42 133674 THE NIMS SYSTEM AND ITS USE IN PUBLIC TRANSPORT PLANNING [Nims-systemet och Naagot om Dess Anvaendning i Kollektivtrafikplanering]. The nims system is a computerised planning system, adaptable to conditions in individual municipalities, comprising methods and programs whereby data bases can be constructed and maintained, analyses performed and information presented statistically or graphically. Geographical location of reference objects is an essential element of the system; this is related to population, business data, etc. The system can be used for public transport planning. Data concerning population and employment on a zonal basis are fed into traffic models. These are used for analyses of bus service availability, accessibility of service facilities, the standard of service, etc. The system has also been used for simulation of the taxi-bus system. /TRRL/ [Swedish]

42 134234 SPATIAL VARIATIONS IN TRANSPORT CHARACTER. The aim of this paper is to show, by means of cluster and principal component analysis of sub-regional data, common patterns of spatial variation among transport and other social economic and demographic characteristics. By creating synthetic proxies for affluence and urban density from the principal components, density is shown significantly to affect both the intensity of car and public transport use and the proportion of work trips dependent upon neither mechanical mode. This, together with the independent effects of population change on ownership and transport use, has two implications for transport forecasting: that at this level of spatial aggregation the relative attractiveness of public transport to choice riders is only a marginal determinant of total modal split and that the assumed correspondence between the travel behaviour of existing and new populations may persistently underestimate levels of car ownership and usage. 42 134264 DISAGGREGATED PERCEPTIONS AND PREFERENCES IN TRANSPORTATION PLANNING. This paper uses preferences and similarity judgments with respect to system characteristics of an integrated innova-

tive urban transport system to better understand the demand for public transportation. This transport system concept embraces dual mode transit, personal rapid transit, and people mover vehicles. A major goal of this study is to identify if insights could be uncovered by segmenting a sample of respondents into homogeneous perceptual groups. Three psychometric models are applied to a set of judgments from a set of respondents. The results from these models are used to cluster individuals into homogeneous population segments on the basis of common pattern of preferences. The patterns of preferences for the various groups are then linked to their socio-economic characteristics. The analysis provides some useful insights as to the socio-economic profiles of groups preferring automatic vehicle control, basic transport service and personal luxury service. These results make it possible to better understand the benefits derived by these user groups from different system alternatives. 42 134297 HOW RAPID TRANSIT GOT LOST IN THE CLOUDS. In the mid-1960's the U.S. government supported a resurgence of public transportation, but simultaneously denigrated the existing practitioners. Now the 10-year-old dream shared among federal government, academics, politicians and some aerospace companies has turned into a financial, technical and political nightmare which has also set back mass transit in many cities by a decade. The American government and aerospace industry have pursued the wrong products, and in consequence harmed established manufacturers, given confidence to the anti-rapid-transit lobby and disillusioned transit's well wishers. The lesson is that money can only be made on standard performance products with cost escalation clauses.

42 134405 SOME IMPLICATIONS OF ALTERING THE BALANCE BETWEEN PUBLIC TRANSIT AND HIGHWAY CAPACITIES IN URBAN AREAS. Current policies on urban transport directed towards increasing the use of public transport are discussed. The private and public aspects of urban transport systems are examined, and the con-

straints which must be observed in attempting to get more people to travel by public transport, without reducing the overall supply of transport services presently existing, are delineated. / TRRL/

42 134513 A MONEY VALUE OF TRAVEL TIME SAVINGS-FACT OR FICTION? With the increasing use of cost-benefit analyses to estimate the relative values of different transport proposals- either public transport or roads improvement schemes numerous efforts have been made to estimate a money value of the benefit of the reductions in travel times likely to be obtained through the implementation of alternative schemes. Several philosophies of how reductions in travel time derive their money values have been advanced as the basis of these estimations. Typical of these methods are those described by M.E. Beesley, H. Mohring, I.N. Moses and H.F. Williamson, T. C. Thomas and G.I. Thompson, and the Melbourne Metropolitan Transportation Committee (MTC). However, the widely differing estimates of money values of time savings (from 9 to 155 per cent of average income) raise the question that these travel time savings (though at first sight one of the main benefits of a transport improvement scheme) may have actually been used instead of other benefits such as increased travel comfort and convenience, or extended travel horizon, which are rather more difficult to measure and quantify. The estimated money values are best described as a price which people are prepared to pay for improved transport, and which will vary with time and with the amounts people are prepared to pay for these benefits. Urban transport improvements which benefit the whole community are most likely to be achieved through increasing the operating efficiency of commercial vehicles and public transport services. (a). 42 134514 THE CALIBRATION OF THE NORMAL MARGINAL DISUTILITY MODAL SPLIT MODEL. With the present interest being shown by government in public transport, demands are being made on the transport planners for improved choice of travel mode modelling techniques. Many models in the past have merely "explained" a high proportion of the variance in the data and consequently their explanatory power is only a causal illusion. To use such models predictively, one must be confident that the invisible relationships underlying the data will continue unchanged through time; this is at best a dubious assumption. The model tested is based on utilitarian theory and can therefore be examined from both theoretical and empirical viewpoints. Until now only hand methods of calibration have been used. A statistical method of calibration using data from Australian cities as input has been developed. 42 134648 NATIONAL TRANSPORTATION POLICY. The need for comprehensive planning, for definition of decision-making responsibility and for adequate transportation funding are discussed in a preamble, concerns relative to the various modes (aviation, highways, transit, railroads, pipelines, transmission lines, specialized transportation) are addressed, the governments role in transportation is examined, and transportation funding alternatives are considered. Some of the principal factors common to various modes of transportation programs are: research and technological achievements, mobility, multiple use and joint development, design, productivity, competition, and safety. Provisions which a national transportation policy should make with regard to the various modes of transportation are listed, and the role played by local, state, federal and special purpose authority are outlined. Transportation funding at two levels (establishment, continuance, and rehabilitation of national networks; and supplementary federal support of state and local transportation systems) is discussed.

American Assn of State Hwy and Transp Officials Nov. 1975, 23 pp

42 134679 CRITICAL DECISIONS IN THE RAPID TRANSIT PLANNING PROCESS. This paper shows how financial, attitudinal, and physical factors influence decisions on whether to build a rapid transit facility and how much to build. The authors discuss the need for a more rigorous planning process that will discriminate among projects considered for financial assistance. They note the inadequacies of aggregate criteria and suggest that cost per passenger mile (kilometer) is a useful but incomplete measure. Results of benefit-cost analysis for major systems are compared, and specifications are suggested to increase the usefulness of such an analysis. Standardized estimates of benefits and costs, although inadequate in insulation, can make a useful contribution to the analysis process.

42 134680 EVALUATION OF RAIL RAPID TRANSIT AND EXPRESS BUS SERVICE IN THE URBAN COMMUTER MARKET (ABRIDGEMENT). The basic alternative transportation modes in the urban commuter market, which are bus and rail transit, are covered in this paper. Comparing these alternatives on the basis of full cost, which includes supplier cost (costs for vehicle, way, and structure) and user-time cost (costs for access, waiting, in-vehicle transfer, and egress time), is dealt with. A modern rail rapid transit line has about the same passenger-carrying capacity as a bus system has if the bus system uses an exclusive busway for line-haul and surface streets for downtown distribution. The levels of user-time cost for a modern rail rapid transit line are equivalent to those for a bus system, but the supplier costs are much higher for rail rapid transit. Lower full cost can be achieved for

low-density, short-haul residential collection if 8-passenger bus-wagon jitneys are used instead of 50-passenger buses.

Boyd, JH, Discussor (Motor Vehicle Manufacturers Association) Asher, NJ (Institute for Defense Analyses) Wetzler, ES (Econ, Incorporated) Vuchic, VR *Transportation Research Record* No. 559, 1976, p 44-50, 9 Ref.; ORDER FROM: TRB Publications Off

42 134681 COMPARATIVE ANALYSIS AND SELECTION OF TRANSIT MODES. Current planning of transit systems in many cities requires comprehensive comparisons of alternative transit modes. This paper reviews the state of the art. Important conceptual studies and successful, practical mode comparisons for several cities are pointed out. Serious deficiencies of studies using hypothetical situations and comparing modes through costs only are shown on a diagram typically used in these studies. Methodology for mode evaluation consisting of several steps is presented. Requirements of passengers, operator, and community are defined; then candidate modes are selected through type of right-of-way, technology, and operation. Each mode then is evaluated in terms of monetary costs, other quantitative units, and qualitative values. A summary of the procedure also is presented.

42 134685 COMPARATIVE ANALYSIS OF URBAN TRANSPORTATION COSTS. This paper develops the methodology and compares door-to-door trip characteristics of some urban transportation modal combinations that are currently in use, are being considered, or appear to hold near-term promise for corridor travel in large U.S. cities oriented to the central business district. The cost and travel time of various options are developed separately for residential line-haul, and downtown trip components. Then they are combined selectively to explore relative merits of door-to-door alternatives. The analysis addresses the many possible variations in corridor length, central business district size, daily volume level, and temporal flow pattern. Furthermore, the sensitivity of costs with respect to changes in design specifications, operating policy, automation, and nature of construction is explored. A case study compares various options for Metro in the Washington, D.C., metropolitan area. The marginal costs of busway-based systems are lower than those of systems based on rail rapid transit. Automation is not likely to lower rail rapid transit operating costs dramatically. High-performance, exclusive busways require substantial initial investment but are less costly and faster than rail rapid transit in almost all environments and volume levels. Residential collection with jitneys costs only a little more than residential collection with buses and provides much better service. Car pools provide the least expensive service and attractive door-to-door time.

42 135031 INDIVIDUAL PASSENGER TRANSPORT AND THE PUBLIC TRANSPORT SERVICES. An investigation is reported of the cross-elasticity or elasticity of substitution of the demand for individual transport with regard to the characteristics of the collective transport offered by public services. Details are given of the variables and the data, and the multiple regression equations which were computed. The results obtained lead to several conclusions. The increasing demand for individual transport measured by the volume of road transport expressed in passenger-kilometers, has been explained almost exclusively by the increasing level of the real GNP per capita. The increase of real level fares for railway commuters and for passengers using urban collective transport seem to have fostered the demand for individual transport, all other conditions being equal. The level of ordinary fares for the collective transport seems to have had no influence on the demand for individual transport. The quality of collective transport service has no influence on the demand for individual transport. Further conclusions are listed regarding the relationship between the demand for individual and collective transport, and the choice of transport.

42 135929 DETERMINING PRIORITY AREAS FOR TRANSIT SERVICE. Using a suburban Philadelphia county as a case study, an ordinal ranking procedure is proposed as one method of defining primary and secondary priority areas for transit service. Bucks County, a fast-growing auto-oriented society is considered with particular consideration being given to the spatial distribution of 3 special groups: school age children, senior citizens, and low income families. The ordinal ranking technique was employed to determine which of the 23 boroughs and 31 townships in the County should be considered as primary and secondary priority areas for new or expanded public transportation service. Each borough and township was ranked in terms of the density measures recorded for each 6 socio-economic indicators (the 3 special groups, population, zero car households and employment) and a composite score was obtained by summing individual values. The applicability of the ordinal ranking technique was initially determined by correlating the amount of new service proposed in the subsequent transit development program with the location of first and secondary areas in Bucks County. It was noted that the productivity of service expressed in passengers per mile or passenger miles per seat miles should vary along a route or among routes serving areas with different socioeconomic characteristics.

Polin, L (Simpson and Curtin Incorporated) Caruolo, JR (Bucks County Planning Commission, Pennsylvania) *Transit Journal* Vol. 2 No. 2, May 1976, pp 27-34, 1 Tab., 2 Phot.

42 135930 DEMAND THEORY: ITS APPLICATION TO TRANSIT. The concept of elasticity of demand is discussed and a methodology that would facilitate its practical usage by transit planners is presented. The discussion focuses on fare elasticity which is defined as the proportionate (percentage) change in the demand for transit resulting from a proportionate change in the fare

charged by transit. As much, this elasticity indicates the sensitivity of demand to alternative fare levels. The practical solution to estimating fare demand elasticities is illustrated with reference to the bus transit in the San Diego Area. It was noted that as the fare increased, demand falls off more than proportionately, and revenues fall despite higher prices. It was also found, in general, that the total revenue is maximum at that point where elasticity equals one; this therefore, sets the lower bound on the fare that should be charged.

42 136313 AN APPROACH TO TRANSPORTATION SYSTEMS MANAGEMENT IMPROVED USER-ORIENTED TRANSIT TO A MAJOR TRIP GENERATOR. The metropolitan Planning Organization in Cooperation with the State and publicly owned operators of mass transportation services are required to develop (Transportation Systems Management-TSM (as a part of the urban transportation planning process) which integrates traffic operations programs with transit development study results as a means of improving the movement of people and goods. TSM which is designed to maximize the use of existing road space, reduce vehicle use, improve transit service and increase transit management efficiency, involves 4 primary tasks. The initial step involves inventorying current state, local and regional programs and developing a tabulation by project type. The second step is that of selecting and defining eligible projects. This is followed by evaluation of the projects and by the development of TSM based on the prioritized list of projects.

JHK and Associates Oct. 1975, 12 pp, 1 Fig.

42 136917 ESTIMATING THE EFFECTS OF URBAN TRAVEL POLICIES. The report presents models and procedures for quick evaluation of transportation policy options on urban travel behavior. The methods described in this report can be used to estimate the travel demand effects of a wide variety of transportation policy instruments with currently available data in a matter of hours, or minutes, with the aid of a calculator. To evaluate the effects of a transportation policy, travel is separated into work and nonwork purposes. The work travel section of the report describes procedures for applying disaggregate logic models to generally available grouped data. To analyze the effects of policies on nonwork travel, a disaggregate travel demand model is estimated which is designed to be broadly applicable to a variety of planning and data contexts. Both the work and nonwork trip demand models and procedures are exercised on sets of policy issues which are of current interest, including gasoline taxes, parking restrictions, transit service improvements and the introduction of new modes. Where appropriate, travel demand elasticities with respect to level of service changes are computed.

42 137360 MACROANALYSIS OF THE IMPLICATIONS OF MAJOR MODAL SHIFTS IN INTEGRATED REGIONAL TRANSPORTATION NETWORKS. The report describes a macroanalytic approach to the problem of analyzing changing travel patterns in an integrated regionwide transportation network. Separate models of residential areas, transportation corridors, and central business districts are combined in a modular representation of urban structure suitable for use in policy analysis and transportation planning. This analytic approach treats demand parametrically, has minimal data requirements, and provides rapid insights into the impacts of alternative patterns of transit and automobile usage. Such impacts as travel time, user costs, congestion, and energy consumption are examined explicitly. Application examples discuss the potential economies of scale available from major shifts in current transit usage patterns, tradeoffs between flexible-route and fixed-route systems, and the potential benefits available from policies to reduce the effects of demand peaking.

Billheimer, JW Bullemer, R Holoszyc, M ; Systan, Incorporated, Department of Transportation Summ. Rpt. System-D147, DOT/TST-76-64, Apr. 1976, 42 pp; Contract DOT-OS-50265; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-254923/6ST, DOTL NTIS

42 137364 INTEGRATED ANALYSIS OF SMALL CITIES' INTERCITY TRANSPORTATION TO FACILITATE THE ACHIEVEMENT OF REGIONAL URBAN GOALS. INTERCITY TRANSPORTATION IN RURAL REGIONS: VOLUME 2. REGIONAL FACTORS AND ANALYSES. The volume includes analyses of the structure and development of economic planning regions as typified by the nine rural regions which constitute the study area for this research. Other research topics include studies of the feasibility of a demand-responsive air taxi system and air ambulance service. Mailed survey instruments were utilized to define patterns and characteristics of travel in rural regions and to afford information concerning behavior in response to shortages of transportation energy and attitudes toward such shortages. Recommen-

dations are formulated to address typical transportation problems in rural regions and to enhance their potential for growth.

42 137418 FUTURE SCENARIOS FOR URBAN TRANSPORTATION. The author finds that, between 1972 and 1990, urban passenger miles will greatly increase. This increased demand will be met by a particular modal split. Presently, these modes have certain characteristics. Unless the internal combustion auto meets the statutory emission standards, it will cause more air pollution harm than the diesel bus and electrified modes. Using total energy consumption comparisons, the internal combustion auto that meets DOT suggested fuel economy standards for 1980 (19.6 mpg) is twice as energy intensive as the diesel bus, three times as energy intensive as rapid rail and the electric bus, and five times as energy intensive as the electric car and the advanced GRT. If 47% of all urban travel is made on electrified modes in 1990, 1.6 billion barrels of petroleum can be saved, at a cost of 1.7% increase in anticipated electricity demand. The author concludes that to decrease energy consumption, improve urban air quality, and improve urban transportation, strategies should be aimed at achieving a transit and electric intensive modal split. Opportunities for action include (1) strongly supporting HR 8800, which, if passed, will appropriate \$160 million for 5 years to the Energy Research and Development Administration (ERDA) for Electric Vehicle R and D; (2) working in cooperation with ERDA to develop an urban private passenger electric vehicle and improved battery powered electric bus.

42 137479 REPORT OF THE TWENTY-SEVENTH ROUND TABLE ON TRANSPORT ECONOMICS, HELD IN PARIS ON 10TH AND 11TH OCTOBER, 1974, ON: GENERAL TRANSPORT PLANS: METHODS, GAPS AND PROSPECTS. Transport planning, whether horizontally integrated with the overall plan for the structure of society or vertically integrated with different levels of transport planning, is stated to have two basic problems. These are determining the optimum infrastructure and transport system for a given economic development and physical distribution of population and industries, and estimating the effect of a given transport system on the population distribution and economic activities. An example from the rimcity is described, and the Dutch integrated transport study for the Netherlands transport plan is summarised. The conclusions drawn from the study were that the real problems of transport lay in the built-in inadequacy of physical planning. For the future, attention is drawn to the need for better methods for integrating various transport models and for explaining the impact of infrastructure and transport systems on land use. Discussions arising from the paper are also reported; they include a survey of planning experiments over the previous fifteen years. The shortcomings of such experiments are highlighted and indicate the need for a reappraisal of the concept of transport plans. /TRRL/

42 137570 EVALUATING PUBLIC TRANSPORT [Att Vaerdera Kollektivtrafik]. The basis of a national economic analysis for public transport is the endeavour to achieve effective utilisation of resources. Costs must be weighed against benefits. Resources are valued according to their alternative use value; only resources with an alternative use are considered. Taxes are regarded as merely a transfer from one sector to another. Road maintenance costs, travellers' time, accidents and environmental effects are also considered, although evaluation of the last two in monetary terms is very difficult. Travellers' time is valued on the basis of how much extra they would pay to travel faster; this, however, gives only average figures since the value placed on time varies greatly in different circumstances. As regards benefits, these are estimated by finding how much extra travellers would pay in fares to retain a route threatened with closure, and thus obtaining a demand curve. Examples are given of applying this method. It is considered that development of models which give a better representation of demand and thus traffic benefit, is most urgent. /TRRL/ [Swedish]

Westerberg, B *Svensk Lokaltrafik* No. 6, 1975, 4 pp, 5 Fig., 1 Tab.; ACKNOWLEDGMENT: National Swedish Road & Traffic Research Institute, TRRL (IRRD-218404); ORDER FROM: National Swedish Road & Traffic Research Institute, Fack, S-581 01 Linköping, Sweden

42 137572 THE DEVELOPMENT OF PUBLIC TRANSPORT MODES [Utvecklingen av Kollektivtrafikneden]. In choosing a traffic system for a certain district, all relevant factors must be considered, such as journey patterns, available resources, and objectives regarding walking distances, journey times, comfort etc. It is difficult to quote general cost levels for different modes; the energy requirement varies considerably. Tests by Swedish rail to introduce 200 km/h trains offer large savings in time, but problems connected with unmanned crossings must be solved. The chief improvements needed for railbound transport concern station comfort. The needs of the handicapped will be catered for, and automatic ticket systems will free staff from routine tasks. Express traffic can be designed to miss a number of stops or to use every other stop. Investment costs for auto-minibuses are very high. Design speed and choice of braking system are critical. Buses are the most versatile mode. To make getting on and off easier, introduction of several smaller wheels may be necessary to lower the floor level. Reserved lanes are useful but bottlenecks occur at end points, and kerbside parking creates obstacles. Bus stops are usually of low standard. Speeds can be increased by using the skip-stop system. Taxibus costs are very high and must be subsidised. /TRRL/ [Swedish]

Sillen, P *Vag-Och Vattenbyggaren* Vol. 21 No. 12, 1975, pp 49-52, 2 Phot.; ACKNOWLEDGMENT: National Swedish Road & Traffic Research Institute, TRRL (IRRD-218408); ORDER FROM: National Swedish Road & Traffic Research Institute, Fack, S-581 01 Linköping, Sweden

42 137574 ROAD USERS CHOICES OF TRAFFIC MODES [Trafikanterns Val av Färdmedel]. Both in planning roads and traffic installations and in controlling traffic, it is essential to know the distribution of traffic over different modes. Over the past 10 years, logit models have been found to have properties which make them very well suited for traffic planning. They have better statistical precision than conventional choice of mode models, and the explanatory factors are also the instruments at the planning authority's disposal. Logit models can be used for: 1. Traditional forecasting, 2. Analyses of the effect of traffic policy changes, 3. Comparisons of standards, 4. National economic cost-benefit analyses. The results of analyses in greater stockholm show that increased service frequency, direct connections without the need to change, and maximum comfort are the measures most urgently needed to increase travel on public transport. Very good agreement is found between forecasts with logit models and actual data. /TRRL/ [Swedish]

42 137724 THE DECLINE AND FALL OF URBAN PUBLIC TRANSPORT. The author criticises the present urban public transport policies which attempt to provide a realistic alternative to the private car restraining their use at commuter peaks. He suggests that restraint of car use does not lead to simple substitution of public

transport journeys; fewer car journeys are used to accomplish the same activities. Although the flow of car traffic has been reduced in city centres, this may have an undesirable long term effect on its level of commercial activity and foster the development of out of town shopping centres. Many commuters now leave their car at home where it can be used by the rest of the family, thus diverting possible off-peak bus users. A revised policy is suggested where peak hour car restraint is removed and urban public transport services are reduced annually by five per cent. Pedestrians should have priority during a designated off-peak when all cars are excluded. Park and ride facilities from peripheral car parks should only operate at off-peak periods. /TRRL/

42 138145 URBAN PUBLIC TRANSPORTATION GOAL DETERMINATION: A RESEARCH APPROACH. Urban problems such as energy shortages, congestion, and increasing highway costs are prompting communities to reassess the need for public transportation. A solution can be achieved if citizens are encouraged to rely less on the automobile and more on public modes for intracommunity travel. However, achieving user shifts in mode preferences is not easy because of the automobile's popularity. Consequently, if public transportation is to realize its potential, effective planning is essential, and it must begin with the setting of appropriate goals for community transportation services. Among the complexities that add to the difficulty of setting goals are the differing needs of existing and potential user groups, the variety of transportation service alternatives, community role structure, environmental constraints, and limited resources. A promising approach to setting community transportation goals is the policy Delphi method. Through this technique information is collected independently from various individuals and groups concerning future events and policy issues. Opinions and information are gathered without the participants' having to interact. Moreover, feedback of information from other participants is provided to each Delphi panel member. The paper examines the community transportation goal-setting task in the context of a complete transportation planning process. Major attention is given to applying the policy Delphi method to generating community transportation goal information and assessing the extent of agreement among policy makers.

42 138294 A PRICE RESISTANCE MODEL FOR PERSONAL TRAVEL. This paper describes the development of a price resistance model for personal travel. The model provides a comprehensive and flexible mechanism for assessing the effect on the demand for travel for any particular mode or modes of cost changes, such as changes in bus fares, petrol prices, parking charges, etc. Both the absolute change in the

overall demand for travel associated with any change in cost (considered in terms of both time and money) for a specific mode, and the competitive adjustments in demand between modes as a result of the change are taken into account in the model. The results of a case study on the effect of bus fare increases shows that the models predictive ability is good and that it is a realistic and robust tool. /Author/

42 138587 TRANSPORTATION PLANNING FOR SMALL URBAN AREAS. The initial focus of this research was to develop a simplified transportation planning process for small urban areas of less than 250,000 population that is sufficiently flexible so that travel forecasts can be based on a small sample home-interview survey or simulation. It was found that the existing standardized procedures were incompatible with the possible variations in the nature of the problems, available resources and expectations of the participants. The need for a customization of planning procedures was established and the current organizational framework and technical practices in both land use and transportation planning were evaluated from that standpoint. Land use planning in small communities was found to be highly standardized in format and content, but not in procedures, which varied significantly in terms of sophistication. The transportation planning procedures appeared to be relatively more standardized. The research identified and presented four types of transportation planning techniques for application in small urban areas: (a) network simulation based on synthetic models and a small sample household survey, (b) consumer-oriented transit planning procedure, (c) simple techniques for corridor analysis, and (d) hand-computation oriented procedure for estimating localized impacts of major traffic generators. Under each category existing techniques were reviewed and tested (to varying levels).

42 138589 DISAGGREGATE TRAVEL DEMAND MODELS: PHASE 1 REPORT. This report presents the results of Phase I of a study to develop improved disaggregate models of urban travel demand. Such models will form the basis for improved travel demand estimation procedures for application to specific urban transportation system planning alternatives and public policy issues. Policy-sensitive travel demand forecasting models are developed and calibrated with data from individual travelers' choices, using data from two urban areas. The resulting models are evaluated and recommendations for their implementation are discussed. Several application scenarios are presented to illustrate how the models may be applied. An extensive analysis of the Independence of Irrelevant Alternatives property of the multinomial logit model is reported. Issues in model specification and calibration and collection of data for disaggregate models are consid-

ered. The findings of the study are that disaggregate demand techniques are workable and versatile, and properly applied, can be used to analyze transportation planning issues not presently addressed by conventional approaches and deserve wider application.

42 138869 ROAD PASSENGER TRANSPORT: POLICIES PROBLEMS AND PROSPECTS. The article discusses the problem of framing road public transport policies, which, it is claimed, should be based on the operating experience of the industry. Although policies designed to develop public transport services while reducing dependence on private transport have been outlined in the past, further action in the form of producing a fully integrated plan has not been taken. In considering the objectives of a transport policy in all its aspects, it is thought important that local authorities should receive guidance while retaining the power to suit transport policy to local conditions. Current government policy at a time of short-term financial restriction is causing operators to impose service reductions to prevent financial collapse, so preventing long-term planning for the better use of national resources. While in forming any transport policy it is politically unrealistic to deny ownership of a car to any section of society, the use of private transport must be controlled to provide greater access and mobility to all sections of society. It is suggested that bus operators should pay greater attention to market research to improve the image of their 'product' by better public relations. The introduction of transport policies and programmes (tpps) for 1975-76 is seen as an advance in attitude towards policy making, allowing a greater co-ordination of public transport to meet the needs of different areas. /TRRL/

42 138948 LOW-BUDGET MODAL SPLIT ANALYSIS. The paper describes the data collection and calibration of A generalised cost modal-split model carried out at very low cost. The model was based upon assumptions about the value of time and relative disutilities of time components derived from other work. Both a straight line and logistic curve model formulations were fitted to the data and, over the range of values considered in the analysis, both gave very similar results. The use of the model to assess alternative pricing policies for car parking and bus fares, and the resulting recommendations on the relative price and supply of central and fringe public car parking space, are also described. (A). /TRRL/

42 138953 NEEDED: A MORE PROGRESSIVE, LESS DEFEATIST ATTITUDE TO PUBLIC PASSENGER TRANSPORT. The author suggests that the recent failings of public

transport policy have been due to particular factors which will not necessarily persist. Factors considered include the slow delivery of buses, cheap petrol, a poor image and slow progress in urban rail programmes which have proved important in Europe. The author attacks proposals suggested in a previous article and puts forward his own ideas on how a smaller and more efficient bus fleet should be managed to stay within the government's reduced subsidy limits. /TRRL/

42 139028 RUCI: A ROAD USER COST PROGRAM FOR LONDON. RUCI is a computer program to determine the present worth of road user costs for roads and road schemes in London. It is similar in purpose to the Department of the Environment's program COBA, the use of which is now mandatory in the evaluation of major non-urban road schemes, but rucI is designed specifically for urban roads and urban traffic conditions, for which COBA is unsuitable. RUCI will assist the technician to (I) identify roads for improvement, (II) select the best design from among a number of alternative proposals for one project, and (III) to determine priorities. At a higher level the rucI program will provide a basis for determining the road budget and/or the successful road projects. Because the program values occupants' costs it will be useful in studies involving public transport, and improve the technician's contribution to community decision making on road projects. /TRRL/

42 139209 TRANSPORTATION PLANNING IN NAGOYA METROPOLITAN AREA-USING PERSON-TRIP SURVEY. The Nagoya Metropolitan Area has an extent of 40 kilometer radius with Nagoya city as its center, and is the third largest metropolitan area in Japan. Its population is about 6-million 110-thousand as of 1970. Nagoya city surpasses other large cities in Japan in the road improvement situation owing to the land readjustment work such as rehabilitation from the ruins of World War II, and its completed road system with enough width has received wide publicity as a successful case of city planning in this country. It has, however, become apparent that many problems have cropped up as in other metropolitan areas of Japan, such as chronic traffic congestion, lack of parking spaces in CBD, waste gas and traffic accidents caused by the rapid increase of population and more excessive increase in the number of motor vehicles. To cope with these problems, it is not sufficient only to improve road networks. It is also necessary to carry out a comprehensive urban transportation planning as a total system, with the optimum assignment of modal functions to motor vehicle, railway transport, two-wheeler, etc. Now, one of the merits of person-trip survey is the grasping of a passenger's preference of transportation by modes, because the survey may get directly the information regarding the movement of people generating a traffic, different from an origin-destination survey of motor vehicle or a survey for railroad users, in trying to get the movement of

vehicles. From such a point of view, we carried out a person-trip survey in the Nagoya Metropolitan Area, and have made an analysis for the present pattern, estimation of future traffic demand, and planning of transportation facilities, using the findings of the survey. /Author/

42 139557 PROGRAMMING TRANSPORT INVESTMENT: A PRIORITY-PLANNING PROCEDURE. A priority-programming procedure was developed and is being implemented by the Ontario Ministry of Transportation and Communications. The procedure initially will deal with rural highway investment but can be extended to transit and urban areas. An earlier paper has given a general background of the procedure. This paper shows how the linear-programming formulation is a valuable extension of current methods of cost-benefit analysis. The basis of the extension is the explicit consideration of trade-offs concerning the time of investment for improvements. The method also provides for different interest rates for discounting benefits and costs. The paper describes the linear-programming formulation including the treatment of alternatives, regional budgets, and commitments. The paper also discusses the treatment of interrelated or joint benefits of improvements. Finally, the paper presents the calculation procedure for the key benefits-user time and vehicle operating cost. This procedure accounts for variations in hourly volumes over the year and uses existing information as input. /Author/

42 139611 ASSESSING NATIONAL URBAN TRANSPORTATION POLICY ALTERNATIVES. This paper describes a model for assessing national urban transportation policy alternatives and its application in the 1974 National Transportation Study in the U.S. This multimodal version of the trans urban model system employs an aggregate modelling technique which treats each urban area as a single analysis unit. Given a level and mix of funds, the model calculates the amount of highway and transit facilities, travel demand by mode, system performance, and external impacts such as fatalities, land consumed, air pollution, dislocations and energy consumed. The model was applied to assess the effects of alternative funding and pricing policies for the 64 largest urbanized areas. /Author/

42 139718 TRAVEL ESTIMATION PROCEDURES FOR QUICK RESPONSE TO URBAN POLICY ISSUES. This report presents the findings of an investigation of the ability of travel estimation procedures to provide information which can respond quickly to urban policy issues. Perhaps the most significant material in the report are descriptions and evaluations of 34 models and procedures which should prove useful to transportation planners in selecting available techniques appropriate for quick response to policy issues. This project identified urban transportation planning issues requiring a quick response on the part of responsible agencies. Questionnaires, on-site visits, as well as a review of pertinent reports, were used to determine current needs. In addition, the project reviewed and evaluated current and emerging techniques as to their ability to respond rapidly to the issues identified. It was found that an effective and responsive transportation planning process must be capable of rapidly providing estimates of the values of criteria used in the evaluation of multi-modal facility and service alternatives. These evaluation criteria include service, impacts and costs at less than the regional scale. It was found that emphasis has shifted away from long-range regional capital facility planning to providing short-range highway and transit improvements at sub-regional scales. Land use is a major issue and no longer can be treated as a fixed input to the transportation planning process. No one existing travel estimating technique was found to be completely adequate in responding to all of the many questions being asked. A quick, efficient four-step transportation planning computer process to provide for improved response to some of the current issues was recommended. Additionally, a policy oriented non-network specific procedure is needed to evaluate system changes and policy changes from a nominal condition. Development of manual methods are recommended to support project level and service changes in meeting quick response needs. The need for new disaggregate techniques which can deal with the non-work travel market was also emphasized.

42 139838 STATUS OF TRANSIT IN OHIO. An overview is presented of public transportation in Ohio, an inventory is made of transit systems in Ohio, and statistics are included which support and summarize the above data. The overview examines the changing role of public transportation, discusses energy issues, expresses concern for elderly and handicapped citizens, are reviews rural public transit, pupil transportation, public transportation planning, federal programs, transit authorities, and revenue sources. The inventory of transit systems describes each system and includes a 1973 transit profile. Twelve districts are reviewed, and the details are outlined of

intercity bus service, limousine service, pupil transportation, intercity rail passenger transportation, water related transportation, and discontinued operations. Statistical figures and tables are presented which show present and past trends in the transit industry and identify the extent of government involvement in urban public transportation.

42 141153 TRANSPORTATION PROGRAM.

The Office of Technology Assessment made several reports to Congress in 1975 concerning the safety, economic, and energy aspects of the nation's transportation systems. An assessment of automated guideway transit defined three classes of these systems and examined their economic and social impacts. The process by which communities plan for and implement rail rapid transit systems was assessed, based on area case studies. A short term study was made of the relationship between cost and availability and transit patronage, between transit incentives and automobile use, and the effect on unemployment of increased expenditures for transit. Another assessment analyzed the testing and operation of automatic train control systems in respect to safety, economics, and performance. In regard to the rehabilitation of the nation's railroads, a group of three related assessments was made on a broad range of railroad issues. The assessment on automobile collision data evaluated methods of data collection on collision forces resulting in occupant injuries. The assessment on changes in the use and characteristics of automobiles was begun late in the year, and will examine such issues as future availability of fuels, shifts in public attitudes, and public policy alternatives.

42 141270 A SHORT RANGE TRANSPORTATION PLAN OF THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS. The Short Range Transportation Plan of the Southern California Association of Governments (SCAG) is designed to address near term transportation problems and solutions by detailing in terms of time, cost and effectiveness all transportation planning activities for the next five years. The proposed short range transportation improvements for the SCAG region include preferential treatment on freeways and major arterials for high occupancy vehicles, carpool action programs, transit development

strategies, bicycle related programs and commuter rail service. A monitoring and evaluation process is included in the Short Range Plan so that individual improvements can be assessed and the cumulative effects of these improvements on air quality can be determined.

42 141281 METROPOLITAN TRANSPORTATION PLANNING: PROCESS REFORM. Shifting public values, increasing competition for public resources, and improved technical capabilities have rendered obsolete certain aspects of the conventional regional transportation planning process. Several recent regional planning reviews and restudies have surfaced a new approach. This paper suggests how philosophy, organization, staffing, and technical approach can be balanced in a new process to incorporate the concern for long-range regional issues with short-range localized issues. The implications of such a restructuring of the planning process will be most dramatically felt in the redefinition of a plan as an open-ended document in response to the current status and future options for a continuing improvement program. /Author/

42 141288 TRANSIT SKETCH PLANNING PROCEDURES. The current urban transportation planning process is highly dependent on a complex set of travel demand models that operate at a relatively fine level of detail. These models ultimately produce travel assignments on alternative modes of travel. Unfortunately, these travel demand estimates are often insensitive to policy variables, and the process is often too cumbersome and time consuming to be used to test a wide range of transportation policy alternatives. This paper describes a complementary analytical method called the transit sketch planning process. Its purpose is not to supplant traditional, more detailed urban transportation planning but to extend the range of existing procedures. The transit sketch planning process uses a much more aggregated data base. A logit modal-choice model is adapted to operate at such a level of aggregation while producing transit-demand estimates that are consistent with detailed estimates. Policy alternatives can be evaluated with respect to their overall impact on central business district, city center, and suburban transit demand. With a complementary cost analysis, the degree of subsidy required for each policy alternative is estimated. Those policies that appear to be most promising can be further tested in the traditional urban transportation planning system to evaluate the detailed impacts at a zone-to-zone and facility level. The procedures do not attempt to advance the state of the art of transportation demand forecasting. Rather they attempt to use the best of existing procedures in a framework that can provide quick responses to transit policy questions that local planners must answer.

42 141410 ECONOMICS OF CAR OWNERSHIP AND USE BY TEENAGERS (ABRIDGMENT). Disaggregate income and expenditure data were produced as part of a comprehensive, exploratory study of subgroup travel behavior and mobility barriers. Information from small panels of 50 white male high school studies from 3 working-class Boston suburbs generated insights that could help refine the analysis of metropolitan transportation planning and programs. Traveler benefits and costs used to investigate and forecast trip and modal-choice decisions must consider perceived costs and anticipated incomes of relatively homogeneous population segments, such as older teenagers, rather than average costs and past incomes for heterogeneous population groups or households. Travel cost estimates of engineers and economists seem to be higher than those of teenagers. Incomes for teenagers and their desire to work to pay for high-quality private transportation seem to be underestimated by planners. The study discussed in this paper suggests that teenagers want jobs and cars as means to other objectives such as avoiding boredom, socializing, and obtaining goods and services. Active teenagers appear willing to spend as much as 50 percent of their budgets on transportation that satisfies their complex requirements for off-peak, unchaperoned dating and social and part-time employment trips. Policymakers should consider that many teenagers' perceptions of car ownership and use benefits far outweigh their perceptions of car costs; no evidence suggests that increased public education programs dealing with true car costs or the provision of inexpensive transit service are likely to significantly affect the modal preferences and travel behavior of older, working-class male teenagers. Public policies that reflect the economic behavioral preferences of these teenagers (and probably many other transit-dependent travel subgroups as well) would promote job-development activities and programs to reduce costs of car ownership and use.

42 141508 MAJOR URBAN TRANSPORTATION INVESTMENTS. A statement is made on the Federal Policy (1975) with respect to decisions on major urban mass transportation investments assisted under the Urban Mass Transportation Act of 1964. This statement has been developed in concrete with Federal, State and local transportation and planning officials, transit operators, public interest groups and other parties potentially affected by the Policy. Comments are made on policy areas which require clarification: namely, the measure of transportation cost-effectiveness; the long range plan; incremental development; short term analysis; Transportation System Management improvements; major urban mass transportation invest-

ment; and the relation between environmental impact statement and the analysis of alternatives. Procedures are outlined which will be followed in reviewing alternative analysis, implementing the environmental impact statement, and in making funding commitments.

Federal Register Vol. 41 No. 185, Sept. 1976, 3 pp

42 141682 URBAN TRANSPORTATION STUDY PROCEDURES. Study Number 2-10-74-17, "Urban Transportation Study Procedures," was originally a three-year planning study. Condensed to a two-year study effort, the technical support and research effort will continue under an interagency agreement contract. Study 17 was directed toward providing continuing technical support for the Texas State Department of Highways and Public Transportation in the conduct of urban transportation studies throughout the State. Under this study, assistance was provided in the analysis and forecasting techniques relative to urban transportation studies. The maintenance and modification of computer programs previously developed was performed under this study. The determination of the feasibility and means of theoretically estimating the trip length frequency distribution for "synthetic" urban transportation studies was investigated. The development of a procedure by which the trip length frequency distribution is theoretically estimated resulted. The procedure was tested and compared with the observed trip length frequency distributions from 18 transportation studies conducted in Texas for home-based and nonwork trip purposes, nonhome based, and truck and taxi trip purposes; this procedure was found to yield acceptable results. The sensitivity of traffic assignment to input from the preceding modeling phases was evaluated. Different random trip matrices were assigned to a network and the resulting assignments were compared to the fully modeled assignment and ground counts. Based on the results of these analyses, a sketch planning approach is proposed which would be expected to produce assignment results of sufficient accuracy for preliminary system evaluation and comparison with other alternatives similarly modeled.

Benson, JD Stover, VG Teniente, MF ; Texas Transportation Institute, (No. 17-3F) al Rpt.730 TII-2-10-74-17-3FFin, Aug. 1975, 36 pp, 4 Fig., 3 Tab., 8 Ref.; Research was sponsored by the Texas State Department of Highways and Public Transportation, Planning Division, in cooperation with the FHWA, DOT.; Contract 2-10-74-17; ORDER FROM: NTIS

42 141930 BART'S OUTCOMES: AN EARLY APPRAISAL. After costing \$1.6 billion, BART is now serving only 2% of all trips made in its 3-county district. The overall effect has been to leave highway congestion levels just about where they would have been anyway. Half the expected riders have chosen the convenience of private cars or buses that bring them close to their jobs over the luxurious but relatively inaccessible train. Fares are paying for only about a third of the annual operating costs, and even if ridership reaches the projected levels in another five years, increasing labor and other costs will continue to produce annual deficits. The initial decision to build BART was unfortunately not substantiated by accurate forecasts of patronage or revenues, and planners were convinced it could compete with

the auto-dominated society and come out on top. Hopefully, other urban planning officials will learn from the lessons of BART, and not continue to make the same costly mistakes in providing the best in transit systems that technology has to offer.

Webber, MM ; California University, Berkeley July 1976, 58 pp, 7 Fig., 7 Tab.

42 141938 APPLICATIONS OF VALUE OF TRAVEL TIME TO TRAVEL DEMAND ESTIMATION. Potential areas of application of the value of time within all the predictive models in the transportation planning process are identified, and basic problems associated with such application and the urban transportation planning package are discussed. Three alternatives are described for determining the function of value of time in predictive models. The major applications of values of travel time are in the conventional travel demand models: trip generation, distribution, mode choice, and route assignment. A formulation that would involve the use of costs and times as major explanatory variables in the various decision processes is discussed. Broad areas in which the generalized cost concept in urban transportation models may be applied are indicated (for possible exploration), and gains that it may provide in terms of realism and accuracy of existing models are considered. The need for considerable research in modeling of trip generation before operational models are produced, incorporation of generalized cost in models of trip distribution and mode choice, use of an algorithm in trip assignment procedures, and model interaction are discussed. The reasons for the lack of a set of modeling tools for interurban travel are noted, and choice situations that should be differentiated are indicated. The value of time should be used specifically in predicting the market for possible new modes of intercity travel.

42 142075 A PLANNING MODEL FOR MULTIPLE-MODE TRANSPORTATION SYSTEM OPERATIONS. The problem of generating a set of "good" transportation alternatives during the early and intermediate stages of transportation planning is addressed in this paper. A linear programming model of a multi-modal transportation system is developed. The model is run interactively to determine optimal operating levels for all modes for various transport policy decisions. The model described is a component of a composite network generation model incorporating dynamic changes. The linear programming component determines optimal operating policies for given points in time. The composite model incorporates these in a dynamic programming framework to determine optimal staged investment policies over several time periods. /Author/TRRL/

42 142157 THE ROLE OF ACCESSIBILITY IN BASIC TRANSPORTATION CHOICE BEHAVIOR. Accessibility measures reflect the level of service provided by transportation systems to various locations. Basic transportation choice behavior is defined to include those decisions of how many automobiles to own and how many trips to make by automobile and by public transit. Here, these decisions are assumed to be made jointly by urban households and are conditional upon residential location decisions. It is the purpose of this paper to explore the role of accessibility as a causal factor in such basic transportation choice behavior. An economic utility theory model of choice behavior is postulated in which the benefits from making trips to specific destinations are reflected by measures of destination attraction. Through determination of utility-maximizing trip frequencies, indirect utility functions are developed which include accessibility concepts. Behavioral implications of these concepts are proposed and contrasts are drawn to accessibility measures used in conventional segregated models of trip distribution, modal choice, and automobile ownership. Sensitivity analyses of alternative empirical definitions of accessibility in the choice model are conducted using data from the Detroit regional transportation and land use study-covering counties in southeastern Michigan. These analyses employ a multinomial logit estimation technique and focus on definitions of trip attraction. Results of these analyses indicate that more complicated attraction measures can be replaced by measures involving the proportion of either urban area population or urban area employment within a traffic analysis zone. Also, evidence is found that decision-makers in the case study area consider trips of up to 60 or even 90 minutes duration when evaluating accessibilities offered by alternative public and private transportation systems.(a) /TRRL/

42 142158 APPROACHES TO THE FUTURE IN U.S. URBAN TRANSPORTATION PLANNING. In appreciation of the fact that longer-run considerations are particularly important in the development of urban transportation, during the past three decades American transportation planning has been employing increasingly sophisticated approaches to the future. This article discusses four phases in this evolution, with a given focus dominant in each period. During the first period, following on the initial provision of federal government funds for the construction of highways in and around cities, major reliance was based on simple projections of travel demand in metropolitan regions, based mainly on current patterns. This was followed by an approach which focused on an analysis of impacts on transportation systems of projected land uses, based on forecasts of population and economic growth for a target year, on the assumption that facilities were to be provided to move all vehicles that wanted to move from here to there at least possible cost. The third period was characterized by an increasing consciousness of the value of articulating national and local goals in making transportation decisions, going beyond narrow economic and mobility objectives, and including

the notion of trade-offs among goals. The most recent period discussed is one characterized by rising interest in futures studies, using methods such as "delphi" and cross-impact analysis and approaches such as "alternative futures," as well as a search for achieving flexibility in transportation development and for means of limiting resource commitment in the face of the uncertainties of the future ("keeping options open"). /TRRL/

Perloff, HS Flaming, DJ (California University, Los Angeles) *Transportation (Netherlands) Analytic* Vol. 5 N June 1976, pp 153-173, 21 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-220922)

42 142193 URBAN TRANSPORTATION MODELING AND PLANNING. This book examines in detail the available techniques and current research in travel-forecasting procedures. In an effort to maintain some perspective on the primary uses, the techniques are examined within the broader construct of the transportation planning process. The evolution of the transportation planning process is outlined and some of the fundamental processes associated with forecasting procedures are highlighted. System analysis and economic aspects are covered as well as fundamental concerns related to model building. The relative importance and interactions of the forecasting or modeling procedures are discussed, and the individual steps involved in the procedures are detailed. The theory, and concepts are described of 4 recent approaches to replacing the conventional travel forecasting process. The direct traffic-estimation method, the spatial-distribution model theory, the theory of econometric models, and behavioral travel-demand models are detailed.

42 142201 TRANSIT RIDERSHIP AND DEFICITS: 1980 PROJECTIONS FOR NEW YORK STATE. This report develops alternative forecasts of transit ridership and deficits for 13 New York State transit operations, relating trends in usage to changes in fares, service levels, and auto registrations. It is prepared as part of NYSDOT's Section 9 Study, mandating an evaluation of the 1975-76 state Transit Operating Assistance program, and is basically an extension of similar forecasts made in 1974, assuming various fare and service policies. Forecasts are made and compared for several different assumptions about fares, service, and auto registration trends. Results show that (1) 1980 deficits will be in the range of \$1.2 billion under all fare policies studied; (2) higher fares will significantly reduce ridership without materially improving the deficit picture.

42 142241 URBAN TRANSPORTATION DECISION-MAKING: 10. MANCHESTER AND LEEDS: A CASE STUDY. The salient features of the Manchester and Leeds metropolitan areas are briefly reviewed and their socio-economic characteristics are discussed. The political structures and process, transportation programs and needs, the institutions involved in the transporta-

tion process in Manchester are described, and corresponding features in Leeds are noted. Manchester is noted as slow to develop participation by the private sector in the transportation decision-making process. Recent efforts by citizens groups are noted. The Picc-Vic tunnel scheme (part of the SELNEC Transportation Plan for the Manchester metropolitan area) controversy is discussed. Transportation planning, programs and institutions in Leeds are examined and ways in which they differ from those of Manchester are noted.

Colcord, FC, Jr Lewis, RS; Tufts University Final Rpt. OST-TPI-76-02,VIII, Jan. 1974, 147 pp, Figs., Refs., 2 App.; Contract DOT-OS-30036; ACKNOWLEDGMENT; ORDER FROM: NTIS

42 142242 URBAN TRANSPORTATION DECISION MAKING: 12. HAMBURG: A CASE STUDY. The historical background and socio-economic characteristics of the city of Hamburg, West Germany are discussed as well as its political features, transportation characteristics, and its institutional structures for transportation planning and programs. The extent, quality and innovative administrative arrangements are noted of Hamburg's transit system. The success of the Hamburg Transport Community (HVV) led to the creation of similar organizations in Munich, Frankfurt and the Ruhr region. The cost of HVV is minimal. The joint tariff and coordination of services undertaken under HVV has led to many beneficial results. Two basic factors are identified as underlying Hamburg's successful public transport: a city requires either a substantial tax base of its own or a large amount of revenue assistance from some higher government; coordination of individual agencies involved in public transport is crucial for efficient operation both from the operators standpoint and that of the passengers.

Colcord, FC, Jr Lewis, RS; Tufts University Final Rpt. OST-TPI-76-02,X, Jan. 1974, 98 pp, Figs., Refs., 2 App.; Contract DOT-OS-30036; ORDER FROM: NTIS

42 142243 URBAN TRANSPORTATION DECISION MAKING: 13. AMSTERDAM: A CASE STUDY. The history, socioeconomic characteristics, transportation aspects, political features, and the institutions for transportation planning and decision-making are reviewed. Transportation has for many years been planned in a coordinated fashion and has been closely related to physical planning. Details are given of Amsterdam's automobiles, roads, and public transport system (trams and metro). Eight new towns have been planned in coordination with transportation. An excellent example of such planning is that of Bijlmermeer around an elevated metro-line and carefully separated highways. Controversies and questions related to transportation are listed. These relate traffic management in the city, the long range plan for metro, the question of traffic arteries through the 19th century city center, and the extent of national government authority in transportation decision-making.

42 142374 TRI-STATE REGIONAL CONFERENCE-PROCEEDINGS. The Conference incorporated an overall review of regional policy as well as intensive examination of specific topics. Panels were convened which focused on major regional issues. Preference was expressed for a denser, compact urban development which would conserve energy, protect the environment, reduce costs of utility systems, preserve agricultural land, make mass transit economically feasible and end waste of public funds. The need was expressed for subregional committees not only in transportation programs but also in housing, health and other social services, land use planning, cultural affairs, and law enforcement. The 6 panels covered the following subjects: Environmental Quality-Who should bear the costs? Transportation goals-Can obstacles be overcome? Land Use-Where and Where not to Build, the Economy-Is the Decline Reversible? Housing: How Much, Where, and How? Energy-What the Region can do. State planning responsibilities and interstate cooperation were covered in further presentations. Participation and exchange sessions, while providing a recapitulation of the discussions, also covered the OMB Circular A-95-local government participation; Human Resource Planning-functional and intergovernmental; Economic Development Planning in a Metropolitan Region; and Water Resources, Coastal Zoning and Offshore Development.

42 142480 MODAL CHOICE AND THE VALUE OF TRAVEL TIME. This book brings together a number of recent research studies dealing with both modal choice and value of savings in travel time. The titles of the individual studies are as follows:-A diagnostic survey of urban journey-to-work behaviour-Heggie,IG; Modal choice behaviour and the value of travel time: Recent empirical evidence-Earp,JH, Hall,RD and McDonald,M; The skyport special: An experimental personalized bus service-Heraty,MJ; Valuation of commuter travel time savings: An alternative procedure-Hensher,DA; The value of travel time savings and transport investment appraisal-Jennings,A and Sharp,C; Resource value of business air travel time-Carruthers, RC and Hensher,DA. /TRRL/Oxford University Press 1976, 190 pp, Figs., Tabs., Refs.; ACKNOWLEDGMENT: TRRL (IRRD 221939)

42 142483 INTERACTION BETWEEN PUBLIC TRANSPORT AND URBAN PLANNING. In this paper separate chapters deal with (1) the urban phenomenon and the industrial

revolution; (2) the growth of towns and development and land use patterns; (3) mobility, traffic flows, public and private transport; and (4) costs and fares. The conclusions contained in chapter 5 emphasise the need to coordinate urban and regional planning and to consider transport (public and private) as an integral part of such planning. /TRRL/

42 142733 TRAVEL TIME AS TRAFFIC ASSIGNMENT INPUT: SOME DIFFICULTIES EXPLORED [Reistijden als assignmentinput; een discussie over enkele problemen]. The main theme of this paper is the hypothesis that it is, in the current situation, probably more fruitful to concentrate efforts on improving assignment input quality, rather than only on developing more and more sophisticated assignment models, in order to increase the precision of assignment results. In particular, emphasis should be placed on travel times or travel time functions. After pointing out in a general fashion the relationship between specification errors and data errors, the ways in which inaccuracies of the travel times affect the outcomes of the travel prediction are indicated. A discussion of potential explanatory factors of travel time is followed by a recommendation to establish a travel time model. Special attention is paid to the amount of travel time intersections account for. Then some drawbacks of current assignment models are discussed. Finally, some problems are outlined concerning travel times, which are related to our experiments on the effect of zone size and network detail on assignment results. /Author/TRRL/ [Dutch]

42 142802 THE DEMAND FOR URBAN BUS TRAVEL. This paper discusses the various factors affecting demand for urban bus travel and considers the strengths, weaknesses and problems of alternative models of bus demand. From this work a simple aggregate model of bus demand was derived which was used to estimate fare and service quality elasticities for 12 municipal bus operators. The study estimated the overall fare elasticity to be 0.31 and the overall service elasticity to be 0.63. These findings are compared with the results of other studies and their implications for future public transport policy discussed. /Author/TRRL/

42 142924 THE BART EXPERIENCE--WHAT HAVE WE LEARNED? This monograph spells out misjudgements of designers of the Bay Area Rapid Transit System which the author defines as a lack of appreciation of the San Francisco region's highway accessibility, the significance of supplemental accessibility afforded by BART and

the traveler's appreciation of time spent getting to moving vehicles as compared to time spent inside them. BART's suburban riders have switched from lower cost buses, have adopted travel patterns which do not relieve highway congestion and BART has not altered automobile use significantly. High capital and operating costs are being compounded by low patronage. It is concluded that high-speed, high-comfort travel on exclusive rights-of-way, features that require mainline rail technology, has insured high costs while a more automobile-like technology would have attracted more riders.

