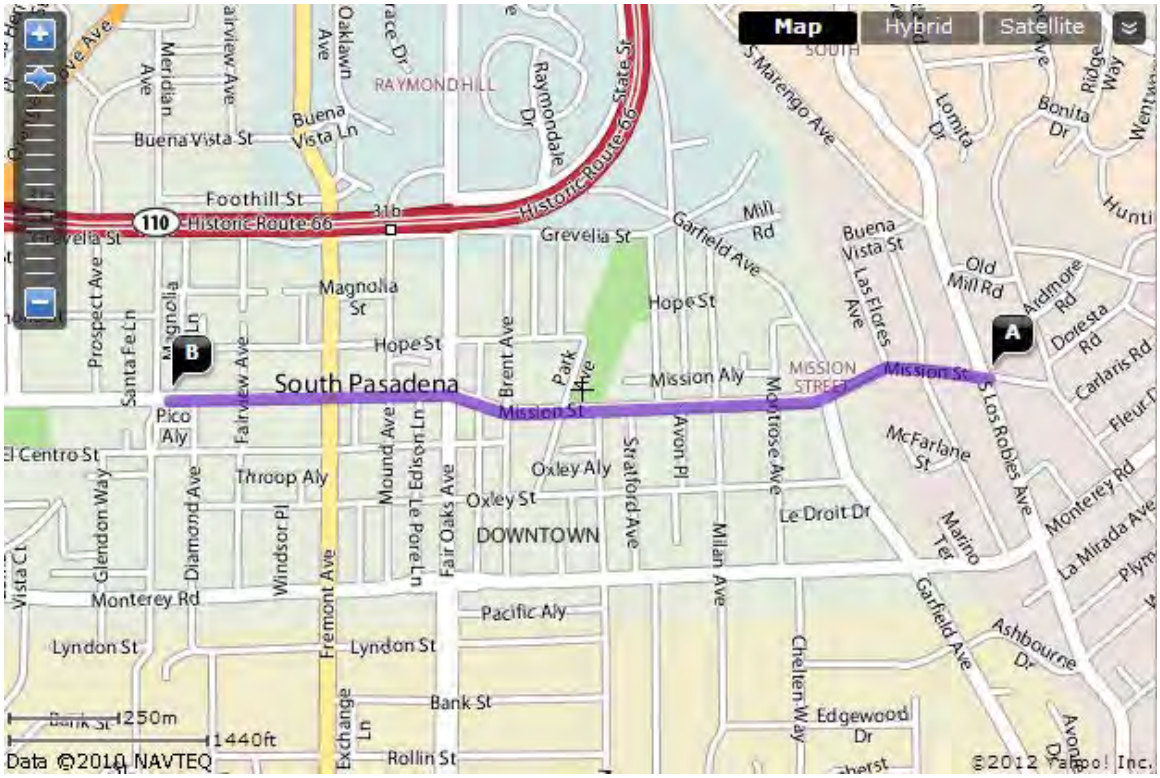


Alhambra

Why is Garfield Avenue not designated a HQTC? It is a major arterial in Alhambra and has a bus routes that extends through South Pasadena that stops at the Gold Line Mission Street station.

Pasadena

Note that both Los Robles Avenue and Oak Knoll Avenue in Pasadena, south of California Boulevard, are single family residential areas.



Alhambra, South Pasadena, San Marino, Pasadena

Fremont marked in purple for reference purposes.

Los Robles Avenue, San Marino to Gold Line Station Mission Street, South Pasadena 1.1 miles

If regional planning is to be based upon the SCS maps, then further information regarding how the HQTC attribute was assigned to streets must be made public. Los Robles Avenue in San Marino does not meet the definition of an HQTC. Regional traffic should not be directed toward the street, exacerbating the existing cut through traffic and its resulting negative impacts upon the residents.

Sincerely,

Stephanie Johnson

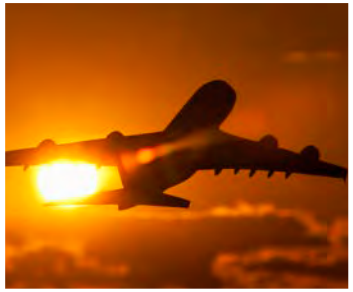
Re: Public Comment to SCAG Regional Transportation Plan

As a former SCAG Regional Council Member that served during the time I was a member of the San Bernardino City Council from 1998-2006, I had the opportunity to work closely with previous Regional Transportation Plan (RTP) implementation efforts. I continue to remain engaged as a private citizen in issues of importance to Southern California. Thank you for the opportunity to submit my public comment by email.

In the last RTP, there was a concept similar to the current GRID (Green Rail Intelligent Development) to which there was no progress during implementation. I am writing to express my desire that this Southern California alternative to Goods Movement be once again included in the current RTP.

The GRID alternative, which proposes the installation of 15-ft. water-tight pipelines housed in an unmanned electrified rail guide way, has a number of advantages for traversing goods from the Ports of Los Angeles and Long Beach to the inland regions of California.

- First, installation of an underground pipeline would employ installation that is identical to the installation of water pipelines that use only a "cut and cover" technique which environmentally presents much less adverse impacts.
- Furthermore, this project holds the potential of creating many jobs in Southern California during the manufacturing and construction of the system because materials proposed in GRID are already manufactured locally.
- Finally, I believe that including an alternative Goods Movement concept that would be powered by electricity, rather than diesel, is good public policy. As a resident of San Bernardino, the concept of moving Port freight through an underground pipeline that would ultimately emerge at an Inland Port holds the promise of someday reducing the truck traffic that is affecting so many of Southern California's Disadvantaged Communities where rail and existing roadways traverse and gravely impact the respiratory health of our children and seniors who have been shown to be disproportionately affected by goods movement.



For those reasons, I urge SCAG to include the GRID alternative in the current RTP providing the opportunity to further examine a concept without any significant impact to air quality as is found in existing rail shipments or container movement by diesel-powered semi trucks.

I look forward to hearing the Regional Council has included the GRID (Green Rail Intelligent Development) as an alternative Goods Movement Alternative. Thank you.

Additional Analysis/Data 152

DISCLAIMER: Data and analysis included in this Appendix does not account for Plan improvements in vehicle technology particularly for truck only corridors. These corridors in the Plan are exclusively for zero and/or near-zero emission vehicles. Furthermore, the Program Environmental Impact Report (PEIR) accompanying the RTP/SCS includes mitigation measures that would reduce impacts associated with health risk within 500 feet of freeways and high-traffic volume roadways to less than significant. Analysis included in this Appendix also does not account for emissions improvements through the implementation of these mitigation measures. As such, emissions and exposure analysis shown in this Appendix is abundantly conservative and demonstrates worst-case scenario outcomes. If these emissions improvements had been accounted for, we believe the analysis would show little or no areas with worsened emissions ("hot spots") associated with the Plan. Moreover, the currently available data on emissions and on the distribution of households and population is imprecise such that the overlay with emissions and EJ populations will tend to overstate any potential impacts. Nevertheless, given on-going concerns and evolving information on health impacts, SCAG encourages project sponsors to be cognizant of any potential health risks in project design and delivery. Consistent with the mitigation identified and to be implemented as part of the proposed final PEIR, SCAG will assist in disseminating information and identifying effective strategies to reduce risk at the project level.

The concept of Environmental Justice is about equal and fair access to a healthy environment, with the goal of protecting underrepresented and poorer communities from incurring disproportionate environmental impacts. The SCAG region is vast and geographically distinct. It encompasses an area of more than 38,000 square miles with a population exceeding 18 million people, and has many geographically dispersed commercial and residential centers. The region includes heavily urban and entirely rural areas, as well as terrain that in some instances make air quality goals difficult to achieve. Demographically, it is one of the most diverse regions in the country, becoming the first to see the total population of Hispanics exceed that of Non-Hispanic Whites. In fact, the Hispanic population is anticipated to exceed 50 percent of the total population in the region by 2035. The area is also quite economically diverse, and displays the extremes in household income.

Title VI and Environmental Justice Overview

Consideration of Environmental Justice in the transportation planning process stems from Title VI of the Civil Rights Act of 1964 (Title VI). Title VI establishes the need for transportation agencies to disclose to the public the benefits and burdens of proposed projects on minority populations. Title VI states that "No person in the United States shall, on the ground of race, color or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance." Additionally, Title VI not only bars intentional discrimination, but also unjustified disparate impact discrimination. Disparate impacts result from policies and practices that are neutral on their face (i.e., there is no evidence of intentional discrimination), but have the effect of discrimination on protected groups. The understanding of civil rights has expanded to include low-income communities, as further described below.

In the 1990's, the federal executive branch issued orders on Environmental Justice that amplified Title VI, in part by providing protections on the basis of income as well as race. These directives, which included President Clinton's Executive Order 12898 (1994) and subsequent U.S. Department of Transportation (DOT) and Federal Highway Administration (FHWA) orders (1997 and 1998, respectively), along with a 1999 DOT guidance memorandum, ordered every federal agency to make Environmental Justice part of its mission by identifying and addressing the effects of all programs, policies and activities on underrepresented groups and low-income populations. Reinforcing Title VI, these measures ensure that every federally funded project nationwide consider the human environment when undertaking the planning and decision-making process.

On August 4, 2011, seventeen federal agencies signed the "Memorandum of Understanding on Environmental Justice and Executive Order 12898." The signatories, including the U.S. Department of Transportation (DOT), agreed to develop Environmental Justice strategies to protect the health of people living in communities overburdened by pollution and to provide the public with annual progress reports on their efforts. The MOU advances agency responsibilities outlined in the 1994 Executive Order 12898 and directs each of the Federal agencies to make Environmental Justice part of its mission and to work with other agencies on Environmental Justice issues as members of the Interagency Working Group on Environmental Justice.

In response to this MOU, DOT revised its Environmental Justice Strategy. The revisions reinforce the DOT's programs and policies related to Environmental Justice and strengthen its efforts to outreach to minority and low-income populations. In addition, on September 29, 2011, the Federal Transit Authority (FTA) issued two proposed Circulars on Title VI and Environmental Justice to clarify the requirements and offer guidance. FTA Circular 4702.1A, Title VI Requirements and Guidelines for Federal Transit Administration Recipients (Docket No. FTA-2011-0054) provides information required in the Title VI Program, proposes changing the reporting requirement from every four years to every three years, and adds a requirement for mapping and charts to analyze the impacts of the distribution of State and Federal public transportation funds. SCAG has reviewed the proposed Circulars as additional guidance for the development of the 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The FTA Circular 4703.1, Environmental Justice Policy Guidance for Federal Transit Administration Recipients (Docket number FTA-2011-0055) provides recommendations to MPOs (and other recipients of FTA funds) on how to fully engage Environmental Justice populations in the public transportation decision-making process; how to determine whether Environmental Justice populations would be subjected to disproportionately high and adverse human health or environmental effects as a result of a transportation plan, project, or activity; and how to avoid, minimize, or mitigate these effects. The proposed Circular does not contain any new requirements, policies or directives. Nonetheless, SCAG complies with the framework provided to integrate the principles of Environmental Justice into our decision-making processes.

In addition to Federal requirements, SCAG must comply with California Government Code Section 11135, which states that, "no person in the State of California shall, on the basis of race, national origin, ethnic group identification, religion, age, sex, sexual orientation, color, or disability, be unlawfully denied full and equal access to the benefits of, or be unlawfully subjected to discrimination under, any program or activity that is conducted, operated, or administered by the state or by any state agency that is funded directly by the state, or receives any financial assistance from the state."

The State of California also provides guidance for those involved in transportation decision-making to address Environmental Justice. In 2003, the California Department of Transportation (Caltrans) published the Desk Guide on Environmental Justice in Transportation Planning and Investments to provide information and examples of ways to promote Environmental Justice. The Desk Guide identified requirements for public agencies, guidance on impact analyses, recommendations for public involvement, and mitigation.

Finally, under Senate Bill 375 (SB 375), SCAG is required to include a Sustainable Communities Strategy within the RTP/SCS. The RTP/SCS represents the collective vision of the six counties in the SCAG region and provides a framework for the future development of our regional transportation system. Through SB 375, the California Air Resources Board (ARB) established per capita targets for GHG reduction for cars and light trucks for the SCS. The targets for the SCAG region are 8 percent in 2020 and 13 percent in 2035, from 2005 levels. As part of the early target setting process, the ARB appointed a Regional Target Advisory Committee (RTAC) to recommend factors to be considered and methodologies to be used for setting the targets. The RTAC report was finalized in September 2009 and included a recommendation on Housing and Social Equity. The report recognized the impact policies to reduce Vehicle Miles Traveled (VMT) could have on social equity, specifically calling for appropriately located affordable housing match local wage levels. The RTAC further recommended that displacement and gentrification, as a result of changing land uses and increased housing costs, should be addressed and specifically avoided to the extent possible in the SCS. As a result of this recommendation and input from our Environmental Justice stakeholders, SCAG has updated its methodology to include new areas of analysis, including gentrification and displacement.

SCAG's Title VI Environmental Justice Policy and Program

As a government agency that receives federal funding, SCAG is required to conduct an Environmental Justice analysis for its Regional Transportation Plan. SCAG's Environmental Justice program includes two main elements: technical analysis and public outreach. Specifically, it is SCAG's role to ensure that when transportation decisions are made, low-income and minority communities have ample opportunity to participate in the decision-making process and that they receive an equitable distribution of benefits and not a disproportionate share of burdens.

Under federal policy, all federally funded agencies must make Environmental Justice part of their mission and adhere to three fundamental Title VI/Environmental Justice principles:

- To avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations.
- To ensure the full and fair participation by all potentially affected communities in the transportation decision-making process.
- To prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations.

To this end, SCAG has completed an ambitious Environmental Justice report that assesses the impacts of the 2012–2035 RTP/SCS on Environmental Justice population groups, and provides a set of measures for the potential mitigation of any adverse impacts.

SCAG's Environmental Justice Outreach

A key component of the RTP/SCS development process is seeking public participation. Public input from our Environmental Justice stakeholders helped SCAG prioritize and address needs in the region. As part of the Environmental Justice outreach effort, SCAG compiled a list of key stakeholders to be contacted regarding RTP/SCS programs and policies. This list is comprised of over 300 individuals and organizations involved with the 2008 RTP as well as additional stakeholders, such as the South Coast Air Quality Management District's (SCAQMD) Environmental Justice Working Group, which included new groups such as local community advocates, air quality interest groups, and unions.

SCAG maintains this list regularly and allows interested persons to sign-up online for the mailing list.

SCAG held two Environmental Justice workshops and convened focus groups on the Environmental Justice analysis to ensure that all members of the public have an opportunity to participate meaningfully in the planning process. All the workshops were properly noticed and advertised. A majority of the region's Environmental Justice organizations were represented at both workshops. In addition to the special Environmental Justice workshops, SCAG held a workshop for Resource Agencies during development of the RTP/SCS, where Environmental Justice was a primary focus. Furthermore, Environmental Justice stakeholders have been involved throughout the planning process. On June 24, 2010, SCAG held a workshop to review the planning process and familiarize the participants with the Environmental Justice analysis process. The workshop drew representatives of all major Environmental Justice groups throughout the region, with video conferencing made available from SCAG's regional offices. Attendance totaled 37 participants.

The following is a summary of the main topics discussed at the workshop:

- SCAG was requested to give a presentation on the agency's transportation modeling process
- The Environmental Justice analysis should include baseline data of major issues facing the region
- Public health was identified as a topic that should be further analyzed
- A Housing plus transportation affordability index should be included in the analysis
- Gentrification should be addressed, particularly with SB 375's emphasis on transit oriented development

As a result of these workshops, SCAG determined that new analysis areas were necessary to capture the concerns raised from our stakeholders. These new areas are discussed in greater depth below and include impacts from rail transportation, gentrification and displacement, pollution exposure along heavily traveled corridors, and impacts from revenue generating mechanisms such as user based VMT fees.

On June 30, 2011, SCAG held a follow-up workshop to discuss the proposed new analysis areas with our stakeholders and to seek further input. In response to comments from the first workshop, SCAG also included a summary of the modeling process. This workshop drew participants (45 in total) to all six regional offices (Ventura, San Bernardino, El Centro, Orange, Riverside and Downtown Los Angeles).

The participants provided thoughtful comments and feedback on SCAG's proposed analysis and planning process including:

- Particulate Matter ($PM_{2.5}$) should be analyzed in the Environmental Justice report
- The Environmental Justice community should be included early in the decision-making processes and advisory committees
- The report should identify communities of concern and compare those areas with the location of investments
- Maps should be produced to show long range trip projections compared to system capacity
- Housing should be included in the performance measures, including housing/jobs fit (costs vs. wages)
- The impacts of freight movement should be analyzed and mitigated

In response to comments made at the workshop, SCAG followed up by organizing focused meetings to further discuss methodology and ensure that it addressed the concerns raised by our Environmental Justice stakeholders. Participants were also urged to attend subsequent public workshops. Many of those who attended the Environmental Justice workshops also attended the RTP/SCS workshops. Furthermore, to address the comments made during SCAG's workshops, the Environmental Justice analysis has been updated from prior years as follows:

- Focus more on non-motorized transportation
- Identify and quantify the primary Environmental Justice challenges in transportation in the region including the development of a baseline for key issues such as poverty, exposure to pollutants, and concentration of pollutants
- Bring public health to the forefront—focus on pollutants and cancer concentration in communities of concern
- Begin to analyze potential gentrification impacts from urban infill and transit oriented development

- Provide an Environmental Justice mitigation toolbox with recommended mitigation measures for subsequent projects

Summary of Performance Measures and Technical Approach

Performance Measures

In the development of this report, SCAG identified eleven performance measures to analyze existing social and environmental equity in the region and to address the impacts of the 2012–2035 RTP/SCS on various Environmental Justice population groups. Detailed analysis is presented for the following eleven performance measures:

1. RTP/SCS Revenue Sources In Terms of Tax Burdens
2. Share of Transportation System Usage
3. RTP/SCS Investments
4. Impacts of Proposed VMT Fees
5. Distribution of Travel Time Savings and Travel Distance Reductions
6. Jobs-Housing Imbalance or Jobs-Housing Mismatch
7. Accessibility to Employment and Services
8. Accessibility to Parks
9. Gentrification and Displacement
10. Environmental Impact Analyses (Air, Health, Noise)
    a. Air Quality and Health Impacts
        - Historic Performance At the Regional Level
        - Environmental Impacts along Freeways and Highly Traveled Corridors
        - Environmental impacts of Plan and Baseline Scenarios
    b. Noise impacts
        - Aviation
        - Roadway
11. Rail-related Impacts

As a precursor to the discussion regarding the eleven performance measures, an introductory analysis is also provided on the historical/projected growth and geographic distribution of various Environmental Justice population groups in the region.

Summary of Analysis

Overall, the Plan results in air quality improvements for Southern California and improves Environmental Justice in the region by providing equitable benefits for various population groups according to income and ethnicity.

RTP REVENUE SOURCES IN TERMS OF TAX BURDENS, VMT FEES, SHARE OF TRANSPORTATION USAGE, RTP/SCS INVESTMENT

The analysis shows that the 2012–2035 RTP/SCS revenue sources (taxable sales and gasoline taxes) and investments are allocated equitably along with the transportation usage by income and ethnicity groups. While both sales and gasoline taxes are regressive—lower income groups pay a larger percentage of their income on these taxes than higher income groups—the mileage-based user fee transportation finance system corrects, to some extent, the regressive nature of the gasoline tax.

TRAVEL TIME AND TRAVEL DISTANCE SAVINGS

Share of travel time savings by income group is generally consistent with each group's mode usage. Higher income quintile groups with frequent auto usage captured more savings in person-hours traveled. However, lower income groups with higher transit usage received more benefits from transit related time savings. Person-mile travel changes are also in line with auto usage by income group. Share of travel time savings and person-mile benefits by ethnic groups are also very balanced, and in line with each ethnic group's use of the transportation system.

JOB HOUSING IMBALANCE OR JOB-HOUSING MISMATCH

This Appendix focuses its analysis on one segment of the job-housing imbalance or mismatch: the inter-county commuters. Statistics indicate that, almost without exception, all inter-county commuters command much higher wages than those commuters who work and live in the same county. Those commuters are able to command wages higher than

workers who work and reside in their destination work counties. From an Environmental Justice perspective, this research does not provide definitive results. Rather, it raises additional questions that could be investigated further to better understand how jobs, workers, housing, and associated income distribution could impact travel patterns of low-income and minority populations.

A strong case could be made for imposing the mileage-based charges to the net inter-county commuting VMT (total inter-county commuting VMT—estimated VMT to reach the county line) to address transportation funding needs and relieve congestion. Further research is needed to investigate the jobs-housing imbalance and jobs-housing mismatch issues and related policy implications more carefully.

ACCESSIBILITY TO EMPLOYMENT AND SERVICES:

Most ethnic groups, lower income quintile households, and people in poverty live in areas with higher than average accessibility to medical facilities, and grocery/general merchandise stores. These observations support the observation that because transportation and long distance travel are expensive, less affluent people will choose residential locations where they can walk, bike, or take transit to access jobs, shopping, or other essential services. The priority policy is to create job and various opportunities for less affluent people near transit or urban cores.

The analysis also indicates that several minority population groups—Non-Hispanic Native Americans, Non-Hispanic Black and others, elderly and disabled—have "very slightly" below average accessibility to either medical services or grocery/general merchandise stores as those observed for Non-Hispanic White and higher-income quintile households. Since there is no mobility element in this analysis, the primary cause could be the residential locations of these population groups relative to the opportunities located in surrounding areas. It is recommended to conduct additional monitoring and study to better understand the accessibility issues for these four Environmental Justice groups (Non-Hispanic Native Americans, Non-Hispanic Black and others, elderly and disabled).

JOB AND SHOPPING ACCESSIBILITY/OPPORTUNITY

The elderly population show only above average accessibility to job opportunities by auto; all other measures come out slightly below average for both job and shopping accessibility. Staff plan to research and study further about residential location and land use in the surrounding areas for this age group, particularly because the region is facing an aging population in the next 20–25 years.

In general, lower income quintile households and population below poverty all showed higher job and shopping accessibility in base year 2008 under every transportation mode. As is the case with distance-based accessibility, non-Hispanic Native Americans and non-Hispanic other, similar to non-Hispanic White, have below average accessibility in both job and shopping accessibility. Nonetheless, through the implementation of recommended strategies in the 2012–2035 RTP/SCS, the elderly, non-Hispanic Native Americans and non-Hispanic others will experience much better improvements than the average population in both job and shopping opportunities.

ACCESSIBILITY TO PARKS

Park accessibility statistics indicate that park accessibility by transit is much lower than by automobile for all groups. This is true for all parks—national, state, or local parks. By transit, there is almost no access to national parks, and very limited access to state parks in all scenarios—base year 2008, baseline, or under the Plan.

In addition to elderly, non-Hispanic Native Americans and non-Hispanic other, further analysis should also focus on non-Hispanic blacks where their park accessibility by auto is below the average for all parks. However, the 2012–2035 RTP/SCS provides improvements for these population groups more than accessibility changes for the rest of the region's population groups.

DISPLACEMENT AND GENTRIFICATION

Based on a review of relevant literature, seven indicators were selected to assess early signs of likely effects of displacement or gentrification through growth in the High Quality Transit Areas (HQTA) or Transit Oriented Communities (areas surrounding rail transit stations) with the 2000 Census and 2005-09 American Community Survey (ACS) data. These indicators include: Percent of minority population, Poverty rate, Share of 65+ population, Percent of households without a car, Percent of non-English speaking, Population without a high school diploma, and Percent of renters.

As indicated in this EJ report, trends observed in those key indicators showing evidence of likely presence of displacement and gentrification from the 2000 Census and 2005-09

American Community Survey (ACS) in areas of transit oriented developments (TODs) are inconclusive. SCAG will continue to evaluate and monitor information based on the framework presented in previous analysis.

ENVIRONMENTAL IMPACT ANALYSIS (AIR, HEALTH, NOISE)

Existing Air Quality and Health Impacts

The region's air quality continues to improve in the last 40 years, and the implementation of the strategies recommended in the 2012–2035 RTP/SCS will contribute significantly in the future to reduced emissions, further improved air quality, and bringing a healthy and livable environment to all people in the region. EJ analysis results are shown for both ozone and PM2.5 during two time periods: 2004-06 and 2007-09. For the years 2007-09, compared with air quality in 2004-06, consistent with the trends, there are reductions across the board for both ozone and particulate emissions at both the regional level and for each EJ population groups.

However there are EJ areas where the region needs to improve in the future. For example, In terms of ozone emissions, all demographic groups are at or below the regional average for both average days exceeding federal ozone standards and average daily ozone exposure in excess of national standards. This, however, cannot be said for PM2.5 emissions, where each demographic group except the elderly population is in excess of the regional average for average annual PM2.5 exposure. This distributional impact of PM by EJ population appears also for cancer risk and respiratory risk, with each group exceeding the regional average except for the elderly population.

Emissions and Health Impacts from the Plan

This section compares regional CO and PM emissions that will result in 2035 through the implementation of the Plan. Regarding existing population and future growth along Freeway 500 feet buffer areas, it should be noted that currently the level of emissions near these facilities is substantially higher than in the region as a whole. In 2035, these areas still will have higher emissions than the region as a whole. However, while regional emissions overall decreased between now and 2035, the rate of decrease near freeways and high volume roads is even greater. The RTP/SCS does result in an increase in population in these locations, and as such health risk is higher for these individuals than if they were not in the buffer area. Subsequent project level analysis and mitigation should be cognizant of on-going health concerns. However, the plan as a whole shows benefits for emissions exposure and decreased levels of risk in areas near freeways. The findings are available in the Environmental Justice Appendix. Also, Environmental Justice information for areas within 1,000 feet of freeways and highly traveled corridors is available as additional analysis at the end of the Appendix.

RAIL RELATED IMPACTS

In response to input and comment from SCAG's federal partners, staff developed a first step analysis framework in conducting rail related Environmental Justice assessment for both current 2012–2035 RTP/SCS and for future RTPs. The EJ Appendix presents a "train traffic index" from both freight and passenger rail traffic data along the region's rail corridors. Environmental Justice Communities, population, and sensitive receptors were identified and mapped for various buffer areas along the rail corridors. Finally, the existing and projected impacts (delay, emissions, and accident reductions) from grade separation projects are presented which will benefit primarily the EJ communities along the rail corridors.

Technical Approach

The following section summarizes the technical approach employed for the 2012–2035 RTP/SCS Environmental Justice analysis. Detailed methodologies explaining SCAG's approach to assessing impacts for each performance measure are available within their respective sections.

SCAG has established itself as a leader in Environmental Justice analyses and has been previously recognized for its technical approach to understanding the benefits and burdens of the agency's regional plan. Each planning cycle presents new and emerging concerns for the region to address. For example, in the 2008 RTP, SCAG analyzed accessibility to public parks including the distribution of parks by income and park accessibility by travel mode and income. In keeping with the trend of developing robust environmental analyses, the current RTP/SCS analyzes Environmental Justice population groups and their distribution along rail corridors, exposure to pollutants along heavily traveled corridors, gentrification and displacement, and impacts from revenue generating mechanisms such as a VMT fee. As with previous RTPs, the goal of the 2012–2035 RTP/SCS is to

ensure that when transportation decisions are made, low-income and minority communities have ample opportunity to participate in the decision-making process and receive an equitable distribution of benefits rather than a disproportionate share of burdens.

THE 2012–2035 RTP/SCS PLAN VERSUS BASELINE

The comparison of the Plan versus Baseline is the primary focus of the Environmental Justice analysis for the 2012–2035 RTP/SCS. The basic concept is to compare the performance of the Plan to the Baseline scenario for 2035. For the purposes of this analysis, the Plan represents the selected strategy to guide the region's transportation planning over the next decades. Baseline is defined as the set of all projects and investments currently underway or for which funds are already committed. Baseline represents "business as usual" and assumes current land use trends and the completion of projects currently under construction or with available funding for construction over the next few years. Tools and data for the analysis is based on SCAG's regional travel demand model.

IDENTIFYING DEMOGRAPHIC GROUPS

Identifying low-income and minority populations is necessary both for conducting effective public participation and for assessing the distribution of benefits and burdens of transportation plans and projects. For the purposes of this analysis, SCAG focused on all low-income groups and minority populations. Executive Order 12898 and the DOT and FHWA Orders on Environmental Justice define "minority" as persons belonging to any of the following groups, as well as "other" categories that are based on the self-identification of individuals in the U.S. Census:[1] Black, Hispanic, Asian, and American Indian and Alaskan Native. SCAG based its analysis on the latest census data for ethnic/racial groups in the SCAG region at the census tract level and by transportation analysis zone (TAZ).

The poverty classification is a federally established income guideline used to define persons who are economically disadvantaged as outlined by the U.S. Department of Health & Human Services guidelines.[2] The poverty level applicable to the SCAG Region is chosen on the basis of regional average household size for the census year. For example, for a regional mean of 2.98 persons—rounded to 3—per household, the threshold would consist of the sum of the value for the first person plus two additional people. The household counts in each income range are then used to determine the number and percentage of households in each census tract below the poverty level. In 2010, a family of three earning less than $17,374 was classified as living in poverty.[3]

TABLE 1 lists the demographic categories that are used in SCAG's Environmental Justice analysis. As noted above, this report refers to the areas with meaningfully greater populations based on these demographic categories as "Environmental Justice Communities."

In addition to complying with federal guidance, SCAG also conducts income equity analyses by breaking down total regional income figures into five income quintiles. A quintile, by definition, is a category into which 20 percent of the ranked households fall. For each new analysis, SCAG defines regional income quintiles based on the most recent census data on household income. Once the income quintiles are established, the incidence of benefits and costs can be estimated and compared across these income categories for multiple data sets. Examples include the number of income tax returns, households, workers/commuters, and consumer units. From statistics provided by the US Census Bureau, the Bureau of Labor Statistics (BLS), Bureau of Transportation Statistics (BTS), and the National Household Travel Survey (NHTS), staff produced various distributions by income quintile, which were further allocated by ethnic groups within each income quintile. Moreover, behavioral differences determined primarily by income levels—categorized by income quintile—are processed for mode usages by trip purposes—work versus non-work, consumer expenditures by categories—taxable items and gasoline, adjusted gross income, tax paid, etc. With the framework and information described above, key Environmental Justice determinants, with respect to major policy instruments for the 2012–2035 RTP/SCS, can be allocated to geographic areas based on various mode usage distributions by income quintile and its share of household counts at areas as small as Tier 2 Transportation Analysis Zones (TAZs) (11,000+ zones equivalent to census block groups).

Using the 2005–09 American Community Survey (ACS), SCAG staff produced a regional household distribution by income quintile. In addition, the ethnic distribution within each

Snapshot of the Region

Existing Conditions and Growth from 2000 to 2005–09

This section describes existing conditions for various population groups in the region and is a new addition to SCAG's traditional Environmental Justice and Title VI Analysis. This section represents a significant effort and improvement in expanding the scope of SCAG's analysis.

In response to stakeholders' desires to understand the nature and geography of communities with high concentrations of minority, underserved, and low income groups, this section will identify clusters of Environmental Justice populations throughout the region and will provide data on their historical growth and interaction with the physical environment (emissions, air quality, and health outcomes). In addition, data will also be presented on Environmental Justice implications of jobs-housing balance and mismatch.

Introduction of the data

The most reliable source for demographic data at multiple geographies in the SCAG region is the US Census Bureau. In order to identify and analyze trends in population at the local and regional levels, two Census derived datasets will most often be compared in this analysis. Historical information for the year 2000 will be taken from the US Decennial Census. Due to the breadth of information available at small area geographies, the 2005–09 American Community Survey (ACS) will be used to illustrate existing conditions in the SCAG region. The five years of data available in the 2005-09 ACS allow SCAG to make statistically valid comparisons to other data elements.

Regional Demographics

Between the years 2000 to 2005–09, population in the SCAG region grew to 17,737,412, a 7 percent increase from the year 2000. When this figure is broken down by race and ethnicity, it can be seen that much of this growth can be attributed to significant population gains in some groups. Most notably, the Hispanic population in the SCAG region increased by 1,133,559 (17 percent) from 2000 to 2005–09. Asians and Pacific Islanders also experienced a significant increase over this period, with population growing by 329,022 (19 percent). More individuals also identified themselves as some "other" race in 2005–09 than was seen in the year 2000. The population of African Americans grew slightly by 2,076, while Whites and Native Americans experienced population decreases during this period. The following tables go into greater detail on the population trends from 2000 to 2005–09.

This analysis also includes information on immigration, language, age, education, poverty, income, and transportation characteristics throughout the region. In terms of immigration, the population of foreign born individuals in the SCAG region grew from 5,113,398 in 2000 to 5,454,808 in 2005–09—an increase of 341,410 or 7 percent. The proportion of immigrants in the total population remained constant during this period at 31 percent. The non-English speaking population also grew from 668,601 to 787,192—an increase of 98,591 or 14 percent. The number of elderly individuals over 65 years of age increased as well, with this cohort growing by 201,901 or 12 percent. In terms of poverty, there has been a decrease of 144,234 in the number of people below the poverty line—a 6 percent decrease. Educational attainment has also seen promising figures, with the instances of individuals not having a high school diploma decreasing by 144,234 to 2,517,107 for 2005–09. This 9 percent overall decrease caused the percentage of individuals without high school diplomas in the total population to decline from 27 percent in 2000 to 22 percent in 2005–09.

