## I. HIGHLIGHTS

The Vehicle Classification Case Study was conducted from late summer of 1980 to early fall of 1981 by five agencies--the Delaware Valley Regional Planning Commission and the States of Arkansas, Iowa, Minnesota, and Washington. The 11,709,156 vehicles classified by these agencies at 139 sites show the following characteristics:

### Rural Versus Urban

- o Seasonal variation in the distribution of most vehicle types in the traffic stream was greater in rural areas than in urban areas.
- o The distribution of most vehicle types in the traffic stream did not change greatly from season to season in urban areas.
- o The distribution of each truck category varied less than 1 percent of the total traffic stream from season to season in urban areas.
- o All truck categories, particularly 3S2's, comprised a larger percentage of the traffic stream in rural areas than in urban areas.
- o Automobiles comprised a larger percentage of the traffic stream on weekends than on weekdays.
- o Trucks comprised a larger percentage of the traffic stream on weekdays than on weekends.

### Functional System

- o Standard/compact cars comprised a greater percentage of the traffic stream on urban systems than on rural systems.
- o The distribution of most vehicle types in the traffic stream varied greatly from season to season for rural systems.
- o The distribution of most vehicle types in the traffic stream did not vary from season to season for urban systems.
- o Motorcycles, buses, and most individual truck categories amounted to less than 2 percent of the traffic stream on each system.
- o Single-unit trucks and 3S2's comprised the largest part of truck traffic for nearly all functional systems in all seasons.
- o The rural Interstate System had the greatest percentage of 3S2's while urban minor arterials and urban collectors had the least for each season.
- o The rural Interstate System had the highest seasonal variation in distribution of 3S2's in the traffic stream.
- o Vehicle distribution in the traffic stream varied significantly from weekday to weekend.

- o Distributions of cars, motorcycles, buses, and pickups increased from weekday to weekend.
- o The percent of most truck types in the traffic stream was lower on the weekends.
- o The percent of trucks in the traffic stream increased at night.

#### Highway Design Type

- o Vehicle type distribution varied significantly among highway design types.
- o Seasonal variation for most vehicle types was higher for rural design types than urban design types.
- o Freeways and expressways in both rural and urban areas had the highest percentage of trucks.
- o Single-unit trucks and 3S2's comprised the largest part of truck traffic for all design types in all seasons.

## II. INTRODUCTION

This report documents the results of the Highway Performance Monitoring System (HPMS) Vehicle Classification Case Study. It provides information on the seasonal, daily, and hourly variation of vehicle types in the traffic stream in both rural and urban areas. This information plays a vital part in pavement design, cost allocation, and the determination of highway needs. The data, in combination with other data sources, can be used to determine the thickness of new pavements and overlays for existing pavements, calculate ton-miles of freight, assess the cost responsibility of various users, evaluate pavement deterioration, and estimate energy consumption.

### Purpose

This case study fulfilled the classification needs of the HPMS and the National Highway Cost Allocation Study and will provide fundamental input to future studies. This case study obtained hourly, day-of-week, and seasonal classification data for 13 vehicle types for each functional system except local.

The HPMS is a continuing information system encompassing data collection, extensive data analysis and modeling, and historical recordkeeping. The HPMS provides the Federal Highway Administration with the capability to periodically assess the extent and condition of the highway system, monitor the performance of the highway systems on a continuing basis, calculate the impacts of existing highway programs and policies, and forecast potential impacts of future alternative programs and policies. The HPMS also serves a host of other activities such as supporting various reports to the Congress, supporting day-to-day program and policy evaluations, satisfying route planning data needs, and responding to continuing inquiries and requests from the Administration, the Congress, and the public.

The HPMS gathers information on statistically selected sample sections of highway. However, there is a limited amount of cost/labor intensive data impractical to get on a section-by-section basis. Gathering this type of data depends on the use of case studies in which typical or representative values are established for broad use and application. This Vehicle Classification Case Study is one of several case studies that have gathered data of this nature. Other studies have addressed vehicle occupancy, truck weight, and capital improvement unit costs.

### Scope

This case study measured variations in vehicle distribution across functional systems. The functional systems covered in both rural and urban areas were Interstate (plus other freeways and expressways in urban areas), other principal arterials, minor arterials, and collectors.

Five agencies participated in this case study--the Delaware Valley Regional Planning Commission (DVRPC) and the States of Arkansas, Iowa, Minnesota, and Washington. Each participating agency selected classification sites to achieve a representative functional system sample in accordance with the Case Study Procedural Manual -Vehicle Classification prepared by the Federal Highway Administration. With the exception of the DVRPC, each agency had a minimum of two sites on each of the nonlocal functional systems. The DVRPC data was limited to the nonlocal urban functional systems. Table 1 shows the distribution of sites by agency.

TABLE 1. DISTRIBUTION OF VEHICLE CLASSIFICATION SITES

<u>FUNCTIONAL SYSTEM</u>	ARKANSAS	DVRPC	IOWA	MINNESOTA	WASHINGTON	TOTAL
<u>Rural</u>						
Interstate	7	-	6	3	4	20
Other Principal Arterial	6	-	6	4	4	20
Minor Arterial	6	-	4	4	4	18
Collector	3	-	2	4	2	11
Total Rural	22	-	18	15	14	69
<u>Urban</u>						
Interstate/Other Freeway and Expressway	4	3	9	3	7	26
Other Principal Arterial	2	3	6	3	4	18
Minor Arterial	2	2	3	4	3	14
Collector	2	2	3	2	3	12
Total Urban	10	10	21	12	17	70
TOTAL	32	10	39	27	31	139

Classification sites were allocated, to the best of each agencies ability, on the basis of relative vehicle miles traveled (VMT) in rural and urban areas with a minimum of two sites for each of the strata listed below:

Rural Functional System

Strata

Interstate:	Percent Trucks 15 Percent Percent Trucks 15 Percent
Other Principal Arterials:	Percent Trucks 10 Percent Percent Trucks 10 Percent
Minor Arterials:	Percent Trucks 10 Percent Percent Trucks 10 Percent
Collectors:	Stratification Not Required

Urban Functional System

Interstate/Other Freeways and Expressways:	Percent Trucks 10 Percent Percent Trucks 10 Percent
Other Principal Arterials:	Stratification Not Required

Minor Arterials:

Stratification Not Required

Collectors:

Stratification Not Required

Classification data were collected to identify hour of day, weekday versus weekend, season of the year, and design type variations. Data were collected for one weekday and one weekend day per site per quarter except for Iowa that provided additional weekday data. Efforts were made to allocate counting efforts among the 5 weekdays and 2 weekend days as equally as possible to obtain representative coverage. Data were collected for each hour of the day.

### Vehicle Categories

Vehicles were classified in accordance with the descriptions indicated below. Common truck categories are illustrated in Figure 1.

1. Standard and Compact Passenger Cars (Standard Car) - All sedans, coupes, and station wagons manufactured primarily for the purpose of carrying passengers which in general meet the following criteria: shipping weights of 3,000 pounds or greater, overall lengths of 15 feet or more, and wheelbases of 100 inches or more.
2. Subcompact Passenger Cars (Small Car) - All sedans, coupes, and station wagons manufactured primarily for the purpose of carrying passengers which in general meet the following criteria: shipping weights of less than 3,000 pounds, overall lengths of less than 15 feet, and wheelbases less than 100 inches.

The following list gives examples of makes and models which would fall into this group:

AMC-Spirit, Gremlin; Buick-Skyhawk; Chevrolet-Chevette, Vega, Monza; Dodge-Challenger, Colt, Omni; Ford-Pinto, Mustang II, Fiesta; Mercury-Bobcat; Oldsmobile-Starfire; Plymouth-Arrow, Champ, Horizon, Sappora; Pontiac-Sunbird, Astre; Toyota; Datsun; Volkswagon; Honda; Fiat; Subaru; Mazda; Audi; Opel; Saab; Renault; Alfa Romeo; and Austin.

Passenger cars not included in the list that meet the weight, wheelbase, and length criteria would, of course, also fall into this group.

3. Motorcycles - All two- or three-wheeled motorized vehicles. Typical vehicles in this category have saddle type seats and are steered by handle bars rather than a wheel. This category includes motorcycles, motor scooters, mopeds, motor-powered bicycles, and three-wheel motorcycles.
4. Buses - All vehicles manufactured as traditional passenger carrying buses with two axles and six tires or three or more axles. This category includes only traditional buses functioning as passenger carrying vehicles. All two-axle, four-tire minibuses should be classified as vans. Modified buses should be considered to be a truck and be appropriately classified.
5. Pickups, Panels, Vans, and Other Two-Axle, Four-Tire Trucks (Pickup) - All two-axle, four-tire, camping vehicles, motor homes, vans, El Caminos, Rancheros, ambulances, hearses, carryalls, and four-wheel drive vehicles, such as Jeep, Scout, Bronco, Blazer, and Ramcharger, power wagons, etc.

6. Two-Axle, Six-Tire, Single-Unit Trucks (SU2A6T) - This category includes all trucks, camping and recreation vehicles, motor homes, etc., having two axles and dual rear wheels.
7. Three or More Axle, Single-Unit Trucks (SU3A) - All vehicles on a single frame with three or more axles in any configuration. This category includes concrete mixer trucks, heavy dump trucks, large motor homes, etc., having three axles or more.
8. Three-Axle Combination Trucks (Comb 3A) - All vehicles consisting of two units, one of which is a power unit, that have a total of three axles. This category includes all two-axle tractors with one-axle semitrailers (2S1) and all two-axle, single-unit trucks with one-axle trailers (2-1).
9. Two-Axle Tractor with Two-Axle Semitrailer Trucks (Comb 2S2) - Only those vehicles consisting of a two-axle tractor, and a two-axle semitrailer.
10. Other Four-Axle Combination Trucks (Comb 4A) - All vehicles consisting of two or more units having a total of four axles in any configuration except the 2S2. This category includes two-axle trucks with two-axle trailers (2-2), three-axle trucks with one-axle trailers (3-1), three-axle tractors with one-axle semitrailers (3S1), and two-axle tractors with one-axle semitrailers and one-axle trailers (2S1-1).
11. Three-Axle Tractor with Two-Axle Semitrailer Trucks (Comb 3S2) - Only those vehicles consisting of a three-axle tractor with a two-axle semitrailer.
12. Other Five-Axle Combination Trucks (Comb 5A) - All vehicles consisting of two or more units with five axles in any configuration except the 3S2.
13. Six or More Axle Combination Trucks (Other Comb) - All vehicles consisting of two or more units with six or more axles in any configuration.

### III. STUDY RESULTS

The results of the classification of 11,709,156 vehicles at 139 sites are presented in this chapter. These results show seasonal coverage for winter (December/January/February), spring (March/April/May), summer (June/July/August), and fall (September/October/November). Hourly coverage is for hour 00 (midnight to 1:00 a.m.) to hour 23 (11:00 p.m. to midnight). Daily coverage is shown for weekdays, weekends, and an average day. The following definitions apply to daily coverage:

1. Weekday Vehicles are the total number of vehicles counted on weekdays.
2. Weekend Vehicles are the total number of vehicles counted on weekends.
3. Average Day Vehicles are 5/7's of the total weekday vehicles divided by the total weekdays counted plus 2/7's of the total weekend vehicles divided by the total weekend days counted.

Vehicle types are shown individually in the tables of this section and are combined on the figures for ease of presentation. Cars, motorcycles, buses, and other two-axle, four-tire vehicles are combined into a nontruck category since they are primarily used to transport people rather than commodities. Other vehicle types are classified as trucks since they are used to transport commodities. The following definitions apply:

1. Nontrucks are cars, motorcycles, buses, and other two-axle, four-tire vehicles.
2. Single-Unit Trucks are two-axle, six-tire, and three or more axle vehicles on a single frame.
3. Combination Trucks are vehicles consisting of two units, one of which is a power unit.

Various methods of analyzing the case study data were investigated including statistical techniques to test data significance. It was concluded that statistical tests would be meaningless since this case study was not based on a random sample. Weighting the data by average annual daily traffic volume groups was also considered but was not feasible since this case study was not designed to gather information on that basis and, consequently, there was an inadequate number of groups. Due to the limitations of these methods, data are presented in this chapter as collected and simple averages are used to present a description of the distribution of vehicles in the traffic stream.

It should be noted that the nationwide rural/urban distribution of traffic (approximately 45 percent rural and 55 percent urban) found in past reports did not occur for the traffic reported by each participating agency. Caution should, therefore, be exercised in using the totals presented in each table. The separate rural and urban subtotals should be primarily used in determining vehicle distributions in the traffic stream. If totals are used, the figures should be weighted by the rural/urban traffic distribution appropriate to the participating agency or combination of agencies.

The case study data are stratified in this chapter by State, rural/urban areas, functional system, and highway design type in order to provide vehicle distributions of interest to diverse groups of users. This resulted in some repetition since the general relationships

(between weekday and weekend traffic for instance) are similar in each strata although the percentage distributions of each vehicle type in the traffic stream is different.

#### Vehicle Distributions by State

Table 2 contains the distribution of vehicle types in the traffic stream for each participating agency. All vehicles counted and classified by each agency are contained in this table. It can be seen in Table 2 that vehicle distributions vary between different areas of the Nation. Standard/compact cars, for instance, comprised the lowest percentage of the traffic stream in the State of Washington and the highest in the DVRPC area. Single-unit trucks amounted to the least percentage of the traffic stream in Minnesota and the greatest in Arkansas. The 3S2 was the lowest in the State of Washington and the highest in the State of Arkansas. These differences in vehicle distribution were considerable since the highest percentage of standard/compact cars was 1.63 times greater than the lowest, the highest percentage of single-unit trucks was 1.81 times greater than the lowest, and the highest percentage of 3S2's was 3.35 times the lowest.

It can also be seen that there are differences between areas of the Nation that are predominately rural, such as Iowa, and areas that are predominately urban, such as the DVRPC area. Each truck category, along with pickups, vans, etc., comprised a greater percentage of the traffic stream in Iowa than in the DVRPC area. Each category of standard/compact cars, small cars, and buses amounted to a greater percentage in the DVRPC area than in Iowa. A more detailed analysis of the difference between rural and urban areas is provided below.