42 142929 URBAN TRAVEL DEMAND MODELS WITH COMPETITIVE MODES. The principle of microeconomics and consumer demand theory are utilized to form the mathematical structure of urban travel demand models. Competition between the automobile and four different public transportation mode options is considered. The automobile, which competes with one of the public transport options in a transit corridor, is assumed to make up a competitive mode model system. A stepwise linear regression procedure has been used to calibrate and test statistical significance of each competitive mode model system. A sensitivity analysis has been performed to evaluate the effect of multicollinearity upon model parameter estimates. A calibration procedure that insures the model estimates are statistically valid and consistent is presented. An investigation of the Boston metropolitan area is used in a case study.

42 142938 A TIME-SERIES ANALYSIS OF THE IMPACT OF MASS COMPETITION ON COMMUTER RAIL RIDERSHIP. Extension of the Chicago Transit Authority Kennedy rapid transit line into the close-in suburban territory served by the Chicago and North Western's Northwest commuter line has been studied. There was an assessment of effects on ridership, an evaluation of the effect of rail fare increases in the presence of a competing mass transit mode, a study of the time interval of the impact and its

geographic range, and an assessment of the impact of the energy crisis on commuter rail usage. This paper gives the background, the methods of study and analysis, and the results with their policy and planning significance.

42 143047 MACROANALYSIS OF THE IMPLICATIONS OF MAJOR MODAL SHIFTS IN INTEGRATED REGIONAL TRANSPORTATION NETWORKS. PHASE I. The report describes a macroanalytic approach to the problem of analyzing changing travel patterns in an integrated regionwide transportation network. Separate models of residential areas, transportation corridors, and central business districts are combined in a modular representation of urban structure suitable for use in policy analysis and transportation planning. This analytic approach treats demand parametrically, has minimal data requirements, and provides rapid insights into the impacts of alternative patterns of transit and automobile usage. Such impacts as travel time, user costs, congestion, and energy consumption are examined explicitly. Application examples discuss the potential economies of scale available from major shifts in current transit usage patterns, tradeoffs between flexible-route and fixed-route systems, and the potential benefits available from policies to reduce the effects of demand peaking.

42 143216 URBAN DENSITIES FOR PUBLIC TRANSPORTATION. The report develops relationships to show the suitability of different urban density arrangements to eight modes of public transportation: the taxicab, dial-a-bus, local bus, express bus, light rail, light guideway transit, rapid transit and commuter rail. Differences in transit ridership among urban areas are largely

explained by areawide density, downtown size measured in nonresidential floorspace and the existence of rail transit. Operating and capital costs of the eight modes are examined. At any particular residential density, the demand level will vary depending on the area's distance from a non-resident concentration, and on the size and character of that concentration. For a minimum cost per passenger, downtowns of about 10, 15, and 35 million square feet of non-residential floorspace provide minimum, intermediate, and frequent service, respectively. Express buses to which passengers walk must be confined to large cities, and can only operate at very low frequencies. Park-and-ride express bus service can provide low and intermediate service frequencies to downtowns in the 20 to 50 million square foot range or larger. Light rail is promising for downtowns in the 35 to 50 million square foot range. The present generation of automated light guideway transit is limited to special applications, not to line haul use with its high peaks. Rapid transit to a downtown of 50 million square feet of total non-residential floor-space appears to be possible, if favorable construction conditions exist. Residential densities as low as 1 to 2 dwellings per acre can support commuter rail if the route connects to a very large downtown.

42 143364 A PUBLIC TRANSPORTATION PLAN FOR COLORADO'S REGIONAL TRANSPORTATION DISTRICT. The report describes the recommended public transportation plan for a seven-county regional transportation district. It is a report of three years of activity which led to the recommendation of the public transportation system RTD believes will best meet the needs of the District. Within this time period studies were conducted on the region's specific transportation needs. RTD identified the transportation services which would satisfy those needs most efficiently. The proposed transit system was further tailored to the region as services were applied. Next, RTD examined what would be involved in implementing the system. Finally, RTD studied methods of financing a transportation system for the District.

42 143928 COMPREHENSIVE TRANSIT STUDY. THE UNIVERSITY OF SOUTH CAROLINA. The purpose of the study is to formulate and evaluate alternative transportation concepts which would provide internal circulation within the University of South Carolina (in Columbia) complex. Such a system would serve both university and non-university persons. The planning efforts made in the study relate to overall transportation system planning for the Columbia area. Demographic information, coupled with interviews of students, faculty, and staff, provided descriptive measures of the university population. A recommended plan was developed which encouraged a pedestrian environment for the campus area integrated with highway improvements and key fringe parking facilities. Access to parking areas and circulation within the campus is to be provided initially by mini-buses, eventually, as long-range demand criteria are satisfied, automated Personal Rapid Transit systems are recommended. Interface with the surrounding community and its transportation facilities, existing as well as planned, is accomplished at all levels of development.

42 144021 BART IMPACT PROGRAM: ANALYSIS OF PRE-BART URBAN RESIDENTIAL ENVIRONMENT SURVEY. This report presents an analysis of a 1972 home

interview survey of 2,541 persons living near BART, after most of the system's construction but before its operation. Most of the survey dealt with anticipated rather than actual impacts, although perceived impacts of the system's construction were included. The analysis emphasized tests of the significance of relationships between perceived (or anticipated) BART environmental impacts and hypothesized determinants of those perceptions including specific characteristics of BART, its physical setting, and the respondents themselves. Results of the analysis included the finding that most residents had very favorable attitudes and expectations regarding BART's effects on them. Variations in these responses tended to be related mainly to the respondent's distance from BART and his or her plans to make use of the system.

42 144053 URBAN TRANSPORTATION PLANNING IN DEVELOPING COUNTRIES. A LIST OF SELECTED REFERENCES. This bibliography presents research citations in 3 major areas: transportation and development, urban transportation planning, and transportation information. The research references given here relate to work dealing with transport at national and regional scales, sometimes in relation to metropolitan planning and urbanization in a global sense. Urban and metropolitan transport studies are categorized under topical headings: transport problem perception; planning process; travel characteristics, analysis, model building; transport technologies (vehicles, energy, infrastructures); traffic engineering and management; transport economics; impact-social and environmental; evaluation-decision making process; transport institutions- national and international financing; and selected major urban transportation planning studies. References are also given which relate to periodical, bibliographic and statistical information sources.

42 144136 TRANSPORTATION SYSTEMS MANAGEMENT: BIBLIOGRAPHY OF TECHNICAL REPORTS. This document is a bibliography of readily obtainable technical reports on operational transportation improvements. It was prepared to assist in the development of Transportation System Management (TSM) plans as required by the Urban Mass Transportation Administration/Federal Highway Administration urban transportation planning regulations that were issued in Fall 1975, and in the implementation of TSM improvements. (TSM plans are intended to document the local strategy for improving air quality, conserving energy, and improving transportation efficiency and mobility through management of the

existing transportation system.) Descriptions and availability information on over 150 reports dealing with low-capital, short-range, or policy oriented urban transportation improvements are included and classified into 9 sections. The first, General, includes transportation management overviews, survey reports on the various operational approaches and strategies for improved transportation efficiency, and demonstration program reports. The remaining sections contain more focused reports in the following areas: Preferential Treatment for High Occupancy Vehicles, Traffic Operations, Parking Management, Transit Improvements, Transit Management, Pooling and Paratransit, Pedestrians and Bicycles, and Transportation Demand Management.

42 144349 LIMITATIONS OF PUBLIC TRANSIT IN MEETING URBAN TRANSPORTATION NEEDS. This paper outlines the nature of public transit, the response of the demand for transit to operating policies and presents a set of policy guidelines of use with transit. The author presents the theory that transit should be designed to provide a basic level of mobility in a city and where economically viable, provide for the mass movement of people. The role of transit should not be to get the people out of their automobiles.

42 145326 ALTERNATIVE SAMPLING PROCEDURES FOR CALIBRATING DISAGGREGATE CHOICE MODELS. In this paper, three sampling techniques for calibrating disaggregate travel demand models are considered: random, stratified, and choice-based sampling. In a random sample, the probability of all members of the population being in the sample is equal; in a stratified sample, the population is divided into groups based on one or more characteristics and each group is sampled randomly but at different rates; and in a choice-based sample, the number

in the sample selecting each alternative is predetermined, i.e., the sample is based on the outcome of a behavioral choice process. Existing disaggregate choice calibration methods yield consistent parameter estimates for random and stratified sampling techniques. Although maximum likelihood estimation for the third technique is extremely complex, an alternative, tractable estimator whose estimates are both consistent and asymptotically normal exists. This new estimation technique can be applied by using existing capabilities in ULOGIT or other multinomial logit estimation programs with only minor revisions. This implies that choice-based samples such as on-board surveys and roadside interviews can now be used for disaggregate model calibration. This should substantially reduce the cost of data collection in disaggregate model development. In addition, it opens an entire range of questions regarding the most appropriate sample design for future data collection efforts oriented toward the development of disaggregate choice models for urban travel demand forecasting. /Author/

42 145531 URBAN TRANSPORTATION DECISION MAKING. SUMMARY. The report is one in a series encompassing ten monographs and a summary. Together they describe the transportation decision process in a number of major cities in the U.S., Canada and Western Europe, and interpret this information in such a way as to derive observations and conclusions useful in the identification of progressive transportation decision-making institutions. The monographs contain largely descriptive information and cover the following cities: United States: Atlanta, Minneapolis/St. Paul, Miami/Dade County, Seattle; Canada: Toronto, Montreal; Europe: Hamburg, Manchester and Leeds, Stockholm and Gothenburg, Amsterdam. Interpretive and analytical information is confined largely to the Summary and Conclusion volume.

42 145624 TRANSPORTATION NEEDS SUMMARY. A REPORT OF THE TRANSPORTATION TASK FORCE OF THE URBAN CONSORTIUM FOR TECHNOLOGY INITIATIVES. The report contains the results of the extensive needs identification and screening process conducted by the member cities and counties of the Urban Consortium for Technology Initiatives. Chapter I provides an overview of this unique needs identification process used by the Consortium. While the needs selection process provided the basis for forming the Task Forces for all nine need areas, this report focuses on the work of the Transportation Task Force. The process by which the Transportation Task Force screened the original 94 transportation

needs identified by the Consortium members to its top 10 priority needs is described. Chapter I also contains a status report on Consortium work in four of the top priority need areas.

42 146291 INNOVATIONS IN TRANSPORTATION SYSTEM PLANNING. The seven papers focus on various aspects of transportation planning ranging from state and regional planning to metropolitan and subcommunity planning. They include (a) review of the metropolitan transportation planning process of the 1960s; (b) discussion of the community aggregate planning model; (c) discussion of circulation simulation model to be used in a heuristic method of evaluating and selecting from alternative transit designs; (d) presentation of a conceptual approach to formulate a more comprehensive program for studying and improving trails for park and recreational areas; (e) discussion of the purposes and objectives of the Regional Rail Reorganization Act of 1973; (f) a report on the progress being made in developing a regional simulation model that is interactive and linked with employment, population, land use, and transportation components; and (g) discussion of experience in Wisconsin as it relates to state-regional transportation planning.

42 146489 TRANSPORTATION TECHNICAL ASSISTANCE NEEDS AND REQUIREMENTS ANALYSIS. As part of the continuing reevaluation of the priorities of transportation decision-makers, the Office of R and D Policy (OST) has undertaken a study to determine the transportation technical assistance needs of the various user groups in the infrastructure. This determination was based on four independent studies: (1) TSC Technology Sharing surveys, (2) the report of the OMB Study Committee on Policy Management Assistance, (3) Urban Consortium for Technology Initiatives needs determination, and (4) the National Conference of State

Legislatures survey. The analysis of these needs determinations was stratified to identify those needs peculiar to each of three user groups: (1) policy, (2) planning and evaluation, and (3) operations. The relationship of the needs to both the public management processes and Federal transportation policy are presented.

42 147504 THE INFORMATION NEEDS OF RESEARCH IN TRANSPORT PLANNING.

This review concentrates on passenger transport in urban areas. Systems described and illustrated include high speed (10 mph) pedestrian conveyors; automatic tracked vehicle systems, offering a local network service and a more extended corridor service; rapid transit systems; and finally inter-city traffic, including road, rail and air transport. Some guidelines are given regarding the overall assessment of transport systems in terms of their interaction with each other. Economic, social and environmental cost benefit considerations are also considered. /TRRL/

42 148084 DECISION-MAKING WHEN WE CANNOT REDUCE EVERYTHING TO MONEY TERMS.

This paper addresses the problem of selection amongst alternative transportation actions. Typically, these involve planning and environmental side-effects. The consequences of each action have been assessed by evaluation of its effect on a standard list of factors (attribute list), the same for each action. The selection task consists of using the attribute list to determine a 'worth' of total worth obtained subject to the resource and other constraints which limit choice. This paper considers only the problem of worth. "Simple additive weighting" or "linear worth" is described; this consists of multiplying each attribute by a coefficient and adding up, basing preference decisions on the single number so obtained. This convenient method has definite implications for how each factor should be measured. The study finds that whenever cost is one of the factors, rational decision-making will assign a money value to each unit of each factor, through these money values need have little connection with market values.

Murchland, JD (London University, England); Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 371-373; This paper appears in "Urban Traffic Models," which is a publication containing the proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

42 148089 A DISAGGREGATED MODAL CHOICE MODEL FOR THE COPENHAGEN AREA. A PRELIMINARY REPORT.

The development of the mode choice model is schematically illustrated, and the properties of disaggregate stochastic behavioral models are described. Survey data and samples are described

which were designed to obtain a firmer knowledge of the transportation system characteristics relevant to urban transport policies. The preliminary results of the study indicate that inclusion of the overall travel time by car (T_c) and by transit (T_t) in the model should be in the form: $\Delta T = T_c - T_t$. The same result was found concerning the overall travel cost difference $\Delta C = C_c - C_t$. These results lead to a value of time of 12.83 Danish Kroner/hour from 6 different models with a standard deviation of 1.80 D.Kr./h.

Schiotz, O (Denmark Technical University); Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 56-63, 2 Tab., 14 Ref.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

42 148090 A MARKOVIAN APPROACH TO MODE AND ROUTE SPLIT.

Research is discussed which was designed to determine the size of the park and ride facility that should be constructed adjacent to the station of a new high speed mass transit, tracked air cushion vehicle (ATCV). It was found that binary modal-split procedures were inappropriate, as there were at least 3 competing modes: car, train, and TACV. Ten "channels" were considered, 4 of which were exclusively car-based, 4 of which involved the use of park and ride, and 3 were based upon bus and ride. A model of general formulation involving mode and route split was considered. Details are given of the Markovian process. The computations require information on the transition probabilities which are a result of the subjective estimation by individuals of the attributes of the different alternatives.

Roulet, J; Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 64-75, 7 Ref.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

42 148092 A THEORY OF URBAN ACCESSIBILITY: A NEW WORKING TOOL FOR THE URBAN PLANNER.

The opportunities opened up in the field of urban transport planning by research relating urban accessibility are analyzed and discussed. The estimation of the level of service provided by a urban system is discussed, and the problems associated with the use of conventional economic indicators to reflect transport conditions are noted. The microeconomic model of users' behavior in the theory of accessibility is described. Accessibility to employment opportunities and accessibility for non-work trips are detailed, and applications to planning criteria are reviewed. Applied to urban planning, the economic theory of accessibility enables an estimate to be made of the likely impact upon the service provided to the population by the various transportation networks. The theory provides a key to traffic predictive models, as well as paves the way for fundamental research into the analysis of urban development trends and the effects upon land use which may be induced by decisions taken within the field of transport. Figures are presented which illustrate the behavioral assumption concerning the choice of destination, and the probability distribution of gross utility.

Joening, JG (SETRA, France) ; Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 99-147, 8 Fig.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

42 148093 ACCESSIBILITY: A MULTI-ROLE PARAMETER IN THE PLANNING PROCESS. Transportation quality describing the space-time system, is re-influenced by the space-time system itself. Its complex form may be explained by various closed loops. Indicators, such as accessibility, opportunity for communication at some location, availability of means of transport: all these are figures to describe the quality of transport as a space-time determinant, and they may be used as evaluation criteria in a decision process. The advantage of location (as a level of communication) influences degressively the socio-economic production (the standard of living) of regions. Besides, in regions with a socio-economic production above the average, already small steps in infrastructural programs let expect outstanding rates of growth in their socio-economic production. /Author/

Ruske, IW (Institut fur Stadtbauwesen) ; Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 148-170, 9 Fig., 8 Ref.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

42 148100 CALIBRATION OF MODAL SPLIT MODELS. The details are given of the formulation and calibration of modal split models (which may be used to predict the proportions of travellers who will use each of a given set of modes for given journeys (in the urban transportation context) in an effort to set these models on a sound logical and statistical basis, so that the effect of any necessary assumptions can clearly be seen. The paper discusses the hypotheses of traveller behavior which enable the setting up of modal choice models, and describes the techniques for validating the hypotheses and estimating the parameters of the models. The application of these models to urban transportation planning is outlined. The paper also indicates how the modelling and calibration techniques can be extended to other aspects of the planning process such as trip distribution and route choice.

Daly, AJ Zachary, S ; Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 236-245, 4 Ref.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

42 148103 COMMUTER MODE CHOICE IN DUBLIN. Socio-economic as well as journey characteristics were found to explain commuter mode choice behaviour in Dublin. City-wide choices were adequately modelled by the five variables: (a) excess time associated with the bus or train, (b) the walking time of the car mode, (c) the age of the choice commuter, (d) the demands of the home on the car and (e) whether the car is employer owned or not. The coefficients in this

model were shown to be reasonably stable over time. A number of important recommendations are made on the methodological approach to modal choice models and planning generally. /Author/

Markham, J (Coras Iompair Eireann, Dublin) ; Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 273-294, 6 Tab., 16 Ref., 4 App.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

42 148105 PASSENGER DEMAND RESEARCH IN LONDON TRANSPORT. Areas demanding further research are considered, the results of partial statistical analysis are briefly reviewed, and the development of a model which incorporates the comprehensive transportation study approach and the results of statistical analysis is outlined. This model will contain behaviorally plausible relationships based on transportation planning theory; segment passenger journeys into a number of market categories; and be comprehensive i.e. include trips made by all modes. The basic data source being used to estimate trip patterns and model market shares is the Greater London Transportation Survey 1971/2.

Fairhurst, MH (London Transport Executive) ; Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 316-332, 3 Fig., 6 Ref., 1 App.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England During July, 1975.

42 148106 MODELING THE WALK MODE. This description of how the walk mode is incorporated in the LGORU public transport modelling suite TRANSEPT (a sequence of models designed for short and medium term bus planning), includes a discussion of the relationship between bus and walk modes and an outline of the problems of scale that make walk modelling difficult. Some methods of estimating walk times are sketched, and theoretical problems involved in the incorporation of the walk mode in the modal split model are explored. The formulation of TRANSEPT's bus network representation is outlined in order to demonstrate how the role of walking as a feeder to bus services can be modelled. TRANSEPT models its modal split model so that predicted traveller's behaviour takes account of the availability of the walk alternative. The basis of the formulation is the generalized cost function which weights together the diverse characteristics of travel alternatives particularly the component times and costs of different parts of the journey. With this measure a comparison of the relative attractiveness of the alternatives available can be carried out which ultimately leads to a prediction of the number of travellers using each.

Last, A Daly, AJ ; Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 333-340, 11 Ref.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

42 148108 VARIATIONS IN TRAVEL BETWEEN INDIVIDUALS LIVING IN AREAS OF DIFFERENT POPULATION DENSITY. Analysis of data from the National Travel Survey 1972-3 indicates that as population density increases, (a) the total number of stages per person remains constant; (b) the average stage distance is less; (c) travel is slower; (d) the use of private transport decreases the effects combine in such a way that; (e) the average time taken per stage for each mode separately and in total is approximately constant; (f) the total amount of time spent on all travel per person is approximately constant. A mathematical model based on fairly simple economic principles is discussed, and although this is not yet fully compatible with the empirical findings, it seems to offer a possibly useful approach. /Author/

42 148129 THE POTENTIAL FOR PUBLIC TRANSIT IN THE COMMUTER-SHED AREAS OF EDMONTON AND CALGARY. This paper reports on the project for a commuter-shed for Edmonton and Calgary. It includes a discussion of the existing commuter system, commuter transit costs and revenues, and commuter services. This report emphasizes the need for a multi-modal approach to transportation planning in commuter-shed areas and lists 9 conclusions as a result of the project.

Brander, B (Stanley Associates Engineers, Limited) Morrall, J (Calgary University, Canada) ; Roads and Transportation Association of Canada Proceeding Report Number 7, Sept. 1975, pp 81-103, 6 Fig., 12 Tab., 10 Ref.; This paper was presented at the Annual Conference held in Calgary, 1975.; ACKNOWLEDGMENT: Roads and Transportation Association of Canada

42 148137 THE NORTH PICKERING PROJECT: TRANSIT STUDIES. This report documents the examination of the role for public transit services with in the North Pickering Project. A large part of the analysis has focused on the development of a transit system to serve 75,000 population. However, the review was expanded to consider guidelines for public transportation if at some future time the Community were to grow beyond that target. Guidelines are given for the initial implementation and staging of transit services in the Community. The analysis incorporates specific assumptions related to the type and location of the regional transit system. The report concludes by outlining the possible consequences of other regional transit scenarios on the internal community structure and the local transit system. /RTAC/

42 148221 MAINTAINING MOBILITY. This comprehensive updating of the "Tri-State Transportation 1985: an interim plan" published in 1966, incorporates some preliminary results of intercity rail freight and passenger planning. The

plan is the result of a unified work program dealing with the technical elements of transportation planning and supplemented by a transportation improvement program. The development of the plan and its elements is illustrated by tabulations, and the degree of attainment of the planning objectives is measured by certain criteria shown in the tables. The plan prescribes particular levels of achievement by specific target dates. The current status of the regional transportation components is described, and priority and future projects which achieve the desired objectives are listed. The capital investments are listed, and the operation and maintenance costs are summarized. The combined highway and transit plan yields financial requirements that are compared with available resources.

Tri-State Regional Planning Commission Sept. 1975, 47 pp, Figs.; Second printing in black and white only, March, 1976.

42 148238 TRANSPLAN 76: INITIAL IOWA TRANSPORTATION PLAN. This plan which stresses the roles played by the public and private sectors in providing transportation services is presented in seven sections which cover: statewide transportation planning, the Iowa Transportation Policy, modes, needs, resources and programming, critical issues, and public investment in transportation. Iowa has been using a needs study approach for more than 15 years as its basic highway planning tool. The Iowa Transportation Plan is concerned with the socio economic and environmental consequences of transportation investments as well as decisions on types and timing of investments and funding sources. Iowa's transportation policy supports the establishment of an adequate and safe multimodal transportation system. Air, waterway, rail, transit, road and pipe transit modes are considered, and financial needs and resources are discussed. Passenger and freight modes and planning values related to energy intensiveness are discussed, and freight and passenger cost characteristics are noted.

42 148876 AN ALTERNATIVES ANALYSIS OF THE ROCK ISLAND COMMUTER RAIL SERVICE. This case-study of a major alternative analysis evaluation presents, in a more general perspective, an empirical analysis of the trade-offs between commuter rail and bus service. A series of alternative services were developed, ranging from complete rehabilitation to partial rehabilitation to total replacement of the Commuter Railroad by bus service. The alternatives were evaluated in terms of capital cost, operating deficit, user cost, social impact, environmental impact and operational feasibility. Based on these criteria, the report recommends a complete rehabilitation of the railroad, and a changing of the railroads downtown terminal. The report shows that no type of bus service (feeder to rapid transit, feeder to other commuter rail lines or express to the downtown) in this corridor can achieve the efficiencies that are associated with a rebuilt Rock Island Railroad.

Permut, H ; Northeastern Illinois Regional Transportation Auth Tech. Rpt. Rpt. No TR-76-09, June 1976, 76 pp, Figs., 7 App.

42 148880 RESPONSES TO ALTERNATIVES ANALYSIS REQUIREMENTS. The federal policy for alternatives analysis of major public transportation investments sets forth five principles which, based on experiences in Buffalo and San Juan, are not easily fulfilled when the planning process is entered in midstream with stringent time requirement for completion. It is felt that until the UMTA guidelines for alternatives analysis are well defined, well understood and applied to planning projects from the outset, a difficult adjustment period must inevitably take place. The guidelines were developed, in part, to put rapid transit proposals from different urban areas in a more consistent analysis basis. However, Buffalo and San Juan studies suggest that, to do this on even a limited basis, extreme care will be required to ensure that qualitative factors which are not easily compared are not ignored or deemphasized; and with wholly consistent assumptions representing similar levels of uncertainty.

42 149155 LEA TRANSIT COMPENDIUM (LTC). One comprehensive reference source has been compiled which reports the latest international developments in transit technology via a standard format, using consistent terminology and definitions. The LTC covers the entire spectrum of urban public transportation, including new technology and conventional proven systems and equipment. There are 9 issues per volume plus 2 special issues for 1976-77. No. 1, Reference Guide, gives a description of the Compendium service, short history of transit technology, a classification of transit systems and a guide to the use of the Compendium (definitions, terminology and reporting standards). The other 8 issues report on the following: Moving Way Transit-accelerating moving walkway systems and fixed-guideway systems where passive vehicles move continuously, propelled by mechanical means from the guideway; Group Rapid Transit-automated fixed-guideway systems designed to carry groups of passengers, generally in the intermediate capacity range; Personal Rapid Transit-automated fixed-guideway transit systems which offer on-demand personal (single-party) service; Light Rail Transit (LRT)-operational LRT systems and recent vehicle designs; Heavy Rail Transit-operational conventional urban heavy rail systems, one monorail system, two heavy monorail systems, and vehicles; Bus Transit-various bus system improvement projects, including exclusive bus lanes, express buses, contra-flow bus lanes, exclusive busways, exclusive bus streets, exclusive or bus

priority ramps and automatic vehicle monitoring systems; Para-Transit-various para-transit operations, including Dial-A-Bus, shared taxi, subscription service, jitneys and vanpooling; Roadway Transit Vehicles-small, medium, and large buses and chassis. One special issue will be on Passenger Admission Processing and will report on items of equipment and systems. The Compendium is periodically revised and updated, giving the latest changes and progress on previously reported subjects as well as new material and assessments of the state of the art. Reporting is unbiased and objective, with no preference expressed for particular systems or equipment.

42 149169 EVOLUTION OF URBAN TRANSPORTATION PLANNING. This study traces the evolution of urban transportation planning from the early highway planning activities to the most recent guidelines issued by the Federal government for a joint highway-transit planning process. From this overview, the author concludes that early urban transportation planning processes were structured too rigidly with little flexibility to adapt to changing conditions. The author suggests that the planning processes be more open and receptive to new ideas and should evolve in a manner which would facilitate treating these issues. With the wider range of issues, impacts and alternatives and the greater diversity of participants, considerable effort in the future must be made to develop approaches for addressing these issues and for keeping urban transportation planning a manageable and relevant activity. Weiner, E; Department of Transportation Apr. 1976, 31 pp, 29 Ref.

42 149190 TRANSIT REQUIREMENTS FOR ACHIEVING LARGE REDUCTIONS IN LOS ANGELES AREA AUTOMOBILE TRAVEL. This paper describes the structure and application of a model for estimating aggregate supply characteristics of bus transit systems that are capable of carrying substantial fractions of the person trips in an urban area. Given the number and geographical distribution of trips that must be carried on transit, the model enables a range of transit options for carrying these trips to be developed. Each option is characterized by the number of buses it requires, the geographical area served by transit, the transit schedule frequency, the transit mode split that must be achieved in the transit service area, average transit travel time and cost per trip, and the average travel time and cost that would result if bus travelers used automobiles. The model is applied to Los Angeles, California. The results indicate that large fractions of current person trips in Los Angeles can be carried on bus transit at a cost that is comparable to the cost of automobile travel and with an average travel time that exceeds average automobile travel time by 15 to 20 minutes. However, this requires bus fleets and transit mode splits that are quite large by current standards. For example, to carry 20 percent of person trips at a cost equal to the cost of automobile travel and with an average travel time 17 minutes greater than average automobile travel time, the transit system must have 9500 buses and must achieve a 45 percent mode split in the areas it serves. /Author/

42 149193 A STUDY OF ALTERNATIVE ORGANIZATIONAL PLANNING STRUCTURES FOR THE SYSTEMS PLANNING PROCESS. This report examines the new role and consequent alternative organizational responses the SDHPT may wish to take relative to the recently established multi-modal metropolitan planning organizations. The goals and objectives of federal, state, and local governments, especially Texas officials, relative to transportation planning organization matters are discussed. The findings of research which has been done on highway system planning are analyzed as they relate to SDHPT systems planning organization. State organization models that are designed to accommodate and facilitate multi-modal, urban transportation planning are also presented and evaluated. Four organizational typologies developed by Roland Warren that characterize ways organizations behave when interacting are used as a framework for identifying different possible interorganizational planning situations that the SDHPT may become involved in when dealing with non-SDHPT MPOs. Within each of the four possible contexts, alternative SDHPT organizational planning arrangements are suggested and shown in chart form. The emphasis is placed on organizational alternatives that can be adopted by the SDHPT, some alternatives, however, require the cooperation of MPOs or local governments. The intent of the suggested alternatives is to provide the SDHPT with maximum input into the MPO planning process within the parameters established by present legislation and regulations. /Author/

42 149244 INVESTIGATION OF MODAL CHOICE FOR DUAL-MODE TRANSIT. The attitudes of individuals regarding dual-mode transit, personal rapid transit, and people-mover forms of urban transportation were collected through a home-interview survey. It was hypothesized that a more thorough understanding of mode choice could be obtained by stratifying the sample into homogeneous groups rather than by considering the set of respondents collectively. Respondents were grouped according to two alternative criteria: socioeconomic characteristics and preference judgements. A multivariate clustering procedure was used to determine groups. Frequently used variables for defining socioeconomic groups were income, age, education, and race. Of the 12 system attributes, those selected most often to define preference groups were temperature control, automatic control, and vehicle privacy. However, socioeconomic groupings were stratified by a more consistent set of variables than the preference groups. Mode choice was examined through the use of linear additive models. The predictor set for socioeconomic and

preference groupings was composed of mode-dependent satisfaction judgements. These judgments were made with respect to system characteristics such as waiting time, comfort, and accessibility. The variability of mode-choice judgements was accounted for more accurately by models that stratified individuals into homogeneous population segments than by modes that totally disaggregated individuals; this confirms the main hypothesis. Also, it was possible to account for a greater percentage of the mode choices with stratification by socioeconomic characteristics than by preference judgements of respondents. In general, the socioeconomic and preference groups used alternative predictor sets to explain their mode choices. Dual-mode transit was preferred to either personal rapid transit or people movers. /Author/

42 149338 IMPLEMENTATION OF THE 1975 STATEMENT OF NATIONAL TRANSPORTATION POLICY-A PROGRESS REPORT. This report reviews the progress to date in implementing the courses of action recommended in the 1975 Statement of National Transportation Policy. Recommendations are divided into thirteen areas and progress in each area is discussed, including the following: The railroad industry is embarking on a major modernization program. The financial condition of the domestic and international aviation industry appear to be improving. Progress is being made in energy conservation in transportation and in bringing about transportation regulatory reform. Mass transit and highway programs are being streamlined. Consumer participation in the decision making process is being facilitated. Programs continue to be implemented across the various modes of transportation to meet safety and environmental goals.

Office of the Secretary of Transportation Sept. 1976, 23 pp; ACKNOWLEDGMENT: OST; ORDER FROM: GPO

42 149498 STUDY OF THE IMPACT OF STAGGERED WORK HOURS ON PUBLIC TRANSPORTATION COSTS AND SERVICE LEVELS: PHASE I, CHICAGO TRANSIT AUTHORITY. This report gives details of the loading standards, the percentage of passengers staggered, temporal parameters, cost criteria, the data collection and modification, and the calculations employed in this study. Three levels of loadings per vehicle were selected to represent the range of loading applicable to CTA during peak hours. Three staggering assumptions and 3 alternative staggering patterns were evaluated. The methodology involved 3 phases: data collection and modification, i.e., the translation of CTA scheduling data into the form necessary for use in this study; calculations, i.e. the application of percentages of passengers shifted under various loading standards in order to arrive at the difference in the number of vehicles needed; and analysis, the process of translating the differences in vehicles into operating and capital costs and

benefits. It is shown that in all uses of staggering under loading conditions of 70 passengers per bus and 90 passengers per transit car, there is a cost saving for CTA which increases with increased staggering. The 60 passengers per bus and 70 passengers per car are standards which best fulfill the joint objectives of staggered work hours, cost saving and improved level of service.

Zimring, M ; Northeastern Illinois Regional Transit Authority Rept. No. TR-75-05, Dec. 1975, 25 pp, 3 Fig., 7 Tab.

42 149666 METHOD FOR THE ANALYSIS AND APPRAISAL OF TRANSPORT SYSTEMS IN URBAN AREAS [Metod foer analys och bedoemning av transportsystem i taetorter]. Model studies will be made to provide data for the appraisal of future traffic solutions. The planning model should have the structure, problem analysis, goal formulation, proposal of solutions and evaluation of these. In all model towns, a study will be made of the present situation, three alternative long-term changes in the traffic situation, and short-term changes. Assessment of different traffic solutions is to be based on expected effects; many of these depend on expected traffic flows. These are dependent on the assumptions made concerning division into modes, traffic regulation measures, financial measures. Effects may be direct and indirect ones. The most important effects are accessibility, traffic safety, cost, and noise levels. Data for evaluation must be presented in a clear manner. The method recommended is graphical presentation in a factor profile. Some effects can probably be presented in combination which will make for clarity. The factor profiles must be seen from the standpoint of different population groups based on age, employment and health; assessment must also be made from the standpoint of the state, the municipality, public transport undertakings and the business sector. /TRRL/ [Swedish]

42 149732 OBJECTIVE OF REGIONAL TRANSPORT TODAY AND ITS NEAR FUTURE [Vocation des transports regionaux aujourd'hui et pour le proche avenir]. The author recalls that regional transport will have to take over parts of the individual transport and freight transport run by other operators if energy savings are to be made, and pollution and congestion are to be prevented. Should individual transport be restricted, regional transport will have to be used for transport of school children and other utilizations. It should therefore be made more attractive (for public transport: quicker and easier journeys, direct itineraries, simplified tariff system, increased service frequency; for freight transport: simplified routing, speeding up of vehicle movements, elasticity of demand, etc.). Emphasis is placed on a closer cooperation between regional and urban transport. To fulfil its aim, regional transport should have technological means at its disposal together with legal arrangements such as reserved corridors for buses, priority for buses leaving a bus stop, activation of traffic signals by buses, etc. The author stresses the importance of cost-effectiveness in public and freight transport,

which could be achieved by imposing tariffs adapted to the market and collective economy. /TRRL/ [French]

42 149785 STAGGERED WORK HOURS: A REPORT ON UNITED STATES AND INTERNATIONAL PRACTICE. In 1974 and 1975 a survey was conducted of 131 U.S. cities and 84 cities abroad to determine the state-of-the-art of Staggered Work Hours Programs. Besides soliciting general information about employment and transportation, this international survey covered the techniques employed, achievements, costs, benefits, and other pertinent factors. The response rate was 66%, with a total of 142 cities returning the questionnaires. Analysis of the responses indicates that Staggered Work Hours Programs are in effect in many parts of the world, particularly in the U.S., Canada, and Europe. A total of 51 cities, the bulk of them foreign, indicated some form of the program in effect. Only 28 cities reported having conducted formal work schedule surveys; congestion in the Central Business District caused by work schedules had only been observed informally. Other work scheduling programs, such as the 4-day work week, had been implemented by 44 cities, 20 of them being foreign.

42 149862 WASHINGTON: DOT SEES HEALTHY FUTURE FOR AUTOS. An overview of the Department of Transportation's study "National Transportation; Trends and Choices" is presented. The study traces the form and function of the U.S. transportation system (moving goods and people as an integrated whole) through the year 2000. Also, the possible effects of such factors as population movements and economic growth factors in the system are included. The following conclusions relate to the automobile industry. The automobile will continue to dominate passenger travel as well as most shopping trips unless there is a tremendous shift in present traditional values. Should public passenger carriers double their share of presenger traffic over the next 25 years, the automobile would still account for 80% of all trips. Passenger-miles and freight-ton-miles are forecasted for a 50% and 70% increase respectively over the next 15 years. This increase in demand can be met without increasing our energy consumption. Most of the motor vehicle fuel efficiency will be precipitated by the advances in vehicle and engine design and increasing social responsibility in the use of automobiles. Lastly, an increase is projected in the number of licensed drivers and vehicles owned (automobiles, light-duty trucks, vans and recreational vehicles).

42 149869 THE JOURNEY TO WORK. A BEHAVIOURAL ANALYSIS. The general objective of this study is to build behavioural models of the decision-making process of commuters in the Dublin conurbation. The models are intended to improve understanding of modal choice determinants, thus assisting urban transport authorities to influence modal split by altering pricing and investment policies in order to achieve the most efficient economic balance (in cost-benefit terms) between private and public transport. This volume contains 8 chapters as follows: 1, introduction; 2, models of modal split; 3, towards a theory of mode choice; 4, hypotheses formulation; 5, sample survey methodology; 6, hypotheses testing and model building; 7, modal split predictions and the value of time; and 8, discussion and conclusion. /TRRL/

42 151742 TRANSPORTATION PLANNING AND IMPACT FORECASTING TOOLS. This is one of eight information bulletins developed for the Urban Consortium for Technology Initiatives' Transportation Task Force. The Consortium is a coalition of 34 major urban governments, 28 cities and 6 counties, with populations over 500,000. This bulletin examines new tools, both automated and manual for transportation planning and analysis. Specific emphasis is given to the Urban Transportation Planning Systems (UTPS) package, its features and its application. An extensive list of contacts and an annotated bibliography are provided, including coverage of transportation planning models, land use models, and major impact assessments.

42 151809 DEVELOPMENT OF A TRANSPORTATION PLANNING SYSTEM. The study was designed to develop an integrated multi-modal transportation planning system that would offer guidelines to transportation management for facilitating planning. The major research included developing agency goals and functional objectives; identifying opportunities and constraints as mandated or restricted by existing legislation; defining procedures, organizational alternatives, a system concept, communications and information, a manpower management plan, and an implementation strategy.

42 152046 GOLDEN GATE CORRIDOR TRANSPORTATION FACILITIES PLAN, PHASE II. The development of the 1971 transportation plan for the Golden Gate Corridor is discussed, and the development of transit activities, improvement programs undertaken and committed on the Golden Gate Bridge, and the District's financial position and near-term outlook are reviewed. The studies undertaken at the legislature's request and the District's plan for future transit program implementation are also described. Studies of the bus and ferry system and the Golden Gate Bridge itself are outlined. Transportation studies relating to the legislative analyst's review of District activities, the pricing policy simulation model, the Golden Gate corridor long range transportation, planning, policies, transportation alternatives, and the public reaction to the alternatives are reviewed. The Board of control has accepted the incremental approach to transportation planning and implementation. The planning for transit development and the District's long-range plan for transit development are briefly outlined.

42 152983 THE PUBLIC TRANSPORT STUDY OF THE STOCKHOLM COUNTY COUNCIL. LAKU FINAL REPORT, CONDENSATION. This condensation of the final report discusses community development and public transport in Stockholm, the framework for the development of the region, the extent of commuting and the factors determining this, and the supply and demand of financial resources. The objectives in transportation planning (the optimal utilization of resources in a sense of welfare economics, improved environment and traffic safety, equitable distribution of wealth amongst the inhabitants of the region) are discussed, and comments are made on the demand for public transport journeys. The various aspects of the supply of public transport services covered here include: the production environment, the planning region, the present public transport system, transfer problems, technology, and costs. Studies which describe measures for more effective utilization of resources, measures for improved environment and traffic safety, and measures for more equitable distribution are discussed.

42 153051 CONCEPT DEFINITION OF AN INTERMEDIATE CAPACITY TRANSIT SYSTEM. It is believed that the project of rail transit lines represents a significant federal initiative in the area of urban transportation research and development. The purpose of this paper is to describe in general terms the work which will be carried out, and the manner in which it will be administered.

42 153263 MASS TRANSIT FOR THE FEW. The issue with mass transit planning, as with most other public questions, is still "who benefits and who pays?" A mass transit system can be immediate bread-and-butter transportation for the masses, or it can be luxury transit for the few, paid for by the many. The latter is the way Los Angeles voters saw SCRTD's proposed system twice within the past two years. To prevent the Los Angeles fiasco from recurring, future studies of transportation alternatives--and indeed of any technological choices--must be explicit in addressing the question of benefit and payment. Political and social analysis should become as indispensable a part of transportation decision making as origin and destination studies or studies of technology are today. /GMRL/

Marcuse, P (Columbia University, New York) *Society* Vol. 13 No. 6, Sept. 1976, pp 43-50; ACKNOWLEDGMENT:

42 153266 PROJECT TRIP: A DESIGN FOR COUNTY-WIDE TRANSIT. The Montgomery County Council has approved funding for a plan devised by the County's Department of Transportation that will ultimately provide some sort of public transit in nearly every section of the county. What the transportation planners devised was a set of coordinated, short-range transit projects designed to improve feeder and intra-county movement, with service tailored to the varying character of the community. Two scheduled minibus systems operated by DOT in the urban lower county will link residential sections with commercial centers, educational and recreational facilities, inter-city and local Metrobus terminals and future Metrorail stations. These consist of various systems incorporating minibuses, dial-a-bus, additional bus routes, commuter rail renovations, peak hour bus additions, shelters, bicycle racks and development of fringe parking spaces. /GMRL/

42 153269 A TRANSIT DISTRIBUTION SYSTEM FOR DOWNTOWN ALEXANDRIA. The proposed regional Metro-rail system, currently under construction in the metropolitan Washington area, is planned through the City of Alexandria, with two stations located approximately one mile west of the downtown. This paper reports on the investigation of the real need for a transit distributor system, connecting the downtown with the two Metro-stations and an evaluation of the different available "genetic" types of transit systems in the context of the demand. The study shows that there is indeed a demand for such a distributor system that can be quantified using modeling techniques. /GMRL/ Khasnabis, S (Wayne State University) Picard, JG (Barton-Aschman Associates, Incorporated) Mann, WE (Washington Area Council of Governments) ; American Society of Mechanical Engineers ASME No. 75-ICT-10, July 1975, 11 pp; Presented at the Intersociety Conference on

Transportation, July 14-18, 1975.

42 153311 USE OF MODELS FOR ANALYSIS OF PUBLIC TRANSPORT SYSTEMS [ANVAENDNINGEN AV MODELLER FOER ANALYS AV KOLLEKTIVTRAFIK-SYSTEM]. Because of the rapid increase in wages over the past few years, rational operation of buses is essential. There is a greater need for planning aids. Computer models have been produced for traffic volume forecasts which take into account choice of mode. Questions of interest which must be answered by investigations of public transport are 1. Which proposed traffic system best meets the specified objectives, 2. What will be the distribution between private and public transport as a result of the proposed traffic system. Choice of mode is influenced by a great number of factors; apart from car ownership, the standard of car travel in relation to that of public transport is of great importance. Traffic volume forecasts therefore estimate journey times for both cars and public transport. Models have been used for analysis of public transport and for estimation of journey times. The models have been tested by comparing estimated times with actual ones, and good agreement has been obtained. Use of the models in choice of mode forecasts has also given good accuracy in estimating journey times, but estimation of the actual distribution of modes has been less satisfactory due to the complexity of determining factors. /TRRL/ [Swedish]

42 153321 PASSENGER TRANSPORT DEMAND IN URBAN AREAS. METHODOLOGY FOR ANALYSING AND FORECASTING. This study relates to urban transport demand modelling. Approach methodologies are described and the scope of available procedures, particularly with regard to relevance and determining the conditions for better results, is discussed. The difficulties of measurability are briefly reviewed, and the stratification approach to their solution is outlined. The report finally raises the question of improved consistency in terms of the objectives of demand models and suggests an evaluation of strategy which is in closer alignment with the expectations of present-day cities. /TRRL/

42 153852 RETURNS TO SCALE AND TECHNOLOGICAL CHANGE IN URBAN MASS TRANSIT. The goals of this research were twofold: first, to estimate the nature & magnitude of technological returns to scale in urban mass transit and second, to identify the structure and growth of technological progress. The results are clear on both counts. The production of route miles of transit service demonstrates constant returns to small (large) scale. In contrast, it was found that increasing returns to small scale prevails in production of seat miles of transit service; and the latter measure seems to yield a

more accurate portrayal of full capacity output than does route miles.

42 153857 TRANSPORTATION SYSTEM MANAGEMENT: STATE OF THE ART. This report summarizes current information concerning the spectrum of actions that are relevant to Transportation System Management (TSM). Under Department of Transportation regulations, urban areas with population greater than 50,000 are required to develop TSM plans that document their strategy for improving air quality, conserving energy, and increasing transportation efficiency and mobility through coordinated operation and management of existing urban transportation facilities and services. TSM therefore includes actions to influence transportation demand as well as actions to manage the supply of service or its performance characteristics. The report presents state of the art information on 31 specific TSM actions within the following seven major categories: improving vehicular flow, preferential treatment of high-occupancy vehicles, reducing peak-period travel, parking management, promoting non-auto or high-occupancy auto use, transit and paratransit service improvements, and transit management efficiency measures. Each summary includes examples of successful experience, advantages and disadvantages, guideline conditions concerning implementation, the range of costs involved, and interrelationships with the other actions. /Author/SRIS/

42 153938 URBAN STRUCTURE AND MODAL SPLIT IN THE JOURNEY TO WORK. Relationships between modal split for the journey to work and patterns of social and economic activity in large urban areas are investigated in this paper. Small zone data from six major land-use transportation studies were used as a basis for a systematic comparative analysis of these relationships. Three of the studies were British (London, West Midlands and Selne) and three American (Tri-State, Penn-Jersey and Los Angeles). Standard correlation and regression programmes were employed on a wide range of data, using three different models. The results reveal the overriding influence of car ownership on modal split, but also demonstrate the limitations imposed by urban structure in the form of employment and population densities. 42 154056 INSTITUTIONAL FRAMEWORK FOR INTEGRATED TRANSPORTATION PLANNING. AN INFORMATION BULLETIN OF THE TRANSPORTATION TASK FORCE OF THE URBAN CONSORTIUM FOR TECHNOLOGY INITIATIVES. This is one of eight information bulletins developed for the Urban Consortium for Technology Initiatives' Transportation Task Force. The Consortium is a coalition of 34 major urban governments, 28 cities and 6 counties, with populations over 500,000. This bulletin covers mechanisms encouraging the consideration of highways and transit together in developing short and long range transportation plans and programs. Areas covered include regulatory issues associated with Unified Planning Work Programs, Transportation Plans, and Transportation Improvement Programs, as well as institutional issues associated with Metropolitan Planning Organizations. A extensive list of contacts, a description of ongoing research programs in this area and an annotated bibliography are also provided.

42 154771 DEVELOPMENT OF AN AGGREGATE MODEL OF URBANIZED AREA TRAVEL BEHAVIOR: PHASE 1. This is the final report of Phase I of a project to develop an aggregated travel demand model for use in urbanized area prediction. The model is designed to be applied in the context of the Department of Transportation TRANS model and is based on the aggregation to the urban area wide level of disaggregate travel demand models. Phase I of the project was concerned with the investigation of alternative aggregation procedures. The results of this theoretical and empirical investigation are summarized in this report. In Phase II of this project the results of Phase I will be used to develop an overall aggregation procedure operating on a full set of disaggregate travel demand models. This report describes the implications of the Phase I results and outlines the approach for the overall aggregate forecasting process to be developed in Phase II.

42 154797 APPLICATIONS OF NEW TRAVEL DEMAND FORECASTING TECHNIQUES TO TRANSPORTATION PLANNING. A STUDY OF INDIVIDUAL CHOICE MODELS. The report documents the application of individual choice (disaggregate) travel demand models in urban transportation planning. Three general areas of application are covered: (1) The traditional travel demand forecasting process; (2) short range, transportation systems management evaluation; and (3) patronage and revenue forecasting for new transportation systems. For each application, the suitability of the model is discussed, recent applications are summarized, and two detailed case studies are presented to demon-

strate how the models were used. A short primer on individual choice models is included to provide the planner with enough information to understand how the models work and their differences from more conventional planning models. References are given for those who would like to know more about individual choice models.

42 154816 TRAVELER RESPONSE TO TRANSPORTATION SYSTEM CHANGES-A HANDBOOK FOR TRANSPORTATION PLANNERS. Transportation planners and decisionmakers need an understanding of how travelers respond to changes in the urban transportation system if they are to correctly identify the most favorable opportunities to maximize beneficial use of highways and transit operations. Traveler response to the following 10 types of transportation change are investigated: pool/bus priority lanes, variable work hours, carpooling encouragement activities, buspools/vanpools, area auto restraints, auto facility pricing, transit scheduling/frequency, bus routing/coverage, transit fare changes, and transit marketing/amenities.

42 155406 TOWARD 2000: OPPORTUNITIES IN TRANSPORTATION EVOLUTION. This report describes possible directions for the Nation's transportation system evolution, and identifies research and development strategies to take advantage of the most promising opportunities. The document begins with a brief examination of population and demographic trends, and makes some conjectures about the future. The report then examines transportation opportunities in

five major areas: urban transportation, intercity transportation, the private automobile, freight-systems, and cross-cutting issues such as decision-making. The report also includes general discussions of the relationships among transportation changes in the spatial organization of the nation (land use), and the use of resources: energy, labor, and capital.

42 156106 TRANSIT PLANNING IN A SMALL COMMUNITY: A CASE STUDY. This paper describes strategies for estimating potential markets for transit or paratransit service, developing a potential set of transit system concepts, estimating demand for each of a selected subset of concepts, developing an evaluation process, and selecting an implementation strategy. The case study has shown that there is considerable value in conducting limited, small-scale surveys of specific market segments as well as in developing a wide variety of system concepts in order to permit an effective choice among possible systems. An extensive educational effort is needed for the community participants in the process as well as broadbased community representation throughout the process. /Author/

42 156130 APPLICATION OF A UNIVARIATE LOGIT MODEL TO PEDESTRIAN/TRANSIT MODE CHOICE BEHAVIOR: A SURVEY OF CAMPUS TRAVEL AT THE UNIVERSITY OF IOWA. The principal purpose of this research is to evaluate the predictive power and utility of a stochastic, disaggregate pedestrian/transit mode choice model for campus planning and transit operations. A specific objective is to determine if a relatively simple survey procedure of collecting campus travel data from a small sample can be used to successfully fit a univariate logit mode choice model of pedestrian/CAMBUS travel at the university of Iowa. The first section of this paper provides a brief review of the application of stochastic, disaggregate analysis techniques to the mode choice problem in transportation research, and the use of logit model in special context planning in particular. The second part of this paper provides a description of the University of Iowa campus physical environment and transportation system attributes. This section of the paper also outlines the procedures and results of the April, 1975 survey of campus travel conducted at the University of Iowa. In the third section of the paper, the application of the results of logit analysis of this data set is reported. In the last section of this paper, the potential utility of the logit model formulated and fitted for pedestrian/COMBUS travel is discussed, and a method of evaluating its predictive power is illustrated. /Author/

42 156133 INFORMATION INTEGRATION MODELS OF TRANSPORTATION DECISIONS. This paper describes an ongoing research program in which behavioral analyses are being applied to transportation-related decisions and judgments. The analyses are being carried out within a theoretical framework for developing decision-making models in psychology. The studies described in the paper were designed to show that transportation consumer behavior can be analyzed in an experimental context which can provide some valuable insights into the processes underlying transportation-related decisions. In two of the studies, subjects indicated the relative likelihood of using an automobile or taking a bus in a series of hypothetical mode choice situations, described by variations in cost-differences and travel time differences. The subjects in these studies seemed to base their mode choice responses on a weighted average of these factors. There were, however, individual differences in weighting policies. A behavioral measure of each subject's response preference was useful in predicting his weighting policy, while his nominal group membership was not. Follow-up studies were designed to relate individual differences to antecedent conditions (e.g., the individual's previous experience and knowledge of local transit parameters) and to use this information to effect desired changes in behavior. /Author/

Levin, IP Corry, FA ; Iowa University Technical Report 61, Sept. 1975, 23 pp, 2 Fig., Refs.; This report was produced as part of a program of Research and Training in Urban Transportation sponsored by DOT, Urban Mass Transportation Administration for presentation at the 55th Annual Meeting of the Transportation Research Board, Washington, D.C., 1976.

42 156183 FRONTIERS IN TRANSPORTATION PLANNING. A compendium of papers on the future of the automobile, demand responsive transportation, energy consideration in transportation planning, planning in third world countries, and commuter transportation is presented. The paper on the future of the automobile focuses on current and future travel, employment, and population patterns. An outline of the Knoxville, Tennessee experience examines the process of establishing a city-wide express bus service. Demand responsive transportation and the role that it can play in serving the needs of the poor, elderly, and handicapped is discussed. A discussion of planning for community transit services examines metropolitan-wide planning policies for the transit dependent. Energy use, and consumption characteristics in urban transportation planning is discussed. The paper on BART/Trails focusses on the commuter and recreational trial potential as well as the possibility of interfacing the bicycle with other modes. A discussion on spatial integration and transportation in third world countries focusses on transportation planning in the context of national development planning. A survey is made of existing transportation planning courses in planning schools.

