[17] Originally these FTZs were located primarily along the border, but recent changes to the Mexican Customs Law now allow them to operate anywhere in the Mexican territory, and several FTZs have opened in mainland Mexico, creating logistic hubs such as San Luis Potosí and Guanajuato.

border. This coordination must consider investment in transportation infrastructure to maintain the regional economic benefits provided by these international border crossings.

International Air Cargo

Los Angeles International Airport (LAX) handled over 1.8 million tons of cargo in 2010, making it the fifth-busiest cargo airport in the United States and the 13th busiest in the world.[19] Most often used for time-sensitive and higher-value goods, international air cargo plays a significant role in the regional economy, with $78 billion in trade.[20] Over 82 percent of the international air cargo at LAX is handled by scheduled passenger airlines or their cargo divisions that operate freighter aircraft. According to the recent air cargo forecast completed for SCAG, air cargo activity has been steadily declining over the past decade. However, this decline has been entirely confined to domestic air cargo. International air cargo reached a peak in 2007, declined in 2008 and 2009 with the recession, then recovered in 2010. It seems likely that international air cargo will continue to grow in the future.

DOMESTIC AND LOCAL GOODS MOVEMENT

While the region is a major gateway for international container movements, local and domestic freight is dominant. An overwhelming majority of goods movement activity in the SCAG region is generated by local businesses moving goods to local customers and serving national domestic trade systems. These local goods movement-dependent industries rely on transportation as a key part of their business model and generally utilize a more geographically dispersed transportation network than the international container market. Over 85 percent of truck trips are associated with intra-regional goods movement. Domestic manufacturers, wholesalers, and retailers also use the rail system and the air cargo system, though to a much more limited extent than international shippers.

The regional transportation system provides the infrastructure to allow these businesses to ship and receive the materials necessary to perform daily operations. Examples include shipments of raw supplies to support manufacturing processes and the delivery of refined or finished products to market. Major goods movement-dependent industries include those related to the manufacturing, wholesale trade, construction, transportation and warehousing, and mining sectors.

In 2010, local goods movement-dependent industries employed over 2.9 million people throughout the region (**FIGURE 2**), and contributed $253 billion to the regional GDP (**FIGURE 3**). These industries are anticipated to grow substantially by 2035 (**FIGURE 4**).

[19] Almost all international air cargo moves through LAX. Ontario International Airport (ONT) handles a very small proportion (about 3 percent in 2010) and the other regional airports handle the remainder.

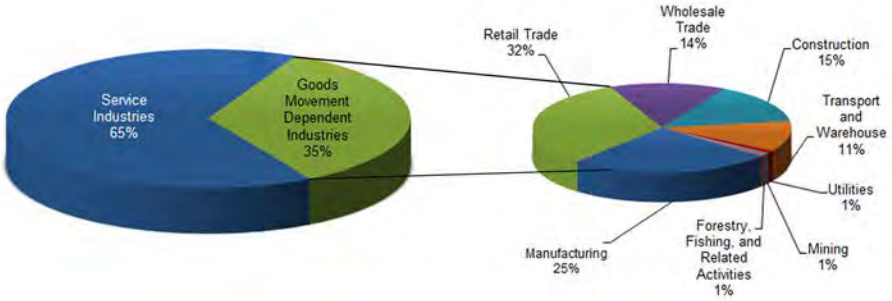
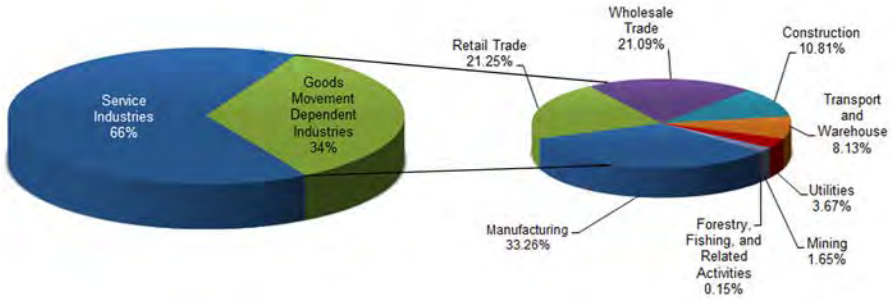
FIGURE 2 2010 Employment Contribution of Goods Movement-Dependent Industries (in Billions)





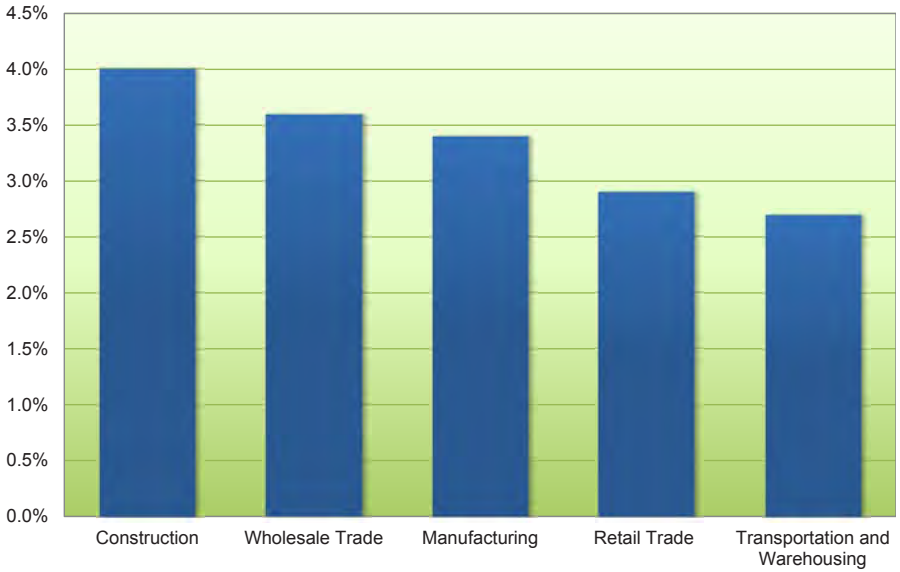


FIGURE 3 2010 Economic Contribution of Goods Movement-Dependent Industries (in Billions)

Regional GDP is a broad indicator of the level and strength of economic activity in a region. In the long term, the region's GDP is projected to grow steadily through 2035 at a rate slightly faster than the U.S. economy as a whole. The region's total GDP was $792 billion in 2009 and is projected to top $1.59 trillion by 2035, growing by over 100 percent at an average rate of 3.9 percent between these years. In comparison, the U.S. economy (U.S. GDP) is expected to grow about 99 percent from 2009 to 2035 (about 3.8 percent annually).[21]

Mirroring national trends, this GDP growth is anticipated to be accompanied by an increasing transition toward a higher value-added manufacturing and service economy. The highest-growth industry sectors from 2009 to 2035 include the manufacturing, wholesale trade, and construction sectors, all of which are highly dependent on the regional goods movement system. All three of these sectors will more than double in size in the next two decades and will contribute a combined $380 billion to regional GDP by 2035 (**FIGURE 4**).

FIGURE 4 2010–2035 Average Real Annual Growth Rates by Major Goods Movement-Dependent Sectors

Goods Movement Trends and Drivers

There are a number of key trends that are anticipated to have major impacts on the goods movement system over the RTP horizon. These trends include:

- **Population and Economic Growth:** As previously referenced, regional population and employment in the SCAG region, key indicators of economic health, are both projected to grow rapidly in the next two decades. The 2010 Census revealed that the SCAG region is home to just over 18 million people, or about 48 percent of the entire population of the state of California.[22] Despite the current economic downturn brought on by challenging global conditions, population and employment in the SCAG region are expected to grow by 24 percent and 22 percent by 2035, respectively. This growing population will be accompanied, after an initially slow period of growth, by healthy job creation.[23] However, employment in California has suffered recently, declining by 1.3 percent in 2008 and 6 percent in 2009.[24] Though unemployment rates in the state, as a whole, will remain high in the foreseeable future, employment in the SCAG region is projected to climb steadily.[25] This growth will create increased consumer demand for products and the goods movement services that provide them. The increased demand will drive stronger growth in freight traffic on shared highway and rail facilities.
- **Recovery and Expansion of International Trade:** Within the RTP time horizon, international trade is anticipated to recover with renewed demand for both import and export capabilities. Despite competition with other North American ports and the expansion of the Panama Canal, the San Pedro Bay Ports anticipate cargo volumes to grow to 43 million containers annually by 2035 – more than tripling from today's levels. This will create the need to expand marine terminal facilities, improve highway connections (particularly those connecting directly to the San Pedro Bay Ports, like I-710 and SR-47), and address on-dock and off-dock intermodal terminal capacities. If port-related rail traffic and commuter demand are to be satisfied, additional main line capacity improvements will be required. Mitigating the impacts of increased train traffic on communities will continue to be a considerable challenge.
- **Continued Expansion of Warehouse and Logistics Activity:** Southern California is an ideal place for expanded distribution and logistics activity and will continue to be a significant source of well-paying jobs in the region through 2035.[26] Demand for port-related warehouse space is projected to grow at a faster pace than demand for domestic warehousing. As space near the San Pedro Bay Ports reaches capacity, port warehousing will push out to the Inland Empire and other parts of the region. Expansion in national and regional distribution facilities is also likely to occur in the Inland Empire, resulting in substantial congestion problems due to the increased truck volumes on regional highways. By 2035, the region may experience a shortfall of more than 228 million square feet in warehouse space relative to demand.[27]
- **Air Quality Issues:** Much of the SCAG region does not meet federal ozone and fine particulate matter ($PM_{2.5}$) air quality standards. Goods movement is a major source of emissions that contribute to these regional air pollution problems (NO_X and $PM_{2.5}$). While emissions from goods movement are being decreased through efforts such as the San Pedro Bay Ports Clean Air Action Plan, these reductions are unlikely to be sufficient to meet regional air quality goals.

2012–2035 RTP/SCS Goods Movement Strategies

Infrastructure in the SCAG region must serve a variety of markets and be able to support diverse supply chains, each having distinct operational needs to continue to ensure continued economic growth. In addition, various policy strategies must be developed to address many of the impacts of regional goods movement including air quality, environmental, and communities concerns. To realize the benefits of efficient and sustainable goods movement, it is critical to identify strategies and projects that address expected growth trends.

2012–2035 RTP/SCS Background

In May 2004, SCAG, the six county transportation commissions in the SCAG region, San Diego County, and Caltrans began development of a plan to deal with regional goods movement challenges. This plan, also known as the Multi-County Goods Movement Action Plan (MCGMAP), identified freight movement constraints and included strategies that would lessen community and environmental impacts. Using the MCGMAP as a foundation, SCAG completed additional analyses to develop policies reflected in the 2008 RTP. The goods movement portion of the 2008 RTP identified a number of strategies aimed at facilitating regional freight movement in an economically viable and responsible manner.

Following the completion of the 2008 RTP, SCAG began the multi-year Comprehensive Regional Goods Movement Plan and Implementation Strategy to develop a refined regional goods movement plan along with an accompanying implementation strategy. Through this effort, SCAG has worked with diverse regional stakeholders to conduct in-depth evaluation of the region's goods movement system and associated regional freight patterns. A final version of the Comprehensive Regional Goods Movement Plan and Implementation Strategy documenting the full breadth of study findings will be released in coordination with adoption of the 2012–2035 RTP/SCS. The study integrates existing strategies and projects with newly developed regional initiatives advanced through recent analyses. The following sections highlight key regional initiatives evaluated for the 2012–2035 RTP/SCS.

Highway Strategies

EXISTING AND PROJECTED HIGHWAY CONDITIONS

Due to continued growth in freight and market demands, regional truck-related activities are expected to increase over the RTP time horizon. Trucks must be able to efficiently carry freight between businesses and consumers throughout the SCAG region to ensure that Southern California continues to capture the economic benefits of goods movement.

As part of the SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy, considerable enhancements were made to SCAG's existing heavy-duty truck (HDT) model to support the region's goods movement policy decisions. The HDT model is the primary analysis tool to evaluate the impacts of truck traffic and highway goods movement strategies on the regional transportation network. Major sources of truck traffic are grouped into the following categories in SCAG's HDT model:

- **Internal Truck Trips:** These are truck trips that have both an origin and a destination within the SCAG region and are generated by local industries, construction sites, domestic warehouses and truck terminals, and residences.
- **External Truck Trips:** These are interregional truck trips that reflect trade between the SCAG region and the rest of the U.S.
- **Port Truck Trips:** These are truck trips with an origin or destination at the San Pedro Bay Ports.
- **Secondary Port Truck Trips:** These are truck trips with an initial origin or destination at the San Pedro Bay Ports that are moved a second time after the first trip to or from the San Pedro Bay Ports. Transloading trips are in this category.
- **Intermodal (IMX) Truck Trips:** These are domestic intermodal truck trips that have origins or destinations at regional intermodal rail terminals. These truck trips do not include those that have either an origin or destination at the San Pedro Bay Ports.

TABLE 5 shows the number of regional truck trips in 2008 by category and county.

TABLE 5 Daily Regional Truck Trips by Category by County

	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura	Total	Percent
Internal	10,271	562,841	186,547	94,469	111,621	46,244	**1,011,993**	**87.3%**
External	4,816	38,794	6,815	11,183	18,140	1,271	**81,019**	**7.0%**
Port	25	37,060	2,499	855	2,752	165	**43,356**	**3.7%**

Total	**15,166**	**654,015**	**197,269**	**107,492**	**137,880**	**48,005**	**1,159,827**	
Percent	**1.3%**	**56.4%**	**17.0%**	**9.3%**	**11.9%**	**4.1%**		

In 2008, the San Pedro Bay Ports were responsible for approximately 50,000 direct daily regional truck trips.[28] As shown in **TABLE 5**, this consitutes only 3.7 percent of regional truck trips. That number is expected to grow to approximately 120,000 daily regional truck trips, an increase of nearly 150 percent, by 2035. Recent data indicates that the vast majority of trips leaving the San Pedro Bay Ports are destined for locations in the southern Gateway Cities, off-dock railyards near downtown Los Angeles, and other locations along the I-710 corridor (**EXHIBIT 2**). Although most truck trips originating at the San Pedro Bay Ports remain in the port vicinity, some still move to destinations throughout the SCAG region, contributing to local challenges on area transportation networks.

However, this pattern is expected to shift in the future with an increase in the number of daily trucks traveling to warehouses in the San Gabriel Valley and the Inland Empire. For example, in 2008, 0.5 percent and 2.3 percent of all truck trips from the San Pedro Bay Ports moved to eastern San Bernardino Valley and western San Bernardino Valley, respectively. By 2035, it is anticipated that 8.8 percent and 7 percent of those truck trips will move to eastern San Bernardino Valley and western San Bernardino Valley, respectively.

Although some areas may show a decline in the percentage of daily truck trips from the San Pedro Bay Ports, all areas will experience higher truck volumes in absolute terms.

All key regional highway corridors used to move goods are expected to see an increase in overall truck volumes by 2035 (**EXHIBIT 3** reflects 2035 baseline conditions). At the corridor level, the highest growth in truck traffic is expected on I-710 as a result of significant growth in port-related traffic. While considerable growth in truck traffic is anticipated on I-10 and I-210, overall growth on SR-60 is forecast to be the highest of all of the east-west corridors. **EXHIBIT 4** illustrates expected speeds on the regional highway network during the PM Peak period in 2035 if no action is taken.

[28] This figure includes inter-terminal truck trips that do not move on the regional highway system, while the figure provided in the table includes only trips on the regional highway system.

EXHIBIT 2 San Pedro Bay Ports Truck Distribution

EXHIBIT 4 Baseline 2035 Highway Speeds – PM Peak

REGIONAL HIGHWAY STRATEGIES

As truck volumes continue to increase, especially eastward beyond the traditional service areas surrounding I-710, it is critical that regional infrastructure accommodate and mitigate the impacts of this growth. As part of the 2012–2035 RTP/SCS, SCAG has identified strategies to relieve congestion, reduce delay and harmful emissions, and improve safety on major truck corridors.

Regional Clean Freight Corridor System

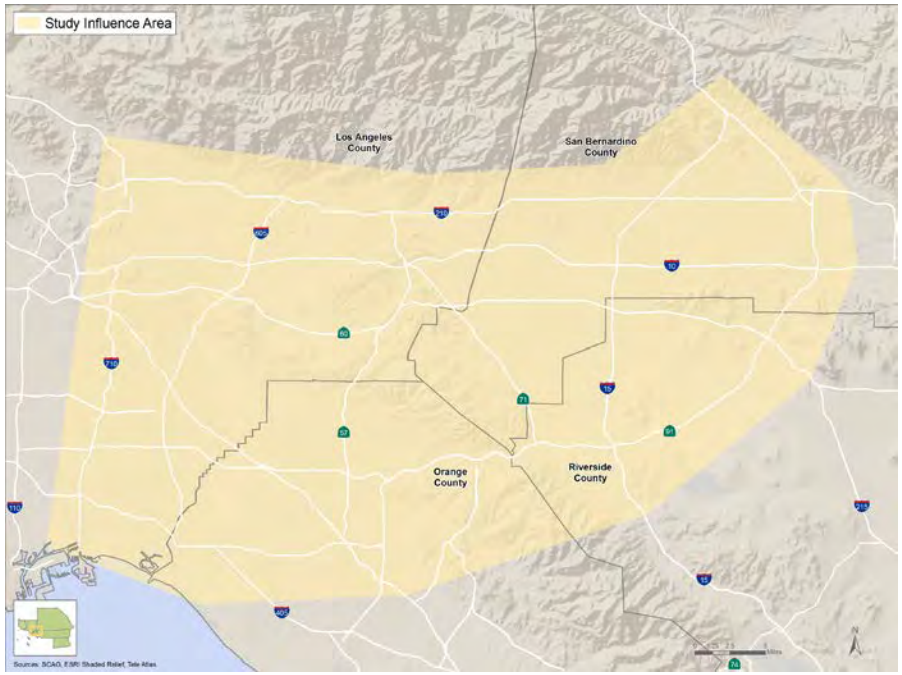
In past RTPs, SCAG has envisioned a system of truck-only lanes extending from the San Pedro Bay Ports to downtown Los Angeles along I-710, connecting to an east-west segment, and finally reaching I-15 in San Bernardino County. Such a system would address the growing truck traffic on core highways throughout the region and serve key goods movement industries in a manner that mitigates impacts on communities and the environment. Physically separated from mixed-flow traffic and with fewer ingress/egress points than typical urban freeways, truck-only freight corridors effectively add capacity in congested corridors, improve truck operations, increase safety by separating trucks and autos, and provide a platform for the introduction and adoption of zero- and/or near-zero emission technologies

SCAG recognizes I-710 as the first segment of a comprehensive regional system of truck-only freight corridors. In the 2008 RTP, SCAG recommended the inclusion of dedicated lanes for zero-emission trucks on I-710. Since that time, significant progress has been made on I-710 as evidenced by recent work on an environmental impact report (EIR) that is expected to be completed in 2013. In the 2012–2035 RTP/SCS, SCAG identifies a refined east-west corridor concept and connections to an initial segment of I-15.

EAST-WEST FREIGHT CORRIDOR

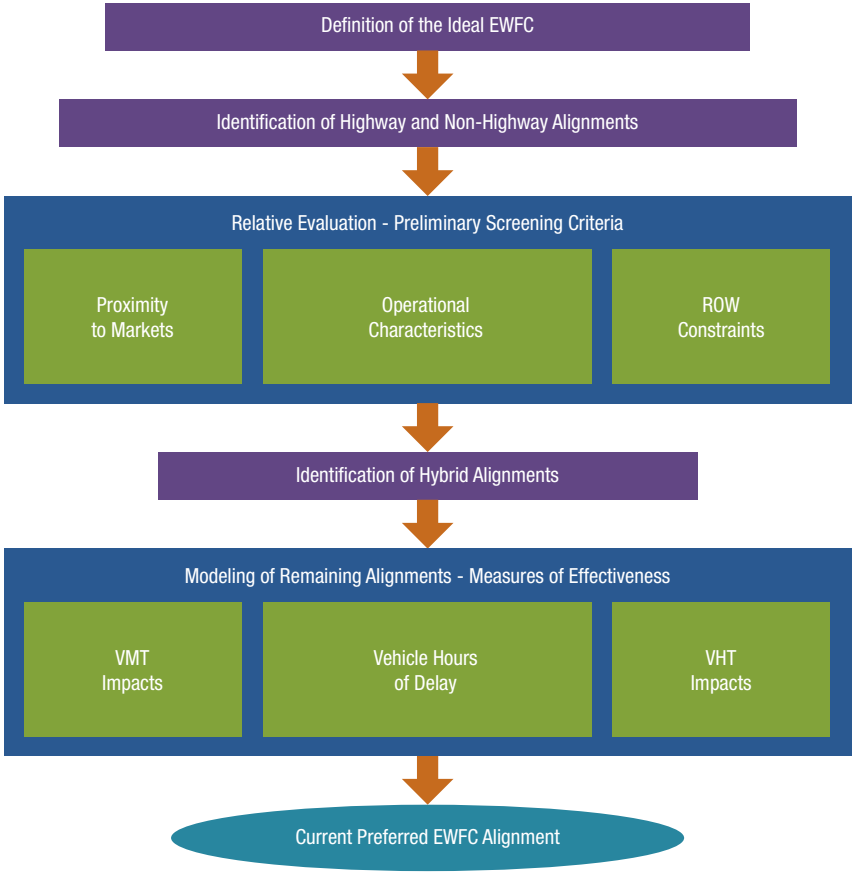
The 2012–2035 RTP/SCS identifies a corridor concept that would connect to the north end of the I-710 freight corridor and roughly parallel the Union Pacific Railroad Los Angeles Subdivision before finally following a route adjacent to SR-60 just east of SR-57 (**EXHIBIT 5**). While numerous east-west freight corridor options were examined, the RTP/SCS identifies a corridor concept to be explored further. The potential use of two non-roadway routes provides an opportunity to move the facility away from neighborhoods and closer to the industrial activities that it would serve. Utilizing a right-of-way of approximately 100 feet, the bi-directional corridor would be restricted to truck traffic and have limited ingress/egress points. The East-West Freight Corridor would be a catalyst for the use of zero-and/or near-emission truck technologies, improving air quality for communities near the corridor and throughout the region.

EXHIBIT 5 Potential East-West Freight Corridor



Following adoption of the 2012–2035 RTP/SCS, additional study of this alignment concept, will be conducted. Additional work for the East-West Freight Corridor would be explored through a full environmental impact report. This would provide substantial opportunity for further community input.

IDENTIFICATION OF THE EAST-WEST FREIGHT CORRIDOR



The preferred East-West Freight Corridor concept included in the 2012–2035 RTP/SCS is the culmination of extensive analysis and stakeholder feedback. **EXHIBIT 6** shows the area most likely to be influenced by the development of the East-West Freight Corridor.

EXHIBIT 6 East-West Corridor Analysis Influence Area

Steps to identify the East-West Freight Corridor are summarized in **FIGURE 5** and explained further below.

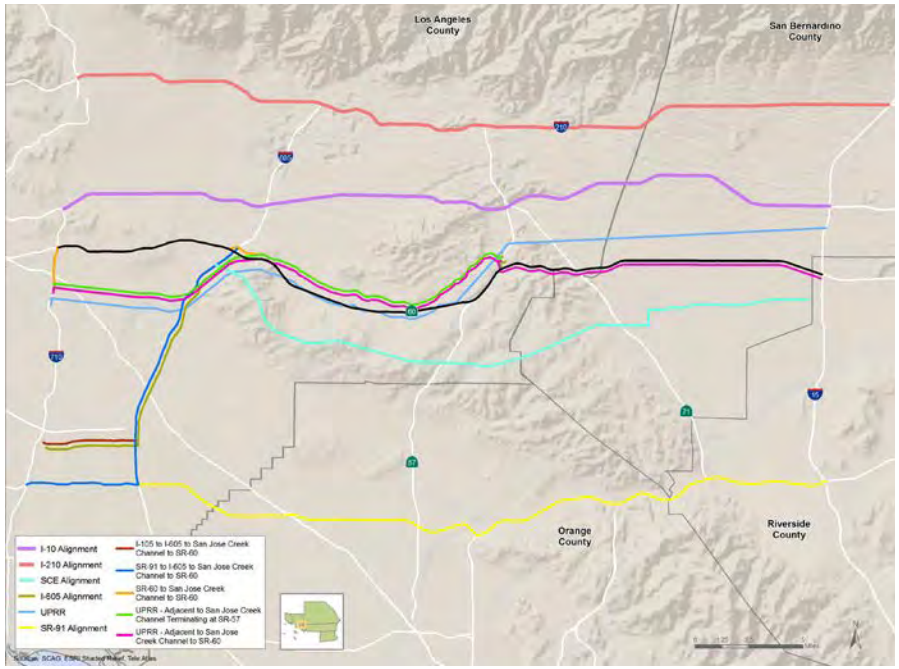


FIGURE 5 Process for Idenfication of the East-West Freight Corridor

Step 1: Definition of the ideal characteristics for the East-West Freight Corridor. An ideal East-West Freight Corridor would support mobility for key industries; serve goods movement markets efficiently; be acceptable to neighboring communities; satisfy regional environmental goals; contribute to regional congestion mitigation; and not conflict with other regional projects under consideration. Satisfying all of these criteria may be a significant challenge, but any East-West Freight Corridor should satisfy as many as possible.

Step 2: Identification of the highway and non-highway alignments that could serve as the East-West Freight Corridor. This included highway corridors such as I-210, I-10, SR-60, and SR-91. It also included an SCE utility Right-of-Way (ROW) and a UPRR-adjacent facility, including the San Jose Creek Alignment. These facilities are identified in **EXHIBIT 7**.

EXHIBIT 7 Initial East-West Freight Corridor Alignments

Step 3: Relative comparison of corridors against initial screening criteria. The potential corridors were evaluated for their proximity to current and future markets, their ROW feasibility and constraints, and corridor operational characteristics including the volume of trucks carried and the incidence rate of truck-involved accidents.

Step 4: Creation of new "hybrid" alignments that minimized community impacts. Following initial screening, the facilities identified below were further analyzed:

- UPRR-adjacent to San Jose Creek to SR-60
- UPRR-adjacent to San Jose Creek terminating at SR-57
- SR-60 to San Jose Creek to SR-60
- SR-91 to I-605 to San Jose Creek to SR-60
- I-105 to I-605 to San Jose Creek to SR-60

Step 5: Modeling of five remaining corridor alignments with the SCAG HDT model, including their impacts on Measures of Effectiveness (MOEs): VMT, VHT, and VHD. MOEs were calculated for the influence area. Results of the modeling analysis are summarized in **TABLE 6**.

Based on this analysis, Alternative 1 (UPRR-adjacent to San Jose Creek Channel to SR-60) was identified as the preferred corridor for further analysis and refinement. It is anticipated that this corridor concept could fall within a five-mile span of Alternative 1 (route illustrated in **EXHIBIT 5**.)

TABLE 6 Modeling/Summary Comparison of Six Potential East-West Freight Corridor Alignments

ID	Alignment	Summary/Key Points
1	UPRR-Adjacent to San Jose Creek Channel to SR-60	Carries the second-highest truck volumes – within 5% of Alt. 5
		Reduces truck traffic on SR-60 by 65%–85%
		Shows greatest reduction in total delay for all traffic (-4.3%) in influence area, as well as highest reduction (-10%) for heavy-duty truck delay
2	UPRR-Adjacent to San Jose Creek Channel Terminating at SR-57	Results in negative traffic impacts – 18% more traffic on SR-60 east of SR-57
		Shows increase in total delay for all traffic (1%) in influence area, as well as the medium reduction for heavy-duty truck delay
3	SR-60 to San Jose Creek Channel to SR-60	Carries the same truck volume as Alt. 1 – within 5% of Alt. 5
		Reduces truck traffic on SR-60 by 70%–85%
		Shows high reduction in total delay for all traffic (-3.7%) in influence area, as well as high reduction (-9%) for heavy-duty truck delay
4a	SR-91 to I-605 to San Jose Creek Channel to SR-60	Carries lower truck volumes than Alt. 1, 3, 4b, and 5
		Shows greatest heavy-duty truck delay reduction (-10.9%) but fairly low (-1.3%) overall total delay for traffic
4b	I-105 to I-605 to San Jose Creek Channel to SR-60	Shows high heavy-duty truck delay reduction (-10.7%) but fairly low (-1%) overall total delay for traffic
5	SR-91	Carries the most trucks of all screenlines – up to 57,780 (two-way volumes)
		Has little impact on parallel freeways east of SR-57
		Shows high heavy-duty truck delay reduction (-10.5%) but fairly low (-1%) overall total delay for traffic

BENEFITS OF THE EAST-WEST FREIGHT CORRIDOR

Continuing to move freight efficiently is critical to retain Southern California's trade competitiveness. The East-West Freight Corridor (Alternative 1) offers the opportunity to address many of the goods movement challenges, including congestion, air quality, and safety concerns. The East-West Freight Corridor will support mobility for key industries, serve goods movement markets in an efficient manner, promote the region's environmental goals, and contribute to alleviating the region's congestion. In addition, it will not conflict with other major regional projects under consideration. Analysis completed as part of the SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy for the 2012–2035 RTP/SCS indicates that major benefits of the potential East-West Freight Corridor include:

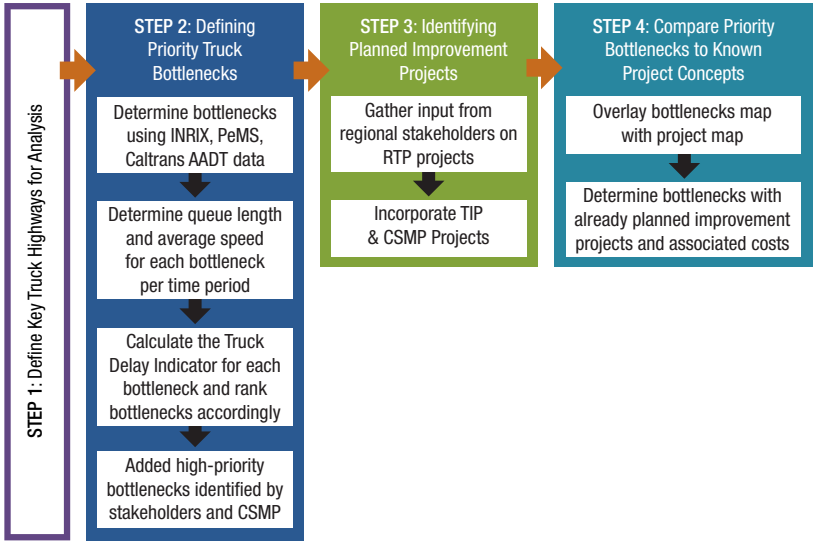
- **Mitigation of Future Truck Traffic:** Truck traffic is projected to grow significantly on all existing key east-west freeway segments. These dramatic increases in truck traffic on east-west corridors will cause increased congestion and longer delays to both trucks and general traffic on existing routes. The construction of the East-West Freight Corridor would increase capacity to accommodate the projected growth in truck activity. The corridor's traffic mitigation impacts would be significant, especially considering that some segments of the East-West Freight Corridor are forecast to carry between 58,000 and 78,000 trucks per day in 2035.
- **Reduction in Regional Delay:** The East-West Freight Corridor is projected to result in substantial delay reduction for both trucks and autos. Within the identified influence area, all traffic is expected to experience a reduction of approximately 4.3 percent, with heavy-duty trucks seeing a nearly 10 percent decrease. This reduced delay would provide demonstrable travel time savings as well as reduce emissions from idling vehicles on congested roadways.
- **Impact on Parallel Routes:** The East-West Freight Corridor is projected to draw significant volumes of truck traffic away from parallel routes, easing congestion and creating capacity for other vehicles on general purpose lanes. Estimates indicate that the East-West Freight Corridor could reduce daily traffic on portions of SR-60 (between 42–82 percent), I-10 (up to 33 percent), SR-91 (up to 19 percent), I-210 (up to 17 percent), and major regional arterials (up to 21 percent).

- **Mobility Benefits for Critical Markets:** The East-West Freight Corridor would offer considerable benefits to regional businesses and industries served by the numerous clusters of warehousing and manufacturing facilities near the route. Portions of the recommended potential East-West Freight Corridor lie within a five-mile radius of 52 percent of the region's warehousing square footage and 27 percent of regional manufacturing employment. Supplemental **EXHIBITS A1–A6** show the proximity of major truck corridors to regional warehousing and manufacturing.
- **Reduction of Truck-Involved Accidents:** The East-West Freight Corridor offers the potential to reduce truck-involved crashes as a result of the separation between trucks and other vehicles. Safety analysis revealed that several existing east-west corridors have high rates of truck-involved crashes, including segments of SR-60, SR-91, and I-10. Over a five-year period, the average of truck-involved crashes on key east-west corridors showed that SR-60 between I-605 and SR-57 has the highest average number of truck accidents—10 to 15 truck crashes per mile on an annual basis. A short segment near the intersection of SR-60 and SR-57 had an average of 20 to 30 crashes per mile annually. The East-West freight corridor designed specifically for use by heavy duty trucks has the potential to improve safety and decrease the number of accidents for trucks and autos on parallel routes.
- **Preservation of Jobs and Income:** Increasing congestion is making Southern California a less attractive place to do business, threatening jobs and the positive economic impacts of the goods movement sector. The East-West Freight Corridor delivers a transportation system with greater capacity and less congestion in support of industries that depend on efficient freight movement throughout the SCAG region.
- **Reduction of Harmful Emissions:** The East-West Freight Corridor provides an opportunity to reduce harmful pollutants through the use of zero- and/or near-zero -emission technologies for freight transportation. Although the technology to be used will be determined as the market evolves, the East-West Freight Corridor offers a significant opportunity to catalyze development, deployment, and commercialization of zero- and/or nearemission technologies for freight transportation.

TABLE 7 Benefits of an East-West Corridor Strategy

Mobility	▪ Truck delay reduction of approximately 11% ▪ All traffic delay reduction of approximately 4.3% ▪ Reduces truck volumes on general purpose lanes—42–82% reduction on SR-60
Safety	▪ Reduced truck/automobile accidents (up to 20–30 per year on some segments)
Environment	▪ 100% zero-emission truck utilization removes: 4.7 tons NO_X, 0.16 tons $PM_{2.5}$, and 2,401 tons CO_2 daily
Community	▪ Preferred alignment has least impact on communities ▪ Removes traffic from other freeways ▪ Zero-emission technology (ZET)—reduces localized health impacts
Economic	▪ Supports mobility for goods movement industries, which comprise 34% of SCAG regional economy and jobs

Bottleneck Strategy



In a recent analysis of critical issues affecting the trucking industry conducted by the American Transportation Research Institute (ATRI), traffic congestion ranked near the top in 2011 after being less of a concern in 2009–2010 as a result of the economic downturn.[29] Besides causing delays to other highway users, heavy truck congestion results in wasted labor hours and fuel. In 2010, it was estimated that the cost of truck congestion in 439 major urban areas was approximately $23 billion.[30] Truck congestion in urban areas within the SCAG region resulted in approximately $2.6 billion in costs.[31] Given that driver wages and fuel costs represent over 50 percent of total motor carrier costs, truck congestion has major impacts on the bottom line of the trucking industry. Truck bottlenecks are also emission "hot spots" and generally have significantly degraded localized air quality caused by increased idling from passenger vehicles and trucks.

A coordinated strategy to address the top-priority truck bottlenecks may be a cost-effective way to improve the efficiency of goods movement in the SCAG region. Additionally, the East-West Freight Corridor concept, alone, will not address congestion on all the major truck corridors; the bottleneck strategy reduces congestion in areas outside of the East-West Freight Corridor. Though some bottleneck projects (such as auxiliary lanes) are large, capital-intensive, projects, others (such as ramp metering) are less complex and would therefore be relatively easier to implement. Regardless of their complexity, bottleneck alleviation projects positively contribute to the region's environmental goals (by reducing emissions "hotspots"), and result in substantial, tangible benefits to commuters and goods movement industries alike.

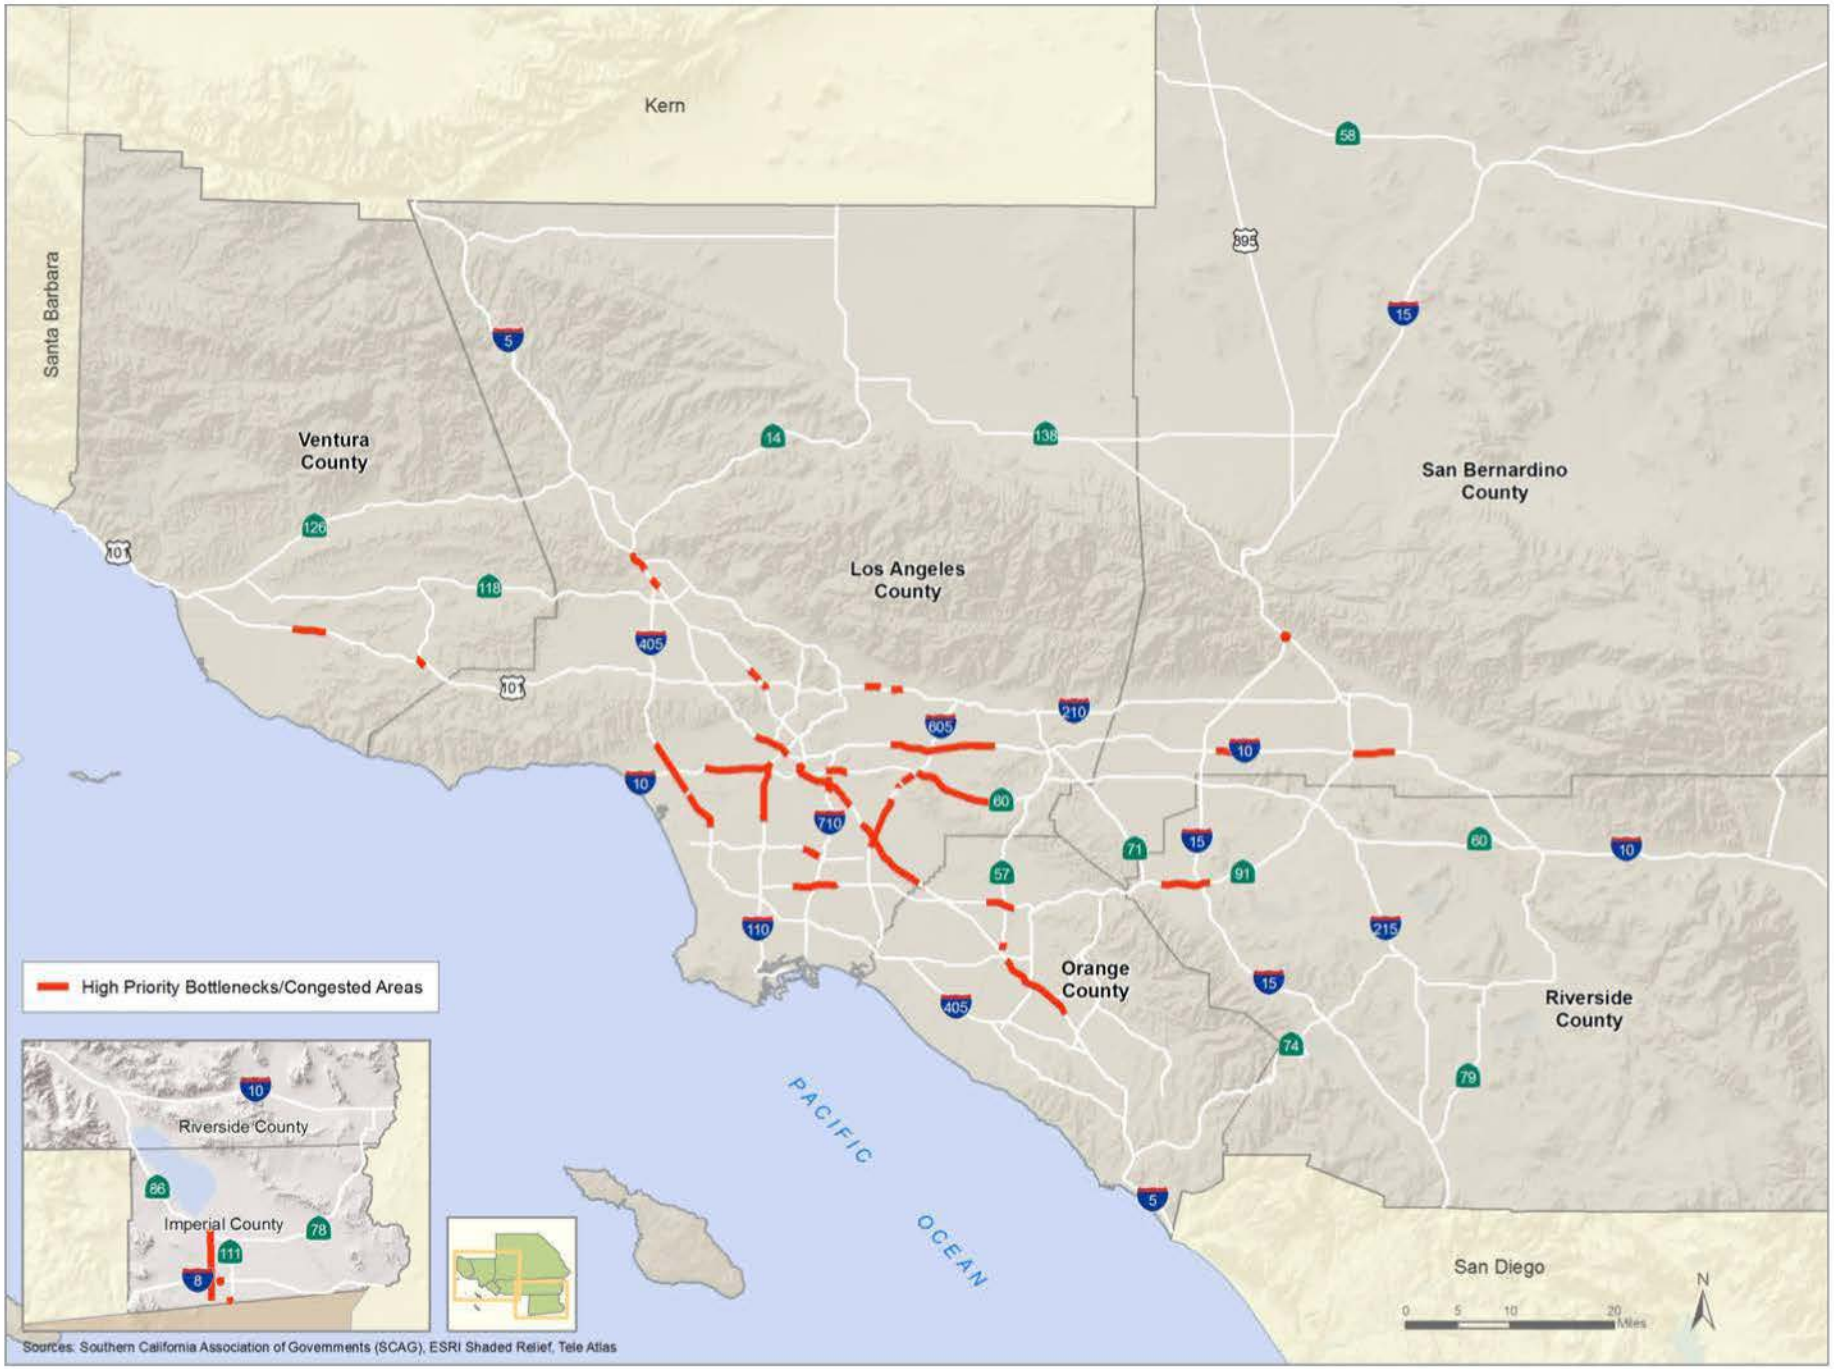
SCAG recently studied regional truck bottlenecks through a four-step process (**FIGURE 6**) that utilized Caltrans truck data, INRIX and PeMS truck traffic data, feedback from key regional stakeholders, and information from the completed Corridor System Management Plans (CSMPs).

This analysis resulted in a list of the top 44 regional priority bottlenecks (**EXHIBIT 8**). Top priority bottlenecks include those that had the highest truck-related annual delay according to the bottleneck assessment performed with INRIX and PeMS data. [32] Also included on this list are high-priority bottlenecks identified through the CSMP process and stakeholder involvement process.

FIGURE 6 Key Steps in the Bottleneck Analysis

The 2012–2035 RTP/SCS allocates an estimated $5 billion toward goods movement bottleneck relief strategies. Examples of bottleneck relief strategies include ramp metering, extension of merging lanes, ramp and interchange improvements, capacity improvements, and auxiliary lane additions. Some bottleneck relief concepts have been identified through the CSMP process and others are currently programmed for implementation. Additional project concepts will continue to be refined through SCAG's Comprehensive Regional Goods Movement Plan and Implementation Strategy.

The top 44 congested areas and bottlenecks in the SCAG region, combined, contribute over 1 million hours of truck delay annually to SCAG regional roadways in congested time periods. Addressing these congested areas and bottlenecks could contribute to a reduction in this delay, as well as associated emissions and air pollution benefits.



29 http://www.atri-online.org/2011_top_industry_issues.pdf.

30 Texas Transportation Institute 2011 Urban Mobility Report.

31 Texas Transportation Institute 2011 Urban Mobility Report. Urban areas as defined in the report include Los Angeles-Long Beach-Santa Ana, Riverside-San Bernardino, Lancaster-Palmdale, Bakersfield, Indio-Cathedral City-Palm Springs, and Oxnard-Ventura.

32 "Highest annual delay" is defined as all bottlenecks that exhibited 20,000 or more hours of truck-related delay on an annual basis.

EXHIBIT 8 Priority Truck Bottlenecks in the SCAG Region

Rail Strategies

The health of the Southern California economy depends on an efficient rail system with the capacity to accommodate projected growth in international and domestic freight. The rail system in the SCAG region provides a critical connection between the largest port complex in the country and producers and consumers throughout the U.S. Over half of the international cargo arriving at the San Pedro Bay Ports utilizes rail, including on-, near-, and off-dock rail. Regional rail also serves domestic industries, predominantly for long-haul freight leaving the region. The extensive rail network in the SCAG region is a critical link in the regional supply chain that offers shippers the ability to move large volumes of goods over long distances at lower costs versus other transportation options. As part of the 2012–2035 RTP/SCS, SCAG has highlighted a comprehensive package of improvements to the regional rail system. The rail package includes goals such as long-term economic competitiveness, job creation and retention, increased freight and passenger rail mobility, improved safety of at-grade crossings, and mitigation of environmental impacts of rail operations. By presenting these goals as a complete rail package, SCAG aims to promote collaboration and coalition building and to develop a unified message to attract leadership support for the program.

EXISTING AND PROJECTED RAIL CONDITIONS

Southern California is served by two Class I railroads:[33] Union Pacific Railroad (UP) and the Burlington Northern Santa Fe Railway (BNSF). Pacific Harbor Line, Inc. (PHL), a Class III railroad, provides rail transportation, maintenance, and dispatching services within the San Pedro Bay Ports area. The Port of Hueneme is served by the Ventura County Railway (VCR), a Class III railroad, which connects to the UP Coast main line in Oxnard. Another Class III line, the Los Angeles Junction Railway (LAJ), provides industrial switching services in the Cities of Vernon, Maywood, Bell, and Commerce. The LAJ provides connections to both UP and BNSF. **EXHIBIT 9** shows key segments of the rail system described in more detail below.

[33] For purposes of accounting and reporting, the Surface Transportation Board designates three classes of freight railroads based upon their operating revenues for three consecutive years using the following scale: Class I–$250 million or more; Class II–less than $250 million but more than $20 million; and Class III–$20 million or less. These operating revenue thresholds are stated in 1991 dollars and are adjusted annually for inflation using a Railroad Freight Price Index developed by the Bureau of Labor Statistics (BLS).

North of the Ports of Los Angeles and Long Beach, UP and BNSF trains operate on the Alameda Corridor, which was completed in 2002. All harbor-related trains of the UP and BNSF use the Alameda Corridor to access the rail main lines that originate near downtown Los Angeles. East of downtown Los Angeles, freight trains operate on the BNSF San Bernardino Subdivision, the UP Los Angeles Subdivision, or the UP Alhambra Subdivision. North and west of Los Angeles, freight trains operate on the UP Coast line toward Santa Barbara, the Antelope Valley line from the San Fernando Valley to Palmdale, or the UP Mojave Subdivision from West Colton to Palmdale.

To transition from the Alameda Corridor to the Alhambra Subdivision, the UP utilizes trackage rights over Metrolink's East Bank Line, which runs parallel to the Los Angeles River on the east side of downtown Los Angeles. The UP Los Angeles Subdivision terminates at West Riverside Junction where it joins the BNSF San Bernardino Subdivision. The BNSF San Bernardino Subdivision continues north of Colton Crossing and transitions to the BNSF Cajon Subdivision. The Cajon line continues north to Barstow and Daggett, and then east toward Needles, CA, and beyond. UP trains exercise trackage rights over the BNSF San Bernardino Subdivision from West Riverside Junction to San Bernardino and over the Cajon Subdivision from San Bernardino to Daggett, which is a short distance east of Barstow. UP trains continue north of Daggett on the UP Cima Subdivision to Las Vegas.

The UP Alhambra Subdivision and the BNSF San Bernardino Subdivision cross at Colton Crossing in San Bernardino County. East of Colton Crossing, the UP operates its transcontinental Sunset Route main line, also known as the UP Yuma Subdivision. The Yuma Subdivision passes through the Palm Springs area, Indio, and continues to Arizona and beyond.

The UP Yuma Subdivision has two main tracks from Colton to Indio. East of Indio, the Sunset Route still has stretches of single track, but construction of a second main track is underway.

The BNSF San Bernardino Subdivision has at least two main tracks with segments of triple track between Hobart and Fullerton. On the Cajon Subdivision, the BNSF recently completed a third main track from San Bernardino to the summit of Cajon Pass.

The UP Alhambra Subdivision is mostly single track, while the UP Los Angeles Subdivision has two main tracks west of Pomona and a mixture of one and two tracks east of Pomona.

North from West Colton, the single-track UP Mojave Subdivision closely parallels the BNSF Cajon Subdivision as the two lines climb the south slope of Cajon Pass. There are connections at Keenbrook and Silverwood to enable UP trains to enter/exit the main tracks of the BNSF Cajon Subdivision. Beyond Silverwood to Palmdale, the UP Mojave Subdivision has very little train traffic. UP uses this line to reach points in Northern California and the Pacific Northwest.

The BNSF operates intermodal terminals for containers and trailers at Hobart Yard (in the City of Commerce) and at San Bernardino. UP operates intermodal terminals at:

- East Los Angeles Yard at the west end of the UP Los Angeles Subdivision
- Los Angeles Transportation Center (LATC) at the west end of the UP Alhambra Subdivision
- City of Industry on the UP Alhambra Subdivision, and the
- Intermodal Container Transfer Facility (ICTF) near the south end of the Alameda Corridor

In addition, both UP and BNSF operate trains hauling marine containers that originate or terminate at on-dock terminals within the Ports of Los Angeles and Long Beach.

UP also has a large carload freight classification yard at West Colton (at the east end of the Alhambra Subdivision). A large automobile unloading terminal is located at Mira Loma (mid-way between Pomona and West Riverside on the Los Angeles Subdivision).

CURRENT AND FUTURE VOLUMES AND POTENTIAL CAPACITY CONSTRAINTS

Rail is expected to continue to play a key role in goods movement transportation in the SCAG region. Significant growth in passenger and freight rail traffic is expected on most segments of the SCAG regional rail system by 2035. This anticipated growth is highlighted in **TABLE 8**, which shows 2010, and the projected 2035 peak day train volumes on key segments. Freight train volumes include container trains, also called intermodal trains (marine and domestic), and non-intermodal trains (unit automobile trains, unit oil trains, unit bulk, and carload trains). Passenger trains include Amtrak and Metrolink service. Increases in railroad traffic will require ongoing infrastructure investment to maintain current levels of service. Increased rail traffic also has an impact on highway traffic and congestion, as more trains will result in increased wait times for vehicles at at-grade crossings.

TABLE 8 Peak Day Train Volumes 2010, 2035 (Metrolink Volumes in Parenthesis)

Line Segments	Type	2010	2035
BNSF San Bernardino Subdivision *Hobart–Fullerton*	Passenger	54(28)	77(51)
	Freight	45	90
BNSF San Bernardino Subdivision *Atwood–W. Riverside*	Passenger	26(24)	42(40)
	Freight	49	99
BNSF San Bernardino Subdivision *W. Riverside–Colton*	Passenger	10(8)	42(40)
	Freight	67	147
BNSF Cajon Subdivision *San Bernardino–Silverwood PLUS* UP Mojave Subdivision *W. Colton–Silverwood*	Passenger	2(0)	2(0)
	Freight	93	147
UP Los Angeles Subdivision *East LA–Pomona PLUS* UP Alhambra Subdivision *Yuma Jct.–Pomona*	Passenger	13(12)	21(20)
	Freight	52	98
UP Los Angeles Subdivision *Pomona–W. Riverside PLUS* UP Alhambra Subdivision *Pomona–West Colton*	Passenger	13(12)	21(20)
	Freight	51	109
UP Yuma Subdivision *Colton–Indio*	Passenger	1(0)	1(0)
	Freight	45	93

Note: A "peak day" experiences the 90th percentile of the distribution of daily train movements.
Source: 2011 Regional Rail Simulation Study, SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy. Forecasts performed through rail simulation conducted by Dr. Robert Leachman, Leachman and Associates, LLC. These numbers do not represent forecasts made by BNSF Railway or UP Railroad. Passenger volume totals include Amtrak and Metrolink.

REGIONAL RAIL STRATEGIES

The proposed regional rail package has several components. These include main line rail improvements (rail-to-rail grade separations, double or triple tracking, new signal systems, universal crossovers, new sidings, etc.) that would benefit both freight rail and passenger rail service depending on their location; rail yard improvements (upgrades to existing yards as well as construction of new yards); rail operation safety improvements such as Positive Train Control (PTC) that could greatly reduce the risk of rail collisions and increase capacity; grade separations; and emissions reduction strategies.

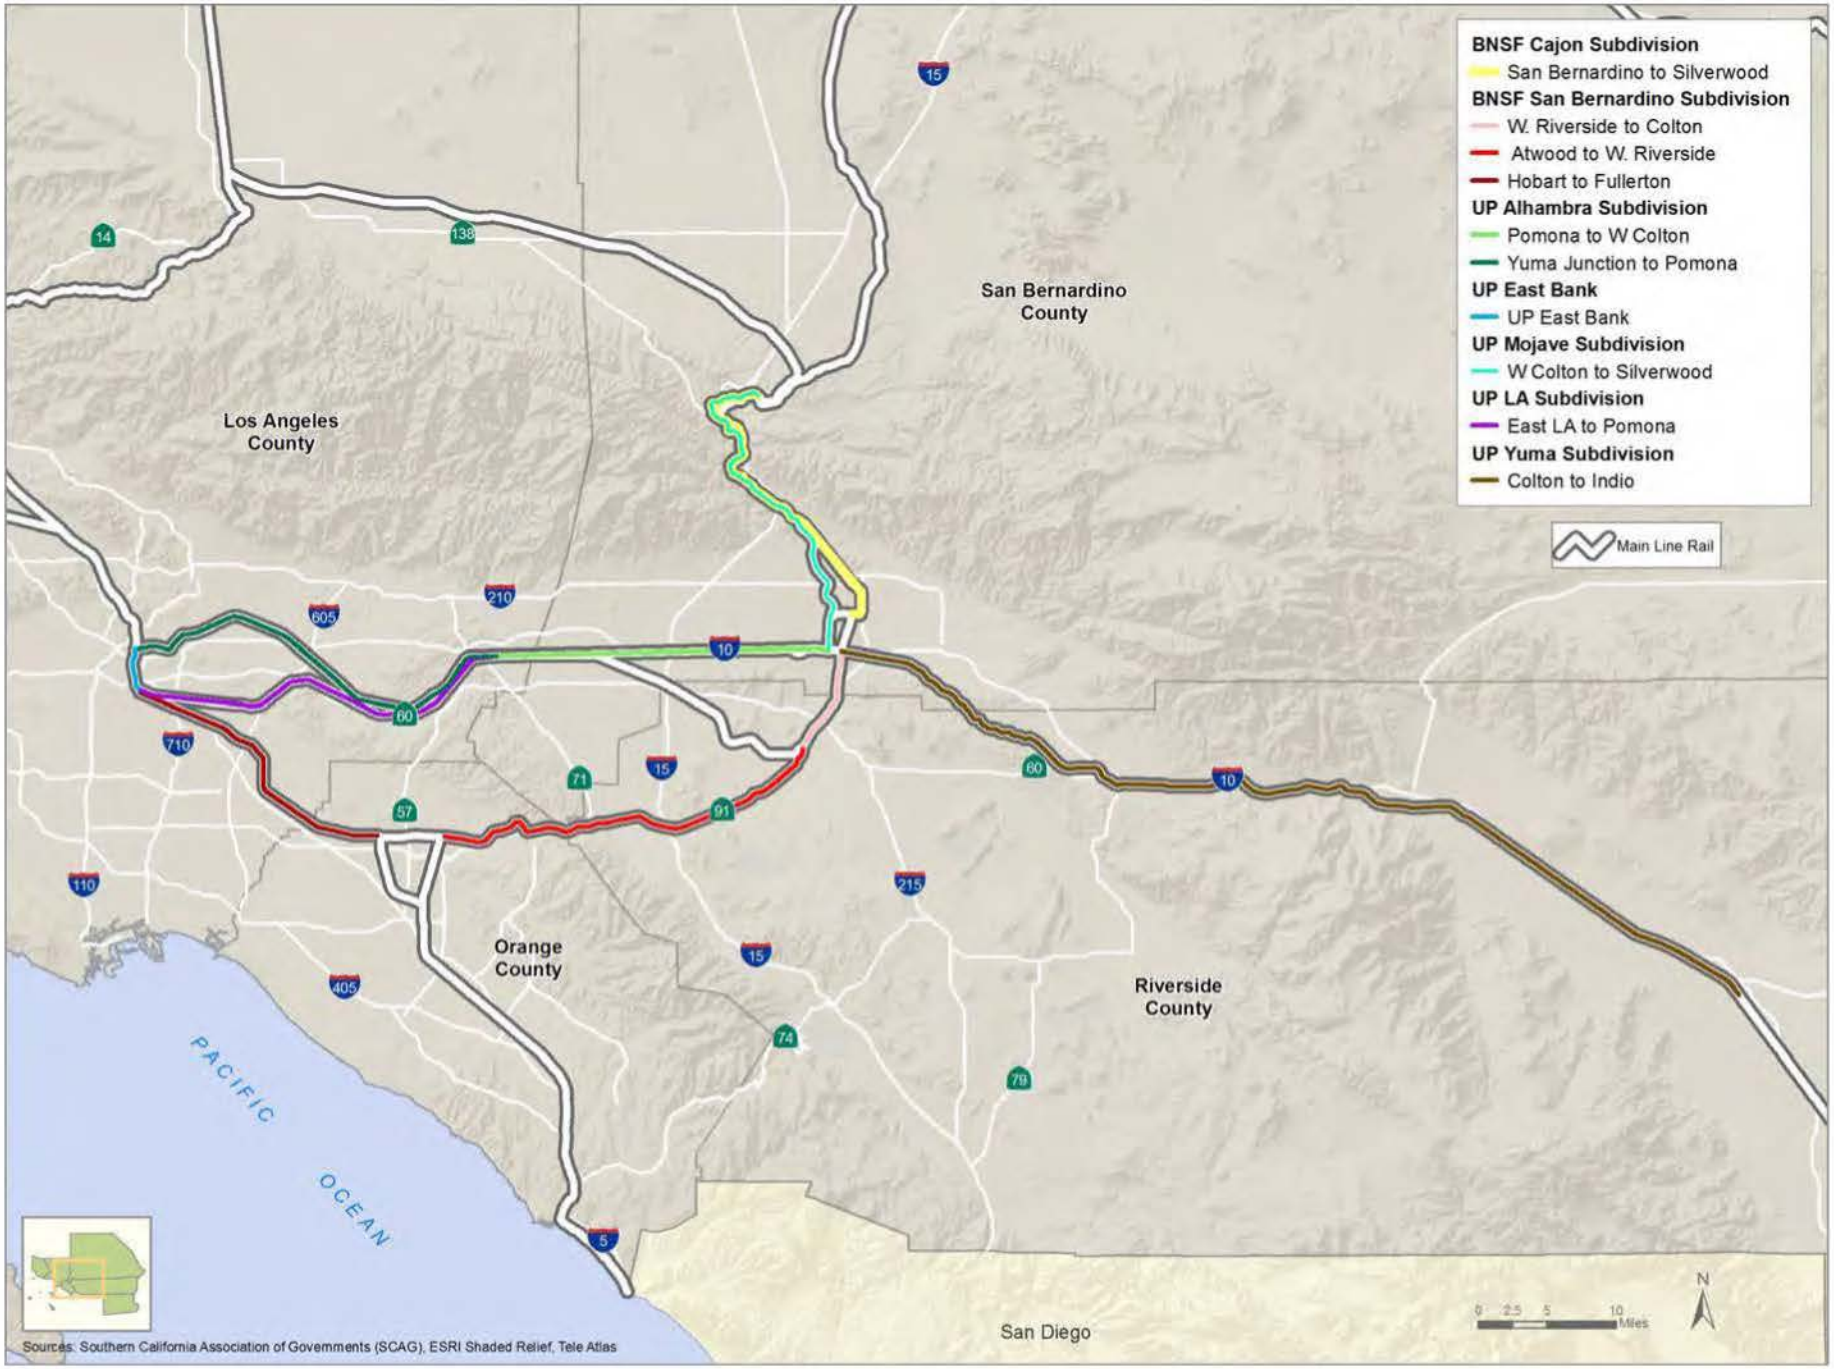
Main Line Capacity Enhancements

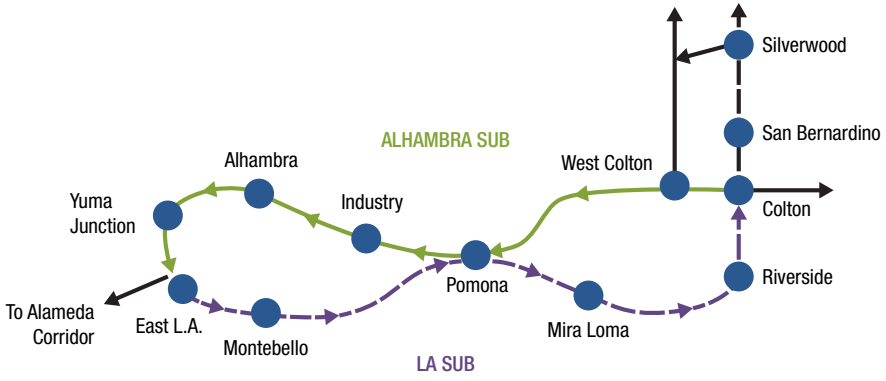
The 2011 SCAG Regional Rail Simulation Study updates the 2005 Inland Empire Main Line Rail Study. The effort evaluates the main line capacity requirements for projected levels of train traffic on the BNSF and UP lines by considering routing alternatives to meet the following goals:

- Reduce capital costs
- Reduce safety risks and impacts
- Reduce train volumes through the worst bottleneck (Riverside–Colton)
- Avoid the most costly line expansion (UP Pomona–Riverside line)
- Separate Metrolink from heavy UP traffic
- Route freight lines where most environmentally friendly (but sustain service to all rail terminals)

Currently, the UP Alhambra and Los Angeles Subdivisions are used to some extent as a paired double track, with eastbound trains operating via the Los Angeles Subdivision from Redondo Junction or East Los Angeles to West Riverside, via trackage rights over the BNSF line through Riverside to Colton (**FIGURE 7**). Because of the locations of certain rail terminals, approximately one-fourth of the UP trains must move against the current of traffic. **FIGURE 7** shows the existing routing of the UP Alhambra and Los Angeles Subdivisions. As an example, trains carrying automobiles that terminate at Mira Loma must use trackage rights over BNSF Colton–West Riverside and then operate westbound over the Los Angeles Subdivision to Mira Loma.

EXHIBIT 9 Regional Rail Segments





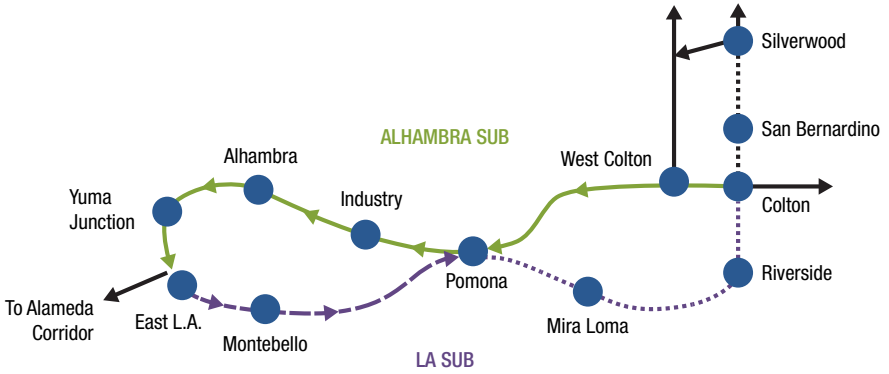


FIGURE 7 Schematic of Status Quo Routing of Union Pacific Trains

FIGURE 8 Schematic of Modified Status Quo Routing of Union Pacific Trains

Source: 2011 Regional Rail Study completed by Dr. Robert Leachman, Leachman and Associates, LLC for SCAG

A complete description of the various routing alternatives considered can be found in the 2011 Regional Rail Simulation Study. One option studied was the Modified Status Quo (**FIGURE 8**). Operations west of Pomona are the same as in the Status Quo (i.e., most UP trains follow a one-way loop westbound on the Alhambra Subdivision and eastbound on the Los Angeles Subdivision). East of Pomona, however, trains that do not have to use the Los Angeles Subdivision are routed via the Alhambra Subdivision from Pomona to West Colton. The Modified Status Quo alternative reduces the total through-train counts in 2035 through downtown Riverside and downtown San Bernardino by 41 and 10 trains, respectively. This alternative concentrates about 92 percent of UP through-train movements via West Colton versus only 8 percent via the UP Los Angeles Subdivision through Riverside.

There are a number of key advantages to the Modified Status Quo routing scenario:

- Routing trains via the UP Los Angeles Subdivision involves use of trackage rights over the BNSF San Bernardino Subdivision between Colton Crossing and West Riverside. This is the most heavily utilized line segment in the Los Angeles Basin. Expansion of the capacity of this segment to accommodate 2035 traffic levels is relatively difficult and expensive under the Status Quo alternative, requiring a fourth main track plus flying junctions to enter and exit BNSF tracks. Moreover, double tracking the remaining portions of the UP Los Angeles Subdivision would be very costly, involving duplication of the lengthy Santa Ana River Bridge and significant property-taking and earth removal in Riverside.
- The cost of main line rail improvements under Modified Status Quo routing is $670 million less costly than the improvements needed under Status Quo routing. Expansion of capacity along the UP Alhambra Subdivision between West Colton and Pomona is much less costly and is consistent with UP's stated capital investment plans.

- Shifting UP trains operating between Cajon Pass and Pomona off the BNSF line and the UP Los Angeles Subdivision and onto the UP Mojave and UP Alhambra Subdivisions reduces conflicts between Metrolink commuter trains and UP freight operations.

For these reasons, the main line track improvements in the 2012–2035 RTP/SCS update are associated with the Modified Status Quo alternative. It is recognized, however, that only UP controls the actual routing of UP trains. While neither BNSF nor UP have committed to route trains as assumed in the study, UP investments to date suggest that the Modified Status Quo represents their plans.

Estimated costs of the recommended main line track improvements are shown in **TABLE 9**. The Colton Crossing rail-to-rail grade separation (already programmed with state, federal, and private funds) involves elevating the east-west Union Pacific tracks over the north-south BNSF line. This project is funded by a $33.8 million TIGER[34] I grant, $91 million from Prop 1B TCIF,[35] and railroad funds.

Improvements to the BNSF Cajon Subdivision include installing a third main track and a fourth main track on specific segments, exceptional earthmoving, crossovers, and bridges across multiple culverts.

Improvements to the BNSF San Bernardino Subdivision include a third main track, as well as a fourth main track along the Hobart to Fullerton segment. Caltrans has provided $121.8 million for the triple tracking from Serapis (MP 151.1) to Valley View (MP 158.7).

Improvements to the UP Mojave Subdivision include a second main track over a key segment and a "flying junction" at Rancho (West Colton).

Improvements to the UP Alhambra Subdivision include double tracking key segments and route connections in Pomona.

34 Transportation Investment Generating Economic Recovery.
35 Trade Corridor Improvement Fund.

TABLE 9 Estimated Cost of Main Line Rail Improvements (Millions of Nominal Dollars)

Main Line Rail Improvements	Estimated Costs
Colton rail-to-rail grade separation–BNSF Cajon Subdivision	$243.60
Barstow to Keenbrook–BNSF San Bernardino Subdivision	$762.10
Colton Crossing to Redondo Junction–UP Mojave Subdivision	$1,188.70
Devore Road to West Colton (inc. Rancho Flying Junction)–UP Alhambra Subdivision	$522.00
West Colton to City of Industry–UP Los Angeles Subdivision	$376.10
UP Yuma Subdivision	$0
Total Main Line Rail Improvements	**$3,092.40**

Note: Estimates consistent with Modified Status Quo Alternative. Colton Crossing grade separation cost updated. Estimates have been escalated to nominal dollars using 3.2 percent annual inflation rate. Source: 2011 Regional Rail Simulation Study, SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy.

On-Dock/Near-Dock Rail Capacity Enhancements

In 2010, approximately 35 percent of the Ports' containers were shipped by rail "intact," meaning the cargo was moved by rail in marine containers without being transloaded or deconsolidated first (**TABLE 10**). An additional market segment is transloaded into 53-foot domestic containers or trailers at deconsolidation facilities in the region. The larger containers are then trucked to off-dock rail yards for loading onto trains and transported out of the region. The 53-foot wheeled trailers are also typically transported out of the region. Containers that are neither shipped by rail intact nor transloaded are trucked directly to/from local warehouses or distribution facilities.

TABLE 10 shows the percentage of direct intermodal cargo handled at on-dock and near-dock rail yards. In 2010, 23.5 percent of direct intermodal cargo was handled using on-dock rail. Containers moved using on-dock rail do not have to be trucked to/from more distant rail yards. In 2010, 11.7 percent of port containers were handled at off-dock yards (e.g., Hobart, East Los Angeles) or existing near-dock yards (i.e., ICTF). These containers must be trucked to/from these yards.

TABLE 10 San Pedro Bay Ports Direct Intermodal Volumes as a Percentage of Total Port Container Throughput (2003–2010)

	2003	2004	2005	2006	2007	2008	2009	2010
% On-Dock	15.9%	18.1%	20.7%	24.1%	23.0%	23.7%	24.6%	23.5%
% Near-/ Off-Dock	23.4%	21.2%	19.5%	18.7%	18.4%	18.5%	15.3%	11.7%
Total % Direct Intermodal	**39.3%**	**39.3%**	**40.2%**	**42.8%**	**41.4%**	**42.2%**	**39.9%**	**35.2%**
Total Throughput (POLA + POLB) Millions of TEUs	**11.8**	**13.1**	**14.2**	**15.8**	**15.7**	**14.3**	**11.8**	**14.1**

Source: Ports of Los Angeles and Long Beach

PORT AREA RAIL INFRASTRUCTURE IMPROVEMENTS

The Ports of Los Angeles and Long Beach have proposed almost $2.7 billion in rail improvements within the harbor area (**TABLE 11**). These projects are designed to facilitate an increase in on-dock rail service, to reduce railroad delay associated with train meets and passes, and to reduce conflicts with highway traffic. By allowing more on-dock rail, truck traffic between the San Pedro Bay Ports and distant rail yards can be reduced. Use of on-dock rail eliminates truck vehicle miles of travel (VMT) and associated emissions by allowing trains to be loaded and unloaded inside marine terminals.

Assuming the proposed improvements to on-dock infrastructure are made, on-dock rail is estimated to account for the movement of approximately 30 percent of all port TEUs by 2035. On-dock rail is not expected to be able to accommodate 100 percent of direct intermodal moves. It is limited by factors such as shipper/steamship line logistics (trans-loading, transportation costs, etc.), railroad operations (equipment availability, the need to generate destination-specific unit trains, train schedules, and steamship line contracts/ arrangements), and terminal operation and congestion.

TABLE 11 Estimated Cost of Port-Area Rail Improvement (Millions of Nominal Dollars)

Port Area Rail Improvements (excluding SCIG and ICTF)	Estimated Costs
Port of Long Beach	
On-Dock Railyards	$765.30
Rail Infrastructure Outside Marine Terminals	$1,321.80
Subtotal Port of Long Beach	$2,087.10
Port of Los Angeles	
On-Dock Railyards	$232.80
Rail Infrastructure Outside Marine Terminals	$216.10
Subtotal Port of Los Angeles	$448.90
Alameda Corridor Transportation Authority (ACTA)	$152.40
Total Port Area	**$2,688.50**

Source: Ports of Los Angeles and Long Beach. Cost estimates in 2011 dollars were escalated for five years at 3.2 percent per year

The "Rail Infrastructure Outside Marine Terminals" category in **TABLE 11** includes the following key projects.

- On-dock Rail Support Facility on Pier B (POLB)
- Cerritos Channel Bridge (triple tracking)
- Third Track at Thenard Junction
- Reconfiguration of Control Point (CP) Mole on Terminal Island
- Reeves Avenue Grade Separation
- Wilmington Avenue Grade Separation
- Pier F Support Yard
- Terminal Island Wye
- Track Realignment at Ocean Boulevard
- Pier 400 Second Lead
- West Basin Rail Improvements

EXHIBIT 10 Regional Mainline Rail Enhancements

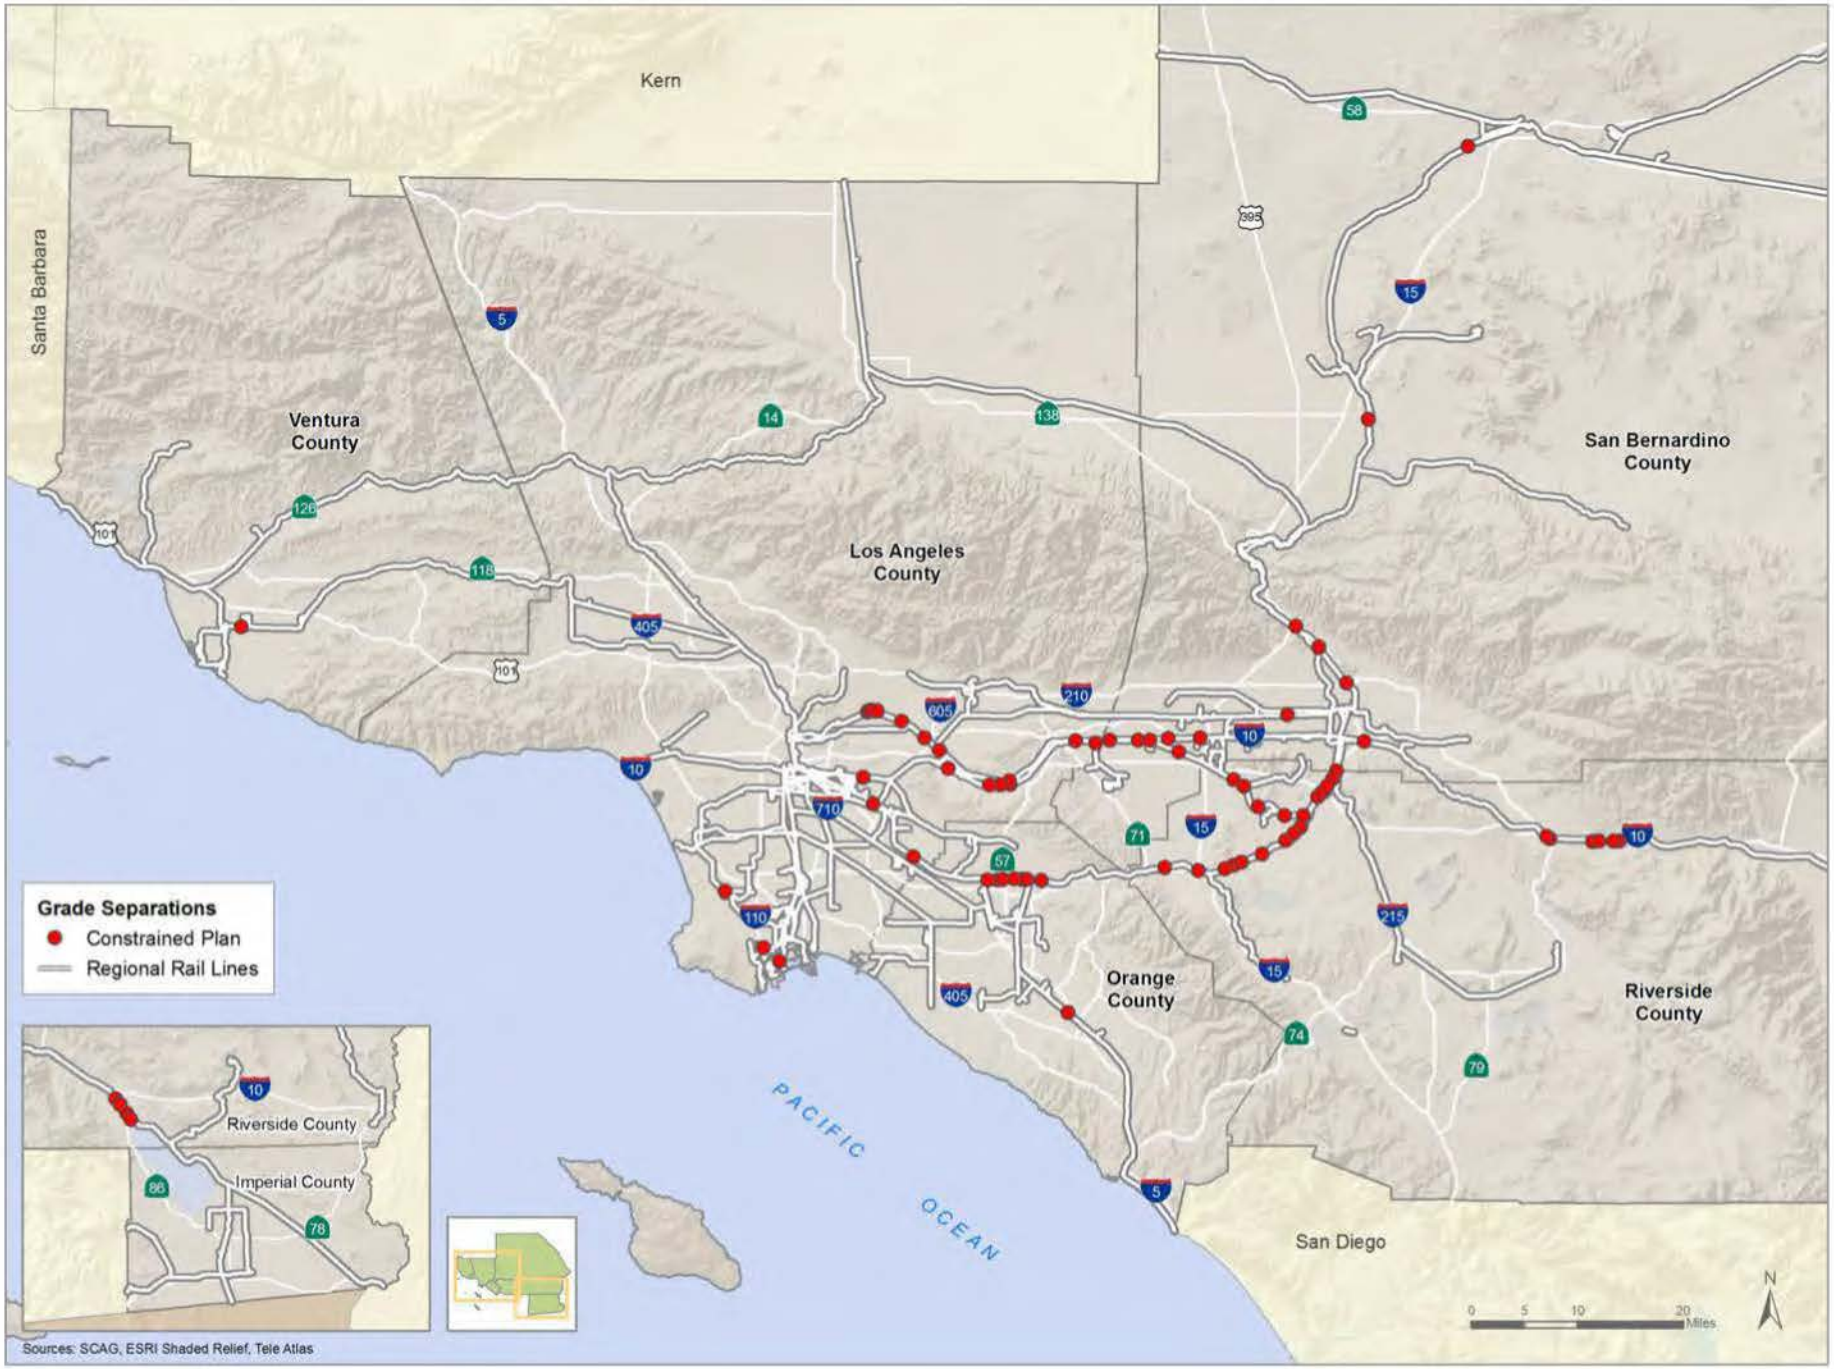
EXPANSION OF NEAR-DOCK RAIL

Additional lift capacity at near-dock yards is needed to accommodate projected demand and to reduce the number of truck trips to off-dock yards. Near-dock rail terminals provide rail accessibility to import and export cargo, using drayage trucks for the connection to and from port terminals. Expansion of near-dock rail will reduce truck VMT and emissions by eliminating the need to access more distant off-dock rail facilities. Two near-dock rail projects are currently undergoing environmental review: BNSF's Southern California International Gateway (SCIG) and modernization of UP's Intermodal Container Transfer Facility (ICTF). Potential benefits of these railyards include a reduction in regional VMT and therefore emissions. Without the SCIG and ICTF expansion, it is estimated that the growth in Marine IPI container volumes would require that at least 1.5 million container lifts would have to be handled at different yards throughout the SCAG region. While the number of truck trips would not be significantly changed, VMT would be reduced due to the shorter distance from the ports to the SCIG terminal (3–4 miles), versus the distance to Hobart and East Los Angeles yards terminal (20 miles). The Alameda Corridor has sufficient capacity to handle the projected increase in railroad traffic from the ICTF and SCIG. Although regionally beneficial, local congestion and emission impacts may affect the communities near the railyards. However, the ongoing environmental review process will identify these impacts and require that they be mitigated to the extent possible.

Intermodal Transfer Container Facility (ICTF)

The UP has proposed to invest $500 million in a modernization project that will increase container throughput at the ICTF even as it reduces the size of the existing facility from 277 to 233 acres. The project will include the replacement of diesel cranes and yard hostlers with electric ones as well as the addition of six new railroad tracks totaling 50,000 ft. Clean technologies will be utilized to cut facility emissions by 74 percent. An EIR is currently being prepared for this project.

Southern California International Gateway (SCIG)



SCIG is a $500 million project that will create a new near-dock facility for the BNSF adjacent to the San Pedro Bay Ports with direct access to the Alameda Corridor. BNSF forecasts the new facility will take millions of truck-miles off regional freeways, easing congestion and reducing air pollution. Although on-dock rail capacity is expected to increase, on-dock rail expansion alone will not be sufficient to keep up with projected growth in demand. The SCIG will include the use of electric and low-emission equipment and requirements that only lower emission trucks serve the facility. The draft EIR for this project was released in September 2011.

Rail Grade Separations

Due to increasing railroad and highway traffic, vehicle delays at grade crossings are expected to increase substantially from 2010 to 2035. Allowing two intersecting axes of traffic to move concurrently, grade crossings eliminate vehicle delay and decrease associated emissions by reducing vehicle idling times. Grade separations reduce traffic congestion and delays, as well as emissions from idling vehicles, and address other critical rail crossing–related concerns such as noise and safety.

Seventy-one grade crossings throughout the SCAG region were identified for inclusion in the financially constrained 2012–2035 RTP/SCS as shown in **EXIBIT 11**. Constrained and strategic grade separation projects are included at the end of this Technical Appendix, along with constrained grade separation maps by county (**EXHIBITS B1–B6**). Another 56 projects were identified for inclusion in the Strategic Plan. The estimated costs of the grade separations in the financially constrained plan total approximately $5.6 billion.

EXHIBIT 11 Regional Grade Separations – Constrained

RAIL PACKAGE SUMMARY

As shown in **TABLE 12**, the combined rail package has been estimated to cost approximately $12.3 billion, including main line rail improvements, port area rail improvements, near-dock railyard improvements, and rail-highway grade separations.

TABLE 12 Estimated Cost of the Proposed Package of Rail Projects, by Major Category (Millions of Nominal Dollars)

Category	Estimated Costs
Main Line Rail Improvements	$3,092.40
Port Area Rail Improvements	$2,688.50
Near-Dock Railyard Improvements	$1,000.00
Rail-Highway Grade Separations	$5,568.90
Total	**$12,349.80**

BENEFITS OF THE REGIONAL RAIL STRATEGIES

The benefits of the rail strategies to the region are considerable, and include mobility, safety, and environmental gains. As shown in **TABLE 13**, these strategies could eliminate almost 6,000 hours of vehicle delay per day at grade crossings, decrease emissions (NO_X, CO_2, and $PM_{2.5}$) by almost 23,000 lb. per day, and reduce overall train delay to 2000 levels.

The capacity enhancements in the rail package would reduce delay so that it does not exceed 2000 levels and provides enough capacity to handle projected tripling of intermodal cargo at the San Pedro Bay Ports. The delay per train is reduced depending on the train type and railroad line. For instance, trains on UP lines would experience almost 50 percent less delay per train, as compared to trains on UP lines in 2000. The rail package therefore allows more cargo to move with less delay than in previous years even with expected rail volume increases.

TABLE 13 Benefits of the SCAG Regional Rail Strategy

Mobility	▪ Reduces train delay to 2000 levels ▪ Provides main line capacity to handle projected demand in 2035 (includes 43.2 million twenty foot equivalent units, or TEUs, port throughput) ▪ Eliminates 5,782 vehicle hours of delay per day at grade crossings in 2035
Safety	▪ Eliminates 71 at-grade railroad crossings
Environment	▪ Reduces 22,789 lb. of emissions per day (CO_2, NO_X, and $PM_{2.5}$ combined) from idling vehicles at grade crossings ▪ Facilitates on-dock rail ▪ Reduces truck trips to downtown railyards and associated emissions

Other Strategies

San Pedro Bay Ports Access Projects

Landside access to the San Pedro Bay Ports is provided by highway facilities, including I-110 and I-710, and the Vincent Thomas (SR-47), Commodore Schuyler Heim (SR-103), and the Gerald Desmond Bridges. The San Pedro Bay Ports have long worked with regional and state transportation planning organizations to identify and promote projects that will alleviate congestion to and from port areas and improve air quality in the region.

Some key projects to improve direct access to the San Pedro Bay Ports are already underway, including:

- The Gerald Desmond Bridge replacement – The bridge, which has been designated as a National Highway System Intermodal Connector Route and part of the Strategic Highway Network, carries nearly 15 percent of the nation's waterborne cargo and is a critical access route for the Port of Long Beach, the Port of Los Angeles, downtown Long Beach, and surrounding communities. A final EIR for the bridge replacement was recently certified by the POLB Board of Harbor Commissioners and the California Department of Transportation (CALTRANS). They have identified the North-side Alignment Alternative as the preferred alternative linking Terminal Island to I-710. This project is important, as it improves the safety of the bridge, which was previously deemed to be seismically deficient. In addition, the new bridge will be able to accommodate increased vehicular and vessel traffic. Moreover, the new bridge will provide additional vertical clearance for vessels passing through the Back Channel to the Inner Harbor.
- The I-110/SR-47 Connectors Improvement Program is composed of three major projects that will improve freeway access to port facilities and surrounding neighborhoods, reduce congestion and conflicts between truck and rail traffic, and improve safety. The port has already begun collecting public comments on this project.
- The Schuyler Heim Bridge Replacement and SR-47 Expressway Project includes replacement of the seismically deficient bridge and development of a truck expressway that will transport port truck traffic on an elevated structure from the new bridge 1.7 miles northwest to Alameda Street. This project is already in the design phase. This project will improve safety (by bypassing three signalized intersections and five rail at-grade crossings) and reduce congestion and delay at many of the Port of Los Angeles' terminals.
- South Wilmington Grade Separation. This project will eliminate the conflict between vehicular traffic and two existing at-grade railroad crossings and provide unimpeded grade-separated vehicular access to the South Wilmington area (including for emergency vehicles), eliminate truck queues on surrounding streets, reduce accidents, and improve safety in the area.
- C Street/I-110 Access Ramp Improvements. This will consolidate two closely spaced intersections and improve connectivity to Figueroa Street and Harry Bridges Boulevard and access to several shipping terminals.
- I-110/SR-47 Interchange & John S. Gibson Intersection/NB I-110 Ramp Access. This project will provide an additional lane from the SR-47 connector to NB I-110 and extend the existing off-ramp at John S. Gibson Boulevard. It will eliminate weaving between the slow-moving, on-ramp traffic from San Pedro and the fast-moving bridge traffic from Long Beach to improve the connection between SR-47 and the I-110 Freeway.

Port of Hueneme Access Projects

In addition to the Ports of Los Angeles and Long Beach, the SCAG region is also home to the Port of Hueneme in Ventura County. Although smaller, the Port of Hueneme supports important economic activities in the region, generating over $650 million for Ventura County's economy every year and supporting 4,500 jobs. The Port of Hueneme Harbor District estimates that $7 billion in trade moves through the port annually. Unlike the San Pedro Bay Ports, the Port of Hueneme does not focus on containerized cargo. Instead, its primary imports and exports are refrigerated goods and produce, automobiles, bulk cargo, and fuels.

Data collected in 2008 indicated that the Port of Hueneme generated approximately 25 percent of truck trips in areas close to the Port. Many of these trucks use the interchanges close to U.S. 101. Average daily traffic counts of heavy-duty trucks on local routes range between 400 and 2,600 trucks per day. In a 2008 study, six out of 25

intersections evaluated had a level of service (LOS) grade of D or F in the AM and PM peak periods.

As residential areas expand into previously agricultural areas in Ventura County, a greater number of people will be exposed to noise, vibration, and pollution impacts of truck traffic along key routes. Encouraging trucks to remain on truck routes through additional signage or restrictions and strategic design of proposed developments can reduce these impacts.

The following projects and strategies are among those anticipated to reduce truck congestion and other impacts:

- Hueneme Road widening between Ventura Road and Rice Avenue
- Reconfiguring the interchange at Rice Avenue and U.S. 101
- Rice Avenue UP Grade Separation
- Rose Avenue UP Grade Separation
- SR-118/Coast Line Grade Separation Maintain Port Hueneme Road/Hueneme Road and Rice Avenue as the primary truck access corridors to the Port of Hueneme and encourage trucks to use this route through additional signage

Imperial County International Ports of Entry

As discussed previously, international border crossings between the U.S. and Mexico in Imperial County are critical components of the freight transportation system in Southern California. Within Imperial County, the three ports of entry (POEs)–Calexico West-Mexicali I, Calexico East-Mexicali II, and Andrade-Los Algodones–accounted for over $10 billion in international trade in 2010.[36]

While most goods in Imperial County move by truck, the border areas also are served by the UP and Carrizo Gorge Railway (CGR). The Calexico East border crossing is the only international rail crossing in the SCAG region and provides the only rail connection from California into Central Mexico.

According to the Overall Economic Development Commission (OEDC), there are a number of challenges in Imperial County that could constrain future economic development.[37] A significant concern is the lack of adequate transportation infrastructure, especially at the U.S.-Mexico border. Some of the most noticeable gaps in the county's truck network include:[38]

- The lack of direct freeway connections to railyards and intermodal facilities;
- The lack of dedicated truck lanes, passing lanes, and truck bypass routes;
- High truck traffic through urban areas including Brawley and Westmorland; and
- Empty trucks returning to Mexico after unloading their cargo in Calexico.

Key transportation strategies identified to date to improve the flow of goods in the area include:

- Improving interchanges and developing bypasses to the "main streets" in the region
- The Brawley Bypass (SR-78/SR-111) (an eight-mile, four-lane divided expressway connecting SR-86 north of Brawley to 1.5 miles south of the eastern junction of SR-111 and SR-78)–expected completion in 2013.
- The I-8/Imperial Avenue Interchange reconstruction and Imperial Avenue Extension projects in the City of El Centro and expansion of the Calexico East POE

High Desert Corridor

Some trucks in the region traverse SR-138, linking the Antelope and Victor Valleys. However, SR-138 currently lacks adequate infrastructure to handle heavy truck volumes. The proposed High Desert Corridor between I-15 and I-5 is anticipated to accommodate an expected three- to six-fold increase in traffic, providing a new level of accessibility, carrying trucks and other through traffic.

Truck Climbing Lanes

Additional highway projects that would facilitate goods movement activities in the region include truck climbing lanes. Examples of corridors identified suitable for truck climbing

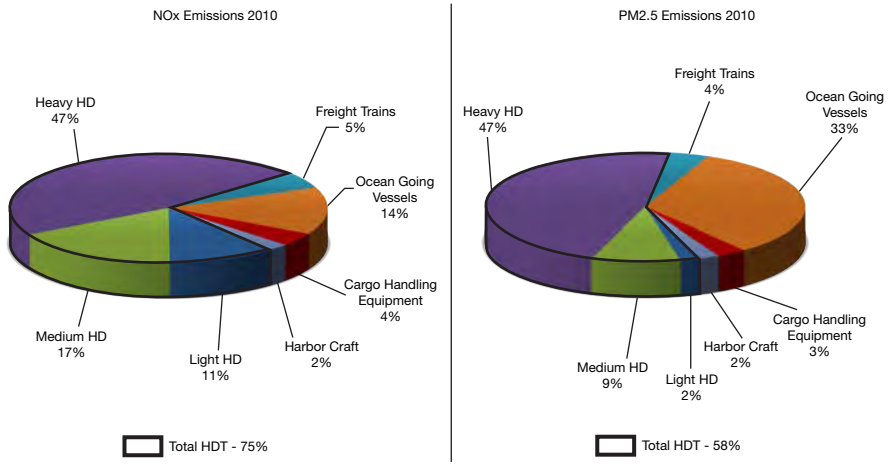
[36] The vast majority of goods traded between the U.S. and Mexico through Imperial County are transported through the Calexico East-Mexicali II port of entry, including nearly all Mexican imports to the U.S. amongst these POEs. The Calexico West-Mexicali I and Andrade-Los Algodones POEs serve significantly less commercial traffic, handling only exports from the U.S. to Mexico.

[37] Imperial County (2009), Planning and Development Services Department, Comprehensive Economic Development Strategy 2008–2009, September 2009.

[38] Imperial Valley Association of Governments (2008), Imperial County 2007 Transportation Plan Highway Element. Prepared by KOA Corporation, March 2008.

lanes and currently programmed with funding and/or under construction include I-15, SR-57, and SR-60. Truck climbing lanes are additional lanes located outside mixed-flow lanes, which permit slower-moving trucks to operate at their own pace. This enables other vehicles to move at a faster pace, thereby reducing congestion. These lanes are typically placed where slow-moving trucks would cause an obstruction to other vehicles, such as hillsides or other areas with significant grade increases.

Goods Movement Environmental Strategy



EXISTING AND PROJECTED ENVIRONMENTAL CONDITIONS

It is a regional priority to reduce and mitigate the environmental impacts of moving goods through our region. Ships, trucks, trains and other goods movement equipment are among the largest contributors to regional air pollution, which must be reduced to comply with federal law. Freight emissions contribute to local health risks, which have raised community concerns and opposition, challenging some freight infrastructure projects. Criteria pollutants such as as NO_X, $PM_{2.5}$, SO_X, and CO can have significant public health impacts, including asthma and other respiratory ailments, increased stress, and increased cancer risk. In addition, noise, safety issues, aesthetic changes, vibrations, and natural resource depletion impact quality of life and may have health implications. Freight transport is also a major producer of greenhouse gas emissions and a user of energy in the form of diesel fuel; cleaner sources of secure, reliable energy must be part of the solution.

Much of the SCAG region does not meet federal ozone and fine particulate air quality standards as mandated by the federal Clean Air Act. NO_X released from goods movement activities combines with volatile organic compounds (VOCs) in the atmosphere to form ozone pollution. In the South Coast Air Basin,[39] there is a strict deadline to reduce ozone concentrations to 80 parts per billion (ppb) by 2023 with a future deadline of 75 ppb by approximately 2031.[40] Failure to adopt sufficient measures to attain these standards in a timely manner will trigger federal sanctions such as curtailment of transportation funds. To attain the federal ozone standards, the region will need broad deployment of zero-and near-zero-emission technologies in the 2023 to 2035 timeframe.

Goods movement sources include trucks, locomotives, cargo handling equipment, marine vessels, and aircraft. These sources, combined with all mobile sources in the region, emit approximately 90 percent of regional NO_X.[41] Currently, heavy-duty trucks contribute 58 and 75 percent of $PM_{2.5}$ and NO_X emissions, respectively, and locomotives contribute 4 and 5 percent, respectively, from goods movement related sources. **FIGURE 9** shows the distribution of emissions from various goods movement sources.

FIGURE 9 Goods Movement NO_X and $PM_{2.5}$ Emissions in SCAB by Source

Source: ICF analysis based on EMFAC 2007 (modified for recession effects), ARB regulatory documents for marine fuel requirements, ARB emission inventory, ARB Goods Movement Plan, ARB and U.S. EPA locomotive analyses. Work completed for SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy.

Goods movement activities are also a source of GHG emissions. Although a reduction in goods movement related GHG emissions is not required under SB 375, which focuses solely on light-duty vehicle emissions, the State has established GHG reduction goals under AB 32 as have a number of local governments. Several measures have been passed by the EPA and the California Air Resource Board (CARB) to reduce GHG from heavy-duty

39 Los Angeles, Orange, and non-desert portions of Riverside and San Bernardino Counties.

40 The attainment deadline for the 75 ppb standard (adopted in 2008) has not yet been established by U.S. EPA, but is expected to be by approximately 2031.

41 South Coast Air Quality Management District, The Need for Zero-Emission Technologies, presentation for Zero-Emission Transportation and Roundtable Discussion, April 20, 2011.

trucks and rail. Despite reductions attributable to these measures, GHG from heavy-duty trucks in the SCAG region are expected to increase by 30 percent from current levels by 2023 and 60 percent from current levels by 2035. GHG emissions from rail in the South Coast Air Basin (SCAB) are expected to increase by 50 percent from 2010 levels by 2023 and by 123 percent from 2010 levels by 2035.[42]

Heavy-duty trucks are usually powered by diesel, which contributes to regional NO_X and PM emissions. As shown in **TABLE 14**, federal and state regulations will contribute to a decrease in NO_X and $PM_{2.5}$, but as VMT increases, these gains become relatively smaller over time. In addition, these regulations do not lead to reductions in CO_2 emissions. In the 2008 RTP, recommendations for truck emissions strategies included truck replacement, engine repowering, exhaust treatment device retrofits, and alternative fuels. CARB's truck and bus regulation, as well as state and local incentive programs, were put into place to accelerate the introduction of cleaner technology.[43] By 2023, nearly all HDVs will be model year 2010 or newer. But further reductions in truck emissions are critical to the region's air quality and must come from the introduction of advanced technology HDVs.

TABLE 14 Percent Change in Truck Emissions from 2010 Measurements (Tons per Day)

	2010 (Tons per Day)	2023	2035
NO_X	352.59	-67%	-58%
$PM_{2.5}$	12.00	-65%	-53%
CO_2	64,319	30%+	60%+

Source: SCAG Regional Comprehensive Goods Movement Study

It is a regional priority to reduce rail pollutants and work toward the objective of a zero-emission freight rail system as well. Reduction of emissions from rail would help eliminate pollution hotspots and would improve associated health impacts in neighboring communities. At the federal level, regulations are in place that will contribute to future reductions in rail emissions, including the U.S. EPA Locomotive Engine Standards, the 2008 EPA rulemaking to reduce locomotive idling, and the EPA non-road locomotive and marine (NRLM) fuel sulfur rule. At the state level, the CARB has passed an intrastate locomotive fuel use regulation and has several agreements with the railroads such as a 1998 MOU between CARB and the railroads to accelerate Tier 2 locomotive use and a 2005 agreement to reduce railyard emissions. In addition, the CARB is finalizing a series of 2010 commitments that will further reduce diesel $PM_{2.5}$ at four high-priority railyards. These regulations will lead to a reduction in $PM_{2.5}$ emissions and a smaller reduction in NO_X emissions, as shown in **TABLE 15**. These regulations, however, do not address reductions in CO_2 emissions.

TABLE 15 Percent Change in Rail Emissions from 2010 Measurements (Tons per Day)

	2010	2023	2035
NO_X	16	-3%	-18%
$PM_{2.5}$	0.62	-47%	-61%
CO_2	1,313	50%+	123%+

42 SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy.

43 Regulations such as the California truck and bus rule that requires all trucks to have a 2010 or cleaner engine by 2023; HHDT GHG regulation; truck idling limit; low carbon fuel standard, and the EPA's HDV fuel economy and GHG standards will contribute to a decrease in truck emissions over time.

In the South Coast Air Basin, attaining the national ozone standards will require reductions in emissions of nitrogen oxides (NO_X) well beyond reductions resulting from current rules, programs, and commercially-available technologies.[44] Because most significant sources are already controlled by over 90 percent, attainment of the ozone standards will require broad deployment of zero- and near-zero-emission[45] technologies in the 2023 to 2031 timeframe. With the projected changes in both truck and rail emissions, greater advancements in technology are needed to meet regional attainment objectives. As such, the 2012–2035 RTP/SCS includes an action plan to facilitate technology development and reduce emissions.

This RTP Goods Movement Environmental Strategy was developed to address community health concerns, federal attainment requirements, and climate change issues, while contributing to our economic and energy security goals. Accordingly, the strategy emphasizes coordinated solutions for mobility, economy, energy, and environment so that investments can provide multiple benefits. A two-pronged approach for achieving such a strategy is identified. For the near term, the regional strategy supports the deployment of commercially available lower-emission trucks and locomotives while centering on continued investments in improved system efficiencies. In the longer term, the strategy focuses on taking critical steps now toward phased implementation of a zero- and near-zero emission freight system. This includes planning for new infrastructure to incorporate evolving technologies—to fuel vehicles as well as to charge batteries and provide power.

GOODS MOVEMENT ENVIRONMENTAL STRATEGY AND ACTION PLAN

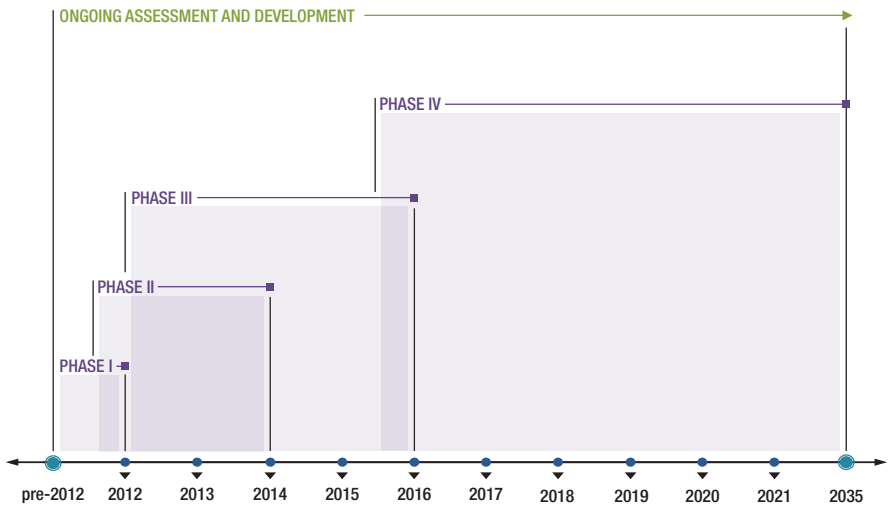
In order to implement this strategy with both near-and long-term objectives, the 2012–2035 RTP/SCS includes a four-phased action plan with key milestones. This plan calls for collaborative decision-making about how to advance research, development, and deployment of new technologies and expands on the use of existing technologies. Where needed, evaluation will be conducted to better understand costs and operational impacts to guide decision-making. The timeline for this action plan is shown in **FIGURE 10**. The four phases of the action plan are:

Phase 1 – **Project Scoping and Evaluation of Existing Work**

Phase 2 – **Evaluation, Development, and Prototype Demonstrations**

Phase 3 – **Initial Deployment and Operational Demonstration**

Phase 4 – **Full-Scale Demonstrations and Commercial Deployment**



The phases above provide a structured means to further develop, evaluate and deploy the technologies that will help the region to meet the objective of a zero-emissions goods movement system. The timeframe represents an estimation of when various technologies may be available for full deployment. However, the development and evaluation process may vary depending on the technology. As this plan is technology neutral, this proposed timeline serves as a general framework for making the decisions necessary to advance technology in the region. It is acknowledged that the timeframe may be subject to further revisions as additional information about specific technologies becomes available with further research and development as well as stakeholder input. The ability to create partnerships and procure funding for research and development efforts may help to accelerate the timeline for specific technologies. As explained below, this plan of technology development, evaluation and eventual deployment will be undertaken in close cooperation with all goods movement stakeholders.

---

44 Preliminary SCAQMD projections indicate a need to reduce regional NO_X emissions by about two-thirds by 2023 and three quarters by approximately 2030. South Coast Air Quality Management District, The Need for Zero-Emission Technologies, presentation for Zero-Emission Transportation and Roundtable Discussion, April 20, 2011.

45 The term “near zero-emissions” refers to emissions approaching zero and will be delineated for individual source categories through the process of developing the Air Quality Management Plan/State Implementation Plan. Based on current analyses, on-land transportation sources will need to achieve zero-emissions where possible, and otherwise will need to be substantially below adopted emission standards-including standards with future effective dates. Near-zero-emissions technologies can help meet this need, particularly if they support a path toward zero emissions (e.g., electric/fossil fuel hybrids with all-electric range).

FIGURE 10 Timeline to Implement a Zero-and Near-Zero-Emission Freight System

- 2012 – Identify potential funding to support truck, wayside power, and rail evaluation and prototype demonstration efforts; incorporate into financially constrained RTP
- 2012 – Implement plan of advocacy to secure action by federal or other governments
- 2012–2013 – Continue to evaluate truck technology implementation and funding mechanisms; initiate testing of zero-emission container movement system along the Terminal Island Freeway and connecting routes to the Ports (or alternative routes serving the same locations)
- 2012-2013 – Continue to evaluate practicability of applying electrified rail or other zero-/near-zero-emission technologies, and evaluate funding and implementation mechanisms
- 2015–2016 – Resolve need for wayside power for trucks (in 2015) and incorporate decisions on wayside power and technology direction, including strategy, funding, and timeframe into 2016 RTP update and SIP revisions; if existing rail technologies are practicable for freight, identify technologies, infrastructure, and implementation mechanisms in RTP update and SIP
- 2015–2020 – Begin deployment of appropriate zero- and near-zero-emission trucks and continue operational demonstration
- 2018–2020 – If existing rail applications were determined not practicable for freight, resolve need for wayside power for new rail technologies (in 2018) and incorporate planning into the 2020 RTP and next major SIP
- 2017–2035 – Full deployment of appropriate zero-and near-zero-emission trucks for substantially all regional transport; if existing electrified rail technologies can be practicably applied to the region, fully deploy such technologies

ACTION PLAN FOR ADVANCEMENT OF ZERO-EMISSION TECHNOLOGY

Phase 1: Project Scoping and Evaluation of Existing Work

Key Action Step:

- Continue to research goods movement user-markets and associated infrastructure needs while exploring a range of technologies as appropriate with equipment manufacturers

The first phase of this environmental strategy has already been initiated through the cooperative efforts of regional stakeholders. Our long-term objective of an economically viable zero-emission freight transport system requires continued coordinated efforts and funding from multiple stakeholders. In addition to the work SCAG has recently undertaken with the Comprehensive Regional Goods Movement Plan and Implementation Strategy, other organizations such as the Ports of Long Beach and Los Angeles, CALSTART, and Los Angeles County Metro are working toward the objective of zero-emission freight transport.[46] [47]

Over the last several years, numerous studies have evaluated our regional transportation corridors that carry high volumes of freight truck traffic. Recent assessment of the I-710 corridor identifies key freight segments as high priority for the introduction of zero-emission technology.[48] Selection of an east-west freight corridor and evaluation of the potential regional penetration of zero-and/or near-zero-emission technology are ongoing additional priorities.

Additionally, significant effort has gone into analyzing the options for a zero- and/or near-zero emission rail system in the Basin. These include recent efforts by the Ports of Los Angeles and Long Beach in their Roadmap study[49] and by SCAG in the freight rail electrification report.[50] Each of these efforts highlights the technical opportunities and the need to pursue a zero-emission freight transportation system for the future. However, they also highlight the difficult challenges associated with this sector, especially with regard to operational needs, integration of the technologies into the national rail system, federal safety requirements, and costs. These challenges will be addressed through various phases of the environmental strategy. Further discussion of potential technologies for locomotives and trucks are addressed in later sections of this appendix.

Phase 1 requires the continued effort of various stakeholders to work through the technical, operational, practical and financial issues to define a long-term zero-emission freight system for the SCAG region. This scoping work will be done by the conclusion of 2012, however communication among stakeholders about various regional efforts will continue throughout the technology development process.

Phase 2: Evaluation, Development, and Prototype Demonstrations

Key Action Steps:

- Convene logistics working groups
- Determine a set of market criteria to move truck vehicles forward to successful commercialization.
- Secure funding commitments for the development of vehicle prototypes and infrastructure demonstrations
- Advance pathway technologies through regulatory, financial, and marketing mechanisms
- Develop and demonstrate truck and truck wayside power prototypes

48 Los Angeles County Metropolitan Transportation Authority, *Alternative Goods Movement Technology Analysis-Initial Feasibility Study Report. Final Report. I-710 Corridor Project EIR/EIS*. Prepared by URS. January 6, 2009.

49 Port of Long Beach and Port of Los Angeles, *Roadmap for Moving forward with Zero-Emission Technologies at the Ports of Long Beach and Los Angeles*, Technical Report, August 2011.

50 Southern California Association of Governments. *Task 8.2 Analysis of Freight Rail Electrification in the SCAG Region*, Technical Memorandum. Draft Version, Prepared by Cambridge Systematics, August 26, 2011.

- Further study operational impacts of zero-emission rail technologies
- Evaluate practicability of applying existing electrified rail technologies
- Select truck technologies for continued fleet evaluation under Phase 3
- Identify vehicle technologies and wayside power applications to be tested under operational demonstrations in Phase 3

Phase 2 involves the development, design validation, and initial demonstration of several types of advanced prototype vehicles (trucks). Phase 2, and Phase 3 if necessary, also includes initial proof of concept and testing of several types of zero-emission locomotive technologies and supporting infrastructure.

To foster regional collaboration during this phase, a logistics working group will be convened to assess logistics decisions and efficiencies as they relate to changes with a long-term freight system. Two additional groups will be formed, one to focus on trucking, the other on rail. One responsibility of these groups will be to collaborate with public and private partners to secure funding commitments for the development of vehicle prototypes and infrastructure demonstrations. These groups may overlap with or draw upon membership from existing regional forums. For instance, the Southern California National Freight Gateway Collaboration provides a forum composed of leaders from regional transportation as well as state and federal resource agencies. One mission of this group is to advocate for a first-class goods movement system and the funding necessary to support such a system.

Phase 2 includes performance assessment of new technologies, including addressing market risks/uncertainties. As prototypes are developed and demonstrated, significant evaluation will also occur. For instance, a truck corridor market mechanism study will assess effective models for financial and regulatory structures to support and enable zero- and/or near-zero-emission truck commercialization and widespread deployment. Models may include incentives, buy-down rebates, preferred or exclusive access to port service, exclusive or preferred access to corridors, regulatory inducements, etc. Truck manufacturers and technology developers will be included to determine a set of market criteria–minimum market size and volumes of vehicles needed to move forward to successful commercialization.

For rail, uncertainties associated with new technologies would be addressed through a rail operational assessment study that evaluates the potential operational impacts of a zero- and/or near-zero rail system both within the Basin and on the larger national freight railroad system. This study would build on the work of SCAG's 2011 Rail Electrification Study, but would further clarify total capital and operating costs for such a system. Because overhead catenary systems have already been proven for passenger and some freight applications, this study would also evaluate the practicability of utilizing existing technologies for rail service.

For rail technologies, initial demonstration would include technology optimization along prescribed routes under conditions applicable to goods movement activities. An initial step in Phase 2 or Phase 3 if necessary, would entail creating a test track to allow for the demonstration of various technologies to move containers. For rail prototypes, basic performance requirements include, but are not limited to, sufficient tractive power to haul a double-stacked railcar, adequate braking capability and other parameters to support safe operation, and the ability to operate in zero-emission mode.

For trucks, certain pathway technologies are currently available but have had limited applications to date. For example, plug-in hybrid technologies are being demonstrated in parcel delivery and utility bucket truck applications; these systems could be scaled to larger vehicles for drayage and local service.

Additionally, the 2012–2035 RTP/SCS includes demonstration and initial deployment for zero-emission truck technologies along the Terminal Island Freeway and connecting routes to the Ports, (or alternative routes serving the same locations.) The shorter distance (approximately 5 miles) reduces technological and cost obstacles and is an important part of the initial effort to develop a regional zero- and/or near-zero freight transportation system. Please see the text box for more information on this important near-term project.

At the conclusion of Phase 2, efforts would be evaluated and technologies selected to continue into Phase 3.

Phase 3: Initial Deployment and Operational Demonstration

Key Action Steps:

- For trucks, scale up efforts to develop, deploy, and evaluate full truck fleets
- Demonstrate wayside power and ability for multiple trucks to enter, exit, and be powered on a corridor
- Conduct advanced technology locomotive demonstrations on test tracks that have sufficient length, switches, and grades to validate operational feasibility within the Basin
- Move the most promising technologies to initial demonstration of operational service
- Select advanced locomotive technologies for Phase 4 initial deployment
- Select truck technologies and infrastructure for Phase 4 deployment and incorporate needed infrastructure into financially constrained RTP for high-priority corridors

In Phase 3, technologies that have been advanced by the Logistics Working Group will be further tested in an operational demonstration. This phase entails initial deployment of multiple vehicles or test tracks as appropriate, with on-going data collection and analysis for rapid iterative design improvement.

Phase 4: Full Scale Demonstrations, Commercial Deployment, and Infrastructure Construction (if wayside power is needed)

Key Action Steps:

- Continue to launch and expand commercialization of zero-emission trucks using regulatory and market mechanisms identified in prior phases
- Continue expanding plans for any needed wayside power infrastructure along high-priority corridors (e.g., the East-West Freight Corridor)
- Foster integration of advanced technologies into regional transportation networks
- Advance rail technologies from small-scale demonstration to full-scale demonstration in operational service, as locomotive technologies will likely require additional field demonstrations prior to full commercialization
- Coordinate locomotive technology deployment with any needed infrastructure improvements

The prior stages of technology testing and demonstrations will have prepared the region for Phase 4 deployment using the commercialization, regulatory, and market steps determined in prior phases. Any new technology deployment must be coordinated with infrastructure planning, and key decisions will be incorporated into RTP updates and future SIP revisions. During Phase 4, technologies will be deployed as they meet the criteria for deployment established by regional stakeholders. As various technologies are currently in different stages of readiness, it is assumed that their deployment will be staggered throughout Phase 4.

Near-Term Zero-Emission Technology Demonstration and Initial Deployment

Description: This project is for near-term demonstration and, if successful, initial operational deployment of zero-emission trucks receiving wayside electric power.

Location: The project will be located in Los Angeles County along the Terminal Island Freeway and connecting routes to the Ports, (or alternative routes serving the same locations).

Schedule:

- By 2013 – Demonstration: Develop and build trucks and wayside power infrastructure sufficient for demonstration within the transport corridor consisting of the Terminal Island Freeway and connecting routes to the Ports (or alternative routes serving the same locations); commence demonstration upon completion of trucks and infrastructure.
- By 2015 – Initial Operational Deployment: Build wayside power infrastructure sufficient for operation on the Terminal Island Freeway and connecting routes to the Ports (or alternative routes serving the same locations), and build maximum number of trucks for initial operational deployment allowed by available funding (with all feasible leveraging of private resources), unless a zero-emission technology not utilizing wayside power is determined to be superior and can be implemented in a similar or earlier timeframe. In the latter case, remaining funds allocated to this project will be applied to demonstration and deployment of zero-emission trucks not utilizing wayside power.

Cost: Project cost is $35 million, for both demonstration and initial operational deployment phases. This includes construction of infrastructure, design and build of demonstration trucks, and acquisition of a small fleet for initial operational deployment.

Funding: AQMD will actively partner in supporting this effort by providing available funding for vehicle technology or infrastructure (staff will make a proposal to the AQMD Board in 2012), seeking funding partners, and developing other support. Additionally, SCAG will work with local transportation agencies, the Ports, and other private and public stakeholders in 2012 to identify funding for this project. Other potential co-funding sources include:

- California Energy Commission AB 118 program
- California Air Resources Board
- California greenhouse gas cap and trade auction revenues
- Federal grants
- In-kind contributions and public private partnerships with technology developers, drayage companies, etc.
- Funds available for project mitigation

Project Rationale: The Ports, vehicle manufacturers, and other entities are currently demonstrating new zero-emission truck technologies, including battery-electric, fuel-cell, and hybrid-electric trucks with all electric range (AER). The purpose of this project is to demonstrate and initially deploy wayside power technology to provide power to these and other types of vehicles along certain high-volume corridors, thus allowing extended zero-emission range. Wayside technology has been used for many decades to power electric buses, mining trucks, and rail systems. It is thus a particularly proven and promising technological approach to achieving zero-emission transport. If coupled with hybrid AER technologies currently in use for passenger cars and now being demonstrated for heavy trucks, wayside power could provide flexibility, range, and compatibility with current port, railyard, and warehouse operations. Hybrid AER trucks could produce zero-emissions along key high-volume corridors (e.g. Terminal Island Freeway, I-710, east-west freight corridor), but could operate off the electrified corridor powered by conventional natural gas or diesel fuels, by fuel cells, or—within certain range—by batteries. Such vehicles thus could provide zero emissions where most needed, and would have range to travel long distances in other modes. The Terminal Island Freeway corridor, as a short, high-volume transport corridor with substantial air pollution impacts to local communities, is an important and ideal venue to initially deploy such technology. Deployment of wayside power technology is compatible with, and builds upon, the current Port efforts to develop and demonstrate electric and hybrid-electric trucks.

AGENCY ROLES AND RESPONSIBILITIES FOR ACTION

TABLES 16 and **17** describe the actions needed by SCAG and its air quality partner agencies to develop plan revisions and implementation mechanisms (e.g. funding and regulatory mechanisms) to deploy zero and near-zero-emission truck and rail technologies as part of a long-term freight system that meets the performance objectives described earlier. These actions will be made through an open process with the collaboration of our stakeholders.

TABLE 16 Trucks: Agency Major Implementation Actions

Year(s)	Agency	Agency Action
2012	SCAG	▪ Incorporate "footprint" for regional truck lanes to accommodate potential use of wayside power in financially constrained 2012 RTP ▪ Include funding to support truck and wayside power evaluation and demonstration efforts into financially constrained RTP See text box for more information. ▪ Implement plan of advocacy to secure action by federal or other governments where required to implement any related elements of the SIP or RTP; include evaluation of impacts of zero- and/or near-zero-emission technologies on national priorities, (e.g. energy security, energy cost certainty, interstate transportation, climate protection).
2012–2014	SCAG, with AQMD/ARB on SIP, other transportation agencies and private sector partners on demonstration and funding efforts	▪ Evaluate potential truck technology implementation and funding mechanisms, including: regulatory requirements; incentives (local, state, federal, interstate cooperative); differential tolls; and public-private partnerships ▪ Evaluate potential funding mechanisms for truck infrastructure (e.g. wayside power), including federal, state, local government funding; tolling; public-private partnerships; and electric utility funding of corridor construction ▪ Demonstrate trucks and wayside power infrastructure sufficient along the Terminal Island Freeway and connecting routes to the Ports, (or alternative routes serving the same locations)

2015	SCAG, with AQMD/ARB on SIP, other transportation agencies and private sector partners on demonstration and funding efforts	▪ Resolve need for wayside power infrastructure for trucks on I-710 and other corridors beyond near-dock rail yards, including East-West Freight Corridor; decision would be based upon whether zero-and near-zero-emission technologies would have sufficient range without wayside power; if wayside power is needed, incorporate such technology description into RTP constrained plan and next major SIP
		▪ Build wayside power infrastructure sufficient for operation along the Terminal Island Freeway and connecting routes to the Ports, (or alternative routes serving the same locations), and build maximum number of trucks for initial operational deployment allowed by available funding (with all feasible leveraging of private resources), unless a zero-emission technology not utilizing wayside power is determined to be superior and can be implemented in a similar or earlier timeframe
		▪ Develop and incorporate recommendations regarding type of funding and implementation mechanisms (including infrastructure needed) into RTP constrained plan and next major SIP, including:
		  ▪ Strategy description and timeframe for any rules
		  ▪ Strategy description, potential funding sources and timeframe for any incentives

TABLE 17 Locomotive/Rail: Agency Major Implementation Actions

Year(s)	Agency	Agency Action
2012	SCAG, with AQMD/ARB on SIP, other transportation agencies and private sector partners (UP/BNSF) on demonstration and funding efforts	▪ Identify funding to support rail evaluation and demonstration efforts ▪ Implement plan of advocacy to secure action by federal or other governments where required to implement any related elements of the SIP or RTP; include evaluation of impacts of zero and near-zero-emission technologies on national priorities, (e.g. energy security, energy cost certainty, interstate transportation, climate protection)
2012–2014	SCAG, with AQMD/ARB on SIP, other transportation agencies and private sector partners (UP/BNSF) on demonstration and funding efforts	▪ Evaluate and determine practicability of applying existing electrified rail technologies to region (by 2013) ▪ Evaluate potential funding and implementation mechanisms for zero-and/or near-zero-emission locomotives, and wayside power, including: Private (railroads); federal, state, local governments; public-private partnerships; electric utilities
2015–2016	SCAG, with AQMD/ARB on SIP, other transportation agencies and private sector partners (UP/BNSF) on demonstration and funding efforts	▪ If existing electrified rail technologies are determined practicable for the region, identify technologies, infrastructure, and implementation mechanisms in RTP amendment and next major SIP

2018–2020	SCAG, with AQMD/ARB on SIP, other transportation agencies and private sector partners (UP/BNSF) on demonstration and funding efforts	▪ If existing electrified rail technologies were determined to not be practicable for the region, resolve need for wayside power for new rail technologies; decision would be based upon whether new technologies can achieve sufficient zero-or near-zero-emission range without wayside power
		▪ If wayside power is needed, include planning for wayside power for rail lines into 2018 constrained RTP
		▪ Include recommendations regarding type of funding and implementation mechanisms into constrained RTP and next major SIP, including:
		  ▪ Strategy description and timeframe for any rules
		  ▪ Strategy description, potential funding sources. and timeframe for any incentives.

Near-Term and Long-Term Technologies for Commercial Deployment

The 2012–2035 RTP/SCS recommends a two-pronged environmental strategy to be implemented in the four phases outlined in the previous section. SCAG recognizes that not all technologies have advanced to the stage where they can be implemented immediately. As the region works to advance and deploy current prototype technologies, focus should be placed on commercializing and implementing existing solutions as well. For trucks, an aggressive program to bring more currently available clean-fuel and hybrid trucks into service represents the best near-term strategy. In the longer term, our infrastructure can serve as a catalyst for the development of longer-range hybrid, dual-mode or battery-operated trucks. For rail, near-term technologies for switcher locomotives can reduce emissions at railyards. A longer-term objective of a zero-emission rail system can be reached through further technology development. This section will briefly describe both near- and long-term technologies that have the potential to reduce emissions and help the region meet attainment deadlines. The technologies identified in this section serve as examples of potential near- and long-term options for further study and do not constitute specific technologies under the financially constrained RTP/SCS.

NEAR-TERM TRUCK TECHNOLOGIES

Natural gas trucks use compressed natural gas (CNG) or liquefied natural gas (LNG) to power an internal combustion engine. Natural gas trucks have already been deployed at the Ports, and have the potential for greater deployment based on provision of fueling infrastructure. Range can be a concern due to limited on board fuel storage; however, adequate fueling infrastructure and/or the use of LNG could address the range issue. Several efforts are underway to expand use of natural gas trucks in the region as a near-term solution. Southern California Clean Cities Coalition is currently assisting with the marketing and education outreach for three projects funded through U.S. Department of Energy (DOE) Clean Cities ARRA 2009 Petroleum Reduction Technology Projects solicitation. These projects include the UPS Ontario–Las Vegas LNG Corridor Expansion Project and the Heavy-Duty Natural Gas Drayage Truck Replacement Initiative, both with the South Coast Air Quality Management District (SCAQMD). A third project is being implemented in partnership with the San Bernardino Associated Governments (SANBAG) and Ryder Truck Rental, Inc. to deploy 202 heavy-duty natural gas trucks and construct two liquefied natural gas fueling stations.

Hybrid-electric trucks contain an internal combustion engine as well as an electric motor, generator, and energy storage device (e.g., a battery). The electric motor and generator absorb energy via regenerative braking and store that energy to offset acceleration and power demands of the vehicle. Several hundred hybrid-electric trucks are on the road due to the ARB's Hybrid Truck and Bus Voucher Incentive Project (HVIP). The incremental cost of this truck is its largest barrier to market penetration; some of this has the potential to be offset through incentive programs or reduced fuel costs for operators.

NEAR-TERM TRUCK OPERATIONAL STRATEGIES

In addition to deployment of new technologies, several programs that address truck operations have the potential to reduce emissions, including increased enforcement of anti-idling regulations, truck inspection and maintenance programs, and use of conditional use permits for warehouses. These are operational changes that do not require new technologies, but may require changes in business practice and enforcement of these changes. Many of these strategies may also reduce noise and vibration impacts.

LONG-TERM TRUCK TECHNOLOGIES

Plug-in hybrid-electric trucks and battery-electric trucks are examples of technologies that may be used in the future. Plug-in hybrid-electric trucks differ from hybrid-electric trucks in that they have a larger battery and can draw energy from the electric grid. This enables the truck to travel under all-electric power when on electrified corridors. These trucks are currently in the development and demonstration stage. The cost and weight of the battery is the most significant barrier to further developing this truck type. Currently, plug-in hybrid technologies are being demonstrated in parcel delivery and utility bucket truck applications; as previously discussed, these systems could be scaled to larger vehicles for drayage and local service. Arvin Meritor is currently developing a dual-mode hybrid, and Vision Motor Corporation has a contract with the Port of Los Angeles to test units made specifically for drayage, using a combination of lithium-ion batteries and fuel cells.

Battery-electric trucks replace the entire engine and drive train of a conventional vehicle with an electric motor and generator. Battery-electric trucks could run entirely on battery packs that are charged when the vehicle is plugged into the grid and via regenerative braking or possibly using an on-board hydrogen fuel cell. Alternatively, these trucks could receive power from an external power source in the roadway, such as an overhead catenary system or through electromagnetic induction from a contact-less power system embedded in the roadway. Zero- and near-zero-emission truck prototype testing is underway with funding from the Port of Los Angeles, the Port of Long Beach, and AQMD. For instance, a demonstration of the Balqon lead-acid battery-electric truck was initiated in 2007. The battery was upgraded to a lithium-ion battery, and testing of the upgraded system is underway. Balqon has a contract at the Port of Los Angeles to test five on-road drayage trucks.

TRUCK TECHNOLOGIES FOR ZERO-EMISSION FREIGHT CORRIDORS

Development of both the proposed I-710 freight corridor and East-West Freight Corridor provide opportunities to commercialize technologies and create incentives for development. Recent studies, such as the I-710 EIR/EIS, research completed by the San Pedro Bay Ports, and the SCAG Comprehensive Goods Movement Study, suggest that fixed guideway systems are less practical to serve the region's needs, as they lack the flexibility to serve the various markets. Zero-emission trucks, however, that either charge

through wayside power infrastructure, at charging stations off the system, or through fuel cell systems, show promise for goods movement corridors.

Wayside power offers a potential advantage to trucks that move on key freight corridors as it offers the potential to extend the range of the vehicle while operating in a zero-or near-zero-emissions mode. There is always a tradeoff between the weight of battery systems (which reduce payload carrying capacity) and the range of the vehicle. Current battery technologies have range limitations of approximately 40 miles in common truck duty cycles. A wayside power system on a freight corridor (truck lanes), for example, could charge batteries so that the truck can continue to operate with a 40-mile range when it leaves the freight corridor. This could provide a more extended range system than would charge stations located at truck stops and fuel stations similar to the current fueling infrastructure. Ongoing efforts are underway to evaluate the costs and operational parameters associated with either method.

Wayside power technologies include overhead catenary, in-road power such as third rail or linear synchronous motor (LSM), and fast charging. All three technologies must be integrated closely with the zero and/or near-zero-emission trucks, and all have the potential to significantly increase the functionality and range of trucks utilizing batteries, including dual-mode hybrids. (It is unlikely that fuel cell trucks would need wayside power, due to their range and relatively quick refueling capability.) In overhead catenary systems, power is delivered from the electrical grid through the overhead wire to a pantograph on the vehicle itself. Catenary systems are well-established and efficient in light-rail applications, trolley cars and buses, and even mining trucks. For in-road power, the roadway itself provides power to the vehicles, which must be equipped with pick-up devices. Alternatively, fast charging is a high-power charging system used to quickly recharge the batteries in an electric vehicle at destination points, e.g., rail yards or distribution centers. While technically not "wayside" power, fast charging is similarly grouped with other approaches that require infrastructure to be designed and built into the freight facilities and corridors. These systems have different operational requirements. Ideally, the system would allow for trucks to enter and exit the system seamlessly, change lanes and could be shared with standard trucks.

NEAR-TERM RAIL EMISSION REDUCTION STRATEGIES

Switcher locomotives contribute only a small share of total locomotive emissions; however, their activity is concentrated in railyards and greatly impacts surrounding communities. Nevertheless, low-emission technologies are available, or soon to be available, and have relatively low costs. To reduce emissions from switcher locomotives, one option is to replace remaining Tier 0+ switchers with cleaner engines, such as Tier 4 switchers when they become available. NO_X and $PM_{2.5}$ emission rates from a Tier 4 switcher would be approximately 10–15 times lower than a Tier 0+ engine. Another option is to rebuild existing Genset switchers with engines that meet the U.S. EPA Tier 4 non-road emission standards, which could cut NO_X and $PM_{2.5}$ emissions by a factor of 10. The emission reductions of these strategies could reduce emissions for switcher engines between 27 and 53 percent. However, since switchers are a small part of the overall fleet, these two switcher strategies would reduce total freight locomotive NO_X and $PM_{2.5}$ emissions by only 1 to 3 percent. Tier 4 engines are not currently available, but are required by the EPA for all new purchases after 2015. **TABLES 18** and **19** show emissions reductions associated with upgrading all engines to Tier 4 after 2015. Such a strategy can be implemented on a voluntary basis, subject to funding availability. This strategy is presented for illustrative purposes and is not part of the financially constrained RTP/SCS.

LONG TERM EMISSION REDUCTIONS STRATEGIES FOR RAIL

Electrification

Several U.S. commuter rail systems use overhead lines to power electric trains, and electrified systems for both passenger and freight trains are common throughout Europe and Asia. There are no major electrified freight rail systems in North America. Electrification technologies require further evaluation to more precisely address questions about cost, funding, and how to best implement such systems with minimal operational impacts. Because of the cost and potential operational challenges associated with main line electrification, such a strategy should be considered a longer-term initiative, requiring further studies as well as proof of concept and prototype testing of zero-emission locomotive technologies which have the potential to minimize cost and operational impacts, as discussed under the phased implementation section of this Appendix.

Three electrification options were analyzed for consideration in SCAG's recent rail electrification study, each with varying costs and levels of technological readiness. Electric catenary rail systems are perhaps the most technologically ready. Dual-mode locomotives are in use for passenger service and, if they could be adapted for freight, could reduce the operational difficulties of removing and switching locomotives, as they can operate both on a catenary or with traditional diesel power. A third option would use linear synchronous motors in the railway to generate a propulsive force by creating an electromagnetic field, thereby avoiding the need to acquire or switch electric locomotives. Construction of any electrified rail system in Southern California would be a large investment, and would need the participation of the BNSF and UP railways.

Electrification of the railroad main lines would reduce line-haul NO_X and $PM_{2.5}$ emissions produced in the SCAG region by introducing cleaner, more efficient electric-powered locomotives and also by shifting the location of emissions to power plants. Although some emissions would still be produced in electricity generation, power plants are highly regulated and release fewer emissions. Furthermore, all power plants in the SCAB region are natural gas powered and also release fewer emissions. Most power plants are located outside the SCAB region and therefore emissions from these sources would be further from population centers.

Battery Hybrid And Fuel Cell Rail Technologies

In future analyses, other additional viable technologies would be considered outside of electrification options. Two promising technologies that are under development include hybrid diesel-electric locomotives and battery-electric tender cars. Each requires additional development and a more thorough understanding of operational considerations. Hybrid diesel-electric locomotives (utilizing advanced batteries) are under development by General Electric (GE). The prototype is based on GE's Tier 2 Evolution locomotive platform (4,400 hp) that will capture energy dissipated during braking and store it in a series of sodium-nickel chloride batteries housed in the locomotive frame. Fuel savings would allow for a small fuel storage tank and provide space for storage of the necessary batteries on individual locomotives. The locomotives would therefore switch between Tier-4 diesel-electric and battery modes. The batteries would recharge as the locomotive is operating in diesel-electric mode.

Also, battery-electric tender car technology could be used with current locomotives. Battery tender cars would be placed behind diesel-electric locomotives and would carry batteries that could power locomotives through environmentally sensitive areas. Such a system could have many of the same advantages as the hybrid diesel-electric locomotives, including zero-emission operation, but would also have the added benefit of being compatible with current locomotives and reducing or eliminating the need for wayside power such as from overhead catenary wires.

IMPLEMENTING THE ENVIRONMENTAL STRATEGY

Broad deployment of zero-and near-zero-emission transportation technologies in the 2023 to 2035 timeframe is a critical and significant undertaking with technological, cost, and operational challenges. As outlined above, the 2012–2035 RTP/SCS delineates a path forward–a series of steps and decision points to move the region to that objective. Industry stakeholder participation will be necessary, including the efforts of numerous state and federal resources agencies, transportation agencies, along with commercial technology developers/manufacturers, and logistics experts. The 2012–2035 RTP/SCS, developed in coordination with many of these stakeholders, reaffirms zero- and near-zero-emission technologies as a priority and establishes the regional path forward to such a goods movement system.

Introduction

The regional growth forecast represents the most likely growth scenario for the Southern California region in the future, taking into account a combination of recent and past trends, reasonable key technical assumptions, and local or regional growth policies. The Integrated Growth Forecast at the regional and small geographic area level is the basis for developing the Regional Transportation Plan (RTP), Sustainable Communities Strategy (SCS), Program Environmental Impact Report (PEIR), and the Regional Housing Needs Assessment (RHNA). The development of the Integrated Growth Forecast is driven by a principle of collaboration between SCAG and local jurisdictions who are major contributors to the process. The integration of the regional and local forecasts is achieved through the joint efforts and collaboration among the various contributors. SCAG's Community, Economic and Human Development (CEHD) Committee provided direction to the growth forecast update process for the 2012–2035 RTP/SCS/PEIR/RHNA. SCAG's Plans & Programs Technical Advisory Committee (P&P TAC) assisted in the forecasting process by providing valuable technical input.

The Growth Forecast Appendix is comprised of four major sections. Section I introduces the major source of challenges in producing the 2012–2035 RTP/SCS growth forecast, and summarizes the nineteen forecasting milestones of forecasting development. Section II describes the past growth trends and describes the size and characteristics of the projected population, households and employment. Section III discusses the forecasting framework, methodology and assumptions. Section IV introduces the SCAG PECAS land use model, including its structure, specifications, calibration, and an example scenario.

Section I: Challenges, Forecasting Timeline and Milestones

Challenges

The new state law requirement (i.e., SB 375) and the Great Recession (2007–2009) posed new challenges in the development of the 2012–2035 RTP/SCS growth forecast. With the introduction of SB 375 in California, federal program/requirement (RTP and conformity analysis) and two state programs (RHNA and Blueprint) as well as local general plans have become more strongly interlinked. Furthermore, as the foundation for developing these plans and programs, the 2012–2035 RTP/SCS growth forecast is required to be consistent.

SCAG began developing the long term growth forecasts for the 2012–2035 RTP/SCS in the middle of the Great Recession (2007–2009). The traditional long term perspective, which might not reflect on-going economic trends and frequently updated short term economic forecasts, had the potential to result in a serious bias in the short term population projections. The most important source of potential projection errors was the unstable/uncertain nature of the key economic-demographic assumptions. Two of the key assumptions were short-term unemployment and migration rates.

Due to the current economic climate and the uncertain nature of the short term economic future in the region, the accuracy and the reasonableness of population projections (and assumptions) by the US Census Bureau and the California Department of Finance (DOF) were questioned by regional demographers and economists. In addition, relevant statistical data has not always been made available to regional planners in a timely manner.

There was also a significant gap between the US Census Bureau and the DOF population estimates during the intercensal period. Both agencies have used their own methods in generating population estimates for this period. The gap in population estimates in the late 2000s was very high. In the SCAG region, the difference was 4.2 percent in 2009. SCAG generally uses the CA DOF population estimates for planning and forecasting purposes. The gap issue was resolved as DOF benchmarked its estimates to the 2010 Census count. Nevertheless, the adjustment process of the preliminary growth forecast was quite challenging, due to the limited time available to produce the revised growth forecast for the 2012–2035 RTP/SCS.

Forecasting Timeline and Milestones

TABLE 1 lists the forecasting timeline and milestones for the development of the regional growth forecast for the 2012–2035 RTP/SCS. SCAG began its forecast update process by conducting subregional workshops throughout the region in September 2008. When necessary, one-on-one meetings were arranged for local jurisdictions or subregions in the SCAG region. Through these workshops and one-on-one meetings, SCAG confirmed the accuracy of the small area socioeconomic data (SED), existing land use as of 2008, and local general plan information. As a result of the workshops and one-on-one meetings, SCAG revised and updated the 2008 regional growth forecast methodology and its key

assumptions, and developed the framework for future dialogue between SCAG planners and local and subregional planners.

During the first quarter of 2009, SCAG developed an initial range of the regional growth forecasts for the 2012–2035 RTP/SCS, which was released in April 2009. Since the Great Recession was in full force at that time, the region had experienced an enormous job reduction accompanied by high unemployment rates. With a high degree of uncertainty on the short term job growth and its potential impact on domestic and international migration, SCAG adjusted its forecasting framework for both the short term and long term perspectives. The direction of the short term economic perspective was considered important in the uncertain forecasting context. Three scenarios of job growth, high, mid, and low were used as a major driver of the region's population growth, which eventually influences household growth.

In May 2009, a first panel of experts meeting was held to review an initial range of regional growth forecasts and related assumptions. The panel of experts was composed of fifteen experts in the field of regional and national economics and demography. Experts were provided with a list of questions regarding assumptions with background information (e.g., historical data and a preliminary range of forecast by the moderator) before the panel of experts meeting. SCAG incorporated the recommendations of the panel of experts into the refined range of regional growth forecasts, and developed a recommended preliminary set of regional growth forecasts in June 2009. The preliminary county and sub-county sets of growth forecasts, reflecting recent trends, were released in July 2009.

Between July 2009 and February 2010, SCAG conducted a second round of local/subregional review through workshops and one-on-one meetings with local jurisdictions and subregions. First, SCAG provided local jurisdictions with the preliminary set of growth forecasts at the city and 2000 census tract, and transportation analysis zone levels. Second, SCAG held a workshop to explain the methods and assumptions of how the growth forecasts at jurisdictional/census tract/transportation analysis zone level were developed. Third, the local jurisdictions or subregions provided SCAG with their input on those growth forecasts along with proper documentation. In February 2010, SCAG released a local input/general plan growth forecast for 2012–2035 RTP/SCS. In fact, this SED data was used for developing the SCAG suggested emission reduction targets for the years 2020 and 2035.

The local input SED data resulted in an imbalance of regional population and employment for the year 2035. As usually occurs, the local input SED data tends to have less regional population (labor force or workers) than required to meet the projected employment in 2035. In April 2010, SCAG began analyzing the sensitivity of the labor force participation level, given population and employment. In May 2010, the second panel of experts meeting was held to evaluate local input, and new Bureau of Labor Statistics (BLS) and US Census projections. The expert panel recommended SCAG reduce employment to maintain a reasonable relationship between population and employment. The relationship between the two regional forecasts is usually assessed using the double jobbing rate, the implied unemployment rate, and labor force participation rates. These factors were assumed to remain unchanged from historical levels. SCAG focused on the uncertainty of the labor force participation rate due to (1) the increasing share of female workers, (2) a higher survival rate, and (3) the sensitivity to extra job opportunities and supply of a skilled workforce. SCAG found that the aging population would effectively respond to the shortage of workforce in the region by increasing their labor force participation rate.

SCAG adjusted the local input regional growth forecast with a 2035 employment reduction between December 2010 and January 2011. This SED data was used for the preliminary regional transportation model calibration and validation for the 2012–2035 RTP/SCS. Between January 2011 and March 2011, SCAG conducted further data gathering workshops and, as necessary, made revisions to the local input growth forecast.

In May 2011, SCAG conducted the third and final panel of experts survey to evaluate new 2010 Census data and existing demographic and economic assumptions. The third expert panel consisted of the same panel members, who had participated in the first and second panel of experts meeting. They provided SCAG with updated perspectives of the short term economic future of the region and its implication for population and household forecasts. SCAG continued collecting and updating the local growth forecasts and revised them as necessary between June 2011 and July 2011. During the same time period, SCAG consulted HCD/DOF for SCAG region growth forecasts and RHNA determination, and held RTP/SCS workshops across the region and conducted public outreach for review of the socioeconomic data.

After developing the draft 2012–2035 RTP/SCS between July 2011 and November 2011, SCAG released the draft plan in December 2011. SCAG distributed the draft RHNA allocation plan in February 2012. The Regional Council will be adopting the 2012–2035 RTP/

SCS in April 2012. The regional growth forecast is adopted as part of the 2012–2035 RTP/SCS and RHNA process.

TABLE 1 Forecasting Timeline and Milestones

	Milestone	Date/Period
1	Adopted 2008 RTP growth forecasts.	May 2008
2	Conducted subregional workshops across the region in anticipation of 2012–2035 RTP/SCS growth forecast, data and tool requirements under the SB 375.	September 2008–January 2009
3	Developed an initial range of preliminary 2012–2035 RTP/SCS regional growth forecasts with major demographic and economic assumptions.	April 2009
4	Held the first panel of experts meeting to assess BLS, Census, and DOF projections and to discuss demographic and economic trends and assumptions.	May 2009
5	Developed a recommended preliminary set of regional growth forecasts.	June 2009
6	Developed a preliminary set of growth forecasts at the county and sub-county level, reflecting the recent trends.	July 2009
7	Held subregional workshops across the region and conducted outreach for local review.	July 2009 – February 2010
8	Released local input/general plan growth forecast for 2012–2035 RTP/SCS. This dataset was used for target setting recommendation.	February 2010
9	Observed the imbalance of 2035 regional population and employment from local input.	April 2010
10	Held the second panel of experts meeting to evaluate local input, and evaluate new BLS and Census projections.	May 2010
11	Local input regional growth forecast with 2035 employment reduction.	December 2010–January 2011
12	Conducted data gathering workshops & made revisions.	January 2011–March 2011
13	Conducted the third panel of experts survey to evaluate new 2010 Census data and existing demographic and economic assumptions.	May 2011
14	Collected local input and revised forecasting data as necessary.	May 2011–August 2011
15	HCD/DOF consultation for SCAG region growth forecasts and RHNA determination.	June 2011–August 2011
16	Held RTP/SCS workshops across the region and conducted public outreach for review.	June 2011–August 2011
17	Developed the draft 2012–2035 RTP/SCS. The dataset was used for regional transportation model calibration and validation.	July 2011–November 2011
18	Released the draft 2012–2035 RTP/SCS.	December 2011
19	Distributed the draft RHNA allocation plan.	February 2012
20	Will adopt the 2012–2035 RTP/SCS.	April 2012

Section II: Regional Growth: Past and Future

Growth Trends

POPULATION

The United States Census of 1850 counted the population of the Southern California Region to be 3,530. At that time, the population of the United States was 23,191,876. The regional share of the nation's population was close to zero. According to the 2010 Census, the population of the Southern California Region was 18,051,534, which represents over 5.8 percent of the US population of 308,745,538, and nearly 49 percent of California's population of 37,253,956. With the region's land area of 38,000 square miles, the region's population density is now 475 persons per square mile. The Southern California region is the 5th highest in population among states in the nation, behind Florida, and the second largest combined statistical area (CSA) in the nation behind the New York CSA.

The region's population growth over the last 160 years can be categorized into four major periods using statewide growth as a reference: very rapid growth (1850–1910), rapid growth (1910–1960), average growth (1960–1990), and slow growth (1990–2010) (see **TABLE 2**). The very rapid growth (1850–1910) represents the early stage of urbanization in the region. The railroad lines were first introduced into this agrarian region, and they played an important role in the region's growth and urbanization. The annual average growth rate of population in the region in this period was 311 percent, which is 60 times higher than the national rate, and 8 times higher than the California rate.

The rapid growth (1910–1960) period represents the beginning and rapid stages of regional growth and urbanization. The region reached one million people in 1920 for the first time, and grew to five million people by 1950. It took only three decades for the region to add four million people. The annual average growth rate of population in the region was 22 percent, which is 10 times more than that of the nation, and twice that of California.

The average growth (1960–1990) period represents regional growth and urbanization comparable to that of the state. In 1970, the SCAG region's population reached 10 million and exceeded 50 percent of the California population. By adding 4.6 million people to the region between 1970 and 1990, the region has evolved into one of the largest metropolitan regions in the nation. There was an accelerated suburbanization during this period. Four of six counties in the region exceeded one million people in 1990. The annual average growth rate of population in the region was 2.9 percent, which is 2 times more than that of the nation, and similar to that of California.

The slow growth (1990–2010) period represents the mature stage of population growth and urbanization. During this period, the region added 3.4 million people, which was a much slower growth pattern than in the previous decades. Although the regional growth stabilized during this period, urbanization and suburbanization continued. Orange County exceeded three million people, and Riverside and San Bernardino Counties exceeded two million people each in 2010. The annual average growth rate of population in the region was 1.2 percent, similar to that of California and the nation. Both the region and California became average growth areas from the perspective of the national growth.

TABLE 2 Annual Average Growth Rate of Population, 1850–2010

Periods	1850–1910	1910–1960	1960–1990	1990–2010
SCAG Region	311.0%	21.6%	2.9%	1.2%
California	41.1%	11.2%	3.0%	1.3%
US	5.0%	1.9%	1.3%	1.2%

Source: US Census Bureau.

Two factors account for population change: natural increase and net migration. Natural increase is the balance between births and deaths in a period and net migration is the sum total of people coming to and leaving the region in the same period. Net migration is of two types: domestic and international. Domestic migration is the movement in and out of the region from other parts of the country, and immigration is the flow of people from other countries. Net migration greatly influenced the region's past and recent population growth.

The region's economic growth is usually a major factor behind net migration and the consequent population growth. The availability of jobs attracts people to the region, whereas in times of recession, the reverse is true. Major economic recessions in the 1930s (1929–1933, 1937–38), 1970s (1973–1975), 1990s (1990–1993), and 2000s (2007–2009) have had a negative impact on the region's population growth. As a result, the annual average growth rate of population in the region during those periods was 2.5 percent, 1.5 percent, 1.3 percent, and 0.9 percent, respectively. The growth of the motion picture, petroleum, and aircraft industries and the region's reputation as the land of opportunity explain the tremendous growth in the region during the 1980s. It should be noted that the recession in the 1990s was the result of major cuts in the national defense budget which affected the region much more severely than the rest of the nation. The regional population over the last couple of decades has become increasingly home-grown Californians (Myers et al, 2010) as the major component of change has been natural increase.

The region currently faces serious challenges caused by the recent economic recession that began in December 2007. The region lost approximately 800,000 jobs from 2007 to 2010. Although the economic recession officially ended in 2009, the region is still struggling to bring its economy back to the pre-recession level. The future growth will depend on how the region addresses its economic challenges.

EMPLOYMENT

Both the economic recession and globalization have heavily affected the restructuring of the industrial sectors from manufacturing to more service oriented industries (see **TABLE 3**). In particular, both the construction and manufacturing sectors declined due to the recessions and globalization, respectively. The construction sector plays an important role in economic growth through diverse development activities. There is usually little development activity during the recession period. The overall share of the construction industry decreased from 5 percent in 1990 to 4 percent in 2010. At one point in 2005, its share reached 6 percent of all industry sectors and immediately declined to 4 percent in 2010 due to the economic recession. The manufacturing sector has consistently decreased its share from 17 percent in 1990 to 9 percent by 2000 and 8 percent in 2010. The manufacturing sector generally provides workers with higher pay than other sectors. With such a rapid decline in the manufacturing sector jobs, the economic quality of the region has declined. In contrast, services sectors including education, health services, and the leisure and hospitality sector showed an increase in their share of jobs in the region. Education and health service jobs increased its share from 17 percent in 1990 to 22 percent in 2010, and leisure and hospitality sector jobs increased its share from 8 percent in 1990 to 11 percent in 2010.

TABLE 3 Regional Employment Trends, 1990–2010

	1990	2000	2010	Difference (1990–10)	% Change (1990–10)

URBANIZATION AND SUBURBANIZATION PATTERNS

Although the regional growth rate stabilized in the last 20 years, the urbanization and suburbanization of the region has continued (see **TABLE 4**). In 2010, Orange County exceeded three million people, and Riverside and San Bernardino Counties exceeded two million people each. Riverside County is now the third largest county in the region. The Counties of Riverside and San Bernardino increased their share of the population from 17.7 percent in 1990 to 23.4 percent in 2010, while Los Angeles County decreased its share from 60.5 percent in 1990 to 54.4 percent in 2010. The fast growth of population, relative to employment, in Riverside and San Bernardino Counties has led to an imbalance of jobs and housing in the SCAG region, and poses serious transportation and air quality challenges.

TABLE 4 The County Share of the Regional Population, 1990–2010

County	1990 Number	1990 %	2000 Number	2000 %	2010 Number	2010 %

ECONOMIC RECESSIONS AND GROWTH TRENDS

The period between 1990–2010 is characterized as a slow growth period. The population growth (3.4 million) and job growth (308,000) during the 1990–2010 period was seriously affected by two major economic recessions.

The first recession started in 1990 and ended in 1993. This recession was caused primarily by federal defense budget cuts. Many defense workers in the region lost their jobs during the 1990–1993 period. The job losses in the region reached 500,000 during the period and the region's unemployment rate ranged from 5.6 percent in 1990 to 9.7 percent in 1993 (see **FIGURES 1–3**). This economic recession primarily affected domestic migration into and out of the region. During the 1990–1996 period, net outmigration reached nearly 1.1 million people as a result of net domestic out-migration, while net immigration was not affected (see **FIGURES 7–8**). As a result of the change in the components of population change, the percent change of population gradually declined from 2 percent in 1990–1991 to 0.5 percent in 1994–1995 (see **FIGURES 5–6**).

The second recession started in 2007 and ended in 2009. During the 2007–2010 period, the region lost 800,000 jobs. The region's unemployment rate reached 12.3 percent in 2010 (see **FIGURE 1**). The impact of this economic recession on migration was different from the recession in 1990–1993. This recession affected both net domestic and net immigration (see **FIGURES 7–8**). During the 2007–2010 period, nearly 420,000 people left the region as a result of net domestic migration. The level of net domestic migration in the recession of 2007–2010 was much smaller than in 1990–1993. The net immigrants in the recession of 2007–2009 are estimated at 250,000 (annual estimate of 83,000), which is much smaller than 767,000 (annual estimate of 128,000) during the 1990–1996. The second recession resulted in the lowest percent change (0.4 percent) in annual population during the past 20 year span.

The number of births declined from 328,000 in 1990–1991 to 258,000 in 2009–2010 (see **FIGURE 9**). Although there was a sign of increasing births from 2001–2002 to 2007–2008, both recessions must have negatively affected the decision to have children.

With two recessions in 20 years, the region's job estimates have moved up and down (see **FIGURE 2**). The region's 6.9 million jobs in 1990 decreased to 6.4 million jobs in 1993. The region had an increase in jobs from 6.9 million in 1990 to 8 million in 2007. As a result of the second recession, the number of jobs was reduced from 8 million jobs in 2007 to 7.2 million jobs in 2010. The percent change of jobs between 1990 and 2000 is only 4.5 percent, which is much lower than the 23.4 percent population increase. Therefore, the population to employment ratio rapidly increased from 2.12 in 1990 to 2.51 in 2010 (see **FIGURE 10**).

Growth Forecast

The regional growth forecast is used as a key guide for future transportation investments in the SCAG region. The 2012–2035 RTP/SCS growth forecast was developed reflecting both the short term and long term perspectives. The latest 2010 Census data and 2011 EDD data indicate lower population, households and employment for year 2010 than forecasted in the 2008 RTP. The region is still expected to grow over the RTP planning period (2008–2035)—adding 4.2 million new residents, 1.5 million new households, and 1.7 million new jobs by 2035 (see **FIGURES 11** and **12**).

FIGURE 11 Population, Employment, and Households, SCAG Region, 2008 and 2035

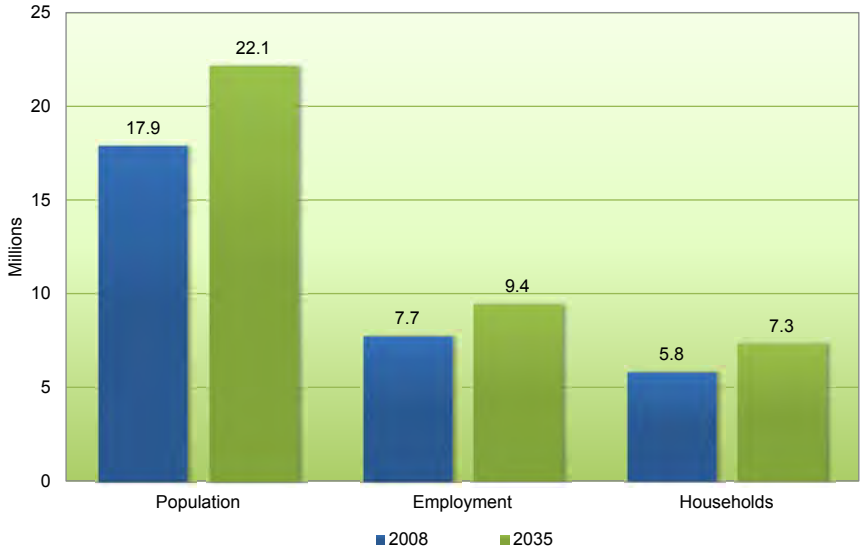

FIGURE 12 Population, Employment, and Household Growth, SCAG Region, 1970–2035

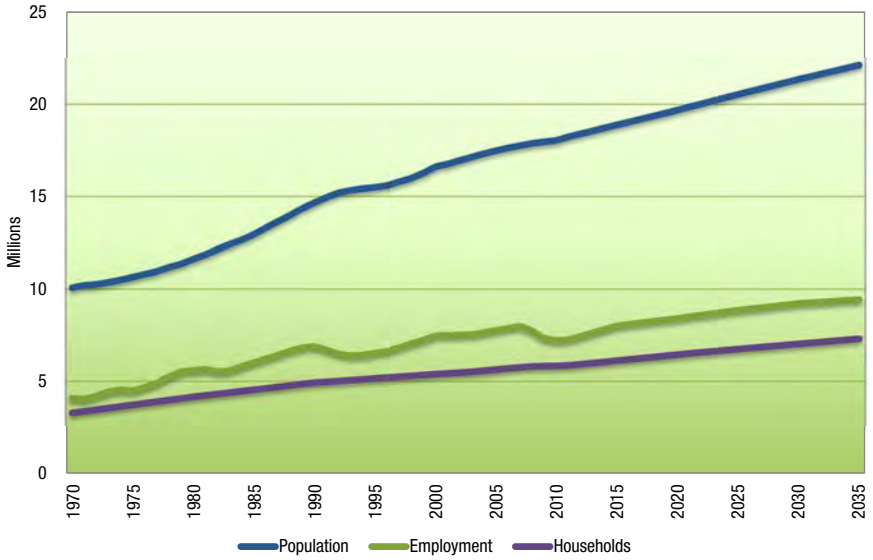

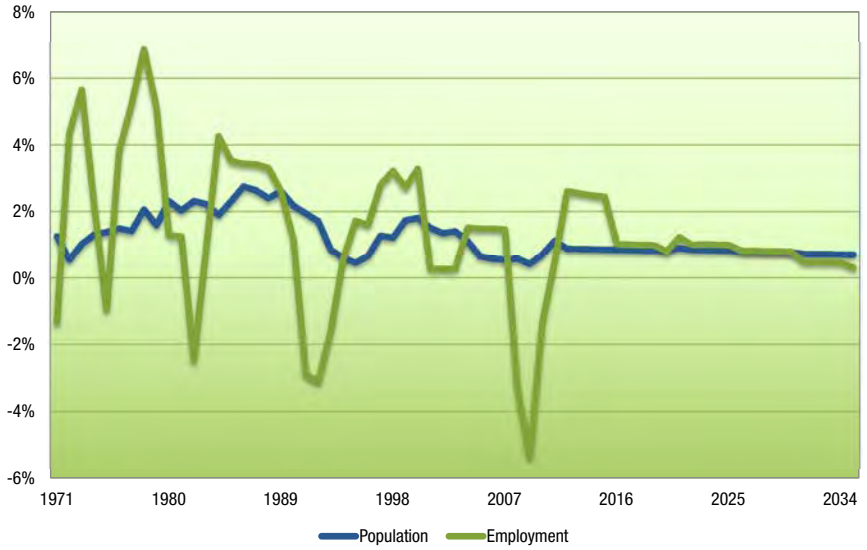

FIGURE 13 Percent Change of Population and Employment, SCAG Region, 1970–2035

POPULATION

The slower population growth pattern experienced in the last decade is expected to continue into the future. Between 2010 and 2035, the annual population growth rate will be only 0.9 percent, which is lower than the growth rate for the past 20 years. The region will grow mainly through natural increase (see **FIGURES 16–18**).

The most salient demographic characteristics of the projected population in the region will be the aging of population and shifts in ethnic distribution (see **TABLE 5** and **FIGURES 14–15**). With the aging of the baby boomer generation (born between 1946 and 1964), the median age of the population is projected to increase from 34.2 in 2010 to 36.7 in 2035. The share of the population 65 years old and over is projected to increase from 11 percent in 2010 to 18 percent in 2035, while the share of the population less than 65 years old decreases from 89 percent in 2010 to 82 percent in 2035. In particular, the share of the population of the working age 16–64 has its share sharply decline from 65 percent to 60 percent during the projection period. This implies a future shortage of workers. With the increasing share of the older population and the decreasing share of the working age population, the aged dependency ratio (i.e., the number of aged people per hundred people of working age) is projected to increase from 17 percent in 2010 to 30 percent in 2035 (an increase of 13 percent during the period).

The other characteristic of the projected population is the racial/ethnic diversity (see **TABLE 5**). The region already has a high level of racial/ethnic diversity in 2010 with a Hispanic population of 45 percent, a non-Hispanic White population of 34 percent, a non-Hispanic Asian population and others of 14 percent, and a non-Hispanic Black population of 7 percent. The region's racial/ethnic composition is projected to exhibit a rapid change toward a majority Hispanic population of 56 percent in 2035, while the share of the non-Hispanic White population is projected to drop sharply to 22 percent.

TABLE 5 Demographic Characteristics of Regional Population, 2010, 2020, and 2035

	2010	2020	2035	Difference (2010–2035)	% Change (2010–2035)

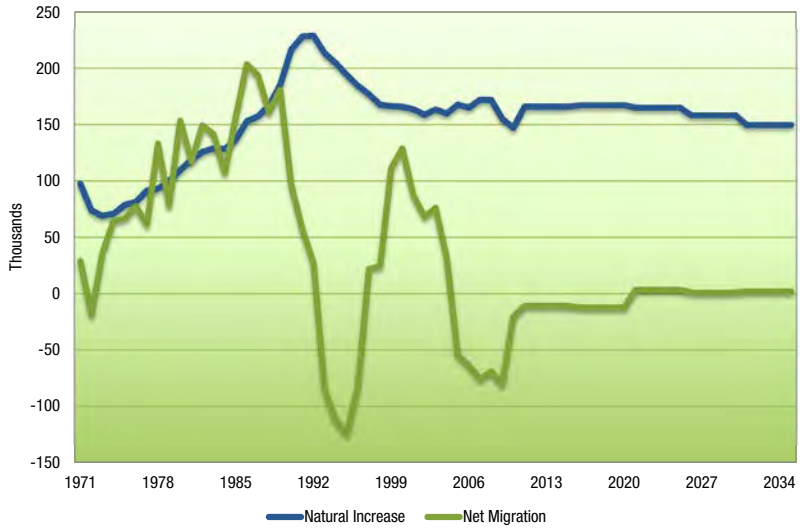

FIGURE 17 Births and Deaths, SCAG Region, 1970–2035

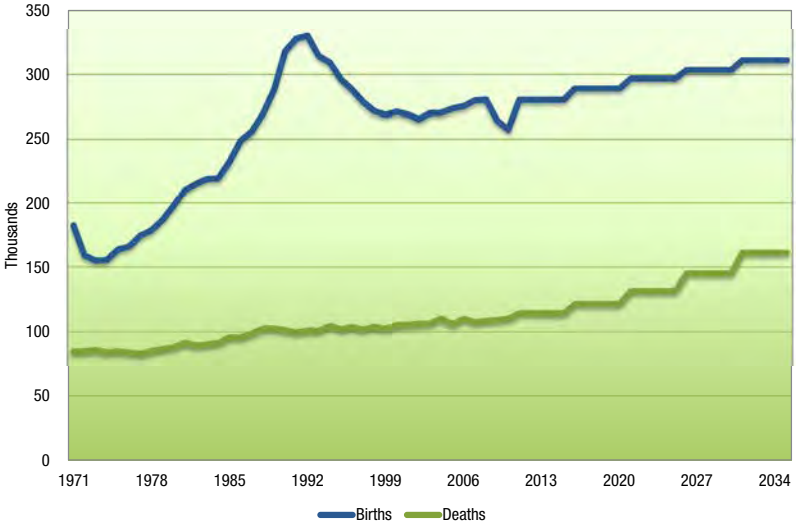

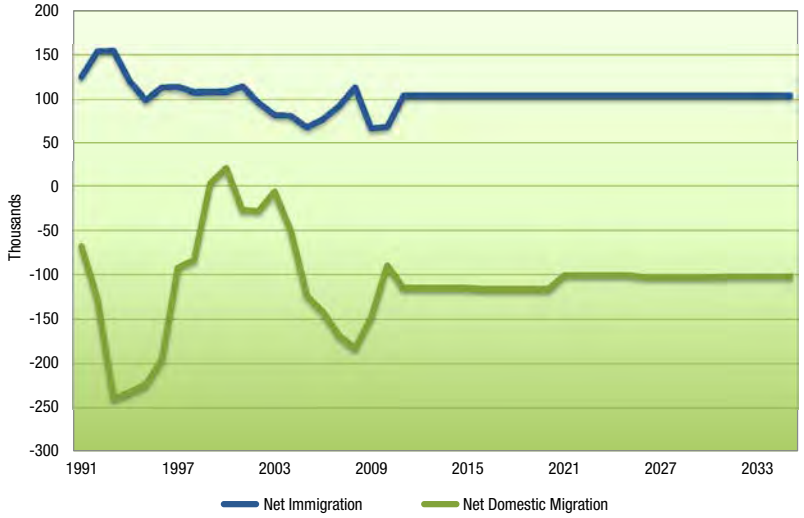

FIGURE 18 Net Immigration and Net Domestic Migration, SCAG Region, 1990–2035

HOUSEHOLDS

As the population ages and diversifies in the region during the projection period, householders follow the same path (see **TABLE 6**). The number of householders 65 years or older will reach more than 2 million in 2035 with the addition of one million households in the next 25 years. The growth of the senior householders will represent more than 70 percent of the projected household growth in the region. However, the share of householders in the younger age groups will decline. In particular, householders 45–54 years old will show an absolute decline.

The racial/ethnic distribution of householders will also change. The non-Hispanic White householders will decrease from 44 percent in 2010 to 29 percent in 2035, while Hispanic householders will increase from 35 percent in 2010 to 47 percent in 2035. The household size will also decline from 3.04 in 2010 to 2.97 in 2035 as a result of the dynamics of the changing age and racial/ethnic composition of the projected population and declining birth rates.

TABLE 6 Characteristics of Regional Households, 2010, 2020, and 2035

	2010	2020	2035	Difference (2010–35)	% Change (2010–35)

EMPLOYMENT

Two economic recessions and globalization were the major factors behind the slow growth in the region over the past 20 years. Although recessions and further globalization are expected, the region is still expected to add 2.2 million jobs, from 7.2 million in 2010 to 9.4 million in 2035. The annual average growth rate in jobs will be over 1 percent. The region will be recovered from the recent economic recession in the near future. In the long run, the regional economy will get back to normal with reasonable labor force participation rates and unemployment levels.

The region's industrial mix, however, will experience continuous change over time due to globalization (see **TABLE 7**). The region will transform its industrial structure from manufacturing oriented industries to the service oriented industries. The construction sector will regain its normal share by increasing from 4 percent in 2010 to 6.5 percent in 2035. Selected service sectors including professional and business services, education and health services will grow by more than one million and their share will increase from 37 percent in 2010 to 40 percent in 2035. The share of employment in the manufacturing sector will continue to decrease from 9 percent in 2010 to 8 percent in 2035 as a result of continued globalization.

There has been a concern about the economic performance of the region in recent years. SCAG initiated a discussion of an economic growth strategy among local and diverse stakeholders in the region. The economic growth strategy intends to improve the economic quality of life by maintaining the manufacturing sector and other traditional high income job sectors.

TABLE 7 Regional Employment Projections by Industry Sectors, 2010, 2020, and 2035

	2010	2020	2035	Difference (2010–35)	% Change (2010–35)

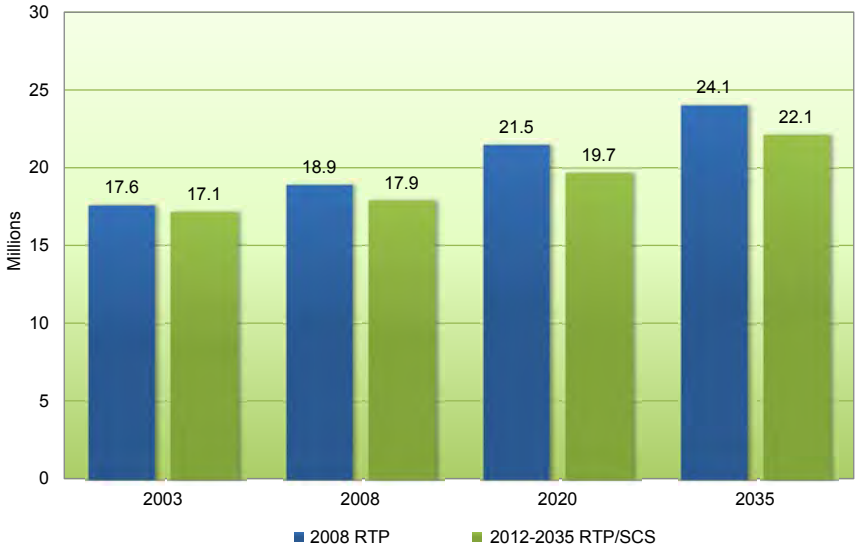
COUNTY DISTRIBUTION OF POPULATION AND EMPLOYMENT

According to the SCAG growth forecast, Riverside and San Bernardino Counties will grow faster and increase their share of regional jobs while Los Angeles and Orange Counties decrease their share, between 2010 and 2035 (see **TABLE 8**). During the same period, in both Riverside and San Bernardino Counties the population to employment ratio will decline as relatively more jobs than population are added. Overall the population to employment ratio in each of the six counties will converge toward the regional average ratio.

TABLE 8 Regional Population and Employment Shares by County, 2010, 2020, and 2035



County	Share of Regional Population			Share of Regional Employment		
	2010	2020	2035	2010	2020	2035
Imperial	1%	1%	1%	1%	1%	1%
Los Angeles	54%	53%	51%	57%	54%	51%
Orange	17%	17%	15%	21%	19%	19%
Riverside	12%	13%	15%	8%	11%	13%

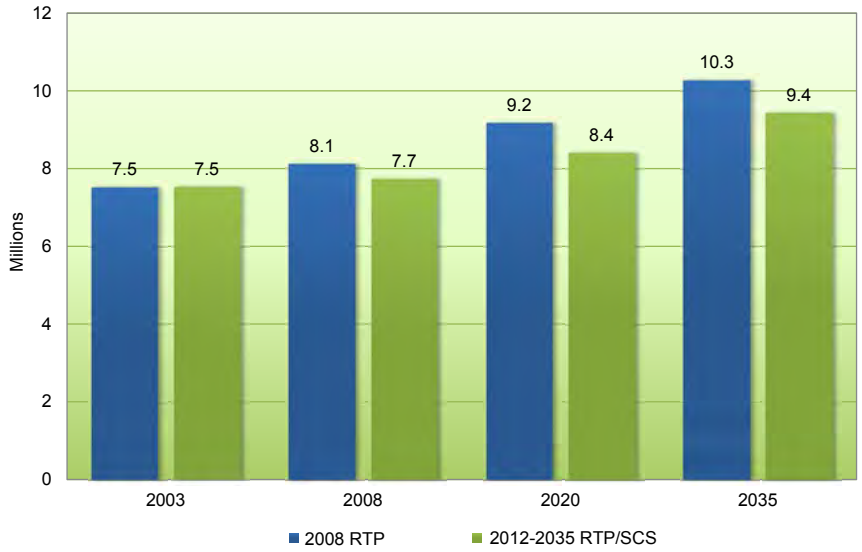
COMPARISON OF 2008 RTP GROWTH FORECAST AND 2012–2035 RTP/SCS GROWTH FORECAST



The growth forecast for the 2012–2035 RTP/SCS reflects the recent trends in components (e.g., births, deaths, domestic migration, international migration) of population growth and in job growth by sectors. The 2012–2035 RTP/SCS growth forecast for 2035 is lower than that of the 2008 RTP growth forecast (See **FIGURES 19–20**).

Section III: Forecasting Framework, Methodology and Assumptions

Forecasting Framework

SCAG began developing the long term growth forecasts for the 2012–2035 RTP/SCS in the middle of the Great Recession (2007–2009). The traditional long term perspective, which might not reflect the on-going economic trends and the frequently updated short term economic forecast, might result in a serious bias in the short term population projections. The major sources of potential projection errors include: (1) the unstable/uncertain nature of the key economic-demographic assumptions, in particular, unemployment rate and migration in the short term framework; (2) the timing and reasonableness of population projections (and assumptions) by the US Census Bureau and CA DOF; (3) the lack of relevant statistical data in a timely manner; and 4) the significant gap in population estimates between the US Census Bureau and CA DOF.

SCAG uses the BULA (Balance, Uncertainty, Latest, and Adaptive) approach toward developing the regional growth forecasts. First, the regional forecasts should maintain the *Balance* between employment, population, and households due to their interrelationship, assuming that employment growth is a driving force of regional population and household growth. The employment-population-household (EPH) forecast framework has been the basis for developing the growth forecast for the SCAG region.

Second, the regional forecasts embrace the forecast *Uncertainty* as the recent population projections of US Census Bureau (2008) and California Department of Finance (2007) are quickly outdated in their consideration of the actual and projected international immigration. A range of regional growth forecasts are derived to reflect the different paths of national population growth with different immigration assumptions and their impact on national growth.

Third, SCAG makes an effort to use the *Latest* demographic and economic assumptions to ensure that the growth forecasts are current. The normative assumptions are also introduced into the forecast process as needed. For example, household formation behavior, measured in headship rates, is used to measure the housing needs of the projected population. The headship rates of minority ethnic populations did not show a convergence toward the headship rates of the White population. SCAG introduces the socially acceptable assimilation pattern into the assumption of the convergence of headship rates toward the White headship rates.

Finally, SCAG approaches development of growth forecasts in an *Adaptive* and flexible way. Many demographic and economic statistics are unstable and quickly outdated as the recession continued. SCAG collected those information materials and regularly went through the expert panel review (2009, 2010, 2011). Through the BULA approach, SCAG developed more realistic and accurate regional growth forecasts. SCAG annually updated the short term forecasts with the quickly changing demographic and economic conditions between 2009 and 2011 before adopting the growth forecast in April 2012.

UNCERTAINTY IN A REGIONAL GROWTH FORECAST AND EXPERT OPINION

In a rapidly changing and volatile economic environment, the usual economic and population projection models do not produce accurate projections. This is particularly true of the short term projections due to the unstable nature of the economic and demographic assumptions. The average approach (e.g., average of the newly available economic or demographic projections) might be a preferred approach for updating the new short term economic and demographic projections (Smith et al, 2001). Timely developed private sources of the near term or long term economic and demographic projections are available with a cost, although the demographic projections tend to rely on the most recent series of projections by the U.S. Census Bureau or the state statistical agency. The collective expert opinion could be a useful reference to reduce the short term and long term projection errors. The following is a brief summary of the expert opinion on critical factors and key economic and demographic assumptions collected through three panels of experts meetings between 2009 and 2011.

The Panel of Experts Meeting (2009)

A first panel of experts meeting was held on May 15, 2009. The panel was composed of fifteen experts in the field of regional and national economics and demography. These experts have developed economic or demographic forecasts for a long time or the agencies that they work for might have produced economic or demographic forecasts. They came from a variety of public or private organizations. Nearly 50 percent of the panel members come from universities in California (e.g., University of Southern California, University of California Los Angeles, University of California, Riverside, University of California, Santa Barbara, California State University, Long Beach, California State University, Fullerton). Other panel members come from state or local government agencies (e.g., Los Angeles Economic Development Corporation, South Coast Air Quality Management District, California Department of Finance), private consulting firms (e.g., Regional Economic Models, Inc., Beacon Economics, DB Consulting). Experts were provided with a list of questions regarding assumptions with background information (e.g., historical data and a preliminary range of forecasts by the moderator) a few days before the panel of experts meeting.

The survey questions focused on three major aspects of job and population projections: 1) short term economic outlook; 2) long term economic assumptions (e.g., regional share of the national job projections, retirement age of workers, labor force participation rate); and 3) long term demographic assumptions (e.g., fertility rate, life expectancy, and net international immigration). The survey questions included, but were not limited to: 1. How deep and long will the recession be? How will the recession affect the economy and prospects for housing in 2020?; 2. After the recession ends, will national job growth be equal to, greater than, or less than the U.S. job growth rate from the current U.S. BLS projection?; 3. Will workers retire at an older age in 2020/2035 than now?; 4. How will California's share of U.S. jobs change in the future?; 5. How will the SCAG region's share of California jobs change in the future?; 6. How does the panel evaluate the new Census Bureau U.S. population projections and related assumptions of fertility rates, life expectancy, and international immigration?; 7. Will labor force participation rates continue to increase for older workers?

First, the short term economic outlook is focused on understanding the timing of the bottom of the national and regional economic recession. According to the responses of the experts, the economic recession measured in job losses in the SCAG Region would most likely end in 2010 (2 respondents), 2011 (7 respondents), or 2012 (3 respondents). Once the economy is recovered from the recession, it might take several years for the unemployment rates to return to a normal range (5–8 percent). Five of seven responded that, after the recession ends, regional job growth would be equal to the annual average U.S. job growth rate (1.04 percent between 2006 and 2016) from the current 2007 US BLS job projection. Two respondents said that the regional job growth would be greater than the U.S. job growth rate from the current 2007 US BLS job projection.

Second, the regional share of the national job projections was surveyed through two different but related questions about 1) California's share of U.S. jobs for 2020 and 2035 and 2) the SCAG Region's share of California jobs for 2020 and 2035. Twelve experts responded to both questions above. The survey results imply that the regional share of the national job projection ranges from 4.3 percent (minimum) to 5.3 percent (maximum) in 2020 and 3.8 percent (minimum) to 5.5 percent (maximum) in 2035 (see **TABLE 2**). The gap between the minimum and maximum is much bigger in 2035 than in 2020. The median regional share remains constant at 5 percent for both 2020 and 2035, which is 0.2 percent lower than the most current regional share (5.2 percent). The overall survey

responses are not optimistic about the SCAG region's relative economic competitiveness in the national economy, although the survey questions did not directly touch on "the regional share of the national job growth". The labor force participation rate (retirement) trends in the SCAG region will be consistent with the national projection, and will support the assumption that workers in the region will tend to retire at an older age in the future.

Third, there is no or little concern about the national and regional assumptions of the future fertility rates and life expectancy. The current regional average total fertility rate of 2.1 is assumed to decline slightly to 2.0 and 1.9 in 2020 and 2035, respectively, during the projection period. The regional life expectancy will increase consistent with the national life expectancy's increase during the projection period. The national immigration assumptions are major concerns of the panel members. The US Census Bureau released one set of long-term population projections for the nation in August 2008. These baseline projections included higher immigration projections, which resulted in an increase in the projected population growth to 2050. The key question is whether SCAG will adjust the current international immigration upward in light of the higher Census Bureau projections. Ten of the thirteen panel members said No to the upward adjustment of the international immigration assumption.

The Panel of Experts Meeting (2010)

Two major projections from the US Census Bureau and US Bureau of Labor Statistics (BLS) were released since the previous year's panel of the expert meeting. In December 2009, the US Census Bureau released alternative sets of population projections with different immigration assumptions. The 2009 national population projections are a supplemental series to the 2008 national population projections released on August 14, 2008, and provide results for differing assumptions of net international migration (http://www.census.gov/population/www/projections/2009projections.html). All other methodology and assumptions of mortality and fertility rates, are the same as those used in the 2008 national population projections. The lower immigration assumption, which looks reasonable in light of the recent trends, results in lower national population. When compared with the baseline projections released in August 2008, the gap between the low migration alternative and the baseline is 4.5 million (1.3 percent of the baseline population) in 2020, 9.7 million (2.5 percent of the baseline population) in 2035. In December 2009, BLS released new job projections to 2018. These projections were based on the national population projections released by the US Census Bureau in August 2008. Since there is only 1.3 percent difference in 2020 population between the low migration alternative and the baseline, the potential impact of the new low immigration alternative on job projections would be negligible. International immigration, in particular, unauthorized immigrants show a rapid decline from 11.8 million in 2007 to 11.6 million in 2008, and to 10.8 million in 2009. The decline in just one year between 2008 and 2009 reaches 800,000, which would be the likely impact of the recent economic recession.

A second panel of experts meeting was held on May 28, 2010, just one year after the first meeting held in 2009. Panel members, who participated in the first panel of experts meeting, were invited to the second panel of experts meeting. Eleven members attended the meeting to: 1) revisit the potential impact of economic recession and recovery in the national economy on the regional economy; 2) provide input on the recent trends in immigration and U.S. population growth; and 3) review the recent trends in the region's share of the national jobs.

With those newly available data in mind, the panel members participating in the second panel of experts meeting provided input to SCAG staff. First, the panel thought that job losses in the region would end in 2010 or 2011 in the 2009 meeting. While panel members differed on the size and timing of the recovery, the panel did not think the recession would affect the size of the region in 2020 and 2035. Some panel members thought there could be a lingering impact on unemployment rates, income growth and housing markets.

Second, U.S. population growth affects the pool of people and jobs in the nation. For any given SCAG share of future growth, higher U.S. immigration and population growth will push the SCAG region growth higher and vice versa. U.S. immigration and population growth is likely to be maintained at the lower level for the next 5 to 10 years.

Third, job shares dropped in 2008 and 2009, and state and regional job losses were larger than in the U.S. The majority of panel members supported the downward revisions of the regional shares of the national jobs. We are not sure if these declines in the regional job shares are temporary, based on the sharp decline in construction. There is a possibility that these declines might be a permanent shift because of the result of the long term demographic trends toward the aging of population, or because of the lack of the timely development and implementation of economic growth policy and strategy

The Panel of Experts Meeting (2011)

A third panel of experts survey was conducted through email on May 2011. Most of the panel members, who participated in the first and second panel of expert meeting, were requested to answer survey questions on the demographic and economic trends and assumptions. Thirteen members responded to questions on: 1) economic recovery of the nation; 2) immigration assumptions at the national level; 3) the projected region's share of the national jobs; 3) household projections. There was an overall consensus on the following few issues: 1) panelists expect the nation to be fully recovered by 2020 from the recession; 2) panelists expect U.S. unemployment to be between 4.5 percent and 6.5 percent; 3) panelists see no need to change the immigration assumptions from last year; 4) while not all panelists gave clear answers, no panelist said the relationship between projected jobs, population and households was not reasonable. On whether the SCAG region would see job growth faster than the nation, six of ten respondents said yes, while only two said no. The housing questions are particularly hard for short email answers. The question on whether household projections should be based purely on demographics was not clear to panelists. Some panelists wanted to comment on changing demographics and the implications for housing. Most panelists think demographics are the major determinant in the long run but had some concerns about 2020. Seven of 10 respondents agreed that market conditions would prevent "enough" housing from being built by 2020.