#### Vehicle Distributions by Rural/Urban Area

Table 3 contains data from the participating agencies for vehicle classification sites in rural areas as well as data from sites in urban areas. Rural and urban data collected on weekdays and weekends, along with calculated average day vehicles, are also shown.

The collected data show that small and standard/compact cars accounted for a greater percentage of the traffic stream in urban areas than in rural areas, motorcycles and buses comprised the same percent of the traffic stream in both rural and urban areas, pickups, vans, etc., comprised a greater percent in rural areas than in urban areas, and each truck category comprised a greater percent in rural areas. This relationship between rural and urban areas was the same for weekday, weekend, and average day traffic distributions.

It should be noted that the distribution percentages for the total of both rural and urban areas were very close to the urban percentages for each category because the greatest number of vehicles classified were in urban areas. If this case study had been designed to classify the same number of vehicles in both rural and urban areas, the total for each category would have been more evenly distributed.

Standard/compact cars, small cars, pickups, and 3S2 combination trucks dominated the traffic stream in both rural and urban areas. Single-unit 2A6T trucks comprised a significant (1 to 3 percent) part of the traffic stream in both areas. All other vehicle types, including buses, motorcycles and the remaining truck types, each amounted to an insignificant (less than 1 percent) part of the traffic.

Standard/compact cars comprised the greatest part of the traffic stream and varied from a low of 40 percent on a weekday in rural areas to 55 percent on a weekend

in urban areas. Pickups in rural areas and small cars in urban areas comprised the second greatest with each comprising 20 to 23 percent of the traffic stream. Third highest were small cars in rural areas and pickups in urban areas with both amounting to 17 to 20 percent of the traffic. Fourth, were the 3S2's which varied from 3 to 14 percent. Fifth, were SU2A6T trucks followed by the other vehicle categories.

#### Seasonal Distributions By Rural/Urban

Vehicle distributions for each season of the year are shown in Figure 2. Only average day distributions for combined vehicle categories are shown for ease of presentation. The figure shows that little seasonal variation occurred in urban areas while rural areas experienced greater variations.

The maximum seasonal variation in vehicle distributions in urban areas occurred in nontruck traffic. This variation, however, was minimal since the maximum difference between seasons was only 1.6 percent. The maximum difference between seasons was 0.3 percent for single units and 1.2 percent for combinations.

The maximum seasonal variation in vehicle distributions in rural areas also occurred in nontruck traffic which had a 4.4 percent difference between summer and winter percentages. There was essentially no difference in single-unit truck distributions and a 4.4 percent difference between winter and summer for combination vehicle distributions. Nontruck traffic increase in the summer resulted in a decrease in combination vehicles as a percent of the traffic stream.

#### Daily Distributions by Rural/Urban

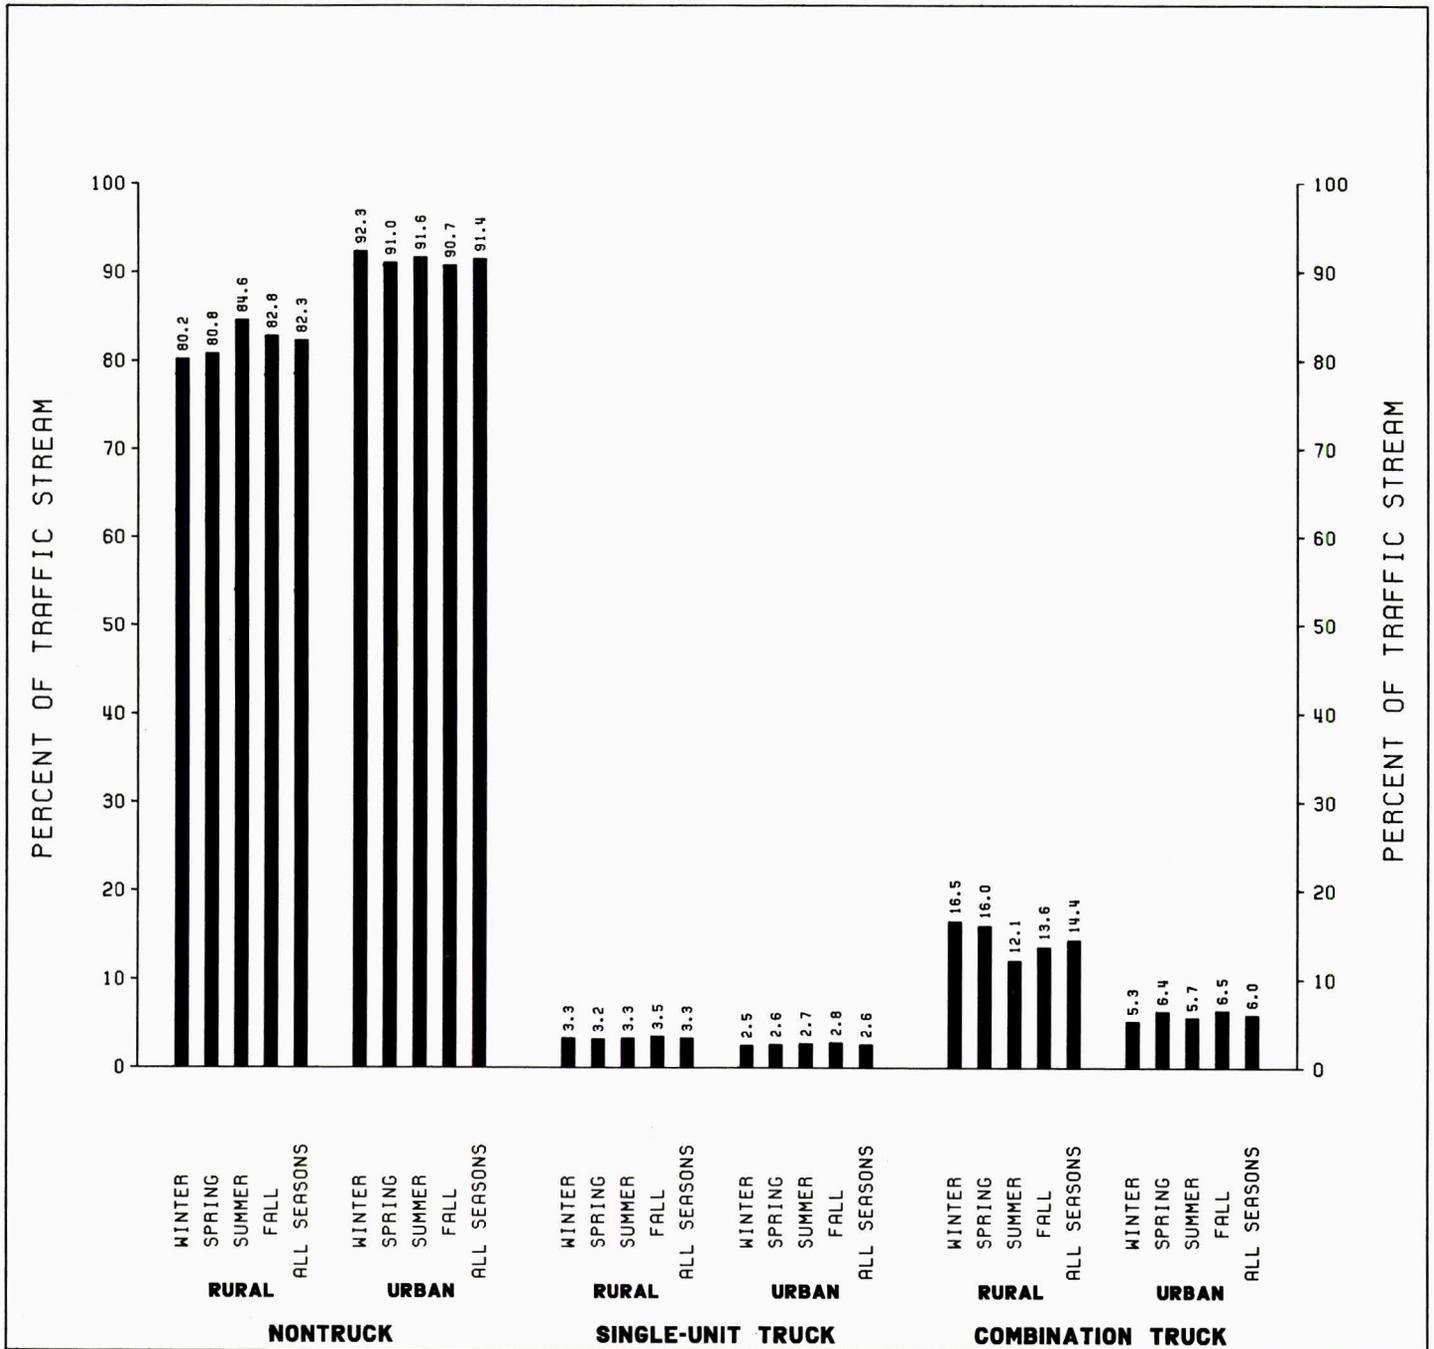

Figure 3 shows weekday, weekend, and average day distributions for both rural and urban areas by combined vehicle categories. Both single-unit and combination vehicles decreased as a percent of the traffic stream from weekday to weekend in both rural and urban areas. This effect was more pronounced for rural areas because single-unit and combination vehicles comprised a greater percentage of the traffic stream. Rural single units reduced from 3.9 percent to 2.0 percent of the traffic stream from weekday to weekend and rural combinations reduced from 16.8 percent to 8.7 percent. In urban areas single units decreased from 3.1 percent to 1.3 percent and combinations decreased from 7.0 to 3.2 percent from weekday to weekend. Nontrucks showed an increase as a percent of the traffic stream on weekends which corresponded with the decrease in single units and combinations.

#### Hourly Distributions by Rural/Urban

Nontrucks comprised a greater percent of the traffic stream during the day than during the night. Combination trucks were the opposite--they comprised a greater percent of the traffic stream during the night. These relationships are illustrated in Figures 4 and 5.

It can be seen in Figures 4 and 5 that in both rural and urban areas, there were pronounced decreases in nontruck distributions during the night, steady increases during early morning hours, and a leveling off during the day (with slight morning and afternoon peaks). Single-unit trucks increased during the day but the increase was relatively minor. There was a pronounced increase in the percentage of combination trucks in the traffic stream during the night, a steady decrease during early morning hours, and a constant flow during the day with slight decreases during peak hours in urban areas.