42 157179 THE EFFECT OF ALTERNATIVE URBAN FORMS ON TWO-MODE TRANSPORTATION SYSTEMS REQUIREMENTS.

It is the objective of the research described in this report to determine the most effective combination of road and transit systems to serve a range of cities with differing density and spatial patterns, and thereby to assess the effects of varying urban form on transportation investment and service requirements. A two-mode network generation model is developed and applied to six hypothetical urban forms of two million population size. The comparative analysis of the transportation requirements for each city type indicates a wide range of mode usage, user travel requirements, and modal system investment requirements. While the evaluation of urban forms from a transportation perspective is dependent on the measure of effectiveness chosen, it is concluded that the transportation system requirements by mode are an important determinant in the choice of urban development patterns. /Author/

42 157198 IMPACT OF SUBURBAN RAPID TRANSIT STATION LOCATION, FARE AND PARKING AVAILABILITY ON USERS' STATION CHOICE BEHAVIOR: ANALYSIS OF THE PHILADELPHIA-LINDENWOLD HIGH-SPEED LINE.

In designing a park-n-ride rapid transit system, locating the stations and determining their parking capacities are among the most important decisions. A simple behavioral model useful for evaluating such plans is proposed, and estimated with survey data on the Philadelphia-Lindenwold High-Speed Line. Model variables include user's access cost and time to stations, and transit fares; a probabilistic version of the model is tested, and satisfactorily predicts the station choice of transit users, thereby determining each station's patronage. As prototypical applications of the model's use, predictions of diversion to a proposed new station on the existing Line, and to two proposed branch lines are developed. The report concludes with a case study of evaluating the addition of a station to an existing rapid transit line. The proposed station choice model states that transit users choose the station that minimizes their total journey cost including the value of travel time. In its deterministic form, the model depicts station market areas with hyperbolic boundaries. This model correctly classifies 60 to 65 percent of observed station choices of park-n-ride and kiss-n-ride commuters on the High-Speed Line. A probabilistic version of the model is formed by relating the proportion of users choosing their least total cost station to the difference in cost between the two least cost stations. Of all users choosing one of their two least cost stations, 87 to 92 percent are correctly assigned by this model. The report consists of nine chapters including a fifteen-page summary. Time series and cross-section analyses of travel patterns in the market area of the High-Speed Line provide a context for the more analytical research described above. /Author/

42 157235 COST-BENEFIT ANALYSIS, GOVERNMENT POLICY AND THE BRITISH RAILWAY NETWORK. In 1963 the Beeching Report on Britain's railways proposed the closure of a substantial part of the railway network (British Railways Board, 1963). Although many services were withdrawn, disquiet at the Report's failure to analyse the social benefits of rail passenger services eventually led to the application of the technique of cost-benefit analysis to the problem of unremunerative rail services. However, although such studies revealed that the retention of many rural rail services could not be justified on social grounds, these services were not withdrawn. This paper outlines briefly the history of attempts to deal with the question of the "optimal size" of the rail passenger network. Secondly, it considers the social cost-benefit case for reducing the present size of the network in Britain and the quantifiable benefits from such a reduction. The problem of joint costs is discussed. Finally, it attempts to explain the failure of successive Governments to apply the results of cost-benefit studies in practice, and suggests how the decision-making process might be altered to facilitate a more rational approach towards public transport problems in Britain.

42 157280 MANAGING THE TRANSPORTATION SYSTEM. The objective of the Baltimore Region Transportation Systems Management Plan (TSM) is to formulate a coordinated set of regional strategies to ensure that the utilization of existing highway and transit facilities is maximized, the use of low-occupancy vehicles is reduced and the bus transit system is strengthened. The regional transportation planning process has identified the following such strategies as alternatives that hold the greatest promise of achieving systems management objectives and transportation goals in the Baltimore Region: Provide preferential treatment for high-occupancy vehicles; encourage ride sharing; encourage transit ridership; establish alternative work schedule programs; improve parking management; improve traffic operations; and improve bicycle facilities. Tables are included which summarize the most promising strategies and techniques, and service as well, as an annual component of the recommended systems management plan.

42 157674 URBAN TRANSPORTATION PLANNING GUIDE. The new Canadian planning guide provides a summary of currently applied techniques and procedures for planning transportation facilities in urban areas in a North American context and presents an analytical structure for the planning process. The formulation of goals and objectives, the collection and analysis of data describing the operation of a system, policy formulation, current procedures in analyzing transportation systems, and the political process of implementation are all discussed. Reference is made to other more intensive material. The book is intended as an introductory treatise for engineers, planners, and other professionals working in the field as well as students and interested members of the public at large.

42 157777 FORECASTING PATRONAGE ON NEW TRANSIT ROUTES. A modeling effort is reported in which a logistic curve can accurately describe the relationship between route patronage and elapsed time, and a transit service trial period of only 30 days is necessary for model calibration. Such a model can predict a new transit route's ridership potential without an extended trial period, and could, therefore, lead to a more efficient allocation of available transit resources. For this model, it was assumed not only that a transit route will attract an ultimate patronage level but also that the change in ridership at any given time is directly proportional to the product of the current ridership and the difference between this patronage and the asymptotic value. The patronage variable was standardized relative to the first day's ridership performance. The mathematical relationships are set forth and comments are made on the model sensitivity and validation.

42 157786 CRITERIA FOR PLANNING A HOME-TO-WORK PUBLIC TRANSPORTATION DEMONSTRATION PROJECT FOR LOW-INCOME WORKERS; A CASE STUDY. This paper discusses some basic criteria that should be considered when a home-to-work transportation demonstration project is planned. Particular attention is given to the concept of relating the level of investment that is required if the objectives of a demonstration project are to have at least a 0.5 probability of being detected. The results of a case study in a large urban areas are discussed in detail. /Author/

42 157821 TESTS OF THE TEMPORAL STABILITY OF TRAVEL SIMULATION MODELS IN SOUTHEASTERN WISCONSIN. The assumption of the stability of travel simulation models over time is an essential element of the urban transportation planning process. This assumption was tested using travel simulation models developed with data from an origin and destination survey conducted in 1963 and travel inventory data from a similar study conducted in 1972. Both surveys were conducted by the Southeastern Wisconsin Regional Planning Commission; the travel models tested were those that had been used in the preparation of a regional land use and transportation plan for southeastern Wisconsin that was completed in 1966. The testing performed as a part of the reappraisal of the land use and transportation recommendations of 1966, which was of the temporal stability of the three major travel simulation models-trips generation, model split, and trip distribution-indicated that 1972 trip generation, transit use, and trip length characteristics within southeastern Wisconsin were predicted with adequate accuracy through the application of the original 1963 models. /Author/

42 157823 TRANSFERABILITY AND UPDATING OF DISAGGREGATE TRAVEL DEMAND MODELS. In recent years much work has gone into the development of disaggregate travel demand models. However, little has been done to evaluate the ability of these models to predict travel behavior in locations other than the area for which the model was estimated. Unlike aggregate models, the parameters of disaggregate models are not dependent on a particular zonal system and therefore have the potential for transferability. The motivation behind transferring is clear-if a model estimated in one area can be transferred to another, the cost of conducting transportation studies could be greatly reduced. Several possible approaches for transferring are

developed and discussed from a theoretical perspective. For an empirical evaluation, a work-trip modal-split model estimated on Washington, D.C., data is transferred to New Bedford, Massachusetts, using each of the proposed approaches. The results of estimating the original model on Los Angeles data are also represented. The most significant result is the exceptional performance of the original Washington work mode choice model on both New Bedford and Los Angeles data. This is noteworthy in view of the extreme differences of the means for several variables between these cities. Of the several approaches for transferring that were developed, Bayesian updating based on combining the existing model coefficients with the estimation results from a new sample gave the best overall performance. The results of this study indicate that the potential transferability of disaggregate travel demand models can be realized. /Author/

42 157826 AN APPLICATION OF MODE-CHOICE METHODOLOGIES TO INFREQUENT COMMUTER-RAIL SERVICE. The feasibility of commuter-rail transit in the southwest Baltimore corridor was studied by a variety of passenger estimation methodologies. The methodologies selected were required to be applicable to the corridor scale, to be run manually, and to be capable of quick response. They were also required to be responsive to the addition of one or two trains per peak period, changes in station location and accessibility, and changes in costs such as parking charges and gasoline costs associated with the automobile. No one methodology met all of the above requirements. However, two methodologies were adapted to consideration of infrequent rail service (one or two trains per peak period) and applied to the corridor. The first methodology involved the application of a simple graphical technique that related modes split to station distance from the CBD; the second involved the application of a marginal utility model to corridor census tracts. The infrequent service capability was added, in the case of the graphical approach, by applying experience factors, and in the computational approach by relating automobile captivity to the number of trains per peak period. Both methodologies were transferable, without reestimation of coefficients, to the southwest Baltimore corridor. Both approaches could be applied manually in a person-week or less; the need for any greater sophistication than the graphical methodology is seriously questioned. /Author/

42 157827 THE SUBAREA FOCUSING CONCEPT FOR TRIP DISTRIBUTION IN THE PUGET SOUND AREA. This paper explores one method of reducing the computational costs associated with urban travel demand modeling.

The technique investigated is a data base approach called subarea focusing. The distinction between this technique and other data simplification methods is in the detailed analysis of only a portion of a study area and the simultaneous presence of several levels of areal detail in the data base. A computerized technique for subarea focusing was developed and used for a sample trip distribution application to data from the Puget Sound region. The procedure was not unduly expensive in either manpower or computer time. When aggregate data sets were used to obtain travel demand predictions, substantial savings in computer time were realized. The error analyses indicated some sacrifice in accuracy, but not a serious sacrifice. The results appear to justify continued refinement of the aggregation procedure and investigation of the effects of subarea focusing on other demand models. /Author/

42 157828 STATEWIDE DISAGGREGATE ATTITUDINAL MODELS FOR PRIMARY MODE CHOICE (ABRIDGEMENT). This effort which developed models using attitudinal and situational (demographic and trip-related) data collected in a home interview survey, had 2 objectives; to build mode choice models having both predictive and explanatory value, and to assess the relative significance of situational and attitudinal variables in regional or statewide models. Disaggregate binary logit models for the choice of bus as primary mode were constructed for 6 area-purpose cases. The results of the study suggest that attitudinal variables are less significant than situational variables in predicting primary mode choice. Data analysis showed that automobile users express more satisfaction with the attributes of transit than did those who actually used transit. The study concluded that small disaggregate data sets appear to be adequate for the development of useful mode choice models at the statewide level. Further conclusions regarding the independent variables best explaining mode choice, and the levels of influence of variables on mode choice are also presented.

42 157880 SUMMARY OF NATIONAL TRANSPORTATION STATISTICS. These periodic reports are compendiums of selected national-level transportation statistics. Included are cost, inventory, and performance data describing the passenger and cargo operations of the following modes: air carrier, general aviation, automobile, bus, truck, local transit, rail, water, and oil pipeline. The report includes basic descriptors of U.S. transportation, such as operating revenues and expenses, number of vehicles and employees, vehicle-miles and passenger miles, etc. As the name implies, these reports are summaries of a larger data base, consisting of time-series col-

lected from a variety of government and private statistical handbooks. In the 1975 and 1976 editions, the selected data cover the periods 1963 through 1973 and 1964 through 1974, respectively.

42 158082 PROCEEDINGS OF THE SECOND URBAN MASS TRANSPORTATION ADMINISTRATION/AMERICAN PUBLIC TRANSIT ASSOCIATION RESEARCH AND DEVELOPMENT PRIORITIES CONFERENCE, 1976. This report is a compilation of material that was presented at the Second Urban Mass Transportation Administration/American Public Transit Association Research and Development Priorities Conference. It contains one or more resource papers, additional papers, a summary and recommendations for each of five workshop sessions held during the conference. In addition, addresses at general, luncheon, and breakfast sessions are included. The material specifically addresses the following aspects of urban transportation research and development: viewpoints on UMTA's R&D priorities from spokesmen for transit operators, State governments, and local governments; needs and priorities in policy-related research and development and deployment; implementation of nonhardware innovations; technology delivery systems; and information exchange. Among the speakers whose remarks are included are APTA Executive Director, B.R. Stokes; Urban Mass Transportation Administrator, Robert E. Patricelli; Senator Birch Bayh; and Jordan D. Lewis, Director of the Experimental Technology Incentives Program of the National Bureau of Standards. A listing of conference participants is also included.

42 158147 ANALYSIS OF URBAN TRANSPORTATION NEEDS WITH IMPLICATIONS FOR AGT SYSTEMS. In this report the current and future development of urban form is illustrated and analyzed in terms of its specific implications for automated guideway systems (AGT). Five cities that are representative of the range of urban attributes in the nation are examined—Chicago, Baltimore, Kansas City, Phoenix, and Grand Rapids. To identify what transportation modes satisfy the transportation needs, seven broad modal categories, operating and economic characteristics, energy consumption and pollution levels are presented. These measures are presented in detail for seven generic modes—Rail Rapid Transit, Light Rail, Conventional Bus, Group Rapid Transit, Personal Rapid Transit, Dail-A-Ride, and Auto. Conclusions as to the ability of AGT, as well as various other possible systems of transportation, to satisfy the predicted future needs of multi-nucleated urban areas are reached through the use of models of applicable demand range, which present, at one end, capacity capability and, at the other, necessary patronage for viable fiscal operation of such systems. Performance measures are developed for line-haul and circulation systems. The line-haul measures are given in terms of the boarding per hour per mile as determined by the capacity of the system and by the fiscal and fare policies. These measures are used to illustrate an approach to developing circulation measures, which are given in terms of the demand density that can be accommodated by the systems, as a function of the system characteristics and the area covered.

42 159004 SOLVING PUBLIC PASSENGER TRANSPORTATION PROBLEMS: A NEED FOR POLICY REORIENTATION, VOLUME II. Public transportation has declined because policymakers and outdated regulations have restricted the evolution of transportation systems which more closely reflect the mobility and life-styles of today. Public policy needs to take a consumer-oriented approach to public transportation by recognizing that all consumers do not have the same transportation needs and that one or two modes of transportation cannot satisfy these needs. This report argues that if public transportation is to become an efficient method of satisfying the transportation needs of a community, a brokerage or consumer-oriented approach should be adopted. The transportation broker will match specific individual needs with a broad array of transportation services, and overcome institutional, legal, and operational barriers to the development of new forms of transportation service.

42 159356 USER DOCUMENTATION FOR THE METROPOLITAN ACCESSIBILITY PROGRAM (MAP). The Metropolitan Accessibility Program (MAP) is a computerized tool that facilitates analyses of transportation access to employment, commercial activities, hospitals, and other desired destination opportunities. This program is capable of producing output records that are interpreted by a special plotting program, MAPLOT. MAPLOT is capable of producing graphic displays of spatial variations in accessibility levels throughout an urban area, sector, or corridor. The MAP program and all subsequent modifications, including the plotting features, is housed within the U.T.P.S. Program, UMODEL. In this report the computer program, MAP, is presented through various User's materials including program documentation and five illustrative case study applications. The five case studies have been developed to aid the programmer in applying MAP and MAPLOT. This report is designed specifically as a User's guide to MAP and should be read in conjunction with the companion report which explains and illustrates the theory and methodology of transportation accessibility studies: 'Accessibility Applications in Urban Transportation,' by Popper and Connelly (UMTA-VA-11-0002-77-2). The MAP Program is used to facilitate transportation accessibility analyses, and to produce graphic maps of the spatial distribution of accessibility to jobs, shopping activities, and other destination opportunities. The program is suggested for use in planning and evaluation studies.

42 159478 ANALYSIS OF CHANGES IN RAIL COMMUTING TO CENTRAL LONDON, 1966-71. Using the population census data for 1966 and 1971 an analysis was made of the way in which rail commuting to central London from a number of local authority areas has changed between these two years. The results of the multiple regression suggest that changes in rail journey time are more important to passengers than changes in frequency. An overall elasticity with respect to journey time of -0.6 (-0.9 for long journeys and -0.5 for short journeys) was obtained, whereas that with respect to frequency was not significantly different from zero. It was not possible to estimate the way rail passengers respond to fare changes owing to insufficient variation in fare levels over the local authority areas during the period. The inclusion of socio-economic variables such as car-ownership, the size of the local labour force and the number of owner-occupied houses in each local authority area improved the fit of the equation but did not tend to affect the absolute or relative size of the rail service elasticities. /Author/TRRL/

42 159487 MULTINOMIAL LOGIT APPROACH FOR MULTIMODAL CHOICE OF WORK TRIPS. This paper reports the results of an explorative study on the possibility of using a multinomial logit model to replicate and predict multimodal choice for work trips in a Canadian urban context. Modal choice data from Toronto, where a multimodal choice situation exists in the line-haul portion of the work trip, are used to develop the model. The developed model is evaluated in terms of statistical criteria and reasonableness tests. It is further examined for its predictive ability by the results with the published ones in this area. The study shows that disaggregate models can provide reasonable results when used in forecasting the modal choice between various modes.

42 159596 PLANNING AND DESIGN OF INTERMODAL TRANSIT FACILITIES. This paper presents an analysis of the present state of the art of transit station planning and design. It discusses the design process in terms of (a) design parameters and standards (e.g., stairways, ramps, and passageways; escalators; platforms; fare and exit control; moving walkways and ramps; bus facilities; and parking facilities); (b) design of the station environment (e.g., lighting, ventilation, acoustics, and fire control; passenger information and graphics; passenger security; commercial activities; and special provision for the handicapped); and (c) design methodology (e.g., deterministic, probabilistic, and impedance models; simulation; and validation problems). A classified bibliography is included.

Hoel, LA (Virginia University) Rozner, ES (GAI Consultants, Incorporated) *Transportation Research Record* No. 614, 1976, pp 1-5, 52 Ref.; This article appeared in TRB Research Record No. 614, Transit Facility Operation.; ORDER FROM: TRB Publications Off

42 159704 APPLICATION AND VALIDATION OF EQUILIBRIUM TRIP ASSIGNMENT METHODS. An application of an equilibrium trip assignment method to the 1970 road network of the City of Winnipeg, Manitoba, Canada is described. The validity of the method is discussed in detail. The results presented show that the differences between predicted and observed values of the relevant parameter are attributable in part to limitations of the model to explain all route choice behavior as a function of time alone and in part to the way in which observed temporal values relate to predictions made by a static model.

42 159716 URBAN TRANSPORT RESEARCH PRIORITIES. This year, Britain, as a nation, will spend ,15000 M or some 17 per cent of the gross domestic product on transportation. A greater understanding of the problems associated with transportation, and the identification of possible solutions and means of attaining them are considered by the author to be a necessary part of urban transport research. It is suggested that the character of transport planning and management over the past few years has changed markedly, and that the future shows signs of being different in some respects in kind and in others in degree from what has been familiar until recently. Some of the more significant changes are identified and discussed. In particular, increased professional involvement to include land use, social and environmental planners and economists; and the growing importance of political concern and general public involvement in transport issues. The relevance of ongoing research and its application and impact is considered in relation to technology, industry and government. It is suggested that interest in better transport operations should be centred around existing

technology, operations administration and institutions with emphasis on how to continue to provide some public transport service in those market areas where traditional heavyweight public transport has become too costly. Gradual but controlled de-centralisation is suggested as a means of increasing the diversity and effectiveness of transport research. /TRRL/

42 159790 ON THE FORMATION OF TRAVEL DEMAND MODELS AND ECONOMIC EVALUATION MEASURES OF USER BENEFIT. This paper examines a variety of issues within the context of two main themes: the formation of travel demand models and economic evaluation measures which are mutually consistent within a theory of rational choice; and a consideration of the structure of models which are representations of the trip decision process over several dimensions: location, mode, and route. Random utility theory is invoked to explore both the role and properties of composite costs or index prices in the 'recursive' approach to the structuring of travel choice models, and their significance in the economic evaluation problem. It is shown that the specification of these costs must be made very precisely, with respect to the demand model form chosen, in order to retain the underlying assumption that the traveller is an optimal decisionmaker. It is argued that the structure of 'simultaneous' models currently in use is inconsistent with the form of utility function assumed to generate those models. Furthermore, it is shown that the "simultaneous" and "recursive" forms are special cases of a more general choice model structure which takes specific account of correlation or 'commonality' of trip attributes. A number of applications are discussed in which consistent demand models and perceived user benefit measures are constructed. These include the formation of strategic transport planning models and of models for mixed-mode, multimode, and multiroute systems. The formalism allows definitive answers to be given to a number of problems of current interest in transportation planning, which have been incorrectly or incompletely treated.(a) /TRRL/

42 163057 TRANSPORTATION: MANAGEMENT--ECONOMICS--POLICY. This book is a synthesis drawing upon a number of underlying fields and disciplines, primarily economics, engineering, and legal and policy studies. The functional approach supplies the integrative thread that ties the work together. The objective is to provide enough conceptual and substantive information that the reader can systematically weigh the alternatives and reach his own solution. The scope of this work is relatively broad. All of the principal passenger and freight modes are covered: railroads, pipelines, waterborne (ocean, inland, Great Lakes and St. Lawrence), and highway (automobile, truck and bus). The carriers are brought together in issues concerning urban transportation and urban intermodal problems. Final chapters cover government plans and policies and the future outlook. While this book

was designed primarily to meet the needs of professional majors, it should be of use to others. Courses in transportation engineering, economics, geography, urban planning, and public administration should find it a useful supplement. There are sufficient issues in the book to be of interest to practicing professionals in the field. It is written with a view to being comprehensible to the informed layman, the non-specialized manager, and government policy officials.

42 163226 THE FEASIBILITY OF UPGRADING PENINSULA PASSENGER RAIL SERVICES. FINAL REPORT. The feasibility of increasing use of Southern Pacific commuter services over the 47 mile Peninsula line between San Jose and San Francisco, CA., was studied under a grant from UMTA. Among potential means for increasing usage would be improved access, all-day transit-type operation, better connection with transit, and extension to a new San Francisco terminal. The experience of a private operator could be combined with the resources of public agencies to produce a staged expansion of service in response to changes in demand. Such steps should be part of an overall transportation plan for the Westbay Corridor.

42 163340 A DETERMINISTIC METHOD OF ASSIGNING TRAFFIC TO MULTIPLE ROUTES OF KNOWN COST. A method is proposed for assigning road traffic to a network of urban streets. The objective is to predict the flows along alternative routes with the accuracy

needed for the design of comprehensive urban traffic management schemes. The method assumes that drivers vary in their perception of costs and choose the route that is best for them. The distribution of perceived costs is, for each link in a network, assumed to have a known average value and variance. A simple set of the deterministic relationships is derived which can be solved efficiently in a digital computer. The proportion of traffic using one of two routes is derived as a quadratic function of the difference in average costs and the relative variance in perceived costs. A network is solved by successive combinations of pairs of routes. A simulation program has been written to check the theoretical predictions. There is, as yet, no evidence that these predictions fit reality. It is suggested that some aspects of trip generation and choice of mode in addition to choice of route, may be analysed by the proposed method.(a) /TRRL/

42 163443 AN EMPIRICAL STUDY OF PARK-AND-RIDE MASS TRANSIT SYSTEMS IN THE U.S.. With increased congestion and pollution in urban streets, as well as the challenge to more effectively use scarce land resources in center city areas, transportation planners need to examine methods of converting commuters to less energy intensive modes. Through emphasizing the key level-of-service variables, i.e. implementing exclusive bus lanes wherever possible, and scheduling park-and-ride services to insure flexibility for commuting patrons, it is hoped that transit policy planners can make mass transit in general, and park-and-ride programs in particular, successful systems in reducing the automobile-dependence of urban areas. /GMRL/

42 163584 RECOMMENDED STATEWIDE TRANSPORTATION GOALS POLICIES AND OBJECTIVES. This publication which represents the policy element of the California Transportation Plan, covers the basic principles and policies to be used in transportation decision-making, as well as the applications and implementations of the policies. The way in which California's transportation system interacts with the social, economic, and natural environment of the state is described, future alternative directions are discussed, and transportation problems and the effect on them of continuing current policies are explored. Eight policy principles to guide decision-making are established. These principles relate to: provision of transportation services by the private sector; efficient use of existing system; full analysis of alternatives; pavement for transportation by users; and regulations. Government (state, local and regional) responsibility in transportation is discussed, and policies are presented to minimize adverse effects of transportation decisions on energy, capital, safety, and labor resources. Environmental protection is considered in policies on land use, air quality, noise and community disruption. Principles relating to

transportation issues and problems are formulated and applied to specific transportation problems. Institutional, financial and regulatory changes resulting from these policies are discussed, and short and long range actions are recommended.

42 163600 TRAVEL BEHAVIOR AND MOBILITY PATTERNS OF LOW-INCOME RESIDENTS OF SYRACUSE, NEW YORK (ABRIDGMENT). This research was designed to study the way in which a low-income population receiving subsidies through the Department of Social Services traveled. Their perceptions of trip modal choice and their satisfaction with the travel mode used were included in a travel diary. The findings indicate that the majority of the travel outings occurred between 10 a.m. and 5 p.m. The trip destinations were generally concentrated in the CBD, in outlying areas where services are concentrated, and in areas where a large number of medical services are located. The majority of the outings were single-purpose trips and could be classified as shopping, or social-recreational or both. The study population felt that they were at a disadvantage because they did not own automobiles. They did not have the freedom to travel, and, because of a heavy reliance on bus service, they were restricted due to the inflexibility of bus routes and schedules. The study concludes that mass transportation is an important entity to a majority of low income individuals. Because of the systems inflexibility, these who are mass transit dependant remain immobile.

42 163604 CITIZEN PARTICIPATION IN RAPID TRANSIT PLANNING. This paper relates the experience of metropolitan Dade County, Florida, in implementing an extensive, bilingual citizen participation program for planning the county's proposed rapid transit system. The overall goals of the program are to ensure that local residents have the opportunity to contribute to the county's transit plans and that public understanding, acceptance, and support of the system are achieved. To accomplish these aims, 25 neighborhood forums and 7 district citizens panels were created and integrated into the county government's decision-making process. The formation of these groups was part of a totally open community involvement process in which any interested resident could take part in the formulation of transit plans for each of eight time-phased decision points. During a 12-month period over 14,000 residents participated through 470 public meetings and hearings. Some of the major results of the program were the resolution of major community transit issues, significant citizen modification to the design guidelines and criteria for the system, and the establishment of long-term citizen participation structure. The

success of the program has confirmed the value and feasibility of citizen participation in proceeding with the final detailed design and construction of the system. /Author/

42 163708 TRANSIT SERVICE STANDARDS FOR SMALL URBAN AREAS REVIEW AND PLANNING APPROACH. This final report documents the results of activities and requirements stipulated in the Development of Service Standards, Research Task 14, of the Small Urban Area Transit Study. The document has been prepared to facilitate an understanding of both the procedures and the data base employed in the development of service level guidelines. It also provides a full discussion of a recommended service evaluation and improvement program design; procedures for implementing this program are also included. The recommended program design was developed as an outgrowth of the research activity that was undertaken to identify and evaluate the underlying issues of service standards applications, and it also presents a practical procedure for evaluating service levels within an adaptive development program, facilitating service improvements.

42 163735 RAILWAYS AND THE FUTURE OF LARGE CITIES. The author, who is Managing Director (Railways) on the London Transport Executive, refers to the predictable expansion of cities in the next half-century; the outstanding importance of a good transport network in support of this expansion; the immense advantages of the railway, which can ensure high capacity transport at relatively high speed, without unacceptable disfigurement of the environment, and with superior efficiency in the use of energy and space. He concludes that a common planning process is required for movement in an urban area, with rail-borne and road-borne transport each contributing in the areas where they are most efficient.

42 163812 CRITERIA FOR THE OPTIMIZATION OF URBAN PUBLIC TRANSPORT [Criteri di ottimizzazione del sistema di trasporto collettivo urbano]. The essential factors in the improvement of a public transport service are the reduction of total journey time, the regularity of the service, and the quality (comfort, convenience and reliability) of the service. The overall optimization of a transport system in these terms must be based on the minimization of the total cost to the public. This paper examines the following criteria for an improved public transport service: less use of private transport during peak hours;

better regularity of service; more efficient use of equipment and personnel during peak hours; the spreading of demand into off-peak hours; greater mobility for non-motorists; and a reduction of noise and exhaust pollution. /TRRL/ [Italian]

42 163867 URBAN TRANSPORT APPRAISAL. The book examines the methods developed for evaluating urban transport projects and policies. The author discusses the characteristics of the demand for transport and the way in which they determine how travel behaviour is analysed. The object of the appraisal being to ensure that value for money is obtained either with respect to the development of transport systems or the use of existing capacity. The book emphasises the economic aspect of policies on which a monetary value can be placed. The subject is discussed in the following chapters: (1) An appraisal framework; (2) Introduction to the analysis and forecasting of travel demand; (3) Some alternative approaches to the analysis of travel demands; (4) The analysis and forecasting of trip generation and attraction. (5) A digression-the specification of travel costs in the analysis of travel demand; (6) Trip distribution; (7) Modal choice; (8) assignment; (9) Economic evaluation: the benefit algorithm; (10) Evaluation criteria and their implications for benefit estimation; (11) Some problems in economic evaluation and (12) Conclusion. /TRRL/

42 163875 THE ROLE OF BRITISH RAIL IN PUBLIC TRANSPORT. In the report the select committee seeks to provide information for the House of Commons to judge the government's policy on transport. Although the committee have concentrated on the role of British Rail, their findings are concerned with all forms of public transport. The findings are based on evidence submitted by government departments, nationalised industries, local authorities, private transport organisations, unions and consumer organisations, and are presented under the following headings: the present state of British Rail; likely pattern of future demand; the future form and size of the rail network; manpower; co-ordinated passenger transport; competition on trunk routes; co-ordination of other services outside major conurbations; the conurbations; freight; expenditure on railways and public transport by central and local government; allocation of benefits derived from public expenditure to users of transport services; pricing; fiscal policy; investment; consumer organisations; exports; property; railway unions; statistics; national transport planning. Conclusions compare BR with similar Western European systems and also makes recommendations concerning the correct use of railway investment, and also the co-operation between all forms of public transport. /TRRL/ Her Majesty's Stationery Office Monog Rpt. 42 163932 URBAN TRANSPORTATION PLANNING SYSTEM: PHILOSOPHY AND FUNCTION. This paper describes the philosophy behind and the functional requirements of a computer-based system for urban transportation planning. It begins with a view of the current transportation problem and the resulting new demands on the planner. After outlining a planning framework composed of three analytical activities, long-range planning, short-range planning, and system surveillance, it outlines the functions of a software system, the Urban Transportation Planning System, that would effectively support the transportation planner of today. Such a system is presently under development at the Urban Mass Transportation Administration. /Author/

42 163959 PSYCHOLOGICAL DETERMINANTS OF USER BEHAVIOUR. The purpose of this report is to bring together details of current problems, and the most recent research results in the field of transport users' behaviour, and to make a critical assessment of developments in research into modal split. Particular attention is given to the degree of credibility attributed to psychological approaches in investigation, and to the stage in the analytical process at which application of psychological methods is most beneficial. The research described leads up to an illustrative model of modal split, which in turn, presents possibilities of quantifying the effects of measures on modal choice. /TRRL/

42 163974 URBAN PASSENGER TRANSPORT: SOME TRENDS AND PROSPECTS. The trends in patronage by the main modes of public transport over the past two decades are described, and quantitative explanations given, where possible, of the changes which have taken place in terms of the main service variables (frequency, accessibility, reliability), fare levels, and the socio-economic variables (income, car ownership, land-use etc) which are mainly responsible for the background trends. The social consequences of these trends, particularly the fall in demand for bus travel and the question of subsidising services for which the users themselves are not prepared to pay, are discussed. The results of various travel surveys are described in relation to the travel "needs" and "desires" of individuals and it appears that people's travel habits are conditioned by constraints on the total amount of time spent travelling, the numbers of trips per day and the cost and effort involved in making them. The benefits of transport improve-

ments can be seen not in terms of time or cost savings, but as an increase in choice of destination. Current work on the evaluation of the main factors affecting public transport patronage is described and the latest information on elasticities with respect to fares, service levels etc is summarised. Use is made of these and other results to indicate the likely effects of certain changes in operating policy and to discuss possible means of affecting rider-ship. A TRRL model is used to see how bus patronage is likely to be affected over the next ten years if a break-even policy is applied, and, alternatively, how the subsidy level will grow if attempts are made to hold on to the present levels of bus patronage. (a) /TRRL/

42 164152 INTERTOWN PUBLIC TRANSPORT. ALTERNATIVES FOR CANBERRA. Canberra's intertown public transport service is the central part of a previously agreed overall strategy of public transport services whereby feeder buses radiate from the independent town centres which, in turn, are linked by A high quality intertown service. Previous studies have

suggested busway, rail, or automated systems (if available) for operation on the metropolitan intertown service. This report describes a study which examined a large number of conventional and non-conventional alternative public transport systems for use on the express intertown service which at present is operated with buses running in mixed traffic. The study primarily evaluated the feasible alternatives on technical, economic and environmental grounds, although other considerations were also taken into account. No consideration was given to the feeder bus system which was assumed to provide the same service irrespective of the type of intertown system utilized. /TRRL/

42 164235 TRANSPORT POLICIES AND PROGRAMMES: THE NEW PLANNING APPROACH. The report was prepared by a working party set up to give guidance on the new system of transport policies and programmes (tpp) which the county councils are required to submit to central government. A survey of 1975/76 tpp submissions was made, and the different weighting given to the main components by councils in urban and in rural areas is illustrated. The effects of public policy on individual transportation requirements are described. Against a historical background the objectives of the new approach are outlined and advice on the preparation of tpp submissions is given. A carefully arranged timetable, use of financial guidelines and monitoring of progress are recommended. The establishment of relationships between county councils and other bodies is discussed. Constructive criticisms of the tpp concept and the transport supplementary grant (tsg) system are made. The opinion of the working party is that the tpp concept is sound and contributes usefully to forward financial and policy planning but no conclusion can be reached as to whether tsg is an effective grant. /TRRL/

42 164305 DISAGGREGATE AND SIMULTANEOUS TRAVEL DEMAND MODELS: A DUTCH CASE STUDY. The purpose of this study was to examine the viability in A Dutch context of disaggregate and simultaneous travel demand modelling. The general, and most important conclusion that can be drawn from the work undertaken in the course of the study is that disaggregate simultaneous models, estimated utilising the multinomial logit model, have considerable potential in the field of transportation, or travel demand, modelling. In addition to application in comprehensive planning studies, they are highly relevant to policy studies and both local and specific studies: indeed the shopping model described in this report clearly could be developed into a full shopping model for use in shopping centre location studies. They offer major advantages over conventional aggregate modelling techniques without, so far as is yet apparent, any significant disadvantages. /TRRL/ [Dutch]

42 164343 TRANSPORT POLICY. This white paper sets out the government's approach to transport policy and some of the specific decisions it has made. The three principal objectives of transport policy are identified as:-(1) to contribute to economic growth and higher national prosperity. (2) to meet social needs by securing a reasonable level of personal mobility, particularly by maintaining public transport for those without the use of a car. (3) to minimise the harmful effects of transport (road accidents, damage to the environment etc.). The subject matter is treated under the following chapter headings:-(1) objectives, (2) the role of government, (3) local planning and choice, (4) transport in towns, (5) the rural areas, (6) inter-urban passenger transport, (7) freight, (8) the public sector, (9) roads, (10) implications for public expenditure, (11) consultation and policy-making, (12) summary of decisions. The white paper concludes with details of transport resources budget, the purpose of which is to show what users, including those providing their own transport spend on different forms of surface transport by road and rail, the value of resources that go into providing transport and how they are paid for- whether entirely by users, entirely from public expenditure or a mixture of the two. /TRRL/

42 165384 URBAN TRANSPORTATION ALTERNATIVES: EVOLUTION OF FEDERAL POLICY. The findings are presented of two successful conferences which formed the foundation of a unique process of federal rule-making, and the underlying process that culminated in the conferences is discussed. The availability of new funds for urban mass transportation in 1974 raised complex questions of equitable resource allocation. Reaching answers to these questions involved the developing of consensus on a series of compromise solutions that would best reconcile the competing demands of different claimants. The first conference in February 1975 reached agreement on five principles which dealt with regional multimodal strategy, incremental planning, managing of the existing system, framework for evaluation, and public involvement. Cost effectiveness and usable segments were other areas of Administration's (UMTA) description of the implementation of 1976 was to review the Urban Mass Transportation Administrations

(UMTA) description of the implementation of the proposed policy as well as to review on the revised policy on Urban Mass Transportation Investment. A number of related issues were discussed at both conferences. Documents prepared by UMTA as background to the conferences are discussed.

Transportation Research Board Special Report No. 177, 1977, 38 pp, 1 Fig., 2 Tab. Report of conferences held February 23-26, 1975 at Airlie House, Warrenton, Virginia, and March 29-April 1, 1976 Hunt Valley, Maryland, and sponsored by the Urban Mass Transportation Administration, U.S. Department of Transportation.; ORDER FROM: TRB Publications Off

42 165563 APPLICATION OF A LOCAL AREA TRAFFIC MODEL IN AN INNER SUBURB OF MELBOURNE. The structure and development of a new traffic assignment procedure for use in small, detailed urban street networks is described. The model couples a probabilistic path selection procedure with a dynamic feedback system for delays, congestion and queueing in a network. It is intended for use with period travel demand data in the evaluation of network traffic and/or environmental management schemes, and the possible traffic impacts of urban redevelopment schemes. To evaluate the model, data regarding peak period traffic movements through an inner suburban area were collected. Included in the data collection were street traffic volumes and speed distributions, and cordonline origin-destination data for the study area. The particular area (West Hawthorn) is subjected to large volumes of commuter traffic on its local street system during peak demand periods. /Author/TRRL/

42 165582 PUBLIC AND PRIVATE TRANSPORT IN URBAN AREAS. The proportion of overall national energy consumed by public transport in urban areas is found to be insignificant, whereas private transport consumption is found to be significant. The paper therefore focuses attention on the direct energy consumption characteristics of motor vehicles, identifying aspects where potential savings could be made. Consideration is given to the range of measures which could reduce energy consumption levels by private transport. These measures are seen as falling into two basic groups: those which reduce the fuel consumption rates for private transport; and those which reduce the travel demands for private transport. These measures would have identifiable implications on the mobility levels of public and private transport users, taking into account the higher mobility potential of private transport in Australian cities. The time scale over which the various measures could be effective is discussed. It is concluded that significant savings in energy use in urban transport could be made and that initiatives being undertaken now, such as in vehicle design and public transport improvements

should recognise these potential savings. / TRRL/

42 165676 TRAFFIC, FUNCTION, FORM AND DEVELOPMENT OF URBAN CENTRES [Vplivi sodobnega prometa na funkcionalnost in oblikovanje mestnega sredista]. Transport, urban development and development of urban centres is viewed in terms of spatial organization of activities and the form which urban accessibility networks and urban development take in the space. Transportation problems in urban centres are analysed and then formalized into three basic but interrelated topics: analysis of prototype patterns of development (future planned development), (patterns of possible development); environmental capacity of urban centres (present situation), (problem situations, trends); strategy for centres and transportation structure development (development potentials of selected patterns). In transportation planning theory it is the view that cities traffic and urban development planning should be coordinated. This study explores the possibilities of relating these two in practice rather unrelated aspects of urban planning at least conceptually, explaining them as parts of the same process of urban structure development in space. /TRRL/ [Slovenian]

42 165746 ERIE: SHORT-RANGE TRANSIT TECHNICAL STUDY. Since the Erie Metropolitan Transit Authority (EMTA) acquired the bus system from the Erie Coach Company in 1967, it has implemented a comprehensive program of transit improvements that has turned-around the ridership decline that was apparent up to 1967 with the result that annually over 5.5 million passengers are now carried on EMTA bus compared to the 3 million in 1967. The purpose of this study is to update EMTA's 1969 Transit Development Program, that is, to maintain planning and capital certification and therefore remain eligible for State and Federal funds. This document contains the Transit Element of Erie's Transportation System Management Program. The program's findings and recommendations serve as the plan (six-year) for maintaining and improving mass transit in Erie. Improvements to transit in Erie have been identified in five major areas: management, marketing, fare structure, service, and capital. This report presents the results of the transit update study: 1) Background information includes a description of existing services and an evaluation on how well services correlate with specific community characteristics; 2) Community attitudes toward transit are examined; 3) An evaluation is made of the adequacy of existing service in terms of PennDOT standards and service; and 4) Capital, management, and marketing improvements are examined. The Appendix (A) contains a synopsis of interviews with social service agency representatives. This report

suggests that the future for mass transit in Erie will continue to be one where buses, rather than more elaborate modes, will provide the basic intracommunity public transportation service. /UMTA/

42 165759 IMPLEMENTATION PROGRAM, URBAN CORRIDOR DEMONSTRATION PROGRAM FOR THE DISTRICT OF COLUMBIA AND MARYLAND. The Washington Urban Corridor Demonstration Program sought to improve peak period travel conditions through improving transportation system efficiency by the implementation of coordinated, complementary low capital projects. This report is the last in a series of three; the first report in the series was the Planning Study; the second report was on an Immediate Action Program. Projects in this implementation Program Final Report include a bus lane, express bus service, a transfer terminal, fringe parking, carpooling, and Dial-A-Ride. Monitoring and public information activities are also included. The Program demonstrated that coordinated transportation projects improve peak period transportation. /FHWA/

42 165762 INCREASING TRANSIT RIDERSHIP: THE EXPERIENCE OF SEVEN CITIES. During the last five years several transit systems have experienced large and sustained increases in ridership. The objectives of this study were to identify and analyze the factors to which the ridership increases are attributed and the techniques used to gain ridership that are transferable to other systems. The seven systems chosen for evaluation and the percentages of change in ridership between 1971 and 1975 were: Eugene, Oregon, 411%; Madison, Wisconsin, 49%; Minneapolis-St. Paul, Minnesota, 40%; Portland, Oregon, 57%; Salt Lake City, Utah, 118%; San Diego, California, 114%; and Vancouver, British Columbia, 57%. All of these cities possessed a common set of ingredients essential to their successes in increasing ridership--strong public and political support which resulted in the availability of substantial financial resources. It was found that most ridership gains were in large part attributable to service expansion, especially the expansion and addition of routes in areas that previously had been poorly served. Fares remained constant or were reduced in all of the cities studied. Furthermore, the energy crisis was credited with having an immediate positive effect on transit use. The types of techniques used in increasing ridership, which are transferable to other systems, are in the areas of: (1) planning, scheduling, monitoring and evaluation; (2) marketing; (3) transportation system management; and (4) route structure. /FHWA/

42 165769 METHODOLOGY FOR IDENTIFYING URBAN TRANSPORTATION TECHNOLOGY ALTERNATIVES. This report reflects the view that the existing urban transportation planning process tends to ignore new transportation technologies (PRT, AGT, accelerated moving walkways, shared taxi). The information system described in this report aims to remedy this deficiency by specifying all the alternative technologies, new or old, that can satisfy a need. This system fits into the planning process after distribution. The intent herein is that this system be useful to transport planners and agencies. This report describes an information system which accepts as input a set of characteristics describing a particular transportation need and yields as output a list of transportation technologies capable of satisfying that need. A broad range of transportation need situations can be fed into this system. The system, however, is concerned with people movement rather than goods movement. The user of the system specifies the nature and extent of demand, as well as certain service requirements. A transportation technology is identified as suited to a particular need situation when the technology meets the demand and the service requirements, and does so at reasonable costs. The technologies identified by the system as suitable to a need are examined to select the one best alternative. This final selection process is not part of the system. The system consists of two tables. Their use is described and examples are presented in this report. The procedure used to develop the tables is discussed. This report recommends that a more comprehensive version of this system be developed. /FHWA/

42 165776 SERVICE AND METHODS DEMONSTRATION PROGRAM. This report contains a description of the Service and Methods Demonstration Program. Recently completed and current and future demonstration projects are described and project results from similar demonstrations are compared. The comparisons are made by grouping projects according to the program objectives addressed: 1) decrease transit travel time; 2) increase transit reliability; 3) increase transit coverage; 4) increase transit vehicle productivity; and 5) improve the mobility of transit dependents. Independent activities carried out in support of the demonstrations are described, such as the development of evaluation guidelines and improved methodologies for demonstration evaluation, analytical studies in support of the development of experimental demonstrations, studies of independent local innovations, and case studies of transit operations in small communities. Information dissemination mechanisms and activities intended to facilitate more widespread knowledge of effective approaches to improving transit are discussed. /UMTA/

42 166501 BART IMPACT PROGRAM: TRENDS IN TRAFFIC PATTERNS AT THE BAY BRIDGE AND CALDECOTT TUNNEL. Utilizing multiple regression techniques, this paper presents an analysis of the effects of the opening of the Bay Area Rapid Transit (BART) System's transbay crossing on the traffic at two major highway facilities, the San Francisco-Oakland Bay Bridge and the Caldecott Tunnel. Looking at data collected semi-annually since 1965, it was found that there was a sudden shift in trend lines in 1974 after the BART transbay tube was opened. Vehicle volumes dropped, transit patronage jumped, but total person trips in the short run followed roughly the trends of the previous eight years. Transbay vehicle and transit traffic has increased at a more rapid rate since 1974, with mid-day off-peak transit patronage showing a large increase. While an important temporary phenomenon, the 1973-74 increase in gasoline prices was not found to contribute much to this sudden change in the long-term trends. BART also caused the removal of a substantial number of buses from the two facilities, effectively increasing their vehicle-handling capacity. This has resulted in higher traffic flow rates during the height of the peak periods. (Color illustrations reproduced in black and white.)

42 166510 TRANSPORTATION IN AMERICA'S FUTURE: POTENTIALS FOR THE NEXT HALF CENTURY. PART 1. SOCIETAL CONTEXT. The report describes four potential socioeconomic futures for the United States and their implications for transportation through 2025. The futures--designated Success, Foul Weather, Disciplined Society, and Transformation--vary particularly in economic performance, climate, institutional structure, and personal values. For each future, Part 1 provides a detailed narrative account or scenario, accompanied by separate analyses of the energy, demographic, economic, and urban implications of each scenario. Part 2 provides demand forecasts for most modes; technology forecasts for twelve transportation modes and seven specific systems or technologies; and analyses of six critical transportation problems.

42 166735 THE TRANSPORTATION SYSTEMS MANAGEMENT PROGRAM FOR NORTHEASTERN ILLINOIS [Staff technical rept]. The Chicago Area Transportation Study (CATS) as the designated Metropolitan Planning Organization (MPO) for the northeastern Illinois region, has the responsibility of developing a Transportation Systems Management (TSM) element as part of the urban transportation planning process. The document represents the initial actions towards the development of a short-range plan designed to implement the objectives of improving system efficiency and maximizing system productivity. The document is composed of three parts: a history of effort on past and ongoing TSM projects in the region, an interim TSM program delineating projects in the FY 77 Annual Element of the Transportation Improvement Program, and documentation of the TSM processes, methodologies and elements as proposed during the coming fiscal year.

42 167038 IMPACT EVALUATION OF MORGANTOWN PRT 1975-1976 RIDERSHIP: INTERIM ANALYSIS. The Morgantown Personal Rapid Transit System (PRT) is a new type of public transportation system which was built as a research development and demonstration project. The system began passenger service in October 1975, and consists of three stations, 2.1 miles of two-lane guideway, and a 45-vehicle fleet. This report describes the Morgantown PRT system ridership levels and trends during its initial period of operation, the 1975-76 academic

year. The analysis measures the impact on ridership of seven operating characteristics: fleet mileage, actual operating hours, system availability, trip reliability, vehicle availability, downtime frequency, and downtime duration. Data were obtained from West Virginia University Management reports on daily ridership, and system operation and analysis included statistical tests of significance and multivariate statistical procedures.

42 167089 URBAN TRANSPORTATION POLICY. REPORT OF THE WORKSHOP ON NATIONAL TRANSPORTATION PROBLEMS (2ND), NOVEMBER 7-8, 1974. PROGRAM OF UNIVERSITY RESEARCH. The workshop is one of a continuing series to develop information useful to the Department of Transportation policymakers through interaction of principal investigators in universities under contract to the Department and members of the Department responsible for programs of in urban transportation. Eight panels were chaired by university and DOT officials to examine the following topics: Suburbanization and its implications for urban transportation; The role of new systems in meeting urban transportation needs; Choosing among transportation alternatives--improving the decision-making process; Urban freight movement; Service standards; Communication systems and urban transportation; Incremental versus ultimate system transit; How can universities organize to be of service to their local communities.

42 167299 TRANSIT PATRON ORIGIN AND DESTINATION SURVEY. A METRO TRANSIT/CITY OF SEATTLE JOINT PROJECT (1973) [Final rept]. The purpose of this survey was to provide a current data base which would assist in the rational planning and marketing of public transportation in King County, Washington. The report presents the methods and preliminary results of the transit patron origin and destination survey conducted on May 23 and 24, 1973, on the Municipality of Metropolitan Seattle (Metro) Transit System. The survey consisted of two parts, including a one-way (inbound) questionnaire distributed to approximately 58,000 passengers who boarded buses outside the Seattle Central Business District (CBD), and a complementary survey questionnaire distributed to approximately 33,000 persons boarding inside the Seattle CBD. The results of the survey were processed and stored in machine-readable form on magnetic tape. Data were summarized on both a geographic and a demographic basis.

42 167320 VALUE CAPTURE AND JOINT DEVELOPMENT APPLICATIONS: CHICAGO/LOUISVILLE/LOS ANGELES. The study presents highlights of findings, defines how value capture can be implemented, describes important legal, financial and community design issues associated with the value capture concept and summarizes the conclusions reached and the methodology employed in this research. In recognition of the diversity of legal, political, economic and physical situations in which mass transit development has and will occur, Value Capture Policy has been studied and is presented as an array of options. Central to Value Capture is a set of techniques which can be applied by a transit or community development entity. Each technique is designed to enable the entity to enhance and capture financial and/or community design benefits related to transit system implementation.

42 167352 AN ANALYSIS OF TRANSPORTATION PLANNING EFFECTIVENESS [Final rept. Sep 76-Feb 77]. The report documents a novel methodology and analysis procedure for measuring a program's effect, and it is based on data from case studies of a representative group of twenty urban areas, conducted during 1976, which are reported in a companion report titled: Transportation Planning Effectiveness: Twenty Case Studies. The twenty urban areas represent all UMTA regions, a range of population sizes, residential densities, and demographic characteristics. The case studies are reported in a uniform format which focuses on transportation planning effectiveness but also includes the urban areas' socio-economic and travel characteristics, transit and transportation planning history. Specifically, the study reports the influence of Technical Study Grants on transportation planning effectiveness which is measured by the development of professional planning capability, acquisition of new capital equipment, introduction of new or improved services with existing facilities, and alterations in the local institutional climate.

42 167353 PHYSICAL FOUNDATIONS FOR SOCIO-ECONOMIC MODELING FOR TRANSPORTATION PLANNING. PART I: INTERACTION BETWEEN URBAN CENTERS AS A POTENTIAL PROCESS [Final rept. Jan-May 76]. The objective of this research is to make use of a physically based social system model to study the determinants of city sizes and their interactions in a nation. In particular, it was required that attention be paid to how new transportation systems affect city sizes. In this first part of a final report, the character of the distribution function for settlements of man is investigated. The distribution for weakly interacting settlements (early man as hunter gatherer) is developed and experimentally tested against his-

torical data. The distribution function for interacting settlements (since agricultural settlements)-Zipf's law-is then treated, first as a pure information theoretic, namely as a communicational living language, and then as a communicational language for communities of man loosely bound to the earth. To keep the ensemble alive, the need for good cheap transportation among a significant mobile fraction of the population is discussed.

42 167450 TRANSPORTATION SYSTEMS MANAGEMENT REPORT. The Federal Highway and Urban Mass Transportation Administrations have jointly issued a series of regulations designed to achieve maximum efficiency from the short-range use of existing resources. The Metropolitan Planning Organization (MPO) for the Dayton area, and the Montgomery-Greene County Transportation and Development Planning Program are both responsible for preparing the TSM element of the areawide transportation plan. The items discussed in the TSM Report include those sections which have already been accomplished, those which have been incorporated in TCC's Fiscal 1977 Overall Work Program or which will be incorporated in the work programs of future years; and those which have been forwarded for implementation by other appropriate agencies. The following major headings are discussed in this report: Efficient use of Existing Road Space. Reduction of vehicle use in congested areas. Improvement of Transit Service. And, increased management efficiency throughout the transportation system. As part of the existing long-range transportation plan, the transportation systems management element is

endorsed annually and updated as needed. Through this element, the Transportation and Development Planning Program will guide the Montgomery-Greene County region to more efficient and less expensive movement of people and goods.

Montgomery County Planning Commission
Mar. 1976, 132 pp, 14 Fig., 2 Tab.

42 167463 TSM-A FEDERAL VIEWPOINT.

