TRANSPORTATION RESEARCH BOARD EXECUTIVE COMMITTEE

Officers

DARRELL V MANNING, *Chairman*
LAWRENCE D. DAHMS, *Vice Chairman*
THOMAS B. DEEN, *Executive Director*

Members

RAY A. BARNHART, JR., *Administrator, Federal Highway Administration, U.S. Department of Transportation* (ex officio)
ROBERT W. BLANCHETTE, *Administrator, Federal Railroad Administration, U.S. Department of Transportation* (ex officio)
FRANCIS B. FRANCOIS, *Executive Director, American Association of State Highway and Transportation Officials* (ex officio)
WILLIAM J. HARRIS, JR., *Vice President, Research and Test Department, Association of American Railroads* (ex officio)
J. LYNN-HELMS, *Administrator, Federal Aviation Administration, U.S. Department of Transportation* (ex officio)
THOMAS D. LARSON, *Secretary of Transportation, Pennsylvania Department of Transportation* (ex officio, Past Chairman, 1981)
ELLIOTT W. MONTROLL, *Chairman, Commission on Sociotechnical Systems, National Research Council* (ex officio)
RAYMOND A. PECK, JR., *Administrator, National Highway Traffic Safety Administration, U.S. Department of Transportation* (ex officio)
ARTHUR E. TEELE, JR., *Administrator, Urban Mass Transportation Administration, U.S. Department of Transportation* (ex officio)
JOHN F. WING, *Senior Vice President, Booz-Allen and Hamilton, Inc., Bethesda, Maryland* (ex officio, MTRB)
CHARLEY V. WOOTAN, *Director, Texas Transportation Institute, Texas A&M University* (ex officio, Past Chairman, 1980)

GEORGE J. BEAN, *Director of Aviation, Hillsborough County (Florida) Aviation Authority*
RICHARD P. BRAUN, *Commissioner, Minnesota Department of Transportation*
ARTHUR J. BRUEN, JR., *Vice President, Continental Illinois National Bank and Trust Company of Chicago*
JOSEPH M. CLAPP, *Senior Vice President and Member, Board of Directors, Roadway Express, Inc.*
ALAN G. DUSTIN, *President, Chief Executive, and Chief Operating Officer, Boston and Maine Corporation*
ROBERT E. FARRIS, *Commissioner, Tennessee Department of Transportation*
ADRIANA GIANTURCO, *Director, California Department of Transportation*
JACK R. GILSTRAP, *Executive Vice President, American Public Transit Association*
MARK G. GOODE, *Engineer-Director, Texas State Department of Highways and Public Transportation*
WILLIAM C. HENNESSY, *Commissioner of Transportation, New York State Department of Transportation*
LESTER A. HOEL, *Hamilton Professor and Chairman, Department of Civil Engineering, University of Virginia*
MARVIN L. MANHEIM, *Professor, Department of Civil Engineering, Massachusetts Institute of Technology*
DANIEL T. MURPHY, *County Executive, Oakland County, Michigan*
ROLAND A. OUELLETTE, *Director of Transportation Affairs for Industry-Government Relations, General Motors Corporation*
RICHARD S. PAGE, *General Manager, Washington (D.C.) Metropolitan Area Transit Authority*
GUERDON S. SINES, *Vice President, Information and Control Systems, Missouri Pacific Railroad*
JOHN E. STEINER, *Vice President, Corporate Product Development, The Boeing Company*
RICHARD A. WARD, *Director-Chief Engineer, Oklahoma Department of Transportation*

The Transportation Research Board is an agency of the National Research Council, which serves the National Academy of Sciences and the National Academy of Engineering. The Board's purpose is to stimulate research concerning the nature and performance of transportation systems, to disseminate information that the research produces, and to encourage the application of appropriate research findings. The Board's program is carried out by more than 250 committees, task forces, and panels composed of more than 3100 administrators, engineers, social scientists, attorneys, educators, and others concerned with transportation; they serve without compensation. The program is supported by state transportation and highway departments, the modal administrations of the U.S. Department of Transportation, the Association of American Railroads, and other organizations and individuals interested in the development of transportation.

The National Research Council was established by the National Academy of Sciences in 1916 to associate the broad community of science and technology with the academy's purposes of furthering

knowledge and of advising the federal government. The Council operates in accordance with general policies determined by the Academy under the authority of its Congressional charter, which establishes the Academy as a private, nonprofit, self-governing membership corporation. The Council has been the principal operating agency of both the National Academy of Sciences and the National Academy of Engineering in the conduct of their services to the government, the public, and the scientific and engineering communities. It is administered jointly by both Academies and the Institute of Medicine.

The National Academy of Sciences was established in 1863 by Act of Congress as a private, nonprofit, self-governing membership corporation for the furtherance of science and technology, required to advise the federal government upon request within its fields of competence. Under its corporate charter, the Academy established the National Research Council in 1916, the National Academy of Engineering in 1964, and the Institute of Medicine in 1970.

PREFACE

This initial bibliography, produced by the Urban Mass Transportation Research Information Service (UMTRIS) following its establishment in 1981, incorporates 7064 citations from the Transportation Research Information Service (TRIS) data base with publication dates from the early 1970s through 1980. These citations were stored in TRIS between 1974 and the spring of 1981 by the Highway Research Information Service, Railroad Research Information Service, Maritime Research Information Service, and Air Transport Research Information Service. All abstracts deal with some phase of public transit and represent coverage of technical reports, journal articles, technical books, statistical sources, computer programs, and other information useful to operators, designers, researchers, planners and government agencies at all levels. Sources are worldwide, although the majority of references is of U.S. origin.

UMTRIS was developed within the National Research Council, Transportation Research Board (TRB), under contract to the Urban Mass Transportation Administration (UMTA), U.S. Department of Transportation. The UMTRIS computerized data system incorporates information on planning, designing, maintaining, operating, managing, and financing all modes of public transit including bus, trolley bus, light and heavy rail, advanced guideway systems, taxi and vanpool services, ferries, and local air service. The concepts and procedures used by UMTRIS are similar to those of the other TRIS modal operations cited above.

In addition to acquisition and selection, UMTRIS tasks include classification, indexing, storage, retrieval, and dissemination of abstracts. Projected are semiannual abstract publications that will augment the collection in this Bibliography by publishing the new UMTRIS citations added to the data base every six months.

Despite the title of this volume, *Urban Mass Transportation Abstracts—Cumulative Bibliography*, it should not be considered a complete collection of the *Urban Mass Transportation Abstracts* periodicals that have been issued by UMTA. No check has been made to assure that all UMTA citations from its own abstract publications are incorporated herein, but it can be anticipated that a major proportion is included.

The numerical categories in this Bibliography are divided into four major segments: Transit Technology (Categories 11-17); Transit Management (Categories 21-29); Transportation Services (Categories 31-34); and Urban Transportation Concerns (Categories 41-48). Descriptions of these areas follow.

Transit Technology

It is the technology of transit—vehicles and their propulsion, communications and control, stations and fare collection, guideways, tunnels and aerial structures, and other aspects of transit “hardware”—that epitomizes urban transportation to its users and the general public. For a century research

has produced the evolutionary changes in transit equipment that initially made possible the development of modern metropolitan centers throughout the world and then has assured their continued viability. Transit does serve other markets. In addition to fixed-route services, there are demand-responsive operations, which, by taking riders directly from their residences to their destinations, prove especially valuable for handicapped, elderly, and rural-area residents.

The motor bus is the most common mode of transit service in the United States, handling more than 65 percent of all transit riders with approximately 60 000 vehicles. Three types of electrically powered transit vehicles—heavy rail, light rail and trolley coach—provide most of the remaining urban fixed-route service with more than 11 000 vehicles. Commuter rail, either electric self-propelled or locomotive-powered, produces about half the passenger miles of the local electrically powered transit services and about a quarter of the total for motor-bus transit. Commuter rail, because of its substantially longer passenger trips, handles less than 4 percent of total transit riders in almost 4500 vehicles. A very small portion of total transit riders is handled by other modes—urban ferry boat, cable car, inclined plane, aerial tramway, and automated guideway transit. In total, some 75 000 transit vehicles (ranging in size from small automated guideway cars to ferry boats) handled 8.5 billion passengers in the United States in 1980 for a total of 40.6 billion passenger miles at an operating cost of \$7.6 billion and with fare-box revenues of \$3.1 billion.

In addition to the fixed-route services discussed above, there are a growing number of paratransit, or demand-responsive, operations. These include charter and brokerage services, vanpools, taxicabs, jitneys, minibuses, and special vehicles for elderly and handicapped.

Although public streets and highways provide the right-of-way for nearly all bus and other motor-vehicle services, some fixed-route bus operations are conducted over exclusive lanes of certain major traffic arteries or through restricted bus malls in the downtown areas. Some busways, exclusive roadways designed and built solely for transit bus service, are also used.

Steel-wheel on steel-rail transit requires, at a minimum, trackwork in public streets and, for full use of its capabilities, exclusive right-of-way where maximum capacity can be achieved by complete grade separation from other modes. In center cities this grade separation is generally achieved by constructing subways, although some new systems and a number of older systems operate on embankments or elevated structures at least in areas outside downtown. Commuter services operated by railroads usually involve operation in conjunction with freight and intercity passenger trains. Automated guideway systems are operated in a number of configurations with advanced propulsion systems used in a number of cases.

Seven categories (see pages 1-257) have references of special interest to designers and to those responsible for

operating and maintaining the rolling stock and fixed properties of transit systems. These categories and their UMTRIS numerical designations are as follows:

Category 11—Bus & Paratransit Vehicle Technology: Bus design and engineering; power units and propulsion systems; life-cycle procurement; fuels; accessibility; and similar topics.

Category 12—Bus & Paratransit Operations Technology: Automatic vehicle monitoring; computer applications; vehicle communications; busways; dual-mode transit; operating costs; vehicular traffic facilities; electric vehicle systems.

Category 13—Rail Vehicle Technology: Light-rail, rapid transit, and commuter car design and engineering; propulsion systems; traction power systems; track structures; electric power distribution.

Category 14—Rail Operations Technology: Automatic train control and operation; signaling systems; fare collection; train communications.

Category 15—Construction and Tunneling Technology: Subway design and construction; tunneling; elevated structures; transit stations; roadbed and track construction; noise barriers.

Category 16—Maintenance and Rehabilitation Technology: Maintenance and rehabilitation for vehicles, facilities, and equipment.

Category 17—New Systems and Automation Technology: Automated guideway transit; people movers; personal rapid transit; accelerating walkways.

Transit Management

Transit is a labor-intensive business that confronts its managers with great challenges in using people and equipment with maximum effectiveness while simultaneously producing marketable transportation services. As with all transportation, transit services cannot be turned out in advance for stockpiling but must be produced only when customers require them.

With the growth of automobile ownership, transit demand has usually declined in off-peak periods when formerly there was substantial use of bus and rail services; at the same time, loading during peak periods has continued high, or even increased, serving to intensify short-term demands for both vehicle capacity and operating staff. With alternatives to transit available, its managers are also confronted with pricing and marketing challenges much more sophisticated than were traditional for the industry.

Nine categories (see pages 258-370) include references of particular interest to administrators and managers of transit systems. These categories and their UMTRIS numerical designations are as follows:

Category 21—Transit Operations Management: Abstracts in this section include references to routing, scheduling, automated run cutting, headways, equipment utilization, operator assignments, insurance, liability, and similar operational topics.

Category 22—Transit Maintenance Management: Management of maintenance and servicing for vehicles, their com-

ponents, and fixed facilities; preventive maintenance programs.

Category 23—Human Resources Management: Education; training; industrial relations; staggered work hours; part-time labor; working conditions; labor relations; labor negotiations; work stoppages.

Category 24—Productivity and Efficiency: Performance measures; performance audits; productivity; reliability.

Category 25—Fares and Pricing: Fare collection; ticketing; fare structures; fare elasticity; no-fare systems; pricing for parking.

Category 26—Safety and Product Quality: Fire safety; crashworthiness; safety guidelines; accident reporting; product qualification; systems reliability; risk management.

Category 27—Security: Crime, policing, lighting, and surveillance aboard vehicles and on fixed properties.

Category 28—Marketing: Market studies; advertising; publicity and public relations; graphics.

Category 29—Information Services: Public information; service information; timetables; inquiry response; signing; telephone services.

Transportation Services

Provision of some form of public transportation service for both urban and rural areas is an important goal of current transportation planning. With the growth of automobile ownership in the United States, scheduled public service in small cities and rural areas has either declined drastically or disappeared completely. Even in major metropolitan areas with highly developed fixed-route transit systems, the growth of private transportation has had major impacts on ridership and public transportation planning.

Four categories (see pages 371-572) cover general or specific public transportation services and, often, their interrelationships. These include bus, trolley bus, light and heavy rail, commuter rail, taxi and vanpool services, jitneys, ferries, and local air services. Most of the coverage of the so-called demand-responsive services is in this section. The categories and their numerical designations are as follows:

Category 31—Conventional Transportation Services: Fixed-route bus services; rail services; routes; interchanges, waterborne transit; airports and air services; park and ride; and bicycles.

Category 32—Paratransit Systems and Services: Demand-responsive services; ridesharing; vanpools; subscription and charter bus services; taxis; jitneys; and brokerage.

Category 33—Non-Urban and Low-Density Area Transportation: Rural services and systems; local providers; demonstrations; demand-responsive services.

Category 34—Transportation of Special User Groups: Services for elderly and handicapped; travel barriers; accessibility; special vehicles.

Urban Transportation Concerns

The relation of public transit to the community-at-large involves demographics, sociology, economics, politics, finance, energy, and the environment. After 1960 and with the de-

cline of mass transit as a private-enterprise responsibility, transportation planning increasingly has involved public groups and government at all levels.

While transit had long been a governmental function in certain U.S. communities, government for the majority of cities had been involved only with franchising and with the regulation of rates and services. In the past two decades government has become the major provider of U.S. mass transit services. After changes in federal highway funding in the mid-1960s to allow transfer of certain amounts for transit purposes, the federal role increased steadily until 1980. Initially, federal funding covered capital projects and by the early 1970s there also was federal assistance for operating subsidies. Likewise, during this same time regional, state, and local agencies were called on for additional funds for all phases of mass transportation.

Eight categories (see pages 573-925) cover primarily the later phases of this cycle of government involvement with urban transport. These categories and their UMTRIS designations are as follows:

Category 41—Socioeconomics of Passenger Services: Human factors; societal benefits; user needs; citizen participation; economic projections; user needs and surveys.

Category 42—Transit Planning, Policy and Programs: Travel demand, assessment, and impact studies; alternatives; modal choice; cost-benefit analysis; forecasting; regional studies.

Category 43—Transit Financing: Financing methods; audits; fund allocation; grants; multiagency funding; subsidies; taxation; budgeting.

Category 44—Political Processes and Legal Affairs: Legislative regulatory public finance; and tax law; motor vehicle and traffic law; contracts; interagency relations; transit boards.

Category 45—Land Use: Joint development; property values; housing development; urban development and revitalization; value capture; land acquisition.

Category 46—Center City Traffic Restraints: Zoning; pedestrian malls; disincentives for automobile use; fringe parking.

Category 47—Urban Goods Movement: Freight terminals; intracity freight movements.

Category 48—Energy and Environment: Air quality; pollution control; environmental impact; energy conservation; noise abatement; aesthetics.

How to Use This Bibliography

This publication (Volume 1) contains only the abstracts, arranged in 28 categories, and is to be used in conjunction with the separate Key Word Index (Volume 2). Key words in the Index are arranged in alphabetical order, and each is followed by document record numbers that consist of the two-digit category designation and the six-digit TRIS acces-

sion number. Most of the key words are followed by several document record numbers that are arranged in ascending category order; within the categories the accession numbers are also arranged in ascending order.

A few of the abstracts in this Bibliography are reproduced entirely in upper case (capital) letters and other citations completely in italics. No particular significance should be attached to either type face; problems associated with original storage in the TRIS magnetic tape file caused these variations.

Although key words in Volume 2 do give the user a good idea of the terms used for indexing UMTRIS records, other terms will be used as the system expands. A special key-word listing with frequency counts will be available at regular intervals. This reference will be useful to on-line searching and for specifying batch-mode searches by UMTRIS.

The UMTRIS file, maintained on magnetic tape, is available for computer-generated literature searches in response to specific inquiries. The key to searching is the key words, although other data fields, such as author, document country of origin, and date of publication may be used as search parameters. The output of such searches may include abstracts of articles and reports, descriptions of computer programs, and summaries of ongoing research (no ongoing research summaries appear in this Bibliography). The output of such a search is a computer-printed listing similar in format to citations that appear in this publication.

Dialog Online

Information inputted to the TRIS data base is also transmitted at regular intervals to Dialog Information Services, Inc., for inclusion in Dialog File 63 from which it is retrievable by authorized users at established rates. On-line retrieval may be done through any standard telephone if the user has a computer terminal and has established proper entry into Dialog. The 7065 citations included in this Bibliography are not currently tagged as UMTRIS references in Dialog, although all subsequent entries are being so marked. This means that the basis for searching the UMTRIS data base from its earliest references through 1980 will have to be with key words and some of the other parameters noted above. Searching may also be done free-text in Dialog, a system that allows titles and abstracts to be searched for desired words or phrases even though they may not be among the UMTRIS key words.

It is important to note that, with the exception of TRB publications, full-text documents are not available from TRB or UMTRIS. Virtually all the citations include an availability statement indicating where a copy or photocopy of the document may be obtained. A guide to document delivery appears on pages vi-vii.

Additional information on UMTRIS and its publications may be obtained by contacting the UMTRIS Manager.

AVAILABILITY OF DOCUMENTS

An availability statement is included with each abstract. Because a large number of documents are available from a few major sources, space and printing costs have been reduced by abbreviating these and not indicating an address in the abstract. The standard abbreviations used by UMTRIS for availability statements are shown below, along with the complete name and address of each organization. In all other cases the organization from which a document may be ordered and its complete address are given in the availability statement. Copies of reports and articles listed in this publication are not available from UMTRIS. When ordering from any source, give full information about the document

desired. When ordering from the National Technical Information Service, be sure to give the NTIS accession number as well as title and other information. A loan and photocopy service for many of the articles and papers cited is operated by six transportation libraries as explained on page xx. Documents published outside the United States are usually written in the language of the country of origin as indicated at the end of the abstract. If a translation is desired, consult the National Translations Center listed below, which maintains a registry of translations. If the document has never been translated, contact translation services listed in the yellow pages of the telephone book in metropolitan areas.

LOAN AND PHOTOCOPY SERVICES

Full-text versions of many of the citations in the Urban Mass Transportation Research Information Service (UMTRIS) data base are available from a number of sources, some of which are indicated below. Municipal, state, and university libraries may have full-text copies, or may be able to secure them through interlibrary loans. Certain reports and books, as well as photocopies of reports, journal articles and conference papers may be obtained from the specialized transportation libraries that are listed. In addition, commercial and government services can supply photocopies or microfiche of many of the journal articles and technical reports. All such services are subject to copyright guidelines.

Six specialized libraries are cooperating with UMTRIS in document services. None of them are UMTRIS repositories; that is, they do not add copies of all UMTRIS-referenced publications to their collections automatically. Each does have an extensive collection of transportation literature. Rates for services vary and are indicated in conjunction with each listing. In every case the librarians have established the following user guidelines:

- Requests may be made on site, by telephone, or by mail (telephone requests for more than 10 items may be redirected as mail requests).
- Requests should include a copy of the entry in this publication, or should include the following data: (a) TRIS document number—the eight-digit number at the beginning of each citation; (b) title; (c) authors, individual and organizations; and (d) publication data, including publisher (or periodical or conference title), date, pages, serial numbers.
- Library responding to the request will lend books and reports for two weeks, plus estimated mailing time.
- If the library approached cannot supply requested materials, the staff will attempt to refer the user to the library or libraries deemed most likely to have the requested items.
- Each of the libraries charges for document delivery, based on cost-recovery for handling and shipping. Prices listed are subject to change without prior notice. Invoices will be sent with the requested materials.

HOW TO READ THE ABSTRACTS

Abstracts are identified by an eight-digit document record number. The first two digits indicate the UMRIS category number and the last six digits indicate the TRIS accession number, which is a unique number assigned to each document. The category number and its designation appear at the top of each page throughout this volume. The document

record number appears at the beginning of the first line of each abstract. Abstracts within each category are listed in ascending order of accession numbers, although these usually will not be consecutive. Examples of a technical paper from a U.S. source, a journal article from a non-U.S. source, and a technical report from a U.S. source are illustrated.

ABSTRACT OF A TECHNICAL PAPER

Document record number	
TRIS accession number	
UMTRIS category	11 301471 AM GENERAL/M.A.N. ARTICULATED BUS. AM General and the main producer of articulated buses in Europe, M.A.N., have jointly introduced this type of bus to the U.S. market. The bus was modified from its originally European configuration to comply with all U. S. regulations and specific customer requirements. Description of the bus and its components are presented in detail, emphasizing the specific aspects of an articulated bus—the under-floor drive train, articulation joint, and braking system. The structure, electrical system, interior and air-conditioning system are also outlined.

11 046231 CALIFORNIA STEAM BUS PROJECT. The California steam bus project was undertaken to evaluate the technical feasibility and public acceptance of the external combustion engine (ECE) as a low-emission, quiet propulsion system, using city buses as demonstration vehicles. Emphasis was placed on the early demonstration of potential, rather than extensive development or technical perfection. The title 'steam bus' was adopted after the choice of Rankine cycle systems to exemplify the ECE. Steam propulsion systems were installed in three 40-foot transit coaches, replacing the original diesel engines. The buses were tested and demonstrated in the metropolitan areas of Oakland, San Francisco, and Los Angeles. The report presents findings on performance, emissions, noise, fuel consumption, operating characteristics, revenue service, and potential for fuel consumption and emissions improvement.

Napuk, K Lane, JA Renner, RA ; Scientific Analysis Corporation, (UMTA-CA-06-0031) Final Rpt Jan. 1973, 32 pp; Paper copy also available from NTIS 4 reports as PB-217 507-SET.; ACKNOWLEDGMENT: NTIS (PB-217508/1); ORDER FROM: NTIS, Repr PC, Microfiche; PB-217508/1

11 046232 CALIFORNIA STEAM BUS PROJECT. The California steam bus project is summarized in a final report on the development and demonstration of Rankine Cycle external combustion propulsion systems for urban transit vehicles. Project history, organization, and financing are summarized in detail. Three contractors were selected to install steam powerplants in conventional motor coaches, replacing the standard diesel engines, each contractor being paired with the transit system in a different city.

Napuk, K ; Scientific Analysis Corporation, (UMTA-CA-06-0031) Final Rpt 1973, 15 pp; Paper copy also available from NTIS 4 reports as PB-217 507-SET.; ACKNOWLEDGMENT: NTIS (PB-217509/9); ORDER FROM: NTIS, Repr PC, Microfiche; PB-217509/9

11 046233 CALIFORNIA STEAM BUS PROJECT. Preliminary to a demonstration of Rankine cycle external combustion propulsion systems in urban transit vehicles, survey data were collected to measure the extent of public concern about air pollution and the extent to

which California residents see the need for alternatives in transportation to alleviate or reduce air pollution. Three surveys were conducted. In addition, a survey of patron attitudes on steam and diesel buses was made. Findings are summarized in detail, and data tabulations are appended. Sampling methods for each survey are also discussed.

Stefanich, FJ ; Scientific Analysis Corporation, (UMTA-CA-06-0031) Proj Rpt Phase I, 1973, 51 pp; Paper copy also available from NTIS 4 reports as PB-217 507-SET.; ACKNOWLEDGMENT: NTIS (PB-217510/7); ORDER FROM: NTIS, Repr PC, Microfiche; PB-217510/7

11 046234 CALIFORNIA STEAM BUS PROJECT. Under the California steam bus demonstration project, Rankine cycle external combustion propulsion systems were installed on three conventional motor coaches, replacing the original diesel engines. The report presents survey data collected among bus passengers, transit managers, and bus drivers concerning attitudes toward the steam-powered vehicles. The findings revealed a high public concern for the problems of air pollution and a very favorable response to the steam buses. All drivers expressed a preference for the steam bus.

Scientific Analysis Corporation, (UMTA-CA-06-0031) Final Rpt 1973, 46 pp; Paper copy also available from NTIS 4 reports as PB-217 507-SET.; ACKNOWLEDGMENT: NTIS (PB-217511/5); ORDER FROM: NTIS, Repr PC, Microfiche; PB-217511/5

11 054491 EVALUATION OF URBAN TRANSIT BUS MODIFICATION KITS TO REDUCE ENGINE SMOKE, ODOR, NOXIOUS EMISSIONS AND NOISE. The Truck and Coach Division of General Motors Corporation (GMC) has developed a modification kit for the current series of GMC diesel transit buses. The kit, known as the EIP Kit, is designed to reduce toxic emissions, odor, smoke, and noise, and can be installed on all GMC transit buses manufactured since 1959. A two-year field evaluation of this kit has been conducted. Toxic emissions, smoke, and noise from buses equipped with the kit were compared with those from control buses in Washington, D.C.; San Francisco, California; and San Antonio, Texas. Odor emissions were measured from modified and control buses at San Antonio. Records were kept of maintenance costs

and of problems encountered in installation and operation.

11 080584 THE ROLE OF AN ERGONOMIST IN THE COMMERCIAL VEHICLE INDUSTRY. The author outlines the ergonomist's task of considering all aspects of vehicle design which affect the performance of the driver, and comfort and safety of passengers. The steps that should be taken to insure correct ergonomics and legal compliance are listed, and the types of test which should be undertaken and the methods employed are illustrated by a bus design experiment carried out by British Leyland and the Transport & Road Research Laboratory. Such factors as seat dimensions and position, size and position of handrails and step height were investigated in tests involving elderly and disabled people, as this section of the population are seen to experience most problems with buses in current use. Methods of assessment include analysis of cine film, questionnaires and subjective assessment or comparison. As a result of these trials, the bus will be based upon the requirements and capabilities of the people who will use it, rather than a design resulting from opinion or arbitrary decisions. The value of quick, simple tests, involving only a few subjects, to provide information to aid decision making is also noted.

Brooks, BM (British Leyland) *Journal of Automotive Engineering* Vol. 5 No. 1, Feb. 1974, pp 10-16, 5 Fig., 10 Phot., 6 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 209961)

11 092144 SMALL TRANSIT VEHICLE SURVEY. Small transit vehicles, defined as those vehicles seating 7-25 passengers and intended for public transportation use, are available in a variety of makes and models with markedly different characteristics affecting both operators and users. This report documents the specifications and operating experience of small transit vehicles available in the United States. Despite the fact that the demand for small transit vehicles

has only recently begun to grow there are many more manufacturers of these vehicles than there are of full size transit vehicles. Vehicles are divided into three main categories: vans and van conversions, small buses, and converted motor homes. Operating experience was obtained by sampling from manufacturer provided user lists. Vehicle specifications were obtained directly from the manufacturer. No vehicle has been completely free of problems; no one vehicle is clearly superior to all others, nor is any one category of vehicle clearly superior to any other. A vehicle operator must weigh a number of variables before determining which vehicle is best for a particular application.

Flusberg, M Kullman, B Casey, R ; ECI Systems, Incorporated, Transportation Systems Center Final Rpt. DOT-TSC-OST-75-17, June 1975, 138 pp; Contract DOT-TS-7769; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243228/4ST

11 092157 PROJECT SUPER BUS: SPECIFICATION FOR AN ARTICULATED TRANSIT BUS. The report is a specification providing a prospective manufacturer with guidelines to develop an articulated bus specifically suited to transit service in the U.S. It specifies the basic physical dimensions, passenger accommodations, and propulsion for a series-built multipassenger public service vehicle designed primarily for urban service but with adaptability to arterial and truck line service. The nominal design capacity is for a vehicle having a single operator and a capacity for 70 or more seated passengers, with state-of-the-art propulsion and human factors design. The specifications meet all applicable U.S. Federal, state, and local safety and performance standards. Chapters discuss vehicle structure, furnishings, driver's station and controls, energy conversion, suspension and guidance (steering), and heating, ventilating, and air conditioning. Appendices contain definitions and abbreviations.

Booz-Allen Applied Research, Incorporated, Urban Mass Transportation Administration, National Transportation Center, (UMTA-PA-06-0007) Final Rpt. UMTA-PA-06-0007-74-1, Oct. 1974, 87 pp; Paper copy also available in set of 2 reports as PB-243 691-SET, ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243692/1ST

11 092158 PROJECT SUPER BUS: HIGH-CAPACITY BUS CONCEPTUAL DESIGN STUDY. The purpose of the study was to determine the technical criteria for high-capacity transit buses for U.S. operation. Principal emphasis was placed on the articulated bus concept, because the maneuverability of articulated buses makes them suitable for service on any routes that can be served by a standard 40-foot rigid bus. The double-deck bus concept was also studied because it offers some operating cost advantages, but vertical clearance problems would limit its use to about 30 percent of the high-capacity routes. Design studies were made of a number of specific configurations for the two generic concepts. The objective in the double-deck design studies was to achieve maximum height in the aisle in both decks while maintaining the maximum number of seats in a conventional arrangement. Information is presented on the market potential and production costs for high-capacity buses.

Booz-Allen Applied Research, Incorporated, Urban Mass Transportation Administration, National Transportation Center, (UMTA-PA-06-0007) Final Rpt. UMTA-PA-06-0007-74-2, Dec. 1974, 193 pp; Paper copy also available in set of 2 reports as PB-243 691-SET, ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243693/9ST

11 092503 SCHOOL BUS SAFETY IMPROVEMENT PROGRAM. SUMMARY REPORT. The objective of the program was to develop an improved school bus structure and to evaluate safety, driver field of view, acceleration and passing, braking, and handling characteristics of typical school buses. Structural and accident avoidance tests were performed on two Baseline Buses. An Improved Bus was designed and two Improved Buses were fabricated for evaluation. Identical tests on the Improved Bus showed structural improvements of 33 to 57 percent were achieved with a cost increase of only \$500 (4.5 percent) and a weight increase of only 530 pounds (3.9 percent). Acceleration and passing, braking, and handling tests showed that the added weight had not degraded performance in these areas. Based on these results, school bus structural standards and feasible compliance test procedures are recommended. Other recommendations are made for improved emergency egress, driver field of view, and handling test procedures.

PC, Microfiche; PB-245031/0ST

11 092698 VIBRATIONS TRANSMITTED TO HUMAN SUBJECTS THROUGH PASSENGER SEATS AND CONSIDERATIONS OF PASSENGER COMFORT. An experimental study was conducted to determine the vertical and lateral vibration-transmission characteristics of several types of transport vehicle seats (two aircraft and one bus) to obtain preliminary estimates and comparisons of the ride acceptability of the various seat types. Results of this investigation indicate that from the standpoint of human comfort the seats exhibit undesirable dynamic response characteristics. Amplification of floor vibrations occurred at the frequencies known to be most critical for human comfort in both vertical and lateral axes. An average transmissibility function for aircraft seats was tabulated together with the associated variability for use by designers who incorporate similar types of seats in their vehicles. The acceptability of vibrations resulting from floor inputs of 0.10g and 0.15g was low over a broad range of frequencies for both axes and all seat types, and was especially low at frequencies where the input was being amplified. (Author)

Leatherwood, J ; Langley Research Center NASA-TN-D-7929, June 1975, 56 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; N75-25582/8ST, DOTL NTIS

11 095602 A NEW STRUCTURAL PERFORMANCE STANDARD FOR SCHOOL BUS BODIES. A comprehensive structural performance standard for school bus superstructures is being developed by a special task force on school bus safety organized by the School Bus Manufacturers Institute. This paper presents a progress report on the standard. Included is a review of the main features: the basic philosophy that the bus body must be capable of safe, controlled energy absorption in the event of a crash; the establishment of a statically equivalent test through the use of energy absorption as a simulation parameter; and detailed specifications for simulated crash modes. As a specific example, the rollover simulation test specification is presented in its entirety and a critical assessment is provided. /SAE/ Jahsman, WE (Colorado University, Denver) ; Society of Automotive Engineers, (SASI 74-2609) SAE #741145, Nov. 1974, 6 pp

11 099305 TRANSPORTATION FOR THE HANDICAPPED--AN EQUAL OPPORTUNITY TO TRAVEL. Regulations, and the establishment of requirements on the subject of transportation services for elderly and handicapped persons are reviewed, and vehicle design to meet the needs of such persons is described. A specially designed Twin Coach bus features an electrically-actuated hydraulic lift for wheelchairs and an extendable step at the front entrance. Twelve buses in Denver were designed with a low floor, low step and a hydraulically operated elevator. Provision is made for seating the blind, the deaf and a seeing eye dog. A demonstration program to provide personalized transit services, and a design contest for vehicles to accommodate the elderly and the handicapped are outlined. A specialized dial-ride service for the handicapped in Milwaukee is described. Three divisions of the para-transit system provide more than 3,200 trips each day for the elderly, handicapped and special education passengers.

Mandel, LL *Metropolitan* Vol. 71 No. 3, May 1975, pp 14-17, 6 Phot.

11 099481 SILENT RIDER--A PROJECT FOR CITY CENTER TRANSPORT. In order to evaluate the energy conversion efficiencies of a full size battery-powered bus, the Chloride Group in conjunction with the Greater Manchester Passenger Transport Executive has developed a prototype 50 passenger, 40 mph battery-powered vehicle named Silent Rider. During test programs on the prototype it has been found that the overall efficiency of the vehicle can be increased from 60% to 72% by the addition of regenerative braking facilities. Several areas requiring further development have been clearly defined resulting from preliminary testing of Silent Rider. /GMRL/ Morris, C (Chloride Technical Limited) ; Society of Automotive Engineers, (SASI 75-1043) Proceeding SAE #750192, Feb. 1975, 9 pp

11 126127 ELECTRIC VEHICLE RESEARCH, DEVELOPMENT, AND DEMONSTRATION ACT OF 1975. This section of the Congressional Record considers bill H.R. 8800, the Electric Vehicle Research, Development, and Demonstration Act of 1975, which establishes a 5-year, 160 million dollar program under the Energy Research and Development Administration (ERDA). The primary goal of the project is to demonstrate the feasibility of electric vehicles,

including the evaluation and demonstration of more than 7,500 vehicles over the next 5 years. The initial objective is the development of "second" cars and specialized delivery vans. Energy conservation is anticipated with the electric vehicles through their use on short (less than 5 miles) trips and in heavy traffic. It is also pointed out that electric vehicles are charged during the night, increasing the efficiency of the electric utility system since this is an off-peak time. Six studies conducted previously on electric vehicle technology and utilization are briefly summarized. These include a report of the Panel on Electrically Powered Vehicles, a symposium on Power Systems for Electric Vehicles, an Energy Task Force Report, a study of the impact of the future use of electric cars in the Los Angeles region, an evaluation of alternative power sources for low-emission automobiles by the Committee on Motor Vehicle Emissions of the National Academy of Sciences, and a report prepared by NSF on the role for Federal Research and Development on alternative automotive power systems. The heart of the present bill is considered to be the demonstration program, which will be carried out in three stages. The first stage involves a few hundred electric vehicles at the present state-of-the-art for in-use demonstration and evaluation. The second stage includes 2,500 vehicles which meet initial performance standards and criteria. The third stage involves 5,000 electric vehicles having advanced components and designs, and meeting appropriately advanced revised standards and criteria. ERDA will arrange to introduce the vehicles into Federal, State, and local government fleets, will undertake demonstration maintenance, and will disseminate safety and operating characteristics and data to appropriate consumer affairs groups. In considering appropriations, a summary of the funding history of electric vehicle research and development is presented. A list is included of electric vehicle manufacturers in the United States. Following this presentation, the bill was discussed by the Committee of the Whole.

Congressional Record Sept. 1975, 8 pp, 5 Tab., Refs. ORDER FROM: GPO, Orig. PC

11 126173 EQUIPMENT AND MAINTENANCE OF DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. SPEAKER 5. Comments are made (based on discussions and surveys made in the parcel, light air cargo, and passenger demand-responsive transportation systems) on the need for, and the design and use of a diversified-use vehicle (DUV). The DUV is a vehicle that can be used for the ground transportation of one or more of the following: able-bodied passengers, handicapped persons, local parcel delivery, and light air-cargo parcels. The desirable vehicle design was identified as a van type vehicle that had the driver in front, a luggage and cargo carriage in the rear compartment over a rear-mounted power plant and transmission. To these must be added the safety dictates of the U.S. Department of Transportation. The vehicle will incorporate the following basic points; unitized construction; 116-in. wheel base; front-wheel power steering; free-float suspension on all 4 wheels of a 4-wheeled vehicle; conventional oil over air suspension; 4-doors; power disc brakes for all 4 wheels and 12-in. rotors; 15-in. steel wheels and medium profile tires; 6-cylinder gaso-

line engine coupled to a 3-speed automatic transmission; bolt-on panels where possible and none if unitized construction; capacity for a maximum of driver and 6 forward-facing passengers; capacity for at least 500 lb of cargo in addition to passengers; and rear-mounted power plant and transmission.

Davidson, JH (Yellow Cab Company) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 79-81; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

11 129690 EVS-THE FUTURE? Battery-powered electric vehicles (ev) have been in use for more than 60 years, but little attempt has been made to develop them for public road transport until recently. The article describes recent designs of electric vans, buses, and cars. The major barrier to progress is shown to be the low energy storage density of batteries. Electric power is ideally suited to buses since their average speed during peak periods in cities is 8.5 mile/h, and 90 percent cover less than 40 miles in that 3-3.5 hour period. Batteries could be charged overnight and between peak periods. The ultimate energy density of lead-acid cells is such that they can only provide electric vehicles with a short range compared with those powered by the internal combustion engine. New types of cell are being investigated, but all have some technical faults; the solution may be to use a small efficient engine running at a constant speed to recharge the batteries until a high energy density battery is available. The major advantage of the electric vehicle is that by using energy from the national grid system the electric car could theoretically travel 100 miles on the same amount of crude oil used to make one gallon of petrol. /TRRL/

11 129909 THE DESIGN OF A STEAM POWERED PARATRANSIT VEHICLE. The design of a new concept in urban transportation, the steam powered paratransit vehicle (PTV), is described. The vehicle incorporates the following features: an external combustion engine (ECE) power system, a unique aluminum chassis and body structure whose primary elements are bonded honeycomb sandwich panels, an automatic passenger door and loading ramp system capable of accommodating a wheel chair seated passenger without assistance, a roof-mounted condenser system, an all-independent suspension system incorporating torsion bar springs and self-leveling shock absorbers, and a near-center driver's station isolated from passengers by a bullet resistant partition. /GMRL/

11 130666 UNITED STATES TRANSIT BUS DEMAND. First, this paper describes the probable service life characteristics of transit buses in

the United States. This description takes the form of an actuarial survivor curve derived from bus purchase data since 1950; age distribution surveys for 1970, 1972 and 1973; and theoretical curves developed at the Iowa State Engineering Experiment Station. The thrust of the paper is the service-retirement model, which estimates the demand for new transit buses as a function of fleet size and service life. Based on the derived survivor curve, this model compares the survivors of buses installed since World War II to a fleet size established by policy. The difference is the number of buses which must be installed in service by the end of each analysis year to satisfy the policy. This installation requirement represents the demand for buses. A new installation record is created by adding one year to the age of each bus and entering the analysis year's installation as age one. Repeated applications of the survivor curve to this "aging" historical file simulates the service-retirement cycle of a fleet of buses. Lastly the paper tests some hypothetical policies to demonstrate the use of the service-retirement model to estimate transit bus demand. Included with these illustrations is a "best estimate" of the U.S. demand through 1990. /Author/

11 131332 CREDIBILITY OF DIESEL OVER GASOLINE FUEL ECONOMY CLAIMS BY ASSOCIATION. Current and proposed legislation regarding gaseous emissions has adversely affected the fuel economy of certain gasoline engines. Recent economic and environmental developments such as the fossil fuel shortage have improved the potential for the use of diesel engines as the power plant for small commercial vehicles and possibly certain passenger cars. Many variables affect fuel economy comparisons. Most of these variables can be associated with either the vehicle design or operation. The objectives of this paper are to relate fuel economy claims with a variety of cycles and to show how some of these claims can be justified, and to show how some of the more impressive diesel over gasoline economy claims relate more to the real world than comparisons based on EPA and SAE cycles. EPA originally started with one cycle and later split it into city and highway driving, to better cover the real world. SAE now has three cycles which represent a broader range of habits and requirements. There is still room for improvements at the low speed, short trip in cold weather, end of the scale. Also, the high volume of small commercial vehicles such as pick-ups, vans, taxis, etc. need attention. To appreciate the significance of comparing the real world to SAE cycles, we must be familiar with "typical vehicle fuel economy as influenced by trip length", "fuel savings potentials in short trip cold weather service", and "other published statistics" that have SAE level research and credibility. These papers show the results of surveys describing how up to 80% of trips and 50% of the auto fuel consumed are associated with trips of 10 miles or less.

11 131336 A STUDY OF THE ENERGY UTILIZATION OF GASOLINE AND BATTERY-ELECTRIC POWERED SPECIAL PURPOSE VEHICLES. The depletion of the supply of liquid hydrocarbon fuels in the predictable future has accelerated interest in vehicles powered by different forms of energy. The battery is one form of energy storage that has successfully found application in special-purpose vehicles for nearly three-quarters of a century. Heavy duty lift-trucks and tugs, golf carts and delivery vehicles are among the vehicle types powered by battery-electric systems. Personal transportation needs have been served to only a limited extent by electric vehicles because of the low power, limited range and lack of durability provided by the energy availability picture have necessitated re-consideration of the electric vehicle. In order to compare the efficiency of utilization of the Earth's fossil energy resources (petroleum and coal) by battery-electric and gasoline powered special-purpose urban vehicles, an analytic study was conducted. The guidelines of this study restricted it to three special-purpose cars that are smaller and have lower performance than conventional subcompact cars and a delivery van. The vehicle power train components represent demonstrated current technology. The most important guide-line of the study required the performance levels and load carrying capacity of the gasoline and electric-powered vehicles to be the same. The results of the study indicate that a lead-acid battery powered, two-passenger shopper vehicle with a 40 km range consumed about 90% more petroleum per kilometer of driving than does its spark ignition engine powered counterpart. With coal as the prime source, they consume about the same amount of energy. increases in desired range, performance and vehicle size beyond that of the shopper increase the electric vehicle energy consumption with respect to the gasoline powered version. The position of the electric vehicle is improved with respect to the gasoline vehicle by the development of advanced batteries, increased electric component efficiencies and an actual electric vehicle mass less than assumed due to a reduced mass compounding factor. An aspect related to the conventionally powered vehicle that tends to reduce the advantage over the electric is a potential efficiency penalty of the spark ignition engine due to its small size. Incorporation of these considerations into the study produce results more favorable for the electric version. The energy consumption of a nickel-zinc battery powered shopper is only about 30 percent more than its spark ignition engine powered counterpart considering petroleum as the prime source of energy. With coal as the prime source, the advanced technology electric vehicle consumes about 30 percent less than the spark ignition engine powered version.

11 131337 A PURPOSE-BUILT ELECTRIC TAXI. Lucas Industries awarded a contract to David Ogle Limited as part of their electric vehicle development programme to develop and build a purpose-built electric vehicle. This paper describes the design and development as well as the deciding factors which made the choice of vehicle a taxi rather than any other vehicle configuration.

Warner, P (Ogle, (David) Limited) ; Society of Automotive Engineers SAE #760124, 1976, 5 pp, Figs., Photos., 2 Ref.; Automotive Engineering Congress and Exposition, 23-27 Feb. 1976, Detroit, Michigan.; ACKNOWLEDGMENT: Highway Safety Research Institute (HSRI-33827)

11 131338 HIGH PERFORMANCE ELECTRIC COMMERCIAL VEHICLES FOR CITY USE. Lucas Industries Limited commissioned work on electric vehicles some seven years ago in order to provide test beds for batteries which were under development. During the past three years the battery development work has been concentrated on lightweight lead acid batteries and work on the vehicles themselves has been stepped up. A comprehensive electric vehicle development program is now being undertaken. During the last 18 months this has led to the production of fifteen 1 ton payload vans, a personnel carrier, a 34-passenger city bus and two city taxis. All these vehicles will be used by operators in service for extended periods in order that they can be evaluated from operational, engineering and financial points of view. /HSRI/ Harding, GG (Lucas, (Joseph) Limited) ; Society of Automotive Engineers SAE #760073, 1976, 13 pp, Tab., Photos., 3 Ref.; Automotive Engineering Congress and Exposition, 23-27 Feb. 1976, Detroit, Mich.; ACKNOWLEDGMENT: Highway Safety Research Institute (HSRI-33765)

11 131660 FLEET USE OFFERS NICHE FOR ELECTRIC VEHICLES. Lucas Industries, A U.K.-based automotive and electrical equipment conglomerate, has developed an elect vehicle for urban commercial applications. The vehicle is a taxi weighing 2250 kb. 40% of which is the weight of a replaceable pack of 36 6-volt lead-acid batteries. Top speed is about 60 km/hr and range is about 160 km. Another firm, the Copper Development Association, has commissioned the development of an electric "town car", considered to be more applicable than the electric taxi in the U.S. The subcompact town car weighs 1330 kb and has a pack of 18 6-volt lead-acid batteries. It carries two passengers with reasonable space and comfort. Top speed is about 100 km/hr and range is about 120 km. In spite of these developments, however, an ERDA study has found that electric vehicles are not the ultimate remedy for energy and environmental problems. They appear to render useful service only where petroleum conservation is the important factor. Air quality would be little affected, and travel costs would be higher.

Chemical and Engineering News Vol. 54 No. 10, Mar. 1976, pp 19-20

11 131713 ELECTRICS SUITED FOR COMMERCIAL USE. Technology has been developed for an electric taxicab and a gasoline-electric hybrid car, and the annual production (in England) is predicted of 10,000 electric taxicabs for the home market and 40,00 (in a few years) for

other European markets. The transmission of the taxi which is front-wheel drive has low loss double-reduction Morse Hyvo chain, and the road wheels are carried on new low-loss SKF bearings. The design will allow batteries to be changed as quickly as a gasoline fill-up is performed. Market studies have indicated that the major electric vehicle market is for light commercial vehicles with payloads of 1/2 to 3/4 ton. To be a viable investment, an electric vehicle would have to be operated 80 or 100 miles a day. A hybrid car where the electric motor is used as an assist to the internal combustion engine and will reduce gasoline consumption by 50 percent in city applications is also described. Laboratory dynamo tests have corroborated a computer analysis which showed fuel economy improvements of 30 to 100 percent for various vehicle configurations of a new prototype engine with electric drive train.

11 132063 TRANSBUS-TESTING AND PUBLIC EVALUATION (AROUND THE COUNTRY IN 80 DAYS). This paper describes the test and evaluation phases of the Rohr Transbus program which was initiated by the Department of Transportation in 1972: Vehicle testing was conducted both by Rohr Industries and by the prime contractor, Booz-Allen Applied Research. This report details the scope of this effort made to analyze the integrity and other qualities of these new buses. An extensive program was conducted to evaluate the public and transit authority acceptance of the new designs incorporated in the Transbuses. This paper describes this program and details some basic information gathered as a result of this evaluation. /Author/

11 132295 HOW THE ELECTRIC TAXI WORKS. A description is given of the electric taxi developed by Lucas. It will carry the same number of passengers as a London taxi, and has the same turning circle, although it is a front wheel drive vehicle; it has a shorter external length. The 50 bhp, 216 volt cav motor is located transversely at the front of the vehicle, level with the floor of the driving compartment. The complete front drive unit assembly is carried on a sub-frame which can be detached as a unit from the vehicle. The control system, developed by Lucas, is of the scr chopper type. The battery pack can be charged in situ or exchanged for a new pack in the time taken to refuel a commercial vehicle. Lightweight, high energy density lead-acid batteries are used. A regenerative braking system is employed. /TRRL/

11 132309 THE 10 YEAR CAR? This article discusses the various economic factors which determine the desirable service life of a vehicle and its components. The author considers two

basic design concepts, i.e., a vehicle intended to last only five years and a vehicle designed for a life of twenty years. The former would be of light weight construction and require less fuel to propel it, but, any savings must be offset against the more frequent replacement of worn out components. Such a vehicle designed for about 80,000 miles would not be attractive to the taxi driver or high mileage motorist, whilst the earlier onset of corrosion would need government legislation against the continued use of a vehicle beyond its intended service life-span. The twenty year vehicle is estimated to cost some 30 to 40 % extra and the author doubts whether many buyers would wish to pay this, to keep the same car for 15 years or more. The article concludes that manufacturers should aim to produce cars and components having an economic life of not less than ten years. /TRRL/

11 133312 TRANSBUS PUBLIC TESTING AND EVALUATION PROGRAM. The report describes the public testing and evaluation component of the overall Transbus test program. Three manufacturers--AM General, GMC and ROHR Industries each built three prototype Transbuses. The No. 3 prototype from each manufacturer was evaluated by the public in Miami, New York, Kansas City and Seattle during the period October 1974 -April 1975. Reactions were obtained from the general public (riders and non-riders), the operating personnel and the handicapped. Reaction of all three groups was favorable toward the inherent features of the Transbus--low steps for boarding and alighting, big windows, wide doors. Bus drivers were favorable toward the handling and braking of all three buses and the driver seat comfort and visibility from the seat. The handicapped, including those in wheel chairs were able to board by means of a ramp (ROHR), a lift device (GMC) or by level boarding from a sidewalk platform (AMG). Reactions of the handicapped to these devices are included in the report. Other measurements made during the program included the time wear, fuel consumption and incidence of failure.

11 133425 BUS INTERIOR DESIGN FOR IMPROVING SAFETY. The report describes a project of testing and analysis directed at finding solutions to the problem of on-board accidents on transit buses which was conducted as part of the Transbus program. Accident statistics are discussed with respect to the on-board accident problem, the on-board accident scenario, interior hazards and potential design changes, and the deceleration problem. A comparison of the risk of on-board accidents to other everyday human risks is presented. An on-board accident test procedure was developed based upon knowledge gained from the accident data analysis. This human factors test procedure is described in detail, in terms of the following: test objectives, detailed test procedures, data analysis procedures. The general test results, a comparison of the test results for the Transbus prototypes, and significant conclusions for urban transit bus safety are presented.

11 133678 QUIET BUS. The cost of reducing noise emission from 89 to 86dba for a 1975 double deck bus is claimed to be at least \$1000; the cost must be borne by the fare paying passengers who gain least benefit from the noise reduction. The modification consists of the encapsulation of the power pack, mounting the radiator outside the capsule to achieve adequate cooling. Quiet packs for single deck buses are more difficult to design because of the limited space between the top and the floor underside. There is evidence to show that near mounted longintal engines work in stagnant air conditions making ventilation of the quiet pack essential, an added complication since space in the engine compartment is already limited. The author suggests that should legislation require further reduction in noise levels the cost of introducing quiet packs should be shown separately in price schedules to demonstrate the impact of noise reduction on investment and operating costs. More parts will be involved and it is to be hoped that adequate servicing ability will accompany their introduction. /TRRL/

11 136818 VALLEY TRANSIT DISTRICT: OPERATIONS, FARE SYSTEM AND VEHICLE DESIGN. The Valley Transit District (VTD) demonstration project is located in an area in southwestern Connecticut which consists of the four towns of Ansonia, Derby, Seymour, and Shelton. Among the accomplishments of the VTD project are: Demand bus operation over a 56 square mile area; investigation of dispatching for wide area demand systems; incorporation of new features for the handicapped; testing of the attractiveness of small vehicles with luxury interior; provision of a unified transport system for regional health and social services; establishment of a new transit district law in Connecticut; and a flexible multi-service operational system. Another feature is the demonstration of a computer-processed credit card fare system called FAIRTRAN which has: deferred billing; a provision for any complexity of fare structure; a cost accountable, selective, user subsidy feature called FARESHARE; and comprehensive ride and demographic data collection capabilities. Chapters specifically address: (1) system operations, which includes sections on marketing, energy, financial analysis, handicapped demand, the dispatching system, and a survey; (2) the fare system; and (3) vehicle design.

11 137484 TOUGH ENOUGH FOR LONDON? A brief account is given of the reshaping of bus services in London since 1964, and of the introduction of one-man operated single decker buses. This change has led to unpredictable and unreliable services, and details are given of a prototype double-decker bus designed by British Leyland, in close co-operation with London transport. Special attention has been given to the conditions affecting operation, driving, passenger

usage, and maintenance of buses in London. In addition, the prototype bus will operate in actual service conditions for 18 months before production commences at the end of 1977. It is envisaged that this bus will go into service as a fully proved, reliable and advanced bus. /TRRL/

11 137496 TROLLEY BUSES RUN OFF THE LINES. Details are given of an experimental bus which has been operating in Esslingen, Germany, since 1975. The bus has nearly 3 tonnes of batteries and can run up to 10 km off the wire. The batteries and electric motor of the trolley bus are in parallel, so that the batteries can be recharged while the bus is running on the wire. There is regenerative braking to save up to 20% of the energy, thus extending off-wire mileage. The trolley poles can be automatically raised and lowered; when the driver presses a button to indicate whether the wire is above, to the right or to the left of the bus. The pole automatically raises and shifts to the correct side until a special sensor touches the wire. The sensor aligns the electrical contact shoe of the pole on the wire. The entire operation takes 15 seconds and can be done while the bus is picking up passengers. This leads to an important saving in the wiring at junctions, which is the most unsightly and expensive part of a trolley bus system to maintain. With the German bus no junctions are needed, the poles are lowered before the bus leaves one set of wires and are raised again at the next stop. /TRRL/ *New Scientist* Vol. 69 No. 988, Feb. 1976, P 395, 1 Fig. ACKNOWLEDGMENT: TRRL (IRRD 218795)

11 138456 FUTURE VEHICLES FOR PARATRANSIT: A DESCRIPTION OF THE GOVERNMENT ROLE. These comments on the modification of existing vehicles and the development of new vehicles, suggests that the most productive role of government in realizing a new vehicle for paratransit service may be achieved through support of design, development, testing and demonstration of vehicles whose concepts are derived from valid vehicle requirements. These requirements must reflect understanding of the service application characteristics for the time period in the future when the vehicle is to be in production and operating in service. A paratransit service vehicle requires an optimum mix of vehicle characteristics. The development was authorized by congress of a small, urban, low-pollution, fuel-efficient paratransit vehicle with the specification that wheelchair passengers be able to board, alight and secure themselves without assistance when using these vehicles. If vehicle capabilities are unavailable in present vehicles, and are not derivable from them, a new vehicle development program will be considered by UMTA. A design competition involving 3 or more contractors is suggested. The importance is emphasized of maintaining, exercising and responding to coordination activities with manufacturers, operators and service users.

11 141005 CONVERTING A SMALL CAR TO LNG: WHAT ARE THE PROBLEMS AND WHAT CAN IT DO FOR ECONOMY AND EMISSIONS? A two litre compact car originally designed to run on gasoline has been converted to run on LNG. Comparative measurements of fuel economy and exhaust emissions were made for the same car running on each fuel under normal on-the-road and simulated taxi service. When tuned to its maximum economy configuration the LNG car gave significant improvements in fuel economy when expressed on an energy basis. For inter-urban journeys the savings would be of the order of 5% and for taxi type service in excess of 20%. Whether or not these savings would justify fleet conversion would depend on local fuel cost and taxation conditions. When set for maximum economy the LNG car gave significantly lower emissions of CO and hydrocarbons than its gasoline counterpart. Emissions of NO sub x were, however, higher with LNG than with gasoline. A tenfold reduction in NO sub x emissions could be obtained by re-tuning the LNG engine to run at air/fuel ratios up to 30:1. Hydrocarbon emissions with this configuration were, however, quite high and would require supplementary means of control. When tuned to operate at very weak mixtures the car remained quite driveable but was 10 to 15% less economical than when tuned for maximum economy. Although technically practical, the use of LNG is likely to be restricted by supply and distribution limitations to fleet operators and other high mileage users who could refuel from centralized points where trained staff would be available.

11 141301 REDESIGNING THE TAXI FOR A NEW ROLE. In order to render the conventional taxi more serviceable and fuel efficient, a new design seems inevitable. UMTA supplied funds on a contract bid to two American firms to design prototypes of a low polluting taxi. Design specifications included reduction of lateral dimensions, optimization for use by 2 to 3 passengers while retaining load capacity for 4, above average comfort, and upgraded turning radius and maneuverability. Volvo and Volkswagen also submitted prototypes. Both designs presented by the American Machine Foundry and Steam Power Systems were steam-driven versions. Both also have built in ramps for wheelchairs in order to accommodate the transportation needs of the elderly and handicapped. The structure of both these vehicles is described in detail. Volvo designed a diesel taxi, and Volkswagen a hybrid vehicle (both electric and galoline engine). The design of these prototypes is also described. The changes needed in paratransit to provide a transportation bridge between route-bound mass transit and private vehicles will require more than then the city taxi, but this one step at least is a beginning in offering wider modal choices.

11 142135 A STUDY OF NOISE, TEMPERATURE AND LIGHTING LEVELS ON URBAN BUSES. A survey was made during the summer months on urban buses on tyneside. The temperature and light level were measured at three positions on each of four single-deck buses and at six positions on each of four double-deck buses. The temperature inside the bus was shown to correlate with that outside the bus as expected and light intensities were found to vary by amounts small enough to be hardly noticeable by the average eye. The noise climates inside two single-deck and two double-deck buses were assessed and the character of the noise was shown not to be the same for all four buses. (A) /TRRL/

11 143981 DEVELOPMENT OF A UNITIZED SCHOOL BUS. VOLUME I. SUMMARY REPORT. The development of new design concepts for school bus body structures and for passively restraining school bus passengers were the major objectives of the program. Passenger protection in front and rear rigid barrier impacts and in a side impact with a rigid pole-all at a 30 mph impact velocity-were the design goals. A unitized bus configuration was specified wherein the body and chassis frame are a single integrated structure in contrast to the typical school bus configuration where the body is bolted onto a chassis frame. Analyses and development tests indicated the feasibility of providing a uniform level of protection to seated occupants, ranging in size from a 6 year old child to a 50th percentile adult male in the front and rear impacts. In the side impact with a rigid pole at 30 mph, the hazard zone existing in the vicinity of the impacted area precludes uniform levels of protection for all occupants. Design layouts of 55-passenger operational school bus incorporating the unitized body structure and passive restraint systems were prepared.

11 148008 TOMORROW'S BATTERY TODAY. The author traces the historical background and development of batteries and of battery electric vehicles. The design, construction and performance of a sodium-sulphur traction battery having a solid state electrolyte of beta aluminium hydroxide and operating in the temperature range 300-350 degrees C are described. Road tests have shown that the sodium-sulphur battery-powered 18 CWT Bedford Van has a range between 60 and 100 miles depending on road and driving conditions. The reduction in cost which would result from large scale production is expected to make the use of the battery feasible and the author forecasts that such a battery might be in use within the next ten years for small vans used by fleets and for multiple modules in public transport such as the "silent rider". /TRRL/

Churchman, AT (Electricity Council Research Centre) *Royal Society of Arts Journal Analytic* Vol. 123 No. 5228, July 1975, pp 459-471, 1 Fig., 6 Tab., 4 Phot., Refs.; ACKNOWLEDGMENT: TRRL (IRRD 222606)

11 148140 TAXIS: A LOOK AT THE FUTURE. Taxis, probably the most popular vehicles of the para-transit group, are receiving more and more notice these days by urban transportation planners. Since the taxi serves so many people without private transportation or access to buses, it should be adapted to provide better service to handicapped persons and people with packages or groceries, and to accommodate more passengers at one time. The Museum of Modern Art in New York City organized an exhibition of taxi designs for the future in order to demonstrate the potential of taxicabs for offering better service. The museum was supported by UMTA, long a backer of better taxi designs. The exhibit featured five prototype vehicles, and UMTA awarded \$1 million contracts to AMF, Inc. and Steam Power Systems. The results are being evaluated for their suitability for widespread use. Besides a new design for taxis, however, ways must be found for their more efficient use. Variations on conventional taxi service include dial-a-ride, jitneys, and car pools. The ideas are not new; it is the renewed interest of urban planners and the willingness of UMTA to provide research funds that is new. In the past 2 years UMTA has spent more than \$18 million and plans to continue support. Demonstrations of para-transit are currently being sponsored by UMTA in various cities across the country, with the results yet to be seen. It seems, though, that the era of more efficient taxis is not far off in the future.

11 149058 A BUS FOR AMERICA-GM'S RTS. In an effort to regain the public's faith in the bus as a mode of transport, the US DOT has placed contracts for the construction of advanced prototype buses with GM, AM General and Rohr Industries. One such design, the 47 seater RTS-2 offered by GM, uses a welded stainless steel integral structure with extruded GRP side cladding. An unusual feature is the use of 12.7 mm acrylic sheet for the windows for the material's

vandal-proof properties. Based on a 5 ft module the bus has an overall length of 35 ft, each module consisting of box-section hoops with steel side panels and a double-skin roof. Although initial versions will use a Detroit diesel type 8V-71 engine, it is intended that this will be replaced by a 280 bhp gas turbine to reduce noise level below 80 dba although the gas turbine has a higher fuel consumption than the diesel engine. It is thought significant that the bus is some 1000 lb heavier than current GM buses and 4500 lb heavier than the 37 ft long Leyland National bus. /TRRL/

11 149071 PROTOTYPE BUS BY NEOPLAN. The article discusses a number of design features of the neoplan prototype low-floor city service bus developed by G. Auwaerter AG of Stuttgart. The design uses a Mercedes-Benz rear engine/transmission pack mounted in an integral structure. A floor boarding height of only 300 mm has been obtained by the use of air-suspension and low-profile tyres of 416 mm free-radius. Panelling in grp is used in the body construction although 30 per cent stainless steel cladding is used. All side windows use 5 mm polycarbonate glazing claimed to be crash-and vandell-proof. The 39-seater prototype bus also incorporates the firestone help (high energy level pneumatic) elastomer bumper system which uses air at atmospheric pressure for energy absorption. /TRRL/

11 149189 BRING BACK THE TROLLEY BUS? This paper discusses the major results of the electric trolley bus study undertaken in Portland, Oregon for the Tri-County Metropolitan Transportation District (Tri-Met). The basic purpose of the study was to assemble factual data and conduct analysis needed to assess the desirability of incorporating trolley buses within the Tri-Met system, given Tri-Met's desire to optimize mass transit to present and potential passengers and to provide service in an economic background of the trolley buses at a viable and attractive background of the trolley buses as a viable and attractive transportation system to the introduction of the internal combustion engine and the diesel engine is described. Portland's experience with trolley buses are examined with respect to comparable vehicle designs, which capital costs, power system capital costs, operating costs and energy costs. Results of the study indicate that an introduction of trolley buses into a fleet currently consisting exclusively of diesel buses will almost certainly result in additional capital and operating costs. The use of trolley buses will result in reduction of diesel oil consumption, be supportive of national energy goals, and lessen dependence on petroleum based fuels whose future supply and costs are uncertain.

Metro Vol. 73 No. 1, Feb. 1977, pp 15-18, 1 Fig., 1 Phot., 6 Ref. This article is condensed from a paper by Walter Kudlick, "Improving Downtown Circulation & Environment-Bring Back the Trolley Bus", presented at the ASCE Annual Meeting, 1 October 1976.; ACKNOWLEDGMENT:

11 149240 DUAL-MODE TRANSIT CONCEPT OF ROHR INDUSTRIES. Under contract to the Urban Mass Transportation Administration, Rohr Industries developed a concept for a dual-mode transit system that combines the advantages of a flexible bus distribution system with an efficient line-haul system. Because dual mode can combine systems in this manner, it can improve transit throughout an urban area in a way that separate systems cannot. By offering scheduled service, subscription service, and door-to-door demand service, dual mode can provide convenience for the rider nearly comparable to that of the automobile. The combination of flexible schedules and routes and high-speed line-haul capabilities with automatic dispatching and control results in high system use and efficiency. An advanced new vehicle design results in excellent ride quality with minimum pollution and noise. The design objective was to develop a system that would make significant improvements in transit service for cities of varying size and would thereby reduce congestion and improve personal mobility. A second objective was to design a system along modular lines. The third objective was to design a system that is technically feasible and economically sound.

Marden, WH, Jr (Rohr Industries, Incorporated) *Transportation Research Board Special Reports* No. 170, 1976, pp 52-54, 8 Fig.; This paper appears in Dual Mode Transportation, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974; ORDER FROM: TRB Publications Off

11 149266 MAINTAINABILITY AND RELIABILITY CONSIDERATIONS FOR DUAL-MODE VEHICLES IN OFF-GUIDEWAY OPERATION. Analyses were made of the reliability and maintainability of current urban buses and were conducted in support of the Transbus program. The paper presents the results and discusses the off-guideway operating environment of dual mode vehicles, particularly street conditions, traffic accidents, and vandalism. Design implications related in maintainability and reliability of dual-mode vehicles in off-guideway operation are presented. /Author/

11 149674 HOW TO BE SEEN AND NOT HEARD. QUIET, POLLUTION-FREE URBAN DELIVERY VAN. This pamphlet describes the silent carrier, a prototype 35 CWT battery-powered van designed by Chloride, Chrysler and the National Freight Corporation. It has a maximum speed of 64 kph and its acceleration is comparable to that of petrol and diesel engine vehicles of the same type. The basic cost of early production silent carrier models will be somewhat higher than that of the internal combustion engine alternatives but running costs will be far lower. Details are given of the design, braking, steering and electrical system of the van. The first silent carriers will have a range of 35-40 miles on a stop-start typical urban daily schedule. In open country, its range will be nearly doubled. Stage 2 will see the introduction of a new chloride high-performance lead-acid battery which will increase the range of the van. A totally

new battery concept is under development. It uses Sodium and Sulphur as Electrodes, is far lighter than and can store many times the energy of the lead-acid battery. /TRRL/

11 149722 ELECTRIC VEHICLES. CURRENT SITUATION AND FUTURE TRENDS [Vehicules electriques. Situation actuelle et perspectives]. The experimental use of electric vehicles in urban areas has proved successful, and the author describes their advantages as regards the improvement they bring in the quality of urban life. Current performance ensures a level of service for public and private transport similar to that provided by thermal-engine vehicles; the disadvantages of electric vehicles are that they can only be used over short distances and for very specific purposes. The use of electric vehicles should increase so that, during the ten-year period 1980-1990, they should take over a large part of the vehicle market. /TRRL/ [French]

11 149805 THE TAXI PROJECT: REALISTIC SOLUTIONS FOR TODAY. The Museum of Modern Art in New York, through its Department of Architecture and Design, sponsored the Taxi Project, a plan to engage the automobile industry in producing working prototypes of a vehicle which would more adequately serve the needs of the taxi industry and the urban public. UMTA made funds available through an open-bid competition, and two American companies, American Machine and Foundry, Inc., and Steam Power Systems, Inc. won contracts to create a low-pollution taxi. In addition, two European companies, Volvo and Volkswagen, also joined the competition. The vehicle had to be designed according to the specifications set out in the Design Specifications Manual. Those prototypes developed would consume less energy, reduce air pollution, limit traffic congestion, and provide better and safer accommodations for passengers and luggage. UMTA is also considering public transit possibilities offered by paratransit, and has implemented the Para Transit Vehicle Project toward achieving this end. Each prototype vehicle developed is described and illustrated, and the Design Specifications Manual is included. Historical and critical essays complete the report.

11 150495 THE GENERAL MOTORS TRANSBUS. VOLUME 2. The report is a summary of the final vehicle design (vol. 1) and the program effort (vol. 2) that went into the building of the GM TRANSBUS. The GM TRANSBUS, designed and built as part of a program of the Urban Mass Transportation Administration, features a number of design departures from present production coaches including a significantly lower floor; an independent front suspension; a special kneeling feature;

a U-shaped lounge; improved air-conditioning, heating, and exhaust systems to provide a year-round, fume-free, temperature-controlled internal environment. This GM TRANSBUS is powered by a Detroit Diesel Allison gas turbine.

11 151845 A STUDY RELATING TO SEAT BELTS FOR USE IN BUSES. This program involved a study of farm labor buses, school buses and transit buses in and for the state of California with respect to the installation and use of seat belts in these various categories of new and used buses. The study included visits, inspections and in-depth discussions with bus owners, operators, maintenance personnel, seat manufacturers, belt manufacturers, and bus manufacturers for the purpose of including all of the required aspects and viewpoints of bus design (including seats and seat belts), production, fabrication, purchase, operation and maintenance because of the impact of these items on both new and used buses. Research on seat belts in automobiles and aircraft has proven that the entire seating system must be considered as a unit to afford the maximum protection for the passenger.

11 152355 NEW STANDARD BUS EQUIPMENT. This report focuses on the hardware aspects of developing improved transit buses, gives a short history of transit bus improvement and comparative data on different types of buses.

The specific issue of a low-floor (22). Transbus is discussed and its advantages and disadvantages are pointed out. The costs and benefits of developing a new bus are discussed, and the pros and cons of standardization are noted. Special design features for elderly and handicapped persons are described. It is noted that innovation and product improvement, initiated and financed by the bus manufactureres, can be anticipated only if the bus market stays at an untypically high level and some form of effective competition exists among manufacturers. A design study is reported which identified a U.S. market for a high-capacity bus-the Superbus-which would provide at least 50 percent more usable floor area than the medium-size, 40 foot bus. Small buses and vans and advanced concepts in bus design are also discussed. Current federal programs relating to buses for use in urban mass transportation services are noted. An annotated bibliography which gives a sampling of available literature on this topic is included.

Public Technology, Incorporated Oct. 1976, 25 pp, 1 Tab.; This report is a product of the activities of the Transportation Task Force of the Urban Consortium for Technology Initiatives, to which Public Technology, Incorporated is the Secretariat. The work has been supported by DOT; Office of the Secretary, Urban Mass Transportation.

11 153960 ROHR INDUSTRIES TRANSBUS. PART I. THE ROHR TRANSBUS. PART II. PROGRAM SUMMARY. PART III. SPECIFICATIONS, ANALYSIS, STUDIES AND TEST RESULTS. Under the Transbus Program three manufacturers each designed and fabricated bus prototypes with design goals that included low floors, wide doors, and other features to improve accessibility and to speed loading and unloading. Rohr built three coaches with a seventeen-inch floor height. This report describes and analyzes the bus design and program effort involved in developing these prototypes. This document consists of three parts: Part 1 is a brief description of the Rohr Transbus that includes summary description of vehicle characteristics and functional elements. Part 2 is a program summary that includes an accounting of design reviews and interim reports shown with a historical milestone chart, as well as discussions on design specification packages, quality assurance, test programs, and technical problems encountered. Part 3 (Appendix to report) consists of detailed voluminous specifications, analyses, studies, and test results. Part 3 is not included in NTIS distribution.

11 156383 EFFORTS TO REDUCE TRUCK AND BUS OPERATOR HAZARDS. Pressures from government legislation (OSHA), organized labor, government regulatory bodies, and litigation are forcing designers to consider more carefully the driver's exposure to hazards. Noise, vibration, heat, carbon monoxide, and fatigue are the performance stressors discussed. Safety considerations, such as visibility, workspace comfort, entry-exit, and crash worthiness, are also presented from the perspective of what standards, practices, or information are available or required for truck and bus cab interior design.

11 156473 MOTORBUS AND MAN. In a discussion of the report of the international commission for the study of motorbuses, it is stressed that physical and psychological conditions and also requirements of passengers should be considered when designing public transport vehicles. Such considerations give rise to construction and design requirements relating to vehicle body, interior design, cleaning and safety. Although power units such as the stirling engine are being examined, the diesel engine is likely to be the principal bus propulsion unit. Attention should be paid to reducing engine noise as well as improving exhaust gas limit values to prevent toxicity. /TRRL/

11 157388 CONSUMER PREFERENCES IN URBAN BUSES AND BUS SERVICES PART A, MAIN REPORT. This main report analyses the results of a survey conducted in Perth Australia during August and September 1974. The survey was conducted in two parts: by the use of an onboard and a household questionnaire. Details of the individual results are given in supplementary reports b and C. Questionnaires were designed to obtain a ranking of bus design and bus service/travel characteristics. The respondents were found to be strongly in favour of measures which would improve comfort and trip convenience; the level of fares charged was considered much less important. Seating comfort during the journey was considered the most important bus characteristic, cleanliness and riding comfort were more important than the colour or exterior style of the bus. The most important feature of the service was considered to be its

frequency. Safety and reliability was rated more highly than seat availability and distance to bus stops. /TRRL/

11 158142 ASSESSMENT OF SERVICE REQUIREMENTS AND DESIGN CHARACTERISTICS OF PRESENT AND FUTURE PARATRANSIT VEHICLES. The objective of this research project is to provide an assessment of present and future paratransit vehicles, their design characteristics and service requirements from the viewpoint of the passenger, the community, and the driver. This assessment includes comfort, safety, and assessibility of all occupants with particular attention to the special driver problems associated with paratransit service; it focuses on the problems of the elderly and handicapped; and it identifies relevant aspects of the operating environment, namely, pedestrian safety. Shortcomings of vehicles now in service and new prototype vehicles are identified, and strategies are described to remedy them with minor and low cost modifications. The scope of this study includes vehicles designed for the Museum of Modern Art (MOMA) Taxi Project, including two paratransit vehicles designed to specifications of UMTA.

11 158356 TOWNOBILE--THE PEOPLE MOVER. A brief description is given of an inner-city type bus developed by L. Roy Leembruggen, an Australian consulting engineer and two major Australian companies, Dunlop Australia Ltd., and John Lysaght (Australia) Ltd. The Townobile carries 116 passengers (48 seated, 68 standing) at speeds up to 60 km/hr. Driven by two electric motors powered by dual half-tonne banks of Dunlop traction batteries, the bus has an operating range of between three and four hours. Battery changeover time is said to be five minutes and recharging can be accomplished in three to four hours. Using two sets of batteries, the bus need be off the road, therefore, for only about 45 minutes in every 24-hour working period. Other design features of the Townobile include contoured, fibre glass perimeter seating which allows plenty of leg room; vandal-proof seating and fittings; one step entry; completely flat flooring and two wide 25-inch aisles divided by stainless steel handrails and stanchions; inside headroom of 6ft. 6in. A feasibility study carried out by Mr. Leembruggen indicates that the system, using 10 such buses running over a circular, three-mile, inner-city route, would call at bus stops every three minutes.

Electric Vehicles for Industry Vol. 62 No. 3, Sept. 1976, pp 4-5ACKNOWLEDGMENT: EI; ORDER FROM: ESL

11 158381 LOW-FLOOR ARTICULATED BUS WITH SPECIAL ADVANTAGES FOR SHORT-DISTANCE TRANSPORT. The low-floor articulated bus embodies numerous technical improvements for urban and suburban

transport. The principal improvement is the particularly low floor, which is intended primarily to facilitate boarding and alighting for school children, disabled and elderly persons. This means shorter travelling times and greater comfort for the passengers, and shorter stopping times, speedier turn-round of vehicles and reduced vehicle requirements for the transport undertakings: in short, increased attractiveness at a lower cost. /GMRL/

11 163826 AERODYNAMIC AND REPAIRABILITY CONSIDERATIONS IN TRUCK CAB AND BUS BODY DESIGN. The main factors affected by aerodynamic performance are operating costs and vehicle safety. Scale models have been used in wind tunnel tests to ensure that good aerodynamic performance is obtained without significant conflict with other areas of design. Drag, which is proportional to the square of the velocity, is the critical factor affecting operating speed. Major changes in drag result from the different airflow characteristics around the cab shape. It was found that the most efficient cab shape allowed the airflow to remain attached to the cab surface. Tests showed that the roof flow had the most significant effect and could add 40 per cent to the drag coefficient. Other factors investigated included the shape of the cab sides

and the valance. Drag features of different load types and vehicle builds were studied to assess the effect of cab design on the vehicle as a whole. Different results were given for low and high loads. A combination of good cab shape and a deflector were needed for high loads. Recommended design shapes are discussed. The author shows how relatively small design changes could give significant cost savings in repairs. The repair of a severely damaged Leyland national bus is given as an example. /TRRL/

11 163994 THE "CLEAN AIR" BUS. A FURTHER REPORT ON THE OPERATION OF THE COUNTRY'S FIRST LPG POWERED BUS COVERING THE PERIOD OF OPERATION FROM 1ST APRIL 1974 TO 31ST MARCH 1976. The report is an account of the operational and mechanical problems associated with the liquefied propane gas powered bus. Also included in appendices are a road test report by commercial motor and weekly records of fuel and oil consumption over the period. Changes in the type of fluid flywheel fitted have improved vehicle performance but the fuel consumption remains high at an average of 3.5 miles per gallon. It was not possible to make direct comparisons of efficiency although the propane gas is cheaper than diesel oil. The power unit was very smooth and quiet in operation. Apart from the unexplained fracture of an oil pipe the system has been very reliable. The Rolls Royce B81 power unit mounted in a vertical, rear, transverse position has been shown to be reliable under urban operating conditions. Its acceleration is superior but its higher fuel consumption makes it uneconomical although it is hoped that the recent relaxation of fuel tax grant for propane powered vehicles will make it more competitive. /TRRL/

11 165134 ELECTRIC BUS ENGINEERED IN AUSTRALIA. An electric-powered passenger bus has been developed for use in central business

districts. The "Townobile" bus, developed in Australia, uses normal industrial lead acid batteries to operate from three to four hours at speeds up to 30 mph. Models with up to 68-passenger capacity are planned. Elroy Engineering of Australia started work on the project in 1970 and production is scheduled to begin in July. "Townobile" can use overhead wires or self-contained batteries for a power supply. It can operate at half the cost of conventional diesel transit buses and involves one-fifteenth the capital outlay of an equivalent tramway system, according to inventor Roy Leembrugger. /GMRL/

ACKNOWLEDGMENT:

11 165135 FITTING "PERCENTILE MAN" GOAL OF SEAT MANUFACTURERS. The mass transit seating industry offers a wide variety of products from firms constantly developing new products. Cantilever seats are now being marketed by manufacturers seeking to expand their line of products. As the importance of mass transit grows, the industry will continue to produce innovative products that are functional in design, durable in construction and aesthetic in appearance. /GMRL/

Metro Vol. 73 No. 3, June 1977, pp 26-29
ACKNOWLEDGMENT:

11 165144 THE IMPORTANCE OF SEAT BELTS IN THE TOTAL SCHOOL BUS SAFETY PICTURE. Private contractors and others in the school bus industry believe that safety equipment such as cross-over mirrors, seat belts for the driver, and more and better driver training programs will prevent accidents and injuries as well as save some lives. Their feeling is that most accidents are the type in which more padding on the hand rails and seat backs, etc., not seat belts, would reduce injuries. Lack of usage, or improper usage, by students in test programs, and problems in releasing some seat belts are given as reasons for not favoring seat belts. Recommendations for more and improved driver training programs, and additional testing and evaluation of new safety devices and construction methods are made. /MSA/GMRL/

11 165730 A STUDY OF WHEELCHAIR ACCESS TO THE CURRENT TRANSIT BUS DESIGN. Public debate currently exists on the best way to improve and increase use of public transit equipment by the elderly and handicapped. This document is the result of a study conducted by AM General under a contract with the Department of Transportation, Urban Mass Transportation Administration, to investigate the feasibility and practicality of incorporating a wheelchair lift platform (level change) device for the standard 40-foot transit bus that would provide safe ingress and egress for wheelchair-bound passengers. This report describes the background and conceptual design of incorporating into the current 40-foot bus a level change device to board such passengers. In addition, it also covers seating, wheelchair positioning, and securing the wheelchair once on board. The recommended lift design for use on the standard bus is controlled by the driver by a set of electric

switches. This lift is under control of the seated driver at all times. It is powered by hydraulics from either an existing power steering pump or a separate pump. The platform folds into a normal step and stepwell configuration when in the stowed position and has no effect on normal bus operations. It adds approximately 400 pounds to the weight of the bus and has a recommended platform load capacity of 1,000 pounds. The estimated costs of a wheelchair lift and restraint system option are in the range of \$6,000 to \$8,000 per bus. No major design problems are anticipated for the installation of such a device on any current design 40-foot transit use. /UMTA/

11 165736 ASSESSMENT OF BATTERY BUSES. This report presents a comprehensive assessment/survey of the performance of electric battery buses operating in passenger-carrying services in the United States, Europe, Japan, and Australia. The survey assessed 16 different systems from 15 suppliers, operating under 18 public transit authorities. These operations varied from single demonstration vehicles to a fleet of 20 buses which provide all the transit service on three routes. The status of electric battery bus development is reflected in the fact that 57 buses have accumulated more than 3.4 million kilometers (2.1 million miles) in passenger-carrying service. The scope of this report includes visiting the operating organization, description of buses and propulsion systems, operational profiles, operating experience, and analysis of data and conclusions about the problems and constraints in the procurement and operation of electric buses. This study also addresses hybrid propulsion systems such as trolley-battery and diesel-battery hybrids. Hybrid bus systems assessed included the Dornier Duo-Bus, the Mercedes-Benz OE305, and the Tokyo Transportation Bureau models built by Kawasaki. This assessment was accomplished through on-site data collection and data analyses. Data analysis included translating the information and reducing the data on performance and technical features to common terms for comparison. The Appendices contain a listing of the contributors to the Electric Battery Bus Assessment as well as a Bibliography. /UMTA/

11 165754 GENERAL AND PERFORMANCE SPECIFICATIONS FOR A SMALL URBAN TRANSIT BUS. The overall objective of the Small Bus Project is the development of a general and performance specification for an advanced small urban transit bus. It is a six-phase program designed to insure that final vehicle specifications would evolve from a comprehensive analysis of all aspects of the operating environment and thus have a broad applicability. The Small Bus Project is presented in six separate reports: 1) Operations of Small Buses in Urban Transit Service in the

United States. This report investigates the operating environment of small buses in the U.S. and relates them to vehicle requirements; 2) Bus Characteristics Needed for Elderly and Handicapped in Urban Travel. Constraints imposed on bus design by the elderly and handicapped are outlined; 3) Operating Profiles and Small Bus Performance Requirements in Urban Transit Service. This report develops a set of operating profiles and service requirements as the basis for specifications for a new small urban transit bus to meet the identified operational needs; 4) Guidelines for the Design of Future Small Transit Buses and Bus Stops to Accommodate the Elderly and Handicapped. This report presents scenarios for the future uses and market of small buses, as well as the conceptual design for three vehicle configurations to assess the feasibility of meeting design requirements; 5) General and Performance Specifications for a Small Urban Transit Bus. Requirements for an advanced design coach which may be used for both demand-responsive and general service on urban arterial streets are presented; 6) Small Transit Bus Requirements Study. This report summarizes the findings presented in the five project reports. /FHWA/

11 166198 RESULTS OF BASELINE TESTS OF THE EVA METRO SEDAN, CITI-CAR, JET INDUSTRIES ELECTRA-VAN, CDA TOWN CAR, AND OTIS P-500 VAN. Five electric vehicles were tested at vehicle test tracks using the SAE. The tests provide range data at steady speeds and for several driving cycles. Most tests were conducted with lead-acid traction batteries. The Otis Van and the Copper Electric Town Car were also tested with lead-acid and nickel-zinc batteries. The tests showed a range increase of from 82 to 101 percent depending on vehicle, speed, and test cycle.

11 166431 ENERGY ABSORBING BUMPERS FOR TRANSIT BUSES: TRANSBUS PROGRAM. The report describes the results of a program to test and evaluate the potential benefits of energy absorbing bumpers for transit buses. The objective of the program is to determine, through controlled tests, the capabilities/limitations of six new design energy absorbing bumper systems. Principal emphasis is placed upon the bumper system performance under simulated in-service tests with respect to its effectiveness in protecting the bus from minor accident hazards encountered during revenue service. The economic benefits of energy absorbing bumpers are discussed with respect to life-cycle accident costs. The test facilities, each type of bumper system tested, and the test procedure is described in detail, in terms of the objectives of the tests, equipment and methodology used for testing, and functional descriptions of each bumper system. The detailed test results for each bumper system are presented in table format, indicating energy absorbing performance at various impact velocities, maximum impact capability, and other attendant characteristics. Conclusions concerning the results of the tests including projected benefits of energy absorbing bumpers are delineated. Significant factors relating to bumper weight, cost, durability, etc., are summarized.

11 166599 EUROPEAN DEVELOPMENTS IN THE NA/S HIGH TEMPERATURE BATTERY FOR AUTOMOBILE PROPULSION AND ENERGY STORAGE. The sodium-sulfur battery is a leading candidate for future use in the propulsion of automobiles, vans, buses, and trains and for energy storage and load-leveling by electrical utilities. This report presents a brief description of the fundamentals of the operation of the battery, with indication of some considerations which control its development into an important technological system. The status of the battery development in England, France and Germany is then reviewed. (Author)

11 167285 TECHNOLOGY DELIVERY FOR A NEW PARATRANSIT VEHICLE. The report reflects the view that a number of technological opportunities are available for solving the long-standing American transportation need—a large, comfortable taxicab/paratransit vehicle, and that the success of the paratransit program may depend on the technology delivery process. The report highlights the need to take the existing state-of-the-art vehicle technology and to convert it into a disseminated vehicle in the marketplace so that it would be profitable to manufacturers, operators, and users. It focuses specifically on the barriers to delivering a new paratransit vehicle to the industry; it identifies the key issues which will become relevant in the future, as innovators attempt to market a vehicle, and its concomitant services, to the riding public. The report outlines UMTA's role with delivering this new technology into the marketplace for paratransit services through the sponsorship of a demonstration project for approximately 200 vehicles, that is, a demonstration that reflects the real world of revenue service of this vehicle. (Portions of this document are not fully legible)

11 167340 GAS TURBINE ENGINE APPLICATION IN TRANSIT COACHES [Final rept]. This report presents an investigation of gas turbine engine application in transit coaches that was conducted as part of the Transbus Program to determine the viability of the gas turbine engine as a potential power source for transit coaches. The state of development of the gas turbine engine as a vehicular power source is described. An in-depth survey and evaluation was conducted of gas turbine engine manufacturers to determine the suitability of these engines for installation in transit coaches. Only one product is developed to a state where volume production can be seriously considered. This engine is described in detail and a comprehensive cost/benefit analysis was performed of this engine installed in a contemporary transit coach fleet. The results of the analysis and evaluation indicate that while current engines are not economically justifiable the gas turbine engine is potentially superior to the diesel engine when fully developed with planned improvements

scheduled for the near time frame. Recommendations are also presented to demonstrate early production turbine engines in a small fleet of transit coaches in revenue service.

11 167871 A TRANSIT OPERATOR VIEWS TRANSBUS. An overview of the Transbus history is presented as well as the implications of the transbus decision for transit operators and the transit industry. The rigid design and performance standards for Transbus, as specified by the Department of Transportation, conflicted with other goals equally important in the design and operation of transit vehicles. The most controversial feature of the Transbus is its 22-inch floor height which cannot be achieved without incurring higher capital and operating costs. The following points highlight the major drawbacks of the Transbus. Reduced operating capability can be expected as a result of lower bus floors which not only lowers the underbody clearance but creates severe operating problems. The new components of the Transbus will ultimately drive up the purchase price for the new vehicle. The added weight, the increased number and complexity of mechanical components, and the smaller tires will result in overall higher operating costs. A lower floor design significantly reduces the possible number of seats in the bus. While the Transbus does represent an improvement in transit service accessibility it does so at an exceptionally high cost. It is noted that UMTA has spent over \$27 million in developing and testing an accessible bus, a bus that will create more operating problems than it will ever solve. Future UMTA research and development efforts should focus on devising service solutions to transit problems, not more hardware solutions which are really not solutions at all. Finally, it is noted that the key to increased transit riding is improved service, not merely new vehicles.

Whitten, C *Motor Coach Age* Vol. 29 No. 9, Sept. 1977, pp 9-16, 7 Phot.; This report was presented at the 5th International Conference on Automotive Safety, July 11, 1977.

11 169787 TRANSBUS ENGINEERING TEST PROGRAM. This report summarizes the engineering tests that were performed in support of the Transbus Program implemented in June 1971. Transbus prototypes built by three manufacturers were subjected to a series of tests. The objectives of the engineering tests were to obtain evaluation data to determine the degree of compliance with the Transbus specification, to assess the design improvements over current production buses, to identify product improvements required for production designs, and to provide overall technical assessments of the designs for a government decision regarding a production phase for Transbus. This report presents an overview of the entire test program—the test articles, procedures and facilities used for the development tests, acceptance tests, and independent engineering tests. It also presents a summary of the data obtained in each individual portion of the testing program.

11 170308 THE STEYR "CITY-BUS" [Der steyr "city-bus"]. The steyr "city-bus s" is designed to be used as follows: on bus routes, as a city-bus on bus routes, by transport authorities, for park and ride systems, in demand bus systems or group taxis, as a mini-bus, for special applications, etc. Following a listing of the individual alterations required in the conversion from the slower conventional bus to the faster "city-bus s", the main mechanical components are described: engine, transmission, wheel suspension, braking system and steering and the driver's cab and passenger cabin. The steyr "city-bus s" because of its mature technical concept, possesses possibilities for the solution of a variety of traffic problems in a range of applications. Its introduction in times of light traffic, instead of the larger buses optimises maintenance and repairs of the large buses making it possible to supply a denser service at peak periods or to reduce the parking facilities required, and to obtain increased financial savings for investment. The technical data for the bus are presented. /TRRL/ [German]

11 172042 FLYWHEEL PROPULSION SIMULATION. Development of a bus propelled by a flywheel instead of by an engine or storage battery has long interested urban transportation planners. The kinetic energy stored in a flywheel supplants the need for petroleum-derived fuels and minimizes negative environmental impacts. This report was prepared in support of the Urban Mass Transportation Administration's program in flywheel energy storage. It can be considered both an evaluation tool and a design tool. This report develops and describes the analytical models and digital computer simulations that can be used for the evaluation of flywheel-electric propulsion systems employed with urban transit vehicles operating over specified routes and with predetermined velocity profiles. The computer simulation is divided into two sections. The first section simulates the dynamic behavior of the vehicle enroute, computes the energy and power requirements, and the power losses of each of the propulsion system components. The second section utilizes thermal models to compute the temperature rises of each of the propulsion system components. The simulations can be used to determine the suitability of a given flywheel-electric propulsion system for an intended mission. The simulation method can be applied to electric-drive systems for battery and flywheel energy-storage vehicles, to hybrid vehicles, and to vehicles operating from wayside power. The Appendices contain Mathematical Models, Input Constants for Computer Program, Parameter Listing for Computer Program, Tabular Outputs for Sample Run, Manufacturers' Data for Major Components, and Report of Inventions. /Author/

11 174733 TRANSIT BUS PROPULSION SYSTEMS ALTERNATE POWER PLANT INSTALLATIONS. This report describes the survey and evaluation that was made of U.S. heavy-duty automotive engine manufacturers who could offer engines to power TRANSBUS during its production life which is expected to run to the 1990's. TRANSBUS is the heavy-duty, 35-to 40-foot long transit coach developed under this contract, and it incorporates the best available technology for improvement of mass transit transportation in urban U.S.A. Installation characteristics of the most suitable engines for each of the three prototype TRANSBUS designs (constructed by AM General, General Motors, and Rohr Industries) are presented herein. Listed and illustrated in this report are: (1) the engine compartments of the three prototype TRANSBUS designs; (2) the candidate engines; and (3) the candidate engines fitted into the three prototypes. The results presented herein show that two engine types, the 4-cycle diesel engine and the gas turbine engine, may challenge the Detroit Diesel 2-cycle diesel engine for the transit coach market. Only one gas turbine engine was identified as a possible alternative to the diesel--the Allison GT-404.

11 175235 DETERMINATION OF THE EFFECTIVENESS AND FEASIBILITY OF REGENERATIVE BRAKING SYSTEMS ON ELECTRIC AND OTHER AUTOMOBILES. VOLUME I. SUMMARY. A report is given of a study conducted by Lawrence Livermore Laboratory in which a determination of the effectiveness and feasibility of regenerative braking systems on electric and other automobiles was made. Regenerative braking concepts applicable to autos utilizing electric, hybrid, or heat engine power systems were evaluated to determine performance improvement, energy savings, and cost effectiveness. Two major conclusions were reached pertaining to privately owned autos driven 16,100 km/yr in an urban environment: (1) regenerative braking is cost effective and is recommended for use on electric and hybrid-powered automobiles, and (2) the addition of a regenerative braking system to the standard heat-engine-powered auto was not found to be cost effective. However, the regenerative system can be cost effective for heat engine powered commercial vehicles such as taxis, city buses, or delivery vans that see high annual usage under stop-and-go conditions. 11 176136 STATE-OF-THE-ART ASSESSMENT OF ELECTRIC VEHICLES AND HYBRID VEHICLES. The Electric and Hybrid Vehicle Research, Development, and Demonstration Act of 1976 (PL 94-413) requires that data be developed to characterize the state of the art of vehicles powered by an electric motor and those propelled by a combination of an electric motor and an internal combustion engine or other power sources. Data obtained from controlled tests of a representative number of sample vehicles, from information supplied by manufacturers or contained in the literature, and from surveys of fleet operators of individual owners of electric vehicles is discussed. The results of track and dynamometer tests conducted by NASA on 22 electric, 2 hybrid, and 5 conventional vehicles, as well as on 5 spark-ignition-engine-powered vehicles, the conventional counterparts of 5 of the vehicles, are presented.

National Aeronautics and Space Administration NASA-TM-73756, Sept. 1977, 595 pp; Contract EC-77-A-31-1011; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; N78-18988/3ST

11 177347 SCENARIO FOR MULTI-MODAL-MAN. The present slow change in the built environment presents a reason for considering the transport properties of the electric car before its future possible use for mass travel, for without further change, the infrastructure for the ice (internal combustion engine) vehicle will be that inherited by the electric car. The flexibility of the present-day car gives a personal modal dominance which is questioned in the context of the electric vehicle. Increased energy cost, a different second-hand market structure as well as range limitations are likely to result in a different car-user relationship. The transport system possible in the future is one in which the type of transport is tailored to the type of journey made in which the traveller is described as the multi-modal-man. /TRRL/

11 178586 CART-BEFORE-HORSE PRINCIPLE FOR ARTIC PUSHES BUS. Demonstrations of a Danish-built Leyland/Dab articulated bus to public transport authorities in the UK have been designed to show that this type of vehicle, with steering on the trailer axle, can be more manoeuvrable than rigid vehicles. An articulated 160-seater bus of this type introduced by Daimler-Benz has an underfloor rear-mounted power unit driving a single axle of the rear section. The vehicle is based on two shortened German standard bus modules jointed by a concertina coupling. This coupling unit incorporates an electro-hydraulic device to prevent jack-knifing and also to facilitate steering. It is this feature of the design which makes the rear powered 'pusher' articulated bus feasible against initial arguments against its development. /TRRL/

11 178621 AN INVESTIGATION OF A BATTERY-TROLLEY BUS SYSTEM. A feasibility study of a combined battery and trolley bus system has been carried out. The double-decked 80-passenger electric bus has a performance compatible with modern traffic. It is powered from overhead wires for only part of its route. For the remainder of its journey, it uses lead-acid batteries which are re-charged from the overhead supply when the bus next reaches a powered route

section. The likely cost and weight of the bus components were investigated and possible technical, environmental, and safety problems were considered. Systems studies were carried out for two urban areas. It was concluded that the system could be made to work satisfactorily in most towns which now have an urban bus system, without significant changes to existing timetables. There would be some improvement in air pollution and noise over diesel buses, but no saving in primary energy or running costs. The capital cost of the system would be much higher than that for a diesel bus fleet.(a) /TRRL/

11 178832 FUTURE TRANSIT BUS DESIGNS. This paper describes recent trends in transit bus design in the United States and Western Europe. It discusses the basic legal, regulatory, and operational constraints that historically have guided the design of full-size transit buses specifically addressing the implications of the constraint that fare payment must occur on-board the transit bus and be monitored by the driver. Future bus design concepts are presented which demonstrate the improvements that would be possible in service characteristics if this constraint were removed. The material presented is based in part upon research conducted for the Urban Mass Transportation Administration on the impact of fare collection on transit bus design.

Daniels, CJ (Urban Mass Transportation Administration) Holcombe, HJ Mateyka, JA ; Society of Automotive Engineers Preprint SAE 780058, Mar. 1978, 20 pp, 12 Ref.; This paper was presented at the SAE Meeting, Detroit, Michigan, February 27-March 3, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

11 179869 STUDY OF FLYWHEEL ENERGY STORAGE-VOLUME 1, EXECUTIVE SUMMARY; VOLUME 2, SYSTEMS ANALYSIS; VOLUME 3, SYSTEM MECHANIZATION; VOLUME 4, LIFE-CYCLE COSTS; VOLUME 5, VEHICLE TESTS. In 1976, the Urban Mass Transportation Administration established the present program--Study of Flywheel Energy Storage--to determine the practicality and viability of flywheel propulsion systems for urban mass transit vehicles. The study began with a review of the U.S. transit properties requirements, which showed that the most suitable vehicle for deployment of flywheel propulsion is the full-size transit bus. Several propulsion concepts were hypothesized and subjected to comparative analysis with present diesel buses, trolley coaches, and battery buses in regard to performance and life-cycle economics. This screening resulted in the establishment of the following basic concepts that can provide various types of high quality transit service: Pure flywheel propelled bus; Flywheel/diesel engine hybrid bus; Flywheel-augmented trolley coach; and Flywheel/battery hybrid bus. The design studies that were conducted for the four propulsion configurations showed a high degree of commonality of components among the four concepts. Final life-cycle cost analyses showed all four concepts to be in a competitive range with present transit vehicles. Plans were

made for a Phase II development program that will result in the design, fabrication, and testing of all four propulsion configurations in full-size buses within 36 months. Volume 1 presents the summary of the results of the Study of Flywheel Energy Storage. The study has shown the viability of flywheel-propelled buses, and a set of plans for successful deployment of these new vehicles has been prepared. The study recommends that the Phase II program leading to the development of prototype vehicles be promptly initiated. Volume 2 reviews, identifies, and defines the requirements for improved rubber-tired urban transit vehicles. It includes the quantification of three baseline vehicles: a 40-ft diesel bus, a trolley coach, and a battery bus. It discusses the requirement needs of 11 transit properties. Volume 3 describes the results of the system mechanization for the four flywheel propulsion configurations that scored highest in the screening: Pure flywheel drive; Flywheel/battery hybrid drive; Flywheel/diesel engine hybrid drive; and Flywheel-augmented trolley coach drive. Volume 4 describes the methodology developed to guide the life-cycle cost analysis of the flywheel propelled vehicles as compared with the three baseline vehicles. Volume 5 presents the major results of the tests performed on a 40-foot diesel bus and a trolley coach as related to the program methodology. It includes the test data from the 20-vehicle M.A.N. Electrobus demonstration program in Germany. Details of the tests, test data, and other test results are included in Appendixes A, B, and C of this report. /UMTA/

11 179870 A STUDY OF FLYWHEEL ENERGY STORAGE FOR URBAN TRANSIT VEHICLES, PHASE I. This report documents the Phase I results of a program--Study of Flywheel Energy Storage--investigating the use of flywheel storage as applied to fixed-route, multistop, rubber-tired, urban transit vehicles. This program, established by the Urban Mass Transportation Administration in 1976, has an ultimate objective of hastening the changeover to electric propulsion from today's petroleum-powered transit vehicles. The objective of Phase I was to evaluate the application of flywheel energy storage to a broad spectrum of electrically powered urban transit vehicles and to identify the systems which could meet the established mission requirements. This document is the final report for Phase I of this flywheel storage program, and it summarizes the results of each of the six tasks of Phase I: Requirements Study; System Concept Study; Supporting Engineering Design and Analysis; Life-Cycle Cost; Development Plan for Phase II; and Technological Advancements. Charts, tables, major conclusions and recommendations are provided. The Appendixes (A-L) chart out such items as system requirements; flywheel/motor energy storage packages; life-cycle cost analysis, methodology, and worksheets; modularity in design; and a list of references. This report concludes that flywheel energy storage is a promising technique for reducing dependence upon

petroleum fuels by urban transit buses as well as offering environmental improvement potentials to transit operators. The study recommends that a hardware development program be initiated for propulsion systems applicable to urban vehicles. /FHWA/

General Electric Corporate Research & Development, (NY-06-0062) Final Rpt. UMTA-NY-06-0062-77-1, Sept. 1977, 210 pp; Contract DOT-UT-60096T; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS; PB-282929

11 180597 EVALUATION OF SELECTED DRIVE COMPONENTS FOR A FLYWHEEL POWERED COMMUTER VEHICLE. PHASE I. FINAL REPORT. The results of tests performed to evaluate the performance of selected high-speed flywheel bearings and shaft seals are reported, and work performed on the development of a high-speed composite flywheel rotor is described. The overall program objective is to develop a composite flywheel system for primary energy storage in a flywheel powered vehicle. These initial tests were intended to evaluate the performance of full-size composite rotor elements, high-speed bearings and shaft seals for that system under conditions simulating as closely as possible those anticipated in a finished vehicle. Performance of the angular contact ball bearings is reported to be satisfactory at all speeds; a simplified lubrication system is recommended for second generation hardware. Performance of the ferrofluidic shaft seals is reported to be marginal, as they failed to hold a hard vacuum at the maximum design speed. Several concepts for improved seals are offered for second generation hardware. The test objectives for the high-speed composite flywheel rotor were not achieved due to dynamic instability problems with the test hardware. Recommendations are offered for the design of second generation hardware, and a scope of activities is proposed for the second phase of this program. (ERA citation 03:021858)

11 180785 EMPIRICAL CRASH INJURY MODELING AND VEHICLE-SIZE MIX. Crash injury prediction models were developed using data from the CPIR file for crashes which occurred since January 1, 1970, involving 1969 or newer cars, vans, and pickup trucks. Hostile and protective effects of vehicle size were separated in addition to injury severity increases with age, front seating position, and lack of restraints. Differences by crash configuration were also isolated. Elasticity of injury with respect to average vehicle weight change was computed using these models. Fuel cost decreases were compared with injury cost increases as vehicle weight decreases. Fuel cost savings exceed injury cost increases as vehicle weight is reduced. The conclusion assumes no change in the relationship between vehicle volume and vehicle weight. Injury reduction from larger and lighter vehicles and from improved vehicle design could increase the difference even more.

11 183094 THE ORIGIN AND USES OF THE ECONOMY VAN. The economy van has evolved through three generations of design changes. From a full-forward control, primarily commercial vehicle first introduced in the U.S. in 1954, it has grown into a semi-forward control vehicle that is now used in a wide range of business and personal applications. Sales will exceed 700,000 units in 1977. The versatility of the original compact closed body design has been enhanced by higher GVW's, larger engines, and improved driver environment to meet growing customer requirements. The future challenge will be to preserve essential functional characteristics while significantly improving fuel economy. /SASI/

11 184146 VEHICLES SUITABLE FOR CITY TRAFFIC. SAFETY-COMBUSTION ENGINES-ELECTRIC PROPULSION. PART A: RESEARCH RESULTS [Stadtgerechte Kraftfahrzeuge. Sicherheit-Verbrennungsmotor -Elektroantrieb. Teil A: Ergebnisband.]. The problems of moving and stationary traffic cannot be solved by improvements in vehicle technology alone. In contrast, noise emissions can be lessened by vehicle modifications. Furthermore, exhaust emission problems can be reduced by implementation of existing and planned (vehicle) requirements. Four separately discussed problem areas are important in relation to active safety. For the experimental study of structural deformations in connection with the protection of (vehicle) occupants, a test facility was developed for the quasi-statistical simulation of progressive deformation in a collision. In addition, the behaviour of electric and hybrid propulsion units arranged in series was investigated by computer simulation. Other chapters deal with: the possibilities of parallel arrangements of combustion motors and electric drives with lead/acid batteries; the development of methods for predicting the nox emissions of combustion motors, with a view to reducing these harmful substances; problems of carburation and combustion in hybrid motors; problems of electric propulsion for road vehicles. The final chapter deals with the total concept of vehicles suitable for city traffic-passenger cars, goods vehicles and taxis-taking account of the results of the above investigations. The advantages and disadvantages of different types of motive power are compared. /TRRL/ [German]

11 184244 A CHARTER FOR THE BUS INDUSTRY-MATTERS THAT NEED ATTENTION. At a time when the UK bus industry is finding it increasingly difficult to operate profitably, and at the same time maintain an adequate service, the article considers a number of aspects of bus design and operation. Although vehicle

comfort and style are of some importance it is suggested that only frequency and time-keeping really matter to a user. In order to achieve better vehicle utilisation, buses should be designed for either crew or one-man operation with either front or under-floor engine location for reliability and ease of maintenance. Greater use should be made of weight-saving integral construction for buses instead of a chassis requiring a separately manufactured body. Other aspects of efficient bus transport operations such as staggered working hours and bus-lanes could be further developed. /TRRL/

11 184314 A BUS FOR ALL SEASONS. This short article comments on a research report recently issued by Daimler-Benz AG makers of Mercedes-Benz buses. The report suggests that the conventional bus will continue to remain the basic element of any public transport system-enjoying the advantage of combining flexibility with low investment costs. With the adoption of special guidance systems which enable it to follow a pre-arranged path, the bus could fulfil a new role using 'o-bahns' or busways. Automatic guidance would enable the bus to take up less road space than when manually steered. Thus it could fit into smaller tunnels than would otherwise be needed or could have its own separate track alongside existing roads. Such buses could continue to run normally as required and special tunnels and guideways could be progressively built and the costs spread over a period. The 3 forms of guidance which have been developed are briefly described; two are manual and one is fully automatic. /TRRL/

11 184494 ELECTRIC VEHICLES-THE STATE OF THE GAME. A report is presented on the second international conference of the British-based electric vehicle development group which was held in Sheffield at the end of May. The author suggests that the results of the conference gave every indication that high-performance battery-electric vehicles might yet become a potent force in the road transport industry. Speakers at the conference discussed the problems of oil versus electricity for vehicle use, the political decisions that will be necessary when dealing with the complex relationships between supply and demand when researching new transport methods, the experience gained from the operation of different types of battery bus vehicle, battery-electric goods vehicle development, and proposals for the operation of public transport vehicles combining battery and mains electric systems. Reference is made to existing operational systems in the United Kingdom and in West Germany. Information is provided on electric vehicle research around the world-especially in the USA. It is suggested that, with manufacturers now able to offer vehicles which could be shown to be usable, that the drive to save fuel was coupled with an international move to revive inner city areas, where electric vehicles could be especially beneficial. /TRRL/

11 184580 ATLANTA WHEELCHAIR ACCESSIBLE BUS STUDY. This document describes the implementation and operation of the Metropolitan Atlanta Rapid Transit Authority's fixed-route, subscription service for handicapped individuals. It is based on a site visit and discussions with several individuals in the Atlanta area. Operational characteristics including the early months of service are presented, as well as pictures/charts depicting the MARTA L-BUS vehicle, floor layout, lift design, lift operation, safety features, wheelchair securement, and problem areas. The subscription service, initiated in May 1977, began with a single bus operating three daily routes and has grown to seven buses operating 27 daily and two weekly routes. The buses are all lift equipped and most have 4 wheelchair positions and seventeen seats. As of May 1978, ridership has increased from 41 to 270 passenger trips per week. New routes are established by grouping trip origin and destination requests into vehicle tours. At least four handicapped passengers must be able to be served in a single tour before that route is incorporated into the system. The dispersion of the desired trip origins and destinations has resulted in low productivities and in high passenger trip costs. The net direct operating cost, excluding the extra deadheading due to special garaging requirements, was \$12.54 per passenger trip for the first seven weeks of service with only very light reductions since that time. The major difficulty that users experience with the lift equipment has been getting onto the lift platform unaided. However, with the driver/others to assist them, their usage of the system has not been restricted. Mechanically, the lift equipment has performed better than the Authority's maintenance staff expected. /UMTA/

11 184904 U.S.A.: EQUIPMENT DESIGN FOR ELDERLY AND HANDICAPPED TRANSPORTATION SERVICES. There is general agreement in the U.S. that the equipment, particularly vehicles, in service specifically to elderly and handicapped clients is less than satisfactory in design and durability. The problem is examined in its various aspects: a highly varied market in which small systems with limited funds, subsidized ridership and low levels of utilization predominate; current production models and their uses; and perceptions by suppliers of insufficient incentive in a limited market for the redesign and tooling necessary to develop a heavy-duty vehicle specifically for public transit paratransit purposes. The range of adaptations in use to improve vehicle accessibility and suitability are reviewed; and U.S. experience with lifts for the wheelchair bound is reported including commentary on reliability, the reported impact on line-haul operations, and the problems of wheelchair securement within moving vehicles. Research and development initiatives, primarily at the federal level, are noted, as well as problems

outside the vehicle environment which impact equipment upgrading. /Author/

11 190277 APPLICATIONS OF KINETIC ENERGY STORAGE TO TRANSPORTATION SYSTEMS. The recent rediscovery of the flywheel as an effective energy storage system, coupled with the growing public and government awareness of the need for energy-efficient passenger vehicles, has led to a resurgence of development activity in kinetic energy storage systems. Programs are currently underway by UMTA and DOE which will make use of pure flywheel and flywheel-assisted propulsion for a wide range of vehicles including subway cars, commuter trains, transit buses, passenger automobiles, and postal vans. The background and status of these ongoing activities is described, along with other planned flywheel applications, such as the recuperation of braking energy from freight trains on long downgrades.

11 190373 ENERGY SAVINGS WITH MULTIGRADED DIESEL LUBRICANTS--AN EXPERIMENTAL TEST DESIGN IN WINTER, URBAN OPERATION. This paper illustrates how experimental design techniques can be employed to obtain an accurate assessment of multigrade Heavy Duty (HD) performance in the field. Compared to monograde (SAE 40) oil, the use of SAE 15W/40 oil was found to improve vehicle fuel mileage (MPG) as well as oil economy (MPQ). The demonstration, conducted in two groups of 10 city buses each in regular service, was structured to dampen out the effect of numerous incidental variables. Statistical data analysis indicate a "most probable" improvement in fuel mileage of 2.7% as well as a 47% increase on multigraded oil economy.

11 190988 PROTOTYPE PARATRANSIT VEHICLE AS DESIGNED BY STEAM POWER SYSTEMS, INC. The report discusses a prototype low pollution paratransit vehicle (PTV) designed and constructed for evaluation by the U.S. Department of Transportation. Special features of this PTV include a large comfortable interior which would accommodate five passengers, an automated door and ramp system that would provide convenient ingress/egress for a wheelchair passenger, and low pollution Rankine cycle (steam) engine. This type of vehicle aims to provide transportation for the infirm, handicapped, and elderly in either a Dial-A-Ride, jitney, or taxicab service. The PTV was completed, acceptance tested, and delivered to the U.S. Department of Transportation in June 1976. The vehicle was displayed as part of a taxi design exhibition (summer 1976) at the Museum of Modern Art in New York City. Following the exhibition, the PTV was scheduled for dynamic testing by an independent contractor. This report concludes that the steam engine propulsion system has the potential for low exhaust emissions, but needs considerable improvement in both efficiency and reliability before it is ready for installation in motor vehicles.

Schneider, PH Norton, DD ; Steam Power Systems, Incorporated, Urban Mass Transportation Administration, (UMTA-CA-06-0079) Final Rpt. 11 191881 LITHIUM/IRON SULFIDE BATTERIES FOR ELECTRIC VEHICLES. Recent progress in the development of LiAl/FeS/sub x/ batteries for electric vehicles has indicated the possibility of near-term commercialization of a version of the battery that utilizes monosulfide (FeS) positive electrodes in conjunction with low-cost, iron-alloy current collectors. Eagle-Picher Industries, Inc., was awarded a one-year contract to fabricate a 40-kWh battery of this type, which will be tested in a van at ANL in 1979. Multiple-electrode cells having a specific energy of about 100 Wh/kg are now under test. Conceptual design problems for a compact insulating jacket, which will maintain the battery temperature at 450 deg C, appear to have been solved. With such a jacket, the energy efficiency of the battery would be decreased by only 3 to 5% as a result of heat losses if the temperature of the battery is permitted to fluctuate by 20 to 50 deg C. A commercial prototype of the FeS-type battery that could be developed by 1981 to 1983, depending on the rate of funding available, would be expected to have a specific energy of about 100 Wh/kg, an energy density of 200 Wh/liter at a 4-h discharge rate (including the weight and volume of the jacket and hardware), and a specific power of 100 to 125 W/kg. Work is also underway on a version of the battery that would utilize FeS sub 2 positive electrodes, which use molybdenum current collectors at present and may require the future development of less expensive current collectors to be commercially attractive. These batteries would ultimately have about 30 to 40% higher specific energy and 50 to 75% higher specific power than the FeS-type batteries.

11 193706 REQUIREMENTS FOR PARATRANSIT VEHICLES. The current state of the art of paratransit vehicles--the sizes the types used, the operating constraints, guidelines for size selection, a vehicle-tender selection process, current trends, and forecasts of the evolution of vehicle design over the next 10 years--is discussed. Action is suggested to reduce uncertainty over individual vehicles performance and improve utilization and design. Vans and integrally designed small buses have proven more reliable than other types of vehicles; their use in Canada and the United States is discussed. The selection process described is used to analyze four theoretical vehicles being reviewed for procurement. The analysis shows that the most cost-effective vehicle could be a bus with the highest initial cost or a low-cost van. /Author/

11 195276 CHILDLINER--A NEW LOGISTICS CONCEPT FOR URBAN-SUBURBAN COMMUTING. This paper presents a totally new concept for a mass transit system for urban-suburban commuters. Its principal features are a new jumbo size double decker bus which consists of compartments entered direct from a double-deck terminal dock. The bus would have no center aisle and would be longer than present vehicles thus vastly increasing the passenger carrying capacity and reducing loading and unloading time. The mainliners would be confined to super highways and terminals. The terminals would also be served by small feeder buses from outlying communities.

11 195437 THE COST OF QUIETER BUSES ON TOWN AND COUNTRY ROUTES [Kostenberekeningen met betrekking tot stillere bussen in stads-en streekvervoer]. This is a study of the financial effects of using three types of quieter buses for public transport services in urban and rural areas: buses with encapsulated diesel engines, buses with engines converted to liquified gas (lpg) and trolley-buses. Because of the limited experience of lpg buses and uncertainty about some costs associated with trolley-buses the observations are extremely provisional and the figures given should be regarded as approximate. All costs in the report refer to 1976 price levels. Gradual introduction of encapsulation, i.e. buying new buses with encapsulated engines, would increase costs on both urban and rural services by 0.3-0.4%. Use of lpg would increase the costs depending on fuel consumption, which is not yet known precisely by 1.2-2.1% on urban services and 1.9-4.0% on rural services. The increase in cost resulting from a switchover to trolley-buses would depend on the frequency of the services in relation to the costs of the network. They would not therefore seem to be a viable financial proposition on rural services. In urban areas, with their frequent services, the result of switching fifty per cent of bus kilometres (the busiest routes) to trolley-bus operation would be to increase the cost of that part of the network by 6%. /Author/TRRL/ [Dutch]

Eygenbrood, WH Hilferink, PBD Vanferink, PB Ministerie van Volksgezondheid in Milieuhygiene Monograph July 1978, 62 p., Tabs.; ACKNOWLEDGMENT: TRRL (IRRD 240214), Institute for Road Safety Research

11 195457 TECHNICAL AND ENVIRONMENTAL ASPECTS OF BUSES FOR USE IN URBAN AND RURAL AREAS [Technische en milieuhygenische aspecten van bussen voor stadsvervoer en streekvervoer]. The aim of this study is to consider the possibilities of making buses used for public transport services quieter. Most consideration has been given to the "encapsulation" of present-day diesel buses and their conversion to liquified gas operation. Encapsulation could be employed relatively soon, and retrofill of present-day buses is also a possibility. There are reservations about converting buses to run on liquified gas on account of the safety aspects involved in storing the fuel. Another interesting possibility is the trolley bus. Alternatives, such as the "silent" diesel engine and the stirring engine, afford only long-term prospects. /TRRL/ [Dutch]

11 196691 ADVANCED BATTERY DESIGN. The three important aspects in battery design for "on the road" electric vehicles are minimum cost, maximum energy density and maximum life. The virtues of new forms of electrochemical couples have been acclaimed in the world press, but to-date, no system has been proven to achieve more than two of these objectives together. The alternative couples to lead/lead dioxide are examined. Most do not appear commercially viable. The sodium sulphur system appears to be the most promising but, without a major break-

through, batteries will not be commercially available this decade so that lead/lead dioxide currently is unrivalled from the cost-effective point of view. /TRRL/

11 196692 ADVANCED MOTOR DESIGN. The paper summarises the development of the electric rotating machine since its origin over 100 years ago, and the improvements which have taken place in motor power/weight ration during the last 50 years. The wide range of electric motors available today is investigated, with comparison of their original and present day applications. Choosing a motor type for traction application involves the consideration of a number of design factors which are dealt with in this paper. Present day design and manufacture of electric motors is discussed with regard to economic considerations, design methods, and the role of new materials. The paper concludes with a look at possible future developments in rotating machines. /Author/TRRL/

11 196698 BATTERY DEVELOPMENTS. This paper presents a brief review of the history of batteries from Volta to Plante and Faure. Following the development of lead acid and alkaline batteries, the former divide into three main streams-automotive starting, lighting and ignition, stationary and motive power batteries. The various elements of battery design, the manner and reason for the incorporation of various improvements are discussed briefly. Charging and discharge and the influence of various techniques on battery performance are also discussed. /Author/TRRL/

11 196707 CONTROL SYSTEMS FOR ELECTRIC VEHICLES. Recent development activity overseas has shown that effective control engineering of electric cars for urban transport is within the scope of contemporary technology. Control systems have been developed from the established and reliable methods of control applied to other types of battery-powered vehicles, from golf carts to industrial vehicles, of which hundreds of thousands are in use. A wealth of valuable and relevant experience is therefore already available for application to the specific requirements of electric cars. Control system choice is influenced by such factors as cost, simplicity and reliability. Efficient energy conversion within the car is also a prime engineering

objective, both from the performance aspect and the viewpoint of resources conservation. /Author/TRRL/

11 196782 ELECTRICITY GENERATION AND SUPPLY. The paper reviews the reserves of fossil, nuclear and other sources of primary energy available for future use and the current consumption rates. Reference is made to the increasing conversion of abundant coal and nuclear fuels into electricity for delivery of energy and the saving of more scarce direct burning fuels (such as oil and gas) that can be achieved, particularly by greater use of electricity for transportation. The resources of the Australian electricity authorities are discussed to illustrate that they could readily cope with a substantial increase in load from battery electric vehicles and electric traction within their normal growth patterns. /Author/TRRL/

11 196793 FLINDERS UNIVERSITY ELECTRIC RESEARCH VEHICLE. The Flinders electric vehicle was designed to meet the urgent requirement for a functional electrical vehicle in the urban environment. Conventional electric vehicles have proved unable to meet requirements for an urban commuter vehicle. Vehicles presently available are excessively heavy, due to the battery requirement, and their range in stop-start city traffic is low. The Flinders concept differs radically from the conventional electric vehicle. The battery current requirements are greatly reduced, resulting in a much lighter, more efficient battery. No electrical control is used to govern either power as the printed-armature motor determines its own requirement from the battery when used in this concept. /Author/TRRL/

11 196858 VEHICLE DESIGN: GENERAL DESIGN FEATURES. The author examines briefly the historical environment from which electrics grew and its apparent inhibiting influence on design and development. The paper discusses how performance can be improved marginally by coupling the power source to varying designs of driving motors, drivers and controllers, whilst gains can also be achieved by recovery of deceleration power. In the final analysis, performance will always be a function of the ability of the charger to refuel without undue loss of vehicle availability and battery deterioration. Finally, the advantages of complex electronics and accessories are weighed against basic simplicity, coupled with acknowledgement of the excellent work being undertaken in private experimentation. /TRRL/

11 197217 HIGH-CAPACITY ARTICULATED BUS DEBUTS. AM General Corp. and M. A. N. (Maschinenfabrik Augsburg-Nurnberg AG) have adapted the articulated bus to specific requirements of the U. S. market. Dimensional changes were made, as well as modifications to comply with all regulations and safety requirements. Redesign of the electrical system was necessary, as was integration of an air conditioning system. The rear portion of the bus is self-steering, controlled from the front unit. All vehicles are either 55 or 60 ft long with either two or three doors on the right side and with or without air conditioning. They consist of a two-axle motor unit with a single axle trailer permanently attached to its rear so as to permit full flexing while assuring full passage for passengers between the units. The motor unit is practically a standard bus with its rear section cut away and its engine and transmission mounted under-floor between front and drive axles. The

trailer is like the rear section of a standard bus, minus an engine. Segments are of identical cross section with a flexible bellows in the hinge area. All three axles have air suspension with automatic floor leveling control. Front and rear axles have independent wheel suspension. The drive (middle) axle is linked to the chassis via a swinging fork and air bellows.

11 197356 FLYWHEEL/DIESEL HYBRID POWER DRIVE: URBAN BUS VEHICLE SIMULATION. This report describes the results of a Transportation Systems Center investigation conducted under Urban Mass Transportation Administration sponsorship, of the practicality of a flywheel/diesel hybrid power drive for urban transit bus propulsion. The program is based on the use of a systems approach to develop propulsion design concepts consistent with environmental, safety, operational, and economic objectives. A simulation model, developed in the program, was the major tool used in the investigation and is described in detail in the report. This model should be useful in further studies of flywheel/heat engine analyses for vehicle propulsion application over various drive cycles. The hybrid used continuously variable ratio transmissions (CVRT) and a control subsystem to optimize fuel consumption in an 'on-off' mode of engine operation. The system is projected to have a reduction in fuel consumption of at least 50% (in gallons per mile) below the diesel-alone fuel consumption for urban bus driving cycles having more than 4 stops per mile. Regenerative braking is used, contributing to fuel consumption improvement.

11 197369 VIBRATION TESTS ON TRANSIT BUSES. The objective of this vibration measurement program was to quantify the vibration environment which would be experienced by Automatic Vehicle Monitoring (AVM) equipment when installed on buses during typical city route service operations. Two buses were utilized in this measurement program: a General Motors Corporation Model 3100 provided by the Southern California Rapid Transit District, and a Flexible Corporation Model 207 provided by the City Transit of Fort Worth, Texas. The approach taken involved instrumenting the buses and representative electronic hardware on the buses with calibrated accelerometers and recording the output of these accelerometers while driving the buses over selected test routes at specified speeds. In general, the tests have provided a definition of the vibration environment typical of transit buses used in city route service. Vibration amplitudes of the levels measured in the program do not pose a threat to the satisfactory operation of equipment produced according to industrial equipment design practice and fabrication methods. The data measurement system used in this program provided data of sufficient detail to accomplish the basic objectives. In evaluating this program, the authors stated that more accurate and more extensive comparisons of the data would have

been made possible by a continuous correlation of calibrated bus speed with data signals. It is recommended that this be incorporated into any future tests of this nature.

11 198428 HIGH-PERFORMANCE BATTERIES FOR ELECTRIC-VEHICLE PROPULSION AND STATIONARY ENERGY STORAGE. PROGRESS REPORT, OCTOBER 1977--SEPTEMBER 1978. The research, development, and management activities of the programs at Argonne National Laboratory (ANL) and at industrial subcontractors' laboratories on high-temperature batteries during the period October 1977--September 1978 are reported. These batteries are being developed for electric-vehicle propulsion and for stationary-energy-storage applications. The present cells, which operate at 400 to 500 deg C, are of a vertically oriented, prismatic design with one or more inner positive electrodes of FeS or FeS sub 2 , facing electrodes of lithium-aluminum alloy, and molten LiCl-KCl electrolyte. During this fiscal year, cell and battery development work continued at ANL, Eagle-Picher Industries, Inc., the Energy Systems Group of Rockwell International, and Gould Inc. Related work was also in progress at the Carborundum Co., General Motors Research Laboratories, and various other organizations. A major event was the initiation of a subcontract with Eagle-Picher Industries to develop, design, and fabricate a 40-kWh battery (Mark IA) for testing in an electric van. Conceptual design studies on a 100-MWh stationary-energy-storage module were conducted as a joint effort between ANL and Rockwell International. A significant technical advance was the development of multiplate cells, which are capable of higher performance than bicells. 89 figures, 57 tables. (ERA citation 04:036555)

11 198465 AERODYNAMIC RESISTANCE REDUCTION OF ELECTRIC AND HYBRID VEHICLES. PROGRESS REPORT, SEPTEMBER 1978. The objectives, approach, and FY'78 progress and results of the Aerodynamic Resistance Reduction work element of the Electric and Hybrid Vehicle System R and D Project are described. The generation of an EHV aerody-

dynamic data base was initiated by conducting full-scale wind tunnel tests on 16 vehicles. Zero-yaw drag coefficients ranged from a high of 0.58 for a boxey delivery van and an open roadster to a low of about 0.34 for a current 4-passenger prototype automobile which was designed with aerodynamics as an integrated parameter. A subscale investigation was performed in order to identify any characteristic effects of aspect ratio or fineness ratio which might appear if electric vehicle shape proportions were to vary significantly from current automobiles. Some preliminary results are presented which indicate a 5 to 10% variation in drag over the range of interest. A rigorous procedure was developed in order to determine effective drag coefficient wind-weighting factors over J227a driving cycles in the presence of annual mean wind fields. The applications of this procedure allows a user to accurately account for statistical wind effects in computer simulations by means of a modified constant-drag coefficient. Such coefficients, when properly weighted, were found to be from 5 to 65% greater than the zero-yaw drag coefficient in the cases presented. In order to guide preliminary design work, a review of the general principles of the aerodynamic design of automobiles is presented along with several drag-estimating procedures and commentary. Also included is a vehicle aerodynamics bibliography of over 160 entries, in six general categories.