**FIGURE 2. SEASONAL DISTRIBUTIONS FOR AN AVERAGE DAY BY RURAL AND URBAN AREAS**

**FIGURE 3. WEEKDAY, WEEKEND AND AVERAGE DAY DISTRIBUTIONS FOR RURAL AND URBAN AREAS**

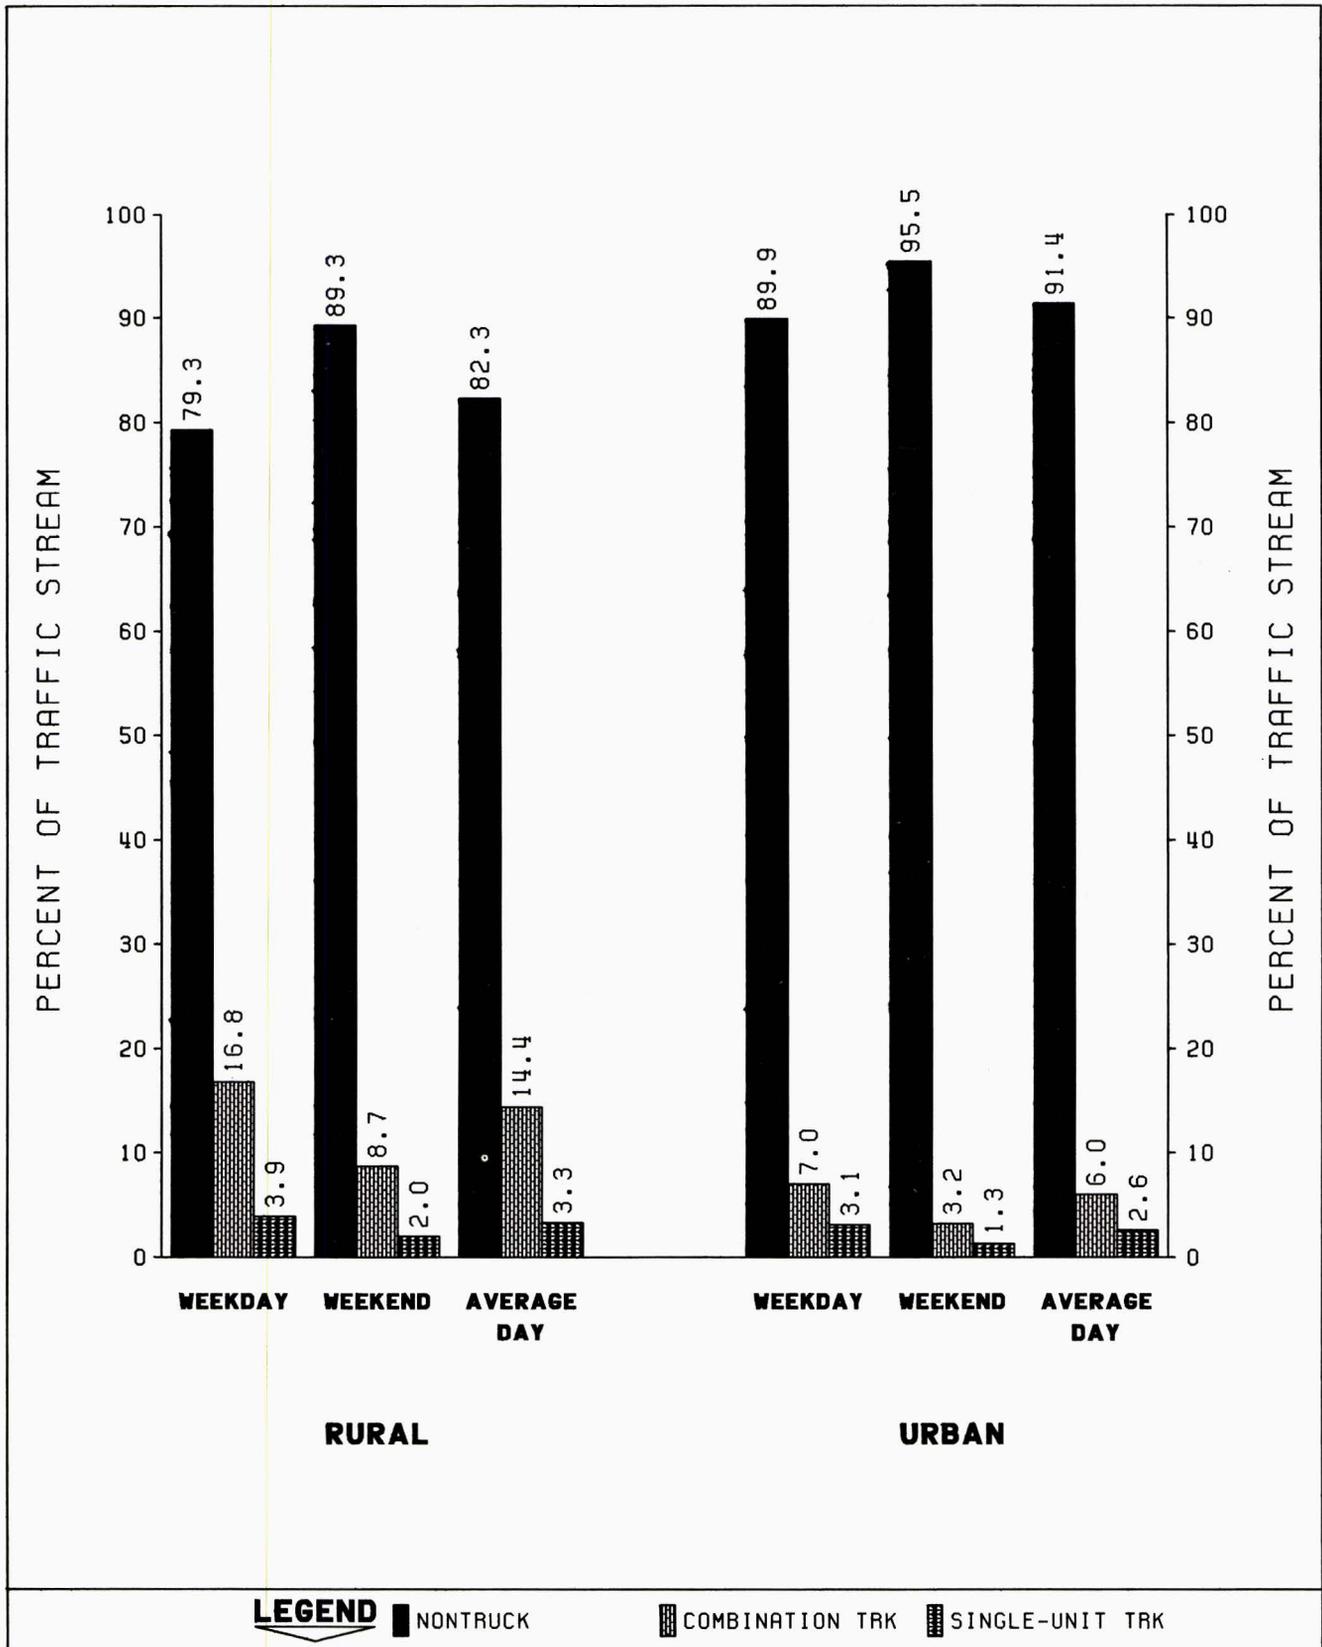

FIGURE 4. HOURLY DISTRIBUTIONS FOR AN AVERAGE DAY IN RURAL AREAS

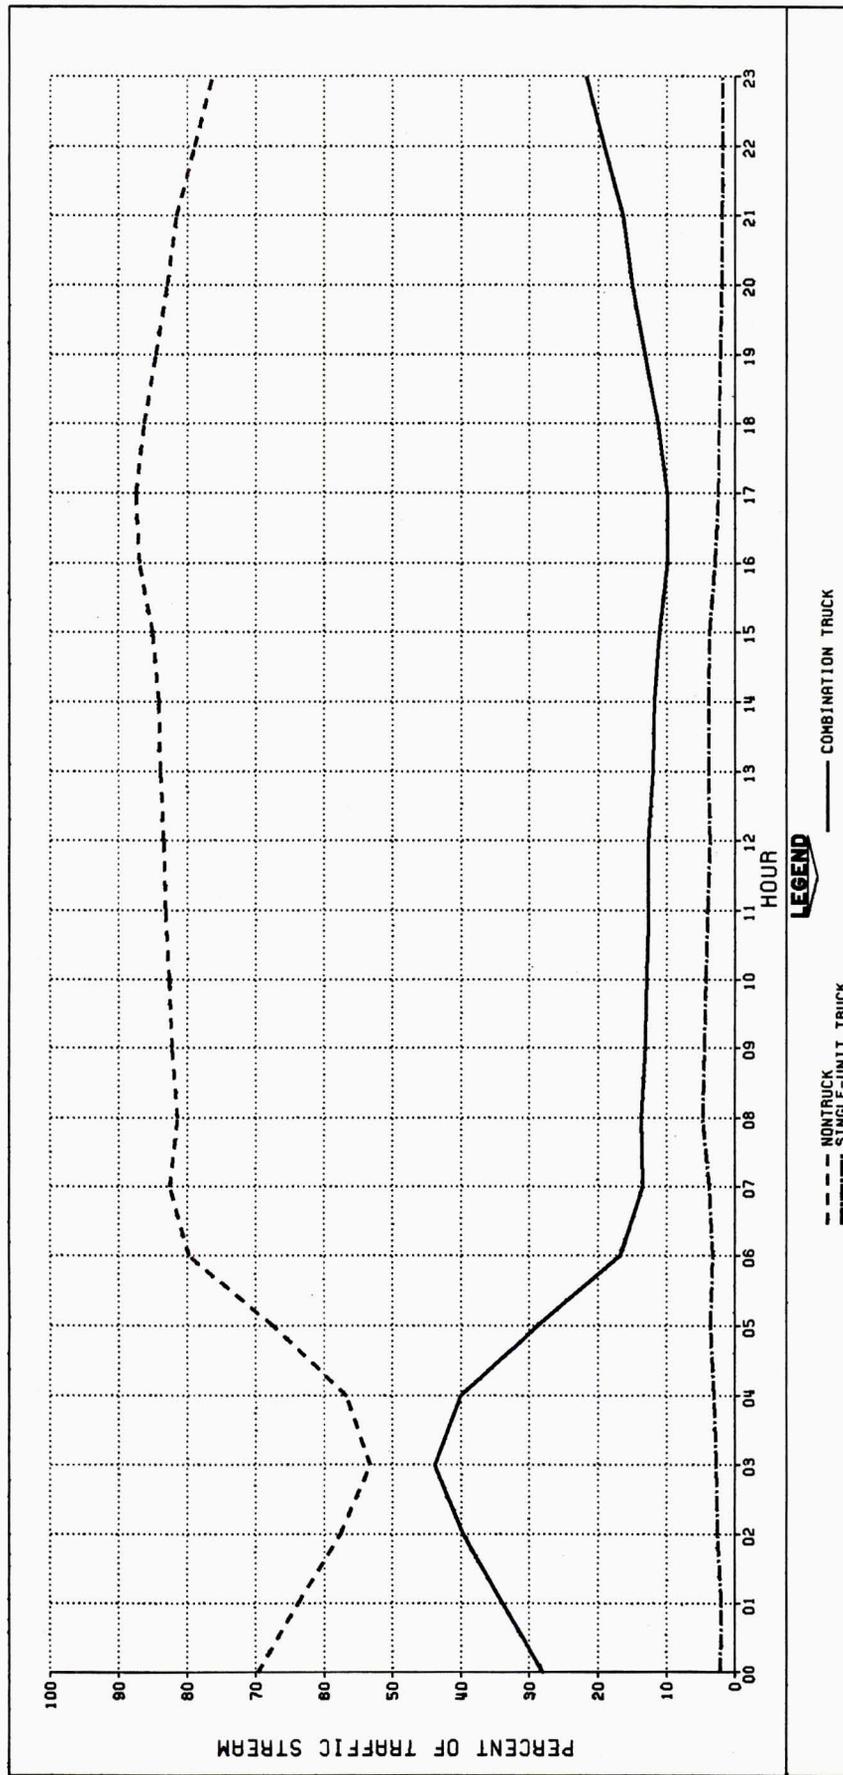

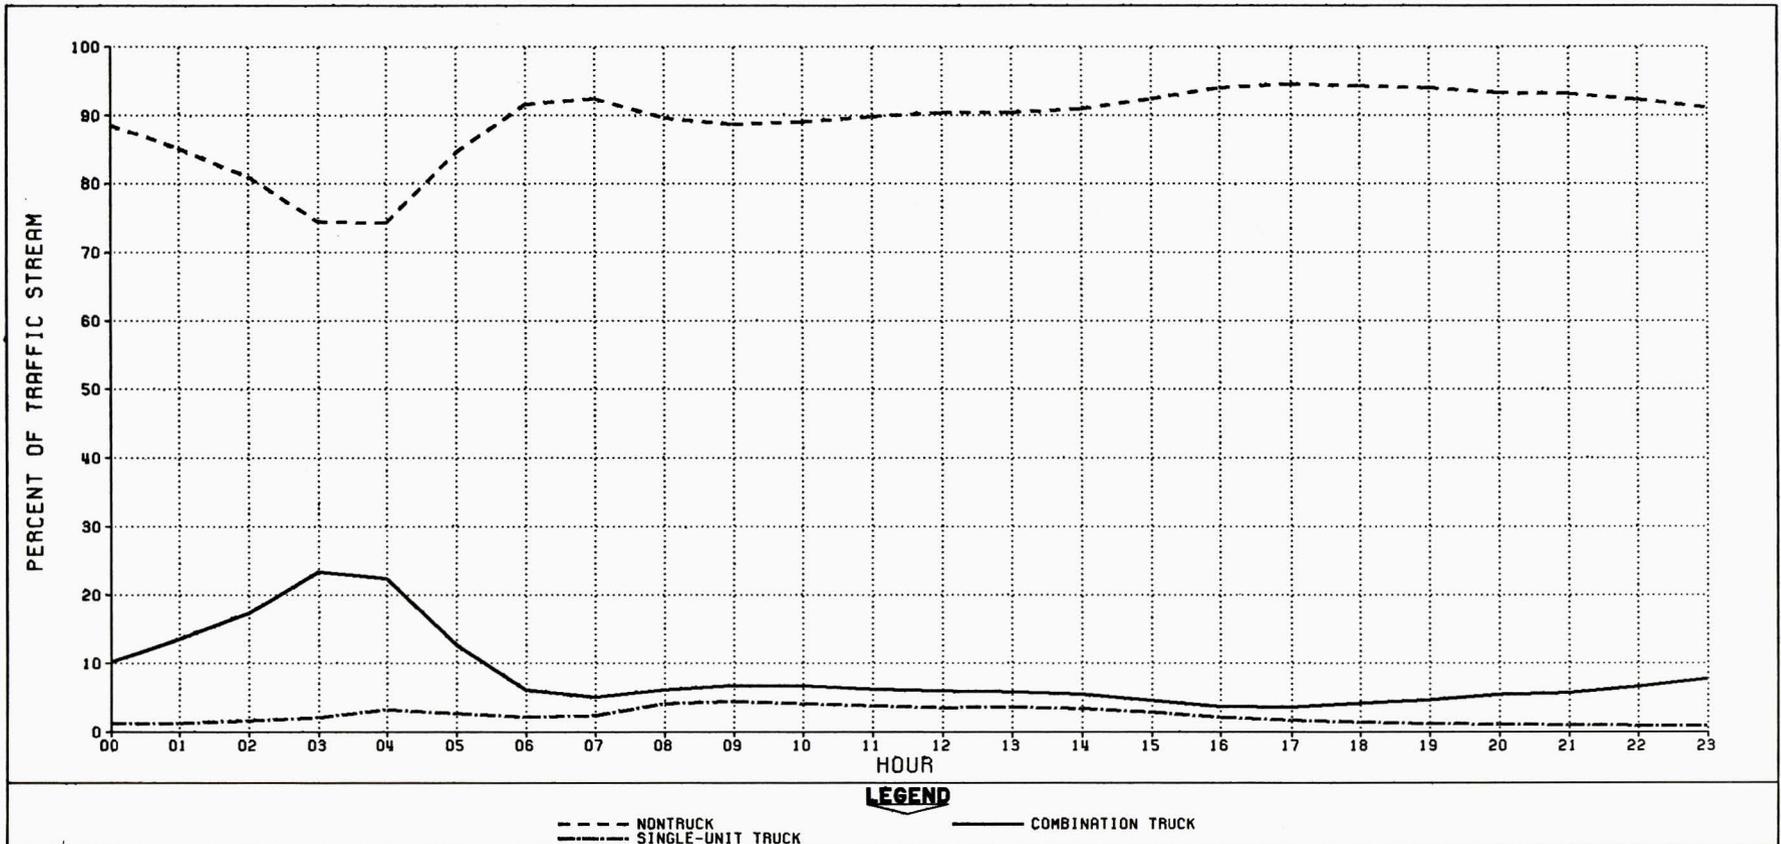

FIGURE 5. HOURLY DISTRIBUTIONS FOR AN AVERAGE DAY IN URBAN AREAS

### Vehicle Distributions by Functional System

Standard/compact cars, as shown in Table 4, comprised a greater percent of the traffic reported by the participating agencies than any other category for each functional system. Small cars, pickups, single unit 2A6T's and 3S2's also comprised a high percent of the traffic on each functional system. All other categories each amounted to less than 2 percent of the traffic using each functional system.

Both standard/compact and small cars were more prevalent on the urban functional systems than on the rural systems. The greatest percent of automobiles occurred on urban minor arterials (75 percent on an average day) while the least occurred on rural collectors (55 percent on an average day). Usage of both types of automobiles varied considerably from system to system with standard/compact vehicles ranging from 42 to 57 percent of the traffic stream on an average day and small cars ranging from 13 to 22 percent.