The concept of Transportation Systems Management (TSM) is essentially that all elements of the urban transportation scene will be treated as members of a single transportation system and that emphasis will be put on maximizing the efficiency of existing transportation facilities and resources. The institutional framework for TSM is essentially coordinating traffic engineers, planners and transit operators. Traditionally, little thought had been given to broadening the scope of this mutual assistance to take in a large area or to attack a problem on a systems basis. The author believes that the Metropolitan Planning Organization (MPO) can play a critical role as conveyor and coordinator. Hopefully within the forum of the MPO, the various groups will sit down together and discuss their problems. Developing a constituency for TSM is essential for certain TSM strategies are likely to be controversial. Bringing these diverse groups together in the early phases of TSM planning can help identify and build rapport for further TSM actions. More cooperation must also be developed in the way projects are actually implemented. The author identifies two major areas of concern. The first is the relatively large unobligated balance of urban funds that is rapidly being built up. The second area of concern is the apparent lack of activity in exercising the funding flexibility that exists in the urban system program. The author concludes the paper with a discussion of the activities at the Federal level related to the urban system program. These include clarifying for State and local officials the options and flexibility available with respect to Federal-aid programs. Streamlining the planning and project development processes. Lastly, FHWA has developed in cooperation with the states an extensive and effective procedures for dealing with project development.

AASHTO Quarterly Vol. 56 No. 3, July 1977, pp 27-28

42 167471 POWER FOR THE MTA: AN EXAMINATION OF FUTURE RIDERSHIP SERVICE, AND ELECTRIC POWER REQUIREMENTS FOR METROPLITAN TRANSPORTATION AUTHORITY FACILITIES. This study begins by documenting the strong relationship between employment in the Manhattan Central Business District (CBD) and the use of electric railtransit-the subways and commuter railroads. The study explores two possibilities: A moderate drop in Manhattan employment below 1975 levels by the year 2000, and a resurgence in CBD employment to 2.1 million. Other variables that strongly affect ridership are transit fares and auto ownership. One policy investigates a fare rise in step with inflation, the other a fare decline. Two features of the automobile are explored. The auto becomes more energy efficient and smaller and auto use remains the same, and increased auto efficiency and auto use decreases. The possibility of a "Second phase"

subway expansion program is explored, which would add another 46 miles of new routes to the 28 miles currently planned, but would also remove 30 miles of elevated lines. In January 1974 prices, the present New Routes program would cost about \$3.3 billion, and the second phase another \$3.0 billion. Another \$3.5 billion would be required over the next two decades for upgrading the existing subway system. Capital improvements considered for commuter railroads in this study are the Long Island Railroad access to the East Side in the first phase and electrification extensions in the second phase. Lastly, changes in transit equipment and their impact on power needs are explored. 128 separate estimates for different combinations of conditions are explored in this study.

42 167477 TRANSPORTATION SYSTEMS MANAGEMENT-LOW CAPITAL ACTIVITIES IN THE TRANSPORTATION SYSTEMS MANAGEMENT PROGRAM, FISCAL YEAR 1977. The purpose of these two technical papers is to document the status of TSM projects and concepts included in the FY 76 and FY 77 TSM Elements, and determine which ones have advanced to the programming and/or implementation stages. Those low-capital activities in the TSM program that were undertaken by the East-West Gateway Coordinating Council during FY77 are described. The objectives of these low-capital improvements were to decrease traffic congestion during peakhours, conserve fuel, and improve air quality. A number of work tasks, ranging from transit promotion and vanpooling to rescheduled work hours and traffic engineering assistance, were under taken to meet these objectives.

42 167501 TRANSIT'S ROLE IN JAPAN'S MAJOR URBAN CENTERS. Three metropolitan centers in Japan occupying 7 percent of the land area contain 40 percent of the nation's population. This report describes current developments in urban transportation in Japan with particular emphasis on identifying problems of major urban areas. While congestion and pollution may be universal problems of urban areas, Japan has special problems such as a rapid increase in demand for transit over very short periods and a great dependence on public transportation for mobility.

Noguchi, T (Weidlinger Associates) *Transit Journal* Vol. 3 No. 3, June 1977, pp 43-58, Figs., Tabs., 8 Ref.; ACKNOWLEDGMENT: Transit Journal; ORDER FROM: American Public Transit Association, 1100 17th Street, NW, Washington, D.C., 20036

42 167533 TRANSPORTATION POLICY IN THE EIGHTIES. Urban transportation policy during the nineteen seventies has been character-

ized by attempts to deal with four major problems: the minimization of environmental impacts of transport investments, the alleviation of inequities in mobility, and financial burdens imposed upon some groups by earlier investments in capital intensive highway networks, the accommodation of demands for public participation in transport decision-making, and the precipitous rise of public transit operating costs. Examples are given of policies which have been pursued in attempting to solve each of these problems. It is shown that policies designed to solve one of them have often intensified others.

42 167590 AN AGGREGATE SUPPLY MODEL FOR URBAN BUS TRANSIT-ABRIDGMENT. This paper describes a model that was developed to estimate aggregate characteristics of bus systems capable of carrying substantial fractions of person trips and automobile trips in the Los Angeles area. The model can be applied to other cities, and is based on a generalization of techniques that have been used in corridor-level comparisons of modal options. The model provides a relatively quick and inexpensive means of generating estimates of transit supply characteristics that can be used in assessing the feasibility of proposals for reducing automobile travel in cities and in identifying other options. Specifically, the model gives estimates of fleet sizes and operating policies that would be needed to accommodate varying degrees of reduction in automobile travel.

Horowitz, J (Environmental Protection Agency) *Transportation Research Record* No. 626, 1977, pp 12-15, 1 Tab., 6 Ref.; From Transportation Research Record No. 626, Bus Service Planning.; ORDER FROM: TRB Publications Off

42 167591 ORLANDO CHANGES DIRECTION: FROM BELTWAY TO BUSWAY. This paper reports on the long-range phase of an overall urban area transportation study in a three-county area centered on Orlando, Florida. The paper focuses on a major shift in perspective regarding solutions to future travel demand problems. Discussed are five transportation system alternatives with various combinations of auto-

mobile-oriented and transit-oriented systems and two major aspects of the study methodology: (a) the formulation of a land use sketch plan designed to be more compatible with a future transit system and (b) the development of a disutility modal-split model based on transit attitudes. Transportation system alternatives are defined and the evaluation and public involvement processes that led to the selection of a preferred alternative plan are described. The implementation of the plan through a short-range transition period is described, and eight major conclusions and observations are given. /Author/

42 167596 WHERE EXPRESS BUSES WORK. Densities of residential areas and sizes of central business districts necessary to generate sufficient demand to support express buses for given frequencies of service at a reasonable cost are estimated. Two types of express-bus operations are considered. In the first case, patrons are picked up by buses circulating in a residential area before the bus travels express to the central business district. In the second, commuters arrive by automobile at a park-and-ride lot before continuing their trips by express bus. We found that, for express-bus operations with pedestrian access, a cost of 6 cents/passenger km (10 cents/passenger-mile) is attainable for only a narrow range of residential densities and only to rather large central business districts. If 12 cents/passenger km (20 cents/passenger-mile) is an acceptable cost standard, a wider range of supporting conditions is possible. Express-bus operations that provide park-and-ride facilities are more broadly applicable at the 6 cents/passenger km (10 cents/passenger-mile) standard. Residential densities as low as 7 dwelling units/hsq m (3 dwelling units/acre) and central business districts of moderate size can in some cases support express-bus service. These findings match reasonably well with empirical data from 11 express-bus operations in two Connecticut cities. The achievement of more express-bus operations is possible by higher residential densities over a larger area and by growth of central business districts in medium-to large-sized cities. /Author/

42 167602 EVALUATION OF ALTERNATIVE STATION SPACINGS FOR RAPID TRANSIT LINES. ABRIDGMENT. This paper presents a case study in which two alternatives for station spacing for non-central business district (non-BCD) sections of rapid transit lines are evaluated in terms of capital and operating costs, demand, and user benefits. This study involves the use of either a long or a short station spacing for a proposed rapid transit line in Chicago. The two alternatives for station spacings were chosen because they represent realistic strategies for station location on the line. The basic trade-offs

between the two alternatives are shown in cost and demand and user savings. Compared with the long alternative, the short alternative cost more to construct and operate, increases the user's in-vehicle time, but decreases the user's access times to stations. A detailed evaluation was undertaken to provide a quantitative examination of the trade-offs between the two alternatives. This evaluation concluded an analysis of the costs, the ridership, and the user savings associated with the long and short alternatives. A quantitative comparison of the alternatives is given as well as a sensitivity analysis of the analytical results. The study concludes that in terms of cost and demand and user savings, the long alternative is superior to the short alternative for the non-CBD section of a rapid transit line in Chicago. The evaluation approach used in this paper can be applied to comparing alternative strategies for station locations as well as to individual station locations in various circumstances.

42 167619 AUTOS AND PUBLIC TRANSIT FRIENDS OR FOES? This article which maintains that a balanced transportation system would exploit the advantages of both private motor vehicles and public systems, centers on a report developed by the General Motors Corporation as well as on other sources. It is noted that except for the gasoline-nationed years of the second world war, the use of public transit has decreased since World War I. It is believed that increased use of public transit would bring secondary benefits such as energy conservation. A recent study indicates that the maximum energy savings accrue when 10-15 percent of all urban trips are attracted to public transit. Public transit can also play a role in reducing congestion in high-density corridors. It is believed that increases in public-transit ridership to 2 to 3 times the present level are attainable and should attract most of the urban trips. Faster transit systems, capital investments, and trained staff will be required. One study has shown that it might be possible to attract 10 percent of the urban trips by 1990 for an investment of \$65 to 70 billion with a combination of transit bus and rail. Brief comments are made on the funding of transit from tax revenues.

42 167861 MASS TRANSIT DECISION-MAKING MARKET SEGMENTATION: A PILOT STUDY. This report describes and then applies what is considered to be a tenable alternative to existing methods of mass transit market segmentation. The approach capitalizes on a resource of findings which have emerged from the modeling of human decision making in psychology over the past fifteen years, which shows potential of being of considerable utility in understanding consumer choice behavior. The resource, known as the theory of information integration, represents the core of the methodological approach posited here. This approach represents a

new way of viewing transit market segments by providing both a theoretical basis for segmentation strategies, something to which existing approaches are insensitive, and a means for estimating the elasticities of the various segments with respect to changes in the transit system. An experiment is reported in which decision-making segments were derived from a population of 62 University of Iowa undergraduates. An attempt was then made to discriminate among these groups based on a set of socioeconomic and travel characteristics of the sample. The results of the experiment as well as implications of the research for mass transit planning and marketing are discussed. /Author/

42 168007 ALTERNATIVE ROLES OF TRANSPORTATION IN URBAN PLANNING. This paper explores the function of transportation in modern urban life, and suggests the more active use of transportation investment planning as a tool for advancing urban planning objectives other than the satisfaction of estimated travel demand. Since unrestrained supply of transportation facilities to meet projected desires appears to be likely to fail both in environmental preservation and the long-term satisfaction of travel demand, strategies for reduction and redirection of that demand are emphasized.

42 168066 STRATEGY FOR IMPLEMENTING INTEGRATED REGIONAL TRANSIT. The recent desire for expanded urban public transportation generated by increased environmental and energy awareness and by the negative impact of extensive freeway construction has increased interest in the more efficient use of existing transportation facilities and in finding more cost-effective means of improving and expanding public transit service. A promising solution to these problems is in restructured conventional and paratransit services that are operated as comprehensive regional transit systems integrated operationally, physically, and institutionally. This paper examines the implications of embarking on a 10-year strategy to implement such a system. Three levels of ridership response are assumed, and their effects on system scale and operating policy decisions at biennial intervals are studied. The operating cost

and deficit implications of these three response levels are then traced, yielding insight into the feasibility of an evaluatory strategy. It is concluded that, if a high ridership response results, the dual goals of expanded and improved transit service and reduced operation deficits can both be accomplished. /Author/

42 168068 MASS TRANSIT GUIDELINES VERSUS A CONSUMER ORIENTATION IN PUBLIC TRANSPORTATION SYSTEMS. This paper evaluates present and proposed mass transit guidelines that contain level-of-service criteria for public transportation. The limited scope of public transportation services that is typically contained within such guidelines is emphasized. The rationale presented supports the need for expansion of these guidelines to include the total range of public transportation alternatives and a consumer orientation. A review of the research concerning the attitudes of the ridership of transit systems illustrates the existing gap between the transit desired and that proposed in the guidelines. Areas for further research are also given, and a time frame for change in which public marketing of urban transportation systems is discussed and set in perspective is given. /Author/

42 168089 DATA PROCESSING OF THE RAIL TRAVEL SURVEYS OF 1971-72. This memorandum describes the computer processing by the GLC of the whole of the British rail survey (1971-72) and part of the underground travel survey (1971-72). These surveys were done to supplement the greater London transportation survey. The resultant data files are used by interested organisations to evaluate transport policies and forecast rail travel demand.

42 168091 URBAN ROAD AND RAIL POLICY. The expectations inherent in legislation concerned with urban transport policy since the 1968 Transport Act are reviewed, and the reasons why these objectives are considered not to have been achieved are discussed. It is suggested that the main reasons for this situation are: institutional flexibility has been more apparent than real, the dearth of really attractive urban public transport capital projects, the apparent irrelevance of public transport subsidy to the congestion issue, the weakness of parking restraint policy, and the inadequate arrangements for administration coordination. The degree of importance placed on urban transport policy in the

consultation document (no more than part of a chapter) is shown to indicate a reduction of emphasis on such problems, and the implications of such a philosophy are considered in relation to such topics as car-restraint policies, measures to reduce the public transport peak, taxation, business cars and problems of management. It is concluded that the change of emphasis-towards a concern for the transport provision for those without a car available-has implications for public transport policy differing from those appropriate to treating public transport as a way of combating congestion.

42 168134 APPLICATION OF BEHAVIORAL DISAGGREGATED MULTI MODAL CHOICE MODELS. In the urban travel demand forecasting process, the modal share can be determined by using either aggregate or disaggregate models. Disaggregate models have two main advantages over aggregate models. The first advantage is that they can explain the individual's trip choices in terms of human travel behavior. The second advantage is that they can guide the decision maker in analyzing the effects of certain policy decisions on the travel demand by various modes. The successful use of disaggregate models, however, depends upon reaching minimal aggregation error during the process of transforming disaggregate choices to aggregate travel demand. The main emphasis of this paper is on the application of disaggregate modal choice models for aggregate demand prediction and for policy decisions and not on disaggregate model development. The latter has been discussed in a previous paper by the authors. Using the multimodal choice model developed for the city of Toronto, this paper shows that reasonable results can be obtained while aggregating the disaggregate models for prediction purposes. Minimal aggregation error is achieved using the technique of "segmentation of population into groups". The results are presented both for the observations used in developing the model and for observations outside the sample area, thus providing an insight into the accuracy of the aggregation procedure. The paper also demonstrates by examples how the disaggregate modal choice model can be used as a policy analysis tool. /Author/TRRL/

42 168149 TRIP GENERATION AND DISTRIBUTION: THE INCONSISTENCY PROBLEM AND A POSSIBLE REMEDY. There are many shortcomings commonly associated with the conventional urban transportation modeling process. This paper focuses on one of the more important problems-the inconsistency between trip generation and distribution components-and suggests a possible way of alleviating it. The suggested approach involves sorting out the independent effects on tripmaking of origin, destination and travel cost characteristics, and

introducing accessibility measures explicitly into the modeling process. The resulting modeling framework can be used to obtain consistent estimates of trip generation and distribution quantities which are responsive to changes in the transportation and spatial systems. 42 168735 URBAN TRAVEL DEMAND FORECASTING PROJECT PHASE I FINAL REPORT SERIES, VOLUME III. DISAGGREGATED SUPPLY DATA COMPUTATION PROCEDURES. The document presents the methods and conventions used by the Urban Travel Demand Forecasting Project to prepare disaggregated urban trip time and cost data for use in the development of behavioral travel demand models. Temporally, spatially, and functionally disaggregated times and costs are calculated for individual work trips taken by surveyed samples of employed persons. The surveys were conducted before and after the introduction of the Bay Area Rapid Transit (BART) service in the San Francisco Bay Area. Together with the socioeconomic data derived from these surveys, the work trip data provide the basis for developing and validating the behavioral models. Chapter 3 describes the development of the temporal disaggregation methods used in the calculation of highway and transit trip attributes. Chapter 4 details the procedures and states the many conventions and assumptions necessary to complete the before-BART data set. It also describes some peripheral procedures used in the preparation of cost and reliability data. Chapter 5 details the preparation of the after-BART data.

42 168736 THE URBAN TRAVEL DEMAND FORECASTING PROJECT PHASE I FINAL REPORT SERIES, VOLUME VIII. DEMOGRAPHIC DATA FOR POLICY ANALYSIS [Special rept]. A forecasting method used to obtain the effects of urban transportation policy is presented. SYNSAM is a methodology for generating a synthetic representative sample of households for an urban area for any specified date. The authors describe the implementation of this procedure for the San Francisco Bay Area, involving the construction of a sample of 12,000 households for the year 1976. In addition to residence and work locations, data for each household comprises a subset of the socioeconomic variables tabulated in the Public Use Sample (PUS) of the 1970 Census. The implementation utilizes 1960 and 1970 Census data plus external projections of population and economic conditions.

42 168783 TIMED DEVELOPMENT STUDY [Final rept]. The study evaluates current development trends in the city of Fremont and remaining development potential, and contains growth policy recommendations. A proposed Timed Development System (TDS) includes three elements: (1) establishment of an annual residential 'growth target' based on employment growth and a desired household/job ratio; (2) designation of residential 'priority growth' areas; and (3) a competitive project review system for the allocation of building permits. In addition, this study recommends that an 'Interim Development Policy for Minimum Density Development on Multi-Family Lands' should be continued. The purposes of the proposed TDS/Minimum Density policies are: (1) reduction of vehicle miles traveled and associated air pollution by expanding local job opportunities and developing multi-family housing in areas accessible to public transit and close to commercial areas; (2) improving the fiscal capacity of the city to provide services; (3) achievement of local and regional housing objectives, including a mix of housing types; (4) promoting urban design and economic development objectives of the city by creating an identifiable and multi-functional urban center; (5) promoting optimum site and project design; and (6) conserving sewage treatment capacity for economic development by phasing residential development. The study includes an analysis of the fiscal impact on the city of projected growth under current development trends.

42 168791 BUSINESS INDUCEMENT AND ECONOMIC DEVELOPMENT IN THE DOWNTOWN LAKE CHARLES AREA [Final rept]. The city of Lake Charles undertook this study in an attempt to evaluate several problems confronting the downtown area. These include the farmers market, a mass transit terminal, an intermodal transit terminal, and the downtown mall. A detailed study of those major assets or problem areas facing downtown led to a listing of suggested improvement alternatives, accompanied by design sketches and architectural plan illustrations. Consideration is given to razing vacant structures, new office developments, governmental offices for parish and city, hotel/tourist attractions, housing, and traffic signalization. The report concludes with a description of organizational mechanisms and an analysis of tax incremental financing possibilities.

42 169202 FEASIBILITY ANALYSIS OF URBAN TRANSPORTATION SYSTEMS WITH SPECIAL REFERENCE TO TUNNELS. Performance-equivalent bus and rail systems were considered under various guideway choices such as dedicated lanes, medians, aerial structures, new rights-of-way, and tunnels. Average per passenger costs were determined for each alternative mode and guideway option. Peak-hour demand was projected for each of the 35 largest metropolitan areas based on analysis of 1970 journey-to-work tables and assumptions on future growth and distribution of population and employment. The decision to prefer tunnels over other choices is highly sensitive to right-of-way costs (property values) and the relative cost of tunnel excavation. If existing property values and construction costs prevail to 1990, 139 miles of tunnels nationwide are projected, while under more favorable conditions, nearly 400 miles of tunnels were found to be justified. The likelihood of fulfilling the optimistic condition is discussed.

42 169258 THE SAN DIEGO TRANSIT STUDY DATA BASE: REFERENCE MANUAL. The manual presents descriptions of the sources and procedures used in compiling a data set for analyzing the impacts of changes in the service and fare policies of the San Diego Transit Corporation (SDTC) bus system over a 40-month period between 1972-1975. The manual describes the data items, the sources of data, the coding procedures, and the creation of computer files. It provides a glossary of terms and concepts adopted in creating and using the data set. The intent of the manual is twofold: (1) to serve as a supplementary reference document to other reports of the Urban Institute's San Diego transit study, and (2) to be a source for those who wish to familiarize themselves with the nature and structure of the computer files.

42 169706 THE URBAN TRAVEL DEMAND FORECASTING PROJECT, PHASE I FINAL REPORT SERIES, VOLUME XI. FORECASTING TRAVEL DEMAND IN SMALL AREAS USING DISAGGREGATE BEHAVIORAL MODELS: A CASE STUDY. The patronage of a new transit system proposed for a suburban city in the San Francisco Bay area is predicted using disaggregate behavioral models of transportation choice. Features of the study include: (1) detailed transportation alternatives (the models that were used estimated the probabilities of choices among seven different travel modes); (2) calculation of time and cost data

needed as inputs to the forecasting models with hand measurements of walk distances for each person in the sample, and descriptions of trips both inside and outside the local area; (3) a method based on iterative proportional fitting used to correct for unrepresentative sampling of the population of potential bus users; and (4) analyses conducted to test and compare the accuracy of the probabilities estimated by different behavioral models, using data available before the bus system was running. Results suggested that the behavioral models used can be feasibly applied to travel demand forecasting in small urban areas, but that additional development and testing of the models should be done before they are used as a basis for policy decisions.

42 169972 SOCIAL "BALANCE SHEET" FOR SHORT-DISTANCE PUBLIC TRANSPORT [Sozialbilanz im öffentlichen Personennahverkehr]. The traditional presentation of company accounts, with their exclusively profit-oriented character, is not a true reflection of the company's activities, in that they tend to overlook the main objectives of a short-distance public transport company. Hence the presentation, for this particular business, of results based on its social aspect, in the form of a "social balance sheet". Alongside general considerations and possible premises for this particular sector of activity, the author identifies the social profit and cost elements, and gives an assessment based on turnover. 42 169986 TRANSIT ALTERNATIVES ANALYSIS FOR LOS ANGELES. An interdisciplinary team of public agency personnel and consultants has recently performed a transit alternatives analysis subject to guidelines promulgated by UMTA mandating a comprehensive assessment of the social, economic, environmental, and urban development goals of an area as an integral part of the transportation planning process. The alternative analysis, the first to be

completed subsequent to the new UMTA directives, utilizes an iterative and hierarchical approach to transit planning proceeding from system level evaluation, followed by a selection of high-priority areas or corridors for further analysis, which is in turn, followed by the selection of the highest priority subareas for extremely detailed analysis and evaluation. Major categories of investigation included an analysis of many quantifiable measures leading toward cost-effective transit solutions (e.g., capital and operating costs) as well as a qualitative comparative assessment of such factors as visual impacts and direct impacts on land-use goals and objectives.

42 169987 TRANSPORTATION SYSTEMS FOR AMERICA'S FUTURE-A MANAGEMENT OVERVIEW. This special publication is based on presentations from the keynote session at the 1976 SAE National West Coast Meeting. Its purpose was to provide an overall view of America's transportation needs for the future and how they can best be met. Because of the outstanding success of the session, SAE decided to publish the keynote presentations so that the viewpoints expressed could reach a broader audience. Specifically, the publication contains an overview of transportation system requirements nationally and panel discussions of this overview from the viewpoints of the automobile industry, the railways, rapid transit equipment manufacturers and railway equipment manufacturers.

42 170566 QUICK-RESPONSE URBAN TRAVEL ESTIMATION MANUAL TECHNIQUES AND TRANSFERABLE PARAMETERS. This Users Guide provides methods, transferable parameters, tables, nomographs, etc., for use with manual and computer techniques for urban travel estimation. A companion report, "Travel Estimation Procedures for Quick Response to Urban Policy Issues" was also prepared. The two documents are the results of an investigation of the ability of travel estimation procedures to provide information which can be used to respond quickly to urban policy issues. This document provides manual techniques and appropriate tables and graphs in the areas of: trip generation, trip distribution, mode choice, auto occupancy, time-of-day distribution, traffic assignment, capacity analysis and development density/highway spacing relationships. Application of the material to three scenarios (site impact, corridor analysis and density/highway spacing) is also included. There are numerous problem areas where application of the manual methods provided will prove advantageous as compared to the application of computer procedures. The transferable parameters allow quick response compared to the time required to collect local information, and may be used by computer methods as "default" values where more appropriate local information may not be available. The parameters

are also used in the manual methods described. /Author/

Comsis Corporation Final Rpt. NCHRP Project 8-12A, Nov. 1977, 604 pp, 169 Fig., 72 Tab., 73 Ref.; Prepared for Transportation Research Board, National Cooperative Highway Research Program. 42 170929 AN ANALYSIS OF THE ROLE OF SUB-REGIONAL TRANSIT STUDIES--A REGIONAL PERSPECTIVE. An analysis is presented of the sub-regional Transit Development Programs (TDP's) for the Regional Transit Authority (RTA), and based on this, a proposal is made to describe the form of transit study most appropriate for the needs of each level of geographical aggregation: local, regional and federal. Such a study will address the transit needs of local areas, will provide the most valuable input into regional plans and programs, and will be translated into specific grant applications. Comparison of the 6 TDP's showed that all programs identified alternative transit concepts, and defined goals and objectives. The full marketing approach was followed in 2 studies. The modeling strategies for ridership estimation varied widely. The important features of each of the six studies are tabulated. It is recommended that the RTA should be involved in the study which will be performed at the local level. RTA support from the Marketing and Service Planning Department is required to lend expertise and to detail routes and schedules. Active RTA input is also required in "selling" the new service. Part of the study involves setting up a structure of responsibilities and communications (monitoring) to assure that the study is kept up to date.

Bowman, LA Bernard, MJ, III ; Northeastern Illinois Regional Transportation Auth TR-76-07, June 1976, 39 pp, 3 Fig., 4 Tab., 2 App.; The preparation of this report has been financed in part through a grant from the U.S. Department of Transportation, Urban Mass Transportation Administration.

42 170944 PRIVATE TRANSPORT. PUBLIC TRANSPORT [Individualverkehr. Öffentlicher Verkehr]. The author, by means of in-depth analysis of transport development in Austria, concludes that private car transport has reached a saturation point, so that more rational organization of public transport is required, bearing in mind the particular characteristics of each mode of transport. Area transport should be restricted to buses, and "linear" transport, with a properly adapted rail network, to the railways.

42 172143 OBSERVATIONS ON TRANSPORTATION SYSTEM MANAGEMENT (TSM) AND SUGGESTED CRITERIA FOR A WORKABLE TSM PROGRAM. In this paper, general observations are made and developmental efforts for improving TSM are suggested. Seven criteria must be met for a workable TSM process: a workable structure to bring together the various elements of the urban transportation scene; an initial classification system for TSM actions by which feasibility studies can be conducted by the most appropriate participants in the process; a second classification system to group TSM actions assigned to the MPO for study, according to their compatibility in achieving TSM objectives; technical process for evaluating arewide TSM actions or groups of actions which is compatible with the evaluation technology for long-range transportation alternatives; coordinated effort between TSM evaluations and the development of transportation control strategies required under the Clean Air Act; a monitoring process to validate results of TSM actions after implementation; an issue format on alternative combinations of TSM actions for discussion and debate by the policy group and funding incentives must be developed to encourage TSM consideration. Topics for priority consideration is developmental work for improving the planning and implementation are also suggested.

42 172364 AN EVALUATION OF PROMOTIONAL TACTICS AND UTILITY MEASUREMENT METHODS FOR PUBLIC TRANSPORTATION SYSTEMS: EXECUTIVE SUMMARY. The first part of the report focuses on the promotion of public transportation. It includes a survey of relevant communications and marketing literature, the research hypotheses that were deemed relevant, the methodology used to test alternative promotional tactics, and results of interpretation of the findings for promotion for public transportation. The second part focuses on recent advances in methods for quantifying preference levels for various products and service features of transportation modes. Similarly, it reviews the relevant literature, presents the methodology whereby alternative measurement methods may be applied to evaluate the attributes of transportation systems in the study area, and reports the findings concerning the usefulness of the methods tried as well as recommendations for transit planning and future research in the problem area. From these results, several suggestions for future research appear to be germane. First, longitudinal studies of the effects of multi-exposure promotional campaigns on attitudes and behavioral intentions toward public transportation need to be undertaken. Second, incremental changes in the attributes having the greatest potential for altering utilities should be implemented and monitored. Third, analytical models for evaluating the political and economic viability of alternative attribute combinations for transportation systems need to be developed. Fourth, further developments

should be undertaken to develop a more parsimonious instrumentation for eliciting trade-off data for potential users of transportation services. Finally, work should be undertaken to reduce the computational costs of analyzing trade-off data. The results of the study indicate that unless there are substantial improvements in the product (public transportation) promotion will not be effective in obtaining attitudinal and behavioral changes. The trade-off analyses developed in this study provide indications of the areas where policy may be most effective in increasing the utility of public transportation services. These findings provide, at least, a first handle on some of the policy levers that may be available to decision makers confronted with choosing alternative strategies for the provision of public transportation in their communities.

42 172543 NORTHERN CORRIDOR BUS-RAIL STUDY. The immediate purpose of this project was to study Adelaide's northern corridor, as a pilot for other investigations elsewhere, "to determine the optimum location and size of interchanges, to develop a preliminary design for bus/rail co-ordinated services and to assess the economic viability of the proposals". The primary output of the study was seen as: (I) identification of stations suitable for development as mode transfer locations; (II) route, frequency and fare policies; (III) projected access mode usage levels; (IV) preliminary layout plans for the recommended interchanges; and (V) examination of the economic and environmental justification of the proposals. This report was prepared for the Director-General of Transport, South Australia. /TRRL/

42 172561 SOME DEVELOPMENTS IN TRANSPORT DEMAND MODELLING. This paper discusses some of the results obtained from the micro-economic interpretation of travel behaviour as it relates to the structuring of transport demand models. Emphasis is on evaluations using consumer surplus measures, and work done in Great Britain is mainly reported. The effects of variations in personal choice on the structure of demand models is analyzed, and the theory of personal difference models is developed. Some examples are given of a type of demand model (referred to as a "structured logit model") which is consistent with personal difference utility variation. /TRRL/

42 172828 GOLDEN GATE RECREATIONAL TRAVEL STUDY. This study investigated the impact of the development of certain lands in the San Francisco Bay Area as a national parkland, and planned methods of carrying visitors to and

within the park areas. The plans attempted to resolve problems related to: the accelerated weekend travel demands in already traffic-congested areas; and access for the general populace to this major new Bay Area recreational source. Funding policies, general policies concerning transit operators, field data for future recreational travel plans, and policies relating to non-monitored access are considered. The Study Plan recommends two basic additions to the existing transportation system--Transit/Information Junctions and Park Shuttles. Specific recommendations for changes in current transit routes are also made. The mathematical model for predicting the amount of travel between the park and populated areas, transportation alternatives, and information systems which would stimulate travel are discussed. The major study findings regarding transit use, auto use, and informational needs are presented.

Metropolitan Transportation Commission Sumry Rpt. UMTA-CA-09-0025, July 1977, 82 pp, Figs.; The preparation of this report has been financed in part through a grant from the U.S. Department of Transportation, Urban Mass Transportation Administration, under the Urban Mass Transportation Act of 1964, as amended. Additional funding has been provided by the National Park Service, the County of Marin, Caltrans and the Federal Highway Administration.

42 172866 FUNCTIONAL FORMS OF THE UTILITY INTEGRATION RULE IN TRADE-OFF ANALYSIS. This paper investigates the sensitivity of the N.Y. State Department of Transportation's trade-off model (an attitude scaling procedure) to the utility integration rule incorporated in the model. Three utility integration rules are tested: a multiplicative model, an additive model, and an exponential additive model. The sensitivity of the procedure is evaluated at two points: first using the utilities estimated by the different forms, then by means of a market simulation. Utilities were estimated for the multiplicative and additive models only. Systematic differences were found but they are very small. The market simulation was done using all three models in conjunction with either a voting share or a Luce preference share model. Expectedly, no differences were found under the voting share model, while again systematic though small differences were found under the preference share model. Overall, there are no significant empirical differences between the results arrived at under the three utility integration rules. Nevertheless, the exponential additive model is the preferred model, in the context of this procedure, because it requires only interval-scale data. /Author/

Koepfel, KWP ; New York State Department of Transportation Research Rpt. 122, Aug. 1977, 69 pp, 4 Tab., 85 Ref.; This report was prepared in part with the financial assistance of the U.S. Department of Transportation.

42 172885 THE TRADE-OFF MODEL: EMPIRICAL AND STRUCTURAL FINDINGS. This paper reports on a number of investigations done by N.Y.S.D.O.T. to investigate empirical and theoretical aspects of trade-off analysis, a multidimensional attitude scaling procedure. Using a split half sample of 110 N.Y.S.D.O.T. employees, and a questionnaire on staggered work hours, the trade-off procedure was com-

pared to categorical judgement. It was found that the methods are not equivalent: the trade-off procedure is preferential for the analysis of incremental changes in policy. Another analysis was conducted to investigate possible respondent fatigue effects due to the lengthy questionnaire: the effect was found to be significant. Further investigation was conducted to investigate the effect of a reduction in the questionnaire length. In general, a reduction of at least 50% in the number of required data matrices can be achieved without a significant loss in the quality of the results. Finally, the sensitivity of the procedure to a number of utility integration rules was investigated. While small differences in the results were found, they are small enough to be of little concern to the practitioner using the procedure. The research concluded that the trade-off procedure is a powerful robust approach that can be used with confidence. /Author/

Eberts, PM Koeppe, KWP ; New York State Department of Transportation Res. Rpt. 123, July 1977, 29 pp, 11 Tab., 10 Ref.; This report was prepared in part with the financial assistance of the U.S. Department of Transportation.

42 173185 PREDICTING THE IMPACTS OF TRANSPORTATION ON THE SPREAD OF URBAN BLIGHT. Large-scale, urban transportation developments can affect the spread of urban blight through residential areas both directly and indirectly. Sources of blight and their specifications in filtering models are reviewed. Relations between transportation developments and sources of blight are considered to determine whether filtering models can be used to predict the impacts of a development. While none of the models are adequate for this purpose, they provide the basis for a procedure to consider a proposed development's impacts.

42 173193 SOME SOCIAL, ECONOMIC, AND ENVIRONMENTAL RESEARCH NEEDS. Four major shifts that will shape research and policy agendas through the 1980's are enumerated and discussed. It is noted that the highway development backlog has now been completed and ways are being sought for improving the performance of the transportation network. Economists, lawyers, environmentalists and sociologists are entering the field of transportation planning and management. The concern for equity has supplanted that for efficiency in the above field. It is also noted that the hitherto powerful role of transport in shaping land use may now be ending. Another major shift is the decline in public transit and the absence of an obvious successor. Concern about highway accidents, energy, and the environment has generated engineering changes that will improve the auto highway system. However, other problems remain, the most serious is that the accessibility afforded by the automobile is not available to everyone. The more effective use of transit services, small vehicle transit service, and paratransit using automobiles as the public transit vehicle are

likely prospects for the future. Studies of new organizational forms for redistributing services is recommended. Comments are made on the influence of the automobile on land use patterns.

42 173299 BUS NETWORKS AND BUILDING AREAS IN MIDDLE-SIZED TOWNS. PARTS 1-3 [Busslinjenæet och bebyggelse i medelstora stæder. Del 1-3]. The aim of this project was to improve the basis of knowledge for bus network and building area planning concerning priority between travel-flows, adjustment of public transport planning to physical planning and adjustment between walking distance and bus frequency. In the network evaluation journey time and time value were considered. The priority between travel flows was studied by comparison of radial networks with tangential networks. The lowest average journey time value was obtained for networks with small tangential line deviations. It is essential for network selection to consider distribution effects between areas and between groups of individuals. Important improvements of travel standards can be obtained by the planning of continuous building areas and central line routeing, co-ordinated location of links and nodes in public transport systems within important destination areas, co-ordination of residential and other building areas with work/service areas. No evident results were obtained from the studies of adjustment between walking distance and bus frequency. This was because of a lack of empirical knowledge of waiting time related to tour interval and of the way in which waiting time and walking time are valued by different groups. The analysis of time value was carried out to compare real time with experienced time value. Both methods of analysis gave analogue results. /TRRL/ [Swedish]

42 173559 MASS TRANSPORTATION ALTERNATIVES: AIR, HIGHWAY, BUS AND RAIL. This article explains where we are today concerning mass transportation. It takes an in-depth look at the past, present and future projections of passenger traffic by discussing the interstate highway, rail, air, and bus systems. It outlines transportation needs in both urban and rural areas, as well as discussing problems which will need to be solved in order to make mass transportation a viable alternative to the private automobile.

42 174014 COMPREHENSIVE IMPACTS OF URBAN TRANSPORTATION SYSTEMS. Solutions to urban transportation problems are twofold: First, alternative transportation systems must become available as a reasonable substitute

for the private automobile. Second, the spatial orientation of urban areas must be planned so as to prevent the inefficient cross-hauling requirements of the populace. As the inefficiencies and dis-economics of private auto transportation increase, users will equitably share a larger proportion of the social and actual costs of the mode. The entire urban planning process should become more oriented towards land-use planning with regard to more efficient accessibility. Because of the increasing diversity of origins and destinations other than the central urban core, there will always be a need for some type of private transportation. The concept should be one of an interfacing of the two modes rather than a reliance on one or the other. The present quality of service offered by mass transit is inferior in terms of convenience, comfort and speed, as well as the low availability of service. In order to offer effective competition with the private automobile, any form of mass transit must offer comparable amenities at reasonable costs. The massive resources required to initiate the development of new systems should be a joint effort of the government and private industry.

42 174024 TRANSPORTATION MODELING IN A CHANGING WORLD: A MIAMI CASE STUDY. Cities throughout the United States are placing increasing demands on the Urban Mass Transportation Administration for funding of improved transit systems. Approximately 40 of these communities are serious about developing rapid transit in one form or another. However, as a class, these proposals are extremely expensive and could utilize the entire Urban Mass Transportation Administration funding as established under the National Mass Transportation Administration Act of 1974 (\$11 billion over six years). To assure fair, systematic evaluation of these requests, the Urban Mass Transportation Administration has developed a series of policy guidelines that emphasize local decision-makers in creating a sound approach to alternative systems evaluation so that the technical results of all "lead-in" studies to rapid transit funding requests can be factually supported. Traditional technical approaches to transportation models are not tailored to the needs of planners and decision-makers. Using the Miami setting as a basis, a modeling approach is discussed that is directed toward: providing local officials and planners with policy options that will allow them to achieve stated goals with regard to the role of the transportation system in the urban environment; and evaluating quantitatively and analytically the effects of various uncertainties on the capital-intensive system investments. This approach uses a mathematically based risk analysis model together with sensitivity analysis and policy modal split techniques. The first model evaluates the degree of uncertainty involved in patronage and revenue projections and thus provides measures of the risk involved in investment alternatives. The latter set of models is capable of developing system characteristics and policy

combinations that will achieve modal split objectives for the region and for certain predefined trip and tripmaker strata. In addition to discussing these approaches and their application in Dade County, Miami, the role of calibration in the behavioral modeling package is described and illustrated.

42 174047 CONSIDERATIONS INFLUENCING THE FEASIBILITY OF COMMUTER RAIL SERVICE. PASSENGER SERVICE EVALUATION. TECHNICAL REPORT 6. This report addresses the feasibility of commuter rail operations designed to serve workday urban travel demands. This report does not provide a detailed evaluation of the potential for commuter rail service in any specific corridor; rather, it provides an overview of issues and problems that should be realized in evaluating the desirability of a commuter rail operation in any corridor. This report is divided into five sections. The first section describes the travel problems that exist which create an interest in the commuter rail alternative. The second section presents operating considerations that would be associated with a commuter rail system in Texas. Following this, a preliminary estimate of the market for commuter service in illustrative travel corridors is provided. The fourth section identifies the general magnitude of revenue and cost that might be generated by a commuter rail system. Finally, a synopsis of the major findings is presented.

42 174168 TRAFFIC FORECASTING. PART 1. The author considers that the central fact of the work on traffic forecasting is the technique used to forecast the growth of car ownership, but that the conversion of this forecast into traffic growth, especially into trunk road traffic, raises a whole series of problems. It is suggested that there are a considerable number of techniques available for car ownership forecasting, depending on the data available for calibration. The Department of Transport's method of forecasting is described as that technique known as time series analysis, initially calibrated on licensing data, but now increasingly being used on census data at a local level. The use of this technique is discussed and compared with other techniques used by the Department of Transport, such as the cross-section technique used for car ownership forecasting in its national traffic model (NTM), and those used by British Rail and by the Greater London Council. The interaction between car purchase and car use in relation to land use and travel is examined, and the traffic implications of petrol prices and prices of public transport, and service levels, both in the short and long term are discussed. The basic assumption in a cross-section technique as compared with a time series analysis technique is that there is a stable relationship between car ownership, or some level of car ownership and income. Such differences are dis-

cussed, and emphasis is placed on the need to calibrate the model used, and to consider the validity of the data used for calibration, and its extent, and the specification of the actual indices used. /TRRL/

Mogridge, MJH (Greater London Council) *Highways and Road Construction International* Vol. 45 No. 1811, Aug. 1977, pp 5-10, 1 Tab., 24 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 230957)

42 174169 TRAFFIC FORECASTING. PART 2. Part 2 of this two-part commentary on the department of transport's method of traffic forecasting is mainly concerned with car purchase and car use. The author suggests that whilst the growth of car ownership appears likely to continue, indeed to levels substantially in excess of the department's estimates, the level of car traffic arising therefrom is much more sensitive to policy on taxation and service levels, whether on trunk roads or generally, and that much more work needs to be done to evaluate what the best policies are for the community as a whole. The author states that the only source of data which simultaneously gives the expenditure on car purchase and car use for each household income level is the family expenditure survey. These data are discussed, and it is suggested that since the car owning sample is only about 4000 households per year, any conclusions must be considered as tentative. The proportion of disposable income allocated to car purchase and use is given as about 15 1/2 per cent, and this finding is discussed in relation to movements in the prices of fuel and the growing demand for increases in car size. The relationship between public and private transport is discussed, together with policy implications concerned with petrol taxation; bearing in mind that the major determinants of car ownership are considered to be incomes and car prices, but not fuel prices. /TRRL/

42 174729 BALTIMORE REGION RAPID TRANSIT SYSTEM. PHASE I [Rept. for Sep 71-Dec 73]. Significant transportation planning for Baltimore was begun in the early 1960's with an analysis of the long-range and specific urban transportation requirements for the region. The T9-6 (September 1971-December 1973) is one more step in the continuing planning and design process leading to the construction and operation of a public rapid transit system in the Baltimore region; it is administered and supervised by the Mass Transit Administration. This report presents a review of the work completed and the results achieved by the T9-6 Baltimore Rapid Transit project, and summarizes the rapid transit development program to date, as well as the current and future program leading to Phase I implementation. The basic purpose of the T9-6 project was to provide preliminary engineering designs, design criteria and guide specifications for the Phase I system; and to develop additional studies and analyses relative to cost, schedule, and other technical aspects to serve as a basis for the current Phase I Capital Grant Project. The Phase I system includes the Northwest and South lines (about 28 miles of line structure and 20 stations). The two Phase I lines are completely grade separated along routes extending northwest and south from Charles Center, and will provide frequent, high-speed, automated rapid transit service utilizing modern steel wheel vehicles traveling on steel rails. The two Phase I lines and corresponding stations are illustrated herein.

42 175939 TRANSPORTATION PLANNING: NETWORK MODELS AND THEIR IMPLEMENTATION. Transportation planning plays an essential role in shaping regional and urban lifestyle. Complex decisions regarding policy alternatives for railroads, shipping, airline, and roadway traffic can often be, and often have been, analyzed using network optimization techniques. In this paper, the authors survey applications of network algorithms to transportation planning, stressing networks models and their efficient computer implementation. They discuss recent contributions concerning shortest paths, minimum cost network flows, traffic equilibrium, vehicle routing, and network design, and they enumerate several open research problems. Much of the discussion reflects an emerging theme in the analysis of transportation problems, the blending of ideas from transportation science, computer science, and operations research. (Author)

42 176160 MAKING FUTURE TRANSPORTATION DECISIONS: INTERMODAL PLANNING NEEDED. Intermodal planning is an examination of interactions and relative costs and benefits between competing and complementary transportation modes. Through intermodal planning, significant savings can be realized in the areas of freight movements and urban passenger travel. To promote intermodal planning by State and local transportation agencies, the Secretary of Transportation should seek (1) congressional legislation to consolidate Federal airport, highway, railroad, and transit planning grants into a block grant for all transportation planning and (2) merge the Department of Transportation's modal planning staffs into a single, all-mode unit.

42 176455 POLICY-CONTINGENT TRAVEL FORECASTING WITH MARKET SEGMENTATION. Market segmentation of travel data gives a data base that is easy to use and interpret. This paper develops methods for tabulating travel data so that disaggregate travel-demand models can be applied to market segments. These methods result in improved accuracy of travel forecasts because appreciation bias is reduced. The approach also allows nearly immediate computation of demand elasticities. These procedures can be applied to most urban travel-data files by using cross-tabulation software. To demonstrate the methods and their accuracy, the work-trip modal split is simulated on Nationwide Personal Transportation Survey data by using a disaggregate logit model. Travel demand is forecast under a variety of transportation policies that involve automobile controls and transit level-of-service improvements. /Author/

42 176456 EFFECTS OF SMALL SAMPLE ORIGIN-DESTINATION DATA ON TRANSPORTATION STUDY RESULTS. This paper discusses the effects of using small-sample origin-destination survey data as the basis for urban transportation planning models. The study was based primarily on home-interview survey data collected in the 1969 San Antonio-Bexar County Urban Transportation Study. The analysis demonstrates the ability of small sample origin-destination data to produce travel estimates that are in close agreement with model results obtained by using traditional large-sample survey data. The survey data for 12,477 dwelling units (i.e., a 5 percent sample) were used as a data base from which repeated geographically stratified random samples of 6400, 3200, 1600, 800, 400, and 200 observations were drawn. Two samples for each sample size, representing the 10th and 90th percentiles of distributions of sample estimates of total automobile-driver travel, were selected for evaluation. This procedure provided a 0.8 probability that samples of similar size will produce travel estimates as good as or better than those obtained here. The selected samples were used to develop inputs to trip-generation, trip-distribution (gravity), and traffic-assignment models. Samples of 400 or more dwelling units were found to produce acceptable results. /Author/

42 176490 TRANSPORTATION PLANNING IN LOS ANGELES. One of the primary transportation efforts in Los Angeles is the development of a starter-line rapid transit system for consideration by UMTA for funding from its capital grant program. Along with this long-term project is a focus on short term transportation improvements, including better management of existing transportation facilities. Results of early pilot and demonstration measures introduced in Los Angeles indicate that they do not yet represent sufficiently attractive alternatives to citizens to compete effectively with accustomed travel habits. Experience with proposals for the use of various disincentives revealed patterns of common characteristics. A fundamental characteristic of incentive-disincentive planning is that they carry a disproportionate number of negative impacts. It is much more difficult to anticipate the degree of antagonism that will be generated, for instance, by reserved lanes than it is for the construction of new transportation facilities. The potential for generation of public antagonism by unfamiliar new measures is so great that as much attention must be given to this negative aspect during preimplementation planning as is given to the planning of other more familiar project elements. Negative impacts must not only be identified but also dealt with. Great care, then, must be taken to prepare high-quality information materials and disseminate them carefully. A planning team must ultimately be representative of both the public and private sectors.

42 176517 THE DECISION-MAKING ENVIRONMENT OF URBAN TRANSPORTATION. The government's influences on the size and shape of the transportation equipment market and the unpredictability of that influence are discussed, as well as the operators' influence on the market. The uncertainty that characterizes government funding of transit is also present in the supply of private capital. Ways in which such uncertainties could be mitigated are considered. The constraint that labor imposes on transit operations is also considered. The ways in which the organizational and institutional environment could be reshaped to encourage better performance are listed: in certain contexts free transit could provide universal mobility while meeting specific social goals; competition in the supply of transit equipment and infrastructure would be stimulated more by subsidizing capital availability through low interest, proprietary interest. Other ways mentioned here include the conversion of some transit systems into employee-owned cooperatives; research into the demand aspects of transit; consumer education; and the examination

of fundamental concepts such as capacity on urban transportation etc.

42 176521 CASE STUDY OF NEW YORK CITY TRANSIT SYSTEM: PART 1. Transportation within the Metropolitan Transit Authority (MTA) is provided by 11 constructed agencies, 4 million private automobiles, 12,000 taxis 40,000 gypsy cabs, and by at least 120 private bus companies. A table is provided which illustrates commuter travel to work. The Consolidated MTA deficit is increasing in absolute size and in relation to the financial operation. The actual and projected deficit figures are illustrated in a table. Employee wages and fringe benefits have risen to the extent that savings gained through reductions in the work force have become insignificant. Also, staff reductions have not kept pace with the decline in ridership. Tables are provided which show ratios of the work force to passenger and the amount of service provided, employment data for MTA affiliates, the sources of deficit financing for the MTA affiliates, and the categories of the sources of financing. An attempt is being made to move to a service plan which is discussed at public hearings of riders and others affected by the operations of MTA so that they have greater control over the services.

42 176698 EXAMINATION OF SIMPLIFIED TRAVEL DEMAND MODEL. A simplified travel demand model, the Internal Volume Forecasting (IVF) model, proposed by Low in 1972 is evaluated as an alternative to the conventional urban travel demand modeling process. The calibration of the IVF model for a county-level study area in central Wisconsin results in what appears to be a reasonable model; however, analysis of the structure of the model reveals two primary mis-specifications. Correction of the mis-specifications leads to a simplified gravity model version of the conventional urban travel demand models. Application of the original IVF

model to "forecast" 1960 traffic volumes based on the model calibrated for 1970 produces accurate estimates. Shortcut and ad hoc models may appear to provide reasonable results in both the base and horizon years; however, as shown by the IVF model, such models will not always provide a reliable basis for transportation planning and investment decisions.

42 176910 INTEGRATED LONG TERM PROGNOSIS FOR TRANSPORT DEMAND IN FREIGHT AND PASSENGER TRANSPORT IN THE FEDERAL GERMAN REPUBLIC UP TO THE YEAR 1990. SECTIONAL STUDY: PASSENGER TRANSPORT-GLOBAL DEVELOPMENT UP TO 1990 AND REGIONAL STRUCTURE IN THE YEAR 1990 [Integrierte Langfristprognose fuer die Verkehrsnachfrage im Gueter-und Personenverkehr in der Bundesrepublik Deutschland bis zum Jahre 1990. Teilstudie: Personenverkehr-Globale Entwicklung bis 1990 und Regionale Struktur im Jahre 1990]. The long term forecasts for passenger transport in the federal German republic should be a particularly useful decision aid for the planning of traffic routes. For this reason, with the aid of many methodological assumptions, the global development of passenger transport up to 1980 is estimated, divided in accordance with the reason for the journey and the type of transport (modal). A special prognosis is required for air transport. In addition to the global forecasts, the 79 districts in the federal republic are checked for expected special developments in individual journey purposes and types of traffic and estimates are made up to the year 1990. The study also demonstrates the movement in passenger traffic between the 79 districts, also taking into account the modal split in this case. [German]

42 176913 ESTIMATES OF FUTURE TRAFFIC VOLUME [Schaetzungen des Kuenftigen Verkehrsumfanges]. Market research is just as important in traffic engineering as it is for a company. Traffic estimates should take into account the sociological, economical and technical aspects simultaneously. This important exercise can only be properly conducted by a comprehensive study of the problem. In many respects the climax of development has passed. Population is on the decrease, an increase in maximum speed has no further advantages, the railway network is more or less complete apart from a few express-and urban routes and the extension of the highway network will probably be complete within a few years. As opposed to the constructive aspects of traffic engineering, the operational aspects are gaining importance. The transition between different modes of transport, and journey speeds, especially in town traffic conditions, has to be improved. A careful watch

on the situation will enable reliable estimates for the future to be possible and will assist in avoiding incorrect investments. [German]

42 177121 DESIGN-SYNTHESIS APPROACH TO TRANSIT PLANNING. Transportation system design should be oriented toward meeting specific local and regional objectives. In most current planning, objectives are used only to evaluate selected alternatives. This paper presents a design-synthesis approach to transit planning, which allows objectives to be input directly to the process and generates a transit system incorporating characteristics that are selected to optimize the attainment of specific service and cost objectives. The design-synthesis technique specifies transit service in the abstract so that characteristics of service such as frequency, headway, travel speed, and fare can be examined individually without being constrained to a specific system alternative. The paper reports successful applications of the approach in (a) identifying short-range transit improvements for San Diego and Denver and (b) designing long-range transit alternatives for Denver.

42 177129 DETERMINING THE NEED FOR UPDATING TRANSPORTATION STUDIES IN SMALLER URBAN AREAS. The available literature describing the transportation planning process, the applicability of the process to urban areas of under 50,000 population, and the techniques used to update transportation studies from a base year to the current year were investigated. Major factors influencing the need for updating were studied and their impact on the transport plan discussed. For small urban areas, a checklist of changes in community attitudes, goals, and objectives; federal regulations regarding service to impacted age groups and other requirements;

changes in population; socioeconomic considerations; land use; alternative models; funding; traffic; and transportation facilities provides an objective measure of the need to update the original study. The various levels of updating and the technical procedures are briefly described.

42 177130 CROSS-CLASSIFICATION: AN APPROACH TO PASSENGER ESTIMATION IN SHORT-RANGE TRANSIT PLANNING. A transit-demand estimation model using cross classification is proposed for transit-system planning in small to medium-sized urban areas. The procedures are particularly applicable for communities that cannot afford to collect the household and transit-use data necessary for sophisticated modeling. The data requirements are limited to available census information, area-wide transit-demand estimates, and transit-system operational characteristics. The recommended synthetic model and its simplified versions have been tested as short-range transit planning tools in several cities. The procedures have been successful in describing the actual demand for existing transit systems and have been used in estimating future transit demands that reflect different policy decisions. The model can be adjusted to reflect local conditions and to incorporate the results of special studies and surveys.