A RANGE OF REGIONAL GROWTH FORECASTS AND LOCAL INPUT

SCAG assumes that any set of growth forecasts (population, employment, and households) within a range of growth forecasts might be a plausible choice set. The scenario was developed in the following way: First, international immigration, one of the major demographic assumptions in US population projections by the US Census Bureau (2008), is not consistent with the recent trends, and is adjusted downward to reflect the recent trends. This downward adjustment of international immigration and the resulting population reduces the baseline US job projections due to the reduced labor supply. A mid national employment forecast is developed as a result of expert panel review (2009), is used as a key guide to develop a range of regional growth forecasts.

Second, a range of the regional employment forecasts (low, mid, high) is derived using a range of the regional shares of the national jobs from the expert panel review. A range of regional employment forecasts is translated into a range of the regional population forecasts (low, mid, high) using a set of demographic assumptions. All related economic and demographic assumptions (e.g., unemployment rates, labor force participation rates, immigration level, fertility rates, and survival rates, etc) for three different employment levels remain unchanged during the conversion process.

Third, a range of the regional population forecasts are translated into a range of the regional household forecasts using six different methods (e.g., cohort method, assimilation method, 2008 headship rate method, trend method, mid-trend method, mid-assimilation). A trend method produces the fewest households, while the assimilation method produces the highest number of households, given the same population level. SCAG uses a mid-trend assumption as a baseline method to convert population into households. It is based on a combination of the extrapolation of headship rates by race/ethnicity and gender and assimilation assumptions of the Hispanic and Asian headship rates. The mid term household projection is used with the population and employment scenarios to generate three scenarios of regional growth. **TABLE 9** presents the three growth scenarios for population, households, and employment as well as the local input scenario. The local based scenario is consistent with the low scenario, and reflects the recent trends. All of these scenarios were derived before the 2010 Census redistricting data was available.

TABLE 9 Regional Growth Forecasts (in Thousands): Three Scenarios and Local Input

2010 DECENNIAL CENSUS AND RE-BENCHMARK OF REGIONAL GROWTH FORECASTS

City and County level demographic data (Redistricting Data [P.L. 94-171]) for the State of California was released by the US Census Bureau on March 8, 2011. **TABLES 10** and **11** show population and household counts from the 2000 and the 2010 Census (April 1st figures) for each county in the SCAG region. The tables also present SCAG's preliminary projections of population and households by county for July 2010. Highlights from the table include: (1) Redistricting data from the 2010 Census showed that the population in the SCAG region was 18.05 million as of April 1, 2010, which is 1.5 million higher (9.3 percent) than the regional population count for the 2000 Census (16.5 million). The 2010 Census population figure for the SCAG region was almost 1 million lower (4.9 percent) than SCAG's preliminary population projections for 2010, which were provided before the publication of 2010 Census and primarily resulted from population estimates from the California Department of Finance (DOF); and (2) The 2010 Census redistricting data also counts the number of households in the SCAG region at 5.8 million, which is 461,000 higher (8.6 percent) than the regional household count for the 2000 Census (5.4 million). The 2010 Census household figure for the SCAG region was about 85,000 lower (1.4 percent) than SCAG's preliminary household projections for 2010, which are based on household estimates from the CA DOF.

On March 4, 2011, EDD released state and county estimates of wage and salary jobs for 2010 and adjustments to its previously released 2008 and 2009 job estimates (see **TABLE 12**). Highlights from the table include: (1) The new job data indicates that employment in the region totaled 7.22 million in 2010, about 128,000 (1.7 percent) less than SCAG's preliminary employment projections of 7.35 million; (2) Among counties in the SCAG region, job losses were much more severe in Los Angeles, Orange and Ventura Counties than previously projected; and (3) The region lost almost 800,000 jobs (7.9 percent) from 2007 to 2010. During this period, for every 100 jobs lost in the United States, 17 were in California, and of those, 9 were lost in the SCAG region.

SCAG incorporated the 2010 Census (Redistricting Data [P.L. 94-171]) and 2011 Employment Development Department data into the 2012–2035 RTP/SCS and RHNA process. Local jurisdictions within the SCAG region participated in the 20-month review and input process for developing the growth forecast dataset. SCAG updated the base year 2008 estimates by backcasting new 2010 Census data and updated 2020 and 2035 growth forecast by using the growth increments for 2008–2020 and 2020–2035 from the most recent database (December 2010).

Forecasting Methodology and Assumptions

The regional growth forecast for the 2012–2035 RTP/SCS was developed using the regional forecast methodology used in the development of the 2008 RTP growth forecast (see SCAG's growth forecast report for 2008 RTP: http://www.scag.ca.gov/rtp2008/pdfs/finalrtp/reports/fGrowthForecast.pdf). The following is an overall approach toward developing the regional growth forecast for the 2012–2035 RTP/SCS.

FORECASTING METHODOLOGY

SCAG projects regional population using the cohort-component model. The model computes population at a future point in time by adding to the existing population the number of group quarters population, births, and persons moving into the region during a projection period, and by subtracting the number of deaths and the number of persons moving out of the region. The patterns of migration into and out of the region are influenced by the availability of jobs. The preliminary regional and county growth forecast of population

and households for the 2012–2035 RTP/SCS was derived using the updated economic and demographic trends and perspectives.

The preliminary city population and household forecast was derived by multiplying the 2008 RTP jurisdiction's share of the county growth delta during the forecast horizon by the updated county household growth delta during the same period. The jurisdictions's relative growth pattern in the 2008 RTP growth forecast remained constant. The jurisdiction level household size and the group quarters population from the recent DOF estimates were incorporated into the new database.

Regional employment is projected using a shift-share model. The shift-share model computes employment at a future point in time using a regional share of the nation's employment. The preliminary regional and county growth forecast of employment for the 2012–2035 RTP/SCS was derived using updated economic and demographic trends and perspectives. The preliminary jurisdiction employment forecast was derived by using a constant-share method. The jurisdiction's share of county jobs for each sector for the base year is assumed to remain constant during the forecast years. By using the constant share method, the jurisdiction's job growth by sector will be determined by the different growth of the specific sector by county. If a city in Los Angeles County is specialized in a specific industry (e.g., manufacturing), its future job growth will be severely affected by a declining pattern of manufacturing sector in Los Angeles County. The initial job forecasts became a basis for the future local input process.

KEY REGIONAL ASSUMPTIONS

Demographic and economic assumptions play a decisive role in determining the size of population, households, and employment in the future. Population size is projected by identifying the demographic rates (e.g., fertility rate, survival rate, migration rate) of the population cohort. The region's total fertility rate remains at 2.2, which is slightly higher than the replacement level of 2.1, during the projection period. The total fertility rate of Hispanic women gradually declines from 2.64 in 2010 to 2.49 in 2035, while other racial/ethnic groups' rates tend to remain constant during the projection period. The total fertility rate of recent Asian and Hispanic immigrants is assumed to be at a higher level than the long-term residents of the same ethnic origin.

The region's life expectancy at birth improves at the same rate as that of the nation's life expectancy improvement as determined by the US Census Bureau's 2008 Projection during the projection horizon.

Domestic migration is fluctuating and is directly influenced by labor demand derived from regional employment projections. International net immigration is kept constant at 104,000, which is an annual average of international net immigration of the region during the 1990–2010 period. The share of racial/ethnic domestic (from within the nation) migrants changes along with the changing population size of the racial/ethnic group. For example, the share of Hispanic migrants increases while that of the non-Hispanic Whites decreases. In addition to demographic assumptions, three additional translation factors are needed to link employment projections to population projections. They are labor force participation rates, the implied unemployment rates, and double jobbing rates. First, labor force participation rates play an important role in translating the labor force demand into labor force supply or vice versa. The labor force participation rates projected in the latest U.S. Bureau of Labor Statistics (BLS) projections for 2016 were used as the starting point for projecting labor force participation rates for 2020 and 2035. The projected labor force participation rates for the population over 55 are especially important as a large share of labor force growth will be in this age group. SCAG kept the projected 2016 labor force participation rates for the population under 55 for the years 2020 and 2035. SCAG increased the projected labor force participation rates for population groups age 55 and above for 2020 and 2035. These increases reflect a continuation of the large increases seen in recent years and projected by BLS to 2016. They reflect the better health and life expectancy of the workforce and the tendency for people to work longer for financial reasons. As a result of the projected increases in age-related labor force participation rates, the overall labor force participation rate is projected to slightly decline from 60.4 percent in 2010 to 59.4 percent in 2035. Second, some workers might keep two or more jobs. The double jobbing rate is assumed to be around 4.5 percent, and remain constant during the projection period. Third, the implied unemployment rate is derived by matching labor supply estimated from population projections with workers estimated from job projections. The panel of experts suggested that the acceptable implied unemployment rate ranges from 5 percent to 8 percent. The current projection assumes a 5 percent unemployment rate during the projection period (2015–2035). Finally, the most important consideration is the reasonable regional share of national jobs. Currently the SCAG

region's share of the national jobs is assumed to be 5.2 percent, and remains constant during the projection period.

TABLE 14 Key Regional Assumptions

Race/Ethnicity	2005–10	2015–20	2030–35
Fertility Rate			
White (NH**)	1.7	1.7	1.7
Black (NH)	2.05	2.05	2.05
Asian & Other (NH)	1.50 (2.06*)	1.51 (2.06*)	1.51 (2.06*)
Hispanic	2.64 (2.88*)	2.58 (2.82*)	2.49 (2.72*)
Total	2.18	2.2	2.2
Crude Death Rate			
White (NH)	11.4	11.9	14
Black (NH)	9.1	9.4	10.4
Asian & Other (NH)	2.6	4	6.8
Hispanic	2.8	3.5	4.8
Total	6.2	6,4	7.5
Domestic In-Migration			
White (NH)	55%	46%	33%
Black (NH)	8%	8%	8%
Asian & Other (NH)	16%	18%	22%
Hispanic	21%	28%	38%
Total	100%	100%	100%
Domestic Out-Migration			
White (NH)	48%	46%	35%
Black (NH)	7%	7%	7%
Asian & Other (NH)	13%	14%	16%
Hispanic	31%	36%	43%
Total	100%	100%	100%
International Migration (annual average)	104,000	104,000	104,000
Labor Force Participation Rate			
White (NH)	62.4%	61.1%	60.9%
Black (NH)	57.8%	57.7%	57.1%
Asian & Other (NH)	59.1%	58.3%	56.4%
Hispanic	59.6%	61.3%	60.0%
Total	60.4%	60.5%	59.4%

Note: *Total Fertility Rates of Asian And Hispanic Immigrants. **NH refers to Non-Hispanic. *Source: CA DOF and SCAG*

The region's households are projected by using projected headship rate. The projected households at a future point in time are computed by multiplying the projected residential population by projected headship rates. Headship rate is the proportion of a population cohort that forms the household. Age-gender-racial/ethnic specific household formation level was applied to the projected population to estimate households. It is specified by age, gender, and race/ethnicity. Headship rate is projected in 5 year intervals for seven age groups (e.g., 15–24, 25–34, 35–44, 45–54, 55–64, 65–74, 75+), both genders (male and female), and four racial/ethnic groups.

The draft headship rate projections were developed using the extrapolation of the recent trends between 2005 and 2010 with different assumptions about the assimilation of Hispanic and Asian headship rates. The two plausible sets of headship rate assumptions were (1) age-sex-racial/ethnic specific household formation trends without assimilation and (2) age-sex-racial/ethnic specific household formation trends with assimilation.

In fact, there has been a gradual decline in the overall headship rates of the SCAG region from 43.7 percent in 1990 to 42.2 percent in 2010, with a sharp decrease by 3 percent from 46.7 percent in 1980 to 43.7 percent in 1990. The region's Hispanic headship rates generally did not converge toward the White headship rates between 1980 and 2000, but the gap of the White and Hispanic headship rates was growing over time and across generations, after controlling for socioeconomic factors. Although Hispanic immigrants

experience a linear assimilation toward the Non-Hispanic White headship rates over time, U.S. born Hispanic residents do not show a linear assimilation toward the Non-Hispanic White headship rates (Choi, 2008). There was generally a stronger effect of the economic recession on headship rates of the minorities or immigrants than that of the native-born White. As a result, the gap in headship rates between minorities or immigrants and the White group is larger (Min & Choi, 2011).

Since there is a potential overestimate of the projected households due to assimilation assumption, SCAG produces an acceptable range of the projected households by using headship rates with/without assimilation assumption. The final projected households will be within the acceptable range. **TABLE 15** shows the projected headship rates of the racial/ethnic groups between 2010 and 2035, which are the basis for deriving the household forecast.

TABLE 15 Headship Rates by Race/Ethnicity

	2010*	2020**	2035**
White (NH)	50.7%	51.6%	52.1%
Black (NH)	49.3%	51.6%	52.1%
Asian & Other (NH)	39.1%	39.6%–40.8%	39.4%–42.6%
Hispanic	34.8%	35.9%–36.5%	36.4%–37.8%
Total	42.2%	42.4%–42.8%	41.6%–42.9%

Note: *The base year (2010) headship rates were derived using ACS 05-07 3 year average and controlled for 2010 Census household estimates. **The 2020 and 2035 Asian and Hispanic headship rates include two assumptions of with/without assimilation. A headship rate assumption with assimilation is developed in the following way, Asian headship rates are reduced by 50 percent of the difference from 2010 White headship rates by 2050; Hispanic headship rates are reduced by 25 percent of the difference from 2010 White headship rates by 2050. *Source: SCAG*

SMALL AREA FORECAST AND ALLOCATION

The socioeconomic input data for the transportation model are processed at the transportation analysis zone (TAZ) level in two different formats: (1) the marginal total of person and household attributes and (2) the joint distributions of person and household attributes. TAZ is often referred to as TIER 2, are generally equivalent to Census block groups, and there are 11,267 TAZs in the region.

A marginal total of 54 independent socioeconomic attributes and 7 joint distributions of two or more attributes are developed as input for the transportation demand model (see **TABLES 16** and **17**). Those variables include population, households, school enrollment, household income, workers, employment, etc. Joint distributions of two or more attributes are now needed as required by the enhanced transportation demand model. One of those joint distributions is the number of households by household income, household size, the number of workers, and the type of dwelling units, at the TAZ level.

SCAG develops the marginal and joint distributions of socioeconomic attributes at the TAZ level using diverse public and private sources of data and advanced estimation methods. The major data sources include 2000 and 2010 Census, 2000 Census Transportation Planning Package (CTPP), American Community Survey (ACS), California Department of Finance (DOF), California Employment Development Department (EDD), InfoUSA, 2008 Existing Land Use, and 2008 County Assessor's Parcel Database.

The socioeconomic input data at the TAZ level is estimated using three major processes: 1) development of three major variables (population, households, employment; 2) development of secondary variables (socioeconomic attributes of persons and households, employment sectors); 3) development of joint distributions of selected attributes.

Development of Major Variables

The household estimates at the TAZ level are initially derived by summing the Minimum Planning Unit (MPU) level household estimates within the TAZ. The MPUs are generally equivalent to parcels. The MPU level household estimates are derived using the following process: (1) add the new residential construction between 2000 and 2008 to 2000 MPU level housing estimates from 2000 Census; and (2) convert housing units into households using the 2000 vacancy rate. The MPU level household estimates are controlled to the 2008 city level household estimates. The employment estimates at the MPU level are initially derived by using 2008 InfoUSA database. The MPU level employment estimates are controlled to the 2008 county level employment estimates from CA EDD. TAZ level household and employment estimates are derived by aggregating the MPU level estimates.

TAZ population and household forecasts are derived using the housing unit (HU) method, as used in the city forecasts. The first step of the housing unit method is to project housing units at the TAZ level. Since SCAG focuses on the household forecast, SCAG derives the initial TAZ household forecasts by reflecting growth patterns incorporated in the 2008 RTP forecasts, recent estimates and trends, and updated city household forecasts. The TAZ household forecast is converted into population by using the group quarters population plus the product of households and average persons per household (PPH). The average number of persons per household is projected using the recent estimates and trends, and is constrained by the updated city PPH. Group quarters population is projected using the TAZ's share of the city population from the 2000 Census and 2008 DOF, which is assumed to remain constant during the projection horizon.

TAZ jobs are initially projected using a constant-share method. The current TAZ's share to city jobs for each sector will remain constant during the forecast years. By using the constant share method, the TAZ's job growth by sector will be simply determined by the different growth of the specific sector by city. The initial TAZ population, household, and employment forecasts become a basis for the local review process.

Development of Secondary Variables

Three major variables are further disaggregated into necessary attributes (e.g., age, persons per households, industry sectors, etc), as required in the transportation demand model development process. The additional attribute variables are called secondary variables. These secondary variables at the TAZ level are estimated using the Large Area Secondary Variables Allocation Model (LASVAM) and Small Area Secondary Variables Allocation Model (SASVAM) (Cho, 2006; Choi & Ryu, 2011). SCAG uses LASVAM to develop the county level secondary variables using the trend extrapolation or the statistical method. SCAG uses SASVAM to develop the TAZ level secondary variables using the probabilistic choice model, which reflects the temporal change of the individual attribute and the changing relationship of the related attributes.

Development of Joint Distributions of Selected Secondary Variables

The marginal distribution of secondary variables at the TAZ level processed by SASVAM is developed into joint distribution of selected secondary variables using the Population Generator (PopGen) 1.1, developed by Arizona State University. PopGen 1.1 generates synthetic populations and households with attribute distributions, which become the basis for computing the joint distributions. SCAG uses the 2000 Census SF3 driven aggregate data at TAZ level and 2000 Census PUMS based individual data at the PUMA level as seed data to produce 2008 synthetic populations and households at the TAZ level.

INCORPORATION OF MAJOR DEVELOPMENT PROJECTS

SCAG incorporates major long range major development projects with regional significance into the TAZ population, household, and employment forecast to accurately assess their impacts on the long term regional transportation system. These projects are often collected through the Intergovernmental Review (IGR) program.

As required by the California Environmental Quality Act (CEQA), SCAG should review projects throughout its jurisdiction to monitor regional development as part of the IGR. Through the IGR, SCAG confirms that the regionally significant projects are consistent

with a range of adopted regional plans and policies. This IGR process allows SCAG to identify the regionally significant major development projects.

Once the small areas are identified as a major development project area through the IGR process, a set of preliminary population, household, and employment forecasts are processed using the information of proposed major development projects. The major development projects and related growth estimates generally do not influence the overall growth forecast of the local jurisdiction, but may influence the growth distribution within the local jurisdictional boundary.

TABLE 16 Description of Socioeconomic Variables

Variables	Description of Variables
Population (8 variables)	Total Population (1 variable): total number of people living within a zone. Total population is composed of residential population and group quarters population.
	Group Quarters (Non-Institutional) Population (1 variable): is primarily comprised of students residing in dormitories, military personnel living in barracks, and individuals staying in homeless shelters. Group quarters (non-institutional) population does NOT include persons residing in institutions.
	Residential Population (1 variable): the number of residents NOT living in "group quarters."
Population (8 variables)	Group Quarters Population living in student dormitories (1 variable): Population living in college dormitories (includes college quarters off campus).
	Population by Age (4 variables): the number of population for different age groups: 5–17, 18–24, 16–64, and 65+.
Households (26 variables)	Total Households (1 variable): Household refers to all of the people who occupy a housing unit. By definition there is only one household in an occupied housing unit.
	Households by Household Size (4 variables): the number of one-person households, two-person households, three-person households, and four or more person households.
	Households by Age of Householder (4 variables): the number of households with age of householder between 18 and 24 years old, 25 and 44, 45 and 64, and 65 or older.
Households (26 variables)	Households by Number of Workers (4 variables): the number of households with no worker, with one worker, with two workers, and with three workers or more.
	Households by Household Income (4 variables): the number of households with annual household income (in 1999 dollars) of less than $24,999, $25,000–$49,999, $50,000–$99,999, and $100,000 or more.
	Households by Type of Dwelling Unit (2 variables): the number of households living in single-family detached housing, and living in other housing.
	Households by Number of College Students (3 variables): the number of households with no college student, with one college student, with two college students or more.
	Households by Number of Children age 5–17 (4 variables): the number of households with no child, with one child, with two children, and three children or more.

Variables	Description of Variables
School Enrollment (2 variables)	K-12 School Enrollment (1 variable): the total number of K-12 (kindergarten through 12th grade) students enrolled in all public and private schools located within a zone. All elementary, middle (junior high), and high school students are included. This variable represents "students by place of attendance".
	College/University Enrollment (1 variable): the total number of students enrolled in any public or private post-secondary school (college or university) that grant an associate degree or higher, located within a zone. This variable also represents "students by place of attendance".
Workers (4 variables):	Total Workers (1 variable): total number of civilian workers residing in a zone. Workers are estimated by the place of residence.
	Workers by earning level (3 variables): the number of workers with earnings of less than $24,999, $25,000–$49,999, $50,000 or more.
Median Household Income (5 variables):	Median Household Income (1 variable): median household income is the median value of household income for all households within a zone. Household Income includes the income, from all sources, for all persons aged 15 years or older within a household.
	Median Household Income by Income Categories (4 variables): the median income is estimated for each of four different income categories: less than $24,999, $25,000–$49,999, $50,000–$99,999, and $100,000 or more.

Variables	Description of Variables
Employment (17 variables)	Total Employment (1 variable): total number of jobs within a zone. The employment variables represent all jobs located within a zone (i.e., employment by place of work). Jobs are composed of wage and salary jobs and self-employed jobs. Jobs are categorized into 13 sectors based on the North American Industry Classification System (NAICS) code definition.
	Employment by 13 Industries (13 variables): the number of total jobs for 1) agriculture & mining, 2) construction, 3) manufacturing, 4) wholesale trade, 5) retail trade, 6) transportation, warehousing, and utilities, 7) information, 8) financial activities, 9) professional and business services, 10) education and health services, 11) leisure and hospitality services, 12) other services, and 13) public administration.
	Employment by wage level (3 variables): total number of jobs by three wage levels: of less than $24,999, $25,000–$49,999, $50,000 or more.

TABLE 17 Joint Distributions of Population, Households, and Workers by Selected Demographic Attributes.

Major Variables	Demographic Attributes
Households	Household income (less than $24,999, $25,000 to $49,999, $50,000 to $99,999, $100,000+)
	Household size (1,2,3,4+ persons in household)
	Number of workers (0,1,2,3+ workers in household)
	Type of dwelling unit (single-family detached, other)
Households	Household income (less than $24,999, $25,000 to $49,999, $50,000 to $99,999, $100,000+)
	Number of workers (0,1,2,3+ workers in household)
	Age of head of household (18–24, 25–44, 45–66, 65+ years old).
Households	Household income (less than $24,999, $25,000 to $49,999, $50,000 to $99,999, $100,000+)
	Household size (1,2,3,4+ persons in household)
Households	Number of college students (0, 1, 2+)
	Household income (less than $24,999, $25,000 to $49,999, $50,000 to $99,999, $100,000+)
Households	Number of children age 5–17 (0,1,2,3+)
	Household income (less than $24,999, $25,000 to $49,999, $50,000 to $99,999, $100,000+)
Population	Age (0–4, 5–17, 18–24, 25+)
	Household income (less than $24,999, $25,000 to $49,999, $50,000 to $99,999, $100,000+)
Workers	Worker's earnings (less than $24,999, $25,000–$49,999, $50,000+)
	Household income (less than $24,999, $25,000 to $49,999, $50,000 to $99,999, $100,000+)

LOCAL INPUT

Local input plays an important role in developing an accurate growth forecast for 2012–2035 RTP/SCS. Although the local input is an on-going process, SCAG sought local input from local jurisdictions for at least three times during the development of the growth forecast. The first and preliminary local input process was conducted between September 2008 and January 2009 in anticipation of 2012–2035 RTP/SCS growth forecast, data and tool requirements under SB 375. SCAG collected the 2008 existing land use, 2008 zoning, and the current general plan land use through the local input process.

The second and major local input process was conducted between July 2009 and February 2010 to collect and update land use information and the preliminary growth forecast. The preliminary projection of population, household and employment growth at the jurisdictional and TAZ level was provided to all local jurisdictions for comments and inputs. SCAG conducted a series of one-on-one meetings with local jurisdictions. Over 90 percent of 195 local jurisdictions provided SCAG with input on growth forecast, existing land use, zoning, and general plan land use. The local input result presented an imbalance of population and employment for the year 2035. The number of jobs in 2035 is larger than that of available labor supply. SCAG eventually adjusted the 2035 employment downward to achieve a balance of population and employment.

The third and final local input process was conducted at the jurisdictional level between May 2011 and August 2011. With the availability of demographic data from the 2010 Census (Redistricting Data [(P.L. 94-171]) and employment data from CA EDD in March 2011, SCAG rebenchmarked the growth forecast's base year demographic and employment figures. SCAG updated the base year (2008) data with the growth delta of the preliminary forecast unchanged. SCAG made an appropriate adjustment of growth forecast as needed.

TABLE 18 presents a proposed growth forecast of population, households, and employment for years 2008, 2020, and 2035 at the local jurisdictional level in the SCAG region. The proposed local growth forecast was primarily derived using the bottom-up local input process.

Section IV: SCAG PECAS Land Use Model

Introduction

SCAG made its initial step in developing an integrated, comprehensive transportation and land use model in early 2009. The model is based on the PECAS (Production –Exchange – Consumption Allocation System) framework. The model has not been officially peer-reviewed and is not fully operational. The model is used only as an internal scenario testing tool for the 2012–2035 RTP/SCS. However, the model will be the main tool to design and develop RTP scenarios in the near future when it is ready. This chapter introduces the related effort and summarizes a selected scenario test.

The following section briefly summarizes the status of consulting project for development of the model. Then the model is introduced in terms of its structure, SCAG specifications, and calibration. An analysis of the impact of the implementation of a 5 cents VMT fee is provided as an example scenario. A brief conclusion remark is provided at the end of the section.

Consulting Projects

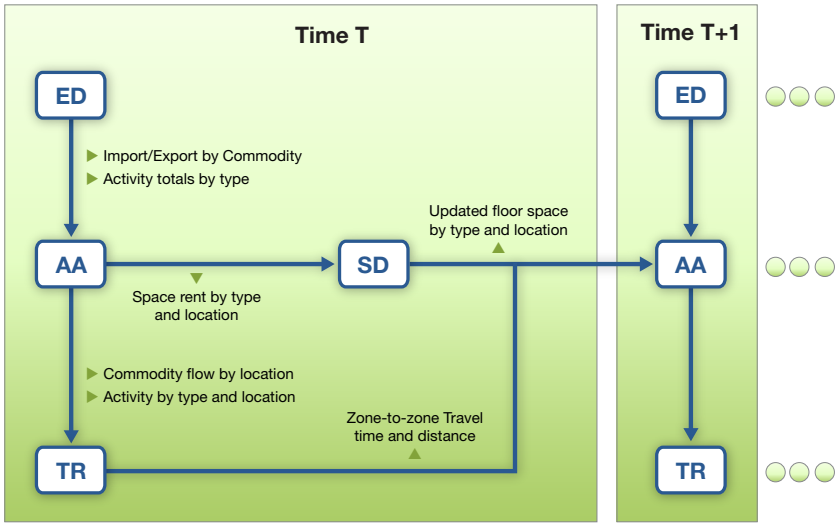
The model was commissioned by SCAG and built by SCAG staff together with the Urban Land Use and Transportation (ULTRANS) Center at the University of California, Davis, and HBA Specto Incorporated in Calgary, Alberta. Over the 25 month contract period from February 2009 to March 2011, the staff tried to achieve two purposes. The first was to develop a working draft model and its related data within the given period of time. To achieve this objective, the development started with the statewide PECAS model, which was developed by ULTRANS and HBA for CalTrans to demonstrate the model. Once the model and the data was delivered, it was modified to make it more specific to the SCAG region through an iterative development approach. The draft model developed from this process represented the SCAG region in geographic sense, but its behavioral parameters and economic data represented the state of California. The second was to acquire knowledge to develop an integrated land use model. This involved staff work in processing raw data, development of the database, model setup and adjustment (calibration) and operation. After twenty-three 2 or 4 day workshops held at SCAG or UC Davis, model has been scrutinized down to the individual source code lines.

Another portion of the consulting project was to establish the economic data and parameters for the SCAG region with MJ Consulting. Based on the transferred knowledge, regional economic data was processed to set up the AA (Activity Allocation) module of the PECAS model. The work was performed from September 2009 to May 2010. As a result of this project, staff was able to develop a more streamlined process to prepare regional economic data, and a calibrated set of the AA module for the region. In addition, this project allowed staff to have time and resource to produce the first SCAG parcel-level land use database.

PECAS Overview

PECAS is a generalized approach for simulating spatial economic systems. It is designed to provide a simulation of the land use component of land use transport interactive modeling systems.

PECAS uses an aggregate, equilibrium structure with separate flows of exchanges (including goods, services, labor and space) going from the production site to the consumption location, based on variable technical coefficients and a market clearing mechanism with exchange prices. It provides an integrated representation of spatially distinct markets for the full range of exchanges, with the transport system and the development of space represented in more detail with specific treatments.



Flows of exchanges from production to exchange zones and from exchange zones to consumption are allocated using the nested logit models, according to exchange prices and transport generalized costs (expressed as transport utilities with negative signs). These flows are converted to transport demands that are loaded to networks in order to determine congested travel utilities. Exchange prices determined for space inform the calculation of changes in space thereby simulating developer actions. Developer actions are represented at the level of land use zones using an aggregate flow treatment. The system is run for each year being simulated, with the travel utilities and changes in space for one year influencing the flows of exchanges in the next year.

PECAS includes two basic modules that are linked together with two other modules to provide a representation of the complete spatial economic system. **FIGURE 21** shows the relationship between modules.

The set of four basic modules includes:

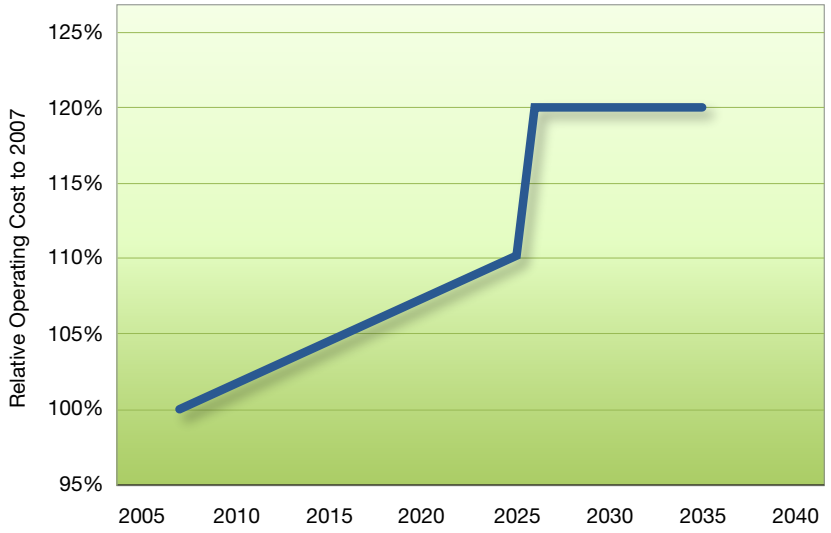
- **Activity Allocation Module (AA Module):** This is one of the two PECAS modules. It represents how the production, exchange and consumption activities locate within the space provided by developers and how these activities interact with each other at a given point in time. For SCAG application, economic activities from 42 industrial sectors and 14 types of households consist of individual markets in each of 302 CSA (Community Statistical Area) zones.
- **Space Development Module (SD Module):** This is another of the two PECAS modules. It represents the actions of developers in the provision of different types of developed space where activities can locate, including the new development, demolition and re-development that occurs from one point in time to the next. This developed space is typically floor space of various types and is called 'space' in the PECAS framework. 9 residential types and 14 non-vacant land use types are represented in the SCAG SD module.
- **Transport Model (TR Module):** This is one of the 'non-PECAS' modules. It represents the transport system connecting locations, including at a minimum a transport network, the transport demands that load onto this network (as a result of the economic interactions represented in the AA Module) and the congested times and costs for interactions between locations arising with the loading of these demands. For SCAG application, two sub-modules are employed to simulate the traditional 4-step model. The first sub-module of trip generation converts the activity flow estimated by AA Module into Origin-Destination matrices between the CSA zones, and another sub-module performs a Frank-Wolfe style traffic assignment to estimate link traffic volume, zone-to-zone travel time, and VMT.
- **Economic Demographic Aggregate Forecasting Model (ED Module):** This is the other of the 'non-PECAS' modules: It is a form of model or approach used to develop aggregate economic forecasts for the study area being modeled. In the SCAG application, this is a regional control total of households by 14 types and employment by 42 industrial sectors.

FIGURE 21 Pecas Module Structure

Scenario Test

As stated above, the PECAS land use model produced as-is based, preliminary impact analysis results for various what-if scenarios. Therefore any measurements presented in this section are not necessarily intended to support any implementation of the plan. The purpose of this section is to demonstrate the functionality of the developing land use model based on the PECAS framework.

As depicted in **FIGURE 21**, each module in PECAS produces intermediate outputs, which are input to the subsequent processes. The AA module primarily estimates the spatial price of commodities, and allocates activities, which consists of households by types and employment by sector. The AA module also estimates commodity flows, between the sectors and locations of production and consumption, in dollars. The main output from the SD module is changes in land use and amount of floor space at parcel level. The presentation of this detail output would prevent finding regionally meaningful implications. It could also cause unnecessary misunderstanding as if that market-driven forecast was



intended for the local land use plan. For SCAG's planning purpose, microscopic outputs are aggregated over sectors and statistical zones.

A what-if scenario was selected to present the comprehensiveness of PECAS. Note that this scenario is independent of and does not reflect the assumptions underlying the financial plan as documented in the Transportation Finance Appendix and Chapter 3 of the 2012–2035 RTC/SCS. Under the test, the following assumptions are applied.

- The current gasoline tax, 36.4 cents per gallon, would gradually increase until 2025 to 50 cents per gallon due to nominal inflation.
- After that, a 5 cents per mile VMT fee would replace the gasoline tax in year 2026.
- The auto operating cost would be 50 cents per mile, and 10 percent is fuel cost.
- The increase of the gasoline tax up to year 2026 would be the equivalent of about a 10 percent increase in operating costs, and the new VMT fee would result in an additional 10 percent surcharge.

FIGURE 22 shows the scenario of auto operating costs over the planning horizon. When evaluating (dis-)utility of locations, importance of travel cost is high with the increase in auto operating costs. In responding to the relatively increased travel cost, economic actors (households and firms) would change their behavior, including relocating the operation location, or job site according to their preference. Such a change would cause shorter travel distance on average, at a given transportation network capacity.

FIGURE 22 Scenario of Auto Operating Cost

Average travel distances are calculated by three categories; Worker Compensation Distance (WCD) is the distance between a worker's residence to work place, which is equivalent to Home-to-Work trip distance. In PECAS flow is reported with the value of the commodity, times the distance between where it originated (produced) to where it is destined (consumed). To calculate the average for WCD, the estimated wage at the place of work is used. Intermediate Goods movement Distance (IGD) is the delivery distance of commodity to the other industries for their production activities. Consumer Goods movement Distance (CGD) is the distance of the same commodities but its destination is to households, and it is equivalent to the distance of Home-to-Shop trips. For IGD and CGD, commodity price at production site is used to calculate average distance.

PECAS estimates the flow of commodities including goods, services, and labor by using the value of commodities multiplied by the movement distance of commodities from where they are produced to where they are consumed. The total transported commodities in the SCAG region were estimated to be 41.98 trillion dollar•miles in year 2007, and 53.19 trillion dollar•miles in year 2035, if no additional auto operating cost is charged.

This 26.7 percent increase is caused by regional economic growth and continuing sprawl. With the VMT fee replacing the current gasoline tax, the estimation is 3.55 percent less than the base case at year 2035. Given that economic growth remains constant in both cases, this reduction is due to the additional travel cost and subsequent reallocation of activity. **FIGURE 23** shows the variation over time that is caused by the changed travel cost.

FIGURE 23 Scenario Test Result: Travel Distance of Commodities in Value * Mile Transported

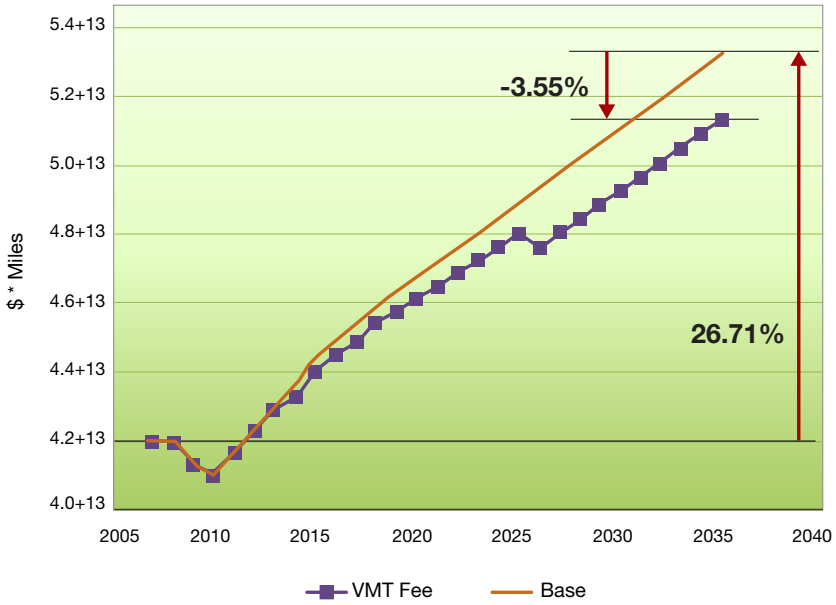


TABLE 19 summarizes the average travel distance by category. In the base case, the average travel distance of working trip (WCD) would increase 10.3 percent in year 2035, while intermediate goods delivery (IGD) and shopping trips (CGD) would increase 7.5 percent and 3.2 percent, respectively. The overall increase is 5 percent. With the new 5 cents per mile VMT fee, overall travel distance would increase 1.3 percent from year 2007.

TABLE 19 Scenario Test Result: Average Travel Distance In Miles

Scenario	Type	2007 (A)	2020 (B)	2020 (B)/(A)	2035 (C)	2035 (C)/(A)
Base	WCD	12.858	13.543	1.053	14.176	1.103

	Sum	32.517	33.257	1.023	34.157	1.050
VMT Fee	WCD	12.858	12.948	1.007	12.668	0.985
	IGD	42.784	43.819	1.024	44.815	1.047
	CGD	25.515	25.390	0.995	25.182	0.987
	Sum	32.517	32.776	1.008	32.928	1.013

Coda

This section introduces the SCAG PECAS land use model, as an available tool to be used in the future RTP. After a 2-year development consulting project, SCAG commissioned a draft version of the PECAS model, and applied it to cursory test of various scenarios internally. At the current stage, the model produced reasonable sensitivity to the what-if scenario with increased auto operating cost.

With refined modeling parameters and input data, the model will be involved more actively in the scenario development process, by supporting region-wide impact measures. Also, with a mature model, its activity reallocation estimation could be the basis of scenario-sensitivity socioeconomic data development.

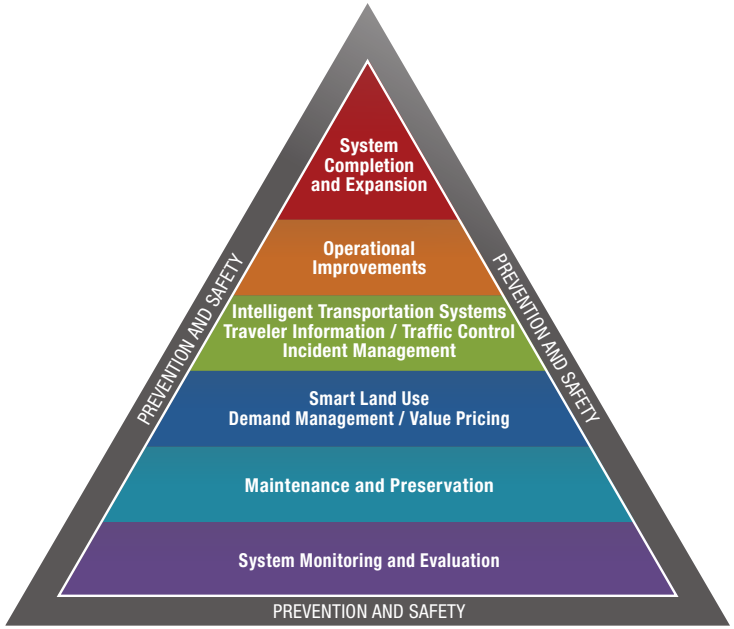
Network Statistics 46

Trip Statistics 50

Mobility Statistics 51



Southern California's highway and arterial system extends for 12,630 miles and serves 62 million trips each day. This roadway system is the backbone of the region's economic well-being, and facilitates the movement of people and goods via multiple modes of transportation, including public transit, and active transportation. According to the Southern California Association of Governments' (SCAG) Regional Travel Demand Model (RTDM), nine out of every ten trips relies either entirely or in part on the highway and arterial system.

Despite the importance of the system, improvements have not kept pace with the region's increasing population and transportation demand. As a result, the region's traffic congestion has increased dramatically, leading to a less productive transportation system with negative consequences such as wasted time and fuel and poor air quality.

The highway and arterial investments included in the 2012 Regional Transportation Plan (RTP) attempt to address these challenges by following the integrated approach depicted in **FIGURE 1**, which calls for the region to first take care of and optimize the existing system before investing in costlier capital expansion projects. The successful preservation and management of the highway and arterial system are crucial to maintaining the region's economic vitality and quality of life. At the same time, there are critical gaps in the network that hinder access to certain parts of the region. The Plan proposes the closure of these gaps to complete the system, allowing the region's residents to enjoy improved access to opportunities, such as jobs, education, healthcare, and recreation.

This technical appendix consolidates and summarizes highway and arterial related RTP investments, including project commitments identified by the local implementing agencies, as well as system preservation and operations investments. Additionally, this appendix consolidates and summarizes the highway and arterial related performance results from SCAG's regional travel demand model.

FIGURE 1 Mobility Pyramid

Programmed Commitments

As the short-range element of the Plan, SCAG's Federal Transportation Improvement Program (FTIP) contains a significant number of highway and arterial improvement projects that local transportation agencies will implement in the near- and mid-term. These projects close critical gaps in the system, relieve significant bottlenecks, and address inter-county travel needs, and include High-Occupancy Vehicle (HOV) lanes and connectors, mixed-flow (or general purpose) lanes, High-Occupancy Toll (HOT) lanes, and strategic arterial improvements.

A sample of major projects in the FTIP is shown in **TABLE 1**. A complete project list can be found in the RTP's Project List Appendix.

TABLE 1 Sample Major Highway Projects in the FTIP

County	Route	Description	Completion Year*	Cost (millions)
HOV Lanes				
LA	I-5	Add HOV lanes from the LA/OC County Line to I-605	2018	$1,242
LA	I-5	Add 1 HOV lane in each direction from SR-134 to SR-170	2014	$712
LA	I-10	Add 1 HOV lane in each direction from I-605 to Puente	2014	$200
LA	I-10	Add 1 HOV lane in each direction from Puente to Citrus	2018	$185
LA	I-10	Add HOV lanes in each direction from Citrus to 57/210	2018	$193
LA	I-405	Add northbound HOV lane from I-10 to US-101	2018	$1,034
LA	I-405	Add 1 HOV lane in each direction from SR-90 to I-10	2012	$190
LA	SR-71	Add 1 HOV lane in each direction from I-10 to SR-60	2023	$250
OR	I-5	Add 1 HOV lane in each direction from South of Avenida Pico to South of Avenida Vista	2020	$106
RV	SR-91	Add 1 HOV lane in each direction from Adams to 60/215	2018	$278
SB	I-10	Add 1 HOV lane in each direction from Haven to Ford	2020	$1,090
Toll Lanes				
LA	I-10/ I-110	HOT Lanes on I-10 and I-110	2013	$123
LA/SB	TBD	Construct new High Desert Corridor connecting Los Angeles and San Bernardino Counties	2020	$5,156
RV	SR-91	Convert HOV lanes to tolled express lanes and add direct connectors	2018	$1,104
Mixed-Flow Lanes				
IM	SR-78	Brawley Bypass Corridor	2012	$228
OR	SR-91	Add 1 eastbound mixed-flow lane from 91/55 connector to SR-241 and 1 westbound mixed-flow lane from SR-241 to Imperial Highway	2018	$86
OR	I-405	Add 1 mixed-flow lane in each direction from SR-73 to I-605	2023	$1,694
RV	SR-91	Add 1 mixed-flow lane in each direction at various locations from SR-241 to Pierce St	2018	$1,490
RV	I-215	Add 1 southbound mixed-flow lane from Murrieta Hot Springs Rd to I-215/I-15 junction	2018	$13
RV	I-215	Add 1 mixed-flow lane in each direction from Scott Rd to Nuevo Rd	2018	$191
SB	US-395	New alignment from High Desert Corridor to Farmington Rd	2018	$14
VE	US-101	Add 1 mixed-flow lane in each direction at various locations from LA/VE County Line to Moorpark Rd	2018	$60

*Represents the Plan network year for which the project was analyzed for the RTP modeling and regional emissions analysis

Additional County Commitments

Beyond the projects included in FTIP, the county transportation commissions (CTCs) have committed to pursue a number of additional projects through the year 2035 as identified in voter-approved sales tax measures and other countywide transportation plans. A sample of major projects is shown in **TABLE 2**. A complete project list can be found in the RTP's Project List Appendix.

TABLE 2 Sample Major Highway Projects Committed by the Counties

County	Route	Description	Completion Year*	Cost (millions)
HOV Lanes				
LA	SR-71	Convert expressway to freeway–add 1 HOV lane and 1 mixed-flow lane	2030	$330
LA	SR-14	Add 1 HOV lane in each direction from Ave P-8 to Ave L	2030	$120
OR	I-5	Add 1 HOV lane in each direction from Avenida Pico to San Juan Creek Rd and reconfigure Avenida Pico interchange	2018	$270
OR	SR-73	Add 1 HOV lane in each direction from MacArthur to I-405	2035	$249
OR	Various	Complete continuous access conversion of the Orange County HOV system where feasible	2014	$12
SB	I-15	Add 1 HOV lane in each direction from RV/SB County Line to I-215	2020	$480
SB	I-15	Add 1 HOV lane in each direction from US-395 to SR-18/Mojave River	2020	$398
SB	I-15	Add 1 HOV lane in each direction from I-215 to US-395	2020	$800
SB	I-215	Add 1 HOV lane in each direction from SR-210 to I-15	2030	$179
SB	I-210	Add 1 mixed-flow lane and 1 HOV lane in each direction from I-215 to I-10	2020	$138
Toll Lanes				
LA	SR-710	SR-710 North Extension (tunnel) (alignment TBD)	2030	$5,636
OR	SR-91/ SR-241	Construct HOV/HOT connector from SR-241 N/B to SR-91 E/B, and SR-91 W/B to SR-241 S/B	2018	$473

County	Route	Description	Completion Year*	Cost (millions)
Mixed-Flow Lanes				
IM	TBD	Widen and improve SR-98 or Jasper Rd to 4/6 lanes	2035	$1,170
IM	SR-111	Widen and improve to a 6-lane freeway with interchanges at Heber, McCabe, and Jasper, and overpass at Chick Rd	2030	$997
LA	SR-57/ SR-60	Improve the SR-57/SR-60 interchange	2030	$475
OR	SR-55	Add 1 mixed-flow lane in each direction and fix chokepoints from I-405 to SR-22 and add 1 auxiliary lane in each direction between select on/off ramps and operational improvements through project limits	2023	$343
OR	SR-91	Add 1 mixed-flow lane on SR-91 eastbound from SR-57 to SR-55 and improve interchange at SR-91/SR-55 and Lakeview Ave	2023	$356
OR	I-405	Add 1 mixed-flow lane in each direction from I-5 to SR-55 and improve merging	2023	$375
RV	I-10/ SR-60	Construct new interchange	2030	$184
RV	I-10	Add 1 mixed-flow lane in each direction from Monterey Ave to Dillon Rd	2030	$127
VE	SR-118	Add one lane in each direction from Route 23 (New LA Ave) to Tapo Cyn Rd	2018	$506

*Represents the Plan network year for which the project was analyzed for the RTP modeling and regional emissions analysis

In total, the RTP commits over $64 billion to highway investments (**TABLE 3**).

TABLE 3 Highway Investments

County	Investment ($, billions)*
Imperial	$1.4
Los Angeles	$11.7
Orange	$19.7
Riverside	$8.6
San Bernardino	$5.5
Ventura	$0.8
Various	$16.4
Regional Total	**$64.2**

*Also see Goods Movement Supplemental Report for additional related improvements.

Numbers may not sum to total due to rounding

EXHIBITS 1–4 depict major highway projects proposed by the CTCs in the RTP.

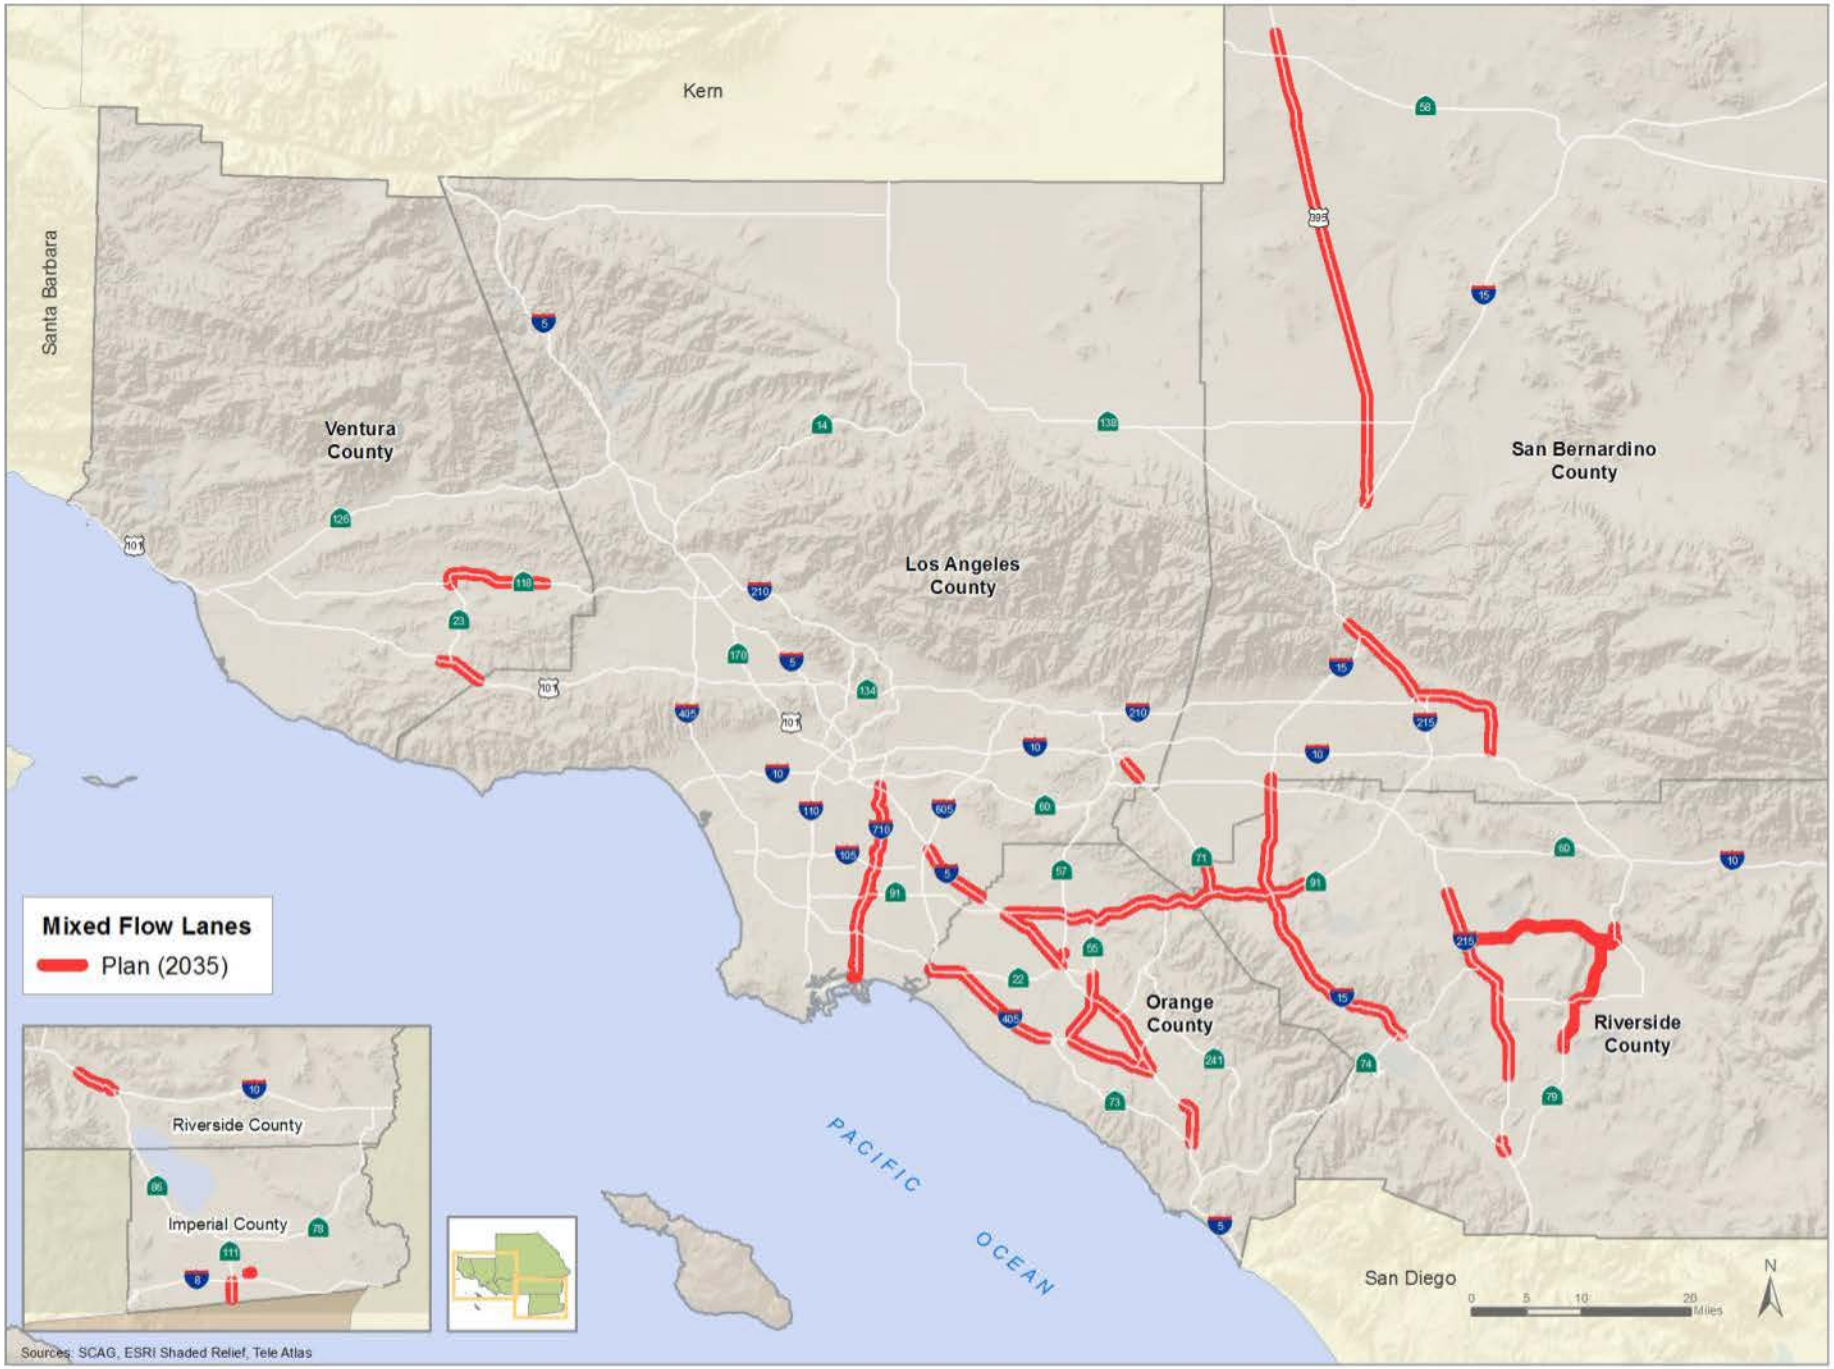

EXHIBIT 4 Major Highway Projects Proposed By Counties

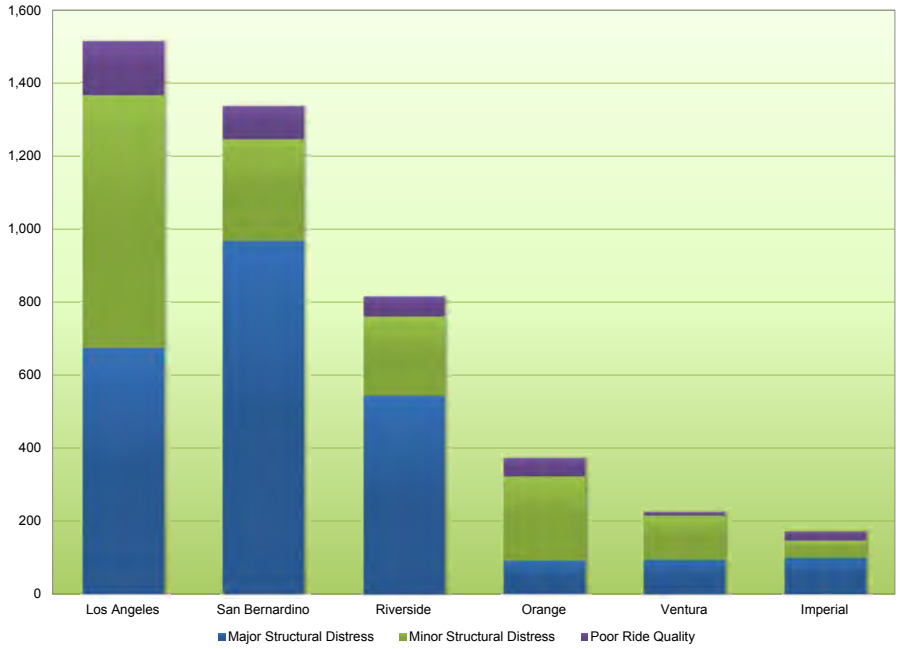
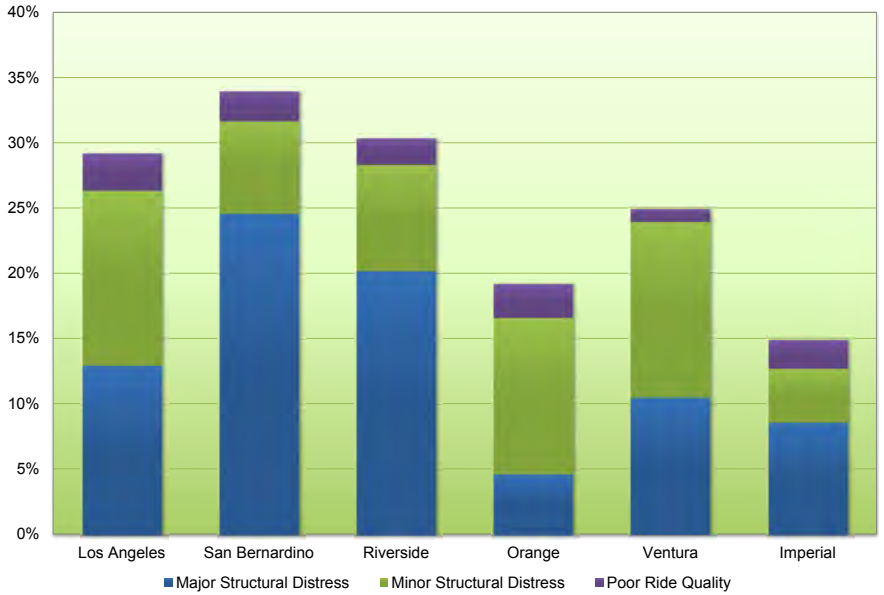
System Preservation

Aging Infrastructure

Over the decades, the region has invested hundreds of billions of dollars in developing and expanding a multi-modal transportation system. As shown in **FIGURES 2, 3,** and **4**, a significant amount of roadways and bridges have fallen into an unacceptable state of disrepair.

FIGURE 2 Total Distressed Lane Miles (2007)





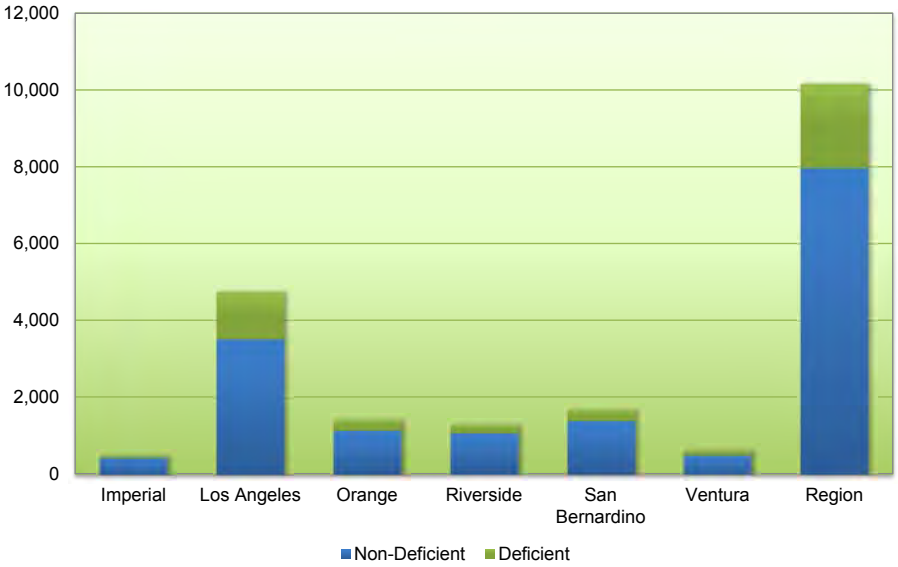


FIGURE 3 Percent Distressed Lane Miles (2007)

Source: 2007 Caltrans Pavement Survey

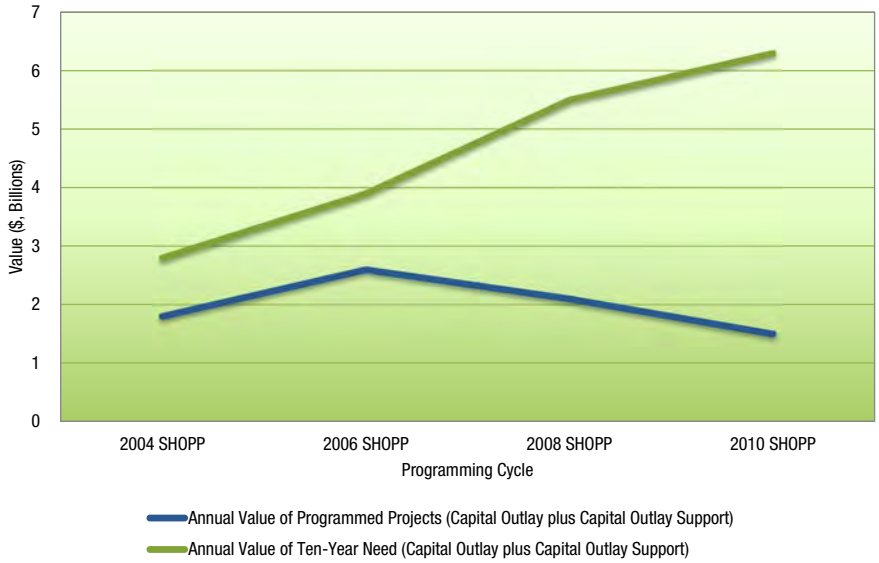

FIGURE 4 State Highway Bridge Conditions in the Region

Source: FHWA National Bridge Inventory (NIB), 4/06/2011 update

This is a result of years of underfunding statewide preservation needs. As seen in **FIGURE 5**, these preservation needs have continued to grow over much of the past decade while funding has declined.

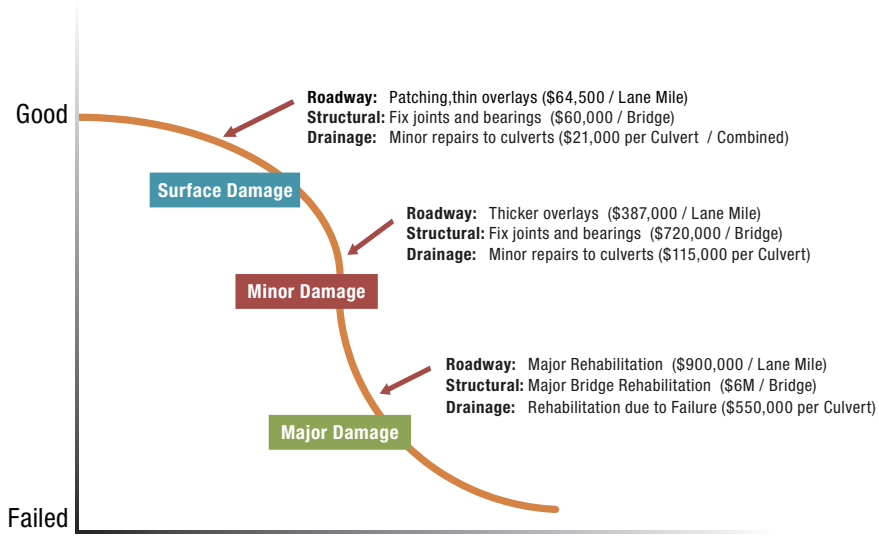

FIGURE 5 Programmed Project Expenditures versus Need

Source: California Transportation Commission 2009 SHOPP Plan

As shown in **FIGURE 6**, deferred maintenance leads to much costlier repairs in the future. While minor repairs to keep roadways in a state of good repair cost between $21,000 and $64,500 per lane mile, the major rehabilitation of a lane mile can cost anywhere from $550,000 to $6 million.

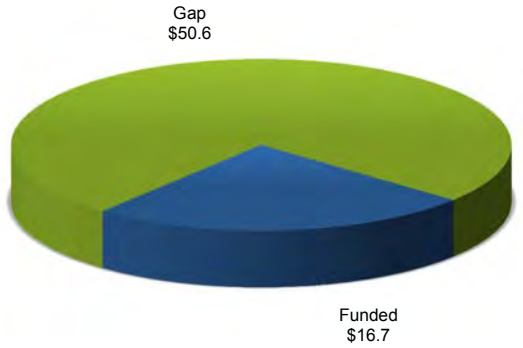

FIGURE 6 Cost Effectiveness of Pavement Treatment

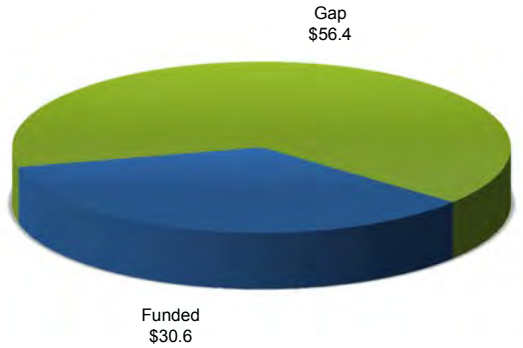
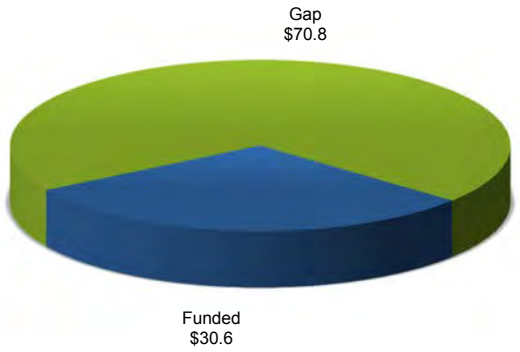
Source: Caltrans 2007 State of the Pavement Report



As shown in **FIGURES 7–9**, current commitments only address a quarter of total regional highway operation and protection needs, and no more than a third of total regional local streets and roads preservation needs.

FIGURE 7 Regional State Highway Operations and Protection
Total Needs: $67.3 Billion



Estimated from the gap between goal-constrained and fiscally-constrained needs in the Caltrans 2011 Ten-Year SHOPP Plan

FIGURE 8 Regional Local Streets and Roads
Total Needs to Maintain Current Conditions: $87.0 Billion

Estimated from 10-year needs or cost-to-maintain estimate

FIGURE 9 Regional Local Streets and Roads
Total Needs to Bring the System to a State of Good Repair: $101.4 Billion

Estimated from 10-year needs or cost-to-maintain estimate

As deferring maintenance will only increase this shortfall over time, preserving the region's assets now is a critical priority of the 2012 RTP. The RTP commits $216.9 billion (including $70 billion of new, reasonably available revenue) to system preservation to help achieve a state of good repair. As more funding becomes available, additional commitments may be made. These additional investments will ensure that over the next 25 years, the region's transportation infrastructure will be in a better condition than it is today. This will also lower user costs in the future, such as vehicle maintenance costs.

SCAG will continue to work with its stakeholders, particularly the CTCs and Caltrans, to prioritize funding for preservation and maintenance.

Corridor System Management Plans

As discussed in the preceding section, the RTP identifies a comprehensive set of strategies that work in concert to optimize the performance of the transportation system. This set of strategies does not focus solely on expanding the system, but also considers how we operate the system; how we coordinate land use planning with transportation planning; how we deal with incidents such as accidents or special events; how we provide information to the traveling public so they can make informed decisions about how, where, and when to travel; and how we maintain the system. All of these strategies are based on a foundation of comprehensive system monitoring so that we can understand how the transportation system is performing and where we need improvement. This approach is based in part on work that Caltrans has done for many years to optimize the performance of the state highway system.

With the passage of Proposition 1B by California voters in November 2006, a program of funding called the Corridor Mobility Improvement Account (CMIA) was created to improve the state highway system. The California Transportation Commission adopted guidelines for the CMIA program that required the development of Corridor System Management Plans (CSMPs) for those projects receiving CMIA funding, to ensure that mobility improvements would be maintained over time. The CSMPs developed in the SCAG region are identified in **TABLE 4** and **EXHIBIT 5**. SCAG contributed funding towards the I-405 CSMP in Los Angeles County, as well as towards the I-210 CSMP undertaken as part of the Governor's Go California initiative.

The intention of the CSMP effort is to continually monitor system performance and identify system improvements that are lower-cost, relatively quick to implement, and less capital-intensive than major corridor widening and expansion projects. In this manner, the CSMPs provide a framework for long-term corridor management, with a focus on operational improvements.

TABLE 4 Corridor System Management Plans in the SCAG Region

County	Route	Corridor Limits
Los Angeles	I-5 North	I-10 to I-210
	I-5 South	I-710 to Orange County Line
	I-405	I-5 to I-110
	I-210	I-5 to SR-57
Orange	SR-22/I-405/I-605	SR-22: I-405 to SR-55 I-405: Los Angeles County Line to I-5 I-605: Los Angeles County Line to I-405
	SR-57	Los Angeles County line to SR-22
	SR-91	I-5 to Riverside County Line
Riverside & San Bernardino	I-10	I-15 to SR-60
	I-215	I-15 in San Bernardino County to I-15 in Riverside County
	SR-91	Orange County Line to I-215/SR-60
Ventura	US-101	Santa Barbara County to Rice Ave/Oxnard

Notes: The I-210 CSMP was developed as part of the Go California initiative, not as part of the CMIA requirements. The US-101 CSMP was a joint effort between Caltrans District 5 in Santa Barbara County and District 7 which includes Los Angeles and Ventura Counties.

The CSMP development efforts began with a comprehensive assessment of corridor performance and the identification of congestion points called bottlenecks. This information was shared and verified with the stakeholders along the corridors. To address the bottlenecks, operational and minor capacity improvement projects were developed with input from stakeholders. These proposed improvements were analyzed using microsimulation models that were created specifically for the corridors. The potential improvements include ramp metering, auxiliary lanes, ramp and interchange improvements, and incident management.

The results from these analyses, including recommended projects and assessment of project costs and benefits, are included in the corridor-level final reports provided at Caltrans' web page: www.dot.ca.gov/hq/tpp/corridor-mobility/ index.html. The CSMP recommendations for new investments (above and beyond any current commitments identified in the FTIP or countywide long range plans) total approximately $840 million and are proposed for inclusion in the 2012 RTP.

In addition to the improvements proposed in the CSMPs, the RTP includes $7.6 billion for Transportation System Management improvements, including extensive advanced ramp metering, enhanced incident management, bottleneck removal to improve flow (e.g. auxiliary lanes), the expansion of the integration of our traffic signal synchronization network, and data collection to monitor system performance. The efficiencies generated by these improvements are expected to increase available freeway capacity by 5 percent.

EXHIBIT 5 Corridor System Management Plans in the SCAG Region

Express/High-Occupancy Toll (HOT) Lane Network

Despite concerted effort to reduce traffic congestion through years of infrastructure investment, the region's system demands continue to exceed available capacity during peak periods. Consistent with the regional emphasis on the mobility pyramid (**FIGURE 1)**, recent planning efforts have focused on enhanced system management including integration of pricing to better utilize existing capacity and to offer users greater travel time reliability and more travel choices. Express Lanes that are appropriately priced to reflect demand can outperform non-priced lanes in terms of throughput, especially during congested periods. Moreover, revenue generated from priced lanes can be used to deliver Express Lanes sooner and to support complementary transit investments.

Based on recent analysis of critical corridors performed for the CSMPs, inter-county trips comprise more than 50 percent—suggesting the value of a regional network of Express Lanes that would seamlessly connect multiple counties. As such, the 2012 RTP includes a regional Express Lane network that would build upon the success of the 91 Express Lanes in Orange County and two demonstration projects in Los Angeles County planned for operation in late 2012.

Additional efforts underway include the extension of the 91 Express Lanes to I-15 in Riverside County along with planned Express Lanes on the I-15. Also, traffic and revenue studies are proceeding for I-10 and I-15 in San Bernardino County.

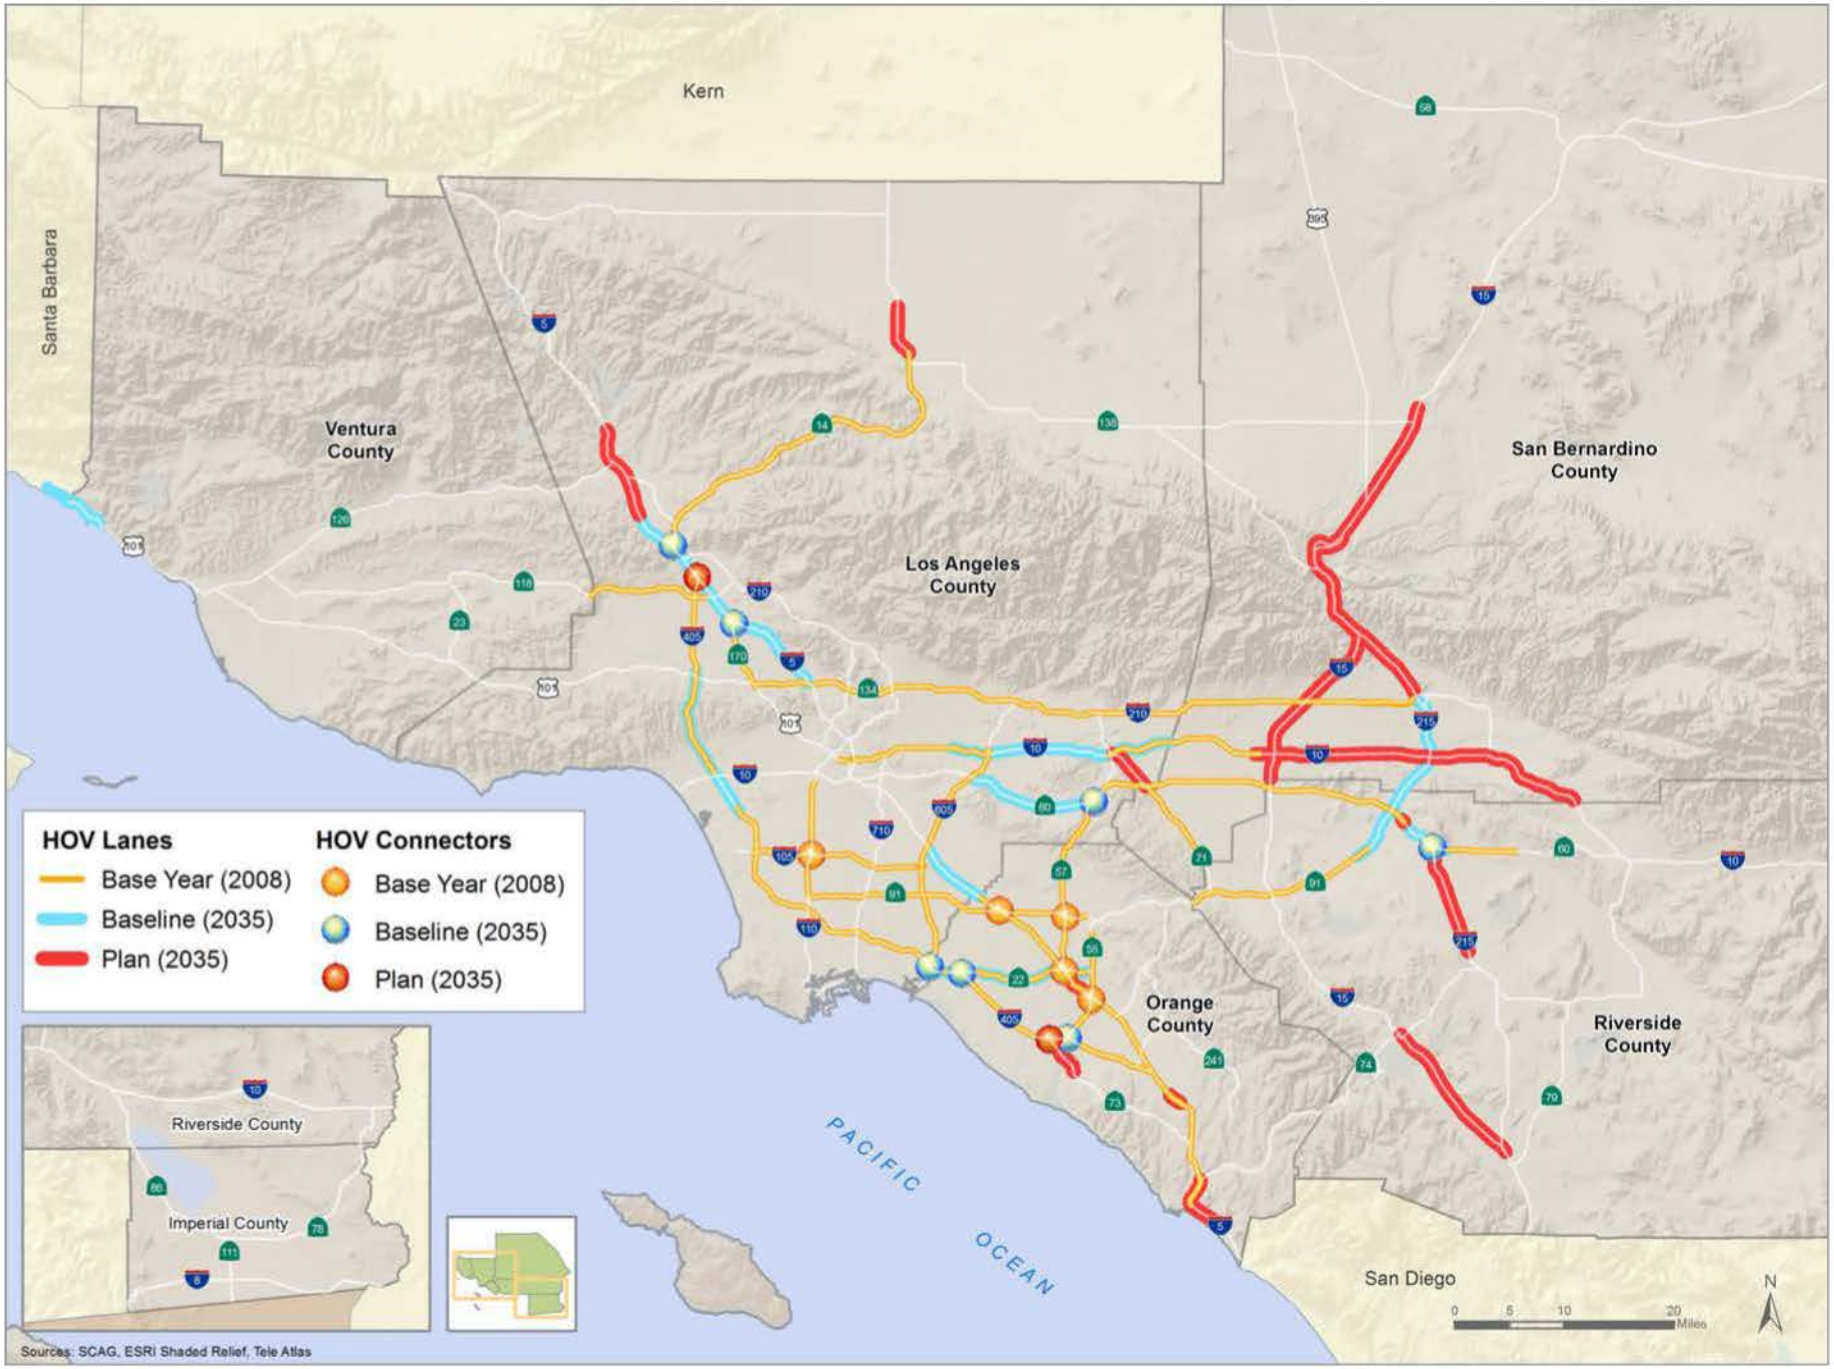


TABLE 5 and **EXHIBIT 6** display the segments in the proposed Express Lane network.

TABLE 5 Express/HOT Lane Network

County	Route	From	To
Los Angeles	I-405	I-5 (North SF Valley)	LA/OC County Line
Los Angeles	I-110	Adams Blvd (s/o I-10)	I-405
Los Angeles	I and SR-110/	Adams Blvd	US-101
Los Angeles	US-101	SR-110	I-10
Los Angeles	I-10	US-101	I-710
Los Angeles	I-10	I-710	I-605
LA, Orange	SR-91	I-110	SR-55
LA, SB	I-10	I-605	I-15
Orange	I-405	LA/OC Line	SR-55
Orange	I-5	SR-73	OC/SD County Line
Orange	SR-73	I-405	MacArthur
Riverside	SR-91	OC/RV County Line	I-15
Riverside	I-15	Riv/SB County Line	SR-74
Riverside	I-15	SR-74	Riv/SD County Line
San Bernardino	I-10	I-15	SR-210
San Bernardino	I-10	SR-210	Ford St
San Bernardino	I-15	SR-395	Sierra Ave
San Bernardino	I-15	Sierra Ave	6th St
San Bernardino	I-15	6th St	Riv/SB County Line

The Express/HOT Lane Network is assumed to be operational by 2035. Implementation plans, including corridor limits, will be refined through the Express Travel Choices Phase II Study.

EXHIBIT 6 Express/HOT Lane Network

Arterials

The region's local streets and roads (**EXHIBIT 7**) account for over 80 percent of the total road network and carry nearly half of all total traffic. They serve different purposes in different parts of the region, often in different parts of the same city. Many streets serve as major thoroughfares or as alternate parallel routes to congested freeways. At the same time, an urban street right-of-way can account for as much as 40 percent of the total land area; streets shape the neighborhoods they pass through and often support different modes of transportation besides the automobile, including bicycles, pedestrians, and transit. **TABLE 6** shows the amounts invested by this RTP in each county.

TABLE 6 Arterial Investments

County	Investment ($, billions)
Imperial	$1.6
Los Angeles	$6.7
Orange	$4.4
Riverside	$6.1
San Bernardino	$2.6
Ventura	$0.7
Regional Total	**$22.1**

Numbers may not sum to total due to rounding.

The RTP contains a host of arterial projects and improvements to achieve different purposes in different areas. In fast-growing suburban and exurban parts of the region, the RTP includes roadway capacity improvements to keep pace with new developments. In all parts of the region, the RTP includes operational and technological improvements to maximize system productivity in a more cost-effective way than simply adding capacity. Such strategic improvements include spot widening, signal prioritization, driveway consolidation and relocation, and grade separations at high-volume intersections. Finally, in a quickly growing number of areas, street improvement projects include new bicycle lanes and other design features such as lighting, landscaping, and modified roadway, parking, and sidewalk widths that work in concert to achieve both functional mobility for multiple modes of transportation, and a great sense of place.

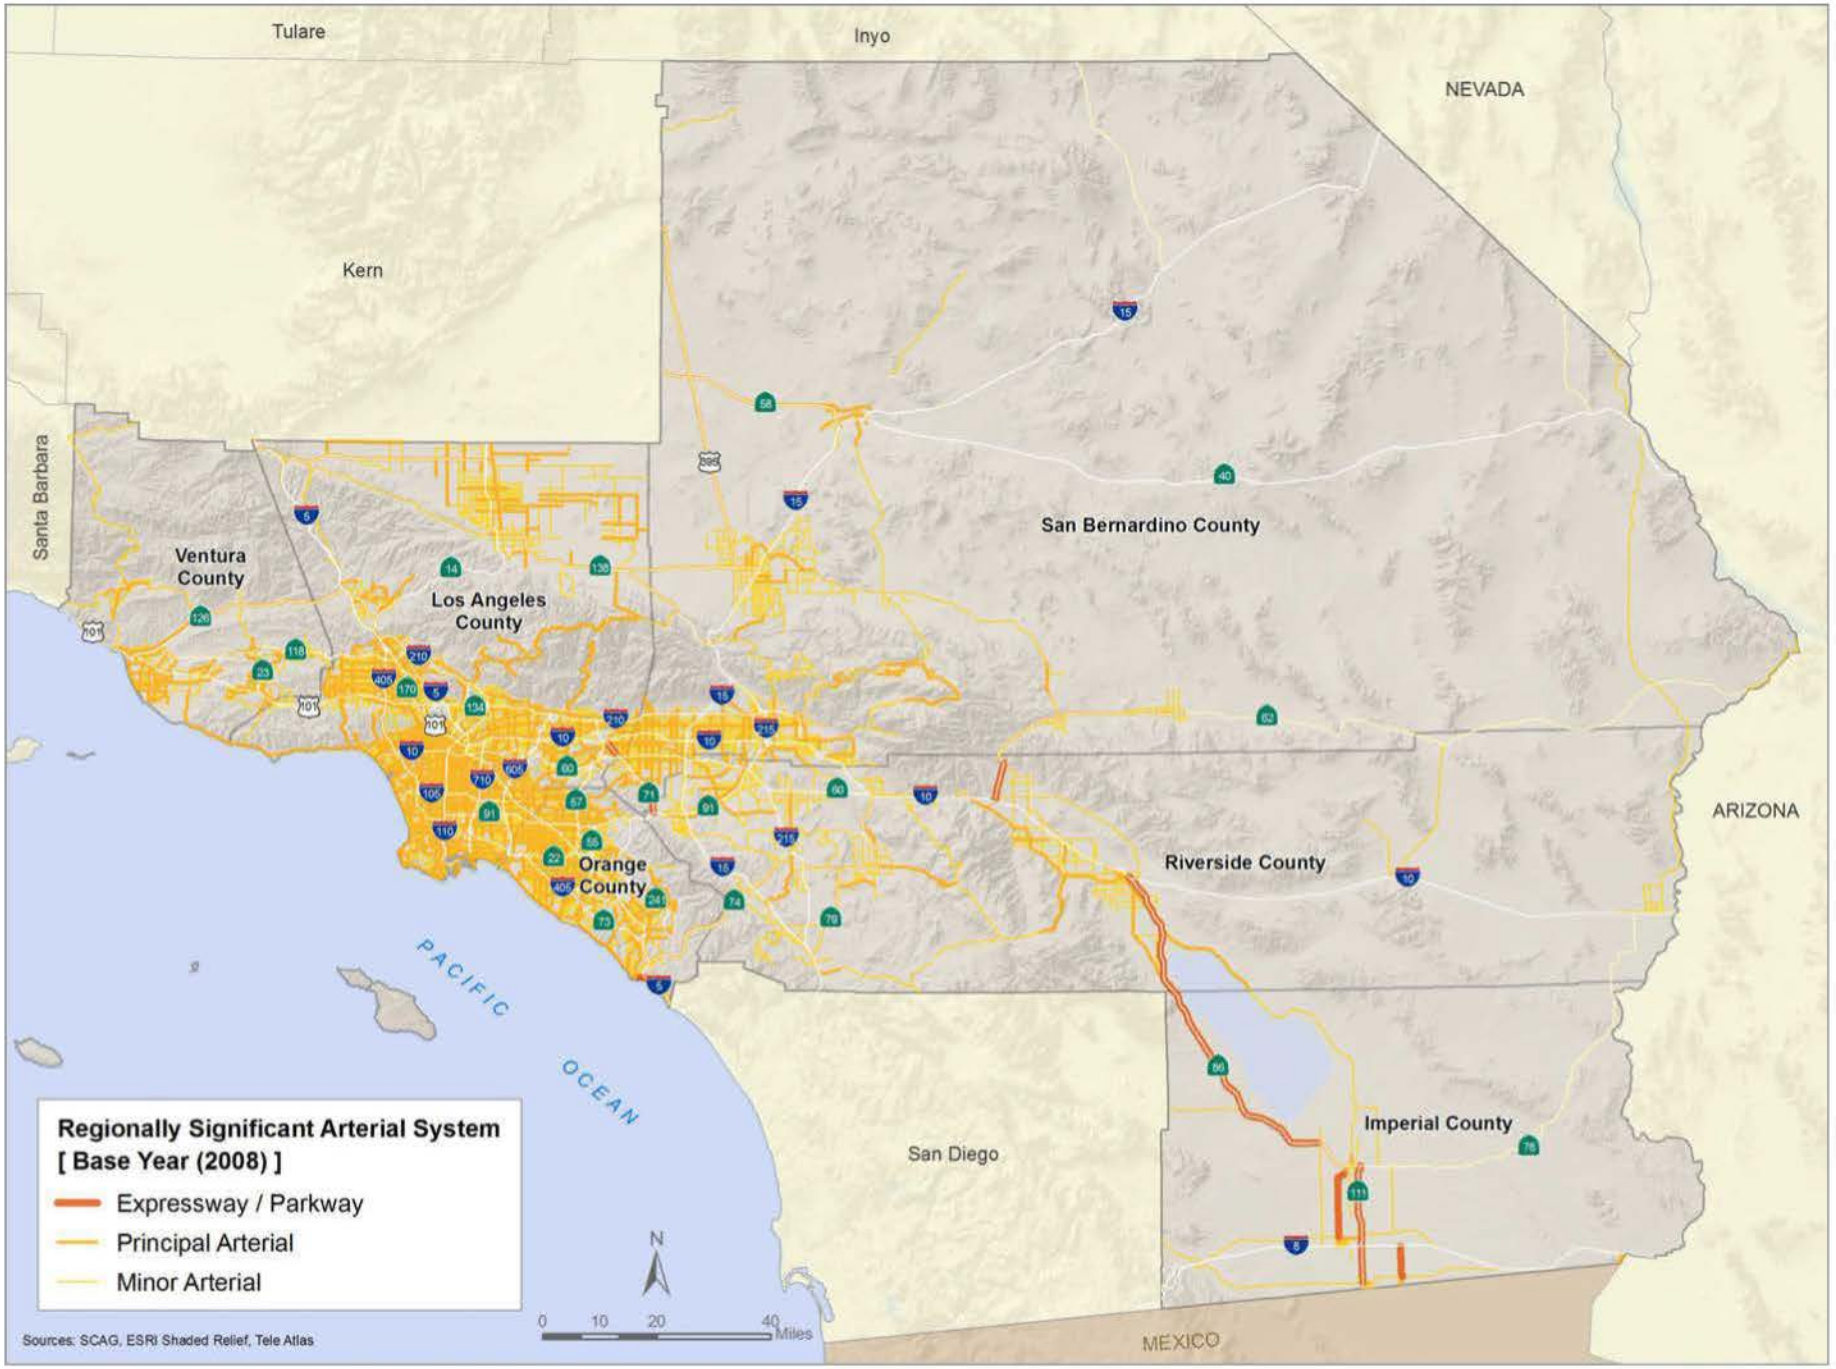

EXHIBIT 8 Baseline 2035 Regionally Significant Arterial System

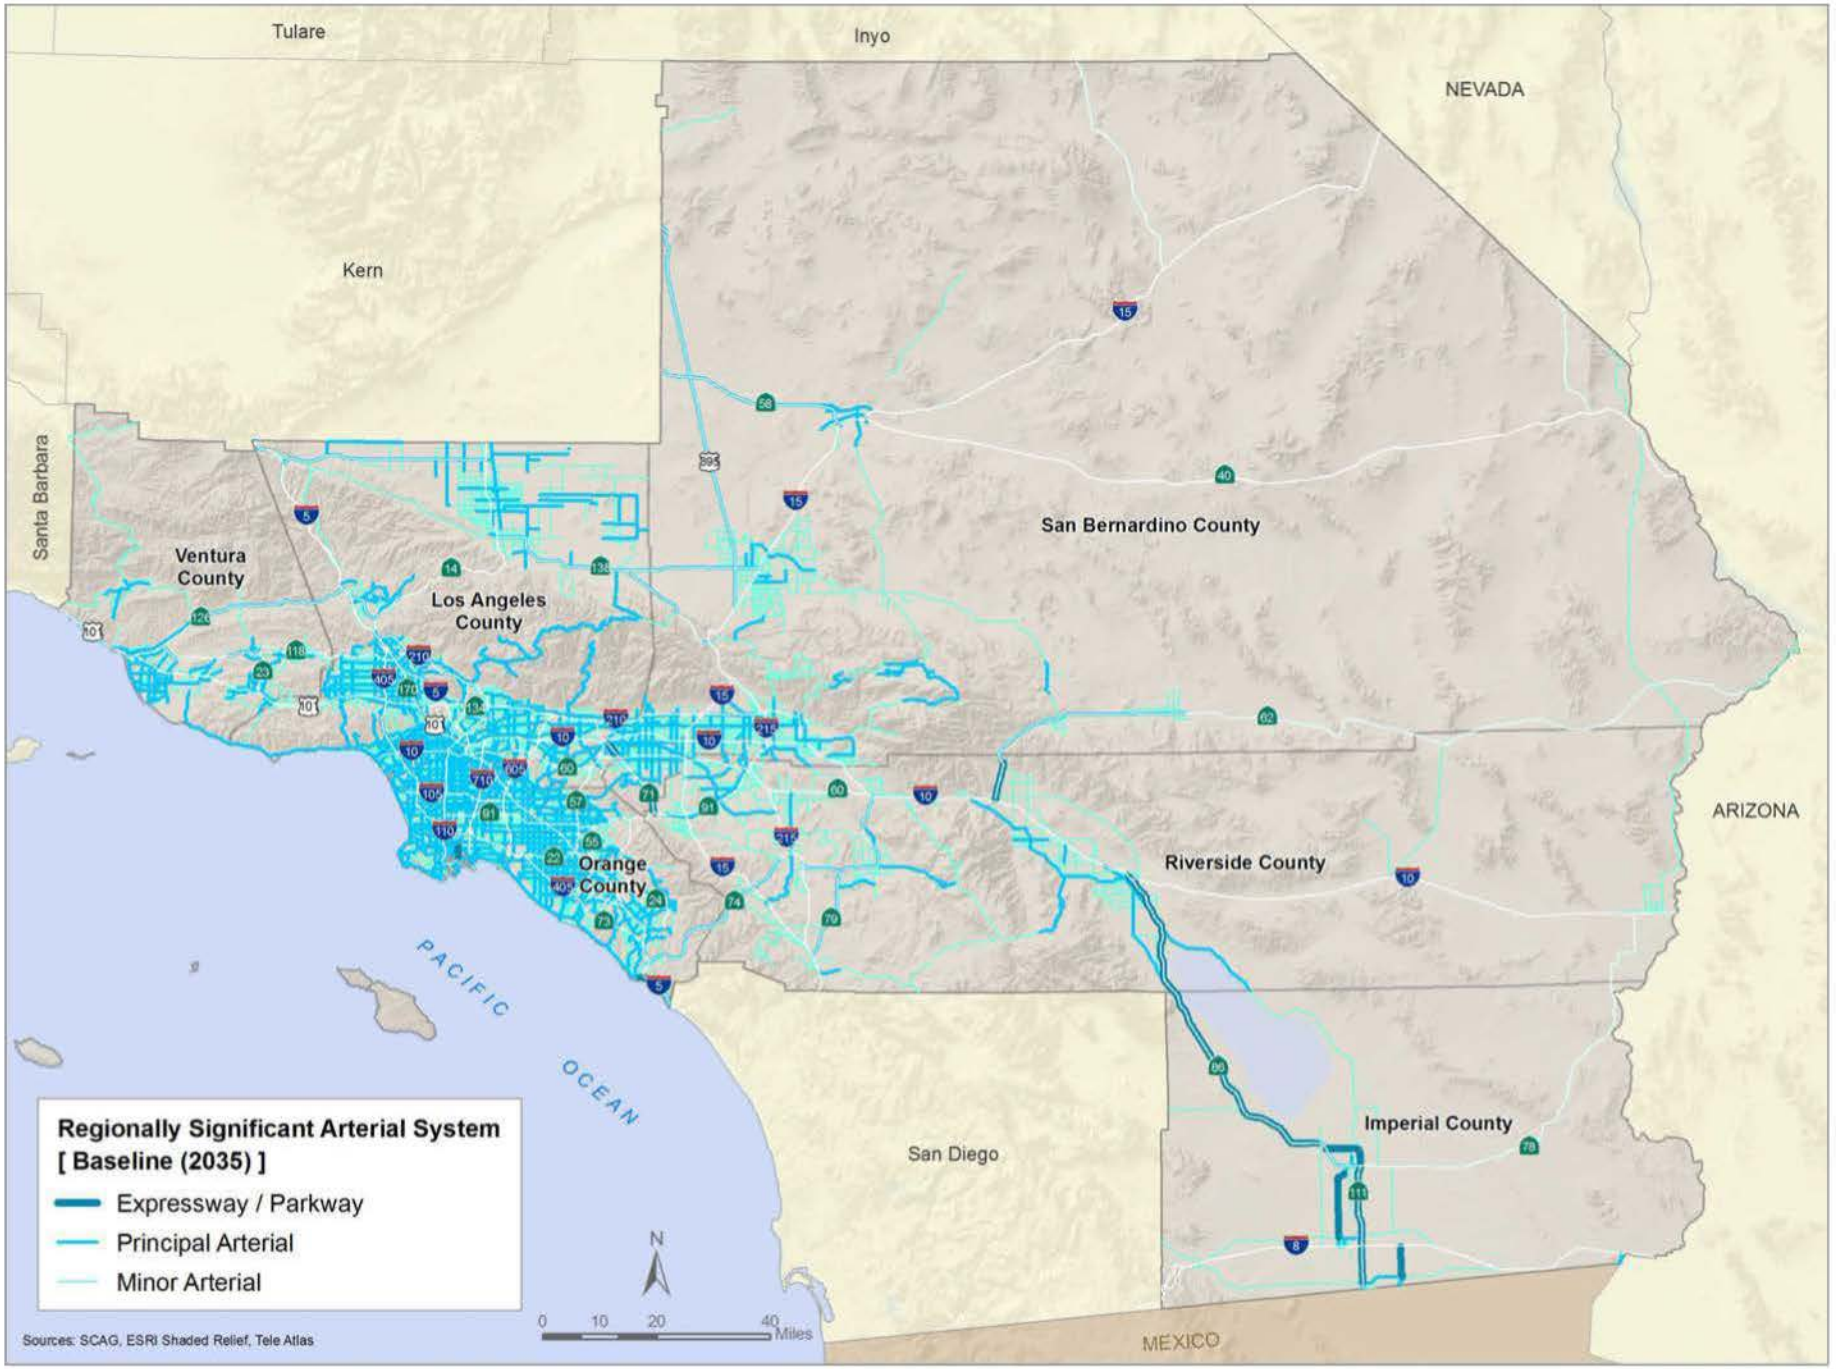

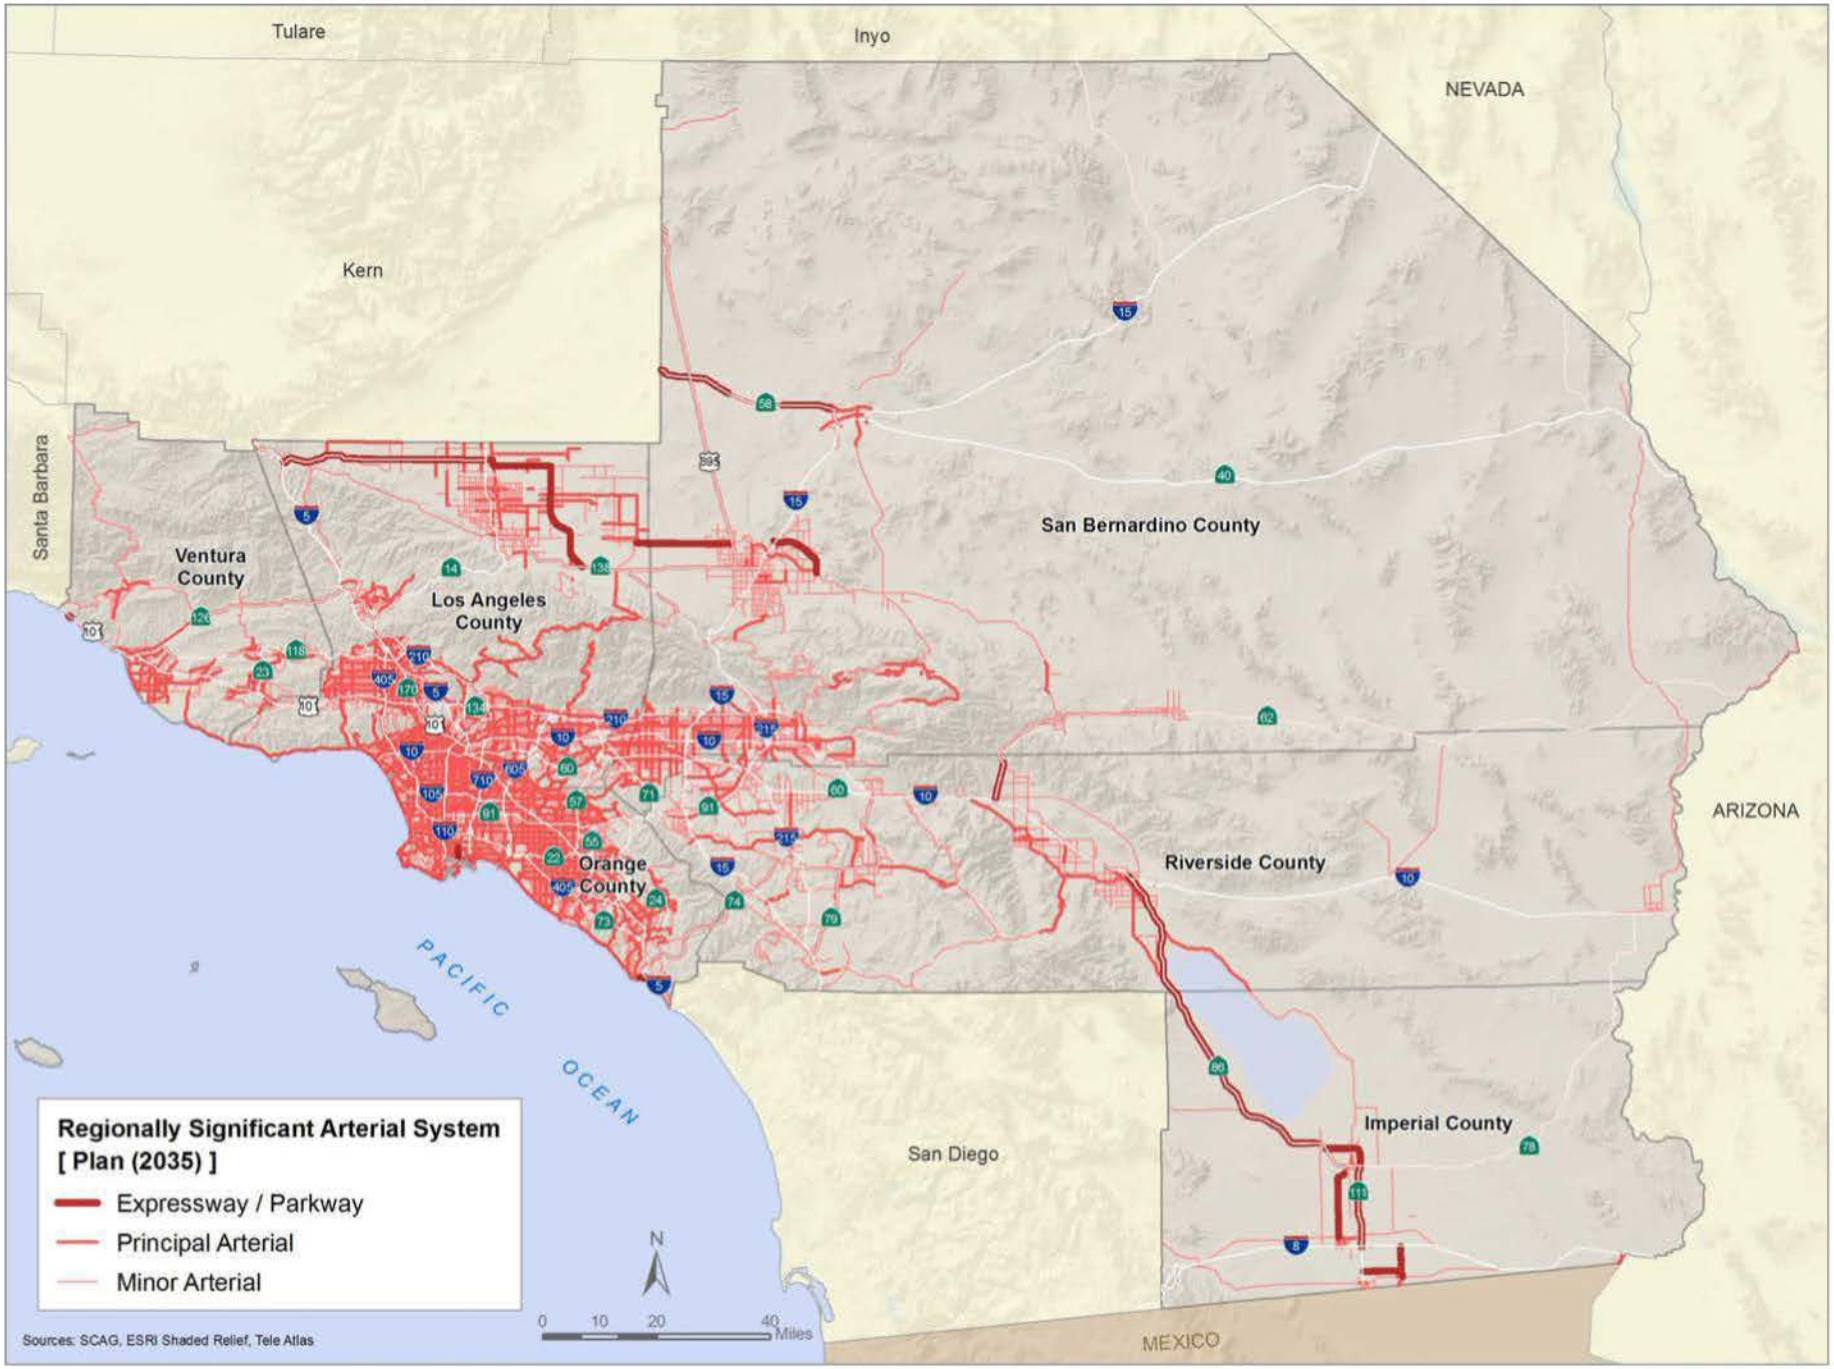

EXHIBIT 9 Plan 2035 Regionally Significant Arterial System

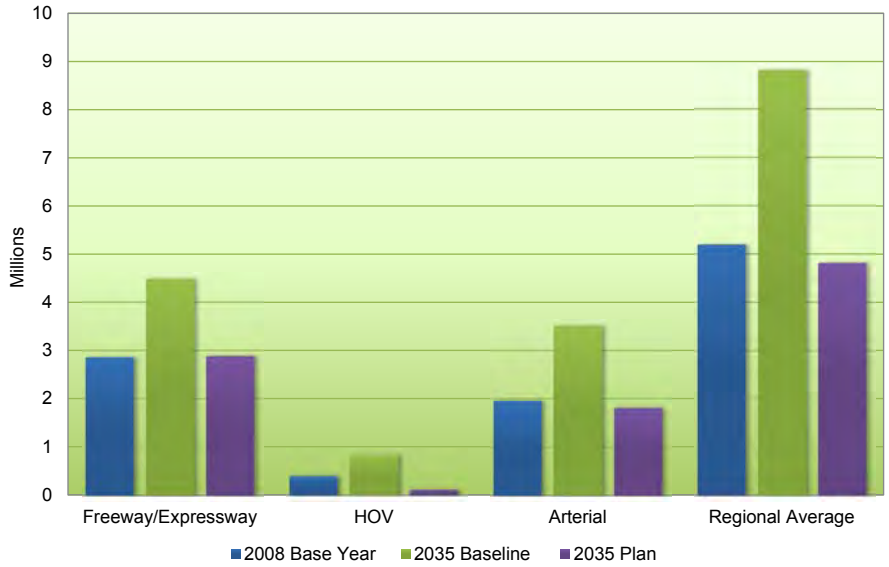
Performance Results

The RTP/SCS performance results for mobility are included in this report. A more complete discussion of all performance results for the RTP/SCS is contained in Chapter 5 of the main document and in the Performance Measures technical appendix.

The mobility performance measure relies on the commonly used measure of delay. Delay is the difference between the actual travel time and the travel time at some pre-defined reference or "optimal" speed for each mode alternative under analysis. It is measured in vehicle-hours of delay (VHD), which can then be used to derive person hours of delay.

The mobility measures used for this outcome are:

- Person Movement Delay by Facility Type (Mixed Flow, HOV, Arterials),
- Person Delay per Capita, and
- Truck delay by facility (Highway, Arterial).



One additional measure for delay that is readily available for on-going monitoring, but that cannot be readily forecast, is non-recurrent delay. Recurrent congestion is the day-to-day congestion that occurs because too many vehicles are on the road at the same time. Non-recurrent congestion is the congestion that is caused by accidents, weather, special events, or other atypical incidents.

Non-recurrent congestion can be mitigated or reduced by improving incident management strategies. Other smart uses of technologies such as traffic signal coordination and the provision of real-time information about unexpected delays allows travelers to make better decisions about available transit or other alternatives.

Person Delay by Facility Type (Mixed Flow Freeways, HOV, Arterials)

For the 2012–2035 RTP/SCS, this measure has been expanded to differentiate between single-occupancy vehicle (SOV) and high occupancy vehicle (HOV) delay. As shown in **FIGURE 10**, person-hours of delay is expected to increase from Base Year to Baseline, but overall the Plan will improve on Baseline conditions by 45 percent, to conditions that are better than what is experienced today.

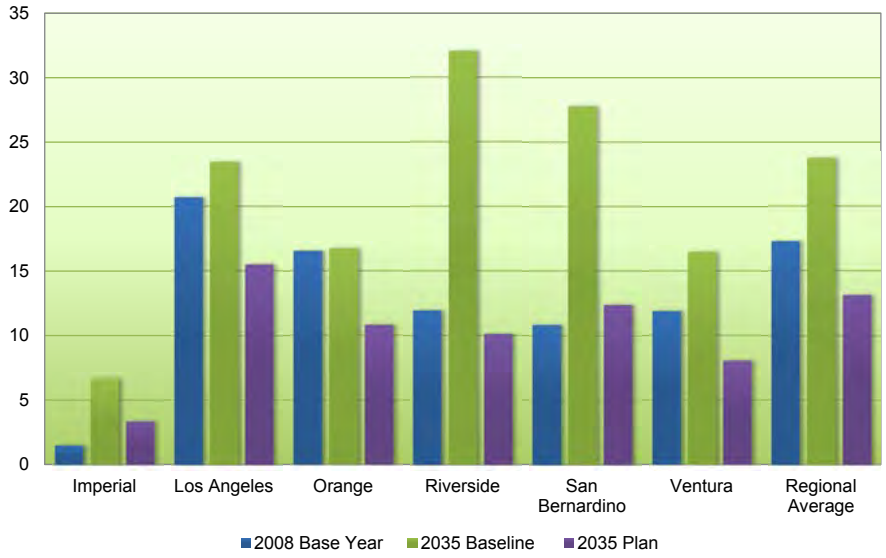


FIGURE 10 Daily Person-Hours of Delay by Facility Type

Person Delay per Capita

FIGURE 11 shows the person-hours of delay per capita for each of the six counties in the region and for the SCAG region as a whole. Normalizing delay by the number of people living in an area provides insight as to how well the region is mitigating traffic congestion in light of increasing population growth. Delay per capita is expected to grow considerably, particularly in the Inland Empire counties of Riverside and San Bernardino, under the Baseline conditions. However, implementation of the Plan is expected to reduce delay substantially, to below 2008 levels. The regional average delay per capita is expected to improve from over 20 minutes under the Baseline, to over 10 minutes under the Plan. Not only does this represent a 45 percent improvement over Baseline, but a 24 percent improvement over Base Year as well.

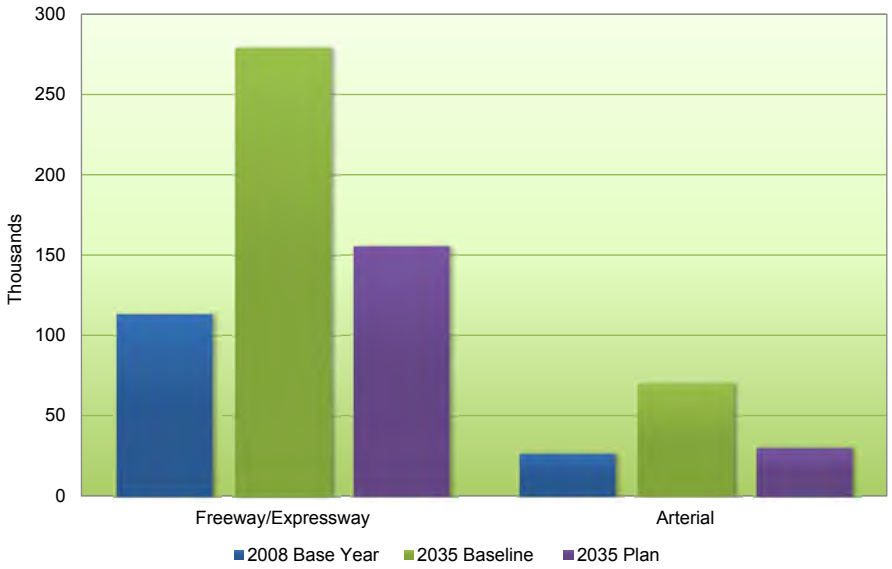

FIGURE 11 Daily Person Delay per Capita by County (Minutes)

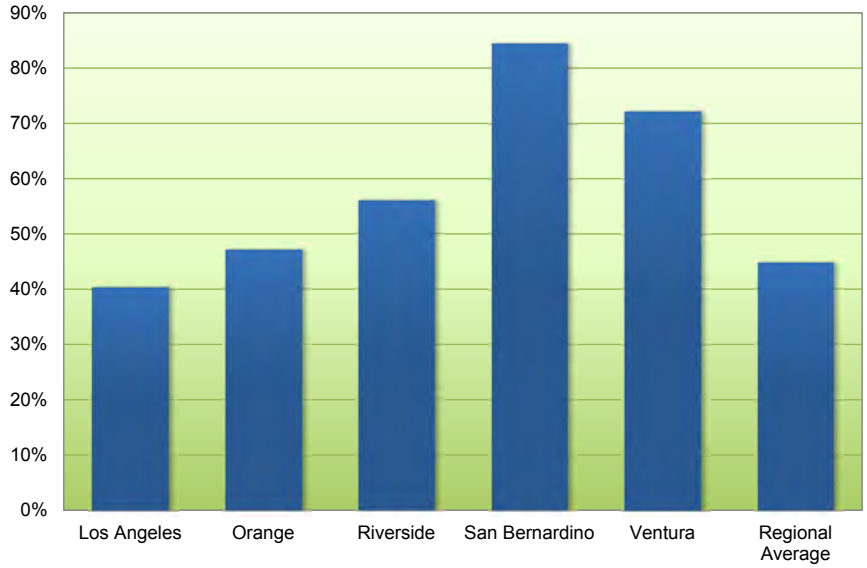
Truck Delay by Facility Type (Highway, Arterials)

This measure estimates the average daily truck delay by facility type for freeways and arterials (**FIGURE 12**). The Plan is estimated to reduce truck delay by approximately 40 percent over Baseline on the freeway system, and by approximately 55 percent on the arterial system.

FIGURE 12 Daily Heavy-Duty Truck Hours of Delay

Non-Recurrent Delay



Data from the Caltrans Performance Measurement System (PeMS) was used to assess the level of non-recurrent delay on regional freeways using the "congestion pie" feature of PeMS. This module breaks down congestion into recurrent and non-recurrent congestion, with recurrent congestion being that day-to-day delay that occurs when there are simply too many vehicles on the road at the same time. Non-recurrent congestion is congestion due to other causes such as accidents, special events, or weather.

The PeMS congestion pie module reports two types of recurrent congestion—"Excess Demand" and "Potential Reduction". Excess demand is the congestion attributed to additional vehicles on the road. Potential reduction also accounts for the "too many vehicles" type of congestion, but this congestion can potentially be mitigated by applying optimal operational strategies such as ramp metering.

For the 2012–2035 RTP/SCS, the mobility performance measure is non-recurrent congestion. This type of congestion also has two major components—"Accidents" and "Miscellaneous". Accident-related congestion is estimated by using the Caltrans Traffic Accident Surveillance and Analysis System (TASAS) accident locations and comparing that to congestion levels reported by roadway sensors. If excess congestion beyond normal is reported at a location where TASAS reports that an accident occurred, then that extra congestion is put in the accident-related congestion bucket. If congestion being reported by a sensor is above normal and there was no accident report, then that congestion falls into the miscellaneous bucket.

The most recent PeMS congestion classification data is for the year 2009. **FIGURE 13** shows the percentage of freeway congestion during a typical day (5:00 AM through 8:00 PM) for the year 2009. The data is reported for each county and for the region as a whole. In 2009, the estimated average percentage of congestion that was due to accidents or other incidents was around 45 percent. In San Bernardino County—with less congestion overall and more susceptible to incident-causing congestion—the data suggested that a majority of congestion was non-recurrent. (The actual percentage is likely exaggerated due to the manner in which PeMS handles some data; more research is needed to verify this assessment.) In the more urbanized Los Angeles County, the data reported that 40 percent of countywide congestion was non-recurrent.

FIGURE 13 Percent Non-Recurrent Congestion by County (2009)

The following maps show the projected improvement in speed between the Baseline 2035 and Plan 2035 scenarios on our highway and arterial system in the PM peak. Additional speed maps can be found in the appendix of this document

Additional Passenger Rail Service 21

Overview and Description

While the SCAG Region is served by a large and diverse transit system, including heavy rail, light rail, fixed route bus and demand response services, it is also served by a network of intercity passenger rail and commuter rail services. These services operate on the region's rail network, often sharing facilities with freight rail. They operate at higher speeds and have less frequent station stops than traditional transit services, and are more likely to serve intercity and interregional trips.

Two operators offer rail services to passengers within our region: Amtrak and the Southern California Regional Rail Authority (Metrolink). Between the two services, Southern California has a passenger rail network serving five of the six counties in the SCAG region.

Within our region, intercity passenger rail service is operated by Amtrak, and is divided into two types of service: long distance and corridor. Four of Amtrak's fifteen long distance routes, the Coast Starlight, the Texas Eagle, the Southwest Chief, and the Sunset Limited, connect our region with destinations throughout the country. Of these services, the Coast Starlight and Southwest Chief offer daily service, and the other two offer service three days a week.

Amtrak provides much more frequent intercity passenger rail corridor service via the Pacific Surfliner. This 351 mile long service traverses the length of the Los Angeles-San Diego-San Luis Obispo (LOSSAN) rail corridor. Amtrak's Pacific Surfliner is the second most used service in Amtrak's national network, moving nearly 9 percent of the system's total national ridership. Surfliner ridership is also growing over 8 percent a year recently. Administrative and management services for this corridor are currently provided by the Caltrans Division of Rail, and both Amtrak and Caltrans contribute operating revenues for the Surfliner.

Metrolink is currently the sole operator of commuter rail service in our region. Metrolink operates 512 route miles of service along seven routes in Ventura, Orange, Los Angeles, San Bernardino, Riverside and San Diego Counties. Metrolink passengers travel further than most other transit passengers, having an average trip length of 36.9 miles. In FY 2011, Metrolink reported providing 10,605,300 unlinked passenger trips. Five routes, the Ventura County Line, the Orange County Line, the Inland Empire-Orange County Line, and the SR-91 Line, share portions of the LOSSAN Corridor with the Pacific Surfliner.

Other Metrolink routes include the Antelope Valley Line, the San Bernardino Line, and the Riverside Line.

High Speed Rail

Despite these services, fast and efficient interregional ground transportation remains an issue within our region. SCAG has historically sought to address these issues through the development of a High Speed Regional Transport (HSRT) system. Beginning in the 1990s, HSRT was seen as a way of providing high speed intraregional mobility in key transportation corridors. This system was seen as a way to provide an alternative to congested commutes, to aid the regional goods movement system, and to help regionalize our aviation system.

As described in the 2001, 2004, and 2008 RTPs, an HSRT system would facilitate the development of a regional airport system and connect major activity and multi-modal transportation centers in Los Angeles, Riverside, San Bernardino and Orange Counties. In December 2002, SCAG's Regional Council approved the focused study of a 56-mile Initial Operating Segment (IOS) of the HSRT system, connecting West Los Angeles with Ontario International Airport via Los Angeles Union Station (LAUS).

TECHNICAL ANALYSES OF THE HSRT IOS

SCAG has produced multiple analyses of the HSRT serving the IOS Corridor since 1998. The first of these reports was "Southern California Intra Regional Maglev for the Next Millennium," published in 1998. This was followed by the "California Maglev Deployment Program" in 2000, which contained a detailed project description and ridership projections for the West L.A. to Inland Empire Corridor. The "SCAG Maglev Deployment Program Phases I and II" were published in 2003 and 2006, respectively. The report for Phase I included financial analyses, and explored the integration of the IOS with existing rail infrastructure. Phase II included detailed cost analysis, and preliminary engineering drawings and station designs. In 2007, SCAG released two more reports, the "West Los Angeles Multi-Modal Transfer Transit Site Survey" and the "HSRT Business Plan." The West Los Angeles report analyzed potential station sites in West L.A., and the Business Plan investigated financial innovations for funding the HSRT system. In early 2009, SCAG released the "HSRT Alternatives Analysis" which presented refined ridership and financial forecasts, as well as analysis of a possible HSRT extension to LAX.

HSRT and the IOS

Much of SCAG's analysis of HSRT has focused on Maglev propulsion systems. Maglev is the name for an elevated monorail using advanced magnetic levitation technology to move people and goods at a very high speed (up to 310 mph). Maglev technology exists on test tracks in Europe, Japan, and the United States. Worldwide, the only high speed Maglev system in revenue service is the Shanghai Transrapid, a 19 mile system connecting Shanghai Pudong International Airport with the Longyang Road Metro Station in Shanghai's suburbs. A low speed Maglev system also operates in the Japanese city of Nagoya. Capital and operating costs remain fairly amorphous in the North American context. As these details became apparent, analysis of the HSRT IOS became mode neutral, and further study of the proposal evaluated both Maglev and conventional High Speed Rail.

In selecting the IOS, SCAG considered the RTP performance measures, stakeholder support and environmental issues. Initial feasibility studies suggested that the HSRT system could be constructed and deployed through a public-private partnership structure administered through a public agency or a Joint Powers Authority (JPA). In 2009, the Southern California Regional High Speed Transport Authority (SCRHSTA) began meeting in order to pursue strategies to deliver an HSRT IOS project. The Cities of Los Angeles, West Covina, and Ontario were the partners in this JPA. The JPA met several times in 2009, but has since been dormant.

SCAG's technical analysis of the potential HSRT IOS evolved over the course of ten years. By the publication of the HSRT AA in 2009, consultant staff were using the most advanced analytical tools and more conservative assumptions. This led to lower performance projections than earlier studies, and methodological reasons for these differences are discussed in the appendices to the HSRT AA. Further, the HSRT AA sought to compare the costs and benefits of both conventional and Maglev high speed transport systems, and of routes along I-10 or the Union Pacific Railroad right-of-way. The proposals examined included station assumptions in West L.A., L.A.Union Station, Ontario International Airport, and either West Covina or the City of Industry.

TABLE 1 Key Findings 2009 High Speed Regional Transportation Alternatives Analysis

Technology	2035 Daily Ridership Forecast	Estimated Capital Cost (in 2008 Dollars)
Conventional High Speed Rail Technology	11,290–12,470	$4.63 Billion–$4.41 Billion
Maglev Technology	11,670–12,800	$7.03 Billion–$7.82 Billion

Source: SCAG [2009] High Speed Regional Transportation System Alternatives Analysis

- Travel Time Variation: Travel time varied by about 12 percent among the four different options. This variety is influenced by technology, alignment, and direction. Neither technology reaches its top design speed (311 mph for maglev and 220 mph for High Speed Rail).
- Capital Cost Estimates: Capital cost estimates range between $4.41 and $7.82 billion for the four options. Maglev options in this corridor appear to be about 60 percent to 70 percent more capital intensive. Maglev systems require much higher guide-beam costs, more intensive traction and power distribution investments, and higher vehicle acquisition costs.
- Operations Costs and Revenue Forecast: Forecast annual operational revenues vary between $52.6 million and $57 million. None of the four alternatives generates an operational surplus by the 2035 forecast year. Annual O&M costs were forecast to be between $73.4 and $81.2 million and projected annual operating deficits in that year range from $16.4 to $28.6 million. Maglev technologies have significantly higher propulsion costs—due to high electric consumption. HSR systems have significantly higher Maintenance of Equipment costs. Farebox recovery would be about 65 percent to 78 percent, which is fairly high for an intraregional transit system. By adjusting fares to a more distance-weighted regimen, the HSRT system would attract 28 percent more riders and 18 percent more revenues.

Given the projected operations loss, none of the proposed HSRT alternatives would likely generate revenues sufficient for bond financing. An economic analysis was performed using Monte Carlo Simulation, and found that in only 14 percent of scenarios would there be positive revenue; even assuming revenue maximizing fares only 38 percent of

operating scenarios would return positive revenue. It would be very difficult to attract private sector financing with these revenue projections. Moreover, it is important to note that in these forecasts technology has no impact on profitability while ridership, revenue, and operational performance are roughly similar across modes, and capital costs are 60–70 percent higher for MAGLEV.

While SCAG was analyzing the potential of a HSRT, the state had begun analyzing the potential of a statewide high speed rail system. In 1996, the state legislature authorized the formation of the California High-Speed Rail Authority (Authority). The Authority has spent the past fifteen years planning and designing a two-phase High-Speed Train (HST) system, intending to link Southern California and the Bay Area. In 2008, California voters approved Prop 1A, authorizing nearly $9 billion in bonds for system design and construction. Phase I of the HST system will connect San Francisco with Anaheim, with several intermediate stops, and Phase II will add connections to Sacramento, Ontario, Riverside, and San Diego.

The evolution of the state HST system illustrated very large challenges to the HSRT system. The first is financial: the HSRT's business model appears to be unprofitable, and there are no apparent programmed funds for project development or delivery. It seems that bond financing or private sector financing is also very unlikely for this proposal.

Secondly, the HSRT IOS would likely occupy a corridor that has also been analyzed by the Authority for Phase II of the California HST, specifically the Los Angeles to San Diego via the Inland Empire segment. The Authority has recently issued a preliminary Alternatives Analysis of this corridor, which included a comprehensive outreach process including monthly meetings with county transportation commissions and MPOs along the corridor, a series of technical working groups with local agency staff, one-on-one meetings with local agencies and jurisdictions, and several series of public meetings. The Authority is currently seeking Prop 1A planning funds to continue technical and outreach work in pursuit of an EIR/EIS.

This competing project is also part a state wide transport system, and ridership numbers would benefit from access to Riverside, San Diego, the Central Valley and the Bay Area. Further, given these longer distances, the fare structure is drastically different than for the HSRT, with much higher maximum ticket prices. These fares give the project a much higher likelihood of profitability, and thus private sector finance.

The state HST system will provide an additional long distance transport option in the state of California, offering an alternative to air and auto travel for Californians. Total cost for Phase I is estimated at $98.5 billion in year of expenditure dollars. This figure does not include Phase II, and the state has secured only $12.6 billion in funds for the project to date. The Authority, in partnership with the Federal Railroad Administration (FRA), has chosen to begin construction in the San Joaquin Valley, using federal High-Speed and Intercity Passenger Rail funds.

Three segments of the project are being developed in the SCAG Region: Los Angeles to Anaheim, Los Angeles to Palmdale, and Los Angeles to San Diego via the Inland Empire. All three segments have produced Alternatives Analysis documents, and are proceeding in various stages of the environmental review process. The Authority's Draft 2012 Business Plan was recently released and has introduced a new construction and implementation approach called the "Blended Approach," that recognizes the funding and implementation realities that have changed dramatically since passage of the bond. A major component of this approach is to connect to, and invest in, existing rail services in the state until the entire HST system is built.

The State of the Existing Passenger Rail System

The Pacific Surfliner

Passenger rail service has been operated in the Los Angeles to San Diego corridor since 1938. This service, dubbed the San Diegan, was initially operated by the Atchinson-Topeka and Santa Fe Railroad. In 1971, when domestic passenger rail services were nationalized, Amtrak assumed operation of the San Diegan service, In 1992, Metrolink commuter rail service was added to the corridor as a result of new state revenues from the passage of 1990's Proposition 116. In 2000, the San Diegan was renamed the Pacific Surfliner, and service was extended north to San Luis Obispo.

In order to coordinate planning activities along the corridor, stakeholders formed the Los Angeles-San Diego-San Luis Obispo Rail Corridor Agency (LOSSAN). LOSSAN is a JPA which seeks to address issues of safety, revenue, productivity and reliability along the LOSSAN corridor. Its membership consists of the San Luis Obispo Council of Governments (SLOCOG), the Santa Barbara Association of Governments (SBCAG), the Ventura County Transportation Commission (VCTC), the Los Angeles County Metropolitan

Transportation Authority (Metro), the Orange County Transportation Authority (OCTA), the San Diego Association of Governments (SANDAG), the North County Transit District (NCTD), the San Diego Metropolitan Transit System (MTS) and the California Department of Transportation's Division of Rail (Caltrans DOR). SCAG, the California High- Speed Rail Authority, and the Riverside County Transportation Commission (RCTC) are all ex officio members of this JPA.

Members of this group have been meeting to coordinate planning activities for the corridor since the 1980s. Over this time period, the LOSSAN partners have attracted nearly $1.2 billion in state and federal funds for the corridor, while also investing nearly a half billion in local funds. As a result of this activity, the Pacific Surfliner has seen significant ridership growth. Between April 2000 and 2011, annual ridership is up 77 percent.

This growth is challenged by two issues, however. The first is On-Time Performance (OTP), which remains a major challenge in the LOSSAN corridor. Due to a combination of congestion and underbuilt infrastructure, any minor delay can lead to a train losing its slot, thereby causing cascading delays throughout the network. In April 2011, OTP for the Pacific Surfliner was 81.2 percent. According to Amtrak's monthly performance report for May 2011, the Surfliner was delayed a total of 20,302 minutes during the course of the month. Of this total, 4,131 minutes of delay were imposed by Amtrak due to passenger hold orders, engine failures, or crew-related delays. An additional 13,587 minutes of delay were imposed by the seven host railroads, including freight train interference, slow orders, and passenger train interference.

Second, operating and maintenance costs also remain a challenge to the Pacific Surfliner service. As per Section 209 of the Passenger Rail Investment and Improvement Act of 2008, Amtrak medium distance corridor services funded by both state and federal revenue streams will lose federal revenues by October of 2013. The FRA is currently working with the states to promulgate operating cost allocation standards by which to make this transition and to recognize in these standards previous capital investments by states such as California. The Pacific Surfliner is one of 11 state supported Intercity Passenger Rail Corridors that will be affected by Section 209, but the only one in California.

The Pacific Surfliner operates 22 trains a day carrying over 8,000 passengers. The Pacific Surfliner carried 2.8 million passengers in FY 2011, a 6.6 percent increase over FY 2010. This continues a ten-year trend of year over year ridership increases. Revenues are also growing. In May of 2011, total fare revenues were $4,791,891, compared with $2,643,578 in May 2003. This is a growth of 81 percent for the Surfliner. However, farebox recovery for FY2010 was 50.7 percent. Of the $47 million operating subsidy for the Surfliner, roughly $28 million was contributed by Caltrans DOR, and roughly $16 million by Amtrak. While 50.7 percent would be an outstanding farebox recovery ratio for an urban mass transit service, the Pacific Surfliner is an intercity transportation mode, with a different fare structure and additional revenue streams such as business class and a dining car. Moving forward, it is important to find strategies to garner increased farebox recovery for the Pacific Surfliner.

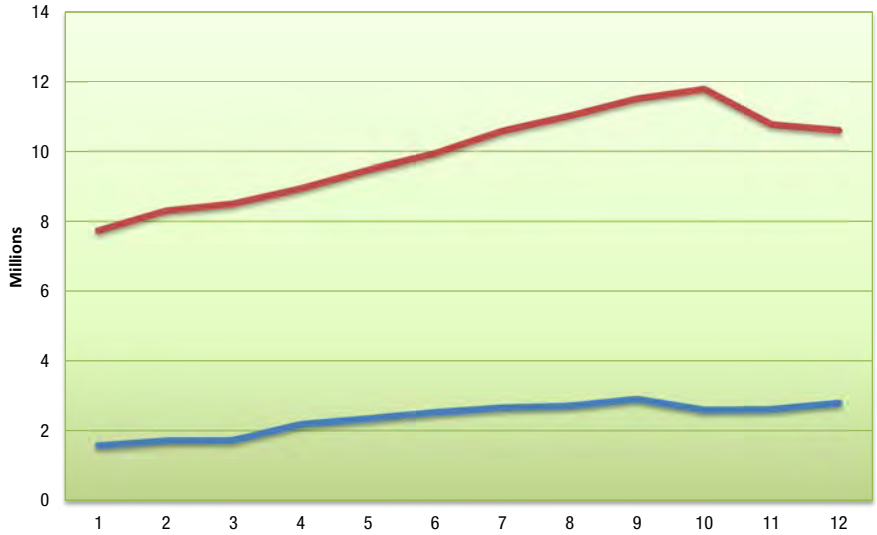
Metrolink

Metrolink operates with a very different business model. Metrolink was formed in 1991, when five local county transportation commissions, Metro, OCTA, VCTC, RCTC and SANBAG, formed a JPA with the intent of addressing congestion on regionally significant highway corridors. This agency, the Southern California Regional Rail Authority (Metrolink) began providing commuter rail service in the fall of 1992.

Commuter rail service is defined by the National Transit Database as a transit mode that is an electric or diesel propelled railway for urban passenger train service consisting of local short distance travel operating between a central city and adjacent suburbs. Service must be operated on a regular basis by or under contract with a transit operator for the purpose of transporting passengers within urbanized areas (UZAs), or between UZAs and outlying areas.

Such rail service, using either locomotive hauled or self-propelled railroad passenger cars, is generally characterized by:

- Multi-trip tickets
- Specific station-to-station fares
- Railroad employment practices
- Minimal stations in the central business district



It does not include:

- Heavy rail rapid transit
- Light rail / streetcar transit service

Commuter rail station stops tend to be much closer together than those of intercity passenger rail. Also, smaller portions of the total route alignment tend to be out of urbanized statistical areas, and a much higher proportion of passengers are daily riders. Peak ridership occurs on weekdays, whereas intercity rail operators often have weekend peak ridership. Commuter rail often fuses urban transit business models with railroad style operations. As such, farebox recovery ratios tend to be lower, though operations costs tend to be similar.

Metrolink operates 163 trains on seven lines carrying roughly 42,000 passengers on weekdays. Metrolink carried 10.6 million passengers in FY 2011, a 1.6 percent decrease from FY2010. Ridership has generally increased year over year but was negatively impacted by the recession. Metrolink has made strong progress in improving its farebox recovery ratio. Nearly 44 percent of Metrolink's FY2011 $173.3 million operating budget was funded with fare revenues. This compares with a 37 percent ratio in FY2002. During the last year, Metrolink implemented operational policies that saved $10 million in costs, increased revenue by $6 million, and reduced fuel consumption by 840,000 gallons. It also is in the process of accepting its new passenger car fleet designed with special new safety features.

FIGURE 1 Pacific Surfliner and Metrolink Ridership 2000–2011

Source: Amtrak and Metrolink Ridership Reports

Compared to commuter rail operators in other metropolitan regions with populations of over five million, Metrolink is a strong fiscal performer. In 2008, Metrolink's average cost per passenger mile was 19 percent lower than the national median, and cost per trip was only 2 percent higher than the national median. The national median farebox recovery for operators in large metropolitan regions was 48 percent, which Metrolink outperformed by 2 percent. However, Metrolink's cost per service hour was 30 percent higher than the national median.

Average speeds for the Pacific Surfliner and Metrolink are 46 mph and 40 mph respectively. The average speeds vary by line and while top speeds are 79 mph, the number of stops and capacity and geographic constraints result in these average speeds which are lower than one would think. These facts demonstrate the need to fund capital projects in order to speed up the service and make these services more attractive to the SOV commuter.

The extent of the total commuter rail network is another area where Southern California is highly competitive. Our region boasts 4.32 commuter rail route miles per 100,000 residents, which is 2.71 times the median for large metropolitan regions. However, in 2008 residents of the SCAG region took only 0.7 per capita trips on the commuter rail system, well below the national median of 0.82. Chicagoans, by contrast, took 8.28 trips per capita, on a network that provides 11.8 route miles for every 100,000 residents. Residents of Baltimore took 34 percent more commuter rail trips per capita on a network similar to that of the SCAG region. Thus, our commuter rail system has the potential and capacity to be used much more intensely.

Projects In Development

Metrolink's short term capital investment priorities include improvements for capacity, access, and safety. The Metrolink Service Expansion Program (MSEP), sponsored by OCTA and Metrolink, will deliver increased Metrolink service between Fullerton and Laguna Niguel/Mission Viejo. This program was approved by OCTA's board of directors in 2005, but the Great Recession and subsequent anemic economic growth has slowed implementation. In order to facilitate increased commuter train volumes, OCTA and Metrolink have begun building station and capacity improvements along the Orange County Line. This $91 million program of improvements includes a turn back facility at Laguna Niguel/Mission Viejo Station, new track at Fullerton station, a new Metrolink station in Placentia, a new parking structure in Fullerton, and new passenger amenities including shade structures and ticket vending machines.

Also in Orange County, an $85 million investment program is also being pursued via the Orange County Grade Crossing Safety Improvement (OCX) program. This program will provide grade crossing safety enhancements at 31 grade crossings in the cities of Orange, Anaheim, Tustin, San Juan Capistrano, Dana Point, San Clemente and Irvine. Additional safety improvements are also being made along the Burlington Northern Santa Fe (BNSF) main line as part of the Orange County Bridges program. Currently, BNSF operates up to 70 freight trains a day along its mainline, and expects to run up to 130 a day by 2030. To reduce delay and improve safety, OCTA is constructing seven grade separations in the cities of Fullerton, Placentia, and Anaheim. The City of Irvine is also engaging in a $55.9 million effort to grade separate Sand Canyon Avenue. As with all grade separation projects, this new underpass will improve both safety and traffic flow.

Metrolink is also pursuing safety and capacity enhancements in Los Angeles County. The Glendale Corridor Grade Crossing Safety Improvements program will enable Metrolink to meet the latest grade crossing and safety standards by installing automatic vehicle exit gates, pedestrian gates, roadway widenings, new sidewalks and handrails, and advance traffic signal pre-emption at six grade crossings in the city of Glendale. Additionally, Metrolink is engaged in a program of improvements to install tunnel lighting and intrusion detection systems in six L.A. County train tunnels, mostly along the Antelope Valley and Ventura County Lines. Metrolink's final major capital priority is the reconstruction of L.A. Union Station's Platform 7. This $8.5 million project will restore tracks 13, 14, and 15 into service after 35 years of non-passenger use, and improve communications systems and install new lighting and message boards.

Additional projects in Los Angeles County that are priorities for Metro include the ongoing Antelope Valley Line Infrastructure Improvement Strategic Plan study, the Control Point (CP) Raymern to CP Bernson Double Track, and the Van Nuys Station second platform.

In Riverside County, the largest near term capital priority is the Perris Valley Line (PVL). The PVL is a 24 mile extension of Metrolink's 91 Line, and will connect residents of the cities of Riverside, Moreno Valley, and Perris with jobs and services in Orange and Los Angeles Counties. This service will connect to the BNSF mainline near the City of Riverside, and use the San Jacinto Branch line paralleling I-215 to reach South Perris. Four new stations will include Riverside Hunter Park, Moreno Valley March Field Station, Downtown Perris Station, and South Perris Station. This project represents the first addition of new track miles to the Metrolink system since the 1990s.

San Bernardino County is also expanding its rail network. The Downtown San Bernardino Passenger Rail Project is a one mile extension of Metrolink service into Downtown San Bernardino. Upon projected completion in 2014, commuter rail service will terminate at the future site of the San Bernardino Transit Center at E Street and Rialto Avenue. This will allow greatly increased regional transit access to downtown San Bernardino, an important center for governance, commerce, and services in the San Bernardino Valley. Metrolink passengers will also be able to connect to the sBX E Street BRT service at this location. SANBAG is also investigating potential transit connections to the city Redlands via the Redlands Subdivision.

The Constrained and Strategic Plans: Our Passenger Rail Vision

Constrained and Strategic Plan Project Selection

In June 2011, the Regional Council approved the formation of the High-Speed Rail (HSR) Subcommittee. The purpose of the subcommittee was to help guide staff in defining and formulating high-speed rail strategies for the RTP's Constrained and Strategic Plans due to the significant number of projects in the planning phase.

Since several HSR projects are in the planning phases, with varying degrees of funding, costing, and operational specifics, the Regional Council formed the HSR subcommittee to evaluate all of the projects in depth, so as to make informed project inclusion decisions for the Constrained and Strategic Plans. Due to their different levels of development, it was difficult to rate and compare the projects on a direct basis, and in some cases projects directly compete with one another. Therefore, staff developed an evaluation approach using various criteria to determine which projects in the planning phases are most viable, beneficial to our region, and offer the greatest chances of being implemented sooner rather than later.

The decision-making approach used to make a final recommendation of HSR projects to include in the RTP had three steps. The first step narrowed down the proposed HSR projects to a set of projects that were qualified for the Strategic Plan. The second step narrowed down the projects further to those to be included in the Constrained Plan. This required higher levels of details relative to costs, funding, ridership potential, community and stakeholder support and other measures. The final step evaluated how the proposed HSR system worked together with the rest of the planned transportation system using SCAG's travel demand model.

The criteria that staff used to formulate the preferred HSR alternative included: reasonableness of available funding, level and amount of costing details, current project status, level of stakeholder and public support, stakeholder consensus of project's alignment and operational characteristics, degree of regional connectivity, ridership potential and commuter rail potential.

TABLE 2 High Speed Rail Matrix

Project	Project Description	Project Readiness	Project Consensus	Stakeholder Support	Regional Connectivity	Ridership Potential	Cost	Funding	Business Plan	Commuter Rail Potential	Staff Recommendation
California High-Speed Rail Phase One	San Francisco to L.A. Union Station with additional alignment south to Anaheim. Top speed 220 mph.	Alternatives Analysis completed.	Some stakeholders have concerns with project finances.	Moderate, especially among cities with stations.	Very good. Connecting and adjacent transit services must be properly adjusted to provide appropriate feeder role.	Very good. Should attract significant inter-city and also current auto and airline trips.	$98.5 billion	Only partially funded. Some of those funds will be used to provide shared benefits improvements to LOSSAN and Metrolink.	New draft business plan out in early November for public comment.	Not good. High-Speed rail fares will be too expensive for commuters without local subsidies.	Include in Constrained Plan.

Project	Project Description	Project Readiness	Project Consensus	Stakeholder Support	Regional Connectivity	Ridership Potential	Cost	Funding	Business Plan	Commuter Rail Potential	Staff Recommendation
California High-Speed Rail Phase Two	Merced to Sacramento and L.A. Union Station to San Diego via the Inland Empire.	In Alternatives Analysis.	Moderate, some concerns of negative impacts in San Gabriel Valley and Inland Empire along alternative alignments.	Moderate, some concerns of negative impacts in San Gabriel Valley and Inland Empire along alternative alignments.	Very good. Connecting and adjacent transit services must be properly adjusted to provide appropriate feeder role.	Very good. Should attract significant inter-city and also current auto and airline trips.	Not estimated.	Currently not funded.	New draft business plan out in early November for public comment.	Not good. High Speed rail fares will be too expensive for commuters without local subsidies.	Include in Strategic Plan.
Desert Xpress	Las Vegas to Victorville with no intermediate stops, generally along I-15 corridor. Phase 2 would connect Victorville with Palmdale. Top speed of 150 MPH using Tier III compliant electric multiple unit trains.	Project specific EIS is complete and federal interstate operating licenses were issued in 2011: FRA Record of Decision (ROD). STB issued Certificate of Public Convenience and Necessity authorizing DesertXpress as an interstate railroad. BLM ROD; FHWA ROD; executed a ROW lease agreement with BLM	High - agreements in place with the State of California, and Surface Transportation Board.	Support from cities in Antelope and Victor Valleys, San Bernardino County, LA County, and in Nevada.	Eventual Phase II Connection to Palmdale could provide for a connection to Metrolink and ultimately to California High- Speed Rail	Very good. Should attract a significant amount of current auto and airline trips along this corridor.	$6.5 billion	Federal loan or privately funded.	Ridership and revenue report completed for loan application but not yet available.	This service is not expected to attract commuter trips, though DXE staff believe phase II might attract some commuters..	Include in Strategic Plan.
California/ Nevada Super-Speed Train	Maglev project from Las Vegas to Anaheim with intermediate stops in Primm, Barstow, Victorville and Ontario. Top speed 300 mph.	Program EIS begun in 2004 has not been completed.	Low. Project not moving forward and is a competing project to Desert Xpress which is further along in project delivery process.	Low. Project not moving forward and is a competing project to Desert Xpress which is further along in project delivery process.	Would be good if project was built.	Would be good if project was built.	$12.1 billion	$45 million federal earmark for environmental work. Potential funding from TIFIA and private bonding.	2007 Financial Plan submitted to FRA.	Moderate. This service would attract some commuter trips between Victorville, Ontario and Anaheim.	Include in Strategic Plan.

Project	Project Description	Project Readiness	Project Consensus	Stakeholder Support	Regional Connectivity	Ridership Potential	Cost	Funding	Business Plan	Commuter Rail Potential	Staff Recommendation
California/ Nevada Super-Speed Train Anaheim to Ontario IOS	Initial operating segment, or stand-alone project of CNSSTP from Ontario Airport to Anaheim. Top speed 220 mph.	Program EIS begun in 2004 has not been completed.	Good, but lower outside of corridor and operator not identified.	Good, but maglev technology does not have broad stakeholder support and consensus in our region.	Very good. Connecting and adjacent transit services must be properly adjusted to provide appropriate feeder role.	Good. Will provide excellent connection from under-utilized Ontario airport to Anaheim Resort area.	$2.77 billion	$45 million federal earmark for environmental work. Potential funding from TIFIA and private bonding.	2003 Financial Plan submitted to FRA and updated in 2011 with Implementation Plan.	Moderate. This service would attract some commuter trips between Ontario and Anaheim.	Include in Strategic Plan.
Orangeline – Northern Segment	Speed and service improvements from Santa Clarita to L.A. Union Station via Bob Hope Airport.	In Metrolink Antelope Valley and Bob Hope Airport Ground Access studies.	Good with corridor stakeholders. Operational characteristics not yet vetted. Duplicates CAHSRA alignment.	OLDA members strongly support concept. Still need to work with some corridor stakeholders.	Good. Provides multi-modal connections along alignment. Can be integrated to serve as feeder to CA HSR, Metrolink and Amtrak. Includes new station at Bob Hope Airport.	Very good. Provides direct connection to Bob Hope Burbank Airport and downtown L.A.	No updated costs available.	Not funded.	Some station area planning completed. Project requires further definition.	Very good. This service would attract commuter trips.	Include in Strategic Plan.
Amtrak LOSSAN Corridor Improvements	Speed and service improvements to Pacific Surfliner corridor in SCAG region. Top speeds up to 110 mph in some segments.	Improvements ready to go with funding.	Very high	Very high	Very good. Connecting and adjacent transit services must be properly adjusted to provide appropriate feeder role.	Very good. Should attract significant intercity and also current auto trips.	Costing for some identified projects is estimated.	Funding will be committed by CAHSRA MOU – up to $1 billion.	2010 LOSSAN Corridor Strategic Assessment. Ridership forecasting in progress for 2030.	Very good. This service already attracts commuter trips.	Include in Constrained Plan.

Project	Project Description	Project Readiness	Project Consensus	Stakeholder Support	Regional Connectivity	Ridership Potential	Cost	Funding	Business Plan	Commuter Rail Potential	Staff Recommendation
IOS HSRT proposed in the 2008 RTP by SCAG	IOS West L.A. to Ontario Airport with four additional possible segments. Technology neutral.	In conceptual stage.	Moderate, with stronger support in the Inland Empire. Operator not identified. JPA has not met in over a year.	Moderate, with some support in the Inland Empire.	IOS redundant to CA HSR Phase 2 from L.A. Union Station to San Bernardino.	IOS redundant to CA HSR Phase 2 from L.A. Union Station to San Bernardino.	$7.8 billion (2007 estimate)	Not funded. Planning assumptions questionable.	2007 Business Case Study	Good. This service would attract commuter trips.	Do not include in 2012 RTP.
Metrolink Improvements	All current Metrolink corridors, with current emphasis on the Antelope Valley Corridor. Top speeds up to 110 mph in some segments.	Improvements being studied.	Very high.	Very high.	Very good. Connecting and adjacent transit services must be properly adjusted to provide appropriate feeder role. Metrolink and the CAHSR will complement one another.	Very good. Should attract significant inter-city and also current auto trips.	Costing for some identified projects is estimated.	Funding will be committed by CAHSRA MOU - up to $1 billion.	2007 Strategic Assessment. Update in progress.	Excellent. This service already attracts many commuter trips.	Include in Constrained Plan.

The projects selected for inclusion in the Constrained Plan are detailed below:

California High-Speed Rail Phase I

Phase I is from San Francisco to Anaheim via L.A. Union Station, and in our region from the Kern County line to Anaheim via L.A. Union Station with stops in Palmdale, Sylmar, Burbank, L.A. Union Station, Norwalk and Anaheim. This inclusion in to the Constrained Plan is conditional upon the California High-Speed Rail Authority (Authority) entering in to a MOU with Southern California transportation agencies to invest $1 billion in HSR funding to the LOSSAN and Metrolink corridors over the next few years.

AMTRAK LOSSAN CORRIDOR AND METROLINK SYSTEM

There has been strong stakeholder support in our region to pursue significant improvements to the LOSSAN corridor and Metrolink system that would enable operation of HSR services at least on some segments that would meet the FRA criteria for HSR (110 mph or above). Amtrak, Metrolink and the LOSSAN Rail Corridor Agency are continuously working towards speed and service improvements. These stakeholders are in the process of identifying and planning corridor projects with estimated costs through the LOSSAN Corridorwide Strategic Implementation Plan, which will identify programs and policies to better coordinate all rail services in the corridor and aim to increase ridership and develop new markets. The plan is expected to be completed in early 2012. This, coupled with the California High Speed Rail Authority's new blended approach for HSR implementation has resulted in consensus among our Region's stakeholders, the Regional Council and the Authority that $1 billion in HSR funding be allocated to the LOSSAN and Metrolink corridors over the next few years. Currently, a MOU is being developed between the Authority, SCAG, Metrolink, Metro, OCTA, RCTC, SANBAG and SANDAG to prescribe how these funds will be allocated.

This is the most viable way to expedite HSR operation in our region and also to connect to the CA HST Phase I that will begin construction in the Central Valley next year. This new approach in our region is reflected nationwide since much of the federal HSR appropriation awards have funded existing Amtrak intercity rail corridors.

EXHIBIT 2 Commuter Rail

TABLE 3 Transit Ridership

SCAG Region Annual Transit Ridership				
	2001	2005	2008	2035 Plan
Metro Rail	61,802,000	74,243,000	86,707,000	150,000,000
Commuter Rail	7,398,000	10,693,000	12,681,000	25,000,000
Bus	548,728,000	609,795,000	622,286,000	806,000,000
Total	**617,928,000**	**694,731,000**	**721,674,000**	**981,000,000**

Source: National Transit Database (NTD) for past years and SCAG model estimates for 2035 based on the 2012 RTP/SCS

Funding Rail Investment: Phased Implementation and the Blended Approach

The Authority's Draft 2012 Business plan outlines new capital cost estimates and new strategies to secure necessary revenues. The new estimate of $98.5 Billion (in year of expenditure dollars) will require new state, federal, and public private partnership (P3) revenues to ensure Phase I completion by 2034. The Authority's new strategy to secure funds and deliver incremental projects between now and 2034 involves a strategy of phased implementation and blended operations.

As part of this strategy, the state's HST program will proceed in two simultaneous paths: the critical path of major corridor delivery, and a coterminous path of early investments that provide early benefits to existing rail operators and passengers. These early investments will delvier more efficient and safer passenger rail service for current services, while eventually linking our region to the state system. As noted on page 2-3 of the draft 2012 business plan:

"It is important to note that, although improvements to local and regional rail systems are intended to improve or facilitate connections to the High Speed Train System, they do not need to be implemented sequentially. As with the stages of the HST system, these improvements, such as grade crossing eliminations and additional tracks, have independent utility that will benefit riders prior to connection to the high speed system. Where possible, they should move ahead independently and as quickly as feasible."

The new critical path outlined by the Authority includes a vision of risk mitigation through incremental project delivery. As each phase of the critical path is delivered, the California High Speed Rail Authority's governing board comes to a decision point:

a. Should the program move forward?
b. What is the appropriate next phase/segment?

The draft business plan envisions this strategy as delivering incremental benefits while allowing the state to opt out of the project if cost or schedule overruns become too burdensome. The plan also lays out the following critical path and concurrent activities:

TABLE 4 Phased Critical Path Sections, California High-Speed Rail Program

Section	Length	Endpoints	Description	Incremental Cost in 2010 Billions	Completion Year
Initial Construction Section (ICS)	130	Fresno – Bakersfield	Provides track and structures to support system spin; allows vehicle testing.	$5.2	2018
IOS Options (North/ South)	290/300	Bakersfield to San Jose/ Merced to San Fernando Valley	Supports 220 mph HSR service; includes trains and systems. Ridership and revenues sufficient to attract private participation. Connects with regional/local rail for blended operation.	$19.4 to $26.4/$21.0 to $25.8	2022
Bay to Basin	410	San Jose and Merced to the San Fernando Valley	First HSR service to connect the San Francisco Bay area with the Los Angeles Basin.	$14.2 to $17.3	2027
Phase I Blended (Non-critical path)	520	San Francisco to Los Angeles/Anaheim	Builds on Bay to Basin with blended operations with existing commuter/intercity rail, and additional improvements for a one-seat ride, connecting downtown San Francisco and Los Angeles/Anaheim. Caltrain corridor electrified for HSR, and new dedicated lines into Los Angeles and Anaheim.	$14.1 to $18.0	2026–2034
Full Phase I	520	San Francisco to Los Angeles/Anaheim	Continues dedicated highspeed alignment in full from San Jose to San Francisco and into Los Angeles/Anaheim.	$8.2 to $10.5	2034

The Authority estimates that the Initial Construction Segment (ICS) will be complete in 2018; this will lead to a decision point:

a. Should the program move forward?
b. Should the next step be to extend south, or extend north?

The business plan identifies two possible Initial Operating Segments (IOS). The first is a northward connection of the ICS into San Jose. This project is estimated to cost between $19.4 and $26.4 billion, and is estimated to generate between $207 and $368 million in net operating surplus by 2025. This option is named the IOS-North.

The second, IOS-South, would build the system south from Bakersfield, extending HST service into the San Fernando Valley. The estimated capital cost of this extension south would be $21.0 to $25.8 billion. The Authority estimates that the IOS – South would generate between $352 and $582 in annual net operating surplus by 2025.

The step on the critical path after the IOS is the "Bay to Basin" phase. In this phase, the authority will deliver the IOS section that was not selected to move forward in the previous section. Two key decisions will have to be made at this step:

a. Should the program move forward?
b. Is the operating surplus significant enough to attract P3 investment?

The net operating surpluses discussed above are crucial to this step. The business plan views the IOS stage as demonstrating the revenue generating potential of the total system, and the first point in the program where there is significant potential to attract

private sector funding. As such, a careful analysis of ridership and revenue forecasts it crucial to the IOS selection process.

Concurrent to the critical path activities are the Phase I Blended projects. These improvements will consist of incremental projects that deliver benefits to existing railroads and lay the foundation for eventual high speed service. Many core projects in this phase will begin in 2026, but early actions on the LOSSAN Corridor and the Metrolink system will occur before then.

Before the full build out of Phase I of the HST program in 2034, the business plan envisions a partial "sharing [of] existing commuter rail infrastructure" resulting in a "one-seat-ride from end-to-end." By upgrading existing Caltrain, Metrolink, or Amtrak rights of way or infrastructure, high speed trains can travel onward to San Francisco or Los Angeles at lower speeds. Eventually, upgrades to existing infrastructure will allow up to 125 mph service.

In the SCAG Region, this plan will be complicated by drive issues. While the Authority's HSTs will be electric drive, and powered by direct-overhead contact lines (often called catenaries), Amtrak and Metrolink currently operate diesel-electric locomotives, as do UP and BNSF. Moving forward, the region will have to reconcile the use of electric and diesel-electric locomotives in the same corridor; and resolve whether these two types of locomotives can share facilities. Blended operations may not be possible until these conflicts are resolved.

The final critical step of the program is the full build out of Phase I between downtown San Francisco, Los Angeles, and Anaheim. Final steps will include electrifying rail infrastructure and sealing corridors here in Southern California, and tunneling from 4th and King to the Transbay terminal in San Francisco.

The blended Phase I step is particularly important to the vision for passenger rail in the SCAG Region presented here. The 2012 RTP contains strategies to accelerate and implement Phase I blended investments, allowing the existing Amtrak Pacific Surfliner and Metrolink system to operate at top speeds over 110 mph in the near term. Funds from Proposition 1A and other Authority revenue streams can be leveraged to allow high speed travel years before the 2034 completion of the HST program. The MOU between the Authority and local rail stakeholders discussed above will set a funding mechanism for moving funds for initial investments from the state to local agencies.

Strategies and Recommendations

There are several strategies to increase rail ridership in our region. It is important to note that there are three distinct rail markets: commuter, intercity, and interregional. The first served by Metrolink, the second by Amtrak, and the third will be served by the state HST service. However, the three carriers can be attractive to the rail travel markets different from their own. Rail strategies include:

- Increasing speed
- Increasing service levels
- Cooperative fare agreements and media
- Cooperative marketing efforts

Speed and Service

The LOSSAN partners and Metrolink are in the process of planning and implementing capital projects to improve capacity, speed, and service, bringing at least some segments of their networks up to the federally defined high speed of 110 mph or greater. This includes a strategic implementation plan for 2030 that is estimating ridership and additional service using a coordinated schedule among Metrolink, Amtrak and NCTD's Coaster commuter rail service. This effort is also looking at extending some Metrolink trips to San Diego and some Coaster trips to L.A. Union Station. As speeds improve, these services will become more competitive with SOV travel and thus ridership will continue to grow. Further, their schedules should be adjusted once the state HST project is implemented so that all rail services complement and feed each other. These local efforts will now be greatly increased and speeded up due to the new funding partnership with the Authority.

Cooperative Agreements

The LOSSAN Rail Corridor Agency Joint Powers Board consists of the Ventura County Transportation Commission (VCTC), the Orange County Transportation Authority (OCTA), the North County Transit District (NCTD), the San Diego Association of Governments (SANDAG), San Diego's Metropolitan Transit System (MTS), the San Luis Obispo Council of Governments (SLOCOG), the Santa Barbara County Association of Governments (SBCAG), the Los Angeles County Metropolitan Transportation Authority (Metro), and the California Department of Transportation, Division of Rail (DOR), and coordinates

EXHIBIT 3 Strategic Plan HSR Map

service and investment planning along the corridor. SCAG, the California High-Speed Rail Authority, Amtrak, and the Riverside County Transportation Commission (RCTC) are ex-officio members of the Joint Powers Board.

Amtrak's Pacific Surfliner is the designated intercity passenger rail service in the corridor, and Caltrans DOR provides administration and management for the Surfliner. Both Amtrak and the DOR currently provide operating subsidies for the Pacific Surfliner. Other rail operations in the corridor include NCTD and Metrolink commuter rail service, and freight service by Union Pacific and Burlington Northern Santa Fe.

The LOSSAN Corridor Strategic Assessment, outlining a long-term, shared vision for enhancing passenger rail service between San Diego, Los Angeles, and San Luis Obispo through 2025, was completed in January 2010. This vision includes express services, faster travel times, and increased coordination between operators.

At the direction of the LOSSAN Board, the LOSSAN member agency CEOs group examined changes to LOSSAN's governance structure that would enhance LOSSAN's ability to implement the Strategic Assessment vision, especially in light of upcoming changes to federal operating subsidies per the Passenger Rail Investment and Improvement Act of 2008. The LOSSAN CEOs proposed a new joint powers structure wherein the LOSSAN Rail Corridor Agency would have direct control of Amtrak operations, similar to Northern California's Capital Corridor JPA. The LOSSAN Board has reiterated that initial governance changes should focus only on the state-supported intercity rail service and not modifications to the Metrolink or NCTD COASTER governance structures.

The benefits of local management of passenger rail service in the LOSSAN corridor include:

- More efficient resource allocation related to service expansion, frequencies, and schedules;
- A unified voice at the state and federal levels when advocating on passenger rail issues, including funding for capital improvements;
- Consolidated services such as fares, ticketing, marketing, and passenger information systems;
- Coordinated capital improvement prioritization; and
- More focused oversight of on-time performance, schedule integration, mechanical issues, and customer service.

It is expected that this new JPA will be formalized over the next year.

Marketing and Fares

Cooperative fare agreements and media also offer opportunities for increasing rail ridership and attracting new riders. For example, the Rail-to-Rail pass allows Metrolink monthly-pass riders who have origin and destination points along the LOSSAN corridor to ride Amtrak. Agreements like this one could be expanded once the CA HST project is built.

Metrolink has recently been pursuing innovative marketing, ticket pricing and operations strategies to increase ridership and reduce costs. In May 2011, Metrolink started express service demonstration programs on its San Bernardino and Antelope Valley Lines. This service shaves a large amount of travel time off the conventional trips. By skipping most stops, travel time is reduced 33 percent to just one hour on the San Bernardino Line, and 25 percent to an hour and a half on the Antelope Valley Line. Metrolink has also started specific trains for both Dodgers' and Angels' games, and other special events.

Amtrak also initiated an express trip in February 2011. It shaves 17 minutes off the northbound trip (currently, there is no southbound express). The provision of more express trips in the future should attract new transit riders.

Metrolink also started some progressive new fares this year, including the $10.00 all-weekend pass. From 7:00 p.m. Friday to 12:00 p.m. Sunday, riders can take multiple trips anywhere on the Metrolink system. Monthly pass holders can also take unlimited trips on the weekend regardless of their pass' origin/destination pair.

The Strategic Plan: Our Ultimate Vision for High Speed Rail

Our ultimate vision for a true HST system that would link major urban areas and activity centers within our region and beyond would be incomplete without Phase II of the proposed state HST system. Phase II would link Los Angeles Union station to San Diego via the Inland Empire in our region. The project is being planned in segments all in different degrees of project readiness. This corridor is approximately 160 miles long, stretching from Union Station in downtown Los Angeles through San Bernardino and Riverside Counties, and terminating in San Diego County. With 20.8 million residents, these four counties make up approximately 56 percent of the state's current population and will grow significantly by 2050.

Phase II of the state HST system, by adding connections to the Inland Empire and San Diego County, completes the backbone of a true regional High-Speed Transport system. The LOSSAN, Metrolink system, and state HST Phase I investments will provide high speed travel alternatives in Northern Los Angeles County, the San Fernando Valley, the Gateway Cities, and Orange County; Phase II will extend those alternatives to the San Gabriel Valley and the Inland Empire. Upon completion, Phase II will provide important access to planned and existing regional centers, including Ontario International Airport, the March Inland Port, and possibly San Bernardino International and Corona airports, helping to meet SCAG's long-term goal of regionalizing air travel in Southern California. Furthermore, Phase II may one day be the basis for further high speed rail extensions into Nevada or Arizona. Another possibility for service to Nevada exists with Phase II of the Desert Xpress Project. That service may eventually operate between Palmdale and Las Vegas, allowing Metrolink or CA HST passengers an option.

The state HST system will provide excellent regional connectivity to our region by connecting with a robust network of intercity and commuter rail, subway and light-rail, and fixed-route transit systems. Integrated planning and service levels of these connecting services will allow them and the state HST to feed and complement each other. While commuter, intercity and interregional rail services are distinct travel markets, the proper coordination of their schedules will further increase the region's rail and transit ridership by attracting crossover passengers to these different markets. It will also significantly relieve capacity constraints of the existing air and highway transportation system as increases in intercity travel demand in California occur. By attracting a large number of trips from current auto and air travel markets, a significant decrease in GHG emissions will be achieved in our region. In addition, the state HST system will provide a much cheaper alternative to building additional airport and highway capacity to serve intrastate aviation routes and auto trips.

Strategic Plan Projects

CALIFORNIA HIGH-SPEED RAIL PHASE II

Phase II is from Madera to Sacramento and in our region from L.A. Union Station to San Diego through the San Gabriel Valley and Inland Empire. Phase II is in the Supplemental Alternatives Analysis phase and includes some alternative alignments in our region: either I-10 or SR 60 through the San Gabriel Valley, and either I-15 or I-215 from the Inland Empire to the San Diego County line. There is currently no funding for Phase II.

DESERTXPRESS

The Desert Xpress would connect Las Vegas to Victorville using steel wheel on steel rail technology. There are no intermediate stops. The project has completed the environmental process and the FRA issued a record of decision (ROD) on July 8, 2011. DesertXpress Enterprises has applied to the FRA's Railroad Rehabilitation Improvement Financing (RRIF) program for a loan to start and complete construction of the project. In addition to the RRIF loan, private debt and equity will be included in the project financing. Phase Two of this project would connect Victorville to Palmdale, thereby providing a connection with the CA HST system and the Metrolink Antelope Valley Line. Phase Two was not included in DesertXpress' environmental process, nor is it part of their FRA loan application.

The DesertXpress EIS has received the following Federal approvals:

- July 8, 2011: Federal Railroad Administration Record of Decision (ROD)
- October 26, 2011: Surface Transportation Board issued Certificate of Public Convenience and Necessity.
- October 31, 2011: Bureau of Land Management ROD
- November 18, 2011: Federal Highway Administration ROD
- December 7, 2011: DesertXpress executed a lease agreement with BLM for the alignment and facilities located on federal land.
- Application for a federal loan under the FRA Railroad Rehabilitation and Improvement Financing program currently under review by US Department of Transportation.

CALIFORNIA/NEVADA SUPER-SPEED TRAIN

The California/Nevada Super-Speed Train (CNSST) project would connect Las Vegas to Anaheim using maglev with intermediate stops in Primm, Barstow, Victorville, and Ontario. A Programmatic EIR/EIS was initiated in 2004 but has not been completed to date, and $45 million of federal funding has been earmarked for the environmental review. Plans call for building the first 40-mile segment either from Las Vegas to Primm or Anaheim to Ontario. To date, no funds for construction have been identified.

CALIFORNIA/NEVADA SUPER-SPEED TRAIN ANAHEIM TO ONTARIO INITIAL OPERATING SEGMENT

This is a maglev project which is part of the larger Las Vegas to Anaheim project. This southernmost segment from Anaheim to Ontario is being considered as the initial operating segment of the larger project due to its strong ridership potential and regional connectivity, and its ability to operate as a stand-alone project. A $45 million planning project for this segment is also included in the Constrained Plan.

ORANGELINE NORTHERN SEGMENT

The northern segment of the Orangeline is between Los Angeles Union Station (LAUS) and Santa Clarita. The Orangeline Development Authority (OLDA) is a joint powers authority formed to pursue development of a higher speed, environmentally friendly, technology neutral transit system from Cerritos to Santa Clarita. The southern section from LAUS to Cerritos is along the West Santa Ana Branch PE ROW that is partially funded by Measure R.

A series of improvements in the corridor are being evaluated including the previously mentioned high-speed rail memorandum of understanding (MOU) effort, the Antelope Valley Line Infrastructure Improvement Plan, and the on-going Bob Hope Airport Ground Access Study. This interagency MOU includes a list of priority projects including a proposed new Metrolink station at the Bob Hope Airport. Therefore, the OLDA Northern Corridor will benefit from a set of investments during the life of the plan that will improve safety, efficiency, capacity, speed and connectivity. This supports OLDA's intermediate vision of more frequent service and increased hours of operation within the corridor.

Greater Vision for our Commuter and Passenger Rail System

Metrolink Enhancements

Metrolink provides our region's commuter rail service operating 163 trips on seven lines carrying 42,000 passengers on weekdays. With the investments proposed within the Constrained Plan in Chapter 2, we expect to achieve more than double the ridership by 2035. But, we believe, the Metrolink system has even greater untapped potential for our region.

Our region boasts 4.32 commuter rail route miles per 100,000 residents, which is over 2.5 times the median for large metropolitan regions. However, in 2008, residents of the SCAG region took only 0.7 per capita trips on the commuter rail system, well below the national median of 0.82. Chicagoans, by contrast, took 8.28 trips per capita, on a network that provides 11.8 route miles for every 100,000 residents. Residents of Baltimore took 34 percent more commuter rail trips per capita on a network similar to that of the SCAG region.

The average speed for Metrolink is about 40 mph today. The average speeds vary by line and while top speeds are 79 mph, the number of stops and physical capacity and geographic constraints result in this average system speed which is lower than one would

think. This shows the need to fund capital projects in order to speed up the service and make Metrolink more attractive to the SOV commuter.

The recent release of the Authority's draft 2011 Business Plan puts off the arrival of the state HST system in our region to 2033, and greatly escalates the official project cost. This confirms long-standing stakeholder concerns of the project's implementation timeline and viability, and therefore confirms the need to spend HSR dollars on our region's current rail services. In fact, the new Business Plan calls for "blended" rail services whereby incremental operating segments of the state HST system will connect with existing rail services until the entire project gets built.

Our Strategic Plan vision for Metrolink speed and service improvements calls for an intensive investment in capital projects to further increase speed and service levels over and above the Constrained Plan. The Strategic Plan results in even more segments of the network operating at speeds of 110 mph or greater. These projects include additional double tracking, sidings, station improvements, grade separations, and grade crossings. Not only will this benefit commuter rail trips in our region, but will benefit Amtrak intercity and the state HST interregional trips also as the three systems feed and complement each other. While these are three distinct travel markets, improving all three networks encourages cross-over rail travel market trips.

In addition to capital improvements, our strategic vision calls for:

- A doubling of system use by 2020, and possibly doubling again by 2035. The constrained plan increases ridership by 338 percent from 2001 to 2035.
- Considerably more express trips
- Regular special event services
- A connection to Ontario International airport
- The implementation of new BRT services that directly connect with the Metrolink system
- A robust growth of TOD around Metrolink stations
- The implementation of first mile/last mile policies for robust bicycle and pedestrian improvements around Metrolink stations.

Additional Passenger Rail Service

An additional Strategic Plan passenger rail element implements daily passenger rail service between downtown Los Angeles and the Coachella Valley. Stops would include L.A. Union Station, Fullerton, Riverside, Redlands/Loma Linda, Beaumont/Banning, Palm Springs, Rancho Mirage and Indio. Service would be operated by Amtrak with ideally at least two if not three daily round trips.

Currently, rail service between downtown L.A. and the Coachella Valley is only provided three days a week with an unattractive schedule as part of Amtrak's interstate services. Union Pacific Railroad owns this rail corridor east of Colton and is opposed to implementing additional passenger service without large capital improvements. However, Amtrak retains the right to operate passenger service on freight-owned railroads and there is a process in place to resolve freight opposition, although Amtrak and other partners such as Caltrans DOR and RCTC may be required to fund capital projects to mitigate potential financial damages to Union Pacific. A 2010 RCTC study estimates $75 million in station costs, $40 million in equipment costs, and $11.4 million in yearly operating costs to start this service. These figures do not include any capital costs required to mitigate service disruptions incurred by Union Pacific.

Subregional Sustainable Communities Strategy – Gateway Cities Council of Governments (GCCOG) and Orange County Council of Governments (OCCOG) **9**

Framework and Guidelines for Subregional Sustainable Communities Strategy

I. Introduction

SB 375 (Steinberg), also known as California's Sustainable Communities Strategy and Climate Protection Act, is a new state law which became effective January 1, 2009. SB 375 calls for the integration of transportation, land use, and housing planning, and also establishes the reduction of greenhouse gas (GHG) emissions as one of the main goals for regional planning. SCAG, working with the individual County Transportation Commissions (CTCs) and the subregional organizations within the SCAG region, is responsible for implementing SB 375 in the Southern California region. Success in this endeavor is dependent on collaboration with a range of public and private partners throughout the region.

Briefly summarized here, SB 375 requires SCAG as the Metropolitan Planning Organization to:

- Prepare a Sustainable Communities Strategy (SCS) as part of the 2012 Regional Transportation Plan (RTP). The SCS will meet a State-determined regional GHG emission reduction target, if it is feasible to do so.
- Prepare an Alternative Planning Strategy (APS) that is not part of the RTP if the SCS is unable to meet the regional target.
- Integrate SCAG planning processes, in particular assuring that the Regional Housing Needs Assessment (RHNA) is consistent with the SCS, at the jurisdiction level.
- Specific to SCAG only, allow for subregional SCS/APS development.
- Develop a substantial public participation process involving all stakeholders.

Unique to the SCAG region, SB 375 provides that "a subregional council of governments and the county transportation commission may work together to propose the sustainable communities strategy and an alternative planning strategy . . . for that subregional area." Govt. Code §65080(b)(2)(C). In addition, SB 375 authorizes that SCAG "may adopt a framework for a subregional SCS or a subregional APS to address the intraregional land use, transportation, economic, air quality, and climate policy relationships." Id. Finally, SB 375 requires SCAG to "develop overall guidelines, create public participation plans, ensure coordination, resolve conflicts, make sure that the overall plan complies with applicable legal requirements, and adopt the plan for the region." Id. The intent of this Framework and Guidelines for Subregional Sustainable Communities Strategy (also referred to herein as the "Framework and Guidelines" or the "Subregional Framework and Guidelines") is to offer the SCAG region's subregional agencies the highest degree of autonomy, flexibility and responsibility in developing a program and set of implementation strategies for their subregional areas. This will allow the subregional strategies to better reflect the issues, concerns, and future vision of the region's collective jurisdictions with the input of the fullest range of stakeholders. In order to achieve these objectives, it is necessary for SCAG to develop measures that assure equity, consistency and coordination, such that SCAG can incorporate the subregional SCSs in its regional SCS which will be adopted as part of the 2012 RTP pursuant to SB 375. For that reason, this Framework and Guidelines establishes standards for the subregion's work in preparing and submitting subregional strategies, while also laying out SCAG's role in facilitating and supporting the subregional effort with data, tools, and other assistance.

While the Framework and Guidelines are intended to facilitate the specific subregional option to develop the SCS (and APS if necessary) as described in SB 375, SCAG encourages the fullest possible participation from all subregional organizations. As SCAG undertakes implementation of SB 375 for the first time, SCAG has also designed a "collaborative" process, in cooperation with the subregions, that allows for robust subregional participation for subregions that choose not to exercise their statutory option.

II. Eligibility and Participation

SB 375 allows for subregional councils of governments in the SCAG region to have the option to develop the SCS (and the APS if necessary) for their area. SCAG interprets this option as being available to any subregional organization recognized by SCAG, regardless of whether the organization is formally established as a "subregional council of governments."

County Transportation Commissions (CTCs) play an important and necessary role in the development of a subregional SCS. Any subregion that chooses to develop a subregional strategy will need to work closely with the respective CTC in its subregional area in order to identify and integrate transportation projects and policies. Beyond working with CTCs, SCAG encourages partnership efforts in the development of subregional strategies, including partnerships between and among subregions.

Subregional agencies must formally indicate to SCAG, in writing, by December 31, 2009 if they intend to exercise this option to develop their own SCS. Subregions that choose to develop an SCS for their area must do so in a manner consistent with this Framework and Guidelines. The subregion's intent to exercise its statutory option to prepare the strategy for their area must be decided and communicated through formal action of the subregional agency's governing board. Subsequent to receipt of any subregion's intent to develop and adopt an SCS, SCAG will convene discussions regarding a formal written agreement between SCAG and the subregion, which may be revised if necessary, as the SCS process is implemented.

III. Framework

The Framework portion of this document covers regional objectives and policy considerations, and provides general direction to the subregions in preparing their own SCS, and APS if necessary.

A. SCAG'S PRELIMINARY GOALS FOR IMPLEMENTING SB 375 ARE AS FOLLOWS:

- Achieve the regional GHG emission reduction target for cars and light trucks through an SCS.
- Fully integrate SCAG's planning processes for transportation, growth, intergovernmental review, land use, housing, and the environment.
- Seek areas of cooperation that go beyond the procedural statutory requirements, but that also result in regional plans and strategies that are mutually supportive of a range of goals.
- Build trust by providing an interactive, participatory and collaborative process for all stakeholders. Provide, in particular, for the robust participation of local jurisdictions, subregions and CTCs in the development of the SCAG regional SCS and implementation of the subregional provisions of the law.
- Assure that the SCS adopted by SCAG and submitted to California Air Resources Board (ARB) is a reflection of the region's collective growth strategy and vision for the future.
- Develop strategies that incorporate and are respectful of local and subregional priorities, plans, and projects.

B. FLEXIBILITY

Subregions may develop any appropriate strategy to address the region's greenhouse gas reduction goals and the intent of SB 375. While subregions will be provided with SCAG data, and with a conceptual or preliminary scenario to use as a helpful starting point, they may employ any combination of land use policy change, transportation policy, and transportation investment, within the specific parameters described in the Guidelines.

C. OUTREACH EFFORT AND PRINCIPLES

Subregions are required to conduct an open and participatory process that includes the fullest possible range of stakeholders. As further discussed within the Guidelines, SCAG amended its existing Public Participation Plan (PPP) to describes SCAG's responsibilities in complying with the outreach requirements of SB 375 and other applicable laws and regulations. SCAG will fulfill its outreach requirements for the regional SCS/APS which will include outreach activities regarding the subregional SCS/APS. Subregions are also encouraged to design their own outreach process that meets each subregion's own needs and reinforces the spirit of openness and full participation. To the extent that subregions do establish their own outreach process, this process should be coordinated with SCAG's outreach process.

D. COMMUNICATION AND COORDINATION

Subregions developing their own SCS are strongly encouraged to maintain regular communication with SCAG staff, the respective CTC, their jurisdictions and other stakeholders, and other subregions if necessary, to review issues as they arise and to assure close coordination. Mechanisms for ongoing communication should be established in the early phases of strategy development.

E. PLANNING CONCEPTS

SCAG, its subregions, and member cities have established a successful track record on a range of land use and transportation planning approaches through the on-going SCAG Compass Blueprint Program, including approximately 60 local demonstration projects

completed to date. Subregions are encouraged to capture, further develop and build off the concepts and approaches of the Compass Blueprint program. In brief, these include developing transit-oriented, mixed use, and walkable communities, and providing for a mix of housing and jobs.

IV. Guidelines

These Guidelines describe specific parameters for the subregional SCS/APS effort under SB 375, including process, deliverables, data, documentation, and timelines. As described above, the Guidelines are created to ensure that the region can successfully incorporate strategies developed by the subregions into the regional SCS, and that the region can comply with its own requirements under SB 375. Failure to proceed in a manner consistent with the Guidelines will result in SCAG not accepting a subregion's submitted strategy.

A. SUBREGIONAL PROCESS

(1) Subregional Sustainable Communities Strategy

Subregions that choose to exercise their optional role under SB 375 will develop and adopt a subregional Sustainable Communities Strategy. That strategy must contain all of the required elements, and follow all procedures, as described in SB 375. Subregions may choose to further develop an Alternative Planning Strategy (APS), according to the procedures and requirements described in SB 375. If subregions prepare an APS, they must prepare a Sustainable Communities Strategy first, in accordance with SB 375. A subregional APS is not "in lieu of" a subregional SCS, but in addition to the subregional SCS. In part, an APS must identify the principal impediments to achieving the targets within the SCS. The APS must show how the GHG emission targets would be achieved through alternative development patterns, infrastructure, and additional transportation measures or policies. SCAG encourages subregions to focus on feasible strategies that can be included in the SCS.

The subregional SCS must include all components of a regional SCS as described in SB 375, and outlined below:

1. identify the general location of uses, residential densities, and building intensities within the subregion;
2. identify areas within the subregion sufficient to house all the population of the subregion, including all economic segments of the population, over the course of the planning period of the RTP taking into account net migration into the region, population growth, household formation and employment growth;
3. identify areas within the subregion sufficient to house an eight-year projection of the regional housing need for the subregion pursuant to Section 65584;
4. identify a transportation network to service the transportation needs of the subregion;
5. gather and consider the best practically available scientific information regarding resource areas and farmland in the subregion as defined in subdivisions (a) and (b) of Section 65080.01;
6. consider the state housing goals specified in Sections 65580 and 65581;
7. set forth a forecasted development pattern for the subregion, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the ARB; and
8. allow the RTP to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506). See, Government Code §65080(b)(2)(B).