Motorcycles and buses generally amounted to less than 1 percent of the traffic stream on all functional systems. Motorcycle traffic was greater than bus traffic (often two to three times greater) except for weekday traffic on rural collectors.

Pickups varied considerably from system to system from 17 percent of the traffic stream on urban Interstate/other freeways and expressways to 32 percent on rural collectors for an average day. The percent of pickups in the traffic stream decreased as the order of the system increased. This was particularly pronounced on rural systems which also had generally greater percentages of these vehicles than urban systems.

Single-unit trucks varied from less than 1 to 6 percent of the traffic stream. Single-unit 2A6T trucks comprised a slightly greater percent of the traffic on the lower order rural functional systems than on the higher order. Single-unit 2A6T trucks also comprised a slightly greater percent of the traffic on rural functional systems than on urban. Single unit 3A trucks comprised less than 1 percent of the traffic stream for each functional system except rural collectors.

Of the combination trucks, only the 3S2 amounted to a significant part of the traffic stream. The 3S2 varied from 1 to 15 percent of the traffic on an average day. The percentage of 3S2's in the traffic stream was large in the higher order rural and urban functional systems and small in the lower order systems. It can be assumed that 3S2's used the higher order systems because of higher design standards which allowed greater speeds and reduced traveltime. Most other combination trucks also followed the same usage pattern as 3S2's but there were some exceptions as shown in Table 4.

### Seasonal Distributions by Functional System

Distributions of nontrucks, single units, and combinations in the traffic stream for each season of the year are shown in Figures 6 and 7 for an average day. The figures show that there was noticeable seasonal variation for most vehicle distributions on each rural functional system and minor seasonal variation on each urban functional system.

The rural Interstate System had the greatest seasonal variation of vehicle distributions in the traffic stream. Nontrucks on this system varied from a low of 76 percent of the traffic stream in the winter to a high of 82 percent during the summer. Single units comprised approximately 3 percent of the traffic during each season. Interstate System combinations increased as part of the traffic stream when nontrucks decreased

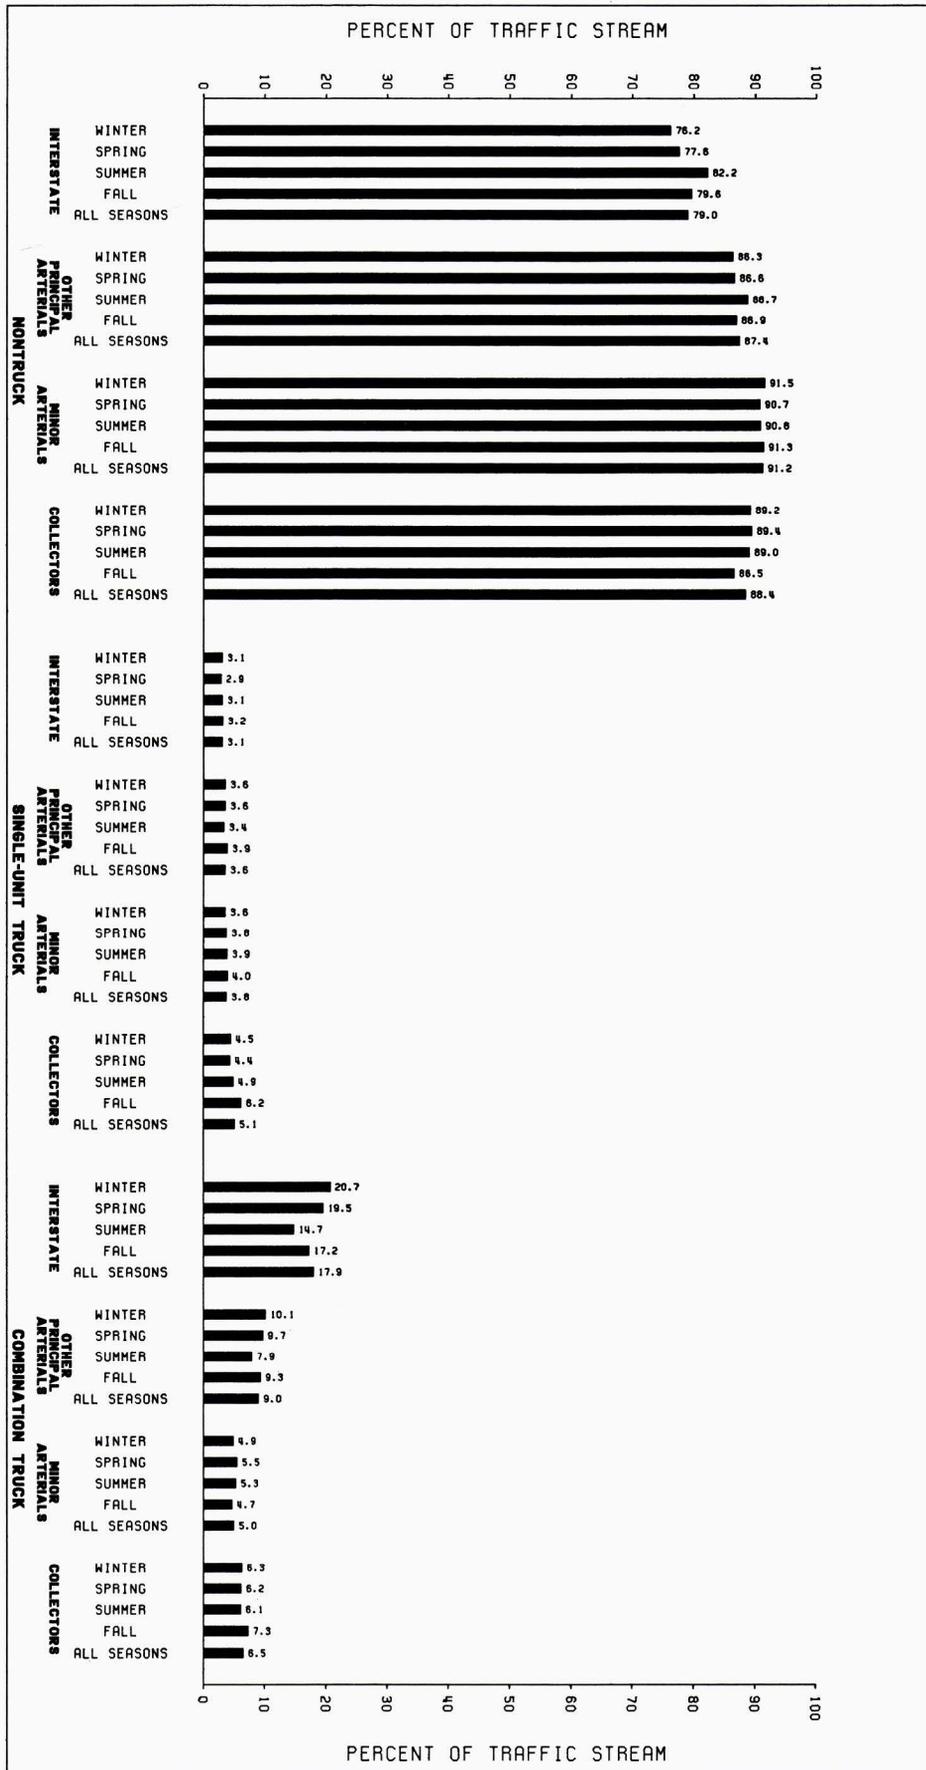

FIGURE 6. SEASONAL DISTRIBUTIONS FOR AN AVERAGE DAY BY RURAL FUNCTIONAL SYSTEM

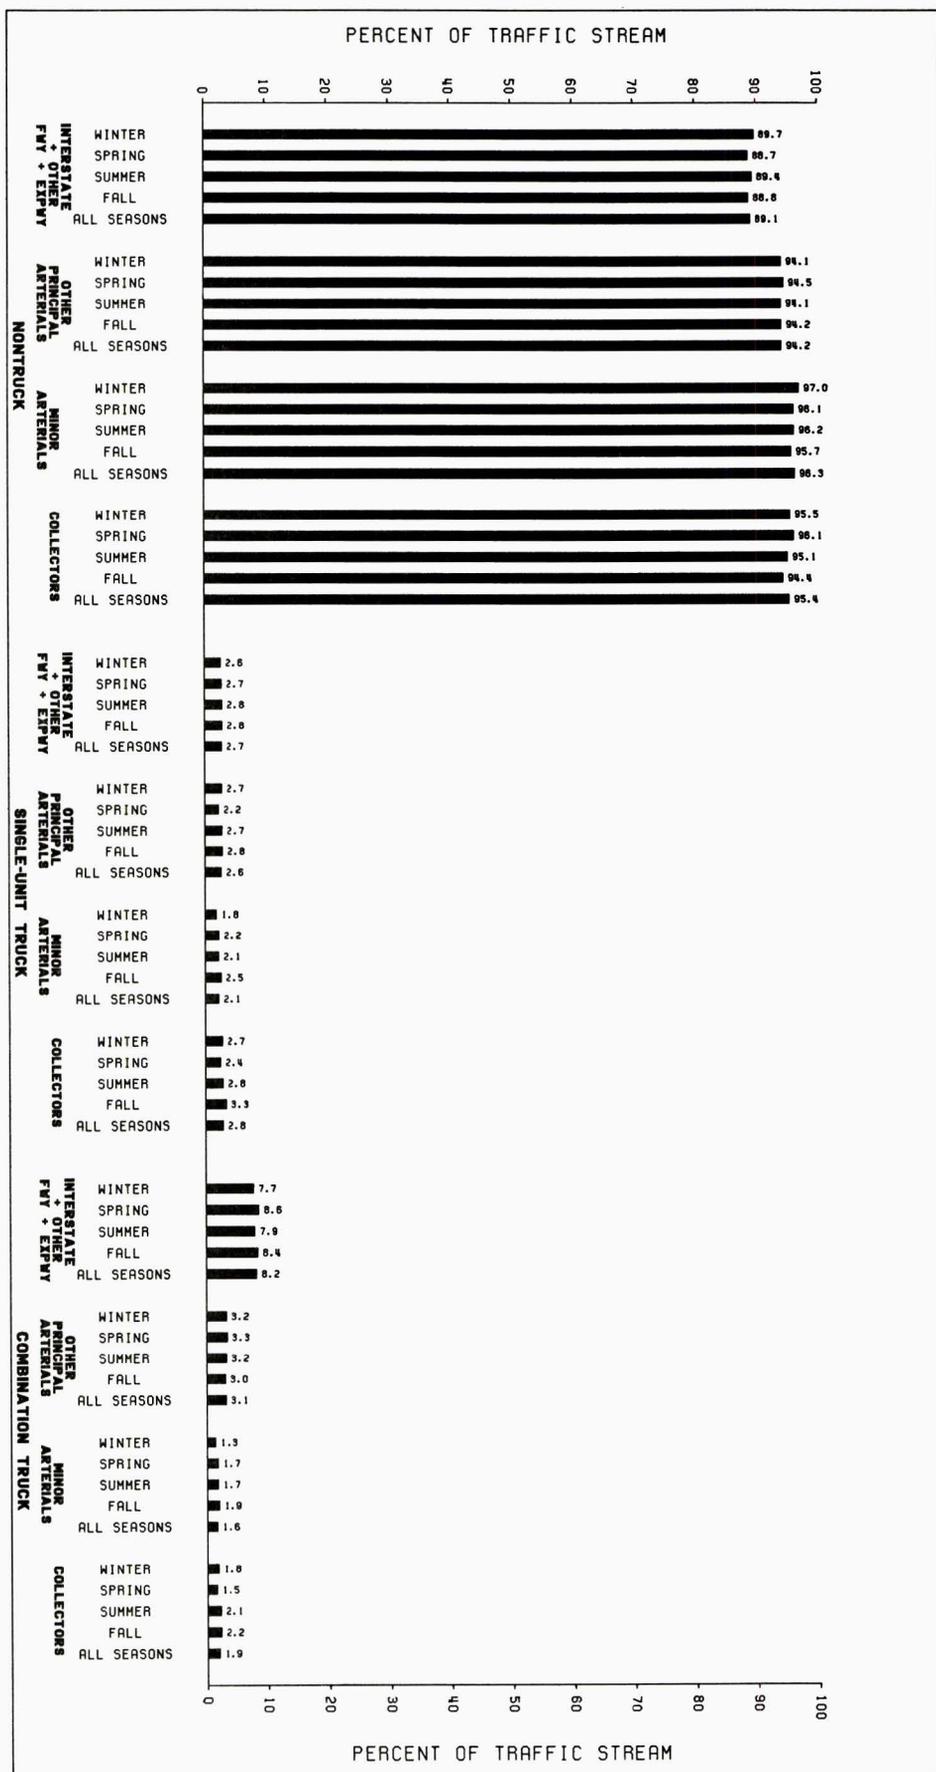

FIGURE 7. SEASONAL DISTRIBUTIONS FOR AN AVERAGE DAY BY URBAN FUNCTIONAL SYSTEM

with a low of 15 percent in the summer and a high of 21 percent in the winter. The higher percentage of nontrucks during the summer, and the corresponding low percentage of trucks, is probably due to increased travel of nontrucks for vacation and other pleasure purposes.

The other rural functional systems had less than half the seasonal variation of the rural Interstate System. Rural other principal arterials had slightly less than 3 percent variation for nontrucks from winter to summer, rural minor arterials had less than 1 percent variation from winter to spring, and collectors had slightly less than 3 percent variation from spring to fall. These systems also had little variation in single-unit distributions from season to season and had changes in combination truck distributions that generally corresponded to changes in nontruck traffic.

Each urban functional system had little seasonal variation in vehicle distributions. Collectors had the greatest variation of these systems (slightly less than 2 percent for nontrucks, less than 1 percent for single units, and less than 1 percent for combination trucks) but these variations were very minor. All other urban functional systems, including Interstate/freeways and expressways, had approximately 1-percent variation for nontrucks and approximately 1-percent variation for single units and combinations combined. The seasonal differences in vehicle distributions were so small that it could be concluded that there was no difference between seasons for each urban functional system.