Households grew in the SCAG region by 7 percent from 5,386,491 in 2000 to 5,689,831 in 2005–09. Median household income experienced a decline by 1 percent during these years and decreased from $66,240 in 2000 to $65,844 for 2005–09. Additional information on the breakdown of income by quintiles and demographic groups at the county level is shown in **TABLES 6** through **9** . The number of households without vehicles decreased during this period by 22 percent, from 542,242 in 2000 to 421,240 in 2005–09.

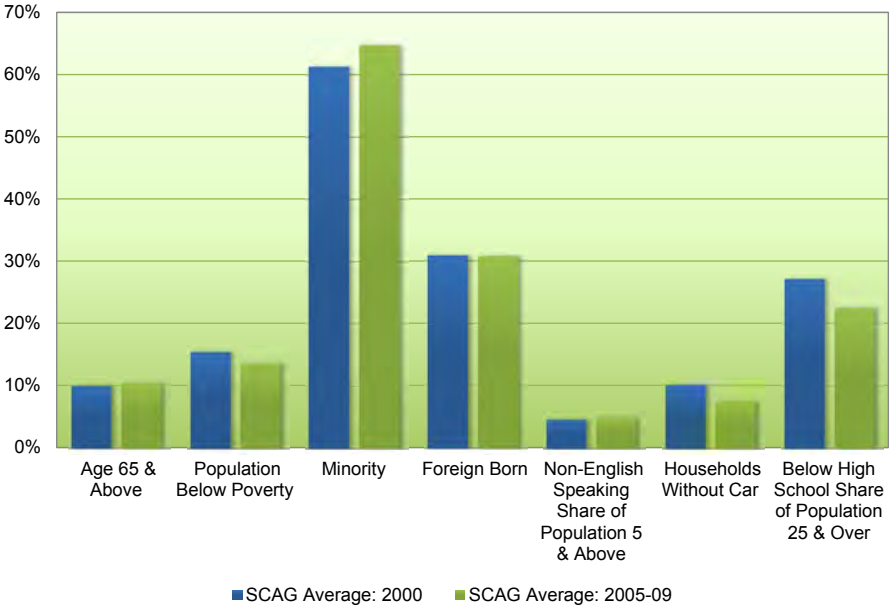
Historical Geographic Distribution of Demographic Groups

The existing guidance suggests that a concentration of a minority population may exist if the percentage of the minority population in a given area is "meaningfully greater" than the percentage of the minority population in the larger general population of the region.

For the purposes of this analysis, clusters of Environmental Justice populations were identified by identifying census tracts with concentrations of specific demographic groups that exceed the regional average. The establishment of these geographic cluster areas allows for an in depth analysis of the historical air quality and health factors of unique socioeconomic cohorts provided in the technical analysis that follows. The identified cluster areas and their shift over time are displayed for each Environmental Justice variable for years 2000 and 2005–09. This report refers to these areas as "Environmental Justice Communities."

FIGURE 4 summarizes the demographic changes from the year 2000 and the 2005–09 time period. Population living below the poverty line decreased from 15.4 percent in 2000 to 13.5 percent in 2005–09. Minority population increased between the two comparison datasets from 61.3 percent to 64.8 percent in 2005-09.

FIGURE 4 SCAG Region, Title VI and Environmental Justice Population Thresholds and Changes



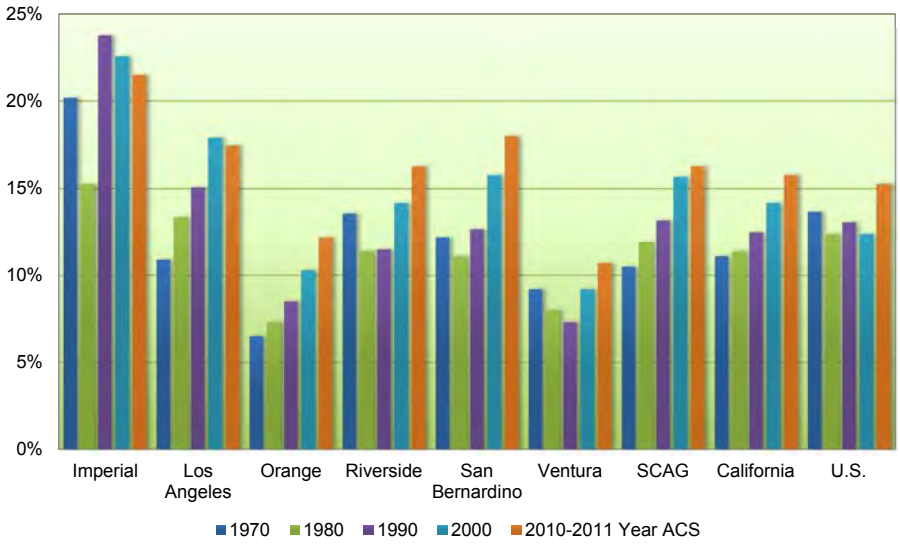


FIGURE 5 shows the historic poverty rates for each county in the SCAG region, as well as for the region as a whole, for California, and for the United States. In comparing these geographies, it can be seen that poverty was generally lower in the SCAG region than in California or the United States as a whole until recently, where poverty rates are now higher in many counties than in the state or the nation.

FIGURE 5 Poverty Rates for SCAG Region Counties, California, and U.S. (1970-2010)

Estimated and Projected Population Growth for Years 2008, 2020, and 2035

As past trends indicate, the SCAG region is projected to continue to experience population growth into the near and distant future. The population in the region is expected to grow to 22.1 million by 2035. The largest increase forecasted is seen in the Hispanic population, which is projected to grow 55 percent between 2008 and 2035. The next largest increases are for the Non-Hispanic White population (24 percent) and for people age 65 and over (17 percent). The share of residents living at or below the poverty threshold is also expected to grow from 13.8 percent in 2008 to 14.5 percent in 2035. See **TABLE 10**: Projected Environmental Justice Population and Demographic Changes in the SCAG Region, 2008–2035.

Performance Areas Analysis

The following section describes the methodology and findings for each of the eleven performance areas analyzed as part of this Environmental Justice Report, which were previously outlined earlier in this report. Each section is comprised of extensive data including maps, charts and graphs to show the results in multiple formats. This section begins with a benefits and burdens analysis, which includes a determination of the existing share of transportation system usage by income group and racial/ethnic group. Next, it describes investment share and taxes paid by income group and ethnicity. This comparison allows the reader to understand how the benefits and burdens of the 2012-2035 RTP/SCS are distributed among environmental justice communities.

The next performance area describes the distribution of travel time and distance savings to better understand how the region's population groups, particularly those in low-income and minority households, experience the Plan's investments in the region's transportation system.

The next area relates to the jobs-housing mismatch and builds on the benefits and burdens discussion to explore how investments affect employment and travel decisions. For example, there are concerns that workers are priced out of housing near jobs thereby resulting in long travel distances.

Accessibility is another important component of the report and is at the foundation of this environmental justice analysis. This performance area focuses on accessibility to services including employment, shopping opportunities, and parks.

A discussion of gentrification and displacement issues is featured in the analysis due to the concerns that have been raised related to the inclusion of land use strategies in the RTP/SCS. This is a new area of Environmental Justice analysis for SCAG and no similar report or analysis can be found in the United States. SCAG offers a methodology and framework for future research, monitoring, and analysis regarding displacement and gentrification concerns for land use development within high quality transit areas (HQTA). The report further provides the socioeconomic makeup of areas with major transit stops and corridors and examines the presence of historic gentrification and displacement within HQTA or transit oriented communities (TOC).

Also, SCAG developed a "4D Statistical Model" to analyze land use strategies and capture additional VMT reduction benefits that result from the 2012-2035 RTP/SCS.

The final series of performance areas discuss the environmental impacts of the 2012-2035 RTP/SCS on minority and low-income populations. This analysis goes beyond the financial and travel time burdens outlined above and focuses on the potential disproportionate impacts from air and noise emissions. The analysis further describes if proximity to freeways or rail facilities result in health impacts to low-income and minority populations.

(1) RTP Revenue Sources in Terms of Tax Burdens by Income and Ethnicity

SCAG reports expenditure distributions in several ways. First, SCAG estimates the share of total RTP expenditures allocated to each category of household income. This is done by totaling expenditures on each type of mode (bus, HOV lanes, commuter/high-speed rail, highways/arterials, and light/heavy rail). This information is then allocated to income categories based on each income group's tendency to use these modes. Staff analyzed the distribution of Plan expenditures based on mode usage information by income quintile.

The Bureau of Labor Statistics (BLS) Consumer Expenditure Survey (CES) program consists of two surveys, the Quarterly Interview Survey and the Diary Survey, which provide information on the buying habits of American consumers, including data on their expenditures, income, and consumer unit characteristics (families and single consumers). The CES is important because it is the only Federal survey to provide information on the complete range of consumers' expenditures and incomes, as well as the characteristics of those consumers. It is used by economic policymakers examining the impact of policy changes on economic groups, by businesses and academic researchers studying consumers' spending habits and trends, by other Federal agencies, and, perhaps most importantly, to regularly revise the Consumer Price Index market basket of goods and services and its relative importance.

SCAG uses consumer expenditure survey data, in particular the tabulation showing the share of aggregate expenditures by income quintile, to assess regional expenditures by taxable sales category and adjusted gross income in order to estimate transportation funding contributions or taxes paid by income quintile. The basic assumption of this

application is that results from the national survey can be applied in the SCAG region as a whole as well as any transportation analysis zone (TAZ) or a combination of TAZs if the analysis is done by income quintile. This application could work well for categories showing very stable trends in areas such as taxable sales (i.e., gasoline, grocery, vehicle consumptions, medical expenses, etc.).

The following table presents the SCAG taxable sales and expenditure allocation by income quintile in 2008 from data collected by the California Board of Equalization and Franchise Tax Board. As can be seen in the table, households in the SCAG region spent $25,856 million in 2008 at service (gas) stations. The lowest income quintile household's share of gasoline consumption—90 percent of service station sales are gasoline—was just over 9 percent, while households in the highest income quintile accounted for almost 31 percent of gasoline sales. In terms of expenditures on vehicle purchases, the lowest income quintile household accounted for just 4 percent of all new vehicle sales and just 7.5 percent for used vehicles. This is not surprising because many low income households cannot afford the cost of vehicle ownership including maintenance, insurance and the purchase of gasoline.

The CES indicates that households in the lower income quintiles predominately owned used and older cars. This situation has implications in terms of fuel efficiency—low income households pay proportionally more on gasoline and gasoline taxes than more affluent households who normally own newer vehicles that are more fuel efficient and allow them to travel further on the same amount of gasoline. Thus a VMT-based transportation finance system could correct the equity issue inherent with a funding system based on gasoline consumption, prices, and taxes.

Source: SCAG staff process 2008 Consumer Expenditures Survey by Bureau of Labor Statistics 2008 Taxable Sales in California Counties, State Board of Equalization, 2008

Different funding sources (i.e. income taxes, property taxes, sales, fuel, etc.) can impose disproportionate burdens on lower income and minority groups. Sales and gasoline taxes, which are the primary sources of funding for the region's transportation system, were evaluated for the purposes of this analysis. The amount of taxes paid was analyzed to demonstrate how tax burdens fall on various demographic groups. As in previous Environmental Justice Reports, the 2012-2035 RTP/SCS environmental justice analysis examined in detail the incidence or distribution of the burden of taxation.

RESULTS

The environmental justice analysis for the 2012-2035 RTP/SCS performed a comparative examination of the amount of taxes (sales, gasoline, and income) paid by the five respective income groups and by ethnicity. The following figure, **FIGURE 6** entitled "Share of Taxes Paid by Income Quintile," indicates that taxes paid as a percent of each group's disposable income puts the heaviest burden on lower-income groups. This is the so-called "regressive" nature of the excise gasoline tax and retail sales tax levy on primarily consumer durable and non-durables that are necessities of daily living. The lower quintile groups (Quintile 1 and Quintile 2) are anticipated to pay 38.7 percent and 9.9 percent of their adjusted gross income on regional sales and gasoline taxes, respectively. By comparison, the higher quintile groups (Quintile 4 and 5) are anticipated to pay 6.6 percent and 3.0 percent of their income on all regional sales and gasoline taxes, respectively. Although the lower income quintile groups pay a larger percentage of their income on taxes than other quintiles, their contribution of the total share of sales and gasoline taxes is the smallest of the group at 8.4 percent for Quintile 1 and 12.8 percent for Quintile 2. Quintile 4 and Quintile 5, in contrast, pay 23.4 percent and 37.7 percent of the total sales and gasoline taxes in the region. Thus, those with limited financial means will not pay a disproportionate amount of overall taxes under the Plan compared with their usage of the transportation system and their shares of RTP/SCS investments.

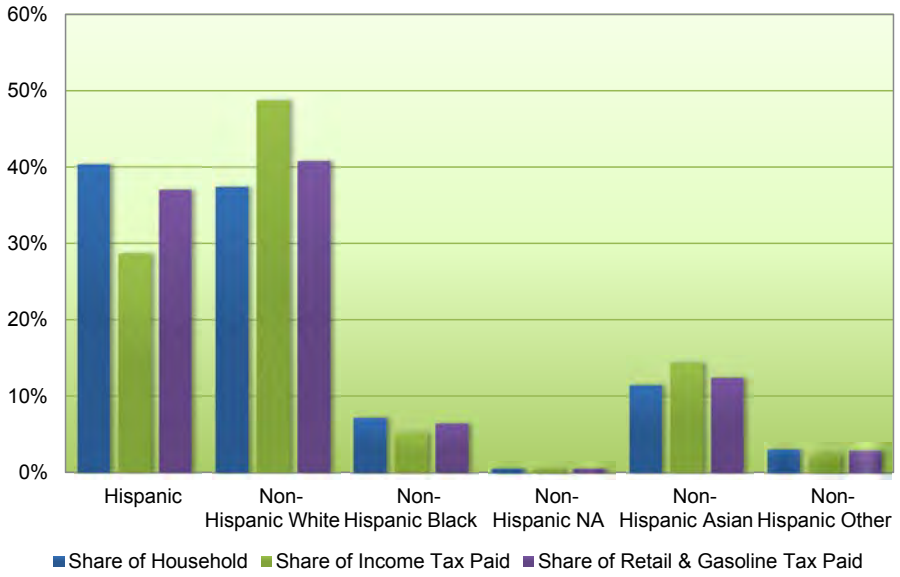
FIGURE 7 Tax Burdens by Income Quintile: Income, Sales and Gasoline Tax (2008)



The following table, **TABLE 14** entitled "Projected RTP Funding Share by Ethnicity," indicates that tax burdens are expected to fall more heavily on non-minority groups with Non-Hispanic Whites paying 48.8 percent of the income taxes and 40.8 percent of retail and gasoline taxes.

TABLE 14 Projected RTP Funding Share by Ethnicity (2008–2035 Average)

	Share of Household	Share of Income Tax Paid	Share of Retail & Gasoline Tax Paid
Hispanic	40.3%	28.7%	37.0%
Non-Hispanic White	37.5%	48.8%	40.8%
Non-Hispanic Black	7.2%	5.2%	6.4%
Non-Hispanic NA	0.5%	0.5%	0.5%
Non-Hispanic Asian	11.5%	14.4%	12.4%
Non-Hispanic Other	3.0%	2.5%	2.9%

FIGURE 8 Share of Households and Taxes Paid By Ethnicity (2008)

(2) Share of Transportation System Usage

In order to determine the existing level of system usage, SCAG analyzed the 2010 National Household Travel Survey (NHTS). The NHTS is a household-based travel survey conducted periodically by the Federal Highway Administration (FHWA). The NHTS is the authoritative source of national data on the travel behavior of the American public. The dataset allows analysis of daily travel by all modes, including characteristics of the people traveling, their households, and their vehicles. The 2009 data includes 69,817 households and 160,758 persons, and the travel diary data includes a total of 642,292 trips. It is a disaggregated database that allows aggregation of any variable as well as cross-categorization of the data with other variables. With its fairly large sample size and key variables typically used for travel behavior analysis, the NHTS data is a valuable resource for analyzing travel patterns.

With about 6,700 households and 15,000 individuals sampled in the SCAG region, the 2009 NHTS dataset provides valuable and sufficient observations to analyze both the demographic and travel characteristics of the SCAG region. This dataset along with SCAG's 2001 household travel survey are used as the basis for developing transportation system usage information for different modes and by income quintile and ethnicity. In addition, the NHTS data set is used to provide data for analysis of the household characteristics and travel behavior of residents in high quality transit areas (HQTA), including ¼, and ½ mile buffer zones for Transit Priority Projects (TPP), Transit Oriented Communities (TOC) and rail/bus stations.

Based on 2009 NHTS data, **TABLES 15** and **16** present transportation mode usage in the SCAG region by ethnicity and by income quintile for both work trips and all trips. Highlights in the tables include:

Work Trips: The automobile (drive alone and car pool), which accounts for just under 90 percent of all trips, is the dominant transportation mode for work trips. The next most popular mode is bus (6.1 percent), followed by non-motorized transportation (4 percent).

Most bus and urban rail riders are lower income quintile households—the lowest two income quintile households combined account for 84 percent of bus riders and 93 percent of urban rail riders. However, the data indicates a more balanced usage distribution by income groups for commuter rail, walking, biking and other modes. Furthermore, given the total number of trips, bus is far more important than urban rail for low income households for commuting purposes.

Compared with their share of total households and commuters, transportation system usage for Hispanic commuters is disproportionately high in the following modes: Auto as passenger (67 percent), bus (84 percent), urban rail (93 percent), commuter rail (62 percent), and biking (51 percent).

All Trips: Transportation system usage by mode for all trips is used to allocate the RTP/SCS investment costs, mobility and accessibility benefits. Since only NHTS and SCAG's 2001 household travel survey data provide information about non-work trips, staff applied both data sets to develop the hybrid version of system usage by mode for all trips. It should be noted that the appropriate and accurate statistics on shares of usage by ethnicity and income quintile are important because they directly affect the Environmental Justice analysis outcomes. This area is recommended for further refinement and research.

Highlights about all trips from statistics presented in the tables and figures below include:

Active transportation, in particular walking, becomes much more important for non-work trips. It jumps to over 14 percent from just about 2.5 percent for work trips.

While accounting for 20 percent of total households, households in the lowest income quintile have less than 15 percent of total transportation system usage, and their share of auto mode as driver is less than 10 percent. On the other hand, low income household usage is disproportionately high in all other modes—bus, urban rail, commuter rail, walking and biking.

By ethnicity, Hispanics disproportionately use more bus and urban rail, and walk more often than their share of total households or population, while Non-Hispanic Whites use disproportionately high auto and bike modes similar to their mode usage for work trips.

Final consolidated transportation system usage by modes, by income quintile, and by ethnicity are shown in **TABLES 17** and **18.** Since projected growth by ethnicity in the SCAG region shows a very different ethnic composition in the future than the distribution today, household projections by income quintile by ethnicity as presented earlier are utilized to adjust and derive the appropriate usage shares by modes for different ethnicity groups.

TABLE 15 Transportation Mode Usage in the SCAG Region by Ethnicity

	Auto Mode	Bus	Commuter Rail	Urban Rail	Non-Motorized	Others	Total Usage	Household
Hispanic	39.2%	44.1%	38.2%	43.2%	41.1%	40.1%	**39.6%**	40.3%

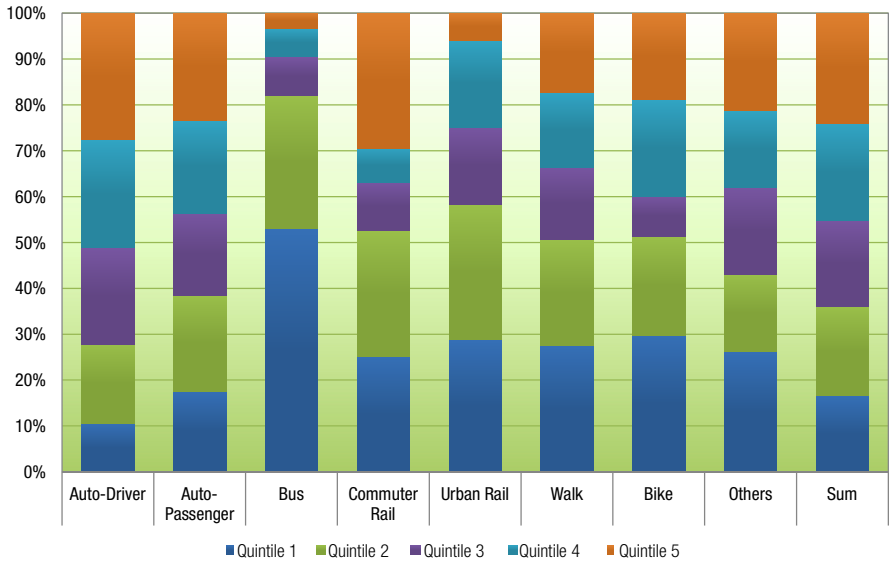
FIGURE 9 Transportation Usage by Mode and by Income Quintile: All Trips



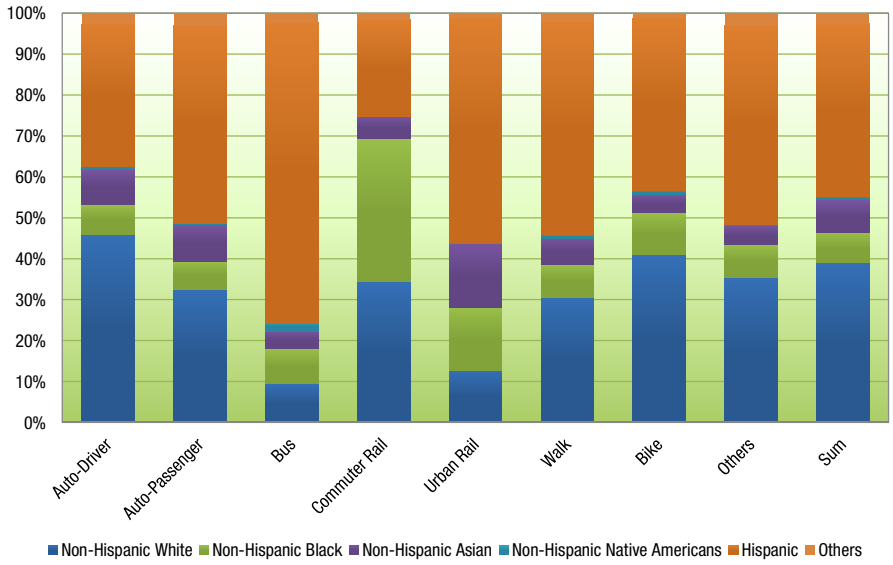


FIGURE 10 Transportation Usage by Mode and by Ethnicity: All Trips

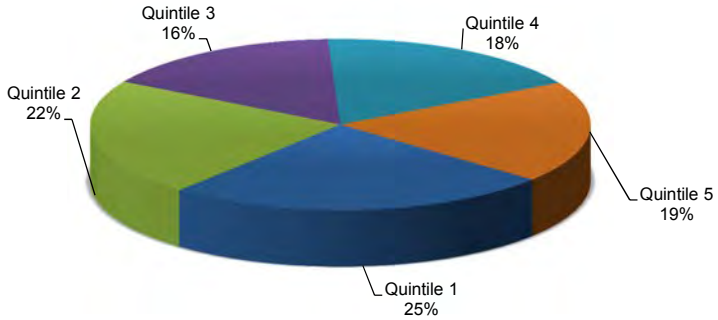

(3) RTP Project Investment Share by Income and Ethnicity

One of the most prominent environmental justice issues is the transportation investment strategy, which can impact the transportation choices of low income and minority communities. A disproportionate allocation of resources for various investments can indicate a pattern of discrimination. Such was the case in the landmark civil rights class action lawsuit *Labor/Community Strategy Center v. Los Angeles County Metropolitan Transportation Authority (MTA)* in October 1996. The lawsuit, which eventually led to a court-ordered Consent Decree, charged that MTA's investment and service priorities disproportionately allocated resources to rail transit over bus ridership, an expenditure pattern discriminatory to low-income and minority communities.

As a regional MPO, SCAG aims to identify and address the Title VI and the environmental justice implications of its planning processes and investment decisions. This analysis intends to determine where the 2012-2035 RTP/SCS is putting its investments and will evaluate whether resources are being allocated equitably. The 2012-2035 RTP/SCS utilized a benefit assessment method that considered to what extent various socioeconomic groups were receiving value from existing and funded transportation investments. SCAG compared the total share of transportation funding borne by low-income households against other income groups. In this analysis, SCAG reported expenditure distribution in several ways. First, SCAG estimated the share of total RTP expenditures allocated to each category of household income. This was done by summing expenditures on each type of mode (bus, HOV lanes, commuter/high speed rail, highways/arterials, and light/heavy rail). These expenditures were then allocated to income categories based on each income group's use-share of these modes.

FIGURE 11, Transportation Investments by Income Quintile, presents the findings for percent of total investments, which looks at the raw dollars and compares the amounts spent on low-income and high-income households. The results in the 2012-2035 RTP/SCS revealed that approximately 25 percent of Plan investments will be allocated to the lowest quintile group (Quintile 1 - as compared with the group system usage of just under 17 percent), while 19 percent will be invested for the highest income category (Quintile 5) with total transportation system usage of almost 25 percent. In other words, transportation investments would go to modes likeliest to be used by lower-income households.

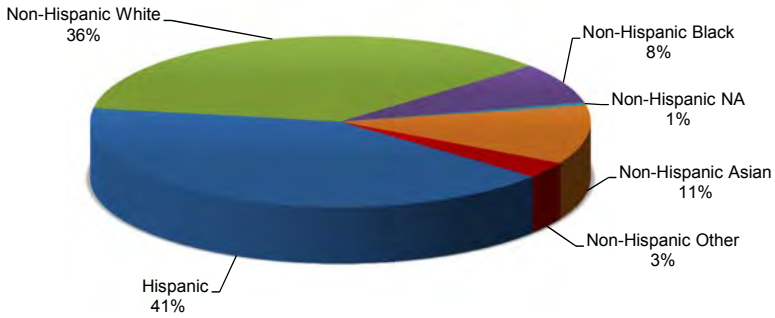

FIGURE 11 2012-2035 RTP/SCS Transportation Investment by Income Quintile

The next figure, Transportation Investments by Ethnicity, evaluates the distribution of transportation investments by various ethnic/racial categories. The current analysis for the 2012-2035 RTP/SCS reveals that Plan investments will be distributed equitably on the basis of system usage by ethnic/racial groups. Transportation investments would go to modes most likely to be used by lower-income households.

For Hispanics, the share of Plan investments (41 percent) is close to this group's share of system usage (39.6 percent); for Whites, the share of Plan investments is at 36 percent, while their system usage is 38.2 percent; for African-Americans, the share of Plan investments (8 percent) also exceeded their share of system usage (6.9 percent).

FIGURE 12 2012-2035 RTP/SCS Transportation Investment by Ethnicity

(4) Impacts from Transportation Funding Based on VMT Fees

METHODOLOGY

This is a new analysis area based on the finance strategy in the 2012-2035 RTP/SCS, which recommends a vehicle mile traveled (VMT) based user fee, which would be assessed beginning in the year 2025. This VMT fee would be implemented to replace the gasoline tax, and is estimated to cost about $0.05 (in 2011 dollars) per mile and indexed to maintain purchasing power starting in 2025. The implementation of this strategy requires actions of both the State Legislature and Congress. The recommended strategy is consistent with recommendations from two national commissions to move towards a mileage-based user fee system. Immediate steps necessary to take include coalescing state and national partners to fund further RD&D (Research Development & Demonstration) in advance of a 2025 broad based implementation.

The following section discusses the environmental justice impacts of a VMT-based user fee and will also assess the measure's likely impact on the distribution of population and employment growth in the future due to the implementation of VMT fees.

Note that potential shifts in growth examined here are not reflected in the Plan's growth forecast and land use assumptions. Rather they are a theoretical analysis of logical changes in land use that may occur with implementation of a mileage based user fee.

In comparing the VMT-based user fees finance system with the traditional gas tax based transportation funding system, the following points arise:

- The gas tax and the VMT-based user fee are similar in nature in that they are both highly regressive—lower income households will pay a disproportionately higher percentage of their income for both a gasoline tax or a VMT-based user fee than is paid by higher income groups.
- The VMT-based user fee is less "regressive" than the gasoline tax because it removes the advantages that higher income households have due to their access to relatively new and more fuel efficient vehicles. In general, new passenger vehicles are normally 15-20 percent more fuel efficient than the general auto fleet. Thus, given the equivalent dollar amount of the gas tax and VMT-based user fees, higher income drivers (who usually own newer and much more fuel efficient vehicles) will now have to pay more through the VMT-based fee system than they have in the existing gasoline tax based transportation funding environment.
- Moreover, as analyzed later in the section on job-housing and workers-job fit, most long distance commuters are high income wage earners who can afford the VMT-based user fees. On the other hand, low income households, minorities, and households without vehicles will be similarly or less impacted under a VMT-based fee system than is the case with the traditional gasoline tax.

SCAG developed an integrated transportation–land use model, based on the PECAS framework, to help analyze the land use impacts from the VMT user fee scenario. For additional detail on the model, please see the Integrated Growth Forecast Technical Appendix. Since the model has not been peer reviewed, and not fully calibrated with the best available regional data, its output shall not be considered to be SCAG's official position on the scenario. Nonetheless, a review would be useful in understanding the impact considered as the market's response to a feasible future.

To parameterize the VMT fee scenario for a model run, the following assumptions were applied:

- The current gasoline tax, which exists at $0.364 per gallon, would gradually increase until 2025 to $0.50 per gallon.
- Subsequently, a $0.05 per mile VMT fee would replace the gasoline tax at year 2026.
- Relative to the PECAS model's base year, 2007, the travel cost would be 10 percent higher in year 2025 than in 2007. Between 2008 and 2024, this cost increase is linear. At year 2026, the travel cost would be 20 percent higher than in 2007, and thereafter stabilized.

RESULTS

With and without a change in travel costs, the PECAS model estimated the total number of households and jobs for 302 CSAs (Community Statistical Areas). The difference in zonal allocation is the impact of increased travel costs. PECAS evaluates the spatial utility for economic activities, such as production, exchange and consumption, such that the regional total of households and jobs are allocated to each zone according to the estimated utility. High travel cost means increases in disutility in the model; therefore, economic actors would try to avoid interactions with longer distances, which would result in 'tighter' concentrations in certain areas.

TABLES 21 and **22** summarize the number of households and jobs over SCAG's 14 subregions, respectively. Note that this allocation is not identical to the socioeconomic data set provided for the RTP process. What the table shows is a set of estimated figures according to the modeled market, while the official socioeconomic data was created from a thorough process that is detailed in the Growth Forecast Technical Appendix.

Comparing the allocation in year 2035, Imperial County gains about 1 percent of households; yet, loses 0.8 percent of jobs under the VMT fee scenario relative to the base case. In Los Angeles County, only North Los Angeles and Las Virgenes-Malibu subregions are estimated to have fewer households due to the VMT fee. Interestingly, the main job centers in Los Angeles County are estimated to have fewer jobs under the scenario, including the City of Los Angeles, Westside Cities Council of Governments and South Bay Cities Council of Governments. San Bernardino County would lose about 0.2 percent of households. Overall, however, the difference is not significant.

The shift in activity allocation caused by the additional travel cost can be better captured with maps. **EXHIBIT 15** shows the difference in households between the base case and VMT-based fee scenario. As indicated in the map, households are leaving zones in outlying areas, due to additional travel costs, and are relocating into a few centers, including Downtown Los Angeles, the Beach Cities, and many other cities in Los Angeles County. Similarly, both Western Riverside County and the southern part of San Bernardino County receive additional growth in several centers.

In general, households are moving towards nearby centers in response to the higher cost of travel. In the future, Downtown Los Angeles could be the center of gravity in the region, and it could be the first place to concentrate. However, the additional 10 percent in travel costs is not high enough to push a significant number of households into Downtown Los Angeles. Instead, dramatic growth is seen in three places region-wide, which are portions of the City of Los Angeles, the western portion of Riverside County, the southern portion of San Bernardino County, and the eastern section of Imperial County. **FIGURE 13** depicts the conceptual centers for household shifts under the scenario.

Jobs showed a distinctly different shift pattern. The most noticeable difference from the household shifting pattern is observed in Los Angeles County. Instead of coming into the urban center, jobs are moving away from the Downtown Los Angeles area to either north Los Angeles County or western Riverside County.

In general, the results suggest that with higher travel costs region-wide as reflected in the VMT-based user fees, people and households will tend to move to nearby local centers where accessibility to job opportunities is plentiful, so as to offset the impacts from an increase in travel costs. On the other hand, employers will relocate to key locations to better align themselves with the newly emerging concentration of workers and households.

It is not clear if this change would happen in the estimated magnitude. Yet, in conjunction with a 3.5 percent estimated reduction in travel distance (see the Growth Forecast Technical Appendix for additional detail), these impacts on directional changes seem reasonable.

(5) Distribution of Travel Time Savings and Travel Distance Savings

METHODOLOGY

This analysis involved measuring the average travel time for both work trips and non-work trips. SCAG assesses the distribution of travel time savings that are expected to result from implementation of the Plan. SCAG conducted this analysis for transit (i.e. bus and light rail) and automobile trips. These travel time savings were reported as a proportion of the total travel time savings for each mode.