In preparing the subregional SCS, the subregion will consider feasible strategies, including local land use policies, transportation infrastructure investment (e.g., transportation projects), and other transportation policies such as Transportation Demand Management (TDM) strategies (which includes pricing), and Transportation System Management (TSM) strategies. Technological measures may be included if they exceed measures captured in other state and federal requirements (e.g., AB32).

As discussed further below (under "Documentation"), subregions need not constrain land use strategies considered for the SCS to current General Plans. In other words, the adopted strategy need not be fully consistent with local General Plans currently in place. However, should the adopted subregional strategy deviate from General Plans, subregions will need to demonstrate the feasibility of the strategy by documenting any affected jurisdictions' willingness to adopt the necessary General Plan changes.

The regional SCS shall be part of the 2012 RTP. Therefore, for transportation investments included in a subregional SCS to be valid, they must also be included in the 2012 RTP. Further, such projects need to be scheduled in the RTIP for construction completion by the target years (2020 and 2035) in order to demonstrate any benefits as part of the SCS. As such, subregions will need to collaborate with the respective CTC in their area to coordinate the subregional SCS with future transportation investments. It should also be noted that the California Transportation Commission is updating their RTP Guidelines. This topic is likely to be part of further discussion through the SCS process as well.

SCAG will accept and incorporate the subregional SCS, unless (a) it does not comply with SB 375, (b) it is does not comply with federal law, or (c) it is does not comply with SCAG's Subregional Framework and Guidelines. In the event that a compiled regional SCS, including subregional submissions, does not achieve the regional target, SCAG will initiate a process to develop and consider additional GHG emission reduction measures region-wide. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process. Furthermore, SCAG will compile and disseminate performance information on the preliminary regional SCS and its components in order to facilitate regional dialogue. The development of a subregional SCS does not exempt any subregion from further GHG emission reduction measures being included in the regional SCS. Further, all regional measures needed to meet the regional target will be subject to adoption by the Regional Council, and any additional subregional measures beyond the SCS submittal from subregions accepting delegation needed to meet the regional target must also be adopted by the subregional governing body.

(2) Subregional Alternative Planning Strategy (APS)

Subregions are encouraged to focus their efforts on feasible measures that can be included in an SCS. In the event that a subregion chooses to prepare an APS, the content of a subregional APS should be consistent with what is required by SB 375 (see, Government Code §65080(b)(2)(H)), as follows:

1. Shall identify the principal impediments to achieving the subregional SCS
2. May include an alternative development pattern for the subregion pursuant to subparagraphs (B) to (F), inclusive.
3. Shall describe how the alternative planning strategy would contribute to the regional greenhouse gas emission reduction target, and why the development pattern, measures, and policies in the alternative planning strategy are the most practicable choices for the subregion.
4. An alternative development pattern set forth in the alternative planning strategy shall comply with Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations, except to the extent that compliance will prevent achievement of the regional greenhouse gas emission reduction targets approved by the ARB.
5. For purposes of the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code), an alternative planning strategy shall not constitute a land use plan, policy, or regulation, and the inconsistency of a project with an alternative planning strategy shall not be a consideration in determining whether a project may have an environmental effect.

Any precise timing or submission requirements for a subregional APS will be determined based on further discussions with subregional partners. As previously noted, a subregional APS is in addition to a subregional SCS.

(3) Outreach and Process

SCAG will fulfill all of its outreach requirements under SB 375 for the regional SCS/APS, which will include outreach regarding any subregional SCS/APS. SCAG staff has revised its Public Participation Plan to incorporate the outreach requirements of SB 375, and integrate the SB 375 process with the 2012 RTP development as part of SCAG's Public Participation Plan Amendment No. 2, adopted by SCAG's Regional Council on December 3, 2009. Subsequent to the adoption of the PPP Amendment No. 2, SCAG will continue to discuss with subregions and stakeholders the Subregional Framework & Guidelines, which further describe the Public Participation elements of SB 375.

Subregions that elect to prepare their own SCS or APS are encouraged to present their subregional SCS or APS, in coordination with SCAG, at all meetings, workshops and hearings held by SCAG in their respective counties. Additionally, the subregions would be asked to either provide SCAG with their mailing lists so that public notices and outreach materials may also be posted and sent out by SCAG, or SCAG will provide notices and outreach materials to the subregions for their distribution to stakeholders. The SCAG PPP Amendment No. 2 provides that additional outreach may be performed by subregions.

Subregions are strongly encouraged to design and adopt their own outreach processes that mimic the specific requirements imposed on the region under SB 375. Subregional outreach processes should reinforce the regional goal of full and open participation, and engagement of the broadest possible range of stakeholders.

(4) Subregional SCS Approval

It is recommended that the governing board of the subregional agency approve the subregional SCS prior to submission to SCAG. While the exact format is still subject to further discussion, SCAG recommends that there be a resolution from the governing board of the subregion with a finding that the land use strategies included in the subregional SCS are feasible and based upon consultation with the local jurisdictions in the respective subregion. Subregion should consult with their legal counsel as to compliance with the California Environmental Quality Act (CEQA). In SCAG's view, the subregional SCS is not a "project" for the purposes of CEQA; rather, the 2012 RTP which will include the regional SCS is the actual "project" which will be reviewed for environmental impacts pursuant to CEQA. As such, the regional SCS, which will include the subregional SCSs, willundergo a thorough CEQA review. Nevertheless, subregions approving subregional SCSs should consider issuing a notice of exemption under CEQA to notify the public of their "no project" determination and/or to invoke the "common sense" exemption pursuant to CEQA Guidelines §15061(b)(3).

Finally, in accordance with SB 375, subregions are strongly encouraged to work in partnership with the CTC in their area. SCAG can facilitate these arrangements if needed.

(5) Data Standards

SCAG is currently assessing the precise data standards anticipated for the regional and subregional SCS. In particular, SCAG is reviewing the potential use of parcel data and development types currently used for regional planning. At present, the following describes the anticipated data requirements for a subregional SCS.

1. Types of VariablesVariables are categorized into socio-economic variables and land use variables. The socioeconomic variables include population, households, housing units, and employment. The land use variables include land uses, residential densities, building intensities, etc, as described in SB 375.
2. Geographical Levels – SCAG is considering the collection and adoption of the data at a small-area level as optional for local agencies in order to make accessible the CEQA streamlining provisions under SB 375. The housing unit, employment, and the land use variables can be collected at a small-area level for those areas which under SB 375 qualify as containing a "transit priority project" (i.e. within halfmile of a major transit stop or high-quality transit corridor) for purposes of allowing jurisdictions to take advantage of the CEQA streamlining incentives in SB 375. For all other areas in the region, SCAG staff will collect the population, household, employment, and land use variables at the Census tract or Traffic Analysis Zone (TAZ) level.
3. Base Year and Forecast Years – The socio-economic and land use variables will be required for the base year of 2008, and the target years of 2020 and 2035.

(6) Documentation

Subregions are expected to maintain full and complete records related to the development of the subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board.

(7) Timing

An overview schedule of the major milestones of the subregional process and its relationship to the regional SCS/RTP is included below. Subregions must submit the subregional SCS to SCAG by the date prescribed. Further, SCAG will need a preliminary SCS from subregions for the purpose of preparing a project description for the 2012 RTP Program Environmental Impact Report. The precise content of this preliminary submission will be determined based on further discussions. The anticipated timing of this preliminary product is approximately February 2011.

(8) Relationship to Regional Housing Needs Assessment (RHNA) and Housing Element

Although SB 375 calls for an integrated process, subregions are not automatically required to take on RHNA delegation as described in State law if they prepare an SCS/APS. However, SCAG encourages subregions to undertake both processes due to their inherent connections.

SB 375 requires that the RHNA allocated housing units be consistent with the development pattern included in the SCS. See, Government Code §65584.04(i). Population and housing demand must also be proportional to employment growth. At the same time, in addition to the requirement that the RHNA be consistent with the development pattern in the SCS, the SCS must also identify areas that are sufficient to house the regional population by income group through the RTP planning period, and must identify areas to accommodate the region's housing need for the next local Housing Element eight year planning period update. The requirements of the statute are being further interpreted through the RTP guidelines process. Staff intends to monitor and participate in the guideline process, inform stakeholders regarding various material on these issues, and amend, if necessary, these Framework and Guidelines, pending its adoption.

SCAG will be adopting the RHNA and applying it to local jurisdictions at the jurisdiction boundary level. SCAG staff believes that consistency between the RHNA and the SCS may still be accomplished by aggregating the housing units contained in the smaller geographic levels noted in the SCS and including such as part of the total jurisdictional number for RHNA purpose. SCAG staff has concluded that there is no consistency requirement for RHNA purposes at sub-jurisdictional level, even though the SCS is adopted at the smaller geographic level for the opportunity areas.

The option to develop a subregional SCS is separate from the option for subregions to adopt a RHNA distribution, and subject to separate statutory requirements. Nevertheless, subregions that develop and adopt a subregional SCS should be aware that the SCS will form the basis for the allocation of housing need as part of the RHNA process. Further, SCS development requires integration of elements of the RHNA process, including assuring that areas are identified to accommodate the 8 year need for housing, and that housing not be constrained by certain types of local growth controls as described in State law. SCAG will provide further guidance for subregions and a separate process description for the RHNA.

B. COUNTY TRANSPORTATION COMMISSIONS' ROLES AND RESPONSIBLITIES

Subregions that develop a subregional SCS will need to work closely with the CTCs in their area in order to coordinate and integrate transportation projects and policies as part of the subregional SCS. As discussed above (under "Subregional Sustainable Communities Strategy"), any transportationprojects identified in the subregional SCS must also be included in the 2012 RTP in order to be considered as a feasible strategy. SCAG can help to facilitate communication between subregions and CTCs.

C. SCAG ROLES AND RESPONSIBILITIES

SCAG's roles in supporting the subregional SCS development process are in the following areas:

(1) Preparing and adopting the Framework and Guidelines

SCAG will adopt these Framework and Guidelines in order to assure regional consistency and the region's compliance with law.

(2) Public Participation Plan

SCAG will assist the subregions by developing, adopting and implementing a Public Participation Plan and outreach process with stakeholders. This process includes consultation with congestion management agencies, transportation agencies, and transportation commissions; and SCAG will hold public workshops and hearings. SCAG will also conduct informational meetings in each county within the region for local elected officials (members of the board of supervisors and city councils), to present the draft SCS, and APS if necessary, and solicit and consider input and recommendations.

(3) Methodology

As required by SB 375, SCAG will adopt a methodology for measuring greenhouse gas emission reductions associated with the strategy.

(4) Incorporation/Modification

SCAG will accept and incorporate the subregional SCS unless it does not comply with SB 375, federal law, or the Subregional Framework and Guidelines. As SCAG intends the entire SCS development process to be iterative, SCAG will not amend a locally-submitted SCS. SCAG may provide additional guidance to subregions so that subregions may make amendments to its subregional SCS as part of the iterative process, or request a subregion to prepare an APS if necessary. Further, SCAG can propose additional regional strategies if feasible and necessary to achieve the regional emission reduction target with the regional SCS. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process.

(5) Modeling

SCAG currently uses a Trip-Based Regional Transportation Demand Model and ARB's EMFAC model for emissions purposes. In addition to regional modeling, SCAG is developing tools to evaluate the effects of strategies that are not fully accounted for in the regional model. SCAG is also developing two additional tools—a Land Use Model and an Activity Based Model—to assist in strategy development and measurement of outcomes under SB 375.

In addition to modeling tools which are used to measure results of completed scenarios, SCAG is developing a scenario planning tool for use in workshop settings as scenarios are being created with jurisdictions and stakeholders. The tool will be made available to subregions and local governments for their use in subregional strategy development.

(6) Adoption/Submission to State

After the incorporation of subregional strategies, SCAG will finalize and adopt the regional SCS as part of the 2012 RTP. SCAG will submit the SCS to ARB for review as required in SB 375.

(7) Conflict Resolution

While SB 375 requires SCAG to develop a process for resolving conflicts, it is unclear at this time the nature or purpose of a conflict resolution process as SCAG does not intend to amend a locallysubmitted SCS. As noted above, SCAG will accept the subregional SCS unless it is inconsistent with SB 375, federal law, or the Subregional Framework and Guidelines. SCAG will also request that a subregion prepare an APS if necessary. It is SCAG's intent that the process be iterative and that there be coordination among SCAG, subregions and their respective jurisdictions and CTCs. SCAG is open to further discussion on issues which may generate a need to establish a conflict resolution process as part of the written agreement between SCAG and the subregional organization.

(8) Funding

Funding for subregional activities is not available at this time, and any specific parameters for future funding are speculative. Should funding become available, SCAG anticipates providing a share of available resources to subregions. While there are no requirements associated with potential future funding at this time, it is advisable for subregions to track and record their expenses and activities associated with these efforts.

(9) Preliminary Scenario Planning

SCAG will work with each subregion to collect information and prompt dialogue with each local jurisdiction prior to the start of formal SCS development. This phase of the process is identified as "preliminary scenario planning" in the schedule below. The purpose of this process is to create a base of information to inform SCAG's recommendation of a regional target to ARB prior to June 2010. All subregions are encouraged to assist SCAG in facilitating this process.

(10) Data

SCAG is currently developing, and will provide each subregion with datasets for the following:

1. 2008 Base year;
2. General Plan/Growth projection & distribution;
3. Trend Baseline; and
4. Policy Forecast/SCS.

While the Trend Baseline is a technical projection that provides a best estimate of future growth based on past trends and assumes no general plan land use policy changes, the

Policy Forecast/ SCS is derived using local input through a bottom-up process, reflecting regional policies including transportation investments. Local input is collected from counties, subregions, and local jurisdictions.

Data/GIS maps will be provided to subregions and local jurisdiction for their review. This data and maps include the 2008 base year socioeconomic estimates and 2020 and 2035 socioeconomic forecast. Other GIS maps including the existing land use, the general plan land use, the resource areas, and other important areas identified in SB 375. It should be noted that none of the data/ maps provided were endorsed or adopted by SCAG's Community, Economic and Human Development Committee (CEHD). All data/maps provided are for the purpose of collecting input and comments from subregions and local jurisdictions. This is to initiate dialogue among stakeholders to address the requirements of SB 375 and its implementation.

The list of data/GIS maps include:

1. Existing land use
2. Zoning
3. General plan land use
4. Resource areas include:

a. all publicly owned parks and open space;
b. open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;
c. habitat for species identified as candidate, fully protected, sensitive, or species of special status by local, state, or federal agencies or protected by the federal Endangered Species Act (1973), the California Endangered Species Act, or Native Plant Protection Act;
d. lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts, or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code, and lands under Williamson Act contracts;
e. areas designated for open-space or agricultural uses in adopted open-space elements or agricultural elements of the local general plan or by local ordinance;
f. areas containing biological resources as described in Appendix G of the CEQA Guidelines that may be significantly affected by the sustainable communities strategy or the alternative planning strategy; and
g. an area subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program or where the area is subject to more protective provisions of state law or local ordinance.

5. Farmland
6. Sphere of influence
7. Transit priority areas
8. City/Census tract boundary with ID
9. City/TAZ boundary with ID

(11) Tools

SCAG is developing a Local Sustainability Planning Model (LSPM) for subregions/local jurisdictions to analyze land use impact. The use of this tool is not mandatory and is at the discretion of the Subregion. The LSPM is a web-based tool that can be used to analyze, visualize and calculate the impact of land use changes on auto ownership, mode use, vehicle miles of travel (VMT), and greenhouse gas emissions in real time. Users will be able to estimate transportation and emissions impacts by modifying land use designations within their community.

Other tools currently maintained by SCAG may be useful to the subregional SCS development effort, including the web-based CaLOTS application. SCAG will consider providing guidance and training on additional tools based on further discussions with subregional partners.

(12) Resources and Technical Assistance

SCAG will assist the subregions by making available technical tools for scenario development as described above. Further, SCAG will assign a staff liaison to each subregion, regardless of whether the subregion exercises its statutory option to prepare an SCS. SCAG staff can participate in subregional workshops, meetings, and other processes at the request of the subregion, and pending funding and availability. SCAG's legal staff will

be available to assist with questions related to SB 375 or SCAG's implementation of SB 375. Further, SCAG will prepare materials for its own process in developing the regional SCS, and will make these materials available to subregions.

D. MILESTONES/SCHEDULE

- CARB issues Final Regional Targets – September 2010
- SCS development (preliminary scenario, draft, etc) – through early 2011
- Release Draft RTP/regional SCS for public review – November 2011
- Regional Council adopts RTP/SCS – April 2012

If other milestones are needed, they will be incorporated into the written agreement between SCAG and the Subregion.

Subregional Sustainable Communities Strategy – Gateway Cities Council of Governments (GCCOG) and Orange County Council of Governments (OCCOG)

The Orange County Council of Governments and the Gateway Cities Council of Governments chose to develop their own SCS, and entered into Memoranda of Understanding with SCAG specifying submission schedules and standards for each component of the subregional SCS. The following subregional SCSs have both been formally approved and adopted by their respective councils of government.

EXHIBIT 1 Gateway Cities COG Subregional SCS

MEMORANDUM OF UNDERSTANDING

BY AND BETWEEN

GATEWAY CITIES COUNCIL OF GOVERNMENTS

AND

THE SOUTHERN CALIFORNIA ASSOCATION OF GOVERNMENTS

FOR

GATEWAY CITIES SUSTAINABLE COMMUNITIES STRATEGY

THIS MEMORANDUM OF UNDERSTANDING (hereinafter referred to as "MOU") is entered by and between the Gateway Cities Council of Governments, (hereinafter referred to as "GCCOG"), and the Southern California Association of Governments, (hereinafter referred to as "SCAG"), collectively referred to as the "Parties."

RECITALS:

WHEREAS, Senate Bill 375 (Chapter 728, laws of 2008, "SB 375") requires SCAG to prepare a regional Sustainable Communities Strategy (hereinafter referred to as "SCS" or "Regional SCS") as part of SCAG's Regional Transportation Plan ("RTP") to achieve goals for the reduction of greenhouse gas emissions from automobiles and light trucks in the SCAG region which comprises the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura;

WHEREAS, SB 375 allows GCCOG, as a subregional council of governments for Southeast Los Angeles County, to develop and submit to SCAG a subregional SCS for its jurisdiction (hereinafter referred to as "Gateway Cities SCS");

WHEREAS, as part of its implementation of SB 375, SCAG has developed and adopted a certain "Framework and Guidelines for the Subregional Sustainable Communities Strategy" (hereinafter referred to as "Framework and Guidelines"), attached hereto as Exhibit "A" and incorporated herein by this reference.

WHEREAS, SCAG is required by SB 375 to include a subregional SCS in the regional SCS, to the extent consistent with state and federal law;

WHEREAS, GCCOG and SCAG desire to enter into this MOU to demonstrate mutual commitments to prepare the Gateway Cities SCS.

NOW, THEREFORE, the Parties enter into the following MOU with respect to the matters set forth herein:

1. This MOU establishes the roles, responsibilities, and requirements for GCCOG and SCAG that are necessary to develop a Gateway Cities SCS that shall be included in the regional SCS prepared by SCAG.

2. GCCOG shall prepare the Gateway Cities SCS consistent with SCAG's adopted Framework and Guidelines, as attached hereto, to ensure that the region can successfully incorporate strategies within the Gateway Cities SCS into the Regional SCS, and not inhibit the region from complying with SB 375.

3. GCCOG agrees to comply with the Milestones Schedule, attached hereto as Exhibit "B" and incorporated herein by this reference, and work with SCAG and the other subregions to ensure the successful delivery of a regional SCS by using the Deliverables Template, attached hereto as Exhibit "C" and incorporated by this reference as the primary template for developing a subregional SCS workplan. The Deliverables Template may be subject to change based on direction from the SCAG Regional Council or Community, Economic and Human Development Policy Committee, and approval by GCCOG.

4. GCCOG are encouraged by SCAG to conduct a public participation process in developing the Gateway Cities SCS, above and beyond the process required for the regional SCS required under Section 65080(b)(2)(D) (E) of the California Government Code. Further, SCAG encourages GCCOG to develop a public participation plan, similar to SCAG's Public Participation Plan adopted in December 2009, for such purposes.

5. GCCOG agrees to participate in all publicly noticed meetings, workshops, hearings, and other outreach activities organized by SCAG within the GCCOG's jurisdiction, at which the regional SCS or Gateway Cities SCS is included on the agenda. All parties shall coordinate with one another during implementation of SCAG's public participation process in order to ensure broad public and stakeholder participation, and to avoid duplication of effort.

6. GCCOG shall retain and deliver to SCAG all documentation pertaining to the Gateway Cities SCS from publicly noticed meetings, workshops, and hearings at which the Gateway Cities SCS is included on the agenda. Such documentation shall include, but is not limited to, meeting notices, agendas, minutes, comments and responses to comments, sign-up sheets, hand-outs, and copies of power point presentations.

7. The Parties acknowledge that population, household, housing, and employment estimates are being prepared by GCCOG and/or its consultants (hereinafter referred to as "GCCOG Dataset"). SCAG agrees to use the GCCOG Dataset as reviewed and approved by

GCCOG, for the Regional SCS and the 2012 RTP; provided, that SCAG, in consultation with GCCOG, may make adjustments to the GCCOG Dataset in order to ensure consistency with SCAG's 2012 RTP growth forecast.

8. The Parties agree and acknowledge that population, household, housing, and employment data submitted to SCAG by GCCOG shall be accurately reflected in all documentation produced by SCAG that relates to the Gateway Cities SCS and the Regional SCS.

9. The Parties agree and acknowledge that RHNA responsibilities shall remain with SCAG, and that GCCOG shall not assume delegation responsibility for RHNA as part of the Gateway Cities SCS development. However, GCCOG is not precluded by this MOU from assuming delegation responsibility for RHNA as part of a subsequent, separate agreement.

10. SCAG agrees that in addition to preparation of the Gateway Cities SCS developed under this MOU, development of an Alternative Planning Strategy (APS) by GCCOG is optional. This understanding shall not preclude SCAG from preparing a regional APS pursuant to SB 375.

11. SCAG shall not develop SCS related targets that are attributable to the subregions. Further, SCAG agrees that it will not impose a penalty on the Gateway Cities subregion if the greenhouse gas targets, as established by the California Air Resources Board, are not met by the Regional SCS.

12. SCAG shall accept the Gateway Cities SCS prepared in accordance with this MOU as the Gateway Cities subregion's input into the Regional SCS prepared by SCAG.

13. GCCOG and SCAG shall amend this MOU in writing or develop a separate, mutual funding agreement addressing Gateway Cities SCS costs should state or federal funding become available that can be applied toward preparation of the Gateway Cities SCS.

14. GCCOG and SCAG agree to work closely together throughout the Regional SCS process and Gateway Cities SCS process to provide technical input, applicable planning data, and constructive feedback with respect to all documents, products and deliverables developed and associated with the Gateway Cities SCS.

15. SCAG agrees to make good faith efforts to provide GCCOG with assistance, including tools and models in its possession, as requested by GCCOG in evaluating preliminary Gateway Cities SCS growth and green house gas ("GHG") estimates.

16. SCAG agrees to make good faith efforts to provide GCCOG with assistance with GIS services relating to the development of the Gateway Cities SCS, as requested by GCCOG.

17. GCCOG and SCAG agree to work together in good faith, using reasonable efforts to resolve any unforeseen issues and disputes arising out of the performance of this MOU.

18 GCCOG and SCAG agree in good faith to provide the resources necessary to implement the provisions of the MOU.

19. GCCOG and SCAG agree to defend, indemnify and hold harmless each other, including their officers, agents, elected officials, and employees, from all liability, claims, losses and demands, including defense costs and reasonable attorneys' fees, whether resulting from court action or otherwise, arising out of the acts or omissions of the defending party, its officers, agents, or employees, in the performance of this MOU. When acts or omissions of one party are directed by another party, the party directing the acts or omission shall owe this defense and indemnity obligation to the party following the directions. The provisions of this paragraph shall survive termination of this MOU.

20. This MOU shall be governed by all applicable federal, state, and local laws. The signatories warrant that in the performance of this MOU, each shall comply with all applicable federal, state and local laws, statutes and ordinances and all lawful orders, rules and regulations promulgated there under.

21. This MOU may only be modified or amended upon written mutual consent of all signatories. All modifications, amendments, changes and revisions of this MOU, in whole or part, and from time to time, shall be binding upon the parties, so long as the same shall be in writing and executed by the signatories.

22. This MOU, including all exhibits and documents incorporated herein and made applicable by reference, constitutes the complete and exclusive statement of the term(s) and condition(s) of the agreement between the parties with respect to the subject matter herein and supersedes all prior representations, understandings and communications. The invalidity in whole or part of any term or condition of this MOU shall not affect the validity of the other term(s) or condition(s).

23. Any party may withdraw from this MOU upon 30 days' written notice to the other, until the due date set forth in Exhibit "B" for submittal to SCAG of the preliminary Gateway Cities SCS. After such due date, any party may withdraw from this MOU only upon mutual written agreement.

24. Each signatory shall be excused from performing its obligations under this MOU during the time and to the extent that it is prevented from performing by an unforeseeable cause beyond its control, including but not limited to: any incident of fire, flood; acts of God; commandeering of material, produces, plants or facilities by federal, state or local government, national fuel shortage; or a material act or omission by any other party; when satisfactory evidence of such cause is presented to the other parties, and provided further such nonperformance is unforeseeable, beyond the control and is not due to the fault or negligence of the party not performing.

25. Any notice sent by first class mail, postage paid, to the address and addressee, shall be deemed to have been given when in the ordinary course it would be delivered. The representatives of the parties who are primarily responsible for the administration of this MOU, and to whom notices, demands and communications shall be given are as detailed below. If there are any changes in the names and/or addresses listed below, the party desiring to make such changes shall give a written notice to the other respective parties within five (5) days of such change

Gateway Cities Council of Governments
Attention: Richard Powers, Executive Director

Paramount, CA 90723

Southern California Association of Governments
Attention: Hasan Ikhrata, Executive Director
818 West Seventh Street, 12th Floor
Los Angeles, CA 90017-3435

26. This MOU shall continue in full force and effect from the Effective Date up to and until the date that the Regional SCS is adopted by SCAG's Regional Council, unless otherwise terminated earlier in accordance with section 23 of this MOU. The Effective Date of this MOU shall mean the date (last date indicated below) that all Parties have fully executed this MOU.

[Signature page to follow.]

IN WITNESS WHEREOF, the Parties hereto have caused this MOU to be executed by their duly authorized representatives.

(Approved by Regional Council - April 1, 2010)

FRAMEWORK AND GUIDELINES
for
SUBREGIONAL SUSTAINABLE COMMUNITIES STRATEGY

I. INTRODUCTION

SB 375 (Steinberg), also known as California's Sustainable Communities Strategy and Climate Protection Act, is a new state law which became effective January 1, 2009. SB 375 call's for the integration of transportation, land use, and housing planning, and also establishes the reduction of greenhouse gas (GHG) emissions as one of the main goals for regional planning. SCAG, working with the individual County Transportation Commissions (CTCs) and the subregional organizations within the SCAG region, is responsible for implementing SB 375 in the Southern California region. Success in this endeavor is dependent on collaboration with a range of public and private partners throughout the region.

Briefly summarized here, SB 375 requires SCAG as the Metropolitan Planning Organization to:

- Prepare a Sustainable Communities Strategy (SCS) as part of the 2012 Regional Transportation Plan (RTP). The SCS will meet a State-determined regional GHG emission reduction target, if it is feasible to do so.
- Prepare an Alternative Planning Strategy (APS) that is not part of the RTP if the SCS is unable to meet the regional target.
- Integrate SCAG planning processes, in particular assuring that the Regional Housing Needs Assessment (RHNA) is consistent with the SCS, at the jurisdiction level.
- Specific to SCAG only, allow for subregional SCS/APS development.
- Develop a substantial public participation process involving all stakeholders.

Unique to the SCAG region, SB 375 provides that "a subregional council of governments and the county transportation commission may work together to propose the sustainable communities strategy and an alternative planning strategy . . . for that subregional area." Govt. Code §65080(b)(2)(C). In addition, SB 375 authorizes that SCAG "may adopt a framework for a subregional SCS or a subregional APS to address the intraregional land use, transportation, economic, air quality, and climate policy relationships." *Id.* Finally, SB 375 requires SCAG to "develop overall guidelines, create public participation plans, ensure coordination, resolve conflicts, make sure that the overall plan complies with applicable legal requirements, and adopt the plan for the region." *Id.*

The intent of this Framework and Guidelines for Subregional Sustainable Communities Strategy (also referred to herein as the "Framework and Guidelines" or the "Subregional Framework and Guidelines") is to offer the SCAG region's subregional agencies the highest degree of autonomy,

flexibility and responsibility in developing a program and set of implementation strategies for their subregional areas. This will allow the subregional strategies to better reflect the issues, concerns, and future vision of the region's collective jurisdictions with the input of the fullest range of stakeholders. In order to achieve these objectives, it is necessary for SCAG to develop measures that assure equity, consistency and coordination, such that SCAG can incorporate the subregional SCSs in its regional SCS which will be adopted as part of the 2012 RTP pursuant to SB 375. For that reason, this Framework and Guidelines establishes standards for the subregion's work in preparing and submitting subregional strategies, while also laying out SCAG's role in facilitating and supporting the subregional effort with data, tools, and other assistance.

While the Framework and Guidelines are intended to facilitate the specific subregional option to develop the SCS (and APS if necessary) as described in SB 375, SCAG encourages the fullest possible participation from all subregional organizations. As SCAG undertakes implementation of SB 375 for the first time, SCAG has also designed a "collaborative" process, in cooperation with the subregions, that allows for robust subregional participation for subregions that choose not to exercise their statutory option.

II. ELIGIBILITY AND PARTICIPATION

SB 375 allows for subregional councils of governments in the SCAG region to have the option to develop the SCS (and the APS if necessary) for their area. SCAG interprets this option as being available to any subregional organization recognized by SCAG, regardless of whether the organization is formally established as a "subregional council of governments."

County Transportation Commissions (CTCs) play an important and necessary role in the development of a subregional SCS. Any subregion that chooses to develop a subregional strategy will need to work closely with the respective CTC in its subregional area in order to identify and integrate transportation projects and policies. Beyond working with CTCs, SCAG encourages partnership efforts in the development of subregional strategies, including partnerships between and among subregions.

Subregional agencies must formally indicate to SCAG, in writing, by December 31, 2009 if they intend to exercise this option to develop their own SCS. Subregions that choose to develop an SCS for their area must do so in a manner consistent with this Framework and Guidelines. The subregion's intent to exercise its statutory option to prepare the strategy for their area must be decided and communicated through formal action of the subregional agency's governing board. Subsequent to receipt of any subregion's intent to develop and adopt an SCS, SCAG will convene discussions regarding a formal written agreement between SCAG and the subregion, which may be revised if necessary, as the SCS process is implemented.

III. FRAMEWORK

The Framework portion of this document covers regional objectives and policy considerations, and provides general direction to the subregions in preparing their own SCS, and APS if necessary.

A. SCAG's preliminary goals for implementing SB 375 are as follows:

- Achieve the regional GHG emission reduction target for cars and light trucks through an SCS.
- Fully integrate SCAG's planning processes for transportation, growth, intergovernmental review, land use, housing, and the environment.
- Seek areas of cooperation that go beyond the procedural statutory requirements, but that also result in regional plans and strategies that are mutually supportive of a range of goals.
- Build trust by providing an interactive, participatory and collaborative process for all stakeholders. Provide, in particular, for the robust participation of local jurisdictions, subregions and CTCs in the development of the SCAG regional SCS and implementation of the subregional provisions of the law.
- Assure that the SCS adopted by SCAG and submitted to California Air Resources Board (ARB) is a reflection of the region's collective growth strategy and vision for the future.
- Develop strategies that incorporate and are respectful of local and subregional priorities, plans, and projects.

B. Flexibility

Subregions may develop any appropriate strategy to address the region's greenhouse gas reduction goals and the intent of SB 375. While subregions will be provided with SCAG data, and with a conceptual or preliminary scenario to use as a helpful starting point, they may employ any combination of land use policy change, transportation policy, and transportation investment, within the specific parameters described in the Guidelines.

C. Outreach Effort and Principles

Subregions are required to conduct an open and participatory process that includes the fullest possible range of stakeholders. As further discussed within the Guidelines, SCAG amended its existing Public Participation Plan (PPP) to describes SCAG's responsibilities in complying with the outreach requirements of SB 375 and other applicable laws and regulations. SCAG will fulfill its outreach requirements for the regional SCS/APS which will include outreach activities regarding the subregional SCS/APS. Subregions are also encouraged to design their own outreach process that meets each subregion's own needs and reinforces the spirit of openness and full participation. To the extent that subregions do establish their own outreach process, this process should be coordinated with SCAG's outreach process.

D. Communication and Coordination

Subregions developing their own SCS are strongly encouraged to maintain regular communication with SCAG staff, the respective CTC, their jurisdictions and other stakeholders, and other subregions if necessary, to review issues as they arise and to assure close coordination. Mechanisms for ongoing communication should be established in the early phases of strategy development.

E. Planning Concepts

SCAG, its subregions, and member cities have established a successful track record on a range of land use and transportation planning approaches through the on-going SCAG Compass Blueprint Program, including approximately 60 local demonstration projects completed to date. Subregions are

encouraged to capture, further develop and build off the concepts and approaches of the Compass Blueprint program. In brief, these include developing transit-oriented, mixed use, and walkable communities, and providing for a mix of housing and jobs.

IV. GUIDELINES

These Guidelines describe specific parameters for the subregional SCS/APS effort under SB 375, including process, deliverables, data, documentation, and timelines. As described above, the Guidelines are created to ensure that the region can successfully incorporate strategies developed by the subregions into the regional SCS, and that the region can comply with its own requirements under SB 375. Failure to proceed in a manner consistent with the Guidelines will result in SCAG not accepting a subregion's submitted strategy.

A. Subregional Process

(1) Subregional Sustainable Communities Strategy

Subregions that choose to exercise their optional role under SB 375 will develop and adopt a subregional Sustainable Communities Strategy. That strategy must contain all of the required elements, and follow all procedures, as described in SB 375. Subregions may choose to further develop an Alternative Planning Strategy (APS), according to the procedures and requirements described in SB 375. If subregions prepare an APS, they must prepare a Sustainable Communities Strategy first, in accordance with SB 375. A subregional APS is not "in lieu of" a subregional SCS, but in addition to the subregional SCS. In part, an APS must identify the principal impediments to achieving the targets within the SCS. The APS must show how the GHG emission targets would be achieved through alternative development patterns, infrastructure, and additional transportation measures or policies. SCAG encourages subregions to focus on feasible strategies that can be included in the SCS.

The subregional SCS must include all components of a regional SCS as described in SB 375, and outlined below:

(i.) identify the general location of uses, residential densities, and building intensities within the subregion;
(ii.) identify areas within the subregion sufficient to house all the population of the subregion, including all economic segments of the population, over the course of the planning period of the RTP taking into account net migration into the region, population growth, household formation and employment growth;
(iii.) identify areas within the subregion sufficient to house an eight-year projection of the regional housing need for the subregion pursuant to Section 65584;
(iv.) identify a transportation network to service the transportation needs of the subregion;
(v.) gather and consider the best practically available scientific information regarding resource areas and farmland in the subregion as defined in subdivisions (a) and (b) of Section 65080.01;
(vi.) consider the state housing goals specified in Sections 65580 and 65581;
(vii.) set forth a forecasted development pattern for the subregion, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the ARB; and

(viii.) allow the RTP to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506). See, Government Code §65080(b)(2)(B).

In preparing the subregional SCS, the subregion will consider feasible strategies, including local land use policies, transportation infrastructure investment (e.g., transportation projects), and other transportation policies such as Transportation Demand Management (TDM) strategies (which includes pricing), and Transportation System Management (TSM) strategies. Technological measures may be included if they exceed measures captured in other state and federal requirements (e.g., AB32).

As discussed further below (under "Documentation"), subregions need not constrain land use strategies considered for the SCS to current General Plans. In other words, the adopted strategy need not be fully consistent with local General Plans currently in place. However, should the adopted subregional strategy deviate from General Plans, subregions will need to demonstrate the feasibility of the strategy by documenting any affected jurisdictions' willingness to adopt the necessary General Plan changes.

The regional SCS shall be part of the 2012 RTP. Therefore, for transportation investments included in a subregional SCS to be valid, they must also be included in the 2012 RTP. Further, such projects need to be scheduled in the RTP for construction completion by the target years (2020 and 2035) in order to demonstrate any benefits as part of the SCS. As such, subregions will need to collaborate with the respective CTC in their area to coordinate the subregional SCS with future transportation investments. It should also be noted that the California Transportation Commission is updating their RTP Guidelines. This topic is likely to be part of further discussion through the SCS process as well.

SCAG will accept and incorporate the subregional SCS, unless (a) it does not comply with SB 375, (b) it is does not comply with federal law, or (c) it is does not comply with SCAG's Subregional Framework and Guidelines. In the event that a compiled regional SCS, including subregional submissions, does not achieve the regional target, SCAG will initiate a process to develop and consider additional GHG emission reduction measures region wide. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process. Furthermore, SCAG will compile and disseminate performance information on the preliminary regional SCS and its components in order to facilitate regional dialogue. The development of a subregional SCS does not exempt any subregion from further GHG emission reduction measures being included in the regional SCS. Further, all regional measures needed to meet the regional target will be subject to adoption by the Regional Council, and any additional subregional measures beyond the SCS submittal from subregions accepting delegation needed to meet the regional target must also be adopted by the subregional governing body.

(2) Subregional Alternative Planning Strategy (APS)

Subregions are encouraged to focus their efforts on feasible measures that can be included in an SCS. In the event that a subregion chooses to prepare an APS, the content of a subregional APS should be consistent with what is required by SB 375 (see, Government Code §65080(b)(2)(H)), as follows:

(i.) Shall identify the principal impediments to achieving the subregional SCS.

(ii.) May include an alternative development pattern for the subregion pursuant to subparagraphs (B) to (F), inclusive.

(iii.) Shall describe how the alternative planning strategy would contribute to the regional greenhouse gas emission reduction target, and why the development pattern, measures, and policies in the alternative planning strategy are the most practicable choices for the subregion.

(iv.) An alternative development pattern set forth in the alternative planning strategy shall comply with Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations, except to the extent that compliance will prevent achievement of the regional greenhouse gas emission reduction targets approved by the ARB.

(v.) For purposes of the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code), an alternative planning strategy shall not constitute a land use plan, policy, or regulation, and the inconsistency of a project with an alternative planning strategy shall not be a consideration in determining whether a project may have an environmental effect.

Any precise timing or submission requirements for a subregional APS will be determined based on further discussions with subregional partners. As previously noted, a subregional APS is in addition to a subregional SCS.

(3) Outreach and Process

SCAG will fulfill all of its outreach requirements under SB 375 for the regional SCS/APS, which will include outreach regarding any subregional SCS/APS. SCAG staff has revised its Public Participation Plan to incorporate the outreach requirements of SB 375, and integrate the SB 375 process with the 2012 RTP development as part of SCAG's Public Participation Plan Amendment No. 2, adopted by SCAG's Regional Council on December 3, 2009. Subsequent to the adoption of the PPP Amendment No. 2, SCAG will continue to discuss with subregions and stakeholders the Subregional Framework & Guidelines, which further describe the Public Participation elements of SB 375.

Subregions that elect to prepare their own SCS or APS are encouraged to present their subregional SCS or APS, in coordination with SCAG, at all meetings, workshops and hearings held by SCAG in their respective counties. Additionally, the subregions would be asked to either provide SCAG with their mailing lists so that public notices and outreach materials may also be posted and sent out by SCAG, or SCAG will provide notices and outreach materials to the subregions for their distribution to stakeholders. The SCAG PPP Amendment No. 2 provides that additional outreach may be performed by subregions. Subregions are strongly encouraged to design and adopt their own outreach processes that mimic the specific requirements imposed on the region under SB 375. Subregional outreach processes should reinforce the regional goal of full and open participation, and engagement of the broadest possible range of stakeholders.

(4) Subregional SCS Approval

It is recommended that the governing board of the subregional agency approve the subregional SCS prior to submission to SCAG. While the exact format is still subject to further discussion, SCAG recommends that there be a resolution from the governing board of the subregion with a finding that the land use strategies included in the subregional SCS are feasible and based upon consultation with the local jurisdictions in the respective subregion. Subregion should consult with their legal counsel as to compliance with the California Environmental Quality Act (CEQA). In SCAG's view, the

subregional SCS is not a "project" for the purposes of CEQA; rather, the 2012 RTP which will include the regional SCS is the actual "project" which will be reviewed for environmental impacts pursuant to CEQA. As such, the regional SCS, which will include the subregional SCSs, will undergo a thorough CEQA review. Nevertheless, subregions approving subregional SCSs should consider issuing a notice of exemption under CEQA to notify the public of their "no project" determination and/or to invoke the "common sense" exemption pursuant to CEQA Guidelines § 15061(b)(3).

Finally, in accordance with SB 375, subregions are strongly encouraged to work in partnership with the CTC in their area. SCAG can facilitate these arrangements if needed.

(5) Data Standards

SCAG is currently assessing the precise data standards anticipated for the regional and subregional SCS. In particular, SCAG is reviewing the potential use of parcel data and development types currently used for regional planning. At present, the following describes the anticipated data requirements for a subregional SCS.

1. Types of Variables
   Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables include land uses, residential densities, building intensities, etc, as described in SB 375.

2. Geographical Levels
   SCAG is considering the collection and adoption of the data at a small-area level as optional, for local agencies in order to make accessible the CEQA streamlining provisions under SB 375. The housing unit, employment, and the land use variables can be collected at a small area level for those areas which under SB 375 qualify as containing a "transit priority project" (i.e. within half-mile of a major transit stop or high quality transit corridor) for purposes of allowing jurisdictions to take advantage of the CEQA streamlining incentives in SB 375.

   For all other areas in the region, SCAG staff will collect the population, household, employment, and land use variables at the Census tract or Traffic Analysis Zone (TAZ) level.

3. Base Year and Forecast Years
   The socio-economic and land use variables will be required for the base year of 2008, and the target years of 2020 and 2035.

(6) Documentation

Subregions are expected to maintain full and complete records related to the development of the subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board.

(7) **Timing**

An overview schedule of the major milestones of the subregional process and its relationship to the regional SCS/RTP is included below. Subregions must submit the subregional SCS to SCAG by the date prescribed. Further, SCAG will need a preliminary SCS from subregions for the purpose of preparing a project description for the 2012 RTP Program Environmental Impact Report. The precise content of this preliminary submission will be determined based on further discussions. The anticipated timing of this preliminary product is approximately February 2011.

(8) **Relationship to Regional Housing Needs Assessment (RHNA) and Housing Element**

Although SB 375 calls for an integrated process, subregions are not automatically required to take on RHNA delegation as described in State law if they prepare an SCS/APS. However, SCAG encourages subregions to undertake both processes due to their inherent connections.

SB 375 requires that the RHNA allocated housing units be consistent with the development pattern included in the SCS. *See*, Government Code §65584.04(i). Population and housing demand must also be proportional to employment growth. At the same time, in addition to the requirement that the RHNA be consistent with the development pattern in the SCS, the SCS must also identify areas that are sufficient to house the regional population by income group through the RTP planning period, and must identify areas to accommodate the region's housing need for the next local Housing Element eight year planning period update. The requirements of the statute are being further interpreted through the RTP guidelines process. Staff intends to monitor and participate in the guideline process, inform stakeholders regarding various material on these issues, and amend, if necessary, these Framework and Guidelines, pending its adoption.

SCAG will be adopting the RHNA and applying it to local jurisdictions at the jurisdiction boundary level. SCAG staff believes that consistency between the RHNA and the SCS may still be accomplished by aggregating the housing units contained in the smaller geographic levels noted in the SCS and including such as part of the total jurisdictional number for RHNA purpose. SCAG staff has concluded that there is no consistency requirement for RHNA purposes at sub-jurisdictional level, even though the SCS is adopted at the smaller geographic level, for the opportunity areas.

The option to develop a subregional SCS is separate from the option for subregions to adopt a RHNA distribution, and subject to separate statutory requirements. Nevertheless, subregions that develop and adopt a subregional SCS should be aware that the SCS will form the basis for the allocation of housing need as part of the RHNA process. Further, SCS development requires integration of elements of the RHNA process, including assuring that areas are identified to accommodate the 8 year need for housing, and that housing not be constrained by certain types of local growth controls as described in State law.

SCAG will provide further guidance for subregions and a separate process description for the RHNA

B. COUNTY TRANSPORTATION COMMISSIONS' ROLES AND RESPONSIBILITIES

Subregions that develop a subregional SCS will need to work closely with the CTCs in their area in order to coordinate and integrate transportation projects and policies as part of the subregional SCS. As discussed above (under "Subregional Sustainable Communities Strategy"), any transportation

projects identified in the subregional SCS must also be included in the 2012 RTP in order to be considered as a feasible strategy. SCAG can help to facilitate communication between subregions and CTCs.

C. SCAG ROLES AND RESPONSIBILITIES

SCAG's roles in supporting the subregional SCS development process are in the following areas.

(1) **Preparing and adopting the Framework and Guidelines**

SCAG will adopt these Framework and Guidelines in order to assure regional consistency and the region's compliance with law.

(2) **Public Participation Plan**

SCAG will assist the subregions by developing, adopting and implementing a Public Participation Plan and outreach process with stakeholders. This process includes consultation with congestion management agencies, transportation agencies, and transportation commissions; and SCAG will hold public workshops and hearings. SCAG will also conduct informational meetings in each county within the region for local elected officials (members of the board of supervisors and city councils), to present the draft SCS, and APS if necessary, and solicit and consider input and recommendations.

(3) **Methodology**

As required by SB 375, SCAG will adopt a methodology for measuring greenhouse gas emission reductions associated with the strategy.

(4) **Incorporation/Modification**

SCAG will accept and incorporate the subregional SCS unless it does not comply with SB 375, federal law, or the Subregional Framework and Guidelines. As SCAG intends the entire SCS development process to be iterative, SCAG will not amend a locally-submitted SCS. SCAG may provide additional guidance to subregions so that subregions may make amendments to its subregional SCS as part of the iterative process, or request a subregion to prepare an APS if necessary. Further, SCAG can propose additional regional strategies if feasible and necessary to achieve the regional emission reduction target with the regional SCS. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process.

(5) **Modeling**

SCAG currently uses a Trip-Based Regional Transportation Demand Model and ARB's EMFAC model for emissions purposes. In addition to regional modeling, SCAG is developing tools to evaluate the effects of strategies that are not fully accounted for in the regional model. SCAG is also developing two additional tools – a Land Use Model and an Activity Based Model – to assist in strategy development and measurement of outcomes under SB 375.

In addition to modeling tools which are used to measure results of completed scenarios, SCAG is developing a scenario planning tool for use in workshop settings as scenarios are being created with jurisdictions and stakeholders. The tool will be made available to subregions and local governments for their use in subregional strategy development.

(6) Adoption/Submission to State

After the incorporation of subregional strategies, SCAG will finalize and adopt the regional SCS as part of the 2012 RTP. SCAG will submit the SCS to ARB for review as required in SB 375.

(7) Conflict Resolution

While SB 375 requires SCAG to develop a process for resolving conflicts, it is unclear at this time the nature or purpose of a conflict resolution process as SCAG does not intend to amend a locally-submitted SCS. As noted above, SCAG will accept the subregional SCS unless it is inconsistent with SB 375, federal law, or the Subregional Framework and Guidelines. SCAG will also request that a subregion prepare an APS if necessary. It is SCAG's intent that the process be iterative and that there be coordination among SCAG, subregions and their respective jurisdictions and CTCs. SCAG is open to further discussion on issues which may generate a need to establish a conflict resolution process as part of the written agreement between SCAG and the subregional organization.

(8) Funding

Funding for subregional activities is not available at this time, and any specific parameters for future funding are speculative. Should funding become available, SCAG anticipates providing a share of available resources to subregions. While there are no requirements associated with potential future funding at this time, it is advisable for subregions to track and record their expenses and activities associated with these efforts.

(9) Preliminary Scenario Planning

SCAG will work with each subregion to collect information and prompt dialogue with each local jurisdiction prior to the start of formal SCS development. This phase of the process is identified as "preliminary scenario planning" in the schedule below. The purpose of this process is to create a base of information to inform SCAG's recommendation of a regional target to ARB prior to June 2010. All subregions are encouraged to assist SCAG in facilitating this process.

(10) Data

SCAG is currently developing, and will provide each subregion with datasets for the following:

(1) 2008 Base year;
(2) General Plan/Growth projection & distribution;
(3) Trend Baseline; and
(4) Policy Forecast/SCS.

While the Trend Baseline is a technical projection that provides a best estimate of future growth based on past trends and assumes no general plan land use policy changes, the Policy Forecast/SCS is derived using local input through a bottom-up process, reflecting regional policies including transportation investments. Local input is collected from counties, subregions, and local jurisdictions.

Data/GIS maps will be provided to subregions and local jurisdiction for their review. This data and maps include the 2008 base year socioeconomic estimates and 2020 and 2035 socioeconomic forecast. Other GIS maps including the existing land use, the general plan land use, the resource areas, and other important areas identified in SB 375. It should be noted that none of the data/maps provided were endorsed or adopted by SCAG's Community, Economic and Human Development Committee (CEHD). All data/maps provided are for the purpose of soliciting input and comments from subregions and local jurisdictions. This is to initiate dialogue among stakeholders to address the requirements of SB 375 and its implementation.

The list of data/GIS maps include:

1. Existing land use
2. Zoning
3. General plan land use
4. Resource areas include:
   (a.)all publicly owned parks and open space;
   (b.)open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;
   (c.)Habitat for species identified as candidate, fully protected, sensitive, or species of special status by local, state, or federal agencies or protected by the federal Endangered Species Act (1973), the California Endangered Species Act, or Native Plant Protection Act;
   (d.)lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts, or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code, and lands under Williamson Act contracts;
   (e.)areas designated for open-space or agricultural uses in adopted open space elements or agricultural elements of the local general plan or by local ordinance;
   (f.)areas containing biological resources as described in Appendix G of the CEQA Guidelines that may be significantly affected by the sustainable communities strategy or the alternative planning strategy; and
   (g.)an area subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program or where the area is subject to more protective provisions of state law or local ordinance.
5. Farmland
6. Sphere of Influence
7. Transit priority areas
8. City/Census tract boundary with ID
9. City/TAZ boundary with ID

(11) Tools

SCAG is developing a Local Sustainability Planning Model (LSPM) for subregions/local jurisdictions to analyze land use impact. The use of this tool is not mandatory and is at the discretion of the Subregion. The LSPM is a web-based tool that can be used to analyze, visualize and calculate the impact of land use changes on auto ownership, mode use, vehicle miles of travel (VMT), and greenhouse gas emissions in real time. Users will be able to estimate transportation and emissions impacts by modifying land use designations within their community.

Other tools currently maintained by SCAG may be useful to the subregional SCS development effort, including the web-based CaLCOTS application. SCAG will consider providing guidance and training on additional tools based on further discussions with subregional partners.

(12) Resources and technical assistance

SCAG will assist the subregions by making available technical tools for scenario development as described above. Further, SCAG will assign a staff liaison to each subregion, regardless of whether the subregion exercises its statutory option to prepare an SCS. SCAG staff can participate in subregional workshops, meetings, and other processes at the request of the subregion, and pending funding and availability. SCAG's legal staff will be available to assist with questions related to SB 375 or SCAG's implementation of SB 375. Further, SCAG will prepare materials for its own process in developing the regional SCS, and will make these materials available to subregions.

D. MILESTONES/SCHEDULE

- CARB issues Final Regional Targets – September 2010
- SCS development (preliminary scenario, draft, etc) – through early 2011
- Release Draft RTP/regional SCS for public review – November 2011
- Regional Council adopts RTP/SCS – April 2012

If other milestones are needed, they will be incorporated into the written agreement between SCAG and the Subregion.

Exhibit B: Milestones Schedule

The key milestones and related schedule required as part of the development of the Gateway Cities COG Subregional SCS are as follows:

1. Status report on Preliminary Subregional SCS – Dec 2010
2. Adopted GCCOG Dataset/Delivery to SCAG – Jan 2011
3. Preliminary SCS / for purposes of preparing PEIR project description (intended to be narrative only project description that describes intended strategies or strategy options that are likely to be incorporated into the final Subregional SCS.) – Feb 2011
4. Status report on Draft Subregional SCS – Feb 2011
5. Draft Subregional SCS (containing all components described above) to be incorporated into draft Regional SCS – Apr 2011
6. Status report on final Subregional SCS – April 2011
7. Final Subregional SCS for incorporation into Regional SCS – June 2011
8. Iterative process, if necessary to meet target – June to November 2011
9. Gateway Cities COG to participate in regional outreach conducted in Orange County – June 2011 to February 2012
10. Regional SCS adoption – April 2012

Exhibit C: Deliverables Template

The Gateway Cities COG Subregional SCS will consist of the following components:

1. Database (GCCOG Dataset) that allocates population, housing, household, and employment to areas of the county. Geographic area should be the smallest level practicable for the COG to produce, preferably at the parcel level. The database must reflect the base year 2008 and each variable in the two GHG target years (2020 and 2035), in accordance with the Data Standards set forth below.
2. A map or series of maps that illustrates the growth distribution described above, and that further delineates uses, intensities, and residential densities, in accordance with the Data Standards set forth below.
3. A listing of transportation projects that are incorporated in the subregional SCS.
4. A listing and description of transportation policies (e.g. TDM, TSM and others) to be employed.
5. Documentation that establishes the process, including the public participation and outreach process used to develop the SCS, and demonstrates the affected jurisdictions willingness to consider general plan changes.
6. A narrative description of the strategies employed to reduce greenhouse gas emissions. A further description of any other strategies that were considered and not ultimately included.

DATA STANDARDS

The following data standards will be used in the development of a subregional SCS:

1. Types of Variables

Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables may include land uses designations, building densities, building intensities, and applicable policies.

2. Geographical Levels

Socio-economic and land-use variables should be provided to SCAG at the smallest geographical level practicable for GCCOG to produce, preferably at the parcel level. At a minimum, such variables will be provided at the Census tract or Traffic Analysis Zone (TAZ) level

3. Base Year and Forecast Years

The socio-economic data and land use variables will be required for the base year of 2008, and as feasible, for the target years of 2020 and 2035

DOCUMENTATION

Subregions are expected to maintain full and complete records related to the development of the Subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board. Subregions shall include information regarding the status of the documentation as part of the required status reports to SCAG, and copies of the actual documentation shall be submitted to SCAG as part the final Subregional SCS.

Executive Summary

The Gateway Cities subregion is one of 14 within the Southern California Association of Governments (SCAG). The California law Senate Bill (SB) 375 requires each of the 18 metropolitan planning organizations (MPO) in the State to prepare a Sustainable Communities Strategy (SCS).[1] The requirement applies as each MPO prepares its next update of its Regional Transportation Plan (RTP). Unique to the SCAG region, however, a subregional council of governments, such as the Gateway Cities Council of Governments (COG), and the county transportation commission (Los Angeles County Metropolitan Transportation Authority (LACMTA)) may work together to formulate the SCS for that subregional area. Two of the 14 subregions, Gateway Cities and Orange County, exercised this option. The remaining subregions elected to participate with SCAG in development of the regional SCS.

The Gateway Cities SCS was built first by each city selecting GHG strategies that work for their individual community. These local strategies are a blend of efforts that the Gateway COG and its communities have been pursuing over the last decade and future efforts that each jurisdiction plans to implement over about the next 25 years. The Gateway City communities then integrated these local strategy portfolios with subregional and regional transportation projects located within the subregion that are expected to be part of the 2012 SCAG RTP. The results are a Gateway SCS that will exceed the regional targets set by the California Air Resources Board (CARB).

This report provides the Gateway Cities subregional SCS, documenting the program the subregion's jurisdictions plan to implement to reduce greenhouse gases (GHG) by 2020 and 2035 using transportation and land use strategies throughout the Gateway Cities.

GHG Reduction Results from Gateway Cities

Gateway Cities COG worked with SCAG to obtain the information needed to generate the Gateway Cities subregional baseline emissions per capita in 2005, which is the base year specified by SB 375. This analysis applied the Adopted

[1] Set forth in amendments to the Government Code Sections 65080, 65400, 65583, 65584.01, 65584.02, 65584.04, 65587, and 65588, and added to Sections 14522.1, 14522.2, and 65080.01 and to amend the Public Resources Code Section 21061.3, add Section 21159.28, and add Chapter 4.2 (commencing with Section 21155) to Division 13 relating to environmental quality.

2008 RTP Growth Forecast and the Local Input/General Plan 2012 RTP Growth Forecast as the per capita denominator for the SB 375 target years of 2020 and 2035. The results of this analysis produced a daily GHG per capita estimate for 2005 of 16.64 lbs of carbon dioxide equivalent (CO_2e) for the Gateway Cities subregion compared to 21.2 lbs CO_2e for the SCAG region.[2] This difference is consistent with the differences between the Gateway Cities subregion and the SCAG region as a whole: higher land use density, lower car ownership per household, higher density and service levels for transit, and lower vehicle miles of travel (VMT) per household. The 16.64 lbs CO_2e per capita in 2005 for the Gateway Cities subregion was used as the benchmark for the Gateway Cities SCS attainment of the CARB targets for the SCAG region. The estimated GHG reductions relative to this benchmark are achieved with the following five bundles of strategies.

- **Transportation Strategies.** Cities and the County submitted approximately 340 strategies.[3] This portfolio generates a significant amount of reduction, the highest GHG reduction after the regional transportation projects. The interactive effects between these strategies and land use (smart growth policies) are accounted for in the land use analysis (described below).
- **Transportation Demand Management (TDM) Strategies.** The focus was on three main categories of TDM: compressed workweek schedules for city employees (12 cities), ridesharing programs for city employees (6 cities), and TDM or Trip Reduction Ordinances for new development (8 cities). This bundle also incorporates the interactive effects between TDM and land use and transit.[4]
- **Land Use.** Of the 26 participating cities, 11 cities chose to evaluate their 2008, 2020, and 2035 default scenarios in the Sustainability Tool (ST). These cities worked with SCAG to revise the 2008 scenario so it more accurately reflected the actual land use at that time. These cities also evaluated their 2020 and 2035 scenarios, which the ST contained as representations of each city's general plan.[5] After these evaluations, most cities made adjustments so the land use patterns in the ST more closely matched their general plan. None of these cities adopted land use strategies for their 2020 or 2035 scenarios that will differ from their general plans. The remaining cities used the ST-equivalents of their adopted general plans (i.e., default scenarios in the ST), which is SCAG's best judgment of city general plans converted to grid cells. The ST has functionality that estimates the interactions between land use and proximity to bus and rail (i.e., fixed guideway) transit node.[6] These are included in the estimated GHG reductions from each city's 2020 and 2035 land use policies.
- **Regional Projects, including Measure R.** Regional transportation projects located within the Gateway Cities will reduce GHG within the subregion. Gateway Cities COG staff determined 17 projects that are included in the RTP, such as multimodal and intermodal facilities; and ramp and freeway improvements, such as carpool (high-occupancy vehicle (HOV)), high-occupancy toll (HOT), and toll lanes. The analysis of their estimated GHG reductions was derived from travel demand model output from LACMTA and SCAG.
- **Interactive Effects Between Land Use and Regional Transit Projects.** The long timeframe for implementation of the Measure R transit projects and the long lead time for redevelopment activities adjacent to new transit justify only attributing estimated GHG reductions resulting from the interaction between land use and Measure R transit projects in the Gateway Cities in 2035 and none in 2020.

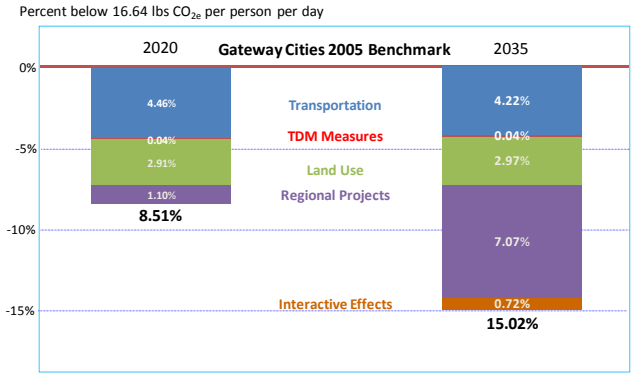
Combining the GHG reduction strategies from the five categories described above, the subregion, as a whole, is expected to reduce GHG per capita from the benchmark in 2005 by approximately 8.4 percent in 2020 and more than 15 percent in 2035. Table ES.1 and Figure ES.1 present these results.

[2] The unincorporated areas of Gateway Cities subregion are included in the daily GHG per capita baseline.

[3] Approximately 50 additional strategies were either incomplete, did not have sufficient information for analysis, or were not relevant.

[4] The inventory of TDM strategies does not include activities being carried out by private businesses or institutions. Insufficient time and resources prevented a survey.

[5] The ST converts general plan information from each city into 5.5-acre grid cells, where each grid cell is assigned one of 26 possible types of land use. This assignment process provides a reasonable approximation of a city's aggregate land use, but may on occasion assign general plan land use designations to incorrect grid cell types.



[6] The influence of land use on travel behavior (i.e., mode choice and VMT) is often separated into four characteristics of the built environment: density, diversity (mix of land use types), design, destination (the 4Ds). The ST has a typology of 24 types of land use that incorporate the significant differences in density, diversity, and design, which is three of the four Ds.

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy

Table ES.1 Summary GHG Reduction Results for Gateway Cities from 2005 Benchmark
In lbs CO2e per Person per Day

	Absolute Daily GHG Reduction per Capita		Percentage Daily GHG Reduction per Capita	
	2020	2035	2020	2035
Transportation	0.74	0.70	4.46%	4.22%
TDM	0.007	0.007	0.04%	0.04%
Land Use	0.48	0.49	2.91%	2.97%

Figure ES.1 Percentage Daily GHG Reduction Per Capita in Gateway Cities
In lbs CO_2e per Person per day from 2005 Benchmark

1.0 Introduction

1.1 Gateway Cities COG

The Gateway Cities make up the area of Los Angeles County generally bordered by the City of Los Angeles on the west, Orange County on the east, the Pomona (SR 60) Freeway on the north, and extending south to the Cities of Long Beach and Avalon. The entire Gateway Cities region is home to about two million residents. The cities' collaboration dates back to their joint establishment of a regional authority, the Gateway Cities Council of Governments (or COG), in the mid-1990s.

The Gateway Cities COG is a California joint powers authority made up of 27 cities and the County of Los Angeles (three County supervisory districts which cover the unincorporated communities within the subregion), formed for the purpose of providing a vehicle for members to voluntarily engage in regional and cooperative planning and coordination of government services for the collective benefit of the residents of Southeast Los Angeles County. The goal and intent of the COG are to foster voluntary cooperation among cities and the County in the areas of transportation, air quality, housing, and economic development. The City of Montebello is a member of the Gateway Cities COG, but associates with the San Gabriel Valley COG, of which it is also a member, on housing policy and regulation. Montebello did not participate in this Sustainable Communities Strategy (SCS), leaving 26 participating cities.[7]

In addition to the member jurisdictions, the Gateway Cities COG includes the Port of Long Beach as an ex-officio member. In addition, other agencies that have an informal affiliation with Gateway Cities COG include the Los Angeles County Metropolitan Transportation Authority (LACMTA) and Los Angeles County.

1.2 Purpose of the SCS

In September 2008, the State passed Senate Bill 375 (SB 375), which became effective on January 1, 2009. SB 375 assigns each of California's 18 Metropolitan Planning Organizations (MPO) with targets to reduce greenhouse gas (GHG)

[7] The Los Angeles County Public Works Department provided intercity arterial improvement projects described in detail in Appendix G.

emissions from passenger and light-truck vehicle miles traveled (VMT).[8] These targets have been set for each MPO by the California Air Resources Board (CARB); and in accordance with SB 375, CARB formed the Regional Targets Advisory Committee (RTAC) to advise them on targets. CARB assigned the Southern California Association of Governments (SCAG) a target of 8 percent reduction in per capita GHG (i.e., carbon dioxide equivalent or CO_2e) from 2005 levels by the year 2020 and 13 percent from 2005 levels by 2035.

SB 375 requires each MPO to prepare an SCS as part of its Regional Transportation Plan (RTP) update that specifies how the region will attain the GHG reduction targets it was assigned. The SCS identifies the land use policies, transportation improvements, transportation demand management (TDM) strategies, and other measures that will in combination reduce GHG to achieve the CARB targets. The SCS may only account for estimated GHG reductions from changes in the emissions from the VMT of autos and light trucks. This narrow specification is difficult to fully understand, so we present the following example:

- Suppose a city launched a new transit service that uses hybrid buses, which emit 50 percent less GHG than buses powered by conventional diesel motors. Suppose this program attracted 1,000 new riders, all of whom were each previously driving single-occupant vehicles (SOV), 10 miles daily. The SCS could account for the difference in GHG between the GHG from the new hybrid buses and the 10,000 VMT eliminated from the mode shift of 1,000 SOVs to the new transit service. It could not include the GHG reduced from using hybrid buses instead of conventional diesel-powered buses. This latter reduction was from a technological source (hybrid power) and not from a transportation improvement (new transit service).
- Now, suppose the city also enacted a new smart growth plan that shifted future commercial development from three low-density business parks to high rises in its central business district (CBD). This compact, high-density development pattern shifted another 1,000 SOVs to use the new transit service that would have otherwise commuted five miles on average to the three business parks. The SCS could add this reduction in GHG from 5,000 VMT towards its target. Nevertheless, the SCS could not take credit for any reduction in GHG from the new high-rise office buildings in the CBD because they were built to green building standards (e.g., efficient heating and cooling, recycling, etc.). This latter reduction comes from a stationary source, which is credited under AB 32, but not SB 375.

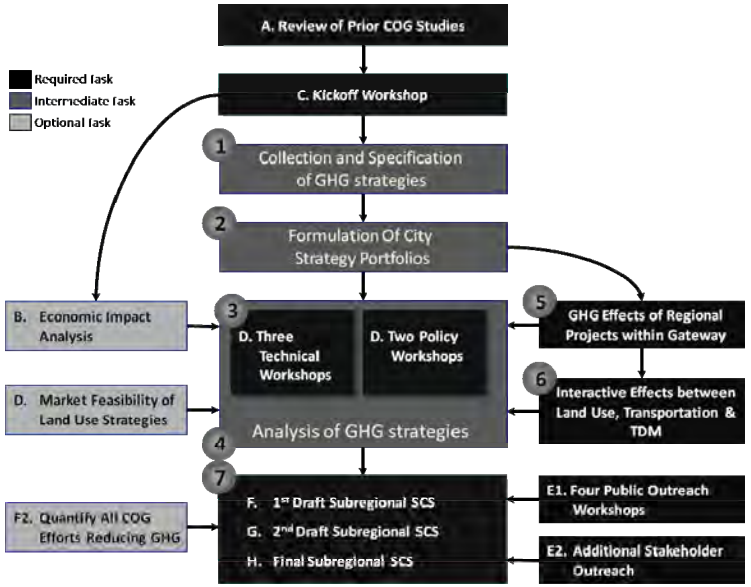
[8] SB 375 is one part of a broader GHG reduction effort to meet the Assembly Bill 32 – Global Warming Solutions Act of 2006 (AB 32) target of reducing GHG emissions statewide to 1990 levels by 2020.

- Furthermore, suppose the city adopted a TDM ordinance that required all employers to provide discounted transit passes, bike lockers, and flex time schedules to all employees in the CBD. Suppose these TDM programs led to an additional reduction of 10,000 VMT compared to the VMT without such an ordinance. The SCS could add the reduction in GHG from another 10,000 VMT towards its target.

The overall goal of the SCS is to identify and implement land use policies, transportation improvements (including transit), and other supporting strategies that work in combination (i.e., interactions or synergies), which shift drivers from SOVs to transit, carpools, bicycle, or walking. And for those that still drive, the SCS provides strategies that reduce their VMT.

1.3 THE SCS DEVELOPMENT PROCESS

SCAG is preparing the regional SCS in conjunction with its RTP, and CARB must approve the regional SCS. Unique to the SCAG region, however, a subregional COG, such as the Gateway Cities COG, and the county transportation commission (LACMTA) may work together to formulate the SCS for that subregional area. Two of the 14 subregional COGs, Gateway Cities and Orange County, exercised this option.[9] The remaining COGs elected to participate with SCAG in development of the regional SCS.



The Gateway Cities COG and its 26 participating member jurisdictions (the City of Montebello participates with the San Gabriel Valley COG) assessed themselves to retain a consulting team led by Cambridge Systematics, Inc. with Willdan Energy Solutions/Engineering, Eric Schreffler Transportation Consultant, and MIG, Inc. to prepare this SCS. The COG decided to develop a subregional SCS that would fulfill virtually all of the requirements set forth by CARB for the regional SCS. This included quantifying the expected GHG reductions in the two target years of 2020 and 2035 from strategies selected and agreed to by the 26 participating cities, Los Angeles County, and LACMTA. Appendix A provides the Memorandum of Understanding (MOU) between SCAG and Gateway Cities COG regarding the subregional SCS, which includes the SCAG Framework and Guidelines for Subregional Sustainable Communities Strategy as Exhibit A.

The consultant team and Gateway Cities COG staff started with a review of the white paper (*Addressing the Requirements of SB 375 at the Sub-Regional Level*, December 2009), which was prepared by Willdan in a prior phase of work; and a survey conducted by Willdan in 2009 of COG sustainability efforts to all member cities (see Figure 1.1). A summary of the white paper can be found in Appendix B.

[9] Gateway Cities COG formally notified SCAG after the COG Board voted on January 6, 2010.

This information was used to prepare a road map and conduct a gap analysis of what information and analysis would be needed to complete a subregional SCS. This road map and gap analysis were used to frame the contents of a kickoff workshop for Gateway Cities COG Board members, city managers, and planning directors, as well as SCAG staff and LACMTA staff. During this kickoff meeting, which took place in October 2010, Gateway Cities COG staff and consultant team worked with city staff and some stakeholders to refine the overall SCS process and a preliminary approach to estimating GHG reduction. This involved augmenting the task plan from that specified in the request for proposals (RFP). The primary augmentations were the addition of intermediate tasks shown in Figure 1.1 below.

Figure 1.1 The SCS Development Process

After the kickoff workshop, the SCS Steering Committee and COG staff acknowledged that no additional funding would be available for the optional tasks. The consultant team, therefore, proceeded with the following required and intermediate tasks:

1. Each of the 26 participating cities included in the Gateway Cities SCS plus the Los Angeles County Public Works Department identified and assisted with the specification of GHG reduction strategies that they would implement. This task constitutes the approach of local formulation of the SCS.
2. Each city conducted between two to five iterations of strategy selections, after which each city formulated a draft strategy portfolio composed of transportation projects (including transit), TDM measures, and land use scenarios.
3. These portfolios were reviewed and refined first by the consultant team, and then by city staff and elected officials during the four technical and two policy workshops. Significant attention was devoted to bundling strategies so that their interactions produce larger effects than if each strategy operated independently.
4. The consultant team refined existing analytical methods on evaluating the performance of GHG strategies to adapt to Gateway Cities' conditions; and applied these methods using sketch planning models, the SCAG Sustainability Tool, and the LACMTA iMpact Tool.[10]
5. In addition to the formulation of each city's portfolio, regional projects were added, and the interaction between these regional projects and land use and transportation improvements was estimated.
6. Once analysis of all city portfolios and regional projects was complete, a further round of analysis evaluated interactions and added these effects to the overall GHG reduction estimates.
7. During the preparation of the draft subregional SCS, the methods, strategies, and some preliminary performance evaluations were presented to the public at four public outreach meetings and a meeting with a group of interested business, housing, and environmental stakeholders.

[10]The iMpact Tool was developed by Cambridge Systematics for LACMTA to facilitate the preparation of a countywide Congestion Mitigation Fee (CMF). The tool is a web-based geographic information system (GIS) application that allows each of the 88 cities and the Los Angeles County to enter candidate CMF transportation projects, edit land use or socioeconomic forecasts, estimate total costs, forecast revenues, and calculate impact fee schedules by jurisdiction. Gateway Cities COG requested that supplemental functionality be added to the iMpact Tool that would calculate the GHG impacts of individual projects. This functionality was used to estimate the GHG of the 340 transportation projects selected by the participating jurisdictions included in this SCS.

8. The results were integrated into the first draft of the SCS, which was provided for review to the 26 participating jurisdictions, COG staff, SCAG, and other stakeholders. The final SCS was delivered to the Board on June 29, 2011.

1.4 ORGANIZATION OF SCS DOCUMENT

The remainder of this document is organized into 12 sections (including appendices). This organization follows the format specified by CARB and in the MOU between the Gateway Cities COG and SCAG (see Appendix A).

2. **Situation Analysis.** This section is an overview of the demographic, transportation, and economic context for the Gateway subregion's SCS. It consists of the following four subsections:

   2.1 Growth Trends and Projections. The demographic setting for the SCS, including population, employment, household income, ethnicity, age, and land use density and its relevance to transportation planning and land use patterns.

   2.2. Transportation Trends. Existing transportation systems throughout the subregion: facilities, services, and travel patterns. This subsection also describes transportation performance in target years based on funded transportation projects and transportation policies (e.g., Traffic Demand Management (TDM), Transportation System Management (TSM), and others) included in the SCAG RTP and the LACMTA Long-Range Transportation Plan (LRTP).

   2.3. Economic and Fiscal Trends. Current real estate markets, employment trends, industry structure of subregion, and other salient business conditions. This subsection also summarizes economic development and current fiscal conditions of cities.

   2.4. 2005 GHG Performance for Gateway Cities. Presents the analysis used to calculate the 2005 base year GHG per capita baseline.

3. **Subregional SCS Development Process.** This section has three subsections that describe the process Gateway Cities COG followed to initiate and develop its SCS.

   3.1. SCS Delegation to Gateway describes the decision to develop a stand-alone SCS versus one that identified strategies at the jurisdictional and subregional levels. The former calculates the expected GHG reduction and compares the amount reduced to a 2005 benchmark calculated specifically for the subregion.

   3.2. Development of Strategy Portfolios describes the approach beginning with each jurisdiction developing its own portfolio, then integration with other jurisdictions, the Gateway subregion, LACMTA, and the SCAG region.

   3.3. Stakeholder and public outreach describes the timeline and public outreach activities.

4. **Land Use Characteristics.** This section identifies the general location of uses, residential densities, and building intensities within the subregion. It presents SCAG and State Department of Finance projections for regional population and employment growth trends, and describes revisions made by member jurisdictions. It also summarizes existing general plans and housing elements from all 26 Gateway Cities participating in the SCS.

5. **Growth Accommodations.** This section identifies areas within the subregion sufficient to house all the population of the subregion, including economic segments of the population, over the course of the planning period of the RTP, taking into account net migration into the region, population growth, household formation, and employment growth. It also identifies areas within the Gateway subregion that are sufficient to accommodate the subregion's projected regional housing need for an eight-year period (pursuant to Section 65584 of the Government Code), and an inventory of surplus development capacity of housing sites by city for the current housing element planning period (2006 to 2014).

6. **Affordable Housing Accommodation.** The law (SB 375) requires this analysis show the ability of the land use patterns proposed in the subregional SCS to accommodate the development of housing to meet the Regional Housing Needs Assessment (RHNA) estimated needs of low-, very low-, and extremely low-income households. It also describes the default densities established in Section 65583.2 of the California Government Code, utilized by the State Department of Housing and Community Development, to determine certification of housing elements of the jurisdictions' general plans. This process, however, cannot be completed at this time because the State's RHNA housing allocations will not be provided to SCAG until the fall of 2011, which is some months past the submittal of this SCS to SCAG.

7. **Transportation Network.** This section describes the roadway, transit, TDM, and other strategies employed to reduce GHG emissions.

8. **Resource Areas and Farmland.** This section describes the resource areas and farmland in the subregion as defined in Subdivisions A and B of Government Code §65080.01. Resource areas within the Gateway Cities subregion include:

   a. Publicly-owned parks and open space;

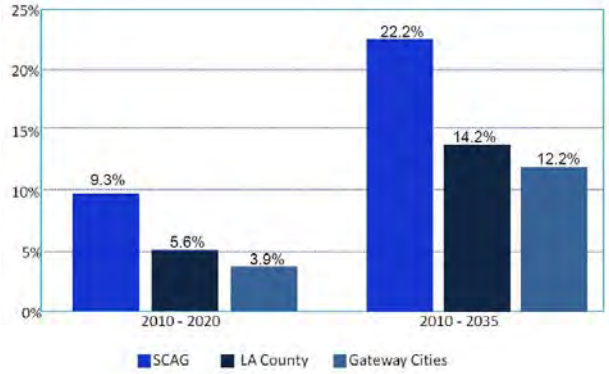
   b. Significant wildlife habitat areas;

   c. Lands subject to conservation or other forms of open space easements; and

   d. Flood prone areas in which development would not meet the requirements of the National Flood Insurance Program.

9. **State Housing Goals.** This section is required to describe the consideration of the state housing goals specified in Government Code §65580 and §65581 and the distribution of SCAG's subregional RHNA allocation among the member jurisdictions. It will identify adequate appropriately zoned sites to accommodate the projected housing needs. The RHNA allocations, however, will not be available until after this SCS is completed, and thus these requirements will be fulfilled as part of the SCAG SCS.
10. **Integration of Development Pattern with the Transportation Network.** This section describes the integration of the forecasted development pattern for the subregion with the transportation network and other transportation measures and policies. It reports interactions or synergies between land use changes and the other transportation measures and policies. These synergies add significant magnitude to the reductions of GHG emissions from individual strategies.
11. **Compliance with Regional and Federal Requirements.** This section consists of three subsections that present the total reduction of GHG from all strategies (including land use).
    - 11.1 This subsection describes the SCS strategies, growth forecasts, land use, and housing accommodation; and how other elements of the subregional SCS conform to the SCAG RTP and SCS plans and assumptions.
    - 11.2 This subsection describes how the Gateway Cities Subregional SCS attains GHG per capita reduction relative to the 2005 GHG per capita benchmark specific for the Gateway subregion. It compares these reductions in 2020 and 2035 to the 2005 benchmark GHG per capita presented in Subsection 2.4. These results demonstrate how well the Gateway SCS achieves the GHG emission targets specified for the SCAG region by the CARB.
    - 11.3 This subsection describes how the Gateway Cities Subregional SCS complies with the Federal Clean Air Act, and specifically with Section 176 of the Federal Clean Air Act (42 U.S.C. Sec. 7506). See Government Code §65080(b)(2)(B). This Federal law forms the statutory basis for the transportation conformity process. While there is no State Implementation Plan (SIP) budget or National Ambient Air Quality Standards (NAAQS) for GHG emissions, current practice treats proposed controls as Transportation Control Measures (TCM) in the SIP and the controls become subject to the timely implementation requirements of the conformity rule.
12. **Financial and Fiscal Implementation**. This section considers the challenges of implementing the SCS strategies, especially those that would be funded by local jurisdictions.

13 **Appendices**. The following 10 appendices provide the underlying data, analytical methods, and other supporting materials for the results presented in this document:



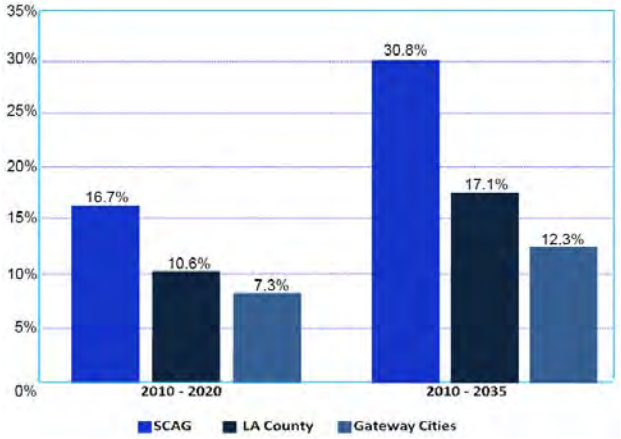
- 13.1 **Appendix A.** Process Document. Memorandum of Understanding (MOU) Between SCAG and Gateway Cities Council of Governments for the Gateway Cities Sustainable Communities Strategy, October 7, 2010.
- 13.2 **Appendix B.** Prior Studies of the Gateway Cities Council of Governments Relevant to SB 375.
- 13.3 **Appendix C.** Public Outreach Materials: Press Release, Stakeholder Invitation list, Workshop Flyer, Open House Looping Presentation, and Display Boards.
- 13.4 **Appendix D.** List of Transportation Improvement Projects in the Gateway Cities and the list of Future (Post 2010) Project Costs and Funding.
- 13.5 **Appendix E.** Analysis for Transportation Demand Management Strategies in the Gateway Cities.
- 13.6 **Appendix F.** Land Use Scenario Strategies from Sustainability Tool (2008, 2020, and 2035).
- 13.7 **Appendix G.** List of Regional Transportation Strategies in the Gateway Cities.
- 13.8 **Appendix H.** Analysis of Interactive Effects Contributing to Further GHG Reduction in the Gateway Cities.
- 13.9 **Appendix I.** CEQA Streamlining.
- 13.10 **Appendix J.** Jurisdiction General Plans.

2.0 Situation Analysis

2.1 Overview of Growth

A comparison of data from SCAG's draft 2012 RTP Growth Forecast (i.e., the Integrated Growth Forecast) indicates that the Gateway Cities will have a lower rate of population growth over the next 10-year and 25-year periods than either the SCAG region or Los Angeles County. Projected population growth for the Gateway Cities subregion is approximately 3.9 percent for the period 2010 to 2020, as compared to 9.3 percent for the SCAG region and 5.6 percent for Los Angeles County for the same period. Similarly, as shown in Figure 2.1, the Gateway Cities subregion has a lower projected population growth at 12.2 percent for the period 2010 to 2035, as compared to 22.2 percent and 14.2 percent for the SCAG region and Los Angeles County, respectively.

Figure 2.1 Relative Population Growth of SCAG, Los Angeles County, and Gateway Cities from Draft 2012 RTP Forecasts

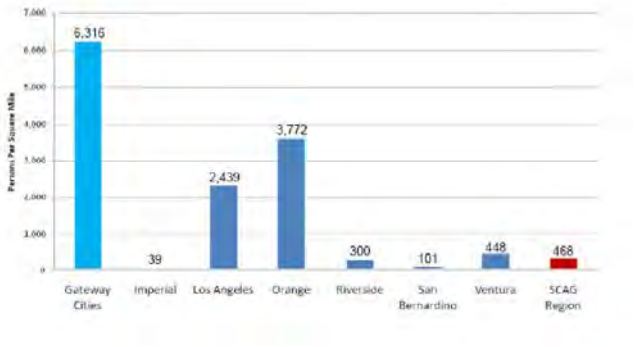


Source: SCAG RTP 2012 Integrated Growth Forecast.

Growth forecasts for employment show a similar trend over the 2010 to 2020 and 2010 to 2035 periods with the Gateway Cities subregion lagging behind higher employment growth rates for the SCAG region and Los Angeles County. Projected employment growth for the Gateway Cities is 7.3 percent for 2010 to 2020 and 12.3 percent for the period 2010 to 2035, as shown in Figure 2.2. By

comparison, projected employment growth for the 2010 to 2020 period is 16.7 percent for the SCAG region and 10.6 percent for Los Angeles County; and 30.8 percent and 17.1 percent, respectively, for the SCAG region and Los Angeles County in the 2010 to 2035 period.

Figure 2.2 Relative Employment Growth of SCAG, Los Angeles County and Gateway Cities from Draft 2012 RTP Forecasts



Source: SCAG RTP 2012 Integrated Growth Forecast.

With regard to growth in the number of households over the 2010 to 2020 and 2020 to 2035 periods, with a household representing the most basic unit of demand for housing, the projected household growth rate for Gateway Cities subregion is once again less than that for either the SCAG region or Los Angeles County. The projected household growth rate for the Gateway Cities is 4.2 percent for the 2010 to 2020 period and 11.1 percent for 2010 to 2035 period. By comparison, the household growth rate for the 2010 to 2020 period is 10.7 percent for the SCAG region and 8.0 percent for Los Angeles County; and 24.7 percent and 17.4 percent for the SCAG region and Los Angeles County, respectively, for the 2010 to 2035 period.

The lower rates for projected population, employment, and household growth in the Gateway Cities COG subregion relative to the SCAG region and Los Angeles County are largely attributable to a higher rate of land utilization or build-out in the Gateway Cities area, as measured by population and employment density. Since the Gateway Cities area is already highly built-out relative to the SCAG region overall, there is less growth opportunity in the Gateway Cities area.

Population density for the Gateway Cities COG subregion in 2010 is reported to be 6,316 persons per square mile, as illustrated in Figure 2.3. This compares with much lower population densities of 468 and 2,439 persons per square mile, respectively, for the SCAG region and Los Angeles County. Similarly, employment density within the Gateway Cities COG subregion is much higher than in the SCAG region and Los Angeles County. Employment density for the Gateway Cities COG subregion was reported at 2,209 employees per square mile. Considerably lower densities were reported for the SCAG region and Los Angeles County at 187 and 1,024 employees per square mile, respectively. Given the highly built-out nature of the Gateway Cities subregion, any major reductions in VMT and related GHG emissions within the subregion will more likely result from the transportation rather than the land use measures that are implemented by the Gateway Cities over the RTP planning period.

Figure 2.3 Population Density by Region – 2010

Source: SCAG and 2010 U.S. Census.

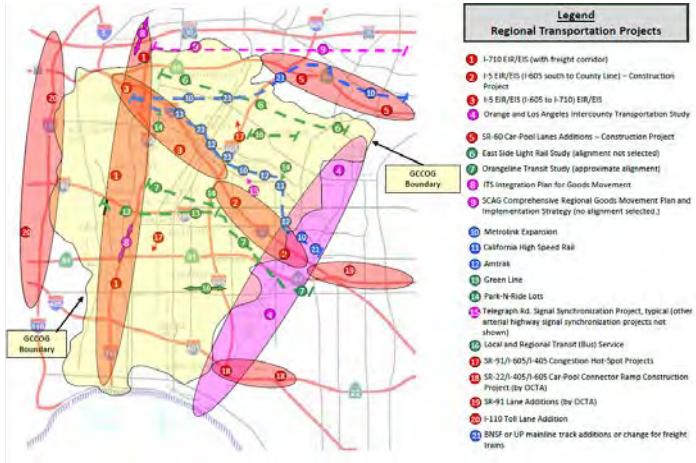
The Gateway Cities subregion is comprised of a lower income population, compared with the SCAG region as a whole and Los Angeles County. Household and per capita income data from the 2010 Census are not available at this time. The 2000 Census, however, reported a median household income of $38,354 for the Gateway Cities COG subregion. The median household income levels for SCAG and Los Angeles County are higher at $45,844 and $42,189, respectively. The average per capita income for the Gateway Cities subregion, according to the 2000 Census, also lags behind Los Angeles County and the State of California. The average per capita income for the Gateway Cities subregion is $16,206, as compared to $20,683 for Los Angeles County and $22,711 for the State of California.

Age further distinguish the population of the Gateway Cities COG subregion from that of Los Angeles County and the State of California. At 31.2 years of age, the median age (average for all cities) reported by the 2000 Census for the Gateway Cities subregion is slightly lower than the median age for Los Angeles County at 32.0 and the State of California at 33.3 years of age.[11] Within the Gateway Cities COG subregion, the median age ranges from a low of 23.8 for the Cities of Bell Gardens and Cudahy to a high of 42.4 for the City of La Habra Heights.

2.2 TRANSPORTATION TRENDS

Although SB 375 does not include the analysis of heavy-duty trucks, the transportation trends and improvements in the Gateway Cities are shaped by its role as a goods movement hub. Within the Gateway Cities COG reside two million residents in close proximity to the Ports of Long Beach and Los Angeles, the largest port complex in the United States. Approximately 45 percent of the nation's containerized imports pass through these two ports, and the I-710 freeway, a primary truck route to service these ports that runs through the Gateway Cities, has the highest concentration of trucks in the country.

The Gateway Cities is also a densely populated residential and employment center with a high density of households and jobs that generates demand for high frequency transit and multimodal services, high quality freeways that can relieve congestion and improve regional travel, and initiatives toward transportation demand management to reduce future travel demand.



The Gateway Cities COG and its member cities have been engaged for the last 20 years in studies aimed at improving mobility, congestion, air quality, and other traffic reduction projects. As part of the I-710 Environmental Impact Report (EIR)/Environmental Impact Statement (EIS), a Multimodal Transportation Report (completed in 2009) reviewed bus and rail transit, park-and-ride facilities, HOV lanes, and goods movement by rail. Transportation Demand Management/Transportation System Management (TDM/TSM) projects were also evaluated along with Intelligent Transportation Systems (ITS), among other alternatives.[12] This report determined that the collective use of multimodal transportation improvements has the potential to reduce future travel demand and increase freeway capacity.

[11] As of this writing, the 2010 Census data on median age has not been published.

[12] I-710 Corridor Project EIR/EIS Technical Memorandum – Multimodal Review, prepared for LACMTA by URS, March 4, 2009, http://www.metro.net/projects_studies/I710/images/710_dr_mmr.pdf.

Figure 2.4 shows the inventory of projects being explored and potentially implemented in the Gateway Cities subregion. An analysis of a subset of these projects is conducted as part of this SCS in Section 10. Transportation performance in target years, based on funded RTP and LRTP transportation projects and transportation policies (e.g., TDM, TSM, and others), is analyzed using a "No Project" baseline with the LACMTA model in Section 10.0.

Figure 2.4 Regional Transportation Projects and Trends for the Gateway Cities

Source: Jerry Wood. Gateway Cities Transportation Project Brochures, 2011.

2.3 ECONOMIC AND FISCAL TRENDS

An economic overview and forecast report completed by the Los Angeles County Economic Development Corporation (LAEDC) in January 2003 is useful in providing a summary of the economic structure of the North Gateway area (i.e., a major portion of the Gateway Cities COG subregion). The report identifies the North Gateway area as including 22 incorporated cities (excluding the Cities of Avalon, Hawaiian Gardens, Lakewood, Long Beach, and Signal Hill) and some unincorporated areas.

The North Gateway area is transected by major transportation lines, including being served by six freeways, the Alameda Corridor rail project, transited by the Burlington Northern Santa Fe and Union Pacific railroads, being served by Metrolink, Amtrak service, and MetroRail Green and Blue lines. The North

Gateway area is substantially built-out resulting in relatively low levels of new residential construction. Most development opportunities for housing are "in-fill" sites on small blocks of land. New residential development has generally been single-family development, but with an increasing shift toward multifamily development on in-fill and mixed-use sites. Some cities have development opportunities on recycled sites, such as brownfield sites, but generally with respect to residential, most activity involved the demolition and replacement of older smaller homes with new larger, single and multifamily structures. Compared to residential development, there have been more opportunities for industrial-commercial development, and there are opportunities for redevelopment efforts in older downtowns.

Even though the LAEDC report is somewhat dated and only focuses on a portion of the Gateway Cities subregion[13], the report identifies a number of forces that will impact the future economic health of the entire subregion and are still quite relevant, including:

- Importance of an educated population and the need for career connections for students;
- Need for improvements to the transportation infrastructure;
- Need for increased rail capacity;
- Need for upgrading aging infrastructure; and
- Need for the local economy to be considered in a global context.

These major issues must be addressed to maintain and grow economic activity in the entire Gateway area.

Economic development and affordable housing strategies implemented by cities in the Gateway Cities COG subregion over the past decade include:

- Transit-oriented development to relieve transportation pressures;
- Brownfield redevelopment as a source of land for economic development and new housing;
- Programs to encourage employers to locate or expand in the subregion to address jobs/housing balance and reduce VMT; and
- Promotion of infill development for housing and mixed-use development involving commercial and residential uses.

[13]This is the only report prepared by the LAEDC for the Gateway Cities subregion. There is no corresponding analysis of the southern portion of the Gateway Cities subregion.

2.4 2005 GHG PERFORMANCE FOR GATEWAY CITIES

Gateway Cities COG obtained the information needed to generate the Gateway Cities subregional baseline emissions per capita in 2005 from SCAG model data. A data request was sent on February 22, 2011, from Gateway Cities COG to SCAG, outlining the methodology and data needs to calculate a 2005 GHG per capita baseline benchmark for Gateway Cities. The information requested included:

- VMT within the SCAG region for all auto trips with a trip origin and/or destination inside of the Gateway Cities COG;
- The VMT not including any light heavy-duty, medium heavy-duty, or heavy heavy-duty VMT;
- Through trips not included in the estimate (i.e., trips that to not have either an origin or destination within the Gateway Cities);
- VMT estimates broken out by into the standard time periods that SCAG models (AM, mid-day, PM, evening, and overnight); and
- VMT provided by speed bin.

The Adopted 2008 RTP Growth Forecast and the Local Input/General Plan 2012 RTP Growth Forecast were used as the per capita denominator for the SB 375 target years of 2020 and 2035.

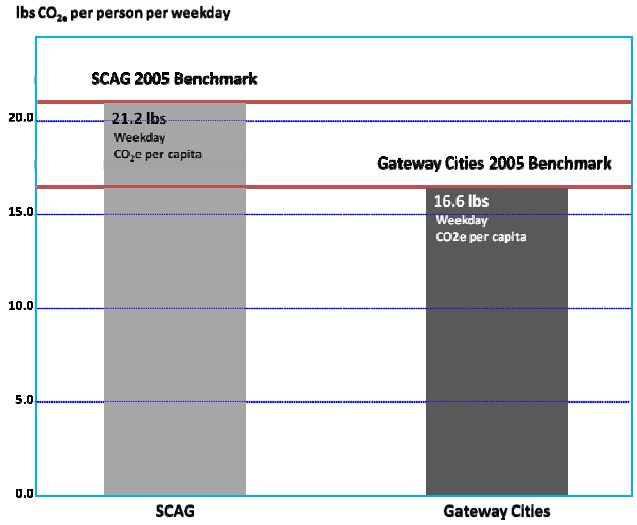


Table 2.1 Data Sources for Gateway Cities Population Estimates

Year	Gateway Cities Population	Source
2005	2,094,268	Adopted 2008 RTP Growth Forecast, by City (RTP07_CityLevel.xls)
2020	2,208,499	Local Input/General Plan Growth Forecast for 2012 RTP) (RTP2012_GROWTH-FORECAST.xls)
2035	2,380,833	Local Input/General Plan Growth Forecast for 2012 RTP) (RTP2012_GROWTH-FORECAST.xls)

Figure 2.5 Benchmarks for SCAG and Gateway Cities

3.0 Subregional SCS Development Process

3.1 SCS Policy Development Committee

The Gateway Cities COG established an SCS Policy Development Committee to oversee the SCS process and direct the work of the consultant team. The SCS Policy Development Committee is a subcommittee of the Gateway Cities City Managers' Steering Committee; and includes five city managers, eight planning directors from geographically representative cities, and one public works director. Three COG staff attended meetings and supported the Committee's work, including Richard Powers, the Executive Director of the Gateway Cities COG. The Committee membership consists of the following officials:

1. Mike Egan, City Manager of Bellflower;
2. Jorge Rifa, City Manager of Commerce;
3. Tom Modica, representing the City Manager of Long Beach;
4. Ron Bates, City Manager of Pico Rivera;
5. Ken Farfsing, City Manager of Signal Hill (Committee Chair);
6. Aldo Schindler, Bell Gardens Planning/Community Development Director;
7. Torrey Contreras, Cerritos Planning/Community Development Director;
8. Sonia Southwell, Lakewood Planning/Community Development Director;
9. Brian Saeki, Downey Planning/Community Development Director;
10. Reuben Arceo, La Mirada Planning/Community Development Director;
11. Wayne Morrell, Santa Fe Springs Planning/Community Development Director;
12. Sonia Shah, South Gate Planning/Community Development Director;
13. Don Dooley, Whittier Planning/Community Development Director;
14. Steve Forster, Chair, La Mirada and Liaison to the Gateway Cities Public Works Officers;
15. Richard Powers, Executive Director of Gateway Cities Council of Governments;
16. Jack Joseph, Gateway Cities Council of Governments Staff; and
17. Nancy Pfeffer, Gateway Cities Council of Governments Staff and Contract Project Manager.

After the consultant team was selected, the Committee met seven times beginning on January 13, 2011 to review progress and provide guidance.

3.2 SCS Delegation to Gateway

The SCAG Regional Council approved the Framework and Guidelines for Subregional SCS on April 1, 2010. This 12-page document laid out the terms and conditions for any of the 14 subregions within SCAG to take delegation of their SCS. In October 2010, SCAG and the Gateway Cities COG signed an MOU officially delegating the preparation of the SCS for the Gateway Cities subregion to the Gateway Cities COG. While this six-page MOU incorporated the Framework and Guidelines, neither document anticipated all of the potential issues that could emerge as a result of SCS delegation. This document can be found in Appendix A.

The most significant issue came to light when the Gateway Cities COG and its member jurisdictions carefully considered the range or scale for their SCS. At the modest end of the spectrum, the subregion could compile a list of strategies, which it was prepared to implement. These would be submitted to SCAG for inclusion in the regional SCS. At the other end of this range would be a virtually stand-alone SCS. This would require a rigorous quantification of the estimated GHG reductions from all strategies implemented from 2005 to 2020 and from 2020 to 2035. Once the Gateway Cities SCS Steering Committee decided to pursue the stand-alone approach, it needed to determine the appropriate GHG (CO_{2e}) per capita benchmarks in 2005 for the Gateway Cities subregion in order to measure its attainment of the regional targets.

The regional targets, assigned to SCAG by CARB for a percent reduction in GHG per capita against the regional 2005 benchmark, do not apply to any individual subregion within the SCAG region. Nevertheless, the SCS Policy Development Committee decided to measure the total reduction in GHG from the bundle of strategies that make up the subregional SCS as a percentage against the 2005 benchmark estimated for the Gateway Cities subregion. Because SCAG had not calculated a 2005 GHG per capita for each subregion, the Gateway Cities SCS Policy Development Committee requested that SCAG provide the methodology it used to calculate the regional 2005 GHG per capita, and then applied this methodology to calculate the Gateway Cities' regional-specific 2005 inventory. The calculations produced the 2005 benchmark of 16.6 lbs of CO_2e per capita for the Gateway Cities region compared to 21.2 lbs of CO_2e per capita as a 2005 average for the entire SCAG region. This analysis was summarized in Section 2.4.

3.3 Development of Strategy Portfolios

The Gateway Cities COG held four technical workshops with the city planning and public works directors from all of the jurisdictions. These workshops were

the interactive tools for cities to work with the consultant research and analysis, and develop portfolios of GHG reduction strategies for each jurisdiction. This approach started with each city assembling three broad categories of strategies that they would select and implement: transportation projects, TDM activities, and land use strategies. The planning directors and public works officers followed a three-step procedure for developing each city's program for contributing to the subregional SCS:

1. **Screening.** Each city would first select among the universe of GHG reduction strategies a subset that could be implemented at the subregional or jurisdictional level. They would then rank these selected strategies according to their fit with the pilot city's market conditions, transit infrastructure, land use characteristics, and other circumstances that would affect the cost effectiveness and political feasibility of each candidate strategy.
2. **Scaling and Measurement.** For each of the strategies that was screened and ranked, city staff considered appropriate levels of deployment for each strategy. This step included considering the following attributes of each strategy:
   a. Total amount of reduced GHG;
   b. Bundling with other strategies to achieve the most effective combination (i.e., interactive or synergistic effects);
   c. Performance over time (i.e., immediate to long term);
   d. Fiscal cost, including any potential to generate revenues;
   e. Cost effectiveness (cost per ton of CO_2); and
   f. Level(s) of government most appropriate to implement them.

   Once each city had assembled an initial portfolio, the consultant team entered the technical characteristics of each strategy into the LACMTA iMpact web-based software that measured GHG impacts of the strategies.[14]
3. **Bundling.** The consultant team worked with each jurisdiction to group strategies into bundles on three criteria: a) logical combinations of strategies that may have synergies, such as transit investment, land use, and nonmotorized travel; b) consideration of the cost effectiveness of various strategies (e.g., selecting only those strategies meeting a particular cost-effectiveness threshold); and c) each jurisdiction's political conditions. The consultants then reestimated the impacts of each bundle using the iMpact software tool that included GHG analysis.

[14] The iMpact Tool, developed by Cambridge Systematics for LACMTA, is a web-based GIS application that calculates the GHG impacts of individual transportation projects. This functionality was based on previous Federally-sponsored research conducted for the *Moving Cooler* study (http://www.movingcooler.info).

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy

An illustration of this process and the linkages associated with the bundling is shown in Figure 3.1.

Figure 3.1 SCS and Strategy Portfolio Development Process

3.4 STAKEHOLDER AND PUBLIC OUTREACH

The SCS outreach program provided opportunities for Gateway Cities stakeholders and community members to learn about the SCS process and provide feedback.

In February 2011, a stakeholder briefing was convened to inform Gateway Cities stakeholders representing climate and environmental groups, chambers of commerce, and housing advocates about the SCS process and to address questions on related topics. Approximately 50 stakeholders were invited by the Gateway Cities COG to attend the two-hour session, which was held at the COG offices.

Public Information Open Houses were also held in four locations representative of the Gateway Cities subregion. These Open Houses were held in the Cities of Cerritos, Long Beach, Pico Rivera, and Commerce. The purpose of these public information events was to present basic information on the SCS process, what the SCS means to the community, and provide an opportunity for community members to have one-on-one dialogue with members of the project team, COG staff, and representatives from subregional cities. Participants were encouraged

to attend exhibit areas, where project staff were available to answer questions and receive feedback from attendees.

Noticing for the public open houses included a series of information materials that were used to advertise the open houses by local media, the COG, and individual Gateway Cities.

- Press release,
- Open house flyer,
- HTML open house invitation, and
- SCS newsletter article.

The press release was distributed to all local media. The open house flyer was distributed to COG cities Planning Directors and Public Works Officers, made available at the COG offices, and mailed to stakeholders that were invited to the stakeholder briefing, with a request for further distribution. Noticing for the open houses was also posted to the Gateway Cities COG web site, as well as made available to the web sites of other Gateway Cities. In addition, information on the open houses and the SCS was packaged for use in local newsletters and other publications. Noticing materials were provided in Spanish as well as English.

The presentation materials that were used at the Public Information Open Houses included:

- Information regarding SB 375 and how the Gateway Cities subregion SCS adheres to the process;
- Display Boards with information on proposed strategies related to land use, transportation, and transportation demand management;
- Frequently Asked Questions information;
- Process Graphic Display Board demonstrating the timeline for the project and depicting the SCS process from start to finish; and
- PowerPoint presentation with background information.

Copies of the outreach materials are included in Appendix C.

All materials presented and utilized at the Public Information Open Houses were made available in English and Spanish. In addition, Spanish-speaking staff were on hand at each open house to answer questions in Spanish.

4.0 Land Use Characteristics

The 2005 land use pattern in the Gateway Cities subregion is shown on Figure 4.1, while the utilization of land within the subregion by acreage is presented in Table 4.1. As seen in Table 4.1, the predominant land use in the subregion is low-density residential, which occupies 43.3 percent of the subregion's land area, exclusive of streets. Industrial and commercial uses occupy approximately 15.1 percent and 10.1 percent of the subregion's land area, respectively. Over 11.5 percent of the subregion is devoted to open space, which primarily consists of the resource areas discussed in Section 8.0 of the SCS, but also includes a minor amount of vacant land available for development. Other substantial land uses include medium-density residential at nearly 8.5 percent and public facilities at 8.1 percent. Transportation uses include airports, rail yards, and transit facilities. The agriculture remaining in the area primarily consists of avocado and citrus orchards on large residentially-zoned lots in the northern portion of the subregion and equestrian uses existing at various locations across the subregion.

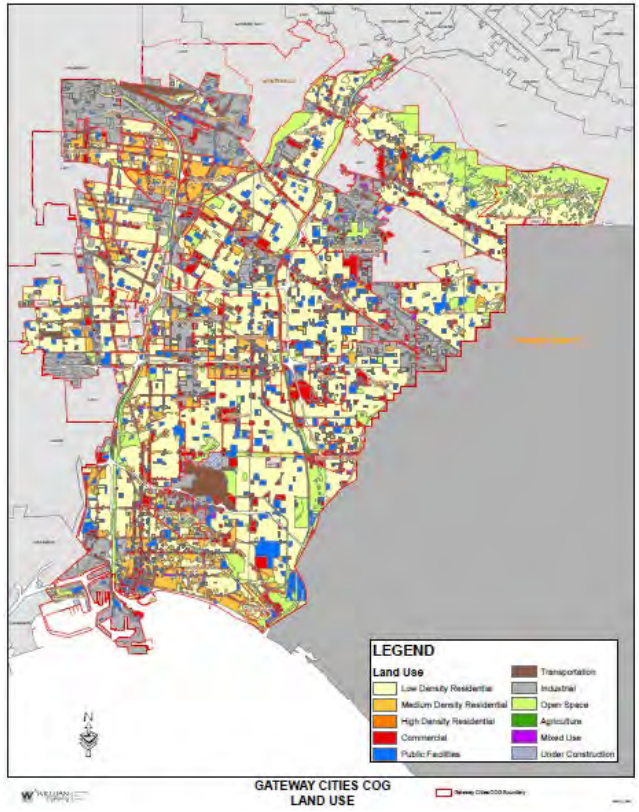

Table 4.1 Gateway Cities Subregion Existing Land Use – 2005[1]

Land Use Category	Acreage[2]	Percentage
Low Density Residential	66,287.51	43.27
Medium Density Residential	13,002.30	8.49
High Density Residential	501.70	0.33
Commercial	15,493.00	10.11
Mixed Use	342.23	0.22
Industrial	23,186.75	15.14
Public Facilities	12,358.25	8.07
Transportation	3,138.27	2.05
Open Space[3]	17,684.84	11.55
Agriculture	442.49	0.29
Under Construction	741.56	0.48
Total	153,178.90	100.00

1. No summary data is available for the 2020 and 2035 target years.
2. Exclusive of streets.
3. Includes vacant land available for development.

Source Acreages tabulated by Willdan Engineering based on 2005 Existing Land Use Map generated by SCAG.

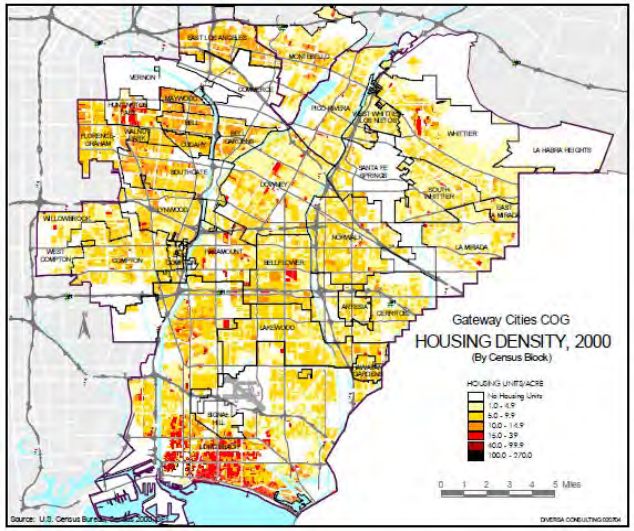

Figure 4.1 Existing Land Use 2005

While the predominant land use in the subregion is low-density residential, the Gateway Cities have provided for a wide range of housing types and densities through their general plans and zoning ordinances, capable of accommodating all economic segments of the subregion's population. This is graphically illustrated on Figure 4.2, which shows 2000 census data for housing density by census block. As seen in this figure, existing housing densities range from large

lot, semi-rural and traditional single-family densities (i.e., from 1 to 5 units per acre) to low-medium density of 6 to 14 units per acre to medium residential densities of 15 to 39 units per acre up to high densities of 40 units, to well in excess of 100 units per acre.

Figure 4.2 Housing Density, 2000

In preparing the SCS, the COG compiled an inventory of the general plans of each of the 26 participating cities. The general plan maps for the Gateway Cities are contained in Appendix J. Collectively, they constitute the land use component of the SCS.

The COG also inventoried the status of the land use, circulation, and housing elements of each city's general plan. The resulting inventory is presented in Table 4.2, which includes the most recent adoption and horizon dates for each element, as well as any pertinent comments regarding the status of these elements. As seen in this table, only one city has a general plan that extends the course of the planning period for the RTP (i.e., 2035), while 12 cities currently have general plans with horizon dates ranging from 2020 to 2030. As the Gateway Cities continue to update their general plans, most, if not all, of the COG's members will eventually have general plans with horizon dates that

coincide with the RTP planning period. However, the financial condition of cities across the SCAG region and State poses a constraint to the future updating of general plans.

5.0 Growth Accommodations

The SCS must identify areas within the subregion sufficient to house an eight-year projection of the regional housing need for the subregion pursuant to California Government Code §65584. The SCS must further identify areas within the subregion sufficient to house all of the population of the subregion, including all economic segments of the population, over the course of the planning period of the RTP, taking into account net migration into the region, population growth, household formation, and employment growth. Regarding the first requirement, Government Code §65584 involves the RHNA component of housing element law and the eight-year period referred to is the 2013 to 2021 planning period for the initial RHNA to be generated under SB 375. In allocating sufficient areas to accommodate the subregion's estimated housing need for this time period, the Gateway Cities COG is also expected to determine that the SCS is consistent with the RHNA for this period. However, it is technically impossible to make this determination due to the timing of these parallel planning efforts.

The Gateway Cities COG must submit its final subregional SCS to SCAG by June 2011. SCAG, in turn, must approve the final regional SCS by April 2012. SCAG will also release the draft RHNA in April 2012, and is tentatively scheduled to adopt the final RHNA when the SCAG RTP and SCS are approved in June 2012. Therefore, neither the Gateway Cities COG nor SCAG will have the ability to determine that the subregional and regional SCSs, respectively, are consistent with the RHNA prior to their finalization. Instead, SCAG will need to determine whether the regional SCS is consistent with the RHNA, upon the release of the RHNA, and amend the regional SCS to achieve consistency, if needed.

Despite the inability to determine consistency between the SCS and RHNA, the SCS must identify areas sufficient to accommodate the subregion's projected housing need for the 2013 to 2021 period; and addressing the second requirement of SB 375, further identify areas sufficient to house the subregion's projected population to the end of the RTP planning period in 2035. In reviewing and commenting on SCAG's preliminary Integrated Growth Forecast for the 2012 RTP, the Gateway Cities have indicated what they believe are realistic estimates for household and population growth in each of their jurisdictions to 2020 and 2035. These estimates were based on past and current growth trends, as well as the capacity of the Gateway Cities general plans to support additional residential development. Since these growth estimates reflect the housing development capacity of local general plans, it can be concluded that the Gateway Cities general plans, as presented in Appendix J, allocate adequate land at appropriate densities to house the subregion's projected population to 2020 and 2035.

The Gateway Cities expect that the subregional housing need eventually identified for the Gateway Cities COG in the 2013 to 2021 RHNA will be consistent with the Integrated Growth Forecast that is the underpinning of the

subregional SCS. Each of the Gateway Cities has provided SCAG with 2020 and 2035 household and population growth projections. The subregion's jurisdictions estimate 21,903 additional households from 2010 to 2020. SCAG initially estimated 25,014 additional households, but released their estimate in May 2011 of 23,980 households over a 2011 to 2021 period, which most closely corresponds with the next RHNA planning period, taking into consideration the local input received and 2010 Census data. As of this date, SCAG and the Gateway COG are still reviewing the projections, and Gateway COG is expecting further adjustments to bring the two projections into convergence.

6.0 Affordable Housing Accommodation

The Gateway Cities' 2020 and 2035 allocations of residential land use are designated in their general plans (Appendix J). These residential land use designations specify allowable density ranges at and well above the default densities established in California Government Code §65583.2 that are applicable to the Gateway Cities. These default densities, which are 20 or 30 dwelling units per acre depending upon city population, are the densities at which the State Department of Housing and Community Development has determined that the development of lower-income housing becomes financially feasible.

Within the Gateway Cities' general plans, the housing elements allocate sufficient land at appropriate densities to accommodate the projected housing needs. In addition, the general plans identify programs for expanding the supply of affordable housing in the subregion to low- and moderate-income households. These programs include:

- Offering incentives to encourage in-fill development on vacant and underutilized residentially zoned land;
- Rezoning to increase the permitted intensity of development on vacant and underutilized residentially zoned land;
- Offering density bonuses and other incentives to encourage the development of housing affordable to low- and moderate-income households;
- Utilizing redevelopment and brownfield development to generate new affordable housing for low- and moderate-income households;
- Facilitating mixed-use development that incorporates high-density housing along major arterial streets and in downtown areas served by mass transit;
- Pursuing and utilizing state and Federal funding sources to expand the supply of housing affordable to low- and moderate-income households;
- Partnering with private developers and nonprofit housing sponsors to promote the development of housing affordable to low- and moderate-income households; and
- Utilizing housing overlay zones to provide options for the development of special needs and other affordable housing in areas otherwise designated for nonresidential uses.

7.0 Transportation Network

This section describes the roadway, transit, TDM, and other strategies employed to reduce GHG.

7.1 Transportation Improvement Projects

Inefficient transportation networks are a key contributor to transportation-related GHG emissions. Transportation improvement projects that improve traffic flow, reduce vehicle idling and delay, and/or reduce overall VMT can significantly decrease per capita emissions on congested networks.

Gateway Cities jurisdictions submitted 340 revenue-constrained transportation improvement projects, which together have the potential to considerably reduce per capita GHG emissions from the transportation sector.

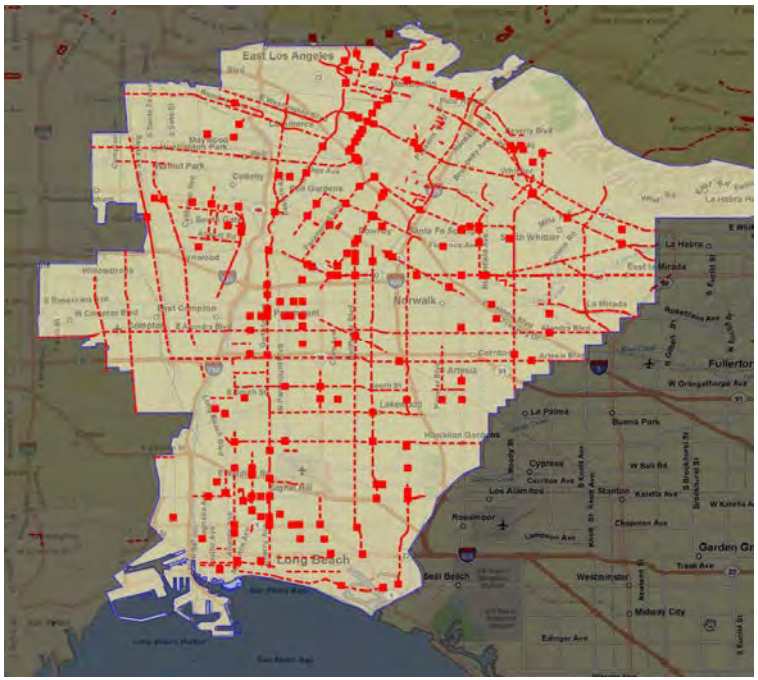

Figure 7.1 shows the locational extent of these transportation improvement projects in the Gateway Cities using the LACMTA iMpact Tool. Figure 7.2 shows the numerical distribution of submitted transportation projects. These projects fall under six categories:

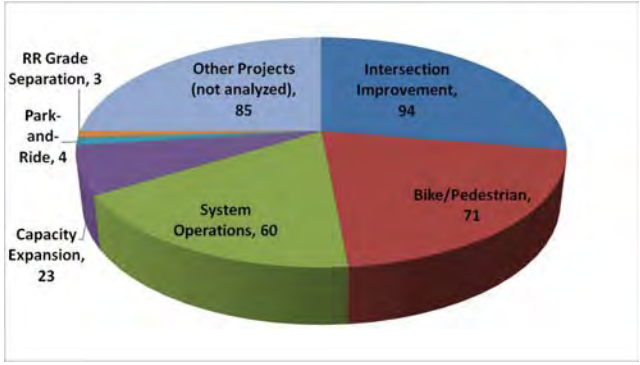
1. Roadway Capacity Improvements (e.g., new lanes, bottleneck relief);
2. Intersection Improvements (e.g., new signals, new signal phases, new intersection approach capacity);
3. System Operations Improvements (e.g., intersection delay improvements, corridor-wide signal timing, ITS, adaptive traffic control systems, arterial management);
4. Railroad Grade Separations;
5. Nonmotorized Transportation Improvements (e.g., new bicycle and pedestrian facilities); and
6. Park-and-Ride Facilities.

Appendix D provides a list of all submitted strategies within these categories.



Gateway Cities Council of Governments Subregional Sustainable Communities Strategy

Figure 7.1 Submitted Transportation Project Locations

Note: All red squares and dashed lines denote transportation projects.

Figure 7.2 Distribution of the Submitted Transportation Projects

Each transportation improvement strategy offers unique potential for reducing per capita GHG emissions, and requires a different methodology to estimate potential emissions reductions. To estimate these potential project-level benefits, a series of sketch planning methodologies was developed for each project type, using algorithms developed in the *Moving Cooler* Report, the Transportation Research Board (TRB) *Highway Capacity Manual* (2000), Federal Highway Administration (FHWA) *Traffic Signal Timing Manual* (2008), and other sources.[15]

The resulting estimated total GHG reduction per capita per day amounts to 0.74 lbs CO_2e per capita per day in 2020 and 0.70 lbs CO_2e per capita per day in 2035.

Each transportation improvement project category is described below, along with a brief note on the project-specific inputs that were required to make sketch planning estimates of potential GHG impacts. (See Appendix K for descriptions of the methodologies used to make these calculations.

[15] *Moving Cooler* was an extensive research and documentation commissioned in 2010 by a wide range of agencies and interest groups to obtain objective information about the potential contributions of transportation strategies to GHG reduction goals. *Moving Cooler* measures the effectiveness and costs of almost 50 types of strategies and combinations of strategies (http://www.movingcooler.info). (See Appendix K).

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy

7.1.1 Roadway Capacity Improvements

Roadway capacity projects are those that either 1) widen an existing facility, or 2) build or extend a new roadway. Roadway capacity improvements have the potential to reduce excess GHG caused by delay at critical bottlenecks and chokepoints on heavily congested roadways. Emission reductions from these projects are derived from increased average vehicle speeds due to capacity expansion and improved traffic flow rates resulting from decreased congestion.[16] Emission reductions vary by the type of facility under expansion and the location of the facility.

At a large network scale, benefits gained from initial improved traffic flow rates on congested major highways are often offset to some degree by induced traffic (i.e., pent-up demand for travel) over the long term, resulting in lower emissions reductions than initially obtained. All of the local transportation projects included in the subregional SCS, however, are small and mostly isolated improvements. Their small scale and scope make it unlikely that their initial benefits would induce a significant amount of additional travel.

Roadway capacity GHG reduction estimates are a function of several inputs, including project length, number of new lanes, corridor traffic volumes, facility type, and land use conditions. Speed and capacity information by facility type and area types were obtained from the LACMTA travel demand model. Travel speed changes on the facility after capacity expansion was calculated by sketch planning tools developed by Cambridge Systematics based on peer-reviewed methodologies (see Appendix K). These tools used speed-flow curves from the travel demand model. Travel speeds were calculated for peak periods and only during weekdays, since it is conservatively assumed that the speed variations during the off-peak periods and weekends are marginal.

7.1.2 Intersection Improvements

Intersection improvements have the potential to reduce excess GHG emissions caused by idling and delay at single intersections. In general, these improvements fall under three categories:

1. **New Signal.** An unsignalized intersection approaching failure due to intolerable levels of delays is improved to a signalized intersection with an acceptable auto level of service.

[16] The estimation of GHG impacts from local transportation projects were made using sketch planning models to estimate changes in speed, vehicle hours of delay, and vehicle miles of travel. These outputs were then used as inputs for the EMission FACtors (EMFAC) model, which calculates CO_2 emissions for 2020 and 2035. The EMFAC model incorporates future year emission factors that account for the lower emissions from future vehicles (see http://www.arb.ca.gov/msei/msei.htm).

2. **New Turning Phase.** A new specific turn or movement is enabled at the intersection, or a permissive turn is made into a protected turn by changing the signal phasing and/or timing.
3. **Improved Intersection Capacity.** Physical improvements are made to the signalized intersection that positively impact level of service, including improvements to geometry, approach redesign, or new lanes.

The GHG reduction methodologies used to evaluate each intersection improvement type vary slightly, but estimates are generally a function of factors, such as approach capacities (i.e., number of lanes); peak-hour traffic volumes; facility types; cycle lengths; and land use densities. Since detailed delay and level of service (LOS) calculations were not available for this analysis, traffic volumes and delay were generally approximated using travel model output. Signal cycle lengths either were specified by jurisdictions or approximated using the FHWA *Traffic Signal Timing Manual* (2008). In each case, emissions reduction benefits were estimated by approximating the average reduction in delay per vehicle due to the improvement.

7.1.3 System Operations Improvements

System operations projects impact GHG emissions by improving traffic flows and reducing vehicle delay along key corridors involving multiple intersections. Examples include arterial management strategies such as corridor signalization and synchronization improvements, and ITS such as Advanced Traffic Management System (ATMS) implementation. Travel timesavings at each intersection along the corridor are calculated and aggregated by applying a delay reduction factor. Los Angeles County Public Works Department, for example, provided 14 traffic signal synchronization projects and ITS projects on primary arterials through both incorporated and unincorporated areas.

System operations project benefits are a function of inputs, such as corridor length, number of intersections affected, number of lanes, traffic volumes, and existing travel times and cycle lengths. These details were provided by jurisdictions or approximated using travel demand model output; the SCAG Highway Inventory[17] (a TransCAD database recently compiled); and sources such as the Caltrans Traffic Light Synchronization Program and the TRB *Highway Capacity Manual* (2000).

[17]The SCAG Modeling/GIS section undertook an inventory of major streets within the six counties comprising the SCAG region. The inventory contains information pertaining to existing LOSs, as well as planned highway improvements. Its primary purpose is to define the highway network for the RTP transportation demand model, but it will also support other programs, such as the Highway Performance Monitoring System. It includes LOS attributes for more than 7,000 streets and highways. It houses attributes such as posted speed, number of lanes, and median type.

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy

7.1.4 Railroad Grade Separations

Separating at-grade railroad crossings reduces vehicle delay and associated GHG emissions caused by railroad facility conflicts. Grade separation project GHG benefits are a function of roadway average daily traffic, existing and improved average speeds, and average gate down time on the affected rail corridor. Average gate down time is used as a proxy for intersection delay prior to the grade separation improvement. Inputs for the sketch analysis were provided by jurisdictions or approximated using travel demand model output, the SCAG Highway Inventory, and documentation and research prepared by local agencies.

7.1.5 Nonmotorized Transportation Improvements

The implementation of bicycle and pedestrian facilities can reduce GHG emissions to the extent that auto trips are replaced by walking or biking, or by transit trips accessed by walking or biking. Generally, bicycle lanes and pedestrian facilities that offer access to transit have greater potential for GHG emissions reduction.

While such improvements typically have a positive impact on reducing auto use, the magnitude of that impact is difficult to estimate. Due to the scarcity of methodologies for accurately estimating the VMT impacts of nonmotorized transportation improvements at the project level, bicycle and pedestrian improvements were approximated using citywide factors based on research by Dill and Carr (2003).[18] Ultimately, the planned bike lanes in Long Beach contributed an estimated 38,000 annual tons of CO_2e reduced per bike lane mile.

7.1.6 Park-and-Ride Facilities

Increasing parking capacity at rail transit stations and major transit hubs reduces emissions by encouraging SOV drivers to shift to transit for a proportion of their commute trip. Both new facilities and expansions of existing parking facilities have the potential to reduce per capita GHG. A park-and-ride lot's potential for reducing GHG is a function of a number of inputs, including number of spaces; average parking lot utilization; average auto trip commute lengths; and the type of transit being served (e.g., urban rail, commuter rail, bus rapid transit (BRT)/ express bus, etc.). Project-specific inputs were provided by jurisdictions. Regional inputs, such as parking lot utilization and commute length, were

[18]Dill, Jennifer, and Theresa Carr, 2003, *Bicycle Commuting and Facilities at Major U.S. Cities: If You Build Them, Commuters Will Use Them*, TRB Annual Meeting, 2003. Based on surveys collected in 35 major U.S. cities with at least 250,000 population; each additional mile of Type 2 bike lanes per square mile is associated with a 1-percent increase in bike commuting. Note that this research differs from the methodology presented in Appendix K for quantifying GHG impacts from bicycle improvements.

approximated using local documents, such as the LACMTA *Gold Line Phase II Draft EIR* (2004).[19]

7.2 TRAVEL DEMAND MANAGEMENT STRATEGIES

7.2.1 TDM Strategies Employed to Reduce GHG Emissions

As stated above, the SCS analysis also included consideration of TDM strategies being employed by Gateway Cities and an assessment of their GHG emission reduction impacts in 2020 and 2035. The analysis keyed on three distinct strategies being implemented by many of the Gateway Cities, including:

1. Compressed work week schedules for city employees,
2. Ridesharing programs for city employees, and
3. TDM or Trip Reduction Ordinances for new development.

Compressed work weeks are generally in the form of city offices closing one day every two weeks, or offering employees 9/80 or 4/40 work schedules. Some cities also utilize 3/36 schedules for safety officers. As shown in Appendix E, 11 cities reported utilizing compressed work week schedules, with more than 3,200 employees participating.[20] It was estimated that, on average, 14 percent of a participating city's workers were off on any given day. Six cities reported having ridesharing programs for their employees, with various incentives and promotions for the use of alternative commute modes. Several of the cities reported that their Average Vehicle Ridership (AVR) was about 1.3 as a result of their ridesharing programs. This rate is a rise from pre-program levels of between 1.21 to 1.23. It was estimated that about 700 city employees subregion-wide were participating in ridesharing programs.

Finally, the last strategy, TDM ordinances, is reinforced by the LACMTA's Congestion Management Program and model TDM ordinance. TDM or Trip Reduction Ordinances have been adopted by many Los Angeles County cities in response to the LACMTA Congestion Management Plan, which includes developer-based TDM programs as one strategy for reducing congestion. Seven cities reported having TDM ordinances that apply to new or expanded commercial development (mainly office) of 25,000 square feet or more. One city reported that 30 percent to 40 percent of all its new commercial developments are subject to its TDM ordinance. Conservatively, estimating that these TDM ordinances result in a 10-percent reduction in vehicle trips (many studies show

[19] LACMTA, 2004, *Gold Line Phase II – Pasadena to Montclair – Foothill Extension DEIS/DEIR*, pp. 3-15-87.

[20] Appendix E provides the cost effectiveness of funded projects using published results of past evaluation studies, including many from the South Coast Air Basin.

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy

reductions of 20 percent or more[21]) and applying this travel behavior impact to 30 percent of the anticipated office growth in these 7 cities, it was possible to estimate the potential GHG reduction from applying TDM ordinance requirements to this new growth.

Table 7.1 provides an estimate of the annual estimated GHG reductions (stated as metric tons of CO2 reduced) for 2020 and 2035 for each of the three TDM strategies described above.

Table 7.1 Estimated Annual GHG Reduction from TDM Strategies for 2020 and 2035
In Metric Tons

TDM Strategy	Annual GHG Emission Reduction 2020	Annual GHG Emission Reduction 2035
Compressed work weeks[1]	607.5	530
Ridesharing program[2]	682.5	597.5
TDM ordinance**	415	607.5
Total TDM Reduction	1,705	1,735

[1] For city employees.

[2] Applied to new office development.

7.2.2 Other TDM Strategies Considered

The TDM analysis also sought to quantify the impact of several other travel-reducing strategies being employed in some Gateway Cities, but available data did not allow for more than a qualitative assessment. TDM strategies that likely would contribute to GHG reduction and that are being implemented in many cities include:

1. Participation in the Los Angeles County Bike to Work day (among city and private employees, estimated to reduce 4.36 ton of GHG on Bike to Work day within the Gateway Cities);
2. Promotion and sales of transit passes to residents and others within the city (the U-Pass program at Long Beach State is estimated to reduce more than 2,000 metric tons of GHG per year);
3. Safe Routes to School projects being implemented in many cities, which can lead to travel behavior change (and reduced idling); and
4. Distance learning at local colleges and universities through on-line courses, which reduces the need for some to drive to campus.

[21] Spack Consulting, "TDM: An Analysis of the Effectiveness of TDM Plans in Reducing Traffic and Parking in the Minneapolis/St. Paul Metropolitan Area," January 2010.

While some evidence exists in the form of the self-reported results provided above, insufficient data was available from which to estimate the GHG potential impacts across a broader set of implementing cities and private entities. The possible participation of private businesses and institutions presents significant potential for TDM strategies. To the degree that there is widespread TDM activities among these private entities, the GHG reduction from TDM may be much larger than estimated for this SCS. Unfortunately, the schedule and resources were insufficient to launch a comprehensive survey of Gateway Cities major employers.[22]

7.2.3 Interactive Effects Between TDM and Land Use/Transit Improvements

The analyses of TDM, transportation, and land use strategies, when considered independently, did not factor in the potential interactive effects between these complementary GHG reduction measures. Smart land use policies and transit service improvements can serve to enhance the effectiveness of TDM strategies, especially when focused on employment at new developments that would benefit from the same land use policies and transit enhancements. Therefore, an additional TDM analysis was undertaken to estimate the multiplicative effects of land use and transit improvements on TDM program effectiveness.

This analysis focused on the TDM Ordinance element of the TDM analysis summarized in Section 7.2.1. The TDM Ordinances are the avenue in which to condition developments to support vehicle trip reduction (and therefore GHG reduction) strategies. These same developments may occur in areas that will benefit from smart land use policies (increased density, mixed uses, etc.) and transit improvements (such as increased coverage, frequency, type of service, fare policies, transit marketing enhancements, etc.). Therefore, the interactive impact analysis of these three measures (TDM, transit, and land use) involved the application of a 13-percent trip reduction to new office development space as analyzed in Section 7.2.1. That analysis assumed an 8-percent vehicle trip reduction (VTR) based on a conservative estimate of TDM program effectiveness at new developments subject to TDM requirements. The higher effectiveness factor (13 percent vs. 8 percent VTR) is based on studies conducted in Utah[23] and Virginia.[24] In Fairfax County, Virginia, the research estimated the VTR impacts

[22] Participating cities were unable to provide sufficient detailed information regarding any business-related TDM strategies needed to calculate GHG emissions.

[23] Cambridge Systematics, *TDM Best Practices*, prepared for the Utah TravelWise Program, Utah DOT, Draft Report, submitted January 13, 2009.

[24] Cambridge Systematics, *Increasing the Integration of TDM into the Land Use and Development Process: Findings and Recommendations*, Draft Final Report, prepared for the Fairfax County DOT, submitted May 12, 2010.

of various TDM programs as implemented at new developments under various transit "intensity" assumptions. The results of that analysis are shown in Table 7.2.

Table 7.2 National Evidence on TDM Program Impacts
Vehicle Trip Reduction from Background Conditions

TDM Program or Strategy	High Transit	Moderate Transit	Low Transit
Support, Promotion, Information	3-5%	1-3%	<1%
Alternative Commute Services	5-10%	*5-10%*	1-3%
Financial Incentives	10-20%	5-15%	1-5%
Combined Strategies			
With Free Parking	*15-20%*	10-15%	3-7%
With Paid Parking	25-30%	15-20%	N/A[a]

Source: Cambridge Systematics, Inc., UrbanTrans, and ESTC for Fairfax County DOT, 2010.

This table was used to derive the projected vehicle trip reduction impacts for the application of the eight cities' TDM ordinances to the new development projected for each city (8 percent) and for enhanced transit and land use policies as reflected in higher transit availability (13 percent). Thirteen percent is a low estimate, as compared to the 15 to 20 percent cited in the table, given the lower base levels of transit availability in the Los Angeles Basin and the somewhat unproven relationship between land use, transit, and TDM effectiveness.

As shown in Table 7.3, the application of a 13-percent vehicle trip reduction to the eight cities with TDM ordinances and their projected growth in office development, the estimated GHG reduction (as compared to TDM ordinance effectiveness without interactive effects or an 8-percent VTR) results in the following estimated impacts.

Table 7.3 Estimated Annual GHG Reduction from TDM Strategies for 2020 and 2035 with and Without Interactive Effects
In Metric Tons

TDM Ordinance Impacts	Annual GHG Emission Reduction 2020	Annual GHG Emission Reduction 2035
Without Interactive Effects	415.0	607.5
With Interactive Effects	652.5	957.5

7.3 OTHER TRANSPORTATION STRATEGIES NOT INCLUDED IN THE GATEWAY CITIES SUBREGIONAL SCS

7.3.1 Strategies Submitted but not Analyzed

Several transportation and transportation demand management strategies were submitted by Gateway Cities jurisdictions for analysis, but were either incomplete, did not have sufficient information for analysis, or were not relevant. Appendix D provides a list of these strategies under "Gateway Cities Submitted Other Projects that Were Not Analyzed." These projects were not analyzed for the SCS due to several overarching reasons:

- **ITS Applications such as Traffic Management Centers and Traffic Control Systems.** These are important systems operations improvements that could relieve congestion and reduce bottlenecks in the corridor. Many of these investments are providing infrastructure for coordinated signal systems; however, based on the information provided by cities, a rigorous analysis could not be performed without more information. These systems could be examined in the future for possible GHG reduction potential. Table 7.4 shows the range of annual GHG reduction that could be achieved with different ITS applications.
- **Transit Amenities on a Micro Scale, such as Bus Stops and Shelters**. There is no peer-reviewed literature on the analysis of GHG reduction due only to transit amenities at the micro scale. Even with improvements at a handful of select bus stops, the change in ridership and GHGs is likely to be minimal. There are studies that show that comprehensive improvements in "customer service orientation," including much more than just bus stops, can lead to a significant ridership increase; however, these strategies would move beyond the amenities submitted.
- **Transit Electric Vehicle Connection.** The Gateway Cities, along with the rest of Southern California, are encouraging electric vehicle usage by installing electric vehicle charging stations at key transit nodes. To date, the research concerning GHG reduction due to mode shift has not been conclusive and there is not yet enough evidence on GHG reduction potential due to electric vehicles as a connection to transit. In the upcoming year, more studies will be conducted, including one by Southern California Edison on Electric Vehicle Readiness.

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy

Table 7.4 GHG Reduction from ITS Applications from *Moving Cooler*

	Moving Cooler Range of Percentage Annual GHG Reduction from Nationwide Baseline[2]		*Moving Cooler* Reduction per Cost (Metric Tons Reduced per 2008 Dollars Implementation Cost)[3]	
ITS Application[1]	Min	Max	Min	Max
Ramp Metering	0.01%	0.44%	0.011	0.025
Variable Message Signs	0.00%	0.01%	0.001	0.003
Active Traffic Management	0.01%	0.42%	0.003	0.004
Integrated Corridor Management	0.01%	0.42%	0.004	0.031
Incident Management	0.00%	0.45%	0.006	0.026
Road Weather Management	0.00%	0.00%	0.000	0.001
Signal Control Management	0.00%	0.15%	0.001	0.003
Traveler Information	0.00%	0.15%	0.002	0.006
Vehicle Infrastructure Integration	0.01%	0.37%	0.000	0.002

1. Further definitions and assumptions on levels of deployment can be found in *Moving Cooler*, Appendix A, page A-14.
2. *Moving Cooler*, Appendix D, Tables D.3 and D.4. Note that percentage reductions are compared to a nationwide baseline, and ITS strategies are only applied in locations with certain levels of congestion. Therefore percentage reductions for urban areas may be higher than national numbers because they have a higher share of congested roadways than the whole nation.
3. Calculated from *Moving Cooler* Main Report, Table 4.1.

7.3.2 Possible Strategies to Consider for the Gateway Cities

Beyond the strategies selected for analysis in the Gateway Cities subregional SCS, there are several additional strategies that could be explored further in future SCS development. The *Moving Cooler* report analyzed nearly 50 strategies; some of which were included in the SCS, some of which do not apply to SB 375, and some of which cannot be implemented at the local or regional level.

There are, however, three categories of strategies that could be explored further in future SCS development.

- **TDM or Trip Reduction Ordinances**. Within this SCS, we have analyzed the GHG reduction for eight cities in the Gateway Cities reporting having TDM ordinances.[25] Based on an understanding of the LACMTA's Congestion Management Program and model TDM ordinance, it is assumed that many

[25] TDM or Trip Reduction Ordinances have been adopted by many Los Angeles County cities in response to the LACMTA Congestion Management Plan, which includes developer-based TDM programs as one strategy for reducing congestion.

cities – if not all of the cities within the Gateway Cities – have adopted a TDM ordinance within the Gateway Cities. Further assessment of which cities in the Gateway Cities have adopted and implemented TDM ordinances could provide more GHG reduction within the subregion.

- **Pricing strategies (congestion, parking, VMT, etc.).** Despite the political challenges associated with implementing pricing strategies, this category can be both cost effective and provide significant GHG reductions. This category of strategies focuses on raising the costs associated with use of the transportation system by autos and especially by SOVs, both in terms of the cost of VMT and fuel consumption. The revenues generated from pricing strategies can be reinvested in transportation infrastructure, potentially covering the costs of implementing GHG reduction strategies.
- **Regulatory strategies (urban nonmotorized zones, urban parking restrictions, etc.).** This category includes various regulatory measures to moderate vehicle travel and encourage more efficient driving.

For the Gateway Cities, parking pricing merits particular attention. Parking fees could be implemented and charged for parking in CBDs in shopping districts and downtown areas, employment areas, and retail centers to encourage "park once" behavior or reduce single-occupant trips. Other approaches include the introduction of taxes or higher fees on otherwise free private parking lots and parking management approaches, including requirements for residential parking permits, as well as permits for delivery and service vehicles and for visitors.

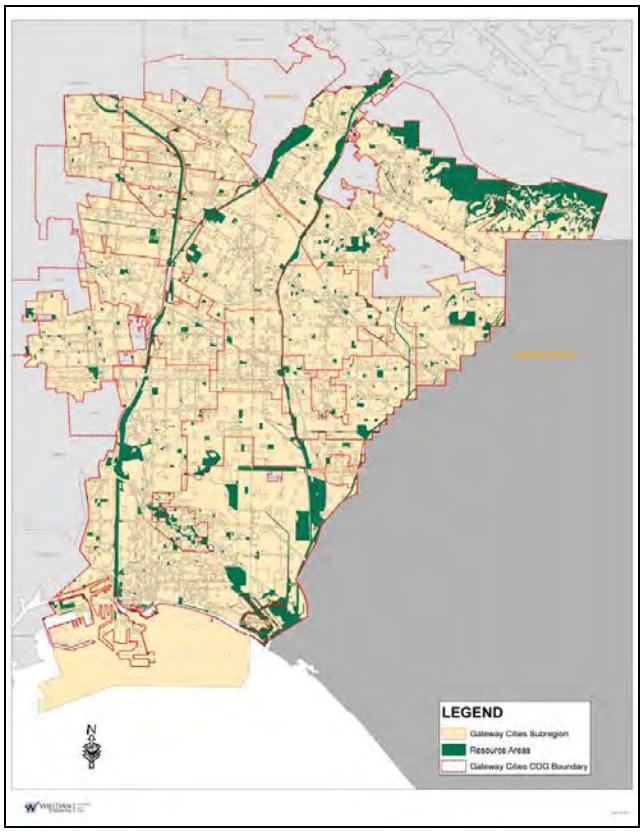
In terms of regulatory strategies, nonmotorized zones could be established in CBDs and regional employment and retail centers, transforming these areas to transit malls, linear parks, or other nonmotorized zones. Parking restrictions could be imposed in urban areas, capping the absolute number of commuter spaces in a CBD and other regional employment and retail centers, with potential exception for carpools.

8.0 Resource Areas and Farmland

In preparing the SCS, the Gateway Cities COG was required to gather and consider the best practically available information regarding resource areas and farmland in the Gateway Cities subregion. As defined in Government Code §65080.01, resource areas include:

1. All publicly owned parks and open space;
2. Open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;
3. Habitat for species identified as candidate, fully protected, sensitive, or species of special status by local, state, or Federal agencies or protected by the Federal Endangered Species Act of 1973, the California Endangered Species Act, or the Native Plant Protection Act;
4. Lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts, or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code, and lands under Williamson Act contracts;
5. Areas designated for open-space or agricultural uses in adopted open-space elements or agricultural elements of the local general plan or by local ordinance;
6. Areas containing biological resources as described in Appendix G of the California Environmental Quality Act Guidelines that may be significantly affected by the SCS or the alternative planning strategy; and
7. An area subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program, or where the area is subject to more protective provisions of state law or local ordinance.

Farmland, as defined in Government Code §65080.01, means farmland that is outside of all existing city spheres of influence or city limits as of January 1, 2008; and is classified as prime or unique farmland or farmland of statewide importance.



There is no farmland as defined above in the Gateway Cities subregion. Given the absence of farmland, there are no lands under Williamson Act contracts. Likewise, there are no areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code. Nevertheless, there are a variety of other resource areas in the subregion, as defined in Government Code §65080.01.

The existing resource areas within the Gateway Cities subregion are shown on Figure 8.1. These resource areas are an integral part of the planned urban development pattern for the subregion as depicted on the general plans of the Gateway cities. These resource areas contribute to the sustainability of the subregion by the various functions they perform, which include:

- Meeting the recreational needs of the subregion's residents, and thereby contributing to their health and well being through the provision of parks, golf courses, and other recreational facilities;
- Serving as aquifer recharge areas that allow for the replenishment of the groundwater basins beneath the subregion on which the Gateway Cities rely for a major portion of their water supply;
- Preserving significant habitat and other ecologically important areas that are critical to maintaining the biodiversity of the subregion;
- Protecting residents and property within the subregion from the hazard of flooding through an integrated system of flood control facilities; and
- Supporting the production of energy resources by accommodating oil recovery operations.

Recognizing the importance of these areas to the sustainability of the subregion, the majority of these areas have been designated in the Gateway Cities general plans and zoned as open space or public facilities. In doing so, the Gateway Cities have clearly expressed their intent that these areas be preserved in perpetuity as open space/publicly-held land. The one major exception is the areas devoted to oil production. However, the preservation of these areas as open space is not essential to the continued production of oil in these areas. Through the consolidation of wells at strategically located drill sites and the use of slant drilling and other recovery techniques, oil production operations can continue within the oilfields existing across the subregion for years to come while releasing surface areas for other forms of urban in-fill development.

Figure 8.1 Resource Areas

9.0 State Housing Goals

The SCS must consider the state housing goals set forth in Government Code §65580 and §65581. In establishing state housing policy, the California Legislature finds and declares in Government Code §65580 that:

- The availability of housing is of vital statewide importance, and the early attainment of decent housing and a suitable living environment for every Californian, including farm workers, is a priority of the highest order.
- The early attainment of this goal requires the cooperative participation of government and the private sector in an effort to expand housing opportunities and accommodate the housing needs of Californians of all economic levels.
- The provision of housing affordable to low- and moderate-income households requires the cooperation of all levels of government.
- Local and state governments have a responsibility to use the powers vested in them to facilitate the improvement and development of housing to make adequate provision for the housing needs of all economic segments of the community.
- The Legislature recognizes that in carrying out this responsibility, each local government also has the responsibility to consider economic, environmental, and fiscal factors and community goals set forth in the general plan; and to cooperate with other local governments and the State in addressing regional housing needs.

In Government Code §65581 the Legislature further states that, in enacting the requirement that each general plan must contain a housing element, it is their intent:

- To assure that counties and cities recognize their responsibilities in contributing to the attainment of the state housing goal;
- To assure that counties and cities will prepare and implement housing elements that, along with Federal and state programs, will move toward attainment of the state housing goal;
- To recognize that each locality is best capable of determining what efforts are required by it to contribute to the attainment of the state housing goal, provided such a determination is compatible with the state housing goal and regional housing needs; and
- To ensure that each local government cooperates with other local governments in order to address regional housing needs.

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy

These state housing goals were considered and fully taken into account during the formulation of this SCS. The general plans of the COG's member cities, which collectively constitute the land use component of the SCS, allocate adequate land at appropriate densities for residential development to meet the projected housing needs of the Gateway Cities subregion. The goals and policies found in the housing elements of these general plans are consistent with the state housing goals, and the housing programs being implemented by the Gateway Cities contribute to the attainment of the state housing goals. Some of the more widely implemented programs being deployed by the Gateway Cities to expand the supply of housing in the subregion that is affordable to low- and moderate-income households, while also contributing to a more sustainable development pattern within the subregion, have already been identified in Section 6.0 of this SCS. Additional measures that have been taken by the Gateway Cities to address the housing needs of all economic segments of the subregion's population include:

- Utilizing zoning and property rehabilitation programs to preserve well-established residential neighborhoods and existing housing affordable to low- and moderate-income households;
- Utilizing zoning and other land use controls to accommodate the housing needs of the elderly, disabled, homeless, and other special needs households;
- Providing rental assistance to lower-income households; and
- Offering first-time homebuyer assistance to low- and moderate-income households.

10.0 Integration of Development Pattern with the Transportation Network

This section describes the methodology used to integrate future land development patterns for the subregion with the transportation network and the travel demand the network accommodates. The SCAG Sustainability Tool is used to analyze 2020 and 2035 land use scenarios for each of the 26 participating cities. Additionally, the subregional transportation network and other transportation measures and policies are layered on top of the locally significant projects listed in Section 7.0 and their combined impacts are assessed. This section also reports interactions or synergies between land use changes and the transportation strategies and policies. These synergies add significant magnitude to the reductions of GHG emissions from individual strategies in 2035.

10.1 Land Use Analysis Using the Sustainability Tool

SCAG has expended significant effort and conducted extensive one-on-one outreach efforts to develop the Sustainability Tool (ST). For the subregional SCS, Gateway Cities has used the ST as the primary method of assessing GHG impacts of future land use scenarios from individual jurisdictions (i.e., the 26 participating Gateway Cities). By using the tool developed by SCAG, the Gateway Cities have been able to estimate GHG reductions from land use strategies, and provide the underlying GIS and Excel datasets to SCAG in order for SCAG to include the analysis in the regional SCS.

One of the primary goals of SB 375 involves motivating local governments to implement aggressive smart growth land use strategies, and integrate these with systematic transit and nonmotorized transportation investments. The consultant team and SCS Policy Development Committee advocated for this goal. Consultants, COG staff, and Committee members encouraged city staffs to consider aggressive land use reforms during the four technical workshops and numerous communications with individual cities throughout the SCS development process. Some cities had already incorporated significant smart growth policies during the most recent update to their general plans. Other cities considered pushing density and clustering of mixed-use development beyond what was specified in their general plans. Long Beach, for example, experimented with some extremely dense development throughout their transit

corridors and CBDs. At the end of this process, however, no city adopted land use policies for this SCS that significantly vary from those in their adopted general plans. This outcome probably came about for four reasons:

1. Some cities have already adopted aggressive smart growth policies in their general plans. As an almost universal fact of local governments, cities will protect their authority over land use planning zealously.
2. All cities are currently facing significant slumps in development and may be concerned that aggressive land use regulation may discourage new development.
3. Just about all Gateway Cities are built out and are expecting modest amounts of in-fill development, which provides only modest opportunities to increase density and envision "place making" development opportunities.
4. High quality transit nodes require high quality transit service to attract riders. Current funding for such services has been reduced and service quality has suffered. Meanwhile, little or no incentives (e.g., parking charges, congestion pricing, carbon tax, etc.) have been seriously proposed, let alone implemented, to encourage less driving and more use of transit, biking, and walking. Most transportation analysts are adamant that until pricing policies are used to discourage driving, auto travel will dominate other modes of travel almost regardless of land use policy.

Of the 26 participating cities, 11 cities evaluated the land use data loaded as default scenarios into the ST, and these cities worked with SCAG to develop a modified 2008 land use scenario, as well as apply smart growth policies in 2020 and 2035 scenarios.[26] The remaining cities used the ST equivalents of their adopted general plans (i.e., default scenarios in the ST), which is SCAG's best judgment of city general plans converted to 5.5-acre grid cells. The ST has functionality that estimates the interactions between land use (expressed as one of 24 types of land use) and proximity to a transit node. The ST specifies proximity as one-quarter mile from a bus stop and one-half mile from a passenger rail station. These interactions are included in the estimated GHG reductions from each city's 2020 and 2035 land use policies.

The resulting GHG reduction amounts to 0.47 lbs CO_2e per capita per day in 2020 and 0.49 lbs CO_2e per capita per day in 2035. Individual city scenarios can be found in Appendix F.

[26] The ST converts general plan information from each city into 5.5-acre grid cells, where each grid cell is assigned 1 of 26 possible types of land use. This assignment process provides a reasonable approximation of a city's aggregate land use, but may on occasion assign general plan land use designations to incorrect grid cell types.

10.2 REGIONALLY SIGNIFICANT TRANSIT AND TRANSPORTATION IMPROVEMENT PROJECTS

Planned regional transportation projects located within or near the Gateway Cities (e.g., HOT lanes on I-110, Green Line extension to LAX, Regional Connector) will impact GHG within the subregion. Gateway Cities COG staff determined 17 such projects are included in the RTP. These include Measure R projects, such as multimodal and intermodal facilities; and ramp and freeway improvements, such as HOV, HOT and toll lanes.[27] The list of projects is shown in Table 10.1.

Table 10.1 Key Regional Projects Included in the Gateway Cities SCS

2020 Regional Project List	Anticipated Completion	Fully Funded/ Part of RTP	Partially Funded/Potentially Likely to Proceed
I-5 (between I-605 to countyline)	2020	✓	
I-110 Harbor Transitway HOV lane conversion to HOT lanes	2012	✓

Signal Synchronization of Major Arterials (re: I-710)	2025		✓
SR 91/I-605/I-405 Arterial Highway Improvements	2035	✓	

[27] Measure R is a one-half-cent, 30-year sales tax dedicated to specific transportation improvements throughout Los Angeles County. Appendix G lists the specific projects located within the Gateway Cities region.

The analysis of their estimated GHG reductions requires using the travel demand model output from LACMTA and SCAG. As shown in the second column of Table 10.1, the anticipated dates of completion for all but one of these projects (I-5 between I-605 to county line) occur after 2020. Most of their estimated GHG impacts, therefore, are accounted for in the second target period from 2021 to 2035. The results of LACMTA and SCAG modeling of these 17 projects were input into EMFAC emission model, which estimated a 7.0 percent reduction in daily CO_2 in 2035, compared to the 2005 benchmark, because of increases in network speed; and a 1.1-percent reduction because of reduced VMT (i.e., mode shift). When these two are combined, the estimated total daily CO_2 reduction is 7.07 percent (the two are combined by multiplying rather than adding).[28] Appendix G explains the methodology and analysis for the quantification of GHG reduction due to regional transportation projects.

10.3 LAND USE – REGIONAL TRANSIT CAPACITY EXPANSION INTERACTION

10.3.1 Overview

The ST estimates the interaction between new development and redevelopment in Gateway Cities and regional public transportation projects funded under Measure R with the same methodology as applied for a local bus or local rail transit service. This interaction, however, may be more substantial for regional transit projects that will serve travel across the subregion, the county, and the region. This higher level of mobility from regional transit produces larger interactive impacts when station areas are developed as higher-density transit-oriented developments (TOD).

10.3.2 Assessment Process in Gateway Cities SCS

There are two primary components to the land use-regional transit capacity expansion interaction under consideration in the SCS:

1. **Regional Transit Walk Access.** There are two potential interactions to consider:
   a. Residential and commercial development and redevelopment identified in the Gateway Cities adjacent to existing and planned transit stations will on average generate less VMT per household than households not adjacent to transit. This interaction is accounted for in the ST.

[28] The relative change in CO_2 emissions based on build/no-build comparisons from Metro's modeling for the 2009 LRTP was used to estimate the emission reductions for the 17 identified projects. This assumes that the benefits of the 2009 LRTP are distributed equitably across Los Angeles County.

b. The improvement of transit access to regional destinations outside the Gateway Cities and new high capacity and frequent regional transit service in Gateway Cities improves the level of service and utility of the transit mode leading to mode shift from vehicle-based trips.

2. **TOD Opportunity.** New or improved transit stations may attract new TOD, as long as the appropriate combinations of higher-density, mixed-use zoning, parking policies, urban design guidelines, and redevelopment investments are implemented. This type of high density and mixed residential and commercial development should facilitate attracting residents and workers with higher propensities for transit trips.

10.3.3 Regional Transit Walk Access

The ST has functionality that estimates the interactions between land use (expressed as the trip generation characteristics and mode shares of the 24 types of land use) and proximity to a fixed-guideway transit node (defined as within one-half mile) or a bus stop (defined as within one-quarter mile). The ST subdivides the growth forecasts from the cities into 5.5-acre grid cells, overlays the data with existing and planned transit facilities (planned transit facilities include all projects in the fiscally constrained RTP), and flags all cells within a one-half mile of rail stations and one-quarter mile of bus stops.

In the ST, regional transit walk access is the most significant environmental predictor of household transit trips, with an average elasticity of 0.25 (meaning that for every 10-percent increase in households flagged with regional transit walk access, there is an estimated 2.5-percent increase in transit trips.). Another way to view this interaction is that for every 100 new trips generated within one-half mile of regional transit, 25 of them will be on transit (a 25-percent mode share).

The GHG reduction estimates developed through the ST reflect the benefit of both the growth and land use changes within the Gateway Cities through 2035 and the added accessibility to regional destinations through new transit access in the RTP.

What the ST does not presently consider is the additional VMT reduction that could occur in the Gateway Cities as a result of long-range implementation of Measure R projects that are partially funded and not included in the current fiscally-constrained RTP. Projects in the Measure R plan, anticipated to be completed by 2035 impacting travel in Gateway Cities, include the Gold Line Eastside Extension, the Orange Line Development Authority (OLDA) grade-separated regional transit project, the Regional Connector project linking the Blue Line to other lines in Downtown Los Angeles, and the Green Line extension to Los Angeles International Airport (LAX). These projects will positively affect transit ridership in the Gateway Cities in two ways: 1) the projects will improve regional access to attractions, employment, and services for Gateway Cities

households, and 2) the projects will provide a new fixed guideway transit alternative to private vehicle or bus transit trips.

Fixed guideway transit (i.e., commuter or light rail) tends to be more attractive than bus transit to discretionary travelers (people who have the option of driving), including commuters, visitors, and people traveling to major sport and cultural events if they are located along transit lines. To reflect the transition from bus to fixed-guideway transit access, an assumption that the regional transit walk access elasticity increases from 0.17 for bus to 0.33 for rail is reasonable for these discretionary trips. In other words, travelers with existing access to bus transit would be 1.5 to as much as 2 times as likely to choose transit if they had access to rail transit (while controlling for socioeconomic variables). This increase in transit mode share makes the regional rail projects that transect the Gateway Cities subregion more effective at reducing GHG than existing bus service, and even more effective when rail station areas are developed as TODs.

10.3.4 TOD Opportunity

In expanding transit corridors in California and elsewhere, the presence of new, high capacity, high level of service public transportation options has been shown to be a catalyst for new or redevelopment. Through zoning codes and development regulations, cities may support development of these areas through reduced parking requirements, tax increment financing, and other incentives to maximize the opportunity for development and capitalize on their investment in transit.

It is uncertain how much the opportunity for rezoning and eventual redevelopment of land uses near planned transit stations is incorporated into city general plans. OLDA is the only transit project in the Measure R plan anticipated to be completed by 2035 within the Gateway Cities. This project, which could facilitate TOD in Gateway Cities, would provide access to Vernon, Maywood, Bell, Huntington Park, Cudahy, Downey, South Gate, Paramount, Artesia, Bellflower, and Cerritos.

In addition, other regional transit projects that increase the level of service and accessibility to attractions outside the Gateway Cities (for example, such as new Green Line access to LAX) could also, to a lesser degree than above, facilitate TOD at existing transit stations in the Gateway Cities. It is likely that the benefits from TOD at these locations would occur sooner than TOD associated with the OLDA project given that the transit infrastructure is already in place.

The level to which growth in the Gateway Cities could intensify or be redistributed to focus in areas adjacent to new fixed-guideway transit stations is dependent on available development capacity, supporting infrastructure, zoning and development regulations, and future economic and market conditions. The example analysis of this interaction considers the effect of TOD in areas within one-half mile of Orange Line transit stations.

10.3.5 Results of Interactions

The data summarized in Table 10.2 reflects the range of potential benefits resulting from the interaction between land use and Measure R transit projects in the Gateway Cities in 2035. Given the anticipated long timeframe for implementation of the Measure R transit projects, as well as the long lead time for redevelopment activities adjacent to new transit, the resulting estimated GHG reductions associated with this interaction are only considered for 2035.

Table 10.2 Gateway Cities SCS – GHG Reduction from Land Use and Regional Transit Interactions

Gateway Cities – Land Use and Regional Transit Interaction	2035
Interaction 1 – Regional Walk Access	
Improved Access to Regional Destinations	
• Average Daily VMT per Household in Gateway Cities	42.5
• Total Daily GHG Reduction (lbs GHG per capita)	0.041-0.062
New Access to Fixed Guideway Transit	
• Total Households within 1/2 mile of possible future station location for potential OLDA project[1]	40,075
• Total Daily GHG Reduction (lbs GHG per capita)	0.021-0.042
Interaction 2 – TOD	
• Target Density Range in TOD Station Areas (TOD defined as ½ mile of station)[2]	23.7-60.7 dwelling units/acre
• Total Households in TOD Station Areas	8,186-20,966
• Total Daily GHG Reduction (lbs GHG per capita)	0.058-0.073
Total Daily GHG Reduction (lbs GHG per capita)	0.120-0.177

Notes:

1. Assumes constant residential density across each city based on 2035 forecasts.

2. Change characteristics of range from *Town Residential Low Mix* to *Town Residential High Mix* for TOD station areas, as defined in the ST.

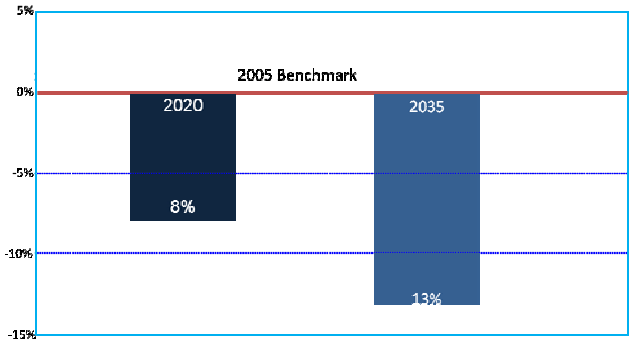
Further explanation on interactive effects between transit and land use can be found in Appendix H.

11.0 Compliance with Regional and Federal Requirements

11.1 COMPLIANCE WITH SCAG SCS/RTP

At the time of this subregional SCS submittal, the SCAG RTP is still under development; thus, Gateway Cities COG cannot determine if the SCS strategies, growth forecasts, land use, housing accommodation, and other elements of this subregional SCS conform with the SCAG RTP and regional SCS plans and assumptions. Nevertheless, the transportation investments included in this subregional SCS must also be included in the 2012 RTP, and must be scheduled in the Regional Transportation Improvement Plan (RTIP) for construction completion by the target years (2020 and 2035) in order to demonstrate any benefits as part of the SCS. Gateway Cities COG has collaborated with LACMTA to coordinate the subregional SCS with future transportation investments.

Gateway Cities COG expects SCAG to accept and incorporate this subregional SCS because 1) it complies with SB 375, 2) it complies with Federal law, and 3) it complies with SCAG's Subregional Framework and Guidelines. Furthermore, the compiled Gateway Cities subregional SCS achieves the regional targets set for SCAG by CARB. Gateway Cities have adhered to a process and timeline; whereby, the draft subregional SCS was delivered to SCAG for its review and comment, so that SCAG could identify any inconsistencies and resolve these prior to the final SCS being completed.



While completion of this subregional SCS does not exempt the subregion from further GHG emission reduction measures being included in the regional SCS, the clear intent and purpose of this subregional SCS is to occupy the field. Thus, the Gateway Cities COG does not expect to be compelled to adopt additional regional measures needed to meet the regional targets.

In addition, this SCS does work with SCAG to take advantage of the California Environmental Quality Act (CEQA) streamlining provisions of SB 375. To help Gateway Cities COG jurisdictions take advantage of the CEQA streamlining, SCAG will include maps in the regional 2012 RTP/SCS in order to show the uses, densities, intensities, and locations for future development; and in order to facilitate subsequent project consistency findings. More on this subject can be found in Appendix I.

11.2 COMPLIANCE WITH CARB REGIONAL TARGETS

According to CARB, the SCAG region is to comply with the regional targets set forth through the Regional Targets Advisory Committee target-setting exercise.[29] For the SCAG region, the proposed targets are 8 percent per capita GHG reduction from passenger vehicles and light trucks for 2020 relative to 2005 and 13 percent in 2035 (Figure 11.1).

Figure 11.1 CARB GHG Emissions Target for SCAG Region (Emission Reduction Based on 2005 per Capita CO_2e)

Although the regional targets are not applicable at the subregional level, the Gateway Cities wished to compare the performance of their SCS with the regional targets. Thus, the Gateway Cities worked with SCAG to obtain the information needed to generate the Gateway Cities subregional baseline emissions per capita in 2005. This analysis applied the Adopted 2008 RTP Growth Forecast and the Local Input/General Plan 2012 RTP Growth Forecast as the per capita denominator for the SB 375 target years of 2020 and 2035. The results of this analysis produced an estimated daily GHG per capita for 2005 of 16.64 lbs CO_2e for the Gateway Cities subregion, compared to 21.2 lbs CO_2e for the SCAG region.[30] This difference is consistent with the following differences between the Gateway Cities subregion and the SCAG region as a whole: higher

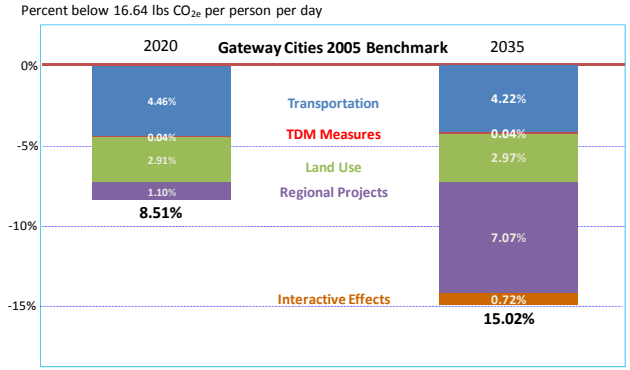
[29] CARB, Staff Report, *Proposed Regional Greenhouse Gas Emission Reduction Targets for Automobiles and Light Trucks Pursuant to Senate Bill 375*, September 23, 2010.

[30] The unincorporated areas of Gateway Cities subregion are included in the total GHG per capita baseline.

land use density, lower car ownership per household, higher density and service levels for transit, and lower VMT per household. The 16.64 lbs CO_2e per capita in 2005 for the Gateway Cities subregion serves as the benchmark for the Gateway Cities SCS attainment of the CARB targets for the SCAG region. The estimated GHG reductions relative to this benchmark are achieved with the following five bundles of strategies.

1. **Transportation Strategies.** Participating cities submitted approximately 340 strategies; of these, a subset of strategies was either incomplete, did not have sufficient information for analysis, or was not relevant. (See Section 7.3.1, Strategies Submitted but not Analyzed, and Appendix D for detailed descriptions of these projects.) This portfolio generates a significant amount of reduction, the highest GHG reduction after the regional transportation projects. The interactive effects between these strategies and land use (smart growth policies) are accounted for in the land use analysis.
2. **TDM Strategies.** The focus was on three main categories of TDM: compressed work week schedules for city employees (12 cities), ridesharing programs for city employees (6 cities), and TDM or Trip Reduction Ordinances for new development (8 cities). This bundle also incorporates the interactive effects between TDM and land use and transit.
3. **Land Use.** Of the 26 participating cities, 11 cities chose to modify their land use in the ST. These cities worked with SCAG to develop a modified 2008 scenario that more closely approximated their current land use, as well as to apply smart growth policies in 2020 and 2035 scenarios. The remaining cities used the ST-equivalents of their adopted general plans (i.e., default scenarios in the ST), which is SCAG's best judgment of city general plans converted to grid cells. The ST has functionality that estimates the interactions between each of its 24 types of land use and proximity to a transit node.[31] These are included in the estimated GHG reductions from each city's 2020 and 2035 land use policies.
4. **Regional Projects, including Measure R.** Regional transportation projects located within or near to the Gateway Cities will reduce GHG within the subregion. Gateway Cities COG staff determined 17 projects that are included in the RTP, such as multimodal and intermodal facilities; and ramp and freeway improvements, such as HOV, HOT, and toll lanes. The analysis of their estimated GHG reductions was derived from travel demand model output from LACMTA and SCAG.
5. **Interactive Effects Between Land Use and Regional Transit Projects.** The long timeframe for implementation of the Measure R transit projects and the long lead time for redevelopment activities adjacent to new transit justify

[31] Proximity is defined as one-half mile from a rail station and one-quarter mile from a bus stop.



only attributing estimated GHG reductions resulting from the interaction between land use and Measure R transit projects in the Gateway Cities in 2035 and none in 2020.

Combining the GHG reduction strategies from the five categories described above, the subregion as a whole is expected to reduce GHG per capita from the benchmark in 2005 by approximately 8.5 percent in 2020 and just over 15 percent in 2035. Table 11.1 and Figure 11.2 present these results.

Table 11.1 Summary GHG Reduction Results for Gateway Cities from 2005 Benchmark
In lbs CO2e per Person per Day

	Absolute Daily GHG Reduction per Capita		Percentage Daily GHG Reduction Per Capita	
	2020	2035	2020	2035
Transportation	0.74	0.70	4.46%	4.22%
TDM	0.007	0.007	0.04%	0.04%
Land Use	0.48	0.49	2.91%	2.97%
Regional Projects	0.18	1.17	1.10%	7.07%
Interactive Effects	N/A	0.12	N/A	0.72%
Total	1.40	2.48	8.51%	15.02%
SCAG Targets			*8%*	*13%*

In lbs CO2e per Person per Day

11.3 Compliance with the Federal Clean Air Act

Under California Government Code §65080(b)(2)(B), the SCS prepared by SCAG is subject to the requirement that it allow the regional transportation plan to comply with Section 176 of the Federal Clean Air Act (42 U.S.C. Sec. 7506). Section 176 is the portion of Title I, Subpart D, Subpart 1 of the 1990 Clean Air Amendments that establishes the statutory authority for the Transportation Conformity rule and the General Conformity rule. While there is no State Implementation Plan (SIP) budget or National Ambient Air Quality Standards (NAAQS) for GHG emissions, the policies and projects included in the SCS are likely to also affect the criteria pollutant and their precursor emissions, which are subject to conformity.

What are the Requirements?

Transportation Conformity and General Conformity requires that Federal actions (including transportation plans and programs) conform to the region's State Implementation Plan [42 U.S.C. Sec. 7506(c)(1)]. Activities cannot:

- cause or contribute to any new violation of any standard in any area;
- increase the frequency or severity of any existing violation of any standard in any area; or
- delay timely attainment of any standard or any required interim emission reductions or other milestones in any area [42 U.S.C. Sec. 7506(c)(1)(B)].

The Transportation Conformity rule specifies procedures for use in the evaluation of transportation plans and programs. Generally, these include an emissions budget test, timely implementation of all SIP traffic control measures (TCM), and use of the latest planning assumptions.

General conformity applies to all Federal actions (e.g., funding, licensing, permitting or approving) that do not include the FHWA/Federal Transit Administration (FTA) projects. In an area with a SIP, General Conformity can be demonstrated in one of four ways:

1. By showing that the emission increases caused by an action are included in the SIP;
2. By demonstrating that the State agrees to include the emission increases in the SIP;
3. Through offsetting the action's emissions in the same or nearby area; or
4. Through mitigation to reduce the emission increase.

Gateway Cities SCS

The emission budget tests are applicable to both Transportation Conformity and General Conformity, but are applicable to the South Coast Air Basin as a whole, rather than the Gateway Cities subregion. The strategies covered in the Gateway Cities SCS are expected to reduce the emissions of criteria pollutants and their precursors and, therefore, are consistent with the emission budget tests that SCAG will be required to meet for the next RTP. Many of the regional projects are already included in conforming SCAG RTP and RTIP.

Transportation conformity requires timely implementation of all transportation control measures from the applicable state implementation plan. The 2007 Air Quality Management Plan (AQMP)/SIP includes the following three Transportation Control Measures (TCM) project categories:

1. HOV measures,
2. Transit and systems management measures, and
3. Information-based transportation strategies.

The TCM project categories in Appendix IV-C of the Regional Transportation Strategy and Control Measures of the 2007 Ozone AQMP/SIP are consistent with those of TCM01 specified in the 1994 and subsequent Ozone SIPs, and consist of the projects as specified in the fiscally-constrained portion, or the first two of the years (i.e., fiscal year (FY) 2010/2011 to 2011/2012) of SCAG's 2011 FTIP, adopted September 2, 2010.

SCAG's 2011 FTIP incorporates LACMTA's 2009 LRTP, which was the basis of the regional projects incorporated into the SCS. Therefore, the SCS incorporates all applicable transportation control measures from the 2007 SIP, and is

consistent with the transportation conformity rule's timely TCM implementation requirement.

Future Implementation

Experience in the Bay Area and San Joaquin Valley has shown that assumptions and proposed controls in the RTP can be treated by U.S. Environmental Protection Agency (EPA) as TCM during SIP revisions. When selecting strategies, the implications of the SCS strategies and land use assumptions becoming SIP TCMs, subject to timely implementation requirements, should be considered.

12.0 Financial and Fiscal Implementation

This section considers the fiscal challenges of implementing the SCS strategies, especially those that would be funded by local jurisdictions. The fiscal challenges are large, including the need for approximately $156 million in project funding, even though the plan provides over $215 million in committed funding (see Table 12.2). The cities and MPOs throughout the State have consistently commented that the success of GHG reductions at the local level relies on the State assisting Cities in developing predictable and stable funding sources in order to implement the SCS. The existing predictable and stable funding sources have been eviscerated at the State and local level as result of the impacts of the severe economic recession of 2008 to 2010 and the slow economic recovery. These include drops in sales tax revenues that support local transportation projects, as well as deferrals of local revenues collected by the State. This unpredictability makes it very difficult to plan the major statewide and regional projects that are necessary for GHG reductions.

In many ways, this has been the most severe economic recession since the Great Depression of the 1930s. The impacts of the current recession have been felt especially in the Gateway Cities in terms of persistent high unemployment. Unemployment in the Gateway Cities totaled 13.2 percent in April of this year. Six of the Gateway Cities have unemployment above 15 percent, while 11 of the local communities have unemployment above 13 percent. The City of Long Beach has an unemployment rate of 12.9 percent, with 30,700 persons out of work. Local municipal budgets have been severely reduced by the impacts of the recession, and the State has proposed the elimination of redevelopment, which up to now has been a successful tool at promoting sustainable communities and transit-oriented development in the Gateway Cities subregion. California's housing market and construction industry has borne the brunt of the recession. The State has the highest number of housing foreclosures in the nation, and the bottom of the housing market has not yet been reached. Building permit activity in the region is at historic lows.

The communities in the Gateway Cities have been proactive in funding this Subregional SCS, and will continue to be proactive in developing and securing the necessary funds to implement the strategy. The voters in Los Angeles County have supported three "self-help" sales tax increases over the last 25 years in order to implement transportation measures, the most recent being Measure R. A small number of the Gateway Cities have traffic mitigation fees, and the LACMTA is working on a pilot program for several of the cities. However, there is great concern in many of the communities that an impact fee will adversely impact a fragile and tentative economic recovery. The success of the Gateway

Cities SCS depends in good part in financial assistance from both the State and Federal government, recognizing that there is only so much local funding that is realistic and available.

12.1 Project Costs and Funding Status

All 26 participating cities plus the Los Angeles County Public Works Department submitted transportation projects totaling 340 projects. Of that total, about 240 were funded and became functional between 2005 and 2011. The remaining 100 are planned to become functional between 2011 and 2035 (see Table 12.1), and are estimated to cost a total of roughly $371 million. These future projects are distributed among 16 of the 27 participating jurisdictions (including Los Angeles County).

The 16 jurisdictions have identified about $206 million in funding, which leaves about $156 million more of required additional funding. Table 12.2 below shows the total costs, number of projects, and the funded and unfunded portions.

The $206 million of available funding comes from a broad range of local, county, regional, state, and Federal sources. Appendix D provides details of each project's funding assumptions.

The estimates for each project's total costs were either provided by the city staff submitting the project, or were generated by the consultant team. The consultant estimates were made by comparing each project to similar projects with established costs. When multiple projects were available for comparison, an average cost was devised and then applied to the project of unknown cost. In the case of those projects where length was a factor, the average cost per mile was established and then multiplied by the length of the project of unknown cost.

The consultant team has also made estimates for the funded and unfunded portions when city staff were unable to provide funding information. Future revisions and refinements to these estimates are expected.

Table 12.1 Types of Transportation Strategies by Jurisdiction to be Implemented from 2011 through 2035

City	Roadway Capacity	Intersection Improvements[1]			System Ops-ITS	Grade Separation	Nonmotorized Transportation	Park and Ride	Total
		New Signal	New Phase	Intersection Capacity					
Bell Gardens				2					2
Bellflower				1				1	2
Commerce	1								1
Compton								1	1
Downey	5	2	4	2	4				17
La Mirada						1			1
LACDPW[2]					14				14
Long Beach	1	4	3	4	4		19		35
Lynwood							1		1
Norwalk	1	1					1		3
Pico Rivera		1	1			1			3
Santa Fe Springs		1					1		2
Signal Hill	2	2	2		1		1		8
South Gate	1								1
Vernon	1			1					2
Whittier		1	3				3		7
Total	12	12	13	10	23	2	26	2	100

1. Intersection improvements are divided into three types: new signals, new phase, and new capacity.
2. Los Angeles County Public Works Department projects are all almost all traffic signal synchronization projects and a few ITS projects on primary arterials through both incorporated and unincorporated areas.

Source: Cambridge Systematics, Inc.

The remaining $156 million in unfunded costs presents a challenge for the subregion's goal of demonstrating a feasible and implementable SCS. The terms laid out in the MOU between SCAG and Gateway Cities COG are silent on the necessity that the subregional SCS conform with the same financial constraint requirement that applies to the SCAG RTP/SCS.[32] If the RTP financial constraint requirement flows down from the regional SCS to a subregional SCS, then this subregional SCS must identify likely revenue sources sufficient to cover the $156 million in unfunded costs.

Gateway Cities will investigate the feasibility of using an assortment of local, regional, state, and Federal sources over the next 24 years. The potential sources

[32]This financial constraint requirement provides the basis for the assumption that the 17 regional projects, which are included in the 2008 RTP, are funded and thus may be included in this subregional SCS.

include local gas tax revenues, redevelopment tax increment, local assessment districts, LACMTA Call for Projects, and state and Federal revenues. Some of these sources will require a local match, or by having a local match put a jurisdiction in a stronger competitive position.

One of the few remaining untapped sources for local funding involves developer impact fees. LACMTA has proposed a countywide Congestion Mitigation Fee (CMF) as a replacement to the debit/credit system previously required (and now temporarily suspended) to conform with the state-mandated Congestion Mitigation Program (CMP). A countywide CMF would collect development impact fees to fund local projects with regional significance. These projects would be selected by each local jurisdiction, but must conform with state requirements for development impact fees (Government Code §66000 *et seq.*). Two of these requirements are the most applicable for qualifying SCS strategies for funding with a CMF:

1. **Nexus test.** An SCS strategy must be shown to mitigate the impact of new development on future congestion in rough proportion to the amount of impact. This means the aggregate benefits of the SCS strategies that are funded with CMF revenues cannot exceed the impacts of new development, and thus remedy existing deficiencies.
2. **Capital investments**. Only capital costs are eligible for CMF funding. The operating costs of SCS strategies must be funded with other revenue sources.

The CMF funds collected from new development remain under the control of each local jurisdiction. The LACMTA's role is limited to providing technical assistance in the nexus studies required to adopt a CMF, and monitoring and auditing the CMF programs once each jurisdiction implements them.

LACMTA has initiated pilot studies with all seven other subregions in the County, but none of these pilot studies obligates a subregional COG or any of its member jurisdictions to adopt a CMF. Each jurisdiction's council (or Board of Supervisors for the unincorporated areas) may decide to adopt a CMF after the LACMTA Board has formally adopted the CMF as the method of complying with the CMP.

Some Gateway Cities jurisdictions have agreed individually to undertake pilot studies for a CMF. The Gateway Cities COG, however, has not formally approved proceeding with a subregional pilot study, so at this point wider participation remains uncertain. This leaves this subregional SCS financially unconstrained. While there is no clear legal guidance from CARB or SCAG, the Gateway Cities COG legal counsel advised the SCS Policy Development Committee (March 11, 2011) that further progress on identifying likely local funding sources may continue after the Gateway Cities COG Board approves and submits this subregional SCS to SCAG. As implementation proceeds, cities may identify additional funding sources and be able to implement all of their strategies.

Appendix A.

Process Document

- Memorandum of Understanding (MOU) Between SCAG and Gateway Cities Council of Governments for the Gateway Cities Sustainable Communities Strategy, October 7, 2010

  Exhibit A. SCAG Framework and Guidelines for Subregional Sustainable Communities Strategy, April 1, 2010

Southern California Association of Governments

(Approved by Regional Council - April 1, 2010)

FRAMEWORK AND GUIDELINES
for
SUBREGIONAL SUSTAINABLE COMMUNITIES STRATEGY

I. INTRODUCTION

SB 375 (Steinberg), also known as California's Sustainable Communities Strategy and Climate Protection Act, is a new state law which became effective January 1, 2009. SB 375 calls for the integration of transportation, land use, and housing planning, and also establishes the reduction of greenhouse gas (GHG) emissions as one of the main goals for regional planning. SCAG, working with the individual County Transportation Commissions (CTCs) and the subregional organizations within the SCAG region, is responsible for implementing SB 375 in the Southern California region. Success in this endeavor is dependent on collaboration with a range of public and private partners throughout the region.

Briefly summarized here, SB 375 requires SCAG as the Metropolitan Planning Organization to:

- Prepare a Sustainable Communities Strategy (SCS) as part of the 2012 Regional Transportation Plan (RTP). The SCS will meet a State-determined regional GHG emission reduction target, if it is feasible to do so.
- Prepare an Alternative Planning Strategy (APS) that is not part of the RTP if the SCS is unable to meet the regional target.
- Integrate SCAG planning processes, in particular assuring that the Regional Housing Needs Assessment (RHNA) is consistent with the SCS, at the jurisdiction level.
- Specific to SCAG only, allow for subregional SCS/APS development.
- Develop a substantial public participation process involving all stakeholders.

Unique to the SCAG region, SB 375 provides that "a subregional council of governments and the county transportation commission may work together to propose the sustainable communities strategy and an alternative planning strategy . . . for that subregional area." Govt. Code §65080(b)(2)(C). In addition, SB 375 authorizes that SCAG "may adopt a framework for a subregional SCS or a subregional APS to address the intraregional land use, transportation, economic, air quality, and climate policy relationships." *Id.* Finally, SB 375 requires SCAG to "develop overall guidelines, create public participation plans, ensure coordination, resolve conflicts, make sure that the overall plan complies with applicable legal requirements, and adopt the plan for the region." *Id.*

The intent of this Framework and Guidelines for Subregional Sustainable Communities Strategy (also referred to herein as the "Framework and Guidelines" or the "Subregional Framework and Guidelines") is to offer the SCAG region's subregional agencies the highest degree of autonomy, flexibility and responsibility in developing a program and set of implementation strategies for their subregional areas. This will allow the subregional strategies to better reflect the issues, concerns, and future vision of the region's collective jurisdictions with the input of the fullest range of stakeholders. In order to achieve these objectives, it is necessary for SCAG to develop measures that assure equity, consistency and coordination, such that SCAG can incorporate the subregional SCSs in its regional SCS which will be adopted as part of the 2012 RTP pursuant to SB 375. For that reason, this Framework and Guidelines establishes standards for the subregion's work in preparing and submitting subregional strategies, while also laying out SCAG's role in facilitating and supporting the subregional effort with data, tools, and other assistance.

While the Framework and Guidelines are intended to facilitate the specific subregional option to develop the SCS (and APS if necessary) as described in SB 375, SCAG encourages the fullest possible participation from all subregional organizations. As SCAG undertakes implementation of SB 375 for the first time, SCAG has also designed a "collaborative" process, in cooperation with the subregions, that allows for robust subregional participation for subregions that choose not to exercise their statutory option.

II. ELIGIBILITY AND PARTICIPATION

SB 375 allows for subregional councils of governments in the SCAG region to have the option to develop the SCS (and the APS if necessary) for their area. SCAG interprets this option as being available to any subregional organization recognized by SCAG, regardless of whether the organization is formally established as a "subregional council of governments."

County Transportation Commissions (CTCs) play an important and necessary role in the development of a subregional SCS. Any subregion that chooses to develop a subregional strategy will need to work closely with the respective CTC in its subregional area in order to identify and integrate transportation projects and policies. Beyond working with CTCs, SCAG encourages partnership efforts in the development of subregional strategies, including partnerships between and among subregions.

Subregional agencies must formally indicate to SCAG, in writing, by December 31, 2009 if they intend to exercise this option to develop their own SCS. Subregions that choose to develop an SCS for their area must do so in a manner consistent with this Framework and Guidelines. The subregion's intent to exercise its statutory option to prepare the strategy for their area must be decided and communicated through formal action of the subregional agency's governing board. Subsequent to receipt of any subregion's intent to develop and adopt an SCS, SCAG will convene discussions regarding a formal written agreement between SCAG and the subregion, which may be revised if necessary, as the SCS process is implemented.