11 260978 A PROMISING START FOR BATTERY BUSES IN THE HIGH STREET. The experimental operation of two prototype battery-powered electric buses on passenger service in seven city centers, is examined. After one year and nine months service respectively, overall reliability in terms of mileage achieved, compared to scheduled mileage, was 82.5%. Improvements during the later stages of operation showed that a reliability of 97% was possible. Maintenance time on the prototype vehicles is high, but corresponding work on a production vehicle would be much less since data recording would not be required as in the experimental project, and battery maintenance has been deliberately generous on the prototypes. Routine maintenance of the whole electrical system is not expected to exceed 3-4 man hours per quarter, and mainte-

nance for the entire traction systems is estimated at about 1 man hour per week. Unscheduled maintenance is expected to add another 82 man hours a year. /TRRL/

11 262463 FEASIBILITY STUDY OF NOISE CONTROL MODIFICATION FOR AN URBAN TRANSIT BUS. An investigation has been conducted to determine the feasibility of reducing exterior acoustic noise produced by an urban transit bus. The noise characteristics of the bus were studied and a number of noise-reducing modifications were designed to attack the principal sources. The modifications included an experimental radiator fan, muffling devices for the engine air inlet and exhaust systems, and a partial enclosure for the engine compartment. Noise tests were performed on the unmodified bus and on the bus equipped with all modifications. Several tests were made with one modification removed each time to determine its individual contribution. A-weighted sound level measurements and octave-band frequency plots are presented to show the effect of the individual noise-reducing modifications. /Author/

11 262965 SILENT RIDER TAKES ON MANCHESTER. THE ELECTRIC BUS BUILT BY CHLORIDE GOES INTO SERVICE IN THE SELNEC PTA AREA.. THIS ARTICLE DESCRIBES THE SILENT RIDER-A BATTERY-POWERED BUS. THE 165-CELL LEAD-ACID BATTERY PRODUCES 330V SUPPLY WHICH IS FED TO THE 72KW TRACTION MOTOR. BATTERIES HAVE AN AUTOMATIC TOPPING-UP SYSTEM. THEY CAN BE RECHARGED IN 3 1/2 HOURS AND HAVE A LIFE OF 750 WORKING DAYS. A 24V BATTERY RUNS THE TRACTION MOTORS IN AN EMERGENCY. SILENT RIDER HAS A RANGE OF 65KM, A MAXIMUM SPEED OF 65KM/HR, AN ACCELERATION OF 1M/S2 ON THE LEVEL AND IT CAN COPE WITH GRADIENTS OF 1 IN 8. IT CAN CARRY 41 SEATED PASSENGERS AND IT WILL BE USED AT PEAK HOURS IN MANCHESTER. THE SILENT RIDER, WHICH HAS REGENERATIVE BRAKING, IS QUIET AND FREE FROM EXHAUST POLLUTION. ALTHOUGH SILENT RIDER'S INITIAL COSTS ARE HIGH, ITS RUNNING AND MAINTENANCE COSTS ARE LOW. A FLEET OF 20 MK IT VEHICLES IS PLANNED. /TRRL/

11 263062 INTERIOR LIGHTING OF PUBLIC CONVEYANCES—ROAD AND RAIL. The present publication is a complete revision of the 1951 report, "Transportation Lighting" and is the result of a continuing study of current practice, standards and existing installations. It contains current illumination recommendations,

a discussion of the basic light sources in use today, maintenance of lighting systems, and a section on typical design methods for lighting specific visual tasks in road and rail conveyances. Since Emergency Lighting is common to all public conveyances, it has been considered as an inherent part of the report itself and, also, as a detailed summary in Appendix A. Electric systems for operating fluorescent lamps in public conveyances and a glossary of lighting terms are included in appendices.

Illuminating Engineering Society, Journal of Vol. 3 No. 4, July 1974, pp 381-396 This article was written by the Committee on Interior Lighting for Public Conveyances.

11 263246 NEW SCHOOL BUS, FEATURES STRENGTHENED BODY TO PROVIDE CRASH PROTECTION FOR PASSENGERS. Details are given of a new school bus, The Lifeguard, designed by the Wayne Corp., Richmond, Ind, in which the multiple side and roof seams have been eliminated inside and outside. Outside, a one-piece shield extends from window to floor along the outer length of the passenger compartment. Further protection is provided by one-piece full-length guard rails applied over the outer panelling and bolted through heavy gauge frame members. On the roof, three full-length panels cover the bus from front to back. Six panels line the interior of the bus where protruding parts have been eliminated. At both front and rear corners strength has been added by means of double-post construction. The new bus has safety fasteners which have more grip strength than rivets or welds. The windows, one-third larger than one conventional buses, provide a larger escape opening beside each seat. /TRRL/

11 263576 DEMAND-RESPONSIVE TRANSPORTATION FOR THE ELDERLY AND HANDICAPPED. In this discussion of demand-responsive transportation for the elderly, the panelists first described the activities in which they were involved, and then responded to prepared questions. The transit program of the Valley Region in Connecticut is described in some detail. The need of this group of riders are discussed, including economics, community services which are available but inaccessible, safety, and design features. The Transbus Program is mentioned, and several of the specific design features for handicapped and elderly persons are discussed. Among these are special handrails, ramps to the curb, skid-free floors, large windows, and wider doors. Specific services provided by these various demand-responsive systems are enumerated.

11 264110 ELECTROBUS—REVIEWS OF 9000 MILES OF CITY TRANSIT DEMONSTRATIONS.. A simple, battery-operated, long life, low maintenance, city transit electric bus has

been developed with low pollution and low noise emission features. Performance and power measurements have been taken from demonstrations at several typical urban center city bus service operations. From test results detailed in this paper, it is shown that the electric bus obtains 11.5 miles/gal of fuel compared to 3.5 and 6.0 miles/gal for equivalent sized gasoline and diesel engine buses in similar urban transit service.

11 264772 BUS MODIFICATION TO IMPROVE SAFETY, COMFORT, AND HUMAN RELIABILITY. The MITRE Corporation has made a preliminary analysis of the needs of bus patrons, with emphasis on the needs of the disabled. This analysis, based on observations and consultation with specialists was used to derive human performance requirements for average, aged and disabled patrons, and for the driver. The bus modification kits described are intended to increase human reliability and safety. To accomplish this the kits should improve: Information on the identification of buses, routes, and destinations; access, equilibrium, and egress for the disabled, exits; nighttime visual access for drivers and patrons; familiarity with vehicle accessories; and safety under mobile or emergency conditions. Modification kits are evaluated on the basis of effectiveness, and costs of research, development, production, and installation. Since it may be impractical to install all kits immediately, they are recommended for implementation on the basis of effect on utility of transportation for the aged and disabled. The following kits meet this criterion: Public Address, Route Identification, Handrails, Stanchions, Raised Seat, and Extended Step.

11 265266 CALTECH SEMINAR SERIES ON ENERGY CONSUMPTION IN PRIVATE TRANSPORTATION. The Caltech Seminar Series was concerned primarily with means of reducing the huge amount of valuable oil burned in private cars. Topics discussed include means to produce vehicles that have: Lower weight with adequate space and safety; efficient, low pollution engines; better suspension and lower-loss tires; reduced power loss in accessories at high speeds; reduced air drag; more efficient transmission; and efficient operation with a shorter warmup period. Other courses discussed that could have a useful effect on oil consumption in the near future are: Computerized traffic control; carpools, vanpools, and commuter buses; demand-responsive transit; and improved fixed-route transit. Hybrid cars, electric cars, personal rapid transit, telecommunications, and legislative changes in the field of taxation are covered. Portions of this document are not fully legible.

11 300709 BUYING THE BUS, OR LESSONS IN EQUIPMENT SELECTION. ABRIDGMENT. Some useful steps in equipping a public transit system are described. The definition of terminology such as bus and van is discussed, and a brief comparison of the characteristics of vehicle types that have 30-passenger capacities is tabulated. It is noted that information on the experience of other users with different types of vehicles and different modifications to standard types of equipment would be most useful for the rural transportation operator. It is recommended that rural planners should have a person who would research information from state DOT's, federal managers and rural project managers for data on equipment manufacturers, vehicle operating problems, passenger-related experience, and driver experience. A main thrust in the project planning process is the development of information for use in evaluating equipment needs. Requirements relating to size and number of vehicles must be determined in the project planning process. It is noted that in rural systems, site-specific and client-specific research is important. The number of vehicles requiring wheel chair accessibility must be determined and package racks may be important if shopping trips are an important function of the system. Suggestions made by experienced operators of rural transportation systems are listed.

11 301919 NEW POLYCARBONATE MAY REPLACE AUTOGLASS. It is claimed that a major obstacle to the use of polycarbonate sheet for automotive glazing applications has been overcome with the development of Margard, a new silicone-coated polycarbonate which is nearly as abrasion resistant as glass. The key to the silicone-coating process is a primer which makes possible the bonding of the silicone to the substrate. The new material is already finding uses in other transportation equipment. A major maker of off-highway equipment has replaced wire-reinforced safety glass with Margard. Amtrak has specified the silicone-coated material for the side windows of 1800 new passenger cars. The Milwaukee transit system, in addition to specifying Margard for new buses, eventually will use it to replace first-generation plastic glazing in older buses.

Chemical and Engineering News Vol. 57 No. 40, Oct. 1979, p 8

11 301939 THE POTENTIAL FOR HIGH CAPACITY BUSES IN CANADA. This working paper presents the conclusions of a study on the potential for high capacity articulated and double-deck transit buses in Canada as well as a review of the state-of-the-art in high capacity buses in North America and Europe. Comparative information is given on standard, articulated and double-deck buses including vehicle maintenance, operating and capital costs. Methods of introducing high capacity buses in place of standard buses are discussed as well as their potential as an alternative to other technologies used for urban transit service. The options available in supplying articulated buses to meet the domestic market and the capability of the bus industry to meet these requirements are also discussed. /TRRL/

11 301940 POTENTIAL OF ELECTRIC VEHICLES IN THE PUBLIC-TRANSPORT SECTOR-THE VIEW OF THE OPERATOR. Public transport in South Yorkshire is the responsibility of the South Yorkshire Passenger Transport Executive, and it is considered that this Executive, in developing future policies must take account of the changing national economic position, eg, the availability of fuel in the future. The development of alternative traction technologies is discussed related to the selection of any possible segregated public transport system in South Yorkshire. The author suggests that there are three basic classes of electric road passenger traction which can apply either to the urban bus or to segregated public transport systems. These three groups of vehicles are described as those vehicles which have no 'on-board' energy-storage capacity and are totally dependent for their power supply on fixed overhead catenary systems; hybrid vehicles depending on a limited on-board energy-storage capacity and external power supplies providing a replenishment of energy, or the diesel-electric bus; and battery electric systems operating independently of 'on-street' power infrastructure. Examples of vehicles in each group are provided. The advantages and disadvantages

of battery electric traction, related to the public-transport section, are discussed in respect of the research programmes undertaken in South Yorkshire which are considered to have been encouragingly successful. /TRRL/

11 302109 SIMULATION OF AN URBAN BATTERY BUS VEHICLE. This report describes the computer simulation of a battery-powered bus as it traverses an arbitrary mission profile of specified acceleration, roadway grade, and headwind. The battery-bus system components comprise a DC shunt motor, solid-state power conditioning unit with regeneration capability, and a battery source consisting of a multi-unit lead acid battery. The computer model determines vehicle tractive effort and power consumption and computes actual vehicle speed for a given mission profile. The program output data is tabulated in a form which allows easy recognition of the various operational modes and power-limited regimes. The computer model uses a "modularization" format which facilitates the simulation of alternate propulsion systems involving the interchange of one system component for another. The model is applied to simulate the propulsion characteristics of a typical bus operating over a specified drive cycle. The results of this study demonstrate the applicability of the battery bus model for predicting bus propulsion characteristics under simulated drive conditions. This report provides charts depicting the plotting program, input data required by the Battery Bus Performance Program, Fortran source listings and data files, as well as a Glossary of Program Constants and Variables. /UMTA/

11 302267 IMPACT OF FARE COLLECTION ON BUS DESIGN APPENDICES A THROUGH G. The primary objectives of this study are: to investigate and evaluate the nature of new bus designs which better accommodate the primary functions of public transit, if the fundamental constraint of on-board driver monitored, fare collection were removed; to postulate and assess new off-board fare collection methods that would complement such bus designs; and to assess the potential synergistic effects of new buses/new fare collection systems that serve to improve transit efficiency and productivity, and

overall service to the riding public. The design concept effort was focused on the standard 40-foot transit bus, although potentially relevant to other sizes of buses. The appendixes in this report contain detailed information on transit bus fare collection systems operations and costs in the United States. Also included is an examination of Swiss experience with total off-board fare collection systems. European transit bus design trends and fare collection systems are surveyed. Drawings of a number of new bus design concepts compatible with off-board fare collection systems are presented. A discussion of technical, design, and operating cost issues related to bus design and off-board fare collection is presented. A very extensive bibliography on fare collection and transit bus design trends is included. (UMTA)

11 302268 IMPACT OF FARE COLLECTION ON BUS DESIGN. The primary objectives of this study are: to investigate and evaluate the nature of new bus designs which better accommodate the primary functions of public transit, if the fundamental constraint of on-board, driver monitored, fare collection were removed; to postulate and assess new off-board fare collection methods that would complement such bus designs; and to assess the potential synergistic effects of new buses/new fare collection systems that serve to improve transit efficiency and productivity, and overall service to the riding public. The design concept effort was focused on the standard 40-foot transit bus, although potentially relevant to other sizes of buses. This report examines the potential impact on transit bus design of freeing the bus designer from the constraint that fares must be collected and monitored on-board the bus by the driver. Conceptual transit bus designs are developed, which offer the potential for operating cost reductions and substantial improvements in passenger service characteristics. Current U.S. fare collection costs and total bus operating costs are assessed and compared to those possible with new buses and compatible off-board fare collection systems. The report contains considerable information on both bus design and fare collection system trends in the U.S. and Western Europe. Although this study focused on the standard 40-foot transit bus, results herein indicate that operational benefits of off-board fare collection become greater on high capacity vehicles rather than on 40-foot transit buses.

11 302276 LOW-FLOOR ARTICULATED BUS DEMONSTRATION. This report is documentation of a program to demonstrate the

stability and anti-jackknifing capabilities of a low-floor articulated bus to the transit industry. This demonstration intended to show that a high passenger capacity Transbus configuration could be developed embodying the low-floor concept by incorporating anti-jackknifing capabilities in the design and thus, maintain coach stability. For the demonstration program a prototype coach built by the firm of Hamburg-Consult of the Federal Republic of West Germany was demonstrated and evaluated at five sites in the U.S.: the U.S. Department of Transportation in Washington, DC; the Southeastern Michigan Transportation Authority in Detroit, Michigan; the Port Authority of Allegheny County in Pittsburgh, Pennsylvania; and the Mass Transit Administration of Maryland in Baltimore, Maryland. Additional testing and evaluation was conducted at the Transportation Research Center of Ohio in East Liberty, Ohio. Representatives from United States and Canadian governments, transit authorities, vehicle and component manufacturers, the news media, and the general public observed and rode in the bus during the demonstration period. Data on performance, reactions of drivers, maintenance and management personnel, and on public relations (news media) were collected. The demonstration showed that the low-floor concept, seen in the prototype, is an improvement over current articulated vehicle designs. The low floor allows faster and easier boarding, thus increasing productivity, and offering an advantage to elderly and handicapped persons. The performance and the industry's favorable reaction to the technology at all five sites is evidence of the prototype's demonstrated stability and anti-jackknifing capabilities of a low-floor articulated bus.

11 303912 PARATRANSIT DEVELOPMENT; CURRENT CONDITIONS. The conference reported here was organized to synthesize and evaluate the many significant paratransit services occurring across the U.S. and Canada. The conference assessed the outcomes as well as implications of the various projects and considered their relevance for other communities. The Conference Advisory Committee believed that careful evaluation was needed of the planning, operation and performance issues that have arisen during the implementation of a variety of paratransit projects. Such analyses would aid in the further development of paratransit systems and services. The Conference was planned in expectation of the release of a final paratransit policy of the Urban Mass Transportation Administration (UMTA), and was organized to provide results that should help UMTA to understand the problems and potentials of paratransit more fully. Comprehensive resource papers were presented on six and labor standards; appropriate institutional framework for paratransit development; evaluation and measurement of service effectiveness; competitive opportunities in paratransit; coordination of social-service-agency transportation; and technology requirements. Each of these papers are briefly reviewed.

11 304763 THE TROLLEY COACH DEVELOPMENT AND STATE OF THE ART: TASK I REPORT FOR THE ELECTRIC TROLLEY BUS FEASIBILITY STUDY. Trolley coaches achieved their greatest level of use in the early 1950's when over 6500 vehicles were employed on 54 systems in North America. However, from the early 1950's through the early 1970's, the trolley coach (TC) disappeared as fast as it had appeared in the previous twenty years. By 1975, only ten systems in North America still retained TC operations. In the U.S. these included Boston, Philadelphia, Dayton, Seattle, and San Francisco; in Canada, Toronto, Hamilton, Edmonton, and Vancouver; and in Mexico, Mexico City. These systems are discussed herein, as well as the reasons for the TC demise. This report presents a brief history of TC operation in North America and a description of currently operating TC systems. TC technology is described and illustrated, including vehicles, propulsion and control systems and overhead wire and fittings. Opera-

tional characteristics of the TC are also described, including its suitability for application in various situations and requirements for trolley coach system design. Environmental effects of TC operation are analyzed, as are user impacts. This report describes and contrasts trolley coaches and TC facilities now in use in North America and Europe.

11 305136 AERODYNAMIC CHARACTERISTICS OF SIXTEEN ELECTRIC, HYBRID, AND SUBCOMPACT VEHICLES. An elementary electric and hybrid vehicle aerodynamic data base was developed using data obtained on sixteen electric, hybrid, and sub-compact production vehicles tested in the Lockheed-Georgia low-speed wind tunnel. Zero-yaw drag coefficients ranged from a high of 0.58 for a boxey delivery van and an open roadster to a low of about 0.34 for a current four-passenger proto-type automobile which was designed with aerodynamics as an integrated parameter. Vehicles were tested at yaw angles up to 40 degrees and a wing weighting analysis is presented which yields a vehicle's effective drag coefficient as a function of wing velocity and driving cycle. Other parameters investigated included the effects of windows open and closed, radiators open and sealed, and pop-up headlights. Complete six-component force and moment data are presented in both tabular and graphical formats. Only limited commentary is offered since, by its very nature, a data base should consist of unrefined reference material. A justification for pursuing efficient aerodynamic design of EHVs is presented.

11 305809 AUTOMATED MIXED TRAFFIC VEHICLE STUDY AT WASHINGTON NATIONAL AIRPORT. Passenger-carrying automated mixed traffic vehicles (AMTV) development has recently demonstrated successful automated vehicle operation in both pedestrian and limited automobile traffic. Passenger-carrying AMTV's are intended to provide the advantages of automation to that segment of the transit market that handles a

moderate demand level over short distances at low speeds. This study examines the site and passenger demand characteristics at Washington National Airport and analyzes the application feasibility of providing AMTV service between the air terminals and the long term and satellite parking lots. The AMTV system analyzed includes three separate routes; all routes use 8-passenger AMTV vehicles. Route 1 operates between the air terminals and the satellite parking lots. Routes 2 and 3, operating in conjunction with a hypothetical accelerating walkway system operating between the Metro Rapid Rail Station and the Main Terminal, provide service between the Main Terminal and Long Term Parking Lots. The AMTV system analyzed herein includes a single lane loop, a single lane shuttle, and a double lane route. Route fleet size requirements range from 1 to 4 vehicles. The entire National Airport AMTV System would cost approximately \$600,000 to build and \$343,000 a year to operate and maintain (O&M). On a route-by-route basis, the AMTV routes studied compare favorably with several other alternative modes in terms of both level of service and costs. Although the AMTV has higher capital costs than the existing shuttle bus system and the upgraded exclusive right-of-way bus system, the AMTV offers significant savings in annual and O&M costs.

11 308049 GARRETT STARTS WORK ON FLYWHEEL. A contract has been awarded to develop a propulsion system which uses a spinning flywheel to load-level a small diesel engine to recover, store, and reuse the braking energy normally lost when a bus comes to a stop. The system will be capable of saving nearly half the fuel used by today's diesel-powered intra-urban transit buses. Under the contract, a standard 40-foot Grumman-Flexible Model 870 transit bus will be modified to incorporate a flywheel-assisted diesel engine/electric propulsion system. Even though the diesel engine power rating is reduced by more than two-thirds, there will be no sacrifice in vehicle performance, acceleration, gradeability or top speed. No compromise in passenger amenities is envisioned for the flywheel bus since both air-conditioning and heating will be provided for passenger comfort. Normal bus lighting and accessory systems will be incorporated using energy from the diesel engine. It is expected that the prototype flywheel diesel bus will be demonstrated in approximately three years.

Electric Vehicle News Vol. 8 No. 3, Aug. 1979, p 22, 1 Phot.

11 308077 THE ELECTRIC TROLLEY BUS--REVISITED. The electric trolley bus (ETB) potential which is now being re-evaluated, combines reliability, passenger-carrying capacity, quiet, pollution-free transit operation with passenger comfort, use of existing streets, and the sense of permanence given by overhead wires. The ETB plays only a minor role in the U.S. with 675 vehicles in service and just over 200 route-miles in five urban areas. In the 1970s there

has been ETB fleet replacement and expansion. Recent conversions to ETBs have taken place in Toronto and Edmonton and are being planned in Seattle and San Francisco. ETB is being used also as an intermediate mode between diesel buses and light rail transit or rail rapid transit. The physical components of an ETB system include revenue service vehicles, electric power distribution systems, electric power generation/conversion equipment, maintenance facilities and facilities for system operation. It is noted that the design of a bus body structure need not limit the types of propulsion units that may be installed in it, and that flexibility of design with regard to bus capacity may be achieved concurrently with standardization of major vehicle subsystems and individual components. Comments are also made on electric power generation/conversion, off-wire systems, network operations, aesthetics, pollution, energy consumption and joint development.

11 308130 NEEDED: MORE BUSES FAST. Articulated buses (artics)-high capacity transit vehicles-are introduced by public agencies as a way to save costs, carry more passengers and lure new riders. These buses first went into service in Los Angeles. The Los Angeles RTD and the San Diego Transit Corp. are among 11 transit properties which formed a nationwide consortium to order and purchase 325 articulated buses in 1976. The buses are hybrids, a mixture of foreign and domestic design, engineering and craftsmanship. The buses are considered successful products although they have some major problems. Despite air-conditioning breakdowns and other problems, the artics have many advantages because of their size. The larger coaches have a seating capacity of 65 with room for 60 standees. No uniformity is noted in the way various members of the consortium have deployed artics. The service patterns in Los Angeles, Phoenix and Chicago are briefly discussed.

11 308888 THE EFFECTS AT STOPS OF THE MAN ARTICULATED BUS. This note describes the results of boarding trials held on the man articulated bus at Chiswick in February 1978. It assesses the likely effects on average stop time of crew and operation of the man together with the effects on operability at stops and compares them with existing bus types. Although the marginal boarding and alighting times of the man are fast, the time taken to open and close the doors is slow. For an average boarding and alighting movement existing bus types are, as a result, quicker at stops. The length of the bus is likely to cause operability problems at stops, garage manoeuvrability problems and garage capacity difficulties, even if service frequencies were reduced. (a) (TRRL)

11 310143 TOWNOBILE ELECTRIC CITY TRANSIT SYSTEM-THE AFFORDABLE, ADAPTABLE ALTERNATIVE. Electric passenger transport systems tend to require expensive and inflexible infrastructure and hence can normally only be economically justified in densely-populated urban regions. Civil engineering cost and time escalations are steadily reducing the range of viable applications for fixed rail systems, while energy and ecology constraints are similarly reducing viability and desirability of petroleum-fuelled bus operations in cities. The timely development and local availability of such non-polluting, energy-conserving, passenger-pleasing operationally flexible road-borne public transit equipment as the townobile battery, trolley and dual-mode battery-trolley coach systems may well fill the technological gap during the next 20 years for urban passenger transport. The systems and their applications are described and compared with other modes, and in particular their role in integrating all city transport modes is described. (TRRL)

11 310443 NEW CITY BUS FOR BETTER PUBLIC TRANSPORT [Ny stadsbuss foer bättre kollektivtrafik]. The aim has been to design a bus based on alternative solutions. In a fullscale model is presented how it is possible to make the improvements. Integrated body with air suspension on all wheels gives a floor level of 430 mm free of steps at exit and entrance. The total length of 9.50 M and a wheelbase of 5.05 M makes the bus light and easy handled. Rear entrance with a large platform allows quick embarkment; in connection with a ticket machine this will bring down the standing time at bus stops. In the research is found advantages in gas and trolley drive. Regenerative braking with flywheel or gas accumulation to store retardation energy brings down fuel costs. Hydrostatic drive on all wheels gives advantages such as low weight, retardation control and no bulky mechanical components under the floor. (TRRL) [Swedish]

11 310446 NON-POLLUTING CITY BUS IS WORKED BY BATTERY [Miljoevaenliga stadsbussar gaar paa batteri]. The battery bus is described concerning design of battery, energy consumption, costs, reach, weight, battery weight etc. Different kinds of batteries, like nickel/zinc, iron/nickel, lead, metal/air, are described. The battery bus can be produced in two ways, partly by reconstruction of diesel buses and trolleybuses and partly by new construction on terms of the electricity. The advantages of the battery bus compared with the diesel bus are less air pollution, longer life time and less noise. The costs are about the same. (TRRL) [Swedish]

11 311798 REAR ENGINES LEAD ARTIC BUS PROGRESS. The aim of developing an energy-efficient means of transporting passengers has attracted manufacturers to develop the 'pusher type' articulated bus. Examples of such vehicles produced by Leyland and associated company Dad A/S of Denmark, are being used in a full-scale evaluation project in South Yorkshire. Benefits of operating articulated buses include better staff utilisation during peak periods, lower cost per passenger and availability of more seats in off-peak hours. Compared with double-deck buses the articulated bus can cause problems at stopping places but has an advantage where headroom is limited. Alternative transmission layouts are discussed from designs by Daimler-Benz, Magirus-Dentz, Man, Berliet, Scania and Vetter. (TRRL)

11 314847 BUS BUILDERS HANG IN SUSPENDED INNOVATION. In 1967 the National Academy of Engineering recommended certain specifications for transit buses. In 1971, the Urban Mass Transportation Administration (UMTA) followed up those recommendations and subcontracted GMC, Flexible and AM General to build three buses apiece which would increase ridership with safer, quieter and cleaner buses. Features to help the elderly and handicapped would be incorporated. When the prototypes were delivered, they went through tours of U. S. cities and endurance tests. The Volpe administration of the Department of Transportation (DOT) then mandated Transbus, incorporating the best features of each manufacturer. But a few years later, under a new administration, UMTA scrapped the mandate and allowed the manufacturers to build interim buses called Advance Design Buses (ADB's). They were allowed because transit operators needed new buses and Transbus simply was not ready. Later administrative changes at DOT have resulted in new pressure for Transbus, which has been resisted by the manufacturers in various ways. Meanwhile, any city wanting to buy a transit bus (with UMTA funding 80% of the purchase) has a choice between two interim buses: GM's RTS II and Flexible's 870. These buses represent a marked departure from the construction techniques of their predecessors, and actually contain over 80% of the Transbus requirements. Detailed descriptions of the GMC RTS II and the Flexible 870 are given.

11 315202 THE VOEV BUS II-THE URBAN VEHICLE OF THE EIGHTIES [Der voev-bus II-das Stadtfahrzeug der Achtziger Jahre]. Hamburg consult, together with the association of public transport operators and the firm falckenried worked on the bus prototype voev-bus 2. The object was to introduce further improvements and avoid the drawbacks of voev-bus 1. Features of the new bus are: different seating arrangement, producing a vehicle which is 250 mm longer, smaller wheels due to the floor being lower, greater availability of seats, and improvements in doors and the driver's cab. The engine gives off less exhaust fumes and is encapsulated to reduce noise, and there is automatic transmission with a hydraulic retarder. The vehicle is simpler to produce, due in particular to the extensive use of adhesion techniques. (TRRL) [German]

11 316501 THE BERLIET TROLLEYBUS-TCO ER 100, SYMBOL OF RENEWAL [Les trolleybus berliet-tco er 100, symbole d'une renouveau]. The appearance of the New trolley-buses on the Lyon network at the same time as their introduction on a route which had hitherto been served by buses, provides a practical example of the change in orientation in favour of this mode of transport. The paper examines successively the reasons for this reversal, the principles which have guided the design of new equipment, the first results obtained and the future of the development of the trolleybus, firstly at Lyon and then in general. 11 318506 EFFECTS OF RECENT VEHICLE DESIGN CHANGES ON SAFETY PERFORMANCE, EXECUTIVE SUMMARY. Design changes in 1974-1977 model year passenger cars have been identified and a preliminary evaluation has been made of the safety effects of design changes inspired by fuel economy requirements. The 1977 General Motors full-size cars and the Volkswagen Rabbit were found to be the only significant design change vehicles. These vehicles do not demonstrate significantly higher risks of fatality in accidents than do other vehicles of similar weight or roominess. Little change is observed in the aggregate characteristics of the 1974-1977 vehicle fleets, although the effects of the 1977 General Motors downsizing are observable. Methodologies have been implemented for the identification of vehicle design changes, for the calculation of observed fatality rates by make and model, and for the projection of future fatality and injury experience based on perceived trends in vehicle design and sales. There are a number of recommendations for further investigation of the effects of vehicle design on safety and for extension of the work to include 1978 and 1979 model year cars, light trucks and vans.

11 318917 LIFE-CYCLE COST PROCUREMENT PROCEDURES FOR ADVANCED-DESIGN BUSES (DEVELOPMENT AND TEST APPLICATION). The report reflects UMTS's efforts to assist the grantees to comply with the DOT FY 1980 Appropriations Act requirement that contracts for the acquisition of rolling stock, including urban buses, and that be awarded only after consideration of performance, standardization, life-cycle costs, etc., in addition to initial capital costs. A key to this assistance is presented in this report, namely--a set of acceptable, workable life-cycle costing procedures and guidelines to be used by the bus manufacturers and the grantees in life-cycle procurements. The study develops the life-cycle cost tools, guidelines, and procedures applicable to the bus industry and to apply the principles of life-cycle costing to the real-life environment of Advanced Design Bus (ADB) purchases. Tests were conducted by two transit properties--Phoenix Transit Authority (Phoenix, Arizona), and the Regional Transportation authority (Chicago, Illinois). The parallel, nonbinding life-cycle cost procurements of ADB by the two transit operators demonstrated that life-cycle costing, when used as a procurement tool, is a viable alternative to the current low-bid acquisition of urban buses. The tests further showed that life-cycle cost procurement provides the grantees with the data necessary to make a more cost-effective purchase; it also provides the manufacturers an incentive to modify their bus designs to achieve better quality at a lower total cost of ownership.

11 319742 VAN FRAME STRUCTURAL EVALUATION. This paper describes the structural evaluation of a van production chassis frame, a light weight frame design and four other modified production frames. Static structural properties were determined by a combination of laboratory joint stiffness measurements and a finite element model incorporating empirical stiff-

ness values. The finite element analysis results are compared to laboratory frame bending and torsion measurements.

11 322652 A BUYER'S GUIDE TO BIG AND NOT SO BIG BUS-INESS. This paper offers suggestions and advice for purchasing transit vehicles. The following key issues should be addressed: the importance of matching the equipment selected to the requirements of the service for which it will be used; the importance of providing a fleet which will support the development of solid basic service before specialized equipment is added for diversifying the services; the importance of providing a strong positive image for transit through equipment selection; and the importance of balancing capital and operating costs. Four categories of transit buses according to size and need are listed: heavy duty full sized transit buses--Advanced Design 870's or RTS-II-s, "new look" buses, and a new 35 foot City Cruiser; heavy duty medium sized transit buses--City Cruiser, Bluebird; heavy small transit buses--Chance; and small body on truck chassis buses--Wayne Transette, Coach and Equipment. A 15 year capital cost comparison of the aforementioned buses is included--which list their length, capacity, unit purchase price, life expectancy, number of repurchases, and fifteen year capital cost. As an example, a discussion of the Citifare Transit System in Nevada--which is currently reviewing equipment options to meet the requirements of an expanded service plan--is also included in the paper.

11 323141 NOISE REDUCTION RETROFIT FOR A "NEW LOOK" FLEXIBLE TRANSIT BUS; SERVICE BULLETIN. This document presents instructions on how to apply a

noise treatment to a contemporary city transit bus without extensive structural alteration. Baseline bus configuration, noise ratings, and performance benchmarks are presented for a Flexible 111DC-D061 transit bus powered by a Detroit Diesel 8V-71N engine. The concepts and much of the hardware described in this report are transferable to similar buses. The information presented herein is of interest primarily to transit bus operators wanting to reduce noise by practical means, and to government agencies, manufacturers, and planners concerned with reducing the noise of buses in service at a moderate cost. In this report instructions are given on how to retrofit the engine with a turbocharger and ancillary hardware. Acoustic benefits and performance side-effects are given. One beneficial side-effect, because of turbocharging, is reduced harmful exhaust emissions. Another, because of smaller injectors and reduced exhaust back pressure, is fuel conservation. The instructions in this report are complete with sources for manufactured components and raw materials, and with mechanical drawings for components to be locally fabricated. Illustrations and text direct installation as well as effects of noise ratings and performance side-effects are also presented. In this report practical application is coupled with theoretical explanation throughout. (UMTA)

11 326944 THIRD INTERIM REPORT ON STATUS OF GAS TURBINE TRANSIT BUS DEMONSTRATION PROGRAM. Progress in a program for demonstrating the use of gas turbines in city buses is reported. Five prototype gas turbine engines, Model GT-40404, manufactured by the Detroit Diesel Allison Division of General Motors Corporation, are being inte-

grated into five RTS-II model transit coaches, manufactured by General Motors Corporation and supplied by the Mass Transit Administration (MTA) of Baltimore, Maryland. They will be acceptance tested at the Transportation Research Center proving grounds in Ohio, where one gas turbine coach will also be performance and mileage tested against a diesel RTS-II coach. The first diesel-to-turbine engine conversion is done. The second conversion is almost completed. The demonstration plan for the 5 gas turbine coaches has been finalized. (ERA citation 05:030836)

11 342501 EXPERIENCES WITH REMOVAL OF BARRIERS TO ELDERLY AND HANDICAPPED USE OF BUS TRANSIT AND RELATED HIGHWAY SERVICES. This study synthesizes prior research and findings concerning efforts to remove barriers to the elderly and handicapped in their use of bus transit. Special emphasis is placed on wheelchair-lift equipment on buses in urban transit, including implementation issues, operating problems, ridership response, cost and effectiveness. In a review of all barriers and experience with solutions, the point is made that, to date, accessibility for wheelchair-users has received by far the most attention in the transit community. The report recommends not only design improvements for wheelchair-lifts but also increased attention to other countermeasures, especially available features such as bus-kneeling, and to training of both operators and users.

12 051474 A STUDY OF LOW COST ALTERNATIVES TO INCREASE THE EFFECTIVENESS OF EXISTING TRANSPORTATION FACILITIES. VOLUME II. RESULTS OF CASE STUDIES AND ANALYSIS OF BUSWAY APPLICATION IN THE UNITED STATES. Volume II details the results of case study investigations and analyses of seven operating exclusive bus lanes. Three of the exclusive bus lanes operate as contraflow facilities on freeways, three as contraflow bus lanes on arterial streets, and one as a specially constructed bus lane. The study found that exclusive bus lanes were capable of processing large volumes of passengers often with substantial time savings over competing modes. Findings indicate that busways offer the potential for substantial gain in total capacity to move people. There is strong evidence that commuters are attracted to public transportation such as can be provided via an exclusive bus lane if travel time saving is achieved. Bus lanes can be made operable in a matter of weeks at a cost that can often be absorbed within operating budgets. A variety of technical, institutional and operating experiences associated with the various bus lanes now operational are detailed. In addition, the potential for bus lanes in five diverse urban environments is analyzed. Data are provided on Federal funding appropriate to establishing bus lanes.

12 072216 DISTINCTIVE MARKINGS AND REGISTRATION OF SERVICE VEHICLES TERMINALS AND BUS STATIONS [Otlíčitel'nye znaki i ofornimlie podvizhnogo sostava avtomobil'nogo transporta, ostanovochnykh punktov i avtobuchykh stantsii]. This standard applies to the distribution, content, and dimensions of the markings on rolling stock, terminals, and bus stations. This is GOST 18857-75. It contains charts which show the form and design of the markings, and a section on technical requirements which include language (i.e., both the national and the Russian languages must be used); material (e.g., plastic, plexiglass, galvanized steel, etc.); size of the letters, etc. The appendices indicate the distribution of signs on the autobus. This is followed by GOST 18858-73, which is concerned with stop signs for passenger transport vehicles. The section on distribution and content provides a description of stopping points (e.g., initial, inter, and final) in the city and inter-city transportation lines of both buses and taxis. There are charts to show the form and design of the markings. The technical requirements are concerned with the type of steel used for the markings, the colors, sizes of the letters, etc. The next standard is GOST 18859-73, which provides schematics and reference tables for bus stations. Again there are reference to the language and dimension variations. The appendix has a schematic for inter-city and suburban autobus lines. The final standard is GOST 18860-73, which pertains to the representation dimensions, and distribution of markings for light and route taxis. The technical requirements include mention of colors and the appendix provides examples of distribution of markings light and route taxis, including stencils, decals.

12 080307 CONTROL OF PAIRING OF VEHICLES ON A PUBLIC TRANSPORTATION ROUTE, TWO VEHICLES, ONE CONTROL POINT. If the time required for a vehicle (particularly buses or elevators) to load passengers is an increasing function of the number of passengers loaded, then, on a route served by more than one vehicle, the vehicles tend to form pairs. If a vehicle runs behind (ahead of) schedule, it typically will pick up more (less) passengers and get even further behind (ahead of) schedule. The following is concerned with a shuttle type of route having just two vehicles and serving passengers who arrive at a constant rate. There is one control point at which vehicles can be intentionally delayed. The object is to devise a strategy of control that will minimize the average waiting time of the passengers. The strategy must correct for random fluctuations in trip time so that the headways will not become sufficiently unequal as to initiate effects of pairing. An approximate solution of the optimization problem suggests that the optimal control involves sufficiently tight control that the pairing effect has little influence on the waiting times.

12 083079 LOS ANGELES PIONEERS EXCLUSIVE BUSWAY. The Southern California Rapid Transit District has constructed a grade-separated bus transit system extending 11 miles through the San Gabriel Valley corridor. This Busway has the potential for even greater passenger capacity since the lanes could be easily converted to rail rapid transit at a relatively minor cost as future patronage and environmental needs warrant. Southern Pacific right-of-way adjacent to a major freeway provided space for the Busway, and relocation and elevation of the railroad was a major part of the overall project. Five years of negotiations and cooperation between a multitude of agencies and government bodies preceded the construction.

12 083964 AFTERMATH OF THE EXCLUSIVE BUS LANE. The New Jersey I-495 exclusive bus lane (XBL) was the first and most successful contraflow freeway XBL. Its success sparked similar projects and greatly facilitated the other elements of Tri-state's Urban Corridor Demonstration Program. These non and low capital projects were set in perspective by a report on the status, plans, and programs for such projects throughout the Tri-State Region. This report was prepared as part of the National Transportation Study and drew considerable interest. Tri-State's XBL and other experiences with non and low capital alternatives proved very helpful during the early part of 1974. As part of the response to the energy crisis, an Energy Saving Transportation Plan was prepared by Tri-State with participation by county, city, state, federal, public authority, and transit personnel in meetings held throughout the Region on two way, closed circuit television. The plan contains transit, highway, and job site incentives as well as a financing/pricing element. Highway incentives include (on freeways) exclusive bus lanes, priority roadways (no single occupant autos), priority lanes (buses and carpools), and a elimination of bus restrictions, rationalized and priority tolls for bridges and tunnels, increased fringe parking, and bicycle lanes for streets throughout the Region. Financing, to be confined to the transport sector, would include changes (both increases and decreases) to bridge and tunnel tolls, changes in Manhattan CBD parking charges and taxes, a 10 percent additional gasoline tax increasing at one percent annually to be spent in the county in which collected, and a graduated annual registration fee to discourage purchase of oversize cars. Beyond the one-time efforts of the bus lane and these other projects, several continuing changes are underway. Non and low capital alternatives are now a regular part of Tri-State's annual work programs. Applications for federal-aid (highway and transit) will increasingly have to demonstrate the need for capital projects, why low capital approaches would be inadequate. Energy and air quality will be just two of several assessments made of all plans. /Author/

Horn, M *Institute of Traffic Engineers, Proceedings* No. 44, Sept. 1974, pp 130-144, 6 Fig., 21 Tab.

12 084750 A ROUTE COST MODEL FOR BUS. In this report, a cost model is developed for calculating total variable cost, by route, for a bus system. The model is designed to predict the total variable cost, by route, as a function of three variables: (1) vehicles; (2) vehicle-miles; and (3) operation days. The financial statements of the system under study are analyzed and the various costs are allocated to the variable with which they vary. The purpose of the model is to provide transit managers and transportation planners with a more rational framework for comparison of costs of alternative plans or operating policies than is being used at present. Also, the model will provide for the calculation of marginal cost fares, by route. The type of pricing will, according to the authors, insure that the transit company covers its costs at any particular level of service. /UMTA/

Talvitte, A Neal, A ; Oklahoma University, National Highway Traffic Safety Administration, (OK-11-0016) UMTA-OK-11-0016-74-1, Nov. 1974, 39 pp; Sponsored by Urban Mass Transportation Administration.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-239833/AS

12 090022 A COMPARISON OF THE DUAL MODE TRANSIT SYSTEM AND VARIOUS OTHER TRANSIT BUS OPTIONS. The annual costs and level of service of a Dual Mode Transit System (DMTS) are compared with those of Exclusive Busway Bus (EBB), Exclusive Busway Bus with Small Bus Feeder (EBB/SBF), Expressway Bus (EB), and Conventional Bus (CB) systems. Large and small-bus versions are studied. The systems, defined for Milwaukee in 1990, all provide the same capacity and routes. UMTA Milwaukee Dual Mode Study baseline data are used. Trip time and transfer characteristics are used as measures of level of service. Construction of busways and creation of reserved lanes increase vehicle speed that, in turn, increases driver/vehicle productivity and decreases travel time. The use of small buses allows for shorter headways, more privacy, and demand-responsive service. But small-bus operations are not economical unless automated operations are used. Transfers may have an unacceptable effect on EBB/SBF ridership.

Lieb, JG ; Mitre Corporation, Urban Mass Transportation Administration Final Rpt. MTR-6697, June 1974, 126p; Contract DOT-UT-10028; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-238038/4ST

12 090512 THE SHIRLEY HIGHWAY EXPRESS-BUS-ON-FREEWAY DEMONSTRATION PROJECT/A STUDY OF REVERSE COMMUTE SERVICE. Bus-on-freeway operations generally provide peak period commuter transit service to persons traveling from suburban residences through congested corridors to jobs in the major employment centers of metropolitan areas. In a few cases, peak period reverse commute operations may provide service to persons traveling from residences near the downtown employment centers to jobs in the suburbs. In early 1973, two major Shirley Highway Ex-

press-Bus-on-Freeway Demonstration Project reverse commute routes began service to office buildings in Northern Virginia. An analysis of this reverse commute service revealed that it was a successful operation because it provided considerable benefits to its patrons and was slightly profitable to the bus operator on an incremental cost basis.

12 092352 CRANSTON TRANSVAN. This is the final report of the Cranston TRANSVAN, a demonstration program of low-cost, demand-responsive transportation for the elderly and the handicapped of Cranston, Rhode Island, a suburban community of over 75,000 population. This report covers activities from Sept. '72 through Dec. '74. TRANSVAN'S unique and innovative scheduling provides a combination of services to maximize the utilization of the systems 3 buses to best serve subscriber demands. Fixed and flexible routes, variable fixed schedule and dial-a-ride, all door-to-door and on demand, operate in concert. Transportation services offered have been: Mon. through Fri., personal trips for medical services, grocery and retail shopping, senior club meetings, personal business, and charters and connections; Sat. group recreational trips; and Fri. evening and Sun. worship service. This report presents a picture of the project in terms of planning, organization and operation and includes data, maps and statistics. Drawings and pictures of the 19-passenger buses as redesigned for the program are included. One of the three buses has a special elevator to allow easy access for passengers in wheelchairs.

12 094040 POTENTIAL FOR FLEXICAB SERVICES: INNOVATIVE USES OF TAXIS AND JITNEYS FOR PUBLIC TRANSPORTATION. Taxis and jitneys can be significant urban transportation resource. Used innovatively to provide public transit services, they can offer mobility in low density areas where mass transit is not feasible, supplement mass transit economically to improve the overall level of service, promote ridership of regional rapid rail and commuter rail systems and express bus services to reduce the use of private vehicles. The term flexicab has been coined to refer to the range of demand-responsive and fixed-route services that can be offered as extensions of existing taxi/jitney operations. The taxi industry, with its experience in small vehicles, dispatching and flexible routing is particularly suited to flexicab operations. Opportunities for profit exist, particularly when several types of flexicab services are offered by the same operator, permitting him to make maximum use of his labor force and equipment. Three examples of multi-service flexicab systems are presented in the form of scenarios set in hypothetical urban areas (small, medium, and large). The examples include the calculation of revenues, operating costs, and net earnings. The report also reviews the present status of the taxi and jitney industry and makes policy and research recommendations. A bibliography and a list of contacts are included in appendixes.

12 094181 VOLVO B-58 ARTICULATED BUS DEMONSTRATION SURVEY RESULTS. The document is a tabulation and summary of questionnaires given to 1235 riders, 51 transit drivers and 8 transit maintenance personnel in the six west coast cities that participated in the 1974 demonstration of a Volvo three-axle articulated motor bus from Stockholm Transit. The bus was leased by the Municipality of Metropolitan Seattle, (METRO), demonstrated in Seattle, and was then demonstrated by B.C. Hydro, Vancouver, British Columbia; AC Transit, Oakland, Golden Gate Transit, San Rafael; Southern California Rapid Transit District, Los Angeles; and San

Diego Transit. The questionnaires for riders were directed at their evaluation of the characteristics of the bus, their transportation habits and their demographic characteristics. Bus drivers were asked their reaction to the features on this bus and its driving characteristics. Maintenance supervisors were asked their comments on servicing this bus compared to standard transit buses and the use of present shops for the longer articulated bus. Overall, the report concludes that the European articulated bus, with some modifications, should perform well in U.S. and Canadian transit service.

12 095301 BUS RAPID TRANSIT OPTIONS FOR DENSELY DEVELOPED AREAS. This report describes and evaluates alternative bus rapid transit systems in densely developed urban areas. It reviews the state-of-the-art, identifies significant options and technologies, and assesses their cost, service, and community impacts. It is intended as a guide for community leaders and transportation planners interested in providing fast, reliable metropolitan bus rapid transit service. Bus rapid transit is feasible from operational, capacity and environmental points of view. Service can be provided on-street where land-use and traffic conditions permit. Contra-flow curb bus lanes on one-way streets, or lanes in the median of a wide street, are more effective than reserved curb lanes in the normal traffic flow direction. The bus-only street, where it can be implemented, is the most effective surface rapid transit option. Bus subways are technically feasible and should be developed where on-street service cannot provide the desired schedule reliability and the needed capacity to attract passengers.

12 096832 THE MODELLING OF BUS JOURNEY TIMES FOR AREA TRAFFIC CONTROL. TRANSYT 5, the latest version of the TRRL's program for designing the offsets between traffic signals in an area control system, allows for buses to be considered as a separate network. This is an important development in the light of world oil prices and the current desire to assist public transport in town centres. The model used for bus movement between signals is a modification of that used previously for general traffic, but, as buses are fewer in number and less predictable, the authors felt the need for further examination. Data on bus flow were obtained from a number of sites in Manchester, the model tested and some suggestions made for improvement. (A) /TRRL/

12 097476 BUS PRIORITY IN INNER LONDON 1. COMPARISON OF ALTERNATIVE BUS PRIORITY STRATEGIES. This article reports an exercise to determine the best way of deploying bus priority measures in inner London. A computer model is used to predict the effects of three types of bus priority measure: bus lanes (short lanes at points of delay and a network of continuous lanes); a restricting cordon controlling the volume of non-bus traffic entering the central area; a series of bus-and taxi-only streets. The methods are evaluated in terms of the costs and benefits to bus passengers and other road users. The concluding section discusses some of the assumptions of the model and further considers the advantages and disadvantages of the measures. It is pointed out that the cost effectiveness of all the measures would be enhanced by improvements to the bus services. /TRRL/

Buchanan, CM Coombe, RD Hewing, RB (Greater London Council) *Traffic Engineering and Control* Vol. 15 No. 10/1, Feb. 1974, pp 480-486, 5 Fig., 2 Tab., 4 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 211605)

12 097853 STANDARD CODING OF VEHICLE INFORMATION [Standaardcodering van Voertuiginformatie]. Vehicle identification can be by means of selective vehicle detection. Efficient processing of information demands a uniform framework for coding. The article deals with the application of a vehicle identification system, an analysis of the information needed, information sources and demands for use. Attention is paid to the organizational structure with regard to the application and current technical possibilities and restrictions. Finally a standard code is given. /TRRL/ [Dutch]

12 099742 TELECOMMUNICATION AND TRANSPORTATION. Automatic vehicle monitoring (AVM) and its application to municipal mass transit, taxis, trains, and general highway systems is briefly discussed. This technically feasible (although expensive) system with great potential social benefits is designed to determine on a periodic basis and without human intervention, the location and status of every vehicle in the system. Random environmental and human factors can cause change in planned headways in urban bus operations. An AVM system with its frequent automatic interrogations and updates could adjust routes and schedules in real time to compensate for unpredictable variations. The system also permits the accumulation of data such as mileage, fuel consumption, and travel time for off-line analysis. Based on a 100-bus fleet, it has been estimated that the annual benefits achievable through improved scheduling and reduced manpower and fleet costs amount to about \$1333 per vehicle. An AVM system that makes use of radio-location technique could function most effectively with police car fleets. An AVM system that offers moderate accuracy for locating vehicles can improve the service, efficiency and revenue of taxi fleets. Taxi dispatching services could be considerably improved by com-

puterized systems. A variety of techniques are being developed to meet the needs of train communications; the techniques range from inductive track circuits to radiating transmission lines and may have the potential for on-board public address systems and passenger telephone service. The benefits derived from an AVM system will depend in large measure, on the information that can be acquired and the manner in which it is processed and used.

Kodis, RD (Transportation Systems Center) *American Society for Information Science, Bulletin* Vol. 2 No. 1, June 1975, 3 pp

12 126151 DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS & SERVICES. INTRODUCTION. Significant, unresolved issues which will impact the future of demand-responsive transportation (DRT) are the focus of this International Conference on Demand-Responsive Transportation Systems. The integration of demand-responsive and fixed route services is of utmost importance in large metropolitan areas. Some area-wide approaches are being implemented in Ann Arbor, Rochester, Orange County, Toronto and other areas. The question of whether door-to-door service for the elderly and handicapped should be combined with the more general service was addressed, and the role of computers in automated dispatching systems was discussed. The conference also addressed the role of taxicab companies in DRT operations as well as the more general issues of taxicabs companies. The Committee on (Urban Transport Service Innovations) paratransit, which organized this conference, recognizes that DRT involves many different groups (transit, taxi, labor, government) who must cooperate with each other and coordinate their work. The Committee recognizes that several unresolved issues such as ride-sharing, vehicle design and institutional problems are common to the different paratransit concepts. It is also recognized that a successful urban transportation system should consist of integrated paratransit and transit services rather than independent uncoordinated services.

Roos, D (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 1-2; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126153 STATE OF THE ART OF DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 2. Demand-responsive transportation (DRT) provides effective suburban services which should be an integral part of metropolitan transit systems and closely coordinated with fixed-route, line-haul services. Operating economics will be realized by such a comprehensive service. Integrating DRT service into a larger system provides management flexibility. Fixed-route drivers can be used on DRT vehicles in off-peak hours to reduce total system costs. DRT service has been effective in raising local funds for transit operations. Origin-destination data collected as a by-product of DRT operations, particularly computer based operations, can contribute to a better

use of vehicles and drivers in both types of services. Such data, which is useful in transit planning, can replace information now collected in surveys. A diversity of DRT scheduling methods have been identified and studies are now in progress to determine the best combination of scheduling methods under a variety of operating circumstances.

Ziegler, EW (Urban Mass Transportation Administration) *Transportation Research Board Special Reports Conf Paper No. 154, 1975, pp 5-7*

Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126154 STATE OF THE ART OF DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 3.

The clarification of the overall role of the taxi industry in the urban transportation system is identified as the major issue facing the industry today. Taxis are a major element in the urban transportation system; they serve more than 3,400 communities. Taxicabs carry more than 27 percent of the urban public transportation market. The taxi is considered the most flexible and efficient for demand-responsive service and shared use of the taxi in coordination with buses is the best short-range solution to urban transportation problems. It could also be the best long-range solution provided it continues to offer flexibility at favorable overall cost. The need for a flexible public passenger transportation system and the coincidental responsibility of making capital grants and fare subsidies is recognized. The need is indicated for subsidies and for monies to fulfill the need for equipment replacement, research and design of vehicles, and automatic identification-dispatch systems that would increase productivity 20 to 30 percent. The whole area of taxi regulation needs to be examined by the industry and government. There is a need for subsidized rides. A change of legal status is also necessary if the industry is to receive help on a continuing basis from local or federal sources. It is proposed that the taxicab industry and UMTA open discussion on eligibility for grants and the subsidization of particular groups of riders. The discussions should initially center on 4 areas: finance; service standards; entry into the industry and exit of the market; and equitable and consistent rate-making policies.

Boynton, C (Salt Lake City Taxicab Association) *Transportation Research Board Special Reports Conf Paper No. 154, 1975, pp 7-13*; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126155 PLANNING FOR NEW AND INTEGRATED DEMAND-RESPONSIVE SYSTEMS. SPEAKER 1.

North American data are presented that indicate a small but rapidly grow-

ing market for demand-responsive transportation (DRT). Systems are proliferating at the rate of 2 to 3 per month and indications are that it will continue. It is shown that except for taxi operations, fleets usually have fewer than 10 vehicles and fares are typically 50 cents or lower. The size of area served by DRT is usually smaller than 13 sq. miles. The DRT services implemented to date differ from each other in 3 ways: technical design of the system; markets served by the service; and funding sources for the service. Tailoring the service offered to the market served is the most important consideration in implementing successful DRT services. The commuter market is a major market; DRT services have sometimes been substituted for unprofitable fixed routes, and sometimes serve as feeders to rail rapid systems. It is noted that commuting patterns have been changing during the past decade. Groups with special mobility needs (elderly, handicapped, and the economically disadvantaged) is a second market. Patrons needing local transportation within a particular area are a third market. A recent survey revealed that of 22 reporting systems, all but 3 required subsidy. Of more than 49 operating services, more than half were funded from a single source. Among the range of options for funding DRT services are: local taxes; fares; receipts from package delivery and sale of marketing space; federal subsidies (in Canada); and UMTA grants. In an effort to disseminate basic information to planners and operators, DOT has devised a method to synthesize the substantial array of available literature on DRT services into a state-of-the-art document and to validate the document (prior to its dissemination) at a workshop where experts and local transit operators and planners would comment on the accuracy and relevancy of the material.

O'Leary, K (Department of Transportation) *Transportation Research Board Special Reports Conf Paper No. 154, 1975, pp 14-20, 6 Fig., 2 Tab., 3 Ref.*; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126156 PLANNING FOR NEW AND INTEGRATED DEMAND-RESPONSIVE SYSTEMS. SPEAKER 2.

Key elements of demand-responsive transportation (DRT) planning are discussed and common pitfalls are identified. Three fundamental items are necessary for the achievement of comprehensive DRT planning: (1) work statements which define the scope of each task to accomplish program objectives; (2) schedules of tasks laid out chronologically in logical sequence of events presented in the form of a bar chart or as a task interrelationship network; (3) budgets containing costs (or applications of funds) to accomplish the tasks-the status of each task is indicated by the relation of funds or person-hours expended to data versus those budgeted. For effective implementation control certain other key elements must be incorporated such as the arrangement of plans to fall into natural phases. Also, resources that must be considered include personnel, sources of funding, facilities and equipment, management, and intan-

gibles such as political support. Contingency plans should be prepared for each element of the plan, and the program should be controlled on the basis of work accomplished, costs incurred, and schedule. Estimates of ridership are important in planning and a sector model has recently been developed. Recently developed supply models are outlined, and economic planning, the required level of technology, and operator selection and personnel are briefly reviewed. Contingency planning must cover aspects such as legal issues arising from competition with other forms of transportation, modifications that must be made to standard equipment, the startup overload, radio license, critical paths in DR schedules (vehicles and radios), and the choosing of the mix of services (many-to-many, may-to-one, subscription, parcel delivery etc.).

Wilson, RJ Simpson, AU (DAVE Systems, Incorporated) *Transportation Research Board Special Reports Conf Paper No. 154, 1975, pp 20-27, 3 Fig., 3 Ref.*; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126159 IMPLEMENTATION AND OPERATION OF NEW DEMAND-RESPONSIVE SERVICES. SPEAKER 1.

The major steps in the process of starting a demand-responsive transportation (DRT) system are highlighted and the problems and potentials of such a system are reviewed. The initial step in DRT planning is the identification of the needs of the area for which it is considered, followed by planning to accommodate those needs. Demographic and geographic characteristics, peak demand, and seasonal variations are some of the factors to be considered. An overall evaluation of land use is also essential. Determination of the financial plan will be the second step. Modifications to fit available funding, and the need for subsidies must be considered. The marketing and advertising of the service is important and money invested in this area will be returned with dividends. Employees can either make or break a DRT operation and care must be expended in the selection and training of personnel. The importance is emphasized of equipment selection and maintenance planning. Vehicle selection must be based on the requirements of the service and the ability of the operator to purchase and to maintain the equipment. In high-demand areas, digital communication may be necessary to minimize air time. Sound accounting and reporting procedures must be developed to prevent losses and to monitor system efficiency. Computer control must be avoided unless it is needed. If a computer is needed, evolution of the system from a manual system is advised. Fast expansion must be avoided. Initial sources of a small system may lead to over extension of the service. Needs must be identified, opportunities for service must be inventoried, potential markets surveyed, funding capabilities evaluated, and financial sources found before actual expansion. Operators may be contracted to operate the system. Professional help may be needed to achieve the DRT planning, implementation and operation objectives.

Shilling, DR (Orange County Transit District, California) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 33-39, 6 Ref.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126160 IMPLEMENTATION AND OPERATION OF NEW DEMAND-RESPONSIVE SERVICES. SPEAKER 2. The essential features of demand-responsive transportation (DRT) are reviewed. The first step in implementing a DRT system is to establish goals and objectives. Goals should be specific and objectives should be set to measure goal achievement. Program management is extremely important, and the program manager should be at a high level in the organization, able to make decisions and able to report directly to the transit agency, community, city council or the mayor. Planning design must be considered a part of system design which also includes determination of hours of service, fare collection methods, type of control system, location of the control center, and areas of high ridership potential. Point-to-point travel times must be determined. Topographic features (hilliness) and accessibility will determine the level of service (design of the system and number of vehicles). Funding sources should be explored before a DRT service is started. Capital costs of most DRT systems are covered by matching grants. Local business managers, taxi operators and private transit operators should be included in discussions of DRT from the outset. Public support must be maintained during the laps between the time the decision is made and the time the DRT system begins service. During the implementation phase, marketing and sales promotion are important. Also during this phase, phase control procedures must be carried out and control personnel selected and trained. Spatial perception tests are useful in the selection of employees.

Helsing, RG (LEX Systems, Incorporated) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 39-41; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126161 IMPLEMENTATION AND OPERATION OF NEW DEMAND-RESPONSIVE SERVICES. SPEAKER 3. Various ways of obtaining federal money for use in implementing a demand-responsive transportation (DRT) system are briefly reviewed. Eligible communities may obtain 80 percent of the funds for all capital equipment and facilities from the capital grants program of the Urban Mass Transportation Administration (UMTA). Funds for capital equipment may also be obtained from the Highway Trust Fund from monies allocated for the Interstate Highway System-if the community decides it no longer wants the Interstate High-

way. Communities may borrow capital funds from the Mass Transit Assistance Act (1974) for use as operating funds. Applications to the UMTA involve submission of a preapplication briefly describing the program and the money needed. If this is successful, a more detailed application is made. UMTA must also be given a 5-year financial plan that includes a 5-year capital improvement program. An environmental impact statement must also accompany the grant application. Before submission of the application, however, a public hearing must be held 30 days after posting a notice of the hearing. A copy of the preapplication is sent to the U.S. Department of Labor, since the UMTA cannot grant money to a community in which those funds would adversely affect labor.

Zobrak, M (DAVE Systems, Incorporated) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, p 41; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126162 IMPLEMENTATION AND OPERATION OF NEW DEMAND-RESPONSIVE SERVICES. SPEAKER 4. The transportation agencies of the states of Michigan, Oregon, Wisconsin and Florida are the most involved in demand-responsive transportation (DRT) and active in aiding local communities or transit district with planning, guidance and funding. New Jersey has funded the Haddonfield project, and California has made available funds (from sales tax on gasoline) through the Transportation Development Act (1971) as local option money. The California Division of Mass Transportation provides technical service and identifies the potential for new services after the local decision-making body has established evidence of interest in a public transportation program. California also provides assistance in marketing, information systems, equipment specifications and special services in areas where DRT already exists. The Santa Clara County DRT project which has 325 Program funding (Transportation Development Act of 1971) is noteworthy.

Gray, G (California Department of Transportation) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, p 42; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126163 IMPLEMENTATION AND OPERATION OF NEW DEMAND-RESPONSIVE SERVICES. SPEAKER 5. The demand-responsive transportation (DRT) service in La Mirada, California is briefly discussed, and certain unique qualities are noted. The system which was marketed not as just transit but an innovative service in a progressive city, was found to have been

oversold prior to start of operations. The system anticipated carrying 50,000 passengers per year, but found that it carried 110,000 during the first year. The system has since been reevaluated and its philosophy is changed. The DRT system has been used as a patrol system and operator reports are a worthwhile service to the community. Public Services such as charter service, free rides to the swimming pool and contacts with shopping center are also offered. A radio communication system and a sophisticated FM paging system are other features of the DRT Service. This DRT Service has contributed considerably to the community image.

Klug, CJ (La Mirada, City of, California) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 42-43; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126164 IMPLEMENTATION AND OPERATION OF NEW DEMAND-RESPONSIVE SERVICES. SPEAKER 6. Comments are made which are based on personal experience and the experience of personnel in the supervision of demand-responsive services. Communication is effected via telephone (by the patron) and radio (between vehicles and the communication center, and possible between vehicles). The telephone equipment must be simple at the start. Sophisticated Automatic Call Distribution System may be used with expansion. Call counters on the lines to indicate incoming flow was found to be useful, as was also the linear recording device to show when the call was answered. A tape system to record all incoming calls and all radio conversations helps eliminate problems between dispatcher and driver, and provides a tool for analyzing and responding to complaints. Radio equipment must also be simple. If DRT is operated by a municipality or transit district, cooperation from the FCC is better if the radio frequency used is from the public safety or transit bus frequency blocks. If a private operator is to operate the system, the use of assigned taxicab frequencies will expediate the initiation of the service. Publicity prior to inauguration of a service is important.

Davidson, JH (Yellow Cab Company) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 43-44; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126165 IMPLEMENTATION AND OPERATION OF INTEGRATED TRANSIT SERVICES. SPEAKER 1. The significant aspects of a short range plan in Orange County, California are reviewed, the preliminary system design is outlined, and the implementation is detailed of a demand-responsive transportation (DRT) in Orange County, California. Initially, 27 feasible

DRT service areas were defined (the criteria are listed), followed by screening the 27 manually controlled areas to determine those most in need of additional service. In the third stage, five criteria were used to rank the candidate areas according to the need for and effectiveness of public transportation. The system design involved establishment of a DRT fare by 50 cents, establishment of service hours the integration of DRT with existing fixed-route services, and the encouragement of commuter services between and within service areas. The preliminary implementation schedule consists of 3 phases; expansion in selected areas, automation, and countrywide expansion. The process, however, requires several projects from designing equipment specifications to locating sites for the storage of vehicles and fuel. Specifications were drawn up covering vehicles, communications equipment, fare boxes, tow trucks, service trucks etc. The system will initially use 2 mountain-top UHF base stations, 1 centrally located UHF base station, 3 microwave terminals and 1 microwave repeater. Each city involved in the expansion program has been asked to contribute 1/3 of the operating deficit of the system operating in the city. Four or more operators will operate the 8 service areas. A common computerized area will be used to avoid duplication of control room space and personnel. A personnel training program is planned which will consist of an aptitude and general intelligence test. An evaluation program is planned which will consist of a monthly overview of each operation and detailed analysis of a day's operation. A management review will take place monthly. A promotional campaign (which avoids overselling) is planned.

Fielding, GJ Grant, SB (Orange County Transit District, California) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 48-55, 2 Fig., 3 Tab., 1 Ref.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126166 IMPLEMENTATION AND OPERATION OF INTEGRATED TRANSIT SERVICES. SPEAKER 2. The major control functions (of considerable importance to integrated demand-responsive transportation (DRT) and conventional transit systems) are reviewed, and alternatives being implemented or are realistic possibilities for the future are presented. Control functions are composed of information transfer (related to service requests and vehicle activities), and decision-making (related to operation of DRT vehicles) functions. The service request option for the customer is the telephone system. For integrated systems, another option is receiving the request from the driver of a fixed-route bus (establishing direct communication between the control center and the driver of any route interfacing with DRT). Although the majority of DRT operations now use voice communication for driver instructions, digital communication will become the usual option for large integrated systems. In the Santa Clara integrated DRT and fixed-route system, digital

communications will be used in conjunction with mobile displays and an automatic interface with a computer used for dispatching. Information for driver progress from the driver to dispatcher may be digital or voice communication system. The decision process in integrated DRT and conventional systems can be divided into 3 functional categories: (1) control of simple DRT-the basic issues of a desirable control system are manual or automatic decision making, extent of future planning and commitment, and decentralization of decision making; (2) control of the conventional system; (3) control of transfer trips-the best issues for analyzing this function are (a) the extent of information pertinent to one subsystem, and (b) the extent of dependence of one subsystem on another.

Wilson, NHM Higonnet, BT (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 55-60; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126169 EQUIPMENT AND MAINTENANCE OF DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. SPEAKER 1. When the Ottawa Transportation Commission converted (1958) from streetcars, trolley coaches and buses to an all-bus operation, specifications were prepared and tenders were requested for 107 buses. The tenders received were evaluated on the basis of initial cost, availability (downtime), reliability (road calls), and operating and maintenance cost. Bus appearance, comfort, driver and passenger appeal, service and delivery were considered as important intangibles. Data, conditions and circumstances that had to be satisfied by acceptable tenders are listed and 3 fictitious tenders are used as illustrative examples. All tenders must be analyzed to consider what has been included or excluded in the buses offered, and the initial cost adjusted accordingly. The calculation of availability and road calls is described. The calculation of availability and road calls is described. In the calculation of maintenance costs, the standard procedure was to plot the maintenance cost of buses in cents per mile against the number of years in operation. The plot falls on a straight line which increases at the rate of 1.2 cents/mile/year. This represents the maintenance cost standard for own property and the bus that has been standardized on. Project cost curves are illustrated and the establishment of relative costs is explained.

Chaput, H (Ottawa-Carleton Regional Transit Commission, Can) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 69-75, 3 Fig., 1 Tab.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126170 EQUIPMENT AND MAINTENANCE OF DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. SPEAKER 2. The criteria developed for the selection of demand-responsive transportation (DRT) vehicles, the minibuses that were bought, the innovative design features and the mechanical problems that were encountered are briefly described. The minibus had low steps, was sturdy, and ecologically acceptable (it had a dual fuel system which used natural gas as the regular fuel and gasoline as a backup fuel). The minibus had disc brakes which were an improvement over the standard drum brakes. Innovative features included an exit door at the extreme rear of the right cantilever, perimeter fiber glass seats, no seat legs in the aisle area, removal of tripping hazards, and storage area under the seats. Some of the mechanical problems (short life of brake linings) were the result of crowding 50 people into a 21-seat bus (at noon). Problems were also encountered with the dual fuel engine; stalling, low fuel mileage overheating and radiator troubles were frequent. A preventive maintenance program has been developed: lubricating, oil change, and normal fluid collection and engine check are done every 3,000 miles, and major inspection is performed every 6,000 miles. Specifications have now been developed which provide for substantially larger, heavy duty brake systems and fuel systems for propane gas or other nonfossil fuels.

Heinle, GW (Southern California Rapid Transit District) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 75-76; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126171 EQUIPMENT AND MAINTENANCE OF DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. SPEAKER 3. Experience in vehicle operation and maintenance in the demand-responsive transportation (DRT) system in Batavia, New York is briefly described. The system uses four 23-passenger Flexible Flexettes, and one 10-passenger Ford Courier each of which travel 600 miles per week during the busy season and totals 23,000 miles per year. The operation's preventive maintenance program requires a maintenance check every 1,000 miles. The cost of maintenance (including interior and exterior washing) for a total of 76,383 miles was 10.6 cents/mile. Maintenance costs and an analysis of maintenance and repair jobs are tabulated. Heavy and frequent use of brakes in DRT service cause excessive wear, and break adjustments, relining etc., have contributed significantly to vehicle downtime. Brakes must be relined every 5,000 miles and brake drums replaced each 10,000 miles. Valve failure is the principal weakness in the automobile type of gasoline engines used in most of the small vehicles. DRT service also requires a better system for the cooling of the transmission oil. The recommendation has been made for a replacement program that calls for new vehicles after 75,000 miles or 3 years of service. The program establishes the life of the body as 6 years, and the bodies are remounted on new chassis.

Aex, RP (Rochester-Genesee Regional Transportation Auth) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 77-78, 2 Tab.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

12 126172 EQUIPMENT AND MAINTENANCE OF DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. SPEAKER 4. The maintenance and operating costs of 3 fleets of buses is briefly discussed and the efforts towards development of specifications for small buses is outlined. The total maintenance cost is 34.71 cents/mile for the fleet of small vehicles, 7.54 cents/mile for the 1968 fleet of large 40-ft. diesel-powered vehicles, and 4.23 cents/mile for the fleet of full-sized 1972 vehicles. A Small Bus Specification Subcommittee was formed which consulted with manufacturers in the development of specifications. The response from people interested in these specifications has been encouraging. The evaluation of bus bids on the basis of more than low price, will provide the incentive to bus manufacturers to provide competitive, high-quality, reliable, small buses for the market.

Schnell, JB (American Public Transit Association) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 78-79; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. 12 126190 EVALUATING DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. PANEL DISCUSSION. In the panel discussion following the presentation of papers on the evaluation of demand-responsive transportation (DRT) systems, comments were invited on the evaluation process. Experience in Washington, D.C. leads one to the view that for the same fixed of dollars, it is possible to provide a much higher level of service by making adjustment in the mix of the service. In the evaluation of DRT as a mode in comparison to other modes, factors considered are the incremental costs of ridership productivity of one mode against another mode under the same circumstances. Taxicabs are identified as a form of DRT and the comment is made that in the industry, measurement is made on a vehicle-per-mile basis whereas most discussions at the conference centered on a vehicle-per-hour measurements. The need is also indicated for a vehicle designed for the handicapped, elderly and children. The importance is emphasized of the study and discussion of DRT system failures as an aid to the better understanding of these systems. It is noted that the study of other transit modes is important as a means to determine under what conditions DRT is an effective strategy. DRT is seen as a means of transportation uniquely suited to the aged, the handicapped, and the young.

Transportation Research Board Special Reports Conf Paper No. 154, 1975, pp 153-156 Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off

12 126857 THE SUCCESS OF THE EL MONTE-LOS ANGELES BUSWAY. The success of this Southern California rapid transit line is considered to prove that involved public agencies can come together to accomplish major transportation improvements, and that given a decent alternative choice, the public will ride public transit. The objectives and development are outlined of the 11-mile busway which cost \$56 million to build. The fan-shaped bus routing system is described, and marketing goals and busway patronage aspects are noted.

McDonald, GL (Southern California Rapid Transit District) *Transit Journal* Vol. 1 No. 3, Aug. 1975, pp 39-44, 1 Fig.

12 129345 EVALUATION OF A NATIONAL EXPERIMENT IN BUS RAPID TRANSIT. An extensive evaluation is being performed of a bus rapid transit system in Los Angeles that uses exclusive bus lanes in the median strip of a freeway. This national experiment is currently quite successful. Operational feasibility has been demonstrated, and the number of busway system riders has continuously grown over the first 18 months of operation even though the facility is only partially operational. The new riders are former automobile users, and their socioeconomic profiles are more similar to automobile commuters than to bus commuters. Assuming that car occupancy is only 1.3 persons/vehicle, the busway system has at least a tenfold greater capacity (per traffic lane) than the highway system. However, the busway lanes during peak periods currently carry only about half of the person trips that are carried by a freeway lane but are catching up fast. The principal causes for travelers switching from automobile to busway commuting, based on survey results, are to save travel time and to avoid the frustration of the stop-and-go characteristics of a congested freeway.

Crain, JL (Bigelow-Crain Associates) *Transportation Research Record* No. 546, 1975, pp 22-29, 5 Fig., 2 Tab.; ORDER FROM: TRB Publications Off, Orig. PC

12 129371 A TEMPORARY CARPOOL LANE. Carpool use of an exclusive bus lane during a 10-week strike at the Southern California Rapid Transit District, provided the opportunity to study the effect on traffic of carpool use of the lane, and to compare the fuel efficiency between carpool and bus operation on the lane. Comparison of travel times on the special lane with travel times on the mainline freeway showed that carpools were saving up to 20 to 30 minutes one way. The busway lane enabled carpools to bypass several bottleneck locations and considerable congestion. Opening the busway to carpools caused an improvement in travel time of about six minutes in the regular freeway lanes. Using a figure of 5 miles per gallon and an average of 34

passengers, a fuel efficiency of 85 passenger miles per gallon was computed for buses. Using an average fuel economy of 13 miles per gallon and average occupancy of 3.3, the fuel efficiency of carpools is 44 passenger miles per gallon.

12 129498 RAPID BUSWAYS: A CHRONOLOGICAL BIBLIOGRAPHY. This bibliography contains more than one hundred references on rapid busways. They date from 1967 to 1975. Included are such topics as demonstration projects, exclusive bus lanes, feasibility studies, freeway priority system operation, impact on traffic congestion, environmental impact on traffic signs, costs, planning and design guidelines, and contraflow bus lanes.

Starbuck, JC ; Council of Planning Librarians Bibliog No. 966, Jan. 1976, 9 pp, 112 Ref.; ORDER FROM: Council of Planning Librarians, P.O. Box 229, Monticello, Illinois, 61856 Orig. PC

12 130769 ALTERNATE USES OF A BUS STOP AT A MODAL TRANSFER POINT. In theory, urban bus stops are for the exclusive use of buses. Practice shows that many different vehicles use the bus stop for a variety of purposes. This project examines the nature of these alternate uses and their effects on bus and traffic operations. The method used was the limited case study. A single, busy bus stop in Brooklyn, New York, was observed during both peak and off-peak periods. It is along a major arterial with commercial strip development where parking is allowed. The bus stop is at a rail rapid transit station that is a link to the Manhattan central business district. Data were collected by means of time-lapse photography. The findings indicate that the alternate uses of the bus stop increase the efficiency of the use of the curb. Bus operations benefit through the reduction of bus dwell times, and the increase of delay to traffic is minimal. The nature of alternate operations does not tend to be inherently unsafe.

Skaliotis, GU Crowley, KW (Polytechnic Institute of New York) Alter, CH, Discussor *Transportation Research Record* No. 557, 1975, pp 21-32, 4 Fig., 4 Tab.; ORDER FROM: TRB Publications Off, Orig. PC

12 131349 AUTOMOBILES USED AS MINIBUSES: HELP FOR HARRIED COMMUTERS. A concept has been developed that is based on the idea that some commuter automobiles may be turned into minibuses that pick up and discharge passengers on relatively fixed routes. In this Community Auto Rapid Transit System (CARTS), drivers wishing to participate are investigated for their safety record and insurability and issued a color-coded decal card for identification. During a 1-pass cruise in a designated pickup route, passengers flag cars heading for their destination. Fares are paid directly and fixed by a regulatory agency. Benefits that could be derived can include gasoline conservation, reduction of traffic congestion and air pollution, lower capital expenditure for the local public transportation system and the provision of feeder service for public transit. However limitations exist: CARTS will have to serve a minimum

population of 20,000 and a central business district or employment center. Crime could also pose a problem.

12 134699 RESULTS OF THE BUS-ON METERED FREEWAY EVALUATION-I35W, MINNEAPOLIS. Evaluation results of an Urban Corridor Demonstration Program sponsored by UMTA, the I-35W Bus-on-metered Freeway System concept are presented in this article. The concept featured the meeting of an urban radial freeway, a real-time traffic management system, an express bus service, priority bus access to the freeway via ramps, and the provision of bus shelters, signs, and parking facilities in the corridor. In addition to the goals of the comprehensive Urban Corridor Demonstration Program, the specific objectives of the I-35W demonstration program; A. improve corridor level of service by metering traffic entering the freeway; B. increase the modal shift of auto drivers and passengers to express bus service; C. improve reliability of the freeway operation through accident reduction and an efficient traffic management system; D. improve transit system performance through decreased travel times and unit costs; E. obtain user acceptance through an advertising program; F. obtain a positive environmental impact through reduced noise and air pollution; G. implement the bus-on-metered freeway system in a cost-effective way. The evaluation of the project, which was divided into three phases, was designed to assess the impact of the project on the corridor and make these observations available to other urban areas. Detailed conclusions for each specific objective are described, with the overall conclusion being that the bus-on-metered freeway concept is a viable solution to medium density radial corridor congestion problems. The concept can be applied where freeway ramp metering can provide a high level of service, where there is a market for express bus service, where freeway ramps can permit rapid access for buses, and where other roads exist for alternate routes.

12 138442 DEMAND-RESPONSIVE TRANSIT: AN OVERVIEW OF INTEGRATED SYSTEMS. A propositional inventory is presented pertaining to definitions, cost, automation, and attitudes of transit managers, unions and taxicab companies. The proposition is considered that demand responsive transportation (DRT) will obtain an increasing share of the transportation market as public officials respond to the transit demands of multinucleated metropolitan areas. The cost of DRT and fixed-route transportation (FRT), the benefits of zonal increments, and the recommendation for critical path method of incremental development (with regard to equipment) are discussed. The demand for DRT is restricted by the inability of operators to supply an acceptable level of service. Automated scheduling and information processing can increase efficiency; a fully integrated DRT cannot be

achieved without automation. Integrated DRT systems which link flexible-route and fixed-route transit are considered and it is pointed out that it is a mix of systems acting cooperatively, and not necessarily under single ownership, that adapts to demand. Computer systems are needed for the control and management of an integrated DRT system, but they lead to unforeseeable complexities. It is noted that institutional attitudes rather than technical problems restrain expansion of DRT, and that taxi companies should be more actively involved as operators if integrated DRT is to expand. The successful projects in Ann Arbor, Michigan, Rochester, New York, the stalled program in Orange County, California, and the unsuccessful experiment in Santa Clara county are considered as illustrations.

12 138812 VEHICLE-SELECTIVE DETECTION-TECHNIQUES AND THE LEVEL OF SERVICE OF PUBLIC TRANSPORT [Voertuigselectieve Detectietechnieken en de Afwikkeling van Het Openbaar Vervoer]. In order to improve public transport great attention must be paid to the quality of the service. Regularity and punctuality must be improved. Before a central processing control can be introduced a favourable traffic situation must be brought about. Free lanes must be constructed and traffic controls related to public transport must be given priority. In a later phase, vehicle-selective detection will be essential for the achievement of a system of control of regularity. [Dutch]

12 145315 VETAG-TEST [Vetag-Proef]. In Amsterdam a continuous test is carried out of selective vehicle detection at a junction using the so called vetag-test. The name vetag is derived from vehicle-tagging, which can be described as equipment for selective detection, identification and localization of vehicles. The vetag system consists of an interrogator, a detection loop and a transponder. A three-day comparative test was carried out, with the aid of a time recorder, by which the functioning of traffic with and without the priority principle was studied. The main purpose was to test the electronic possibilities of the vetag system. The conclusions are presented and discussed. /TRRL/ [Dutch]

12 148448 THE ROLE OF ADVANCED ELECTRONIC COMPONENTS IN COMMUNICATING WITH MOVING VEHICLES.

The viability of methods of communicating to and from moving vehicles depends on the availability of inexpensive and reliable electronic components of advanced performance. If suitable components are available, a variety of sophisticated schemes for managing private, commercial, and public transport becomes feasible economically and technically (if not politically); possibilities include the transmission of route or hazard information to vehicles, the extraction of data from vehicles (identity, axle loading, etc.), and two-way communication for public-transport vehicles. This paper surveys the roles which may exist in traffic management for modern solid-state components such as advanced silicon integrated circuits, charge-transfer devices, surface-acoustic-wave structures, and microwave sources. Special emphasis is given to the basic problems of, firstly, establishing localized regions for propagation on a space-division-multiplex basis and, secondly, providing structures which operate, store, and detect complex codes or messages.

12 148717 PRINCIPLES FOR DEVELOPMENT OF AUTOMATED CONTROL SYSTEMS FOR URBAN TRANSPORTATION AND THE METHODS USED [Printsiy sozdaniya avtomatizirovannykh sistem upravleniya dvizheniem gorodskogo obshestvennogo transporta i kharakteristika ispol'zuemykh tekhnicheskikh sredstv].

The main goal of controlling urban passenger transportation is satisfying travel needs while utilizing resources with maximum efficiency. Three stages of automated control are evolutionary. Initially dispatcher communications is followed by information display and then the stage which has been achieved: Automated systems of traffic control for individual types of urban transport. The ASSDY-A automated system of control for buses and the ASDY-3 for electrified city transport, streetcars and trolleybuses, can be developed into the ASDY-MT automated system of dispatcher control for routed transport. A separate system for control of taxis also exists. At present the automated system of dispatcher control is being implemented in various USSR cities. [Russian]

12 151147 AUTOMATIC VEHICLE MONITORING SYSTEMS.

Automatic Vehicle Monitoring (AVM) systems, which provide the location of fleet vehicles automatically determined and made available at a central office, have been the subject of study for many years. This report examines a variety of techniques proposed for AVM applications, as well as, the efforts made in the related field of Automatic Vehicle Identification (AVI). Technologies for locating urban fleet vehicles are discussed and classified under four broad categories: Dead-reckoning, Radio Time-of-Arrival, Proximity, and Triangulation techniques. AVM offers the potential of increasing the efficiency of several types of fleet operation, including mass transit, police, taxi, and other fleet systems, while simultaneously improving the security on board these vehicles. AVM also offers a high potential for commercial users in urban areas, namely, package delivery services, private maintenance services, and truck delivery systems.

12 156096 HIGH-PERFORMANCE BUS RAPID TRANSIT SYSTEMS: A DESIGN-PROCESS EXPERIMENT.

This paper evaluates an experimental approach for designing a bus rapid transit system. The particular system was to serve a single large destination, the University of Washington, and to meet desired levels of performance within a series of constraints regarding its physical characteristics. Five groups of students were given this design problem and asked to find satisfactory solutions using the Urban Transit Analysis System (UTRANS), an interactive graphic system, within a 10-week period. The experimental definition included a large and complex network, a demand

set, a cost-benefit framework that includes 23 performance measures, a group-determined set of weights of relative importance for the performance measures, acceptable and ideal standards for the performance measures, a group-determined set of parameters for the modal-split model contained in UTRANS, and a set of upper limits on the size of the system. The five teams generated and evaluated 82 alternative designs and finally recommended 7, all of which had acceptable levels of performance for all 23 objectives. These 7 final designs were compared in physical and performance terms and found to be similar. The design strategies used are discussed briefly, and the experience of one team that processed 28 design alternatives is illustrated. All final designs were quite conventional; no unusual designs having a high level of performance were discovered. The major finding was that inexperienced persons could solve this complex problem in a relatively short time with the aid of the UTRANS systems. /Author/

12 156099 BUS AND SHARED-RIDE TAXI USE IN TWO SMALL URBAN AREAS.

The demand for publicly owned fixed-route, fixed-schedule bus service was compared with the demand for privately owned shared-ride taxi service in Davenport, Iowa, and Hicksville, New York, through on-board surveys and cab company dispatch records and driver logs. The bus and shared-ride taxi systems in Davenport competed for the off-peak-period travel market. During off-peak hours, the taxi tended to attract social-recreation, medical, and personal business trips between widely scattered origins and destinations, while the buses tended to attract shopping and personal business trips to the CBD. The shared-ride taxi system in Hicksville, in addition to providing many-to-many service, competed with the countywide bus system as a feeder system to the Long Island commuter railroad network. In each study area, the markets of each mode of public transportation were similar. There were no statistically significant differences between bus and shared-ride taxi users in Davenport relative to ability to drive, household income, employment status, number of automobiles available to the household, and physical capabilities. Bus and shared-ride taxi users in Hicksville differed slightly in age, household income, number of automobiles available to the household, and distance from home to bus stop. In general, a major portion of the market of both shared-ride and taxi systems were of people likely to be dependent on some form of public transportation for some of their trips. /Author/

12 156320 AUTOMATION FOR BUS OPERATION IN PARIS.

For several years the Paris Transport Authority has been automating operations aiming to adapt bus traffic to demand or to improve bus control. The various aspects of the system are data collection on bus running and

passenger flow, assignment of buses and establishing of bus scheduling and crew duty rosters, real-time tracking of bus movement and its perturbations, traffic control, passenger control and information. The paper discusses the various devices and processes involved in the systems that are under study, under experimentation or in operational use. As far as possible, the results and progress of the projects or of evaluations in process are given.

12 159007 MANAGEMENT OF VEHICULAR TRAFFIC FACILITIES FOR BETTER TRANSIT MOVEMENT: SOME ASPECTS. This report represents the completion of a project which deals with the analysis and management of transportation facilities. The purpose is to contribute to the management of transportation systems and to provide a better environment for people movement via transit and paratransit. This report discusses bus stop utilization and impact of bus stop location; the conflict between user and system-oriented assignments of traffic to a network; the expected travel time assignment (ETTA) model; the importance of freeway incidents in shifting traffic assignments; and the response to incidents on limited access facilities. The method of study is the limited case study. Data in some cases were collected by time lapse photography and then further processed by computer programs.

12 159026 VEHICLE DETECTION-PHASE III. PASSIVE BUS DETECTOR/INTERSECTION PRIORITY SYSTEM DEVELOPMENT. VOLUME I. PROJECT OVERVIEW AND TECHNICAL DISCUSSION. The Passive Bus Detector/Intersection Priority System was developed under this project. The system functions as a fully independent traffic controller with completely passive bus detection capability using inductive-loop detectors (ILD) placed in the roadway. Bus detection is based on ILD signal processing (classifier) techniques, thereby eliminating need for any modifications or additions to the bus. Passive bus detection hardware

includes special ILD electronics, a high-speed programmable processor, and a microprocessor. Using the same microprocessor, plus programming panel, stored programs, and switching and safety units, the system design is sufficient to exercise bus priority control at urban intersections containing up to 23 signal circuits and 16 ILD transducers. In addition, the system has capability of commanding the traffic signals in either one of three fixed timing patterns, selected at the system by the traffic engineer or controlled by a loop master.

12 159029 VEHICLE DETECTION. PHASE III. PASSIVE BUS DETECTOR/INTERSECTION PRIORITY SYSTEM DEVELOPMENT. VOLUME III. VEHICLE SIGNATURE ACQUISITION. Analysis and design of a successful passive bus detector cannot even begin until the characteristic features of the bus and other vehicles are known. These characteristic features are contained in the time history signals (signatures) detected by transducers located in the pavement. Three transducers were candidates for the passive bus detector: the inductive loop detector (ILD), the magnetic-gradient vehicle detector (MGVD), and the magnetometer. Early analysis eliminated the magnetometer from the candidate list. A total of 450 signatures were acquired from the ILD and MGVD from various vehicle types and test conditions. These signatures depicted all necessary feature data for the vehicles and test conditions, and allowed for subsequent analysis, design, and demonstration of a successful passive bus detector.

12 163130 EXPERIMENTS IN BUS SERVICE CONTROL USING AN INTERACTIVE MODEL OF A TYPICAL BUS ROUTE. An interactive computer model of a bus route, developed by GEC-Marconi Electronics, has been used by TRRL to investigate the effectiveness of 3 types of operational control when applied to a London service route. The control systems considered were: a roadside inspector system, a voice radio system and an Automatic Bus Location (ABL) system. Results showed that operational control improved passenger waiting time on a simulated route by an average of about 11% for roadside control, 14% for voice radio control and 16% for ABL control. The use of these methods also resulted in a reduction of operating crew overtime payments due to more journeys being completed on time. This particular benefit was

slight compared with the community benefit represented by the reduction in passenger waiting time. /TRRL/

12 163592 CRITERIA FOR BUS RAPID TRANSIT SYSTEMS IN URBAN CORRIDORS: SOME EXPERIMENTS WITH AN INTERACTIVE GRAPHIC DESIGN SYSTEM. A man-computer interactive graphic system, developed at the University of Washington, is applied to a series of experiments designed to identify the characteristics of high-performance bus rapid transit systems for CBD-bound riders who reside in ageneralized suburban corridor. The solution spaces of each of 12 problem cases, derived from the combination of several trip demand densities, highway network characteristics, and trip-making behaviors, are explored in an interactive graphic search process. The purpose of the search is to identify optimal solutions using two operator objectives, one maximizing profit and the other maximizing patronage within a given subsidy constraint. Furthermore, the search is aimed at identifying solutions that cannot be dominated in terms of any combination of patronage and profit, thus forming an envelope in the patronage versus profit-deficit space. From a comparison of these envelopes some general relationships between bus rapid transit operating characteristics and external conditions are developed. Similarly, relationships between system characteristics and external conditions are derived from a comparison of the penoptimal solutions. Finally it is shown that the penoptimal solutions may violate some of the environmental, social, or political constraints commonly imposed on public transit systems, and it is also demonstrated that, by complying with such constraints, the operator may incur significant losses. /Author/

12 163924 BUSWAY VERSUS RAIL BRANCH: ANALYSIS OF ATLANTA'S TUCKER-NORTH DEKALB CORRIDOR (ABRIDGMENT). The purpose of this study was to evaluate comprehensively the costs, operational effects, and patronage aspects of busway versus rail rapid transit in the Tucker-North Dekalb (T/ND) corridor in Atlanta. Two transportation alternatives were considered: a rail branch providing direct, no transfer service and operating as a separate radial line; and a busway alternative operating a feeder service route. A discussion of passenger attraction, capital costs, operating cost, and quality of service factors for both the rail and busway alternatives is included. It is concluded that for the study corridor, capital costs of busways will be lower than those for rail branches; rail service into a branch corridor will

invariably be of a higher quality than will a busway feeding a main rail line; and operating costs will not be as costly to operate as a busway feeder system. For these reasons, a rail branch will attract a substantially greater number of riders than will be busway alternative.

12 163989 THE OPERATION OF URBAN BUS ROUTES. 1. BACKGROUND AND PRELIMINARY ANALYSIS. This is the first in a series of three articles which present the findings of an investigation into the operation of urban bus routes. The operation is studied in terms of the times taken by passengers and buses in different stages of their journeys. This article introduces the subject area and the framework for assessing route performance, and describes an analysis of factors affecting average bus speeds. The two subsequent articles deal with sources of irregularity and other, wider, aspects.(a) /TRRL/

Chapman, RA Gault, HE Jenkins, IA (Newcastle-Upon-Tyne University, England) *Traffic Engineering and Control Analytic* Vol. 18 No. 6, June 1977, pp 294-298, 1 Fig., 3 Tab., 12 Ref.; ACKNOWLEDGMENT: 1 (TRRL67260E)

12 164404 THE ECONOMIC PERFORMANCE OF AN EXPRESS BUS SYSTEM. The first phase is reported of a 2-phase project to implement, operate and evaluate various strategies for providing high standard bus and car pool service through a transportation corridor of North Dade County, Miami. The priority techniques studied included the following: exclusive, reversible bus lane in the center of the roadway; bus preemption of traffic signals; and progression on traffic signals. These were tested in different combinations. Two primary measures of effectiveness were used: operating costs and revenues. It was found that relatively low bus usage along with the high percentages of vehicle-miles and vehicle-hours expended in nonrevenue producing travel resulted in an operating cost which was about 3 times the income. Further findings relating to the feeder route service, success of the various routes, times of service and the fare structure are presented. Recommendations for reducing the operating deficits are offered.

Wallace, CE (Florida University, Gainesville) *Transportation Engineering* Vol. 47 No. 9, Sept. 1977, pp 27-31, 3 Fig., 2 Tab., 3 Ref.; The preparation of this report was financed in part by DOT, Urban Mass Transportation Administration.

12 165192 INCREASING THE TAXIS' ROLE IN URBAN AMERICA. The solutions now being offered to the public transportation problem (such as BART and METRO), however fast (once you get on them) and pretty, are nothing more than 1970 versions of 1870 commuter railroads that tied together the suburbs and the downtowns. They lack the accessibility and central-city coverage afforded by earlier rail rapid transit, and they fail to provide easy-to-reach, door-to-door service for most would-be users--

-especially for people without automobiles, for people who are physically infirm, and for people who live within central cities, close to downtown. Given some reasoned tinkering with regulation, pricing, and operation, taxicabs might very well have a profound and lasting impact on transit patronage and lead to reduced automobile commuting. It is also possible to think of ways in which taxis would better serve some urban groups who are served poorly or not at all by existing transit systems.

12 165751 EXPERIMENTS ON FOUR DIFFERENT TECHNIQUES FOR AUTOMATICALLY LOCATING LAND VEHICLES: A SUMMARY OF RESULTS. In 1975, to further the development and to refine and demonstrate multiuser Automatic Vehicle Monitoring (AVM) application, the Urban Mass Transportation Administration and the Transportation Systems Center (TSC) initiated a two-phase program. Phase I of this AVM program was completed in March 1977. The Phase I objective was to formally test four different vehicle-location concepts against a technical performance specification prepared by TSC. Phase II of the AVM program will involve the selection of one of the tested location methods, the detailed design of an overall AVM system, and its deployment in a major urban area for test and evaluation in bus-transit and police operations. During the winter of 1976-1977, four different technical methods for automatically locating surface vehicles were tested in both high and low-rise regions in Philadelphia, Pennsylvania. The tests were designed to evaluate the methods for their applicability as location subsystems of AVM systems. Two "signpost" concepts, one utilizing semi-passive transponders and the other active transmitters as well as two "area-coverage" concepts, one employing Loran-C and the other a pulse trilateration method, were tested. This report (Phase I) outlines the experimental objectives, summarizes the test results and presents the major findings. The Tables in this report chart out the Fairchild, the Hazaltine, the Hoffman, and the Teledyne Test Results. /UMTA/

12 165772 OPERATIONS OF SMALL BUSES IN URBAN TRANSIT SERVICE IN THE UNITED STATES. The overall objective of the Small Bus Project is the development of a general and performance specification for an advanced small urban transit bus. It is a six-phase program designed to insure that final vehicle specifications would evolve from a comprehensive analysis of all aspects of the operating environment and thus have a broad applicability. The Small Bus Project is presented in six separate reports: 1) Operations of Small Buses in Urban Transit Service in the United States. This report investigates the operating environment of small buses in the U.S. and relates them to vehicle requirements; 2) Bus Characteristics Needed for Elderly and Handicapped in Urban Travel. Constraints imposed on

bus design by the elderly and handicapped are outlined; 3) Operating Profiles and Small Bus Performance Requirements in Urban Transit Service. This report develops a set of operating profiles and service requirements as the basis for specifications for a new small urban transit bus to meet the identified operational needs; 4) Guidelines for the Design of Future Small Transit Buses and Bus Stops to Accommodate the Elderly and Handicapped. This report presents scenarios for the future uses and market of small buses, as well as the conceptual design for three vehicle configurations to assess the feasibility of meeting design requirements; 5) General and Performance Specifications for a Small Urban Transit Bus. Requirements for an advanced design coach which may be used for both demand-responsive and general service on urban arterial streets are presented; 6) Small Transit Bus Requirements Study. This report summarizes the findings presented in the five project reports. /FHWA/

12 165773 PRE-DEMONSTRATION ACTIVITIES OF THE WESTPORT INTEGRATED TRANSIT SYSTEM. In August 1976 the Urban Mass Transportation Administration of the U.S. Department of Transportation awarded a demonstration grant to the Westport Transit District (WTD) to examine the feasibility of combining shared-ride taxi service and other paratransit services with conventional bus services in Westport, Connecticut. This report describes the Westport, Connecticut, Service and Methods Demonstration Project involving integrated transit operations and paratransit services, and documents and assesses the implementation process associated with this demonstration. This report focuses on documenting and assessing the brokerage role performed by the WTD in implementing shared-ride services. The contents include a discussion of the institutional and operational elements involved in contracting with local taxi operators to provide shared-ride service. In addition, arrangements for system maintenance, marketing, and public information dissemination are described. Implications from the Westport pre-demonstration experience are potentially of interest and applicability to other locales. /FHWA/

12 165817 DESIGN AND EVALUATION OF ON-FREE WAY TRAFFIC CONTROL SYSTEMS AND SURVEILLANCE TECHNIQUES. Studies of urban traffic operations were conducted on the freeways of Texas to determine the design and effectiveness of traffic control systems and surveillance techniques. The control systems were designed to relieve peak period congestion. Surveillance techniques were

studied for application in detecting disabled vehicles and their impact on the operation and safety of freeways. This study used demonstration installations and field testing under laboratory conditions to determine the implementation requirements as well as to evaluate the operational theory. /Author/

12 167373 A COMPREHENSIVE FIELD TEST AND EVALUATION OF AN ELECTRONIC SIGNPOST AVM SYSTEM. VOLUME I. TEST RESULTS [Final rept. Sep 76-Mar 77 on Phase 1]. The report covers the activities of Phase I which involved the installation and test of a HI3 AVM System in Philadelphia, Pennsylvania, during the winter of 1976-1977. A summary report on all systems tested is Experiments on four different techniques for automatically locating land vehicles (PB-270 951). Phase I tests were divided into two primary categories: (1) random-route tests (police, paratransit, taxi, etc.), and (2) fixed-route (transit). In the random-route tests, the system showed the capability of locating the vehicle to within 282 feet, at 95 percent of the sample points under a wide range of urban and environmental conditions. In the fixed-route tests, an odometer and 15 signposts provided the vehicle's location to within 105 feet at 95 percent of the sample points along a 13-mile route. The time of passage of designated bus schedule 'timepoint' was automatically determined to within 11 seconds 95 percent of the time. Phase I consists of two volumes: Volume I: Test Results contains a description of all test configurations, test procedures, location algorithms, data processing, and test results; Volume II: Appendix contains the test log sheets, test data, and data processing results corresponding to all Phase I tests.

12 167592 INCREASING THE PEOPLE-MOVING CAPABILITY OF SHIRLEY HIGHWAY. Because of the dramatic increase in construction costs of rail rapid transit in recent years, the exclusive highway right-of-way for high-occupancy vehicles has emerged as a possible cost effective alternative for transporting peak-period commuters through congested corridors. The Shirley Highway busway in northern Virginia offered the first such exclusive right-of-way when its first section was opened to buses in 1969. The busway was opened to car pools of four or more riders in December 1973 and became the principal element of the Urban Mass Transportation Administration's Shirley Highway express-bus-on-freeway project, which was conducted for 1 year until December 1974. Priority treatment accorded buses and car pools resulted in a substantial improvement in the corridor's people-moving capability during peak hours. In addition, considerable travel-time savings were realized by all commuters using Shirley Highway. This paper discusses (a) increases in the people-moving capability of Shirley Highway and (b) the reasons for the increases. The increases in the people-moving capability of Shirley Highway can be attributed to increases in commuter use of buses and car pools. Particular attention was given to bus users to determine why a large number of automobile users--many with upper-middle incomes from homes with several automobiles--switched to bus and why some bus users switched to automobiles (driving alone or car pooling). /Author/

12 168069 BUS PASSENGER SERVICE-TIME DISTRIBUTIONS. The characteristics of bus passenger service-time distributions are a necessary input for the transportation simulation models that are used to evaluate the operations of street transit systems. In this paper, distributions of passenger service times through bus doors (the rates at which passengers entered, passed through, and departed from the bus) are analyzed by photographic studies and simulated by an Erlang function. These mathematical expressions simulating the passenger rates of flow entering and departing from a bus are compared with the observed times; the differences are not significant at the 95 percent level. The results of this research can be used to analyze a series of bus transit-flow situations and may serve as guidelines in assisting the designer and operator in evaluating existing or proposed bus systems. Specific models could be developed to evaluate the effects of the method of fare collection on passenger queue lengths and average waiting time under different rates of passenger arrivals. The overall design of bus transit vehicles has been shown to affect passenger flows in relation to such items as fare collection and in the use of door(s) for boarding alighting. /Author/

12 168142 THE OPERATION OF URBAN BUS ROUTES. 3 WIDER ASPECTS OF OPERATION. This is the last in a series of three articles on the operation of urban bus routes. The operation is studied in terms of the times spent by passengers and buses in different stages of their journeys. The first article provided an introduction to the subject area and a framework for assessing route performance, together with some results. The second article assessed the sources of irregularity in bus route operation and compared their magnitudes. This final article presents a variety of topics of a broader nature of relevance to the passenger, the traffic engineer and the bus operator. Included are walking to and waiting at stops, measuring delays to buses, and the optimum spacing of stops and routes. It concludes with a discussion on the implications of the work reported in the whole series. /Author/TRRL/

12 168917 A COMPREHENSIVE FIELD TEST AND EVALUATION OF AN ELECTRONIC SIGNPOST AVM SYSTEM. VOLUME II. APPENDIX [Final rept. Sep 76-Mar 77 on Phase 1]. The application of Automatic Vehicle Monitoring (AVM) to enhance the management of mobile resources has, in recent years, become a subject of continued interest to all types of fleet vehicle operations. This report covers the activities of Phase I which involved the installation and test of a HI3 AVM System in the City of Philadelphia during the winter of 1976-1977. These tests represent the most extensive tests ever performed on an AVM system which can locate vehicles which operate either as fixed-route vehicles (transit) or as random-route vehicles (police, para-transit, taxi, etc.). Volume I of this report contains a description of all test configurations, test procedures, location algorithms, data processing, and test results. This Appendix contains the test log sheets, test data and detailed data processing results corresponding to all Phase I tests. Section 2 of this Appendix is an executive summary of the Phase I program. Section 3 contains pertinent random-route data and data processing results. Section 4 contains fixed-route data and data processing results. (Portions of this document are not fully legible)

12 169628 THE FEASIBILITY OF APPLYING THE ACTIVE TVTIME SYSTEM TO AUTOMATIC VEHICLE LOCATION [Final rept]. The National Bureau of Standards Boulder laboratory has studied the use of television as a carrier for accurate time and frequency signals. The usefulness of the TvTime System applied to locating cars and other vehicles automatically is examined. Such a need exists in transit, police, taxi, utility and many commercial fleets. Past approaches to the problem are outlined. The NBS TvTime System and experimental results are discussed. Two models of a car locating system are outlined, each having three parts: (1) a TV decoder in the car, (2) a radio link such as a mobile channel between car and central dispatch, and (3) a computer which determines the car's position. Results show that this system is capable of achieving a location accuracy of better than 60 m with 95 percent confidence. Some advantages and limitations of the system are discussed and cost estimates for the equipment are given.

12 169761 EVOLUTION AND OPERATIONS OF THE RESTON, VIRGINIA COMMUTER BUS SERVICE. The report focuses on documenting and assessing the evolution and operations of the Reston Commuter Bus (RCB). RCB is a good example of a community group overcoming many legal, regulatory, and institutional constraints to develop and refine a viable commuter bus service for community residents. UMTA sponsored this review and assessment of RCB because the RCB approach to commuter bus service is of potential interest and applicability to other communities across the country. RCB is a community-based nonprofit corporation which operates a non-subsidized, weekday, peak-period express commuter bus service operating between Reston, Virginia, and Washington, D.C. area employment centers. RCB is managed essentially by volunteer support. Since 1968 RCB has contracted with public and private carriers to operate the service. The current RCB service is supplied by a private carrier. This report examines the current RCB service operations, the development of the service and the organization, as well as ridership, cost, and productivity data.

It addresses the viability of RCB service in terms of contractual costs of transportation weighed against the revenue generated by system ridership. System productivity is addressed over time by comparing actual and breakeven load factors.

12 170389 BUSES IN URBAN AREAS 1970-1976. The material listed in this bibliography is a selection of the books and articles relating to buses in urban areas available in the headquarters library of the departments of environment and transport. It has been arranged in seven main sections which are then sub-divided into (I) books, pamphlets and conference reports; (II) articles; (III) other countries. Publications since 1970 have been included but the emphasis throughout is on material published since 1974. The main sections are as follows: (a) DOE publications, includes official and non-official material published by the department since 1970, DOE circulars, and a selection of the reports and supplementary reports produced by the departments' transport and Road Research Laboratory (TRRL). (b) urban transport: policy and research, includes general works on urban transport policy with particular reference to buses, and to documents dealing with modes of travel within the city. (c) management and operation of bus services, is divided into eleven parts. Part (I) relates to overall bus operation and management; parts (ii)-(x) deal with specific aspects, and part (xi) includes some miscellaneous references. (D) and (e) are concerned respectively with theoretical models used in planning of bus services and technical advances being discussed but not yet incorporated into bus management and operational practice. (F) includes a few references, mainly of an historical nature, intended as background reading. (g) lists a few of the current research projects relating to bus services in urban areas. /TRRL/

12 170394 A ONE-YEAR TRIAL EXPERIMENT WITH ELECTRIC BUSES IN NORTH RHINE-WESTPHALIA. FIRST OPERATIONAL RESULTS AND THEIR APPLICATION TO A COMPLETE ELECTRIC TRAFFIC SYSTEM [Ein Jahr Modellversuch Elektrobus in Nordrhein-Westfalen. Erste Betriebserfahrungen und Ihre Anwendung auf ein Gesamtsystem des Elektrischen Strassenverkehrs]. In October 1974 an existing public transport system operated by diesel buses was changed, for the first time, to battery operated electric buses. The most important data applicable in tabular form. The operational performance is presented in numerical terms and an initial study of the troubles incurred during the first year are given in four main categories. In connection with the discussion of special problems of electric vehicles and their component accessories, exhaustive studies are made of the operational running and the control of electric driving units, the

protection of the electric circuits, the requirements of traction batteries, the current and voltage curve of the electrical supply to the auxiliary units, the influence of braking, battery charging and changing points and the production of auxiliary power for the operation of various services. Electricity can play an important role as the motive power for vehicles in urban areas, supported on the existing public transport network. The importance of the trial experiment with electric buses, in association with further large scale trials with other categories of vehicles lies in the fact that it yields information which not only facilitates comparison with other competing systems but also assists the planning of production and operation of larger systems. /TRRL/ [German]

12 170934 VARIABLE MESSAGE SIGNING FOR TRAFFIC SURVEILLANCE AND CONTROL--A STATE OF THE ART REPORT. This report is a state of the art summary of variable message signing (VMS) technology currently utilized for traffic control applications. The report briefly describes the four basic component of a VMS system. These are the VMS display, VMS control system, VMS system interconnect, and VMS highway surveillance system. The report focuses on the VMS display. It covers the following nine display types: (1) Flap, (2) Scroll, (3) Drum, (4) Inert gas (Neon) (5) Fiber optics, (6) Light bulb matrix, (7) Electromechanical flap matrix, (8) Electrostatic vane matrix, (9) Electromagnetic disk matrix. For each display type its functional characteristics, manufacturers, operational experiences, and currently available publications are presented. The final section of the report describes current VMS research activity being undertaken by the federal government and by the VMS manufacturers. /FHWA/

12 172060 REPORT ON PHASE I TESTS OF FAIRCHILD AUTOMATIC VEHICLE MONITORING (AVM) SYSTEM. During the winter of 1976-77 four different techniques for automatically locating land vehicles were tested in both the low and high-rise regions in Philadelphia, Pennsylvania. The tests were carried out by four different companies under separate contract to the Transportation Systems Center. These tests were designed to evaluate the four techniques for their applicability as location subsystems for automatic vehicle monitoring (AVM) systems. The overall objective of this AVM program is to design, implement, and operate an area-wide multi-user AVM system in Los Angeles (Phase II) for the purpose of making a quantitative evaluation of AVM effectiveness for transit, paratransit, and other AVM users. A summary report on all four systems is available and titled: Experiments on Four Different Techniques for Automatically Locating Land Vehicles (PB-270951). This document contains the results obtained by one of the contractors, Fairchild

Industries, and covers the activities of Phase I which involved the instrumenting of a section of downtown Philadelphia with approximately 140 signposts. Part of the allocated section was used for tests applicable to fixed-route (transit) systems, and part was used for random-route applications (police cars, taxis, paratransit, etc.). In addition to the Philadelphia tests a series of separate engineering tests were performed at the Fairchild Plant in Germantown, Maryland. This Fairchild report states that the complete exercise served a two-fold purpose: 1) it proved the reliability of AVM systems and, 2) it performed as an invaluable learning tool from which all parties will profit. /Author/

12 172550 PUBLIC TRANSPORT TIMING: CAUSES OF DELAY ARISING DURING BUS JOURNEYS. Bus movement times were studied on three routes. An attempt was made to analyse delays at traffic-light-controlled intersections in the city centre along these routes. In the study it was concluded that: delay times are seldom more than 20 per cent of the mean travel time and on average vary from 4 to 10 per cent of the mean travel time; about 80 per cent of the delays are caused by traffic-light-controlled intersections; delays due to congestion caused by other vehicles are a substantial minor factor; boarding time per passenger on one-man-operated buses is twice that on two-man operations; the timetable allowance for inbound journeys is not realistic compared with the time allowed for outbound journeys; in this case, very little time would be saved by rerouting of the services; the average running speeds of the buses varied between 25 and 50 km per hour, depending on the route, the average travel speeds being higher than the scheduled speeds; there was very little variation in mean travel time between that on average weekdays and on Saturdays. /TRRL/

12 173316 EVALUATION BY SIMULATION OF CONTROL STRATEGIES FOR A HIGH FREQUENCY BUS SERVICE. In order to assess the potential value of bus control a computer simulation of a high frequency urban bus service (London Transport Service 11) has been used to estimate the likely effects of applying a number of control strategies formulated for use when the positions of buses on the route were known. Four strategies were considered: the first three regularised bus departures from termini by making adjustments to bus layover periods, while the fourth curtailed buses short of their scheduled destinations in order to make up lost time. Initially these strategies were evaluated with levels of cancellations (16 per cent) and unpunctuality at the start of the day which were typical of service 11 at the time of the study (1975). Combined use of the layover adjustment strategies reduced the mean passenger waiting time by up to 20 per cent (about 1.2 minutes), but did not effectively reduce late running. Additional use of the curtailment control had little effect on the improved waiting times but reduced the occurrence of bus lateness in excess of 10 minutes by a factor of about two. These benefits were shown to be sensitive to both the level of cancellations and the degree of poor time-keeping on starting. When all the buses started on time the magnitude of the waiting time reduction attributable to control was reduced by a factor of about 4. /Author/TRRL/

12 173955 BUSWAYS IN NEW TOWNS. The author stresses that among the many suggested improvements to urban transportation systems in recent years is the busway, of which several are in operation in the United States, and many others are in various stages of development, planning, or contemplation. The several advantages that they are supposed to have and list of the various subtypes possible are reviewed.

12 174674 EVALUATION OF EXPRESS BUSWAY ON SAN BERNARDINO FREEWAY-THIRD YEAR REPORT [Final rept]. This is the final report completing the evaluation of the San Bernardino Freeway Express Busway in the operational mode of exclusive use by buses. The San Bernardino Freeway Express Busway is an 11-mile, double-lane, exclusive roadway for buses connecting downtown Los Angeles to the City of El Monte. The busway lanes, which were built in the median strip of land, at some points, alongside the freeway, are physically separated by concrete and flexible barriers from those lanes which serve automobile traffic, making it a bus rapid transit system. This \$57 million system is the most complete facility of its kind in the country, having off-line stations, park-ride facilities, double (bi-directional) bus lanes, feeder bus lines, and a downtown reserved (contraflow) lane. The Busway offers a service that is competitive with automobile commuting on the semi-congested freeway. The running time on the 11.2 mile

busway, including two intermediate station stops, is 14 minutes. The project is part of the SCAG High Occupancy Vehicle Program consisting of transportation measures for improving air quality and energy conservation, and includes preferential treatment for high occupancy vehicles on freeways and major arterials, carpool action programs and transit development strategies.

12 176516 EMPLOYEE PROTECTION: PARATRANSIT AND ITS IMPACT ON THE OPERATOR WITH DISCUSSION. The extension of service to various outlying areas is discussed, and a recent trend toward the use of transportation in social services whereby social service agencies take the responsibility of using transit as a method of developing skills is noted. In this situation, there is a competitive organization that is not recognized because it is under the guise of social service. The problem of the driver who works during the peak hour, thereby obtaining union benefits, and also works regular hours at another job is discussed, as well as the problem of the full time union people who moonlight for private operators for less money than they receive as union drivers. Some points that were raised during discussions of paratransit and section 13c are also include here.

12 176595 NATIONAL AUTOMATIC POSITION INDICATOR SYSTEM (NAPIS). The demand for an automatic vehicle monitoring system (AVM system) which automatically detects the present position and operating condition of a vehicle station has increased as a result of diversification of social conditions and deterioration of traffic conditions. The present system has been developed for taxis, to make possible an integrated dispatch and control system which automates dispatch functions by automatically detecting and displaying the present position of an available vehicle, and produces a daily report for management. The new system is based on the inverse proximity technique using tone frequency signal and weak radio wave. This technique uses the digital transmission and voice communication channel of FSK-200 BPS, based on the AVM system for a patrol car delivered to the National Police Agency in Japan. The system has been improved in various aspects through actual oper-

ation tests and analysis of the test results in order to realize the fair and speedy dispatch of vehicles. As a result, position detection accuracy is ensured within a 0.5 to 1 km area, and dispatch capacity is doubled. "NAPIS" is a trademark of Matsushita Electric Industrial. Co., Ltd. [Japanese]

12 177026 AUTO OPINION: FLEXIBILITY STILL COUNTS. The bus and the automobile are compared for energy efficiency in urban passenger transport. Results of several studies are given and discussed, and it is indicated that possibility the greatest fuel savings can be achieved by design and use of energy-efficient automobiles rather than by substitution of buses for automobiles. The social and economic factors associated with large and small buses, shuttle service, railway rapid transit, and automobiles are discussed.

12 178752 THE SANTA MONICA FREEWAY DIAMOND LANES: FREEWAY ACCIDENT ANALYSIS. The Santa Monica Freeway Diamond Lanes, a pair of concurrent-flow preferential freeway lanes for buses and carpools linking the City of Santa Monica, California with the Los Angeles Central Business District (CBD), opened on March 16, 1976, and operated amid much controversy for 21 weeks until the U.S. District Court halted the project. One of the most disturbing aspects of the project was the high incidence of freeway accidents, which increased by a factor of 2.5 times pre-project levels when the barrier-free preferential lanes were operating. This paper tabulates accident levels before, during and after the project; postulates and analyses a number of hypotheses regarding potential accident causes; compares the Santa Monica Freeway accident history with that of other preferential lane projects; and identifies the most likely causes of the increased accident levels. This analysis is part of a broader study of the Diamond Lane Project sponsored by the Urban Mass Transportation Administration's Service & Methods Demonstration program. Factors contributing to the increased accident rate included the distracting effect of increased enforcement activities and the congestion resulting from the removal of freeway lanes from general use. However, it appears that the most significant factor was the pronounced speed differential between the free-flowing traffic in the sparsely-occupied preferential lane and the stop-and-go traffic in congested adjacent lanes, coupled with the frequent lane changes made by vehicles entering and leaving the freeway. The experiment in Santa Monica raises serious questions about the use of barrier-free preferential lanes. /Author/

12 178753 THE SANTA MONICA FREEWAY DIAMOND LANES: EVALUATION OVERVIEW. The Santa Monica Freeway Diamond Lanes, a pair of concurrent-flow preferential lanes for buses and carpools linking the City of Santa Monica, California with the Los Angeles Central Business District (CBD), opened on March 16, 1976 and operated amid much controversy for 21 weeks until the U.S. District Court halted the project. The Diamond Lane project marked the first time preferential lanes had been created by taking busy freeway lanes out of existing service and dedicating them to the exclusive use of high-occupancy vehicles. Although the Diamond Lanes entailed no major physical modifications or construction on the freeway itself, they caused significant physical and emotional dislocation among freeway drivers, public officials and other residents of Los Angeles, and generated considerable controversy regarding the reported and actual impacts of the project. This paper summarizes the findings of the official, objective, independent evaluation of the project sponsored by the U.S. Department of Transportation as part of the UMTA Service and Methods Demonstration Program. The paper addresses a broad range of project impacts in the following major areas: traffic speeds and travel times; traffic volumes and carpool formation; bus operations and ridership; safety and enforcement; energy and air quality; and public attitudes and response. Analysis shows that the project succeeded in increasing carpool ridership by 65% and the increased bus service accompanying the Diamond Lanes caused bus ridership to more than triple. Nonetheless, energy savings and air quality improvements were insignificant, freeway accidents increased significantly, non-carpoolers lost far more time than carpoolers gained, and a heated public outcry developed which has delayed the implementation of other preferential treatment projects in Southern California and given planners and public officials in other areas ample cause for reflection before attempting to implement similar projects. /Author/

12 180645 SIMULATION STUDIES OF BUS OPERATIONS AND CONTROL ON LONDON TRANSPORT ROUTE 11. Computer simulation of London Transport Route 11 has been used to examine the effects and interaction of various measures aimed at reducing the irregularity of the service. The measures investigated are both preventative (the improvement of punctuality of garage departures, the reduction of cancellations and rescheduling of a depleted service) and remedial, by means of bus control. The results show that the two basic approaches (preventative and remedial) are interdependent in that the adoption of one type of action reduced the scope for improvement by the other. This is an important consideration when taking investment decisions aimed at improving bus service regularity. The results suggest that for Route 11, the provision of more buses is an expensive way to improve the services compared with measures which make more efficient use of existing resources. 12 180801 AUTOMATED GUIDEWAY TRANSIT SERVICE AVAILABILITY WORKSHOP. The workshop consisted of four panel sessions: Service Availability Definitions; Operator Experience in Operational Systems; Theoretical Aspects of AGT Service Availability; and User-Manufacturer Relationships. The workshop presented a wide spectrum of informed opinion on how to specify, predict, design, and measure the effectiveness of automated guideway transit systems. The document contains the papers and remarks presented at the four panel sessions, the comments made during the question and answer period that followed, and a list of attendees. The discussions illustrated the wide spectrum of meanings currently given to the term 'service availability.' The positions taken by representatives of the various portions of the transit industry--properties, designers, researchers, and manufacturers--showed the variety of ways in which system performance is specified and evaluated today, and the reasons for such a variety.

12 181168 A COMPARATIVE COST/BENEFIT ASSESSMENT OF MINITRAM AND OTHER URBAN TRANSPORT SYSTEMS. This report gives a summary account of a cost/benefit analysis of several hypothetical fixed track automatic passenger transport systems in an urban scenario based on the West Midlands. The assessment was carried out as part of the Minitram project study and is mainly concerned with a system using 20 place Minitrams, but other automatic systems studied for comparative purposes include a network cab system (Cabtrack) and Minitram systems using larger vehicles. Comparative work was also done on a rail rapid transit system, trams, and express buses running on ordinary roads. The report includes a brief description of the methodology used, with particular reference to the problems of estimating modal split to a new mode when two or more existing modes are present. The main conclusion reached from the study was that a suitable Minitram network is likely to produce enough cash revenue to cover its direct operating costs and to produce sufficient social benefit to give an internal rate of return of more than 10 per cent on its capital cost. However the capital cost of the infrastructure is too great for capital charges to be paid out of net revenue, and a substantial capital grant would be required as an initial subsidy. The report stresses the importance of selecting appropriate economic criteria for optimization before a valid economic comparison can be made with other systems. 12 183320 ECONOMIC AND SERVICE COMPARISON OF CONVENTIONAL BUS AND AUTOMATED TRANSIT-A CASE STUDY. The paper discusses the findings of an automated guideway transit (AGT)-bus comparative analysis carried out for the city of Trenton, NJ, for 1985. Four transit modes were originally assessed: demand-responsive bus, light rail, scheduled bus and automated guideway transit. Two of these, light rail and demand-responsive bus, were eliminated as relatively ineffective in the area concerned. The other two systems, conventional bus and AGT, were examined in detail as extreme alternatives. Area-wide AGT represents the ultimate in urban mobility while conventional line-haul buses offer easily introduced short-term improvements. The analysis showed that while AGT would offer a high level of mobility to compete with car travel and could enhance future development in Trenton, investment requirements were prohibitive. The analysis of the fixed-route bus system network showed that a significant increase in use could be achieved by increasing frequencies along certain corridors for a relatively modest investment. /TRRL/

12 183460 RUFBUS, RETAX AND BUSTAXI: THREE EUROPEAN SYSTEMS OF DEMAND-ACTUATED PUBLIC TRANSPORT. The article describes three European systems, Rufbus, Retax and Bustaxi, of demand-actuated public transport. The rufbus system developed by dornier is intended for rural areas and offers transport between bus-stops in the area of Friedrichshafen. There is no schedule or fixed route and the destination is always reached without passenger transfer. A trip request can be made either by telephone or by a trip selector at the bus stop. The vehicles used are 20-seater Mercedes 0303D buses in which route information is displayed on a terminal in front of the driver. The retax system developed by mbb is designed for urban areas and also offers transport between bus stops, the route being determined by trip requests from microprocessor-controlled trip selector units. Although initial trials were carried out using the Steyr Citybus, the network now uses a volkswagen bus with a capacity of 20 passengers. This system features a display showing the next stop as well as the number of passengers to be picked up. The Retax system is controlled by a PDP 11/70 computer. The demand-actuated bustaxi system developed at delft university of technology, uses selectors connected to the control centre by leased telephone lines. Bus drivers are informed of the route to be followed by digital mobilophone transmission. The system is designed to handle trip requests in urban areas of up to 1500 requests/h. The most important difference between the Bustaxi and the two West German system is the algorithm used to allot passengers to the vehicles. The differences in the

algorithms and operating systems are discussed. /TRRL/

Breur, MWKA Verdonck, W (Delft University of Technology, Netherlands) *Traffic Engineering and Control* Vol. 19 No. 6, June 1978, pp 287-291, 7 Fig., 7 Phot., 6 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 234538)

12 183838 VEHICLE DETECTION USING A MAGNETIC FIELD SENSOR. The measurement of vehicle magnetic moments and the results from use of a fluxgate magnetic sensor to actuate a lighting system from the magnetic fields of passing vehicles is reported. A typical U.S. automobile has a magnetic moment of about 200 A-m squared (Ampere-meters squared), for a school bus it is about 200 A-m squared. When the vehicle is modeled as an ideal magnetic dipole with a moment of 200 A-m squared, the predicted results from an analysis of the sensor-vehicle geometry agree closely with observations of the system response to automobiles.

12 184849 THE NEW YORK CITY DOUBLE DECK BUS DEMONSTRATION PROJECT: AN EVALUATION. From July 1974 through June 1977, the Double Deck Bus (DDB) Demonstration Project was conducted in New York City and in Los Angeles. The primary objective at the two sites was to assess potential increase in vehicle productivity in a feeder/park-and-ride-express busway service (L.A.) and in local service (NYC). Double deck buses carry from 68 to 85 passengers as contrasted with conventional buses which carry from 45 to 47 passengers. Both buses call for only a single transit employee, the driver. This report provides a comparative evaluation between the eight British Leyland double deck buses and four conventional GM buses in New York. Volume I contains an executive summary of both projects, while Volume III provides a detailed analysis of the double deck bus demonstration in Los Angeles. Bus routes in New York were characterized by congested traffic, heavy passenger loads, frequent stops, and frequent passenger turnover. A full-range of socio-economic classes was served and the routes traversed lower-to upper middle-class residential districts, major shopping centers and commercial and business areas. Only seven months of revenue service data are analyzed in this report, due to delays in manufacturing and in satisfying United

States safety and environmental requirements. The evaluation considers passenger (including transit dependent) acceptance and perceptions of the DDB when compared with the conventional bus. Drivers, mechanics, and dispatchers were interviewed to identify their reactions to the new bus. Statistics are presented on schedule adherence, dwell times, passenger throughput, vehicle reliability, on-board safety, fuel and oil consumption rates, operating costs, and financial and scheduling implications. Problems encountered in introducing a non production-line vehicle into revenue service in an existing fleet are discussed.

12 184855 LORAN C TRACKING OF LAND VEHICLES USING MICROCOMPUTERS. The concept, design, and evaluation of two similar Loran C land vehicle tracking systems developed by MITRE are presented. One system was developed to provide field demonstrations of applications of Loran C location techniques such as highway inventory accounting, highway resident site recording, control and dispatch of emergency and law enforcement vehicles, and control of mass transit vehicles. The second system was configured to automatically display the reported status and location of two emergency medical service (EMS) vehicles to aid in more efficient dispatch and control functions. The Loran coordinates of the vehicle are transmitted to the base station where a microcomputer resolves the Loran coordinates into geographic/display coordinates and displays the vehicle location. Accurate Loran C land vehicle tracking requires calibration of the Loran signals to respective geographic or map coordinate locations. The two systems being discussed use a linear approximation of the hyperbolic Loran grid. The Loran coordinate to display screen position algorithm is therefore, linear. Automatic tracking Loran receivers are installed in the vehicles. The receivers have been modified to output an audio band signal containing the two Loran time coordinates, the internal status of the receiver, a vehicle identification code, and 1 of 8 vehicle status codes entered on a manual keyboard located in the vehicle. A transmitter key control is also available. Commercial land mobile radios are used for transmission and reception of the audio signal. The land mobile receiver output at the base station is demodulated by a commercially available demodulator and input to the microcomputer on a serial port. After initialization of the system, map display, tracking, screen refresh, and status reporting are all automatic. /Author/

El-Sawy, AA Feuerstein, JW Mayer, RP (Mitre Corporation); Institute of Electrical and Electronics Engineers 1978, pp 157-161, 7 Fig., 2 Ref.; This paper was presented at the 28th IEEE Vehicular Technology Conference at Denver, Colorado, March 22-24, 1978. 12 184857 PHILADELPHIA FIELD TESTS OF AN OVERLAPPING SIGNPOST AVM SYSTEM DURING THE MULTI-USER AVM PROGRAM. The system tested was a direct proximity RF signpost system utilizing overlapping signposts operating at 49.86 MHz. Testing was divided into three categories, (1) random-route tests (taxi, police, pick-up and delivery, dial-a-ride), (2) fixed-route tests for transit-type vehicles, and (3) special tests for verifying performance under any conceivable urban environmental condition. The location system was specified to provide a basic vehicle location accuracy of at least 3000 feet at 95 percent and 450 feet at 99.5 percent of all test locations. At each checkpoint the location of the vehicle, as determined by the AVM System, was compared to the vehicle's actual location, the radial difference between these locations being the location error. For random route tests, signposts were installed such that the fields from adjacent signposts overlap. Each signpost periodically transmits a 16-Bit digital code using CFSK at 79.86 MHz. Each code includes a 7-Bit North code and a 7-Bit East code. Along any street, only the North or the East codes of adjacent signposts change, thereby creating a "chain." In the AVM equipped vehicle, a simple processor compares the codes received from adjacent signposts and determines if they "chain." By (1) identifying the code from the closest signpost, (2) comparing the codes from the two chaining signposts, and (3) comparing the levels received from each signpost, the vehicle is able to determine its location at one of five locations between each signpost pair. The combination of (1), (2), and (3) above results in an 18-Bit Location Region Code (LRC) which is stored in the vehicle until transmission over a communication link to the base station. At the base station each LRC is assigned to an X-Y coordinate in a data base file. Upon receipt of an LRC from a vehicle, the base station performs a table look-up and generates a physical X-Y location for the vehicle. When signposts are laid out as in the Philadelphia tests, an average of six unique LRC's are generated for each signpost. Thus, ignoring the perimeter, the number of valid X-Y location coordinates is approximately six times the number of signposts. Hoffman signposts may be laid out in different patterns. This flexibility allows virtually any specified location accuracy to be achieved. During fixed-route tests, signposts were located approximately one mile apart along the route. These signposts cause an odometer on the vehicle to be reset. An algorithm based on the last received signpost code and the elapsed odometer distance, provided accurate vehicle location. Testing involved recording, on cassette, the LRC output from a vehicle unit, the output of a reference fifth-wheel, and a series of manual reference inputs. Off-line processing of these cassettes produced location error statistics. Test results, including the effects of a simulated 5 percent communication error rate are presented.