Travel time savings is one performance measure that SCAG analyzed to determine the share of benefits and burdens in using the regional transportation system for the region's population groups. For the 2012-2035 RTP/SCS, transportation modeling results were used with data on mode usage by income and ethnicity to determine travel time savings. Results were calculated for trips made by automobile (the most common mode of travel) and for trips using transit (transit by local bus and/or by all transit).

SCAG assessed the distribution of travel time savings that are expected to result from the implementation of the 2012-2035 RTP/SCS by analyzing demographic data and the associated mode usage statistics for each Transportation Analysis Zone (TAZ) in the region. With this input, an estimate for the time savings for each income and ethnic group can be identified for trips involving transit (i.e. local bus and all transit) and automobiles.

Another way of estimating benefits is to calculate savings in terms of person-miles traveled (PMT). These results indicate that the share of driving distance savings, similar to time savings, generally resembles the share of usage. This is another way of estimating the benefits of land-use strategies—locating homes nearer to work places and intensifying land-use—reflected in the Plan. Similar to the methodology used to estimate travel time savings, staff used the differences between the RTP/SCS and baseline scenario in trip distribution and distance to estimate per-mile travel benefits.

There are two ways to examine and to determine whether the RTP/SCS outcomes on travel time and person-mile changes are adequately allocated by various income/ethnicity groups. The first is to compare the distribution of total savings (benefits) by income/ethnicity with each group's usage of the system, share of RTP investment, and their contributions through gasoline and sales taxes to fund the transportation system. The second, is to examine whether relative improvements from proposed RTP/SCS strategies for each income/ethnicity group are generally in line with their usage—i.e., to ensure that every group benefits appropriately from the system investment and improvements in the 2012-2035 RTP/SCS.

RESULTS

FIGURES 15 and **16** present Share of System Usage, Taxes Paid, Travel Time Savings (auto, local bus, all transit), and Person-mile Changes (auto) by income/ethnicity. **FIGURES 17** and **18** present the relative improvements of travel time savings and person-mile reductions from implementation of the 2012-2035 RTP/SCS. Highlights among the figures include the following:

- Share of travel times savings by income groups are generally consistent with each group's mode usage. Higher income quintile groups captured more savings in person hour traveled proportionally to their relative higher usage of autos. However, lower income groups received more benefits from transit related time savings for their higher usage of transit.
- Person-mile travel changes are also in line with usage by income groups of autos.
- Share of travel time savings and person-mile benefits by ethnic groups are also very balanced, and in line with each ethnic group's use of the transportation system.
- Lower income quintile groups received greater improvements in person-mile travel reductions and local bus travel time savings than higher income groups, and about the same level of improvement in person hour savings as higher income households. Alternatively, higher income households enjoyed a moderately better improvement in all transit mode time savings.
- Improvements in mobility and person-mile travel benefits are fairly similar and close for all ethnic groups.

(6) Jobs-Housing Imbalance or Jobs-Housing Mismatch

In the practice of urban and transportation planning, the subject of job-housing imbalance and job-housing mismatch is considered a key contributor to traffic congestion and, some argue, an impediment to environmental justice. Among the arguments:

- Workers are priced out of the job rich areas, which makes long distance travel and congestion inevitable for many
- Coastal counties have not built enough housing, forcing workers to move to inland counties where housing is affordable. This results in long distance commuting and traffic congestion

While this analysis is not expecting to allay all concerns related to jobs-housing imbalance and/or jobs-housing mismatch, however, the statistics are provided to investigate socio-economic profiles of long distance commuters—defined here as "inter-county commuters—such that stakeholders and policy makers can better understand the demographic composition of long distance commuters.

From an economic point of view, transportation and driving are expensive; workers without a car or people with less income who cannot afford a vehicle have to either live close to their jobs where they can have access to transit or can walk or bike. Moreover, since long distance commuting is expensive, people do not partake of it unless subsidies exist to own a dependable vehicle, access is available to relatively fast and cheap transit, or they have a well-paying job.

The following tables identify the median wages for inter-county and intra-county commuters using the 1990 Census, 2000 Census, and the most recent 2008 American Community Survey (ACS).

TABLE 23 Median Wage/Earnings for Workers by Place of Residence and Place of Work, 1990–2008

The statistics indicate that, almost without exception, all inter-county commuters command much higher wages than those commuters who work and live in the same county. Those commuters also command wages higher than workers who work and reside in their destination work counties. From an environmental justice perspective, this research does not provide definitive results. Rather, it raises additional questions that could be investigated to better understand how jobs, workers, housing, and associated income distribution could impact travel patterns of low income and minority populations.

Policy Implications:

A strong case could be made for imposing future VMT-based charges to the net inter-county commuting VMT (total inter-county commuting VMT—estimated VMT to reach the county line) to address the transportation funding needs and relieve congestion.

Further research is needed to investigate the jobs-housing imbalance and jobs-housing mismatch issues and related policy implications more carefully. One observation, which remains valid today, and was provided in SCAG's Environmental Justice Report for the 1998 RTP, indicated that "for people who cannot afford a car for long distance travel, and have to cluster around certain areas, their mobility and accessibility are severely limited. An example is if growth in entry level jobs is primarily in suburban areas but is not served by public transit in peak hours, or is too far by walking/biking." The 2012-2035 RTP/SCS transportation investment and land use strategies will provide relief for this concern.

(7) Accessibility to Employment and Services

METHODOLOGY

Accessibility is a foundation for social and economic interactions. As an indicator, accessibility is measured by the spatial distribution of potential destinations, the ease of reaching each destination, and the magnitude, quality and character of the activities at the destination sites. Travel costs are central: the lower the costs of travel, in terms of time and money, the more places that can be reached within a certain budget and, thus, the greater the accessibility. Destination choice is equally crucial: more destinations and the more varied the destinations, the higher the level of accessibility.

The analysis of accessibility for the 2012-2035 RTP/SCS Environmental Justice report includes the following:

- Investigate the distance-based accessibility of medical services and grocery/general merchandise stores that are within transportation modes for walking, biking, and using the local bus system for the base year (2008). Staff used both 3-mile and 5-mile radii and compared Environmental Justice groups with the average population in terms of accessibility to medical service facilities and grocery/general merchandise stores.
- Present both the base year job and shopping accessibility improvements through implementation of the 2012-2035 RTP/SCS by three transportation modes—auto, local bus, and all transit, and two travel time intervals—30 and 45 minutes. However, this report only presents results for 45-minutes of travel.
- Apply the same analysis and methodology used for job and shopping accessibility for analyzing park accessibility for Environmental Justice Communities.

Employment and retail accessibility evaluates how well the transportation system is providing access to jobs and shopping for underrepresented populations. In this analysis, both employment and shopping accessibility is defined as the percentage of the population who can travel between work and home or between retail stores and home within 30 or 45 minutes during the morning peak period. The general procedures for these exercises are:

- Obtain Transportation Analysis Zone (TAZ) to TAZ travel time matrix by mode: auto, local bus, and all transit
- Identify medical facilities, grocery stores, and general merchandise stores from SCAG's employment database, and the projected growth of total employment and retail jobs within the study area
- Identify from SCAG's land use database all local, regional, state, and national parks
- For each TAZ, select all of the TAZs accessible with different transportation modes within 45-minutes of travel (30-minute travel time results are available upon request)
- Summarize total jobs, retail jobs, medical facilities, grocery/general merchandise stores, and acreage of parks

RESULTS

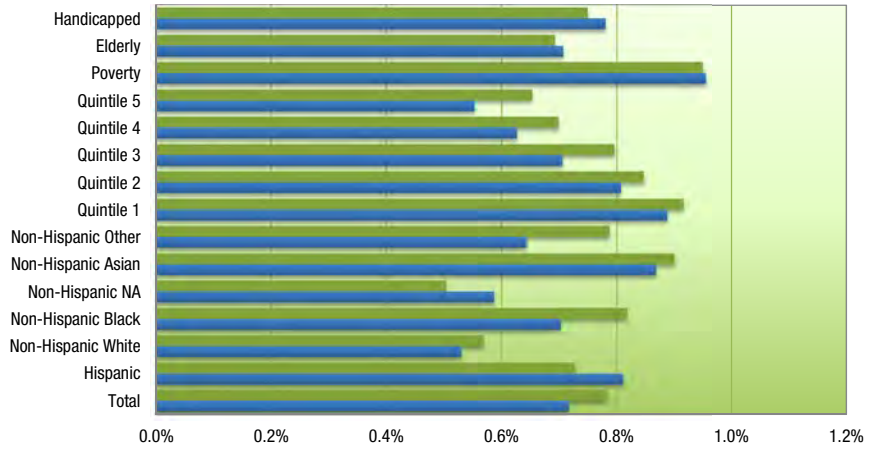
DISTANCE-BASED ACCESSIBILITY

The following figures present medical facility/grocery stores accessibility in 3-mile and 5-mile radius by key Environmental Justice interested groups.

As illustrated in both figures, most ethnic groups, lower income quintile households, and people in poverty live in areas with higher than average accessibility to medical facilities, grocery/general merchandise stores. These observations support the statement made earlier that because transportation and long distance travel are expensive, less affluent people will choose residential locations where they can walk, bike, or take transit to access jobs, shopping, or other essential services. The priority policy is to create job opportunities for less affluent people near transit or urban cores. Promoting development in TOD areas is a good policy, but the unintended impacts on displacement and gentrification need to be mitigated.

The analysis also indicates that several population groups—Non-Hispanic Native Americans, Non-Hispanic Black and others, elderly and disabled—have "very slightly" less than average accessibility to either medical services or grocery/general merchandise stores as those observed for Non-Hispanic White and higher-income quintile households. Since there is no mobility element in this analysis, the primary cause could be the residential locations of these population groups relative to the opportunities located in surrounding areas. It is recommended that additional monitoring and study are conducted to better understand the accessibility issues for these four Environmental Justice groups (Non-Hispanic Native Americans, Non-Hispanic Black and others, elderly and disabled).

FIGURE 19 Local Stores and Medical Facilities within 3-Mile Radius Area (2008)



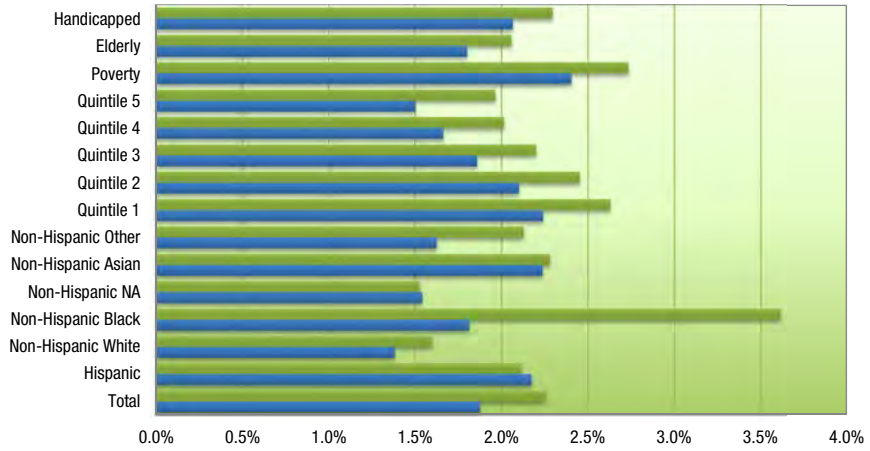


FIGURE 20 Local Stores and Medical Facilities within 5-Mile Radius Area (2008)

JOB AND SHOPPING OPPORTUNITY

Job and shopping accessibility calculations are presented in the following figures. The base year job and shopping accessibility and improvements from the 2012–2035 RTP/SCS are also shown. Summary highlights from the base year job and shopping accessibility analysis include the following:

- Elderly population showed only above average accessibility to job opportunity by auto; all other measures come out slightly below average for both job and shopping accessibility. As mentioned earlier, staff plan to research and study further about residential location and land use in the surrounding areas for this population group, in particular because the region is facing an aging population in the next 20–25 years.
- In general, lower income quintile households and population below poverty all showed higher job and shopping accessibility in base year 2008 under every transportation mode.
- As the case of distance-based accessibility, non-Hispanic Native Americans and non-Hispanic other, similar to non-Hispanic White, have below average accessibility in both job and shopping accessibility.
- Nonetheless, through the implementation of recommended strategies in the 2012–2035 RTP/SCS, the elderly, non-Hispanic Native Americans and non-Hispanic others will experience much better improvements than the average population in both job and shopping opportunities.

(8) Accessibility to Parks

METHODOLOGY

Public parks serve all residents. National parks, state parks, and numerous community parks are all found within the SCAG region. However, not all parks are created equal. Not all neighborhoods and people have equal access to these cherished public resources (see Map 1: Distribution of Parks and Low-income Households). Some neighborhoods have more open space, some parks are better maintained, some are built so that those with disabilities can enjoy them, and some parks are safer. SCAG conducted additional analysis on accessibility to parks for the 2012–2035 RTP/SCS.

Three types of parks were considered for the environmental justice analysis: 1) local parks; 2) state parks; and 3) national parks. The acreage of each park type in all TAZs was identified. The underlying assumption is that the more acreage of parks that can be reached within a certain travel time and cost, the greater the park accessibility within a community.

Similar to the method for measuring job accessibility, park accessibility is defined as the percentage of park acreage reachable within 45 minutes of travel via 1) automobile; 2) local bus; and 3) all transit options. SCAG's existing typical weekday model was utilized for the analysis, as there is currently no weekend transportation model for the region.

RESULTS

The results of this park accessibility analysis by auto, local bus, and all transit modes within 45 minutes of travel are presented in the following tables and figures. General conclusions from the table and figures include:

- Park accessibility statistics indicate that park accessibility by transit is much lower than that by automobile for all groups. This is true for all parks, national, state, or local parks. By transit, there is almost no access to national parks, and very limited access to state parks in all scenarios—base year 2008, baseline, or under the plan. This observation is consistent with the conclusions of the 2008 RTP Environmental Justice report that there is a near complete lack of public transportation services into, in particular, the National Forests.
- Income quintiles 4 and 5 will have moderately higher access to either state and/or local parks in the region via automobile. Population groups showing marginally lower accessibility to national parks by auto include: non-Hispanic black, income Quintile 1 and 5, and population below poverty. As to state park accessibility by auto, all population groups show slightly lower than average accessibility except for non-Hispanic white and the two higher income quintile households. More Environmental Justice population groups, including Hispanics, non-Hispanic Asians, income Quintile 2, and the disabled population show higher than average accessibility to local parks than the average population in the region.
- In addition to elderly, non-Hispanic Native Americans and non-Hispanic other, further analysis should also focus on non-Hispanic blacks where their park accessibility by auto is below the average for all parks. However, the 2012–2035 RTP/SCS provides improvements for these population groups more than accessibility changes for the rest of the region's population groups.

(9) Gentrification and Displacement

The major land use strategy in the 2012–2035 RTP/SCS is to follow emerging demographic trends and to collaborate with local jurisdictions to redirect future growth to high quality transit areas (HQTA). According to the 2012–2035 RTP/SCS recommended land use scenario, this strategy calls for the placement of over 50 percent of future growth in households, and therefore population (782,000, or 52 percent) and employment (905,000, or 53 percent), in the HQTA.

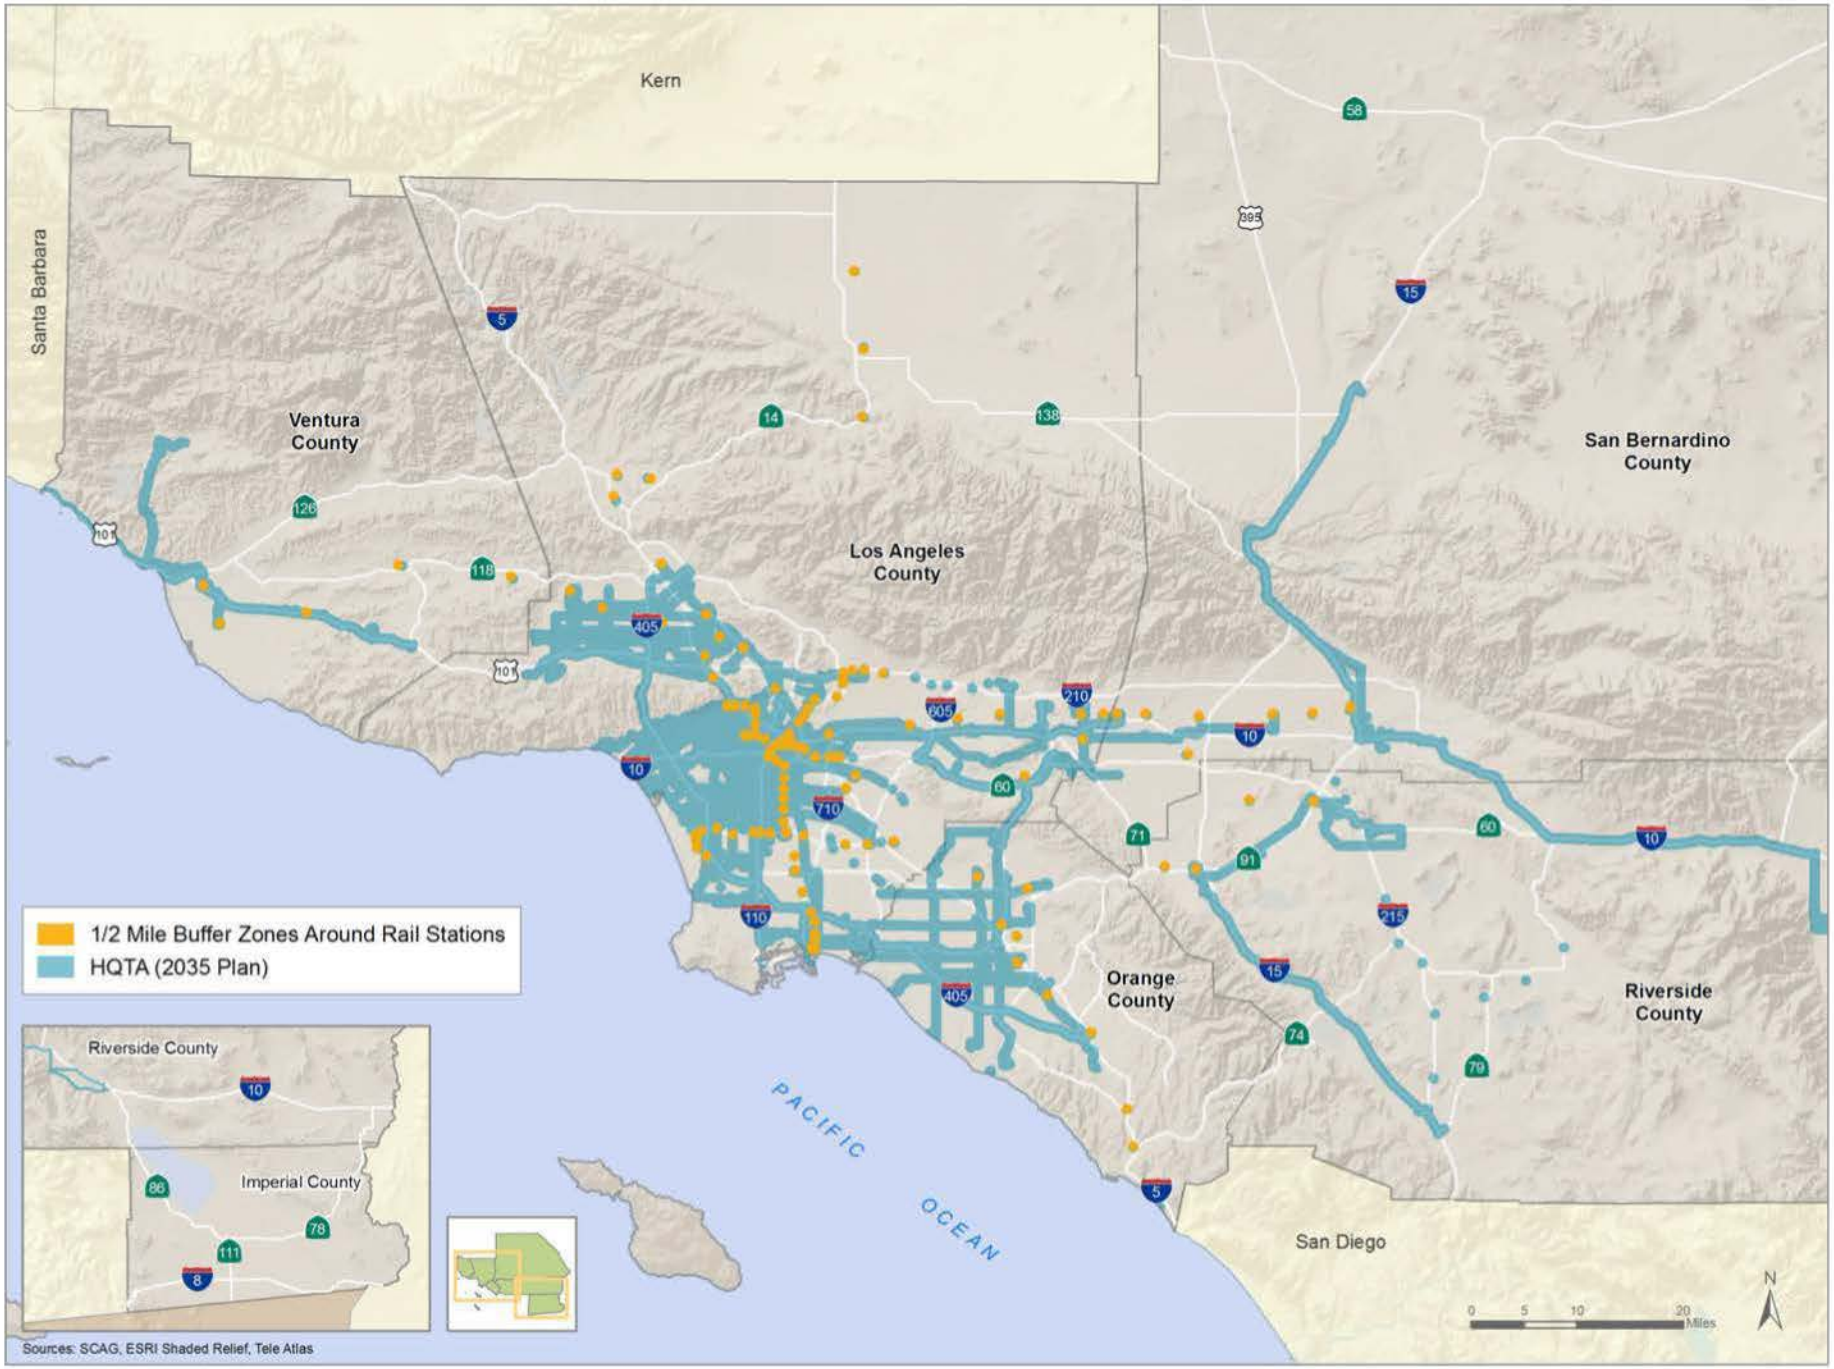
While the regional population is increasingly using transit and showing interest in living in transit-rich neighborhoods, this trend is tempered by growing gentrification and displacement concerns. Will current neighborhood residents, some of whom are low income and/or people of color, benefit from transit-induced neighborhood revitalization? Or will low-income residents be displaced by more affluent residents because new development is less affordable? Planners and policy makers have to prepare to address these outcomes if transit investment and expansion inevitably lead to gentrification and displacement.

It is important first to analyze whether gentrification and displacement are actually occurring in high quality transit areas. This analysis will follow the methodology and framework from the report, "Maintaining Diversity in America's Transit Rich Neighborhood-Tools for Equitable Neighborhood Change," by Stephanie Pollack, Barry Bluestone, and Chase Billingham, October 2010, a report prepared by the Dukakis Center for Urban and Regional Policy at Northeastern University. In this analysis, SCAG staff processed key indicators related to changes in neighborhood characteristics from the 2000 Census and from the more recent 2005– 09 American Community Survey (ACS) for the HQTA and the rest of the region to test if there exists any indications or concerns for potential or actual displacement or gentrification.

This analysis also looked into the characteristics of the population in the HQTA including by income and ethnicity and their travel behavior. This was accomplished by using data from the National Household Travel Survey (NHTS).

Staff has also developed a statistical tool based primarily on the NHTS data, to quantify potential benefits from the land use strategy recommended in the 2012–2035 RTP/SCS. The statistical tool is designed to complement the regional transportation model so that it can capture land use and the so-called "4D"(design, density, diversity, destination), and accessibility factors for a more refined growth allocation at the parcel level, as well as growth redirected into HQTA, which has been difficult for the regional model to quantify.

There have been concerns raised by environmental groups, the heath community, housing, and air quality regulation agencies about incompatible land uses, including sensitive receptors such as hospitals, senior/day care centers, and housing near freeways and busy roadway. The 2012–2035 RTP/SCS land use strategy calls for redirecting future growth into HQTA. Inevitably, part of this growth will occur in areas where the HQTA overlaps with 500 feet freeway buffer areas. According to land use statistics in the 2012–2035 RTP/SCS, 8.1 percent of new households added to HQTA from 2008 - 2035, fall within these 500 feet freeway buffer areas. Finally, staff has developed statistics to document the recent growth and socioeconomic profile within the 500 feet freeway buffer areas.



It is logical to expect increases in local traffic and congestion as a result of the additional development in HQTA. In previous RTPs, staff observed from regional modeling increases in local congestion from various compact land use scenarios. However, an initial examination of traffic delays for principal and minor arterials and major and minor collectors shows that there is no increase in net delay at the regional or county levels. Staff will investigate detailed link-based traffic outcomes from the regional 4-step transportation model to investigate local traffic conditions around the HQTA and to assess the impacts on environmental justice. This additional task may be completed before the adoption of final 2012–2035 RTP/SCS in April 2012.

HQTA: RECENT GROWTH AND CHARACTERISTICS— EVIDENCE FROM 2000 CENSUS AND 2005–09 ACS

The following research question was examined: will transit investment change the surrounding neighborhood? While patterns of neighborhood change vary, the predominant pattern is one in which housing becomes more expensive, neighborhood residents become wealthier and vehicle ownership becomes more common. In some of the newly transit rich neighborhoods, the research reveals how a new transit station can set in motion a cycle of unintended consequences in which core transit users—(e.g. renters and low income households)—are priced out in favor of higher-income, car-owning residents who are less likely to use public transit for commuting.

In order to assess whether HQTA are moving toward more transit oriented, sustainable, and livable communities, staff applied block group data processed from the 2000 Census and the 2005– 09 ACS, and calculated a set of performance indicators for both HQTA and other areas for comparison. Staff demonstrated some observed trends between the two time periods to evaluate the changes in HQTA. In addition, staff designed the research to understand impacts from different types of HQTA, specifically areas around urban and commuter rail stations versus other areas such as bus corridors. These transit oriented neighborhoods, shown in **EXHIBIT 19** and referred to in this analysis as "Transit Oriented Communities" (TOC), consist of the 1/2 mile buffer zones that surround rail transit stations. Staff also identified existing HQTA as well as those proposed in the 2012–2035 RTP/SCS. The following performance indicators were developed for five categories: (1) Growth, (2) Economies, (3) Equity, (4) Sustainability, and (5) Transportation collected data for 125 rail stations.

EXHIBIT 19 High Quality Transit Areas (HQTA)

Performance Indicator 1: Growth

TABLE 30 Growth

	Total	Non HQTA	HQTA	TOC	Rest HQTA (HQTA-TOC)
Population from 2000 Census	16,516,006	10,118,314	6,397,692	621,842	5,775,850
Population from 2005–09 ACS	17,737,412	11,227,449	6,509,963	642,379	5,867,584
Growth	7.4%	11.0%	1.8%	3.3%	1.6%
Household					
2000 Census	5,386,491	3,303,532	2,082,959	200,865	1,882,094
2005–09 ACS	5,689,831	3,576,167	2,113,664	210,620	1,903,044
Growth	5.6%	8.3%	1.5%	4.9%	1.1%

Source: SCAG staff process 2000 Census and 2005–09 ACS data

Based on the above research, the following observations can be made:

- The growth rates of population and households in HQTA (1.8 percent) was much lower than the growth rates in the whole region and in the rest of non-HQTA.
- Within HQTA, the growth rate in rail stations was much faster than in the rest of HQTA. Comparing data between 2000 Census and 2005–09 ACS data, population growth in TOC was more than twice as fast as the growth in the rest of the HQTA (3.3 percent versus 1.6 percent) , and more than four times higher than the household growth rate registered in the TOC than recorded in the rest of the non-TOC HQTA.

Comparisons in other performance indicators in sections below will focus on TOC versus the region as a whole or non-TOC areas.

Performance Indicator 2: Economies

TABLE 31 Economies

	Total	Non HQTA	HQTA	TOC	Rest HQTA (HQTA-TOC)
Workers from 2000 Census	6,810,823	4,297,437	2,513,386	227,563	2,285,823
Workers from 2005–09 ACS	8,082,681	5,070,136	3,012,545	286,368	2,726,177
Growth	18.7%	18.0%	19.9%	25.8%	19.3%
Jobs					
2000 Census	6,661,287	3,343,874	3,317,413	1,104,873	2,212,540
2005–09 ACS	7,193,159	3,664,853	3,528,306	1,173,754	2,354,552
Growth	8.0%	9.6%	6.4%	6.2%	6.4%
Median Household Income					
2000 Census	$50,855	$57,046	$41,037	$33,024	$41,892
2005–09 ACS	$49,022	$54,462	$39,818	$33,267	$40,543
Growth	-3.60%	-4.50%	-3.00%	0.70%	-3.20%

Source: SCAG staff process 2000 Census and 2005–09 ACS data

The above table illustrates the following trends:

- Median household income in the TOC areas is less than the income in non-TOC areas, however, the median household income was almost unchanged between 2000 and 2005–09 period. In contrast, all other places experienced declines of between 3 percent to 4.5 percent in median household income.
- The statistics show higher growth in the number of workers in TOC areas, however, slower growth in jobs than those in the non-TOC areas.

Performance Indicator 3: Equity & Ethnicity

- There is no dominant difference in age distribution between TOC areas and the SCAG region, and between the two time periods.
- The share of Hispanic population is about 13 percentage points higher in the TOC areas than in the SCAG region.

TABLE 32 Equity & Ethnicity

SCAG			TOC		
% Age	2000	2005–09	% Age	2000	2005–09
<5	7.8%	7.6%	<5	8.5%	7.6%
5-15	17.8%	16.3%	5-15	17.6%	15.4%
16-64	64.4%	65.8%	16-64	65.0%	67.6%
>65	9.9%	10.4%	>65	8.9%	9.4%
All	100.0%	100.0%	All	100.0%	100.0%
% Hispanic	40.6%	44.2%	% Hispanic	54.0%	56.6%

Performance Indicator 4: Sustainability

Based on an analysis of sustainability, the following observations can be made about households without a vehicle in transit oriented communities versus the rest of the region.

- In 2000, nearly a quarter of households in the TOC areas don't own automobiles compared with about 10 percent zero-vehicle households for the region as a whole.
- The percent of zero-vehicle households declined significantly region-wide between 2000 and 2005–09 ACS. As indicated in the figure households without vehicles dropped by almost 7 percentage points compared with a 3 percentage point decline in the region. As a result, the average number of household vehicles increased by 13 percent in the TOC areas and by just 8 percent for the whole region.

TABLE 33 Sustainability

SCAG			TOC		
# of Vehicles	2000	2005–09	# of Vehicles	2000	2005–09
0	10%	7%	0	25%	18%
1	35%	32%	1	40%	40%
2	37%	37%	2	25%	29%
3+	18%	23%	3+	11%	14%
Vehicle/ Household	1.63	1.76	Vehicle/ Household	1.22	1.38

Performance Indicator 5: Transportation

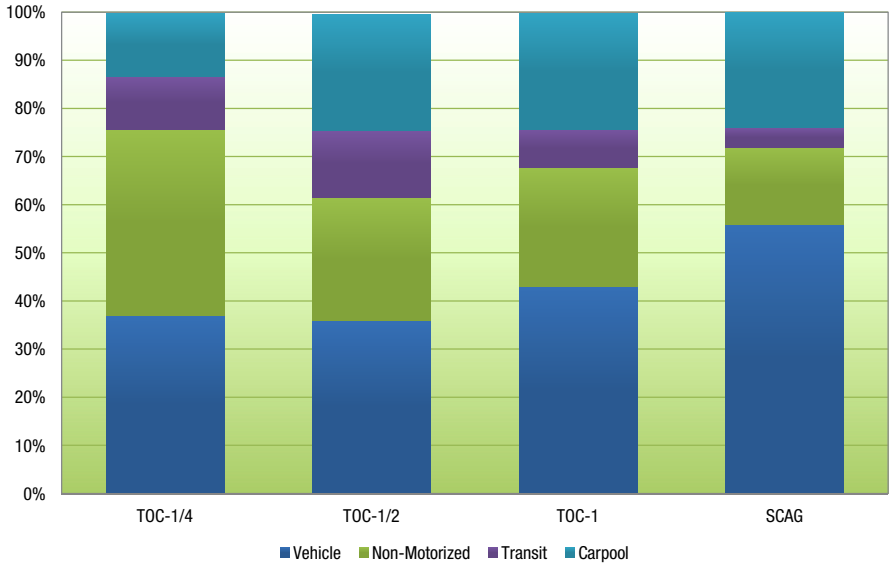
Transportation indicators for the TOC areas are derived from the NHTS data. With about 6,700 households and 15,000 individual samples, the 2009 NHTA dataset provides valuable and sufficient observations to analyze both demographic and travel characteristics of the SCAG region and the TOC areas. In order to understand the demographic/travel characteristics of the TOC areas in detail, staff analyzed the NHTS household dataset with ¼, ½, and 1 mile buffer zones for the 125 rail stations around the region. The following subsection summarizes the socioeconomics of TOC areas.