III. FRAMEWORK

The Framework portion of this document covers regional objectives and policy considerations, and provides general direction to the subregions in preparing their own SCS, and APS if necessary.

A. SCAG's preliminary goals for implementing SB 375 are as follows:

- Achieve the regional GHG emission reduction target for cars and light trucks through an SCS.
- Fully integrate SCAG's planning processes for transportation, growth, intergovernmental review, land use, housing, and the environment.
- Seek areas of cooperation that go beyond the procedural statutory requirements, but that also result in regional plans and strategies that are mutually supportive of a range of goals.
- Build trust by providing an interactive, participatory and collaborative process for all stakeholders. Provide, in particular, for the robust participation of local jurisdictions, subregions and CTCs in the development of the SCAG regional SCS and implementation of the subregional provisions of the law.
- Assure that the SCS adopted by SCAG and submitted to California Air Resources Board (ARB) is a reflection of the region's collective growth strategy and vision for the future.
- Develop strategies that incorporate and are respectful of local and subregional priorities, plans, and projects.

B. Flexibility

Subregions may develop any appropriate strategy to address the region's greenhouse gas reduction goals and the intent of SB 375. While subregions will be provided with SCAG data, and with a conceptual or preliminary scenario to use as a helpful starting point, they may employ any combination of land use policy change, transportation policy, and transportation investment, within the specific parameters described in the Guidelines.

C. Outreach Effort and Principles

Subregions are required to conduct an open and participatory process that includes the fullest possible range of stakeholders. As further discussed within the Guidelines, SCAG amended its existing Public Participation Plan (PPP) to describes SCAG's responsibilities in complying with the outreach requirements of SB 375 and other applicable laws and regulations. SCAG will fulfill its outreach requirements for the regional SCS/APS which will include outreach activities regarding the subregional SCS/APS. Subregions are also encouraged to design their own outreach process that meets each subregion's own needs and reinforces the spirit of openness and full participation. To the extent that subregions do establish their own outreach process, this process should be coordinated with SCAG's outreach process.

D. Communication and Coordination

Subregions developing their own SCS are strongly encouraged to maintain regular communication with SCAG staff, the respective CTC, their jurisdictions and other stakeholders, and other subregions if necessary, to review issues as they arise and to assure close coordination. Mechanisms for on-going communication should be established in the early phases of strategy development.

E. Planning Concepts

SCAG, its subregions, and member cities have established a successful track record on a range of land use and transportation planning approaches through the on-going SCAG Compass Blueprint Program, including approximately 60 local demonstration projects completed to date. Subregions are

encouraged to capture, further develop and build off the concepts and approaches of the Compass Blueprint program. In brief, these include developing transit-oriented, mixed use, and walkable communities, and providing for a mix of housing and jobs.

IV. GUIDELINES

These Guidelines describe specific parameters for the subregional SCS/APS effort under SB 375, including process, deliverables, data, documentation, and timelines. As described above, the Guidelines are created to ensure that the region can successfully incorporate strategies developed by the subregions into the regional SCS, and that the region can comply with its own requirements under SB 375. Failure to proceed in a manner consistent with the Guidelines will result in SCAG not accepting a subregion's submitted strategy.

A. Subregional Process

(1) <u>Subregional Sustainable Communities Strategy</u>

Subregions that choose to exercise their optional role under SB 375 will develop and adopt a subregional Sustainable Communities Strategy. That strategy must contain all of the required elements, and follow all procedures, as described in SB 375. Subregions may choose to further develop an Alternative Planning Strategy (APS), according to the procedures and requirements described in SB 375. If subregions prepare an APS, they must prepare a Sustainable Communities Strategy first, in accordance with SB 375. A subregional APS is not "in lieu of" a subregional SCS, but in addition to the subregional SCS. In part, an APS must identify the principal impediments to achieving the targets within the SCS. The APS must show how the GHG emission targets would be achieved through alternative development patterns, infrastructure, and additional transportation measures or policies. SCAG encourages subregions to focus on feasible strategies that can be included in the SCS.

The subregional SCS must include all components of a regional SCS as described in SB 375, and outlined below:

(i.) identify the general location of uses, residential densities, and building intensities within the subregion;
(ii.) identify areas within the subregion sufficient to house all the population of the subregion, including all economic segments of the population, over the course of the planning period of the RTP taking into account net migration into the region, population growth, household formation and employment growth;
(iii.) identify areas within the subregion sufficient to house an eight-year projection of the regional housing need for the subregion pursuant to Section 65584;
(iv.) identify a transportation network to service the transportation needs of the subregion;
(v.) gather and consider the best practically available scientific information regarding resource areas and farmland in the subregion as defined in subdivisions (a) and (b) of Section 65080.01;
(vi.) consider the state housing goals specified in Sections 65580 and 65581;
(vii.) set forth a forecasted development pattern for the subregion, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the ARB; and

(viii.) allow the RTP to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506). See, Government Code §65080(b)(2)(B).

In preparing the subregional SCS, the subregion will consider feasible strategies, including local land use policies, transportation infrastructure investment (e.g., transportation projects), and other transportation policies such as Transportation Demand Management (TDM) strategies (which includes pricing), and Transportation System Management (TSM) strategies. Technological measures may be included if they exceed measures captured in other state and federal requirements (e.g., AB32).

As discussed further below (under "Documentation"), subregions need not constrain land use strategies considered for the SCS to current General Plans. In other words, the adopted strategy need not be fully consistent with local General Plans currently in place. However, should the adopted subregional strategy deviate from General Plans, subregions will need to demonstrate the feasibility of the strategy by documenting any affected jurisdictions' willingness to adopt the necessary General Plan changes.

The regional SCS shall be part of the 2012 RTP. Therefore, for transportation investments included in a subregional SCS to be valid, they must also be included in the 2012 RTP. Further, such projects need to be scheduled in the RTIP for construction completion by the target years (2020 and 2035) in order to demonstrate any benefits as part of the SCS. As such, subregions will need to collaborate with the respective CTC in their area to coordinate the subregional SCS with future transportation investments. It should also be noted that the California Transportation Commission is updating their RTP Guidelines. This topic is likely to be part of further discussion through the SCS process as well.

SCAG will accept and incorporate the subregional SCS, unless (a) it does not comply with SB 375, (b) it is does not comply with federal law, or (c) it is does not comply with SCAG's Subregional Framework and Guidelines. In the event that a compiled regional SCS, including subregional submissions, does not achieve the regional target, SCAG will initiate a process to develop and consider additional GHG emission reduction measures region-wide. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process. Furthermore, SCAG will compile and disseminate performance information on the preliminary regional SCS and its components in order to facilitate regional dialogue. The development of a subregional SCS does not exempt any subregion from further GHG emission reduction measures being included in the regional SCS. Further, all regional measures needed to meet the regional target will be subject to adoption by the Regional Council, and any additional subregional measures beyond the SCS submittal from subregions accepting delegation needed to meet the regional target must also be adopted by the subregional governing body.

(2) Subregional Alternative Planning Strategy (APS)

Subregions are encouraged to focus their efforts on feasible measures that can be included in an SCS. In the event that a subregion chooses to prepare an APS, the content of a subregional APS should be consistent with what is required by SB 375 (*see*, Government Code §65080(b)(2)(H)), as follows:

(i.) Shall identify the principal impediments to achieving the subregional SCS.

(ii.) May include an alternative development pattern for the subregion pursuant to subparagraphs (B) to (F), inclusive.
(iii.) Shall describe how the alternative planning strategy would contribute to the regional greenhouse gas emission reduction target, and why the development pattern, measures, and policies in the alternative planning strategy are the most practicable choices for the subregion.
(iv.) An alternative development pattern set forth in the alternative planning strategy shall comply with Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations, except to the extent that compliance will prevent achievement of the regional greenhouse gas emission reduction targets approved by the ARB.
(v.) For purposes of the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code), an alternative planning strategy shall not constitute a land use plan, policy, or regulation, and the inconsistency of a project with an alternative planning strategy shall not be a consideration in determining whether a project may have an environmental effect.

Any precise timing or submission requirements for a subregional APS will be determined based on further discussions with subregional partners. As previously noted, a subregional APS is in addition to a subregional SCS.

(3) Outreach and Process

SCAG will fulfill all of its outreach requirements under SB 375 for the regional SCS/APS, which will include outreach regarding any subregional SCS/APS. SCAG staff has revised its Public Participation Plan to incorporate the outreach requirements of SB 375, and integrate the SB 375 process with the 2012 RTP development as part of SCAG's Public Participation Plan Amendment No. 2, adopted by SCAG's Regional Council on December 3, 2009. Subsequent to the adoption of the PPP Amendment No. 2, SCAG will continue to discuss with subregions and stakeholders the Subregional Framework & Guidelines, which further describe the Public Participation elements of SB 375.

Subregions that elect to prepare their own SCS or APS are encouraged to present their subregional SCS or APS, in coordination with SCAG, at all meetings, workshops and hearings held by SCAG in their respective counties. Additionally, the subregions would be asked to either provide SCAG with their mailing lists so that public notices and outreach materials may also be posted and sent out by SCAG, or SCAG will provide notices and outreach materials to the subregions for their distribution to stakeholders. The SCAG PPP Amendment No. 2 provides that additional outreach may be performed by subregions. Subregions are strongly encouraged to design and adopt their own outreach processes that mimic the specific requirements imposed on the region under SB 375. Subregional outreach processes should reinforce the regional goal of full and open participation, and engagement of the broadest possible range of stakeholders.

(4) Subregional SCS Approval

It is recommended that the governing board of the subregional agency approve the subregional SCS prior to submission to SCAG. While the exact format is still subject to further discussion, SCAG recommends that there be a resolution from the governing board of the subregion with a finding that the land use strategies included in the subregional SCS are feasible and based upon consultation with the local jurisdictions in the respective subregion. Subregion should consult with their legal counsel as to compliance with the California Environmental Quality Act (CEQA). In SCAG's view, the

subregional SCS is not a "project" for the purposes of CEQA; rather, the 2012 RTP which will include the regional SCS is the actual "project" which will be reviewed for environmental impacts pursuant to CEQA. As such, the regional SCS, which will include the subregional SCSs, will undergo a thorough CEQA review. Nevertheless, subregions approving subregional SCSs should consider issuing a notice of exemption under CEQA to notify the public of their "no project" determination and/or to invoke the "common sense" exemption pursuant to CEQA Guidelines § 15061(b)(3).

Finally, in accordance with SB 375, subregions are strongly encouraged to work in partnership with the CTC in their area. SCAG can facilitate these arrangements if needed.

(5) Data Standards

SCAG is currently assessing the precise data standards anticipated for the regional and subregional SCS. In particular, SCAG is reviewing the potential use of parcel data and development types currently used for regional planning. At present, the following describes the anticipated data requirements for a subregional SCS.

1. Types of Variables
   Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables include land uses, residential densities, building intensities, etc, as described in SB 375.

2. Geographical Levels
   SCAG is considering the collection and adoption of the data at a small-area level as optional for local agencies in order to make accessible the CEQA streamlining provisions under SB 375. The housing unit, employment, and the land use variables can be collected at a small-area level for those areas which under SB 375 qualify as containing a "transit priority project" (i.e. within half-mile of a major transit stop or high-quality transit corridor) for purposes of allowing jurisdictions to take advantage of the CEQA streamlining incentives in SB 375.

   For all other areas in the region, SCAG staff will collect the population, household, employment, and land use variables at the Census tract or Traffic Analysis Zone (TAZ) level.

3. Base Year and Forecast Years
   The socio-economic and land use variables will be required for the base year of 2008, and the target years of 2020 and 2035.

(6) Documentation

Subregions are expected to maintain full and complete records related to the development of the subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board.

(7) Timing

An overview schedule of the major milestones of the subregional process and its relationship to the regional SCS/RTP is included below. Subregions must submit the subregional SCS to SCAG by the date prescribed. Further, SCAG will need a preliminary SCS from subregions for the purpose of preparing a project description for the 2012 RTP Program Environmental Impact Report. The precise content of this preliminary submission will be determined based on further discussions. The anticipated timing of this preliminary product is approximately February 2011.

(8) Relationship to Regional Housing Needs Assessment (RHNA) and Housing Element

Although SB 375 calls for an integrated process, subregions are not automatically required to take on RHNA delegation as described in State law if they prepare an SCS/APS. However, SCAG encourages subregions to undertake both processes due to their inherent connections.

SB 375 requires that the RHNA allocated housing units be consistent with the development pattern included in the SCS. *See*, Government Code §65584.04(i). Population and housing demand must also be proportional to employment growth. At the same time, in addition to the requirement that the RHNA be consistent with the development pattern in the SCS, the SCS must also identify areas that are sufficient to house the regional population by income group through the RTP planning period, and must identify areas to accommodate the region's housing need for the next local Housing Element eight year planning period update. The requirements of the statute are being further interpreted through the RTP guidelines process. Staff intends to monitor and participate in the guideline process, inform stakeholders regarding various material on these issues, and amend, if necessary, these Framework and Guidelines, pending its adoption.

SCAG will be adopting the RHNA and applying it to local jurisdictions at the jurisdiction boundary level. SCAG staff believes that consistency between the RHNA and the SCS may still be accomplished by aggregating the housing units contained in the smaller geographic levels noted in the SCS and including such as part of the total jurisdictional number for RHNA purpose. SCAG staff has concluded that there is no consistency requirement for RHNA purposes at sub-jurisdictional level, even though the SCS is adopted at the smaller geographic level for the opportunity areas.

The option to develop a subregional SCS is separate from the option for subregions to adopt a RHNA distribution, and subject to separate statutory requirements. Nevertheless, subregions that develop and adopt a subregional SCS should be aware that the SCS will form the basis for the allocation of housing need as part of the RHNA process. Further, SCS development requires integration of elements of the RHNA process, including assuring that areas are identified to accommodate the 8 year need for housing, and that housing not be constrained by certain types of local growth controls as described in State law.

SCAG will provide further guidance for subregions and a separate process description for the RHNA.

B. COUNTY TRANSPORTATION COMMISSIONS' ROLES AND RESPONSIBLITIES

Subregions that develop a subregional SCS will need to work closely with the CTCs in their area in order to coordinate and integrate transportation projects and policies as part of the subregional SCS. As discussed above (under "Subregional Sustainable Communities Strategy"), any transportation

projects identified in the subregional SCS must also be included in the 2012 RTP in order to be considered as a feasible strategy. SCAG can help to facilitate communication between subregions and CTCs.

C. SCAG ROLES AND RESPONSIBLITIES

SCAG's roles in supporting the subregional SCS development process are in the following areas:

(1) Preparing and adopting the Framework and Guidelines

SCAG will adopt these Framework and Guidelines in order to assure regional consistency and the region's compliance with law.

(2) Public Participation Plan

SCAG will assist the subregions by developing, adopting and implementing a Public Participation Plan and outreach process with stakeholders. This process includes consultation with congestion management agencies, transportation agencies, and transportation commissions; and SCAG will hold public workshops and hearings. SCAG will also conduct informational meetings in each county within the region for local elected officials (members of the board of supervisors and city councils), to present the draft SCS, and APS if necessary, and solicit and consider input and recommendations.

(3) Methodology

As required by SB 375, SCAG will adopt a methodology for measuring greenhouse gas emission reductions associated with the strategy.

(4) Incorporation/Modification

SCAG will accept and incorporate the subregional SCS unless it does not comply with SB 375, federal law, or the Subregional Framework and Guidelines. As SCAG intends the entire SCS development process to be iterative, SCAG will not amend a locally-submitted SCS. SCAG may provide additional guidance to subregions so that subregions may make amendments to its subregional SCS as part of the iterative process, or request a subregion to prepare an APS if necessary. Further, SCAG can propose additional regional strategies if feasible and necessary to achieve the regional emission reduction target with the regional SCS. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process.

(5) Modeling

SCAG currently uses a Trip-Based Regional Transportation Demand Model and ARB's EMFAC model for emissions purposes. In addition to regional modeling, SCAG is developing tools to evaluate the effects of strategies that are not fully accounted for in the regional model. SCAG is also developing two additional tools – a Land Use Model and an Activity Based Model – to assist in strategy development and measurement of outcomes under SB 375.

In addition to modeling tools which are used to measure results of completed scenarios, SCAG is developing a scenario planning tool for use in workshop settings as scenarios are being created with jurisdictions and stakeholders. The tool will be made available to subregions and local governments for their use in subregional strategy development.

(6) Adoption/Submission to State

After the incorporation of subregional strategies, SCAG will finalize and adopt the regional SCS as part of the 2012 RTP. SCAG will submit the SCS to ARB for review as required in SB 375.

(7) Conflict Resolution

While SB 375 requires SCAG to develop a process for resolving conflicts, it is unclear at this time the nature or purpose of a conflict resolution process as SCAG does not intend to amend a locally-submitted SCS. As noted above, SCAG will accept the subregional SCS unless it is inconsistent with SB 375, federal law, or the Subregional Framework and Guidelines. SCAG will also request that a subregion prepare an APS if necessary. It is SCAG's intent that the process be iterative and that there be coordination among SCAG, subregions and their respective jurisdictions and CTCs. SCAG is open to further discussion on issues which may generate a need to establish a conflict resolution process as part of the written agreement between SCAG and the subregional organization.

(8) Funding

Funding for subregional activities is not available at this time, and any specific parameters for future funding are speculative. Should funding become available, SCAG anticipates providing a share of available resources to subregions. While there are no requirements associated with potential future funding at this time, it is advisable for subregions to track and record their expenses and activities associated with these efforts.

(9) Preliminary Scenario Planning

SCAG will work with each subregion to collect information and prompt dialogue with each local jurisdiction prior to the start of formal SCS development. This phase of the process is identified as "preliminary scenario planning" in the schedule below. The purpose of this process is to create a base of information to inform SCAG's recommendation of a regional target to ARB prior to June 2010. All subregions are encouraged to assist SCAG in facilitating this process.

(10) Data

SCAG is currently developing, and will provide each subregion with datasets for the following:

(1) 2008 Base year;
(2) General Plan/Growth projection & distribution;
(3) Trend Baseline; and
(4) Policy Forecast/SCS.

While the Trend Baseline is a technical projection that provides a best estimate of future growth based on past trends and assumes no general plan land use policy changes, the Policy Forecast/ SCS is derived using local input through a bottom-up process, reflecting regional policies including transportation investments. Local input is collected from counties, subregions, and local jurisdictions.

Data/GIS maps will be provided to subregions and local jurisdiction for their review. This data and maps include the 2008 base year socioeconomic estimates and 2020 and 2035 socioeconomic forecast. Other GIS maps including the existing land use, the general plan land use, the resource areas, and other important areas identified in SB 375. It should be noted that none of the data/ maps provided were endorsed or adopted by SCAG's Community, Economic and Human Development Committee (CEHD). All data/maps provided are for the purpose of collecting input and comments from subregions and local jurisdictions. This is to initiate dialogue among stakeholders to address the requirements of SB 375 and its implementation.

The list of data/GIS maps include:

1. Existing land use
2. Zoning
3. General plan land use
4. Resource areas include:
   (a.) all publicly owned parks and open space;
   (b.) open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;
   (c.) habitat for species identified as candidate, fully protected, sensitive, or species of special status by local, state, or federal agencies or protected by the federal Endangered Species Act (1973), the California Endangered Species Act, or Native Plant Protection Act;
   (d.) lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts, or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code, and lands under Williamson Act contracts;
   (e.) areas designated for open-space or agricultural uses in adopted open-space elements or agricultural elements of the local general plan or by local ordinance;
   (f.) areas containing biological resources as described in Appendix G of the CEQA Guidelines that may be significantly affected by the sustainable communities strategy or the alternative planning strategy; and
   (g.) an area subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program or where the area is subject to more protective provisions of state law or local ordinance.
5. Farmland
6. Sphere of influence
7. Transit priority areas
8. City/Census tract boundary with ID
9. City/TAZ boundary with ID

(11) Tools

SCAG is developing a Local Sustainability Planning Model (LSPM) for subregions/local jurisdictions to analyze land use impact. The use of this tool is not mandatory and is at the discretion of the Subregion. The LSPM is a web-based tool that can be used to analyze, visualize and calculate the impact of land use changes on auto ownership, mode use, vehicle miles of travel (VMT), and greenhouse gas emissions in real time. Users will be able to estimate transportation and emissions impacts by modifying land use designations within their community.

Other tools currently maintained by SCAG may be useful to the subregional SCS development effort, including the web-based CaLOTS application. SCAG will consider providing guidance and training on additional tools based on further discussions with subregional partners.

(12) Resources and technical assistance

SCAG will assist the subregions by making available technical tools for scenario development as described above. Further, SCAG will assign a staff liaison to each subregion, regardless of whether the subregion exercises its statutory option to prepare an SCS. SCAG staff can participate in subregional workshops, meetings, and other processes at the request of the subregion, and pending funding and availability. SCAG's legal staff will be available to assist with questions related to SB 375 or SCAG's implementation of SB 375. Further, SCAG will prepare materials for its own process in developing the regional SCS, and will make these materials available to subregions.

D. MILESTONES/SCHEDULE

- CARB issues Final Regional Targets – September 2010
- SCS development (preliminary scenario, draft, etc) – through early 2011
- Release Draft RTP/regional SCS for public review – November 2011
- Regional Council adopts RTP/SCS – April 2012

If other milestones are needed, they will be incorporated into the written agreement between SCAG and the Subregion.

REPORT

AGENDA ITEM # 7

DATE: October 7, 2010

TO: Executive/Administration Committee
Regional Council

FROM: Joann Africa, Chief Counsel, (213)-236-1928, africa@scag.ca.gov

SUBJECT: Memorandum of Understanding (MOU) between SCAG and Gateway Cities Council of Governments for Gateway Cities Sustainable Communities Strategy

EXECUTIVE DIRECTOR'S APPROVAL:

RECOMMENDED ACTION:

Approve the attached MOU between SCAG and Gateway Cities Council of Governments (COG) for Gateway Cities Sustainable Communities Strategy, and authorize the SCAG Executive Director or his designee to execute the MOU.

EXECUTIVE SUMMARY:

SCAG and Gateway Cities COG have worked out an agreement concerning the development of the Gateway Cities subregional sustainable communities strategy (SCS). Similar to the Regional Council's action last July related to the OCCOG/OCTA MOU, SCAG staff seeks approval by the EAC and Regional Council of the attached MOU, and authority for the Executive Director or his designee to execute the MOU.

STRATEGIC PLAN:

This item supports the following goal and objective of the Strategic Plan:
Goal 1: Improve Regional Decision Making by Providing Leadership and Consensus Building on Key Plans and Policies.
Objective a: Create and facilitate a collaborative and cooperative environment to produce forward thinking regional plans

BACKGROUND:

The attached, proposed MOU between SCAG and Gateway Cities COG sets forth the roles, responsibilities, and requirements for each party regarding the development of the Gateway Cities subregional SCS (Gateway Cities SCS), which will be included in the regional SCS prepared by SCAG, in accordance with Senate Bill 375 (Chapter 728, laws of 2008, "SB 375"). The terms of the attached MOU are identical to the agreement approved by the Regional Council at its July 2010 meeting, for the Orange County subregional SCS entered into by SCAG, the Orange County Transportation Authority and the Orange County Council of Governments.

The MOU includes requirements for preparation of the Gateway Cities SCS consistent with SCAG's adopted Framework and Guidelines; a Milestones Schedule for submittal of deliverables to SCAG by Gateway Cities COG; and Deliverables Template for utilization by Gateway Cities COG in developing their

REPORT

subregional SCS workplan. This attached MOU was previously approved by Gateway Cities COG Board in the summer. In order to finalize the agreement, staff seeks approval by the EAC and Regional Council, and authority for the Executive Director or his designee to execute the MOU.

FISCAL IMPACT:

Funding is not provided to any parties under this MOU. However, in the event that state or federal funding becomes available for preparation of the Gateway Cities SCS, the MOU may be amended or a separate, mutual funding agreement developed to address Gateway Cities SCS costs. SCAG staff time necessary to implement this MOU and coordinate with subregions as part of SB 375 implementation activities, will be charged to work element 055.SCG00934.01.

MEMORANDUM OF UNDERSTANDING

BY AND BETWEEN

GATEWAY CITIES COUNCIL OF GOVERNMENTS

AND

THE SOUTHERN CALIFORNIA ASSOCATION OF GOVERNMENTS

FOR

GATEWAY CITIES SUSTAINABLE COMMUNITIES STRATEGY

THIS MEMORANDUM OF UNDERSTANDING (hereinafter referred to as "MOU") is entered by and between the Gateway Cities Council of Governments, (hereinafter referred to as "GCCOG"), and the Southern California Association of Governments, (hereinafter referred to as "SCAG"), collectively referred to as the "Parties."

RECITALS:

WHEREAS, Senate Bill 375 (Chapter 728, laws of 2008, "SB 375") requires SCAG to prepare a regional Sustainable Communities Strategy (hereinafter referred to as "SCS" or "Regional SCS") as part of SCAG's Regional Transportation Plan ("RTP") to achieve goals for the reduction of greenhouse gas emissions from automobiles and light trucks in the SCAG region which comprises the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura;

WHEREAS, SB 375 allows GCCOG, as a subregional council of governments for Southeast Los Angeles County, to develop and submit to SCAG a subregional SCS for its jurisdiction (hereinafter referred to as "Gateway Cities SCS");

WHEREAS, as part of its implementation of SB 375, SCAG has developed and adopted a certain "Framework and Guidelines for the Subregional Sustainable Communities Strategy" (hereinafter referred to as "Framework and Guidelines"), attached hereto as Exhibit "A" and incorporated herein by this reference.

WHEREAS, SCAG is required by SB 375 to include a subregional SCS in the regional SCS, to the extent consistent with state and federal law;

WHEREAS, GCCOG and SCAG desire to enter into this MOU to demonstrate mutual commitments to prepare the Gateway Cities SCS.

NOW, THEREFORE, the Parties enter into the following MOU with respect to the matters set forth herein:

1. This MOU establishes the roles, responsibilities, and requirements for GCCOG and SCAG that are necessary to develop a Gateway Cities SCS that shall be included in the regional SCS prepared by SCAG.

2. GCCOG shall prepare the Gateway Cities SCS consistent with SCAG's adopted Framework and Guidelines, as attached hereto, to ensure that the region can successfully incorporate strategies within the Gateway Cities SCS into the Regional SCS, and not inhibit the region from complying with SB 375.

3. GCCOG agrees to comply with the Milestones Schedule, attached hereto as Exhibit "B" and incorporated herein by this reference, and work with SCAG and the other subregions to ensure the successful delivery of a regional SCS by using the Deliverables Template, attached hereto as Exhibit "C" and incorporated by this reference as the primary template for developing a subregional SCS workplan. The Deliverables Template may be subject to change based on direction from the SCAG Regional Council or Community, Economic and Human Development Policy Committee, and approval by GCCOG.

4. GCCOG are encouraged by SCAG to conduct a public participation process in developing the Gateway Cities SCS, above and beyond the process required for the regional SCS required under Section 65080(b)(2)(D)-(E) of the California Government Code. Further, SCAG encourages GCCOG to develop a public participation plan, similar to SCAG's Public Participation Plan adopted in December 2009, for such purposes.

5. GCCOG agrees to participate in all publicly noticed meetings, workshops, hearings, and other outreach activities organized by SCAG within the GCCOG's jurisdiction, at which the regional SCS or Gateway Cities SCS is included on the agenda. All parties shall coordinate with one another during implementation of SCAG's public participation process in order to ensure broad public and stakeholder participation, and to avoid duplication of effort.

6. GCCOG shall retain and deliver to SCAG all documentation pertaining to the Gateway Cities SCS from publicly noticed meetings, workshops, and hearings at which the Gateway Cities SCS is included on the agenda. Such documentation shall include, but is not limited to, meeting notices, agendas, minutes, comments and responses to comments, sign-up sheets, hand-outs, and copies of power point presentations.

7. The Parties acknowledge that population, household, housing, and employment estimates are being prepared by GCCOG and/or its consultants (hereinafter referred to as "GCCOG Dataset"). SCAG agrees to use the GCCOG Dataset as reviewed and approved by

GCCOG, for the Regional SCS and the 2012 RTP; provided, that SCAG, in consultation with GCCOG, may make adjustments to the GCCOG Dataset in order to ensure consistency with SCAG's 2012 RTP growth forecast.

8. The Parties agree and acknowledge that population, household, housing, and employment data submitted to SCAG by GCCOG shall be accurately reflected in all documentation produced by SCAG that relates to the Gateway Cities SCS and the Regional SCS.

9. The Parties agree and acknowledge that RHNA responsibilities shall remain with SCAG, and that GCCOG shall not assume delegation responsibility for RHNA as part of the Gateway Cities SCS development. However, GCCOG is not precluded by this MOU from assuming delegation responsibility for RHNA as part of a subsequent, separate agreement.

10. SCAG agrees that in addition to preparation of the Gateway Cities SCS developed under this MOU, development of an Alternative Planning Strategy (APS) by GCCOG is optional. This understanding shall not preclude SCAG from preparing a regional APS pursuant to SB 375.

11. SCAG shall not develop SCS-related targets that are attributable to the subregions. Further, SCAG agrees that it will not impose a penalty on the Gateway Cities subregion if the greenhouse gas targets, as established by the California Air Resources Board, are not met by the Regional SCS.

12. SCAG shall accept the Gateway Cities SCS prepared in accordance with this MOU as the Gateway Cities subregion's input into the Regional SCS prepared by SCAG.

13. GCCOG and SCAG shall amend this MOU in writing or develop a separate, mutual funding agreement addressing Gateway Cities SCS costs should state or federal funding become available that can be applied toward preparation of the Gateway Cities SCS.

14. GCCOG and SCAG agree to work closely together throughout the Regional SCS process and Gateway Cities SCS process to provide technical input, applicable planning data, and constructive feedback with respect to all documents, products and deliverables developed and associated with the Gateway Cities SCS.

15. SCAG agrees to make good faith efforts to provide GCCOG with assistance, including tools and models in its possession, as requested by GCCOG in evaluating preliminary Gateway Cities SCS growth and green house gas ("GHG") estimates.

16. SCAG agrees to make good faith efforts to provide GCCOG with assistance with GIS services relating to the development of the Gateway Cities SCS, as requested by GCCOG.

17. GCCOG and SCAG agree to work together in good faith, using reasonable efforts to resolve any unforeseen issues and disputes arising out of the performance of this MOU.

18. GCCOG and SCAG agree in good faith to provide the resources necessary to implement the provisions of the MOU.

19. GCCOG and SCAG agree to defend, indemnify and hold harmless each other, including their officers, agents, elected officials, and employees, from all liability, claims, losses and demands, including defense costs and reasonable attorneys' fees, whether resulting from court action or otherwise, arising out of the acts or omissions of the defending party, its officers, agents, or employees, in the performance of this MOU. When acts or omissions of one party are directed by another party, the party directing the acts or omission shall owe this defense and indemnity obligation to the party following the directions. The provisions of this paragraph shall survive termination of this MOU.

20. This MOU shall be governed by all applicable federal, state, and local laws. The signatories warrant that in the performance of this MOU, each shall comply with all applicable federal, state and local laws, statutes and ordinances and all lawful orders, rules and regulations promulgated there under.

21. This MOU may only be modified or amended upon written mutual consent of all signatories. All modifications, amendments, changes and revisions of this MOU in whole or part, and from time to time, shall be binding upon the parties, so long as the same shall be in writing and executed by the signatories.

22. This MOU, including all exhibits and documents incorporated herein and made applicable by reference, constitutes the complete and exclusive statement of the term(s) and condition(s) of the agreement between the parties with respect to the subject matter herein and supersedes all prior representations, understandings and communications. The invalidity in whole or part of any term or condition of this MOU shall not affect the validity of the other term(s) or condition(s).

23. Any party may withdraw from this MOU upon 30 days' written notice to the other, until the due date set forth in Exhibit "B" for submittal to SCAG of the preliminary Gateway Cities SCS. After such due date, any party may withdraw from this MOU only upon mutual written agreement.

24. Each signatory shall be excused from performing its obligations under this MOU during the time and to the extent that it is prevented from performing by an unforeseeable cause beyond its control, including but not limited to any incident of fire, flood; acts of God; commandeering of material, produces, plants or facilities by federal, state or local government; national fuel shortage; or a material act or omission by any other party; when satisfactory evidence of such cause is presented to the other parties, and provided further such nonperformance is unforeseeable, beyond the control and is not due to the fault or negligence of the party not performing.

25. Any notice sent by first class mail, postage paid, to the address and addressee, shall be deemed to have been given when in the ordinary course it would be delivered. The representatives of the parties who are primarily responsible for the administration of this MOU, and to whom notices, demands and communications shall be given are as detailed below. If there are any changes in the names and/or addresses listed below, the party desiring to make such changes shall give a written notice to the other respective parties within five (5) days of such change.

Exhibit A: SCAG's Adopted Framework and Guidelines

Southern California Association of Governments

(Approved by Regional Council - April 1, 2010)

FRAMEWORK AND GUIDELINES
for
SUBREGIONAL SUSTAINABLE COMMUNITIES STRATEGY

I. INTRODUCTION

SB 375 (Steinberg), also known as California's Sustainable Communities Strategy and Climate Protection Act, is a new state law which became effective January 1, 2009. SB 375 calls for the integration of transportation, land use, and housing planning, and also establishes the reduction of greenhouse gas (GHG) emissions as one of the main goals for regional planning. SCAG, working with the individual County Transportation Commissions (CTCs) and the subregional organizations within the SCAG region, is responsible for implementing SB 375 in the Southern California region. Success in this endeavor is dependent on collaboration with a range of public and private partners throughout the region.

Briefly summarized here, SB 375 requires SCAG as the Metropolitan Planning Organization to:

- Prepare a Sustainable Communities Strategy (SCS) as part of the 2012 Regional Transportation Plan (RTP). The SCS will meet a State-determined regional GHG emission reduction target, if it is feasible to do so.
- Prepare an Alternative Planning Strategy (APS) that is not part of the RTP if the SCS is unable to meet the regional target.
- Integrate SCAG planning processes, in particular assuring that the Regional Housing Needs Assessment (RHNA) is consistent with the SCS, at the jurisdiction level.
- Specific to SCAG only, allow for subregional SCS/APS development.
- Develop a substantial public participation process involving all stakeholders.

Unique to the SCAG region, SB 375 provides that "a subregional council of governments and the county transportation commission may work together to propose the sustainable communities strategy and an alternative planning strategy . . . for that subregional area." Govt. Code §65080(b)(2)(C). In addition, SB 375 authorizes that SCAG "may adopt a framework for a subregional SCS or a subregional APS to address the intraregional land use, transportation, economic, air quality, and climate policy relationships." *Id.* Finally, SB 375 requires SCAG to "develop overall guidelines, create public participation plans, ensure coordination, resolve conflicts, make sure that the overall plan complies with applicable legal requirements, and adopt the plan for the region." *Id.*

The intent of this Framework and Guidelines for Subregional Sustainable Communities Strategy (also referred to herein as the "Framework and Guidelines" or the "Subregional Framework and Guidelines") is to offer the SCAG region's subregional agencies the highest degree of autonomy.

flexibility and responsibility in developing a program and set of implementation strategies for their subregional areas. This will allow the subregional strategies to better reflect the issues, concerns, and future vision of the region's collective jurisdictions with the input of the fullest range of stakeholders. In order to achieve these objectives, it is necessary for SCAG to develop measures that assure equity, consistency and coordination, such that SCAG can incorporate the subregional SCSs in its regional SCS which will be adopted as part of the 2012 RTP pursuant to SB 375. For that reason, this Framework and Guidelines establishes standards for the subregion's work in preparing and submitting subregional strategies, while also laying out SCAG's role in facilitating and supporting the subregional effort with data, tools, and other assistance.

While the Framework and Guidelines are intended to facilitate the specific subregional option to develop the SCS (and APS if necessary) as described in SB 375, SCAG encourages the fullest possible participation from all subregional organizations. As SCAG undertakes implementation of SB 375 for the first time, SCAG has also designed a "collaborative" process, in cooperation with the subregions, that allows for robust subregional participation for subregions that choose not to exercise their statutory option.

II. ELIGIBILITY AND PARTICIPATION

SB 375 allows for subregional councils of governments in the SCAG region to have the option to develop the SCS (and the APS if necessary) for their area. SCAG interprets this option as being available to any subregional organization recognized by SCAG, regardless of whether the organization is formally established as a "subregional council of governments."

County Transportation Commissions (CTCs) play an important and necessary role in the development of a subregional SCS. Any subregion that chooses to develop a subregional strategy will need to work closely with the respective CTC in its subregional area in order to identify and integrate transportation projects and policies. Beyond working with CTCs, SCAG encourages partnership efforts in the development of subregional strategies, including partnerships between and among subregions.

Subregional agencies must formally indicate to SCAG, in writing, by December 31, 2009 if they intend to exercise this option to develop their own SCS. Subregions that choose to develop an SCS for their area must do so in a manner consistent with this Framework and Guidelines. The subregion's intent to exercise its statutory option to prepare the strategy for their area must be decided and communicated through formal action of the subregional agency's governing board. Subsequent to receipt of any subregion's intent to develop and adopt an SCS, SCAG will convene discussions regarding a formal written agreement between SCAG and the subregion, which may be revised if necessary, as the SCS process is implemented.

III. FRAMEWORK

The Framework portion of this document covers regional objectives and policy considerations, and provides general direction to the subregions in preparing their own SCS, and APS if necessary.

A. SCAG's preliminary goals for implementing SB 375 are as follows:

- Achieve the regional GHG emission reduction target for cars and light trucks through an SCS.
- Fully integrate SCAG's planning processes for transportation, growth, intergovernmental review, land use, housing, and the environment.
- Seek areas of cooperation that go beyond the procedural statutory requirements, but that also result in regional plans and strategies that are mutually supportive of a range of goals.
- Build trust by providing an interactive, participatory and collaborative process for all stakeholders. Provide, in particular, for the robust participation of local jurisdictions, subregions and CTCs in the development of the SCAG regional SCS and implementation of the subregional provisions of the law.
- Assure that the SCS adopted by SCAG and submitted to California Air Resources Board (ARB) is a reflection of the region's collective growth strategy and vision for the future.
- Develop strategies that incorporate and are respectful of local and subregional priorities, plans, and projects

B. Flexibility

Subregions may develop any appropriate strategy to address the region's greenhouse gas reduction goals and the intent of SB 375. While subregions will be provided with SCAG data, and with a conceptual or preliminary scenario to use as a helpful starting point, they may employ any combination of land use policy change, transportation policy, and transportation investment, within the specific parameters described in the Guidelines.

C. Outreach Effort and Principles

Subregions are required to conduct an open and participatory process that includes the fullest possible range of stakeholders. As further discussed within the Guidelines, SCAG amended its existing Public Participation Plan (PPP) to describes SCAG's responsibilities in complying with the outreach requirements of SB 375 and other applicable laws and regulations. SCAG will fulfill its outreach requirements for the regional SCS/APS which will include outreach activities regarding the subregional SCS/APS. Subregions are also encouraged to design their own outreach process that meets each subregion's own needs and reinforces the spirit of openness and full participation. To the extent that subregions do establish their own outreach process, this process should be coordinated with SCAG's outreach process.

D. Communication and Coordination

Subregions developing their own SCS are strongly encouraged to maintain regular communication with SCAG staff, the respective CTC, their jurisdictions and other stakeholders, and other subregions if necessary, to review issues as they arise and to assure close coordination. Mechanisms for on-going communication should be established in the early phases of strategy development.

E. Planning Concepts

SCAG, its subregions, and member cities have established a successful track record on a range of land use and transportation planning approaches through the on-going SCAG Compass Blueprint Program, including approximately 90 local demonstration projects completed to date. Subregions are

encouraged to capture, further develop and build off the concepts and approaches of the Compass Blueprint program. In brief, these include developing transit-oriented, mixed use, and walkable communities, and providing for a mix of housing and jobs.

IV. GUIDELINES

These Guidelines describe specific parameters for the subregional SCS/APS effort under SB 375, including process, deliverables, data, documentation, and timelines. As described above, the Guidelines are created to ensure that the region can successfully incorporate strategies developed by the subregions into the regional SCS, and that the region can comply with its own requirements under SB 375. Failure to proceed in a manner consistent with the Guidelines will result in SCAG not accepting a subregion's submitted strategy.

A. Subregional Process

(1) Subregional Sustainable Communities Strategy

Subregions that choose to exercise their optional role under SB 375 will develop and adopt a subregional Sustainable Communities Strategy. That strategy must contain all of the required elements, and follow all procedures, as described in SB 375. Subregions may choose to further develop an Alternative Planning Strategy (APS), according to the procedures and requirements described in SB 375. If subregions prepare an APS, they must prepare a Sustainable Communities Strategy first, in accordance with SB 375. A subregional APS is not "in lieu of" a subregional SCS, but in addition to the subregional SCS. In part, an APS must identify the principal impediments to achieving the targets within the SCS. The APS must show how the GHG emission targets would be achieved through alternative development patterns, infrastructure, and additional transportation measures or policies. SCAG encourages subregions to focus on feasible strategies that can be included in the SCS.

The subregional SCS must include all components of a regional SCS as described in SB 375, and outlined below:

(i.) identify the general location of uses, residential densities, and building intensities within the subregion;
(ii.) identify areas within the subregion sufficient to house all the population of the subregion, including all economic segments of the population, over the course of the planning period of the RTP taking into account net migration into the region, population growth, household formation and employment growth.
(iii.) identify areas within the subregion sufficient to house an eight-year projection of the regional housing need for the subregion pursuant to Section 65584;
(iv.) identify a transportation network to service the transportation needs of the subregion;
(v.) gather and consider the best practically available scientific information regarding resource areas and farmland in the subregion as defined in subdivisions (a) and (b) of Section 65080.01.
(vi.) consider the state housing goals specified in Sections 65580 and 65581;
(vii.) set forth a forecasted development pattern for the subregion, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the ARB, and

(viii.) allow the RTP to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506). See, Government Code §65080(b)(2)(B).

In preparing the subregional SCS, the subregion will consider feasible strategies, including local land use policies, transportation infrastructure investment (e.g., transportation projects), and other transportation policies such as Transportation Demand Management (TDM) strategies (which includes pricing), and Transportation System Management (TSM) strategies. Technological measures may be included if they exceed measures captured in other state and federal requirements (e.g., AB32).

As discussed further below (under "Documentation"), subregions need not constrain land use strategies considered for the SCS to current General Plans. In other words, the adopted strategy need not be fully consistent with local General Plans currently in place. However, should the adopted subregional strategy deviate from General Plans, subregions will need to demonstrate the feasibility of the strategy by documenting any affected jurisdictions' willingness to adopt the necessary General Plan changes.

The regional SCS shall be part of the 2012 RTP. Therefore, for transportation investments included in a subregional SCS to be valid, they must also be included in the 2012 RTP. Further, such projects need to be scheduled in the RTIP for construction completion by the target years (2020 and 2035) in order to demonstrate any benefits as part of the SCS. As such, subregions will need to collaborate with the respective CTC in their area to coordinate the subregional SCS with future transportation investments. It should also be noted that the California Transportation Commission is updating their RTP Guidelines. This topic is likely to be part of further discussion through the SCS process as well.

SCAG will accept and incorporate the subregional SCS, unless (a) it does not comply with SB 375, (b) it is does not comply with federal law, or (c) it is does not comply with SCAG's Subregional Framework and Guidelines. In the event that a compiled regional SCS, including subregional submissions, does not achieve the regional target, SCAG will initiate a process to develop and consider additional GHG emission reduction measures region-wide. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process. Furthermore, SCAG will compile and disseminate performance information on the preliminary regional SCS and its components in order to facilitate regional dialogue. The development of a subregional SCS does not exempt any subregion from further GHG emission reduction measures being included in the regional SCS. Further, all regional measures needed to meet the regional target will be subject to adoption by the Regional Council, and any additional subregional measures beyond the SCS submittal from subregions accepting delegation needed to meet the regional target must also be adopted by the subregional governing body.

(2) Subregional Alternative Planning Strategy (APS)

Subregions are encouraged to focus their efforts on feasible measures that can be included in an SCS. In the event that a subregion chooses to prepare an APS, the content of a subregional APS should be consistent with what is required by SB 375 (see, Government Code §65080(b)(2)(H)), as follows:

(i.) Shall identify the principal impediments to achieving the subregional SCS.

(ii.) May include an alternative development pattern for the subregion pursuant to subparagraphs (B) to (F), inclusive.
(iii.) Shall describe how the alternative planning strategy would contribute to the regional greenhouse gas emission reduction target, and why the development pattern, measures, and policies in the alternative planning strategy are the most practicable choices for the subregion.
(iv.) An alternative development pattern set forth in the alternative planning strategy shall comply with Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations, except to the extent that compliance will prevent achievement of the regional greenhouse gas emission reduction targets approved by the ARB.
(v.) For purposes of the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code), an alternative planning strategy shall not constitute a land use plan, policy, or regulation, and the inconsistency of a project with an alternative planning strategy shall not be a consideration in determining whether a project may have an environmental effect.

Any precise timing or submission requirements for a subregional APS will be determined based on further discussions with subregional partners. As previously noted, a subregional APS is in addition to a subregional SCS.

(3) Outreach and Process

SCAG will fulfill all of its outreach requirements under SB 375 for the regional SCS/APS, which will include outreach regarding any subregional SCS/APS. SCAG staff has revised its Public Participation Plan to incorporate the outreach requirements of SB 375, and integrate the SB 375 process with the 2012 RTP development as part of SCAG's Public Participation Plan Amendment No. 2, adopted by SCAG's Regional Council on December 3, 2009. Subsequent to the adoption of the PPP Amendment No. 2, SCAG will continue to discuss with subregions and stakeholders the Subregional Framework & Guidelines, which further describe the Public Participation elements of SB 375.

Subregions that elect to prepare their own SCS or APS are encouraged to present their subregional SCS or APS, in coordination with SCAG, at all meetings, workshops and hearings held by SCAG in their respective counties. Additionally, the subregions would be asked to either provide SCAG with their mailing lists so that public notices and outreach materials may also be posted and sent out by SCAG, or SCAG will provide notices and outreach materials to the subregions for their distribution to stakeholders. The SCAG PPP Amendment No. 2 provides that additional outreach may be performed by subregions. Subregions are strongly encouraged to design and adopt their own outreach processes that mimic the specific requirements imposed on the region under SB 375. Subregional outreach processes should reinforce the regional goal of full and open participation, and engagement of the broadest possible range of stakeholders.

(4) Subregional SCS Approval

It is recommended that the governing board of the subregional agency approve the subregional SCS prior to submission to SCAG. While the exact format is still subject to further discussion, SCAG recommends that there be a resolution from the governing board of the subregion with a finding that the land use strategies included in the subregional SCS are feasible and based upon consultation with the local jurisdictions in the respective subregion. Subregion should consult with their legal counsel as to compliance with the California Environmental Quality Act (CEQA). In SCAG's view, the

subregional SCS is not a "project" for the purposes of CEQA; rather, the 2012 RTP which will include the regional SCS is the actual "project" which will be reviewed for environmental impacts pursuant to CEQA. As such, the regional SCS, which will include the subregional SCSs, will undergo a thorough CEQA review. Nevertheless, subregions approving subregional SCSs should consider issuing a notice of exemption under CEQA to notify the public of their "no project" determination and/or to invoke the "common sense" exemption pursuant to CEQA Guidelines § 15061(b)(3).

Finally, in accordance with SB 375, subregions are strongly encouraged to work in partnership with the CTC in their area. SCAG can facilitate these arrangements if needed.

(5) Data Standards

SCAG is currently assessing the precise data standards anticipated for the regional and subregional SCS. In particular, SCAG is reviewing the potential use of parcel data and development types currently used for regional planning. At present, the following describes the anticipated data requirements for a subregional SCS.

1. Types of Variables
   Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables include land uses, residential densities, building intensities, etc, as described in SB 375.

2. Geographical Levels
   SCAG is considering the collection and adoption of the data at a small-area level as optional for local agencies in order to make accessible the CEQA streamlining provisions under SB 375. The housing unit, employment, and the land use variables can be collected at a small-area level for those areas which under SB 375 qualify as containing a "transit priority project" (i.e. within half-mile of a major transit stop or high-quality transit corridor) for purposes of allowing jurisdictions to take advantage of the CEQA streamlining incentives in SB 375.

   For all other areas in the region, SCAG staff will collect the population, household, employment, and land use variables at the Census tract or Traffic Analysis Zone (TAZ) level.

3. Base Year and Forecast Years
   The socio-economic and land use variables will be required for the base year of 2008, and the target years of 2020 and 2035.

(6) Documentation

Subregions are expected to maintain full and complete records related to the development of the subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board.

(7) Timing

An overview schedule of the major milestones of the subregional process and its relationship to the regional SCS/RTP is included below. Subregions must submit the subregional SCS to SCAG by the date prescribed. Further, SCAG will need a preliminary SCS from subregions for the purpose of preparing a project description for the 2012 RTP Program Environmental Impact Report. The precise content of this preliminary submission will be determined based on further discussions. The anticipated timing of this preliminary product is approximately February 2011.

(8) Relationship to Regional Housing Needs Assessment (RHNA) and Housing Element

Although SB 375 calls for an integrated process, subregions are not automatically required to take on RHNA delegation as described in State law if they prepare an SCS/APS. However, SCAG encourages subregions to undertake both processes due to their inherent connections.

SB 375 requires that the RHNA allocated housing units be consistent with the development pattern included in the SCS. *See*, Government Code §65584.04(i). Population and housing demand must also be proportional to employment growth. At the same time, in addition to the requirement that the RHNA be consistent with the development pattern in the SCS, the SCS must also identify areas that are sufficient to house the regional population by income group through the RTP planning period, and must identify areas to accommodate the region's housing need for the next local Housing Element eight year planning period update. The requirements of the statute are being further interpreted through the RTP guidelines process. Staff intends to monitor and participate in the guideline process, inform stakeholders regarding various material on these issues, and amend, if necessary, these Framework and Guidelines, pending its adoption.

SCAG will be adopting the RHNA and applying it to local jurisdictions at the jurisdiction boundary level. SCAG staff believes that consistency between the RHNA and the SCS may still be accomplished by aggregating the housing units contained in the smaller geographic levels noted in the SCS and including such as part of the total jurisdictional number for RHNA purpose. SCAG staff has concluded that there is no consistency requirement for RHNA purposes at sub-jurisdictional level, even though the SCS is adopted at the smaller geographic level for the opportunity areas.

The option to develop a subregional SCS is separate from the option for subregions to adopt a RHNA distribution, and subject to separate statutory requirements. Nevertheless, subregions that develop and adopt a subregional SCS should be aware that the SCS will form the basis for the allocation of housing need as part of the RHNA process. Further, SCS development requires integration of elements of the RHNA process, including assuring that areas are identified to accommodate the 8 year need for housing, and that housing not be constrained by certain types of local growth controls as described in State law.

SCAG will provide further guidance for subregions and a separate process description for the RHNA.

D. COUNTY TRANSPORTATION COMMISSIONS' ROLES AND RESPONSIBILITIES

Subregions that develop a subregional SCS will need to work closely with the CTCs in their area in order to coordinate and integrate transportation projects and policies as part of the subregional SCS. As discussed above (under "Subregional Sustainable Communities Strategy"), any transportation

projects identified in the subregional SCS must also be included in the 2012 RTP in order to be considered as a feasible strategy. SCAG can help to facilitate communication between subregions and CTCs.

C. SCAG ROLES AND RESPONSIBILITIES

SCAG's roles in supporting the subregional SCS development process are in the following areas:

(1) Preparing and adopting the Framework and Guidelines

SCAG will adopt these Framework and Guidelines in order to assure regional consistency and the region's compliance with law.

(2) Public Participation Plan

SCAG will assist the subregions by developing, adopting and implementing a Public Participation Plan and outreach process with stakeholders. This process includes consultation with congestion management agencies, transportation agencies, and transportation commissions; and SCAG will hold public workshops and hearings. SCAG will also conduct informational meetings in each county within the region for local elected officials (members of the board of supervisors and city councils), to present the draft SCS, and APS if necessary, and solicit and consider input and recommendations.

(3) Methodology

As required by SB 375, SCAG will adopt a methodology for measuring greenhouse gas emission reductions associated with the strategy.

(4) Incorporation/Modification

SCAG will accept and incorporate the subregional SCS unless it does not comply with SB 375, federal law, or the Subregional Framework and Guidelines. As SCAG intends the entire SCS development process to be iterative, SCAG will not amend a locally-submitted SCS. SCAG may provide additional guidance to subregions so that subregions may make amendments to its subregional SCS as part of the iterative process, or request a subregion to prepare an APS if necessary. Further, SCAG can propose additional regional strategies if feasible and necessary to achieve the regional emission reduction target with the regional SCS. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process.

(5) Modeling

SCAG currently uses a Trip-Based Regional Transportation Demand Model and ARB's EMFAC model for emissions purposes. In addition to regional modeling, SCAG is developing tools to evaluate the effects of strategies that are not fully accounted for in the regional model. SCAG is also developing two additional tools – a Land Use Model and an Activity Based Model – to assist in strategy development and measurement of outcomes under SB 375.

In addition to modeling tools which are used to measure results of completed scenarios, SCAG is developing a scenario planning tool for use in workshop settings as scenarios are being created with jurisdictions and stakeholders. The tool will be made available to subregions and local governments for their use in subregional strategy development.

(6) Adoption/Submission to State

After the incorporation of subregional strategies, SCAG will finalize and adopt the regional SCS as part of the 2012 RTP. SCAG will submit the SCS to ARB for review as required in SB 375.

(7) Conflict Resolution

While SB 375 requires SCAG to develop a process for resolving conflicts, it is unclear at this time the nature or purpose of a conflict resolution process as SCAG does not intend to amend a locally-submitted SCS. As noted above, SCAG will accept the subregional SCS unless it is inconsistent with SB 375, federal law, or the Subregional Framework and Guidelines. SCAG will also request that a subregion prepare an APS if necessary. It is SCAG's intent that the process be iterative and that there be coordination among SCAG, subregions and their respective jurisdictions and CTCs. SCAG is open to further discussion on issues which may generate a need to establish a conflict resolution process as part of the written agreement between SCAG and the subregional organization.

(8) Funding

Funding for subregional activities is not available at this time, and any specific parameters for future funding are speculative. Should funding become available, SCAG anticipates providing a share of available resources to subregions. While there are no requirements associated with potential future funding at this time, it is advisable for subregions to track and record their expenses and activities associated with these efforts.

(9) Preliminary Scenario Planning

SCAG will work with each subregion to collect information and prompt dialogue with each local jurisdiction prior to the start of formal SCS development. This phase of the process is identified as "preliminary scenario planning" in the schedule below. The purpose of this process is to create a base of information to inform SCAG's recommendation of a regional target to ARB prior to June 2010. All subregions are encouraged to assist SCAG in facilitating this process.

(10) Data

SCAG is currently developing, and will provide each subregion with datasets for the following:

(1) 2008 Base year,
(2) General Plan/Growth projection & distribution;
(3) Trend Baseline; and
(4) Policy Forecast/SCS

While the Trend Baseline is a technical projection that provides a best estimate of future growth based on past trends and assumes no general plan land use policy changes, the Policy Forecast/ SCS is derived using local input through a bottom-up process, reflecting regional policies including transportation investments. Local input is collected from counties, subregions, and local jurisdictions.

Data/GIS maps will be provided to subregions and local jurisdiction for their review. This data and maps include the 2008 base year socioeconomic estimates and 2020 and 2035 socioeconomic forecast. Other GIS maps including the existing land use, the general plan land use, the resource areas, and other important areas identified in SB 375. It should be noted that none of the data/ maps provided were endorsed or adopted by SCAG's Community, Economic and Human Development Committee (CEHD). All data/maps provided are for the purpose of collecting input and comments from subregions and local jurisdictions. This is to initiate dialogue among stakeholders to address the requirements of SB 375 and its implementation.

The list of data/GIS maps include:

1. Existing land use
2. Zoning
3. General plan land use
4. Resource areas include:
   (a.) all publicly owned parks and open space;
   (b.) open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;
   (c.) habitat for species identified as candidate, fully protected, sensitive, or species of special status by local, state, or federal agencies or protected by the federal Endangered Species Act (1973), the California Endangered Species Act, or Native Plant Protection Act,
   (d.) lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts, or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code, and lands under Williamson Act contracts;
   (e.) areas designated for open-space or agricultural uses in adopted open-space elements or agricultural elements of the local general plan or by local ordinance;
   (f.) areas containing biological resources as described in Appendix G of the CEQA Guidelines that may be significantly affected by the sustainable communities strategy or the alternative planning strategy, and
   (g.) an area subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program or where the area is subject to more protective provisions of state law or local ordinance.
5. Farmland
6. Sphere of influence
7. Transit priority areas
8. City/Census tract boundary with ID
9. City/TAZ boundary with ID

(11) Tools

SCAG is developing a Local Sustainability Planning Model (LSPM) for subregions/local jurisdictions to analyze land use impact. The use of this tool is not mandatory and is at the discretion of the Subregion. The LSPM is a web-based tool that can be used to analyze, visualize and calculate the impact of land use changes on auto ownership, mode use, vehicle miles of travel (VMT), and greenhouse gas emissions in real time. Users will be able to estimate transportation and emissions impacts by modifying land use designations within their community

Other tools currently maintained by SCAG may be useful to the subregional SCS development effort, including the web-based CaLOTS application. SCAG will consider providing guidance and training on additional tools based on further discussions with subregional partners

(12) Resources and technical assistance

SCAG will assist the subregions by making available technical tools for scenario development as described above. Further, SCAG will assign a staff liaison to each subregion, regardless of whether the subregion exercises its statutory option to prepare an SCS. SCAG staff can participate in subregional workshops, meetings, and other processes at the request of the subregion, and pending funding and availability. SCAG's legal staff will be available to assist with questions related to SB 375 or SCAG's implementation of SB 375. Further, SCAG will prepare materials for its own process in developing the regional SCS, and will make these materials available to subregions.

D. MILESTONES/SCHEDULE

- CARB issues Final Regional Targets – September 2010
- SCS development (preliminary scenario, draft, etc) – through early 2011
- Release Draft RTP/regional SCS for public review – November 2011
- Regional Council adopts RTP/SCS – April 2012

If other milestones are needed, they will be incorporated into the written agreement between SCAG and the Subregion.

12

33

Exhibit B: Milestones Schedule

The key milestones and related schedule required as part of the development of the Gateway Cities COG Subregional SCS are as follows:

1. Status report on Preliminary Subregional SCS – Dec 2010
2. Acopted GCCOG Dataset/Delivery to SCAG Jan 2011
3. Preliminary SCS / for purposes of preparing PEIR project description (intended to be narrative only project description that describes intended strategies or strategy options that are likely to be incorporated into the final Subregional SCS.) – Feb 2011
4. Status report on Draft Subregional SCS – Feb 2011
5. Draft Subregional SCS (containing all components described above) to be incorporated into draft Regional SCS April 2011
6. Status report on final Subregional SCS – April 2011
7. Final Subregional SCS for incorporation into Regional SCS – June 2011
8. Iterative process, if necessary to meet target – June to November 2011
9. Gateway Cities COG to participate in regional outreach conducted in Orange County – June 2011 to February 2012
10. Regional SCS adopt on – April 2012

34

Exhibit C: Deliverables Template

The Gateway Cities COG Subregional SCS will consist of the following components:

1. Database (GCCOG Dataset) that allocates population, housing, household, and employment to areas of the county. Geographic area should be the smallest level practicable for the COG to produce, preferably at the parcel level. The database must reflect the base year 2008 and each variable in the two GHG target years (2020 and 2035), in accordance with the Data Standards set forth below.
2. A map or series of maps that illustrates the growth distribution described above, and that further delineates uses, intensities, and residential densities, in accordance with the Data Standards set forth below.
3. A listing of transportation projects that are incorporated in the subregional SCS.
4. A listing and description of transportation policies (e.g. TDM, TSM and others) to be employed.
5. Documentation that establishes the process, including the public participation and outreach process used to develop the SCS, and demonstrates the affected jurisdictions willingness to consider general plan changes.
6. A narrative description of the strategies employed to reduce greenhouse gas emissions. A further description of any other strategies that were considered and not ultimately included.

DATA STANDARDS

The following data standards will be used in the development of a subregional SCS:

1. Types of Variables

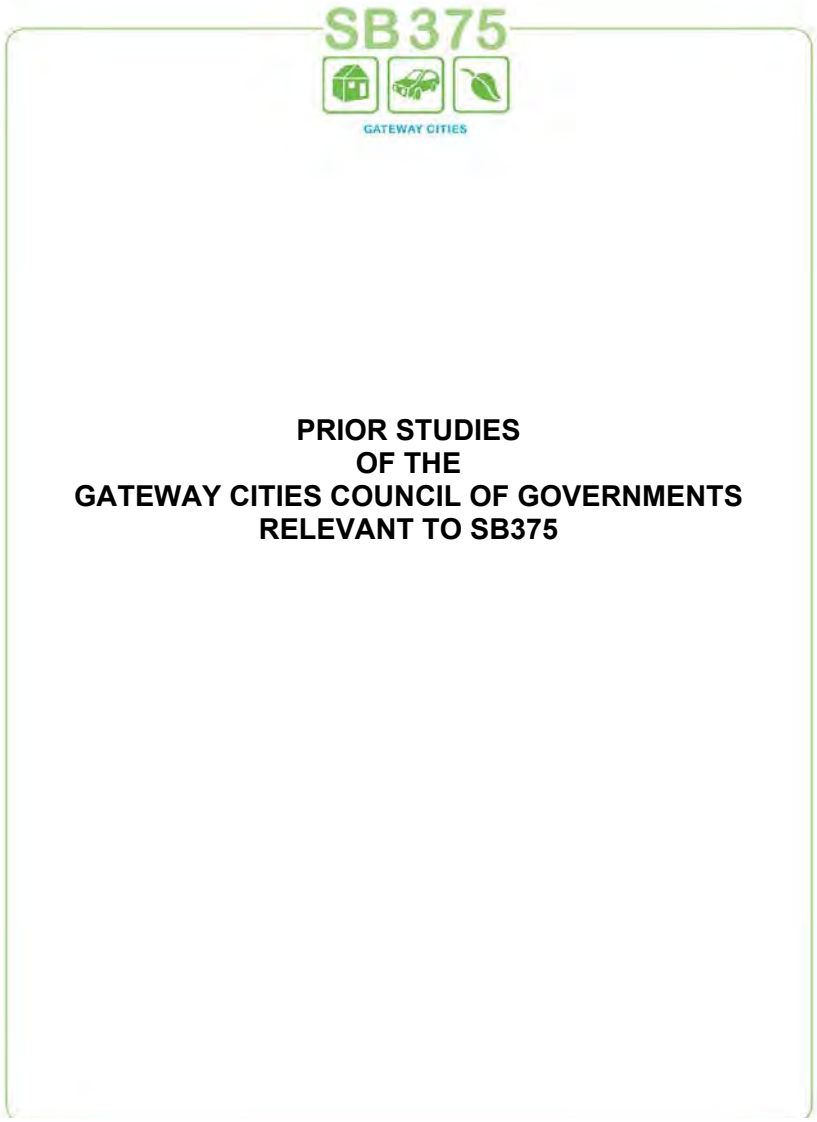
Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables may include land uses designations, building densities, building intensities, and applicable policies.

2. Geographical Levels

Socio-economic and land-use variables should be provided to SCAG at the smallest geographical level practicable for OCCOG to produce, preferably at the parcel level. At a minimum, such variables will be provided at the Census tract or Traffic Analysis Zone (TAZ) level.

3. Base Year and Forecast Years

The socio-economic data and land use variables will be required for the base year of 2008, and as feasible, for the target years of 2020 and 2035.



DOCUMENTATION

Subregions are expected to maintain full and complete records related to the development of the Subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by

the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board. Subregions shall include information regarding the status of the documentation as part of the required status reports to SCAG, and copies of the actual documentation shall be submitted to SCAG as part the final Subregional SCS.

SB 375
GATEWAY CITIES

BACKGROUND/INTRODUCTION

In mid-2010, the Gateway Cities Council of Governments (COG) retained a Cambridge Systematics led team to assist the COG with the development of a Sustainable Communites Strategy (SCS) for the Gateway Cities sub-region, in accordance with the requirements of SB 375. One of the initial tasks of the work program for the development of the SCS involved the review of prior COG studies. The purpose of this task was to review prior studies to identify Vehicle Miles Traveled/ Greenhouse Gas (VMT/GHG) reduction measures contained in these studies that could be included in SCS Strategy portfolios to be prepared for each city by Cambridge Systematics. Team member Willdan Engineering was charged with this task of compiling and reviewing the prior COG studies.

Being proactive in addressing issues facing its sub-region, the Gateway Cities COG has generated a number of studies since its inception. The COG has conducted 37 studies since 1996, exclusive of addendums and supplements, and of these, 25 are germane to SB 375 and the development of the sub-regional SCS and/or Regional Housing Needs Assessment. On the pages that follow, the 16 reports that contained the most relevant measures or other information with regard to VMT/GHG reductions are discussed in the chronological order in which they were prepared. Each report is briefly summarized and any key findings/recommendations relevant to VMT/GHG reductions are listed.

SB 375 GATEWAY CITIES

Report: Community Link 21: Southern California Association of Governments (SCAG's) Draft Regional Transportation Plan

Date: February 1998

Summary: This report reviews SCAG's draft Regional Transportation Plan (RTP) (Community Link 21), explains its significance for the Gateway Cities Sub-region, and makes recommendations as to what position the Gateway Cities COG should take with respect to these issues.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- Gateway Cities Goods Movement Network, a system of intersections and connecting arterials, should be accorded programmatic status by SCAG, similar to the Alameda Corridor East, and properly budgeted with regional funding;
- endorse truck lanes on I-710 in concept only, subject to further review and clarification;
- request SCAG to allocate funding in the RTP for grade crossing improvements in the Gateway Cities;
- Gateway Cities COG should participate in any regional bus restructuring and smart shuttles studies to have adequate local control over route and service decisions;
- LAX expansion should be subject to the Metropolitan Transportation Authority's (MTA's) Congestion Management Plan requirements;
- Intelligent Transportation System technologies should be identified as a means to improve the efficient and safe movement of people and goods; and
- Gateway Cities COG should request a reconfiguration of the RTP to support infrastructure improvements in the industrial core as opposed to funding for spread out development that increases the burden on meeting air quality requirements in increasing vehicle miles traveled.

SB 375 GATEWAY CITIES

Report: Livable Cities Case Studies

Date: 2001

Summary: Three case studies are presented in this report to demonstrate the possibilities of creating a livable community through strategies of downtown revitalization, reuse of industrial lands, and streetscape improvements to arterial corridors. Alternatives and recommendations presented in each case study are intended to provide lessons that can be utilized by all member cities facing similar challenges. Alternatives and recommendations by city include:

1. The case study for the City of Artesia focused on revitalizing an existing downtown by incorporating a healthy mix of uses, utilizing building form, architectural details and design guidelines to showcase the unique qualities of the city. In addition, the case study showed how to utilize the current assets of the city to focus their redevelopment energy and use the vitality of the downtown to strengthen the structure of the city as a whole.
2. The case study for the City of Paramount focused on the redevelopment of underutilized industrial land to achieve a city structure based on a series of walk-able, mixed-use districts serving local residents. In addition, the case study addressed how to link these districts through the use of public transit and streetscape design.
3. The case study for the City of Pico Rivera focused on the revitalization of a commercial arterial through the use of streetscape enhancements and urban design recommendations. More specifically, the case study addressed how to handle the transformation of a large thoroughfare historically dominated by industrial truck traffic into a mixed-use boulevard that contributes to the overall structure and vitality of the city.

One of the greatest issues facing the case study cities of Artesia, Paramount and Pico Rivera, and of relevance to all of the Gateway Cities, is the shift in land use caused by the changing regional economy. As large-scale manufacturing becomes less relevant to local economies, the conversion of post-industrial land becomes a key opportunity for these otherwise built-out metropolitan areas. Study and analysis of regional trends, as well as an understanding of what is important to the community, can help to direct the reuse of this land. New uses should support current and anticipated future trends in both the economics of land use and allocation, and support the retail, civic, and residential structure necessary to create "livable cities".

SB 375 GATEWAY CITIES

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- Increase utilization of underutilized industrial land to create mixed-use activity areas that are linked through public transportation;
- Improve the vitality of the downtown by incorporating a mix of uses and through the use of building form, architectural details and design guidelines; and
- Transform a traffic-ridden thoroughfare into a more pedestrian-friendly, mixed-use boulevard.

Report: OrangeLine Feasibility Study

Date: 2002

Summary: The OrangeLine feasibility study is a financial, engineering and environmental assessment of an advanced technology, 30-33 mile high-speed transportation system operating along the former Pacific Electric "Red Car" land and adjoining corridors. This corridor extends from downtown Los Angeles to central Orange County. Results indicate that the OrangeLine transportation system can provide the required transportation improvements to support current and future development, and that it could be successfully built and operated without the need for significant government subsidies.

It is anticipated that additional housing, office and retail development projects completed along the OrangeLine corridor by 2025 will accommodate an increased population of 8,000 people within a quarter mile of station areas and tens of thousands more in the surrounding area, as well as up to 125,000 additional jobs. This growth in population and employment will result in added trips per day in the corridor. In addition to providing a very high quality, non-polluting transportation service to over 46,000 daily riders by 2025, the OrangeLine will also divert an estimated number of daily riders to other transit modes, thus significantly reducing the traffic impacts of future growth. The OrangeLine is projected to reduce auto trips in the corridor compared to travel patterns that would exist if the OrangeLine were not built.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- reduce auto trips by providing an advanced technology high-speed transportation system along a transportation corridor linking Los Angeles with central Orange County; and

SB 375 GATEWAY CITIES

- provide for higher intensity housing, office and retail development projects along this public transit corridor.

Report: Supplemental Southeast Area Bus Restructuring Study

Date: 2003

Summary: The purpose of this study was to identify and evaluate opportunities to improve existing local and regional fixed-route bus transit services, transit facilities, and community-level transit and Para transit systems serving the Southeast study area. This study builds on the Southeast Area Bus Restructuring Study, completed in August 2000, with an increased focus on community-based services in the Southeast area. The study presented concrete recommendations for improving transit service within the Southeast study area.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- County should conduct a more detailed review and analysis of passenger trip-making patterns to determine whether current service area designations effectively match reasonable trip requests from County residents (i.e., review the destinations commonly served or commonly requested to identify destination-rich areas and to determine what fit or misfit may exist with current service area designation);
- cross-jurisdictional trips should be provided when needed to enhance services and provide services more cost-effectively;
- cities within the study area should view the gradual implementation and development of both city-specific and coordinated multi-jurisdictional transit projects as wholly interrelated and necessary to develop a cohesive transportation network in the Southeast; and
- cities in the study area should establish a formalized institutional arrangement that is easy to administer and consistent with MTA current plans for the Southeast area and other transit funding plans (i.e., programming of projects). The recommended option is a cooperative agreement based on an MOU among all parties, with the City of Norwalk designated as the lead agency as recommended by the Technical Advisory Committee for this study. This option is recommended for several reasons: simplicity; ease of implementation; flexibility; effectiveness in achieving its goal; and ability to encompass the MTA Sector as an accepted partner.

SB 375 GATEWAY CITIES

Report: The Gateway Cities Council of Governments Sub-Regional Housing Implementation Strategy

Date: July 2003

Summary: The Gateway Cities COG is mandated by the State to assist in developing housing policy, and as a result, is required to go through a series of processes to identify housing issues and needs. The objective of this study was to identify ways that the Gateway Cities COG, as a coalition of twenty-seven cities, can play a beneficial role in solving the regional housing shortage. Particular emphasis was placed on identifying potential financing mechanisms available to local governments that could be effectively used by the Gateway Cities COG to make new housing more feasible.
The study identifies a number of strategies for promoting the sub-region and affordable housing.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- transit-oriented development relieving transportation pressures;
- brownfield redevelopment as a source of available land for economic development and new housing;
- initiate programs to promote manufacturing-based sustainable economic development, educational programs and employee training programs to help encourage new employers to locate or expand in the sub-region to address the jobs/housing balance and reduce VMT; and
- promote infill development for housing.

Report: Gateway Cities Infrastructure Needs Assessment

Date: September 2003

Summary: This report summarizes the finding and recommendations from the Gateway Cities Infrastructure Needs Assessment project SCAG. The Gateway Cities sub-region is located in a major goods transportation corridor connected to the Port of Los Angeles and the Port of Long Beach, which generates high concentrations of heavy truck traffic passing through the sub-region. In a recent study by SCAG, the Gateway Cities Trucking Study identified pavement deterioration resulting from heavy truck traffic as the number one concern of Gateway Cities Public Works staff. The primary purpose of the study was to conduct an inventory of current pavement management and rehabilitation practices, an assessment of pavement conditions of the study area through selective

SB 375 GATEWAY CITIES

sampling of representative streets, and an assessment of the current under-funded needs of each Gateway City. The study also reviewed the latest pavement maintenance and rehabilitation practices of each Gateway City. The study concluded that a significant shortfall exists between the total annual maintenance and rehabilitation budget for the Gateway Cities region and the projected annual maintenance and rehabilitation costs. Most cities will be faced with a significant maintenance and rehabilitation shortfall for their streets.

Report: I-710 Tier 2 Community Advisory Committee Final Report

Date: August 2004

Summary: A broad-based committee, known as the Tier 2 Committee, was appointed by the I-710 Oversight Policy Committee (OPC) to study the current congestion and design of the I-710 Freeway. The I-710 Corridor impacts homes, businesses, schools, parks and lives of the communities in the immediate area. The committee's recommendations were made in the areas of health, jobs and economic development, safety, noise, congestion and mobility, community enhancements, design concepts and environmental justice.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- implement local alternative fuels/electrification and/or hydrogen policies and programs to reduce diesel emissions;
- implement port-specific air quality improvement strategies;
- position the I-710 corridor and Gateway communities for a post-oil economy;
- separate trucks and cars;
- conduct a study to assess how truck traffic from extended gate hours will impact communities, and assess what mitigations may be appropriate;
- maximize use of existing infrastructure;
- implement expanded public transit solutions;
- provide a comprehensive bicycle and pedestrian network with connectivity throughout the area;
- support cooperative planning among all ports along the West Coast;
- preserve existing parks, open spaces, and natural areas;
- provide programs to minimize construction impacts;
- use of new truck lanes; and
- redesign unsafe and congested I-710 interchanges.

SB 375 GATEWAY CITIES

Report: I-710 Oversight Policy Committee Adopted Locally Preferred Strategy

Date: November 2004

Summary: The I-710 Oversight Policy Committee (OPC) is advised by a Technical Advisory Committee (TAC) and several Community Advisory Committees (Tier 1 Committee and Tier 2 Committee). The TAC was directed by the OPC in May 2003 to develop a hybrid design alternative to the 5 alternative designs presented in the I-710 Major Corridor Study.

Working from the following guiding principles:

1. Minimize ROW acquisitions to preserve existing houses, businesses and open space.
2. Identify and minimize exposure to air toxics and pollution through diesel emissions reduction programs, use of alternative fuels, and project planning and design.
3. Improve safety through truck safety inspection facilities, reduced truck/car conflicts and improved roadway design.
4. Relieve congestion and reduce traffic by employing a comprehensive regional systems approach adding needed capacity and deploying Transportation Systems Management (TSM) and Transportation Demand Management (TDM) to make full use of freeway, roadway, rail and transit systems.
5. Facilitate effective public participation.

The OPC adopted the Locally Preferred Strategy developed in close cooperation with the TAC, Tier 1 and Tier 2 Committees:

- The hybrid design concept consists of 10 mixed flow lanes, specified interchange improvements, and 4 truck lanes between inter-modal rail yards in Vernon/Commerce and Ocean Boulevard in Long Beach.
- Implementation of Alternative B TSM/TDM measures.
- Improvement of arterial highways within the I-710 Corridor.
- Construction of truck inspection facilities to be integrated with the selected overall design.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- Interchange improvements;
- Coordination of truck and inter-modal rail yards; and
- Transportation Systems Management and Transportation Demand Management.

8

SB 375 GATEWAY CITIES

Report: Gateway Cities COG – Summary of the Proceedings of the Joint Housing Summit "Strategies and Tactics for Infill Development Success"

Date: November 2004

Summary: This joint housing summit by the Gateway Cities and the South Bay Cities Councils of Governments discussed federal and state initiatives to promote affordable housing and home ownership. The President's initiative: America's Affordable Communities Initiative: Bringing Homes Within Reach Through Regulatory Reform emphasizes that government regulation contributes to the high cost of housing and regulatory reform may serve to increase the affordability of housing. The initiative is supported by research conferences, awards programs, incentives in competitive grants and HUD internal screening of housing programs and regulations that create barriers for affordable housing. The State supports the availability of housing as a key factor to promote a prosperous economy, a quality environment and social equity. Anticipated State initiatives will promote program changes to support affordable housing and seek funding sources to help house low and very low income persons.

Report: SR-91 / I-605 Needs Assessment Study

Date: September 2005

- **Summary:** The freeways in Southern California are continuing to become increasingly congested due to the region's expanding population. In addition, the freeways in Southeast Los Angeles County are also affected by the continuing growth of the Ports of Long Beach and Los Angeles. The impetus to prepare the SR-91 and I-605 Needs Assessment is, in large part, the result of the effect on these two freeways by the truck traffic volumes from the two ports, as well as the additional truck volumes in the future from continued port growth. The report analyzed projections for continued traffic growth that would affect these two freeways and examined improvements needed to accommodate this increasing traffic. Intelligent Transportation Systems (ITS) were also examined as a technology to increase mobility and improve safety for people and freight to complete end-to-end trips as efficiently as possible.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- additional freeway lanes for general purpose traffic;

9

SB 375 GATEWAY CITIES

- upgrade and improve the I-405/I-605, the SR-91/I-605 and the I05/I-605 interchanges;
- analysis of possible carpool-to-carpool interchanges at major freeway interchanges;
- further study the possibility of adding truck lanes to SR-91, I-105 and I-605;
- add additional lanes to at least one arterial highway that parallels each freeway, including signal synchronization and consideration/ evaluation of removal and replacement of on-street parking (as needed) along freeway corridors;
- all arterial bridges over the San Gabriel River next to the I-605 freeway need to be widened by one lane in each direction;
- signal synchronization of most of the nearby arterial highways that border the SR-91 and I-605 corridors as part of an ITS strategy;
- develop an ITS master plan for the COG region and establish traffic management centers as needed within the region; and
- air quality and quality of life issues and concerns should be addressed as part of any additional studies.

Report: The Gateway Cities & Surrounding Areas Intelligent Transportation System (ITS) Research and Strategies For Transportation and Goods Movement Study

Date: December 2005

ITS is the application of technology to the highway systems. Many Gateway Cities are in the process of implementing a variety of ITS programs. This study was initiated to research the ITS planning, design, deployment and operations that are being planned or implemented by other agencies for traffic and for goods movement strategies to reduce traffic congestion, increase safety, reduce pavement/roadway damage and improve real time traveler information sharing for the freeways in the Gateway Cities COG area. The increasing cargo shipments in the ports, expected to double over the next 15 years and possibly triple over the next 20 years, will increase diesel emissions affecting regional air quality and increase traffic along routes to and from the ports. Improving the goods movement systems and infrastructure can serve to reduce environmental impacts and relieve congestion on freeways and increase mobility in the area. The application of ITS technology includes:

- automatic collection and transmission of “real time” traffic information;
- commercial vehicle operations;

SB 375 GATEWAY CITIES

- electronic tolling and collection;
- traffic management centers;
- arterial highway traffic signal synchronization;
- development of a 511 Traveler Information System;
- development of telecommunications systems providing “real time” traffic information to the driver;
- incident management alerts for drivers and the California Highway Patrol; and
- incident reduction systems.

This study identifies a number of ITS projects adopted by various agencies in the region.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- ramp metering;
- signal coordination with ramp metering;
- incident management;
- real-time traveler information;
- arterial signal management;
- isolated traffic actuated signals;
- actuated corridor signal coordination;
- central control signal coordination;
- automatic transit vehicle location and scheduling;
- transit vehicle signal priority;
- traffic management center;
- traffic signal synchronization;
- clean air program; and
- shuttle train pilot program.

Report: SR-91 / I-605 / I-405 Proposal for Major Corridor Study and RSTIS Peer Review Presented by Gateway Cities COG

Date: October 2006

Summary: On January 27, 2005, the Board of Directors of the Los Angeles County Metropolitan Transportation Authority (Metro) adopted the Draft Final Report on the I-710 Major Corridor Study. As a result of the I-710 Major Corridor Study (MCS), it was apparent that existing and future port-related truck traffic impacting the I-710 freeway

would also impact the other freeways in Southeast Los Angeles County east of the I-710 freeway. These freeways include the SR-91, I-605, I-405 and I-105. The results of a needs assessment study showed that these freeways will be overwhelmed with general purpose, car-pool and heavy-duty truck traffic in the future, clearly identifying a need for further analysis and mitigation. In order to proceed with a Major Corridor Study, federal funding is required. Therefore, Regionally Significant Transportation Investment Studies (RSTIS) requirements needed to be followed. Based on the preceding, the Gateway Cities COG requested a RSTIS Peer Review for these freeway corridors.

Report: Draft (Revised) Technical Scope of Work Southeast Los Angeles County SR-91 / I-605 / I-405 Freeway Corridors Major Corridor Study (MCS)

Date: May 2007

Summary: This Scope of Work addresses the transportation issues to be addressed through the preparation of a Major Corridor Study for the SR-91 / I-605 / I-405 Corridors, as required for the Regionally Significant Transportation Investment Study (RSTIS) by SCAG. The purpose of the study is to conduct a comprehensive evaluation of the overall transportation system, the results of which will be assembled into a Corridor Analysis Report and will include a Preferred Alternative assuming a built-out environment for all alternatives considering existing houses and businesses.

Report: Development of the Air Quality Action Plan for the I-710 Corridor

Date: May 2007

Summary: A study assessing the options and costs associated with widening the freeway to expand the capacity of the Interstate 710 Freeway (I-710) from the ports (Ocean Boulevard) to SR-60 freeway began in 2001. As part of the study, feedback was obtained from the communities in the I-710 corridor and determined that the main concerns about expanding the freeway were related to issues of air quality in the region. The Gateway Cities COG was asked by stakeholders in the I-710 Corridor planning process to prepare an Air Quality Action Plan (AQAP) to address the air quality concerns associated with expanding the freeway. This report was a preliminary step in the development of the AQAP. This report summarizes the process that resulted in the

creation of the AQAP and the expectations that stakeholders have for the document. It also reviews the primary emission reduction measures from diesel fueled engines and the goods movement sector that have been proposed or which are being implemented and should improve air quality in the I-710 Corridor communities.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

Provided below is a listing of emission reduction policies and programs from various agencies that should have a direct impact on GHG emissions.

California Air Resources Board Goods Movement/Diesel Risk Reduction Measures

- stricter PM and NOx emissions standards for new and in-use cargo handling equipment (CHE) at California's ports and inter-modal rail yards;
- limit the amount of time 2008 and newer sleeper berth equipped trucks can operate at idle;
- measure to reduce emissions from diesel-powered trucks in port service;
- measure to reduce emissions from in-use heavy-duty diesel powered vehicles by requiring in-use controls such as verified diesel emission controls to ensure engines operate as cleanly as possible;
- railroads commitment to studying and reducing pollution risks at 17 designated rail yards in and around Los Angeles County;
- require public agency and utility vehicle owners to reduce diesel PM emissions from their affected vehicles through the application of best available control technologies (BACT);
- manufacturer-run heavy-duty diesel engine in-use compliance program on 2007 and newer heavy-duty engines;
- measure to reduce emissions from in-use off-road vehicles requiring each fleet to meet fleet average requirements by March 1 of each year or demonstrate that BACT technology be applied;
- requires the use of low-sulfur fuel in the main engine of ocean-going vessels (OGVs);
- requires ships entering California's ports to use 0.5 percent sulfur content Marine Diesel Oil by January 1, 2007, or Marine Gas Oil for auxiliary diesel engines within 24 nautical miles of the California coast;
- regulation to reduce emissions from commercial harbor craft such as tugs, tows, ferries and fishing vessels through engine retrofits and re-powers, as well as regulations on fuel type;
- requires OGVs use shore power (connecting to electrical power at the dock) in lieu of auxiliary engines while hotelling; and

- assess the emission reduction results from the other OGV measures.

San Pedro Bay Ports Clean Air Action Plan Measures

- requirement to meet or be cleaner than the EPA 2007 on-road PM emissions standards and the cleanest available NOx at the time of replacement or retrofit for all trucks frequently or semi-frequently calling at ports by the end of 2011;
- measure providing for the development of an alternative fuel refueling and central maintenance facility, jointly owned by both ports, and located on Terminal Island;
- compliance with the vehicle speed reduction requirement 20 nautical miles (nm) from Point Fermin, with the prospect of expanding the measure to 40 nm from Point Fermin;
- mandates the use of shore power to reduce hotelling emissions at container terminals, cruise terminals, container terminals and one crude oil terminal and exploration of alternative emission reduction technologies for hotelling OGVs;
- measure establishing a fuel standard for fuel used in on-board auxiliary power units of ≤0.2 percent sulfur distillate or Marine Gas Oil equivalent reduction;
- establishes a fuel standard for fuel used when ships are arriving or departing San Pedro Bay of ≤0.2 percent sulfur distillate or Marine Gas Oil equivalent reduction;
- measure provides research money for the development of new technologies that reduce emissions from both auxiliary power units (APUs) and main engines;
- requirement that, beginning in 2007, all cargo handling equipment (CHE) purchases will be required to have either the cleanest available NOx alternative fueled engine or the cleanest available NOx diesel fueled engine;
- San Pedro Bay Ports (SPBP) harbor craft will meet EPA standards within specified timeframes and eventually all previously re-powered harbor craft will be retrofitted with the most effective NOx and PM emission reduction devices;
- require that, by 2008, all existing switch engines in the ports be replaced with cleaner engines and use emulsified fuels as available or other equivalently clean alternative diesel fuels. Additionally, new switch engines acquired after the initial replacement must meet even cleaner standards;
- require, by 2011, all diesel-powered Class 1 switcher and helper locomotives entering port facilities be 90 percent controlled for PM and NOx and have 15-minute idle restriction devices installed. After January 1, 2007, all locomotives

will be required to use ultra low sulfur diesel fuel. Additional cleaner standards are required by 2012; and
- require the cleanest available technology for switcher, helper and long haul locomotives for new or redeveloped rail yards on SPBP's property and require "green-container" transport systems, idling shut off devices, idling exhaust hoods, ultra-low sulfur diesel or alternative fuels and clean CHE and heavy-duty vehicles.

Tier 2 Committee Report Measures

- establish a baseline of current levels of pollution, identify level of air quality impacts from increasing truck, rail and shipping and determine costs of health care that can be traced to pollution encountered by corridor communities as a result of construction; and
- require the increased use of enforcement and inspections to control emissions from on-road heavy-duty vehicles.

Report: SR-91 / I-605 / I-405 Initial Corridors Studies

Date: April 2008

Summary: This report is a follow-up to the 2005 SR-91 / I-605 Needs Assessment which projected growth in ports-related goods movement will significantly increase truck traffic on all the freeways in the Gateway Cities area. This follow-up report reflects a new SCAG Regional Model with 2035 projections (previously 2030 projections), applying the same assumptions for port operations and adding results for three additional links including I-605 north of I-405, I-405 between I-110 and I-710 as well as I-405 between I-710 and I-605. The projected increase in truck traffic has resulted in the freeway study evolving to include an assessment of regional goods movement through the area without total reliance on the traditional port-to-truck-to-freeway-to-destination option. The report's adopted guiding principles are provided below:

1. Confine new freeway construction to existing State right-of-way in order to preserve and enhance local economies and environments.
2. Address freeway operational deficiencies, relieve freeway congestion "hot-spots" and decease the impact of truck bypass traffic on communities.
3. Secure funding for major corridor studies and improvements.
4. Support a separate freight movement corridor provided it is evaluated

and constructed along non-freeway (e.g., rail or utility) alignments using minimally or non-polluting technologies.

5. Implement additional Intelligent Transportation Systems (ITS) improvements in the SR-91 / I-605 / I-405 Corridor and advocate a broader regional approach.
6. Continue collaborative planning efforts.
7. Advocate to preserve and enhance health and quality of life in the corridor.

The report identifies a number of needs and recommendations for improvements.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- Gateway Cities COG and its communities will support a separate freight movement corridor constructed along non-freeway alignments using minimally or non-polluting transportation technologies;
- ITS Integration Plan demonstrates the computer technology providing real-time traveler information can be used to have a significant benefit for both the private and public sectors for goods movement and should be implemented;
- freeway operational deficiencies should be addressed as mainline freeway improvements including local freeway interchanges;
- one additional lane in each direction added to freeways (with some local property impacts) may be sufficient to meet projected general traffic demands if a successful and reliable freight movement corridor can be implemented; and
- HOV direct connectors may be feasible at some freeway-to-freeway interchanges.

Report: White Paper – Addressing the Requirements of SB 375 at the Sub-regional Level

Date: December 2009

Summary: This report discusses in detail the month's long process undertaken by the Gateway Cities COG during 2009 to determine its response to the requirements of SB 375 and the formulation of a Sustainable Communities Strategy. The COG initially engaged the MTA as a co-partner in the SB 375 process and then its member jurisdictions assessed themselves to retain a consulting team to provide technical support in responding to this complex and evolving legislation.

Over an 8-month period, the consultant team conducted an on-line survey of COG sustainability efforts; compared the general plans of COG jurisdictions to SCAG growth assumptions; evaluated the current efforts of COG members as compared to the efforts that may be needed, based on a Best Management Practices list and weighting factors, in order to attain the desired level of GHG emissions reductions; monitored and reported on the SB 375 process and related meetings; organized and conducted a series of SB 375 workshops for COG representatives; and presented the results of these efforts in a final comprehensive report to the COG. Based on the recommendations presented in this report, the COG Board elected to assume responsibility from SCAG for preparing the SB 375 required Sustainable Communities Strategies (SCS) for the Gateway Cities sub-region.

Findings/Recommendations Relevant to GHG and VMT Reductions include:

- the web-based survey documented that COG member cities have already initiated or are planning to undertake various measures that have/will reduce VMT and GHG emissions;
- the Gateway cities demonstrate a strong institutional capacity for strategies that are the foundation for complying with SB 375 and SCS requirements;
- current and planned policies and improvements could achieve ±15% of a hypothetical sub-regional target of 4% GHG reduction by 2020;
- in order to meet the hypothetical target, 80% of COG members would need to adopt various land use and transportation policies; and
- the COG should assume responsibility from SCAG for developing the sub-regional SCS and Regional Housing Needs Assessment (RHNA) as allowed by SB 375.

GATEWAY CITIES
COUNCIL OF GOVERNMENTS

For Immediate Release **April 12, 2011**

SOUTHEAST AREA CITIES TO ADOPT PLAN TO REDUCE GREENHOUSE GASES

Twenty-six cities in southeastern Los Angeles County, located in the area called the Gateway Cities, are working together to develop an unprecedented plan to reduce greenhouse gas emissions from cars and light trucks by changing land use and transportation patterns. The plan, called a Sustainable Communities Strategy or SCS, is a new requirement of state law adopted in 2008 known as SB 375.

The Gateway Cities SCS is under development and is expected to be finalized in June. The plan compiles city, county, and regional strategies in three categories. The first category, transportation projects, includes bicycle and pedestrian improvements, such as separated bike lanes, intersection improvements, and traffic signal synchronization, among many others that will help reduce auto usage and emissions. For example, in 2009 the City of Bellflower reclaimed a bike and pedestrian path from an unused rail right-of-way.

The second category, land use changes, involves denser development near existing or planned transit stations. Examples can be seen on Long Beach Boulevard in Long Beach, along the Metro Blue Line.

The third category is known to planners as TDM, or travel demand management. This refers to programs like shortened work weeks and employer-sponsored ride sharing, which enable commuters to use their personal cars less often while still getting to and from work. The City of Commerce, for one, makes extensive use of this strategy.

The projects and strategies comprising the Gateway Cities SCS are expected to be implemented by one of two target years: 2020, or 2035. The California Air Resources Board has set regional emission reduction targets for each of these years. The targets must be collectively met by six Southern California counties that comprise the Southern California Association of Governments, or SCAG.

The Gateway Cities make up the area of Los Angeles County generally bordered by the City of Los Angeles on the west, Orange County on the east, and the Pomona (SR-60) Freeway on the north, and extending south to the cities of Long Beach and Avalon. The entire Gateway Cities region is home to about 2 million residents. The cities' collaboration dates back to their joint establishment of a regional authority, the Gateway Cities Council of Governments (or COG) in the mid-1990's.

With SB 375, the Gateway Cities had a choice: to prepare their own plan, or allow the regional authority, SCAG, to prepare it on their behalf. According to Gil Hurtado, President of the COG's Board of Directors and Council Member from the City of South Gate, "The Gateway Cities have a long history of working together to address our unique situation: high density, built-out cities, and very diverse residents. The Gateway Cities wanted to create our own vision of a cleaner, lower-emissions future."

According to SCAG Executive Director Hasan Ikhrata, "As a regional partner, SCAG is pleased that Gateway Cities is undertaking its own SCS. Their ability to work directly with their member jurisdictions will ensure an inclusive, bottoms-up approach. We look forward to including the Gateway Cities' strategies as a key component of a successful Regional SCS."

To learn more about the Gateway Cities SCS, please visit the COG web site at www.gatewaycog.org/sb375.html. Additionally, four public information sessions about the SCS will be offered in late April and early May at various locations around the Gateway Cities as follows:

- Tuesday, April 26: Cerritos – Cerritos Library, Skyline Room, 6:30 – 8:30 p.m.
- Tuesday, May 3: Long Beach – Mark Twain Library, 6:30 – 8:30 p.m.
- Monday, May 9: Pico Rivera – Golf Course - Banquet Room, 6:30 – 8:30 p.m.
- Thursday, May 12: Commerce – Senior Center, 6:30 – 8:30 p.m.

The Gateway Cities Council of Governments is a California joint powers authority made up of twenty-seven cities and the County of Los Angeles, formed for the purpose of providing a vehicle for the members to voluntarily engage in regional and cooperative planning and coordination of government services for the collective benefit of the residents of Southeast Los Angeles County. The goal and intent of the COG is one of voluntary cooperation among cities and the County in the areas of transportation, air quality, housing, and economic development. For further information, please contact Richard Powers, Executive Director, 562-663-6850 or richardpowers@gatewaycog.org.

Gateway Cities Council of Governments Sustainable Communities Strategy

SB 375

GATEWAY CITIES

The Gateway Cities Council of Governments (COG) is leading a process to develop a plan that includes strategies to reduce greenhouse gas emissions from cars and light trucks in the sub-region. The Sustainable Communities Strategy (SCS) is required by California law in order to achieve the State's greenhouse gas reduction goals.

Please join us for a public open house!

To learn more about the SCS drop in on one of these information sessions!

Tuesday, April 26, 6:30 - 8:30 p.m.
Cerritos - Cerritos Library, Skyline Room, 18025 Bloomfield Avenue, Cerritos, CA 90703

Tuesday, May 3, 6:30 - 8:30 p.m.
Long Beach - Mark Twain Library, 1401 East Anaheim Street, Long Beach, CA 90813

Monday, May 9, 6:30 - 8:30 p.m.
Pico Rivera - Golf Course, Banquet Room, 3260 Fairway Drive, Pico Rivera, CA 90660

• ursday, May 12, 6:30 - 8:30 p.m.
Commerce - Senior Center, 2555 Commerce Way, Commerce, CA 90040

Representatives from the COG's member cities have been working with the COG staff and consultants to identify specific strategies to include in the plan for the Southeast Los Angeles County sub-region.

Come and learn more about:

- SCS process and schedule
- Relationship of the SCS to local planning efforts
- Types of transportation and land use strategies included in the SCS
- How the SCS will affect you
- Opportunities to stay involved in process

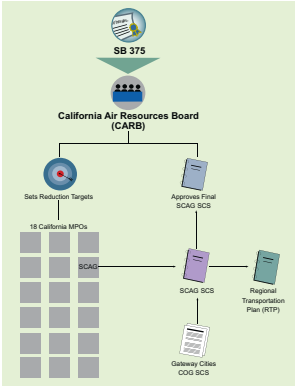
www.gatewaycog.org/sb375.html



What is a Sustainable Communities Strategy?

Senate Bill 375 Basics

California State legislation that prompts California regions to work together to reduce greenhouse gas (GHG) emissions from *cars* and *light trucks*.

This law directs the California Air Resources Board (CARB) to set greenhouse gas reduction targets for regions of the state and work with California's 18 metropolitan planning organizations (MPOs) to align each region's transportation, housing, and land-use plans with greenhouse gas reductions in mind.

In Southern California, the sub-regions have an option to create their own SCS. The Gateway Cities have accepted delegation in creating their own sub-regional SCS that will be incorporated into the regional SCS that the Southern California Association of Governments (SCAG) is developing. The final adopted regional SCS is then incorporated into a federally required Regional Transportation Plan (RTP) for the Southern California Region.

SB 375

Frequently Asked Questions

1. What is SB 375?

SB 375 is California state legislation that became law effective January 1, 2009. It prompts California regions to work together to reduce greenhouse gas (GHG) emissions from cars and light trucks. This new law requires the integration of planning processes for transportation, land-use and housing. The plans emerging from this process will lead to more efficient communities that provide residents with alternatives to driving alone.

2. What is the Gateway Cities COG?

The Gateway Cities COG is a joint powers authority compose of city and county governments in southeastern Los Angeles County"The COG provides regional leadership and focuses on priorities such as reducing traffic congestion, improving air quality, addressing housing needs, and strengthening the economy"

3. Will this affect my utility bills?

The Sustainable Communities Strategy (SCS) seeks to reduce greenhouse gas emissions from cars and light trucks through concentrated planning efforts. It is not related to home energy usage.

4. Will there be rebates for home improvements?

SB 375 is not related to home energy usage.

5. Will this make my community more "dense"?

It could increase densities consistent with a City's Land Use Element of their General Plan. These plans are sensitive to the history and character of the existing community"

6. What if our community does not meet the Southern California Association of Governments (SCAG) targets?

The Gateway Cities SCS by itself is not required to meet the SCAG targets. SCAG, as the metropolitan planning organization (MPO), is required to demonstrate how the region will meet the greenhouse gas emission targets by including a "Sustainable Communities Strategy" (SCS) in the regional transportation plan. If the regional SCS falls short of meeting the targets, SCAG must prepare an "alternative planning strategy" that, if implemented, would meet the targets. The Gateway Cities, together or individually, are not required to prepare an alternative planning strategy"

7. How does my business fit into this strategy?

Cities can include strategies to incentivize businesses and employees to participate.

Preguntas Frecuentes

1. ¿Qué es la Ley SB 375?

La Ley SB 375, es parte de la legislación estatal de California que se entro en vigor partir del 1º. de enero del 2009. Esta ley indica las regiones que deben de trabajar en conjunto para reducir las emisiones de gases con efecto invernadero (GHG) emitidas por autos y camiones de carga ligera. Esta nueva ley requiere la integración de procesos de planeación para transporte, uso de suelo y vivienda. Estos planes son el resultado de procesos que llevarán a las comunidades a ser más eficientes y a proveer a los residentes de alternativas para los que manejan solos en sus autos.

2. ¿Qué es el COG de las Ciudades Gateway?

El COG de las Ciudades Gateway es un conjunto de poderes de autoridades que se compone de ciudades y gobiernos del condado en el suroeste del Condado de Los Angeles. El COG provee liderazgo regional y se enfoca en prioridades tales como la reducción del congestionamiento de tránsito, mejorar la calidad del aire, atender las necesidades de vivienda y fortalecer la economía.

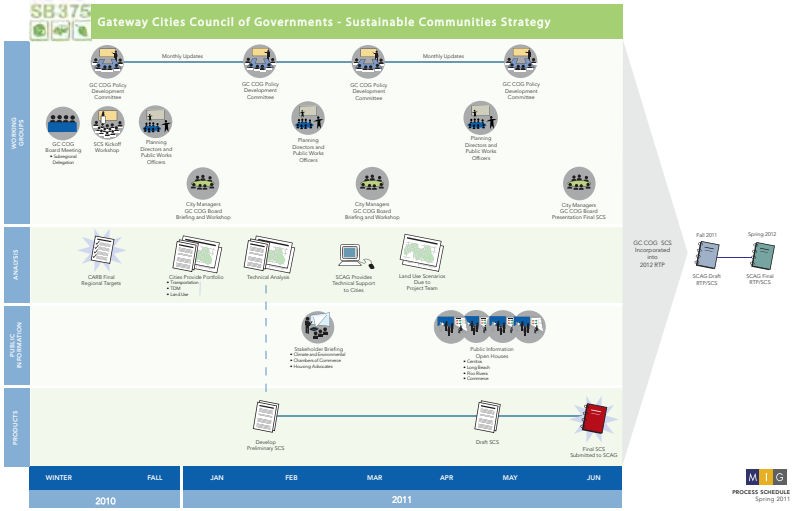
3. ¿Afectará el costo de los servicios públicos?

La Estrategia para Comunidades Sustentables (SCS) busca reducir la emisión de gases con efecto invernadero generados por autos y camiones de carga ligera por medio de esfuerzos conjuntos de planeación. No tiene nada que ver con el uso de energía en casa.

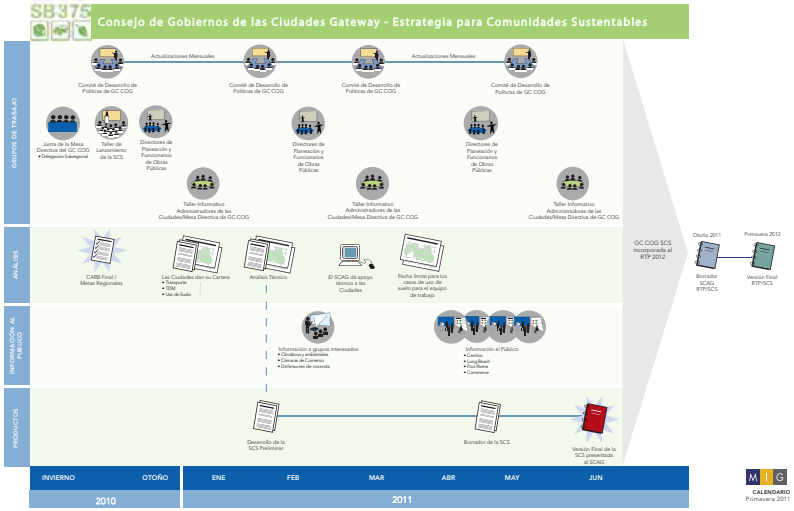
4. ¿Habrá reembolsos para mejoras en el hogar?

La SB 375 no tiene nada que ver con el uso de energía en casa.

5. ¿Qué es lo que hace a mi comunidad más "densa"?

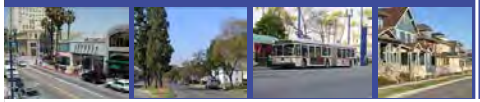


Las estrategias de la SCS que están relacionadas con la vivienda o el desarrollo urbano, reflejan lo que ya se ha desarrollado en las comunidades de manera individual. Estas estrategias son sensibles a los antecedentes históricos y al carácter de la comunidad ya existente.



6. ¿Qué pasa si nuestra comunidad no cumple con las metas de La Asociación de Gobiernos del Sur de California (SCAG)?

La SCS de las Ciudades Gateway no está obligada por si misma a cumplir con las metas del SCAG. El SCAG como organismo de planeación metropolitano (MPO) está obligado a demostrar cómo la región cumplirá con las metas para la reducción de emisión de gases con efecto invernadero al incluír la "Estrategia para Comunidades Sustentables" (SCS) en el plan regional de transporte. Si la SCS regional se queda corta para alcanzar las metas, el SCAG deberá preparar una "estrategia de planeación alternativa" que al implementarse, deberá cumplir con las metas establecidas. Las Ciudades Gateway, en conjunto o de manera individual, no están obligadas a preparar una estrategia de planeación alternativa.



7. ¿Cómo encaja mi negocio en esta estrategia?

Las ciudades pueden incluír estrategias para motivar a que los comercios y sus empleados participen.

Gateway Cities COG SCS Overview

SB 375

GATEWAY CITIES

Spring 2011
Public Information
Open Houses

Background

Senate Bill 375 - Overview

- *Legislation passed in 2008*
- *Aims at reducing greenhouse gas emissions (GHG) from cars and light trucks*
- *Includes mechanism for California Air Resources Board (CARB) to set GHG reduction targets for 2020 and 2035 to 1990 levels*

Background

Senate Bill 375 - Approach

- *Metropolitan Planning Organizations (MPOs) produce Sustainable Communities Strategy (SCS) as part of the Regional Transportation Plan (RTP)*
- *The Southern California Association of Governments (SCAG) - MPO for Southern California - will update its RTP by 2012*

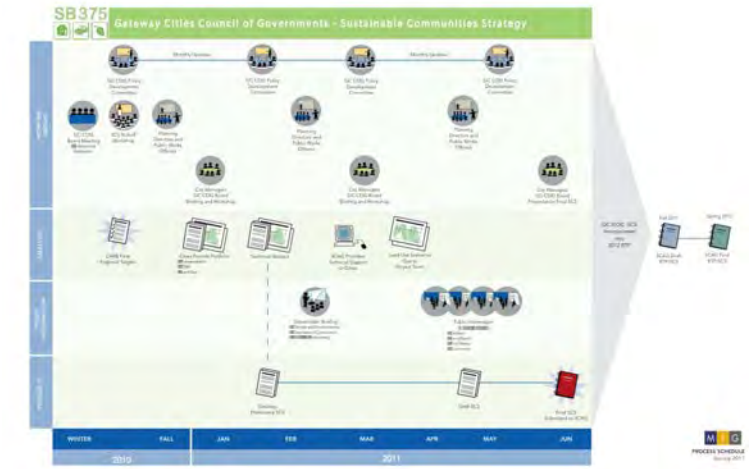
Background

Senate Bill 375 - Sustainable Communities Strategy (SCS)

- *Is a regional GHG plan that links transportation, housing and land use to reduce GHG emissions from cars and light trucks*
- *Achieves GHG reduction targets set by the California Air Resources Board*

Gateway Cities Sub-regional SCS

Gateway Cities Process



- *Council of Governments (COG) have option to prepare SCS for sub-region*
  - *Gateway Cities COG provides regional leadership for southeast Los Angeles County cities*
- *Gateway Cities COG Board chose SCS delegation in January 2010*
- ***First effort of its type!***

Gateway Cities Sub-regional SCS

Gateway Cities Approach

- *Focus on three strategy categories for GHG Reduction*
  - *Travel Demand Management*
  - *Land Use*
  - *Transportation projects*
- *Work with city staff to provide inputs*
- *Develop strategies consistent with cities' plans*

Process Schedule

Findings

Preliminary results indicate GHG reductions in Gateway sub-region meet the CARB regional targets

- *Strategies contributing to reductions*
  - *Local transportation projects*
  - *Local land use projects*
  - *Travel Demand Management*
  - *Regional transportation projects*

Lessons Learned

Some strategies result in greater reductions than others

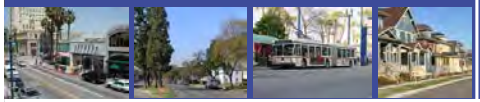
- *Regional transportation projects*
- *Local transportation projects*

- *Need to refine tools and models*
- *These lessons will assist in future 4-year planning cycles*

Public Engagement

- *Attend Public Information Open Houses*
  - *Cerritos*
  - *Long Beach*
  - *Pico Rivera*
  - *Commerce*
- *Attend Gateway Cities COG Board meeting*
  - *May – Draft SCS*
  - *June – Final SCS*

Next Steps



- *Final Gateway Cities SCS approval by Gateway Cities COG Board - June, 2011*
- *Submit Final Gateway Cities SCS to SCAG - June, 2011*
- *SCAG Incorporates Gateway Cities SCS into regional SCS and RTP - Summer 2011*
- *SCAG completes draft Regional SCS - Fall 2011*
- *SCAG submits final Regional SCS to CARB - Spring 2012*

COG SCS CIUDADES GATEWAY GENERALIDADES

Primavera 2011
Difusión Social
Juntas Informativas

Antecedentes

Ley del Senado 375 - Generalidades

- *Se aprobó la legislación en 2008*
- *Trata de reducir la emisión de gases con efecto invernadero (GHG) producidos por autos y camiones de carga ligera*
- *Incluye mecanismos de la Junta de Recursos Atmosféricos de California (CARB) para establecer metas para la reducción de GHG en el 2020 y 2035 a los niveles de 1990*

Antecedentes

Ley del Senado 375 - Enfoque

- *Las Organizaciones Metropolitanas de Planeación (MPOs) diseñaron la Estrategia para Comunidades Sustentables (SCS) como parte del Plan Regional de Transporte (RTP)*
- *La Asociación de Gobiernos del Sur de California (SCAG)-MPO para el Sur de California, actualizará su RTP para el 2012*

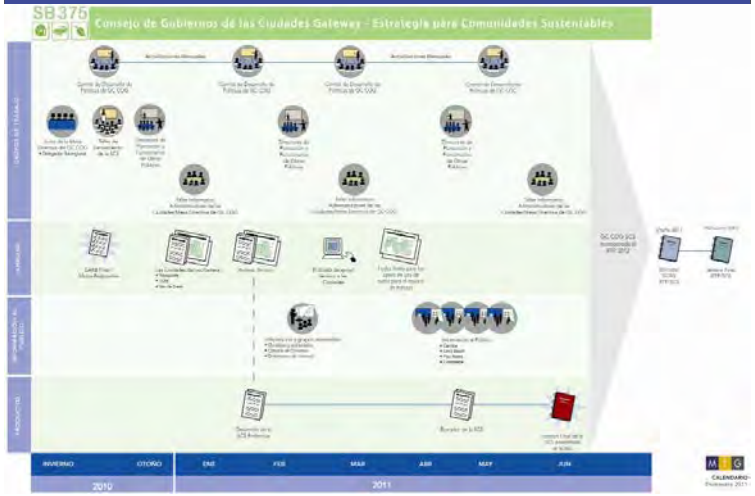
Antecedentes

Ley del Senado 375 – Estrategia para Comunidades Sustentables (SCS)

- *Es un plan regional de GHG que relaciona el transporte, la vivienda y el uso de suelo para la reducción en la emisión de GHG producidos por autos y camiones de carga ligera*
- *Alcanza las metas de reducción de GHG establecidos por la Junta de Recursos Atmosféricos de California*

La SCS Subregional, Ciudades Gateway

Proceso de las Ciudades Gateway



- *El Consejo de Gobiernos (COG) tiene la opción de preparar la SCS para la sub-región*
  - *El COG de las Ciudades Gateway provee liderazgo regional para las ciudades del sureste del Condado de Los Angeles*
- *La Mesa Directiva del COG de las Ciudades Gateway optó por la delegar la SCS en enero del 2010*
- ***¡Son los primeros trabajos de este tipo!***

La SCS Subregional, Ciudades Gateway

Enfoque de las Ciudades Gateway

- *Enfoque en tres categorias para estrategias de reducción de GHG*
  - *Gestión para la Demanda del Transporte*
  - *Uso de Suelo*
  - *Proyectos para transporte*
- *Trabajar con el personal de la ciudad para la retroalimentación de información*
- *Desarrollar estrategias que sean consistentes con los planes de la ciudad*

Calendario del Proceso

Resultados

Los resultados preliminares indican que la reducción de GHG en la sub-región Gateway, cumplirá con las metas regionales establecidas por CARB

- *Estrategias que contribuyen a la reducción*
  - *Proyectos locales para el transporte*
  - *Proyectos locales para uso de suelo*
  - *Gestión de la demanda de transporte*
  - *Proyectos regionales de transporte*

Lecciones Aprendidas

Algunas estrategias resultan en una mayor reducción que otras

- *Proyectos regionales de transporte*
- *Proyectos locales de transporte*

- *Se necesita afinar los modelos y herramientas*
- *Estas lecciones ayudarán a futuro en los ciclos de planeación de 4 años*

Participación Pública

- *Asistir a las Juntas Informativas Abiertas al Público*
  - *Cerritos*
  - *Long Beach*
  - *Pico Rivera*
  - *Commerce*
- *Asistir a las Juntas de la Mesa Directiva del COG de las Ciudades Gateway*
  - *Mayo – Borrador de la SCS*
  - *Junio – Versión Final de la SCS*

Pasos a seguir

- *Aprobación de la versión final de la SCS de las Ciudades Gateway por la Mesa Directiva del COG de las Ciudades Gateway - Junio 2011*
- *Presentación de la versión final de la SCS de las Ciudades Gateway al SCAG Junio 2011*
- *El SCAG incorpora la SCS de las Ciudades Gateway en la SCS regional y el RTP - Verano 2011*
- *El SCAG finalizará el borrador de la SCS regional Otoño 2011*
- *El SCAG presenta la versión final de la SCS regional a la CARB – Primavera 2012*

Appendix D.

List of Transportation Improvement Projects in the Gateway Cities

Gateway Cities Submitted Roadway Capacity Projects

City	Project Name	Project Description	Location	Length of Project (miles)	Facility Type	Area Type	No. of Lanes (Pre-Project)	No. of Lanes (Post-Project)	ADT (weekday)	ADT (18.4% growth in VMT)
Bell Gardens	Eastern Avenue Widening	The Street was widened by 5 feet to create better flow of traffic	Eastern Avenue from Muller to Florence	1.5	Primary Arterial	Urban	4	6	14,351	16,992
Commerce	Washington Blvd Reconsttuction	Reconstruct pavement in concrete, add 1 lane, traffic signals, landscape & hardscape improvements, ADA ramps, RxR crossing, street lights, etc.	Washington Blvd from I-5 Fwy to westerly City limit (west of Arrowmill)	2	Primary Arterial	CBD	2	3	26,788	31,717
Downey	LAKEWOOD BLVD IMPROVEMENT - Phase 2	Minor widening to provide three continuous travel lanes, additional turn lanes, wider lanes and larger turning radii to decrease congestion and accommodate truck traffic. Rehab pavement, construct curb, gutter, and sidewalk, block wall(s), center landscaped medians, street and ornamental pedestrian lighting systems. Upgrade to traffic signal at Gardendale St and Lakewood Bl.	On Lakewood Bl between Dalen Street and Gardendale Street	0.44	Primary Arterial	Urban	2	3	26,233	31,060
Downey	PARAMOUNT MEDIAN	Construction of raised medians, installation of landscaping and irrigation system, construction of stamped concrete paving, installation of accent tree lighting fixtures, and replacement of traffic striping and pavement markings. Added to this contract was the installation of a midblock traffic signal in front of Fire Station No. 3.	On Paramount Bl between Florence Avenue and Lubec Street	0.27	Primary Arterial	Urban	2	2	35,332	41,833
Downey	LAKEWOOD BLVD IMPROVEMENTS PHASE 3	Minor widening to provide three 12-foot travel lanes, minor widening of intersections, traffic signal system upgrades, drainage improvements, reduction of cross-slopes, pavement removal and resurfacing, construction of curb, gutter and sidewalk, raised medians with landscaping, parkways with landscaping, install pedestrian and street lighting system.	On Lakewood Bl from Florence Ave to Telegraph Road	1.01	Primary Arterial	Urban	2	3	45,921	54,370
Downey	LAKEWOOD BLVD IMPR PHASE 3A 5TH TO FLORENCE	Minor widening to provide three 12-foot travel lanes, center LS medians, installation of decorative street lighting, construction of a recycled water main, resurfacing of existing asphalt concrete, and repair of miscellaneous concrete.	On Lakewood Bl between Fifth St and Florence Ave	0.64	Primary Arterial	Urban	2	3	20,101	23,800
Downey	IMPERIAL LANDSCAPED MEDIAN	Construction of raised LS medians, sidewalk, curb ramps, street trees, solar-powered irrigation systems, striping and signage modifications. Construct new midblock traffic signal at school at La Reina Ave, upgrade to the traffic signal at the intersection of Imperial Highway at Downey Avenue.	On Imperial Hwy between Paramount Bl and Bellflower Bl	1.9	Primary Arterial	Urban	3	3	29,512	34,942
Downey	IMPERIAL MEDIAN, SAFETY & REHAB IMPROV PH 2	Minor widening to provide 11-foot travel lanes, minor widening at intersections, construction of new raised landscaped median islands, rehabilitation of the existing pavement, reclaimed water irrigation system, traffic signal improvements and modifications, sound walls, sidewalk, curb ramps, and signing and striping modifications.	On Imperial Hwy between Old River School Rd and Paramount Bl and between Bellflower Bl and Woodruff Avenue	1.44	Primary Arterial	Urban	3	3	29,602	35,048

Gateway Cities Submitted Roadway Capacity Projects

City	Project Name	Project Description	Location	Length of Project (miles)	Facility Type	Area Type	No. of Lanes (Pre-Project)	No. of Lanes (Post-Project)	ADT (weekday)	ADT (18.4% growth in VMT)
Downey	LAKEWOOD BLVD IMPR FROM IMP HWY TO S & G	Constructing AC pavement; resurfacing with a variable AC overlay; cold planning; curb and gutter, driveway approach; curb ramps and sidewalk; local depressions and cross gutters; curb opening catch basins; masonry walls; reclaimed water main and potable water improvements; traffic signal upgrades, ornamental street and pedestrian lights, irrigation and landscaping; and traffic striping.	On Lakewood Bl from Imperial Hwy to Stewart & Gray Rd	0.9	Primary Arterial	Urban	2	3	23,112	27,364
Downey	TELEGRAPH RD TRFIC THRPUT & SFTY ENHCMTS PHS 1	Construction of raised landscaped median islands	On Telegraph Rd between the Passons Bl and E City Limit	0.5	Primary Arterial	Urban	2	3	48,039	56,879
La Mirada	Additional Lane on Artesia	Restriping to add an additional lane	Artesia from Knott and Valley View	1	Primary Arterial	Urban	2	3	17,355	20,548
Long Beach	Spring Street Transporation Improvement Project	Roadway geometrics were modified to convert a 4 lane highway into a six lane highway.	Spring Street between Cherry Avenue and Redondo Avenue		Primary Arterial	Urban	4	6	21,890	25,918
Long Beach	Lakewood Boulevard Transporation Improvement Project	Parking was removed and roadway geometrics were modified to convert this regional highway from 4 lanes to 6 lanes. Traffic signals were modernized to facilitate traffic flow.	Lakewood Boulevard between Willow Street and PCH.		Primary Arterial	Urban	4	6	14,711	17,418
Long Beach	PCH & Cherry	Cities of Long Beach & Signal Hill are working collectively to acquire property to widen Cherry Avenue to add a second travel lane in Long Beach from the Signal Hill boarder to south of PCH.	Cherry Avenue between 19th Street and 15th Street		Primary Arterial	Urban	3.5	4.5	12,142	14,376
Norwalk	Firestone Bridge	Extend 3rd WB lane.	Firestone Bridge over SG River	0.5	Primary Arterial	Urban	2	3	61,490	72,804
Signal Hill	786 Cherry Ave	Additional lanes	19th St to PCH	0.04	Primary Arterial	Urban	2	4	17,882	21,172
Signal Hill	800 Crescent Heights Street Improvement	Reconstruction of Crescent Street	Cherry Ave to Gardena	0.1	Secondary	Urban	2	4	8,899	10,536
Signal Hill	California Avenue	Reconstruction	Patterson St to Willow Avenue	0.1	Secondary	Urban	2	2	8,899	10,536
South Gate	424-ST Kauffman and Dorothy Ave Street Widenings	Removal of existing improvement and widening on Kauffman Ave and Dorothy Ave and construction and landscaping of median island in Firestone Blvd	Kauffman and Dorothy Avenues between Firestone Blvd and Southern Ave	0.4	Secondary	Urban	2	2	7,811	9,249
South Gate	409-ST Willow Place Widening	Removal of existing improvement and widening on Willow place	Willow Pl between Santa Fe Ave and Long Beach Blvd	0.3	Secondary	Urban	2	2	7,811	9,249
South Gate	I-710/Rio Hondo Bridge Widening Project	Widen both sides of Firestone Boulevard Bridge over the Rio Hondo channel to provide a seven-lane structure, three through lanes in each direction with a median/turning lane.	Firestone Boulevard over Rio Hondo Channel	0.2	Primary Arterial	Urban	2	3	42,018	49,749
South Gate	I-710/Firestone Blvd Interchange	This project involves widening south side of the Firestone Boulevard Bridge over the Los Angles River to provide three through lanes in each direction with a center raised median from Rayo Ave to I-710 freeway.	Firestone Boulevard over LA River	0.2	Primary Arterial	Urban	2	3	58,662	69,455
Vernon	26th Street - Widening & Storm Drain	Widen 26th Street, added new C&G, shoulder, and middle lane. Installation of storm drain system. New Traffic Signal System Installation.	Project extended from 2500 feet west of Indiana to west of Atlantic Boulevard. New traffic signal on 26th Street at Bonnie Beach Place ("T" Intersection)	2.1	Secondary	Urban	2	2.5	7,811	9,249

Gateway Cities Submitted Roadway Capacity Projects

City	Project Name	Project Description	Location	Length of Project (miles)	Facility Type	Area Type	No. of Lanes (Pre-Project)	No. of Lanes (Post-Project)	ADT (weekday)	ADT (18.4% growth in VMT)
Vernon	Atlantic Blvd. Bridge over the LA River	The City of Vernon proposes to widen Atlantic Blvd. bridge over the Los Angeles River. Project will enhance the safety and operational use of Atlantic Blvd. bridge over the Los Angeles River and improve the intersection performance at District Blvd. The project involves widening Atlantic Blvd. for approximately 1,300 linear feet to provide traffic shoulders, standard sidewalks and extending the right-turn lane over to the Atlantic Blvd. Bridge. The proposed roadway configuration includes six 11-foot through traffic lanes, one northbound 11-foot right turn lane, 4-foot minimum shoulders, 5' sidewalks, and a center median. The adjacent intersection of Atlantic Blvd. and District Blvd. will be reconfigured and the traffic timing optimized.	Project limits are from Atlantic Blvd. north of the Los Angeles River to 800 feet south of the intersection with District Blvd. The proposed project is located approximately 0.25 miles (mi) southwest of the Long Beach Freeway (1-710) in the City of Vernon.		Primary Arterial	Urban	6	6.5	57,528	68,114

Gateway Cities Submitted Intersection Improvements - New Signal

City	Project Name	Project Description	Location	Area Type	Facility Type -	Total Number	Facility Type -	Total Number of	ADT - Street 1	ADT - Street 2	Peak Hour Volume - Street	Peak Hour Volume - Street	Proposed Intersecti	Peak Hour
Artesia	Norwalk Blvd/186th St	Replace obsolete signal controllers; install new traffic signal, improve vehicle detection to reduce traffic congestion	Norwalk Blvd/186th St	Suburban	Primary	4.5	Primary	4	12618	325	1262	33	60	50
Bell Gardens	Signal at Fire Station 39	New Signal was installed at the Fire Station 39 to facilitate movement of Fire Trucks in and out of Station as as well as to be used by Pedestrian to cross Garfield from City Hall to Post Office and DMV across the Street	Garfield Avenue at Fire Station 39	Suburban	Primary	4.5	Secondary	1	24396	7645	2440	765	90	50
Cerritos	Beach Street @ Carmenita Avenue, Project No. 75072	New traffic signal	Beach Street and Carmenita Avenue	Suburban	Secondary	2.5	Primary	5	7645	18076	765	1808	60	50
Cerritos	Dumont Avenue @ Artesia Boulevard, Project No. 45071	New traffic signal	Dumont Avenue and Artesia Boulevard	Suburban	Primary	4.5	Secondary	1	20620	7645	2062	765	60	50
Commerce	Garfield @ Slauson	Reconstruct intersection in concrete, new traffic signal, enhance turning radius, ADA ramps, concrete repair (sidewalk, curb & gutter), etc.	Garfield & Slauson	Suburban	Primary	5	Primary	6	34173	21065	3417	2107	90	50
Commerce	Telegraph @ Slauson	Reconstruct intersection in concrete, new traffic signal, enhance turning radius, ADA ramps, concrete reparis (sidewalk, curb & gutter).	Telegraph & Slauson	Urban	Primary	6	Primary	6	41635	44326	4163	4433	90	50
Downey	WOODRUFF/VIA AMORITA TRAFFIC SIGNAL	Installation of a new vehicle and pedestrian-actuated traffic signal, video detection, countdown pedestrian signals, provide fiber optic communication to the intersection to enable remote traffic management and surveillance	Woodruff Ave, Via Amorita	Suburban	Primary	2	Secondary	1	7297	7645	730	765	60	50
Downey	FLORENCE AVE / ARRINGTON AVE TRAFFIC SIGNAL	The installation of traffic signals at the intersection of Florence Avenue and Arrington Avenue, modifications to the traffic signals at the intersection of Florence Avenue and Lakewood Boulevard, and the purchasing of equipment required for the application of thermoplastic pavement markings to be installed.	Florence Ave, Lakewood Bl, Arrington Ave	Urban	Primary	7	Secondary	2	47055	7645	4706	765	60	50
Downey	IMPERIAL Improvements, La Reina Ave	Construct new midblock traffic signal at school at La Reina Ave	At Imperial Hwy and La Reina Ave	Suburban	Primary	7	Secondary	1	25863	16036	2586	1604	60	50
Long Beach	Walnut Avenue Transportation Enhancement Project	Reconfigure two separate intersections into a single intersection and provide new signalized pedestrian crossings at a location that serves four grade schools and adults accessing LBCC.	Walnut Avenue & Alamitos/20th Street	Suburban	Primary	2	Secondary	2	13615	7645	1362	765	60	50

Gateway Cities Submitted Intersection Improvements - New Signal

City	Project Name	Project Description	Location	Area Type	Facility Type -	Total Number	Facility Type -	Total Number of	ADT - Street 1	ADT - Street 2	Peak Hour Volume - Street	Peak Hour Volume - Street	Proposed Intersecti	Peak Hour
Long Beach	LCD Traffic Enhancement Project	Reconfigure the LCD (LOS COYOTES DIAGONAL) & Studebaker Road/Parkcrest intersection into two separate intersections to improve traffic opeations and capacity while improving access to a new high school currently underconstruction. Project also includes reconfiguration of the lanes and traffic signal operations at LCD & Carson Street to address peak period congestion issues.	LCD (LOS COYOTES DIAGONAL) between Studebaker & Carson Street	Suburban	Primary	4.5	Primary	6	27215	16292	2721	1629	60	50
Long Beach	Del Amo & Locust Intersec	Signalize intersection to provide improved neighborhood connectivity and access to transit and park facilities	Del Amo Boulevard & Locust Avenue	Suburban	Primary	7	Secondary	2	37129	7645	3713	765	60	50
Long Beach	Park Avenue & Anahiem	Installation of a new traffic signal to adress access and traffic congestion related to Wilson High School and events at Recreation Park.	Park Avenue & Anahiem Street	Suburban	Primary	2.5	Primary	5	25546	19562	2555	1956	60	50
Long Beach	2nd Street & Pomona Ave	Construction of a new traffic signal to facilitate traffic flow during the peak period while also providing a new signalized pedestrian crossing in a dense retail shopping center.	2nd Street & Pomona Avenue	CBD	Primary	4.5	Secondary	1	25546	7645	2555	765	60	50
Maywood	Slauson @ Loma Vista	Traffic Signal	Slauson @ Loma Vista	urban	Primary	5	Secondary	2	30740	2673	3074	267	60	50
Norwalk	Project 7209	New traffic signal	Rosecrans Avenue/Greenstone Avenue	urban	Primary	5.5	Secondary	2	49351	7645	4935	765	120	50
Norwalk	Project 7219	New traffic signal	Shoemaker Avenue/Excelsior Drive	urban	Primary	4	Secondary	2.5	16933	5050	1693	505	90	50
Norwalk	Project 7214	New traffic signal	Norwalk Boulevard/Cheshire Street	Urban	Primary	4	Secondary	2	14662	7645	1466	765	90	50
Norwalk	Project 7215	New traffic signal	Imperial Highway/Fairford Avenue	Urban	Primary	6.5	Secondary	2	56291	7645	5629	765	90	50
Norwalk	Project 7211	New traffic signal	Firestone Boulevard/Paddison Avenue	Urban	Primary	4.5	Secondary	2	28621	7645	2862	765	90	50
Paramount	Downey and Madison	Installation of new traffic signal		Urban	Primary	4.5	Secondary	2	15572	7645	1557	765	60	50
Paramount	Orange and Jackson	Installation of new traffic signal		Urban	Primary	4.5	Secondary	2	11804	619	1180	62	60	50
Paramount	Somerset and El Camino	Installation of new traffic signal		Urban	Primary	4.5	Secondary	2	15979	7645	1598	765	60	50
Paramount	Garfield and Peterson	Installation of new traffic signal		Urban	Primary	4.5	Secondary	2	35255	7645	3526	765	60	50
Paramount	Garfield and Howery	Installation of new traffic signal		Urban	Primary	4.5	Secondary	2	17623	7645	1762	765	60	50
Paramount	Garfield and Exeter	Installation of new traffic signal		Urban	Primary	4.5	Secondary	2	22934	7645	2293	765	60	50
Pico Rivera	Beverly Boulevard Median Rehabilitaon Project	Installation of new signalized intersection	Beverly Boulevard and Sandoval Avenue/Pico Park	Urban	Primary	6.5	Secondary	2	65675	7645	6568	765	120	50

Gateway Cities Submitted Intersection Improvements - New Signal

City	Project Name	Project Description	Location	Area Type	Facility Type -	Total Number	Facility Type -	Total Number of	ADT - Street 1	ADT - Street 2	Peak Hour Volume - Street	Peak Hour Volume - Street	Proposed Intersecti	Peak Hour
Pico Rivera	Traffic Signal Plan	Installation of new signalized intersection	Washington Boulevard and Loch Alene Avenue	Urban	Primary	6.5	Secondary	2	14409	535	1441	54	120	50
Pico Rivera	Traffic Signal Plan	Installation of new signalized intersection	Rosemead Boulevard and L.A. Fitness Driveway	Urban	Primary	5	Secondary	2	28976	11721	2898	1172	120	50
SantaFe Springs	Traffic signal; Norwalk at Mora/Heritatge Springs Drive	Installation of new traffic signal. Installation of right turn only pocket for NB traffic	Norwalk Blvd. & Mora Dr.	Suburban	Primary	4.5	Secondary	2	19236	14289	1924	1429	60	50
SantaFe Springs	Traffic signal; Bloomfield at Heritage Springs Dr. East	Installation of new traffic signal. Installation of right turn only pocket for SB traffic.	Bloomfield & Heritage Springs Dr. East	Suburban	Primary	4.5	Secondary	2.5	16159	7645	1616	765	60	50
SantaFe Springs	Traffic Signal; Florence at Laurel (LA County)	Installation of new traffic signal at intersection of Florence at Laurel	Florence Ave. & Laurel Ave.	Urban	Primary	4.5	Secondary	2.5	31564	7645	3156	765	60	50
SantaFe Springs	Traffic Signal Installation at Bloomfield at Corral	Installation of new traffic signal at intersection of Bloomfield at Corral	Bloomfield Ave. & Corral Pl.	Urban	Primary	4.5	Secondary	2	24544	7645	2454	765	60	50
SantaFe Springs	Traffic signal; Telegraph at Villages Dr.	Installation of new traffic signal. Installation of right turn only pocket for EB traffic	Telegraph Rd. & Villages Drive, (new road between Bloomfield and Norwalk)	Urban	Primary	5.5	Primary	2	35845	7645	3584	765	60	50
Signal Hill	746 Traffic Signal Cherry & 20th Street	New traffic signal (no signal or stop sign currently)	Cherry Ave/ 20th St	Suburban	Primary	4.5	Secondary	2	17882	7645	1788	765	60	50
Signal Hill	Orizaba & PCH Traffic Signal	New traffic signal	Orizaba & PCH intersection	Urban	Secondary	2	Primary	6.5	7645	54215	765	5421	60	50
South Gate	357.TRF Traffic Signal at Tweedy & Alameda	Installation/modification of traffic signals, lighting, electrical systems, tree removals, and concrete curb and sidewalk work.	Tweedy Blvd, Alameda St	Urban	Primary	4.5	Primary	6.5	13258	30990	1326	3099	60	50
Vernon	New Traffic Signal 26th at Bonnie Beach Pl	Widen 26th Street, added new C&G, shoulder, and middle lane. Installation of storm drain system. New Traffic Signal System Installation.	Project extended from 2500 feet west of Indiana to west of Atlantic Boulevard. New traffic signal on 26th Street at Bonnie Beach Place ("T" intersection)	Suburban	Secondary	2.5	Secondary	2.5	7645	7645	765	765	60	50

Gateway Cities Submitted Intersection Improvements - New Signal

City	Project Name	Project Description	Location	Area Type	Facility Type -	Total Number	Facility Type -	Total Number of	ADT - Street 1	ADT - Street 2	Peak Hour Volume - Street	Peak Hour Volume - Street	Proposed Intersecti	Peak Hour
Whittier	Santa Gertrudes Avenue at Starbuck Street	Installation of new traffic signal	Santa Gertrudes Avenue and Starbuck Street	Suburban	Primary	4.5	Secondary	2.5	8703	7645	870	765	60	50
Whittier	Philadelphia Street at Whittier Greenway Trail/Gregory Avenue	Installation of new traffic signal	Philadelphia Street at Whittier Greenway Trail/Gregory Avenue	Urban	Primary	4	Secondary	2	4539	7645	454	765	60	50
Whittier	Pickering Avenue at Bailey Street	Installation of new traffic signal	Pickering Avenue at Bailey Street	Suburban	Secondary	2.5	Secondary	2	7645	7645	765	765	60	50
Whittier	Hadley Street at Whittier Avenue	Installation of new traffic signal	Hadley Street at Whittier Avenue	Urban	Primary	4.5	Primary	4.5	16832	5993	1683	599	60	50

Gateway Cities Submitted Intersection Improvements - New Phase

City	Project Name	Project Description	Location	Intersection Improvement Type	Type of Turn with New Phase	Proposed Intersection Signal Cycle Length (sec)	Number of lanes for which the movement is being enabled
Cerritos	Traffic Signal Modifications at 195th Street and Norwalk Boulevard, Project No. 75041	Added left turn phasing	195th Street and Norwalk Boulevard	Added left turn phasing	Left	120	4
Cerritos	Traffic Signal Modifications at Marquardt Avenue and Artesia Boulevard, Project No. 75042	Added left turn phasing	Marquardt Avenue and Artesia Boulevard	Added left turn phasing	Left	120	4
Cerritos	Traffic Signal Modifications at 195th Street and Pioneer Boulevard, Project No. 75044	Added left turn phasing	195th Street and Pioneer Boulevard	Added left turn phasing	Left	120	4
Cerritos	Traffic Signal Modifications at 195th Street and Studebaker Road, Project No. 75044	Added left turn phasing	195th Street and Studebaker Road	Added left turn phasing	Left	120	4
Downey	PARAMOUNT/GALLATIN T.S. UPGRADE	Traffic signal upgrades including E-W left-turn phasing, implementation of vehicle video detection system, signal communication system.	Paramount Bl. Gallatin Rd	Improved phasing for left or right turns only	Left	120	2
Downey	PARAMOUNT/TELEGRAPH T.S. UPGRADE	Traffic signal upgrades including E-W left-turn phasing, implementation of vehicle video detection system, signal communication system, emergency vehicle pre-emption system.	Paramount Bl, Telegraph Rd	Improved phasing for left or right turns only	Left	120	2
Downey	WOODRUFF / WASHBURN TRAFFIC SIGNAL	Upgrade of the existing traffic signal, including the installation of accessible audible pedestrian devices to accommodate the disabled	Woodruff Ave, Washburn Road	Improved phasing for left or right turns only	Left	90	4
Downey	IMPERIAL HWY/COLUMBIA WY TRAFFIC SIGNAL	Traffic signal upgrades, curb ramps.	Imperial Hwy, Columbia Way	Improved phasing for left or right turns only	Left	90	4
La Mirada	Alondra and Valley View Int. Improvement	Extend westbound left turn lane	Alondra and Valley View	Signal phasing improvement with LT lanes	Left	90	1
Long Beach	7th Street & Park Avenue	Reconfigure medians & add left-turn phasing	7th Street & Park Avenue		left	100	4
Long Beach	Carson Street & Woodruff Avenue Intersection Improvement Project	Modernize traffic signal control and provide improved left-turn phasing to improve safety and operations	Carson Street & Woodruff Avenue		left	100	4
Long Beach	Paramount & South Street Intersection Enhancement Project	Modernize traffic signal to provide left-turn phasing, countdown pedestrain indications, and improved lighting to address elevated accident rate and severe peak period congestion	Paramount Boulevard & South Street		left	100	4
Long Beach	Atlantic Avenue & Carson Street	Reconfigure travel lanes and install westbound left-turn arrows to improve safety and improve traffic operations	Atlantic Avenue & Carson Street		left	100	1
Long Beach	Spring Street & Woodruff Avenue Intersection Improvement Project	Modernize traffic signal to provide left-turn phasing in two directions and improved pedestrian crossings to address safety and congestion issues.	Spring Street & Woodruff Avenue		left	100	2

Gateway Cities Submitted Intersection Improvements - New Phase

City	Project Name	Project Description	Location	Intersection Improvement Type	Type of Turn with New Phase	Proposed Intersection Signal Cycle Length (sec)	Number of lanes for which the movement is being enabled
Long Beach	Willow Street & Woodruff Avenue Intersection Improvement Project	Modernize traffic signal to provide left-turn phasing and improved pedestrian crossings to address congestion issues at this intersection that provides access to and from the I-405 freeway ramps	Willow Street & Woodruff Avenue		left	100	4
Long Beach	Magnolia & Willow	Add Left-turn phasing to improve access to freeway and reduce congestion	Magnolia Avenue & Willow Street		left	100	4
Long Beach	Pine & Ocean Transporation Enhancement Project	Modernization of an existing traffic signal to provide adaptive control and left-turn phasing to address congestion arrising from brisk pedestrian and vehicle demand related to special events and other evening activity.	Pine Avenue & Ocean Boulevard		left	100	4
Long Beach	Studebaker & Willow Intersection Improvement	Project to modernize the traffic signal to provide left-turn phasing, countdown pedestrian indications, and modification of landscaped medians to address congestion issues and facilitate the safe and orderly movement of left-turn vehicles.	Studebaker Road & Willow Street.		left	100	4

Vernon	Atlantic Blvd. And District Blvd Intersection Improvement	The City of Vernon proposes to widen Atlantic Blvd. bridge over the Los Angeles River. Project will enhance the safety and operational use of Atlantic Blvd. bridge over the Los Angeles River and improve the intersection performance at District Blvd. The project involves widening Atlantic Blvd. for approximately 1,300 linear feet to provide traffic shoulders, standard sidewalks and extending the right-turn lane over to the Atlantic Blvd. Bridge. The proposed roadway configuration includes six 11-foot through traffic lanes, one northbound 11-foot right turn lane, 4-foot minimum shoulders, 5' sidewalks, and a center median. The adjacent intersection of Atlantic Blvd. and District Blvd. will be reconfigured and the traffic timing optimized.	Project limits are from Atlantic Blvd. north of the Los Angeles River to 800 feet south of the intersection with District Blvd. The proposed project is located approximately 0.25 miles (mi) southwest of the Long Beach Freeway (I-710) in the City of Vernon. Long Beach	South Waterfront Bike Path Connection	The South Waterfront Bike Path Connection (SWBPC) project is the construction of a new Class I bike path segment that closes an existing gap in the area. The project will include a mid-block crossing and wayfinding. The SWBPC links two primary segments of an existing pathway system in the south waterfront area to one of Downtown Long Beach's primary pedestrian and bikeway networks. This proposed path closes a vital gap between the existing Class I path across Queensway Bridge and the existing Class I bike and pedestrian path along the south waterfront, connecting the Greater Downtown with the hotels and commercial centers located across the harbor. This proposed bike path creates a safe and much needed segment that connects two existing systems and provides what will be both an alternate	The proposed South Waterfront Bike Path starts at the north end of the Queensway Bridge at the existing terminus of the Class I path. The proposed alignment follows the north side of Queensway Drive within the City right-of-way as a Class I bike path to the Special Events Park existing Class I path. Total proposed bike path ditance in miles: 0.3.	0.3		N			4-6	3

Long Beach	Millikan High School Transporation Improvement Project	Modernize a traffic signal to address ADA issues, traffic congestion, and an ackward intersection jog, thereby improving traffic operations and safety for residents and students.	Spring Street & Snowden Avenue
Long Beach	Pacific Avenue & Spring Street Intersection Enhancement Project	Intersection provides primary access across Blue Line tracks, to an adjacent park, and nearby hospital. Improvements include pedestrian countdown signals, lighting improvements, and adaptive control elements to address varrying traffic and emergency vheicle demands while providing traffic calming elements off peak.	Pacific Avenue & Spring Street
Long Beach	Orange Avenue/Alamitos Avenue Traffic Improvement Project	Reconfigured a schewed roadway alignment to eliminate conflicts, concentrate pedestrian movements, and provide traffic signal control.	Alamitos Avenue between 17th Street & 15th Street
Long Beach	Virgina Village Transportation Enhancement Project	Construct median, install two new traffic signals, convert cross streets to one-way to reduce conflicting traffic movements, enhance capacity, and improve safety	Long Beach Boulevard between Del Amo Boulevard and 55th Street
Long Beach	Wardlow Road Transportation Improvement Project	Complete gaps in sidewalks and modernize traffic signals to facilitate peak period traffic flow and safety	Wardlow Road between Cherry Avenue & Long Beach Boulevard
Long Beach	Atherton Transportation Improvement Project	Modernize one traffic signal to provide left-turn phasing and adaptive control and install a new traffic signal to improve access for vehciles and pedestrians to improve traffic opeations between freeway connections and CSULB.	Atherton Street between Studebaker Road & Bellflower Boulevard
Long Beach	Iron Triangle Transporation Improvement Project	Project to provide grade separation of a number of traffic movements at the primary access point between freeways and the southeast area of the City	7th Street, Bellflower, & PCH triangle of intersections.
Long Beach	Shoreline Adpative Traffic Signal Project	Implement an Adaptive Traffic Signal Control system, including CCTV, CMS, and other motorist information systems in downtown Long Beach to address peak period congestion and special events.	Downtown Long Beach
Long Beach	Long Beach Traffic Management Center	Construction of a new regional TMC to operate traffic signals and motorist information systems for the Cities of Long Beach, Lakewood, Signal Hill, Bellflower, Hawaiian Gardens, and some State owned traffic signals/facilities	Long Beach City Hall
Long Beach	Douglas Park ATCS Expansion Project	Expansion of the recently completed 160 traffic signal Long Beach TLSP project to include approximately 120 additonal traffic signals into the new system	8 Square Mile area comprising multiple jursdictions in the area bounded by I-405, I-605, CA-91, I-710
Long Beach	Orange Avenue Transportation Improvement Project	A project to reduce conflicts and traffic operations adjacent to a new grocery market and fire station underconstruction. Project involves a number of improvements to an existing traffic signal and the installation of a new traffic signal.	Orange Avenue between CA-91 and Artesia Boulevard
Lynwood	Imperial Hwy and Martin Luther King Blvd. Intersection Improvement Project	Truck impacted instersection. County project to widen curb returns, PCC intersection, traffic signal improvements and sidewalk improvements.	Imperial Hwy and Martin Luther King Jr, Blvd.
Lynwood	Long Beach Blvd Improvement Project	Street improvement project including realignment and improve intersection geometry of Long Beach Blvd., State Street and Tenaya Avenue.	Long Beach Blvd., State Street and Tenaya Avenue.
maywood	Slauson @ Atlantic	Intersection widening and concrete lanes	Slauson @ Atlantic
Multiple		install wireless communications for traffic signal system	City of South Gate, Lynwood, Huntington Park, La Mirada, Commerce,
Multiple		install wireless communications for traffic signal system	City of Bell, Bell Gardens, Santa Fe Springs, Cudahy, Maywood, Pico Rivera, Paramount
Norwalk	Project 7212	Replaced signal cabinet and upgraded traffic signal controller assembly, conduits, cables, and electrical service	Pioneer Boulevard/Lakeland Road
Norwalk	Firestone Boulevard Rehabilitation	Extend 3rd WB lane.	WB Firestone Boulevard at Target Driveway (west of I-605 Freeway)
Norwalk	Traffic Control System	Installation of a traffic control system	Citywide
Norwalk	Traffic Control System	Upgrade and expand traffic control system	Citywide

Signal Hill	673 Orange Ave Signal Upgrades	Replace traffic signals	32nd and 33rd Streets @ Orange Ave
Signal Hill	Citywide bus stop improvements	Install newly designed bus stops	Citywide
South Gate	329-ST Truck impacted intersection Phase II Imperial Highway and Garfield Ave	This project will benift the city by improving the traffic flow conditions on Imperial Highway and Garfield Avenue. The construction consists of widening the intersection that includes new curbs, gutters, sidewalk and drainage system as well as upgrades of traffic signals.	Imperial Hwy, Garfield Ave
South Gate	365-ST Atlantic Ave & Firestone Blvd Intersection Improvements	Three thru lanes in each direction and a left turn lane is designated for arterial roadways. The proposed improvements will be consistent with the General Plan. Provide a wider typical section in order to realign the intersection.	Firestone Blvd, Atlantic Ave
South Gate	358-ST Atlantic Ave Improvement Project	Roadway pavement rehabilitation with asphalt rubber hot mix, construction landscaped median island , sidewalk, curb, and gutter repairs, reconstruction of curb ramps to meet Americans with Disabilities Act standards, signal interconnect between Tweedy Boulevard and Michigan Avenue and traffic signal upgrades, and peripheral improvements.	Atlantic Ave and Tweedy Blvd, Atlantic and Michigan Ave.
South Gate	448-TRF Traffic Signal Left Turn Phasing on Firestone Blvd at Santa Fe, Long Beach, California, Otis	design protected left turns for the 4 intersections, provide compliance with ADA as it relates to access ramps at the 4 intersections, and synchronize the modified signals with the Firestone corridor	Firestone Blvd at Santa Fe Ave, Long Beach Blvd, California Ave, Otis St
South Gate	Traffic Management Center	Remodeling and upgrade space at the City Yard with work stations, TCS software, computers, video display. Upon completion the TMC will contribute traffic data to the Information Exchange Network, integrate traffic signals into the Traffic Control System, and develop coordination plans from information gathered.	TMC construction at the City Yard, upgrades to approx. 40 intersections throught the City
South Gate	358-ST Atlantic Ave Improvement Project	Roadway pavement rehabilitation with asphalt rubber hot mix, construction landscaped median island , sidewalk, curb, and gutter repairs, reconstruction of curb ramps to meet Americans with Disabilities Act standards, signal interconnect between Tweedy Boulevard and Michigan Avenue and traffic signal upgrades, and peripheral improvements.	Atlantic Ave and Tweedy Blvd, Atlantic and Michigan Ave.
South Gate	448-TRF Traffic Signal Left Turn Phasing on Firestone Blvd at Santa Fe, Long Beach, California, Otis	design protected left turns for the 4 intersections, provide compliance with ADA as it relates to access ramps at the 4 intersections, and synchronize the modified signals with the Firestone corridor	Firestone Blvd at Santa Fe Ave, Long Beach Blvd, California Ave, Otis St
South Gate	Traffic Control System	Installation of a traffic control system and Traffic Management Center	Citywide

Appendix E.

Analysis for Transportation Demand Management Strategies in the Gateway Cities

E. Analysis for Travel Demand Management Strategies in the Gateway Cities

The TDM analysis, the impacts of which were summarized in Section 7, was based on information provided by the Gateways cities. Two inquiries were made of the cities to elicit information on if and what TDM strategies the cities employed or were present in the cities. Not surprisingly, most of the strategies reported were those under the control of the city as employer and land use regulator.

The results of this inquiry are summarized in Table E.1. Although cities reported activities in some eight categories of TDM strategies, participation (mode shift) data was available for only two strategies (Compressed Work Weeks and City Employee Rideshare Programs). Additionally, for those cities who reported having active TDM ordinances, trip reduction estimates were made based on growth in office development in each of these cities. Clearly, additional trip and emission reduction impacts are being produced by all eight types of TDM strategies, such as on-line course offerings at local colleges, shuttle services, safe routes to school projects, and bicycle programs, such as the Long Beach Bike Station.

Table E.1 TDM Strategies by Gateway City

City	Compressed Work Schedule	City Employee Rideshare Program	Bus Pass Sales	Higher Education TDM Initiatives	Shuttles	Bike/Ped Initiatives	Safe Routes to School	TDM Ordinance

Santa Fe Springs	X		X					
Signal Hill	X							
Southgate	X	X	X				X	X
Vernon	X	X						X
Whittier	X	X	X				X	X

The calculation of impacts for each of the three TDM strategies, for which mode shift or related data existed, is summarized below.

Compressed Work Weeks

Some 14 cities reported using compressed work week schedules for some or all of municipal employees. This is a very common strategy among South Coast Air Basin cities. While most cities used a 9/80 schedule, closing nonessential city office every other Friday, other cities employed 4/40 and 3/36 schedules.

In total, 3,309 employees are using a CWW schedule in the Gateway Cities. Most of these programs were implemented after 2005. The number of participants is not expected to grow in the planning years of 2020 and 2035. The calculation of GHG emission reduction impacts (in metric tons) is as follows:

- Participating employees — 3,309 (a)
- Vehicle trip reduction (a x 80% prior SOV) — 2,647 (b)
- VMT reduction (b x 20 mile commute) — 52,944 (c)
- 2020 GHG reduction (c x 327.36 g/mi) — 17.3 tons per CWW day off (d)
- 2035 GHG reduction (c x 286.13 g/mi) — 15.15 tons per CWW day off (e)

- 2020 GHG daily reduction (d x 14% of days are CWW days off) — 2.43 tons per day (f)
- 2035 GHG daily reduction (e x 14%) — 2.12 tons per day (g)
- 2020 GHG annual reduction (f x 250 commute days) — 607.5 tons per year
- 2035 GHG annual reduction (g x 250 commute days) — 530 tons per year

City Employee Ridesharing Program

Six cities reported having employee ridesharing programs for municipal workers. These cities reported that approximately 700 employees participated in the programs. Two of the cities reported an average vehicle ridership (AVR) of 1.29 and 1.31. Therefore, an AVR of 1.3 was applied to this employment and exemplary mode shares developed to equate to 1.3. This equated to a vehicle trip reduction of 418 trips. Assuming a 20-mile round trip commute, this equated to a VMT reduction of 8,360 miles. Applying the same emission factors cited above for CWW, this VMT reduction equates to a GHG emission reduction of 2.73 tons per day (2020) and 2.39 tons per day (2035). Annual reductions equate to 682.5 tons (2020) and 597.5 tons (2035). The diminishing reductions are due to lower emission factors in 2035 as California cars being cleaner and more efficient. City employee ridesharing participation was not expected to grow in future years.

TDM Ordinance

Eight cities reported having active TDM ordinances, seeking trip reduction mitigation at new commercial developments. While other cities presumably have TDM ordinances, they may not have reported due to inactivity of commercial development or with the ordinance application itself. The TDM ordinance analysis was different from that for Compressed Work Weeks and Employee Ridesharing, which had reported participation statistics. The known information related to this area was the existence of an ordinance and amount of estimated future office development in each city for 2020 and 2035 (from the SCAG Sustainability Tool).

First, trip reduction impacts were derived for new employment based on three scenarios: 1) a typical baseline mode split at office worksites, 2) an expected trip reduction of 8 percent due to the implementation of TDM strategies at new office developments (with the expected range of impacts from the most recent TDM literature – see Section 7), and 3) an expected trip reduction of 13 percent due to the interactive effects of TDM implemented at new developments, which are located in cities with aggressive smart growth and transit improvement policies and programs (see Section 10). These forecasted impacts were applied to a hypothetical group of 1,000 office workers and resulting mode splits were derived.

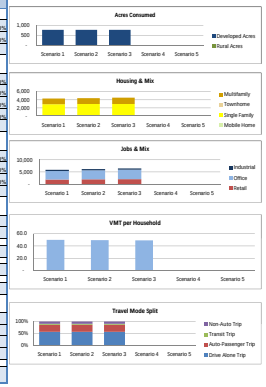
DRAFT DRAFT

- The vehicle trip reduction impacts estimated for the second scenario (TDM ordinance alone) was calculated to be 80 trips per 1,000 employees or 2,400 miles (for a 30-mile round trip commute).
- The 2020 emission reduction impacts were estimated to be 0.79 tons per 1,000 office employee or 0.031 tons per 10,000 sq. ft. of office space.
- The 2035 emission reduction impacts were estimated to be 0.69 tons per 1,000 workers and 0.027 tons per 10,000 sq. ft.
- The vehicle trip reduction impacts estimated for the third scenario (interactive effects) was calculated to be 126 trips per 1,000 employees or 3,780 miles (for a 30-mile round trip commute).
- The 2020 emission reduction impacts were estimated to be 1.24 tons per 1,000 office employee or 0.0495 tons per 10,000 sq. ft. of office space.
- The 2035 emission reduction impacts were estimated to be 1.08 tons per 1,000 workers and 0.043 tons per 10,000 square feet.

The emission reduction estimates per 10,000 square feet of office development were then applied to the forecasted growth in such development in each city. The estimated 2020 growth in office development in the eight TDM ordinance cities is 1,759, 380 square feet of office space. In 2035, this number is expected to grow to 2,945,340. However, TDM ordinance provisions only apply to developments of a certain size (generally 25,000 square feet or larger). Therefore, trip and emission reduction impacts were only applied to 30 percent of new office space growth (as per one cities estimate).

The resulting emission estimates, using the same emission factors, were calculated to be:

- 1.66 tons per day or 415 tons per year for 2020 due to TDM ordinance application;
- 2.43 tons per day or 607.5 tons per year in 2035 due to TDM ordinance application;
- 2.61 tons per day or 652.5 tons per year in 2020 due to interactive effects of smart growth and transit; and
- 3.83 tons per day or 957.5 tons per year in 2035 due to interactive effects.



DRAFT

Appendix F.

Land Use Scenario Strategies from Sustainability Tool (2008, 2020, and 2035)

Greenhouse Gas Emissions per Household (Tons)	0.0222		0.0217		0.0216		-		-	

** GHG emissions per Household is calculated by dividing GHG emissions total (total VMT X Emission Factor) by the total number of households.*
The below Emission Factors are for light- and medium-duty vehicles only (excluding motorcycles), calculated with EMFACT model output based on 2008 RTP Amendment #3:
Year 2008: 0.000446 tons per vmt
Year 2020: 0.000439 tons per vmt
Year 2035: 0.000445 tons per vmt
By default, emission factors for the years 2008, 2020, and 2035 are applied to calculate GHG emissions per Household values for Scenario 1-3 respectively (row 37 under columns B, D, F).

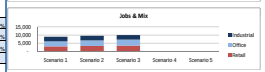
Greenhouse Gas Emissions per Household (Tons)	0.0177		0.0176		0.0176					



** GHG emissions per Household is calculated by dividing GHG emissions total (total VMT X Emission Factor) by the total number of households.*
The below Emission Factors are for light- and medium-duty vehicles only (excluding motorcycles), calculated with EMFACT model output based on 2008 RTP Amendment #3:
Year 2008: 0.000446 tons per vmt
Year 2020: 0.000439 tons per vmt
Year 2035: 0.000445 tons per vmt
By default, emission factors for the years 2008, 2020, and 2035 are applied to calculate GHG emissions per Household values for Scenario 1-3 respectively (row 37 under columns B, D, F).

** GHG emissions per Household is calculated by dividing GHG emissions total (total VMT X Emission Factor) by the total number of households.*
The below Emission Factors are for light- and medium-duty vehicles only (excluding motorcycles), calculated with EMFACT model output based on 2008 RTP Amendment #3:
Year 2008: 0.000446 tons per vmt
Year 2020: 0.000439 tons per vmt
Year 2035: 0.000445 tons per vmt
By default, emission factors for the years 2008, 2020, and 2035 are applied to calculate GHG emissions per Household values for Scenario 1-3 respectively (row 37 under columns B, D, F).

** GHG emissions per Household is calculated by dividing GHG emissions total (total VMT X Emission Factor) by the total number of households.*
The below Emission Factors are for light- and medium-duty vehicles only (excluding motorcycles), calculated with EMFACT model output based on 2008 RTP Amendment #3:
Year 2008: 0.000446 tons per vmt
Year 2020: 0.000439 tons per vmt
Year 2035: 0.000445 tons per vmt
By default, emission factors for the years 2008, 2020, and 2035 are applied to calculate GHG emissions per Household values for Scenario 1~3 respectively (row 37 under columns B, D, F).

** GHG emissions per Household is calculated by dividing GHG emissions total (total VMT X Emission Factor) by the total number of households.*
The below Emission Factors are for light- and medium-duty vehicles only (excluding motorcycles), calculated with EMFACT model output based on 2008 RTP Amendment #3:
Year 2008: 0.000446 tons per vmt
Year 2020: 0.000439 tons per vmt
Year 2035: 0.000445 tons per vmt
By default, emission factors for the years 2008, 2020, and 2035 are applied to calculate GHG emissions per Household values for Scenario 1~3 respectively (row 37 under columns B, D, F).

Memorandum

TO: Gateway Cities COG

FROM: Cambridge Systematics, Inc.

DATE: April 25, 2011

RE: Gateway Cities GHG Emission Reduction Benefits from Regional Projects

This memorandum documents the regional greenhouse gas (GHG) emission reduction estimates provided for Gateway Cities Sustainable Communities Strategy (SCS). Those reductions were:

- Daily CO_2 reduction due to changes in network speed = 7 percent;
- Daily CO_2 reduction due to reduced VMT (i.e., mode shift) = 1.1 percent; and
- Packaging is multiplicative: so the combined benefit is 7.07 percent.

GHG emission reduction estimates from regional actions are based on the expected carbon dioxide (CO_2) reductions from the Los Angeles County Metropolitan Transportation Authority (LAMTA) 2009 to 2040 Long-Range Transportation Plan (LRPT)[1]. The 2009 LRTP project lists confirmed that the Gateway Cities 17 key projects (see Table 1) had been included in LRTP modeling. The 2040 no-build and 2040 plan model summaries for Los Angeles County were obtained from LAMTA. (Gateway Cities specific results were not available.) The datasets are provided as Attachment 1 and Attachment 2, respectively. Calculations were done to reflect the vehicle miles traveled (VMT) reduction and changes in speed distributions.

VMT Reductions

VMT reductions result in a proportional reduction in CO_2 emissions. The 2009 LRTP resulted in a 1.1 percent (i.e., 0.011) reduction in VMT for 2040. This 1.1 percent reduction is used for the 2035 horizon year of the SCS.

SR 91/I-605/I-405 Arterial Highway Improvements	2035

Speed Distributions Changes

The 2009 LRTP projects alter the average network speeds by targeting bottlenecks. The resulting change in speeds yields a net reduction in CO^2 emissions. This emissions benefit was estimated based on the ratio of the Unified cycle correction factor (Equation 1)[2], applied by EMFAC2007 to account for the variation in emissions as a function of average trip speed.

[2] On-Road Emission Model Methodology Documentation Section 6.2, available on-line at http://www.arb.ca.gov/msei/onroad/doctable_test.htm, last accessed on April 25, 2011.

$$CCF = e^{-[-0.026423\,(S-27.4) + 0.000744\,(S-27.4)2]} \quad \text{Equation 1}$$

Where:

CCF = CO_2 Cycle Correction Factor for light- and medium-duty fuel injected vehicles given speed "S".

For example, the CCF at 18.1 mph is 1.364 and the CCF at 20.9 mph is 1.225; and the emission reduction is therefore 1-1.23/1.36 or 10.1 percent. The calculation for each period modeled for the 2009 LRTP is shown in Table 2 below.

Table2. Unified Cycle Correction Factors Calculations for No-Build and Plan Network Speeds

Period	2040 Plan VMT	2040 No-Build Average Speed	2040 Plan Average Speed	CO2 Reduction	VMT Weighted CO2 reduction
AM Peak	49,433,206	18.1	20.9	10.1%	2.2%
Mid Day	65,659,326	33.3	35.2	3.0%	0.9%
PM Peak	76,791,120	16.1	19	11.2%	3.8%
Night time	35,186,868	46.4	45.2	0.1%	0.0%
Total	**227,070,520**				**7%**

Packaging

The emission reduction based on reduced VMT and the emission reduction based on network speed changes are not additive. The factors can be combined as multiplicative adjustments rather than additive adjustments. The combined benefit is therefore 7.07 percent.

Analysis of Interactive Effects Contributing to Further GHG Reduction in the Gateway Cities

H. Land Use – Regional Transit Capacity Expansion Interaction

Overview

The interaction between new development and redevelopment in Gateway Cities as modeled through the Sustainability Tool (ST) and regional public transportation projects funded under Measure R is a critical component of estimating GHG emission reductions in 2020 and 2035. This interaction is assumed to represent all components of the 4D concept – that households in communities featuring high density development, a diverse and balanced mix of uses, a high quality pedestrian environment, and superior access to regional opportunities via transit are much less auto dependent.

The element of the 4Ds under more careful consideration in the Gateway Cities SCS analysis is with regard to change in transit access and level of service. The reason for this additional attention is the recognition of the significant role that regional transit projects in the RTP and funded under Measure R will play in future development patterns and travel choices in the Gateway Cities.

Assessment Process in Gateway Cities SCS

There are two primary components to the land use-regional transit capacity expansion interaction under consideration in the SCS:

1. **Regional Transit Walk Access –** There are two potential interactions to consider:
   a. Residential and commercial development and redevelopment identified in the Gateway Cities adjacent to existing transit stations will on average generate less VMT per household than households not adjacent to transit. This interaction is accounted for in the ST.
   b. The improvement of transit access to regional destinations outside the Gateway Cities and new high capacity and frequent regional transit service in Gateway Cities as identified in the RTP and Measure R project list improves the level of service and utility of the transit mode leading to mode shift from vehicle-based trips.
2. **Transit-Oriented Development (TOD) Opportunity –** New or improved transit stations attract new TOD, consisting of high-density, mixed residential and commercial development with a higher propensity for transit trips.

Regional Transit Walk Access

The Sustainability Tool has functionality that estimates the interactions between land use (expressed as the 4Ds: density, diversity, design, destination) and

DRAFT

proximity to a fixed-guideway transit node (defined as within ½ mile). The ST subdivides the growth forecasts from the cities into 5.5-acre grid cells, overlays the data with existing transit facilities, and flags all cells within a one-half mile of transit station locations and one-quarter mile of bus transit routes.

In the ST, regional transit walk access is an environmental (nondemographic based) predictor of household transit trips, with an average reported elasticity of 0.25 (meaning that for every 10-percent increase in households flagged with regional transit walk access, there is a 2.5-percent increase in transit trips).

The GHG reduction estimates developed through the ST reflects the benefit of growth and land use change within the Gateway Cities through 2035 overlaid on the existing regional transit network.

The ST does not consider the additional VMT reduction that could occur in the Gateway Cities as a result of long-range implementation of Measure R transit projects. Projects in the Measure R plan anticipated to be completed by 2035 that will affect travel in Gateway Cities includes:

1. The Gold Line Eastside Extension,
2. The Orange Line Development Authority (OLDA) grade-separated regional transit project,
3. The Regional Connector project linking the Blue Line to other MTA facilities in Downtown Los Angeles, and
4. The Green Line extension to LAX.

These projects will positively affect transit ridership in the Gateway Cities in two ways: 1) the projects will improve regional access to attractions, employment, and services for Gateway Cities households; and 2) the projects will provide a new fixed guideway transit alternative to private vehicle or bus transit trips.

Inside Gateway Cities, the primary project of interest is the OLDA project. It is likely that most, if not all, of the households adjacent to this project already have access to transit. The ST currently applies the same regional transit walk access approach for the households in these grid cells, however, uses a one-quarter-mile access buffer.

Fixed guideway transit tends to be more attractive than bus transit to discretionary travelers (people who have the option of driving), including commuters, visitors, and people traveling to major sporting and cultural events if they are located along transit lines. To reflect the transition from bus to fixed-guideway transit access, an assumption that the regional transit walk access elasticity increases from 0.17 for bus to 0.33 for rail is reasonable for these discretionary trips. Essentially, travelers with existing access to bus transit, which will in the future have access to rail transit, will be 1.5 to 2 times as likely to choose transit than before (while controlling for socioeconomic variables). Results from travel demand modeling activities completed for these regional transit projects will effectively demonstrate the benefit of this interaction as well.

TOD Opportunity

In expanding transit corridors in California and elsewhere, the presence of new, high capacity, high level of service public transportation options has been shown to be a catalyst for new or redevelopment. Through zoning codes and development regulations, cities may support development of these areas through reduced parking requirements, tax increment financing, and other incentives to maximize the opportunity for development and capitalize on their investment in transit.

It is uncertain how much the opportunity for rezoning and eventual redevelopment of land uses near planned transit stations is incorporated into city general plans. The only project in the Measure R plan anticipated to be completed by 2035 that could facilitate TOD in Gateway Cities is the Orange Line Development Authority grade-separated high-speed regional transit project planned to provide access to Vernon, Maywood, Bell, Huntington Park, Cudahy, Downey, South Gate, Paramount, Artesia, Bellflower, and Cerritos.

In addition, other regional transit projects which increase the level of service and accessibility to attractions outside the Gateway Cities (for example such as new Green Line access to LAX) could also, to a lesser degree than above, facilitate TOD at existing transit stations in the Gateway Cities. It is likely, that the benefits from TOD at these locations would occur sooner than TOD associated with the OLDA project given that the transit infrastructure is already in place.

The level to which growth in the Gateway Cities could intensify or be redistributed to focus in areas adjacent to new fixed-guideway transit stations is dependent on available development capacity, supporting infrastructure, zoning and development regulations, and future economic and market conditions. The example analysis of this interaction considers the affect of TOD in areas within one-eighth mile of Orange Line transit stations.

Results

The data summarized in Table H.1 reflects the range of potential benefits resulting from the interaction between land use and Measure R transit projects in the Gateway Cities in 2035. Given the anticipated long timeframe for implementation of the Measure R transit projects, as well as the long lead time for redevelopment activities adjacent to new transit, the resulting GHG reductions associated with this interaction is only considered for 2035.

DRAFT

Table H.1 Gateway Cities SCS – GHG Reduction from Land Use and Regional Transit Interactions

Gateway Cities – Land Use and Regional Transit Interaction	2035
Interaction 1 – Regional Walk Access	
Improved Access to Regional Destinations	
• Average Daily VMT per Household in Gateway Cities	42.5
• Total Daily GHG Reduction (lbs GHG per capita)	0.041-0.062
New Access to Fixed Guideway Transit	
• Total Households within 1/2 mile of "Orange Line" Station Locations [1]	40,075
• Total Daily GHG Reduction (lbs GHG per capita)	0.021-0.042
Interaction 2 – TOD	
• Target Density Range in TOD Station Areas (TOD defined as 1/8 mile of station)[2]	23.7-60.7 hu/acre
• Total Households in TOD Station Areas	8,186-20,966
• Total Daily GHG Reduction (lbs GHG per capita)	0.058-0.073
Total Daily GHG Reduction (lbs GHG per capita)	0.120-0.177

Notes:

1. Assumes constant household density within each city based on 2035 forecasts.

2. Apply characteristics of range "Town Residential High Mix to Town Residential Low Mix" to TOD station areas.

DRAFT

Appendix I.

CEQA Streamlining

I. CEQA Streamlining: Existing Land Use, Density, and Building Intensity Data

SB 375 provides incentives in the form of CEQA streamlining to support community designs that help reduce GHG emissions. To take advantage of these CEQA streamlining provisions in SB 375, projects must prequalify based on two criteria:

1. A project must be consistent with the land use designation, density, building intensity, and applicable policies in an approved SCS or Alternative Planning Strategy[1]; and
2. A project must be considered a Transit Priority Project (TPP) or a Residential/Mixed Use Residential Project (as defined in SB 375).

To help Gateway Cities Council of Governments (GCCOG) jurisdictions take advantage of the CEQA streamlining provisions in SB 375, SCAG will include maps in the regional 2012 RTP/SCS in order to show the uses, densities, intensities, and locations for future development; and in order to facilitate subsequent project consistency findings. These maps will use the GCCOG dataset as reviewed and approved by GCCOG. SCAG, in consultation with GCCOG and their jurisdictions, may provide more detail to allow interested jurisdictions to take advantage of the CEQA streamlining provisions in SB 375. SCAG will only show more land use detail, where a jurisdiction has acknowledged that the land use information is based on their input and approved of its being displayed in the adopted plan.

To facilitate SB 375 CEQA Streamlining, individual GCCOG jurisdictions are asked to provide detailed land use information (uses, densities, intensities at a defined geographic level) to SCAG. These data are called out in the SCAG Framework and Guidelines and the legislation specific to the streamlining

[1] CARB will review the regional SCS to accept or reject SCAG's determination whether or not the implementation of the SCS would achieve the GHG emission reduction targets for the region. If the regional targets cannot be achieved by the regional SCS, then SCAG must prepare an Alternative Planning Strategy (APS). An APS is a separate document from the RTP and describes how the targets could be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy
Appendix

provisions. Additionally, or in lieu of detailed land use information, jurisdictions may work with SCAG in designating the appropriate regional "development type" in locations for potential future projects. Jurisdictions themselves will determine whether a particular project meets the CEQA streamlining qualifications, including making the consistency finding. If a jurisdiction does not participate in the SCS data collection effort for existing land use, density, and building intensity, there is no direct adverse consequence due to not providing input.

In order to provide the most accurate data possible for the GCCOG subregion, and to preserve individual jurisdictions' general plan and existing data accuracy, detail, and integrity, and to meet the requirements under SB 375 for purposes of CEQA streamlining, SCAG prepared and provided GCCOG local jurisdictions with a set of data/GIS maps of detailed land use information, including General Plan, zoning, and existing general land use designation, density and building intensity data and maps, all for the jurisdictions' review and comment. The data was provided in the format of the Sustainability Tool by January 31, 2011. GCCOG consultants helped to extract the data for review during the February 16 workshop at the GCCOG offices in Paramount, California.

The information contained in the data packets document was developed and/or collected by the staff in the Data and GIS group in the Department of Research, Analysis, and Information Services (RAIS) under the Land Use and Environmental Planning (LUEP) Division at SCAG. The SCAG Data/Map Guide included information on the sources, methodologies, and contents of each dataset. These data/GIS maps are identified in SB 375 as required to be considered in the SCS development to address the requirements of SB 375 and its implementation for purposes of CEQA streamlining. Comments and corrections from subregions and local jurisdictions are due to SCAG as part of the Gateway SCS process by April 29, 2011. The list of data/GIS maps included in the SCAG map and data packets, along with the review requested of GCCOG jurisdictions, appears as Table I.1 below.

DRAFT

Natural Areas	Yes
Open Space and Parks	Yes
Farmland	Yes

Background: Existing Land Use, Density, and Building Intensity

In 2008 and early 2009, SCAG began to collect the general plan and zoning information from local jurisdictions, with year adopted ranging from 1971 to 2009 by jurisdiction. The general plan and zoning documents, maps, and/or GIS shapefiles collected were coded into GIS shapefiles at parcel level. Parcel data were acquired from Digital Map Product for Gateway Cities COG. Beginning in July 2009, SCAG communicated with local jurisdictions, and revised the general plan and zoning data based on the results of the local review. Through a process of collecting general plan and zoning documents and receiving comments from local jurisdictions, information included in the data packets reflected the local inputs received by January 31, 2010. SCAG continues to receive local input, and will incorporate them into the database. General Plan data are shown at a parcel level; in many areas, they depict a local agency's adopted documents accurately. However, the data shown in some areas may be generalized or inaccurate for many reasons, a primary reason because the parcel-level database representing general plan does not support multiple uses or designations on a single parcel (either splitting the parcel or representing overlays). Additionally, data on building size, existing use, and other specific parcel-related information that SCAG collected from other original data sources, such as the Gateway Cities

Gateway Cities Council of Governments Subregional Sustainable Communities Strategy
Appendix

County Assessor's Office, may have been in error and/or not up to date. Due to these inaccuracies and limitations, if site-specific data is necessary, users should always reference a local agency's adopted documents or field surveys to determine actual land use designations.

At the jurisdiction level, both general plan land use and zoning maps are prepared with the land use or zoning codes used in each local jurisdiction. General Plan land use maps are also available at larger geographic levels, such as subregion, county, or the entire SCAG region with SCAG's standardized General Plan codes. For detailed information on the standardized codes, please refer to SCAG's General Plan Code Table.

SCAG prepared three sets of land use maps (General Plan Land Use, Zoning and 2008 Existing Land Use) at parcel level. The three land use maps were originally provided to local jurisdictions in September/October 2009. Based on one-on-one meetings and communication with local jurisdictions throughout the first round outreach (July 2009 to January 2010) the Data/Map packets of existing land use, density, and building intensity data transmitted to Gateway Cities COG jurisdictions in February 2011 reflect the local inputs received by January 31, 2010.

Gateway Cities Jurisdiction Review Process

GCCOG distributed the electronic files and hard copies to Gateway cities for review. They were asked to review and submit updates and comments for purposes of SB 375 CEQA streamlining and with regard to the land use strategies developed for GHG reduction in SB 375. All GCCOG jurisdictions received the SCAG datasets in both electronic and hard copy format. Most, but not all, GCCGOG jurisdictions reviewed the data for purposes of SB 375.

SCAG staff presented a data orientation and review session to the GCCOG on February 16, 2011, at a technical workshop held at the Gateway COG. Additionally, SCAG staff was available and conducted one-on-one meetings with cities who were interested in modifying and/or reviewing their land use during the last week of March 2011 to provide technical data and GIS assistance to GCCOG jurisdictions with limited data/GIS capability that needed assistance in the Data/Map review.

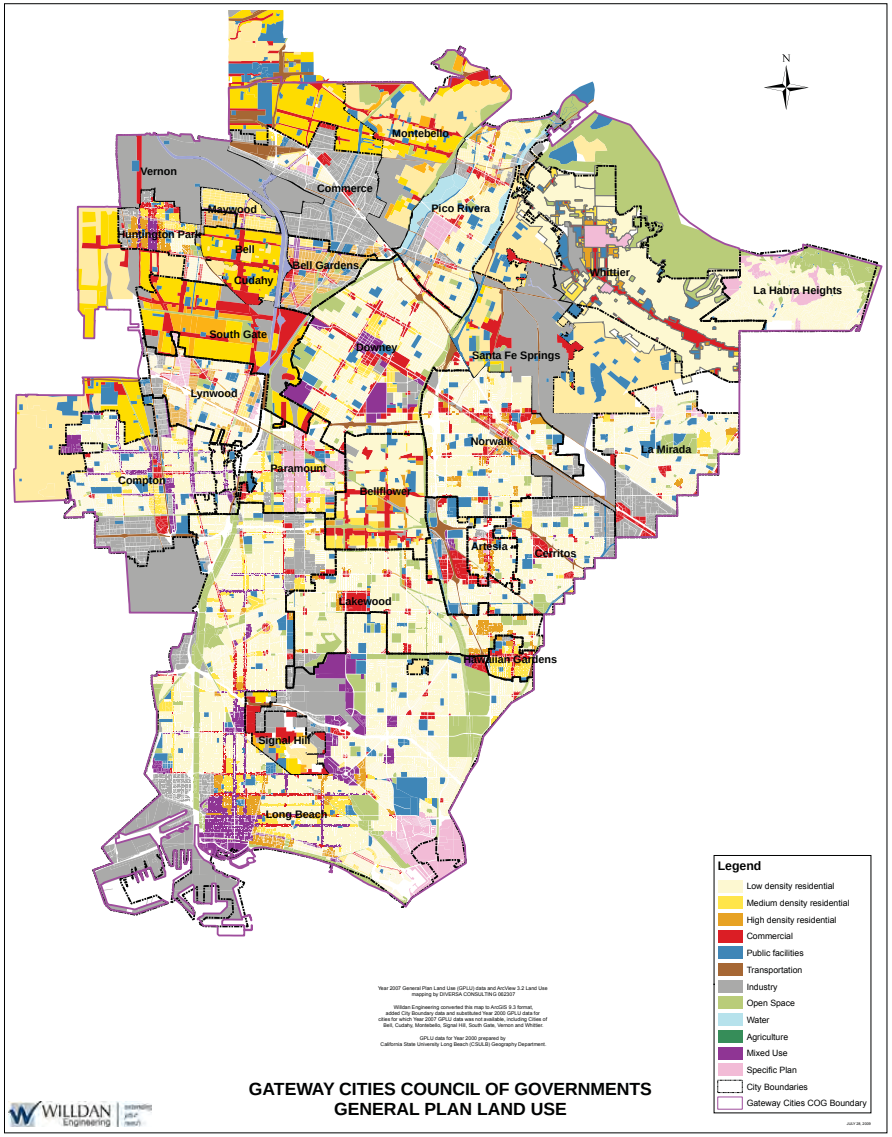
Based upon parcel level data originally provided by SCAG, GCCOG jurisdictions reviewed the data to various degrees for purposes of CEQA streamlining.

Results

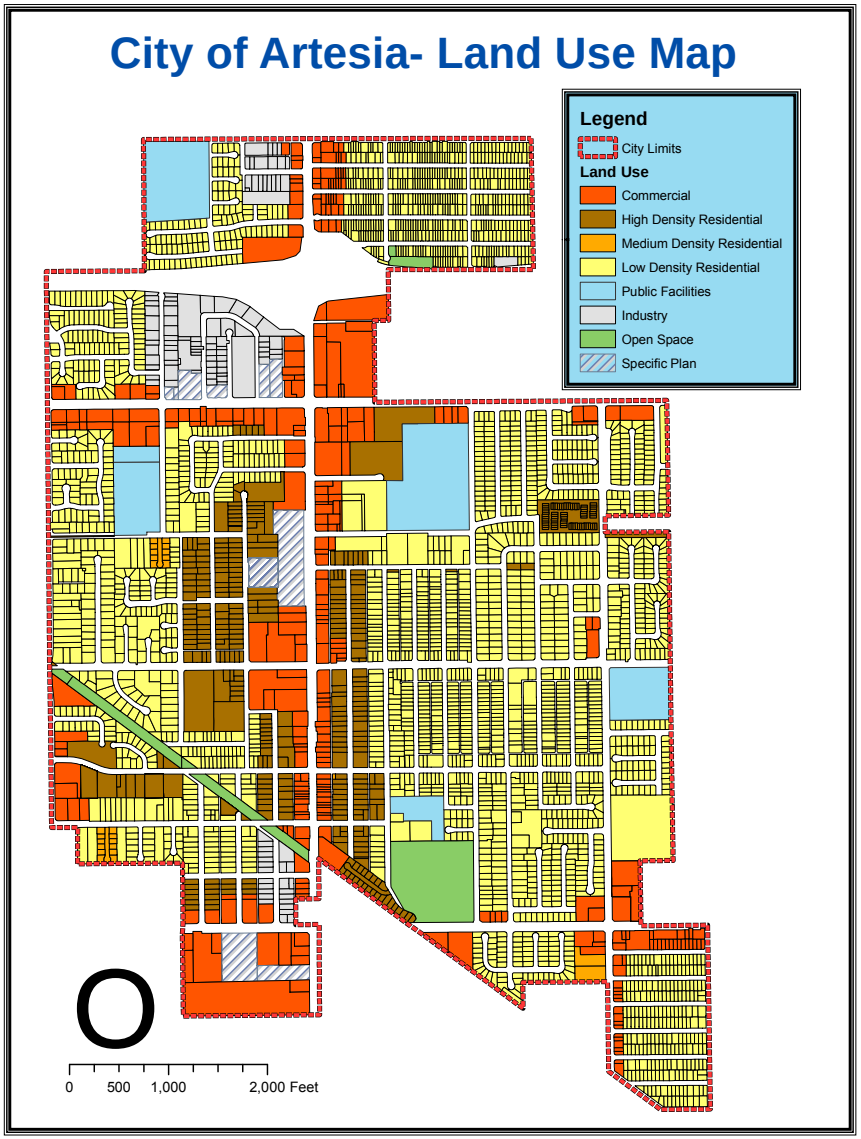
The results of that process have been provided electronically to SCAG through the Sustainability Tool. For a select number of cities, modifications were made in conjunction with SCAG staff. For the remainder, default scenarios were used, which were part of the SCAG original dataset.

DRAFT

In Appendix J, individual jurisdiction General Plans are presented along with web address links to individual jurisdictions' General Plans. Individual jurisdiction General Plans are always considered the final and ultimate authority on land use and zoning, especially for those jurisdictions that opted not to review the SCAG data.



For those jurisdictions that did not fully review, there are some limitations, conditions, and caveats to the existing land use, density, and building intensity data. Data provided by SCAG on land use is in some areas inaccurate and/or generalized. Because the parcel-level database representing existing land use, general plan, and zoning data does not support multiple uses or designations on a single parcel (either splitting the parcel or representing overlays, such as zoning overlays), the data ultimately shown may generalize the data and thus not accurately depict a local government's adopted general plan or zoning or the existing land use on the site (including land use designated through a development or other legal agreement).



Due to these caveats and limitation, if site-specific data is necessary, users should always reference and rely on individual Gateway Cities jurisdiction general plans as the final authority. A local agency's adopted documents are always the final say on allowable land use designations and zoning, and actual site visits or field surveys to determine densities and building intensities should be undertaken.

1.0 Introduction

At the behest of the Los Angeles County Metropolitan Transportation Authority (MTA), Cambridge Systematics (CS) developed a set of sketch-planning tools designed to estimate the potential greenhouse gas (GHG) reduction benefits of congestion mitigation fee (CMF) candidate projects included in the web-based *Fee Revenue and Growth Forecast Calculator*.