12 185382 SOUTHEAST EXPRESSWAY HIGHWAY OCCUPANCY VEHICLE LANE EVALUATION REPORT. A non-separated concurrent-flow lane was instituted on Boston's Southeast Expressway on May 4, 1977. An eight-mile section of the left-most inbound lane was reserved for buses and carpools of three or more persons between the hours of 6:30 a.m. and 9:30 a.m. There were no official intermediate points of access or egress, removable plastic inserts were used to separate the lane from the other northbound lanes, and compliance was voluntary until October 17, 1977. Construction on a portion of the roadway began in June, 1977, reducing capacity at that point by about 25 percent. The report describes the project development, implementation, and operations and addresses impacts in the following areas: travel times on the Expressway and alternate routes; transportation system use patterns; cost of express lane operation; violations, enforcement, and safety; and institutions and attitudes. By the end of the project the Expressway was carrying eight percent fewer people while the number of automobiles had declined 16 percent, reflecting a 71 percent increase in the number of carpools. Bus ridership increased by only 5 to 6 percent while ridership on rapid rail increased by 12 percent. Travel times were lower during the summer months for all Expressway users, but during the enforcement period an average trip in the general lanes took 7.5 minutes longer. The violation rate fell from 80 percent to 35 percent when enforcement was initiated. /Author/

12 185703 BUS TRANSPORTATION. PART 2. LOCAL STUDIES (A BIBLIOGRAPHY WITH ABSTRACTS). The second part of a two-part study of bus transportation, principally in the U.S., covers the planning, testing, operation, and evaluation of bus systems and facilities in specific localities. Abstracts are alphabetically arranged according to the states or other areas from which information has been obtained. The materials deal with community relations, environmental issues, financing, management, maintenance, problems, benefits and costs, alternatives, travel patterns and modes, demand, vehicles, theories, and social aspects. Feasibility studies, performance assessments, public relations, road and highway issues, experimental programs, local projects, and special services are also included. (This updated bibliography contains 259 abstracts, 27 of which are new entries to the previous edition.)

12 186167 ACCELERATING MOVING WALKWAY SYSTEMS. MARKET ATTRIBUTES, APPLICATIONS, BENEFITS, REPORT D. This report is part of a series that assesses the technology and development of Ac-

celerating Moving Walkway Systems (AMWS). The system is a pedestrian assist device with the capability through changing treadway configuration to accelerate pedestrians to 4 to 5 times the normal entrance speeds after boarding, and to decelerate prior to discharge. This report attempts to show how AMWS offers the prospects of improving average pedestrian speeds and trip times and reduces human energy expenditure. This would effectively extend the pedestrian range and provide for increased urban development constrained by the limits of acceptable walking distance. Pedestrian movement within cities is not always convenient, vehicular transportation does not function well on congested urban streets, vehicles pollute and are energy intensive, and the central city is in need of improvement in its quality of life. Effective human scale horizontal movement systems are seen as an important means of fulfilling many of these objectives. Potential applications include feeders to transit; substitutes for AGT, bus, or rail; airport movement systems; urban land use integrators; and vehicle free zone support systems. Benefits include improved transit connections, pedestrian safety, reduced pollution and energy use, and improvements in urban life.

12 186230 THE NEW YORK CITY DOUBLE DECK BUS DEMONSTRATION PROJECT: AN EVALUATION. REPORT NO. 2 (FINAL). This report is the second of three documents that constitute an evaluation of the Double Deck Bus (DDB) Project sponsored by UMTA. The project was conducted in New York City and Los Angeles (July 1974-June 1977). The primary objective at the two sites was to assess potential increases in vehicle productivity in an express, limited busway service (L.A.) and in regular service (NYC). DDB carry from 68-84 passengers; conventional buses carry from 45-47 passengers. Both buses require a single transit employee, the driver. This report provides a comparative evaluation between the eight British Leyland double deck buses and four conventional GM buses in New York City. Bus routes in New York were characterized by congested traffic, heavy passenger loads, frequent stops, and frequent passenger turnover. Only seven months of revenue service data were analyzed, due to delays in manufacturing and in satisfying U.S. safety and environmental requirements. The evaluation considers passenger acceptance/perceptions of the DDB vis-a-vis the conventional bus. Statistics are presented on schedule adherence, dwell times, passenger throughput, vehicle reliability, on-board safety, repair and maintenance costs, and fuel and oil consumption. This report concludes that: passengers preferred the DDB; there were no serious problems with the use of internal stairs nor with crime or vandalism on the second level; the DDB project was hampered by problems related to the purchase of foreign vehicles and their re-design to meet American requirements; and the results favored the incorporation of the double decker into the American bus fleets from

both an economic and level-of-service point of view.

McCall, CHJ Simkowitz, HJ ; CACI, Incorporated, Urban Mass Transportation Administration UMTA-NY-06-0044-78-1, May 1978, 200 p.; See also Report No. 3, PB-297837.; Contract DOT-TSC-1082; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-287836/1ST

12 186231 THE LOS ANGELES DOUBLE DECK BUS DEMONSTRATION PROJECT: AN EVALUATION. REPORT NO. 3 (FINAL). This report is the third of three documents that constitute an evaluation of the Double Deck Bus (DDB) project sponsored by UMTA. The DDB project involved the purchase and operation of contemporary DDBs in New York City and Los Angeles (July 1974-June 1977). The intent was to assess whether the DDB was able to make its greater passenger capacity available at a cost per capacity-mile less than or equivalent to its conventional counterpart. DDBs carry from 68-84 passengers; conventional buses carry from 45-47 passengers. Both buses require a single transit employee, the driver. This report provides a comparative evaluation between the two German Neoplan DDBs and the two conventional Flexible buses, and it explores vehicle-related, transit operator-related, and user-related issues. In Los Angeles, the two Neoplan buses operated between the suburbs and the central business district, providing a combination of express and collection/distribution/park-and-ride services. Only eleven months of revenue service are analyzed, due to project delays to correct original manufacturing deficiencies. This evaluation considers passenger acceptance/perception of the DDB vis-a-vis the conventional bus. Statistics are presented on schedule adherence, dwell times, passenger throughput, vehicle reliability, on-board safety, repair and maintenance costs, and fuel/oil consumption. The report concludes that: passengers (52%) preferred the DDB; operating costs were nearly identical for the two bus types; major delays were associated with debugging and retro-fitting the DDBs; and results argued for the incorporation of the DDB into the American bus fleets from both an economic and level-of-service point of view.

McCall, CHJ Simkowitz, HJ ; CACI, Incorporated, Urban Mass Transportation Administration UMTA-CA-06-0069-78-1, May 1978, 142 p.; See also PB-287838.; Contract DOT-TSC-0069; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-287837/9ST

12 186232 THE DOUBLE DECK BUS DEMONSTRATION PROJECT: EXECUTIVE SUMMARY. This report is one of three documents that constitute an evaluation of the Double Deck Bus (DDB) Demonstration Project sponsored by UMTA. The project was conducted in Los Angeles and New York City (July 1974-June 1977). The primary objective at the two sites was to assess potential increases in vehicle productivity in an express, limited busway service (L.A.) and in regular service (NYC). DDB carry from 68-84 passengers; conventional buses carry from 45-47 passengers. Both buses require a single transit employee, the driver. In New York City, eight British Leyland double deckers operated on two Manhattan routes characterized by congested traffic, heavy passenger loads, frequent stops, and frequent passenger turnover. In Los

Angeles, the two German Neoplan buses operated between the suburbs and the central business district, providing a combination of express and collection/distribution/park-and-ride services. Seven months of revenue service were analyzed for NYC project and eleven months of revenue service for Los Angeles. The evaluation considers passenger acceptance/perceptions of the DDB vis-a-vis the conventional bus. Statistics are presented on schedule adherence, dwell times, passenger throughput, vehicle reliability, on-board safety, repair and maintenance costs/capacity mile, and fuel and oil consumption rates. It was concluded that: passengers preferred the DDB; foreign production line vehicles should have been treated as prototypes and undergone extensive on-site testing and re-design before they were produced as standard production line vehicles and accepted for revenue service--this procedure is recommended for all future purchases of double deck vehicles.

12 188356 THEORETICAL CAPACITY AND SPACE REQUIREMENTS OF HEAVY RAIL AND BUS RAPID TRANSIT. An investigation has been made to establish the theoretical capacity of an unidirectional single track heavy rail transit service as offered by the South African Railways and a similar study has been made for an exclusive unidirectional single bus-way. This information is used to examine the spatial requirements per passenger for these two modes of transport for an open section right of way, an intermediate halt and a terminal, and to subsequently determine the effectiveness of these two high density urban passenger systems.

12 188381 SELECTIVE DETECTION-CENTRAL SWANSEA. The purpose and operation of the detection system using a passive unit mounted under a bus and buried loops in the road powered from roadside equipment is discussed. A brief history of the development of selective detection is given. The system is used in non-segregated flows to give buses a higher priority at traffic signals. Provisions are made to compensate other traffic after a bus priority sequence has operated and ensure that buses do not take complete control of a junction. The effect on the travelling public, motorists and pedestrians is examined. It is estimated that a high rate of return will be obtained with benefits to public transport and private vehicles making more efficient use of junctions outweighing the slight disbenefits to motorists on non-priority approaches. The cost of providing bus priorities by bus-lanes or any other means is far greater. The Swansea System, the first operational system in Europe will be closely monitored and modified if required. /TRRL/

12 188384 STUDY OF BUS TRAFFIC CONTROL IN AN URBAN ENVIRONMENT. APPENDIX: SIMULATION (RESBUS PROGRAM) [Etude sur le controle et la regulation d'autobusen milieu urban. Annexe: Simulation (Programme Resbus)]. This report describes part of the research into processes for improving the regularity or level of service of a bus network. The appendix "simulation" (resbus program) outlines the simulation approach used to investigate the different processes on a network. The program takes the passengers into account individually by means of an origin-destination, station to station or zone to zone matrix. The simulation is applied to the case of the public transport network of the town of Besançon. /TRRL/ [French]

12 189098 SAN BERNARDINO FREEWAY EXPRESS BUSWAY EVALUATION OF MIXED-MODE OPERATIONS. Evaluation of the San Bernardino Freeway Busway has been going on since it was opened in January 1973. From October 1976 through June 1978, carpools of three or more were permitted on this previously bus-only facility. This report evaluates mixed-mode (bus and carpool) operations of the busway; it includes a summary of the bus-only phase (Jan. 1973-Oct. 1976) as well as implications of this research to other possible busway developments. Data was collected from traffic studies and from written and oral surveys. All of the surveys are described in detail in Appendixes A through D of this report. This project has shown that busways can be cost-effective, non-controversial, and a way of attracting substantial numbers of solo auto drivers into buses and carpools. There are about 2600 people now carpooling as a direct result of mixed-mode busway operations. Surveys show that public opinion at all levels support the mixed-mode operation of the busway. The busway is an 11-mile, double-lane, exclusive roadway for high occupancy vehicles, running eastward from downtown Los Angeles. The busway lanes are physically separated by either concrete or flexible barriers from auto traffic lanes, making it a true rapid transit system for buses and carpools. This \$57 million system is the most complete facility of its kind in the country, with offline stations, park-ride facilities, two uni-directional bus lanes, feeder bus lines, outlying park-pool lots, and supplemented by a downtown reserved lane. This report concludes that the user-cost savings, for busway-induced carpools and bus riders only, cover two thirds of the annual (capital and operating) costs of the busway. /UMTA/

12 190932 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-1. EVALUATION OF THE NW 7TH AVENUE EXPRESS BUS AND BUS PRIORITY SYSTEMS. This report presents a summary of the evaluation of Phase I of the I-95/NW 7th Avenue Bus/Car Pool Systems Demonstration Project in Miami. The twenty-six month Phase I evaluation consisted of evaluation of several techniques for providing express buses with a priority service on an urban arterial street. Four bus priority systems were implemented and evaluated on NW 7th Avenue in Miami. These systems were: buses with traffic signal preemption capability in mixed mode operation; buses with traffic signal preemption capability in a reversible exclusive bus lane; buses in the exclusive lane with traffic signal progression; and buses with traffic signal preemption capability in the exclusive lane with traffic signal progression. For the traffic pattern and geometric configuration on NW 7th Avenue, it was found that the travel times for both buses and autos were reduced under each of the priority treatments. Auto accident rates were unaffected but the provision of the exclusive bus lane introduced some problems with bus accidents. Buses moved up to 25% of the passengers and represented less than 2% of the vehicles in the traffic stream. The express bus system achieved a modal split of 8.6% of the potential trips. Several inefficiencies in the transit system reduced the economic viability of the transit service.

Wattleworth, JA Courage, KG Wallace, CE Wolfe, RS Reaves, DP ; Florida University, Gainesville, Urban Mass Transportation Administration, Florida Department of Transportation, (UMTA-FL-06-0006) Final Rpt. 12 190933 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-2. EFFECTS OF NW 7TH AVENUE BUS PRIORITY SYSTEMS ON BUS TRAVEL TIMES AND SCHEDULE VARIABILITY. Bus priority techniques have been widely implemented in recent years in an effort to improve the effectiveness of public transportation. To facilitate the evaluation of bus priority operations, a new automated technique for data recording and analysis was developed and applied to a demonstration project in Miami, Florida, in which two schemes were evaluated. The first involved preemption of 35 traffic signals along an arterial route. In the second, an exclusive bus lane was added to the system, with the signal preemption features retained. The measures of effectiveness used to evaluate the two bus priority techniques include speed, delay, travel time, fuel consumption, and comfort measures such as speed noise, number of stops, and speed changes. It was found that both priority techniques resulted in significant improvement in all of the measures of effectiveness. The most dramatic improvement occurred in the number of unscheduled stops, which were reduced by 87%.

12 190934 I-95 NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-3. CHANGES IN TRANSIT OPERATIONAL CHARACTERISTICS ON THE NW 7TH AVENUE EXPRESS BUS SYSTEM. This report was written to present the evaluation of the operational characteristics of the Orange Streaker express bus system. The evaluation was conducted collecting data needed to develop primary and secondary measures of system performance for determination of system operating, ridership and revenue characteristics of the Orange Streaker system. The analysis showed that one-way peak period express service resulted in large portions of non-productive (deadhead) time and miles. Ridership generally increased although some routes experienced low levels of utilization. The fare structure provided revenue-generating characteristics that were inadequate to support the quality of service provided. Service modifications to improve the efficiency of operation and fare increases are necessary to reduce deficit operations.

12 190936 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-5. EFFECT OF THE PARK'N'RIDE FACILITY ON USAGE OF THE NW 7TH AVENUE EXPRESS BUS SYSTEM. This report presents a description of the Golden Glades Park'n'Ride Facility and an assessment of the impact of the Facility on usage of the I-95/NW 7th Avenue Express Bus/Car Pool Systems Demonstration Project during Phase I. The Golden Glades Facility is an intermodal transfer facility which provides parking for persons transferring from the auto mode to the express bus or car pool mode. The Facility serves as a staging area for Orange Streaker buses and car pools with provisions for kiss'n'ride and local bus transfers, as well as the park'n'ride transfers. Covering 8.1 acres and providing 967 parking spaces, the Facility is located at the southern end of the Project market area with access to the Project corridor via NW 7th Avenue. This report represents an analysis of data from daily MTA starter counts, input/output studies, air photo studies, system user and intermodal transfer studies, which were used to determine the type of use, growth, and distribution of vehicles as they arrived and left the Facility.

sored in part by Florida State Dept. of Transportation, Tallahassee.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-291141/0ST

12 190937 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-6. EFFECTS OF NW 7TH AVENUE BUS PRIORITY SYSTEMS ON NW 7TH AVENUE TRAFFIC STREAM FLOW AND PASSENGER MOVEMENTS. The purpose of this report was to document the effects of several bus priority systems implemented on NW 7th Avenue in Miami, Florida, on traffic stream flow and passenger movement characteristics. Data were collected regarding traffic volume, vehicle occupancy, system delay (air photos), violations of the reserved lane, auto travel time and accidents. Analyses were conducted to determine the effects of each bus priority system on the operational characteristics of automobile traffic and passenger movements on NW 7th Avenue. Some of the general conclusions were: (1) none of the implemented bus priority systems produced an adverse effect on auto traffic and, in fact, the auto traffic was generally improved under all bus priority systems; (2) the bus priority system consisting of a reversible, exclusive bus lane and traffic signal progression produced better operation for the automobile traffic than did the systems which used the exclusive bus lane and traffic signal preemption; (3) the initiation of the exclusive lane was associated with a significant increase in bus accident rates; after a 'start up' period, the bus accident rate decreased somewhat but still remained higher than the bus accident rate before the initiation of the bus lane; (4) the rate of violation of the reserved lane was relatively low (about 5%); there was an indication that the violation rate decreased with time as drivers learned of the reserved lane and left turn restrictions.

12 190938 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-7. EVALUATION OF THE CHARACTERISTICS OF USERS AND NON-USERS OF THE NW 7TH AVENUE EXPRESS BUS/CAR POOL SYSTEM. This report presents the findings of three surveys performed during Phase I of the I-95/NW 7th Avenue Express Bus/Car Pool Systems Demonstration Project. The surveys were administered to obtain data on the socio-economic, travel, and attitudinal characteristics of two types of transit users, express bus passengers and Golden Glades car pool patrons; and similar data from a representative sample of non-users from among the target market population. The user surveys were self-administered questionnaires distributed to the respondents at the Golden Glades Terminal while the non-user survey consisted of telephone interviews conducted by a market research firm. An analysis of the data indicated that the users

differed from the non-users with respect to the distribution of several socio-economic traits within each group. Users had a disproportionately larger percentage of females while the non-users had a greater concentration of males. This difference carried over to other socioeconomic traits as well.

Reaves, DP Goldberg, AP Wolfe, RS Wattleworth, JA Wallace, CE ; Florida University, Gainesville, Urban Mass Transportation Administration, Florida Department of Transportation, (UMTA-FL-06-0006) Final Rpt. 12 190939 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-8. EFFECT OF THE BUS PRIORITY SYSTEMS OPERATION ON PERFORMANCE OF TRAFFIC SIGNAL CONTROL EQUIPMENT ON NW 7TH AVENUE. This report deals with the effects of a bus preemption system on the traffic control system operation on NW 7th Avenue in Miami. The quantities examined in detail were the operating parameters of the signal system, i.e., cycle length, bus phase length, non-bus phase length, etc. Substantial variation in these parameters was found throughout the course of the Project. However, most of the variation was attributable to misoperation of detectors and other signal equipment and to changes in the design parameters which were necessary throughout the course of the Project. The bus preemption system performed satisfactorily from a reliability point of view. No difficulties were experienced either with the failure to recognize buses or with false alarms. Preemption equipment problems accounted for only 3 percent of the maintenance calls. The traffic control system itself, however, presented somewhat of a maintenance problem. The rate of maintenance calls for this particular system was approximately double the county-wide average. The introduction of the computerized signal system on NW 7th Avenue compounded the general maintenance problem.

Courage, KG Wallace, CE Wattleworth, JA ; Florida University, Gainesville, Urban Mass Transportation Administration, Florida Department of Transportation, (UMTA-FL-06-0006) Final Rpt. 12 190940 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-9. ECONOMIC VIABILITY OF THE NW 7TH AVENUE EXPRESS BUS OPERATION. Several priority techniques were tested in Miami, Florida, to demonstrate methods of providing preferential treatment for express buses on an arterial highway (NW 7th Avenue). The techniques implemented and evaluated included express bus preemption of traffic signals, progression of traffic signals to favor express flow and a reversible, exclusive lane for the express buses. Also included in the Project was a new park'n'ride lot and

deluxe buses for the transit service. All of the priority techniques proved to be highly successful in improving the quality of transit service, particularly in terms of travel time advantages. However, the cost of several of the priority treatment strategies was quite high, both to implement and to operate. The benefits derived were in terms of reductions in vehicle miles per person, and total passenger hours per person in the corridor. Economic analyses were conducted to determine the economic viability of the transit service, the cost trade-off for express transit users and the total system cost effectiveness.

12 190975 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT II-1. EVALUATION OF THE I-95 EXPRESS BUS AND HIGH OCCUPANCY VEHICLE PRIORITY SYSTEMS. This report, Report II-1, presents a summary of the evaluation of Phase II of the project, and it consists of the evaluation of the effect of the exclusive bus/car pool lanes on the I-95, Golden Glades Park'n'Ride facility, and a direct flyover connector between the facility and the reserved lanes on I-95.

Wattleworth, JA Courage, KG Long, G Wallace, CE Wolfe, RS ; Florida University, Gainesville, Florida Department of Transportation, Urban Mass Transportation Administration, (UMTA-FL-06-0006) Final Rpt. UMTA-FL-06-0006-78-10, Sept. 1978, 143 p.; Sponsored in part by Florida Department of Transportation. See also PB-291147 and PB-291145.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-291146/9ST

12 190976 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT II-2. EVALUATION OF THE EFFECTS OF THE I-95 EXCLUSIVE BUS/CAR POOL LANE PRIORITY SYSTEM ON VEHICULAR AND PASSENGER MOVEMENTS. Express bus operations on the new priority lanes on I-95 in March 1976 constitute Phase II of the project. The report, Report II-2, discusses the effects of priority systems on vehicle operations, passenger movements, violations and enforcement, and safety. The report concludes that: all travel times were reduced when lanes were opened; violation rate dropped from 63% (three persons occupancy) to 37% (two persons occupancy); additional lanes on I-95 significantly decreased the accident rate on a daily basis.

12 190977 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT II-3. EVALUATION OF THE EFFECTS OF THE I-95 EXCLUSIVE BUS/CAR POOL PRIORITY SYSTEM ON THE EXPRESS BUS SYSTEM. Express bus operations on the new priority lanes on I-95 in March 1976 constitute Phase II of the project. This report, Report II-3, presents the evaluation of the effects of Phase II on the express bus and car pool operation. In addition, the effect of Park'n'Ride facility and flyover ramp on the utilization of the I-95 priority system is presented along with the effect of the marketing program. The economic viability of the I-95/NW 7th Avenue bus/car pool priority systems is also presented.

12 193619 ANALYZING TRANSIT OPTIONS FOR SMALL URBAN COMMUNITIES. VOLUME I: TRANSIT SERVICE OBJECTIVES AND OPTIONS. The information and analytical techniques contained in this manual are designed to assist in the planning of new or improved transit services in small urban communities with less than 200,000 residents, that are currently sponsoring, promoting, providing, or considering such services. Portions of the manual will be useful in larger urban areas. Techniques are presented to assist in planning for both conventional bus transit and paratransit alternatives and for estimating the demand, cost, and revenue implications of various transit service alternatives. Opportunities for Federal and State financial assistance are summarized, Federal requirements are described, and the experience of urban communities involved in local mass transportation is illustrated. Volume One contains Chapters 1 through 4, and presents a generalized process for planning transit and paratransit options in small urban communities. The process consists of a logical sequence of steps which combine the form basic tasks. These tasks are outlined in the report. Information is presented to assist in the first and second set of activities in the planning process, which includes discussions of the relationship between goals, standards, and criteria; the importance of transit service objectives; guidelines for establishing local transit goals and objectives and for assessing the local need for transit service; and the range of characteristics that differentiate between transit service alternatives. In addition, the capabilities of specific modal opportunities are summarized, and their relationship to the achievement of local transit service objectives are addressed. A Listing of Publications is included for guidance in preparing the design of the alternatives. /UMTA/

James, DH, Transportation Consultant ; Peat, Marwick, Mitchell and Company, (IT-06-9020) Manual UMTA-IT-06-9020-78-1, Jan. 1978, 109 p.; Sponsored by the Urban Mass Transportation Administration. Experience". (Three volume set available as PB-291449.); Contract DOT-UT-50021; ACKNOWLEDGMENT: UMTA, NTIS; ORDER FROM: NTIS; PB-291450/AS

12 193620 ANALYZING TRANSIT OPTIONS FOR SMALL URBAN COMMUNITIES. VOLUME TWO: ANALYSIS METHODS. The information and analytical techniques contained in this manual are designed to assist in the planning of new or improved transit services in small urban communities with less than 200,000 residents, that are currently sponsoring, promoting, providing, or considering such services. Portions of the manual will be useful in larger urban areas. Techniques are presented to assist in planning for both conventional bus transit and paratransit alternatives, and for estimating the demand, cost, and revenue implications of various transit service alternatives. Opportunities for Federal and State financial assistance are summarized, Federal requirements are described, and the experience of urban communities involved in local mass transportation is illustrated. Volume Two contains Chapter 5 of the manual. The transit planning process in small urban communities consists of a logical sequence of steps, which combine to form basic tasks, and are outlined in Volume One. Volume Two presents information and techniques designed to assist in the third set of activities in the planning process. Evaluation is an activity that continues throughout this process, and is based on: (1) the degree to which each alternative achieves transit service objectives set by the community or transit manager; and (2) the financial implications of each alternative in relation to transit service cost limits or budgets set by the community. In this volume, an evaluation approach is described and detailed techniques are presented with which one can estimate the patronage, cost, and revenue implications of a transit service operation, which are the key elements in evaluating transit service alternatives. References are also contained herein. /UMTA/

12 193621 ANALYZING TRANSIT OPTIONS FOR SMALL URBAN COMMUNITIES. VOLUME THREE: SUMMARY OF MANAGEMENT AND OPERATIONS EXPERIENCE. The information and analytical techniques contained in this manual are designed to assist in the planning of new or improved transit services in small urban communities with less than 200,000 residents, that are currently sponsoring, promoting, providing, or considering such services. Portions of the manual will be useful in larger urban areas. Techniques are presented to assist in planning for both conventional bus transit and paratransit alternatives, and for estimating the demand, cost, and revenue implications of various transit service alternatives. Opportunities for Federal and State finan-

cial assistance are summarized, Federal requirements are described, and the experience of urban communities involved in local mass transportation is illustrated. Volume Three contains the last chapters of the manual, which are 6 and 7. This volume describes the activities of a transit operation, explores the relationships between these activities, identifies arguments for and against local control of transit organizations, provides estimates of stall requirements of various-sized transit systems, and describes the desired characteristics of a transit manager. Numerous data and statistics are given on the financial and operating performance of existing conventional transit and paratransit services in small urban communities. This information is available for the quick evaluating of transit service alternatives in comparable communities. A Listing of References is also contained herein. /UMTA/

12 193915 COMBINATORIAL PROBLEMS IN AN ADAPTIVE PUBLIC TRANSPORTATION NETWORK. The paper addresses the following combinatorial problems: what are the minimal number of buses and drivers needed to keep up an adaptive public transportation network with prescribed departure and travel times. The system is adaptive in the sense that buses as well as drivers are not restricted to travel only one given two way line, but may also traverse among lines. However, adaptation to passenger loading is not yet directly considered. The relaxation of the "two way lines" constraint should provide more flexibility in employing the resources required to maintain and operate the network. No assumptions are imposed upon either the departure or travel times. The solution process is simple and intuitive and it seems that it can serve as a basic framework for accommodating some changes in the underlying structure of the system. The algorithm is an interim step in a mathematical program where the departure times are taken as control variables and are selected to minimize the average waiting time of passengers, or alternatively other performance indices of the network. The final buses' trips are not unique and their choice is subject to managerial considerations.(a) /TRRL/

12 193921 BUS CONTROL: A REVIEW OF PRESENT KNOWLEDGE. The routes where bus control will lead to the greatest benefit are the heavily congested, high frequency routes in urban areas. The types of control system considered are: (1) roadside inspector systems, which are efficient when operated effectively (however, their use is likely to decline owing to high staff costs.); (2) centralised systems relying primarily on the use of radio-telephones, which is potentially the cheap-

est method of control in many instances (however, their effectiveness depends on the accuracy of information passed to the controller and the ability to maintain effective supervisory control if roadside staff are withdrawn); and (3) centralised systems relying on the use of radio-telephones in conjunction with some form of vehicle monitoring. Some experimental systems introduced in the UK were unnecessarily complex. A possible low cost system is outlined. Various manipulatory control actions, together with comments on their potential limitations, are given. /TRRL/

12 193923 APPLICATIONS OF TRANSYT [Toepassing van transyt]. TRANSYT is a computer program that simulates and optimizes the traffic flow in a network with controlled intersections. The program has shown to be a good study tool and an instrument for the design of control schemes. The program has some restrictions because it works with fixed traffic volumes and fixed control schemes. It is possible, however, to construct traffic dependant modifications, for instance to give absolute priority to vehicles of public transport. This paper describes some possibilities and restrictions of TRANSYT. /Author/TRRL/ [Dutch]

12 195415 THE DEVELOPMENT AND TESTING OF A COST EFFECTIVE TRANSIT PASSENGER COUNTER. Presently transit properties must conduct costly labour intensive and time consuming passenger counts in order to assess in a reliable way the performance of the system and to improve responsiveness of operations. Because of the costs and the number of field staff required these counts are generally carried out infrequently, on a fragmentary basis, and are sometimes not particularly reliable. Because of their infrequency, they do not provide a dynamic up-to-date picture of the transit property's market penetration and changing demand situations on the various routes in the system. To overcome this, the IBI group has developed and continues to develop for a number of properties (Toronto, Edmonton and Mississauga) transit passenger counting systems and prototype devices tailored to the needs of these properties. The purpose of this paper is to review the costs and benefits involved in counting passengers manually vs mechanically; the approach taken in developing counting devices for Edmonton and Toronto; the development, testing and performance characteristics of these devices, and provide some guidance on realistic passenger counter criteria such as costs, accuracy, reliability, adaptability, flexibility, etc. /TRRL/

12 195450 STATISTICAL ANALYSIS OF AN URBAN BUS ROUTE. The present paper is a mathematical description of an urban bus route carrying peak hour traffic. The deterministic and stochastic mechanisms of bus operation are analysed-with focus on time evolution-and general models for route structure, boarding and alighting, link travel times and stop times are formulated. Estimation of model parameters is performed on data from a bus route in central Stockholm. Various measures of goodness of fit are used for validation and model choice, the final models being chosen primarily for application in an interactive simulation program. /TRRL/

12 195459 A TIME DEPENDENT MODEL FOR SIMULATION OF AN URBAN BUS ROUTE. During the interactive simulation, the route and the buses are shown on a display. The operator acts from a keyboard by giving commands e.g. for an extra bus or to turn a bus short of its terminus, as in real traffic. The purpose is to evaluate control strategies in varying situations, by repeated simulation runs of one or two strategies, for the training of controlling operators and for the assistance of traffic engineers in formulating general rules for strategy application. The program collects overall statistics automatically, but the operator has to ask for local data e.g. waiting times at certain stops. The report refers to an example from a bus route in Stockholm, where each simulated 20 min run takes 0.8 seconds cpu-time on a Dec-10 computer. /TRRL/

12 195882 FOURTH U.S.-GERMAN URBAN TRANSPORTATION WORKSHOP, LOS ANGELES, SAN FRANCISCO, CHICAGO, CAMBRIDGE, APRIL 17-25, 1978. The Fourth US-German Workshop on Urban Transportation was conducted in the United States on April 17 through April 25, 1978. These workshops are held in alternate years in the Federal Republic of Germany and the United States on their basis of International agreements between the Federal Ministry of Transportation, the Federal Ministry of Research and Technology, and the U.S. Department of Transportation. The purpose of the Workshops is to share experience and research

findings relative to policy, finance, planning, management, operations, and technologies in the field of urban transportation. The visiting group generally consists of from 12 to 15 delegates. Half of these represent the Federal Government and the other half represent local governments and the transportation industry. This report contains papers presented during the conference portion at the Transportation Systems Center (TSC) at Cambridge on April 24 and 25. The conference sessions were preceded by a series of briefings, discussions, and site inspections in Los Angeles, San Francisco, and the Chicago during the week of April 17 through April 21. Topics presented in the conference at TSC include: planning; legislation and finance policies in the United States and the Federal Republic of Germany; progress in performing alternative analyses for making urban transportation decisions in the United States; preliminary findings of the Service and Methods Demonstrations Program of the Urban Mass Transportation Administration (UMTA); practical organizational approaches toward public transportation in semi-urban areas in Germany; recent developments in bus and paratransit in both countries; rail safety practices and railcar standardization approaches in both countries; and marketing research in the United States. Papers or summaries of papers are provided in both English and German. /UMTA/

12 196812 ELECTRIC CARS-THEIR FUTURE ROLE IN URBAN TRANSPORT, CANBERRA, 1975. CONFERENCE PAPERS. This conference was arranged by the Bureau of Transport Economics, Australia in conjunction with the Australian Electric Vehicle Association. Papers presented at the conference discussed topics such as the future transport needs of Australian cities, the role of electric vehicles, and the potential demand for electric vehicles in the future. The impact of electric vehicles on the environment is also discussed. Electric vehicle operating costs, energy consumption of these vehicles compared to motor vehicles running on petroleum as well as technological developments in motor and control systems, batteries and the overall design of electric cars and commercial vehicles are also covered. /TRRL/

12 196816 NEW STRUCTURES FOR AUSTRALIAN CITIES: THE ROLE OF ELECTRIC VEHICLES. The cities commission has just completed a study examining possible future structures for Australian cities. The study concerned new cities in metropolitan and other regions and the planning and development opportunities they offer. It did not attempt to design any specific new city, but rather to suggest a range of urban forms which might be considered when developing new cities; to discuss some techniques for planning and developing them; and to introduce some considerations which normally have not been part of city planning in Australia. This

paper highlights the role electric vehicles could play in the four alternative new city models developed. /Author/TRRL/

12 197028 RIDE A BENDIBUS TO BANBURY CROSS. Details are given of the performance and of some of the handling characteristics of the man bendibus during a trial drive around the country market town of Banbury. Banbury itself has narrow congested streets and the surrounding housing estates were not planned with public transport in mind. The bus is designed to the standard German VOV Bus layout, is of integral construction having 4 doorways, seats 63 with space for 96 standing passengers-a total of 159. Its manoeuvrability is said to be impressive though it really requires modern city layouts of countries such as the USA. The author does not see the bus being widely adopted in the United Kingdom where urban bus operations are geared to the short, large capacity double-decker and the introduction of a bus of this sort would lead to many changes in fare structures and collection systems and in many cases could lead to a complete revision of routes and siting of stops. /TRRL/

12 197357 DESIGN GUIDELINES FOR PARK-AND-RIDE FACILITIES. The report presents guidelines for designing bus park-and-ride facilities. Specifically, guidelines are developed for: (1) locating park-and-ride lots; (2) determining the desired size of a park-and-ride lot; (3) evaluating the capacity of selected design components of the lot (access/egress, kiss-and-ride, bus loading spaces, shelter area); and (4) establishing the physical layout of the parking area. The guidelines developed should be of greatest use to those individuals already familiar with typical parking lot design who are involved in the initial design of new park-and-ride facilities.

12 197646 EVALUATION OF PASSENGER COUNTER SYSTEM FOR AN AVM EXPERIMENT. VOLUME I: TECHNICAL REPORT. Passenger count information is needed by transportation planners and transit management to determine total transportation system requirements based on projected passenger movement throughout the transit network. This report, Volume I, contains the results of an evaluation of three commercial transit-line passenger counter systems for use in transit buses, namely: Dynamic Controls, Inc.; Dyniman, Inc.; and International Pro-data Corporation. (One counter incorporated treadle mats at each door step, and the other two

counters incorporated infrared beams established across each doorway.) The evaluation was conducted to assess the potential performance of these systems for use as part of the Multi-User (Automatic Vehicle Monitoring) System. It involved three phases: (1) controlled testing of each candidate's counting accuracy under laboratory conditions; (2) simultaneous field testing of all three candidates on a transit bus during normal in-service operation; and (3) simultaneous environmental testing of the three candidates' sensors. The evaluation results indicated that the passenger counter which incorporated treadle mats operated by the pressure of passengers' feet, exhibited slightly superior counting performance under virtually all test conditions.

12 197691 CONTROL OF SERVICE RELIABILITY IN URBAN BUS NETWORKS: SIMULATED MODEL USERS' MANUAL. The manual provides the information required to use the bus network simulation model developed as a part of a project on analysis of control strategies for improving service reliability. The manual includes: (1) information on computer requirements, preparation of inputs and interpretation of outputs, and limits on the size of system which can be modeled; (2) detailed descriptions of all major subroutines; (3) error messages which can be produced by the model; and (4) a sample problem set-up.

12 198144 BROOME COUNTY / TOWN OF OWEGO RURAL-URBAN TRANSPORTATION / HUMAN SERVICES STUDY. The results of a 10-month study of the potential for rural transit development and coordination of human service agency transportation in Broome County and the town of Owego, New York, are presented. Existing conditions in the study area

are described, as well as the planned rural transit system design. Consideration is given to alternative rural transit systems, the recommended transit system design, the 5-year development program for the area, the management approach, the implementation plan, the marketing plan, and human service agency coordination. The recommended rural transit system is a demand-response service with a 24-hour advance notice requirement. This service will operate from 8 a.m. to 6 p.m., Monday through Friday. Coordinated transfers between the rural transit system and the Broome Transit System will be available in downtown Binghamton. The basic fare for the recommended system is \$0.25 per trip. It is also recommended that one free transfer to the Broome Transit System be allowed for each trip into the urban area and that a discount ticket program be initiated. The proposed management structure for the rural transit system includes the Broome County structure which is already operational and a transportation commission for the town of Owego. Data on financial projections and the cost structure are provided. Coordination and consolidation are the two key concepts recommended to facilitate implementation in the study area. Five coordination and consolidation elements are identified: information and referral coordination, volunteer driver coordination, an operations clearinghouse, centralized dispatching, and consolidation.

12 198677 APPLICABILITY OF DIGITAL DATA COMMUNICATION FEATURES IN PUBLIC TRANSIT SYSTEMS: EXECUTIVE SUMMARY. A survey was conducted of the state of the art of automatic vehicle monitoring (AVM) systems and their use in public transit, taxi, and police operations. The survey identified systems applicable to improving operational efficiency and quality of service, and reviewed various of their elements related to AVM systems. These elements included vehicle location, vehicle identification, vehicle monitoring, computer scheduling, computer dispatch, silent alarms, security alarms, mechanical alarms, on-board readout, real time display, passenger counting, management reporting, and digital data hardware.

12 198752 VEHICLE DETECTION, PHASE III: PASSIVE BUS DETECTOR/INTERSECTION PRIORITY SYSTEM DEVELOPMENT, OPTION II: MANUFACTURING DRAWINGS AND PROTOTYPE DEVELOPMENT, VOLUME I. OPERATION AND MAINTENANCE MANUAL. General information regarding the installation, operation and maintenance of the Passive Bus Detector (PBD) is discussed. Installation and operation require no special adjustments except tuning the inductive-loop electronics to the loop and lead-in. When operated with a 6-ft x 6-ft loop, correct classification of mass transit (40-ft) buses should reach or exceed 95% with less than 1% false classification.

Lubke, RA Sawyer, DD ; Honeywell, Incorporated, Federal Highway Administration FHWA-RD-77-120, F2186-FR1, Oct. 1977, 145 p.; See also Volume 1, Phase 3, Option 1, dated December 1975, PB-268879.; Contract DOT-FH-11-8149; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-298193/4ST

12 198753 VEHICLE DETECTION, PHASE III: PASSIVE BUS DETECTOR/INTERSECTION PRIORITY SYSTEM DEVELOPMENT, OPTION II: MANUFACTURING DRAWINGS AND PROTOTYPE DEVELOPMENT. A production prototype 16-channel Passive Bus Detector (PBD) was developed, based on the engineering model Passive Bus Detector/Intersection Priority System. The PBD is functionally the same as the engineering model except that the traffic controller function was not carried along into the production prototype mode. The PBD was repackaged to facilitate production and evaluated in an intersection with a typical traffic controller. Operation in the intersection for a 2-month period was successful.

12 224973 FEASIBILITY STUDY FOR BUS RAPID TRANSIT IN THE SHIRLEY HIGHWAY CORRIDOR. THE OBJECTIVES ARE TO DETERMINE (1) IF BUS RAPID TRANSIT (HIGH-SPEED EXPRESS SERVICE) CAN BE INSITUATED IN THE SHIRLEY HIGHWAY CORRIDOR AND, IF SO, THE FORM SUCH SERVICE SHOULD TAKE; (2) THE PATRONAGE ATTRACTED TO THE

IMPROVED TRANSIT SERVICE ON AN INTERIM AND LONG-RANGE BASIS; (3) THE EFFECT OF THE SERVICE ON HIGHWAY SERVICE AND USE IN THE CORRIDOR. THE RESULTS OF THE STUDIES WOULD BE UTILIZED TO ENSURE THE BEST MIX OF AUTO AND BUS USE AND PROVIDE THE BEST POSSIBLE OVERALL TRANSPORTATION SERVICE IN THIS AND SIMILAR TRAFFIC CORRIDORS. TO MEET THESE OBJECTIVES, A DETAILED ANALYSIS OF HIGHWAY OPERATING CHARACTERISTICS FOR THE SHIRLEY HIGHWAY CORRIDOR WAS DEVELOPED. BUS TRANSIT OPERATIONS AND PATRONAGE FIGURES WERE ANALYZED. AUTO AND BUS SURVEYS WERE CONDUCTED TO DETERMINE TRAVEL PATTERNS. ALL OF THESE COUPLED WITH THE CURRENT AND PROJECTED SOCIO-ECONOMIC CONDITIONS PROVIDED THE BASIS FOR SELECTION OF TWO ALTERNATIVE EXPRESS BUS PLANS. A COST/BENEFIT ANALYSIS WAS CONDUCTED AND A PREFERRED ALTERNATIVE WAS SELECTED. EXPRESS BUS ROUTES AND "PARK AND RIDE" LOCATIONS WERE RECOMMENDED AND A FINANCING AND IMPLEMENTATION PLAN WAS PROVIDED. /FHWA/

12 242572 BUS TRANSIT PLANNING AND OPERATIONS, SELECTED REFERENCES. THE BIBLIOGRAPHY LISTS 483 REFERENCES PUBLISHED BETWEEN 1965 AND 1971 ON THE OPERATION AND DEVELOPMENT OF BUS TRANSIT IN THE UNITED STATES. THE ENTRIES INCLUDE REPORTS, CONFERENCE PAPERS, AND PERIODICAL ARTICLES DRAWN FROM THE TRANSPORTATION CENTER LIBRARY COLLECTION. ARRANGEMENT IS TOPICAL WITH EACH ENTRY IDENTIFIED BY A SECTION/ITEM ALPHANUMERIC. TOPICAL CATEGORIES INCLUDE: GENERAL RESEARCH; VEHICLE AND DRIVER SCHEDULING AND ROUTING; ACCESS AND WAITING TIME; SPEED AND DELAY IN STREET TRAFFIC; IDENTIFICATION, COMMUNICATIONS, AND CONTROL; FARES AND FARE COLLECTION; BUSES; MINIBUSES AND JITNEYS; FEEDER SERVICE; FREEWAY OPERATIONS; BUSWAYS; DUAL MODE; DEMAND SERVICE; AND AREA STUDIES. THE REPORT CONCLUDES WITH A GEOGRAPHIC INDEX. /AUTHOR/

12 242739 BUS USE OF HIGHWAYS: STATE OF THE ART. This report, based on a review of ongoing and completed research, reflects the experience of more than 200 bus priority treatments in the United States and elsewhere. The types of treatments, the number of people they serve, and the design details they utilize vary widely. Treatments can be grouped into three broad categories: those relating to freeways,

arterials, and terminals. Most bus priority treatments consist of reserved bus lanes on downtown city streets. Busways and other freeway-related treatments are ground or proposed mainly in large U.S. cities with rail transit systems, large downtown employment, and/or heavy peak-hour transit use. These specialized treatments, however, were of greatest concern to public officials, for they involved larger expenditures and produced the most significant benefits. Design standards should consider the driving skills of professional bus drivers, the high levels of vehicle maintenance, and the relatively light bus volumes needed to accommodate heavy passenger flows. It is significant to note that most existing express bus priority treatments represent either contra-flow operations on existing radial freeways or special treatments to bypass queues. Most major proposals, however, call for exclusive bus roadways. Yet, measured in capital costs per person-minute saved, busways are far cost-effective than contra-flow lanes and other operational treatments. The importance of ramp metering, downtown distribution facilities, fringe parking effective enforcement of arterial buslanes, and the importance of allowing for future conversion to other systems are also discussed.

12 261656 CARPOOL AND BUSPOOL MATCHING GUIDE (THIRD EDITION). Important aspects of any comprehensive carpool include public information to inform the commuter of the benefits of carpools, incentives in the form of parking priorities and priority lanes, a locator service for matching and a continuing program to maintain locating services for new or moving employees. The critical factor in carpools and vanpools is Time-Origin-Destination, from that point, public information can promote the time, cost, convenience, ecological and energy saving advantages of carpools. Data processing can make the Time-Destination-Origin available by collecting the information, matching it by manual or computer methods and distributing the information. Methods of matching include hand matching and grid overlays of maps in conjunction with computer programs. A continuing service keeps the program up to date. Well established programs include McDonnell Douglas Corporation, St. Louis, Missouri, the Connecticut Department of Transportation, Hartford, Conn., the Bouroughs Corporation and Operation Oxygen, Pasadena, California, the National Aeronautics and Space Administration, and several other agencies in Washington, D.C.

12 261730 PARA TRANSIT: NEGLECTED OPTIONS FOR URBAN MOBILITY. Increasing concern over pollution, congestion, and fuel consumption accompanying the use of private the auto in urban areas, together with greater emphasis on needs of those without access to autos, has led to major efforts to upgrade scheduled bus and rapid rail transit service in the U. S. cities. Other forms of transportation which are available to the public and use the streets and highways of urban areas, referred to as "para-transit," are now under

consideration as transportation alternatives. This study was designed to review the experience to date with para-transit services, to access their potential for servicing urban transportation demand, and to design an RD&D program as needed to identify and demonstrate innovations in the provisions of para-transit services which would be beneficial. Services studies were grouped into 3 categories: (1) "hire and drive"-daily car rentals and forms of short-term car rentals that have been proposed including Minicar and Public Automobile System; (2) "hail or 'phone"-taxi, dial-a-ride, jitney and related services; and (3) pre-arrange ride-sharing-forms of car pool, van pool, and subscription bus services. Four major applications of para-transit services are identified. Chapters include comparative study of para-transit modes, innovations in para-transit regulations and case studies. A para-transit bibliography is furnished. Tables and figures complement the text. A summary of this report is "Para-Transit: A Summary Assessment of Experience and Potential."

Kirby, RF Bhatt, KU Kemp, MA McGillivray, RG Wohl, M ; Urban Institute, (UI-4800-8-2) UMTA-CA06-0045-74-2, June 1974, 442 pp; Contract DOT-UT-20018; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche

12 261731 PARA-TRANSIT: A SUMMARY ASSESSMENT OF EXPERIENCE AND POTENTIAL. Increasing concern over the congestion, pollution, and fuel consumption accompanying the use of the private automobile in urban areas, together with greater emphasis on the needs of those without access to an auto, has led to major efforts to upgrade the scheduled bus and rapid rail transit service in U. S. cities. Other forms of transportation which are available to the public and use the streets and highways of urban areas, referred to as "para-transit," are now under consideration as transportation alternatives. This study was designed to review the experience to date with para-transit services, to access their potential for servicing urban transportation demand, and to design a research, development, and demonstration (RD&D) program as needed to identify and demonstrate innovations in the provisions of para-transit services which would be beneficial. The services studied were grouped into 3 categories: (1) "hire and drive"-comprising daily car rentals and the various forms of short-term car rentals that have been proposed including the Minicar and Public Automobile Systems; (2) "hail or 'phone"-taxi, dial-a-ride, jitney and related services; and (3) pre-arranged ride-sharing-including various forms of car pool, van pool, and subscription bus services. Four major applications of para-transit services are identified, recommendations put forth and references furnished. This report is the executive summary and overview of the study, "Para-Transit: Neglected Options for Urban Mobility."

12 261815 SAN BERNARDINO FREEWAY-BUSWAY-PEOPLE MOVING IN THE L.A. AREA. The California Department of Transportation's goal of creating preferential

treatment for high-occupancy vehicles has resulted in the San Bernadino Freeway-Busway. This was created as a solution to getting high-occupancy vehicles into the center of Los Angeles faster. It consists of a tri-modal transportation corridor incorporating a freeway, busway, and railroad. Parking lot with "kiss and ride" facilities are provided, as well as new terminal for buses. The article details the many government agencies involved in the whole project, the division of responsibilities involved, the need for cooperation among the various agencies, and the measures undertaken for noise pollution control. This concept of a bus rapid transit system was untried at the time of its initiation, and the question was whether motorists would leave their cars and use it. The energy crisis proved that people will tolerate many inconveniences rather than leave their cars. Patronage on the busway has increased, but it has also increased on the freeway. An evaluation of the busway is being done by a consulting firm which will involve experimenting with controlled freeway access for carpools, and exclusive bus use of the busway to elicit public reaction. At this time, the two goals of higher vehicle occupancy and greater use of the freeway which created the San Bernadino Busway are also making it work effectively.

12 263441 LOCATING AND OPERATING BUS RAPID TRANSIT PARK-RIDE LOTS: A SYNTHESIS OF EXPERIENCE AND SOME PRELIMINARY PLANNING GUIDELINES. This report reviews and synthesizes previous experiences with locating and operating park-ride lots throughout the country in such places as Seattle, Washington, Washington, D.C., New Brunswick, New Jersey, Milwaukee, Wisconsin and the Northeast Corridor in general. The data represents the experiences of 7 municipalities and accounts for approximately 4500 park-ride spaces in 13 park-ride lots serving as change of mode facilities for bus transit. The characteristics of park-ride users are investigated. Data were analyzed to determine the characteristics of trip lengths and trip times as well as the trip purpose, type of employment, trip origin and mode to bus. Further considerations included mode of travel to work prior to the establishment of park-ride lots and environmental impact factors. From the analysis of data gathered, some preliminary and general planning guidelines relevant to the location and sizing of a park-ride facility in an urban transportation corridor are developed. References are furnished.

Gatens, DM ; Washington University, Seattle, (WA-11-0003) UMTA-WA-11-0003-73-6, Aug. 1973, 33 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-236010

12 263571 SPECIAL REPORTS FROM ENGLAND AND SWEDEN. Special reports from England and Sweden are presented on the status of demand-responsive transport experiments in those countries. One major consideration in England is the lack of telephone availability—approximately a third of what it is in the United States. This factor, combined with the well-used transit system will produce a de-

mand-responsive system with a compromise between fixed-route and dial-a-ride operations. Because of the high density of the urban areas, it is proposed to have the dial-a-ride vehicle provide fast line-haul service into the city center. The experiments under way are entirely manual, fixed schedule, and variable route. A thorough social and economic evaluation will be conducted of the costs and benefits to the operator and to society as a whole. A dial-a-ride feasibility study, partially supported by the government, was done in Gothenburg. One major problem in Europe is obtaining an acceptable vehicle for a dial-a-ride system. Gothenburg has for some years had a transportation service for disabled persons. The operation of this service and the vehicles it utilizes are discussed.

Slevin, R (Cranfield Institute of Technology, England) Elmberg, CM (Gothenburg Transit Authority, Sweden) *Transportation Research Board Special Reports* No. 147, 1974, pp 78-80; Proceedings of the Fourth Annual International Conference on Demand-Responsive Transportation Systems conducted by the Highway Research Board on October 3-5, 1973, Rochester, New York.; ORDER FROM: TRB Publications Off

12 263578 GROWING DEMAND-RESPONSIVE SYSTEMS IN THE UNITED STATES AND CANADA. A panel discussion was organized with members of communities having successful, even expanding demand-responsive systems. The systems are considered from the point of view of users, rather than from a technological orientation. The panelists were asked the reasons for expansion. In each case an increase in transit ridership was evident. Improvements to the systems based on experience were discussed. There included placement of stations in parks rather than in residential areas, selection of the best vehicle, improvement of dispatching procedures and fare collection. Alternative systems such as capital-intensive PRT, dial-a-bus, and Teltran are considered, and the methods of integrating demand-responsive systems with public transit are discussed. An examination was conducted of the users of research, costs and operation of the system, such as deviation from schedules and waiting times. Government regulation, primarily through subsidy, is discussed, as are dispatching procedures and diverted and new trip makers. Finally, staff hiring and training programs and management requirements are examined.

12 267013 OVER VIEW OF AUTOMATIC VEHICLE MONITORING SYSTEMS. This report is an overview of Automatic Vehicle Monitoring (AVM), systems which automatically determine and make available to a central control point the position of a vehicle or a group of vehicles. AVM systems used in urban applications are based upon, or are varieties of, four basic techniques: radio propagation time, proximity, dead reckoning, and triangulation. The relative merits of each of these systems is discussed. Test

or simulation data and cost information are provided where available. Also included is a discussion of secondary systems functions (polling, computation, telemetry, etc.) that must be addressed before a workable AVM system can be implemented. Potential applications for AVM systems include: transit buses, police vehicles, taxi fleets, delivery services, maintenance services, and possibly even moving vans, which would require inter-city capabilities in order to be completely responsive. This state-of-the-art in AVM systems begins with a brief discussion of these applications, followed by a more detailed analysis of AVM techniques that have been demonstrated, tested, or proposed. The best available technical and cost data have been used throughout and are documented. The report concludes with a discussion of the various system considerations. An appendix summarizes the cost data for one specific AVM system. A full list of references and an extensive bibliography is provided.

12 300138 ARTIC BUSES-HOW PRACTICAL ARE THEY?. The feasibility of using articulated buses on roads in the United Kingdom is discussed. Although their carrying capacity is higher and they can take up and discharge passengers more rapidly than the normal British double-decker they take up more road space and are less manoeuvrable. Also it is estimated that articulated buses would cost more to run with maintenance costs of 1.2 to 1.8 times those of the compatible two-axled vehicles. Several methods of fare collection are possible and a low floor could be achieved with a front or rear engine configuration. The author suggests that the extra capacity of the articulated bus could be used to provide a more appealing standard of comfort on suburban operation rather than the traditional "standee" layout used for urban work. There are possible advantages associated with a system using a quickly-detachable two-wheeled trailer. The trailer could be coupled on to cope with peak demand and removed for normal off peak working. /TRRL/

12 300439 SYSTEM FAILURES ON ROAD TRAFFIC NETWORKS: CAN ERGONOMICS HELP. The nature of urbanisation in Western society requires a certain type of transport system. Conversely, the type of transport system provided strongly influences our society. When dealing with such complex systems it is unlikely that an investigator will establish fundamental causal relationships. There are many cases of the system being tampered with to achieve one objective, only to find that the secondary results negate any improvements. Thus it is impossible to say exactly why a particular project does not show the expected benefits. Our knowledge and methodologies are just not sufficient. This paper will attempt to show where weaknesses in technique have contributed to the failure (serious non-optimum performance) of some schemes. Emphasis will be placed on illustrating how an

ergonomics viewpoint would have alleviated the situation. Three projects, selected to illustrate the wide spectrum of the problem area, will be simplified and examined. The first is the continuing attempt to provide master control for a network of traffic signals, where the simplistic model of human behaviour used reduces the chances of obtaining good results. The second is concerned with the signposting of motorways and purports to show how 'engineering' solutions to problems and the methodologies adopted ignore fundamental user requirements. The final project is the Bay Area Rapid Transit System. This is used to demonstrate how a simple lack of understanding of human preferences contributed to the poor usage of the system. /Author/TRRL/

12 301154 TECHNICAL AND ECONOMIC ASPECTS OF ARTICULATED BUSES. One answer to the increased need for high-capacity trams and buses is the articulated bus. This article describes several types of articulated buses currently in use and analyses the results of a survey of European bus companies which employ these vehicles. In general, the principal advantages of articulated buses were economic, i.e. their higher capacity lowered labor costs and operating costs per passenger. The disadvantages most cited were difficulties in maneuverability, especially on curves. It is concluded that, since articulated buses involve the lowest specific investment per passenger place offered on urban services (assuming a large number of standing spaces) and (needing no infrastructure of their own, (e.g. rails or overhead lines) offer a particularly economical cost price per place-kilometer offered, they are thus advisable on heavily loaded routed, especially if they have the benefits of various traffic priorities (priority thorough fares, special bus lanes, control of traffic lights to give priority at crossings, etc.) an appendix which summarizes these provisions of United Nations Regulation 36 (Uniform Provisions concerning the construction of Public Service Vehicles) dealing with articulated motorbuses which, if approved by all countries, permit their use in countries whose statutory requirements currently preclude it (e.g. Great Britain) and alleviate difficulties in countries whose road traffic legislation does not take these vehicles into account, is included.

12 301800 U. S. DEPARTMENT OF TRANSPORTATION'S AUTOMATIC VEHICLE MONITORING PROGRAM. The Urban Mass Transportation Administration (UMTA) and the Transportation Systems Center (TSC), a Department of Transportation systems engineering organization, are developing a fully-functional automatic vehicle monitoring (AVM) system which will be installed on selected routes of the Southern California Rapid Transit District (SCRTD). The objectives of this program are to: conduct a thorough test and evaluation of a fully-functional, area coverage AVM system; quantify the benefits to transit and other users;

advance the state of the art of AVM; and establish technical and economic bases for future deployments. The UMTA/TSC AVM system to be installed in Los Angeles will involve two experiments—a fixed route experiment and a random-route experiment and will be primarily intended for transit application. Information on each (equipped) vehicle's location, passenger load by bus stop, dispatch readiness and silent alarm status will be instantaneously known at the central control point. The system is intended to be used as a real-time transit fleet command and control system.

12 302054 URBAN TRAFFIC CONTROL AND BUS PRIORITY SYSTEM. EQUIPMENT CHECKLIST SPECIFICATION MANUAL. The Urban Traffic Control System (UTCS)/Bus Priority System (BPS) was developed and implemented in Washington, D.C. jointly under contract to the Federal Highway Administration (FHWA) and the Urban Mass Transportation Administration (UMTA). The functions of this system include on-street surveillance of private vehicles as well as buses, and the digital computer control of traffic signals. The specifications used in the procurement of the various subsystems have been generalized and condensed into a checklist format, and combined into a manual. This manual serves as a guide in checking equipment specifications which have been prepared, or are in the process of being prepared, for a similar traffic system. /FHWA/

12 302264 PROCEEDINGS OF THE THIRD UMTA R&D PRIORITIES CONFERENCE, CAMBRIDGE, MASSACHUSETTS, NOVEMBER 1978. VOLUME V: UMTA SPECIAL TECHNOLOGY PROGRAMS WORKSHOPS. This is a compilation of material that was presented at the Third UMTA R&D Priorities Conference Workshops on UMTA Special Technology Programs. Part I deals with safety, qualification, and life-cycle costing, and includes discussions of rail transit safety and product qualification. Part II—consumer inquiry technology, National Cooperative Transit R&D Program, and technology program—includes discussions of consumer need for information on transit availability, the National Cooperative Transit R&D Program (NCTRP), the technology sharing program, and transit marketing. This volume contains six resource papers which can be found summarized in Volume I of this report along with summaries of other workshop sessions. Volume I also includes the proceedings of the general sessions and a listing of conference participants. These proceedings (Rpt. Nos. UMTA-DC-06-0157-79-1 thru UMTA-DC-06-0157-79-9) consist of nine separately titled

volumes, namely: Volume I: Proceedings of General Sessions and Summarized Reports of Workshops; Volume II: Bus and Paratransit Technology Workshops; Volume III: AGT and Advanced Systems Workshops; Volume IV: Service and Methods Demonstration Workshops; Volume V: UMTA Special Technology Programs Workshops; Volume VI: Rail and Construction Technology; Volume VII: Transit Management Workshops; Volume VIII: Access for Elderly and Handicapped Persons Workshops; and Volume IX: Urban Transportation Planning Workshop.

12 302921 ROAD ACCIDENTS IN HONG KONG. The author presents an account of his experiences during a 2 1/2 year contract as a motor vehicle examiner in the enforcement and control section of the Hong Kong government. Data presented indicate that some 4 1/2 M people live in a total land area of 1049 square km, with some 6.1 M trips made daily on public transport by road, rail and sea. Official statistics indicate that there are 208000 vehicles sharing 1092 km of road surface, and during 1977 there were 14000 traffic accidents. The results of certain investigations undertaken to determine the contribution of vehicle defects to the accident situation are described and discussed, related to steering, brakes, lights, tyres and damage. In particular, reference is made to buses owned by the Kowloon Motor Bus Co, public light buses consisting of 7400 taxis and 4350 mini buses which augment the overloaded public transport systems and certain commercial vehicles. /TRRL/

12 303295 URBAN TRANSPORTATION FOR HANDICAPPED PERSONS: ALTERNATIVE FEDERAL APPROACHES. This paper evaluates three alternative options for providing transportation services to handicapped persons living in urban areas. The first option—the Transit Plan—presents one possible outcome of the rules issued by DOT under Section 504. The second alternative—The Taxi Plan—calls for a number of small modifications on existing systems, and door-to-door public transportation for severely disabled persons. The third option—the Auto Plan—offers financial aid to severely disabled persons for the purchase of specially adapted automobiles, as well as door-to-door public transportation for those unable to drive cars. The three options are compared on the basis of costs and the number of persons who could be expected to benefit from the services. The modifications to transportation vehicles and the services required under the three options are outlined in a table, and the corresponding costs and patronage are also summarized in a table. The decision by the Congress will most likely be based on these factors as well as on the issues of civil rights and social integration of handicapped persons. (Authors)

12 303935 EVALUATION OF BUS AND CARPOOL OPERATIONS ON THE SAN BERNARDINO FREEWAY EXPRESS BUSWAY. The San Bernardino Freeway Express Busway, which runs eastward from downtown Los Angeles, is the most complete busway in the national. It includes park-and-ride and on-line stations, feeder bus lines, outlying park-and-pool lots, and a supplemental contraflow bus lane in the central business district. Beginning in October 1976, carpools of three or more were permitted on the previously bus-only facility. During the mixed-mode operations, the number of carpools on the busway and freeway more than doubled, increasing by at least 800. These carpools were new and not caused by diversion from parallel roadways. Bus ridership was not noticeably effected until after a major fare increase. During the peak 1 h, the busway lane carries twice the number of people as does one adjacent freeway lane, but traffic still moves at 88 km/h (55 mph). Surveys were conducted among bus riders, busway carpoolers, and freeway users (busway non-users). Most carpoolers said they would not be carpooling if they could not use the busway. Attitudes of most busway nonusers were positive; the busway is not controversial. There were no major safety or enforcement problems. The type of separation between busway and freeway was found to strongly affect safety and enforcement requirements. The busway was generally found to be more cost effective than an additional freeway lane. The average savings in out-of-pocket costs, for busway-induced carpoolers and bus riders only, covered two-thirds of the annual (capital and operating) costs of the busway. Most of these conclusions would probably change, however, if congestion on the adjacent freeway was reduced or eliminated (for example, because of ramp metering or freeway widening).

12 303936 ANALYSIS OF BUS SYSTEMS TO SUPPORT RAIL RAPID TRANSIT (ABRIDGMENT). This paper describes an evaluation of alternative bus systems that will serve as line-haul and feeder service for the Metropolitan Dade County Stage I Rapid Transit System (Miami area). The weighted derivative (sensitivity) of Transit ridership is defined and computed for all study-area zones, zone pairs, districts, and district pairs. Then a comprehensive transit system is determined for the study area to aid in the planning process. These two concepts were applied to a large urban area by using the urban transportation planning system (UTPS) and UTPS compatible programs: the weighted derivative of transit ridership and a comprehensive transit system. Because design of bus route systems for Dade County had progressed considerably before application of these concepts, they did not lead to major changes in alternative transit systems. However, they did provide clear and meaningful new insight in explaining the superiority of a grid bus system; because it was

able to achieve higher productivity by concentrating service in the core districts, which have much greater weighted derivative values. Since the comprehensive system attracted about the same number of riders for both connected service areas, the difference between the two design systems is largely emphasis on different areas. It is hoped that these concepts will be used to guide subsequent refinements of the grid system.

12 305778 COMPUTER DIAL-A-RIDE. Computer Dial-A-Ride is a system of computer programs that automates the operation of a personalized transportation service; a service that provides on request a shared-ride from any location within a community to another. Since 1975 this computer system has been tested and operational in Rochester, New York with guidance and project management provided by the Massachusetts Institute of Technology, Department of Civil Engineering. The system consists of a real-time program that controls all aspects of scheduling and dispatching the transportation service and various support programs used for file maintenance and statistical analyses...Software Description: The program is written in the FORTRAN programming language for implementation on a IBM computer using the TOPS-10 operating system. 650K bytes of core storage are required to operate the model.

12 305832 BENEFIT-COST ANALYSIS OF INTEGRATED PARATRANSIT SYSTEMS. VOLUME 5: THE IMPACTS OF TECHNOLOGICAL INNOVATION. A number of new technologies have been implemented with or proposed for paratransit systems. As part of the overall IP benefit cost study, the potential impact of two such technologies, digital communications and computer dispatching, have been analyzed in detail and are reported here. In addition, some preliminary analyses have been conducted on the potential impacts of computer-aided dispatching, computer control of radio channels, automated control-to-passenger communications, automated passenger information systems, automatic vehicle monitoring, and a new paratransit vehicle.

12 307709 THE DEVELOPMENT OF A FUTURE BUS SYSTEM CONCEPT [Entwicklung Eines Konzeptes fuer ein Zukuenftiges Bus-Verkehrssystem]. The aim of this study is to suggest comprehensive measures for the qualitative improvement of public transport bus services. In this respect it is fundamental that the interaction of vehicle, route/stopping place and operation should characterise the consideration of the system. After the compilation of a list of requirements from the user, management and general public viewpoints measures are developed to fulfil these requirements. In doing this two phases for the realisation of the measures are recognised: up to 1980/85 and up to 1995. Cost-benefit studies are carried out for the different measures. For calculation purposes cost-effectiveness analysis was selected. A sensitivity analysis was effected by varying the weighting factors in the user, operator and public sectors. For the further development of bus services within a system it is recommended that priority should be given to the introduction of special bus lanes and bus-priority measures in road traffic and the erection of bus shelters with a greater degree of comfort for the passenger. It appears that the diesel engine has the best chance for success in the future of all the power sources discussed. Regional bus services are considered as well as urban services. Due to severe rises in the cost of operation dial-a-ride systems have only slender chances of being brought into operation. /TRRL/ [German]

12 308073 COMPUTER DIAL-A-RIDE: COMPUTER SOFTWARE AND DOCUMENTATION (TAPE); VOLUME 1: SOFTWARE INSTALLATION GUIDE; VOLUME 2: OPERATORS HANDBOOK AND REFERENCE MANUAL; VOLUME 3: STREET NAME FILE BUILDING SYSTEM; VOLUME 4: SOFTWARE DESIGN AND FUNCTIONAL DESCRIPTION; VOLUME 5: TERMINAL HANDLING SYSTEM. Computer Dial-A-Ride (DAR), a demand-responsive transit system, is a system of computer programs that automates the operation of a personalized transportation service—a service that provides on request a shared-ride from any location within a community to another. DAR is a research and development program sponsored by UMTA, performed by ADP Network Services, and in collaboration with the Massachusetts Institute of Technology (MIT). The intended users of DAR are researchers, private or public agencies, transit operators, and other interested persons. The project was instituted in February 1972 in Haddonfield, New Jersey. Since 1975 this computer system (referenced on this tape) has been tested and operational in Rochester, New York, with guidance and project management from MIT, Department of Civil Engineering. The software was developed from the experience gained in the Haddonfield demonstration. The system consists of a real-time program that controls all aspects of operating the transportation service and various support programs used for file maintenance and statistical analyses. The Computer Dial-A-Ride program also consists of five separate volumes (UMTA-DC-06-0141-77-1 through UMTA-DC-06-0141-77-5), respectively: computer Dial-A-Ride Software Installation Guide; Computer Dial-A-Ride Operators Handbook and Reference Manual; Computer Dial-A-Ride Street Name File Building System; Computer Dial-A-Ride Software Design and Functional Description; and Computer Dial-A-Ride Terminal Handling System. 12 309027 TRANSIT PRIORITIES AND DEVELOPMENT OF A PASSIVE BUS DETECTION SYSTEM IN EDMONTON. This paper describes the need which led to the development of a cost-effective passive bus detection system in Edmonton (Alberta, Canada). The system utilizes "of-the-shelf" equipment and, through the use of a simple algorithm, its discrimination reliability between local diesel buses or trolley-buses and other vehicles approaches 100 per cent. Software is based on identification of basic features of vehicle 'signatures' as produced by a standard loop-detector. The development objectives and principles, as well as the initial experience, are discussed. (TRRL)

12 309131 DEMAND-RESPONSIVE PUBLIC TRANSPORT: A SIMULATION MODEL. This paper was presented at Session 31-Traffic Systems and Analysis 2. This paper reviews some analytical methods which may be employed by public road passenger transport operators and transportation planners to effect some improvement in public road passenger transport. Four areas where improvement is possible (transportation planning, bus route and timetable planning, bus and crew scheduling, control and communications) are discussed, with particular emphasis upon mathematical techniques for bus route and timetable planning. The paper also describes a computer model for simulating the behaviour of a dial-a-bus system operating on an irregular road network. The model is suitable for use with a small computer, and can be used to determine the effect of three critical factors (the level and pattern of demand, the service area size, the level of service as reflected by service time constraints) upon the cost of a dial-a-bus system. The simulation model can be used to determine the feasibility of a dial-a-bus system and could be used as the basis of a computer procedure for controlling (or assisting a despatcher to control) a dial-a-bus system. 12 309569 BUS STOPS ON RURAL AND HIGH CAPACITY ROADS. MOTIVES FOR DESIGN AND LOCATION [Busshaalplatter paa landsbygd och vid hoegklassiga trafikleder. Motiv till utformning och placering]. This report describes background data and standpoints of a committee work preceding the design of specifications for bus stops on rural and high capacity roads. The report deals with basic criteria such as: (1) bus length, width and manoeuvring geometry, (2) bus acceleration, deceleration and jerk, (3) types of stop, (4) bus manoeuvring performance and speed. The motives for design and location are presented under the following headlines: (1) choice of stop type, (2) stop design, (3) stop location and (4) footways at stops. Appendices are dealing with the following factors: (1) design acceleration, (2) model for choice of stop type, (3) possible entrance and exit speeds at stops, (4) comparison of bus bay dimensions and (5) driving models for stop location. 12 310592 REGIONAL PARATRANSIT SERVICES: AN EVALUATION. The primary purpose of this paper is to evaluate a data collection method that is being used in a public transportation project in Barnstable County, Mass. An integral part of the method is the use of a serially numbered rider identification pass. Each person who uses the bus service acquires a pass in

advance and completes a questionnaire regarding their socioeconomic characteristics and physical disabilities. When a passholder telephones to schedule a trip, the dispatcher records his or her pass number, pickup time, trip purpose, origin, and destination. As a result, socioeconomic and trip data are collected for 100% of all riders. These data may be used to: (1) Evaluate vehicle productivity and efficiency; (2) examine the impacts of local policy decisions; (3) assess the portion of a deficit to be paid by each town; (4) develop social service agency user charges and contractual agreements; (5) identify social service agency eligibles; and (6) describe user characteristics.

12 313190 THE APPLICABILITY OF NON-STANDARD BUSES FOR SERVICE IN THE WASHINGTON METROPOLITAN AREAS. Higher capacity buses allow higher driver and vehicle productivities to be achieved, which, in turn, would allow costs to be reduced or capacity expanded at little or no increase in cost. A series of demonstration projects, conceptual design and vehicle specification studies led ultimately to the creation of a consortium of ten U.S. transit operators supporting development of a high capacity articulated bus. This report analyzes the characteristics and requirements of these buses and outlines the plan for their introduction into the Washington Metropolitan Area Transit Authority (WMATA) system. This report is a first step in the implementation process, beyond the actual ordering of the vehicles. It identifies and analyzes the distinguishing characteristics of the articulated vehicle, and relates these to its utilization, maintenance, and servicing.

12 314790 BUS TRANSIT MONITORING STUDY: INTERIM REPORT 1: DATA REQUIREMENTS AND COLLECTION TECHNIQUES. In recent years, an interest in revitalizing public transportation has led to an increased awareness of the need to utilize existing resources more efficiently. This implies that transit properties must carefully evaluate, or re-evaluate, all services, both current and planned. As a result, the collection of passenger-related transit operations data has received much more attention. Research into the utilization of this data has received much more attention. Research into the utilization of this data has considerably advanced the state-of-the-art of transit evaluation and,

simultaneously, generated considerable controversy regarding its proper role. Some transit operators, faced with an increasing need to provide the most effective service, have adopted sets of performance measures and standards and have developed plans for using them in a systematic service evaluation. In many cases, however, transit operators have not been able to implement the measures and standards because they have had difficulty in developing a cost-effective system to collect the needed information. To assist these operators, UMTA's Office of Planning Assistance, through its Special Studies Program, has initiated a study in data collection. The purpose of this study is to develop a comprehensive statistically-based data collection manual that will enable transit operators to collect passenger-related data in a cost-effective manner which maximizes the usefulness of the overall data base. This first interim report presents the results of the first two tasks of the study, which were to identify current data collection techniques and data requirements. These two closely related tasks were conducted in parallel through three major activities: 1) a literature review; 2) a review of material collected by the Massachusetts Bay Transportation Commission in Norfolk, Virginia, in a study for UMTA, focusing on service evaluation techniques; and 3) discussions with forty-one transit properties in the United States and Canada. 12 322066 OPERATION OF ELECTRIC BUSES IN URBAN AREAS. This paper discusses two areas where the performance and travel range of battery powered buses can be optimized: (I) public transport priority traffic management schemes and (II) more efficient power sources. An analysis of the bus journeys on a radial route into Edinburgh showed that buses do not spend much time at their cruising speed. It was shown that the introduction of bus lanes had minimal impact on the effect of key obstacles such as traffic lights and bus stops. The situation could be improved by reducing the number of bus stops and extending bus lanes up to traffic lights using detectors to give bus priorities. At present, the low energy density of batteries presents a problem but it is possible that sodium/sulphur batteries will meet the criteria for successful economic operation. Dual-mode systems, such as trolley/battery, trolley/diesel or diesel/battery may also be suitable for present applications. (TRRL)

13 041318 STATE OF THE ART CAR: READY FOR REVENUE TESTING.

Two State of the Art transit cars are now undergoing testing at the UMTA test facility at Pueblo. Next month the cars will be moved to begin a series of revenue service tests. These cars represent the first phase of a three year program. Phase two will attempt to produce a better transit car, constrained only by 600 volt DC power, standard track gauge, and the clearance envelope of five transit systems. Systems manager Boeing-Vertol has five tasks: observe the prototype car program of BART, manage production of the state of the art cars, manage design competition leading to Advanced Concept Train ACT-1 cars, manage the ACT-2 component development program to move from first generation ACT-2 cars to second generation ACT-3 cars, and plan for ACT-3 revenue demonstration. There are two versions of the state of the art car, a 64 seat version and a 72 seat version. The car bodies are stainless steel. The lightweight trucks use air bellows and eliminate metal to metal contact from the car body to the rail. In tests, the interior noise level at 40 mph was 63 db. Each truck is fitted with a pair of 175 hp DC traction motors. Solid state chopper propulsion is used. The car builder, St. Louis Car, and the truck supplier, GSI Castings Division, are both being liquidated. The cars are air conditioned.

13 041625 BART SETS THE PACE.

BART is serving as a model for other metropolitan areas, but Toronto and Montreal led the way in building less complex systems. Toronto opened subway lines in 1954, 1963, and 1966, and the lines are now being extended. The Toronto lines spurred building booms. Montreal's Metro was opened in time for Expo '67. Montreal's Metro uses rubber tired wheels, which increase adhesion and reduce noise level; but cost more to build, generate more friction, and cost more for power. BART was envisioned to avoid conventional urban sprawl. So far, only San Francisco has really had a building boom, other parts of the Bay Area have a 'wait and see' attitude. Metropolitan Atlanta Rapid Transit Authority is producing an impact study encompassing: socio-historic factors, economic factors, esthetic factors, ecologic factors, acoustic factors, air quality, and water resources. The economic return is estimated at 2.79 to 1. Construction is well underway for the Washington Metropolitan Area Transit Authority. This 158 km system will serve 86 stations. Rohr will build 300 Metro cars. The automatic fare collection system will be similar to that of BART. Washington Metro will use padded rails and floating slabs to reduce noise and vibration. Special tunnel ventilation will be used.

13 043023 SEPARATELY EXCITED DC TRACTION MOTOR APPLIED TO DC AND SINGLE PHASE AC RAPID TRANSIT SYSTEMS AND ELECTRIFIED RAILROADS--1.

The introduction of power thyristors and rectifiers in dc-dc chopper and ac-dc converter circuits allows the replacement of the traditional dc series motor by the separately excited dc motor. This paper considers the characteristics of separately excited dc motors operating from either a dc input with a dc chopper using dynamic braking, or from a single-phase ac input with an ac-dc converter using regenerative braking.

13 046353 KEISEI TRAINS SERVE NEW NARITA AIRPORT LINK.

Opening of the new Tokyo International Airport at Narita, due to take place this spring, will bring a heavy demand for transport to and from the city centre. Although an extension of the JNR Shinkansen high speed network is planned within the next four years, immediate needs will be met by a 7.3 km branch of the standard-gauge Keisei Electric Railway, recently completed and due to open at the same time as the airport. To operate the line, KER placed orders with Tokyo Car Manufacturing Company, Limited, Tokyo, for five 6-car electric trains specially designed for airport service. Known as the AE (Airport Express) type, these units have been delivered well in advance to

allow ample time for crew training and service testing before the opening date.

13 046390 NEWLY DEVELOPED THYRISTOR CHOPPER EQUIPMENT FOR ELECTRIC RAILCARS.

In the chopper control system for railcars, it is effective to adopt high operation frequency of the chopper for achievement of the following: 1) decrease of higher harmonic current induced in the trolley wire, 2) reduction of weight for reactors and capacitors in the traction circuit, and 3) improvement of control response. Through development of reverse-conducting thyristors with very short turn-off time and a repulsion type two-phase chopper, we finally realized production of a new standard high-frequency chopper equipment with regenerative braking for 1500-V dc railcars. Technical achievements mentioned previously were completely realized as a result of adoption of high frequency, 660 Hz, in the equipment. The newly developed standard high-frequency chopper equipment for 30 cars were delivered to the Chiyoda Line of Teito Rapid Transit Authority in Tokyo, and they have been operated satisfactorily in revenue service since March 1971. This paper also describes: 1) the chopper circuit using fast-switching reverse-conducting thyristors and series saturable reactors, 2) analysis of commutation circuit and methods of suppressing reapplied forward voltage increasing rate (dv/dt) and shortening commutation period, 3) the composition of the traction circuit including the protection system, such as protection for overvoltage at the regenerative braking, and 4) test results on the Chiyoda Line of Teito Rapid Transit Authority.

13 046415 ALTERNATIVE SYSTEMS FOR RAPID-TRANSIT PROPULSION AND ELECTRICAL BRAKING.

The need for rapid transit is stimulating further development in the technology and equipment for propulsion and electrical braking. Although the traditional cam-controller equipment is being improved, control systems based on thyristors have some advantages over it, achieved at a cost in weight and complexity of the control equipment. The thyristor approaches overcome 2 basic problems of cam-controller equipment: the need for continual maintenance on the cam switch contacts and the power losses incurred when voltage is controlled by resistors.

13 047273 DEVELOPMENT AND TESTING OF A COMPLETELY PASSIVE, AIR SUSPENDED, AIR PROPELLED PERSONAL RAPID TRANSIT VEHICLE. A prototype Uniflo vehicle base with mock-up superstructure was tested on 55 ft. of full-scale track. Sound treatment to meet NCA 60 at 25 ft. from the guideway enclosure and within the vehicle was proposed and the costs determined. A heating and cooling system using passive vehicle heat sink elements with station berth recharging was found desirable because of its lower cost and reliability. An evaluation of the estimated production quantity costs for the vehicle base, guideway surface, levitation and thrust elements showed a reduction of 49% compared to previous design estimates. Extensive tests confirmed the feasibility of the track based linear air turbine used for acceleration and service braking in the Uniflo PRT system. Ride quality measurements indicated a need for improved secondary suspension. Empty vehicle speeds over 20 ft./sec. and accelerations exceeding 5 ft./seconds squared were achieved with an air flow of 72.0 cubic feet/sec. Vehicle starting drag was less than 5 lbs. force. 13 047276 URBAN-RAIL SUPPORTING-TECHNOLOGY PROGRAM (UM-204). FISCAL YEAR 1972, YEAR-END SUMMARY. The report outlines activities managed by the Transportation Systems Center for the Urban Mass Transportation Administration, Office of Research, Development and Demonstrations' Rail Programs, in support of advancing urban rail technology. The emphasis has been in the area of rapid transit; however, the long-range applications of the program will benefit both commuter rail and light rail. The report describes the major instrumentation and equipment development activities directed toward the establishment of a basic measurement capability, in support of the evolving program plan, for the test and evaluation of rapid rail cars, car subsystems, and track structures. Under the category technology development, several projects are described including a tunneling plan, noise abatement project, wheel-rail dynamics research facility and descriptions of various contractor reports.

13 047476 ELECTRIC BRAKING-PART 1: MULTIPLE UNITS. Braking is simply a means of converting energy from one form into another. The moving train has kinetic energy which can be calculated. If the train slows down for any reason, its kinetic energy must be converted into some other kind of energy. If a simple mechanical brake is used, the energy appears as heat; similarly, if the vehicle is coasting to a lower speed, heat appears in the bearings as a result of friction. If an electric brake is used, electricity is the new form of energy. This article is the first of two dealing with electric brakes on railways; it deals mainly with electric braking on multiple-unit trains.

13 047485 THE SEARCH FOR STANDARD TRANSIT. Standardization of rapid transit rolling stock can lower construction and operating costs, but it may also impose undesirable limits on innovation. Leaders of the rapid transit industry in several parts of the world show a qualified concern for standardization; rolling stock profiles are already determined by the infrastructure, but there is scope for a standardized line voltage which would widen the choice in traction equipment.

Railway Gazette International Vol. 129 No. 5, May 1973, pp 172-175 ORDER FROM: ESL, Repr PC, Microfilm

13 047902 STATE-OF-THE-ART TRANSIT CARS GO THE ROUNDS. The two experimental cars designed to raise technical and comfort standards on US transit systems are described. The high-density car has molded fiberglass seats with small upholstered cushions, but the commuter car has fully-upholstered seats. Rubber chevron primary springs isolate wheelset vibration from the body.

13 047925 CALCULATION OF THE DISTRIBUTION OF THE CURRENT AND VOLTAGE IN THE RAIL NETWORKS OF D.C. TRACKS TAKING INTO ACCOUNT GROUND LEAKAGE [DIE BERECHNUNG DER STROM-UND SPANNUNGSVERTEILUNG IN SCHIENENNETZEN VON GLEICHSTROMBAHNEN MIT BERUECKSICHTIGUNG DER ABLEITUNG GEGEN ERDE]. The problem of calculation is considered under conditions of uniform load. After constructing basic equations for single tracks it is shown that in arbitrarily intertwined networks there exist linear dependences between the junction voltages and the currents at the track ends, although the distribution of the current and voltage within individual tracks can be described only by means of considerably complicated functions. A method is indicated how the extensive calculation work can be solved by means of a computer program. [German]

13 048136 APPLICATIONS OF BART PROGRAM EXPERIENCE TO THE UMTA URBAN RAPID RAIL VEHICLE AND SYSTEMS PROGRAM. The Bay Area Rapid Transit (BART) System prototype car demonstration program was observed and reviewed to identify possible improvements applicable to the State-Of-The-Art Car (SOAC) and Advanced Concept Train (ACT) projects within the Urban Rapid Rail Vehicle and Systems Program. Such improvements which were incorporated in SOAC during the design phase involved the windshields, side window material, brakes, propulsion motor cooling and coupling, console, equipment trays, accessibility and noise specifications. These and other requirements based on BART experience were considered during the ACT study and proposal efforts and are reflected in the specifications for the ACT-1 vehicles.

13 048174 BART ELIMINATES THE BUGS--AND TRAFFIC FIGURES CLIMB. Since last September, when the Bay Area Rapid Transit (BART) system opened the first 44 km of its projected 113-km, the eyes of United States' city authorities have been firmly fixed on its progress. If BART succeeds, other new subways could sweep in on its coat tails. If it fails the cause of US transit could be set back drastically. Passenger results to date have compared well with pre-service forecasts. By the end of last year about 95% of BART's projected patronage for the 1972-73 year had been achieved.

13 048293 SOLID-STATE PROPULSION TECHNOLOGY. The advent of solid-state thyristors with large power capabilities is providing several practical alternatives to the cam-controller equipment that has been almost universally used in rapid-transit cars. Cam-controller equipment controls the voltage and current, and thus the speed and torque, of d-c series motors by switching voltage-dropping resistors in and out of the circuit by means of cam switches. One of the alternative approaches is to supply d-c power to series propulsion motors from a thyristor chopper, which controls acceleration by very rapidly turning the motor current on and off in a controlled pattern. The chopper also provides for either regenerative braking (regeneration of the car's stored energy into the d-c supply) or dynamic braking (dissipation of the stored energy in a resistor).

13 050049 DYNAMIC RESPONSE OF A RAPID TRANSIT VEHICLE TO RANDOM GUIDEWAY ROUGHNESS. Measured roadway roughness data and the transfer function for a five-degrees-of-freedom model of a rapid transit vehicle are used for determining vertical and lateral passenger motion of a rapid transit vehicle. Optimization studies are used for spring and damping parameters to minimize passenger discomfort for the input spectra associated with the sums and difference of the measured random individual wheel input profiles.

Hartz, BJ Platt, RM ; Washington University, Seattle 73-ICT-15, Sept. 1973; Presented at the Intersociety Conference on Transportation, September 23-27, 1973.; ACKNOWLEDGMENT: ASME Journal of Mechanical Engineering; ORDER FROM: ESL, Repr PC, Microfilm

13 050056 PROPULSION DRIVE FOR ADVANCED CONCEPT TRAIN. Discussed are the requirements imposed on an optimized propulsion system for this type of service. These requirements are then implemented by utilizing an advanced concept regenerative drive coupled to a d-c shunt or series motor. A generalized approach is evolved. It is shown that close analogy exists between a-c and d-c systems intended to fulfill the same requirements. The approaches differ mostly in the method of implementation, i.e., induction machine versus synchronous machine--PWM versus AVI power processor, etc. The paper thus projects the philosophy that advanced concepts and improved performance are not synonymous, as is often assumed, with the exercise of varying the method of implementation.

13 050060 KINETIC ENERGY STORAGE: A "NEW" PROPULSION ALTERNATIVE FOR MASS TRANSPORTATION. The increasing public awareness of the dual problems of air pollution and energy shortage has provided impetus for a search to find new vehicle propulsion alternatives which can alleviate the present dilemma. Recent studies have shown that the incorporation of practical energy storage elements into vehicle drives offers the potential of significant reduction emissions as well as improvement in overall efficiency. The recent "rediscovery" of the kinetic energy flywheel as a highly effective energy storage system provides several new candidate propulsion systems either in heat engine/flywheel hybride or pure flywheel-drive configurations.

13 050479 THYRISTOR CONVERTERS FOR TRACTION DC MOTOR DRIVES. Based on tests in laboratories and on German Federal Railways (GFR) trial vehicles type ET 25 as well as on an industrial locomotive type 500 of the Rheinische Braunkohlen AG the subsequent development has been concentrated on the improvement of the power factor lambda and the displacement factor cos phi in four vital stages: 1) introduction of half-control, unsymmetrical half-controlled, and fully-controlled single-phase bridge connection with specially designed control systems; 2) introduction of sequence connection of several half-controlled bridges; 3) optimization of the so far applied connections for major assemblies such as rectifier transformer, rectifier, and smoothing reactor for improving the power factor; and 4) introduction of sector control with self-commutating unsymmetrical bridge for improving the power factor. The design of the control systems and power circuits is demonstrated for each step with the aid of actual constructions. Test results and precalculated theoretical power factor characteristics of the primary line current as function of the speed or Ud/Udo, respectfully, are given. Measurements and calculations, however, showed that the growing concentration of thyristor vehicles may increase the expenditures for railway power supply systems up to approximately 30 percent.

13 050730 INVESTIGATION OF VOLTAGE TRANSIENTS AND SPIKES IN DIRECT CURRENT RAPID TRANSIT SYSTEMS. Voltage transients and spikes have been investigated on five existing rail rapid transit systems to define the power environment in which new rail transit cars might be expected to operate. A final report describes and evaluates observed third-rail shoe transient and spike voltages, measured in subway installations in Philadelphia, New York City, Boston, Cleveland, and Chicago during rush and non-rush hours. It condenses these data into curves which may be used as the basis of a general performance specification. The underlying theory as well as special test equipment used during the field test activity is described in detail, together with a special computer program required for test data evaluation. The results obtained may be applied to future subway car speed control systems using static power conversion.

13 051529 TWO MEANS OF ALLEVIATING RUSH-HOUR CROWDING. Two means are suggested for increasing the rush-hour capacity of urban train systems already operating trains of maximum headway. They are: (1) Replacing some or all of the regular cars by standee-only cars; and (2) using double-length trains and, at the stations, having each train first stop with its front half alongside the station platform, and then advance to put its second half alongside the platform. A theoretical analysis shows that in some cases these methods can lead to a significant increase in the carrying capacity of a system. Formulas are presented for estimating the increase achievable in any particular case.

Libove, C (Syracuse University) *ASCE Journal of Transportation Engineering Proc Paper* Vol. 99 No. TE4, #10144, Nov. 1973, pp 845-862, 6 Fig., 1 Ref.; Presented at the July 9-12, 1973, ASCE National Transportation Engineering Meeting, held at Tulsa, Oklahoma.; ACKNOWLEDGMENT: ASCE; ORDER FROM: ESL, Repr PC, Microfilm

13 051532 THE DYNAMICS OF HIGH SPEED SLIDING POWER COLLECTION SYSTEMS FOR ELECTRICALLY PROPELLED VEHICLES. Methods for estimating the contact force variation are presented. Particular attention is given to third rail waviness and flexibility and their effects on contact force at high speed. Waviness measurements of a commercial third-rail are given in power density form. Conclusions are drawn concerning the feasibility of power collection at 300 mph as affected by waviness, rail flexibility, and brush wear.

13 052505 APPLICATION OF THYRISTORS IN RAILWAY TECHNOLOGY: CONSEQUENCES AND REMEDIES. INVESTIGATIONS ON A.C. MOTIVE POWER UNITS WITH SEVERAL THYRISTOR CIRCUITS (TESTS AND RESULTS OBTAINED FROM THE BLS-LOCOMOTIVE RE4/4 NO. 161). This report concerns the tests undertaken with the BLS-Locomotive Re 4/4 161 fitted with several thyristor circuits. The object of the tests was to clarify the changes in the power factor and the harmonic wave content-the latter in view of its effects on signalling and telecommunication installations-resulting from the increased number of inverter steps and the limitation of the firing angle of the thyristor bridges to 35 degrees. The tests conducted have shown that in the case of thyristor-controlled motive power units, a multi-step control of the voltage regulation leads to a reduction of the harmonics of the line current and to an improvement in the power factor during acceleration and running below full power. The limitation of the firing angle of the thyristor bridges of 35 degrees, considered in its entirety, does not bring any advantages however.

13 052506 APPLICATION OF THYRISTORS IN RAILWAY TECHNOLOGY: CONSEQUENCES AND REMEDIES. TESTS WITH A STATIC FREQUENCY CONVERTER FOR 50-16 2/3 HZ. The Swedish State Railways (SJ) have conducted several comparative measurements on the Moholm-Skovde line, using a prototype of a static frequency converter (power 6 MVA) During the tests the equivalent disturb-

ing currents and the weighted longitudinal e.m.f. induced in telecommunication circuits were measured; for these tests, the test line was fed through the static converter or through rotary converters. When the feeding took place through the static converter, the levels of the disturbing current in the overhead contact system and the induced weighted longitudinal e.m.f. were raised. However, a lowering of the levels measured may be expected, after the filter for the static converter has been modified. On the three-phase side there are no adverse effects, as long as the power of the static converter is very small in comparison with the short-circuit power of the high voltage network. The SJ have ordered, for two sub-stations, two static converters each with a power of 15 MVA each.

13 053729 ROLLING STOCK FOR THE SUB-URBAN SERVICES OF THE ITALIAN STATE RAILWAYS. The Italian State Railways have developed suitable suburban public transport systems in the more important Italian conurbation areas such as Rome, Milan, Turin, Genoa, Bologna and Naples. In this connection, it became necessary, after the end of the second world war, to provide purpose designed rolling stock for these services. Special vehicles with low slung floors were developed for the peak commuter services operated in the suburbs of the more important cities. These vehicles afford direct access from the station platforms through two large vestibules with double doors on either side.

13 053731 POWER SUPPLY FOR RAILWAYS IN CITY REGIONS. I. BASIC CONSIDERATIONS. On the occasion of the last symposium in Vienna in 1968, attention was drawn to the difficulties arising from current collection and power supply for high-speed running. These problems were taken up by ORE and are at present being tackled. In the meantime, it had to be recognised that problems of a partly similar and partly different nature are also encountered, and must be solved, in respect of current collection and power supply for high-frequency train services in large conurbations. Here,

the first step must be to analyse the problems themselves and to assess the range where the difficulties are liable to occur within a near future. It should be pointed out that the present paper is exclusively concerned with conventional railway systems and well-known systems of current supply to motive power units.

Breyer, W (Austrian Federal Railways) *Rail International* No. 1, Jan. 1973, 9 pp, 7 Fig., Tabs., 8 Ref.; ORDER FROM: ESL, Repr PC, Microfilm

13 053732 POWER SUPPLY FOR RAILWAYS IN CITY REGIONS. II. PRACTICAL APPLICATIONS. It is a common observation throughout the world that motor traffic in large cities has grown to such an extent that it can no longer be tackled even with a road construction programme which destroys the traditional urban structures. There is a lack of proportion between the space available in large cities and the space requirements of private motor traffic. Most of the existing means of local public transport such as buses and trams share the use of the roads and get stuck in traffic jams during rush hours so that their attractiveness is impaired. In some cases, remedies are sought by according privileges to public transport, but these reduce the road space available for private motor traffic. It is therefore not surprising that there is an increasingly urgent clamour for high-capacity modes of public transport, independent of the streets. The aim is to restore the attractiveness of local public transport and thereby to attract a great number of commuters who have hitherto regarded the use of their own car for the journey to work as indispensable. In future, local public transport will not succeed without acquiring a certain "rider appeal".

13 054004 "PROJECT 21" RAPID TRANSIT SYSTEM. SYNTHESIS OF THE SYSTEM AND VALIDATION OF THE GUIDEWAY. Project 21 is a complete new railroad system, particularly adapted for elevated rapid transit in medium-density cities. It features (a) low cost and esthetic acceptability of guideway and stations; (b) prefabricated, reusable guideway and station elements to allow quick installation and flexibility of relocation; and (c) a practical switch for two-way traffic. Trains carry some 35 to 150 passengers and operate generally like streetcars. This paper covers synthesis of the Project 21 concept and structural/dynamic analyses to validate the guideway design.

Edwards, LK Donnell, LH ; American Society of Mechanical Engineers ASME #74-RT-6, Jan. 1974, 17 pp, 14 Fig, Apps; Contributed by the Rail Transportation Division of The American Society of Mechanical Engineers for presentation at the ASME-IEEE Joint Railroad Conference, Pittsburgh, Pa., April 3-4, 1974; ACKNOWLEDGMENT: ASME; ORDER FROM: ESL, Repr PC, Microfilm

13 054286 WHEEL SIZES FOR CITY AND SUBURBAN STOCK. Dearth of suitable guiding information brought to a head with long-accepted P-D ratios restricting wheel-diameter reductions which are conducive to wheelset weight-saving, savings in first cost and energy economies. P-D ratios shown to over simplify the position and recent studies into contact stresses of wheels and rails have given valuable information. The author shows that maximum contact pressures of higher values than could be accepted by traditional P-D values are currently giving no problems.

13 054750 BART IN OPERATION--INNOVATIONS IN RAPID TRANSIT. The San Francisco Bay Area Rapid Transit System (BART) is the first completely new full-scale urban mass transportation system to be completed in the United States in approx. 70 yr. As such, it offered engineers an unusual opportunity to develop new technology in vehicle performance use of electronics for automatic train controls and fare collection, esthetics, multiple use of transportation corridors, passengers station design, subway construction, and other aspects of rapid transit planning and construction. These features are described in this article, along with "start-up" problems encountered, early patronage, and the significance of the System to the economic well-being of the Bay Area.

13 056771 NEW UNITED STATES STANDARD LIGHT RAIL VEHICLE. This paper presents details of the new United States standard light rail vehicle (LRV) being built by the Boeing Vertol Co. for the Boston and San Francisco public transportation authorities. System operation, design features, and performance are described for the LRV, successor to the ubiquitous President's Conference Committee car, last built in the United States in 1951. Used most effectively for an intermediate mass transit volume of 8000-24,000 passengers/h, the Boeing LRV incorporates much of the available state-of-the-art technology. The car body is tough and lightweight with numerous functionally oriented features. The propulsion system is the latest in thyristor-chopper control as applied to separately excited d-c traction motors. In addition, a variety of features enhance the comfort, safety, and maintainability of the LRV. Its multiple-wear resilient wheels make it a more quiet neighbor.

13 056789 ELECTRO-MAGNETIC COMPATIBILITY DESIGN FOR RAPID TRANSIT SYSTEMS. Design criteria and techniques used to minimize the interference levels between the communication and signal channels for control of rapid transit vehicles and other working systems (such as propulsion, power system, auxiliaries, etc.) or the environment, are analyzed in this paper. The particular system under consideration utilizes a higher frequency band to allow a wide separation from signal to noise, but below 10 KHz and at low power level so that it does not require special license to operate. In addition, the use of FSK and the well known features of signal capture as developed in fm systems, are used to further increase the EMC of the overall system. The techniques presented in this paper have been successfully implemented in various transit systems which are presently in operation.

13 056790 ELECTROMAGNETIC COMPATIBILITY BETWEEN THYRISTOR-CHOPPER CONTROLLED CARS AND ELECTRIC FIXED INSTALLATIONS IN TOKYO SUBWAYS. When commercial operation was initiated between Ayase and Kasumigaseki stations

on the Chiyoda Line (Tokyo) in March, 1971, the Teito Rapid Transit Authority put into service 130 chopper-controlled cars made up of thirteen 10-car trains. In February 1972, 60 chopper-controlled cars were put into service. Compared with conventional rheostat-controlled cars, chopper-controlled cars offer improved riding comfort, reduced electric power consumption, and low temperature rise in subway tunnels. However, the thyristor-chopper control generated ripple currents in the trolley wires and rails causing problems with the signaling and communication installations. Analytical studies and tests provided a solution to these problems by employing such measures as filtering and adopting a 660 Hz chopper frequency. As a result of the tests, compatibility between chopper-controlled cars and electric fixed installations was established

13 056798 INTERFERENCE TO TELECOMMUNICATION INSTALLATIONS BY RAPID TRANSIT SYSTEMS. Power conversion by means of semiconductor elements, i. e. the use of thyristors in traction systems operating with dc or ac has resulted in new electromagnetic compatibility problems. While it has hitherto been possible to control the interference to telecommunication installations caused by the fundamental frequency and harmonics of the traction current without great difficulties, the growing number of harmonics may call for special measures to be taken. In addition, traction currents are also increasing due to the demand for higher acceleration and speed of trains, particularly of rapid transit systems in densely populated areas-a demand which can particularly be met by the thyristor technique. This paper examines the electromagnetic compatibility problem from both the viewpoint of the Railways and the telecommunication authorities. Moreover, measures for keeping the interference within tolerable limits are indicated.

13 056814 SELF-COMMUTATED RECTIFIER TO IMPROVE LINE CONDITIONS.

When thyristor rectifiers are used for electric drives, reactive power is produced with fundamental and harmonic frequencies. Especially in single-phase traction lines, with their low short-circuit power, a technical solution of this problem, applicable mainly to thyristor-driven rail cars and locomotives, had to be found. In this paper, the sector-control system of a self-commutated unsymmetrical bridge is described. In the unsymmetrical half-controlled bridge connection, the two thyristors can be quenched by adding a self-commutating device. This attachment (supplement) can be applied to the single bridge or to two bridges in series (sector control). By using this self-commutating attachment, it is possible to shift the fundamental of the current to a leading angle with respect to the voltage.

13 056949 COMMUTER RAILROAD FEASIBILITY STUDY ON SELECTED LINES IN THE LOS ANGELES METROPOLITAN AREA.

The objective of the report was to explore feasibility if installing and operating a limited scope rail commuter service over one Southern Pacific and two Santa Fe routes into Los Angeles, California. A package of data is provided including statistical compilations on the operational and physical characteristics of the rail lines under consideration. It is believed possible to inaugurate limited commuter service relatively early, employing Santa Fe trackage on the Santa Ana and Los Angeles route and the San Bernadino-Los Angeles route via Pasadena. Summary of principle statistics of the proposed routes is presented.

Findings include annual deficits, projected ridership, marketing aspects, operational and capital costs and implementation of service.

13 057150 BART BATTLES COMPLEX PROBLEMS.

Since Bart opened, its cars and automatic train control systems have not operated properly. Until electronic problems in the Trans Bay Tube system are overcome, hopefully by September 1974, the transit system operates in two parts and ridership is not as high as it should be. Defects in the automatic, computer controlled operation have led to a series of train failures, derailments, etc. However, BART hopes to have these problems solved within eight months. The car problem is just as serious as the electronic problems. On some days over half the cars are unserviceable.

13 057440 FINNISH RAILROADS AND PUBLIC TRANSPORT IN HELSINKI

[Le ferrovie finlandesi ed i trasporti pubblici di Helsinki]. Recently, the Finnish railways started the electrification of some lines starting from Helsinki, on which there is an intense suburban traffic. One of the main reasons which induced the VR to make this decision was that of limiting the importance of fuels of foreign origin and to make a better use of national power resources deriving from the possibility of exploiting, with hydroelectric power stations, the numerous lakes and rivers which cover about a tenth of the area of the country. In the Helsinki Region, for essential connections not served by VR suburban lines, two metropolitan lines will be constructed, with advanced characteristics, on which the use is envisaged of trains with automatic drive. The street car network of Helsinki, made up of 9 lines, will be maintained and modernized with the introduction, among other things, of 40 modern articulated cars equipped with static speed regulation. Details of the the Finnish RR development program are given. [Italian]

13 057884 ASSESSMENT OF DESIGN TOOLS AND CRITERIA FOR URBAN RAIL TRACK STRUCTURES. VOLUME I. AT-GRADE TIE-BALLAST TRACK. The report presents the results of a critical review of the technical factors which govern the design and performance of at-grade tie-ballast track for urban rail systems. The assessment of current design practice is based on a review of the literature and discussions with experienced track design personnel. The evaluation includes design loads and the criteria for selecting rail size, tie size and spacing, ballast depth, and subgrade parameters. The major track problems identified were rail joints, rail wear and noise on curves, rail fasteners, and rail corrugation. Detailed technical evaluations were made to determine those areas where the track design procedures are inadequate. The report includes detailed information for the engineering design of track and recommendations for both short and long-range program plans for future research pertaining to the improvement of track performance.

Prause, RH Meacham, HC ; Battelle Columbus Laboratories Final Rpt. Apr. 1974, 247 pp; See also Volume 2, PB-233017. RRIS #012656.; Contract DOT-TSC-563; ACKNOWLEDGMENT: NTIS (PB-233016/5); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233016/5, DOTL NTIS

13 057885 ASSESSMENT OF DESIGN TOOLS AND CRITERIA FOR URBAN RAIL TRACK STRUCTURES. VOLUME II. AT-GRADE SLAB TRACK. This report presents the results of a critical review of the technical factors which govern the design and performance of at-grade slab track for urban rail systems. The assessment of current design practices is based on a review of the literature and discussions with experienced track design personnel. The evaluation includes descriptions of slab structures now in use in four countries, followed by review of design and analysis procedures used to characterize the subgrade and its support characteristics; the reinforced concrete slab itself, and the subgrade-support system. With a few exceptions, most of the work reported in the literature is based on highway or runway applications, where the mechanism of load transfer into the slab is completely different than in a rail support slab. Further research on the mechanisms of load

transfer from rail fasteners into a reinforced concrete slab is needed, and the newly developed finite element approach appears well-suited.

13 071794 BOEING'S STATE-OF-THE-ART CAR: THE BIG TEST BEGINS IN NEW YORK. Two State-of-the-Art Cars (SOAC) operating on New York's Eighth Avenue subway line were produced as vehicles with an overall length of 74 ft. 8 in. and a truck center distance of 54 feet. The lightweight SOAC truck has a cast alloy-steel frame isolated from the axles by rubber-chevron primary springs which eliminate metal-to-metal contact between rail and carbody. The air-bellows secondary springing controls carbody leveling as well as further isolating rail-generated noise. Each truck is fitted with two 175-hp DC traction motors driving through double-reduction helical gears and elastomeric couplings.

13 071812 CHOPPER CONTROL EQUIPMENT WITH REGENERATIVE BRAKE SUPPLIED TO TORONTO TRANSIT COMMISSION. An experimental conversion of 6 conventional resistor-controlled subway cars to chopper control was made. The 2-phase 600 v dc chopper equipment is capable of controlling eight 86 kw traction motors (per two cars) and provides 65% weak field controlling regenerative braking. All major components are designed to withstand severe service conditions in temperatures as low as -30 C. Computer simulation indicates that electric cars using this control system consume about 30% less power than resistor-controlled cars.

13 071843 ATA RAIL TRANSIT CONFERENCE HELD IN SAN FRANCISCO, CALIFORNIA ON APRIL 14 AND 16, 1974. CAR EQUIPMENT SESSIONS. PAPERS. Two of the papers concern the BART maintenance philosophy and their scheduled and unscheduled maintenance, rail vehicle inspection, diagnostic procedures and vehicle warranties as well as personnel training and tools and materials. The paper by Jeffrey Mora discusses the AC motor versus D.C. motor demonstration project conducted on three Cleveland Transit System rail cars. Mr. Lawson discusses a current study of the use of a kinetic energy flywheel as an efficient energy storage system and his intention to demonstrate this system in San Francisco Muni electric trolley coaches. The paper by J. R. Vollmar discusses the merits, costs and problems of electric locomotive versus multiple unit electric trains in both commuter and inter-city service.

13 072005 TRACKED TRANSPORT SYSTEMS OF THE FUTURE: STATE-OF-THE-ART AND DEVELOPMENT IN EUROPE IN 1973 [Spurgebundene Verkehrssysteme der Zukunft Stand und Entwicklung in Europa 1973]. The report gives an overview of the existing tracked transport systems and of the techniques available. It outlines the state of development of technical components. It reviews planning and research in Germany and in 15 other European nations and also studies undertaken by European and international organizations. The report concludes that by the end of the century a tracked high efficiency rapid transport system will be an economic and social necessity in Europe. Such a system could be based on several technical solutions, specifically on the wheel-on-track system, air cushion or magnetic levitation. It is very important that European nations collaborate rather than compete in the research for the best technical and economical solutions. Planning should start immediately for the anticipated future European structure of population and economy. The network for a future high efficiency rapid transport system should be determined. Projections for passenger and freight transport in such a network should be made and speed limits should be determined. [German]

13 072047 INTER-AIRPORT CONNECTION CGN-DUC WITH A HIGH-EFFICIENCY RAPID TRANSIT SYSTEM [Flughafenverbindung CGN-DUC mit einer Hochleistungsschnellbahn]. The report projects the demand for a high-efficiency rapid transit system (HSB) between the airports of Cologne (CGN) and Dueseldorf (DUC) for 1980 and compares it to the demand of 1968. The projection is based on the existing structure of the airport access and may have to be adjusted when new systems are introduced. Investments and costs of a high efficiency rapid transit access (HSB) are calcu-

lated. A table gives travel time for the airport access. [German]

13 072444 PREDICTION AND CONTROL OF RAIL TRANSIT NOISE AND VIBRATION. A STATE OF THE ART ASSESSMENT. As systems manager for the Urban Mass Transportation Administration's Rail Supporting Technology Program, the Transportation Systems Center has undertaken research in rail transit noise abatement. As part of this effort, this report contains the results of a critical review of current technology for the prediction and control of urban rail transit noise and vibration, with primary emphasis on the parameters affecting propagation paths. Specifically included are tools for the prediction of wayside noise and vibration adjacent to both at-grade and elevated transit track, groundborne noise propagation from subway tunnels, and noise in cars and in stations. In addition, several noise and vibration control techniques are evaluated including resilient rail fasteners, floating slabs, noise barriers, elevated structure enclosures, structural damping, and acoustical treatment of stations and tunnels. Specific recommendations are made for areas requiring further research and development. Two of these areas, elevated structure noise and groundborne vibration from tunnels, have been selected for continued investigation under this contract.

13 072449 SUPPRESSING NOISE AND VIBRATION IN THE SUBWAY. With extensions totalling 8.5 miles due for completion by 1977, partly through environmentally-sensitive areas along the route of the abandoned Spadina Expressway, Toronto Transit Commission acknowledges the need for continuing research to fill gaps in existing knowledge about noise and vibration problems. TTC has examined these in detail, and in many cases successful solutions have been developed to meet standards set by the Institute for Rapid Transit.

Murray, RJ (Toronto Transit Commission) *Railway Gazette International* Vol. 130 No. 9, Sept. 1974, pp 337-340, 4 Fig., 3 Phot., 4 Ref.; ORDER FROM: XUM, Repr. PC

13 072459 INITIAL CORROSION SURVEY OF THE BAY AREA RAPID TRANSIT SYSTEM. The 75-mile (120-km) Bay Area Rapid Transit System has a dc traction power supply that uses the continuously welded steel running rails for its negative current return. The rails are mounted on insulating fasteners to minimize leakage current. However, high values of stray current have been measured during the initial operation of the system. Testing has demonstrated that the negative return grounding at traction substations and its interconnection with other grounding has been the major cause of stray earth currents. An alternate method of negative return grounding through diodes has been tested

and is being installed. The diodes block exchange currents, but allow leakage and fault current return to the traction rectifiers.

13 072655 DIRECTIONS IN TRACK STRUCTURE RESEARCH. This paper presents a survey of contemporary problems in track structure

technology and the programs of research and development addressing these problems. It reports current and anticipated investigations into aspects of the service environment of railroad track structures, the mechanics of track structure degradation, the fatigue and fracture of rails, the development of rational design and maintenance techniques, the improvement of track components, and the development of non-conventional, low maintenance track structures for application to high speed high density service. Efforts involved with both the fundamentals of track mechanics, and the design of improved structures for urban rapid transit applications, as well as mainline railroad use are included.

13 072672 PROGRESS IN RAILWAY MECHANICAL ENGINEERING (1973-1974 REPORT OF SURVEY COMMITTEE) CARS AND EQUIPMENT. This survey covers some of the major developments in freight and people transportation equipment made public in the last calendar year. Because of the oil embargo, the increasing demand for power, and more stringent pollution laws, the demand for low sulfur coal out of the west is in great demand. Hence, there is a large need for cars to haul coal. Because of large loss and damage claims in the automotive industry, new equipment for transporting automobiles that is vandalism-and damage-free was developed. In the people transport area, new developments, mostly funded by the Department of Transportation (D.O.T.), are continuing to materialize.

13 072764 RUNNING GEAR DESIGN INCORPORATING RUBBER SPRINGS. The use of rubber springs and components at primary and secondary suspension stages has spread very rapidly, notably with city rolling stock such as underground railways and tramways, and also with industrial, shunting and main line locomotives. Body-supporting airsprings are used in conjunction with primary rubber suspensions with underground, city and suburban coaches and to a lesser extent, with main line coaches. The reasons are to a great extent because of the exceptionally low, if any, demands as far as maintenance is concerned, combined with reduced noise levels, the absorption of high-frequency oscillations and the ability to implement the desired characteristics in all three planes.

13 072794 A BIBLIOGRAPHY ON THE DESIGN AND PERFORMANCE OF RAIL TRACK STRUCTURES. This bibliography was prepared as part of the Rail Supporting Technology Program being sponsored by the Rail Programs Branch of the Urban Mass Transportation Administration. It is based on the reference material that was used to evaluate the technical factors which govern the design and performance of at-grade track structures for urban rail systems. While most of the reference material that has been included is directly related to track used for railroad, rail rapid transit and light rail transportation, there are some additional references on related topics such as rail vehicle dynamics, soil mechanics, stress analysis, etc. However, this bibliography does not include a comprehensive review of these related topics. This survey includes much of the published literature on track design, track loading, ballast, wood and concrete cross ties, rail and rail fasteners. It also includes considerable material on track problems such as rail wear corrugation, rail defects, rail joints and track degradation. The formal literature search for this bibliography covered the time period from about 1963 to 1973. The principal sources were the National Technical Information Service (NTIS) file of government reports, Engineering Index, and the Applied Science and Technology Index. Earlier references were identified from the Railroad Research Information Service (RRIS) computerized data base and bibliographies prepared by the RRIS and the Association of American Railroads.

13 080072 THE IMPORTANCE OF TIME SPENT AT STATION STOPS. The demand for high schedule speeds must be met by ensuring effective passenger interchange at stations and circulation within the coaches. To facilitate this, doors should be provided every 4,000 to 5,500 mm. These should offer a 1,250 to 1,300 mm wide passage. A space of 350 to 375 mm should be provided between door edge and partition for standing passengers, who will thus be moved out of the path of entering or leaving passengers. The use of swing-sliding (ss) doors will permit a simpler and lighter body structure and reduce draughts and at the same time improve noise insulation.

13 080300 THE INFLUENCE OF RAILS ON TRAIN NOISE. This paper presents an evaluation of the dynamic interaction of steel wheels on steel rails and an estimation of the contribution of sound radiated by rails to total train noise levels. The interaction is modeled as a random process, for which dynamic forces at the wheel/rail interface are related to wheel and rail impedances and roughness wavenumber spectra. Roughness spectra, estimated from rail vibration data, are found to be proportional to the fourth root of the wavenumber. Comparing analytical predictions with measured data shows that the rail can be adequately modeled as a beam on an elastic foundation. Modeling the wheel as a simple mass reveals that at intermediate frequencies the wheel impedance is much higher than the rail impedance. Therefore, rail vibration levels are expected to be substantially higher than levels of wheel vibration. Analytical models of rail radiation, confirmed by experimental data acquired by shaking a rail in a reverberant chamber, show that rail radiation is efficient above 500 to 1000 Hz. When these models and data are combined, it is found that rail radiation may dominate at mid-and high frequencies (between 500 and 5000 Hz), but it is less important than other sources outside of these frequency regimes.

13 080359 MULTIPLE CAR PERFORMANCE, AC PROPULSION PROJECT. In 1971 the Cleveland Transit System received a grant contract from the Department of Transportation's Urban Mass Transportation Administration to test, demonstrate and evaluate a solid state AC propulsion system on three rapid transit cars (Project OH-06-0006). The AC propulsion system was developed by the Westinghouse Air Brake Division, Westinghouse Air Brake Company (WABCO), Wilmerding, Pa. This report is one of a series on various aspects of the project. To demonstrate general performance and applica-

bility of the propulsion system, an on-board computer controlled data acquisition system was used to collect performance data. The data were reduced, analyzed, and plotted by computer. This report presents the performance data collected during the multiple car operation. The general performance characteristics are displayed by means of graphs plotted by computer from the raw data. Detailed descriptions of the data system and single car performance results are reported separately in UMTA-OH-06-0006-73-1 and UMTA-OH-06-0006-73-3 respectively.

13 084707 QUIET PROGRESS OF A RAILROAD WHEEL. The problem of subway car wheels screeching along the tracks is receiving practical attention by the use of a new wheel. Developed specifically by Standard Steel, it can reduce noise levels above 90 decibels, which can be harmful to human ears. Slated to be used initially on standard light rail vehicles in Boston and San Francisco, the "Acousta Flex" is the most effective design so far in eliminating wheel-track interface, the source of the noise. Patterned after a wheel designed for BART, it is composed of an aluminum center, which lessens its weight, and a steel tire which absorbs the wear and can be replaced when fully worn. It also incorporates acoustic features which suppress the noise. The design of the Acousta Flex emerged after much testing, and other research still continues for other noise-reducing wheels. One such wheel is the Penn Cushion Wheel, which has a special rubber cushion design. Noise levels depend on many factors, and the amount of the reduction varies. With this design, it is usually between 20 and 50 percent.

13 091889 STEEL WHEEL PLATE CRACKING. This document describes the results of an investigation into the cause of premature cracking on 28-inch reversed dish transit car wheels. Methods used in determining the operating thermal and track load stresses in the critical areas of a wheel are presented. The observations made on the cracked specimens all indicate that the cracks which formed were due to fatigue. The problem was resolved by specifying a new wheel plate thickness and also by machining and shot peening the plate surface.

13 092216 STATE-OF-THE-ART CAR DEVELOPMENT PROGRAM FINAL TEST REPORT. VOLUME I. COMPONENT TESTING. The Urban Rapid Rail Vehicle and Systems Program is an integrated development program directed toward improving high speed, frequent-stop urban rail systems. The overall objective is to enhance the attractiveness of rail transportation to the urban traveler by providing service that is as comfortable, reliable, safe and economical as possible. The objective of the State-of-the-Art Car (SOAC) is to demonstrate the best state-of-the-art in rapid rail car design, with two improved cars using existing proven technology. Primary goals for the cars are passenger convenience and operating efficiency. This document, Volume 1 of the SOAC Final Test Report, presents the test results of the component testing of the State-of-the-Art car. The purpose of these tests was to show compliance with the SOAC Detail Specification (NTIS PB-225 934). All component tests were conducted by the supplier of the applicable subsystems. An introduction, test procedures and results, and conclusions are presented. Appendices are titled: Propulsion, Dynamic Braking and Auxiliary Power Equipment; Truck Frame; Truck Bolster;

Windshield; Seat Strength; and Materials-Fire Resistance.

Boeing Vertol Company, Urban Mass Transportation Administration Final Rpt. D174-10024-1, UMTA-IT-06-0026-74-1, Aug. 1974, 291 pp; See also Volume 2, PB-244 048. Paper copy also available in set of 5 reports as PB-244 047-SET, PCS\$26.00.; Contract DOT-UT-10007; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-244048/5ST, DOTL NTIS

13 092217 STATE-OF-THE-ART CAR DEVELOPMENT PROGRAM FINAL TEST REPORT. VOLUME 2. SUBSYSTEM FUNCTIONAL TESTING. The Urban Rapid Rail Vehicle and Systems Program is an integrated development program directed toward improving high speed, frequent-stop urban rail systems. The objective of the State-of-the-Art Car (SOAC) is to demonstrate the best state-of-the-art in rapid rail car design, with two improved cars using existing technology. Primary goals for the cars are passenger convenience and operating efficiency. This document, Volume 2 of the SOAC Final Test Report, presents the test results for the subsystem functional testing of state-of-the-art transit cars. The purpose of these tests was to show compliance with the SOAC Detail Specification (NTIS no. PB-222 147). After adjustments and changes where required, all subsystems met the requirements of the detail specification. Chapters of the report present instrumentation, test procedures and results, and conclusions. Items discussed in the chapter on test procedures and results are car body, lighting, wiring, equipment, main propulsion control and motor rotation, braking, propulsion auxiliaries, car weight, pantograph, air compressor, hostling panel, and visual.

13 092218 STATE-OF-THE-ART CAR DEVELOPMENT PROGRAM FINAL TEST REPORT. VOLUME 3. ACCEPTANCE TESTING. The Urban Rapid Rail Vehicle and Systems Program is an integrated development program directed toward improving high speed, frequent-stop urban rail systems. The objective of the State-of-the-Art Car (SOAC) is to demonstrate the best state-of-the-art in rapid rail car design, with two improved cars using existing proven technology. Primary goals for the cars are passenger convenience and operating efficiency. This document, Volume 3 of the SOAC Final Test Report, presents the test results for the vehicle acceptance testing of two state-of-the-art transit cars. Performance, ride quality, noise and electromagnetic interference (EMI) acceptance tests were conducted. Chapters contain a summary of test results, configuration, test equipment and instrumentation, and test procedures.

13 092219 STATE-OF-THE-ART CAR DEVELOPMENT PROGRAM FINAL TEST REPORT. VOLUME 4. SIMULATED DEMONSTRATION TEST. The Urban Rapid Rail Vehicle and Systems Program is an integrated development program directed toward improving high speed, frequent-stop urban rail systems. The objective of the State-of-the-Art Car (SOAC) is to demonstrate the best state-of-the-art in rapid rail car design, with two improved cars using existing proven technology. Primary goals for the cars are passenger convenience and operating efficiency. Simulated Demonstration Tests of the SOAC two-car train was conducted with the purpose to enhance the probability of trouble-free operation in the demonstrations for the riding public to be held in the cities of New York, Boston, Chicago, Cleveland, and Philadelphia. The demonstration profile was set up as a composite of the five demonstration city routes.

13 092220 STATE-OF-THE-ART CAR DEVELOPMENT PROGRAM FINAL TEST REPORT. VOLUME 5. POST REPAIR TESTING. The Urban Rapid Rail Vehicle and Systems Program is an integrated development program directed toward improving high speed, frequent-stop urban rail systems. The objective of the State-of-the-Art car (SOAC) is to demonstrate the best state-of-the-art in rapid rail car design, with two improved cars using existing proven technology. Primary goals for the cars are passenger convenience and operating efficiency. This document presents the test results for the Post-Repair Testing of the SOAC. The purpose of these tests was to show: (1) compliance with the SOAC Detail Specification (NTIS no. PB-222 147) following repairs to the Number 2 car damaged in an accident on August 11, 1973 at the DOT High Speed Ground Test Center, Pueblo, Colorado; and (2) to complete the Simulated Demonstration Testing (Volume 4) which had been interrupted by the accident. Chapters present configuration, instrumentation, test procedures, test results and conclusions.

13 092340 WHEEL/RAIL NOISE AND VIBRATION. VOLUME I: MECHANICS OF WHEEL/RAIL NOISE GENERATION. The final reports are reported of a project to develop

a basic understanding of urban transit wheel/rail noise control measures. Analytical models of impedance, response, radiation efficiency, and directivity of wheels and rails are presented and compared with field and laboratory measurements. Analytical formulas for the prediction of noise in the three general categories of wheel/rail noise- squeal, impact, and roar-are presented and verified by comparison with laboratory measurements as well as field measurements using a small steel-wheeled personal rapid transit vehicle on a test track. Volume one deals with the theory of wheel/rail noise generation.

Boeing Company, Urban Mass Transportation Administration, Transportation Systems Center Jan. 1975, 824p-in 6V; Set includes PB-244 747 thru PB-244 752.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC; PB-244746-SET/ST, DOTL NTIS

13 092464 SOAC: STATE-OF-THE-ART CAR ENGINEERING TESTS AT DEPARTMENT OF TRANSPORTATION HIGH SPEED GROUND TEST CENTER. FINAL TEST REPORT. VOLUME I. PROGRAM DESCRIPTION AND TEST SUMMARY. The six-volume report presents the technical methodology, data samples, and results of tests conducted on the SOAC on the Rail Transit Test Track at the High Speed Ground Test Center in Pueblo, Colorado during the period April to July 1973. The Test program comprises three areas: Vehicle testing,

ways and structures testing and track geometry measurement. The objective of the SOAC program is to demonstrate the current state-of-the-art in rail rapid transit vehicle technology, with passenger convenience and operating efficiency as primary goals. In this series, Vol. I contains a description of the SOAC test program and vehicle, and a summary of the test results; Vol. II, Performance Test data; Vol. III, Ride Quality Test data; Vol. IV, Noise Test data; Vol. V, Structural, Voltage, and Radio Frequency Interference Test data; and Vol. VI a description of the Instrumentation system used for performance, ride quality and structural testing.

13 093346 URBAN RAPID RAIL VEHICLE AND SYSTEMS PROGRAM. The report reviews the third year's efforts of the Urban Mass Transportation Administration's Urban Rapid Rail Vehicle and Systems Program. The objective of the Program is to enhance the attractiveness of rail rapid transit to the urban traveler by providing him with transit vehicles that are as comfortable, reliable, safe and economical as possible. Accomplishments for the year ending June 1974 included the following: Completion of the review of BART data; completion of the SOAC test and simulated demonstration programs at the High Speed Ground Test Center, Pueblo, Colorado after repairing the damage to the SOAC cars resulting from a collision with a standing car on August 11, 1973; completion of SOAC demonstration runs on the NYCTA lines.