#### Daily Distributions by Functional System

Weekday, weekend, and average day distributions for nontrucks, single units, and combinations are presented in Figure 8. The rural Interstate System and rural collectors are shown to illustrate that the data collected by the participating agencies had definite daily differences in vehicle distributions among the functional systems.

The rural Interstate System had an increase in nontruck distributions from 76 percent of the traffic stream on a weekday to 87 percent on a weekend. Single unit and combination truck distributions decreased by one-half, from 21 to 11 percent for combinations, and from 4 to 2 percent for single units.

Rural collectors also had an increase in nontruck distributions on the weekends (86 percent to 94 percent of the traffic stream). There was also a corresponding decrease in truck distributions on the weekends (from 6 to 3 percent of the traffic stream for single-units and from 8 to 4 percent for combinations).

The relationship between weekday and weekend traffic illustrated for the rural Interstate System and for rural collectors occurred for each functional system as shown in Table 4. Nontrucks increased as a percent of the traffic stream and each truck category decreased on the weekends. The same relationship between weekday and weekend traffic was previously noted in the discussion on rural/urban distribution.

#### Hourly Distributions by Functional System

Hourly distributions in the traffic stream for nontrucks, single-unit trucks, and combination trucks for an average day are shown in Figures 9 and 10. The rural Interstate System and rural collectors are presented to illustrate the difference in hourly distributions between functional systems. Hourly distributions for these functional systems show similar trends as rural/urban distributions although the actual numbers (percent of the traffic stream) are different.