A diverse range of national, state, and regional tools and research were referenced to support the development of the tool, including CS' *Moving Cooler* report and the U.S. Department of Transportation (U.S. DOT) Report to Congress, *Transportation's Role in Reducing U.S. GHG Emissions*. Significant adaptations and refinements were made to these existing tools and research findings in order to ensure these methodologies are context sensitive to MTA regional features and produce the most reasonable results possible. CS used the following four-step process to adapt these various tools and research into an analytical tool for use in Los Angeles County:

1. **Define the context of the MTA region.** The accurate GHG analysis of any individual project or set of projects relies on a relationship to the location context in which these projects are deployed. This step also involved analyzing and categorizing projects included in the *Fee Revenue and Growth Forecast Calculator* to ensure that methodologies were available for the vast majority of projects that might be included in a Los Angeles County CMF program.
2. **Adapt the *Moving Cooler* tools to regional analysis.** The *Moving Cooler* methodology evaluates the efficacy of more than 50 transportation and land use strategies, and estimated synergies between individual strategies when bundled. The methods rely on empirical data and experience from research projects. CS updated these methods to pivot off the *Moving Cooler* analysis while applying region-specific data. As appropriate, additional region- and/or state-specific tools were incorporated into the analysis. These data and resources were applied to the preliminary list of CMF-eligible projects, and 10 separate project methodologies were identified for development.
3. **Develop and test a draft analytical tool.** CS developed and tested an interactive sketch-planning model in Excel spreadsheet format, allowing for on-the-fly individual project GHG emission reduction analysis, pursuant to a set of user-defined inputs.
4. **Develop and test a web-based GHG analysis tool**. CS adapted the spreadsheet-based sketch-planning tools into a user-friendly, web-based module to be used within the *Fee Revenue and Growth Forecast Calculator's* Geographic Information System (GIS) tool. The finished tool allows cities and subregions to test individual GHG reduction scenarios for one or more CMF projects specified by Los Angeles County jurisdictions. The spreadsheets and web-based tool tested five identical sets of inputs by project type to validate consistency between the spreadsheet and web-based coded methodologies.

Each of the 10 project types available for analysis within the web tool are subject to specific user-defined inputs, constraints, and calculations, as detailed in Section 2.0 of this technical memorandum. While the 10 project type methodologies are able to analyze the GHG impacts of the vast majority of preliminary projects entered in the CMF web tool, some unique projects may not be suitable for these analyses. However, for the vast majority of eligible projects, the tool provides a common platform to estimate GHG reduction benefits and compare results within and across different geographic and political boundaries. Section 3.0 details two project types not included in this version of the web tool. Section 4.0 outlines the approach for developing carbon dioxide (CO_2) emission factors via the California Air Resources Board's (CARB) Emissions Factors (EMFAC) model; and the process for applying emissions factors in combination with estimates of changes in travel behavior (e.g., vehicle miles traveled (VMT), speed, and delay) to determine CO_2 emission reductions. Section 5.0 provides a summary of the major limitations of the tool as currently designed, and identifies next steps for expanding the tool's calculation abilities.

The references are provided in Appendix A. Appendices B, C, and D provide additional details regarding factors used in the calculation of GHG emission reductions for each project type. Appendix B presents a map of SCAG-defined area types; Appendix C includes the LA MTA model free-flow speed and capacity lookup table; and Appendix D presents all constants and assumptions, along with the citation and justification for their use in the project calculations.

2.0 Technical Documentation by Project Type

This section presents the project type objective, evaluation constraints, inputs, assumptions, and methodologies supporting the calculation of GHG emission reduction benefits of 10 unique types of CMF projects:

1. Roadway capacity,
2. Interchange capacity,
3. Intersection improvement,
4. System operations,
5. Grade separation,
6. Bike / pedestrian,
7. Bike / pedestrian and transit,
8. Transit expansion,
9. Park-and-ride, and
10. Managed lanes.

Sketch-planning tools are used to calculate emission reductions for all projects within each project type. It is important to note that there are some travel model and microsimulation-based approaches not included here that are considered extremely effective for simulating and calculating emission reductions on a project-by-project basis. The web-based platform is currently unable to accommodate this precision of detail at the project level without performing many costly and time consuming model runs. Nevertheless, these project-type methodologies offer a reasonable approximation of GHG impacts given the limited details provided by CMF project descriptions.

The design of the equations, lookup tables, and overall calculation process is transparent, while maintaining technical validity. The critical lookup tables and background information supporting the calculations and their location in this document are listed below:

1. **Roadway Capacity**
   a. SCAG area type map (Appendix b)
   b. LA MTA model speed and capacity lookup table (Appendix C)
   c. LA MTA model speed-flow curve equations (Section 2.1)
   d. EMFAC emission factors (Section 4.0)
2. **Interchange Capacity**

10. **Managed Lanes**
    a. LA MTA model speed-flow curve equations (Section 2.1)
    b. EMFAC emission factors (Section 4.0)

Each existing CMF project-type calculation was first developed and tested in a spreadsheet format. Five unique test cases were evaluated for each project type

in the spreadsheets, and then retested in the web-based platform in order to validate the calculations.

All project-level calculations are first estimated at the daily level, and then annualized based on a factor of 250 days.[1] All emission factors and calculations are presented in Section 4.0.

2.1 ROADWAY CAPACITY

Overview and Project Types

This project type evaluates those roadway capacity projects that add new capacity by widening an existing facility, or by building or extending a new roadway. The evaluation requires the user to specify a facility type, which defines the physical characteristics of the facility under improvement; and an area type, which describes the area where the facility is located. Emission reductions from these projects are derived from increased average vehicle speeds due to capacity expansion and improved traffic flow rates resulting from decreased congestion. Emission reductions vary by the type of facility under expansion and the location of the facility.

Methodology Limitations

This approach is used for projects involving capacity expansion through the addition of additional travel lanes. Construction of new access lanes or connecting facilities can only be evaluated using this method if the existing average speed on alternative routes is known; and the anticipated traffic volume due to the construction of the proposed facility can be estimated from a study, modeling exercise, or analysis based on valid assumptions. Turning lanes, center-turn lanes, and capacity additions at intersections cannot be evaluated using this method. Emission reductions benefits are calculated for the peak period, and it is assumed that benefits are negligible during off-peak hours.

This approach does not account for the impact of diverted traffic resulting from the capacity expansion. Enhanced capacity in one corridor may act to move trips from a parallel corridor with higher congestion. It is assumed that, at a regional level, the impact of diverted traffic results in no net change in GHG emissions.

It is further assumed that the potential impact of induced travel is negligible due to the minor impact of these projects on cumulative regional travel.

[1] There are approximately 250 workdays in a year.

User-Defined Inputs

The methodology requires a set of project-specific, user-defined inputs presented in Table 2.1.

Table 2.1 Roadway Capacity Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
Average Annual Weekday Traffic (AAWT) Volume		• Enter total daily weekday traffic on the corridor
Facility type		• Select from Interstate, Expressway, Primary, or Secondary arterial type • Definitions inherited from the Southern California Association of Governments (SCAG) travel demand model
Area type		• Select from Central Business District (CBD), Urban, Suburban, Mountain, and Rural area types • Definitions based on traffic analysis zone attributes and inherited from the SCAG travel demand model (see Appendix A)
Total number of lanes (existing, in 2010)		• Enter total number of lanes before improvement in one direction in case of a divided facility, and in both directions in case of an undivided facility • Intersection turn pockets are represented by ½ lanes
Total number of lanes (proposed, by 2020)		• Enter total number of lanes after improvement in one direction in case of a divided facility, and in both directions in case of an undivided facility
Project Length (miles)		• Enter total length of the project
Truck percentage		• Enter share of trucks as a fraction of total corridor traffic

Methodology

Emission reductions due to capacity expansion projects are a result of improved traffic flow as a result of added capacity. The extent of improvement is based on the type of facility being improved and area characteristics representing travel intensity. Speed and capacity information by facility type and area types have been obtained from the MTA's travel demand model (see Appendix B). Travel speeds on the facility's before-and-after capacity expansion are calculated using speed-flow curves from the MTA's travel demand model. Speed flow equations used in the MTA travel demand model are as follows:

$S = s0/(1+1.5\ (x)\text{^}6)$ for Freeways, high-occupancy vehicle (HOV), and Toll Facilities

$S = s0/(1+0.15\ (x)\text{^}5)$ for Other Facility Types

Where:

$s0$ = Free-flow speed; and

x = Volume to capacity ratio.

Travel speeds are calculated for peak periods and only during weekdays, since it is conservatively assumed that the speed variations during the off-peak periods and weekends are marginal. The methodology calculates separate emissions reduction rates for trucks and cars, pursuant to a user-defined estimate of the average share of trucks relative to total traffic on the segment.

2.2 INTERCHANGE CAPACITY

Overview and Project Types

Interchange capacity projects are those that improve capacity through existing interchange and ramp improvements, either by adding lanes to existing ramps, or by improving traffic flow conditions by improving vehicle delay at off-ramps serviced by a downstream-signalized intersection. The evaluation methodology incorporates emissions reductions due to improvements in traffic flow for both on-ramps and off-ramps.

Methodology Limitations

In order to accommodate as many types of interchanges as possible, the methodology addresses improvements by classifying them for on-ramps and off-ramps. Otherwise, the project input will be dependent on the type of intersection; opening the door to a number of possibilities, which makes the data input complex for a sketch-planning approach. New ramp access connections cannot be evaluated using this method.

User-Defined Inputs

The methodology requires the set of project-specific, user-defined inputs presented in Table 2.2.

Table 2.2 Interchange Capacity Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
On-ramp 1 AAWT		• Enter average annual weekday traffic on the first on-ramp
On-ramp 2 AAWT		• Enter average annual weekday traffic on the second on-ramp
On-ramp 1 existing number of lanes		• Enter total number of lanes before improvement on the on-ramp (2010) • Intersection turn pockets are represented by ½ lane
On-Ramp 2 existing number of lanes		• Enter total number of lanes before improvement on the off-ramp
On-ramp 1 capacity enhancement (added # of lanes by 2020)		• Enter total number of lanes after improvement on the first on-ramp
On-ramp 2 Capacity Enhancement (added # of lanes by 2020)		• Enter total number of lanes after improvement on the second on-ramp

Methodology

Emission reductions from interchange improvements can be classified from two different types of improvements: 1) adding capacity to existing ramps to improve traffic flow, and thereby improve speeds and reduce emissions; and 2) reducing delay on interchange off-ramps due to traffic control (such as a signalized intersection) downstream of the off-ramp.

Emission reductions from improvements to interchanges are achieved through providing improved access to arterial streets or other connecting highway facilities through ramp improvements. Turn lanes at the traffic signal downstream of the off-ramp from the interchange are considered to be one-half the capacity of a single lane. Generalized ramp capacity and average speeds are obtained from LA MTA's travel demand model output.

The methodology is similar to providing additional capacity, resulting in improved speed and level of service (LOS). Speed-flow curves equations from MTA's travel demand model are used for calculating the travel time taken to navigate the ramps before and after the improvement.

$$TC = T0 * (1 + 1.50*(X)\text{^}6)$$

Where:

TC = Congested travel time;

$T0$ = Free-flow travel time; and

X = Volume to capacity ratio.

Travel time before and after the improvement is translated to average speed. Emission factor lookups are applied based on the before-and-after improvement speeds and ramp VMT to estimate total change in emissions.

Improvements downstream of an off-ramp may include changes to signal timing and phasing, or adding turn pockets and right-turn phases to reduce intersection delay. Control delay per vehicle can be calculated by an intersection delay study, or by estimation on the basis of traffic arrival patterns and progression criteria. Table 2.3 provides guidance for determining intersection LOS and control delay per vehicle.

The estimate of total delay savings as a result of an intersection improvement at the ramp termini uses the Section following formula:

$$d_1 = \frac{0.5C\left(1-\frac{g}{C}\right)^2}{1-\left[\min(1,X)\frac{g}{C}\right]}$$

Where C = is the cycle length, g/C = is the green time to cycle ratio = 0.5 (for simplicity) and X is the highest volume to capacity ratio of any turning movement or a lane group at the intersection. This approach is consistent with the calculation for intersection project type #3 as presented in Section 2.3.

The improvement in delay experienced per vehicle due to a change in capacity at the intersection is transformed into total delay in vehicle hours and thereby used for estimation of emission reductions.

Ultimately, total emission savings for this project type is a product of both the savings from improving ramp capacity and the savings from reduced intersection delay at ramp termini.

2.3 INTERSECTION IMPROVEMENT

Overview and Project Types

The model is designed to evaluate at-grade intersection improvement projects. CO_2 emission reductions due to intersection improvements are a result of the reduced delay navigating the intersection– – either due to idling at the red light, or due to deceleration and queuing that occurs at the intersection. The methodology to estimate the reduction in greenhouse gas emissions includes three types of intersection improvements leading to emission reductions:

- **Type 1.** New Signal. An unsignalized intersection approaching failure due to intolerable levels of delays is improved to a signalized intersection with an acceptable level of service.

- **Type 2.** New Turning Phase. Enabling a specific turn or movement at the intersection that was non-existent or making a permissive turn into a protected turn by changing the signal phasing and / or timing.
- **Type 3.** Improved Intersection Capacity. Changes to the signalized intersection positively impacting level of service, including improvements to geometry, approach redesign, or new lanes.

In each case, average reduction in delay per vehicle due to the improvement is estimated to determine the emission reduction benefits as a result of the improvement. Intersection delay can be measured by conducting intersection delay studies or by estimation with input data like signal cycle length and effective green times for critical movements.

This methodology strives to hit the middle-ground between conducting a full intersection delay analysis for determining delay before and after improvement, and conducting a field study for obtaining delay parameters. To achieve this, the methodology makes some key assumptions. Typically, agencies perform delay and LOS calculations as part of an intersection delay study or intersection LOS analysis. In the absence of such detailed data, delay can be estimated by arrival patterns and LOS data. Some of this data is already available from intersection studies and corridor studies, or might be maintained by the traffic or public works departments charged with maintaining the signals.

A major overarching assumption is that the design methodology considers the signals as pre-timed, given the difficulty of accounting for the dynamics of changes to signal times and phases under an actuated setting.

Methodology Limitations

The intersection improvement methodology calculates delay at a single intersection level, and is not equipped to estimate improvement benefits for multiple intersections or systemwide improvements. Intersection delay studies are the best source for delay measurements, if available. In the absence of observed intersection delay information, guidance to estimate delay is provided based on arrival types or LOS, as presented in Table 2.3. This methodology is not applicable in case of a staggered (five-legged or more) intersection.

In the absence of accurate delay data, estimation through vehicle approach and progression should be made as accurately as possible. LOS corresponding to delay windows may only be used to approximate control delay due to the difference in lower and upper bounds of each LOS (for example, LOS F corresponds to a delay between 55 to 80 seconds per vehicle, which might not be precise enough to provide an accurate estimation of emission reduction benefits).

User-defined input data like peak hour volumes, cycle length, and approach capacity are the minimum required to support the calculation of intersection improvement emission reduction benefits. Available traffic data and signal

operating plans from a traffic management data center or a public works/transportation department is recommended. If unavailable, observed delay or intersection LOS can be used as an approximation. In order to calculate delay reduction benefits, a number of key assumptions are required to simplify the calculations so that the number of inputs is manageable.

Note: The web-based version of the GHG Emissions Calculator allows users to assign one or more of the intersection improvement project types listed above. In project definitions where both a new phase and added capacity are included (i.e., a mix of project type 2 and 3), the following approach is recommended:

1. For projects adding only turn-lane capacity and new turn phasing, only apply the project type 2 approach, entering the new number of turn lanes as an input.
2. For projects adding both turn-lane and through-lane capacity, apply both the project type 2 and project type 3 approach separately.

User-Defined Inputs

The three unique intersection project approaches require the set of project-specific, user-defined inputs presented in Table 2.3.

Table 2.3 Intersection Improvement Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
1. Unsignalized (2-way of 4-way stop) to Signalized Intersection		
Area Type		Five options are available (CBD, Urban, Suburban, Mountain, Rural)
Peak Hour Volume (Approach Street 1 and 2)		Enter the average weekday peak hour volume for each intersection approach[2]
Total number of lanes (Street 1 and Street 2)		Note: Each turn lane, auxiliary lane or reversible lane equals 1/2 lane. Input total lanes for both approaches of the street.
Facility Type (Street 1 and Street 2)		Four options are available (Interstate, Expressway, Primary, Secondary)
Proposed Signalized Intersection Cycle Length (sec)	60 – 120	Guidance based on FHWA signal timing manual (see Table 2.4)
Peak Hour Intersection Delay before Improvement (s/veh)	50	50 sec. per vehicle is the default assumption for LOS F at unsignalized intersections. Higher values may be entered if supported by a recent study.

[2] If only average daily traffic is known, peak-hour volumes can be approximated by applying a factor of 0.1 (regional average).

User-Defined Input	Default Values	Input Guidance
2. New or Protected Turn Phasing at Existing Signalized Intersection		
Type of Turn Affected by Project		Input the turn movement (left or right) enabled by the new phase. Project approach can measure the benefit of adding a single phase only.
Proposed Total Cycle Length (sec) (including impact from new or extended turn phases)	60 – 120	Guidance based on FHWA signal timing manual (See Table 2.4)
Total number of turn lanes on improved turn movements		The total number of turn lanes for all of the improved turn movements. For example, if 2 left turns at the intersection are being improved, each with 1 turn lane, the user should enter 2.
3. Improvement in Overall Intersection Capacity		
Area Type		Five options are available (CBD, Urban, Suburban, Mountain, Rural)
Facility Type (Street 1 and Street 2)		Four options are available (Interstate, Expressway, Primary, Secondary)
Total number of lanes (Street 1 and Street 2)		Note: Each turn lane, auxiliary lane or reversible lane equals 1/2 lane. Input total lanes for both approaches of the street.
Total number of lanes after improvement (Street 1 and Street 2)		Note: Each turn lane, auxiliary lane or reversible lane equals 1/2 lane. Input total added lanes for both approaches of the street.
Peak Hour Volume (Approach Street 1 and 2)		Enter the average weekday peak hour volume for each intersection approach
Existing Cycle Length (sec)	60-120	See signal complexity guidance from FHWA Signal Timing Manual (see Table 2.4)

Table 2.4 FHWA Signal Timing Manual Reference

Signal Complexity	Commonly Assumed Cycle Lengths
Permissive left turns on both streets	60 seconds
Protected left turns, protected-permissive left turns, or split phasing on one street	90 seconds
Protected left turns, protected-permissive left turns, or split phasing on both street	120 seconds

Source: FHWA Traffic Signal Timing Manual, 2008.

Methodology

Intersection improvements that provide additional turn lanes, better geometric design, improved signal timing and phasing can reduce vehicle delay in navigating the intersection. This delay reduction results in lower vehicle emissions due to less vehicle time spent decelerating, accelerating, or idling. Existing vehicle hours of delay for each intersecting street (by each approach) must be estimated separately, either via an intersection delay study or data from a traffic management center. Alternatively, estimation through vehicle approach and progression should be instrumental in estimating the average delay for each approach, and thereby for intersecting streets.

Delay at the intersection is calculated given the delays for individual approaches and flow rates as follows:

$$\frac{\sum_{i=1}^{n}(v_i \cdot d_i)}{\sum_{i=1}^{n} v_i}$$

Where:

d = Delay for the approach;

v = Approach flow rate (vehicles per hour); and

n = Number of approaches to the intersection.

This reduction in average delay per vehicle approaching the intersection equates to less time spent idling, where CO_2 emission rates are highest. Since control delay takes into consideration the time elapsed for deceleration, queuing, and idling, the difference in travel speeds for noncongested conditions before-and-after improvements are not included in the GHG reduction calculation. The total change in vehicle hours of delay at the intersection, before and after the improvement, is calculated as follows:

$$\Delta D_{int} = D_{intnb} - - D_{intb}$$

Where:

D_{intnb} = Total delay at the intersection for the no-build condition; and

D_{intb} = Total delay at the intersection for the build condition.

The change in delay (ΔD_{int}) is multiplied by the idle CO_2 emissions factor (g / hr) to estimate emission reductions.

Project Type #1– – New Signal

For estimating the delay at a planned signalized intersection, short of obtaining basic design parameters of the intersection including turning movements and the

lane configuration changes, the user is prompted to provide peak hour volumes for intersecting streets, respective capacity at the intersection and the total signal cycle length at the intersection. Delay at the intersection is calculated using the following formula (this formula is used within each project type approach):

$$d_1 = \frac{0.5C\left(1-\frac{g}{C}\right)^2}{1-\left[\min(1,X)\frac{g}{C}\right]}$$

Where C = is the cycle length, g/C = is the green time to cycle ratio = 0.5 (for simplicity) and X is the highest volume to capacity ratio of any turning movement or a lane group at the intersection.

The improvement in delay experienced per vehicle due to signalization is transformed into total delay in vehicle hours and thereby used for estimation of emission reductions.

Estimated delay in this methodology is assumed to be uniform delay resulting due to uniform arrival of traffic at the intersection, which is an ideal assumption. In the absence of detailed turning movement data and proposed signal timing and phasing details, green time to cycle ratio is assumed to be 0.5. It should be recognized that the mid-block capacity of a street is different from the capacity at the intersection due to turning traffic and effects of signal controls.

Project Type #2- New Turn Phase

Intersection delay can be reduced by enabling a specific turn or movement at the intersection that was non-existent or permissive before into a protected turn by providing a new phase, or by including the movement in an existing phase by changing the time allocated to the phase. If the movement is not allowed at the intersection in the existing set-up, the existing delay is assumed to reflect a level of service F or more, which translates into a delay of 80 seconds or more. By providing protected phase to this movement, we are not only changing the signal timing plan, but also potentially adding to the cycle length. Because the delay at the intersection will be reduced for this movement, due to the provision of a green time to serve this movement, delay can be calculated based on the new cycle time and the effective green time for that movement.

The same formula presented in Project Type 1 is used to calculate before and after intersection delay. This methodology relies on assuming several constants for estimation of delay at the intersection for the turning lane group. Saturation flow rate is adjusted to area type and based on the type of turn. Saturation flow

rate in CBDs and urban areas is assumed to be 1,700 veh/hr/lane[3]. Further, this saturation rate needs to be adjusted for the type of turn, which is lower for right and left turns compared to the through movement. For right turns, the adjustment factor is 0.85 and for left turns, it is 0.95. The default v/c ratio for the turning movement is 0.9.[4]

Project Type #3– – Improved Intersection Capacity

Physical changes to the intersection for increasing capacity or geometric design, including provision of new through or turn lanes can reduce delay-related emissions at congested intersections under certain conditions. These changes to capacity result in an easing of capacity restrictions due to changes caused by the improvement. Volume is considered constant for practical purposes, since it is hard to estimate the quantity of traffic that is re-routed from other facilities due to improvement in delay at the intersection. Given the added capacity and geometric redesign resulting in delay reduction, a comparative analysis of intersection configuration before and after the improvement can be conducted to estimate the reduction in greenhouse gas emissions due to physical intersection design changes.

The same formula presented in Project Type 1 is used to calculate before and after intersection delay. Effective green to cycle ratio is assumed to be 0.5 for simplification in absence of turning movement and signal timing data to calculate it. Traffic is assumed to arrive in a uniform fashion at the intersection and improvement in uniform delay is estimated for calculating reductions in total greenhouse gas emissions as a result of improved geometric design and approach changes.

2.4 SYSTEM OPERATIONS

Overview and Project Types

Projects that can be evaluated using this methodology include corridor signalization and synchronization improvements and intelligent transportation systems (ITS)/Advanced Traffic Management System (ATMS) implementation. Travel timesavings at each intersection along the corridor are calculated and aggregated by applying a delay reduction factor.

[3] Highway Capacity Manual (HCM 2000), Chapter 16-11, Adjustments for Saturation Flow Rate Chapter.

[4] HCM 2000, Chapter 16-99, Signalized Intersections, Design Strategies for Signal Timing Plan Design for Pre-timed Control.

Methodology Limitations

This method specifically evaluates arterial management strategies, such as corridor signalization, and cannot estimate systemwide or areawide improvements. However, areawide improvements can be estimated by testing individual corridors separately and summing their unique impacts. The length of the corridors and the signals being improved for synchronization should be reasonably spaced to achieve a meaningful reduction in travel savings. For example, travel time savings will be minimal for two signals spaced a mile apart compared to seven signals in a one-mile corridor.

User-Defined Inputs

The methodology requires the set of project-specific, user-defined inputs presented in Table 2.5.

Table 2.5 System Operations Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
Length of the signalized corridor (miles)		• Enter length of corridor targeted for signal synchronization
Existing number of signalized intersections		• Enter number of signalized intersections in the corridor
Existing number of lanes		• Enter number of through lanes that serve the highest directional flow of the peak-hour traffic in the corridor • Intersection turn pockets are represented by ½ lane
Peak-hour traffic volume		• Enter highest one-hour directional volume of the day in the corridor for the highest volume segment in the corridor
Existing peak-hour travel time (minutes)		• Enter time it currently takes for a vehicle to travel the length of the corridor during the peak hour in the peak direction
Existing average cycle length (seconds)		• Enter average cycle length of all the signalized intersections in the corridor

Methodology

This methodology uses California DOT's (Caltrans) Traffic Light Synchronization Program (TLSP)[5] evaluation algorithms to calculate delay at each intersection along a defined corridor. The TLSP offers an established method of calculating various benefits of corridor traffic signal synchronization in California, and is consistent with the evaluation and calculation of fuel savings from signal synchronization projects in the State of California. Travel timesavings due to the synchronization are estimated by calculating average delay at each intersection in the corridor. The travel timesavings formula is based on the Highway Capacity Manual (HCM) equation for delay (Equation 16-11 Chapter 16). When signals are synchronized, it is assumed that delay is reduced by a factor of 0.55.[6]

$$d_1 = \frac{0.5C\left(1-\frac{g}{C}\right)^2}{1-\left[\min(1,X)\frac{g}{C}\right]}$$

Where:

C = Cycle length; and

g/C = Green time to cycle ratio.[7]

The travel timesaving is the difference in seconds per vehicle per signal. It is multiplied by the number of signals and divided by 60 to return the benefit in minutes per vehicle for the total length of the arterial. Finally, the approach multiplies this by the volume to estimate total savings in minutes.

2.5 GRADE SEPARATION

Overview and Project Types

This approach evaluates projects that improve the roadway capacity and safety of current at-grade railroad crossings. Potential improvements include grade separation of at-grade railroad crossings, which reduces delay caused by at-grade railroad facility conflicts.

This method is applicable for projects that facilitate uninterrupted movement for vehicles along a roadway and reduce delay at the crossing. Average gate down time is used as a proxy for intersection delay prior to the grade separation improvement. Gate down time varies between freight rail and passenger rail, and should be adjusted in accordance with the type and number of trains operating along the rail corridor.

Methodology Limitations

This approach should only be used to analyze projects that remove at-grade crossings of active rail corridors. Installing a grade-separated interchange at an existing at-grade intersection is not accommodated through this project approach. Improvements to at-grade rail crossings that do not include a full grade separation can be analyzed as long as future average crossing speed can be estimated, and the total daily delay resulting from queues when gates are down does not change.

User-Defined Inputs

The methodology requires the set of project-specific, user-defined inputs presented in Table 2.6.

Table 2.6 Grade Separation Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
Daily number of trains using rail corridor		• Enter average number of weekday trains passing through the at-grade crossing
Average gate down time for each train (minutes)		• Enter average length of time during which the gate at the crossing remains down for each train
Roadway average daily traffic		• Enter total daily weekday traffic on the highway facility
Average vehicle railroad crossing speed (mph)	25 mph	• Enter average speed of vehicles negotiating the crossing when gate is not down • According to the California Department of Motor Vehicle (DMV), speed limits are to be 15 mph within 100 feet of a railroad crossing without gates; it is assumed that most urban locations have gates, and hence have a default crossing speed of 25 mph
Improved roadway posted speed limit (mph)		• Enter improved speed due to the construction of a grade-separation or other alternative that eliminates at-grade conflicts

[5] Caltrans (2008), *Traffic Light Synchronization Program (TLSP) Evaluation and Scoring Methodology*, California Department of Transportation, available on-line at: http://www.catc.ca.gov/programs/tlsp.htm.

[6] HCM (2000), *Highway Capacity Manual*, Transportation Research Board (TRB), Exhibit 16-12.

[7] To avoid users having to enter time-to-cycle ratios for each intersection, g/C is assumed to be 0.5 for the corridor. This is a recommended practice per HCM (2000).

LA MTA Congestion Mitigation Fee Tool - GHG Emissions Calculator

Methodology

The duration of conflict of movement between roadway and railroad modes can be calculated by assuming an average gate down time for trains passing through the crossing, which is a proxy for existing intersection delay. Once there is a grade separation, the intersection delay is avoided completely, resulting in fuel savings, and thereby emission reductions.[8]

This methodology assumes that railroads are afforded preference of movement (right-of-way) at the intersection, thereby eliminating any delays to the rail services due to roadway traffic (Extreme circumstances like passage of emergency vehicles is not considered to occur frequently enough to affect rail services substantially.). Three types of vehicle delays result from an at-grade crossing: 1) stopping, 2) deceleration, and 3) queuing. Since stopping delay accounts for the vast majority of delay experienced by vehicles at an at-grade crossing, it is considered a reasonable and conservative proxy for total at-grade delay.

Because data on the length and type of trains passing through the grade crossing may be difficult for most users to specify accurately, an average gate down time is used to approximate vehicle delay. Gate down time and total vehicles delayed are estimated as follows:

Gate Down Time = Length of the Train / Train Speed

Total Vehicles Delayed (Daily) = Total Gate Down Time (Daily hrs) / 24 x Annual Average Daily Traffic (AADT)

The approach assumes that the total vehicular traffic impacted by delay caused by gate down time is equal to the total daily share of gate down time.

Table 2.7 Bike/Pedestrian Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
ADT on the parallel arterial		• Enter average weekday passenger vehicle traffic on nearest parallel roadway
Length of project (miles)		• Enter total length of the bike/pedestrian project
Within 2 miles of a university or college (Y/N)?		• Select "Y" if any segment of project is within 2 miles of a university or college
Average length of bicycle trips (miles)	1.8	• Enter estimated average length of bicycle trips in the area; leave blank if a pedestrian project only • Default value (1.8 mi) is based on National Household Travel Survey (NHTS) statistics, excluding purely recreational trips.
Average length of pedestrian trips (miles)	0.5	• Enter estimated average length of pedestrian trips in the area; leave blank if bike project only • Default value (0.5 mi) is based on NHTS statistics, excluding purely recreational trips
Number of activity centers within ½ mile and ¼ mile of project		• Select the number of activity centers within ½ mile (bike) and ¼ mile (pedestrian) of the project • Activity center examples include banks, churches, hospitals, park-and-ride, office parks, library, shopping, and schools; credit is only given for 3 or more centers

Methodology

The bike project approach is consistent with *Methods to Find the Cost-Effectiveness of Funding Air Quality Projects*, a handbook prepared by the CARB in 2005. The CARB handbook describes how to evaluate Motor Vehicle Registration Fee Projects and Congestion Mitigation and Air Quality Improvement (CMAQ) projects, and is the basis for determining the amount of GHG reductions from bicycle facility projects.

The 2009 report *Methodologies for Evaluating Congestion Mitigation and Air Quality Improvement Projects*, developed for the Maricopa Association of Governments (MAG), is the basis for determining GHG reductions resulting from auto trips replaced by pedestrian trips. The MAG document adapted the methodology for calculating the impact of pedestrian improvements from the 2005 CARB handbook.

The approaches for bike and pedestrian projects are consistent. Within the general CARB approach, two primary factors drive the calculation of reduced

auto trips: 1) the number of activity centers adjacent to the project, and 2) the project location with respect to a nearby university or college.[9] These factors are presented in Appendix C.

The number of activity centers within one-quarter mile of a pedestrian project and one-half mile of a bike project feed into a lookup table of factors generating percent auto trip reductions. The university/college location factor increases average trip lengths on the assumption that willingness to bike or walk, and the average distances for these trips are greater for college students.

Auto trip reductions are translated into VMT based on average bike and walk trip lengths. These average trip lengths default to 2001 National Household Travel Survey (NHTS) data, but the user interface allows users to override these figures with local-specific data.

Calculations for auto trips reduced as a result of increased bike and pedestrian trips generated by the project are listed below. Trips are then equated to VMT savings based on average bike and walk trip lengths. The VMT reductions are calculated separately for bike and pedestrian on a daily scale, then summed together and annualized (assumes a factor of 250 days, since commute benefits are assumed only to accrue during workdays). The GHG emissions calculation approach is included in Section 4.0.

$$\text{Daily auto trips reduced}_{(bike)} = AWT * 0.091 * (A_{\frac{1}{2}\text{ mile}} + C)$$

$$\text{Daily auto trips reduced}_{(walk)} = AWT * 0.091 * (A_{\frac{1}{4}\text{ mile}} + C)$$

Where:

AWT = Average weekday traffic on the adjacent or nearest parallel arterial.

0.91 = Factor to convert average weekday traffic to AADT.

[9] Per CARB documentation, adjustment factors were derived from a limited set of bicycle commute mode split data for cities and university towns in the southern and western United States (Source: U.S. DOT (1992), *National Bicycling And Walking Study––Transportation Choices for a Changing America*). This data was then averaged and multiplied by 0.7 to estimate potential auto travel diverted to bikes. On average, about 70 percent of all person trips are taken by auto driving (Source: Caltrans (2002), *2000-2001 California Statewide Travel Survey*), and it is these trips that can be considered as possible auto trips reduced. Finally, this number was multiplied by 0.65 to estimate the growth in bicycle trips from construction of the bike facility. Sixty-five percent represent the average growth in bike trips from a new bike facility, as observed in before and after data for bike projects (Source: U.S. DOT (1994), *A Compendium of Available Bicycle and Pedestrian Trip Generation Data in the United States*). Benefits are scaled to reflect differences in project structure, length, traffic intensity, community size, and proximity of activity centers. The scale has been adapted from a method developed by Dave Burch of the Bay Area Air Quality Management District (BAAQMD).

A = Adjustment factor for ADT (auto trips replaced by bike or pedestrian trips). The adjustment factor is based on a lookup table of project length and AADT.

C = Credit for number of activity centers within one-quarter mile of the pedestrian project and one-half mile of the bike project.

2.6 BIKE/PEDESTRIAN AND TRANSIT

Overview and Project Types

This approach evaluates all bike and pedestrian infrastructure improvements that provide increased nonmotorized accessibility to transit. Projects can be evaluated individually for bike or pedestrian facilities, or combined. The approach and rules for inputs are similar to those used in the bike/pedestrian project-type methodology, but also include additional factors to estimate the effect of the interaction of nonmotorized infrastructure improvements with existing transit facilities.

Pedestrian and bicycle facilities can reduce GHG emissions when auto trips are replaced by walking and biking to transit stations. The methodology estimates the annual number of vehicle trips reduced, and the annual auto VMT reduced to approximate the GHG reduction associated with pedestrian and bike improvements at and around transit stations.

Methodology Limitations

The approach does not completely account for all elements of pedestrian bridges or multiuse facilities/greenways in exclusive ROW; however, these can be tested with careful consideration of inputs. In these cases, the total travel demand between the facility start point and end point, or an estimate of total walk or bike access trips to the transit stop or station can be entered in lieu of ADT.

The approach does not test potential mode shifts to nonmotorized and transit modes as a result of complete street elements (e.g., benches, lighting, improved buffers); traffic-calming strategies; transit station design elements, such as a bike station; employer-based strategies (e.g., bike lockers, showers); or improved transit amenities.

User-Defined Inputs

The methodology requires the set of project-specific, user-defined inputs presented in Table 2.8.

Table 2.8 Bike/Pedestrian and Transit Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
Project Type		• Select from bike, pedestrian, or bike + pedestrian.
ADT on the parallel arterial		• Enter average weekday passenger vehicle traffic on nearest parallel roadway.
Length of project (miles)		• Enter total length of the bike/pedestrian project.
Average length of bicycle trips (miles)	1.8	• Enter estimated average length of bicycle trips in the area; leave blank if a pedestrian project only. • Default value (1.8 mi) is based on 2001 NHTS statistics, excluding purely recreational trips.
Average length of pedestrian trips (miles)	0.5	• Enter estimated average length of pedestrian trips in the area; leave blank if bike project only. • Default value (0.5 mi) is based on 2001 NHTS statistics, excluding purely recreational trips
Average length of transit trips (miles)	5.2	• Enter estimated average length of transit trips in the area. • Default value based on the American Public Transportation Association (APTA) 2009 Factbook,[10] Table 7 (Bus = 3.9 mi; Commuter Rail = 24.3 mi; Heavy Rail = 4.7 mi; Average = 5.2 mi).
Number of activity centers within ½ mile of project		• Select appropriate number of activity centers. • Activity center examples include banks, churches, hospitals, park-and-ride, office parks, library, shopping, and schools.
Within 2 miles of a university or college (Y/N)?		• Select "Y" if any segment of project is within 2 miles of a university or college.
Area type		• Select from CBD, Urban, Suburban, Mountain, and Rural area types. • Definitions based on traffic analysis zone attributes and inherited from the SCAG travel demand model (see Appendix A).
Does project provide direct access to transit?		• Answer "Y" if any segment of project provides direct access to transit (station or bus stop).
Existing daily transit boardings		• Enter estimated total weekday boardings for all transit access points along project corridor.
Provides access to fixed guideway transit?		• Select "Y" if the segment provides direct access to fixed guideway transit.

[10] APTA (2009), *Public Transportation Factbook, 60th Edition*, American Public Transportation Association, accessed at http://www.apta.com/gap/policyresearch/Documents/APTA_2009_Fact_Book.pdf.

Methodology

The bike and pedestrian project approach follows the same procedures outlined in Section 2.6. The additional transit access element within this project approach is addressed through a lookup table quantifying the increase in transit trips, based on type of access and area type (two percent for improved access to bus; four percent for improved access to fixed guideway).

The source for increases in transit trips is the Transit Cooperative Research Program (TCRP) Report 95, *Traveler Response to Transportation System Changes, Chapter 17 – Transit-Oriented Development (TOD)*, which summarizes travel mode shifts of residents upon relocation into TODs. The TCRP report specifically references California results based upon a 2003 study by Lund, Cervero, and Willson.[11] The shift to transit was larger for residents along the Bay Area Rapid Transit District (BART) heavy-rail system (4.2 percent) than for TOD survey respondents statewide (1.8 percent). These results indicated a reasonable estimate for percent increases as a result of improved accessibility: two percent for bus trips and four percent for fixed guideway trips. Results from the *TCRP Report 95* sources are assumed to approximate responses in high-density areas. Increase percentages in suburban, mountain, and rural areas are based on VMT per capita relationships by population density from the 2001 NHTS (see Tables 2.9 and 2.10).

Table 2.9 Increase in Transit Trips by Area Type and Transit Mode

Area Type	Bus	Fixed Guideway
CBD/Core	2.0%	4.0%
Urban	2.0%	4.0%
Suburban	1.6%	3.2%
Mountain	1.4%	2.8%
Rural	1.4%	2.8%

Source: NHTS (2001).

Table 2.10 VMT per Capita by Area Type

Area Type	Population Density People per Square Mile (ppsm)	Annual VMT Per Capita
Mountain/Rural	0– – 499	11,818
Suburban	500 -1,999	10,435
Urban	2,000– – 3,999	9,678
Urban	4,000– – 9,999	8,285
CBD/Core	10,000+	4,639

Source: 2001 NHTS.

Auto trips reduced by bike, walk, and transit modes are translated into VMT based on average bike, walk, and transit trip lengths. The methodology uses default average trip lengths based on the NHTS and APTA *2009 Factbook* data, but can be replaced with user-defined, local-specific data.

For a description of the methodology for calculating reduced auto trips resulting from the project, see Section 2.6.4. The calculation for transit trips is detailed below. Trip reductions are equated to VMT savings based on average bike, walk, and transit trip lengths. VMT reductions are calculated separately for all modes on a daily scale, and then summed together and annualized (assuming a factor of 250 days). For the GHG emissions calculation approach, see Section 4.0.

$$\text{Daily auto trips reduced}_{(\text{transit})} = B_{(\text{project corridor})} * I_{(\text{area type \& mode})}$$

B = Daily transit boarding for all transit access points along bike/pedestrian project corridor; and

I = Percent increase in transit trips as presented in Table 2.9.

2.7 TRANSIT EXPANSION

Overview and Project Types

Transit expansion projects can cause shifts from auto travel, resulting in reductions in VMT and thus GHG emissions. The methodology assumes that, per passenger mile, all modes of transit, including buses, emit less CO_2 than an average occupancy light-duty vehicle trip.

This methodology estimates the emission reduction benefits of transit amenities, such as real-time transit arrival information or decreased out-of-vehicle travel times due to increased frequency of service (or reducing headways) and fleet expansions.

Methodology Limitations

This method is not applicable to new transit routes in areas without existing transit services. The evaluation design is tailored to "typical" CMF-eligible projects (e.g., purchasing new buses, headways, stop amenities, traveler info). Improvements such as service extensions; new corridors; new stations; general enhancement of transit amenities (stops, sidewalks, benches); transit signal priority; queue jumper lanes; or bus rapid transit (BRT) are beyond the scope of this analysis.

User-Defined Inputs

The methodology requires the set of project-specific, user-defined inputs presented in Table 2.11.

Table 2.11 Transit Expansion Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
Average peak-period headway before improvements (mins)		• Enter average peak-period headway (minutes) before the project (2010)
Average peak-period headway after improvements (mins)		• Enter average peak-period headway (minutes) after the project (2020)
Does project include real-time arrival information?		• Select "Y" if project involves real-time arrival information
Existing (2010) project corridor transit travel time (mins)		• Enter average time it takes transit to travel the affected corridor (average can be for one route or across multiple routes)
Average peak-period transit ridership (2010) affected by improvements		• Enter average peak-period transit ridership affected by improvements (2010)

Methodology

The approach calculates the increase in transit ridership resulting from a change in headways using elasticities reported in the TCRP Report 95.[12] The methodology applies an average headway elasticity of +0.5. In other words, for each 1-percent decrease in headways, a corresponding 0.5-percent increase in

[12] TCRP 95c9 (2004), *TCRP Report 95, Chapter 9– – Transit Scheduling and Frequency*, Transportation Research Board, on-line at: http://onlinepubs.trb.org/onlinepubs/tcrp/tcrp_rpt_95c9.pdf.

ridership occurs. This elasticity is derived from an average effect observed on multiple bus transit systems in urban areas across the U.S. CS performed a validation using coefficients in SCAG's mode choice model, and arrived at a comparable elasticity for changes in headways in Southern California.

The TCRP Report 95 references case studies for Santa Clarita Transit in the mid-1990s and Santa Monica Municipal Bus Lines in 1998 that suggest the region-specific headway elasticity may be higher– – from +0.8 to +1.1. However, the current calculation framework maintains the more conservative +0.5 elasticity assumption.

The equation to calculate the change in ridership and resulting decrease in weekday light-duty VMT is as follows:

$$VMT = \frac{(\Delta H \times e_h \times R)}{AVO} \times TL$$

Where:

VMT = Reduction in daily light-duty VMT;

ΔH = Percent change in headways due to improvement;

e_h = Headway elasticity (-0.5);

R = Existing ridership impacted improvement;

AVO = Average passenger vehicle occupancy; and

TL = Average passenger vehicle trip length.

The methodology also accounts for the impact of real-time transit arrival information, which is based on an average travel time reduction as a result of real-time transit information. The 1995 NHTS indicated that transit wait times represent 22 percent of total transit trip time (or 10 minutes) on average (This was also validated through evaluation of the 2001 NHTS.).[13] The methodology assumes that the presence of real-time transit arrival information allows users to reduce average wait times by approximately 50 percent, resulting in a 10-percent reduction of overall travel time.

$$VMT = \frac{(\Delta T \times e_t \times R)}{AVO} \times TL$$

Where:

VMT = Reduction in daily light-duty VMT;

ΔT = Percent change in travel time due to real-time arrival info (10 percent);

[13]CUTR (1998), Public Transit in America: Findings from the 1995 Nationwide Personal Transportation Survey, Center for Urban Transportation Research, Table 4-13.

et = Travel time elasticity (+0.23);[14]

R = Existing ridership impacted improvement;

AVO = Average passenger vehicle occupancy; and

TL = Average passenger vehicle trip length

The reduction in GHG caused by shorter headways is offset somewhat by the addition of transit revenue miles that generate CO_2 emissions. The increase in total corridor transit revenue miles is estimated via the change in total number of daily buses multiplied by transit corridor length.

2.8 PARK-AND-RIDE

Overview and Project Types

Increasing parking capacity at transit stations reduces emissions by encouraging single-occupant vehicle drivers to shift to transit for a proportion of their commute trip.

This method is applicable for new or existing parking lots providing park-and-ride access to transit. The projects can include both expansions of existing parking facilities adjacent to transit. The user-defined type of transit station (urban rail, commuter rail, BRT/express bus, or transit center) determines the share of additional parking lot users that are new transit riders. This factor is combined with a parking lot utilization factor to estimate reduced vehicle trips as a result of the parking expansion.

Methodology Limitations

This methodology is not designed to estimate the impact of a new parking facility associated with a new transit station. The station must be existing with some level of existing parking available, but any type of existing parking (public, private, or shared) or type of transit station can be accommodated.

User-Defined Inputs

The methodology requires the set of project-specific, user-defined inputs presented in Table 2.12.

[14]VTPI (2010), *Transportation Elasticities: How Prices and Other Factors Affect Travel Behavior*. Victoria Transport Policy Institute, May 3, 2010.

Table 2.12 Park-and-Ride Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
Transit station type		• Select from urban rail, commuter rail, BRT/express bus, transit center, or other.
Additional parking added by 2020		• Enter number of new parking spaces (by expansion of an existing lot or a new lot).
Average auto trip length (miles)	15	• Enter average commute distance traveled by autos in the area. • 15 miles is the default option, based on 2009 NHTS data for the Los Angeles-Riverside-Orange County MSA.[15]
Average weekday parking lot utilization	95%	• Enter post-parking expansion expected average weekday utilization expected • Default value, 95% parking occupancy, is the assumed utilization in MTA's Gold Line Draft Environmental Impact Statement (DEIS)[16]; • Other input guidance by transit station type: 77% for Metrolink (the midpoint of the 70-85% range for commuter rail reported in TCRP 95, Ch.3), 65% for BRT/Express Bus; and 50-60% for urban bus systems/shared use facilities.[17]
Average auto access trip length (miles)	5	• Enter the average distance traveled by vehicles accessing the park-and-ride lot. • 5 miles is the default option. As a reference, per TCRP Report 95 (2004), 80% of trips to a park-and-ride facility travel less than 10 miles. Given the density of transit service in LA County, an average drive to park-and ride of less than 10 miles is reasonable for this application.
Parking lot usage	Weekdays	• Select from weekdays (250 days per year) and everyday (365 days per year)

Methodology

The approach calculates the CO_2 emissions reductions from added parking capacity at transit stations as a result of new transit riders shifting from the private vehicle mode. The calculation of the VMT reduction is tied to a combination of user-defined inputs, as presented in Table 2.12. In addition, the percentage of new transit riders utilizing park-and-ride lots is assumed to be 37 percent, pursuant to data collected for the Metro Gold Line Foothill Extension environmental documents.[18]

The calculated VMT reduction is only applied to the portion of the trip length that shifts from auto to transit. Default average auto commute trip lengths and auto access to park-and-ride trip lengths are assumed to be 15 and 5 miles, respectively (see Table 2.12 for references). However, users may substitute unique corridor- or subregion-specific average auto trip length and auto access to parking trip lengths.

The volume of new transit riders utilizing the expanded park-and-ride lot capacity is estimated by multiplying the new parking spaces by the parking lot utilization, and by the percent of new riders using the park-and-ride lots (37 percent).[19] This new rider estimate is multiplied by the average round trip distance, excluding auto access, to obtain a daily VMT reduction for the project. The daily VMT reduction is calculated as follows:

$$VMT = \frac{(TL_1 - TL_2)}{2} \times (P \times U * NR_m)$$

Where:

VMT = Reduction in daily light-duty VMT;

TL_1 = Average auto trip length;

TL_2 = Average auto access to PNR trip length;

P = Total added parking spaces;

U = Average parking lot utilization; and

NR_m = Percentage of new transit riders using park and ride lot (37 percent).

2.9 MANAGED LANES

Overview and Project Types

The emissions reduction for transit managed lanes projects is calculated based on the benefit of: 1) decreased travel time on ridership, and 2) increased bus transit speed on GHG emissions per mile.

[15] NHTS (2009), *National Household Travel* Survey, data available at: http://nhts.ornl.gov/tools.shtml,

[16] MTA (2004), *Gold Line Phase II– – Pasadena to Montclair– – Foothill Extension DEIS/DEIR*, Los Angeles County Metropolitan Transportation Authority, pp. 3-15-87.

[17] TCRP 95c3 (2004), *TCRP 95, Chapter 3– – Park and Ride/Pool*, Transportation Research Board, http://onlinepubs.trb.org/onlinepubs/tcrp/tcrp_rpt_95c9.pdf.

[18] FTA (2003), *Metro Gold Line East Side Extension, Pending Full-Funding Grant Agreement*, Federal Transit Administration. www.fta.dot.gov/documents/LA_Metro1AA.doc.

[19] Per TCRP 95c3 (2004), the percent of new riders using park-and-ride lots varies from 20 to 75 percent nationwide. Per FTA (2003), 37 percent of ridership are new riders.

The El Monte busway project assumes new ramp access to an existing managed lane facility. This project approach evaluates the benefit of switching a portion of an existing bus transit corridor operating in general purpose lane traffic to a managed lane as a result of new ramp access points.

Methodology Limitations

The methodology does not consider any inputs or emission impacts regarding change in corridor transit service (headways or route alignment), any mode shifts from single-occupancy vehicle (SOV) to HOV as a result of new managed lane capacity, or a general reduction in corridor delay resulting from overall improved flow. While there are expected GHG emission impacts resulting from these outcomes of managed lane projects, at this point, the benefit to existing transit is the only outcome considered per the currently proposed list of CMF projects.

User-Defined Inputs

The methodology requires the set of project-specific, user-defined inputs presented in Table 2.13.

Methodology

The user-defined inputs presented in Table 2.13 describe characteristics of the managed lane (restrictions, AADT, and number of lanes) and the corridor transit service (travel time, total length, length on managed lane, peak and off-peak number of buses, and existing daily ridership).

These inputs are combined with default transit-related factors, such as the elasticity of transit ridership with respect to travel time. Managed lane capacity and free-flow speed assumptions come from the same speed and capacity lookup table used in the roadway capacity methodology.

Table 2.13 Managed Lane Project User-Defined Inputs

User-Defined Input	Default Values	Input Guidance
Managed lane restrictions		• Select the appropriate managed lane restriction: 1) bus only, 2) HOV, or 3) HOV + high-occupancy toll (HOT)
Managed lane annual average daily traffic		• Enter the existing average daily traffic on the managed lane facility. • If restriction = 1, AADT = total daily buses; if 2, AADT = buses + HOV; if 3, AADT = buses + HOV + tolled SOV
Managed lane # of lanes (one-way)		• Enter number of managed lanes in a single direction (peak direction, if reversible lanes are in place)
Corridor total average travel time (min) (existing)		• Existing average travel time for the transit corridor (route start point to end point)
Total transit corridor length (mi)		• Enter transit corridor length (route start point to end point)
Corridor length on managed lane (mi)		• Enter total mileage of transit corridor proposed for operation on the managed lane
Daily # of peak buses (6:00-9:00 a.m., 3:00-:00 p.m.)		• Enter total number of peak-period buses
Daily # of off-peak buses		• Enter total number of off-peak-period buses
Daily corridor transit ridership affected by improvements		• Enter existing transit ridership in the affected transit corridor

Existing average speed on the transit corridor is calculated based on user-defined corridor length and travel time. Managed lane average peak speeds are estimated based on MTA model speed-volume curve equations, while off-peak speeds are assumed to represent free-flow conditions. Calculated speeds are reduced by 10 percent to reflect slightly lower transit vehicle operating speeds.

$$S_m = S0 / (1+1.5X^6)$$

Where:

S_m = Managed lane average peak transit speed

$S0$ = Managed lane free-flow speed (70 mph) * 0.9 (adjustment for transit vehicles); and

X = Peak-period volume/capacity.

Based on the changes in average speed and corridor distance on and off the managed lanes, improved total peak and off-peak travel times are calculated. The difference in travel time is applied to the transit ridership with respect to travel time elasticity (+0.23) to obtain an estimate of the increase in transit trips. Transit trips are converted to VMT savings based on average trip lengths and average vehicle occupancy.

$$VMT = \frac{(\Delta T \times e_t \times R)}{AVO} \times TL$$

Where:

VMT = Reduction in daily light-duty VMT;

ΔT = Percent change in travel time resulting from change in route alignment to managed lane;

e_t = Travel time elasticity (+0.23);[20]

R = Existing ridership impacted improvement;

AVO = Average passenger vehicle occupancy; and

TL = Average passenger vehicle trip length.

In addition, the change in average transit corridor travel speed is input into CO_2 emission factor lookup tables to estimate emission reductions resulting from more efficient travel conditions.

[20] VTPI (2010).

3.0 Other Project Types

Two project types entered in the July 2010 CMF project list were considered for inclusion within the tool, but were removed from the tool development process due to insignificant GHG reduction potential and questionable adherence to AB 1600 nexus requirements.

3.1 Corridor Improvement/Streetscape

These projects involve the installation of medians, new landscaping, street lighting, signage or pedestrian amenities (i.e., benches, trash cans). It is not clear how median installation would positively affect speed or travel time in a way that substantially impacts GHG emissions. Conventionally, installation of a median reduces speeds and reduces truck traffic in urban settings– – commonly due to the difficulty in navigating around the barriers. While the other elements within this project category may lead to increased walking, biking, or transit research, the literature is not conclusive on the level of impact. Benefits of improved bike, pedestrian, and transit infrastructure are included in other project types within the tool.

3.2 Roadway Upgrade

A national comparison of speed study results for individual resurfacing sites found that the differences in mean speed before and after resurfacing ranged from an increase of 7 mph to a decrease of 4 mph, with an average of 1 mph increase. The differences in 85th percentile speed ranged from an increase of 6 mph to a decrease of 4 mph; also with an average difference of 1 mph.[21] These findings suggest negligible potential for reducing regional GHG emissions through resurfacing.

[21] NCHRP (2003), *NCHRP Report 486: Systemwide Impact of Safety and Traffic Operations – Design Decisions for 3R Projects*, National Cooperative Highway Research Program.

4.0 GHG Emission Calculations

4.1 EMFAC CO_2 Emission Factor Lookup Tables

The CARB's EMFAC model was used to calculate CO_2 emission factors by speed and vehicle type. EMFAC is the official emissions model for California, and is currently being used by SCAG for SB 375 analysis. Since EMFAC does not consider the recently implemented Pavley I clean car standards or the Low Carbon Fuel Standard (LCFS) in California, adjustments were made after the EMFAC runs were completed.[22] CARB has created a post-processor for EMFAC that adjusts for these new standards, but it does not accept emission factors by speed. Therefore, the adjustments were made manually in an Excel sheet.

The following steps summarize the assumptions supporting the EMFAC runs and the outputs post-processed to provide CO_2 emission factors by speed and vehicle type:

1. Run EMFAC using the following parameters:
   a. Los Angeles County;
   b. Calculation Method: Use Average;
   c. Calendar Years: 2010, 2020, and 2030;
   d. All model years;
   e. All vehicle classes;
   f. Default I/M program schedule;
   g. Burden Inventory Output;
   h. Detailed Planning Inventories (CSV);
   i. Provide detail for model years, tech groups, and speed; and
   j. Speed Categories: 5 mph.
2. Summarize CO_2 running emissions inventory by calendar year, vehicle type, tech group (selecting only total for each speed category), and model year.
3. Summarize VMT by calendar year, vehicle type, tech group (selecting only total for each speed category), and model year.

[22] The regional per capita emissions reduction targets set by CARB do not include emissions reductions resulting from Pavley I or LCFS.

LA MTA Congestion Mitigation Fee Tool - GHG Emissions Calculator

4. Divide each CO_2 inventory number by each VMT number to obtain CO_2 emission factors. Multiply by 907,184.74 grams per ton to convert from tons per mile to grams per mile.
5. Apply Pavley reduction factors to appropriate vehicle types and model years, as specified in CARB's User's Guide for the Pavley I + LCFS Post-Processor.[23]
6. Calculate composite emission factor for all model years by using a VMT-weighted average.
7. Apply an adjustment factor for the LCFS to the composite emission factor using the reduction factors found in CARB's User's Guide for the Pavley I + LCFS Post-Processor.[24]
8. Final CO_2 emission factors are provided in grams per mile by speed and vehicle type.

Since EMFAC does not provide idling emission rates in grams per hour, these were approximated by using emission rates for 3 mph. These were calculated in EMFAC using the same method, as described above; however, at the end the gram per mile emission rates are multiplied by 3 miles per hour to convert to grams per hour.

All metric units were subsequently converted to pounds (lbs).

Table 4.1 presents the lookup tables used in the emissions calculator tool. Results by vehicle type are aggregated into three primary vehicle types for the emissions calculation lookups by project type. The aggregation of emissions factors are based on a weighting by VMT by speed by vehicle type. The aggregation process by vehicle type combines the following vehicle types:

- Light-duty passenger cars: LDA, LDT1, LDT2, and MCY; and
- All trucks: HHD, LHD1, LHD2, MDV, and MHD.

The aggregation process works the same for 2010, 2020, and 2030. Ultimately, the 2020 emissions factors are applied in the emission reduction calculations in the tool. The 2020 emission factors are presented in Table 4.1 by 5 mpg speed increments (the emission reduction calculations use each 1 mph increments).

[23] CARB (2010), *Pavley I + Low Carbon Fuel Standard Postprocessor, Version 1.0 User's Guide*, California Air Resources Board, http://www.arb.ca.gov/cc/sb375/tools/pavleylcfs-userguide.pdf, Table 1.

[24] Ibid., Table 2.

Table 4.1 2020 CO_2 Emission Factors by Vehicle Type and Speed

	Vehicle Type		
	Light-Duty	Truck	Urban Bus
Speed	CO_2 grams/mile		
Idle (grams/hour)	2,724.96	5,197.15	7,081.33
5 mph	908.32	1,732.38	2,360.44
10 mph	675.38	1,383.41	2,217.43
15 mph	520.03	1,092.16	2,024.59
20 mph	415.75	896.14	1,908.85
25 mph	345.56	785.96	1,837.53
30 mph	297.38	718.25	1,793.02
35 mph	265.70	676.46	1,765.58
40 mph	247.89	680.79	1,749.82
45 mph	239.65	691.13	1,742.88
50 mph	239.63	676.64	1,743.56
55 mph	248.70	695.19	1,751.97
60 mph	266.66	744.09	1,769.58
65 mph	296.33	882.24	-
70 mph	310.31	919.65	-
Average VMT Weighted Speed	327.36	807.25	1,826.77

Note: All emission factors by speed are grams CO_2 per mile, except for idling, which is grams CO_2 per hour.

4.2 CO_2 Emission Reduction Calculation

Each project calculates a change in vehicle speed, delay, or VMT; and equates these results to a reduction in CO_2. Table 4.2 presents the output for each project type and a summary of the emissions calculation.

Table 4.2 CO_2 Emission Reduction Calculations by Project Type

Project Type	Project Performance Outputs	CO_2 Emissions Calculation
Roadway capacity	Change in peak-hour speed by vehicle type for project limit VMT	Emission factors (g/mi) for pre- and post-improvement speeds are multiplied by total VMT.
Interchange capacity	Change in average peak-hour speed by vehicle type for all ramp VMT, change in intersection hours of delay.	Emission factors (g/mi) for pre- and post-improvement speeds s multiplied by total VMT; and idle emission factor is multiplied by pre- and post-improvement intersection hours of delay by vehicle type.
Grade separation	Change in speed by vehicle type for project limit VMT, total reduction in delay resulting from removing queues at existing at-grade intersection.	Emission factors (g/mi) for pre- and post-improvement speeds is multiplied by total VMT; and idle emission factor is multiplied by pre- and post-improvement intersection hours of delay.
Intersection improvement	Change in average seconds of delay per vehicle by intersection approach	Idle emission factor is multiplied by pre- and post-improvement intersection hours of delay.
System operations	Change in corridor average speed resulting from decreased travel time	Emission factors (g/mi) for pre- and post-improvement speeds (average speed for entire corridor, including idling at signalized intersections) is multiplied by total VMT.
Bike/pedestrian	Reduction in VMT	Total reduction in VMT is multiplied by average VMT weighted speed light-duty vehicle emissions factor.
Bike/pedestrian and transit	Reduction in VMT	Total reduction in VMT is multiplied by average VMT weighted speed light-duty vehicle emissions factor. No additional emissions from transit are assumed (no change in service provision).
Transit expansion	Reduction in VMT	Total reduction in VMT is multiplied by average VMT weighted speed light-duty vehicle emissions factor; and additional transit revenue miles are multiplied by average urban bus VMT weighted speed emission factor.
Park-and-ride	Reduction in VMT	Total reduction in VMT is multiplied by average VMT weighted speed light-duty vehicle emissions factor. No additional emissions from transit are assumed (no change in service provision).
Managed lanes	Reduction in VMT, improvement in transit speeds	Total reduction in VMT is multiplied by average VMT weighted speed light-duty vehicle emissions factor; and emission factors (g/mi) for pre- and post-improvement urban bus speeds are multiplied by total transit miles.

5.0 Next Steps

Depending on the next steps in the evolution of the congestion mitigation fee program, there are a range of potential updates and enhancements to the web tool calculation methodologies as currently defined. The three most critical near term enhancements are:

1. **Expansion of the transit expansion project type.** The current approach is designed only to assess benefits of a combination of average corridor transit frequency adjustment or the deployment of real-time arrival information at transit stops. The scope of potential other transit improvements included within the CMF program suggests that a number of other options may be appropriate. These additional modules within the transit approach may include transit priority corridors/signal priority, new routes or circulator systems, transit vehicle replacements (i.e., diesel replaced with hybrid or other low emission technologies).
2. **Expansion of the system operations project type.** The current approach is constrained to assessing the benefits of corridor-specific signal synchronization projects. It does not represent the full scope of traditional system management projects/programs, particular corridor, subarea, or citywide ITS and ATMS applications, as currently defined in the congestion mitigation fee program list. An enhancement to this tool, or a completely new, separate approach, is a near-term priority in order to fill in this project gap.
3. **Expansion of the managed lanes project benefits calculation.** The current approach focuses exclusively on the GHG emission reductions resulting from rerouting a portion of a bus route onto an existing managed lane via construction of new access. As more information becomes available about this project type, it is possible that inclusion of an assessment of how new managed lane access points improve HOV access to new developments and results in mode shifts and potential travel timesavings should be considered. In addition, the existing tool could also be adjusted or combined with the transit tool to assess the benefits of bus-only lanes or BRT on major arterials.

In addition, the methodologies as currently constructed can report other project-related outputs, such as reduction in VMT and reduction in delay or vehicle hours of travel. These outputs could be reported through the web tool interface; or serve as the starting point for other critical project calculations, such as project-level cost-benefit assessments and reductions in criteria pollutant emissions.

Chief Executive Officer

September 22, 2010

Ms. Justine Block
Deputy Counsel
Southern California Association of Governments
818 W. 7th St., 12th Floor
Los Angeles, CA 90017

Subject: **Memorandum of Understanding C-0-1712**

Dear Ms. Block:

Enclosed please find one fully executed original copy of Memorandum of Understanding No. C-0-1712 between the Orange County Transportation Authority, Orange County Council of Governments, and The Southern California Association of Governments for your file.

If you should you have any questions, please contact me at (714) 560-5615.

Sincerely,

Carolina Coppolo
Manager, Contracts and Procurement
Contracts Administration
and Materials Management

Enclosure

MEMORANDUM OF UNDERSTANDING NO. C-0-1712

BY AND BETWEEN

ORANGE COUNTY TRANSPORTATION AUTHORITY

AND

ORANGE COUNTY COUNCIL OF GOVERNMENTS

AND

THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS

FOR ORANGE COUNTY SUSTAINABLE COMMUNITIES STRATEGY

THIS MEMORANDUM OF UNDERSTANDING (hereinafter referred to as "MOU") is entered by and between the Orange County Transportation Authority, (hereinafter referred to as "AUTHORITY"), the Orange County Council of Governments, (hereinafter referred to as "OCCOG"), and the Southern California Association of Governments, (hereinafter referred to as "SCAG"), collectively referred to as the "Parties."

RECITALS:

WHEREAS, Senate Bill 375 (Chapter 728, laws of 2008, "SB 375") requires SCAG to prepare a regional Sustainable Communities Strategy (hereinafter referred to as "SCS" or "Regional SCS") as part of SCAG's Regional Transportation Plan (RTP) to achieve goals for the reduction of greenhouse gas emissions from automobiles and light trucks in the SCAG region which comprises the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura;

WHEREAS, SB 375 allows AUTHORITY, as the county transportation commission for Orange County, and OCCOG, as a subregional council of governments for Orange County, to develop and submit to SCAG a subregional SCS for Orange County (hereinafter referred to as "Orange County SCS");

WHEREAS, as part of its implementation of SB 375, SCAG has developed and adopted a certain "Framework and Guidelines for the Subregional Sustainable Communities Strategy" (hereinafter

referred to as "Framework and Guidelines"), attached hereto as Exhibit "A" and incorporated herein by this reference.

WHEREAS, SCAG is required by SB 375 to include a subregional SCS in the regional SCS, to the extent consistent with state and federal law, including the SCS conducted by Orange County; and

WHEREAS, AUTHORITY, OCCOG and SCAG desire to enter into this MOU to demonstrate mutual commitments to prepare the Orange County SCS.

NOW, THEREFORE, the Parties enter into the following MOU with respect to the matters set forth herein:

1. This MOU establishes the roles, responsibilities, and requirements for AUTHORITY, OCCOG, and SCAG that are necessary to develop an Orange County SCS that shall be included in the regional SCS prepared by SCAG.

2. AUTHORITY and OCCOG shall prepare the Orange County SCS consistent with SCAG's adopted Framework and Guidelines, as attached hereto, to ensure that the region can successfully incorporate strategies within the Orange County SCS into the Regional SCS, and not inhibit the region from complying with SB 375

3. AUTHORITY and OCCOG agree to comply with the Milestones Schedule, attached hereto as Exhibit "B" and incorporated by this reference, and work with SCAG and the other subregions to ensure the successful delivery of a regional SCS by using the Deliverables Template, attached hereto as Exhibit "C" and incorporated herein by this reference as the primary template for developing a subregional SCS workplan. The Deliverables Template may be subject to change, based on direction from the SCAG Regional Council or Community, Economic and Human Development Policy Committee, and approval by OCCOG.

4. AUTHORITY shall prepare the transportation element of the Orange County SCS through AUTHORITY'S Long-Range Transportation Plan (LRTP). Such transportation element shall, at a minimum, identify a transportation network (i.e., list of transportation projects) to service the

transportation needs of Orange County, and describe transportation policies (e.g., Transportation Demand Management and Transportation System Management strategies).

5. OCCOG shall prepare the Orange County SCS, and use AUTHORITY'S LRTP as the transportation element of the Orange County SCS.

6. OCCOG and AUTHORITY are encouraged by SCAG to conduct a public participation process in developing the Orange County SCS, above and beyond the process required for the regional SCS required under Section 65080(b)(2)(D)-(E) of the California Government Code. Further, SCAG encourages OCCOG to develop a public participation plan, similar to SCAG's Public Participation Plan adopted in December 2009, for such purposes.

7. OCCOG and AUTHORITY agree to participate in all publicly noticed meetings, workshops, hearings, and other outreach activities organized in Orange County by SCAG at which the regional SCS or Orange County SCS is included on the agenda. All parties shall coordinate with one another during implementation of SCAG's public participation process in order to ensure broad public and stakeholder participation, and to avoid duplication of effort.

8. OCCOG and AUTHORITY shall retain and deliver to SCAG all documentation pertaining to the Orange County SCS from publicly noticed meetings, workshops, and hearings at which the Orange County SCS is included on the agenda. Such documentation shall include but is not limited to meeting notices, agendas, minutes, comments and responses to comments, sign-up sheets, handouts, and copies of power point presentations.

9. AUTHORITY, OCCOG, and SCAG acknowledge that population, housing, and employment estimates are being prepared by the Center for Demographic Research at California State University Fullerton through the Orange County Projection process and the 2012 RTP growth forecasting process (hereinafter referred to as the "OCP dataset"). SCAG agrees to use the OCP dataset as reviewed and approved by OCCOG, for the Regional SCS and the 2012 RTP; provided, that SCAG, in consultation with OCCOG, may make adjustments to the OCP dataset in order to ensure consistency with SCAG's 2012 RTP growth forecast.

10. AUTHORITY and Orange County local agencies shall provide SCAG with population, employment, and housing estimates in transportation analysis zone (TAZ) format consistent with the Orange County Transportation Analysis Model (OCTAM).

11. AUTHORITY agrees to incorporate new land use-transportation interactions into OCTAM, and these shall include, at a minimum, net residential and employment densities, jobs/housing diversity, design characteristics, and destination accessibility.

12. The Parties agree and acknowledge that population, housing, and employment data submitted to SCAG by OCCOG and AUTHORITY shall be accurately reflected in all documentation produced by SCAG that relates to the Orange County SCS and Regional SCS.

13. The Parties agree and acknowledge that RHNA responsibilities shall remain with SCAG, and neither AUTHORITY nor OCCOG shall assume delegation responsibility for RHNA as part of the Orange County SCS development. However, neither AUTHORITY nor OCCOG is precluded by this MOU from assuming delegation responsibility for RHNA as part of a subsequent, separate agreement.

14. SCAG agrees to accept AUTHORITY's LRTP as Orange County's program of transportation projects as input for the 2012 Regional Transportation Plan.

15 SCAG agrees to acknowledge that the Renewed Measure M program is exempt from SB 375 requirements, to the extent consistent with SB 375 and the final, adopted California Transportation Commission RTP guidelines.

16. SCAG agrees that in addition to preparation of the Orange County SCS developed under this MOU, development of an Alternative Planning Strategy (APS) by AUTHORITY and OCCOG is optional. This understanding shall not preclude SCAG from preparing a regional APS pursuant to SB 375.

17. SCAG shall not develop SCS related targets that are attributable to the subregions.

18. SCAG agrees that it will not impose a penalty on the Orange County subregion if the greenhouse gas targets, as established by the California Air Resources Board, are not met by the Regional SCS.

19. SCAG shall accept the Orange County SCS prepared in accordance with this MOU, as the Orange County subregion's input into the Regional SCS prepared by SCAG.

20. AUTHORITY, OCCOG, and SCAG shall separately amend this MOU in writing or develop a separate, mutual funding agreement addressing Orange County SCS costs should state or federal funding become available that can be applied toward preparation of the Orange County SCS.

21. AUTHORITY, OCCOG, and SCAG agree to work closely together throughout the regional SCS process and Orange County SCS process to provide technical input, applicable planning data, and constructive feedback with respect to all documents, products and deliverables developed and associated with the Orange County SCS.

22. The AUTHORITY, OCCOG, and SCAG agree to work together in good faith, using reasonable efforts to resolve any unforeseen issues and disputes arising out of the performance of this MOU.

23. The Parties agree in good faith to provide the resources necessary to implement the provisions of the MOU.

24. AUTHORITY, OCCOG, and SCAG agree to defend, indemnify and hold harmless the other parties, their Officers, agents, elected officials, and employees, from all liability, claims, losses and demands, including defense costs and reasonable attorneys' fees, whether resulting from court action or otherwise, arising out of the acts or omissions of the defending party, its officers, agents, or employees, in the performance of the MOU. When acts or omissions of one party are directed by another party, the party directing the acts or omission shall owe this defense and indemnity obligation to the agencies following the directions. The provisions of this paragraph shall survive termination of this MOU.

25. This MOU shall be governed by all applicable federal, state, and local laws. The signatories warrant that in the performance of this MOU, each shall comply with all applicable federal, state and local laws, statutes and ordinances and all lawful orders, rules and regulations promulgated there under.

26. This MOU may only be modified or amended upon written mutual consent of all signatories. All modifications, amendments, changes and revisions of this MOU in whole or part, and from time to time, shall be binding upon the parties, so long as the same shall be in writing and executed by the signatories.

27. This MOU, including all exhibits and documents incorporated herein and made applicable by reference, constitutes the complete and exclusive statement of the term(s) and condition(s) of the agreement between the parties and it supersedes all prior representations, understandings and communications. The invalidity in whole or part of any term or condition of this MOU shall not affect the validity of the other term(s) or condition(s).

28. Any party may withdraw from this MOU upon 30 days written notice to the other, until the due date set forth in Exhibit "B" for submittal to SCAG of the preliminary Orange County SCS. After such due date, any party may withdraw from this MOU only upon mutual written agreement by all Parties.

29. Each signatory shall be excused from performing its obligations under this MOU during the time and to the extent that it is prevented from performing by an unforeseeable cause beyond its control, including but not limited to: any incident of fire, flood; acts of God; commandeering of material, produces, plants or facilities by federal, state or local government; national fuel shortage; or a material act or omission by any other party; when satisfactory evidence of such cause is presented to the other parties, and provided further such nonperformance is unforeseeable, beyond the control and is not due to the fault or negligence of the party not performing.

30. Any notice sent by first class mail, postage paid, to the address and addressee, shall be deemed to have been given when in the ordinary course it would be delivered. The representatives of the parties who are primarily responsible for the administration of this MOU, and to whom notices, demands and communications shall be given are as detailed in Exhibit "D". If there are any changes in the names and/or addresses listed in Exhibit "D", the party desiring to make such changes shall give a written notice to the other respective parties within five (5) days of such change.

31. This MOU shall continue in full force and effect from the Effective Date up to and until the date that the Regional SCS is adopted by SCAG's Regional Council, unless otherwise terminated earlier in accordance with section 28 of this MOU. The Effective Date of this MOU shall mean the date (last date indicated below) that all parties have fully executed this MOU.

[Signature Page to follow.]

MEMORANDUM OF UNDERSTANDING NO. C-0-1712

IN WITNESS WHEREOF, the Parties hereto have caused this MOU No. C-0-1712 to be executed by their duly authorized representatives.

Exhibit A: SCAG's Adopted Framework and Guidelines

Southern California Association of Governments

(Approved by Regional Council - April 1, 2010)

FRAMEWORK AND GUIDELINES
for
SUBREGIONAL SUSTAINABLE COMMUNITIES STRATEGY

I. INTRODUCTION

SB 375 (Steinberg), also known as California's Sustainable Communities Strategy and Climate Protection Act, is a new state law which became effective January 1, 2009. SB 375 calls for the integration of transportation, land use, and housing planning, and also establishes the reduction of greenhouse gas (GHG) emissions as one of the main goals for regional planning. SCAG, working with the individual County Transportation Commissions (CTCs) and the subregional organizations within the SCAG region, is responsible for implementing SB 375 in the Southern California region. Success in this endeavor is dependent on collaboration with a range of public and private partners throughout the region.

Briefly summarized here, SB 375 requires SCAG as the Metropolitan Planning Organization to:

- Prepare a Sustainable Communities Strategy (SCS) as part of the 2012 Regional Transportation Plan (RTP). The SCS will meet a State-determined regional GHG emission reduction target, if it is feasible to do so.
- Prepare an Alternative Planning Strategy (APS) that is not part of the RTP if the SCS is unable to meet the regional target.
- Integrate SCAG planning processes, in particular assuring that the Regional Housing Needs Assessment (RHNA) is consistent with the SCS, at the jurisdiction level.
- Specific to SCAG only, allow for subregional SCS/APS development.
- Develop a substantial public participation process involving all stakeholders.

Unique to the SCAG region, SB 375 provides that "a subregional council of governments and the county transportation commission may work together to propose the sustainable communities strategy and an alternative planning strategy . . . for that subregional area." Govt. Code §65080(b)(2)(C). In addition, SB 375 authorizes that SCAG "may adopt a framework for a subregional SCS or a subregional APS to address the intraregional land use, transportation, economic, air quality, and climate policy relationships." *Id.* Finally, SB 375 requires SCAG to "develop overall guidelines, create public participation plans, ensure coordination, resolve conflicts, make sure that the overall plan complies with applicable legal requirements, and adopt the plan for the region." *Id.*

The intent of this Framework and Guidelines for Subregional Sustainable Communities Strategy (also referred to herein as the "Framework and Guidelines" or the "Subregional Framework and Guidelines") is to offer the SCAG region's subregional agencies the highest degree of autonomy,

A. SCAG's preliminary goals for implementing SB 375 are as follows:

- Achieve the regional GHG emission reduction target for cars and light trucks through an SCS.
- Fully integrate SCAG's planning processes for transportation, growth, intergovernmental review, land use, housing, and the environment.
- Seek areas of cooperation that go beyond the procedural statutory requirements, but that also result in regional plans and strategies that are mutually supportive of a range of goals.
- Build trust by providing an interactive, participatory and collaborative process for all stakeholders. Provide, in particular, for the robust participation of local jurisdictions, subregions and CTCs in the development of the SCAG regional SCS and implementation of the subregional provisions of the law.
- Assure that the SCS adopted by SCAG and submitted to California Air Resources Board (ARB) is a reflection of the region's collective growth strategy and vision for the future.
- Develop strategies that incorporate and are respectful of local and subregional priorities, plans, and projects.

B. Flexibility

Subregions may develop any appropriate strategy to address the region's greenhouse gas reduction goals and the intent of SB 375. While subregions will be provided with SCAG data, and with a conceptual or preliminary scenario to use as a helpful starting point, they may employ any combination of land use policy change, transportation policy, and transportation investment, within the specific parameters described in the Guidelines.

C. Outreach Effort and Principles

Subregions are required to conduct an open and participatory process that includes the fullest possible range of stakeholders. As further discussed within the Guidelines, SCAG amended its existing Public Participation Plan (PPP) to describes SCAG's responsibilities in complying with the outreach requirements of SB 375 and other applicable laws and regulations. SCAG will fulfill its outreach requirements for the regional SCS/APS which will include outreach activities regarding the subregional SCS/APS. Subregions are also encouraged to design their own outreach process that meets each subregion's own needs and reinforces the spirit of openness and full participation. To the extent that subregions do establish their own outreach process, this process should be coordinated with SCAG's outreach process.

D. Communication and Coordination

Subregions developing their own SCS are strongly encouraged to maintain regular communication with SCAG staff, the respective CTC, their jurisdictions and other stakeholders, and other subregions if necessary, to review issues as they arise and to assure close coordination. Mechanisms for on-going communication should be established in the early phases of strategy development.

E. Planning Concepts

SCAG, its subregions, and member cities have established a successful track record on a range of land use and transportation planning approaches through the on-going SCAG Compass Blueprint Program, including approximately 60 local demonstration projects completed to date. Subregions are

(viii.) allow the RTP to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506). Sec. Government Code §65080(b)(2)(B).

In preparing the subregional SCS, the subregion will consider feasible strategies, including local land use policies, transportation infrastructure investment (e.g., transportation projects), and other transportation policies such as Transportation Demand Management (TDM) strategies (which includes pricing), and Transportation System Management (TSM) strategies. Technological measures may be included if they exceed measures captured in other state and federal requirements (e.g., AB32)

As discussed further below (under "Documentation"), subregions need not constrain land use strategies considered for the SCS to current General Plans. In other words, the adopted strategy need not be fully consistent with local General Plans currently in place. However, should the adopted subregional strategy deviate from General Plans, subregions will need to demonstrate the feasibility of the strategy by documenting any affected jurisdictions' willingness to adopt the necessary General Plan changes.

The regional SCS shall be part of the 2012 RTP. Therefore, for transportation investments included in a subregional SCS to be valid, they must also be included in the 2012 RTP. Further, such projects need to be scheduled in the RTIP for construction completion by the target years (2020 and 2035) in order to demonstrate any benefits as part of the SCS. As such, subregions will need to collaborate with the respective CTC in their area to coordinate the subregional SCS with future transportation investments. It should also be noted that the California Transportation Commission is updating their RTP Guidelines. This topic is likely to be part of further discussion through the SCS process as well.

SCAG will accept and incorporate the subregional SCS, unless (a) it does not comply with SB 375, (b) it is does not comply with federal law, or (c) it is does not comply with SCAG's Subregional Framework and Guidelines. In the event that a compiled regional SCS, including subregional submissions, does not achieve the regional target, SCAG will initiate a process to develop and consider additional GHG emission reduction measures region-wide. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process. Furthermore, SCAG will compile and disseminate performance information on the preliminary regional SCS and its components in order to facilitate regional dialogue. The development of a subregional SCS does not exempt any subregion from further GHG emission reduction measures being included in the regional SCS. Further, all regional measures needed to meet the regional target will be subject to adoption by the Regional Council, and any additional subregional measures beyond the SCS submittal from subregions accepting delegation needed to meet the regional target must also be adopted by the subregional governing body.

(2) <u>Subregional Alternative Planning Strategy (APS)</u>

Subregions are encouraged to focus their efforts on feasible measures that can be included in an SCS. In the event that a subregion chooses to prepare an APS, the content of a subregional APS should be consistent with what is required by SB 375 (*see*, Government Code §65080(b)(2)(H)), as follows:

(i.) Shall identify the principal impediments to achieving the subregional SCS.

subregional SCS is not a "project" for the purposes of CEQA; rather, the 2012 RTP which will include the regional SCS is the actual "project" which will be reviewed for environmental impacts pursuant to CEQA. As such, the regional SCS, which will include the subregional SCSs, will undergo a thorough CEQA review. Nevertheless, subregions approving subregional SCSs should consider issuing a notice of exemption under CEQA to notify the public of their "no project" determination and/or to invoke the "common sense" exemption pursuant to CEQA Guidelines § 15061(b)(3).

Finally, in accordance with SB 375, subregions are strongly encouraged to work in partnership with the CTC in their area. SCAG can facilitate these arrangements if needed.

(5) Data Standards

SCAG is currently assessing the precise data standards anticipated for the regional and subregional SCS. In particular, SCAG is reviewing the potential use of parcel data and development types currently used for regional planning. At present, the following describes the anticipated data requirements for a subregional SCS.

1. Types of Variables
   Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables include land uses, residential densities, building intensities, etc, as described in SB 375.

2. Geographical Levels
   SCAG is considering the collection and adoption of the data at a small-area level as optional for local agencies in order to make accessible the CEQA streamlining provisions under SB 375. The housing unit, employment, and the land use variables can be collected at a small-area level for those areas which under SB 375 qualify as containing a "transit priority project" (i.e. within half-mile of a major transit stop or high-quality transit corridor) for purposes of allowing jurisdictions to take advantage of the CEQA streamlining incentives in SB 375.

   For all other areas in the region, SCAG staff will collect the population, household, employment, and land use variables at the Census tract or Traffic Analysis Zone (TAZ) level.

3. Base Year and Forecast Years
   The socio-economic and land use variables will be required for the base year of 2008, and the target years of 2020 and 2035.

(6) Documentation

Subregions are expected to maintain full and complete records related to the development of the subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board.

projects identified in the subregional SCS must also be included in the 2012 RTP in order to be considered as a feasible strategy. SCAG can help to facilitate communication between subregions and CTCs.

C. SCAG ROLES AND RESPONSIBLITIES

SCAG's roles in supporting the subregional SCS development process are in the following areas:

(1) Preparing and adopting the Framework and Guidelines

SCAG will adopt these Framework and Guidelines in order to assure regional consistency and the region's compliance with law.

(2) Public Participation Plan

SCAG will assist the subregions by developing, adopting and implementing a Public Participation Plan and outreach process with stakeholders. This process includes consultation with congestion management agencies, transportation agencies, and transportation commissions; and SCAG will hold public workshops and hearings. SCAG will also conduct informational meetings in each county within the region for local elected officials (members of the board of supervisors and city councils), to present the draft SCS, and APS if necessary, and solicit and consider input and recommendations.

(3) Methodology

As required by SB 375, SCAG will adopt a methodology for measuring greenhouse gas emission reductions associated with the strategy.

(4) Incorporation/Modification

SCAG will accept and incorporate the subregional SCS unless it does not comply with SB 375, federal law, or the Subregional Framework and Guidelines. As SCAG intends the entire SCS development process to be iterative, SCAG will not amend a locally-submitted SCS. SCAG may provide additional guidance to subregions so that subregions may make amendments to its subregional SCS as part of the iterative process, or request a subregion to prepare an APS if necessary. Further, SCAG can propose additional regional strategies if feasible and necessary to achieve the regional emission reduction target with the regional SCS. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process.

(5) Modeling

SCAG currently uses a Trip-Based Regional Transportation Demand Model and ARB's EMFAC model for emissions purposes. In addition to regional modeling, SCAG is developing tools to evaluate the effects of strategies that are not fully accounted for in the regional model. SCAG is also developing two additional tools – a Land Use Model and an Activity Based Model – to assist in strategy development and measurement of outcomes under SB 375.

Data/GIS maps will be provided to subregions and local jurisdiction for their review. This data and maps include the 2008 base year socioeconomic estimates and 2020 and 2035 socioeconomic forecast. Other GIS maps including the existing land use, the general plan land use, the resource areas, and other important areas identified in SB 375. It should be noted that none of the data/ maps provided were endorsed or adopted by SCAG's Community, Economic and Human Development Committee (CEHD). All data/maps provided are for the purpose of collecting input and comments from subregions and local jurisdictions. This is to initiate dialogue among stakeholders to address the requirements of SB 375 and its implementation.

The list of data/GIS maps include:

1. Existing land use
2. Zoning
3. General plan land use
4. Resource areas include:
   (a.) all publicly owned parks and open space;
   (b.) open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;
   (c.) habitat for species identified as candidate, fully protected, sensitive, or species of special status by local, state, or federal agencies or protected by the federal Endangered Species Act (1973), the California Endangered Species Act, or Native Plant Protection Act;
   (d.) lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts, or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code, and lands under Williamson Act contracts;
   (e.) areas designated for open-space or agricultural uses in adopted open-space elements or agricultural elements of the local general plan or by local ordinance;
   (f.) areas containing biological resources as described in Appendix G of the CEQA Guidelines that may be significantly affected by the sustainable communities strategy or the alternative planning strategy; and
   (g.) an area subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program or where the area is subject to more protective provisions of state law or local ordinance.
5. Farmland
6. Sphere of influence
7. Transit priority areas
8. City/Census tract boundary with ID
9. City/TAZ boundary with ID

(11) Tools

SCAG is developing a Local Sustainability Planning Model (LSPM) for subregions/local jurisdictions to analyze land use impact. The use of this tool is not mandatory and is at the discretion of the Subregion. The LSPM is a web-based tool that can be used to analyze, visualize and calculate the impact of land use changes on auto ownership, mode use, vehicle miles of travel (VMT), and greenhouse gas emissions in real time. Users will be able to estimate transportation and emissions impacts by modifying land use designations within their community.

11

Exhibit B: Milestones Schedule

The key milestones and related schedule required as part of the development of the Orange County Subregional SCS are as follows:

1. Status report on Preliminary Subregional SCS – Dec 2010
2. Adopted OCP 2010/Delivery to SCAG – Jan 2011
3. Preliminary SCS / for purposes of preparing PEIR project description (intended to be narrative only project description that describes intended strategies or strategy options that are likely to be incorporated into the final Subregional SCS.) –Feb 2011
4. Status report on Draft Subregional SCS – Feb 2011
5. Draft Subregional SCS (containing all components described above) to be incorporated into draft Regional SCS – April 2011
6. Status report on final Subregional SCS - April 2011
7. Final Subregional SCS for incorporation into Regional SCS – June 2011
8. Iterative process, if necessary to meet target – June to November 2011
9. OCCOG to participate in regional outreach conducted in Orange County – June 2011 to February 2012
10. Regional SCS adoption – April 2012

Exhibit C: Deliverables Template

The Orange County Subregional SCS will consist of the following components:

1. Database (OCP dataset) that allocates population, housing, household, and employment to areas of the county. Geographic area should be the smallest level practicable for the COG to produce, preferably at the parcel level. The database must reflect the base year 2008 and each variable in the two GHG target years (2020 and 2035), in accordance with the Data Standards set forth below.
2. A map or series of maps that illustrates the growth distribution described above, and that further delineates uses, intensities, and residential densities, in accordance with the Data Standards set forth below.
3. A listing of transportation projects that are incorporated in the subregional SCS.
4. A listing and description of transportation policies (e.g. TDM, TSM and others) to be employed.
5. Documentation that establishes the process, including the public participation and outreach process used to develop the SCS, and demonstrates the affected jurisdictions willingness to consider general plan changes.
6. A narrative description of the strategies employed to reduce greenhouse gas emissions. A further description of any other strategies that were considered and not ultimately included.

DATA STANDARDS

The following data standards will be used in the development of a subregional SCS:

1. Types of Variables

Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables may include land uses designations, building densities, building intensities, and applicable policies

2. Geographical Levels

Socio-economic and land-use variables should be provided to SCAG at the smallest geographical level practicable for OCCOG to produce, preferably at the parcel level. At a minimum, such variables will be provided at the Census tract or Traffic Analysis Zone (TAZ) level.

3. Base Year and Forecast Years

The socio-economic data and land use variables will be required for the base year of 2008, and as feasible, for the target years of 2020 and 2035.

DOCUMENTATION

Subregions are expected to maintain full and complete records related to the development of the Subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board. Subregions shall include information regarding the status of the documentation as part of the required status reports to SCAG, and copies of the actual documentation shall be submitted to SCAG as part the final Subregional SCS

Exhibit D: Notices

Notices, demands and communications between the Parties related to this MOU shall be provided to the following persons:

Orange County
Sustainable Communities Strategy (SCS)

Prepared for

Orange County Transportation Authority
Orange County Council of Governments

Prepared by

BURKE CONSULTING

LSA
LSA ASSOCIATES, INC.

ORANGE COUNTY
BUSINESS COUNCIL

June 14, 2011

ACKNOWLEDGEMENTS

In early 2010, a joint committee with equal representation from the Orange County Council of Governments (OCCOG) and the Orange County Transportation Authority (OCTA) was formed to develop the Orange County Sustainable Communities Strategy (OC SCS). The OCCOG/OCTA SCS Joint Working Committee led overall efforts to develop a subregional OC SCS to meet the requirements of SB 375 and the mutual agreements with the Southern California Association of Governments (SCAG) with a plan that all local jurisdictions in Orange County could support. The SCS Joint Working Committee provided a forum for stakeholders to engage in the process along with direction and recommendations to the full OCCOG Board of Directors as the OC SCS was being developed.

The SCS Joint Working Committee was advised at a technical level by Orange County jurisdictions through the OCCOG Technical Advisory Committee (OCCOG TAC) comprised of staff from all OCCOG member agencies. In addition, David Simpson, OCCOG Executive Director, provided direction and support to the full board, the OCCOG/OCTA Joint SCS Working Committee, consultants and community stakeholders throughout the development of the OC SCS.

As a result of this collaborative effort, the OC SCS was adopted unanimously by the OCTA and OCCOG Boards of Directors in June of 2011.

The following OC SCS Joint Committee Members are recognized for their significant contributions in the development of the OC SCS:

OCCOG/OCTA SCS Joint Working Committee

Kris Murray, Chairwoman, Anaheim City Council Member, OCCOG Board Member

Carolyn Cavecche, Vice Chairwoman, Mayor of Orange, OCTA Director

Patricia Bates, Orange County Supervisor, OCTA Chairwoman

Peter Herzog, Mayor of Lake Forest, OCTA Director and OCCOG Chairman

Brett Murdock, Brea City Council Member, OCCOG Board Member

Sharon Quirk Silva, Fullerton City Council Member, OCCOG Board Member

Former Joint SCS Working Committee Members

Cheryl Brothers, Fountain Valley City Council Member, OCCOG Board Member

Peter Buffa, OCTA Director and past Chairman

Richard Dixon, former Lake Forest City Council Member, OCTA Director and OCCOG Board Member

Paul Glaab, City of Laguna Niguel Council Member, OCTA Director

OCCOG TAC Leadership

Marika Modugno, Chair, City of Irvine

Greg Nord, Vice Chair, OCTA

Tracy Sato, City of Anaheim

Deborah Diep, Center for Demographic Research, CSU Fullerton

Gail Shiomoto-Lohr, City of Mission Viejo

Art Bashmakian, City of Westminster

Jay Saltzberg, City of Buena Park

EXECUTIVE SUMMARY

In 2008, California State Senate Bill 375 (SB 375) was enacted to reduce greenhouse gas (GHG) emissions from automobiles and light trucks through integrated transportation, land use, housing and environmental planning. To achieve the goal of reduced GHG emissions, the legislation requires Metropolitan Planning Organizations (MPOs) throughout the state to include a new element in their Regional Transportation Plans (RTPs) called a Sustainable Communities Strategy (SCS).

The Southern California Association of Governments (SCAG) is the MPO encompassing the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. They prepare the RTP for the SCAG region, with input from each of the counties and county transportation commissions. SCAG is also responsible for developing the Sustainable Communities Strategy for the SCAG Region, known as the SCAG Regional SCS.

However, in the SCAG region, SB 375 also allows for a subregional council of governments and county transportation commission to work together to propose a subregional SCS. As one of these subregions, Orange County has availed itself of this opportunity to prepare its own *subregional* SCS (OC SCS). As long as the OC SCS follows the requirements of SB 375, SCAG will incorporate it into the SCAG Regional SCS.

The following document constitutes the OC SCS. It was prepared by the Orange County Council of Governments (OCCOG) and the Orange County Transportation Authority (OCTA), in collaboration with multiple Orange County stakeholders including city agencies, the County of Orange, County special districts, OCTA, the Center for Demographic Research (CDR), the California Department of Transportation (Caltrans), Transportation Corridor Agencies, and many community organizations and the public.

The OC SCS begins with the setting of current population, housing, and employment in Orange County, and then describes projected long-term trends for these socio-economic variables. The resulting assessment is this: a majority of Orange County's projected growth of population, housing, and employment will occur near existing and future job centers, which will positively impact transportation patterns and therefore be beneficial to GHG emission reductions.

The projected growth in Orange County housing units will be sufficient to house the anticipated population growth in the subregion. Further, Orange County will create housing to accommodate employment growth during this period.

Because there is an indisputable interconnectedness between Orange County's population, housing and employment and the transportation systems that support them,

the OC SCS also delineates the foundational transportation systems that currently exist in Orange County. Transportation systems described include freeways, arterial streets and local roads, rail and bus transit, bikeways, and demand responsive services and transportation demand management.

Central to the OC SCS are the strategies identified to reduce GHG emissions. These strategies illustrate that there is already a collective effort by many Orange County jurisdictions, agencies, and groups to link transportation and land uses through a variety of processes and an array of progressive measures. The strategies outlined in the OC SCS and summarized below are collectively called sustainability strategies, and include both land use-related strategies and transportation system improvements.

Sustainability Strategies

✓	Support transit-oriented development.
✓	Support infill housing development and redevelopment.
✓	Support mixed-use development and thereby improve walkabilty of communities.
✓	Increase regional accessibility in order to reduce vehicle miles traveled.
✓	Improve jobs-to-housing ratio.
✓	Promote land use patterns that encourage the use of alternatives to single-occupant automobile use.
✓	Support retention and/or development of affordable housing.
✓	Support natural land restoration and conservation and/or protection offering significant carbon mitigation potential via both sequestration and avoidance of increased emissions due to land conversion.
✓	Eliminate bottlenecks and reduce delay on freeways, toll roads, and arterials.
✓	Apply Transportation System Management and Complete Street practices to arterials and freeways to maximize efficiency.
✓	Improve modes through enhanced service, frequency, convenience, and choices.
✓	Expand and enhance Transportation Demand Management practices to reduce barriers to alternative travel modes and attract commuters away from single occupant vehicle travel.
✓	Continue existing, and explore expansion of, highway pricing strategies.
✓	Implement near-term (Transportation Improvement Program and Measure M2 Early Capital Action Plan) and long-term (LRTP 2035 Preferred Plan) transportation improvements to provide mobility choices and sustainable transportation options.
✓	Acknowledge current sustainability strategies practiced by Orange County jurisdictions and continue to implement strategies that will result in or support the reduction of GHG emissions.

In summary, Orange County is engaged in a collective effort to link transportation and land uses. This effort includes a variety of progressive measures undertaken by Orange

County jurisdictions, agencies, and groups that lead to changes in the use of automobiles and light duty trucks, resulting in reductions in GHG. The scope of current and planned strategies is broad and encompasses significant investment by both the public and private sectors to implement them. They include the following:

- Promoting a land use pattern that accommodates future employment and housing needs.
- Using land in ways that make developments more compact and improves linkages among jobs, housing and major activity centers.
- Protecting natural habitats and resource areas.
- Implementing a transportation network of public transit, managed lanes and highways, local streets, bikeways, and walkways built and maintained with available funds.
- Managing demands on the transportation system (TDM) in ways that reduce or eliminate traffic congestion during peak periods of demand.
- Managing the transportation system (TSM) through measures that maximize the efficiency of the transportation network.
- Utilizing innovative pricing policies to reduce vehicle miles traveled and traffic congestion during peak periods of demand.

These strategies and actions are Orange County's contribution to the region's efforts to achieve both 2020 and 2035 GHG thresholds established by CARB.

INTRODUCTION

BACKGROUND

SB 375 was enacted in 2008 to reduce greenhouse gas (GHG) emissions from automobiles and light trucks through integrated transportation, land use, housing and environmental planning. To achieve the goal of reduced GHG emissions, the legislation requires MPOs throughout the state to include a new element in their RTPs called an SCS. Specific to the SCAG region, SB 375 also allows for a subregional council of governments and county transportation commission to work together to propose a subregional SCS.

When SB 375 was enacted, it set in motion several activities related to regional and local planning for transportation and land use. The legislation focused attention on the relationship that land use and transportation have on one another relative to how people choose to move around the region, which in turn affects GHG emissions that result from those choices. SB 375 established new processes and procedures for land use and transportation planning that are intended to ensure that opportunities for the synergy between land use and transportation will result in a reduction of GHG emissions from passenger cars and light duty trucks.

THE REGIONAL TRANSPORTATION PLAN

Each urbanized area in California with a population of 50,000 or more has a designated regional planning organization called an MPO. MPOs prepare and regularly update an RTP, a long-range planning document that details the transportation plans, policies, projects, and related funding necessary to address the transportation needs of the region.

SCAG is the MPO encompassing the Counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The SCAG region appears in Figure 1. SCAG prepares the RTP for the SCAG region, with input from each of the counties and county transportation commissions. OCTA prepares a county-level Long Range Transportation Plan (LRTP) that offers input into SCAG's RTP. Like the RTP, the LRTP analyzes the trends in Orange County related to population, housing, employment, and transportation, and sets forth a comprehensive plan for transportation projects and programs to meet the

County's transportation needs. SB 375 requires that the RTP for each region include a new planning element, the SCS, to be developed by the region's MPO.

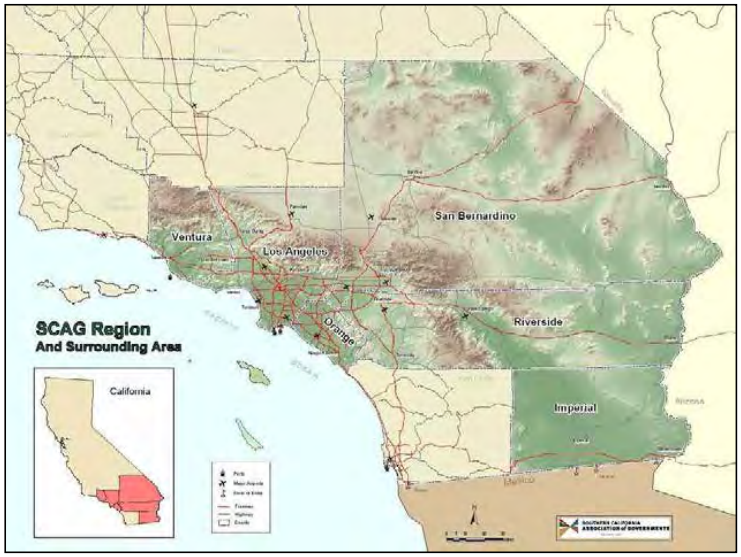

Figure 1: SCAG Region and Surrounding Area

SUSTAINABLE COMMUNITIES STRATEGY

As mentioned earlier, one of the key items established by SB 375 is a new planning element, the SCS, to be developed for inclusion in each region's RTP by its MPO, with input from the counties and county transportation commissions in each region. Each SCS must outline the strategies being undertaken in order to reduce GHG emissions from automobiles and light trucks in the region.

SB 375 outlines the elements that must be included in the SCS document. The SCS must do the following:

- Identify the general location of uses, residential densities, and building intensities within the region
- Identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth
- Identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region pursuant to state law (Government Code Section 65584)
- Identify a transportation network to service the transportation needs of the region
- Gather and consider the best practically available scientific information regarding resource areas and farmland in the region as defined in state law (Government Code subdivisions (a) and (b) of Section 65080.01)
- Consider the state housing goals specified in state law (Government Code Sections 65580 and 65581)
- Set forth a forecast development pattern for the region, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board
- Allow the regional transportation plan to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506)

THE REGIONAL SCS

As the MPO for the region, SCAG is tasked with preparing the regional SCS element of the RTP. This element, referred to as the SCAG Regional SCS, includes the strategies proposed to reduce GHG emissions in the SCAG region, along with analysis documenting the amount of reduction that can be achieved through the plans, programs, and projects in the regional SCS.

SB 375 requires the California Air Resources Board (CARB) to provide each affected MPO/region with GHG emission reduction targets for 2020 and 2035. In September 2010, CARB approved the following GHG emissions reductions targets for the SCAG region, expressed as a percentage reduction of per capita GHG emissions produced by cars and light duty trucks, and using 2005 as the baseline:

- 2020—8 percent reduction
- 2035—13 percent reduction, conditioned on discussions with the MPO (See Appendix A for SCAG's letter to CARB dated September 20, 2010, which outlines conditions.)

No subregional GHG emissions reduction targets were set by CARB or SCAG. GHG emissions reduction targets, and the GHG emissions reductions achieved by the regional SCS, are only calculated at the regional level.

Although the base year set by federal agencies for the RTP is 2008, CARB has identified 2005 as the initial year for calculating GHG emissions reduction. In other words, the amount of GHG reduction achieved through the region's collective sustainable communities' strategy will be measured by comparing projected GHG emissions for 2020 and 2035 against GHG emissions that occurred in 2005. All projects, programs, and policies put into place after 2005 to help reduce GHG emissions will be included in the analysis of the region's GHG emissions reductions.

THE SUBREGIONAL SCS

Unique to the SCAG region, SB 375 provides for a subregional council of governments and county transportation commission to work together to propose the SCS for a subregional area. Orange County is one of these subregional areas. As allowed, OCCOG and OCTA have agreed to prepare the OC SCS.

Orange County's subregional effort aims to ensure an accurate reflection of existing and planned local land uses, conditions, and activities. Additionally, the OC SCS demonstrates that the subregion is already undertaking strategies to reduce GHG emissions through existing and planned transportation projects and programs; showcases Orange County's longstanding history of integrating land use and transportation planning; and facilitates and supports the ongoing leadership and innovation occurring in Orange County towards sustainable land use and transportation practices.

To reiterate, no subregional GHG emissions reduction targets were set by CARB or SCAG. GHG emission reduction targets are only calculated at the regional level.

A Memorandum of Understanding (MOU) among SCAG, OCCOG, and OCTA formalized the roles and responsibilities of each party related to the preparation and acceptance of the Orange County subregional SCS as it relates to the SCAG Regional SCS. In summary, SCAG is required to prepare the regional SCS, and OCCOG and OCTA are tasked with preparing the OC SCS consistent with SCAG's adopted Framework and Guidelines. SCAG must include the OC SCS in the SCAG Regional SCS

and RTP as long as the OC SCS meets the requirements set in statute and in SCAG's Subregional SCS Framework and Guidelines. The MOU and SCAG Framework and Guidelines are in Appendix B. The Framework and Guidelines requires documentation of affected jurisdictions' willingness to adopt the necessary General Plan changes if necessary. For this OC SCS, the jurisdictions General Plan policies actively support GHG emissions reduction; therefore, no General Plan changes are necessary. This documentation is provided in Appendix C.

PUBLIC PARTICIPATION IN THE SCS

SCAG is leading the public participation process for the SCAG Regional SCS. As part of their public outreach effort, SCAG will hold informational meetings, workshops, and public hearings on the draft SCS including some in Orange County, in order to solicit input and recommendations. Additionally, the OCCOG will augment the regional public participation effort with local outreach for the OC SCS.

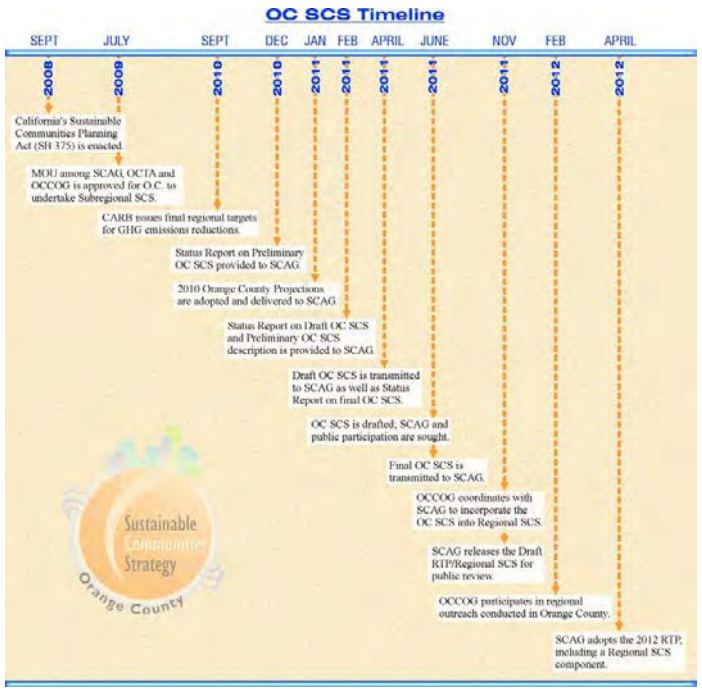
WHO'S WHO IN THE ORANGE COUNTY SUSTAINABLE COMMUNITIES STRATEGY

Multiple organizations and stakeholders are involved in the implementation of SB 375 and the creation of an Orange County Sustainable Communities Strategy: municipal agencies, the County of Orange, County special districts, OCTA, CDR, Caltrans, Transportation Corridor Agencies, and many community organizations.

Orange County Stakeholders: SB 375 mandates public participation in the development of a sustainable communities strategy. SCAG is the lead for public participation in the development of the SCAG Regional SCS, with support from OCCOG in Orange County. OCCOG augmented SCAG's regional public outreach efforts, engaging the public in the SCS development process via a web tool, public meetings, and local workshops. This process allows for revisions and clarifications to ensure stakeholder and public participation in creation of the OC SCS.

Collectively, Orange County local jurisdictions, transportation agencies, interested organizations, and the public participated in identifying ongoing and planned projects, programs and policies for reducing GHG emissions.

Orange County Council of Governments (OCCOG): OCCOG is a Joint Powers Authority whose board is comprised of elected representatives from Orange County public agencies, including local jurisdictions, transportation agencies, and special districts. Non-voting ex officio members represent the business community, private sector, universities, healthcare, and nonprofit housing communities.



In conjunction with the Orange County Transportation Authority, the OCCOG is tasked with preparing the OC SCS. In addition to the Board, the OCCOG has a Technical Advisory Committee that is comprised of technical staff from each of the member agencies. This Committee provides technical review and input for relevant issues taken up by the Board and affecting Orange County agencies, including the OC SCS.

Orange County Transportation Authority (OCTA): OCTA is Orange County's transportation commission. It serves Orange County residents and travelers by providing countywide bus and paratransit service; Metrolink rail service; the SR-91 Express Lanes; freeway, street and road improvement projects; individual and company commuting solutions; motorist aid services; and taxi operation regulation. The Authority is governed by an 18-member Board of Directors consisting of five county supervisors, 10 city members, two public members, and the Director of Caltrans District 12 as a non-voting member. As the Countywide transportation planning agency, OCTA prepares the County-level LRTP that offers input into SCAG's RTP and is incorporated into the OC SCS, which in turn is incorporated into the RTP/Regional SCS. This incorporation ensures consistency among the subregional and regional transportation planning documents.

Center for Demographic Research (CDR): Since 1996, the CDR at California State University, Fullerton, has undertaken a consistent and collaborative effort to collect and compile data, and to generate socio-economic projections that accurately represent all 35 local jurisdictions in Orange County. The CDR maintains a centralized data source of Orange County demographic characteristics, including population, housing, and employment. These data are used by public and private agencies and individuals. Sponsors of the CDR include the County of Orange, Orange County Transportation Authority, Orange County Council of Governments, Orange County Sanitation District, Transportation Corridor Agencies, Municipal Water District of Orange County, Orange County Water District, and the Orange County Local Agency Formation Commission. The socioeconomic data and growth forecasts for the OC SCS process and document were developed through the Orange County Projections process, involving extensive data collection, analysis, outreach, and review directed and managed by the CDR.

Southern California Association of Governments (SCAG): SCAG is the MPO that encompasses the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. As the MPO, SCAG prepares the RTP, setting forth forecast development patterns for the region, the future transportation network, and strategies to reduce greenhouse gas emissions from cars and light duty trucks. Once the SCAG RTP is adopted, SCAG submits the SCS element to the CARB (see below) for review. Included in this submittal is the quantification of GHG emissions reductions achieved by the Regional SCS.

California Air Resources Board (CARB): At the state level, CARB is responsible for setting GHG emissions reduction targets for each region of the State. These targets are scheduled to be updated every eight years. However, CARB has the option to revisit the targets every four years. CARB also comments on the methodology to be used by each MPO for measuring GHG emissions. SCAG submits the adopted Regional SCS to CARB for review. CARB cannot modify the Regional SCS and is limited in its action either to accept or to reject the MPO's determination that the SCS will achieve the targets if implemented.

CHAPTER 1: POPULATION, HOUSING, AND EMPLOYMENT

INTRODUCTION

This chapter describes the 2008 base year conditions for key socio-economic variables required in the subregional SCS, including Orange County population, housing, and employment. SB 375 designates two future dates for which GHG emissions reductions targets are set: 2020 and 2035. Therefore, this chapter also describes projected conditions for these socio-economic variables and gives a synopsis of countywide trends.

The socio-economic variables of population, housing, and employment are reported for geographic areas known as Traffic Analysis Zones (TAZs), units of geography most commonly used for transportation planning models. In order to be consistent with the regional SCS, SCAG TAZs were used in this analysis. One SCAG TAZ is generally made up of three Orange County TAZs that nest into one SCAG TAZ and covers an average of 767 acres; an OC TAZ, in comparison, covers an average of 294 acres and does not follow jurisdictional boundaries. Thus, any given TAZ can be made up of areas that span one or more jurisdictions and include aggregated socio-economic information from the multiple jurisdictions within it. The TAZs represent the same geographic unit for population, employment and housing; they do not change from variable to variable.

A few important things to note when reviewing the maps in this chapter:

- Not all acreage within each TAZ is slated for development. For example, acreage within any TAZ that is protected open space, forests, land preserve, etc., is not factored for future development. The growth reported by TAZ is only for the developed and developable land within each TAZ. However, due to data limitations, the density analyses require using acreage of the full TAZ.
- The transit networks that are shown on the maps are included for illustrative purposes to highlight the connections current and planned land uses will have to potential high-quality transit corridors. These corridors reflect transit improvements discussed in the OCTA Long-Range Transportation Plan that may take place between 2021 and 2035. Further, these transit improvements are

subject to change based on future action by the OCTA Board of Directors regarding the ongoing Transit System Study.

- There are currently 34 incorporated cities and several unincorporated areas within Orange County (see Figure 2).

The following tables summarize the base year and projected data for population, housing, and employment in Orange County from the approved 2010 Orange County Projections. A description of the demographic data projections and development process conducted by CDR to produce the forecast data is provided in Appendix D.

Table A: 2010 Orange County Projections for Population, Housing, and Employment 2008, 2020 and 2035

	2008	2020	2035
Population	3,123,058	3,430,505	3,582,266
Housing Units	1,035,005	1,100,260	1,174,912
Employment	1,624,061	1,646,437	1,799,477

Orange County Projections and the 2010 Census

The OCP-2010 dataset (population, housing and employment) referenced in the OC SCS was approved by the OCCOG Board on January 27, 2011. OCP-2010 is based on the approved OCP update and revision process which took place during 2009-2010; it does not include the 2010 Census data for California released on March 8, 2011.

SCAG policy committee actions have directed SCAG staff to revise the draft growth forecast dataset for the Regional SCS and RTP to include the 2010 Census data and the 2010 State Employment Development Department (EDD) employment benchmark. The CDR is coordinating with SCAG on this update process, and is evaluating the timeline and process to revise OCP-2010 to include the new data and be consistent with the growth forecast update effort being undertaken by SCAG.

Consistent with SCAG's process, any update to the growth forecast dataset will be to the 2010 totals for population, housing, and employment, and the growth increments from 2010 to 2035 will remain the same and be applied to the revised 2010 totals. If a revision is made to the OCP-2010, this effort will be completed after the June 2011 submittal deadline of the final OC SCS to SCAG. Further, the updated dataset will be provided to SCAG through a data amendment process and the full OC SCS document will not be revised.

POPULATION

In 2008, Orange County's population was 3,123,058 persons (see Figure 3). Though the majority of residents live in the northern regions of the County, the southern region also holds a sizeable portion of the population, with increasingly even population distribution occurring throughout the County. Figure 4 shows that the majority of people are concentrated mostly in the mature, northern and central cities—areas established as bedroom communities for Los Angeles prior to the 1970s. U.S. Census and other demographic information sources reveal that Orange County is no longer a suburb. In fact, it is one of the most densely populated areas in the United States, and according to the 2010 U.S. Census, as Table C shows, Orange County is the most densely populated county in the SCAG region and has the highest residential density per square mile.

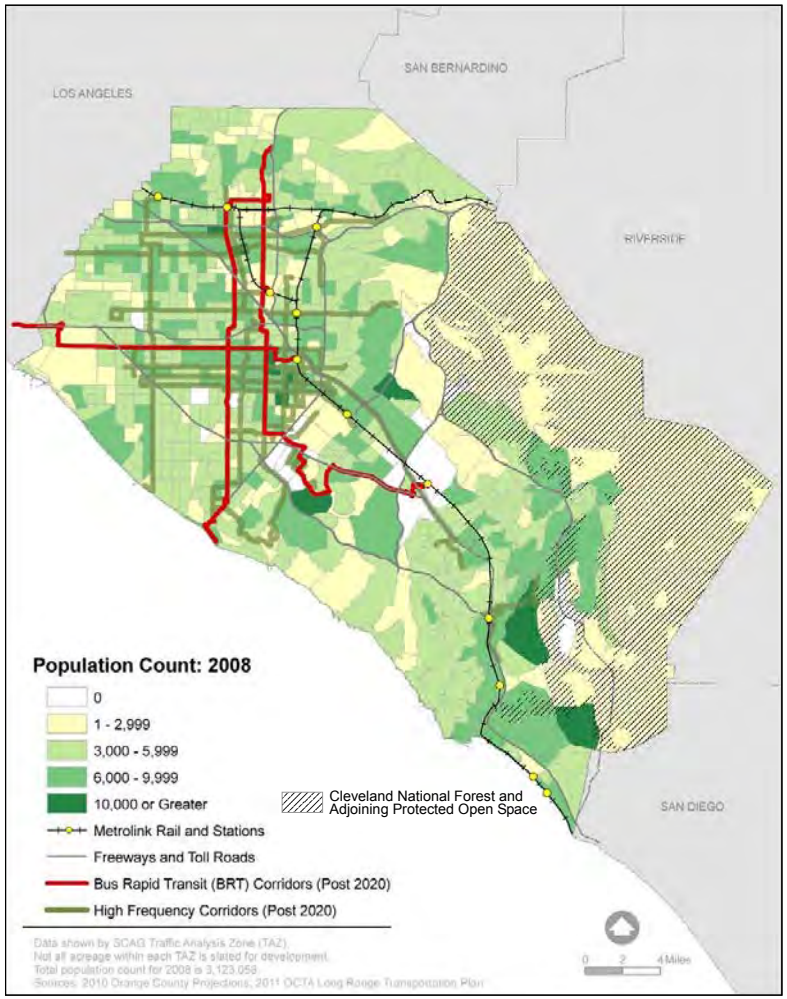

Figure 3 **Existing (2008) Orange County Population**

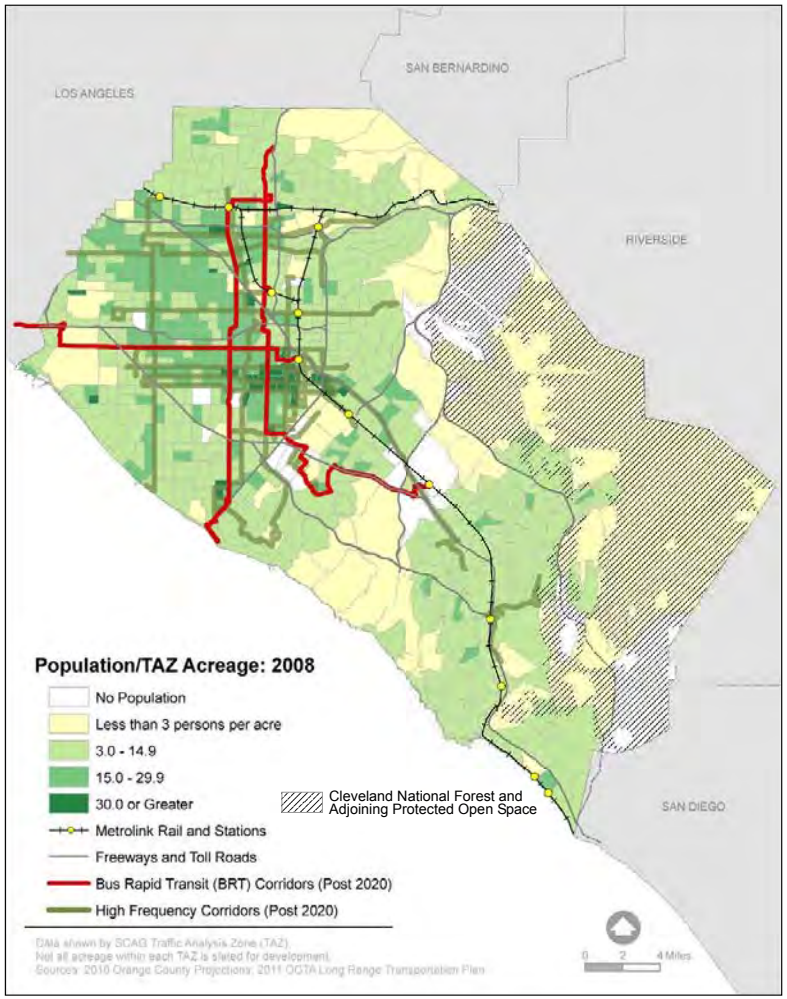

Figure 4 **Existing (2008) Orange County Population Density**

Table C: Comparative Population Density for Counties within SCAG Region, 2010 Census

County	Population Density per Square Mile	Housing Units per Square Mile
Orange	3,813	1,329
Los Angeles	2,405	848
Ventura	446	153
Riverside	304	111
San Bernardino	101	35
Imperial	42	13

Source: U.S. Census Bureau, 2010 Census.
Note: The above densities reflect total square miles of land, without distinguishing between developable or undevelopable land.

Between 2008 and 2020, Orange County's total population is projected to increase by 307,447 persons to a total of 3,430,505 (Figure 5). The number of sparsely populated TAZs is projected to shrink, along with the number of "zero population TAZs" in the southern portion of the County. Jurisdictions projected to experience the most population growth during this time include Anaheim, Brea, Tustin, Irvine, and areas within the unincorporated County. There is also significant growth in the number of TAZs with populations of 6,000 to 9,999 residents, and 10,000+ residents, occurring in central and south county (Figures 6 and 7).

Orange County's population density in 2020 (Figure 8) is projected to mirror the population changes forecast to occur between 2008 and 2020 (see Figure 9). In short, the County will become more densely populated. While population growth will occur in the remaining vacant areas planned for growth, increased density will also be prevalent in the established urban cores due to infill, reuse, and mixed-use developments. This increased density of development will result in more efficient residential land use. Efficient land use, as discussed in this document, is a land use or pattern of land uses anticipated to reduce regional GHG emissions from automobiles or light duty trucks. The land uses and patterns of use will foster efficient usage of transportation resources and infrastructure such that people will have options other than a single-occupant vehicle for travel. The projected population of Orange County in 2035 totals 3,582,266 (see Figure 10), an increase of 151,761 or 4.4% between 2020 and 2035, and an increase of 459,208 or 14.7% from 2008 to 2035. Figures 11 and 12 demonstrate that population growth will continue throughout the County.

By 2035, Orange County's population density (Figure 13) is projected to have increased along with population totals throughout the County. This increase in density is anticipated to be most prevalent in the urban core of the County, as the result of increased

infill development, reuse of land, and increased creation of mixed-use developments, providing housing, employment, recreational, and leisure opportunities (Figure 14).

POPULATION CONCLUSION

Compared to 2008 conditions, Orange County's population is projected to grow 10% by 2020 and 15% by 2035. A majority of this forecast growth will occur in areas with approved entitlements for large residential developments such as La Floresta and Canyon Crest in Brea, the Great Park in Irvine (formerly Marine Corps Air Station, El Toro), the Platinum Triangle in the City of Anaheim, the East Orange planned community in the City of Orange and unincorporated County, and the Rancho Mission Viejo planned community known as The Ranch Plan, also located in unincorporated County territory. It is important to note that population growth is forecast to occur throughout the County, within the built environment and in areas with new development. This will result in increased infill development in housing and demand for support services (i.e., employment, recreation, education, etc.). The County's population density will increase, most markedly in the established urban core.

Population growth in Orange County will be served by a robust transportation system offering mobility choices other than passenger car travel. The existing and future transportation infrastructure of Orange County includes freeways, arterial highways, a priced transportation network, fixed bus routes, High Frequency Corridors (corridors with 15-minute or better transit headways), and Metrolink rail service.

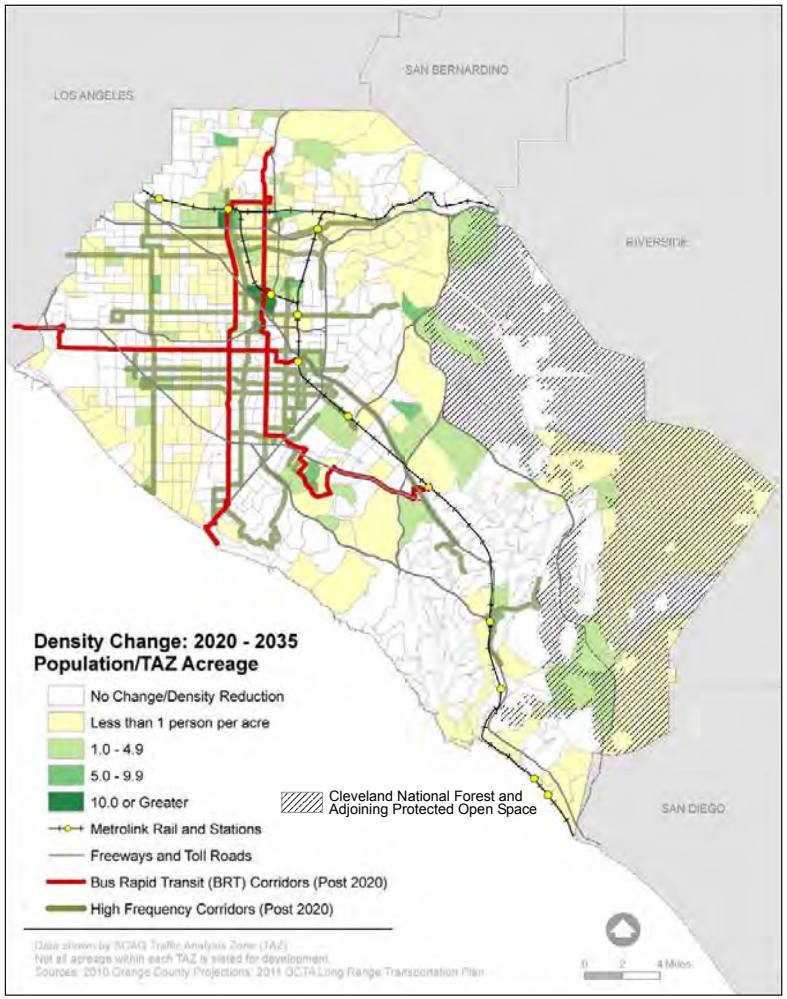

Figure 14

Orange County Population Density Change 2020 - 2035

HOUSING

In 2008, Orange County had 1,035,005 housing units (Figure 15). Taking population and employment into account, this equates to one housing unit per 3.02 Orange County residents, and one housing unit for every 1.57 jobs. Due to the large influx of population from the 1950s to the 1980s, most housing units in Orange County were built during that time. Table D shows housing construction from 1950 to 2005 and later, as reported by the 2008 American Community Survey.

Figure 16 shows that between 2005 and 2008, housing construction clearly outweighed housing demolitions. The largest pockets of housing construction occurred in the coastal and southern regions of Orange County, while the majority of housing demolitions occurred in the mature central and northern portions of the County. This concentration of demolitions may point to the projected transition near the urban cores, tending to increase residential density in these areas.

Table D: 2008 American Community Survey Orange County Homes by Decade

Year Built	Number	Percent
2005 or later	20,677	2%
2000 to 2004	60,876	5.9%
1990 to 1999	112,207	10.8%
1980 to 1989	164,819	15.9%
1970 to 1979	268,535	25.9%
1960 to 1969	213,269	20.6%
1950 to 1959	142,282	13.7%
Before 1950	52,545	5.3%
Total	1,035,210	100.0%

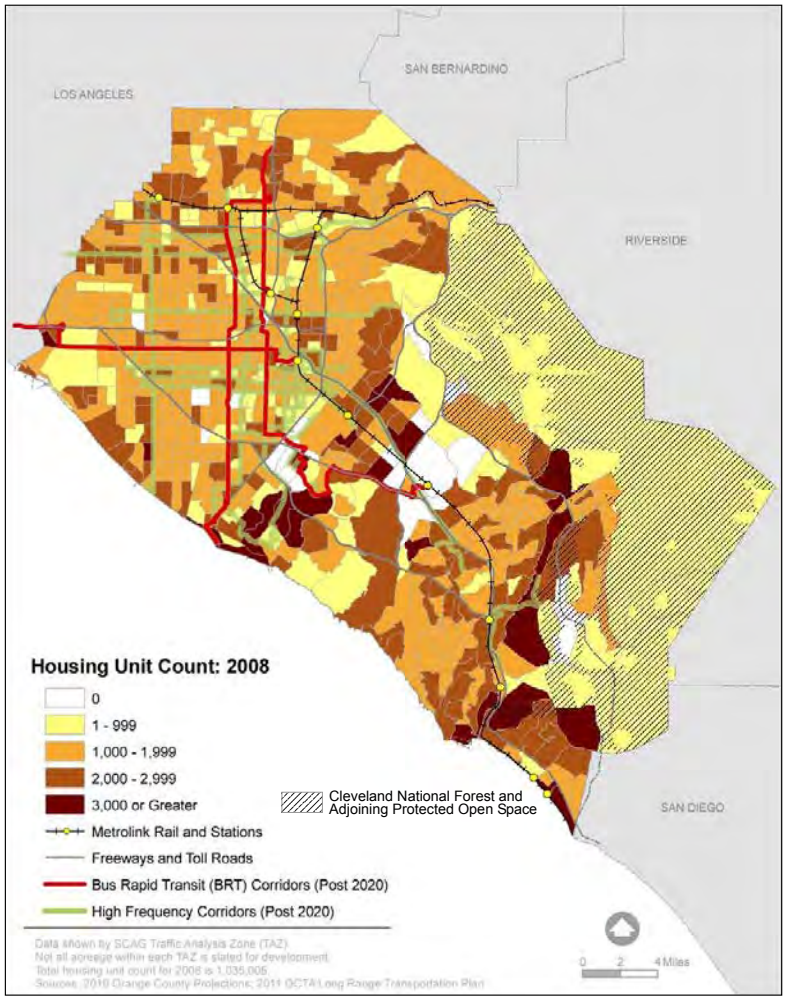

Figure 15 **Existing (2008) Orange County Housing Units**

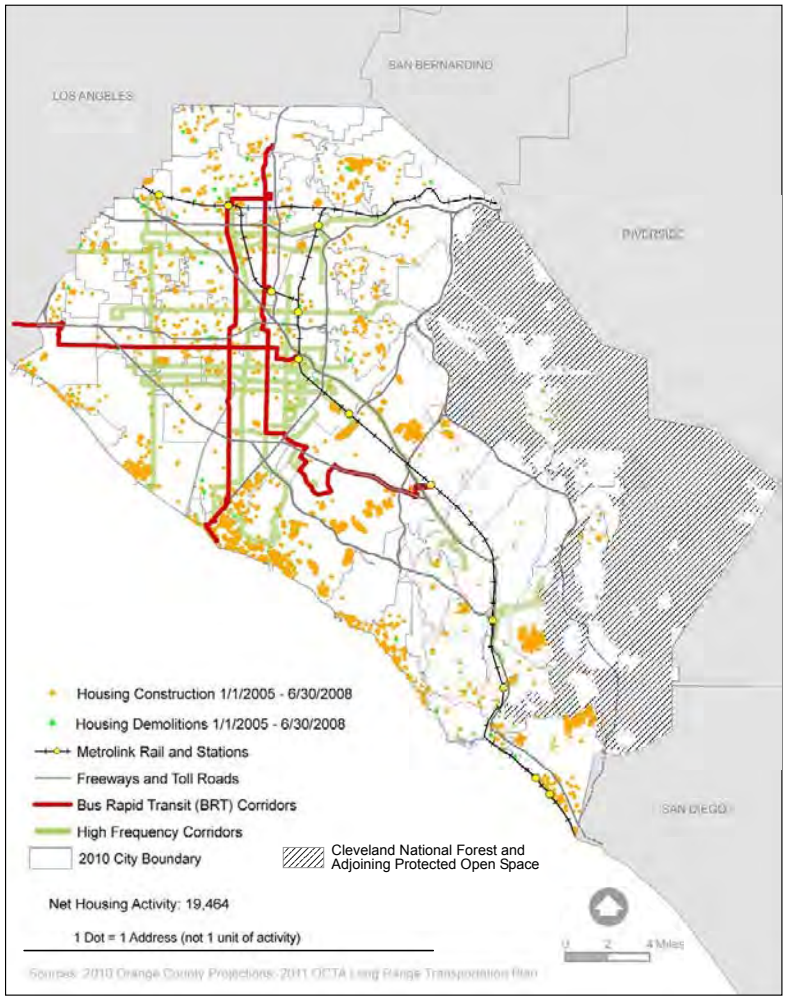

Figure 16 **Orange County Housing Activity 2005 - 2008**

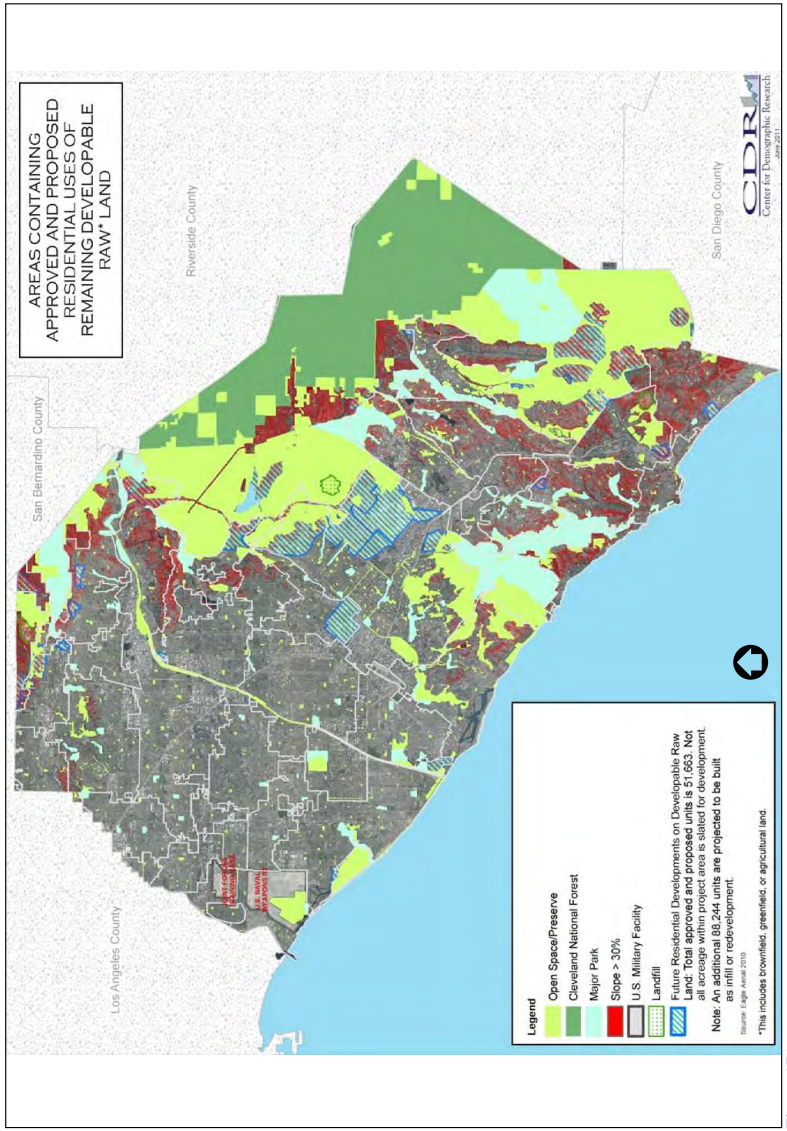
Table E shows that just over half of Orange County's housing (51.6%) is comprised of one-unit, detached structures. The second most common housing is 20-unit or more structures, which make up 12.6% of housing in the County, followed by one-unit, attached housing at 11.7%.

Table E: 2008 American Community Survey Orange County Homes by Type



Type of Structure	Number of Units in Structures	Percent of Total
1-Unit, Detached	533,218	51.6%
1-Unit, Attached	121,432	11.7%
2 Units	16,471	1.6%
3 or 4 Units	73,948	7.1%
5 to 9 Units	69,788	6.7%
10 to 19 Units	56,357	5.4%
20 Units or More	130,209	12.6%
Mobile Home	33,254	3.2%
Boat, RV, Van, Etc.	533	0.1%
Total	1,035,210	100.0%

Source: 2008 American Community Survey 1-Year Estimate, Housing Data Profile

Between 2008 and 2035, Orange County is projected to experience a net gain of 139,907 housing units, based upon the input of the Orange County jurisdictions, with about a third of these units (36.9% or 51,663 housing units) planned on raw land within the hashmarked areas on Figure 17A.[1] Raw land for the purpose of developing Figure 17A was defined as land not previously developed or land that is a decommissioned military base and is not a protected, open space or habitat area. Figure 17B illustrates permanently protected open space areas, consolidated from several categories.[2] The remaining two thirds of projected housing units, (88,244 units or 63.1%), will be infill or redevelopment projects. Of the total, 38,821 (27.7%) are projected to be single-family detached units and 101,086 (72.3%) are projected to be attached units.

[1] Figure 17A was first developed in 2002 by CDR to look at future housing development on raw land in Orange County. This map is updated over time and has been updated with the OCP-2010 housing projections data, which was reviewed and approved by jurisdictions in Orange County. This map first identifies areas not available for development including national forest, land or habitat preserves, major parks and open space, military installations, and landfills. Because of the scale of the map, smaller parks and open space areas are not displayed. The areas identified in red, most prevalent in the eastern and southern portions of the County, have slopes of 30% or greater on which it is typically cost-prohibitive to build. An aerial photo was reviewed to identify large areas in the county that looked vacant. Those areas were bounded and then each jurisdiction with an identified area was contacted about any residential development planned for the area. Although some of the project areas are large, not all of the land within the project areas will be developed for residential or employment uses. Much of the land within those project areas will be left as open space.

[2] Though certain elements of open space are illustrated in Figure 17B, Chapter 5 provides a comprehensive inventory of the resource areas and farmlands located within the County.

Areas Containing Approved and Proposed Residential Uses of Developable Raw* Land

Figure 17A

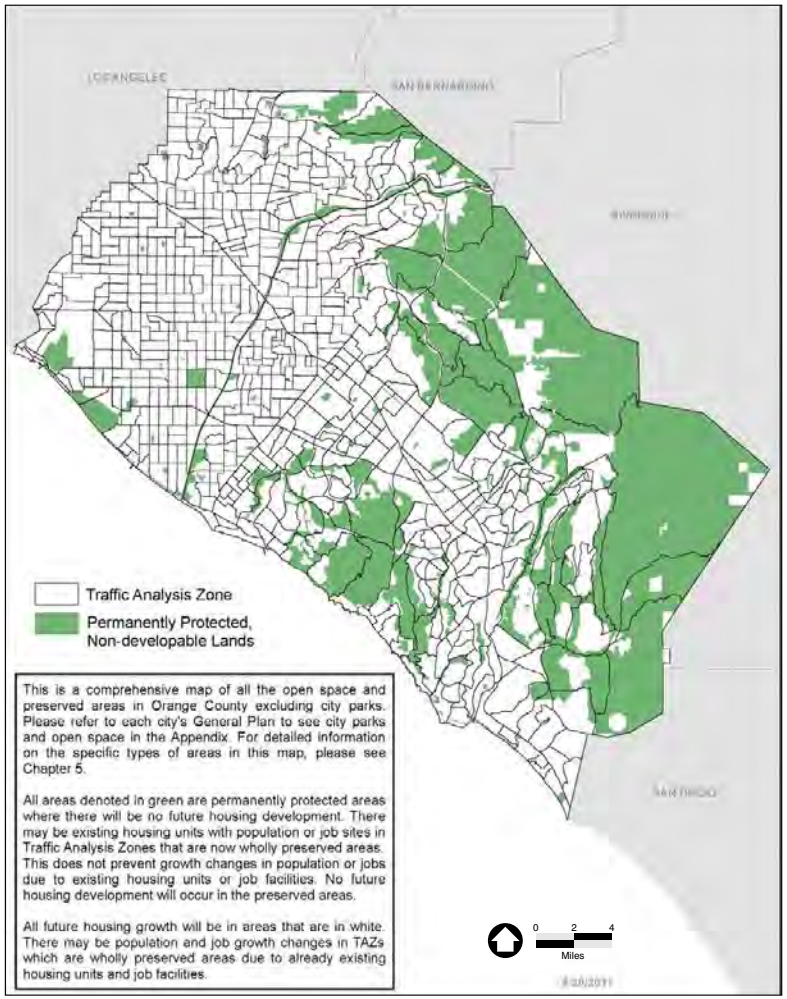


Figure 17B **Orange County Comprehensive Permanently Protected Areas**

To summarize, about three of every four units to be built between 2008 and 2035 are projected to be attached residential, such as a condominium, townhome, or apartment.

In 2008, the majority of TAZs in the County have housing densities of one to under five housing units per TAZ acre. The use of the term "housing density" for a TAZ refers to the housing density of the total TAZ acreage, not the density of any specific housing development within the TAZ. The concentration of TAZs with high densities of housing in the central region of the county follows the trend established in the population density analysis. In other words, the urban cores are experiencing increased infill, reuse of land, and increased developments of multi-unit housing structures to support the growing populations in these regions (see Figure 18).

By 2020, the total number of housing units in Orange County is projected to increase by 65,255, from 1,035,005 to 1,100,260 (see Figure 19). A growing population requires approximately one housing unit per 3.28 residents or 1.5 jobs.[3] The projected housing production by 2020 will continue to satisfy the growing population. Given the forecast growth in population, this projected growth in housing is sufficient to house all the population of Orange County by 2020.

This housing growth will occur throughout the County and there will be fewer large areas without housing. The largest concentration of housing growth between 2008 and 2020 will occur in Brea; the middle section of the County straddling the I-5 Freeway in Irvine; Tustin's Legacy development; and Rancho Mission Viejo in unincorporated South County. Additionally, TAZs with 3,000 or greater housing units are expected to grow in numbers, signaling increased densification (see Figure 20).

Overall, the County is projected to experience an even spread of housing unit growth between 2008 and 2020. During this time, the majority of TAZs will experience an increase of between 1-99 housing units. Figure 21 does show many TAZs that will experience no growth or loss of units that can be explained by the fact that much of Orange County's developable land has already been built on and, therefore, is limited in the number of units that can be added. This is especially true where the housing stock is newer and/or within planned communities. Future developments will be more dense to offset the limited land supply. As previously mentioned, 75 percent of the future housing growth will be an attached or some form of attached unit.

Chicago: Planners Press; Weitz, Jerry. 2003. "Jobs-Housing Balance." Planning Advisory Service Report 516. Michigan: American Planning Association.

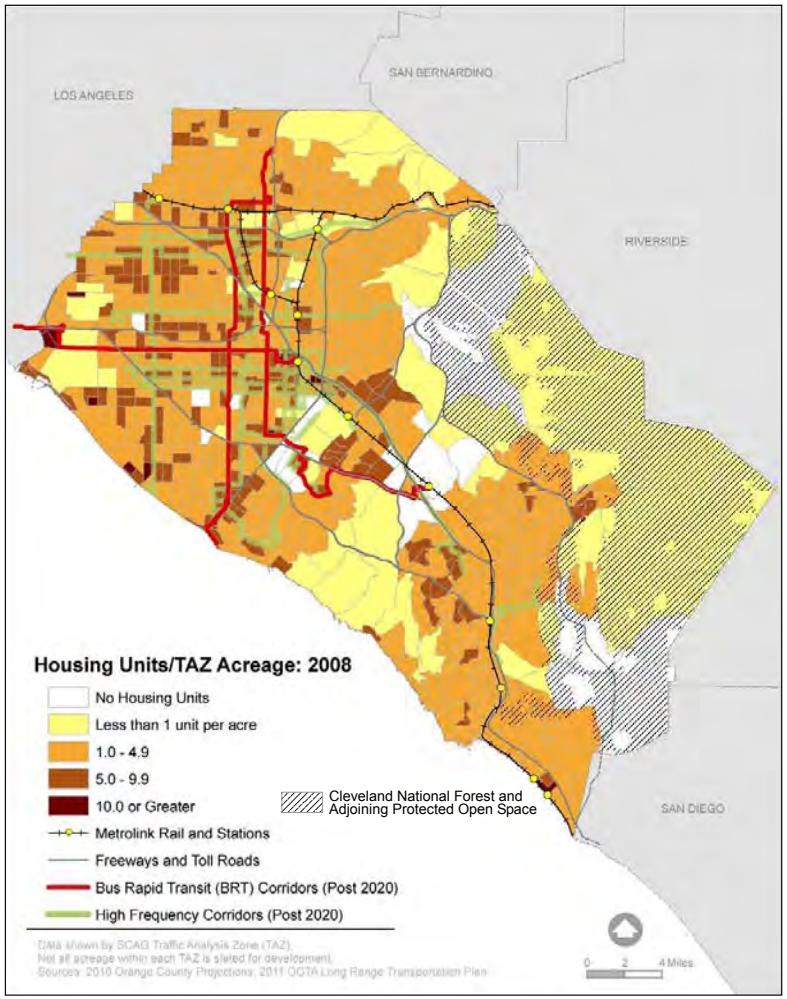

Figure 18 **Existing (2008) Orange County Housing Density**

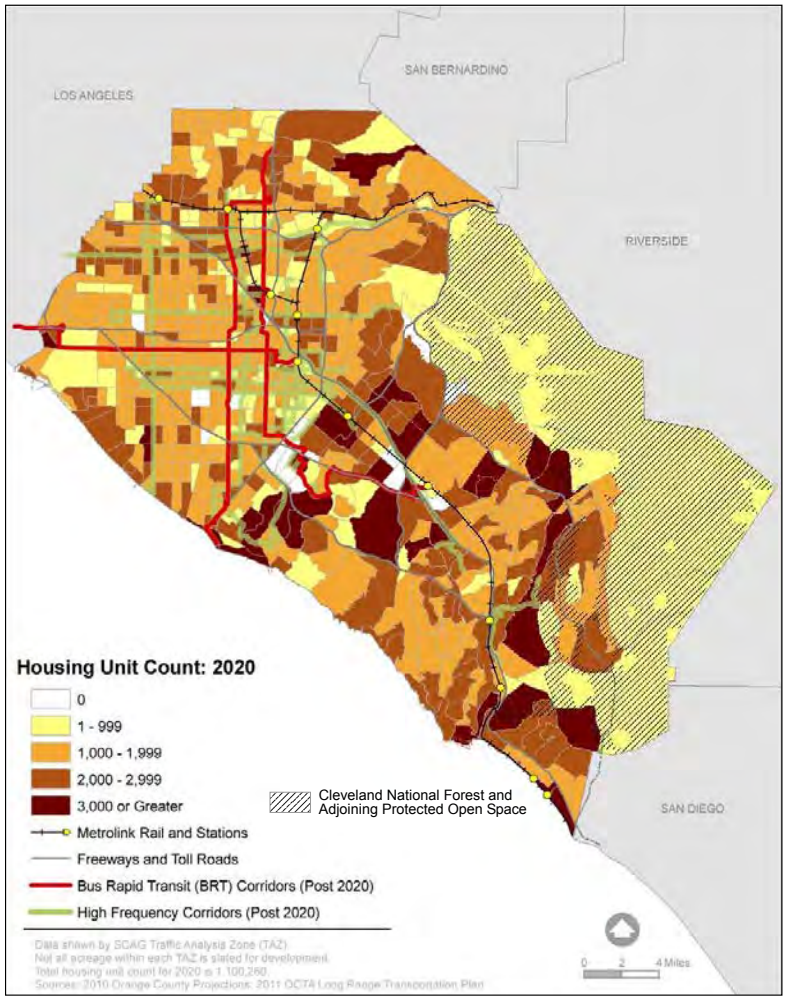

Figure 19 **Year 2020 Orange County Housing Units**

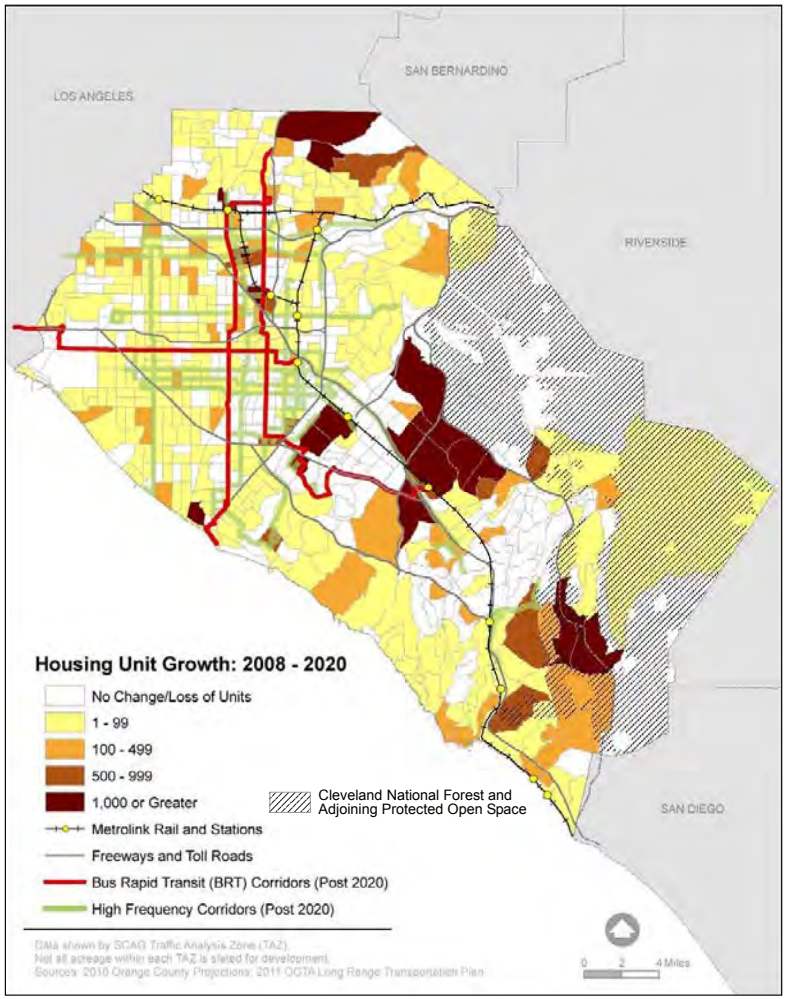

Figure 20 **Orange County Housing Growth 2008 - 2020**

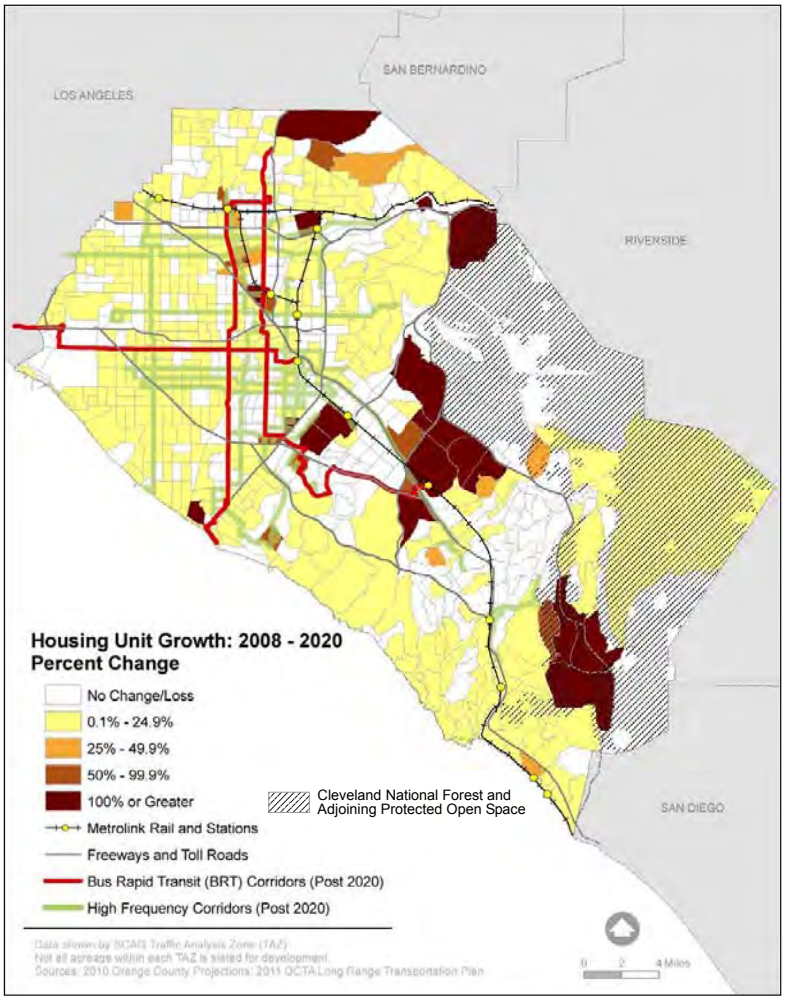

Figure 21 **Orange County Percent Change Housing Unit Growth 2008 - 2020**

Orange County housing unit density in 2020, measured in units per TAZ acre, shows pockets of increasing densification adjacent to transit options, especially around the Metrolink rail line (see Figures 22 and 23).

By 2035, housing totals in Orange County are projected to grow to 1,174,912. This constitutes an increase of 74,652 units between 2020 and 2035. This equates to one housing unit for every 3.02 Orange County residents and one housing unit for every 1.53 jobs.

In 2035, the only TAZs with no housing units are areas of permanently dedicated open space and parkland. The densest TAZs, holding 3,000 housing units or more, become much more prevalent in 2035 and are most notably found in Brea, Fullerton, Anaheim, Tustin, Irvine, Lake Forest, Newport Beach, San Juan Capistrano, Yorba Linda, and unincorporated south county communities of Ladera Ranch and Rancho Mission Viejo (Figure 24).

As shown in Figures 25 and 26, from 2020 to 2035, the majority of high-growth TAZs that grow by 1,000 units or more, and by 100% or more, effectively double the housing units in those areas. These include TAZs in Anaheim, La Habra, Orange, Fullerton, Irvine, Tustin, and the future Rancho Mission Viejo community in unincorporated South County.

In 2035, the continued trend of housing unit densification is clearly seen. Many of the most housing-dense TAZs are concentrated in the centralized urban cores of Orange County, along the commuter rail lines, and the proposed bus rapid transit and high frequency bus routes (Figures 27 and 28).

In summary, from 2008 to 2035, the County is projected to add 139,907 housing units, an increase of 13.5%, of which 75% will be attached units. The projected evolution of the County is for housing unit growth and housing unit density to increase throughout the County, with growth concentrated in the traditional urban cores. The majority of future residential developments on raw land are projected to occur in the central cities of Irvine and Tustin, and the southern region encompassing Rancho Mission Viejo in the unincorporated portion of the County east of San Clemente.

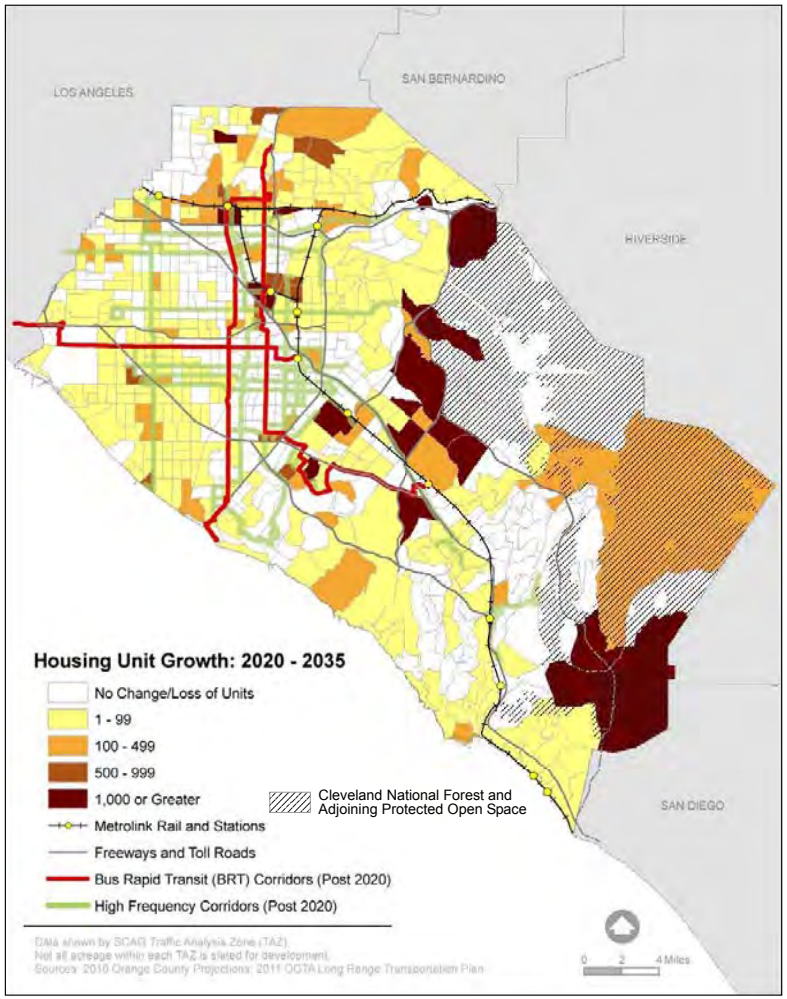

Figure 25 **Orange County Housing Unit Growth 2020 - 2035**

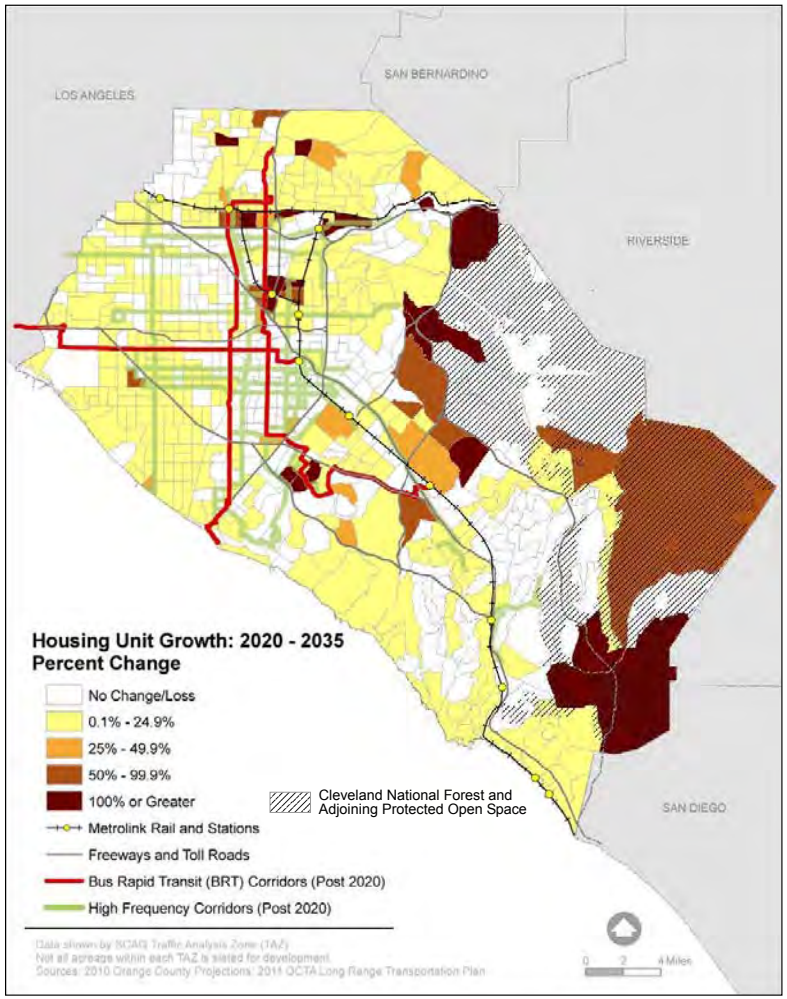

Figure 26 **Orange County Percent Change Housing Unit Growth 2020 - 2035**

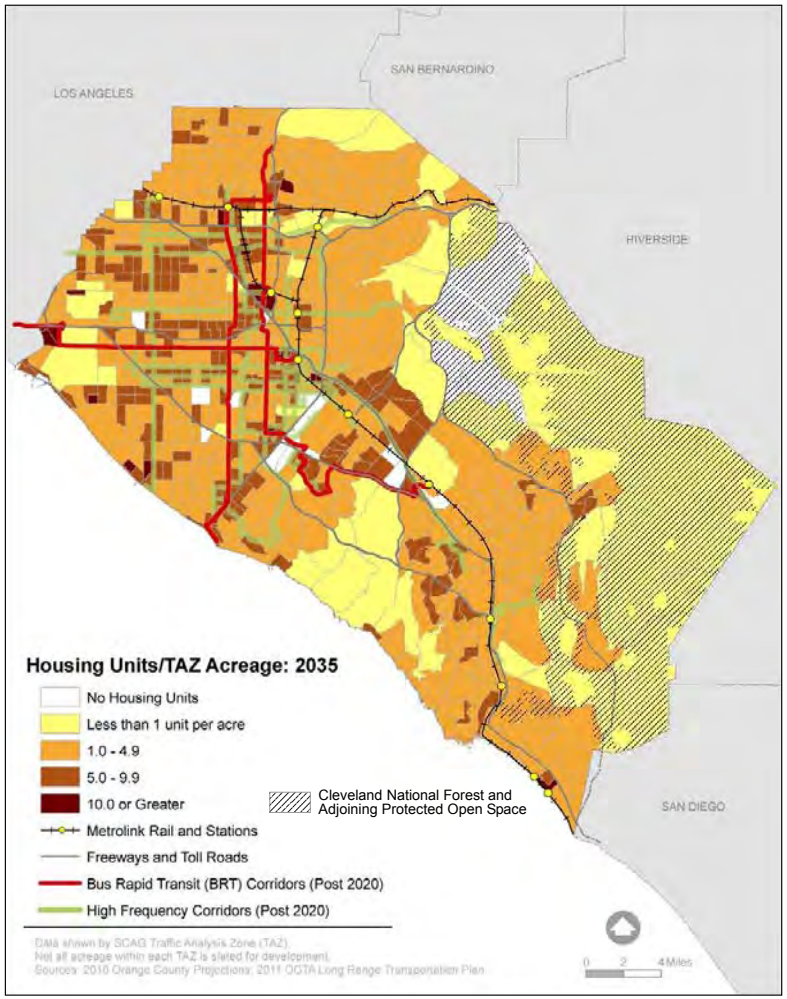

Figure 27 **Year 2035 Orange County Housing Density**

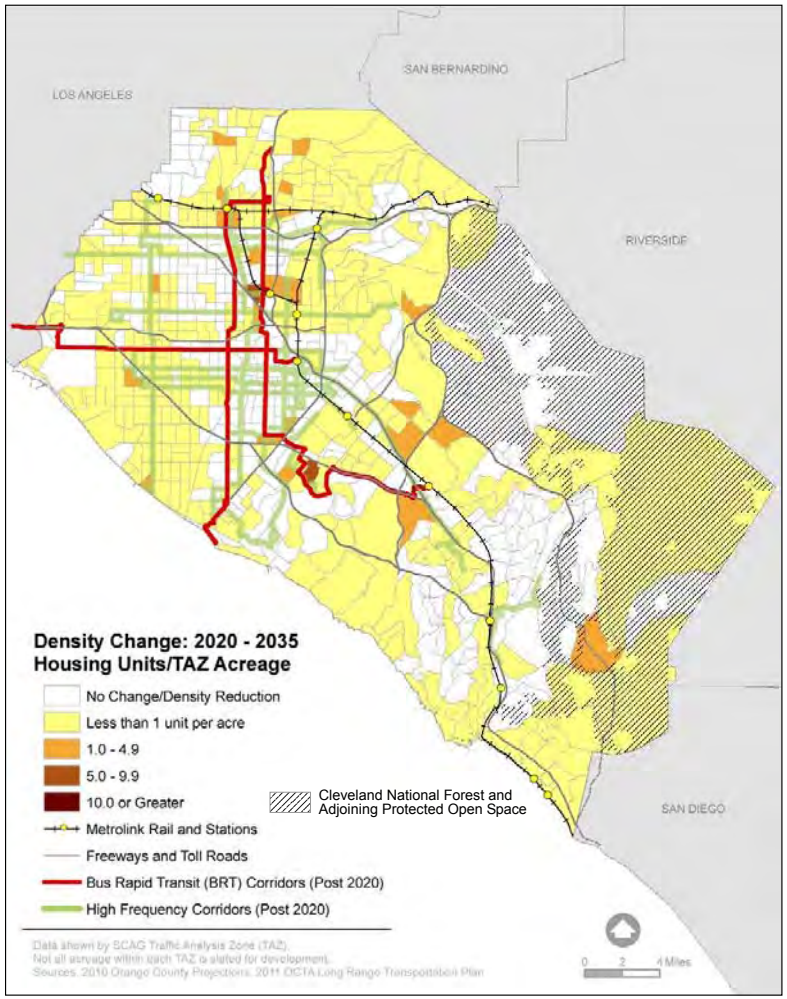

Figure 28 **Orange County Housing Density Change 2020 - 2035**

HOUSING CONCLUSION

Orange County's existing (2008) housing stock includes a variety of densities, and only about half of the housing inventory is single-family detached structures. Approximately three out of every four housing units projected to be built between 2008 and 2035 will be some type of attached unit. The result will be denser housing developments and a future housing stock whose makeup will have a majority of attached units instead of a housing stock with a majority of single-family detached structures.

The number of new housing units is forecast to grow sufficiently to house all the population of the subregion. By 2020, the total number of housing units in Orange County is projected to increase by 65,255 units, resulting in an average of 3.12 Orange County residents per housing unit by 2020 and one housing unit per 1.50 jobs (one housing unit created for every 0.34 jobs created between 2008 and 2020). Between 2008 and 2035, Orange County is projected to create one housing unit for every 1.25 new jobs and one housing unit for every 3.28 new residents, resulting in a 2035 total of one housing unit for every 3.02 Orange County residents and one housing unit for every 1.53 jobs. The standard "healthy" ratio of jobs to housing is 1.50 jobs to 1.0 housing unit.[4]

Because available land is scarce, housing will grow primarily in terms of density. Increased housing density affords greater variety in housing type (i.e., multi-family, flat, apartment, condominium, high-rise, etc.) and increased supply contributes to housing affordability. Increasing the supply of affordable housing within Orange County may result in workers living closer to their jobs, thereby reducing vehicle miles traveled and urban sprawl. The densification of housing is forecast to accommodate population growth and locate proximate to major transportation routes and the priced transportation network, including the High Frequency Corridors and Metrolink stations.

Housing growth is projected to occur in and adjacent to areas that are forecast for increased employment growth. This adjacency will create opportunities to link housing and jobs at a human scale and afford pedestrian, cycling and transit choices for home/work travel.

Additionally, intensification of both employment and housing will enhance the built environment for mixed uses, transit-oriented and transit-adjacent developments, and multi-use projects along pedestrian and bicycle facilities.

[4] Cervero, Robert. 1991. "Jobs/Housing Balance as Public Policy." ***Urban Land*** 50, no.10:10-14; Ewing, Reid. 1996. ***Best Development Practices: Doing the Right Thing and Making Money at the Same Time***. Chicago: Planners Press; Weitz, Jerry. 2003. "Jobs-Housing Balance." ***Planning Advisory Service Report*** 516. Michigan: American Planning Association.

EMPLOYMENT

Orange County's estimated total job market was 1,624,061 jobs in 2008 (see Figure 29). The preponderance of TAZs host fewer than 5,000 jobs in 2008. Only three TAZs hold no employment, and these are located in areas comprised predominantly of parkland. TAZs with 5,000-9,999 employed workers are spread throughout the northern, central, and southern portions of the County along major transportation routes, as are TAZs holding 10,000-14,999 workers. The three largest employment TAZs—those holding 15,000-24,999, or 25,000 or more jobs—are located in the Irvine Business Complex, the Canyon industrial and business area north of the 91 Freeway located in Anaheim.

Figure 30 illustrates Orange County's employment density by jobs per acre in 2008. The northern and central portions of the County contain the majority of TAZs with mid- and high-level employment density.

By 2020, Orange County's total job count is projected to increase to 1,646,437, an increase of 22,376 jobs between 2008 and 2020 (see Figure 31). Employment growth between 2008 and 2020 is apparent near the Irvine Spectrum, Irvine Business Complex, Tustin Legacy, and in and around the Orange County Great Park—most likely developments of mixed-use structures and high-rise structures to offset the scarcity of developable land in the area (see Figures 32 and 33).

In 2020, TAZs with less than five jobs per TAZ acre are projected to make up the majority of TAZs in the County. High-density employment will continue in The Canyon, Anaheim Resort, and Irvine Business Complex. This high density of employment will also be expanded to additional areas including the Santa Ana Civic Center, the Irvine Spectrum, and other areas surrounding these locations (see Figures 34 and 35).

Orange County's net job growth from 2008 to 2020 includes the significant job losses incurred during the latest recession, starting in 2006 and lasting through 2009. The large decrease in overall employment, coupled with the slower-than-average past annual job growth, translates to a slow recovery of the County's employment landscape.

Consistent with employment growth trend projections by the UCLA Anderson School, Chapman University, Cal State Fullerton, and Cal State Long Beach, the estimated recovery of Orange County's employment level—back to its prior peak employment—is anticipated sometime between 2016 and 2020.

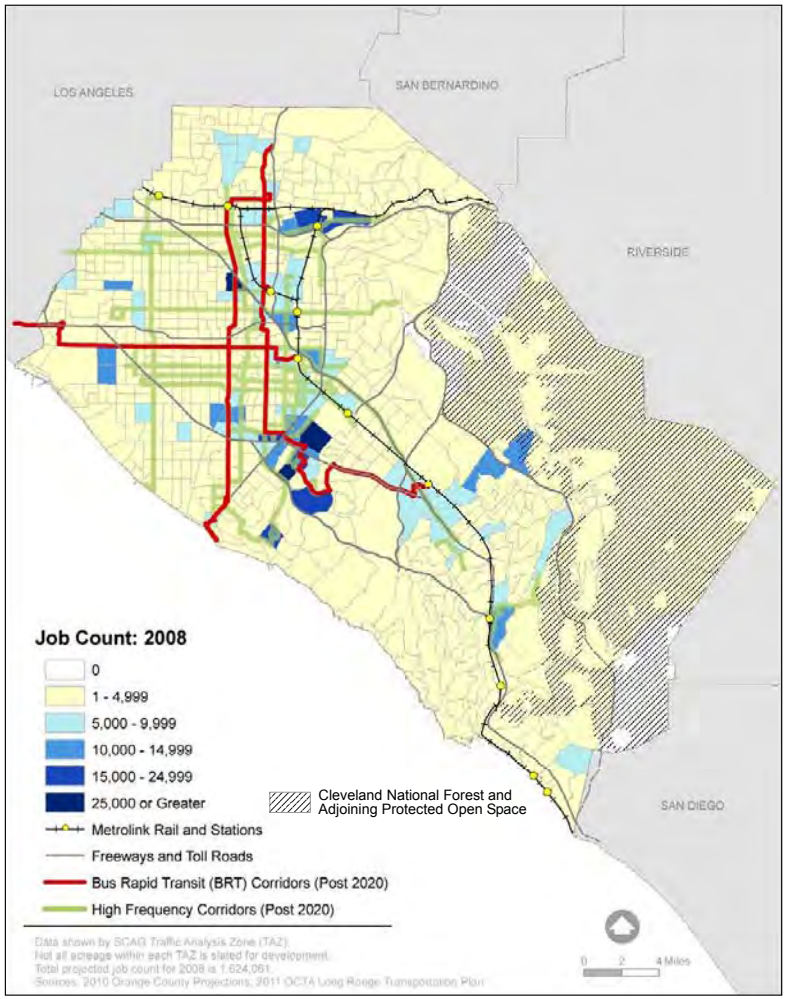

Figure 29 **Existing (2008) Orange County Employment**

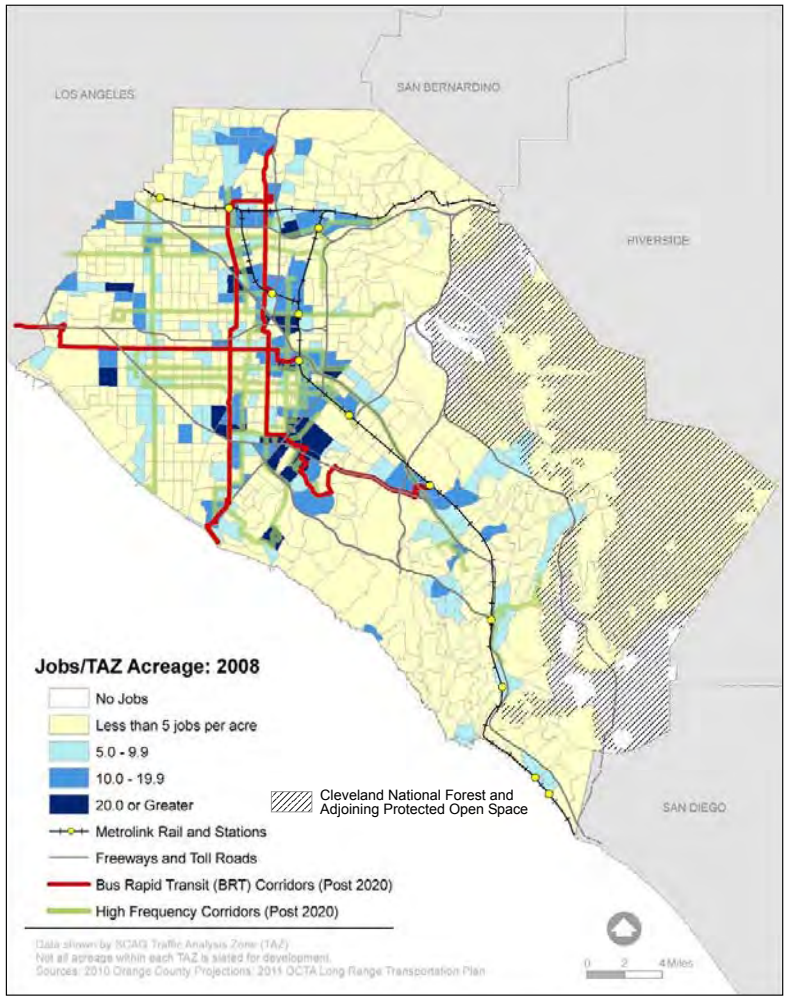

Figure 30 **Existing (2008) Orange County Employment Density**

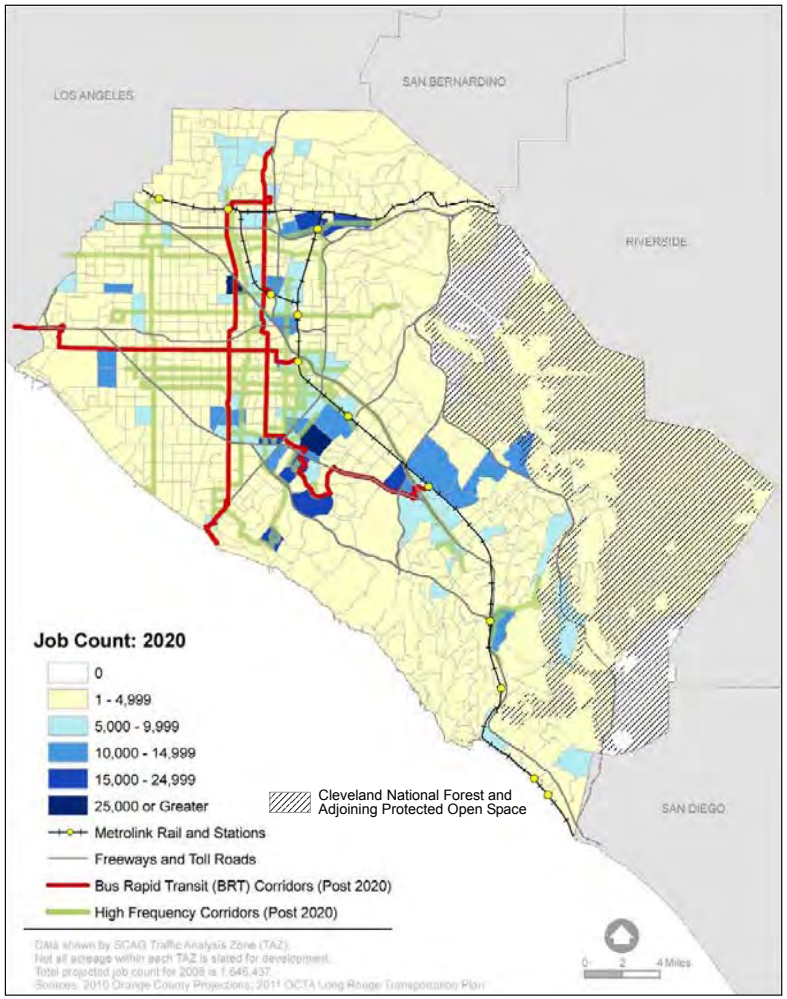

Figure 31 **Year 2020 Orange County Employment**

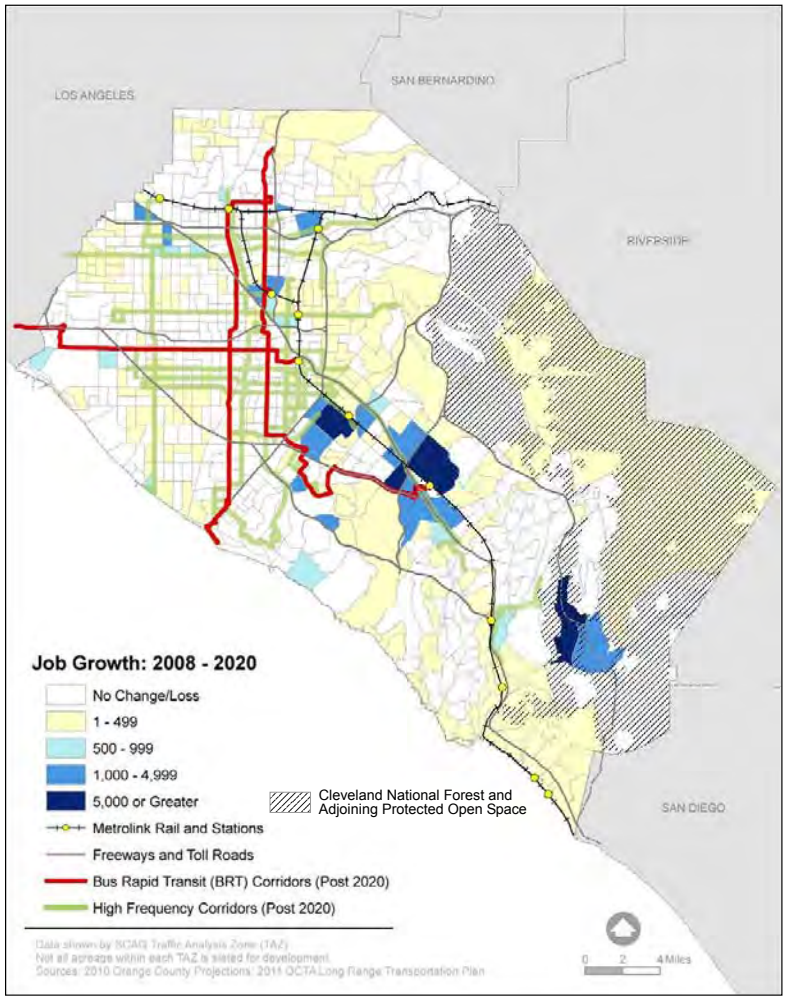

Figure 32 **Orange County Employment Growth 2008 - 2020**

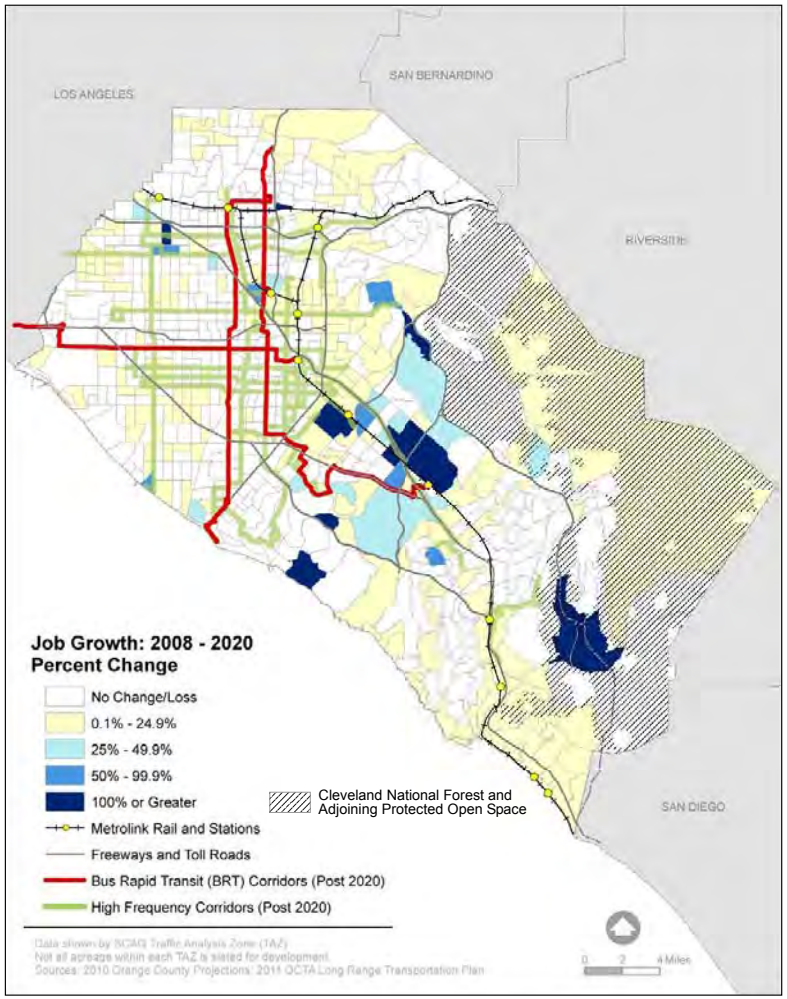

Figure 33 **Orange County Percent Change Employment Growth 2008 - 2020**

Orange County Sustainable Communities Strategy

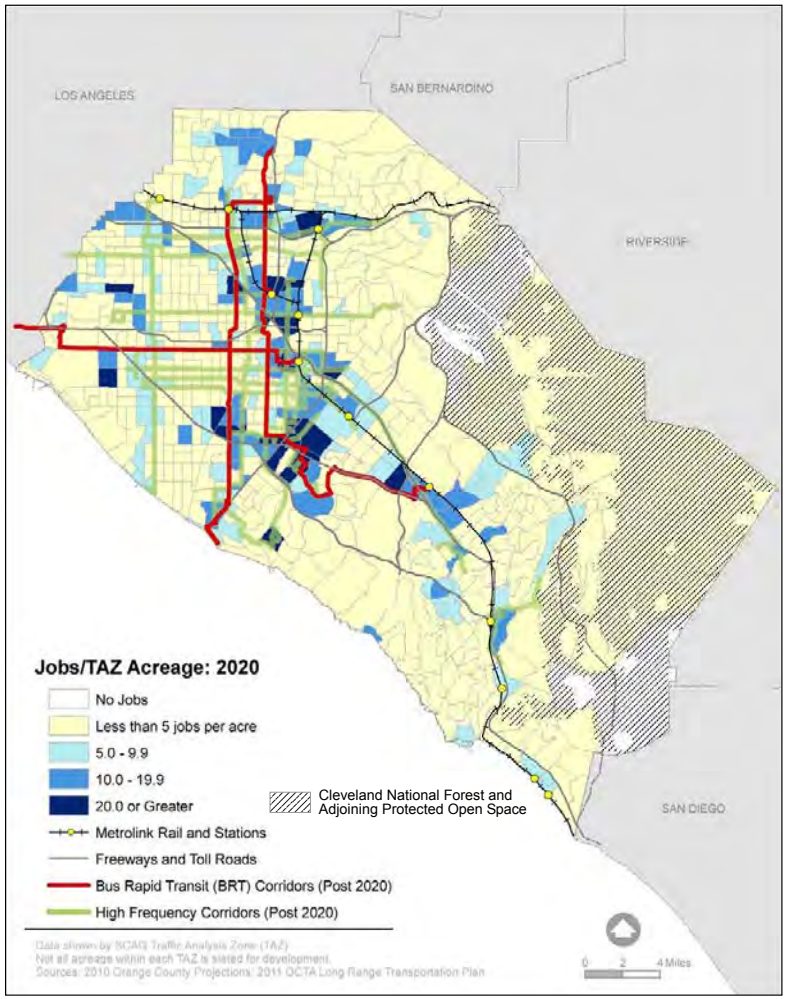

Figure 34 **Year 2020 Orange County Employment Density**

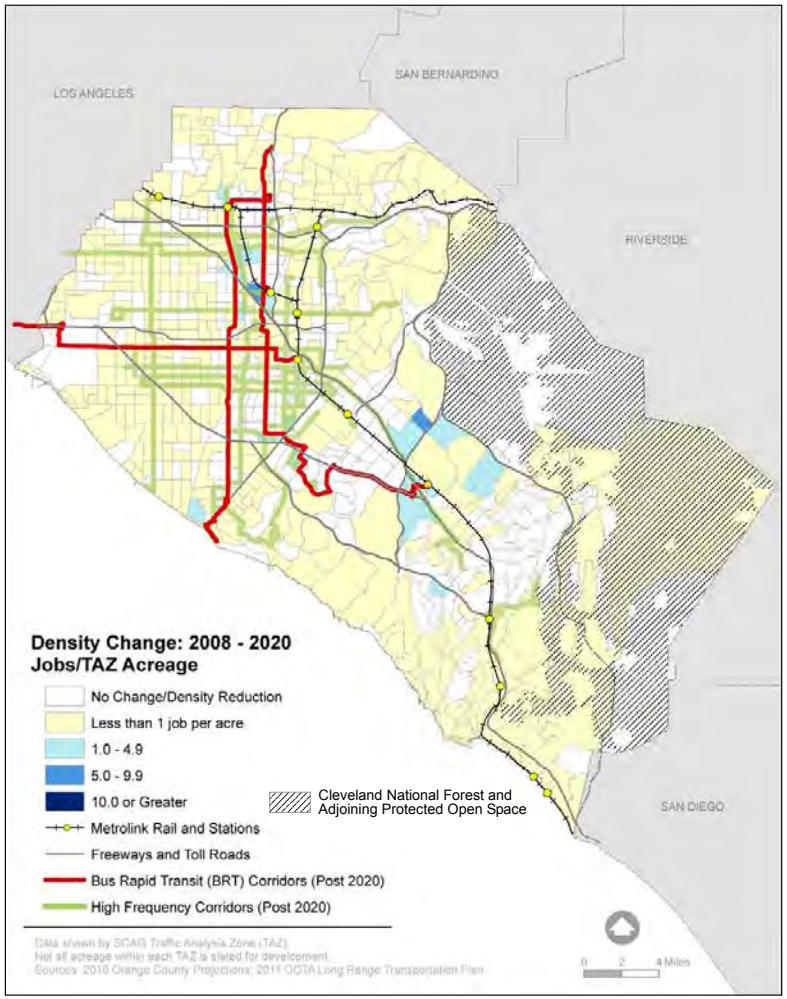

Figure 35

Orange County Employment Density Change 2008 - 2020

By 2035, Orange County is projected to have 1,799,477 jobs, an increase of 153,040 jobs between 2020 and 2035 (see Figure 36). This represents an increase of 9.3% from 2020, and equates to 130,664 jobs or almost seven times more jobs than are projected to be added between 2008 and 2020. The large difference between the numbers of jobs added between these two time periods is attributed to initial job losses in the early phases of the time period and then slow economic recovery leading to sluggish employment growth expected between 2008 and 2020.