Boeing Vertol Company, Urban Mass Transportation Administration Ann. Rpt., 3 D174-10033-1, UMTA-IT-06-0026-74-1, July 1974, 125 pp; See also PB-224 141.; Contract DOT-UT-10007; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-245310/8ST, DOTL NTIS

13 093468 EVALUATION OF THE WABCO AC PROPULSION SYSTEM. VOLUME 1. CTS/UMTA AC PROPULSION PROJECT. In 1971, the Cleveland Transit System received a grant contract from UMTA to test, demonstrate, and evaluate a WABCO solid state AC propulsion system on three rapid transit cars (Project OH-06-0006). The independent evaluation was performed by Transportation and Environmental Operations, TRW, Inc, Redondo Beach, Calif. This is the final project report. AC Pulse Width Modulation propulsion test data is evaluated to determine whether the advantages claimed for AC PWM propulsion were demonstrated. Retro-fit feasibility, AC/DC car compatibility, signal

compatibility, and electromagnetic interference are assessed. Factors related to the relatively undeveloped state of the AC system limit the specificity of the results and conclusions relative to their applicability to other transit properties in the future. Chapters present project objectives, project description, summary and conclusions, principal task evaluations, the AC/PWM propulsion system, and ancillary task evaluations. A bibliography is furnished.

Hoppe, CF ; Cleveland Transit System, Urban Mass Transportation Administration Final Rpt. UMTA-OH-06-0006-74-3, Sept. 1974, 211 pp; Paper copy also available in set of 2 reports as PB-245 388-SET, PC\$15.00.; Contract UMTA-OH-0006; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; Repr. PC \$7.75, Microfiche\$2.25

13 093469 EVALUATION OF THE WABCO AC PROPULSION SYSTEM. VOLUME 2. RELATED REPORTS AND EXHIBITS. In 1971, the Cleveland Transit System received a grant contract from UMTA to test, demonstrate, and evaluate a WABCO solid state AC propulsion system on three rapid transit cars (Project OH-06-0006). The independent evaluation was performed by Transportation and Environmental Operations, TRW, Inc, Redondo Beach, Calif. This is the final project report. Measurements of wheel wear, window safety glazing, ride quality, and passenger reaction to the restyled car interiors and new AC propulsion system are discussed. Contents of this report are: experimental design description for the CTS/WABCO AC propulsion demonstration program; instrumentation assessment, AC propulsion project; life cycle cost analysis plan for the Cleveland Transit System AC propelled cars; passenger reaction to AC propelled restyled rapid transit cars; evaluation of safety glazing; survey of Cleveland Transit System rapid transit maintenance procedures and facilities; and, telephone influence factor measurements.

13 094184 ASSURED ENERGY RECEPTIVITY STUDY. The study objective was to determine the amount of heat removed from rapid transit tunnels by adding wayside resistors which would absorb braking energy that could not be absorbed by normal regeneration. In addition, preliminary design and cost data for the installation of the wayside resistors was to be provided. As the study progressed it was found that the addition of the wayside receptive devices provided a very marginal improvement over normal regeneration, and a substitution in the direction of the study made; the effect of improving the regenerative capability of the trains was measured rather than completion of the design for the wayside resistors.

Westinghouse Electric Corporation, Transit Development Corporation, Incorporated Final Rpt. TDC-AER-75-3, May 1975, 138 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-247760/2ST, DOTL

NTIS

13 094317 ASSURED ENERGY RECEPTIVITY. A PROJECT OVERVIEW. The program successfully verified the technical feasibility of wayside resistors and produced two alternative preliminary designs for the mechanization of this concept. It was further verified that such wayside resistors for assured receptivity would have a very beneficial effect on ventilating and air-conditioning apparatus for subway stations and tunnels. However, cost-effectiveness analysis showed that in the general case wayside resistors are not cost-effective. The program results conclusively demonstrated that natural regeneration is highly cost effective in a system designed or adapted for effective functioning of regeneration to a naturally-receptive distribution network. Additionally, this phase of the program established the feasibility of an alternative wayside system utilizing flywheel motor generator sets (based on state-of-the-art apparatus) for energy storage and reuse.

Phelps, DR ; Transit Development Corporation, Incorporated Final Rpt. TDC/500-75/10, Sept. 1975, 30 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-246247/1ST, DOTL NTIS

13 094319 ASSURED ENERGY RECEPTIVITY STUDY. The objective of this study is to compare a conventional chopper-controlled train propulsion system without regeneration with two schemes of regeneration: (1) natural receptivity and (2) assured receptivity. A system that employs natural receptivity regeneration converts the kinetic energy of braking trains to electrical energy which is used to power onboard equipment. An assured receptivity regeneration system operates in a manner similar to a natural receptivity system, except that the excess electrical energy is stored, dissipated, or redistributed. The objective of this study is to quantify savings achieved in power consumption and cooling capacity by the use of a regenerative braking system, and compare them to the added costs of the electrical system for both natural and assured energy receptivity.

Transit Development Corporation, Incorporated, Parsons, Brinckerhoff, Quade and Douglas, Inc Final Rpt. TDC-AER-75-1, June 1975, 61 pp; Prepared by Parsons, Brinckerhoff, Quade and Douglas, Inc., New York.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-246244/8ST, DOTL NTIS

13 094483 ENERGY STORAGE PROPULSION SYSTEM FOR RAPID TRANSIT CARS. SYSTEM DESIGN AND EQUIPMENT DESCRIPTION. When a transit rail car accelerates, it draws energy from a wayside electric power source; when it decelerates, the car must rid itself of this energy. Conventional rail cars dissipate this energy in the form of heat. This report describes a transit car propulsion system which will save much of this presently wasted energy by storing the car's kinetic energy in flywheels which are mounted below the car floor. The stored energy is then available for the subsequent acceleration of the car. Thus a significant reduction in energy usage is expected, along with a resultant reduction in subway tunnel heating. This energy storage propulsion system

has been installed on two New York City subway cars and will be subjected to an extensive series of tests. This report discusses the background and design approach and describes the technical features of the Energy Storage propulsion system.

Co., Torrance, Calif.; Grant DOT-UT-550; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-249063, DOTL NTIS

13 094606 URBAN RAIL SUPPORTING TECHNOLOGY PROGRAM FISCAL YEAR 1975. YEAR END SUMMARY. The Urban Rail Supporting Technology Program is described for the 1975 fiscal year period. Important areas include program management, technical support and applications engineering, facilities development, test and evaluation, and technology development. New projects were started in all important areas. Specific technical discussion includes: Technical Support and Applications Engineering, the Crashworthiness of Vehicles, Advanced Concept Train, and Rail Transit System Costs; Facilities Development, Permanent Track Power, Catenary, Wheel truing Machine, and Track Scale; Test and Evaluation, State-of-the-Art Car testing and Revenue Service Demonstration, the testing of existing Revenue Service Vehicles, testing on the UMTA RTTT (Energy Storage Car Gas-Turbine/Electric cars, Standard Light Rail Vehicle, Track Geometry Measurement System, and General Vehicle Test System); Technology Development, Noise Abatement, and Tunneling.

13 095227 ALUMINUM CENTER WHEELS FOR RAPID TRANSIT RAIL SERVICE. This paper is a report on the experience with aluminum-center steel rim wheels used on the rapid transit cars on Bay Area Rapid Transit. These wheels are exhibiting some properties not noticed previously. Some particular problems encountered are cited and the measures taken to counteract their effect are described. It is intended as a preliminary report to the industry, with further data to follow, as they become available.

Van Overveen, JP (San Francisco Bay Area Rapid Transit District) Grosser, JF (Westinghouse Electric Corporation); American Society of Mechanical Engineers 75-RT-5, Apr. 1975, 8 pp, 11 Fig., 4 Tab., 1 App.; Contributed by the Rail Transportation Division of The American Society of Mechanical Engineers for presentation at the IEEE-ASME Joint Railroad Conference, San Francisco, California, April 15-17, 1975.; ACKNOWLEDGMENT: ASME; ORDER FROM: ESL, Repr. 13 095229 EVOLUTION OF A NEW TRUCK DESIGN FOR NEW YORK CITY TRANSIT AUTHORITY. This paper describes the specification, design, and testing required to develop the new lightweight air spring truck design for cars presently under construction for the New York City Transit Authority (NYCTA) under Equipment Contract R-46. The design is of particular significance since the trucks are part of the largest rail passenger car contract in history and for the largest rapid transit property in the world. This paper also summarizes the design characteristics of trucks which have been operating under transit cars on the New York City Transit System during the past seven decades.

13 095818 ONTARIO'S PROGRAM FOR INTERMEDIATE-CAPACITY TRANSIT. This paper describes the Ontario government's program for building and testing a demonstration transit system of intermediate capacity in Toronto. This demonstration system is considered a forerunner and test-bed for revenue systems, which, it is anticipated, will be built in major Ontario cities in the next decade. The scope of the revenue systems is also described as are the government's plans to develop an industrial capability in Canada for developing improved transit systems.

Harmelink, MD (Ontario Ministry of Transp & Communications, Can) *Transportation Research Record* No. 522, 1974, pp 1-9, 2 Fig., 3 Tab., 3 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

13 095867 DYNAMIC BRAKING. The kinetic energy of rapid transit trains that is normally dissipated as heat during braking can be converted to potential energy. The use of a flywheel energy storage system is an old idea that has recently been revived. A competitive idea being advanced is the thyristor inverter-recuperative system. While extensive operational experience is not yet available for either, both are currently being tested. The flywheel system is being tested on the New York Transit Authority and the regenerative system on the Sao Paulo, Brazil, Metro. It appears that the regenerative system is more efficient and requires less maintenance, thereby justifying the additional capital investment.

13 096541 BRUSSELS METRO COMPARES WELDED AND RIVETED ALLOY BODIES. In designing the equipment for full-scale rapid-transit operation of the Brussels Metro, which was built for light-rail operation initially, prototypes were built utilizing riveted wide extrusions and welded extrusions of more conventional design. Previously the weight savings of aluminum alloys had been adopted; the method of construction had to be established. Since wide aluminum extrusions could become popular for high speed intercity trainsets and for urban railways, the STIB tests have compared the alternate construction techniques.

Railway Gazette International Vol. 131 No. 4, Apr. 1975, pp 156-157, 2 Fig. ORDER FROM: XUM, Repr. PC

13 096605 WEST GERMANY: THE PHOENIX RISES. Various features of the German Federal Railway (Deutsche Bundesbahn or "DB") are described. Of the 29,000 total route kilometers, some 9000 route kilometers (or 31 percent of the system) are electrified. The DB traction equipment consists of a mix of all-electric, diesel-hydraulic, relatively few diesel-electric, and steam locomotives. Details on the DB electric, diesel-hydraulics and diesel-electrics are given. The Intercity mainline railway service, S-Bahnen (rapid transit rail systems) operating from center city to nearby and/or outlying suburbs, U-Bahnen (subways), and tramways are discussed.

13 098019 TYPE B'B'B' CLASS BE 8/8 DOUBLE-ARTICULATED TRAMS NO. 1 TO 16 OF THE CITY OF BERN TRANSPORT AUTHORITY. The electric equipment for a series of double-articulated trams with four single-motor bogies is described in detail. The conventional switchgear equipment (electropneumatic contactors) is controlled through traction electronics. This permits constant acceleration or deceleration during starting and braking and also constant speed downhill running. The

electrical equipment was designed to facilitate operation with trailers. As a result, the carrying capacity can be adapted to peak period demands.

13 098054 SUSPENSION AND STRUCTURE: SOME FUNDAMENTAL DESIGN CONSIDERATIONS FOR RAILWAY VEHICLES. Some of the fundamental criteria which affect the design of suburban passenger equipment are reviewed. There are many design approaches to both suspension and structure. The goals for cars for commuter and rapid transit service are minimum weight, maximum comfort, and maximum reliability at minimum cost. Based on U.S. DOT ride quality specifications, the authors recommend air bag secondary suspension and combined natural frequencies as low as 0.6 Hz which will require active self-centering and frequency-sensitive damping along with anti-roll bars at each truck. Natural frequencies of a typical carbody may be close to a natural frequency of truck frames. Lightweight all-welded carbodies are at a disadvantage because of the minimal structural damping within them.

13 099229 STUDY OF TRANSIENT VOLTAGES IN TRANSIT SYSTEMS. Data on transient-voltage environment are needed for the specification and design of reliable transit-system electrical equipment, especially those containing semiconductor devices. Such data taken on the 600-V dc propulsion systems of the Chicago Transit Authority (CTA) and the Long Island Railroad (LIRR) are presented. Transient-voltage counters, supplemented by an automatic cathode ray oscilloscope, were used to monitor transient voltages in substations, wayside switching stations and transit cars. The 37.5-V dc battery line was also monitored on board one transit car on the LIRR system. This program spanned a period of two and a half years. Theoretical analysis on the characteristics of transients caused by lightning and switching is also presented. /Author/

13 099795 A SLOW ORDER FOR BART. After six months of limited level revenue service on its 71-mile system, the Bay Area Rapid Transit still is confronted with a multitude of technical problems. It has also filed a \$237 million suit against its consultant and three major suppliers, claiming inadequate engineering and contract management and failure to meet equipment specifications. Train control equipment and the availability and reliability of the rolling stock are major problems which are being attacked by a task force approach.

13 125791 REINFORCED (GLASS) PLASTIC COMPONENTS FOR RAPID TRANSIT CARS. This paper describes the procedure for the production of fiberglass reinforced polyester exterior and interior components for use in mass transportation and people-mover vehicles. The major emphasis of this presentation deals with describing the preparation of Skybus-type front ends and interiors. The paper covers the design and production of the wood patterns, finishing of the patterns, preparation of the production molds from fiberglass and polyester resins and the production of finished gel-coated exterior and interior components using hand lay-up and spray-up techniques. The sizes of these exterior and interior components range from eight to ten feet in width and height, constituting a very large production piece. Special jigs and holding fixtures are used in handling the components during the various stages of their production.

13 126410 RESILIENT WHEELS TO REDUCE NOISE OF CARS. In this paper, the construction, the characteristics and the state of development of resilient wheels is discussed. It has been ascertained that resilient wheels contribute to reducing the noise from rolling contact of the wheels on rails and, until now, they have been mainly used for low-speed cars, i.e., streetcars and some subways. Recently, the noise of higher speed cars has also become a major problem. Hence the necessity of studying the use of resilient wheels in higher speed cars, as well as their construction. [Japanese]

13 127636 OBSERVATIONS ON ENERGY REGENERATION IN RAPID TRANSIT SYSTEMS [He'arot 'al Hehzayr Energiya Be-ma'arakhot Le'hassa'a Hamonit]. Present-day electric train systems for rapid transit use single wagons following closely one another, not long trains, separated by great distances. Energy regeneration is therefore not produced by a single train moving down a grade and returning energy to the national network, but rather by the supply of braking energy from one wagon to another wagon that is accelerating nearby. The actual saving of energy will depend on adequate organization of the traffic time-table, which should ensure that when a wagon starts up, there should be another one nearby that is braking. The factors involved in energy regeneration are discussed and computation methods presented. Diagrams, curves, and equations complement survey. [Hebrew]

13 128577 RAPID TRANSIT CAN BE ECONOMICALLY SOUND. The Lindenwold-Philadelphia Rapid Transit Line has proved that attractive, modern rail rapid transit trains working in coordination with the private automobile can produce an efficient transportation system. Operational concepts which have contributed to the success of the transit include the following: the train is operated by one man regardless of the length; trains are designed to facilitate rapid changes in train-consist without intervening moves to a marshalling yard; successful automation; and an automatic fare collection system. The design of this transit system emphasized concepts of speed, reliability and cleanliness. The factors which influence choice of travel mode have been identified as (in descending order): speed, convenience, comfort and cost. Features regarding the operating organization and operating results are briefly outlined. The transit service has shown that it can reduce air and noise pollution and

conserve energy; materially reduce traffic congestion; and existing technology is capable of providing the kind of rapid transit service which will induce automobile drivers to become transit riders.

13 128621 PROGRESS IN RAILWAY MECHANICAL ENGINEERING (1974-1975 REPORT OF SURVEY COMMITTEE) CARS AND EQUIPMENT. This survey of the annual ASME report covers some of the major developments in freight and passenger equipment made public in the last calendar year. Because of federal legislation and, in general, a continuing shortage of oil, the need for cars to haul low sulfur coal is still large. The establishment of "Rail Box" has created a large need for a "standardized" general purpose box car. In the people transport area, rapid transit is continuing to grow and new equipment is in the offing for Amtrak.

13 129813 LIGHT RAIL PERMANENT-WAY REQUIREMENTS AND SOURCES. This paper sets forth the technical requirements for the permanent way needed in construction of light rail transit facilities and then develops sources for assembling rights-of-way. Described first are the physical capabilities of light rail transit for grade, curves, and clearances. Requirements for the guideway are established with the development of standards for track work suited to light rail transit. The latest techniques in track component design are evaluated. Pitfalls to be avoided in light rail facility design are pointed out. General requirements for stations are set forth with particular emphasis on space needs. Types of platforms, shelters, and security enclosures are described. Station needs for light rail transit are contrasted with the needs of full-scale rapid transit. Sources that can be considered for light rail rights-of-way are treated in a way intended to stimulate the imagination of the engineer and planner in locating potential routes. Dealt with are surplus railroad tracks, boulevard and freeway center strips, canal beds, stream channelization, electric transmission lines, parkways, street running, reservation of streets, and the selective application of elevated lines, bridges, and subways to light rail transit. Advantages and limitations of each type of right-of-way are explained.

13 129816 FOREIGN LIGHT RAIL VEHICLE DEVELOPMENT. This paper begins with a brief description of how the light rail mode has been developed in several West European countries, especially in the Federal Republic of Germany. The basic features of the light rail vehicle and how the vehicle was derived from the streetcar and the subway or heavy rapid transit car are explained. Finally, the various attempts at standardization of light rail vehicles in West Germany after World War II are discussed. Several modern light rail vehicles are described, and it is explained why standardization could only be partially achieved.

13 129827 DIRECTIONAL ROLLER BEARING RINGS AND BOGIES FOR THE PARIS METRO [Couronnes d'orientation et bogies de metro]. The author explains that a new link-up between body and bogie has been tested with success on coaches of the Paris Metro. The orientation of the bogies in relation to the body is effected by means of a crossed roller bearing ring. Small-radius curves can be taken very easily, and wheel flange wear is avoided. The directional roller bearing rings, which are pre-stressed during manufacture, provide a rigid assembly which gives the body excellent lateral stability. This rigidity also enables the bogie thrust centre to be lowered to axle level, which limits the transmission of bogie hunting movement to the body, and increases the comfort of the coaches. [French]

13 131271 THE RELATIONSHIP BETWEEN VEHICLE SIZE AND OPERATING COSTS IN URBAN TRANSIT NETWORKS [Der Einfluss der Fahrzeuggrösse auf die Betriebskostenstruktur im Schnellverkehr]. The authors based their study on the Berlin and Hamburg networks, but a typical 20 km standard line was chosen for the study of the relationship between vehicles and productivity. Variable information concerning traffic, comfort, timetables, vehicle size and costs were used and it was seen that the volume of traffic must be determined before deciding on the size of the vehicles to be used. Operating costs for vehicles are lowest for vehicles/trains with seating for less than 100 passengers, for example, if peak traffic involves less than 3,000 passengers per hour in each direction. Trains with seating for 100 to 200 passengers are required for traffic involving 4,000 to 7,000 passengers per hour in each direction. For all types of operating, capital costs represent between 43 and 70% of rolling stock operating costs. [German]

13 131630 REGENERATIVE DRIVE FOR SUBWAY TRAINS. PART 1: MECHANICAL ACCUMULATOR DESIGN. A regenerative drive system for subway trains is mathematically modeled and numerically evaluated for the Toronto Bloor-Danforth Subway Line. The scope of the study dictates a multipaper presentation of system and component modeling. This first paper designs and optimizes the mechanical accumulator subsystem (bearings, seals, losses) of the vehicle propulsion package. Preliminary design criteria (stress-energy relationships) predict the required performance capability of the one and two accumulator per vehicle systems; the need for high energy densities is of secondary importance compared to the required power density for vehicle operation. Accumulator performance tests suggest ease of integration with the current drive system. Subsequent papers model the external and internal drive systems, and numerically optimize the flywheel control concept and accumulator size; day savings, on a round-trip basis, are predicted in the order of 26 percent.

13 131631 REGENERATIVE DRIVE FOR SUBWAY TRAINS. PART 2: OVERALL SYSTEM MODEL. The external system (track, vehicle) for the regenerative drive study is modeled from actual construction drawings and performance specifications. A general duty cycle is constructed and found to compare within a few percent of actual measured data; furthermore, the duty cycle simulates all vehicle operational modes ("all out," cruise, coast, brake). Vehicle dynamics are simulated using current railroad engineering practice; the equivalent mass of rotational elements (transmissions, rotors), about 16 percent of the vehicle curb mass, is accounted for in the accelerated state. The internal d.c. electric drive system is modeled using current industrial design practice; the technique of energy flow-through efficiencies facilitates the determination of vehicle station-station tractive requirements.

Suokas, LA Flanagan, RC (Toronto University, Canada); American Society of Mechanical Engineers 76-RT-2, Jan. 1976, 7 pp, 8 Fig., 4 Tab., 11 Ref.; Presented at the 1976 Joint ASME/IEEE Railroad Technical Conference, Chicago, Illinois, April 6-8, 1976.; ACKNOWLEDGMENT: ASME, IEEE; ORDER FROM: ESL, Repr. PC, Microfilm

13 131632 REGENERATIVE DRIVE FOR SUBWAY TRAINS. PART 3: SYSTEM EVALUATION. The most efficient hybrid drive philosophy eliminates high-acceleration power peaking and operates as a fully regenerative system (little or no accumulator top-off during station stop). The optimal accumulator control concept is designed as vehicle velocity dependent and is shown to vary only slightly with vehicle load and station distance. Furthermore, accumulator sizing is numerically determined subject to this control concept. The effect of large coast (5 percent) or cruise periods opposes the justification of any regenerative system and is herein questioned as an integral part of the drive cycle. Conversely, short coast (2 percent) or cruise has little effect on the hybrid drive performance. As a basis of comparison (with other drive systems), the ideal vehicle concept is postulated.

Flanagan, RC Suokas, LA (Toronto University, Canada); American Society of Mechanical Engineers 76-RT-3, Jan. 1976, 5 pp, 7 Fig., 3 Ref.; Presented at the 1976 Joint ASME/IEEE Railroad Technical Conference, Chicago, Illinois, April 6-8, 1976.; ACKNOWLEDGMENT: ASME, IEEE; ORDER FROM: ESL, Repr. PC, Microfilm

13 131633 REGENERATIVE DRIVE FOR SUBWAY TRAINS. PART 4: OVERALL SYSTEM PERFORMANCE. Vehicle energy consumption and savings for the Toronto Bloor-Danforth Subway Line are evaluated. Two vehicle loads are chosen (for this evaluation) indicative of rush-hour and nonrush-hour operation. A comparison test run shows the numerical simulation to be within a few percent of actual measured data. Evaluation of round trip results indicate energy savings as high as 33 percent for a large vehicle weight, but based on daily operation, savings are more realistically 26 percent. The effect of long coasts (5 percent) on actual station runs is again shown to be detrimental to the energy savings for the regenerative system.

Suokas, LA Flanagan, RC (Toronto University, Canada); American Society of Mechanical Engineers 76-RT-4, Jan. 1976, 5 pp; Presented at the 1976 Joint ASME/IEEE Railroad Technical Conference, Chicago, Illinois, April 6-8, 1976.; ACKNOWLEDGMENT: ASME, IEEE; ORDER FROM: ESL, Repr. PC, Microfilm

13 131646 DESIGN OF A TURBINE/ELECTRIC BIMODAL RAIL PASSENGER CAR.

This paper presents the unique features of a rapid transit rail passenger car having two modes of power, conventional 650 volts DC third rail plus two on-board gas turbine power modules. Design objectives are defined with a description of the car's systems showing how the objectives were met. Early track test experience is also reviewed.

13 132947 COMPOSITE CONDUCTOR RAILS FOR RAPID TRANSPORTATION SYSTEMS-STATE OF THE ART.

By way of introduction some details of the rapid transportation networks planned in various countries are given together with an account of the kind of development work involved. Rapid transportation systems are intended to operate over distances of 200 to 600 km. Speeds of up to 500 km per hour are planned and so a whole series of problems not previously encountered have to be solved. The paper deals mainly with the problems concerning the conductor rail which has to supply the electrical power to the vehicle. The need for a lightweight ac rail makes composite rails attractive. A wide range of conductor rails available is presented and it is shown that the need for a lightweight rail eliminates a number of otherwise interesting designs. Factors such as corrosion resistance, rigidity and safety are discussed with a view to their importance and limits which can be tolerated.

13 133090 GENERAL VEHICLE TEST PLAN (GVTP) FOR URBAN RAIL TRANSIT CARS.

The General Vehicle Test Plan provides a system for general vehicle testing and for documenting and utilizing data and information in the testing of urban rail transit cars. Test procedures are defined for nine categories: (1) Performance; (2) Power Consumption; (3) Power System Interaction; (4) Adhesion; (5) Ride Roughness; (6) Passenger Compartment Noise; (7) Community Noise; (8) Simulated Revenue Service; (9) Structure Dynamics. The procedures can be adapted to any vehicle in the general class of urban rail vehicles. They are derived from testing on UMTA's Rail Transit Test Track in Pueblo, Colorado. In addition, these procedures can be modified for use on other urban rail tracks as required. Specifications are included for instrumentation required to implement the tests. Data processing and analysis requirements are defined by specifying standard output formats for the parameters of interest.

13 133294 NEW YORK CITY TRANSIT AUTHORITY DESIGN GUIDELINES. POWER. The Power Standards for new lines provide the basic concepts for the design of traction power systems for new routes. The Standards describe the criteria used for the determination of the power requirements, the parameters used in the selection of substation sites and the types of electrical equipment employed for the conversion of High Tension AC power to DC traction power. They include the techniques used to control the power system from one control point and the means by which each substation can be controlled in the event of a supervisory cable failure. The Standards also describe the methods employed to give maximum safety in the substations and on the railroad in case of faults or emergencies. These guides should prove helpful in the design of traction power systems for new routes.

13 133430 SOAC: STATE-OF-THE-ART CAR ENGINEERING TESTS AT DEPARTMENT OF TRANSPORTATION HIGH SPEED GROUND TEST CENTER. VOLUME VII. POST-REPAIR TESTS. The document presents the test results for the State-of-the-Art Car Post-Repair Engineering Test Program conducted at the DOT High-Speed Ground Test Center, Pueblo, Colorado, from March 18th to 29th, 1974. The SOAC has been developed under UMTA's Urban Rapid Rail Vehicle and Systems Program to enhance the attractiveness of rapid rail transportation to the urban traveller. The test data continuity between the original HSGTC Engineering Tests and the Post-Repair Test was established. Test data of variations from the original data have not been significant in terms of overall vehicle performance. A description of test procedures, equipment and facilities was provided in the original six-volume report, UMTA-MA-06-0025-75-1 through -6. PB-244 746 is the complete six volume set; PB-244 747 through PB-244 752 are the NTIS document numbers for each volume, I through VI respectively.

13 133627 THE STAGE CONSTRUCTION OF METROPOLITAN RAILWAYS: THE EXAMPLE OF FEDERAL GERMANY [La realizzazione delle ferrovie metropolitane in fase successiva: L'esempio della Germania Federale]. The term u-bahn refers to an urban transport system of the following characteristics: vehicles that run on rails; a rail network entirely reserved to the system, and which can be elevated, at ground level, or underground; the intervals between vehicles or trains must be automatically controlled; station platforms must be at the level of entry into the cars; the light rolling stock must be capable of 100km/h maximum speeds, have a capacity of 200-250 seats, and allow rapid entry and exit. The stage construction of u-bahn systems in West Germany is dictated by budget restraints, the first projects being built in areas of insufficient public transport. /TRRL/ [Italian]

13 136409 TRACKSIDE TEST PROGRAM FOR REGENERATIVE CHOPPER-CONTROLLED SUBWAY CARS. Six subway cars in Toronto were retro-fitted with a chopper control system which also provides regeneration capability during braking cycles. Testing was concurrent with a test program to evaluate vehicle performance. Trackside testing identified and investigated the level of chopper-produced interference in signals, communication, data transmission, remote supervisory control and traction power systems. Safety considerations, such as the possibility of sustained voltage on de-energized contact rail sections, were also investigated. Energy consumption of the chopper-equipped cars was expressed as a percentage saving compared with that of conventional cars.

13 136604 RETROFIT AIR CONDITIONING OF SUBWAY CARS. Recognizing the desirability of air conditioning as an inducement to attract patrons and offer them amenities that make rail mass transit comfortable as well as convenient, new car orders specify inclusion of air conditioning equipment (where climatic conditions justify consideration). Married pair cars and shared undercar equipment paired cars, as well as improved packaging, permit relatively easy installation in new vehicle purchases. The challenge is to air condition existing subway cars whose remaining life precludes replacement. Resolution of complicated design and retrofit problems faced by the New York City Transit Authority in its effort to develop a method of air conditioned cars on its IRT Division are described in this paper.

13 136828 ANALYTICAL METHODS AND DESIGN IMPLICATIONS OF DETERMINISTIC RIDE QUALITY CRITERIA. An alternative ride quality standard that involves the instantaneous values of acceleration and rate of change of acceleration (jerk) in all six degrees of freedom is proposed. The report develops an analytical form for the standard and discusses a twelve-dimensional 'comfort' ellipsoid along with possible maximum values for each axis. These values are obtained from a review of available data on human response to levels of acceleration and jerk. An analytical design approach, using such a deterministic standard, is developed employing linear system theory. The method developed allows the designer to design the vehicle's suspension system and/or to bound the allowable range of guideway disturbances so that the ride quality standard is satisfied. A rigorous development of the method is presented along with examples to illustrate its usage.

13 137318 AN ASSESSMENT OF THE CRASHWORTHINESS OF EXISTING URBAN RAIL VEHICLES. VOLUME III: TRAIN-COLLISION MODEL, USERS MANUAL. The crashworthiness of existing urban rail vehicles (passenger cars) and the feasibility of improvements in this area were investigated. Both rail-car structural configurations and impact absorption devices were studied. This final report issued under the crashworthiness effort covers: (1) The development of analytical tools to predict passenger threat-environment during collision; (2) criteria for predicting passenger injury due to train collisions; (3) an application of injury criteria and analytic models to predict passenger injuries resulting from collisions of trains that represent existing construction types; (4) a preliminary investigation of applying impact absorption devices to transit vehicles; (5) a design study of car structural configurations for improved impact energy management; (6) a review of engineering standards for Urban Rail Car Crashworthiness. The report consists of three volumes.

13 137320 URBAN RAPID RAIL VEHICLE AND SYSTEMS PROGRAM. The report reviews the fourth year's efforts of the Urban Mass Transportation Administration's Urban Rapid Rail Vehicle and Systems Program. The objective of the Program is to enhance the attractiveness of rail rapid transit to the urban traveler by providing him with transit vehicles that are as comfortable, reliable, safe and economical as possible. Accomplishments for the year included the following: Completion of the five-city test and evaluation of the SOAC cars; progress from the preliminary design phase to delivery of initial test hardware; completion of the integration of a self-synchronous propulsion system, a monomotor truck, and a synchronous brake into the SOAC cars; and preparation of subsystem specifications.

13 137327 SOAC. STATE-OF-THE-ART CAR DEVELOPMENT PROGRAM. VOLUME 2. REPAIR, RE-TEST AND OPERATIONAL EVALUATION. The two-volume report documented the design, fabrication and test of two new State-of-the-Art Cars (SOAC) whose objective was to demonstrate the best available (1971-72) rail rapid transit vehicle technology. The SOAC features a DC-DC chopper in the propulsion system, separately excited DC traction motors, all-steel construction (with molded fiberglass ends), and vandal-resistant and fire-retardant materials in the interior. This volume, Volume 2, of a two-volume report covers the repair of the damage sustained by the No. 2 car in an accident at the Transportation Test Center (TTC) in August 1973, the post-repair testing at

the TTC, and the operational evaluation of the SOAC in revenue service in New York, Boston, Cleveland, Chicago and Philadelphia.

Dunton, WH ; Boeing Vertol Company, Urban Mass Transportation Administration Final Rpt. D174-10031-2, UMTA-IT-06-0026-75-2, Sept. 1975, 249 pp; See also report dated April 74, PB-235703; Contract DOT-UT-10007; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-254770/1ST, DOTL NTIS

13 137365 ACOUSTIC IMPACTS OF BART: INTERIM SERVICE FINDINGS. The report documents the findings and methodologies developed during a study of BART sound and vibration levels. The findings focus on: delineation of impacted regions, major factors affecting BART-generated sound, prototype vs. operational sound levels, BART vs. other transportation sound sources and BART-generated vibration levels. BART-generated sound levels were derived from direct wayside measurements and indirectly from on-board recording of sound levels throughout the BART system. Ambient community sound levels were based on predictive techniques verified by field measurements.

13 137370 A PROCEDURE FOR OPTIMIZING RAPID TRANSIT CAR DESIGN. The report provides a methodology for creating an initial rough design of a rail rapid transit car, or for evaluating an existing design. It is based on optimizing the design features by minimizing the sum of the annual costs of purchasing, power consumption, maintenance, and on-board operating labor for a fleet of such vehicles. Linear programming is used to arrive at a solution based on the interaction of several hundred equations which describe the complex inter-relationships amongst the elements of car design, dimensions, and performance, and the various components and sub-assemblies which comprise the vehicle, and the associated costs.

13 137698 APPLICATION OF THE FINITE ELEMENT TECHNIQUE TO THE STRUCTURAL ANALYSIS OF ROAD AND RAIL VEHICLES AT LONDON TRANSPORT. The structures of road and rail vehicles being used by London transport are of conventional design. Road vehicles consist of a separate body and chassis, the main structural members being steel and the skin panels being aluminum. Underground rolling stock, because of the constraints imposed on shape, size and interior layout, are of "tubular construction" and in most stocks consist of an aluminum roof and bodyside, with large openings for windows and doors, mounted on a

heavy steel underframe. The structural design of these vehicles has been the responsibility of the carbuilders and has been based on traditional stress analysis techniques consisting, in the main, of equivalent framework type analyses and relying heavily on past experience. Recently, however, London transport has been taking a greater involvement in the design of these vehicles and there has been a departure from the conventional designs. An emphasis on light weight has meant the use of aluminum throughout the vehicles and there is a tendency towards a more integral type of structure (as opposed to separate body and chassis) in the case of road vehicles. This departure from conventionality has led to the need for a more refined stress analysis technique. An investigation into the structural behavior of an underground railway coach has shown that the finite element technique is superior to the other techniques in predicting stresses and deflections. The dynamics section which has recently been set up within the design division of the chief mechanical engineer's department at London transport, has been applying the finite element technique to analysing bus and railway coach structures (including wheels) and to the calculation of the natural frequencies of these structures. The computer program used is the newpac package developed by the engineering research division of British Rail at Derby, the computation being performed at Derby on the IBM 370 computer. The computation facilities include an input/output graphical display which enables data checking and presentation. /Author/TRRL/

13 137704 THE APPLICATION OF STRESS, NOISE AND VIBRATION ANALYSIS TO DESIGN OF RAIL RAPID TRANSIT VEHICLES. This is a review paper dealing with design developments occurring with the aid of, or as a result of, noise and vibration analysis. To examine the main strength of a vehicle body, finite element techniques now provide a method vastly superior to previous methods, but its cost and complexity cannot always be justified at the present time. The much simpler framework analysis and approximate methods still have important functions. Comprehensive structural testing employing strain measurement techniques provides not only a final check on a new design but also yields information invaluable in the evolution of later designs. These techniques are applied to produce designs lighter in weight, cheaper in material or manufacturing costs, and hence more economic to the operator, whilst at the same time preserving the reliability and freedom from fatigue required for a vehicle life of 30 years or more. Increasing public awareness of noise being a form of environmental pollution is leading to greater efforts to produce quieter vehicles, both from the passenger's point of view and with regard to wayside problems. Measurement and analysis techniques show that great improvements can be achieved, often without undue penalties in cost and weight. Attention is given to vibration isolation of the body from track irregu-

larities, rotating machines on the body and to the effect of the body itself as a vibrating beam. (a). For covering abstract of the conference see IRRD no. 219564. /TRRL/

13 137705 A PRELIMINARY INVESTIGATION INTO THE STRUCTURAL BEHAVIOUR OF AN UNDERGROUND RAILWAY COACH. The specialised function of urban underground railways, that of providing a frequent-stop, mass transportation facility catering for a very high volume of passengers with a large amount of changing at stations, sets an 'architectural' form on underground rolling stock, which is much more prescribed than that possible for main-line railways. Thus, not only is the exterior geometry largely decided by loading gauge, tunnel height, platform curvature, etc. When an existing network is being used but the internal layout is also closely defined. In particular, the number of doorways, their position, size and type, along with the need for large windows, dominates the form of the structure of the coach sides. Furthermore, freedom of circulation internally inhibits the over-use of structural bulkheads and pillars. Thus, the structural designer is confined to a large extent as to the geometrical parameters which he can vary. An underground railcar conventionally has a very heavy chassis or underframe which includes two main longitudinals, the solebars. These alone constitute a large proportion of the structural cost of the entire car. Much of the work done in the project described in this paper was concerned with examining the effects of alternative sizing of the main structure, the solebars, doors and window pillars and roof, in an endeavour to make the coach body work more efficiently overall. The loading case mainly considered was the dead-weight plus 'super-crush' passenger load. The analyses were carried out by the finite element method. This was the first time, as far as is known, that this method has been used on underground rolling stock in this country. The computer program used was the newpac package, developed by the engineering research division of British rail at Derby, and the computation was performed on the icl 1903a computer at Brunel University. The paper describes the idealisations used for the analyses, the main results, with comparisons with existing data available from other methods, and general conclusions concerning the structural behaviour and design of railcars for the loading case considered.

13 141274 PREDICTION OF WAYSIDE RAILROAD NOISE. The recent trends in the revitalization of rail transport in this country have

resulted in increased interest in the use of rail rapid transit systems in our cities and high-speed surface rail links between major population centers. Included in the technology assessment of new and improved rail service will be the associated environmental problems, including potentially serious wayside noise problems. The solution to the railroad noise problem requires a valid technique for prediction of wayside noise to assess the benefit of various noise control strategies. This paper describes a graphic method for use when the geometry is rather simple and a computer program for use in situations when track and terrain geometry are complicated.

13 141569 ACT-1 TURNS IDEAS INTO HARDWARE. Flywheel energy storage, lightweight sandwich body panels and aircraft air-conditioning are some of the innovations on UMTA's two-car Advanced Concept Train (ACT), due for delivery by Garrett. Like the State-of-the-Art (SOAC) cars produced in 1973, Act-1 is an attempt to push transit car technology forward after decades of neglect. UMTA's two objectives are to promote vehicle and component standardization in the USA so as to cut unit costs, but also to make the best use of novel techniques once they are proved to be thoroughly reliable. Beyond the test program, ACT-1 may serve as the engineering basis for a production car tailored to suit specific needs, but meeting as far as is practicable UMTA's goal of standardization in the interests of economy and reliability.

13 141570 HOW THE WEIGHT OF PASSENGER CARS HAS BEEN TRIMMED. In two decades, Japanese carbuilders have reduced the linear mass of carbody shells by improving construction techniques and using light alloys. Similar savings might have been made in trucks and electrical equipment had weight reduction measures not been offset by more elaborate suspensions and demands for higher power ratings. It is in these two areas that the search for

further savings must be made, as large extrusions have brought economic use of material in body construction close to the theoretical limit.

13 144032 LIGHT RAIL TRANSIT: ITS NATURE AND ROLE. The U.S. Department of Transportation's policy to support efforts to develop a type of rail system which is less costly to build, operate and maintain than conventional rail transit (CRT) systems is noted, the rather arbitrary distinctions between the latter and light rail transit (LRT) systems are discussed, the principal characteristics of selected LRT systems are tabulated, and the key features common to all such systems are listed. The LRT systems may range from the simple streetcar line to the high capacity CRT and the heavy main-line commuter rail service. LRT's flexibility permits its operation anywhere that tracks and overhead wire can be constructed. This flexibility is derived from the overhead power collection and the ability to handle passengers at either high or low platforms. Significant cost savings and operating flexibility result from LRT's ability to run on "open" surface lines as well as in subways. Attention is focussed on certain noteworthy features of the Cleveland Shaker Heights LRT system, the MBTA Blue Line CRT system, and the San Francisco Muni Metro now under construction. It is suggested that any metropolitan area planning a new transit system or an unconstrained addition to an old system should consider LRT as an alternative.

13 144066 DETERMINATION OF THE OPTIMAL APPROACH TO RAIL RAPID TRANSIT CAR STANDARDIZATION. This report documents the findings of Phase I of a two-part program on standardization of rail rapid transit cars. The purpose of Phase I was to determine the optimal form of standardization

which would: stabilize the prices of new rail rapid transit cars; reduce operating and maintenance costs; improve equipment reliability and maintainability. APTA, the American Public Transit Association, and RPI, the Railway Progress Institute, established technical boards which provided transit industry technical analysis and review of the work plans, approaches, and findings of the technical contractor. This first phase final report documents the analysis leading to a determination that rail rapid transit car standardization is feasible and should be implemented under a phased program to develop a qualified products list and products qualification procedure, a car prototype certification procedure, and a family of car performance specifications.

13 145141 PROGRESS IN RAILWAY MECHANICAL ENGINEERING (1975-1976 REPORT OF SURVEY COMMITTEE) CARS AND EQUIPMENT. This survey of the annual ASME report covers some of the major developments in freight and passenger equipment made public in the last calendar year. It also covers developments worldwide as well as domestic. In the freight area, the main developments aimed at the transport of bulk commodities and unit trains with some thought being given to increased speeds. The passenger developments are continuing in LRVS, Rapid transit, and commuter transport.

13 148248 REGENERATION AND ASSURED RECEPTIVITY IN RAIL TRANSIT. Concern for energy conservation and reduced heat in the subway has caused increased interest in regeneration. However, receptivity of the distribution system to regenerated energy is questionable, leading to consideration of controlled wayside resistors to assure receptivity. The question was studied in terms of train operation, electrical network performance, ventilation and cooling system requirements, and present-worth economic analysis.

Metsch, WW (Parsons, Brinckerhoff, Quade and Douglas, Inc) Phelps, DR Sotak, RA Uher, RA Vitt, H ; American Society of Mechanical Engineers Conf Paper Paper D&O-14, 1976, 21 pp, 15 Ref.; Presented at the 4th Annual Intersociety Conference on Transportation, Los Angeles, California, July 18-23, 1976, see also RRIS 26 148247.; ACKNOWLEDGMENT: EI; ORDER FROM: ASME

13 148253 ENERGY STORAGE PROPULSION SYSTEM FOR ADVANCED CONCEPT TRAIN. The paper describes the propulsion system for the Advanced Concept Train (ACT-1), which is designed to minimize energy consumption of urban rail vehicles by the inclusion of on-board, motor-driven flywheels for recovery and storage of braking energy. This energy source then is used for the next required vehicle acceleration. Minimizing the energy consumption of this type of system requires that the flywheels be sized to absorb all energy recovered from the traction motors during normal vehicle decelerations. In addition, since the recovered energy is processed twice through the traction and flywheel motors, both these devices must be highly efficient.

McConnell, RW (Garrett Corporation) ; American Society of Mechanical Engineers Conf Paper Paper D&O-38, 1976, 6 pp; Presented at the 4th Annual Intersociety Conference on Transportation, Los Angeles, California, July 18-23, 1976, see also RRIS 26 148247.; ACKNOWLEDGMENT: EI; ORDER FROM: ASME

13 148305 THREE-PHASE TRACTION MOTOR FOR D.C. TRAMS [Drehstromantrieb fuer Gleichstrombahnen]. A tram traction motor of squirrel-cage design is described. The motor is supplied by a converter consisting of a d.c. controller and an inverter with phase-sequence suppression. The vehicle has a combined regenerative and dynamic brake system. The transient characteristics of the motor are similar to those of a series-wound traction motor fed through a d.c. controller. [German]

13 148313 NOISE AND VIBRATION CONTROL FOR THE MARTA RAIL TRANSIT SYSTEM. The noise produced by new high-speed rail rapid transit system operations is much less than traditionally expected due to the modern design concepts and equipment which include specific features for reducing noise and vibration. Using data obtained from various

operational and experimental rail transit vehicles and systems, the noise characteristics to be expected from the MARTA facilities and equipment have been determined. The known and specified noise characteristics can be used during the planning and design of the transit systems to determine the expected wayside or community noise levels for various types of way structures, vehicles, and operational conditions, and can also be used to determine design features or system characteristics which should be included for the control of noise. This permits the inclusion of noise as one of the factors affecting the system planning and design.

13 150482 PRELIMINARY ANALYSIS OF THE EFFECTS OF NON-LINEAR CREEP AND FLANGE CONTACT FORCES ON TRUCK PERFORMANCE IN CURVES. Prediction of wheel displacements and wheel-rail forces is a prerequisite to the evaluation of the curving performance of rail vehicles. This information provides part of the basis for the rational design of wheels and suspension components, for establishing criteria for maintenance of track and wheels, for use as a guideline for safety standards, and for understanding the mechanism of noise generation and wheel-climbing. The analysis presented here extends the results from linear steady-curving appropriate to flangeless guidance, and provides a foundation for the examination of the details of forces and displacements under more severe conditions necessary to the understanding, prevention, and suppression of undesirable effects.

13 152464 ELECTRICAL POWER SYSTEMS OF THE WASHINGTON METRO RAIL TRANSIT SYSTEM. The electrical systems of the METRO rail system may be divided into two basic functional systems. These are the electric traction system and the support utility electrical system. The traction system converts incoming primary energy to nominal 700 volts direct current for distribution via the contact rail to provide propulsion power for the multiple-unit rail transit cars. The support utility system transforms incoming primary energy for distribution via load centers to station and right-of-way for lighting, mechanical equipment, escalators, elevators, pumps, ventilation, communications and control systems. Both of these facilities are served at primary voltages from the power utility company that serves the jurisdiction that the facility is located in. The METRO power system does not employ sub-transmission between transit facilities at primary voltages.

Pap. 77CH1237-71A, 1977, pp 32-41, 22 Fig., 3 Ref.; Presented at the 1977 Joint ASME/IEEE/AAR Railroad Conference, March 30-April 1, in Washington, D.C.; ACKNOWLEDGMENT: IEEE; ORDER FROM: ESL

13 152677 A BASELINE AUTOMATIC TRAIN CONTROL SYSTEM INCORPORATING SYSTEM ASSURANCE CONSIDERATIONS. Agencies responsible for rail rapid transit projects are increasingly aware of the area of system assurance, including reliability, maintainability and safety. Specifications call for contractors to include system assurance programs establishing objectives, with supporting organization, procedures and documentation. This recognizes the contribution of system assurance in determining quality of service offered. Recently this thinking has been extended to a conceptual command and control system for a rapid transit system. The conceptual system is a baseline from which final performance and hardware specifications could be developed after analysis of variations therefrom. The baseline system permits automatic operation and takes advantage of the facts that acceptable performance can be achieved without an excessive number of commands, and that recent developments in rail insulated joints

offer high reliability of insulated track circuits. This permits use of power-frequency track circuits modulated by a limited number of command codes. The result is a relatively low system component count and reduction in active elements, factors with favorable impact on system availability. Principal command and control functions included in the baseline system, and subjected to system assurance analysis, include vehicle direction, speed, train separation, station stopping profile, platform positioning, door control, station dwell time, and train to wayside communication. Analysis indicates configuration variations are possible which could appreciably increase the estimate of mean time between failure while maintaining fail-safe standards of baseline system.

13 152784 R-32 ENERGY STORAGE PROPULSION SYSTEM. This paper describes a transit vehicle propulsion system which saves much of the presently wasted energy by storing the car's kinetic energy in two flywheels during vehicle braking. This stored energy is then used to accelerate the vehicle out of the station without drawing power from the wayside electric power source. The flywheel energy storage propulsion system has been installed on two New York City R-32 subway cars in place of the conventional propulsion equipment. The two cars have completed extensive testing at the Department of Transportation Test Center in Pueblo, Colorado. Extensive testing of the energy storage propulsion system cars is being carried out on the New York City Transit Authority system. At the conclusion of the test program the cars will be put into revenue service for reliability and energy saving evaluation.

13 153063 TRAMWAYS AND TROLLEYS: THE RISE OF URBAN MASS TRANSPORTATION IN EUROPE. This book is an historical and statistical investigation of the growth of the European electric tramway industry between 1890 and 1910 with primary focus on France, Germany and Great Britain. Data is evaluated in terms of three basic sociological disciplines: Development, diffusion and public management of technology and innovation; patterns of entrepreneurship and economic activity; and the impact of transportation changes upon the urban environment. Conclusions are drawn concerning these and inferences are made about the future. Discussing technological innovation, it is observed that such movements that have vast consequences for society cannot be allowed to run wildly on the basis of what is presently cheapest and most dependable, without proper regard for long-term cost and related negative consequences.

13 153381 SYNCHRONOUS MOTOR RAIL-CAR PROPULSION. Development of ac motor drives for rail transit car propulsion has centered on the induction motor with pulsewidth modulated (PWM) inverter control. Interest in the induction motor as a replacement for the series dc traction motor stems from the simplicity of the squirrel cage rotor of the induction motor. In this article, the short-comings of PWM inverter-induction motor transit car drive are examined. It is shown that the synchronous, or brushless dc, motor drive can provide performance exceeding both the PWM inverter-induction motor and the conventional dc motor in the transit car application.

Bourbeau, FJ (General Motors Corporation) *IEEE Transactions on Industry Applications* Conf Paper Vol. 1A13 No. 1, Paper IOD-75-57, Jan. 1977, pp 8-17, 12 Fig., 20 Ref., 1 App.; Presented at the IEEE/IAS 9th Annual Meeting, Pittsburgh, Pa., 7-10 October 1974.; ACKNOWLEDGMENT: IEEE Transactions on Industry Applications; ORDER FROM: ESL

13 153382 INVERTER-INDUCTION MOTOR DRIVE FOR TRANSIT CARS. The advent of large power semiconductors has made it possible to apply inverters and ac motors to traction applications. Either synchronous or induction motors and several types of power converters can be considered. The induction motor and the pulsewidth modulated (PWM) inverter are selected as favorable for application to a transit car drive. A general method of sizing the PWM inverter and induction motor in terms of the car performance requirements is outlined. This method results in a minimum size inverter and allows optimization of system weight and cost. A discussion of wheel size effects and the optimization of regenerated energy is included.

13 154841 GUIDEWAY-VEHICLE COST REDUCTION. PART I: GUIDEWAY-VEHICLE PERFORMANCE AND COSTS. The cost and performance benefits of using improved suspensions in passenger railcars are investigated. Preliminary results from the first year of a two year study are presented. The primary objective is to determine if improved vehicle suspensions can reduce overall system cost by allowing lower

guideway maintenance standards. Cost determinations are limited to guideway annual maintenance and vehicle suspension installation and maintenance. The guideway/suspension system is divided into several areas which are analyzed separately. In Part I, transfer function models of passenger railcar and bus dynamics, and power spectral density models of guideway disturbances are developed. Preliminary guideway and suspension cost data are also analyzed.

Klinger, DL Cooperrider, NK Hedrick, JK White, RC Calzado, A; Arizona State University, Tempe, Department of Transportation Final Rpt. DOT/TST-76/95-1, July 1976, 159 pp; See also Part 2, PB-265 967.; Contract DOT-OS-50107; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-265966/2ST, DOTL NTIS

13 154842 GUIDEWAY-VEHICLE COST REDUCTION. PART II: ACTIVE SUSPENSION FEASIBILITY. The cost and performance benefits of using improved suspensions in passenger railcars are investigated. Preliminary results from the first year of a two year study are presented. The primary objective is to determine if improved vehicle suspensions can reduce overall system cost by allowing lower guideway maintenance standards. Cost determinations are limited to guideway annual maintenance and vehicle suspension installation and maintenance. In Part II, an assessment of active suspension feasibility is made which includes the preliminary design of a new low power pneumatic concept. A preliminary suspension/guideway maintenance cost tradeoff is described which shows that active suspensions are cost effective for low vehicle density routes.

13 158073 STATE-OF-THE-ART CAR (SOAC) ENGINEERING TESTS AT DEPARTMENT OF TRANSPORTATION HIGH-SPEED GROUND TEST CENTER VOLUME V11 POST-REPAIR TESTS. This document presents the test results from the State-of-the-Art Post-Repair Engineering Test Program conducted at the DOT High-Speed Ground Test Center, Pueblo, Colorado, from March 18th to 29th, 1974. The SOAC has been developed under UMTA's Urban Rapid Rail Vehicle and Systems Program to enhance the attractiveness of rapid rail transportation to the urban traveller. The test data continuity between the original HSGTC Engineering Tests and the Post-Repair Test was established. Test data of variations from the original data have not been significant in terms of overall vehicle performance. of overall vehicle performance.

13 159602 MEANS FOR IMPROVING THE STEERING BEHAVIOR OF RAILWAY VEHICLES (ABRIDGMENT). Three specific means to improve the steering behavior of railway vehicles are under development. A new Canadian design is described which provides for a steering motion of the wheelsets in curves and a damping of the wheelset hunting. A modified conventional freight car truck is now being tested in which the parameters that govern curving and high-speed stability are virtually identical to those of the Canadian truck. However because these trucks use standard truck side frames, the radial curving is limited by the existing side frame clearances to about 4 deg of track curvature. A high speed transit car that uses a positive steering arrangement in addition to the basic construction feature of the truck designs described above is also outlined. Further highlights of these truck designs are outlined. Comments are also made on the truck steering mechanics. The truck designs described here can effect a considerable reduction in wheel wear, rail wear, truck component wear and fatigue, carbody component wear and fatigue, derailments, noise, traction power consumption, and constraints on the layout of rail transportation systems.

13 163279 PROBLEM OF EMERGENCY POWER SUPPLY ON METROPOLITAN RAILWAYS. DESCRIPTION OF THE POSSIBLE SOLUTIONS [Il problema della alimentazione di emergenze nelle ferrovie metropolitane. Descrizione delle soluzioni possibili]. The problem of the continuity of power supply on the underground metropolitan railways is considered. A review of the various possible solutions is given, bringing out, in particular, two systems based, respectively, on the adoption of inverters or direct current motors coupled with synchronous generators, very similar in principle, but very different from the point of view of technical realization. The technological content of these systems is, however, so high that both are in a position to guarantee an extremely high level of trustworthiness. [Italian]

13 164415 REMOTE CONTROL OF ELECTRIC POWER SUPPLY IN THE MUNICIPAL RAPID TRANSIT SYSTEM. HISTORICAL DEVELOPMENT OF THIS TECHNOLOGY IN BERLIN, GERMANY, FROM 1930 TO 1975--ON THE OCCASION OF THE 75TH ANNIVERSARY SINCE THE ESTABLISHMENT OF THIS UNDERGROUND SYSTEM [Fernsteuerung der Stromversorgung im Stadtbahnschnellverkehr. Historische Entwicklung dieser Technik in Berlin von 1930 bis 1975--Aus Anlass des Fuenfund-siebzigaehrigen Bestehens dieser U-Bahn]. The operational network of the Berlin underground railroad lines has been extended to 100 km within 75 years. Growing power and energy demand of the multiple units called for an increasingly higher installed power level in substations with smaller distances. The economical and operational use as well as staff problems required the development of automation and remote control. A description is given, from the historical, technical and economical point of view, of the development from the very beginning of remote control to the operating control center installed according to the most modern technical aspects. 13 164445 THE METRO AT ATLANTA [Le Metro d'Atlanta]. The Metropolitan Atlanta Rapid Transit Authority (MARTA) has ordered 100 coaches for the metro lines now being built in Atlanta, capital of Georgia (USA), from the "Societe Franco-Belge de materiel de Chemin de fer" (Franco-Belgian Railway Rolling Stock Company). Delivery will commence in June 1978

and the rolling stock is designed to meet specifications and requirements that are quite different from those generally encountered in Western Europe. The body of the coaches is similar in many respects to that of the MF77 Series of the Paris Transport Authority (RATP) and their common origins are obvious. They have an integral body and chassis without framework of sheet metalwork. The sides, underframe and roof consist of extruded aluminum sections welded together. The electrical equipment, supplied by Garrett and designed for the 750 V 3rd rail system, includes two direct-current traction motors on each bogie. The traction motor speed is controlled by thyristor chopper equipment. A dual braking system is provided using electric regenerative brakes and pneumatic friction brakes. [French]

13 166445 GENERAL VEHICLE TEST INSTRUMENTATION EVALUATION. A General Vehicle Test System (GVTS) has been developed by the Transportation Systems Center, Cambridge, Massachusetts to facilitate rail transit vehicle testing at the Transportation Test Center (TTC), Pueblo, Colorado. This system was designed to be responsive to requirements specified in the publication GENERAL VEHICLE TEST PLAN (GVTP) for URBAN RAIL TRANSIT CARS, report number UMTA-MA06-0025-75-14. This report presents the results of evaluation tests carried out on the GVTS at the TTC, Pueblo, Colorado, in May 1975. The GVTS is an integrated instrumentation system consisting of transducers, signal conditioners, signal filters, interface and control electronics, a data acquisition system, signal monitoring and output devices, and all related hardware and software. The objective of this test series is to evaluate the performance of the instrumentation system under actual rail transit operating conditions. Parameters evaluated include vehicle current, voltage, acceleration/vibration pressure, pressure, temperature, displacement, and strain. The GVTS as tested provides 37 of the 48 required Standard Outputs described in the GVTP.

13 167997 ANALYSIS OF ELECTRIFIED GROUND TRANSPORTATION NETWORKS. The analysis of a transportation network presents two special problems: the positions of its electrical loads are continually changing; and some or all of it may operate at dc while the parent network in which it is imbedded and from which it draws its power, operates at 60 Hz. When confronted with these problems conventional power system analysis procedures become either inapplicable or inconvenient to use. This paper presents alternative methods and computer algorithms that are better suited to the analysis of transportation networks.

13 169214 GENERAL VEHICLE TEST INSTRUMENTATION MANUAL. A General Vehicle Test System (GVTS) has been developed by the Transportation Systems Center to facilitate rail transit vehicle testing at the Transportation Test Center, Pueblo, Colorado. This system was designed to be responsive to requirements specified in the report General Vehicle Test Plan (GVTP) for Urban Rail Transit Cars (PB-250 575). The purpose of this manual is to describe the instrumentation system (Part 1) of the GVTS and the standardized techniques to be employed to ensure the acquisition of valid test data using the system. The GVTS includes measurement systems for vehicle voltage, current, acceleration/vibration, pressure, temperature, displacement, strain and test reference data. Each individual measurement system is described in detail in the Appendix of this document. This document presents a system overview of the entire GVTS as well as a summary of the instrumentation systems referenced to the applicable Standard Outputs of the GVTP. It also describes signal monitor and calibration equipment and electrical shielding and grounding techniques. Descriptions of the supporting documentation file, the inventory control system, and miscellaneous system notes are also included. References are listed in this report. A companion document, General Vehicle Test Instrumentation Evaluation (PB-269 598), reports the results of evaluative tests performed on the instrumentation systems.

13 170875 PROPULSION SYSTEM PERFORMANCE REQUIREMENTS FOR GUIDED URBAN TRANSIT SYSTEMS. A methodology is presented for analyzing different performance levels, such as acceleration, deceleration, top speed and peak power to weight ratios, of transit vehicles. The optimization of these levels is desirable to attain certain performance objectives, including the maximization of travel time, capital costs, operating costs and energy consumption. Presented is a method which analyzes the trade-offs involved to achieve various levels of these objectives. The report describes the measures of propulsion system performance and the factors to be considered in their determination, and relates them to the design characteristics and parameters of a typical light rail transit (LRT) system. Additional factors which may affect the selection of performance parameters are discussed, namely the effect of curves, grades and spot speed restrictions. A set of values is recommended which could be used as design guidelines until more definitive studies can be performed on specific applications. /Author/

13 172654 THE DYNAMIC BEHAVIOUR OF BOGIE VEHICLES ON ROLLER END PLATES [Das dynamische Verhalten von Drehgestellfahrzeugen auf Rollschelben]. The paper reports on fundamental theoretical studies to back up experimental investigations on the limit of stability. The studies were conducted on a six-axle articulated rapid transit train, the running properties of which were measured. The model statements are investigated for testing bench for running qualities with two, four and six axles with new and worn roller end plate profiles. The influence of wear on the adhesion function, which cannot yet be quantified, was considered in the calculation by assuming a reduction of its initial trend. With this model statement, a two-axle roller testing bench is sufficient for determining the limit of stability if the influence of the shape of the wheel profile is determined with new and worn roller end plates. 13 175299 A TWO-DIMENSIONAL METHOD FOR CALCULATING UNSTEADY PRESSURE DISTRIBUTIONS ON RAILROAD TRAINS [Ein Zweidimensionales Verfahren zur Berechnung Instationaerer Druckverteilungen an Eisenbahnzuegen]. A method is discussed for calculating unsteady aerodynamic phenomena occurring upon the encounter of high speed railroad trains and on their entering a tunnel; it is based upon two-dimensional potential flow. A singularity method is used for calculation of the potential as a function of time and the contour velocity, incorporating source distributions on body contours (trains, tunnel walls). Tail contours are open to approximate effects of wake flow. The coefficient of the unsteady static pressure is formed by accounting for the potential variation in time. Longitudinal and lateral forces, as well as the moment, result from the integration of the pressure distribution. A FORTRAN program is described. [German]

13 177184 STEERABLE STEEL WHEEL SYSTEMS AND WHEEL NOISE SUPPRESSION. Steel wheel/steel rail vehicles have a long and successful history in transportation; however, the irritating screech noise generated while negotiating sharp curves is a characteristic of these systems. This paper shows how steerable wheel systems can reduce curving noise, determines the necessary accuracy for effective noise reduction. The most effective method to reduce squeal is to provide accurate steering, and some methods of improving steering systems are suggested.

13 177192 MODERN CHOPPER PROPULSION CONTROL SYSTEM FOR RAPID TRANSIT APPLICATIONS WITH HIGH REGENERATION CAPABILITY. This paper describes a rapid transit propulsion system with the following features: minimum size and weight; minimum contactor operation for mode changes; maximum regeneration commensurate with system capability; a fixed-frequency crystal-controlled chopper; and separately-excited traction motors with flashover protection. The equipment has been thoroughly tested on a flywheel system with most rapid transit system characteristics either duplicated or simulated. A prototype equipment was installed on a Chicago Transit Authority development car and run on the GE Test Track in Erie, Pa. Over one thousand trouble-free miles have been run.

13 178869 STATE-OF-THE-ART CAR ADVANCING RAPID RAIL TRANSIT. The State-of-the-Art Cars (SOAC) are designed to operate on urban rail rapid transit systems. These systems are characterized by: Heavy passenger volumes; frequent stops; exclusive right-of-way; steel rails; electric power; and multiple-unit operation. Currently, six U.S. metropolitan areas have rail rapid transit systems: Boston, Chicago, Cleveland, New York, Philadelphia, and San Francisco. In addition, Washington, D.C. is building a new rail rapid transit systems, and many cities such as Atlanta, Baltimore, and Buffalo are planning new systems. The SOAC has been developed to demonstrate the optimum in current technology. It represents today's best available technical know-how in rail rapid vehicle development. SOAC interior and wayside raise levels, ride quality, interior design, propulsion system, suspension system, auxiliary power and the HVAC system (heating, ventilating and air conditioning) are described.

13 178922 ENVIRONMENTAL CONTROL FOR A RAPID TRANSIT SYSTEM IN A TROPICAL CLIMATE. The need for rapid transit systems in tropical cities has brought into focus the problem of giving acceptable conditions underground when the ambient temperature is elevated and coupled with high levels of humidity. It is an economic problem to set reasonable comfort levels. The amount of power liberated within a tropical underground system is discussed and the size of air conditioning plant required for trains if these are used. Three general systems of dealing with the overall problems are discussed, together with the effect on the systems arising from the speed of the trains and the special problems created when stationary within the tunnels. The conclusions indicate that for tropical conditions a closed system underground is to be preferred without air conditioning on the trains. The use of power to achieve acceptable conditions is one of economics rather than a technical question, but cooling is expensive in energy for any underground system in the tropics.

13 180387 ELECTRICAL INTERFERENCE FROM THYRISTOR-CONTROLLED DC PROPULSION SYSTEM OF A TRANSIT CAR. Analysis and measurement of radiated and conducted electromagnetic interferences were performed on a transit car equipped with chopper-controlled dc propulsion system. The measured values of the radiated interference showed significant disagreement with the calculated values. It was determined from the analysis of the measured data that the voltage drop caused by the dc propulsion-current harmonics contributed to the discrepancies. Extensive tests showed that the interference levels generated from the chopper-controlled propulsion equipment are acceptable. However, it is felt that the existing and impending electromagnetic compatibility (EMC) standards are, in some instances, neither technically sound nor realistic. Suggestions are made for the improvements of standards and measurement procedures.

13 181789 PUBLIC HEARING BEFORE SENATE TRANSPORTATION AND COMMUNICATIONS COMMITTEE ON COMMUTER RAIL SERVICE IN NEW JERSEY HELD IN TRENTON, NEW JERSEY ON OCTOBER 11, 1977. The Committee examined what is being done to improve commuter rail service and performance. Examined were issues as regards progress on the electrification project for the North Jersey Coast Train, formerly known as the New York and Long Branch and the reasons for the proposed closings of grade crossings in Monmouth and Ocean counties and the process through which these closings are determined. It is well known that the performance of commuter rail service in New Jersey is inadequate. Riders of Amtrak are faced with proposed service cutbacks. The Committee has invited representatives from the state, Federal Government, Conrail, Amtrak, counties, labor organizations, and the riding public to examine commuter rail service and to discuss ways of improving it. The document contains statements from the Department of Transportation as well as statements from Amtrak and Conrail. (Portions of this document are not fully legible)

13 181988 A LIMITED INVESTIGATION INTO REGENERATIVE BRAKING AND ENERGY STORAGE FOR MASS TRANSIT SYSTEMS. This study examines the technical and economic aspects of a regenerative braking/flywheel energy storage subway system. In order to define the analytical models accurately, it was necessary to gather data on the trains, rail network, schedules, and ancillary equipment. Data on projected costs of flywheels, motors, rails, and other equipment were also gathered for use in the economic analysis. During this data gathering phase, it was decided that the Massachusetts Bay Transportation Authority (MBTA) Red Line would be the source of the most representative and complete data. The problem was to determine what, if any, combination of energy storage devices and high conductivity rails would yield a subway system with a lower life cycle cost. The primary goal of the study was to compare the system costs of wayside storage with those of on-board storage. Using data provided by MBTA, power levels vs. time and rail losses were calculated and used to determine the sizing and location of energy storage units. From the amounts of energy storage required, the costs of the flywheels and i/o equipment were calculated. Utilizing these modules for load leveling was also considered. However, since the energy storage required for load leveling is much greater than that required for regenerative braking, a separate study is needed to examine this in detail.

13 182094 THE UNITED STATES AND THE INTERNATIONAL MARKET FOR RAIL EQUIPMENT. The report deals with the international market for rail transit cars and the firms which manufacture the equipment, with emphasis on the position of the U.S. domestic segment of that market at the present time and in the foreseeable future. The U.S. transit car market has been penetrated successfully in recent years by Canadian, French, and Italian carbuilders. The author discusses the circumstances surrounding these events. The report discusses the following issues: (1) the commercial and economic outlook of carbuilders and component suppliers; (2) government funding of the rail passenger equipment market (worldwide); (3) the degree of interdependence that exists among the economies of the world, the corporations who manufacture and trade on a global scale, and the rail industry itself; (4) the U.S. domestic transit car market; and (5) the implications for public policy. This report is based mainly on a series of interviews and discussions with people drawn from the rail carbuilding industry, component supply companies, transit authorities, railroads, trade associations, and government agencies. Some conclusions drawn from this study are: (1) the principal problems faced by U.S. carbuilders were strongly in evidence well before the appearance of foreign competitors; (2) transit authorities and UMTA have been faced with rising transit equipment costs and a bid pattern which shows an alarming tendency for only one or two (or none) U.S. firms to bid; and (3) none of the sources consulted expect all U.S. carbuilders to disappear,

but most tend to regard a reduction in the number of carbuilders as inevitable.

13 182585 DRIVE FOR RAILROAD VEHICLES OF MUNICIPAL MASS TRANSPORTATION WITH INDUCTION MOTORS [Pohon koljovych vozidel mestske hromadne dopravy s asynchronnimi motory]. The traction properties of an induction motor fed by a variable frequency from a thyristor converter are considered. The properties of the induction motor are derived from its impedance diagram reduced to a frequency of 1 cps. This measure eliminates the feeding frequency and the variable feeding voltage from the description of the properties of the motor. The method permits a simple derivation of the principal traction properties of the machine: the moment of the machine is proportional to the square of its current. The coefficient of proportionality between the square of the current and the moment depends on the rotor frequency, the parameters of the machine, and is independent of the feeding frequency and the voltage. The principles for an optimum control of the motor are derived. As a converter of frequency and output voltage, an inverter of voltage attached directly to the dc source is employed permitting both motor and generator operation. At lower output frequencies, the inverter is controlled by pulse-width-modulation; at higher frequencies by the method of rectangular control. Both methods are uniformly described by means of the three-dimensional Park vector, which permits a comparison and explains the physical principle of the control of the inverter. [Czech]

13 182796 CALCULATION AND MEASUREMENT OF ELECTROMAGNETIC INFLUENCE ON TELECOMMUNICATION CABLES IN SUBWAY SYSTEMS BY POWER ELECTRONIC CIRCUITS. For the subway in Vienna/Austria electrical drives for air flow control are considered whose speed is controlled by power electronic circuits. The electric power line feeding the power electric circuits is mounted in parallel with the subway telecommunication cables over a length of close to six-hun-

dred meters. The current pulses--caused by the power electronic control--in the electric power line lead to induced voltages in the telecommunication cables. This paper provides a derivation of equations to calculate the induced voltages. A Fourier analysis of the current in the electrical power lines is performed. The difficult problem of calculating the induced voltages in the telecommunication cables is solved by the conform mapping. The real geometric configuration concerning magnetic field calculation. In this configuration, by different mathematical operations, the induced voltages can be calculated. Good comparison is found between calculation and measurement of induced (EMI) voltages.

13 182797 INTERFERENCES IN TELEPHONE CIRCUITS DUE TO THYRISTOR CONTROLLED D.C. TRACTION. For efficient control of motors in the case of d.c. traction, a thyristor chopper is used. Prior to introduction of thyristor chopper control in the metropolitan railway system extensive measurements were made in three cities of Fed. Rep. of Germany. After a brief review of chopper control this paper deals with the inductive interference on telephone cables. In general it can be established that the interference in telephone cables is mainly due to the current harmonics from the rectifier station. Furthermore, as far as the induced voltage is concerned it makes practically no difference which type of control is being used, as long as the d.c. traction power is the same.

13 183512 RAIL RAPID TRANSIT AND ENERGY: THE ADVERSE EFFECTS (WITH CLOSURE). Because it is generally believed that transportation energy can be saved by diverting people from automobiles to rail transit, the United States is now building or planning a number of multi-billion-dollar rail systems. These new-generation rail systems were examined and found to be a net user of energy. The two main points prompting this conclusion are that (a) the energy invested in building a rail system is enormous and thus difficult to repay and (b) the possible savings in operating energy are small, or even negative, because most rail passengers are diverted from buses and buses are more energy efficient than modern rail systems. The analysis was done for San Francisco's Bay Area Rapid Transit (BART) system, but evidence is cited to show that the results are typical for other modern rail systems as well. To the extent that BART is atypical, it appears to be atypically efficient. The analysis takes into account the reduced demand for automobiles and buses because their passengers are diverted to rail and then calculates the energy saved because these conventional vehicles

are not built or driven and the roads on which they would travel are not constructed. It is concluded that even radical improvements in automobile diversion, rail patronage, and load factors would not significantly alter the results. /Author/

13 183581 WIRELESS TRANSMISSION OF MEASURED VALUES FROM THE MOVING RAIL WHEEL [Drahtlose Messwertuebertragung vom rollenden Eisenbahnrad]. The Institute for Transport Planning and Route Construction (Railway and Tracked Local Transport) at the Technical University in Berlin has developed a system of Wireless transmission of measured values from the moving wheels of rail vehicles. For the first time this allows the detection on the wheel itself of the level and distribution of solid-borne noise as used in the study of wheel vibration. The influence of various parameters such as speed, spatial acceleration components, type of permanent way, rail condition where there is greater unevenness, etc., can be determined at the wheel. Some influences have been recorded and can be used to assess the effect of various parameters. The measured results can also be used for the investigation of various mechanisms which cause solid-borne noise in the rail/wheel system. This in turn allows determination of parameters of importance for altering the vibratory condition on rail vehicles. [German]

13 184159 SOME EXPERIENCES OF WEAR, CORROSION AND CRACKING IN WHEELSET COMPONENTS OF A RAPID TRANSIT RAILWAY SYSTEM. While fretting corrosion and wheelset cracking of axles have been overcome, deep fatigue cracks could form in axle bodies under exceptional circumstances. Ultrasonic testing must include the entire axle length. Quenching of an axle may extend the endurance of an axle containing a crack or other defect in the body and seems worthy of further investigation. London Transport's tests of various compositions and heat treatments of wheels and tires have shown nothing likely to eliminate formation of thermal cracks, although rim quenching shows some promise. Various factors in tread and flange wear are also discussed.

13 186339 THE APPLICATION OF OPTIMAL CONTROL THEORY TO HYBRID ELECTRIC TRANSIT SYSTEMS [Master's thesis]. In an effort to minimize energy losses through the optimal control of an electric rapid transit system, three vehicle/flywheel configurations are modeled using the bond graph technique. Field and armature control of an on-board flywheel are presented along with field control of a station flywheel used in conjunction with a typical regenerative vehicle. Pontryagin's Minimum Principle is used to develop the optimal control trajectories for vehicle accelerations and decelerations. The time integral of mechanical and electrical losses is minimized as the cost function. Armature control of the hybrid vehicle and field control of the station flywheel are equally efficient in the reversible energy flow between vehicle and flywheel. Field control of the hybrid vehicle is slightly less efficient. The optimal trajectory for deceleration is nearly linear, but the optimal trajectory for acceleration, due to the effect of mechanical losses over a longer time period, is highly concave and differs radically from a typical transit acceleration. The vehicle weight and resistance in the armature windings have a large influence on system performance. (Author)

13 188061 SOME STATIC AND DYNAMIC PROPERTIES OF RAILWAY WHEELS. To improve the understanding of wheel/rail noise generation, experiments were conducted on four railway wheels to determine their static and dynamic behavior. The railway wheels used were the Bochum wheel, the Acoustaflex wheel, the S.A.B. wheel and a standard railway wheel. The properties measured were their frequencies, modal damping ratios, and mode shapes. Deflec-

tion properties are also given. Two prototype wheels also included in the tests were found to produce higher damping ratios than any of the four established railway wheels.

13 188090 REMOTE CONTROL EQUIPMENT FOR THE ELECTRIC POWER SUPPLY OF THE URBAN RAPID TRANSIT SYSTEM IN HAMBURG, WEST GERMANY [Neue Fernwirkanlage fuer die Energieversorgung der Hamburger S-Bahn]. For more than 35 years the electric power supply installations have been monitored and operated by a remote action installation. After many years in service the first installation no longer satisfied modern requirements. Therefore, October 1977, a new installation has been put into operation. A report is given on the remote action system with selective dialing technique and the main network control center. [German]

13 188136 GLASGOW UNDERGROUND-DESIGN, DEVELOPMENT AND CONSTRUCTION OF THE NEW CARS. Designing the new cars was a question of scale. With only 33 cars required, it was desirable to use established technology, but the tunnel diameter and track curvature decreed that no existing design was suitable. The article describes areas of the cars made special to the 'mini' system to overcome tunnel and track constraints.

13 188306 COMBINED SIMULATION OF A RAPID TRANSIT SYSTEM. Three approaches to simulating a rail rapid-transit system are compared. The system is itself partly continuous in nature (equations of motion, for example) and partly discrete (dispatch of trains, for example).

The three approaches are (1) a basically continuous model modified to accept discrete events, (2) a basically discrete model modified to accept representations of continuous portions, and (3) a combined model designed to accommodate both the discrete and continuous parts. The third approach, combined simulation, is described in detail and is illustrated by its application to an 8-train system. The value of simulation for designing rapid transit systems and analyzing their problems is discussed. The benefits of combined simulation as compared to discrete and continuous simulation are enumerated. As an example, all three methods for modelling a simple station exchange process are presented.

13 188325 TYNESIDE REPORT NO 7. This report, the seventh in a series dealing with all aspects of the Tyne and Wear metro project, describes the progress of the scheme following on from the governmental decision in December, 1976 that the project could go ahead as planned within the constraint that the cost of the scheme would not exceed ,161 M at November 1975 prices (the 1972 estimate was ,65 M). The special factor that caused most of the cost overruns is described as the decision by British rail and the tyne and wear PTE not to share tracks except in special circumstances, the fundamental reasons being in the field of overhead clearances and signalling. Problems of incompatibility are discussed, by reference to trains, tracks, electrification (1500 volts DC from overhead wires), routes and signalling. A map provides information on the metro and adjacent br lines, with details of station and control centre locations and other relevant data. Methods to be employed for train identification and control including the use of train-borne transponders, trackside interrogators, and closed-circuit television systems are described. Techniques to be employed for automatic fare collection are detailed, bearing in mind that most metro stations ('metrostops') will be unstaffed, and that there will be no barriers at the station entrances.

13 188996 CURRENT RECOVERY BY REGENERATION BRAKING OF ELECTRIC VEHICLES IN A TRANSIT SYSTEM [Strom-rueckgewinnung durch nutzbremsen von Schienenfahrzeugen im Nahverkehr]. Feedback of the regenerated energy into the supply system during electric braking of motor vehicles reduces considerably the total energy consumption, especially for transit railway systems. Although this fact has been known for a long time, such regenerative braking has been of limited propagation due to the lack of suitable control devices which could be applied in an economic way. Power electronics nowadays offer possible creation of regenerative braking circuits using chopper control systems which are capable of accomplishing braking energy feedback into supply system within the

entire speed range of the vehicle. After explanation of the circuits being proposed the results of the energy feedback measurements during electric braking are detailed which have been carried out for the modern light rail vehicles of the Transport Authority Hannover. Based on the existing service conditions in Hannover an average energy amount of 25% compared with the consumption required during motoring will be resupplied into the overhead system during braking if chopper control technique is used. 13 190303 INFLUENCE OF SYSTEMS OF OPERATIONS ON RAPID RAIL ENERGY UTILIZATION. The objective of this paper is to collectively quantify and assess the potential of new rapid rail hardware and operational techniques to reduce rail energy utilization. With regard to the desire to apply these concepts to urban rail as a generic mode, it is recognized that

in certain cases the impact of the application will be site dependent. However, the approach taken is one of bounding the overall energy improvements in order to assess exactly what can be expected in terms of future rapid rail energy utilization. Further, this assessment has been constrained to consider only operating energy plus those systems and operational techniques which have been proven as feasible candidates for reducing energy utilization.

13 190503 IN-SERVICE PERFORMANCE AND COSTS OF METHODS TO CONTROL URBAN RAIL SYSTEM NOISE. INITIAL TEST SERIES REPORT. The purpose of this project is to determine the acoustic and economic effectiveness of resilient wheels, damped wheels, wheel truing, and rail grinding for reducing wheel/rail noise on urban rail transit systems. The project consists of a six-phase series of field tests being performed on the Southeastern Pennsylvania Transportation Authority System's Market Frankford Line, and in-depth interviews with management and operating personnel of the North American steel wheeled rapid transit systems regarding their experience with the above mentioned noise abatement procedures. This is the third report of this project. The first two reports, the Experimental Design and the Test and Evaluation Plan contained the procedures to be followed in conducting the project. This report includes: (a) the results of the testing performed in Phases I, II, and III including tentative recommendations; (b) changes which have occurred to the Experimental Design and to the Test Evaluation Plan; (c) economic data for the wheel types, rail grinding equipment, and wheel truing equipment under consideration; (d) a preliminary discussion of problems and enumeration of constraints which are relevant to use of these techniques on other systems; (e) a summary of remaining testing to be accomplished under the program including recommended changes to the Experimental Design or to the Test and Evaluation Plan. It has been determined that overall noise reduction obtained by use of the various techniques is limited by the noise of the propulsion system.

13 191406 NOISE DEGRADATION OVER TIME IN RAIL RAPID TRANSIT CARS. The purpose of this effort was to study the degradation of noise quality of selected cars over time, and to relate this degradation to treatment events if possible. To this end, three trains were observed monthly for a period of seven months in an extensive collection and analysis effort. The three car types studied were: IRT cars comparable to the R17; IRT cars (R17), with a special design feature the 'Traction Fault Detector'; and R46

cars. Because of the substantial measurement problems encountered, the project has in fact two sets of major results: (1) those relating to the novel data collection and analysis methods employed; and (2) those relating to wheel-rail interaction and degradation.

Slutsky, S McShane, WR Starace, JJ ; Polytechnic Institute of New York, Urban Mass Transportation Administration, (UMTA-NY-11-0002) Final Rpt. UMTA-NY-11-0002-79-2, Dec. 1978, 69 p.; See also PB-292 032.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-292031/2ST

13 191407 NOISE ABATEMENT IN RAIL RAPID TRANSIT: EFFECT OF SOME VARIATIONS. Noise abatement in rail rapid transit is an expensive and complicated undertaking. Cost is minimized by selecting a proper mix of treatments to attain a specified noise objective, or target. Assessments of specific properties and development of an abatement methodology were accomplished in earlier works. In this report the abatement methodology is refined and a number of case studies conducted. This report focuses on changes in the system-wide treatment plan, the program cost, and the net impact due to such factors as: variations in discount rate; changes in abatement target level; introduction of new cars; prohibition of certain treatments, such as resilient wheels and steel el barriers; and specification of certain treatments on a categoric basis. In the course of the studies, it was found that a system average noise level index is rather insensitive to system changes. A measure based upon percent of system exceeding certain noise levels is developed. Programs for in-train abatement were developed for 1976 and 1985 car fleet compositions, and estimated to be comparable in net effect. A program costing in the order of \$5.0 million annual cost for in-train abatement was found to have the greatest abatement per unit cost, although additional abatement is achieved with additional money. Effects of changes in the relative importance of different noise sources were studied. Additional studies on in-community abatement are reported herein, as are some ancillary in-train studies.

13 191428 NOISE ASSESSMENT OF THE PORT AUTHORITY TRANSIT CORPORATION LINDENWOLD RAIL TRANSIT LINE. The report describes the noise climate on and near the Port Authority Transit Corporation (PATCO) Lindenwold High Speed Line. The PATCO urban rail transit line has approximately 14.2 miles of two-way revenue track (of which about four miles are in subway), and 12 stations. Noise level data is given for specific measurements made in cars, in stations, and along the non-subway wayside at appropriate locations. The rationale for choice of measurement sites and the methodology for arriving at the summary noise distributions from the data are discussed explicitly. Measurement and analysis instrumentation and procedures are also described.

13 191670 A STUDY TO ACCOMMODATE THE ELDERLY AND HANDICAPPED ON EXISTING COMMUTER RAIL COACHES. The report examines the feasibility of making the existing Detroit-Pontiac commuter rail service more readily accessible by the elderly and handicapped. It examines three types of railroad coaches (1500, 4800, and 9600 series cars) currently owned by the Southeastern Michigan Transportation Authority (SEMTA) as well as existing rail stations in the overall analysis to provide rail service for the elderly and handicapped. The report is definitive toward the methods required to modify the interiors of these cars to accommodate the onboard handicapped passenger (including bathroom facilities). The report also presents innovative concepts to the problem of boarding/unloading the handicapped. Some of the conclusions presented are the following--(1) that present commuter rail facilities are not accessible for ingress/egress by the unassisted elderly and handicapped; and (2) that two of the three types of railcars owned by SEMTA can be modified to accommodate the elderly and handicapped providing that each station platform complement the proposed car modification. The guidelines used as reference material for this study were the Michigan 'General Rules' of the Construction Code Commissions Barrier Free Design Graphics. This report provides numerous diagrams depicting floor arrangements and the proposed modifications to these cars.

13 191913 REALIZATION OF GRAVITY DRIVE IN METROPOLITAN RAILWAYS FOR LOW LOSS RECUPERATION OF KINETIC ENERGY OF VEHICLES WITHOUT LINEAR INDUCTION MOTOR. One of the advantages of the Cyclo Train gravity drive with a great slope lies in the possibility of a very flexible position of the line in the vertical plane and, additionally, in a high transport velocity (e.g., 32 km/h at 512 m distance between stops).

The disadvantage lies in the large tunnel depth and in the necessity of applying the linear induction motor with variable frequency, synchronous and asynchronous, respectively. If the maximum slope is limited to $100 \exp 0 / \infty$, it is possible to omit the linear induction motor and make the drive interact by friction between the wheel and the rail. If the distance between stops is increased from 512 m to 662 m, the mean transportation velocity of 32 km/h can be maintained. The maximum tunnel depth is reduced from 38 m to 21 m with stations provided in open hollows of 120 m length, inclusive of the open slopes, and with 2.5 m deep platforms to save space for traffic on the zero level. The maximum transportation rate is 12,000 persons per hour in one direction for platforms of 64 m length, 2.20 m width of the vehicles, and a sequence time of 90 s. If the platforms, arranged sideways of the tracks, have a width of 2.5 m, a total width of 10.0 m is needed for a station. This value would increase to 14 m for full profile trains. (ERA citation 04:013911)

13 194143 TYNE AND WEAR METRO. Tyne and Wear is described as the major conurbation of the north-east of England with a population of approximately 1.2 M, industrial in nature centred on the banks of the rivers Tyne and Wear, and the regional capital of a large mainly rural hinterland serving a population of about 2.5 M. Transportation problems within the region are reviewed, which led to the establishment of the metro concept and the introduction of the Tyneside Metropolitan Railway Act in 1973. The metro as described will form the backbone of Tyne and Wear's integrated public transport system. It will be 54 route kilometres long, comprising 41 kilometres of converted British rail suburban routes and 13 kilometres of new construction, about half of which is underground to provide accessibility to central Newcastle and Gateshead and to improve the cross-river link. Other new sections described include the byker alignment where metro will run through a major area of inner-urban revitalisation along what was to have been an urban motorway alignment. A new route through the centre of South Shields will replace the existing route which is no longer suitably located to serve a major residential area and link with a focus of the local bus network. In the north-east of Newcastle a freight line will be doubled to provide passenger service as far as Kenton Bank through a rapidly developing area. Reference is made to transport integration, pattern and frequency of service, engineering and engineering equipment-with a system voltage of

1500 volts DC from overhead equipment- and future plans. The first section of metro from Regent's Centre and West Monkseaton to Haymarket will open in the summer of 1979.

13 194634 SAFE BRAKING MODEL FOR A RAIL RAPID TRANSIT SYSTEM. Safe braking distance is an important consideration in signaling block design for rail rapid transit systems. Historically, block design has developed in accordance with empirically determined stopping distances from various operating speeds plus a safety margin, frequently 35 percent. Because of the impact of poor wheel/rail adhesion and vehicle equipment failures on actual train performance during braking, it became necessary to use a more comprehensive and scientific technique for determining safe braking distance requirements for block design. The safe braking model is an analytic approximation of the performance of automatic train protection equipment, its interaction with passenger vehicle propulsion and braking equipment, and the resulting train performance while decelerating from an initial speed to a stop. The safe braking model considers performance parameters of train control equipment, certain wayside and vehicle characteristics, and performance parameters of vehicle subsystems, and it provides an analytic tool for evaluating the impact of each on safe braking distance. In order to achieve a high level of confidence in the safe braking distance calculations, the safe braking model must be conservative, considering failure modes and worst-case equipment performance parameters which can affect train braking. This paper describes the safe braking model in terms of a train speed-distance profile during braking. The safe braking distance is described in terms of vehicle characteristics and components of the speed-distance profile. Input parameters required to define each component of the safe braking distance are identified, the safety impact of each is discussed, and typical values are presented.

13 194656 INVESTIGATING THE COMPATIBILITY OF THYRISTOR-CONTROLLED DIRECT-CURRENT RAILWAYS WITH THE SIGNALLING AND COMMUNICATION EQUIPMENT. Detailed studies have shown that additional alternating currents result in the power supply systems when d.c. control technology is employed on local-transport rail vehicles, but the influence on the signalling, communication and data systems is small in view of the chosen dimensions of the vehicle equipments. By adopting suitable measures on the vehicle itself and on the affected railway subsystem, those plant components can be made compatible which were found to be inadequate in measurement of the S/N ratio. 13 195059 SIMULATION SHOWS HOW CHOPPERS CAN SAVE ENERGY. Chopper-type controls cause lower energy loss for transit trains than does resistance control of traction-motor voltage. Because choppers do involve first cost and weight penalties, the reduction in electric power demand must be accurately predicted before rolling stock is ordered. These savings depend on physical characteristics of the route, pattern of service, power supply sectioning and maximum overvoltage to be tolerated.

13 195084 SERVICE IMPROVEMENT OF THE QUENCHABLE NONSYMMETRIC BRIDGE CIRCUIT IN MULTIPLE-UNIT TRAINS TYPE ET 420 [Betriebsertuechtigung der Loeschbaren Unsymmetrischen Brueckenschaltung (LUB) in den Triebzuegen ET 420]. The electric multiple units series ET 420 for West German urban rapid transit systems are equipped with phase angle control, which is operated as sequence control of two converter bridges in order to diminish the reactive power requirements. Some years ago three multiple units had been additionally equipped with a quenching circuit at one of the bridges in order to improve the power factor. It is shown how this installation has been gradually improved to meet operational requirements. [German]

13 195100 ELECTRIC BRAKING OF ELECTRIFIED URBAN TRANSIT VEHICLE. Problems connected with regeneration of electric energy are discussed and relationships are given for calculating the regeneration efficiency of electrified vehicles and the contact system, as well as the over-all regeneration efficiency. To increase the effectiveness of electric braking, electric traction motors of urban-transit vehicles must be operated in a regime realizing maximum braking capacity. Here in the high-speed range, for existing series of traction motors it is best to use a traction regime characterized by simultaneous variation in armature current and excitation current in a manner ensuring constant maximum voltage between commutator bars. For constant pairwise series-parallel connection of traction motors and follow-up resistive-regenerative braking at maximum permissible subway-car speed, regeneration efficiency is about 64% of the kinetic energy of the train, and is nearly independent of the load carried by a car.

13 196380 PROGRAMMABLE DIGITAL VEHICLE CONTROL SYSTEM. A programmable digital vehicle control system or PVDVCS is based upon a microprocessor and is designed to replace the hardwired discrete components traditionally used in the on-board control of automated rapid transit vehicles. The PVDVCS can easily be adapted for use in any automated transit system. A breadboard PVDVCS has been programmed to perform the basic longitudinal control system functions, including closed-loop

emergency braking, and has been subjected to closed-loop laboratory testing. Prototype tachometers and a seventh-order nonlinear analog computer simulation of motor, brake, and vehicle dynamics were used to close the control loop for test purposes; command scenarios were input manually. The test results demonstrate the feasibility of microcomputers in on-board vehicle control and show their capability to meet the performance requirements associated with a short headway (3 s) system.

13 196460 CHOPPER CONTROLLED ELECTRIC CARS FOR NAGOYA MUNICIPAL TRANSPORTATION BUREAU. In Nagoya City, Nos. 1, 2, and 4 subway lines are now in commercial operation. To expand the urban traffic network, construction work on the No. 3 subway line with an overall length of about 20 km has been carried out. A section of 8 km was opened for service in March 1977. Eighteen cars (basically for four-car train formation), and a number of machines including chopper control equipment have been delivered for the No. 3 subway line. These electric cars were designed by utilizing up-to-date techniques and sophisticated electronic technology. Their semi-stainless bodies requiring no painting permit easy maintenance. Chopper control equipment with regenerative braking is adopted for energy saving. Air cooling equipment is mounted for better service to passengers. The car body design and chopper controller-salient features of these cars-are described.

13 196463 TRIP AVAILABILITY FOR RAPID TRANSIT SYSTEMS. Passenger acceptance of mass transit system depends on predictable travel times. The major sources of travel time uncertainty are passenger wait delays due to system loading and travel time delays due to failures. The second of these effects is treated analytically. Travel time distributions are developed for a typical automated group rapid transit network with a passenger load of 14,000 passengers per hour. In addition, an approximate availability solution is presented and compared to the analytical solution.

13 196522 OPTIMAL CONTROL OF ON-BOARD AND STATION FLYWHEEL STORAGE FOR RAIL TRANSIT SYSTEMS. The energy efficiency of rail transit systems using regenerative braking is enhanced by flywheel storage elements used to store energy not accepted by the wayside power rail. In this paper three storage system control concepts are examined: armature and field control of on-board flywheels, and field control of a station-based storage device. The energy recovery efficiency and performance characteristics of each system are determined subject to optimal control laws derived to minimize energy loss. The resulting control systems are bilinear, due to the use of separately excited DC traction and flywheel motors as continuously variable transmissions. The three systems yield similar energy recovery efficiencies for deceleration, with the advantages of each for practical applications discussed.

13 196929 ENERGY PROBLEMS IN METROPOLITAN RAILWAYS. This paper reports the specific energy consumption per passenger-kilometer or per passenger-journey on typical metropolitan railways, discussing this in two parts--fixed installations and rolling stock. After citing measures taken to minimize energy consumption by traction and non-traction functions, there is discussion of regenerative braking, thyristors, reversible substations, ac induction traction motors and energy storage. Appendices include results of a survey of representative metropolitan railways, description of thyristor-controlled choppers and inertia storage equipment.

13 196937 SUBSTATIONS FOR THE POWER SUPPLY TO THE SAO PAULO METRO. Continuity of power supply is very important for an underground railway particularly during the frequent very short peak periods.

For this reason, when designing substations it is essential to carry out detailed investigations concerning power requirements, trend of power requirements and the peak loads likely to occur. Planning of the power supply system and the overall protection concept has to be guided by the operational load peaks. A problem which plays only a subordinate role in surface transport is the temperature rise of the air in the tunnel, resulting from energy losses and braking energy of the traction vehicles. Thus, the question of current recovery during braking cannot be solved solely from the viewpoint of economy with the cost of energy as parameter. Here it is also necessary to settle the questions of pollution control in the tunnel and the cost of ventilating the tunnel. The power consumption and the possible peak loads were calculated on the basis of the Sao Paulo Metro's envisaged timetable. This study showed that it must be possible to feed the energy back into the ac system if economical operation is to be guaranteed. The following substations are envisaged for distribution and transformation of the energy required: 3 transformer substations 88/22 kv; 10 rectifier substations for 22 kv, 850 v dc (two of which are equipped with static braking inverters); and 20 systems supplying power to the passenger stations, 22/0.48 kv.

13 197435 PREDICTION AND CONTROL OF NOISE AND VIBRATION IN RAIL TRANSIT SYSTEMS. The purpose of this report is to present a balanced introductory view of noise from rail transportation systems and its control, and to provide references to more specialized material. The emphasis is on urban transit systems. However, data on intercity passenger and freight trains are included. The noise environments treated include community noise and vibration near rail lines, vehicle interior noise of urban and intercity passenger trains, locomotive cab noise, and noise in stations and tunnels. For each environment, some or all of the following topics are addressed: measured noise and vibration levels and spectra; prediction and control of noise and vibration; measurement methods; and applicable standards, specifications, and criteria.

13 197438 TRANSIT CAR PERFORMANCE COMPARISON STATE-OF-THE-ART CAR VS. PATCO TRANSIT CAR, NYCTA R-46, MBTA SILVERBIRDS. The first phase of this contract authorized the design, development, and demonstration of two State-Of-The-Art Cars (SOAC). This document reports on the gathering of comparative test data on existing in-service transit cars. The three transit cars selected for testing were the PATCO transit car, the NYCTA R-46 transit car, and the MBTA Silverbird transit car. These cars were instrumented and then run in simulated revenue service while data was gathered. The results of these tests are reported in this document in a comparative format with the SOAC data recorded at each of the properties. The SOAC was found to be superior to all three of these existing transit cars in the area of noise reduction. The SOAC ride quality is better than

the R-46 and the Silverbird, but not as good as the PATCO transit car. The SOAC propulsion system was inefficient while operating on the New York and Boston route structures, and only marginally better than the PATCO transit car in Philadelphia.

13 197453 COST SAVINGS POTENTIAL OF MODIFICATIONS TO THE STANDARD LIGHT RAIL VEHICLE SPECIFICATION.

This report describes an assessment of the Standard Light Rail Vehicle (SLRV) specification to determine whether the relaxation or modification of some requirements could result in a significant reduction in vehicle costs. A Technique of Assessment by Structured Interviewing was applied to include judgments and ideas by each facet of the industry concerning modifications to the specification which would be acceptable and could reduce car costs. A five-stage filtering process was used to select 20 cost reducing modifications from an initial list of 640 candidate specification modifications. The large list resulted from an in-depth review of the current specification. The final set of 20 areas were analyzed quantitatively to estimate cost savings that might be realized. SLRV cost savings of 16 percent are shown to result by implementing the 15 specification modifications which are termed as having acceptable impact upon mission performance. The remaining five modifications have major impact upon mission performance (e.g., unidirectional operation, doors on only one side, simplified friction brakes, no articulation, and elimination of compressed air). Cost savings of 25 percent are shown to result from specifying a bidirectional, non-articulated car with simplified friction brakes and no compressed air and which also incorporates the 15 specification modifications with acceptable impact on mission performance.

13 197652 URBAN RAPID RAIL VEHICLE AND SYSTEMS PROGRAM. This sixth Annual Report describes the work accomplished and summarizes pertinent technical and design data. The objective of the Program is to enhance the attractiveness of rail rapid transit to the urban traveler by providing him with transit vehicles that are as comfortable, reliable, safe, and economical as possible. Three major hardware tasks were active during this reporting period, namely: the State-of-the-Art Cars (SOAC), the Advanced Concept Train (ACT-1), and the Advanced Subsystem Development Program (ASDP). Accomplishments for the year ending September 1977 included the following: Completion of the PATCO revenue service program; Delivery of the first ACT-1 car to the DOT Transportation Test Center; Fabrication and developmental testing of

the components for the Advanced Sub-systems Development Program including the self-synchronous propulsion system, the monomotor truck and the synchronous brake system.

13 198280 LABORATORY EVALUATION OF CONCRETE TIES AND FASTENINGS FOR TRANSIT USE. This report was prepared as part of an ongoing research effort by the Urban Mass Transportation Administration (UMTA) to develop standard concrete ties for rapid transit use. The overall objective of this contract was to fabricate and evaluate, by laboratory tests, standard ties of different designs intended for transit use. Two tie designs, a pretensioned monoblock and a post-tensioned two-block, together with preliminary specifications for tie manufacture were developed in an earlier study by the Transit Development Corporation. Objectives of the investigation were to evaluate, by laboratory tests, the adequacy of: each of three fastening systems; each of the tie designs; and the assembled track components with ties supported on ballast and subjected to simulated rapid transit loading. Work performed to accomplish these objectives included fabrication of prestressed concrete ties and testing of ties, fastenings, and assembled track components.

13 198283 MEASUREMENT PROGRAM FOR EVALUATION OF CONCRETE TIES AND FASTENINGS IN TRANSIT TRACK. This report outlines a measurement program to obtain data on the performance of standard tie designs and associated fastening systems under field service conditions. In addition, the program identifies limited data to be obtained from a wood tie track for comparison. Recommendations are presented for a measurement program for monitoring, over an extended duration, the performance of different cross tie track systems under typical transit conditions. The following topics are discussed herein: type of data to be collected; type of instrumentation to be installed; type of equipment required for data acquisition; test schedule; and criteria for evaluating test data. The recommendations presented in this report are applicable to wood and concrete cross-tie track systems.

13 198579 RAILROAD ACCIDENT REPORT, REAR END COLLISION OF CONRAIL COMMUTER TRAIN NO. 400 AND AMTRAK PASSENGER TRAIN NO. 60, SEABROOK, MARYLAND, JUNE 9, 1978. About 6:40 p.m., on June 9, 1978, Conrail commuter train No. 400 struck Amtrak passenger train No. 60, which was slowing to stop at a grade crossing at Seabrook, Maryland. Eight cars of train No. 60 and the three head cars of train No. 400 derailed. Sixteen crewmembers and 160 passengers were injured, and damage was estimated to be \$248,050. The National Transportation Safety Board determines that the probable cause of this accident was the failure of the engineer of train No. 400 to perceive the train ahead and to properly apply the brakes in sufficient time to prevent a collision. Contributing to the accident was the failure of Amtrak to assure that the train crews were adequately trained. The causes of the large number of injuries in this relatively low-speed collision were the failure to maintain and service seats on the Amfleet equipment, and the injury-producing fixtures designed into the commuter cars.

13 198745 THE STATUS OF ADVANCED PROPULSION SYSTEMS FOR URBAN RAIL VEHICLES. Rheostatic control of dc traction motors has been in use for several decades. With the advent of power electronics, however, more efficient alternate propulsion systems have been developed. These include chopper controls, ac drive with induction motors, systems using onboard energy storage and ac drive with tubular axle motors. Of these concepts, chopper controllers have been in regular revenue service for several years while others are still under prototype testing. This report is a technology review of advanced traction systems. It is based on information and data gathered from propulsion equipment suppliers in Europe, Japan, and the United States. The report describes in detail the status of all these propulsion systems. The performance characteristics, the significant ad-

vantages and disadvantages and the deployment of the hardware in revenue service for all these systems is discussed. The report concludes with a general description of alternate traction motors and power converters.

13 199051 SELF-SYNCHRONOUS PROPULSION SYSTEM FOR RAPID TRANSIT RAILCARS-ADVANCED SUBSYSTEM DEVELOPMENT PROGRAM. VOLUME II: DETAILED TECHNICAL DISCUSSION. Development of the Self-Synchronous Propulsion System was conducted under the Advanced Subsystem Development Program (ASDP), which is a part of the Urban Rapid Rail Vehicle and Systems (URRV&S) Program sponsored by the Urban Mass Transportation Administration. The Self-Synchronous Propulsion System was one of the advanced subsystems that had been identified during the Advanced Concept Train (ACT) proposal evaluation as showing outstanding merit, and was planned to be developed for evaluation

by the Transit Authorities. The objective of the overall ASDP was to develop advanced subsystems suitable for application in existing or future transit cars. This report, Volume II, discusses the program technical effort, program scope, objectives, and background; summarizes the design and testing efforts and problem areas; contains conclusions and recommendations; discusses system functional characteristics, train performance characteristics, major component design, interfaces, and product assurance; covers developmental, major component and system level testing; contains a description of the changes made during system testing; discusses the status of the final configuration; and addresses unresolved problems.

13 262199 NEW GENERATION OF CARS. The U.S. Department of Transportation has been acting as a catalyst to further the state of the art in transit car technology and design. Two state-of-the-art cars (SOAC) are currently on tour to demonstrate to the transit operators and the public the best subway car industry can offer with existing technology. Designed to hold an average of 100 passengers and travel up to 80 mph, SOAC with lighting, climate control, quality of ride and noise control, sets a new standard in rail car design. The Advanced Concept Train (ACT-1) represents the next generation of rapid transit trains. One ACT-1 is powered by an energy storage flywheel propulsion system designed to conserve electric power. The new car is expected to reduce cost of operation and maintenance from about 55 cents to around 30 cents per car mile. An example of the program's use of standardization to benefit the maximum numbers is a new street-car called the Standard Light Rail Vehicle (SLRV), which will fit virtually all eight existing streetcar systems in the U.S. The first GT-E (gas-turbine-electric engine) commuter rail car, will appear on the Long Island Railroad and a flywheel energy saving device will also be tested on subway cars.

13 262573 STATE-OF-ART CAR DEVELOPMENT PROGRAM VOLUME I: DESIGN, FABRICATION AND TEST. As systems manager for the Urban Mass Transportation Administration's Urban Rapid Rail Vehicle and Systems Program, the Boeing Vertol Company is supervising the design, fabrication and testing of two new State-of-the-Art Cars (SOAC) with the objective of demonstrating the current state-of-the-art in rail rapid transit vehicle technology. Passenger convenience and operating efficiency are primary goals for the cars. Built by the St. Louis Car Division of General Steel Industries, the SOAC features a DC-DC chopper in the propulsion system, separately excited DC traction motors, all-steel construction (with molded fiberglass

ends), and vandal-resistant and fire-retardant materials in the interior. This volume, Volume 1 of a two-volume report, covers the development program through engineering testing; including data on design and performance, propulsion and braking, subsystems, test program, mockup and demonstration programs, and economic analysis. Volume 2 will report on operational tests and evaluations to be performed in revenue service in New York, Boston, Cleveland, Chicago and Philadelphia.

Boeing Vertol Company, (D174-10031-1) Final Rpt. UMTA-IT-06-0026-74-1, Apr. 1974, 182 pp; DOT-UT-10007; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-235703

13 263162 BASIC PRINCIPLES AND GUIDE LINES FOR THE PLANNING AND CONSTRUCTION OF S-BAHN SYSTEMS. The integrated transport service is described toward which the planning and development of the S-Bahn Systems of large cities are oriented. In a review of the basic principles and guide lines for the planning and construction of S-Bahn systems, details are given of network models interchange facilities and location of stations. The special cases of monocentric and polycentric city regions are discussed. The alignment principles of horizontal and vertical alignment are set forth. In the design of platforms, the constituent parts should be designed and harmonized such that they comply with the operating requirements for short station stops of the S-Bahn trains, as well as with certain comfort criteria affecting passengers. The arrangement of the platforms and platform dimensions are discussed. The arrangement of platform entrances, facilities to overcome differences in level, and the width of access facilities are described. Weather protection, and passenger handling facilities are other aspects reviewed. Details are given of design criteria for tunnel sections and interchange stations. In a discussion of technical equipment for the automation of S-Bahn operation, consideration is given to basic technical equipment, continuous automatic train running control, computer control and train monitoring. A review of S-Bahn projects already realized of under construction, include systems in Munich, Hamburg and Frankfurt-on-Main. Construction methods for S-Bahn tunnels are discussed. conclusions based on the report are presented. The improvement of the quality of local public transport requires capital investment which the transport undertaking is often not able to sustain on its own. The success of a transport community if dependent on the systematic and intensified expansion of rapid transit networks in connection with high capacity park-and-ride facilities. Urban and regional transport plans should be continually harmonized with the land use and urban development plans.

13 264627 WHEEL/RAIL NOISE AND VIBRATION CONTROL. Reported here are the interim results of a program under the UMTA Urban Rail Supporting Technology Program to develop a basic understanding of urban transit wheel/rail noise generation for application to the evaluation and improvement of wheel/rail noise control devices. The report critically reviews existing analytic models and related experimental

findings for the wheel/rail dynamic system and for the three categories of wheel/rail noise generation: squeal, impact, and roar. The limitations found result in recommendations for the remaining work required. A compilation is presented of existing or promising wheel/rail noise control devices, their acoustic and nonacoustic effects. The relative severity of the three noise categories is compared by examining wayside noise data from numerous transit systems and railroads around the world, and by using a scale recommended here for rating urban transit wheel/rail noise, i.e., the peak A-weighted sound pressure level to which the receiver of interest is exposed. Squeal produces the most annoying noises followed closely by impact and roar. Lastly, methodology is presented for assessing the non-acoustic performance of wheel/rail noise control devices. The method is applied to an example in which it is assumed that resilient wheels are installed on all New York City Transit Authority cars.

13 267028 WABCO DATA ACQUISITION SYSTEM AC PROPULSION PROJECT. In June 1971, the Cleveland Transit System received a grant contract (Project OH-06-0006) from the Department of Transportation's Urban Mass Transportation Administration to test and evaluate on three rapid cars an AC propulsion system developed by the Westinghouse Air Brake Company (WABCO). The AC propulsion system incorporates a pulse width modulated inverter to convert constant voltage DC energy to variable frequency, variable voltage AC energy which in turn powers simple AC traction motors. This report describes the data acquisition system which was developed to measure, record and analyze performance data for the AC-powered rapid transit cars. This report is one of a series on various aspects of the project.

13 291117 RAIL VEHICLES FOR URBAN AND UNDERGROUND SERVICE. The paper briefly describes the commuter situation in most great cities of the world today, and gives some background as to why the situation has arisen. The basic elements of train movement are briefly considered with special reference to urban and suburban traffic, and the salient requirements from this are combined with other electrical, mechanical, and passenger amenity features to form a picture of the general requirements for this type of stock. Examples are given of modern stock designed to meet the requirements. The new high-density stock of British railways is described and reference is made to the London Transport Victoria Line stock with particular reference to

automatic train operation. Short descriptions are then given of north American practices, followed by a brief review of European developments. From these examples a general similarity in design emerges which very adequately meets the requirements of the commuter problem, and it is suggested by the author that an urban railway system in conjunction with other forms of street transport can provide a suitable overall solution to this modern and increasing problem. /TRRL/ Jowett, WG (British Railways Board) *Institution of Mechanical Engineers Proceedings* Proceeding Vol. 184 No. 3S, pp 1-19, 14 Fig., 2 Tab., 8 Phot., 4 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 203062)

13 300571 ROLLING STOCK FOR MASS TRANSPORT [Materiale rotabile per trasporti rapidi di massa]. For the rail systems which represent the supporting element of the transport system in metropolitan areas, the rolling stock, with rare exceptions, is obsolete and causes dissatisfaction on the part of the users, giving rise to high operating costs. From this there arises the necessity for modernization, which essentially represents a problem of financing. The technical evolution of rail stock, today very rapid, must take account of traction requirements; of great significance was the introduction of electronics and the use of lightweight structures. For the means destined for commuter services, the deep comparison between the diverse possible solutions has made it possible to perfect a type of railcar with the body in light alloy and chopper equipment, characterized by a considerable flexibility of use and economical operation. A description of the new type of car, its design and mechanical and electronic equipment, is presented. [Italian]

13 300579 IMPROVING PERFORMANCE IN RAPID TRANSIT SYSTEMS. Recognized reliability and maintainability techniques, developed by the aerospace industry, have been modified for application to the rapid transit industry. From the evaluation of existing and proposed transit systems, it is evident that through the application of design techniques and operating strategies, the Operational Dependability can be significantly increased. Quantum improvements in the state-of-the-art are not required. However, increased cooperation between manufacturers, designers, and those responsible for specification

preparation is necessary. Also, through better defined programs, more extensive testing, and inclusion of other techniques such as derating and redundancy, we should be able to provide the public with a more dependable, safe transit system while enabling the properties to maintain and operate the system more effectively.

13 300617 PROCEDURE FOR THE OPTIMAL DISTRIBUTION OF ELECTRIC POWER (PROMETHEE) FOR THE METRO AT A FIXED LEVEL [Procedure de repartition optimale, pour le metro, a un horizon fixe, de l'energie electrique (PROMETHEE)]. An interactive system is described which is part of a more comprehensive process for managing the power supply system of the metro. Using a generator of feasible "line-assignments" the problem is formulated as a bivalent (0.1) linear program. To solve it, two approaches were successively studied. The first uses both linear programming and branch and bound (PSES). The second, by relaxing some constraints, combines a decomposition method of Dantzig and Wolfe with a subgradient method. The results obtained show a substantial improvement in the objective function which has been retained as representative of the cost of mean and long range planning. [French]

13 300619 FAILURE DATA ANALYSIS FOR TRANSIT VEHICLES. This paper describes an effort to create a data base for the reliability of transit vehicles and their components. Failure data on approximately 500 subway cars, 400 streetcars and 1100 buses was obtained from the Toronto Transit Commission. The results of the analysis of this data are summarized in this paper and reference to more detailed information is provided.

Singh, C (Ontario Ministry of Transportation & Communic, Can) ; Institute of Electrical and Electronics Engineers Conf Paper IEEE 79CH1429-OR, 1979, pp 308-313, 6 Ref.; Proceedings of the Annual Reliability and Maintainability Symposium, Washington, D.C., January 23-25, 1979.; ACKNOWLEDGMENT: EI; ORDER FROM: IEEE

13 300620 DETERMINATION OF TRANSIT SYSTEM DEPENDABILITY. This paper develops a passenger-based technique to calculate the overall system dependability (or, equivalently, system availability) of a rail rapid transit system, and demonstrates the technique by means of a numerical example, based on an actual transit system. The technique uses as dependability the proportion of passengers who complete their trip with no delay greater than a given tolerance limit, and takes into account dwell and blockage delays, operating policies in response to an incident, and passenger flow rates. The resulting technique is intended to tie together the various concepts of reliability, maintainability, failure modes and effects, etc., into a single measure of system performance.

13 300737 SINGLE-STEP AC MOTOR/INVERTER SYSTEM FOR RAPID TRANSIT VEHICLES. The paper describes the problems connected with a single-step inverter system for three-phase ac drives of tramcar units. The inverter is directly connected to the contact line and controls both the output frequency and the voltage. The most essential components of the drive are described: basic circuit configuration, traction motor, control scheme and circuit diagram of inverter. The drive operates without any contacts. The motor is controlled for the optimum rotor frequency and well utilised. Reducing the number of components, space requirements and weight of the inverter presents the main problem in the further development of the drive system. [German]

13 301201 PROTECTING STREETCAR ELECTRIC EQUIPMENT AGAINST OVERVOLTAGES. In recent years the Kalinin Lenin-grad Polytechnical Institute (LPI) has investigated internal overvoltages for the electric equipment of electric rolling stock. Some results of this research obtained for the type LM-57 car are given. The measurements were carried out by means of an automatic internal-overvoltage recorder. It is shown that overvoltages with amplitudes 2.1 KV (more than the operating test voltage) may be expected to occur more than 60 times a year in the power circuit of a streetcar protected by conventional type RMVU-0.55 arrestors; thus, nonlinear-resistance arrestors with improved characteristics must be developed and placed into service.

13 301307 EFFECT OF VARYING LIGHT-RAIL DESIGN STANDARDS. Light-rail transit (LRT) is a flexible transit mode that can be implemented in a variety of ways. This complicates the task of comparing it with other modes when carrying out the alternatives analysis required by the Urban Mass Transportation Administration to secure federal funding for fixed-guideway transit projects. A recent study for Santa Clara County, California, dealt with this problem by evaluating four possible variations in LRT design standards. This paper draws on the results of that study. It features a description of the study area and site conditions, a definition of the four LRT design standards considered, analysis of the different capital costs associated with each design standard, a discussion of the range of estimates of expected patronage, and a review of the resulting operating requirements and costs. The paper then presents a detailed comparison of the cumulative impact of these design differences on the cost-effectiveness

measures for the bus alternatives that were also analyzed in the Santa Clara County study. It was found that, while capital cost for LRT can vary significantly according to the assumed design standard, the cost-effectiveness measures for the bus alternatives that were also analyzed in the Santa Clara County study. It was found that, while capital costs for LRT can vary significantly according to the assumed design standard, the cost-effectiveness is primarily dependent on other factors. It is therefore concluded that alternatives analysis requires the study of only one LRT design standard to establish the relative advantages and disadvantages of transit mode alternatives for a given metropolitan area. /Authors/

13 301320 THE DESIGN OF LIGHT-RAIL TRACK IN PAVEMENT. Many existing light-rail transit (LRT) networks and parts of some new ones require the construction of track in pavement. Sometimes this track is intended for joint use with street traffic or buses; in other places paved track is used in pedestrian areas or on medians. This paper describes the types of LRT track used in pavement in North America and Europe and suggests that the standards now in use in the United States may be in need of revision. There has been very little construction of LRT track in pavement in North America in the last 40 years. What little has been built has followed the traditional standards of the industry, which date from the earliest streetcar days, and has generally used girder rail, ties, and ballast set in concrete pavement. By contrast, most European LRT systems have adopted a basically different type of track for use in pavement. It is built without conventional ties and is mechanically separated from the street pavement structure. Such track is quieter and may also be less costly; it appears to warrant serious consideration for new U.S. installations. /Author/

13 301321 APPLICATION OF LIGHT-RAIL TRANSIT VEHICLES. Flexibility is the primary concept associated with light-rail transit (LRT). This flexibility includes its application, implementation, operation, and capacity and has clear implications for light-rail vehicle (LRV) design, since the capabilities of a vehicle selected for a specific system must meet the requirements of that system. The thesis of this paper is that all such LRT requirements can be met by a family of vehicle designs based on standardized subsystem componentry. System requirements are dealt with in four categories—capacity, geometry, performance, and impact; the vehicle components include the car-body alternatives; it is shown that the use of single-ended LRVs is desirable whenever system characteristics permit and that articu-

lation is properly used to solve clearance rather than capacity problems. The Toronto Transit Commission's ordering of new LRVs is used to illustrate the process of selecting vehicle attributes that meet the system requirements and the process of moving from a definition of desirable vehicle characteristics through development and testing to car delivery. The ability to derive several vehicle designs from the basic design is discussed in the context of ongoing development activities in order to prove the feasibility of the family-of-vehicles idea. /Author/

13 301322 POWER SUPPLY FOR LIGHT-RAIL AND RAPID TRANSIT SYSTEMS IN GERMANY. The purpose of this paper is to define the present state of the art in the design of the power supply for light-rail and rapid transit systems in Germany. The scope includes the incoming alternating-current switchgear, rectifier direct-current switchgear, catenary, and third-rail systems, as well as the breaker on the light-rail vehicle. Attention is paid to the problems of coordinating the various components of standard design and of dealing with corrosion due to the leakage of current from the power supply. Experiences with various catenary designs and their interconnections in Germany are also described. This paper is limited to experience in Germany, and the underlying design criteria are based on German electrical regulations. Since the implementation and reliability of power supply for light-rail and rapid transit systems in Germany are considered to be highly successful, the data, views, and experience presented in this paper should be of interest in North America. /Author/

13 301323 TECHNOLOGY AND ECONOMICS OF REGENERATION FOR LIGHT-RAIL APPLICATIONS. Regeneration is one method of recycling a vehicle's surplus kinetic energy during braking. Regeneration is recuperative braking in which the recycled energy goes back to the vehicles' power supply system for use by other vehicles. Several propulsion systems that use regenerative braking have been applied and operated on direct-current electrified rail systems. The fundamental limitations on effectiveness that are beyond the propulsion designer's control are considered. The performance of an alternating-current induction motor system with an inverter and a direct-current series motor system with a chopper are explored to illustrate the present state of technology. Comparison is made with two other types of recuperative braking—flywheel energy storage and height changes in the route profile. The inefficiency of the former and the difficulty of construction of the latter are

noted. The industry's present interest in regeneration is questioned since it would have minimal economic impact but require complex propulsion hardware and extra maintenance costs. /Author/ Vutz, N (Klauder (Louis T) and Associates) *Transportation Research Board Special Report Conf Paper No. 182, 1978, pp 149-160, 15 Fig., 4 Ref.*; This paper appeared in TRB Special Report No. 182, Light-Rail Transit: Planning and Technology.; ORDER FROM: TRB Publications Off

13 301328 SOPHISTICATION AND COMPLEXITY VERSUS ECONOMY: THE PROBLEM OF GOLD-PLATING. Workshop participants noted the many mistakes made in the past decade in light-rail transit (LRT) and rapid transit planning and design that can be attributed to gold-plating (i.e. spending more than is needed to do the job). It was not quite apparent who was responsible for these mistakes. Although advances in LRT are desirable, the problem is in determining which advances are necessary and are cost-effective. It is noted that overdesign is often introduced early in the planning stages when system designs for civil engineering, railroad or rapid transit power supply, signalling, and fare collection are being selected. Experiences with LRT in Buffalo are quoted. Signaling was discussed and it was noted it would soon be possible to compare many aspects of actual systems in Canada and the U.S. Overdesign was discussed with respect to portions of Muni, the Washington Metro, and the Los Angeles proposals for rapid transit. Comments were also made on chopper control and power collection by means of pantographs or trolley poles.

13 301422 REDUCTION OF ENERGY REQUIREMENTS WITH REGENERATIVE BRAKING ON ELECTRIC VEHICLES [Energiebedarfssenkung durch Nutzbremsen bei Elektrofahrzeugen]. Comparative appraisals for different types of vehicles show that some 20 to 50% of energy can be saved by regenerative braking on railway vehicles in short-distance traffic. On the other hand, in the case of road vehicles, the energy saving is only 5 to 25% because of the higher resistance to forward motion of pneumatic tyres. [German]

13 301607 PARAMETRIC ANALYSIS: A SKETCH-PLANNING TOOL. An analytical procedure to conduct sketch-planning analysis for exclusive transit facilities and its application in the Jacksonville, Florida, metropolitan area are described. Unlike detailed testing, in which the objective is to select a single recommended transportation scheme, the sketch-planning technique only screens alternatives to identify candidate transportation systems for more detailed testing. The method suggested for assessing the feasibility of rapid transit is termed parametric

analysis and generally conforms to the transportation planning process currently used throughout the nation. Two major differences are that the parametric analysis is usually conducted at a larger-than-zonal scale and, instead of computing a single modal split, assumes various transit capture rates. In addition, each transit technology is specified in terms of performance parameters such as minimum headways, speeds, and unit costs. The consequences for patronage, revenue, and cost can be determined for each capture rate and test situation, and thus the feasibility of exclusive transit facilities can be assessed. Parametric analysis provides a useful, cost-effective procedure for conducting rapid transit sketch planning. /Author/

13 301831 FIRST LINE OF ATLANTA'S NEW TRANSIT SYSTEM OPENS. With lessons learned from San Francisco and Washington, D. C., Atlanta hopes to avoid some of the problems encountered by those cities in building and operating its new transit system. The first line of that system, known as MARTA for Metropolitan Atlanta Rapid Transit Authority, opens for passengers this month. When complete, the system will encompass 53 miles of rail line and 8 miles of busways served by 41 passenger stations. It is expected to provide some relief against a gasoline-starved transportation future; it will also help to revitalize parts of the deteriorating center city. Covered are facts about the subway section, elevated structures, trackwork, stations and the unique organization that designed and is building the system. Also, a sidebar article on restructuring the urban environment by planning the development of station sites is by Paul E. Potter, who worked as assistant director of design for general consultant Parsons Brinckerhoff/Tudor.

13 301848 SIEMENS/DUEWAG H-BAHN SYSTEM. The design and operation of a high-level narrow slotted box beam rapid transit system using suspended vehicles of various sizes is discussed. The elevated beam guidance arrangement can be quickly erected but is usually best suited to modern surroundings as it is visually intrusive. Box section track beams provide a

protective envelope for the traction equipment, running surfaces and points. Support columns are needed at 30 M intervals on straight and 20 M intervals at curves and points. Vehicle sizes can vary from small 8 seater cabins to articulated vehicles with room for 50 seated and 152 standing passengers. The vehicles are controlled automatically at three levels. Vehicle headways, speeds and point operations are monitored at the safety level; traffic control level uses station computers and data transfer equipment between stations. The operations control level serves the system as a whole, monitoring the technical equipment and providing communications with vehicles.

13 302383 THE RIO DE JANEIRO SUBWAY SYSTEM-A CASE STUDY IN APPLYING THEORY TO PRACTICE. A case study of translation of theoretical developments (Friedman, 1975; 1976) to implementation procedures is outlined with specific reference to the Rio de Janeiro subway system. Within the overall framework of establishing the time schedule of trips of a single line that minimizes the average waiting time of passengers with possible generalization and extension to multi-line network, the present manuscript has the limited aim of developing a time table and determining the minimal number of trains required to keep up a given schedule of trips of a single line. The incorporation of a new ad-hoc procedure of "inclusion and exclusion trips" to and from an intermediate regulating station is a novel feature not included in the original Friedman model. This supplement characterizes an important physical attribute of the Rio de Janeiro system, namely, the limited train storage capacity at the terminal stations which is offset by virtual unlimited storage capacity at the intermediate regulating station. The case study has generated a procedure for creation and manipulation of large data bases in real life applications encountering practical constraints using a theoretically sound set of efficient algorithms.

13 302718 THE MASS TRANSIT EQUIPMENT SECTOR IN ONTARIO AND QUEBEC. The domestic mass transit equipment sector can best thrive by penetrating international markets. In order to be competitive in this market place, national consortia will have to be formed. This can only come about if the Federal government is willing to aid in the formation of national consortia, along with vehicle producers, transit operators, labour, consultants and other relevant interests. This conclusion is based on a detailed examination of the interests, problems and prospects for the equipment sector within Canada, North America and international markets. The study is divided into five parts. Part One presents an overview of the sector, identifying supplier-operator relationships and government involvement. Part Two discusses the roles of research and development in the sector. Part Three elaborates on the current state of the sector in Canada, including information from The Urban Transportation Equipment Industry in Canada, published by the Federal Department of Industry, Trade and Commerce. Part Four presents a range of strategies that the sector could adopt in marketing their products. All are based on collaborative actions by the interests that form the sector. Part Five provides a brief summary on the study. The appendix presents the results of the two surveys, notes on the one day seminar held on October 6, 1978; a copy of the transit property questionnaire and the bibliography.

13 303255 SIGNAL INTERFERENCE EFFECTS WITH CHOPPER CONTROLLED TRACTION. Rapid transit and commuter services operated with direct current usually have ac signaling systems that can be adversely affected by chopper propulsion controls that permit regeneration and reduce power consumption. Magnetic or conductive interference mechanisms are now well understood and it should be possible to write a specification that meets signal requirements without excessive increases in costs of propulsion equipment on the train. Tests by London Transport confirm that the solution lies

in specifying an adequate input filter, together with fail-safe control and monitoring of frequencies generated by the chopper.

13 303581 BART: THE ROAD IS STILL BUMPY, BUT THE GOAL IS IN SIGHT. While its most protracted labor dispute was taking place, Bay Area Rapid Transit was actively working to improve reliability, safety and capacity. In the wake of its tunnel fire, BART is investigating new types of seat upholstery and ways to inhibit the spread of flames and smoke in its cars and tunnels. Improvements in brake and traction components are to increase car availability. A Sequential Occupancy Release System is to supplement the original automatic train control to permit closer headways and cab signals will permit full-speed operation in cases of some central control failures. Fare gates are also being improved. Ahead will be additional track capacity and new computers which will be adjuncts to a completely new control system.

Middleton, WD, Consulting Editor *Railway Age* Vol. 180 No. 21, Nov. 1979, p 28, 4 Phot.; ORDER FROM: ESL

13 303656 BRITAIN'S MOST UNUSUAL METRO NEARS COMPLETION. The public transport system nearing completion in the United Kingdom's northeast capital of Newcastle-on-Tyne is described. The design features a rapid transit light rail system using electrical-powered Supertrams.