42 177131 TRIP-GENERATION SYNTHESIS FOR SMALL AND MEDIUM-SIZED CITIES. A generalized-synthesis approach for planning transportation facilities in small and medium-sized cities is presented in this paper. The object of this synthesis approach was to determine whether major travel parameters are independent of city size. Trip purpose distribution was found to be independent of city size. Distributions of 22.3 percent home-based work, 48.3 percent home-based other, and 29.4 percent non-home-based trips were used for synthesis application. Total trip-generation equations were developed by using both dwelling units and motor vehicles, and then a step-down procedure was applied. These generalized generation study-area equations were then evaluated against specific study-area equations and other generalized equations.

42 177135 DEVELOPMENT OF TRANSIT PLANNING GUIDELINES FOR SMALL URBAN AREAS IN PENNSYLVANIA. Guidelines for short-range transit-planning studies for small urban areas are proposed in this paper. These guidelines are based on experience gained during the conduct of four studies in Pennsylvania. Three were undertaken in areas with existing transit service. The fourth was a transit-feasibility study for an area without transit service. The cities ranged in population from 16,000 to approximately 55,000. Specific guidelines are proposed for study initiation, data collection, demand forecasting, and local participation. The major conclusion is that studies in small urban areas need not be expensive or time-consuming. The major emphasis should be on the interaction of the planning team with local transit officials, planners, elected officials, and community groups. The technical aspects of the study play only a supportive role in the dialog among them.

42 177137 ASSESSING TRANSIT NEEDS IN SMALL COMMUNITIES (ABRIDGMENT). In order to develop a methodology useful in determining the location and magnitude of public transportation needs, in rural and small urban areas in California, 10 sites, called representative sites, were selected and studied in detail by household surveys for each. Then, by the use of a site-pairing technique, over 200 sites, called candidate sites, were matched with the 19 representative sites through similar relevant characteristics such as land form, land use, area population, population of largest town, distance to nearest urban area, climate, and existing transportation facilities. Analysis of the data caused rejection of the original model and the use of classical regression approaches. A refined model was developed by using several variables chosen from the literature and the survey results, which suggested relative mobility needs. The values from the uncalibrated model were then presented to the local planning agencies. Their policy judgments were solicited as to the number of transit trips they were able or desired to satisfy. It was found that, while traditional regression approaches are inappropriate in these areas, travel needs in rural and small urban areas can be quantified to suggest relative transit deficiencies in such a way as to be useful for indicating legislative funding priorities.

42 177138 EVALUATION OF RURAL PUBLIC TRANSPORTATION DEMAND MODELS THAT INCLUDE LEVEL-OF-SERVICE MEASURES (ABRIDGMENT). Two rural public transportation (RPT) demand models, one with level of service measures (developed by

Burkhardt and Lago) and one without (Pennsylvania trip-rate model), were evaluated by direct application to estimate the demand for two existing RPT systems in Northern Wisconsin, Ashland and Ladysmith. While no final conclusions as to the relative accuracy of the two models can be reached on the basis of a sample of only two rural transit systems, the application of the models to two systems with markedly different levels of service has demonstrated the importance of including level of service as an independent variable. On balance, the level-of-service model provided more accurate estimates of demand.

42 177139 TRANSPORTATION PLANNING IN RURAL REGIONS OF IOWA (ABRIDGMENT). Changes in population, population density, and travel patterns, as well as economic changes, in the state-designated transportation planning regions of Iowa from 1950 to 1970 were analyzed in order to determine the validity of the present planning region boundaries. It was found that, as a result of the substitution of manufacturing for farm employment, the rural regions have become less self-contained with inter-regional commuting, and shopping trips more the norm than intra-regional travel for such purposes. It is suggested that rural transportation planning regional boundaries may have to be redrawn in order to avoid the interjurisdictional problems that would arise with the present boundaries.

42 177217 MONITORING THE EFFECTIVENESS OF STATE TRANSPORTATION SERVICES. This report discusses procedures that state governments might use to monitor the effectiveness of state transportation services on a regular (preferably annual) basis. Measurements procedures are discussed for assessing the out-

comes of a variety of state transportation services, including highway planning, maintenance, mass transit, the division of motor vehicles, and highway emergency services. Measures of effectiveness and data collection procedures addressing the following state transportation concerns are described: rapid movement; access to important destinations; safety; travel convenience and comfort (including road rideability); environmental and aesthetic impacts; and provision of quality services to citizens in terms of courtesy, fairness, responsiveness, and equitability. The problems and limitations of the measurements are also discussed. A special section on measuring the effectiveness of local and intercity mass transit services is included. An illustrative citizen survey for obtaining information on a variety of state transportation effectiveness concerns is provided as an appendix. It is based on the results of statewide citizen surveys tested in North Carolina and Wisconsin as part of the project. Experiences regarding tests of a number of other measures by these and other states--including cost information--are also reported. /Author/

42 177274 FORMULATING AN URBAN PASSENGER TRANSPORT POLICY: A RE-APPRAISAL OF SOME ELEMENTS--ACCESSIBILITY, ENERGY AND URBAN FORM. This paper re-evaluates the appropriateness of the dominant role of speed improvement and congestion reduction, by looking at the ramification of such objectives for the entire urban system. The appraisal leads to a proposal for alternative objectives thought to be more consistent with the achievement of efficiency in resource allocation. There is a need to re-appraise the approach to transportation planning, rather than concentrate on more refinement to models and politics within the present planning framework. Topics include a discussion of downtown commuter mode travel, speed, accessibility to opportunities, energy, and transport. This paper raises a number of important issues in order to provide more information for the debate on transportation policy in the future. It is noted that the two dominant mobility objectives (speed and reduction in congestion) should be replaced with the more appropriate urban areawide objectives of accessibility to opportunities and energy consideration.

42 177308 EVALUATION OF ALTERNATIVE MARKET SEGMENTATIONS FOR TRANSPORTATION PLANNING. Market segmentation in transportation planning is a division of a total population of travelers into groups (segments) which are relatively homogeneous with respect to certain personal characteristics (the segmentation base). It is desirable that the segments be distinct in terms of travel behavior and their reactions to changes in the travel environment such as the introduction of new transportation services. This report documents a comparison of market segmentation using six different bases. The first two segmentations represent alternative ways of dividing the

population into groups which had homogeneous demographic characteristics; the second two segmentations divided the population into groups based upon such travel choice constraints as auto availability and transit service; the last two segmentations divided the population into groups based upon their responses to attitude surveys. Among these pairs of segmentations, some were multivariate, while others involved only a single variable. The six segmentations were compared with respect to five criteria judged to be important considerations in transportation planning: measurability (data availability), statistical robustness, substantiality (size and importance of resulting segments), relationship with travel behavior, and relationship with planning of service options. The comparisons showed that no single segmentation base was superior according to all criteria. On balance, however, multivariate segmentations. In addition, the segmentation based upon multivariate choice constraints satisfied more of the criteria than other segmentation bases. Segmentations of the traveling population based upon attitudes were found to have certain specific uses but to be inferior to choice constraints segmentation for most planning purpose. /Author/

Nicolaidis, GC Wachs, M (California University, Los Angeles) Golob, TF ; General Motors Research Laboratories GMR-2289, Nov. 1976, 33 pp, 17 Ref., 20 Tab.; This paper was prepared for the 56th Annual Meeting of the Transportation Research Board, January 25, 1977, Washington, D.C.

42 177333 PREDICTING DEMAND FOR RURAL TRANSIT SYSTEMS. The object of this research report is to present a simpler method of predicting the patronage of rural public transportation systems. Previous methods of estimating the need or demand for rural public transportation are discussed. These methods include subjective, gap analysis, surveys, per capita aggregate estimates, and simulation of demand functions. Using data from approximately 100 existing rural transport systems, simulation models of factors influencing the number of riders were developed. It was found that reliable estimates of demand could be produced by using a small number of variables that described characteristics of the area and people served, and attributes of the transportation system. The elements affecting the ridership of rural demand-responsive transit systems are similar to those affecting the demand for rural fixed-route transit systems, but there are significant differences in the definition of area served, trip generation, and measurement of service responsiveness. The following factors were identified as having a major influence on the number of persons that can be expected to ride a given rural transit system: Monthly bus miles; availability of service; population served; other public transportation systems; distance; and fares. The greatest benefit of the demand equations is that they provide a rough estimate of how many people might use a system according to specific rural area and transit system conditions.

42 178330 AN INVESTIGATION OF MACROSCOPIC MODELS OF URBAN TRAFFIC. A model of urban automobile traffic which does not rely on a link-by-link network description would be useful in analyzing impacts of policies intended to improve various measures of urban traffic efficiency. Here a steady-state macroscopic traffic flow model is extended to accommodate heterogeneous road types. A comparison to an equilibrium traffic assignment on a test network specifies errors due to spatial aggregation in the macroscopic model. Potential errors due to the assumption of steady state are indicated and a time-dependent macroscopic model is developed to study road system response to time-varying demand. /Author/

42 178456 THE PROBLEMS OF TRANSPORTATION PLANNING AND AREA PLANNING IN URBAN CONURBATIONS [Probleme von Verkehrsplanung und Raumplanung in Ballungsgebieten]. The origins of transportation problems are examined with reference to the following aspects: (1) the present situation regarding lack of training (of architects and civil engineers); (2) the lack of understanding of transportation planning (the conflicts that exist between politicians and planners); (3) insufficient data; (4) the legal situation (unclear regulations, the division of legal rights); (5) the chronological transference of resolutions (keeping proposed routes free of development, urban structure comes before infrastructure); (6) the lack of compatibility between transportation planning decisions and changes in structure. In actual cases the known deficiencies are discussed relating to private and public transport and public action groups and the lack of information the population has. Prerequisites to the success of a transportation planning analysis are comprehensive data and qualitatively proportionate analyses of parallel transportation plans. As a step in the planning stage of a prognosis it is shown that a present possible practiced method of approach for transportation planning is the processing of variants which serve as a basis for establishing a range of decision areas. /TRRL/ [German]

42 178495 COST-EFFECTIVENESS GUIDELINES FOR TRANSIT PLANNING. Cost-effectiveness has increasingly become a required feature of rapid transit planning for Federal approval. Uncertainty still exists with regard to what specifically constitutes cost-effectiveness analysis. With respect to measures of "transport" cost-effectiveness, a framework is proposed as a guide to which measures should be incorporated into an alternatives analysis involving rail transit proposals. Consideration should be given to the use of "marginal" measures that reflect the marginal costs, marginal usage, or marginal capacity provided by one alternative over another and to sensitivity analyses that indicate the

impact of variations in required input forecasts. For rail systems it is important to provide measures at the corridor or subarea level since systemwide measures, although valuable, can mask variations in performance by line or line segment. Because of their high capital cost, it is also important to calculate measures that reflect total costs of rail systems, not just operating costs.

42 178659 ROAD PRICING-EXPERIMENT WITH PUBLIC ROAD PRICING [Le prix de la route. Essai sur la tarification publique]. The author recalls the various aspects of transport: commodity for the community (road network), commercial service (heavy vehicle transport), private use (private vehicle ownership), and public service (public transport). Taking into account external effects and environmental problems increases the difficulty of transport pricing, e.g. The allocation to each service of the fairest price for the individual or the community. This book represents an attempt at finding an overall answer to the problem of road pricing. /TRRL/ [French]

42 178666 STUDIES OF THE VALUATION OF COMMUTER TRAVEL TIME SAVINGS. A COMMENT. The author considers that in the literature on the value of travel time, a good deal of interest has been focused on the question of whether, and how, the value of time varies with income, trip length, and "amount of time" saved. This interest is felt to relate to an underlying doubt as to the appropriateness of microeconomic theory, which predicts a close dependence of value of time on income but not on account of time saved, since value of time is defined with respect to marginal changes in travel time, the rejected alternatives being irrelevant. Thus, strong evidence that value of time does vary with the time difference between the chosen and the next best alternative, or that it does not vary with income, would cast doubt on the microeconomic approach. Empirical work by Hensher is reported which indicates such evidence, and which also argues for an alternative method of consumer behaviour which forms the basis of the quoted empirical results. The author considers that the purpose of this comment is first, to demonstrate that Hensher's conclusion, if valid, would indeed contradict the "revealed preference" or utilisation approach to consumer theory usually favoured by economists; and secondly, to argue that Hensher's statistical work and theoretical arguments are faulty, and cannot be said to add any evidence regarding the questions at issue. A rejoinder by Hensher follows this comment. /TRRL/

42 178713 EQUITY: TESTING AND ACHIEVING IT IN MASS TRANSIT. A prototypical study was made of public transportation services within the greater St. Louis, Mo., area from standpoints of adequacy and equity. At issue was whether the transit-dependent minority residents of the area were served adequately and as well as the remainder of the population. This paper describes the criteria and analyses employed in the Bi-state study. The criteria investigated are those which are primarily design-related (financial assistance, transit coverage, transferring, duration, frequency, fare, trip time, trip speed, accessibility), and those which are supply related (accident exposure, crime exposure, vehicle loading, waiting facilities, predictability, bus age, equipment, bus cleanliness, public information). The analysis also investigated other factors,

including ambient conditions they may contribute or directly cause inequities or inadequacies, eg. traffic conditions, crime, operating and maintenance facility limitations, physical location of facilities and effects of ridership patterns.

42 178735 INNOVATIVE APPROACHES TO RURAL TRANSPORTATION. This paper identifies innovative approaches to rural public transportation at federal, regional, state and local levels. There is no attempt to evaluate them. Examples include federal and regional task forces; a state assistance with planning, management, funding and cash-flow, coordination, and insurance; and local level approaches to service provision, cost savings, revenue sources, coordination, user-side subsidies, maintenance, and promotion. /Author/

42 178737 RURAL TRANSPORTATION COSTS. This paper presents a rural transportation costs model which was developed while determining potential future demand for UMTA capital and operating assistance in rural areas. The model is designed to account for all costs incurred in the operation of a rural transit system, with considerations given to regional location, firm size and public/private ownership characteristics. The bulk of the data used to develop this model came from the Section 147 Demonstration funded by FHWA and UMTA. By combining the cost information and the information available on operating characteristics, a standardized cost per vehicle mile can be calculated for a given vehicle type. Several conclusions regarding costs are noteworthy: 1) Total operation costs per vehicle mile are highest in the Northeast and Pacific coast states. 2) In rural transit operations, the bulk of the total system costs are directly attributable to drivers' wages, overhead costs, and vehicle capital costs. 3) Economics of scale are not obvious in rural transportation operations. /Author/

42 178741 PUBLIC TRANSPORTATION PLANNING FOR THE SUBURBS (ABRIDGMENT). Due to the demographic characteristics of suburban areas and the unusual transportation problems they present, effective public transportation planning demands flexible and innovative approaches. This paper describes a unique procedure used in a recent planning assignment for Camden and Burlington Counties, the New Jersey suburbs of Philadelphia. They typify the diversified geographic, socio-economic and population attributes and limited planning resources of such areas across the country. The essence of the planning methodology was a "prototype" approach which entailed: Formulating a list of the bi-county transportation problems which was then condensed to a shorter list of "model problems," selecting a "prototype" for each particular problem within the general categories of: transit user groups, geographic areas and major trip attractors/generators, developing a unique solution for each problem, analyzing each prototype solution for adaptability to other similar problems within the same group. Using this mechanism as the primary tool for public transportation planning for suburban areas maximizes the impact of available resources by concentrating upon solving specific problems while concurrently establishing the basis for wide application of results and recommendations. /Author/

42 178742 GEORGIA'S CRITICAL PUBLIC TRANSPORTATION NEEDS (ABRIDGMENT). This analysis is designed to identify public transportation needs of Georgia's rural transportation disadvantaged including elderly Georgians 60 years of age and older, and the handicapped under Section 16(b)(2) and Section 147. Approximately 12 percent or a half million of Georgia's population are over 60 years of age. One fourth of this group is handicapped numbering around 130 thousand. It is estimated that 1.5 percent of Georgia's under 60 population, or 60 thousand, are handicapped. Georgia's rural population approximates two million people. The rural target population, this study's focus, slightly exceeds 400 thousand of which 34 percent are transportation deficient. Subsequently, rural Georgians require 611.3 thousand trips to satisfy 135.4 thousand rural transportation deficient citizens. This analysis provides a cursory view by use of a broad-brush sketch plan. Many data gaps exist; the estimates are crude! Therefore, reliance on a professional "best-judgment" to identify Georgia's transport needy predominates. /Author/

42 178862 TRANSPORT REQUIREMENTS FOR URBAN COMMUNITIES: PLANNING FOR PERSONAL TRAVEL. An OECD Working Group has considered some of the problems involved in the methodology of transport planning as applied to personal travel requirements. The Group's report is concerned chiefly with the framework in which recent planning exercises have been carried out, and it examines a number of ways in which these can be improved in the future. The report starts by reviewing the issues currently facing transport planners, and looks at the way in which the transport planning process has evolved to deal with issues. It then considers in detail three areas in which present approaches can be improved. Firstly, the objectives of transport planning require clearer definition in order to make explicit the relationship between technical decisions and policy issues. Secondly, new methods should be used to incorporate the study of needs, (as expressed in terms of travel requirements) into a planning process that concentrates on demand modelling. Thirdly, evaluation methodologies can be improved by recognising that no single criterion is sufficient for making a comprehensive assessment of the impact of proposed measures. It is intended that the report should be a background document for practitioners. /Author/

42 178871 BETTER INTEGRATION OF TRANSPORTATION MODES. This study is made up of four interrelated components. The general intent of the project was to evaluate the deficiencies of selective elements of the New York City public transportation system and to formulate strategies that would result in improved service for the travelling public. Part I, the express bus policy study, seeks to formulate policy guidelines and implementable projects for the operation and improvement of express bus service in the city of New York, fully integrated with all other modes of public transportation. Part II, the park and ride study, seeks to develop a comprehensive Park and Ride system fully integrating the highway and arterial network of New York City with the public transportation system. Part III seeks to create improved graphics and information layouts at points of modal interchange which will facilitate user understanding of transit services and travel alternatives. Part IV seeks to ascertain the potential for modal switch from automobiles to transit (primarily to reduce auto works trips and promote transit patronage) through the utilization of marketing research techniques. The project results are designed to improve the efficiency of existing services and infrastructures by operational changes and low capital intensive investments. They are consistent with federal and local emphasis on TSM policies, and result from cooperative planning between a multitude of different government agencies.

New York City Department of Transportation Final Rpt. UMTA-IT-09-0023, Sept. 1977, 280 pp, Figs., Tabs., 3 App.; Sponsored by Tri-State Regional Planning Commission and by DOT, Urban Mass Transportation Administration.

42 179019 DISAGGREGATE TRAVEL DEMAND MODELS. Disaggregate models are policy-sensitive travel demand forecasting models that are consistent with travel choice theory using data at the level of individual travelers. Such models were found to advance the existing state-of-the-art in explaining present travel behavior. Disaggregate models can also be applied with greater ease than aggregate models to corridor and project planning within urban areas. This study has developed new disaggregate demand models for work-trip mode choice and for shopping choices as follows: Mode, destination, frequency, and time of day. Specific findings related to these models are presented. The report gives hypothetical examples to illustrate how disaggregate models can be used to forecast the effects of travel changes in the price of gasoline, of a reduction in off-peak transit fare, of an increase in driving time to the downtown, and of change to the transportation models available to individuals.

42 179043 DIMENSIONS OF TRANSIT SERVICE. This paper reviews several approaches to setting service standards for public transit systems and discusses the problems inherent in setting such standards. It examines particularly two attempts to find consistent relationships between measures of transit service and community characteristics in the hope that such relationships can then be used to set service standards for operations based on the demographics of the areas they serve. One effort used data for small urban areas from the National Transportation survey while the other used data for large transit operations in New York State. Both efforts used factor analysis as well as less sophisticated analytical methods to uncover relationships in the data. Neither effort identified any inherent relationships in transit characteristics. It is concluded that the analysis accomplished, using the limited data available does not support establishment of service standards based on the underlying dimensions of transit service. /Author/

42 179046 FORMULATION AND EVALUATION OF ALTERNATIVE STATE TRANSIT OPERATING ASSISTANCE PROGRAMS: A QUANTITATIVE PREFERENCE TECHNIQUE. This paper presents three applications of a technique known as trade-off analysis, a tool which allows the analyst to quantify preferences based on survey results which have been transformed into ratio-scaled data. The data is from the NYSDOT Public Opinion Survey, conducted in November 1974 sampling 1,000 households across New York State. The first application discussed is evaluation of alternative transit operating assistance programs, to determine which of several feasible programs are most acceptable to the public. The determination of which levels of individual program attributes are most preferred, and to what degree, is the second application discussed. Leading to information useful in developing new transit operating assistance programs. The last analysis develops preference shifts at different transit fare levels, introducing some interesting theoretical work. /Author/

Donnelly, EP ; New York State Department of Transportation Res. Rpt. 90, Aug. 1975, 25 pp, 5 Fig., 7 Tab., 6 Ref.; This paper was submitted to the 55th Annual Meeting of the Transportation Research Board, Washington, D.C., January 1976.

42 179052 NFTS HOME-INTERVIEW SURVEY--ANALYSIS OF THE "OPINION COMPONENT". This report documents the opinions of households in the Niagara Frontier region (Buffalo, New York) on community problems, transportation, transit service improvements and participation in transportation planning. These views were obtained from the opinion component of the NFTS Home-Interview Survey, conducted in the fall of 1973. The sample consists of 535 voluntary responses. The analysis was performed by cross-tabulating questions contained in the opinion component. The results show that crime and law enforcement is the most serious community problem, and bus service is viewed as having the most serious transportation problems. Too few bus routes and lack of rapid transit service are the major problems with bus service; rail rapid transit is the improvement desired by the largest percentage of households. /Author/

Holthoff, WC ; New York State Department of Transportation Res. Rpt. 77, Apr. 1975, 70 pp, 1 Fig., 20 Tab., 4 Ref.

42 179054 AN APPLICATION OF DISAGGREGATE MODE CHOICE MODELS TO SYSTEMS-LEVEL TRAVEL DEMAND FORECASTING. This paper describes the development and application of disaggregate models to systems-level transit forecasting in the Niagara Frontier Region (Buffalo, New York). In this study, the disaggregate mode choice models are developed from trip information directly obtainable from standard home interview surveys conducted by most State or local transportation planning agencies. The data set used is a 12% sub-sample of the 1962 home interview in the Niagara Frontier. Binary logit models are calibrated for four kinds of trips, classified by trip purpose and auto availability. For each model, the individual's probability of using transit is related to two system variables: the transit-to-auto travel time ratio, and trip length. Aggregated transit usage proportions for the entire system are then obtained by combining the disaggregate probabilities with an approximation term which reflects the "within-zone" variance of system characteristics. The prediction performance of the disaggregate modeling approach is compared to that of the conventional modal split model. Results suggest that the disaggregate mode choice method can produce at least as accurate modal split predictions as the conventional method, by using the same type of information, but only 12% of the sample. The report also contains a description of the procedures necessary to integrate the disaggregate mode choice method into typical urban transportation planning modeling systems. /Author/

Liou, PS Cohen, GS Hartgen, DT ; New York State Department of Transportation Res. Rpt. 75, Apr. 1975, 25 pp, 3 Fig., 7 Tab., 9 Ref.; This paper was presented at the 54th Annual Meeting of the Transportation Research Board, Washington, D.C. January, 1975.

42 179070 INTRODUCTION, SUMMARY AND FINDINGS OF THE TRANSPORTATION SYSTEM MANAGEMENT CONFERENCE. The conference on Transportation System Management (TSM) was designed to address three objectives: To provide the latest information and requirements; to provide the latest information on experiences with the actual implementation of a range of TSM actions; and, to examine the emphasis of the regulations on a regional or metropolitan planning perspective. Throughout the conference, three major issues arose continually in the substantive and information presentations as well as during the discussions of the implementation of individual TSM actions: TSM as a planning process and the role of the MPO's in that process; perceived conflict between short-term and long-term transportation objectives; and, public involvement and acceptance of TSM actions. Two additional key issues stand out. The first is the question of the appropriate role for a planning professional in an MPO and the appropriate role for the MPO given its authority and resources. The second issue stems from the frustration felt by many of the participants when hearing case histories of both successful and unsuccessful TSM actions. The difficulty of identifying the "right" and "wrong" way before a project is actually started. Papers on each of the major topics addressed during the conference appears in the volume. Also included are reports of the workshop discussions and the case studies of cities in which TSM actions have been or are being implemented.

Rosenbloom, S (Texas University, Austin) *Transportation Research Board Special Report* No. 172, 1977, pp 1-5; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

42 179074 MANAGEMENT OF DEMAND. The scope of the workshop discussion was with the manipulation of work schedules to influence patterns of demand for urban transportation facilities. Experience suggests that the abandonment of uniform working hours is popular with employees and employers. Furthermore, society at large gains from the reduction of peak-hour congestion on transportation facilities. As to maximizing the beneficial transportation consequences, the best form of work schedule adjustment appears to be the most radical: flexible working hours. The New York City experience suggests that flexible working hours are more difficult to promote to employers than are less radical forms of schedule adjustment. The 4-day workweek appears to be the least popular form of schedule adjustment with employers, and to a lesser extent with employees too. A local government that is strongly committed to promoting staggered work hours should also consider fiscal or legal incentives for firms to participate.

Kemp, MA (Urban Institute) *Transportation Research Board Special Report* No. 172, 1977, pp 9-10; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Trans-

portation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

42 179075 ACTIONS TO REDUCE VEHICLE USE. The workshop identified a list of objectives and constituencies that were relevant to TSM. Five categories were developed: National objectives, citizen participation objectives, transit objectives, taxpayer objectives, and local and national government objectives. Several general conclusions were drawn from the discussion: There may be negative reactions to TSM, especially if it involves reducing vehicle use; a careful understanding should be developed of local public objectives, and public involvement and support should be reached before moving ahead with TSM actions; efforts must be made to define local transportation problems and to analyze closely alternative solutions in which the public is involved. Although TSM may be viewed as a set of projects, it is also a planning process emphasizing short-term, low capital solutions that may also complement long-term capital intensive solutions, which are the traditional focus of this process.

Fisher, RJ (Urban Mass Transportation Administration) *Transportation Research Board Special Report No. 172, 1977, pp 10-12*; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

42 179076 ACTIONS TO IMPROVE TRANSIT MANAGEMENT EFFICIENCY. Workshop participants began by listing the following areas in which improvements could be made in the management efficiency of transit operations: Service standards, commuter market approaches, organization of planning and operations; integration of paratransit, use of standard cost information, role of state departments of transportation, integration of control, small capital improvements, marketing, parking strategies, and payment of transit fares. However, only the first four topics were fully discussed. The workshop agreed that adequate service standards were needed but that provisions should be made so that new forms of public transportation would not be hindered by strict adherence to such service standards. The majority of the participants agreed that the cost of providing service to commuter markets with additional fixed-route, fixed-schedule transit systems or even express systems appeared to outweigh the benefits derived. With respect to paratransit, the discussion concluded with the general feeling that no one approach could be viewed as a panacea but that experimentation was needed with a variety of approaches to see what could be achieved in various urban areas. With respect to planning and operations, participants concluded that closer cooperation was necessary between planning and operation, and that an organizational form that encompassed both these functions with appropriate control mechanisms was highly desirable.

Mundy, RA (Tennessee University, Knoxville) *Transportation Research Board Special Report No. 172, 1977, pp 12-13*; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

42 179077 DEFINITION, OBJECTIVES, AND IMPLICATIONS OF TSM. Transportation system management is a process for planning and operating a unitary system of urban transportation. Its key objective is conservation of fiscal resources, of energy, of environmental quality, and of quality of urban life. Broader implications of and issues raised by the TSM concept include (a) the need for a national policy on urban conservation (the federal government cannot set local land use policy, but it must restore locational neutrality to its programs); (b) institutional challenges (all elements of the urban transportation system cannot be treated in a unitary way unless the various governments cooperate fully); (c) federal support of TSM (UMTA may need transit operating funding to seed TSM operations); and (d) urban transportation and private ownership (UMTA should attempt some demonstration of private ownership of multipurpose urban transportation systems). /Author/

42 179083 STATE HIGHWAY DEPARTMENT VIEW OF TSM. Transportation system management is not a new concept but has been practiced as long as there have been transportation facilities. The need now is to have a balanced transportation system in which each mode does

the job that it is best suited to do and for which there is an expressed need or desire. In addition, one mode is not artificially enhanced by impeding the efficiency of another mode. Achieving a balanced transportation system requires the cooperative efforts of all agencies involved. /Author/

Hunter, RN (Missouri State Highway Department) *Transportation Research Board Special Report No. 172, 1977, pp 33-34*; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

42 179091 MANAGEMENT BY OBJECTIVES APPLIED TO TRANSPORTATION SYSTEM MANAGEMENT. Management by objectives requires input by all members of the management and supervisory staff of an organization; efforts are aimed at the achievement of stated results or objectives. Transportation system management in urban areas demands that transit and highway interests join forces in developing plans and action programs to make better use of existing facilities. This paper explores both management by objectives and transportation system management and provides suggestions on how the MBO technique can be used to design a TSM action plan. /Author/

Ross, HS (Louisville University) Maull, PJ Smerk, GM (Indiana University, Bloomington) *Transportation Research Board Special Report No. 172, 1977, pp 81-86, 5 Ref.*; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

42 179096 PACKAGING TRANSPORTATION ELEMENTS TO MEET ENVIRONMENTAL OBJECTIVES. Controversy over the relation between air quality requirements and urban transportation planning appears to center around two basic issues. The first is whether the implementation of transportation measures that improve air quality is consistent with the achievement of other transportation objectives. The second concerns the changes in the planning process needed to accommodate air quality requirements. This paper outlines the basic elements of a potential resolution of these issues. The transportation measures that have been proposed to improve air quality are virtually identical to the measures now being proposed to achieve a wide variety of other transportation objectives. However, the various measures are not necessarily equally effective in improving air quality and achieving other objectives. Thus, the process of selecting transportation measures for implementation often will involve making trade-offs between air quality objectives and other objectives. The need for such trade-offs is recognized by the Environmental Protection Agency, and the

changes in the transportation planning process needed to enable the trade-offs to be made are consistent with current planning trends. However, three problem areas may require further attention in the future: encouraging the implementation of innovative demand-management approaches, developing procedures for mediating disputes between EPA and state and local agencies over the rate at which transportation change should take place, and preventing the planning process from becoming overly cumbersome. /Author/

Horowitz, JL (Environmental Protection Agency) *Transportation Research Board Special Report No. 172, 1977, pp 122-127, 11 Ref.*; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

42 179097 ROLE OF THE MPO IN FORMULATING THE TSM ELEMENT. Developing and implementing effective transportation system management elements in urban transportation plans will depend greatly on the ability of the metropolitan planning organization to develop an acceptable institutional framework for cooperation and joint action that does not detract from the basic responsibility and authority of participating local and state agencies. MPOs, particularly those operating within the framework of councils of governments, can play a key role in the further refinement and implementation of TSM elements because of their ability to work with local and state policy and decision makers to achieve consensus in a metropolitan area. Because of their concerns with a wide range of functional and social service goals and needs, MPOs can recommend trade-offs among competing objectives, identify opportunities for applying locally successful TSM measures to other parts of a metropolitan region, and integrate and relate TSM planning to other elements of the areawide transportation planning process. /Author/

42 179098 IMPLEMENTING TSM: A DISCUSSION. Selected viewpoints of the public sector, the business community, and the media regarding the implementation of TSM are highlighted. For the elected official it is noted that the major problem is one of communication. Measures adopted that will ultimately affect the freedom of citizens to come and go as they please require prior communication. Citizen involvement is one way of opening channels of communication and allowing for citizen input. With respect

to the business community, it is noted that unless they are involved. TSM actions such as staggered work hours, and carpool programs will not be as successful as they could be with respect to the media, it is noted that relations could be improved by informing the press of the conferences, better timing of press conferences and more cooperation.

42 179099 BOSTON, MASSACHUSETTS, A CASE STUDY PRESENTED AT THE TRANSPORTATION SYSTEM MANAGEMENT CONFERENCE. The Boston case study deals with the development of an automobile-restricted zone (ARZ) in the retail center of the city through a reordering of circulation patterns of all the transportation elements converging in the area: private automobile, transit, service vehicles, taxis, pedestrians, and paratransit vehicles. This plan is one of several TSM elements included in the broad transportation plan for the Boston region. Two aspects of the plan are discussed in this report: First, this plan reflects the development of Boston's transportation policy during the past several years. Second, the implementation of a TSM element can be a complex process. TSM strategies, the ARZ development process, and the implementation of the ARZ plan are included in this case study.

42 179101 PORTLAND, OREGON, A CASE STUDY PRESENTED AT THE TRANSPORTATION SYSTEM MANAGEMENT CONFERENCE. The nature and purpose of many decisions, programs, and projects acted on in the city of Portland and in the Portland region before the final regulations conserving TSM were set forth, were consistent with the objectives and rationale of the TSM program. Because of this and because of the relatively high level of success on TSM efforts in Portland, the Portland experience provides a perspective on the early application of the TSM approach. More specifically, the TSM experience in Portland offers some useful insights on the relation between broad policies and TSM strategies and projects, considerations

that should be addressed in the implementation of individual TSM projects, and apparent problems that must be confronted if TSM is to play an effective role in regional transportation planning and implementation process. TSM projects undertaken include the efficient use of road space, vehicle reduction in congested areas, and actions to improve transit service. It is noted that the public acceptance of TSM projects, flexibility of projects after completion, the simultaneous development of several projects, and a strong transportation policy direction are prerequisites to the eventual success of TSM.

42 179102 MADISON, WISCONSIN, A CASE STUDY PRESENTED AT THE TRANSPORTATION SYSTEM MANAGEMENT CONFERENCE. This article describes the efforts undertaken by the city of Madison with respect to TSM planning and implementation. It is noted that the city already has a developed set of transportation objectives and policies. Also, the Madison Department of Transportation is currently engaged in developing a municipal transportation policy that will provide a policy base for the city in its dealing with the legislative bodies of the county, state, and federal governments as well as their respective administrative branches. An inventory of the existing situation that includes travel patterns, street volumes, core area parking, and the transit system is described. The major activities of the transportation system management element include the following: Improve traffic operations by managing and controlling vehicle flow; provide preferential treatment for transit and other high occupancy vehicles; provide improvements for bicycles and pedestrians; improve management and control of parking facilities; reduce peak-hour traffic; reduce vehicle use in congested areas; and, continued action to improve transit service. Improvement planning in the Madison urban area for 1976-1980 and continued efforts to increase transit management efficiency are discussed. The problems of implementing TSM are described and it is noted that the main problem involves conflict between different policies or objectives.

Somerfeld, WO Hoffman, M (Madison Department of Transportation) Favour, T (Dane County Regional Planning Commission) *Transportation Research Board Special Report No. 172, 1977, pp 148-157, 4 Fig., 16 Ref.*; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

42 179103 RESPONSE TO THE CASE STUDIES PRESENTED AT THE TRANSPORTATION MANAGEMENT CONFERENCE.

Three questions are addressed in this article. What are the problems to which TSM is addressed? How great is the challenge of integrating the new planning requirements that have been imposed on urban areas for the past several years? And, what are the constituencies of TSM? It appears at first glance that congestion is the primary problem and that TSM is the new traffic engineering strategy for alleviating congestion. However, issues such as increased equity, increased amenity, air quality improvements, and energy conservation also appear to be primary objectives. It is not always clear the extent to which TSM is addressed explicitly to these other issues on the extent to which it is an instrument for dealing with them. With all of the various types of planning—highway, transit, paratransit, long- and short-term capital & operating—to what extent is this proving to be a nearly insuperable burden or one that is proving to be quite manageable in urban areas? It is noted that in those regions that still have major highway, transit, and capital-intensive transit projects, policymakers and planners are finding it difficult to focus on TSM and paratransit kind of issues. TSM, it is noted, is an initiative that has only succeeded insofar as it has pursued modest objectives that have not inconvenienced significant numbers of drivers or voters and not significantly changed the basic urban transportation system. Such constituencies as the downtown businesses, central city governments, and transit authorities may eventually enable TSM to try more bolder initiatives and become more pervasive with respect to the nature of the urban transportation system.

42 179720 A TRANSPORTATION PLANNING MODEL FOR DETAILED TRAFFIC ANALYSES.

This paper contains a brief outline of a transportation planning model developed for the purpose of providing detailed analyses of commuter traffic. It sets out to model the movement of automobile, transit and pedestrian traffic taking into account the interaction between and within each of the traffic components. The model is most appropriately applied to areas of high traffic activity, such as the central business district of a metropolitan area or arterial streets of a region-wide network during peak demand. /Author/

42 179822 CURRENT TRENDS AND ISSUES IN PUBLIC TRANSPORTATION.

This report discusses four broad categories: Political decision making and transportation development; rail transit and urban development; concepts in transportation systems management; and, ethics in policy development and decision making. A five point approach to transportation development and decision making is presented. Three hypothesis on rail transit policy are given. First, rail transit in itself is neither good nor evil, but it possesses certain qualities and attributes which make it suitable in some circumstances and inappropriate in others. Second, rail transit varies considerably in design characteristics, costs, performance capabilities and level of service. Third, rail transit can serve as a tool of urban revitalization. The objective and development of the TSM concept are described. These include neighborhood conservation, paratransit, the brokerage concept, and transit performance. Lastly, eight ethical issues in transportation policy making are outlined. It is noted that overriding alternatives should be given by the transportation profession to the balancing that has to do with public access to information, simplification of alternatives, and a weighing of interests of many alternatives.

Emerson, NH ; Hawaii University CETP-TS-78-1, Mar. 1978, 58 pp; This paper was presented at the Transportation Seminar, University of Hawaii, Honolulu, Hawaii, March 15, 1978.

42 179901 DISTRIBUTION OF URBAN TRANSPORT SERVICES IN THE COMMUNITY.

The structure of urban housing markets tends to segregate low income households into (1) inner suburbs where they generally suffer high personal costs imposed by external effects of other people's transport, and affecting different members of the household to different extents or else (2) into outer suburbs where they face high access costs through poor quality of provision and differential pricing. The outer suburban 'transport-poor' are particularly compelled, by the structure of blue-collar employment markets, to a high level of automobile use. The report suggests that any effective transport policy must include such elements as: differential pricing of fuel and of other components (with price related to income and to location); pricing to reflect imposed external costs; impact amelioration programs to correct external effects, or else to compensate for them; rationing of parking space in inner city and similar areas, but with exemptions for the handicapped and other disadvantaged persons, etc. Further however, there must ultimately be fundamental changes to the division of labour and division of leisure: the distribution of transport services is merely a symptom of historic processes of competition and conflict, whose effects must be reversed if 'transport' policies are to have real success. 42 179927 AN INITIAL REPORT ON MINIMUM LEVELS OF SERVICE FOR RURAL PUBLIC TRANSPORT.

This report is presented in 10 sections. Section 1 covers the context

of the study (background, approach, scope and main elements), and reviews the main findings regarding development of rural transport policy, definition of transport needs and scope for improved evaluation. Subsequent sections deal with: (2) objectives for rural transport policy; (3) rural transport policy and minimum standards; (4) issues relating to the role of minimum standards; (5) the definition of needs; (6) evidence on the importance of rural public transport; (7) evidence on the factors affecting need; (8) evidence on how far needs are being catered for; (9) the value of meeting needs; and (10) conclusions and recommendations. Two appendices list (A) the authorities and organizations visited, and (B) references. /TRRL/

42 179989 PUBLIC TRANSPORT-THE UNCERTAIN FUTURE?

The authors depict three ways in which public transport might have evolved by the 21st century, and follow this with a review of the current public transport situation, looking particularly at those aspects where public transport has, and will continue to have, a strong role to play. In the second part of the paper the authors briefly examine some ways in which first the transportation engineer and then the public transport industry itself can strengthen and enhance that role over the next 20 years or so. /Author/TRRL/

42 180024 THE ROLE OF PLANNING IN THE PRE-CONSTRUCTION OF URBAN TRANSPORT PROJECTS IN AUSTRALIA.

Metropolitan communities demand and use transport facilities as a tool which is ancillary to their normal social and economic activity. Few individuals have an inherent preference for particular modes of routes but will simply choose the most convenient, cheapest and safest way of getting from a to b. Transport is not an end in itself. The aim of this paper is to make a number of suggestions relating to the purpose, scope, position and timing of the transport planning process as one part of our future activities, which lead to new transport projects or adjustments to our existing system in the years ahead. /Author/TRRL/

42 180326 SUBURBAN CONNECTION.

A variety of transit modes and operating strategies that are available to connect the core areas with suburban communities are described. These options range from capital intensive programs with transit operating on an exclusive right of way through more modest schemes of buses operating on surface streets.

42 180373 THE SUCCESSFUL TRANSPORTATION SYSTEM AND THE REGIONAL PLANNING PROBLEM: AN EVALUATION OF THE MUNICH RAPID TRANSIT SYSTEM IN THE CONTEXT OF URBAN AND REGIONAL PLANNING POLICY. The development of the Munich Rapid Transit System, coupled with the growth of the Munich region, has had a major effect on the spatial structure of the region. The radial form of the rapid transit system has led to an outward movement of higher income families and a strengthening of the service function of the city centre, to the cost of local centres. Lower income families are tending to settle in the city centre fringe areas, although their primary employment opportunities, in manufacturing industry, are increasingly moving to the urban fringe. There is, thus, a growing spatial separation between homes and workplaces and although the rapid transit system has reduced traffic congestion in Munich, it has encouraged the development of an urban structure which is not compatible with the objectives of either the state or the region.

42 180377 INTERACTION BETWEEN PUBLIC TRANSPORTATION AND OTHER SOCIAL ACTIVITIES: A SYSTEMS APPROACH. This paper describes a quantitative method of evaluating public transportation systems in areas in which the frequencies of transportation services are low. The starting point of the evaluation is an overall view of the interaction between public transportation, private transportation, and the area with its physical and socio-economic variables. The problem concerning the evaluation of the public transportation system is treated.

42 180381 IMPACT OF BART ON HIGHWAY PLANNING AND POLICY. The construction and operation of BART resulted in no dramatic changes in State highway facilities and planning. However, the State of California and BART did enter into policy agreements to develop existing highway rights-of-way for joint transit and highway use. The policy decision-making process and BART-State interactions were traced through the period of BART planning and construction to assess changes in highway planning and policy that might have resulted from BART. The policy outcome--joint use of facilities for transit and highways--appeared to be a cost effective development strategy in terms of broad public constituencies. An assessment of this policy outcome also provides some "lessons learned" for other communities considering rapid rail transit development such as the need for an independent third

party to make trade-offs during negotiations and the need for clarity and formality in policy agreements.

42 180625 FULLY AUTOMATED URBAN TRAFFIC SYSTEM [Final Report, Jul. 1976-Aug. 1977]. The replacement of the driver with an automatic system which could perform the functions of guiding and routing a vehicle with a human's capability of responding to changing traffic demands was discussed. The problem was divided into four technological areas; guidance, routing, computing, and communications. It was determined that the latter three areas being developed independent of any need for fully automated urban traffic. A guidance system that would meet system requirements was not being developed but was technically feasible.

42 181164 A THEORETICAL MODEL FOR ESTIMATING THE EFFECTS OF FARES, TRAFFIC RESTRAINT AND BUS PRIORITY IN CENTRAL LONDON [Laboratory report]. A theoretical model which represents passenger and vehicular travel in the Central Area of London by the characteristics of the average main road has been used to estimate, in the central London situation (1) the effect of different fare levels (profit, breakeven, zero fares), (2) the benefits which might result from restraint of non-bus traffic, (3) the benefits from comprehensive bus lanes and (4) combinations of (1) to (3). Benefits in this study relate mainly to changes in time and money costs of travel and do not include social and environmental aspects. The absolute values of the benefits predicted by this relatively simple model should be treated with caution, but it is believed that the model is able to provide a ranking of the different options. Where these options require substantial public expenditure, however, no account has been taken of the scarcity of available financial resources or of the competition between transport services and the many other demands on such limited funds.

42 181735 THE SPATIAL UNIFORMITY OF TRIP RATES IN THE READING AREA IN 1971. Data from the 1971 Reading Travel Survey are used to determine the effect of location on the number of trips made by households. After classifying households according to their size and composition, car ownership, and location within one of three concentric sub-areas, the importance of each classification factor is tested statistically. Both household and person trip rates are considered for several combinations of trip purpose and mode of travel. The effect of linking trips through incidental purposes is also examined. The results show that household location generally had little effect on the trip rates. The two exceptions are cycle trips to school where the trip rate was lower

in the central area; and walk trips to work where the trip rate was higher in the central area. For some combinations of trip purpose and mode of travel it is not necessary to classify by household size or composition when person trip rates are used. Linking trips through incidental purposes makes little difference to the significance of the classification factors. (Copyright (c) Crown Copyright 1977.)

42 181736 AN ANALYSIS OF TRAVEL PATTERNS USING THE 1972/73 NATIONAL TRAVEL SURVEY. The study analyses travel patterns in Great Britain, using data from the 1972/73 National Travel Survey. Information is provided on journey length, journey duration and mode of travel for five major trip purposes; variations in these which result from social factors are considered. The car and walk modes each account for 41 percent of the journeys made. Two thirds of all journeys are less than 4.8 km in length and three-quarters last for less than 30 minutes. Journeys for work and social purpose are, on average, longer and involve greater use of motorised modes than those for education, personal business and shopping purposes. Members of car owning households make more journeys than do those from non-car owning households. They also make much greater total use of the motorised travel modes--car, bus, rail and motorcycle. Car ownership is three times higher and female licence holding four times higher in those households with heads in professional or managerial occupations than they are in those households whose heads have manual occupations. 42 181986 MONETIZATION OF TRANSPORTATION IMPACTS: POLICY EVALUATION METHODOLOGY. The impacts of transportation investments are often measured in units that make comparisons difficult. Converting the units of an impact into equivalent dollar values (called monetization) will allow the combination of diverse effects measured in different inherent units. The result of this monetization process should provide additional objective and useful information in the decision-making process, and thus improve the analysis of investment alternatives. This report concentrates on those impacts that are relatively easy to monetize (travel time, energy use) and those impacts that are relatively difficult to monetize (pollution, accidents). Monetization for current values only is considered. The report consists of nine parts: an introduction and summary of the findings plus eight appendixes detailing the monetization process for a number of transportation impacts. The appendixes discuss the following: pollution, crime, accident costs, comfort, residential and business relocation, travel time and energy use.

42 182028 SYMPOSIUM PROCEEDINGS ON COMMUNITY DEVELOPMENT AND PASSENGER TRANSPORTATION, HELD IN WASHINGTON, D.C. ON NOVEMBER 8-9, 1977. The objective of the symposium was to exchange information among local multi-purpose project operators and federal program managers interested in improving passenger transportation and community development. The report is a compilation of material that was presented at the symposium and contains summaries of remarks presented at one plenary session and four workshops. Discussion topics include the joint economic development of land uses and transportation facilities; non-work trip purposes and multi-use community development; community development planning and site selection for transportation benefits; and uses of passenger transportation for community resource management. Viewpoints on the relationship between community development and passenger transportation are presented by major Federal programs dealing with community development, and illustrated with significant Federal demonstrations.

42 182059 INNOVATION IN PUBLIC TRANSPORTATION: A DIRECTORY OF RESEARCH, DEVELOPMENT AND DEMONSTRATION PROJECTS, FISCAL YEAR 1975. The purpose of UMTA's RD&D Program is to provide information about possible improvements to urban mass transportation systems which communities can use in selecting the best way to deal with their particular transportation requirements. The principal means of providing this information is through annual publication of the compilation of reports on the status of individual projects. Research projects are intended to produce information about possible improvements in urban mass transportation; development projects involve fabrication, testing and evaluation of new equipment, facilities, systems or methods; and demonstration projects introduce, on an experimental basis, new methods, equipment or systems of urban mass transportation into a representative urban environment. This volume is a supplement to the 1972 comprehensive volume. The directory is divided into the following subject areas: bus transit and paratransit, rail transit, new systems and automation, socioeconomic and special projects, transit planning, and transit management.

42 182456 A STUDY OF FACTORS AFFECTING TRAVEL BEHAVIOUR AND TRANSPORTATION ATTITUDES AMONG YOUNG ADULTS. A 1976 survey of third-and fourth-year undergraduates at two Toronto universities provides the data base for an extensive

analysis of factors underlying transportation behaviour and transportation-related attitudes among young adults. The study examines how behaviour and attitudes are affected by early transportation experience, "automobility," quality of available transit service, socio-economic circumstances and variations in urban structure. Its conclusions draw on the statistical analysis and on the transportation attitudes and policy preferences expressed by study participants to address important concerns for future urban transportation policy. /Author/

42 182609 UCOST: A MICRO APPROACH TO A TRANSPORTATION PLANNING PROBLEM. UCOST is a software system that has been developed for use by planners in estimating the cost of proposed mass transportation systems. The models in UCOST represent an unusual micro approach to a planning problem. To derive its cost estimates, UCOST finds feasible vehicle schedules and an accurate estimate of crew requirements over the day for the proposed multi-modal transit system. The procedures in UCOST differ from the usual macro approach of costing transit systems which are based on simple characteristics of the proposed transit system such as vehicle in-service hours. Through the development of fast computational procedures such a micro approach is possible. UCOST is being implemented within the Urban Transportation Planning System, a computer package for transportation planners developed by the Urban Mass Transportation Administration. A description of the procedures in UCOST and its implementation is presented.

42 182667 TOWARDS A MULTI-DIMENSIONAL ASSESSMENT FRAMEWORK FOR DEVELOPING AND EVALUATING ALTERNATIVE URBAN TRANSPORTATION PROPOSALS. Since transportation planning is basically concerned with accessibility to resources, it is a political decision making process with both direct and indirect distributional effects. Transportation planners must, therefore, extend their evaluation criteria from transport-specific, efficiency standards to explicitly include issues of equity and accountability. This study suggests ways of addressing this situation by highlighting the need: for an interdisciplinary approach to planning; for community interaction; to consider the range of alternative courses of action available; to determine the implications of each as fully as possible, including the no-build alternative; to develop compensation programmes for adversely affected interests; and to yield the highest social return on the investment. /Author/TRRL/

42 182672 URBAN STRUCTURE, PASSENGER TRANSPORT AND ENERGY CONSUMPTION. URBAN STRUCTURE AND THE INCREASE IN WORKING TRIPS DURING THE SEVENTIES [Ortsstruktur, persontransporter och energikonsumtion. Utspridning av bbyggelse och arbetsresornas oekning under 70-talet]. This report deals with the following problems in Gothenburg and a region in the south west of Sweden. (1) General changes concerning location of residential areas and working areas during the seventies. (2) The development of travel patterns for journeys to work during recent decades and changes in travel patterns during recent years. (3) Influencing the location of residential areas and working areas with the purpose of influencing the need for working trips. (4) Influencing the traffic process with the purpose of reducing the energy dependence without changing the location pattern. Problems 3 and 4 are briefly dealt with. The following conclusions were drawn from the studies: (A) The introduction of measures reducing the spreading of residential areas is the most strategic method of achieving balance between working areas and residential areas. (B) Transferring activities from large urban areas to smaller urban areas may satisfy the need for residential areas near the place of work. (C) Present urban and regional planning is developing unfavourably from the point of view of working trips. (D) Public transport is of importance from the point of view of energy only in cities. (E) The car, the bicycle and the footway are the most realistic transport modes considering the quality of residential areas. (F) Changing the urban structure by locating works within walking and cycling distance is in the long term the most interesting alternative from the energy viewpoint. (G) The urban and regional planning and residential policy during the seventies regarding the possibilities of travelling to work and saving energy has been erroneous. /TRRL/ [Swedish]

42 182680 PLANNING FOR PERSONAL MOBILITY--A DIFFERENT VIEW. An investigation into the economic advantages of providing a comprehensive system of urban cycle-ways in Bedford is described. The Bedford urban transportation study (1974/76) showed that nearly as many people cycled in the area as travelled by bus, and that the average journey length by cycle and car was 3.75 km. It is planned that some 39 km of cycle-way be constructed by 1991 at a cost of .04 million (1974 prices). Lighting, signing and nineteen signal controlled crossings are envisaged. Adequate parking facilities in the centre are to be provided. The environmental advantages, as well as reduced accidents and the potential increased daily capacity of the highway network are examined. It is claimed that an annual saving in accidents worth over ,37000 could be achieved when the scheme is completed. On this basis alone, benefits are large compared with minor road improvements. /TRRL/

42 183117 METHODS FOR MEASURING RURAL TRANSPORTATION NEEDS AND DEMAND, AN ITE INFORMATIONAL REPORT. The objective of Committee 6F-10, Rural Transportation Needs, is to survey the state-of-the-art literature on rural public transportation needs and demand, and to synthesize currently available methods for needs estimation and demand forecasting. The scope of the study is focused on pre-implementation planning rather than post-implementation evaluation of a demonstration project. Distinction is made between the need versus potential demand for rural public transit services. /GMRL/

42 183126 RURAL TRANSIT NEEDS AND FEASIBILITY TECHNIQUES. Members of the Transportation Institute at North Carolina Agricultural and Technical State University visited 12 rural areas which had operating transit systems. The research team attempted to synthesize the various steps that were taken in the planning and implementation of these systems. A critical and difficult step in the sequence leading to implementation is an assessment of the need for a rural transit system. Once a measure of the need has been developed the rural transit planner is faced with deciding whether it is possible to put together the economic resources and political institutions to make a system feasible. These two

steps, collectively called the Needs and Feasibility Study, are the focus of this paper.