**FIGURE 8. WEEKDAY, WEEKEND AND AVERAGE DAY DISTRIBUTIONS FOR RURAL INTERSTATE AND RURAL COLLECTOR**

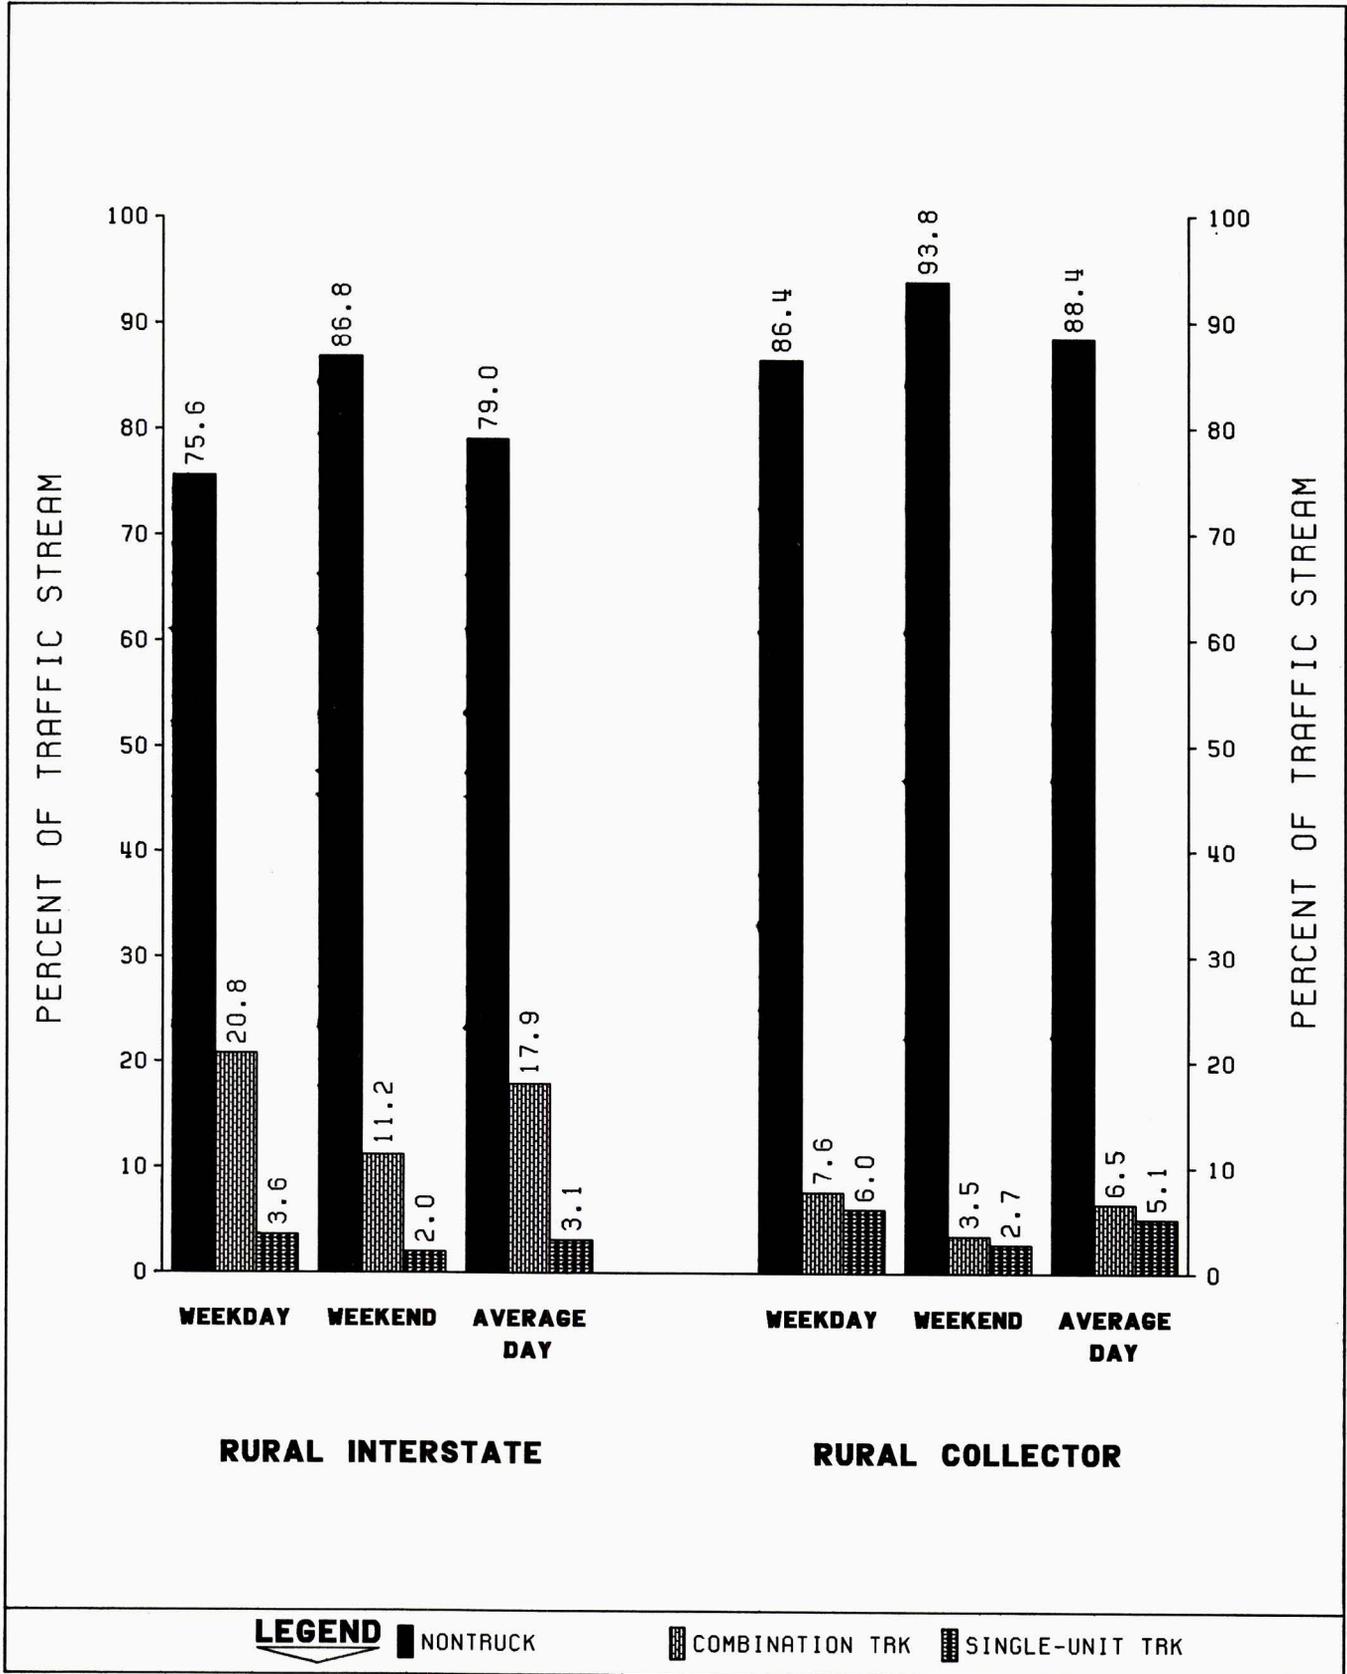

FIGURE 9. HOURLY DISTRIBUTIONS FOR AN AVERAGE DAY ON THE RURAL INTERSTATE SYSTEM

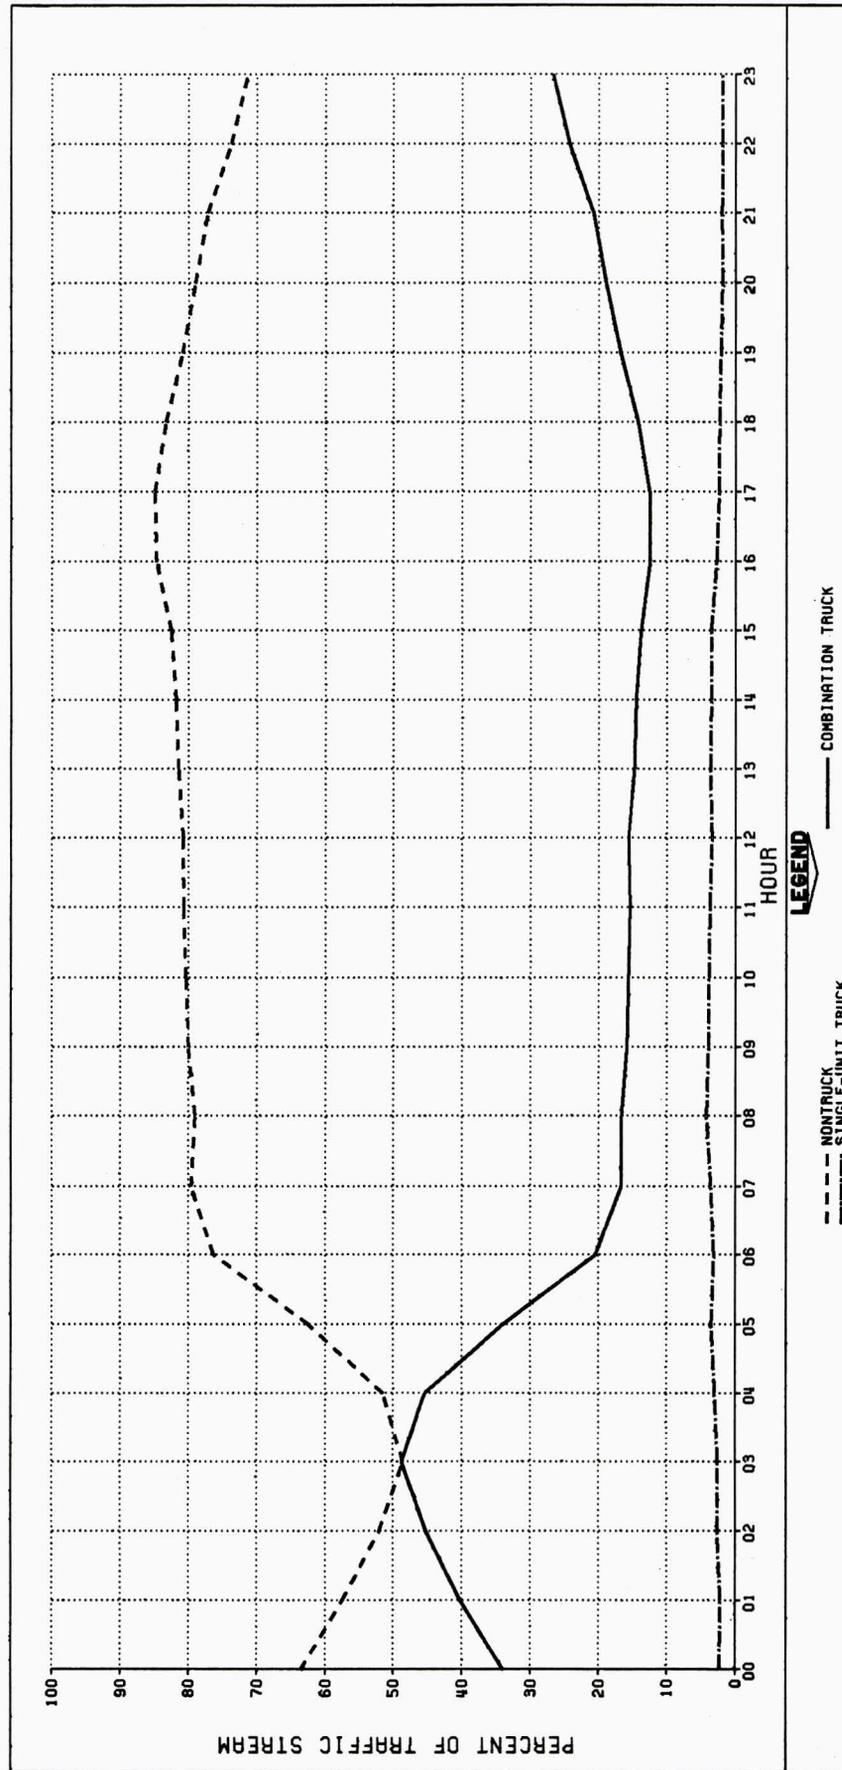

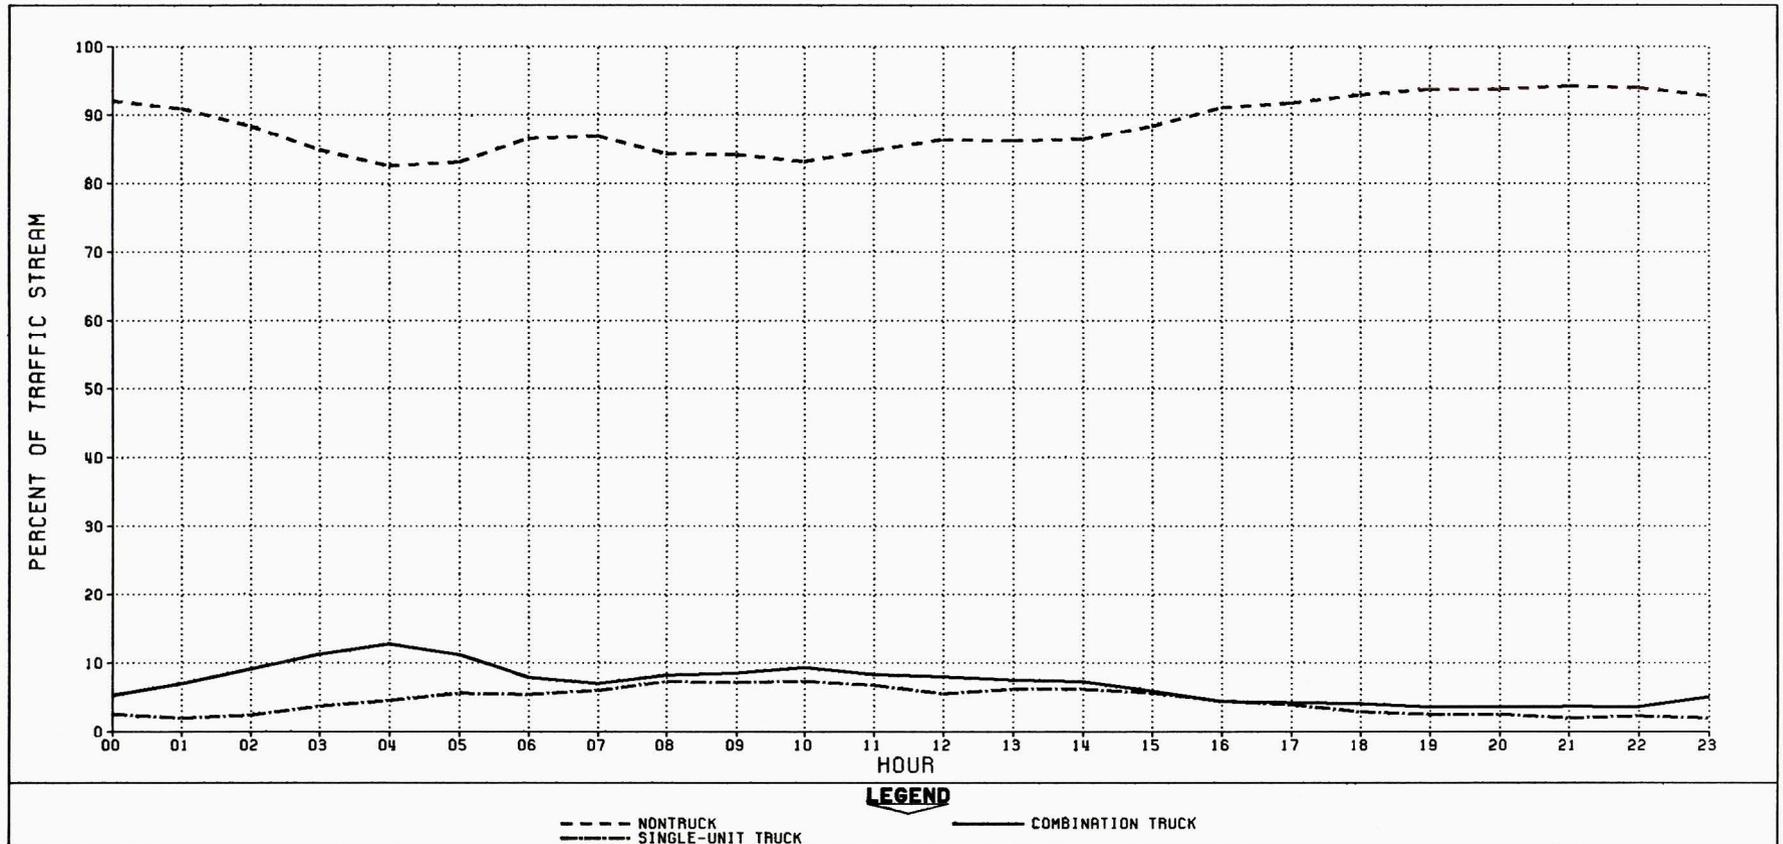

FIGURE 10. HOURLY DISTRIBUTIONS FOR AN AVERAGE DAY  
ON THE RURAL COLLECTOR SYSTEM

The rural Interstate System had increased nontruck distributions during the day and decreased distributions at night. There were slight but noticeable peaks in nontruck distributions during the morning and afternoon. Single-unit truck distributions, although slightly higher during the day, were relatively constant from hour to hour. Combination truck distributions, which decreased during the day and increased at night, complemented nontruck distributions.

Rural collectors followed a similar pattern as the rural Interstate System with a decrease in nontruck distributions during the night accompanied by an increase in combination truck distributions. During the day, nontrucks slightly increased and combinations slightly decreased until the late evening. Single-unit trucks comprised a relatively stable amount of the traffic stream although there were very slight increases during the day.

### Vehicle Distributions by Highway Design Type

This case study was not initiated in order to gather vehicle distributions by design type of highway. It was, however, considered desirable to stratify the data collected by the participating agencies according to design type since there is an interest in this type of information and a sufficient number of classification sites in each stratum existed. The following number of classification sites existed in each stratum:

	<u>Rural</u>	<u>Urban</u>
Freeways and Expressways	21	35
Multilane Highways	2	11
Two-lane Highways	46	24

It can be seen from a comparison between Table 4 and Table 5 that rural freeway and expressway distributions were the same as rural Interstate System distributions. The same relationships among vehicle types previously discussed for the rural Interstate System also apply to rural freeways and expressways.

Other design type distributions were also similar to functional system distributions. Standard/compact cars, for instance, which comprised the highest percent of the traffic stream for each functional system also comprised the highest percent for each design type. These vehicles varied from 40 to 63 percent of the traffic stream.

Pickups comprised the second greatest and small cars the third greatest percent of the traffic stream for most design types (functional system distributions were similar). Pickup percentages were higher for rural design types and on urban two-lane roads while small car percentages were higher on urban freeways and expressways. Pickups varied from 16 to 28 percent of the traffic stream while small cars varied from 9 to 24 percent.

Similar to functional system distributions, the next highest percent of the traffic stream was comprised of 3S2's, which varied from 1 to 17 percent, followed by single-unit 2A6T vehicles which varied from 1 to 5 percent. All other vehicle types, with the exception of single-unit 3A trucks and motorcycles on rural other multilane and rural two-lane highways, amounted to less than 1 percent of the traffic stream for each design type.

### Seasonal Distributions by Highway Design Type

Vehicle distributions by season of the year are shown in Figures 11 and 12 for nontrucks, single-unit trucks, and combination trucks. Both rural and urban design types are shown.

Nontrucks had observable differences in seasonal distributions on rural freeways and expressways and rural other multilane highways. Nontrucks varied from 76 to 83 percent of the traffic stream on rural freeways and expressways and from 80 to 89 percent on rural other multilane highways. Seasonal differences were very minor (1 percent or less) on rural two-lane roads and each urban design type.

Single units had seasonal variations of up to 5 percent on rural other multilane highways and minor (1 percent or less) on all other design types.

Combination vehicles varied from 14 to 21 percent of the traffic stream on rural freeways and expressways and from 6 to 12 percent on rural other multilane highways. Seasonal differences were negligible (less than 1 percent) on each urban design type.

### Daily Distributions by Highway Design Type

Weekday, weekend, and average day distributions in the traffic stream for nontrucks, single-unit trucks, and combination vehicles are shown in Figure 13. Two design types are shown, rural freeways and expressways and rural two lane highways, in order to illustrate the fact that there were daily differences in distributions among design types.

Nontrucks increased from 76 percent of the traffic stream on weekdays to 87 percent on weekends for rural freeways and expressways and from 86 percent on weekdays to 94 percent on weekends for rural two-lane highways. The increase on the weekends shown for these two design types also occurred for the other design types as can be seen in Table 5.

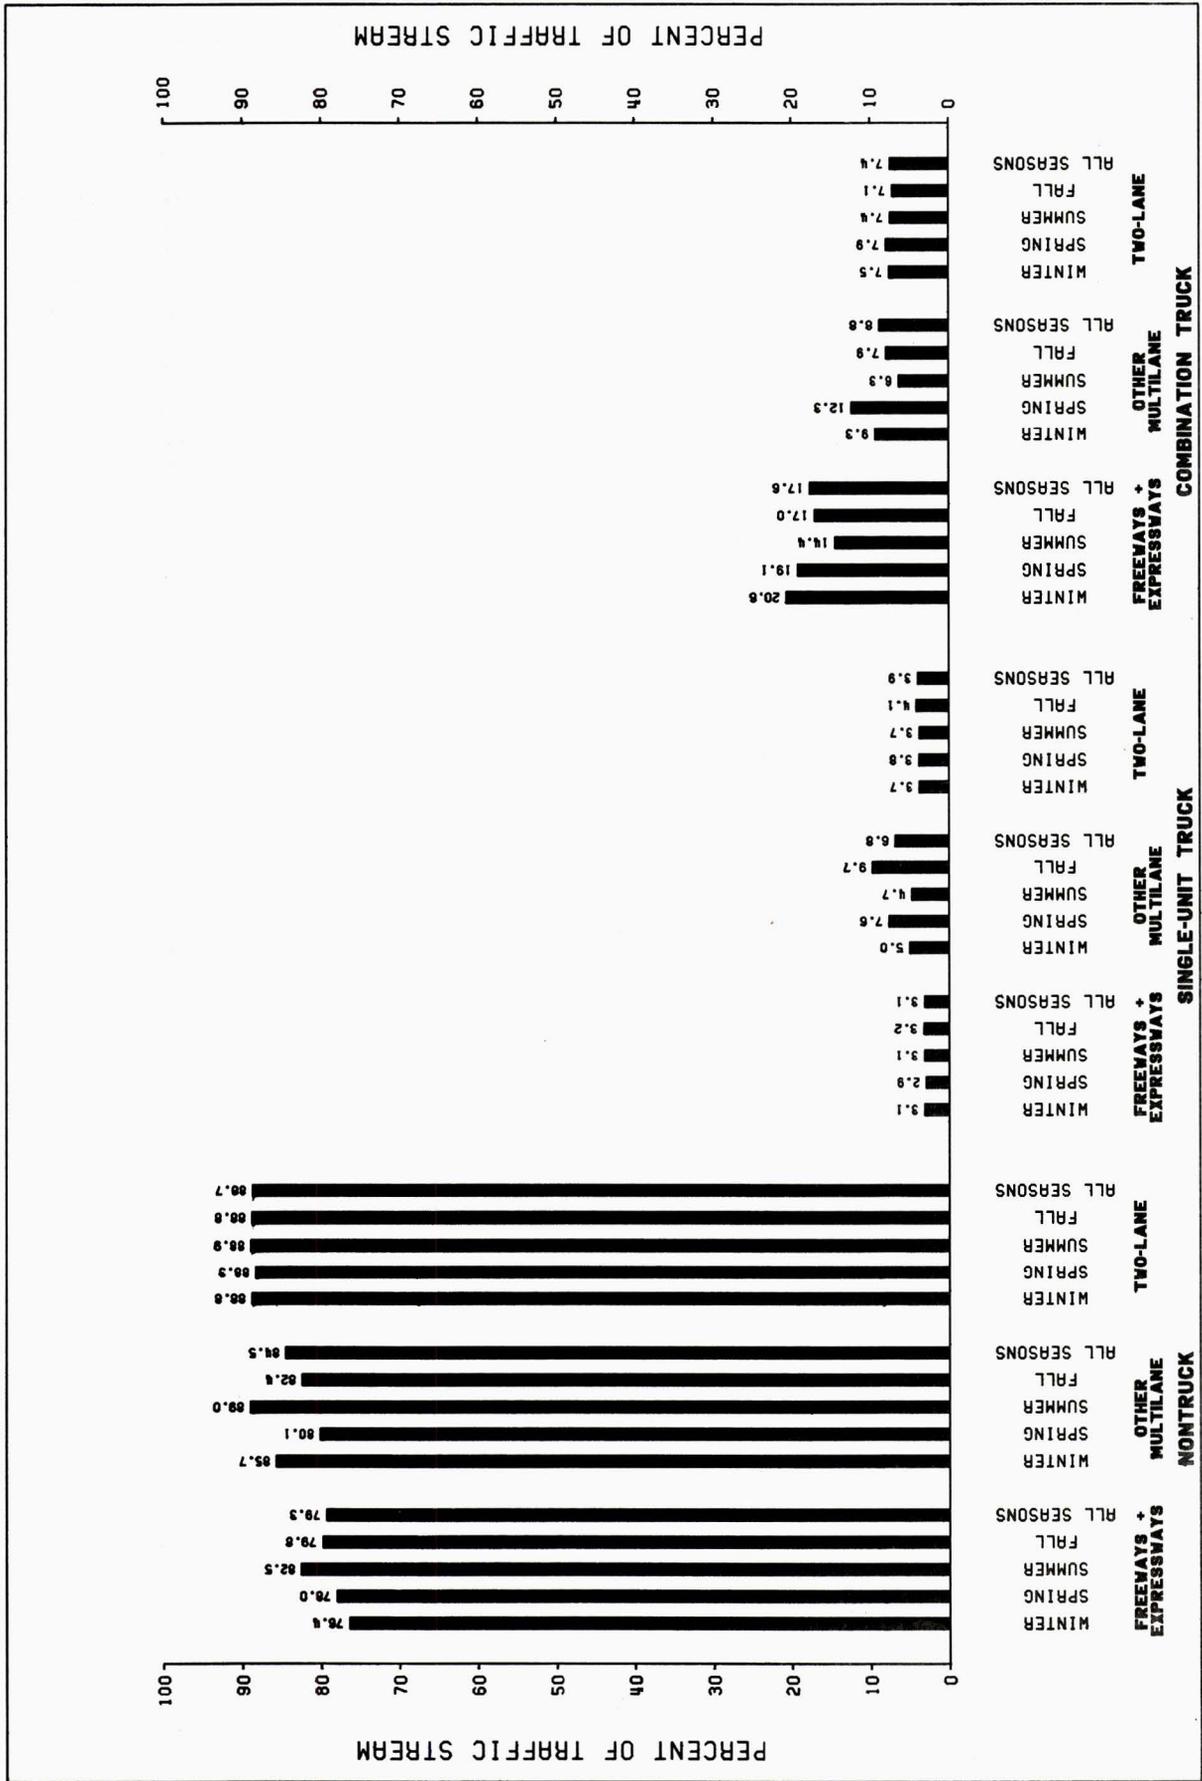

Single unit trucks as a percent of the traffic stream decreased by one-third to one-half from weekday to weekend. Single units decreased from 3.5 percent to 2.0 percent on rural freeways and expressways and from 4.6 percent to 2.0 percent on rural two-lane highways. Both types of single-unit trucks, as shown in Table 5, decreased on the weekend for each design type.