1. TOC HOUSEHOLD CHARACTERISTICS

- Smaller household size in TOC areas
- Higher percentage of 1-person households and households without children
- More households with workers than in the region as a whole

TABLE 34 TOC Household Characteristics

	Household Size	% 1 person	% No Kids	% 1 Person HH, Retired	% 2 Person + HH, Retired	% HH with Workers
TOC-¼	2.28	44.6	46.4	19.6	7.1	59%
TOC-½	2.60	35.6	38.3	16.3	13.6	52%
TOC-1	2.80	28.4	34.8	13.4	17.0	49%
SCAG	2.82	22.3	30.2	12.0	24.4	49%



2. TOC TRAVEL CHARACTERISTICS

- Households in TOC areas show less driving than the region as a whole.
- The statistics indicate that the travel behaviors proportionally shift (increase) as distance from the TOC increase.
- People in TOC areas use more non-motorized transportation and transit, and less auto as their transportation mode.

TABLE 35 TOC Travel Characteristics

	Trips	Trip Distance	# of Vehicle Trips	VMT
TOC-¼	5.5	26.0	2.0	16.6
TOC-½	7.3	34.9	2.6	16.8
TOC-1	7.9	42.7	3.4	23.7
SCAG	8.5	57.5	4.7	35.9

FIGURE 33 Mode Shares: TOC vs. SCAG Region

- 3. TOC Travel Characteristics: Hispanic vs. Non-Hispanic Compared with Non-Hispanic households, Hispanic households have larger household size and lower household income
- Compared to the SCAG region, both Hispanic and Non-Hispanic in the TOC areas showed similar travel patterns: fewer total trips, less auto use, and less VMT

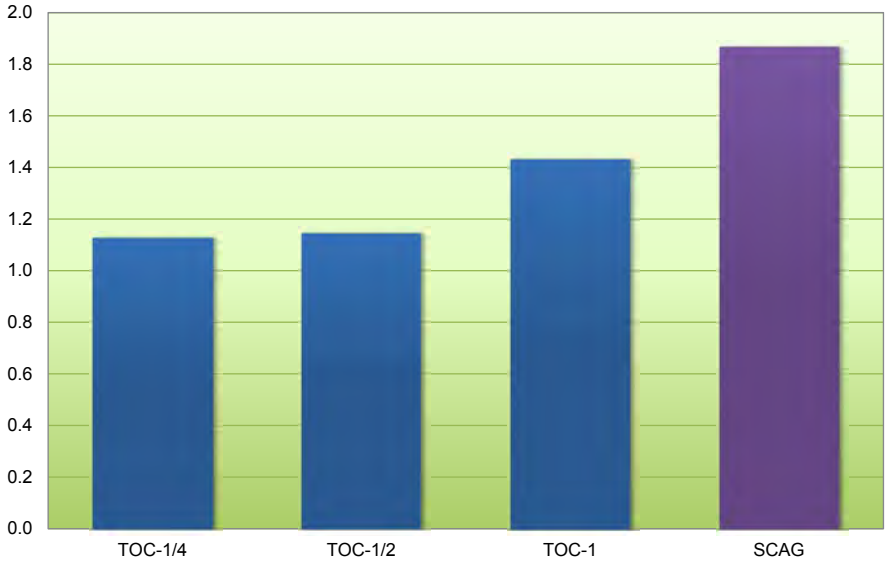
TABLE 36 TOC Travel Characteristics: Hispanic vs. Non-Hispanic

	% Household		Household Size		Household Income		Trips		VMT	
	Hispanic	Non-Hispanic	Hispanic	Non-Hispanic	Hispanic	Non-Hispanic	Hispanic	Non-Hispanic	Hispanic	Non-Hispanic
TOC-¼	54%	46%	2.75	1.73	$17,040	$36,370	5.1	5.8	10.7	23.7
TOC-½	58%	42%	3.07	1.95	$18,070	$35,100	6.3	8.0	14.0	20.5
TOC-1	50%	50%	3.42	2.18	$21,400	$39,630	6.9	8.8	19.2	28.2
SCAG	35%	65%	3.59	2.41	$28,880	$49,060	7.9	9.6	30.5	38.8

4. AUTO OWNERSHIP

- Compared with the SCAG region, the households in TOC areas own fewer vehicles. About 20 percent of the TOC households don't own a car, twice that of the SCAG region.

FIGURE 34 Transportation - Auto Ownership - Average Household Vehicles



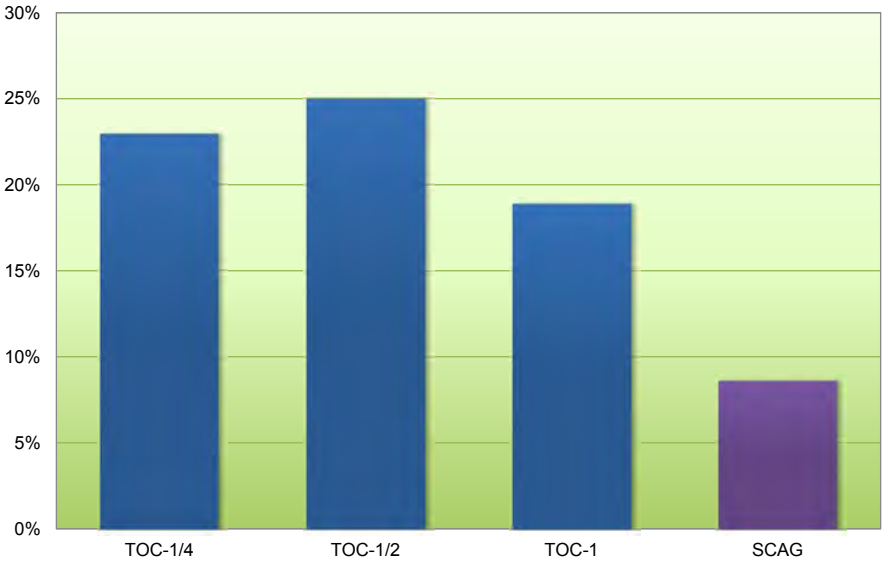


FIGURE 35 Transportation – Auto Ownership – Percent of Households without a Car

5. COMMUTING DISTANCE BY VEHICLE

The analysis of commuting distance by vehicle shows the following:

- Total commuting distance is much shorter for workers in TOC areas than for workers in the rest of the region
- Regionwide, 86 percent of total commuting distance is completed by automobiles, compared with just 30 percent of total commuting distance for workers in TOC areas by autos.

TABLE 37 Transportation – Commuting Distance by Vehicle

	Vehicles	Total	VMT/Total Distance
TOC-¼	4.1	13.6	30%
TOC-½	9.7	19.2	51%
TOC-1	16.5	21.5	77%
SCAG	19.2	22.4	86%

6. COMMUTING DISTANCE AND TIME

The following observations can be made about commuting distance and time:

- Workers in TOC areas commute a much shorter distance but spend about the same time in commuting.

FIGURE 36 Transportation – Commuting Distance and Time

EVIDENCE OF GENTRIFICATION/DISPLACEMENT IN HQTA/TOC AREAS

Based on a review of relevant literature, seven indicators (see table below) were selected to assess early signs of displacement or gentrification through growth in the HQTA or TOC areas. These indicators include:

- Percent of minority population
- Poverty rate
- Share of 65+ population
- Percent of households without car
- Percent of non-English speaking
- Population without a high school diploma
- Percent of renters

As indicated in the table that follows, directional and magnitude changes in several indicators include:

- Poverty rates decline more in the HQTA/TOC areas than in the rest of the region. This may be the result of low income people moving out of these areas (gentrification/displacements) or higher income people moving in.
- Households without cars decline significantly and more in HQTA/TOC areas than in the rest of the region. This could be due to either low income people moving out, or more affluent people moving in or the combination of the two.
- The Non-English speaking population is normally associated with immigrants, low income households, or transit dependent peoples. Similarly, the percent of the adult population without a high school diploma is also overlapping with the demographic and transportation characteristics observed from the population in HQTA or TOC areas. Thus, the declines in the share of non-English speaking households and/or people without high school diplomas are signals either of the disappearance of that population or a significant increase in more affluent populations.

TABLE 38 Gentrification/Displacement Related Indicators

2000 Census	Total	Non HQTA	Whole HQTA	TOC	Rest HQTA (HQTA-TOC)	p-value

As shown above, trends observed in key indicators showing evidence of displacement and gentrification from the 2000 Census and 2005-09 ACS in areas of Transit Oriented Development (TODs) are inconclusive. SCAG recognizes the risk that transit investment could stimulate undesirable neighborhood change and is substantial enough that it needs to be managed when transit investments or improvements are being planned. Thus, SCAG will continue to use the methodology and framework in this report to monitor the trends of those indicators in the HQTA and TOC areas. The 2012–2035 RTP/SCS Environmental Justice report also presents a toolkit of policy options for shaping equitable neighborhood change in HQTA and TOC areas. These tools are increasingly available and in use across the country.

DEVELOP AN ENHANCED SCAG LOCAL SUSTAINABILITY PLANNING TOOL[1]

Based on the "4D" principles (density, destination, accessibility, diversity, etc.), SCAG has developed a Local Sustainability Planning Tool (LSPT) which was used for an extensive 2012–2035 RTP/SCS outreach process to help local jurisdictions to explore various land use scenarios. As part of an enhancement to the LSPT, SCAG developed a module from National Household Travel Survey (NHTS) data to analyze land use strategies and capture additional VMT reduction benefits for the 2012–2035 RTP/SCS. The new module provides key inputs to the LSPT such as the VMT and GHG impacts of land use variations. The enhanced LSPT also complements the Regional Travel Demand Model so that it can capture land use and the so-called "4D" factors for a more refined growth allocation at the parcel level, as well as growth redirected into HQTAs. Lastly, the LSPT can help monitor socioeconomic data and travel behavior at the parcel level, addressing some environmental justice concerns.

(10) Environmental Impact Analyses (Air, Health, Noise)

HISTORICAL AIR QUALITY AND HEALTH IMPACTS

Exposure to air pollutants is an environmental justice issue due to the disproportionate share of minority and low-income populations living in close proximity to heavily traveled corridors, particularly near port and logistics activity. This exposure to unhealthy air results in 5,000 premature deaths and 140,000 children with asthma and respiratory symptoms. More than half of Americans exposed to $PM_{2.5}$ pollution, exceeding the national standard, reside in the SCAG region.[2]

New to the Title VI and Environmental Justice analysis for the 2012–2035 RTP/SCS, SCAG has mapped exposure to ozone, concentration of particulate matter emissions, cancer risks, and respiratory hazard risks. In order to assess the impact of emissions on various demographic groups throughout the region, emissions information was summarized and presented to the Environmental Justice communities.

Air pollution comes from many different sources and can be classified into two types: ozone pollution and particulate matter. Ozone pollution takes a gaseous form and is generated as vapor emitted from fuel commonly used in vehicles, industrial processes, etc. Ozone is formed by the reaction between volatile organic compounds (VOC) and oxides of nitrogen (NO_X) in the presence of sunlight. Ozone negatively impacts the respiratory system. Particulate matter (PM_{10} and $PM_{2.5}$) are very fine particles made up of materials such as soot, ash, chemicals, metals, and fuel exhaust that are released into the atmosphere. Particulate pollution has been linked to significant health problems, including aggravated asthma, increases in adverse respiratory problems, chronic bronchitis, decreased lung function, and premature death. **EXHIBIT 20** shows the average daily ozone exposure that is in excess of the national 8 hour standard (0.075 parts per million [ppm]) in the SCAG Region for years 2004–06. Although the region as a whole largely experiences average daily ozone exposure exceeding the federal standard, the highest concentration of ozone exposure can be seen mostly in southwest San Bernardino and northwest Riverside counties, and also in north Los Angeles County. **EXHIBIT 21** shows the same emissions factor for years 2007–09. In comparing these figures, it can be seen that average daily ozone exposure has decreased in most areas across the region between these two study periods. Indeed, the regional average declined from 0.18 ppm to 0.14 ppm (22 percent) during this time. The geographic distribution of ozone exposure, however, largely remained the same with the highest concentrations still prevalent in north Los Angeles County and western San Bernardino and Riverside counties.

[1] For a detailed description and technical report on the development of the NHTS Module, please see the Performance Measure Appendix and its sub-appendix, which includes the full technical report.

[2] California Air Resources Board, South Coast Air Quality Management District, and Southern California Association of Governments. Powering the Future. August 2011.

EXHIBIT 22 displays the number of days that exceeded the federal 8 hour standard of ozone exposure in the SCAG region for the period of 2004–06. The areas with the lowest number of days are in south Los Angeles County, south Ventura County, east San Bernardino County, and east Imperial County. The areas that have the highest number of days that exceed the federal ozone exposure standard are north Ventura County, west San Bernardino County (including the high and low desert areas), west Riverside County (including parts of the Coachella Valley), and west Imperial County. **EXHIBIT 23** shows the same data element for years 2007–09. When these maps are compared side-by-side, it can be seen that the intensification of this factor has decreased over time, but the geographic distribution has remained quite similar.

Along with information on ozone emissions, SCAG was able to obtain data from the California Air Resources Board (ARB) showing particulate matter pollution throughout the region for years 2004–06 and 2007–09. **EXHIBIT 24** shows the average annual exposure to particulate matter smaller than 2.5 micrometers ($PM_{2.5}$) for years 2004–06. South Los Angeles County, northeast Orange County, southwest San Bernardino County, and northwest Riverside County experienced the highest average annual exposure to $PM_{2.5}$, with average rates ranging from 14.6 to 21.4 micrograms of $PM_{2.5}$ per cubic meter of air (ug/m3). Other high exposure areas include north Los Angeles County, east Ventura County (along the US 101 corridor), central Orange County, central Riverside County (Coachella Valley), and central Imperial County (Imperial Valley basin). Also included in this group are the areas in San Bernardino and Riverside County that are directly outside of the highest intensity areas identified previously that fall between the SR 74, I-15, and I-215 corridors. **EXHIBIT 25** shows this same data element for years 2007–09. As is seen in this figure, the average annual concentration of $PM_{2.5}$ decreased in both numbers and geographic intensity from 2004–06 to 2007–09. The communities with the highest intensity of average annual $PM_{2.5}$ are shown to be somewhat constrained within the areas between I-210 and SR-91 in the north and the south and the I-405 and I-215 in the east and the west, whereas before the highest intensity areas went far beyond these markers. Indeed, average annual $PM_{2.5}$ emissions decreased during this period from 14.76 ug/m3 in 2004–06 to 12.91 ug/m3 in 2007–09.

The impact of ozone and particulate emissions on health can be seen in the instances of cancer or poor respiratory health in a designated geographic area. The rate of cancer risk per one million people as a result of emissions in the SCAG region is displayed in **EXHIBIT 26**. This dataset was determined by considering a number of indicators detailing cumulative impacts and vulnerability at the census tract level in the SCAG region. These indicators include: "(a) proximity to air pollution hazards and land uses that are either associated with high levels of air pollution or [areas that are] 'host' [to] sensitive populations...; (b) exposure and health risk measures associated with specific air pollutants and pollutant types; and (c) measures of social and health vulnerability that have been identified from epidemiological literature on social determinants of health as well as EJ literature on the determinants of siting and emissions."[3] As is seen in this exhibit, the highest instance of cancer risk is exhibited in the area in and around Downtown Los Angeles, along the I-10 and SR-60 highways in San Bernardino County, at the SR-91/I-15, SR91/I-215 intersections in Riverside County, and at the SR-57/SR-22 intersection in Orange County. Generally speaking, the other areas that have high instances of cancer risk in the SCAG Region are south Ventura County, south and central Los Angeles County, southwest San Bernardino County, northwest Riverside County, and all of Orange County.

In addition to cancer risk, respiratory risk is also an indicator of emissions impact on public health. **EXHIBIT 27** shows respiratory risk for the year 2005 in the SCAG Region. This dataset was developed by the United States Environmental Protection Agency (EPA) and measures the risk for non-cancer respiratory conditions over a lifetime based on available emissions data. If the hazard index is equal to or less than 1.0, no adverse health effects are anticipated. A hazard index that is greater than 1.0 indicates that there may be a greater risk of respiratory conditions due to exposure from air pollutants. The highest areas of respiratory risk are the segments that closely follow major freeways in the most urbanized portions of the region, with the areas surrounding Downtown Los Angeles showing the highest geographic concentration of respiratory risk in the region. Respiratory risk is also present in the urbanized portions of south Ventura County, south and central Los Angeles County, southeast San Bernardino County, northwest Riverside County, Orange County, and central Imperial County.

Existing Air Quality Impacts on Environmental Justice Populations at the Regional Level

In order to assess the impacts of air quality on various demographic groups throughout the region, air quality information was summarized and presented to the Environmental Justice communities. **TABLE 39** and **FIGURES 37–41** show the results of this analysis. For years 2004–06, the average days exceeding federal ozone standards are shown. Most demographic groups fall below the regional average, except for the elderly population which exceeds the regional total at 18.09. This trend holds true for average daily ozone exposure as well, where the elderly population had average daily ozone exposure identical to the regional average. The opposite, however, is true for average annual $PM_{2.5}$ exposure. All groups except for the elderly population are in excess of the regional average, with minority populations having the highest average annual $PM_{2.5}$ exposure at 16.19 ug/m3. This pattern also appears with cancer risk and respiratory risk. All groups except for the elderly population exceed the regional average, with the Foreign Born population having the highest cancer risk at 635.23 per million people and Non-English Speakers having the highest respiratory risk at 5.77. For the years 2007–09 as compared with figures from 2004-06, there are reductions across the board for ozone and particulate emissions at both the regional level and for each demographic group. In terms of ozone emissions, all demographic groups are at or below the regional average for both average day exceeding federal ozone standards and average daily ozone exposure in excess of national standards. This, however, cannot be said for $PM_{2.5}$ emissions, where each demographic group except the elderly population is in excess of the regional average for average annual $PM_{2.5}$ exposure, with Foreign Born and Non-English Speakers each having 13.74 ug/m3. This trend again appears for cancer risk and respiratory risk, with each group exceeding the regional average except for the elderly population. Non-English Speakers have both the highest cancer and respiratory risk, with cancer risk at 612.15 per million people and 5.62 for respiratory risk.

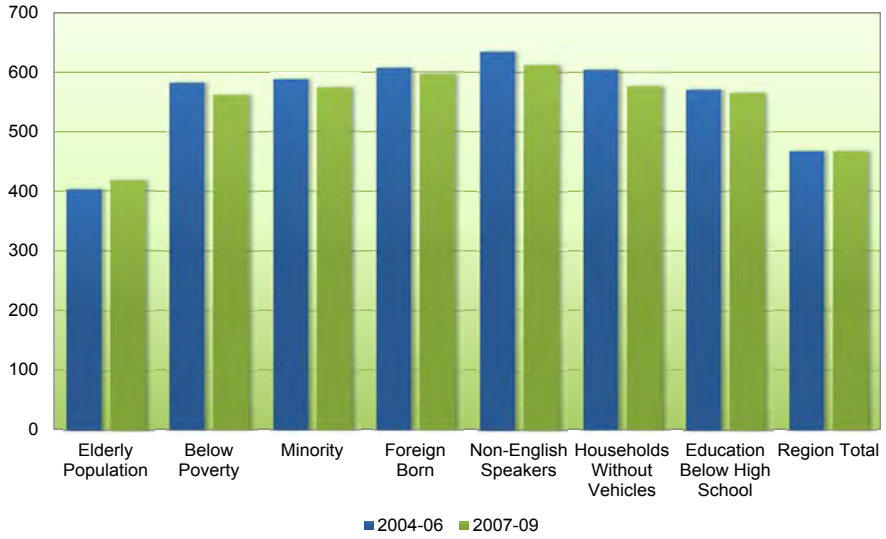

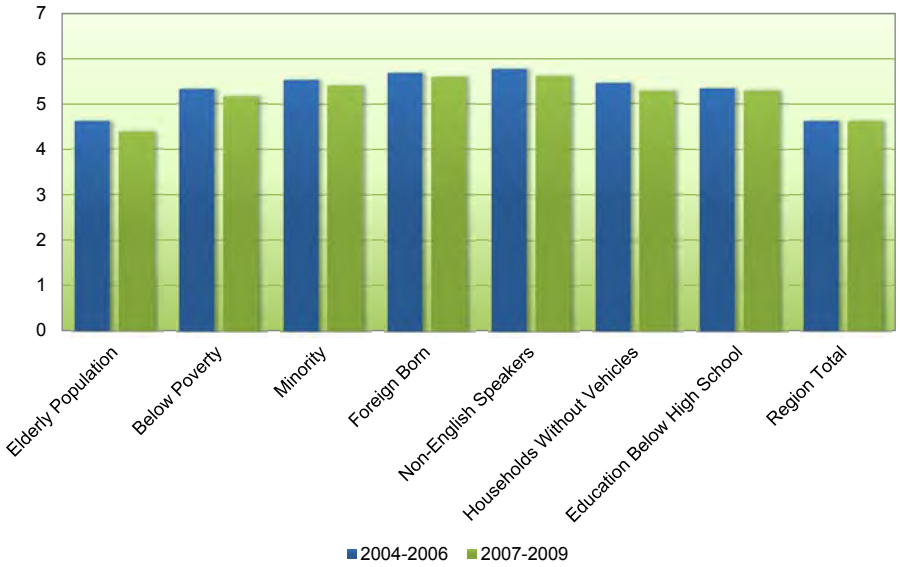

FIGURE 41 Respiratory Hazard Risk Per Individual (2005)

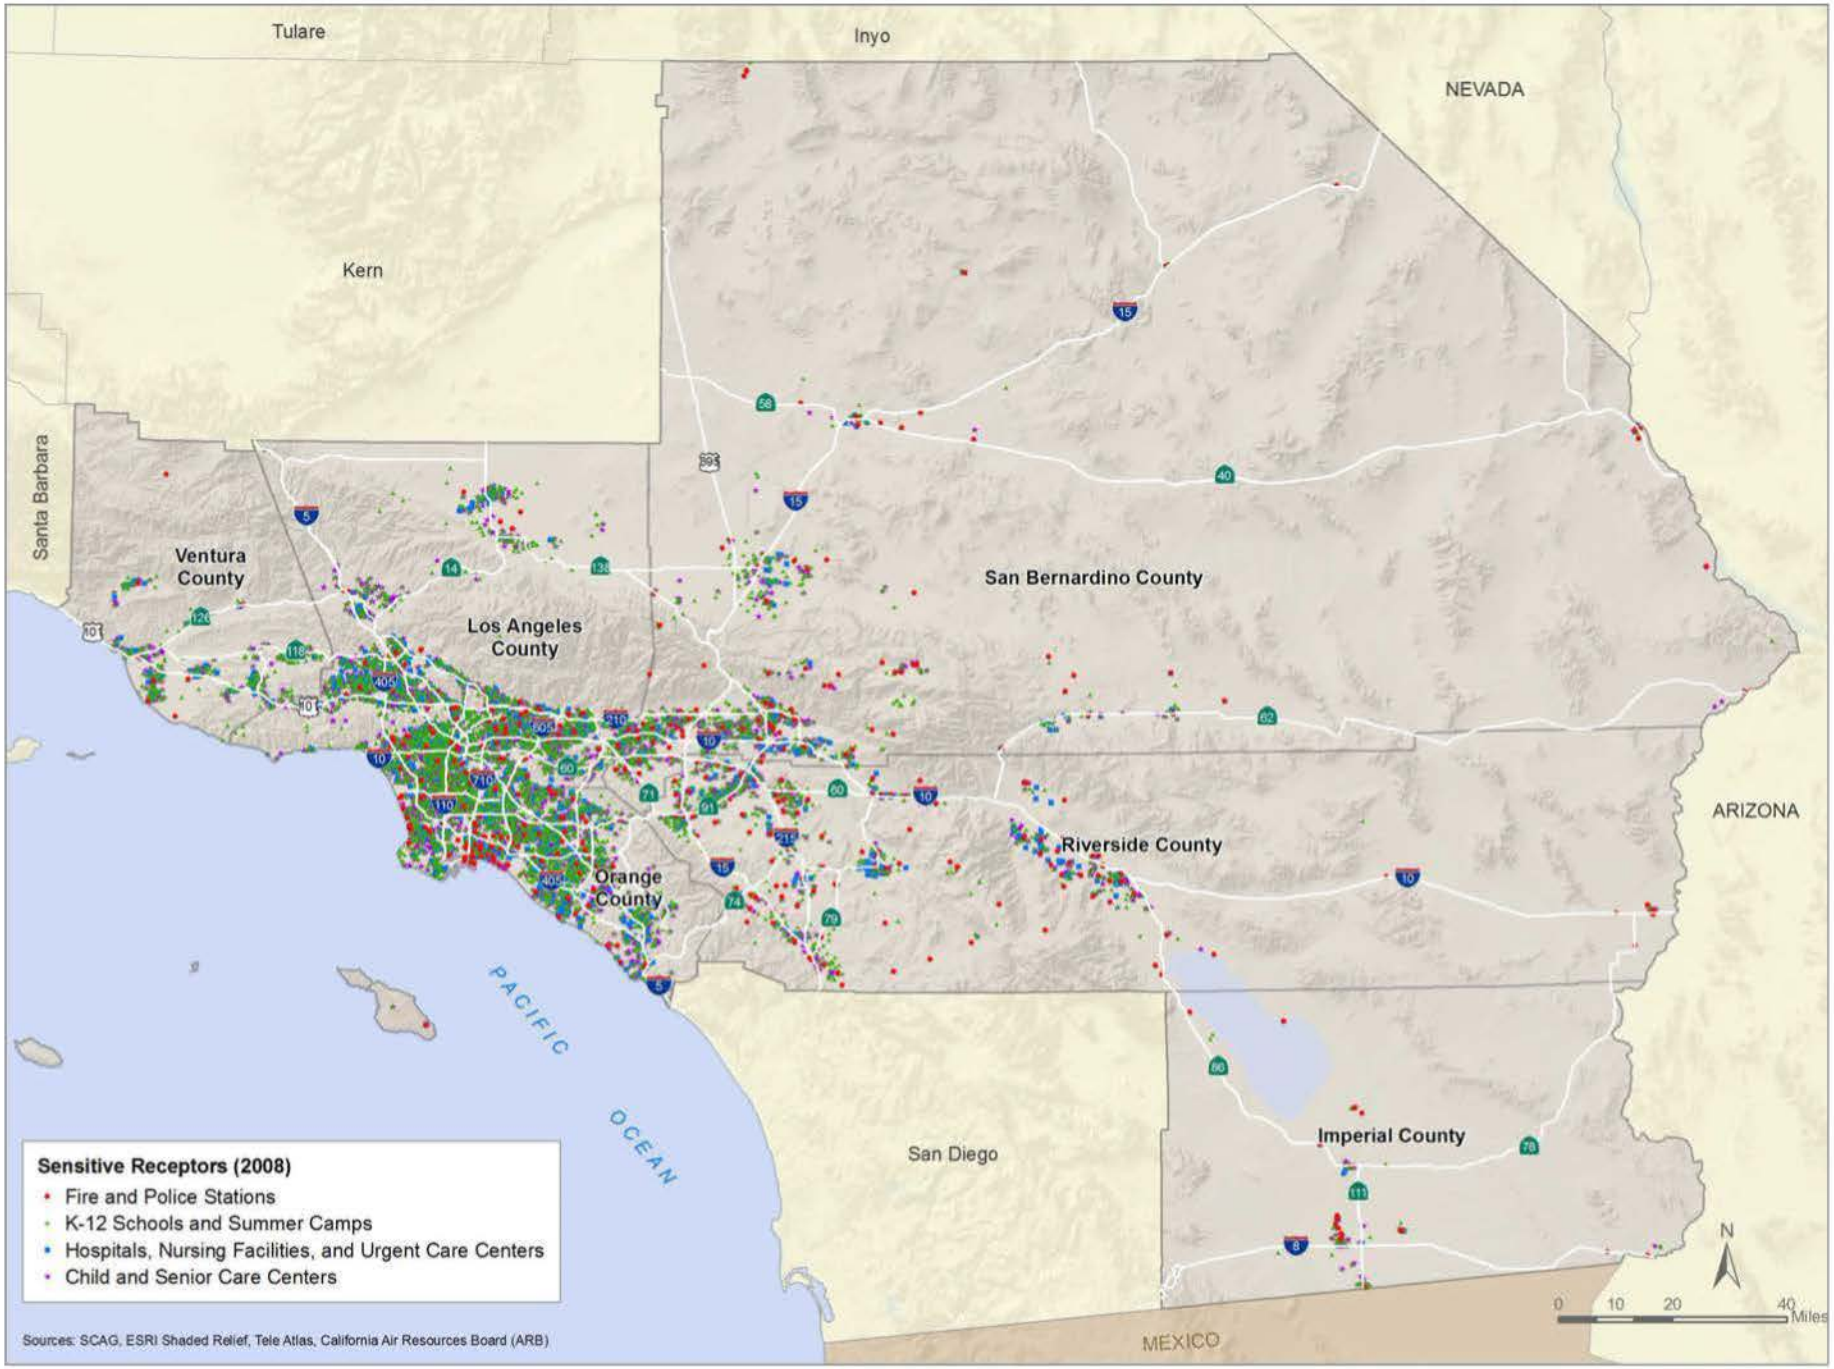

In addition to historical information on regional demographics, it is also important to note the intensity and location of sensitive receptors in the SCAG Region. A sensitive receptor is a person in the population who is particularly susceptible to health effects due to exposure to an air contaminant. The following are land uses (sensitive sites) where sensitive receptors are typically located:[4]

- Schools, playgrounds and childcare centers
- Long-term health care facilities
- Rehabilitation centers
- Convalescent centers
- Hospitals
- Retirement homes
- Residences

EXHIBIT 28 shows fire stations, police stations, k-12 schools, summer camps, hospitals, nursing facilities, urgent care centers, child care centers, and senior care centers in the SCAG region. The concentration of sensitive receptors is highest in south Los Angeles County, north Orange County, southwest San Bernardino County, and northwest Riverside County. The distribution of these facilities highly correlates with $PM_{2.5}$ emissions in the SCAG Region, which suggests that there may be health impacts to these sensitive populations.

EXHIBIT 28 Sensitive Receptors in 2008

Air Quality Impacts along Freeways and Highly Traveled Corridors

METHODOLOGY

The concentration of air pollutants along heavily traveled corridors, particularly PM_{10} and $PM_{2.5}$, is a major concern in Southern California. SCAG identified major corridors defined as urban roads with 100,000 average daily trips and rural roads with 50,000 daily trips. Next, SCAG overlaid the income, race and ethnic composition of those households within 500 feet of the corridor. This analysis allows SCAG to better understand the impacted populations and allow for greater outreach to those communities of concern.

RESULTS

The following table illustrates the population and household growth within the areas adjacent to heavily traveled corridors compared to the entire region. The table is further refined by county and 2000 census and 2005/09 ACS data. The table shows that the total number of residents and households within 500 feet of a heavily traveled corridor increased from approximately 1.08 million people in 2000 to 1.14 million people in 2005–09, an increase of 5.7 percent. Within the SCAG region as a whole, the population increased at a higher rate of 7.4 percent.

TABLE 40 Environmental Impacts along Freeways and Highly Traveled Corridors

Freeway Buffer	2000		2005–09		2000 – 2005–09	
County	Population	Households	Population	Households	Pop %	HH %
Imperial	2,663	793	2,899	895	8.9%	12.9%
Los Angeles	673,278	211,736	690,688	216,760	2.6%	2.4%
Orange	193,860	63,628	204,734	66,862	5.6%	5.1%
Riverside	74,415	26,089	94,625	32,341	27.2%	24.0%
San Bernardino	92,315	27,986	104,014	30,505	12.7%	9.0%

SCAG Region	1,077,209	344,658	1,139,089	362,280	5.7%	5.1%
SCAG Region	**2000**		**2005–09**		**2000 – 2005–09**	
County	Population	Households	Population	Households	Pop %	HH %
Imperial	142,361	39,384	160,034	46,405	12.4%	17.8%
Los Angeles	9,519,338	3,133,774	9,785,295	3,178,266	2.8%	1.4%
Orange	2,846,289	935,287	2,976,831	974,001	4.6%	4.1%
Riverside	1,545,387	506,218	2,036,304	645,185	31.8%	27.5%
San Bernardino	1,709,434	528,594	1,986,635	588,796	16.2%	11.4%
Ventura	753,197	243,234	792,313	257,178	5.2%	5.7%
SCAG Region	16,516,006	5,386,491	17,737,412	5,689,831	7.4%	5.6%

The following table, **TABLE 41**, shows that 263,323 acres of the SCAG region are within 500 feet of a heavily traveled corridor. This acreage represents 1 percent of the total area within the SCAG region.