The TAZs projected to experience the largest employment growth—additions of 5,000 jobs or more—are primarily located in the cities of Irvine, Anaheim, Tustin, and Orange, all existing employment centers, which are projected to continue to grow as major employment centers (see Figures 37 and 38).

Orange County employment density in 2035 (jobs per acre) is projected to increase throughout the County (see Figure 39). Between 2008 and 2035, Orange County is projected to add 175,416 jobs, the majority of which will be added between 2020 and 2035. While southern regions of Orange County are projected to increase employment and experience employment densification, this will be comparatively small relative to those increases projected to occur in the northern and central regions of the County. Significant employment growth is projected to occur predominantly in the cities of Anaheim and Irvine (see Figure 40). Mixed-use and single-use, higher-density developments will continue to play a large role as population levels increase with employment opportunities.

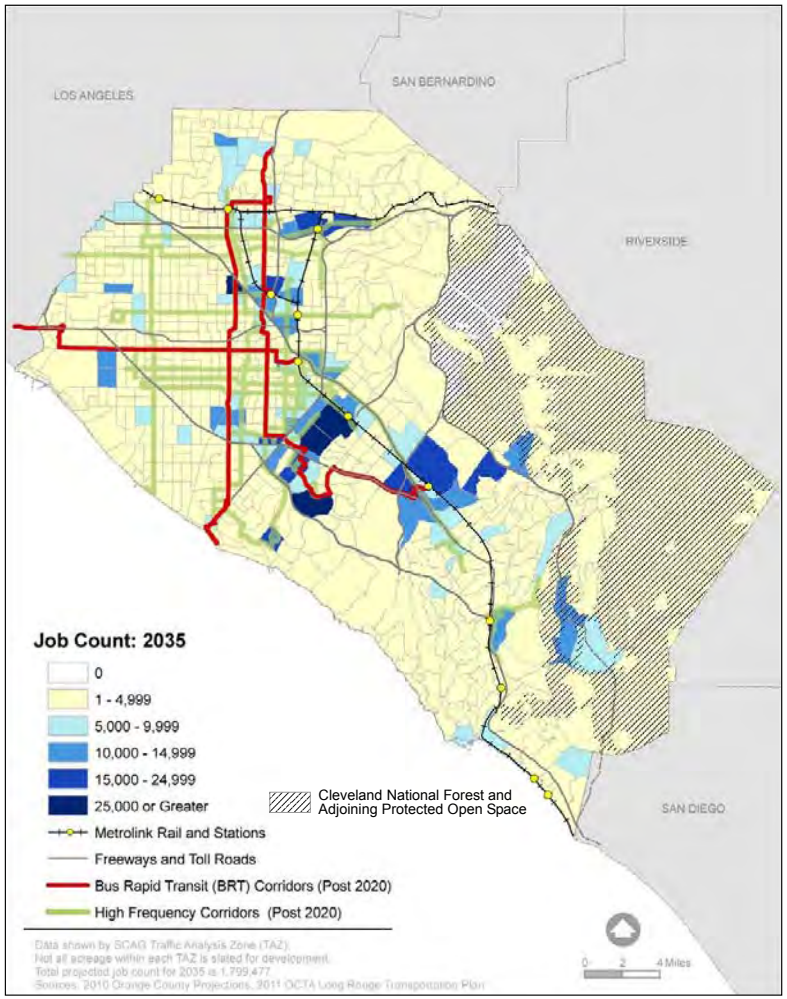

Figure 36 **Year 2035 Orange County Employment**

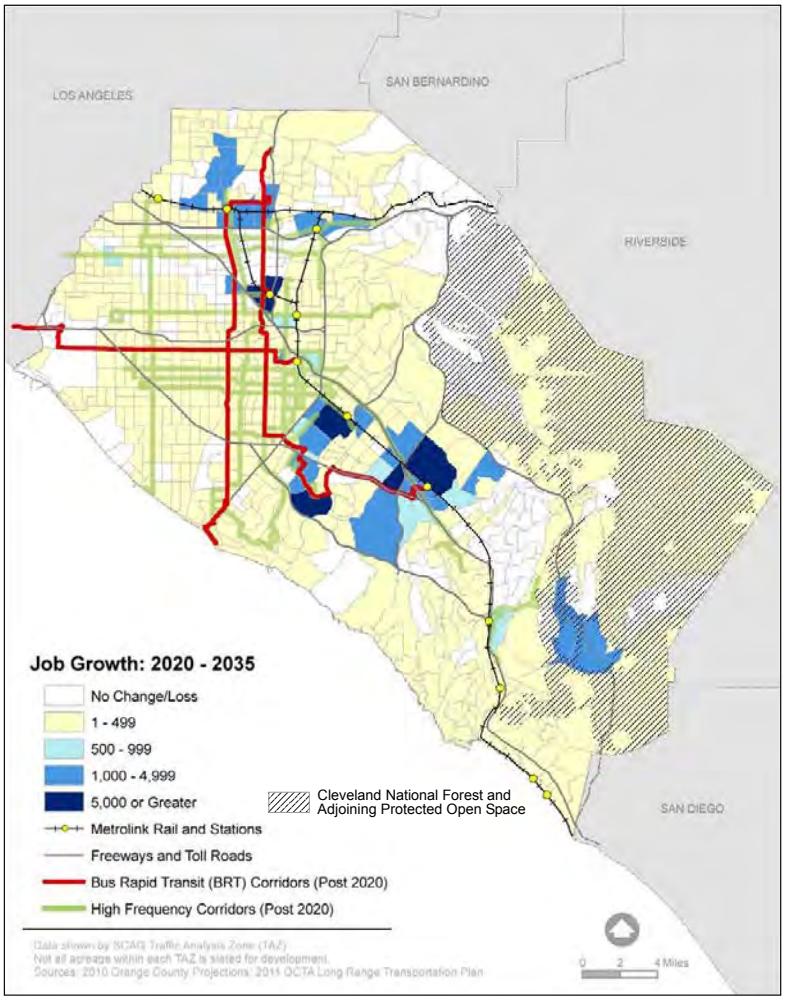

Figure 37 **Orange County Employment Growth 2020 - 2035**

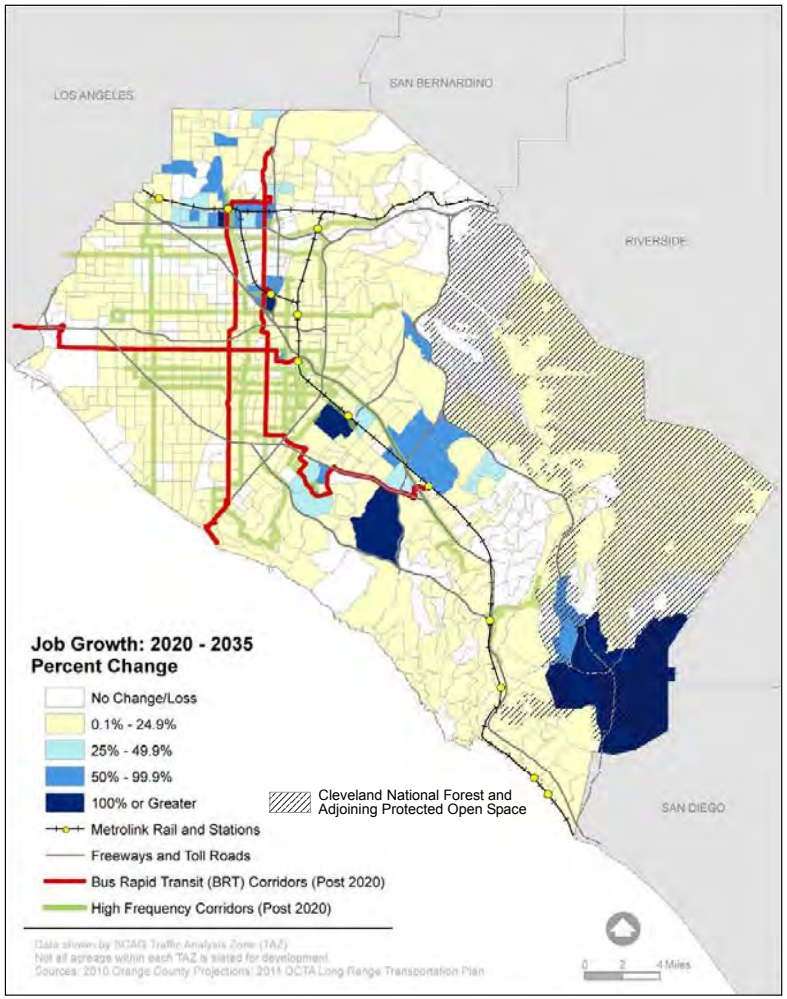

Figure 38 **Orange County Percent Change Employment Growth 2020 - 2035**

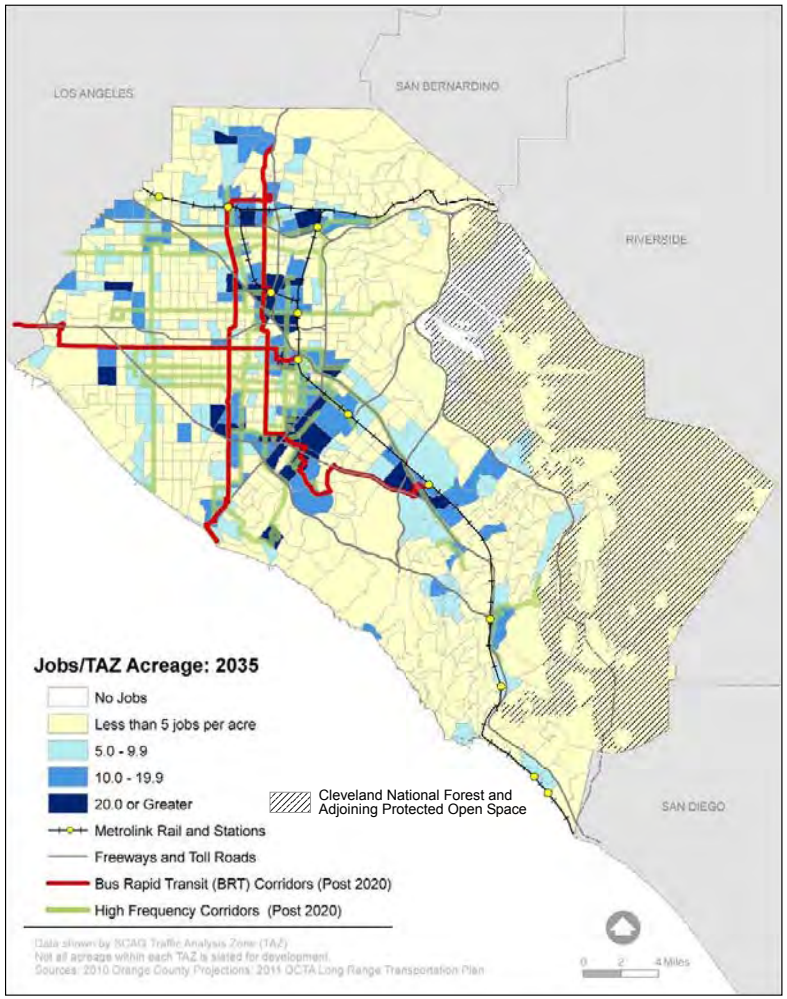

Figure 39 **Year 2035 Orange County Employment Density**

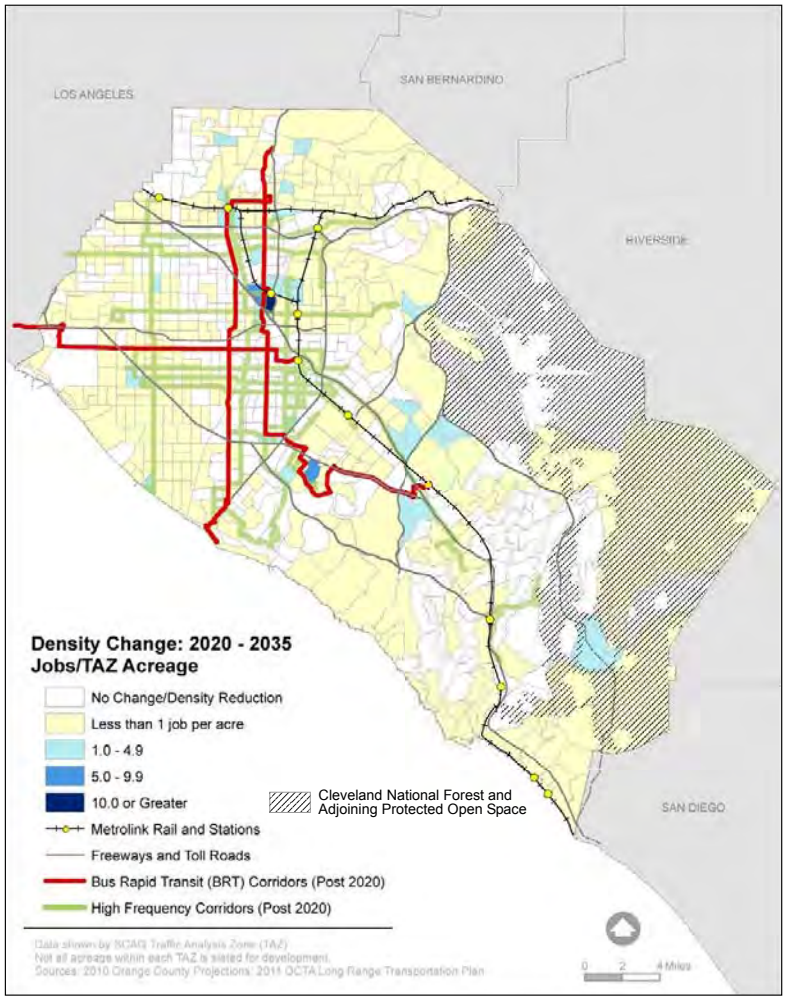

Figure 40 **Orange County Employment Density Change 2020 - 2035**

EMPLOYMENT CONCLUSION

Existing (2008) employment centers are located near major transportation nodes and routes, as commerce requires transportation infrastructure to thrive. Most Orange County employment is aggregated around the major highways (I-5, I-405, SR-22, SR-55, SR-57, and SR-91 freeways).

In more recent developments, job centers have tended to locate near transit stations or areas served by bus service and other transit options. The same trend is expected to occur for projected developments. Major growth in employment is projected to occur near Fullerton, Buena Park, Tustin, and around the Irvine Spectrum and the Anaheim Canyon, all near Metrolink stations. Toll roads also provide access to and from Anaheim and Irvine, both major receptors of future job growth and workers. Growth in employment will continue in these centers. This intensification will result in more of the working population proximate to High Frequency Corridors for rubber tire transit, as well as the Orange County Metrolink stops.

Intensification of employment centers also means increased density of land uses and the creation of synergies and opportunities to mix uses to satisfy a variety of needs. As mixed uses are developed within intense employment nodes, opportunities for pedestrian scale mobility are enhanced. Social and commercial needs, once satisfied only by passenger car due to distance, will be met by walking, cycling, or transit options.

CONCLUSION

Orange County's current and projected growth of population, housing, and employment near existing and future job centers will influence transportation patterns and therefore have the potential to be beneficial to GHG emission reductions.

Higher density vertical developments are being built in many Orange County jurisdictions, such as Anaheim's Platinum Triangle project. The construction of residential towers in Irvine, Anaheim, and Santa Ana illustrates that Orange County is indeed building "up." Such towers are part of a larger set of new developments built inside existing urban areas and known as infill developments. Infill developments may be anything from single-family homes to high-density residential complexes; the key is that they are built within existing urbanized areas, not on the periphery. Even before the start of these high-rise residential developments, many County jurisdictions experienced substantial increases in population density between 1990 and 2005. Gains in density can be attributed in part to jurisdictions' efforts to increase multi-unit housing, and/or to rezoning for higher and more efficient uses (referring to land uses or patterns that will

reduce regional GHG emissions from automobiles or trucks by fostering efficient usage of transportation resources and infrastructure).

Additionally, many Orange County jurisdictions have already begun the process of more strategic growth, with higher densities and housing development concentrated around employment centers, transportation nodes, and transit options. Of the projected net gain of 139,907 housing units in the County between 2008 and 2035, about two out of every three units to be built will be infill/redevelopment that will use and be supported by existing infrastructure. An estimated 51,663 units are planned to be built on raw land (36.9%), but the remaining 88,244 units (63.1%), will be infill or redevelopment projects, demonstrating Orange County's increasingly strategic growth. Further, 38,821 units (27.7%) of the 2008-2035 new housing total will be single-family detached units, while 101,086 (72.3%) will be attached units which tend to be more affordable to a wider range of the regional income spectrum.

Infill development will likely prove an asset for the already-prominent Orange County economy. Young professionals to retirees alike are turning from suburbs to urban areas to find ease of movement and access to services offered by dense, vibrant mixed-use areas. The County already has most of the infrastructure of an urban metropolis, and as revealed by the OCP-2010 data and analysis, the County also has tremendous potential for providing compact, mixed-use development.

In terms of employment, between 2008 and 2020, Orange County is projected to generate 22,376 jobs. Research by Dr. John Landis, Chair of the City and Regional Planning Department at UC Berkeley, and other housing experts and planners, finds that a healthy ratio of housing to jobs is one housing unit for every 1.5 jobs. This ratio is also affirmed as a benchmark by Workforce Housing Scorecards created for Orange County, San Diego County, and Los Angeles County. Workforce housing is housing supply, type, and affordability sufficient to adequately house the broad spectrum of workforce employed in the region. Orange County is expected to create approximately one new housing unit for every 0.34 jobs, which is greater than the projected employment growth that will be required between 2008 and 2020. Between 2008 and 2035, Orange County is projected to create one housing unit for every 1.25 new jobs, resulting in a 2035 total of one housing unit for every 1.53 jobs, nearly matching the standard healthy ratio of 1.0 housing unit for every 1.5 jobs.

MEETING ORANGE COUNTY'S HOUSING NEEDS

The projected growth in Orange County housing units between 2008 and 2035 is sufficient to house the anticipated population growth in the subregion. In fact, Orange County will create more housing units than employment growth will require: one housing unit per 3.12 Orange County residents by 2020 and one housing unit per 1.50 jobs (one housing unit created for every 0.34 jobs created between 2008 and 2020).

The same is true for housing growth between 2008 and 2035. During this time period, Orange County is projected to create one housing unit for every 1.25 new jobs and one housing unit for every 3.28 new residents, resulting in a 2035 total of one housing unit for every 3.02 Orange County residents and one housing unit for every 1.53 jobs.

Of the new housing units created between 2008 and 2035, fully 63% will be created through infill or redevelopment projects. Further, 72% of the total housing units will be attached units, which tend to be more affordable to a wider range of the regional income spectrum.

Based upon Orange County's projected population and job growth, Orange County's projected housing unit supply growth is more than sufficient to meet the subregion's 8-year projected growth. Additionally, it is anticipated the mix and type of units identified through the OCP process will be ample to meet the needs of all income segments of Orange County's population.

Housing growth envisioned in the OC SCS is intended to be consistent with the SCAG region's Regional Housing Needs Assessment (RHNA). However, because the draft RHNA for the SCAG region will not be released until August 2011, it is not possible to address the RHNA or its context with the State housing goals in the OC SCS that is due to SCAG in June 2011. Therefore, it is anticipated that the RHNA and State housing goals will be addressed in SCAG's Regional SCS.

CHAPTER 2: EXISTING TRANSPORTATION SYSTEMS

INTRODUCTION

Orange County's population, housing, employment, and the transportation systems that support them are intricately connected. This chapter describes the transportation systems in place as of 2008, which are both foundational and influential to the socio-economic trends described in the previous chapter.

SB 375 requires the regional SCS to be included in the RTP. The base year for the 2012 RTP is 2008. For consistency, this year—2008—is also the base year for the subregional and regional SCSs. As outlined in the MOU between SCAG, OCCOG and OCTA, the OC SCS uses OCTA's LRTP to define the 2008 base year transportation system.

FREEWAY SYSTEM

Orange County's (County) travel network is anchored by an extensive freeway system that includes toll roads, express lanes, and the most comprehensive HOV network in the nation. As of 2008, the freeway system consisted of 1,100 lane miles of general-purpose travel lanes and 230 lane miles of HOV lanes. The system also included over 280 lane miles of toll roads and 40 lane miles of express lanes. Over 19 percent of the County's freeway system is comprised of priced facilities, the most sophisticated priced transportation network in California. Figure 41 illustrates the existing 2008 freeway system, which totals approximately 1,650 lane miles. The existing freeway system experiences high levels of congestion and delay during peak hours. According to the Orange County Long Range Transportation Plan, only half of the freeway system operates at the minimum acceptable level of service (LOS D), while the other half operates at or above capacity (14 percent at LOS E and 33 percent at LOS F), where speeds and travel times are highly impacted.

Orange County Sustainable Communities Strategy

Figure 41 Existing (2008) Freeway System

ARTERIALS AND LOCAL ROADS

The freeway system is complemented by an arterial roadway system that serves both regional and local travel. Since 1956, the Orange County Master Plan of Arterial Highways (MPAH) has served as the guiding plan for future roadway improvements. The existing 2008 number of lanes over the MPAH is illustrated in Figures 42A and B. Today, the arterial roadway system carries approximately one-half of the daily vehicle miles traveled in the County.

The arterial roadway system also experiences congestion during peak periods. About 10 percent of the system operates at or near capacity. The performance of the countywide system is also affected by the condition of the streets and roads. Potholes and damaged roadway infrastructure can reduce the operational capacity of roads, slow traffic, and contribute to traffic incidents. Local jurisdictions monitor the pavement conditions through a Pavement Management Plan, which is adopted and updated on a biennial basis.

RAIL AND BUS TRANSIT

The County is served by a commuter rail network (Metrolink) that provides both north-south and east-west service on three routes extending past the County's boundaries (Figure 43). The Southern California Regional Rail Authority (SCRRA) is the regional commuter rail agency for Southern California, and operates Metrolink commuter rail service as a joint powers authority (JPA) comprised of the transportation agencies in Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties. Metrolink and Amtrak services connect Orange County to San Diego, Los Angeles, Riverside, Ventura and San Bernardino Counties. Amtrak's Pacific Surfliner inter-city rail service and Thruway Bus also operates in Orange County, serving stations in Fullerton, Anaheim, Orange, Santa Ana, Irvine, Laguna Niguel/Mission Viejo, San Juan Capistrano, and San Clemente, and has instituted limited stop service to improve cross-regional travel time. The California Department of Transportation Division of Rail manages and coordinates the intercity Amtrak rail passenger services in the region.

OCTA and local bus transit providers offer over 80 bus routes serving commuters that begin or end their trip within the County, as well as travelers within the County that need local and express bus services. OCTA operates 40 local fixed routes, 14 community and shuttle routes, five intra-county express routes, 13 StationLink Metrolink rail feeder routes and five inter-county express routes. In some cities, such as Anaheim, Brea, Buena Park, Irvine, Laguna Beach, and Laguna Woods, OCTA bus service is complemented by service provided locally, expanding the transit options available to County residents and commuters. Additionally, private providers of bus service and shared ride shuttles such as Greyhound, Disneyland Resort Express, and Airport Shuttle operate in Orange County. Public transit agencies serving adjacent counties also provide limited service into Orange

Orange County Sustainable Communities Strategy

Orange County Sustainable Communities Strategy

Figure 42B Existing (2008) Arterial Highways (South County)

Orange County Sustainable Communities Strategy

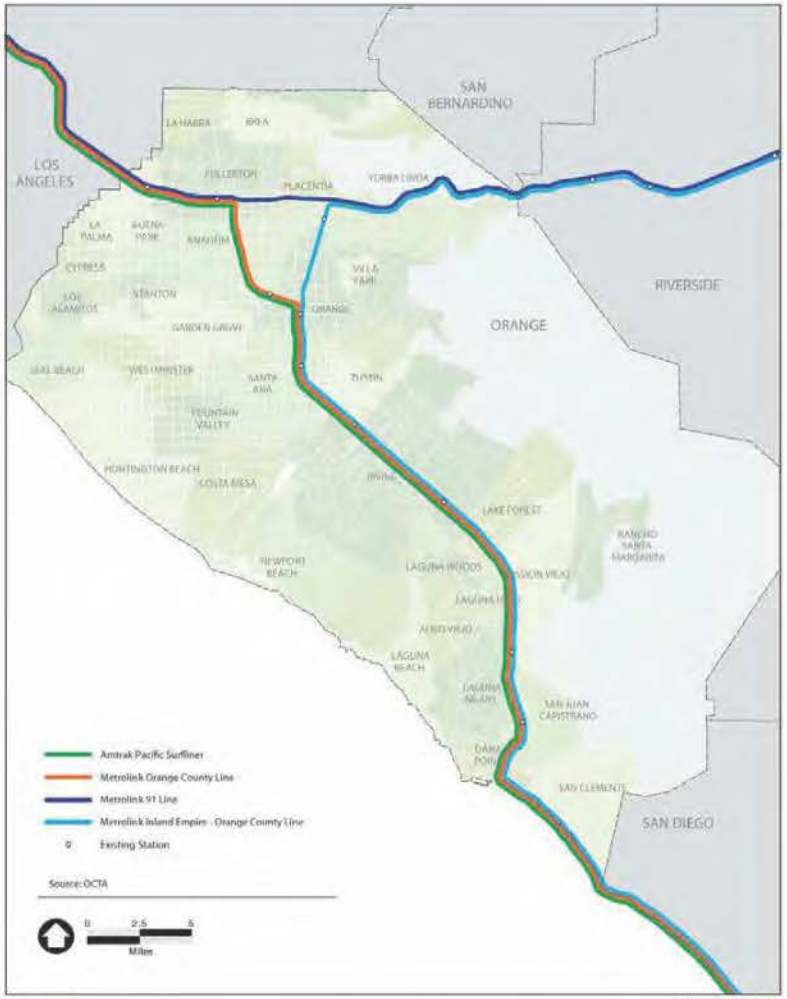

Figure 43 Existing (2008) Commuter Rail Network

County including Los Angeles Metro, Long Beach Transit, Norwalk Transit System, Foothill Transit, Riverside Transit Agency, and North County Transit District.

While there have been extensive investments in commuter rail and transit bus services within Orange County, ridership on public transit has declined during the recent economic crisis. The losses in sales tax and state funding revenues dedicated to transit operations, when combined with the decrease in fare revenue, created a need to reduce bus service levels by about 20 percent between 2008 and 2010.

BIKEWAYS

Orange County's transportation system includes over 1,000 miles of bikeways linking residential communities to employment and activity centers, and to transfer points to other types of transportation (Figures 44A and B). There are three classes of bikeways with different levels of infrastructure complexity. Class I bikeways are off-street paved bike paths which may be shared with pedestrians. Nine percent of the Orange County bicycle network are Class I bikeways. Class II bike lanes are on-road striped and signed bicycle lanes. Class II bike lanes comprise 65 percent of the Orange County bicycle network. Class III bike routes are on-road signed bicycle routes shared with automobiles. Class III bike routes represent 26 percent of the Orange County bicycle network. The bikeway network is denser in the coastal cities and in South Orange County. Bikeways connect business centers to residential areas in some jurisdictions including Irvine, Costa Mesa, and Newport Beach, and provide several good connections to Metrolink stations south of State Route 55 (SR-55).

All OCTA buses are equipped with bicycle racks, located at the front of the vehicle, with capacity to carry two bicycles at a time, expanding the number of potential destinations that can be reached by bicycle. Additionally, all iShuttle buses – which serve the Tustin Metrolink station - have bike racks. Bicycle lockers at Metrolink stations and bicycle racks on Metrolink trains provide safe and secure storage and transport of bicycles for train riders using a bicycle as an access mode to transit. These amenities encourage bicycle use by commuters.

PEDESTRIAN PROGRAMS

Pedestrian friendly environments improve the efficiency and connectivity of other modes of transportation, such as transit. A safe and attractive walking environment also furthers the goals of environmental sustainability by supporting reduced automobile dependence.

While not all public thoroughfares have sidewalks, there are many miles of sidewalks and walkways throughout Orange County that allow pedestrians to complete their trips without the use of motorized vehicles. Progress is being made in adding sidewalks to

Orange County Sustainable Communities Strategy

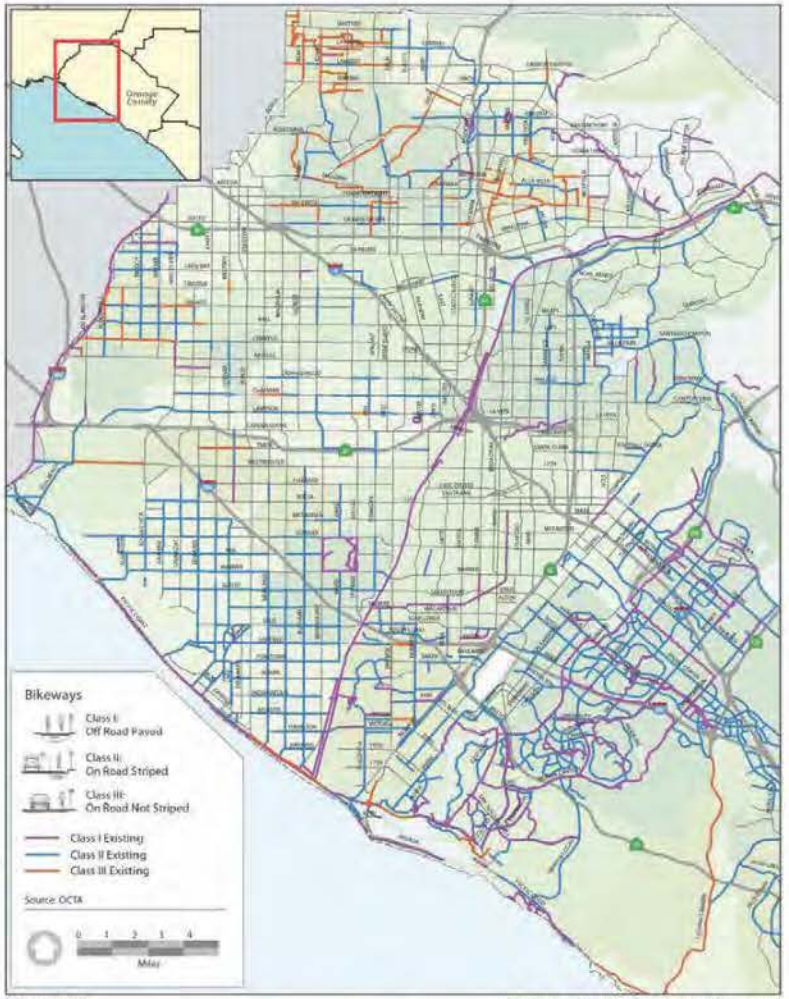

Figure 44A Existing (2008) Commuter Bikeways (North County)

Figure 44B Existing (2008) Commuter Bikeways (South County)

commercial areas that lack them, and in removing obstacles to pedestrian travel where they exist.

OCTA recently incorporated the requirements of the Complete Streets Act into the MPAH guidelines for roadway design and cross sections. This Act requires that jurisdictions' general plan circulation elements and transportation plans meet the needs of all roadway users, including pedestrians, bicyclists and transit users. These requirements will be reflected in the buildout of the MPAH proposed as part of the LRTP Year 2035 Preferred Plan.

DEMAND-RESPONSIVE SERVICES AND TRANSPORTATION DEMAND MANAGEMENT

The County's multi-modal transportation system includes other transportation-related services and programs that reduce demand for auto travel, increase the efficiency of the system, meet legal requirements, and mitigate impacts of freeways on adjacent communities:

- **Paratransit Service:** Demand-responsive transit services are provided for seniors, disabled, and other populations through ACCESS Services. This includes curb-to-curb service (standard), door-to-door service, and same-day taxi service, and meets the requirements of the Americans with Disabilities Act (ADA).
- **Taxi Operations:** The Orange County Taxi Administration Program (OCTAP) is responsible for issuing permits, controlling the number of providers, performing security checks, and monitoring insurance compliance for taxi companies in Orange County. The countywide system in 2010 consists of 25 companies and over 820 taxicabs.
- **Park-and-Ride Services:** Park-and-ride facilities encourage ridesharing, vanpooling, and transit use by providing transit users with a convenient centralized location to meet and connect with various transportation services. Park-and-ride facilities are located throughout Orange County. Park-and-ride facilities are publicly owned either by Caltrans, OCTA, or a local jurisdiction. Many of these facilities are located adjacent to a transit center or Metrolink station, expanding access to alternative transportation modes. Other sites are located on private property, typically in a parking lot owned by a religious institution or other use with low parking demands on weekdays, and leased by a public agency.
- **Rideshare Services:** OCTA participates in regional programs that provide support for carpools, vanpools, and other services that encourage ridesharing. This includes customer call centers, cross-county databases that link individuals

to carpools and vanpools, and support material (e.g., marketing, promotions, and training). A 2007 vanpool program has resulted in the creation of over 300 vanpools that have served over 230 destinations in the County.

- **Southern California 511 Motorist Aid and Traveler's Information System:** The Southern California 511 Motorist Aid and Traveler's Information System (MATIS) is a free traveler information service and provides traffic, transit, and commuter service information via toll-free number or website. The system was launched in Southern California in June 2010.
- **Freeway Call Boxes/Motorist Aid:** OCTA helps fund a network of freeway services to assist motorists in distress. Its call boxes, situated on freeway shoulders at intervals of a quarter mile, provide stranded motorists with the ability to access emergency services. In addition, OCTA funds a network of freeway service patrol tow trucks that monitor freeways to remove stalled vehicles from freeways and minimize the traffic jams that can severely hamper the functioning of the freeway system.

CHAPTER 3: STRATEGIES TO REDUCE GREENHOUSE GAS EMISSIONS

INTRODUCTION

The OC SCS coordinates transportation and land use planning in order to contribute to the reduction of GHG emissions in the SCAG region. This chapter begins with a brief review of practices already occurring in Orange County that integrate land use and transportation elements, or that are known to reduce or avoid the creation of GHG emissions. This is followed by the proposed strategies, collectively called sustainability strategies, set forth by this OC SCS to reduce GHG emissions.

A HISTORY OF INTEGRATING LAND USE AND TRANSPORTATION AND IMPLEMENTING ACTIVITIES

The integration of land use and transportation is not new to Orange County. Examples of integrated planning and community development efforts in Orange County abound; several are described below. On one hand, significant development-related planning has occurred tying a broad range of infrastructure—including transportation—to development. On the other hand, significant transportation-related planning has also occurred whereby land uses are developed and created to maximize the use of transportation systems, such as transit-oriented development near Metrolink routes and development of housing and employment centers along major arterials.

Planned Communities

A significant portion of Orange County was developed as part of master planned communities, where—on a large-scale basis—specific attention was given to the relationship between the planned land uses and the infrastructure needed to support those uses, from transportation to water and waste, to recreation and open space. Examples of planned communities in Orange County that integrated transportation and land use planning include the City of Aliso Viejo, City of Irvine, City of Mission Viejo, City of Rancho Santa Margarita, and the communities of Anaheim Hills, Coto de Caza, Tustin

Ranch, Talega, and Ladera Ranch. Within these communities the integration of transportation into the overall plan was an explicit planning objective. The linkage of transportation and land use minimizes the effects of vehicle travel within these communities.

Traditional Neighborhoods

Many of the older neighborhoods of Orange County were built before car travel was common. Most Orange County cities with historic downtowns still retain patterns of compact development, grid-pattern streets, live-work mixed uses, pedestrian access to local services and neighborhood grocery stores, and most are served by rail or bus service.

Master Plan of Arterial Highways

The MPAH was established in 1956 and is continuously updated to reflect changing development and traffic patterns throughout the County. The MPAH defines a network of surface roadways, showing both built and planned arterial streets that are necessary to serve existing and planned land uses in the County. OCTA is responsible for administering the MPAH, including the review and approval of amendments requested by local agencies. In order to be eligible to receive Measure M2 (M2) funds, cities and the County must ensure their local circulation elements are consistent with the MPAH.

In response to the State of California's recent passage of the Complete Streets Act, OCTA recently amended the MPAH guidelines to encourage local jurisdictions to consider and evaluate all mobility needs when requesting modifications to the MPAH.

Congestion Management Program

With the passage of the Proposition 111 gas tax increase, in 1990, came the requirement for urbanized areas in California to adopt a Congestion Management Program (CMP). The Orange County CMP is regularly updated every two years by OCTA to address and monitor transportation system performance issues. The CMP includes elements developed in coordination with local jurisdictions, the California Department of Transportation, and the South Coast Air Quality Management District. These elements aim to effectively manage traffic congestion and improve regional mobility and air quality. They include the following:

- Traffic LOS Standards
- Transit Service Performance Measures
- Promotion of Transportation Demand Management
- A Capital Improvement Program

- A Land Use Impact Analysis Program
- Deficiency Plan Procedures

Every two years, OCTA monitors local conformance with the CMP. In 2009, OCTA found that all local jurisdictions were in conformance with the CMP. To ensure consistency among CMPs within the SCAG region, OCTA submits each biennial update to SCAG. As the regional planning agency, SCAG evaluates consistency with the Regional Transportation Plan and with the CMPs of adjoining counties, and incorporates the program into the Federal Transportation Improvement Program, once consistency is determined.

OCTA's Mitigation and Resource Protection Program (MRPP)

M2 includes a comprehensive Environmental Mitigation Program that provides landscape-level mitigation to offset environmental impacts for the 13 freeway improvement projects using five percent of M2 freeway program revenue. OCTA is implementing the mitigation program through a collaborative partnership with CDFG, USFWS, Caltrans, and the environmental community.

The M2 mitigation program was among a handful of projects identified by the OCTA Board of Directors that allowed for early planning, advance funding, and implementation. Approximately $42 million has been authorized for the acquisition and long-term management of natural lands as part of the M2 Environmental Mitigation Program. As of June 2011, OCTA has purchased four properties totaling approximately 900 acres through this program (Saddle Creek South ≈ 84 acres, Hayashi ≈ 296 acres, O'Neill Oaks ≈ 119 acres, and Ferber Ranch ≈ 399 acres).

Additional funds are anticipated to be available in the future; the specific amount of funds available will be dependent on the revenue stream from the sale tax measure. A suite of the most biologically valuable properties and those that most closely align with the freeway impacts are under consideration and/or negotiation. This program is conducted through a voluntary process, similar to private open market transactions. Offers have been made to a number of properties and it is conceivable that the initial funding allocation could yield over a thousand acres of acquired open space properties throughout Orange County. OCTA will receive streamlined permits from the resource agencies for its freeway projects.

These protected open space areas provide GHG emissions reduction benefits, by promoting densification of urban areas and impeding sprawl. More compact development encourages fewer, shorter trips, which also help reduce greenhouse gas emissions associated with passenger vehicles.

TCA's Open Space Mitigation Programs

The TCA has an existing 2,200-acre open space mitigation program that is integral to the development of the 67-mile public toll road network. This open space mitigation program includes the Live Oak Preservation Area, Chiquita Canyon, Bonita Creek and portions of Limestone Canyon.

In 1996, TCA placed a conservation easement over a 1,182 acre area, known as Upper Chiquita Canyon. The conservation area was originally planned for development as a golf course and residential area. The TCA has been actively managing the site since 1996 and increasing its habitat values. In 2005, TCA acquired the Live Oak Preservation Area, a 23.2-acre site that sits east of the 241 Toll Road at El Toro Road and Live Oak Canyon. The Bonita Creek Mitigation Site comprises approximately 40 acres of wetland and coastal sage scrub, and is the main wildlife link from Upper Newport Bay to the San Joaquin Hills. The Cactus Wren Habitat Linkage and Restoration Project includes planting cactus in a habitat corridor used by the federally threatened California gnatcatcher bird along the wildlife linkage area that parallels the 73 Toll Road from Upper Newport Bay south through Bonita Channel to Coyote Canyon.
These protected open space areas provide GHG emissions reduction benefits from carbon sequestration. As described above, extensive protected open space contributes to a more compact development form for Orange County, which encourages infill development and fewer, shorter trips, which also help reduce greenhouse gas emissions associated with passenger vehicles.

SUSTAINABILITY STRATEGIES

Particular to the development of the OC SCS, local jurisdictions throughout Orange County were polled about the strategies and policies employed within their cities or the unincorporated areas of the County of Orange. Collectively, they used over 30 different tiered measures tied to reducing greenhouse gas emissions. Many of these measures relate to reducing vehicle miles traveled, such as approving compact building designs with a mix of uses, improving the accessibility of housing to transit, and increasing housing densities within or adjacent to employment. Other measures promote green building and efficiencies, such as developing model green development and green building laws or enhancing energy efficient code enforcement.

Key sustainability strategies related to land use and transportation employed within Orange County are provided below. A listing of Sustainability Strategies being practiced in Orange County is provided in Appendix F. Existing and planned land uses for all

jurisdictions comprising Orange County are provided in the General Plans for jurisdictions, included as Appendix I.

OC SCS Sustainability Strategy A:
Support Transit-Oriented Development.

Creating development around a transit hub can increase people's access to and use of transit. This may shift trips from cars to transit leading to reduced vehicle trips, vehicle miles traveled and greenhouse gas emissions. Several land use actions can support transit-oriented development, including mixed-use development within walking distance of transit facilities, increasing housing density near transit, increasing employment density near transit, and providing transit-oriented amenities. Further, transit agencies may provide new or increased service to a transit hub, positively compounding the use of transit and reduction in vehicle trips. (Sources: ***Draft Policy Brief on the Impacts of Transit Access***, Gil Tal and Susan Handy, UC Davis and Marlon G. Boarnet, UC, Irvine for California Air Resources Board, 2010; and ***Driving Change: Reducing Vehicle Miles Traveled in California***, Louise Bedsworth, Ellen Hanak, Jed Koiko, Public Policy Institute of California, 2011.)

The Metrolink Service Expansion Program (MSEP) will increase the frequency of mid-day rail service through the core of Orange County. This program is expected to begin implementation in 2011. The Measure M2 Go Local Program (M2) (described in greater detail below) will address increases in demand induced by the rail improvements through development of feeder services between rail stations and key destinations. OCTA is also undergoing the Transit System Study to determine where and how to increase public transportation service oriented to existing and future land use and maximizing ridership.

In Orange County, seven jurisdictions report having implemented transit-oriented development policies. New development has already occurred adjacent to, and taking advantage of, transit infrastructure in many jurisdictions. Examples include the following:

- Founders Walk in Buena Park
- SoCo Walk in Fullerton
- The Platinum Triangle in Anaheim
- Depot Walk in Orange
- The Transit Zoning Code in Santa Ana

OC SCS Sustainability Strategy B:
Support infill housing development and redevelopment.

Developing new housing in existing urbanized areas—also known as "infill development"—helps to avoid urban sprawl. Because the majority of Orange County is already developed, and there is limited vacant, buildable land, when infill housing development occurs, it creates an overall increase in housing density throughout the County. As recently as 2004, almost 50% of new residential development in Orange County was infill housing, primarily multiple-family dwelling units. This trend is expected to continue in the future, with 63% of housing units projected from infill or redevelopment between 2008 and 2035.

Infill development can help reduce the number of miles residents have to travel between home and work or other activities, which in turn reduces freeway and arterial congestion and related GHG emissions. Increased housing density has been linked to reduced vehicle travel and related GHG. Policies that support increased housing infill development and residential density therefore support reduced vehicle miles traveled (VMT) and reduced GHG.

Jurisdictions may promote higher residential densities through combinations of infrastructure, zoning, or public finance policies that encourage higher densities—for example, relaxing minimum lot size requirements, increasing the density of allowed development, or focusing development around transit stations. (Source: ***Draft Policy Brief on the Impacts of Residential Density***, Susan Handy, UC Davis and Marlon G Boarnet, UC, Irvine for California Air Resources Board, 2010)

In Orange County, several jurisdictions have adopted land use policies that support infill development and increased housing densities. Seven jurisdictions have reported General Plan policies to add new housing and jobs within a half mile of existing or planned transit stations. Twelve cities have General Plan policies that allow increased residential or commercial density near transit. And twelve cities have General Plan policies that promote accessibility of housing to transit.

OC SCS Sustainability Strategy C:
Support mixed-use development and thereby improve walkabilty of communities.

Jointly developing different types of land uses together within a building, a set of buildings or a specific area is referred to as "mixed use" development. Locating land

uses such as housing, essential neighborhood-serving retail, and employment together may result in shorter distances between individuals' destinations. This facilitates both lower VMT and the use of non-motorized transportation such as walking and biking. (Source: ***Draft Policy Brief on the Impacts of Land Use Mix***, Steve Spears and Marlon G. Boarnet, UC Irvine and Susan Handy, UC, Davis for California Air Resources Board, 2010.)

Nineteen Orange County jurisdictions have developed or planned mixed use communities with housing, employment, retail and recreational facilities co-located. A total of 20 jurisdictions have General Plan policies supporting horizontal or vertical mixed use. Some jurisdictions have created "walkable communities" designed specifically to promote pedestrian use as an alternative to automobile travel. Nineteen jurisdictions have General Plan policies to improve the pedestrian environment through either beautification or facilities construction. Projects to improve the pedestrian environment are ongoing in 25 Orange County jurisdictions.

OC SCS Sustainability Strategy D:
Increase regional accessibility in order to reduce vehicle miles traveled.

Regional accessibility is the ease with which destinations can be reached throughout a region; it encompasses both the proximity of housing to potential destinations like employment, shopping and recreation, and the transportation links to those destinations. Higher regional accessibility results in shorter travel distances on roadways to potential destinations, thereby reducing VMT. When there is higher regional accessibility via a transit system, residents may choose transit or another mode over using an automobile. On the other hand, higher regional accessibility can increase trips, so this may lead to more vehicle miles traveled. In short, the significance of the impact of regional accessibility on VMT depends on the combination of these different effects. (Source: ***Draft Policy Brief on the Impacts of Regional Accessibility***, Susan Handy and Gil Tal, UC Davis and Marlon G. Boarnet, UC Irvine for California Air Resources Board, 2010).

An example of regional accessibility is seen in the Coto de Caza General Store. This store, which has been in existence for over 20 years, serves the community as a local grocery store and deli. While this may seem a commonplace element of any number of neighborhoods in Orange County, it illustrates the importance of the proximity of housing (in the neighborhoods close to the general store) to potential destinations (the grocery/eatery) thereby reducing the need for vehicle trips for residents to pick up household essentials. Regional accessibility is influenced by historical land use and

transportation patterns, which may be preserved and enhanced through land use and transportation policies.

OC SCS Sustainability Strategy E:
Improve jobs to housing ratio.

The concept of creating an improved ratio of jobs to housing suggests that when residence and work locations are closer together, people's travel distance to and from work will be reduced. This, in turn, will reduce vehicle-related greenhouse gas emissions. Policies related to an improved jobs-housing ratio are intended to shorten commute distances (this strategy focuses on work travel as opposed to shortening all travel as described in the regional accessibility strategy described above). Fourteen Orange County jurisdictions have General Plan policies to increase housing density near employment areas. Factors influencing jobs-housing ratio include the necessary match between worker skills and type of jobs, as well as other amenities that might attract residents to a specific area. However, studies show an association between an improved ratio of jobs to housing and reduced VMT. (Source: ***Draft Policy Brief, Impact of Jobs-Housing Balance on Passenger Vehicle Use***, Marlon G. Boarnet and Hsin-Ping Hsu, UC Irvine and Susan Handy, UC Davis for California Air Resources Board, 2011.)

OC SCS Sustainability Strategy F:
Promote land use patterns that encourage the use of alternatives to single-occupant automobile use.

This strategy covers multiple activities undertaken by local jurisdictions. Strategies range from constructing pedestrian and bicycle facilities and improving linkages between these facilities to implementing site planning and design strategies that promote alternative transportation, to parking preferences for rideshare vehicles to support of transit facilities and amenities.

Because a large number of practices fall within this strategy, a few have been selected to highlight parking strategies and bikeway/pedestrian facilities:

- Expansion of parking facilities at all Metrolink stations as part of Metrolink Service Expansion Program.
- Incentivizing affordable housing projects through reductions in parking requirements in Anaheim.

- Preferential parking for alternative fuel vehicles in Huntington Beach.
- Completion of sidewalk system in the Irvine Business Complex as part of developer fee program.
- Promotion of bicycle sharing project in Garden Grove.
- Development of bicycle facilities plan in Newport Beach.
- Review of Downtown Specific Plan for human scale activity in Fullerton.

OC SCS Sustainability Strategy G:
Support retention and/or development of affordable housing.

Because available land is scarce in Orange County, housing will grow primarily in terms of increasing density. Increased housing density affords greater variety in housing type (i.e., multi-family, flat, apartment, condominium, high-rise, etc.) and increased supply contributes to housing affordability. Increasing the supply of affordable housing within Orange County may result in workers living closer to their jobs, thereby reducing vehicle miles traveled and urban sprawl. The densification of housing is forecast to accommodate population growth and locate residents proximate to employment centers, shopping and recreation opportunities and major transportation routes, including the High Frequency Corridors and Metrolink stations.

One of the sustainability strategies identified for reducing GHG emissions is a land use strategy for local jurisdictions to provide affordable as well as market rate housing. Among the jurisdictions that responded to the survey of sustainability strategies, 12 indicated they have completed projects within Orange County employing this land use strategy, and 18 additional jurisdictions report ongoing projects. There are 14 planned future projects that provide affordable housing and 20 local jurisdictions report General Plan policies that promote this strategy.

OC SCS Sustainability Strategy H:
Support natural land restoration and conservation and/or protection offering significant carbon mitigation potential via both sequestration and avoidance of increased emissions due to land conversion.

Leverage existing regional conservation efforts that lead to reduced carbon emissions. Superior resource management, restoration, and resource land protection are emerging means of emissions avoidance or reductions. This conservation or protection may occur through the purchase of natural resource lands. There are a multitude of

benefits and co-benefits for this strategy including decreased need for future infrastructure in less developed regions of the county; avoidance of construction, household, and infrastructure emissions; and avoidance of VMTs that would have been generated if the land was converted.

The OC SCS, by leveraging existing conservation efforts such as Renewed Measure M's Mitigation Program, can lead the way for strategic open space/resource protection as a means of reducing the County's carbon footprint and meeting the goals of SB 375. Through this strategy, local jurisdictions and other organizations may align their planning priorities and land use decisions together with funds necessary to purchase and preserve natural lands. Jurisdictions and organizations have the option to invest early in this open space strategy which offers both near-term and long-term GHG emissions avoidance benefits.

Another example of protected natural lands is the TCA's open space mitigation program described above, which includes the following protected natural lands:

- Cactus Wren Habitat Linkage and Restoration Project (Completed)
- Bonita Creek Mitigation Site (Completed)
- Chiquita Canyon Conservation Area (Partially Completed)
- Live Oak Preservation Area (Planned)

OC SCS Sustainability Strategy I:
Eliminate bottlenecks and reduce delay on freeways, toll roads, and arterials.

Freeway Vision

The freeway vision provides guidance for prioritizing freeway projects within the financially constrained Preferred Plan for the Orange County LRTP.

In order for the freeway vision to serve its intended purpose, and to make certain it contributes toward meeting the OC SCS goals and objectives, the following guiding elements are identified:

- Deliver committed projects, including M2
- Expand access for high-occupancy vehicles
- Improve freeway system operations
- Consider recent transportation studies
- Promote environmental sustainability
- Seek additional funding opportunities

Deliver Committed Projects, including M2

As of 2008, the Orange County freeway network has about 1,650 lane miles in operation, including HOV lanes and toll facilities. The voter-approved M2 program plans for numerous improvements to Orange County freeways, adding roughly 155 lane miles to the system.

Additionally, a number of freeway projects are not part of M2 but have funding commitments within the Federal Transportation Improvement Program. These committed projects will also enhance freeway accessibility and add about 100 lane miles to existing toll facilities and about 90 lane miles of new toll facilities. These improvements (Figure 45) will benefit every mode of travel on Orange County freeways, from single-occupant commuters to commercial truckers.

Expand Access for High-Occupancy Vehicles (HOV)

The continuous access HOV project on the Garden Grove (SR-22) Freeway opened to the public in May 2007, and was the first of its kind in Southern California. Since then, continuous access was expanded on the portion of the Costa Mesa (SR-55) Freeway, between the Riverside (SR-91) Freeway and the Santa Ana (I-5) Freeway. Figure 46 highlights the expansion of the continuous access HOV program. Additionally, through the committed improvements identified in the LRTP, OCTA plans to expand the HOV network by roughly 20 lane miles.

Priced Transportation Travel Options

The Orange County toll road and express lane network currently consists of the San Joaquin Hills Transportation Corridor (SR-73), portions of the Laguna Freeway (SR-133), the Foothill Transportation Corridor (SR-241), and the Eastern Transportation Corridor (SR-261), managed by the Transportation Corridor Agencies, as well as the OCTA-operated 91 Express Lanes on the Riverside (SR-91) Freeway. These facilities total about 325 lane miles and allow the traveling public the option to pay a fee in order to use a more direct and/or less congested route.

The committed improvements contained in the Orange County LRTP and the OC SCS will expand the toll network to roughly 520 lane miles. To leverage these committed investments, priority was given to projects that enhance connectivity between toll facilities in an effort to provide a seamless free-flowing network throughout the County.

Consider Recent Transportation Studies

In recent years, several major investment studies (MISs) have been completed for some of Orange County's most heavily-traveled corridors. MISs study multimodal corridors, collect input from elected officials and the public, and find consensus on a locally

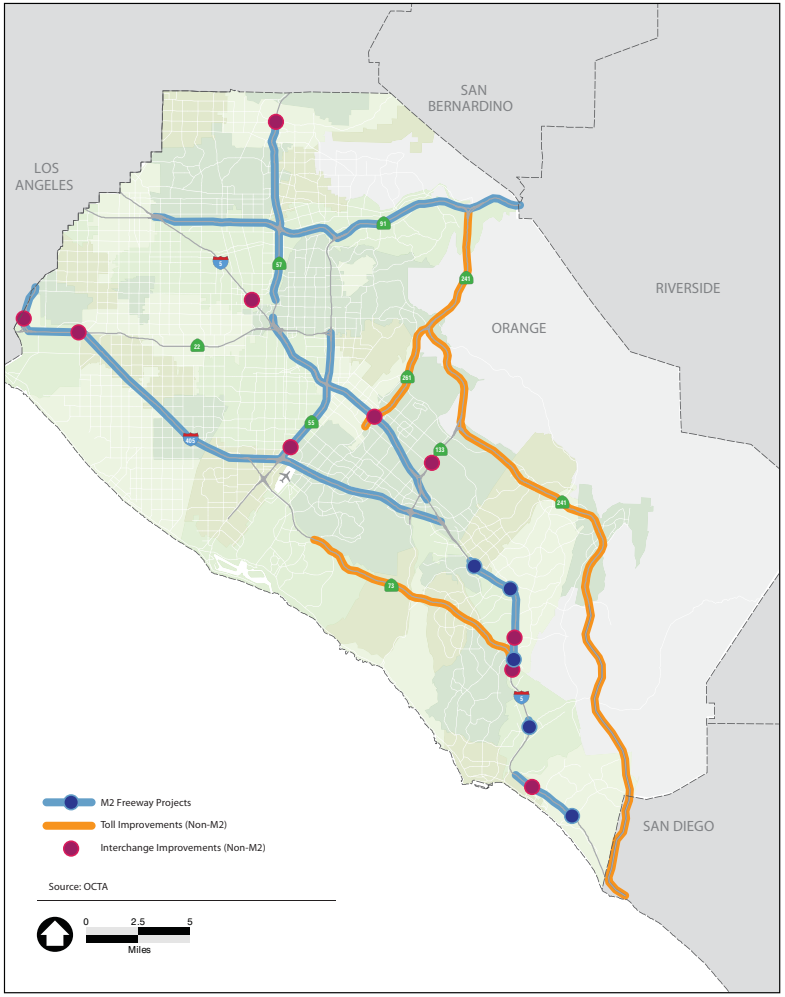

Figure 45 Orange County
Committed Freeway Improvements

Orange County Sustainable Communities Strategy

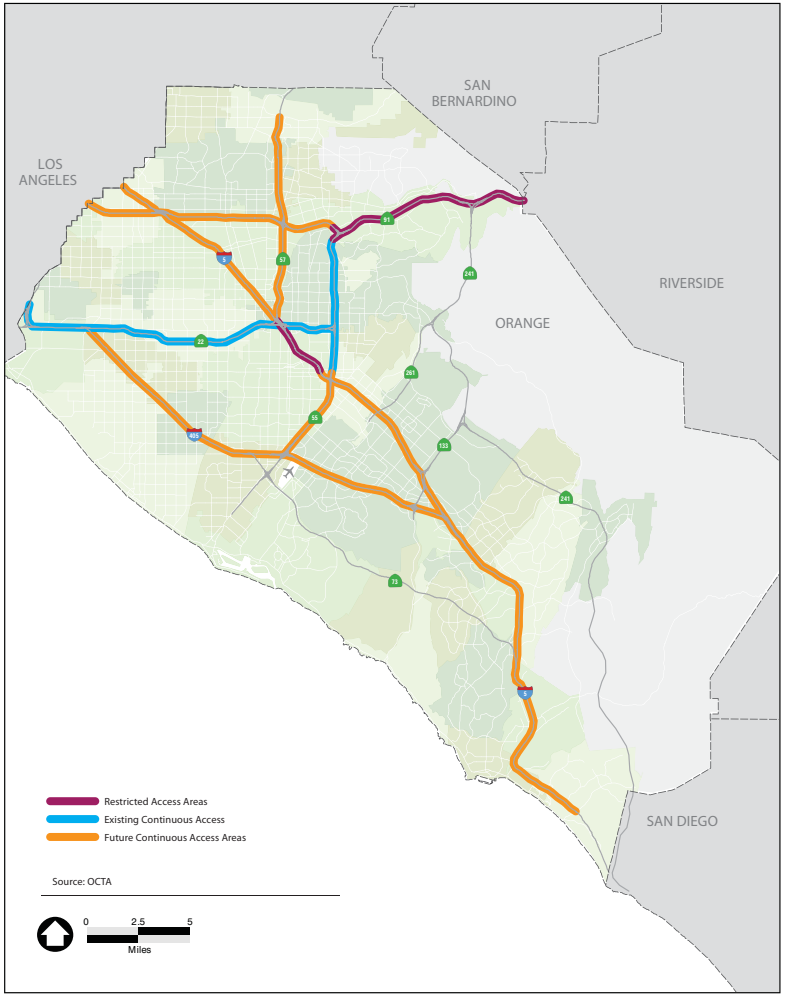

Figure 46 Orange County
Continuous Access HOV Program

preferred alternative that identifies the best projects for Orange County. In addition, Caltrans is currently completing a series of Corridor System Management Plans (CSMPs).

As a result of these studies, Caltrans and OCTA are cooperatively considering augmenting many freeway/tollway-related Transportation System Management (TSM)/Transportation Demand Management (TDM) investments. These investments could include, but are not limited to, increased support for park-and-ride lots, directional lanes, enhanced use of electronic message boards, and improved incident and event management strategies. The Orange County LRTP and OC SCS incorporate selected locally preferred alternatives from the OCTA MISs into the preferred and unconstrained plans. OCTA will also coordinate with Caltrans and consider the proposed improvements from the CSMPs.

Promote Environmental Sustainability

New state requirements for greenhouse gas emissions brought on by SB 375, along with previously existing air quality requirements, have brought environmental concerns to the forefront of planning. Pricing and other TDM and TSM methods will need to be looked at more closely in order for Orange County to contribute toward improving air quality. As previously mentioned, the M2 Mitigation and Resource Protection Program is providing for coordinated environmental benefits on a regional scale rather than a piecemeal project-by-project approach. The mitigation program is currently being implemented under an agreement among OCTA and state and federal resource agencies.

OC SCS Sustainability Strategy J:
Apply Transportation System Management and Complete Street practices to arterials and freeways to maximize efficiency.

Arterial Roadways

Streets and roads form the foundation of Orange County's transportation system. This transportation infrastructure provides residents and commuters with access to the County's freeway network, the OCTA bus system, and it connects residential neighborhoods to jobs, schools, and services.

Master Plan of Arterial Highways

The MPAH was established in 1956 to provide a roadmap for the implementation of a countywide network of roadways that follow consistent standards and design guidelines. Recently, OCTA completed the Regional Capacity Needs Assessment study, which

identifies priority street improvement projects that would be eligible for funding under M2 programs. M2, passed by Orange County voters in 2006, ensures the continuation of an important local funding source for the continued implementation of the MPAH.

The current MPAH reflects the existing roadway plans for the 34 Orange County cities and the County of Orange (Figures 47A and B). Implementation of the MPAH is essential to ensuring the mobility of Orange County residents and commuters into the future. Implementation of the MPAH, along with the complementary elements of the County-wide transportation network, results in a system that operates with improved levels of service when compared to 2008 conditions.

Complete Streets

In 2007 the State of California passed the Complete Streets Act. This act requires local jurisdictions to consider and evaluate the needs of all users of the roadway, including pedestrians, bicyclists, users of public transit, motorists, children, the elderly, and the disabled when they update their General Plans. Orange County cities will comply with the state law when updating the Circulation Elements of their General Plans. Some cities such as Santa Ana, Irvine, and Huntington Beach report they have already begun to adopt and implement a complete streets policy. In addition, OCTA recently amended the MPAH Guidelines to encourage local jurisdictions to consider and evaluate all mobility needs when requesting modifications to the MPAH.

Traffic Light Synchronization Master Plan

In the past, the traffic signals on individual roadways could be coordinated within the boundaries of a particular city, but not necessarily across city limits to the neighboring city. OCTA and local jurisdictions have initiated the Traffic Light Synchronization Master Plan, targeting key roadway corridors throughout Orange County for the implementation of a regional traffic signal synchronization program.

OCTA recently conducted two traffic signal synchronization demonstration projects to examine the potential benefits of regional traffic signal synchronization. Oso Parkway in South County and Euclid Avenue in North County were designated as the demonstration corridors for this program. Both projects showed substantial improvements to travel time and congestion levels within the individual corridors. The success of these demonstration projects led to the development of the Traffic Light Synchronization Master Plan and the identification of a County-wide network of synchronized corridors, allowing for more efficient travel across multiple jurisdictions.

Further, all Orange County jurisdictions adopted a local signal synchronization plan identifying traffic signal system routing consistent with the Regional Traffic Signal Synchronization Master Plan. The implementation of this plan begins with 10 regional

corridors. Eventually, signal synchronization will be implemented along 750 miles of roadways and at over 2,000 intersections (Figure 48). Completion of the traffic signal synchronization projects is a key element of the LRTP and these improvements are funded by M2, local match requirement, and Proposition 1B.

Roadway Pavement Management Plan

Ongoing roadway maintenance is an important element to ensuring that roadways operate at peak efficiency and service levels, and that travelers can move safely and conveniently. As a condition for receiving M2 funds, each city and the County must have a certified Pavement Management Plan, which includes an inventory of pavement conditions, identification of needed pavement rehabilitation or replacement, and a budget to complete the required maintenance.

Transportation System Management. While expansion of the transportation system is vital to responding to the growing needs of Orange County, making the existing system operate as efficiently as possible is critical. TSM strategies are designed to maintain and preserve the transportation system and ensure that it functions at an optimal level. OCTA is activity participating in or exploring several TSM strategies.

Caltrans already incorporates TSM and TDM strategies on many of their facilities, such as metered ramps, traffic monitoring technologies, and park and ride lots, which contribute to improved freeway performance. However, if further investments are made cooperatively with OCTA, there is potential to increase the efficiency of Orange County's facilities. These investments could include, but are not limited to, increased support for park and ride lots, directional lanes, enhanced use of electronic message boards, and improved incident and event management strategies. Augmenting these TSM strategies from the LRTP are sustainability strategies employed by jurisdictions in Orange County, such as improving circulation efficiency through signage, and implementing operational improvements to relieve bottlenecks.

ITS. Technology has long played a role in transportation, from communication and scheduling systems for buses and rail services to vehicle detection sensors under the pavement that control traffic signals. More and more agencies are using technology and applying it regionally so that freeways, roadways, and transit vehicles operate more cohesively and carry more people without needing more lanes or transit vehicles. Intelligent Transportation Systems (ITS) are used to improve the operational efficiency, effectiveness, and safety of ground transportation. ITS technology includes ramp metering, bus fleet management and signal priority, and computerized traffic signal systems. Examples of these systems include the following:

Orange County Sustainable Communities Strategy

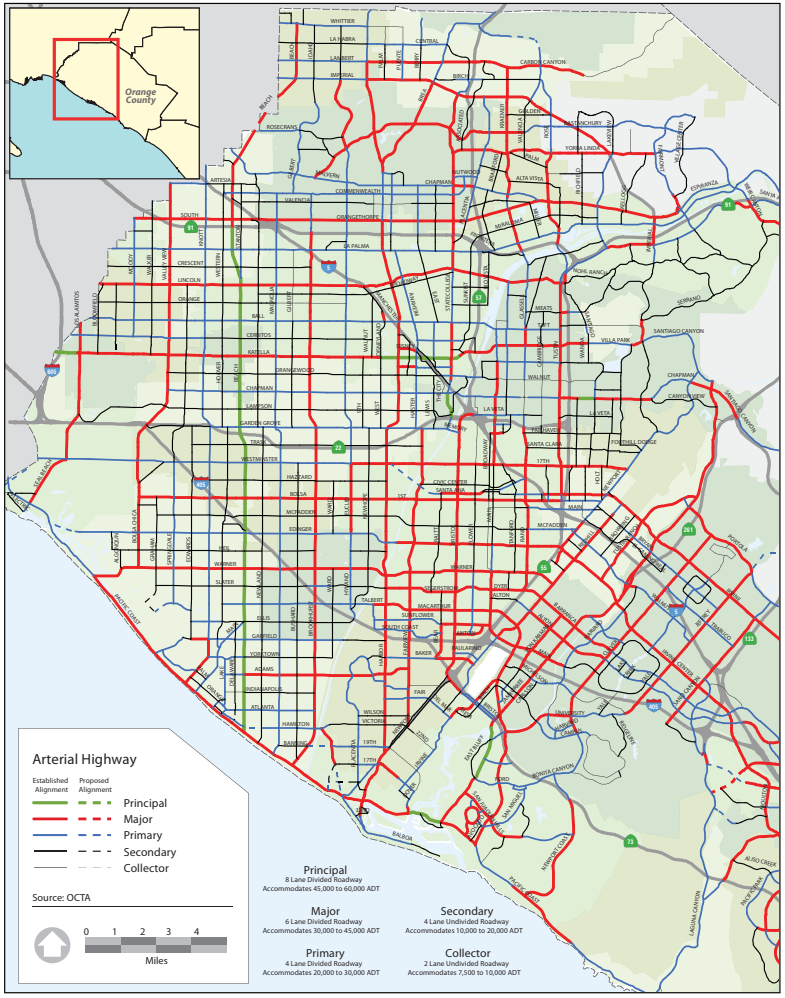

Figure 47A Orange County Master Plan of Arterial Highways (North County)

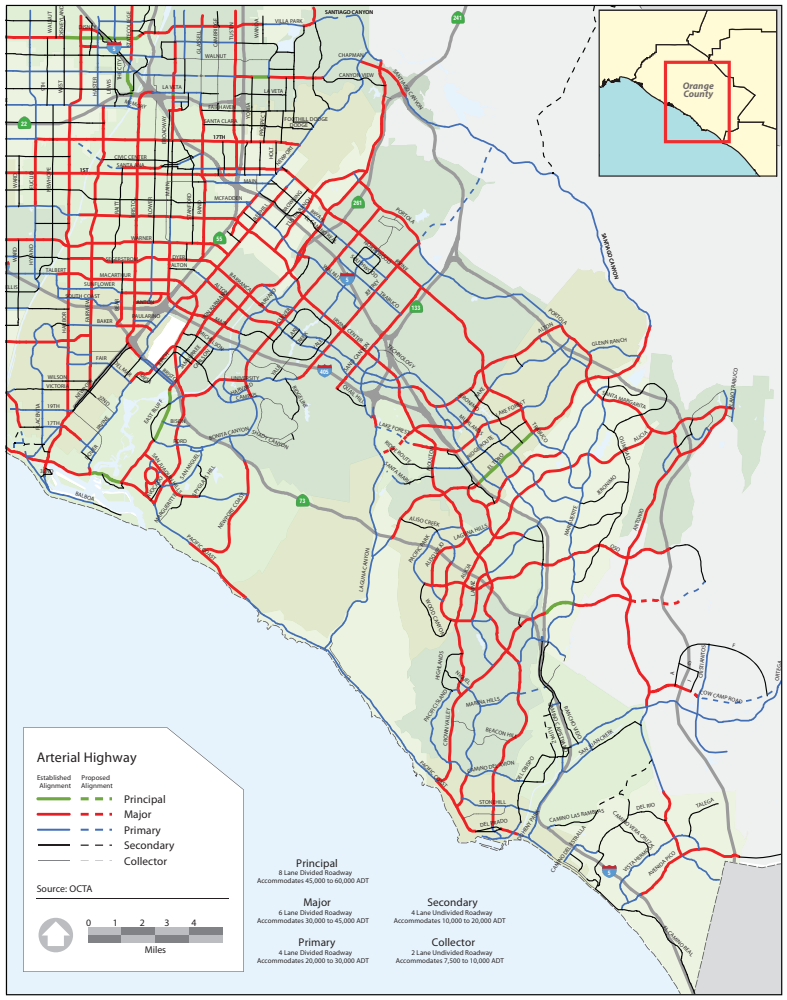

Figure 47B **Orange County Master Plan of Arterial Highways (South County)**

Orange County Sustainable Communities Strategy

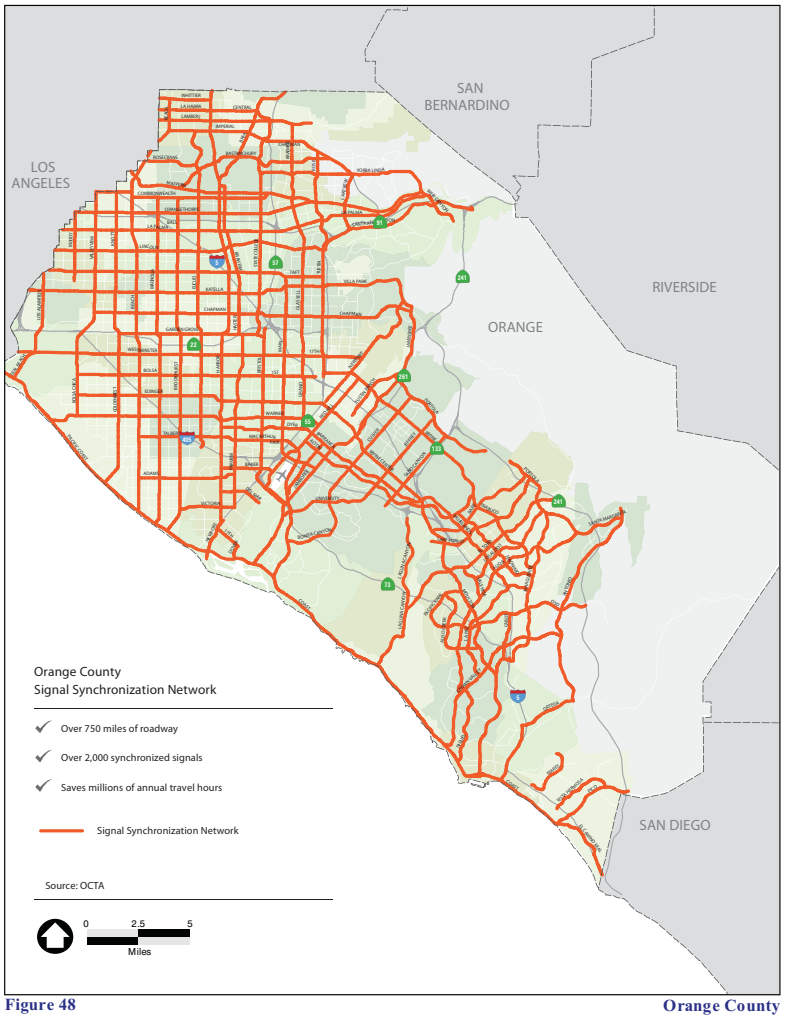

Figure 48 **Orange County Signal Synchronization Plan**

- Arterial management (traffic control, surveillance, information dissemination, parking management, and travel information systems)
- Freeway management (lane management, ramp control, surveillance, information dissemination, special event management, and travel information)
- Crash prevention and safety (warning systems)
- Transit management (operations and fleet management, information dissemination, transportation demand management, and safety and security management systems)
- Electronic payment and pricing (toll collection, pricing, transit fee, parking fee and multi-use payment systems)
- Commercial vehicle operations (credential administration, safety assurance, electronic screening, carrier operations/fleet management, and security operations systems)
- Intermodal freight (freight tracking, asset tracking, freight terminal processes, drayage operations, international border crossing process, and freight-highway connection systems)

Traffic accidents, stalled vehicles, weather-related congestion, and special events at major attractions are all examples of occurrences that can cause nonrecurring congestion. Because nonrecurring congestion is not always predictable, traditional solutions such as adding lanes are not always effective. ITS solutions can help relieve this type of congestion by identifying the type of incident and developing a response plan, such as dispatching assistance or providing information to motorists.

Orange County has developed a framework for coordinating all future ITS projects, called the Orange County Regional ITS Architecture. OCTA, Caltrans, the Federal Highways Administration, and Orange County jurisdictions have collaborated on this foundational plan, which has a 10-year time frame. Orange County's ITS plan is integrated with the Southern California Regional ITS Architecture, completed by the SCAG. It is part of a nationwide mandate to establish national standards and common or interchangeable technologies for transportation management.

OCTA currently uses ITS technologies for a number of purposes ranging from supervising bus fleets to managing traffic on the Riverside (SR-91) Freeway express lanes. In addition, OCTA is in the process of identifying opportunities to implement ITS projects throughout the County within the Orange County Regional ITS Architecture framework.

OC SCS Sustainability Strategy K:
Improve transit modes through enhanced service, frequency, convenience, and choices.

Public Transit Network

Orange County's existing public transportation network is described in detail in Chapter 2. Orange County is served by Metrolink commuter rail service and Amtrak's Pacific Surfliner intercity rail service connecting Orange County to San Diego, Los Angeles, Riverside, San Bernardino, and Ventura Counties. OCTA operates local fixed route bus service, community shuttle routes, StationLink Metrolink rail feeder routes, and express bus routes both within and outside the County. OCTA bus service is complemented by local transit service in the cities of Anaheim, Buena Park, Irvine, and Laguna Beach. Losses in sales tax and state funding revenues, combined with a decrease in fare revenue during the recent economic crisis created a need to reduce bus service levels by about 20 percent between 2008 and 2010.

The transit strategy identifies broad objectives for prioritizing future transit improvements to meet future demand as effectively and efficiently as possible. These objectives will serve to meet as much of the forecast transit demand as financially feasible and support OCTA's existing transit goals:

- Target high-demand corridors for improvements to fixed-route frequencies and hours of operations
- Initiate bus rapid transit (BRT) services
- Invest in Metrolink and Go Local feeders, and support California high-speed rail
- Explore express bus opportunities
- Improve access to regional bus service and local destinations with community circulators and rideshare programs
- Coordinate service planning with local land-use agencies
- Seek to restore transit funding from state and federal sources, as well as new funding and savings for transit operations

Target High-Demand Corridors and Initiate BRT Service

High-demand transit corridors are identified as corridors that received 15-minute or better peak-period headway service, on aggregate, during OCTA's peak level of service observed in June 2008. It is anticipated that these corridors will continue to show enough future demand to support the 15-minute or better peak-period headway transit service by 2035. These corridors are typically located in close proximity to many Orange County

employment centers and higher density residential areas. Figure 49 highlights potential high-demand corridors for high-frequency transit service, including proposed BRT routes. OCTA will continue periodic evaluation of transit demand and potential high-frequency transit corridors. As financial resources become available over the next 25 years, core service areas such as these will be prioritized for fixed-route bus service expansion.

The first three BRT projects being planned are as follows:

- Westminster Avenue/Westminster Boulevard/17th Street: 22-mile fixed route BRT between Santa Ana and Long Beach including bus shelters and rolling stock
- Harbor Boulevard: 19-mile fixed route BRT between Fullerton and Costa Mesa including bus shelters and rolling stock
- Bristol Street-State College Boulevard: 28-mile fixed BRT from Brea Mall to Irvine Transportation Center includes shelters, and rolling stock

Invest in Metrolink and Go Local Feeders and Support California High-Speed Rail

OCTA is implementing the MSEP that involves the addition of more frequent commuter rail service between Fullerton and Laguna Niguel, and the necessary station and infrastructure improvements to accommodate this service. Additionally, OCTA is coordinating with the State on the California High Speed Rail project. To support these future rail services, regional gateway station improvements such as the Anaheim Regional Transportation Intermodal Center (ARTIC) are underway. These efforts will strengthen the backbone of Orange County's transit system.

The MSEP will increase the number of trains operating between Fullerton and Laguna Niguel and expand service outside typical peak commute periods in the morning and evening to provide more mid-day and off-peak services. These improvements, designed to attract additional riders, will enhance the Metrolink services by offering more frequent services throughout the day, providing up to 30-minute headways (Figure 50). Through M2, OCTA's goal is to extend the enhanced Metrolink service levels to Union Station in Los Angeles.

The M2 Go Local Program is intended to address increases in demand induced by the rail improvements noted above. Go Local provides a competitive opportunity for local jurisdictions to develop feeder services between rail stations and key destinations. Figure 51 displays the coordinated efforts between rail service expansion and feeder service. The California High-Speed Rail corridor and Metrolink service improvements are highlighted, along with the proposed Go Local projects.

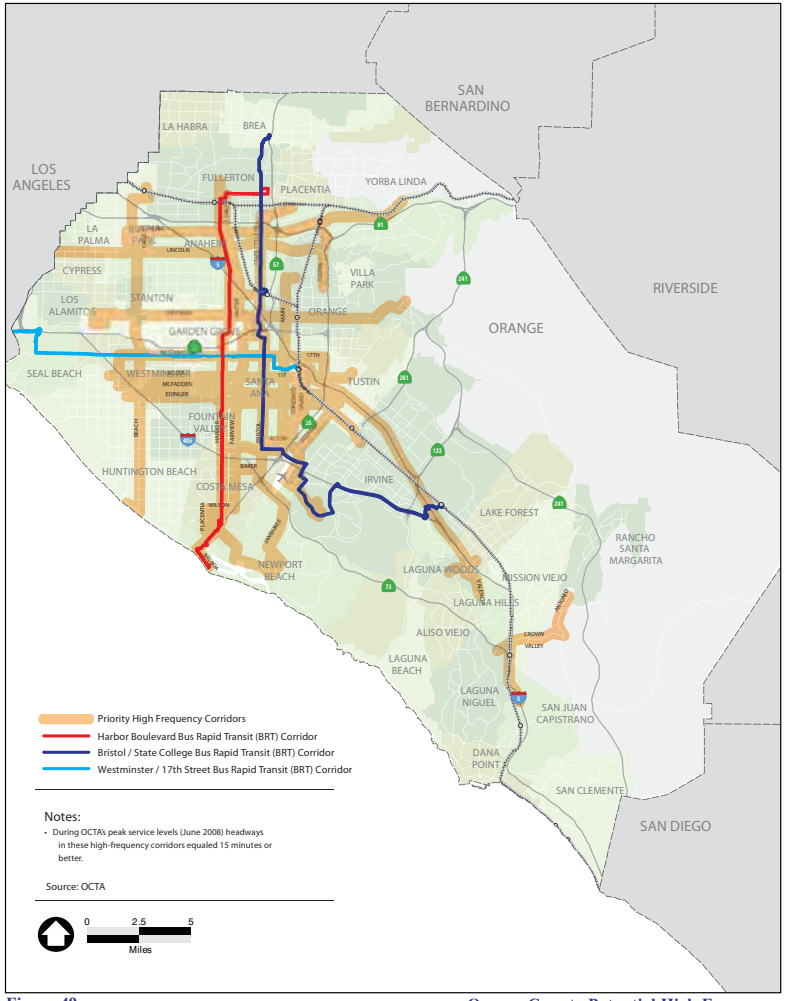

Figure 49 **Orange County Potential High Frequency Public Transportation Corridors**

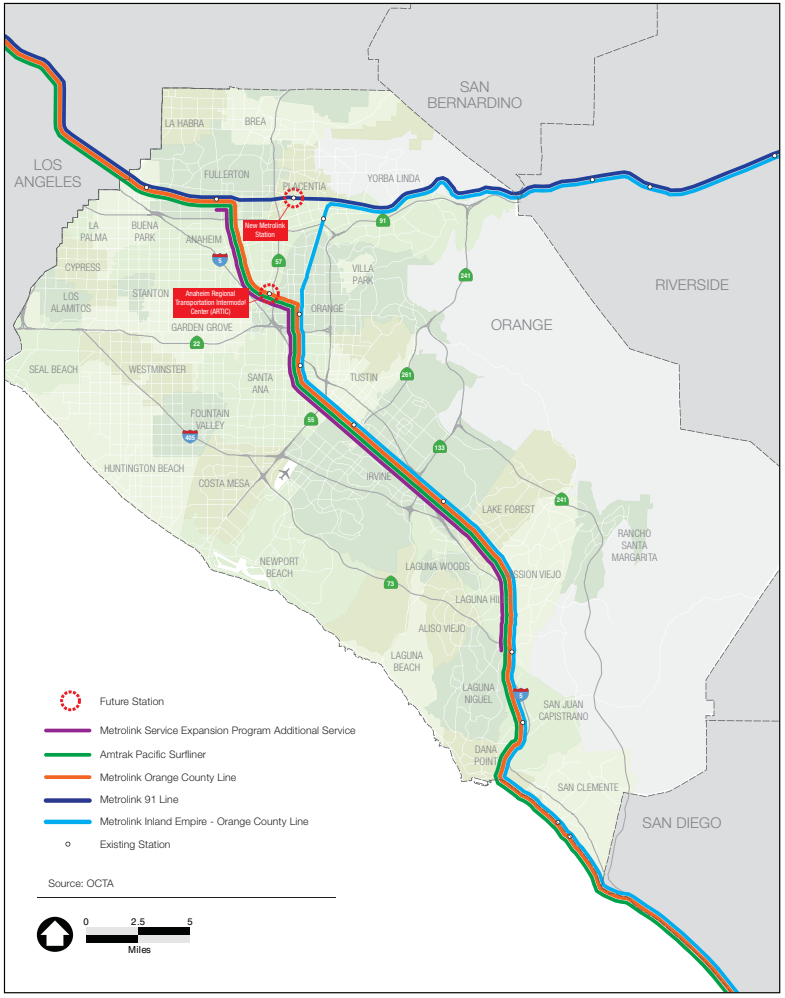

Figure 50 Orange County Metrolink Service Expansion Program

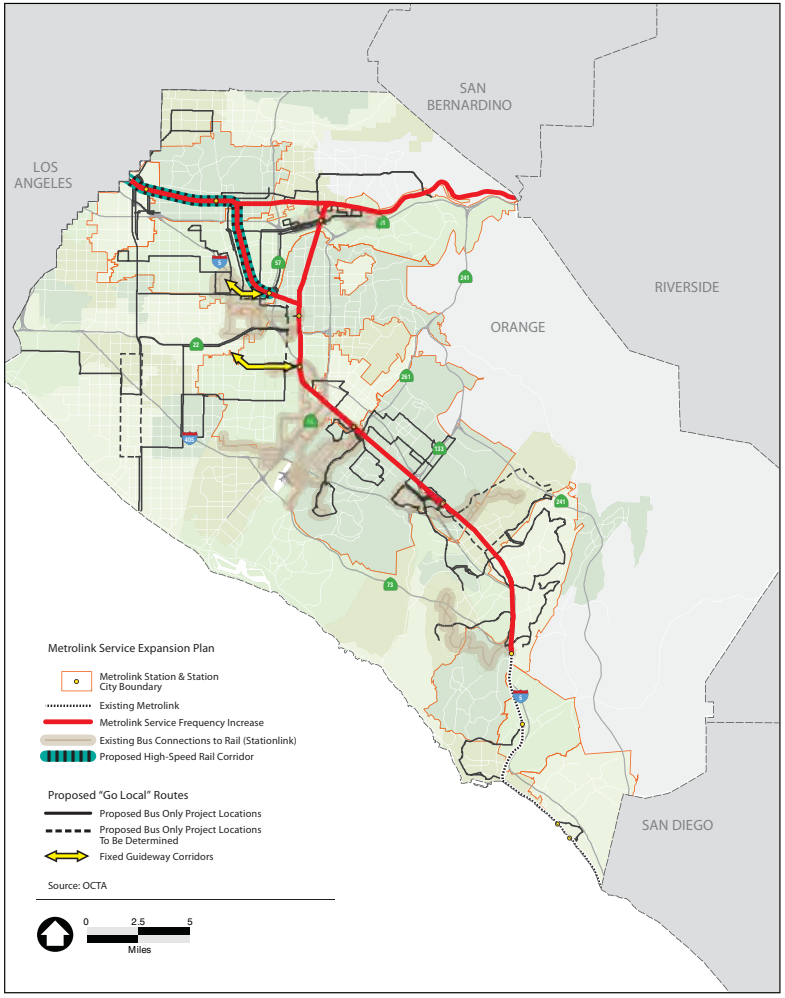

Figure 51 Orange County Rail Service Expansion and Station Feeder Service Plan

OCTA also plans to increase StationLink services as needed to coordinate with Metrolink service.

Explore Express Bus Opportunities

Intercounty and intracounty bus services are planned for those corridors that serve major destination areas and improve regional connectivity. Figure 52 identifies selected potential express bus corridors that will be further studied to determine their viability.

Improve Access to Regional Bus Service and Local Destinations

M2 provides another competitive opportunity to local jurisdictions to develop community circulator shuttles that will provide access to and from regional bus service and local destinations. These services could greatly improve the effectiveness of some major regional services such as BRT and express bus.

Other Transit Enhancements

The LRTP also includes safe transit stops and expanded transit convenience and choices for the elderly and handicapped population. Demand-responsive transit services are provided for the elderly, disabled, and other populations through ACCESS Services. This includes curb-to curb service, door-to-door service, and same-day taxi service, all of which meet the requirements of the ADA. The growth rate in demand for ACCESS services is higher than for traditional bus transit service. This is projected to continue throughout the timeframe covered by the LRTP. Between 2010 and 2035, ACCESS costs are projected to increase from 19% of the transit operating budget to 31%. As a result, OCTA is initiating a review of strategies that could continue to meet the requirements of ADA in a more cost-effective manner.

Orange County Sustainable Communities Strategy

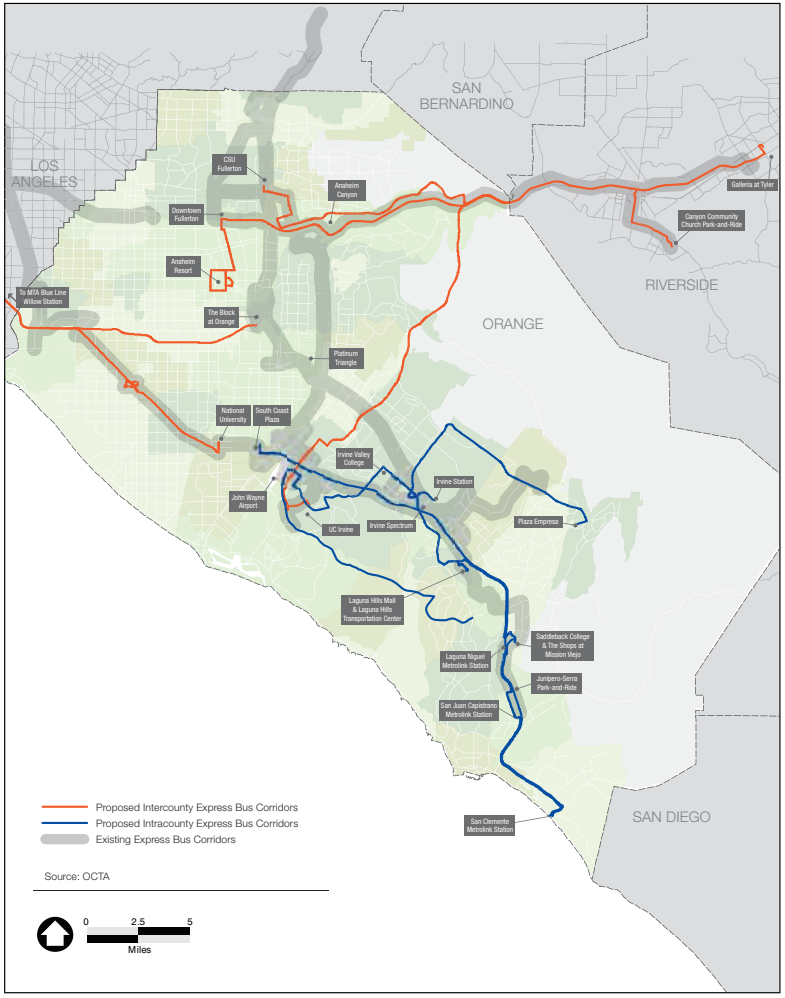

Figure 52 **Orange County Potential Express Bus Corridors**

OC SCS Sustainability Strategy L:

Expand and enhance Transportation Demand Management practices to reduce barriers to alternative travel modes and attract commuters away from single occupant vehicle travel.

TRANSPORTATION DEMAND MANAGEMENT (TDM)

TDM Ordinances

All jurisdictions in Orange County have adopted TDM ordinances that incorporate provisions consistent with rules adopted by the South Coast Air Quality Management District (SCAQMD). There are many programs administered or supported by OCTA to manage travel demand through the use of alternative transportation modes. These services help to reduce single occupant vehicle travel, reduce congestion, and enhance the quality of life for Orange County residents, commuters, and visitors.

Vanpool and Rideshare Programs

Vanpools and ridesharing provide substantial benefits for reducing congestion and reducing vehicle miles traveled. Vanpools and carpools typically reduce the number of long distance commute trips within a particular region, maximizing the congestion reduction and air quality benefits from each trip removed from the transportation system.

The expansion of vanpool services will focus on two target commute markets. The first commute market consists of expanding the long-distance vanpool services by targeting new or expanded services to employment and activity centers that are not currently well served by existing vanpools. Target employment centers include the Irvine Spectrum area, the Santa Ana Civic Center, the South Coast Metro area, and the Anaheim Canyon employment center along the Riverside (SR-91) Freeway.

The second vanpool strategy would explore the potential for shorter distance vanpools that would originate from Metrolink stations in Orange County and provide connections to employment centers that are not currently well served by OCTA's existing Stationlink and local bus services. These employment destinations could be directly served by the vanpool, reducing travel times from the Metrolink station to the commuter's ultimate destination. These services are beneficial in that the Metrolink commuter rail service can fulfill the long-distance portion of the commute and bring together several commuters from a larger area than a traditional vanpool.

Potential opportunity areas for vanpools for the year 2010 and 2035 within Orange County are depicted on Figure 53. These opportunity areas have an employment density

Orange County Sustainable Communities Strategy

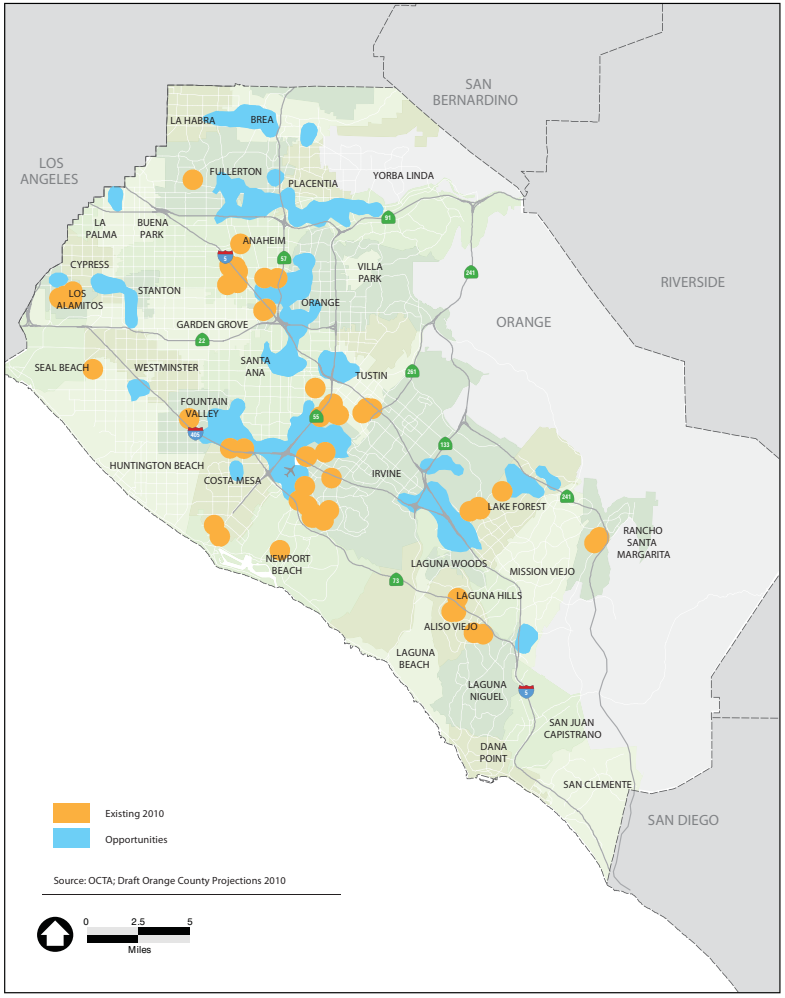

Figure 53 **Orange County Vanpool Opportunities**

of 5,000 jobs per square mile or more and could be served by vanpools developed through either of the strategies described above.

Park-and-Ride

Park-and ride facilities play an important role in increasing commuter access to alternative transportation modes. Orange County will continue to explore opportunities to increase the number of park-and-rides facilities through coordination with Caltrans, local jurisdictions, and private property owners to identify additional suitable park-and-ride sites, and will actively pursue resources to fund the construction and/or lease of new park-and-ride facilities.

Bicycle Programs

Bicycles can be used as the sole mode of transportation or as a complement to bus and rail travel. Bicycles can also play an important role in mitigating the growing challenges imposed by automobile dependence, including congestion and air pollution.

Bikeway planning, implementation, and maintenance efforts are recorded in the Commuter Bikeways Strategic Plan (CBSP). The CBSP was developed through a collaborative process among cities, the County, OCTA, Caltrans, and nonprofit organizations and the general public. The resulting CBSP (shown on Figure 54) includes a compilation of local bikeway plans proposing the addition of a total of 210 miles of Class I bikeways, 480 miles of Class II bikeways, and 95 miles of Class III bikeways. The CBSP also identifies regional bikeway priority locations that include transit stations, major employment centers, and schools. OCTA encourages implementing agencies to give priority to bikeway projects that connect to, or within these locations to improve regional connectivity. OCTA also recommends that projects be prioritized based on CBSP performance criteria that include safety, ease of implementation, and continuity.

Pedestrian Programs

Pedestrian-friendly environments improve the efficiency and connectivity of other modes of transportation, such as transit. A safe and attractive walking environment also furthers the goals of environmental sustainability by supporting reduced automobile dependence. Pedestrian programs and improvements are currently underway in many jurisdictions and will continue to be supported in Orange County.

Other TDM Programs

Multimodal Transportation Hubs. Multimodal transportation hubs are staffed or automated facilities that provide commuters access to multiple transportation modes in order to complete all or a portion of their trip. These facilities are typically located adjacent to a commuter rail station, park-and-ride or transit center and provide access to

Orange County Sustainable Communities Strategy

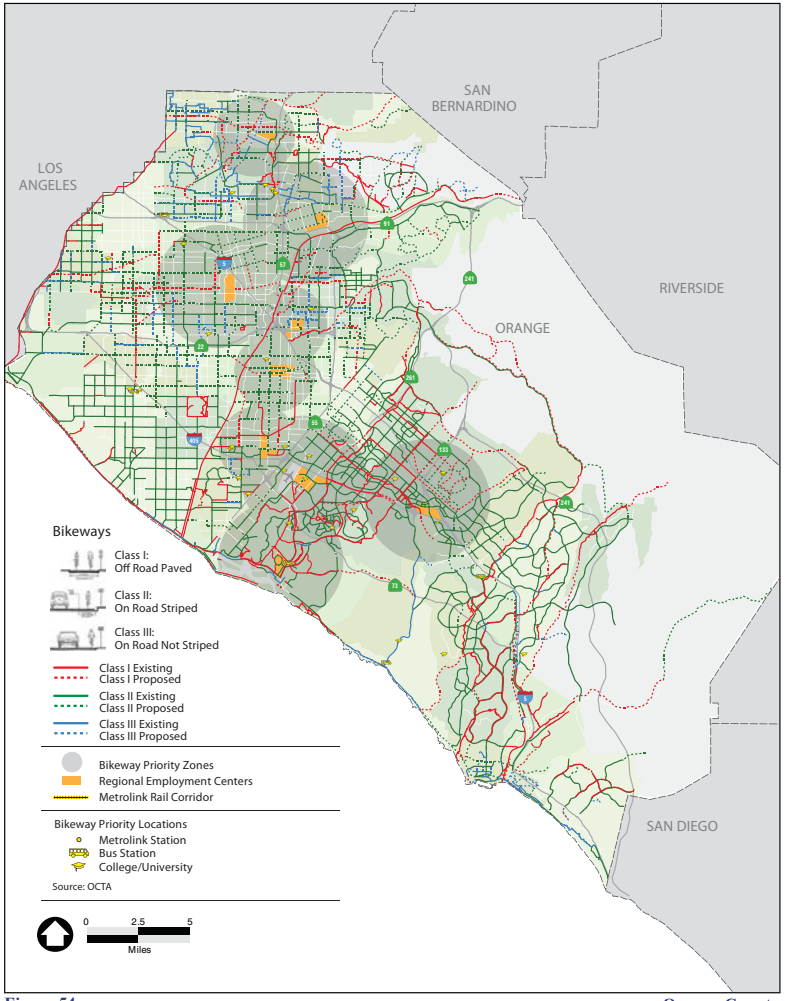

Figure 54 **Orange County Commuter Bikeways Strategic Plan**

bicycle lockers, bicycle rental, and carshare services. In the future, OCTA will explore the potential for implementing these types of facilities at Metrolink stations and transit centers in Orange County and work to identify potential satellite facilities that would supplement and extend the reach and effectiveness of the facilities placed at commuter rail stations and transit centers.

Commuter Financial Incentives. Commuter financial incentives incorporate a wide range of strategies and incentives that are intended to encourage alternative commute modes. Common incentives include employer-subsidized transit, parking, and rideshare benefits offered to commuters who utilize an alternative mode of transportation for a majority of their commute trips. A program that has been implemented elsewhere in the State offers employers the opportunity to provide their employees with discounted transit passes that are deducted pre-tax from employee paychecks, offering tax benefits for both the employer and the employee. Orange County employers are encouraged to explore the potential viability of this and other commuter incentive programs.

OC SCS Sustainability Strategy M:
Continue existing, and explore expansion of, highway pricing measures.

Priced Transportation Network

Orange County already has a unique resource in its priced transportation network. The OC SCS pricing strategy is designed to complete and optimize the scope and capacity of the County's priced transportation network composed of publicly-owned toll and express lanes. Priced facilities are an especially important tool for providing intra-county, inter-county and interregional capacity, while at the same time contributing to sustainability and emission reduction goals related to SB 375 and other state and federal mandates. The existing priced transportation network serves the locations where major employment and housing growth are projected to occur.

Toll roads and express lanes charge users a fee for travel but typically offer less congested traffic lanes than nearby freeways and roadways. Reduced congestion provides improved and more efficient mobility with fewer air pollutant and greenhouse gas emissions caused by congestion.

The toll road system is designed to interrelate with transit service. The toll roads can accommodate Bus Rapid Transit and express bus service, and toll road medians are sized and reserved to provide the flexibility for future transit, if appropriate.

Existing Priced Network

As of 2008, the County's "freeway" system includes over 280 lane-miles of toll roads and 40 lane-miles of express lanes. The existing toll road and express lane network in Orange County includes the following facilities:

- State Route 91 (SR 91) Express Lanes
- Eastern/Foothill Transportation Corridors (SR 261, SR 241, and SR 133)
- San Joaquin Hills Transportation Corridor (SR 73)

The Eastern, Foothill, and San Joaquin Hills Transportation Corridors are owned by Caltrans and operated by the Transportation Corridor Agencies (TCAs). OCTA owns and operates the SR 91 Express Lanes. The Eastern, Foothill, and San Joaquin Transportation Corridors are operated with variable tolls that are adjusted based on peak and non-peak traffic levels and usage. The pricing for the SR 91 Express Lanes is dynamic, with toll rates directly tied to congestion levels in the express lanes and in the adjacent freeway lanes. Both toll programs serve as potential models for future pricing strategies that could be implemented elsewhere in Orange County and the region. The toll roads and the express lanes use the same FasTrak electronic payment system, providing seamless consumer convenience and flexibility.

Future Pricing Facilities and Related Services

Planned future toll projects in Orange County include the Foothill Transportation Corridor South project and the addition of direct toll-to-toll connectors at the State Route 91/State Route 241 interchange. When completed, the southern portion of State Route 241 would enhance the network by an adding 105 new tolled lane-miles.

In addition, TCA's public toll roads can accommodate and facilitate additional future intra-county and inter-county express bus services. The Toll Roads access major future employment growth concentrations in Irvine, Anaheim, Orange and south Orange County, where express bus service may be viable.

Further, TCA is planning to convert its operations to all-electronic tolling, eliminating any potential congestion at toll booths due to cash transactions. This streamlining program will result in further GHG emission reduction associated with congestion.

OC SCS Sustainability Strategy N:

Implement near-term (Transportation Improvement Program and Measure M2 Capital Action Plan) and long-term (LRTP 2035 Preferred Plan) transportation improvements to provide mobility choices and sustainable transportation options.

MEASURE M2 CAPITAL ACTION PLAN: YEAR 2020 STRATEGIES

Following the approval of M2 by Orange County voters in 2006, OCTA prepared the Measure M2 Capital Action Plan (CAP), which outlines a 5-year plan to advance the implementation of M2 projects through the 2011–2012 fiscal year. The primary objectives of the M2 CAP are the following:

- Objective 1: Complete the first major milestone (conceptual engineering) for every M2 freeway project. This ensures that all projects are eligible for matching funds and are ready to enter environmental review, design, and construction.
- Objective 2: Start construction of five major M2 freeway projects on the Riverside (SR-91), Orange (SR-57), and Santa Ana (I-5) Freeways.
- Objective 3: Enable Orange County local agencies to meet eligibility requirements for M2 funds, including new pavement management and signal synchronization programs.
- Objective 4: Award up to $165 million to cities and the County for signal synchronization and road upgrades.
- Objective 5: Implement high-frequency Metrolink service within Orange County with associated railroad crossing safety and quiet zone improvements completed or under construction. Begin project development for at least five major grade separation projects.
- Objective 6: Award up to $200 million in competitive funding for transit projects.
- Objective 7: Complete development work and allocate funds for transit fare discounts and improved services for seniors and persons with disabilities.
- Objective 8: Complete an agreement between OCTA and resource agencies detailing environmental mitigation of freeway improvements and commitments for project permitting. Begin allocation of funds for mitigation.
- Objective 9: Complete program development for road runoff/water quality improvements. Begin allocation of funds to water quality projects.

Major projects completed, currently underway, and planned within a Year 2020 horizon under the M2 CAP include the following:

- Conceptual engineering for all CAP freeway projects (Figure 55)
- Start construction for these freeway projects:
  - Orange (SR-57) Freeway: Add northbound lane from Orangethorpe Avenue to Lambert Road and from Katella Avenue to Lincoln Avenue
  - Riverside (SR-91) Freeway: Add eastbound lane from Eastern Transportation Corridor (SR-241) to the Corona Expressway (SR-71)
  - Riverside (SR-91) Freeway: Lane additions from Costa Mesa (SR-55) Freeway to Eastern Transportation Corridor (SR-241)
  - San Diego (I-5) Freeway interchange at Ortega Highway (SR-74)\
  - Riverside (SR-91) Freeway: Add westbound lane from Santa Ana (I-5) Freeway to Orange (SR-57 Freeway)
- Approval of the M2 Local Agency Eligibility Procedures Manual
- Award of $8 million in funding for traffic signal synchronization along 10 significant street corridors
- Final design for seven railroad grade separation projects in Fullerton and Placentia

Initiation of rail rolling stock purchases for MSEP

- Initiation of rail grade crossing safety enhancements and quiet zone improvements at 51 grade crossings in Orange County
- Initiation of construction on the Sand Canyon Avenue grade separation project
- Approval of $82.3 million in funds to be used towards the completion of Phase 1 for ARTIC
- Ongoing planning and design work for Go Local fixed-guideway and bus/shuttle projects
- Planning for policies related to transit fare discounts for seniors and persons with disabilities
- Initiation of work on the M2 Freeway Environmental Mitigation Program
- Development of program guidelines for water quality programs is currently underway. Implementation of the M2 CAP projects will provide noticeable benefits for Orange County residents. The construction projects proposed in the CAP will also help the local economy by creating jobs within Orange County.

LRTP YEAR 2035 PREFERRED PLAN

OCTA has developed a detailed program of transportation projects and improvements to address the transportation needs and challenges through the Year 2035. Specific focus is placed on the identification of projects that improve connectivity and mobility throughout the County, improvements that provide benefits for person throughput, travel time, and

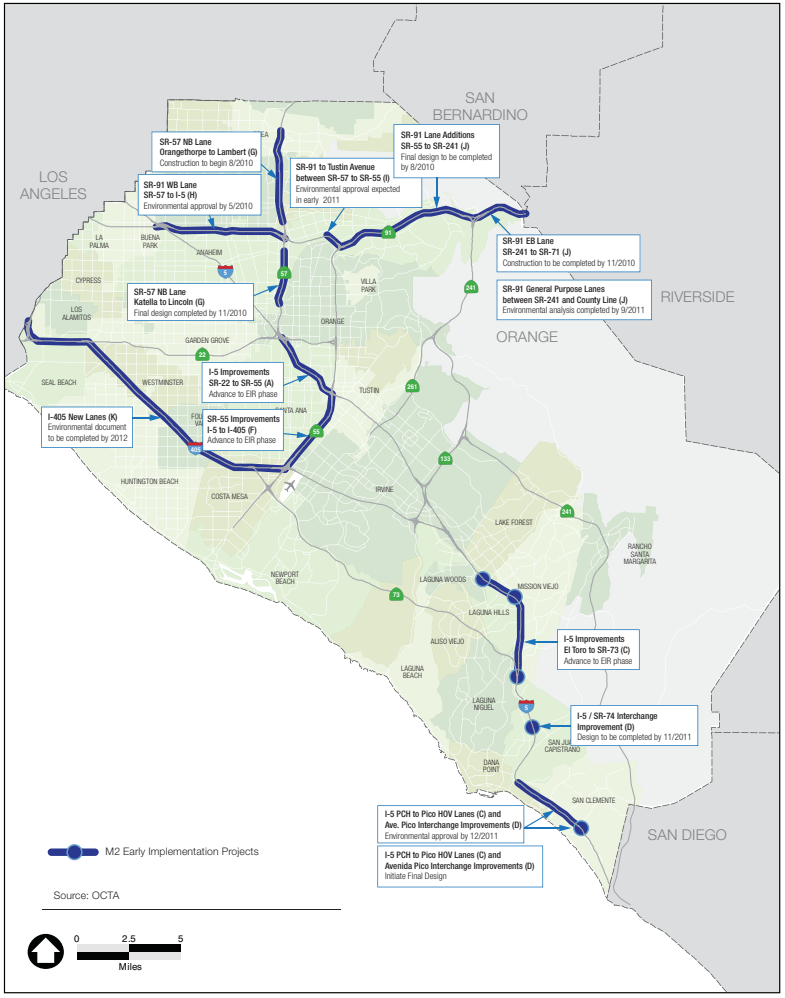

Figure 55 **Orange County Measure M2 Capital Action Freeway Projects**

level of service, and projects that provide for alternative modes of transportation and/or help to offset and minimize the environmental impact of transportation sources. The Year 2035 Preferred Plan represents the financially constrained plan identified in the Orange County LRTP. The Orange County LRTP also includes an unconstrained plan that will be included as part of the RTP development.

Transit Projects

Transit projects contained in the LRTP Year 2035 Preferred Plan range from improvements to OCTA bus services, to expansions of Metrolink commuter rail service, to the construction of regional transit gateways in Orange County that will improve access to a range of transit, including high-speed rail. A brief overview of transit projects contained in the Year 2035 Preferred Plan is provided below. A full list of transit projects with forecast costs is included in the Year 2035 Preferred Plan is provided in Appendix E.

Bus Service

- Fixed Route Service Expansion: Local bus service expansion, providing both capital and operational funding countywide, but primarily in the high-demand corridors identified in Figure 49. Service expansion will return bus service to 2008 levels, which were in place prior to budget and service cuts.
- Express Bus Service: Intercounty and intracounty express bus service will increase.
- Bus Rapid Transit Projects:
  - Westminster Avenue/Westminster Boulevard/17th Street: 22-mile fixed route BRT between Santa Ana and Long Beach.
  - Harbor Boulevard: 19-mile fixed route BRT between Fullerton and Costa Mesa.
  - Bristol Street–State College Boulevard: 28-mile fixed BRT from Brea Mall to Irvine Transportation Center.
- Go Local Bus/Shuttle: Locally-developed rail feeder bus services that provide connections between Metrolink stations and local destinations.
- StationLink: StationLink services focus on creating linkages and necessary connections to Metrolink stations and employment destinations.

Go Local Fixed-Guideway

- The Anaheim Rapid Connection (ARC): The City of Anaheim's fixed guideway project linking the Platinum Triangle/ARTIC and the Anaheim Resort area.

- Santa Ana-Garden Grove Fixed Guideway: Santa Ana and Garden Grove fixed guideway project proposes a transit service linking the Santa Ana Regional Transportation Center to the Santa Ana Civic Center and Garden Grove.

Rail

- Regional Gateways Program: The Regional Gateways program enhances key Orange County Metrolink stations.
- Metrolink Service Expansions: Increased Metrolink service to Los Angeles is planned by 2035.
- High Speed Rail: The California High-Speed Rail will connect Anaheim to Los Angeles and the Bay Area.

Other

- Safe Transit Stops: Promotes safer transit shelters and transit stops
- Vanpool and Park-and-Ride Program Expansion: Expands rideshare services by over 100 percent over existing 2010 levels.
- Elderly and Disabled Assistance: Expands transit convenience and choices for the elderly and disabled populations.

Freeway Projects

A brief overview of freeway projects contained in the Year 2035 Preferred Plan is provided below. A full list of freeway projects and their costs included in the Year 2035 Preferred Plan is provided in Appendix E.

Transportation System Management Projects

- Interstate 5: On Interstate 5 (I-5), from Avenida Pico to Pacific Coast Highway (PCH), add one HOV lane in each direction and improve the Avenida Pico Interchange. On the I-5, from SR-55 to SR-57, add one HOV lane in each direction. HOV ramp improvements at Barranca Parkway.
- Interstate 405: From the SR-73 to the San Gabriel River Freeway (I-605), add two express lanes each direction, converting existing HOV lanes, and adding one new express lane in each direction.
- State Route 57 Projects: On the Orange (SR-57) Freeway, provide an HOV interchange at Cerritos Avenue. Add a southbound deceleration lane at the Imperial Highway interchange. Add a northbound truck climbing auxiliary lane from Lambert Road to the Los Angeles County line and include a ramp improvement at Lambert Road.
- State Route 73 Projects: Add an HOV lane in each direction from MacArthur to the San Diego (I-405) Freeway. Provide an HOV connector at the I-405.

- State Route 91 Projects: Add an HOV connector at the Foothill Transportation Corridor (SR-241).
- Freeway TDM/TSM: Freeway TDM/ TSM design, implementation and operation.
- All—Freeway Service and Patrol Boxes: Maintain the freeway call box program and invest in motorist aid.

General Purpose Improvements

- Interstate 5: Widen from the Costa Mesa (SR-55) Freeway to the San Diego (I-405) Freeway and from the Orange (SR-57) Freeway to the Riverside (SR-91) Freeway providing a new mixed-flow lane in each direction. From Avery Parkway to Alicia Parkway, add one mixed-flow lane in each direction.
- Interstate 405: Add an auxiliary lane northbound from Jeffrey Road to Culver Drive. From SR-73 to the San Gabriel River (I-605) Freeway, add one mixed-flow lane in each direction. From the Santa Ana (I-5) Freeway to the Costa Mesa (SR-55) Freeway, add lanes and improve merging.
- State Route 55: From I-405 to I-5, add one auxiliary lane and one mixed-flow lane in each direction. From I-5 to SR-22, add one mixed-flow lane in each direction.
- State Route 57: On SR-57, widen to provide an additional mixed-flow northbound lane from Orangewood Avenue to Katella Avenue.
- State Route 91: Add a westbound mixed-flow lane from SR-241 to Gypsum Canyon Road. Add one auxiliary lane in each direction from Green River Road to SR-241 with additional improvements sponsored by Riverside County. Add one mixed-flow lane eastbound from the Orange (SR-57) Freeway to the Costa Mesa (SR-55) Freeway.

Interchange Projects

- Interstate 5: Reconfigure interchanges at Avery Parkway, Avenida Pico, La Paz Road, Los Alisos Boulevard, First Street, and Fourth Street. Add an interchange at Marguerite Parkway, Alicia Parkway, and Stonehill Drive. Improve access ramps.
- Interstate 605: Ramp improvements at Katella Avenue.
- State Route 55: Add interchange at Meats Avenue.
- State Route 57: Interchange improvements at Lambert Road.
- State Route 73 Projects: Interchange improvement at Glenwood Drive/Pacific Park Drive.
- State Route 91: Improve interchange at Costa Mesa Freeway (SR-55) and Lakeview Avenue. Improve access ramps at Gypsum Canyon. Add interchange and overcrossing at Fairmont Boulevard.

- State Route 241: Add interchange at Jeffrey Road.

Street Projects

Street projects contained in the Year 2035 Preferred Plan include expanding and extending arterials, ongoing maintenance, transportation demand management, ITS, and signal synchronization. A brief overview of street projects contained in the Year 2035 Preferred Plan is provided below. A full list of street projects included in the Year 2035 Preferred Plan is provided in Appendix E along with forecast costs.

Transportation Demand Management

- Signal Synchronization Program: Implement traffic signal synchronization over 750 miles of roadways.
- Commuter Bikeways Strategic Plan: Implement the Commuter Bikeways Strategic Plan (Figure 54, above). Responsibility for implementation lies with local jurisdictions.

Capacity & Maintenance

- Local Fare Share Program: Local fair share program funded by M2 is allocated to cities proportionally countywide
- Regional Capacity Program: Add over 800 miles of new capacity on the MPAH network. These projects build on previous efforts from the Original Measure M to complete the MPAH. Figure 56 shows the number of roadway lanes by segment to complete the current MPAH plan. Responsibility for implementation lies with local jurisdictions.
- Arterial Overpasses: Add an overpass over the Costa Mesa (SR-55) Freeway at Alton Parkway.

Achievements of the Transportation Strategies

The Year 2035 Preferred Plan makes investments in Orange County's transportation network using available funding over the next 25 years. The Preferred Plan of projects includes the implementation of the projects and programs contained in the M2 program, as well as numerous other transit, freeway, street, and travel demand management projects located throughout Orange County.

Expand Transportation System Choices

The Year 2035 Preferred Plan would result in substantial expansion of options across transportation modes including transit, driving, bicycling, walking, and ridesharing. On the transit side, approximately 400,000 additional bus service hours (restoring service to 2008 levels) would be added to the system, including Go Local projects. Metrolink

Orange County Sustainable Communities Strategy

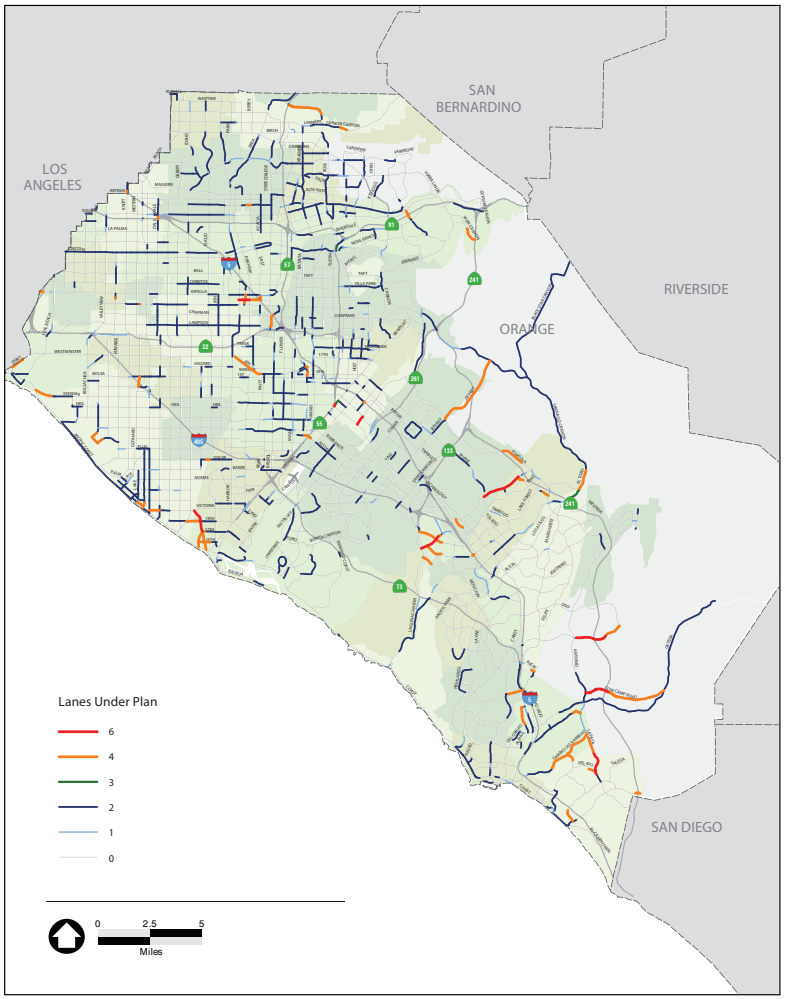

Figure 56 Roadway Lanes to Complete Orange County Master Plan of Arterial Highways

service would be expanding, resulting in up to 30-minute headways between Laguna Niguel and Los Angeles.

Connectivity and access to the freeway system would also be improved. The implementation of the continuous access HOV lanes through nearly all of Orange County will improve access to these facilities and smooth traffic flow. The addition of freeway lane miles and targeted interchange improvements help to increase capacity and access to the freeway system from nearby roadways.

The completion of the MPAH Regional Capacity Plan will expand access to arterial roadways throughout Orange County. The Year 2035 Preferred Plan expands access to alternative transportation modes, including vanpool and rideshare services, bicycle facilities, and other transportation demand management strategies.

Improve Transportation System Performance

The performance of the transportation system with the implementation of the projects outlined in the Year 2035 Preferred Plan has been measured in the OC LRTP. Table F, below, summarizes the level of improvement over the Year 2035 Baseline condition in several transportation performance metrics with the implementation of the projects contained in the Year 2035 Preferred Plan.

As Table F and Figure 57 show, the Year 2035 Preferred Plan is forecast to help reduce travel delays and improve travel speeds on freeways and streets throughout Orange County. The projects are also forecast to contribute an increase in transit ridership over the Year 2035 Baseline condition.

The projects contained in this plan also reduce traffic congestion. Severely congested segments of Orange County's freeway network, defined as segments operating above capacity (LOS F), are forecast to be reduced by 35 percent compared to the Year 2035 Baseline. Similarly, a 40 percent decrease is forecast to occur in the number of roadway segments that are severely congested under the Baseline 2035 scenario.

Table F: Preferred Scenario Performance Analysis (Compared to 2035 Baseline)

Performance Measure	2035 Baseline	2035 Preferred Plan
Daily vehicle hours traveled	3.4 million	Reduced by 24%
Daily hours of delay due to congestion	1.5 million	Reduced by 56%
Average peak period freeway speed (AM)	29 miles per hour	Increased by 22%
Average peak period HOV speed (AM)	35 miles per hour	Increased by 24%
Average peak period roadway speed (AM)	13 miles per hour	Increased by 82%
Daily transit trips	144,000	Increased by 11%

Note: Forecasts prepared by the California High-Speed Rail Authority project an additional 10% increase in transit ridership in Orange County with the Phase I High-Speed Rail project.

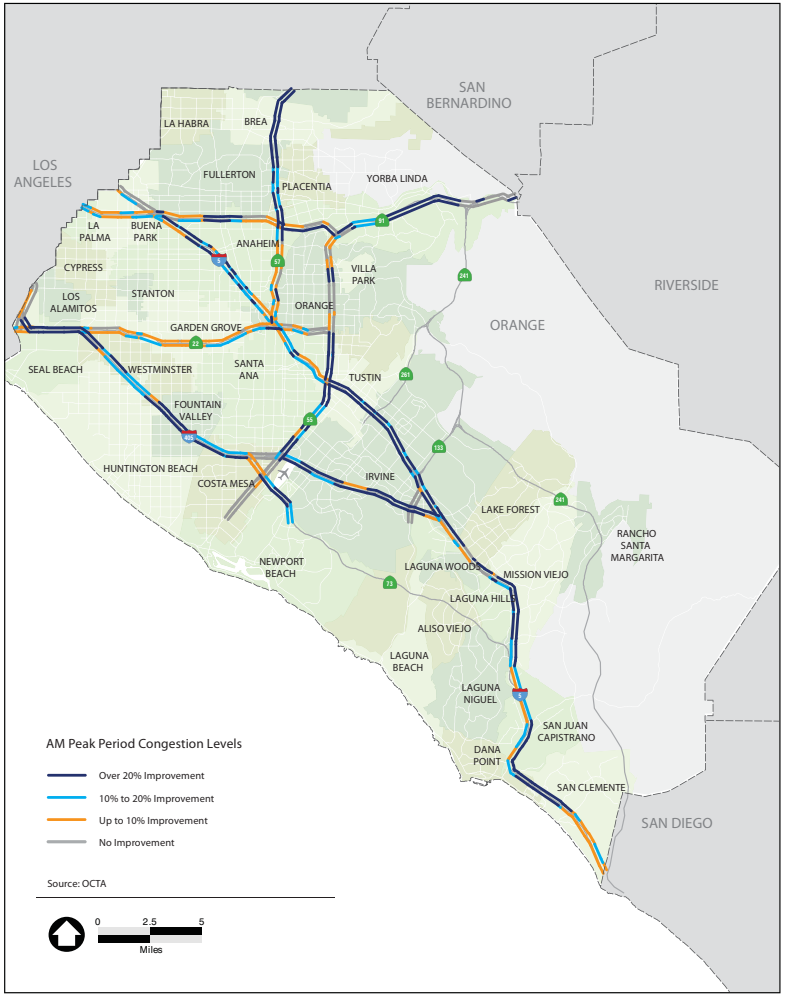

Figure 57 **Performance of Orange County Long Range Transportation Plan**

Ensure Sustainability

The Year 2035 Preferred Plan is forecast to invest over $39.4 billion in transportation improvements over the next 25 years. This investment is allocated in a fiscally sound and responsible manner, timing project implementation to available financial resources. The Plan also includes substantial investments in system maintenance and operations to help ensure that capital investments are maintained and operated at a consistent level for each project's life-cycle.

The environmental and water quality protection programs called for in M2 would be implemented through the Year 2035 Preferred Plan. These measures are designed to help reduce the amount of contaminated water runoff generated on freeways and streets, and to help create and preserve critical habitat in a coordinated fashion, increasing the benefit of these protections. A potential co-benefit of the preservation of these open space lands is the intensification, redevelopment, and infill of existing built environments.

The Preferred Plan includes improvements to transit service and transportation demand management measures. These investments are intended to help address future transit demand and reduce single-occupant vehicle trips to help the performance of the transportation system.

OC SCS Sustainability Strategy O:

Acknowledge current sustainability strategies practiced by Orange County jurisdictions and continue to implement strategies that will result in or support the reduction of GHG emissions.

In the OC SCS, a sustainability strategy is a project or policy that will result in or support the reduction of GHG emissions. For the SCS, an aggregated list of 222 sustainability strategies was created from lists produced by SCAG, CARB, and Orange County agencies. All strategies identified are measures that jurisdictions, agencies, and stakeholders have employed or may employ, and implementation of proposed projects or policies is at their discretion. The resulting list covers a wide range of projects and activities that fall generally within the following categories:

- Alternate Fuel
- Alternate Modes of Transportation
- Alternate Work (telecommuting/flexible work schedules)
- Bicycling
- Co-location of Facilities

- Freight/Goods Movement
- Land Use Policies
- Parking
- Pricing
- Transportation Demand Management (TDM)
- Transportation Infrastructure Investments
- Transportation System Management (TSM)
- Walking
- Other—activities that don't fit cleanly within one of the above

As part of the development process of the OC SCS, all jurisdictions within the County, as well as transportation agencies, stakeholders, and the public, were invited to identify sustainability strategies actively being used, as well as strategies planned for implementation during the SCS growth period from 2008 to 2035. Figure 58 depicts 14 categories of sustainability strategies and the number of Orange County agencies with projects or policies in those areas as of March 2011—a sort of "snapshot in time" of GHG-reducing activities in Orange County.

The list of sustainability strategies should be considered a sampling of measures available to reduce GHG emissions, and not a comprehensive or mandatory list of measures to be applied in any given situation. Some of these policies may be applicable in a general plan or at a regional scale, while others are applicable only to transportation agencies and projects. Still others may be applicable only at a development project level. Others are applicable only to transportation agencies and projects. Still others may be applicable only at a development project level. As such, the list of sustainability strategies should be considered a sampling of measures available to reduce GHG emissions, and not a comprehensive or mandatory list of measures to be applied in any given situation.

Transportation Infrastructure Investment and Transportation System Management
Transportation Infrastructure Investment and Transportation System Management are two of the most common strategies in Orange County. Transportation infrastructure investments are capital expenditures to improve the utility of the transportation system for all users and include strategies such as implementation of smart streets, improving links between travel modes, and providing enhanced bus stops. These are projects identified in addition to conventional municipal Capital Improvement Projects.

Transportation System Management seeks to enhance the performance of transportation infrastructure through better management and operation of the system. These investments demonstrate a commitment by agencies to maximize the utility and efficiency of infrastructure. Examples include traffic signal synchronization, bus fleet management and

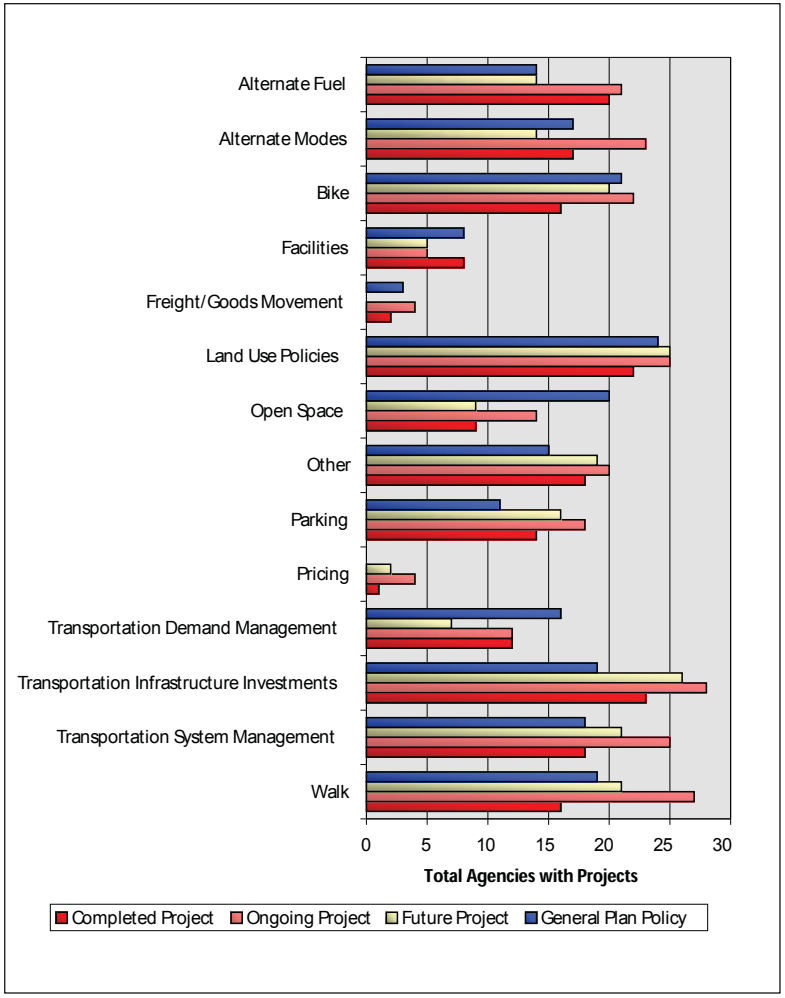

Figure 58 **Orange County Sustainability Strategies Participation**

Orange County Sustainable Communities Strategy

signal priority, freeway information dissemination, ramp control, improvement of circulation efficiency through information (i.e. signage), and improvements to reduce or eliminate bottlenecks. Most jurisdictions also have land use policies designed to encourage residential and commercial development near existing transportation infrastructure.

Transportation infrastructure investments are ongoing with at least 26 agencies and Transportation System Management projects are ongoing with at least 23 agencies. Twenty-four agencies report future transportation infrastructure investments, and 20 agencies report future Transportation System Management projects. These include agencies that serve the County as a whole and some of these projects will be implemented countywide. Twenty-four cities have General Plan policies supporting land use related sustainability strategies. Within the 34 categories of land use strategies, Orange County cities report a total of 251 ongoing projects and 217 future actions. Encouraging placement of land uses near transit assets and investing in the utility of the transportation system will affect the mobility choices for residents of Orange County and will reduce vehicle miles traveled.

Orange County agencies are also active in improving bicycle facilities and the pedestrian environment. At least 20 agencies have ongoing projects to improve the bicycle transportation system or otherwise encourage commuting by bicycle. Eighteen agencies report that future projects are planned. Projects to improve the pedestrian experience are ongoing with at least 25 agencies, and 20 agencies report future planned projects. In addition to directly affecting the non-motorized environment, Orange County agencies also seek to encourage the use of alternate modes of transportation through policies such as encouraging large businesses to develop alternative transportation plans and providing for employer incentives. Improved facilities and experiences for non-motorized users coupled with incentives to seek alternatives to commuting by automobile create the potential to affect residents' mobility choices and reduce GHG emissions.

Alternative Fuels/Vehicles

Alternative fuels and Vehicles are emerging strategies being considered and implemented by jurisdictions and institutions in Orange County. Currently, the city of Newport Beach has constructed electric vehicle fuel stations for city vehicles and general public use. Plans for new neighborhoods in unincorporated areas of south Orange County include provision of neighborhood electric vehicles (NEVs) for short trip purposes. The Brea Lofts project, completed in 2008, included the provision of NEVs for each dwelling unit. Major educational institutions such as UC Irvine have developed a full menu of alternative fuel and vehicle strategies for on-campus and local mobility needs.

A complete listing of sustainability strategies submitted by jurisdictions, agencies, stakeholders and the public is included as Appendix F. The sustainability strategies are compiled as completed projects, ongoing projects, future projects, and General Plan policies. Each of these strategies results in outcomes that affect the planning of land use and mobility in Orange County by supporting regional objectives to reduce GHG. These sustainability strategies are offered for inclusion in the overall regional SCS as evidence of real measures resulting in integrated planning and reduced GHG in Orange County and throughout the SCAG region.

SPECIFIC EXAMPLES OF ORANGE COUNTY SUSTAINABILITY STRATEGIES

To highlight the comprehensive nature of sustainability strategies and their geographic distribution throughout the County, several examples of measures being implemented by Orange County jurisdictions follow. In addition to government agencies, the Orange County community is supported by many interests and organizations. Groups specializing in health care delivery, education, the environment, social justice, and affordable housing all have a role in the future of Orange County. These agencies engage in projects and implement plans that have direct and collateral benefits to mobility and the reduction of GHG emissions. A brief description of a small sample of these programs and plans also follows.

IMPACTS OF ORANGE COUNTY SCS SUSTAINABILITY STRATEGIES

What do we know about the potential impact of the different OC SCS strategies on potential GHG reductions? The California Air Resources Board (CARB) hired researchers from the University of California (Irvine and Davis campuses) to summarize the evidence on how different transportation and land use strategies could reduce greenhouse gas emissions.[1]

Summarizing the CARB Policy Briefs

In 2010, the CARB contracted with UC Irvine and UC Davis to develop 15 policy briefs which summarize the academic literature on land use and transportation policies that can reduce vehicle miles traveled (VMT) and greenhouse gas (GHG) emissions. The policy

[1] See http://arb.ca.gov/cc/sb375/policies/policies.htm.

briefs focused on the magnitude of impact, quantifying how GHG would change based on a specific policy.

The information on impact should be combined with local knowledge about the cost of and support for implementing specific policies. It is possible that a relatively low impact policy might be implemented broadly, while a high impact policy might be either expensive or politically difficult to implement. Consequently, one should not conclude that low impact policies or strategies are necessarily unattractive tools.

Appendix G provides a summary of the CARB briefs. These briefs each contain a discussion of GHG emissions in the context of the evidence summarized in each brief, and readers are referred there for more information: http://arb.ca.gov/cc/sb375/policies/policies.htm.

Grouping CARB Policies by Impact

Based on the CARB evidence, policies to reduce GHG emissions were assessed and grouped into impact categories as shown below.[2]

- **High Impact:** Policies that have a 0.1% or larger impact on VMT, driving, or driving emissions for a 1% policy implementation
- **High-Medium Impact:** Policies that have a 0.05 to 0.1% impact on VMT, driving, or driving emissions for a 1% policy implementation
- **Low-Medium Impact:** Policies that have a 0.01 to 0.05% impact on VMT, driving, or driving emissions for a 1% policy implementation
- **Low Impact:** Policies that have less than a 0.01% impact on VMT, driving, or driving emissions for a 1% policy implementation
- **No Impact:** Polices that can be expected to have no impact on VMT.

Linking OC SCS Sustainability Strategies to the CARB Evidence

Each OC SCS strategy is related to a corresponding CARB strategy. For most cases, clear matches and correspondence between the CARB strategies and those in the OC SCS exist, but the language and description of the strategies sometimes differs slightly. The evidence summarized for the CARB was drawn from the academic literature, while the OC SCS strategies are based on a public input process and consultation with jurisdictions

[2] The evidence reviewed for CARB largely focused on VMT. SB 375 targets GHG reduction. To group policies by impact, it was often necessary to use VMT reduction as a proxy for GHG reduction, which abstracts from questions of vehicle fleet composition, vehicle fuel efficiency, and the carbon content of fuels. For a more complete discussion of the relationship between each policy and GHG reduction, see the CARB policy briefs at http://arb.ca.gov/cc/sb375/policies/policies.htm

within Orange County. For that reason, the OC SCS strategies are typically phrased in ways that link more directly to local land use plans and policies while the evidence from the CARB is often phrased in the more abstract mode of the scholarly literature. Yet a crosswalk between the two nomenclatures was easy to develop.

Having developed such a crosswalk between the category descriptions from the CARB and the OC SCS, the OC SCS strategies are then ranked as high, high-medium, low-medium, and low impact. One strategy is ranked as "no impact" based on the academic literature.

Table G: CARB Policies and OC SCS Strategies, Grouped by Impact Category

Policy	Impact Category	Corresponding OC SCS Strategy or Strategies
Road Pricing	High	Toll road options, highway pricing measures. ***(Sustainability Strategy M)***
Parking Pricing	High	Parking, Pricing ***(Sustainability Strategy O)***
Regional Accessibility to Employment	High	Support infill housing development and redevelopment, and increase regional accessibility. ***(Sustainability Strategies B and D)***
Jobs-Housing Balance	High	Improve jobs-housing ratio. ***(Sustainability Strategy E)***
Neighborhood Design (combination of density, mixed land use, and street network connectivity)	High	Support transit-oriented development, support infill housing development, support mixed use development ***(Sustainability Strategies A, B, C and G)***
Telecommuting	High	Alternate Work: telecommuting/flexible work schedules ***(Sustainability Strategy O)***
Reductions in Distance to Transit	High-Medium	Improve transit service, frequency, convenience, and choices. ***(Sustainability Strategy K)***
Reductions in Transit Fare	High-Medium	Improve transit service, frequency, convenience, and choices. ***(Sustainability Strategy K)***
Increases in Transit Service Hours or Service Miles	High-Medium	Improve transit service, frequency, convenience, and choices. ***(Sustainability Strategy K)***
Increases in Transit Service Frequency	High-Medium	Improve transit service, frequency, convenience, and choices. ***(Sustainability Strategy K)***
Employer-Based Trip Reduction (implemented at a workplace)	High-Medium	Transportation Demand Management ***(Sustainability Strategy L)***
Traffic Incident Clearance Programs	High-Medium	Transportation System Management ***(Sustainability Strategy J)***
Pedestrian Strategies	Low-Medium	Promote land use patterns that encourage the use of alternatives to single-occupant automobile use; Transportation Demand Management ***(Sustainability Strategy F and L)***

Policy	Impact Category	Corresponding OC SCS Strategy or Strategies
Bicycle Strategies	Low	Promote land use patterns that encourage the use of alternatives to single-occupant automobile use; Transportation Demand Management ***(Sustainability Strategy F and L)***
Increases in (Unpriced) Freeway Lane Miles	No Impact	Implement the Transportation Improvement Program and Measure M2 (if unpriced and if does not include HOV or express lane options) ***(Sustainability Strategy N)***

Some strategies were not assessed for impact because they are not tied directly to available CARB research described above or are broadly categorized (some but not all of their elements are included in the categories above.) These include: support retention and/or development of affordable housing (G); support natural land restoration and conservation and/or protection offering significant carbon mitigation potential via both sequestration and avoidance of increased emissions due to land conversion (H); implement near-term (Transportation Improvement Programs and Measure M2 Capital Action Plan) and long-term (LRTP 2035 Preferred Plan) transportation improvements to provide mobility choices and sustainable transportation options (N); and acknowledge current sustainability strategies practiced by Orange County jurisdictions and continue to implement strategies that will result in or support the reduction of GHG emissions (O).

Anaheim Platinum Triangle

Project Location	*City of Anaheim*
Sustainability Strategy Category 	**Land Use Policies:** • Horizontal or vertical mixed-use • Increasing housing densities within/adjacent to employment areas • Increasing residential/commercial density near transit • Integrate affordable and market rate housing • Local housing for local workforce • Making developments transit ready • New housing and jobs within 1/2 mile of existing/planned transit stations **Alternate Modes:** • Increase bike/walk trips with improved streets and facilities
Project Description	Anaheim's Platinum Triangle features high-density housing, millions of square feet of new development opportunities for office and commercial, two national sports teams, an exciting array of dining and entertainment, plus immediate access to and from the rest of Southern California from three freeways and a major transit center. The project includes both vertical and horizontal mixed-use in an infill environment.
Emissions Reductions Benefits	The Platinum Triangle provides pedestrian- and transit-friendly environments both internally and through linkages to regional trails and bikeways, an employment and entertainment destination that encourages transit use to the area, and new energy and water efficient buildings and residences, all of which contribute to a greener future.
Project Status	Project is approved, and construction has begun.

Irvine Business Complex and Vision Plan

Project Location	*City of Irvine*
Sustainability Strategy Category 	**Land Use Policies:** • Horizontal or vertical mixed-use • Increasing housing densities within/adjacent to employment areas • Increasing residential/commercial density near transit • Integrate affordable and market rate housing • Local housing for local workforce • Making developments transit ready • New housing and jobs within ½ mile of existing/planned transit stations or stops **Alternate Modes:** • Increase bike/walk trips with improved streets and facilities **Transit Infrastructure** • Enhanced bus stops • Improve transit options – including the i shuttle • Targeted infrastructure growth
Project Description 	The 2,800-acre Irvine Business Complex (IBC) is a unique part of the City of Irvine. Dating from the 1970s, the IBC was developed solely as a commercial and industrial center serving Southern California as a regional economic and employment base, including hotel, restaurant, commercial, retail, industrial, and office uses. Over time, the IBC began its transition from a suburban mixed-use commercial and industrial center to a more urban regional mixed-use center. In early 2004, the number of applications for residential units within the IBC increased dramatically. The City of Irvine identified the opportunity for a mixed-use community with a coordinated urban design framework within the IBC while ensuring the continued economic viability of existing and future businesses. The IBC Vision Plan aims to develop a comprehensive strategy and guiding urban design framework for future IBC development. The Vision Plan and Irvine Business Complex Residential Mixed-Use Overlay Zone call for creating sustainable urban neighborhoods within a framework of new streets and open spaces, a newer approach than has traditionally been considered in other residential areas of Irvine. The Vision Plan reflects a long-term view of the IBC as a mixed-use community and reflects the best planning techniques available to assist in the evolution of the IBC. In order to achieve a

	balanced urban environment, the IBC needs walkable neighborhoods where people can work, live, and play; feeling part of an evolving and vibrant cosmopolitan city. This requires a mix of uses and places that are activated both day and night, drawing together diverse community segments. The IBC is served by a system of public transportation bus routes. The Tustin Metrolink train station is 1.5 miles north of the IBC. In 2008, the iShuttle, operated by the City of Irvine and designed for the IBC community, went into service. The shuttle allows residents and employees an alternative way to commute to jobs and other destinations throughout the IBC.
Emissions Reductions Benefits	The IBC Vision Plan will provide enhanced pedestrian- and transit-friendly environments both internally and through linkages to the City's extensive trails and bikeways system. Providing public transportation options such as the i shuttle encourages transit use in the area and increases the use of alternate modes, which contribute to a greener future.
Project Status	IBC Vision Plan is approved and individual projects are under construction.

Tustin Legacy

Project Location	***City of Tustin***
Sustainability Strategy Category	**Land Use Policies:** • Develop "complete communities" • Horizontal or vertical mixed-use • Increase housing densities within/adjacent to employment areas • Improve accessibility of housing to transit • Locate major regional activity centers near existing development • Increase residential/commercial density near transit • Integrate affordable and market rate housing • Local housing for local workforce • Locate schools in neighborhoods with student populations • Make developments transit ready • New housing and jobs within 1/2 mile of existing/planned transit stations **Alternate Modes:** • Arterial Improvements • Construct Regional Bikeways • Facilitate Increased Biking Opportunities • Improve Pedestrian Environment (E.G., Beautification, Access, Safety) • Improving Bicycle Infrastructure And Facilities (Lockers, Racks, Valets, Safe Bike Parking, Subsidies) • Improving Pedestrian Infrastructure And Facilities E.G. Pedestrian Bridge • Increase Bike/Walk Trips With Improved Streets And Facilities • Sidewalk Construction • Trail Improvement Project • Upgrade Bike Transportation System
Project Description 	Tustin Legacy is being developed on the site of the nearly 1600-acre former Marine Corps Air Station (MCAS) Tustin. To date, construction of the following has been completed at Tustin Legacy: • 1,680+ homes • "The District" Regional Shopping Center • Various educational institutions • Social services facilities • Neighborhood parks • Major roadways and related infrastructure

Project Location	*City of Tustin*
	Future development calls for an additional 2,100 residences, 6-7 million square feet of non-residential space (office, retail, restaurant, entertainment, research and development), educational facilities, new roadways including a major arterial connection, infrastructure and significant parkland and open spaces. One component will be a vibrant "Urban Community Core," a pedestrian-oriented, mixed-use district integrating a variety of uses and activities including retail, restaurant and entertainment uses, hotels, for-sale and apartment homes, and offices.
Emissions Reductions Benefits	Tustin Legacy is a complete community that provides pedestrian and transit friendly environments both internally and through linkages to the Tustin Metrolink Station and regional trails and bikeways. Linking land uses and trip purposes reduces overall vehicle miles traveled.
Project Status	Project is approved and under construction.

Santa Ana Transit Zoning Code

Project Location	*City of Santa Ana*
Sustainability Strategy Category 	**Land Use Policies:** • Horizontal or vertical mixed-use • Increasing housing densities within/adjacent to employment areas • Increasing residential/commercial density near transit • Integrate affordable and market rate housing • Local housing for local workforce • Making developments transit-ready • New housing and jobs within 1/2 mile of existing/planned transit stations **Alternate Modes:** • Increase bike/walk trips with improved streets and facilities **Transit Infrastructure:** • Enhanced bus stops, improved transit facilities, targeted infrastructure growth
Project Description	The Transit Zoning Code (TZC) is a visionary new land use tool to create a healthier, more livable and more sustainable community. The cornerstone of this policy document is the interconnectedness of zoning and development standards with the creation of walkable communities, which in turn supports the successful creation of new transit opportunities. The 400-acre project area allows for both vertical and horizontal mixed-use in an infill environment. Density /intensity range from 5 to 90 dwelling units per acre, and 0.5 to 5.0 floor area ratio. Buildout potential includes 4,075 new housing units and 260,000 SF of commercial development opportunities.
Emissions Reductions Benefits	The TZC provides the framework for new housing and mixed-use development in a pedestrian and transit friendly environment. The Transit Zoning Code area is in close proximity to Metro East and Downtown/Civic Center employment hubs; as well as the Santa Ana Regional Transportation Center (SARTC) and proposed fixed guideway. Linking complementary land uses with non-motorized and transit travel options reduces overall vehicle miles traveled. . . . Concentration of pedestrian friendly, higher intensity development near transit opportunities promotes use of cleaner alternate modes of travel.
Project Status	The Transit Zoning Code was approved in June 2010. Development proposals are under review for over 140 infill residential units.

Beach and Edinger Corridors Specific Plan

Project Location	***City of Huntington Beach***
Sustainability Strategy Category	**Land Use Policies:** • Horizontal or Vertical Mixed-use • Increasing Housing Densities within/Adjacent to Employment Areas • Increasing Residential/Commercial Density Near Transit • Integrate Affordable and Market Rate Housing • New Housing and Jobs within 1/2 Mile of Existing/Planned Transit Stations **Alternate Modes:** • Increase Bike/Walk Trips with Improved Streets and Facilities **Transit Infrastructure:** • Targeted Infrastructure Growth
Project Description 	The Beach and Edinger Corridors Specific Plan (BECSP) encompasses 459 acres along the City's two major commercial arteries, one a State highway and the other close to the OCTA bus transit station. Both are well-served by bus transit. The BECSP encourages mixed-use development with a focus on improving the pedestrian experience. This is achieved by not having a maximum density cap or floor area ratios, and by requiring public open space and private and public improvements that benefit the pedestrian in all projects. The BECSP requires that all required affordable housing be located within the Plan area.
Emissions Reductions Benefits	The BECSP fosters emission reductions by allowing for over half of the City's anticipated growth within the Plan area, an area well served by existing infrastructure and bus transit, and traversed by an existing rail line that may be used for passenger service in the future. The BECSP standards compel efficient land development, allow for reduced parking standards, and require sustainable building practices in all new development.
Project Status	The BECSP was approved March 2010. Two significant mixed-use projects have been approved and two are in the environmental review stage.

Laguna Niguel Gateway Specific Plan

Project Location	***City of Laguna Niguel***
Sustainability Strategy Category	**Land Use Policies:** • Horizontal or vertical mixed-use opportunities • High density housing opportunities within/adjacent to employment areas • High density residential/commercial density near transit station • New housing and jobs within ½ mile of existing transit station • Housing densities to accommodate both affordable and market rate housing **Alternate Modes:** Increase bike/pedestrian trips with improved bike lane, sidewalk, and trail connectivity throughout Gateway area and to regional systems **Transit Infrastructure:** Improved transit facilities, including expanded station operations and enhanced bus stops
Project Description	Laguna Niguel's Gateway area features high-density housing with as many as 2,994 dwelling units, development opportunities for as much as 2.1 million square feet of office, retail, restaurant or entertainment uses, hotel development opportunities for as many as 350 rooms, opportunities for both vertical and horizontal mixed-use in an infill environment, immediate access to and from the rest of Orange County from both the I-5 and 73 freeways, and a transit station that is the southern terminus of the region's double track system.
Emissions Reductions Benefits	The Gateway Area provides pedestrian- and transit-friendly environments both internally and through linkages to regional trail and bikeway systems; an employment, shopping, and entertainment destination that encourages multi-purpose trips to the area; increased transportation choices increases use of alternate modes, all of which contribute to fewer vehicle-miles traveled and to related emissions reductions.
Project Status	City Council approval of the Specific Plan Project is anticipated in July 2011.

Laguna Hills Urban Village Specific Plan

Project Location	*City of Laguna Hills*
Sustainability Strategy Category	**Land Use Policies:** • Horizontal or vertical mixed-use • Increasing housing densities within/adjacent to employment areas • Increasing residential/commercial density near transit • Integrate affordable and market rate housing • Local housing for local workforce • Making developments transit ready • New housing and jobs within 1/2 mile of existing/planned transit stations **Alternate Modes:** • Increase Bike/Walk Trips With Improved Streets And Facilities
Project Description	The Laguna Hills Urban Village Specific Plan regulates a 240-acre area in the City for the purpose of developing a community core in which a variety of public, regional commercial, recreational, and high density residential uses work in concert to create an urban village. The Laguna Hills Transportation Center is located within this area, which is served by transit. The plan allows for both vertical and horizontal mixed-use in an infill environment.
Emissions Reductions Benefits	The Urban Village Specific Plan provides the framework for new housing and mixed-use development in a pedestrian- and transit-friendly environment. The Laguna Hills Transportation Center is located within this area. Linking complementary land uses with non-motorized and transit travel options reduces overall vehicle miles traveled. Concentration of pedestrian-friendly, higher-intensity development near transit opportunities promotes use of cleaner alternate modes of travel.
Project Status	The Urban Village Specific Plan was adopted in November 2002 and updated in April 2011. The City is actively working with surrounding owners in the area to encourage redevelopment and new infill development.

South Brea Lofts

Project Location	*City of Brea*
Sustainability Strategy Category 	**Land Use Policies:** • Redevelopment of underutilized, blighted commercial properties downtown • Vertical mixed-use • Compact building design • Encourage new housing units adjacent to employment areas • Increasing residential/commercial density near Downtown Brea • Local workforce housing • Infill in areas with existing infrastructure • Integrate affordable and market rate housing **Alternative Transportation Modes:** • Each dwelling unit was provided a street-ready electric (NEV/Gem) vehicle • Increase bike/walk trips with improved streets and facilities
Project Description 	South Brea Lofts features 47 residential units in a live/work arrangement and 7,500 square feet of commercial uses with access to City Hall Park and Downtown Brea. The project features a vertical mixed-use design on a 2.8-acre infill site. Key elements of the project include workforce housing for moderate income households, dedicated work space with neighborhood commercial uses, activated street due to improved pedestrian access, and a "GEM" electric vehicle with each loft for local trips to school, post office, Brea Mall, community center, senior center, or businesses nearby.
Emissions Reductions Benefits 	The South Brea Lofts provides a pedestrian friendly environment to nearby community destinations. The project has strong internal and external pedestrian linkages to the Brea Boulevard corridor that connects to the employment and entertainment center of Downtown. By linking multiple land uses within this project, the reduction of overall vehicle trips and miles traveled reduces GHG levels for the region. The project provides Loft owners options that improve use of alternative transportation modes – all of which contribute to a sustainable future for Brea.
Project Status	Project was completed and occupied in 2008.

Transportation Corridor Agencies Habitat Preservation and Restoration Projects

Project Location	***SR 73 Toll Road and SR 241 Toll Road, City of Newport Beach and Orange County***
Sustainability Strategy Category	**Open Space:** Preservation of Habitat
Project Description	Transportation Corridor Agencies (TCA) have set aside 2,200 acres of permanently protected open space. **Cactus Wren Habitat Linkage and Restoration** In partnership, the Nature Reserve of Orange County (NROC), the University of California, Irvine (UCI), and the TCA were awarded a grant in 2010 to enhance and restore habitat for the cactus wren, a small bird declining in the region. The project includes planting cactus in a habitat corridor used by the federally threatened California gnatcatcher bird along the wildlife linkage area that parallels the 73 Toll Road from Upper Newport Bay south through Bonita Channel to Coyote Canyon. Within four months of transplanting the cactus, a new cactus wren pair was observed using the newly transplanted habitat. **Bonita Creek Mitigation Site** The Bonita Creek Mitigation Site is one of 15 locations comprising 2,200 acres in Orange County that TCA conserved to compensate for the effects of constructing the Toll Roads. The approximately 40-acre wetland and coastal sage scrub site is the main wildlife link from Upper Newport Bay to the San Joaquin Hills and was restored in association with construction of the SR 73 Toll Road. The project consisted of restoring a creek from a narrow rip-rap lined ditch to thriving wetland and coastal sage scrub community. Coyote and mountain lion have been recorded using the site. **Live Oak Preservation Area** In 2005 TCA acquired the Live Oak

Project Location	***SR 73 Toll Road and SR 241 Toll Road, City of Newport Beach and Orange County***
	Preservation Area, a 23.2-acre site that sits east of the SR 241 Toll Road at El Toro Road and Live Oak Canyon. The site serves as an important buffer to a national forest and provides habitat for a number of sensitive animal species declining in the region. The site also contains valuable oak woodlands and coastal sage scrub habitat for the California gnatcatcher Riverside fairy shrimp. Protecting the land as open space helps preserve natural wildlife movement corridors in the area. **Upper Chiquita Canyon** In 1996, TCA placed a conservation easement over a 1,182 acre area, known as Upper Chiquita Canyon. The conservation area was originally planned for development as a golf course and residential area. Upper Chiquita provides habitat to the federally threatened California gnatcatcher, as well as the coastal cactus wren and numerous other plants and wildlife. The site serves as an important buffer to regional parks and open space preserves to the south. The TCA has been actively managing the site since 1996 and increasing its habitat values. Protecting the land as open space helps preserve natural wildlife movement corridors in the area.
Emissions Reductions Benefits	Carbon sequestration
Project Status	Completed

Sustainable Transportation at UC Irvine

Project Location	*City of Irvine*
Sustainability Strategy Category	**Alternate Modes:** • Employer incentives for alternative modes • Provide local shuttles • Rideshare programs • Vanpools **Bike:** • Improve bike/walk trips with improved streets and facilities.
Project Description	UC Irvine has 3 full-time and 1 part-time staff committed to implementation of Sustainable Transportation programs including: **Bike Infrastructure:** Extensive bike path network/ Signage/ Bike-Pedestrian bridges. **Bus:** University Pass Program provides annual OCTA access for $95 - an 86% subsidy. **Carpool**: Available for employees; provides reduced-rate parking and preferential parking for participants. **Shuttle**: UCI maintains a shuttle fleet for on-campus and near-campus transportation. **Train**: Provides 20% rebate for 10-day and monthly pass holders. **Vanpool**: UCI has 18 vanpools carrying passengers from various locations to UCI. **Pedestrian Infrastructure:** Extensive pedestrian path network / Signage / Bike-Pedestrian bridges. **ZEV-NET**: Zero-Emission Vehicles stationed at the Irvine Transportation Center for pooling to/from UCI. **Rideshare support** for individuals who do not bring a car to campus: • ZotWheels Bikeshare – The first fully-automated bikeshare program at a U.S. university. • Zipcar Carshare – 11 cars on campus available for hourly or daily use at $7-$8/hour.
Emissions Reductions Benefits	Extensive promotion of non-motorized transportation and alternatives to single-occupant vehicles results in reduced VMT.
Project Status	Programs are in place and ongoing.

Anaheim Resort Transit

Project Location	*City of Anaheim*
Sustainability Strategy Category	**Alternate Modes:** • Convert transit buses to alternative fuels • Provide local shuttles **Transit Infrastructure:** • Improve transit service • Intercity bus transit
Project Description 	The Anaheim Resort Transit (ART) is the transportation system for the residents, employees and guests of the City of Anaheim and the greater Anaheim Resort area, including the cities of Anaheim, Garden Grove and Orange. ART's frequent service with seventeen interchangable routes allow for easy access and convenient connections. The ART runs on alternative fuel which is a clean, comfortable, safe and easy way to access access Disneyland™, Disney California Adventure™, Downtown Disney®, the Anaheim Convention Center, restaurant and shops around The Anaheim Resort™ area. All buses are accessible to persons with disabilities. A unique, stable funding source was established and implemented to provide resources for 17 transit routes in a highly congested area.
Emissions Reductions Benefits	Combined resources have reduced the need for increased taxi service and individual shuttles formerly operated by the lodging establishments.
Project Status	Project is operating successfully and service levels have not been reduced due to economic conditions.

Beach Boulevard Signal Synchronization

Project Location	***Project spans the cities of Anaheim, Buena Park, Fullerton, Huntington Beach, La Habra, Stanton and Westminster.***
Sustainability Strategy Category	**TSM:** Implement Traffic Signal Coordination
Project Description	A study conducted to evaluate the benefits of traffic synchronization along Beach Boulevard (SR-39) resulted in the following improvements: • Travel times improved between 10 percent and 16 percent • Reduced number of stops between 20 percent and 38 percent • Increased average speeds between 11 percent and 19 percent The project synchronized more than 70 intersections along Beach Boulevard.
Emissions Reductions Benefits	Traffic light synchronization allows a series of lights along a street to turn green as traffic approaches during peak traffic hours. The resulting outcome is reduced congestion. Daily traffic along Beach Boulevard near Warner Avenue and the San Diego Freeway (I-405) ranges between 17,000 and 84,000 vehicles. Traffic engineers estimate that during a three-year period the traffic light synchronization along this area will save commuters approximately 2.2 million gallons of fuel.
Project Status	Completed 

FasTrak Tolling/Interoperability Technology

Project Location	***SR 73, 241, 133 and 261 Toll Roads, Orange County***
Sustainability Strategy Category	**TSM:** Implement effective pricing.
Project Description	TCA developed and licenses FasTrak, the technology that enables interoperability on all priced facilities in the region and the state. For example, all priced facilities in Orange and San Diego Counties currently use the FasTrak transponder technology, making the system flow more smoothly with less congestion-related GHG emissions. This technology also provides interoperability on tolled facilities statewide; OCTA's 91 Express Lanes as well as priced lanes in San Diego County and in the Bay Area also employ FasTrak.
Emissions Reductions Benefits	FasTrak is essential to uncongested operation of a broader regional priced transportation network in the future.
Project Status	Electronic tolling via the FasTrak technology is available on 460 lane miles of SR 241, SR 261, SR 133, SR 73 and SR 91. FasTrak will expand to 105 lane miles of SR241 when the facility is completed to the Orange/San Diego County line.

Robinson Ranch Road Traffic Calming Project

Project Location	*City of Rancho Santa Margarita*
Sustainability Strategy Category	**Transportation Infrastructure Investments:** • Traffic calming measures • Develop traffic calming systems
Project Description	The traffic calming project will construct four curb extensions along the north side of Robinson Rancho Road between Briarwood Lane and Morningside Drive, thereby reducing downhill vehicle speeds, and creating added protection for pedestrian crossings at the intersections. In addition, the curb extensions will improve sight distance for motorists exiting residential neighborhoods adjacent to Robinson Ranch Road.
Emissions Reductions Benefits	Traffic calming reduces speeds and volumes on specific roads. Typical strategies include traffic circles at intersections, raised crosswalks, and partial street closures to discourage short-cut traffic through residential neighborhoods. This reduces car use, increases road safety and creates a more pedestrian- and bicycle-friendly environment.
Project Status	Project is included in the City's Seven-Year Capital Improvement Program, and was recently awarded a Highway Safety Improvement Program project grant from the State.

Ladera Ranch and the Ranch Plan Planned Communities

Project Location	*Southeasterly Unincorporated County of Orange*
Sustainability Strategy Category	**Land Use Policies:** • Compact building design with a mix of uses • Develop "complete communities" • Water-wise and ecologically friendly landscape plans • Horizontal or vertical mixed-use • Increasing housing densities within/adjacent to employment Areas • Local housing for local workforce • Preservation of habitat **Alternate Modes:** • Use of neighborhood electric vehicles. • Construct regional bikeways. • Upgrade bike transportation system. • Improve pedestrian infrastructure and facilities (Crown Valley pedestrian bridge).
Project Description 	**Ladera Ranch Planned Community:** In 2006, the prestigious Urban Land Institute chose Ladera Ranch as the winner of its Award of Excellence as the best planned community in the Americas. Begun in 1998 and substantially completed in 2006, Ladera Ranch set a new standard for the development of walkable master planned communities in Southern California. Its final-phase villages of Terramor and Covenant Hills have created a model for sustainable community practices; convincing many national production builders to apply green-building techniques used for the first time in Ladera Ranch to other projects around the country. **Ranch Plan Planned Community:** The Ranch Plan is a long-term land use plan approved in 2004, and likely to be developed over the next two decades. One of the corner-stone principles of the Ranch Plan is to create a community where all residents may easily and safely walk or bike to jobs, shopping, schools, parks and regional open spaces.
Emissions Reductions Benefits	**Ladera Ranch Planned Community:** • Emissions have been reduced through the creation of a Complete Community where homes, schools, shops, restaurants, offices, places of worship, child-care centers, and parks

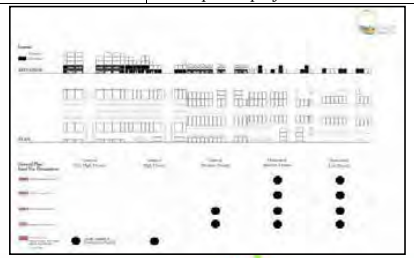
Project Location	*Southeasterly Unincorporated County of Orange*
	all easily accessible via a short auto trip, or via the system of walking and bicycle trails. • The 1,260 home Terramor village land plan in particular emphasized walkability through the creation of a central Arroyo/Paseo trail network that doubled as a Biofiltration Treatment system. **Ranch Plan Planned Community:** • Builds upon the Ladera Ranch Complete Community model by integrating up to 5.2 million square feet of non-residential uses in addition to the 14,000 homes, including vertically integrated home-based businesses. • Incorporates an extensive system of regional and community level bikeways, hiking and walking trails that will provide linkages within and between each of the future neighborhoods and villages and to surrounding cities, nearby beaches, Caspers Regional Park and the Cleveland National Forest. • The land plan is based on the recognition that neighborhood streets are not just corridors for moving traffic, but should serve as Complete Streets; allowing social interaction, walking, biking and other transportation modes, including neighborhood electric vehicles. • Six villages have been entitled, each to be surrounded by natural open space and ranch/agriculture lands. Three quarters of the 22,815 acre Ranch Plan area will be dedicated to a conservancy to be preserved and privately managed as open space for habitat preservation (including the protection of seven threatened or endangered species, in addition to 25 sensitive species)
Project Status	**Ladera Ranch Planned Community:** • The 8,100 dwelling unit Ladera Ranch community is 99% built-out, implemented primarily between 1999 and 2006. **Ranch Plan Planned Community:** • Construction of Phase One of the Ranch Plan planned community has begun, with home sales beginning in 2013, and office and commercial uses to be built soon thereafter.

City of Aliso Viejo Green City Initiative

Project Location	*City of Aliso Viejo*
Sustainability Strategy Category	**Land Use Policies:** • Compact building design • Water-efficient landscape • Downtown revitalization • Enhanced energy efficiency codes • Land use and building code reform • Horizontal or vertical mixed-use • Increasing housing densities within/adjacent to employment areas • Increasing residential/commercial density near transit • Integrate affordable and market rate housing • Local housing for local workforce • Making developments transit ready • New housing and jobs within 1/2 mile of existing/planned transit stations • Provide recognition programs • Provide regulatory relief • Zoning reform • City educational programs • Reduce vehicle miles traveled • Adopt complete streets policy **Alternate Modes:** • Promote cleaner modes of transport • Trail improvement project • Improve connectivity of streets with pedestrian network • Improve pedestrian environment • Improve pedestrian infrastructure and facilities • Increase bike/balk trips with improved streets and facilities **Transit/Transportation Infrastructure:** • Enhanced bus stops • Improve transit service • Intercity bus transit • Traffic calming measures • Implement traffic signal coordination
Project Description	The Green City Initiative (GCI) will establish goals, policies and implementation actions related to energy conservation, water conservation, vehicle management,

Project Location	*City of Aliso Viejo*
	transportation, air quality, recycling, land use and adaptation to climate change, and will include requirements for a greenhouse gas emissions reduction monitoring program. Furthermore, a GCI Website has been created that posts a variety of information related to the GCI. Together with a new Facebook page, the Website will provide additional important venues for public participation in the Green City Initiative process. Finally, the City will establish a "Green Award Program" to recognize individuals and businesses who take steps to reduce their greenhouse gas emissions footprint.
Emissions Reductions Benefits	Though the impetus to GCI is in response to State legislative requirements, GCI is equally dedicated to creating a more sustainable, livable Aliso Viejo as well as about reducing GHG emissions. Furthermore, the GCI also is intended to enhance Aliso Viejo's ability to promote a healthy economic environment for residents and businesses in the City. The belief is that an enhanced "green" residential and business environment will attract and retain additional investment money and business income into Aliso Viejo – all of which contribute to a greener future.
Project Status	Project is in process, with expected completion date of December 2011.

Costa Mesa Urban Plans



Project Location	*City of Costa Mesa*
Sustainability Strategy Category 	**Land Use Policies:** • Compact building design • Horizontal or vertical mixed-use • Improve accessibility of housing to transit • Increasing residential density near transit • Infill in areas with existing infrastructure • Support revitalization of older, densely settled urban areas. • Zoning reform measures • Shared parking **Alternate Modes:** • Facilitate increased biking opportunities • Improve bicycle infrastructure and facilities **Transit Infrastructure:** • Enhanced bus stops and improve transit facilities.
Project Description 	In 2006, three Urban Plans were developed to establish overlay zones in specific areas of the westside of Costa Mesa: (1) 19 West Urban Plan, (2) Mesa West Bluffs Urban Plan, and (3) Mesa West Residential Ownership Urban Plan. West Costa Mesa is currently developed with mostly marginal commercial and light industrial uses in a great geographical location. The three main purposes of the urban plans are to do the following: • **Encourage Commercial/Residential mixed-use development** that combines residential and nonresidential uses in a single building (vertical mixed-use development) or in proximity on the same site (horizontal mixed-use development). This type of development could include office, retail, business services, personal services, public spaces and uses, and other community amenities to revitalize the area without exceeding the development capacity of the General Plan transportation system. • **Encourage adaptive reuse** of existing industrial or commercial structures, which would result in rehabilitated buildings with

	unique architecture and a wider array of complementary uses. • **Meet demand for a new housing type** from artists, designers, craftspeople, professionals and small-business entrepreneurs.
Emissions Reductions Benefits	The urban plans provide for new housing and mixed-use development. Concentrating and intensifying development within half to one mile of the Harbor Boulevard transit corridor will encourage alternative transportation modes, reduce vehicle miles traveled and generally contribute to greener development.
Project Status	The Urban Plans were approved in 2006. Several projects for mixed-use and live-work units have been approved. One is currently under construction.

Orange 2010 General Plan Update

Project Location	***City of Orange***
Sustainability Strategy Category	**Land Use Policies:** • Horizontal or vertical mixed-use • Increasing housing densities within/adjacent to employment areas • Increasing residential/commercial density near transit • Integrate affordable and market rate housing • Local housing for local workforce • New housing and jobs within 1/2 mile of existing/planned transit stations **Alternate Modes:** • Increase bike/walk trips with improved streets and f acilities **Transit Infrastructure:** • Enhanced bus stops • Improve transit facilities
Project Description	The Plan locates mixed-use districts around major employment and activity hubs including three regional medical centers, County justice facilities, shopping, entertainment, a university, the historic downtown Plaza, and major sports venues. Existing multi-modal transit in these areas are planned for expansion.
Emissions Reductions Benefits	The Plan's Land Use and Circulation and Mobility Elements improve efficiencies between land use and circulation, and encourage pedestrian and multi-modal linkage between neighborhoods, employment, goods, services, and recreation.
Project Status	The Plan was approved in 2010 and is under implementation through development of new mixed-use zoning standards, a transit-oriented specific plan around the Orange Transportation Center, and private development projects.

LAND USE, TRANSPORTATION, AND SUSTAINABILITY STRATEGY CONCLUSION

Orange County is engaged in a collective effort to link transportation and land uses through a wide spectrum of processes and organizations working together. This effort includes a variety of progressive measures undertaken by Orange County jurisdictions, agencies, and groups that lead to changes in the use of automobiles and light duty trucks, resulting in reductions in greenhouse gas emissions.

The scope of current and planned strategies is broad and encompasses significant investment by both the public and private sectors to implement them. They include the following:

- Promoting a land use pattern that accommodates future employment and housing needs.
- Using land in ways that make developments more compact and better links jobs, housing and major activity centers.
- Protecting natural habitats and resource areas.
- Implementing a transportation network of public transit, managed lanes and highways, local streets, bikeways, and walkways built and maintained with available funds.
- Managing demands on the transportation system (TDM) in ways that reduce or eliminate traffic congestion during peak periods of demand.
- Managing the transportation system (TSM) through measures that maximize the efficiency of the transportation network.
- Utilizing innovative pricing policies to reduce vehicle miles traveled and traffic congestion during peak periods of demand.

These strategies are Orange County's contribution to regional strategies to achieve both 2020 and 2035 GHG thresholds established by CARB.

CHAPTER 4: COMPLYING WITH THE CLEAN AIR ACT

INTRODUCTION

SB 375 requires the SCS to allow the regional transportation plan to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506). This chapter describes how the strategies outlined in the OC SCS help to achieve this compliance by reducing air pollution.

AIR POLLUTION REDUCTIONS

While GHG emissions reduction is a significant goal of SB 375, the legislation recognizes that automobiles and light trucks account for 50% of air pollution in California and 70% of petroleum consumption. Established modeling methodology has shown that changes in land use and transportation policy can reduce air pollution.

The SCS strategies help to achieve the SB 375 objective of allowing the RTP to comply with the federal Clean Air Act by accomplishing one or more of the following goals:

- A reduction of Vehicle Miles Traveled (i.e., vehicles travel shorter distances from their origin to destination, by placing residential uses near work and shopping areas);
- A reduction of Vehicle Hours Traveled (i.e., vehicles spend less time on the roadways; they may travel the same distance as before, but reduced congestion and stop-and-start activity improves travel time); and,
- Minimizing the use of gasoline-powered vehicles by increasing the use of non-motorized travel, alternative fuel vehicle use, or shared rides.

Many of the strategies to reduce GHG emissions outlined in the OC SCS, including the sustainability strategies detailed in Appendix F, also will achieve at least one of the above actions. Air pollution can be reduced by avoiding extra miles, reducing traffic congestion, and reducing the number of gasoline-powered vehicles with single occupants. In doing so, they will help meet the federal air pollutant concentration standards, and provide significant assistance to California's goals of implementing the federal and state Clean Air Acts and reducing its dependence on petroleum.

Additionally, OC SCS strategies help to reduce smog-forming and other emissions that pose health risks. Further, many of the strategies provide increased opportunities for people to be physically active which can improve people's general health, potentially reduce costs of transportation by offering alternative choices, and increase social benefits by providing increased mobility for people who do not have the option of using a passenger vehicle (e.g., disabled, economically disadvantaged, etc.).

CLEAN AIR ACT CONCLUSION

Implementation of the strategies outlined in the OC SCS is expected to result in decreased air pollution, allowing the RTP and OC SCS to comply with the federal Clean Air Act.

CHAPTER 5: RESOURCE AREAS AND FARMLAND

INTRODUCTION

SB 375 requires the SCS to gather and consider the best practically available scientific information regarding resource areas and farmland in the region. This chapter provides a summary of the resource areas and farmlands located within Orange County. These lands are considered unavailable for development, thus focusing future development in more dense cores and along major transportation infrastructure.

California Department of Fish and Game: California Natural Diversity Database (CNDDB)

The CNDDB is a "natural heritage program" under the auspices of CDFG and is part of a nationwide network of similar programs, all of which provide location and natural history information on special status plants, animals, and natural communities to the public, other agencies, and conservation organizations. The data help drive conservation decisions, aid in the environmental review of projects and land use changes, and provide baseline data helpful in recovering endangered species and research projects. The CNDDB used here (Figure 59) has been pared down further, to highlight only those species considered rare, threatened, or endangered according to the State of California or the United States government. Sightings that were considered less accurate (greater than an 80m [meter] area) were also omitted.

The CNDDB is updated monthly and contains information that has been mapped at the parcel level to about 1:24,000 scale. The November 2010 CNDDB is used in this document, which is applicable to County-level maps.

National Flood Hazard Layer

The National Flood Hazard Layer (NFHL) created and maintained by Federal Emergency Management Agency (FEMA) is a compilation of effective flood insurance rate maps and Letter of Map Change. In its basic form, NFHL shows areas within the 100-year

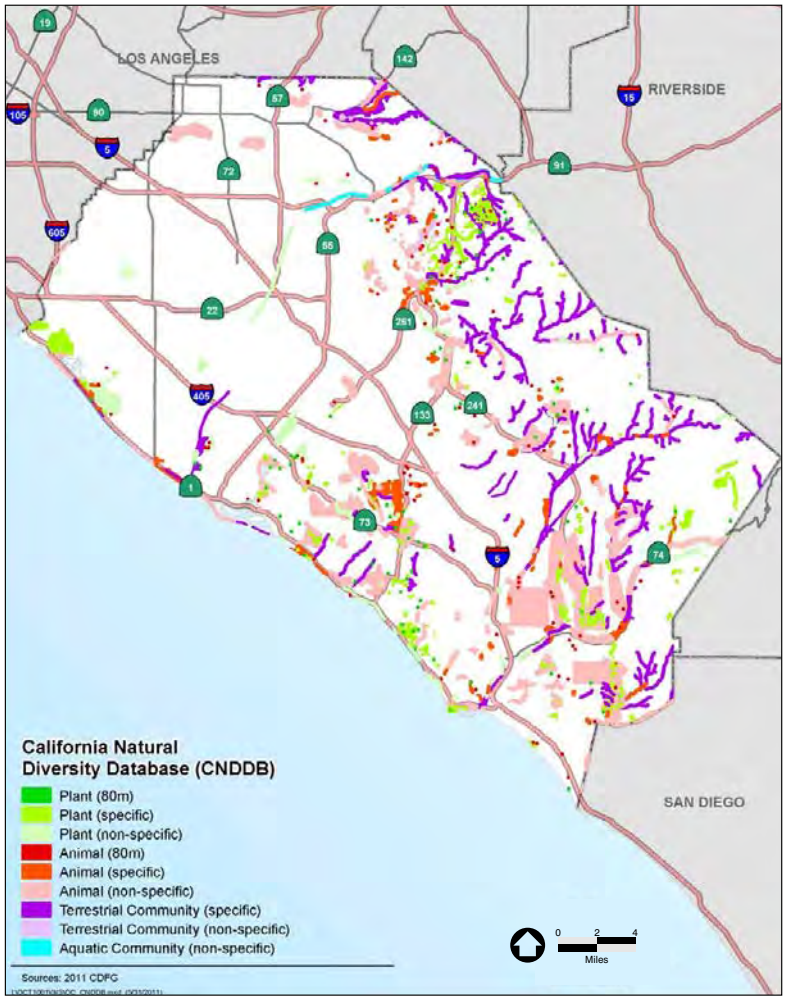


Figure 59 **California Natural Diversity Database**

floodplain at risk of flood damage during such an event. The NFHL on Figure 60 has been mapped at a scale of 1:6,000 or better (i.e., a larger scale) and is applicable for County-level maps. The information is updated approximately quarterly; September 2010 is the date of the information used here.

Natural Community Conservation Planning (NCCP)

In 1991, the California legislature passed the NCCP Act to encourage a collaborative process for regional planning. As a result, natural open space reserves have been set aside in the coastal and central portions of Orange County.

The NCCP is administered by the U. S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), and the County of Orange and is designed to protect open space associated with species preservation. Within each NCCP boundary, set areas are open space reserves and natural corridor linkages that allow for animals to move from one to another. Any potential changes from the existing open space land use to another type of land use must be reviewed thoroughly by USFWS, CDFG, and the County, and be consistent with the goals of the NCCP.

The reserves for the central and coastal NCCP have been established, but the reserve for the southern NCCP has not been fully approved and is still awaiting CDFG approval. That being said, the southern NCCP reserve will not be modified significantly upon CDFG approval and should be viewed as an area where land use changes are discouraged.

For the most part, the NCCP depicted on Figure 61 has been mapped at the parcel level and is applicable for County level maps. The dates for the datasets used in the mapping are as follows:

- NCCP, Central & Coastal: August, 2010
- NCCP, Southern: 2006

California Protected Areas Database (CPAD)

The California Protected Areas Database (CPAD) is a GIS inventory of all lands owned by agencies whose general mission is to continue the open space uses on them. The database contains lands held in fee ownership by public agencies and non-profits; it does not contain data on private conservation and other similar public agency easements. This information is collected and compiled by GreenInfo Networks on an as-needed basis, which usually runs about once a year. The CPAD database highlights public lands owned or managed by the federal government, State of California, Orange County, or local city or non-governmental agency.

Orange County Sustainable Communities Strategy

Figure 60 Flood Hazard Layer

Orange County Sustainable Communities Strategy

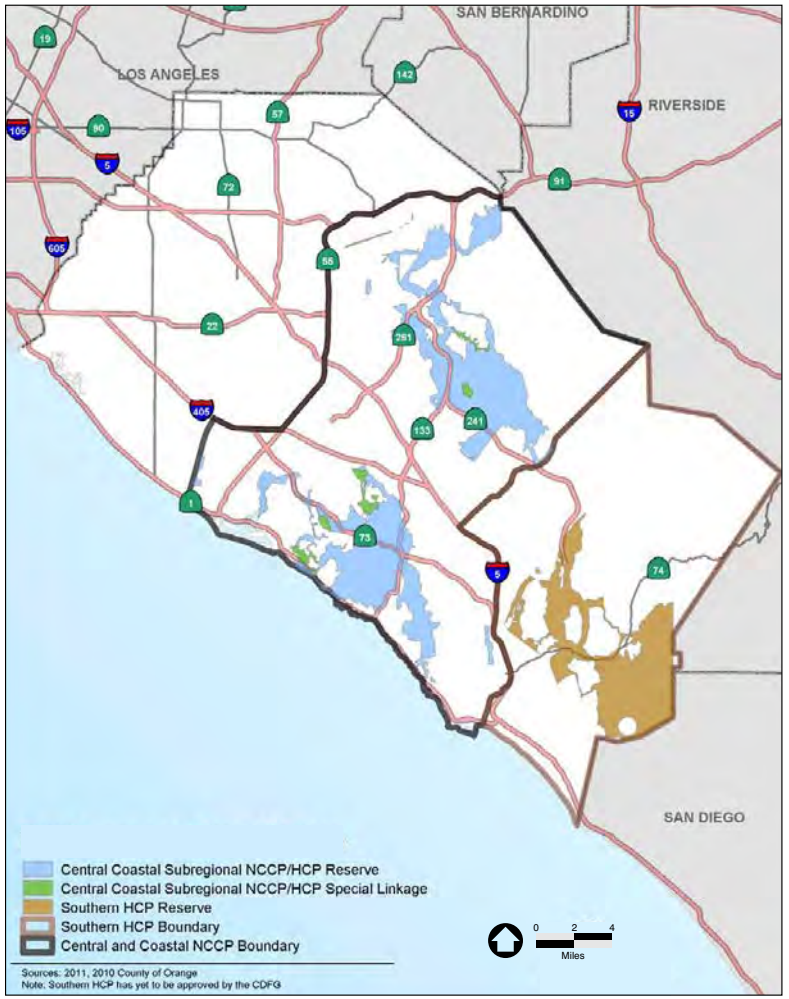

Figure 61 Natural Community Conservation Plan

The CPAD version used for Figure 62 is version 1.5 (June 2010). The data was compiled by GreenInfo Networks. The scale of mapping is done at 1:24,000 (or larger) and is applicable to County level maps.