Combination trucks decreased by approximately one-half on the weekends. Combinations decreased from 21 percent of the traffic stream on weekdays to 11 percent on weekends for rural freeways and expressways. These vehicles decreased from 9 percent on weekdays to 4 percent on weekends for rural two-lane highways. Table 5 shows that each combination vehicle decreased on the weekends for each design type.

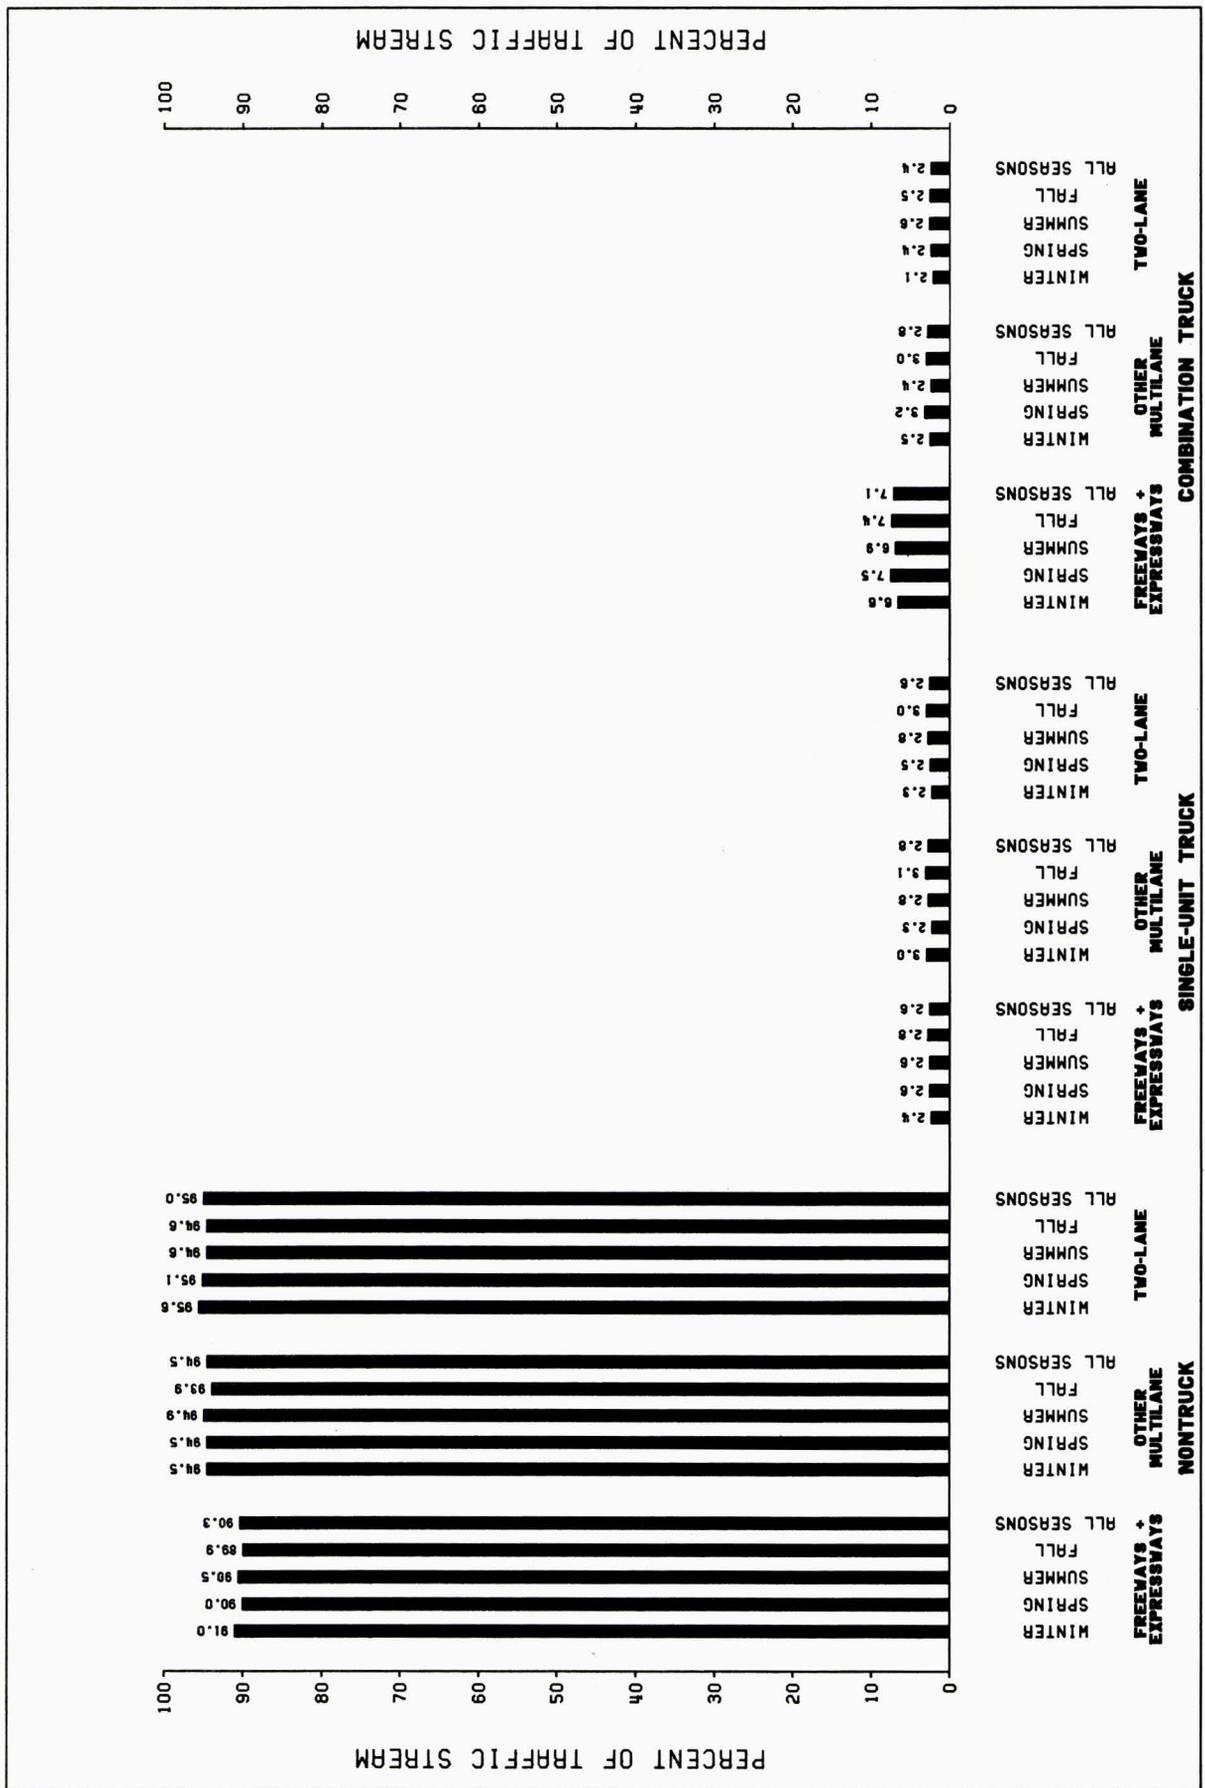

### Hourly Distributions by Highway Design Type

Typical hourly distributions for an average day are shown in Figure 14 for rural freeways and expressways and in Figure 15 for rural two-lane highways. Each design type had distributions similar to those shown in the figures. These distributions had similar hour-to-hour trends previously discussed for rural functional system distributions.