42 183140 TRAVEL TIME EMPIRICAL STUDY. The purpose of this empirical analysis was to determine the relative significance of several parameters influencing the travel time rate on urban streets. The main thrust was toward an understanding of which parameters had a significant primary effect and which did not. This research phase was not directed toward an empirically derived travel time estimation equation such as a regression equation. /GMRL/

42 183141 URBAN TRAVEL ALTERNATIVES: MODELS FOR INDIVIDUAL AND COLLECTIVE PREFERENCES. A method of estimating preference functions for alternative urban travel modes using non-metric scaling and conjoint measurement is introduced. The method treats travel alternatives as alternative collections of generic attributes and disaggregates preference orderings for alternative modes into components associated with the generic attributes. Preference functions are fitted for individual respondents and alternative methods of estimating collective preference functions for the group of respondents are examined. Particular attention is given to the error associated with aggregating individual responses. The methods are designed to be effective with relatively modest quantities of survey data. /GMRL/

42 183230 MANAGING THE TRANSPORT SERVICES FUNCTION. SECOND EDITION. This book groups together all the factors involved in the movement of freight and personnel. This second edition incorporates the changes made since 1972 in the transport industry, not least the effects of EEC regulations and new tax legislation. Cost figures have been brought up to date. The book is divided into the following chapters: part 1- management objectives (area responsibility, organisation and management structure, transport services management); part 2 -financial controls (achieving a cost-effective operation, budgetary controls, setting financial standards); part 3- movement of freight (transport planning, vehicle selection and design, vehicle

plan, mobility of the sales and service function); part 4-movement of personnel (company car and chauffeur services, company air service). An appendix lists companies specializing in air taxi operations and charter services. /TRRL/

42 183428 IS MODAL CHOICE MODELING BECOMING OBSOLETE? Increasing emphasis on promoting public transport and restricting the car during the 1960s led to changes in urban transport modelling. Models depicting choice of mode as a consequence of continuous adjustments to differences in modal generalised costs were introduced. Doubts that this concept of choice is valid are growing. Recent studies indicate very little choice of public transport, providing a car is available for use, while theoretical work has stressed the importance of habitual selection. The size of the error term in estimating small amounts of effective choice suggests that little accuracy is gained by using conventional choice modelling. Moreover, the modal choice issue is becoming less important as transport policy evolves and problems are seen in a fresh light. /Author/TRRL/

42 183436 EFFECTIVE TRANSPORT OPERATION IN THE HIGHWAY SYSTEM. The report describes work by the Transport Operations Research Group, University of Newcastle upon Tyne, on traffic control and bus operations, and sets it in the context of other related work. The benefits of urban traffic control are outlined, current possibilities and the results of recent research in this field, and the capacity of signal-controlled junctions, are considered. Techniques for giving priority to buses at traffic signals are outlined. A framework for the study of many of the principal aspects of the operation of urban bus routes is set out, and illustrated by results from a range of studies. Research into the possibility of using traffic control to influence the traffic pattern is briefly examined. /TRRL/

42 183453 PUBLIC TRANSPORTATION, FEARS AND RISKS. Train and flight services make up only a small portion of passenger traffic in Sweden. The major part consists of private motoring, which is more dangerous and is not very convenient for society as a whole. The public does not seem to choose means of conveyance on the basis of safety and those who do not dare to fly have fears that are more readily related to classical phobias than to (real) danger. It might well be that feelings of repulsion, fear and aversion direct peoples choice more than is generally suspected with regard to habits of travelling. Also, in the future, the public would be expected to choose less by novelty and status or other evaluative aspects but more by efficiency of means. Train and flight services are safe compared with buses, private cars, motor cycles and bicycles and one reason for that is the clear-cut responsibility. Decentralization of public transportation might lower its safety in a way the public would not notice. /TRRL/

42 183535 PROCEDURE FOR ESTIMATING DEMAND FOR REGIONAL FRINGE PARKING FACILITIES. Purpose of this study was to determine the best location and the optimum feasible quantity of additional parking spaces that would effectively serve potential demand for change-of-mode parking at the interface between highway and passenger rail systems. Selection criteria, such as available land, accessibility to highway system, current rail ridership, and current parking demand, were used to identify 20 potential fringe parking sites. Future demand for parking spaces at the selected sites was deter-

mined in four steps. The first step dealt with trip interchanges. All future trip makers who reside in the influence area of each of the potential sites, and whose trip destinations lie in the distribution service area of the passenger rail system were identified and quantified. In the second step, the market share of each mode was calculated by using a disutility mode-choice model. Disutility rates for the automobile and rail modes were computed for each of the trip origin areas, and the percentage of passenger rail trips was derived from diversion curves. In the third step, the proportion of projected commuter rail patrons demanding parking spaces at each site was established by using a relationship between the distances patrons travel to the station and their access modes to the station. Finally, additional parking spaces over and above the number of spaces already existing or planned were calculated for each site. /Author/

42 183649 VARIATION IN URBAN WORK TRIP LENGTH BY MODE, LOCATION AND WORKER CHARACTERISTICS. Variation in work trip length is examined as related to mode of travel, spatial distribution of residence and employment locations, and socioeconomic characteristics of workers. Using multiple regression analysis on dummy variables, 15 characteristics of workers in a metropolitan area were related to work trip length. Statistically significant relationships (p less than 0.001) were found for 13 of 15 variables, but the explained variance of ten of these variables was less than one percent. Travel mode and the two location variables each explained more variation than any of the socioeconomic variables. Both additive and multiplicative models were tested: the models performed equally well and the statistical significance of the variables did not appreciably differ. An improved understanding of work trip length variation is needed to provide a theoretically sound basis for calibration of a general class of spatial interaction models including trip distribution, residential location, and work and shopping location models. This research indicates that disaggregation of a trip distribution model by workers' socioeconomic characteristics will not improve its performance. Disaggregation by zone of residence or employment will result in only slight improvements in model performance. /Author/TRRL/

42 183653 TRANSPORTATION PLANNING, POLICY AND ANALYSIS. After tracing the development of modern transport planning, the author describes changes in transport administration (role played by central and local government structure, organization of conurbation transport studies, establishment of the Greater London Council and passenger transport authorities). Various traffic and public transport policies

proposed during the 1960's such as traffic management techniques, traffic restraint and promotion of public transport are outlined together with methods of evaluating transport policies. Mention is made of the transportation planning models used in mathematical simulation. In part 2, developments during the 1970's (including transport policies and programmes and transport supplementary grants) are reviewed. In conclusion, the importance of the preservation of environmental quality and accessibility is emphasized. /TRRL/

42 183696 MANAGERIAL DECISION-MAKING CRITERIA IN URBAN MASS TRANSIT. The changing role of public transit in North America has generally not been accompanied by improvements in the state-of-the-art data collection and analysis. The new orientation that transit has acquired through public control has become increasingly costly and exceeded revenues generated from the specific services rendered. Only little evidence exists regarding the nature and size of benefits resulting from specific programs and services. Unless the transit industry is perceived to be of merit such as defense and higher education, it will increasingly be challenged to support the magnitude of the social benefits that result from specific expenditures and services. To avoid unwise expenditures, programs and services, the industry should embark on a program to develop the necessary technology and resources to measure specific impacts of public transit services and relate these measurements to the broad social objectives that transit is supposed to achieve.

42 183698 A STUDY OF APPLICABILITY-POLITICAL IMPACT ANALYSIS IN TRANSPORTATION PLANNING. This article discusses the applicability of an innovative planning tool, the Political Impact Analysis, in community planning and, more specifically, urban transportation. The basic premise of this concept is that all too often planners fail to determine the effect of their plan on an individual community, or the community political reaction to a particular issue. That failure not only adversely affects a community because negative social and economic impacts may not be realized until after the fact, but it also could delay the implementation of the entire planning project because of potential political reactions and pressures brought about by the communities. The Political Impact Analysis attempts to uncover these potential community impacts and subsequent political reactions through a proposed multi-step methodology. The most important step includes interviews of key informants. The execution of this concept also improves the communication and participation processes between the planner and the community. This type of analysis was tested for feasibility in Cincinnati, Ohio. The results indicate that the Political Impact Analysis has potential to be a viable concept in community planning. /Author/

42 183837 TRAVEL TIME VARIABILITY ON COMMUTER JOURNEYS. This paper presents some results from a study of travel time reliability for private car commuter journeys conducted in Melbourne, Australia. Statistical analyses of the data were used to investigate the distribution of travel times, the independence of travel times on adjacent sections of a route and the relationship between congestion and the variability of travel times. Some new and some confirmatory results were obtained. The use of the results in a traffic assignment context is discussed and areas of future research outlined.

42 183952 MODELING THE JOINT DISTRIBUTION OF HOME AND WORKPLACE LOCATIONS IN A CITY. This paper investigates the fit of a spatial model to the joint distribution of homes and workplaces, taking into account that home and workplace locations are interrelated. The model is expressed as a single continuous function of the home and workplace coordinates, and in its simpler form has three parameters, each with a clear physical interpretation. The model is compared with data on desire-line lengths of work-trips in London and Bristol in the United Kingdom. For different modes of transport, and the results show close agreement in most of the cases that are examined. The model describes the spatial pattern of travel, provides a direct estimate of the travel demand, without the need for an iterative procedure. Some implications of the model are discussed and it is shown that the model can be expressed as a continuous variable form of the standard gravity model.

42 184090 GUIDELINES FOR STUDIES OF REORGANISATION OF URBAN TRANSPORT NETWORKS [Guide des etudes de restructuration des reseaux de transport collectif]. This report outlines the aims of a public transport reorganisation study which can be divided into 5 phases: analysis of the current situation, study of services after 10 and 5 years, definition of the network at 2-3 year, implementation and follow-up study. Each phase is very detailed. An appendix discusses the collection of data, forecasting of patronage, calculation of the operating costs of a bus network, examples of contracts between the community and urban transport contractor. /TRRL/ [French]

42 184110 A NEW METHOD OF APPRAISAL OF TRAFFIC FLOW [Ein Neues Verfahren zur Schätzung des Verkehrsumfanges]. Until now reliance has been placed mainly on the Lillian laws of travel or a simplification of the newtonian gravity model for the forecasting of traffic flows. The criticism of these methods is of their schematic method of approach and the insufficient statistical weight given to the traffic relieving factors. A new method of calculation attempts to overcome these deficiencies. The starting point is the travel requirements of the population, whereby the differing communal and economic conditions of different groups of people are taken into account. Also the differences in travel habits between large, medium and small towns which result from the differences in their economy and their attractiveness are taken into account. The use of the new method is illustrated using as an example the rail and road traffic of the Lahn area in 1972. /TRRL/ [German]

42 184293 TEMPORAL STABILITY AND FORECASTING ABILITY OF TRIP GENERATION MODELS IN READING. The paper examines the temporal stability of trip generation models, and the accuracy of current forecasting methods. Three methods were used to explain trip generation. The first adopts the traditional approach of applying multiple regression analysis to explain zonal trips in terms of zonal characteristics. The second method uses the main alternative of category analysis or, more generally, the cross classification of household trip rates. With the growing interest in household regression for conserving the variability of household trip data, the third approach applies regression analysis directly to the household data. All three methods are examined for the degree of representation which they provide at zone level for the temporal stability of the explanation and for the ability of the 1962 mode to produce satisfactory 1971 zonal forecasts. /TRRL/

42 184300 THE POLITICS OF URBAN TRANSPORT PLANNING. Highway construction policies encourage the use of private vehicles, the dispersal of residential areas and the reduced patronage of public services. Public service improvements generate the opposite trends. The balancing or mixing of these two policies is complex, and methods of effectively achieving the combined benefits of both are not well developed. The purpose of this book is to demonstrate the importance of transport planning in cities, to present the basic arguments of the two policies, and to analyse the processes by which these arguments were resolved in the three county boroughs of Portsmouth, Southampton and Nottingham during the period 1947 to 1974. The chapter headings are as follows: (1) transportation in urban areas; (2) theories of urban policy making; (3) research methods; (4) relevant environment of transportation planning 1947-1974; (5) case studies: Portsmouth, Southampton and

Nottingham; (6) analysis of the technicians in the policy making process; (7) analysis of community groups in the policy making process; (8) analysis of the politicians in the policy making process; (9) conclusions (measures of needs and resources, implications). /TRRL/

42 184334 BUS POLICY-CONCLUSIONS FROM A CASE STUDY. The main policy conclusions from a recent bus study in the new town of Telford in the UK are summarised and discussed. The choice of bus routes and their combination into networks is examined. Alternative fares systems are compared and the implications for the fare levels necessary to cover costs are discussed. It is argued that bus services can generally be financed from the fare-box but that, unless services are cut as passenger demand falls, unduly high fares will result and these will unnecessarily drive more passengers away from the buses. Several particular aspects of service marketing are then examined and the paper concludes by discussing the actual organisation of the bus services. /Author/TRRL/

42 184335 THE IMPORTANCE OF ATTITUDES IN THE DECISION TO USE MASS TRANSIT. This paper reports the results of tests of the hypotheses that attitudinal variables are important in mode choice decisions and that they can significantly increase the explanatory power of network-based mode choice models. Conflicts between the results of previous work by Lovelock and Johnson are resolved by this study. Attitudinal items used by Johnson and by Lovelock in separate studies in the San Francisco Bay area were included in a survey of Chapel Hill households. Tests of the incremental explanatory power of the attitudinal variables in mode choice models confirm that the items used by Johnson do not contribute to the explanatory power of models using network time and cost data. Similar tests showed that Lovelock's attitudinal items do significantly increase the predictive ability of the models. The conflicting results of these previous studies are therefore due to the content of the items. Attitudinal data, including both attitude items and measures of perceptions of system attributes, do enhance the predictive power of models involving network data.(a) /TRRL/

42 184336 AN EMPIRICAL COMPARISON OF DISAGGREGATE CATEGORY AND REGRESSION TRIP GENERATION ANALYSIS TECHNIQUES. Category and regression household trip generation analysis techniques were compared and contrasted. The comparative research was facilitated through a discussion that revealed the interchangeability of two methods of calibrating a category model. While the cell mean method is simple to implement, it does not readily yield statistical indexes for comparison with

regression models. The general linear model analysis of variance (Glanova) readily provides statistical indexes for the comparison of category and regression trip generation models, and it produces identical empirical results to the simpler cell mean approach of calibrating a category model. The empirical comparison supports the widespread use of category models for trip generation analysis in transportation planning studies. It was found that regression and category models yielded equivalent results for typical planning applications at the district level of aggregation. In addition, both techniques estimated overall trip rate with equal accuracy in the calibration phase, and the two approaches were indistinguishable with respect to sample size sensitivity. However, households with extremely large trip rates were underestimated to a greater degree by category models than regression models. This tendency, in turn, resulted in larger calibration coefficients of determination for regression models. Since the cell mean method of calibrating a model is simpler and easier to understand than a regression model representation, category models can be recommended over regression models for planning studies.(a) /TRRL/

42 184338 A METHODOLOGY FOR PLANNING BUS SERVICE. A methodology to assist transportation planners in designing bus services is developed. The methodology is most relevant for use in locations where bus service of the type being studied does not currently exist and therefore no information is available on past choice behavior, or in instances when transferability of travel models estimated in another location is difficult. The methodology assesses the sensitivity of bus service characteristics upon intended bus usage using survey data collected in Orange County, California, by the Orange County Transit District (OCTD). The methodology is based on a nonparametric statistical test developed by Kolmogorov and Smirnov. Scenarios describing hypothetical operations of bus service are presented to survey respondents who indicate their intended levels of bus usage under each situation. Significant differences between the response distributions associated with pairs of scenarios are identified and potential ridership levels, as bus operations become more favorable, are assessed. Various user segments are then identified on the basis of their levels of intended bus usage and the corresponding marketing implications associated with each segment are discussed.(a) /TRRL/

42 184427 CONTROL MEASURES USED IN TRAFFIC PLANNING IN URBAN AREAS [Styrmedel vid trafikplanering i taetorter]. Although car ownership and car travel are regarded as an important democratic right, control measures are necessary to reduce their negative effects. In Stockholm, traffic policy goals are: (1)

to improve communications, (2) to counteract environmental disturbances, (3) to reduce accident risks, (4) to give public transport priority, (5) to give goods deliveries priority. Control measures may relate to (1) changes in land use, (2) traffic system, (3) standard of public transport, (4) parking, or consist of (5) economic and administrative measures, (6) traffic management measures. The choice of measures depends on whether traffic is to be restricted on some streets or in certain parts of a municipality, or whether the use of certain vehicle types, or the use of vehicles for certain purposes is to be restricted. There is a discussion of control measures applicable to these choices. The use of parking restrictions is an important means of controlling the type of traffic. The introduction of tolls for travel into a certain area, or of charges for journeys inside a certain area, can also be considered. Traffic management measures may consist of restriction of access to certain areas at certain times of the day. /TRRL/ [Swedish]

42 184438 MEETING TRAFFIC PRESSURES IN TOWNS AND VILLAGES. The paper first reviews the main changes that have taken place in transport over the past fifteen years and the way in which projections of traffic growth have had to be amended. The Newbury case study in "traffic in towns" and the approach used for studying towns in the recently-completed West Yorkshire transportation studies are used to exemplify changing attitudes to the means of meeting traffic pressures. The benefits from defining issues and objectives at an early stage in the latter study are described, together with the choice of appropriate measures and standards. /Author/TRRL/

42 184581 MARKET SEGMENTATION ANALYSIS: THE POTENTIALS OF CARTOGRAPHIC ANALYSIS AND CENSUS DATA. Segmentation of transportation markets is based on the principle that areas within the metropolitan region which have similar attitudinal/demo-

graphic characteristics will have similar transportation needs. This study examines several ways in which these homogeneous subareas of the city may be identified and in turn how they relate to the transportation (work trip) patterns, namely, mode split. The purpose of this study is to illustrate the strength of the relationships between demographic characteristics and modal choice patterns using census data. Most of the arguments developed use a cartographic based analysis supplemented by statistical measures; hence, the arguments rely extensively on visual interpretation. It is contended herein that such interpretations can, in some cases, be as powerful and convincing as numerically based evaluations. The maps produced in this study use the U.S. Bureau of the Census Urban Transportation Planning Package (UTPP) as input data. The authors demonstrate and conclude the validity/utility of three basic premises: 1) there are distinct areas within the metropolitan region which can be delimited by demographic variables which correspond to mode specific areas for the purpose of market segmentation; 2) the U.S. Bureau of the Census UTPP data can be easily used to easily and quickly perform such an analysis; and 3) this analysis can be conducted principally with maps to give visual credence to the relationships discussed. The authors point out that the main advantage of the UTPP data is that it can be readily mapped. /UMTA/

42 184610 DOWNTOWN TRANSPORTATION CENTER STUDY MILWAUKEE, WISCONSIN. Data was collected to describe the central business district (CBD) in physical, functional and operational terms. This data was used to establish baseline conditions and likely changes which could then be interpreted into more specific needs for a CBD transportation center (a facility to serve a mode change function). The CBD is described in terms of the major land-uses, the transportation systems and activity patterns. CBD travel characteristics are also described. The basis for future planning is discussed. In order to develop real or site-specific alternatives, 2 steps are necessary. Planning objectives with corresponding criteria have to be articulated. These interpret notions about the transportation centers into a series of end-state conditions or achievements. The criteria establish quantitative measures for those achievements. Second, the planning objectives creating a framework or context, inventory and travel information can be analyzed to more precisely describe service needs. On the basis of research findings and considerations of the goals and objectives, a set of transportation center alternatives were developed. The process began with basic concepts for individual elements, then proceeded to possible combinations and more detailed designs (physical and operational). The intent was to identify the broadset range of potentially feasible alternatives for testing and evaluation. The alternatives were evaluated with respect to the set of approved planning objectives in terms of certain specific criteria related to: patron service, operational performance, cost, land-use relationships, and implementation. A recommended plan was developed on the basis of the study findings, additional analyses, and comments from various agencies.

Gilman (WC) and Company Incorporated May 1978, 115 p., 41 Fig., 17 Tab., 2 App.; Sponsored by the Department of Transportation, Urban Mass Transportation Administration.

42 184611 MULTI-USER VEHICLE SYSTEMS FEASIBILITY ASSESSMENT. An evaluation was made to determine the feasibility of utilizing a multi-user vehicle system (MUVS) as an integral part of an urban transportation system. The analysis began with an appraisal of existing experience with MUVS city circulation services to determine whether the limited success with MUVS to date is indicative of inherent weaknesses with the concept or whether it can be attributed to isolated factors which could be overcome in future demonstration projects. It is concluded that neither of the two experiments with MUVS to date-one in Montpellier, France, and the other in Amsterdam, The Netherlands--provided conclusive evidence on the ultimate viability of MUVS. In both instances, a variety of unique and potentially correctable institutional and system design factors limited the potential of the systems. Based upon a thorough analysis of the key factors related to MUVS demand and supply issues and overall feasibility of a successful MUVS demonstration, however, it has been concluded that it is unlikely that MUVS is a viable and promising alternative mode for intra-CBD service with or without auto restrictions. The basic reasons for this conclusion are the following: unreliability of service; low system utilization; potentially large fleet size and terminal requirements; and potentially high system cost; These conclusions are derived from both qualitative and quantitative analyses.

42 184640 COMPARISON OF RAPID TRANSIT PLANNING EFFORTS. The recent major rapid transit planning efforts of four medium sized metropolitan regions were reviewed. Comparisons are made of existing characteristics, planning procedures, and the recommended guideway proposals. Major technical considerations that led to the proposals are also reviewed. Existing characteristics are introduced first, including political structure, demographic information, topographic features, existing transportation facilities, and transit usage indicators. Next, each region's varying approach to rapid transit planning is examined. The identification of the priority guideway corridor, the selection of the first segment for implementation, and the evaluation of technologies are all reviewed for each area. Recommended proposals are described that emphasize facility type, patronage, and cost estimates. To enhance the understanding of these programs, major technical considerations are highlighted. These include unique aspects of transit ridership forecasts, benefit-cost estimates, existing transportation system analysis procedures, and citizen participation programs.

42 184641 CASE STUDY OF BUFFALO'S RAIL TRANSIT DEVELOPMENT. The history of the Buffalo, N.Y., Light Rail Rapid Transit System is presented. The 10-yr development period includes the establishment of a regional public transportation authority, the initial planning, the alternatives analysis, and the final development of the LRRT system. Guidelines for other cities planning rail transit systems are offered from this experience. They include establishing a strong transportation authority, involving the public from the conception of the project, developing public support, organizing political leaders, being cost conscious, and emphasizing cost of delay.

42 184676 MOBILITY COSTS AND METROPOLITAN DECENTRALISATION IN SYDNEY. The research described in this paper was undertaken to quantify the value of supportive land use and transport planning policies, and thus to quantify the extent to which a traditional transport problem (the provision of upgraded railway connections and additional capacity between developing fringe areas and the centre of the city) can be solved by a non-transport action--the creation of employment concentrations in the fringe areas. The "transport solution" and the "land use" solution were both tested and the benefits of both solutions are compared. The second purpose of the study was to examine the work journey mobility costs of the future residents of a growth centre on the fringe of a metropolitan area to justify the decentralisation of a balancing and significant amount of employment in addition to significant improvements in the transport services to the fringe. (a) the number of the covering abstract of the conference is IRRD No. 234299.

42 184695 INTERACTIVE GRAPHICS SKETCH-PLANNING MODEL FOR URBAN TRANSPORTATION. This paper presents a description of an interactive graphics sketch-planning model for urban transportation developed at Princeton University. The model was developed to operate in an IBM 370 VM/CMS environment with functions and subroutines written in both APL and assembler language to improve flexibility and speed in accessing and manipulating large networks and data bases. Benefits of the interactive sketch-planning aspects of the model are described. The sensitivity of sketch planning to spatial aggregation of demand data and remedies for alleviating the inaccuracies resulting from spatial aggregation are discussed. /Author/

42 184710 THE EFFECTS OF URBAN STRUCTURE ON AUTOMOBILE OWNERSHIP AND JOURNEY TO WORK MODE CHOICES. This study documents an investigation of the effects on automobile ownership and use of intermetropolitan differences in transit and highway service levels and overall urban development patterns. Specifically, we present models of the determinants of automobile ownership and mode choice for 163,488 white, single-worker households from the largest 125 standard metropolitan statistical areas in 1970. Indexes of highway capacity, transit service levels, and overall residential density for each area as well as each household's socioeconomic characteristics, work-place location, and residence choice, are used to explain the number of automobiles owned by each household, and, given that, each household's work trip mode (automobile, bus, or rail passenger; or walking). The models offer a framework for considering the effect of alternative urban development scenarios on automobile ownership and use, and for comparing alternative development and infrastructure policy options. Because the models were estimated using households from different areas, they are particularly appropriate for investigation changes in spatial structure. /Author/

42 184711 A TRANSIT-ORIENTED CITY. Cities are designed to accommodate the automobile. A transit-oriented city is one that from inception is designed for public transportation modes rather than the automobile. In such a city, automobile use would be possible but unnecessary. The goal of a transit-oriented city is to make public transportation travel more attractive than driving so that automobiles will be little needed or used. One possible transit-oriented city is described. From this example we see that many of the advantages of current urban and suburban life-styles are attainable without automobiles. The building of a transit-oriented city as an experiment is suggested. /Author/

42 184714 IMPACT OF TRANSPORTATION ON URBAN DENSITY FUCTIONS. A method is proposed for analyzing the variable impact of transportation on urban structure. The varying coefficient model, which uses the negative exponential density function as a theoretical base, provides a means for systematically incorporating hypothesized effects of current and past levels of transportation while holding constant population, income, and other factors identified with

current urban spatial structure. The aspects discussed include the following: the theoretical basis for the hypothesized effects of the conditioning variables to be investigated, the development of the model in relation to changing density functions, the estimation of model parameters by use of available cross-sectional data, the application of the model to the generalized problem of the urban density function, and simulated forecasts and analyses of transportation-related changes in urban structure for selected cities. /Author/

42 184893 TRAVEL ESTIMATION PROCEDURES FOR QUICK RESPONSE TO URBAN POLICY ISSUES. The results of a 2-phase effort are presented here. In Phase I, policy issues facing transportation planning agencies were identified by onsite visits to agencies at the state, regional and county levels. Questionnaire responses from urban areas, planning documents and literature were reviewed. Policy issues were compiled and classified and the demands placed on travel estimating procedures were determined. Available estimation procedures were compiled, cataloged, described and evaluated. Phase I recommended that a set of capabilities be developed that include: simplified computerized methods for the 4-step (trip generation, distribution, mode split and traffic assignment) procedure that is efficient and will provide quick response at the regional and subarea level; an efficient, policy-sensitive procedure that would evaluate transportation service and cost changes in terms of economics and social and environmental impacts on a macro basis; manual methods useful for short-range application at the corridor and project level. A Users Guide was developed in Phase II to describe transferable parameters, factors, manual techniques, and the like to enable the user to carry out a simplified analysis without the need for reference to other sources. The Guide covers the following planning elements: transportation planning; trip generation; trip distribution; mode choice; auto occupancy; time of day distribution; traffic assignment; capacity analysis; and development density/highway spacing relationships. The guide also illustrates how models may be changed or modified and applied to provide a quicker and less expensive planning tool.

42 185297 TRANSPORTATION SYSTEM MANAGEMENT. This publication contains workshop reports, conference papers and case studies that were presented at the conference on Transportation System Management (TSM). The conference addressed three objectives: provision of the latest information on DOT policies and requirements, the provision of the latest information on experiences with the actual implementation of a range of individual TSM actions, the examination of the emphasis of the regulations on a regional or metropolitan planning perspective. The conference emphasized urban areas that had

or were having success in implementing TSM actions. Three major issues were highlighted in the presentations as well as during the discussion of implementation of individual TSM actions. The issues are: TSM as a planning process and the role of metropolitan planning organizations in that process, perceived conflict between short-term and long-range transportation objectives and public involvement and acceptance of TSM actions.

42 185387 GUIDELINES FOR COMMUNITY PLAN TRANSIT DEVELOPMENT. These guidelines, which are oriented to the creation of a useful public service, are intended to provide direction for planners of transit services in developing areas. The objectives for community transit development are listed. Studies have shown that a "convenient" transit stop should be within 1,300 ft of a person's origin or destination. Factors which should be considered in making this distance criterion possible are listed. The principles of route layout are detailed and figures are used as illustrations. The planning of timed connections, and the viability of community transit service are considered. The estimation of patronage and mapping requirements and review procedures are also discussed.

42 185409 GLOSSARY OF URBAN PUBLIC TRANSPORTATION TERMS. This glossary attempts to serve as a basic reference for persons interested in urban transit planning. It is designed to assist transit system operators to understand the analytical language of urban planners and the latter to understand the operational language of transit system operators. The glossary organizes and to some extent standardizes terms related to urban public transportation. The definitions are organized alphabetically by term. Acronyms and abbreviations are presented at the beginning of each alphabetical section.

42 185702 BUS TRANSPORTATION. PART 1. NATIONAL AND GENERAL STUDIES (A BIBLIOGRAPHY WITH ABSTRACTS). A broad coverage is made of research on bus transportation. Part 1 deals with topics of general and national scope, such as safety, maintenance, scheduling, engines and propulsion, travel demand, costs, stations and terminals, subsidies, fuel, special services, user groups, bus types, vehicle engineering, and highway aspects. Traffic models, mathematical analysis, computer aided planning, marketing, and urban needs are also discussed. Other subjects are express routes, air pollution, fares, ridership, bus lanes, forecasting, simulation, park-and-ride, personnel training, crime and vandalism, comfort, operating and handling dynamics, and allied topics. (This updated bibliography contains 242 abstracts, 31 of which are new entries to the previous edition.)

42 185734 PLANNING FOR AIRPORT ACCESS: AN ANALYSIS OF THE SAN FRANCISCO BAY AREA. A multidisciplinary systems analysis of airport access to the major airports of the San Francisco Bay Area was made. Basically, it was found that there is no major airport access problem. The argument of the report is that commonly perceived airport access problems are either minor inconvenience magnified out of proportion by a combination of the traveler's unreasonable expectations, anxiety over flight departure and lack of information, or not subject to solutions which do not consider the entire urban transit system. Nine specific conclusions and recommendations for improvement are presented and discussed.

42 185857 REGIONAL PRODUCTIVITY, SUMMARY. Metropolitan Affairs Nonprofit Corporations (MANCs) explored means for improving productivity and technology utilization in the nonfederal public sector. In the first phase of the project, conferences were held in four regions--San Francisco, Minneapolis, Pittsburgh, and New York. The regions were selected to represent a cross section of the country's large urban areas. The subjects included four key technological concerns--transit, environmental monitoring, service delivery, and physical development. Participants included leaders from industry, government, civic organizations, foundations, universities, and consulting firms. In the second phase, the conclusions were tested and refined through review conferences in the additional cities of Detroit, Atlanta, and Washington, DC. As a consequence of this conference study and review process, this report constitutes a comprehensive appraisal by more than 300 highly-experienced practitioners of technology and public affairs in seven representative urban regions across the country. Included in the summary are the report findings, and recommendations.

42 185975 NOTTINGHAM ZONES AND COLLAR STUDY, RESULTS OF THE 'AFTER' SURVEYS. The Nottingham 'Zones and Collar' experiment in the western sector of the city was implemented in August 1975. The principal aim of the experiment was to make bus travel in the morning peak period more attractive by re-locating traffic queues at points where buses could be given priority. At the same time it was intended to limit the flow of traffic on the approaches to the city center to August 1973 levels. Away from the selected delay points, the reduction in traffic would allow the remaining vehicles, including buses and commercial vehicles to flow freely. A 'before' study was made in April/May 1975 and a report on the results has been published. The present report gives results of the 'after' study made in April/May 1976 by TRRL, Nottinghamshire County Council and the Traffic Advisory Unit, now of the Department of Transport. These include surveys of bus and car journey times, traffic flows, infringements of the newly introduced traffic regulations and the use of the newly introduced traffic regulations and the use of the special 'park and ride' sites. To complement these a roadside interview survey was held and also a household interview survey to determine changes in the travel habits of individuals. (Copyright (c) Crown Copyright 1978.)

42 185977 CALIFORNIA INNOVATION GROUP, INTEGRATED LIST OF URBAN NEEDS [Final rept]. The report should serve as the initial phase of a process by which NASA's existing technology can be matched with identified urban problems. A review of the various problems/needs lists (included) should provide an entry point for technological and analytical problems which are within NASA's ranges of interest. Objectives of the study were to: (1) provide an integrated problem/needs listing with participation in the needs assessment by Anaheim, Fresno, Pasadena, and San Jose; (2) provide a preliminary analysis to determine the priority ranking of the identified problems/needs; (3) provide some identification of approaches to potential solutions, utilizing aerospace technology; (4) begin to establish a working relationship between the member cities of the California Innovation Group and NASA, as well as other Federal Laboratories, to more effectively utilize existing technology in satisfying urban needs. Items selected by the Science Advisors as meriting special consideration for technology transfer activity are included.

42 185987 CHICAGO TECHNOLOGY AND URBAN NEEDS PROGRAM. The study examines how to overcome social and technological barriers in the process of technology transfer to the public sector. The program described is experimental in nature, realizing that the mechanisms for improving technology transfer are not yet well defined. The program began operations in December 1973. It was to be a five-year effort to develop a cooperative public-private organization called the Chicago Technology Council. The activities of this organization were to identify and develop processes and institutional linkages to transfer technology to the public sector. Public and private sector officials participated in a set of councils organized around functional areas of education, environment, health, housing, management support, manpower, protection of persons and property, recreation and leisure time, and transportation. The report is a description of the first year activities of the Program in terms of the nature of the program, the barriers to technology transfer encountered and the successes and failures of actions taken to overcome these barriers.

42 186115 ON THE DEVELOPMENT OF A THEORY OF TRAVELER ATTITUDE-BEHAVIOR INTERRELATIONSHIPS. No abstract available.

Charles River Associates, Incorporated, Transportation Systems Center 3 Volumes, Aug. 1978, 482 p.; See also Volume I through Volume III, PB-286663 through PB-286665 in RRIS 23 186116 through 186118 respectively; Bulletin 7901.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-286662-SET/ST

42 186116 ON THE DEVELOPMENT OF A THEORY OF TRAVELER ATTITUDE-BEHAVIOR INTERRELATIONSHIPS: VOLUME I. INPUT TO THEORY DEVELOPMENT. The first volume of this Final Report is principally directed at the generation of materials to facilitate the development of a theory of traveler attitude-behavior interrelationships. Such a theory will be useful in the design of transport systems and operating policies which satisfy passenger requirements. Literature review efforts were undertaken to survey attitudinal and marketing concepts which could contribute to theory development. Attitudes are divided into three components in order to better understand how they relate to traveler behavior. Hierarchical and multiattribute models are explicitly considered. It is recognized that not all travelers are identical, and market segmentation is an aspect of our modeling orientation designed to account for differences between groups of travelers. A tentative model framework is presented along with an overview of how to quantitatively evaluate variations within the framework. This volume concludes with a review of data collection

considerations that support quantitative analyses of traveler attitude-behavior interrelationships.

42 186118 ON THE DEVELOPMENT OF A THEORY OF TRAVELER ATTITUDE-BEHAVIOR OF INTERRELATIONSHIPS. VOLUME III: EXECUTIVE SUMMARY; OVERVIEW OF METHODS, RESULTS, AND CONCLUSIONS. The summary report offers an overview of methods, results, and conclusions which support the development of a theory of traveler attitude-behavior interrelationships. Such a theory will be useful in the design of transport systems and operating policies which satisfy passenger requirements. A summary of project methods and achievements as evidenced by project reports serves as an introduction of theoretical considerations which guided the study. Various attitudinal components are identified and defined. Brief discussions of multiattribute models, hierarchical models, market segmentation, and structural equations are offered as a basis for appreciating theoretical and empirical findings. Selected findings are presented to clarify the nature of traveler attitude-behavior interrelationships. The relevance of study findings to traveler behavior theory and transport policy analysis is noted.

42 186692 ANNUAL REPORT, 1977 [Annual rept. for 1 Jan-31 Dec 77]. Highlights of the year's accomplishments include: opening of Phase II (the Blue Line, National Airport-Stadium Armory) on July 1, drawing a daily ridership of 135,000, the combined system now had 25 stations and carried over six times as many passengers as before, rerouting of 385 bus routes to serve the rail stations and eliminate duplicate service, reorganization of the Authority staff to function as a transit service agency in addition to a construction agency, purchase of 281 buses, over half equipped with wheelchair lifts, implementing two fare increases, phasing in two-way bus radios and improving graphics in the rail stations. At year's end, five stations and 14.2 miles of line were substantially completed and 21 stations and 21.0 miles of line were under construction, and another 21 stations and 27.2 miles of line were under design.

42 186792 MESA NEW YORK BIGHT ATLAS: TRANSPORTATION [Monograph no. 24]. Transportation facilities in the New York Bight region include extensive highways, subways, railroads, airports, tunnels, and bridges. In 1970, 14.9 million people lived in the Bight region; there were 6.8 million jobs. The dominant mode of transportation is the automobile. Fully 70% of all weekday trips in 1970 were made by car; 13% were made by rapid transit (predominantly the subway) and 12% by bus. Though New York City contained most of the region's employment (60%) and population (53%) in 1970, decentralizing influences are at work. As the suburban and outer fringe counties grow, their almost total dependence on the automobile will mean increased congestion and pollution unless mass transit utilization is encouraged.

42 186796 ECONOMIC DEVELOPMENT/CENTRAL BUSINESS DISTRICT STUDY [Final rept]. The Central Business District (CBD) has played a multi-level role in the economy of the city. The new and future trends in the central business district towards the development of retail sales, tourism and recreation hotel activity and other business development provide the basis for a diverse strategy to improve the economic vitality of the Center City. The Central Business District plays a unique role in the economic and social existence of the city and complements the functions and activities of other sections of the urban community. To further their objectives, a series of conferences was held, bringing together nationwide policy-level management in govern-

ment and in the private sector. The workshops pointed out that with thirty-eight participating cities, that there are many common problems relative to the Central Business District that all of these cities are presently facing.

42 186869 METRORAIL ALTERNATIVES ANALYSIS. Since 1968 cost estimates for completing the 100-mile Metrorail system within the Washington Metropolitan Area have escalated, and concern has been expressed about financing the full system and whether the full 100-mile system provided the best solution to the transportation problems of the area. The study reviewed a full range of rail and non-rail alternatives for the 'E' Route to Greenbelt, the 'F' Route to Branch Avenue, the 'J-H' Route to Franconia, and the 'K' Route to Vienna. The study was designed to analyze the relative costs and effectiveness of each alternative. Criteria used to evaluate each alternative included patronage, costs, deficits, funding requirements, automobile use, energy consumption and economic measures. Of the 1700 possible regional combinations, 72 were analyzed in detail; five regional candidates were chosen for final study. After eighteen months of study, the JPSC reaffirmed a complete system for the area.

42 187070 SUMMARY OF NATIONAL TRANSPORTATION STATISTICS. This annual report provides time series data collected from a variety of government and private statistical handbooks. The information consists of selected national-level transportation statistics, including cost, inventory, and performance data describing the passenger and cargo operations of the following modes: air carrier; general aviation; automobiles; trucks; buses; local transit; rail; water; and oil pipeline. The report covers basic

descriptors of U.S. transportation such as operating revenues and expenses, number of vehicles and employees, vehicle miles, and passenger miles. Previous editions cover selected data over a 10-year span beginning in 1960.

42 188011 INTEGRATED URBAN TRANSPORTATION—A MAJOR CHALLENGE FOR TRANSPORTATION ENGINEERS. Pedestrians, private automobile, public transportation and other modes are components of a total urban transportation system. However, for historical reasons and because of major differences in their physical, operational and cost characteristics, different modes are being planned and operated by different organizations or public agencies. Transportation, including all modes, should be treated as a single activity which must be closely coordinated with urban form and land use. Coordination of different modes should be based on the fact that the basic unit in transportation is not a vehicle, but a person.

Vuchic, VR (Pennsylvania University, Philadelphia) ; Institute of Transportation Engineers 1977, pp 263-268; Compendium of Technical Papers of the 47th Annual Meeting of the Institute of Transportation Engineers at the Fourth Transportation Engineers Conference, Mexico City, October 2-6, 1977.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

42 188012 NO-BUILD POLICY AS A MEANS TO IMPROVE TRANSPORTATION IN URBAN AREAS. No-build policy is as important an element of urban transport planning as the improvement of public transport, the expansion of the road system and the linking of land use and planning to transport need. It therefore has to be developed and evaluated as part of a comprehensive approach taking into account these and socioeconomic aspects of city and transport planning. In this paper a review of no-build policies is given summarizing concepts and experienced results. Because the potential and chance of implementation of no-build policies is often dominated by the local situation and its characteristic restrictions, no general methodology can be presented and therefore a structure of measures was developed which have certain aspects in common. 42 188022 TRAVEL ANALYSIS AND IMPLICATIONS FOR THE FUTURE. The paper reports on a study to evaluate results from various policy scenarios tested in the SANBAG Mode Choice Model used for travel forecasting. An attempt was made to predict transit ridership if one or a combination of several changes occur in the factors affecting travel characteristics in the San Bernardino Valley Metropolitan area. All tests were made using variations of two basic transportation systems—a historical base of 1970 highway and transit networks and future year systems networks. The policy variables tested were auto operating costs, auto parking costs (in major commercial areas), transit running speed, transit fares, and auto occupancy. The scenarios tested were identified as Base, Moderate, and Extreme.

42 188207 TRAVEL TO WORK IN BRITAIN: A SELECTIVE REVIEW. This report presents information about the changing pattern of the work-journey in Britain. Since 1950 a number of studies have been made of various aspects of the work-journey including modal split, spatial distribution of residences and workplaces and broad patterns of movement. These studies are reviewed briefly in this report. The information obtained from the literature review is supplemented with 1975/76 National Travel Survey data giving modal split, journey length and time for different socioeconomic groups. The main findings from the review and the survey data include: An increase in the use of cars as the principal mode of travel to work and a corresponding decline in the use of public transport; An increase in average length for the work-journey at the annual rate of 1 per cent between 1921 and 1966; Residential locations of car users are more widely distributed than those of public transport users; A progressive outward shift of residences from inner areas to conurbation peripheries with an attendant increase in in-commuting; An increase in out-commuting by residents of conurbations and conurbation centres; Residents in inner areas make shorter trips than residents in outer areas; and Workplaces in inner areas attract longer work-journeys than workplaces in peripheral areas. /Author/

42 188311 SUMMARY REPORT OF A SURVEY "MONITORING EFFECTS OF MODAL INTERCHANGES ON TRAVEL PATTERNS". This report of a survey has been prepared for the Victorian Ministry of Transport, which is involved in the implementation of large structural improvements centred on Frankston and Box Hill railway stations designed to improve and facilitate modal interchange movements and thereby to stimulate the use of the rail and feeder bus services. The purpose of the survey is to collect information relating to detailed individual behaviour "before" and "after" to provide a basis for the formulation of prediction models, which explain the change in aggregated travel patterns. Data were collected for the following parameters: pedestrians, parking, taxis, traffic, buses and trains. Each different parameter is dealt with separately, and where relevant, under the following headings: description of parameter, how it was measured, problems encountered in measurement, how it relates to modal interchange, results and commentary on results. /TRRL/

42 188410 EFFECTS OF AN EMPLOYEE TRANSPORTATION PROGRAM. Following the national trend, the excessive use of the automobile to get to work was experienced at a large administrative and laboratory complex located in suburban St. Paul, Minnesota. After an extensive survey in 1970, the various employee transportation trend lines were projected into the future, and it was determined that the ultimate number of people that could be employed on the site would be determined by the access that could reasonably be expected. In order to remove this barrier, the transportation trend lines would have to be altered and an employee transportation program was implemented to accomplish this. The paper discusses the initial program, subsequent modifications, and results.

42 188453 A PARTIAL BUS PATRONAGE COMPOSITION SURVEY. This study was designed to: expose the students to an established

method of bus usage data collection; assess the capability of first-semester juniors to conduct such counts accurately; obtain data that could be used as a rough check of the factors in current use; and provide a first-level approximation of bus usage by handicapped pass holders. A mathematical formulation of the method used for the estimation of the total ridership and its composition is presented. The details of the study are given. The survey developed additional factors corresponding to transferring revenue passengers, handicapped riders and other non-revenue users. The usefulness of the information that may be derived from patronage composition surveys supports a recommendation to study the feasibility of installing a strategic number of fareboxes equipped with special counters. The implementation of these instruments would require the cooperation of bus drivers.

42 188499 THE EFFECTS OF URBAN STRUCTURE ON HOUSEHOLD AUTO OWNERSHIP DECISIONS AND JOURNEY TO WORK MODE CHOICE. This report presents the first phase of a comprehensive study of the interrelationships between urban transportation and land use. More specifically, it considers the effects of inter-metropolitan differences in transit and highway service levels and urban spatial structure on the auto ownership and modal choice decisions of a sample of 163,488 white, single-worker households residing in the 125 largest SMSAs in 1970. The principal contribution of the present study is its consideration of the determinants of auto ownership and modal choice of households working and living in different metropolitan areas, where they face different metropolitan areas, where they face different combinations of work-place, housing, and transportation costs. /Authors/

42 188913 ESTIMATING THE FUNCTIONAL FORM OF TRAVEL DEMAND MODELS. This paper shows how many particular models found in the travel demand literature, such as the linear, multiplicative, logit forms and their formulation in terms of first differences, can be derived as special cases of the specification of the fixed and stochastic parts of more general models. Estimates of the appropriate functional form of the two equations of a cross-sectional inter-city travel demand model and of the two equations of a time-series urban travel demand model are presented. It is demonstrated, using current maximum likelihood techniques extended to take multiple-order auto-correlation into account, that estimating the functional form dominates more restricted procedures on grounds both of the statistical significance and of the economic reasonableness of the results.

42 188928 TSM: TINKERING SUPERFICIALLY AT THE MARGIN? This paper summarizes the findings of a 2 yr. evaluation of the Transportation System Management (TSM) program of the U. S. Department of Transportation. The study assessed both the technical options commonly associated with TSM--such as car pool matching, flexible work hours, exclusive lanes for buses and car pools, and discriminating pricing--and the planning philosophy implicit in the federal regulations. The analysis suggests that a package of TSM measures combining preferential freeway entry, car pool matching, paratransit, and flexible working hours, which emphasize exploiting underutilized capacity, are technically and politically superior to the more drastic penalty-centered alternatives, such as dedicating freeway and arterial lanes to high-occupancy vehicles, removing parking in congested areas, and heavy auto-disincentive surcharges (in excess of marginal cost pricing). The research concludes that time-management strategies, such as variable work hours, are the least exploited of the promising measures available, and thus deserve increased attention.

42 188992 VALIDATION TEST OF DISAGGREGATE MODE CHOICE MODEL. A model of work trip mode choice was developed on a sample of workers taken before Bay Area Rapid Transit (BART) opened for service. Validation tests of the model were performed on a sample of workers taken after BART service began. Two validation methods were used: the actual mode shares in the post-BART sample were compared to the mode shares predicted by the models estimated on the pre-BART sample, and the parameters of models estimated on the post-BART sample were compared with the parameters of the models estimated pre-BART. Three possible reasons were explored for the differences in actual and predicted shares and in the pre- and post-BART model parameters.

42 189244 TRIP RATE CHARACTERISTICS OF EDUCATIONAL LAND USES. The authors report that trips for educational purposes form a major component of non-work journeys; for example, in the West Midlands morning

education trips account for 60 per cent of all peak-hour non-work trips and nearly a quarter of all peak-hour trips. An understanding of the behavioural context within such trips is considered to be crucial to the formulation of plans and policies more sensitive to the needs of particular social groups. This paper reports the first stages of a study into both trip-synthesising models for non-work trips and also into the question of behavioural content. The background to the survey is presented, information given on some previous studies, and the survey methods described. The surveys were carried out on a Tuesday and Thursday at 114 primary and 60 secondary schools using the 'whole-class' response technique, and 12 colleges, a polytechnic and a university also took part by means of a self-administered questionnaire. The results of the survey are presented in a series of tables, and the data collected by means of a more detailed supplementary survey are also described. A number of conclusions indicate that (1) the choice of a 'whole-class' response method for the schools surveyed appears to have been vindicated, (2) the use of self-administered questionnaires was also successful, (3) the trend forecast by the West Midlands transportation study for an increased reliance on private rather than public transport within a purely vehicular category has, to date, been confirmed, (4) in terms of measures-of-attraction, school type appears the most significant factor affecting modal choice, whilst the precise relationship between student trips and certain trip-maker characteristics has yet to be determined. /TRRL/

42 189464 MANUAL METHODS OF ESTIMATING PUBLIC TRANSPORTATION NEEDS IN SMALL URBAN AND RURAL AREAS. This manual provides manual analytical techniques assigned to assist small urban and rural technicians in analyzing public transportation options. It is intended for use primarily by planners, engineers and others in communities with less than 50,000 residents. Outside assistance, including computer analysis, should not be required if this manual is used. Two approaches using ten techniques are considered in this manual, and include a rate making and budgeting "How To Do" discussion. /Author/

Gamble, P ; Washington State Department of Transportation Final Rpt. Aug. 1978, 109 p., Figs., Tabs., 2 App.; Contract WA-09-8001-1; ORDER FROM: Washington State Department of Transportation, Public Transportation and Planning Division, Olympia, Washington, 98504

42 189497 THE LOCATION OF PUBLIC SERVICES CONSIDERING THE MODE OF TRAVEL. By reason of their generally longer travel times, transit users are not so well-served by many public facilities as are automobile drivers. This paper investigates the implications of this fact for the location of a specific type of service, public child day care. A location-allocation model is employed to determine the most accessible locations for a set of centres in Edmonton, Canada, for users of both modes. Transit is

found to be capable of providing only 51% of the accessibility of the automobile, at 2.4 times the average travel time. The argument is advanced that in order to reduce the inequality of service to a minimum, public facilities should be located with the accessibilities of transit users in mind. The optimal systems are compared with Edmonton's present system which is found to be spatially inefficient and quite discriminatory in its inefficiency against transit users. This is attributed to the city's piecemeal planning policy and an inadequate understanding of the notion of accessibility. The paper concludes by recommending improvements which would improve our simple diagnostic model to the level of a useful planning device. /Author/

42 189498 A PROCEDURE FOR FULLY EVALUATING THE ANTICIPATED IMPACTS OF SELECTED PUBLIC SYSTEM INNOVATIONS ON VARIOUS ENVIRONMENTS USING CITIZEN-GENERATED INFORMATION INPUTS. A flexible, yet relatively comprehensive and easy to implement, technique of project evaluation is presented. Its contrasts to traditional cost-benefit techniques are made explicit. The procedure relies on judgmental inputs from both citizens and technicians, thereby establishing an appropriate division of labor that takes expert opinion into account and at the same time permits citizens to play a key role in planning. Raw benefit data are obtained by soliciting a set of numerical ratings from concerned citizens and/or a panel of experts. These data are then transformed by matrix multiplication to yield numbers that provide rankings for all projects in all areas. Given the properly discounted costs of each possible project in each subarea, a set of benefit-cost ratios can be calculated. Then, given a capital budget for the entire city or region, projects can be implemented in order of decreasing benefit cost ratios. Sample application of the technique involving the evaluation of urban transportation system innovations is presented in detail.

42 189549 DYNAMIC MODELS OF MODAL CHOICE. The paper is described as an attempt to produce an approach to general time-dependent transportation analysis based on the best understood transport problem where time-dependent effects are important: namely, the modal choice between private car and bus. The paper contains formulations, results and discussions of this study of the dynamic modal choice problem. The object of the work being to determine the degree of representation required to bring out time-dependent effects, how simple the formulations could realistically be made, what effect different optimisation criteria would have, and, to what overall factors were the equilibria most sensitive. /TRRL/

42 189626 SPECIFICATION, TRANSFERABILITY AND THE EFFECT OF DATA OUTLIERS IN MODELING THE CHOICE OF MODE IN URBAN TRAVEL. Three problems of great importance to urban travel demand modeling using multinomial logit models are examined in this paper. They are (1) the effect of data outliers on model coefficients; (2) the effect of model specification on coefficients and model explanatory power; and (3) the transferability of model coefficients within the region, between regions, and in time. Four data sets are used in the study. They are: Washington, DC, Minneapolis-St Paul, and two data sets from the San Francisco Bay area, pre-bart and post-bart. The data are standard home-interview survey data appended with network supplied modal travel cost and time information. The findings of the research are occasionally contradictory; the majority of the evidence supports the following conclusions. The "outliers" do not have a statistically significant effect (at 0.05 level) on the coefficients; however, the outliers can have a substantial effect on the point estimates of some of the coefficients. Model specification has an impact on model coefficients and model explanatory power. In particular, the definition of out-of-vehicle travel time appears to be important and, if available, the use of separate walk and wait times is preferred over their sum, the out-of-vehicle time. Finally, the model coefficients do not appear transferable within region, between regions, or in time.(a) /TRRL/

42 189630 THE STEVENAGE SUPERBUS EXPERIMENT. APPLICATION OF RESULTS TO TRANSPORTATION PLANNING. This paper discusses the stevenage superbus experiment with respect to the application of results to other transportation plans. The philosophy of providing an improved bus service as a positive benefit to the community is one which is finding fruition in the West Hertfordshire transportation study. The cost-benefit relationship of deference to improved public transport has been investigated in depth in Stevenage and application of results of the superbus experiment, in particular a generalised-cost/demand model, has led to a public transport strategy which is to be implemented in Hemel Hempstead. A demand model is derived for the newly introduced superbus 3 service and the results are compared with previous models derived for the first two superbus services. A high degree of correlation between these models would reinforce the application of previous results to the Hemel Hempstead public transport system. /TRRL/

42 189657 THOUGHTS ON THE MERITS OF TRANSPORT-PLANNING PACKAGES.

Transport-planning packages are increasingly being reappraised for technical content and role, in the current climate of capital rationing and short-run planning horizons. This paper outlines in a broad manner the major roles of established packages and suggests the major areas of deficiency, given that the present perceived planning emphasis will hold in the future. The important distinction between the concept of packages per se and the particular models used therein is emphasised. Particular reference is made to the improved urban transportation planning system (UTPS) package of the U.S. Department of Transportation (1977). /Author/TRRL/

42 189659 TRANSPORT PLANNING AND ENERGY CONSUMPTION [Transportsektorns energibehov].