TABLE 41 Acreage Within 500 Feet of a Heavily Traveled Corridor by County

County	Total Acres	Acres within 500 Feet of a Heavily Traveled Corridor	Percent
Imperial	2,867,801	14,062	0.5%
Los Angeles	2,616,307	74,953	2.9%
Orange	511,120	26,279	5.1%
Riverside	4,672,082	42,421	0.9%
San Bernardino	12,861,065	66,175	0.5%
Ventura	1,188,842	12,433	1.0%
SCAG Region	**24,717,217**	**236,323**	**1.0%**

The following table, **TABLE 42**, shows the distribution of Environmental Justice communities residing within 500 feet of a heavily traveled corridor. Low-income groups comprise 7 percent of the population living within 500 feet of a heavily traveled corridor, while 7.1 percent of minorities reside in these areas. This is higher than the regional level, which shows that 5.7 percent of the region's population lives within 500 feet of a heavily traveled corridor.

Environmental Impacts of Plan and Baseline Scenarios

Transportation projects can have both positive or negative impacts on the environment. On the one hand, investments can cause travelers to shift to less polluting modes (e.g. bus, train, carpooling, or commuter rail). On the other hand, investments that increase traffic on a particular facility usually degrade air quality in the immediate vicinity of that facility.[5] In order to evaluate the environmental impacts of the 2012–2035 RTP/SCS, the environmental justice analysis addressed air pollutant emissions and noise generated from aviation, highway, and freight rail activities.

SCAG's air pollutant emissions analysis is based on emission estimates for pollutants that have localized health effects: carbon monoxide (CO) and particulate matter (PM). Analysis is also conducted for PM exhaust emissions from heavy-duty vehicles: an indicator of diesel toxic air contaminants. The results are computed based on the average emissions at the TAZ level.

Transportation is a major source of noise. Some typical principal noise generators within the SCAG region are associated with airports, freeways, railroads, and arterial roadways. Intrusive noise can cause stress and degrade the quality of life for people in affected areas. In extreme cases, intrusive noise can pose a threat to hearing. New transportation facilities or other system changes that increase traffic levels will generally increase noise levels near the facility. Investments in sound walls or new pavement can help to mitigate vehicle noise.[6]

Sound is measured on a non-linear scale in units of decibels. An adjusted scale, using A-weighted decibels [dB (A)], emphasizes those sound frequencies that are audible to humans. On this scale, a 10 dB (A) increase is perceived as a doubling of sound. Sound above 65 dB (A) is considered annoying and sound above 125 dB (A) is painful. Noise generated from the transportation system generally falls above the annoyance level, but below that which is painful.[7]

SCAG's analysis of noise for the 2012–2035 RTP/SCS considers three sources: aviation noise (from aircraft at the region's airports), railroad noise, and highway noise. While insufficient data was available to analyze noise from freight and passenger trains, this analysis will attempt to identify rail segments based on train activities and other indicators that may post more significant noise and air pollution impacts than other places. Because of the differences in the data sources, and varying standards used to regulate the different sources, SCAG's analysis takes a different approach for aviation noise than for highway noise and train noise. Given the metrics used for the noise analyses, it is not appropriate to combine the data to estimate aggregate noise impacts of the Plan.[8]

METHODOLOGY

Since ambient pollutant concentration levels are directly linked to localized emissions and can not be easily estimated, the geographic emissions distribution analysis presented here focuses on pollutants that tend to have localized effects which are generally proportionate to emissions—carbon monoxide (CO)and fine particulate matter (PM_{10} and $PM_{2.5}$). The analysis does not cover pollutants that do not have localized effects proportionate to emissions, but are regionally distributed as a result of chemical interactions, photochemical reactions and meteorology (VOC, NO_X, and SO_X).

RESULTS

EXHIBITS 29 and **30** display the difference in CO and PM emissions between the Baseline and Plan scenarios (Baseline minus Plan) in 2035. As mentioned previously, data and analysis included in this Appendix does not account for Plan improvements in vehicle technology particularly for truck only corridors. These corridors in the Plan are exclusively for zero and/or near-zero emission vehicles. Furthermore, the Program Environmental Impact Report (PEIR) accompanying the RTP/SCS includes mitigation measures that would reduce impacts associated with health risk within 500 feet of freeways and high-traffic volume roadways to less than significant. Analysis included in this Appendix also does not account for emissions improvements through the implementation of these mitigation measures. As such, emissions and exposure analysis shown in this Appendix is abundantly conservative and demonstrates worst-case scenario outcomes. If these emissions improvements had been accounted for, we believe the analysis would show little or no areas with worsened emissions ("hot spots") associated with the Plan. Moreover, the currently available data on emissions and on the distribution of households

8 Ibid

and population is imprecise such that the overlay with emissions and EJ populations will tend to overstate any potential impacts. Nevertheless, given on-going concerns and evolving information on health impacts, SCAG encourages project sponsors to be cognizant of any potential health risks in project design and delivery. Consistent with the mitigation identified and to be implemented as part of the proposed final PEIR, SCAG will assist in disseminating information and identifying effective strategies to reduce risk at the project level.

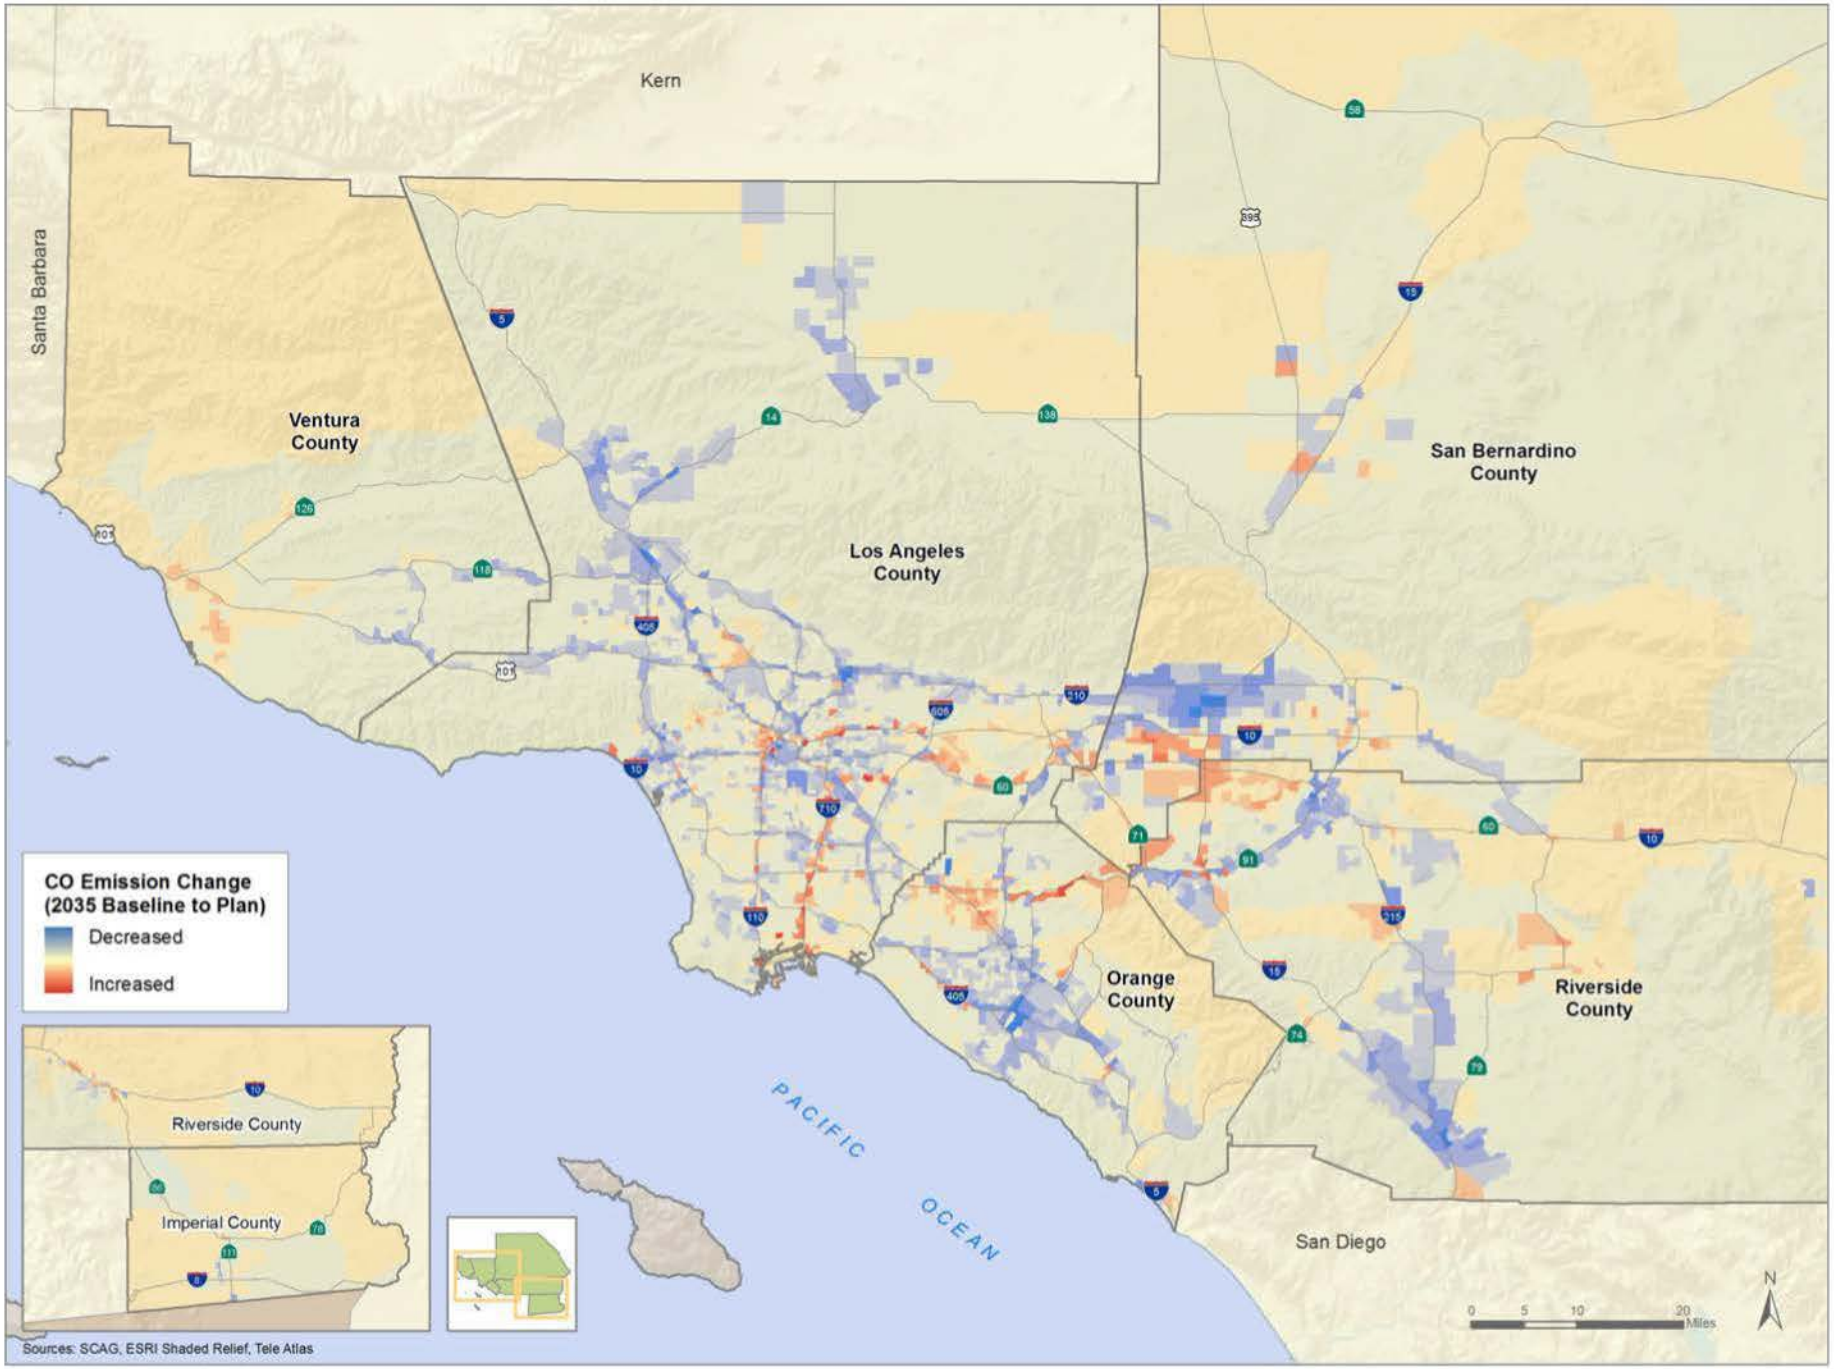

EXHIBIT 30 PM Emission Change (2035 Baseline to Plan)

GROWTH AND SOCIOECONOMIC CHARACTERISTICS IN AREAS ADJACENT TO FREEWAYS

As discussed earlier, recently there have been concerns raised by environmental groups, the health community, housing groups and air quality regulation agencies about incompatible land uses, including sensitive receptors such as hospitals, senior/day care centers, and housing near freeway and busy roadways. The 2012–2035 RTP/SCS land use strategy calls for redirecting future growth into HQTA. As a result, part of this growth will occur in areas where HQTA is overlapping within 500 feet freeway buffer areas. The table below provides statistics of growth allocation among geographic areas of high quality transit areas (HQTA), Freeway 500 feet buffer areas (here called freeway adjacent areas), and overlapping areas of HQTA & FWYB for the 2012–2035 RTP/SCS.

EXHIBIT 31 High Quality Transit Areas (HQTA) and 500 Feet Freeway Buffer

Socioeconomic Profile in the 500 Feet Freeway Adjacent Areas

As indicated in the table, freeway adjacent areas account for just 1 percent of the SCAG land area but accommodate 5.8 percent of regional households and less than 10 percent of total SCAG region jobs. There are disproportionately higher concentrations of Environmental Justice communities in the freeway adjacent areas both currently and in our 2035 projection. The following figure presents a comparison of the Environmental Justice communities' distribution in the freeway adjacent areas with those in the SCAG region.

All Environmental Justice communities are present in a higher concentration in the freeway adjacent areas than the regional average, except for the following: percent of Non-Hispanic Black, Non-Hispanic Others, Native Americans, and elderly age 65 and above. On the other hand, there is a disproportionately low Non-Hispanic White population and the highest income quintile household presence in the freeway adjacent areas.

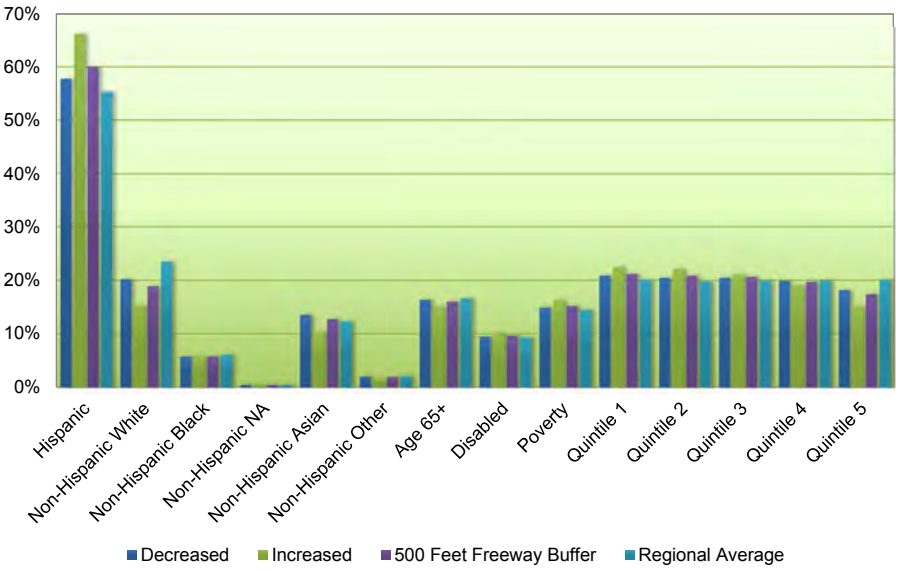
FIGURE 44 Environmental Justice Population in the 500 Feet Buffer Area

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

Environmental Impacts in the Freeway Adjacent Areas

Exposure levels to PM and CO are often higher in freeway adjacent areas than is seen elsewhere in the region. The average exposures of the population, workers, and other sensitive receptors located in the freeway adjacent areas become much higher than other places in the region if measured by some kind of concentration index (for example, emissions divided by land area).

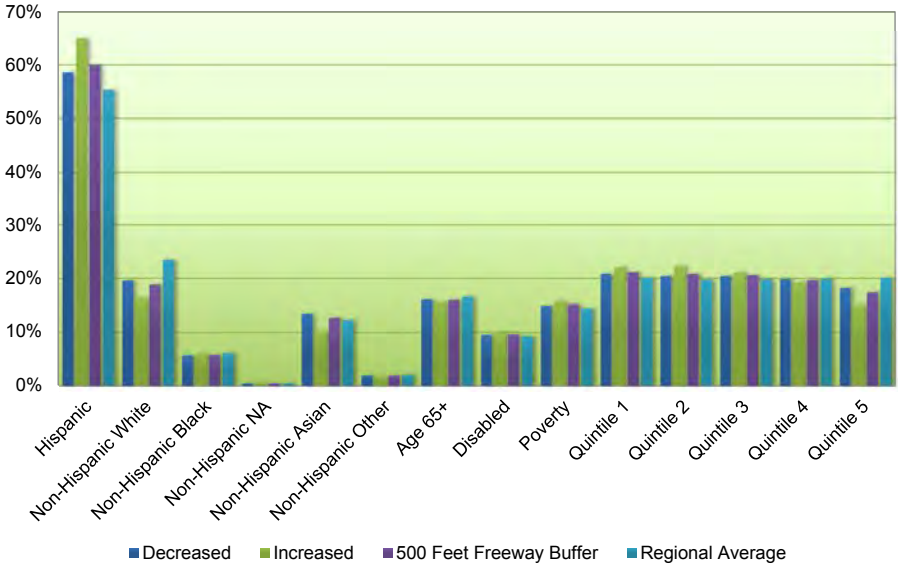
As mentioned before, data and analysis included in this Appendix does not account for Plan improvements in vehicle technology particularly for truck only corridors. These corridors in the Plan are exclusively for zero and/or near-zero emission vehicles. Furthermore, the Program Environmental Impact Report (PEIR) accompanying the RTP/SCS includes mitigation measures that would reduce impacts associated with health risk within 500 feet of freeways and high-traffic volume roadways to less than significant. Analysis included in this Appendix also does not account for emissions improvements through the implementation of these mitigation measures. As such, emissions and exposure analysis shown in this Appendix is abundantly conservative and demonstrates worst-case scenario outcomes. If these emissions improvements had been accounted for, we believe the analysis would show little or no areas with worsened emissions ("hot spots") associated with the Plan. Moreover, the currently available data on emissions and on the distribution of households and population is imprecise such that the overlay with emissions and EJ populations will tend to overstate any potential impacts. Nevertheless, given on-going concerns and evolving information on health impacts, SCAG encourages project sponsors to be cognizant of any potential health risks in project design and delivery. Consistent with the mitigation identified and to be implemented as part of the proposed final PEIR, SCAG will assist in disseminating information and identifying effective strategies to reduce risk at the project level.



SCAG prepared additional analyses to highlight the emissions exposure in buffer areas within 500 feet of freeways and high volume roads. It should be noted that the 2008 level of emissions near these facilities is higher than in the region as a whole. In 2035, these areas still will have higher emissions than the region as a whole. However, while regional emissions overall decreased between now and 2035, the rate of decrease near freeways and high volume roads is even greater. The RTP/SCS does result in an increase in population in these locations, and as such health risk is higher for these individuals than if they were not in the buffer area. Subsequent project level analysis and mitigation

should be cognizant of on-going health concerns. However, the plan as a whole shows benefits for emissions exposure and decreased levels of risk in areas near freeways. Also, environmental justice information for areas within 1,000 feet of freeways and highly traveled corridors is available in the Additional Analysis/Data section of this Appendix.

TABLE 44 Emissions Along Freeways and Highly-Traveled Corridors



Criteria Pollutant	Emissions in 500 feet Freeway Buffer (gram per day per acre)		Emissions in the Region (gram per day per acre)		Emissions Gap (Buffer - Region) (gram per day per acre)		Narrowing of the Emission Gap from 2008 to 2035
	2008	2035	2008	2035	2008	2035

NOISE IMPACTS

Roadway Noise Impacts

The SCAG region has an extensive roadway system with nearly 21,000 centerline miles and 65,000 lane miles. It includes one of the country's most extensive High-Occupancy Vehicle lane systems and a growing network of toll lanes, as well as High Occupancy Toll (HOT) lanes. The region also has a vast network of arterials and other minor roadways. Roadway facilities noise may cause significant environmental concerns.

Noise associated with highway traffic depends on a number of factors that include traffic volumes, vehicle speed, vehicle fleet mix (cars, trucks), as well as the location of the highway with respect to sensitive receptors (i.e., schools, daycare facilities, parks, etc.). According to Federal Highway Administration (FHWA) guidance, noise impacts occur when noise levels increase substantially when compared to existing noise levels. For the purposes of this analysis (consistent with FHWA guidance), noise increases of 3 dB along highways where noise levels are currently, or would be in the future, above 66 dB are considered to be significant, regardless of adjacent land use.

Highways that would be expected to have an increase of 3 dB or more include those where any of the following would occur: (1) the total traffic volumes increase by 100 percent compared to existing conditions; (2) the medium/heavy truck traffic volumes increase by 130 percent compared to existing conditions; or (3) the medium/heavy truck traffic volumes increase by 100 percent and there is an increase in other traffic volumes by 50 percent. These highway segments were identified using the results of SCAG's regional transportation model.

On some highways, there is no potential for noise levels to reach 66 dB. To eliminate these from the analysis, the following criteria were applied: (1) arterials where the FHWA's Traffic Noise Model (TNM) indicated that the motor vehicle volume (and the percentage of medium/heavy trucks) would result in traffic noise levels less than 66 dB; (2) arterials where the calculated motor vehicle speed was less than 17 mph; or (3) freeways where the average volume-to-capacity ratio was equal to or greater than 1.0, which would result in vehicle speeds of less than 30 mph. If a highway met any one of these criteria, it was eliminated from further consideration.

For each highway segment where a significant increase in noise would occur, a 150-foot impact zone was identified on either side. Using GIS, the percentage of each affected TAZs land area that fell within this zone was identified, and this percentage was applied to the demographic data forecast for this TAZ. This methodology was utilized in both the 2008 and 2004 RTP.). Maps were created for 2035 Baseline and 2035 Plan alternatives from the 2008 base year (see maps). They show significant noise clusters in the South Bay region near the ports and the Inland Empire, in the vicinity of Ontario, Rancho Cucamonga, and San Bernardino. Other areas of noise significance include the Antelope Valley and Apple Valley. For both scenarios, truck traffic volumes 130 percent or greater (from existing conditions) had the largest impact, as depicted by the green color in the maps.

The demographic characteristics of each impacted TAZ were aggregated and compared with the regional demographics to determine if there would be any disproportionate impacts to any of the demographic groups identified in Section I of this Appendix.

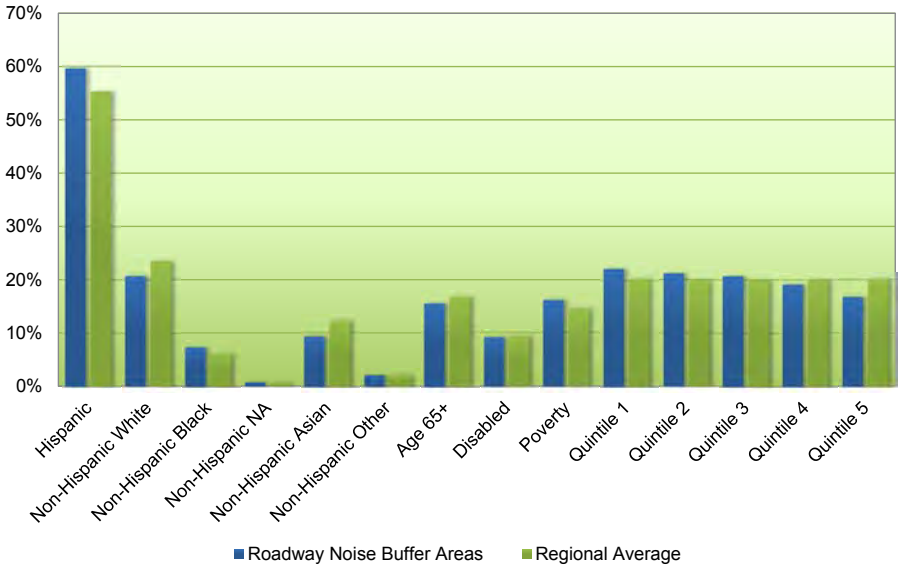

FIGURE 47 compares the share of people within an Environmental Justice Community of interest with the rest of the region residing within roadway noise areas. The lowest income group (Quintile 1) will account for 22 percent of the affected population in 2035. In contrast, the highest income group in the region (Quintile 5) will account for 17 percent of the population in Highway Noise Areas. **FIGURE 47** also illustrates that there is a marginal disproportionate impact on households below the poverty line. Within the region as a whole, 14 percent of households are below the poverty line. Within the Highway Noise Areas, this percentage rises to 16 percent.

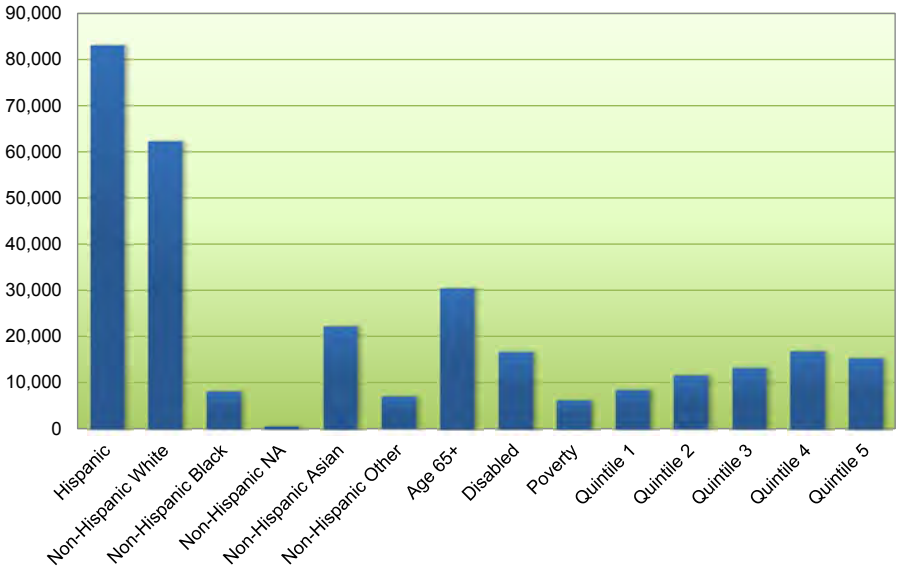
In addition, the distribution of the disabled population established that there is no significant concentration of that Environmental Justice population in these areas. Similarly, distribution of age 65+ revealed that the elderly were not disproportionately impacted by the large changes in dB associated with Highway Noise Areas. Within the region, this group represents 17 percent of all households. In contrast, households age 65 and over only represented 15 percent of the households in Highway Noise Areas.

The 2012–2035 RTP/SCS also found that minority populations were primarily affected by highway noise impacts. As indicated by the distribution of households in Highway Noise Areas by Ethnic/Racial Category, minority populations, specifically Hispanics, would be disproportionately impacted by highway noise. Approximately, 60 percent of Hispanics would be residing in highway noise areas by 2035.

The identification of these disparate highway noise impacts at the regional level can be attributed to a the issue of incompatible land use, where high polluting transportation projects, such as freeway construction, airport expansions, or rail extension projects, are located in minority populated neighborhoods. The Mitigation Toolbox provided below includes potential mitigation measures to address noise impacts including corridor-level analyses for proposed projects in areas where impacts are concentrated. In addition, the 2012–2035 RTP/SCS further proposes mitigating these impacts to the extent possible, for example, by requiring new sound walls where freeway expansions are proposed. Furthermore, the RTP also proposes grade crossings, new technologies, and other clean technologies for goods movement corridors.

FIGURE 47 Environmental Justice Population Impacted Along Roadway Noise Areas (2035)



In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

Staff further investigated the impacts on areas and the number of people affected by improvement of roadway noise from the proposed 2012–2035 RTP/SCS as it compared with the baseline condition. As illustrated in the roadway segment maps where noise impacts are identified for both baseline and for proposed plan, areas or number of segments under proposed plan are much smaller/less than those under the baseline condition. Thus it is projected that will be 183,000 fewer people (13.9 percent reduction) and 63,000 less households (15.3 percent reduction) affected by roadway noise than those under baseline condition (1,321,600 people/426,700 households).

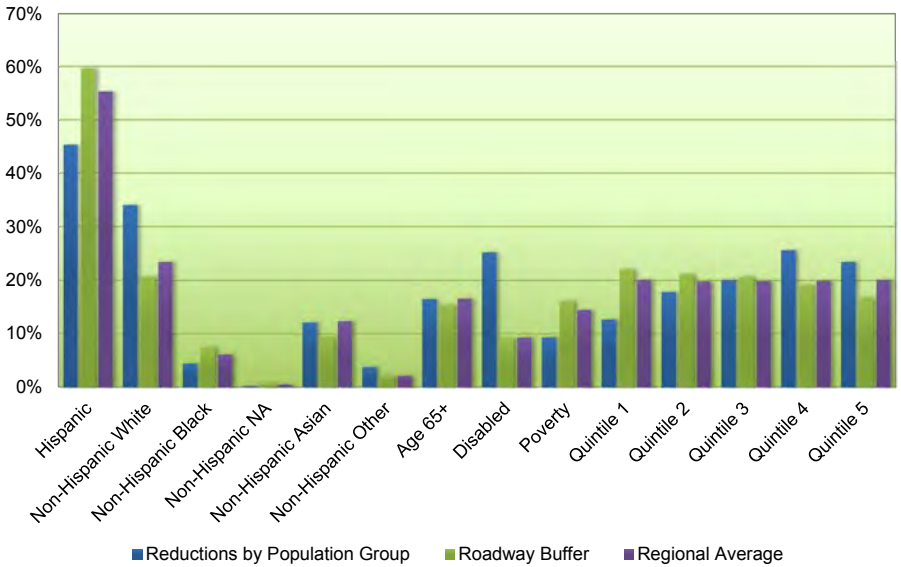


FIGURE 48 provides allocation by Environmental justice Communities for those affected population and household where their roadway noise conditions are improved from proposed 2012–2035 RTP/SCS.