Farmland Mapping Provided by the USDA Farmland Monitoring and Mapping Program (FMMP)

The FMMP was established in 1982 in response to a critical need for assessing the location, quality, and quantity of agricultural lands, and conversion of these lands over time. FMMP is a non-regulatory program and provides a consistent and impartial analysis of agricultural land use and land use changes throughout California.

Specific farmland was identified using the FMMP dataset created for Orange County in 2008 by the U. S. Department of Agriculture. Of all of the categories of farmland, only Prime Farmland, Farmland of Statewide Importance, and Unique Farmland were identified and used in our mapping. While the conversion of agricultural land to nonagricultural uses represents an important environmental concern which requires appropriate discussion in environmental documents prepared pursuant to the California Environmental Quality Act (CEQA), development of such land is not prohibited by law.

Farmland mapping through the FMMP occurs biennially (depending on governmental funding levels), the most current year for Orange County being 2008. The scale of mapping for Figure 63 is 1:24,000 and is applicable to County level maps.

Williamson Act parcels (separate from the FMMP but part of the overall conservation effort of farmlands) do not exist within Orange County. The last Williamson Act parcels were located in Rancho Mission Viejo in the southern part of Orange County and expired by 2008.

USFWS Critical Habitat

The USFWS creates and manages critical habitat for a variety of species deemed to be endangered or threatened due to habitat loss. These critical habitat areas are identified by the USFWS as areas critical to the species survival and success. Each critical habitat is unique to the species it covers.

The various critical habitats are all mapped on Figure 64 at a scale of 1:24,000 or greater and are applicable to County-level maps. Following are the dates of the various critical habitats mapped in our mapping:

- Arroyo Toad: 2/11/2011
- Braunton's Milk-vetch: 12/14/2006
- Coastal California Gnatcatcher: 12/19/2007

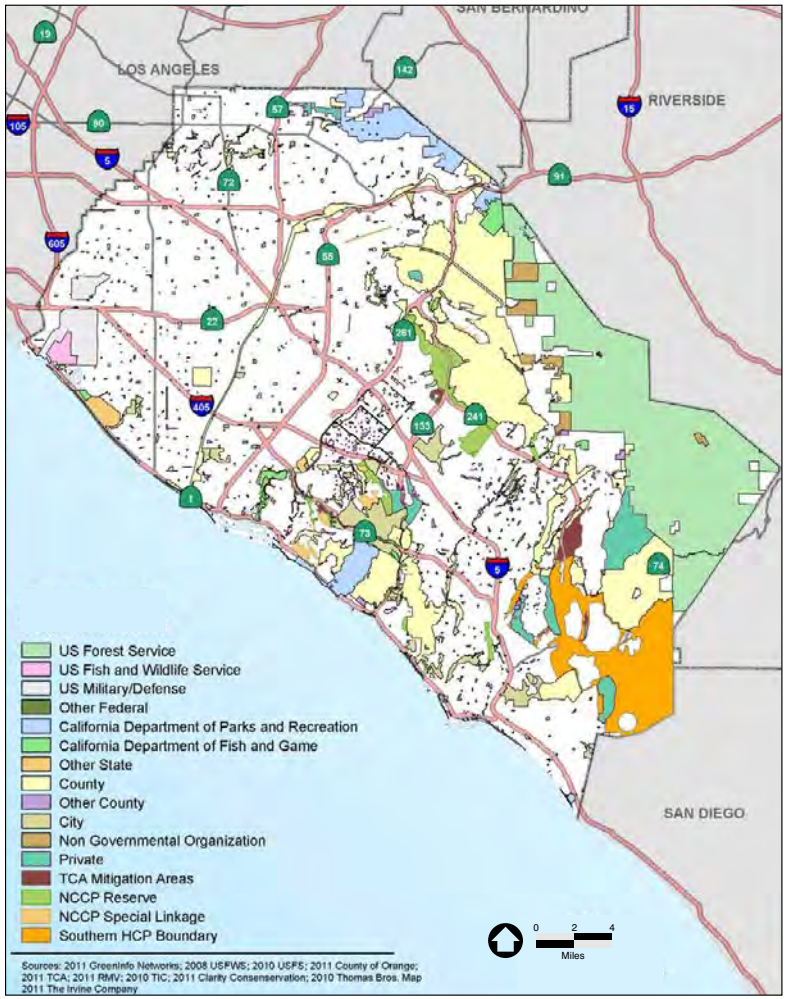

Figure 62 **California Protected Areas Database**

Figure 63 Farmland Monitoring and Mapping Program

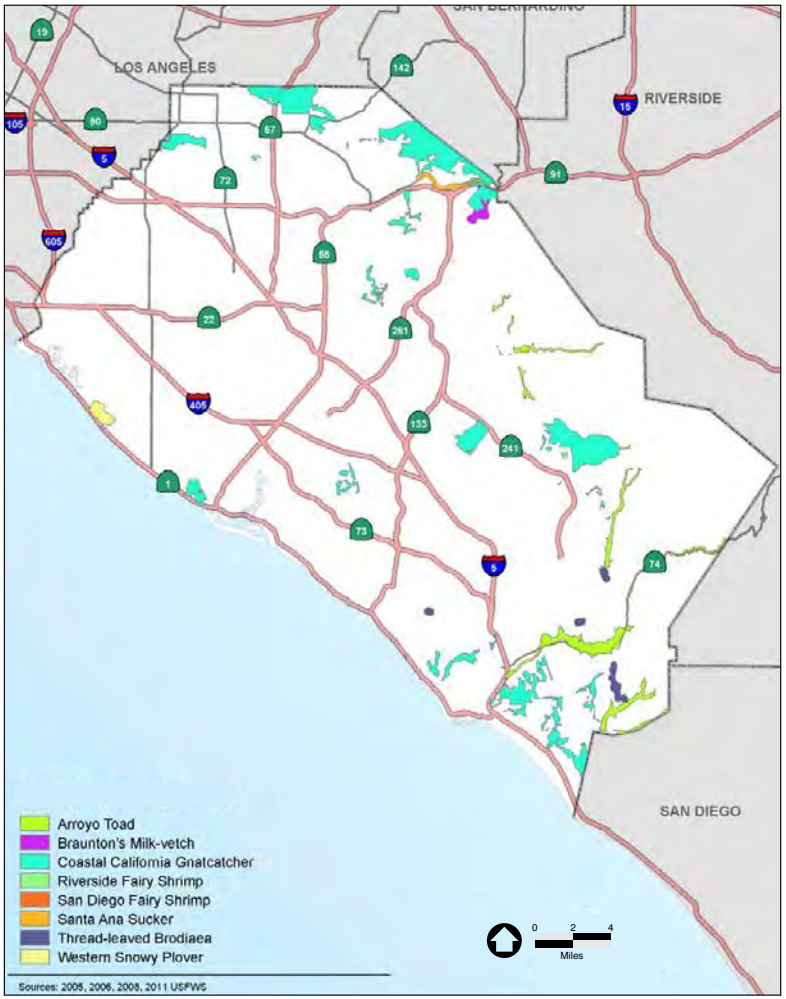

Figure 64 U. S. Fish and Wildlife Service Critical Habitat

- Riverside Fairy Shrimp: 5/12/2005
- San Diego Fairy Shrimp: 1/11/2008
- Santa Ana Sucker: 1/13/2011
- Thread-leaved Brodiaea: 2/11/2011
- Western Snowy Plover: 10/31/2005

Measure M2 Mitigation Program

M2 includes a comprehensive Environmental Mitigation Program that provides landscape-level mitigation to offset environmental impacts for the 13 freeway improvement projects using five percent of M2 freeway program revenue. OCTA is implementing the mitigation program through a collaborative partnership with CDFG, USFWS, Caltrans, and the environmental community.

The M2 mitigation program was among a handful of projects identified by the OCTA Board of Directors that allowed for early planning, advance funding, and implementation. In late 2010, the Board of Directors authorized expenditure of approximately $42 million for acquisition of natural lands (inclusive of long-term management costs) as part of the M2 Environmental Mitigation Program. Additional funds are anticipated to be available in the future; the specific amount of funds available will be dependent on the revenue stream from the sales tax measure. A suite of the most biologically valuable properties and those that most closely align with the freeway impacts are under consideration and/or negotiation. This program is conducted through a voluntary process, similar to private open market transactions. Offers have been made to a number of properties and it is conceivable that the initial funding allocation could yield over a thousand acres of acquired open space properties throughout Orange County. OCTA will receive streamlined permits from the resource agencies for its freeway projects.

Orange County Sustainable Communities Strategy

RESOURCE AND FARMLAND CONCLUSION

Following is a summary of the resource areas and farmland described above:

Areas that fall within a category of the CNDDB would most likely be protected as a natural resource or habitat, so they would not support residential development under SB 375.

SB 375 excludes areas where it has been "determined that the flood management infrastructure designed to protect that land is not adequate to avoid the risk of flooding."

NCCP reserves and/or special linkages (central, coastal, and southern NCCP) do not support residential development under SB 375 and are protected open space areas.

The public lands or open-space lands identified in the CPAD do not support residential development under SB 375. The CPAD areas should be considered as protected open space areas.

Development of Prime Farmland, Farmland of Statewide Importance, and Unique Farmland often constitutes a significant impact under CEQA. Critical habitat represents land that has been preserved for existing natural resources and is therefore not suitable for residential development under SB 375.

Approximately $42 million has been authorized for the acquisition and long-term management of natural lands as part of the M2 Environmental Mitigation Program. Additional funds are anticipated to be available in the future; the specific amount of funds available will be dependent on the revenue stream from the sale tax measure.

Ms. Mary Nichols
Chair,
California Air Resources Board
PO Box 2815
Sacramento, CA 95812

Dear Chairwoman Nichols:

This letter is to transmit the Regional Council action of September 2, 2010 regarding the upcoming Air Resources Board (ARB) meeting to consider establishing greenhouse gas emission reduction targets for 2020 and 2035 in accordance with SB 375 (Steinberg).

The Regional Council at its September meeting approved the following motion:

"SCAG recommends to ARB the following targets for GHG reductions: in 2020, 6%, and in 2035, 8%. And, if ARB accepts the 11 recommendations or the 11 items that we have (see attached report), including adding in fully funding the redevelopment funds and adding the self-help projects/counties, then SCAG would sit down with ARB as a partner and renegotiate the higher numbers."

Thank you for your consideration of this recommendation. As you may be aware, the recommendation came after a long discussion and hearing public input from numerous stakeholders in our region.

SCAG Regional Council looks forward to working with the ARB to successfully implementing SB 375 requirements. Please feel free to contact Mr. Hasan Ikhrata, SCAG Executive Director or me at 213-236-1800 should you have any questions or comments.

Sincerely,

Larry McCallon
SCAG President
Councilmember, City of Highland

SUBJECT: SB 375 Final Draft Regional Targets

EXECUTIVE DIRECTOR'S APPROVAL:

RECOMMENDED ACTION:
Support the California Air Resources Board's (ARB) staff recommended SB 375 final draft greenhouse gas (GHG) emission reduction targets of 8% for 2020 and 13% for 2035. This support for the final draft targets are conditioned upon a combination of the following actions or alternative equivalent measures:

- Restoration of previous levels of State funding for transportation, transit in particular.
- Continued leadership by the regional partners to increase availability of State funds for the region.
- Continued partnership by the state and regional partners to increase availability of state funding for the region.
- Continuing partnership and commitment from each County Transportation Commission (CTC) to support the SCS development process, including a focus on non-motorized transportation solutions.
- Continued leadership by the regional leaders to increase availability of federal funding through the next transportation authorization and through climate change legislation.
- ARB will commit to working with MPOs, local governments, state agencies and the Legislature to identify, pursue and secure adequate incentives and sustainable sources of funding for local and regional planning and other activities related to the implementation of SB 375.
- Targeted increase in funding commitments for Transportation Demand Management, non-motorized transportation (walk and bike), transit, transportation, redevelopment and other necessary funding from Federal, State and local agencies.
- Timely implementation of the "30-10" proposed acceleration for Measure R projects in Los Angeles County.
- Improvements in land use planning in cooperation with local governments, mostly at the neighborhood scale.
- Expanded funding for Compass Blueprint demonstration projects, a voluntary city/county grant program directed to sustainable planning objectives (as discussed at the SCAG General Assembly).
- Implementation of Green Cities voluntary recognition and awards program (as discussed at the General Assembly).

EXECUTIVE SUMMARY:
On August 9, 2010, the ARB released a staff report recommending final draft GHG targets for each region pursuant to SB 375. This report summarizes activity leading up to this stage, and recommends action for the Regional Council in response to ARB's staff recommendation. This report contains (A) a

REPORT

description of what is required for the region to succeed in meeting targets, (B) a rationale supporting the staff's recommendation, (C) an update and chronology of events leading up to the release of the final draft targets, and (D) identification of anticipated next steps.

STRATEGIC PLAN:

1. Improve Regional Decision Making by Providing Leadership and Consensus Building on Key Plans and Policies
   a. Create and facilitate a collaborative and cooperative environment to produce forward thinking regional plans.
2. Obtain Regional Transportation Infrastructure Funding and Promote Legislative Solutions for Regional Planning Priorities

BACKGROUND:

Since SB 375 went into effect in January 2009, SCAG has worked to ensure this region's successful implementation of this important legislation. The long term importance of this legislation and the efforts and dialogue it has thus far generated, a statewide policy discussion has occurred as to how to best implement SB 375 that ensures California's future regarding the key issues of land use, transportation and emissions reduction.

One of the keys in achieving a successful outcome of SB 375 includes obtaining from the ARB appropriate per capita GHG reduction targets for 2020 and 2035. The appropriate targets for SCAG are those that can be achieved with a sound Sustainable Communities Strategy (SCS) in the Regional Transportation Plan (RTP), while still challenging the region to submit a SCS plan in 2012 that successfully achieved the targets established by the ARB.

ARB has sole discretion to adopt regional targets under SB 375, but has engaged in a collaborative process to enable stakeholder input and collaboration of the MPOs as well as other stakeholders as a part of their final decision-making process. After considerable additional analysis and discussion, both with stakeholders in over 100 outreach meetings within the SCAG region as well as with our major MPO partners throughout California, SCAG staff recommends support of the targets proposed by ARB staff in their August 9 staff report of 8% in 2020 and 13% in 2035, based on the ambitious principal.

In making this recommendation, it is acknowledged that these targets will not be easily achieved and cannot be met by adopting a "business as usual" approach. Successful implementation is predicated on several key assumptions outlined below where SCAG, in partnership with cities, counties, the business community, and county transportation commission's, must work together in the next year to develop and submit a SCS plan that achieves the goals set by ARB. This report outlines certain areas of change that appear to be achievable based on current data, the final and more specific analysis of how these goals can best be met will occur as part of the next phase of the implementation process as we prepare and then complete a SCS for the SCAG region.

These final draft targets for SCAG are on par with those currently proposed by the other three major MPOs in the State (Bay Area, Sacramento and San Diego) and, while certainly challenging for Southern California, they are possibly achievable based on updated assumptions and analysis of the options and resources

REPORT

available to SCAG for the 2012 RTP/SCS. Staff recommends that working together with the Federal and State governments, this region needs to make the effort to do all that it reasonably can to meet these targets. Such an effort will allow this region to be successful both in developing a SCS as required by SB 375 and, more importantly, positioning our region to create opportunities for a substantially improved quality of life for our residents and businesses in the areas of public health, congestion relief, air quality and land use.

A. Path Forward

In March 2009, the Regional Council and policy committees set broad goals for the implementation of SB 375 in the SCAG region. These goals included a strong preference for achieving the GHG target with the SCS contained within the RTP, and not resorting to the optional, unconstrained Alternative Planning Strategy (APS). SCAG has been actively involved in the target setting process, including developing five scenarios for input to ARB. Those initial scenarios demonstrated achievability of targets of 7-8% for 2020 and 5-6% for 2035. Since that time, the three other large MPOs in the State developed scenarios that were more aggressive, achieving up to 19% per capita reductions in 2035. Consequently, SCAG staff performed additional sensitivity testing of 2035 scenarios that considered additional Transportation Demand Management (TDM) and non-motorized measures (equivalent to SANDAG's 2035 scenario), refined forecasting analysis of local socioeconomic input, revised modeling parameters, and off-model analyses. The tests indicate that a 13% or more per capita reduction target in 2035 is very ambitious, but possibly achievable, assuming successful implementation of projected regional projects (including 30-10 plan in Los Angeles County) and commitments from the State and Federal governments as outlined in the staff recommendation. The specific revised analysis to demonstrate achievability of these targets is described further below, under "Rationale and Outcomes."

SCAG has placed a high degree of importance on input and involvement from key partners and stakeholders throughout the target setting process and will continue to do so during the development of the SCS. As part of SCAG's review of ARB's final draft targets, staff has provided briefings to the Plans and Programs Technical Advisory Committee, County Transportation Commission's Executive Officers, Southern California Leadership Council (SCLC), Greater Land Use Economic Council (GLUE), AQMD, individual business meetings, individual and group environmental stakeholders meetings, and others. The staff recommendation reflects input from these groups.

Input from the key regional stakeholders has been summarized below:

- Environmental Groups: Staff conducted several meetings with representatives from the environmental community (including the National Resources Defense Council (NRDC), Environmental Defense Fund (EDF), Climateplan, Clean Air Coalition, and Move LA) During these meetings, staff responded to extensive questioning about the SCAG submitted target setting methodology, modeling assumptions, and whether the proposed seven scenarios considered in setting a target range for 2020 and 2035 GHG reduction were sufficiently ambitious. The general consensus received from these discussions was that SCAG could do more GHG reduction by 2035 than SCAG staff is recommending to the SCAG Board. Further, these environmental groups indicated they intended to transmit correspondence to the Regional Council and ARB. Members requested SCAG staff provide another option which clarifies what it would take (i.e., funding and other actions) to do more than 13% GHG goal proposed by ARB staff. Staff indicated they would continue to consider all relevant information as part of the upcoming development of the SCS Plan.

SOUTHERN CALIFORNIA ASSOCIATION of GOVERNMENTS

Joint Policy, September 2010

- Business Groups: Staff met several times with business leaders (including the SCLC, GLUE, Building Industry Association of Southern California (BIA), and the Irvine Company, including representatives from Orange County Business Council (OCBC), Orange County Transportation Authority (OCTA) and Orange County Council of Governments (OCCOG) to discuss the SCAG staff recommendation supporting the ARB staff recommendation with the conditions outlined above to achieve the proposed 2020 and 2035 GHG reduction targets. There was general consensus from the meetings, given the state of the California economy, that there is significant risk to the region to support a higher GHG goal than originally submitted to ARB without an ARB Board funding commitment to partner with SCAG. They indicated that it is imperative that ARB Board commit to a funding partnership with SCAG to achieve the 2035 GHG reduction goals by providing incentive funding for activities such as expanded compass program for cities/counties who want to voluntary implement the ARB goals. In addition, the SCLC has transmitted a letter to ARB addressing other actions the Board could take to reduce GHG and at the same time improve the economy.

- Regional Transportation Agencies Executive Officers: Staff has regularly sought input from the Chief Executive Officers (CEOs) of the County Transportation Commissions as the ARB target setting process has preceded. Staff met with the CEOs on August 20 and provided an update on staff's recommendation to support the ARB staff GHG target recommendations pending Regional Council support on September 2. Full partnership with the Commissions is essential to the successful development of a SCS in 2012 and accepted by ARB. Meaningful GHG reduction in the transportation sector can only be accomplished with the support of the Commissions. The Commissions are mandated to fulfill the voter approved local sales tax transportation programs. In addition, program State and Federal transportation funds that will support clean fuel alternatives, provide increased modal alternatives to single occupancy vehicles, reduce congestion chokeholds, increase bikeway program investments, and increase transportation demand management options (such as HOV lane expansion, congestion pricing, signal synchronization, etc.). The overall consensus of the discussion at the CEOs meeting was to support SCAG staff recommendation with the understanding of the need to clarify in writing that ARB will be a full funding partner with the region to implement SB 375 GHG goals. At the point of this report being prepared no Board actions of the CTCs have yet taken place.

A key component of the anticipated path forward is SCAG's commitment to an expanded Compass Blueprint program and the development of a new Green Cities Initiative. The Compass Blueprint program has created a successful collaboration with local government for 84 demonstration projects throughout the SCAG region to implement strategies consistent with the goals of SB 375. These strategies include in-fill development, transit oriented development, mixed use, and neighborhood design to encourage walking and biking. SCAG's new Green Cites Initiative, announced at the General Assembly is anticipated to provide voluntary tools and tracking capacity for local government in preparing sustainability plans. Further, the program will allow local governments to compete for awards and recognition for the communities doing the most to reduce GHG emissions. As part of the staff recommendation included in this report, SCAG will be seeking a commitment from ARB to assist in pursuing and securing further funding for these programs.

B. Rationale and Outcomes

As mentioned, ARB has the sole discretion to determine regional targets. That said, it is important for SCAG to participate in the process of determining targets in order to ensure the appropriate planning is done

REPORT

to best position this region's ability to achieve these targets and to remain competitive with the rest of the State.

The proposed final GHG targets, particularly those for 2035, would be challenging for the SCAG region, in that it would be necessary to move substantially beyond status quo commitments in a number of areas. Nevertheless, staff believes it is important for SCAG, as the largest region in the State, to continue to establish a responsible leadership role in the implementation of SB 375. The targets as currently proposed are in approximate parity with each of the major regions in California, as shown below under "Chronology." This approximate parity with other regions is important, especially if any future State funding opportunities or criteria were to be based on these targets. Each of the other three large MPOs at this point has formally recommended a GHG target as reflected in the ARB staff report.

As noted, SCAG has prepared further scenario analysis that demonstrates that a 13% target, or more, can be attainable with significant funding from State, Federal and regional sources in 2035 assuming certain adjustments to both policy measures and technical assumptions. Specifically, SCAG tested a scenario with the following assumptions beyond those included in the 2008 RTP and the analysis that was performed earlier this year for the initial SCAG draft targets:

a) In conjunction with the Compass Blueprint program already included in the analysis, recent local input on an improved jobs/housing balance was analyzed.

b) A 1% reduction in home-based work trips, 174% increase in vanpools, 144% increase in carpools, and 20% increase in walk/bike to school (e.g., "safe routes to school"), which is similar to the TDM levels assumed by SANDAG in their 2035 scenario;

c) A 2.5 % reduction in VMT associated with non-motorized transportation;

d) Additional auto operating cost increase of $0.02/mile to a total of $0.24/mile (e.g., increases in fuel costs, repairs, maintenance, tires, and accessories); and

e) Capturing on-going local land use and community design improvement through off-model analysis, beyond that which has already been accounted for within the Compass Blueprint program.

As outlined by the conditions that are a part of staff's recommendation, in order to demonstrate achievement of a 13% target through the SCS, SCAG , its partners and the State and Federal governments would need to show commitment to implement and fund the underlying measures, or measures that achieve equivalent results. While the analysis shows the potential for such a target to be met, it should not be interpreted to mean that the region could do so without significant challenge and additional resources.

While the current focus is on target setting, it needs to be recognized that this entire effort and the overall intent behind SB 375 is to encourage regions throughout California to engage in a concerted, but reasonable effort, to put the State on a path toward a more sustainable future. In this light, as compared to the performance of the existing 2008 RTP, achieving the 13% per capita GHG reduction target in 2035 would be expected to result in the following estimated outcomes:

REPORT

- 1.7 million hours reduction in daily vehicle delays, equivalent to $7.7 billion annual cost savings (in 2009 dollars) due to congestion relief
- 3.4 million gallons daily reduction in light and medium vehicle fuel consumption
- 3.2 tons daily reduction in NOx and 2.9 tons daily reduction in PM10

Beyond these important outcomes for increasing the region's livability for 19 million residents, the region would accrue related benefits in public health due to reduced emissions exposure and illness, increased productivity, and economic activity due to reduced congestion and transportation cost.

At present, our current capacity to more specifically measure benefits and outcomes is limited both by time and by the availability of proper data and tools. As a function of the on-going MPO consultation efforts, regions are working to develop a set of performance measures that could be applied to the SCS statewide. Additionally, SCAG is continually working to improve our technical tools, including those made available to the local government members for their own planning processes.

C. Chronology

The chronology leading to ARB's determination of final regional targets includes:

- SCAG region outreach and dialogue among members and stakeholders – on-going, beginning November 2008 (more than 100 meetings to date)
- Completion of statewide Regional Targets Advisory Committee (RTAC) report, establishing parameters and process for target setting – September 2009
- Regional Workshop to review the RTAC report (Ontario) – November 18, 2009
- Consultation with other Metropolitan Planning Organizations (MPOs) on scenario development and other issues – September 2009 to present
- Development of five "sketch" scenarios to establish range of "ambitious/achievable" targets for the SCAG region – January 2010 to May 2010
- Regional Council authorization for SCAG staff to submit target information and recommendation to ARB – April 2, 2010
- General Assembly and Regional Conference (La Quinta) featuring review and discussion on target scenario – May 5-6, 2010
- Formal submittal of target scenarios in coordination with other large MPOs – May 18, 2010
- ARB release of preliminary draft GHG targets – June 30, 2010, as follows:
  - SCAG - 5-10% for 2020, 3-12% for 2035
  - SANDAG - 5-10% for 2020, 5-19% for 2035
  - MTC - 5-10% for 2020, 3-12% for 2035
  - SACOG - 5-10% for 2020, 13-17% for 2035
- Additional analysis testing scenarios assumptions and measures – May 18, 2010 to present
- ARB release of final draft GHG targets – August 9, 2010, as follows:
  - SCAG - 8% for 2020, 13% for 2035
  - SANDAG - 7% for 2020, 13% for 2035
  - MTC - 7% for 2020, 15% for 2035
  - SACOG - 7% for 2020, 16% for 2035
- Comments due to ARB on the final draft targets – September 22, 2010
- Scheduled ARB hearing to adopt targets – September 23, 2010

REPORT

Staff has reported extensively to the Regional Council and policy committees at critical stages of the targets setting process. Background information on target setting, including the RTAC report, SCAG and other regional scenarios, and ARB's staff report on proposed final targets are available on ARB's website - http://www.arb.ca.gov/cc/sb375/sb375.htm, and on SCAG's website, www.scag.ca.gov/sb375.

D. Next Steps

Pending direction from the Regional Council, SCAG will participate in the conclusion of the target setting process, including providing written comments and testimony at the September 23 ARB hearing. Subsequently, the focus will shift to the development of the 2012 RTP/SCS and the process to seek and define commitment to the steps and options as described above.

Of note for SCAG region local jurisdictions, staff is developing a round of workshops that will engage local governments, CTCs, and regional stakeholders (including the business community and environmental community) on the development of the SCS. Finally, SCAG staff continues to take steps to implement the expansion of Compass Blueprint and the Green Cities award and recognition program discussed at the General Assembly. Future staff reports to the Regional Council will request input and discussion on these new initiatives.

Staff has prepared a draft comment letter to ARB in response to their August 9 staff report. The comment letter includes the recommendations contained in this staff report and associated comments. The draft letter is attached to this report.

Staff has attached the correspondence received to date. Subsequently received correspondence received related to this matter will be distributed at the meeting.

FISCAL IMPACT:
SCAG staff work to implement SB 375 is included in the 2010-2011 Overall Work Program 020.SCG0599.

APPENDIX B

SCAG/OCCOG/OCTA MOU
SCAG Framework and Guidelines

Orange County Sustainable Communities Strategy

OC SCS: THE PROCESS

Public Participation

SCAG is leading the regional public participation process for the SCAG Regional SCS. In December 2009, SCAG approved a Public Participation Plan that includes public involvement in the development of the Regional SCS, as follows:

- Hold at least two informational meetings in each county for members of the Board of Supervisors and/or City Councils in order to present a draft of the SCS and to solicit and consider their input and recommendations.
- Hold at least three iterative public workshops per county (with the exception of Imperial County, where only one is required) in order to provide the public with the information and tools necessary to provide a clear understanding of SCS related issues and policy choices.
- Hold at least three public hearings on the draft SCS in the RTP, in different parts of the region, in order to maximize the opportunity for public participation throughout the region.

In addition to the SCAG outreach described above, the OCCOG Board directed staff to augment the regional effort with local outreach. The following is a brief description of the enhanced public outreach conducted in Orange County by OCCOG.

Local Jurisdictions

Orange County is made up of 34 cities and the County of Orange, which represents the unincorporated communities. Representatives from each of these 35 local jurisdictions participated in the creation of the OC SCS through a variety of means including the following:

- Development and approval of OCP-2010
- Providing input on the OC SCS outline and draft document
- Contributing strategic counsel regarding the approach to creating an OC SCS

Local jurisdictions participated in the development of the OC SCS by providing important background and setting information, incorporation of critical sustainability strategies, including transportation and land use strategies, and opportunities and ramifications for OC SCS implementation.

Public Meetings

All of the OCCOG Board and TAC meetings and meetings of the joint OCTA/OCCOG Sustainable Communities Strategy Joint Working Committee—created to guide and oversee the development of the OC SCS—were open to the public. At various milestones

in the development of the OC SCS (e.g., the project schedule, approval of the OCP-2010 data, the draft outline, and the draft SCS), items were brought to these policy and technical groups for review, discussion and input. Public comments were solicited at each meeting.

Stakeholder Roundtables
OCCOG hosted a series of roundtables with Orange County nonprofit organizations representing housing, health care, environment, transportation, and education. At these roundtables, staff introduced the OC SCS process, provided status reports on the OC SCS, and gathered feedback throughout the development of the OC SCS.

Web Tool
A web tool was created for the OC SCS to facilitate and document public engagement in the local SCS process (www.oc-scs.org). The web tool provided general information about SB 375, the regional and local SCS, and the various organizations involved in the development of the SCS. The web tool also was used for distribution of key OC SCS documents including a draft outline for the OC SCS, and draft and final draft versions of the complete text and maps of the proposed OC SCS. Comments on these documents were compiled and became part of the comprehensive record of public participation in the OC SCS (to be provided as an Appendix to the final document).

Documentation
Clearly outlined in the SCAG/OCCOG/OCTA MOU is a requirement to deliver to SCAG comprehensive documentation of the OC SCS process and public participation, including meeting notices, agendas, minutes, comments and responses to comments, handouts and presentations. This documentation has been compiled and will be included as an Appendix to the final version of the OC SCS.

MEMORANDUM OF UNDERSTANDING NO. C-0-1712

BY AND BETWEEN

ORANGE COUNTY TRANSPORTATION AUTHORITY

AND

ORANGE COUNTY COUNCIL OF GOVERNMENTS

AND

THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS

FOR ORANGE COUNTY SUSTAINABLE COMMUNITIES STRATEGY

THIS MEMORANDUM OF UNDERSTANDING (hereinafter referred to as "MOU") is entered by and between the Orange County Transportation Authority, (hereinafter referred to as "AUTHORITY"), the Orange County Council of Governments, (hereinafter referred to as "OCCOG"), and the Southern California Association of Governments, (hereinafter referred to as "SCAG"), collectively referred to as the "Parties."

RECITALS:

WHEREAS, Senate Bill 375 (Chapter 728, laws of 2008, "SB 375") requires SCAG to prepare a regional Sustainable Communities Strategy (hereinafter referred to as "SCS" or "Regional SCS") as part of SCAG's Regional Transportation Plan (RTP) to achieve goals for the reduction of greenhouse gas emissions from automobiles and light trucks in the SCAG region which comprises the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura;

WHEREAS, SB 375 allows AUTHORITY, as the county transportation commission for Orange County, and OCCOG, as a subregional council of governments for Orange County, to develop and submit to SCAG a subregional SCS for Orange County (hereinafter referred to as "Orange County SCS");

WHEREAS, as part of its implementation of SB 375, SCAG has developed and adopted a certain "Framework and Guidelines for the Subregional Sustainable Communities Strategy" (hereinafter

referred to as "Framework and Guidelines"), attached hereto as Exhibit "A" and incorporated herein by this reference.

WHEREAS, SCAG is required by SB 375 to include a subregional SCS in the regional SCS, to the extent consistent with state and federal law, including the SCS conducted by Orange County; and

WHEREAS, AUTHORITY, OCCOG and SCAG desire to enter into this MOU to demonstrate mutual commitments to prepare the Orange County SCS.

NOW, THEREFORE, the Parties enter into the following MOU with respect to the matters set forth herein:

1. This MOU establishes the roles, responsibilities, and requirements for AUTHORITY, OCCOG, and SCAG that are necessary to develop an Orange County SCS that shall be included in the regional SCS prepared by SCAG.

2. AUTHORITY and OCCOG shall prepare the Orange County SCS consistent with SCAG's adopted Framework and Guidelines, as attached hereto, to ensure that the region can successfully incorporate strategies within the Orange County SCS into the Regional SCS, and not inhibit the region from complying with SB 375.

3. AUTHORITY and OCCOG agree to comply with the Milestones Schedule, attached hereto as Exhibit "B" and incorporated by this reference, and work with SCAG and the other subregions to ensure the successful delivery of a regional SCS by using the Deliverables Template, attached hereto as Exhibit "C" and incorporated herein by this reference as the primary template for developing a subregional SCS workplan. The Deliverables Template may be subject to change, based on direction from the SCAG Regional Council or Community, Economic and Human Development Policy Committee, and approval by OCCOG.

4. AUTHORITY shall prepare the transportation element of the Orange County SCS through AUTHORITY'S Long-Range Transportation Plan (LRTP). Such transportation element shall, at a minimum, identify a transportation network (i.e., list of transportation projects) to service the

transportation needs of Orange County, and describe transportation policies (e.g., Transportation Demand Management and Transportation System Management strategies).

5. OCCOG shall prepare the Orange County SCS, and use AUTHORITY'S LRTP as the transportation element of the Orange County SCS.

6. OCCOG and AUTHORITY are encouraged by SCAG to conduct a public participation process in developing the Orange County SCS, above and beyond the process required for the regional SCS required under Section 65080(b)(2)(D)-(E) of the California Government Code. Further, SCAG encourages OCCOG to develop a public participation plan, similar to SCAG's Public Participation Plan adopted in December 2009, for such purposes.

7. OCCOG and AUTHORITY agree to participate in all publicly noticed meetings, workshops, hearings, and other outreach activities organized in Orange County by SCAG at which the regional SCS or Orange County SCS is included on the agenda. All parties shall coordinate with one another during implementation of SCAG's public participation process in order to ensure broad public and stakeholder participation, and to avoid duplication of effort.

8. OCCOG and AUTHORITY shall retain and deliver to SCAG all documentation pertaining to the Orange County SCS from publicly noticed meetings, workshops, and hearings at which the Orange County SCS is included on the agenda. Such documentation shall include but is not limited to meeting notices, agendas, minutes, comments and responses to comments, sign-up sheets, handouts, and copies of power point presentations.

9. AUTHORITY, OCCOG, and SCAG acknowledge that population, housing, and employment estimates are being prepared by the Center for Demographic Research at California State University Fullerton through the Orange County Projection process and the 2012 RTP growth forecasting process (hereinafter referred to as the "OCP dataset"). SCAG agrees to use the OCP dataset as reviewed and approved by OCCOG, for the Regional SCS and the 2012 RTP; provided, that SCAG, in consultation with OCCOG, may make adjustments to the OCP dataset in order to ensure consistency with SCAG's 2012 RTP growth forecast.

10. AUTHORITY and Orange County local agencies shall provide SCAG with population, employment, and housing estimates in transportation analysis zone (TAZ) format consistent with the Orange County Transportation Analysis Model (OCTAM).

11. AUTHORITY agrees to incorporate new land use-transportation interactions into OCTAM, and these shall include, at a minimum, net residential and employment densities, jobs/housing diversity, design characteristics, and destination accessibility.

12. The Parties agree and acknowledge that population, housing, and employment data submitted to SCAG by OCCOG and AUTHORITY shall be accurately reflected in all documentation produced by SCAG that relates to the Orange County SCS and Regional SCS.

13. The Parties agree and acknowledge that RHNA responsibilities shall remain with SCAG, and neither AUTHORITY nor OCCOG shall assume delegation responsibility for RHNA as part of the Orange County SCS development. However, neither AUTHORITY nor OCCOG is precluded by this MOU from assuming delegation responsibility for RHNA as part of a subsequent, separate agreement.

14. SCAG agrees to accept AUTHORITY's LRTP as Orange County's program of transportation projects as input for the 2012 Regional Transportation Plan.

15. SCAG agrees to acknowledge that the Renewed Measure M program is exempt from SB 375 requirements, to the extent consistent with SB 375 and the final, adopted California Transportation Commission RTP guidelines.

16. SCAG agrees that in addition to preparation of the Orange County SCS developed under this MOU, development of an Alternative Planning Strategy (APS) by AUTHORITY and OCCOG is optional. This understanding shall not preclude SCAG from preparing a regional APS pursuant to SB 375.

17. SCAG shall not develop SCS related targets that are attributable to the subregions.

18. SCAG agrees that it will not impose a penalty on the Orange County subregion if the greenhouse gas targets, as established by the California Air Resources Board, are not met by the Regional SCS.

19. SCAG shall accept the Orange County SCS prepared in accordance with this MOU, as the Orange County subregion's input into the Regional SCS prepared by SCAG.

20. AUTHORITY, OCCOG, and SCAG shall separately amend this MOU in writing or develop a separate, mutual funding agreement addressing Orange County SCS costs should state or federal funding become available that can be applied toward preparation of the Orange County SCS.

21. AUTHORITY, OCCOG, and SCAG agree to work closely together throughout the regional SCS process and Orange County SCS process to provide technical input, applicable planning data, and constructive feedback with respect to all documents, products and deliverables developed and associated with the Orange County SCS.

22. The AUTHORITY, OCCOG, and SCAG agree to work together in good faith, using reasonable efforts to resolve any unforeseen issues and disputes arising out of the performance of this MOU.

23. The Parties agree in good faith to provide the resources necessary to implement the provisions of the MOU.

24. AUTHORITY, OCCOG, and SCAG agree to defend, indemnify and hold harmless the other parties, their Officers, agents, elected officials, and employees, from all liability, claims, losses and demands, including defense costs and reasonable attorneys' fees, whether resulting from court action or otherwise, arising out of the acts or omissions of the defending party, its officers, agents, or employees, in the performance of the MOU. When acts or omissions of one party are directed by another party, the party directing the acts or omission shall owe this defense and indemnity obligation to the agencies following the directions. The provisions of this paragraph shall survive termination of this MOU.

25. This MOU shall be governed by all applicable federal, state, and local laws. The signatories warrant that in the performance of this MOU, each shall comply with all applicable federal, state and local laws, statutes and ordinances and all lawful orders, rules and regulations promulgated there under.

26. This MOU may only be modified or amended upon written mutual consent of all signatories. All modifications, amendments, changes and revisions of this MOU in whole or part, and from time to time, shall be binding upon the parties, so long as the same shall be in writing and executed by the signatories.

27. This MOU, including all exhibits and documents incorporated herein and made applicable by reference, constitutes the complete and exclusive statement of the term(s) and condition(s) of the agreement between the parties and it supersedes all prior representations, understandings and communications. The invalidity in whole or part of any term or condition of this MOU shall not affect the validity of the other term(s) or condition(s).

28. Any party may withdraw from this MOU upon 30 days written notice to the other, until the due date set forth in Exhibit "B" for submittal to SCAG of the preliminary Orange County SCS. After such due date, any party may withdraw from this MOU only upon mutual written agreement by all Parties.

29. Each signatory shall be excused from performing its obligations under this MOU during the time and to the extent that it is prevented from performing by an unforeseeable cause beyond its control, including but not limited to: any incident of fire, flood; acts of God; commandeering of material, produces, plants or facilities by federal, state or local government; national fuel shortage; or a material act or omission by any other party; when satisfactory evidence of such cause is presented to the other parties, and provided further such nonperformance is unforeseeable, beyond the control and is not due to the fault or negligence of the party not performing.

30. Any notice sent by first class mail, postage paid, to the address and addressee, shall be deemed to have been given when in the ordinary course it would be delivered. The representatives of the parties who are primarily responsible for the administration of this MOU, and to whom notices, demands and communications shall be given are as detailed in Exhibit "D". If there are any changes in the names and/or addresses listed in Exhibit "D", the party desiring to make such changes shall give a written notice to the other respective parties within five (5) days of such change.

31. This MOU shall continue in full force and effect from the Effective Date up to and until the date that the Regional SCS is adopted by SCAG's Regional Council, unless otherwise terminated earlier in accordance with section 28 of this MOU. The Effective Date of this MOU shall mean the date (last date indicated below) that all parties have fully executed this MOU.

Exhibit A: SCAG's Adopted Framework and Guidelines

Southern California Association of Governments

(Approved by Regional Council - April 1, 2010)

FRAMEWORK AND GUIDELINES
for
SUBREGIONAL SUSTAINABLE COMMUNITIES STRATEGY

I. INTRODUCTION

SB 375 (Steinberg), also known as California's Sustainable Communities Strategy and Climate Protection Act, is a new state law which became effective January 1, 2009. SB 375 calls for the integration of transportation, land use, and housing planning, and also establishes the reduction of greenhouse gas (GHG) emissions as one of the main goals for regional planning. SCAG, working with the individual County Transportation Commissions (CTCs) and the subregional organizations within the SCAG region, is responsible for implementing SB 375 in the Southern California region. Success in this endeavor is dependent on collaboration with a range of public and private partners throughout the region.

Briefly summarized here, SB 375 requires SCAG as the Metropolitan Planning Organization to:

- Prepare a Sustainable Communities Strategy (SCS) as part of the 2012 Regional Transportation Plan (RTP). The SCS will meet a State-determined regional GHG emission reduction target, if it is feasible to do so.
- Prepare an Alternative Planning Strategy (APS) that is not part of the RTP if the SCS is unable to meet the regional target.
- Integrate SCAG planning processes, in particular assuring that the Regional Housing Needs Assessment (RHNA) is consistent with the SCS, at the jurisdiction level.
- Specific to SCAG only, allow for subregional SCS/APS development.
- Develop a substantial public participation process involving all stakeholders.

Unique to the SCAG region, SB 375 provides that "a subregional council of governments and the county transportation commission may work together to propose the sustainable communities strategy and an alternative planning strategy . . . for that subregional area." Govt. Code §65080(b)(2)(C). In addition, SB 375 authorizes that SCAG "may adopt a framework for a subregional SCS or a subregional APS to address the intraregional land use, transportation, economic, air quality, and climate policy relationships." ***Id.*** Finally, SB 375 requires SCAG to "develop overall guidelines, create public participation plans, ensure coordination, resolve conflicts, make sure that the overall plan complies with applicable legal requirements, and adopt the plan for the region." ***Id.***

The intent of this Framework and Guidelines for Subregional Sustainable Communities Strategy (also referred to herein as the "Framework and Guidelines" or the "Subregional Framework and Guidelines") is to offer the SCAG region's subregional agencies the highest degree of autonomy,

flexibility and responsibility in developing a program and set of implementation strategies for their subregional areas. This will allow the subregional strategies to better reflect the issues, concerns, and future vision of the region's collective jurisdictions with the input of the fullest range of stakeholders. In order to achieve these objectives, it is necessary for SCAG to develop measures that assure equity, consistency and coordination, such that SCAG can incorporate the subregional SCSs in its regional SCS which will be adopted as part of the 2012 RTP pursuant to SB 375. For that reason, this Framework and Guidelines establishes standards for the subregion's work in preparing and submitting subregional strategies, while also laying out SCAG's role in facilitating and supporting the subregional effort with data, tools, and other assistance.

While the Framework and Guidelines are intended to facilitate the specific subregional option to develop the SCS (and APS if necessary) as described in SB 375, SCAG encourages the fullest possible participation from all subregional organizations. As SCAG undertakes implementation of SB 375 for the first time, SCAG has also designed a "collaborative" process, in cooperation with the subregions, that allows for robust subregional participation for subregions that choose not to exercise their statutory option.

II. ELIGIBILITY AND PARTICIPATION

SB 375 allows for subregional councils of governments in the SCAG region to have the option to develop the SCS (and the APS if necessary) for their area. SCAG interprets this option as being available to any subregional organization recognized by SCAG, regardless of whether the organization is formally established as a "subregional council of governments."

County Transportation Commissions (CTCs) play an important and necessary role in the development of a subregional SCS. Any subregion that chooses to develop a subregional strategy will need to work closely with the respective CTC in its subregional area in order to identify and integrate transportation projects and policies. Beyond working with CTCs, SCAG encourages partnership efforts in the development of subregional strategies, including partnerships between and among subregions.

Subregional agencies must formally indicate to SCAG, in writing, by December 31, 2009 if they intend to exercise this option to develop their own SCS. Subregions that choose to develop an SCS for their area must do so in a manner consistent with this Framework and Guidelines. The subregion's intent to exercise its statutory option to prepare the strategy for their area must be decided and communicated through formal action of the subregional agency's governing board. Subsequent to receipt of any subregion's intent to develop and adopt an SCS, SCAG will convene discussions regarding a formal written agreement between SCAG and the subregion, which may be revised if necessary, as the SCS process is implemented.

III. FRAMEWORK

The Framework portion of this document covers regional objectives and policy considerations, and provides general direction to the subregions in preparing their own SCS, and APS if necessary.

A. SCAG's preliminary goals for implementing SB 375 are as follows:

- Achieve the regional GHG emission reduction target for cars and light trucks through an SCS.
- Fully integrate SCAG's planning processes for transportation, growth, intergovernmental review, land use, housing, and the environment.
- Seek areas of cooperation that go beyond the procedural statutory requirements, but that also result in regional plans and strategies that are mutually supportive of a range of goals.
- Build trust by providing an interactive, participatory and collaborative process for all stakeholders. Provide, in particular, for the robust participation of local jurisdictions, subregions and CTCs in the development of the SCAG regional SCS and implementation of the subregional provisions of the law.
- Assure that the SCS adopted by SCAG and submitted to California Air Resources Board (ARB) is a reflection of the region's collective growth strategy and vision for the future.
- Develop strategies that incorporate and are respectful of local and subregional priorities, plans, and projects.

B. Flexibility

Subregions may develop any appropriate strategy to address the region's greenhouse gas reduction goals and the intent of SB 375. While subregions will be provided with SCAG data, and with a conceptual or preliminary scenario to use as a helpful starting point, they may employ any combination of land use policy change, transportation policy, and transportation investment, within the specific parameters described in the Guidelines.

C. Outreach Effort and Principles

Subregions are required to conduct an open and participatory process that includes the fullest possible range of stakeholders. As further discussed within the Guidelines, SCAG amended its existing Public Participation Plan (PPP) to describes SCAG's responsibilities in complying with the outreach requirements of SB 375 and other applicable laws and regulations. SCAG will fulfill its outreach requirements for the regional SCS/APS which will include outreach activities regarding the subregional SCS/APS. Subregions are also encouraged to design their own outreach process that meets each subregion's own needs and reinforces the spirit of openness and full participation. To the extent that subregions do establish their own outreach process, this process should be coordinated with SCAG's outreach process.

D. Communication and Coordination

Subregions developing their own SCS are strongly encouraged to maintain regular communication with SCAG staff, the respective CTC, their jurisdictions and other stakeholders, and other subregions if necessary, to review issues as they arise and to assure close coordination. Mechanisms for on-going communication should be established in the early phases of strategy development.

E. Planning Concepts

SCAG, its subregions, and member cities have established a successful track record on a range of land use and transportation planning approaches through the on-going SCAG Compass Blueprint Program, including approximately 60 local demonstration projects completed to date. Subregions are

encouraged to capture, further develop and build off the concepts and approaches of the Compass Blueprint program. In brief, these include developing transit-oriented, mixed use, and walkable communities, and providing for a mix of housing and jobs.

IV. GUIDELINES

These Guidelines describe specific parameters for the subregional SCS/APS effort under SB 375, including process, deliverables, data, documentation, and timelines. As described above, the Guidelines are created to ensure that the region can successfully incorporate strategies developed by the subregions into the regional SCS, and that the region can comply with its own requirements under SB 375. Failure to proceed in a manner consistent with the Guidelines will result in SCAG not accepting a subregion's submitted strategy.

A. Subregional Process

(1) Subregional Sustainable Communities Strategy

Subregions that choose to exercise their optional role under SB 375 will develop and adopt a subregional Sustainable Communities Strategy. That strategy must contain all of the required elements, and follow all procedures, as described in SB 375. Subregions may choose to further develop an Alternative Planning Strategy (APS), according to the procedures and requirements described in SB 375. If subregions prepare an APS, they must prepare a Sustainable Communities Strategy first, in accordance with SB 375. A subregional APS is not "in lieu of" a subregional SCS, but in addition to the subregional SCS. In part, an APS must identify the principal impediments to achieving the targets within the SCS. The APS must show how the GHG emission targets would be achieved through alternative development patterns, infrastructure, and additional transportation measures or policies. SCAG encourages subregions to focus on feasible strategies that can be included in the SCS.

The subregional SCS must include all components of a regional SCS as described in SB 375, and outlined below:

(i.) identify the general location of uses, residential densities, and building intensities within the subregion;
(ii.) identify areas within the subregion sufficient to house all the population of the subregion, including all economic segments of the population, over the course of the planning period of the RTP taking into account net migration into the region, population growth, household formation and employment growth;
(iii.) identify areas within the subregion sufficient to house an eight-year projection of the regional housing need for the subregion pursuant to Section 65584;
(iv.) identify a transportation network to service the transportation needs of the subregion;
(v.) gather and consider the best practically available scientific information regarding resource areas and farmland in the subregion as defined in subdivisions (a) and (b) of Section 65080.01;
(vi.) consider the state housing goals specified in Sections 65580 and 65581;
(vii.) set forth a forecasted development pattern for the subregion, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the ARB; and

(viii.) allow the RTP to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506). See, Government Code §65080(b)(2)(B).

In preparing the subregional SCS, the subregion will consider feasible strategies, including local land use policies, transportation infrastructure investment (e.g., transportation projects), and other transportation policies such as Transportation Demand Management (TDM) strategies (which includes pricing), and Transportation System Management (TSM) strategies. Technological measures may be included if they exceed measures captured in other state and federal requirements (e.g., AB32).

As discussed further below (under "Documentation"), subregions need not constrain land use strategies considered for the SCS to current General Plans. In other words, the adopted strategy need not be fully consistent with local General Plans currently in place. However, should the adopted subregional strategy deviate from General Plans, subregions will need to demonstrate the feasibility of the strategy by documenting any affected jurisdictions' willingness to adopt the necessary General Plan changes.

The regional SCS shall be part of the 2012 RTP. Therefore, for transportation investments included in a subregional SCS to be valid, they must also be included in the 2012 RTP. Further, such projects need to be scheduled in the RTIP for construction completion by the target years (2020 and 2035) in order to demonstrate any benefits as part of the SCS. As such, subregions will need to collaborate with the respective CTC in their area to coordinate the subregional SCS with future transportation investments. It should also be noted that the California Transportation Commission is updating their RTP Guidelines. This topic is likely to be part of further discussion through the SCS process as well.

SCAG will accept and incorporate the subregional SCS, unless (a) it does not comply with SB 375, (b) it is does not comply with federal law, or (c) it is does not comply with SCAG's Subregional Framework and Guidelines. In the event that a compiled regional SCS, including subregional submissions, does not achieve the regional target, SCAG will initiate a process to develop and consider additional GHG emission reduction measures region-wide. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process. Furthermore, SCAG will compile and disseminate performance information on the preliminary regional SCS and its components in order to facilitate regional dialogue. The development of a subregional SCS does not exempt any subregion from further GHG emission reduction measures being included in the regional SCS. Further, all regional measures needed to meet the regional target will be subject to adoption by the Regional Council, and any additional subregional measures beyond the SCS submittal from subregions accepting delegation needed to meet the regional target must also be adopted by the subregional governing body.

(2) Subregional Alternative Planning Strategy (APS)

Subregions are encouraged to focus their efforts on feasible measures that can be included in an SCS. In the event that a subregion chooses to prepare an APS, the content of a subregional APS should be consistent with what is required by SB 375 (***see***, Government Code §65080(b)(2)(H)), as follows:

(i.) Shall identify the principal impediments to achieving the subregional SCS.

(ii.) May include an alternative development pattern for the subregion pursuant to subparagraphs (B) to (F), inclusive.
(iii.) Shall describe how the alternative planning strategy would contribute to the regional greenhouse gas emission reduction target, and why the development pattern, measures, and policies in the alternative planning strategy are the most practicable choices for the subregion.
(iv.) An alternative development pattern set forth in the alternative planning strategy shall comply with Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations, except to the extent that compliance will prevent achievement of the regional greenhouse gas emission reduction targets approved by the ARB.
(v.) For purposes of the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code), an alternative planning strategy shall not constitute a land use plan, policy, or regulation, and the inconsistency of a project with an alternative planning strategy shall not be a consideration in determining whether a project may have an environmental effect.

Any precise timing or submission requirements for a subregional APS will be determined based on further discussions with subregional partners. As previously noted, a subregional APS is in addition to a subregional SCS.

(3) Outreach and Process

SCAG will fulfill all of its outreach requirements under SB 375 for the regional SCS/APS, which will include outreach regarding any subregional SCS/APS. SCAG staff has revised its Public Participation Plan to incorporate the outreach requirements of SB 375, and integrate the SB 375 process with the 2012 RTP development as part of SCAG's Public Participation Plan Amendment No. 2, adopted by SCAG's Regional Council on December 3, 2009. Subsequent to the adoption of the PPP Amendment No. 2, SCAG will continue to discuss with subregions and stakeholders the Subregional Framework & Guidelines, which further describe the Public Participation elements of SB 375.

Subregions that elect to prepare their own SCS or APS are encouraged to present their subregional SCS or APS, in coordination with SCAG, at all meetings, workshops and hearings held by SCAG in their respective counties. Additionally, the subregions would be asked to either provide SCAG with their mailing lists so that public notices and outreach materials may also be posted and sent out by SCAG, or SCAG will provide notices and outreach materials to the subregions for their distribution to stakeholders. The SCAG PPP Amendment No. 2 provides that additional outreach may be performed by subregions. Subregions are strongly encouraged to design and adopt their own outreach processes that mimic the specific requirements imposed on the region under SB 375. Subregional outreach processes should reinforce the regional goal of full and open participation, and engagement of the broadest possible range of stakeholders.

(4) Subregional SCS Approval

It is recommended that the governing board of the subregional agency approve the subregional SCS prior to submission to SCAG. While the exact format is still subject to further discussion, SCAG recommends that there be a resolution from the governing board of the subregion with a finding that the land use strategies included in the subregional SCS are feasible and based upon consultation with the local jurisdictions in the respective subregion. Subregion should consult with their legal counsel as to compliance with the California Environmental Quality Act (CEQA). In SCAG's view, the

subregional SCS is not a "project" for the purposes of CEQA; rather, the 2012 RTP which will include the regional SCS is the actual "project" which will be reviewed for environmental impacts pursuant to CEQA. As such, the regional SCS, which will include the subregional SCSs, will undergo a thorough CEQA review. Nevertheless, subregions approving subregional SCSs should consider issuing a notice of exemption under CEQA to notify the public of their "no project" determination and/or to invoke the "common sense" exemption pursuant to CEQA Guidelines § 15061(b)(3).

Finally, in accordance with SB 375, subregions are strongly encouraged to work in partnership with the CTC in their area. SCAG can facilitate these arrangements if needed.

(5) Data Standards

SCAG is currently assessing the precise data standards anticipated for the regional and subregional SCS. In particular, SCAG is reviewing the potential use of parcel data and development types currently used for regional planning. At present, the following describes the anticipated data requirements for a subregional SCS.

1. Types of Variables
   Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables include land uses, residential densities, building intensities, etc, as described in SB 375.

2. Geographical Levels
   SCAG is considering the collection and adoption of the data at a small-area level as optional for local agencies in order to make accessible the CEQA streamlining provisions under SB 375. The housing unit, employment, and the land use variables can be collected at a small-area level for those areas which under SB 375 qualify as containing a "transit priority project" (i.e. within half-mile of a major transit stop or high-quality transit corridor) for purposes of allowing jurisdictions to take advantage of the CEQA streamlining incentives in SB 375.

   For all other areas in the region, SCAG staff will collect the population, household, employment, and land use variables at the Census tract or Traffic Analysis Zone (TAZ) level.

3. Base Year and Forecast Years
   The socio-economic and land use variables will be required for the base year of 2008, and the target years of 2020 and 2035.

(6) Documentation

Subregions are expected to maintain full and complete records related to the development of the subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board.

(7) Timing

An overview schedule of the major milestones of the subregional process and its relationship to the regional SCS/RTP is included below. Subregions must submit the subregional SCS to SCAG by the date prescribed. Further, SCAG will need a preliminary SCS from subregions for the purpose of preparing a project description for the 2012 RTP Program Environmental Impact Report. The precise content of this preliminary submission will be determined based on further discussions. The anticipated timing of this preliminary product is approximately February 2011.

(8) Relationship to Regional Housing Needs Assessment (RHNA) and Housing Element

Although SB 375 calls for an integrated process, subregions are not automatically required to take on RHNA delegation as described in State law if they prepare an SCS/APS. However, SCAG encourages subregions to undertake both processes due to their inherent connections.

SB 375 requires that the RHNA allocated housing units be consistent with the development pattern included in the SCS. ***See***, Government Code §65584.04(i). Population and housing demand must also be proportional to employment growth. At the same time, in addition to the requirement that the RHNA be consistent with the development pattern in the SCS, the SCS must also identify areas that are sufficient to house the regional population by income group through the RTP planning period, and must identify areas to accommodate the region's housing need for the next local Housing Element eight year planning period update. The requirements of the statute are being further interpreted through the RTP guidelines process. Staff intends to monitor and participate in the guideline process, inform stakeholders regarding various material on these issues, and amend, if necessary, these Framework and Guidelines, pending its adoption.

SCAG will be adopting the RHNA and applying it to local jurisdictions at the jurisdiction boundary level. SCAG staff believes that consistency between the RHNA and the SCS may still be accomplished by aggregating the housing units contained in the smaller geographic levels noted in the SCS and including such as part of the total jurisdictional number for RHNA purpose. SCAG staff has concluded that there is no consistency requirement for RHNA purposes at sub-jurisdictional level, even though the SCS is adopted at the smaller geographic level for the opportunity areas.

The option to develop a subregional SCS is separate from the option for subregions to adopt a RHNA distribution, and subject to separate statutory requirements. Nevertheless, subregions that develop and adopt a subregional SCS should be aware that the SCS will form the basis for the allocation of housing need as part of the RHNA process. Further, SCS development requires integration of elements of the RHNA process, including assuring that areas are identified to accommodate the 8 year need for housing, and that housing not be constrained by certain types of local growth controls as described in State law.

SCAG will provide further guidance for subregions and a separate process description for the RHNA.

B. COUNTY TRANSPORTATION COMMISSIONS' ROLES AND RESPONSIBLITIES

Subregions that develop a subregional SCS will need to work closely with the CTCs in their area in order to coordinate and integrate transportation projects and policies as part of the subregional SCS. As discussed above (under "Subregional Sustainable Communities Strategy"), any transportation

projects identified in the subregional SCS must also be included in the 2012 RTP in order to be considered as a feasible strategy. SCAG can help to facilitate communication between subregions and CTCs.

C. SCAG ROLES AND RESPONSIBLITIES

SCAG's roles in supporting the subregional SCS development process are in the following areas:

(1) Preparing and adopting the Framework and Guidelines

SCAG will adopt these Framework and Guidelines in order to assure regional consistency and the region's compliance with law.

(2) Public Participation Plan

SCAG will assist the subregions by developing, adopting and implementing a Public Participation Plan and outreach process with stakeholders. This process includes consultation with congestion management agencies, transportation agencies, and transportation commissions; and SCAG will hold public workshops and hearings. SCAG will also conduct informational meetings in each county within the region for local elected officials (members of the board of supervisors and city councils), to present the draft SCS, and APS if necessary, and solicit and consider input and recommendations.

(3) Methodology

As required by SB 375, SCAG will adopt a methodology for measuring greenhouse gas emission reductions associated with the strategy.

(4) Incorporation/Modification

SCAG will accept and incorporate the subregional SCS unless it does not comply with SB 375, federal law, or the Subregional Framework and Guidelines. As SCAG intends the entire SCS development process to be iterative, SCAG will not amend a locally-submitted SCS. SCAG may provide additional guidance to subregions so that subregions may make amendments to its subregional SCS as part of the iterative process, or request a subregion to prepare an APS if necessary. Further, SCAG can propose additional regional strategies if feasible and necessary to achieve the regional emission reduction target with the regional SCS. SCAG will develop a written agreement with each subregional organization to define a process and timeline whereby subregions would submit a draft subregional SCS for review and comments to SCAG, so that any inconsistencies may be identified and resolved early in the process.

(5) Modeling

SCAG currently uses a Trip-Based Regional Transportation Demand Model and ARB's EMFAC model for emissions purposes. In addition to regional modeling, SCAG is developing tools to evaluate the effects of strategies that are not fully accounted for in the regional model. SCAG is also developing two additional tools – a Land Use Model and an Activity Based Model – to assist in strategy development and measurement of outcomes under SB 375.

In addition to modeling tools which are used to measure results of completed scenarios, SCAG is developing a scenario planning tool for use in workshop settings as scenarios are being created with jurisdictions and stakeholders. The tool will be made available to subregions and local governments for their use in subregional strategy development.

(6) Adoption/Submission to State

After the incorporation of subregional strategies, SCAG will finalize and adopt the regional SCS as part of the 2012 RTP. SCAG will submit the SCS to ARB for review as required in SB 375.

(7) Conflict Resolution

While SB 375 requires SCAG to develop a process for resolving conflicts, it is unclear at this time the nature or purpose of a conflict resolution process as SCAG does not intend to amend a locally-submitted SCS. As noted above, SCAG will accept the subregional SCS unless it is inconsistent with SB 375, federal law, or the Subregional Framework and Guidelines. SCAG will also request that a subregion prepare an APS if necessary. It is SCAG's intent that the process be iterative and that there be coordination among SCAG, subregions and their respective jurisdictions and CTCs. SCAG is open to further discussion on issues which may generate a need to establish a conflict resolution process as part of the written agreement between SCAG and the subregional organization.

(8) Funding

Funding for subregional activities is not available at this time, and any specific parameters for future funding are speculative. Should funding become available, SCAG anticipates providing a share of available resources to subregions. While there are no requirements associated with potential future funding at this time, it is advisable for subregions to track and record their expenses and activities associated with these efforts.

(9) Preliminary Scenario Planning

SCAG will work with each subregion to collect information and prompt dialogue with each local jurisdiction prior to the start of formal SCS development. This phase of the process is identified as "preliminary scenario planning" in the schedule below. The purpose of this process is to create a base of information to inform SCAG's recommendation of a regional target to ARB prior to June 2010. All subregions are encouraged to assist SCAG in facilitating this process.

(10) Data

SCAG is currently developing, and will provide each subregion with datasets for the following:

(1) 2008 Base year;
(2) General Plan/Growth projection & distribution;
(3) Trend Baseline; and
(4) Policy Forecast/SCS.

While the Trend Baseline is a technical projection that provides a best estimate of future growth based on past trends and assumes no general plan land use policy changes, the Policy Forecast/ SCS is derived using local input through a bottom-up process, reflecting regional policies including transportation investments. Local input is collected from counties, subregions, and local jurisdictions.

Data/GIS maps will be provided to subregions and local jurisdiction for their review. This data and maps include the 2008 base year socioeconomic estimates and 2020 and 2035 socioeconomic forecast. Other GIS maps including the existing land use, the general plan land use, the resource areas, and other important areas identified in SB 375. It should be noted that none of the data/ maps provided were endorsed or adopted by SCAG's Community, Economic and Human Development Committee (CEHD). All data/maps provided are for the purpose of collecting input and comments from subregions and local jurisdictions. This is to initiate dialogue among stakeholders to address the requirements of SB 375 and its implementation.

The list of data/GIS maps include:

1. Existing land use
2. Zoning
3. General plan land use
4. Resource areas include:
   (a.) all publicly owned parks and open space;
   (b.) open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;
   (c.) habitat for species identified as candidate, fully protected, sensitive, or species of special status by local, state, or federal agencies or protected by the federal Endangered Species Act (1973), the California Endangered Species Act, or Native Plant Protection Act;
   (d.) lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts, or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code, and lands under Williamson Act contracts;
   (e.) areas designated for open-space or agricultural uses in adopted open-space elements or agricultural elements of the local general plan or by local ordinance;
   (f.) areas containing biological resources as described in Appendix G of the CEQA Guidelines that may be significantly affected by the sustainable communities strategy or the alternative planning strategy; and
   (g.) an area subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program or where the area is subject to more protective provisions of state law or local ordinance.
5. Farmland
6. Sphere of influence
7. Transit priority areas
8. City/Census tract boundary with ID
9. City/TAZ boundary with ID

(11) Tools

SCAG is developing a Local Sustainability Planning Model (LSPM) for subregions/local jurisdictions to analyze land use impact. The use of this tool is not mandatory and is at the discretion of the Subregion. The LSPM is a web-based tool that can be used to analyze, visualize and calculate the impact of land use changes on auto ownership, mode use, vehicle miles of travel (VMT), and greenhouse gas emissions in real time. Users will be able to estimate transportation and emissions impacts by modifying land use designations within their community.

Other tools currently maintained by SCAG may be useful to the subregional SCS development effort, including the web-based CaLOTS application. SCAG will consider providing guidance and training on additional tools based on further discussions with subregional partners.

(12) Resources and technical assistance

SCAG will assist the subregions by making available technical tools for scenario development as described above. Further, SCAG will assign a staff liaison to each subregion, regardless of whether the subregion exercises its statutory option to prepare an SCS. SCAG staff can participate in subregional workshops, meetings, and other processes at the request of the subregion, and pending funding and availability. SCAG's legal staff will be available to assist with questions related to SB 375 or SCAG's implementation of SB 375. Further, SCAG will prepare materials for its own process in developing the regional SCS, and will make these materials available to subregions.

D. MILESTONES/SCHEDULE

- CARB issues Final Regional Targets – September 2010
- SCS development (preliminary scenario, draft, etc) – through early 2011
- Release Draft RTP/regional SCS for public review – November 2011
- Regional Council adopts RTP/SCS – April 2012

If other milestones are needed, they will be incorporated into the written agreement between SCAG and the Subregion.

Exhibit B: Milestones Schedule

The key milestones and related schedule required as part of the development of the Orange County Subregional SCS are as follows:

1. Status report on Preliminary Subregional SCS – Dec 2010
2. Adopted OCP 2010/Delivery to SCAG – Jan 2011
3. Preliminary SCS / for purposes of preparing PEIR project description (intended to be narrative only project description that describes intended strategies or strategy options that are likely to be incorporated into the final Subregional SCS.) –Feb 2011
4. Status report on Draft Subregional SCS – Feb 2011
5. Draft Subregional SCS (containing all components described above) to be incorporated into draft Regional SCS – April 2011
6. Status report on final Subregional SCS – April 2011
7. Final Subregional SCS for incorporation into Regional SCS – June 2011
8. Iterative process, if necessary to meet target – June to November 2011
9. OCCOG to participate in regional outreach conducted in Orange County – June 2011 to February 2012
10. Regional SCS adoption – April 2012

Exhibit C: Deliverables Template

The Orange County Subregional SCS will consist of the following components:

1. Database (OCP dataset) that allocates population, housing, household, and employment to areas of the county. Geographic area should be the smallest level practicable for the COG to produce, preferably at the parcel level. The database must reflect the base year 2008 and each variable in the two GHG target years (2020 and 2035), in accordance with the Data Standards set forth below.
2. A map or series of maps that illustrates the growth distribution described above, and that further delineates uses, intensities, and residential densities, in accordance with the Data Standards set forth below.
3. A listing of transportation projects that are incorporated in the subregional SCS.
4. A listing and description of transportation policies (e.g. TDM, TSM and others) to be employed.
5. Documentation that establishes the process, including the public participation and outreach process used to develop the SCS, and demonstrates the affected jurisdictions willingness to consider general plan changes.
6. A narrative description of the strategies employed to reduce greenhouse gas emissions. A further description of any other strategies that were considered and not ultimately included.

DATA STANDARDS

The following data standards will be used in the development of a subregional SCS:

1. Types of Variables

Variables are categorized into socio-economic variables and land use variables. The socio-economic variables include population, households, housing units, and employment. The land use variables may include land uses designations, building densities, building intensities, and applicable policies.

2. Geographical Levels

Socio-economic and land-use variables should be provided to SCAG at the smallest geographical level practicable for OCCOG to produce, preferably at the parcel level. At a minimum, such variables will be provided at the Census tract or Traffic Analysis Zone (TAZ) level.

3. Base Year and Forecast Years

The socio-economic data and land use variables will be required for the base year of 2008, and as feasible, for the target years of 2020 and 2035.

DOCUMENTATION

Subregions are expected to maintain full and complete records related to the development of the Subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board. Subregions shall include information regarding the status of the documentation as part of the required status reports to SCAG, and copies of the actual documentation shall be submitted to SCAG as part the final Subregional SCS.

Exhibit D: Notices

Notices, demands and communications between the Parties related to this MOU shall be provided to the following persons:

To Authority/OCCOG:

Kris L. Murray
Executive Director, Government Relations Orange County Transportation Authority
Executive Director Orange County Council of Governments

APPENDIX C

REQUIRED DOCUMENTATION

- Correspondence regarding consistency of General Plans
- Electronic copies of Transportation Demand Management Ordinances
- Electronic copies of individual jurisdictions' response to sustainability strategies

OCCOG

Orange County Council of Governments
Member Agencies

MEMORANDUM

DATE: June 13, 2011

TO: Southern California Association of Governments

FROM: Dave Simpson, Executive Director Orange County Council of Governments

SUBJECT: OC SCS Documentation

The Orange County Council of Governments (OCCOG) has reviewed the Southern California Association of Governments (SCAG) Framework and Guidelines for references to required documentation in the Orange County Sustainable Communities Strategy (OC SCS). Two paragraphs in the SCAG Framework and Guidelines describe subregions' obligations for documentation. Both are provided below:

> "As discussed further below (under "Documentation"), subregions need not constrain land use strategies considered for the SCS to current General Plans. In other words, the adopted strategy need not be fully consistent with local General Plans currently in place. However, should the adopted subregional strategy deviate from General Plans, subregions will need to demonstrate the feasibility of the strategy by documenting any affected jurisdictions' willingness to adopt the necessary General Plan changes."
>
> **Documentation**
> "Subregions are expected to maintain full and complete records related to the development of the subregional SCS, including utilizing the most recent planning assumptions considering local general plans and other factors. In particular, subregions must document the feasibility of the subregional strategy by demonstrating the willingness of local agencies to consider and adopt land use changes necessitated by the SCS. The format for this documentation may include adopted resolutions from local jurisdictions and/or the subregion's governing board."

OCCOG interprets these requirements to state that the OC SCS must include agendas, action minutes, and resolutions and declarations related to land use strategies that would require local General Plan Amendments. Land use strategies within the Draft OC SCS are consistent with all Orange County jurisdictions. No actions to General Plans will be necessitated as a result of this OC SCS process or document. Therefore, no documentation of willingness to make these changes is included.

Orange County Council of Governments

APPENDIX D

ORANGE COUNTY PROJECTIONS DATA DEVELOPMENT PROCESS

ORANGE COUNTY PROJECTIONS DATA DEVELOPMENT PROCESS

INTRODUCTION

The socioeconomic data and growth forecasts for the OC SCS process and document was developed through the Orange County Projections process, involving extensive data collection, analysis, outreach, and review directed and managed by the Center for Demographic Research (CDR) at Cal State Fullerton.

Orange County Projections (OCP)

The OCP series was developed by the County of Orange in the 1970s to provide County departments and agencies with a consistent set of projections of population, housing, and employment for use in their operations and planning activities. The uses and applications have expanded over time, and numerous private and public agencies use the OCP to serve Orange County in the future. Some of these applications include forecasting traffic, sewer, and water demands; public service needs such as fire, police, social, and health; pollution from mobile sources; and revenues.

In addition, all the requirements of local and regional planning efforts (including transportation and infrastructure planning, congestion management, air quality management, integrated waste management and growth management) have emphasized the importance of an accurate and uniform set of projections for use by all jurisdictions, agencies and programs. For example, as the uniform dataset used in Orange County planning, the OCP is incorporated into each of SCAG's RTP growth forecasts, which are used in environmental impact reports and transportation plans.

The OCP series is updated every three to four years. Over time, the update process has expanded to increase the level of countywide coordination, commitment, and review. The OCP contains population, housing, and employment projections at the County level for a 25-30 year horizon, as well as a variety of other geographic areas including the general government jurisdictions (34 cities and the unincorporated county area); the County's 70 Community Analysis Areas (CAAs) and 10 Regional Statistical Areas (RSAs); and the 577 census tracts in the County. These additional geographic distributions of the data have been made available for programmatic applications and information purposes.

Small Area Projections

A major step in developing the 2010 Orange County Projections was the collection of data from each jurisdiction in Orange County. Initially, jurisdictions were asked to respond to draft projections for themselves and for the smaller statistical sub-areas within them. These preliminary numbers were evaluated in the light of jurisdictional policies,

significant trends or anticipated policy changes, or projections the jurisdictions themselves may have developed. Standard supportive documentation citation such as the General Plan and its housing and land use elements, annexation plans, and development phasing schedules also was solicited. The small area projections went through several iterations with the jurisdictions' feedback incorporated into the draft projections until a consensus was achieved. In this way, a large amount of information was collected for small geographic areas across the County.

Data for the OC SCS

In order to provide the most accurate picture possible of the Orange County subregion, and to preserve the detail and integrity of the data submitted by local jurisdictions, the OCP-2010 data set was used for the development of the OC SCS.

In fall 2009, CDR sent out 2008 estimates for jurisdictions to review and provide feedback. Corrections were incorporated. In March 2010, the CDR met with all 35 jurisdictions and distributed the draft projections data. Once again, jurisdictional feedback was incorporated. The final draft projections data were distributed in fall 2010, and final comments and changes incorporated into the final dataset. The OCP-2010 was approved by the CDR TAC and CDR MOC in December 2010. The OCCOG TAC and OCCOG Board approved the OCP-2010 in January 2011.

OCP 2010 Development and Process Schedule

Develop Base Year Estimates	Summer 2009
Develop Population, Housing, and Employment (PHE) Assumptions	September 2009
Review and Approval by CDR Technical Advisory Committee	October 2009
Project Countywide PHE (control totals)	October-November 2009
Approval by CDR Technical Advisory Committee (TAC) & Management Oversight Committee	December 2009
OCCOG Approval of Countywide PHE	January-March 2010
Allocate Countywide PHE to Split Traffic Analysis Zones (TAZ)	Winter 2010
Jurisdictional Review/Adjustment of PHE/Jurisdictional Approval	March-October 2010
Approval by CDR TAC & MOC	December 2010
OCCOG Technical Advisory Committee Approval	January 2011
OCCOG Board of Directors Approval	January 2011

As part of the revision and update process to the Orange County Projections, once the OCP data is approved by the OCCOG Board, the data is then transmitted to SCAG by CDR on behalf of OCCOG and Orange County. During the development process of the OC SCS and SCAG's Regional SCS and RTP, draft and OCP data is provided to SCAG to incorporate into the draft and final versions of the integrated growth forecast.

The OCP-2010 dataset (population, housing and employment) referenced in the OC SCS was approved by the OCCOG Board on January 27, 2011. OCP-2010 is based on the approved OCP update and revision process which took place during 2009-2010; it does not include the 2010 Census data for California released on March 8, 2011.

It is acknowledged that SCAG policy committee actions have directed SCAG staff to revise the draft growth forecast dataset for the Regional SCS and RTP to include the 2010 Census data and the 2010 State EDD employment benchmark. The CDR is coordinating with SCAG on this update process, and is evaluating the timeline and process to revise OCP-2010 to include the new data and be consistent with the growth forecast update effort being undertaken by SCAG.

Consistent with SCAG's process, any update to the growth forecast dataset will be to the 2010 totals for population, housing, and employment, and the growth increments from 2010 to 2035 will remain the same and be applied to the revised 2010 totals. If a revision is made to the OCP-2010, this effort will be completed after the June 2011 submittal deadline of the final OC SCS to SCAG. Further, the updated dataset will be provided to SCAG through a data amendment process and the full OC SCS document will not be revised.

Ensure Adequate Access to Open Space And Preservation Of Habitat [Note that TCA toll roads provide access to beach destinations, as well as recreational areas adjacent to the Cleveland National Forest and HCP/NCCP open space; this access will further expand when the 241 completion project is constructed];

Use Toll Revenue to Fund Alternative Fuel Vehicles [Note that this BMP will not apply to TCA's toll roads, as the bond covenants require all toll revenues collected on TCA facilities to be used to repay existing construction bonds];

Expand High Occupancy Toll (Hot Lanes) System [Note that TCA toll roads are all general purpose lanes, so this BMP would not apply];

Adopt Emission Based Tolls;

Convert Existing Roads to Toll Roads; and

Implement Urban and Intercity Road Tolls.

RECOMMENDATIONS

In light of their potential GHG reduction importance, we suggest that these and all transportation other pricing related BMPs (such as cordon pricing) be grouped together to better convey the full range existing pricing implementation and future options. At present, they are identified as a mix of TDM, TSM and pricing measures. Grouping them will also better correspond to SCAG's SCS guidelines calling for pricing strategies.

We also recommend that the seven tolling related BMPs be expanded to capture the full range of pricing actions and future options being pursued by the TCA on its public toll road system. The following additional measures are either being currently implemented and/or are being considered for future implementation by the TCA. All of them have a high degree of feasibility:

1) Implement Inter-County and Inter-Regional Toll Facilities.

In contrast to the existing BMP that focuses on urban and intercity tolls, this new BMP addresses the type of facility exemplified by the TCA toll corridors that provide intra-county, inter-county and inter-regional access.

Existing Implementation: TCA has constructed and currently operates 460 lanes miles of toll road that serve intra-county, inter-county, and inter-regional trips.

Future Implementation: TCA will add 105 new tolled lanes between 2012 and 2035 to meet intra-county, inter-county and inter-regional travel demand.

2) Reduce congestion and associated GHG emissions through variable toll pricing.

Existing Implementation: TCA currently implements variable peak hour pricing on 460 lane miles of FTC, ETC and SJHTC toll roads.

Future Implementation: TCA will continue to implement variable peak hour pricing on 460 lane miles FTC, ETC and SJHTC toll roads, and will expand this by 105 additional lane miles of variably priced roads by 2030.

3) Reduce congestion and associated GHG emissions through dynamic toll pricing.

Future Implementation: Although TCA tolls do not vary continuously throughout the day in response to congestion at this time, this technique is available for use when and if appropriate on The Toll Roads.

4) **Reduce vehicle trips and associated GHGs by providing express bus transit on toll lanes.**

Existing Implementation: TCA and OCTA currently have in place agreements allowing such routes.

Future Implementation: TCA, OCTA and other providers could expand express/rapid bus service on toll lanes.

5) **Reduce vehicle trips and associated GHGs by providing transit in the dedicated median of existing toll corridors.**

TCA has reserved right of way for future mass transit in the median of its corridors.

6) **Reduce congestion and associated GHGs with a common, transferrable tolling technology for priced facilities.**

Existing Implementation: All priced facilities in Orange and San Diego Counties currently use the FasTrak transponder technology, making the system flow more smoothly with less congestion-related GHG emissions. Electronic tolling via the FasTrak technology is available on 460 lane miles of SR 241, SR 261, SR 133, SR 73 and SR 91. This technology also provides interoperability on tolled facilities statewide; OCTA's 91 Express Lanes as well as priced lanes in San Diego County and in the Bay Area also employ FasTrak.

Future Implementation: Expansions of the priced transportation network should use the same technology to avoid duplication and user confusion. For example, the completion of SR 241, the Foothill Transportation Corridor South, will employ FasTrak technology on 105 additional lane miles. This BMP should also be employed in the SCAG regional SCS to maintain regional and statewide interoperability.

7) **Reduce congestion and associated GHGs with cashless full electronic tolling.**

Mr. Scott Martin
February 10, 2011
Page 4 of 4

Future Implementation: TCA is planning to implement cashless, full electronic tolling on 460 existing lane miles of SR 241, SR 261, SR 133 and SR 73 between 2012 and 2020. This total will grow to 565 lane miles when the southern portion of 241 is fully built out by 2030.

8) **Reduce vehicle trip and development-related GHG emissions through toll road open space mitigation.**

Existing Implementation: The San Joaquin Hills, Eastern and Foothill Transportation Corridor toll roads have provided approximately 2,200 acres of dedicated open space as environmental mitigation. This acreage will remain undeveloped in perpetuity despite significant future pressure for urban development to accommodate a growing population and economy in Orange County. In doing so, the dedicated open space will contribute to higher densities and more compact development elsewhere in the Orange County subregion, which is beneficial for GHG reduction. In addition, the dedicated open space provides permanent carbon sequestration benefits that the SCS should capture.

Future Implementation: Any additional toll road open space dedications will expand on the benefits described above.

Thank you for the opportunity to comment on the draft BMP list. I am available to discuss any questions or comments you have on the requested additions above. You can reach me at (949) 754-3475 or vmcfall@thetollroads.com.

Sincerely,

Valarie McFall
Deputy Director
Environmental Planning

February 18, 2011 — OC School Districts - SCS Info. — prepared by Andrea Sullivan 714/966.4325

OC SCS Questions	ACSD	AUHSD	BOUSD	BPSD	CUSD	CESD	CYSD	FVSD	FJUHSD	FSD	GGUSD	HBCSD	HBUHSD	IUSD	LHCSD	LBUSD	LAUSD	LJSD	MSD	NMUSD	OCDE	OUSD	PYLUSD	Saddleback College	SVUSD	SAUSD	So. Community College	TUSD	WSD
Does your district have any plans to improve parking or access from arterials on campuses?			N	N		N			N		Y	N		Y							N			Y	N	Y	N		
GGUSD- Yes/Maybe. We are hoping to obtain approval for State modernization funding through the School Facilities Program to modernize 66 sites. Parking and access will be improved through these efforts.																													
HBCSD- Last summer we expanded and improved parking lots and access at Huntington Seacliff and Smith Elementary Schools. No further plans.																													
FJUHSD - No, we did that in the last 3 years.																													
CESD - No immediate plans.																													
SOCCD - Not in the immediate future. There are proposals but they appear to be twenty plus years out.																													
IUSD - Parking improvements, such as circulation upgrades/enhancements and increased parking capacity occur at sites being modernized when funding/budget allows																													
SAUSD - We have around 15 parking lot improvement projects. We also are adding parking lots at two schools that do not currently have parking.																													
Walk or bike to school programs/incentives for students/parents/staff?			N	N		N			N		N	N		Y							N			N	N	Y	N		
OCDE - Alternative Ed. Program students are not allowed to drive themselves to school. Our Green Committee encourages green practices.																													
SAUSD - A limited number of District Safety Officers will be deployed at their respective school sites on bicycles to augment patrol and crime prevention coverage. All District Safety Officers were allowed the opportunity to express an interest in this strategy that augments other primary methods of patrol, i.e., foot patrol and golf carts.																													
IUSD -The City of Irvine offers a grant program in coordination with Irvine Unified School District to promote pedestrian travel to schools.

OC SCS Questions	ACSD	AUHSD	BOUSD	BPSD	CUSD	CESD	CYSD	FVSD	FJUHSD	FSD	GGUSD	HBCSD	HBUHSD	IUSD	LHCSD	LBUSD	LAUSD	LJSD	MSD	NMUSD	OCDE	OUSD	PYLUSD	Saddleback College	SVUSD	SAUSD	So. Community College	TUSD	WSD
Any new bike accommodations planned? (trail connections, bike lockers)			N	N		N			N		N	N		Y							N			N	N		N		
GGUSD- No funding.																													
HBCSD - No plans. One middle school intends to add skateboard racks in the bike area.																													
IUSD - The City of Irvine's Master Plan incorporates numerous walking and biking trails that connect many of the existing and planned communities to																													
OCDE - We have bike racks at our new school - Harbor Learning Center.																													
Any telecommuting or similar programs ongoing?			N	N		N			N		Y	N		N							N			N	N	N	Y		
GGUSD- As much as possible. The instructional staff (teachers) have access for many of our web-based computer programs (Student system-entering grades at home, viewing test scores of data assessment system, e-mail….)																													
OCDE - We have teleconferencing and videoconferencing capabilities.																													
SAUSD - Just conference calls for the district office and consultants to reduce travel costs.																													
Online courses offered?			N	N		N			Y		Y	N		N							Y			Y	Y	Y	Y		
GGUSD- We have had several on-line courses for high school students, and looking into on-line Independent Study.																													
FJUHSD - Not yet we are starting independent study on line and will be expanding…surprisingly the union is not in support.																													
SVUSD - Health, Civics, Economics, Calculus BC																													
BOUSD - Not at this time, but will in the future.																													
OCDE - At our Pacific Coast High School and at teacher trainings.																													
SOCCD - Including a plan for increase in same																													
SAUSD - Online courses are being currently offered at Century and Valley for credit recovery. Web conferencing and online learning is beginning to be used for professional development. Web conferencing is extensively used for admin planning.																													

OC SCS Questions	ACSD	AUHSD	BOUSD	BPSD	CUSD	CESD	CYSD	FVSD	FJUHSD	FSD	GGUSD	HBCSD	HBUHSD	IUSD	LHCSD	LBUSD	LAUSD	LJSD	MSD	NMUSD	OCDE	OUSD	PYLUSD	Saddleback College	SVUSD	SAUSD	So. Community College	TUSD	WSD
Staggered start times for schools?			Y	Y		N			Y		Y	Y									N			N	Y	N	Y		
GGUSD- We have a few schools with staggered starts – which were negotiated many years ago (decades). Staggered starts are problematic for some as they can extend meal schedules but more efficient for bus transportation (less bus drivers needed.) However, staggered starts complicate employee contractual issues. Many teachers unions have negotiated 'collaboration' time on a specific day each week, and staggered starts make it more difficult to implement collaboration programs among teachers (they like to do this all at the same time – just like taking lunch at the same time each day).																													
HBCSD-Slightly staggered start times(8:05-8:40) to accommodate district bus services.																													
TUSD - Some of our schools in Tustin Ranch and West Irvine have staggered start times but only by 15 min. At these sites kindergarten starts school at say 8:00 a.m. and the others (grades 1-5) start at 8:15 a.m.																													
CESD - No, school start times were standardized this year.																													
IUSD - Some of the elementary schools have staggered start times. In addition, the middle and high schools rely on differentiated schedules through the use of block scheduling, late start, and implementation of zero period.																													
SAUSD - We have suggested adjusting the bell schedules before and likely will again. At the time, it was not a priority and had a large impact on parents and students.																													
Daycare offered on campus? (limits trips)			Y	Y		N			Y		N	Y						Y			N			Y	Y		Y		
GGUSD- We have preschool programs for community students, but not day care for employees and their offspring.																													
HBCSD- Before/after school care to accommodate parent needs for childcare.																													
FJUHSD - Just completed a new facility for 80 students at one location and about 20 employees at another.																													
LJUSD - We offer onsite daycare at a few of our elementary sites.																													
SOCCD - Yes there are daycare services on both campuses. Not sure what you mean by quantify campus utilization in a number if you are asking can we evaluate the number or percentage of students that are served, then yes.																													
SVUSD - We offer daycare before and after school for school aged students for elementary only. Not an all day program.																													

IUSD -Yes, all elementary and K-8 campuses have daycare services offered through the City of Irvine.

SAUSD - We do not have ES student daycare, with the exception of Think together, which houses our afterschool program. We have a cal-safe program that allows parenting teens to bring their kids to school. Not all parenting teens are given a space. Additional information breakdown of schools available upon request.

OC SCS Questions	ACSD	AUHSD	BOUSD	BPSD	CUSD	CESD	CYSD	FVSD	FJUHSD	FSD	GGUSD	HBCSD	HBUHSD	IUSD	LHCSD	LBUSD	LAUSD	LJSD	MSD	NMUSD	OCDE	OUSD	PYLUSD	Saddleback College	SVUSD	SAUSD	So. Community College	TUSD	WSD
Can they quantify campus utilization in a number?			Y			N																		Y			Y?		

FJUHSD - 100 trips each way?

BPSD - Not sure.

GGUSD - ???

SOCCD - Not sure what you mean by quantify campus utilization in a number if you are asking can we evaluate the number or percentage of students that are served, then yes.

Question not answered or understood by most participants

Bus transit offered?			Y	Y		N			Y		N	N		Y							Y			Y	Y	Y	Y		

GGUSD- Not available for employees, but we sure do offer bus passes for the 'homeless' students.

FJUHSD - No home to school but we do sell OCTA bus passes at student rates

SOCCD - Yes, there are bus stop locations at both campuses

SVUSD - Yes for six sites.

OCDE - All Special Ed students are bussed; no bussing for other programs

IUSD - Limited to a few schools.

SAUSD - We do not have any plans to provide transit shuttle services. We only have 3 bus routes for our 54,000+ students, outside of SDC.

Alternative fuel vehicles used?			N	Y		N			Y		Y	N		N							N			N	N	N			

GGUSD- Yes – we have 27 CNG busses, and due to replace another 13 diesel busses in the near future with CNG (110 busses in fleet).

BPSD - CNG

FJUHSD - 13 CNG

OUSD - Since we are in the South Coast Air Quality Management District (SCAQMD), school District must comply with SCAQMD rule 1195. This means we cannot purchase Diesel powered engines. For our white fleet (maintenance & other), we purchase gasoline powered engines. We also purchase the smaller school buses with gasoline powered engines. When we purchase or receive a grant for our larger school buses, we purchase Compressed Natural Gas (CNG) powered engines. currently have six (6) school buses that are powered by CNG. We also have retrofitted most of our Diesel engines with a Particular Trap. This trap replaces the muffler and doesn't allow the particulate matter to get into the air. We also installed a CNG fuelling station at our bus yard.

SOCCD - Electric carts are used in some instances for on campus deliveries and services.

Subject: UCI Information

Les:

Sorry this is so slow in coming. Here is a brief description of what we're doing for Sustainable Transportation here at UCI.

STAFF –

UC Irvine has **3 full-time employees**, **1 part-time** dedicated to Sustainable Transportation efforts:

- Mike Davis, Interim Manager
- Antoinette Saenz, Employee Transportation Coordinator
- Ramon Zavala, Employee Transportation Coordinator
- Ken Ezell, Employee Transportation Coordinator (part-time); Charter Services Coordinator

WEB PRESENCE –

www.parking.uci.edu/AT

PROGRAMS –

- Bike – Bike infrastructure: Extensive bike path network / Signage/ Bike-Pedestrian bridges. Safety & Training: B.E.E.P. program. Information: www.bike.uci.edu
- Bus – University Pass Program: Membership provides annual OCTA access for just $95 (next year $155). Presently represent an 86% subsidy (next year 77%). Information: www.parking.uci.edu/AT/modes/OCTA.cfm
- Carpool – Available for employees. Provides reduced-rate parking and preferential parking for participants. Information: www.parking.uci.edu/AT/modes/carpool.cfm
- Shuttle – UCI maintains a shuttle fleet for on-campus and near-campus transportation. The fleet has real-time tracking. Information: www.shuttle.uci.edu
- Train - Provides 20% rebate for 10-day and monthly pass holders. Information: www.parking.uci.edu/AT/modes/train.cfm
- Vanpool – UCI presently has 18 vanpools carrying passengers from various locations to UCI. These vanpools come in during morning rush hour; return at evening rush hour. Information: www.parking.uci.edu/AT/modes/vanpool.cfm
- Walk – Infrastructure: Extensive pedestrian path network / Signage / Bike-Pedestrian bridges. Information: www.parking.uci.edu/AT/modes/walkorbike.cfm
- ZEV-NET – Zero-Emission Vehicles stationed at the Irvine Transportation Center for pooling to/from UCI. Information: www.parking.uci.edu/AT/documents/zevnetflyer.pdf

INCENTIVES – [Complimentary "rainy day" parking permits given to employees for each month in the program.]

- Bike – 5 complimentary "rainy day" parking permits for each month in the program
- Bus – 2 complimentary "rainy day" parking permits
- Carpool – 2 complimentary "rainy day" parking permits
- Shuttle – 2 complimentary "rainy day" parking permits
- Train - 2 complimentary "rainy day" parking permits
- Vanpool - 4 complimentary "rainy day" parking permits
- Walk - 5 complimentary "rainy day" parking permits

"RIDESHARE" SUPPORT – [These give mobility options to those who don't bring a car to campus]

- ZotWheels Bikeshare – The first fully-automated bikeshare program at a U.S. university; the only bikeshare program in the Western U.S. Information: www.parking.uci.edu/zotwheels/main.cfm
- Zipcar Carshare – 11 cars on campus available for hourly or daily use at $7-$8/hour. Gas, insurance, and 180 miles included. Information: www.zipcar.com/uci/
- Zimride – Ride matching site for the UCI campus. Allows people to post or request a ride. Links with Facebook. Information: www.zimride.com/uci
- Holiday Shuttle - Provides complimentary shuttle service for the UCI community to John Wayne Airport and the Irvine Transporation Center before and after the Thanksgiving, Winter, and Spring breaks. Information: www.parking.uci.edu/public/holidayshuttle.cfm
- Pre-Tax Benefit: UCI provides a pre-tax benefit through payroll deduction for those who involved in the Bus, Carpool, and Vanpool Programs.

SAVINGS FROM UCI SUSTAINABLE TRANSPORTATION–

- Financial: $14.5 million saved annually ($12 million in fuel, vehicle, & parking costs for participants; $2.5 million for UCI community via reduction of need for parking construction & maintenance).
- Emissions: More than 23,000,000 Vehicle Miles Traveled (VMT) saved annually through all UCI sustainable programs. This equates to nearly 10,800 metric tons in GHG emissions saved each year.

AWARDS –

- 2011 League of American Bicyclists' "Certified Bicycle Friendly University" - Silver Designation
- 2010 Best Workplaces for Commuters' Race to Excellence - Gold Award
- 2010 Parking Program of the Year Award – California Public Parking Association (CPPA)
- 2010 Best Workplaces for Commuters designation – National Center for Transit Research / U.S. EPA
- 2010 Innovative Achievement in Auxiliary Services Award- National Association of College Auxiliary Services (NACAS)
- 2010 Rideshare Diamond Award – presented by the OCTA, VCTC & MTA
- 2010 Employee Transportation Coordinator (ETC) Champion Award – Mike Davis - Association for Commuter Transportation
- 2010 Honoree - Spirit of Volunteerism Award – Volunteer Center of Orange County (VCOC renamed OneOC)
- 2010 Bright Idea Award – Zotwheels Automated Bikeshare - Harvard University's Ash Center for Democratic Governance and Innovation
- 2010 Innovators Award – Student Systems and Services Category - Campus Technology
- 2010 Leadership Award – Transportation Category - Green California / California EPA
- 2009 Best Workplaces for Commuters Race to Excellence Silver Award
- 2009 OCTA Share the Ride Challenge Award
- 2009 Perfect 10 - Transportation Category - Sierra Club
- 2009 Environmental Achievement Award - US EPA Region IX
- 2009 Rideshare Diamond Award - presented by the OCTA, VCTC & MTA
- 2009 Best Work Places for Commuters - US EPA National Transit Research Center

- 2008 Governor's Environmental and Economic Leadership Award (GEELA) - Climate Change - State of California
- 2008 Clean Air Award - Innovative Transportation Program - SCAQMD
- 2008 Award - Innovation and Collaboration from the McHenry County Economic Development Corporation's Business Accelerator Program - ZotWheels Design
- 2008 Best Practice Award - TDM Category – UC / CSU / CCC Sustainability (Project Greenlight)
- 2007 Best Practice Award - TDM Category – UC / CSU / CCC Sustainability (Strategic Mobility Program)
- 2007 Best Practice Award - Fleet Category – UC / CSU / CCC Sustainability (Biofuel conversion)

Also attached is a form we completed for SCAG, our last AQMD survey (showing our Average Vehicle Ridership and describing our programs).

Let me know if you have any questions.

APPENDIX G

CARB POLICY BRIEF RANKING ANALYSIS

Summarizing the ARB briefs leads to the rankings of policies based on impact shown in the table below.

Table H: Summary of ARB Policy Briefs

Policy	Change in Policy	Reduction in VMT or change in other policy variable when noted	Impact Category	ARB policy brief
Road Pricing	1% increase in toll or price	0.1 to 0.45% reduction in traffic volumes	High	Road user pricing
Parking Pricing	Offering employees parking cash out[a]	12% reduction for employees accepting cash out	High	Parking pricing
Regional Accessibility to Employment	1% increase in access to employment [b]	0.13 to 0.25% reduction in VMT	High	Regional Accessibility
Jobs-Housing Balance	1% improvement in jobs-housing balance	0.29 to 0.35% reduction in VMT	High	Jobs-Housing balance
Neighborhood Design	Changes in density, mixed use, and street connectivity simultaneously	0.25% reduction in VMT [f]	High	
Residential Density	1% increase in neighborhood residential density [c]	0.05 to 0.12% reduction in VMT		Residential Density
Mixed Land Use	1% increase in land use mix [d]	0.02 to 0.11% reduction in VMT		Land Use Mix
Street Network Connectivity	1% increase in connectivity [e]	0.06 to 0.12% reduction in VMT		Network Connectivity
Telecommuting	Per individual telecommuter	17% VMT reduction on average weekday [g]	High	Telecommuting
Transit				
Distance from transit station	1 mile reduction in distance to nearest station	1.3% to 5.8% reduction in VMT	High-Medium	Distance to Transit (Transit Access)
Fare	1% reduction in fare	0.4% increase in transit ridership [i]	High-Medium	Transit Service
Service hours or service miles	1% increase in service hours or miles	0.7% increase in transit ridership [i]	High-Medium	Transit Service
Service frequency	1% increase in service frequency	0.5% increase in transit ridership [i]	High-Medium	Transit Service
Employer-Based Trip Reduction	Implementation of program at a worksite	4% to 6% reduction in commute VMT for employees at work site	High-Medium	Employer-Based Trip Reduction
Traffic Incident Clearance Programs	Regional implementation of a freeway incident clearance program	Approximate 1% reduction in two criteria pollutants, CO and NOx	High-Medium [h]	Traffic Incident Clearance Programs
Pedestrian Strategies	1% increase in sidewalk coverage,	0.09 to 0.27% increase in walking [i]	Low-Medium	Pedestrian Strategies

Policy	Change in Policy	Reduction in VMT or change in other policy variable when noted	Impact Category	ARB policy brief
	length, or width			
Bicycle Strategies	1% increase in either bicycle lane density (miles of lane per square mile of land) or spending share of federal transportation funds on bicycle infrastructure (per capita)	0.32% increase in bicycle commute mode share [i]	Low	Bicycle Strategies

Notes:

[a] Parking cash-out offers employees income equal to the value of free parking at work, and then charges employees for parking.

[b] Access to employment is measured by a distance-weighted gravity variable that sums all jobs in region or metropolitan area, inversely weighting jobs by a function of the distance from a residence to the job location.

[c] Neighborhoods were typically census tracts or transportation analysis zones, or approximately ¼ to ½ mile distances around residences.

[d] In the academic literature, land use mix is often measured by entropy or dissimilarity indices. See http://arb.ca.gov/cc/sb375/policies/mix/landusemix_bkgd.pdf.

[e] Measured as percent of street intersections that are four-way or by average block size.

[f] From National Research Council (2009) based on Bento et al. (2005). See http://www.arb.ca.gov/cc/sb375/policies/density/density_brief.pdf.

[g] Includes both telecommute and non-telecommute days. (Adjusts for the fact that telecommuters typically telecommute some but not all days per week.)

[h] Classification as "high-medium" is based on fact that regional impact (approximate 1% reduction in two criteria pollutants) is of same magnitude as regional VMT reduction from regional implementation of employer-based trip reduction programs, where region is a metropolitan area.

[i] Increases in walking, bicycling, and transit ridership will not lead to one-for-one reductions in driving, as low market shares for walking, bicycling, and transit imply that large percentage increases in walk, bicycle, or transit mode share will be associated with smaller decreases in driving share. Paulley et al. (2006), cited in the ARB transit service policy brief, gives evidence that changes in transit service are associated with about 1/10th of the impact on driving as on transit service, and a factor of 1/10 is used to scale the impacts for walking, bicycling, and transit ridership in Table 1 when organizing the policies into impact categories in Table 2.

Orange County Sustainable Communities Strategy

APPENDIX H

CEQA STREAMLINING: EXISTING LAND USE, DENSITY, AND BUILDING INTENSITY DATA

CEQA Streamlining: Existing Land Use, Density, and Building Intensity Data

SB 375 provides incentives in the form of CEQA streamlining to support community designs that help reduce GHG emissions. To take advantage of these CEQA streamlining provisions in SB 375, projects must prequalify based on two criteria:

- A project must be consistent with the land use designation, density, building intensity, and applicable policies in an approved SCS or Alternative Planning Strategy.[1]
- A project must be considered a Transit Priority Project (TPP) or a Residential/ Mixed Use Residential Project (as defined in SB 375).

To help OCCOG jurisdictions take advantage of the CEQA streamlining provisions in SB 375, SCAG will include maps in the regional 2012 RTP/SCS in order to show the uses, densities, intensities and locations for future development, and in order to facilitate subsequent project consistency findings. These maps will use the Orange County Projection dataset as reviewed and approved by OCCOG. SCAG, in consultation with OCCOG and OCCOG jurisdictions, may provide more detail in order to allow interested jurisdictions to take advantage of the CEQA streamlining provisions in SB 375. SCAG will only show more land use detail where a jurisdiction has acknowledged that the land use information is based on their input and approved of its being displayed in the adopted plan.

To facilitate SB 375 CEQA Streamlining, individual Orange County jurisdictions are asked to provide detailed land use information (uses, densities, intensities at a defined geographic level) to SCAG. These data are called out in the SCAG Framework and Guidelines and the legislation specific to the streamlining provisions. Additionally, or in lieu of detailed land use information, jurisdictions may work with SCAG in designating the appropriate regional "development type" in locations for potential future projects. Jurisdictions themselves will determine whether a particular project meets the CEQA streamlining qualifications, including making the consistency finding. If a jurisdiction does not participate in the SCS data collection effort for existing land use, density, and building intensity, there is no direct adverse consequence due to not providing input.

In order to provide the most accurate data possible for the Orange County subregion, and to preserve individual jurisdictions' general plan and existing data accuracy, detail, and integrity, and to meet the requirements under SB 375 for purposes of CEQA

[1] CARB will review the regional SCS to accept or reject SCAG's determination whether or not the implementation of the SCS would achieve the GHG emission reduction targets for the region. If the regional targets cannot be achieved by the regional SCS, then SCAG must prepare an Alternative Planning Strategy (APS). An APS is a separate document from the RTP and describes how the targets could be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

streamlining, SCAG prepared and provided Orange County local jurisdictions with a set of data/ GIS maps of detailed land use information, including General Plan, zoning, and existing general land use designation, density and building intensity data and maps, all for the jurisdictions' review and comment. Data/Maps Guides and Review Packets were provided by SCAG in electronic and hard copy format to OCCOG on February 11, 2011, for individual Orange County jurisdiction's review by April 29, 2011.

The information contained in the data packets document was developed and/or collected by the staff in the Data and GIS group in the Department of Research, Analysis, and Information Services (RAIS) under the Land Use and Environmental Planning (LUEP) Division at SCAG. The SCAG Data/Map Guide included information on the sources, methodologies, and contents of each dataset. These data/ GIS maps are identified in SB 375 as required to be considered in the SCS development to address the requirements of SB 375 and its implementation for purposes of CEQA streamlining. Comments and corrections from subregions and local jurisdictions are due to SCAG by April 29, 2011.

The list of data/GIS maps included in the SCAG map and data packets, along with the review requested of Orange County jurisdictions, appears as Table F, below.

Table F: Contents of the SCAG Map and Data Packets, with Review of Orange County Jurisdictions

Category	Action	GIS Shapefile available?
Land Use		
General Plan	review & comment	Yes
Zoning	review & comment	Yes
Existing Land Use as of 2008	review & comment	Yes
Geographical boundaries		
Jurisdiction Boundary & Sphere of Influence	review & comment	Yes
Census Tract Boundary	None	Yes
TAZ Boundary	None	Yes
Transit Priority Projects		
Major Stops & High Quality Transit Corridors	review & comment	Yes
Resource Areas & Farmland		
Endangered Species and Plants	review & comment	Yes
Flood areas	review & comment	Yes
Natural Habitat	review & comment	Yes
Open Space and Parks	review & comment	Yes
Farmland	review & comment	Yes

BACKGROUND: EXISTING LAND USE, DENSITY, AND BUILDING INTENSITY

In 2008 and early 2009, SCAG began to collect the general plan and zoning information from local jurisdictions, with year adopted ranging from 1971 to 2009 by jurisdiction. The general plan and zoning documents, maps, and/or GIS shapefiles collected were coded into GIS shapefiles at parcel level. Parcel data were acquired from Digital Map Product for Orange County. Beginning in July 2009, SCAG communicated with local jurisdictions, and revised the general plan and zoning data based on the results of the local review. Through a process of collecting general plan and zoning documents and receiving comments from local jurisdictions, information included in the data packets reflected the local inputs received by January 31, 2010. SCAG continues to receive local input, and will incorporate them into the database. General Plan data are shown at a parcel level; in many areas, they depict a local agency's adopted documents accurately. However, the data shown in some areas may be generalized or inaccurate for many reasons, a primary reason because the parcel level database representing general plan does not support multiple uses or designations on a single parcel (either splitting the parcel or representing overlays). Additionally, data on building size, existing use, and other specific parcel-related information that SCAG collected from other original data sources such as the Orange County Assessor's Office may have been in error and/or not up to date. Due to these inaccuracies and limitations, if site specific data is necessary, users should always reference a local agency's adopted documents or field surveys to determine actual land use designations.

At the jurisdiction level, both general plan land use and zoning maps are prepared with the land use or zoning codes used in each local jurisdiction. General Plan land use maps are also available at larger geographic levels, such as subregion, county, or the entire SCAG region with SCAG's standardized General Plan codes. For detailed information on the standardized codes, please refer to SCAG's General Plan Code Table.

SCAG prepared three sets of land use maps (General Plan Land Use, Zoning and 2008 Existing Land Use) at parcel level. The three land use maps were originally provided to local jurisdictions in September/October 2009. Based on one-on-one meetings and communication with local jurisdictions throughout the 1st round outreach (July 2009-January 2010) the Data/Map packets of existing land use, density, and building intensity data transmitted to Orange County jurisdictions in February 2011 reflect the local inputs received by January 31, 2010. Data was also incorporated for the cities of Irvine, San Clemente and San Juan Capistrano that was received after January 31st. The City of Costa Mesa is continuing to work with SCAG to correct the existing land use map for their jurisdiction.

Orange County Jurisdiction Review Process

OCCOG distributed the electronic files and hard copies to Orange County cities and the County of Orange for review. They were asked to review and submit updates and comments for purposes of SB 375 CEQA streamlining, a description of which is attached. All Orange County jurisdictions received the SCAG datasets in both electronic and hard copy format. Most but not all OC jurisdictions reviewed for purposes of SB 375 CEQA Streamlining.

SCAG staff presented a data orientation and review session to the OCCOG TAC on March 1, 2011 and additionally at a broader meeting of SCS stakeholders on March 9, 2011. Additionally, SCAG staff was available and conducted meetings at CDR during the last week of March 2011 to provide technical data and GIS assistance to Orange County jurisdictions with limited data/GIS capability that needed assistance in the Data/Map review.

Based upon parcel level data originally provided by SCAG, Orange County jurisdictions reviewed the data to various degrees for purposes of CEQA streamlining.

Results

The results of that process are attached as data elements and appendices to this document. General Plan, zoning, and existing land use (density and building intensity) data are identified and provided at the parcel level in attached Excel files by Orange County jurisdiction.

In Appendix I, individual jurisdiction General Plans are presented along with web address links to individual jurisdictions' General Plans. Individual jurisdiction General Plans are always considered the final and ultimate authority on land use and zoning, especially for those jurisdictions that opted not to review the SCAG data.

For those jurisdictions that did not fully review, there are some limitations, conditions, and caveats to the existing land use, density, and building intensity data. Data provided by SCAG on land use is in some areas inaccurate and/or generalized. Because the parcel level database representing existing land use, general plan, and zoning data does not support multiple uses or designations on a single parcel (either splitting the parcel or representing overlays, such as zoning overlays), the data ultimately shown may generalize the data and thus not accurately depict a local government's adopted general plan or zoning or the existing land use on the site (including land use designated through a development or other legal agreement).

Due to these caveats and limitation, if site-specific data is necessary, users should always reference and rely on individual City and County of Orange general plans as the final authority. A local agency's adopted documents are always the final say on allowable land

use designations and zoning, and actual site visits or field surveys to determine densities and building intensities should be undertaken.

Strategic Plan: Looking Ahead – Beyond the Horizon 33

Overview and Description

The transit system in our six-county region is comprised of an extensive network of services provided by dozens of operators. The network includes fixed-route local bus, community circulators, express bus, bus rapid transit (BRT), demand response, commuter rail, heavy rail, and light rail. The operators include well established agencies in mature service areas as well as smaller municipal operators whose services are developing smartly in their respective parts of the region. Ridership in our region continues to grow, and significant progress is being made in making transit more available and attractive by virtue of a burgeoning rail network, transit oriented development (TOD) and other service improvements. However, this progress has been slowed by recent cutbacks in funding and decreases in revenue.

As of FY2009, our region's transit system represents approximately 8,700 miles of bus routes, 70 miles of heavy and light rail, and 512 miles of commuter rail service. Almost 5 percent of commuters in the SCAG region used transit to reach their place of employment as of 2009. However, this is significantly below the percentage of commuters using transit in other large metropolitan areas such as Chicago or the Bay Area. As of FY2009, transit agencies in the SCAG Region reported 747.3 million boardings. This represents a net growth of nearly 20 percent between 2000 and 2010; however, there has been only a 4 percent growth in per capita trips, meaning that most of the growth in boardings could be explained by population growth.

While Southern California has a national reputation for auto-centricity, our region has an extensive transit network. According to APTA's Public Transportation Fact Book, the Los Angeles-Long Beach-Santa Ana Urbanized Statistical Area (UZA) ranked number two nationally in several important measures. Only the New York-Newark UZA reported more Vehicles Operated Maximum Service, Vehicles Available for Maximum Service, Vehicle Revenue Miles, Vehicle Revenue Hours, and Unlinked Passenger Trips. Los Angeles-Long Beach-Santa Ana ranked third in Passenger Miles Travelled, behind the New York-Newark and Chicago UZAs. LA Metro is the fifth largest operator nationally, when ranked in terms of service hours. Eight other properties, The City of Santa Monica's Big Blue Bus, Orange County Transportation Authority (OCTA), Access Services Incorporated (ASI), Foothill

Transit Modes in the SCAG Region

Transit service in the SCAG region is composed of five modes of service:

- **Fixed Route Bus Service**, referred to as Motor Bus in the National Transit Database and defined as "a transit mode comprised of rubber tired vehicles operating on fixed routes and schedules over roadways."
- **Demand Response**, defined as "a transit mode comprised of passenger cars, vans, or small buses operating in response to calls from passengers or their agents to the transit operator, who then dispatches a vehicle to pick up the passengers and transport them to their destinations."
- **Light Rail**, defined as "a transit mode that typically is an electric railway with a light volume traffic capacity compared to heavy rail (HR). It is characterized by passenger rail cars operating on fixed rails in shared or exclusive right-of-way (ROW) and vehicle power drawn from an overhead electric line via a trolley or a pantograph."
- **Heavy Rail**, defined as "a transit mode that is an electric railway with the capacity for a heavy volume of traffic. It is characterized by separate ROWs from which all other vehicular and foot traffic are excluded and high speed and rapid acceleration passenger rail cars operating singly or in multi-car trains on fixed rails."
- **Commuter Rail (CR)**, defined as "a transit mode that is an electric or diesel propelled railway for urban passenger train service consisting of local short distance travel operating between a central city and adjacent suburbs. Service must be operated on a regular basis by or under contract with a transit operator for the purpose of transporting passengers within urbanized areas (UZAs), or between urbanized areas and outlying areas." Discussion of this mode is included in the Passenger Rail Appendix.

Coupled with the revenue setbacks, costs for transit providers are heading in the opposite direction by rising faster than inflation. Each mode has shown cost per passenger mile traveled (PMT) increase over the past decade: bus service by 24 percent, Metro Rail by 41 percent, and Metrolink by 48 percent. Transit providers' fare revenue, or "farebox recovery," has decreased from 32 percent of the cost of providing service to just 27 percent since 2000.

These cost and revenue trends weaken the long term stability of transit services in the SCAG Region. Unless transit operators in our region find ways to improve the fare revenue to cost ratio, transit services will require much greater subsidies or services will continue to be cut. This conflict will grow as new operational funds will need to be applied towards new capital projects currently in development once they are ready for revenue service.

The State of the System

A detailed analysis was completed to gauge the state of SCAG's transit system. The analysis studied the 25 inter-jurisdictional operators in our region over the last ten years. The goals of the analysis were to:

- Assess the region's ability to attract and retain new transit riders
- Assess the region's utilization of transit resources
- Show transit availability and connectivity to smart growth/TOD
- Show the effects of the recession

TABLE 1 Transit Properties Included in 2012–2035 RTP/SCS Transit Performance Analysis

Antelope Valley Transit Authority	Beach Cities Transit
Culver CityBus	Foothill Transit
Gardena Municipal Bus Lines	Gold Coast Transit
Imperial Valley Transit	Long Beach Transit
Los Angeles Department of Transportation	Los Angeles County Metropolitan Transportation Authority (Metro)
Southern California Regional Rail Authority (Metrolink)	Montebello Bus Lines
Morongo Basin Transit Authority	Mountain Area Regional Transit Authority (MARTA)
Norwalk Transit District	Omnitrans
Orange County Transportation Authority	Riverside Transit Agency
Santa Clarita Transit	City of Santa Monica Big Blue Bus
Simi Valley Transit	SunLine Transit Agency
Torrance Transit	Ventura Intercity Service Transit Authority
Victor Valley Transit Authority	

The analysis shows that transit usage continues to grow in our region. This is especially true when fixed guideway projects such as rail and BRT are implemented and result in new riders to transit. As of FY2009, transit agencies in the SCAG Region reported 747.3 million boardings. This represents growth of nearly 20 percent in the ten years between 2000 and 2010, but only 4 percent growth in per capita trips due to population growth. Metrolink and Metro Rail (L.A. County) have seen ridership growth of 6 percent to 8 percent a year, while traditional local bus has grown 1.5 percent a year. This rate is well below the region's rate of population growth, meaning that bus transit is actually losing ground in the SCAG Region, even though local buses carry 86 percent of our region's transit riders. Bus transit's per capita ridership loss is troubling, given that this mode forms the backbone of the SCAG Region's transit network. This loss also demonstrates the importance of introducing "premium" transit services, such as rail, BRT, limited-stop and point-to-point express services, to our region.

Transit ridership growth is important, but so is the availability of transit: frequency, span-of-service, and the location of stops and services affect residents' ability to travel by transit. The provision of transit service in the SCAG region is growing faster than the growth in boardings. In the past ten years, total transit service hours are up 26 percent, while boardings are up only 20 percent. This trend results in slightly lower productivity, or boardings per hour, meaning transit resources are being used slightly less efficiently.

As our region becomes more and more congested, transit speed is also important. The analysis shows that over the last ten years, transit modal speeds have remained relatively constant. Metrolink's average speed is about 40 mph, Metro Rail about 23 mph, and local bus about 13 mph. Auto speeds remain very competitive with transit. Freeway speeds are about 40 mph, and 26 mph for major arterials. Metrolink speeds are competitive with highway speeds, but overall travel times for Metrolink passengers are likely longer due to the time needed to travel to and from the Metrolink stations on each end of the trip.

Transit costs and revenues are not fairing as well over the last decade. Farebox recovery is down significantly, from 32 percent to 27 percent. Even more concerning, each transit mode has seen costs per passenger mile traveled increase: bus service 24 percent, Metro Rail 41 percent and Metrolink 48 percent, in constant dollars.

FIGURE 1 Per Capita Transit Trips 2000–2009

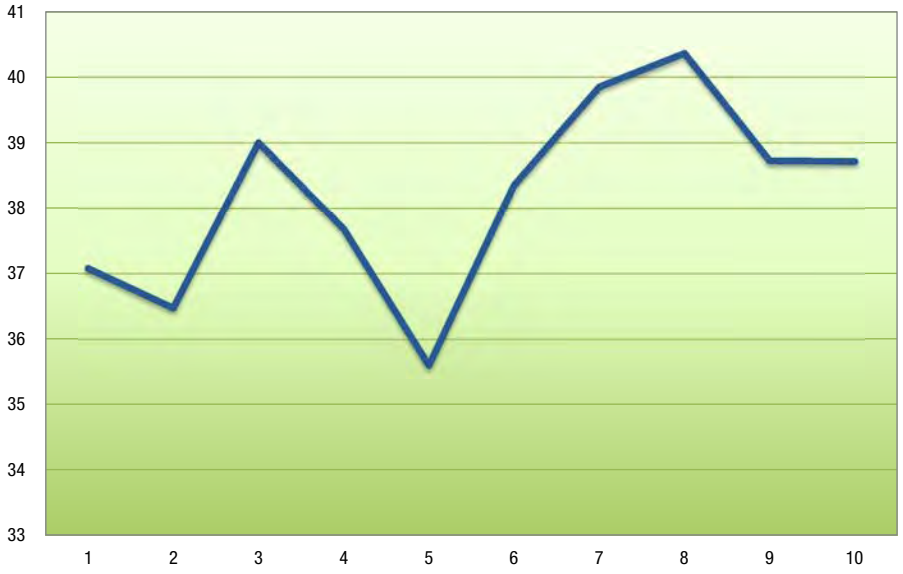

FIGURE 2 Cost per Bus Passenger 2000–2009

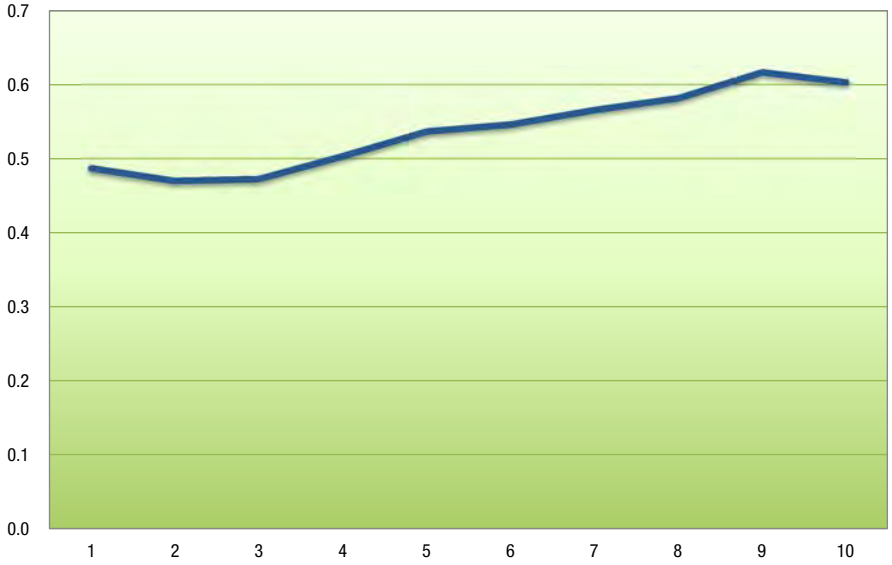

FIGURE 3 Regional Farebox Recovery

Availability Analysis

Another part of the analysis looked at the region's availability of transit. Transit services were separated by mode to see what percentage of jobs, housing and population have available transit. The modes are commuter rail, heavy and light rail, express bus, BRT, and local bus in four frequency subcategories. Availability is defined as being within a half-mile of the rail services, express bus and BRT, and within a quarter-mile of the local bus services. Findings show that the Metrolink system offers good availability to our region's employment sites: Anywhere from 22 percent to 34 percent of jobs are within a half-mile of a Metrolink station.

In Los Angeles County, the Metro Rail system is within a half-mile of 19 percent of jobs, and about 14 percent of households. Metro's Metro Rapid service however, is available to 51 percent of jobs, and about 42 percent of households. Also of importance is frequency of regular local fixed-route bus service; more frequent transit services obviously benefit residents more than less frequent services. Outside of L.A. County, only 23 percent

of Orange County residents have access to transit service with 15 minutes or better frequency, only 11 percent of Riverside and San Bernardino county residents have this access, and no residents in Imperial or Ventura counties have such access. This analysis shows the need to introduce rail and BRT services in our region outside of Los Angeles County and also to improve the frequency of local bus service.

The Great Recession

The impacts of the Great Recession on transit operators in the SCAG region are significant. Up until this time, transit ridership nationally was at near modern record levels, and had been continually growing in Southern California, as Los Angeles County has continued to add new transit facilities and other operators have continued to increase and improve their services as well.

Transit ridership is growing in conjunction with the growth and maturation of urbanized areas in Southern California, realizing important transformations in land use and travel behavior. More and more transit-oriented development is being built, and more and more citizens are moving back into the urban core where "old towns" are being re-developed.

Beyond our region, fiscal challenges for transit properties are nationwide. Cuts to state and local operating subsidies are forcing transit properties to raise fares, reduce service, and lay off employees. According to a March 2011 survey conducted by the American Public Transit Association, of 117 responding agencies 71 percent saw static or decreasing local funding, and 83 percent saw static or decreased state funding. 79 percent of those agencies reduced service after January 2010, and 51 percent had already reduced service prior to January 2010.

Beginning in FY 2008, the state began diverting the majority of the State Transit Assistance Program (STA) from transit operators in order to help balance its general fund (completely eliminated in FY 2010). Since FY 2008, the state has diverted $759 million from transit operators in our region. The California State Supreme Court recently ruled that these fund diversions were illegal, but no funds have been returned to date.

In addition to the STA funds, sales tax revenues that many operators use for operations were down considerably as well. In fact, the decrease in sales tax revenues has had an even greater impact on transit operators. For example, the Local Transportation Fund (LTF), which is a ¼ cent of the sales tax dedicated to transit, was down 2 percent between FY 2007 and FY 2008, 11 percent between FY 2008 and FY 2009, and 10 percent between FY 2009 and FY 2010 for the SCAG region. Overall FY2010 LTF funds were down 21 percent from pre-recession FY 2007 levels.

Twenty-five transit operators in the SCAG region were surveyed regarding their boardings, service hours and fares from FY 2008 to FY 2010. Information was also collected for FY 2011. Findings include:

- About half of transit operators have cut service hours due to the recession, by between 2 percent and 20 percent. Of those, four agencies have cut service by more than 10 percent. However, an interesting finding is that this happened mostly with operators who have more established service areas. Operators in rapidly growing service areas have tended to add hours. These areas include the Victor and Imperial Valleys, and operators who are actively developing or expanding their system such as VISTA and Gold Coast Transit. Cuts range from relatively mild, like Santa Clarita Transit and Omnitrans, to OCTA, which has cut over 20 percent of its service.
- Boardings are also generally down, by between 2 percent and 27 percent. Four agencies have seen boardings reduced by more than 15 percent. But again, in the burgeoning areas, it tends to have increased. In this study, a unique experience in ridership increase was experienced by Santa Monica's Big Blue Bus. They established an institutional pass arrangement where Santa Monica College students can ride free with their student IDs. The college is served by their number one and two lines in terms of boardings so this has increased their system-wide ridership overall. Another interesting fact is that while Metro Bus ridership is down 5.4 percent, its rail is up slightly in the last two years. The opening of the Metro Gold Line Eastside Extension may be a factor in this growth. Employment is generally the number one factor affecting transit boarding levels. Most of the decrease seen is due to the contraction of jobs in the SCAG region. Only a minor amount is due to the reduction in hours. This is because as agencies reduce service hours, they do so to affect the least amount of riders first. Generally, frequencies and span-of-service are reduced first, before outright line truncations or cancellations, which has happened at a few of these agencies. However, OCTA has reduced service at such a significant level that a large share of the boardings decrease is attributable to the cuts alone.
- Almost all agencies surveyed raised fares, with some still planning additional increases in the coming year. Fare increases generally correspond to a decrease in boardings, at least initially. The amount of decrease varies by operator, and the overall structure of the fare adjustment and elasticities for that operator.

SYSTEM PERFORMANCE: BENCHMARKING TO PEER REGIONS

Analysis of the region's transit network's performance via Key Performance Indicators (KPIs) revealed a worrying trend: the growth in costs of transit provision is growing far faster than inflation, and far faster than the rate of growth in consumption. This analysis focused on twenty-five transit properties from throughout the region that a) provide service between jurisdictions, and b) report performance data to the National Transit Database (NTD). The report included a section focused on transit KPIs including ridership, productivity, mobility, and cost.

Analysis of the findings of the KPI exercise led to the comparison of our regional transit system's performance to those other regions. Doing so establishes a frame of reference for the cost effectiveness of current operations, and identifies areas where other regions are providing service at a lower cost. Further, doing so will allow regional stakeholders to identify areas of possible improvement, and to identify peer regions and peer agencies who might provide best practices examples.

Performance benchmarking through peer comparison is relatively new in transit--peer comparison exercises by public agencies are more commonly performed in the education and public safety fields. Increasingly though, transit properties are using the availability of NTD data to measure agency performance in comparison to peer agencies. It is also an emerging practice at the regional level.

Over the past ten years, several performance benchmarking exercises have been performed at the system level by regional bodies. Beginning in 2003, The Metropolitan Council of Minneapolis has added a benchmarking component to its quadrennial transit system performance audit. The Atlanta Regional Council (ARC) performed similar analysis in 2005, focusing on peer regions with similar populations, growth rates, density, and travel characteristics. The State of Illinois Department of Transportation's Performance Audit of Mass Transit Agencies in Northeastern Illinois: RTA, CTA, Metro and Pace, included comparison of each mode in the region with five peer services.

Methodology

In order to perform the analysis, staff began by constructing a peer regions group. Previously, SCAG has performed performance benchmarking activities in the context of the State of the Region Report, where our region's performance was measured and compared along a broad axis of multi-sectoral indicators. Historically, the peer group in this analysis has been regions with populations over 5 million.

For the purposes of this exercise, that peer group metric has been retained. Using US Census 2009 estimates, a cohort of 10 Consolidated Statistical Areas (CSAs) and one Metropolitan Statistical Area (MSA) with more than 5 million residents was built (the Miami Fort Lauderdale Pompano Beach MSA in not part of a CSA).

TABLE 3 Peer Regions Comparison Group

CSA / MSA Designation	2009 Estimated Population, US Census
New York-Newark-Bridgeport, NY-NJ-CT-PA CSA	22,232,494
SCAG REGION	17,987,767
Chicago-Naperville-Michigan City, IL-IN-WI CSA	9,804,845
Washington-Baltimore-Northern Virginia, DC-MD-VA-WV CSA	8,440,617
Boston-Worcester-Manchester, MA-RI-NH CSA	7,609,358
San Jose-San Francisco-Oakland CA CSA	7,427,757
Dallas-Fort Worth, TX CSA	6,805,275
Philadelphia-Camden-Vineland, PA-NJ-DE-MD CSA	6,398,896
Houston-Baytown-Huntsville, TX CSA	5,968,586
Atlanta-Sandy Springs-Gainesville, GA-AL CSA	5,831,778
Miami-Fort Lauderdale-Pompano Beach, FL MSA	5,564,635
Detroit-Warren-Flint, MI CSA	5,327,764

The peer regions group contains 109 million residents as of the 2009 Census estimates, roughly one-third of the national population. The peer group also represents a significant portion of the nation's transit investment, service, and ridership. There are 192 separate agencies reporting data within the peer regions comparison group, across a variety of transit modes. To contextualize, the table below presents the amount of service and productivity of various modes in the peer regions comparison group.

For rail modes, the small number of agencies allows direct comparisons. As such, ridership and cost performance data were compared evenly by agency across the regions. For the purposes of fixed route bus analysis, the SCAG Region's transit properties were tiered and compared to a series of peer region comparison group performance over time. In order to capture data at the system level, and represent each of the included transit agencies, analysis was conducted through unweighted averages. This is helpful for understanding performance at the operator level, but does not reflect total volume or consumption of service. To give more a comparative perspective, different data years were employed, allowing comparisons of national trends to regional trends.

Our region is very competitive in service consumption. Southern California ranks fourth in per capita unlinked bus trips, behind New York-Newark, San Jose-San Francisco-Oakland, and Chicago–Naperville Michigan CSAs. Southern California's heavy and light rail network is not as competitive. Of ten regions with heavy or light rail systems, the SCAG Region ranks 8th in per capita urban rail trips. One reason for this may be the limited extent of the network. Southern California operates 0.78 directional route miles of rail for every 100,000 residents, which ranks 9th out of ten nationally.

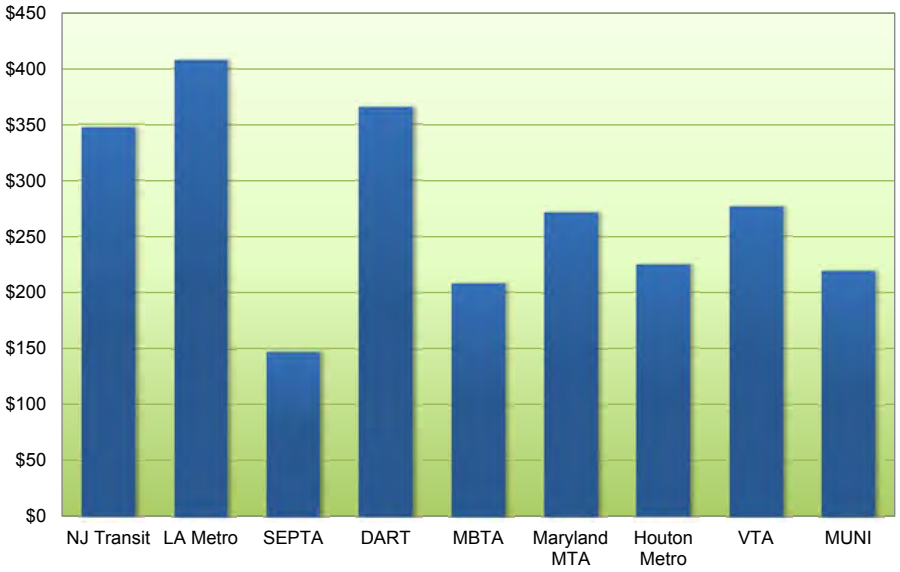

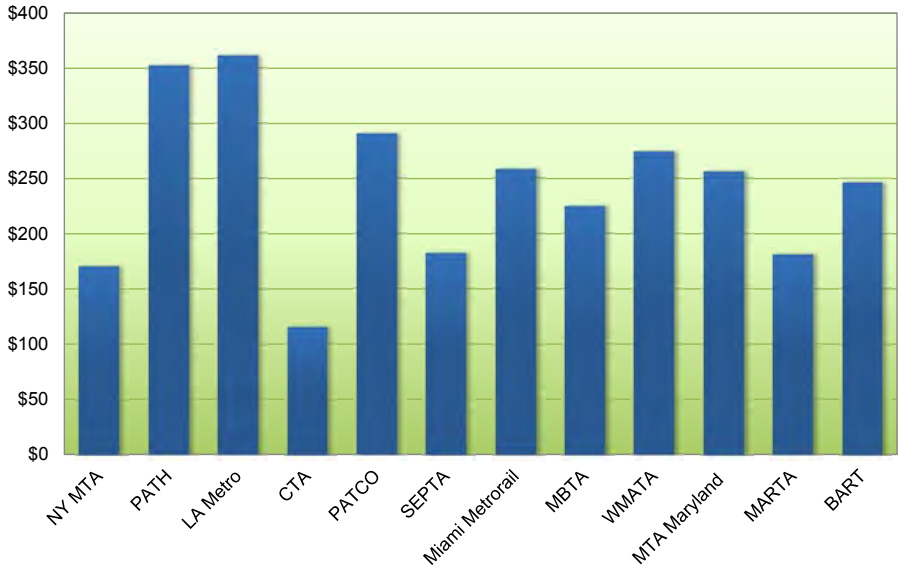

FIGURE 18 Heavy Rail Cost per Service Hour, Peer Regions Comparison Group, 2008 NTD

The SCAG Region is performing relatively well compared to other regions. LA Metro's heavy rail system is the most productive in the country, but this is partially a product of providing a relatively small number of service hours. Metro recorded 265,149 service hours in FY2008, slightly more than the total at the Maryland Transit Administration (214,285) and slightly less than Miami Dade Transit's 318,765. In contrast, two of the three most productive systems after Metro offer vastly more service. New York's MTA delivered over 19 million service hours in FY2008, and Boston's MBTA provided 1.2 million. PATH Transit, which connects New York City and New Jersey, provided only 146,102. Other less productive services, including SEPTA, MARTA, BART, and WMATA, offered over 500,000 service hours. These data present a strong argument for service expansion of Metro's existing Purple and Red lines, and suggest that Metro's "More trains, More Often" pilot program may be very successful.

LA Metro's Light Rail Service is the third most productive of the national peer group. Houston Metro carries 167 passengers an hour, MBTA 122, and LA Metro 115. DART is

the next most productive at 80 per hour, nearly double the service on a system that is 42 percent of LA Metro's total route miles. LA Metro's existing light rail system is actually the largest of any in the peer region's group; NJ Transit, the second largest, offers on 84 percent of LA Metro's total route miles. DART, SEPTA, MUNI, and Santa Clara VAT all operate systems at roughly 66 percent to 80 percent of the route miles of the LA Metro system. The SCAG Region is somewhat unique among large metropolitan areas in using light rail technology over large geographic areas, as opposed to more highly concentrated areas such as San Francisco, San Jose, or Boston. That the system can do so at such high comparative productivity levels is an achievement.

Small bus properties in the SCAG Region are also more productive than their national counterparts. **FIGURE 11** displays the productivity performance of bus services providing less than 100,000 service hours in FY1991, FY2008, and FY2010. While in 1991 performance was roughly similar at the national and regional levels, by 2008 the SCAG region was outperforming the unweighted national average by roughly 30 percent. This remained true in 2010. However, these data points represent a drop of 41 percent for the national group, and 28 percent for the SCAG Region. Our region's productivity is simply declining much more slowly than that of the national peer group.

FIGURE 12 displays the unweighted average productivity of operators offering between 100,000 and 200,000 hours of service. Both the national peer group and the SCAG region are declining. While service in this tier has grown 49 percent nationally between 1991 and 2010, in the SCAG Region the hours provided by medium tier operators have grown by 160 percent. This growth significantly outpaces the diminishing productivity, and suggests that properties in this tier should be working to target service expansions to the most productive corridors.

The vast bulk of fixed route bus service in the SCAG Region is provided by a handful of very large operators. As displayed in **FIGURE 9**, in FY 1991, those services were 16 percent less productive than their national counterparts; by FY 2008 they were 12 percent more productive. This trend continued into FY 2010. It should also be noted here that while productivity diminished between 1991 and 2008 at the national level, it grew by 27.5 percent over the same period in the SCAG Region.

FIGURE 6 displays the cost per passenger mile for small tier bus properties. In FY1991, cost per passenger mile were almost exactly the same. Cost growth is significant for both the peer group and the regional operators, but much more pronounced at the national level. Adjusted for inflation, costs grew 55 percent for the peer group between FY 1991 and FY 2008, but only 35 percent for the SCAG Region. Between FY 2008 and FY 2010, costs in the SCAG Region actually declined by 5 percent. However, 30–35 percent in inflation adjusted growth is still deeply problematic.

In FY 1991, the SCAG Region was significantly outperforming the peer group, but by FY 2008 the performance was almost exactly even ($0.8820/mile vs. $0 8801/mile). In FY 2010, the region and the peer group performance remained similar. However, this indicates that costs in the SCAG Region are growing at a much faster rate; our region's costs grew by 69 percent versus the national average of 40 percent. As displayed in **FIGURE 2**, these costs are growing at a troubling rate.

Costs per passenger mile are also growing rapidly for properties delivering large amounts of service.

TABLE 4 Findings of Peer Comparison Benchmarking Exercise

Measure	Outperforming National Peer Group	Underperforming National Peer Group	Roughly Even
Cost per PMT, Large Bus Properties, 1991	X

System Productivity, Light Rail, 2008	X		

Of thirty-three measures surveyed in the peer comparisons exercise, The SCAG Region outperformed the national peer group in seventeen, and was roughly even with the peer group in six. In ten measures of unweighted average performance, the peer comparison group outperformed our region; however, of those measures, four were historical data points from 1991. Moreover, our system is very competitive where the bulk of the service is; nine of the measures where the SCAG Region is outperforming the peer group are rail or large bus providers.

At the agency level, the SCAG Region's transit system is very high performing compared to other peer regions. Our costs and our productivity are in no way atypical of large metropolitan regions; rising operations costs are typical nationally. However, rising operations costs will continue to pose a challenge to our ability to provide transit service, to meet air quality conformity targets, and to comply with laws such as SB 375. In subsequent regional transportation plans, cost containment strategies will need to be an important piece of the overall transit strategy.

Transit and Sustainable Communities

Transit availability and attractiveness are crucial elements of sustainable communities. The ability of our region to continue to attract new riders in greater numbers calls for implementing strategies and policies to meet this goal.

While these new facilities are mostly in Los Angeles County, other counties in our region have BRT and rail projects in the planning phases. Most of these corridors will serve new transit oriented development (TOD) offering residents the availability of transit trips, or bicycling or walking, over auto trips. High Quality Transit Areas (HQTAs) are an element of SB 375 that are designed to align regional transportation, land use, housing and greenhouse gas emissions planning through the SCS. A HQTA is an area within a ½-mile of a rail stop or a bus corridor that provides or will provide at least 15-minute frequency service during peak hours by the year 2035.

Strategic and cooperative planning among various levels of government will result in a greater level of Greenhouse Gas (GHG) reductions. Following is a discussion of strategies and policies to further improve the public transit and land use nexus.

SB 375

In addition to connecting regional planning processes, SB 375 was also designed to make it easier for communities to expand housing and transportation choices. A key element of SB 375 is the option for regions and their local governments to provide significant CEQA regulatory streamlining incentives for Transit Priority Projects (TPPs). TPPs are housing or mixed-use projects with 20 dwelling units per acre or more that are located within a HQTA. CEQA streamlining can provide certainty, cost and speed benefits needed by infill and TOD.

Transit agencies and local governments should take full advantage of these opportunities to plan transit service to serve these new development opportunities. In addition to the 15-minute frequency defined by SB 375, SCAG's SCS emphasizes this transit/land use nexus to transit corridors where 30-minute of better service is or will be provided.

While many of these strategies would be implemented by transit agencies in their service areas, local cities can add to these opportunities by adding or adjusting local circulators within their jurisdiction to serve TOD and increase transit mode share.

HIGH-SPEED RAIL

In 2008 California voters passed Proposition 1A authorizing nearly $10 billion in bonds to build the California High-Speed Train (HST) system between San Francisco through Los Angeles and continuing to Anaheim. Once completed, the project will attract a significant amount of travelers who now travel by airline or auto. This could significantly reduce GHGs. CA HST stations will provide new or enhanced nodes for real estate development, approximating the growth and uses currently seen at small to medium sized airports. In addition, the proper planning of feeder bus and rail systems to these stations should increase passenger trips for all carriers involved. Following are some general and specific recommendations for the region:

- Encourage the development of new transit modes in our subregions such as BRT, rail, limited-stop service, and point-to-point express services utilizing the HOV and HOT lane networks.
- Encourage transit providers to increase frequency and span-of-service in TOD/HQTA areas and along targeted corridors where there is latent demand for transit usage.
- Encourage regional and local transit providers to develop rail interface services at Metrolink, Amtrak and HST stations.
- Collaborate with local jurisdictions to plan and develop residential and employment development around current and planned transit stations.
- Collaborate with local jurisdictions to provide a network of local community circulators that serve new TOD and HQTAs, providing an incentive for residents and employees to make trips on transit.
- Develop first-mile/last-mile strategies on a local level to provide an incentive for making trips by transit, bicycling or walking.

- Encourage transit fare discounts and local vendor product and service discounts for residents and employees of TOD/HQTAs, or for a jurisdiction's local residents in general who have fare media.
- Work with the California High-Speed Rail Authority and local jurisdictions to plan and develop optimal levels of retail, residential and employment development that fully takes advantage of new travel markets and rail travelers.
- Lobby the state to provide funding for increased transit service in TOD/HQTA areas in support of reaching SB 375 goals.
- Continue to work with neighboring Metropolitan Planning Organizations to provide alternative modes for interregional travel, including Amtrak and other passenger rail services.

Needs Assessment and Transit Challenges

Our region will undergo an impressive expansion of transit facilities and service over the next 25 years. The local county sales tax programs, most recently Measure R in Los Angeles County, are providing for most of this expansion in facilities and services.

Los Angeles County will greatly expand its rail network, adding entire new corridors and lengthening existing ones by 2035. Metro's 30/10 initiative seeks to speed up these Measure R projects by building 12 new services in the next ten years. Orange County will introduce its first BRT services, greatly expand Metrolink service, and introduce new transit systems in Santa Ana, Anaheim, and Garden Grove. Riverside County will also introduce its first BRTs and introduce the Metrolink Perris Valley Line. San Bernardino County will introduce BRT service as well and the Redlands Rail.

This expansion of premium transit services beyond Los Angeles County is critical for attracting new riders to transit. Also of importance is frequency of regular local fixed-route bus service. Outside of L.A. County, only 23 percent of Orange County residents have access to transit service with 15 minutes or better frequency, only 11 percent of Riverside and San Bernardino county residents have this access, and no residents in Imperial or Ventura counties have such access.

While these capital projects will provide our region with a much more mature public transportation system, operational improvements and new transit programs and policies will also contribute greatly to attracting more trips to transit and away from single occupant vehicle (SOV) travel. First, the expanding HOV and HOT lane networks call for the development of an extensive express bus point-to-point network. Second, transit oriented and COMPASS 2 percent land use developments call for increasing the frequency and quality of fixed-route bus service by virtue of adding new BRT service, limited-stop service, increased frequencies along targeted corridors, and the introduction of local community circulators to provide residents of smart growth developments with the option of taking transit over using a car to make short, local trips.

Another emphasis on transit network improvements includes transit priority facilities, like bus lanes and traffic signal priority. Our region has virtually no bus lanes, especially compared to other major metropolitan areas. The Los Angeles County Metro Rapid Bus network employs bus signal priority that gives buses up to 10 percent more green light time from the normal green light phase. This should be expanded to other counties in our region.

Additional enhancements to our region's transit services include expanding bike-carrying capacity on transit vehicles, implementing regional and intercounty fare agreements and media like L.A. County's EZ Pass, and expanding and improving real-time passenger information systems.

Economics and Funding

Transit faces significant funding challenges in the SCAG region. While five of the six Counties in the region have passed or extended local option sales taxes dedicated to transportation within the last decade, state and federal revenues for transit have been diminishing, particularly from the state's State Transit Assistance (STA) and Local Transportation Fund (LTF). These two funds provide transit operations funding, and if they continue to diminish transit, sustainable communities strategies in the SCAG region will need to be geared toward low cost incremental improvements, operational enhancements, and policies that increase access to transit rather than increasing transit service to appropriate levels and corridors to meet passenger demand.

These positive developments have been significantly impacted however by recent revenue declines and cutbacks in funding. The Great Recession and its anemic recovery have led to serious fiscal challenges for our transit operators. Since FY2008, transit providers within the SCAG region have seen a decrease in State Transit Account (STA) funds of approximately $759 million. Local Transportation Fund (LTF) allocations for FY2010 were

21 percent lower than FY2007. By February of 2011, half of the surveyed agencies had cut service by between 2 percent and 20 percent. Of those, four agencies had cut service by more than 10 percent. During this same period, 14 out of 25 of these operators had seen their boardings fall between 2 percent and 27 percent. Of those, four agencies had boardings fall by more than 15 percent. To offset this large revenue decline, almost all operators have raised fares. While this has increased fare revenues in the region, it does not provide an incentive for increased passenger boardings.

Coupled with the revenue setbacks, costs for transit providers are heading in the opposite direction by rising faster than inflation. Each mode has shown cost per passenger mile traveled (PMT) increase over the past decade: bus service by 24 percent, Metro Rail by 41 percent, and Metrolink by 48 percent. Transit providers' fare revenue has decreased from 32 percent of the cost of providing service to just 27 percent since 2000.

These cost and revenue trends weaken the long term stability of transit services in the SCAG Region. Unless transit operators in our region find ways to improve the fare revenue to cost ratio, transit services will require much greater subsidies or services will continue to be cut. This conflict will grow as new operational funds will need to be applied towards new capital projects currently in development once they are ready for revenue service.

Coordinated Planning

As per 49 U.S.C. Sections 5302, 5303, 5310, 5311, 5314, 5316, and 5317; SAFETEA-LU Section 3046, metropolitan regions or component parts of metropolitan regions are required to produce a Coordinated Human Services Transportation Plan. Projects receiving Federal Transit Administration funds in the 5310 Transportation for Elderly Persons and Persons with Disabilities, some 5311 Formula Grants for Other than Urbanized Areas, 5316 Jobs Access Reverse Commute, and 5317 New Freedoms Programs must be consistent with that plan.

In the SCAG region, Consolidated Transportation Service Agencies (CTSAs) are responsible for producing Coordinated Plans. These agencies, often incorporated within County Transportation Commisions, operate at the county level, and since the passage of SAFETEA-LU have produced coordinated plans at that level.

Coordinated Human Services Plans in effect in the SCAG Region include:

- The Human Service Transportation and Transit Service Coordination Study, Approved by the VCTC in 2007
- The Imperial County Coordinated Human Services Transportation Plan, approved by the Imperial Valley Association of Governments in 2008
- The Public Transit – Human Services Transportation Coordination Plan for Orange County, adopted by OCTA in 2008
- The Public Transit-Human Services Transportation Coordination Plan For San Bernardino County, adopted by SANBAG in 2007
- Action Plan: A Locally Developed, Coordinated Public Transit Human Services Transportation Plan for Los Angeles County, adopted by Access Services Incorporated in 2007
- The Public Transit – Human Services Transportation Coordination Plan for Riverside County, adopted by RCTC in 2008

Constrained Plan

Baseline Transit Investments and Policies

Public transportation in Southern California is highly varied. As the geographically largest metropolitan region in the country, the SCAG Region has a diverse set of transportation needs across the six county area. Transportation providers within that area use a diverse set of strategies and services to meet those needs.

Since the 2008 RTP, Los Angeles, San Bernardino, and Riverside Counties have increasingly seen capital project development as a strategy to meet transit needs within their respective counties.

In November 2008, the voters of Los Angeles County approved a third Local Option Sales Tax to fund both capital and operations within Los Angeles County. The Los Angeles County Metropolitan Transportation Authority (Metro), which already administers Proposition A and C funds, will use 35 percent of Measure R revenues to develop a series of major transit capital projects.

TABLE 5 Major Transit Capital Projects Funded with Measure R Revenues

Major Transit Capital Projects Funded with Measure R Revenues	
Exposition Transit Corridor, Phase 2	South Bay Metro Green Line Extension
Regional Connector Transit Corridor	Sepulveda Pass Transit Corridor
Crenshaw LAX Transit Corridor (includes project acceleration)	San Fernando Valley (East) North South Rapidways
Eastside Transit Corridor Phase 2	Metro Orange Line Extension (includes project acceleration)
Gold Line Foothill Extension, Phase 2a	Pacific Electric Right of Way / West Santa Ana Branch Corridor
Metro Green Line to LAX	Westside Subway Extension[1]

[1] Measure R Expenidute Plan Adopted by Metro Board of Directors July 24, 2008 (http:/www.metro.net/measurer/images/expenditure_plan.pdf)

Since the 2008 RTP was released, Metro completed construction and began operations of the Edward R. Roybal Metro Gold Line Eastside Extension, which extended Gold Line service to Boyle Heights and East Los Angeles. Metro and the Exposition Construction Authority staff also plan to begin revenue service between downtown L.A. and Culver City in early 2012.

Additionally, the San Bernardino Associated Governments (SANBAG) is working with local transit properties to provide more travel options in the San Bernardino Valley. Two capital projects of note include the E street sbX BRT Corridor, and the Downtown San Bernardino Passenger Rail Project, which will extend Metrolink service into Downtown San Bernardino.

Similarly, the Riverside County Transportation Commission continues to develop the Perris Valley Line, a 24 mile extension of Metrolink's 91 Line service to South Perris. RCTC also continues to evaluate further extensions of Metrolink service.

In Ventura, Orange, and Imperial counties, transit planning has recently been more focused on operational changes. The Imperial County Transportation Commission is currently initiating a Comprehensive Operational Analysis for Imperial Valley Transit, which will seek to assess whether existing transit service can be altered to more efficiently and effectively meet existing travel demand. Given that Imperial County has had approximately 33 percent growth over the past ten years, this project is especially timely.

In Orange County, while bus service has been significantly cut due to local and state operational funding shortfalls, OCTA is moving forward with three transit initiatives. One is the Orange County Metrolink Service Expansion which is funded by Measure M, Orange County's half cent transportation Local Option Sales Tax. This $382.5 million program expands Metrolink service between Fullerton and Laguna Nigel / Mission Viejo, funds capital improvements to facilitate increased train traffic, and builds a new Metrolink station in the City of Placentia.

OCTA is developing strategies to complement these service expansions through the Measure M-funded Go Local Program. After measure M was renewed in 2006, OCTA partnered with each of the 34 cities in Orange County to study alternatives for local circulators to connect with Metrolink stations. As a result of these studies, OCTA is partnering with the Cities of Anaheim and Santa Ana to develop two local circulator projects,

the Anaheim Rapid Connection and the Santa Ana-Garden Grove Fixed Guideway. These projects will provide onward connectivity from the Anaheim Regional Transportation Intermodal Center and the Santa Ana Regional Transportation Center.

As a response to the financial pressures which have forced service cuts, OCTA has also been investigating service realignment. OCTA's Transit System Study seeks to find financially sustainable service delivery strategies, and to more closely tie bus and rail services to passenger demand. A final plan will be issued in the fall of 2011 and its guiding principles will be to:

1. Invest in high performing services,
2. Replace lower performing services with lower cost services,
3. Integrate city shuttles to connect Metrolink service and community circulators with the fixed route network,
4. Match service products to markets, and
5. Improve service efficiency and speeds in an integrated network.

Planned Investments

The 2035 RTP includes significant investment in public transit across all transit modes. There is a $56.6 billion dollar investment in transit capital, a $47.7 billion dollar investment in Passenger Rail, and a $139.3 billion investment in transit operations and maintenance. Transit represents 64 percent of total operations and maintenance in the 2012 RTP, and 20 percent of capital investments. Passenger rail, including Phase I of the California HST program, accounts for another 18 percent of total capital investment in the 2012 RTP. Many major capital projects that were part of county level sales tax expenditure plans have been amended into the 2008 RTP. These include Los Angeles County's Measure R projects, and Orange County's Measure M projects.

TABLE 6 Investment in Transit and Passenger Rail

Investment in Transit and Passenger Rail	
Mode	**Total Investment in Nominal Billions**
BRT	$ 4.6
Bus	$20.9
Commuter Rail	$ 3.9
Light Rail	$13.1
Heavy Rail	$11.1
High Speed Rail	$47.7

TABLE 7 Major Transit Capital Projects in the 2012 RTP

Major Transit Capital Projects in the 2012 RTP	
Exposition Transit Corridor-Phase 2 to Santa Monica	Green Line South Bay Extension
Regional Connector Transit Corridor	Sepulveda Pass Transit Corridor (funded outside the outside the planning horizon of the 2012 RTP)
Crenshaw/LAX Transit Corridor	San Fernando Valley (East) North/South Rapidways
Eastside Transit Corridor-Phase 2	Orange Line Canoga Extension
Gold Line Extension to Glendora	West Santa Ana Branch Corridor
Green Line LAX Extension	Westside Subway Extension (to Westwood)
Redlands Passenger Rail Project	E Street BRT (sbX)
OCTA Bravo BRTs	Perris Valley Line Metrolink Extension
OCTA Metrolink Service Expansion Program	Anaheim Rapid Connection
Santa Ana/Garden Grove Fixed Guideway	Fixed Guideway Gap Closures

The 2012 RTP includes major capital projects that extend the scope and reach of "premium" transit throughout the SCAG Region. By 2035, the projects detailed in this plan will begin to provide an integrated network of transit options for travellers in the region. This plan calls for a drastic expansion of heavy rail, light rail, rapid bus and BRT service throughout the region. Especially in Los Angeles and Orange Counties, travellers will have greatly increased ability to access the transit network, and the ability to connect onward to high speed, intercity, and commuter rail.

TABLE 8 Total Tier 2 Travel Analysis Zones Served by Transit in 2035

	Tier 2 TAZs with more than 150 Residents or 50 Jobs per acre	Tier 2 TAZs with more than 50 Residents or Jobs per acre	Tier 2 TAZs with more than 30 Residents or Jobs per acre	Tier 2 TAZs with more than 15 Residents or Jobs per acre
Total 2035 Transit Network	100%	100%	99.6%	99.4%
Premium Transit Services	88.8%	77.6%	67.3%	53.6%
Rapid Transit Services	63.7%	77.6%	41.5%	29.9%

The 2035 total transit network represents a large step for connectivity and the ability of transit riders to access both the system and their destinations. The 2035 network does an excellent job of serving the densest areas of the region. As seen in **TABLE 8**, 100 percent of Traffic Analysis zones with over 150 residents or 50 jobs will have access to transit within a quarter mile radius; 88.8 percent of those zones will have access to premium transit services including Rapid buses, Express buses, BRT, Urban Rail, or Commuter Rail. A further 63.7 percent of TAZs will have all or part of their area within a half mile buffer of Rapid Transit Services, including BRT, Urban rail and Commuter Rail.

Areas of compact development, including those TAZs with more than 50 jobs or residents, are similarly well served. All zones have transit access, and 77.6 percent have access to both premium and rapid transit. Slightly less dense TAZs, with more than 30 jobs or residents, are also well served by the 2035 regional transit network. Only .04 percent will have no transit access, and two thirds will have access to premium transit. Slightly over 40 percent are located within a half-mile of rapid transit.

Almost all TAZs with more than 15 jobs or residents are served by some form of transit in 2035 (99.4percent); however only half are served by premium transit and less than a third are served by rapid transit. Sparser zones tend to be less productive for transit agencies, leading to more limited services.

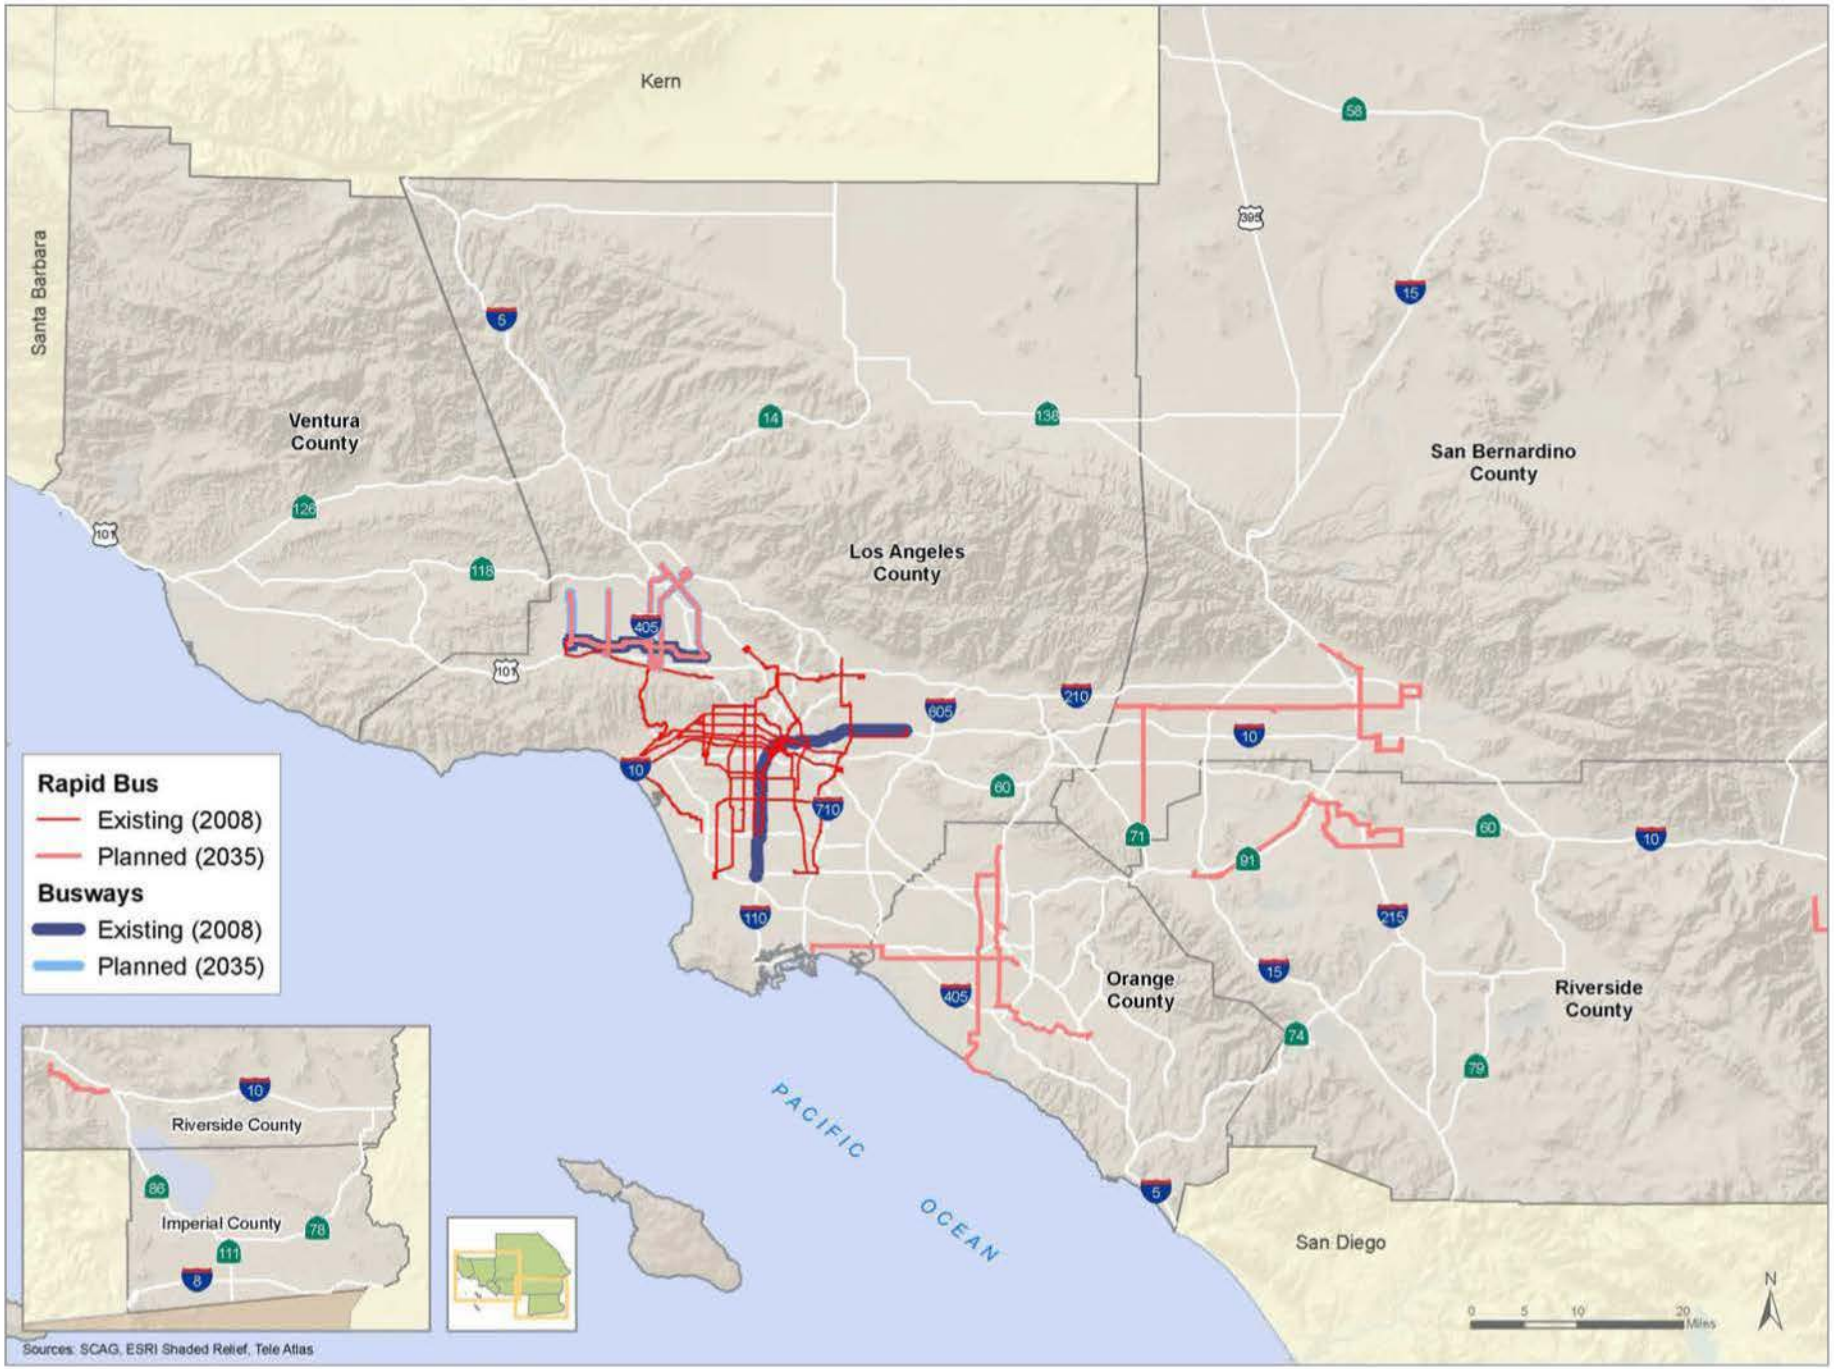
Several sets of projects will provide a massive expansion of mobility in our region. Three mega-projects, the Westside Subway extension, the Regional Connector Transit Corridor, and the Exposition Transit Corridor have the potential to connect residents to employment centers in the highly congested central Los Angeles area and the similarly congested Westside Subregion, providing important alternatives to car travel. These three projects also represent a large increase in the SCAG Region's capacity to move passengers. The Regional Connector will also radically change the operational environment for rail transit in Los Angeles County. Light rail vehicles will use the Regional Connector tracks to connect between now unconnected Blue, Gold, and Exposition rail corridors. Upon completion, passengers boarding a rail vehicle in Pasadena or Azusa will be able to travel to Long Beach without transferring; similarly, passengers boarding at the terminus of the Metro Gold Line Phase 2 will be able to travel to Culver City or Santa Monica without transferring.

Other Measure R projects will extend the reach of the Metro Rail system to a large portion of Los Angeles County. The South Bay Metro Green Line extension will extend rail transit much deeper into the South Bay Subregion, and connect residents of the South Bay cities to an important jobs center in El Segundo. Similarly, the Foothill and Eastside Gold Line Extensions will increase the ability of residents of eastern Los Angeles County to access the Metro Rail System, and travel to important regional centers.

The Pacific Electric Right Of Way / West Santa Ana Branch Corridor represents an enormous opportunity for the SCAG region. While final modal and alignment decisions remain to be made, this corridor will be an important step forward for regional mobility. It will serve a currently underserved market in the Northeastern and Central Gateway Cities area, and provide important links to the Metro Green Line and a variety of transit options in downtown Los Angeles. Many corridor area residents are in low income households and have limited vehicle access; the corridor serves them by connecting it to important recreational and shopping opportunities, in addition to employment centers.

EXHIBIT 1 2035 Planned and Existing Urban Rail Network

EXHIBIT 2 2035 Bus Rapid Transit



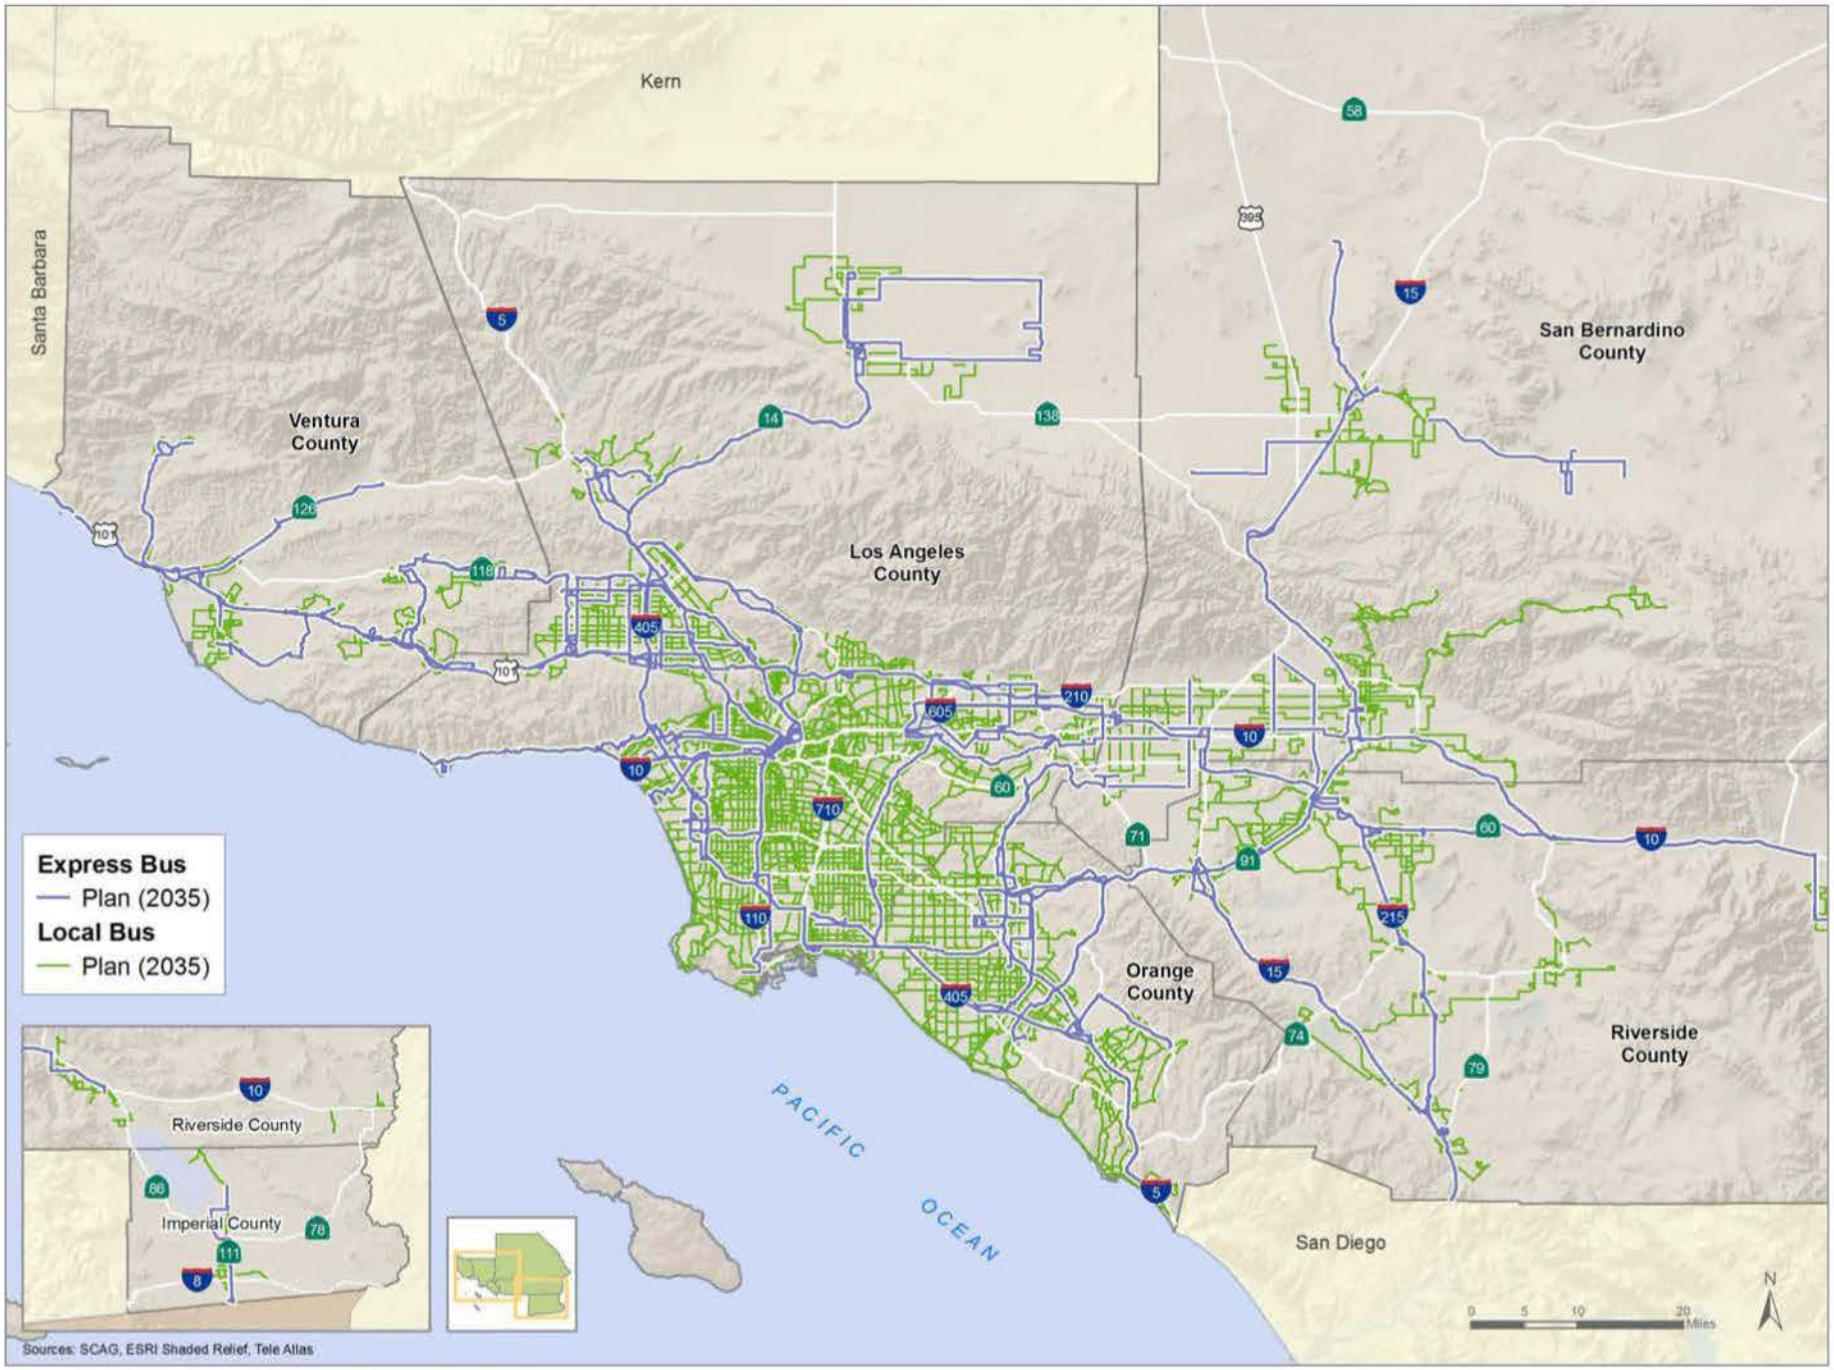


EXHIBIT 3 Local and Express Bus Network

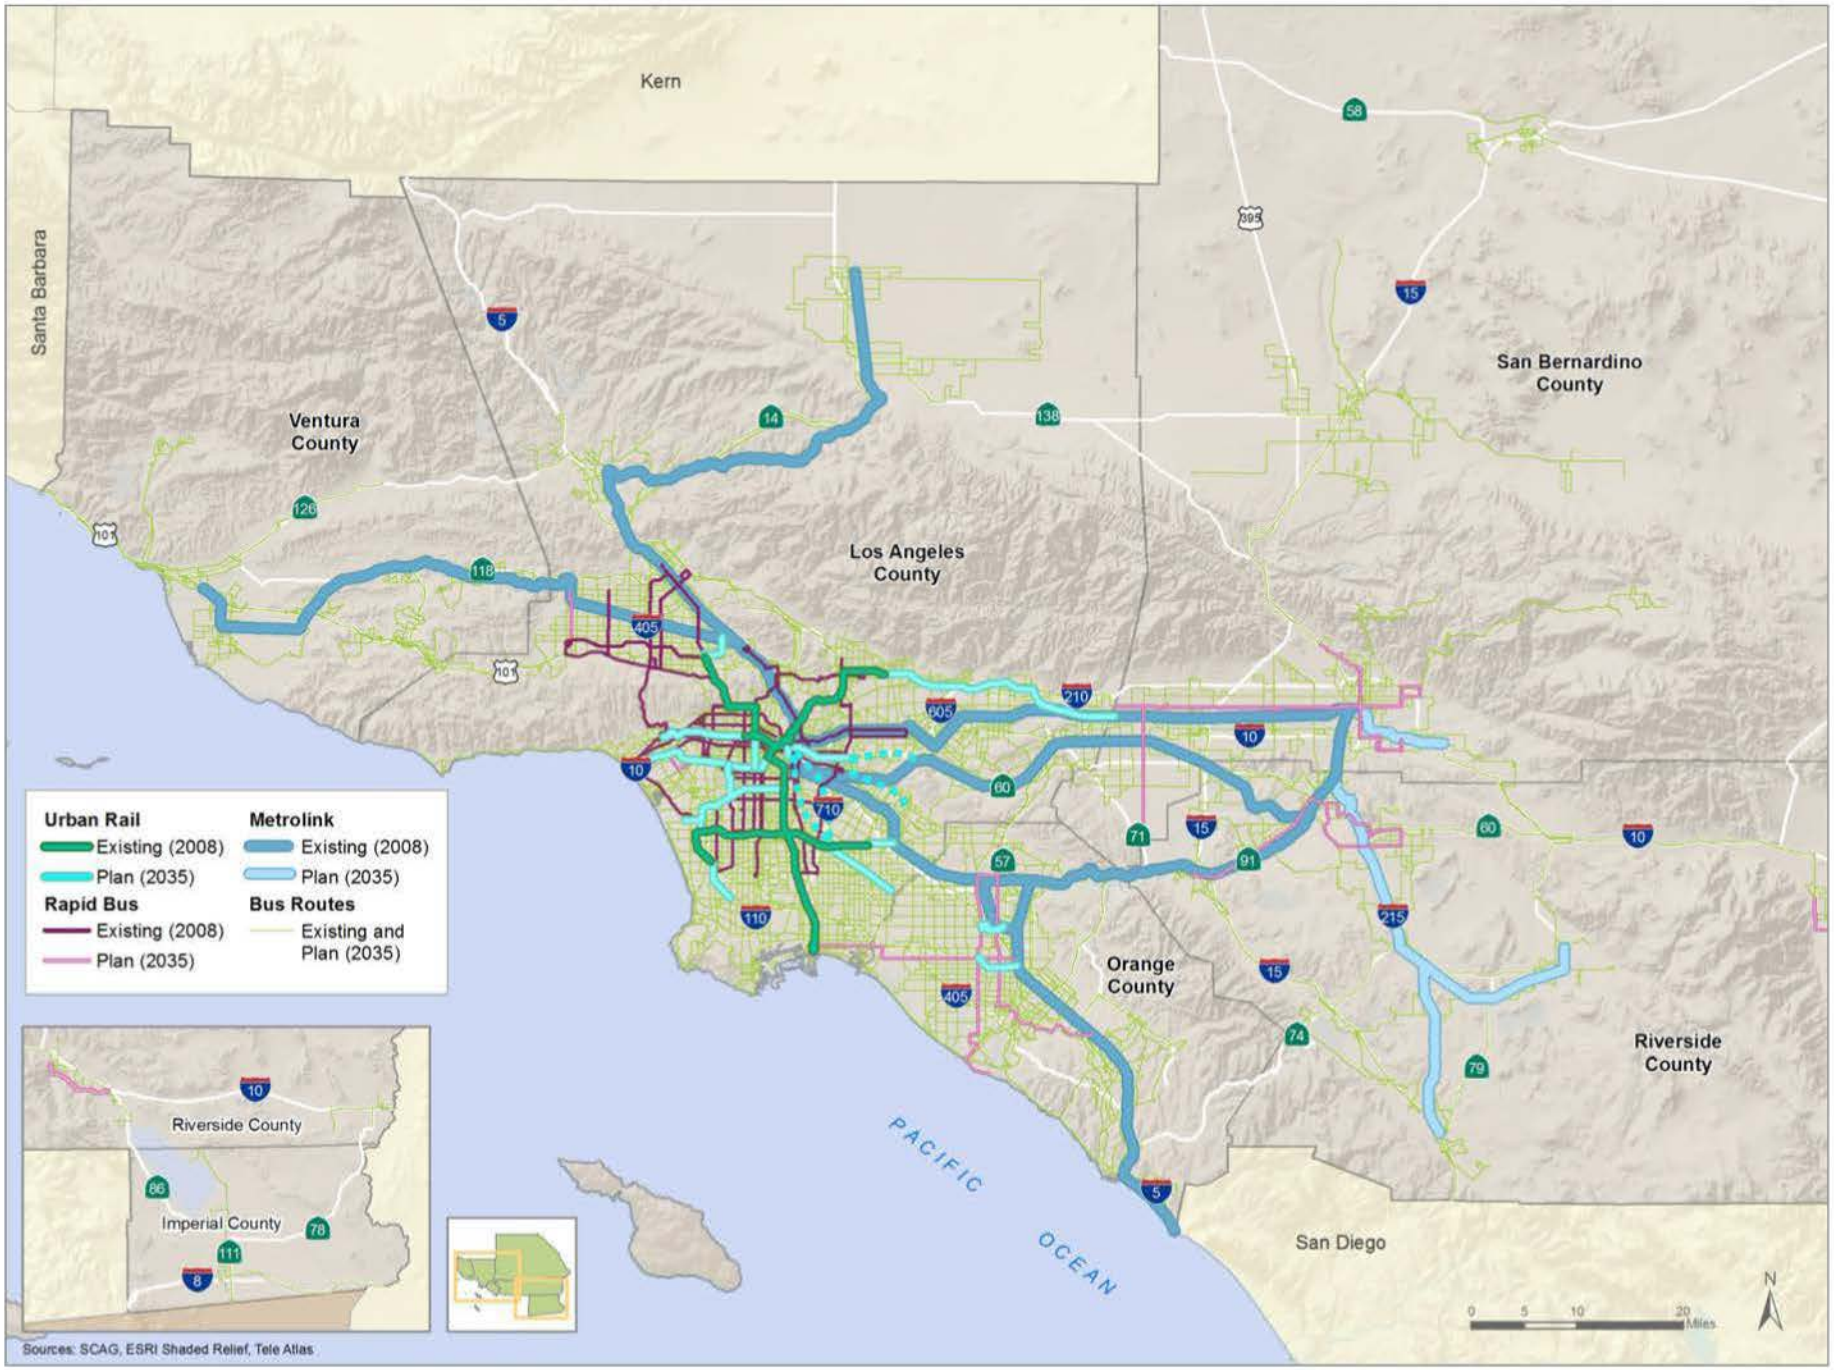
Orange County's Measure M investments will also greatly expand access to rapid transit. Orange County will initiate BRT on three initial corridors. Westminster, Harbor, and Bristol and State College boulevards will be the site of these initial investments. These corridors will connect into Priority High Frequency Corridors, where local bus bus service operating at high frequencies will provide heightened mobility for travelers.

Two additional Measure M investments will also connect to the growing BRT network. The Go Local program will offer connectivity between the existing Metrolink network and important regional destinations. The Anaheim Rapid Connection (ARC) will offer onward connectivity to the Anaheim Resort from the planned Anaheim Regional Transportation Intermodal Center (ARTIC). Travelers on ARC will be able to transfer to the Harbor Blvd BRT line, Metrolink, Amtrak's Pacific Surfliner, and High-Speed Rail at ARTIC. Similarly, the Santa Ana Garden Grove Fixed Guideway will connect the central business district of Santa Ana to the Santa Ana Regional Transportation Center, allowing transfers to Metrolink and the Pacific Surfliner. The other terminus of the Santa Ana Garden Grove Fixed Guideway, at Harbor Blvd, will also offer connectivity to two separate BRT routes.