This report presents some examples of calculations in order to investigate the connection between different forms of traffic planning and energy consumption. During recent years questions concerning efficient management of energy resources have increasingly come to the attention of researchers in various fields. One field of particular interest is the transportation sector, which is responsible for 15% of the total oil consumption in Sweden. The private car has by far the greatest fuel consumption, and transferring passengers from private cars to buses and other public transport would result not only in less fuel consumption, but would bring other welfare benefits as well. In the examples presented in the report, estimates are made of the changes in fuel consumption to be expected from such measures or assumptions as: 50% or 100% increase of bus travel; introduction of bus lanes; rerouting of traffic from the city center; introduction of zones for pedestrians. The study was conducted in Gävle (population 90000), Sweden and detailed account of the city's traffic environment is given in the report. /TRRL/ [Swedish]

42 189660 TRANSPORTATION AND THE QUALITY OF HUMAN LIFE.

This article represents part 1 of a two-part discussion related to the author's concern that traffic technology has been developed in a direction that satisfies the requirements of those who provide transportation services, but that the needs and requirements of those who are transported, have been almost totally forgotten. Japanese experience at international transport exhibitions in Paris and Chicago are described to explain the development of modern technology, and this is related to Japanese experience as a whole. Reports are presented based on visits made by the author to cities in a number of countries to investigate their transport systems and problems. In the USA reference is made to the Washington subway (partially opened in 1976) and the buses in the area which are under the management of the Washington Area Transit Authority, the high level of services

provided for and to attract customers, and the reduction of daytime traffic congestion in the central business district of Los Angeles by the use of minibuses and the large scale telephone enquiry centre. In the Netherlands, the operation of a "traffic mixture" system in Delft, a city of 70,000 population, is described, whereby in certain selected areas sectors called "woonerf" have been established to enable pedestrians and vehicles to coexist. The supplementary licensing system in the two million population city of Singapore is described, established to deal with congestion in a 6.2 square kilometre area in the central business district. The operational aspects of park and ride systems and restricted zones is described.

42 189664 URBAN TRANSPORTATION PLANNING. CURRENT THEMES AND FUTURE PROSPECTS. PARTS 1, 2, 3, 4 AND 5.

The papers which form the major part of this book have been edited from material presented at a conference on urban transport planning held at The University of Leeds in the spring of 1976. Part 1--"Introduction" contains: "The Development of Transport Objectives", Prestwood-Smith, P; Part 2 entitled: "Estimation of Demands for Travel", contains the following papers: Trip Generation: What Should we be Modelling? Dale, HM; Travel as a Manifestation of Activity Choice: Trip Generation Re-Interpreted, Jones, PM Greater London Transportation Study: A Procedure for Forecasting Trip-Ends, Havers, GE. Part 3 entitled: "Modelling the Interaction between Land-Use and Transport" contains the following papers: Problems in the Integration of Land-Use/Transportation models, Senior, ML; A Dynamic Activity Allocation Transportation

Model, Mackett, RL; Compact Land/Use/Transportation Models, Echenique, M and de La Barra, T. Part 4 entitled: "Transport Networks: Some Technical Problems in Assignment" contains the following papers: Congested Assignment: Test Problems With Known Solution, Murchland, JD; An Application of Mathematical Programming to Network Assignment, Van Vliet, D. Part 5 entitled: "Evaluation: Consistency, Efficiency and Equity" contains the following papers: The Generation of Consistent Travel-Demand Models and Uses-Benefit Measures, Williams, HCWL; Problems of Optimising Investment in Road Networks, Pearman, AD; The Redistributive Impact of Road Investment, Dalvi, MQ and Nash, CA. /TRRL/

42 189765 PUBLIC TRANSPORT PLAN 1979/80. PRELIMINARY DRAFT FOR CONSULTATION.

The Transport Act 1978 requires non metropolitan county councils in England and Wales to publish public transport plans and reach agreement with operators over the financing and maintenance of socially necessary but commercially unsuccessful public passenger transport services. This publication is the Kent County Council's draft outline public transport plan, presented in 12 sections as follows: (1) county council duties towards public transport; (2) problems of the public transport industry; (3) summary of needs for public transport; (4) county council objectives and policy; (5) area review of public transport; (6) school transport; (7) finance; (8) rail service; (9) consultation; (10) agreements; (11) summary of major tasks to be undertaken over the five years 1979/80-1983/84; (12) appendices consisting of summaries of passenger road services and existing rail services, together with proposals for adjustments, and a summary of

major comments on the plan from district councils and other interested bodies.

42 189836 CONSUMER PSYCHOGRAPHICS: TRANSIT RIDER AND NONRIDER MARKET SEGMENTS. This study attempted to apply psychographic analysis to the mass transit market and more specifically: to obtain a lifestyle profile of the users as compared to the nonusers of mass transit; to pinpoint some of the subtle variations between riders and nonriders in terms of their psychographics; and to establish some of the motive the transit marketer can appeal to in marketing efforts directed to the rider and nonrider market segments. The research methodology is detailed, and the findings are tabulated and discussed. The findings provide useful insights for the effective design of marketing programs. Some of the programs offered by transit operators reflect and cater to the tendencies noted in the findings. Thus, the data serve to validate marketing policies, or to give a sense of direction for future marketing efforts. Separate marketing programs can be designed to appeal to each of the market segments, rider and nonrider.

42 189843 QUICK-RESPONSE URBAN TRAVEL ESTIMATION TECHNIQUES AND TRANSFERABLE PARAMETERS. USER'S GUIDE. This report provides detailed descriptions of manual techniques for use in each aspect of travel demand estimation, i.e., trip generation, trip distribution, modal choice, auto occupancy, time-of-day distribution, Traffic assignment, capacity analysis, and development density versus highway spacing relationships. Numerous charts, tables, and nomographs are included to simplify each analysis step. Data requirements are also reduced by making maximum use of transferable parameters developed from other studies and urban areas. Three scenario applications of the manual techniques are included to illustrate the potential usefulness of the various analysis techniques. Much of the information contained in the report is also applicable to computer analysis. The presentation of the procedures is structured to allow their utilization by transportation planners with various levels of experience. A companion document, NCHRP Report 186, describes and evaluates other manual and computer methodologies that are available. /Author/

42 189969 SERVICE AND METHODS DEMONSTRATION PROGRAM. ANNUAL REPORT. The Urban Mass Transportation Administration's Service and Methods Demonstration (SMD) Program addresses the national

need to improve the quality, quantity, and efficiency of public transportation services of innovative transit operating techniques and services which utilize existing technology. This report contains a description of the SMD Program for Fiscal Year 1977. Program activities and accomplishments are reviewed, including current and future demonstration project descriptions, project findings, and other support activities. Project findings are organized into four program areas: Conventional Transit, Pricing and Service Innovations, Paratransit, and Special User Groups. In this report, results of demonstration projects and studies leading to or in support of demonstrations are summarized. Areas where there are gaps in the understanding of innovative concepts are mentioned, together with future projects aimed at obtaining necessary experience to arrive at more conclusive understanding of the applicability and potential of these concepts. Other activities carried out in support of the demonstrations are reviewed, such as the development of structured approach to project evaluations, studies of independently initiated local innovations, and the information dissemination program. /UMTA/

42 190094 EQUILIBRIUM SOLUTIONS TO COMBINED URBAN RESIDENTIAL LOCATION, MODAL CHOICE, AND TRIP ASSIGNMENT MODELS. Urban land use and transportation models have historically incorporated the effects of highway capacity and congestion in a conceptual sense; however, methods for solving these models that satisfy Wardrop's conditions of user-equilibrium have been developed only recently. The application of these convergent equilibrium methods to Lowry-type residential location models provides a means for determining the spatial distribution of residential activities which is in equilibrium with multi-model transportation costs.

42 190102 KNOXVILLE METROPOLITAN AREA PUBLIC TRANSPORTATION STUDY. PARTS I, II AND APPENDICES. This document outlines a transit development

program for shortrange transit improvements in Knoxville-Knox County and encompasses a five year period beginning in 1977. Capital improvements and operating strategies required to meet the public transit mobility needs of the community over the next five years are specifically documented. The recommended public transit service concept and system are based on an analysis of several alternative schemes. Each alternative was evaluated in terms of estimated costs, revenues, and the mobility needs of the population. The primary concern was limited to short-range improvements which could be implemented realistically over a five year period and which would make maximum use of existing facilities and service providers, whether public or private, and established operating concepts.

42 190108 TRANSPORTATION PLANNING EFFECTIVENESS: TWENTY CASE STUDIES. This document consists of 20 site-specific case studies of urban area experience with the Technical Study Grant Program of the Urban Mass Transportation Administration (UMTA). The objective of the case studies is to determine how the Technical Study Grant Program has contributed to transportation planning effectiveness by impacting local transportation policy and decision-making or guiding capital investments. The case studies employ a standardized format which focuses on transportation planning effectiveness in terms of development of professional planning capability, acquisition of capital equipment, introduction of new or improved service, and altered institutional climate. In addition, this document contains matrices which summarize and compare urban area transportation planning effectiveness, an explanation of the urban area selection procedure, and an appendix, describing the data collection procedure.

42 190162 PROPOSAL FOR TECHNICAL SERVICES SUPPORTING THE SEMTA BUSINESS DEVELOPMENT PROGRAM. This document is a proposal to provide various data analysis and evaluation services in support of the Southeastern Michigan Transportation Authority's (SEMTA's) business development activities. The proposal is focused on SEMTA employment access services to Detroit's Central Business District. The initial efforts of the work program will be to aid SEMTA in developing new business for public transportation services which already serve the Renaissance Center and to assist SEMTA in the definition of additional

transportation services to support the growing demand to this site.

General Motors Corporation EP-77084, Aug. 1977, n.p.:

42 190218 PENINSULA TRANSIT STUDY: SIMPLIFIED TRANSIT SYSTEM PLANNING AND ASSESSMENT PROCESSING FOR LOW DENSITY, SMALL TO MEDIUM SIZED CITIES. The objectives of this research project are (1) to develop simplified processes for relating land use and transit operations and, (2) develop simplified processes for assessing the transportation need of transit-dependent consumers for low density, small to medium-sized cities of 50,000 to 300,000 population. This project was conducted in four phases: 1) Background data collection and mapping; 2) Conduction of bus ridership and household surveys; 3) Application of alternative planning and assessment processes; and 4) Use of simplified processes and procedures for producing an effective public transit system for low density, small to medium-sized cities. The study restricts itself to the examination of particular local problems faced by Peninsula Transportation District Commission (Pentran) and its service area (cities of Hampton and Newport News, Virginia). Since the findings will apply to this local area, generalizations from this study must wait similar findings for other similar areas. This report states that within the Pentran service area, transit ridership depends upon (1) density variation of residential land use; (2) zero and one car households; and (3) low income populations. Due to the density variation and dispersed activity centers, the transit system cannot effectively compete with the car as an alternative transportation mode, but the need of the system remains strong due to transit-dependent consumers. More than 50 percent of the transit trips and, therefore, distribution of non-residential land use has a strong impact on route structuring. This report provides a bibliography. /UMTA/

42 190219 NEW MEXICO PUBLIC TRANSPORTATION DIRECTORY. Public transportation providers in New Mexico are composed mainly of three groups: private companies, non-profit organizations, and publicly-owned systems. The purpose of the New Mexico Public Transportation Directory is to acquaint the general public with the accessibility of transportation by bus, van, taxi, and train. This directory is a comprehensive guide to the transportation services available throughout the state, and it represents an effort to provide social service and governmental agencies with a source of reference to aid in determining future needs, developing programs, and to encourage coordination of existing services. The directory includes urban transit companies, Amtrak intercity rail passenger service, taxi companies. Data presented in this directory has been gathered from various individual state and local agencies and is the most accurate information available as of June 1, 1978. The data is arranged according to the State Planning Office Regional Planning Districts; Regional Planning Agencies for each of the seven districts are also listed. Included in this report are maps of Regional Planning Districts, of Amtrak

and Intercity Bus Routes, and of Taxicab Companies. /UMTA/

42 190228 GUIDELINES FOR UNDERTAKING A NEIGHBORHOOD TRANSPORTATION NEEDS ASSESSMENT. The purpose of this Manual is to present guidelines by which a neighborhood organization or individual citizens can analyse their transportation needs and present their problems to the proper agency so that they will get that agency's attention and a serious evaluation of their problem. The Manual provides instructions, information, sources, and guidelines which may be used by neighborhood organizations to undertake analysis of transportation problems in their area. The main body of this report is subdivided into the three major areas into which most neighborhood related transportation problems fall: transit projects, parking projects, and traffic projects. Typical problems, and a suggested format to solve the problems are contained in each of these three sections. These problems were included because they were identified by neighborhoods as being serious problems and they seemed solvable, if the neighborhoods take the proper approach. Based on a literature review, results from a national questionnaire, and two case studies in neighborhoods (Baltimore and Pittsburgh), the report concludes that the problems discussed in this Manual appear to be the major transportation problems now affecting the neighborhoods in the United States. The Appendixes contain typical forms which can be used to collect data, a list of useful references, a discussion of the field survey which was performed along with the actual survey questionnaires, the warrants for stop signs and traffic signals, an appreciation for other neighborhood transportation problems, and a glossary of terms. /UMTA/

42 190229 IMPROVING URBAN MOBILITY: A DIRECTORY OF RESEARCH, DEVELOPMENT AND DEMONSTRATION PROJECTS IN PUBLIC TRANSPORTATION. The purpose of the Urban Mass Transportation's RD&D Program is to provide information about possible improvements to urban mass transportation systems which communities can use in selecting the best way to deal with their particular transportation requirements. The principle means of providing this information is to publish annually a compilation of reports on the status of UMTA's projects. Research projects are intended to produce information about possi-

ble improvements in urban mass transportation; development projects involve fabrication, testing and evaluation of new equipment, facilities, systems or methods; and demonstration projects introduce, on an experimental basis, new methods, equipment or systems of urban mass transportation into a representative urban environment. This report is a supplement to the 1972 volume, and contains updated descriptions of projects sponsored and funded by UMTA. The project numbering scheme used in this volume was changed in FY 72 and conversion tables from old to new project numbers are provided in the 30 June 72 report compilation, but are not repeated in this supplement. The annual volumes that comprise UMTA's RD&D projects are: "Research, Development and Demonstration Projects, 30 June 72" (this report is an historical record of all projects funded earlier under authorization of the Housing Act of 1961, and is available from the National Technical Information Service, NTIS Order No. PB 213-228), and "Innovation in Public Transportation: A Directory of Research, Development and Demonstration Projects, 30 June 1974" and for fiscal years 1975 and 1976 (three separate reports with the same title), which are also available from NTIS. The annual report for FY 1977 will be available within the near future. /UMTA/

42 190265 SOME ASPECTS OF THE OUTLOOK FOR URBAN TRANSPORT. This paper was presented to the workshop on the future of urban passenger transport in Australia, Canberra, 1978. A major problem confronting transport planning authorities is the continuing low density urban expansion and the accompanying dispersion of travel movements throughout urban areas. Major factors influencing the growth pattern for urban transport demand in Australia are identified to be population, real incomes, real fares, service levels and car ownership, and the implications of these factors are discussed. Demand levels for private motor car transport are expected to increase and patronage levels on public transport are expected to decline less rapidly than indicated by simple extrapolation. In order to better understand the nature of the urban passenger transport task and the problems associated with it, it is important to know the distribution of urban transport demand by mode, time of day and trip purpose. For abstract of a summary report of the workshop see IRRD no. 236740.

42 190522 THE DYNAMICS OF URBAN EVOLUTION. VOLUME I: INTER-URBAN EVOLUTION. The concept of "order by fluctuation," that has appeared recently in physico-chemical and biological systems, is applied to the description of urban growth. It is shown that fluctuations play a vital role in the evolutionary process of urban growth. The evolution of a complex system cannot be known simply by

studying deterministic equations describing the system. It is necessary, in addition, to study the effects of fluctuations, or historical accident, which can drive the system to new modes of behavior. Taking account of both the deterministic elements of urban growth and the appearance of innovations at chance locations in an economic region, a transportation-sensitive dynamic model of the evolution of the organization of urban centers was developed.

42 190769 TRANSPORTATION ISSUES. The Federal Government spends over \$18 billion a year on transportation programs. These programs affect every part of the transportation system including aviation, highways, inland waterways, intercity buses, motor vehicles, ocean shipping, pipelines, rail freight service, rail passenger service, trucking and urban mass transit. This study examines current and emerging issues relating to Federal involvement in transportation. It emphasizes congressional interests and potential congressional needs for GAO assistance.

42 190941 FORECASTING AUTO OWNERSHIP AND MODE CHOICE FOR U.S. METROPOLITAN AREAS. VOLUME II: MODEL EQUATIONS. Volume I of this report describes a multivariate model of auto ownership and mode choice, as well as its use in forecasting 1990 travel behavior, for a sample of 346,000 households and 407,000 workers in the largest 125 SMSAs. Household auto ownership decisions depend on family type and composition, household income, residential location, workplace location, highway and transit service levels, and measures of overall urban spatial structure for each SMSA. Given the number of cars owned and the variables used to explain auto ownership, each worker in the household selects one of five worktrip modes. This volume presents the coefficients of the detailed equations which comprise the models described in Volume I. (Portions of this document are not fully legible)

Kain, JF Fauth, GR Zax, J ; Harvard University, Department of Transportation Final Rpt. DOT/RSPA/DPB50-78/22, Dec. 1978, 194 p.; Contract DOT-OS-30099; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-291373/9ST

42 190959 THE DYNAMICS OF URBAN EVOLUTION. VOLUME II: INTRA-URBAN EVOLUTION. In this report the concept of "order by fluctuation," that has appeared recently in physico-chemical and biological systems, is applied to the description of urban growth. It is shown that fluctuations play a vital role in the evolutionary process of urban growth. The evolution of a complex system cannot be known simply by studying the deterministic equations describing the system. It is necessary, in addition, to study the effects of fluctuations or historical accident which can drive the system to

new modes of behavior. Taking account of both the deterministic elements of urban growth and the occurrence of fluctuations in population in an urban region, a transportation-sensitive, dynamic model of the evolution of the spatial distribution of urban populations was developed. This is the second of two volumes. Volume I presented a model of the evolution of the organization of urban centers.

42 191437 TRANSPORTATION SYSTEM MANAGEMENT: PROMISE, PERFORMANCE AND PROGNOSIS. The report is an assessment of the efficacy of transportation system management (TSM) as both a strategy of transportation system improvement and a philosophy of planning administration. The report summarizes the results of two years of technical and institutional studies conducted by faculty and students at the University of California at Berkeley, but in the form of a policy-oriented executive summary rather than an all-inclusive technical summary. The companion technical reports are referenced. The report is organized into four sections. The first discusses the impetus for TSM and its roots in the recent history of transportation planning and finance. The second section articulates a set of assertions and propositions that are imbedded in the Federal regulations and critiques them in light of the research findings. Section three reaches conclusions about the efficacy of TSM--as both a transportation improvement strategy and a philosophy of public administration. Section four proposes an "idealized" or "model" TSM planning process that responds to the conclusions reached in the previous sections. The various research activities supported by the DOT Program of University Research from September 1975 to December 1977 and covered by this report were conducted under the general title of "Managing the future evolution of the urban transportation system."

Jones, DW Garrison, WL May, AD ; California University, Berkeley, Department of Transportation Final Rpt. DOTRSPA/DPB-50/78/30, Dec. 1978, 43 p.; Contract DOT-OS-50237; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-292447/0ST

42 191438 TRANSPORTATION SYSTEM MANAGEMENT ACTIONS: IMPLICATIONS OF FLEXIBLE WORK HOURS. Strategies to reduce peaking in urban transportation through work rescheduling are a promising element of Transportation System Management (TSM). To date most discussions of work-schedule management have focused on work staggering and the four-day week. This report explores the merit of flexible or variable work hours as a traffic management strategy. It concludes that flextime is compatible with programs that seek to increase bus ridership and carpooling. Flextime also appears promising as a strategy of congestion relief. These conclusions are based on a survey of almost 500 employees of a California State agency which recently adopted flexible work hours. The report

also offers an analysis of the peaking characteristics of travel to and from the San Francisco Central Business District.

42 191608 STATISTICAL ANALYSIS AND GENERATION OF DRIVING CYCLES FROM THE ST. LOUIS HEAVY-DUTY CHASE-CAR DATA. This report presents a summary and documentation of the work performed under EPA Contract NO. 68-03-2429 entitled "Statistical Analysis and Generation of Driving Cycles from the St. Louis Heavy-Duty Chase-Car Data". Program Objectives were successfully met with a statistical analysis of the driving patterns of 70 trucks and 5 buses, the development of driving cycles representative of various categories of operational data, and a comparison of the St. Louis and CAPE-21 data bases to help validate the assumption that the CAPE-21 cities, New York City and Los Angeles, represent extremes in heavy-duty vehicle speed patterns.

42 191660 THE IMPACT OF BART ON LOCAL TRANSIT SERVICE AND FINANCIAL POLICY. The paper assesses the public policy impacts of BART on existing and planned local transit service and its financing in the three BART counties in the San Francisco Bay Area. Three specific policy areas were considered: (1) The impact of BART on changes in service, routes, fare, transfer and personnel policies of existing local transit operators; (2) the impact of BART on the creation of new local transit systems to provide feeder service to BART as well as local transit service; (3) the impact of BART on changes in State, regional or local policies for financing local transit service.

42 191682 FORECASTING AUTO OWNERSHIP AND MODE CHOICE FOR U.S. METROPOLITAN AREAS. VOLUME 1. The report describes a multivariate model of auto ownership and mode choice, as well as its use in forecasting 1990 travel behavior, for a sample of 346,000 households and 407,000 workers in the largest 125 SMSAs. Household auto ownership decisions depend on family type and composition, household income, residential location, workplace location, highway and transit service levels,

and measures of overall urban spatial structure for each SMSA. Given the number of cars owned and the variables used to explain auto ownership, each worker in the household selects one of five worktrip modes. The research advances the field of travel demand forecasting by considering auto ownership and mode choice behavior in a large number of metropolitan areas; by quantifying how metropolitan land use patterns affect auto ownership and use; by documenting the influence of racial discrimination on black household behavior; and by analyzing walk to work trips. The 1990 projections indicate that increases in household income will have the most significant impact on urban travel behavior, with changes in household composition and size and land use patterns having smaller effects.

Kain, JF Fauth, GR Zax, J ; Harvard University, Department of Transportation Final Rpt. DOT/RSPA/DPB50-78/21, Dec. 1978, 186 p.; Portions of this document are not fully legible. See also Volume 2, PB-291373; Contract DOT-OS-30099; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-292873/7ST

42 191689 CHARACTERISTICS OF URBAN TRANSPORTATION DEMAND; A HANDBOOK FOR TRANSPORTATION PLANNERS. The handbook is intended to guide transportation planners, engineers, and decision-makers in: assessing demands for urban, highway, and transit systems; applying and validating conventional transportation planning techniques; and establishing sound transportation planning decisions. It contains characteristics of urban bus, rail, and highway systems, and urban trip-making. The handbook may be used to compare travel parameters for a given community with those in other cities, thereby providing a basis for cross-checking and refinement. As part of the Urban Transportation Planning System (UTPS) of UMTA and FHWA, it provides basic inputs to the urban transportation planning process as well as ways of checking the results for reasonableness and relevance.

Levinson, HS ; Smith (Wilbur) and Associates, Urban Mass Transportation Administration, (UMTA-IT-06-0049) UMTA-IT-06-0049-79-1, Apr. 1978, 129 p.; See also report dated Feb 77, PB-265 830.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-293220/0ST

42 191758 EXPLANATORY MODELING OF TRANSBAY TRAVEL CHOICE. The 71-mile Bay Area Rapid Transit (BART) System, serving San Francisco, Oakland, Berkeley, and their suburbs, is the first regional-scale rapid transit system to open in the United States in over 50 years. The report analyzes the reasons underlying BART-bus and BART-automobile travel choices in the key transbay travel corridor linking San Francisco and Oakland. Travel modes are defined in terms of 14 service attributes including quantifiable attributes such as travel time and cost, and more difficult-to-quantify attributes such as dependability and safety. Disaggregate models which relate mode-choice probability to perceived satisfaction with the alternative modes are estimated using data for the 14 attributes collected by semantic differential scales. Several different models are estimated and compared for BART-bus and BART-auto choices, for work and nonwork trip purposes, for geographic stratifications of the data, and using linear and logit

functional forms. The models provide convincing explanations of mode choice behavior and show that travel time and travel time-related attributes such as dependability and flexibility are the dominant determinants of choice.

42 193388 SADAT CITY: TRANSPORTATION PLANNING FOR MAJOR NEW TOWNS IN DEVELOPING COUNTRIES. Sadat City, Egypt is a new town planned on the edge of the Nile Delta halfway between Cairo and Alexandria with a population possibility of one million people. The preliminary planning phase has just been completed, and transportation considerations were among the major determinants of location, macroform, and the detailed physical plan. The overall city plan calls for relatively high density and compact shape—which will make all activities readily accessible, reduce total trip distances, and increase the potential for short walking and cycling trips. At a population of 500,000, the city's public transportation system is designed to operate buses within exclusive rights of way. The proposed transitways can be

operated efficiently through a wide range of traffic loads, which gives the system excellent staging characteristics and the flexibility to respond to natural traffic growth and to unforeseen patterns of development.

42 193389 CAN TRANSPORT POLICY DECISIONS CHANGE URBAN STRUCTURE?. It is generally believed that compact cities, such as typically found in developing countries, require comparatively little motorized travel, since more opportunities in them are within walking distance. This belief can easily lead to the conclusion that changing dispersed cities into compact ones would result in less motorized travel and gasoline savings. In an effort to prove or disprove such an assumption, this paper compares the relationship between population density and automobile use in six cities in the United States with that of six cities in developing countries. The comparison was made in terms of population, area, and number and length of person and auto trips. Contrary to popular belief, it was found that the actual car trip rates are significantly higher in cities in developing countries than in U.S. cities despite the higher population density and compactness of the former. Although the examples are limited, it is evident there may be other interpretations than the conventional ones to explain travel patterns and behavior in different cities.

42 193395 TRANSPORTATION NEEDS IN DECLINING URBAN AREAS. The speaker expressed concern about the fact that most highway builders and transit operators favor the multi-billion dollar facilities that are proposed in the long-range transportation plans of most older metropolitan areas. He argued that efficiency calls for getting more out of existing system capacity and de-emphasizing new construction. He cited three areas for emphasis in developing an efficient transportation plan: improvement of mobility of the transit dependent population; better use of existing transportation facilities including consideration of street use pricing and ramp metering; and improvement of compensation (incurred by transportation development) for poor cities and poor people.

Krumholz, N (Cleveland Department of Community Development) *Transportation Research Circular* No. 199, Feb. 1979, p 14; ORDER FROM: TRB Publications Off

42 193396 COPING WITH REALITY: TRANSPORTATION PLANNING IN THE 1980'S. The speaker prefaced a discussion about transportation planning in the 1980's with a profile of transportation systems and community dynamics experienced since the 1950's. He then examined the federal role and emerging state and local roles in that regard. He concluded by saying the major goal for the 1980's should be to achieve cost efficient, energy efficient, high urban density by directing the stream of new growth into infill areas. "However, he urged that this goal must be achieved gradually and realistically because of the

attachment most Americans have to their automobiles, resulting from the pattern of suburban scatteration that began over two decades ago.

42 193476 TRANSPORTATION POLICIES, PROGRAMS, AND PRIORITIES: QUESTIONS OF EQUITY, EFFICIENCY, AND REVITALIZATION OF CITIES. Among the issues addressed in the discussion are: the existence of a pluralistic society precluding discovering which of several courses of action is the "right" one (since each alternative will affect different segments of the population differently); revising the definition of efficiency so that land-related impacts (positive and negative) be included in calculation of costs and benefit; and the need for planners to examine whether by their actions some individuals have been deprived of their constitutional rights) especially regarding travel and mobility.

42 193608 TRANSIT SERVICE OPTIONS FOR SMALL CITIES. The purpose of this guide is to develop an awareness and understanding of the potential afforded by transit services and to begin to apply this toward the development of methods for continuing creative, unique resolution and use of transit services in small cities. It is not a guide to transit design; rather, it is a guide to the options to be used in such designs. Its scope is to define and expand on the use and meaning of transit in order to stimulate ideas for transit services that are innovative and at the same time, relevant and practical. The guide is divided into three major sections: the need for transit services in small cities, the various options available for each of the major components of transit service, and the selection process for transit service options.

42 193610 APPLICATIONS OF BEHAVIORAL SCIENCES TO ISSUES IN TRANSPORTATION PLANNING. This paper investigates the potential for applying methods and concepts in the behavioral sciences to transportation planning. A review of recent trends in transportation planning shows increasing concern for more policy-sensitive and behavioral approaches. Some behavioral science methods, particularly from sociology, psychology, and social psychology, have been used to date in transportation. A brief summary of issues in 4 content areas (short-range transit operations, transportation for mobility limited, environmental and social impact analysis, and energy) shows that certain elements from the behavioral sciences

have (or may be) proved useful in understanding these issues. Particularly strong bonds now exist between the disciplines in attitude theory and measurement, behavior, and attitude-behavior linkages. Other potential areas are life style and family, culture, human factors, group dynamics, and certain methodologies. The paper concludes that interaction between transportation and the behavioral sciences should be encouraged and established at numerous methodological and conceptual points. /Author/

42 193618 FUTURE DIRECTIONS FOR PUBLIC TRANSPORTATION: A BASIS FOR DECISION. This report is a long range planning study that was prepared to assist the Urban Mass Transportation Administration (UMTA) in its planning to meet the mobility needs of the American population in the coming decades. The authors have identified a number of important societal forces and considered reasonable scenarios based upon those forces, with particular attention to the implications for the mobility of people in the public sector. Based upon considerations of (1) population growth and dispersion, (2) energy costs and availability, (3) technological advances, and (4) economic conditions, the report concludes that urban decentralization is likely to continue through the year 2000. Therefore, UMTA must accept and support to a greater extent than presently innovative uses of the automobile and paratransit modes as the most efficient mode for most urban area trips. At the same time, existing conventional transit systems in dense areas must continue to be supported. But a major opportunity exists for UMTA to support a total efficient transportation system in a low-density environment. This report provides conclusions and recommendations for future UMTA policy decisions as well as a list of references. /UMTA/

42 193710 PERSPECTIVES ON THE EVALUATION OF URBAN TRANSPORTATION SYSTEMS. The term evaluation is very broad and has different implications for different people: An evaluation can be designed only after it is specified who is evaluating for what purpose against what criteria. The different perspectives of some of the more important actors are discussed here. There is a difference between comprehensive evaluation and functional evaluation. Comprehensive evaluation is concerned with external effects, e.g., pollution, energy consumption, evolution of land-use patterns, and other contributions to the quality of life. Functional evaluation is concerned with system performance parameters, e.g., wait times, coverage, productivity, ridership, and the other variables that characterize the supply characteristics and their appropriateness to the markets served. Two primary conclusions are developed. The first is that intelligent interpretation of an observed set of system descriptors requires a knowledge of the

ridership pattern being served. Both potential productivity and service level are sensitive to ridership pattern, and without a knowledge of its nature, other comparisons are uncertain. The second is that the equilibrium between supply and demand is unstable. This implies that an observed trend in ridership will, in the absence of external change, probably continue. Thus the rate and direction of change in ridership is the single most important evaluative measure, because it portends the future of the system and can be an early warning signal of a need for change. /Author/

42 193934 STRUCTURAL MODELS FOR THE ANALYSIS OF TRAVELLER ATTITUDE-BEHAVIOUR RELATIONSHIPS. Traveller attitudes and behaviour have been shown to correlate in numerous previous studies. However, the correlation by itself leaves open the nature of the interrelationships between traveller attitudes and behaviour. For example, attitudes could either cause or be caused by behaviour. In fact, both options are concurrently possible. Structural equations are applied to a set of data gathered from Los Angeles central business district workers to ascertain the direction and nature of interrelationships between attitudes and behaviour with respect to frequency of taking the bus to work. A mutual dependence between attitudes and behaviour is demonstrated in the context of this dataset and behavioural choice situation; behaviour and attitudes concurrently cause each other. In addition, it is found that two attitudinal components, perceptions of and affect toward a mode, function differently with respect to travel behaviour.(a) /TRRL/

42 194154 TRANSPORTATION SKETCH PLANNING REPORT. This report describes the sketch planning undertaken to give planners and decision makers an overview of the range of transportation options for the Houston area up to 1995, including intensive citizen involvement in each aspect of the planning process. The citizens groups contributed ideas regarding Houston's residential and employment growth patterns, established criteria, and generated and selected alternatives; while the staff had responsibility for technical input to the citizens and the more in-depth analysis of the travel demand resulting from the population and employment scenarios. Citizens were generally in agreement on the nature of the system, important corridors, and an incremental development approach. An important characteristic of this type of planning is that it creates a forum for citizen input and increasing confidence in the chosen set of priority corridors. It also precluded premature conclusions about "optimum" long-range plans by forcing planners to keep a broad perspective of the transportation options. The variety of citizen concern left no doubt that all potential solutions should be analyzed.

Houston Office of Public Transportation
TX-9-0066.4, July 1978, v.p., Figs., Tabs., 8 App.

42 194156 125TH STREET CORRIDOR TRANSPORTATION STUDY. The justification and purpose for the analysis and planning of the 125th Street Corridor are clear: the Corridor is the heart of one of the City's major communities-Harlem. This report attempts to analyze the assets and weaknesses of the Corridor and to propose strategies towards strengthening its roles as Harlem's principal "downtown" and one of this City's key commercial Districts. While specific proposals are directed towards the improvement of existing transportation systems, the underlying patterns of human activity are of primary concern. Transportation is viewed as a servant system by which the major social and economic goals of the community can be effected. Therefore, the report isolates, as far as possible, the major developmental issues within the community in order to ascertain their implications for future transportation needs. Of the many dimensions inherent in this analysis, one is more useful in describing the existing state of affairs than time. The study of the roots of a community is crucial both to the evaluation of the present and

to the formulation of policy for the future. The report includes a brief historical profile and a sketch of the forces which have shaped the economy of Harlem. /Author/

42 194164 CHARACTERISTICS OF URBAN TRANSPORTATION DEMAND--A HANDBOOK FOR TRANSPORTATION PLANNERS. This report is a handbook which can be used by urban transportation planners in estimating the various components of urban transportation demand. It contains characteristics of urban bus, rail, and highway systems, and urban trip-making. A part of the Urban Transportation Planning System (UTPS) of UMTA and FHWA it provides basic inputs to the urban transportation planning process as well as ways of checking the results for reasonableness and relevance. It also complements the previously distributed UTPS handbooks: Characteristics of Urban Transportation System (CUTS) is available on the UPS distribution tape and from NTIS as PB 233 580/AS and Traveler Response to Transportation System Changes Limited copies available from FHWA (HHP-22) or from NTIS as PB 265 830/AS. This handbook is being distributed to State DOT's, MPO's and transportation libraries and will be distributed on the UTPS tape in the future. It will be available from NTIS by Project No. UMTA IT-06-0049-78-1. An Appendix to the CUTD handbook offers detailed data on individual cities, roads, routes, stations, etc. These are not in a form that is comparable from place-to-place but may be of interest from an historical perspective for the urban areas concerned. The Appendix is available only from NTIS as Project No. UMTA IT-06-0049-78-2. /UMTA/

42 194180 CANADIAN URBAN TRANSPORT RESEARCH INFORMATION STRUCTURE AND DATA BASE-PHASE 1. This is the product of the first phase of a project to establish a structured Canadian Urban transportation data base and improve primary data sources and reporting mechanisms. This first phase established the content and format of the data base and developed a suitable Urban reference zone system and Urban transportation level-of-service indicator. The report details data presentation, demographic and transportation data presentation, and data sources. The data will be presented at 3 levels of spatial disaggregation in each city: entire Urban area, which is divided into core frame and fringe areas, which are divided into reference zones. A discussion of urban level-of-service indicators covers the combination of "accessibility" and "personal reference", the application of the proposed accessibility index, and the personal reference factor. The implementation of the data base is discussed in some detail.

Lea (ND) Associates, Limited TP 1819, Oct. 1978, v.p., Figs., Tabs., 7 Ref., 1 App.; Prepared by N.D. Lea and Associates for the Urban Transportation Research Branch, Canadian Sur-

face Transportation Administration, Transport Canada.

42 194182 URBAN MASS TRANSIT IN ARIZONA: ITS PAST AND ITS POTENTIAL. Within Arizona, only Phoenix and Tucson provide public mass transit service. In each city a substantial part of the operating costs of the bus system is provided by government funds. Both cities face the problems of extended Urban areas, low population density, and low utilization of their bus systems. Tucson's public transportation history is briefly described as an example of the complex problems inherent in providing mass transit in a middle sized, sprawling city where the private automobile is not only the dominant travel mode but a symbol of a way of life. System management and performance is described and passenger response to increased service and fares is discussed. Fare increases succeeded in raising total revenue from 17% of operating cost during 1975-76 to 26% during 1977-78. The community benefits of public transportation are outlined, and policy suggestions are presented. The suggestions include: constant review and adjustment of the route system; reduce peak hour travel without losing total passengers (by for e.g. offering student and reduced fare service during off-peak hours); use portion of student fees allocated to parking lots to cover bus passes--thus reducing University of Arizona traffic and congestion; substitute low-cost subscription service for a direct subsidy; establish more express buses; and construct safe, comfortable shelters.

42 194408 RURAL TRANSPORT AND COUNTRY PLANNING. PROCEEDINGS OF THE CONFERENCE HELD AT THE UNIVERSITY OF NOTTINGHAM IN MARCH 1977. The four parts of this book cover many aspects of rural transport and country planning, from the broad social needs, through aspects of structure plans and the economics of rural transport operation to the new experiments which are now emerging. In Part 1: Rural development policy and public transport, the needs of rural communities are considered, together with the place of public transport in structure plans covering rural areas. A case study of rural transport policy in the Netherlands presents a comparison with the British situation.

Part 2: Rural transport policy and finance highlights the economic and future policy issues involved in providing rural passenger transport services. Part 3: Public transport operation in rural areas examines the priorities for public transport in the transport policies and programmes and considers the coordination of rural transport and the place of rural rail services. Part 4: New rural transport techniques deals with the various experiments which are being carried out or are proposed in order to attempt to develop new methods of providing rural transport, including the possibilities of smaller buses, part-time drivers, amended routing and timings, and the modification of the controlling legislation. /TRRL/

42 194459 DETERMINANTS OF TRAVEL CHOICE. The book provides a comprehensive introduction to the subject of the determinants of travel choice and is intended to form a starting point for future research in this area. The following chapters discuss the subject: (1) The transport determinants of travel choices: an overview (Goodwin, PB and Hensher, DA); (2) Economic theories of travel choice, (Dalvi, Q); (3) Behavioural dimensions of travel choice, (Heggie, IQ); (4) Behavioural analysis of travel and activity choices, (Stoner, J and Milione, V); psychological measurement of travel attributes (Louviere, J); (6) Issues in the estimation of journey attribute values, (Daly, AJ); (7) Valuation of journey attributes: some existing empirical evidence, (Hensher, DA); (8) Destination choice and travel attributes, (Jones, PM); (9) Travel choices for recreational journeys, (Vickerman, RW); (10) Improved multiple choice models, (Daly, AJ and Zachary, S); (11) Travel choice and time budgets, (Goodwin, PB); and, (12) Concluding comments, (Dalvi, Q and Beesley, M). /TRRL/

Saxon House, Teakfield Limited, (0 566 00184 5) Monograph 1978, 394 p., 25 Fig., 23 Tab., Refs.; ACKNOWLEDGMENT: TRRL (IRRD 237995)

42 194888 A GUIDE TO COMMUNITY TRANSPORT. This book discusses the concept of "community transport", defined as the use of volunteer, unpaid drivers to organise and operate a rural public transport service. The intention of the book is to give practical advice and information to enable local communities to evaluate the options available to run such a service. The two main forms of community transport discussed are social car and community bus schemes: chapter 1-first steps, discusses the basic options available, while chapter 2-community bus services, and chapter 3-social car schemes, discuss these services individually. The appendices give brief details of planning a flexibly routed bus service, instructions for driver and controller, and traffic commissioners requirements. /TRRL/

42 194898 TRANSPORTATION SYSTEM MANAGEMENT: TSM-TYPE PROJECTS IN SIX SELECTED EUROPEAN COUNTRIES. The report provides an inventory and analysis of

156 projects in Denmark, France, West Germany, the Netherlands, Sweden and the United Kingdom. Transportation system management (tsm) is concerned with strategies that make the most efficient use of existing transportation systems by means of low cost improvements. The following eleven classes of strategy were considered: paratransit, parking control, pedestrian/bicycle priority treatment, pricing, traffic engineering techniques, traffic restraint, transit management and marketing, transit operations, goods movement, work schedule. The study procedure is described: a literature study, initial contacts and identification of projects, completion of inventory forms, visits and interviews in the six selected countries. The projects identified are reviewed and the characteristics of the projects for each of the selected countries are described. Each of the eleven strategies is considered separately. In addition, references classified according to strategy class and subdivided between the six countries, are listed. /TRRL/

42 194968 DEMAND ORIENTATED PASSENGER PUBLIC TRANSPORT POLICY [Nachfrageorientierte Personennahverkehrspolitik]. The supply of public passenger transport should in future be improved both as regards quantitative and qualitative demands. This applies also to the introduction of new transport technology. The number of public transport passengers shows a downward trend. In competition with private cars, public transport can only succeed if comparable conditions are obtained. This is a question of covering costs where this is possible. Where no private of private sector alternative is available, the introduction of public transport is essential to ensure a minimum availability of means of transport. [German]

42 195412 EFFECT OF POPULATION DENSITY CHANGES ON TRANSIT RIDERSHIP. This report is to be considered as a companion piece to the report titled An Analysis of Transportation Planning Effectiveness. (Ref. 1) In that report the impact of Technical Standards and Capital Grant monies on planning effectiveness is analyzed. Among other findings, that report found that the average annual increase in transit system ridership relates directly to increased capital acquisitions. But, as an adjunct to the study, it was also found that no relationship existed between increased transit ridership and increased population densities. The purpose of this companion document is to examine more closely that one issue only, the relationship between transit system ridership and population density. The results of this study indicate that a positive relationship between transit ridership and population density growth, in fact, does exist. /Author/

42 195465 TRANSPORT AND PUBLIC POLICY: PAPERS AND DEBATE, VOLUME 2.

This document contains the papers presented at a transport policy symposium, together with the contributions to the ensuing debate on each paper. The papers presented were as follows: Car Ownership Forecasting, (Beilby, MH and Walker, MBA) Which Looked at the Questions Posed on the Consultative Document on Transport Policy Issued by the Government in 1976 and at the Technical Side of the Forecasting Methods. It attempts to answer the question, "is the present method of traffic forecasting sound and fair?" Accessibility in the Design of Local Transport Policies, (Benwell, M), which discusses the recent changes that have taken place in transport planning, and outlines the potential applicability of an accessibility framework for the development of techniques appropriate to normative transport planning. Options for Public Transport Policy in Rural Areas, (Knowles, RD), which discussed rural transport services as related to policies put forward by successive governments, and suggests what are considered to be available alternative options as solutions to rural problems. Superstores, Shopping Trips and Public Policy in Great Britain, (Thorpe, D), which describes the impact of such stores on shopping patterns, and the locational impact of a superstore as related to the catchment zone and changes in social behaviour. A Reaction to the Government White Paper on transport, (Taitz, L), in which it is suggested that the white paper fails to recognise that the essential issues of transport are environmental and social, not economic, hence the failure of economists to make sense of them. It is argued that in the long run, the decisions on transport are going to have to be made on social and political grounds, and not economic ones. A summary of government white paper decisions is given in an appendix. /TRRL/ Williams, AF, Editor ; Birmingham University, England Monograph 1977, 94 p., Figs., Tabs., Refs.; Proceedings of a Symposium on Transport and Public Policy, Aston University, Birmingham, September 1977.; ACKNOWLEDGMENT: TRRL (IRRD 240439)

42 195466 TRANSPORTATION AND TRANSPORT RESEARCH. FUTURE DIRECTIONS [Transporter och transportforskning. Ett framtidsperspektiv]. The aim of this study is to provide a basis for the long term direction of R&D work within the Swedish transport research delegation in the field of transportation. The report contains the following chapters: (1) Transport Systems and Society--An Introductory System Outline, (2) the Present Transport Systems and Problems: Passenger Transport, Freight Transport, Side Effects of Transport Systems, Financing and Transport Policy, (3) Alternative Developments of the environment of transport systems, (4) Technical Development Within the Field of Transportation, (5) Plans and Trends Within the Field of Transportation, (6) Transportation Research Management and (7) Problem and Research Areas. /TRRL/ [Swedish]

42 195475 THE EFFECTS OF DIFFERING LEVEL OF SPATIAL MOBILITY: A DISCUSSION. This paper reports the initial stages of a study of the impact of differing levels of spatial mobility upon various sections of the population and is based on a review of the literature relevant to the social dimension of the urban transport problem. A conceptual framework for studying mobility is outlined but the difficulty of defining operational measures is emphasised. A summary follows of the principal results of empirical studies which have sought to describe variations in mobility in the population and their effects on both trip-making behaviour and activity patterns. Relevant social, economic and physical trends are discussed and conflicting views of the value to society of increasing mobility are presented. This leads to an assessment of the objectives and policies which might be pursued in approaching the social aspect of the urban transport problem and of the planning process necessary for devising suitable policies.(a) An earlier version of this paper was read at the Annual Conference of the Universities Transport Study Group at the University of Surrey, January 1975. /TRRL/

42 195479 FACTORS AFFECTING PUBLIC TRANSPORT PATRONAGE. THE PROCEEDINGS OF A SYMPOSIUM HELD BY THE TRANSPORT AND ROAD RESEARCH LABORATORY, LIVINGSTON, 14 JUNE 1977. The main objective of the symposium was to review the current state of knowledge in this field, and to examine the implications for transport policy. A further objective was to inform delegates more fully about relevant TRRL activities. This report contains the papers given to the symposium, together with summaries of the discussion for each session. The papers were as follows: The need for an understanding of the factors which affect travel by public transport (Stirling, WN); Methods of estimating passenger response to operational and fares changes (McTavish, AD); passenger response to service factors (White, PR); NBC studies of patronage and travel demand factors (Kilner, AA); studies of Scottish operations (Stark, DC); Passenger response to changes in public transport-an overview (Bly, PH); Some implications of the results of elasticity determinations (Webster, FV). /TRRL/

42 195497 INTERNATIONAL COLLABORATIVE STUDY ON FACTORS AFFECTING PUBLIC TRANSPORT PATRONAGE. The aim of this report is to collect and evaluate Swedish experiences from studies of factors affecting public transport patronage and to analyse factors affecting travel patterns and modal choice

in urban areas. Development trends in urban areas and domestic travel are described together with a general framework of factors affecting travel consumption in a 40-year context. Four different methods of analysing travel behaviour are discussed and aggregated and disaggregated models are compared. Results from Swedish cross-sectional studies are presented. An analysis of different factors such as modal choice and demand elasticities is performed. This analysis comprises disaggregate studies using the logit model and studies based on aggregate data (a car ownership model and a transportation market-equilibrium model-trama). The interdependence between urban structure and travel pattern is analysed by means of three different sensitivity studies. The first of these studies uses the ic-s-model, based on a combined cross-sectional and time-series data set. The two following sensitivity studies utilize the trama-model as a tool for evaluating travel pattern in different urban structures. /TRRL/

42 195527 A RATIONAL ASSESSMENT OF TRAVEL DEMAND THROUGH INTEGRATION OF PHYSICAL AND TRANSPORTATION PLANNING OBJECTIVES: CASE STUDY OF MADRAS METROPOLITAN AREA. The conventional four stage modelling process to determine the travel demand primarily developed in the West, relates the existing travel pattern to the prevailing socio-economic and land use characteristics to forecast the travel demand. The procedure suffers from certain basic limitations in not reflecting the rapid socio-economic changes taking place in the Indian situations and also not incorporating the planning objectives stipulated for the perspective land use plan. It is felt that substantial modifications and moderations are needed at various stages for assessing travel demand under Indian situations. The Madras metropolitan plan envisages a ring and radial pattern of transportation system. Six urban nodes are proposed to be developed with varying socio-economic and land use characteristics providing a high degree of self-containment to reduce the travel demand for work, shopping, recreation and other facilities. In estimating travel demand for Madras metropolitan area the conventional process is moderated to suit the specific situation of relating physical planning objectives to transportation planning process. /TRRL/

42 195539 THE VALUE OF TIME: SOME IMPLICATIONS FOR URBAN ANALYSIS. This study investigates how the different valuations that individuals put on travel time savings can best be treated in urban and transportation evaluation models. An essential distinction is drawn between two concepts imbedded in the term 'value of time'. One of the assumptions underlying the utility maximising derivation of travel time values is shown to be inapplicable in practice in Great Britain. The effect of differential wage rates on travel time values is explored but is

found to be less important than that of differential working hours. This influences residential location patterns in the conurbations. The necessity for a parallel theoretical treatment of time and money is outlined. Some contemporary issues are discussed to illustrate the importance for planning policies of time spent on travel.(a) /TRRL/ Williams, I *Martin Centre Transactions, URBAN STUDIES, UNIVERSITY OF CAMBRIDGE* Vol. 3 1978, pp 259-300, 5 Tab., Refs.; Transactions of the the Martin Centre for Architectural and Urban Studies, University of Cambridge.; PERFORMING AGENCY; ACKNOWLEDGMENT: TRRL (IRRD 240318)

42 195619 PASSENGER TRANSPORT. This paper, published by the American Public Transit Association, is the weekly publication of the transit industry. This issue contains articles of national interest in areas such as: allocation of fuel for public transit, President Carter's transit budget, and appraisal of Transbus. It also contains several articles concerning transit issues of local importance in various major population centers in the United States and Canada.