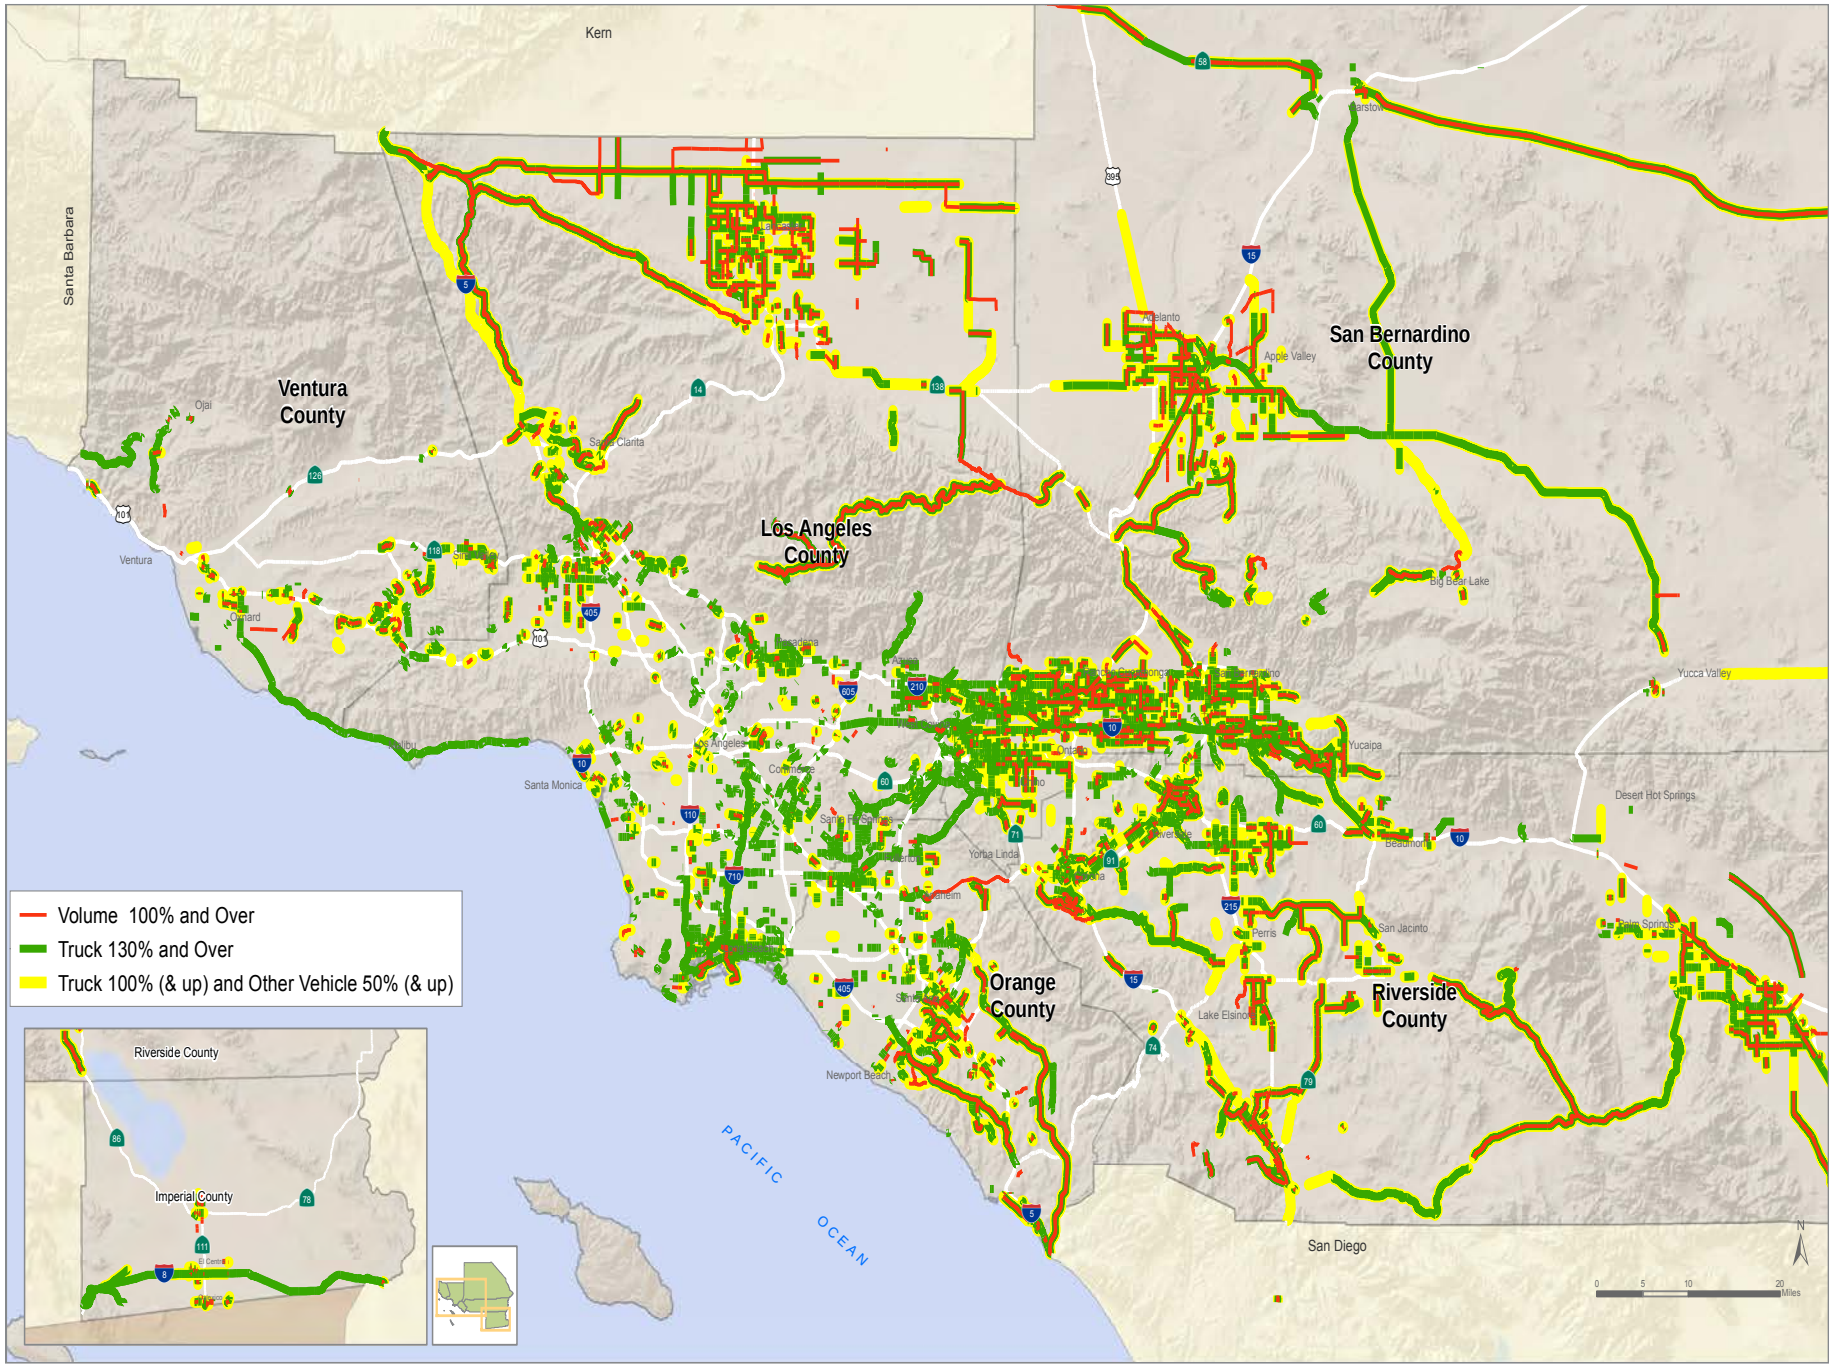
FIGURE 48 Environmental Justice Population Impacted (Reduced) by Roadway Noise Improvement between Baseline and Plan (2035)

While the proposed 2012–2035 RTP/SCS improves the roadway noise conditions by reducing the areas, roadway segments, and the number of people affected by roadway noise, the benefits are not proportionally shared by each Environmental Justice category as observed in the roadway noise impacted areas or in the region as whole. SCAG's analysis found that the roadway noise reductions will disproportionately benefit Non-Hispanic Whites and the two highest income quintile groups. Several other Environmental Justice communities also receive greater benefits from roadway noise improvements including Non-Hispanic Asian, Non-Hispanic others, elderly, and disabled (See **FIGURE 49**).

FIGURE 49 Environmental Justice Population Distribution of Roadway Noise Improvement between Baseline and Plan (2035)

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

EXHIBIT 32 SCAG Region Roadway Noise (2035 Baseline from Existing Conditions)



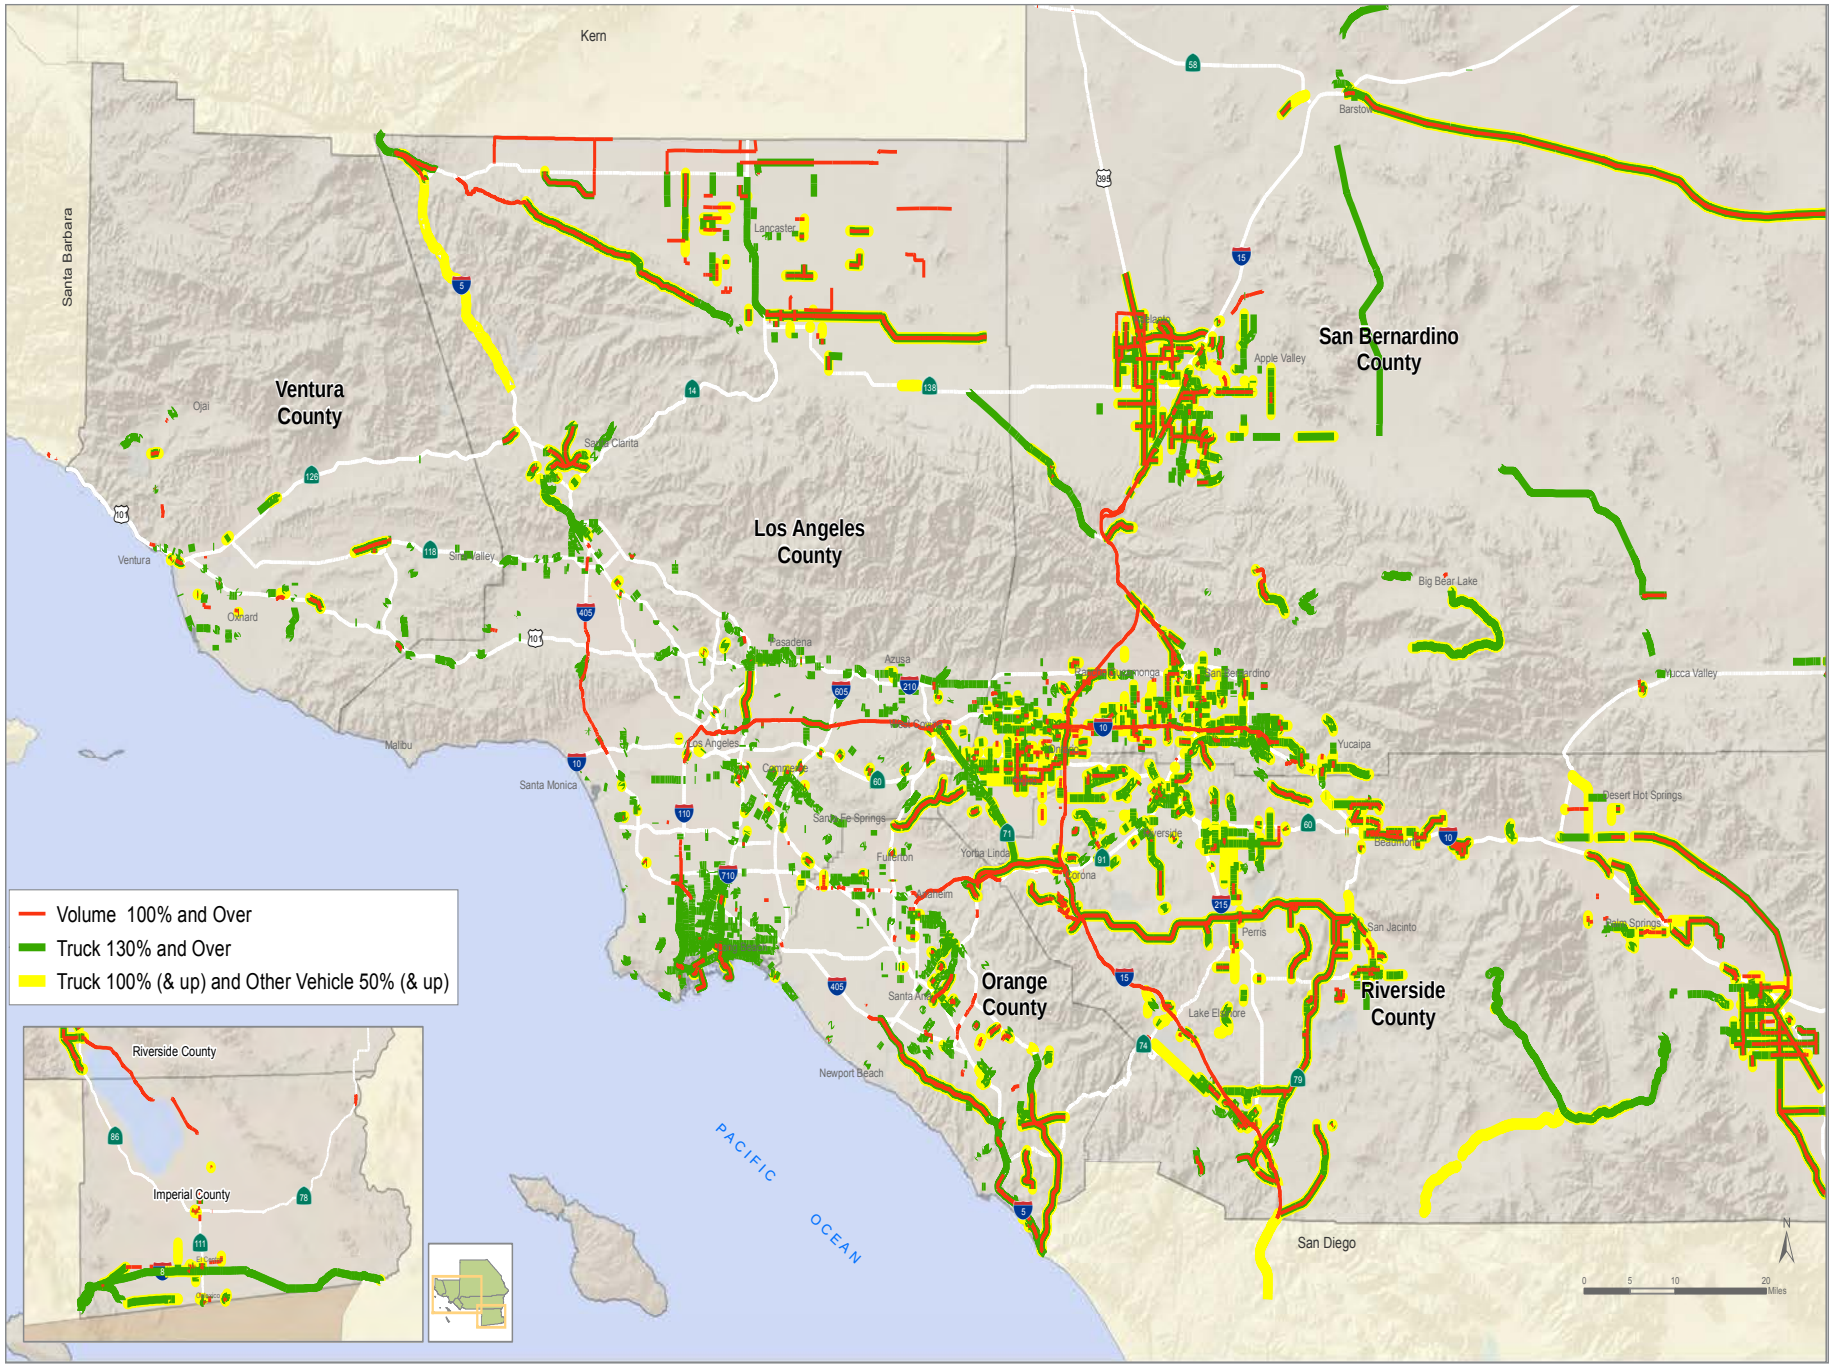


EXHIBIT 33 SCAG Region Roadway Noise (2035 Plan from Existing Conditions)

Airport Noise Impacts

The SCAG Region supports the nation's largest regional airport system in terms of number of airports and aircraft operations. It operates in a very complex airspace environment. The system has six established air carrier airports including Los Angeles International (LAX), Bob Hope (formerly Burbank), John Wayne, Long Beach, Ontario and Palm Springs. There are also four emerging air carrier airports in the Inland Empire and North Los Angeles County. These include San Bernardino International Airport (formerly Norton AFB), March Inland Port (joint use with March Air Reserve Base), Southern California Logistics Airport (formerly George AFB) and Palmdale Airport (joint use with Air Force Plant 42). The regional system also includes 45 general aviation airports and two commuter airports, for a total of 57 public use airports. Although the projected demand for airport capacity has decreased compared to the 2008 RTP, there is still moderate growth planned for the future. The challenge is striking a balance between the aviation capacity needs of Southern California with the local quality of life for the affected populations.

Projected noise impacts from aircraft operations at the region's airports in 2035 were modeled for inclusion in the Programmatic Environmental Impact Report for the RTP. For each airport, modeling produced a contour or isoline for the 65 dB Community Noise Equivalent Level (CNEL), a measure of noise that takes into account both the number and the timing of flights, as well as the mix of aircraft types. The Federal Aviation Administration (FAA) considers residences to be an "incompatible land use" with noise at or above 65dB. To identify potentially impacted populations, the anticipated population within the 65 dB CNEL contour was calculated using the following steps:

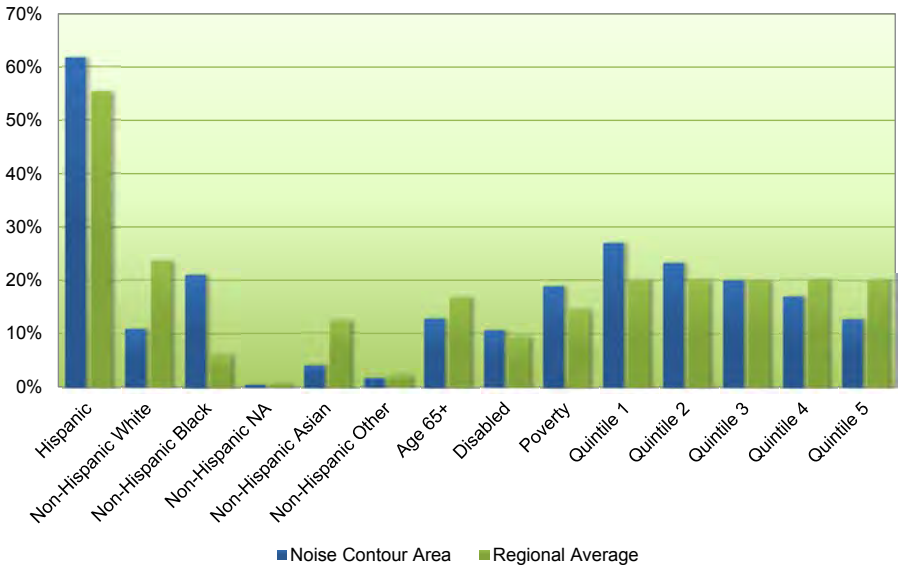
1. Calculate the percentage of TAZs that would lie within a 65 dB CNEL contour.
2. Assign the SCAG projected population to the TAZ.
3. Apply the demographic breakdown of the TAZ as a whole to the population within the 65 dB CNEL contour.

It should be noted that after 9-11 and "Great Recession" experienced since 2008, the global aviation industry remains in a depressed state. SCAG region air passenger demand and cargo forecasts have been revised downward repeatedly in 2004 RTP and 2008 RTP from the aviation scenario and forecasts adopted in the 2001 RTP. Currently for the 2012 RTP, projections of aviation demand and air cargo remained significantly less than those projected and adopted in 2001 RTP. Thus the downward revisions in projected demand at airports resulted in the reduction of Airport Noise Areas and the corresponding communities that will be studied.

For the purposes of this study, Aviation Noise Areas are defined as areas that are adversely affected by aircraft and airport noise. As part of the Environmental Justice Analysis, special attention will be paid to income, disability, age, and race/ethnicity of affected populations.

FIGURE 50 presents distribution of all environmental justice variables within the aviation noise impacted areas, and their comparisons with regional average. The analysis indicates that the 2012–2035 RTP/SCS results in a disproportionate aviation noise impact to low income and minority populations. Under the 2012 RTP, the lowest income group (Quintile 1) will represent 27 percent of the households impacted by noise above the 65 dB CNEL, while the highest income group (Quintile 5) will only represent 13 percent of the households impacted by noise above the 65 dB CNEL.

Similarly as indicated in the figure, a disproportionate number of households below the poverty threshold will be affected by airport noise levels above the 65 dB CNEL. While 14 percent of the SCAG region households are projected to be living below the poverty level, 19 percent of those that live within the Noise Contour Areas will be below the poverty line.



In terms of race/ethnicity, the aviation plan of the 2012–2035 RTP/SCS is projected to have a disproportionate aviation noise impact on minority groups who make up 89 percent of population within the noise contours compared with a regional average of 76 percent of minority population in 2035. Specifically, Hispanic and African-American populations are disproportionately affected. These two groups will make up 55 percent and 6 percent of the regional population in 2035 respectively, but represent 62 percent and 21 percent of those that will live within the impacted Noise Contour Area.

Distribution of the disabled in aviation noise areas shows that there will be a slightly higher concentration of disabled people compared to the region. It is projected that 11 percent of the households in aviation noise areas will be disabled, while the average is 9 percent for the region. On the other hand, elderly households age 65 and above are less concentrated in aviation noise areas in 2035 (13 percent), than the regional average of 17 percent.

SCAG has adopted the Aviation Decentralization Strategy, which calls for relieving the pressure at LAX and Ontario airports. Coupled with the ground access strategy which would relieve surface congestion in the surrounding areas, some of the negative effects of airports could be addressed. The Aviation Decentralization Strategy explores available airport capacity in the Inland Empire and North Los Angeles County. However, as a result of the Great Recession, projected demand for all airports in the region is down. This new reality has had the effect of reducing the number of communities that fall within Aviation Noise Areas, though the problem will still exist. A decentralized airport system will relieve pressure on constrained airports, minimize environmental impacts such as noise, traffic, and encroachment on adjacent neighborhoods, and reduce stress on the region's surface transportation infrastructure. The challenges facing the Aviation Decentralization Strategy, relate to the fact that the core of aviation demand will continue to reside in the urban areas of Los Angeles and Orange counties.

The environmental justice analysis results demonstrate that lower income, minority and disabled residents bear a disproportionate burden from aviation noise pollution with the 2012 RTP. It is therefore critical to continue addressing this issue. SCAG has included potential mitigation measures in the Environmental Justice Mitigation Toolbox at the end of this Appendix.

FIGURE 50 Environmental Justice Population Within the Aviation Noise Impacted Area (2035)

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

(11) Rail-Related Impacts

METHODOLOGY

As described in the Goods Movement Technical Appendix (page 32), freight rail emissions are 5 percent and 4 percent of regional goods movement related NO_X and PM emissions, respectively. When compared to all regional PM and NO_X sources, the contribution of freight rail emissions is even lower. However, environmental pollution from locomotives, rail yards and other rail facilities must be considered as concentrations of rail activities can cause localized rail pollution. In response to input from our federal partners, SCAG developed a summary analysis to address potential environmental justice impacts in areas adjacent to railroads and rail facilities, although further discussion and analysis is recommended. This section includes an analysis of Environmental Justice communities adjacent to railroads and rail facilities, rail impacts to sensitive receptors, and a summary examination of potential environmental justice concerns that are alleviated by grade separation projects. The train traffic index and related analysis provided in the Environmental Justice Appendix includes data from both passenger and freight rail traffic.

SHARE OF KEY ENVIRONMENTAL JUSTICE POPULATION IN AREAS ADJACENT TO RAILROADS: FROM 2000 CENSUS AND 2005–09 ACS

The following figures present the socioeconomic indicators from the 2000 Census and 2005–09 American Community Survey in areas within 500 and 1,000 feet from railroads, by key Environmental Justice communities including the elderly population (age 65 and over), population below poverty, minority, foreign born population, non-English speaking population, households without a vehicle and population without a high school diploma. As shown in the figures below, the share of most Environmental Justice communities residing in close proximity to railroads is higher than regional average both in 2000 and in 2005–09. The only exception is elderly population. These observations suggest that rail-related environmental burdens, such as air pollution and noise from locomotives, rail yard and other rail facility, are higher for low-income and minority communities than the regional average. However, SCAG recommends further analysis with our partner agencies to verify this observation.

SENSITIVE RECEPTORS AND REGIONAL RAILROADS

EXHIBIT 35 depicts areas adjacent to railroads overlaid with sensitive receptor areas. Sensitive receptors include, but are not limited to, hospitals, schools, daycare facilities, elderly housing facilities where there are populations susceptible to greater impacts from air pollution and toxic chemicals. As shown in the map below, a significant number of sensitive receptors are located in close proximity to railroads. Further analysis is needed to better understand rail-related pollutants and contaminants in areas adjacent to railroads.

EXHIBIT 35 Sensitive Receptors and Regional Railroads

IMPACTS RELATED TO KEY GRADE CROSSING AREAS

The following tables and figures present the socioeconomic indicators from 2000 Census and 2005–09 American Community Survey in areas within a ½-mile, 1-mile and 2-mile distance from grade separation projects, by key Environmental Justice population groups—elderly population (age 65 and over), population below poverty, minority, foreign born population, non-English speaking population, households without a vehicle and population without a high school diploma. As shown in the figures below, the share of most key Environmental Justice communities residing close to railroads is higher than regional average both in 2000 and in 2005–09. The exceptions are the elderly population and households without a vehicle. These observations suggest that many Environmental Justice communities are more likely to be affected by impacts from grade crossings, such as traffic delays, idling emissions and grade-crossing related accidents than other demographic groups.

% Change	351%	127%	317%	318%	180%
	5-Year Average Number of Crashes Per Year	5-Year Average Number Killed Per Year	5-Year Average Number Injured Per Year	5-Year Average Damage Per Year ($)	
2006–2010	6.4	1.0	2.4	37,440	

*Assuming no grade separation projects.
**Emissions isolates idling emissions (autos and trucks) at the crossing.
***Damage Costs derived as follows: (veh-hrs of delay per day) x (grams/hr) x (1/tons per gram) x (tons per short tons) x (dollars per short ton) x 365 days per year = dollars per year for all vehicles
Source: SCAG, 2011

BENEFITS FROM GRADE SEPARATION PROJECTS

Table 49 presents the existing and projected impacts from grade crossings where the grade separation projects are planned to be constructed in the future. It shows grade crossing-related impacts, such as traffic delay, idling emission and relevant accidents in 2010 and 2035. For 2035 projections, the statistics are projected based on the assumption of no grade separation project construction. For example, without the grade separation projects, the daily total vehicle hours of delay will increase from 1,253 vehicle-hours per day to 5,133 vehicle-hours per day, and the daily NO_X, $PM_{2.5}$, CO_2 emissions from 2,196 kg per day to 9,170 kg per day. However, with the grade separation projects constructed, traffic delay at crossing, idling emissions and grade-crossing related accidents could be reduced by redirecting vehicles and pedestrians above or below railroad tracks.

EXHIBIT 38 Train Traffic Index

TRAIN TRAFFIC INDEX

The train traffic index is one measure that SCAG used to determine the usage of railroad segments and concentration of rail activities in the region. This tool informs the degree of environmental impacts on areas adjacent to railroads and grade separation projects.

The train traffic index of each railroad segment is calculated by multiplying its average daily train volume of passenger and freight rail traffic by the daily total gate down time of key grade crossings located at both ends of an individual segment. Exhibit 38 illustrates the train traffic index of railroad segments adjacent to grade separation projects in 2010. As shown in the map provided, San Bernardino County and Riverside County have higher train traffic index values than other counties. As railroad emissions and noise increase where there is a large amount of train traffic volume, these observations suggest that the rail-related environmental impacts could be greater in San Bernardino County and Riverside County than other counties. Based upon the analysis of Environmental Justice categories described previously, the low-income and minority communities adjacent to railroads and grade-crossings in San Bernardino County and Riverside County may be more affected by rail-related impacts than population groups located in other places of the region. Further study and demonstrations are needed to develop and design effective measures to address rail related environmental impacts, if any. Please refer to the Goods Movement Technical Appendix to review the 2012 RTP Goods Movement Environmental Strategy and Action Plan for Technology Advancement.

Additional SCAG Strategies: Environmental Justice Mitigation Toolbox

New to the 2012–2035 RTP/SCS, SCAG has developed a toolbox of potential mitigation measures to address potential impacts to Environmental Justice communities. The toolbox presents optional mitigation recommendations that may be effective in addressing project-specific environmental justice impacts after a comprehensive review of impacts and consultation with all stakeholders. These measures were identified through a review of the literature, the PEIR, and recent planning activities.[9] Measures incorporating or referring to compliance with existing regulations are for informational purposes only, and do not supersede existing regulations.

Potential Mitigation for Noise Impacts

Project sponsors may voluntarily, to the extent feasible and applicable, and where their jurisdictional authority permits:

- As part of the appropriate environmental review of each project, conduct a project specific noise evaluation and identify and implement applicable mitigation.
- Employ land use planning measures, such as zoning, restrictions on development, site design, and use of buffers to ensure that future development is compatible with adjacent transportation facilities.
- Maximize the distance between noise-sensitive land uses and new roadway lanes, roadways, rail lines, transit centers, park-and-ride lots, and other new noise-generating facilities.
- Construct sound reducing barriers where feasible and applicable, between noise sources and noise-sensitive land uses. Sound barriers can be in the form of earth-berms or soundwalls. Constructing roadways so as appropriate and feasible that they are depressed below-grade of the existing sensitive land uses also creates an effective barrier between the roadway and sensitive receptors.
- Maximize distance of new route alignments from Environmental Justice communities. For example, if a transit project were constructed along the center of a freeway (as opposed to a new route or along side the freeway), operational noise impacts would be reduced by the increase in distance to the noise sensitive sites and the masking effects of the freeway traffic noise.

Potential Mitigation for Air Quality Impacts Along Freeways and Heavily Traveled Corridors

Local air districts, local jurisdictions and project sponsors may voluntarily implement measures adopted by ARB designed to attain federal air quality standards for PM2.5 and 8-hour ozone. ARB's strategy includes the following elements:

- Set technology forcing new engine standards;
- Require clean fuels, and reduce petroleum dependency;
- Work with US EPA to reduce emissions from federal and state sources; and
- Pursue near-term advanced technology demonstration and deployment such as:
  - Zero emissions heavy-duty trucks (2013 and beyond)[10]
  - Tier 4 marine engine repowers and replacements (2014 and beyond)
  - Tier 4 and zero emissions railyard equipment (2015 and beyond)[11]
- Pursue long-term advanced technology measures
- Consider proposed new transportation-related SIP measures including:
  - Improvements and Enhancements to California's Smog Check Program
  - Expanded Passenger Vehicle Retirement
  - Modifications to Reformulated Gasoline Program
  - Cleaner In-Use Heavy-Duty Trucks
  - Ship Auxiliary Engine Cold Ironing and Other Clean Technology
  - Cleaner Ship Main Engines and Fuel

[9] The Environmental Justice Mitigation Toolbox draws from, among other sources, mitigation measures included in the Draft 2012–2035 RTP/SCS Program Environmental Impact Report (PEIR), particularly for air quality and noise impacts. As captured here, Environmental Justice mitigation is geared toward reducing impacts for Environmental Justice communities as defined in this appendix, whereas PEIR measures are more broadly geared to sensitive receptors as defined in the PEIR. Mitigation activities cited here (e.g. performing corridor specific analysis) are consistent between this toolbox and the Final PEIR Appendix G.

[10] Please see Chapter 2, Transportation Investments for more information regarding a heavy-duty truck demonstration project in partnership with SCAQMD

[11] For more information see http://www.dieselnet.com/standards/us/marine.php and http://www.dieselnet.com/standards/us/loco.php

- Port Truck Modernization
- Clean Up Existing Commercial Harbor Craft

Conduct corridor-level analysis for proposed projects in areas where roadway air quality impacts may be concentrated among Environmental Justice communities.

Project sponsors may consider identifying the environmental justice impacts of each project. In consultation with the affected community, mitigation measures can be identified to best address the project's impacts.

Potential Mitigation for Rail Related Impacts

- Construct sound reducing barriers, where feasible and applicable, between noise sources and noise-sensitive land uses

Potential Mitigation for Road Pricing Mechanisms

- Transit, vanpools, or other options as alternatives in locations not served by transit
- Upper limits on road pricing
- Exemptions or discounts for persons who are disadvantaged people such as those whose earnings are below a certain income level and people with disabilities
- Limits on the number of priced crossings in a period for cordon charges
- Allowances for unlimited use of priced facilities in certain periods, typically off-peak hours and holidays[12]
- Develop detailed program design including billing and collection technology, rate structure, enforcement, spillover guards, revenues and gas tax replacement strategy, and mitigation for perceived geographic inequity before communicating with public[13]
- Develop an explicit benefit plan for increased revenues dovetailing with goals and mitigation concerns (e.g., enhanced transit, spillover protections and better enforcement)[14]
- Include environmental justice mitigation actions as part of the NEPA review[15]

Potential Mitigation for Environmental Justice Impacts

- Fund proactive measures to improve air quality in neighboring homes, schools, and other sensitive receptors
- Provide public education programs about environmental health impacts to better enable residents to make informed decisions about their health and community
- Engage in proactive measures to train and hire local residents for construction or operation of the project to improve their economic status and access to health care

Potential Resources Related to Gentrification and Displacement

Trends related to gentrification and displacement observed in areas with transit oriented developments (TODs) are inconclusive. However, the following resources are provided for informational purposes only. Local agencies may consider them at their discretion.