13 303859 ENERGY CONSUMPTION OF RAIL RAPID TRANSIT: AN ANALYSIS OF THE BART EXPERIENCE. This paper documents and analyzes the operating energy consumption of the San Francisco Bay Area's new rapid-transit system; it briefly compares BART's energy consumption with that of other rail rapid-transit systems and includes a partial analysis of energy consumption of BART, bus, and automobile in one travel corridor of the Bay Area using recent data on actual passenger volumes. Components of operating energy in BART that are considered are: station energy, maintenance energy, and traction energy. Basic conclusions are: in terms of energy consumed per seat-mile provided, BART is less fuel-efficient than bus but much more efficient than automobile; and in a major travel corridor of the Bay Area where much of BART's ridership come from buses, where automobile occupancy is high, and where BART's load factors in the peak period/reverse direction and off-peak are low, the actual energy savings due to BART are much smaller than the potential. And if the many new trips apparently induced by BART are taken into account, the net energy savings may be negligible.

13 303860 PUBLIC TRANSPORTATION: PATH AS AN EXAMPLE. The PATH rail-transit system (Port Authority Trans-Hudson system) is a 14-mile long, 70-year old heavy rail rapid-transit system operating in the New York Metropolitan area. The operational and technological programs to conserve energy in the last few years are described. The paper first concentrates on PATH itself, based largely on propulsion energy and utilization of the system. The second part reflects regional perspectives. PATH's primary energy source is electricity. Only insignificant amounts of other energy are consumed, primarily space heating at various maintenance facilities or for use in various vehicles operated by PATH. Data are sparse that identify the energy effectiveness of other rail-transit systems for peak versus off-peak services; but with some data, comparisons are made with PATH performance-other systems in the Northeast and some foreign systems. The simplest and quickest way to improve rail-transit's Btu-per-passenger-mile effectiveness is to adopt policies that would increase its utilization, the author says.

13 304078 STATIONARY FLYWHEEL ENERGY STORAGE SYSTEM SSB. The study investigates whether the braking energy expended on the projected down-grade tunnel section of the Stuttgart Stadtbahn can be economically rewon by means of a stationary flywheel storage system. A design concept was drawn up for a low-loss large flywheel store of up to 25 Mg rotating mass and the service life of forged steel flywheels investigated. The final design resulted in a system with a 5 Mg flywheel and field rheostat controlled dc motor as an electromechanical converter. Study of the energy flux ratios in the light railroad power network revealed that 680 MWh of electrical energy could be saved annually. Plant costs (without conversion) for a tested plant would amount to DM 962,000. With savings in power costs of 80,000 to DM 100,000 per year and depending on interest rates and on rates of increase in electrical current price the plant would be amortized in 12 to 22 years compared to an expected service life of more than 30 years. 13 304675 ENERGY STORAGE PROPULSION SYSTEM FOR RAPID TRANSIT CARS. TEST RESULTS AND SYSTEM EVALUATION. The principal objectives of this test program were to evaluate the ability of the Energy Storage (ES) System to: reduce propulsion energy usage; reduce propulsion power demands; and reduce tunnel heating caused by

propulsion energy use. This report describes the test and evaluation of the ES system for rapid transit cars. The characteristics of the system were investigated in the real world by installing the novel equipment under two New York City subway cars and operating the cars both under test track conditions and in revenue service on several lines of the New York City Transit System. Tunnel heating effects, power reduction, gyroscopic forces, and other characteristics were investigated and evaluated. Overall propulsion energy reductions of 14-26%, as compared with conventional equipment, were measured in revenue service operations. Further reductions should be attainable by this system, if improvements derived from this test program were to be incorporated into the equipment and control configuration. The authors state that the equipment tested under the two R-32 cars demonstrated that on-board flywheel energy storage is an impressive means for achieving major savings in transit car propulsion energy. Part II of this report describes the methods for applying the energy conservation data to rapid transit systems other than New York's. Appendixes are provided which give specific information on the New York subway routes and on the instrumentation used.

13 304686 PROCEEDINGS OF THE UMTA R AND D PRIORITIES CONFERENCE (3RD) HELD AT CAMBRIDGE, MA., ON NOVEMBER 16-17, 1978. VOLUME VI: RAIL AND CONSTRUCTION TECHNOLOGY WORKSHOPS. The document is a compilation of material that was presented at the Third UMTA R&D Priorities Conference Workshops on Rail and Construction Technology. Part I deals with railcars and equipment and includes discussions of the rail technology R&D program, the rail system studies of the Congressional Office of Technology Assessment, and the problems connected with technology deployment. Part II, construction technologies, includes discussions of construction technologies and costs and the transit industry's views of UMTA's R&D program in this area. This volume contains five resource papers which can be found summarized in Volume I of this report along with summaries of other workshop sessions. Volume I also includes the proceedings of the general sessions and a listing of conference participants.

13 304697 SLRV (STANDARD LIGHT RAIL VEHICLE) ENGINEERING TESTS AT DEPARTMENT OF TRANSPORTATION, TRANSPORTATION TEST CENTER. FINAL TEST REPORT. VOLUME I-INTRODUCTION. The Standard Light Rail Vehicle (SLRV) is a 71-foot vehicle, articulated to negotiate curves down to 32-foot radius and designed to operate at speeds up to 50 mph. Although the basic configuration and performance is standardized, the current operating properties (Massachusetts Bay Transportation Authority and San Francisco Municipal Railway) have specified individual requirements for auxiliary equipment and passenger accommodation. Engineering testing on the SLRV was conducted by the Boeing Vertol Company at the Transportation Test Center in Pueblo, Colorado in accordance with the General Vehicle Test Plans (GSP-064), which are designed to provide the data necessary for quantitative comparison of different transit cars. This report presents the results of the series of tests conducted. The general objective of the test program was to establish a data baseline for the SLRV obtained in accordance with the General Vehicle Test Plans and to provide further experience in the use of the Test Plans in testing urban rail vehicles. Volume I contains a description of the SLRV Test Program and the vehicle, and a summary of the test results.

13 304707 URBAN RAPID RAIL VEHICLE AND SYSTEMS PROGRAM. ANNUAL REPORT. The report reviews the seventh year's efforts of the Urban Mass Transportation Admin-

istration (UMTA) Urban Rail Vehicle and Systems Program. It describes the work accomplished and summarizes pertinent technical and design data. The objective of the Program is to enhance the attractiveness of rail rapid transit to the urban traveler by providing him with transit vehicles that are as comfortable, reliable, safe, and economical as possible. Three major hardware tasks were active during this reporting period, namely: the State-of-the-Art Cars (SOAC), the Advanced Concept Train (ACT-1), and the Advanced Subsystem Development Program (ASD).

13 305826 INTERACTION BETWEEN NORTHEAST CORRIDOR ELECTRIFICATION PLANS AND SEPTA/NJDOT COMMUTER RAIL SERVICES. The report examines the effects on SEPTA and NJDOT commuter rail operations of NECIP plans to change the NEC electrification system from 11 kv/25 hz to 25 kv/60 Hz and to add catenary phase breaks every six to eight miles. Under the proposed NECIP plan, branch lines would remain at 11 kv/25 Hz. Commuter trains operating over the 25 kv/60 Hz system would require the addition of phase-break negotiating apparatus. Those operating on the branch lines as well would also require, automatic voltage changeover apparatus. Automatic train control would be required on all trains operating on the NEC. For the SEPTA system, most of the electrification would remain at 11 kv/25 Hz. However, trains providing service to Trenton, Wilmington and Chestnut Hill West would require the ability at both 11kv and 25 kv. At a minimum, the 232 Silverliner IV cars should be modified for dual-voltage operation.

13 305884 PROCEEDINGS OF THE URBAN RAIL VEHICLE CRASHWORTHINESS WORKSHOP HELD AT CAMBRIDGE, MASSACHUSETTS ON APRIL 13-14, 1978. The first part of the document contains the research activities presented by the Calspan Corporation, Boeing Vertol Company, and Illinois Institute of Technology Research Institute; transit authority experience by Metropolitan Transportation Authority (MTA) of New York, Chicago Transit Authority (CTA), Metropolitan Atlanta Rapid Transit Authority (MARTA), and New York City Transit Authority (NYCTA); and the manufacturing industry experience by the Budd Company, Franco-Belge (France), and Boeing Vertol. The second part contains the proceedings from the two workshops, namely, crashworthiness and rail car design and test and evaluation; and the concluding remarks from the Office of Safety and Product Qualification (UMTA), and from the Transit Systems Branch (TSC). The major recommendations from the group fall into two categories: (1) The need for

(industry-wide) vehicle design engineering guidelines including structural criteria and passenger compartment criteria; and (2) The need for validating these criteria through programs of test and evaluation.

13 305891 IN-SERVICE PERFORMANCE AND COSTS OF METHODS TO CONTROL URBAN RAIL SYSTEM NOISE. This study evaluates the acoustic and economic effectiveness of five methods of controlling wheel/rail noise and vibration on urban rail transit systems, namely: rail grinding, wheel truing, resilient wheels, ring-damped wheels, and welded vs. jointed rail. The noise reduction methods were tested under revenue operation conditions on the Market-Frankford Line of the Southeastern Pennsylvania Transit Authority rail transit system. In addition to the evaluation of these noise control methods, the study included an economic analysis of the long and short term costs of the control methods if implemented on typical U.S. urban rail systems. Life-cycle cost equations were developed for the control methods. This report summarizes noise, vibration, and cost results and compares the measurement results with similar studies.

13 308443 AUTOMATIC DATA ACQUISITION AND PROCESSING OF TRAIN DECELERATION FOR RAPID TRANSIT TRAIN SYSTEMS. A microprocessor-based computer system has been developed for the dedicated acquisition of data associated with the deceleration characteristics of trains in a rapid transit system. The computer collects braking profiles (velocity and position) along a 4325-ft. section of track prior to station entry, at one-foot intervals. These data, occupying a volume of about 8K bytes per train, are stored on tape and transmitted to a remote microprocessor during

non-revenue periods. The remote computer archives these data, and performs data reduction and analysis. Results are useful as a monitor of braking performance, and enable a statistical inference of braking distances under various ambient and train-related conditions.

13 309885 PROBLEMS CONFRONTING U.S. URBAN RAILCAR MANUFACTURERS IN THE INTERNATIONAL MARKET. Five of nine urban railcar orders partially funded by the Urban Mass Transportation Administration were awarded to foreign firms during 1976-78. Foreign competition entering the U.S. railcar market has raised concerns about whether U.S. firms can compete and has prompted one U.S. firm to commission Gordian Associates Incorporated to study the issue. GAO reviewed the study's findings at the request of the Chairman, Subcommittee on Transportation and Related Agencies, Senate Committee on Appropriations. GAO found that U.S. firms submitted acceptable bids on only two of the five orders awarded to foreign firms. GAO agrees with Gordian that railcar markets in Europe, Japan, and Canada are closed to U.S. railcar firms and that, before a "Buy America" provision was included in recent transit legislation, the U.S. urban railcar market was open. GAO does not believe the study demonstrated that U.S. firms are at a competitive disadvantage.

13 309954 WASHINGTON'S METRO IS THE SOLID-GOLD CADILLAC OF MASS TRANSIT. Citing overdesign and planning mistakes, the author points out that the Washington Metro's capital cost of \$7.2 billion exceeds that of the five other systems under construction in the U.S. in the 1970s and has ended up with a disproportionate share of federal mass-transit funds. The processes of benefit-cost analysis and alternatives analysis are discussed with reference to the Washington situation. Effects of political pressures are also described.

13 310635 DOOR LOCKING SYSTEM FOR PASSENGER COACHES. Locking of passenger coach doors against inadvertent or intentional opening during running has been decisively improved during recent years. The most important improvement involves the introduction of an electromagnetic door locking system which has been installed as a standard feature on rapid transit vehicles since 1971 and on express train coaches since 1976. Retrofitting programmes for older coaches are presently under way in combination with a centralised door closing facility, this system affords an almost absolute protection of the passenger against falling from a running train. Following an introductory analysis of the causes of accidents and a description of previous safety precautions, the paper describes the design and performance of the electromagnetic door locking system for double hinged doors and hinged sliding doors. [German]

13 310668 OPTIMIZATION OF POWER CONSUMPTION BY ELECTRIC TRANSPORT VEHICLES; CONTRIBUTION TO ON-BOARD INSTRUMENTATION IMPROVEMENT [Ottimalizzazione del consumo energetico nei trasporti elettrici: contributo al miglioramento della strumentazione di bordo]. The present trend towards a reduction of power consumption and research problems involved to rationalize power consumption by city electric transportation vehicles are considered. An analysis of vehicles under different conditions of movement and a comparison of different vehicles to select those best suited for specific utilization is briefly outlined. During the first phase of research, effort was centered on the design of power meters that would be best suited for installation on board vehicles and be sufficiently precise. The use of a microprocessor to arrive at a solution to this problem is described and results are summed up. [Italian]

13 310684 RAPID TRANSIT AND THREE-PHASE DRIVES. PROBLEMS, WISHES, POSSIBILITIES [Nahverkehr und Drehstromantriebe--Aufgaben, Wuensche, Moeglichkeiten]. DC operated vehicles and multiple units dominate in rapid transit systems. Traction motors with commutator are controlled either conventionally by resistors, which can be switched off step-by-step, or by electronic thyristor-choppers. The technical development now tends to three-phase traction motors. This step offers many advantages, for example economies in energy consumption and maintenance. The new traction technique, at present, offers many positive possibilities in vehicle production which cannot be fully appraised yet. The same applies to the interaction of vehicle techniques and the environment. [German]

13 310686 ELECTRIC TECHNOLOGY FOR URBAN RAPID TRANSIT SYSTEMS [Elektrotechnik fuer S-Bahnen]. Urban rapid transit systems are characterized by such quality factors as rigid timetables, short intervals between two stops and high speed. Electrical engineering with its application fields, electric drives and controls, energy supply, protection of train running and train control has contributed most towards realizing these goals. The role of electrical engineering in this field in the past as well as in the future is discussed. [German]

Gladigau, R *Elektrische Bahnen* Vol. 77 No. 6, June 1979, pp 180-182; Also covered in Volume 77 No. 7, July 1979 issue, pages 209-211.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

13 310688 MASS PRODUCED NEW SUBWAY TWIN MOTOR COACHES FOR THE BERLIN TRANSPORTATION SERVICE [Die neuen U-Bahn-Doppeltriebwagen in Serienaufuehrung fuer die Berliner Verkehrsbetriebe]. After trial runs of four prototype twin multiple units for the underground line, the design was remodelled and in 1978 the production of the first series was started. The operational trial runs confirmed the total concept of the electric multiple unit. Therefore only a small number of alterations of the series version has been necessary in relation to the prototype version. [German]

13 311020 OVERHEAD URBAN-SUBURBAN TRANSPORT SYSTEMS. NOISE FACTOR AND THE REACTION OF LOCAL RESIDENTS [Nahverkehrssysteme in Hochlage. Geraeuschsituation und deren Beurteilung durch die Anlieger]. For reasons of security, high commercial speed and popularity, an effort is always made to put short distance railway passenger traffic on track without crossings. In urban

areas an uninterrupted track can only exist in a tunnel or on an overhead bridge support system. The overhead line is cheaper but could have adverse effects on the environment and the inhabitants because of the greater noise level. The reactions of residents to the overhead railway are studied here: how the noise nuisance affects them, how they judge it and what factors influence their judgment. [German]

13 311049 NEW APPLICATIONS OF THE TELOC-E ELECTRONIC SPEED MEASURING SYSTEM. A new range of equipment derived from the Teloc-E speed measuring systems, operates on a mixed digital-analog principle. These hybrid systems are particularly suitable for applications where the requirements are less exacting as regards the number of functions that have to be performed. Up to now they have mainly been employed for underground railways. Since these are usually equipped with automatic train control, the concept of the Hasler equipment has to be matched to the automatic system of the train in each case.

13 311072 ELECTRIC LOCOMOTIVES, SUBURBAN TRAINS AND UNDERGROUND TRAINS. This paper recounts ASEA (Allmanna Svenska Elektriska Aktiebolaget) development of electric rail vehicles up to the modern thyristor-controlled locomotives, suburban trains, underground trains and trams. Extensive tests to evaluate the energy savings of a chopper car compared to a resistor controlled car under the same conditions have been run by Melbourne and Metropolitan Tramways Board, MMTB, during 1977. These tests demonstrated that a properly designed chopper car with the ASEA system for regenerative braking may consume nearly 40% less energy than equivalent conventional cars in normal revenue service. By applying modern technology and calculation methods to the design of rail vehicles it has been possible to supply the rail transportation industry with safe and energy-efficient high-performance-vehicles with improved ride and reduced maintenance.

13 312085 CONTRACTOR MEETS CHALLENGE OF CABLING GLASGOW'S UNDERGROUND. Problems encountered in the installation of all cabling for railway traction, signalling and control are described. One contractor, Alex Robertson of Glasgow was responsible for the complete P.S. 2M contract. Work on the renewal and improvement of Glasgow's Underground, originally a cable-hauled system opened in 1896, electrified in 1935 using a 600V DC third rail configuration, began in 1977. Traffic control measures and pedestrianisation have increased the importance of the underground, which carried some 14 million passengers a year in 1977. It forms a key link with other parts of Glasgow's integrated passenger transport system. Trains are scheduled at three minute intervals, when fully operational, with a minimum time of 12 minutes between any two points on the circuit. Because of the small clearances in the tunnel, a computer program was used to calculate the optimum track line and to produce a "kinematic" envelope template which was clamped on to a railcar and used during the contract to check the clearance. Bad working conditions and a tight work schedule are other problems described.

13 312425 MULTIOBJECTIVE TRAJECTORY OPTIMIZATION FOR ELECTRIC TRAINS. A method is developed for generating Pareto efficient trajectories that provide optimal tradeoffs between two conflicting attributes--the total energy consumed and the total time taken to complete each trajectory. Straightforward formulations of the multiobjective optimization problem in these attributes are difficult to solve because of certain nonlinearities in train models and certain constraints on train trajectories. A discrete reformulation is developed to circumvent these difficulties and produce computationally feasible algorithms. The results from the algorithms can be used to develop operating strategies for existing systems and to compare hardware alternatives in planning new systems. An illustration is included.

13 313099 IN-SERVICE PERFORMANCE AND COSTS OF METHODS TO CONTROL URBAN RAIL SYSTEM NOISE. SECOND TEST SERIES REPORT. The goal of the project is to provide sufficient information to allow a transit system with given track and car conditions and budgetary constraints to determine the mix of available noise control methods which will result in the greatest overall benefit. Included in this benefit evaluation is the reduction of noise radiated to adjacent communities and the reduction of patron noise exposure. This project is designed to provide information on both the long-term and short-term costs and effectiveness of various wheel/rail noise abatement procedures if implemented on typical urban rail systems in the United States. This interim report presents the results of the final four phases of a seven-phase test program to determine the acoustic and economic effectiveness of resilient wheels, damped wheels, wheel truing, and rail grinding for reducing wheel/rail noise on urban rail transit systems.

13 313228 PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON ADVANCED PROPULSION SYSTEMS FOR URBAN RAIL VEHICLES, HELD AT WASHINGTON, DC. ON FEBRUARY 5-6, 1980. This conference proceedings report reflects the view that (on the basis of current R&D activities in the area of propulsion system designs) advances in control systems, motor design, thermal control techniques, diagnostics and energy efficient systems are realizable. The conference was structured to serve as a forum for the exchange of information among the various international organizations shaping the future of the industry. This conference report contains the papers prepared by experts around the world--

-Brazil, Finland, France, Germany, Japan, Sweden, United Kingdom, and the United States. The papers were jointly authored by propulsion equipment manufacturers and transit authority personnel to present both designer and user viewpoints toward the propulsion technology. This approach has emphasized the experience of propulsion equipment in the transit environment and presented its effects on transit system performance.

13 313251 ACT-1: URBAN RAPID RAIL VEHICLE AND SYSTEMS PROGRAM. ENGINEERING TEST OF ACT-1 VEHICLE AT TRANSPORTATION TEST CENTER. This document contains a description of the ACT vehicles as delivered to UMTA, including major changes incorporated during testing at the Transit Test Center (TTC), in Pueblo, Colorado, and the rationale for these changes. The test program is described in detail and results are presented for checkout, adjustment, engineering, and acceptance testing of the ACT vehicles. These vehicle tests include: (1) crash attenuation; (2) performance tests, i.e., acceleration, speed regulation, deceleration, power consumption, thermal duty cycle, slip/spin efficiency, ride quality data, and acoustics data. The instrumentation system description is included in the appendix. The test program results in confirmation of significant achievements in vehicle operating efficiency; technology advances in component design and integration; and of considerations for passenger safety, security, and comfort.

Boeing Vertol Company, Urban Mass Transportation Administration Final Rpt. D174-10054-1, UMTA-IT-06-0026-79-6, Dec. 1979, 455 p.; See also PB80-155294; Contract DOT-UT-10007; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-155286

13 313252 ACT-1: ADVANCED CONCEPT TRAIN DEVELOPMENT PROGRAM. SIMULATED DEMONSTRATION TEST REPORT. The Simulated Revenue Service Demonstration at the TTC consisted of two activities, namely: ACT-1 Operation and ACT-1 Maintenance. The simulated transit route was laid out on the UMTA Rail Transit Test Track at TTC--this route is a composite of routes in the originally planned demonstration cities. Every equipment malfunction that occurred was recorded for corrective action in the Vehicle Maintenance Log. The Maintenance Program used to support the ACT-1 cars during the Simulated Revenue Service Demonstration was based on the Maintenance Workbook Items accumulated during the initial test and adjustment running of the vehicles. The report concludes that the Simulated Revenue Service testing of the ACT-1 vehicle at the TTC demonstrated that the ACT-1 cars can be operated consistently with moderate maintenance support.

13 314003 AN INVESTIGATION OF RAIL RAPID TRANSIT CARBODY MATERIALS. The behavior of the three carbody materials commonly used in the United States, which are aluminum, low alloy high tensile steel, and stainless steel, is examined in this report and compared throughout the range of rapid transit and inter-city passenger rail service applications and operating environments in North America and Europe. Life cycle cost implications of each material in specific applications and environments were derived from a statistical analysis of the conditions of a representative, structured sample of 520 rapid railcars, which were selected for detailed, careful examination of the 21 critical points which together permit characterization of structural material behavior. The cars comprise a representative sample of carbody materials, construction techniques, operating environments, and years-in-service. A computer-input form was completed for each of the cars, making possible an intensive statistical analysis of the observed conditions and the collective experience of operators and carbuilders.

13 315150 MODERN TRAMCAR DESIGN IN WESTERN EUROPE [Moderna Spåravagnskonstruktioner i Väst Europa]. In this report modern tram-cars from 13 different transport

companies are studied. These companies are situated in the Netherlands, West Germany, Finland and Switzerland. Some trials have been undertaken to standardize the fleet of trams. The following conclusions could be drawn: (1) length of vehicle. Most modern trams are made with six or eight axles. (2) speed control. The trams are usually equipped with an electronic system which controls the acceleration and the deceleration of the vehicles. (3) monomotor bogies. The static adhesive weight is better utilized, and, when the problem with the transmission is solved, almost all trams are equipped with longitudinal motors which operate the two axles. (4) one-man-service or as in Basel and Zurich, self-service is introduced in most transport companies. (5) because of the vandalism some tram companies use only single trams. (6) feed-back. Only one of the trams studied is able to feed braking energy back to the overhead contact system. (7) variable floor height. Two of the transport companies have trams which have a variable floor height. [Swedish]

13 316230 APPLICATION OF MICRO-PROCESSORS TO VEHICLE SPEED CONTROL SYSTEMS. The onboard speed control system of automated rapid transit vehicles receives a wide variety of legitimate commands from external sources. These commands occur at random intervals and include speed changes and commands to stop at a precise distance. These commands must be processed in such a manner that longitudinal acceleration and jerk of the vehicle are always within specified limits. One way to meet these requirements is to compute a command profile for each external command using a microprocessor. One of the tasks of UMTA'S AIRTRANS Urban Technology Program (AUTP) with the Dallas/Fort Worth (D/FW) Airport and Vought Corporation was to develop a speed control system employing a microprocessor. The system has been installed in the AIRTRANS system and has been demonstrated at the D/FW Regional Airport. This paper describes the development of the AUTP speed control system.

Sellers, DF (Vought Corporation) ; Institute of Electrical and Electronics Engineers Conf Paper IEEE 79CH1484-51A, 1979, pp 304-306; Conference Record IAS Annual Meeting, 14th Paper presented Cleveland, Ohio, September 30-October 5, 1979; ACKNOWLEDGMENT: EI; ORDER FROM: IEEE

13 316236 RAPID TRANSIT EXPERIENCE WITH CHOPPER CONTROLLED DC MOTOR PROPULSION. BART cars using solid-state choppers and regenerative braking have accumulated about 154 million car mi since 1972, and are adding about 28 million additional car mi/yr. For the Feb. '78 to Feb. '79 year, the propulsion system MTBF was just over 500 h and contributed 37% of all vehicle failures. In the same period, the four-traction motor MTBF was 2174 h, which is more than twice its value of

several years ago. Modifications currently planned or in progress are expected to increase the propulsion system MTBF to about 800 h by 1981.

Brockman, JJ King, JH Kusko, A ; Institute of Electrical and Electronics Engineers Conf Paper IEEE 79CH1484-51A, 1979, pp 338-345; Conference Record IAS Annual Meeting, 14th, Paper presented Cleveland, Ohio, September 30-October 5, 1979.; ACKNOWLEDGMENT: EI; ORDER FROM: IEEE

13 316265 SURGE TESTING OF TRACTION MOTOR ARMATURES. Direct current traction motors operate in one of the most severe environments of any rotating electrical apparatus. Since the motors are used on transit systems, extremely high reliability is essential. This level of reliability can be increased by testing before the new or rebuilt armatures are installed. In order to test the bar-to-bar and coil insulation at relatively high voltage, either a high frequency or pulsed test must be used. Two approaches to this test have been developed and used by the various manufacturers. The first technique uses a standard current surge generator and pulses a span of bars in series between two probes connected to the commutator. The voltage drop across this span produces the bar-to-bar stress on the system. Insulation faults are detected and located by simultaneously comparing readings across two equal numbers of bars on a dual channel oscilloscope. The second technique uses a high current surge generator and tests a single pair of bars. The higher current level is required because of the lower inductance of a single coil. The advantage of this test is that it more closely approximates the operating condition of the armature. Also, since the voltage is not dropped across a group of bars, a uniform bar-to-bar distribution of voltage need not be assumed. Tests have shown that the voltage distribution using span testing is far from uniform. Location of any insulation fault is also facilitated by testing individual coils. Following the description of two test methods, a comparison of test results is made. The advantages of both techniques are discussed.

13 316278 MEANS TO ACHIEVE HIGH REGENERATION CAPABILITY IN A MODERN CHOPPER PROPULSION SYSTEM.

The chopper technique has now been used in mass transit propulsion systems for approximately ten years. Literature is abundant with articles about chopper theory, principles and features, and therefore these generalities will not be dealt with further here. This paper concentrates on the regeneration issue, partly through an analysis of the line receptivity and how the external factors, the feeding network, affect the result, but chiefly by discussing the implications of various solutions used in the propulsion package, and what measures can be taken to improve the regeneration figure, based on the experience in Sweden and elsewhere. The presentation is accompanied by calculations and results from underground and streetcar services.

13 316279 THE COUPLING OF PROVEN RELIABILITY AND MODERN PERFORMANCE ON BOSTON'S NO. 4 AND NO. 12 RAPID TRANSIT CARS. With the advent of sophisticated, state-of-the-art transit systems, there appears to have arisen an attendant trade-off between reliability and performance. Typically, forced to prioritize, most operating properties will opt for reliability. Specification requirements for the new No. 4 and No. 12 MBTA rapid transit cars dictated the use of propulsion and braking systems whose reliability had been demonstrated throughout the years. The specification also required, however, the integration of these systems into a cohesive unit that exhibited modern day ride performance. This paper provides a brief description of each of the subject vehicles, and then traces the technical history of the endeavor to blend the electrical and pneumatic braking systems' tractive effort outputs into a uniform deceleration rate without the use of complex system feedback and interface networks.

13 316565 CHOPPERS AFFECT OPERATION OF AF TRACK CIRCUITS. Interference has been observed on US metros between the

latest chopper-controlled trains and coded track circuits used for train detection as well as cab signals and ATO. The most dominant interference mechanism is inductive coupling between equipment carried on the car and the loop formed by the rails and axles under the car. Currents induced in this loop can result in transient "track clear" indications as a powered car passes over the impedance bond separating adjacent track circuits. A joint government-industry working group is developing ways of quantifying and controlling the problem.

13 316592 CALCULATING THE ENERGY CONSUMPTION FOR AN UNDERGROUND RAILWAY, AND METHODS OF OPTIMIZATION [Calcolo del consumo di energia per una ferrovia metropolitana e metodi di ottimizzazione]. In this study on the optimization of energy consumption on underground railways, the author proposes: (a) a method for arriving at energy consumption-journey time expressions by an analytical rather than numerical resolution of the differential equations of motion; (b) a simplified analytical method for determining the energy consumption-journey time ratio by reference to a simplified motion diagram; and (C) an optimisation procedure which, based on the values obtained at (a) or (b) will give the distribution of journey times on the various sections, which produce the minimum energy consumption for a pre-fixed commercial speed on the line. A numerical example is presented. [Italian]

13 316743 PHILADELPHIA: HELP IS ON THE WAY--AND NONE TOO SOON. Southeastern Pennsylvania Transportation Authority has been forced to emphasize capital projects for line extensions rather than getting funds for maintenance of existing facilities. This has meant that rapid-transit and light-rail operations are confronted with equipment shortages until new cars are delivered and some old ones rebuilt; an elevated transit line must also be completely rehabilitated. SEPTA contracts with Conrail for an extensive commuter service which is to be further expanded upon completion of a major downtown tunnel on a line extension to Philadelphia International Airport.

13 318036 METROPOLITAN ATLANTA'S RAPID TRANSIT SYSTEM: PROBLEMS AND PROGRESS. Progress and performance is good on Metropolitan Atlanta's rapid transit system, but GAO found (1) ineffective administration of the railcar contract, (2) inadequate contract provisions and recordkeeping procedures for proper warranty management, and (3) replacement of public housing at costs exceeding the appraised value. Better guidance from the Urban Mass Transportation Administration could have eliminated, or at least lessened, the

management weaknesses. The report includes GAO recommendations for more Urban Mass Transportation Administration input into rapid transit authority procedures and practices. Dissemination of the management experiences on this project to other transit authorities may avoid future problems.

13 318088 BART AND METRO--RAPID TRANSIT FOR THE SAN FRANCISCO AND WASHINGTON, DC. AREAS 1964-MARCH, 1980 (CITATIONS FROM THE NTIS DATA BASE). The two-section bibliography is devoted to the development of rapid rail mass transportation in two major metropolitan areas. The first section contains citations referring to BART, the San Francisco Bay area rapid transit system in California. Section two refers to the combined subway and surface transit system for the District of Columbia and outlying areas in Maryland and Virginia. Materials in both sections cover line siting, policies and planning, cars and power systems, stations and trackwork, human factors, travel patterns, and public attitudes. Attention is given to financing, revenue, maintenance, local impact, and environmental impact, as well as fare collection, noise, and legislation. Local and regional needs are discussed. (This updated bibliography contains 351 abstracts, 23 of which are new entries to the previous edition.)

13 318423 U. S. TRANSIT TRACK ASSESSMENT AND RESEARCH NEEDS. The overall objective of the study is to help expand and systematize the current search for improvements in transit track. The study was initiated to identify new technology and research tasks that may help increase the performance, reliability, and safety of urban rapid transit systems, and to help ensure that track research provides maximum benefits to the transit industry. Track problems and practices were investigated at transit properties in the United States, and technology was studied in the transit industry and other industries in the United States and Europe. Throughout the study, information was sought on the best technological practices currently available and on improvements that may be obtained through systematic research. This report describes track conditions; current practice in track design, construction, maintenance, and inspection; potential opportunities for improvements; favorable technology that is available but not commonly used in transit track systems; and research and support tasks to fill identified needs. The report also describes the evaluation of research and support tasks for relative importance, the analysis of their costs and benefits, and a recommended implementation plan for a track research program.

13 318459 VEHICLE LATERAL CONTROL AND SWITCHING. VOLUME II. DESIGN AND ANALYSIS. PART B. VLACS EVALUATIONS. This report contains design and analysis results from UMTA's Vehicle Lateral Control and Switching (VLACS) Project of the Automated Guideway Transit Technology (AGTT) Program. The objective of the VLACS project is to develop lateral control and switching systems which will reduce the cost and improve the performance of these systems on automated transit vehicles. The VLACS project tasks include a review of existing lateral control and switching technology, detailed mathematical modeling, analysis, simulation, detailed hardware studies, experimentation with alternative designs, and development of guideline specifications for VLACS systems. In this report, lateral control system models are developed for wire-follower, wall-follower active, and wall-follower passive lateral control systems, including the vehicle, lateral position sensors, and actuators. Vehicle dynamic models are developed for vehicles having Ackermann steering geometry and for vehicles with wagon-wheel steering. AGT vehicle models developed include ten-degree-of-freedom models used for ride quality analysis and simpler three-degree-of-freedom models used for lateral control system design and analysis. Part B of this report contains systems evaluations.

13 318490 PROPOSED ANALYSIS METHODOLOGY FOR RAIL CAR PROPULSION SYSTEM SELECTION. This report proposes a rail car propulsion system selection methodology based on life cycle costing. The objective of the proposed methodology is to provide transit operators with a practical method of calculating propulsion system life cycle costs to be used in bid evaluation of different rail car propulsion and control system technologies. If life cycle costing is to become part of the car acquisition process, it is important that the methodology is known and accepted by the suppliers and purchasers. The analysis methodology as presented here is to some extent based on previously applied methods and includes results from new work performed for this project. In this report, recent railcar propulsion system procurement practices and other related information were reviewed, and discussions were held with propulsion system suppliers and various operating systems. Results of this research were used in the development of the propulsion system evaluation and selection methodology, and the structured application of life cycle costing.

13 318517 INCREASED RAIL TRANSIT VEHICLE CRASHWORTHINESS IN HEAD-ON COLLISIONS. VOLUME I. INITIAL IMPACT. A specific goal of safety is to reduce the number of injuries that may result from the collision of two trains. In Volume I, a two-dimensional analytic simulation model of the leading cars of two impacting transit car consists is formulated. This model is capable of simulating the mechanics of head-on initial impact of two transit cars on straight level track. Specifically, the model is capable of establishing the critical parameters which govern whether the cars crush, override, or crush with subsequent override. This simulation model is used to assess impact control devices currently in service, such as anticlimbers, couplers, and draft gear. The report also presents a detailed experimental test plan for evaluating the strength and effectiveness of future designs of impact control devices which has been developed.

13 318518 INCREASED RAIL TRANSIT VEHICLE CRASHWORTHINESS IN HEAD-ON COLLISIONS. VOLUME IV. TRAIN USER'S MANUAL. A specific goal of safety is to reduce the number of injuries that may result from the collision of two trains. In Volume IV, a computer code for the simulated crash of two railcar consists is described. The code is capable of simulating the mechanics of head-on impact of two consists on straight level track. The simulation is limited to two dimensions, namely a vertical plane containing the length of the track. The user can model the individual car components or cars in a complex or as simple a manner as is warranted by the simulation results desired. Although specifically developed for transit cars, the code can also be used to simulate freight trains or intercity passenger trains.

Hahn, EE ; IIT Research Institute, Transportation Systems Center, Urban Mass Transportation Administration, (UMTA-MA-06-0025) Final Rpt. UMTA-MA-06-0025-804, June 1980, 233p

13 318519 INCREASED RAIL TRANSIT VEHICLE CRASHWORTHINESS IN HEAD-ON COLLISION. VOLUME II. PRIMARY COLLISION. A specific goal of safety is to reduce the number of injuries that may result from the collision of two trains. In Volume II, an analytical model in two dimensions, longitudinal and vertical, of the primary collision of two impacting urban railcar consists is formulated. This model includes the formulation of the leading cars developed in Part I of this program, and the distribution of mass and nonlinear force-deformation relationships existing among major structural sub-assemblages. This model also is capable of determining the extent of crushing and/or override suffered by the individual cars in the consists, as well as the time histories of displacement, velocity, and acceleration in both the longitudinal and vertical direc-

tions. Methods are developed for generating the dynamic force-deformation relationships for structural sub-assemblages comprising the critical modules of railcars. These methods include finite-element analysis, scale modeling, and full-scale testing procedures including specifications for required testing equipment and instrumentation.

13 318957 MEASUREMENT OF WHEEL/RAIL FORCES AT THE WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY. VOLUME I. ANALYSIS REPORT. Under the direction of the Urban Mass Transportation Administration (UMTA), measurements of wheel/rail forces were made in August 1979 by the Transportation Systems Center (TSC) with the assistance of Battelle Columbus Laboratories to determine the causes of excessive wheel/rail wear experiences by the Washington Metropolitan Area Transit Authority (WMATA) Metrorail System during its first three years of operation. In addition to measuring the absolute magnitude of the wheel/rail forces, it was the intent to compare alternative methods for relieving wheel/rail wear at WMATA and other transit properties. Measurements of the wheel/rail forces were made at the Washington National Airport Test Site and the Brentwood Shop Test Site. This report describes the results of that effort.

13 318960 NOISE CONTROL FOR RAPID TRANSIT CARS ON ELEVATED STRUCTURES: PRELIMINARY INVESTIGATION OF VEHICLE SKIRTS, UNDERCAR ABSORPTION, AND NOISE BARRIERS. In the report, procedures to reduce the propulsion system noise of urban rail transit vehicles on elevated structures are studied. Experiments in a laboratory use a scale model transit vehicle to evaluate the acoustical effectiveness of noise barrier walls, vehicle skirts, and undercar absorption. These experiments assume that the propulsion system noise is the only source of noise. Field measurement of urban rail transit vehicles at the Port Authority Transit Corporation (PATCO) in New Jersey provide additional data to compare the noise from elevated-structure and at-grade track sections. The results show that vehicle skirts and undercar absorption can provide a cost-effective noise reduction alternative to noise barriers if the propulsion system is the dominant noise source. The scale model results are only approximate and must be verified by full-scale demonstration tests. However, the potential value of the results can be demonstrated by applying the measured noise reductions in octave bands to the actual measured noise spectrum of the PATCO vehicle.

13 318963 ROSTER OF NORTH AMERICAN RAPID TRANSIT CARS, 1945-1980 SECOND EDITION. The document is a compilation of data on rapid transit cars built or currently on order between 1945 and 1980, and in service as of July 1980. It includes cars in the United States, Canada, and Mexico. Data includes cost, performance, dimensions, weights, electrical equipment, heating and ventilating systems, traction motors, propulsion equipment, lighting systems, and trucks and suspensions. The Roster is organized by alphabetical order. Within each section, the cars are listed in chronological order and includes cars of the following transit systems: BART-San Francisco Bay Area Transit Authority; BRTS-Baltimore Regional Rapid Transit Authority; CTA-Chicago Transit Authority; GCRTA-Greater Cleveland Regional Transit Authority; MARTA-Metropolitan Atlanta Rapid Transit Authority; MBTA-Massachusetts Bay Transportation Authority; WMATA-Washington Metropolitan Area Transit Authority; MDCTA-Metropolitan Dade County Transportation Administration; MUCTC-Montreal Urban Community Transit Commission; NYCTA-New York City Transit Authority; PATCO-Port Authority Transit Corporation; SEPTA-Southeastern Pennsylvania Transportation Authority; STC-Sistema de Transporte Colectivo Organismo Publico Descentralizado; and TTC-Toronto Transit Commission.

13 319640 INTERMODAL TRANSPORTATION GARAGE FACILITY. A regional rapid transit terminal has been designed to integrate various transportation modes for the South Braintree Extension of the Massachusetts Bay Transportation Authority. The South Quincy Rapid Transit Station and Garage is one of the first, if not the first, transit facility constructed that has direct access to the converging point of three major highways. This facility provides long-term parking for 1,800 cars in two garages separated by a concourse, which is the focal point of all activity. The highway ramp system which connects to the garage has the capacity for handling 1,130 cars/hr in the peak commuter hours. A community parking area for 390 cars, with access only from the local streets, is provided for the exclusive use of local residents. The bus terminal permits the picking up or discharging of 12 buses simultaneously, accommodating both local transit buses and private buses from local communities. The design permits the addition of an extra platform.

13 319648 RETROFIT NOISE CONTROL OF RAPID TRANSIT CARS. Describes a retrofit noise control study for existing, electric-powered transit cars currently operated by the New York City Transit Authority. The study focused on a test car considered to be representative of the fleet, that was outfitted with monitoring equipment and operated through a series of experiments. The dominant noise-producing components were determined and the important noise and vibration transmission paths located. Simple, easy-to-implement treatments that would reduce the noise levels to acceptable levels were recommended. Some of the recommendations included better side-door and end-door seals, increased floor mass, and quieted traction motor fans.

13 319672 VARIABLE FREQUENCY TRACTION DRIVE WITH INVERTER FED INDUCTION MOTOR FOR RAPID TRANSIT ELECTRIC TRAINS. Direct current motors are going to be replaced by variable frequency inverter-fed-asynchronous motors thanks to their undeniable advantages. It goes without saying that the electric equipment is to be devised as a whole, in order to reach a real optimization for the design of each component. An explanation is provided for the choices that must be made in order to obtain the optimization of the two basic components of this traction system, that is the inverter and the asynchronous motor.

13 319935 DEVELOPING A STANDARD TRANSIT TIE.... UMTA, through Transportation Systems Center, has sponsored development of universal concrete cross ties for North American transit track. Design, preparation of prelimi-

nary specification and laboratory testing extended from 1975 through 1979. Two types, a monoblock and a two-block design, were developed which could be used with any of three fastener systems. Field testing was delayed when it was found U.S. transit track specifications would not accommodate the "standard" ties and possible alterations are being studied.

Witkiewicz, PJ *Railway Track and Structures* Vol. 76 No. 6, Aug. 1980, p 38, 1 Phot.; ORDER FROM: ESL

13 319981 DEVELOPMENT TRENDS IN ELECTRIC TRACTION FOR LOCAL TRANSPORT SERVICES. A distinction is made in public rail transport services between rapid transit, underground, urban railways and tramways with their different roles in respect of carrying capacity, distance between halts, service speed and distinctive operating areas within the cities, in the region, or in inter-urban services. Common to all is the wish to provide an attractive service with respect to passenger comfort and convenience, traction dynamics and profitability, i.e., a low level of expenditure on upkeep and energy. New railcars must meet these requirements to a high degree. Lightweight construction, new types of drive, electronic controls, new ideas on heating and ventilating as well as other developments make an important contribution. The successful efforts of the Association of Public Transport Enterprises to standardize many vehicle features and components will be taken into account in the further developments and will also have an influence on the design of new vehicles for foreign railways. Scholtis, G *Eisenbahntechnische Rundschau* Vol. 29 No. 4, Apr. 1980, p 277; ACKNOWLEDGMENT: British Railways; ORDER FROM: Hestra-Verlag, Holzhofallee 33, Postfach 4244, 6100 Darmstadt 1, West Germany

13 322012 ELECTRIC TRACTION FOR RAIL-BOUND RAPID TRANSIT SYSTEMS [Antriebstechnik fuer den Schienennahverkehr]. The development of electric traction equipment for tramways, light rapid transit and underground railways was greatly influenced in the last 20 years by semiconductor technology. This produced semiautomatic electronic running and braking controls, as well as the d.c. choppers and three-phase equipment. The d.c. chopper equipment permits continuous and low-loss control of motor voltage both for running and braking, with even good control of regenerative braking. With three-phase traction, the conventional d.c. motor is replaced by a maintenance-free squirrel-cage induction motor. [German]

13 322566 TYNESIDE REPORT 8. PART 1: ROLLING STOCK. This article is part of a series of three describing: (1) the rolling stock, (2) the construction and (3) the operation of the Tyne and Wear Metro. The Metro is of standard BR width track, using a 1500 volt DC overhead catenary. There will be 90 metro cars used, each with 84 seats per car and a crush capacity of 272 passengers. Opening of the doors installed in a 1.3 M wide aperture will be by passengers after the trainman has operated a door release button at a station. The doors can only be closed by the driver. Superb riding quality has been achieved by the use of an air body suspension and a rubber axle suspension. Drivers are able to couple and uncouple metrocars from their cabs without shunters. Control equipment, based on the air/oil camshaft uses automatic acceleration. Braking is mainly rheostatic, supplemented by electro-pneumatic disc brakes and electro-magnetic track brakes. Electronic equipment measuring the speed of each independent axle, protects the car against wheel-spin during acceleration and braking. Safety devices fitted include a passenger emergency brake and an emergency door handle. For abstracts of parts 2 and 3 of this article see IRRD nos 248773 and 248774.

13 322787 A MANUFACTURER'S VIEW OF THE TRANSIT MARKET. With only one survivor among five firms that had produced transit cars in the U.S. in the past decade, the author observes that foreign competition did not drive U.S. firms out of the market but rather moved to fill the vacuum produced when U.S. carbuilders quit. While operators need stable manufacturers to produce reliable cars which can be supported throughout their entire life cycle, suppliers need also a market which they can afford to serve. Barriers to such a stable, profitable transit-car market include absence of a consistent policy at DOT and UMTA; the sealed, low-bid procurement policy which is required; the use of detailed specifications which inhibits designer innovation; and absence of uniformity among cars of various systems.

Schlemmer, CJ (General Electric Company) *Transit Journal* Vol. 6 No. 3, 1980, pp 5-12; ORDER FROM: American Public Transit Association, 1225 Connecticut Avenue, NW, Washington, D.C., 20036

13 322804 COMPETING FOR THE LIGHT-RAIL VEHICLE MARKET. After the UMTA-sponsored Standard Light Rail Vehicle program ended in failure, North American operators looking for new light rail vehicles looked to technology evolving in Canada through the Urban Transit Development Corp. and to LRV

technology existing in Europe and Japan. Details are given for the single-unit and articulated vehicles being offered to and being bought by North American transit properties.

13 324450 PROGRESS IN RAILWAY MECHANICAL ENGINEERING (1979-1980 REPORT OF SURVEY COMMITTEE)-CARS AND EQUIPMENT. This survey of the annual ASME report covers some of the major developments in rail freight and passenger equipment made public in the last calendar year. It covers developments worldwide.

Hawthorne, KL (Association of American Railroads Technical Center) Fisher, FG (STV Engi-

neers); American Society of Mechanical Engineers Conf Paper 80-WA/RT-11, 1980, 14p, 39 Fig.; Contributed by the Rail Transportation Division of the American Society of Mechanical Engineers for presentation at the Winter Annual Meeting, Chicago, Illinois, November 16-21, 1980.; ORDER FROM: ESL

13 324901 DISC BRAKES FOR MASS TRANSIT. In mass transit operations like streetcar-, underground-and metro-operations the braking performance is of utmost importance. Depending on the type of service and type of brake system the requirements on the disc brake as service brake and emergency brake may be very high. The thermal and mechanical performance of the disc is, however, influenced by the choice of disc material, the effectiveness of the cooling and design. This paper discusses the requirements of the mass transit operations, the performance limits of disc brakes and the factors influencing these performance limits. The results are founded on extensive laboratory and service tests and computer analysis, which are reported.

Cavell, BG Saumweber, CE Berndt, P Gerich, R *Institution of Mechanical Engineers Conference Pub Conf Paper* 1979-11, 1979, pp 195-205; International Conference on Railway Braking, University of York, England, September 26-27, 1979.; ACKNOWLEDGMENT: EI; ORDER FROM: Mechanical Engineering Publications Limited, 1 Birdcage Walk, Westminster, London SW1H 9JJ, England

13 324902 COPPER DISC BRAKES ON THE ADVANCED CONCEPT TRAIN I. The friction brake system components described in the paper were developed on behalf of the United States Department of Transportation for the Advanced Concept Train I (ACT I), a 220-passenger rapid transit rail vehicle. The choice of chrome copper as disc material and disc-associated friction lining was made to meet severe friction-brakes-only operating mode and utilizes the high friction coefficient and diffusivity of chrome copper. Results from dynamometer tests and from a limited program of rail trials corresponded well with predictions contained in the thermal analysis. Braking rates were maintained and occasionally exceeded during simulated round trip tests at disc surface temperatures to 850 K.

13 324911 MEASUREMENT OF ENERGY SAVING BY REGENERATIVE BRAKING IN RAILBORNE TRACTIVE UNITS [Messung der Energieersparnis durch die Nutzbremse bei Schienengebundenen Triebfahrzeugen]. Tests performed in Hanover, West Germany, involving trial runs under service conditions, are reported. The purpose of these tests was to check the results of theoretical investigations about the level of energy savings due to the use of tractive units with regenerative braking. The energy savings measured were between 24% and 29%. The influence of vehicle design, timetable and the feeding conditions within the energy supply network are discussed. [German]

Moellendorff, H von (AEG-Telefunken) *Elektrische Bahnen* Vol. 78 No. 1, Jan. 1980, pp 21-25, 5 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

13 324937 SYSTEM FOR THE ACCURATE CALCULATION OF ENERGY LOSSES IN A DIRECT CURRENT TRACTION NETWORK [Verfahren zur genauen Berechnung der Energieverluste in einem Gleichstrom-Traktionsnetz]. To estimate regenerative braking performance it is necessary to evaluate what amounts of energy can be saved. Losses in the fixed equipment are examined first of all. In the urban railway system studied there was found to be little difference between operating with or without regenerative braking as far as losses in the supply system and the return current were concerned. If, with the regenerative braking system the return current cannot be used by trains on the same section of overhead line, much greater losses are to be expected. Practically 30 to 48 percent of the energy used during acceleration can be recovered during regenerative braking. [German]

Heijst, T Hamels, D *Elektrische Bahnen* Vol. 78 No. 7, July 1980, pp 170-179, 9 Phot., 9 Ref.; ACKNOWLEDGMENT: International Union of Railways, BD; ORDER FROM: ESL

13 324941 REGENERATIVE BRAKING OF ELECTRIC MOTIVE POWER UNITS [Nutzbremmung von elektrischen Triebfahrzeugen]. From the running diagram of a motive power unit and the energy balance sheet drawn up in parallel, it is seen that the introduction of regenerative braking is mainly advisable for tractive units in short-distance traffic. Suburban rolling stock is generally equipped with d.c. tractive units, for which a detailed explanation of the technique of fitting the regenerative brake is given. Numerous measurements conducted on the installations described confirm that considerable energy savings (20 to 30 percent) can be made on trams, urban railways and metropolitan railways. To conclude, the corresponding technique for a.c. motive power units is described.

13 325285 URBAN RAIL NOISE ABATEMENT PROGRAM DIGEST. Transit operators, transit patrons and communities have all expressed concern over rail transit noise and indicated that its reduction should have priority. The UMTA Urban Rail Noise Abatement Program has assessed the dimensions of this problem to identify, develop and test noise abatement technology, and to share such control techniques with transit systems, suppliers, manufacturers and others concerned with urban rail noise. The Program consists of three major areas: Noise Assessment in which the mechanics of noise transmission and methods of acoustic measurement are described; Technology Development and Evaluation in which the various types of wheel/rail noise are described along with damping systems, as well as the problems of elevated structures, subway tunnel vibration, ground-borne noise and propulsion system noise.

13 325446 MULTIPLEXING CAN REDUCE ON-TRAIN CABLING. Techniques used to transmit several controls and indications over a few pairs of wires are being applied by London Transport to multiple-unit trains. Though distances are short, multiplexing not only cuts the number of inter-car and inter-unit jumpers, it also reduces the space and weight of cabling within each car. Two batches of rolling stock have used multiplexing for indications only, and experiments are being carried out with controls also. Lessons learned from 1973 subway cars include the need to separate electronic decoding and processing equipment from the indication panel in the cab, as the failure modes are essentially different.

Harding, MA *Railway Gazette International* Vol. 136 No. 12, Dec. 1980, p 1066, 3 Fig., 2 Phot.; ORDER FROM: ESL

13 325886 ROLE OF INNOVATIVE ENGINEERING IN RAIL OPERATIONS. Engineers were deeply involved in both construction and operation of early railroads. The situation has changed today to the degree that it is suggested that the best solutions to operating problems may not be employed. Three different examples of innovative engineering solutions to the problems on a major commuter railroad are given: development of a chemical toilet servicing system, productivity of the inspection function, and energy conservation. The need for familiarity of all types of engineering, need to really understand operation, and the need to sell new concepts within the institutional structure are stressed.

13 325929 DESIGNING WORKSHOPS WITHIN METRO PARAMETERS. Good workshop design is essential to ensure the smooth day-to-day running of a metro, as poor maintenance will immediately affect car availability. The Layout and equipment chosen for the workshops of the Hong Kong and Caracas metros show how tough operating requirements can be met.

Sheldon, J *Railway Gazette International* Vol. 136 No. 9, Sept. 1980, pp 770-774, 3 Fig., 1 Tab., 8 Phot.; ACKNOWLEDGMENT: International Union of Railways, BD; ORDER FROM: ESL

13 326305 MASSACHUSETTS BAY TRANSPORTATION AUTHORITY BLUE LINE VEHICLE EVALUATION. The report presents the results of engineering tests carried out on a pair of rapid transit cars for the Massachusetts Bay Transportation Authority. The tests were performed at the Transportation Test Center, Pueblo, Colorado, from April 1979 through October 1979. The scope of the test program included an evaluation of performance, ride quality, and interior and wayside noise, using standardized test procedures; special engineering tests were made to evaluate energy conservation methods and three types of experimental brake shoes. The tests showed that the vehicles met their design specification requirements with some deficiencies, notably in emergency braking rates. An energy conservation technique was evaluated, in which response characteristics of the vehicle propulsion system were modified to reduce energy needs due to aerodynamic drag at high speeds. Several potential energy-saving configurations were identified, with minimal impact on round-trip times. The experimental brake shoes tested were found to give performance comparable to the original equipment at normal operating speeds for the MBTA Blue Line, but were inferior at higher speeds.

13 326306 MEASUREMENT OF WHEEL/RAIL FORCES AT THE WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY. VOLUME II. TEST REPORT. Measurements of wheel/rail forces were made in August 1979 by the Transportation Systems Center (TSC) with the assistance of Battelle Columbus Laboratories to determine the causes of excessive wheel/rail wear experiences by the Washington Metropolitan Area Transit Authority (WMATA) Metrorail System during its first three years of operation. In addition to measuring the absolute magnitude of the wheel/rail forces, it was the intent to compare alternative methods for relieving wheel/rail wear at WMATA and other transit properties. Measurements of the wheel/rail forces were made at the Washington National Airport Test Site and the Brentwood Shop Test Site. This report describes the results of that effort. The study found that for tight gage, the average flange force between the leading outer wheel and the high rail of an 800-foot radius curve was 9400 pounds, unworn cylindrical profile; 6300 pounds, unworn tapered profile; and 7900 pounds, worn cylindrical profile. For widened gage, the average flange force was 6300 pounds, unworn cylindrical profile and 5500 pounds, unworn tapered profile. On the basis of these results, it was recommended that cylindrical wheels be replaced by tapered wheels and tight gage curves be widened to standard gage.

13 328364 THE FEASIBILITY OF RETROFITTING LIFTS ON COMMUTER AND LIGHT RAIL VEHICLES. The objectives of this study were to determine if lift retrofit applications to rail vehicles are technically feasible, and if so, the extent to which existing bus lift technology can be utilized. This report examines some of the technical issues associated with the retrofitting of lifts for elderly and handicapped passengers on light and commuter rail vehicles. There are four major sections to this report. The first section develops the inventory of light rail (LR) and commuter rail (CR) vehicles in the U.S. by number and type. It addresses the characteristics of rail vehicles that differentiate them from buses and makes preliminary indications of which vehicles might be preferable candidates for lift retrofits. The second section assesses the existing bus lift technology. Descriptions of lift designs and operation obtained from manufacturers are presented. The third major section of this report develops the interface requirements between lifts and vehicles based on existing vehicle characteristics and on lift kinematic concepts. The final section examines ancillary issues of lift retrofits on rail vehicles, such as ancillary hardware modifications, safety and liability concerns, and concerns about costs and sources of required funding.

14 041620 A PRESCRIPTION FOR BART. As the result of a sequence of mishaps and incidents occurring in the automated operation of the Bay Area Rapid Transit (BART) system since partial revenue service was inaugurated last September 11, considerable skepticism has been expressed by many sources as to the safety of this ultrasophisticated mass-transit system. These critical evaluations led to the empaneling of a select three-man committee to report on the safety of the BART ATC system. In brief, the panel did not find the system's present mode of operation unsafe, but said the present system would not provide adequate passenger safety under full-scale operation, and recommended modifications and redesign to correct the deficiencies.

Friedlander, GD ; Institute of Electrical and Electronics Engineers Vol. 10 No. 4, Apr. 1973, pp 40-44; ACKNOWLEDGMENT: IEEE Spectrum; ORDER FROM: IEEE, Repr PC

14 043538 BIGGER BUGS IN BART. Six months in partial service have raised questions about BART's automation and its safety features. On October 2, 1972 a computer-controlled BART train overshot the Fremont station and plunged the lead car onto a sand bank. The cause was a malfunction of a crystal oscillator on board the lead car. This article reviews some of the problems that have occurred, and summarizes some of the reports that have been released. A report by State Legislative Analyst Alan Post has two principal stipulations: (1) that BART's service be without adequate checks and with train control deficiencies, and (2) that BART was overcharged for the system engineering and construction-management services. Post's report explains that the low-power circuit in the tracks may not detect a train under certain conditions. BART has run 28 million passenger miles in automatic mode with manual block as backup for train separation. Present operations, according to BART, are fully automatic more than 95% of the time. A report by Battelle Institute concluded that under normal conditions the system appears to operate in a manner that is not unsafe; under conditions of single malfunctions no clearly defined unsafe operating condition was identified, and that the operating safety of the vehicle system depends on redundant rather than fail-safe circuits. The article also presents some of the reactions of the consultants and of the supplier of the automatic control system. The article notes that off-the-shelf mechanical wheel scrubbers may solve the train detection problem. The article concludes with some findings of a blue ribbon panel.

14 044201 TWO-WAY RADIO COMMUNICATION MASS TRANSPORTATION DEMONSTRATION PROJECT. Existing equipment prior to the demonstration required that train crews descend to the tracks to report trouble, while police had to rely on conventional telephones available only in station clerks' booths. A variety of alternative mobile systems and components were considered, including train-to-wayside intercom systems currently used in Chicago, Toronto, and London. These proved too limited in scope for the complex New York City subway

network. A portable, transistorized transmitter/receiver was judged ideal, particularly for the policemen who required compact, durable equipment. The engineering, operation, and maintenance of the selected system is documented. The improved communications were evaluated primarily in terms of reduced train delays and police reaction time. The latter was demonstrated to be particularly effective. Message delays between police dispatchers and transit patrolmen were reduced by 99%, and the ratio between crimes and arrests improved by 8% during daylight hours and rose to 95% at night. Overall operational efficiency also showed substantial improvement. The average number of train delays per month decreased 41%, and the average duration of such delays decreased 9% in the test area as compared with the system as a whole. Ridership within the test area was also shown to increase during the demonstration. It is concluded that overall, the project was successful enough to warrant the use of two-way radio equipment throughout the New York subway system. Appendices deal with capital and overhead costs for the project, and requirements for extension of the system to other divisions of the subway network.

14 050646 RATP RESEARCH AND PLANNING OF UNDERGROUND RAILWAY OPERATING METHODS [ETUDES DES PROJETS DE LA R.A.T.P. CONCERNANT LES METHODES D'EXPLOITATION DES LIGNES DE METRO]. 1967 saw the beginning of an era of concrete achievements in the automa-

tion of the RATP (Paris Transport Authority). These achievements affected the various sectors of operations in general, particularly traffic monitoring and control, power distribution, terminus line switching, automatic driving, ticket checking and issuing; they enable the best use to be made of the underground railway as such and therefore to improve and increase the service it provides. Modernization schemes of this scope can only be introduced after they have been investigated thoroughly by simulation on a computer. In this article the authors, who are RATP officials, explain the research tools employed (simulation models) and their field of application (in particular, train and traffic movement), they consider the technical developments which enable line capacity and transport conditions to be improved, and in conclusion describe the experiments with and the projects for traffic regulation (programmed departure, hourly scheduling and headway). They state that favourable results have already been obtained and there are good grounds for predicting considerable improvements in the future. [French]

14 050655 I HAVE SEEN THE FUTURE AND IT WORKS. This article presents the authors' impressions of rapid transit systems and commuter railroads in London, Paris, Munich, Molding, Rome, Madrid, and New York, with references to Venice, Perugia, and Pompeii. Most of the systems visited involve conventional technology well utilized rather than any exotic new technology. The author points out that while 21 new rapid transit systems are under construction in the world, only one is in the U.S. (Washington Metro).

14 050740 SAFETY METHODOLOGY IN RAIL RAPID TRANSIT SYSTEM DEVELOPMENT. The report records the results of a study by the National Transportation Safety Board of the October 2, 1972, accidental derailment of a BART train and of the significant management and institutional approaches used to achieve safety as they influenced this system. The purpose of focusing attention on the cause and effect impact of this subject matter on the safety of the BART hardware system is to make this experience available to other municipalities who are implementing or are contemplating the development of a new rail rapid transit system. The report recommends abandonment of the fail-safe concept, and an organized disciplined approach to accomplishing rapid transit system safety, through the application of current safety management and engineering concepts.

14 051301 INFORMATION FLOW IN THE BART CONTROL COMPUTER SYSTEM.

The control system for San Francisco's Bay Area Rapid Transit (BART) consists of several levels of control: a primary level operated by equipment at each passenger station and a secondary level accomplished by the central computer control system. This paper describes the control capabilities of each level of control and the ways in which the two work together to control and optimize the movement of trains on the system.

14 051408 THE WASHINGTON METRO AUTOMATIC TRAIN SUPERVISION SYSTEM.

The Washington Metro will be operated as a fully automated rapid transit system. Normal system operation will be controlled by the Automatic Train Control System which is comprised of the Automatic Train Protection, Operation and Supervision subsystems. This paper is divided into two parts: Part I provides an overview of system operation, including the role played by each of the subsystems in providing control of train separation and train speed, route security, control of acceleration and station stopping, and maintenance of schedules through computer-directed performance level and dwell adjustments. Part II provides a detailed description of the Automatic Train Supervision system and the methods employed by the computer software to exercise supervisory control of the system. The major programs and the software-hardware interface which provide the supervisory functions for train and terminal operations are described. A discussion of the strategies employed during major service disruptions closes the paper.

14 051444 ATC EQUIPMENT FOR NEW SOBU LINE CARS OF JNR. The Sobu Line of the Japanese National Railways (JNR) recently added an underground section connecting Kinshicho Station to Tokyo Station, and the new section went into service in July 1972. This article describes the Type TS-7 automatic traffic control (ATC) equipment for electric railcars adopted on the new underground line. This ATC equipment employs a triple-system totally digital ring-calculation system and features high accuracy, high reliability, and fail-safe performance. The most outstanding feature is the ring calculation system which makes dynamic control possible. It is composed of fewer parts and simpler circuits, still

ensuring high reliability and positive detection of faults. As such the ring calculation system is expected to find wide application.

14 051528 TELECOMMUNICATIONS RESEARCH IN THE UNITED STATES AND SELECTED FOREIGN COUNTRIES: A PRELIMINARY SURVEY. A preliminary investigation has been carried out on the command and control of rail transportation, both in the U.S. and overseas. An overriding consideration of rail transportation is safety, both for reasons of preservation of human life and for the high cost of a failure in potential damage to property. As such, railway signaling has evolved not only in a "fail-safe" mode, but in one where innovation must pass a series of slowly ascending levels of trial before being generally accepted in the industry. The second consideration is that of low R&D funding levels. In recent years gross investment in rail transportation has been low as the high technology fields of air and space have preoccupied governments.

14 051558 TRACK CIRCUITS FOR MODERN RAPID TRANSIT SYSTEMS. Track circuits have been used in American Railroads for over a hundred years. Although the basic idea (use of rails as part of detection circuit) remains the same, changes in implementation have been made constantly to meet new requirements and to take advantage of advances in technology. In modern rapid transit applications track circuits must meet certain requirements in performing their function of train detection and broken rail protection. The track circuits must operate reliably without insulating joints and with lightweight cars using disk brakes. As modern rapid transit systems use chopper controlled propulsion systems the track circuits have to be designed for operation without interference from chopper harmonics. Track circuits without insulating joints result in problems which must be solved for safe and reliable operation.

14 053761 SUPER-TRAMWAYS FOR EDINBURGH?

Growth in the swing of informed public opinion towards improved public transport rather than the disamenity and pollution implied by unrestricted growth of individual or private car transport is indicated by a report produced by the Scottish Association for Public Transport, which has evolved from the former Scottish Railway Development Association. This Study Paper No. 4 concerns Edinburgh and the options for transport in the Scottish capital and sharply disagrees with the views expressed by consultants. The consultants evaluated alternative strategies for Edinburgh in 1971; a conventional rail service was outlined and a more detailed but incomplete study of a limited light rail system, but both were rejected in favour of an 'enhanced bus system'. Following the keen interest shown in light rapid transit (LRT) or a super-tramway system in the Tyneside PTE, it is of interest that Option B in these plans is for higher capital investment in a service designed to serve a greater portion of the population.

14 054130 ANALYTICAL APPROACH TO RAILWAY SIGNAL BLOCK DESIGN.

Originally intended for rapid transit systems, it is also applicable to any rail system where high-speed, short-headway characteristics are required to maintain a smooth and efficient flow of passengers of goods. Analytical techniques are used to select system speed commands using a cost-benefit analysis; to determine the speed-location operating profile; to locate signal block boundaries; and to determine signal logic. Four computer programs are used to calculate station dwell times, to simulate train performance, to calculate safe braking distance, and to determine headway. These programs determine the highest feasible speeds, consistent with civil design restrictions, at which trains can travel while at design headways. The algorithm for block layout then ensures that the minimum number of blocks will be used to provide the design headway subject to all system limitations. Program inputs include car character-

istics and track profile, user demand statistics, and the design headway.

14 072493 THE ARCHITECTURE OF COMMAND AND CONTROL SYSTEMS FOR MODERN RAPID TRANSIT. Automatic Train Control comprises three subsystems: Automatic Train Protection, Automatic Train Operation and Automatic Train Supervision. ATP performs the vital safety functions. ATO controls propulsion and braking, ATS operates the transit system so it effectively provides the transportation service that is its sole reason for existence. The author noted that the rapid transit trend today is for more sophistication in the centralized control function. This control stabilizes system operation and provides dependable and expeditious service. A dollar invested in command and control can save many dollars of expenditure on rolling stock and fixed plant. There is also the potential for saving operating labor.

Freehafer, JE (General Railway Signal Company) Institute of Electrical and Electronics Engineers, (74 CHO 833-41A) Proceeding Part 1, 1974, pp 507-515, 9 Fig., 5 Ref.; This paper was presented at the Ninth Annual Meeting of the IEEE Industry Applications Society, Pittsburgh, Pennsylvania, 7-10 October 1974.; ACKNOWLEDGMENT: IEEE; ORDER FROM: ESL, Repr. 14 083064 THE COLOGNE PRE-METRO. After it was decided that buses would be inadequate for major cross-city service, the Cologne government made two major decisions: (1) It would not finance a full-scale rapid transit subway system; (2) That since a segregated right-of-way was required, this should not be at street level and should be operated with the same vehicles as the streetcar system that remained in the other areas of the urban region. As this subway light-rail system has been built, it has always been designed so various sections should be complete without leaving unfinished structures even when funds were short. An additional constraint was that historic buildings were not to be endangered. The article describes the construction of the cut-and-cover subway and the erection of elevated segments using prefabricated components.

14 096676 AN ASSESSMENT OF THE APPLICATION OF ON-LINE COMPUTERS TO CONTROL OF AN UNDERGROUND RAILWAY-A SIMULATION STUDY. This paper describes the method and summarizes the results of work within the operational research department of London Transport to assess the benefits that on-line computer control of signals on the Northern and Victoria lines would bring to passengers. From a simulation study it was concluded that reduction in travel times, waiting times and overcrowding could be achieved by computer control. In the simulation, travel time from Modern to Kings Cross was reduced by 1 min and passenger waiting time at stations reduced by up to 11 sec. The improvement derives mainly from better integration of conflicting movements. The total benefit to passengers over the Northern line is estimated to be 64,000 p.a. In addition there is the possibility of an increased revenue to London Transport from generated traffic. /Author/TRRL/

14 097302 CAR CITY TO PEOPLE CITY (OR TAMING THE TRUCK). This report is essentially a non-technical study of how to resolve Manhattan Island's traffic problems and in doing so to return the island to the people. The use of Light Rail Transit is advocated by the report as being superior to buses and as giving more convenient neighborhood service than subways.

14 098066 SELTRAC OPERATING CONTROL SYSTEM FOR LOCAL TRANSPORT [Die Betriebsablaufsteuerung SELTRAC fuer Nahverkehrssysteme]. The SELTRAC (registered trademark) operating control system has been developed by SEL for tracked urban transport applications such as underground and rapid transit railways and also large cabin systems. The modular hardware and software allows the degree and extent of system automation to be extended step by step as required. Full automation can be achieved in several stages, starting from a purely monitoring system. Described here are the basic operating concept, operating sequences and possible alternatives, also vehicle distribution in the network and planning of the running schedules. Even with a high degree of automation a central controller is required, and his workplace and scope for action are described. In conclusion there is a description of the layout and function of a SELTRAC demonstration system. [German]

14 098659 GETTING READY FOR THE MUNI METRO. Major events and factors crucial to the San Francisco Municipal Railway system are described. This system which will integrate urban and regional transit networks, will have a fleet of 55-mph Light Rail Vehicles and a brand new or largely rebuilt, largely graded separated rail system that will permit reductions in overall running times ranging from a third to nearly half. The retainment and requirement of 5 heavily used street railway lines operating in the city's principal thoroughfare, and the new BART-built Market Street (principal thoroughfare) subway are seen as key elements in the development of the municipal railway system. Surface improvements provided for by the system are described. An innovative feature for the upgrade program for existing trackage, was the establishment of a reserved median strip for rail lines in place of trackage in paved street areas. The construction of a new shop facility and the new fleet of 100 articulated Boeing-Vertol cars are briefly described. The gradual and carefully tested introduction of the Muni and its integration with regional BART system are outlined.

Middleton, WD *Railway Age* Vol. 176 No. 11, June 1975, pp 26-32, 2 Fig., 1 Phot.

14 098660 LRV A WORLD OVERVIEW. The light rail transit mode is defined (as an evolutionary mass transit mode based on established technology, which offers a variety of services and an effective means to control operating costs), its successful operation in many cities (212 in 35 nations) is noted, and the most common approach to its establishment (upgrade existing street car systems by tackling fixed facilities and vehicles) is outlined. The removal of trolleys and substitution of buses, the survival of the streetcar in European cities, the automated rapid rail and personal rapid transit systems, the ease of negotiation of 5 or 6 percent grades by light rail vehicles, and total route segregation in some cities are

briefly reviewed. Vehicle technology for this system of transportation is outlined. Longer vehicles which offer high passenger/driver ratio may be utilized.

Taylor, SF (Sanders Associates, Incorporated) *Mass Transit* Vol. 2 No. 6, June 1975, pp 7-9, 10 Phot.

14 099206 A LOOK AT THE LIGHT SIDE. Light rail transit is a very popular concept in North America at the moment. Transit planners like light rail because it is not experimental like some rapid transit systems. It is also cheaper to install than a subway system. However, despite the great interest in light rail no new systems are being built in North America at the moment, although several are planned. The main development in light rail has been the new car design for replacing old equipment on the San Francisco and Boston systems. The article gives a brief summary of existing and proposed light rail systems in the United States and Canada.

Modern Railroads Vol. 30 No. 6, June 1975, pp 52-54 ACKNOWLEDGMENT: Canadian National Railways, Headquarters Library; ORDER FROM: Cahners Publishing Company, Incorporated, 5 South Wabash Avenue, Chicago, Illinois, 60603 Repr. PC

14 099307 ANOTHER ALTERNATIVE: THE CASE FOR LIGHT RAIL, PART 1. The objectives of providing better mass transit through conventional means (bus, heavy rail transit and personal rapid transit) are examined, and the possibilities of increasing system efficiency by incorporating light rail rapid transit into the overall plan is explored. A discussion the physical characteristics of light rail cover aspects of the vehicle, the operator, fare collection, design criteria and standardization, right-of-way, stations, controls and communication. Light rail's basic characteristic is versatility, and it can be used effectively in: basic service supplemented by bus; supplement to high capacity rapid transit; rapid transit feeder service; high-speed suburban service; and short haul intercity service. Light rail's capability to meet fluctuating traffic demand is discussed and comments are made on light rail as an instrument for integrated public transportation.

Taylor, SF (Sanders and Thomas, Incorporated) *Transit Journal* Vol. 1 No. 2, May 1975, pp 15-34, 3 Fig., 13 Ref.; ORDER FROM: American Transit Association, 1100 17th Street, NW, Washington, D.C., 20036 Repr. PC

14 099812 SEPTA'S RED ARROW DIVISION: TRACTION IN THE LIMELIGHT. The three routes of the Southeastern Pennsylvania Transit Authority which qualify for light rail transit status serve suburbs to the west of the center city. All connect with the elevated/subway system at the SEPTA 69th Street Terminal. Details of the operation, physical plant and cars are given in this article.

14 099813 FIRST BART-NOW MUNI METRO. San Francisco is transforming its conventional streetcar operation, the Municipal Rail-

way, into a light rail transit system in conjunction with a new center city access through the tunnels built for Bay Area Rapid Transit. The goal is a transit service comparable with the most modern tramways in western Europe. Changes and improvements include new cars, extended routes and upgraded service facilities.

Anderson, J *Passenger Train Journal* Vol. 7 No. 4, Apr. 1975, pp 13-14, 5 Phot.; ORDER FROM: Passenger Train Journal, 29 East Broad Street, Hopewell, New Jersey, 08525 Repr. PC

14 099835 POINTS AND TRAFFIC LIGHTS UNDER COMMON CONTROL USING VETAG. A trial installation of Philips' Vetag (vehicle tagging) equipment will be made in Amsterdam following a policy decision on adopting a standard method of automatic control of tramway switches and traffic lights. Vetag functions to detect, identify and locate selected vehicles in a stream of road traffic and is adapted to automation of LRT or streetcar signalling which must operate without external supervision. Vetag consists of three basic units--an interrogator installed along the roadway, a detection loop in the roadway surface and a transponder underneath each vehicle.

14 099836 41ST CONGRESS. A series of articles on light rail transit is introduced by a comment of the president of the International Union of Public Transport in which he sees the urgent need to develop and exploit cheaper ways of providing reserved tracks free from congestion caused by road traffic. The articles: Koln-Bonn LRT route will be completed in three years; Designing a car for the tramway/metro transition; All aboard the LRT bandwagon; US and Canada develop standard trams.

Belin, R (International Union of Public Transport) *Railway Gazette International* Vol. 131 No. 5, May 1975, pp 173-174, 1 Phot.; 41st Congress of the International Union of Public Transport, held in Nice, France May 25, 31, 1975.; ORDER FROM: ESL, Repr. PC, Microfilm

14 127617 SPOORPLAN (GEOGRAPHICAL TYPE) INTERLOCKING SYSTEM SPDRS U FOR URBAN RAILWAYS. Urban railways are characterized by short distances between stops, identical vehicle type overground and underground lines as well as close headway. For railways showing essentially these features, Siemens has developed and in several cases already placed in service the Spoorplan interlocking system SpDrS U. The building block technique of such interlocking systems considerably facilitates planning making available of building blocks, and assembly. The fail-safe function of all building blocks and their co-operation have passed successfully the inspections of the supervising authorities. The authors deal in detail with principle and function of this Spoorplan interlocking system.

14 127635 APPRECIATION OF THE POTENTIALITIES AND LIMITATIONS OF COMPUTERIZED CONTROL OF LINEAR TRANSIT SYSTEMS. The paper considers the theory of safe stopping on a trackway and the problem of station delay accretion from the viewpoint of control requirements and performance. It is shown that existing control methods relying on trackside-sensing equipment only is limited in scope and requires on-board supplementation if substantial headway reduction is to be achieved. A control equation is suggested similar to that used in practice by car-drivers which should allow this reduction to be achieved using existing technology.

14 127637 AUTOMATIC TRAIN CONTROL AND COMMUNICATIONS FOR WASHINGTON METRO. The automatic train control and the communication systems for the Washington Metro rail are outlined.

Greenway, JP (Washington Metropolitan Area Transit Authority) Sheldon, RH *Communications Society Newsletter* Vol. 12 No. 6, Nov. 1974, 8 pp, 11 Fig., 11 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

14 127868 DESIGN PHILOSOPHIES IN AUTOMATIC TRAIN CONTROL. Two broad categories of automatic control have emerged in 15 years of rapid transit automation, identified by use of track circuits or separate conductors for the ground-to-train communications channel. Continental Europe has favored a wide-band link which gives flexibility in allocating functions to lineside and on-train equipment, but places heavy reliance on reliability of electronic logic. North American practice, represented by the Washington Metro, is to build up a control hierarchy from elements which can function independently in the event of failure.

14 127912 NON-STOP ON THE TYNESIDE EXPRESS. This article is concerned with the construction of the first stage of the Tyneside metro. Monorails and minitrains were considered but rejected as offering no real advantages, and London style heavy tube trains discarded in favour of 27M long articulated cars in a light rapid transit system. A 75 percent government grant has been approved. The system is being fully integrated with other forms of transport, and a study has shown the system as giving an eleven percent return over an all-bus system. The author discusses the form of stations followed by an account of the construction of the first stage with particular reference to the problems encountered. Boulders prevented the use of a full-face tunneling machine and shields and roads headers are being used from both ends. Methods will be adjusted to suit ground conditions, and particular care is being taken to ensure the stability of overhead buildings. The methods include the specification of compressed air in some areas and,

the use of small explosive charges to remove siltstone. Tolerance in line, grade and circularity is only 30mm overall. The gateshead side of the river is riddled with old mine shafts, and requires special methods. These include drilling and grouting from above and the pneumatic stowing of pfa/cement and stone/cement grout. /TRRL/

FERGUSON, H *New Civil Engineer* No. 142, May 1975, pp 19-21, 2 Fig., 2 Phot.; ACKNOWLEDGMENT: TRRL (IRRD 214550); ORDER FROM: Institution of Civil Engineers, 91-93 Farringdon Road, London EC1M 3LE, England Repr. PC

14 128148 "SUPERTRAM" NETWORK TO SPEED TYNESIDE TRAVELLERS. The author discusses the "supertram" network at Tyneside and what it will involve. The decision to adopt a rapid transit system is considered feasible due to the combination of traffic congestion and government aid. The track will require a bridge across the river Tyne, tunnelling beneath the city centre and some re-alignment of part of the track already present from the river route towards the city. The cost of the phases of work is quoted. An overhead electrification system was selected because of greater safety. The 2-track Tyne road bridge will soon go out to Tender; the bridge is a through truss design connecting directly with a tunnel at the cliff face. A viaduct is also used and a test track is under construction. The electronically operated "Supertram" was chosen for its quietness and freedom from fumes; the train will run directly to shopping areas, hospitals and schools. Buses are expected to be used to transport people to the rapid transit systems and interchanges for public and private transport. /TRRL/

14 128887 OCCUPANCY DETECTION TECHNIQUES FOR TRANSIT SYSTEMS. A relatively simple and inexpensive method of verifying one of the most crucial functions in transit systems, that of continuous verification of train location is presented. While the system described is based primarily on hardware implementation, it would be relatively easy to implement the off-train logic using redundant minicomputers and software logic. While more sophisticated techniques could be developed, many present and future systems could adapt themselves to this technique, thereby increasing their reliability and safety.

14 129608 LIGHT RAIL TRANSIT SYSTEMS. This compendium of information on Light Rail Transit (LRT) systems operating in 23 cities throughout Europe and North America, describes types of LRT (such as tram, semi-metro, and pre-metro), vehicle types, city characteristics, and government policies relating to such systems. The systems described were predominantly radial network configurations serving center city, and mostly confined within a 5 km radius. Increasing use was noted of tunnel sections in the center city as well as pedestrian mall service. There was also extensive modal integration. The broad range of LRT fleets consist of single, articulated and trailer units. Observations are also recorded of the vehicle ability to serve both low and high level platforms, monitoring and signal prioritization, honor-type fare collection, performance, ridership, operating costs, and subsidy sources specific to each country.

14 129804 LIGHT RAIL TRANSIT: A MODERN RENAISSANCE. The evolution of light rail transit from the earliest street railways is traced. Between the demise of the electric interurban and streetcar systems and the resurgence in urban rail transit, the concept of light rail was lost. The rediscovery is not now motivated by sentimentality, but on the inherent advantages of this technology. Rapidly increasing costs in heavy rail development and uncertainty about new transit technology served to spark the new interest. It offers the opportunity to initiate rail transit development at rather modest costs. The flexibility of light rail technology allows transit service, system capacity and available resources to be traded off in a variety of ways.

Mills, JR *Transportation Research Board Special Reports* No. 161, 1975, pp 3-6; This article is extracted from Light Rail Transit, Proceedings of a National Conference conducted by TRB and Sponsored by UMTA, Am Public Transit Assoc and U Penn, 23-25 June 1975. 14 129806 THE URBAN MASS TRANSPORTATION ADMINISTRATION VIEW OF LIGHT RAIL TRANSIT. This paper addresses the issues of how the Urban Mass Transportation Administration views light rail transit, what future role UMTA sees for this technology in American cities, and what considerations lead UMTA to sponsor a Light Rail Transit Conference. Although UMTA recognizes the virtues of the light rail concept, it does not see this as a panacea for urban mobility problems. It is believed that light rail may be a major solution to the search for less costly, more efficient and more environmentally attractive transportation systems that can economically serve the dispersed land use and travel patterns of metropolitan areas.

Orski, CK (Urban Mass Transportation Administration) *Transportation Research Board Special Reports* No. 161, 1975, pp 14-15; This article is extracted from Light Rail Transit, Proceedings of a National Conference conducted by TRB and Sponsored by UMTA, Am Public Transit Assoc and U Penn, 23-25 June 1975. 14 129807 LIGHT RAIL TRANSIT: AN URBAN TRANSPORTATION ALTERNATIVE. The Urban Mass Transportation Administration expects federal policy for investment in major urban transportation projects to lead to a rational allocation of limited resources. This is not a new concept and analysis on the basis of cost effectiveness by both federal and local agencies should encourage more cities to consider light rail as an alternative. Light rail on exclusive right of way can be an attractive competitor to the automobile.

Herringer, FC (Urban Mass Transportation Administration) *Transportation Research Board Special Reports* No. 161, 1975, pp 16-18; This article is extracted from Light Rail Transit, Proceedings of a National Conference conducted by TRB and Sponsored by UMTA, Am Public Transit Assoc and U Penn, 23-25 June 1975. 14 129808 PHYSICAL, OPERATIONAL, AND PERFORMANCE CHARACTERISTICS OF THE LIGHT RAIL MODE. An overview of the light rail mode is presented. General characteristics and application of the mode are described, emphasizing the versatility of its guideway, the railway track. Physical characteristics of the right-of-way and ranges of dimensions for right-of-way and vehicles are discussed. Stations are discussed briefly. Basic technical simplicity of the light rail mode is pointed out as a significant virtue. Operating characteristics (both maximum running speeds and typical average operating speeds) are indicated. Acceleration of typical vehicles is noted. Frequency of service is discussed, and ranges for various traffic control systems are given. Riding quality and visual impact are pointed at as being favorable. Capacity of light rail lines is given as a few thousand to 12,000 passengers/h. In special cases, a high of 18,000 passengers/h can be achieved by using multiple-unit trains of 3 or more cars. Choices a designer has to attain maximum capacity are stated. Capital costs of contemporary new light rail systems are given as ranges of costs for various configurations. It is concluded that light rail transit is a medium-cost mode providing a medium level of capacity at medium speeds that can find application in many corridors or areas in medium and larger sized urban areas. It is pointed out that light rail is an existing mode with proved capabilities that needs little or no new research and development.

Vigrass, JW (Port Authority Transit Corporation) *Transportation Research Board Special Reports* No. 161, 1975, pp 19-25, 5 Ref.; This article is extracted from Light Rail Transit, Proceedings of a National Conference conducted by TRB and Sponsored by UMTA, Am Public Transit Assoc and U Penn, 23-25 June 1975. Payment in advance is requested. For handling charges add 5% for domestic and 10% for foreign orders.; ORDER FROM: TRB Publications Off

14 129812 PLACE OF LIGHT RAIL TRANSIT IN THE FAMILY OF TRANSIT MODES. The paper attempts to clarify concepts and terminology of urban transit systems. Modes are defined by type of right-of-way, system technology, and type of service and operation. Right-of-way is shown to be the most important single feature determining mode performance and cost. Advantages of partial or full separation of transit from surface traffic are defined. The basic features of system technology are analyzed. Guided systems are compared with driver-steered systems; rail systems are compared with rubber-tire guided systems; and manually driven systems are compared with automated systems. With respect to operations, it is pointed out that commuter transit should be a supplement to, not a substitute for, regular transit. An analysis of optimal vehicle

size shows that, for guided systems that are in use or may be operational in the near future, minimum vehicle capacity should be 40 to 50 spaces. Based on this analysis of mode components, it appears that potential light rail applications are in medium-sized cities as carriers serving major routes and in large cities as a supplement to rapid transit. In large cities with low densities, light rail transit or light rapid transit (fully grade-separated light rail transit) also has potential for application. Small cities and special services may sometimes also use this mode. The following rights-of-way are best suited for light rail street and highway medians, railroad rights-of-way, aerial structures, and, in downtown areas, short tunnel sections.

14 129814 ELECTRIFICATION AND CONTROL SYSTEMS FOR LIGHT RAIL SYSTEMS. This paper provides a broad overview of available electrification and control system technologies for new light rail systems. It is intended for groups with widely diverse backgrounds ranging from city planners to economists and consequently does not deal with detailed, specific, technical design parameters. The portion on electrification is subdivided into sections on power generation, distribution, and collection on the light rail vehicle. The portion on control systems is broader and is divided first into propulsion control on the vehicle and then into systemwide operational control features that are further subdivided into sections on control on the vehicle, control among a number of vehicles, control as a central status reporting area, and automation. The paper concludes with general recommendations for a typical light rail system but recognizes that conditions might require additional or fewer optional features. This is done to emphasize the flexibility and adaptability of light rail systems.

Touton, RD, Jr (Klauder (Louis T) and Associates) *Transportation Research Board Special Reports* No. 161, 1975, pp 86-92; This article is extracted from Light Rail Transit, Proceedings of a National Conference conducted by TRB and Sponsored by UMTA, Am Public Transit Assoc and U Penn, 23-25 June 1975. of a National Conference conducted by TRB and Sponsored by UMTA, Am Public Transit Assoc and U Penn, 23-25 June 1975. Payment in advance is requested. For handling charges add 5% for domestic and 10% for foreign orders.; ORDER FROM: TRB Publications Off

14 129821 LIGHT RAIL TRANSIT SOCIAL COSTS AND BENEFITS. This paper identifies the social aspects of light rail transit and categorizes them according to the viewpoints of the rider, those on the wayside, the community, and the contributor of capital funds. The physical characteristics and service qualities of light rail transit accumulate to benefits that are judged to outweigh the social costs. Highlighted is the light rail transit attribute of serving a greater number of persons' travel needs through extensive distance covered for a given investment, frequent stations, easy access, and short door-to-door travel time. The ability of light rail transit to condense the amount of time between ground breaking and operation of service is stressed. This is credited to simpler construction enabled by need for narrower rights-of-way, use of sharper curves and steeper gradients, and tolerance of grade crossings. The ability of light rail transit to evolve at a later date, through additional investment, into conventional rapid transit is acknowledged. The paper draws conclusions from a 1960 study in Frankfurt, Germany, that served as the springboard for the now extensive development of light rail transit networks throughout Europe. Instances of specific social aspects are cited.

Thompson, GJ *Transportation Research Board Special Reports* No. 161, 1975, pp 147-158, 2 Tab., 82 Ref.; This article is extracted from Light Rail Transit, Proceedings of a National Conference conducted by TRB and Sponsored by UMTA, Am Public Transit Assoc and U Penn, 23-25 June 1975. 14 129822 LIGHT RAIL TRANSIT SYSTEM EVALUATION. Evaluation of a light rail transit system involves many considerations that are specific to sites or systems and cannot be treated in a general study. However, it is possible to establish a value for reductions in running time relative to reductions in direct operating cost, savings in passenger time, and increases in net system revenue. These values, which depend on passenger volume, can be related to capital cost improvements. These include eliminating on-street running, eliminating grade crossings, instituting high-platform loading, and varying fare-collection systems. Brief comments are included on other factors of system evaluation including reliability, safety, and provision for future growth. The paper concludes that, although certain intensive improvements are likely to be justifiable, these must depend on a more detailed system-specific evaluation. In general it suggests that the planning and design of light rail transit should keep the system as simple as possible and, on the surface, avoid automatic application of rapid transit or railroad standards-and costs.

Parkinson, TE *Transportation Research Board Special Reports* No. 161, 1975, pp 159-166, 4 Tab. This article is extracted from Light Rail Transit, Proceedings of a National Conference conducted

14 129823 PUBLIC CONSIDERATIONS OF THE ECONOMICS AND MARKETING OF LIGHT RAIL TRANSIT. The term light rail transit is defined for its use in this paper. This paper is concerned with that type of rail transit that permits electric operation of rail vehicles, singly or in trains, and is capable of subway, elevated, at-grade, and in-street operation on any given route. Economics and marketing are related in the same manner that revenue and expense are related. Adaptation of the service to maximize public response cost will confer public benefits to both the user and the taxpayer when more costly alternatives are relieved or avoided. The unique aspects of light rail transit in developing and conferring benefits are reviewed and analyzed. Light rail transit is often less costly and more convenient than full-scale rapid transit; it is often more efficient, attractive, and economical than conventional bus transit within its proper area of operation.

14 129970 AN AUTOMATIC BLOCK SYSTEM OF A NEW TYPE GIVES FOR THE PRE-METRO A MODERN SOLUTION TO THE PROBLEM OF PUBLIC TRANSPORT IN VILLAGES OF AN AVERAGE IMPORTANCE [Un block automatique de type nouveau fait du pre-metro une solution moderne au probleme des transports en commun dans les villes de moyenne importance]. In order to attain its objectives transit must fulfil A certain number of conditions of which the main are: comfort, speed and frequency. The first part of the paper describes how to optimize the commercial speed and how to obtain, by A rational block system, a short vehicle headway, at the same time ensuring safety. The notions of mobile block, fixed block and buffer block are dealt with and illustrated by suitable applications. The second part gives a detailed description of the solution chosen for the Brussels pre-metro: four aspect block system controlled by logic fail-safe devices based on fully static technology, duplicated by pinpoint speed control using inductors and pick-up coils. The pre-metro so designed appears to be better able to solve public transit problems in medium size cities than does the traditional metro system. The covering abstract for the conference is IRRD no 215903. [French]

14 130793 SAFE TRAIN SEPARATION IN MODERN RAPID TRANSIT SYSTEMS. Modern rapid transit systems are equipped with automatic train control, slip-spin control, brake assurance system and emergency braking system. Therefore, the reaction times and operating conditions are more predictable and the braking distances can be calculated with a high degree of confidence. This paper describes a computer model for designing speed profiles in a transit system to optimize headway and average speed characteristics without compromising safety margins. The model may also be used to calculate safety margins when the transit system operates under impeded mode conditions.

14 131317 ANOTHER ALTERNATIVE: THE CASE FOR LIGHT RAIL. PART II. This article explores the cost factors and the planning and development of light rail and includes a worldwide survey of light rail technology.

Taylor, SF *Transit Journal* Vol. 1 No. 3, Aug. 1975, pp 45-63, 5 Fig., Tabs., 11 Ref.; ORDER FROM: American Public Transit Association, 1100 17th Street, NW, Washington, D.C., 20036 Repr. PC

14 131807 LIGHT RAIL TRANSIT: OUT OF HISTORY INTO NEW SOLUTIONS FOR URBAN MOBILITY. The potential of light rail transit to provide a new urban transport mode was considered at a 3-day conference. Development of light rail systems has been more rapid in countries where streetcar lines are still available than in the U.S., where most of the railway street industry was wiped out as highway construction advanced. Nonetheless, transportation planners are becoming more aware of the versatility of light rail systems with respect to location. Options for location are discussed, as are such aspects as community benefits and design characteristics.

14 132243 FULL SPEED AHEAD FOR THE SUPERTRAM. This brief article is concerned with the likely future of supertrams and is based on a recent conference on light rail transport held in Philadelphia. Interest in this mode of transport has been fostered by energy and environmental factors, rapidly increasing costs of conventional

rail rapid transit systems and an unexpected reaction against the difficulties of introducing advanced technology to public transport. Reference is made to the problems of BART, maglev, PRT and skybus to illustrate this point. The author points out that after 40 years of steady abandonment of trams, there is now a dramatic reversal. Extensive tramway upgradings have occurred in Germany, USSR and the Netherlands, and wholly light rail systems have been constructed at Tyneside, Utrecht, Edmonton and the Ruhr. An outline is given of this system (supertram) which employs small light vehicles designed for sharp curves and steep hills with rapid acceleration and frequent stops. Details are given of the German supertrams and of their system of payment which is designed keep manpower to a minimum. Tram systems are compared with bus systems and underground railways, and have the advantages over underground railways of being more flexible and less costly to construct, but require special priority measures to be able to compete with buses. It is said that in general light rail seems best for peak hour volumes of 6000 to 20000 and total daily volumes of at least 20000. Below that buses are better and above that the full underground is probably better. /TRRL/

14 133290 NEW YORK CITY TRANSIT AUTHORITY DESIGN GUIDELINES. SIGNALS AND COMMUNICATION. The main purpose of signaling is to provide safety and headway for rapid transit operations. This is accomplished by installing and interconnecting thousands of components of signal equipment into a coordinated system that, in all phases,

stresses safety. There are three (3) main classifications of signals: automatic signals, approach signals and home signals. The purpose of the manual is to assist in standardizing the procedures involved in furnishing and installing of equipment to establish a signal system.

14 136404 TRACK CIRCUITS AND NEGATIVE BONDING. The paper discusses cross-bonding of running rails to improve negative return path for propulsion current and to minimize electrolysis to adjacent structures. A standard application method is investigated to prevent interaction with railway train control systems when rails are used simultaneously for single rail track circuits or double rail track circuits. Application to audio frequency track circuits is discussed, and the effect of cross-bonding on broken rail protection is examined.

14 136566 RECOMMENDED PREREQUISITES FOR REPLACING CABS WITH SOR IN THE BART TRAIN CONTROL SYSTEM. An evaluation is given of the prerequisites for the replacement of the train control system for the Bay Area Rapid Transit (BART). The Sequential Occupancy Release System (SOR) has several potential advantages for long-range improvement over the currently used Computer Augmented Backup System (CABS): (1) better resolution capability--train occupancy information for more than 1500 individual blocks can be displayed; and (2) better maintenance capability--an automatic problem reporting system is compatible with the SOR system. SOR will, however, have some shortcomings with respect to certain operational problems, failsafe reliability, and failure detection. It is concluded that SOR, used as a backup system, can provide a level of safety comparable to that provided by CABS.

14 136568 EVALUATION OF BART, AUGUST 3 TEST FOR TRANSBAY SERVICE. A full-scale performance test is reported of the Computer Augmented Backup System (CABS) for the Bay Area Rapid Transit (BART). The test, involving 36 trains, was performed to analyze the original computer augmented train control system as it would operate in a failure situation. Recommendations for improved automatic safeguards were made to achieve two objectives: (1) to improve the CABS ability to automatically maintain a one-station separation between trains; and (2) to have the protection revert to that provided by the basic Automatic Train Control system for the worst case that could arise in the computer augmented system.

14 136571 BACKUP SYSTEM TO BART AUTOMATIC TRAIN CONTROL SYSTEM LEADING TO TRANSBAY CROSSING. PROGRESS REPORT, MARCH 1974. A program was begun to: (1) investigate problems of the Bay Area Rapid Transit District (BART) Automatic Train Control (ATC) system; (2) evaluate tentative corrective strategies; and (3) provide technical evaluations of other system matters. BART ATC problem areas include train detection and collision avoidance resulting from lost occupancy indications. Corrective measures, referred to as the Backup System, were developed to add additional memory capability to the ATC for the last detected position of all trains. Additional efforts are being made to measure the performance of the ATC and to evaluate the logic equations and the traffic-simulation programs.

14 138362 AN ECONOMIC ANALYSIS OF TRAIN CONTROL. This report represents the completion of project which deals with the economics of rapid transit train control. Information dealing with rapid transit control systems from all parts of the world is used for the development of a computer program to analyze costs of an automatic vs. manual train control system. The Train Control Analysis Program (TCAP) utilizes actual data from a rapid transit operator. This data can be from an existing manual system which is considering automation, or it may be a system in the planning phases, which is trying to determine the proper transit control to utilize. Once the data has been entered through the computer terminal keyboard, an analysis is made. The program operates in a time sharing mode so that it is very convenient to change certain input parameters and observe the corresponding analysis immediately. This program can be used to determine what the above benefits may cost in relation to a less sophisticated system. The results of this analysis may be used in the decision making process of selecting an adequate control system.

14 139490 THE RESURGENCE OF LIGHT RAIL TRANSIT. With the development of a new Standard Light Rail Vehicle there has been an increased interest in light rail systems for community mass transit. Light Rail Transit systems can be tailored to the needs of communities having too many passengers for successful busing and too few for an elaborate metro system. Existing systems, ranging from street running lines to private right-of-way cars, illustrate the diverse roles possible. Among many uses for the intermediate capacity light rail systems are: off loading subways; feeding and cross-connecting areas to subways, light car service for initial use on lines expected to grow to metro status; supporting special products such as entertainment centers.

14 139535 DUTCH CITIES BEGIN TO DEVELOP THE TRAM. A long period of decline eliminated trams from all but the three principal cities of Holland, but these networks are now being expanded and Utrecht is planning a new line. The tram is seen as a much cheaper alternative to the heavy metro, but more important is the way better management of street traffic to give trams priority is slowly tipping the balance against competing private transport. Trams have a higher passenger/crew ratio than buses.

14 139938 AUTOMATIC TRAIN CONTROL IN RAIL RAPID TRANSIT. The history of train control technology has seen extensive, but not complete, replacement of the human operator by machines. The increasing reliance on automation, both on existing transit systems and those under development, raises several basic issues about this application of technology. Questions about the safety, operational advantages, cost effectiveness and institutional factors associated with automation were raised by the Transportation Subcommittee of the Senate Committee on Appropriations in conjunction with federally supported rail rapid transit projects. This report deals with the degree of automation which is technically feasible, economically justifiable, or otherwise appropriate for rail rapid transit. Divergent opinions are included and, where the subject matter is controversial, an attempt has been made to present a balanced treatment.

14 141500 SINGLE TRACK WORKING. This paper examines the possibility of employing sections of single track for two-way operation of autotrams and metros in urban areas. A comparison between head-on and alternate operation, shows the former to be preferable for routes with long links and short waiting times. Alternate operation is advantageous when the link transit time is the same or only slightly more than the waiting time and a high frequency service is desired, and when the mean journey length is short. A cost analysis shows that for routes with

moderate passenger flows, elevated or tunnelled track and reasonably even and close station spacings, substantial overall cost savings can be achieved with a single track system: /TRRL/

14 143927 LIGHT RAIL TRANSIT: STATE OF THE ART REVIEW. Operational experience in cities of Western Europe and North America suggests that light rail is a viable transit alternative for U.S. cities as well. This state-of-the-art review seeks to establish a common level of understanding of light rail transit among planners, community leaders and decision makers. Contemporary planning concepts of light rail are reviewed and a description is provided of guideways, stations, hardware, operations and costs. The report examines the developmental trends of the last two decades which caused the revival of light rail in some western countries. The review focuses on the range of transit services offered by light rail, the utilization of a range of right-of-way opportunities along its routes, the lower investments and the potential for staged deployment associated with this mode.

14 144068 IN-SERVICE PERFORMANCE AND COSTS OF METHODS FOR CONTROL OF URBAN RAIL SYSTEM NOISE. EXPERIMENTAL DESIGN. This report presents an experimental design for a project to evaluate four techniques for reducing wheel-rail noise on urban rail transit systems: (a) resilient wheels, (b) damped wheels, (c) wheel truing, and (d) rail grinding. The design presents the project questions to be answered: (1) What reduction in noise can be achieved by the techniques, individually and in combinations? (2) What are the costs of the techniques? The design gives data requirements for acoustic testing on the Southeastern Pennsylvania Transportation Authority Market-Frankford Line, as well as requirements for collection of non-acoustic data covering all United States rapid transit systems. It prescribes methods for analysis of the data, means for drawing inferences to answer the questions posed, and formats for presentation. The design requires that the findings of the completed study be presented in a manner such that the information can be used by transit system personnel who may not have a background in acoustics or cost analysis.

14 148264 OVERVIEW OF EUROPEAN LIGHT RAIL DEVELOPMENT AND ITS SIGNIFICANCE IN NORTH AMERICA. The paper discusses the development of transit planning concepts in Europe as they relate to light rail systems, and shows how these concepts are intertwined with the parallel development of technology and operating techniques. Of particular interest are those areas in which a consensus

appears to have developed, such as in the design of vehicles and the treatment of grade crossings and intersections. In the past few years two forms of light rail are becoming discernable. These are typified by the high performance, high investment systems, and by a recent variation which seeks to achieve comparable performance by a low impact, low investment approach, relying heavily on exclusive transit lanes and signal pre-emption.

Fox, G (De Leuw, Cather and Company) ; American Society of Mechanical Engineers Conf Paper Paper P&P-26, 1976, 8 pp; Presented at the 4th Annual Intersociety Conference on Transportation, Los Angeles, California, July 18-23, 1976, see also RRIS 26 148247; ACKNOWLEDGMENT: EI; ORDER FROM: ASME

14 149008 TYNE AND WEAR METRO-A MODERN RAPID TRANSIT SYSTEM. The paper outlines the processes which gave rise to the rapid transit proposals for Tyneside, and the development of these into the Tyne and Wear metro. The concept of a fully integrated public transport system, capable of making a significant contribution to local movement and land use is explained, and the feasibility of introducing metro over a significant part of the existing British rail network detailed. A technical description of the metro includes civil engineering, signalling and communications, and electrification. The rolling stock is described in detail. The paper concludes with sections on finance and organization. /Author/ /TRRL/

14 149506 TRANSPORTATION YEAR OF TRAVAIL: ALTHOUGH SOME PROJECTS WERE HALTED OR DELAYED NEW URBAN AND MAINLINE SYSTEMS ARE PROCEEDING. The effect of adverse economic conditions on all forms of transportation is briefly discussed, and the observation is made that although some projects were halted or delayed, new urban and mainline systems are proceeding. Urban mass transit is considered to have been crippled even though transit technology has progressed. Automatic train operating systems in Montreal and Italy are described. The control systems also consist of an automatic train protection subsystem and an automatic train supervision subsystem. A West German Train-guidance System for a rapid transit network is also described. Another example of progress is the supertram concept (consisting of a 2-unit articulated vehicle carried on 3 bogies) of the lightweight rapid-transit system of Newcastle, England. Two minisized electric cars marketed in the U.S. are outlined, and comment is made on the return of the trolley car.

14 152678 FAILURE MODE AND EFFECT ANALYSIS FOR SYSTEM SAFETY ASSURANCE OF ELECTRONIC CONTROLS. The need to achieve the highest levels of train safety while offering fast service with short headways leads to specification of automatic train control (ATC) as a major subsystem of rapid transit operations. Specifications recognize potential consequences of malfunction on quality of service and safety. The automatic train protection function of the ATC system must not only have acceptable failure rates but any failures which do occur must not degrade safety. The author discusses analyses of the fail-safe function: Failure mode and effect analysis (FMEA) as applied to electronics, electrical/electronic safety analysis. The way in which General Railway Signal applies these methods is described.

14 152785 EVALUATION OF INTERMEDIATE CAPACITY TRANSIT SYSTEMS. This paper is concerned with the evaluation of intermediate capacity transit system (ICTS). The overall objective is to examine those technologies suitable for application to cities of 1/2 to 1 million population, and to present a framework for the evaluation of the systems when applied to such cities. The framework proposed is comprehensive but simple, using a linear rating technique to compare each system against set standards and objectives, with a subjective assessment of qualitative factors. The technologies evaluated provide capacity in the 6,000 to 20,000 persons per hour per direction range, cost approximately 1/3 to 1/2 that of heavy rapid transit on a per-mile basis and include such systems as light rail transit, light guideway transit and bus transit. The application of the framework is illustrated with an evaluation of candidate transit technologies for the City of Calgary which is typical of North American cities of approximately 500,000 population.

14 156220 TRAIN AND TRAFFIC CONTROL SYSTEMS FOR SUBWAYS. Automatic control of trains has so far been discussed principally in terms of control of individual trains. As far as control techniques are concerned, the target seems to have been achieved. Meanwhile, with the

successive introduction of practical supervisory systems that control train groups from the ground, progress is being made worldwide in the commercial application of a new type of highly efficient train control system by combining the ground-based system with the train-mounted system through a data transmission system. The high efficiency of the new system could never have been realized by individual ground or trainboard systems. This paper describes recent developments and examples of automatic train control systems with specific reference to the system for the Sapporo Municipal Transportation Bureau's Tozai Line. In this system, trains are automatically operated by transmitting data to them by very high frequency radio from the ground-based computer-aided traffic control system.

14 156221 TRAFFIC CONTROL SYSTEMS FOR RAILWAYS. Railways in Japan are shouldering ever-growing responsibilities as a means of public conveyance. Urban traffic particularly for commuters is expected to increase further in density. Consequently, speedier and more accurate operations are required for train traffic. And to secure safe and smooth transportation, new systems will be needed. Against such a background, this paper describes the latest results in computer-aided traffic control systems and outlines a few newly developed systems.

14 157952 TECHNOLOGY TRANSFER--TRANSPORTATION. The Technology Utilization Program of the National Aeronautics and Space Administration aims to transfer space-related technology to the solution of non-space problems. One of the areas is transportation. Members of SRI Technology Applications Team routinely work with a user community comprising, among others, DOT and the railroads. Rail industry needs addressed by the team included: the need for early warning of impending roller bearing failure; detection of residual stresses in wheels and rails; dynamic relationships between cars and track; quieting of diesel locomotive exhaust; fire-resistant construction materials and improved management techniques (for the rapid-transit industry).

14 159903 FORWARD TO LIGHT RAIL TRANSIT. The papers presented in this report cover a wide range of subjects related to light rail transit including a description of system concepts, such as performance characteristics of such transit; comparison with other modes; and applications. The technology and operational aspects of light rail transit are treated in a set of papers that address permanent way requirements, electrification and control systems, and U.S. and foreign vehicle developments. Of major significance are the economic considerations of light rail transit. A number of papers also discuss the various costs of construction, operation, and maintenance as well as social costs and benefits. The observation is made that the current trend to move away from a unimodal solution to a system that blends a number of discrete transit elements, each of which is closely tailored to demands and local conditions, should make light rail transit desirable for cities that require a fixed guideway system.

14 159904 INTRODUCTION TO LIGHT RAIL TRANSIT. The papers published here were presented at the National Conference which was designed to put forward the basic characteristics of light rail transit, and the techniques of applying it to improve transportation and the quality of urban life. The first session established the rationale for considering light rail transit from among several modes, and worldwide developments in light rail transit were described. The second session (on system concept) described specific characteristics that give light rail transit a place in the public transportation spectrum. How such transit coordinates with other modes was an important aspect of this session. Physical and operating characteristics were discussed in the third session; both fixed facilities and vehicle received extensive coverage. Economics (cost and revenue potential) were examined, and the beginnings of a method for selecting an optimum urban transport system that uses various modes were formulated in the fourth session. The final session, which considered the potential of light rail transit in the institutional context of contemporary American society, indicated that tangible effort must be made in the U.S. to emulate the developments in Canada and Europe if the true potential of this mode is to be realized.

14 163247 A PECULIARITY OF RAILWAY SIGNALLING: THE OVERLAP [Une particularite de la signalisation ferroviaire: l'overlap]. After giving a concise historical background to railway signalling, the author defines overlap and the different ways of achieving it in practice; with the automatic block, the overlap involves there being a protective zone down the line from

each block signal and this effects the block signal control for the section immediately up the line. The author then refers to uses of overlap on the metropolitan railways in London, Paris, Munich, Nuremberg and discusses the purpose of the system. [French]

14 164008 EDMONTON LIGHT RAPID TRANSIT—FIRST IN CANADA. The development of the Edmonton Rapid Transit (ERT) System is reviewed, the light rail vehicles used are described, and salient features of the signal and control system and grade crossings are noted. Conventional 1435 mm gauge tracks were introduced into an existing right-of-way. The light rail vehicles consists of six-axle, articulated, double-ended, multiple-unit vehicles of a standard design. The signal and control system selected for the ERT line provides automatic protection against collision between trains and against overspeeding on curves and crossing approaches. Nine grade crossings will be protected by existing devices as well as by devices initiated by the ERT

train operator. To minimize disruption of high-way traffic and avoid queued vehicles on the crossing, the ERT Signal System will be interfaced with a computerised traffic detection and control system operating adjacent signalled high-way intersections.

14 165803 TRANSPORTATION NEEDS OF THE ELDERLY AND HANDICAPPED. The current state of the transportation services available in the Toledo urbanized area was reviewed. While many services are offered, the services provided were exclusive rather than inclusive in their clientele. The number and location of the elderly/handicapped in the urbanized area was estimated and plotted by census tract. It was found that the elderly tend to concentrate in residential areas around the Toledo CBD, while handicapped tend to reside throughout the urbanized area. Specific transportation constraints were analyzed as to how they affect the mobility of the elderly/handicapped and were prioritized. Alternative service, equipment, and revenue strategies were reviewed to determine their applicability in meeting these constraints. A recommended transportation solution for the Toledo urbanized area promulgates a subscription service for the handicapped operated by TARTA using barrier-free, retro-fitted transit vehicles. To better utilize existing services, the study recommended bus shelters, improved information services, and continued cooperative inter-agency planning effort to improve transit services for the elderly/handicapped in the urbanized area. /Author/

14 166482 ALTERNATIVE CONCEPTS FOR UNDERGROUND RAPID TRANSIT SYSTEMS: EXECUTIVE SUMMARY. A study was performed for the Office of the Secretary of the U.S. Department of Transportation to determine if construction costs and operating energy requirements of future high-performance underground rail mass-rapid-transit systems can be decreased while maintaining or improving service. The alternative design approaches studied were limited to well-established design concepts which differ from those used in the BART (San Francisco), WMATA (Washington, D.C.) and MARTA (Atlanta) systems. They include: gravity assist; over/under tunnels; over/under and short stations; various subway train propulsion configurations; and optimized operational control policies. Comparisons were made of several system designs for a specific route and patronage structure. These comparisons indicate that it is practical to significantly reduce construction costs and operational energy requirements of modern underground systems while improving service by incorporating alternative concepts. Without any attempt at optimization, savings in capital costs in excess of 24% and savings in energy as high as 70% in traction effort and 88% in braking are shown to be achievable. The Executive Summary briefly describes the purpose, approach, and results of the study.

14 167598 INNOVATIVE SCHEDULING FOR THE BAY AREA RAPID TRANSIT SYSTEM. ABRIDGMENT. This paper explains the scheduling constraints imposed by both the computer automated block system (CABS) logic and the track geometry of the Bay Area Rapid Transit (BART) system in the Oakland area, which is called WYE because the track configuration is like a Y. The alternative schedules that were developed within these constraints to ameliorate the excess passenger demand on the Concord-Daly City route are also presented.

Harmon, FE (Bay Area Rapid Transit District) Wong, PJ (Stanford Research Institute) *Transportation Research Record* No. 627, 1977, pp 1-4, 4 Fig.; From TRB Record 627, Rail Transit.; ORDER FROM: TRB Publications Off

14 167600 AT-GRADE CROSSINGS OF LIGHT RAIL TRANSIT. ABRIDGMENT. The purpose of this paper is to provide a methodology for analyzing and estimating the effect of semiexclusive LRT line on motor-vehicle traffic. Four major concerns are identified: The expected level of impact on traffic; the improvements required in terms of added lanes; And, the minimum grade separation requirements. This type of analysis may provide the transportation planner with the tool by which the grade separation requirement could be minimized, or staged to some future year for the cases in which the motor vehicle flow was estimated at the time of the analysis would exceed the capacity, the additional ROW for crossing improvement was unavailable or too costly, or totally grade-separated intersections must be considered. The results of this analysis indicate that the deployment of LRT semiexclusive lines in fringe areas is a feasible alternative to transit lines that are totally grade-separated, fixed guideways. This analysis also indicates that, for LRT systems planned for multicar operations at high service frequencies, locating transit stops at grade crossing is desirable to reduce traffic impact.

14 167980 OPTIMUM STATION SPACING ON A RAILROAD LINE [Interstation optimale sur une ligne de chemin de fer]. The author makes a theoretical study of a model for building a railroad line or a metropolitan railroad in a given area taking the minimization of the passenger's journey time as the optimization criterion. Such a model enables the repercussion of the various solutions considered to be tested in relation to the cost of infrastructure, rolling stock and operations. [French]

14 168071 APPROACH TO THE PLANNING AND DESIGN OF TRANSIT SHELTERS. For a transit patron, the transit shelter is one of the most easily recognizable elements of the transit system, but, at present, this type of transit-interface facility is considered simply for its cosmetic value. This attitude creates a weak link between the transportation system and its users and can threaten the viability of the urban transit system. This paper presents the theses that transit shelters have a more significant role in the community and in the transit system than being just a windbreak or weather-protection device; that they are an interface point with the system and should protect, comfort, inform, and guide the user; that they should blend into the surroundings but still be visible; and that they should not be isolated or passive agents. The paper sets forth an innovative approach to the planning and design of shelters and describes what a shelter facility is versus what it ought to be. It also describes the types of activities that are involved in the development of the transit shelter and the types of functional social financial physical and user issues that should be considered. The benefits that can be derived through the use of this approach are discussed. /Author/

14 168076 TRAFFIC-CONTROL MEASURES AT HIGHWAY-RAILWAY GRADE CROSSINGS WITH PROVISIONS FOR LIGHT RAIL TRANSIT. Railway rights-of-way in cities are attractive alternatives for transit corridors, but, for modes that are not fully grade-separated, such as light rail transit systems, there may be problems with combined railway and transit crossings of arterial streets. This situation has been studied in Edmonton, Alberta, where a light rail transit line is under construction. The surface portion of this line is along the railway right-of-way, and as a result, the operation of its eight grade crossings is regulated by railway authorities. The short headways of light rail transit could cause frequent disturbances to the road traffic that operates at a saturation during peak hours. This paper illustrates the method used for the analysis of the problem and discusses the surveys conducted. The basic principles governing the solutions to the grade-crossing problem are (a) the coordination of adjacent signalized intersections in such a way that the impact of the crossing closure is minimized and the system recovers shortly after the closure, (b) the integration of light rail transit scheduling and control with traffic control, i.e., restricting the closures to the periods of minimum impact on road traffic, and (c) the use of special features to increase safety. /Author/

14 170469 AUTOMATIC TRAIN CONTROL FOR RAIL RAPID TRANSIT SYSTEMS. Most all rail rapid transit systems operate on a block signal approach for the basic train detection and protection system. This block system is described and two laws implicitly used in a control system are discussed. It is shown that these two laws are used as the basis for the hierarchical control system concept. Automatic train control systems are described for several current rail systems. References are discussed which indicate the future of this technology and the research areas which need to be pursued.

14 173415 A SIMULATION STUDY ON THE UTRECHT-NIEUWEGEIN TRAMWAY LINE [Simulatiestudie smeltram Utrecht-Nieuwegein]. Simulation may be a good tool, when one wants to get insight into the operation of a future transport system. This technique has been applied to the tramway line between Utrecht and Nieuwegein in order to get an impression of the extent of the variation in the travel times and its sensitivity to the traffic control at the intersections along the line and the location and size of the tram doors. Setting up a good simulation takes years, especially due to the construction of a valid model. This problem has been avoided by connecting some existing reliable models with each other. The simulation was tried out with good results on a tram line in The Hague. 14 176923 LIGHT RAPID TRANSIT. The phrase light rapid transit (lrt), together with alternative descriptions such as intermediate rapid transit (irt), or pre-metro has been used to describe those rail systems which were neither full or 'heavy' rapid transit systems, eg. the London underground, the Paris metro and the Munich u-bahn, nor conventional modern tramway systems. The author discusses the development of such systems and suggests that there are two main reasons for the interest in and development of these 'intermediate' systems: one to reduce the cost of a rapid transit system, and the other as an intermediate step to the achievement of a full rt system involved as this is with the necessity to provide for complex signalling systems, intrusive overhead equipment and larger cars. The author describes recent visits to Antwerp, Brussels, Cologne, Hannover and Frankfurt undertaken to study the current state-of-the-art in such transit systems, and to see if any principles or guidelines for more general application are discernible. In particular, does LRT have a place in Britain? The objectives, approach and systems are briefly described and contrasted. As a result of this study it is suggested that there are clearly two lines of development: the pre-metro system as being developed in Brussels, and the lrt systems as being developed as an end in themselves in Antwerp, Cologne/Bonn, Hannover and Frankfurt. Such developments are discussed, and the question 'do lrt systems have anything to offer in the British scene' is considered in relation to the Tyneside metro.

14 177181 SAO PAULO METRO E-W LINE INNOVATIONS. This paper describes the vehicles, track design, stations, and control system of the planned east-west line of the Sao Paulo (Brazil) Metro, scheduled to begin partial service by January 1980. Three objectives have been followed in the specifications for the E-W line. The first objective is to increase the reliability and availability of equipment on the E-W line. This is to be achieved by increasing the reliability of the equipment itself and by providing different levels of operation so that service can be continued under degraded conditions when equipment failures occur. The second objective is to increase the proportion of equipment manufactured in Brazil to 60% of total cost. The third objective is to reduce the cost per kilometer of the E-W line as far as possible.

14 177186 TECHNOLOGY SELECTION AND DEVELOPMENT FOR AN INTERMEDIATE CAPACITY TRANSIT SYSTEM. The objective of the Intermediate Capacity Transit System (ICTS) program is the development and implementation of a transit mode which offers a high degree of community acceptance and high service levels for urban applications in the capacity range of 5,000-15,000 pphpd. Elevated and at-grade guideways will be used as much as possible in lieu of underground construction to reduce system capital costs. The primary emphasis on urban integration has led to stringent requirements for minimum wayside intrusion. Features of the ICTS include steel-wheel on steel rail suspension, steerable trucks, alternating-current propulsion, and moving-block train control. The government of Ontario has funded a three year, \$55.5M development program to design, construct and test a prototype system. The ICTS program includes the development of advanced electrical systems for longitudinal control of the vehicle, specifically, high power inverters and complex microprocessor applications in braking and signalling.

14 178745 SOME AESTHETIC CONSIDERATIONS IN LIGHT RAIL DESIGN. Concern over the visual impacts of LRT remains one of the obstacles to a more general acceptance of the mode. Nor is this concern unjustified; for often, in the past, once a project had been approved, scant attention was paid by transit engineers to the appearance of LRT overhead and trackway. Yet all the fixed elements of LRT, trackway, overhead, and stations, are amenable to visual improvement if some of the principles of visual design, widely used in other fields, are applied. This paper outlines and illustrates some of the concepts that lie behind the installation of visually satisfactory and operationally functional LRT facilities, and suggests that closer coordination is needed between technical specialists and urban designers. /Author/

14 178947 TYNE & WEAR METRO DEFINES A CONTROL PHILOSOPHY. In 1979 8 km of Britain's first modern light rail system will commence operations in the northern suburbs of Newcastle-upon-Tyne. LRT practice in Germany and Belgium was the starting point in minimizing staff while keeping capital costs down. Although the 55-km network will be signaled throughout and stations will be monitored by CCTV from a central control room, routes will be set automatically through interlockings according to destination data derived from approaching trains.

14 179153 ECMT. ROUND TABLE 38 (PARIS, 24-25 MARCH 1977). POSSIBILITIES OFFERED BY CERTAIN TRADITIONAL TECHNIQUES FOR URBAN TRANSPORT. TRAMS AND TROLLEYBUSES [CEMT. Table ronde 38 (Paris, 24-25 mars 1977). Possibilités offertes par certaines techniques traditionnelles pour les transports urbains. Trams et trolleybus]. After a short historical review of rail-borne public transport and its competitors, the author studies what is actually required of local public transport. Respect for the environment and easy access to the town centre are two essential elements for assessing a public transport system, which, to be efficient, must have its own right of way. The author advocates "express trams" in medium-sized towns. [French]

14 179843 BOSTON'S COMPUTERIZED TRAFFIC CONTROL SYSTEM. To cope with serious traffic congestion on streets in the City of Boston, Massachusetts, a traffic signal control system which serves the demands of both private vehicles and public transit is being implemented. The initial project provides for control of Massachusetts Avenue, a principal north-south arterial

in Boston. All phases of the system will be under the supervision of the central computer located in a control center in Boston City Hall. The project is designed for expansion to include other locations, and Commonwealth Avenue is currently being added to the system. The nature of traffic operations on city streets requires that the control system be flexible to respond to the irrational and often unpredictable demands and conditions that occur, including double and triple parking. To provide this flexibility the system has been designed for alternative modes of operation, with changes and variations to these modes programmed as software items in the computer. A daily statistical printout, both tabular and graphic, with be produced automatically giving volume, occupancy, speed and stop data. In addition, the central control will have the capability of monitoring local controllers, sampling detectors, and stop-line presence detectors to determine whether they are functioning normally. Special detection equipment senses the movement of buses on Massachusetts Avenue and the central control computer then adjusts the timing of signals to accelerate traffic flow in approaches occupied by buses. In Commonwealth Avenue the system will include priority for street cars (trolley cars and light rail vehicles) which operate in the median. New trolley priority hardware and control logic have been developed for the Commonwealth Avenue trolley line. The control logic, uses two specially designed features to facilitate trolley movements through signalized intersections and eliminate conflicts with normal street traffic. Phase flipping is built into traffic signal controllers which permit the transit vehicle to effect changes in phasing in order to allow the traffic computer an additional degree of freedom. The second unique feature of the control logic is use of successively updated and narrowed predictions of trolley car arrival in a time window at downstream intersections with far side transit stops. /Author/

14 180311 REMOTE CONTROL OF THE R.A.T.P. ELECTRICAL ENERGY DISTRIBUTION SYSTEM. Structure of the electric power supply network for the subway system (Metro) in Paris, France, is described. The power is supplied by the Electricite de France nationally connected system directly at 63 kv from 8 supply points and at 225 kv from one supply point. Later two further 225 kv points will be added in 1977, and two additional points in 1979, all spread throughout Paris in order to diversify the supply sources. Operational and functional details are discussed, along with data processing and control facilities.

14 182595 AUTOMATIC CONTROL OF TRACKBOUND VEHICLES. Increased railway safety can be achieved by using modern electronic control techniques, such as the SELTRAC system for urban transport systems. On-board equipment for this system has been undergoing trials in Berlin. The control center transmits data such as expected position, maximum permissible speed, and recommended speed to the vehicle and the onboard control system compares this with the measured values. Any discrepancies are corrected by forwarding control signals to the speed control or braking systems. The paper deals with the techniques and especially the safety factors involved.

14 182763 ELECTRICALLY POWERED PUBLIC TRANSPORTATION SYSTEMS [Elektrisk Kollektivtrafik i Medelstore Staeder: en Dokumentation]. In December 1977 a seminar was conducted at the University of Linkeoping on the subject of electrically powered public transportation systems. During this seminar a general discussion took place on the various aspects of such systems, and the resulting report deals with the following topics: demand specification for public transportation systems in medium sized cities; energy and environmental aspects on city traffic; the Gothenburg tramcar study; tramcar traffic in Norrkoeeping (a report); development of light railway vehicles; the Linkoeeping case-light railway system; the uppsala case-a trolleybus study; trolleybus system in Linkoeeping-cost estimation. In the last three chapters of the report, a detailed economic comparison is made with other conventional bus systems, in regard to fixed costs, running cost of the various vehicles, depreciation of assets etc. Finally, a detailed technical description is given of some of the vehicles discussed at the seminar. /TRRL/ [Swedish]

14 183289 A MONITORING STUDY OF RAIL COMMUTING ON MERSEYSIDE: 1974 TO 1976. The authors took advantage of marked changes in transport costs--in petrol in 1974, in rail fares in 1975/76--to examine their effects on the patterns of commuting. They were particularly interested in substitution to public transport effects of increased petrol prices from the viewpoint of their wider study of energy consumption in surface passenger transport. The paper describes the data collection procedures in the study area and the monitoring data collected over two seasons, autumn to spring, 1974/75 and 1975/76. Its major findings include a significant

temporary increase in rail commuting in 1974 with a real increase of some 70 percent in the pump price of petrol, and travel decision evidence that a substantial majority of relatively new rail commuters had decided to commute by rail for more complex reasons than simple comparison of the time and money costs of travel by alternative travel modes. The monitoring data are also compared with those for rail commuting in the Merseyside conurbation as a whole. Factors which might have affected the monitoring data are examined, also the sensitivity of demand for rail commuting to increased out-of-pocket private transport costs, qualified estimates of cross-elasticities are presented. The study findings are discussed.