In the Inland Empire, new projects will also increase transit mobility. New BRT services in San Bernardino will complement the soon-to-open E street sBX BRT line, connecting to multiple Metrolink stations and extending the reach of our region's commuter rail network. Furthermore, the Redlands Rail project will extend Metrolink's service area deeper into the eastern San Bernardino Valley, and provide access to one of San Bernardino County's major universities.

In order to further develop the integrated transit passenger rail networks, SCAG staff developed a list of fixed guideway gap closures for the 2012 RTP. These projects were developed by reviewing performance data from county transportation commission strategic planning documents, and were analyzed from a list of over 32 potential projects developed in these plans and studies. The resulting projects were analyzed on the basis of several factors:

1. Did the project close a gap in the existing rapid transit network?
2. Did the projects serve comparatively dense areas?
3. Did the projects provide intermodal connectivity?
4. Did the projects serve important regional or subregional centers for housing or employment?
5. Using locally generated performance data, what was the capital cost per out-year boarding?



Five projects were selected using this analysis. These projects, collectively titled the "fixed guideway gap closures," will provide important links in our 2035 transit network. All but one of the five projects serve a minimum of 20 tier 2 Travel Analysis Zones (TAZ) projected to contain over 15 jobs or residents in 2035. All five projects connect a minimum of two other fixed guideway transit corridors, leverage those connections in to additional transit mobility, and produce at least a million annual boardings by the 2035 forecast year.

TABLE 10 Number of TAZs Served by Fixed Guideway Gap Closure Projects

	Tier 2 TAZs with more than 150 Residents or 50 Jobs per acre	Tier 2 TAZs with more than 50 Residents or Jobs per acre	Tier 2 TAZs with more than 30 Residents or Jobs per acre	Tier 2 TAZs with more than 15 Residents or Jobs per acre
Metro Red Line Extension	0	2	13	21
Vermont Short Corridor	7	39	60	66
Slauson Light Rail	0	10	39	77
Metro Green Line Norwalk Extension Extension	0	0	0	23
Metro Foothill Goldline Extension Phase 2b	0	0	0	14

The fixed guideway gap closure projects leverage existing investments in rail transit technology to expand the connectivity of the rail travel network, creating a system of seamless transferability throughout the network.

EXHIBIT 4 2035 Transit Network

The Vermont Short Corridor is a 3 mile southward extension of the Metro Red Line serving one of the most important transit markets in Southern California. Vermont Avenue has long been Metro's second most productive bus corridor, and its ridership is often competitive with the entirety of the Metrolink system. On the north end, the Vermont Corridor will allow transferability to the completed Metro Westside Subway extension, allowing access to important employment, residential, and cultural centers on the Westside. On the southern end, the short corridor will allow onward transfers to the Metro Exposition Line, allowing passengers to travel to Culver City, Santa Monica, or to transfer to the Crenshaw Corridor and travel to South Los Angeles, Inglewood, or LAX.

Important regional destinations including the University of Southern California, Pico Union, and Koreatown are directly served by the Vermont Short Corridor. Similarly, the corridor has a high proportion of low income transit dependent residents; the corridor will allow them greater ability to access job centers on the Westside, in the South Bay, and in downtown Los Angeles.

The Northward extension of the Metro Red line to the California High-Speed Rail Authority's planned Burbank station will similarly allow greater access to intermodal transportation. The likely Burbank station for Phase I of the HST project is at Bob Hope Burbank Airport, which is also served by Metrolink and Amtrak. By using tunnels and people mover technology in the new Red Line station, the station could serve all three transportation facilities. This extension will allow users to access intercity rail, commuter rail, high speed rail, and air travel facilities.

Together, these two projects form a new vision for the Metro Red Line, allowing "one–seat" travel between the Burbank HST station and University of Southern California, or any point in between.

Similarly the Norwalk Green Line Extension will increase the ability of travellers in the South Bay and Gateway Cities to access the proposed California HST station in Norwalk. This station, which is already served by Metrolink and the occasional Surfliner train, also provides good connectivity to bus transit via the Norwalk Transit System.

The Slauson Light Rail would connect the Crenshaw Corridor with the Metro Blue line, and provide important mobility improvements in a dense corridor with a high percentage of transit dependent residents. As noted in Chapter 6 of the Harbor Subdivision Alternatives Analysis, the corridor is currently underserved by transit and would provide many stops within close distance to dense population and employment nodes.

Phase 2b of the Metro Gold Line Foothill Extension will extend the reach of the Metro Gold Line an additional 12.6 miles in to the San Gabriel Valley, adding stations in Glendora, San Dimas, La Verne, Pomona, Claremont, and Montclair along a former Atchison Topeka Santa Fe right-of-way.

TABLE 9 Fixed Guideway Gap Closures Initial Performance Analysis

Corridor	Boundaries	Length (miles)	Cost	Locally Estimated Annual Boardings	Rail Transit Connections
Vermont Short Corridor	Wilshire/Vermont to Exposition and Vermont	3.0	$1,177.9	3,709,332	Metro Purple Line, Metro Red Line, Metro Exposition Line
Slauson Light Rail	Crenshaw Corridor to Metro Blue Line Slauson Station	5.4	$ 554.0	5,213,808	Metro Crenshaw Corridor, Metro Blue Line
Metro Red Line Extension	From North Hollywood Station to Burbank Airport Metrolink	2.4	$ 933.3	5,350,818	Metro Red Line, California High Speed Rail, Amtrak Pacific Surfliner, Metrolink
Metro Green Line Norwalk Extension	Norwalk Transit Center to Norwalk Metrolink (aerial option)	2.3	$ 480.2	1,495,006	Amtrak Pacific Surfliner, California High Speed Rail, Metro Green Line, Metrolink
Metro Gold Line Foothill Extension Phase 2b	Sierra Madre Villa Station to Montclair Metrolink station	13.1	$ 998.4	3,023,603	Metro Gold Line, Metrolink,

Plan Performance

Our region's investment in transit and passenger rail, coupled with its commitment to attaining sustainable communities, pays heavy dividends. In 2035, we will have realized a 36 percent increase in transit and rail boardings. This includes a 30 percent increase for bus, a 73 percent increase for light and heavy rail, and an almost doubling of 97 percent for Metrolink. Passenger miles are also up significantly, for all types of bus service including BRT and Local, and especially for rail, reflecting a higher percentage of transit trips on to rail due to the new rail facilities being built between now and 2035.

On a per capita level, growth in transit ridership is also fairly aggressive. The region will see 23.8 percent population growth, 21.9 percent employment growth, and 26 percent more households by 2035. The rate of growth for per capita transit trips is much higher. Between 2008 and 2035, per capita Metro Rail trips will grow by 73 percent, and per capita Metrolink and Amtrak trips will grow by 97 percent. Bus trips will grow by 30 percent, meaning that the overall growth in per capita transit ridership will be 30 percent.[1]

Vehicle Miles Traveled (VMT) Reduction

The host of new investments in transit facilities, from new rail on fixed guideways to smaller capital projects for BRT, such as bus signal priority and bus lanes, will produce a large reduction in vehicle miles traveled (VMT) as these new services garner new riders to transit and reduce SOV commuting.

Some of this plans's transit initiatives and strategies that are not capital-intensive will also reduce VMT. These include the expansion and improvement of real-time passenger information systems on our region's transit systems, the expansion of bicycle carrying capacity on our region's transit and rail vehicles, and the implementation of regional fare media consolidation and agreements. The improvement of real-time passenger information systems makes taking transit more appealing and convenient to non-regular or new users. This plan estimates a 2 percent increase in transit boardings by 2020, and 5percent increase by 2035 due to these improvements. This corresponds to a reduction of 1 million vehicle miles by 2020, and 2.6 million by 2035. The regional (intercounty) fare

[1] RTP/SCS, population estimates from SCAG and California Department of Finance

consolidation and agreements and the expansion of bicycle carrying capacity strategies also will encourage new and more frequent riders to transit. The plan estimates the effect on boardings for both at an additional 1 percent by 2020 and an additional 3 percent by 2035. This corresponds to a reduction of 500,000 vehicle miles by 2020, and 1.6 million by 2035.

Strategies and Recommendations

Much progress is being made in our region. The many new transit facilities and services programmed through 2035 will certainly increase the transit modal share as they serve the developing sustainable communities, jobs/housing balance and population increases. But aside from capital projects, there are many improvements that can be made in transit accessibility and operations. Our transit strategy calls for a number of transit initiatives including:

Operational Strategies

- Implement and Expand Transit Priority Systems. Transit priority systems include traffic signal priority, queue jumpers and bus lanes. Signal priority is a highly effective treatment that has proven to speed up bus service and attract new transit riders. Metro's Metro Rapid program has increased speeds by over 20 percent compared to the local service on the same street. It also has brought new riders to its system. Bus lanes are even more effective at increasing speeds, yet, in our region, there is a dearth of such lanes. Transit agencies should heavily lobby local jurisdictions in which they operate to implement them, at least for peak-period operation.
- Implement Regional and Intercounty Fare Agreements and Media. Implementing additional inter-jurisdictional fare agreements and media like L.A. County's EZ Pass will make transit more attractive and available. A pass that would cover all transit services in L.A. and Orange counties, or the whole SCAG region, is an example. The Pacific Surfliner also has fare agreements with some local transit operators along its corridor where an Amtrak ticket is good for connecting transit fare. This could be expanded to all operators along its corridor.
- Implement new BRT and limited-stop bus service. As noted above, BRT service is a good 20 percent faster than traditional local bus service. It is viewed as a "premium" service, and has proven to attract new riders to transit. BRT implementation does require a capital outlay, so in an environment of scare funding, offering limited-stop service is an excellent alternative. Limited-stop service has been shown to be about 15 percent faster than traditional local service, yet very few transit agencies in our region offer it.
- Implement increased frequencies in targeted corridors. With additional funding, there are many corridors in our region that would benefit from an increased frequency of service. In many of our subregions outside of L.A. County, frequencies are seldom 15-minutes or better, and often 30, 45, or even 60-minutes on primary arterials. Orange County shaved their frequencies generally across the board due to their financial crisis. Increasing frequencies in targeted corridors where there is TOD/TPP developments, along with latent demand due to low frequencies, can increase transit mode share.

Accessibility Strategies

- Increasing bicycle carrying capacity on bus and rail vehicles. Bicycling for commute or other trip purposes is taking off in our region. The implementation of bike facilities is only starting to catch up. Most transit systems have two-bike racks on their buses, some have three. Metro and Metrolink have recently adjusted their bike-on-railcar guidelines to allow more bicycles. Allowing more bikes on transit vehicles, to a reasonable point, will increase transit ridership.
- Expanding and improving real-time passenger information systems. Most medium to large size transit agencies have implemented real-time passenger information systems. These have shown to attract and keep new transit riders. Knowing exactly when a bus will arrive provides an incentive to the potential transit user. Continuing to implement and expand these systems will increase transit modal share.
- Implementing First Mile/Last Mile strategies to extend the effective reach of transit. This is an area of study with recent focus. Making transit available for that first mile to a transit station, or from a transit station, or both, will encourage more transit usage, and also reduce GHGs. More than 90 percent of Metrolink riders drive to their origin station.
- Implementing new point-to-point express bus service in key corridors in the region's HOV and HOT lane network. Our region's HOV network is being transferred from a patchwork to a complete system of freeway-to-freeway connectivity. In addition,

HOT lanes are scheduled to begin on the Harbor Transitway at the end of 2012, and the El Monte Busway in early 2013. Yet, these facilities are currently underserved by express bus services. Implementing new express point-to-point services, at least in the peak-periods, will prove an attractive option to the SOV commuter.

- Implementing Local Circulators. Many local cities already have impressive networks of local community circulators and fixed-route systems. As more TOD/HQTA is built, and as the jobs/housing balance improves, more of these services should be implemented or expanded to encourage residents of these developments to not use their auto to make short, local trips.

Strategic Plan: Looking Ahead – Beyond the Horizon

The RTP strategies discussed in Chapter 2: Transportation Investments, represent the region's collective vision for addressing our transportation needs within the constraints of committed, available, or reasonably available revenue sources. Despite the substantial commitments of over $500 billion contained in the RTP and the associated benefits discussed in Chapter 5: Measuring Up, this level of investment does not meet the full needs identified through the RTP development process. If we truly want to address all the needs set forth in this RTP, we must look toward additional strategies and investments to get us there. Often this will entail controversial and difficult choices that will push the envelope and test the boundaries of what is politically acceptable. For now, these elements are contained in the Strategic Plan with the recognition that they merit further study and that, over time and with further consensus-building, these programs and policies may move forward into the constrained RTP.

The concept of a Strategic Plan was first incorporated into the 2008 RTP. It was envisioned that the 2012 and subsequent RTPs would draw from the projects contained in the Strategic Plan. This has in fact occurred. The 2012–2035 RTP/SCS investments discussed in Chapter 2 attest to the success of the 2008 Strategic Plan, since several of its projects and strategies have now moved to the constrained portion of the 2012–2035 RTP/SCS. These include:

Preservation investments – The 2008 Strategic Plan called for a higher level of investment to preserve the region's multi-modal system. The 2012–2035 RTP/SCS includes $65 billion in additional preservation funding.

Operations investments (TSM) – The 2008 Strategic Plan recommended increasing funding to the cost-effective transportation system management strategies that increase the productivity of the existing system. The 2012–2035 RTP/SCS allocates $5 billion to TSM.

Dedicated Lanes for Clean-Technology Trucks on the East West Corridor – The 2008 Strategic Plan called for more detailed study of the different east west corridors and recommending one for inclusion in the RTP. The 2012–2035 RTP/SCS includes the recommended East West Freight Corridor and provides full funding for it.

Metrolink and LOSSAN Rail Improvements – The 2008 Strategic Plan included unfunded improvements to Metrolink and the LOSSAN Rail corridor. The 2012–2035 RTP/SCS fully funds these improvements, partially using newly available federal and state funds.

The Westside Purple Line Extension – The 2008 Strategic Plan included the unfunded Purple Line Extension to Westwood. The 2012–2035 RTP/SCS now fully funds this extension, relying on the recently adopted Measure R in Los Angeles.

The 2008 Strategic Plan strongly influenced the 2012 Constrained Plan as originally intended. Moving forward, it is again envisioned that future updates to the 2012–2035 RTP/SCS would draw from the projects contained in this Strategic Plan; exceptions would be handled on a case-by-case basis.

TABLE 11 Strategic Plan

County	Category	Route Name
Los Angeles	BRT	Metro Orange Line
Los Angeles	Light Rail	Metro Blue Line
Los Angeles	Light Rail	Metro Gold Line
Los Angeles	Light Rail	Metro Green Line
Los Angeles	Light Rail	Metro Gold Line
Los Angeles	High-Speed Rail	Orangeline

Section IV: Summary of Public Comments and Responses 62

Executive Summary

The federal Clean Air Act (CAA) establishes air quality standards and planning requirements for certain air pollutants. To comply with the CAA in achieving the National Ambient Air Quality Standards (NAAQS), the California Air Resources Board (ARB) develops State Implementation Plans (SIPs) for federal non-attainment and maintenance areas. In California, SIP development is a joint effort of the local air agencies and ARB working with federal, state, and local agencies (including the Metropolitan Planning Organizations [MPOs]). Local Air Quality Management Plans (AQMPs) are prepared in response to federal and state requirements.

Transportation conformity is required under the CAA to ensure that federally supported highway and transit project activities "conform to" the purpose of the SIP. Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. Conformity currently applies to areas that are designated non-attainment and those re-designated to attainment after 1990 ("maintenance areas") for the following transportation-related criteria pollutants: ozone, particulate matter ($PM_{2.5}$ and PM_{10}), carbon monoxide (CO), and nitrogen dioxide (NO_2).

Under the U.S. Department of Transportation (DOT) Metropolitan Planning Regulations and U.S. Environmental Protection Agency's (EPA) Transportation Conformity Rule requirements, SCAG's 2012 Regional Transportation Plan (RTP) needs to comply with four tests upon adoption by the SCAG Regional Council in order for the RTP to conform:

- Regional Emissions
- Timely Implementation of Transportation Control Measures
- Financial Constraint
- Interagency Consultation and Public Involvement

The analyses in this report demonstrate a positive conformity finding for each of these tests and, therefore, for the 2012 RTP.

Preface

The federally required conformity analyses and findings for the 2012 RTP are set forth in the following sections. The conformity sections cover all federally required analyses for the conformity determination of the 2012 RTP. These analyses also update the 2011 Federal Transportation Improvement Program (FTIP). All transportation and air quality conformity analyses in this document are in compliance with applicable federal and state law, including conformity and transportation planning regulations. This report contains four sections that specifically address the conformity analyses required for federal approval.

- Section I summarizes the conformity requirements and findings.
- Section II provides modeling methodologies and assumptions and results of the regional emissions analyses for the 2012 RTP.
- Section III highlights the conformity findings of the Timely Implementation of Transportation Control Measures (TCMs) analysis and describes the implementation status of all applicable TCMs in the SCAG Region.
- Section IV summarizes the conformity comments and responses.

Section I: Conformity Requirements and Findings

Federal and State Requirements

SCAG, the MPO for Southern California, is mandated to comply with federal and state transportation and air quality regulations. Federal transportation regulations authorize federal funding for highway, highway safety, transit, and other surface transportation programs. The federal CAA establishes air quality standards and planning requirements for various criteria air pollutants.

REGIONAL TRANSPORTATION PLAN AND FEDERAL TRANSPORTATION IMPROVEMENT PROGRAM

Federal transportation law requires that SCAG develop an RTP for a 20-year minimum period. SCAG must also develop an FTIP that allocates monies over a four-year period to implement the RTP. The FTIP must be consistent with the RTP (e.g., projects, scope, implementation schedules, etc.).

FEDERAL NON-ATTAINMENT AND MAINTENANCE AREAS

The U.S. EPA may make a federal "non-attainment area" designation to any area that has not met CAA health standards for one or more pollutants. A non-attainment area designation may require additional air-quality controls for transportation plans, programs, and projects. The ARB recommends the federal non-attainment area boundaries to U.S. EPA for final designations. Subsequently, the EPA finalizes and defines the boundaries of the federally designated non-attainment areas for each criteria pollutant.

STATE IMPLEMENTATION PLANS

To comply with the CAA in achieving the NAAQS, the ARB develops SIPs for federal non-attainment and maintenance areas. The SIP is a plan which provides for implementation, maintenance, and enforcement of the national primary ambient air quality standard in each air quality control region within the state. 42 U.S.C. § 7410(a)(1). Each state must submit a SIP to EPA within three years after the promulgation of a national primary ambient air quality standard (or any revision thereof) for any air pollutant. In California, SIP development is a joint effort of the local air agencies and ARB working with federal, state, and local agencies (including the MPOs). Local AQMPs are prepared in response to federal and state requirements.

In California, all SIPs have to go through three steps: air district action, ARB action, and finally EPA action. Each air district submits its respective AQMPs/SIPs to ARB. ARB is the official State agency that submits the SIPs to EPA for all federal non-attainment and maintenance areas in California.

The SIP includes two important components relative to transportation and air quality conformity requirements—emissions budgets and TCMs. Emissions budgets set an upper limit which on-road mobile sources are permitted to emit. TCMs are strategies to reduce emissions from on–road mobile sources. The 2012 RTP must conform to the applicable SIPs [i.e., emissions budgets and TCMs] in the SCAG region.

FEDERAL TRANSPORTATION CONFORMITY RULE

Transportation conformity is required under CAA section 176(c) to ensure that federally supported highway and transit project activities "conform to" the purpose of the SIP. Conformity currently applies to areas that are designated non-attainment, and those re-designated to attainment after 1990 ("maintenance areas" with plans developed under CAA section 175[A]) for the specific transportation-related criteria pollutants. Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. The transportation conformity regulation is found in 40 CFR part 93.

Clean Air Act Designations in the SCAG Region

APPLICABLE CRITERIA POLLUTANTS IN THE SCAG REGION

Four criteria pollutants are subject to air quality conformity for the RTP and FTIP:

- CO – a product of automobile exhaust. CO reduces the flow of oxygen in the bloodstream and is particularly dangerous to persons with heart disease.
- Ozone – formed by the reaction between volatile organic compounds (VOC) and oxides of nitrogen (NO_X) in the presence of sunlight. Ozone negatively impacts the respiratory system.

- NO2 – created under the high pressure and temperature conditions in internal combustion engines. It impacts the respiratory system and degrades visibility due to its brownish color.
- PM_{10} and $PM_{2.5}$ – extremely small particles and liquid droplets associated with dust, soot and combustion products. Particulate pollution has been linked to significant health problems, including aggravated asthma, increases in adverse respiratory problems, chronic bronchitis, decreased lung function, and premature death.

AIR BASINS AND AIR DISTRICTS IN THE SCAG REGION

SCAG is a six-county region that contains four air basins administered by five air districts:

- The South Coast Air Basin (SCAB) covers the urbanized portions of the Los Angeles, Riverside, and San Bernardino counties as well as the entire County of Orange and is within the jurisdiction of the South Coast Air Quality Management District (SCAQMD).
- The South Central Coast Air Basin (SCCAB), Ventura County portion, is within the jurisdiction of the Ventura County Air Pollution Control District (VCAPCD).
- The Mojave Desert Air Basin (MDAB) covers the desert portions of Los Angeles, Riverside, and San Bernardino counties. A small portion of this air basin is in Kern County and outside of the SCAG region. The SCAG portion of this air basin is under the jurisdiction of three air districts:
  - The Mojave Desert Air Quality Management District (MDAQMD) administers portions of the MDAB situated in San Bernardino County and eastern Riverside County. The Riverside County portion is known as the Palo Verde Valley Area.
  - The SCAQMD administers the portion of MDAB in Riverside County situated between the Salton Sea Air Basin and the Palo Verde Valley Area.
  - The Antelope Valley Air Quality Management District (AVAQMD) administers the Los Angeles County portion of the MDAB.
- The Salton Sea Air Basin (SSAB) covers all of Imperial County and the eastern portion of Riverside County (excluding the MDAB portion). This air basin is under jurisdiction of two air districts:
  - The Imperial County Air Pollution Control District (ICAPCD) administers the Imperial County portion of the SSAB.
  - The SCAQMD administers the Riverside County portion of the SSAB , Coachella Valley, situated between the SCAB and the MDAB.

NON-ATTAINMENT / MAINTENANCE AREAS IN THE SCAG REGION

The Federal non-attainment/maintenance areas in the SCAG region are as follows:

- Ventura County Portion of SCCAB – non-attainment area for 8-hour ozone
- SCAB – non-attainment or maintenance area for: NO_2; CO; PM_{10}; $PM_{2.5}$; and 8-hour ozone
- Western MDAB (Antelope Valley portion of Los Angeles County and San Bernardino County portion of MDAB excluding Searles Valley) – non-attainment area for 8-hour ozone
- San Bernardino County portion of MDAB:
  - Searles Valley – non-attainment for PM_{10}
  - San Bernardino County (excluding the Searles Valley area) – non-attainment area for PM_{10}
- Riverside County Portion of SSAB (Coachella Valley) – non-attainment area for: PM_{10} and 8-hour ozone
- Imperial County Portion of SSAB – non-attainment for 8-hour ozone; $PM_{2.5}$; and PM_{10}

The boundaries of the air basins, air districts, and non-attainment and maintenance areas are illustrated in Exhibits 1 through 7 at the end of the report.

APPLICABLE EMISSIONS BUDGETS IN THE SCAG REGION

For the 2012 RTP conformity determination, the applicable emissions budgets are established in the SIPs as described below.

- Ventura County Portion of SCCAB
  - 2008 8-Hour Ozone Early Progress Plan
- SCAB
  - 2007 Ozone SIP (using budgets found adequate by EPA May 2008)
  - 2007 $PM_{2.5}$ SIP (using budgets found adequate by EPA November 2011)
  - 2007 CO SIP (Maintenance Plan)

  - 2007 NO2 SIP (Maintenance Plan) (using budgets found adequate by EPA January 2010)
  - 2003 PM_{10} SIP
- Riverside County Portion of SSAB (Coachella Valley)
  - 2008 8-Hour Ozone Early Progress Plan (using budgets found adequate by EPA May 2008)
  - 2003 PM_{10} SIP
- Western MDAB (Antelope Valley and portion of Los Angeles County and San Bernardino County portion of MDAB excluding Searles Valley)
  - 2008 8-Hour Ozone Early Progress Plan
- Imperial County Portion of SSAB (Ozone)
  - 2008 8-Hour Ozone Early Progress Plan

SIP STATUS IN OTHER AREAS OF THE SCAG REGION

In absence of applicable emissions budgets for conformity, SCAG has to conduct interim emissions tests for regional emissions analysis of the 2012 RTP. At the present time, there is no federally approved SIP for the following areas.

- San Bernardino County Portion of MDAB (PM_{10})
- Searles Valley Portion of MDAB (PM_{10})
- Imperial County Portion of SSAB ($PM_{2.5}$ and PM_{10})

APPLICABLE TCMS

The SIP documents for the applicable TCMs in the SCAG region are listed below:

- SCAB – The TCM01 established in the 1994 Ozone SIP functions as the applicable TCM categories for the conformity finding (timely implementation of TCM analysis). The TCM categories in the 2007 AQMP/SIP as well as the 2003 Ozone AQMP/SIP and the 1997 (as amended in 1999) Ozone AQMP/SIP are consistent with the TCM01 categories listed in the 1994 Ozone AQMP/SIP.
- The Ventura County portion of SCCAB – The TCM strategies incorporated in the 1994 (as amended in 1995) Ozone AQMP/SIP function as the applicable TCMs for conformity finding.

There are no applicable TCMs in any other federal non-attainment or maintenance areas in the SCAG region. For more information on TCMs and timely implementation of the TCMs, see Section III of this document.

Conformity Status of Current RTP and FTIP

The FHWA and FTA approved the conformity determination for the amended 2008 RTP and the 2011 FTIP on December 8 and 14, 2010 respectively for the following non-attainment and maintenance areas:

- SSCCAB (Ventura County portion) – Ozone
- SCAB – Ozone, PM_{10}, $PM_{2.5}$, CO and NO_2
- Western MDAB (Antelope Valley and San Bernardino County portion excluding Searles Valley) – Ozone
- MDAB (San Bernardino County and Searles Valley portion) – PM_{10}
- SSAB (Coachella Valley portion) – Ozone, PM_{10}
- SSAB (Imperial County portion) – Ozone, PM_{10}, and $PM_{2.5}$

Conformity Analysis and Findings for the 2012 RTP

Under the U.S. DOT Metropolitan Planning Regulations and EPA's Transportation Conformity Rule requirements, SCAG's 2012 RTP needs to pass four tests.

- Regional Emissions Analysis (40 CFR, Sections 93.109, 93.110, 93.118, and 93.119)
- Timely Implementation of Transportation Control Measures Analysis (40 CFR, Section 93.113)
- Financial Constraint Analysis (40 CFR, Section 93.108 and 23 CFR, Section 450.322)
- Interagency Consultation and Public Involvement Analysis (40 CFR, Sections 93.105 and 93.112 and 23 CFR, Section 450.324)

CONFORMITY DETERMINATIONS

SCAG has made the following conformity findings for the 2012 RTP under the required federal tests.

Regional Emissions Tests

These findings are based on the regional emissions test analyses shown in **TABLES 13–40**.

Finding: The regional emissions analyses for the 2012 RTP update the regional emissions analyses for the 2011 FTIP.

Finding: The 2012 RTP regional emissions analysis for $PM_{2.5}$ and its precursors meet all applicable emission budget tests for all milestone, attainment, and planning horizon years in the SCAB.

Finding: The 2012 RTP regional emissions for the Ozone precursors meet all applicable emission budget tests for all milestone, attainment, and planning horizon years for the SCAB, SCCAB (Ventura County portion), Western MDAB (Los Angeles County Antelope Valley portion and San Bernardino County western portion of MDAB), and SSAB (Riverside County Coachella Valley and Imperial County portions).

Finding: The 2012 RTP regional emissions for NO2 meet all applicable emission budget tests for all milestone, attainment, and planning horizon years in the SCAB.

Finding: The 2012 RTP regional emissions for CO meet all applicable emission budget tests for all milestone, attainment, and planning horizon years in SCAB.

Finding: The 2012 RTP regional emissions for PM_{10} and its precursors meet all applicable emission budget tests for all milestone, attainment, and planning horizon years in SCAB and the SSAB (Riverside County Coachella Valley portion).

Finding: The 2012 RTP regional emissions for PM_{10} meet the interim emission test (build/no-build test) for all milestone and planning horizon years for the MDAB (San Bernardino County portion excluding Searles Valley portion and Searles Valley portion of San Bernardino County) and for the SSAB (Imperial County portion).

Finding: The 2012 RTP regional emissions analysis for $PM_{2.5}$ and its precursors meet the interim emission test (build/no-build test) for all milestone, attainment, and planning horizon years for the SSAB (urbanized area of Imperial County portion).

Timely Implementation of TCM Test

Finding: The TCM project categories listed in the 1994/1997/2003/2007 Ozone SIPs for the SCAB area were given funding priority, are expected to be implemented on schedule, and, in the case of any delays, any obstacles to implementation have been or are being overcome.

Finding: The TCM strategies listed in the 1994 (as amended in 1995) Ozone SIP for the SCCAB (Ventura County) were given funding priority, are expected to be implemented on schedule, and, in the case of any delays, any obstacles to implementation have been or are being overcome.

Financial Constraint Test

Finding: The 2012 RTP is fiscally constrained. SCAG's 2012 RTP demonstrates financial constraint in the financial plan by identifying all transportation revenues including local, state, and federal sources available to meet the region's programming totals.[1]

Inter-agency Consultation and Public Involvement Test

Finding: The 2012 RTP complies with all federal and state requirements for interagency consultation and public involvement. SCAG's Transportation Conformity Working Group has served as a forum for interagency consultation and, additionally, there were many ad-hoc meetings held between the stakeholder agencies for this purpose. SCAG's RTP public outreach effort is documented in a separate Public Participation and Consultation Report. To view a summary of comments received on the Draft 2012 RTP Conformity Report, refer to Section IV. All comments and responses on the Draft RTP/SCS can be foundat www.scag.ca.gov.

[1] See the 2012 RTP Financial Plan

Section II: Regional Emissions Analysis

Background

SCAG's Regional Travel Demand Model is an advanced four step model that meets and in many cases exceeds the state of the practice. The Model meets all the requirements of the Transportation Conformity Rule, specifically 40 CFR 93.122(b) (see **TABLE 10**).

The results from the Regional Travel Demand Model are input to the ARB's EMFAC model for calculating regional emissions.

Regional Travel Demand Model Overview

SCAG is the primary agency responsible for the development and maintenance of travel demand forecasting models for the SCAG Region. SCAG has been developing and improving these travel demand forecasting models since 1967. SCAG's Modeling Task Force, consisting of modeling technical peers from the various county and state agencies and private firms, meets every other month at SCAG to discuss regionally significant modeling projects and modeling issues, including the development, maintenance, and application of SCAG's Regional Travel Demand Model as well as the travel demand models used by other stakeholders agencies. The SCAG model has undergone periodic peer reviews, the latest occurring in June 2011 (see SCAG Regional Travel Model Enhancement Program and Year 2008 Model Validation Report).

SCAG's regional transportation modeling area covers the entire SCAG region, including Counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. This modeling area is divided into 11,267 Transportation Analysis Zones (TAZ's) with an additional 40 external cordon stations, 12 airport nodes, and 31 port nodes for the Ports of Los Angeles and Long Beach. The Model was validated for the Year 2008, which is the base year for the 2012 RTP (see Year 2008 Model Validation Report).

Model Inputs and Assumptions

SCAG's modeling methodologies, parameters, and inputs are regularly updated to reflect current travel conditions and demographic changes.

Socioeconomic Data by Census Block Group – Socioeconomic data (SED), which describes population, households, and employment at Block Group level, are used as major input to SCAG's Regional Travel Demand Model. The concept is that travel is a derived demand, which is directly related to the demographics and economic characteristics of households. The model uses both aggregate and disaggregate SED. The aggregate data are counts of population, households and employment for each TAZ. The disaggregate data are Public Use Microdata Sample (PUMS) records from the Census, which contain detailed information about person and household characteristics in the region.

Highway Networks – The highway networks were originally developed from the Thomas Brothers GIS database and then updated with street inventory survey data (the latest SCAG region street inventory survey was conducted in year 2008) in the TransCAD environment. The networks include detailed coding of the region's freeway system (mixed-flow lane, auxiliary lane, HOV lane, HOT lane, toll lane, truck lane, etc.) as well as arterials, major collectors, and some minor collectors. Separate highway networks for each time period were developed to simulate time of day differences in roadway capacity and vehicle travel restrictions, such as arterial parking restrictions during peak hours, HOV lane minimum vehicle occupancy requirement, and heavy-duty vehicle restrictions on certain roadways.

Land Use and Accessibility for Auto Ownership Model – Accessibility refers to the ease of reaching goods, services, activities, and destinations. Many factors affect accessibility, including the quality and affordability of transport options, transport system connectivity, and land use patterns. The auto and non-auto accessibilities of a zone directly influence household auto ownership. Land use patterns, in particular high density, mixed-use developments also directly influence household auto ownership.

Land Use, Parking, Pricing, TDM, Walk and Bike for Mode Choice Model – Land use, zonal parking, roadway pricing, and Travel Demand Management (TDM) are inputs to mode choice, in addition to the modal level of service obtained from the highway, transit, and non-motorized networks. Parking fees/restrictions, road pricing cost/policies, and land use densities have direct influence on travelers' mode choice. For example, increasing parking fees encourages travelers to shift from auto to transit. Also, high employment and residential densities encourage the use of transit and non-motorized modes.

Transit Networks – The transit networks include more than 3,300 transit routes/patterns, representing approximately 70 transit operators with fixed route service over

the entire SCAG region. The transit routes are completely compatible with the highway geography. Separate transit networks are developed for five time periods based on the transit service information contained in the up-to-date Los Angeles County Metropolitan Transportation Authority (LACMTA) Transit Trip Master database and data collected from transit agencies not included in the TripMaster database. Transit services are grouped into 8 transit modes (Local Bus, Rapid Bus, Express Bus, Bus Rapid Transit (BRT), Transit Way, Urban Rail, Commuter Rail, and High Speed Rail (HSR), according to their service characteristics and fare structures. The transit networks include detailed representation of all rail stations, transfer opportunities among the different modes and between transit routes and park-and-ride locations. A TeleAtlas street network along with Census Block level data is used to calculate walk accessibilities and to develop walk access to transit.

External Trips – External trips (i.e., inter-regional trips) are trips with one or both ends located outside the SCAG modeling area. SCAG model includes 40 cordon locations consisting of freeways and arterials leading into and out of SCAG modeling area. A cordon traffic origin-destination survey was conducted in year 2003 and the results were used to develop inter-regional Light and Medium (LM) duty vehicle trip matrices, including External-to-External (E-E), External-to-Internal (E-I), and Internal-to-External (I-E) trips. The origin-destination survey is updated for the 2012 RTP.

Airport Trips – Airports trips include passenger trips and cargo trips, and are represented by approximately 100 zones in the SCAG modeling area. The daily airport passenger trips are disaggregated into regional model TAZ (using employment data for business trips and household data for non-business trips) and further split into five time periods by four modes of travel: drive alone, 2-person carpool, 3~person carpool, and 4-or-more person carpool. The airport vehicle trips are merged with the other auto vehicle trips prior to the network assignment step. Air cargo truck trips are disaggregated into the regional model TAZs based on the North American Industry Classification System (NAICS) employment data. The daily air cargo trips are split into five time periods by three heavy-duty truck (HDT) types (light HDT, medium HDT, and heavy HDT) and merged with the HDT truck trips prior to network assignment.

Employment, Commodity Flow, Ports, and Warehouse Activities – These inputs to the transportation model are data related to the freight activities, including employment by industrial classification, commodity flows, seaports, warehousing, trucking and wholesale trade, etc.

Model Modules and Procedures

Household Classification and Population Synthesizer – This module classifies zonal households into several household segments. Prior to the application of Auto Ownership module, households are classified across the following four attributes:

1. Household Size (4 categories): the number of one-person households, two-person households, three-person households, and four or more person households.
2. Number of Workers (4 categories): the number of households with no worker, one worker, two workers, and three workers or more.
3. Household Income (4 categories): the number of households with annual household income (in 1999 dollars) less than $25K (Low), $25K–$50K (Medium), $50K–$100K (High), and $100K or more (Very High).
4. Type of Dwelling Unit (2 categories): single-family detached, and multi-family/ attached and group quarters.

For Home-Based-Work (HBW) trip generation, households are aggregated across the dwelling unit type and size attributes, and then further disaggregated into four Age of Head of Household groups (18 to 24 years old, 25 to 44 years old, 45 to 64 years old, and 65 years old or older).

The Population Synthesizer is a module that generates a synthetic population by expanding existing disaggregate sample data (from 2000 Census PUMS data) to mirror known aggregate distributions of household and person attributes (from SCAG zonal data). A set of population and household variables of interest are used as control variables in the population synthesizer. A synthetic population is generated for the entire SCAG region using this procedure.

Auto Ownership Model – The auto ownership model provides an estimate of households by auto ownership level (0, 1, 2, 3, 4 or more) for each zone. This information is used in trip generation models to estimate zonal person trips. The basic structure of the auto ownership model is a multinomial logit formulation, using input socioeconomic variables (household size, household income, number of workers, and type of dwelling unit) and land use and accessibility variables (mixed residential and employment, intersection density, transit accessibility, and non-motorized accessibility).

Trip Generation Model – Trip generation is the process of estimating daily person trips generated by (i.e., trip production) and attracted to (i.e., trip attraction) each TAZ on an average weekday. The trip generation model contains 9 trip purposes: home-based work (HBW), home-based school (HBSC), home¬based college/university (HBCU), home-based shopping (HBS), home-based social-recreational (HBSR), home-based serving-passenger (HBSP), home-based other (HBO), work-based other (WBO), and other-based other (OBO) trips. HBW trips are further split into 10 types based on trip categories ("Direct" versus "Strategic") and market segmentation (zero car households, households with fewer cars than workers, other households with income less than $25,000, income between $25,000 and $50,000, and income equal to or higher than $50,000). "Direct" home-work trips go directly between home and work. "Strategic" home-work trips include one or more intermediate stops between home and work. In total, there are 16 trip types: 8 types for home-based work, and one type for each of the other 8 trip purposes.

Trip Distribution Models – The trip distribution model estimates the number of trips from each TAZ to each other TAZ. Destination choice models are developed for HBW, HBS, HBSR, HBSP, HBO, WBO, and OBO trip purposes while a gravity model approach is used to distribute trips for HBSC and HBCU trip purposes. The trip distribution is estimated as a function of the attractiveness of the destination zone and the travel impedance from origin to destination. The destination choice models include other variables, such as intrazonal indicators, employment or residential density variables, and flags for special generators. For each of the 9 trip purposes, the productions and attractions are split into both peak and off-peak periods.

Mode Choice Models – Mode choice is the process of taking the zone-to-zone person trips by trip purpose from the trip distribution model, and determining how many of these trips are made by various travel modes. The SCAG mode choice model is a nested logit model. The top branch of the nesting structure includes Auto, Transit, and Non-Motorized. The branch under Auto includes Drive Alone and Shared Ride which is further split into 2-person carpool, 3-person carpool, and 4-or-more person carpool. The branch under Transit includes Local Bus, Rapid Bus, Express Bus, BRT, Transit Way, Urban Rail, Commuter Rail, and High Speed Rail (HSR). The branch under Non-Motorized includes Walk and Bicycle. Separate mode choice models are estimated for each trip purpose and time period. Mode choice is a function of level of service attributes (in-vehicle travel time, out-of-vehicle travel time, fares, parking fees, roadway tolls, auto operating costs), household attributes such as income, and zonal attributes such as residential and employment densities.

Heavy Duty Truck (HDT) Model – HDT trucks are defined by ARB as a truck with a gross vehicle weight of 8,500 pounds or more. The SCAG HDT Model includes internal truck and external truck trip models. The internal truck trips are generated using a cross¬classification method by applying truck trip rates for a two-digit NAICS code by the number of employees in that category and the number of households within each zone. The daily truck trip ends are distributed using a gravity model to create daily truck trips for each of the three truck types: I) light HDT, 2) medium HDT, and 3) heavy HDT. The external truck trips are developed using an econometric model to estimate inbound and outbound commodity flows by counties. The county to county commodity data are allocated to the zonal level based on NAICS employee distribution and then converted to trucks trips using observed data collected during model development. Seaport and airport related truck trips were included as special generator truck trips. The daily truck trips by truck types are allocated to five time periods and merged with the auto trips in trip assignment.

Network Assignment Model – Network assignment is the process of loading vehicle trips on the appropriate networks. For highway assignment, the Regional Model consists of a series of multi-class simultaneous equilibrium assignments for eight classes of of vehicles (drive alone, 2-person carpool using HOV, 2-person carpool using general purpose lanes, 3 or more person carpool using HOV, 3 or more person carpool using general purpose lanes, light HDT, medium HDT, and heavy HDT) and for each of the five time periods. During this assignment process, trucks are converted to Passenger Car Equivalent (PCE) for each link and each truck type based on 1) percentage of trucks, 2) percentage of grade, 3) length of the link, and 4) level of congestion (v/c ratios). Transit vehicles are also included in the highway assignment. For transit trip assignment, the final transit trips from the last loop mode choice models are aggregated by access mode and time period, and then assigned to transit networks for each time period. The vehicle trip tables obtained from mode choice, airport, and heavy duty models are aggregated to the 4,109 Tier1 zone system prior to network assignment.

Model Convergence – In order to maintain consistency between the speeds predicted by the highway assignment and the travel times input to the entire travel demand model chain, the predicted speeds are used to re-compute highway and transit travel times, and

the entire model sequence are repeated until input and output speeds are consistent with each other.

Highway Performance Monitoring System (HPMS) VMT-based Post-Process – In this step, the outputs from the Network Assignment Model, which including traffic volumes, speeds, VMT, Vehicle Hours Traveled (VHT), and Vehicle Hours of Delay (VHD) are adjusted so that the base-year model VMT by air-basin by county is consistent with HPMS VMT as appropriate.

Model Outputs

Population Synthesizer Outputs – The synthetic households by Number of Workers, Household Size, Household Income, and Type ofDwelling Unit, and a separate classification of households by Number of Workers, Age of Household Head, and Household Income are the outputs from the Population Synthesizer module and the inputs to the Trip Generation Model.

Auto Ownership Model Outputs – The auto ownership model generates households by auto ownership, in other words, the number of households with 0 car, I car, 2 cars, 3 cars, and 4 or more cars for each zone, which are the inputs to the Trip Generation Model.

Trip Generation Model Outputs – The output from trip generation model includes person trip tables by 9 trip purposes, of which HBW trips are further split into 8 types by 4 income groups and Direct/Strategic categories for both peak and off-peak periods. These 32 person trip tables are used individually in the Trip Distribution step.

Trip Distribution Model Outputs – The Trip Distribution Model distributes person trips from each trip production zone to each and every attraction zones, resulting in 32 person trip Production/Attraction (PIA) matrices, which are the inputs to the Mode Choice Model.

Mode Choice Model Outputs – The outputs from the Time of Day Model include passenger vehicle trip matrices in OD format by time period and occupancy level. These matrices are then combined with external trips, airport trips, and HDT trips to produce final vehicle OD matrices (3 passenger vehicle classes and 3 HDT classes in 5 time periods) for Network Assignment step. The 3 passenger vehicle classes are drive alone, 2-person carpool, and 3-person carpool. The 3 HDT classes are light HDT, medium HDT, and heavy HDT. Transit person trips matrices for each of five time periods are also produced in this step for transit assignment.

Network Assignment Model Outputs – Major outputs of the Network Assignment Model are highway and transit level of service attributes, including traffic flows and the associated speeds, VMT, VHT, and VHD on the highway networks as well as transit boarding and passenger loads on each transit line for each time period.

2012 RTP Modeling Assumptions

Socio-Economic Data – **TABLES 1** and **2** show population and employment summaries by county and air basin which reflect current trends. This forecast has been in development since 2010 under direction from the SCAG's Regional Council Community, Economic and Human Development Policy (CEHD) Committee and in collaboration with SCAG's subregions and local jurisdictions. The process involved several major steps outlined as follows:

1. Analysis of regional growth trends and estimates from sources ranging from the U.S. Departments of Commerce, Health and Human Services, Bureau of Labor Statistics and Internal Revenue Service and the California Department of Finance and Employment Development Department.
2. Analysis of key assumptions (fertility rate, mortality rate, net immigration, labor force rates, headship rates, etc.) and methodologies (cohort-component and shift-share models).
3. Review and feedback by SCAG's Plans and Programs Technical Advisory Committee, three Panel of Forecasting Experts, counties, subregions and cities including subregional workshops and one-on-one meetings.

The comprehensive discussion of the socio-economic data is included in the 2012 RTP Growth Forecast Report.

TABLE 1 Summary of Population Data

County	Air Basin	2008	2012	2014	2020	2030	2035

Networks – A summary of the transportation system attributes for the highway and transit networks for Years 2008 to 2035 are shown in Tables 3, 4 and 5. Lane mile data includes freeway to freeway connectors. Other freeway ramps, freeway Type 3 lanes, and centroid connectors are not included. Note that values in the tables in this Report may not add exactly due to rounding. A detailed list of modeled projects is in the Modeling List Appendix.

Work-at-Home and Telecommuting – Home-Based-Work trips were reduced for Work-at-Home and Telecommuting. In year 2000, Work-at-Home trips were 3.58 percent and Telecommute trips were 3.34 percent for a total Home-Based-Work trip reduction of 6.92 percent. Trip rates used in trip generation are based on the 2000 Travel Survey. **TABLE 6** below shows the total reductions to the home-based-work person trips over the 2000 base as applied in the trip generation model.

TABLE 6 Total Home–Based-Work Person Trip Reductions

Category	2000	2008	2012	2014	2020	2030	2035
Work-at-Home	3.58%	4.41%	4.62%	5.03%	5.65%	6.69%	7.21%
Telecommute	3.34%	3.73%	4.74%	5.86%	11.10%	13.51%	14.90%
Total Trip Reductions	6.92%	8.14%	9.36%	10.89%	16.75%	20.20%	22.11%
Increase over 2000 Base	0.00%	1.22%	2.44%	3.97%	9.83%	13.28%	15.19%

Auto Operating Cost – There are two components used in calculating auto operating cost: the cost of gasoline and "other" costs. The "other" costs category includes costs for repairs, light maintenance, lubrication, tires, and accessories. The assumption used in the modeling work is that if an auto is available at the household then the depreciation of the car and the insurance costs are already being paid for whether the car is left at home or used for commuting to work. **TABLE 7** lists the auto operating costs used for 2012 RTP. All costs are in 1999 constant dollars. Note: costs are expressed in 1999-dollar values for input into the mode choice models. Auto Operating costs are calculated using the following formula: Auto Operating Cost = Fuel Cost / Fuel Economy + Other Costs.

TABLE 7 Auto Operating Costs

Category	2008	2012	2014	2020	2030	2035
Auto Operating Cost *	20.63	21.58	22.05	23.47	23.67	25.77

** Cents/mile; year 1999 constant $. 2035 includes a two cents vmt fee.*

Transit Fares – The transit network includes three types of transit fares: base boarding fares, zone fares, and transfer fares; and two types of fare factors: base fare factor and transfer fare factor. Fare values were collected through the Transit Level of Service Data Collection program. Considering the complex fare structure for most carriers only published full cash fares for initial boarding and transfers are used to represent the base fare and transfer fare. To account for the revenue composition of different fare types, such as one-way walkup fares, daily/weekly/monthly passes, Senior/Student/Disabled fares, and other special fares, base fare factors and transfer fare factors are estimated from the boarding and revenue data provided by transit operators. By applying fare factors to the published full cash fare, the resulting fares represent actual fares paid by an average passenger. Finally, all boarding fares (base fare and transfer fare) are converted into 1999 dollars using a CPI adjustment factor derived from the CPI factor published by the US Department of Labor for the Los Angeles-Riverside-Orange County metropolitan area.

The fare structure varies significantly by operator and by service for the same operator. For example, LACMTA has both local and express bus service. For local bus, the general fare is a flat rate of $1.25. For express bus, there is a surcharge of $0.60 for each zone in addition to the $1.25 fare. As However, OCTA, another major operator in the region, charges a general fare of $1.50 for local bus. For express bus, the fare is a flat rate of $3.00 or $4.50 depending on the route. To accommodate variations in the fares for different routes, the transit network codes general flat fares (i.e., base fares, transfer fares) at the route level, while the fare factors are calculated at the carrier level.

Two other major operators, Metrolink and Amtrak, follow a zone-based fare structure. For example, Metrolink fares are calculated with a distance-based formula using the shortest driving distance between stations, with an 80-mile maximum charge. To capture the published cash fare between two station pairs, a fare matrix was developed for Metrolink and Amtrak. Similarly, the LACMTA Express bus and LADOT Commuter Express bus that have zone-based fare are also included as a zone-to-zone fare matrix.

Similar to the development of fare factors for flat-rate routes, a fare factor matrix was developed based on Metrolink sales and boarding data to represent the weighted average fare for each station pair. In addition, regression analysis was conducted to generate the relationship between the distance and fares for Metrolink to predict future fares for new stations.

No real cost increase in transit fares was assumed from 2008 to 2035.

Non-Motorized Trips – 2035 Plan scenario assumes that there will be a shift of approximately one percent of the motorized trips to non-motorized forms of travel (i.e., walking and bicycling) due to the RTP's investment in active transportation.

Capacity and Free Flow Speed – Highway capacities (including for heavy duty truck) used in the Model for each of the facility types vary, depending on area location (i.e., CBD, urban, suburban, rural, or mountain). Free flow speeds are based on posted speeds.

TABLE 8 Highway Capacities and Free Flow Speeds Used in the Model

Facility Type	Vehicles / Lane / Hour	Free Flow Speed (MPH)
Freeway (MF, HOV)	1,900 – 2,100	60 – 75
Principal Arterial	475 – 975	21 – 56
Other Arterial	475 – 975	19 – 55
Collector	375 – 975	17 – 52

Toll Roads – There were approximately 325 lane miles of toll roads in 2008, increasing to about 1,600 toll/HOT lanes in 2035. This includes a regional Express Lane network (**TABLE 9**) that would build upon the success of the 91 Express Lanes and TCA Toll Roads in Orange County and two demonstration projects in Los Angeles County.

TABLE 9 Express/HOT Lane Network

County	Route	From	To
Los Angeles	I-405	I-5 (North SF Valley)	LA/OC County Line

Orange	SR-73	I-405	MacArthur
Riverside	SR-91	OC/RV County Line	I-15
Riverside	I-15	Riv/SB County Line	SR-74
Riverside	I-15	SR-74	Riv/SD County Line
San Bernardino	I-10	I-15	SR-210
San Bernardino	I-10	SR-210	Ford St
San Bernardino	I-15	SR-395	Sierra Ave
San Bernardino	I-15	Sierra Ave	6th St
San Bernardino	I-15	6th St	Riv/SB County Line

The effect of the toll charges on the toll roads was incorporated into the highway assignment procedure. The toll charge was added to each toll facility by inserting the cost to the appropriate link and identifying the link with a unique Toll Class Number. Toll costs (in 1999 dollars) were converted to a time value (in minutes) in the network assignment step.

ITS – The speeds and capacities on Smart Streets were increased by 5 percent to reflect the improved traffic flow due to the ATT/IVHS.

TABLE 10 Conformity Requirements Related to Travel Demand Model

CFR	Requirement	How Requirement is Satisfied
93.122(b)(1)(i)	Network-based travel models must be validated against observed counts (peak and off-peak, if possible) for a base year that is not more than 10 years prior to the date of the conformity determination. Model forecasts must be analyzed for reasonableness and compared to historical trends and other factors, and the results must be documented.	The SCAG travel demand models were estimated and calibrated using data from SCAG's Year 2000 Post-Census Regional Travel Survey, 2003 External Travel Survey, the 2010 US Census and various Transit on-board Surveys. The model was validated against 2008 ground counts and 2008 HPMS data.
93.122(b)(1)(ii)	Land use, population, employment, and other network-based travel model assumptions must be documented and based on the best available information.	All land use, population, households, employment, and network-based model assumptions were updated for 2012 RTP and documented in 2012 RTP Growth Forecast Report and this Conformity Report.
93.122(b)(1)(iii)	Scenarios of land development and use must be consistent with the future transportation system alternatives for which emissions are being estimated. The distribution of employment and residences for different transportation options must be reasonable.	Land development and use are consistent with future transportation systems. The distribution of employment, population, and household is reasonable with respect to the transport systems.
93.122(b)(1)(iv)	A capacity-sensitive assignment methodology must be used, and emissions estimates must be based on a methodology which differentiates between peak and off-peak link volumes and speeds and uses speeds based on final assigned volumes.	The SCAG travel demand model includes separate multi-modal user equilibrium assignments for peak and off-peak time periods. The network assignments are capacity-sensitive. Link speeds are calculated based on final assigned volumes.
93.122(b)(1)(v)	Zone-to-zone travel impedances used to distribute trips between origin and destination pairs must be in reasonable agreement with the travel times that are estimated from final assigned traffic volumes. Where use of transit currently is anticipated to be a significant factor in satisfying transportation demand, these times should also be used for modeling mode splits.	The SCAG travel demand model includes full feedback of travel time among trip generation, trip distribution, mode choice, and trip assignment steps. Both highway and transit times are included in the mode choice model.

SUMMARY OF REGIONAL VEHICLE MILES TRAVELED

Table 11 on the next page is a summariy of VMT in 1,000-mile increments by air basin. VMT data were produced from the SCAG Regional Travel Model and does not include VMT from school buses, urban buses, and motor homes (non-modeled). These non-modeled VMT were provided by the ARB and are included in the emissions analysis.

2012 RTP Regional Emissions Analysis

EPA's Transportation Conformity Rule requires that the 2012 RTP regional emissions be consistent with (i.e., not exceed) the motor vehicle emissions budgets in the applicable SIPs. Consistency with emissions budgets must be demonstrated for each year that the applicable emissions budgets are established, for the transportation planning horizon year, and for any milestone years as necessary so that the years for which consistency is demonstrated are no more than ten years apart. Where there are no EPA approved SIP budgets, an interim emission test is used for conformity. For the interim emissions tests, the build scenario's emissions must be less than or equal to the no-build scenario's emissions and/or the build scenario's emissions must be less than or equal to the base year. Listed below is a description of the various network scenarios.

2012 RTP Conformity Base Year – The conformity base year for 8-hour ozone and $PM_{2.5}$ is 2002; for all other pollutants the conformity base year is 1990.

2012 RTP No Build – The "No Build" scenario includes all existing regionally significant highway and transit projects, all ongoing TDM or TSM activities, and all projects which are undergoing right-of-way acquisition, are currently under construction, have completed the NEPA process, or are in the first year of the previously conforming FTIP (2011).

2012 RTP Build – The "Build" scenario is generally defined as all RTP projects, including the 2012 RTP No Build, and the future transportation system that will result from full implementation of the 2011 FTIP and the 2012 RTP.

For more specific individual project information as part of the RTP modeling and regional emissions analysis, refer to the 2012 RTP Modeled Projects list available at www.scag.ca.gov/rtp2012.

Section 93.122(d)(2) of the EPA Transportation Conformity Rule requires that in PM non-attainment and maintenance areas for which the SIPs identify construction-related fugitive dust as a contributor to the area problem, the regional emissions analysis should include construction-related fugitive PM. Of the SCAG PM non-attainment areas, only the SCAB and the Coachella Valley portion of SSAB have PM SIPs. The relevant emissions budgets for these two areas include construction emissions, and the 2012 RTP PM regional emissions analyses includes construction emissions as appropriate.

The on-road motor emissions estimates for the 2012 RTP were analyzed using the EMFAC2007 emission model developed by ARB. For paved road dust, SCAG uses the approved South Coast AQMD methodology, which uses EPA's AP-42 for the Base Year and a combination of additional growth in center-line miles and VMT for future years.

Required Regional Emissions Tests for 2012 RTP

The required regional emissions tests for the 2012 RTP are presented in Table 12. Since transportation conformity findings are needed out to the RTP's horizon year (i.e. 2035), the latest budget years deemed adequate by U.S. EPA serve as the budgets for future years in each emissions test.

TABLE 12 Required Regional Emissions Test for 2012 RTP

Year	8-hr Ozone	$PM_{2.5}$	PM_{10}	CO	NO_2
2012	CV	SC			
2014	CV, IMP, SC, VEN, WMD	IMP*, SC	CV, IMP*, MD*, SC		SC

2035	CV, IMP, SC, VEN, WMD	IMP*, SC	CV, IMP*, MD*, SC	SC	SC

SC = South Coast Air Basin; CV = Coachella Valley (SSAB); VEN = Ventura County (SCCAB); WMD = Western Mojave (Antelope/Victor Valleys); MD = Mojave Desert (San Bernardino Portion and Searles Valley portions); IMP Imperial County (SSAB);
** Build/No-Build test (all other are budget tests); ** Interpolated per conformity rule.*

Summary of Regional Emissions Analysis

The following tables summarize the required regional emission analyses for each of the non-attainment areas within SCAG's jurisdiction. For those areas which require budget tests, the RTP emissions values in the summary tables below utilize the rounding convention used by ARB to set the budgets (i.e., any fraction rounded up to the nearest ton), and are the basis of the conformity findings for these areas.

***AQMP Backstop Measure: There is projected long-term growth in direct PM10 emissions due to increased vehicle travel on paved and unpaved roads. To address this increase in primary PM10 emissions from travel while continuing to provide for attainment after 2006, the 2003 AQMP included the "Transportation Conformity Budget Backstop Control Measure" which commits to achieve additional PM10 reductions from transportation-related PM10 source categories in future years to offset the increased emissions.*

Section III: Timely Implementation of Transportation Control Measures

Introduction

This section itemizes and reports the findings of timely implementation of TCM projects as specified in the fiscally constrained portion, or the first two years (i.e., FY 2010/11-2011/12), of the 2011 FTIP. These projects comprise the committed TCMs in the 2012 RTP. The findings are required only for the applicable TCM projects contained in the approved SIPs which, in the SCAG Region, are the ozone attainment plans for the SCAB and the Ventura County portion of the SCCAB.

Transportation Conformity Rule

The criteria for identifying TCM projects and the requirements for timely implementation of these projects are defined in the U.S. EPA's Transportation Conformity Rule, 40 CFR Part 93:

A TCM is any measure that is specifically identified and committed to in the applicable implementation plan, including a substitute or additional TCM that is incorporated into the applicable SIP through the process established in CAA section 176(c)(8), that is either one of the types listed in CAA section 108, or any other measure for the purpose of reducing emissions or concentrations of air pollutants from transportation sources by reducing vehicle use or changing traffic flow or congestion conditions. Notwithstanding the first sentence of this definition, vehicle technology-based, fuel-based, and maintenance-based measures which control the emissions from vehicles under fixed traffic conditions are not TCMs for the purposes of this subpart.

Section 108(f)(1)(A) of the federal CAA lists the following sixteen measures as illustrative of TCMs. However, this list should not be considered exhaustive.

- Programs for improved use of public transit;
- Restriction of certain roads or lanes to, or construction of such roads or lanes for use by, passenger buses or high occupancy vehicles;
- Employer-based transportation management plans, including incentives;
- Trip-reduction ordinances;
- Traffic flow improvement programs that achieve emission reductions;
- Fringe and transportation corridor parking facilities, serving multiple occupancy vehicle programs or transit service;
- Programs to limit or restrict vehicle use in downtown areas or other areas of emission concentration, particularly during periods of peak use;
- Programs for the provision of all forms of high-occupancy, shared-ride services;
- Programs to limit portions of road surfaces or certain sections of the metropolitan area to the use of non-motorized vehicles or pedestrian use, both as to time and place;
- Programs for secure bicycle storage facilities and other facilities, including bicycle lanes, for the convenience and protection of bicyclists, in both public and private areas;
- Programs to control extended idling of vehicles;
- Programs to reduce motor vehicle emissions, consistent with Title II of the Clean Air Act, which are caused by extreme cold start conditions;
- Employer-sponsored programs to permit flexible work schedules;
- Programs and ordinances to facilitate non-automobile travel, provision and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts of a locality, including programs and ordinances applicable to new shopping centers, special events, and other centers of vehicle activity;
- Programs for new construction and major reconstruction of paths, tracks or areas solely for the use by pedestrian or other non-motorized means of transportation, when economically feasible and in the public interest; and
- Programs to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks.

In addition to the types of measures listed above, other measures may be considered as TCM projects if they reduce emissions or concentrations of air pollutants from transportation sources by modifying vehicle use, changing traffic flow, or mitigating traffic congestion conditions. TCM projects may be voluntary programs, incentive-based programs,

regulatory programs, as well as market- or pricing-based programs. However, all TCM categories must be listed in the applicable (EPA-approved) SIP to be considered TCMs.

It should be noted, however, that measures and projects that use technology to reduce emissions—such as innovations in fuel formulation technologies, or the promotion of zero-emission vehicles, or of alternative fueled engines—cannot be considered TCM projects. Roadway capacity enhancement projects are also not typically considered TCMs.

The transportation conformity process is designed to ensure timely implementation of TCM strategies, thus reinforcing the link between AQMP/SIPs and the transportation planning process. If a TCM cannot be implemented or is only partially implemented, the shortfall must be made up by either substituting a new TCM strategy or by enhancing other control measures through the substitution.

CRITERIA AND PROCEDURES FOR THE TIMELY IMPLEMENTATION OF TCMS

The Transportation Conformity Rule (40 CFR 93.113) states:

a. The transportation plan, TIP, or any FHWA/FTA project which is not from a conforming plan and TIP must provide for the timely implementation of TCMs from the applicable implementation plan.
   1. For transportation plans, this criterion is satisfied if the following two conditions are met: The transportation plan, in describing the envisioned future transportation system, provides for the timely completion or implementation of all TCMs in the applicable implementation plan which are eligible for funding under title 23 U.S.C. or the Federal Transit Laws, consistent with schedules included in the applicable implementation plan.
   2. Nothing in the transportation plan interferes with the implementation of any TCM in the applicable implementation plan.

b. For TIPs, this criterion is satisfied if the following conditions are met:
   1. An examination of the specific steps and funding source(s) needed to fully implement each TCM indicates that TCMs which are eligible for funding under title 23 U.S.C. or the Federal Transit Laws are on or ahead of the schedule established in the applicable implementation plan, or, if such TCMs are behind the schedule established in the applicable implementation plan, the MPO and DOT have determined that past obstacles to implementation of the TCMs have been identified and have been or are being overcome, and that all State and local agencies with influence over approvals or funding for TCMs are giving maximum priority to approval or funding of TCMs over other projects within their control, including projects in locations outside the nonattainment or maintenance area.
   2. If TCMs in the applicable implementation plan have previously been programmed for Federal funding but the funds have not been obligated and the TCMs are behind the schedule in the implementation plan, then the TIP cannot be found to conform if the funds intended for those TCMs are reallocated to projects in the TIP other than TCMs, or if there are no other TCMs in the TIP, if the funds are reallocated to projects in the TIP other than projects which are eligible for Federal funding intended for air quality improvement projects, e.g., the Congestion Mitigation and Air Quality Improvement Program.
   3. Nothing in the TIP may interfere with the implementation of any TCM in the applicable implementation plan.

c. For FHWA/FTA projects which are not from a conforming transportation plan and TIP, this criterion is satisfied if the project does not interfere with the implementation of any TCM in the applicable implementation plan.

Applicable SIPs in the SCAG Region

In the SCAG region, SIPs developed in the SCAB and the Ventura County portion of the SCCAB contain TCM strategies and thus are the applicable SIPs per EPA's Transportation Conformity Rule. The other SIPs do not contain any TCM strategies. The two SIPs with TCM strategies are:

2007 OZONE SIP (SCAB)

The 2007 Ozone AQMP for the SCAB was approved by the SCAQMD Board on June 1, 2007 and by the ARB as part of the SIP on September 27, 2007. The EPA has approved the 2007 South Coast Ozone SIP effective April 30, 2012. The TCM categories in the 2007 Ozone AQMP/SIP are consistent with the TCM01 categories established in the 1994 Ozone SIP.

1994 OZONE SIP (VENTURA COUNTY PORTION OF SCCAB)

The EPA approved the 1994 Ozone SIP revisions on January 8, 1997. The 2007 Ozone AQMP/SIP revision (pending EPA approval) makes no changes to previously approved TCMs contained in the 1994 SIP (as amended in 1995).

It is noted that the Ventura County SIP does not claim emission reduction credits from TCM projects. They have been included to assist transportation and air quality agencies to identify projects that have the potential of reducing vehicle emissions, vehicle trips and vehicle miles traveled.

TCM Reporting Process in the SCAG Region

Only those TCM-category projects that have been committed for implementation are considered for purposes of timely implementation reporting. As such, only those projects designated as TCMs in the first two years (the fiscally constrained portion) of the prevailing FTIP are considered for reporting. The projects reported on in this report are those TCM-category projects which have been committed to right-of-way acquisition, construction or implementation in the Fiscal Year 2010–2011 and 2011–2012 portions of the 2011 FTIP. In addition, those TCM projects designated for reporting in previous FTIPs, and which are still under construction or implementation, will continue to be reported. Further, completed TCM projects are also reported. Thus, this Timely Implementation Report provides the programmed completion dates as set forth in the 2011 FTIP and current status for the 2012 RTP.

Although project implementation remains an enforceable commitment by project sponsor agencies, SCAG is responsible for assuring the timely implementation of TCMs. Per a request from the federal agencies, beginning with the 2003 AQMP/SIP, SCAG began to develop a protocol for tracking currently anticipated project completion dates against previously reported completion dates, as provided by the County Transportation Commissions (CTCs). It is SCAG's intention that project completion dates reported when a TCM is first listed in an approved FTIP will be reported in all subsequent Timely Implementation Reports alongside any changes to these completion dates that may arise, until such a time as the project is completed or open to use. In this case, ongoing and completed projects include the date listed in the 2004 FTIP, which was the first FTIP to include this reporting requirement.

SCAG has traditionally relied on the established project status update process used for the RTP and the FTIP to provide the initial structure for the Timely Implementation Report. This data, which is submitted to SCAG by the CTCs, is then tabulated into a Timely Implementation Report and then re-circulated to the CTCs so as to obtain the most current project information available with regard to implementation status. This final data on project implementation status, and on currently anticipated completion dates, is then used to establish the final Timely Implementation Report. SCAG's process integrates an assessment of the specific steps and funding sources needed to fully implement each TCM, and confirms that the projects are on or ahead of schedule; or, in the case that some particular project is delayed, the analysis establishes that the obstacles to implementation have been or are being overcome, and that the project is henceforth expected to be expeditiously implemented.

Timely Implementation of TCM Projects in the SCAG Region

The federal Transportation Conformity Rule states that timely implementation is to be measured against the TCM projects in the applicable SIP. SCAG evaluates the TCM-category projects to determine the anticipated level and current status of implementation. The enforceable commitment is to report on the funding and implementation of TCM projects in the first two years of the six-year FTIP. In each FTIP, TCM category projects roll forward and the enforceable commitment is automatically revised to encompass the first two-year schedule of TCM-category projects without the need for a SIP revision. The implementation status of each of these TCM projects then continues to be reported on in subsequent FTIPs, until the TCM project is reported as having been completed, or the suitably replaced or substituted project has been completed.

TCM FUNDING SOURCES

The following types of funding sources contribute to demonstrating timely implementation of TCM projects:

- SAFETEA-LU programs provide federal funds for eligible TCM projects under EPA requirements.
- TCMs are eligible expenditures under funds provided for the National Highway System (NHS), Congestion Mitigation and Air Quality Improvement (CMAQ) Program, and the Surface Transportation Program (STP). TCMs listed in federal CAA Section

108 (f)(1)(A) [other than clauses xii and xvi] are specifically listed as eligible uses for federal funding.

- Under CMAQ, funds are targeted for TCMs and may not be used for projects that do not contribute to the attainment of NAAQS. CMAQ funds may not be provided for a project resulting in the construction of new capacity available to single occupancy vehicles, except on the HOV portion of a larger freeway project, or where the project consists of a HOV facility made available to single occupancy vehicles only during non-peak travel times.

SOUTH COAST AIR BASIN

The 2007 AQMP/SIP includes the following three TCM project categories:

- High Occupancy Vehicle (HOV) Measures,
- Transit and Systems Management Measures, and
- Information-based Transportation Strategies.

It should be noted that the TCM project categories in Appendix IV-C, Regional Transportation Strategy and Control Measures, of the 2007 Ozone AQMP/SIP, are consistent with those of TCM01 specified in the 1994 and subsequent Ozone SIPs, and are updated by the list provided in the Timely Implementation Report section of this document.[2]

VENTURA COUNTY PORTION OF SCCAB

The applicable TCM projects in Ventura County include the following strategies:

- Ridesharing
- Non-Motorized Strategies
- Traffic Flow Improvement Strategy
- Land Use Strategy
- Transit Strategies

[2] SCAG will continue working with EPA, ARB and SCAQMD to understand the full implications of the recent Ninth Circuit Court ruling in the *Association of Irritated Residents et al. v. EPA* case (Nos. 09-71383 and 09-71404) related to the Transportation Control Measures (TCMs) for the severe or extreme ozone non-attainment area contained within this plan. SCAG will amend the plan (if required) once the EPA has completed its analysis and provided any direction that may be needed.

LISTING OF TCMS SUBJECT TO TIMELY IMPLEMENTATION AND COMPLETED/CORRECTED PROJECTS

The information in the following tables demonstrates timely implementation of TCMs (by county).

TABLE 41.1 Los Angeles County TCMs Subject to Timely Implementation

Lead Agency	Project ID	Project Description	Original Completion Date	2011 FTIP Completion Date	2012 RTP Completion Date	2012 RTP Project Status
BALDWIN PARK	LAFA141	BALDWIN PARK METROLINK TRANSPORTATION CENTER. FUNDED THRU STIP AUGMENTATION CONSTRUCTION A TRANSPORTATION CENTER AND PARKING STRUCTURE AT THE BALDWIN PARK METROLINK STATION.	2012	11/1/2012	11/1/2014	OBSTACLES ARE BEING OVERCOME. THE PROJECT IS IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED). DELAY IS THE RESULT OF THE ENVIRONMENTAL DOCUMENT PROCESSING TAKING LONGER THAN ORIGINALLY EXPECTED.
FOOTHILL TRANSIT ZONE	LA0B311	PARK AND RIDE FACILITY TRANSIT ORIENTED NEIGHBORHOOD PROGRAM SAFETEA-LU # 341 (E-2006-BUSP-092) (E-2006-BUSP-173)	2003/2005	12/31/2013	12/31/2013	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. AGENCY IS FINALIZING PLANS FOR THE NEW SITE FOR THE PARK AND RIDE. PROJECT IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED).
GLENDALE	LA0G406	FAIRMONT AVE. PARK-N-RIDE FACILITY (83 PARKING SPACES) TO SERVE COMMUTERS USING SR-134, I-5. THE LOCATION OF THE PARK-N-RIDE IS FAIRMONT AVENUE AND SAN FERNANDO RD.	12/30/2012	12/30/2012	12/30/2013	OBSTACLES ARE BEING OVERCOME. ONE YEAR DELAY DUE TO COORDINATION AND LAG TIME BETWEEN PROJECT COMPONENTS AS THE PROJECT WAS COMBINED WITH FAIRMONT AVE GRADE SEPARATION. AGENCY HAS AN APPROVED MOU WITH METRO AND THE PROJECT IS UNDERWAY.
LOS ANGELES COUNTY	LAF1514	EMERALD NECKLACE BIKE TRAIL PROJECT. DESIGN AND CONSTRUCT 1.1 MILES OF CLASS I BIKE PATH TO CONNECT DUARTE ROAD TO THE SAN GABRIEL RIVER BICYCLE TRAIL.	2011	12/31/2011	6/30/2013	OBSTACLES ARE BEING OVERCOME. DELAY DUE TO REQUIRED COORDINATION WITH CORPS OF ENGINEER AND CITY OF DUARTE TO EXECUTE NECESSARY AGREEMENTS FOR INSTALLATION OF BIKE PATH THROUGH SANTA FE DAM RECREATIONAL AREA. REVISED PLANNED OBLIGATION DATE FOR THIS PROJECT IS JUNE 2012 WITH AWARD OF CONTRACT IN SEPTEMBER 2012 AND CONSTRUCTION COMPLETION BY JUNE 2013.
LOS ANGELES COUNTY MTA	LA0G270	EXPANSION AND IMPROVEMENT TO EXISTING TRANSIT CENTER IN THE CITY OF PALMDALE. E2009-BUSP-137.	9/30/2012	9/30/2012	9/30/2013	OBSTACLES ARE BEING OVERCOME. THE PROJECT IS IN THE ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED). ADDITIONAL TRAFFIC STUDIES WERE REQUESTED BY THE FTA PRIOR TO THE APPROVAL OF THE ENVIRONMENTAL DOCUMENTS. ADDITIONAL YEAR NEEDED TO CONDUCT TRAFFIC STUDIES, INCORPORATE THE INFORMATION INTO THE ENVIRONMENTAL DOCUMENT AND SEEK APPROVAL FROM FTA.
LOS ANGELES COUNTY MTA	LA0F021	EXPOSITION LIGHT RAIL TRANSIT SYSTEM PHASE II – FROM CULVER CITY TO SANTA MONICA		12/31/2017	12/31/2017	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. PROJECT IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED)

Lead Agency	Project ID	Project Description	Original Completion Date	2011 FTIP Completion Date	2012 RTP Completion Date	2012 RTP Project Status
LOS ANGELES COUNTY MTA	LA29202W	MID -CITY TRANSIT CORRIDOR: WILSHIRE BLVD. FROM VERMONT TO SANTA MONICA DOWNTOWN- MID-CITY WILSHIRE BRT INCL. DIV. EXPANSION AND BUS ONLY LANE	2009/2010	12/31/2012	12/31/2014	OBSTACLES ARE BEING OVERCOME. AFTER INITIAL DELAYS WITH PROCESSIG ENVIRONMENTAL DOCUMENTS, PROJECT IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED). NOTE: 2011 FTIP TCM TIMELY IMPLEMENTATION REPORT PROJECT DESCRIPTION AND COMPLETION DATE ONLY ACCOUNT FOR FIRST PHASE OF PROJECT.
LOS ANGELES COUNTY MTA	LA0G194	ACQUIRE FOUR (4) ALTERNATE FUEL BUSES FOR THE CITY OF ARTESIA TO BE USED FOR NEW FIXED ROUTE SERVICE EARMARK ID #E2008-BUSP-0694	10/31/2011	10/31/2011	10/31/2012	OBSTACLES ARE BEING OVERCOME. GRANT HAD BEEN APPROVED BY FTA. ACQUIRING NEW VEHICLES BEING COORDIATED WITH THE COMPLETION OF A REDEVELOPMENT PROJECT TO BETTER UNDERSTAND THE NEEDS FOR BUS STOPS AND ROUTING.
LOS ANGELES COUNTY MTA	LA0C10	MID-CITY/EXPOSITION CORRIDOR LIGHT RAIL TRANSIT PROJECT PHASE I TO VENICE-ROBERTSON STATION	2011/2012	12/31/2012	12/31/2012	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. THE PROJECT IS UNDER CONSTRUCTION.
LOS ANGELES COUNTY MTA	LA0G431	MULTI-MODAL TRANSIT CENTER AT CSUN TO INCLUDE PASSENGER LOADING AREAS AND BUS SHELTERS	10/1/2012	10/1/2012	10/1/2012	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. THE GRANT FOR THE PROJECT HAS BEEN APPROVED BY FTA. PROJECT IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED).
LOS ANGELES COUNTY MTA	LA974165	MACARTHUR PARK STATION IMPROVEMENTS INCLUDE DESIGN AND CONSTRUCTION OF A PLAZA TO ACCOMMODATE PUBLIC ACCESS (PEDESTRIAN ENTRANCES, WALKWAYS, BICYCLE FACILITIES) PPNO# 3417	2002/2007	12/30/2011	12/30/2011	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED)
LOS ANGELES, CITY OF	LA0G155	LACRD – TRANSIT SIGNAL PRIORITY IN THE CITY OF LOS ANGELES.	12/31/2011	12/31/2011	02/28/2012	OBSTACLES ARE BEING OVERCOME. IN CONSTRUCTION/IMPLEMENTATION PHASE.
PASADENA	LAE3790	THE PASADENA ITS INTEGRATES 3 COMPONENTS; TRAFFIC SIGNAL COMMUNICATION AND CONTRL, TRANSIT VEHICLE ARRIVAL INFO AND PUBLIC PARKING AVAILABILITY INFO. SAFETEA-LU PRJ #3790 AND #399	2010	06/2011	6/30/2013	OBSTACLES ARE BEING OVERCOME. FUNDS HAVE BEEN OBLIGATED. THE PROJECT IS CURRENTLY IN THE DESIGN PHASE AND THE WORK IS 95% COMPLETE. DELAY DUE TO ADDITIONAL COORDINATION REQUIRED WITH THE LOCAL STAKEHOLDERS REGARDING THE PROJECT.

Lead Agency	Project ID	Project Description	Original Completion Date	2011 FTIP Completion Date	2012 RTP Completion Date	2012 RTP Project Status
PICO RIVERA (PREVIOUSLY LEAD AGENCY WAS SGVCOG)	LA0C57	ACE/GATEWAY CITIES-CONSTRUCT GRADE SEP. AT PASSONS BLVD IN PICO RIVERA (& MODIFY PROFILE OF SERAPIS AV,)(PART OF ALAMEDA CORR EAST PROJ.)SAFETEA-LU HPP # 1666 (TCRP #54.3)	2006	12/31/2010	12/31/2012	OBSTACLES ARE BEING OVERCOME. UNDER CONSTRUCTION. THE PROJECT ENCOUNTERED SEVERAL DELAYS FOR ISSUES RELATED TO ROW CERTIFICATION AND SEVERAL CASES OF EMINENT DOMAIN. THE CONSTRUCTION PHASE OF THIS PROJECT STARTED 12/6/10 AND THE UNDERPASS (BRIDGE) IS ESTIMATED TO BE COMPLETED WITHIN 19-20 MONTHS.
ROLLING HILLS ESTATE	LAF1529	PALOS VERDES DRIVE NORTH BIKE LANES. CONSTRUCTION OF CLASS II BIKE LANE AND RELATED IMPROVEMENTS ON PALOS VERDES DRIVE NORTH	12/31/2012	12/31/2012	12/31/2013	OBSTACLES ARE BEING OVERCOME. DELAY DUE TO TIME NECESSARY FOR CALTRANS TO REVIEW AND APPROVE THE ENVIRONMENTAL DOCUMENT. PROJECT HAS RECEIVED ITS E-76 FOR PE (PS&E). THE CITY WORKED WITH METRO TO UPDATE THE SCHEDULE AND REPROGRAM THE CONSTRUCTION FUNDS; PLANNING TO OBTAIN CONSTRUCTION ALLOCATION BY JUNE 30, 2013 AND COMPLETE CONSTRUCTION BY DECEMBER 31, 2013.
SANTA CLARITA	LAF1424	MCBEAN REGIONAL TRANSIT CENTER PARK AND RIDE. PURCHASE LAND, DESIGN, AND CONSTRUCT A REGIONAL PARK-AND-RIDE LOT ADJACENT TO THE MCBEAN REGIONAL TRANSIT CENTER IN THE CITY OF SANTA CLARITA.	2012	10/1/2012	10/1/2013	OBSTACLES ARE BEING OVERCOME. PROJECT CURRENTLY IN PRE-CONSTRUCTION PHASE. DELAYED TO ALLOW NEGOTIATIONS WITH THE CURRENT PROPERTY OWNER AND COMMUNITY OUTREACH. FUNDING IS IN AN APPROVED FTA GRANT CA-95-X137 AND CA-96-X071
WHITTIER	LA0G257	WHITTIER GREENWAY TRAILHEAD PARK. EXTENSION OF WHITTIER GREENWAY TRAIL FROM MILLS AVENUE TO 300 FEET EAST OF MILLS AVENUE ON CITY OWNED RIGHT-OF-WAY IN CONJUNCTION WITH THE CONSTRUCTION OF NEW TRAILHEAD PARK WITH A PARK AND RIDE PARKING LOT FOR NEARBY PUBLIC TRANSIT STOP. NEW 20 SPACE PARKING LOT WOULD BE CONSTRUCTED OF “GREEN” PERMEABLE PAVEMENT IN COMPLIANCE WITH NPDES REQUIREMENTS. INCLUDES THE INSTALLATION OF PARK AMENITIES, DRINKING FOUNTAIN FOR THE CONVENIENCE OF PEDESTRIAN AND BICYCLE PATRONS OF THE WHITTIER GREENWAY TRAIL. CONSTRUCTION OF NEW SIDEWALKS ALONG MILLS AVENUE TO PROVIDE WHITTIER GREENWAY TRAIL CROSSING CONNECTION AT THE SIGNALIZED INTERSECTION OF MILLS AVENUE AT LAMBERT ROAD.	9/30/2012	9/30/2012	9/30/2014	OBSTACLES ARE BEING OVERCOME. THE CITY OF WHITTIER HAS PLACED THIS PROJECT ON TEMPORARY HOLD DUE TO RESUMED NEGOCIATIONS WITH THE UNION PACIFIC RAILROAD (UPRR) FOR ACQUISITION OF A PORTION OF RAILROAD ROW ADJACENT TO CITY OWNED PROPERTY TO BE DEVELOPED INTO THE WHITTIER GREENWAY TRAILHEAD PARK. CITY IS ATTEMPTING TO SECURE A PORTION OF RAILROAD ROW FOR EXTENDING THE WHITTIER GREENWAY TRAIL FURTHER EAST TO THE EAST CITY LIMITS OF WHITTIER (LOS ANGELES/ORANGE COUNTY BOARDER). THE PRELIMINARY DESIGN LAYOUT OF THE PROPOSED PARK AND PARKING LOT COULD BE REARRANGED IF THE CITY IS SUCCESSFUL IN OBTAINING THE ADDITIONAL LAND FOR THE GREENWAY TRAIL EASTERN EXTENSION.

Lead Agency	Project ID	Project Description	Original Completion Date	2011 FTIP Completion Date	2012 RTP Completion Date	2012 RTP Project Status
ARTESIA	LAF1607	SOUTH STREET PEDESTRIAN, BIKEWAY AND TRANSIT IMPROVEMENT. IMPROVE PEDESTRIAN ENVIRONMENT AND TRANSIT STOP LOCATIONS WITH LANDSCAPED MEDIANS, TRANSIT SHELTERS, BENCHES, SIDEWALK ENHANCEMENTS AND LIGHTING. CLOSE EXISTING BIKE LANE GAP.	2014	10/1/2014	10/1/2014	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. PROJECT IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED)
AVALON	LAF1501	COUNTY CLUB DRIVE BIKEWAY IMPROVEMENT PROJECT. CONSTRUCTION OF A 4-FOOT WIDE CLASS II BIKE LANE IN BOTH DIRECTIONS ALONG A ONE MILE SECTION OF COUNTRY CLUB DRIVE.	2013	10/1/2013	10/1/2013	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. PROJECT IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED)
AZUSA	LAF3434	AZUSA INTERMODAL TRANSIT CENTER. CONSTRUCT REGIONAL AZUSA INTERMODAL TRANSIT CENTER TO ACCOMMODATE EXISTING AND FUTURE PARKING DEMAND AND SUPPORT EFFECTIVE TRANSIT USE.	6/30/2015	6/30/2015	6/30/2015	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. PROJECT IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED)
BALDWIN PARK	LAE0076	CONSTRUCT ADD'L VEHICLE PARKING (200 TO 400 SPACES), BICYCLE PARKING LOT AND PEDESTRIAN REST AREA AT THE TRANSIT CENTER	2010	2014	12/31/2014	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. ON SCHEDULE. PROJECT IN ENVIRONMENTAL DOCUMENT/PRE-DESIGN PHASE (PAED)
BALDWIN PARK	LAF1654	BALDWIN PARK METROLINK PEDESTRIAN OVERCROSSING. CONSTRUCT A PEDESTRIAN OVERCROSSING OVER BOGART AVE AND THE METROLINK LINE TO LINK THE STATION WITH VITAL BUS TRANSFER POINTS AND TO PROVIDE ACCESS TO PARKING OVERFLOW AREAS.	2015	10/1/2015	10/1/2015	NO CHANGE IN COMPLETION DATE FROM 2011 FTIP TCM REPORT. Section IV: Summary of Public Comments and Responses

As discussed previously, SCAG's Transportation Conformity Working Group served as the forum specifically for interagency consultation relative to conformity and, additionally, there were many ad-hoc meetings held between the stakeholder agencies for this purpose. The comprehensive public participation and interagency consultation conducted for the 2012 RTP is detailed in the 2012 RTP Public Participation and Consultation Report.

The public review and comment period for the Draft 2012 RTP Conformity Report began in December 2011 and closed in February 2012. Six non-substantive comments on confomrity were received during the public review period. The comments sought clarification, provided update or minor revisions to the information in the Draft Conformity Report or the conformity summary information included in the main RTP document. Appropriate changes were made to to reflect the comments.

All comments and responses on the Draft 2012 RTP can be accessed at http://rtpscs.scag.ca.gov/Pages/default.aspx.

TRANSPORTATION SAFETY

Executive Summary 1

Recommended Policies and Actions 1

Introduction 5

Existing Conditions 5

Consequences of Accidents in the SCAG Region 5

Existing Conditions 6

California Five Percent Report for the SCAG Region 32

Executive Summary

In 2008, over 1500 people died on roadways in the SCAG region and just under 125,000 were injured. While both fatalities and injuries have declined over the past 10 years, the impacts, both emotional and financial, are still far too high. The average costs for each traffic death, traffic injury, or property damage crash were (in 2005):

Death – $1,150,000

Nonfatal Disabling Injury – $52,900

Property Damage, including non-disabling injuries – $7,500

In 2006, the State of California initiated the Strategic Highway Safety Plan (SHSP), as a way of setting targets and strategies to reduce transportation fatalities in the State in absolute numbers by 2010 in 16 challenge areas (impaired driving, street crossing, bicycling, older drivers, etc). While the targets in most challenge areas were met by 2010, a new goal is to reduce fatalities even further. The SHSP Steering Committee is establishing new targets, which will be finalized in 2012, including a 17th Challenge Area, Distracted Driving.

While the California SHSP sets 152 various actions that State agencies can perform to reduce fatalities, there are complementary strategies that can be performed by local governments that can help further reduce transportation fatalities.

The safety of people and goods as they travel is one of the key characteristics of any transportation system. The importance of providing a safe and secure transportation system is emphasized by transportation and law enforcement agencies at all levels, and is recognized as one of the chief responsibilities of transportation planners.

SCAG's safety goal is to ensure transportation safety, security, and reliability for all people and goods in the region.

SCAG is recommending 69 actions for local governments that complement the State actions in the 17 SHSP Challenge Areas. A large portion of traffic collisions amongst many of the challenge areas occur at intersections. The mixing of various travel modes, combined with changes in cross traffic provides a greater potential for collisions. By placing the highest emphasis on intersection safety within each challenge area, SCAG hopes to have the greatest effect in reducing traffic fatalities.

This report reviews each SHSP Challenge Area within the SCAG region, noting trends in fatalities and injuries, and makes the following recommendations for local governments to help further reduce transportation fatalities throughout the region and State.

Recommended Policies and Actions

Challenge Area 1. Reduce Impaired Driving Related Fatalities

- Local jurisdictions should increase frequency, consistency and publicity of sobriety checkpoints in areas with high DUI caused accidents
- Local jurisdictions should pursue grant funds to new Portable Evidential Breath Testing devices
- Local jurisdictions should extend and promote late night transit during holiday weekends and after major sporting/special events
- Consider reviewing the SHSP "tool kit" which will identify programs, providers, and resources that assist communities in implementing effective community-based, comprehensive, multijurisdictional DUI task forces.
- Local jurisdictions should implement and maintain anti-DUI programs such as, Teenage Party Prevention, Enforcement and Dispersal, Minor Decoy Program, the Shoulder Tap Program, and the Target Responsibility For Alcohol Connected Emergencies (TRACE) program.

Cities/Counties can continue this work by pursuing National Highway Traffic Safety Administration (NHTSA) Incentive/Transfer Program Grants under 23 U.S.C. 402 or 23 U.S.C. 410.

Challenge Area 2. Reduce the Occurrence and Consequence of Leaving the Roadway and Head-on Collisions

- Local jurisdictions should incorporate into highway construction/ reconstruction methods to warn drivers (such as rumble strips, "Botts' Dots," pavement markers, curve warning signs/beacons) they are leaving the highway or wandering into other lanes.

- Continue the deployment of high visibility signage and road striping that enhance driver's ability to notice, recognize and respond to warning signs during nighttime or periods of inclement weather.

Challenge Area 3.
Ensure Drivers are Licensed and Competent

- Local jurisdictions can support the State in developing driver education components for teens and new drivers.

Challenge Area 4.
Increase Use of Safety Belts and Child Safety Seats

- Local jurisdictions should support State authorities in the education and enforcement of safety device violations.

Challenge Area 5.
Improve Driver Decisions about Rights of Way and Turning

- Encourage the installation of improved visibility traffic signals as part of the normal traffic signal replacement cycle
- Local jurisdictions should support the use of traffic control devices, traffic calming, and speed reduction design practices to reduce the likelihood and severity of crashes related to turning movements.
- Local jurisdictions should consider redesigning the geometry at high accident locations as an option to restrict unsafe turns by motor vehicles.
- Local jurisdictions should support the use of advanced technology and ITS to reduce collisions.
- Local jurisdictions should incorporate ITS at high incident intersections to reduce red-light violations causing collisions.

Challenge Area 6.
Reduce Young Driver Fatalities

- Local jurisdictions can support the State in developing driver education components for teens and new drivers.
- Local jurisdictions should support State authorities in the education and enforcement of safety device violations.
- Local jurisdictions should increase frequency, consistency and publicity of sobriety checkpoints in areas with high DUI caused accidents.
- Local jurisdictions should implement and maintain anti-DUI programs such as, Teenage Party Prevention, Enforcement and Dispersal, Minor Decoy Program, the Shoulder Tap Program, and TRACE.

Challenge Area 7.
Improve Intersection and Interchange Safety for Roadway Users

- Local jurisdictions should incorporate intersection safety into the Compass Blueprint strategies.
- Local jurisdictions should incorporate ITS at high-incident intersections to reduce red-light violations causing collisions.
- Local jurisdictions should encourage clearly marked, visible crosswalks.
- Local jurisdictions should support installation of adequate lighting around crosswalks to provide better visibility of pedestrians crossing streets at night.
- Local jurisdictions should consider installation of improved visibility traffic signals as part of the normal traffic signal replacement cycle.
- Local jurisdictions should incorporate median sanctuaries for pedestrians at appropriate intersections.
- Local jurisdictions should incorporate signalization at problem non-signalized intersections.
- Local jurisdictions should consider changing intersection geometries, where applicable. (offset intersection to aligned intersection, intersection to interchange, intersection to roundabout).
- Local jurisdictions should plan for, and develop roadway, intersection and interchange improvements that support improving rights of way decision by older drivers.
- Local jurisdictions should review existing or potential high-crash at-grade railroad/highway crossings for contributing factors and implement Median Island Programs or make other improvements such as visibility, advance warning, and geometrics.

Challenge Area 8.
Make Walking and Street Crossing Safer

- Local jurisdictions should develop pedestrian safety action plans based on FHWA criteria.
- Local jurisdictions should ensure all sidewalks and intersections are ADA compliant.
- Local jurisdictions should consider pedestrian needs in all roadway and transit projects.
- Local jurisdictions should improve pedestrian striping and include standard safety upgrades in routine maintenance and striping projects.
- Local jurisdictions should incorporate median sanctuaries for pedestrians at appropriate intersections.
- Local jurisdictions should increase pedestrian crossing times to account for older or slower pedestrians.
- Local jurisdictions should incorporate pedestrian safety into smart growth, land use planning, and other local plans.
- Local jurisdictions should continue the enforcement of violations of pedestrian law by pedestrians and motorists.
- Local jurisdictions should participate in programs to educate all roadway users regarding the rights and responsibilities of pedestrians.
- Local jurisdictions should incorporate ITS at high-incident intersections to reduce vehicle-pedestrian collisions.
- Local jurisdictions should consider installation of lighting surrounding crosswalks at intersections and mid block locations to provide better visibility of pedestrians crossing streets at night.
- Local cities should develop citywide Safe Routes to School strategies to guide measures around local schools.
- Local jurisdictions should continue to improve pedestrian safety expertise among transportation professionals and others involved in roadway and land-use design.

Challenge Area 9.
Improve Safety for Older Roadway Users

- Support roadway, intersection and interchange improvements that support improving rights of way decision by older drivers.
- Local jurisdictions should consider installation of improved visibility traffic signals as part of the normal traffic signal replacement cycle.
- Support signage and striping that enhance driver's ability to notice, recognize and respond to warning signs during nighttime and/or inclement weather conditions.
- Local jurisdictions should incorporate median sanctuaries for pedestrians at appropriate intersections.
- Support JARC/New Freedom, para-transit to include those over 65 years of age.
- Encourage formation and expanded use of Supplemental Transportation Systems (STPs), particularly in locations where standard public transit is sparse or unavailable.

Challenge Area 10.
Reduce Speeding and Aggressive Driving

- Local jurisdictions should use ITS and traffic signalization as a strategy to reduce speeding on arterials during light traffic conditions.
- Traffic Management Centers should contact police or CHP when traffic cameras observe reckless speeding on arterials and freeways.
- Local jurisdictions can support the State in developing driver education components for teens and new drivers.
- Local jurisdictions should increase frequency, consistency and publicity of sobriety checkpoints in areas with high DUI caused accidents.

Challenge Area 11.
Improve Commercial Vehicle Safety

- Local jurisdictions should support the use of dedicated truck capacity on corridors with significant truck traffic in order to separate commercial vehicles from passenger vehicles.

- Local jurisdictions should identify intersections and interchanges prone to high commercial vehicle collisions, identify appropriate infrastructure improvements and make adjustments as needed.
- Local jurisdictions should support the use of truck climbing lanes as a method to segregate commercial vehicles from passenger vehicles.

Challenge Area 12. Improve Motorcycle Safety

- Local jurisdictions should focus motorcycle-related law enforcement activities on areas with high motorcycle volumes.

Challenge Area 13. Improve Bicycling Safety

- Local jurisdictions should develop and regularly update bicycle master plans.
- Local jurisdictions should fund and install dedicated bicycle facilities where appropriate and safe.
- Local jurisdictions should incorporate applicable Complete Streets policies—providing safe access for all modes—as fundamental principles of transportation plans.
- Local jurisdictions should consider bicycle and pedestrian safety as part of Compass Blueprint Land Use Planning.
- Local jurisdictions should consider pedestrian and bicycle safety in all maintenance projects where new striping will be required or existing striping is to be replaced.
- Local jurisdictions should consider the use of intersection control devices that detect bicyclists, particularly left turn signals.

Challenge Area 14. Enhance Work Zone Safety

- Local jurisdictions should ensure that work zones accommodate all modes of transportation.
- Local jurisdictions should ensure that work zones have signs warning of pavement irregularities and other work zone issues that could be collision factors.
- Local jurisdictions should consider temporary traffic signal changes to mitigate congestion around work zones.

Challenge Area 15. Improve Post Crash Survivability

- Local jurisdictions should utilize Intelligent Transportation System technology to improve response time for EMS to and from collision sites.

Challenge Area 16. Improve Safety Data Collection, Access and Analysis

- Local jurisdictions should improve data collection and analysis regarding trip characteristics, level of service, injuries and fatalities on roadways.
- Local jurisdictions should use Geographical Information Systems or the Web Based Transportation Injury Mapping System to better identify high-accident locations
- Local jurisdictions should work with the State and county transportation commissions to improve the quality, timeliness, accessibility and usefulness of traffic safety data.

Challenge Area 17: Reduce Distracted Driving

- Local jurisdictions should increase frequency, consistency and publicity of Distracted Driving enforcement.
- Local jurisdictions should participate in the annual statewide cell phone/texting observational survey.

Introduction

The safety of people and goods as they travel is one of the key characteristics of any transportation system. The importance of providing a safe transportation system is emphasized by transportation and law enforcement agencies at all levels, and is recognized as one of the chief responsibilities of transportation planners.

Safety is defined as the protection of persons and property from unintentional damage or destruction caused by accidental or natural events.

In 2005, Congress passed the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), which required states to develop Strategic Highway Safety Plans (SHSPs).

The California Department of Transportation (Caltrans) responded by developing its SHSP through a participatory process with over 300 stakeholders throughout California. The overarching goal was to reduce the California roadway fatality rate to less than 1.0 fatality per 100 million vehicle miles traveled (VMT) by 2010. Caltrans is currently updating the SHSP to reflect new goals, actions and challenge areas to further reduce transportation fatalities in the State.

The following report documents how the SCAG region is meeting the SHSP goals, and details what steps should be taken to further reduce traffic fatalities in the SCAG region.

Existing Conditions

The rate of fatal and injury collisions on California's highways has declined dramatically since the California Highway patrol began keeping such data in the 1930s. California has led the nation in roadway safety for much of the past 20 years. Only recently have roadways nationally become as safe as those in California.

California's 2008 Mileage Death Rate (MDR) – Fatalities per 100 million miles traveled (100 Million VMT) is 1.05, much lower than the national MDR of 1.25. Of the five largest states in terms of total traffic fatalities, (CA, FL, TX, GA, & NC), California has the best rate.

FIGURE 1 California Mileage Death Rate (1933–2009)

Source: SWITRS

Consequences of Accidents in the SCAG Region

While the trend indicates a long-term decline in fatalities compared to VMT, it represents an unacceptable personal burden on those involved. There is also a regional burden in lost productivity, increased traffic congestion and pollution.

The National Safety Council reports that the calculable costs of motor-vehicle crashes are wage and productivity losses, medical expenses, administrative expenses, motor vehicle damage, and employers' uninsured costs. The average costs for each traffic death, traffic injury, or property damage crash were (in 2005):

- Death – $1,150,000
- Nonfatal Disabling Injury – $52,900
- Property Damage, including non-disabling injuries – $7,500

While the California SHSP focuses on activities at the State level, local governments can supplement these activities providing additional benefit. This document provides a brief overview of how jurisdictions can help in the implementation of each strategy laid out in the SHSP.

As SCAG is a planning agency, and does not coordinate enforcement, education or emergency response, this document will focus on engineering improvements. Where funding information is available for education, enforcement or emergency response, that information is provided.

Existing Conditions

The SCAG region has an extensive transportation system with over 50,000 freeway and arterial lane-miles. The region had 11.1 million licensed drivers and 13.4 million registered vehicles in 2008. The same year, over two million people rode public transit daily. Unfortunately, 1,533 people died and 124,975 were injured in traffic collisions in the SCAG region.

The primary source for collecting accident data in the California SHSP is the Statewide Integrated Traffic Reporting System (SWITRS). The California Highway Patrol collects collision data from local and State agencies. Data collected for 2008 in the SCAG region are summarized in **TABLES 1** and **2**.

TABLE 1 Traffic Fatalities in the SCAG Region (2008)

County	Driver Killed	Passenger Killed	Pedestrian Killed	Cyclist Killed	Motorcyclist Killed	Total Killed

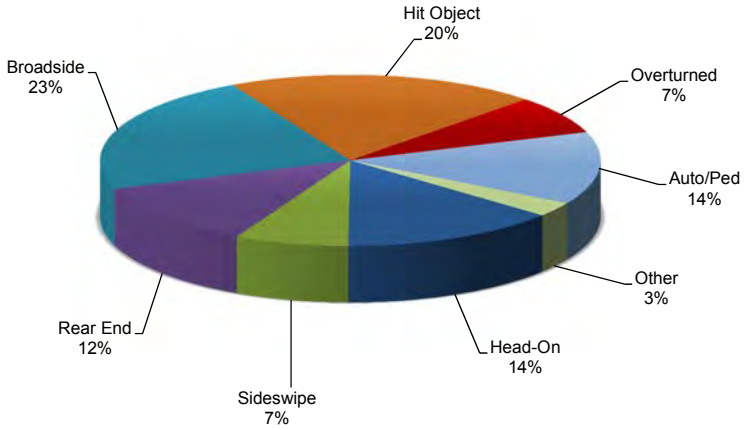
FIGURE 2 Drivers in Fatal Collisions by Type of Collision by Movement Preceding Collision



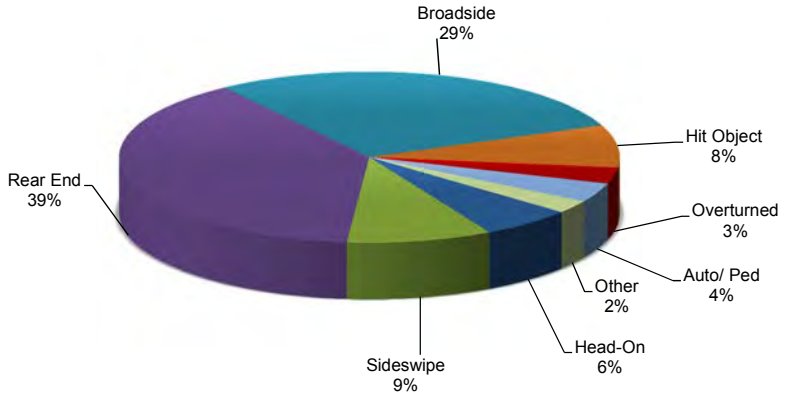


FIGURE 3 Drivers in Injury Collisions by Type of Collision by Movement Preceding Collision

In research for the SHSP, the data indicates that intersections and turns/rights of way are significant factors in many collisions within the various challenge areas (drunk driving, elderly drivers, bicycling, etc.). By placing the highest emphasis on intersection safety within each challenge area, SCAG hopes to meet the goals of the SHSP to reduce transportation fatalities as well as increase transportation safety in the region.

TABLE 7 Persons Killed by Primary Collision Factor

Persons Killed by Primary Collision Factor	2005	2006	2007	2008	2009
Driving or Bicycling Under Influence of Alcohol or Drug	23.47%	23.42%	22.89%	23.23%	23.05%
Improper Turning	20.07%	19.28%	20.09%	19.17%	19.90%
Unsafe Speed	15.85%	15.20%	17.34%	16.55%	15.02%
Pedestrian Violation	9.08%	9.44%	8.77%	10.47%	10.24%
Wrong Side of Road	7.18%	7.60%	7.03%	6.85%	5.82%
Automobile Right-of-Way	6.06%	6.43%	5.52%	6.20%	5.88%
Traffic Signals and Signs	5.23%	5.38%	5.70%	4.44%	5.43%
Unsafe Lane Change	2.21%	2.29%	2.47%	2.15%	2.99%
Unknown	2.16%	2.31%	1.79%	1.85%	2.70%
Pedestrian Right-of-Way	1.84%	2.29%	2.09%	2.71%	2.60%
Other Than Driver	1.72%	1.57%	1.13%	1.68%	2.24%

Challenge Area 1:
Reduce Impaired Driving-Related Fatalities

California SHSP Goal: By 2010, reduce the number of roadway user fatalities attributed to alcohol and drug use by 15 percent from their 2004 level.

TABLE 8 Traffic Deaths Related to Alcohol or Drugs

	2004	2005	2006	2007	2008	2009	Goal (15% Below 2004 Levels	% Increase/ Decrease from Goal
Imperial	20	11	4	13	6	7	17	-58.82%
Los Angeles	259	240	276	268	258	204	220	-7.34%
Orange	67	78	80	75	62	62	57	8.87%
Riverside	116	112	136	129	101	87	99	-11.76%
San Bernardino	138	120	133	105	94	98	117	-16.45%
Ventura	19	16	31	28	27	23	16	42.41%
SCAG Region	**619**	**577**	**660**	**618**	**548**	**481**	**526**	**-8.58%**
Total	**1,462**	**1,387**	**1,420**	**1,347**	**1,239**	**1,146**	**1,243**	**-7.78%**

While the SCAG region has seen a decline in DUI/Drug collision fatalities since 2004 exceeding the goal set by the State, Orange County and Ventura County still exceed the goal. In addition, there was a sharp rise in fatalities in most SCAG counties in 2006 indicating that a reversal in the trend of reduced DUI fatalities could easily occur.

In addition, data indicates a significant rise in alcohol related fatalities beginning when drivers turn 18.

FIGURE 4 Persons Killed in Alcohol Involved Collisions by Age of Victim

SCAG Response

SCAG has no implementation authority, so can do little to enforce traffic laws, educate travelers, or provide EMS. What SCAG can do is work with the state and county transportation commissions to develop projects that promote the goals of the strategic highway safety plan, in conjunction with the enforcement, education and EMS goals. Local Governments should consider the following strategies from the SHSP Implementation Plan:

1.1 Consider increasing frequency, consistency, and publicity of sobriety checkpoint operations by law enforcement agencies in areas with the highest fatality rates.

Law enforcement increased the number of checkpoints in 2010 compared to a year earlier at the 50 cities with the highest rates of DUI fatalities. DUI arrests at the checkpoints increased by almost 25 percent.

Cities/counties can continue this work by pursuing NHTSA Incentive/Transfer Program Grants under S23 U.S.C. 402 or 23 U.S.C. 410

1.2 Encourage and increase statewide crime laboratory support and distribution of portable evidential breath testing devices to allow for increased use by law enforcement personnel.

The California Office of Traffic Safety (OTS) solicited counties to apply for funding for new PEBT devices. Kern and Ventura Counties were awarded 2010 grants. OTS funded $1.7 million toward support and infrastructure to the Department of Justice's (DOJ) project to replace existing PEBT devices.

Cities/Counties can continue this work by pursuing NHTSA Incentive/Transfer Program Grants under Section 410: Alcohol Impaired Driving Countermeasure Incentive Grants.

Cities and Counties should consider many of the following additional strategies as they relate to local measures to reduce DUI fatalities.

1.3 Implement and maintain the Traffic Safety Resource Prosecutor program including specialized (DUI) prosecution training statewide and DUI prosecutor mentoring.

1.4 Promote implementation of vertical prosecution of DUI offenders.

1.5 Institute programs that provide intense monitoring of "worst of the worst" repeat DUI offenders.

1.6 Develop uniform and consistent system for hospital staff to notify law enforcement upon the arrival of a person who has been involved in a traffic collision in which alcohol may have been involved.

1.7 Design and develop a study to identify discrepancies in county DUI rates and develop recommendations for system improvements.

1.8 Increase, by 15 percent, the number of law enforcement officers who are trained and certified as Drug Recognition Evaluator officers.

1.9 Develop protocol and staffing to expand use of Screening and Brief Intervention Programs in hospitals and trauma centers, and encourage courts to obtain pre-sentence alcohol and drug screening investigations as authorized in Vehicle Code Section 23249.50 and include resulting recommended treatments in sentencing of convicted DUI offenders.

1.10 Track and report in the Department of Motor Vehicles (DMV) DUI Management Information System annual report the enrollment and completion rates of DUI offenders into alcohol programs.

1.11 Increase the use of Minor Decoy and Decoy Shoulder Tap Programs to detect and deter the furnishing of alcohol to minors.

1.12 DUI countermeasure evaluations including an increase in the use of home arrest (electronic confinement) for nonviolent DUI offenders.

1.13 Develop and distribute a "tool kit" identifying programs, providers, and resources that will assist communities in implementing effective community-based, comprehensive, multijurisdictional DUI task forces.

1.14 Encourage Licensee Education on Alcohol and Drugs training to retail licensees and their employees.

1.15 Encourage full law enforcement, forensic laboratory, and DMV compliance and application of the administrative license suspension law provisions, through ongoing administrative training and outreach to law enforcement agencies, and by continuously tracking and reporting statewide and regional administrative operation trends.

1.16 Facilitate the development and distribution of reference materials for use by judicial officers in court at entry of plea and sentencing proceedings to include mandatory sentencing requirements for license suspension, treatment programs, ignition interlock requirements, enhancements for elevated Blood Alcohol Content (BAC) levels, and open container laws.

1.17 Increase publicity of the DUI Management Information System annual report to law enforcement, alcohol program providers, and the courts.

Challenge Area 2: Reduce the Occurrence and Consequence of Leaving the Roadway and Head-On Collisions

California SHSP Goal: By 2010, reduce the number of fatalities attributed to vehicles leaving the roadway by 15 percent from their 2004 level.

"Within California, data shows that the number of fatalities from vehicles leaving the roadway and head-on collisions accounted for 34 percent of total fatalities from

2002–2004. Although lower than the national average, further safety improvements are possible. In order to reduce the fatalities and injuries resulting from vehicles leaving the road, efforts must be made to: (1) keep vehicles from leaving the road, (2) reduce the likelihood and severity of errant vehicles crashing into fixed objects, and (3) reduce the likelihood of errant vehicles overturning."

California intends to employ the following strategies to reduce the occurrence and consequence of leaving the roadway:

1. Keep vehicles on the roadway.
2. Minimize the consequences of leaving the roadway.
3. Reduce head-on collisions.
4. Apply advanced technology to reduce collisions.

SCAG Response

Work with subregions and county transportation commissions to continue to incorporate into highway construction/reconstruction methods to warn drivers (such as rumble strips, "Botts' Dots," pavement markers, curve warning signs/beacons) they are leaving the highway or wandering into other lanes.

Support the continuing deployment of high visibility signage and road striping that enhance driver's ability to notice, recognize and respond to warning signs during nighttime or periods of inclement weather.

Strategies that the State is pursuing where local governments can provide assistance include:

2.1 Implement a program to reduce run-off-road collisions on local roadways.

2.2 Develop a collision severity reduction program for local roadways.

2.3 Enhance existing collision concentration identification programs (specifically the Tables C and C Wet in the Traffic Accident and Surveillance Analysis System (TASAS) database) on the State Highway System.

2.4 Develop a program for local roadways that monitors 2- and 3- lane roadways for cross centerline collision concentrations.

2.5 Enhance the existing 2- and 3- Lane Monitoring Program on State Highway System.

2.6 Enhance the 210.015 Collision Severity Reduction Program on the State Highway System.

2.7 Continue to implement and enhance the Run Off Road Program on the State Highway System.

2.8 Continue to implement and enhance the Median Barrier Monitoring System on the State Highway System.

Challenge Area 3: Ensure Drivers are Properly Licensed

California SHSP Goal: By 2010, reduce the number of fatalities attributed to drivers with no license, invalid license, or not licensed for class of vehicle by 15 percent from their 2004 level.

California intends to employ the following strategies to address the challenge of unlicensed and incompetent drivers:

1. Improve the initial licensing process.
2. Improve the competency of licensed California drivers.
3. Improve how California manages unlicensed drivers.
4. Improve how California manages drivers who operate vehicles with a suspended or revoked license.

SCAG Response

While SCAG has an interest in ensuring drivers are [properly licensed, SCAG has no implementation authority with regard to the strategies and implementation plan. Implementation is at a State level.

For reference, the implementation strategies from the Strategic Highway Safety Plan are listed below.

3.1 Improve driver competency assessment tools to improve the renewal driver licensing process.

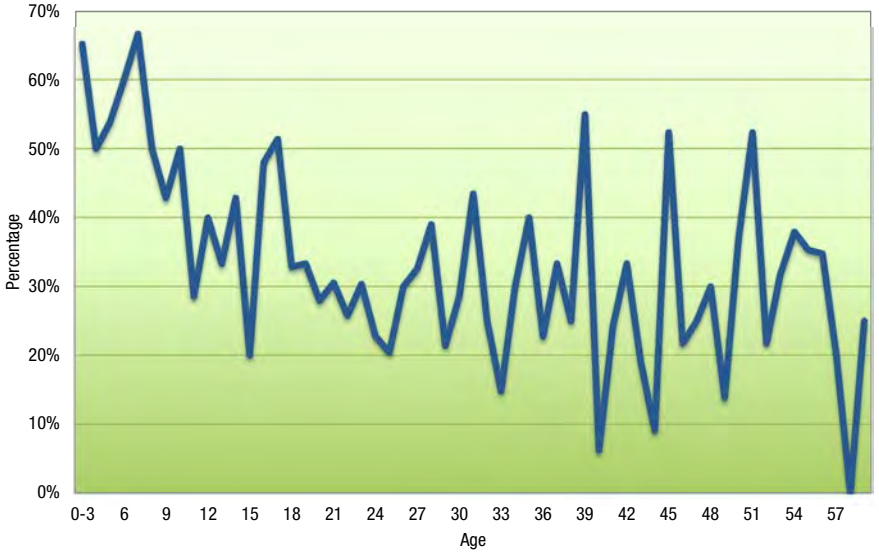
3.2 Improve educational components to inform the public about the new laws as new initial licensing and renewal licensing laws are implemented and established.

3.3 Encourage and increase vehicle impoundment for drivers whose licenses are suspended or revoked, or who are unlicensed.

3.4 Create a public awareness campaign addressing the consequences of driving without a valid license.

3.5 Improve driver competency assessment tools to improve the initial driver licensing process.

3.6 Examine the reasons why some individuals choose to drive without a proper license rather than reinstate licensing privileges when eligible and based on this information propose ways to increase the reinstatement rate.



3.7 Increase the integrity of the written testing process for driver license

Challenge Area 4: Increase Use of Safety Belts and Child Safety Seats

California SHSP Goal: By 2010, increase statewide safety belt usage from the 2005 level of 92.5 percent to 95 percent, improve the use of child safety seats from 2005 level of 86.9 percent to 90.0 percent, and increase the percent of all vehicle occupant fatalities that are restrained to 70 percent.

The combination of air bags and lap and shoulder safety belts offers the most effective safety protection available for passenger vehicle occupants. California reports a 92.5 percent usage of safety belts in motor vehicles for 2005, yet in 60 percent of traffic fatalities involving victims under age 9 in California, safety devices were not used.

FIGURE 5 Percentage of California Traffic Fatalities Where Safety Equipment Was Not Used (by Age) 2009

Nearly 150 children under age 5 were killed in vehicle collisions within the SCAG region between 2004 and 2009, an average of 24.6/year.

TABLE 9 Passenger Victims Aged 5 and Under Killed in Collisions by County

	2004	2005	2006	2007	2008	2009
Imperial	2	2	0	1	0	1
Los Angeles	7	8	5	5	5	7
Orange	3	1	0	3	3	1

Ventura	0	3	1	1	2	1
Total	**29**	**27**	**19**	**28**	**22**	**20**

While SCAG has an interest in ensuring vehicle safety equipment is used, SCAG has no implementation authority with regard to the strategies and implementation plan. Implementation is at a State level and local level.

Localities can provide increased enforcement, particularly for child safety device usage and seat belt use among young (15–24) drivers and passengers.

For reference, the implementation strategies from the Strategic Highway Safety Plan are listed below.

4.1 Implement occupant protection programs targeted at ages 15–24 years.

4.2 Encourage increased enforcement and education campaigns for occupant protection programs.

4.3 Implement education campaigns for child passenger safety usage.

4.4 Develop and implement a social norms (media) campaign targeted to ages 15–24 years to influence or promote seat belt usage.

4.5 Initiate a project to develop a system that links the California Emergency Medical Services Information System (CEMSIS), SWITRS, and medical data (for example, data on injuries treated in hospitals and emergency departments.

4.6 Encourage prioritization of child passenger safety enforcement statewide.

4.7 Enhance occupant protection curriculum and oversight in all traffic related education programs.

4.8 Incorporate child passenger safety training (from certified child passenger safety trainers) into firefighter, health care, law enforcement, community-based organizations, and child care curricula/training for both initial and continuing education.

4.9 Promote the establishment of permanent child passenger safety fitting stations with paid staff, targeting counties based on need.

4.10 Develop a program that increases the accuracy of California child safety occupant protection misuse data.

4.11 Improve the child passenger safety violator process.

4.12 Implement substantially more child passenger violator educational programs statewide.

Challenge Area 5: Improve Driver Decisions about Rights-of-way and Turning

California SHSP Goal: By 2010, reduce the number of fatalities attributed to improper rights of way and turning decisions by 10 percent from their 2004 level.

In 2009, California was 17.7 percent below the goal, a remarkable achievement. However, driver errors in rights of way and turning represent nearly 40 percent of all traffic fatalities in California. Improper turning represented the most frequently cited collision factor representing nearly 20 percent of all traffic fatalities in 2009.

TABLE 11 Fatalities by Primary Collision Factor as a Percentage of All Traffic Fatalities

	Crossing in crosswalk - at intersection	Crossing in crosswalk – not at intersection	Crossing – not in crosswalk	In roadway – includes shoulder	Not in roadway	Approach/leave school bus	Not Stated	Total
0–4	2.30%	2.70%	6.30%	3.30%	5.30%		3.30%	3.80%
5–14	13.90%	14.70%	23.90%	9.90%	11.80%	18.20%	13.10%	15.80%
15–24	22.20%	24.90%	20.00%	24.10%	19.20%	18.20%	25.70%	21.80%
25–34	12.60%	10.50%	9.80%	17.50%	13.40%	9.10%	14.80%	12.70%
35–44	10.50%	12.30%	9.30%	15.30%	12.00%	9.10%	10.90%	11.10%
45–54	13.90%	10.50%	12.70%	14.70%	14.30%	36.40%	10.90%	13.70%
55–64	10.60%	9.90%	7.90%	7.80%	10.50%	9.10%	10.40%	9.40%
65 and over	13.30%	13.50%	9.30%	6.50%	13.20%		8.70%	11.00%
Total	**44.20%**	**2.40%**	**27.30%**	**16.50%**	**8.10%**	**0.10%**	**1.30%**	**100.00%**

The Challenge Area Team defined Rights of Way and Turning as the following:

RIGHT OF WAY is a driving concept that is fundamental to the most important decision that a driver makes. It is more commonly associated with decisions to cross or enter an intersection, but it also applies to maneuvers performed along a uni-directional flow of traffic (e.g. weaving, passing, merging and diverging).

IMPROPER TURNING is the primary collision factor (PCF) most often reported when vehicles traveling on highway segments (i.e. between access points) leave their lane, then the highway, and then crash along the roadside.

UNSAFE LANE CHANGING – is also used to report collisions on highway segments, but with one difference: the offending vehicle collides with a vehicle in an adjacent or other lane before it can leave the highway. IMPROPER TURNING and UNSAFE LANE CHANGING are closely related, and can be mitigated with the same improvement strategies.

The Challenge Area Team developed the following hypotheses concerning the conditions causing improper Rights of Way and Turning decisions. The two most prevalent operating conditions that occur on a regular (at least daily) basis at high collision locations include:

a. Combination of high volumes and speeds
b. Combination of unstable flow and speed differential between adjacent lanes; this condition is noteworthy because it is the primary source of abrupt or last second lane changing that appears to present a higher risk or potential for collisions than ordinary lane changing.

The most common physical (geometric) conditions or deficiencies at locations or segments with concentrated collisions are:

a. Access points that meet, or violate the minimum spacing requirements (per Caltrans or AASHTO policy)
b. Cross-sections of eight or more lanes (4 or more lanes in one direction of travel)
c. High ramp density due to closely spaced access points and multiple ramps serving single interchanges (due to high volumes seeking to enter or exit a freeway).

The most complex combination of geometrics, operational maneuvers and decision-making occurs along freeway corridors containing HOV lanes, especially when limited access design and operation is employed (the standard practice in Southern California). These facilities usually have the highest volume of traffic, the widest cross sections, a high level of recurrent and non-recurrent congestion, and left-side access openings between the HOV lane and adjacent freeway lanes that are superimposed over the existing right-side access ramps in a way that violates standard interchange spacing requirements.

A large percentage of collisions for this Challenge Area are located in the Los Angeles Basin - the area comprised of LA and Orange Counties, and parts of Ventura, Riverside and San Bernardino Counties.

This area contains:

- The highest volume highways (freeways) in the state
- The most congested highways (freeways) in the state
- The most lane miles of HOV lane found anywhere in the state (or nation)
- The highest density of freeway access points in the state (especially where HOV access openings have been superimposed on the existing freeway system)
- The longest commutes in the state (in terms of both distance and duration).

Finally, it is important to recognize that millions of decisions related to operational maneuvers occur throughout the entire highway network on a daily basis, yet collisions are concentrated over a very small portion of the infrastructure, and only when a certain combination of conditions exist. This clearly suggests that the frequency of maneuvers is not by itself responsible for collision concentrations. In fact, the presence of specific geometric features (including deficiencies) and operating conditions are prerequisites for collision concentrations.

STRATEGIES

California intends to employ the following strategies to reduce the number of fatalities attributed to improper rights of way and turning decisions:

1. Educate drivers on turning rules to support proper turning decisions.
2. Increase enforcement of drivers who make unsafe turns.
3. Employ traffic control devices, traffic calming, and speed-reduction design practices to reduce the likelihood and severity of crashes related to turning movements.
4. Improve roadway geometrics to restrict unsafe turns by motor vehicles.
5. Apply advanced technology to reduce collisions.

SCAG Response

Support the use of traffic control devices, traffic calming, and speed-reduction design practices to reduce the likelihood and severity of crashes related to turning movements.

Support improved roadway geometrics to restrict unsafe turns by motor vehicles.

Support the use of advanced technology and ITS to reduce collisions.

Encourage local governments to use the Transportation Injury Mapping System (TIMS) [See http://tims.berkeley.edu/index.php] to identify high crash locations within their jurisdictions.

5.1 Develop and encourage implementation of a systematic approach to the identification and improvement of existing and potential “high crash concentration locations” involving improper driver decisions about rights-of-way and turning.

5.2 Develop and encourage implementation of a systematic approach for the review of traffic control devices to identify devices in need of replacement, relocation or upgrade prior to the routine maintenance cycle.

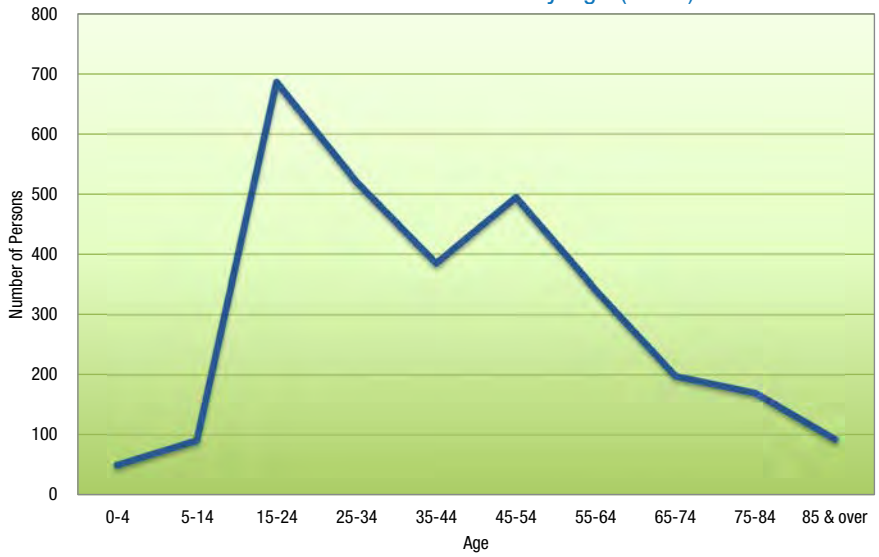
5.3 Review driver education materials and procedures to include turning rules to support proper turning decisions.

5.4 Explore and implement approved technologies being used by other states and countries to reduce severe traffic collisions associated with turning and lane changing on high-speed, multilane facilities.

5.5 Expand the use of existing technology-based tools and strategies that have been demonstrated to correct or minimize the traffic operating conditions that are a primary cause of collisions related to abrupt lane changing near freeway merge and diverge points.

5.6 Improve and update highway design and operational policy, standards, and practices to reflect safety-related lessons learned and research findings. Apply new policy, standards, and practices during the planning and design of improvement projects on high-speed, multilane highway facilities.

5.7 Support new and ongoing research and development projects associated with in-vehicle communication and information technologies to help detect and warn drivers of potential collision with other vehicles in the adjacent lane during lane change maneuvers.



Challenge Area 6: Reduce Young Driver Fatalities

California SHSP Goal: By 2010, reduce the number of fatalities attributed to drivers age 15–20 by 15 percent from their 2004 level.

In 2004, 983 persons aged 15–24 were killed on roadways in California. Nearly 550 of them were drivers of motor vehicles. To reach the goal, driver deaths in this age group would have to decline to below 468 by 2010. In 2009, 372 drivers, aged 15–24 were killed, exceeding the goal set in the Strategic Highway Safety Plan.

Motor Vehicle accidents are the leading cause of death for young drivers. As the Figure 8 indicates, fatalities rapidly increase by age up until age 25, where they decline to levels normally associated with older, more experienced drivers.

FIGURE 6 Persons Killed in Traffic Collisions by Age (2009)

STRATEGIES

As part of its SHSP Implementation Plan, Caltrans developed the following strategies:

6.1 Implement the Driver Performance Evaluation drive test, as originally developed, to include freeway driving.

6.2 Establish a task force to resolve issues and make recommendations related to improving driver education and training.

6.3 Increase the use of law enforcement for graduated driver licensing outreach programs and proactive enforcement.

6.4 Initiate a program that promotes usage of parent-teen contracts related to driving privileges.

6.5 Expand the implementation of young driver programs such as: Smart Start, Right Turn, Teen Smart, Every 15 minutes, Friday-night Live, Sober Graduation, and Target Responsibility for Alcohol Connected Emergencies (TRACE), and encourage development of new programs.

6.6 Modify completion certificates for the required driver education and training courses to allow the DMV to include information on the driver record reflecting the modality of course offered as well as the type of organization that conducted the training.

6.7 Implement program to have DMV send a congratulatory letter to every provisional licensee that goes six months without any violations or collisions, until the provisional status is terminated at age 18 years. Encourage the insurance industry to provide discounts for parents and teens who receive a letter.

6.8 Increase schools district awareness of the State-legislated Safe Routes to School Program (SR2S) and the federal Safe Routes to School (SRTS) Program and encourage implementation of elements of these programs whenever possible if funding is insufficient for a comprehensive implementation.

6.9 Establish a task force to work with existing statewide media campaigns and to develop and pursue use of public service announcements to convey traffic safety messages related to young drivers and use of alcohol and drugs.

6.10 Encourage additional local communities to implement and maintain anti-DUI programs such as, Teenage Party Prevention, Enforcement and Dispersal, Minor Decoy Program, the Shoulder Tap Program, and TRACE.

SCAG Response

SCAG has no jurisdiction regarding the licensing of drivers

Challenge Area 7: Improve Intersection and Interchange Safety for Roadway Users

California SHSP Goal: By 2010, reduce the number of intersection crash fatalities by 15 percent from their 2004 level.

Over 166,000 people were injured or killed at intersections in the SCAG region between 2003 and 2005 (an annual average of 55,333), representing nearly 22 percent of traffic fatalities and 35 percent of all traffic injury and fatality victims.

The Challenge Area Team noted that in California, on average, during 2003-2005, more than 97,000 people were injured or killed each year attempting to navigate the unique characteristics of roadways crossing another road or railroad tracks. There are several major aspects of the fatal intersection safety problem. Fatal collisions tended to:

- Occur on local roads (80 percent),
- Involve broadside collisions (64 percent), and/or
- Involve violations of traffic signals, stop signs, or another user's right of way (58 percent).

Collisions at intersections represent the greatest factor in a majority of the challenge areas. Pedestrians, young drivers, older drivers and impaired drivers each represent over 20 percent of fatalities and injuries at intersections.

STRATEGIES

Seven strategies were developed that, along with relevant strategies from other challenge areas, have the potential to reduce fatalities at intersections and interchanges. These include:

7.1 Review existing or potential high-crash intersections and implement appropriate safety countermeasures, including but not limited to: visibility, advance warning, signal timing, access control, geometrics, operation and safety of all transportation modes, the use of roundabouts, intelligent transportation system tools, and targeted law enforcement.

7.2 Review existing or potential high-crash interchanges and implement appropriate safety countermeasures, including but not limited to: visibility, advance warning, access control, geometrics, operation and safety of all transportation modes, intelligent transportation system tools, and targeted law enforcement.

7.3 Establish a program, or utilize an existing program, for proactive review and safety improvements at rural high-crash concentration locations.

7.4 Review existing or potential high-crash at-grade railroad-highway crossings for contributing factors and implement Median Island Program or make other improvements such as visibility, advance warning, and geometrics.

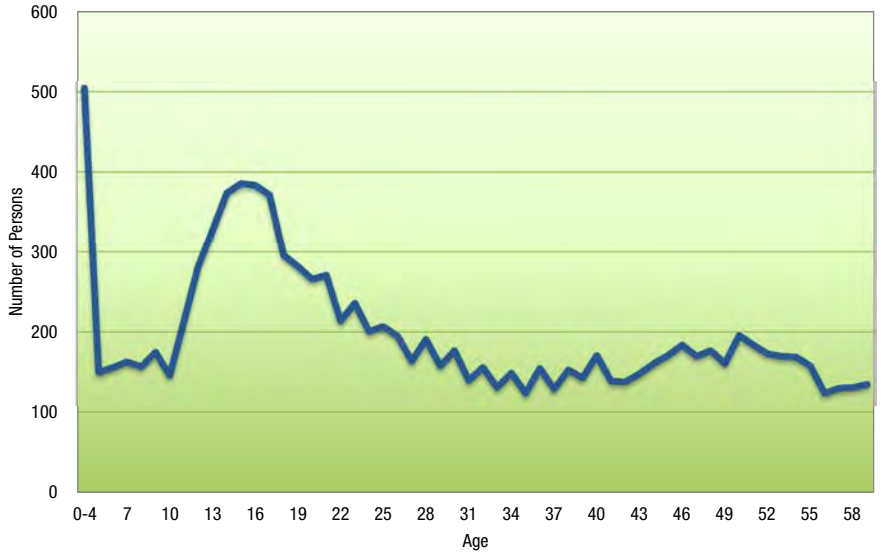
7.5 Review existing or potential high-crash offset "T" intersections and convert to four-legged, signalized intersections as appropriate to improve traffic operations and safety.

7.6 Assess both the DMV's current California Driver Handbook and standard traffic school curriculum for information on intersection/interchange safety and make necessary additions and revisions.

7.7 Establish a State program to encourage local agencies to participate in blueprint visioning planning with participating MPOs/RTPA to provide streetscapes that incorporate land use and traffic measures that increase the safety of the intersections for pedestrian, bicyclists, and motorists.

SCAG Response

SCAG is working with communities as part of the blueprint process in order to coordinate local land use with transportation. This process incorporates transit oriented development and walkable communities. This can include:



- Incorporate intersection safety into the compass blueprint strategy.
- Incorporate ITS at high incident intersections to reduce red-light violations causing collisions.

- Encourage clearly marked, visible crosswalks
- Encourage the installation of improved visibility traffic signals as part of the normal traffic signal replacement cycle.
- Encourage development of median sanctuaries for pedestrians
- Support signalization at problem non-signalized intersections
- Encourage changing intersection geometries, where applicable. (offset intersection to aligned intersection, intersection to interchange, intersection to roundabout)

Challenge Area 8: Make Walking and Street Crossing Safer

California SHSP Goal: By 2010, reduce the number of pedestrian fatalities attributed to vehicle collisions by 25 percent from their 2000 level.

FIGURE 7 Pedestrians Injured by Age

Over 7,500 pedestrians were injured or killed in the SCAG region in 2009. Los Angeles County, the most urbanized, has the highest number of killed and injured. In looking at percentages, Los Angeles County leads also (the lower absolute number of fatalities and injuries in Imperial County skews the data).

One goal of the California Strategic Highway Safety Plan is "By 2010, reduce the number of pedestrian fatalities attributed to vehicle collisions by 25 percent from their 2000 level." The SCAG region had 349 pedestrian fatalities in 2000. That would entail reducing pedestrian fatalities to less than 280 by 2010. In 2009, SCAG had 312 pedestrian fatalities. While progress is being made, the region is still significantly higher than the goal.

SCAG reviewed the SWITRS fatality and injury data. The results of this data indicate:

- The months of October through January have disproportionately high numbers of pedestrian injuries.
- Fridays and Saturdays have disproportionately high numbers of pedestrian fatalities and severe injuries.
- The highest percentage of pedestrian injuries and fatalities (44 percent) occurred while crossing in a crosswalk at an intersection
- Although the bulk of walking trips take place during daylight hours, 60 percent of pedestrian fatalities occur during the hours of 7 PM to 7 AM.
- Two-thirds of pedestrians killed in the State and 60 percent of those injured were male.
- Older pedestrians (65 and over) account for 19 percent of pedestrian injuries, but 25 percent of pedestrian fatalities.
- Children 14 and under account for 20 percent of pedestrian injuries, yet only 5 percent of pedestrian fatalities.
- Somewhat lower vehicle speeds in urban areas increase survivability of vehicle occupants in a collision, increasing the proportion of pedestrian fatalities to all traffic fatalities.

STRATEGIES

The California SHSP intends to employ the following overall strategies to reduce pedestrian fatalities:

1. Incorporate pedestrian safety into smart growth, land use planning, and other local plans.

2. Enhance the enforcement of violations of pedestrian law by pedestrians and motorists.
3. Educate all roadway users regarding the rights and responsibilities of pedestrians.
4. Promote and improve roadway safety infrastructure for pedestrians including the use of advanced technology.
5. Improve the visibility of pedestrians on the roadway.
6. Improve the safety of pedestrians traveling to and from schools.
7. Improve data collection and analysis regarding pedestrian trip characteristics, level of service, injuries and fatalities on California roadways.
8. Improve pedestrian safety expertise among transportation professionals and others involved in the design process.
9. Consider pedestrian needs in all roadway and transit projects.
10. Reduce vehicle speeds on urban thoroughfares and rural highways.

SCAG Response

- Encourage cities and counties to develop funding mechanisms to maintain and improve sidewalks and intersections to make them ADA compliant
- Encourage every city to develop Safe Routes to School policies and plans
- Encourage cities and counties to consider the needs of elderly and persons with disabilities crossing streets and develop appropriate countermeasures for their safety.
- Encourage cities and counties to integrate pedestrian safety into general & specific plans, non-motorized transportation plans and other land use policy documents
- Encourage the development of Pedestrian Safety Action Plans in all urban and rural communities
- Incorporate applicable Complete Streets policies—providing safe access for all modes—as fundamental principles of transportation plans
- Encourage safe, convenient, high visibility pedestrian crossings at mid-block and intersection locations on urban thoroughfares and rural highways.
- Encourage clearly marked, visible crosswalks at intersections and mid block locations
- Encourage the use of advanced signalization at intersections
- Encourage pedestrian and bicycle safety in all maintenance projects where new striping will be required or existing striping is to be replaced

8.1 Expand the SRTS to implement a comprehensive, age-appropriate approach to school traffic safety, including school facilities planning, collaboration, and coordination among those responsible for education, transportation, and land use planning to maximize safety for children walking to and from schools.

8.2 Develop pedestrian safety improvement programs to identify and improve safety at high-crash concentration locations involving pedestrians.

8.3 Form a task force to assist in development of pedestrian safety action plans, to facilitate training delivery, and to establish pedestrian safety improvement programs in California's urban and rural communities.

8.4 Promote pedestrian safety audits and implementation of recommendations.

8.5 Establish a Pedestrian Safety Data Think Tank to develop and implement a comprehensive Pedestrian Safety Data Plan which improves and institutionalizes pedestrian safety data collection and analysis, ensures that existing data collection efforts include information on pedestrian fatalities, injuries, and exposure, and implements a readily available format for local research and investigation.

8.6 Improve pedestrian striping and include standard safety upgrades in routine maintenance and striping projects.

8.7 Assess both the DMV's California Driver Handbook and standard traffic school curriculum for information on pedestrian-related laws, collision factors, and defensive walking and make additions/revisions as necessary. Develop and provide complementary ongoing pedestrian safety education materials reinforced with public information programs.

8.8 Implement Complete Streets—providing safe access for all modes—and model pedestrian safety principles as fundamental in transportation and land use plans with incentives to cities, counties, and regions to integrate pedestrian safety in general and specific land use plans, transportation plans, and other policy documents.

Challenge Area 9: Improve Safety for Older Roadway Users

California SHSP Goal: By 2010, reduce the number of fatalities attributed to drivers age 65 and older by 10 percent from their 2004 level.

Older drivers tend to self-regulate, driving less, avoiding rush hour and nighttime driving unless necessary. However, that means that older drivers are over represented when taking into account vehicle miles traveled. In addition, the frailty associated with advancing years means that older drivers are more likely to succumb to injuries in a minor collision than a younger person.

Intersections pose a particular safety problem for older drivers. Navigating through intersections requires the ability to make rapid decisions, react quickly, and accurately judge speed and distance. As these abilities can diminish through aging, older drivers have more difficulties at intersections and are more likely to be involved in a fatal crash at these locations. Research shows that 37 percent of traffic-related fatalities involving drivers aged 65 and older occur at intersections compared with 18 percent for drivers aged 26 to 646.

"Failure-to-yield crashes occurred most often when drivers were turning left and occurred more frequently at stop signs than at signalized intersections. One reason was because failure-to-yield crashes at traffic signals were coded only for drivers turning left or right (going straight through a red light was coded as ran traffic control), whereas failure-to-yield crashes at stop signs were coded for drivers traveling straight as well as turning left or right. However, even among failure-to-yield crashes when drivers were turning left or right, a greater percentage occurred at stop signs (45 percent) than at signalized intersections (29 percent)..."

"...Compared with drivers of other ages, drivers ages 70–79 made more evaluation errors in failure-to-yield crashes, and these errors generally occurred when drivers saw the other vehicles but misjudged whether there was enough time to proceed."[7]

This may occur because of the level of cooperation needed at unsignalized intersections. At signalized intersections, the light dictates who moves. At a stop sign, there is greater interaction within the intersection proper. Some drivers enter the intersection "out of order" or come close to other cars already in the intersection "Among the oldest drivers, failure to see other vehicles may be due to age-related declines in visual ability or decreased ability to process multiple sources of information simultaneously." At "two way stop" intersections, the problems include, determining two-way or four-way stop, and assessing speed of non-stopping cars.

Recognizing that intersections are particularly problematic for older drivers, the FHWA's top priority in its Highway Design Handbook for Older Drivers and Pedestrians is intersection improvements. Practices to improve older drivers' ability to navigate intersections include using bigger signs with larger lettering to identify street names, consistent placement of lane use signs and arrow pavement markings, aligning lanes to improve drivers' ability to see oncoming traffic, and using reflective markers on medians and island curbs at intersections to make them easier to see at night.

STRATEGIES

California intends to employ the following strategies to reduce older driver crashes:

1. Improve driver licensing testing and assessment procedures to more accurately reflect behind-the-wheel capabilities.
2. Create and promote wellness and behavioral strategies for older persons, making it possible for them to drive safely for added years.
3. Enhance law enforcement training to recognize older driver behaviors that may necessitate priority driver license re-examinations, and provide law enforcement with a broader understanding of older driver sensitivities.
4. Develop public education materials, programs and tactics that clearly explain how the aging process affects driving and what families, friends and the public can do to help seniors (1) drive for more years safely and (2) transition comfortably to alternate forms of transportation when driving ceases.
5. Explain and encourage older persons' self-assessment of driving abilities and how to take advantage of that information to make appropriate decisions about driving.
6. Seek the cooperation and coordination of the transit (bus, light rail, etc.) community to make these transportation options more accommodating and practical for older persons who can no longer drive.
7. Implement advancements in highway lighting, striping, signing and engineering practices to make the highway environment safer for older drivers.

8. Leverage the programs and resources of the Older Californian Traffic Safety Task Force to help with accomplishment of stated objectives.
9. Promote the establishment and enhanced capacity of occupational therapy driving evaluation and rehabilitation programs that serve seniors.
10. Improve the ability of health care professionals to provide effective assessment, counseling, and remediation to improve safe mobility of seniors.

SCAG Response

- Support JARC/New Freedom, paratransit to include those over 65 years of age.
- Support roadway, intersection and interchange improvements that support improving rights of way decision by older drivers.
- Encourage formation and expanded use of Supplemental Transportation Systems (STPs), particularly in locations where standard public transit is sparse or unavailable.
- Support signage and striping that enhance driver's ability to notice, recognize and respond to warning signs during nighttime and/or inclement weather conditions.

9.1 Implement and widely disseminate older driver safety and mobility programs of partner organizations.

9.2 Improve left-turn options and intersections to meet the needs of older drivers.

9.3 Provide statewide training, tools, and outreach to physicians and other health care providers on driving and dementia.

9.4 Continue to hold the yearly Senior Safe Mobility Summit to:
(1) Stimulate communities to assess the need for, and if needed, offer transportation choices more responsive to the needs of older adults, and
(2) Assist seniors to remain safe drivers for as long as possible.

9.5 Encourage implementation and installation of traffic control devices included in California Manual on Uniform Traffic Control Devices (CAMUTCD) to accommodate older drivers and pedestrians, particularly in areas with senior populations.

9.6 Provide training to local and county design engineers and others on CAMUTCD-approved recommendations for accommodating older drivers and pedestrians.

9.7 Expand senior orientation and travel training by all major transit systems initially and smaller systems eventually.

9.8 Implement a multimedia education campaign to:
(1) broaden senior awareness of transportation options
(2) increase senior willingness to use these options; and
(3) enlist the support of families, friends, and the community in helping seniors transition to alternative forms of transportation.

9.9 Encourage all California law enforcement agencies to adopt a policy to use the revised Form DS427, Notice of Priority Re-Examination, to standardize the process throughout the state.

9.10 Encourage formation and expanded use of supplemental transportation systems, particularly where standard public transit is sparse or unavailable.

9.11 Seek approval from the Commission on Peace Officers Standards and Training to incorporate the National Highway Traffic Safety Administration National Older Driver Law Enforcement Curriculum into the core curriculum taught at California's law enforcement academies.

9.12 Develop models for funding occupational therapist evaluation of older persons' functional driving skills.

9.13 Encourage efforts to establish a mobility action plan as described in Senate Bill 910 for California and to form a Mobility Council, which would oversee activities to ensure the action plan is carried out. Recommend that the Mobility Council include consumer representation.

Challenge Area 10. Reduce Speeding and Aggressive Driving

California SHSP Goal: By 2010, reduce the number of fatalities attributed to speeding and other forms of aggressive driving by 15 percent from their 2004 level.

The SHSP Challenge Area Team performed a review of the statistics from SWTRS reports between 2003 and 2005. The results indicate a number of trends in California:

The five counties having the highest number of aggressive driving fatalities in the state are Los Angeles (25.1 percent), San Diego (9.5 percent), San Bernardino (7.6 percent), Riverside (7.1 percent) and Orange (4.8 percent).

STRATEGIES

California intends to employ the following strategies to reduce speeding and aggressive driving collisions.

The SHSP Implementation Plan will present specific action items to implement these strategies:

1. Change our social norms to reduce the acceptability of speeding and other forms of aggressive driving.
2. Provide targeted enforcement to locations prone to speeding and other forms of and aggressive driving.
3. Employ engineering methods to deter speeding and other forms of aggressive driving (e.g. traffic calming).
4. Ensure consistent adjudication of drivers cited for speeding and other forms of aggressive driving.
5. Apply advanced technology to reduce collisions.
6. Reduce the presence of speeding, unsafe and aggressive driving on the television and in movies.

SCAG Response

Work with the State and county transportation commissions to determine if various project submissions have potential benefit to safety in this challenge area.

10.1 Develop a statewide definition for aggressive driving.

10.2 Conduct public information and education media outreach campaign.

10.3 Develop and encourage implementation of a systematic approach to identify and improve safety in high-crash concentration locations involving speeding and aggressive driving.

10.4 Form multijurisdictional traffic enforcement teams to address speeding and aggressive driving.

10.5 Employ vehicle impounding as a potential deterrent to speeding and aggressive driving.

10.6 Educate traffic commissioners and judges with consistent training programs on speeding and aggressive driving.

10.7 Develop a pilot re-education program to assess the effectiveness of behavior modification training on recidivism rates of repeat aggressive driving offenders

Challenge Area 11. Improve Commercial Vehicle Safety

California SHSP Goal: By 2010, reduce the number of commercial vehicle crash fatalities by 10 percent from their 2004 level.

Commercial Vehicle Safety is critical to the SCAG region. The region hosts three seaports and six active commercial airports that represent a significant amount of imported and exported cargo passing into and through the region. In addition, agriculture, particularly in Imperial and Ventura counties represent time-critical commercial transportation.

The State has exceeded its goal, reducing fatal collisions involving commercial vehicles in 2009 by 31 percent from 2004.

TABLE 11 Pedestrians Killed and Injured by Action – 2009

Collisions	2004	2009	Percent Decline
Total fatal collisions	3,701	2,805	24.20%
Fatal truck collisions	342	236	31.00%
Percent of total	9.20%	8.40%	
Total injury collisions	203,386	163,524	19.60%
Injury truck collisions	7,949	4,874	38.70%
Percent of Total	**3.90%**	**3%**	

The SCAG region represented 52.1 percent of the State's 5110 truck collisions that involved a fatality or injury in 2009. Of the 5110 truck involved collisions in the State, 2,124, or 42 percent had truck drivers at fault.

The majority of the 5,110 truck involved collisions in the State occurred when the truck was going straight (3,058), stopped (390) followed by changing lanes (331).

SCAG Response

- Support the use of dedicated truck capacity on corridors with significant truck traffic in order to separate commercial vehicles from passenger vehicles.
- Support the continued modernization of intersections and interchanges prone to high commercial vehicle collisions to promote safety
- Support the use of truck climbing lanes as a method to segregate commercial vehicles from passenger vehicles.

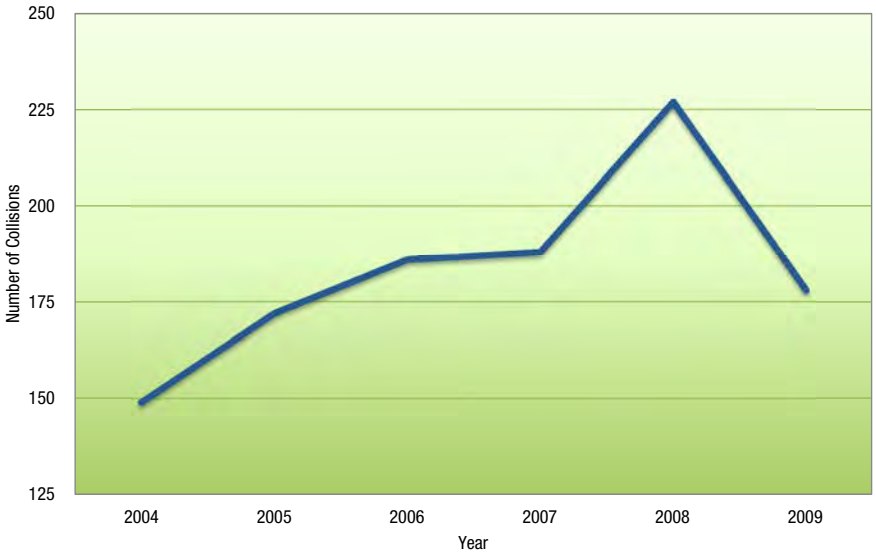
11.1 Establish minimum training standards for new commercial vehicle drivers.

11.2 Increase the number of strike force operations.

11.3 Conduct joint studies at high-crash collision locations involving commercial vehicles, identify appropriate infrastructure improvements, and make adjustments as needed.

11.4 Enhance the Commercial Industry Education Program.

11.5 Increase Biennial Inspection of Terminal inspections from 2006 levels.



11.6 Study the feasibility of improving commercial vehicle safety by adding additional rest stops in identified locations, and increase the number of rest stops as needed.

11.7 Advertise next rest stop location, use rest stop smart technology, and add rest stop information on the Caltrans website.

Challenge Area 12: Improve Motorcycle Safety

California SHSP Goal: By 2010, reduce the number of motorcycle rider fatalities by 10 percent from their 2004 level. In 2004 in the SCAG region, there were over 3,853 motorcycle collisions, of which 149 were fatal. In 2009, there were 4,789 motorcycle collisions, of which 178 were fatal. This represents a 19.5 percent increase in motorcycle fatalities in the SCAG region. In contrast, while State motorcycle fatalities increased in the same period, it did so by only 10.5 percent.

FIGURE 8 Fatal Motorcycle Collisions 2004–2009

In the State of California, motorcycles are involved in 13.9 percent of all fatal collisions, and 6.2 percent of all injury collisions. Within the SCAG region, motorcycles are involved in 14.7 percent of all fatal traffic collisions.

In researching the data for this challenge area, motorcyclists in their 20s were more than twice as likely as most other age groups to be at fault in a collision.

The primary collision factors for motorcycle collisions in 2009 were: unsafe speed, improper turning and driving under the influence (DUI) of alcohol and/or drugs.

- Alcohol impairment is a substantial problem for motorcyclists, more so than for drivers of other motor vehicles.
- Unsafe speed and improper turning indicate a need for an emphasis on rider education and training.
- Licensing (written/practical testing) and training standards for motorcyclists are lower than for drivers of passenger vehicles. This is despite the fact riding a motorcycle requires higher levels of both vehicle control and cognitive skills.

The greatest primary collision factor with motorcycle collisions is unsafe speed. Also noted in the table is that the 20–24 age group is significantly higher in collisions with a primary collision factor of unsafe speed. Younger motorcycle drivers have the highest number of collisions in 12 primary collision factors.

STRATEGIES

California intends to employ the following strategies to reduce motorcyclist fatalities:

1. Educate the public on motorcycle safety.
2. Improve the training, testing, and licensing of motorcyclists.
3. Enhance the enforcement of motorcyclist violations and violations by the operators of other vehicles.
4. Increase the use of safety equipment by motorcyclists.
5. Improve motorcyclist visibility to other roadway users.
6. Improve roadway design to enhance motorcycle safety.
7. Promote the use of helmets that meet USDOT standards.

SCAG Response

- Work with the State and county transportation commissions to determine if various project submissions have potential benefit to safety in this challenge area.
- Work with local governments to help identify motorcycle high-collision concentration locations and help develop plans to mitigate possible causes.

12.1 Develop a monitoring program to identify motorcycle high-collision concentration locations and implement engineering, enforcement, and education improvements.

12.2 Hold a motorcycle safety summit to review the SHSP actions and create an action plan for statewide motorcycle safety initiatives. Include stakeholders representing riders, government, safety organizations, law enforcement, insurance companies, and dealers.

12.3 Assess both the DMV's California Driver Handbook and standard traffic school curriculum for information on sharing the road with motorcycles and make additions and revisions as necessary.

12.4 Create and implement an on-line traffic violator school curriculum specifically for motorcyclists.

12.5 Install signs and markings at high-crash concentration locations involving motorcycles, that are consistent with the CAMUTCD; remove, relocate, make breakaway or shield fixed objects; consider crashworthy barriers that are more "forgiving" to motorcyclists, or make curve corrections.

12.6 Identify owners of motorcycles who are not licensed to operate a motorcycle and alert them to California's requirement to be licensed in order to operate their motorcycle.

12.7 Educate judges, judge pro-tems, and court commissioners through DMV court liaisons to make them aware that the Basic Rider Course can be used to educate violators and to help them recognize proper and legal safety equipment.

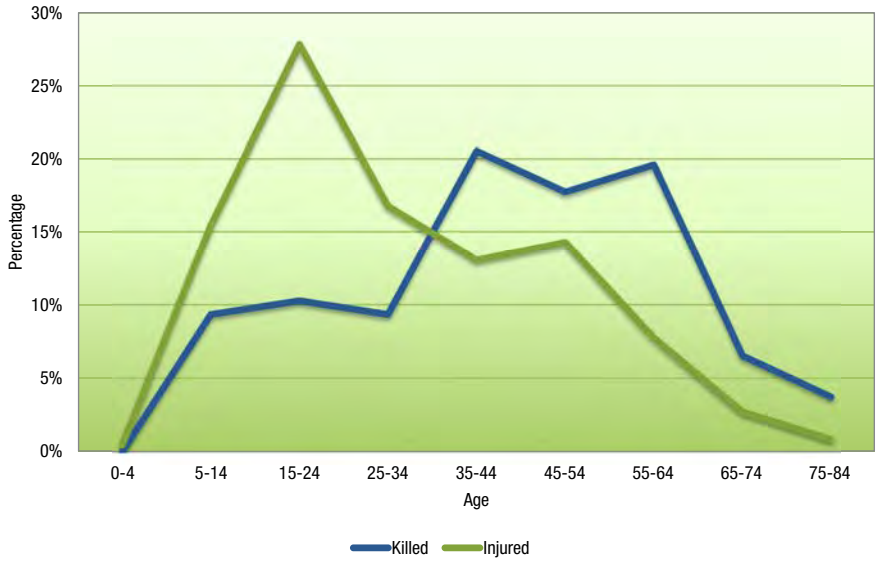
12.8 Focus motorcycle-related law enforcement activities on areas with high motorcycle volumes.

12.9 Develop and implement motorcycle media campaigns such as "Ride like you're invisible, not invincible!" using a social marketing approach and using new media (YouTube, My Space, etc.).

12.10 Encourage the development and distribution of the CHP brochure, a DVD, and new media that describe the difference between the United States Department of Transportation (USDOT) approved helmet and other helmets.

12.11 Encourage use of approved USDOT helmets. Establish opportunities for helmet exchange and discount certificates towards the purchase of a safer helmet.

12.12 Create a Motorcycle Initiatives Review Committee to increase quality, continuity, and relevance of materials as well as to promote sharing of information related to motorcyclist-safety or motorcycle-awareness.



Challenge Area 13. Improve Bicycling Safety

California SHSP Goal: By 2010, reduce the number of bicycle roadway fatalities by 25 percent from their 2000 level.

In 2000, 118 bicyclists were killed on roads in the SCAG region, and 12,074 were injured. In contrast, in 2009, 107 bicyclists were killed and 12,043 were injured, a 9.3 percent and .26 percent decline, respectively.

The highest bicycle collision injuries are within the 15–24 age range (27.9 percent as a percentage of all bicycle collision injuries). It slowly declines, but then has a slight uptick in the 45–54 age range. The highest percentages of bicycling fatalities are within the 35–44 range (20.6 percent) and 55–64 (19.6 percent)

FIGURE 9 Bicyclists Killed and Injured by Age

Bicycling fatalities as a percentage of all traffic fatalities are low when compared to the number of motor vehicle deaths. The 107 bicyclists killed in 2009 represented 3.5 percent of all traffic fatalities in the State. Bicyclist injuries represented 5.2 percent of all traffic injury collisions in the State during the same period.

Collisions involving bicyclists tend to peak in late summer and fall, declining after October, before rising again in March.

FIGURE 10 Percentage of Bicyclist Collisions by Month

Historically, the primary goal of roadway design for urban thoroughfares and rural highways has been to increase vehicular traffic flow particularly at peak congestion times. This has created situations where slow speed bicycles are traveling at speeds less than 25 miles per hour are sharing lanes with cars often going at much greater speeds. This speed differential, coupled with the physics of a 30 pound bicycle colliding with, or being struck by, a 3000+ pound vehicle, is a factor in the severity of injuries.

The increasing popularity of bicycling for commuting, utilitarian and recreational use has created increasing conflicts between motor vehicles and bicyclists. One obvious potential solution is to build more dedicated bicycle facilities in order to separate bicyclists from

motorists whether through bike paths or bike lanes. Anecdotal evidence from New York City, Portland and other cities indicate that increasing facilities for bicycles both increase the number of bicyclists while also increasing their safety.

STRATEGIES

California intends to employ the following strategies to reduce bicyclist fatalities on California's roadways:

1. Improve data collection regarding bicyclist trips, injuries, and fatalities on California roadways.
2. Incorporate bicyclists into smart growth, land use planning, and other local plans.
3. Enhance the enforcement of bicyclist and motorist roadway laws.
4. Educate all roadway users regarding the rights and responsibilities of bicyclists.
5. Promote and improve roadway safety infrastructure for bicyclist use.
6. Improve the visibility of bicyclists on the roadway.
7. Improve the safety of bicyclists traveling to and from schools, utilizing education, encouragement, enforcement and engineering techniques.
8. Increase the use of helmets and enforcement of related laws.
9. Improve bicycle safety expertise among transportation professionals.

SCAG Response

- Encourage every city in the SCAG region to be connected via bicycle facilities, including wayfinding signage
- Develop regionally significant bicycle corridors for bicycle travel throughout the region
- Encourage every city to fully implement their bicycle master plans
- Encourage all local jurisdictions to develop Active Transportation Master Plans.
- Incorporate applicable Complete Streets policies—providing safe access for all modes—as fundamental principles of transportation plans.
- Encourage the consideration of bicycle and pedestrian safety as part of Blueprint Land Use Planning.
- Encourage pedestrian and bicycle safety in all maintenance projects where new striping will be required or existing striping is to be replaced
- Encourage the use of intersection control devices that detect bicyclists, particularly left turn signals.
- Encourage bicycle education in lieu of fines for bicyclists and motorists who commit bicycle related traffic violations
- Support expanding Safe Routes to School programs for non-infrastructure projects focusing on education, bicyclist visibility, motorist awareness, and accommodation of bicyclists
- Develop a standardized database of bicycle data, including safety, counts, surveys, etc. for use throughout the SCAG region.

13.1 Establish a bicycle safety improvement program-with project selection criteria-for State highways and local roads. Establish more bicycle and pedestrian corridors and create partnerships in high-collision incident areas.

13.2 Increase bicycle helmet usage through education and promotion.

13.3 Enhance bicycling information in DMV materials and procedures.

13.4 Enhance bicycling information in current Peace Officer Standards and Training, California Vehicle Code, and traffic law enforcement modules.

13.5 Support and expand the California Bicycle Coalition Complete Streets Sub-Committee to develop a curriculum and design standards for complete streets, traffic calming, safe intersection design, and appropriate vehicle speeds for environments where pedestrians and bicyclists are legal users.

13.6 Provide improved guidance and standards in the CAMUTCD for safely accommodating bicyclists in work zones.

13.7 Provide information about policies concerning bicycling to transportation professionals-including State and local agencies and transportation consultants.

13.8 Implement and encourage bicycle safety inspections, training, and education at schools as part of physical education or other programs.

13.9 Support expanding Safe Routes to School programs for non-infrastructure projects focusing on education, bicyclist visibility, motorist awareness, and accommodation of bicyclists.

13.10 Improve data collection-from various sources-regarding bicycle trips and bicycle collisions.

13.11 Develop and implement a bicycle safety public education, information, and enforcement program for all age groups of road users.

Challenge Area 14. Enhance Work Zone Safety

California SHSP Goal: By 2010, reduce work zone fatalities by 10 percent from their 2004 level.

A work zone is an area of the road where maintenance or construction occurs and may involve lane closures, detours, shoulder work and moving equipment. In the SCAG region, the work zone can be any time of year. On many of SCAG roadways, the work often occurs at night. Many fatalities occur because of excessive speed, impaired, and distracted driving.

In 2009, there were 46 work zone fatalities in California, a 58 percent reduction from the 109 work zone fatalities in 2004. Those killed included drivers, vehicle occupants, workers, bicyclists and pedestrians.

Highway work zones create a major safety concern for roadway users and workers alike. In 2003, national fatalities in work zones totaled 1,068. This number included 117 pedestrians, most of whom were construction workers, and 943 vehicle drivers and occupants.

STRATEGIES

California intends to employ the following strategies to reduce work zone fatalities:

1. Enhance safe driving through work zones with education and enforcement.
2. Improve traffic control in work zones.
3. Reduce worker exposure and improve worker visibility.
4. Apply advanced technology to enhance work zone area.
5. Improve data collection and analysis.

For California Temporary Traffic Control Zones" http://dot.ca.gov/hq/traffops/signtech/signdel/pdf/PedBrochure.pdf

14.1 Expand present efforts to create and implement a joint training program for field personnel and law enforcement officers to better understand each others' responsibilities and coordinate activities in the work zone.

14.2 Improve collection, storage, and evaluation of work zone crash data.

14.3 Encourage present efforts to increase use of dynamic merge systems to reduce rear-end collisions and aggressive driving.

14.4 Encourage and permanently fund present efforts to influence driver behavior with Slow for the Cone Zone and Work Zone Awareness campaigns and to reduce traffic through work zones using project specific public awareness campaigns.

14.5 Encourage present efforts to deploy more and better mobile and temporary barriers and attenuators (rather than just cones) to provide positive protection for workers and safe deflection of errant vehicles.

14.6 Increase work zone safety training and proficiency of workers and traffic control staff.

14.7 Encourage present efforts to consider full closures early in the project design process with the goal of increasing the use of this option.

14.8 Develop a web-based system that records or gathers in one location information about the number, duration, and location of actual major, minor, blanket, and rolling work zones. Local road work by counties and cities, including utility companies, will be gathered at a minimum, but other data needs should be identified as well.

14.9 Encourage incorporation of the Safety Edge in construction paving projects.

14.10 Assess the DMVs' California Drivers Handbook for information on work zone safety and update or expand it as necessary.

14.11 Form a team to develop industry standards to evaluate innovative technology on a routine basis as practitioners propose new methods and technologies to improve work zone safety.

14.12 Encourage present efforts to improve access and detours for bicyclists and pedestrians near work zones.

14.13 Expand improvements to traffic control and encourage use of project specific websites to provide motorists with work zone delay information.

14.14 Form a team to evaluate best work zone safety practices in other states and to develop a request for proposal purchasing process for innovative technology to allow routine use with minimum legal challenges.

SCAG Response

Encourage work zone safety training and proficiency for all transportation modes) at city and county governments.

Encourage efforts to improve access and detours for bicyclists and pedestrians near work zones, such the brochure on "Pedestrian Considerations

Challenge Area 15. Improve Post Crash Survivability

California SHSP Goal: By 2010, reduce crash-related fatalities in California at least 5 percent from their 2004 level through focused improvements in Emergency Medical Services (EMS) system communications, response and safety education.

In 2004, 302,176 persons in California required Emergency Medical Service (EMS) response as a result of a serious motor vehicle collision.

Challenge Area 15 focuses on the person that survives a serious motor vehicle collision. Improving EMS response time to the collision, transport time, and inter-facility transfer time (when appropriate) will result in achieving the targeted "Golden Hour" (the time period from the incident until the victim receives definitive specialized trauma care; ideally no longer than 60 minutes) Adherence to the "Golden Hour" concept is critical to survival and optimum outcome.

The first peak in post-crash deaths is within seconds or minutes of injury. If the number of these deaths is to be reduced, it must be through effective prevention programs. The second peak in deaths occurs within the first four hours after incident and is due to undiagnosed and untreated injuries. These patients, whose numbers are significant, would benefit most from appropriate level of trauma care. Regionalized trauma care facilitates rapid transport to the nearest trauma center appropriate for the severity of injury. These complications can be positively affected by prompt initial resuscitation efforts in an appropriate level trauma center.

STRATEGIES

California intends to employ the following strategies to improve post-crash survivability:

1. Improve technology for locating crash sites and for improving EMS access routes and response times.
2. Ensure interoperability of communications systems between all responders to crash sites.
3. Improve patient transportation and destination from crash location.
4. Increase availability of appropriate-level trauma centers, with emphasis on rural areas.
5. Improve access to trauma-related training courses for Emergency Medical Technicians and paramedics.
6. Encourage Emergency Medical Dispatch programs to train dispatchers to assist victims awaiting arrival of EMS.
7. Improve data access to meet the needs of EMS.
8. Increase public access to first aid, cardio pulmonary resuscitation CPR, and automated external defibrillation training.

15.1 Implement the CEMSIS with appropriate linkage to other data systems, which include but are not limited to the SWITRS, Office of Statewide Health Planning and Development, and Vital Statistics.

15.2 Increase hospital participation in an inclusive State Trauma System, supporting the California Statewide Trauma Planning: Assessment and Future Direction Document.

15.3 Encourage the increased communication linkage between all emergency response agencies.

15.4 Develop a multifaceted educational program with common language for identifying location of crash, destination, and appropriate transportation of injured persons. The education will be aimed at the public (e911 cellular phone calls), law enforcement, Caltrans, and all pre-hospital personnel.

15.5 Implement a full-spectrum education program developing collaborative practice for rural trauma care. To cover the continuum of care, this education will encompass the bystander public, pre-hospital responders, and hospital personnel.

SCAG Response

- Utilize Intelligent Transportation System technology to improve response time for EMS to and from collision sites.

Challenge Area 16.
Improve Safety Data Collection, Access and Analysis

California SHSP Goal: Improve the quality, timeliness, accessibility, and usefulness of traffic safety data.

STRATEGIES

California intends to employ the following strategies to improve safety data collection, access, and analysis:

1. Improve the quality, completeness, and uniformity of data collection practices.
2. Improve data sharing among State, federal, and local agencies and stakeholders.
3. Improve accessibility to real-time information by California roadway users.
4. Enhance accessibility of traffic safety data.
5. Improve data collection and analysis regarding trip characteristics of all roadway users, level of service, injuries, and fatalities on California roadways.
6. Coordinate traffic safety information system improvements through the State Traffic Records Coordinating Committee.

SCAG Response

- Work with the State and county transportation commissions to improve the quality, timeliness, accessibility and usefulness of traffic safety data.
- Publish SHSP safety data and statistics in the annual State of the Region or State of the Commute report.

Challenge Area 17.
Reduce Distracted Driving

Interim California SHSP Goal: By 2014, based on the California Traffic Safety Survey, reduce the percentage of drivers who "regularly" talk on a hand-held cell phone, hands-free cell phone, or text while driving by 10% from the 2010 level.

STRATEGIES

California added this Challenge Area in response to collisions where cell phone usage was listed as a factor and developed the following three strategies to reduce fatalities caused by distracted driving.

17.1 Develop and implement a statewide campaign to change social norms related to distracted driving

17.2 Conduct increased enforcement and public awareness annually during National Distracted Driving Awareness Month

17.3 Document driver behavior through an annual statewide cell phone/texting observational survey.

SCAG Response

The focus of this challenge area is primarily enforcement and education. SCAG encourages local jurisdictions to develop enforcement and education programs designed to discourage distracted driving.

California Five Percent Report for the SCAG Region

The following tables represent the SCAG portion of the California Five Percent Report. The Five Percent Report is in response to the Federal requirement that each state describe at least 5 percent of its locations currently exhibiting the most severe highway safety needs, in accordance with 23 U.S.C. Sections 148(c)(1)(D) and 148(g)(3)(A). The Tables include:

- Five Percent of State Highway Locations
- Five Percent of State Highway Intersections/Interchanges
- Five Percent of State Highway Ramp Locations
- Five Percent of Local Streets and Roads

The Five Percent Report is intended to educate the State of California and local governments where problem locations are, and allow them to take steps to provide solutions. The report is for educational purposes and cannot be used in legal proceedings.

In identifying State highway locations, Caltrans used the SHS location information from its Traffic Accident Surveillance and Analysis System (TASAS) Table C Report, which generates a list of high-collision-concentration locations requiring traffic safety investigation. The TASAS Table C Report provides information for the 36-month period from January 1, 2006, through December 31, 2008. It considers collisions for 3-, 6-, 12-, 24-, and 36-month periods; traffic volumes; collision rates; average collision rates; and roadway types. The locations on the TASAS Table C Report were sorted into three lists: roadway segments (0.2-mile segments), intersections (each intersection location includes 250 feet on all approaches), and ramps (each ramp location includes entry, exit, and body of ramp). For each of these lists, the top 2.5 percent locations by fatal and injury collision rates and the top 2.5 percent locations by the number of fatal and injury collisions were identified. Combined, these figures comprise the 5 percent SHS locations for this Report.

The California Highway Patrol's Statewide Integrated Traffic Records System was used to obtain collision information for identifying locations on local streets and roads for this Report. The local streets and roads were divided into 0.5-mile segments within each county, resulting in a total of 280,166 segments. Collision concentrations were determined for segments on which at least one fatal or severe injury collision occurred from 2006 through 2008, with the assumption that these areas could have potential safety needs. There were 17,535 segments identified and sorted to generate lists by county. Each county list was sorted from high to low by the number of fatal or severe injury collisions for each segment. Following that, the top 5 percent segments for each of these county lists were identified. Segments with at least three or more fatal or severe injury collisions were included in this Report as locations.

Discovery and admission into evidence of certain reports, surveys, and information.—Notwithstanding any other provision of law, reports, surveys, schedules, lists, or data compiled or collected for any purpose directly relating to paragraph(1) or subsection(c)(1)(D), or published by the Secretary in accordance with paragraph(3), shall not be subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location identified or addressed in such reports, surveys, schedules, lists, or other data.

The information in this Report is also protected by title 23 United States Code section 409, "Discovery and admission as evidence of certain reports and surveys."

TABLE 12 California State Highway System Roadway Segment Locations

County	Route	Location (0.2-Mile Segment with Beginning Post Mile)	County	Route	Location (0.2-Mile Segment with Beginning Post Mile)
Los Angeles	2	029.658 to 029.858	Los Angeles	110	023.250 to 023.450 North

Southern California Association of Governments

ADOPTED APRIL 2012

THE ROLE OF VEHICLE TECHNOLOGY IN MEETING LONG-TERM AIR QUALITY AND ENERGY CHALLENGES

SCAG's Collaborative Efforts Relative to Clean Vehicle Technology **1**

The Air Quality / Energy Connection 1

The SCAG region has a long history of addressing the need for significant regional emission reductions in order to attain the federal air quality standards. Of particular concern for air agencies and stakeholders is the significant amount of emission reductions necessary to meet the standards, and that a substantial portion are included in long term measures that are not yet clearly defined. More recently, concerns related to GHG emissions and future energy costs/sustainability have entered the discussion.

From the related air quality and energy discussions, stakeholders have focused on the role that technology will play for transportation sources and which concepts or strategies may possibly be incorporated into SCAG's 2012–2035 RTP/SCS to that end.

It is important to note that SCAG has consistently promoted or otherwise put forth concepts, performed necessary planning, or set forth policies that have helped move the region to a more efficient and cleaner transportation system. To name a few:

- Facilitating the linkage of a regional HOV system
- Initial planning for Metrolink
- Conceptualization of the Alameda Corridor
- Telecommuting
- Planning for a comprehensive, clean technology goods movement system
- System efficiency through improved urban form
- Administering the Southern California Clean Cities Coalition

SCAG will continue to champion such strategies and to seek ways, within the constraints set forth by regulation and jurisdictional authority, to set the framework for the strategies within the 2012–2035 RTP/SCS or otherwise facilitate moving such concepts forward.

SCAG's Collaborative Efforts Relative to Clean Vehicle Technology

The Air Quality / Energy Connection

To stimulate more active dialogue and begin to comprehensively addressing the related issues of air quality and energy costs and sustainability, ARB, South Coast AQMD, and SCAG have released a joint brochure entitled: Powering the Future: A Vision for Clean Energy, Clear Skies, and a Growing Economy in Southern California. This brochure discusses the economic, mobility, energy security and climate benefits of transitioning from traditional combustion of fossil fuels in cars, trucks and factories, to broad use of clean energy such as electricity. It includes "10 Steps for Governments" and "10 Steps for Business and Individuals" for "powering clean growth."

SCAG's policy with regard to alternative fuels is technology neutral and does not favor any one technology over any other. SCAG's alternative fuel goals are to promote emissions reduction and improved mobility in ways that are effective and cost-effective. Alternative fuels for transportation include, but are not limited to, the following commercially available and emerging fuels[1]:

Commercially Available Alternative Fuels

- Biodiesel
- Electricity
- Ethanol
- Hydrogen
- Natural Gas
- Propane

Emerging Alternative Fuels

- Biobutanol
- Biogas

[1] U.S. Department of Energy, Alternative Fuels and Advanced Vehicles Data Center, http://www.afdc.energy.gov/afdc/fuels/index.html

- Hydrogenation-Derived Renewable Diesel (HDRD)
- Methanol
- P-Series
- xTL Fuels (Fischer-Tropsch)

COMPREHENSIVE GOODS MOVEMENT PLANNING

The 2012–2035 RTP/SCS delineates a path forward—a series of steps and decision points to move the region to a near-zero and zero emission freight system. Broad deployment of near-zero and zero emission transportation technologies in the 2023 to 2035 timeframe is a critical undertaking, but with significant technological, cost and operational challenges. To achieve this objective requires industry stakeholder participation, as well as the efforts of numerous state and federal resources agencies, transportation agencies, along with commercial technology developers/manufacturers and logistics experts. The 2012–2035 RTP/SCS developed in coordination with many of these stakeholders reiterates this as a priority and establishes the regional path forward to such a system. Please refer to Goods Movement Technical Appendix to review the 2012–2035 RTP/SCS Goods Movement Environmental Strategy and Action Plan for Technology Advancement.

ELECTRIC VEHICLE PLANNING GRANTS

SCAG and regional partner agencies have successfully collaborated on submission of federal and state grant applications to the specific end of planning for accelerated penetration of electric vehicles into the market. The objective of the U.S. Department of Energy (DOE) grant is to develop a comprehensive, statewide PEV readiness project. To advance the state of readiness in California, the Bay Area AQMD, Plug-In Electric Vehicle Collaborative, South Coast AQMD, and Clean Cities Coalitions in California will form the California PEV Coordinating Council (CalPEVCC). The CalPEVCC will oversee the creation of a PEV Readiness Guidelines document, six Regional Infrastructure Plans, and a compiled Statewide Infrastructure Plan. The objective is to create a unified statewide approach to planning critical PEV charging infrastructure activities with regional implementation plans in order to support and expand the market for PEVs in California. DOE awarded this coalition $1,000,000 in September 2011, with allocations of $200,000 for SCAG and $100,000 for SCAG's Clean Cities partners.

SCAG, along with key regional partners, was awarded $200,000 from the California Energy Commission grant solicitation, Regional Plans to Support Plug-In Electric Vehicle Readiness. Core partners include South Coast AQMD, Southern California Edison (SCE), South Bay Cities Council of Governments (SBCCOG), and Western Riverside Council of Governments (WRCOG), and also includes many cities and stakeholders working together to develop the first-ever regional plug-in electric vehicle (PEV) strategic plan. The purpose of the project is to develop two subregional PEV Readiness Plans; establish best practices for "PEV-ready" building and public works guidelines; and streamline PEV electric vehicle supply equipment permitting, installation, and inspection processes. This Plan will also become part of a larger effort to provide support the forecasted growth in PEVs throughout California while promoting economic development within the green technology sector. The project will complement the proposed work outlined for the creation of a California PEV Readiness Plan outlined in the U.S. DOE proposal. Two complementary subregional Charge Port Infrastructure Plans will also be developed as part of this CEC project. Two subregions were selected based on their differing land use characteristics, allowing other subregions to relate to one of the models. This will facilitate the gradual development of PEV Readiness Plans at the subregional scale throughout Southern California.

NEIGHBORHOOD ELECTRIC VEHICLES

Neighborhood Electric Vehicles (NEV) provide a low speed, zero emission transportation option that can assist communities and regions in improving mobility while reducing carbon-based vehicle emissions and related pollution. Existing law authorizes certain local agencies to establish a NEV transportation plan subject to certain requirements.

NEVs have the following key benefits:

- Reduce reliance upon fossil fuels;
- Improve utilization of existing Class I and Class II bicycle lanes through shared use where appropriate;
- Provide safe and efficient transportation alternatives for short trips;
- Offer sustainable/livable community planning tool; and
- Enabling broad use of zero emission vehicles aids in attainment of GHG emission reductions outlined in SB 375 and AB 32;

With funding in part from the SCAG Blueprint Demonstration Project Program, the Western Riverside Council of Governments (WRCOG) conducted a four-city study in 2010 that evaluated how small electric vehicles could fit into the region's road network. The purpose of the WRCOG 4-City NEV Transportation Plan is to further the vision of creating a sustainable development that reduces gasoline demand and vehicle emissions by offering a cleaner, more economical means of local transportation within the plan area.

As a result of this effort, WRCOG sponsored legislation (AB61, Jeffries), signed by Governor Brown into law on August 4, 2011, that authorizes the County of Riverside or any city in the county to establish a NEV transportation plan. NEV transportation plans are needed to overcome connection issues, identify safe routes, and enable clear communication about where residents can go in low speed vehicles. The WRCOG 4-City NEV Transportation Plan presents a multi-jurisdiction transportation planning approach to leverage existing and future public street networks for maximum transportation benefit. This Plan identifies low speed connectors and potential NEV/bike lane backbone facilities within and between the cities of Corona, Norco, Riverside and Moreno Valley. The Plan also benefits unincorporated communities within the study area.

The Plan provides the necessary tools for local jurisdiction Plan adoption and may be used as a template for other communities contemplating similar transportation network enhancements.

The Plan includes Near Term and Long Range (Future) routes. Near Term routes are assumed as an initial implementation phase in the one to three year time frame. Near Term routes rely on existing or planned Class II bike lanes suitable for shared use with NEVs. These routes can be converted for NEV use with little or no capital cost. Not all Class II bike lanes are appropriate for shared use with safety as a primary determining factor. Long Range (Future) routes include select existing and planned Class II bike lanes to complete the backbone NEV network. Long range routes can be implemented over time and concurrent with future road improvements. The Backbone network map also includes low speed connector roads. These low speed connectors also provide easy transition to potential NEV / bike lanes leading to more places and increased mobility.

In another part of the SCAG region, the South Bay Cities Council of Government (SBCCOG) commissioned the report Neighborhood Electric Vehicles in Mature Suburbs (funded by South Coast AQMD) on a demonstration of NEVs in the South Bay sub-region. This effort is part of the Sustainable South Bay Strategy, adopted by the Board of Directors of SBCCOG in October 2010, as the basis for the sub-regions contribution to the regional SCS and as a guide to land use planning and transportation. In a related effort funded by SCAG's Compass Blueprint Program, SBCCOG, in conjunction the South Bay Livable Communities Working Group, developed a presentation to promote the South Bay Smart Suburban Vision to City Councils and Planning Commissions in the South Bay. The vision set forth a strategy that would intensify commercial uses at the corners of major arterials, transition mid-block strip commercial to residential, and encourage street-fronting buildings with parking at the rear. Taken together, these land use changes are intended to address the goals of SB 375 while creating an urban form supportive of NEVs. The study included potential NEV travel networks, mobility case studies, development models supportive of NEVs, land use analyses, and an economic analysis.

SUSTAINABLE COMMUNITIES STRATEGY / LAND USE

As part of the 2012–2035 RTP/SCS development process, SCAG has worked collaboratively with local jurisdictions on comprehensive growth forecasts and land use strategies. This dialogue has coalesced around a series of land use scenarios under consideration for the 2012–2035 RTP/SCS that seek create land use patterns with the following objectives (among others):

- promote and enable shifts to non-auto transportation modes (transit, walk, bike);
- reduce trip lengths by promoting mixed use development and access to daily needs at the neighborhood scale; and
- increase overall energy and resource efficiency by allowing for a greater mix of unit types.

The 2012–2035 RTP/SCS workshops scenarios captured a range of land use strategies that vary in aggressiveness from scenario to scenario. The package of strategies includes increasing densities at priority locations in order to maximize investment in transit, increasing the share of development in more urban typologies in order to promote mixed use and neighborhood oriented development, and shifting the locations of projected jobs and housing to achieve an improved regional balance. Further, all scenarios attempted to improve the region's responsiveness to housing market conditions by addressing a greater share of development to housing types where there is expected to be more demand (e.g. attached, rental, and small lot single family). The resulting land use policy

encourages overall efficiencies in energy consumption and emissions associated with both transportation and building energy use.

Other Related Efforts for Fleet Conversion

Numerous efforts are underway to require and facilitate zero and/or near-zero emission vehicles throughout the State. Foremost, ARB has recently adopted their proposed Advanced Clean Car package of regulations on January 26, 2012. The Advanced Clean Cars program combines the control of soot, smog-causing pollutants and greenhouse gas emissions into a single coordinated package of requirements for model years 2017 through 2025. The new rules will clean up gasoline and diesel powered cars, and deliver increasing numbers of zero-emission technologies, such as full battery electric cars, newly emerging plug-in hybrid electric vehicles and hydrogen fuel cell cars. According to ARB, in 2025, average consumers will see nearly $6,000 in fuel cost savings over the life of the car. Further, an ARB economic analysis indicates that the overall savings generated by the proposed rules will result in an additional 21,000 jobs in California in 2025, rising to 37,000 in 2030. The proposed Advanced Clean Cars package of regulations is further designed to deliver a total of 1.4 million zero-emission and plug-in hybrid vehicles on the road in California by 2025.

The Luskin Center for Innovation, UCLA, recently prepared the study, Realizing the Potential of the Los Angeles Electric Vehicle Market, to estimate the number of electric vehicles that would be purchased by City of Los Angeles residents over the next decade, and examine the effectiveness of policies to increase this number.

The Plug-in Hybrid & Electric Vehicle Research Center, under a grant from the California Energy Commission, prepared a plan to facilitate PEV market growth (TAKING CHARGE: Establishing California Leadership in the Plug-In Electric Vehicle Marketplace). The California Plug-In Electric Vehicle Collaborative, an ad hoc group of high-level stakeholders, played a guiding and consulting role in developing the plan that leverages their ongoing and extensive activities and recommends new actions that require their coordination. This plan aspires to facilitate PEV market growth so that, by the end of the decade, hundreds of thousands of PEVs are sold annually in California and the market contributes significantly to California's ongoing economic, energy, and environmental policy objectives. Its strategic focus intends to solidify California as a technological, manufacturing, economic, and policy leader that benefits from—and shapes—the global PEV market for decades to come.

Southern California Clean Cities Coalition is currently assisting with the marketing and education outreach for three projects funded through U.S. Department of Energy (DOE) Clean Cities ARRA 2009 Petroleum Reduction Technology Projects solicitation. These projects include two initiatives with the South Coast Air Quality Management District (SCAQMD) totaling nearly $16 million: the UPS Ontario–Las Vegas LNG Corridor Expansion Project and the Heavy-Duty Natural Gas Drayage Truck Replacement Initiative. The third project is being implemented in partnership with the San Bernardino Associated Governments (SANBAG) and Ryder Truck Rental, Inc. to implement the largest heavy-duty natural gas truck project in the U.S. SANBAG received $19.2 million from the Department of Energy and the California Energy Commission to deploy 202 heavy-duty natural gas trucks and construct two liquefied natural gas fueling stations.

SCAG will continue to champion and work with our stakeholders on innovative and technology neutral, yet practicable approaches to the air quality and energy challenges facing our Region. As one means of doing so, the efforts of SCAG and other stakeholders, as described above, promises a synergistic impact on accelerating the penetration of zero and/or near-zero emission transportation technologies.