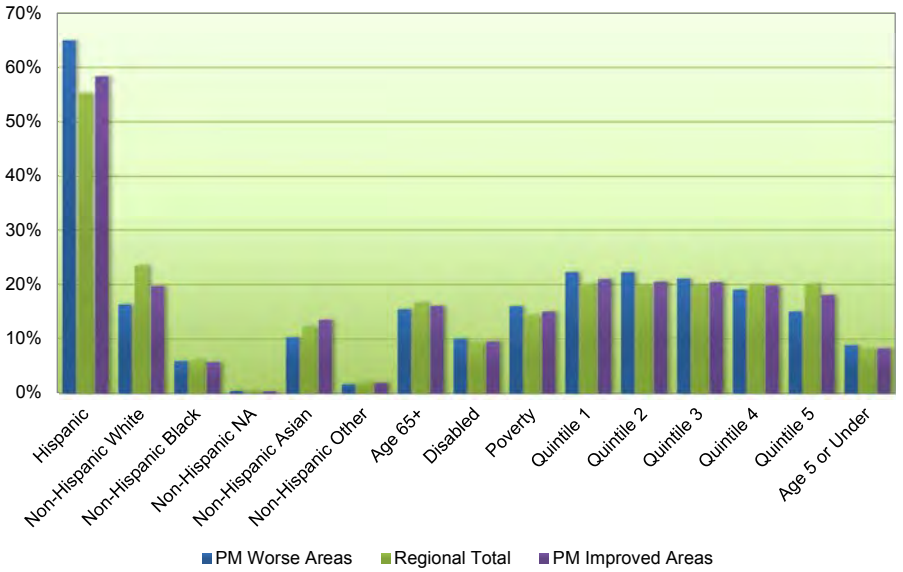
Areas of Future Research

Given the anticipated growth and dynamic nature of the SCAG region, there are many policy areas that may present future challenges and are of interest for further research:

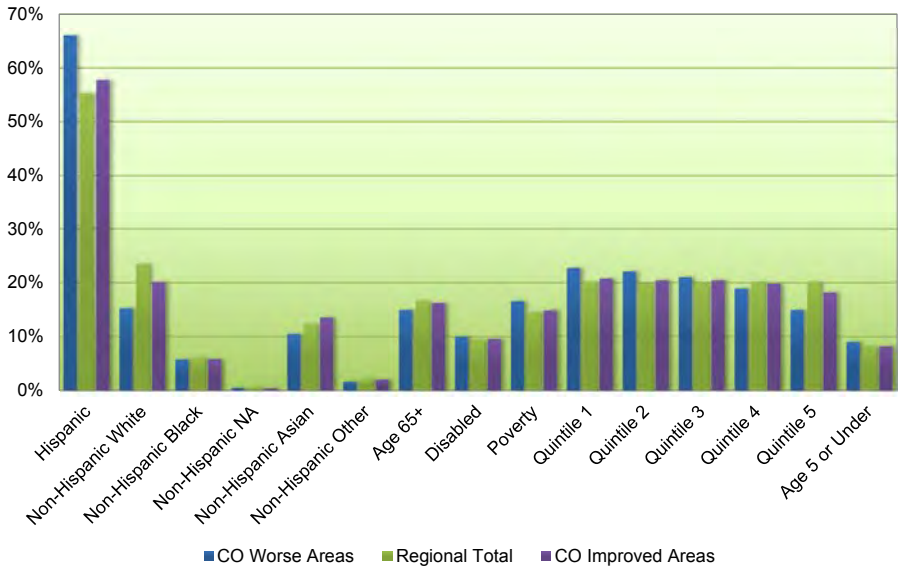
- Currently there is no racial/ethnic majority in the SCAG region, but the sum of all minority groups comprises over 50 percent of the total population in the region. Around 2025, the Hispanic population is projected to obtain a population majority in SCAG region
- Future research is necessary to monitor and analyze population trends related to gentrification and displacement. As such, the development of new indicators and data are needed at increasingly refined geographic levels
- Additional research is needed to evaluate the implications of general job wages/worker earnings mismatch and jobs-housing imbalance at the regional, county, and community levels
- Continued work is necessary to increase understanding of the linkages and interactions between emissions, air quality, and health outcomes, and their overall relationship with the region's socioeconomic cohorts related to income, education, race/ethnicity, among many other characteristics
- Further research is needed to understand the residential choices, surrounding communities, and the built environment for Native Americans, and population identified as Non-Hispanic Other
- The implications of VMT-based transportation fees on population growth and distribution will also require additional attention in the coming years
- Additional data and analysis is needed to understand the future environmental justice impacts of rail related freight traffic in the region
- Continual engagement and outreach with regional stakeholders is needed to address future environmental justice concerns



Additional Analysis/Data

Data and analysis included in this Appendix does not account for Plan improvements in vehicle technology particularly for truck only corridors. These corridors in the Plan are exclusively for zero and/or near-zero emission vehicles. Furthermore, the Program Environmental Impact Report (PEIR) accompanying the RTP/SCS includes mitigation measures that would reduce potential impacts associated with health risk within 500 feet of freeways and high-traffic volume roadways to less than significant. Analysis included in this Appendix also does not account for emissions improvements through the implementation of these mitigation measures. As such, emissions and exposure analysis shown in this Appendix is abundantly conservative and demonstrates worst-case scenario outcomes. If these emissions improvements had been accounted for, we believe the analysis would show little or no areas with worsened emissions ("hot spots") associated with the Plan. Moreover, the currently available data on emissions and on the distribution of households and population is imprecise such that the overlay with emissions and EJ populations will tend to overstate any potential impacts. Nevertheless, given on-going concerns and evolving information on health impacts, SCAG encourages project sponsors to be cognizant of any potential health risks in project design and delivery. Consistent with the mitigation identified and to be implemented as part of the proposed final PEIR, SCAG will assist in disseminating information and identifying effective strategies to reduce risk at the project level.

The following section provides additional information on the potential environmental justice impacts for population living within 1,000 feet of freeways and highly traveled corridors, as well as for young children age 5 or under.



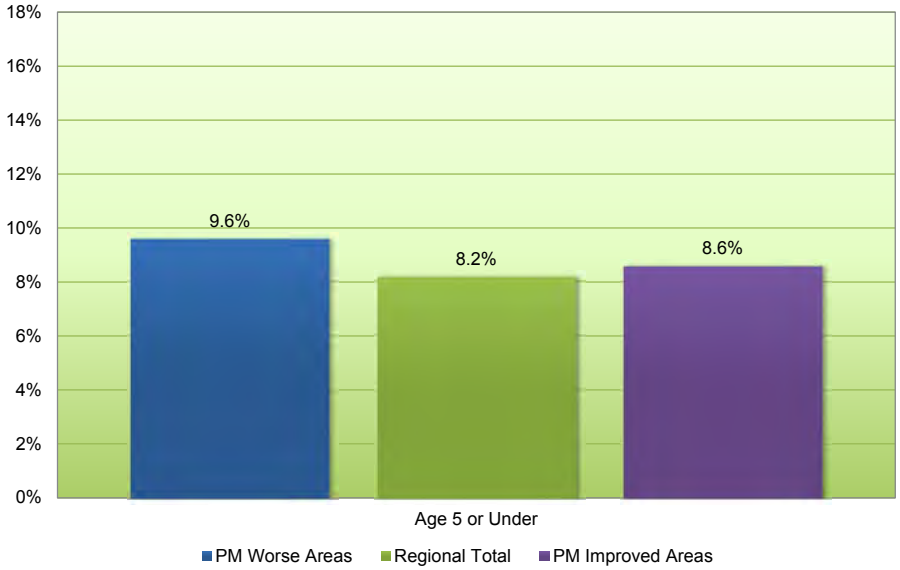
FIGURES A1 and **A2** show the breakdown of population for areas that are worse off or improved in terms of CO and PM emissions as a result of implementing the Plan. In order to evaluate if there is a disproportionate impact, the percent of population for worse off and improved areas is compared to each individual group's percentage in the regional population. As is seen in the graphs below for CO and PM emissions, there is a higher concentration of the Hispanic population in areas that are worse off and are within 1,000 feet of freeways than is seen at the regional level. This holds true for the disabled population, households in poverty, income quintiles 1, 2, and 3, as well as for young children age 5 and younger. Conversely, some of these same groups have a higher concentration of population in areas that are better off than is seen at the regional level, namely, Hispanics, Non-Hispanic Asians, and income quintiles 1, 2, and 3.

FIGURE A1 Distribution of Environmental Justice Groups for Areas Affected by PM Emissions that are within 1,000 Feet of Freeways and Highly Traveled Corridors - Plan vs. Baseline (2035)

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

FIGURE A2 Distribution of Environmental Justice Groups for Areas Affected by CO Emissions that are within 1,000 Feet of Freeways and Highly Traveled Corridors - Plan vs. Baseline (2035)

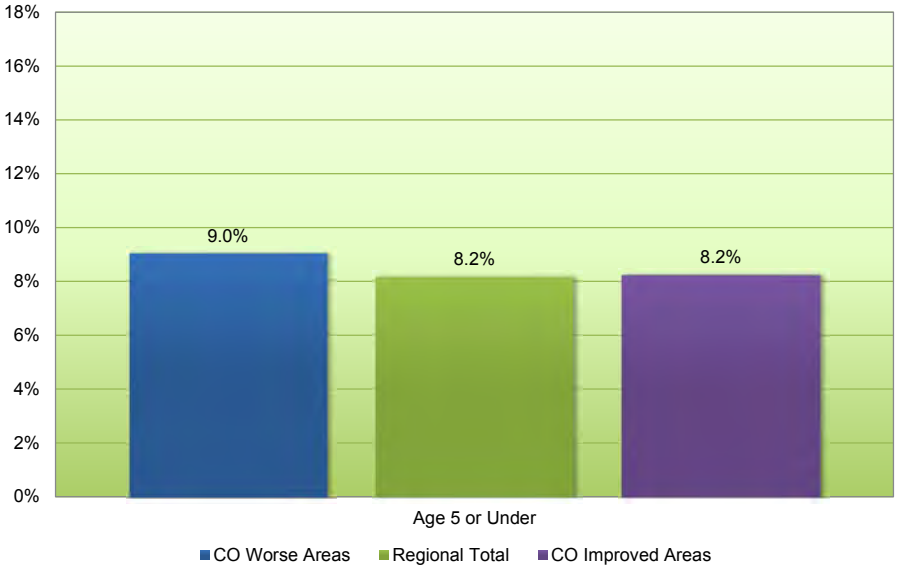
In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.



Potential Environmental Justice impacts for young children age 5 or under are presented in the following graphs. The analysis included compares the performance of the Plan scenario with the Baseline scenario:

- PM and CO emissions within 500 feet of freeways and highly traveled corridors
- Roadway noise
- Aviation noise
- Concentration of young children near rail lines

As indicated from the information presented here, the presence of children age 5 or under is somewhat higher than the regional average in environmentally sensitive areas, including near roadways, within aviation noise contours, and near rail corridors. However, as is the case for other groups, it should be noted that regionwide both air quality and associated health outcomes are improving with the plan compared to current and baseline conditions. Also, while regional emissions overall will decrease between now and 2035, the rate of decrease near freeways and highly traveled corridors is even greater.



For areas that are within 500 feet of freeways and highly traveled corridors, young children represent a slightly higher percentage of the population in areas that are adversely impacted from the plan than is seen for the region. Young children are slightly more prevalent in areas that show improvement in terms of PM emissions, but are concentrated at the same level that is seen in the larger region for areas that are improved in terms of CO emissions as a result of the plan.

FIGURE A3 Percentage of Young Children for Areas Affected by PM Emissions that are within 500 Feet of Freeways and Highly Traveled Corridors – Plan vs. Baseline (2035)

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

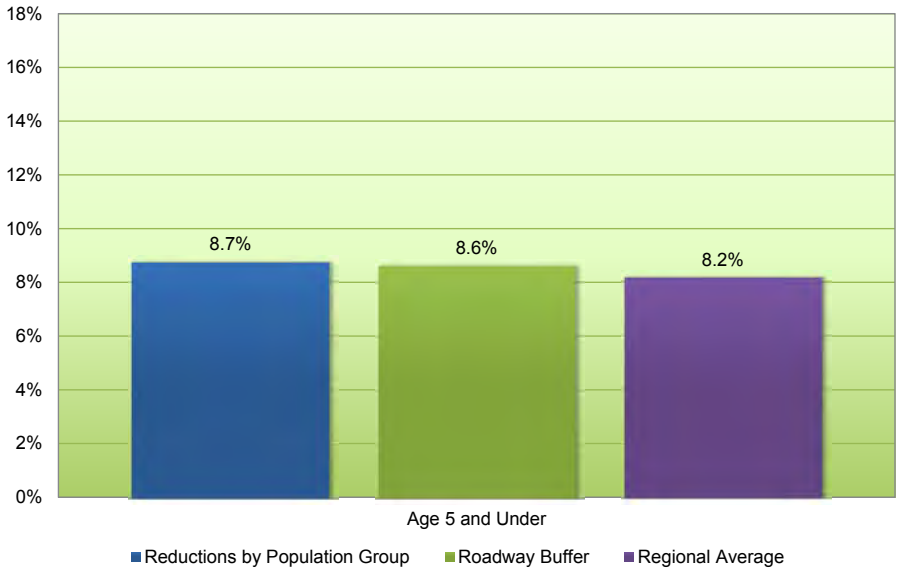


FIGURE A4 Percentage of Young Children for Areas Affected by CO Emissions that are within 500 Feet of Freeways and Highly Traveled Corridors – Plan vs. Baseline (2035)

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

The Plan scenario results in a reduction in the number of people affected by roadway noise as compared to the Baseline scenario. Of the 450,000 people across the region who are no longer affected by roadway noise as a result of the Plan, young children represent 9 percent of the total. Looking at the Plan scenario in more detail, young children comprise 9 percent of the population in areas impacted by roadway noise, whereas this group represents 8 percent of the region's population.

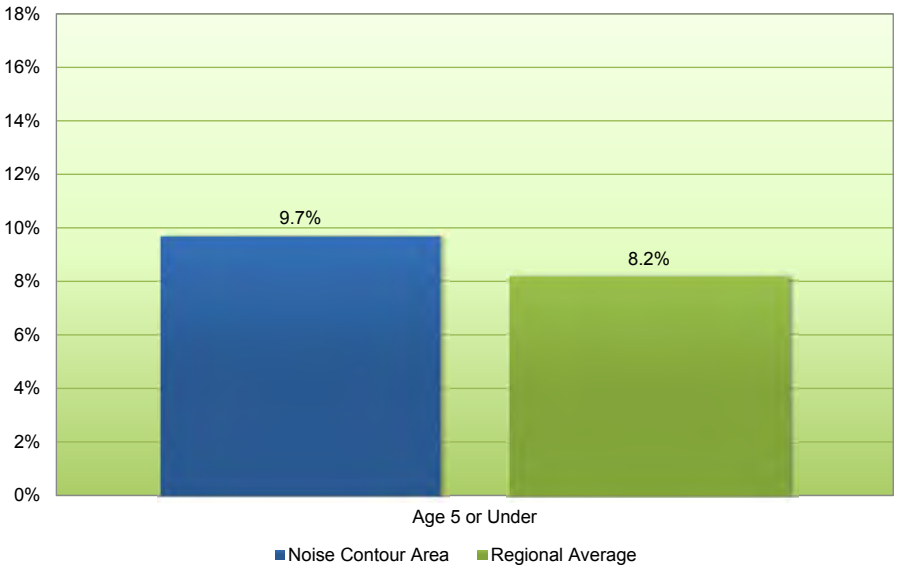

FIGURE A5 Percentage of Young Children within Areas Affected by Roadway Noise – Plan vs. Baseline (2035)

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

The same can be said for areas that are impacted by aviation noise, where young children comprise 10 percent of the population, which is slightly higher than is seen for this population at the regional level.

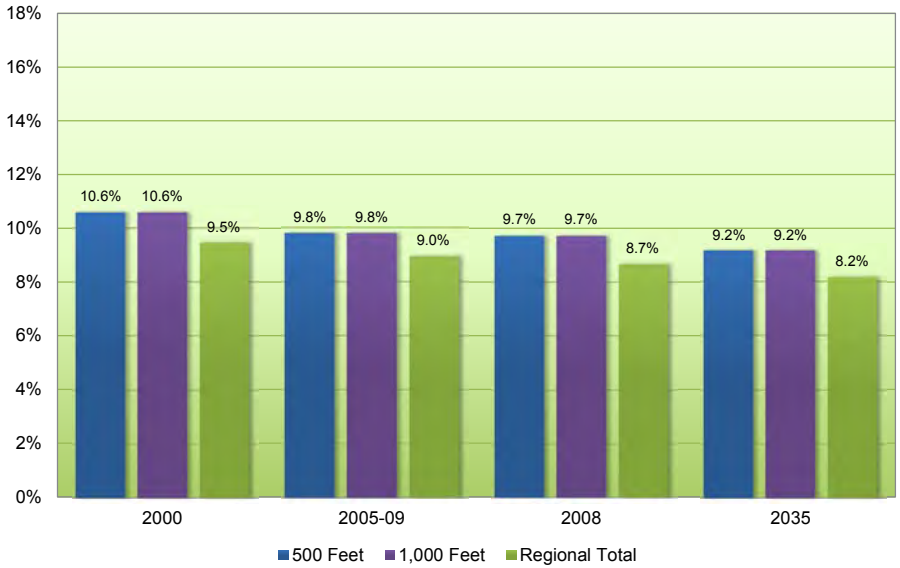

FIGURE A6 Percentage of Young Children within Areas Affected by Aviation Noise – Plan (2035)

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

Children age 5 and under are more concentrated in areas that are within 500 and 1,000 feet of regional rail lines for years 2000 and 2005–09. In terms of projected population, this level of concentration is anticipated to go down in 2035, but is in line with the reduction for this group as a percent of the regional population during this time.

FIGURE A7 Concentration of Young Children Near Rail Lines

In the figure shown above, the breakdown of population by Environmental Justice group within impacted areas is compared to each individual group's concentration in the regional population.

In addition, historical air quality and health factors are presented for areas that have a concentration of young children that is higher than seen in the region at large. **TABLE A1** displays the following factors for young children:

- Average days exceeding federal ozone standards
- Average daily ozone exposure in excess of national standards
- Average annual $PM_{2.5}$ exposure
- Cancer risk per million persons
- Respiratory risk

As is seen from the data provided, many air quality indicators have improved across the region in 2007–2009 as compared to 2004–2006. Reductions were experienced for average number of days exceeding ozone standards, average daily ozone exposure in excess of national standards, and in average annual $PM_{2.5}$ exposure. These reductions produced benefits to young children during this period as well. Although this improvement is promising, it is important to note that these same air quality and health factors are higher for young children in both 2004-06 and 2007-09 than is seen in the region. Also, due to the geographic changes for young children during this time, cancer risk and respiratory risk decreased from 2004-06 to 2007-09.

TABLE A1 Summary of Air Quality and Health Risks for Young Children (2004–06 and 2007–09)

Summary of Air Quality and Health Risks by Environmental Justice Population Group												
	2004–2006						2007–2009					
Environmental Justice Demographic Groups	Population[1]	Average Days Exceeding Ozone Standards[2]	Average Daily Ozone Exposure in Excess of National Standards[2]	Average Annual $PM_{2.5}$ Exposure[2]	Cancer Risk Per Million[3]	Respiratory Risk	Population[1]	Average Days Exceeding Ozone Standards[2]	Average Daily Ozone Exposure in Excess of National Standards[2]	Average Annual $PM_{2.5}$ Exposure[2]	Cancer Risk Per Million[3]	Respiratory Risk
Age 5 or Under	1,562,913	18.67	0.20	15.45	529.65	5.03	1,588,986	15.48	0.15	13.04	504.38	4.87
Region Total	16,516,006	17.77	0.18	14.76	467.13	4.62	17,737,412	15.03	0.14	12.91	467.13	4.62

1. Population and Household data is representative of the 2000 Decennial Census and the 2005–09 American Community Survey.
2. Emissions data shows averages based upon two data sets, one representing averages from 2004–06 and the other showing averages from 2007–09.
3. Cancer risk data represents a single data point from 2005.

Our Vision

Towards a Sustainable Future

For the past three decades, the Southern California Association of Governments (SCAG) has prepared Regional Transportation Plans (RTPs) with the primary goal of increasing mobility for the region's residents and visitors. While mobility is a vital component of the quality of life that this region deserves, it is by no means the only component. SCAG has placed a greater emphasis than ever before on sustainability and integrated planning in the 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), whose vision encompasses three principles that collectively work as the key to our region's future: mobility, economy, and sustainability.

The 2012–2035 RTP/SCS includes a strong commitment to reduce emissions from transportation sources to comply with SB 375, improve public health, and meet the National Ambient Air Quality Standards as set forth by the federal Clean Air Act. As such, the 2012–2035 RTP/SCS contains a regional commitment for the broad deployment of zero- and near-zero emission transportation technologies in the 2023–2035 time frame and clear steps to move toward this objective. This is especially critical for our goods movement system. The development of a world-class zero- or near-zero emission freight transportation system is necessary to maintain economic growth in the region, to sustain quality of life, and to meet federal air quality requirements. The 2012–2035 RTP/SCS puts forth an aggressive strategy for technology development and deployment to achieve this objective. This strategy will have many co-benefits, including energy security, cost certainty, increased public support for infrastructure, GHG reduction, and economic development.

Never before have the crucial linkages and interrelationships between the economy, the regional transportation system, and land use been as important as now. For the first time, the 2012–2035 RTP/SCS includes a significant consideration of the economic impacts and opportunities provided by the transportation infrastructure plan set forth in the 2012–2035 RTP/SCS, considering not only the economic and job creation impacts of the direct investment in transportation infrastructure, but also the efficiency gains in terms of worker and business economic productivity and goods movement. The 2012–2035 RTP/SCS outlines a transportation infrastructure investment strategy that will benefit Southern California, the state, and the nation in terms of economic development, competitive advantage, and overall competitiveness in the global economy in terms of attracting and retaining employers in the Southern California region.

The 2012–2035 RTP/SCS provides a blueprint for improving quality of life for our residents by providing more choices for where they will live, work, and play, and how they will move around. Its safe, secure, and efficient transportation systems will provide improved access to opportunities, such as jobs, education, and healthcare. Its emphasis on transit and active transportation will allow our residents to lead a healthier, more active lifestyle. It will create jobs, ensure our region's economic competitiveness through strategic investments in our goods movement system, and improve environmental and health outcomes for its 22 million residents by 2035. More importantly, the RTP/SCS will also preserve what makes the region special, including our stable and successful neighborhoods and our array of open spaces for future generations to enjoy.

The Setting

In order to successfully overcome the challenges that lie before us, this RTP/SCS first recognizes the impacts that recent events and long-term trends will have on how people choose to live and move around.

ECONOMIC RECESSION

[800,000] jobs have been lost in the region due to the Great Recession

The economic turmoil faced by many of the region's residents is likely to impact their housing choices and travel behavior, including their transportation mode choice and day-to-day travel patterns. This will potentially require different types of transportation solutions.

POPULATION GROWTH

The region will add **[4 million]** people by 2035

This growth in population will only exacerbate our region's existing mobility challenges. The SCAG region is already home to 18 million people, or 49 percent of California's population. If it were its own state, the SCAG region would be the fifth most populous in the nation. Furthermore, this expected growth will occur mainly in the suburban inland counties of Riverside and San Bernardino, adding to the existing imbalance of jobs and housing in the region, and requiring people to travel, which contributes to transportation and air quality challenges. In addition, with the aging of the Baby Boomer generation (the share of the population 65 years or older will increase from 11 percent in 2010 to 18 percent in 2035), the region will have a greater need for more efficient modes of transportation for those who can no longer drive as their main form of transportation.

Image courtesy of Metro © 2012 LACMTA

MULTIMODAL TRANSPORTATION SYSTEM

Over the past few decades, the region has invested heavily in a multimodal transportation system that serves as the backbone of the region's economic well-being.

THE SYSTEM AT A GLANCE

[21,690] miles of highways and arterials

[470] miles of passenger rail

[6] air carrier airports

Nine out of ten trips in the region utilize our extensive highway and arterial network, which supports a host of modes, including the automobile, transit, and active transportation. The region is also home to a growing number of passenger rail lines, none of which existed 20 years ago. Our regional aviation system is the nation's largest and most complex in terms of number of airports and aircraft, and our goods movement industry plays a critical role in sustaining the economy of our region. The importance of this system to our region cannot be overstated.

THE REGION IN MOTION

[446 million] miles driven each day

[81 million] air passengers each year

[45%] more urban rail riders between 2000 and 2006

[34%] of our jobs depend on the goods movement industry

Challenges

The challenges facing the region are daunting. When combined, our mobility, air quality, and funding challenges present an imposing threat to the quality of life for both current and future residents.

MOBILITY CHALLENGES

The region wastes over **[3 million]** hours each year sitting in traffic

The region's roadways are the most congested in the nation, and traffic relief is critical, even more so in our current economic situation. By failing to address our congestion, we have foregone jobs—every 10 percent decrease in congestion can bring an employment increase of about 132,000 jobs.

SAFETY CHALLENGES

On the brighter side, our roadways are among the nation's safest, with rate of fatal and injury collisions declining dramatically since the 1930s. But as we continue to successfully improve safety for our motorists, we cannot neglect the alarming fatality rates of those traveling on other modes of transportation.

[21%] of all traffic-related fatalities involve pedestrians

This fatality rate is unacceptable, and if we plan to successfully move toward a more sustainable future that includes plenty of active transportation, we must address the safety deficiencies in all modes of transportation.

AIR QUALITY CHALLENGES

In addition, while Southern California is a leader in reducing emissions, and ambient levels of air pollutants are improving, the SCAG region continues to have the worst air quality in the nation, and air pollution still causes thousands of premature deaths every year, as well as other serious adverse health effects. The South Coast Air Quality Management District (AQMD) estimates the monetary cost of air pollution in Southern California to be at least $14.6 billion annually.

Even with ongoing aggressive control strategies, ever more stringent national ozone standards require further oxide of nitrogen (NOx) emission reductions in the SCAG region. In the South Coast Air Basin, for example, it is estimated that NOx emissions will need to be reduced by approximately two-thirds in 2023 and three-quarters in 2030. This is a daunting challenge. The level of emission reduction required is so significant that 2030 emissions forecasted from just three sources—ships, trains, and aircraft—would lead to ozone levels near the federal standard. Because most sources, including cars and factories, are already controlled by over 90 percent, attainment of ozone standards will require broad deployment of zero- and near-zero emission technologies in the 2023–2035 time frame.

Senate Bill 375

New to this RTP, California's Sustainable Communities and Climate Protection Act, or Senate Bill (SB) 375, calls for this RTP to include an SCS that reduces greenhouse gas (GHG) emissions from passenger vehicles by 8 percent per capita by 2020 and 13 percent per capita by 2035 compared to 2005, as set by the California Air Resources Board (ARB). SB 375 enhances the State's goals of Assembly Bill 32, the Global Warming Solutions Act of 2006. Meeting the required targets will not be easy, but it must be done for the health and quality of life of current and future generations. Meeting these targets will point the region toward overall sustainability and will provide benefits beyond reducing carbon emissions.

FINANCIAL CHALLENGES

Of all the challenges facing us today, there is perhaps none more critical than funding. With the projected growth in population, employment, and demand for travel, the costs of our multimodal transportation needs surpass projected revenues available from our historic transportation funding source—the gas tax.

State and federal gas taxes have not changed in nearly **[20]** years

Yet, highway construction costs have grown by **[82%]**

As a result of years of underinvestment, a significant number of our roadways and bridges have fallen into a state of disrepair. It is imperative that this situation be addressed. The rate of deterioration will only accelerate with continued deferral, significantly increasing the cost of bringing our transportation assets back into a state of good repair. Furthermore, with recent declines in transit funding, the region's transit operators continue to face major obstacles to providing frequent and convenient transit service.

Rail operating costs have increased by over **[40%]** in the past decade

Intercity transit operators have been forced to cut service by up to **[20%]**

The region must consider ways to stabilize existing revenue sources and supplement them with reasonably available new sources. This region needs a long-term, sustainable funding plan that ensures the region receives its fair share of funding, supports an efficient and effective transportation system that grows the economy, provides mobility choices, and improves our quality of life.

Our Approach

To address these challenges, SCAG performed a careful analysis of our transportation system, the future growth of our region, and potential new sources of revenue, and embarked on a massive outreach undertaking to hear what the region had to say. While SCAG continued to work closely through hundreds of meetings with stakeholder agencies with which it has always collaborated, it also conducted a series of planning sessions throughout the region to find out what Southern Californians want to see in their future. The result of this multi-year effort is the 2012–2035 RTP/SCS, a shared vision for the region's sustainable future.

Transportation Investments

The RTP/SCS contains a host of improvements to our multimodal transportation system. These improvements include closures of critical gaps in the network that hinder access to certain parts of the region, as well as the strategic expansion of our transportation system where there is room to grow in order to provide the region with the mobility it needs. These improvements are outlined in **TABLE 1**.

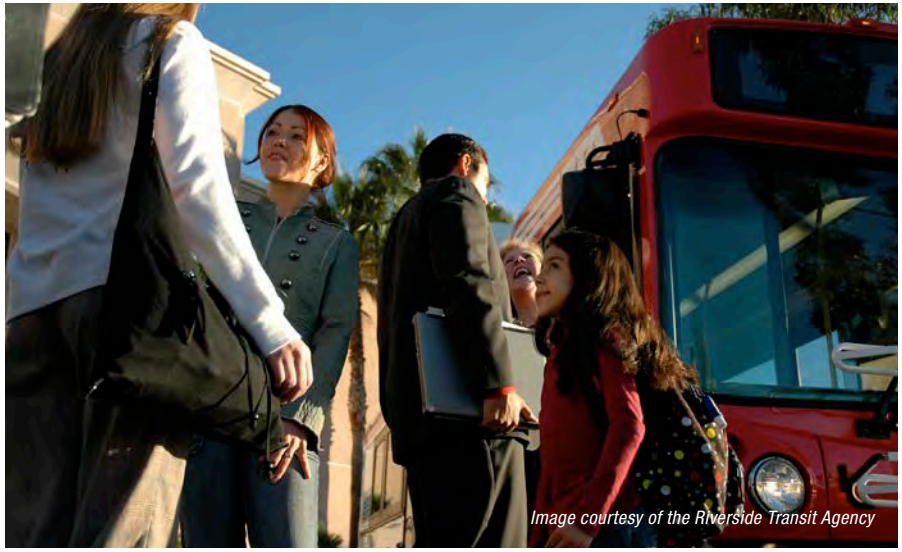

Image courtesy of the Riverside Transit Agency

TABLE 1 Transportation Investments (Nominal Dollars, Billions)

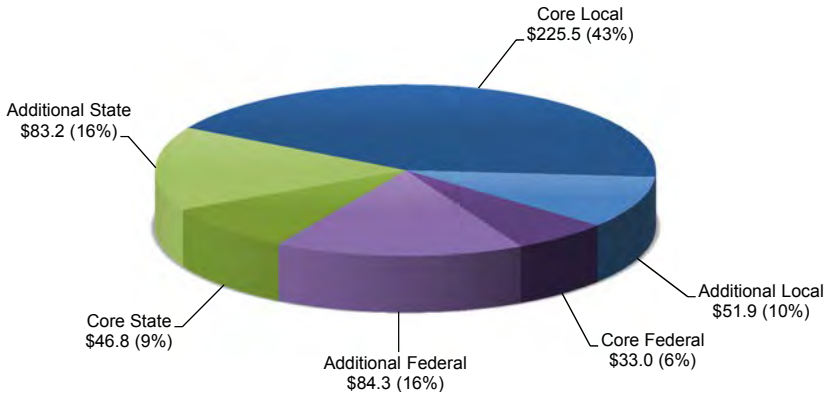
Component	Description	Cost
Transit		$55.0 billion
Bus Rapid Transit (BRT)	New BRT routes, extensions, and/or service enhancements in Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties	$4.6 billion
Light Rail Transit (LRT)	New Light Rail routes/extensions in Los Angeles and San Bernardino Counties	$16.9 billion
Heavy Rail Transit (HRT)	Heavy Rail extension in Los Angeles County	$11.8 billion
Bus	New and expanded bus service in Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties	$21.7 billion
Passenger and High-Speed Rail		$51.8 billion
Commuter Rail	Metrolink extensions in Riverside County and Metrolink systemwide improvements to provide higher speeds	$4.1 billion
High-Speed Rail	Improvements to the Los Angeles to San Diego (LOSSAN) Rail Corridor with an ultimate goal of providing San Diego-Los Angeles express service in under two hours Phase I of the California High-Speed Train (HST) project that would provide high-speed service from Los Angeles to the Antelope Valley	$47.7 billion
Active Transportation		$6.7 billion
Various Active Transportation Strategies	Increase our bikeways from 4,315 miles to 10,122 miles, bring significant amount of sidewalks into compliance with the Americans with Disabilities Act (ADA), safety improvements, and various other strategies	$6.7 billion
Transportation Demand Management (TDM)		$4.5 billion
Various TDM Strategies	Strategies to incentivize drivers to reduce solo driving: ▪ Increase carpooling and vanpooling ▪ Increase the use of transit, bicycling, and walking ▪ Redistribute vehicle trips from peak periods to non-peak periods by shifting work times/days/locations ▪ Encourage greater use of telecommuting ▪ Other “first mile/last mile” strategies to allow travelers to easily connect to and from transit service at their origin and destination. These strategies include the development of mobility hubs around major transit stations, the integration of bicycling and transit through folding-bikes-on-buses programs, triple bike racks on buses, and dedicated racks on light and heavy rail vehicles	$4.5 billion

Component	Description	Cost
Transportation Systems Management (TSM) (includes Intelligent Transportation Systems (ITS))		$7.6 billion
Various TSM Strategies	Enhanced incident management, advanced ramp metering, traffic signal synchronization, advanced traveler information, improved data collection, universal transit fare cards (Smart Cards), and Transit Automatic Vehicle Location (AVL) to increase traffic flow and reduce congestion	$7.6 billion
Highways		$64.2 billion
Mixed Flow	Interchange improvements to and closures of critical gaps in the highway network to provide access to all parts of the region	$16.0 billion
High-Occupancy Vehicle (HOV)/ High-Occupancy Toll (HOT)	Closure of gaps in the high-occupancy vehicle (HOV) lane network and the addition of freeway-to-freeway direct HOV connectors to complete Southern California's HOV network A connected network of Express/HOT lanes	$20.9 billion
Toll Facilities	Closure of critical gaps in the highway network to provide access to all parts of the region	$27.3 billion
Arterials		$22.1 billion
Various Arterial Improvements	Spot widenings, signal prioritization, driveway consolidations and relocations, grade separations at high-volume intersections, new bicycle lanes, and other design features such as lighting, landscaping, and modified roadway, parking, and sidewalk widths	$22.1 billion
Goods Movement (includes Grade Separations)		$48.4 billion
Various Goods Movement Strategies	Port access improvements, freight rail enhancements, grade separations, truck mobility improvements, intermodal facilities, and emission-reduction strategies	$48.4 billion
Aviation and Airport Ground Access		Included in modal investments
Various Airport Ground Access Improvements	Rail extensions and improvements to provide easier access to airports, and new express bus service from remote terminals to airports	Included in modal investments
Operations and Maintenance		$216.9 billion
Transit		$139.3 billion
Highways	Operations and maintenance to preserve our multimodal system in a good state of repair	$56.7 billion
Arterials		$20.9 billion

Financial Plan

The 2012–2035 RTP/SCS financial plan identifies how much money is available to support the region's transportation investments. The plan includes a core revenue forecast of existing local, state, and federal sources along with funding sources that are reasonably available over the time horizon of the RTP/SCS. These new sources include adjustments to state and federal gas tax rates based on historical trends and recommendations from two national commissions (National Surface Transportation Policy and Revenue Study Commission and National Surface Transportation Infrastructure Financing Commission) created by Congress, further leveraging of existing local sales tax measures, value capture strategies, potential national freight program/freight fees, as well as passenger and commercial vehicle tolls for specific facilities. Reasonably available revenues also include innovative financing strategies, such as private equity participation. In accordance with federal guidelines, the plan includes strategies for ensuring the availability of these sources.