14 184602 TRAFFIC PLANNING FOR LIGHT RAIL TRANSIT. Planning for light rail transit in San Diego highlighted the need for special, detailed traffic engineering analysis as part of the transit design effort. While LRT offers significant cost-savings potential in an intermediate transit demand situation, it has attendant traffic impacts that bear close scrutiny. Such was the case in San Diego where 28 at-grade crossings and 1.6 miles of on-street operation were encountered. Conclusions resulting from the San Diego work, as reported on here, include the following: The traffic impact brought about by an LRT-traffic crossing, or by LRT operating on-street, must be examined over the entire area of influence—not just for the isolated intersection or street segment where the project is centered. Where an LRT stop is located near an intersecting roadway, Offset, far-side stops are least detrimental to the crossing traffic level of service, while offset, near-side stops are most detrimental to crossing traffic. With regard to on-street LRT operation, Mixed traffic environment is extremely detrimental to both LRT and auto levels of service; if parallel auto traffic is permitted, some physical or operational barrier should separate the LRT path; passenger boarding/deboarding areas require special attention due to safety considerations—the resulting treatment of vehicular traffic may be predicated on the placement of these waiting areas; prohibition of left turns by parallel vehicular traffic (in same flow direction as well as opposing flow) is a desirable safety measure, and mitigating measures must be viewed in terms of their appearance

relative to urban design impacts. Automatic gate protection has been shown to be superior to other types of warning devices. /Author/

14 184943 LIGHT RAIL TRANSIT IN MEXICO CITY. This paper presents an evaluation of the light rail transit system in Mexico City. It sets forth the effectiveness of the light rail transit mode as one of the several transport options offered to the ten million residents of Mexico City and details the operations of four of the principal routes emanating from the center of the city. The paper points out the advantages of Mexico City's light rail transit system in that it penetrates into small communities, passes easily through narrow and winding streets in the old sections of the city, and offers transport at surface level through those parts of the city more recently upgraded without polluting the areas either chemically or esthetically. The light rail transit mode operates with public fares at 30-60 percent lower than comparable alternatives in public transit.

14 194633 SITE-SPECIFIC ANALYSIS OF REGENERATION ON THE PATCO AND PAT CASTLE-SHANNON TROLLEY LINES. The use of regeneration as an energy conservation strategy was studied on the Delaware River Port Authority's Lindenwold Line (PATCO) and the Port Authority of Allegheny County (PAT) Castle-Shannon Trolley Line. These transit systems are quite different from each other in both operating and physical characteristics; the former characteristic of a commuter railroad and the latter a light rail vehicle system. The energy management simulation model, developed at Carnegie-Mellon University over the past two years, was used to realistically duplicate the operation of the systems under conditions of no regeneration and regeneration with both natural and assured receptivity. Although these two systems differ physically and operationally, energy savings on a percent basis under conditions of assured receptivity without on-board storage are rather similar—PATCO (28-32%), PAT (30-35%). On-board storage presents less savings—PATCO (25%), PAT (23%)—principally because of the additional weight required of the storage devices and associated control. Under conditions of natural receptivity, savings are smaller—PATCO (5-9%), PAT (10-12%). There are so many physical and operational parameters in a transit system which can affect the energy savings upon application of regeneration, that it is both necessary and desirable to do site-specific studies of this type when planning regeneration capability for either a new or existing transit system.

14 194645 "CLOSE HEADWAY" OPERATION FOR BAY AREA RAPID TRANSIT (BART). The original decision to signal BART for 90-sec headways was based on limited data collected mainly under "dry" and simulated adverse track conditions. Subsequent natural condition testing demonstrated that the corresponding 2.7 mph/sec design brake rate assumption could not be relied on in "wet" or rainy weather; and, consequently, BART has had to operate with station-to-station separation of

trains and severe speed reduction penalties. The above restrictions have, at times, caused a well-publicized throughput problem for the transit system. An initial test program was conducted by BART in the winter of 1975, making possible identification of important variables influencing train braking performance. However, firm conclusions regarding safe stopping distances could not be reached based on the 1975 data. In order to solve BART's stopping distance problem and provide "close headway" operation to the public as originally promised, a major full-scale test program was conducted during the winter months of 1977-1978 to accurately determine train braking performance under adhesion-limited conditions. This program made use of some basic concepts from the statistical theory of experimental design. The main results and conclusions of this study, recommending safe and efficient "close headway" operation for BART, is the subject of this paper.

14 195720 ADVANCEMENTS IN AUTOMATIC TRAIN CONTROL FOR RAPID TRANSIT SYSTEMS. A versatile and proven solid-state train control system has been operating on the Paris Metro since 1970. An updated version of this system is now being offered in the U.S. Unique features of this system are: track circuits for train detection that have a block detection accuracy better than one foot with continuously-welded rail, and are virtually immune to propulsion return-current harmonics; a highly flexible two-way data link between the trains and the wayside using a remote inductive antenna; and extensive use of lightweight, fail-safe solid-state relays in both wayside and carborne equipment.

14 196379 RAIL-TRANSIT PEOPLE-MOVER HEADWAY COMPARISON. For many years, the General Railway Signal Company has supplied control systems for conventional rail transit. Headways for these systems range from minutes or hours down to as low as 75 s. In the last few years, the company has supplied control systems for people-mover applications in which minimum headways of 10-20 s have been achieved. There are many factors working together to permit achievement of this large reduction in headway. These factors are identified and evaluated for their impact on capacity. The fundamentals underlying the disparity in headway are discussed from the viewpoint of potential for increased capacity of rail transit.

14 196948 CENTRALISED SIGNALLING CONTROL AND SUPERVISION OF THE SERVICES ON THE LONDON UNDERGROUND. It is the policy of London Transport to supervise the operation of its railroad services from central control rooms, each covering at least one line. The lines are, where possible, operated independently of each other so that a disruption in any part of the system is contained, leaving the remainder unaffected. Each room is connected to local signaling interlockings which normally operate individually in an automatic mode. If there is a disruption, delays are minimized by regulating the service from the central control room. Traffic regulators in these rooms are able to coordinate the routing of trains through the various local interlockings; each traffic regulator is provided with a control console from which changes may be carried out.

14 197888 RELIABILITY IMPROVEMENT OF BART TRAIN CONTROL. Results of a two-year effort of a task group to improve the reliability of the Bay Area Rapid Transit district's vehicle-borne Automatic Train Control equipment are reported. The effort included modifications to the train control equipment designed both by the manufacturer and by the task group. It also included the development and implementation of improved maintenance test procedures and equipment. A significant constraint on this effort was the need to maintain, and where necessary, improve the fail-safe nature of the train control system. Particular attention was paid to reducing the fraction of maintenance diagnoses which resulted in a No Trouble Found report; at the start of the task-team effort, these represented half of the revenue service failures of this system. A substantial improvement in the maintenance capability and decrease in service failures has resulted from this effort.

14 198186 EVALUATION OF SIGNAL/CONTROL SYSTEM EQUIPMENT AND TECHNOLOGY. TASK 1: ASSESSMENT OF SIGNAL/CONTROL TECHNOLOGY AND LITERATURE REVIEW. The report presents the results of an investigation to obtain an assessment of the present technologies in use throughout the world for railroad signals and control systems applicable to high-speed passenger trains. Questionnaires were developed and sent to foreign and domestic railroads, rapid transit systems, and manufacturers of signal and control equipment. Railroads, transit systems and manufacturers were visited and interviewed. Many hundreds of articles and technical papers were researched. Over 250 were cataloged, translated and cross-indexed to form a complete technical library. This inventory data has been arranged to permit a logical review of all known technology in relation to each type of railroad signal or control system or subsystem(s).

14 241785 INVENTORY, EVALUATION AND SYSTEM PLANNING OF THE SAN FRANCISCO MUNICIPAL RAILWAY POWERPLANT. THIS REPORT DEALS WITH A PROPOSAL TO MODERNIZE SAN FRANCISCO MUNICIPAL RAILWAY'S (MUNI) EXISTING POWERPLANT. MUNI OPERATES AND MAINTAINS SEVEN SUBSTATIONS (BRYANT, DOWNTOWN, RICHMOND, SAN JOSE, TURK, WEST PORTAL, AND OUTER MISSION) AND THE DISTRIBUTION SYSTEMS FOR TROLLEY COACHES AND STREETCARS. AN ANALYSIS OF OPERATIONAL PROCEDURES AND MAINTENANCE FUNCTIONS OF THE POWERPLANT SHOWED THE SYSTEM'S FLEXIBILITY TO BE LIMITED BY THE WEST PORTAL AND OUTER MISSION SUBSTATIONS, ELECTRICALLY ISOLATED FROM THE DISTRIBUTION SYSTEM. THE FIVE ROTATING MACHINERY SUBSTATIONS CONTAIN OUTDATED EQUIPMENT, EXPENSIVE TO OPERATE AND TO MAINTAIN, AND FOUR OF THE SUBSTATIONS CONTAIN ABANDONED EQUIPMENT. INTERIOR LIGHTING BEING INADEQUATE, OPEN-FACED SWITCHGEAR CONSTITUTES HAZARDOUS OPERATING CONDITIONS FOR THE POWERPLANT OPERATORS. THE FIRST PHASE COINCIDES WITH BARTD OPERATION IN SAN FRANCISCO AND COMPLETION OF THE MUNI SUBWAY UNDER MARKET STREET AND IN THE TWIN PEAKS TUNNEL; IT ENTAILS REDUCTION OF TROLLEY COACH LINES AND EVENTUAL ELIMINATION OF STREETCAR LINES, DECREASING POWER LOAD REQUIREMENTS OF VARIOUS EXISTING SUBSTATIONS, PARTICULARLY BRYANT, RICHMOND, AND TURK SUBSTATIONS. SOLID STATE RECTIFIER TYPE ELECTRIFICATION EQUIPMENT IS RECOMMENDED FOR THE MARKET STREET-TWIN PEAKS RAPID TRANSIT LINE; THIS ELECTRIFIED SYSTEM UTILIZES A THIRD RAIL FOR SUPPLYING POWER TO THE RAPID TRANSIT TRAIN. THE PRESENT TWIN PEAKS SUBSTATION WOULD BE RETAINED AND THE OUTER

MISSION SUBSTATION (750 KW) WOULD BE RELOCATED TO SUPPLY POWER TO THE NEW RAPID TRANSIT RAILCAR FACILITY. THE DOWNTOWN, TURK, BRYANT, RICHMOND, AND SAN JOSE SUBSTATIONS MAY BE SCRAPPED, WITH THE 600 V D.C. POWER SOURCE OF THE TROLLEY COACH LINES, NOW SERVICED BY THE PRESENT MUNI SUBSTATIONS, BEING SUPPLIED BY THE RAPID TRANSIT SUBSTATIONS. THE PROJECTED PHASE OF THE PROGRAM PROPOSES TWO ADDITIONAL RAPID TRANSIT LINES. THE SUNSET CORRIDOR RAPID TRANSIT LINE REQUIRES TWO SUBSTATIONS AND THEIR ASSOCIATED EQUIPMENT; THE RICHMOND CORRIDOR RAIL RAPID TRANSIT LINE REQUIRES FIVE NEW SUBSTATIONS AND THEIR ASSOCIATED EQUIPMENT. THE TROLLEY COACH LINES BEING SERVICED BY THE PACIFIC GAS AND ELECTRIC COMPANY SUBSTATIONS PRIOR TO THE LATTER LINE BEING INSTALLED, WOULD BE SUPPLIED BY THE RAPID TRANSIT SUBSTATIONS; THE SUBSTATION PACKAGES, THE SILICON RECTIFIER TYPE WHICH CONTAINS THE NECESSARY A.C. AND D.C. SWITCHGEAR, TRANSFORMERS, ETC., CAN BE PLACED IN TUNNEL VAULTS OR IN PROPOSED PASSENGER STATIONS. THE SUBSTATIONS WOULD BE SUPPLIED FROM TWO INDEPENDENT 15KV A.C. 3-PHASE FEEDERS TO PREVENT OUTAGES; SUFFICIENT D.C. CIRCUITS ARE PROVIDED TO SUPPLY THE THIRD RAIL WITH MANUAL DISCONNECTS AT THE RAIL FOR MAINTENANCE OR REPAIRS. /UMTA/

14 301195 POSSIBILITIES OF AUTOMATIC CONTROL SYSTEMS INCORPORATED IN ELECTRIC TRACTION EQUIPMENT, THEIR COMMAND SEQUENCE AND EXAMPLES OF SIGNAL TRANSMISSION USING LIGHT GUIDES [Möglichkeiten der Automatik in Elektrischen Traktionsausruestungen, ihr Befehlsablauf und Anwendungsbeispiele der Befehlsuebertragung Mittels Lichtleiter]. Following an outline of the developments in the control of electric motor vehicles, especially for local transport, an automatic traction control equipment is described. The important signals to be processed, such as current setting, load compensation, slip-slide protection and power control of series and induction traction motors are discussed. The principal features of a signal transmission system using light guides are mentioned and described by means of examples. [German]

14 301298 EVOLUTION OF LIGHT-RAIL TRANSIT. Social, economic, and governmental needs frequently dictate changes in the use of urban transport technology. It is the evolution of public belief and policy that most influences the development of any technology. Overdependence on petroleum fuels for transport and industrial growth has cast doubt on long-term options for continued urban life-styles and mobility. There is a need now for planning and deployment of new light-rail transit (LRT) systems. LRT, like all forms of transport, must be judged on its benefits and social costs to both users and nonusers. A look at Ghent, Hannover, Mannheim, Zurich, and Utrecht can show the transit planner how five cities have developed and used their LRT services in a manner that provides greater accessibility for all citizens as well as less direct pollution and easier adaptability to the existing urban setting. The technology of LRT is simple when innovative planning and engineering are used. /Author/

Rogers, LH (Institute of Public Administration) *Transportation Research Board Special Report* Conf Paper No. 182, 1978, pp 4-8, 1 Ref.; This paper appeared in TRB Special Report No. 182, Light-Rail Transit: Planning and Technology.; ORDER FROM: TRB Publications Off

14 301299 CURRENT TRENDS: PROBLEMS AND PROSPECTS OF LIGHT-RAIL TRANSIT. The difficult task of rescuing our urban transit systems from several decades of neglect has only started. Among the obstacles to transit improvements is our deeply rooted double standard for different types of expenditures: Purchase of wasteful items by consumers is considered to move the economy but the use of public funds, even for the construction of very useful projects, is often criticized as wasteful. Another serious obstacle to the development of rail transit in our country has been a lack of expertise in the planning, technology, and operation of these modes. We have virtually invented a new mode: unreliable rail transit. A concerted effort must be made to apply the technical skills that this technology requires to fully realize its great potential. A major step toward that goal would be made if the Urban Mass Transportation Administration would redirect some of its efforts from the development of exotic modes (some of which have little potential) toward the modernization of standard rail and bus technologies. In spite of these obstacles, light-rail transit (LRT) has recorded significant advances. It is now broadly recognized as a serious contender for major transit improvements in many medium-sized and large cities. Its modernization in Europe is continuing, new LRT systems are under construction in Canada, and several U.S. cities are actively planning or designing new LRT systems. There is also a major potential for extensive deployment of LRT in the large cities of developing countries that has not been fully recognized yet. President Carter has promised to pursue three important goals: to revitalize cities, to decrease unemployment, and to increase energy efficiency; if he takes a correct path toward these goals, we should see construction of LRT in a number of our cities in the near future. /Author/

14 301300 ISSUES IN THE IMPLEMENTATION OF LIGHT-RAIL TRANSIT. A conference on light-rail transit (LRT) invariably seems to draw out a highly explicit discussion about car design, the existence of rights-of-way for construction, and the great disparities between European advances and those in the United States. This paper suggests that, despite the high degree of competence that the technical community can claim in advocating LRT implementation, it is all little more than an academic exercise if the local, state, and national political realities are not recognized as integral aspects of implementation. The discussion in this paper is based on a survey conducted on a national scale of the key political figures in those states or areas considering LRT, as well as many key members of the agency and consulting staffs. The paper calls attention to the essential weaknesses inherent in current efforts to revitalize LRT as a primary element in urban transportation. /Author/

14 301301 SAN FRANCISCO'S MUNI METRO, A LIGHT-RAIL TRANSIT SYSTEM. This paper describes improvements that are being made in San Francisco's light-rail (streetcar) transit system, the Muni Metro. The new dual-level Market Street subway accommodates Muni on the upper level and the Bay Area Rapid Transit System on the lower level. The new articulated light-rail vehicles, designed to serve the needs of both San Francisco and Boston, are described. In order to provide facilities for storage and maintenance of these vehicles, a new rail center is being constructed. The design of this facility was a particular challenge because of constraints imposed by the small size of the urban site used. Virtually all surface tracks in the city are being replaced. Muni had hoped to develop special transit rights-of-way in conjunction with the rerailling projects but encountered a political snag in the process. The power supply system that provides Muni's electrical power is unique, and the facilities it uses are also being upgraded. Finally, several route extensions contemplated by Muni are described. The new Muni Metro system is scheduled to be in full operation in late 1979. /Author/

14 301302 EDMONTON'S NORTHEAST LIGHT-RAIL RAPID TRANSIT LINE. Edmonton's light-rail transit (LRT) line has a total length of 7.2 km, 1.6 km of which is in subway. The line goes from the central business district (CBD) to the northeast sector of the city and uses the Canadian National Railways right-of-way. The project was approved at \$65 million and is currently below estimates as well as ahead of schedule. The LRT line is the result of a balanced transportation plan that was finally adopted in 1974 to serve a city of nearly 500,000. The subway portion has two underground stations with full mezzanine floors. The mezzanine floors are part of an overall pedestrian system and connect with the basements of adjacent buildings. The subway was built to accommodate the largest standard subway car. The equipment specifications for the 14 articulated cars were based on performance and proven reliability. The construction methods used caused a minimum of interference in the CBD. Since relatively small portions were let successively, local contractors were able to use proven techniques to handle the work on a fixed-price basis. Despite the severe inflation of 1975 and 1976, costs were kept within reasonable limits. The proposed service will provide 5-min headways in the peak hour, giving a capacity of 5000 passengers/h. At midday the headway will be 10 min. The LRT line will be fully integrated with the bus transit system, and timed transfers will be provided between bus and rail. The LRT line in Edmonton makes use of available opportunities and provides the least expensive solution to the transportation problems of the northeast sector and its rapid residential development. /Authors/

14 301303 CALGARY'S LIGHT-RAIL TRANSIT SYSTEM. This paper describes some of the background to the development of the South Corridor light-rail transit (LRT) line in Calgary. Characteristics of the city, the corridor, and the existing transit system are also presented. The results of a recent study undertaken to determine the type and timing of transit improvements are briefly summarized. Alternatives studied in detail included LRT, busways, and exclusive bus lanes; LRT was selected and implementation has begun. Finally, the paper describes the vehicles and route chosen.

14 301304 BUFFALO'S LIGHT-RAIL RAPID TRANSIT SYSTEM. The 1976 agreement in principle by the Urban Mass Transportation Administration (UMTA) to participate in the financing of Buffalo's \$336 million light-rail rapid transit (LRRT) project was the culmination of almost 10 years of planning by the Niagara Frontier Transportation Authority and the western New York community for an integrated bus and rail rapid transit system. At least 5 more years of design development and construction lie ahead. This agreement also marked the end of a lengthy, and often frustrating, alternatives analysis process that helped to guide UMTA's development of federal policy on major urban mass transit investments. Buffalo will be the first U.S. city to have a completely new rail transit project that features the advantages of light-rail technology. This paper describes the LRRT project and reports on the results of the alternatives analysis process. Comparative cost-effectiveness statistics for various transit alternatives are included in the paper. The current phase of project development (general architecture and engineering) is described, and a schedule is given for the completion of the system. /Author/

14 301305 LIGHT-RAIL TRANSIT IN PITTSBURGH. The \$228 million Early Action Program conceived by the Port Authority of Allegheny County in 1969 and funded by the local, state, and federal governments in 1970 was intended to end the seemingly endless series of biennial transit studies and begin the construction of a countywide rapid transit system on an incremental basis. It was to use various technologies, including existing trolleys, exclusive busways in the east and south, and the Transit Expressway (Skybus)—rubber-tired computer-

controlled vehicles tied to an exclusive guideway--in the South Hills sector. Perhaps no rapid transit effort, especially the Transit Expressway element, has undergone as close public and technical scrutiny as has the Early Action Program. The inability to implement the program expeditiously resulted in the Urban Mass Transportation Administration's suspension of further action in the South Hills sector in October 1974. In 1975, key representatives of local and state governments as well as the Port Authority began working together to break the deadlocked argument about a fixed-guideway transit system for the South Hills corridor. An independent consultant was selected to perform the final alternatives analysis. When the South Hills alternatives analysis was completed and the recommendation of light-rail transit (LRT) technology was accepted in March 1976, a community consensus had been achieved. As a result, the Port Authority amended the Early Action Program to substitute LRT for the rubber-tired vehicles on the Transit Expressway and is proceeding with engineering and environmental impact studies with the objective of having the first stage of the LRT system operational in the South Hills sector by the Early 1980s. /Author/

14 301306 LIGHT-RAIL TRANSIT: LESS CAN MEAN MORE. Perhaps the single most appealing and most useful characteristic of light-rail transit (LRT) is its inherent flexibility. Yet engineers and planners have sometimes overlooked the opportunities that accrue from this flexibility and have tried to use LRT to create a system as much like conventional rapid transit as possible at less than rapid transit's cost. This paper explores LRT's flexibility to operate in a conventional rapid transit environment, as well as its ability to not operate in a rapid transit environment. LRT is also at home in contexts more typical of the bus mode. This provides for a broad range of designs between these two extremes and allows optimal design choices to be accommodated. Design options considered in this paper include right-of-way treatment, approaches to fare collection, grade and curvature alignments, high-versus low-level platforms, signal and vehicle-protection requirements, and trade-offs between speed and capacity. /Author/

14 301313 FORT WORTH'S PRIVATELY OWNED SUBWAY SYSTEM. For the past 14 years a small subway system has been carrying passengers into and out of the central business district (CBD) of Fort Worth, Texas. It has two unique features: It is privately owned, and passengers ride it for free. In the early 1960s, two merchants in Fort Worth hit on the idea of providing subway service to their downtown

department store from a large parking lot on the banks of the nearby Trinity River. They bought second-hand electric trolley cars from Capitol Transit Company of Washington, D.C., modified them extensively, dug a tunnel from the edge of the parking lot to the lower level of their store, and began operating the subway in February 1963. Tandy Corporation bought the department store in 1967 and continued to operate the subway, which carried nearly 15,000 passengers/d. Tandy is now rebuilding the subway cars to give them a squared-off configuration and many refinements. Introduction of these refurbished cars will coincide with the opening of Tandy Center--an eight-block complex of office buildings and shopping malls in downtown Fort Worth that the subway system will serve. There has been some preliminary exploration of the feasibility of extending the subway system several blocks south through the CBD. This short-haul do-it-yourself subway system has proved that shoppers and downtown workers can be induced to leave their automobiles in a fringe parking lot and ride into the heart of the city by light-rail transit. /Author/

14 301314 EVALUATIONS OF OPERATING LIGHT-RAIL TRANSIT AND STREETCAR SYSTEMS IN THE UNITED STATES. The goal of the research presented in this paper is to evaluate how closely each of the light-rail transit (LRT) and streetcar systems in the United States approaches the LRT concept. Both LRT and streetcar systems are evaluated because the usual pattern of development, here as in Europe, has been for streetcar systems to be upgraded gradually to LRT standards. Of the surviving networks, several run largely on reserved rights-of-way and closely approach the LRT concept; others are clearly street-car operations that possess few true LRT characteristics. Highlighting the strengths and weaknesses of existing systems should be helpful to those planning new LRT installations. The paper also stresses two of the most important qualities of LRT systems: (a) flexibility in right-of-way location and its concomitant, the ability to improve segments of systems on an incremental basis, and (b) ability of systems constructed in a trunk-and-branches pattern to provide both line-haul and collection and distribution functions, thus giving most patrons a single-vehicle ride. /Author/

14 301317 CONTROL OF LIGHT-RAIL TRANSIT OPERATIONS IN EDMONTON. The first line of Edmonton's light-rail transit (LRT) system is currently being completed. The underground portion of the line in the downtown area connects to a surface portion that shares its corridor with a major railway line. Interactions between the railway, LRT, and other transportation modes have created problems in the areas of safety, roadway capacity, and regularity of service. This paper describes the approach taken in Edmonton to overcome these problems. The new transportation management system, which is in its initial stages of implementation, is a major tool in minimizing the negative impacts of LRT. The system focuses on the establishment of LRT controls that, in addition to the categorical requirements of safety, must guarantee optimum use of the LRT tunnel, which in turn depends greatly on the regularity of service on surface portions of the LRT line, and integration with other transportation modes in terms of safety, coordination of scheduling between LRT and buses, and minimization of disruption to all modes at the nine grade crossings. In general, the flexibility of LRT operations and the implementation of an integrated transportation management system has enabled cost-effective solutions to be developed. /Author/

14 301318 LIGHT-RAIL TRANSIT SIGNALING. This paper presents considerations regarding conventional signal systems that should be helpful to people planning a light-rail system. Attention is first directed to establishing the need for a signal system, including a discussion of its advantages and disadvantages on the basis of the technical, operational, economic, labor, and regulatory elements involved. A definition of conventional signal systems is provided, and the various types of systems are explained on the basis of their capabilities. Safety and failure modes are addressed as the key issues in any signal-system design. To illustrate the importance of all these factors, a comprehensive description of the new San Francisco Municipal Railway's subway signal system is presented, and conclusions are then drawn as to the general design concepts required for other future light-rail systems. /Author/

14 301324 INVESTIGATING THE POTENTIAL FOR STREET OPERATION OF LIGHT-RAIL TRANSIT. This paper examines the potential for light-rail transit (LRT) operations in the street with mixed traffic. It is hypothesized that street operation of LRT is possible, and in some areas desirable, for both cost reduction and service improvement. It is believed that the potential cost savings in construction should lead planners to consider using LRT in streets. However, little work has been done in analyzing the problems associated with street operation. This paper attempts to establish a systematic framework for investigating the potential for a shared street environment and to stimulate a discussion among LRT Planners about the role of street operations in proposed systems. The methodology used in this study has two phases: the identification and investigation of the associated problems and the analysis of various design elements and strategies. Several possibilities for street operation are discussed and the generic problems of street running and traffic conflicts are analyzed. The approach is based on existing data from Toronto. /Author/

14 301325 INSTITUTIONAL BARRIERS TO IMPLEMENTING LIGHT-RAIL TRANSIT. The workshop briefly reviewed the different types of institutional barriers to the implementation of light-rail transit (LRT), and discussed issues raised by participants. The institutional barriers include those relating to the blurred definition of LRT, the issue of who makes the decision about LRT, and the complexities of the governmental process. Institutional barriers at the federal level are perceived to be of a bureaucratic nature. The overlap of programs of different agencies have also caused problems. Among the issues raised by participants was the question of how an urban area achieves consensus to ensure the implemen-

tation of capital improvements on a system-wide basis without a public referendum, the issue of support for non-highway projects by state departments of transportation, the subversion of the metropolitan planning process by state agencies and federal funding inequities, and the federal framework for the examination and evaluation of mass transportation facilities. Views were expressed on WMATA. A private industry spokesman expressed disappointment with UMTA'S lack of action in approving LRT systems, and a congressional aide explained congressional intent with regard to the Urban Mass Transportation Program. It was also pointed out that the weakness of the transit industry itself was a formidable barrier.

14 302384 A PLANNING MODEL FOR PHASING IN A NEW FLEET OF LIGHT RAIL VEHICLES. This paper describes a computerized planning model developed to assist the operations planning groups of urban transportation systems. The model is to be utilized in planning the phasing in a fleet of new light rail vehicles (lrvs). The model consists of a system of interrelated, calibrated mathematical functions following iterative procedures to meet specified tolerances. Applications of the model are given within the context of the Massachusetts Bay Transportation Authority. The experimental investigations include: the impact of the lrvs on ridership demand, operating costs, revenues and on operating performance measures. Additionally, assignment rules for allocating arriving lrvs are evaluated. The experimental results show that the "best" assignment rule changes as a function of the number of lrvs available. In addition, the results show that following the introduction of the lrvs, "economies of scale" can be expected. The model is written in FORTRAN and consists of ten modules, the main routine and nine sub-routines.

14 309928 NOTES ON LIGHT RAIL TRANSIT IN GREAT BRITAIN. This report combines a broad review of the state-of-the-art in modern light rail transit (LRT) systems with a survey of the potential for their introduction in the larger British cities. Following a short history of Britain's earlier tramways, an account is given of the latest techniques and technologies, with an example in the Tyne and Wear Metro. A look at costs shows that in favourable circumstances the savings in operating cost compared with urban buses can help to offset the much greater initial capital cost of an urban light railway. Recent experience in western Europe demonstrates this operational saving, and shows that LRT can also be more attractive to passengers than buses. Although several studies of possible LRT systems have been made recently in Britain, a survey of planners and transport operators in eleven large cities showed their preference for electric buses-battery or trolley-should oil become prohibitively expensive. There are comparatively few cities where LRT could be installed without physical difficulty or uneconomic expense. Even so, LRT could be economically attractive in several cities now because of its potential to lower operating costs. Recommendations are made for further study.(a)

14 309932 POLITICAL STORM BREWS OVER TYNESIDE METRO. The article describes progress on the 54 km Tyneside metro system which will use existing BR track or rails

laid alongside. Delays and a large increase in costs are causing concern for the local council, particularly as the government has a fixed price ceiling for the contract. Difficulties have arisen over the transfer of BR staff and the access to BR land for construction. However the twin 4.8 M diameter tunnels below the city centre are nearly complete. Problems encountered in the construction of the totally underground Monument station are described; it is estimated that completion will be delayed by about a year. Some delays were also experienced due to union action at Greensfield, where twin tunnels mainly in cut and cover, have been driven through a large maintenance shed and a marshalling yard. Accurate timing was essential as 10 weeks notice of track possession had to be given. Glacial deposits in the ground at this site required excavation with supported sides.

14 309936 MODERN TRAMWAY [Le tramway moderne]. Compared to French tramways just after the war, the modern tramway is a new transport mode which combines comfort for the user and safe operation for the operator. This article outlines the characteristics of the modern tram (permanent guidance, use of metal on metal, electric traction), performance as regards speed when loaded and empty, and noise level. All modern trams are fitted with bogies or semi-bogies. Details are given of the frame, the interior and users' equipment. [French]

14 311444 AN AUTOMATIC OPERATING SYSTEM FOR THE RHINE-RUHR URBAN RAIL SYSTEM [Automatisches Betriebsfuehrungssystem der Stadtbahn Rhein-Ruhr]. The automatic operating system of the Rhine-Ruhr railway is part of an integrated technical operating system for extensive automation of the many functions of a rapid transit railway. Commencing with a strictly hierarchical classification of the overall function according to the disposition of the operations, the running of the operation, operational safety and the appropriate central functions, the system is described together with that of the hierarchically classified system of process computers for carrying out especially important sub-functions. These components of the system provide the automation for operating signal boxes and the provision of information on the operational situation for the supervision and control of the rail traffic. In addition they support the central station supervision and provide passengers there with information. Following the initial realisation of the system on the urban railway model stretch Essen-Mulheim the concept of the system extended since will also include central remote control of signals using data-processing technology. To fulfil this task there are, in view of the safety problems related to this, engineering problems of a special type which have to be overcome. [German]

14 311445 EXPRESS ROAD TRAMWAY ROUTE 64 IN VIENNA [Die Schnellstrassenbahnlinie 64 in Wien]. Following the construction of large residential flats in Vienna's residential Area 23 it became necessary to connect development axis "south" with an efficient means of public transport. The express road tramway route 64 now under construction will cope with the newly developed transport requirements in the foreseeable future as a road tramway on a line which is more or less free of crossings on its own track and in the far future as the U-bahn underground route U6. This paper contains details of the project tender, the alternative design, preparations for the works, the site establishment and finally the construction of this express road tramway route. (TRRL) [German]

14 312093 COMMUNICATIONS ON RESEARCH AIMED AT COMPARING TRANSPORT CONDITIONS IN CITIES, TOWNS AND OTHER BUILT UP AREAS. EXTENDED ABSTRACT OF THE STUDY REPORT. AN ENQUIRY INTO THE PROVISION OF BETTER SERVICES FOR THE HANDICAPPED ON LOCAL PUBLIC TRANSPORT [Mittellungen ueber Forschungen zur Verbesserung der Verkehrsverhaeltnisse der Gemeinden. Erweiterte Kurzfassung des Forschungsberichts. Untersuchung zur frage der Staerkeren Beruecksichtigung der Belange von Behinderten im Oeffentlichen Nahverkehr]. The journal contains a review of the research contracts let by the federal minister of transport on the subject of urban transport. It also contains an extended summary of the "investigation into the question of greater consideration of the needs of the disabled in public transport". The proportion of persons who are considered "participation-impaired" or "participation-disabled" is estimated to be 8-10% of the whole population. Consideration is to be given to the standards of comfort change and as a result in the future-with unchanged provision-a greater number of people

will feel (subjectively) impaired when using public transport. For these persons the gaining of facilities in public transport for the disabled, insofar as they improve the general usefulness, has increasing significance. Various possibilities of making vehicle or constructional changes in public passenger transport have been investigated, such as the forming of pavements and pedestrian overpasses, of steps, ramps, escalators, platforms and lifts, stopping places and station facilities for light railways. A further chapter is concerned with the installation of entrances and exits of public track-bound vehicles and with the internal areas of such vehicles. The investigation has also considered the problems arising from the introduction of certain measures, including the problems of the time and cost of subsequently introducing aids for the disabled in underground stations and the building of on level bus stops. As it is hardly to be expected that the towns and transport firms, who must consider the use of their capital almost exclusively for traffic and operational projects, will pursue the development of acceptable facilities for the disabled on their own initiative, it must be assumed that the provision of certain equipment will depend upon a political clarification of the investment responsibility. [German]

14 312444 TOWARDS AUTOMATIC TRAIN CONTROL. A review is provided of recent developments in automatic train control around the world, and some aspects of railway automation are discussed in an Australian context. These discussions indicate that, while full automation may be justified on urban mass-transit systems, semi-automatic control of individual trains (by means of microprocessor-based driving aids) is an appropriate intermediate development for Australian non-urban railway networks. Such a development should lead to improved regulation of traffic and substantial savings of energy. A brief theoretical section is included which should provide a useful starting point for traction and signaling engineers who wish to investigate the possibilities of more precise control of traffic than the conventional fixed-block signalling system will allow.

14 315016 SAN DIEGO LIGHT RAIL: ON TRACK '81. Metropolitan Transit Development Board is meeting its 30-month schedule for converting a 14-mile segment of former freight-only San Diego and Arizona Eastern Railway into a light-rail transit line reaching the Mexican border. Methods of acquiring SD&AE, funding the project without UMTA participation, construction details, operations planning and estimates of potential traffic are detailed. MTDB owns entire 115-mile railroad and is resuming freight service to the East over this mountainous region.

Railway Age Vol. 181 No. 11, June 1980, p 34, 2 Phot. ORDER FROM: ESL

14 315402 LIGHT RAIL A TRANSPORT SYSTEM FOR THE FUTURE. This paper begins with the previous history of the International Light Rail Commission, the results of its meetings, and its future work program. The various stages of light rail development are discussed as well as the differences between metropolitan railways and light rail. The majority of the paper contains discussion of the various light rail systems throughout the world. These systems are located in: Australia; Belgium--Brussels, Antwerp, and Charleroi; The Federal Republic of Germany--Stuttgart, Hanover, and Essen; Finland; France; Italy; The United States--Boston, Cleveland, Philadelphia, and San Francisco; Canada--Edmonton and Toronto; The Netherlands--Amsterdam, The Hague, and Rotterdam; The German Democratic Republic; Yugoslavia; Poland; The Soviet Union; Austria; Sweden; and Switzerland--Zurich, Basle, Berne, and Geneva.

14 316227 MARTA TRAIN CONTROL SYSTEM--A VIEW FROM THE WAYSIDE. This paper describes the Metropolitan Atlanta Rapid Transit Authority (MARTA) train control system. The major operational features are discussed to direct the reader's attention to the relative importance of the wayside subsystem. The MARTA system is described through five major operational features, with special emphasis on the wayside subsystem as a local point of system operations. The aspects of the automatic and manual modes of operation are explained in detail to emphasize the attention that has been given to the design of the system to ensure uninterrupted service.

14 316598 A STUDY OF NOISE FROM THE TYNE AND WEAR METROCAR. This paper reports on a detailed study of the noise emitted by the new metrolcar which will be in operation in Tyne and Wear from 1980. The level and frequency characteristics of wayside, standstill, braking and accelerating noise are discussed. A formula is derived empirically which enables the peak noise level at a given distance from a metrolcar travelling at a particular speed in a "free-field" situation to be predicted. On the basis of this result and on an assessment of the present acoustic environments of an industrial and residential area of Newcastle, some suggestions are made as to the changes to be expected in the noise levels when the metro is fully operational. Comparison with other research work has been made whenever possible.(a)

14 318430 A REPORT ON LIGHT RAIL TRANSIT: SURFACE OPERATIONS. This report recognizes the fact that the high costs of segregated fixed-guideway transit have dampened LRT's popularity. As a result, the Transportation Research Board (TRB) and UMTA decided to conduct an examination of the obstacles to lower-cost surface configurations. Toward this end, a by-invitation-only seminar was convened in Washington, DC, on December 5-6, 1978. Its objective was to trace specific problems and to propose where effort toward their solution should be most effectively directed. These problems were expressed as a set of issues that served to focus thought and guide proceedings. This report contains three background papers as well as the summary of discussions on the impact of align-

ment options, traffic-engineering requirements, safety requirements, safety requirements for installation and operation requirements for passenger stop locations, intermodal interface, fare-collection options for surface operation, and future actions.

14 322568 TYNESIDE REPORT 8. PART 3: OPERATION. The greatest innovation in the operation of the metro is that by using the Phillips Vetag micro-processor based control system, the driver can control his train as well as drive it. On setting a code, the train is automatically routed through the system, changing the points, clearing signals, and changing station indicators. Two transponders are mounted on each passenger car giving signals to trackside sensors through loops sited on the track between the rails. There are 41 unstaffed stations, under the supervision of a central station controller who can monitor stations, through a closed-circuit TV, and address passengers on a PA system. Trains maintain constant radio contact with the control centre.

Each service will run at 10 minute intervals for most of the day, allowing 5 minute headways on most of the track, but this time is reduced to 2 1/2 minutes at peak periods in the centre. Automatic fare collection, similar to that used in Paris and Lyon, has been installed. Ticket machines have change-giving facilities but will not accept banknotes. A comprehensive public relations exercise has been carried out to publicise the system and to educate children into the potential dangers of the high-voltage overhead wires.

14 322645 SIMULATION STUDIES OF AN ELECTRICAL INTERFERENCE PROBLEM AFFECTING MASS TRANSIT CIVIL ENGINEERING DESIGN. Part I of the Paper gives a brief description of an automatic train protection (ATP) system for a mass transit railway, and indicates some problems that may arise because of inductive interference caused by the presence of reinforcing steel in the structures supporting the track. Part II deals with two months of study capable of yielding quantitative estimates of the interference effects in a reliable and systematic manner. In the first method a full-scale simulated track system was built and, based on suitable instrumentation, the physical parameters as well as the relationships governing the inductive interference were determined. The second method relies on establishing a mathematical model that invokes basic electromagnetic field theory and transmission line theory to arrive at a generalised solution. The results obtained with both methods are presented and compared.

14 323351 INTEGRATION IS KEY TO SUCCESSFUL PUBLIC TRANSPORT. The potential of the Tyne and Wear Metro rail system, the first phase of which is now in operation, lies in its integration with public transport such as bus services and parking facilities, as well as its ability to attract short distance travellers. A feature of the system is the increase in number of stations from 26 to 42 compared with the former suburban rail system. The service pattern has been based on a number of standard journeys with a 10 min headway. The metro system has been designed for future extension in three further phases. The ability of the system to negotiate 4% gradients and sharp curves will allow its penetration into areas where existing rail alignments are not sufficient. Stations are unmanned and are designed with emphasis on simplicity for ease of maintenance.

Transport Vol. 1 No. 3, July 1980, pp 65-67, 1 Fig., 3 Phot. ACKNOWLEDGMENT: TRRL (IRRD 249627); ORDER FROM: City Press Limited, Fairfax House, Colchester, Essex, England

14 324438 MICOL, MICROCOMPUTERS IN OPERATION CONTROL CENTERS. Automatic operations control system of urban rapid-transit systems is described by taking an example of an underground railway using microcomputers for decentralized data processing. The task complex is divided into an information processing section with safe signaling characteristics, and a processing section without safety functions. The safety side of the system is implemented by a network of fail-safe microcomputer while the non-safety-oriented work is accomplished by process-control computers suitable for handling large volumes of process-control data. Each microcomputer is allocated a certain share of the tasks. This modular arrangement, while increasing the hardware outlay, restricts any failure to just one part of the control center's functions.

14 325874 TYNESIDE TRAVEL GOES CONTINENTAL. The introduction of the Tyne & Wear Metro has shown the first UK attempt to introduce an upgraded public transport system using "supertram" technology and automatic fare collection. The network has required the construction of north-south and east-west tunnels under central Newcastle and a tunnel section under central Gateshead linked by the Tyne bridge. A viaduct serving the Byker area of the city was also constructed. Key stations in the

network are designed to provide multiple interchange facilities so that the same season ticket or travel pass can be used on both the metro and bus systems. A feature of the metro, due for completion in 1983, is that it can be readily extended at relatively low cost.

Aldovs, T *Municipal Journal* Aug. 1980, p 1014, 1 Fig., 1 Phot.; ACKNOWLEDGMENT: TRRL (IRRD 250348); ORDER FROM: Municipal Journal Limited, 178-202 Great Portland Street, London, England

14 325875 TYNE & WEAR METRO-FARE COLLECTION. Fare collection methods employed in the Tyne & Wear Metro are designed for maximum cost-efficient staffing levels. Each station is unmanned while trains only carry a single motorman. The metro system employs a simple ticketing procedure with only random inspection to prevent fraud. With this system a passenger carries a card ticket with a magnetically encoded stripe indicating zone, station number, fare and passenger category. The unmanned ticket barriers, based on Paris metro barriers, allow platform access once a ticket has been checked for validity and then returned. The integrated Tyne & Wear system allows a traveller to use the same ticket for a journey which includes metro and bus travel. Details are given of equipment used in the fare collection system and its method of operation.

Wyse, WJ *Modern Tramway and Light Rail Transit* Vol. 43 No. 515, Nov. 1980, pp 374-380, 2 Tab., 8 Phot.; ACKNOWLEDGMENT: TRRL (IRRD 251010); ORDER FROM: Allan (Ian) Limited, Terminal House, Shepperton TW17 8AS, Middlesex, England

14 325877 MIXED FORTUNES FOR METRO. Despite a small number of early mechanical problems the Tyne and Wear Metro light rail system is now said to be offering a popular and efficient service for its passengers. Such a form of light rail service is ideal for overcoming public transport problems of cities which are too small to warrant the consideration of a costly underground rail system. Although it was hoped that once the Tyne and Wear Metro was operating successfully, other similar schemes might follow, only Avon has so far commissioned a feasibility study.

15 044810 AERIAL STRUCTURE AND RAIL SUPPORT METHODS REPORT NO 11. A series of tests was run for BART to evaluate the ability of rail fasteners to maintain electrical isolation, reduce noise levels, and provide safety and economy; and to determine their suitability for use on advanced design concrete aerial structures. The evaluation of several types of concrete ties and the results of tests on a new concept in the installation of rail fasteners and associated hardware on concrete aerial structures are included. Investigation showed that a new concept of track support was required for aerial structures and subways; further, it was realized that the fastener chosen for use on the aerial structures can also be used on the underground portions of the rapid transit system, a fact which will limit the types of rail fasteners needed for the system. Subsequent studies, therefore, are geared to the choice of a fastener suitable for use on aerial structures. On aerial structures rail fasteners must be simple enough for one man to assemble with hand-carried tools. The fastener must remain stable under the application of a 15,000-pound wheel load and must be capable of holding a longitudinal force of approximately 2,000 pounds of 3,000,000 cycles of loading in a test machine. Other criteria for fasteners of rail and aerial structures are listed. The "second pour" technique, which still requires further development, is to be used in installing track fasteners on concrete surfaces in order to guarantee that the anchor bolts will not come in direct contact with reinforcing steel. Indications from test results indicate that concrete ties are safe and economical and perform well under the type of transit loadings expected in the BARTD system.

15 046087 GUIDELINES AND PRINCIPLES FOR DESIGN OF RAPID TRANSIT FACILITIES. In designing structures which are to be used by the public, it is essential that such structures be designed and built to conform to accepted practice, with regard to safety and with regard to adopting the latest technological developments. Similarly, in designing or providing for the supply of equipment, either fixed or moving, it is equally important that such equipment be designed or specified to conform with the safest and best of accepted practices. The purpose of these guidelines and principles is to describe in general terms what is considered to be good practices in rapid transit so that those responsible for designing and planning such facilities may have the benefit of this information. A summary of applicable standards presently in use by rapid transit agencies is also attached in the appendix. 15 047007 TRANSVERSE VENTILATION OF DOUBLE TUBE TUNNELS USING AN AUXILIARY TUNNEL. A transverse ventilation system proposed for double tube tunnels uses an auxiliary gallery. With this system complete separation is attained between fresh air ducts (in the auxiliary gallery) and used air ducts over the main tunnels ceiling. The proposed system makes it possible to reduce the cross-section of the fresh air supply ducts, by using a contemporaneity factor of the peak traffic flows in the two tubes. A further advantage is the reduction of construction problems and the solution of safety problems.

15 048165 KEEPING COOL IN THE SUBWAY. With cities in the tropics such as Caracas, Sao Paulo and Calcutta now building transit systems, the problem of keeping air temperatures in tunnels to a tolerable level is becoming more acute. Norman H. Danziger outlines the basic principles evolved to produce a satisfactory thermal balance on underground railways, part of a three-year research programme sponsored by the Institute for Rapid Transit. It has been found that trains account for between 85 and 90 percent of all the heat generated in a subway system. About half of this heat is caused by braking, the remainder largely by acceleration, traction, and vehicle air conditioning.

15 048171 BELGIAN TRAMWAYS PREPARE FOR FULL METRO WORKING. A total of five Belgian cities are now building—or firmly planning to build—new subway systems. With the exception of Liege they are, in the initial stages, confining metro operations to tram working. But tunnel construction in each city is designed for eventual conversion to full-scale metro working as the demand for mass transit grows. And in Brussels, where the first pre-metro line went into operation in 1969, construction has already begun on the city's first full-scale metro line.

15 050137 BART—EARTHMOVING AND MASS TRANSIT. This paper gives a description of the Bay Area Rapid Transit (BART) system in San Francisco. The design and construction of the system depended upon the geography of the areas and upon the equipment and skills of the many contraction involved—all of which are described. Details are given of the excavation for tunnels and stations and the equipment used in these operations. The design of the vehicles on the BART system was aimed toward passenger safety and comfort, and some details of the cars are shown. BART may be a model for rapid-transit development in communities where mass-transit systems will help solve urban transportation problems.

15 050635 ORSAY-INVALIDES JUNCTION LINE [UNE INTERCONNEXION SIMPLE ORSAY-INVALIDES]. In this article, the author explains why it has been decided to build this junction line; it will provide a connection between the South-Western suburban lines and the Paris-Invalides to Western suburban lines. He mentions the various difficulties involved in constructing this connection because of the different electrification systems in service (1,500 V catenary on the Orsay side and 750 V third rail on the Invalides side), the relatively shallow work sites along the bank of the Seine in the political heart of Paris with its heavy road traffic and already extensively occupied subsoil. The project will be carried out in two stages. He gives details of the work to be done in Paris-Orsay and Paris-Invalides stations. [French]

15 050666 BEHAVIOUR OF SUBAQUEOUS TUNNELS DURING EARTHQUAKES. Three-dimensional models of a subaqueous tunnel were built on a shaking table and vibrated for the purpose of investigating the dynamic behaviour of the tunnel. The material of the soft surface layer was gelatin gel and that tunnel was silicon rubber. In addition, earthquake observations at the site of the real subaqueous tunnel have been carried out using accelerometers and strain gauges set on the walls of the tunnel. At the site, micro-tremors were also measured. In these studies, it was noted that non-uniform displacements of the ground along the tunnel axis were caused variations of the dynamic behaviour of the ground, and that the tunnel deforms correspondingly to the varying deformations of the ground. From these experimental results, a mathematical

model of the subaqueous tunnel was formulated for anti-seismic design studies.

15 051402 SUBWAY AERODYNAMIC SCALE MODEL TESTING. Described is a 1/16-scale model test (SAT) facility designed, built, and operated for the purpose of studying the aerodynamics and thermodynamics of subway systems as they relate to the understanding and improvement of subway environmental control. The SAT facility is horizontal, the models run at real speeds, and the geometry is more realistic than previous experimental studies. A

detailed description of the SAT facility and the train models used is presented, as well as a discussion of the measurements made, and several examples of results, e.g.: drag coefficients, air flow motion values, as a function of tunnel venting. Drag coefficient results for a range of train blockage ratios and tunnel length-to-diameter (L/D) ratios are compared to a theory developed at CalTech by Harris and data from several drop tube experimental studies; the comparison is seen to be good. SAT facility data for several venting configurations are also presented.

15 051427 COFFERDAM FOR BART EMBARCADERO SUBWAY STATION. Inward deformations of cofferdam walls during deep excavation in soft soils are inevitable but steps can be taken to minimize these movements. An excavation 1,160 ft (354-m) long by 55 ft (17 m) wide by 70 ft (21 m) deep in a busy downtown San Francisco street, flanked by major buildings, was performed for the BART Embarcadero station successfully in soil strata that contained varying depths of soft clay locally known as "recent Bay mud." To provide an impervious rigid cofferdam wall of adequate strength and reasonable thickness a soldier-pile and tremie concrete (SPTC) system of sheeting was selected. Successive excavation cuts below prescribed bracing levels were held to a practical minimum. Struts were preloaded to reduce compression deformations. Inclined meters recorded deflections of the walls while strain gages enabled determination of strut loads. The thicker the layer of soft clay the greater the inward movements of the walls notwithstanding the corresponding increases in wall sizes.

Armento, WJ *ASCE Journal of Soil Mechanics & Foundations Div Proceeding* Vol. 99 No. SM10, Paper 10075, Oct. 1973, pp 727-744; ACKNOWLEDGMENT: ASCE; ORDER FROM: ESL, Repr PC, Microfilm

15 051428 TUNNEL SURVEY AND TUNNELING MACHINE CONTROL. An outline of the survey work necessary for the construction of a large tunnel project such as the San Francisco Bay Area Rapid Transit System is presented. In the second part of the paper, a method for shield or tunneling machine control by laser and double target is described. This method has proven successful during the driving of the tunnels of the BART system both by hand and machine methods.

15 053977 AN INTEGRATED ENGINEERING-PLANNING APPROACH TO THE PRESERVATION, IMPROVEMENT, AND REPLACEMENT OF ELEVATED TRANSPORTATION STRUCTURES. This paper outlines the considerations surrounding the community acceptance of elevated railroad and rapid transit structures, both old and planned for future construction. Covered are such factors as type of neighborhood affected, land use, traffic surveys, urban renewal plans, and environmental considerations. Particular emphasis is placed upon methods of improving existing elevated structures: evaluation of the physical condition and load-carrying ability of the structure, need for structural repairs, and improved analysis techniques. Computer modeling techniques have been applied to these studies. It is shown that through use of these techniques, the transit operator can more accurately plan renewal programs to reflect the community's needs.

Silver, ML Belytschko, TB Gelick, M (Illinois University, Chicago Circle); Society of Automotive Engineers Paper SAE #740029, SP-389, Feb. 1974, 8 pp, 7 Fig, 2 Tab, 11 Ref; The Office of University Research of the Department of Transportation, compiled this information under report No. DOT-TST-74-15.; ACKNOWLEDGMENT: SAE; ORDER FROM: SAE, Repr PC

15 054129 ESCALATORS IN RAPID TRANSIT STATIONS. As it becomes more apparent that comfort and convenience must be offered to the potential passenger to encourage him to change his travel mode, newer systems intend to install many more escalators per station. Several publications present escalator capacity recommendations ranging from 9,6000/hr to 10,7000/hr for 48-in. escalators operating at a speed of 120 fpm. While observed values were extrapolated to hourly volumes to permit comparison with existing capacity recommendations, it should be noted that peaking generally occurs within 1-min periods and a capacity value expressed in passengers per minute is more realistic. With this in mind, the recommended practical capacity would become 103 passengers per minute and the design value 90 passengers per minute, for 48-in. escalators operating at 120 fpm.

O'Neill, RS *ASCE Journal of Transportation Engineering* Proc Paper Vol. 100 No. TE1, #10333, Feb. 1974, 12 pp; ACKNOWLEDGMENT: ASCE; ORDER FROM: ESL, Repr PC, Microfilm

15 054637 THE IMPORTANCE OF AERODYNAMICS IN THE DESIGN OF INTRA-URBAN TRAINS TRAVELLING IN TUNNELS. Aerodynamics can be a major factor in the design and operation of intra-urban subway-train transportation systems. In order to develop an adequate understanding of the aerodynamic characteristics of such systems, an experimental program was carried out. The major portion of the testing was conducted under equilibrium, incompressible conditions so that the fundamental aerodynamic characteristics could be isolated. The effects of geometric parameters (such as train speed, blockage ratio, wall roughness and train tunnel length) upon train drag and tunnel flow velocities were determined and compared with a simple theoretical model. The effect of aerodynamic forces upon typical subway-train operations is shown in order to give proper perspective to the importance of aerodynamics.

15 054661 MONTREAL METRO, A DOWNTOWN SUCCESS, IS NOW SPREADING OUT. Montreal is undertaking an expansion programme, costing \$630 million, that will increase the subway system by 32.5 miles. To date the whole system has been paid for by the city and surrounding communities but Quebec may start to contribute to the operating deficit. A major advantage of rubber tired trains is that they can climb a steep grade (part of the new extension will be 6.5%) and hence construction costs are reduced. On the other hand, the track has to be completely enclosed which limits the system's expansion into the suburbs. Some outlying communities are reluctant to have the subway serve their area. They fear that shoppers will be attracted to Montreal.

15 054927 UNDERGROUND FORECAST: HUMAN WAYS OUT OF AN URBANIZATION DILEMMA. Tunnelling has obvious connections with the urbanization process in the world. Tunnels and other subsurface constructions play an important part in supply plants which provide power, water and communications. Increasing density in the more developed urban areas demand increasing subsurface space for these activities and for storage and certain industrial processes. Where the urbanization is far developed—that is in the central business districts of big cities—the subsurface space is the saving possibility to guarantee the functions in the metropolitan area. The intention of this article is to propose a hypothesis for the future development of tunnelling in the world as a whole.

15 056758 PERFORMANCE ANALYSIS OF NATURAL-DRAFT AIR-COOLERS FOR SUBWAY TUNNEL COOLING. Recently, the air temperature in subway tunnels has risen to more than 30 degrees C due to the heat of many electric cars, many passengers, etc. Then, the natural-draft type air-coolers have made it possible for use to cool the air in the subway tunnel as low as 20 degrees C. The authors believe that the method will be the first development in the field of subway tunnel cooling. In this paper, authors present a method of analysis for a natural-draft type air-cooler and delineate the performance of a natural-draft type air-cooler under various conditions obtained by use of a digital computer.

15 056776 CONCRETE VS. STEEL AERIAL GUIDEWAY TRADEOFFS. The designer of an aerial guideway structure for new transit systems has a choice of two major construction materials concrete and steel. His selection will depend largely on four considerations: esthetic, structural, economic, and acoustical. Esthetic considerations cover such matters as configuration, compatibility of the structure with the environment, color, and surface texture. Structural considerations cover foundation requirements and size and shape of members to accommodate the design loads. Economic considerations include comparative costs of girders of various lengths, ease of installation in available right-of-way, comparison techniques possible through the use of one material or another, capability of local materials producers in terms of both technological expertise and plant capacity, and comparative cost of maintenance. Acoustical considerations include the ability of the material to minimize noise or to permit treatment which will absorb noise. Neither steel nor concrete offers all of the characteristics sought. By a process of both objective analysis and good taste, the designer selects one or the other, or produces a composite design to incorporate the better features of both.

15 056857 AERODYNAMIC TESTING TECHNIQUE FOR SCALE MODEL SUBWAY VENT SHAFTS AND STATIONS. Describes a 1/16-scale model test (VST) facility designed, built and operated for the purpose of studying the aerodynamic characteristics of subway vent shafts and stations. The VST facility is a steady-state test facility, where geometrically realistic scale model subway components are tested and evaluated. The fluid mechanic behavior of the vent shafts and stations is characterized in terms of driving potential, impedances and geometry. A detailed description of the VST facility, a discussion of the measurements and an example of a vent shaft test are presented and compared to analytical predictions.

15 056871 RECONSTRUCTING LONDON'S UNDERGROUND. Sections of London's Underground are a century old, and continuous reconstruction and improvement has been in progress for the last 50 years. LT's former Chief Civil Engineer gives a fascinating account of how this updating has been carried out while keeping traffic moving. While of great interest to the general reader, the specialist will find it a useful key to a complicated subject which, with its copious references, will lead him to more detailed accounts of unusual and difficult tasks faced in urban railway building. The subjects range from the enlargement of the City & South London tube tunnels in the 1920s to the very recent reconstruction of Moorgate station.

15 056954 THEORETICAL AERODYNAMIC CHARACTERISTICS OF VEHICLES IN CONFINED SPACES. The report has been prepared under the Transit Development Corporation (TDC) project, 'Ventilation and Environmental Control in Subway Rapid Transit Systems,' and is one of many such reports leading to the final product—a 'Subway Environmental Design Handbook.' It describes the results of a theoretical effort pertaining to the non-steady flow in a tunnel induced by a moving vehicle. A study is made of the entry problem and the problem of a vented tube.

15 057436 SILENT UNDERGROUND TO HEATHROW. Access to London's Heathrow airport will be improved by a new extension of the Underground railway. Natural-rubber bearing pads will ensure that houses near the new line are not disturbed by traffic vibration. The extension, 3.5 mi (5.6 km) long, will be in a tunnel constructed by the cut and cover technique. A novel feature of the line is that in the residential area of Hounslow the track is not laid directly on the floor of the tunnel. Instead it is contained in reinforced concrete troughs, each 7m (22 ft) long and weighing about 20 tons. After the concrete has set the precast units are lowered into place with specially designed handling equipment. The separate troughs are then joined with in situ concrete to form two continuous parallel decks. It is here that the natural rubber bearings become involved. They fulfil a dual role. They function as transverse strip bearings. Each trough is symmetrically supported by two rows, 18 ft (5.4 m) apart, of five bearings. These take care of the vertical load. In addition, bearings will be inserted between each trough and the tunnel wall, and between the two troughs; here they function as supporting side bearings.

15 057872 VIBRATION REDUCTION BY VIBRATION-PROOF MATS IN TOKYO SUBWAY. Noises and vibrations produced by trains running in a subway tunnel propagate through earth and sometime affect nearby buildings. While noises and vibrations resulting from the contact of wheels and rails are the principal source, the most effective way to reduce the problem is to alter the track structure. Vibration-proof mats of used rubber tires are used under the ballast of the Chiyoda Line. They functioned as desired but the track settled about 3 mm on account of reduced elasticity.

15 071769 EFFECT OF ENVIRONMENT ON RAPID TRANSIT CONSTRUCTION. Rapid transit systems must be constructed in a hostile environment. The space required for construction is already crowded. Hindrance of traffic must be avoided or minimized. Existing utility systems and adjacent structures must be maintained and

remain useful during construction and must be restored to as good as, or better than, original condition upon completion. Care must be exercised to minimize imitation or harm to the public. All these factors cost extra expense and time, but the effect may be lessened by preparatory work, by vigorous public relations, by working closely with governing officials, and by timely acquisition of real estate.

15 072208 SUBWAY PROBLEMS [I problemi delle Metropolitane]. This book is the second volume of a research devoted to the subways' problems. It is essentially the work of a structural engineer on the various architectural problems that the construction of a subway must meet. Chapter ten analyzes different methods of tunnel excavation, considerable space is given to the history of tunnels and to the problems that their construction may create for the surrounding buildings; with respect to this last point various architectural solutions-Europa Haus in Berlin, the Church of Auteuil in Paris, the E-O line in London, the Dnieper tunnel in Kiev-are examined in some detail. Chapter 11 is devoted to the features of an optimal route for a subway system. Chapter 12 treats the problem of stations from a functional point of view: location, maximum number of buildings, maximum speed of the escalators, the minimal set of rules to which the buildings of a station must conform and an overview of the most remarkable international experiences are covered in this chapter. Chapters 13,14,15 deal respectively with a study of the materials to be used, the main features of the network, and the electricity network that goes with subway systems. The last three chapters deal with the problems that may drive from insufficient automation, from the construction of special plants-made necessary, for example, by the particular conditions of the soil-and with the extremely serious problem of financing and managing the economics of a subway system. 15 072457 LEGAL, ECONOMIC, AND ENERGY CONSIDERATIONS IN THE USE OF UNDERGROUND SPACE. The U.S. National Committee on Tunneling Technology was established in 1972 to stimulate advancement in effective use of the subsurface. Improvements in technology and increased access to the underground result in benefits to society from the availability of additional mineral resources and in opportunities to use underground space for many purposes. Increased access gives rise to problems in legal and other social systems. This workshop examined and discussed the problems and their possible solution. Among the eight papers are: Development of Policy for Airspace; Legal Aspects of Use of the Underground; Planning the Underground Uses; and Economic Trends and Demand for the Development of Underground Space.

15 072952 BETTER CONTRACTING FOR UNDERGROUND CONSTRUCTION. Increasing pressure for preservation of surface environments in urban and rural areas is forcing the utilization of subsurface space for transportation and other purposes. Technological developments, such as in rock mechanics and in tunneling machines, will make possible the rapid and successful utilization of subsurface space. For several years it has been recognized that contracting practices in the U.S. are inadequate for even past methods and constitute a serious barrier to application of new technology and to economical development of underground space. This survey of U.S. and foreign underground construction results gives 17 recommendations for improving contracting practices.

15 080712 RESEARCH AND DEVELOPMENT IN WEST GERMAN TUNNELLING. The author gives an account of the general situation in Germany, where the underground railways are the most important area in which tunnelling is being carried out. He lists the main groups of research institutions that work on tunnelling, and their main areas of work. An outline is given of the research subjects for which information is available; these are divided into those which are finished and those that are still underway. Mention is made of individuals and organizations doing the work and publications that are available. Subjects include measuring instruments, tunnel linings, tunnelling machines, tunnelling by means of drilling the blasting, tunnel statics and rock mechanics, and the waterproofing of tunnels. Some of the general aspects of the work which is to be carried out in the near future are discussed; this includes studies of improving rock strength with plastics, the development of a special rock bolt for stress measurement, stress distributions near rock caverns, optical methods for measuring deformation, and safety matters. The author concludes with comments on International Cooperation in Research on Tunnelling and the formation of a German committee for underground construction work.

15 080713 SYDNEY RAIL TUNNEL MACHINERY. This short article is concerned with details of the boring machinery that has been used in the twin rail tunnels between Edgecliff and Bondi junction near Sydney in Australia. It is the largest of its kind in Australia. Eight motors were

used in conjunction with hydraulic pumps to exert a thrust of 180kn and a torque of 650 kilonewton metres on the cutting wheel, and gripping legs which stabilized the machine, and permitted transmission of the thrust and torque to the tunnel face. Details are given of the dust spoil extraction system and of the 1.67 km conveyor system that was used to remove the 152 tonnes of spoil per hour. The power supplies for the boring machine and tunnel services, the provisions that were made for eventual partial failure of the supply, and the method of connecting the power line to the machine are described. The article concludes with details of the organizations that took part in this 8 million dollar contract. It is accompanied by illustrations of the machine cutting head and of the motors and pumps.

15 080932 TUNNEL BORING MACHINES--A MEANS TO RAILWAY LINE IMPROVEMENT. The paper which describes tunnel boring machines (used in Europe) for improving railway routes by shortening them and reducing grades, mentions the proposed tunnel beneath the English Channel for a double-track railway line, and suggests improvements in tunnel equipment for improved productivity of the machines. The machines may be one of two main types; the soft machine is usually of the face trace type and is capable of cutting vertical sides and arch roof; machines used for hard rock cutting are generally of the full face type and are capable of cutting a circular bore only. Figures are presented which describe the machines and illustrate their mode of action. Instances are describe of the use of the boring machine when both hard and soft rock are encountered together, when fault zones are encountered, and when the rock being worked upon, deteriorated on exposure to air (necessitating shotcrete application). Experience of the Swiss Federal Railways is described, as well as European designs which call for concrete ties to be nested into the slabs. Design features are listed that will not necessitate stoppage of the boring machine for any abnormal length of time. Standardizing of the size of machine components is urged. The use of boring machines is highly economical and rapid, and can be highly automated (using one operator only per shift).

MacNabb, TC (Canadian Pacific Railway) *AREA Bulletin* Vol. 75 No. 468, 75-648-9, June 1974, pp 779-796, 18 Fig.

15 082870 STAGE POST-TENSIONING--A VERSATILE AND ECONOMIC CONSTRUCTION TECHNIQUE. The author, whose company has been a prime developer of stage post-tensioning, describes the mechanics and structural advantages of this new and powerful prestressing technique and discusses its application to several major high rise structures. Some of the structures include large girders (of minimum depth) over subways and supporting high rise buildings, girders in nuclear facilities, girder ties in buildings with sloping columns, and in the foundation of the world's tallest free-standing tower. It is concluded that stage post-tensioning will play an important role in the future growth of the prestressed concrete industry.

15 083757 LINKING UP THE LIVERPOOL LOOP. THE CONSTRUCTION OF AN UNDERGROUND RAIL NETWORK LINKING FOUR STATIONS IN LIVERPOOL IS DESCRIBED. THE EXTENSION OF EXISTING RAIL SERVICES IS AIMED AT REDUCING THE CONGESTION IN LIVERPOOL'S CENTER CITY. LARGE CAR PARKS ARE TO BE PROVIDED AT STATIONS TO ENCOURAGE PEOPLE TO TRAVEL INTO THE CITY BY TRAIN. THE LOOP AND LINK TUNNELS WERE DRIVEN THROUGH SANDSTONE, WHICH VARIES IN COMPRESSIVE STRENGTH FROM 5-28 MN/M2. MODIFICATIONS TO THE DOSCO TUNNELER USED ARE DESCRIBED. COLLIERY ARCH GIRDERS SUPPORT THE WEAKER SANDSTONE AND IN-SITU CONCRETE LINING WAS USED. SPRAYED CONCRETE LINING WAS SUITABLE FOR THE STRONGER SANDSTONE. IN THE STATIONS THE 7.5M TUNNEL HAS EXTENSIVE RIB SUPPORT. CONSTRUCTION DETAILS OF THE 5.1M EXTERNAL DIAMETER TUNNELS FOR THE 1.8 KM LINK ARE GIVEN. THE DOWNLINE TUNNEL PASSES THROUGH A DISUSED TUNNEL, WHICH WAS FILLED WITH CONCRETE AFTER THE SHAPE OF THE NEW UPLINE TUNNEL HAD BEEN FORMED IN POLYSTYRENE. THE CONTRACT IS SCHEDULED FOR COMPLETION IN DECEMBER 1976.

15 083923 FAST SET SHOTCRETE IN CONCRETE CONSTRUCTION. Shotcrete as a supporting material for tunnel and for tunnel lining

has not been used a great deal in North America. This paper discusses the technique of coarse aggregate shotcreting and how it is being used today. In the past shotcreting was used on a limited basis, mainly as a rock sealant technique. With advances in technology and equipment, an increased use of coarse aggregate shotcrete in tunnels and underground mines is expected. The main thrust is coming from the ability to use accelerators in wet mix shotcrete.

Stenson, HN *American Concrete Institute, Journal of* Vol. 71 No. 6, June 1974, pp 289-295; ACKNOWLEDGMENT: British Railways; ORDER FROM: ESL, Repr. PC, Microfilm

15 084123 HISTORY OF LOADS AND DISPLACEMENTS FOR A DEEP EXCAVATION IN A MIXED SOIL PROFILE. A history of the behavior of an 82-ft-deep excavation for the Washington, D.C. subway is presented. Improvements in the methods for limiting and forecasting soil movements should result in reduced construction costs and damage claims. It was found that the largest volume of soil displacement takes place beneath the advancing excavation and accounts for approximately 60 percent of the total lateral displacement. Maximum apparent earth pressure for this excavation can be predicted by a trapezoidal earth pressure envelope of width 0.25 gamma H (where gamma is the soil unit weight of 120 pcf and H is the full depth of excavation).

15 084739 SIMULATION OF A PASSENGER FLOW THROUGH A RAPID TRANSIT STATION. This report presents the development of a mathematical model to describe the flow of passengers through a rapid transit interchange. The model represents a key element in the development of a completely rational approach to the design of transportation interface facilities, and depicts the movement of pedestrians as sequential flows of people across individual station components. Stochastic elements of the model design include the magnitude and distribution of passenger demand, and the modal split of arrivals. The basic processing algorithm for passenger flow is deterministic. The model incorporates the use of empirically derived functions of pedestrian flow through specific station components. The model is developed to serve as an aid to the station designer by simulating the movement of passengers on a digital computer. Examples are provided to demonstrate the program's flexibility and its application to access mode analysis, transit scheduling, and the testing of alternative station layouts.

15 084774 EIGHT MINUTES TO NEW YORK. The Hudson River made New York inaccessible by railroad at the beginning of the 19th century. The only way to cross was by ferry. Construction of the Brooklyn Bridge began in 1867 using a new engineering technique, the

caisson. A California financier, D.C. Haskins, observed this technique of pressurized tanks that allowed digging in mud or sandy soil and began advocating its use for building tunnels. He formed the Hudson Tunnel Railroad Company and, after legal battles with railroad companies who owned the ferries, the tunneling began at Hoboken, N.J. It halted a year later after workmen had died of nitrogen narcosis, then known as "caisson disease" and there had been a blow up of the caisson. The company went bankrupt. As tunnels were successfully completed in the East River and in London attention was brought to finishing the Hudson tunnel. W.C. McAdoe and C.M. Jacobs formed the Hudson and Manhattan Railroad Company and in 1902 they began tunneling using a new technique known as a shield which consisted of an inclined ram pushed by hydraulic jacks. The shield enabled the workmen to tunnel about 3 feet a day. In 1908 the first subway train left from Nineteenth Street and Sixth Avenue in New York for Hoboken; the trip took eight minutes. A rash of other tunnels were soon begun until commuting under the Hudson became routine. In 1954 the historic first subway station was closed to the public.

15 090185 CABLE-STAYED GUIDEWAY. ANALYSES AND DYNAMIC MODEL TESTS. This report presents the results of scale model tests and parametric structural analyses which were performed in support of a conceptual investigation of cable-stayed guideways for suspended vehicle systems (SVS). The SVS concept would use high speed ground transportation (HSGT) vehicles suspended from an overhead guideway and which could achieve large cabin bank angles for high speed turns. This cabin bank mechanism allows the SVS to maintain a high speed, even when the guideway is collocated with an existing freeway or railroad with relatively tight turn radii. The possibility of collocating the SVS guideway is further improved by the use of cable-stayed guideways with spans of 200 feet or greater. This report describes the static and dynamic tests of a 1:24 scale model of a 250-foot span cable stayed guideway which was designed for a conceptual SVS.

Whitelaw, RL Szeless, AG Counts, J Garst, DA Virginia Polytechnic Institute & State University, Federal Railroad Administration Final Rpt. FRA/ORD/D-74-18, Apr. 1974, 239 pp; Contract DOT-FR-3004; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-238915/3SY, DOTL NTIS

15 090465 STATIC THREE DIMENSIONAL ANALYSIS OF ELEVATED STEEL TRANSPORTATION STRUCTURES. A three-dimensional finite element modeling technique that may be used to statistically analyze many classes of steel elevated transportation structures for design, analysis, and maintenance studies was developed and tested. Parameter studies on a typical class of steel elevated transit structure found in many cities showed that: (1) a 50 foot long built-up plate girder representation modeled as 50 beam elements and 100 plate elements gave calculated shear and moment values that com-

pared well with analytical values. The errors resulting from the use of fewer elements were found to be large. (2) Locations on the structure subjected to stress reversals or stress concentration are clearly indicated by the technique and show where damage due to fatigue and deterioration is likely to occur. (3) Forces in cross-bracing and sway frames, which are not readily obtained in a conventional analysis, may be easily obtained. (4) Calculated deflection taking into account the three-dimensional effects of bracing and sway frames may be determined and compared with allowable values.

15 090564 SUMMARY OF GEOLOGIC AND HYDROLOGIC INFORMATION PERTINENT TO TUNNELING IN SELECTED URBAN AREAS. A summary of the available geologic and hydrologic information pertinent to tunneling technology and underground construction for 34 U.S. urban areas is presented. Each summary includes a map showing the area of coverage, the geologic and ground water situation to a depth of 200 feet, special features related to tunneling, and a list of sources. Selected urban areas surveyed were: Atlanta, Baltimore, Boston, Providence, Buffalo, Chicago, Cincinnati, Cleveland, Columbus, Dallas, Denver, Detroit, Fort Lauderdale, Fort Worth, Houston, Indianapolis, Kansas City, Los Angeles, Louisville, Memphis, Miami, Milwaukee, Minneapolis, St. Paul, New Orleans, New York City, Philadelphia, Trenton, Phoenix, Pittsburgh, Portland, St. Louis, San Antonio, San Diego, San Francisco, Seattle, Washington, D.C.

15 090847 SUBSURFACE INVESTIGATION, SECTION A013, ROCKVILLE ROUTE. Results are summarized of 65 test borings made at the locations of aerial structure piers and cut-and-cover construction in Section A013 of Rockville Route, generally following Rockville Pike north of the Capital Beltway in Montgomery County, Maryland, of the Washington Metropolitan Area Metro system. The report includes a continuous geological section along the centerline of the METRO structures through the test borings, logs of these borings, results of laboratory tests on soil samples and comments on potential design and construction problems.

15 091372 CONSTRUCTION MONITORING OF SOFT GROUND RAPID TRANSIT TUNNELS. VOLUME I: A DEFINITION OF NEEDS AND POTENTIAL DEVELOPMENTS. The Urban Mass Transportation Administration (UMTA) Tunneling Program Concentrates its efforts on reducing tunneling costs, minimizing environmental impact and enhancing safety as it applies to the planning, organization, design, construction and maintenance cycles of rapid transit tunnels in the urban environment. This study investigates the area of construction monitoring of rapid transit tunnels in soft ground. Soft ground tunnel construction monitoring has the potential to reduce construction costs, safety hazards and environmental impacts. Monitoring can diagnose face stability and ground movement problems, and allow appropriate preventive or remedial action. Monitoring provides data for prediction of ground movements and allows the compilation of useful legal documentation. Such data are also required for improving design and prediction methods.

15 091613 SUBSURFACE INVESTIGATION, SECTION L001, WASHINGTON CHANNEL L'ENFANT-PENTAGON RIVER CROSSING. Results are summarized of a series of 'shake-tests' performed on 12 samples from six borings in the Washington Channel portion of Section L001 of the L'Enfant-Pentagon River Crossing between southwest Washington and

East Potomac Park, of the Washington Metropolitan Area Metro system. The investigation was made in order to satisfy requirements of the U.S. Environmental Protection Agency relating to constituents of the mix formed by disposal at sea of spoil dredged from the location of sunken tubes within Washington Channel. The report contains geological sections showing locations of these samples, results of chemical analysis of the 'shake tests' and a brief text summarizing the background of the investigation.

15 091752 A PROBABILISTIC APPROACH TO GEOLOGY IN HARD-ROCK TUNNELING. The report presents an approach for evaluating alternative strategies for construction of hard-rock tunnels on the basis of expected cost. Central to the proposed approach is the use of subjective degree-of-belief probability in the evaluation of geologic conditions. Subjective probability is used as a quantitative measure of a geologist's uncertainty about the existence of various geologic conditions along the tunnel alignment. The general conclusion of the report is that the proposed approach will lead to a more thorough analysis of the uncertainties involved in predicting geologic conditions, and of the costs of employing various construction strategies in various geologic settings. The approach will not reduce the uncertainties in tunneling, but will lead to the selection of that construction strategy which is most likely to perform successfully and economically in any given hard-rock tunnel.

Vick, SG ; Massachusetts Institute of Technology, National Science Foundation Tech. Rpt. R75-11, June 1974, 236 pp; Grant NSF-GI-34029; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-242598/1ST, DOTL NTIS

15 091757 TUNNEL COST ESTIMATING UNDER CONDITIONS OF UNCERTAINTY. Of all areas of heavy construction, tunnel projects are subject to perhaps the greatest degree of uncertainty from the standpoint of predicting cost and progress. Sources of uncertainty include the unknown nature of geologic conditions along the tunnel alignment, and the difficulty of estimating the performance of men and equipment within the narrow confines of the tunnel. In this report a method is presented for explicitly reflecting these uncertainties in estimates of the time and cost of tunnel construction.

Wyatt, RD ; Massachusetts Institute of Technology, National Science Foundation Tech. Rpt. R75-13, Sept. 1974, 211 pp; Also pub. as Tunnel Construction-5.; Grant NSF-GI-34029; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-242428/1ST, DOTL NTIS

15 091758 THE PROBABILISTIC ESTIMATION OF CONSTRUCTION PERFORMANCE IN HARD ROCK TUNNELS. This report concerns the development of a computer-based simulation model which can be used to evaluate costs and risks associated with hard rock tunneling. This report is the 4th in a series of

reports dealing with this subject. The report examines conventional cost estimating procedures and concludes that there are two major inadequacies which exist: (1) the inability to account for the uncertainty in suspected geologic conditions at the tunnel depth; and (2) the inability to quantify the effect of uncertain geology and the effect of the additional uncertainty in productivity of men and equipment on the performance of a construction strategy. The model employs techniques of probability and simulation to avoid these two shortcomings.

Minott, CH ; Massachusetts Institute of Technology, National Science Foundation Tech. Rpt. R74-47, July 1974, 198 pp; Also pub. as Tunnel Construction-4.; Grant NSF-GI-34029; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-242427/3ST, DOTL NTIS

15 092288 DYNAMIC SOIL PROPERTIES REQUIRED TO PREDICT THE DYNAMIC BEHAVIOR OF ELEVATED TRANSPORTATION STRUCTURES. In this investigation, dynamic triaxial tests were performed (1) to provide additional data on the dynamic properties of soils at the range of strain amplitudes generated under the foundations of poorly performing transportation structures, (2) to justify that dynamic soil properties determined by triaxial tests are appropriate to represent field conditions, and (3) to investigate the effect of testing procedures on dynamic soil properties, soil volume changes, and induced pore water pressures which influence the performance of elevated transportation structure foundations.

15 092338 SUBWAY ENVIRONMENT SIMULATION (SES) HEAT CONDUCTION MODEL VALIDATION. The purpose of this particular report describes the validation of heat conduction analytical model which comprises part of the subway environment simulation (SES) computer program. The conduction model is a closed form transfer cylindrical coordinate frame solution which treats the case of unsteady heat transfer in two, interfacing concentric materials. The validation was accomplished through field tests conducted within the Toronto Transit Commission subway over several months. The field measurements, including temperature at the tunnel air-wall interface and temperature in the earth beyond the tunnel structure, were compared directly with analytical model predictions.

15 092716 SECTION G003: ADDISON ROUTE, PUMPING TEST. Results are summarized of a full-scale field pumping test made on East Capitol Street near the intersection with 65th Street S.E. in Section G003 of Addison Route, of the Washington Metropolitan Area Metro System. Three test borings, 3 wash borings and a 36-inch diameter deep well were placed for performance of the test. The record of drawdown, pumping quantities, computed permeability and some laboratory identification testing are included.

15 092717 PUMPING TEST, SECTION C010C, HUNTINGTON ROUTE [Rept. no. 12]. Results are summarized of a full-scale deep-well pumping test made for the investigation of ground water dewatering conditions at a location directly south of Huntington Station in Section C010c, Huntington Route in Alexandria, Va. of the Washington Metropolitan Area Metro system. The report contains geological sections which summarize information from the pumping test, showing the drawdown achieved, a record of observations of water levels and pumping rates at the test well, and results of laboratory test performed on samples recovered.

PC, Microfiche; PB-243487/6ST

15 092808 SUBSURFACE INVESTIGATION, SECTION C009, HUNTINGTON ROUTE. Results are presented of 41 test borings made along the line of Section C009 of Huntington Route between Braddock Road on the south and Four Mile Run on the north in Alexandria, Virginia of the Washington Metropolitan Area Metro System. The purpose of the work was to provide information for design of surface trackage, cut-and-cover construction, retaining walls and the planned Braddock Road Station. The report contains logs of the test borings, results of laboratory tests on undisturbed samples, a continuous geological section along the line of METRO trackage, sections through the station parking areas and comments regarding anticipated design and construction problems.

Mueser, Rutledge, Wentworth, & Johnston, Washington Metropolitan Area Transit Commission, De Leuw, Cather and Company, Incorporated, (MRWI-75-133) Report No. 133, May 1975, 96 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-242963/7ST, DOTL NTIS

15 093082 SUBSURFACE INVESTIGATION, SECTIONS E003 TO E005, GREENBELT ROUTE. Results are presented of 75 test boring made to study Alternatives 'A', 'B' and 'C' from Columbia Heights Station location near the intersection of 14th Street and Columbia Road N.W., extending northeast 3.5 miles to the District boundary of the Washington Metropolitan Area Metro system. The purpose of the exploration was to provide information for general plans studies relating to these several alternatives, which chiefly involve mined earth tunnels. The report contains logs of the test borings, results of laboratory tests on undisturbed samples, a continuous geological section along the line of METRO trackage for the various alternatives and comments regarding anticipated design and construction problems.

15 093091 SUBSURFACE INVESTIGATION, SECTION B006E, SILVER SPRING STATION, GLENMONT ROUTE. Results are presented of six tests boring made at the locations of pier foundations for Colesville Road Bridge and the Silver Spring Station structure in Section B006e at the intersection of Colesville Road and Glenmont Route in northwest Washington, D.C., of the Washington Metropolitan Area Metro System. The purpose of the work was to evaluate subsurface conditions at the locations of a group of pier foundations to determine the need for pile support or the suitability of spread footings. The report contains logs of the test boring, results of laboratory strength test on 2-inch Shelbytube samples, geological sections along the lines of the bridge piers and comments regarding foundation conditions.

Mueser, Rutledge, Wentworth, & Johnston, Washington Metropolitan Area Transit Authority, De Leuw, Cather and Company MRWJ-75-137, #13, July 1975, 25p; Prepared in cooperation with Washington Metropolitan Area Transit Authority, Washington, D.C., and De Leuw, Cather and Co., Washington, D.C.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-244490/9ST

15 093092 SUBSURFACE INVESTIGATION, SECTION E-002, GREENBELT ROUTE. Results are presented of 14 test pits made adjacent to the line of Section E002, on U Street and 14th Street N.W. in Northwest Washington, D.C., of the Washington Metropolitan Area Metro System. The purpose of the work was to provide information on the characteristics of existing building foundations for the design of underpinning or building protection in preparation for excavation of the subway in the streets. The report contains sketches illustrating the test pits, results of laboratory tests on hand-cut undisturbed samples, and a discussion of the general subsurface and foundation conditions.

Mueser, Rutledge, Wentworth, & Johnston, Washington Metropolitan Area Transit Authority, De Leuw, Cather and Company MRWJ-75-138, #14, Aug. 1975, 32 pp; Sponsored in part by Washington Metropolitan Area Transit Authority, D.C.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. 15 093292 ACCOMODATION OF UTILITY PLANT WITHIN THE RIGHTS OF WAY OF URBAN STREETS AND HIGHWAYS. STATE OF THE ART. The report presents a technological background and factual practices upon which local agencies could build an effective, workable utility location program. Findings are based on in-depth, on-site interviews of 40 communities in the U.S. and Canada, a mail survey of 500 local agencies, of which 222 submitted replies, and the assistance and cooperation of representatives of all major utility associations, the American Society of Civil Engineers, and the Institute for Municipal Engineering of the American Public Works Association. It was found to be infeasible to recommend national

standards for location of utilities due to the very large number of local and physical factors which influence location practices. Many examples of local standards are given. The report and the companion manual should be of valuable assistance to state and local highway agencies in cooperation with utility companies for making improvements to utility accommodation policies and practices.

15 093363 VIBRATION PREDICTION MODEL FOR FLOATING-SLAB RAIL TRANSIT TRACK. This report presents the theoretical development of a model to predict the vibration reduction by floating-slab tracks in subway tunnels. Data from a field study in New York City are also presented. The report is one of three reports dealing with noise and vibration control for urban rail transit track and elevated structures. The theoretical model described allows for the prediction of the force transmissibility--the ratio of the amplitudes of the force on the tunnel floor and the force on the rail. Data from the field study support the use of a simple single-degree-of-freedom oscillator for predicting vibration reduction. The theoretical model developed allows predictions to be made for a more general case.

15 093743 SUBSURFACE INVESTIGATION SECTION C010B, HUNTINGTON ROUTE.

Results are presented of 74 test borings made along the line of the METRO trackage in Section C010b of Huntington Route, generally in the City of Alexandria and crossing the Valley of Cameron Run south of the city to Huntington Station in Rose Hill of the Washington Metropolitan Area Metro System. The report contains a continuous geological section along the line of the trackage, logs of the borings, results of tests performed on samples obtained in the borings and a text summarizing anticipated design and construction problems.

Mueser, Rutledge, Wentworth and Johnston, Washington Metropolitan Area Transit Authority, De Leuw, Cather and Company MRWJ-75-130, Oct. 1975, 73 pp; Prepared in cooperation with Washington Metropolitan Area Transit Authority, D.C., and De Leuw, Cather and Co., Inc., Washington, D.C.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-245777/8ST, DOTL NTIS

15 093745 SUBSURFACE INVESTIGATION SECTION A006B, ROCKVILLE ROUTE.

Results are presented of two slant borings made from the inbound running tunnel mined through the location of Zoological Park Station in Section A006b of Rockville Route of the Washington Metropolitan Area Metro System, north of Rock Creek in northwest Washington, D.C. The purpose of the work was to provide information on the probable extent and orientation of shear zones which were expected to pass through the position of the station entrance excavation on the west side of Zoological Park Station. The report contains geological sections illustrating conditions along the line of these borings, logs of the borings and a discussion of general subsurface conditions.

Mueser, Rutledge, Wentworth and Johnston, Washington Metropolitan Area Transit Authority, De Leuw, Cather and Company MRWJ-75-141, Rept. No. 2, Sept. 1975, 14 pp; Prepared in cooperation with Washington Metropolitan Area Transit Authority, D.C., and De Leuw, Cather and Co., Inc., Washington, D.C.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, NTIS Price, /MFS\$2.25; Repr. 15 094187 DEVELOPMENT OF STANDARD SPECIFICATIONS FOR CONCRETE TIES FOR RAPID TRANSIT. PHASE I. TASKS 1 TO 5.

This report presents the results of the first part of a project to develop specifications for standard concrete ties for rapid transit use. The report is presented in five sections: Section 1 estimates the market potential of concrete ties for the transit industry. Section 2 presents a technical and economic evaluation of concrete ties based on international experience. Section 3 presents parameters necessary for the design of standard concrete ties for rapid transit use. Section 4 covers the preliminary specifications for the materials, fabrication and handling of the standard concrete ties.

15 094292 DEMONSTRATION OF ACOUSTICAL SURVEY SYSTEM. WASHINGTON METRO AREA TRANSIT AUTHORITY.

This report reviews the techniques and results of the demonstration of the Holosonics Acoustical Survey System in a tunnel of the Washington Metro Area Transit Authority subway system. Acoustical data from a small sampling--a drill hole--was related to the actual conditions of the large volume of rock to detect geological and man-made anomalies. This report also discussed the computer equipment, systems applications and data processing methods involved in the acoustical probe.

15 094295 FIELD MEASUREMENTS OF GROUND DISPLACEMENTS ABOUT A TUNNEL IN SOIL.

Soil displacements were measured during the construction of two 21-ft OD shield-driven tunnels in principally granular soil for the Washington, D.C. Metro. The program of field observations and measurements was implemented to determine the relationship of construction procedure to ground movements about the tunnels. Inclinometers, extensometers, and surface settlement surveys measured the soil displacements at three instrument cross-sections in the Lafayette Park Test Section. The soil displacements were measured at a sufficient number of points at each cross-section such that the complete pattern of ground movements at different stages of construction could be determined.

UILU-ENG-75-2021, Sept. 1975, 359 pp; Prepared in cooperation with DeLeuw, Cather and Co., Washington, D.C.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-246938/5ST, DOTL NTIS

15 094692 SUBSURFACE INVESTIGATION, BRANCH ROUTE, 'B' CORRIDOR, STATIONS 17825 TO 484 (F004 TO F008) AND ARS MEDIAN STATIONS 310 TO 424 (F008).

Results are presented of 87 borings made on two alignments of Branch Route, the "B" Corridor extending south from Anacostia through Congress Heights to a yard at Rosecroft Raceway and Section F008 of ARS Median from Station 310 along the Suitland Parkway median to a yard near Henson Creek, of the Washington Metropolitan Area Metro system. The investigation was made to determine subsurface conditions at the subway locations which consist chiefly of single-track earth tunnels in the "B" Corridor alignment and at-grade construction or aerial structures in ARS Median. The report includes continuous geological sections along the line of the subway in the area of the investigations, logs of the test borings, laboratory test data and conclusions regarding design and construction problems.

15 094698 SECTION A009: ROCKVILLE ROUTE, YUMA STREET ALTERNATIVES, SUBSURFACE INVESTIGATION.

The report summarizes results of eight borings made in connection with a study of a series of possible alternatives for the Yuma Street link in Section A009 of Rockville Route connecting the subway on Connecticut Avenue with the continuation of the subway on Wisconsin Avenue within Northwest Washington, D.C., of the Washington Metropolitan Area Metro system. The investigation was made to generally assess subsurface conditions at the locations of subway structures in connection with an environmental impact statement. The report contains a series of geological sections illustrating four alternative positions for this connecting link, logs of the eight borings and a general discussion of anticipated subsurface conditions.

15 096371 SOIL STABILIZATION TEST AT THE SWEDEN BRIDGE IN VIENNA-A NEW APPLICATION OF RADIO NUCLIDES IN BUILDING [Badenverfestigungsversuch Bei Der Schwedenbuecke In Wien Eine Neue Anwendung Von Radionukliden In Der Bauwirtschaft].

As part of the preliminary work for the construction of the underground railway tunnel tubes under the Danube canal, experimental injections were made to stabilize the soil, but these were not successful. Following this an attempt was made to develop a control procedure for routine injections using radioactive marking substances. Based on measurements made of filter rate and direction of flow, an assessment was able to be made of the condition of the soil and thus of the effectiveness of soil stabilizing injections. The testing methodology (central boreholes in which

to introduce the water and the inspection equipment) are described in detail. The results of the four tests showed that the method used appears to effect a workable control of injections for stabilization and possible also for support. /TRRL/ [Germa.]

15 096372 STATE OF THE ART OF SLURRY TRENCH WALL TECHNOLOGY [Der Stand Der Schlitzwandtechnik]. The large area of application of slurry trench wall technology is described with reference to several large-scale construction sites (high-rise buildings, underground railways, nuclear reactors). Constant progress, particularly in drilling technology, in supporting liquids and in precast construction, has made possible a reduction in costs and rationalisation of the working method. Efforts are currently being made to allow the building of a whole construction pit to be undertaken by one contractor in order to attain maximum safety. The paper was presented at the meeting of the Austrian architectural and engineering association held in Vienna on 18th January 1972. /TRRL/ [German]

15 096670 TECHNIQUES AND EQUIPMENT FOR DETECTING UNDERGROUND SERVICES. This report is intended to be a guide to engineers who wish to employ specialist techniques to locate underground services. The tasks may range from checking a whole site for the existence of buried pipes or cables to tracing the routes of services already known to be present. The need for such techniques arises at various stages in road works from the preliminary survey for a new scheme to the maintenance of an old road. The characteristics of the service to be located and the conditions under which this must be done vary widely and few of the devices available fulfil multiple roles. To assist the engineer in choosing the most appropriate equipment, the report includes brief notes on the principles of operation of most types of device and lists a wide range of commercially available instruments together with an indication of the likely applications of each. /Author/TRRL/

15 096876 NEW RAILWAY BRIDGES OVER LONDON'S EAST CROSS ROUTE. The east cross route, or London Inner Ring Road System, affects the eastern region of British Railways at Victoria Park and Old Ford. Two under-line bridges are required at Hackney Depot, and three in the Victoria Park area including a 7 span box girder viaduct. A major under-line bridge is required at Old Ford. Site problems required

differing forms of structure and different modes of erection. Problems with respect to the demolition of the old railway arch arose at the bridge over Wick Road. Special consideration was given to temperature effects on the Victoria Park viaduct which is on a curve. Old Ford bridge was a particularly difficult problem due to the high density electrified rail traffic and the presence of London transport tunnels and sub-station. This governed the choice of thrust bored abutments under the seven tracks. Superstructure design of all bridges was based on steel box girders, some strong enough to support a single track and others used as a beam group. Plated or concrete decks were used, and some of the parapet girders were clad. Waterproofing was by membrane or epoxy resin. Abutments were generally of reinforced concrete, sometimes on bored piles. /TRRL/

15 097277 EXTENDING THE PARIS METRO. The Regie Autonome des Transports Parisiens (RATP) has been engaged in construction of a new "Regional Express Rail" transit system and in extension of the existing Paris Metro system. Many differing construction methods have had to be utilized because of the variety of soil and geological conditions. Construction under many of the city's landmarks produced other problems. Each new work has been analyzed and several solutions are studied to find the most suitable solution. After technical and economic analysis, contracts are let. This is the first of two installments.

15 098087 ACCOMMODATION OF UTILITY PLANT WITHIN THE RIGHTS-OF-WAY OF URBAN STREETS AND HIGHWAYS: MANUAL OF IMPROVED PRACTICE. This manual sets forth principles and practices under which utility facilities can be successfully accommodated within urban rights-of-way. These principles and practices can be characterized by five steps. 1. Enabling legislation to establish rights of local agencies to control use of the right-of-way; 2. Provision of adequate staff and budget to protect the public's investment in its streets and highways; 3. Establishment and implementation of adequate permit, inspection, and pavement restoration controls; 4. Implementation of cooperation and coordination mechanisms and record systems among all major utilities; and 5. Provision of accurate information to the field forces who excavate in the rights-of-way to allow them to work safely and protect existing utility plant. This manual and the companion report should be of valuable assistance to State and local highway agencies in cooperation with utility companies for making improvements to utility accommodation policies and practices.

15 098750 STEEL RIB STRESS ANALYSIS. The file name is RIB. This program computes the maximum thrust and maximum moment in a steel tunnel support, or rib having a constant radius and selects the appropriate steel member. The method of analysis used is that given by Commercial Shearing and Stamping Co. in its book, "Rock Tunneling With Steel Supports", by Proctor and White. The input required is the radius of the rib, width of tunnel, assumed overbreak, assumed blocking point spacing, rock loading and rib spacing. The output consists of the following: Vertical Rock Load at each Blocking Point, Maximum Thrust, Moment, the steel W section to be used for rib, the length of the rib, and total weight of steel required for ribs for the particular length of design in question.

15 125511 VIBRATION MEASUREMENTS OF STEEL TRANSIT STRUCTURES. Vibrations induced into rail rapid transit structures may be radiated from the structure as airborne noise that disturbs the rider and the wayside community, or as ground-borne vibrations that propagate into the foundations of wayside structures setting walls, floors, and common household items into annoying vibrations. This report describes the results of field measurements on existing steel elevated structures presented to aid civil engineers concerned with design, performance, repair, and evaluation of steel elevated transportation structures. These measurements showed that peak acceleration levels are generated in decreasing order of magnitude on the rail, on the top and bottom girder flanges, on the girder web, on cross-bracing, on the column, and at the footing base. In addition, peak acceleration levels of 70 g are little attenuated as they are transmitted from the rail through the structure, and peak acceleration levels significantly increase for increasing train speeds. /Author/

15 126194 GROUND WATER AND URBAN PLANNING. REPORT FROM STEGA 1966-73 [Grundvatten och Byggnade. Stegas Arbete 1966-73]. Knowledge of groundwater conditions is essential in designing building structures, particularly when foundations are complex and at great depth. Drops in the water table can lead to serious damage to ground and buildings. This project comprised questionnaire surveys, groundwater measurements in reference areas, damage due to settlement near Stockholm, measurements of water table and settlements in new development areas, groundwater problems near tunnels and deep excavations, a computer model for groundwater, a land cost index, effect of groundwater on vegetation, and bacterial decomposition of foundation timber. In a Stockholm suburb, serious settlements occurred in an area built on postglacial clay; piles buckled and there was corrosion. In another Stockholm area, settlement damage is so extensive that repair costs amount to 50% of property value. Several tunnelling projects are in progress in this area. Water table conditions before and after construction were studied in two

model areas. Some tunnelling and deep excavation projects were investigated. A drop in water table can affect vegetation; timber piles which had always been below the water table suffer bacterial decomposition. The group compiled building geological maps comprising geological and geotechnical data and also foundation and land costs index maps based on these. /TRRL/ [Swedish]

15 127134 FOUNDATION UNDERPINNING FOR STRUCTURES OVER SUBWAY EXCAVATION. To protect structures from settling due to the excavation for the Washington, D.C., subway, it was necessary to underpin their foundations. For the soil and construction conditions of this project, the influence zone for major historic and public buildings was defined as the area above a line rising from each side of the excavation at a slope of 1:1 from a point 2 ft (0.61 m) below the edge of the base of the subway excavation. Building foundation bearing areas above the influence zone were underpinned to deliver the foundation load below this sloping line. Work on two of the 36-year-old Superior Court Building of reinforced concrete and/or structural steel in Judiciary Square is described in this article. In general, the underpinning involved transferring those column loads and building wall loads, which are outside the subway excavation limits, but within the influence zone, to a pile foundation. Construction directly over the subway excavation was transferred onto prestressed concrete beams which spanned the excavation and rested on new pile foundations constructed on each side of the excavation. All foundations within the influence zone had to be temporarily supported on "pickup" beams while they were being undermined for pile installation, so as to avoid foundation movement.

Cohen, E Solomon, J *American Concrete Institute, Journal of* Vol. 72 No. 8, Aug. 1975, pp 387-394, 15 Fig.

15 127898 WATERPROOFING OF THE AUBER STATION BY MEANS OF EPOXY RESINS [Execution de l'etanchelie a la station auber au moyen de resines epoxydes]. One of the main problems during the construction of the Auber underground station was that of the adhesion of the waterproofing lining to the walls. A continuous resin film with high mechanical strength was used. A cement coating was also necessary to protect the resin coating and to be

used as a support for later finishing processes (tiles, paint, etc). Because of the high level of humidity in the tunnel, polyester and polyurethane could not be utilized. The waterproofing of the tunnel proceeded as follows: (1) treatment of joints by means of injection; (2) treatment of isolated points and cleaning of the surface; (3) application of two coats of resin on dried surfaces; (4) application of cement coating. /TRRL/ [French]

15 127911 AUCKLAND RAPID TRANSIT SCHEME. This article is based on the environmental impact report on the Auckland rapid transit scheme. This has the objective of providing a public passenger transport service which will make use of an electrified railway fully integrated and co-ordinated with road transport. It will involve a 30km rapid transit system and an underground loop line. The authors outline the proposals for the rail component including electrification, elimination of level crossings and a standardized service. Details of stations are given, which are designed for pleasantness and convenience, and include provisions for handicapped people. The route of the rail service is next discussed followed by brief details of the overhead power system. Three-car units each seating 150 passengers will operate at up to 120km/h two being operated in tandem during peak hours. After briefly describing the storage and servicing complex the authors discuss the construction of the underground section most of which will be excavated in unweathered sandstones and siltstones, which can be tunnelled by a header unit with a small traversing cutter or by a tunneling machine. 2.5 and 4 meter ventilation and emergency shafts will be incorporated. The 200,000 cubic metres of spoil are to be used in the Grafton Gully motorway construction. Environmental features of the system are discussed with particular reference to appearance and noise. Noise reduction is to be achieved by the use of long welded rails on rubber pads and heavy sleepers, by high quality alignment, the use of ballasted bridge deck designs and noise barriers. /TRRL/ *New Zealand Engineering* Vol. 30 No. 4, Apr. 1975, pp 99-102, 4 Fig., 1 Phot. 15 127913 HEATHROW SUBWAYS WAIT FOR RAIL LINK. This article describes the progress of the construction of the passenger subways to the new underground station at Heathrow Airport. These subways are being built with minimum of disturbance to road traffic; the methods used are described: the use of "secant" bored piles to form the walls of the subway and that of a capping beam, on which are placed precast prestressed inverted T-Beams, forming the roof of the subway. Diaphragm wall techniques also were considered but they would have caused severe disruption above the ground. It was necessary to carry out 50 major service diversions and many sewer alterations. Method of installing the secant piles is described. When crossing a road the piling, roofing and reinstatement operations follow closely behind each other. The walls

of the subways are being covered by a 100 M thick layer of gunnite. To construct the subway under terminal one car park a mini-rig was used because of the restricted head room. Chemical stabilization was utilized to help the strata withstand the horizontal pressures developed by the exposed footings. The subway enters terminal one just above the foundation slab which is 4M thick. The main subways will be 8M wide and 2.42M high and will accommodate 1.4M wide moving walkways in both directions. The subways should be in use by the end of 1977. /TRRL/

15 127932 BRITISH EXPERIENCE IN STANDARDIZATION AND METRIC CONVERSION. Experience in standardization and soft-ground tunneling for the underground railways of London are reviewed, and metric conversion in the construction industry and in the tunneling industry are discussed. Standardization of expertise is illustrated by the existence in Britain of contractors specializing in underground construction and those specializing in tunneling. A measure of standardization of running tunnel diameter was instituted in 1924. The shape of the load gauge and its limited dimensions, the absolute minimum clearance that must be assured around the outside of the vehicle to determine the structure gauge are important basics in standardizing the cross-sectional area of a railway tunnel. Walking space requirements are also incorporated. Different requirements in different cities determine the shape of the vehicle. The standard tunnel diameter dating back to 1900 is 11 ft. 8 1/4 inch and the standard station tunnel diameter (internal) is 21 ft. 2 1/2 inch. Departure from the standards (in 1907) and the reasons for it are set forth. Comments are made on the variations of conditions from city to city and the impracticability of applying the same standards in all cities. The standardization of machinery and equipment for tunneling, underground construction and mining are also discussed. Metric conversion has occurred in the tunneling industry because the construction industry has gone metric. The conversion has been monetarily costly. However, a peculiar situation exists: the engineers have metricated while users of the infrastructure, the operating personnel and others have not.

Follenfant, HG (British Tunnelling Society) ; National Research Council 1975, pp 28-40; Report of a symposium conducted by Standing Subcommittee No. 5, International Activities of the U.S. National Committee on Tunneling Technology, held on May 21-22, 1974 in Washington, D.C.; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243754

15 127939 A DESIGNER'S VIEWS: FUNCTIONAL REQUIREMENTS AND LIMITATIONS. The standardization of tunnel equipment is discussed, the potential for saving based on actual and theoretical costs for two tunnels is briefly analyzed, and comments are made on the possibility of adapting a machine to different diameters, and the potential cost saving with regard to linings. It is desirable to standardize the components performing the various functions of the tunnel boring machines, so that they are interchangeable between systems. The effect

of standard-size tunnels on projected tunnel design is discussed. Estimates indicate that there is no clear-cut economic advantage in standardization of tunnel diameter. The possibility of adapting a machine to different diameters depends on whether it is a shield machine or a hard-rock machine. The design of tunnel linings will vary with the depth of the tunnel below ground surface and the quality of the ground. Depending on the purpose of the tunnel, similar design criteria may govern different tunnels and lead to standardization of design: metropolitan tunnels for transit systems; municipal tunnels for water supply and sewage disposal; tunnels shared by several utilities within the same conduit. In types of tunnel with no standardization potential with regard to size, economics could be effected by use of standard specifications for the operations involved in the procedure. Work schedule which ensured machinery movement in sequence from one tunnel to another would lead to savings; designers could ensure that station and ventilation shafts are scheduled. The development of a standardized tunnel lining system for the Bay Area Rapid Transit System is briefly described.

Thon, JG (Bechtel Corporation) ; National Research Council 1975, pp 123-132; Report of a symposium conducted by Standing Subcommittee No. 5, International Activities of the U.S. National Committee on Tunneling Technology, held on May 21-22, 1974 in Washington, D.C.; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243754

15 128126 SAFE ROCK BLASTING [Foersiktig Spraengning]. The technique of blasting rock without causing harmful effects on surrounding buildings or other objects is described. The theory of wave propagations in rock is presented briefly. Tables are given showing: 1. The risk of damage in ordinary housing areas with reference to particle-motion velocity and type of rock. 2. Reducing factors for different types of detonators. 3. Recommended charge depending on distance to endangered object. Buildings with electrical installations such as relay devices, computers and automatic switchboards must be particularly considered. These devices are extremely sensitive to the acceleration of vibrations. Recommended maximum amplitudes and accelerations for continuous or intermittent vibrations are given for IBM computers. These restrictions necessitate a maximum charge of 250 times less than that permissible for the building itself. For economic reasons this cannot be done. As an alternative a method of moderating the vibrations reaching the computers has been developed. These are put on rubber dampers and thereafter will withstand the same vibrations as the building. The planning and execution of a pilot project is described and also the measuring equipment used. See also IRRD abstract no. 214777. /TRRL/ [Swedish]

15 128557 JET-FAN VENTILATION. Tunnel ventilating systems are discussed and a jet fan system designed to maintain pollutants below the design level is described. An automatic fan control system has been devised to switch off half of the fans when pollutant concentrations are low and ensure that the fresh air flow is in the direction of the prevailing wind. The theory on which the jet-fan model is based is detailed. The fan thrust, tunnel resistance, vehicle drag and external wind force are all determined by means of equations. The jet fans for the Terrace Tunnel are fully reversible. If the direction of the piston effect is the same as the direction of the net external wind force, the fans may be run in the direction to take advantage of this external assistance. The direction in which the fans are switched on is controlled by a wind vane suspended from the tunnel ceiling. The purpose of the wind vane is to detect the direction of tunnel air flow due to the net effect of external winds and traffic piston-effect. The data upon which the system is based on an average specific emission rate of approximately 40 g CO/km. If the 1980 goal of 2.1 g CO/km is attained, the Terrace Tunnel may require ventilation only for emergencies.

15 128585 THE SINKING OF THE AMSTERDAM METRO. Subway construction was not practical in Amsterdam, the Netherlands, until this new placement technique. Most of the buildings in Amsterdam rest on old, untreated wooden piles that would deteriorate if the high water level were lowered for most conventional subway construction methods. Therefore, the tunnel segments for Amsterdam's new Metro are constructed on the surface and then allowed to settle

into their submerged final position with aid of hydraulic excavation by water jets and slurry pumps.

15 128891 VIBRATION MEASUREMENTS OF STEEL TRANSIT STRUCTURES. Vibrations induced into rail rapid transit structures may be radiated from the structure as airborne noise that disturbs the rider and the wayside community, or as ground-borne vibrations that propagate into the foundations of wayside structures setting walls, floors, and common household items into annoying vibration. This report describes the results of field measurements on existing steel elevated structures presented to aid civil engineers concerned with design, performance, repair, and evaluation of steel elevated transportation structures. These measurements showed that peak acceleration levels are generated in decreasing order of magnitude on the rail, on the top and bottom girder flanges, on the girder web, on cross-bracing, on the column, and at the footing base. In addition, peak acceleration levels of 70 g are little attenuated as they are transmitted from the rail through the structure, and peak acceleration levels significantly increase for increasing train speeds.

15 129109 MANAGEMENT OF RISK. There are many risks involved with subsurface construction, but most of them can be identified. By thoughtful management, some can be overcome,

others reduced and still others shared in such a manner that their overall cost to the owner is minimized. When innovative methods, equipment, or materials are introduced, certain risks may increase to the point that advancement of the state-of-the-art is discouraged. In such cases, the owner, and society in general, may benefit from a reallocation of these risks. By recognizing the various classes of risk and deliberately setting out to manage them effectively, the mining and construction industries can optimize their service to society.

Mathews, AA (Mathews (AA) Incorporated); American Inst of Mining, Metallurg & Petrol Engrs Proc Paper Vol. 2 1974, pp 1167-76; Presented at the Rapid Excavation and Tunneling Conference, San Francisco, Calif., June 24-27, 1974.; ACKNOWLEDGMENT: EI; ORDER FROM: American Inst of Mining, Metallurg & Petrol Engrs, Society of Mining Engineers, New York, New York, 10017 Repr. PC

15 129110 TUNNEL CONSTRUCTION FOR THE SAO PAULO SUBWAY. Careful planning and execution of tunneling procedures kept surface settlement over the tunnels below a magnitude of .05 feet, allowing tunneling adjacent and under high rise buildings without large expenditures for building protection by under-pinning or chemical grouting. The strict requirements of the adopted tunneling procedures were responsible for many delays, reducing tunnel system utilization to 55%. When shields or tunneling machines are to be used for several headings or have to be transferred through subway station construction, provisions for easy assembly should be incorporated into the basic design concept of the equipment. Descriptions are included of soil and groundwater conditions, tunneling equipment and methods, lining, settlement and underpinning.

15 129111 ROSSLYN STATION, VIRGINIA: GEOLOGY, EXCAVATION AND SUPPORT OF A LARGE, NEAR SURFACE, HARD ROCK CHAMBER. The large chamber was excavated in hard rock by conventional drill-and-shoot methods and supported with steel ribs and shotcrete. The station design, based on a moderate amount of subsurface information, was proven well suited to the actual rock conditions encountered. Although some problems were anticipated with jointed, large rock blocks, these problems were minimized by using drilled-in-spile bars in the crown and rock bolting in the sidewalls. It can only be concluded that the station design was compatible with the geologic conditions expected which were hard, blocky rock and tight joints. These factors permitted excavation and support of the opening without serious loss of ground, settlement of the surface street, or other adverse incident.

Bock, CG; American Inst of Mining, Metallurg & Petrol Engrs Proc Paper Vol. 2 1974, pp 1373-91; Presented at the Rapid Excavation and Tunneling Conference, San Francisco, Calif., June 24-27, 1974.; ACKNOWLEDGMENT: EI;

15 129112 TUNNELING AND UNDERGROUND EXCAVATION-GENERATOR OF LITIGATION. Contractors, in the present climate of cost escalation of labor, materials and equipment, general inflation and oppressive contract provisions are showing increasing reluctance to bid either a firm lump sum price or firm unit prices for major projects that will require more than a year or two to complete. But public agencies generally are forced by policy, regulations or legal authority to award contracts on competitive bids that call for a firm price commitment. One possible way of reducing litigation in such risky work as tunneling would be to include in firm price bid invitations bid items for specific changed conditions or other foreseeable contingencies. The prices quoted for these items would be paid only to the extent the changed conditions were encountered or the contingencies occurred.

Matthias, FT; American Inst of Mining, Metallurg & Petrol Engrs Proc Paper Vol. 2 1974, pp 1163-66; Presented at the Rapid Excavation and Tunneling Conference, San Francisco, Calif., June 24-27, 1974.; ACKNOWLEDGMENT: EI; ORDER FROM: American Inst of Mining, Metallurg & Petrol Engrs, Society of Mining Engineers, New York, New York, 10017 Repr. 15 129113 PLANNING UNDERGROUND CONSTRUCTION OPERATIONS. The modern underground constructor faces economic and competitive conditions which demand exacting planning, logistics and scheduling; the most efficient operation methods and equipment known; and realistic, comprehensive; analytical risk evaluation with adequate contingencies or other protection. Planning can usually be separated into two phases: preconstruction and during construction. Preconstruction work includes a thorough review and familiarization with engineering and contract documents, site investigations, evaluating such local conditions as weather and labor supply, selection of construction methods and equipment, and preparation of detailed cost estimates. During construction, planning encompasses preparation of detailed work schedules, cost controls, and contingency plans.

15 129115 WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY'S EXPERIENCE WITH CONTRACTUAL RELATIONSHIPS IN TUNNELING CONTRACTS. Each subsurface project must be given intense study, more subsurface data must be collected, and made available to bidders and ample time for design and review should be available. The early determination that there is or is not a differing site condition should be made only after a complete study at the Contracting Officer level where all elements of expertise are

available. Audits are of major assistance to negotiators and adequate audit staff to keep up with the workload is essential. Contractual relationships are improved when construction management and technical inspection services are provided by other than the designer. The owner and the contractor must establish and maintain good public relations, otherwise poor contractual relations might develop.

Aldredge, WS (Washington Metropolitan Area Transit Authority) ; American Inst of Mining, Metallurg & Petrol Engrs Proc Paper Vol. 2 1974, pp 1137-62, 12 Ref.; Presented at the Rapid Excavation and Tunneling Conference, San Francisco, Calif., June 24-27, 1974.; ACKNOWLEDGMENT: EI; ORDER FROM: American Inst of Mining, Metallurg & Petrol Engrs, Society of Mining Engineers, New York, New York, 10017 Repr. 15 129118 FORECASTING RAPID EXCAVATION DEMANDS IN THE URBAN SECTOR.

The paper describes efforts made since the 1972 Rapid Excavation Conference in Chicago to generate more thoughtful and more robust estimates of urban sector demands, and to apply what has been learned to the most difficult category of predictions: those for urban mass transit systems. A modest sample survey has been undertaken of demands by major category in three key American Urban areas: New York, Los Angeles, and Minneapolis-St. Paul. This is the only empirical effort going on to establish comprehensive benchmarks for present and future activity in these major metropolitan areas. From the data collected it should be possible to estimate propensities to spend in other cities for the important urban utilities.

Newcomb, R (West Virginia University) ; American Inst of Mining, Metallurg & Petrol Engrs Proc Paper Vol. 1 1974, pp 325-330; Presented at the Rapid Excavation and Tunneling Conference, San Francisco, Calif., June 24-27, 1974.; ACKNOWLEDGMENT: EI; ORDER FROM: American Inst of Mining, Metallurg & Petrol Engrs, Society of Mining Engineers, New York, New York, 10017 Repr. PC

15 129126 PLANNING SUBWAYS BY TUNNEL OR CUT-AND-COVER. SOME COST-BENEFIT COMPARISONS. The largest single cost for any new transit system is construction, accounting for up to 70 percent of the total system cost. But intangible social costs, borne by the affected neighborhood community, may add as much as 25 percent to the total system cost. When these intangibles are taken into account in terms of loss of local economy, decrease of social activities, and general community disruption, high speed and deep tunneling methods become more competitive with cut and cover construction.

15 129128 KARL TERZAGHI AND THE CHICAGO SUBWAY. Terzaghi's engagement on the Chicago Subway, 1939-1941, influenced his decision to take up permanent residence in the United States and had a strong impact on the development of applied soil mechanics. So-called squeeze tests, in which the settlements and subsurface movements were correlated with construction procedures, permitted improvements in construction methods and decreases in lost ground. Measurement of loads in bracing of open cuts led to better understanding of behavior of soft clay in undrained shear. Full-scale test sections provided basis for more economical design of permanent tunnel lining. All these activities evolved under Terzaghi's stimulation and in turn helped formulate his conceptions of the ways in which soil mechanics should be applied in practice.

15 129131 FIVE DECISIONS IN TRANSIT STATION DESIGN. In each of the five areas the decisions may either aid or hinder the realization of design objectives, depending on the interplay of client-consultant consultation. The decision areas include the nature of station design; how best to handle people-moving requirements; providing for amenities and environmental quality; providing intermodal transfer facilities; and the level of community involvement in professional problem-solving. The paper suggests design methodologies in each of these areas to guide the achievement of design objectives.

McCutchen, WR (Bay Area Rapid Transit District) ; American Society of Civil Engineers Proc Paper 1975, pp 95-99; Presented at the Transportation Facilities Workshop: Passenger, Freight and Parking, New York, N.Y., May 22-24, 1974.; ACKNOWLEDGMENT: EI; ORDER FROM: ASCE, Repr. PC

15 129133 GENERAL PROBLEMS IN DESIGN AND CONSTRUCTION IN URBAN AREAS. The paper examines some of the existing policies and lack of policies on underground space as they pertain to rapid transit development projects in the United States. It discusses problems which have occurred during the development of both San Francisco's BART and the Washington, D.C. Metro project due to the conflict of interest in the use of such underground space. Several guidelines are offered for consideration and formulation of a national policy on the use of underground space.

15 129818 LIGHT RAIL TRANSIT CONSTRUCTION COSTS. Light rail transit has attractive service characteristics that can be secured in most cities for modest investments. The relatively low construction costs of light rail transit are due primarily to avoiding large civil works by relying instead on reserved

rights-of-way at grade. Many options are available for alignments at grade, and costs for way reservation can vary widely. This paper describes the construction costs for modern light rail transit; it takes into consideration way reservation and the more predictable costs for stations, street crossings, track, cars, electrification, signals, communications, and other requirements. The costs presented are estimates, based on the experience of the author in recent evaluations of light rail transit for several U.S. cities. Few new light rail facilities have been built in the United States in recent years; therefore, little opportunity exists for relating estimates of this type to actual construction. Figures discussed here range from high to low where convenient, and single estimates presented are conservative representations of the largest values likely to be experienced in most cities.

15 130643 DISCUSSION FOLLOWING PANEL 2, NEW HORIZONS IN UTILIZATION OF UNDERGROUND SPACE. In this discussion, studies performed on shales in Canada are described, and questions related to civil defense, instrumentation studies, five protection evacuation ventilation, and fire insurance are asked and answered. Problems associated with the construction of a large dam across the South Saskatchewan River in the geological area of the Bearpaw Shale are discussed. Heaving problems have been encountered in the Ottawa area where shale is exposed in building. Mineralogical, chemical and bacteriological studies have been performed on the shale. With regard to civil defense, it is observed that most of the subsurface buildings are not designed to protect against blast damage, and concussion, but can offer protection against fall out. About a million people could be accommodated in the subsurface buildings. An inventory has been made of all of the buildings with a protection factor of 20 and 50. A inert gas fire protection system with 3 to 6 percent concentration is described which would extinguish any fire instantaneously. Comments are made on the establishment of fire protection criteria, and experience with fires on the Canadian subways is described. The need is indicated for the provision for fire prevention in the form of brigade training for the employees.

Hilpan, PL, Moderator ; National Science Foundation Proceeding Mar. 1975, pp 115-122; Published in the Proceedings of the Symposium on the Development and Utilization of Underground Space, March 5-7, 1975, Kansas City, Mo., sponsored by the Department of Geosciences, University of Missouri, Kansas City.

15 130645 THE UNDERGROUND OF CITIES. Examples from Canada and other countries are described, and attention is directed to the most important of all the features of such works, the local geology and the urgent necessity for

immediate attention to this basic feature of all cities. The North Bay complex (a combat and control center for the air defense force in eastern Canada) is an underground location in competent gneiss which was explored through an extensive test-hole program before excavation started. Excavation started in 1959 and was complete in 16 months. The main complex consists of two caverns 400 feet long, 60 feet high, and 45 feet wide in which a 3-story steel frame building stands, with an effective floor area of 140,000 square feet. A water purification plant about to be constructed is described. The underground plant will include both low-and high-lift pumping station and a five million-gallon storage reservoir with a rated capacity of 50 million per day. The use of the underground in association with large center-city buildings and their use for civic services is mentioned. The British underground transportation services, and an underground hospital for asthmatics in Poland are also described. All successful underground space development depends on the certain and detailed knowledge of the local geology. A methodical collection of all subsurface information available for public use is essential for all cities. A city with such information is that of Prague in Czechoslovakia. Each quadrangle of the city is covered by 4 separate maps which show: the detailed geology; the depth of overburden over the bedrock; and the hydrogeology.

Leggett, RF ; National Science Foundation Proceeding Mar. 1975, pp 125-133, 7 Ref.; Published in the Proceedings of the Symposium on the Development and Utilization of Underground Space, March 5-7, 1975, Kansas City, Mo., sponsored by the Department of Geosciences, University of Missouri, Kansas City.

15 130649 SUBSURFACE USES IN SWEDEN AND FRANCE: A REPORT. A brief reconnaissance survey was made in Stockholm, Sweden, and the Loire and Cher Valleys of France, in an effort to observe the uses of the subsurface in these areas, and compare them with the underground development in greater Kansas City. In Sweden, a section of subway under construction and an underground sewage plant were visited. It is noted that Swedish skills in blasting are highly proficient, that subsurface development is not a reclamation of mined areas, and that commercial uses of the subsurface other than the military sites are of the basement type. In Sweden, the subsurface is viewed as a way to preserve the surface. The costs of subsurface development are weighed against climatic maintenance cost of similar surface construction, energy cost of an exposed surface location, costs of a disrupted surface environment and the cost of defense inadequacy. The Lorie and Cher valleys of France have much in common with Kansas City. The uses here were secondary to an original mining venture. The physiographic presence of rivers and their resultant bluffs have played an important part in both the Kansas City and Loire-Cher regions. The difference lies in the rural nature of the French valleys which have made economical housing the most desirable use for the abandoned mines. This is augmented by developments which exploit the areas as unique and economical vacation sites.

15 131030 DESIGN OF TRANSIT STRUCTURES FOR URBAN AREAS. Design of transit structures for urban area requires consideration of many factors in addition to the purely technical strength and size designs. The task is to design the most effective and economical structures that will meet the overall transit and surrounding community needs. Development of such designs should achieve a coordinated balance among factors related to operation of the transit system and impact on the community, long range and during construction. This involves detailed consideration of many things, chiefly among which are: (1) The operating philosophy and plan of the transit system; (2) existing community development along the system planned; (3) constraints--physical, financial, visual public reaction; (4) geological conditions and probable construction methods; (5) nonstructural items, e.g., vehicles and train-control; (6) detailed design and contract packaging; and (7) scheduling construction--equipment and testing.

15 133227 DEMONSTRATION OF ACOUSTICAL UNDERGROUND SURVEY SYSTEM IN THE WASHINGTON METROPOLITAN AREA. The purpose of the subject study was to demonstrate current capabilities of Acoustical Surveying in conjunction with tunnelling operations to aid in geologic determination and prediction. The Holosonics Acoustical Survey system served as the basic equipment for the survey program. Peripheral equipment such as a fast transient recorder, perforated paper tape punch and CRT storage monitor was used to implement the system. Interfacing and field packaging were fabricated by Holosonics to allow use as an integral system. New computer software was applied to handle the changed input format and to refine the output. Five-hundred-and-ten feet of drill hole were logged in five separate holes requiring four field mobilizations. Four short holes totalling 210 feet were logged under the equipment and software calibration phase. The fifth hole was a 270 feet long cored hole.

15 133306 THE AERODYNAMICS AND THERMODYNAMICS OF SUBWAY DESIGN CONCEPTS [Technical rept]. This report is one of many such reports leading to the final product—a 'Subway Environmental Design Handbook.' Subway environment simulation (SES) computer program applications to a variety of hypothetical double-track subway rapid transit systems with bi-directional train operations are presented and discussed. The study encompasses the effects of subway geometrical features, such as ventilation shaft configuration and location, mechanical systems, such as fans and cooling equipment, and train operations. Results are presented

in terms of both instantaneous and average subway air flows and temperatures.

15 133626 SUBWAY TRAMS KEEP GUADALAJARA ON TOP. This article describes a construction programme in Guadalajara Mexico, designed to avoid traffic congestion as the population doubles in the next 10 years. The first 5.3 km of subway, recently completed, will eventually form part of the city's projected underground railway system. Used initially as a tram way, it will change to tracked underground, railway following extensions to north and south. Each section therefore comes into immediate use and can be integrated into the whole system as it is completed. It is claimed that using trams gives flexibility in planning and construction of the network because the pressure to complete a given line is less severe. Trams will continue to follow the same route during the change to railways but at surface level where new dual three-lane carriageway roads are being built concurrently as each section of the subway cut and cover work is completed. Brief details are given of the ground conditions, the construction of the concrete subways and of the ventilation and lighting systems. /TRRL/

15 133634 IN SITU CONCRETING IN TUNNELS. This article outlines the various problems, and the methods of answering them which arise during the concreting stage of tunnel construction, using the experience of the Liverpool loop line as a typical example. This line is a new underground railway system which incorporates 3.2km of 5M dia. tunnel. Access for the contractors was limited to five vertical shafts down to the tunnel which ranges in depth from 20 to 35M below ground level. The question of inaccessibility, no concrete lorry could gain access to the tunnel, raised major problems involving delivery of concrete to the tunnel, rapid transit from the access point to the working point and the handling of the concrete at the working point. The use of steel-lined boreholes incorporating pneumatic doors at the base of the downpipes to deliver concrete to the tunnel is described, together with the use of pneumatic-tyred and railway-tracked vehicles in addition to pumping to rapidly transmit the material to the workpoint, and the placing methods employed at the workpoint. In all these operations timing was considered to be of utmost importance, and a high degree of effective supervision necessary /TRRL/

15 134063 TRANSPORT TUNNELS IN URBAN AREAS. After a short consideration of the vital role of transport in urban areas the various types of transport tunnel are described and the merits and problems of using tunnels to carry transport facilities are outlined. Data are given on the cost of constructing road and underground railway tunnels. Ground settlement due to tunnelling and the ventilation of road tunnels are considered. Examples of recent developments in European cities incorporating substantial underground works providing mass-transit, road and car parking facilities are described and an attempt is made to assess the future prospects of transport tunnels. /TRRL/

15 136402 ELASTIC CHARACTERISTICS OF TRACTION DRIVES OF TRANSPORT VEHICLES. A wide application has been found among the traction, drives of transport vehicles (rail and road vehicles) for designs in which the motor and the distributor reduction gear are fixed to a sprung vehicle frame, and the driving axles (the pairs of wheels) are connected to this gear by elastic transmission mechanisms. The presence of a reduction gear which is fixed on a vibrating base and works in connection with it as a planetary mechanism is responsible for a substantial interconnection between the torsional vibrations of the revolving masses of the drive and the angular vibrations of the vehicle frame. The selection of the elastic drive parameters is an important factor for such a design because in case of their deviation from the optimum values the drive becomes sensitive to disturbances which act on the vehicle from the direction of the track. The processes of interaction between the torsional vibrations of a drive which has a distributor reduction gear, and the angular vibrations of the vehicle were investigated in an example of a single-motor traction drive which has been adopted in the locomotive manufacture in the USSR.

15 136471 SUBSURFACE INVESTIGATION, SECTIONS E006 TO E008, GREENBELT ROUTE [Rept. no. 6]. Results are summarized of 33 test borings made along two alternative alignments studied for Sections E006 to E008 of Greenbelt Route of the Washington Metropolitan Area Metro System. The borings were positioned within planned sections of earth tunnels to delineate potential tunneling difficulties to assist the General Engineering Consultant in studies and recommendations of the optimum tunnel profile position. The report contains continuous geological sections incorporating the new borings, logs of the borings, results of laboratory tests on soil samples obtained and a discussion of anticipated construction difficulties for the alternative tunnel schemes.