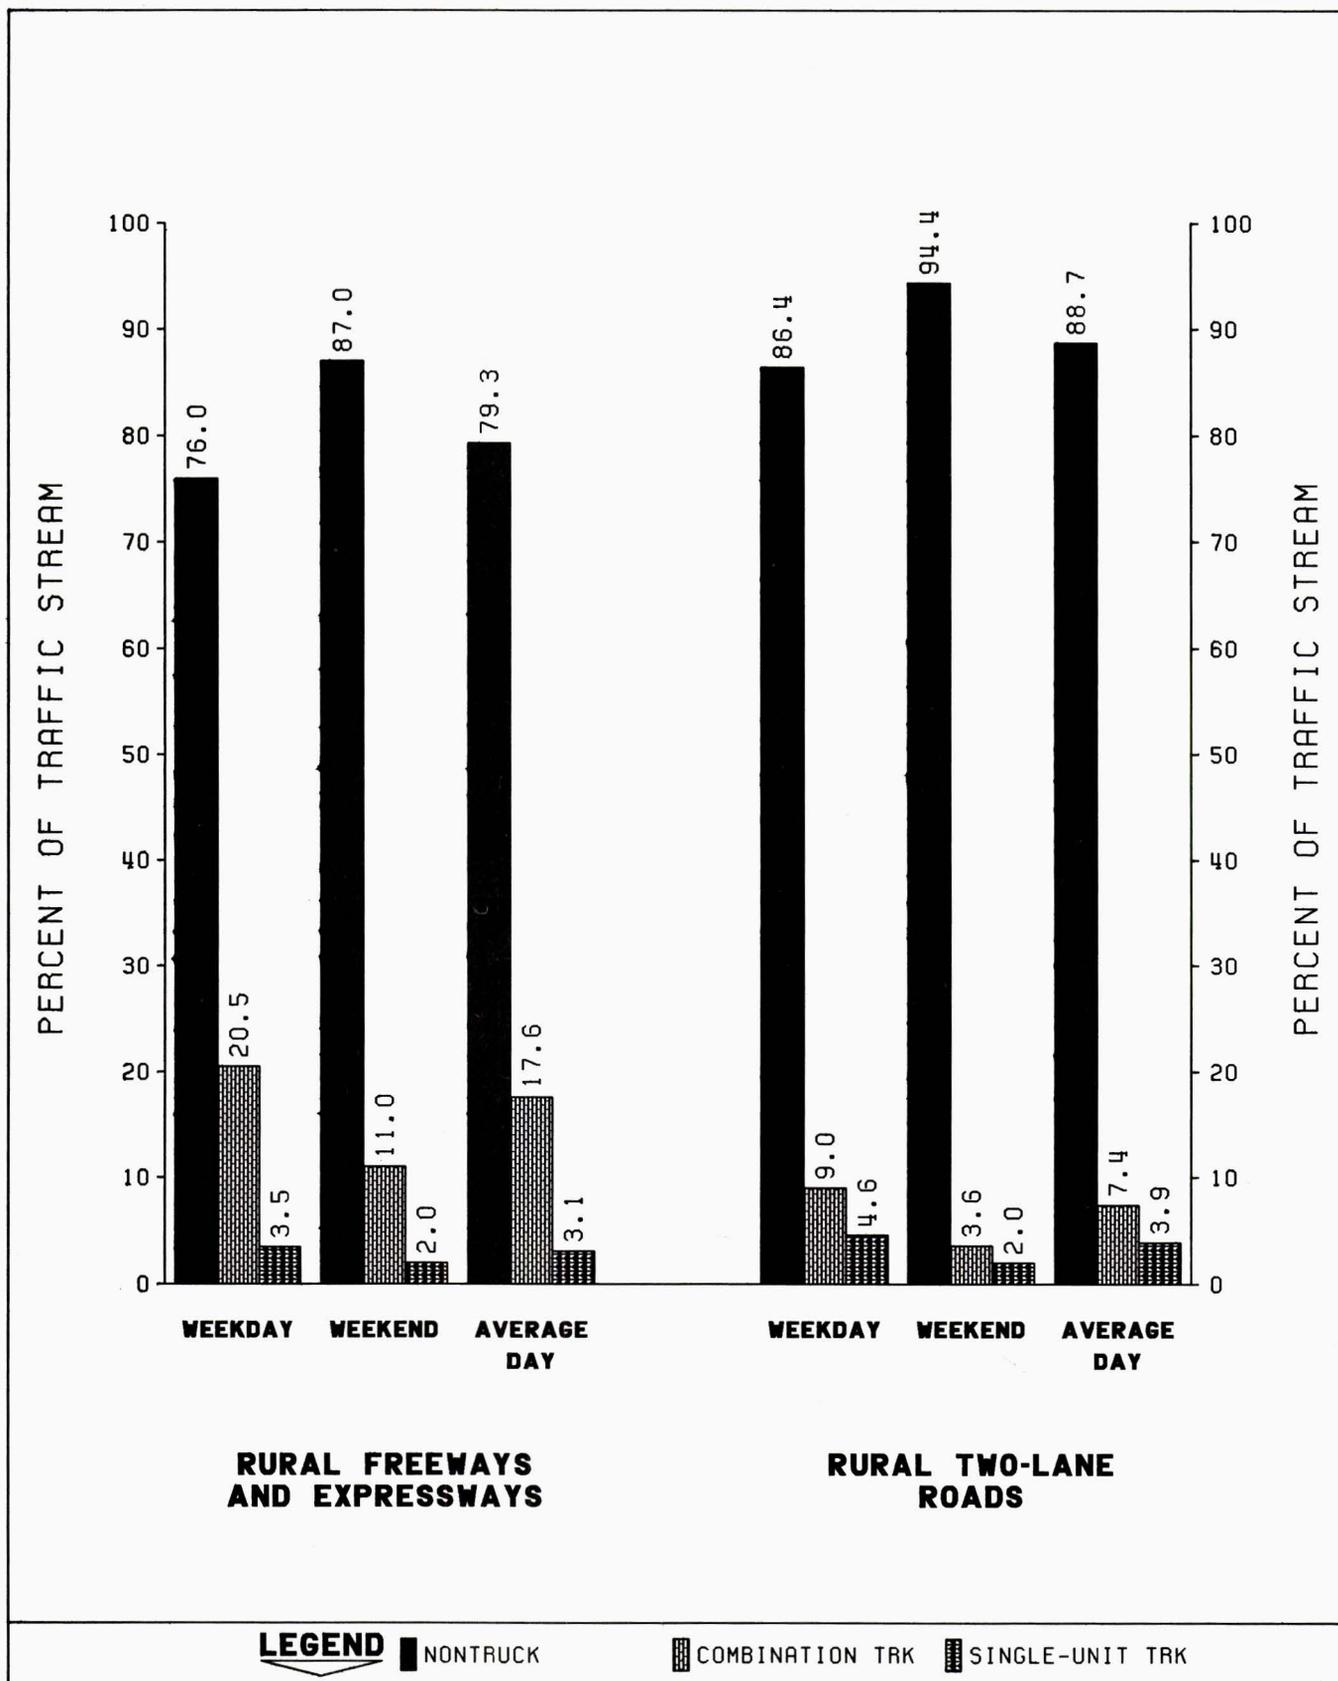

FIGURE 11. SEASONAL DISTRIBUTIONS FOR AN AVERAGE DAY  
BY RURAL DESIGN TYPE

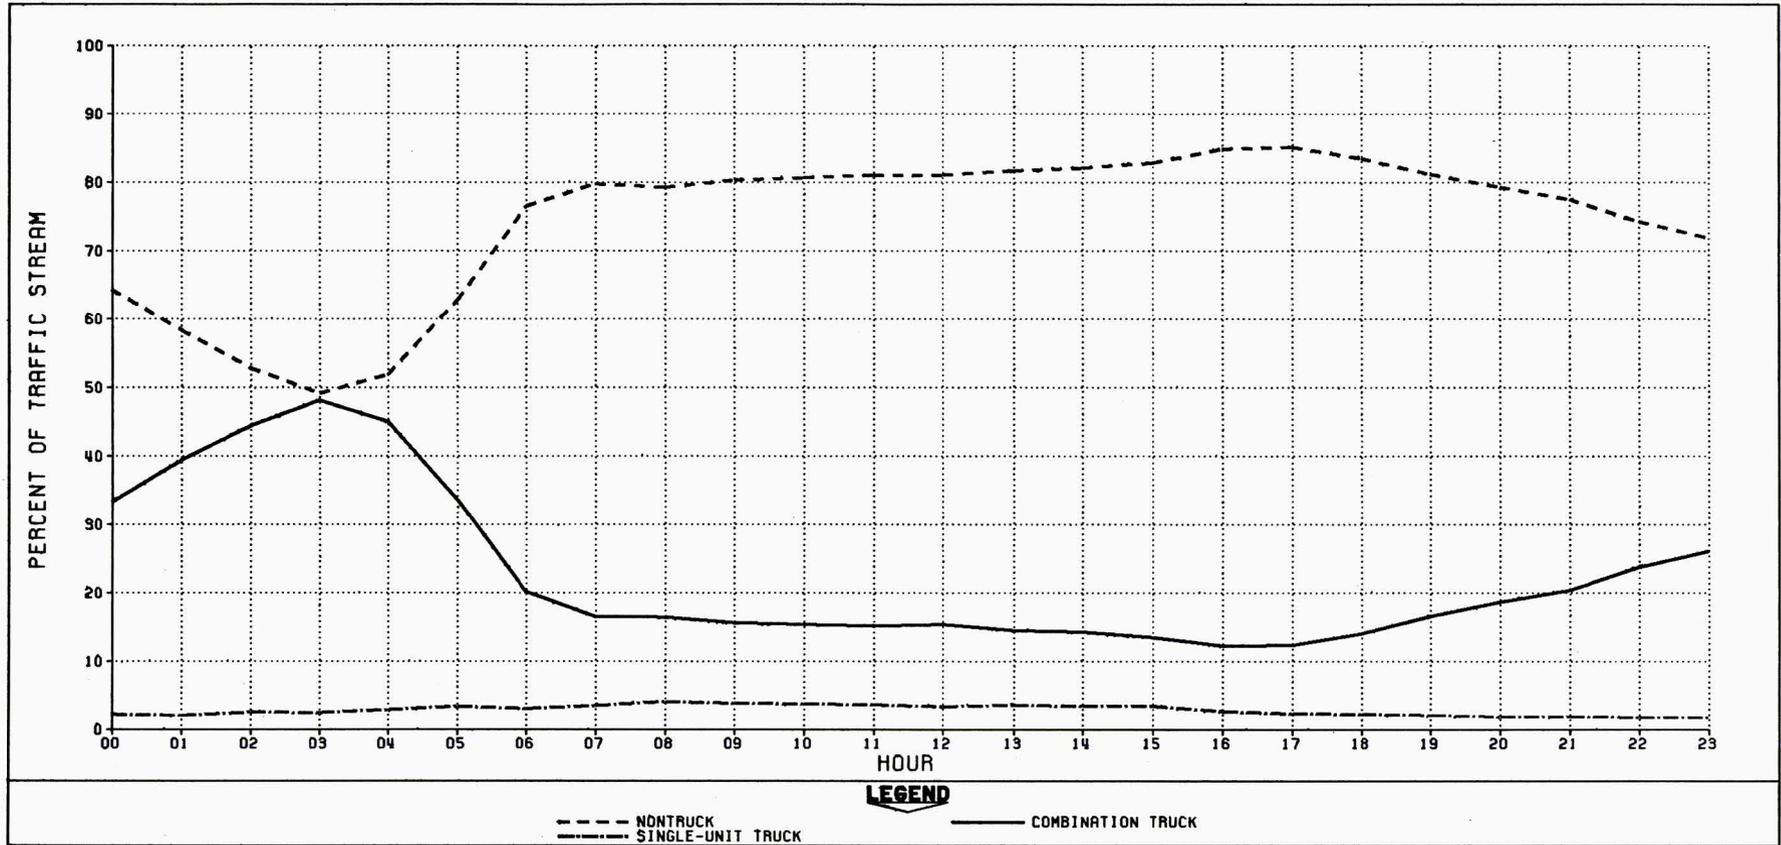

**FIGURE 12. SEASONAL DISTRIBUTIONS FOR AN AVERAGE DAY  
BY URBAN DESIGN TYPE**

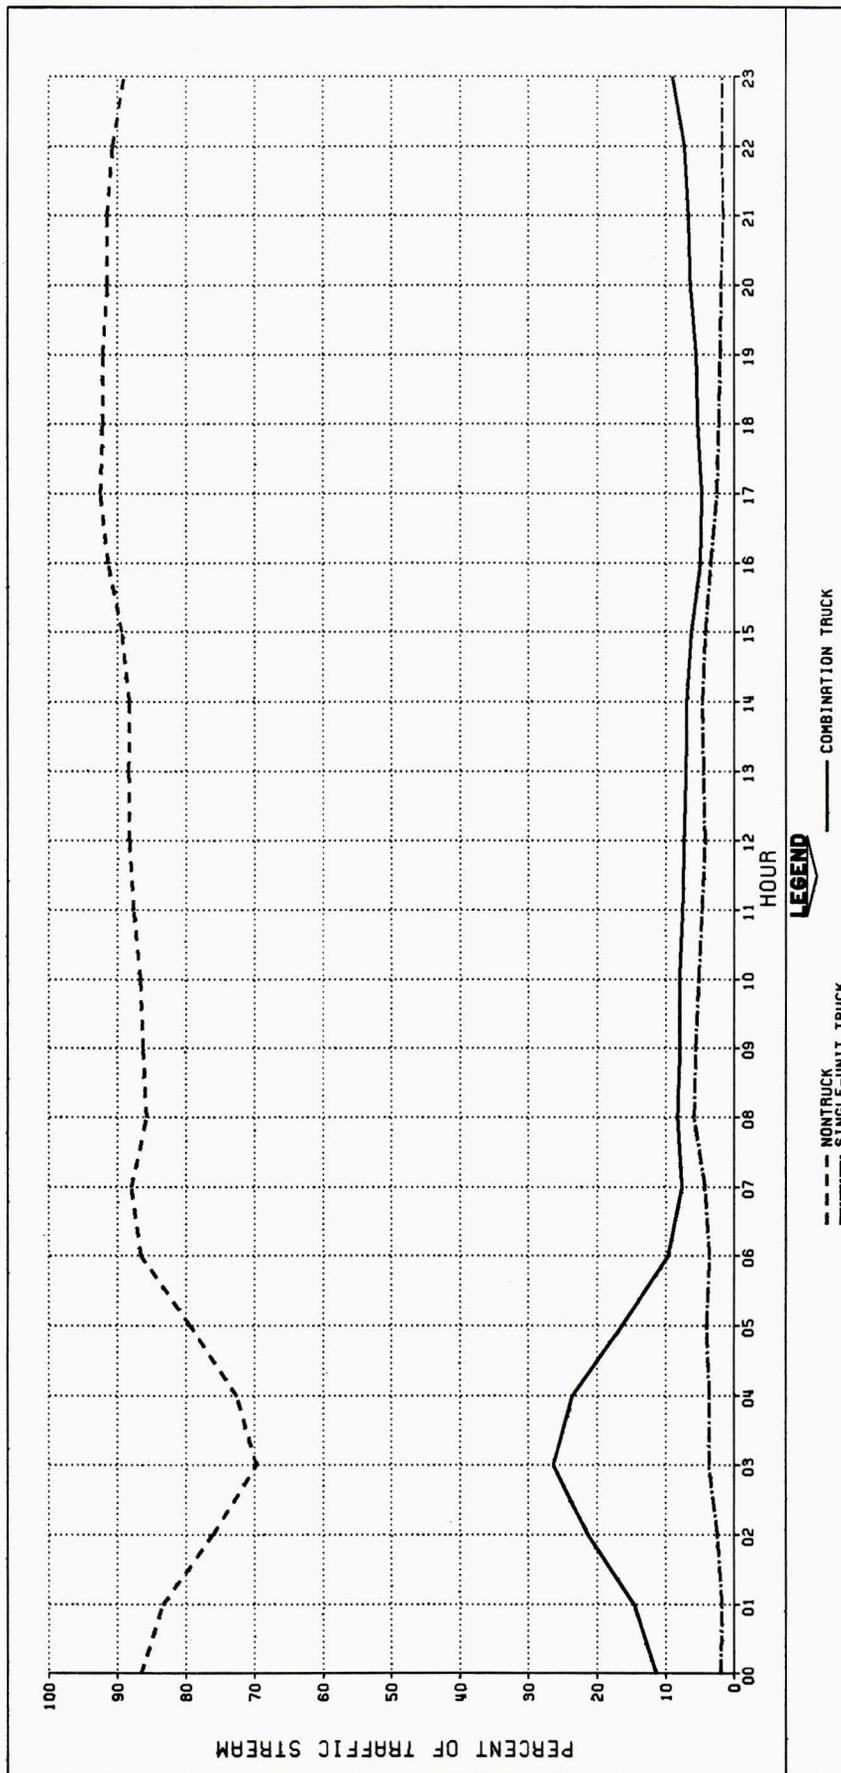

**FIGURE 13. WEEKDAY, WEEKEND AND AVERAGE DAY DISTRIBUTIONS FOR RURAL FREEWAYS AND EXPRESSWAYS AND RURAL TWO-LANE ROADS**

**FIGURE 14. HOURLY DISTRIBUTIONS FOR AN AVERAGE DAY  
ON RURAL FREEWAYS AND EXPRESSWAYS**

**FIGURE 15. HOURLY DISTRIBUTIONS FOR AN AVERAGE DAY  
ON RURAL TWO-LANE ROADS**

Nontrucks, in general, decreased as a percent of the traffic stream at night and increased during the day. These vehicles comprised the lowest percent of the average day traffic stream near 3:00 a.m. and steadily increased until they reached their highest value during the afternoon peak near 5:00 p. m. The morning peak occurred near 7:00 a.m. Other design types had similar distributions although urban design types had more pronounced morning and afternoon peaks.

Single-unit trucks comprised a relatively constant percent of the traffic stream (generally less than 5 percent) for all design types although the hourly percentages during the day were usually higher than during the night. These vehicles comprised the highest percentage of the traffic stream near 8:00 a.m. and the lowest near 10:00 p.m. These vehicles also had slight decreases on urban design types which matched the morning and afternoon peaks of nontrucks.

Combination trucks increased as a percent of the traffic stream during the night and decreased during the day in concert with the nighttime decrease and daytime increase of nontrucks for all design types. Generally, these vehicles had percentage decreases which matched the morning and afternoon peaks of nontrucks.

Information from five agencies that participated in the Vehicle Classification Case Study was combined to form a national database. This information is presented in this appendix to provide a national picture of vehicle distributions in the traffic stream by hour, day of week, and season of year for rural and urban areas and for functional systems. Vehicle distributions by design type are available upon request. A limited amount of State-by-State data is also presented in order to allow for regional comparisons.

Particular attention should be paid to the number of vehicles associated with each distribution in order to avoid giving undue emphasis to distributions with small databases. Caution should be exercised in using hourly data on the lower order functional systems since few vehicles were counted and classified in some cases.