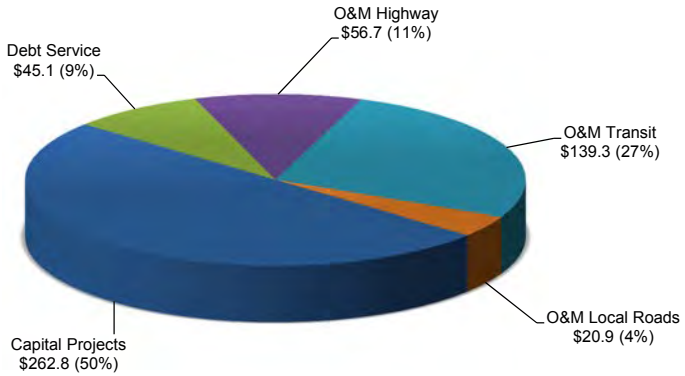
TABLE 2 presents ten categories of new revenue sources and innovative financing techniques that are considered to be reasonably available and are included in the financially constrained plan. For each funding source, SCAG has examined the policy and legal context of implementation, prepared an estimate of the revenue potential, and identified action steps to ensure the funds are available to implement the region's transportation vision.



Revenue Sources and Expenditures

FIGURES 1 and **2** provide a summary of the plan's forecasted revenues and expenditures. As shown in these figures, the region's budget over the next 25 years totals an estimated $524.7 billion.

TABLE 2 New Revenue Sources and Innovative Financing Strategies (Nominal Dollars, Billions)



Revenue Source	Description	Amount
Bond Proceeds from Local Sales Tax Measures	Issuance of debt against existing sales tax revenues: Los Angeles, Orange, Riverside, and San Bernardino Counties.	$25.6 bil
State and Federal Gas Excise Tax Adjustment to Maintain Historical Purchasing Power	Additional $0.15 per gallon gasoline tax imposed at the state and federal levels starting in 2017 to 2024—to maintain purchasing power.	$16.9 bil
Mileage-Based User Fee (or equivalent fuel tax adjustment)	Mileage-based user fees would be implemented to replace gas taxes—estimated at about $0.05 (in 2011 dollars) per mile starting in 2025 and indexed to maintain purchasing power.	$110.3 bil (est. increment only)
Highway Tolls (includes toll revenue bond proceeds)	Toll revenues generated from SR-710 North Extension, I-710 South Freight Corridor, East-West Freight Corridor, segment of the High Desert Corridor, and Regional Express/HOT Lane Network.	$22.3 bil
Private Equity Participation	Private equity share as may be applicable for key initiatives: e.g., toll facilities; also, freight rail package assumes railroads' share of costs for main line capacity and intermodal facilities.	$2.7 bil
Freight Fee/National Freight Program	A national freight program is anticipated with the next federal reauthorization of the surface transportation act. The U.S. Senate's proposal would establish federal formula funding for the national freight network.	$4.2 bil
E-Commerce Tax	Although these are existing revenue sources, they generally have not been collected. Potentially, the revenue could be used for transportation purposes, given the relationship between e-commerce and the delivery of goods to California purchasers.	$3.1 bil
Interest Earnings	Interest earnings from toll bond proceeds.	$0.2 bil
State Bond Proceeds, Federal Grants & Other for California High-Speed Rail Program	State general obligation bonds authorized under the Bond Act approved by California voters as Proposition 1A in 2008; federal grants authorized under American Recovery and Reinvestment Act and High-Speed Intercity Passenger Rail Program; potential use of qualified tax credit bonds; and private sources.	$33.0 bil
Value Capture Strategies	Assumes formation of special districts including use of tax increment financing for specific initiatives.	$1.2 bil

Sustainable Communities Strategy

Within the RTP, the SCS demonstrates the region's ability to attain and exceed the GHG emission-reduction targets set forth by the ARB. The SCS outlines our plan for integrating the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375, as evidenced by several Compass Blueprint Demonstration Projects and various county transportation improvements. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas in existing main streets, downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. This overall land use development pattern supports and complements the proposed transportation network that emphasizes system preservation, active transportation, and transportation demand management measures. Finally, the RTP/SCS fully integrates the two subregional SCSs prepared by the Gateway Cities and Orange County Council of Governments.

Photo by Alan Thompson

Measuring Up

The investments in this RTP/SCS are expected to result in significant benefits to the region with respect to transportation and mobility, as well as air quality, economic activity and job creation, sustainability, and environmental justice. They will result in better placemaking, lower overall costs, improvements in public health and the environment, responsiveness to a changing housing market, and improved accessibility and mobility.

Air Quality and GHG Targets

We will reduce greenhouse gas emissions by [**9%**] by 2020, and by [**16%**] by 2035

This RTP/SCS successfully achieves and exceeds our greenhouse gas emission-reduction targets set by ARB by achieving a 9 percent reduction by 2020 and 16 percent reduction by 2035 compared to the 2005 level on a per capita basis. This RTP/SCS also meets criteria pollutant emission budgets set by the EPA. With each passing year, Southern Californians should expect to breathe cleaner air and live healthier lives.

This air quality benefit is made possible largely by more sustainable planning, integrating transportation and land use decisions to allow Southern Californians to live closer to where they work and play, and to high-quality transit service. As a result, more residents will be able to use transit and active transportation as a safe and attractive means of travel.

Location Efficiency

Over [**twice**] as many households will live near high-quality transit

Share of households living in the High-Quality Transit Area will more than double over the plan period, signaling a more efficient overall development pattern in the future.

Mobility

Delay on our roadway system will improve over today's condition

Our roadways will be less congested, allowing our region's residents to spend less time in traffic onboard a bus or behind the wheel, and more time with their families.

Safety

Not only will residents be more mobile, they will also be safer. This RTP/SCS's emphasis on safety will result in significantly lower accident rates, giving our residents the peace of mind to travel freely throughout the day and come home to their loved ones every night.

Economy

We will generate [**500,000**] jobs per year

Not only will the region be more mobile, it will also be more prosperous. An annual average of 174,500 new jobs will be generated by the construction and operations expenditures in the RTP/SCS, and an additional 354,000 annual jobs will be created in a broad cross-section of industries by the region's increased competitiveness and improved economic performance as a result of the improved transportation system.

Investment Effectiveness

We will get [**$2.90**] back for every $1 spent

The RTP/SCS makes dollar sense. While overall expenditures by 2035 are a significant investment, the region will recover $2.90 for every $1 this RTP/SCS commits, which will only help propel the region to more prosperous days ahead.

Public Participation

The development of the Draft 2012–2035 RTP/SCS involved implementation of one of the most comprehensive and coordinated public participation plans ever undertaken by SCAG. The public and stakeholder involvement program went above and beyond meeting the requirements of SB 375 and the SAFETEA-LU. SCAG engaged the widest range of stakeholder groups, elected officials, special interest groups, and the general public through a series of workshops and public meetings, as well as SCAG's policy committees, task forces, and subcommittee structure. The input received through this process has truly shaped the Draft 2012–2035 RTP/SCS in a meaningful way. Furthermore, SCAG continued to involve and engage the stakeholders and the public in the process of refining and finalizing the 2012–2035 RTP/SCS through the close of the formal comment period in February 2012. SCAG developed a state-of-the-art video and the iRTP, an interactive RTP/SCS website, that enhanced our capability to engage and involve the stakeholders and the public in shaping the 2012–2035 RTP/SCS in an unprecedented way.

Strategic Plan—Looking Ahead—Beyond the Horizon

The 2012–2035 RTP/SCS proposes investing over $524 billion over the next 25 years to improve the quality of life of the region's residents by enhancing our transportation system. However, additional strategies and projects are needed. The Strategic Plan identifies additional long-term initiatives such as zero- and/or near zero emission transportation strategies, new operational improvements, expanded transit investments and high-speed rail system, as well as increased commitment to active transportation. Although elements of these strategies are included in the financially constrained plan, further work is needed to ensure there is regional consensus and commitment to fund the balance in subsequent RTPs.

System Vision

Goods movement and freight transportation are essential to support the SCAG regional economy and quality of life. The goods movement system in the SCAG region is a multimodal, coordinated network that includes deep-water marine ports, international border crossings, Class I rail lines, interstate highways, state routes and local roads, air cargo facilities, intermodal facilities, and regional distribution and warehousing clusters. In 2010, over 1.15 billion tons of cargo valued at almost $2 trillion[1] moved across the region's transportation system. Whether carrying imported goods from the San Pedro Bay Ports to regional distribution centers, supplying materials for local manufacturers, or delivering consumer goods to SCAG residents, the movement of freight provides the goods needed to sustain regional industries and consumers on a daily basis.

Working with its public and private partners, SCAG has established a vision for a comprehensive regional goods movement system that is reflected in the 2012–2035 RTP/SCS.

RTP/SCS Goods Movement Vision Statement

A world-class, coordinated Southern California goods movement system that accommodates growth in the throughput of freight to the region and nation in ways that support the region's economic vitality, attainment of clean air standards, and the quality of life for our communities

This vision promotes the improvement of the goods movement system by:

- Maintaining the long-term economic competitiveness of the region
- Promoting local and regional job creation and retention
- Increasing freight and passenger mobility
- Improving the safety of goods movement activities
- Mitigating environmental impacts of goods movement operations

In support of this vision, the 2012–2035 RTP/SCS describes a goods movement system with regional initiatives and projects totaling nearly $50 billion through 2035. Key regional initiatives include a comprehensive system of zero- and/or near-zero-emission freight corridors, alleviation of major bottlenecks, a rail package totaling approximately $12 billion, and an environmental strategy to address emissions through both near term initiatives and a long term action plan for technology advancement. The comprehensive system of zero- and/or near-zero-emission freight corridors includes I-710, which is currently undergoing environmental review, and an east west corridor extending to an initial segment of I-15. The rail package includes main line capacity enhancements, on-dock and near-dock rail facility improvements, and 71 grade separations. In addition, critical projects to facilitate access to the San Pedro Bay Ports (e.g., improvements to the Gerald Desmond Bridge) and the Port of Hueneme, and to alleviate congestion at critical border crossings, are underway.

This plan was developed as part of the SCAG multi-year Comprehensive Regional Goods Movement Plan and Implementation Strategy. Through this effort, SCAG has worked with diverse regional stakeholders to develop a multimodal regional freight plan. A final version of the Comprehensive Regional Goods Movement Plan and Implementation Strategy, documenting the full breadth of study findings, will be released in coordination with adoption of the 2012–2035 RTP/SCS.

This appendix includes an overview of regional goods movement activities and specific initiatives to facilitate a world-class goods movement system. The first section provides an introduction to the regional goods movement system, describing key components and how they work together to support the regional economy. The following section describes critical markets served by the regional goods movement system and how these markets depend on transportation infrastructure. The final section identifies regional strategies and initiatives, including an action plan to support the development and commercialization of technologies necessary for a zero- and near-zero emissions goods movement system.

[1] FHWA Freight Analysis Framework: http://faf.ornl.gov/fafweb/Extraction0.aspx.

The Regional Goods Movement System

The goods movement system in the SCAG region is a complex series of interconnected infrastructure components designed to serve commercial activities spurred by regional and national demand. This goods movement system provides the backbone for the movement of goods between businesses and consumers. Numerous demand factors (e.g., types of products, destinations, urgency, costs, etc.) create unique markets that must be accommodated by varying types of goods movement activities. Markets in the SCAG region range from those that move goods directly from manufacturing centers to local consumers, to those traveling from the San Pedro Bay Ports, to distant destinations across the U.S. These markets depend heavily upon an extensive regional transportation network that provides the mobility necessary to ensure economic growth. These mobility needs, coupled with the accompanying air quality, environmental, and community challenges posed by regional goods movement activities, serve as the driving force for developing a comprehensive plan to enhance the regional freight system.

Components of the Regional Goods Movement System

Both international and domestic trade thrive in Southern California in large part due to the extensive existing transportation and goods movement infrastructure in the SCAG region (**EXHIBIT 1**). This system is comprised of the following major elements:

- **Seaports:** The ports in the SCAG region (Los Angeles, Long Beach, and Hueneme) handled just under 120 million metric tons of cargo imports and exports, valued at $336 billion in 2010.[2] The Ports of Los Angeles and Long Beach represent the largest container port complex in the U.S., and the sixth largest in the world. In 2010 the San Pedro Bay Ports handled 14.1 million twenty-foot equivalent units (TEUs) of containerized cargo. The Port of Hueneme, in Ventura County, specializes in the import and export of automobiles, fresh fruit, and produce, and serves as the primary support facility for the offshore oil industry.
- **Land Ports:** The international border crossings in Imperial County (Calexico West-Mexicali I, Calexico East-Mexicali II and Andrade-Los Algodones) are busy commercial land ports responsible for over $10.4 billion in trade in 2010 despite the recent economic downturn.[3] Driven by the maquiladora trade and movement of agricultural products, the volume of goods passing through these international ports of entry is expected to increase over the time horizon of the RTP.
- **Air Cargo Facilities:** The SCAG region is home to numerous air cargo facilities, including Los Angeles International Airport (LAX) and Ontario International Airport (ONT), which combined handled over 96 percent of the region's air cargo in 2010.
- **Interstate, Highways, and Local Roads:** The region has about 53,400 road miles, 1,630 miles of which are interstate and freeway type.[4] Sections of I-710, I-605, SR-60, and SR-91 carry the highest volumes of truck traffic in the region, averaging over 25,000 trucks per day in 2008.[5] Other major components of the regional highway network also serve significant numbers of trucks, including I-5, I-10, I-15, and I-210, with some sections carrying over 20,000 trucks per day.[6] These roads carry a mix of local, domestic trade, and international cargoes. The arterial roadway system also plays a critical role, providing "last mile" connections to the ports, manufacturing facilities, intermodal terminals, warehouses, and distribution centers.
- **Railroads:** Two Class I railroads, the Burlington Northern Santa Fe Railway (BNSF) and Union Pacific (UP), carry international and domestic cargo to and from distant parts of the country. The BNSF operates on the Transcontinental Line (Cajon and San Bernardino Subdivisions) as well as the Orange and Olive Subdivisions. The UP operates on the Coast, Santa Clarita, Alhambra, Los Angeles, Mojave, and Yuma Subdivisions. Both railroads operate on the Alameda Corridor that connects directly to the San Pedro Bay Ports. The railroads are served by six major intermodal terminals in the region as well as multiple on-dock railyards at the Ports of Los Angeles and Long Beach. The SCAG region also has Class III railroads (Pacific Harbor Line, Los Angeles Junction Railway, and the Ventura County Railway).

EXHIBIT 1 Existing SCAG Regional Goods Movement System

- **Warehousing and Distribution Centers:** As of 2008, the region had about 837 million square feet of warehousing space. Another 185 million square feet[7] could be developed on vacant land that is zoned for warehousing. In 2008, an estimated 15 percent of the occupied warehouse space[8] served port-related uses while the remaining 85 percent supported a mix of domestic and international cargo.[9] Many of these warehouses are clustered along key goods movement corridors. Port-related warehousing tends to be concentrated near the Ports, while distribution facilities for domestic cargo tend to be located in areas farther away from the Ports including the Inland Empire.

The Supply Chain System and Southern California

As previously mentioned, regional transportation infrastructure supports the movement of goods to discrete markets dependent upon diverse business and consumer needs. The goods movement system in Southern California provides critical network connections between freight origins and destinations. Transportation infrastructure in the SCAG region facilitates multiple types of supply chains (also called logistics or supply networks). These supply chains are coordinated systems of organizations, people, activities, information, and resources involved in moving products from suppliers to customers.

All industries depend on reliable and efficient transportation services to meet their business objectives. Understanding the impacts and linkages between improvements in the transportation system and typical supply chains for key goods movement-dependent businesses in Southern California is critical for making decisions to support the regional economy. Supply chains are dependent on many variables, including the weight, size, and perishability of raw materials or finished product, as well as the availability and cost of different transportation modes. However, it is possible to summarize some general supply chain characteristics for key goods movement industries in the SCAG region:[10]

1. **Extraction Industries:** This sector includes industries that ship forest products, grain, and coal. In general, raw materials and products associated with these industries are heavy and not as time-sensitive as other products. Therefore, they generally prefer supply chains structures with low unit transportation costs and high asset utilization.
2. **Manufacturing Industries:** These industries – and their inputs / outputs – vary widely. In the SCAG region, top manufacturing subsectors include computer and electronic product manufacturing, fabricated metal products, apparel, food, and transportation equipment manufacturing. Each of these industry subsectors has different supply chain needs, depending on the weight, size, and time-sensitive nature of their raw inputs or products. However, in general, manufacturing industries are characterized by companies that run continuous processing facilities. They typically have few sites and highly specialized equipment, such as chemical and plastic companies. These industries generally prefer supply chain structures with low unit transportation costs and a high degree of service reliability.
3. **Make-to-Stock Industries:** These industries typically have multiple sites and a complex set of inbound and outbound product flows, and use roughly equal parts of labor and machinery. Industry examples include lumber and paper shippers, auto assembly plants, and heavy machinery manufacturers. These industries generally prefer supply chain structures with consistent and reliable service.
4. **Make-to-Order Industries:** Supply chains for this technologically advanced industry group are typified by few sites with limited flows of inbound and outbound materials. Examples include airplane manufacturers or the defense industry. These industries generally prefer supply chain structures with reliable service and fast delivery.
5. **Distribution Industries:** Industries in this group have many locations, numerous transactions, and product flows in various quantities. Many shipments are small and rely on the use of a number of vehicles. Examples might include small-package carriers and specialty electronics and aftermarket parts distributors. These industries generally prefer supply chain structures with predictability and reliable service.
6. **Retail Industries:** This includes all retail sales products. These supply chains tend to be the longest and most far reaching, usually requiring transportation flexibility, agility, and the ability to respond to forecast changes quickly. Examples include computer makers, discount retailers, and grocery stores. These industries generally

8 SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy.

9 Some domestic warehouse space may include international goods as well.

10 There are many approaches to categorizing supply chain types. This particular approach is based on an approach developed by Boston Logistics Group, Inc. and is referenced in "Guide to Quantifying the Economic Impacts of Federal Investments in Large-Scale Freight Transportation Projects," prepared by Cambridge Systematics, Economic Development Research Group, and Boston Logistics Group for the Office of the Secretary, U.S. Department of Transportation, August 2006.

prefer supply chain structures with the ability to handle high velocities and provide flexible service.

These goods movement industries contribute substantial public benefits to the region. As shown in **TABLE 1**, manufacturing and retail trade, alone, are responsible for approximately $142 billion in overall regional GDP (over 18 percent) and almost 1.7 million jobs (nearly 20 percent of all regional jobs).[11] In fact, despite the recent economic downturn, SCAG's manufacturing sector remains one of the largest in the nation. In 2009, Los Angeles County was ranked as the top manufacturing center in the country in terms of manufacturing shipment volume, with Orange County and Riverside-San Bernardino also ranked in the top 15 manufacturing centers nationally.[12] Understanding the supply chain characteristics of key industries helps to target transportation system investments into projects that support key job and GDP-producing industries. This is particularly critical as goods movement-dependent industries are projected to grow. Between 2009-2035, manufacturing is projected to grow at 3.4 percent annually, retail trade at 2.9 percent annually, and transportation and warehousing at 2.7 percent. The transportation system demands of these industries will also grow steadily throughout this time period.

TABLE 1 Regional GDP and Employment Contribution of Key Goods Movement-Dependent Industries (2010)

Key Industries	Regional Contribution	
	Jobs (in Thousands)	GDP (Billions)
Manufacturing	744	$88
Retail Trade	950	$54
Wholesale Trade	429	$51
Construction	431	$21
Transportation and Warehousing	330	$20
Other Goods Producing	70	$12

MANUFACTURING AND RETAIL TRADE SUPPLY CHAINS

Trade splits for manufacturing output in the SCAG region suggest that the region develops products that are in demand by local, national, and international markets. In 2010, 35 percent of sales from SCAG's manufacturing industries was destined for international markets, compared to 38 percent of sales with other regions in the U.S. and 27 percent of sales within the SCAG region itself.[13] The geographic distribution of sales for manufacturing industries means that they will benefit from investments into the local and regional transportation systems, including their connections to national and international markets.

As a whole, higher-value manufacturing industries (such as computer and electronics manufacturing–the top subsector in the SCAG region) have increasingly adopted "just-in-time" inventory strategies that are focused on delivering goods as needed, with very little inventory requirements. Though this strategy lowers the costs of carrying inventory, it requires a high level of flexibility from suppliers and responsiveness in the supply chain. Goods that are part of "just-in-time" supply chains are extremely time-sensitive, as missing parts may cause disruptions in the manufacturing process. These products are increasingly dependent on an efficient, reliable, and safe freight movement and transportation infrastructure. Expenditures on transportation industries by the manufacturing sector in the SCAG region totaled over $17.5 million in 2010 (**TABLE 2**).

13 SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy.

TABLE 2 Expenditures on Transportation by Manufacturing Industries (2010)

Transportation Mode	Spending on Different Transportation Modes (Insourced and Outsourced)	
	Millions of Dollars	Percent of Total
Truck	$3,711	21%
Rail	$3,261	19%
Air	$5,116	29%
Water	$2,471	14%
Courier	$2,101	12%
Warehousing and Storage	$876	5%
Total	**$17,536**	**100%**

Source: SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy

Retail industries also include a wide variety of subsectors (including clothing and household goods). In general, retail industries are heavily dependent on international trade to receive materials and products, usually through containerized cargo imported through the San Pedro Bay Ports. The output sales of retail industries in the SCAG region are dominated by local markets. In 2010, roughly 86 percent of sales was to local markets, compared to 14 percent of sales to other domestic U.S. locations and less than 1 percent to international locations. Retail industries in the SCAG region therefore depend heavily on the region's transportation system to move goods to market, and will benefit from investments into local connector facilities, access roads, and other facilities providing interregional mobility. Expenditures on transportation by the retail sector in the SCAG region totaled nearly $11 billion in 2010 (**TABLE 3**).

TABLE 3 Expenditures on Transportation by Retail Industries (2010)

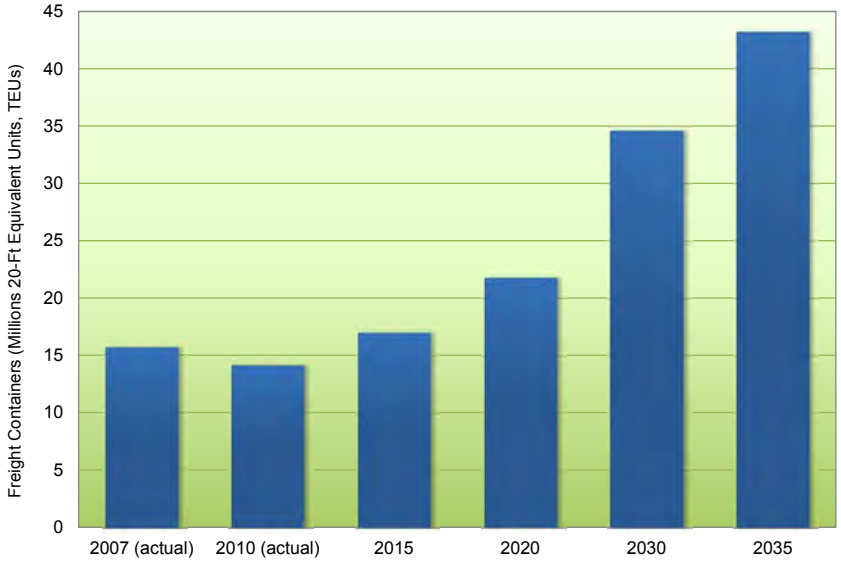
Transportation Mode	Spending on Different Transportation Modes (Insourced and Outsourced)	
	Millions of Dollars	Percent of Total
Truck	$7,136	65%
Rail	$542	5%
Air	$1,619	15%
Water	$709	6%
Courier	$506	5%
Warehousing and Storage	$416	4%
Total	**$10,929**	**100%**

Source: SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy

Though individual shippers utilize different types of supply chains, lowering transportation costs and improving reliability across logistics networks are a critical and constant focus. While significant investments in processes, technologies, and assets have made supply chains increasingly productive and cost-efficient, shippers regularly evaluate transportation costs to drive business decisions. Given the impact of transportation infrastructure on efficiencies, and thereby operating costs of supply chains, a world-class goods movement system is crucial to attract and retain businesses in Southern California. Through ongoing dialogue with regional transportation interests, the 2012–2035 RTP/SCS offers a portfolio of initiatives and projects to ensure that the SCAG region continues to benefit from goods movement activities.

Key Functions and Markets

The goods movement system has developed in the SCAG region to serve a wide range of user markets. Each of these markets has unique performance needs that dictate the components of the system that they will use. A brief summary of international, domestic, and local trade, follows.



INTERNATIONAL TRADE

The SCAG region is the largest international trade gateway in the U.S. International trade moving through the San Pedro Bay Ports, international border crossings with Mexico, and regional airports is supported by an extensive transportation system that includes a highly developed network of roadways and railroads, air cargo facilities, intermodal facilities, and an abundance of regional distribution and warehousing clusters. While the SCAG region has made great strides in building infrastructure and planning for the future, significant investment is needed to support the expected growth in the nation's largest and most important integrated freight system.

San Pedro Bay Ports

Containerized trade between the U.S. and Asia comprises the majority of international cargo entering the SCAG region, with over 31 percent of all containers in the U.S. moving through the San Pedro Bay Ports.[14] While there has been a modest shift recently in container volumes to other U.S., Canadian, and Mexican ports, total container volume for the San Pedro Bay Ports is still expected to grow to 43 million by 2035, more than three times current volumes (**FIGURE 1**). This projected increase in freight moving through the region will place greater strain on an already congested transportation system, directly affecting residents and businesses alike.

FIGURE 1 San Pedro Bay Ports Containerized Cargo Forecasts

Imports, which constitute most of the containers that move through the San Pedro Bay Ports, may be categorized as local or discretionary. Local containerized traffic is that which is ultimately consumed in a geographical area local to the San Pedro Bay Ports (Southern California, Southern Nevada, Arizona and New Mexico, and southern portions of Utah and Colorado). Discretionary containerized traffic is that which terminates outside this region. Recent analysis indicates that local traffic accounts for approximately 23 percent of San Pedro Bay Ports' total traffic. The other 77 percent is assumed to be discretionary traffic, routed through the San Pedro Bay Ports for economic reasons.[15]

Imports can be further categorized as Local, Direct Shipping or Transloaded. When containers arrive at the San Pedro Bay Ports, the way they move are determined by the economics of inventory and transportation costs (see **TABLE 4**).

[14] Source: American Association of Port Authorities (AAPA), North American Container Traffic (1990-2010), http://aapa.files.cms-plus.com/PDFs/CONTAINER%20TRAFFIC%20NORTH%20AMERICA%201990%20-%202010%20for%20the%20web.pdf.

[15] SCAG Port and Modal Elasticity Study, Phase II.

TABLE 4 Modal Strategies for Imported Cargo

Import Cargo Type	Modal Strategy
Local: Imports consumed within the greater region (i.e., imports consumed within Southern California, Southern Nevada, Arizona, New Mexico and southern portions of Utah and Colorado) for which San Pedro Bay serves as the closest container port with the lowest land-side transportation costs.	1. Movement of marine containers to destinations within the greater SCAG region using local trucks.
Direct-shipping: Imports moving to destinations outside the SCAG region that simply pass through Southern California while remaining intact in the original marine container.[1]	1. Direct movement of marine containers to destinations outside the greater SCAG region (e.g., Chicago, Kansas City, etc.) using on-dock rail facilities found at the San Pedro Bay Ports. These containers are then moved to their final destinations by local dray trucks upon arrival via rail. 2. Direct movement of marine containers to destinations outside the greater SCAG region using near-dock or off-dock rail facilities at locations in the SCAG region (usually close to the San Pedro Bay Ports). The container requires movement from the port terminal to the origin rail terminal using a local dray truck. These containers are then moved to their final destinations via rail plus a local dray at the destination end.
Transloaded:[2] Imports that are unloaded from the original marine container in Southern California and moved to local warehouses where the contents are reloaded into larger domestic containers or trailers for reshipment. A portion of transloaded imports are reloaded immediately using a cross-dock facility, but most are warehoused in Southern California for some time before reshipment.	1. Movement of marine containers to an import warehouse/transloading facility within the SCAG region using local dray trucks. This is followed by the final movement of the newly transloaded domestic container to destinations both within and outside the greater SCAG region using trucks. 2. Movement of marine containers to an import warehouse/transloading facility within the SCAG region using local dray trucks. This is followed by the movement of the newly transloaded domestic container to a local rail terminal using local dray trucks where it is transported using an intermodal train.

[1] This type of import movement is also known as inland point intermodal (IPI) movement.

[2] In the 2012 RTP, transloading is broadly defined as activities that involve the deconsolidation of the contents of marine containers, which are usually forty-foot equivalent units (FEUs), and reloading of their contents into 53-foot domestic trailers that can be transported by trucks. Transloading allows for the movement of increased amounts of goods while utilizing less equipment, resulting in significant cost savings through economies of scale and other transportation-related savings. Transloading sometimes provides value-added services as well. Existing infrastructure, equipment, and trade flows in the SCAG region provide a substantial competitive advantage and serve as a major economic incentive for importers to move freight requiring transloading through Southern California.

Drivers of Modal Decisions

The SCAG region consists of broad modal segments. Transportation mode choice is often a complicated process that reflects the type of industry being served.[16] Considerations include:

- **Product Characteristics (including the size, weight, value, and perishability of the commodity):** Commodities that are perishable, high value, or small tend to be carried by air cargo or truck modes, but will likely not make sense as a rail commodity. Similarly, heavy, low-value, or bulky materials will likely be carried by rail or truck, but are highly unlikely to be an air cargo commodity. Construction materials—including sand, gravel, and wood—are generally best moved by trucks because of their flexibility and ability to carry heavy loads. High-tech manufacturing components normally favor truck or air cargo modes to provide safe shipment for high-value, lightweight materials.
- **Trip Characteristics (including the length of the trip being made and product demand):** According to the 2007 Commodity Flow Survey, the average length haul of U.S freight shipments was over 600 miles. However, the average rail shipment was over 850 miles in length, air-truck combination was almost 1,100 miles in length, and truck trips were about 200 miles.

Supply Chain Characteristics: Many companies now operate using a "just-in-time" logistics strategy where on-site inventory is limited and a constant supply of goods serves to replenish raw materials. A product that is part of a "just-in-time" supply chain process will select a transportation mode that is fairly fast, such as truck or air. Inventory-rich industries requiring materials that are not as time-sensitive may use a transportation mode such as rail.

[16] Source: The Center for Urban Transportation Research at the University of South Florida, 2002. Analysis of Freight Movement Mode Choice Factors. Florida Department of Transportation.

International Border Crossings

International border crossings between the U.S. and Mexico are critical components of the freight transportation system in Southern California. Mexico is the third-largest trading partner of the U.S. behind Canada and China, with a $367.5 billion trade volume in 2008, accounting for 11 percent of total U.S. foreign trade. It is also the largest market for exports of goods made in California, accounting for approximately $20.5 billion (14.1 percent) of California's overall goods exports in 2008. Most of the merchandise flows in the California-Baja California region are made by truck, often to support the export-oriented manufacturing and maquiladora industries that lie on the Mexican side of the international border.

Increased trade across the border has been bolstered by the existence of multiple free trade zones (FTZs). As a result of the associated tax savings and lower wages in Mexico, FTZs have been used by U.S. companies to export raw materials into Mexican manufacturing firms (maquiladoras), where goods are processed or assembled, and then exported back in their finished state to the U.S.[17] The ability to transfer goods from one FTZ to another within Mexican territory without losing any of the fiscal incentives (tax savings) is slowly creating a logistic and manufacturing network of FTZs that is expected to boost Mexican foreign trade with the U.S. (Intermodal México, 2010).

The future economic performance of Mexico faces strong competition as low-wage manufacturing jobs from Asia have eroded the maquiladoras' once-traditional competitive advantage. However, studies show that some maquiladoras have evolved from primarily labor-intensive factories to organizations with greater complexity, technology utilization, and research and skill specialization. As such, the future of the maquiladora industry in the Baja California region is likely to have a positive future.[18]

Accommodating expected growth in cross-border trade will require close coordination and partnership among federal, state, regional, and local agencies on both sides of the