15 136825 MULTISPAN ELEVATED GUIDEWAY DESIGN FOR PASSENGER TRANSPORT VEHICLES. VOLUME I. TEXT. Analysis techniques, a design procedure and design data are described for passenger vehicle, simply supported, single span and multiple span elevated guideway structures. Analyses and computer programs are developed to determine guideway deflections, moments and stresses and vehicle accelerations resulting from a two-dimensional vehicle with finite pad length front and rear suspensions traversing a multispans elevated guideway. A preliminary design procedure is described to estimate guideway beam structural requirements so that a vehicle-guideway system will meet specified levels of passenger comfort. Design data for 150 mph and 300 mph intercity 40,000, 80,000 and 120,000 lb. air cushion vehicle single and multiple span (span lengths of 50 to 150 ft.) guideways is summarized. For both urban and intercity operating regimes, the data indicate that improvements in the vehicle suspension and the use of multiple span structures rather than single span structures may result in reduced guideway material requirements.

15 136979 DATA ANALYSIS AND INSTRUMENTATION REQUIREMENTS FOR EVALUATING RAIL JOINTS AND RAIL FASTENERS IN URBAN TRACKS. Rail fasteners for concrete ties and direct fixation and bolted rail joints have been identified as key components for improving track performance.

However, the lack of statistical load data limits the development of improved design criteria and evaluation tests. This report evaluates the data required for design, laboratory tests, and for the development and verification of analytical models of fastener and joint performance. Available track instrumentation is reviewed for fulfilling these requirements, and functional specifications have been developed for improved tie plate load cells and instrumented wheels. Also included are recommendations for data analysis and data processing procedures and test site selection criteria needed to plan and conduct comprehensive measurement programs.

15 136981 DOUBLE TRACK POROSITY TESTING. The Subway Environmental Research Project (SERP) was undertaken in order to provide the subway design engineer with a basic understanding of the effects of various design parameters on subway aerodynamics and thermodynamics (and hence on the subway environment). Such understanding permits subway design with an eye toward efficient environmental control. In Phase II of the SERP, a test matrix designed to study the effects of center wall porosity (in a dual-track tunnel) on train drag and far-field air velocity was performed in the DSI SAT-DT facility. Additional testing in the SAT-DT facility was proposed (and conducted) in an attempt to discover the center wall porosity at which system performance nears that of a single tunnel (i.e., solid center wall). The purpose of this report is to describe the results of this additional testing, and to relate these results to those obtained during the original program.

15 137038 CRITERIA FOR EVALUATING ALTERNATIVE TRANSIT STATION DESIGNS. The urban transit interchange facility is described in terms of the important functional facility components and the quality of the station environment. These terminal dimensions are interpreted to establish a list of design objectives which reflect the points of view of the user, the special user (elderly and handicapped) and the operator. The stated objectives are then used to identify criteria for the evaluation of alternative urban transportation interface facility designs. A general evaluation is derived and compared with the basic systems evaluation procedures: effectiveness analysis, benefit-cost analysis, and ranking and rating models. A terminal facility evaluation model with a specific set of measurable criteria is described with respect to three primary areas of application; i.e., a set of mutually exclusive project designs, an iterative design process, and the analysis of a major design strategy (e.g., modular construction).

15 137329 SUBWAY ENVIRONMENTAL DESIGN HANDBOOK. VOLUME I. PRINCIPLES AND APPLICATIONS. SECOND EDITION. This handbook is a guide and reference for the planning, design, construction and operation of environmental control systems for underground rapid transit. The handbook follows the engineering sequence from criteria through load analysis, and from system conceptual design to selection of equipment. It covers a broad range of parameters, including temperature, humidity, air quality and rapid pressure change, and, to a limited extent, noise and vibration as related to environmental control equipment. The content of the handbook is divided into two volumes. Volume I (this volume), Principles and Applications, encompasses all of the above subject matter so that much of the environmental system design can be accomplished using the techniques, computations and related graphic data contained therein.

15 137330 SUBWAY ENVIRONMENTAL DESIGN HANDBOOK. VOLUME II. SUBWAY ENVIRONMENT SIMULATION COMPUTER PROGRAM (SES). PART 1. USER'S MANUAL. This document forms part of the Subway Environmental Design Handbook. It contains the background information and instructions to enable an engineer to perform an analysis of a subway system by using the Subway Environment Simulation (SES) computer program. The SES program is a designer-oriented tool which provides estimates of the airflow, temperature, and humidity characteristics, as well as the air-conditioning requirements, for both operating and proposed multiple-track subway systems of any given design and operating characteristics. The SES program can be used to evaluate the impact on the subway environment of alternative subway system design parameters such as tunnel and station cross-sectional area and length, tunnel interconnections, location and size of ventilation shafts and passenger entrances, ventilation fans, train headway and operating speed, and other parameters. The SES program is a numerical simulation model which incorporates the results of theoretical research, scale-model tests and field tests, and has been verified through comparisons with measurements taken in operating subway systems.

15 137331 SUBWAY ENVIRONMENTAL DESIGN HANDBOOK. VOLUME II. SUBWAY ENVIRONMENT SIMULATION COMPUTER PROGRAM (SES). PART 2. PROGRAMMER'S MANUAL. The Subway Environment Simulation Computer Program (SES) is a product of a four-year research and development project in the area of subway environmental control sponsored by the U.S. Department of Transportation's Urban Mass Transportation Administration and the Transit Development Corporation, Inc. The project produced a two-volume Subway Environmental Design Handbook. Volume 2 consists of two separate documents: Part 1, the SES User's Manual, and Part 2, the SES Programmer's Manual. The Programmer's Manual is intended to assist computer department personnel in making the SES Program operational on a given computer and to aid a programmer needing to understand the details of the internal operation and sequencing of the program. The information contained herein is not intended for design engineers and will be of no assistance to those wanting to use the program as it stands; all information necessary for application of the program is provided in the User's Manual. Portions of this document are not fully legible.

15 138073 MEASUREMENTS OF GROUND MOVEMENT AND LINING BEHAVIOR ON THE LONDON UNDERGROUND AT REGENTS PARK. An investigation of ground movement and tunnel lining behaviour was carried out during the construction of the Fleet Line of the London Underground at Regents Park. For two tunnels, 4.15 m in diameter, constructed with expanded concrete linings at depths of 34 m and 20 m, 5 mm and 7 mm of surface settlement respectively were caused with a trough of settlement some 50-65 m wide at right angles to the tunnel axis. Comparing the settlements at various depths with those obtained for a tunnel of the same line constructed with cast iron linings at

Green Park it was concluded that settlements for an expanded concrete lining were a little less than those for a cast iron one, which is to be expected in view of the more rapid rate of progress for the concrete lining and the fact that the ground is supported immediately after the passage of the shield. After a year, load cells at the axis and the crown of the lining showed that 0.51 and 0.31 of the overburden pressure had developed at these positions.

15 138088 SUBWAY CONSTRUCTION IN MAJOR RURAL CITIES. Several Japanese cities having metropolitan area populations of approximately one million are constructing or planning to construct subway systems connecting residential suburbs and central business districts. The aim is to alleviate highly concentrated rush-hour demands for commuter transport. Sapporo, Fukuoka, Sendai and Hiroshima are discussed briefly and then Sendai City is examined in detail in the light of future trends in land use, population and urbanization. In such studies, it is concluded, future use of subways must be estimated on the basis of changes in urban characteristics, suburban development and all new factors created by operation of the line. Future, rather than present, demographic trends and land use patterns must be understood.

15 138810 BRAZIL'S UNDERGROUND MOVEMENT FOR AN UNDERGROUND REVOLUTION. Both of Brazil's major cities of Rio de Janeiro and Sao Paulo are building underground railway systems through poor ground covered with buildings. Because of the treacherous conditions in Rio the cut-and-fill technique is being used. The ground is a mixture of clays, sands and salty water 2 M below the surface. In the city centre, where the line passes through shops on either side, building settlement is prevented by diaphragm walls and dewatering wells in the trench interior. Threading through the old services has been very difficult. Because of low wages it has been possible to employ over 8000 men in the construction of the 12 km tunnel. Costly method of waterproofing are employed. The new construction at Sao Paulo supplements the existing 17 km stretch that has been in use since September 1975. Most of the 28 km new line will be on the surface, but 9 km will be constructed by the cut-and-cover method, and 3.5 km in bored tunnel using full faced machines with precautions to reduce ground disturbance under buildings. /TRRL/

15 139713 LATERAL SUPPORT SYSTEMS AND UNDERPINNING. VOLUME 3: CONSTRUCTION METHODS. This provides specific design recommendations, design

considerations, and construction techniques for the construction of lateral support systems and underpinning. The design considerations are presented for each technique or method (soldier piles, steel sheeting, diaphragm walls, internal bracing, tiebacks, underpinning, grouting, and freezing). The factors affecting the design or implementation of these schemes are discussed. Construction techniques are presented, and literature references are provided for those seeking even greater detail. An overview of the construction methods compares the applicability of the techniques and the construction costs of each. Other reports developed from the study are FHWA-RD-128, Volume I, Design and Construction; FHWA-RD-129, Volume II, Design Fundamentals; and FHWA-RD-131, Concepts for Improved Lateral Support Systems.

15 139723 MINIMUM COST DESIGN OF ELEVATED TRANSIT STRUCTURES. The results of a minimum cost design study for a typical elevated transportation structure for rail transit are presented. Special emphasis is given to clarify the impact of major variables such as span length, beam spacing, and soil conditions on the partial cost of each structural subsystem, on the total cost of the structure and on the minimum cost span. Suitable minimum cost design procedures are rapidly reviewed and the influence of the structural material is presented. The analysis of the results obtained in this investigation and their comparison to results obtained by other investigators for different structural systems and materials lead to a number of simple guidelines particularly useful when planning and designing elevated transportation structures. Most importantly, it was found that the minimum cost span is not very sensitive to the soil conditions, to the vehicle loadings, to the structural system and material, and to the minimum cost procedure used.

15 141112 UTILIZATION OF HIGHWAY CONSTRUCTION SPECIFICATIONS AND TECHNIQUES FOR MASS TRANSPORTATION PROJECTS. The paper describes the use of highway construction specifications and techniques for mass transportation projects in Connecticut. The Department of Transportation has undertaken several mass transportation projects. Two of the projects involving highway specifications were the construction of high level platforms at 22 locations along the Penn Central Railroad between New Haven and Greenwich and the people mover demonstration project at Bradley International Airport. Highway specifications were incorporated into these projects to varying degrees based on the nature of the

project. This was done to maximize the use of time-tested specifications.

15 141253 EXECUTIVE PRESENTATION: RECOMMENDATIONS ON BETTER CONTRACTING FOR UNDERGROUND CONSTRUCTION. This document which provides background information for presentations by the subcommittee before government agencies and others concerned with planning and developing projects for urban underground transportation, and which is based upon a 1974 report-Better Contracting for Underground Construction-defines the scope of the problem facing public contracting agencies and the construction industry, and what could be done to alleviate it. The unique problems encountered in underground construction are related to the risk involved and of how the responsibility for this risk should be divided. The cost of risk related to the unpredictabilities of underground construction and inflation are discussed, and the need for answers to certain questions regarding basic contracting practices is emphasized. The usefulness is noted of experiences of European countries which undertake considerable underground work and of the Federal government which has designed and constructed large and complicated underground facilities. The method by which European

countries contract such work is reviewed. Recommendations are presented relating to sharing construction risks and financial risks, expediting claims, stimulating innovation in construction, assuring award to qualified contractors, and effecting cost savings.

15 142956 URBAN TUNNELS--AN OPTION FOR THE TRANSIT CRISIS. There has been no fundamental modification of the basic system of subway construction in the United States since the first subways were built in the 19th century. Excavation equipment and methods have been vastly improved, but subway system design and the basic construction sequence and procedure remain the same. New high-speed boring machine technology in suitable subsurface geologic conditions can introduce radical economies and reduce environmental impacts, if transit planners are aware of construction processes that include the economies of boring machine excavation. New approaches to subway construction are examined.

15 143228 ASSESSMENT OF DISRUPTIVE EFFECTS ASSOCIATED WITH URBAN TRANSPORTATION TUNNEL CONSTRUCTION. FINAL REPORT. Social, economic, and environmental impacts resulting from tunnels' being constructed for mass transportation purposes in urban areas are identified. A matrix is constructed identifying the locus of costs to affected groups by four kinds of causal agents: traffic interference, property takings, environ-

mental disturbances, and utility disruptions. A separate matrix must be constructed for social, economic, and environmental costs. The cells of the matrix must be further expanded in order to pinpoint actual costs: variables must be identified for each affected group and each causal agent and measures for the variables determined. The measurement and aggregation of impacts are discussed. Four possible ways of lessening impacts are mentioned.

15 143229 CUT-AND-COVER TUNNELING. VOLUME 1. CONSTRUCTION METHODS, DESIGN, AND ACTIVITY VARIATIONS. This report presents the results of a study to develop an analytical method for evaluating and optimizing cut-and-cover tunneling operations. The method is based on the results of a series of multiple estimates prepared by contractor type of basic resource estimating, rather than published unit prices. Major variables are type of structure, type of ground support, type of bracing, depth of excavation, and depth of water table. Volume 1 contains detailed descriptions of the study situations considered, the methodology to be employed, design criteria used, alternate methods of performing each construction activity, and a discussion on methods of cost analysis.

15 143760 SUBSURFACE INVESTIGATION, SECTION F003, BRANCH ROUTE. Results are summarized of thirteen supplementary borings made at the location of sewer crossings on M street in southeast Washington, District of Columbia and at selected locations within the Washington Naval Shipyard. The borings were performed to investigate conditions at the planned crossing of the subway tunnels beneath the M Street sewers and to ascertain the character of deep bearing strata for high-load underpinning piles to be installed within the Navy Yard. The report contains geological sections incorporating the new borings, logs of these borings, results of laboratory tests on soil samples obtained and a discussion of anticipated design and construction problems. This investigation is for the Washington Area Metro System.

15 144012 SUBSURFACE EXPLORATION METHODS FOR SOFT GROUND RAPID TRANSIT TUNNELS. VOLUME I: SECTIONS 1-6 AND REFERENCES. The objectives of the Urban Mass Transportation Administration (UMTA) Tunneling Program are to lower subway construction costs and reduce construction hazards and damage to the environment. Some measure of each of these objectives for bored tunnels and deep excavations can be achieved through a more detailed knowledge of the subsurface and of how changes in soil types or characteristics will affect construction. This study assesses subsurface exploration methods with respect to their ability to provide adequate data for the construction of rapid transit, soft-ground bored and cut-and-cover tunnels.

15 147314 DESIGN CRITERIA FOR ELEVATED TRANSPORTATION STRUCTURES AND MODAL EXCHANGE FACILITIES. Investigations and evaluations of existing elevated

transportation systems were made to establish new guidelines and design standards for elevated transportation structures and modal exchange facilities. These criteria may be used to improve the physical condition of existing elevated systems and reduce their negative environmental impact on wayside areas. Prototypical renovations of existing transit structures and station areas are presented showing ways in which the new design standards may be applied to improve existing transit systems. Also, a prototypical elevated structure and a prototypical modal exchange facility are presented to demonstrate an application of the design criteria to hypothetical situations.

15 147677 NEW LIFE FOR GLASGOW TRAVEL TUNNELS. The author reviews the state of passenger transport in Glasgow and describes improvements being made to bus, underground and rail services. The underground system is to be completely rebuilt and new 2 or 3 car trains at a 2 minute frequency brought into service. British Rail's central low level line which passes beneath the city is to be reopened and will link the north and south electric systems. Other alterations described include the elimination of through traffic from part of the city centre and a city centre circular bus service to link Glasgow's inter-city stations. Brief details are given of the work involved and the problems that have been encountered. /TRRL/

Merchant, M *Surveyor - Public Authority Technology* Vol. 147 No. 4385, pp 9-11, 3 Fig., 5 Phot.; ACKNOWLEDGMENT: TRRL (IRRD 221487); ORDER FROM: IPC Building and Contract Journals, Limited, 32 Southwark Bridge, London SE1, England

15 147940 FINLAND'S FROZEN TUBE. Gives details of the problems associated with the Kluuvi cleft region of the proposed Helsinki metro. The underground section passes through this glacial cleft which is filled with alluvial water-bearing deposits. Compressed air and grouting methods are considered to be unlikely to be satisfactory because of the high water table, instability of the fill and doubts as to the origin of the water. Ground freezing methods have therefore been proposed for this 40 M section of the tunnel, which is to be lined with a cast iron circular lining. The remainder of the tunnel is in strong rock requiring no lining. The article discusses the advantages and disadvantages of the two freezing methods that have been proposed. The vertical method involves freezing from the surface and avoids disturbance of the water table. However, it would interfere with surface activities and would need insulation to avoid the heave that would result from freezing the entire block of ground. The horizontal method would probably need drilling from two chambers and from both ends and would also require the provision of compressed air in the workings. Because neither method was obviously best, tenders were called for prices on either scheme. /TRRL/

15 148262 TOWARD A METHODOLOGY FOR EVALUATING ALTERNATIVE TRANSIT STATION DESIGNS. The paper describes a comprehensive approach for transit station design that includes criteria development for system users and operators. This approach involves an iterative process wherein a basic design is created and evaluated relative to established criteria and then incrementally modified until all objectives are satisfied. A comprehensive set of criteria for assessing the performance of alternative transit station design configurations is provided and an interest-impact matrix model is recommended for transit station evaluations. The potential of the evaluation framework is in application to numerous terminal design settings.

Hoel, LA (Virginia University) Demetsky, MJ ; American Society of Mechanical Engineers Conf Paper Paper D&O-26, 1976, 4 pp; Presented at the 4th Annual Intersociety Conference on Transportation, Los Angeles, California, July 18-23, 1976, see also RRIS 26 148247.; ACKNOWLEDGMENT: EI; ORDER FROM: ASME

15 148269 REDUCING ENERGY CONSUMPTION THROUGH TRAJECTORY OPTIMIZATION FOR A METRO NETWORK. The problem considered is the determination of tunnel trajectories in the "equivalent" vertical plane when trains traveling in both directions must follow the same trajectory. The problem is first formulated as a control problem with control and state constraints. Then, under certain simplifying assumptions, an heuristic method employing a direct search algorithm is presented and used in the trajectory optimization. The trajectories are optimized to reduce the sum of the energy consumed by the trains traveling in both directions on the trajectory. The results show an average reduction of 7.73 percent in energy consumption as compared with existing trajectories.

15 148590 A COMPUTER MODEL FOR SIZING RAPID TRANSIT TUNNEL DIAMETERS. A computer program was developed to assist the determination of minimum tunnel diameters for electrified rapid transit systems. Inputs include vehicle shape, walkway location, clearances, and track geometrics. The program written in FORTRAN IV calculates the locations of six critical points with respect to the top of the low rail. Twenty triplets of points are considered, each triplet defining a possible circle. Circles not containing all six points are discarded and the minimum-diameter circle is selected. An additional plotting option is available to provide a visual presentation of tunnel, vehicle envelope, and walkway envelope.

15 148676 HALF A CENTURY PROGRESS IN SOFT GROUND TUNNELING. The paper summarizes major developments in the practice of soft ground tunneling in the United States, highlighting the important tunnels constructed in the last half century. The evolution of the shield, of the cast-iron fabricated steel or concrete lining, of the rate of progress concreting, grouting and cost over the last 50 yr are presented. The procedures and improvements are given of the major soft ground tunnels: Holland, Detroit-Windsor, Sumner-Boston, Lincoln, Queens Midtown, Chicago Subways, Brooklyn-Battery, Callahan-Boston, N.Y. Sewer Tunnels, San Francisco-BART, Washington-WMATA. The conclusion points out expected future improvements in procedure, equipment, progress rates, and cost.

Fox, GA Nicolau, LE (Grow Tunneling Corporation) *ASCE Journal of the Construction Division* Vol. 102 No. C04, Dec. 1976, pp 637-667, 5 Fig., 1 Tab., 51 Ref., 1 App.

15 148870 CONSTRUCTION: WHERE THE \$ GO. The experience of the Metro in Washington, D.C. is used to illustrate how the cost of subway construction has risen in recent years, and what subway builders can expect in the next few years. The cost of completing Metro was estimated prior to the 1969 groundbreaking at \$2.5 billion, or an average of \$25 million a mile, completed and equipped. At this writing, Metro confronts a new estimate of \$5.1 billion. The upward spiral of wages and prices at a time when a downward trend was forecast coupled with schedule delays is considered to have thrown the financial plan into disarray. Delay causes are listed and discussed. Comments are made on the Montreal system of contracting (differs from the fixed price system in the U.S.), and the Swedish approach where the contractor designs as well as constructs the tunnel, and there is total interchangeability of jobs among workers.

15 149140 SUPPORTED EXCAVATION IN WEAK CLAY. The performance of a supported (or braced) excavation is influenced by a large number of variables. These variables, together with the complex interaction and behaviour of the soil and supporting materials, are the subject of the text. The parameters involved in the perfor-

mance of a braced excavation was acquired by studying the detailed case records obtained during the construction of the Oslo subway. Using this information as a guide a computer program was developed which could adequately model a braced excavation and which incorporated as many of the parameters as possible. The details of the case study and a description of the computer program, together with a user's manual, three example problems and a program listing, are included. /RTAC/

15 150474 COMBINED UTILITY/TRANSPORTATION TUNNEL SYSTEMS-ECONOMIC, TECHNICAL AND INSTITUTIONAL FEASIBILITY. Although utility tunnels are common in Europe and Asia, United States use is largely confined to institutions where all utilities are under single ownership. Cut-and-cover transportation projects appear to display nearly ideal conditions for the use of utility tunnels. This project evaluated the economic, technical and institutional feasibility of incorporating utility tunnels into cut-and-cover transportation tunnel projects. Direct construction costs for the utility tunnel and conventional utility treatment options were projected and found to be comparable. In addition, significant reductions in urban disruption result when the construction of the utility tunnel and transportation tunnel is properly integrated. The combined tunnel system is the recommended option. The treatment of each utility, the structure of the tunnel operating entity and recommendations for implementation are included.

15 150537 SUBSURFACE INVESTIGATION, SECTION A014 ROCKVILLE ROUTE [Rept. no. 9]. Results are summarized of 58 test borings made at selected locations along the line of Section A014 of Rockville Route, generally following Rockville Pike north of Strathmore Avenue to Station 76440 of the Washington Metropolitan Area METRO system where the METRO adjoins the B and O Railroad right-of-way. Five of these test borings were made with a large-size hollow-stem auger to assess the difficulty of excavation in the subsurface materials. The report includes a continuous geological section along the centerline of the METRO structures, special cross-sections at the location of the subway station and parking lots, logs of the test borings, results of laboratory tests on soil samples and comments on potential design and construction problems.

15 151219 FIELD MEASUREMENTS OF THE VIBRATION PROPERTIES OF ELEVATED RAPID TRANSIT STRUCTURES. Vibrations induced into rail rapid transit structures may be radiated from the structure as airborne noise that disturbs the rider and the wayside community or as ground-borne vibrations which propagate into the foundations of wayside structures setting walls, floors, and common household items into annoying vibration. This report describes the results of field measurements on existing steel elevated structures presented to aid transit operators and engineers concerned with design, performance, repair, and evaluation of steel elevated rapid transit structures. These measurements showed that the peak acceleration levels are generated in decreasing order of magnitude on the rail, on the top and bottom girder flanges, on the girder web, on cross-bracing, on the column, and at the footing base. In addition, peak acceleration levels of 70 g are little attenuated as they are transmitted from the rail through the structure, and peak acceleration levels significantly increase for increasing train speeds.

15 151745 PROCEEDINGS: SEMINAR ON UNDERGROUND CONSTRUCTION PROBLEMS, TECHNIQUES AND SOLUTIONS HELD AT CHICAGO, ILLINOIS ON OCTOBER 20-22, 1975. The seminar on "Construction Problems, Techniques and Solutions" held at the First Chicago Center in Chicago on October 20-22, 1975, was organized to focus on anticipated construction problems of the Chicago Central Area Transit Project to include underground construction techniques, new technology, ground engineering techniques (underpinning, dewatering, grouting), and involved an exchange of experiences among owners, design teams, contractors, and other pertinent agencies. Because of the continuing requests for seminar materials 19 papers prepared for the seminar follow in their entirety. The authors are identified by their titles and associations as of October 1975. Additionally, a complete summary of the panel

discussion held during the last afternoon of the seminar and moderated by Mr. Nelson, CUTD Executive Director, is furnished because of the pertinent views that were expressed therein.

15 151779 CONSTRUCTION MONITORING OF SOFT GROUND TUNNELS: A RATIONAL HANDBOOK OF PRACTICES FOR RAPID TRANSIT SYSTEM PLANNERS AND MANAGERS. This report aims to fit the objectives of the Urban Mass Transportation Administration (UMTA) Tunneling Program to lower subway construction costs and to reduce construction hazards and damage to the environment. This report generated from an UMTA sponsored study that disclosed the art of instrumentation and monitoring as being advanced but not as potentially sufficient on tunneling projects. One of the main reasons for this stemmed from a lack of general procedures and guidelines, as well as, a lack of expertise among decision-makers regarding tunnel monitoring. UMTA commissioned this Handbook to remove such difficulties. The principal purpose of this Handbook is to encourage and improve the use of monitoring for urban mass transit tunnels, and other deep excavations. This Handbook documents the findings of a recent UMTA construction monitoring instrumentation research project. The Handbook is directed to systems planners and managers and points out how to incorporate a successful monitoring program(s) into their systems that help to control and reduce costs.

Schmidt, B ; Parsons, Brinckerhoff, Quade and Douglas, Inc, Urban Mass Transportation Administration, Transportation Systems Center, (MA-06-0025) Handbook UMTA-MA-06-0025-77-1, DOT-TSC-661, Jan. 1977, 70 pp; Contract DOT-TSC-661; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-264361/7ST, DOTL NTIS

15 152538 UMTA TRIES TO DIG OUT FROM BURDEN OF RISING TUNNEL COSTS. Faced with the rapidly increasing tunneling cost on one hand and a mandate to improve urban transportation on the other, UMTA is aggressively funding its tunneling research and development program. The program has four major parts: Interaction with society. Materials handling. Ground control and stabilization. Site exploration. UMTA and local DOT officials have been working together on ways to encourage designers and contractors to adopt new techniques on certain sections of a mass transit contract. An UMTA funded study, involving 400 feet of a soft ground tunnel in the WMATA system is designed to check the settlement and ground movement of ungrouted, moderately grouted, and heavily grouted sections. UMTA is also observing two grouting projects: One project on WMATA involves a grouting for underpinning a freeway underpass. The other project involves underpinning with compaction grouting for brick buildings in the Bolton Hill section of Baltimore's system. In the rock tunneling area, UMTA has suggested that shotcrete and rock bolts be used wherever possible. Other areas of

concern for UMTA are materials handling, including muck use; new design approaches for both flexible and stiff tunnel liners; the potential for standardizing components of tunnels; and, assessing the cost trade off between sealing trains entering a tunnel against rapid pressure changes or using modified portal designs.

15 152668 ELEVATED STRUCTURE FOR ATLANTA TRANSIT SYSTEM. A standardized elevated structure for above-ground segments of the Metropolitan Atlanta Rapid Transit system was designed primarily for installation with adequate clearance on railroad rights-of-way and also as a low-profile aerial guideway which would be aesthetically suitable in residential neighborhoods. The concept involves a prestressed concrete deck slab acting compositely with single box girders supported on rectangular concrete columns. Various sound-deadening arrangements have been part of the structural design.

15 152808 WASHINGTON METRO'S TOP-LESS TUNNELS. Soil investigations for a section of the Metro where existing major highway and bridge structures would leave relatively little cover over the tunnels revealed that the tunnels would have to be driven through mixed face, with a clay invert and a waterlogged sand crown. Thus, there was a good chance that the roof would fall in. The design settled on a scheme of grout injection to stabilize the granular soils and preclude the development of runs in the crown of the tunnel headings. Combined with careful tunneling, it was felt that this would be sufficient to maintain both safety and decorum. The paper discusses the construction planning, design provisions, grouting program, equipment and methods, problems and costs.

Kuesel, TR (Parsons, Brinckerhoff, Quade and Douglas, Inc) ; American Inst of Mining, Metallurg & Petrol Engrs Conf Paper 1976, pp 296-310; Presented at the 3rd Rapid Excavation & Tunneling Conference, Las Vegas, Nevada, 14-17 June 1976.; ACKNOWLEDGMENT: EI (EIX770200129); ORDER FROM: American Inst of Mining, Metallurg & Petrol Engrs, 345 East 47th Street, New York, New York, 10017

15 152809 SELECTION OF THE VERTICAL ALIGNMENT OF RAPID TRANSIT TUNNELS. The paper presents an abbreviated view of factors that influence selection of vertical align-

ment of rapid transit tunnels in an urban setting. The two principal factors relating to pre-existing site conditions are the geological setting and the impact of tunneling on adjacent structures. However, a wide variety of other influences makes itself felt, which includes geometric criteria based on train operations, overall route interaction, environmental and public policy considerations, and finally the total economic appraisal.

Daugherty, CW (De Leuw, Cather and Company) Ware, KR Gould, JP ; American Inst of Mining, Metallurg & Petrol Engrs Conf Paper 1976, pp 311-331; Presented at the 3rd Rapid Excavation & Tunneling Conference, Las Vegas, Nevada, 14-17 June 1976.; ACKNOWLEDGMENT: EI (EIX770200130); ORDER FROM: American Inst of Mining, Metallurg & Petrol Engrs, 345 East 47th Street, New York, New York, 10017

15 152810 AS-BUILT GEOTECHNICAL REPORT: ITS USE FOR DESIGN OF SUPPORT FOR THREE ROCK STATIONS, WASHINGTON, D. C. METRO. The three rock station areas have been explored by crown pilot tunnels and an as-built report, with geologic maps and sections, has been prepared for use by the design engineer as the basis of design for support of the structures. The geotechnical report describes the geologic structure in detail and relates it to excavation and support of the three crown pit tunnels and the running tunnels which will be enlarged to create the stations. The information was complete enough to permit the design engineer to visualize the geologic structure, compute loads for the various types of rock conditions, and design the steel set supports.

Bock, CG (Bechtel Corporation) ; American Inst of Mining, Metallurg & Petrol Engrs Conf Paper 1976, pp 430-447; Presented at the 3rd Rapid Excavation & Tunneling Conference, Las Vegas, Nevada, 14-17 June 1976.; ACKNOWLEDGMENT: EI (EIX770200132); ORDER FROM: American Inst of Mining, Metallurg & Petrol Engrs, 345 East 47th Street, New York, New York, 10017

15 152812 TRANSPORTATION TUNNELING DEMAND, PRESENT AND FUTURE. Currently, the two major types of transportation tunnels being constructed are highway and rail transit. The technological and institutional improvements which are needed in order to reduce capital construction costs can be achieved by an effective Federal research and development program which is responsive to the industry needs. A responsive R&D program should be based on clearly defined cost benefit ratios; hence demand forecasting is an integral part of the R&D activity. Demand studies can also provide guidance to policy makers in all sectors of the tunneling industry, such as the needed capacity of the industry to meet projected construction. How much the increase in tunneling might be through the 1980's is the subject of the paper.

15 153969 SYSTEMS STUDY OF PRECAST CONCRETE TUNNEL LINERS. The study addresses precast concrete lining systems. Existing precast concrete systems designed or constructed in Europe, Japan, and the United States are evaluated. With these as a point of departure, designs for lining systems applicable to the specific conditions encountered in the United States are developed. A comparative cost analysis is made between the linings designed in the study, one existing precast concrete design and two in fabricated steel. Appreciably lower costs are found for all of the concrete liner designs when compared to those in fabricated steel. Water sealing systems are discussed and recommendations for the development and testing of sealing details are made. Guidelines for dissemination of information about, and for the implementation of the systems, are presented.

15 154798 AN INVENTORY OF FUTURE TRANSIT SUBSURFACE CONSTRUCTION. An inventory of future transit (fixed guideway) subsurface construction in the United States and Puerto Rico was undertaken, covering the 1976-1990 time frame. A total of 19 transit constructing authorities in 17 cities were surveyed by questionnaire and on-site visitations. Information was gathered on status, routes, type of construction, costs, geology, environmental factors, and any other unique factors. A total of over

120 miles of planned construction was revealed, expected to cost over \$7.5 billion, in the survey time period. However, the total is heavily influenced by planned Washington construction. Among other cities about 30 miles is totally funded; the rest is planned but unfunded. Costs of cut and cover are beginning to approach mined tunnel (except in New York), and environmental considerations often swing the balance.

15 156035 SHIELD-DRIVEN TUNNELS WITH OR WITHOUT COMPRESSED AIR. The following discussion of major shield-driven tunnels describes the state of the art, the problems, and the imposed restraints. No one particular method is considered superior because the method that is used depends on specific project conditions which vary widely. Construction of shield-driven tunnels under compressed air in Chicago, New York, Oakland-San Francisco, and Washington, D.C. are described. Future research in shield-driven tunnels are recommended in the following areas: safety regulations in tunnel construction; methods to fill tail voids more quickly and more effectively; methods of improving tail seals to prevent grout, pea gravel, or water from running back into the shield; developing a precast concrete primary lining that would be water tight and require no secondary lining; successful foreign methods of filling the tail void should be studied; more efficient backhoes are needed to improve the rate of progress in shield-mined tunnels; lastly, small cities which do not anticipate large crowds utilizing a rail rapid transit system should consider narrower cars, thus saving on the cost of shield driven tunnels.

15 156341 PRACTICAL EXPERIENCE FROM THE EXCAVATION OF SLURRY TRENCHES IN OSLO CLAY. Subway and railroad tunnel through the center of Oslo where the tunnel walls are constructed by means of the slurry trench method is described. Every 4.5 m crosswise along the tunnels, slurry trenches are excavated and cast with concrete 5 m below the

bottom of the tunnels. This contributes both to preventing bottom heave failure and to bracing the tunnel walls. Of the total 31,000 square meters of slurry trench excavated, 18,000 square meters are carried out with only water as slurry, while for the remaining trenches, partly the traditional bentonite slurry and partly a slurry made of clay from the site are used. The stability of the slurry trenches and results of some of the extensive measurements, observations and experience gathered during the execution of the projects are discussed.

15 157210 STRUCTURES FOR MASS TRANSIT. This manual which is intended for the structural engineer, considers those facets of mass transit which affect aerial guideway design and discusses the interaction between the vehicle and the supporting structure. Aspects of vibration and passenger comfort are discussed in detail. Aspects of vibration and passenger comfort are discussed in detail. The manual illustrates the difference in design technique required for some vehicles. Continuous spans are shown to have an advantage over simple spans for most guideways. The design of guideways for vehicle speeds in the range of 60 mph and less is generally found to be governed by stress rather than by stiffness. The opposite is true for speeds in the range of 150 mph and greater. The relationship between guideway surface roughness and passenger comfort is discussed. Tables are presented in which systems with similar requirements are grouped to facilitate the study of aerial structures by class rather than by individual system. Gross weight and velocity were chosen as the elements needed to define a class. Dynamic studies and design examples are described which are based upon 3 hypothetical vehicles having weights of 10k, 25k and 60k.

15 157246 SYSTEMS SAFETY AND TUNNEL SUPPORT. About 10 years ago a Swiss engineer, John Bernold, designed a tunnel support system that needs three requirements: (1) It seals off rock from the effects of air slacking and water entrainment; (2) It immediately provides a strong temporary support for the miners; (3) All of the steel placed can be used as part of the permanent tunnel support structure. With the Bernold system, shot-crete is supported, and together with the steel plates, has a very high shear strength. This support system, in addition to providing safety for tunnel employees, substantially reduces the work effort, because the need for vast quantities of temporary timber lagging no longer exists; it reduces the amount of steel needed for the permanent support; it eliminates the need for large quantities of concrete to cover a tangle of temporary steel arches and a mat of re-steel. This system can be compared to a thin arch dam, and it reacts to extreme ground forces by flexing to shift the load. A great number of tunnels in Europe have used the Bernold systems safety approach for tunnel support. The St. Gotthard Highway Tunnel through the Swiss Alps is notable for the use of this system. The subways in Tokyo also have used this system to good

advantage. The Bernold system has been used in almost 1,000 miles of tunnels, and not one has fallen. It is stated that the Bernold system can easily meet the safety requirements of OSHA, the U.S. Corps of Engineers, and the State of California Tunnel Orders.

15 157580 NEW TUNNEL "SAN BERNARDINO" ON THE GENOVA-VENTIMIGLIA LINE [La nuova galleria San Bernardino della linea Genova-Ventimiglia]. Tunneling through highly degraded shales, in the presence of buildings existing in vertical with respect to the portal, with an average coverage of about fifteen meters, required the perfecting of a particular method of construction. This method, based on the construction of a pre-portal, made up of metallic inserts injected with mortar, is briefly described, both with regard to the characteristics and the planning of the project, and with regard to the modalities for its execution. Furthermore, mention is made of the reasons which induced the rejection of defense structures of a different type, such as the underpinning or the consolidation of the terrains involved by means of chemical injections. The works described have been completely carried out, in full compliance with the programs of time and expenditure, and achieving the prime objective of safeguarding the integrity of the buildings located above the tunnel. 15 157687 FLOATING TRACK SLAB ISOLATION FOR RAILWAYS. Where an underground railway is in existence, it is up to the developer to take what precautions may be necessary to provide an acceptable interior environment. Many a building has been isolated on resilient bearings from the ground-borne vibrations produced by an adjacent railway with the result that the occupants are unaware of the trains running underneath the building. The technique for the resilient mounting of large structures has been well developed, and there is a B.S.I. Draft for Development in which some guidelines have been established. Where a new underground railway is to be constructed close to or under existing properties it may be more expedient to isolate the railway. Several design of a "floating track slab" have been constructed, usually with very beneficial effect. Some of these floating track slabs are described in this contribution.

15 158942 THE GROUND MOVEMENTS RELATED TO BRACED EXCAVATION AND THEIR INFLUENCE ON ADJACENT BUILDINGS. This report summarizes the settlement and lateral displacement measurements associated with urban excavation projects in the dense sands and interbedded stiff clay of Washington, D.C. and the soft clay of Chicago. The ground movements caused by excavation in each area are discussed in light of the soil profile and construction techniques. The relationship between soil displacement and the damage caused to adjacent buildings is examined. Criteria for the onset of architectural damage are recommended for brick-bearing wall and frame structures subject to excavation movements. Brick-bearing wall structures are described, with special emphasis on the construction details related to building stability. Various modes of instability caused by differential ground movements are examined for brick-bearing wall structures. Case histories of building damage caused by adjacent excavation are presented.

15 159345 STUDY OF SUBWAY STATION DESIGN AND CONSTRUCTION. Due to the high cost of urban underground transit construction in recent years, construction practices used in other countries were reviewed to determine if construction methods which are commonly accepted there might be adapted to U.S. practice. Design and administrative practices were also reviewed to determine which have the most significant effect on station costs to assure that future system developers are aware of the items that offer the greatest opportunities to control costs. Using 13 on-site interviews in Europe and North America, unusual construction methods, design considerations, and general considerations which offer opportunities for cost savings were identified. Two basic points for reducing costs were emphasized repeatedly by those interviewed: the basic recommendation for obtaining economy in station design and construction is to take advantage of every opportunity which the locale and site offer; and while final design and construction practices are the most visible sources of expenditure, it is almost universally the early policy, planning, and design decisions which have the greatest effect on the final cost of a transit project. With the experience and opinions of the many transit authorities and construction agencies and a review of current literature as a base, a set of seven recommended subway station designs were developed. To examine costs, three series of estimates were performed comparing the station types among themselves, comparing the costs of varying major station dimensions, and comparing costs of alternative construction meth-

ods, such as slurry walls and other excavation support systems which performed multiple functions.

15 159600 CENTRAL-AREA BUS TERMINALS; PLANNING AND DESIGN GUIDELINES (ABRIDGMENT). Bus terminal planning and design must reflect the particular needs of each specific situation. The terminal must be located in conjunction with rail rapid transit lines, busways, and contraflow bus lanes and are useful mainly where the urban area population exceeds 750,000 and the downtown employment exceeds 50,000. Freeway access by free-flowing grade-separated ramps and bus roadways is essential for a major terminal. Comments are made on the relationship of terminals to bus volume concentrations, cost, revenue, demand and economic feasibility. The scale of development and basic functions. Internal terminal design should separate vehicle and passenger movements, carefully reflecting their specialized circulation and geometric requirements. Intercity and commuter services should have separate platforms to reflect their differing service patterns and berth occupancy requirements. Berth space requirements should reflect both scheduled and actual peak-period bus arrivals and departures. General design features are listed.

15 163829 A TITAN AT GATESHEAD. The article describes the operation of the first of a new range of large road-header excavating machines, the titan, being used in the UK on a site for the tyne and wear rapid transit system at gateshead. The excavation contract consists of the construction of a new station in an open cut operation, and also the construction of running tunnels on either side of the station. The running tunnels are being constructed through coal measures and so equipment must be subject to flameproofing regulations. Examples of pick use rate and excavation rates are given for the german-made machine. Construction methods chosen for the tunnelling project are described as well as the problems that have been met and the ways in which they have been overcome. It is stated that further machines of this type are to be manufactured in the UK. /TRRL/

15 163998 THE AERODYNAMICS AND VENTILATION OF VEHICLE TUNNELS-A STATE OF THE ART REVIEW AND BIBLIOGRAPHY. The publication presents a state of the art review and bibliography on the aerodynamics and ventilation of road and rail tunnels, and also of underground rapid transit systems. The review discusses the subject in the following sections: road tunnels--the nature of the problem; effects of air pollution; the quantity of air required for efficient road tunnel ventilation; systems of road tunnel ventilation; instrumentation and control; planning of ventilation stations; economic considerations. Rail tunnels and rapid transit systems underground--classification of tunnel systems; the thermal environment; the pressure and environment for both main line tunnels and RTSU; air quality in both main-line tunnels and RTSU; tunnel exit noise and vibration; possible future tube vehicle systems. The bibliography contains details of 588 publications in four sec-

tions: (a) general and related references; (b) road tunnels; (c) motor vehicle exhaust emission, and (d) rail tunnels and other tube-vehicle systems. Two indexes to the bibliography are provided, the first by subject, tunnel name and country and the second by author. /TRRL/

15 165317 SEGMENTAL CONCRETE LINER FOR SOFT GROUND TUNNELS. Concrete is presented as a low-cost material for use as a sole tunnel liner material in future mass transit tunnel projects. Existing mass transit tunnels throughout the world which have used concrete liners are presented. A systems summary is given which outlines numerous factors that must be considered for implementation of concrete as a sole tunnel liner material. Various concretes and liner sealant systems are presented as well as past and current research efforts directed toward greater use of concrete in future transit tunnel projects. Many aspects for consideration in a sealant system test verification program are also presented. /Author/

15 165763 INSURANCE FOR URBAN TRANSPORTATION CONSTRUCTION. This report investigates insurance programs for urban transportation construction, including subways, and establishes guidelines by which an authority owner can choose the insurance program which best serves the needs dictated by the conditions and factors of the specific job. An optimal insurance program combines lowest costs, highest standards, and most effective administration. There are many possible tradeoffs, thus, the decision is complex. An analysis of insurance programs is presented; e.g., coordinated and conventional, withholding policies, deductibles, liability, Completed Operations Coverage and other possible coverage combinations. Various forms of insurance are discussed, as are programs for general construction safety. Innovative variations of Coordinated Insurance Programs are explored. The results are decision-making guidelines for owners for managing risk in urban transportation construction.

15 166453 METHODOLOGY FOR THE DESIGN OF URBAN TRANSPORTATION INTERFACE FACILITIES. Procedures and techniques are described which determine measures of the performance of transit station designs. Categories of measures are defined according to the manner by which they are treated in the design process; as a result of policy, or as measures of performance and economic efficiency. Policy items considered include concessions, advertising, personal care facilities, telephones, acoustics, construction materials, design flexibility, parking facilities, and provisions for the handicapped. Performance measures are associated with passenger processing, passenger orientation, the physical environment safety, and security. The policy and performance considerations along with cost factors are used to specify a systematic transit interchange facility design methodology that is recommended to practitioners. Comprehensive descriptions of appropriate analytical techniques for the evaluation of transit station designs are provided in the appendices to the report.

15 167108 MARTA TUNNEL CONSTRUCTION IN DECATUR, GEORGIA-A CASE STUDY OF IMPACTS. PHASE II. The focus of this report is on the assessment-forecasting relationship, namely, how to assess impacts and then to illustrate how those actual impacts could have been forecast. This report presents a case study conducted in Decatur, Georgia, in order to assess the disruptive effects associated with the construction of rapid transit tunnels for the Metropolitan Atlanta Rapid Transit Authority (MARTA) East Line. This case study has three objectives: (1) to pilot test the assessment methodology developed, (2) to refine the methodology as a forecasting tool; and (3) to develop mitigation procedures. A socio-economic profile of Decatur is presented. Impacts of the construction are considered, both in general and specific terms.

15 167286 MUCK UTILIZATION PLANNING. URBAN TRANSPORTATION TUNNELING: A HANDBOOK OF RATIONAL PRACTICES FOR PLANNERS AND DESIGNERS. This handbook alerts transportation system planners and designers to planning methods which can lead to more efficient use of earth and rock materials produced during excavation for transportation tunnels and large excavations. The earth and rock materials produced from

tunnel operations are commonly described by the miner's term, 'tunnel muck'. Tunnel muck has been traditionally treated as a waste product of the construction process. This handbook documents the results of a study of alternative uses for tunnel muck including use of muck as backfill materials within the transit project. The suggested procedures are consistent with construction methods and project management procedures.

15 167342 A PROCEDURAL GUIDE FOR THE DESIGN OF TRANSIT STATIONS AND TERMINALS. PHASE I. The guide provides a synthesis of state-of-the-art concepts regarding the planning, design, and evaluation of passenger transportation stations. The enclosed material directs transportation planning teams to search for efficient station designs. The guide describes the important stages and considerations in a comprehensive terminal analysis methodology. When it is used with the two supplementary research reports, the specific details of the various tasks are given. The guide acknowledges that the transit station design process requires contributions from many disciplines and skills. It assists to coordinate station development programs in accommodating inputs from the disciplines. It further highlights the elements of different stations to assure valid comparisons relative to performance and cost criteria.

15 167549 SUBWAY TUNNELS IN AREAS OF MINING SUBSIDENCE IN THE RUHR DISTRICT, GERMANY. Because the city of Gelsenkirchen is undergoing subsidence movements due to coal mining, special problems arise in the design and erection of the tunnel for the underground system of the municipal railway. The principal results of the design rules derived from extensive preliminary studies are discussed. The subsidence movements are causing compression and straining of the ground in which the tunnel is embedded. These actions of the soil have to be translated into idealized design displacements for engineering purposes. If the tunnel structure follows these deformations without restraints, no stresses (or, at least, only minor stresses) will occur. The conditions to which the tunnel structure should comply are cited. The design principles proposed are those of a tunnel lining that is almost completely flexible in the direction of the tunnel axis and stiff transversely to the axis. The theory of plasticity is applied to calculate the strains and stresses due to subsidence movements. Thus, the material chosen for the tunnel lining should provide sufficient capacity to yield without coming close to rupture. General rules for the design principle are given for tunnels constructed either by cut-and-cover or by covered driving.

15 167603 DESIGN OF ELEVATED GUIDEWAY STRUCTURES FOR LIGHT RAIL TRANSIT. ABRIDGMENT. This paper outlines a rationale for designing an elevated guideway for urban rail transit, and applies this to a design of a double-track guideway for a proposed light rail transit (LRT) line. Three factors that affect the rationale for designing elevated guideway structures for LRT include performance requirements that specify guideway function; constraints that limit the choices available to the designer; and, design considerations that tell the designer how to choose among options, all of which satisfy the performance requirements and constraints. A design study is included which develops a suitable guideway configuration and examines in some detail a typical four-span structure. The following design aspects are discussed: Vehicle specifications; guideway cross sections; structural design; construction options; and, costs. The authors conclude that the rationale presented for the design of elevated guideway structures for LRT is neither a specification nor a code, but should form the basis for either. It identifies performance requirements that must be met for the structure, constraints that limit the designer's range of choice in meeting the performance requirements, and design considerations that provide the basis for making design choices.

15 168093 MELBOURNE'S TROUBLED TUNNELLER GRINDS TO A HALT. The problems encountered in tunnelling Melbourne's underground railway are described. Drill and blast methods were prohibited to minimize ground disturbance under the tall buildings and steel ring beams had to be inserted at 1 m intervals just behind the face. Also shotcreting of the tunnel sides within 1 m of the face was required within one hour of exposure. The tunnelling machine covered nearly 40 m/week until it hit hard rock when numerous problems arose culminating in the failure of the main bearing. This failure meant that the machine had to be completely rebuilt with a new 12 spoked head and the triple-disc cutters replaced by more efficient single discs. Front support is provided by a sliding shoe, and steering jacks on the shoe help to prevent the head dropping. Bearing design was changed, and the cutter head speed reduced from 5.2 rev/min to 3 rev/min. Gearboxes and variable

speed motors have been replaced with high-torque low-speed motors. Mucking out is now by rail instead of conveyor. The new hard-rock machine can work at up to 73 m/week.

15 169298 SYSTEMS ANALYSIS OF RAPID TRANSIT UNDERGROUND CONSTRUCTION. VOLUME I. SECTIONS 1-5. This study describes rapid transit system implementation, design, and construction procedures. The relationships and responsibilities of governmental, private, and public groups involved in planning and implementing an urban rapid transit system are discussed. In this report, techniques and processes of cut-and-cover and tunnel construction are discussed in detail. Environmental impacts of this construction as well as safety and insurance aspects are presented. Physical and institutional controls (sensitivities) on construction are identified. Physical controls include such factors as utility density, traffic conditions, maintaining existing structure integrity, ground conditions, and weather. Institutional controls include the project schedule, right-of-way acquisition, material and equipment supply, and labor agreement and productivity.

15 169299 SYSTEMS ANALYSIS OF RAPID TRANSIT UNDERGROUND CONSTRUCTION. VOLUME II. SECTIONS 6-9 AND APPENDIXES. Three San Francisco Bay Area Rapid Transit (BART) projects and two Washington Metropolitan Area Transit Authority (WMATA) projects are analyzed with respect to time schedules, costs, and sensitivity to physical and institutional controls. These data are utilized in developing generalized models of four specific types of underground construction: cut-and-

cover station, cut-and-cover line, free-air-driven tunnel, and compressed-air-driven tunnel. The models presented herein are a planning tool for evaluation of the alternative types of underground construction in a transit system with respect to local costs and physical and institutional controls. Possible future tunneling cost-reduction techniques and recommendations for further research are made. (Portions of this document are not fully legible)

15 169955 MOVEMENT OF NON-STATIONARY AIR IN UNDERGROUND TUNNELS. AN APPROXIMATION METHOD FOR EVALUATING AIR CURRENTS [Die instationaere Luftstroemung in U-Bahn-Tunneln. Eine Naeherungslösung zur Berechnung des Anfachvorganges]. Equations can be obtained for evaluating air currents produced by trains in tunnels by means of an approximation method of evaluating the increase in speed of an underground trainset as the driver accelerates after stopping in a tunnel. The results of calculations have been compared against results obtained from measurements and both coincide with each other. [German]

15 170458 FORMS ROLL OVER STREET-CAR TRACKS TO CAST STATION IN HILL. The construction of a new station in the side of a hill in San Francisco by using massive arched traveling forms that roll over existing tracks to cast the station's vaulted walls and ceiling is described. The station, 51 ft wide and 26 ft high, is elliptical in cross section and lies on a vertical curve with a 2% grade. The 212-ft-long underground section will be topped by a 150 x 125-ft building, also underground.

15 173061 TUNNELS FOR THE NEW HONG KONG METRO. Hong Kong will have its first underground railway system in operation by 1980. In the mid 1980's, five interconnected lines will serve 5.5 million people living or working within 30 square miles. By the end of the 1980's it promises to be the most heavily used system in the world. The article describes the background, design and construction of the tunnelling works. /TRRL/

15 173402 BEHAVIOR DURING CONSTRUCTION OF THE DUPONT CIRCLE SUBWAY STATION LINING. The paper reports on the results of an instrumentation program conducted during construction of the station in Washington, D.C. The primary objective of this study was to evaluate the short-term performance of the lining for a large, shallow underground opening in rock. Lining behavior was evaluated with respect to induced moment, thrust, and deflection. The instrumentation program was conceived to verify assumptions made in lining design and to provide insight into procedures for designing and constructing thick, permanent shotcrete linings. Among the subjects discussed are rock mass geology at the project site, construction sequence and the instrumentation program, measured behavior of the station and a comparison of the measured behavior with the results of a stress analysis of the lining.

15 174021 PLANNING AND ITS IMPORTANCE IN REDUCING THE COST OF URBAN TUNNELS. Planners can significantly increase the utilization of underground space for transportation, water, sewage, and utility services through better understanding of the effect of geology and construction depth on the cost of underground construction. Planners should realize that construction in soft, near-surface soil in many urban areas is first expensive and second requires underpinning of existing structures, utility relocation, and restoration of city street activities that can cost more than the original tunnel. On the other hand, planners should realize that competent rock exists at reasonable depths under most urban areas in which tunnel boring machines or even conventional drill and blast methods can be used to advance relatively economical tunnels at very fast rates. Such deep tunnels in rock do not require the relocation of utilities, the underpinning of structures or street restoration. Moreover, vertical access to deep tunnels in good construction materials is not prohibitive in cost and can be made to be acceptable to the public. For example, access to a 50 M deep tunnel is equivalent to vertical access via an express elevator to the 14th story of a high rise building. Cost estimates of underground tunnelling in a typical urban area such as Chicago have shown that the basic cost of construction of a cut-and-cover tunnel is in the order of \$13400/M, while the cost of an equivalent tunnel in rock below the surface is in the order of \$3800/M. The cost for the vertical access to the deep tunnel is more than offset by the highly variable cost of underpinning, utility relocation and restoration which can more than double the cost of shallow tunnels. Clearly, the economics of deep tunnels to provide urban services points to an innovative alternative for providing underground space under U.S. urban areas.

15 174022 RESEARCH AND DEVELOPMENT NEEDS FOR SYSTEMS AND MANAGEMENT IN UNDERGROUND TRANSPORTATION CONSTRUCTION. Relative to other sectors of the U.S. economy, construction is experiencing a higher rate of inflation, technological stagnation, and a decreasing physical share of the gross national product. This at least in part results from the lack of incentives for and activity in research and development. This paper focuses primarily upon the consequent problems faced in urban transportation construction. At this stage it appears that

some of the major obstacles that impact costs, slow productivity and inhibit the implementation of innovations result from: (1) decisions made and policies set during the planning and design phases; and (2) the contractual and organizational structure chosen for project administration. There are also major opportunities for improvements through wider and more effective use by construction contractors of existing methodologies and management techniques that have already proven to be successful. Changes in all of these areas are necessary if the limited amount of research now being done is to have any major impact through implementation.(a)

15 174023 MATERIALS HANDLING RESEARCH FOR TUNNELLING. Recent research at the Colorado School of Mines has focused on the materials handling problem of muck haulage in rapid transit tunnels. For the muck rates projected within the next decade, high-volume transportation modes will be required. Hydraulic and pneumatic pipelines appear attractive as high capacity haulage systems serving a confined space. Slurry pipelines are examined here in detail with special reference to muck preparation, extensible conveyor systems, slurry pipelining, and slurry dewatering. Pipeline efficiency and reliability depend on a controlled particle size and distribution. Therefore, some crushing of the muck will be necessary. A simple means for temporarily extending the transport system between muck preparation and slurry pipeline is necessary for high capacity-continuous operation. Assuming that the slurry water is recycled to the tunnel face, dewatering schemes must be considered. Technical feasibility is demonstrated in these areas.

Faddick, RR Martin, JW (Colorado School of Mines) *Underground Space Analytic* Vol. 2 No. 2, Dec. 1977, pp 121-127, 5 Fig., 5 Tab., 4 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 230947); ORDER FROM: Pergamon Press, Incorporated, Maxwell House, Fairview Park, Elmsford, New York, 10523

15 174026 THE STOCKHOLM UNDERGROUND. The paper summarizes the drill-and-blast techniques of excavation used in constructing the underground railway public transport system of Stockholm. The Stockholm Tunnelbana now totals 110 km of rail including 53 km in rock tunnels. The paper treats drill-and-blast methods, stability requirements, methods of controlled blasting to obtain stability and avoid damage to structures, and methods and requirements for ground water control in urban areas. Recent underground stations on the Jaerva line have been given a new design in which the traditional cast concrete ceiling has been discarded. The rock ceiling is exposed by a thin (7.5-10 cm) layer of reinforced shotcrete only. In some station walls the bare beautiful rock surface itself is exposed and is utilized as a decorative work of art. The number of the covering abstract of the conference is IRRD 231024.

15 174070 CONTROL OF GROUND MOVEMENTS AND SUPPORT OF TUNNELS- RESEARCH AND PRACTICE. Research and practice in ground support is discussed under three headings: stability of the tunnel heading, lining design, and ground movements and building damage. Many of the developments in these areas have resulted from observations of field performance, in some cases closely coordinated with analytical and laboratory studies. Lining studies conducted by means of destructive testing of models, analytical studies, and field measurements and observations have been used to economize on lining design by taking maximum advantage of the support and passive reaction provided to the lining by the surrounding ground. Support procedures are being developed to interface with tunnel boring machines so that permanent linings can be rapidly installed and provide early support in a variety of tunnel ground conditions. The stability of the tunnel heading is often of more concern than the dimensioning and placement of a permanent lining, particularly where ground conditions are bad or the tunnel is large. Rock displacements are commonly monitored for large deep chambers as well as for the large shallow chambers currently under construction for subways along the east coast of the United States. In several projects, measurements have provided early warning of potentially unstable conditions so that corrective measures could be provided. Ground movements are of primary concern for soft ground tunnels in urban areas. Measurements obtained after each shove of the tunnel shield have provided a means of evaluating the processes causing lost ground so that adjustments can be made in tunnel procedures. Lateral and vertical ground movements have been measured and related to building distortions and damage. /TRRL/

15 174731 PROCEEDINGS OF WORKSHOP ON MATERIALS HANDLING FOR TUNNEL CONSTRUCTION HELD AT KEYSTONE, COLORADO ON AUGUST 3-5, 1977. With the anticipated increases in tunnel construction in the next decade greater demands will be made on transportation systems to remove tunnel muck at rates consistent with tunnel excavation rates. Conventional materials-handling systems such as rail, rubber-tire vehicles, and conveyors will have to expand their capabilities. Simultaneously, hybrid and lesser known systems such as pneumatic and slurry pipelines must be considered as potential systems for muck haulage, particularly since they show substantial promise of being capable of transporting the muck volumes projected for the next decade. A workshop entitled, 'Materials Handling for Tunnel Construction', was held August 3, 4, 5, 1977 at Keystone, Colorado. Experts were invited from the construction, metal and non-metal mining

industries. The participants evaluated the state of the art of materials-handling systems for underground construction, exchanged information on current systems applications and research, itemized research needs, and produced a written summary of their conclusions. This report comprises the proceedings of the workshop.

15 175271 DEVELOPMENT OF RESEARCH IN THE CONSTRUCTION OF TRANSPORTATION FACILITIES: A STUDY OF NEEDS, OBJECTIVES, RESOURCES, AND MECHANISMS FOR IMPLEMENTATION. The report describes an in-depth research study to (1) evaluate and quantify the current and projected state of productivity in the construction of transportation facilities; (2) determine areas having the highest potential economic returns and the greatest needs where research could lead to improvements in technology and management that in turn could lead to improved productivity; quantify decisionmaking criteria where possible; (3) assess the present and potential interests and capabilities of institutions-universities in particular-that would do such research in transportation construction; and (4) explore improved mechanisms for implementing transportation construction innovations. Some of the major obstacles that impact costs, slow productivity and inhibit the implementation of innovations result from (1) decisions made and policies set during the planning and design phases; and (2) the contractual and organizational structure chosen for project administration. There are also major opportunities for improvements through wider and more effective use by construction contractors of management techniques that have already proven to be successful.

15 175543 MUCK UTILIZATION IN URBAN TRANSPORTATION TUNNELING PROCESS. The purpose of this study is to develop a workable approach to muck utilization for transit tunnels, including cut and cover construction, in the urban area. This report presents the results of a detailed investigation into the potential for muck utilization in the urban transportation tunneling process, and it documents the necessary technical and planning procedures that may be used to evaluate its utilization. This report provides transportation system planners and engineers with the necessary information to use more efficiently the earth and rock materials produced during excavation for transportation tunnels and large excavations. Six guideline steps for muck utilization planning are presented as well as the selection of a Muck Utilization Coordinating Committee (MUCC) for implementing these guideline steps. The muck utilization planning concepts were investigated for three U.S. cities (case studies): Atlanta, Georgia; Chicago, Illinois; and Baltimore, Maryland. Additionally, a trial case study of the muck utilization guidelines was made for the Baltimore Rapid Transit System.

15 175906 SUBSURFACE INVESTIGATION, SECTION A017, ROCKVILLE ROUTE [Rept. no. 4]. Results are summarized of 100 test borings made in Section A017 of Rockville Route of the Washington Metropolitan Area Metro System. The exploration was performed to investigate conditions along the running line of the rapid transit system which includes at-grade and aerial structures and Shady Grove station plus several crossing structures. The report includes a continuous geological section along the center line of Metro outbound track, special cross-sections at station locations and the various crossing structures and parking lots, logs of the test borings, results of laboratory tests on soil samples and comments on potential design and construction problems.

15 176013 RAPID TRANSIT SUBWAYS-GUIDELINES FOR ENGINEERING NEW INSTALLATIONS FOR REDUCED MAINTENANCE. Economic design of new subways requires optimization of installation and maintenance costs of all the major constituent items. A prerequisite for this is an awareness of the rigorous environmental and other conditions imposed on the subway. Changing ground pressures crack structures, and this results in water seepages that deteriorate both the structure and the installed items. Durable watertight structures are obtained by using appropriate structural systems, material specifications, construction details, and waterproofing systems. Cathodic protection provides an economic protection against corrosion of metallic items in aggressive soil conditions. Ventilation and pump structures should be planned for ease of access and maintenance. Vents flush with street or sidewalk increase the dirt load and maintenance; above-surface alternatives should be evaluated. Escalators are high total cost items and operate under especially arduous conditions. Maintenance costs are reduced by using heavy duty components, adequate monitoring systems, and by designing the housing and machine room to permit ready maintenance and inspection. Automatic lubrication or sealed bearings also reduce maintenance. Elevators, ventilation equipment, and pumps and their housings should be engineered and specified to maximize durability of component and minimize maintenance on a similar basis to escalators. Passenger elevators should be planned to also move maintenance equipment and materials. Satisfactory architectural finishes should be selected for durability and ease of cleaning as well as for appearance. Stations should be planned for adequate monitoring of all spaces and for good illumination to reduce vandalism and to enhance public safety. Effective maintenance depends on ready accesses and provisions for movement of equipment and materials in the various sections of the subway. Station entrances, the portals, and ventilation and pump shafts should be designed accordingly. Guidelines and justification of good design practice for these and related subjects are presented.

15 177200 NEW AIR SHAFT DESIGN FOR RAILROAD TUNNELS. An outline of the various methods for reducing pressure fluctuations is given. These range from simple non-aerodynamic methods to complex proposals involving the optimum positioning of airshafts. The latter case leads to a new airshaft design which overcomes some of the problems caused by long airshafts of conventional design. The description has been concentrated on the case of long shafts, that is shafts which exceed about 5% of the tunnel length.

15 178747 A TRANSIT STATION DESIGN PROCESS (ABRIDGMENT). The state-of-the-art of transit station planning is characterized by a lack of consistency among principles, standards, and techniques. Design standards and design guidelines as developed by transit operating agencies do not address trade-offs among the different station features or design components. In order to provide for consistency among the procedures used by different agencies to design transit stations and to ensure comprehensive treatment in the station design process, a methodology which uses analytical techniques for designing and evaluating alternative transit stations has

been developed. The performance of the station must be judged relative to a set of predefined objectives which derive from anticipated interests. Typical station design objectives reflect the points of view of the general user, the special user (the elderly and handicapped), and the operator concerning passenger processing, the station environment, and cost. The design objectives are then translated into a set of performance criteria which serve to define explicit performance measures that are the basis for comparisons among alternative station designs. This paper shows a method for analyzing transit interface facilities. The discussion focuses on the procedures which can be used to establish policy for station features, to provide performance measures for subsystems, and to give cost estimates. /Author/

15 178779 DEVELOPMENT OF ECONOMIC FACTORS IN TUNNEL CONSTRUCTION. The escalating cost of underground construction of urban transportation systems has made transit planning, especially construction cost estimating, difficult. This is a study of the cost of construction of underground, rapid transit tunnels in soft ground and is sponsored by UMTA's Office of Rail Technology. Twenty-two tunnels from the San Francisco Bay Area Rapid Transit District (BART), the Chicago Metropolitan Sanitary District, and the Washington, D.C. Metropolitan Area Transit Authority (UMATA) have been analyzed to determine what factors influence the Rate of Advance (ROA) through the ground. A statistical study of factors that influence tunnel construction costs was made to determine the magnitude of the major factors involved in construction cost. Tunnel construction data on cost and resources expended was collected and used to develop relations between construction ROA and physical variables. The data is also used in an analysis of the cost impact of institutional factors such as: availability and analysis of geologic conditions; flexibility and quality of engineering specifications; conditions for obtaining right-of-way and construction and entry permits; potential contractor liability; and labor agreements. Utilization of the study results are expected to better the accuracy of cost estimating procedures for further tunnel construction. The appendices contain numerous charts and tables illustrating such items as: Case History Data/format; Ring & Face Log Data/sheets; Average Weekly Progress Data/key punch forms; Systems Calculations for estimating tunnel construction cost; Rate of Advance Calculations; Calculations of Downtime Hours; Mexico City Tunnel Data; and References.

15 179524 TUNNELLING TECHNOLOGY. AN APPRAISAL OF THE STATE OF THE ART FOR APPLICATION TO TRANSIT SYSTEMS. This appraisal forms part of a continuing study of the applicability of tunnelling technology to urban transit systems in tunnels of intermediate diameter. It deals specifically with present and potential tunnelling methods suited to the subsurface conditions of three Ontario locations: Toronto, Hamilton and Ottawa. Experience gained in these areas in the construction of deep sewers and of transit tunnels is related to present world-wide technology. The conclusions from this study are that the cost and feasibility of a transit tunnel are more dependent on the variations in subsurface conditions along the tunnel route, on contractual arrangements and on the length of tunnel necessary to amortize the cost of specialized equipment, rather than on the exact diameter of the tunnel within the range under consideration. The study indicates that the technology and expertise necessary for construction of transit tunnels is readily available in Ontario. It is further concluded that tunnelling merits serious consideration for transit routes where land acquisition costs are high or where the disruption of services is a major problem. In favorable subsurface conditions, the benefits arising from reduced environmental intrusion into a community may more than offset the somewhat greater costs of tunnel transit systems over surface or elevated systems.

15 180332 WRIGGLE SURVEY FOR HONG KONG METRO. The alternatives that have become available as a result of recent developments in survey methods and instrumentation were investigated. The method used for the metro that uses EDM tacheometry for taking the measurements which are then processed on a mini-computer is described. The initial route length of an underground railroad is 15 km, and the journey time for that distance is expected to be 40 minutes. It includes 26 km of tunnels and 6 km of overhead structures. The nominal diameter of the tunnels is 4.9 m. The advantages of the new method are outlined.

15 180380 MANAGEMENT OF A LARGE PROJECT--BART. The economic, political, and sociological implications of a project the size and complexity of BART are enormous. Its design, construction, and operation interacts with, and affects, most segments of the Bay Area's population. As no new large rapid transit systems had been built since the early 1900's, BART, during its planning and design period, was not able to draw on existing data banks of progressive and analytical transportation design criteria, formulas, and concepts. The BART Board of Directors decided that planning, design, and construction management would be performed by consultants under direction of the District. This decision was based on the undesirability of BART's attempting to assemble a large and diverse staff for a relatively short-term requirement, coupled with the unavailability of transit people with the necessary experience. The BART staff included a small but strong technical group to give direction to the consultants and to clear the way in nontechnical areas to enable the consultants to carry out their directives.

15 180391 LINING AND WATERPROOFING TECHNIQUES IN GERMANY. Since 1967 in the Federal Republic of Germany the improvement of public mass transit has been financially promoted in overcrowded regions and city centers. Without including road tunnels and sewers,--solely in the area of railway transit an enormous volume of tunnel construction work has been carried out. Various technical research and development programs have been combined with this volume of construction work. Whereas in the sixties the tunnels were almost exclusively constructed in open cut because of the, in most cases, rather difficult soil conditions, the underground excavation method has been increasingly used in the seventies. This, of course, is a consequence of technical developments, which have had a considerable effect on the cost. The article discusses three problem areas and developments that have taken place in them; they include tunnel lining and especially, reinforced concrete

lining; joint sealing with special consideration of the waterproofing of concrete segmental lining; tunnelling costs and the most important factors that influence them.

15 183235 SURFACE ACCESS TO HEATHROW AIRPORT--THE UNDERGROUND SOLUTION. The article discusses the extension of the London transport underground to Heathrow airport and how it operates within the existing underground services. One of the main benefits of the underground extension has been to reduce road congestion in the approach roads to the airport by carrying an expected 30% of air travellers. The Piccadilly Line, of which the extension forms a part, operates fifteen trains per hour at peak periods. The 3.5 ml extension from Hounslow West was constructed by cut and cover methods to the airport and then by deep level tube tunnels under the runways to the centre of the airport. It is at this location that Heathrow Central station has been built in a reinforced concrete construction 400 ft long and 75 ft wide.

The ticket hall is connected with each of the three air terminals by wide subways equipped with moving walkways in both directions. It is thought that early misgivings concerning the possibility of conflict between air passengers and other users of the Piccadilly Line are unlikely to be justified even with further traffic growth.

Ellen, ER (London Transport, England) *Chartered Institute of Transport Journal* Vol. 38 No. 4, May 1975, pp 107-110, 1 Fig., 3 Phot.; ACKNOWLEDGMENT: TRRL (IRRD 233680); ORDER FROM: Chartered Institute of Transport, 80 Portland Place, London W1N 4DP, England

15 183288 THE RER (EXPRESS REGIONAL NETWORK) [Le RER]. The whole issue of this journal is devoted to the RER which was extended by 17 km of additional lines in December 1977. The first part outlines the history of the RER, part 2 deals with the construction of the tunnel, the architecture of the stations, and various types of equipment: tracks, mechanical staircases, electrical equipment, traffic signals, telecommunications, energy supply, ventilation. New techniques were used, some of them being described: uplifts in large structures, aerodynamic phenomena caused by trains moving, centralized control. Part three describes the operation of the system. [French]

15 183893 USE OF FLOATING-SLAB TRACK BED FOR NOISE AND VIBRATION ABATEMENT. Underground rail rapid transit systems can produce ground-borne vibration and noise from trains that creates intrusion in buildings located close to the underground facilities. This intrusion is usually a low-frequency (31.5- to 125-Hz range) noise or rumble transmitted via the intervening ground to the building structure. The use of floating-slab track bed, concrete slabs supported on resilient elements, to isolate the vibration of the rail support from the subway structure has been effective in reducing the transmission of vibration and noise to the surrounding ground and nearby buildings. This paper presents details on two types of lightweight floating-slab track bed; i.e., the continuous and the discontinuous designs. Some sections of continuous floating-slab track bed are in service at the Washington Metropolitan Area Transit Authority Metro System, and measurements of the reduction of the noise and vibration levels are presented.

15 183898 IMPROVED SEATINGS FOR BALLASTED TRACKS [Verbesserung des Schotteroberbaus in Tunneln und auf Bruecken mit elastischen Polyurethan-Matten]. When the track ballasting is laid on a hard surface this not only produces higher stressing, but also increases the level of sound transmission. The problem is

particularly acute in tunnels and on bridges carrying high-speed traffic. The fitting of flexible mats--especially SYLOMER matting--has an ameliorative effect as follows: deadening of solid-borne noise on underground railways (passing below built-up areas), reduced noise reflection from steel bridges, reduced dynamic stressing of the ballast, especially at high speeds, retention of the correct track level for considerably longer periods in tunnels and on bridges, reduced maintenance costs. The article describes the properties of the matting and various laboratory and practical test results. [German]

15 183899 SURVEY WORK IN THE BUILDING OF THE STUTTGART S-BAHN REVERSING TUNNEL [Vermessungsarbeiten beim Bau des Wendetunnels der S-Bahn Stuttgart]. The work of the survey engineer is of particular importance in tunnel construction, when high demands are placed on practical experience and expertise in overcoming problems and preventing errors. Modern surveying equipment, particularly the electronic distance meter and the tunnel laser apparatus for driving data, ease the work of the survey engineer, but the difficult working conditions (dust, noise, bad lighting) still place great demand on him. That such a satisfactory job, completed within the contract period, was made of the reversing tunnel for the Stuttgart S-Bahn can be attributed to the good co-operation with the contractor's survey staff and the other experts (geologists, construction engineers, etc.). The article describes the project, the geodetic conditions, the survey work for tunnel driving and the building of the tunnel shell, and the special survey work involved in the building of the tunnel.

15 184595 DIAPHRAGM WALLING IN GLASGOW'S ARGYLE STREET. This article describes the processes and problems involved in the construction of two sets of diaphragm walls (one more than 30m deep and within 2m of the shop fronts on either side of Glasgow's busiest shopping street) and the other more than 24m deep from within an existing tunnel with only 4.5m of headroom for the purpose of widening a subway tunnel to make room for an underground station with an island platform. The need for minimal disruption to normal activity along a major shopping area, as well as the maintenance of emergency access for fire-fighting and the like, and the limited space affected both design and construction procedures. The diaphragm walling was carefully programmed so as to permit as early a start on the actual construction of the station at the east end of the station area while the diaphragm walling continued to proceed westward (eg., because movement of construction equipment to and from the sites was limited to the evening hours, equipment needs had to be taken into account several shifts in advance so as to

prevent delays caused by the lack of a vital piece of equipment). The outer diaphragm walls were formed in panels 3-4.1m long which were installed after excavation through sand, clay with silt and gravel lenses overlying a dolerite bedrock and which extended vertically from street level down 23-30m to up to 300 mm into the rock. Bentonite slurry was provided to each panel site via a pipeline linked to a mixing and storage area away from the street. Excavation on the narrow street was accomplished by a unit suspended from twin cables and mounted on a crane. Special excavators, had to be used also when the inner diaphragm walls were constructed from within the old tunnel prior to its demolition because of the low head room. (4.5m). Headroom also restricted the length of panel reinforcement cages that could be handled. Sections were installed in 3.5m lengths using a small crane and lowered into the trenches, subsequent elements being spliced on by means of bulldog clamps to give the required final depth. Concrete was either brought in by trucks from Central Station 0.8 km away or, when space was limited, pumped from the surface.

15 188077 VERTICAL "S" CURVE GUIDES CWR STRING TO SUBWAY TUNNEL. Fabrication of welded rail strings above the tunnel site in which they would be installed for Washington Metro necessitated a delivery arrangement which saw the rail placed in a vertical reverse curve of sufficient radius to avoid exceeding the elastic limit that could have produced permanent kinking. A Soviet-developed portable welder was used in a fixed position with other stations generally found in a butt-welding plant. The string then passed over rollers in a trench and through an entry into the subway where roller supports at varying heights completed the 45-ft drop to the tunnel invert. On the floor, rollers were used to move the strings to their installation sites.

15 188223 TUNNELING FOR URBAN TRANSPORTATION: A REVIEW OF EUROPEAN CONSTRUCTION PRACTICE. Several underground construction methods are examined

with reference to recent European applications. An evaluation of the inherent strengths and weaknesses associated with each method is made. The methods under review include grouting in soil, grouting in rock, ground freezing, cast-in-situ walls, prefabricated walls, secant piles, slurry shield tunneling, and the New Austrian Tunneling Method as applied to soft ground conditions. The economics of underground construction are examined. The tunneling costs associated with six European metro systems are summarized. Where appropriate, the construction costs are itemized and the cost structures are viewed in the light of the ground conditions and construction methods used. The operation and organization of several European metro authorities are discussed. Tunneling practice in the United Kingdom is studied and used as a focal point for examining such issues as the apportionment of risk under contract and the resolution of contract disagreements. Comparisons are made between urban tunneling costs for rapid transit in the U.S. and Europe. Recommendations for improving tunneling practice are offered. /Author/

15 188323 TUNNELLING IN JAPAN. The article discusses the problems associated with tunnel construction in Japan. The natural rock formation of the country affected by ancient tectonic action coupled with volcanic activity has resulted in mixed geological conditions of very hard rock and decomposed weak ground. As most of the country's cities are located on river deltas, tunnelling construction encounters low strength fluvial deposits and high water levels. Ground treatment such as grouting, dewatering and freezing are required to aid excavation and to protect the work face. Details are given of tunnelling construction in progress in Japan including railway, highway, underground railway and water supply tunnels. /TRRL/

Tunnels and Tunnelling Vol. 10 No. 5, June 1978, pp 19-22, 7 Fig., 2 Tab., 1 Phot. ACKNOWLEDGMENT: TRRL (IRRD 236906); ORDER FROM: ESL

15 188333 THE ATMOSPHERE IN THE METRO [L'atmosphère du métro]. The first chapter deals with the specific characteristics of the atmosphere in the metro: composition and physical parameters of the air, comfort as regards temperature, and includes a brief outline of the railway authorities objectives in this field. A table describes the air conditioning equipment, the urban metro and the regional metro. The means employed to improve the atmospheric conditions in the metro are presented in the third chapter: improvement in ventilation, reduction in heat dissipated in the tunnel, air conditioning of stations, metro lines, surge shafts, cleaning. Four appendices deal with: temperature control in the urban network, the technical construction of a ventilation plant, temperature curves for the railway lines, layout plans for the installation of ventilators and ventilation bays. 15 188336 THE METRO: 'PALACES FOR THE PEOPLE'. Low cost public transport in Moscow restricts commuting by car to a low level. The metro is the most popular form of transport and although half the size of London's underground is used for an average of 5.7 M journeys per day compared with London's 2 M. The article describes the history, design and construction of the underground system which will be extended and improved before the 1980 olympic games. It is planned that there will be some 330 km of track and 300 stations by the year 2000. The first shafts were excavated by hand in 1932 through wet and variable ground-quite unsuitable for an underground rail system. Shields were not used initially; ground freezing was a common method of dealing with the poorest ground conditions. An outstanding feature of the system is the ornate architecture of the early stations; marble cladding and semi-precious stones such as onyx are still used for decoration and mosaics in the modern constructions.

15 188337 ENVIRONMENTAL TRADE-OFFS OF TUNNELS VS CUT-AND-COVER SUBWAYS. Heavy construction projects in cities entail two kinds of cost-internal cost, which can be defined in terms of payments from one set of parties to another, and external cost, which is the cost borne by the community at large as the result of disutilities entailed in construction and operation. Environmental trade-offs involve external costs, which are commonly difficult to measure. Cut-and-cover subway construction probably entails higher external and internal cost than deep tunnel construction in many urban geological environments, but uncertainty concerning the costs and environmental trade-offs of tunneling leads to limited and timid use of tunneling by American designers. Thus uncertainty becomes a major trade-off which works

against tunneling. The reverse is true in Sweden after nearly 30 years of subway construction. Econometric methods for measuring external costs exist in principle, but are limited in application. Economic theory based on market pressure does not address the real problem of urban environmental trade-offs. Nevertheless, the problem of uncertainty can be addressed by comparative studies of estimated and as-built costs of cut-and-cover vs tunnel projects and a review of environmental issues associated with such construction. Such a study would benefit the underground construction industry and the design of transportation systems. It would also help solve an aspect of the urban problem.

Walton, M (Minnesota Geological Survey) *Underground Space* Vol. 3 No. 2, Sept. 1978, pp 62-67, 5 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 237150); ORDER FROM: Pergamon Press, Incorporated, Maxwell House, Fairview Park, Elmsford, New York, 10523

15 188340 BLADE SHIELD TUNNELLING IN ESSEN. The article describes the excavation and lining of the fourth construction section of Essen's underground railway. The tunnel is located in an area of green sand and coarse silt in which the water table is located 5 M above the tunnel floor. As compressed air tunnelling methods could not be used because of thin cover and the soil structure, it was necessary to lower the water table by sinking wells. Tunnel excavation was performed with blade shield tunnelling equipment designed for use in unstable ground conditions. The article gives details of excavation methods used with this equipment in a built-up area and evaluates the resulting ground settlements.

15 188993 DRIVING WITH A FULL-FACE DIAPHRAGM. A full-face diaphragm on a shield offers means of driving tunnels through soft, wet alluvial soils such as are often found in estuaries. This paper describes an investigation of small diameter tunnels driven at three such sites using the full-face diaphragm on a shield. It was found that this arrangement can successfully

drive tunnels through both very wet and very soft ground. Reasonable agreement was found between the observed and calculated ground resistance to driving. The importance of accurately determining the nature and depth of the strata during the site investigation is emphasized.

15 189006 SUBWAY DESIGNS AND CONSTRUCTION METHODS THAT CUT COSTS. The author describes how the high cost of subway construction in the United States can be reduced by adopting station and track structure configurations, structural systems, and construction techniques best suited to the site geology and other constraints. The mixed soils and high water tables generally encountered in U.S. cities, together with a highly mechanized construction industry, constrains subway design and construction. For such conditions, estimates are provided that indicate the influence on cost of length and diameter of tunnels in different materials. Costs of stations constructed by cut-and-cover and by tunnel-enlargement are also compared. Alternative station construction techniques are described.

15 189007 CROSS-VENTILATION OF UNDERGROUND RAILWAY TUNNELS. The aerodynamic merits and demerits of cross-ventilating adjacent tunnels in underground rapid transit systems are discussed. Three types of cross-ventilation are considered, namely (a) numerous small holes in the dividing wall between the tracks in a cut-and-cover tunnel, (b) a curtailed dividing wall, and (c) passages linking separately bored tunnels. It is shown that considerable reductions in the air velocities expected on station platforms will result if the end regions of the tunnels are well cross-ventilated. Additionally, useful reductions in the aerodynamic drag force on trains can be expected if cross-ventilation is provided along the whole length of the tunnel. However, this is recommended only for low-speed systems because interaction between passing trains will cause large pressure fluctuations at high speeds.

15 190212 SETTLEMENTS AROUND TUNNELS IN SOIL: THREE CASE HISTORIES. This report presents the results of three case histories of field observations of settlements around tunnels in soil. Two of the cases are twin, 20-ft (6-m) diameter, single-track tunnels for the Washington, D.C. Metro System: Section F2a, F Route, is a steel segment lined tunnel in interbedded sands and gravels and clays, typical of downtown Washington; (2) Section G1, with an expanded rib and lagging lining, is in transition from these deposits to a hard, fissured clay. The third case is a 9-ft (3-m) diameter sewer tunnel with an expanded rib and lagging lining driven in dewatered, dense sands at Rockford, Illinois.

Detailed measurements of subsurface settlements at points 3 to 6 ft (1 to 2m) above the tunnel crowns are used to determine sources and magnitudes of lost ground. Where the tunnel face was controlled to prevent large losses, ground losses due to overcutting and plowing of the shield were about one-half of the total estimated ground loss; incomplete filling of the tail void was the next biggest source of loss. Ground surface settlement data, including widths, slopes, and volumes of the surface settlement troughs are reported for several cross-sections on each tunnel and for points along the tunnel centerlines. The volume of surface settlement was less than the volume of ground loss because the disturbance of tunneling caused a net volume expansion in the dense granular materials. The relationship between ground loss and surface settlement volume, as shown by sand bin model test data is also reported. A procedure for estimating ground loss and surface settlement in advance of tunneling is suggested. /UMTA/ MacPherson, HH ; Illinois University, Urbana, (IL-06-0043) Final Rpt. 15 192188 ELECTROMAGNETIC CROSS-BOREHOLE SURVEY OF A SITE PROPOSED FOR AN URBAN TRANSIT STATION. LLL has developed and tested an electromagnetic method for probing between boreholes and has applied the method to characterize the site for a future urban rapid-transit station--the Forest Glen/Georgia Avenue station Washington, DC. Using this technique, the subsurface region's transmission properties were determined by sending a continuous-wave (cw) electromagnetic signal between a transmitter and a receiver in different boreholes. From the network of sampled signals, which vary according to the electrical properties of the media through which they pass, the region's properties can be determined. For the Forest Glen/Georgia Avenue site, there has been an excellent correlation of the predicted subsurface geologic structure and fracture density with the borehole core information. This suggests that cross-borehole probing has significant merit for inferring the detailed structure between boreholes. This is a desired capability that no other technique meets with as high a resolution as the described procedure.

15 194141 RHINE-RUHR METRO-CASE STUDY NO 1. BOCHUM CITY RAILWAY. CONTRACT 3. The article describes a case study concerning the construction of contract B3 forming part of the underground rapid transit system being commissioned by the city of Bochum as part of the Rhine-Ruhr metro system. Contract B3 is located at the end of the first tunnel section of line B and incorporates a station, a ramp to street level and provision for a future extension of the tunnel section. The construction method used was the new Austrian tunnelling method instead of open cut as originally planned for some sections. Headings were excavated by road-heading machines and a telescopic shovel feeding

wheeled loading shovels. Front end loaders transported the spoil to shafts for lifting and removing from site. Steel arches were placed every metre with sprayed concrete for initial support. When the excavation was complete a final in-situ concrete lining was constructed in 8-10 M lengths. Details are given of tunnel dimensions and construction techniques employed.

15 194142 RHINE-RUHR METRO-CASE STUDY NO 2. HERNE CITY RAILWAY. CONTRACT 5. The Herne city railway, which is to form a link in the Rhine-Ruhr metro system, consists of a single line beneath the city centre connecting Recklinghausen and Bochum. The line is divided into eight sections, one of which, the 660 M long section no 5, is described in this study. The cut and cover excavation method was used with bored pile retaining walls. The geological conditions consisted of 1-2 M of alluvial fill below street level with weathered marl beneath. The water table at 5 M below ground level was lowered below formation level by sinking wells and installing pumping equipment. The floor slab and walls were concreted in one operation to prevent water inclusion using a 60 tonne mobile formwork rig. The article describes construction stages and equipment used.

15 194155 BETTER MANAGEMENT OF MAJOR UNDERGROUND CONSTRUCTION PROJECTS. The object of this study was to recommend actions that result in public underground projects that are completed on schedule, and at reasonable cost, and operate to design. To this end, a hypothetical model of a major urban underground transportation construction project called the Key City Model was developed by a subcommittee of the National Committee on Tunnelling Technology. From this model, the subcommittee derived a list of primary elements-social, political, physical, and technical-that could conceivably be faced in building an urban rapid transit system which might have a bearing on management. A questionnaire containing these elements was sent to 105 people experienced in underground construction who were asked to rank them. Using the survey results, the subcommittee ranked the elements and then sent out another survey asking for recommendations. As a result this survey and the comments made at a workshop attended by people involved in underground construction, the recommendations presented here were formulated.

15 194906 FLEXIBLE TUNNEL TO RIDE WITH QUAKES. The paper reports that a Japanese joint venture contractor is building a flexible sunken tube rail tunnel under Tokyo Bay designed to accommodate as much as 4 ft of soil settlement and survive a major earthquake. Joints between the elements have a rubber gasket on the outside and a small gap on the inside for flexibility. Post tensioning cables strung through the joints tie the segments together, and H-shaped steel members form a shear key embedded in the end of one element at each joint to prevent excessive vertical displacement. /EI/

15 195078 REDUCING COSTS IN URBAN TRANSPORTATION CONSTRUCTION. This paper describes an in-depth research study to evaluate the current and projected state of productivity in the construction of transportation facilities and explores improved mechanisms for implementing transportation construction innovations. At this stage it is evident that some of the major obstacles that impact costs, reduce productivity, and inhibit the implementation of innovations result from:(1)Decisions made and policies set during the planning and design phases; (2)the contractual and organizational structure chosen for project administration; and (3)delays and cost increases resulting from third-party intervention. There are also opportunities for further improvements through wider and more effective use by construction contractors of management techniques that have already proven to be successful.

15 195086 TUNNEL CATENARY OF THE URBAN RAPID TRANSIT SYSTEM RHINE-MAIN (RIVERS) IN WEST GERMANY [Die Tunnel-fahrleitung der S-Bahn Rhein-Main]. The catenary installations of the Rhine-Main rapid transit system have essentially been designed according to the parameters of the counterpart in Munich (West Germany). Because of different systems of tunnel construction and special structural conditions, extensive special structural measures were necessary. Therefore the supports and anchors of the catenary, switching equipment and feeding installations had to be installed by appropriate arrangements in the clear spaces between the structural elements and the normal structure gage. In general, only limited use could be made of the clear space. This required appropriate intensive and extensive job planning. The application of special working techniques during the installation of the catenary was the precondition for a rational, trouble-free realization of all catenary work. [German]

15 196143 SOIL-STRUCTURAL INTERACTION AND CONCRETE TIE DESIGN. In this closure, the author summarizes several points made by the discussor which he feels are well taken. It is agreed that the analysis (which was general) should not be extended to light rail. In that context, heavier rails (132-1/4yd or 66-kg/m or over) would not be economically justified. Also, the need for more data on the dynamic loads imposed on concrete, or indeed wood, ties for North American heavy wheel loading is emphasized, since dynamic loading is very dependent on track quality. (Currently in the U.S., trains with lighter wheel loads are permitted to go slightly faster poor-and medium-quality, but have no speed advantage over heavier trains on high-quality track). The discussor's point out that line loading was assumed at the rail seat, and any optimum tie length would thus be increased by only assumption made for the bearing distribution of the rail, rail pad, and tie thickness is well taken. The use of equal positive and negative moments at the two critical sections, as well as the optimization using these two critical moments as equal, were questioned by the discussor. While not agreeing with his reasons for questioning such requirements the writer basically agrees with the discussor for a practical tie design. In response to the suggestion that speed restrictions on curves generally lead to lower requirements on curves, the author notes that such restrictions are generally imposed after construction due to operating problems and never, to his knowledge, specifically specified prior to construction.

15 196622 ANALYSIS OF NATIONWIDE DEMAND FOR URBAN TRANSPORTATION TUNNELS. For the purpose of determining estimates of the amount of transportation-related tunneling activity likely to occur to 1990, a methodology was devised whereby the conditions necessary to justify the application of tunnel segments for mass transit facilities were identified and matched against the number of situations in which these conditions are likely to be fulfilled. A corollary outcome of the analysis is an appraisal of factors that affect the preference of one type of mass transit system over others and an understanding of the sensitivity of preferred system choice to these factors. A technical evaluation of supply and demand for alternative types of mass transit systems was conducted to determine the future viability of such systems for cities that do not have them. Results of city-by-city application of the methodology developed revealed that, with current construction costs and property values, three cities currently without mass transit systems--Detroit, Cincinnati, and Denver--would meet necessary conditions for tunneled systems by 1990. At the other extreme, tunnel distance was computed for conditions in which tunnel construction costs in real terms were postulated to fall to 40 percent of today's cost and right-of-way values to rise by 5 percent/year. Other sensitivity results for the preference of tunnels to new right-of-way and for the forecast of nationwide tunnel construction under other assumptions are also reported. /Author/

15 196626 SOFT-GROUND TUNNELING BY GROUND FREEZING: A CASE HISTORY. A brief introduction to artificial ground freezing for temporary excavation retention during construction is presented. The major aspects that affect the suitability of ground freezing in a particular project are discussed. To illustrate the applicability of artificial ground freezing, a case history in Washington, D.C., is presented. The project consisted of a circular 3.8-m (12.5-ft) diameter sewer tunnel approximately 33.5 m (110 ft) in length that passed 2.7 m (8.9 ft) beneath four sets of railroad tracks. The design process, including the frozen-soil laboratory testing program and the computer modeling, is presented. An instrumentation program was used during construction to monitor the performance of the project. The instrumentation consisted of thermocouples to monitor ground temperatures and elevation monuments to monitor ground movement during construction. /Author/

15 196627 PRACTICAL DESIGN OF CONCRETE DIAPHRAGM WALLS. Diaphragm walls constructed by the slurry trench method achieve their greatest economy when it is possible to use them as part of the permanent underground structure. To use these support-of-excavation structures as permanent components of a structure, engineers must be assured of their compatibility with structures built in an open excavation. There should be consistent reliability in applied loads, levels of stress, watertightness, durability, and performance. It is suggested that the use of diaphragm walls of precast concrete panels can provide reliable strength and durability and that use of a cement bentonite grout on the backside of the diaphragm wall to displace excess slurry can meet waterproofing requirements. It is recommended that plastic analysis be combined with ultimate strength methods in the design of these walls to resolve the problem presented by the complicated residual stress patterns generated in the diaphragm wall by the construction processes of excavation; installation, prestressing, and removal of braces; and backfilling. In addition, use of a built-in hinge in the diaphragm wall at the lowest brace facilitates control of residual moments. This approach can satisfy the need for reliability in stress levels in the structure. A structure so designed and constructed will be compatible with one built in an open excavation. /Author/

15 196715 SUBWAY STRUCTURES RELATIVELY GOOD, OTHER ELEMENTS OF SUBWAY SYSTEM NEED REHAB. New York has postponed construction of its Second Avenue Subway but is going ahead piecemeal with the line between midtown Manhattan and Jamaica, Queens. Seventy percent of the Transit Authority capital budget is going into rehabilitation and modernization of existing lines. Elevated structures, despite ages up to 93 years, appear in good shape. Oldest subway, the 75-year-old Lexington Avenue IRT, is getting priority in rehabilitation of power and signal systems, and in refurbishing of the stations.

15 197284 STATION EXCAVATIONS IN HARD ROCK FOR THE WASHINGTON METRO. Details are given of the construction of rock caverns for mass transit railway stations in Washington DC. Ten of the stations have been excavated in gneiss, schist and quartz where these vaulted rock excavations measure some 650 ft long, 45-50 ft high and 60 ft wide. The caverns are designed without interior supporting columns. For drilling and roof bolting operations four pneumatic Ingersoll-Rand, three-boom, ramp-master jumbos were used. The drills have penetration rates of 1 m/min on 50 mm diameter blastholes. A stabilator robot shotcrete unit following behind the jumbos spray a 50-100 mm layer of shotcrete to stabilise the rock face.

15 197344 ECONOMIC FACTORS IN TUNNEL CONSTRUCTION. This report describes a new cost estimating system for tunneling. The system is designed so that it may be used to aid planners, engineers, and designers in evaluating the cost impact of decisions they may make during the sequential stages of planning and design of urban transportation tunnels. In developing a cost estimating technique and method, an

extensive review was made of currently available estimating systems. Techniques were adapted from the systems studied where applicable, and new methodologies were developed as needed for optimization. A detailed estimating technique is used in which units of effort are converted to obtain a base cost for a "standard" tunnel constructed in 1976 in Washington, DC. Correction factors may then be applied to obtain the costs in other time frames and geographic locations. The use of units of effort provides a technical base which does not change rapidly with time, but may be updated as changes in technology and productivity occur.

15 197442 DEVELOPMENT OF DESIGN PROCEDURES FOR STABILIZED SOIL SUPPORT SYSTEMS FOR SOFT GROUND TUNNELING. VOLUME IV. CASE HISTORY STUDIES, WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY SYSTEM. The practice of injecting chemical grouts into permeable soils in order to stabilize them for tunnel construction is a common procedure in Great Britain, Europe, and Japan. It is only within the last five years that this technology has been used in the U.S., namely, in the work for the Washington Metropolitan Area Transit Authority (WMATA) subway construction. This report documents five WMATA case histories where chemical grouting was used; information is provided as to the soil conditions, method of treatment, reason for treatment, and tunnel performance. The document is the fourth in a series directed towards the subject of use of chemical injection technology to stabilize sand soils for ground movement control during tunneling. The research program has been carried out over the last three years at Stanford University. Other available project reports are: Volume I: A Report on the Practice of Chemical Stabilization Around Soft Ground Tunnels in England, France, and Germany (PB-272 771), and Volume II: Preliminary Results (PB-273 064). The chemical grouting was used as an economic alternative to conventional underpinning. Ground movement data show that the settlements in the grouted areas were generally small (less than 50mm) and that no cases of serious ground runs occurred. The best ground control was achieved where the soils in the upper half of the tunnel cross-section and above the crown were uniformly groutable, and good, general construction and support practices were used. Grouting of the soils around the tunnel was less effective at movement control in cases where soil layers in the crown area were ungroutable.

15 197460 A QUANTITATIVE METHOD FOR ANALYZING THE ALLOCATION OF RISKS IN TRANSPORTATION CONSTRUCTION. The report presents a conceptual model of risk that was developed to analyze the impact on owner's cost of alternate allocations of risk among owner and contractor in mass transit construction. A model and analysis procedure are developed, based on decision analysis but extending the standard methodology to include: (1) explicit consideration of risk as an incentive to perform, and (2) the interaction between two decision-makers (owner and contractor) trading risk for price.

15 197698 CASE STUDIES OF BUILDING BEHAVIOR IN RESPONSE TO ADJACENT EXCAVATION. A substantial portion of the cost of soft ground tunnels and braced excavations in urban environments is devoted to the protection and repair of adjacent structures and utilities. Often, the choice between cut-and-cover tunnel construction is based on the potential ground movements associated with each method and the anticipated response of the nearby buildings to these ground movements. In some instances, the locations of tunnel routes and large braced excavations are selected to avoid large and/or sensitive structures. This report summarizes one year of field observations and data collection of the ground movement and resultant building distortion and change in response to underground construction. It documents case histories of the distortion and damage to structures adjacent to tunnels and excavations. Measurements of ground movements and building response were made at two test sites in Washington, D.C. The sites were a nine-story apartment building adjacent to a 60-foot-deep open cut and a pair of two-story brick-bearing wall structures near two 21-foot-diameter tunnels. The structures at the test sites were instrumented to measure settlement and tilt of the bearing walls and foundations. Both lateral and diagonal displacements were measured with tape extensometers extending between column lines and bearing walls at various floor levels in the structures. From these data, the slope of the settlement trough could be separated into the components causing angular distortion and tilt of the structure. Lateral extension, shearing, or bending could also be distinguished from the data. Additional data were gathered at other sites in Washington, D.C. and in Chicago, Illinois through construction records and field inspections. The ground surface settlement data, building response data, and the progress of the excavation are compared and related.

15 198024 RECOMMENDATIONS FOR BETTER MANAGEMENT OF MAJOR UNDERGROUND CONSTRUCTION PROJECTS. EXECUTIVE PRESENTATION. This report identifies procedures and practices in major underground construction projects and recommends improved procedures that will ensure more efficient and economic execution of these projects. It is the continuation of a previous study by the subcommittee on Contracting Practices of the U.S. National Committee on Tunneling Technology which noted that many of the problems encountered in the contracting and construction phases of underground projects result from actions taken in development, pre-design, and design phases. A hypothetical model of a major urban underground transportation construction project is described in detail. One of the most important causes of management is delayed decisive action. Thirty-nine most critical elements of a project are listed. Steps leading to completion and operation of the project are outlined. Recommended objectives and specific recommendations to support each objective are presented in the concluding section. The report is intended for use by government organizations, professional associations, and industry concerned with underground construction.

National Committee on Tunneling Technology, Office of the Secretary of Transportation, Urban Mass Transportation Administration, National Science Foundation NSF/RA-780467, 1978, 31 p.; Grant NSF-DAR76-21335; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-293543/5ST

15 198284 THE ATLANTA RESEARCH CHAMBER; APPLIED RESEARCH FOR TUNNELS; BLASTING TECHNIQUES, CONVENTIONAL SHOTCRETE, STEEL-FIBER-REINFORCED SHOTCRETE. MONOGRAPHS ON THE STATE-OF-THE-ART OF TUNNELING. This report describes the construction of the Atlanta Research Chamber and the research conducted in it. In addition, 24 monographs on the state-of-the-art of modern tunnel practice are included. The Atlanta Research Chamber was conceived as a team effort of 18 individuals from twelve engineering firms in the United States, Canada, and Austria to combine their special expertise to study various aspects of tunnel support system in hard rock. It was primarily a practical effort by practical engineers, attempting to develop useful tools for tunnel designers and builders. Later, the team was expanded, and a number of team members were asked to write monographs on modern tunnel practice. All have practical application, and by being gathered together in one volume, may serve to promote the common goal, which is to construct underground space economically and safely. To balance these predominately technical monographs, new team members were recruited to write monographs representing owners, contractors, labor, legal aspects, insurance, overseas practice, and additional technical ideas.

Rose, DC ; Metropolitan Atlanta Rapid Transit Authority, Urban Mass Transportation Administration, (UMTA-GA-06-0007) Intrm Rpt. UMTA-GA-06-0007-79-1, June 1979, 361 p.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-297574/6ST

15 199068 MATERIALS HANDLING FOR URBAN TUNNELING IN ROCK. An examination of prior forecasts of tunnel construction provides an estimate of 2.4 million feet of rock tunnel to be constructed during the 1976-2000 period. Tunnel projects for the near term (1980) and far term (1990) periods are defined for study. The flow and characteristics of materials handled are defined for the tunnel projects. The state-of-the-art and status of R&D programs for materials handling are reviewed. Based on extensive interviews with representatives of tunnel contractors, equipment manufacturers, government agencies, and consultants, the application of various methods of material handling to tunneling is discussed, including conventional rail haulage, crane and hoist lifting, and horizontal transport and lifting by hydraulic and pneumatic pipeline and by conveyor. Total job cost estimates using these modes of material transport are obtained (with material handling costs isolated) by modification of an estimating technique used for preparing contractor bid estimates. A comparison of the results indicates that major cost savings through substitution of alternative material handling modes should not be anticipated. R&D program elements are recommended to assure that material transport will not become the limiting factor as the rate of tunnel excavation increases in future years.

15 260348 THE IMPORTANCE OF AERODYNAMICS IN THE DESIGN OF INTRA-URBAN TRAINS TRAVELING IN TUNNELS. Aerodynamics can be a major factor in the design and operation of intraurban subway-train transportation systems. In order to develop an adequate understanding of the aerodynamic characteristics of such systems, an experimental program was carried out. The major portion of the testing was conducted under equilibrium, incompressible conditions so that the fundamental aerodynamic characteristics could be isolated. The effects of geometric parameters (such as train speed, blockage ratio, wall roughness, and train speed, blockage ratio, wall roughness, and train and tunnel length) upon train drag and tunnel flow velocities were determined and compared with a simple theoretical model. The effect of aerodynamic forces upon typical subway-train operations is shown in order to give proper perspective to the importance of aerodynamics.

15 263680 DEVELOPMENT OF SHOTCRETE FOR METRO CONSTRUCTION IN WASHINGTON. The use of shotcrete in the Washington, D.C. Metro System is reviewed. Shotcrete in this instance is defined as coarse aggregate as opposed to the ACI definition which is broader and includes fine aggregate and non-structural uses. Six-inch shotcrete linings in fair to good rock with moderate overbreak used

in conjunction with rock bolts was considered to be an economical solution. Such linings could also be used as temporary supports eliminating steel ribs, and serve as the first step in building up a permanent lining with further layers of shotcrete. This paper which outlines basic steps utilized in developing shotcrete, also outlines the experience gained in implementing the specifications. The early set of shotcrete was selected at 500 psi at 8 hours and the 28 day strength was specified to be 5000 psi. The high early and final strength values must be selected for optimum effect and a trade-off has to be made between high early strength and high final strength for durability. The two gradations are presented which were specified for the combined coarse and fine aggregates. In the accelerating admixture needed to reduce rebound, two to 3 percent by weight of cement is used. A maximum of 3 minutes for initial set and 12 minutes for final set for the cement-accelerator paste, and a paste strength of 800 psi in 8 hours are specified. Control aggregate gradation was achieved by selecting fine-coarse aggregate gradation bands which could be met with available local aggregates. In the testing of shotcrete mix in laboratory for conformity with specifications, two sizes of aggregate with maximum sizes of 0.75 and 0.5 inch were selected. Field trials by nozzlemen, quality control during production and construction testing are also discussed. Of the accelerators tested, Sigunite and Triacasol T-1 conformed to requirements. Tests were made to determine the compatibility of cements with the selected acceleration and the ability of the combinations to produce the desired early strength.

Bawa, KS (Lorezi, Dodds and Gunnill); American Society of Civil Engineers, American Concrete Institute Conf. Proc SP-45, 1974, pp 33-49, 6 Fig.; In "Use of Shotcrete for Underground Structural Support: Proceedings of the Engineering Foundation Conference, South Berwick, Maine, 16-20 July 1973".

15 263684 CURRENT FIELD RESEARCH PROGRAM ON SHOTCRETE. The field work is described and a preliminary evaluation is presented here of a comprehensive research program (conducted in an underground station of the Washington, D.C. subway) designed to evaluate the practical aspects of the behavior of conventional and experimental shotcretes (regulated-set shotcrete and steel fiber shotcrete). The project was planned to demonstrate the practicality of the experimental shotcrete for routine construction by using the normal crews and equipment available to the contractor. It was also intended to develop information on the experimental shotcrete for potential users. The need for a control of a conventional shotcrete led to inclusion of research on conventional shotcrete. Coarse aggregate mixes of regulated set shotcrete and steel fiber shotcrete were shot successfully in the dry-mix process by a civil engineering contractor using on-site crews and equipment. The results of rebound tests showed that the rate of rebound for about the first 0.5 inch was more than five times the rate of rebound for the remainder of the layer. There was a greater percentage of coarse particles in the rebound than in the wall. A high percentage of steel fibers rebounded. A homemade long nozzle consisting of a single water ring about 14 feet behind the tip of the hose appeared to provide more uniform mixing than other nozzles. At the

end of a few hours the compressive strength of reg-set shotcrete was 3 to 10 times the compressive strength of conventional shotcrete. After 29 days the compressive strengths of conventional and reg-set shotcrete were generally greater than 5,000 psi but the compressive strength of the steel fiber shotcretes was somewhat less. However, the ratio of flexural strength to compressive strength was much higher for steel fiber shotcrete. The steel fiber shotcrete exhibited considerable post-crack resistance.

Parker, HW (Illinois University, Urbana); American Society of Civil Engineers, American Concrete Institute Conf. Proc SP-45, 1974, pp 330-350, 6 Ref.; In "Use of Shotcrete for Underground Structural Support: Proceedings of the Engineering Foundation Conference, South Berwick, Maine, 16-20 July 1973".

15 263686 INSTRUMENTATION TO MONITOR BEHAVIOR OF SHOTCRETE SUPPORT SYSTEMS. In this discussion which comments on the construction conditions (which are directly related to the instrumentation results), and the general behavior of shotcrete-rock bolt and shotcrete-steel rib support systems, emphasis is placed on the rock instrumentation program which was conducted in the Washington, D.C. subway tunnels. The types of instruments used and their performance is described, as well as the instrumentation program and the preliminary results of the studies. The effects of rock geometry, rock block movements, shotcrete-rock bond, as well as the shrinkage properties of the shotcrete on development of tensile and compressive strains in a rock bolt-shotcrete lining are illustrated. Conclusions regarding design considerations of shotcrete support systems are presented. The instrumentation consisted of the use of extensometers to monitor general rock behavior in the tunnels and stations, and extensometers and strain gages placed in test sections to measure rock movements and strains in the shotcrete lining. The basic approach used was to correlate local geologic conditions and construction procedures with these measurements. The extensometers consisted of mechanical rod-type, double-position and six-position units. The bonded resistance gages used here, were read using a Wheatstone bridge, and the vibrating wire embedment gages were read using a frequency counter. Rock movements in steel supported sections of the tunnel were as much as five times those in the shotcrete-lined reaches. Tension stresses were developed in locations where chloride seams and bedding plane orientation was such that tension would develop. Rock bolt-shotcrete combination support system was used in these areas.

Jones, RA Mahar, JW (Illinois University, Urbana); American Society of Civil Engineers, American Concrete Institute Conf. Proc SP-45, 1974, pp 297-319, 7 Fig., 2 Ref.; In "Use of Shotcrete for Underground Structural Support: Proceedings of the Engineering Foundation Conference, South Berwick, Maine, 16-20 July 1973".

15 263687 USE OF SHOTCRETE FOR TUNNELING IN DIFFICULT GROUNDS. The use of shotcrete in Europe is discussed. Experience in the use of shotcrete in a hydroelectric plan tunnel in Italy is described. Special reinforced shotcrete was used to line the tunnel immediately

after excavation. The reinforcement consisted of steel mesh ribs placed at distances varying from 0.5 to 1.20 m and completed by secondary rods and by a large steel mesh behind the steel mesh ribs. Details are outlined of this construction which, subsequent studies indicate, was completely successful. A second project is detailed which consisted of road tunnels which underpassed built-up zones and garden zones. The ground consisted of various types of argillaceous slates inserted with chalky sandstone strata, some part of which were greatly decomposed and others totally decomposed. The problems presented in this particular situation could be solved only by the shotcrete system. A section in which the shotcrete ring was the only support of the tunnel up to the completion of the excavation works (2 years later), was continuously tested by survey of bench marks installed from 5 up to 7 on a part of the steel mesh ribs. The maximum subsidences (on single bench marks) were of 0.30 mm after 272 days and of 0.416 mm after 242 days at another point. These data confirm the validity of the shotcrete method. Comparisons are made of the results of the shotcrete method with those constructed according to traditional methods. The successful use of the shotcrete method for the construction of the Milan Subway System (1967-1970) is described. Attention is drawn to certain points which are of importance for the shotcreting method. Shotcrete must be applied only where the ground characteristics require it. The widths employed must be adequate to support the ground. The steel mesh ribs and metal support must be distributed and placed in such a way that they will be integrated in a resistant, calculable complex with the shotcrete. The components of the concrete must incorporate an ideal and accurate granulation for the kind and percent of accelerators employed.

Curzio, PQ Barazzoni, G Nobili, F Anselmi, A (Quadrio Curzio S.p.A., Italy); American Society of Civil Engineers, American Concrete Institute Conf. Proc SP-45, 1974, pp 79-95; In "Use of Shotcrete for Underground Structural Support: Proceedings of the Engineering Foundation Conference, South Berwick, Maine, 16-20 July 1973".

15 263694 GEOLOGIC CONSIDERATIONS IN SHOTCRETE DESIGN. The use is described of shotcrete in large shallow underground openings in rock, and several examples are presented which indicate the effect of geology on shotcrete behavior. The results of observations of rock movement and cracking in the shotcrete have indicated a characteristic behavior of the shotcrete support in blocky rock. This behavior (illustrated with examples) has implications for the design of shotcrete in a support system. Large underground openings excavated for the Washington, D.C., Metro stations and the geology of the area are described. In the construction of such openings shotcrete (in combination with other support methods) is a useful construction tool for limiting rock movements and fallouts and for maintaining the stability of the face, headings, intersections, pillars and walls. Specifications should provide for sufficient thickness to be initially placed in the headings during the cycle. They should be flexible enough to permit additional thicknesses to be placed in areas where cracking or rock movement is observed. The thickness requirement of the shotcrete may be established by observations of the size and shape

of the overbreak and the protruding rock blocks, by noting the planarity, slickness, and water on the joint surfaces bounding the blocks, and by observation of cracks in the shotcrete and movement of rock blocks. In blocky rock, shotcrete is used in combination with other supports. The fast-setting properties of the shotcrete make it possible to install the permanent lining near the face of the tunnel. A continuous thick shotcrete arch can be analyzed in a manner similar to a concrete arch. The parameters controlling the behavior of a thin shotcrete lining in blocky rock are listed. Observations are presented which relate to aspects such as the thickness of shotcrete, bond and frictional strength of rock-shotcrete interface, the tensile properties of shotcrete, and the orientation and shape of rock blocks and the nature of bonding surfaces.

Cording, EJ (Illinois University, Urbana); American Society of Civil Engineers, American Concrete Institute Conf. Proc. SP-45, 1974, pp 175-199, 10 Fig., 1 Ref.; In "Use of Shotcrete for Underground Structural Support: Proceedings of the Engineering Foundation Conference, South Berwick, Maine, 16-20 July 1973".

15 265304 DESIGN OF OUTLYING RAPID TRANSIT STATION AREAS. Design of modern rapid transit stations in outlying areas is a complex process that has had only limited documentation. The paper attempts to help the designer in organizational and technical aspects of his or her work. Steps in the design procedure are outlined, and data needed for design are listed. The designer's work starts with an analysis of the requirements of the 3 interested parties: passengers, transit system operator, and community. Design principles and standards emphasize priority sequence for different access modes: pedestrians, feeder bus, kiss-and-ride, and park-and-ride. Maximum separation of modes is desirable: Bus stops should be close to the station entrance, preferably in a separate transit area; kiss-and-ride should be next in distance from the station; park-and-ride should be in the farthest areas. Design should be such that the maximum concentration of automobile traffic is on the periphery of the station, for close-in areas have pedestrian concentrations. Safe and convenient pedestrian movement must be provided for throughout the station area. Examples of design elements for each mode are presented. Finally, the paper contains several examples of total designs of different types of stations.

15 300761 THE ATLANTA RESEARCH CHAMBER APPLIED RESEARCH MONOGRAPHS. The Atlanta Research Chamber is located directly below Peachtree Street in down-

town Atlanta, Georgia. It is included in the CN-120 contract for the Peachtree Center Station, which is a part of the Metropolitan Atlanta Rapid Transit Authority's (MARTA's) multi-billion dollar "Phase A" 53-mile transit project. The Urban Mass Transportation Administration (UMTA) funded the Atlanta Research Chamber as part of UMTA's continuing effort to discover ways to reduce tunnel and rapid transit costs. This report describes the construction of the Atlanta Research Chamber and the research conducted in it. In addition, 24 monographs on the state-of-the-art of modern tunnel practice are included. The Atlanta Research Chamber was conceived as a team effort of 18 individuals from twelve engineering firms in the United States, Canada, and Austria to combine their special expertise to study various aspects of tunnel support system in hard rock. It was primarily a practical effort by practical engineers, attempting to develop useful tools for tunnel designers and builders. Later, the team was expanded, and a number of team members were asked to write monographs on modern tunnel practice. All have practical application, and by being gathered together in one volume, may serve to promote the common goal, which is to construct underground space economically and safely. To balance these predominately technical monographs, new team members were recruited to write monographs representing owners, contractors, labor, legal aspects, insurance, overseas practice, and additional technical ideas.

15 301143 TUNNEL CONSTRUCTION UNDER HISTORICAL BUILDINGS IN NUERNBERG [Tunnelbau unter Historischen Gebaueuden in Nuernberg]. In the central city area of Nurnberg an underground station was constructed using traditional techniques. This involved working underneath the "Nassau House" which was built in the 12th and 13th centuries, the soffit of the tunnel being only 2,50 M below the bottom of the foundations. Furthermore the station tunnel had to be driven only 0,80 M beside the foundation of the 75 M high south tower of the Lorenz Church (13th century). The underground station is situated in friable keuper sandstone. An additional complication was that the rock core remaining between the two tunnel tubes was only 2,80 M wide and had to accommodate three transverse passages and two access halls. The chosen method of construction, the progress of the work and the results of measurements during the work are described in detail. The settlements observed in the case of the Nassau House were only 9 mm and for the south tower of the Lorenz Church only 2 mm. The measurements showed among other things, that for such closely spaced tunnel tubes a common relieving arch is formed in the surrounding strata even for such small cover and low strength rock which serves to reduce the loads on the tunnel lining. On the basis of the comprehensive preliminary investigations it was possible to include all the necessary work in the tender documents and to complete the work within the allotted time

without exceeding the estimated costs. The relatively small settlements which occurred had no adverse effects on the valuable historic buildings. /TRRL/ [German]

15 301209 ON THE RANGE OF VALIDITY OF SIMPLIFIED ONE DIMENSIONAL THEORIES FOR CALCULATING UNSTEADY FLOWS IN RAILWAY TUNNELS. Methods of calculating unsteady flows in tunnels have been developed in Japan in connection with the Shinkansen high speed train. In this country the High Speed Train, the Advanced Passenger Train and the Channel Tunnel project have provided the incentive for work on methods of calculation. Another approach has been developed in France, aimed primarily at underground metro systems.

15 301838 NATM PROVES ITS ADAPTABILITY. The article summarizes the New Austrian Tunneling Method (NATM) which has been successfully used in many deep alpine rock tunnels also in German underground railway

construction. Rock bolts and grouting compound the surrounding mass forming an integral structure independent of a lining. Tunneling takes place in increments of complete rings of sprayed concrete forming a tabular shell of predictable strength. Steel arches and wire mesh reinforcement can be used to strengthen the concrete layer. Short and long anchors can be added to the support system to control instability. Instability at the face is predictable if pressure changes and actual movements are monitored. Tunnel geometry is monitored by convergence measurements. Illustrations are given of how the method can be used to excavate very large tunnel sections in caverns by dividing operations into manageable working stages.

15 301974 THE ROCKETING COST OF WASHINGTON'S METRO. Details are given of the progress made on the construction of the Washington Metro, described as the USA's biggest public works project. Inflation has overtaken funding rates and real progress has been retarded. The Metro at present with 50 km of line and 34 stations has 110 km of line and 53 stations still to be completed. The financial history of the project is described. An associated article (pp 42-3) shows diagrammatically the projected network and the various construction contracts currently underway are described together with the associated geological problems. Another of the problems has been caused by building height controls which have led to structures being typically 10 floors high and seated on shallow pad foundations which have required considerable underpinning. A final article (p 44) briefly describes the complex tree of responsibility on the Metro project. /TRRL/

15 302205 PROCEEDINGS OF A CONFERENCE ON SITE EXPLORATION IN ROCK FOR UNDERGROUND DESIGN AND CONSTRUCTION. During the period March 29-31, 1978, FHWA sponsored a "Conference on Site Exploration In Rock For Underground Design and Construction." This conference was developed around a field research study for evaluation of geologic structure using new site exploration techniques which utilized various new site exploration techniques currently under development or consideration by the FHWA Office of Research. The site chosen for this study was the proposed underground, Forest Glen Metro Station, to be included in D.C. Metro System. Future excavation of this site would allow field verification of the predictions by the various investigators. In addition to descriptions of the site investigation systems employed in this study, these proceedings include a key note address, state-of-the-art presentation and a description of the site geology. /FHWA/

15 302381 APPLICATION OF THE SLURRY TRENCH WALL TECHNIQUE DURING THE CONSTRUCTION OF THE UNDERGROUND RAILWAY IN MOSCOW [Primenenie sposoba "stena v grunte" na stroitel'stve moskovskogo metropolitena]. This article describes the construction of two reinforced concrete walls 110 M long, 11 M high and 0.6 M wide by means of skips designed by NIOSP. The experimental site was in an urban environment; the soils were saturated sand silt, sand, gravel, rounded pebbles, large blocks and dense clay. The work continued in the summer, autumn and winter. The slurry trench walls built are used as retaining walls and waterproofing walls beyond which the tunnels are being built. The latter will then be covered up. The walls will also protect buildings against noise and vibrations caused by trains. [Russian]

15 303276 IRF TEAM COMPLETES STUDY OF EUROPEAN SLURRY TRENCH WALLS. As part of a FHWA funded study of current slurry trench (or diaphragm) wall design and construction methods, an IRF team inspected several projects in Europe. (The slurry trench method entails constructing a wall in a narrow fluid-filled trench which, as excavation proceeds, is kept filled with a dense bentonite (clay) slurry which in turn supports the sides of the trench until being replaced by cast-in-place concrete or precast concrete panels. It is widely used in Europe for urban highway and rail transit cut and cover work.) The team observed such projects as a retaining wall at a depressed intersection of the A6 and A580 motorway near Manchester and diaphragm walls on the Glasgow, and Munich and Paris subway systems, as well as such unusual applications as two found in Italy: a new foundation for a earthquake damaged church north of Trieste and a barrier to prevent pollution from an oil refinery reaching a fish hatchery near Milan.

15 303587 EGGS LAID IN KOLN SOFTEN TRACK NOISE. An elliptical cushioning unit incorporating an oval elastomer ring which functions in shear has been installed in a test section of the Cologne subway to combat transmission of noise to surrounding buildings and structures. The unit is mounted on the concrete tunnel floor and has the rail fasteners on its top. The so-called "egg track" was developed as an alternative to tracks which rest on heavy-duty concrete slabs that rest on springs on the tunnel floor. Vibration and sound dampening are claimed to be comparable at a much smaller cost.

15 303591 SYSTEMS AND PRACTICES FOR RAPID TRANSIT TUNNELLING. This paper examines various systems and practices for rapid transit tunnelling, with special emphasis on European practice. Several underground construction methods are studied, which include grouting in soil, grouting in rock, ground freezing, cast in situ walls, prefabricated walls, secant piles, and the new Austrian tunnelling method as applied to soft ground conditions. The organizations of several European metro authorities are discussed. Tunnelling practice in the United Kingdom is studied and used as a focal point for examining such issues as the apportionment of risk under contract and the resolution of contract disagree-

ments. The economics of underground construction are examined, and tunnelling costs associated with six European metro systems are summarized. Where appropriate, the construction costs are itemized and the cost structures are viewed in the light of the ground conditions and construction methods used. Comparisons are made between urban tunnelling practice for rapid transit in the us and Europe. Recommendations for improving tunnelling practice are offered.

15 303646 ARCHES GIVE OPEN LOOK TO WASHINGTON METRO STATIONS. One of the early decisions in the planning for the Metro system was a design for the 53 underground passenger stations which is artistically pleasing as well as functional. The stations are semicircular in cross section, having very low sidewalls joined by a wide expanse of arch. Both sidewalls and arch feature a pattern of recessed coffers which become increasingly deep toward the center of the arch. The design eliminates the need for central pillars and roof supports, and provides the station with an open look which is unusual for underground construction. Blaw-Knox Equipment, which has supplied forms for 16 of the 19 stations built to date, approached the problem of forming by scaling up their tunnel-forming methods to match the size of the stations. Forming methods developed to overcome these problems have not only been economically successful, they have helped the construction crews stay on schedule.

15 303956 DADE COUNTY'S EXPERIENCE WITH URBAN STATION SIMULATION (USS) PROCEDURES (ABRIDGMENT). Urban Station Simulation (USS) is a transit station simulation computer program developed by the Urban Mass Transportation Administration (UMTA) to analyze the capacities of stations. The geometric configuration of a proposed station and the proposed capacities of its various service facilities are input to the USS program, which simulates the movements of individual passengers through the station and records statistics on how they are distributed along alternate routes and on the delays they encounter in waiting lines (or queues) that develop at various points. This paper is an analysis of a USS program used by the Kaiser Transit Group (KTG) to assist analysis of

transit stations in the Metropolitan Dade County Transportation Improvement Program. The USS program has been applied to designs for the proposed Douglas Road, South Miami, Dade and North stations in the southern (Dixie Highway) corridor of the stage one Dade County Rapid Transit System. Although the USS program has not been widely released by UMTA--which has even taken the first steps to produce a new version--due to many known deficiencies, this paper demonstrates that pedestrian simulations can provide many useful analyses of station design. KTG's simulation results have been well received by the architects who must use them, and more analyses have been requested.

15 305293 DEVELOPMENT OF IMPROVED DESIGN PROCEDURES FOR UNDERGROUND STRUCTURAL SUPPORT SYSTEMS IN ROCK. An investigation to develop more rational analyses and design procedures than those currently used for structural support systems for underground openings in rock is reported. The primary focus is on analytical procedures that can be used to predict the loads on support systems from the rock conditions, the construction procedure, and the behavior of the support. The non-linear behavior of the loosening rock is also considered. A diagram of project organization is followed by a brief description of each task performed during the first year effort. Completed work on Task 1, collection and review of basic data, and Task 2A, a comparative analysis using spring loaded beam models, 2-D finite element elastic models, and 2-D finite element slip-joint models, is reported. The WMATA Dupont Circle Subway station was selected for the comparative analysis under Task 2, and the WMATA Bethesda subway station was selected for prediction calculations. Recommendations and proposed schedules for future tasks are outlined.

Young, GA Sennett, RE; Agabian Associates, National Science Foundation Prog Rpt. 7814-4615, NSF/RA-780631, Apr. 1978, 79 p.; Grant NSF-APR76-80044; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-300393/6ST

15 305440 COMPARATIVE COST OF NEAR SURFACE AND DEEP TUNNELS. Comparative cost estimates are presented for deep and shallow tunnels constructed under geologic conditions that are found in major U.S. urban areas. The cost data presented can be used in the pre-design planning of tunnel systems for sewer, water, utilities, and transportation. Particular emphasis was placed on the potential for reducing the overall cost of tunnel projects in urban areas by placing tunnels at greater depths where geologic conditions are more favorable and disruption of the surface environment is avoided. The cost analyses were performed using COSTUN, a comprehensive computer program for estimating the cost of soil and rock tunnels. The geologic conditions assumed for the analysis were modeled after the known conditions in Atlanta, Boston, Chicago, Denver, and Los Angeles. Results of the

cost comparison are: (1) the cost of deep underground heading tunnels is much more sensitive to different geologic conditions than is the cost of cut and cover tunnels; (2) for tunnel sizes less than 6 to 10m, deep rock tunneling is less expensive than cut and cover construction; (3) the cost difference between rock tunneling from underground heading and cut and cover construction decreases with tunnel size with the cost of both types of construction being nearly the same for tunnels in the 10 to 12m size range; and (4) the cost of underpinning, utility relocation, and surface restoration associated with cut and cover construction is extremely variable and can sometimes exceed the cost of the basic tunnel construction.

Peters, JF Peck, LG Silver, ML; Illinois University, Chicago, National Science Foundation Final Rpt. NSF/RA-790156, June 1979, 303 p.; Grant NSF-APR76-00315; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-102403

15 305531 POTENTIAL FOR STANDARDIZATION IN RAIL TRANSIT TUNNEL CONSTRUCTION. The research reported within this report was performed in two phases. Phase I provided a detailed catalogue of the interacting components of the factors shown to have a significant effect on tunnel planning, design, construction, and operation. This research concentrated on engineering considerations, identification of interrelations among components and their parameters, and criteria applied during the planning, design, construction, and operation of tunnel systems. However, greater emphasis was placed on design and construction aspects. Phase II consisted of an evaluation of the identified critical tunnel components and parameters to establish specific components and/or parameters which are suitable for standardization and future work needs in the area of tunnel standardization. This research study was limited to a review of rapid transit tunneling systems located in Atlanta, Baltimore, Chicago, New York, San Francisco, and Washington, DC., and was limited to driven tunnels. Based on knowledge gained from this study, and from the literature search of the authors, the savings to be expected from tunnel standardization is approximately 2% of construction costs.

15 305935 IMPROVED DESIGN OF TUNNEL SUPPORTS: EXECUTIVE SUMMARY. This report focuses on improvement of design methodologies related to the ground-structure interaction in tunneling. The design methods range from simple analytical and empirical methods to sophisticated finite element techniques as well as an evaluation of tunneling practices in Austria and Germany. The purpose of this report is to provide the tunneling profession with improved practical tools in the technical or design area. These design tools provide more accurate representations of the ground-structure interaction in tunneling. The Executive Summary is the first of six publications to be published on the Improved Design of Tunnel Support. Volumes 1

through 5 will be published in March, 1980. This Executive Summary summarizes improvements in the methodology available to tunnel designers with the objective of reducing the cost of tunnel construction in the United States. This report summarizes each of the five volumes--Volume 1: Simplified Analysis for Ground-Structure Interaction; Volume 2: Aspects of Yielding in Ground-Structure Interaction; Volume 3: Finite Element Analysis of the Peachtree Center Station in Atlanta; Volume 4: Tunneling Practices in Austria and Germany; and Volume 5: Empirical Methods for Rock Tunneling--Review and Recommendations.

15 307653 LARGE-SCALE FREEZING WORK FOR SUBWAY CONSTRUCTION IN JAPAN. Four parallel tunnels and two utility tunnels are being constructed simultaneously by the freezing method under a river in the central part of Tokyo. Over the proposed tunnels there exists an old concrete arch bridge across the river. In addition, in the river there are piers of an expressway viaduct close to the tunnels to be constructed. Under such conditions, this freezing work is being carried on with care, taking safety measures. The freezing work is described in detail, as are the safety measures.

15 307654 SOIL-FREEZING METHOD FOR LARGE TUNNEL CONSTRUCTIONS. Examples of the use of the soil-freezing method applied in large tunneling projects show that this construction method can compete with traditional methods in both technical and economic aspects. Tunneling works executed in Stuttgart, Aarburg, Helsinki, Frankfurt, Duesseldorf and Zurich are described.

Wind, H *Engineering Geology* Vol. 13 No. 1-4, Apr. 1979, pp 417-423; International Symposium on Ground Freezing, 1st, Bochum, West Germany, March 8-10, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

15 307655 SUBWAY CONSTRUCTION IN STUTTGART UNDER PROTECTION OF A FROZEN SOIL ROOF. Experiences gained on the building of the City Railway turning loop are described, the new Austrian tunneling method is used in connection with the freezing technique. The Metro-tunnel lies in leached-out gypsum marl and unleached zones, respectively. In a section of this tunnel within the leached-out gypsum marl, the excavation was protected by a frozen soil roof in order to keep away any water seepage which could be dangerous for the excavation itself, and for the buildings superimposed as well. The drilling for the freeze pipes, the installation and operation of the freezing system and the tunnel driving, including the erection of the final support, are described.

Jonuscheit, G-P *Engineering Geology* Vol. 13 No. 1-4, Apr. 1979, pp 425-428; International Symposium on Ground Freezing, 1st, Bochum, West Germany, March 8-10, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

15 307911 POWERVANE WINDS UP A CHEAP TUNNELLING SOLUTION. The article describes the powervane tunnelling machine, which is five times cheaper than American electrohydraulic alternatives. The powervane design incorporates two moving parts—a semi oscillating cutting head motor and a hollow spool propulsion ram. Unobstructed access through the core of the machine is a major advantage. The compressed air system is served by a 17 cu m/min capacity compressor at the surface supplying a 100 t shove capacity through the hollow spool pneumatic ram at the face. Other systems served by this power source are four 10 t steering rams, the muck scabbler screw, conveyor and the lighting. The powervane has a self ventilating system, free of electrical equipment and is thus completely flameproof. The powervane has undergone three trials and the first production machine has now been built. (TRRL)

15 308870 ATTITUDE AND COMMUNICATION IN THE MANAGEMENT OF UNDERGROUND CONSTRUCTION PROJECTS. A number of management strategies can be implemented in underground construction projects to benefit all parties by reducing delays and cost overruns. Though discussed here in terms of mass-transit projects, these management strategies are applicable to all underground construction projects. Citizen participation should be encouraged during the planning stage of the project. Because communication among all parties (government, designers, contractors, suppliers, etc) is essential during planning, design,

and construction, a typical hierarchical management team might not be appropriate: one alternative is matrix management, in which specific tasks are performed by identified subgroups. Many problems in underground construction projects can be overcome by encouraging a win-win attitude, in which participants concentrate on actions that benefit all parties involved, instead of the prevailing win-lose attitude, in which each party attempts to gain at the other's expense. Advisory panels of recognized experts can be useful in evaluating changed conditions or other problems that may occur during the project. Professional liability litigation is costly and time-consuming, and can often be avoided through risk management, communication, and equitable contract documents. If, however, a dispute does arise, mediation/arbitration, a new concept of conflict resolution, offers several advantages over litigation or conventional arbitration, and can effectively reduce costs and risks to the parties involved. 15 309912 PRECAST CONCRETE SEGMENT LINING OF THE BUDAPEST METRO. The article describes the design and construction of the tunnel lining system in the Budapest metro. The lining consists of unconnected reinforced concrete hinged segments in which each ring consists of a bottom segment, six side segments of uniform size and one key segment consisting of three pieces. The lining, made up of ten segments of three basic sizes, has an outside diameter of 5.5 M and a wall thickness of 200 mm. Each 1.0 M wide concrete ring has a volume of 3.46 cu m and a weight of 8.68 t. A feature of the lining structure are the hinges where the segments support each other. The hinge design allows movement of the segments to minimize the bending moment. The lining system overcomes waterproofing problems by a combination of concrete mix technology and a bituminous coating with caulking between segments. Details are given of construction techniques used for the tunnel lining system.

15 309921 BALTIMORE RAPID TRANSIT SYSTEM TESTS SEGMENTAL CONCRETE RINGS. A description is given of the construction of the 8 mile Baltimore rapid transit system which includes 4.5 miles in tunnels. The system includes nine stations, six of which are underground, and is designed for future extension. Excavation involves soft ground machine tunnelling in alluvial soils and also hard rock drill and blast methods. All six underground stations are being built by cut-and-cover methods—two of the stations are at depths of 100-120 ft. Compressed air is used to stabilize the surrounding ground for excavation with an hydraulic shield. Following normal practice in the USA, steel linings are used except for a 1500 ft experimental section which is being lined with concrete segmental rings. Running tunnels are 18 ft diameter so that the railway will accept current US and Canadian rail cars.

15 309927 SOFT GROUND TUNNELLING PROBLEMS SOLVED IN GERMAN METROS. The construction of the first section of the S-bahn underground railway networks in Frankfurt and Stuttgart has provided the stimulus for the development of soft-ground tunnelling techniques. After its completion, the 6.1 km Frankfurt network will connect the eastern and southern suburban lines. Geological conditions consist of gravelly sands on a formation of clay marl. Four parallel single-track 7 M diameter tubes were shield-driven with a permanent lining of cast iron segments. Subsidence was avoided by the injection of mortar between the segments and soil. The covering gravel was consolidated by an injection of a bentonite suspension. The article details the use of cut-and-cover methods and the New Austrian Tunnelling Method at the crossing of the S-bahn station at Frankfurt station. A further 385 M tunnel was constructed by the NATM under main streets and buildings.

15 311057 CONSTRUCTION OF RAILWAY TRUNK LINE TUNNELS UNDER MAJOR CITIES USING THE SHIELD METHOD. The paper reports on construction of a 9.4 km tunnel in Tokyo, which is part of the Japanese National Railways' expansion program. A tunneling shield was used for about 7 km of the length, and the remainder was built by cut-and-cover techniques. This paper discusses the technical investigations and actual results of shield tunnel excavation in gravel deposits under high water pressure and non-cohesive sand deposits. To obtain data for economical and safe tunnel construction, various field measurements were made during the construction work. Some of these data are introduced and are discussed in connection with the design methods.

15 311214 A DIAGNOSTIC APPROACH TO MANAGEMENT INFORMATION SYSTEMS. The reporting requirements of Section 15 of the Urban Mass Transportation Act of 1964, as amended 1974, have pushed transit systems into a new area of data management, which has led to the development of management information systems. There is, however, danger that in some cases these information systems and the standards of service they generate will become ends in themselves. They offer a comfortable structure for decision making that may not always be justified. The purpose of these systems is not simply to generate data; primarily, they are designed to help managers manage. But to do so they must be simple to use and carefully integrated to explore all factors affecting the organization. The staff responsibility at the level of operations planning is not to simply provide facts and measure them against predetermined yardsticks but, more importantly, to analyze trends and identify and isolate specific problems so that well-reasoned decisions can be made. An integrated system is the key to success: The interrelationships within a transit organization, especially in such areas as labor and vehicle utilization, can provide the basis for accurate and sound diagnosis, which can in turn result in more effective management. 15 311334 THE HONG KONG MASS TRANSIT IMMERSSED TUBE-SOME ASPECTS OF CONSTRUCTION. MTRC Contract 103-Immersed Tube, comprised the construction of a twin tube tunnel 1400m long between Tsimshatsui and Wanchai including the North and South Ventilation Buildings and associated works. The immersed tube is located beneath Victoria Harbour starting within reclaimed land adjacent to Fenwick Street, Wanchai, on the Island, to a point approximately 24m seaward of the then existing seawall south of Nathan Road in Tsimshatsui, Kowloon, and forms the major part of the longest stretch of line between stations on the MIS. The tunnel comprises fourteen 100m long concrete units and the contract included demolition and reconstruction of the Wanchai seawall and provision of temporary access to the North Ventilation Building (NVB). Included in the construction of the concrete ventilation buildings were emergency stairs, the provision and installation of floodgates and all building and architectural works. Kumagai, Gumi Co. Ltd of Japan were awarded the contract in March 1976 with a tender and construction method being based on the engineer's design. The period of

contract was 196 weeks, from March 1976 to contract completion at 30 December 1979. This paper describes in detail the major activities of this project such as: construction of the dry dock and the 14 tunnel units, the dredging of the trench across the harbor, screening the trench bottom with an aggregate bed, backfilling the trench, constructing of two ventilation building caissons, installation of the floodgates and reconstruction of the seawalls at Wanchai and Tsimshatsui.

15 311438 COMPLETING ROME'S METRO. The article describes the problems encountered in the construction of the final stages of the 10.2 km line of the Rome metro. The line includes a section constructed by Metrroma running from central Rome to Ottaviano. The 4.4 km of twin bore line, with a finished internal diameter of 5.5 M, includes six stations and two roadway underpasses to take the Tiber embankment roads beneath the line where it surfaces. In this section 3.1 km of twin tunnels were bored at depths from 16-60 M. The bores converge, surface, cross the river and then go underground again for 1.3 km. The shield-driven bores cross volcanic and travertine soils then travel through silty clay deposits. Two water tables permeate the volcanic deposits and also the gravel and sand. The lining system used for the bored tunnels involved the use of 280 mm thick precast concrete segments joined by longitudinal and circumferential pre-stressed diwydag bars. This method, a world first, was adapted as it was considered that bolted segments would not prove as durable in the ground conditions encountered. (TRRL)

15 311842 CONSTRUCTION METHOD FOR TUNNELS BY MEANS OF IMMEDIATE SUPPORT WITH SHOTCRETE AND BOLTING-PROVISIONAL TEXT PROVISOIRE [Presentation de la methode de construction des tunnels avec soutènement immediat par beton projete et boulonnage-Texte provisoire]. The author recalls the development of the "new Austrian method", the most important basic principle of which is not to disturb the soil around the cavity and to derive maximum benefit of the initial mechanical characteristics of the terrain. Details are given of the role of shotcrete, that of bolting, the necessity of adapting the support to the real behaviour of the terrain and conditions, ease and speed of installation. Excavations and support characteristics are given together with the recommended techniques, limits of the latter. Examples are presented of tunnels and underground structures built with final application of shotcrete. (TRRL) [French]

15 312084 UNDERGROUND RAILWAYS AND TUNNELLING, AN OVERVIEW OF BRITISH ACTIVITIES. Although tunnelling has been slow to enter the scientific age, and variable and difficult ground conditions have hampered attempts to devise efficient mechanical excavation and support systems, several significant improvements have been made in recent years. These advances have occurred in the areas of geotechnical investigation, excavation, groundwater management, and tunnel lining. Largely as a result of these improvements, thorough site investigations and the consequent development of a tunnelling system are now carried out prior to driving a tunnel. Modern tunnelling, as opposed to cut and cover construction, offers advantages of minimal surface disruption and comparable or reduced costs. Although it requires a high capital cost, the underground location of rapid-transit systems provides an efficient and convenient mode of transportation that is more energy-efficient than other forms of wheeled transportation. Urban redevelopment also can be centered around an underground transportation system by the construction of public and commercial facilities along the route.(a)

15 312115 CONTINUOUS CONCRETE SUPPORTS STRENGTHEN HONG KONG'S UNDERGROUND TRACKS. Settlement and lateral distortion of supports have always plagued conventional rail support systems. A method devised to solve these problems has been employed in the construction of 15.5 km of double track in Hong Kong's underground railway. With the system the "Pandrol" shoulders are cast precisely into the rail supporting plinth. The Pandrol shoulders are held in position by "Pandrol support bars" while the concrete sets. It is these support bars which form the key to the system. Two pairs of Pandrol shoulders are held in position on the Pandrol support bar by simple pins. The Pandrol support bars are clipped to modified conventional plinth forms. These forms are relatively inexpensive to fabricate and are made in short lengths. The method has three major advantages: the forms can accommodate normal railway curves; the forms can readily be transported down small shafts and accesses; and the system is flexible and can be assembled in

short lengths on several headings or in long lengths as desired.

15 312133 SUBWAY FIGHTS POOR SOIL IN SEVEN DIFFERENT WAYS. The paper reports that German contractors are using seven different methods to build a 2-mile stretch of subway through poor soil in a congested area of West Berlin. Most of the project is being carried out without dewatering and resembles a marine construction job more than dry-land tunneling. Approaching a river crossing, the job shifts to giant concrete caissons built on grade and sunk through the soil. The job is divided by diaphragm walls of double steel sheetpiles placed every 350 ft. They help resist soil pressure and allow dewatering and finished tunnel construction to take place in stages.

15 312426 VIBRATIONS OF CURVED SPANS FOR MASS TRANSIT. Nondimensional dynamic responses of simple and multiple-supported, horizontally curved beams with moving loads are measured in laboratory-scale experiments. Effects of system parameters involving span stiffness, arc length, frequency, end support constraints, and various transit load speeds and spacings are investigated. For critical combinations of certain parameters, adverse coupling of bending and torsional span responses are observed. For instance, as critical load speeds are approached, measured twist angles and bending strains at midspan approach unboundedness for multiple spans, but are bounded for equivalent simple spans placed end-to-end. Calculations based on Bernoulli-Euler curved beam theory (with negligible warping rigidity) complement these simple span measurements. Experiments also include multiple spans with up to 90 degree turns, subject to both transit point loads in tandem and sprung vehicles. Results are applicable to dynamic span designs for mass transit systems.

15 312791 SUBSURFACE INVESTIGATION, GLENMONT ROUTE, SECTIONS B009, B010, AND B011, STATIONS 97950 TO 123059 [Supplementary rept]. Results are presented of a total of 242 borings of several series made for final design of Sections B009, B010 and B011 along Georgia Avenue in Montgomery County of the Washington Metropolitan Area Metro system from its junction with the B&O Railroad Metropolitan branch to the community of Glenmont. The investigation was made to determine subsurface conditions over a length of 25,000 feet for subway tunnels in rock and at the locations of three subway stations, Forest Glen, Wheaton and Glenmont. Two of these stations are planned to be deep mined excavations in rock; whereas the northernmost station will be a cut-and-cover excavation from the surface. The report includes continuous geologic sections of the test borings made in the area for WMATA since Report No. 146 of June 1976, laboratory test data and discussions regarding design and construction problems.

15 313097 CONSTRUCTION OF URBAN RAIL TRANSIT SYSTEMS: THE CHALLENGE OF MORE COST EFFECTIVE CONSTRUCTION. The goal of the conference was to seek input from the construction community on improving the use of public funds and insight into identifying new ways to control and reduce cost of construction of urban rail transit systems in the United States. The conference was organized into four sections and addressed the following topics: Transportation Overview, Transit Assistance Program, Technology Development and Deployment, and Policy; Owners' Point of View, Designers' Point of View, and Contractors' Point of View; Insurance and Bonding, Value Engineering, Construction Management; and Management R&D Review, Technology R&D Review, and Test Sections.

Dewey, RW ; Pacific Consultants, Transportation Systems Center, Urban Mass Transportation Administration DOT-TSC-UMTA-79, Sept. 1979, 106p; Conference Proceedings Held at Williamsburg, Virginia on December 7-8, 1978.; Contract DOT-TSC-1526; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-130479

15 313106 RAIL TRANSIT CRITERIA FOR SYSTEM REVIEW AND PRELIMINARY DESIGN. This report is a manual intended to assist in evaluating rail transit proposals and to provide information for preliminary design of

trackways and to serve as a guide to the acquisition and use of data required for the final design of a specific system. The standards and characteristics of a number of operating and proposed systems were analyzed and organized to produce this manual. The first three chapters describe and contrast light and heavy rail systems, outline the system planning process, and discuss the implications of choices within systems. These chapters also describe vehicle and facility characteristics and requirements that affect trackway location and design. Finally, they discuss system operational factors and the magnitude and range of major cost elements. The last chapter contains principles, conventions and criteria for trackwork and for the preliminary design of trackways.

15 313213 FIELD EVALUATION OF FRACTURE CONTROL IN TUNNEL BLASTING. The objective of this research was to implement fracture control procedures in a tunnel project and to assess the practicality, advantages, disadvantages, performance and cost effectiveness of fracture control methods against smooth blasting procedures. This report describes the procedures and results of field tests of fracture control—a procedure for achieving fracture plane control in tunnel blasting. It describes and discusses the project and site geology, the theory and applications of fracture control blasting, and the experimental procedures used. The report provides conclusions and recommendations for future research. The procedures and results of an experimental smooth blasting round utilizing milli-second delay detonating caps are described in Appendix A.

15 313914 SITE INVESTIGATION AND CONSTRUCTION OF THE LIVERPOOL LOOP AND LINK TUNNELS. The site investigation and the construction records for the Liverpool Loop and Link underground railway tunnels have been compared to see what lessons of good practice in site investigation emerge. The tunnels were constructed almost entirely within Triassic sandstones generally ranging in strength from weak to moderately strong, enabling road-headers to be used effectively for most of the excavation. The Report discusses the site investigation and the ground conditions as encountered during construction in some detail. (Copyright (c) Crown Copyright 1978.)

15 314005 PROCEEDINGS OF A WORKSHOP ON TUNNEL LINING DESIGN HELD AT CAMBRIDGE, MASSACHUSETTS ON MARCH 12-13, 1979. The workshop provided a forum for the identification and discussion of problems in the design and construction of tunnels centering around six topics, namely: Lining Design, Qualification, Geotechnical Investigations, Observational Approach, Specifications, and Constructibility and Cost Considerations. A position paper on each topic is arranged together with appropriate discussions from the working group members. In addition to background information regarding the planning of this workshop, this report also contains the keynote address, position papers, names and addresses of subcommittee members, as well as information about the six topics discussed at the workshop.

15 314786 CUT-AND-COVER TUNNELING. EXECUTIVE SUMMARY. The purpose of the research study was to develop a method for evaluating alternate cut-and-cover tunneling construction systems. This brief report summarizes the evaluation method, which is given in detail in Volume 2 of the final report. (FHWA)

Wickham, GE Tiedemann, HR ; Jacobs Associates Final Rpt. FHWA-RD-79-61, Dec. 1979, 13p; Sponsored by DOT, FHWA.; SPONSORING AGENCY.; RESPONSIBLE INDIVIDUAL: Sallberg, JR (HRS-11); Contract DOT-FH-11-8513; ACKNOWLEDGMENT: Federal Highway Administration; ORDER FROM: NTIS; PB80-183791

15 314787 CUT-AND-COVER TUNNELING. VOLUME 2-COST ANALYSES AND SYSTEMS EVALUATION. This volume summarizes the findings of the entire study. It presents a method for comparing the costs of alternate construction schemes for cut-and-cover tunneling in urban areas. It considers both the cost of construction and the cost of urban disruption, enabling the planner to choose that construction most effective for his particular requirement. (FHWA)

Wickham, GE Tiedemann, HR ; Jacobs Associates, (JA 165) Final Rpt. FHWA-RD-76-29, Dec. 1979, 304p; SPONSORING AGENCY.; RESPONSIBLE INDIVIDUAL: Sallberg, JR (HRS-11); Contract DOT-FH-11-8513; ACKNOWLEDGMENT: Federal Highway Administration; ORDER FROM: NTIS; PB80-183809

15 314788 CUT-AND-COVER TUNNELING. VOLUME 3-SUMMARY COST ANALYSES. This volume contains summary cost analyses for 15 of the 176 study situations. The analyses give the unit costs of all labor, equipment, and material resources required to complete each project and are typical of the 176 cost estimates prepared for this study. (FHWA)

Wickham, GE Tiedemann, HR ; Jacobs Associates, (JA-166) Final Rpt. FHWA-RD-76-30, Dec. 1979, 242p; Sponsored by DOT, FHWA, Office of Research and Development.; SPONSORING AGENCY.; RESPONSIBLE INDIVIDUAL: Sallberg, JR (HRS-11); Contract DOT-FH-11-8513;

15 314789 CUT-AND-COVER TUNNELING SUPPLEMENTAL VOLUME-CONSTRUCTION COST DATA FOUR BASIC ESTIMATES. The overall report presents a method for making comparative evaluations of cut-and-cover tunneling operations required for highway and transit construction within urban areas. It considers both the cost of construction and cost of disruption, enabling the planner to choose construction most effective for his particular requirement. This Supplemental Volume contains computer printouts showing complete cost detail for four cut-and-cover projects. It is primarily reference material for those interested in the basic details used by the study team to develop the series of 176 multiple estimates summarized in Volume 2. (FHWA)

15 315299 GEOLOGY AND TUNNELING ECONOMICS IN MONTREAL. The economic construction of transportation projects depends in part on the availability of all relevant geological and geotechnical data. In Montreal, Canada, all of the 120 km (75 miles) of subways, major sewers, and aqueducts constructed during the last 18 years have been affected by local geological factors. Contracted costs for subway tunnels in shale were about 20 percent higher than for those in limestone. Locally, the presence of weathered zones in limestones and shales, where they have been faulted or intruded, increased actual costs to six times the normal unit price in good limestone. The contracted cost was 12.5 times the normal for a transition from an open cut into a tunnel in soil or rock. Variations of costs for contractors were estimated from rates of advance, amounts of concrete required to backfill overbreaks, and numbers of steel arch ribs used for roof supports. Tunnel-boring machines were more sensitive to geological surprises than were normal construction methods. Comparisons were made between data from preconstruction investigations and

both construction records and site mapping. It was confirmed that, although preconstruction data usually give general warning of problems, precise notice is often lacking. Even the use of techniques such as the measurement of rock-core lengths gives only a partial indication of actual tunneling conditions, which emphasizes the need for continuous detailed mapping during construction. 15 316581 MULTIPLE GROUTING TECHNIQUES BEAT STOCKHOLM'S GROUND-WATER. The article examines the problem of water ingress in tunnel workings, with the subsequent lowering of groundwater table and subsidence, following drill-and-blast operations. This subsurface disruption can result in subsidence and damage to buildings and structures. An example is given of a multiple-hole grouting technique used to overcome the problem in the construction of an 1800 M section of a 6 km twin-tube line for the Stockholm Metro. Depth of cover over the 22 sq M tunnels varies from 6-50 M with the overall project 20 M below sea-level. To avoid lowering of the groundwater table a pre-grouting operation was carried out using the Hany multiple hole grouting system. This automatic system delivers grout through hoses into holes drilled in the rock before excavation takes place. Details are given of the Hany system and the drilling and grouting equipment used. (TRRL)

15 316595 HONG KONG METRO COMPLETED EARLY AND WITHIN BUDGET. The first 15.6 km long section of the Hong Kong underground railway, completed ahead of schedule and within the projected budget, will be one of the few commuter railways to be financially self-supporting when the other lines are opened in 1983. The Kong Kow line starts on Hong Kong island and crosses the harbour through an immersed tube tunnel to Kowloon where it runs north to Prince Edward. The air-conditioned, eight-car trains can seat 384 passengers with a crush capacity of 3300. At a maximum operating frequency of 2 min, the capacity of each line is 60000 passengers per hour. Fares are automatically collected using magnetically coded tickets. The main tunnels were driven through granite and soft marine deposits using compressed air and ground treatment techniques. The soft ground tunnels were lined with precast concrete and cast iron segments while rock tunnels were treated with in-situ concrete. The 1400 M long immersed tube tunnel has a constant radius of 3000 M and is claimed to be the first such construction built on a continuous curve.

15 317808 EFFECTS OF TUNNEL AND STATION SIZE ON THE COSTS AND SERVICE OF SUBWAY TRANSIT SYSTEMS. The feasibility of less spacious, less costly underground rail mass transit system designs is studied. The major cost saving expected from alternative tunnel designs results from using precast concrete segment liners in place of steel. The saving expected for a two-foot decrease in the diameter of twin, single track tunnels is about two million dollars per route mile from 13 million dollars for precast concrete segment liners (a saving of about 16%). The cost per route-mile of a double track tunnel appears to be 15 to 25% higher than for the twin, single track tunnels. The effective cost saving expected from stations with four-car train capability instead of the usual eight-car trains is nearly 25% or seven million dollars per route mile. The saving in station costs can be obtained while

improving service to the user (lower transit time and less waiting for trains) up to a capacity of 36,000 riders per hour in each direction.

15 317930 SUBSURFACE INVESTIGATION, GREENBELT ROUTE, STATIONS 30530 (E005) TO 65746 (E007) ARS MODIFIED ALIGNMENT AND STORAGE YARD (E008) AND S-CURVE ALIGNMENT [Rept. no. 10 (Final)]. Results are presented of 49 borings of the E-series made in Sections E005 to E008 and 23 borings of the E-series made along the S-Curve alignment in Sections E005 and E006 of Greenbelt Route of the Washington Metropolitan Area Metro system in Prince Georges County, east of the District of Columbia boundary. The line extended east and north along Queens Chapel Road to the B&O Railroad line, passing through College Park, Maryland to the Capital Beltway. The investigation was made to determine subsurface conditions over a length of approximately 38,000 feet for subway construction involving structures at-grade, on piers, in cut-and-cover boxes and mined tunnels between the District boundary and College Park. The report includes continuous geologic sections along the line of the subway on the ARS Modified Alignment and in Sections E005 and E006. Also included are logs of all test borings made in the E-series on this alignment since the inception of these studies, laboratory test data and recommendation regarding design and construction problems.

15 318485 FIELD EVALUATION OF ADVANCED METHODS OF SUBSURFACE EXPLORATION FOR TRANSIT TUNNELING.

This report presents the results of a field evaluation of advanced methods of subsurface exploration on an ongoing urban rapid transit tunneling project. The objective of this study is to evaluate, through a field demonstration project, the feasibility, applicability, reliability, and cost effectiveness of selected advanced methods of subsurface exploration and instrumentation to produce data usable for rapid transit tunnel design and construction within the time, cost, and schedule constraints common to the industry. Numerous methods of subsurface exploration, including hole advancement techniques, sampling procedures, and geophysical logging tools, were used to predict stratigraphy within a test section on an urban rapid transit project under construction. A test section on the Massachusetts Bay Transportation Authority Red Line Extension-Northwest, Cambridge, Massachusetts, was selected to evaluate methods of subsurface exploration used to investigate stratigraphy, ground water levels, bedrock structure, and other geotechnical parameters. The site represents a typical urban setting with the test section located under a major, four-lane divided street, with structures adjacent on both sides.

15 319694 TUNNEL-DRIVING TECHNIQUES UNTIL THE YEAR 2000. The author surveys the various methods of rock disintegration at present being studied in research laboratories throughout the world. Many methods have

been proposed including jet piercing, fusion, electronic heating, pressure waves from spark discharges, ultrasonics, laser techniques, plasma rays and water jets. He suggests that there will be no completely new and revolutionary principle for tunnelling and an evolution of current equipment is more likely. The penetration rate of drills has greatly increased since 1920. Greater automation is forecast to aid with the moving and aligning of drilling booms. Similarly, the equipment for charging explosives, scaling and spraying concrete could be automated and remotely controlled. The continuous working method of full-face boring machines can also be automated, provided tool lives are adequate. Even when an operator is necessary, he could be installed in a protected, air conditioned cab. Remote control will also have increased applications in loading work. The operation of large diesel powered rubber-tyred loaders could be electronically controlled and supervised from a central control room. The control installation would be similar to that of a modern underground transit system. Eventually very few personnel will be required in the drift or tunnel. (TRRL)

15 322249 TRANSPORTATION CONSTRUCTION IN JAPAN. This report focuses upon the transportation construction industry in Japan. Chapters 2 and 3 each address organizational and institutional factors in the Japanese construction industry. Chapter 2 discusses the structure of the industry and characteristics of Japanese construction administration and management. Chapter 3 gives more specific information on the role of research and education in Japanese construction. Chapters 4 through 7 each examine a specific technological area of interest to transportation construction, especially for projects involving excavation and tunneling. Chapter 4 deals with tunneling technology for shallow urban transit tunnels. Chapter 5 introduces methods for excavation and construction of underground stations and cut-and-cover methods that help reduce disruption to the urban environment. Chapter 6 describes some Japanese improvements on the underwater tube-tunnel concept that has been employed on rapid transit projects in San Francisco and Washington. Finally, Chapter 7 gives an overview of two new inter-urban rail tunnel projects for the high-speed Shinkansen of two new inter-urban rail tunnel projects for the high-speed Shinkansen ("Bullet Train") line. These include the record-breaking Seikan undersea tunnel for the Hokkaido line, and the Nakayama tunnel on the Joetsu line. Both tunnels are setting new world standards for coping with seemingly impossible topographic and geologic conditions. (Author)

15 322275 LOW-COST BUS-TUNNELS TO THE CENTRAL BUSINESS DISTRICT. An important aspect of the bus-tunnels proposed in this study is the practicality of converting the bus-tunnel to a subway system. The objectives of this study were 1) to determine if small diameter, unventilated, hence inexpensive tunnels could be used for bus links between the Central Business District (CBD) and outlying areas; 2 to estimate the cost of bus-tunnels; and 3) to indicate the basic features of an underground station and to make a rough cost estimate. The tunnels selected were 16 1/2 ft. inside diameter (same as a single-track tunnel conventionally used for recently constructed U.S. subway rail systems). Concentration levels of exhaust emissions were within acceptable limits to a capacity of 150 diesel buses per hour for a one route-mile bus-tunnel; for a two route-mile tunnel, 54 buses per hour were acceptable. The costs of such an underground guideway are moderate (\$16M per route-mile with simultaneous operations in both directions). The incorporation of an underground station at the CBD end of the bus-tunnel, and the ventilation requirements for a typical station are also examined. cost estimate for the station is in the typical station are The cost estimate for the station is in the range of \$26-39M. Based upon service, operations, and costs, this report states that use of small diameter, unventilated tunnels for bringing diesel buses into the CBD appears attractive and should be considered. (UMTA)

15 322567 TYNESIDE REPORT 8. PART 2: CONSTRUCTION. This article describes the constructional features of the new sections of the Tyne and Wear Metro. The largest is the 2.1 km long tunnel from Jesmond, under central Newcastle, to Forth Banks. Tunnel diameters are 4.75 M compared with London's 3.85 M. Tunneling operations were complicated by the need to underpin the foundations of Newcastle Central Station and the need for compressed air in pockets of water-bearing sand. Twin 800 M long bored tunnels beneath Gateshead are flanked by cut-and-cover sections at each end. Two new

bridges have been built. The through-train bridge over the River Tyne was chosen because it was strong, economical and of compatible appearance with the four existing bridges. The 815 M long Byker viaduct spanning a difficult side over a steep sided valley, was the first to use glued segment concrete cantilever construction in the UK. The viaduct has 18 spans and 253 precast deck segments. The Monument station, at the centre of the Metro, has been built in stages and roofed over to keep at least half the street open for buses and pedestrians. For abstracts of parts 1 and 3 of this article see IRRD nos 248772 and 248774.

15 322824 ECONOMIC POTENTIAL OF TUNNEL STANDARDIZATION. An analysis was made of the economic potential of standardization in rail transit tunnel construction. The analysis shows that the potential savings from standardization is in the range of approximately 1.5% to 5.5% of construction costs, with a "most probable" savings of approximately 2% of same. Such savings, though significant, are small with the result that it may not be beneficial to pursue such savings. For example, there is no certainty that the total magnitude of the potential savings would be passed on to the owner. This paper also considers the impact of planning, design and maintenance on tunnel standardization. It is indicated that the greatest potential for cost savings is reducing the time period between initial submission of the grant application and completion of construction, due to the rapid rate of inflation. UMTA, the board of directors of local transit agencies, local politicians and citizen advocate groups are the principal potential sources of delayed decision making which must be addressed in this regard.

Hampton, D (Hampton (Delon) and Associates) McCusker, TG *ASCE Journal of the Construction Division* Vol. 106 No. 3, Sept. 1980, pp 247-265, 13 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

15 322825 MIXED FACE TUNNELING ON MELBOURNE UNDERGROUND. Adequate preliminary investigation, continued monitoring of ground conditions and construction procedure by the engineer, and a resourceful contractor combined to result in the economical design and construction of a four-track (double-under-double-over) rapid transit railway project in Melbourne, Australia. One tunnel contract required a variety of heading-and-benching-type operations to overcome mixed face conditions, with the soft ground being either on top, underneath, or in the middle of the face. Close monitoring of the tunnel construction by the engineer, skillful execution of the work by the contractor, and a good specification, permitted several variations of the original design resulting in economies.

15 322840 SIMULATION MODELING OF INTERMODAL FACILITIES IN THE DESIGN PROCESS. This paper discusses the application of UMTA's newly developed station simulation model (USS) to the transit station design process. The USS program is intended to be a design and evaluation tool to assist in developing alternative configurations for rapid transit stations. The design process described is a sequence of six phases leading to the successful resolution of a complex facility design problem. This report describes where USS can be effectively used in the design process to provide answers to key design questions.

15 323357 DOUBLING MEXICO CITY'S METRO NETWORK. Details are given of some of the work being undertaken with the aid of British rigs on the scheme that will add 41 km of railway track extensions. The rigs are excavating diaphragm walls on 14 km of cut-and-cover tunnel construction. In the inherently unstable subsoil with its high water table and comprising 80% water and clay, the cut-and-cover construction is being carried out between diaphragm walls—a technique adopted in the building of the earlier metro sections. Design of the underground sections is based on a flotation equilibrium principle for the "box" that will contain the tracks and train. The description of the construction details is illustrated by means of a number of photographs of different stages of the process. A brief note is also included on the construction of the elevated lines. With predictions that the city's population is expected to treble by the year 2000, plans are in hand for further extensions to extend the metro system again, to a total of 250 km.

15 324881 SOME IDEAS FOR REDUCING SUBWAY CONSTRUCTION COSTS. This article presents the conclusions of a major study made during the past few years of both U. S. and European practices in building subways. Among the key conclusions: Planners and designers should consider making subway stations and subway-tunnel diameters smaller. Subway sta-

tions alone can account for up to 80% of the subway cost. The people-carrying capacity of the system shouldn't be larger than necessary. Less restrictive specs on such things as the amount of leakage of water permissible into the tunnel could substantially reduce cost. Other things that could cut cost include better written contracts and better overall project management.

15 325708 FATIGUE TESTS OF BOLTED CONNECTIONS DESIGNED BY SHEAR FRICTION. The elevated structure of the Metropolitan Atlanta Rapid Transit Authority involves bolted connections designed to provide composite action between precast concrete deck slab units and the main longitudinal girders. The connection employs pretorqued, high-strength bolts not only to simplify assembly but also to produce a clamping force to maintain compression in the grout layer between girder and deck slab and to eliminate stress changes and minimize fatigue effects. This publication describes 16 test specimens that simulated the joint, producing data concerning the integrity of such connections under repeated loads from 2 to 5 million cycles.

15 325751 UNDERGROUND CONSTRUCTION OF THE REINE ASTRID STATION UNDER A SCREEN OF TUBES DRIVEN IN THE SOIL [La construction souterraine de la gare Reine Astrid sous une grille de tubes foncés dans le sol]. The covering slab of the Koningin Astrid premetro station in Anvers consists of a series of parallel cylindrical beams practically adjoining each other. These beams are obtained by driving in the soil asbestos-cement tubes in which the reinforcement is introduced before they are filled with concrete. The driving is carried out according to the technique of horizontal drilling. A concrete joint built under the soil ensures the closing of the space between adjacent cylindrical beams. Compared to conventional construction methods, this technique has the advantage of allowing traffic and commercial activities to continue on the surface during the duration of the construction operations. [French]

15 325870 DEEP EXCAVATIONS FOR THE MEXICO CITY UNDERGROUND RAILWAY USING ELECTRO-OSMOSIS [Excavaciones profundas para el metro de la ciudad de Mexico empleando electroosmosis]. This paper describes the construction method used in deep excavations for the Mexico City underground railway, through a deposit of volcanic clays of high compressibility and very low shear strength. The soil was excavated between two parallel braced walls of reinforced concrete which had been constructed with the use of bentonite mud. Thereafter, the floor slab was constructed, followed by the inner walls and the roof slab. As the stability of the floor of the tunnel was precarious in spite of the pre-existing system of pumping wells, an electroosmotic treatment procedure was used, applied for an average of 8 days for every 31,5 M of length. The results of laboratory tests made before and after the treatment are presented. The increase in the shear strength of the clay exceeded 20 per cent, while its natural water content was reduced by only 3 per cent and subsidence in neighbouring areas did not exceed 5 cm over four months. [Spanish]

15 326065 IMPROVED DESIGN OF TUNNEL SUPPORTS. VOLUME 4: TUNNELING PRACTICES IN AUSTRIA AND GERMANY. Volume 4 documents and evaluates extensive information gathered on tunnel construction practices in Austria and Germany, identifies differences compared to U.S. practices, and describes new developments. The objective was to assemble all available information about the economic, contractual, and technical aspects of tunneling in these countries. The cost information includes general cost data as well as specific costs for tunnels recently constructed, and discusses the reasons why tunneling there is often more economical and technically innovative than it is in the United States. The contractual information is based on a review of contractual standards and procedures in these countries and contractual arrangements for selected projects. The technical information includes general information on design philosophy and construction procedures, and detailed information on analytical and empirical methods and design aspects. A large number of transmountain tunnels in Austria and subway tunnel sections in Germany were visited, and many discussions were held with owner-authorities, design firms, and contractors.

15 326403 SEGMENTED CONCRETE TUNNEL LINER AND SEALANT SYSTEMS. Precast reinforced concrete tunnel support lining has been used in Europe for some time as a viable method in tunnel construction. In late 1975 UMTA sponsored a study on segmented concrete tunnel liner and sealant systems. A five-phase study plan was developed and work began in 1976. This report presents the five phases. Phase 1 consists of information gathering and review; Phase 2 consists of the development of segment liner design parameters and trade-off study; Phase 3 consists of the sealant materials and test program; Phase 4 consists of a program to test joint and sealant systems; and Phase 5 addresses the design and manufacture of liner system. The purpose of this study is to identify the design criteria for a bolted circular segmented concrete tunnel liner system; devise, fabricate and test all the components of that system; and develop specifications applicable to the tunneling industry. These specifications are to provide tunnel authorities, designers, contractors, owners, and the general public with proven data for the safe and economical implementation of segmented concrete liners for rapid transit tunnels. Reinforced concrete, a well-established structural material that can be easily designed to withstand the handling, erection, and in situ forces as a tunnel liner, presents the problem of potential leakage at segment junctures. Thus, the main objective of this effort is to identify sealant materials/systems that can demonstrate satisfactory watertightness characteristics at segmented concrete liner joints under simulated soft-ground tunnel environmental conditions.

15 328247 TRANSIT STATION DESIGN: CASE STUDIES OF PLANNING AND DESIGN METHOD. The application of a previously developed and documented transit station design methodology is described. Two example design scenarios, a central area bus terminal and a rail rapid transit station are illustrated. The experiences with the station design procedures have shown the method to be very useful in selecting and improving upon a station design that compares to the stated design objectives. Technically, many subjective decisions are required even with the formalized method and, thus, objectivity must be stressed in terms of procedure rather than practice.

15 329523 SUBWAY CONSTRUCTION COSTS: THE ROLE OF THE ENGINEER. Methods of controlling costs through design in the underground construction of transit systems are covered. Seven types of stations were developed according to method of excavation, and cost estimates were prepared for different depths of cover to show the potential range of costs. A full-height station with mezzanine inside the train room was established as a reference. The costs of the various types of stations were found to vary as much as 100%. New construction techniques which offer cost saving opportunities are also explored as well as the importance of selecting a designer on the basis of credentials instead of fee.

15 329980 TYNE AND WEAR METRO: BYKER VIADUCT. The design and construction of the 800 M prestressed concrete, box girder Byker viaduct section of the Tyne and Wear Metro system is described. Design studies showed that for the western valley section of the viaduct piling through coal measures would be required, grouting under pier foundations to consolidate

coal seams would be necessary, the valley flanks were unsuitable for founding falsework, and, the overall design should be in sympathy with existing bridge structures. The eastern Byker hill section of the viaduct required foundations in shallow pads located in boulder clay. Details are given of passenger train loadings of the structure which governed fatigue design and critical braking forces while the slow-moving works trains governed the direct bending and shear loads.

15 329981 TYNE AND WEAR METRO, BYKER CONTRACT: PLANNING, TUNNELS, STATIONS AND TRACKWORK. The article describes the design and construction

stages for the Byker contract of the Tyne and Wear Metro system. The contract includes a 550 M length of cut and cover tunnel section where the ground consists of coal measures covered by stiff boulder clay with areas of soft laminated clay. As the rocks of the coal measures were found to be standing vertically, an economical form of tunnel was adopted which consisted of thick walls of concrete cast against the vertical rock face with a 200 M thick reinforced concrete arch spanning the tracks. The cement for the concrete walls contained 70% blast furnace slag and 30% portland cement. Details are given of tunnel construction methods and track laying techniques.

15 330161 URBAN RAIL TUNNELING TECHNOLOGY PROGRAM DIGEST. Following a four-fold increase in urban tunnel construction costs during the 1970s, subway building now will cost up to \$100 million per mile in congested urban areas. UMTA is seeking ways to control and reduce expenditures for urban tunneling and has conducted a research and development program aimed at these objectives. This booklet has individual chapters dealing with each of the major facets of the R&D program: Cost estimating; socioeconomic and environmental impacts; contracting and management; construction monitoring; subsurface exploration; ground-support systems; excavation technology and muck transport; design and construction guidelines; lining and support systems. A glossary and bibliography of pertinent UMTA reports are also included.

16 050593 RATP--THE TRAIN USED FOR CLEANING THE LINES ON PARIS UNDERGROUND [RATP--LE TRAIN DEPOUS-SIEREUR DU METRO DE PARIS]. The problem of cleaning the 340 km of line, with 330 stops, on Paris Underground, was resolved by means of the introduction of a "vacuum-cleaner train", consisting of a motive-power unit together with three vehicles equipped for pneumatic cleaning by means of a combined blowing and suction action. The equipment provided on this train was designed for the cleaning of tracks on ballast, and running tracks with guide rails. More thorough cleaning in stations is ensured by reducing the running speed. The equipment also includes a vacuum-cleaner and fire-prevention installation. [French]

16 050895 QUIET "SHHICAGO...". In 1961 the Chicago Transit Authority (CTA) purchased two small rail grinders to remove irregularities (corrugations) from steel rails so as to reduce the high-frequency fluttering noise that is produced by trains passing over a corrugated rail. The grinders were pushed or pulled in tandem by motorized work cars, but because of their size and light weight could be operated only at a restricted speed while making repeated passes over a short stretch of track. The operation could be performed during midnight hours only. A new rail smoother has now been installed that can be operated between regularly scheduled runs; its first operational test was on the Skokie Swift line of CTA. No special crew is required.

16 051483 MBTA GREEN LINE TESTS-RIVERSIDE LINE, DECEMBER, 1972. VOLUME I. TEST DESCRIPTION. The Urban Rail Supporting Technology Program emphasizes three major task areas; facilities development, technology development, and test program development. The test program development is composed of three sub-areas; vehicle testing, ways and structures testing, and track geometry measurement. The report presents the technical methodology, data samples, and results of tests conducted on the Massachusetts Bay Transit Authority (MBTA) Green Line in December, 1972 prior to initiation of the Green Line refurbishment effort. An instrumented revenue type car was used for the measurement of track geometry, ride roughness, and interior noise. Actual car speed was approximately the same as normal revenue speed. The objectives of the tests were to identify critical track sections for improvement to quantify the benefits produced by the track rehabilitation program, and to provide data for Transportation Systems Center's development of an advanced track geometry measurement system.

16 054474 TUNNEL CLEANING METHOD. A method has been devised to scrub tunnel surfaces clean by using rotating brushes, water and tunnel washing soap. Proportional Electro-hydraulic Control Valves provide accurate controls for the operator to position boom mounted brush heads on the tunnel surfaces. The four axle, 48,000 GVW carrier vehicle transports 1,000 gallons of water, 700 gallons of soap, operator and driver cabs, as well as all hydraulic components needed to accomplish the task of tunnel washing. Since the speed of operation is related to the amount of contaminant deposited and the surface condition of the tunnel, the effective forward travel speed of the washer varies up to a top speed of 143 ft/min.

16 094608 BUS MAINTENANCE FACILITIES. A TRANSIT MANAGEMENT HANDBOOK. An understanding of current urban transit bus maintenance facility capabilities is needed for use in planning new facilities and for the evaluation of requests for aid. Industry guidelines, based on a survey of 55 properties with fleets of 11 to 4300 buses, were developed for garages, shops, service lanes, and capital equipment. Facility ages varied from new to 100 years; 61 percent were older than 21 years. Building costs varied from a low of \$12 to \$28 a square foot for indoor bus storage space, to a high of \$55 to \$82 a square foot for equipment intensive servicing facilities (1975 dollars). Cost multiplier curves for bid forecast years from 1975 to 1985 were developed, including inflation rates varying from 6 to 12 percent per year. Small, single facility properties (less than 100 buses) were found to have greater unit space needs for repairs than large properties.

16 099299 LOCATION AND DESIGN OF MOTORBUS GARAGES AND DEPOTS: OPEN-AIR, COVERED OR MIXED GARAGING. In an effort to study how an undertaking's garages influences its costs and to determine how ingenious solutions have offset disadvantages to certain types of garaging, 92 transportation undertakings in over 14 European countries were surveyed by questionnaire. The questionnaire dealt with various technical and economic matters. The garage capacity was considered as well as the influence of the type of garage on equipment (fixed installations, rolling stock, operating methods, maintenance etc.) and vehicles. The influence of the type of garage on the staff and on the passengers and the economic consequences of the garaging system used were also considered. The study indicates that open air garaging is not adopted with enthusiasm. Among the arguments against open-air garaging, the most frequently quoted was the cold and the resultant inconvenience.

16 165133 THE BUS PARTS BUSINESS—BIG MONEY. Big, fascinating and more than a little bit complicated. Those are all terms which could be applied to the bus aftermarket—the multimillion dollar business of delivering the repair parts and service needed to keep the nation's 50,000-plus transit buses rolling. For the people in charge of maintaining a city's bus fleet,

knowing how and where to get the parts—and at the best price—is vital. Large transit systems usually stock from 6,000 to 7,000 different parts at one time. While many parts are available from the company that built the particular bus—either AM General, Flexible or GMC (General Motors Corporation)—a good percentage of needed parts must be gotten elsewhere.

16 167604 MODEL FOR COST-EFFECTIVE MAINTENANCE OF RAIL TRANSIT VEHICLES IN URBAN MASS TRANSIT SYSTEMS. A new computer-based model to assist rail transit management in determining maintenance schedules for rail transit vehicles is presented. The model evaluates the aggregate cost and service implications of conducting prescheduled inspections and preventive maintenance activities for the various components of a transit vehicle. The model also consolidates information on size of vehicle fleet, cost of maintenance and repair of vehicle parts, relations between maintenance frequency and subsystem failures, and historical patterns of the different types of in-service breakdowns. On this basis, the model determines relations among preventive maintenance alternatives, average number of transit cars available for peak service, expected number of in-service car failures, and the total cost of maintenance and repair. The model was originally developed for use by the Massachusetts Bay Transportation Authority in Boston. Preliminary findings in the initial application of the model to generate and evaluate alternative maintenance schedules for the authority's Red Line suggest that use of the model could result in noticeable, though probably not dramatic, savings for this particular line. The authority intends to refine the data used in these analyses and to extend the use of this model to its other lines. The model is a conversational FORTRAN program. It can be adopted for use in any rail transit system that has the required data on vehicle maintenance and repair activities. /Author/

16 168073 REHABILITATION OF SUBURBAN RAIL STATIONS. This paper reports the results of a study of the feasibility of rehabilitating underused suburban railroad stations. Seventy-seven stations on eight commuter lines in New Jersey were surveyed. Each station was inspected, photographed, and evaluated for its restoration potential by criteria that were developed for the study. The Red Bank station was selected as a case study. The study included the development of community and local government participation, the renovation of the 100-year old depot, the redesign of the passenger facility as an intermodal terminal for bus, rail, and taxi the redesign of the pedestrian facilities, and an economic analysis. The municipality has now taken possession of the station, which is used by 1500 daily commuters. Preliminary architectural plans have been drawn up, the station has been designated as an historic site, and the building restoration and sitework are nearly completed. This study is intended to be a prototype for other restoration projects that could modernize urban transportation facilities while preserving historically valuable structures. The emphasis is on maximizing the economic benefits of the project. /Author/

16 182071 MASSTRAM. No Abstract.

Boston University, Urban Mass Transportation Administration 3 Volumes, 1977, 339 p.; Set includes PB-285449 thru PB-285451, RRIS 17 182072 thru 182074 respectively; Bulletin 7901.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-285448-SET/ST, DOTL NTIS

16 182072 MASSTRAM: THE DEVELOPMENT OF A COMPUTER SYSTEM FOR THE COST-EFFECTIVE MAINTENANCE OF RAIL EQUIPMENT IN URBAN MASS TRANSIT SYSTEMS. This document is intended as a management oriented guide to the rail vehicle maintenance scheduling problem and to the new model (MASSTRAM) developed for evaluating such schedules. This final report outlines and discusses a three phase project for the development of a conversational computer system for the cost-effective maintenance of heavy equipment in urban mass transit systems. Phases I and II consisted of operations analysis of maintenance activities at selected properties, namely, on maintenance procedures at the Massachusetts Bay Transportation Authority (MBTA). Phase III consisted of the development of a model

called MASSTRAM (Maintenance Analysis and Scheduling System for Transit Management). A new model, MASSTRAM, has been designed to be compatible with whatever information system a transit property uses for collecting and storing information on vehicle maintenance and repair activities. MASSTRAM has the ability to evaluate the cost and service loss implications of any specified maintenance strategy, given the prevailing maintenance/breakdown relationships. In addition, the model can be used to generate an 'optimal' preventive maintenance schedule. A 'User's Manual' has been written for MASSTRAM containing detailed explanations of all options available. MASSTRAM is now operational. MBTA plans to incorporate MASSTRAM in their Computerized Maintenance Records System when their system is completed. The value of MASSTRAM rests with the use to which it is put by transit management and staff, and with the ability of information systems to provide the model with up-to-date accurate information in the required formats.

16 182076 TRACK GEOMETRY MEASUREMENT SYSTEM SOFTWARE MANUAL. The Track Geometry Measurement System (TGMS) was developed through the United States Department of Transportation's, Urban Mass Transportation Administration by the Transportation Systems Center in Cambridge, Massachusetts under its Test and Evaluation studies to aid transportation planners and maintenance personnel to better assess the quality of track for rapid rail, light rail, and commuter rail systems. The purpose of this document is to describe the TGMS real-time software and provide operating instructions for its use. The TGMS real-time software collects and stores raw data from the TGMS sensors, processes the raw data to compute track geometry parameters, and records and displays the processed data. All of these functions are performed in real time as the raw data is being collected. The current version of the TGMS real-time software is designated TGM6C.

16 184884 STORAGE, REPAIR, AND INSPECTION FACILITIES. The results are presented of a study to determine the facilities required to support the operation and maintenance of an expanded transit system (eleven new rapid transit routes comprising approximately forty miles of new subway lines). The study deals principally with the yards and shops facilities thought the system and is primarily concerned with car storage and yard operations, car maintenance functions, and major maintenance-of-way functions. The program consisted of 3 major tasks leading to the development of recommendations of modifications to the existing facilities to accommodate the requirements of the expanded system. The tasks were as follows: inventory of existing system; determination of car requirements and car mileage; investigation and evaluation of operating maintenance practices and procedures.

16 198762 TRANSIT STATION RENOVATION: A CASE STUDY OF PLANNING AND DESIGN PROCEDURES. The general techniques and procedures for planning and evaluating transit interface facilities are applied

comprehensively to the problem of station renovation. The 69th Street Terminal in Philadelphia is evaluated in terms of its performance in accomplishing its transportation function, its effectiveness in relation to transportation policies, development objectives and costs. The planning procedures are employed to develop possible improvement programs. The report identifies modifications to the transit station that will produce operational conformity with policy guidelines and suggests alternative renovation plans to meet system and user objectives. The alternatives are evaluated and compared using factor profiles. Modifications of the selected plans are suggested, and the methodology is reviewed in terms of its performance in the renovation planning process.

16 308158 THREE "PS" OF BUS MAINTENANCE. A bus maintenance system using "paper, preventive maintenance and personal responsibility" has been set up at NORTRAN, the North Suburban Mass Transit District, which serves 21 suburbs north of Chicago. A detailed set of maintenance forms has been designed for use during each vehicle's periodic inspection (Buses are inspected every 3000 miles, with a more detailed inspection every 1800 miles) which must signed by each mechanic. Furthermore, each driver must note any defects in a bus at the end of a shift. This assigning of individual responsibility insures that preventive maintenance is carried out according to manufacturer recommendations. The detailed forms also speed up operations, since they give specific information about manufacturer recommendations, thus eliminating the need to consult other references. The maintenance program includes testing the engine oil for acidity, viscosity and the presence of harmful particulates. In most cases, the oil is reusable. As a result, oil use has been out by a third, an example of the economies possible with such a maintenance program.

16 319979 ELEVATORS AT RAILWAY AND S-BAHN STATIONS. As a contribution to greater objectivity in the discussion about elevators at main-line and rapid-transit railway stations, the author presents the results of an investigation into what groups of persons use elevators, what experience has been gained with elevators, what technical and other improvements are possible, and under what circumstances they can be used at non-staffed stations. The results can be seen as a challenge to the planners to integrate elevators into the station complex. It was found that elevators are used by all classes of

persons, that negative experience relates only to relatively light usage where the elevators are in out-of-the-way places. New installations should be easily recognizable from a distance and should not be hidden behind stairways and other structures, so that travellers and others can see them immediately. Elevators can also be employed at non-staffed stations in cases where the latter have cable links with an operating control centre, emergency-power sets, etc. [German]

16 325881 USER'S MANUAL FOR THE MAINTENANCE COST METHODOLOGY FOR HIGH SPEED PASSENGER TRAIN TRUCKS. This document is a user's manual for the simulation cost modeling (SCM) technique as applied to a passenger railcar truck and its component parts. The manual includes application of the technique through the development of an example maintenance schematic diagram, example truck component cost data, and example maintenance procedures. The computer program and its various operating modes are described with the aid of a full set of example data obtained

from Amtrak personnel. A complete listing of the FORTRAN IV program and a set of example data for its operation are contained in the appendixes. A set of cost results from the example Amtrak data cover maintenance expenditures by maintenance actions and by component truck subassemblies. Also listed in the sample results are a set of cost sensitivities related to the modeled maintenance system. In addition to the present application, the SCM technique has been employed successfully for other railroad systems, including track maintenance. The technique is generally useful for fleets in which individual cost data are not available, such as a proposed transit system or the introduction of new sub-systems or components.

16 330170 PLANNING PROCEDURES FOR TRANSIT-STATION RENOVATION. The application of planning and design procedures to the problem of transit-station renovation is described. The process is illustrated by using as an example the 69th Street Terminal in Philadelphia,

a complex transit terminal that handles many transfer movements and transit vehicle connections and has a variety of system elements that are badly in need of renovation. The performance of the existing station was evaluated based on selected objectives and criteria and in light of its conformance with current policy guidelines. A series of alternative renovation layouts was produced to improve the processing of passengers by reducing conflicts, trip times, and level changes. These plans included consideration of horizontal and vertical separation, station access for fare collection, passenger volumes on each transit line, and accommodations for the disabled. Each alternative renovation plan was then evaluated along lines similar to those for the evaluation of the existing station. The results indicated the priority of each interest group and showed where conflict existed. The next step in the process is the preparation of detailed architectural and structural design plans and specifications, cost estimates, and a financial plan. (Authors)

17 044279 AN ELEVATED TAXICAB COMMUTER SYSTEM. The basic attributes of the taxicab are used as design guidelines for a community commuter system. The system consists of many small cablike vehicles with a capacity range of 4 to 6 passengers. These travel in closed, elevated tubes with street level boarding stations every block or every other block. Track system consists of one-directional loops which may be operated independently or interlinked. Stopping and starting are minimized. Accessibility is maximized. Important to the esthetics of the system is the innovation of vertical switching which permits the system to be slim and unobtrusive. The community system discussion is augmented with a brief description of an intercommunity system which would be needed to tie the community systems together. Optimum performance curves are given for the integrated system.

17 047848 STUDY OF A MAGNETICALLY LEVITATED VEHICLE. The objective of this program was to design and construct a magnetically levitated test vehicle whose motion was unrestricted in all degrees of freedom except in the direction of motion, and to make elementary measurements of the motion of the vehicle after traversing vertical and lateral offsets in the guideway. The vehicle constructed fulfilled these requirements and consisted of a platform levitated by four super-conducting magnets contained in liquid helium dewars. Position and acceleration sensors and a telemetry package were on board. The vehicle was towed by a winch at speeds up to 12 m/s (approximately 27 mph). Tests were performed on a 400-ft long aluminum guideway. These tests consisted of measuring the vertical and lateral accelerations and vertical position of the center of mass of the vehicle before, during, and after traversing offsets in the guideway. 17 047881 PRACTICAL SAFETY CONSIDERATIONS FOR SHORT HEADWAY AUTOMATED TRANSIT SYSTEMS. Continued interest in Personal Rapid Transit (PRT) systems as one solution to urban traffic congestion emphasizes the need for careful consideration of the safety of short headway automated transit systems. Current approaches to the determination of safe headways are reviewed. The reduction in headway which could be achieved by improved braking and signaling hardware is outlined. Improved design of emergency brakes is the most important single factor in the reduction of safe headways. Very short headway systems are reviewed from a safety standpoint. Such systems might be safely operated if operation at intermediate headways (separations on the order of the stopping distance) can be avoided.

17 047905 PERSONAL RAPID TRANSIT (WITH SPECIAL REFERENCE TO THE MORGANTOWN PROJECT). The PRT project was inaugurated in Morgantown, West Virginia, on Oct. 24, 1972. The installation is a combination line-haul and circulatory system over exceptionally difficult terrain, providing a testing ground for the design and implementation of this new technology. The system utilizes small vehicles on a separate guideway (on, above, and below ground) to convey individuals from origin to destination without intermediate stops. Vehicles are operated entirely automatically and respond directly to passenger demand without any significant waiting period. They are rubber-tired and electrically powered, and therefore nonpollutant and silent in operation. The system is centrally controlled and supervised.

17 048184 REVIEW OF TECHNICAL AND OPERATIONAL ASPECTS OF SEVERAL FIXED-GUIDEWAY PUBLIC TRANSPORTATION SYSTEMS. The purpose of this paper is to review the major technical and operational characteristics of several contemporary fixed-guideway public transportation systems and to determine the functional distinctions among them. Six systems are compared with respect to the following characteristics: nature of the vehicle-guideway interface, station layout, vehicle spacing control, general operating specifications, and specifications for nominal levels of vehicle performance. The 6 systems considered range from urban rail transit systems to monorail systems. Although they are unlike one another in many respects, they nonetheless function in much the same manner when contrasted to personal rapid transit systems currently being developed.

17 050434 THE HOVERTRAIN AFFAIR. A fundamental fact is that the hovertrain is not a train and probably is unlikely ever to be a convenient vehicle for making up into trains of capacity to suit different volumes of traffic or for switching between tracks. So, any hovertrain system is likely to have to use individual vehicles running in strict order, lacking completely any of the flexibility of present railway systems and ruling it out completely from consideration for any urban transport role as far as can be seen into the future. A second fact is that magnetic levitation is in its earliest infancy--and so are the basic techniques on which magnetic levitation would rely, putting a practical full-scale system probably not less than 20 years away. That leaves air levitation, which is used by the British and French vehicles--the only full-size tracked hovercraft yet built.

17 050749 PRELIMINARY DESIGN STUDIES OF MAGNETIC SUSPENSIONS FOR HIGH SPEED GROUND TRANSPORTATION. The report examines certain critical problem areas relative to magnetic suspension of high-speed vehicles and develops a baseline design for a TMLRV (tracked magnetically levitated research vehicle). Both types of magnetic suspension, the repulsive-force suspension and the attractive-force suspension, are considered. The present study has not turned up any problems serious enough to completely eliminate one of these competing suspensions. Areas considered in the report include propulsion systems and their compatibility with magnetically-levitated high-speed vehicles, aerodynamic effects, failure modes, studies of ride quality, and criteria for maximum allowable track roughness. In regard to the repulsive-force suspension, experiments have been carried out to measure ac loss in the superconducting magnets and an assessment of the magnetic shielding requirement has been made. Two model electromagnets for the attractive-force suspension, and their feedback control systems, were built and tested during the present study.

17 051418 THE URBAN TRACKED LEVITATED VEHICLE. Presented is a brief summary of one of the newest concepts in transportation--the Urban Tracked Levitated Vehicle. Air levitated, magnetically guided, propelled by single-sided LIMs, it is a really new idea in mobility. It holds a practical hope of filling the transportation gap between the 60 mph of autos and the 500 mph plus of aircraft.

Ward, JP (LTV Aerospace Corporation); American Society of Mechanical Engineers Paper 73-ICT-96, Sept. 1973, 8 pp, 12 Fig; Contributed by the Intersociety Committee on Transportation for presentation at the Intersociety Conference on Transportation, Denver, Colo., Sept. 23-27, 1973; ACKNOWLEDGMENT: ASME Journal of Mechanical Engineering; ORDER FROM: ESL, Repr PC, Microfilm

17 051421 MERGE CONTROL IN AUTOMATED TRANSIT SYSTEM NETWORKS. Many small vehicle automated transit system concepts will require vehicles to negotiate intersections and merge with other vehicles while traveling through a network of guideways. Assuming that the longitudinal control of vehicles is accomplished by what is known as the moving-cell or point-follower approach, the merge control problem becomes one of determining necessary point-skip maneuvers to assure that points equi-distant from a merge junction are not simultaneously occupied by vehicles. This paper describes an original algorithm for intersection control which can satisfactorily resolve such merge conflicts 95 percent of the time for system

traffic densities approaching 80 percent of capacity by monitoring the status of only twelve points on each line. The algorithm is suitable for programming in a small digital computer; one of which is conceptually located at each intersection.

17 051461 VICS-120, A TUBE-VEHICLE SYSTEM TEST FACILITY. A large test facility designated the VICS-120 has been designed, constructed and operated at the Caltech Jet Propulsion laboratory as part of the research in support of the aerodynamic and ventilation section of a handbook on subway design. Tests can be conducted under both equilibrium and non-equilibrium model velocity conditions. Design concepts, instrumentation, and an outline of construction details as well as operational procedures and models are described. The kinds of testing suitable for a facility of this type are discussed and examples of the various forms of data obtained are presented.

17 051484 LINEAR INDUCTION MOTOR RESEARCH VEHICLE. SPEED UPGRADING TESTS. A series of linear induction motor research vehicle (LIMRV) runs were conducted at the High Speed Ground Test Center on the 6.2-mile test track. These runs were made primarily to evaluate the dynamic performance of the vehicle at speeds up to the maximum achieved, 187.9 mph. The vehicle was equipped with instrumentation that measured accelerations and displacements. Of particular interest were the motions of the trucks and suspension, and the LIM guidance system. The initial truck dynamics data evaluation indicates an increase in concity resulting from a narrow band of wheel treadwear. Since the next series of tests will be conducted with new wheels, the problem at least initially will not be significant. Other tests run during this program provided acceleration and braking profiles. Also, some LIM electrical performance data was recorded and evaluated. (Author)

17 051557 OPTIMIZATION OF TRANSIT SYSTEMS BY PARAMETRIC MEANS. The philosophy of this paper has been applied to the Personalized Rapid Transit (PRT) concept which utilizes a rubber-wheeled vehicle propelled by an electric motor travelling along a guideway. The design of a transportation system involves maximizing the beneficial aspects while at the same

time minimizing parameters such as cost, energy consumed, or visual blight. For this study, the decision model developed is a computer program that incorporates the technology of transit vehicles. With a computer program one can do various trade-offs, sensitivities, and optimization in arriving at the optimal transit design with timeliness and credibility. The parameters that are influential in transit design, station spacing, vehicle and station size, vehicle speed, headway, etc., are perturbed and figure-of-merits are determined using several criterion and optimization techniques.

17 051579 PRELIMINARY DESIGN STUDIES OF MAGNETIC SUSPENSIONS FOR HIGH SPEED GROUND TRANSPORTATION. VOLUME II, EXPERIMENTAL RIDE SIMULATION STUDIES. The report describes an experimental program using human subjects to evaluate the ride quality resulting from specific suspension strategies, and to compare these with a standard ride. The study is part of a more general task to learn how to isolate guideway irregularities from high speed ground vehicles to insure passenger comfort. The results of the study show the following: A ride evaluation by different individuals is a meaningful approach; the discomfort index criterion is roughly correct but has some limitations; the standard ride which was used for comparison, namely, the DOT ride quality specification, is not a particularly good ride; and magnetic suspensions operating on a moderately smooth guideway at 483 km/hr will require active control in order to produce ride quality approaching that of a jet aircraft on a quiet day.

17 051584 LIM GUIDANCE SYSTEM DYNAMICS. THEORETICAL STUDIES AND EXPERIMENTAL TESTS. The linear induction motor research vehicle (LIMRV) is a test bed constructed to evaluate the LIM as a propulsion system. Satisfactory LIM guidance system performance is vital to the ongoing progress of this research program. The report describes preliminary theoretical studies of LIM guidance system dynamic behavior, and documents the experimental results obtained during the first phase of the LIMRV speed upgrading tests conducted at the DOT High-Speed Ground Test Center, Pueblo, Colorado. After the operational tests, additional analytical work was accomplished, leading to system modifications that provided better control of the LIM/reaction rail clearance (mechanical gap), statically, without adversely affecting dynamic behavior. Guidance system dynamics tests were later performed to confirm the theoretical work.

17 052076 LEANWAY: A LEANING SUBWAY. This paper proposes a new type of subway. Surface stations and very deep tunnels would result in steep grades. The Leanway vehicle would have passenger pods that remain level on the grades. Gravity would accelerate and decelerate the vehicles, contributing to energy conservation. Fairly detailed projections are presented, and cost savings compared with contemporary rapid transit subways are claimed. Linear Induction Motors and Magnetic Levitation are considered.

17 056756 MODERN TRANSPORTATION SYSTEMS. Rohr Industries is committed to developing multiple ground technologies to satisfy transportation's varied needs. This paper discusses the company's diversification from aerospace into ground transportation, starting with rapid transit systems and leading to advanced transportation systems. The two most promising advanced transportation developments include an aerotrain, a tracked air cushion vehicle, and the Romag, a magnetically levitated and propelled vehicle. This paper reviews these events and describes in detail the two new developments.

17 056770 ADAPTIVE CONTROL IN TRANSPORTATION. Recent progress in the implementation of adaptive control systems in transportation is summarized. In transportation applications an adaptive control system combines five basic functions: (1) surveillance, to detect traffic; (2) communications, to relay surveillance data and control signals; (3) performance evaluation, to compare the difference between the desired and current operation; (4) on-line data processing, to determine the control signals and scheduling; and (5) overall system operation, i. e. the functional summation of (1), (2), (3) and (4). The applications discussed include control of freeway ramps, urban street traffic, air traffic, and urban rapid transit.

17 056773 ARAMIS PRT SYSTEM. The ARAMIS system is an intermediate capacity transportation system. It provides, at the same time, a high traffic capacity (up to 15,000 passengers/hour/day) and a direct service capability. It is now developed jointly between MATRA and the Paris Metro Authority and the first commercial line will be in operation in late 1977 in the Paris suburbs. Its investment cost is moderate, due to the limited civil engineering required and the operating costs are in the range of the conventional subway.

17 056775 AUTOMATIC URBAN TRANSPORTATION IN BRITAIN. For several years the British Government's Transport and Road Research Laboratory has been working on advanced, automatic, urban transportation systems. Further to this in July 1973, the British Government placed its first contracts with industry for studies leading to the development of these new forms of PRT-like systems. This paper describes the work of one main contract, intended to lead to a public demonstration system in Sheffield. A description is given of the scenario to which this Minitram system must relate, and the organization and institutional situation in Britain is outlined. A brief history of affairs leading to the placing of the contracts, including the Transport and Road Research Laboratory and Hawker Siddeley participation in the Autotaxi and Cab-track PRT projects, is given.

17 056778 PERSONAL RAPID TRANSIT SYSTEM IN MORGANTOWN, WEST VIRGINIA. A unique personal rapid transit system is currently being installed at Morgantown, West Virginia. The system consists of small, automatically controlled vehicles operating on a dedicated guideway either on a scheduled basis or on a passenger-demand basis. The rubber-tired, electric-powered vehicles will carry up to 21 people. The transportation system will connect the business district of Morgantown and the widely separated areas of the West Virginia University campus. The overall project is being built in phases, with the first phase being the construction of approximately 2.1 miles of guideway, five vehicles, three stations, and a maintenance facility. Final installation will be approximately 4.0 miles of guideway, 70-100 vehicles, six stations, and an expanded maintenance facility.

17 056779 RUBBER TIRE VS. STEEL WHEEL TRADEOFFS. The choice of rubber tired or steel wheeled vehicles for a mass rapid transit (MRT) system or for a personal rapid transit (PRT) system involves a number of considerations. For the PRT system, the rubber tired vehicle possesses advantages in its ability to utilize steeper grades and shorter radius curves. The rubber tired vehicle can, if required, operate without a fixed guideway. It is more economical than the steel wheeled vehicle for PRT application. The steel on steel system seems to have little application to PRT as PRT is defined in this paper. For MRT systems, the advantages of the steel on steel system seem quite evident. Capacity, operating speed, and passenger comfort are increased with the steel on steel system. Energy requirements and the need for environmental control are decreased with the steel wheeled system. Capital costs for the infrastructure and the systemwide elements of the system decrease with the use of a steel wheeled MRT system, as do maintenance and operations costs.

17 056879 WARWICK SYMPOSIUM MOVES AWAY FROM PRT. Two significant changes in outlook were evident at this year's symposium on Advanced Transport Systems in British Cities, held at the University of Warwick from March 27 to 29. Most marked was the shift of emphasis away from the schemes for small four to six passenger cars on fine mesh networks which dominated previous gatherings of this kind to systems having much larger vehicles on coarse-mesh networks approximating more closely to those of conventional rapid transit. Compared with earlier conferences on advanced systems, there was a greatly increased readiness at Warwick this year to discuss steel wheel technology, particularly that of street trams.

17 056959 TRANSIT EXPRESSWAY REPORT: PHASE II. Transit Expressway envisions a system operating on fixed guideways with continuous headways as close as 90 seconds. The system is based on operating compact, minimum weight vehicles to provide economy of operations in off-peak hours and still maintain high frequency service. The all electric fully automated vehicles resemble buses and run on 4 pairs of driven pneumatic tires. The project is comprised of 9,360 foot long main guideway, principally on an aerial structure with a short section of at-grade guideway. Forms complete loop with stations at north and south ends. Rolling stock is 3 vehicles operated simultaneously or singularly. Specific discussion of test includes spur roadway with 10% grade, emergency walkway, grounding. Conclusions and recommendations are delineated. Appendices contain a glossary and summary of Phase I report.

17 057646 PLATOON-OPERATED STATIONS FOR QUASI-SYNCHRONOUS PERSONAL RAPID TRANSIT NETWORKS. The report focuses on the management and simulation of captive vehicles in a personal rapid transit (PRT) or dual-mode transit (DMT) system. The simulation of a station for a quasi-synchronous network is presented. Quasi-synchronous systems allow slot slipping or advancing at interchanges to avoid merge conflicts. Vehicles are dispatched from stations with the first slot that can converge without conflict at the immediate merge point. The report is a computer simulation of vehicle operations in an off-line, single ramp personal rapid transit station. The major results of interest to station designers are the curves relating throughput to the total number of berths in the station and queue areas. Curves corresponding to 0.5% and 1% abort rates are exhibited.

17 057818 CONTROL ALLOCATION INVESTIGATION: SAMPLING RATE SELECTION. One of the major considerations facing the design of high performance automated transit systems is the efficient and economical allocation of the control functions between the transportation vehicle and a digital computer located at the wayside. The report examines the non-emergency control of vehicle speed and spacing (i.e., the vehicle regulation problem). The primary goal is to identify the type of information and the rate at which this information must be exchanged across the vehicle/guideway interface in order to achieve precise vehicle regulation. A successful system design keeps the communication requirements within the available channel capacity. The effect of control allocation on these requirements is examined by varying the complexity of the on-board vehicle control system.

17 057907 ELECTROMAGNETIC ENVIRONMENT MEASUREMENTS OF PERSONALIZED RAPID TRANSIT SYSTEMS AT 'TRANSPO 72'. VOLUME XII. The report covers the measurements of the broadband conducted noise present on the A.C. power lines feeding the Personalized Rapid Transit (PRT) systems with all four systems operating simultaneously. The purpose of the measurement effort was to evaluate the electrical environment existing on each of the PRT 'hot' and neutral A.C. power lines and to assess the effect if any, on each individual system with all of the other systems

operating simultaneously. Each system is isolated from the main high voltage line by a stepdown transformer which should filter out most unwanted higher frequency spikes. The measurements obtained during this test will be used for a comparison with data obtained with no PRT systems operating and with each system operating individually.

17 057912 ELECTROMAGNETIC ENVIRONMENT MEASUREMENTS OF PERSONALIZED RAPID TRANSIT SYSTEMS AT 'TRANSP0 72'. VOLUME VII.

The report covers the measurements of the broadband conducted noise present on the A.C. power lines feeding the Personalized Rapid Transit (PRT) systems at Dulles Airport with all four systems off. The purpose of the measurement effort was to evaluate the electrical environment existing on each of the PRT 'hot' and neutral A.C. power lines prior to the installation and operation of any of the systems. These data will provide a baseline for use in establishing the relative increase in EMI levels associated with PRT system operation. Data obtained under this effort will enable an evaluation of whether or not existing or potential EMI levels might effect the normal operation of the PRT systems. Such interference could conceivably contribute to breakdown, malfunctions, or safety problems associated with the automated equipment used by the PRT systems in performing normal functions.

17 071764 SERVICE AND CAPACITY OF PEOPLE MOVER SYSTEMS. People mover systems are being advocated as solutions to a wide range of urban transportation problems, including internal circulation within activity centers. People movers are most applicable where trip demands are uniform without extreme peaks, and concentrated at definitive node points well beyond acceptable walking distances. This type of trip pattern occurs at most airports and some activity centers but is not common within the typical central business district. Internal trip patterns within CBD's are comprised of many short multipurpose trips with high peaking characteristics and dispersed rather than concentrated desire lines. Trip patterns of this type are best accommodated by walking. Enhancement of pedestrianism within appropriate activity centers, by providing pedestrian only precincts and grade-separated convenience networks are practical and viable alternatives for improving their internal circulation. Many cities are implementing programs of this type.

17 071801 TRANSURBAN SYSTEM. The design of new urban transportation systems must take many factors into consideration, including passenger comfort and safety, reliability and cost of service, economy of operation and installation, integration with existing modes of transportation, varying capacity requirements during peak and off-peak hours, need for low exhaust and noise pollution, and compatibility with a city's character. This paper describes one system which tries to meet these requirements, the Transurban system developed by Krauss-Maffei. Use of 12-passenger vehicles enables the make up of varying train lengths to meet fluctuating demand up to about 15,000 passengers/h. The vehicles are elevated and powered by electromagnets controlled by an electronic system and propelled by linear induction motors.

17 072045 SOCIAL ASSESSMENT OF NEW LOCAL TRANSPORT SYSTEMS [Gesellschaftliche Beurteilung von Neuen Nahverkehrssystemen]. The Battelle Institute, Prognos AG Basel and the SNV Hamburg made a social

assessment of the introduction of new personal rapid transit systems (Kabinen-Bahn). This report considers questions of demand (objective demand and individual willingness for using rapid transit) and it considers the effect of construction and operation of new local transportation systems on various aspects of life and on future urban development. The report defines the parameters of new systems and studies their economic and social benefits on a long-term basis. It investigates urban areas in which new transit systems should be introduced and tested first and it studies the problems that might arise from introducing such new systems. [German]

17 072111 ON THE GO-URBAN IMMEDIATE CAPACITY TRANSIT SYSTEM PROGRAM. The legislature of Ontario, Canada is informed by the Minister of Transportation that the contract with the German company Krauss-Maffei for the Go-Urban Demonstration Program at C.N.E. has been terminated. The Ontario Transportation Development Corporation, OTDC, takes over existing research and development data. Ontario will have free access to the Krauss-Maffei test tracks and equipment in Munich. Ontario investment in a demonstration track can therefore be postponed. The future program will be Canadian directed. McDonnell Douglas will share cost and collaborate with ATDC. The new agreement between Ontario, OTDC and Krauss-Maffei is attached to the minister's statement.

17 072129 CURRENT TREND AND PROBLEMS CONCERNING NEW TRAFFIC SYSTEMS. In this report the author offers abstracts and his personal opinions of the various new transportation systems discussed in the ECMT conference, June 1973, Paris. As far as Japan is concerned the new transportation system must provide the following: elimination of harmful exhausts, low noise pollution, low energy consumption, safe, public needs, punctuality, low man power, comfort, economy, versatile construction, and attractive design. The method which advocates the division of Personal Rapid Transit and People Mover, and Johns Hopkins University's Fast Transit Link System and Collection and Distribution System may solve some of the traffic problems readily, but lack the long range solution the Japanese transportation authorities seek. The author finds the guideway system the most attractive system among those discussed at the conference. A brief review of available Japanese technology on the guideway system (the KCV, MAT, VONA and Palento-lai) is presented, and Momo-tai New Town, commercial area in Kobe, and Okinawa Oceanographic Fair sight are possible areas for pilot programs. America is the leading researcher on the guideway system (PRT and TTI). Europe is concentration their efforts on High Speed Surface Transit, TRANSRAPID, TRAKSURBAN, CABINEN-TAXI, H-BAHN, TREDIM, VAL, AEROTRAIN, ARAMIS, URBA systems are discussed. [Japanese]

17 072499 PERSONAL RAPID TRANSIT SYSTEMS. Starting with the Urban Mass Transportation Act of 1964, the federal government has sponsored development of transportation alternatives to the automobile in dispersed metropolitan areas, systems which have come to be known as Personal Rapid Transit. This paper discusses the PRT programs of the Urban Mass Transportation Administration, system design requirements as identified in the various studies, PRT performance specifications (including capacity, and speed), and the major subsystems—suspension/propulsion/guideway and command/control. The author concludes that many configurations need to be examined in arriving at optimum designs.

17 072501 THE APPLICATION OF LEVITATED VEHICLES TO URBAN RAPID TRANSIT. It is generally conceded that transportation looms large in any list of problems affecting our major urban areas. As we search for solutions to such problems, it appears that rapid transit will be called upon to play an increasing role. With the growth in rapid transit construction and expansion, a variety of new systems and system proposals has followed. Of the many types, the levitated vehicle system (LVS) has substantial advantages because of the reduced weight resulting from the elimination of wheels, trucks, and axles. This paper examines these levitated systems in more detail, and explores the advantages and disadvantages they may have in urban rapid transit service.

17 072689 AN EVALUATION OF THE DYNAMICS OF A MAGNETICALLY LEVITATED VEHICLE. An analytical and experimental evaluation was made of the stability and dynamic characteristics of a small scale magnetically levitated vehicle. The vehicle was levitated over a variety of guideway perturbations in an attempt at stimulating unstable modes of oscillation. No instabilities developed in the five degrees of freedom measured using either passive or active damping. The analytical model was used to simulate the observed motions of the vehicle using a computer. Reasonable agreement was found although more damping was observed than

was simulated using the model. This work was performed as a part of the Federal Railroad Administration's program of research and development on high speed ground transportation for use in intercity passenger service.

17 072955 LATEST DEVELOPMENTS AFFECTING MAGNETIC LEVITATION VEHICLES. Prompted by the hope that a novel high-speed ground transportation mode might permit speeds up to 500 kph, worldwide research has more and more concentrated on contact-free track-guided levitation techniques, especially since technical advances have been made in control techniques and data processing. In the German Federal Republic, activities are mainly concentrated on magnetic levitation with groups separately working on electro-dynamic suspension and on electromagnetic suspension techniques. The principles have been shown applicable to railway-type operations. There are still a multitude of problems to be solved. Railways should continue to promote the wheel-on-rail technology, it was concluded.

17 080045 PERSONAL RAPID TRANSIT (PRT) SYSTEM FOR LAS VEGAS, NEVADA. Las Vegas, Nevada is one of the ideal urban environments for a Personal Rapid Transit (PRT) System. The city operates on a "round the clock" basis and highway traffic congestion is becoming severe with the growth of tourism. The principal industry is tourism and a fare structure can be imposed which will make a PRT system self-supporting. A PRT system is described which meets the anticipated Las Vegas requirements of 24h/day operation, vehicle and service being designed to compete favorably with the automobile. The PRT system elements described include vehicle, guideway, control features, stations, and maintenance facility. The results of a maintenance plan analysis and financial considerations are also discussed.

17 080097 THE SYNCHRONOUS MOVING-CELL CONTROL PHILOSOPHY FOR AUTOMATED TRANSPORTATION SYSTEMS. One of the major factors influencing the capacity of any mode of transport is the degree of control that can be exerted over individual vehicles. For this reason, a system of discrete driverless vehicles traveling on a network of automated single-lane guideways, is seen by many as one possible solution to the problem of congestion in densely populated urban areas. In this paper, the authors discuss the benefits and limitations of the synchronous moving-cell control philosophy that has been developed in recent years as a method of controlling vehicles in such automated systems. The problems of controlling a stream of vehicles, both on an automated main-line guideway and at a merge point, are examined in detail and the advantages of the synchronous moving-cell concept over alternative control schemes are illustrated. Finally, the authors consider some of the practical problems which would arise when implementing such a scheme.

17 080218 DISPOSITION OF EMPTY VEHICLES IN A PERSONAL RAPID TRANSPORTATION. A basic vehicle management function, associated with operation of a Personal Rapid Transit (PRT) System, is that of continually redistributing empty vehicles throughout the system. In this report a procedure for performing this function is developed and evaluated. The procedure, carried out periodically (e.g. every few minutes) consists of three steps: (a) estimation of the surplus or deficit of empty vehicles at each station; (b) allocation of surpluses to deficits; and (c) preparation of a dispatch list for each station, based on the allocations, the list giving the disposition of successive empty vehicles as they become available. Two computer simulations were constructed to evaluate the procedure. Simulation runs demonstrated that the procedure worked well.

17 080974 PERSONAL RAPID TRANSIT II. PROGRESS-PROBLEMS-POTENTIAL. This collection of over 60 papers was presented at the 1973 International Conference on Personal Rapid Transit in Minneapolis, Minnesota. PRT is the class of fixed-guideway systems in which automated vehicles no larger than small automobiles carry people and/or goods nonstop between any pair of stations in a network of slim guideways that serve major activity centers or may span an entire urban area. There is great emphasis on technological issues with relatively little attention given to issues involved with planning, economics, implementation and the implications of PRT for urban society. The papers are classified in ten sections in the volume.

17 081295 ELECTROMAGNETIC ENVIRONMENT MEASUREMENTS OF PRT SYSTEMS AT "TRANSPO 72", VOLUME III--FORD SYSTEM. An X-Y plot is made of the radiated electromagnetic signals and noise between 1 KHz and 50 KHz at each of the four Personalized Rapid Transit (PRT) sites at Dulles International Airport. The PRT systems were operated individually to establish the signal characteristics of each system. A spectrum analyzer was used to view the frequency spectrum broadband prior to recording and a Polaroid scope camera was used in conjunction with the spectrum analyzer to photograph signals between 50 KHz and 50 MHz. This frequency range was sufficiently broad to cover all command and control frequencies of the four PRT systems. The purpose of the measurements program was to establish some base line information on the electromagnetic signal characteristics in the Dulles area in the event there was an interaction between the PRT Command and Control systems

and the Federal Aviation Administration Air Traffic Control equipment. The measurements obtained during this series of tests will be used for a comparison with data obtained with no PRT systems operating and later with all four systems operating simultaneously.

17 081908 CRASHWORTHINESS FOR HIGH-CAPACITY PERSONAL RAPID TRANSIT VEHICLES. This study is concerned with the design of crashworthy vehicles for high-capacity personal rapid transit (PRT) systems. PRT systems offer on-demand, non-stop service from origin to destination over an extensive network of exclusive guideways. Proposed high-capacity PRT systems operate at fractional second headways. The necessity for such short headway operation has resulted in concern for passenger safety in high-capacity PRT. This study is undertaken to establish guidelines for the design of PRT vehicles in which passengers would not be seriously injured even under the conditions of a worst case collision. It is established that even in the case of a collision with a fixed unyielding barrier, adequate passenger protection can be obtained using existing technology provided impact velocities do not exceed 30 to 40 m.p.h. /UMTA/

17 082724 THE MOD: A MODULAR URBAN TRANSPORTATION SYSTEM. The MOD is described as an urban transportation system which is based on a very small, two-passenger automotive rental vehicle using existing city roadways at the exclusion of the private passenger car. The proposed units of the MOD system have an empty weight of 300 pounds and have provisions for easy vertical parking. The MOD system is proposed as a self-supporting operation, run by private enterprise as a public utility. The urban transportation offered by the MOD system generates the set of institutional problems involved in proposals which exclude the private passenger car from the city. /Author/

17 082997 CABTRACK: COMMUNICATIONS AND CONTROL INSTRUMENTATION FOR A ONE-FIFTH SCALE TEST TRACK. Cabtrack is a proposed high-density urban transport system in which four seat electrically powered vehicles run on a network of segregated tracks under automatic control. A principle of position-lag slot control is discussed whereby vehicles would operate in synchronism with each other on main tracks, but change to asynchronous operation after diverting into a station loop. A one-fifth scale model cabway was constructed to develop and test the methods of control. The communication and control instru-

mentation which was developed to enable up to 14 cabs to operate under the control of a small digital computer is described. The model cabway was successfully operated with 6 cabs of length 66 cm running at 2 m/s with headways of 54 cm (equivalent to a flow of 4000 cabs per hour on a track which is 70% occupied) thereby demonstrating a viable system of control which could be developed for use with various types of vehicle on segregated tracks. 17 090174 PARAMETER OPTIMIZATION STUDIES OF MAGNETIC SUSPENSIONS FOR HIGH SPEED GROUND TRANSPORTATION. The study investigates efficient, cost-effective methods of high speed ground transportation for intercity travel. Previous aspects of the program have demonstrated the technical feasibility of two types of magnetic suspensions (the attractive-force, and the repulsive-force suspensions) for such applications, and have developed a baseline design for a TMLRV (tracked magnetically levitated research vehicle). The attractive force suspension considers the development of a mathematical model which predicts the magnetic behavior of the magnet-rail system for high speed, and a parameter optimization of the magnet. The repulsive-force suspension examines various track geometries to see if the amount of aluminum in the track could be reduced without loss of performance. Experimental studies have been carried out to support the analytical aspects of the program.

17 090189 SURVEY OF PRT VEHICLE MANAGEMENT ALGORITHMS. The document summarizes the results of a literature survey of state of the art vehicle management algorithms applicable to Personal Rapid Transit Systems (PRT). The surveyed vehicle management algorithms are organized into a set of five major component subcategories: network routing, merge control, empty vehicle management, station management, and blocked segment management. The classification scheme enables the comparison and description of algorithms in common terms. One intent of the survey was to form a data base for system designers and users. Another intent was to use the results of the survey to aid in designing a simulation model to evaluate and develop PRT vehicle management algorithms.

System Development Corporation, Urban Mass Transportation Administration, (UMTA-CO-06-0006) Final Rpt. June 1974, 48 pp; See also PB-239 893.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-239892/3SL

17 090472 DUAL MODE TRANSIT SYSTEM, APPENDIX F: THE INTERACTION OF DMTS DEMAND AND SERVICE LEVELS. The purpose of the study is to determine likely demand for and operational strategies of the Dual Mode Transit System when implanted in a realistic urban environment. Various large U.S. cities were investigated and the Washington, D.C. and Houston metropolitan areas were chosen as most suitable. A computerized model was built to simulate trip generation, trip distribution and

modal split for any urban area subdivided into a manageable number of zones (20-100). Required input consists of travel time matrices for conventional and DMTS modes, as well as economic and demographic information about each zone. Demand for the DMTS was simulated by trip purpose and time of day. Station and link loads were calculated. Likely service strategy options were identified for different times of day, various trip purposes, and various locations.

17 090536 DUAL MODE POTENTIAL IN URBAN AREAS. The purpose of this study was to determine the potential national applicability of an urbanwide Dual Mode system. The system, consisting of a mixed fleet of specially designed small personal vehicles and 12-passenger dial-a-ride minibuses operating on local streets and on a network of guideways, was examined in three hypothetical urbanized areas reflecting a broad spectrum of 1990 city types. After determining system cost and ridership in each scenario, Dual Mode's applicability as an urbanwide system was determined on the basis of three criteria: the abstract city's ability to pay for the system, the regional cost-benefit characteristics of Dual Mode, and the degree of need for additional high-capacity transportation facilities within the abstract city. The classification of the abstract cities as definite or doubtful candidates for Dual Mode was used to generate population-based applicability ranges, which in turn were used to identify the urbanized areas where Dual Mode appears to have definite or possible potential.

Heaton, C Barber, J Benjamin, P Paules, G Ward, DE ; Transportation Systems Center Final Rpt. DOT-TSC-OST-74-20, Feb. 1975, 91 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-240411/9ST

17 090556 OPERATIONAL POTENTIAL OF SUSPENDED VEHICLE SYSTEMS (SVS). Earlier high speed ground transportation (HSGT) studies have confirmed the feasibility of high speed suspended vehicle systems (SVS). This study determines the operating regimes within which the SVS offers potential advantages over other HSGT alternatives such as high speed rail (HSR) and tracked air cushion vehicle (TACV) systems. Each system type provides an equal level of transportation service for typical high speed applications, including 200 mile intercity and 40 mile airport access corridors. Various design options concerning guideway supporting structures for above, below and at-grade construction are examined considering costs and planning and community preferences for each basic land use category. Collocation with existing transportation corridors offers the potential of significantly reduced right-of-way costs and less negative impact on the surrounding community.

17 090570 SUSPENDED VEHICLE SYSTEMS (SVS). VOLUME 1, SYSTEM ENGINEERING STUDIES. This report discusses generic high speed ground transportation (HSGT) vehicles which are suspended from an overhead guideway. The performance and cost are predicted for trainable revenue vehicles which would use the overhead monorail principle and operate in the 150 to 250 mph speed regime. These vehicles and the necessary elevated guideway structure comprise the suspended vehicle system (SVS), which is an alternative to overriding HSGT systems, such as the tracked air cushion vehicle (TACV) or high speed rail (HSR) systems. The unique feature of the SVS is the vehicle pendulous suspension used to achieve large cabin bank angles (up to 25 degrees) in order to achieve high speeds on curved guideway alignments. The results of system studies are described in which the vehicle and guideway concepts are developed to satisfy the performance and safety requirements.

17 091066 SUPERCONDUCTING MAGNET SUSPENSIONS IN HIGH SPEED GROUND TRANSPORT. There are a number of magnetic suspensions of which superconducting suspensions are a subset. In these suspensions the movement of the vehicle is used to induce currents in a conducting track which then interacts with the magnets on the vehicle to produce a repulsive suspension force. This work provides a technical

and economic definition of high speed ground transport systems using these suspensions. The full range of common superconducting suspensions and of propulsions are covered with designs produced for speeds ranging from 100 m/s (225 miles/hr) to 250 m/s (560 mile/hr). For operating cost evaluation, throughputs ranging from one to thirty million seats per annum, each way, are considered. Technical descriptions of the vehicles, their suspensions, propulsions and tracks are given in some detail and operating costs are presented for all the systems together with details of the breakdown of costs and the capital costs involved.

17 091082 SOME APPLICATIONS OF CRYOGENICS TO HIGH SPEED GROUND TRANSPORTATION. The current status (December 1972) of worldwide research on high speed ground transportation techniques is reviewed. Particular attention is given to studies of magnetic levitation using superconducting magnets, including comparison with alternative magnetic techniques and with air suspension systems. Superconducting levitation appears to be a strong contender in the U.S. Department of Transportation hopes to select in the late 1970's the best of the possible levitation techniques for subsequent advanced development. Cryogenic engineering research needed in support of major development of a superconducting levitated system is identified.

17 092034 TEST AND EVALUATION OF AN EDDY CURRENT CLUTCH/BRAKE PROPULSION SYSTEM. This report covers the Phase II effort of a program to develop and test a 15 hp eddy-current clutch propulsion system. Included in the Phase 2 effort are the test and evaluation of the eddy-current clutch propulsion system on board a test vehicle. The test vehicle was designed and built to be compatible with an existing monorail track and was instrumented for the duration of the test program.

17 092154 DYNAMIC INTERACTIONS OF PRT VEHICLES AND ELEVATED GUIDEWAYS. The study provides an analytical basis for preliminary design of Personal Rapid Transit (PRT) system guideways and vehicle suspension systems. Careful attention has been given to the development of high fidelity mathematical models of PRT vehicle dynamics, including primary and secondary suspension systems. The report presents the equations of motion of a nine degree of freedom vehicle model traversing a moving guideway. Also included are the equations of small elastic vibration for both straight and curved elevated guideways, modeled as elastic beams. Vehicle and guideway equations are combined for purposes of system stability analysis and simulation.

17 092423 ANALYSIS OF POSITION ERROR HEADWAY PROTECTION. An analysis is developed to determine safe headway on PRT systems that use point-follower control. Periodic measurements of the position error relative to a nominal trajectory provide warning against the hazards of overspeed and unexpected stop. A computer program has been developed to model these hazards for arbitrary safety system design

parameters. The results of computer runs indicate that the critical hazard on the main guideway is unexpected stop of a preceding car; on a station entry deceleration ramp, it is overspeed of a following car. The deceleration ramp headways are larger and are more sensitive to system parameters than are the main guideway headways. Typical headways are five seconds on a 30 mph main guideway and 16 seconds on a deceleration ramp for state-of-the-art system parameters. With advanced system parameters and emergency decelerations applicable to well supported, seated passengers, required headways are 2.5 seconds on the main guideway and 3.5 seconds on the deceleration ramp.

17 093548 AUTOMATED GUIDEWAY GROUND TRANSPORTATION NETWORK SIMULATION. The report discusses some automated guideway management problems relating

to ground transportation systems and provides an outline of the types of models and algorithms that could be used to develop simulation tools for evaluating system performance. The system management problems are related to the routing and scheduling of both passengers and vehicles, as well as to control strategies such as synchronous and quasi-synchronous. The simulation outline provides background material for model descriptive, functional requirements, and simulation structure that can be used in future development activities.

Toye, CR ; Transportation Systems Center, Urban Mass Transportation Administration Final Rpt. DOT-TSC-UMTA-75-18, UMTA-MA-06-0048-75-1, Aug. 1975, 60 pp; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-246758/7ST, DOTL NTIS

17 093564 THE AVAILABILITY SIMULATION OF AGT SYSTEMS. The report discusses the analytical and simulation procedures that were used to evaluate the effects of failure in a complex dual mode transportation system based on a worst case study-state condition. The computed results are an availability figure of merit and not an absolute prediction with associated confidence levels of system availability. The advantage of this procedure is that it avoids the use of a dynamic network traffic flow simulation which is both costly and time-consuming. The analytical and simulation approach taken encompasses fault tree and failure mode and effect analyses. The novel aspect of this approach is the use of the Monte Carlo technique to determine the physical location of failed vehicles in the system (on or off the guideway, in station berths, or at various merge/demerge sectors).

17 093733 EXPERIMENTAL AERODYNAMIC CHARACTERISTICS OF VEHICLES TRAVELING IN TUBES. A simplified theoretical model for a vehicle traveling through an unvented tube under equilibrium incompressible conditions was used to guide the test program, reduce the data, and determine the self-consistency of the results. The results were then used to establish values for the arbitrary coefficients in the theoretical model. Substantial progress was made in understanding the aerodynamic characteristics of vehicles traveling in tubes as exemplified by the good agreement of the theoretical model predictions with the experimental data throughout the Reynolds number range (three orders of magnitude, up to that for an actual full-scale system) and the many geometric variables tested. 17 094115 CONCEPTUAL DESIGN AND ANALYSIS OF THE TRACKED MAGNETICALLY LEVITATED VEHICLE TECHNOLOGY PROGRAM (TMLV). REPULSION SCHEME. VOLUME II. APPENDICES A-F. This report summarizes the studies of a program to establish the technology of magnetic suspension for ultimate use in a passenger-carrying high-speed ground transportation (HSGT) system-at speeds or the order of 134 m/s (300 mph). Magnetic Levitation (MAGLEV) is one of the advanced vehicle suspension concepts considered as alternatives to conventional transportation modes in the short-haul regime. This volume presents some details of the mathematical analysis associated with the MAGLEV vehicle dynamics and control (i.e., ride quality) in Appendices A through D; the noise or acoustic characteristics associated with the baseline Hamilton Standard Q-fan air propulsion system (Appendix E); and the Raytheon final report for the linear synchronous motor (LSM) studies (Appendix F).

Philco-Ford Corporation, Federal Railroad Administration, First Atomic Ship Transport, Incorporated Final Rpt. 17 094116 CONCEPTUAL DESIGN AND ANALYSIS OF THE TRACKED MAGNETICALLY LEVITATED VEHICLE TECHNOLOGY PROGRAM (TMLV). REPULSION SCHEME. VOLUME III. APPENDIX G. 5 DOF COMPUTER PROGRAM. This report summarizes the studies of a program to establish the technology of magnetic suspension for ultimate use in a passenger-carrying high-speed ground transportation (HSGT) system-at speeds on the order of 134 m/s (300 mph). Magnetic Levitation (MAGLEV) is one of the advanced vehicle suspension concepts considered as alternatives to conventional transportation modes in the short-haul regime. This third volume contains the computer programs for the solution of the equations of motion for 5 degrees-of-freedom, and a summary of the analytical background. These programs provide the capability for performing stability analyses of magnetically levitated vehicles, and for evaluating vehicle response and ride quality characteristics for operation over guideways with irregularities. Each program is listed along with a sample run. The programs are written in BASIC language for use on time-sharing systems.

17 094484 AUTOMATED GUIDEWAY TRANSIT SYSTEMS VEHICLE-ELEVATED GUIDEWAY DYNAMICS: MULTIPLE-VEHICLE SINGLE SPAN SYSTEMS. Analysis and design techniques are described for synchronously controlled AGT vehicles crossing elevated span structures. Computer simulation programs have been developed to determine time histories of guideway deflections, moments and stresses and vehicle accelerations (peak, total rms and rms in one-third octave bands) for a string of multiple AGT vehicles crossing flexible spans with random vertical, angular, camber and surface roughness irregularities. Specific data has been developed to identify operating conditions corresponding to potential span resonant conditions. A computer-aided design program has also been developed to determine span structural requirements needed to meet stress and passenger comfort conditions. Span designs for both large and small headway operation of 4, 6 and 12 passenger AGT vehicles have been determined.

17 095262 RIDE QUALITY AND GUIDEWAY ROUGHNESS MEASUREMENTS OF THE TRANSPO '72 PRT SYSTEMS. An extensive series of performance and evaluation tests has been conducted on the four Personal Rapid Transit (PRT) systems demonstrated at the Dulles TRANSPO '72 transportation exposition. Included among these tests were the measurement of vehicle ride quality and of guideway irregularity. In the Ride Quality tests, a portable instrumentation system developed at the applied Physics Laboratory, the John Hopkins University, was used to measure the accelerations experienced by passengers aboard the four PRT systems while operating over a wide speed range and during various modes of operation. Volunteer subjects rode the systems and these ride juries provided ratings on ride quality, appearance, safety, and convenience. Guideway Roughness and Alignment tests were conducted to determine the characteristics of the vertical and horizontal running surfaces. These tests are briefly reviewed and a sample of the results is presented. The ride quality tests show that meaningful vehicle accelerations can be measured and that the data can be successfully processed for correlation with ride

quality specifications and subjective judgments. It is shown that accelerations on the seat can be greater than those on the floor and that in some instances measured jerk values were higher than those considered to be acceptable.

Caywood, WC (Johns Hopkins University, Silver Spring) Rubinstein, N *High Speed Ground Transportation Journal* Vol. 8 No. 3, 1974, pp 213-225, 9 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

17 095264 ENERGY REGENERATION AND CONVERSION EFFICIENCY IN A HYDRAULIC HYBRID PROPULSION SYSTEM. An energy storage system having a limited capacity is employed for the purpose of (i) removing the burden of acceleration from internal and external-combustion type prime movers used in rubber-tired and rail urban mass transit vehicles and (ii) providing an efficient regenerative braking system to significantly increase fuel economy during typical stop-start vehicle schedules. Energy is stored in a hydraulic accumulator which is designed to be an integral part of the propulsion system. Data from laboratory tests are presented to indicate achievable energy conversion efficiencies. Computer simulation of various size vehicles being driven over typical transit-vehicle schedules is used to estimate the reduction in vehicular emissions and energy consumption resulting from the energy storage capability. An increase in fuel economy of up to 30% and an emissions reduction of up to 36% (NO sub x) were observed for the spark-ignited prime mover. When a simple cycle, single shaft gas turbine was simulated, the maximum increase in fuel economy was 24% with up to 50% reduction in emissions.

Wojciechowski, PH (Rochester Institute of Technology) Dunn, H *High Speed Ground Transportation Journal* Vol. 9 No. 1, 1975, pp 383-392, 12 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

17 095446 NEW TRANSPORTATION SYSTEMS. The papers in this Record report on an intermediate-capacity transit system, station and intersection for a personal rapid transit network, feasibility of an elevated STOL-port test facility, application and development of demand-actuated transportation system, and a moving walkway. Ontario's Program for Intermediate Capacity Transit describes the Province's plan for building and testing a demonstration transit system of intermediate capacity in Toronto, the forerunner for revenue systems in major Ontario cities over the next decade. The paper on PRT networks describes an effort to develop geometric designs for high-capacity systems, stations and intersections with predictions of their performance under quasi-synchronous control at different design and operating conditions.

17 095819 DESIGN ANALYSIS OF STATIONS AND INTERSECTIONS OF HIGH-CAPACITY PERSONAL RAPID TRANSIT NETWORK. This paper describes an effort to develop geometric designs for high-capacity personal rapid transit links, stations, and intersections and to predict and evaluate their performance under quasi-synchronous control at different design and operating conditions. The system assumed 1-way routes and vehicle accelerations and decelerations only on the off-lines. The geometric design of off-lines at stations and intersections considers recommended normal and centripetal acceleration and jerk rates, allowable radius of curvature, required maneuver zone length, and required capacity of the off-line and the line spacing chosen. Typical conditions for a large urban area are considered. In the PRT system, vehicle queues are formed on the upstream and downstream sides of station platforms and intersection turns. The modeling, analysis, and simulation of these queues are described. The excess capacities and the sizes of queuing zones needed can be obtained from simulation results for stations and intersections of different capacities. The resulting average waiting time, the probability of vehicle rejection on the upstream side, the probability of forced switching to prevent the stopping of vehicles on the downstream side, and the achievable guideway density are given as functions of design and operating parameters. The possible trade-offs among design capacity, traffic density, length of queuing zone, and user costs involved at stations and intersections are discussed.

17 096029 THE CABTRACK URBAN TRANSPORT SYSTEM. This paper starts from the argument that improved public transport is the best way to mitigate the adverse effects of the motor car on urban life. The disadvantages of existing bus and rail system are such that a contribution would be required from a new form of transport. The features required of a new system are listed, including frequent access points, minimal waiting time, high speed and absence of interchanges. Cabtrack is one system which meets these requirements: automatic four-seater vehicle would provide a demand actuated service along a network of interconnected tracks. Design features of the cabs, cab stops and the track are presented. Methods of system control and the overall capacity of the system are discussed. The environmental impact in terms of noise, pollution and visual intrusion would be acceptable. In conclusion the advantages and disadvantages are summarized. Diagrams and photo-montages are appended to illustrate the system. /TRRL/

17 096032 MCALPINE BACK HANG-UP HOVERTRAIN. This article describes a new suspended hovertrain design known as the bliss pendair system. The vehicle is suspended from a precast concrete box beam track. Portal frames support the track. The problems of detecting obstacles on the track and the effect of snow and ice are minimized in the enclosed track. A suction air cushion generated by a fan is formed between the platform from which the vehicle is suspended and the adjacent inside track surfaces. The platform rotates about its longitudinal axis to form a pendulum suspension which allows for the negotiation of tight curves at speed. The project, backed by a civil engineering contractor, has led to the manufacture of arbitrarily curved beams in a flexible mould. A model of the pendair system and its design detail's are given. It is envisaged that the pendair system will provide rapid urban and suburban transport with a top speed of 100 km/hr although it would be suitable for 500 km/hr vehicles. /TRRL/

17 096396 DYNAMIC WHIP OF ELASTICALLY RESTRAINED PLATE STRIPS TO RAPID TRANSIT LOADS. A plate strip of infinite length and constant width is cantilevered on a uniform elastic support along one edge and free along its opposite edge. A normal line load of constant intensity applied across its width travels along the strip at constant speed. Using plate theory, steady state solutions for the flexural waves are derived in terms of the generalized Fourier integral. Superposition is used to simulate responses to distributed transit loads. Results are applicable to the design of cantilevered guidance panels for air cushion vehicles and also in the design of the metal plates for the linear induction motors sometimes used to power these vehicles. /Author/

17 096400 A LOW SENSITIVITY MODERN APPROACH TO THE LONGITUDINAL CONTROL OF AUTOMATED TRANSIT VEHICLES. Modern control and estimation techniques are applied to the design of longitudinal controllers for automated transit vehicles. The sensitivity of dynamic response to changes in vehicle parameters and the effects of noisy sensors on control system performance are studied. A method for sensitivity reduction by augmentation of the state vector with the sensitivity vector is proposed and low sensitivity design is developed which provides excellent dynamic response over a wide range of operating conditions and vehicle parameters. /Author/

Yang, SC (Honeywell, Incorporated) Garrard, WL (Minnesota University, Minneapolis) *ASME Transactions* Vol. 96 No. 2, June 1974, pp 218-228, 13 Fig., 4 Tab., 15 Ref.

17 096527 IS MINITRAM AN ECONOMIC PROPOSITION? "Minitram" denotes an advanced urban transport system employing small automatic vehicles operating on its own track. This paper reports the economic implication of a possible minitram route in Coventry. Data from the transportation survey are used to predict the impact on travel behaviour. Cost-revenue and cost-benefit analyses are conducted and it is concluded that minitram could yield a rate of return close to the 10% minimum for public investment. It is pointed out that as minitram requires a high level of demand it would only be suitable for certain corridors of certain cities. In conclusion, comparisons are made with cartrack systems. /TRRL/

17 096528 PERSONAL RAPID TRANSIT. A CASE FOR SMALL VEHICLES. This article is concerned with a proposed personal rapid transit system for Gothenburg, Sweden. The system was intended to compete with the private car through: wide area coverage, short travel time, high degree of comfort, direct travel without changes. The main features of the proposed system are then described: dimensions of the network traffic flow, capacity, travel time and costs. The economic implications of the number of passengers per cab are discussed and ways of organizing joint riding considered for the afternoon peak (concentrated departures, dispersed destinations), for the morning peak (dispersed departures, concentrated destinations), and between groups of stations. It is concluded that if a level of service comparable to the private car is to be achieved cabs should carry 3-4 passengers and 5-seater cabs should be used. The concluding section quotes from a report on the future of public transport in Gothenburg. /TRRL/

17 096678 HOW BRITAIN CAN STAY FIVE YEARS AHEAD IN TRACKED HOVERCRAFT. This article gives an account of progress that has been made in the research and development of tracked hovercraft. The work carried out by the Tracked Hovercraft Company (THL) is discussed. Its aim is to investigate the economic and technical potential of a high speed ground transportation system using air cushion suspension and linear induction drive. THL found that the air cushion was viable but noisy, and failed to prove the worth of the system. The author also describes the work of a number of organizations who continued the work under research contracts to the government, when THL's work ceased, and activities of other organizations including the Universities of Sussex and Warwick. The work covers both suspension systems (air cushion and magnetic) and linear motors. After discussing the possible future of the THL test track at Earith, the author concludes by referring to work being carried out overseas. Particular reference is made to the work of the U.S. Department of Transportation, the French Aerotrains, and a Canadian Minitram contract near Ontario. /TRRL/

McCallum, P *Engineering* Vol. 239 No. 6183, Sept. 1974, pp 48-50, 1 Fig., 2 Phot.; ACKNOWLEDGMENT: TRRL (IRRD 400064S); ORDER FROM: ESL, Repr. PC, Microfilm

17 096682 OPPORTUNITIES IN AUTOMATED URBAN TRANSPORT. The report examines the use of two automated travel systems as solutions to the congestion at present experienced in urban areas. Existing technologies are assessed and desirable characteristics of new systems are described, such as good access, allowance for short trips, above ground and automated. It is argued that some new technology is necessary. The operational attributes and network structure of both systems-minitram and cabtrack are discussed in detail. The former provides for larger movements of people on a fixed network of stops and the latter serves more as a personalized demand-activated service. Visual intrusion is assessed by the use of photomontages, and possible sites for networks are evaluated in Westminster, Southampton and Sheffield. A more detailed description is given of spartaxi-a similar scheme to cabtrack, that is planned for Gothenburg. Concluding, the authors argue that the systems are fast, flexible and cheap. /TRRL/

17 097124 HIGH CAPACITY PERSONAL RAPID TRANSIT SYSTEM DEVELOPMENTS. High capacity personal rapid transit (HCPRT) is a system concept which utilizes small, four to six passenger, vehicles at very short headways on exclusive guideway networks. The automatic operation of small vehicles at headways of 1 s or less presents a major technical problem which is amenable to a combination of design approaches. This paper explores the effect of basic parameters such as vehicle length, reaction time, emergency and failed vehicle deceleration rates, and emergency jerk rate on potential minimum operating headway. The results of this analysis are then discussed in the context of five HCPRT programs: Cabtrack (United Kingdom); Aerospace (U.S.A.); MBB-Demag "Cabintaxi" (Germany); CVS "Controlled Vehicle System" (Japan); and Matra "Aramis" (France).

17 097672 PERSONAL AUTOMATED TRANSPORTATION A PAT SOLUTION FOR AUSTRALIAN CITIES. Despite the rapid rise in material standard of living, cities have become less pleasant places to live in. In order to reverse this trend transportation systems need early attention. An examination of the parameters which set limits to the location and design of an automated transportation system, within the constraints of available technology, lead to the specification for a system designed to serve a major Australian city. A complete description is given of all parts of the system including: layout and station location; the guidance and type of motor to be used; the three types of vehicle to be carried by the system; line speed and average

waiting time. The total cost of the system is calculated in a simple way. The stages in which the scheme would be implemented are discussed. These would involve restructuring the local car industry and changing the form of the taxes levied upon the ownership and use of cars. Appendices describe the technical options available, the method of calculating the cost of the system, and developments in rapid transit systems in other countries. /TRRL/

17 097799 INSTEAD OF CARS. The book deals with the future of transport and has two central themes: the need for revolutionising ideas on moving people and goods and the conclusion that there is no single panacea. The author examines a number of new technologies such as driverless vehicles, electronic guidance systems and moving pavements, and discusses ways in which they can be put to use and their limitations. New ways of using existing vehicles-trains, buses, taxis, bicycles and cars-are also considered, together with new concepts of town planning and life-style that could reduce the need to travel. /TRRL/ /TRRL/

17 097817 DESIGN OF HIGH SPEED MOVING PAVEMENTS FOR MASS TRANSIT. Part 1 of this report is a broad survey of High Speed Moving Pavements (HSMP's), and Part 2 presents a new design for a HSMP. The first part considers the urban transportation problem, and develops the role of HSMP's as a viable solution. Basic use requirements, and operating principles of various concepts are discussed. There follows a review of current HSMP designs, considering safety, capacity, speed, etc. Entry and exit techniques, and some inherent user problems are considered. Thirteen systems, 2 of which exist as working prototypes, are included. Part 2 describes the design of a gravity accelerator which would take passengers from 2 mph walking speed to 8 mph cruising speed. Aspects considered in detail are the use of gravity for acceleration, the geometrical configuration of lenticular pallets, the design of track, the ability of the system to execute horizontal curves, and a design for the drive system. A scale model is described, and results obtained from testing it are used to assess a full-scale system design. A computer program to calculate coordinates for the accelerator track of the above system is listed in full. /TRRL/

17 097996 TRAFFIC CONTROL AND TRANSPORTATION SYSTEMS. Proceeding of the symposium include 57 papers that point out the most recent advances in automation and control as applied to the various transport fields with emphasis on the systems aspect. The main topics dealt with are: urban as well as road and

highway traffic control; bus control systems; urban transportation systems on segregated tracks; air and railway transportation systems. In all these fields, the emphasis is placed on the link between the more or less theoretical research and the practical applications. Sessions are also devoted to modeling and decision aids methods as well as to the methods proper to provide harmony between transport planning and social organization planning. Some papers are in French with English abstracts. Following is a partial list of titles and authors of the papers presented. Methodology and Programming Package for Railway Traction Simulation. By Marko Vuskovic and Branko Lusicic. Regulation des Circulations en Gare de Paris-Nord. (Traffic Control on the Paris Nord Railroad in France). By Marcel Aubert and Andre Lemaire. 17 099208 PRT-SEARCH FOR A DEFINITION. Although there is still a large amount of controversy on the subject, "Personal Rapid Transit" appears to be a sound concept. Morgantown, West Virginia, and the Dallas-Fort Worth airport system, are presently the only operating prototypes; Morgantown is still experimental but Dallas-Fort Worth airport is now in revenue service. The article describes the other plans that are presently considered for PRT in North America.

17 099333 A SIMULATION MODEL FOR PLANNING DUAL-MODE SYSTEMS. The adequacy of the existing techniques in performing the tasks related to the planning of dual-mode transit systems is evaluated and a new model to enhance the analytical capability of the planners is presented. The network analysis and operations analysis phases of the transportation planning process are examined and the limited scope of analysis with programs of the UMTA Transportation Planning Systems (UTPS) is pointed out. A new simulation model for dual-mode systems is described which incorporates the demand responsive characteristics of the system and provides an additional tool in operations analysis. The model which is based on several assumptions, is applied (for illustrative purposes) to a hypothetical problem.

17 099351 AUTOMATED GUIDEWAY TRANSIT. This assessment of Personal Rapid Transit and other forms of Automated Guideway Transportation has been prepared in response to a request from the U.S. Senate Committee on Appropriations. Its objectives: To provide the Committee with information on the current status and social and economic aspects of Automated Guideway Transit development; to assess the key problems associated with AGT as perceived by potential riders, the communities and the transit industry; to identify major policy issues and automated guideway transit program alternatives and to explore their implications. It is concluded that to date the Federal AGT R&D program has not produced the direct results which could be reasonably expected from an expenditure of \$95 million.

United States Congress June 1975, 399 pp, Tabs., Refs., 4 App.; This report was prepared at the request of the Senate Committee on Appropriations, Transportation Subcommittee.; ACKNOWLEDGMENT; ORDER FROM: GPO, Repr. PC, NTIS, Repr. PC, Microfiche

17 099748 NETWORK MODEL STUDIES FOR PERSONAL RAPID TRANSIT. The development is described of network models (for personal rapid transit, systems) which contain the basic network geometry and trip-making characteristics and provide a baseline model for service policy/cost trade-off studies as well as for the design of various system management algorithms required to implement a chosen service policy.

This effort involved the determination of the discriminating characteristics of the high performance PRT and high capacity PRT systems developments, the review and classification of planning studies, and the determination of basic forms for the networks and travel patterns. The planning studies were further reviewed to determine special constraints considered in the urban implementation.

17 125022 AN ENVIRONMENTAL EVALUATION OF A NEW SYSTEM. This paper reports a process of environmental appraisal of the effects of introducing a system like cabtrack into central London. The characteristics of the system are first considered: cabstops, track, cabs. Criteria for the assessment of the impact of the system are presented and illustrated. The problem of changing a network to avoid conservation areas, listed buildings, areas of good visual quality and narrow streets but take advantage of the opportunities provided by redevelopment areas and inaccessible areas are discussed. It is concluded that the system has sufficient flexibility not to involve excessive environmental costs. The conclusion discusses problems of embodying the potential of new technology into long term planning. The number of the covering abstract of the textbook is IRRD abstract no 212297. /TRRL/

17 125047 MINITRAM-CROYDON OR SHEFFIELD FIRST? This article describes the current potential of minitram for usage in Sheffield. It briefly discusses initial reactions to the scheme and the different attitudes to it between the local authorities, their departments, the government, and TRRL. The need for a public demonstration system and the reasons why Sheffield is suitable are noted. The features of the system such as mechanics, performance, controls, vehicle interior and general exterior design are listed as are a series of criteria for guideway design relating to alignment, power, control, robustness and environmental intrusion. Consultants admit that there will be a degree of intrusion but suggest that suitable treatment may soften the impact. Croydon is also noted as a possible site for an installation for a number of reasons. /TRRL/

17 125048 IMPROVEMENTS IN OR RELATING TO GUIDANCE APPARATUS FOR TRACK FOLLOWING VEHICLES. This patent gives details of an invention relating to guidance apparatus for track following vehicles of the kind in which the vehicle is normally guided along the track by a guidance abutment at each

side of the track. The invention incorporates left and right hand secondary guidance, which can be moved by a selector on the vehicle. This prevents loss of vehicle guidance at fork junctions. Figures show (1) the plan and end elevation of a vehicle on a track (2) a plan view of a track junction and (3) a detailed end view of co-operating parts of the vehicle and track. Operation of the guidance apparatus is described. /TRRL/

17 125050 CONFERENCE ON CONTROL ASPECTS OF NEW FORMS OF GUIDED LAND TRANSPORT HELD AT THE INSTITUTION OF ELECTRICAL ENGINEERS, LONDON, 28-30TH AUGUST, 1974. AUTOMATICALLY CONTROLLED ROAD VEHICLES. This report describes the dual mode concept of vehicle automation being considered at TRRL. Details are given of (1) the lateral control of the guidance system which is provided by a cable buried below the road surface and energised with an audio frequency of 5 KHZ at 150 M.A. Two ferrite-cored pick-up coils are mounted on either side of the front of the vehicle to sense the horizontal component of the electromagnetic field about the cable. The original TRRL guided vehicle, a Citroen ds19, used a hydraulic jack in the steering linkage to provide the steering force. This technique was complex and expensive. Recent advances in dc motor design have now made dc motor drives both feasible and economically attractive. The switching amplifier designed for TRRL is described; (2) the longitudinal control systems which are based on a closed loop control of vehicle speed. Speed commands in voltage form in the range 0-10 volts are supplied to the control

system, the amplitude of the voltage command being proportional to the required vehicle speed. The speed command signal, fed to the speed control loop, is generated by (1) a cruise control selector, (2) a road to vehicle speed command link, and (3) an automatic headway control system. During normal experimental running only one of these three sources is switched on at any time. For the covering abstract of the conference see IRRD abstract No. 400100. /TRRL/

17 125054 A NEW VERSION OF THE HOVERTRAIN. Very brief details are given of a new version of the hovertrain driven by a rack and pinion system announced by the Aerotrains Company in France. "Tridim" is cheap to build because the track is so light-the cost of a 300 metre test track and model vehicle was less than L25000. The vehicle can be manufactured in sections and assembled at the point of delivery. Individual vehicles carry between 4 and 100 passengers providing an overall capacity of 15-20000 passengers an hour. Its maximum speed is 64 km/h or on incline of 3% and can climb 15% inclines. The car is braked by pads gripping the track. /TRRL/

17 125073 TRANSPORTS OF DELIGHT? This is a discussion of innovative transport as applied in Ontario, Canada. \$1.3 billion will be invested over ten years, hopefully giving Canada the lead in the world market. Because of rapid urbanization, the Ontario government has, since 1969, heavily supported public transport. The goal in planning now is to reduce the need for travel, rather than to allow a suburban sprawl.

Toronto is the location for several experiments. A dial-a-bus service operates in the suburbs, while staggered working hours have reduced peak-hour travel. The most important step is the development of an intermediate transit system, in a public park, to test the acceptability of such a system. This could carry up to 30,000 passengers per hour, with far less visual intrusion, noise and pollution than rapid transit or motorways. Eight firms tendered for the design, and Krauss-Maffei of Germany won the contract, with a magnetically-suspended vehicle. A test track and vehicles were built in Germany. They have now withdrawn, leaving the project to the public urban transportation development corporation. Another company, with government help, is designing linear induction motors. The current system design is for a rubber-tyred vehicle powered by linear motors. One large American Firm has a license to market the Krauss-Maffei system in the USA, and is collaborating with the UTDC on the Toronto demonstration. /TRRL/

17 125148 USING TRANSPORT MODELS TO FORECAST A LONG RANGE MARKET. This essay sets out the conclusions of a study to estimate the likely overseas market for automated personal rapid transit systems. The UK share of that market is inferred. Personal rapid transit and more conventional systems are considered as competitors for the world market. A survey was made (by questionnaire) of planning officers in 151 cities in 22 countries, to find out their long-range plans, and to gather general data. The data were used to predict demand for prt as a function of location, size of city, etc. In the next 10 years U.S. cities will constitute the sole market; cities elsewhere will lag 5 to 10 years behind. A dynamic model was developed to predict the share of public transport won by a new system. Auto-taxi is best if car-drivers are to be attracted. A probabilistic market model was used to estimate world and U.K. markets. The author warns that development of these markets depends on political and social, rather than technological, forces. A distribution is presented, showing pessimistic and optimistic forecasts of the world market for PRT. Good agreement with two independent estimates is shown. The U.K. share of the market is discussed, although no actual estimate is given. /TRRL/

17 125530 A REVIEW OF CURRENT DEVELOPMENTS. Four types of urban passenger transport journey are distinguished and the characteristics of the transport systems needed to cater for them are outlined. This leads to a basic distinction between area or network systems and line-haul systems. Technical developments which will make the new systems feasible are outlined. Some studies of the application of particular systems are reported, both in hypothetical and concrete situations. Two major constraints on the adoption of new systems are then discussed: economic viability and environmental impact. The number of the covering abstract of the textbook is IRRD Abstract No. 212297. 17 125772 QUANTITATIVE ANALYSIS OF SYNCHRONOUS VERSUS QUASI-SYNCHRONOUS NETWORK OPERATIONS OF AUTOMATED TRANSIT SYSTEMS. This paper investigates the performance of the synchro-

nous and quasi-synchronous network control policies proposed for modern automated transit systems. Performance is analyzed from the user point-of-view in terms of the expected travel time delay associated with each policy. Using an idealization of the network layout and uniform demand for service, analytic expressions for the expected delay are derived for each policy in terms of fundamental parameters (line spacing, trip rate, trip length distribution, maneuver region). Comparisons of the performance of each policy are presented in parametric form. /Author/

17 125804 PRT IMPACT ON TRANSPORTATION. The increasing congestion of urban areas requires multimodal transportation solutions. Personal Rapid Transit (PRT) is discussed as one of the supporting modes for regional systems as a feeder to high-speed corridors and for circulation and distribution missions. PRT may begin as small loop or linear systems and expand to complex network grids in planned phases. For equal dollars spent, increased ridership and route coverage is possible with PRT systems versus line-haul corridor systems. All modes must complement each other.

17 125830 NEW TRANSIT MODES: APPLICABILITY AND CURRENT STATUS. A survey of new urban transportation systems around the world reveals that four significant technology classes are presently emerging: Moving Way Transit (MWT), Light Guideway Transit (LGT), Personal Rapid Transit (PRT) and Dial-A-Bus (DAB). The author concludes that LGT a state-of-the-art, that accelerating MWT systems are at an awkward state with respect to the marketplace that high capacity PRT appears to be no less than four years away from state-of-the-art and the DAB systems are operational.

17 126149 THE DYNAMIC SCHEDULING APPROACH TO AUTOMATED VEHICLE MACROSCOPIC CONTROL. APPENDIX III TO PROJECT EES 276A. In the research reported here a new approach to network control, termed Dynamic Scheduling, is evaluated by simulation techniques. Although this approach utilizes the concept of synchronous slots, it does not employ "preprogramming" or "origin-destination slot reservations" as is common to many schemes, but rather employs a combination of path reservations through interchanges (as each one is approached) and maneuvering-space reservations (for the "next" interchange). Control tasks concerned with individual vehicles (e.g., scheduling and maneuvering) are handled at the local level, and those concerned with vehicles in the aggregate (e.g., "lane flow" distribution and "entrance flow" control) are handled at the central level. Dynamic Scheduling was evaluated by simulations of a variety of networks including directional interchanges; entrance-exit interchanges in a loop; and a twelve-interchange urban network. It was found that: flow rates through interchanges will, in general, be limited by the interactions among vehicles maneuvered on the approach lanes; both a traveler's expected total longitudinal maneuvering delay and its dispersion increase with both the level of demand on the system and the number of interchanges he traverses; and based on simulated egress flow restrictions, it appears that blockages would be effectively handled by this approach. /Author/