42 195874 TRANSIT NEEDS ANALYSIS VOLUME I: TRANSIT NEEDS ASSESSMENT, APPENDIXES. The St. Louis Mass Transit Program was undertaken to determine if an improved regional transit system is needed; it is directed at the mobility requirements of the total population. Special emphasis was given to travel characteristics and need of transit-dependent persons. This report, Volume II, provides a detailed description of the methodology employed in the analysis. The appendixes are as follows: A-Definition of Terms; B-Review of nationwide research on latent demand and transit-dependency; C- Detailed analysis of existing St. Louis travel data with regard to identifying regional transit service needs; D- Key person community survey results; E-Results of transit-dependent survey; F-Estimates of persons in autoless household (for 1985) and supplemental tables; G- Summary of literature review, with annotated bibliography. Volume I titled "Transit Needs Analysis, Volume I: Transit Needs Assessment" (UMTA-IT-09-0067-79-4) describes the transit needs analysis, including total transit needs and mobility needs of transit-dependents. "Volume II: Procedural Manual" (UMTA-IT-09-0067-79-6) consists of procedures use in analysis of existing data sources, in transit-dependent survey, and in key person community survey. Other reports of this study are: "Mass Transit Program for Saint Louis Metropolitan Area" (UMTA-IT-09-0067-79-7) defines a 1985 Mass Transit Program for the area and consists of an expanded all-bus system with the addition of Freeway Bus Service and Park-Ride facilities in eight corridors; and "Public Acceptance Plan" (UMTA-IT-09-0067-79-8) basically describes the need to promote and sell public mass transportation. /UMTA/

42 195875 TRANSIT NEEDS ANALYSIS VOLUME II: PROCEDURE MANUAL. After ten years of serious consideration of some type of steelwheel-steelrail public transit improvements, the conclusion was reached that for the foreseeable future buses operating on existing streets and highways with certain modifications are the most cost-effective means to meet this region's transit needs. Attention is now focused on financing existing transit service and the improvement proposals made in this report. This volume, Volume II, provides a description of the methodology utilized in the analysis, and it is intended to provide guidelines for other urban areas. This volume consists of procedures employed in the transit dependent survey, in transit analysis of existing data sources, and in the key person community survey. In addition, Volume II includes four appendixes. The first two appendixes present the survey instruments used in both the transit dependent and the key person community surveys. Appendix C details the survey manual used to train interviewers for the transit-dependent survey, and Appendix D describes the community participation program. Other reports of the Mass Transit Program are: "Volume I: Transit Needs Assessment" (UMTA-IT-09-0067-79-4); "Volume I: Transit Needs Assessment, Appendixes (UMTA-IT-09-0067-79-5); "Mass Transit Program for the Saint Louis Metropolitan Area" (UMTA-IT-09-0067-79-7); and "Public Acceptance Plan" (UMTA-IT-090067-79-8). /UMTA/

42 195886 PUBLIC ACCEPTANCE PLAN. Public transportation in the St. Louis area will be buses on the local streets and highways for the next 10-15 years. The improvements suggested in this Mass Transit Program are modest and designed to strengthen the existing bus service. This brief report reflects the view that the need for a public acceptance plan is not to try to promote and sell major transit improvement to the public, but to promote and sell public mass transportation with the relatively modest improvement which have been recommended and to gain support for the necessary financing. The report identifies and very briefly describes the five basic themes that comprise the public acceptance effort, namely; public transportation as a Public Service; Efficient Operation; Improvements in Service; Environmental Improvements; and Equity of Service. Other reports of the St. Louis Mass Transit Program are: "Transit Needs Analysis, Volume I: Transit Needs Assessment" (UMTA-IT-09-0067-79-4); "Transit Needs Analysis, Volume I: Transit Needs Assessment Appendixes (UMTA-IT-09-0067-79-5); "Transit Needs Analysis, Volume II: Procedural Manual" (UMTA-IT-09-0067-79-6); "Mass Transit Program for the Saint Louis Metropolitan Area" (UMTA-IT-09-0067-79-7). /UMTA/

42 195944 DEVELOPMENT OF AN EVALUATION FRAMEWORK FOR TRANSPORTATION SYSTEM MANAGEMENT STRATEGIES. The overall purpose of this project was to develop a framework for the evaluation of Transportation System Management (TSM) strategies. The general intent of the research was to conduct a practical framework which can be easily integrated into the current urban transportation planning process and which can also be adapted to previously established institutional arrangements with medium-sized metropolitan areas. For this, a systems analytic approach was applied to build the specific components which must comprise the framework. Based on this approach, six specific tasks were undertaken to construct such a framework: 1) the identification of specific transportation objectives which can be achieved through various TSM strategies; 2) the construction of a set of TSM performance measures or measures of effectiveness to monitor the performance of TSM strategies; 4) the development of a decision rule which when given the TSM objectives, measures of effectiveness, and strategies, can be used to evaluate overall performance of TSM strategies; 5) the testing of monitoring techniques for various TSM strategies; and 6) the development of an information system for the collection, retention, and retrieval of TSM information. In order to test this framework, a case study of TSM evaluation within the Omaha-Council Bluffs Metropolitan Area was undertaken. Based on the review of other TSM elements and this case study, an implementation program for the framework was proposed. This program includes the identification of the evaluation tasks, an identification of the specific roles for each implementing agency and Metropolitan Planning Organization, and a recommended TSM information system which encompasses data generation, data retention and retrieval, and data transmission. /UMTA/

Lima, PM McCoy, PT Jepsen, SR ; Nebraska University, Lincoln, (NE-11-0001) Final Rpt. UMTA-NE-11-0001-79-1, Aug. 1978, 177 p.; Sponsored by the Urban Mass Transportation Administration.; Contract NE-11-0001; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS; PB-295023/AS

42 195945 TRANSPORTATION SYSTEMS MANAGEMENT ELEMENT. Transportation Systems Management (TSM) denotes a process designed to increase the efficiency of existing transportation facilities and resources by implementing low-capital measures which reduce the need for major capital improvements. In addition to fiscal economy, the TSM process insures that meaningful steps can be taken toward attaining broader local and national goals, which include: energy conservation; environmental improvements; equity for transit dependents; and urban preservation. Several factors strongly influence the conception of the TSM planning process. First, TSM must be an integral part of some overall scheme or approach to transportation planning in the region. Second, in order to be successful, TSM planning must conform to a key set of attributes or requirements. Third, and most

important, the process must effectively generate results, because the process itself is not the end product. TSM planning must produce projects designed to meet preconceived goals and objectives in the most cost-effective and publicly acceptable manner. This report documents the TSM planning process in the St. Louis, Missouri region, and includes TSM goals and objectives, planning programs, projects and concepts, and project monitoring. A part of this document sets the stage and direction for future TSM planning for this area. /UMTA/

Sterman, L Schold, S Ferris, B ; East-West Gateway Coordinating Council, (EWG-LS-0377.10.0) Final Rpt. UMTA-MO-09-0014-79-1, Mar. 1979, 112 p.; Sponsored by the Urban Mass Transportation Administration.; ACKNOWLEDGMENT: UMTA, NTIS; ORDER FROM: NTIS; PB-295349/AS

42 195962 REDEFINING THE SCOPE OF TODAY'S TRANSPORTATION PROBLEMS. Because of current fiscal restraints, transportation planners must revise their concept of transportation needs to include only those projects which are essential. Transportation needs studies should focus mainly on identifying near-term (up to five years) problems (i.e. project-related problems within a planning period for which fiscal resource projections can reasonably be made). This article describes a study by the Illinois Department of Transportation which worked under this assumption. The study evaluated the highway system, public airports, and the public transportation system in the metropolitan areas. Although a year 2000 horizon was chosen, the study emphasis is on projects required now to solve transportation problems, as well as on those required during the next five years.

42 195964 SENSITIVITY ANALYSIS OF SELECTED TRANSPORTATION CONTROL STRATEGIES. The relative potential of 13 different transportation control strategies for reducing projected regional vehicle kilometers of travel in the San Francisco Bay Area is analyzed. Through the use of a series of representative home-based work trips, it is possible to analyze mode-choice sensitivities directly by means of additional runs of the recently developed set of mode-split models for the region. These mode-split models are stratified by three automobile ownership categories for both primary and secondary workers. Ranges of potential mode-split shift for automobile, transit, and shared-ride modes are established for each transportation control strategy. Four combinations of strategies are examined. Graphs that help to depict relative mode shift potentials are developed by using stepwise incremental testing of various control measures. Mode-split sensitivities for representative trips are generalized to the regional level.

42 195965 EVALUATION OF ROAD AND TRANSIT SYSTEM REQUIREMENTS FOR ALTERNATIVE URBAN FORMS. Research was performed for the purpose of evaluating the road and transit system requirements of a range of cities that have different density and spatial patterns and thereby assessing the effects of varying urban forms on transportation investment and service measures. The assessment is conducted in the context of a proposed policy evaluation framework that uses the end-state transportation and land-use plan for policy guidance and the time stream of benefits and costs as the object of evaluation. For the analysis of the transportation implications of a number of urban forms, a two-mode network generation model is developed and applied to six hypothetical city types of 2 million population. The comparison of the transportation requirements for these urban forms indicates a range of transit use among the city types of from 8 to 24 percent and wide differences in the need for high-capacity service routes. In terms of person hours of travel and mean trip length, the multicentered city in particular and the centrally oriented cities in general have the lowest requirements. These conclusions have important implications for the use of horizon-year transportation and land-use plans within the proposed framework of dynamic evaluation. /Author/

42 195966 MODELERS, MUDDLERS, AND MULTITUDES: ESTABLISHING A BALANCED TRANSPORTATION PLANNING PROCESS. Urban model builders and policy makers are turning a more flexible approach to planning and implementing urban transportation investments. This paper seeks to extend these recent efforts in unexplored planning processes to enable the newly emerging transportation planning process to better cope with the uncertainties of complex urban and regional systems. The discussion is conceptual and builds on current literature and trends. Diagrammatic representation of "old" and "new" approaches to transportation planning are set out to clarify and the nature of the emerging processes. The paper concludes that the trend away from highly structured analytical methods of planning toward more synthetic and open-ended approaches is worthwhile but should not be overdone. What is most needed is a delicate balance between rigorous analytic techniques and less rigorous synthetic and qualitative ones. It is through such balance that technicians (analysts) will work closely with politicians and other policy makers (synthesists) to provide flexible responsive, and carefully thought-out urban transportation planning. /Author/

42 195968 MODELS FOR PREDICTING THE IMPACT OF TRANSPORTATION POLICIES ON RETAIL ACTIVITY. Comprehensive urban land-use models designed in the past to predict the affects of large, capital-intensive transportation facilities on the spatial distribution of urban activities are not well suited for predicting the impacts of newer policies to control and manage existing facilities. This paper describes a case study that develops two alternatives models with a much sharper, policy-oriented focus and substantially reduced requirements for data and computational resources. The case selected for study involves the hypothetical adoption of transportation control measures to improve air quality in the Denver central business district and the potential impact of controls on retail activity. The two models are a cross-section, lagged-adjustment regression that identifies determinants of aggregate sales at any location and a set of disaggregate travel demand models that predicts the equilibrium between shopping trips and retail activity. The forecasts of both models are consistent in predicting substantial declines in retail activity in response to restrictions on automobile access and negligible offsetting effects of improvements in transit service. It is concluded that compensatory nontransportation measures that enhance downtown amenities or the uniqueness of downtown retail opportunities may offset the negative influence of reduced accessibility. /Author/

42 195980 CREATION OF URBAN TRANSPORTATION NETWORK MODELS FROM DIME FILES. The development of a set of computer programs that use U.S. Bureau of the Census geographic data to create urban transportation network models is reported. The process uses the Dual Independent Map Encoding (DIME) files created by the U.S. Bureau of the Census for each of the major standard metropolitan statistical areas of the United States. Manual coding of networks is reduced to a minimum, and highly detailed network models can be created. Functioning and use of the program are documented, and the way in which computer graphic displays are readily generated from DIME file data is demonstrated. Examples of computer graphic output from the program are presented. /Author/

42 195985 ATTRIBUTE IMPORTANCE IN MULTIATTRIBUTE TRANSPORTATION DECISIONS. This report describes a study of the relative importance of various travel attributes as influences on commuters' choices among car, bus, and Bay Area Rapid Transit (BART) for traveling to work in the San Francisco Bay area. A sample of commuters were interviewed, and each was asked to rate his or her satisfaction with

car, bus, and BART on each of the attributes studied. The relative importance of the attributes was inferred by examining these ratings and the relationships between the ratings and the usual choice of travel mode. The study differed from previous similar research in that attribute importance was measured with a statistic that estimated how much each attribute contributed to differences in utility among the choice alternatives. Most previous research failed to consider an essential component of the quantity measured by this statistic, namely, average differences in utility among alternatives caused by average differences among alternatives in the levels of each attribute. Among the attributes judged to be most important were safety from crime, seat availability, and dependable arrival, which are ordinarily not included in quantitative planning procedures such as travel demand forecasting and cost-benefit analysis. /Author/

42 195987 FORECASTING TRAVEL DEMAND IN SMALL AREAS BY USING DISAGGREGATE BEHAVIORAL MODELS. A study was done to forecast the patronage of a new transit system proposed for a suburban city in the San Francisco Bay Area, using disaggregate behavioral models of transportation choice. The results suggested that behavioral models of the type used in the study can be applied to travel demand forecasting in small urban areas but that additional development and testing of the models should be done before they are used for policy decisions. The time and expense required for data collection and analysis were within reasonable limits for general application. Although implementation of the forecasting methodologies was quite successful, results of tests of the predictive accuracy of the behavioral models were disappointing. /Authors/

42 195988 MANUAL TECHNIQUES AND TRANSFERABLE PARAMETERS FOR URBAN TRANSPORTATION PLANNING. This paper summarizes research conducted under the National Cooperative Highway Research Program to identify contemporary transportation policy issues and to evaluate current travel estimation models and procedures in terms of their abilities to respond to such issues. A set of manual techniques and transferable parameters corresponding to the commonly used four-step transportation planning process is described. Brief descriptions are provided for trip generation, trip distribution, mode choice, traffic assignment, time-of-day characteristics, car occupancy factors, capacity analysis, and land development and highway spacing relationships. The travel estimation material developed has been organized in the form of a user's guide, which also includes applications to three scenarios of realistic situa-

tions. The manual methods are more advantageous than the computer methods in that transferable parameters allow for quick response in terms of the time required to collect and process local information. /Authors/

42 195989 TABULATING DEMAND ELASTICITIES FOR URBAN TRAVEL FORECASTING. This paper presents a compendium of demand elasticities in a tabulated form in order to facilitate urban travel forecasting. A number of elasticity estimates have been reported for a variety of cities over the past decade, but the scenarios or base conditions differ from one site to another. In order to systematically tabulate these disparate estimates, demand elasticities were pooled into four cells according to urban size (large versus medium) and urban structure (core-concentrated versus multinucleated). Such a classification has been verified to stratify cities into groups sharing common socioeconomic and travel patterns. Demand elasticities can be divided into two categories: empirical elasticities and calibrated elasticities. The former were measured in the field before and after notable incidents such as a fare increase in the transit system, while the latter were derived from demand models. The elasticities can be further identified as either aggregate or disaggregate depending on whether they are calculated from demand models. The elasticities can be further identified as either aggregate or disaggregate depending on whether they are calculated from areawide or subarea data. All these result in a collection of elasticities that have rather different values. This paper tries to explain some of these differences to gain insights into the general characteristics of elasticities for urban areas of different sizes and structures. The elasticity tabulation and the general properties of the elasticities provide both practitioners and researchers with factual information for estimating urban travel demand simply and systematically. /Authors/

42 195990 TECHNIQUE FOR DETERMINING TRAVEL CHOICES FOR A MODEL OF NONWORK TRAVEL. In transportation corridor studies, it is not always clear whether the effects of non-mode-choice decisions for discretionary travel demand should be considered in detailed analyses. This paper presents a manual approach that can be used by planners to determine quickly whether time-of-day, trip frequency, or destination choice effects can be neglected early in the planning process. The approach relies on demand elasticities obtained from disaggregate travel demand models. Demand models that capture the causal structure of shopping trip decisions were first introduced in 1972 in a study performed by Charles River Associates for the Federal Highway Administration. To simplify the

modeling approach, the study developed the concept of inclusive price. This paper presents a revised specification of the inclusive price variables and identifies the resulting new elasticity equations for separable discretionary travel demand models. The differences between the previous and revised definitions of elasticity with respect to travelers' responses to changes in transportation level of service are highlighted. /Author/

42 195997 SPATIAL AGGREGATION OF DISAGGREGATE CHOICE MODELS: AREAWIDE URBAN TRAVEL DEMAND SKETCH-PLANNING MODEL. This paper describes an aggregate urban travel demand model designed for areawide transportation policy evaluation with limited preparation of input data and fast response times. It does not include supply models but it can be used by itself for travel demand predictions with exogenously specified transportation level-of-service changes or it can be incorporated in the framework of the TRANS model. The methodology is generally applicable to urban transportation sketch-planning situations in which large geographic units are used. Aggregation is performed over spatial travel alternatives and spatially distributed individuals to produce required aggregate travel demand forecasts. An efficient solution method for spatial aggregation was developed that employs mathematical functions, expressed in terms of coordinates in the urban space, to describe the spatial choice process and to represent the geographic distribution of behavioral units, spatial alternatives, level-of-service characteristics, and locational attributes. This allows the spatial aggregation problem to be solved efficiently, by integrating the travel demand models over the urbanized area. Monte Carlo simulation techniques are employed and the procedure entails (a) generation of a sample of representative households distributed over the urban area using available census data, (b) generation of a sample of destinations for each trip purpose for each household, (c) computation of travel demand forecasts for each household based on the sampled destinations using a system of disaggregate travel demand models, and (d) accumulation and expansion of disaggregate predictions to produce aggregate forecasts. /Authors/

42 195999 PLANNING MODEL FOR TRANSPORTATION CORRIDORS. The paper describes a planning model for transportation corridors and outlines its application to one such study. The components of the model--demand, level-of-service equilibration, and computation of travel impacts--all have new features that make

the model system easy and inexpensive to operate. Demand is predicted on the basis of a representative sample of households from the study area by using a disaggregate logit model; level of service is expressed by means of equations, which avoids the pitfalls and costs of lengthy network coding procedures; equilibration is accomplished by solving, in essence, the demand and level-of-service equations. Finally, the consequences of policies can be computed by any user-defined market segment. This is made possible by use of a representative household sample and the disaggregate demand and level-of-service models. /Author/

42 196001 DISAGGREGATE TRAVEL DEMAND MODELS FOR THE SAN FRANCISCO BAY AREA. SYSTEM STRUCTURE, COMPONENT MODELS, AND APPLICATION PROCEDURES. Significant advances have recently been made in developing and applying disaggregate behavioral travel demand models to many aspects of urban travel decisions. What has not previously been developed is a full set of urban models integrated into a complete forecasting system for use by a metropolitan planning organization. The purpose of this paper is to describe the first such system, which was developed for the Metropolitan Transportation Commission, the designated metropolitan planning organization for the San Francisco area. First, the background of the current modeling project is briefly set out, followed by a description of the structure of the model system. The model development process--estimation, prediction testing, and validation--is described, and two computerized model application procedures--a regional network analysis system compatible with available urban transportation planning packages and a generalized policy analysis system based on random sample forecasting--are presented. Conclusions concerning the advantages and disadvantages of the system of disaggregate models are presented. /Authors/

42 196002 DISAGGREGATE TRAVEL DEMAND MODELS FOR THE SAN FRANCISCO BAY AREA. NON-HOME-BASED MODELS. This paper describes a practical model of non-home-based travel that can be incorporated in existing urban transportation model systems. The model is estimated by using a disaggregate sample of trips drawn from the 1965 home interview survey of the San Francisco Bay Area for the Metropolitan Transportation Commission. The model predicts trip generation, distribution, and mode split with full sensitivity

to travel times, costs, and zone characteristics. The paper describes the overall model structure and estimation results. Comparisons with other research on non-home-based travel are drawn and recommendations for future research presented. /Authors/

42 196011 MODEL TO ESTIMATE COMMUTER AIRLINE DEMAND IN SMALL CITIES. This paper considers the factors indicating a community's potential demand for commuter air carrier service compares these factors to a profile of commuter airline passenger characteristics, and reports the results of an extensive regression analysis to develop a model to estimate commuter airline demand in small cities. The final regression model was nonlinear in nature and incorporated community populations and measurements of isolation from the certificated air carrier transportation system. This model was the basis of a recommended program to integrate commuter air carriers into Iowa's total transportation system. /Authors/

42 196013 COMMUTER RAIL DIVERSION MODEL (ABRIDGMENT). Over the past two decades, commuter railroads have been experiencing declines in ridership that have led to a rather stable but low level of ridership. One of the methods of offsetting losses resulting from declining ridership is to increase commutation rates to increase the entire fare structure. This paper describes a diversion model that presents a general technique for determining the number of people diverted to other modes of transportation as a result of fare increases. Although the diversion rate may differ from railroad to railroad and from urban area to urban area, the model can be used to determine a general diversion value applicable anywhere in the country. Furthermore, the methodology provides a framework in which railroads and transit properties, or any other agency, can develop their own relationships or assess the impact of a specific rate increase. Based on the analyses performed, it can be concluded that: a ridership loss of approximately three percent can be expected for every ten percent increase in commuter rail fares; ridership on other transit facilities appears to be affected similarly to that of commuter railroads by fare increases; an increase in commuter fares, when accompanied by an increase in service, does not necessarily result in ridership losses; and user and system characteristics differ throughout the country.

42 196014 IMPACT OF THE RELATIVE TRANSIT AND HIGHWAY SERVICE LEVELS ON TRIP DISTRIBUTION (ABRIDGMENT). The purpose of this investigation is to measure the impact of the public transit service level on the destination choices of trip makers. It is often hypothesized that trip makers will have a tendency to make more trips to areas with a relatively high level of public transit, particularly if the service is superior to that provided by the auto, and to make fewer trips to areas with poorer transit accessibility. This propensity is measured by comparing the error in travel volumes predicted by a standard Bureau of Public Roads highway time gravity model with the relative transit and highway service levels, as measured by the disutility difference measure used in most utilitarian modal split models. Doubly constrained gravity models were calibrated on the basis of highway travel times for three trip purposes: home-based work, home-based non-work, and non-home. The results of the models were obtained for the Delaware Valley Region, which has an extensive public transit system--some 2900 route kilometers (1800 route miles) of high-type rail facilities. Examination of the results yielded the following conclusions: a highway-based gravity trip distribution model has a measurable bias in the Delaware Valley Region with respect to the relative public transit and highway service levels; this bias is well defined, rational, and statistically significant for home-based work, home-based non-work, and non-home-based trips; the bias varies only marginally by trip purpose, for only the non-home-based trips are significantly different from home-based work trips and total trips; the highway time-based gravity model has a significant tendency to underestimate person-trip interchanges even when the transit and highway service levels are equal; and the correction of the bias results in significant changes in the synthetic person-trip tables. Although these conclusions are drawn from a specific region, they can probably be generalized to other regions that now have or are considering some form of high-speed public transit service; because the total amount of transit service may not be as significant as the relative quality of transit service in individual corridors.

42 196015 AUTOMOBILE AVAILABILITY PER WORKER: A TRANSPORTATION-SYSTEM-SENSITIVE SOCIOECONOMIC VARIABLE (ABRIDGMNET). The general objective of this research was to investigate the impact of a viable transit alternative on household decisions to have automobiles for use in making home-based trips. The specific objectives were to determine differences in automobiles available per worker (APERW) between households in areas

served by transit and to recommend socioeconomic variables that appear to have high correlation and possible causal effects on APERW for consideration in travel demand models. The study was carried out in Laurel, Maryland, which has a population of 48,000 and an area of 23 sq km (9 sq mi) and is located approximately midway between Baltimore and Washington, D.C. The transit service hypothesized to influence APERW is an express commuter service operated by Greyhound from Laurel to Washington. Other transit service is provided to Washington by the B&O Railroad. Automobile competition with transit is substantial. One limited-access highway (Baltimore-Washington Parkway) and a primary highway (US-1) link Laurel with Washington. Ninety-two percent of all households in the study area were given a questionnaire to complete and return to convenient pick-up areas. In addition to socioeconomic and sociodemographic questions, respondents were asked to identify all work trips and the modes taken for all family members. The response rate was 4.2 percent. The finding of other studies, that the variable automobiles-available-per-worker is strongly related to mode choice, was corroborated. For work trips to Washington, the percentages carpooling or using transit greatly decreased with increasing automobiles available per worker.

42 196017 MODIFIED SIMULATION TECHNIQUE FOR MODE-CHOICE ANALYSIS (ABRIDGMENT). This paper describes the simulation process developed by the Delaware Valley Regional Planning Commission to forecast travel demand for the bi-state Philadelphia metropolitan area. The modeling concept consists of a four-step process. Trip generation (step 1) uses a disaggregate trip rate; and it requires extensive knowledge of the magnitude and location of regional activities such as land use, employment, and the demographic characteristics of the resident population. Trip distribution (step 2) uses a typical gravity formulation stratified by trip purpose. Mode choice (step 3) estimates the proportion of the trips between two zones that will use the transit system and the proportion that will use the highway system. The final step of the process is the assignment of the various types of trips to the transportation system networks. Also described in this paper is a modified simulation technique (MST)--which is applicable to the study of changes in mode choice resulting from changes in service level, skip-stop or express service, station spacing, and shifts in route alignment. The underlying assumption is not that the primary transit submode route does change, but that the specific links of the path might change. The primary impact of these service changes will be in the level of transit mode choice for a given trip interchange. The MST does provide a useful and cost effective means around the expense of the standard simulation process; although, its applicability is limited to those studies where the underlying assumption of "no significant change in primary transit submode route" is considered a reasonable approximation.

42 196056 TRANSPORTATION CORRIDOR IN NORTHWEST INDIANA. This report describes a study of passenger transportation service in Northwestern Indiana South Bend to Chicago. The objective of the study was to determine the appropriate transportation service that would meet the travel needs of the residents of Northwestern Indiana including St. Joseph, La Porte, Porter and Lake counties. The transportation corridor is defined by existing public transportation and highway facilities in the area from South Bend, Indiana, to Chicago, Illinois. A summary of the history of commuter transportation in the corridor is presented herein. Estimates of the number of railroad and other trips that would be made in the corridor in 1980, 1990, and the year 2000 are made. Nine options for providing commuter transportation in the corridor were presented and evaluated in the terms of environmental criteria, quality of service, economic and financial factors, and special factors. The study recommends that the Chicago, South Shore and South Bend passenger service be continued. The study found that the South Shore is the most energy efficient, the safest, and fastest, and the least costly mode of commuter transportation in the corridor. In addition, it does not increase the congestion of highways or parking problems in downtown Chicago. It has positive economic effects on and is essential to the efforts to decrease air pollution in the heavily industrialized area. Finally, the study found that the continuation of the South Shore would have positive effects on recreation at the National Lakeshore Park and the proposed multimodal terminal at St. Joseph County airport. /UMTA/

42 196298 MODE CHOICE MODELS WITH PERCEIVED RELIABILITY MEASURES. Several previous attitudinal surveys indicated the importance of reliability of travel modes. This research identifies perceived reliability measures of urban transportation modes. These measures are included in a multinomial mode choice logit model for work trips in the Chicago area. The statistical significance of the reliability measures is evaluated as well as their importance relative to more traditional performance measures such as travel time and travel cost.

42 196317 TSM PLANNING FOR FRINGE PARKING TRANSIT. The transportation planning profession lacks documentation and examples of explicit procedures for determining the feasibility of specific Transportation System Management (TSM) strategies and when warranted,

their planning and design. A series of tasks that define a method for investigating one TSM strategy, i.e., express bus-fringe parking transit service, are described. The methodology addresses the following tasks: (1) Feasibility study; (2) designation of potential lot sites; (3) demand analysis for alternative sites; (4) evaluation and comparison of potential lot sites; and (5) the development and marketing of the transit service. The set of procedures that are identified and applied are recommended as a standard method for planning express bus-fringe parking transit.

42 196322 POLICY EVALUATION WITH TRAVEL BEHAVIOR MODELS: METHODOLOGICAL ISSUES AND CASE STUDIES.

The purpose of this study was to test the ability of disaggregate demand models to evaluate the cost-effectiveness of a variety of transportation system improvements such as air quality transportation control plans, and recommend further improvements in demand modeling and policy evaluation. The issues raised include the ability of such models to isolate short-run from long run travel behavior, to incorporate supply side characteristics of modes, and to facilitate generation of meaningful impact measures. The study found that disaggregate demand models need to integrate information from before and after studies in order for them to more readily distinguish short run from long run effects. These models, estimated from cross-section data currently tend to overpredict the short run responsiveness of individuals to transportation system changes. The study also found that using small samples and simple network configurations, relatively accurate cost-effectiveness evaluations of various express bus and paratransit feeder systems as well as non-transit strategies such as parking, gas, or toll surcharges were possible. Disaggregate demand models were found to be versatile in accounting for the distribution of impacts in performing a cost-benefit analyses of a project. Measures of user benefit were easily obtained from these models. /Author/

42 196583 ALTERNATIVE METHODS FOR DEVELOPING TRANSPORTATION IMPROVEMENT PROGRAMS FOR URBAN AREAS. Three approaches for preparing a transportation improvement program (TIP) are examined. The first involves ratification by the metropolitan planning organization of programming decisions made by state and local transportation-implementing agencies. The second would rely on the collective judgment of an urban-area committee or forum to choose projects for implementation. The third would also use such a forum but would provide the committee with a formalized decision-making structure whereby programming decisions would be based on an expressed determination of priorities. Such a structure is described in detail: Projects are first submitted by implementing agencies. They are then reviewed for consistency with the transportation plan and those found to be consistent are placed on needs lists by type of project. The projects from the needs lists are placed in groups of similar relative priority. The groups are arrayed in priority order by funding source. The available money in from that source arrayed in priority order. Projects in whole groups covered by available funds are inserted directly in the TIP. An analysis is made of the intermediate connective transportation system that will result. The results of this analysis are combined with other considerations, and projects from the unfunded groups are selected to use the remainder of the available funds. /Author/

42 197469 MASS TRANSIT PROGRAM FOR THE SAINT LOUIS METROPOLITAN AREA. The Mass Transit Program is Phase I of the Alternatives Analysis program for the St. Louis metropolitan area. The major activities included surveys of community leaders, transit dependents and areawide survey (a telephone

random sample). An analysis of transit needs of the region with special emphasis on the transit dependent was performed. Physical opportunities for transit improvements were identified. Three alternative regional systems were prepared and analyzed for patronage, costs, benefits and impact. Four refined (composite) systems were prepared and analyzed. Initially, light rail transit was considered worthy of Phase II alternatives analysis, but the final decision was to proceed with an all-bus on local streets system.

42 198209 SHORT-TERM IMPLICATIONS OF SELECTED TRANSPORTATION POLICY ALTERNATIVES. The Continuing, Comprehensive, and Cooperative (3-C) Transportation Planning Process recently completed an analysis of travel demand likely by the year 1985. The primary conclusion of the analysis is that peak traffic is likely to continue increasing. In many locations, traffic conditions will significantly deteriorate unless actions are taken to reduce the growth in peak vehicular traffic or to construct and improve highways. Several alternatives could reduce the projected increase in vehicular traffic volumes. The purpose of this report is to determine how effective each alternative would be in reducing traffic demand, fuel consumption and auto emissions. Each alternative was explored independently to provide a thorough understanding of the potential ramifications. The implications of seven alternatives are estimated for the year 1985.

42 198219 CHARACTERISTICS OF TRAVEL IN THE BALTIMORE REGION. A concerted effort is being made in the Baltimore region to deal with travel and its implications on personal mobility, traffic congestion, job accessibility, economic development, parking shortages, air quality and energy consumption. To assist this effort, information has been collected on the characteristics of the region's travel. In summary, travel in the region is currently: Peaked (60% of commuter work trips are made during short rush hours); Auto dependent (88% of peak trips are in automobiles); Work trip dominated; Dominated by long trips (80% of commuter traffic on trips longer than 10 miles one way); Made in low occupancy vehicles; and Diffused.

42 198230 TRANSPORTATION CONTROL PLAN. VOLUME 3: TECHNICAL DOCUMENTATION. The Transportation Control Plan for the Baltimore metropolitan area sets forth the actions that will be taken by the region between now and 1987 to reduce the amount of air pollution caused by motor vehicles. Volume III contains technical documentation of emissions inventory and travel impact calculations, as well as the assumptions underlying the evaluation of the control measures.

42 198231 TRANSPORTATION CONTROL PLAN. VOLUME 4: EVIDENCE OF COMMITMENTS. The Transportation Control Plan for the Baltimore metropolitan area sets forth the actions that will be taken by the region between now and 1987 to reduce the amount of air pollution caused by motor vehicles. Volume IV consists of evidence of the state and local commitments required for implementation of the recommended measures.

42 198266 TRAVEL AND ENVIRONMENTAL CHANGES THROUGH 1985-AN EXTRAPOLATION OF PAST TRENDS. During the next decade, traffic volumes are projected to continue increasing significantly, with about a 39 percent increase in overall traffic levels. The use

of public transportation, presently 8 percent of the region's travel, is projected to increase about 13 percent. Both of these estimates are consistent with recent trends. Within the region, major variations in traffic increases are projected. The largest increases are projected for radial roads outside of the Beltway and on cross-county highways. As traffic levels increase, peak traffic congestion will deteriorate. The amount of congestion depends on the particular corridor in question. Though congestion is projected to increase, pollutants emitted and gasoline consumed by autos will most likely decrease below today's levels because of federal mandates on new car sales.

42 198271 DIRECTIONS TO IMPROVE URBAN TRAVEL DEMAND FORECASTING: CONFERENCE SUMMARY AND WHITE PAPERS. Recent research in travel behavior has provided many new insights into the travel needs and actions of the public. The most promising areas for additional research are the application of time and money budgets to planning, increased understanding of location theory (land use, spatial perception, accessibility measures), development of multinomial supply models, and determination of the temporal and geographic stability of demand and supply models used in transportation planning. Also recommended is additional research in data collection procedures, especially diary data and household interactions.

42 198649 TRANSPORTATION NEEDS, REPORT FROM A WORKSHOP CONSIDERING PROBLEMS IDENTIFIED BY THE INTERGOVERNMENTAL SCIENCE, ENGINEERING AND TECHNOLOGY ADVISORY PANEL HELD AT LEESBURG, VIRGINIA ON FEBRUARY 1-3, 1979. The workshop presents critical problems facing state and local governments on transportation needs. The following problem areas are considered: transit system productivity; the integration of paratransit and conventional transit, including small community mass transportation systems; and road and bridge construction and maintenance, including permanent winter repair materials. One issue of general concern was diffusion of innovation and its application. Recommendations for each of the problem areas are summarized.

42 198706 STATE AND LOCAL TRANSPORTATION POLICIES AND PROGRAMS. The report considers transportation institutions, programs, and policies from an intergovernmental perspective. It includes: an inspection of pertinent Federal legislation and programs; an analysis of state and local institutions responsible for transportation, including state departments of transportation, modal transportation agencies, state regulatory bodies, local governmental and quasi-governmental bodies; a discussion of state and local transportation programs; an overview of transportation policies and policy issues of concern to state and local governments; and a discussion of major conflicts engendered by present approaches to the provision of transportation at the state and local level.

42 198837 MULTIMODAL TRANSPORTATION PLANNING (A BIBLIOGRAPHY WITH ABSTRACTS). The bibliography presents many aspects of transportation planning—passenger and freight—for urban areas and intercity corridors. Multimodal systems, planning and programming, transportation models, forecasting and management is covered. This includes work travel patterns, trip generation, urban transportation demand, modal choice, and travel forecasting models. Urban and intercity freight transportation as regards modal choice, planning and intermodal systems, including intermodal consolidation terminals is also included. (This updated bibliography contains 87 abstracts, all of which are new entries to the previous edition.)

42 199011 TRANSPORTATION AND THE FUTURE. The document covers technological developments in connection with urban, rural, intercity, cargo and space transportation over the next twenty to thirty years. Demographic changes will place an added emphasis on automated systems around the turn of the Century, and energy constraints may make electrically-powered systems more attractive. The passenger automobile will probably retain dominance of transportation; public transportation systems in urban areas will evolve into more complex, multi-element operations serving both downtown and the suburbs. Energy constraints may lead to added reliance on rail and bus travel for intercity runs. Cargo vehicles will make more sophisticated use of intermodal containers. Finally, the advent of the space shuttle will completely alter the nature of orbital missions.

42 199063 THROUGH THEIR EYES, PART IV: PROVIDING TRANSPORTATION FOR RURAL AMERICANS. The report documents the process of state and local government consultation used in developing the new Department of Transportation (DOT) rural and small urban transit assistance program. Special emphasis is placed on four consultative trips, conducted during summer 1979, in which top DOT officials visited a number of innovative state and local operations. The groups consulted put a lot of emphasis on reducing red tape, and allowing sufficient flexibility in the program to reflect local conditions. This led to the evolution of an approach in which individual states would develop their own program management plan. Other issues highlighted included insurance costs, importance of coordination, the need to simplify or waive labor protection (13(c)) provisions, and technical assistance needs.

42 199133 SIMPLIFIED AIDS FOR TRANSPORTATION ANALYSIS: ANNOTATED BIBLIOGRAPHY [Final rept]. This is one of a series of six reports describing simplified aids to improve transportation decisions without resorting to computers or extensive data collection. The report contains the annotated summary of each of the analytical aids submitted for review and consideration. In each case, it identifies the person or agency that submitted the aid, provides a brief description of the aid, and in many cases, provides a reference document which describes the technique and/or an application of the technique. These descriptions are intended to assist the transportation analyst in determining which of these analytical aids might be useful in a particular local application and they also provide a source or reference for obtaining additional information concerning the technique.

42 239530 URBAN MASS TRANSIT PLANNING PROJECT, TECHNICAL REPORT NO 5: RECOMMENDATIONS FOR URBAN MASS TRANSPORTATION RESEARCH. THE REPORT DOES NOT ATTEMPT TO RECOMMEND PRIORITIES AMONG THE PROPOSED RESEARCH TOPICS; RATHER, IT SEEKS TO PROVIDE AN INVENTORY OF RELEVANT STUDY PROJECTS FROM WHICH SUCH PRIORITIES CAN BE DEVELOPED. THE INTRODUCTORY TEXT EXAMINES SOURCES OF FEDERAL FINANCIAL ASSISTANCE FOR R&D AND CONCLUDES THAT DESPITE COMPREHENSIVE PROGRAMMING SUBSTANTIAL KNOWLEDGE GAPS REMAIN WITH REFERENCE TO CERTAIN BASIC TRANSPORTATION ISSUES. FOUR BROAD CATEGORIES OF RESEARCH RELEVANT TO THE PLANNING AND OPERATION OF MASS TRANSPORTATION ARE IDENTIFIED: (1) ADMINISTRATION; (2) SYSTEMS DESIGN; (3) URBAN TRAVEL CHARACTERISTICS; AND (4) EDUCATION AND TRAINING. TWENTY-THREE SPECIFIC RESEARCH TOPICS ARE RECOMMENDED WITHIN THESE GUIDELINES, BROKEN DOWN BY PROBLEM, PROPOSED STUDY, AND RESEARCH STRATEGY. SIX ADMINISTRATIVE RESEARCH TOPICS ARE ADVANCED: (1) LEGAL IMPEDIMENTS TO IMPROVED TRANSIT SERVICE; (2) THE EFFECT OF LABOR REGULATIONS ON IMPROVED TRANSIT; (3) ADVANTAGES OF AN URBAN TRANSPORTATION MANAGEMENT ADVISORY CENTER; (4) THE RELATIONSHIP BETWEEN SCHOOL BUS AND TRANSIT SERVICE; (5) THE EFFECTIVENESS OF TRANSIT MARKETING; AND (6) THE IMPLICATIONS OF RISING LABOR COSTS. SEVEN SYSTEMS DESIGN PROPOSALS ARE ADVANCED: (1) THE IMPACT OF RAPID TRANSIT ON LAND USE; (2) A STUDY OF FORECASTING TECHNIQUES, PLANNING PROCEDURES, AND IMPACT ANALYSIS OF THE BAY AREA RAPID TRANSIT SYSTEM IN SAN FRANCISCO; (3) THE DEVELOPMENT OF IMPROVED ANALYTICAL AND MANAGEMENT TOOLS; (4) APPLICATION OF TRAFFIC ENGINEERING IMPROVEMENTS TO TRANSIT SYSTEMS DESIGN; (5) THE IMPACT OF TRANSIT SYSTEMS ON URBAN STRUCTURE; (6) A COMPARATIVE CASE ANALYSIS STUDY; AND (7) THE EFFECTS OF SPECIAL VEHICLE PRIORITIES ON URBAN FREEWAY LANES. SIX TOPICS WITH REFERENCE TO URBAN TRAVEL CHARACTERISTICS ARE DELINEATED: (1) THE IMPACT OF TRANSIT SERVICE ON TRAVEL PATTERNS; (2) THE EFFECT OF IMPROVED SERVICE ON TRANSIT PATRONAGE; (3) LAND USE TRANSPORTATION REQUIREMENTS; (4) DATA REQUIREMENTS FOR AN ORIGIN-DESTINATION SURVEY; (5) COMPREHENSIVE ANALYSIS OF FACTORS INFLUENCING MODE CHOICE; AND (6) TRAVEL BETWEEN AIRPORTS AND ADJACENT MET-

ROPOLITAN AREAS. FINALLY, FOUR EDUCATION AND TRAINING PROJECTS ARE PROPOSED: (1) SPECIALIZED TRAINING PROGRAMS; (2) SPECIALIZED TRAINING MATERIALS; (3) CREATION OF A TRANSPORTATION INFORMATION CENTER; AND (4) DEVELOPMENT OF AN URBAN TRANSPORTATION MANAGEMENT COURSE. /UMTA/

42 241820 THE RAPID TRANSIT PLAN FOR THE METROPOLITAN SEATTLE AREA-TECHNICAL APPENDIX. THE REPORT IS A DETAILED TECHNICAL APPENDIX TO THE LONG-RANGE TRANSIT PLANNING STUDY FOR METROPOLITAN SEATTLE IN 1985. SIXTEEN CRITERIA FOR EVALUATING PROPOSED TRANSIT SYSTEMS ARE ADVANCED WHICH EMPHASIZE CAPACITY, FLEXIBILITY, SPEED, PASSENGER AMENITIES AND RIDE QUALITY, ECONOMY, PERFORMANCE, AND URBAN ECOLOGY. TWENTY-NINE POTENTIAL TRANSIT SYSTEMS WERE THEN EVALUATED. BASED UPON THE RESULTING DATA, THE AUTHORS SYNTHESIZED FOUR POTENTIAL TRANSIT ALTERNATIVES FOR IMPLEMENTATION. THESE INCLUDED: (1) BUSES IN MIXED TRAFFIC; (2) BUSES ON METERED FREEWAYS; (3) GRADE-SEPARATED BUSWAYS; AND (4) A DUAL-MODE BUS AND RAIL SYSTEM. COMPARATIVE ESTIMATES OF REVENUES, OPERATIONAL AND CAPITAL COSTS, TRIP TIMES, AND RIDERSHIP WERE EMPLOYED TO YIELD THE OPTIMAL SYSTEM. THE AUTHORS RECOMMEND ADOPTION OF THE FOURTH ALTERNATIVE. THE REPORT CONTAINS A TRANSPORTATION CORRIDOR ANALYSIS DESIGNED TO LOCATE DESIRABLE ROUTES FOR TRANSIT OPERATIONS. SPECIFIC DESIGN STANDARDS ARE ALSO ADVANCED FOR THE VEHICLES, STATIONS, AND GUIDEWAYS. ECONOMIC FACTORS ARE EXAMINED AT LENGTH. AN IMPLEMENTATION PROGRAM IS ALSO DISCUSSED WHICH WILL REQUIRE A REGIONAL TRANSPORTATION AUTHORITY SUPPORTED BY PUBLIC FUNDING. A DETAILED COST-BENEFIT ANALYSIS IS INCLUDED. FINALLY THE REPORT DOCUMENTS RESULTS OF URBAN DESIGN STUDIES TO CALCULATE THE EFFECTS OF THE COMMUNITY ON TRANSIT, ENVIRONMENTAL AND SOCIETAL EFFECTS OF ALTERNATIVE TRANSIT SYSTEMS, AND THE IMPACT OF TRANSIT ON THE METROPOLITAN AREA. THE AUTHORS CONCLUDE THAT TRANSIT CONSTRUCTION WILL BE A STIMULUS TO LAND USE DEVELOPMENT, PROVIDED THAT EFFECTIVE ECOLOGICAL CONTROLS ARE MAINTAINED. /UMTA/

42 260122 PARTICIPATORY PLANNING FOR BOSTON METRO-AREA TRANSPORTATION. Participation of private citizens, organized groups, and local officials in the

transportation planning and decision-making process are important elements of the new approach to Boston metro-area transportation. Transit for access to the city center, improvement of existing transportation corridors, increased emphasis on local road and transit needs, the management of existing facilities for more efficient use and improved formulas for funding are goals of the new approach, after community objections led to the halting of work on two Boston area freeway projects. /Author/

42 260145 1974 NATIONAL TRANSPORTATION STUDY. The 1974 National Transportation Study is the second in a series of biennial National Transportation Studies undertaken cooperatively by the U.S. Department of Transportation, state and local governments, and the private transportation industry. Northwestern Indiana's contribution to the study has been built from numerous procedures, standards and source studies. Primary responsibility for the coordination of the study was given to the Northwestern Indiana Regional Planning Commission. The major purpose of this report is to provide a source document of Northwestern Indiana's contribution to the 1974 Study. The report is divided into the following four sections: (I) A summary of the 1974 National Transportation Study; (II) Modes of transportation reported in the 1974 National Transportation Study for Northwestern Indiana; (III) Northwestern Indiana--1995 Transportation Plan; and (IV) 1974 NTS Issues and Comments. Appendices contain monthly progress reports, quarterly financial reports, and selected correspondence.

Kiebles, CR ; Northwestern Indiana Regional Planning Commission, (219/923-1060) Jan. 1974, 8 Ref., 3 App.; The preparation of this report has been financed in part through a grant from the U.S. Department of Transportation, Urban Mass Transportation Administration, under the Urban Mass Transportation Act of 1964, As Amended.

42 260183 THE USE OF MODELS IN URBAN TRANSPORTATION PLANNING. The report describes the most commonly used models in urban transportation planning. A background on urban transportation planning is given including changes in planning objectives and the effects of Federal legislation. General concepts and problems in the use of the models are also presented. An assessment of the situation is made and recommendations for improvement are suggested.

42 260302 THAMESMEAD TRANSPORTATION STUDY. This paper describes in detail the Thamesmead road and public transport models and their recent application in the examination of the transport implications of the latest planning proposals for Thamesmead. The study also took account of the GLDP planning and transport context which had been developed since the

earlier Thamesmead travel predictions were made. The form of the two models is explained; the input data, test structure and analysis of results are described and the form of road and public transport systems most likely to meet the needs of Thamesmead is indicated. /TRRL/

Eldridge, DA Chakraborti, SC ; Greater London Council R&D Rpt. Research Memo. 346, 1973, 66 pp, 14 Fig., 17 Tab., 9 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 207132)

42 260545 SEGMENTING A TRANSPORTATION MARKET BY DETERMINANT ATTRIBUTES OF MODAL CHOICE. A summary is presented of actions undertaken in the area of problem definition and research goal delineation, conferences with interested agencies and personnel, and a literature survey. Details are given of questionnaire design and pretesting (an exploratory questionnaire and a second questionnaire were administered to two samples of Austin residents). The analytical procedures used and on-going work and follow-up for future reports is discussed. A method was developed for identifying the transportation mode features or attributes that determine modal choices for specified trip purposes. An estimate was made of the percentage of people using private cars who would be likely to switch to public transportation if it was improved. Existing low-density (cars) and high-density transportation modes (buses) were evaluated to spot critical gaps between perceived features of buses versus cars, along determinant attributes of modal choice. Local media most utilized by potential high density rider 'converts' were determined and recommendations will be made with regard to advertising. The general community and a "leaders" subset was surveyed for attitudes towards high-density transportation and appropriate means of financing improvements.

42 260601 JOURNEY TIMES BY BUS AND CAR IN CENTRAL LONDON IN 1972.. Twenty-five journeys between randomly selected points in Central London, previously studied by the Road Research Laboratory in 1963, were resurveyed in 1972 to find the effect of the changes which have occurred in the road and was also made of travel by motor cycle. It was found that mean direct travel speeds (straight line distance divided by journey time) have increased for car travel from 10.2 mile/h in 1963 to 11.2 mile/h in 1972. The mean direct travel speed by motor cycle for the 25 journeys was found to be 13.2 mile/h. It was found that the journey time by bus for these journeys could be estimated by assuming a direct journey speed of 5.3 mile/h and adding 4.4 minutes. On average if a journey was less than 0.68 miles it was quicker to walk than travel by bus. It was found that for bus journeys the total travel time had increased by 12 per cent between 1963 and 1972; 80 per cent of this increase was due to increased time spent traveling on the bus, 16 per cent to increased walking time and 4 per cent to increased waiting time. The results from this study also indicated that in central London in 1972 the average journey takes approximately 2.5 times as long by bus as it does by car, whereas in 1963 bus journey times were approximately twice car journey times. /Author/

Buckles, PA *Traffic Engineering and Control* Vol. 15 No. 7, Nov. 1973, pp 337-339, 4 Fig., 3 Tab., 3 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 208099S)

42 260620 MODE PREFERENCE MODEL. The concept of the mode preference model has evolved in response to the need for information that transit operators can use in their efforts to tailor efficient public transit systems to the potential market for transit patronage. This technique is based on the theory that people who have common trip destinations often also have common trip origins. The basis for the market research that underlies the mode preference model is a series of attitude surveys that relate to major trip attraction areas in the metropolitan region of Kansas City. This model is perhaps more sensitive to public socio-economic needs than any other method of market research and some of its findings can serve as meaningful input into such techniques as the modal-split system. The method's relatively low cost and the very limited research period required, make it an ideal tool for transit inquiries and ongoing research that cannot await complex traffic studies.

Roeseler, WG *Traffic Quarterly* Vol. 28 No. 3, 1974, pp 401-418

42 260752 DEVELOPMENT AND CALIBRATION OF THE CRISTAL TRANSPORT PLANNING MODEL. The Report describes the development of a strategic urban transport planning model known as CRISTAL. The object is to enable rapid comparisons to be made of the traffic benefits of alternative transport policies or investment plans when these can be expressed in a sufficiently generalized form. The model deals with four passenger travel modes and with road goods vehicles and uses the concept of the generalized cost of a trip, i.e. the sum of time and money costs. The representation of demand and modal splits permits straightforward economic evaluation. A distinctive feature of the model is the use of a simplified geographical representation, in which the actual road and railway networks are represented by idealized transportation corridors of a symmetric ring and radial form. This simplification reduces the data handling requirements and therefore speeds up the computing process. The first part of the report describes the logical and theoretical structure of the model. The second part describes how the model has been set up to represent the Greater London area and lists the numerical values of the various parameters. Possible applications of the model are also discussed, and relevant data presented.

42 260850 CENSUS DATA AND URBAN TRANSPORTATION PLANNING. This report results from a conference conducted to review the process for tabulating census data, hear reports on experiences in using these data, evaluate how useful or adequate the data are for transportation planning, and recommend improvements for consideration by the Bureau of the Census and the U.S. Department of Transportation in future programs. The conference was

attended by approximately 70 professionals working in census and transportation planning activities. One session was devoted to discussions of the Urban Transportation Planning Package (UTPP), which contains tabulations of the 1970 census socioeconomic and journey-to-work data, another to reports of user experiences, and a third to suggestions for future direction. Two more sessions were devoted to workshops for developing recommendations regarding the type of data collected and the use of those data by planning agencies. The workshop sessions included discussions of experiences and requirements of census data users and a review of a questionnaire that was distributed to conference participants. Questions pertained to both short-range and long-range data uses. The recommendations that were developed by the workshops and presented in this report deal with different aspects of the preparation and use of the census Urban Transportation Planning Package. Although they emphasize the overwhelming consensus of the conference: Far greater federal-local communication and joint planning are required if present and future programs are to be useful.

Transportation Research Board Special Reports Conf Paper No. 145, 1974, 103 pp, Figs., Tabs., Refs., 1 App. Proceedings of a conference held in Albuquerque, New Mexico, August 21-23, 1973.; ORDER FROM: TRB, Orig. PC

42 260851 CONCEPTS AND PROCEDURES USED IN TABULATING 1970-CENSUS DATA FOR THE URBAN TRANSPORTATION PLANNING PACKAGE. In response to the request from many Urban Transportation Studies for 1970-census place-of-work data, the Federal Highway Administration submitted tabulation specifications to the Bureau of the Census for the compilation of both socioeconomic and journey-to-work data from the 15 and 20 percent sample data (Appendix C in this paper explains the sample design) for traffic zones in standard metropolitan statistical areas. The standardized tabulations contained in this 1970-census Urban Transportation Planning Package (UTPP) were designed to provide a common data base for transportation studies in the country and reduce processing costs for such tabulations. This paper focuses on the concepts of the 1970 Census of Population and Housing as they relate to the UTPP, the procedures used to code the place-of-work data for the 15 percent sample, the processing steps involved in tabulating these data by traffic zone, and the limitations of these data for use in the transportation planning process.

42 260852 APPLICATIONS AND USES OF THE CENSUS URBAN TRANSPORTATION PLANNING PACKAGE. The 1970-census Urban Transportation Planning Package (UTPP) represents a minimum common data set intended to be useful to urban transportation planning studies for continuing planning purposes. The package provides a useful supplemental base data source to aid studies in routine review of changing socioeconomic and travel conditions. It also provides a source of data that can be incorporated

into the maintenance and updating of an urban transportation plan and program. This paper discusses the following two main issues: (a) how and where the UTPP can be applied in the continuing urban transportation planning process and (b) how the data can be used for transportation model development. Suggestions are presented for incorporating data from the 1970 census into the continuing urban transportation planning process, and it is concluded that in the continuing plan and program review process, census data can be applied as a basis for current socioeconomic data for generating current trips with existing models, in the development of new trip generation models, in the refinement of old trip generation models, as a benchmark against which new updated long-range and short-range land use and socioeconomic data may be compared, and as a beginning base or a benchmark to check an ongoing surveillance program.

Fleet, CR (Federal Highway Administration) *Transportation Research Board Special Reports Conf Paper No. 145, 1974, pp 30-40, 12 Fig., 9 Ref.;* This article appeared in "Census Data and Urban Transportation Planning."; ORDER FROM: TRB, Orig. PC

42 260853 EXPERIENCES IN USING CENSUS DATA FOR TRANSPORTATION PLANNING: THE RHODE ISLAND PROJECT. To answer the question of whether the 1970-census Urban Transportation Planning Package (UTPP) for various areas of the country provides a valid source of data for use in updating urban transportation studies, the Federal Highway Administration awarded the Comsis Corporation a contract to investigate the use of these data. The project is being accomplished in conjunction with the state of Rhode Island and the Office of the Secretary of Transportation. The intent of the project is to run a series of comparisons between data obtained in the census and data obtained in origin-destination surveys conducted by the state of Rhode Island in 1961 and 1971. The project includes 3 tasks: to investigate and report on the feasibility of the project and detail the remaining tasks, to develop assignment volumes by using the 1970-census journey-to-work data, and to evaluate the methods used for developing assignment volumes. The first task has been completed and is the subject of this report.

Sosslau, AB (Comsis Corporation) *Transportation Research Board Special Reports Conf Paper No. 145, 1974, pp 41-51, 4 Fig., 5 Ref.;* This article appeared in "Census Data and Urban Transportation Planning."; ORDER FROM: TRB, Orig. PC

42 260854 EXPERIENCES IN USING CENSUS DATA FOR TRANSPORTATION PLANNING: THE ALBUQUERQUE PROJECT. This report gives the preliminary results of a study conducted in Albuquerque to verify the reliability of the data from the 1970-census Urban Transportation Planning Package (UTPP) and to test and evaluate their practical usefulness in an actual transportation planning program. The study was conducted prior to the official release of the UTPP to other metropolitan areas in the anticipation that results of the Albuquerque study would be of general benefit to all transportation planning staffs at-

tempting to use the census data. Phase 1 of the study was a test of the validity of the UTPP data and of the techniques used in assigning them to traffic subzones. This phase was specifically an evaluation of the data contained in the zone-of-residence table. Phase 2 incorporated the UTPP data into the transportation planning process. In this phase, the zone-of-work data and home-to-work trip table were evaluated.

Davenport, OA Howell, KM (Middle Rio Grande Council of Governments) *Transportation Research Board Special Reports Conf Paper No. 145, 1974, pp 51-54;* This article appeared in "Census Data and Urban Transportation Planning."; ORDER FROM: TRB Publications Off

42 260855 EXPERIENCES IN USING CENSUS DATA FOR TRANSPORTATION PLANNING: THE WILMINGTON PROJECT. The 1970-census Urban Transportation Planning Package (UTPP) was evaluated to determine if it would provide actual data to satisfy generation equations and data for developing a modal-split model, in an effort to produce a multimodal transportation plan for the Wilmington region. The following shortcomings of the UTPP were observed: (1) nonresidential employment data are not provided; (2) for population and dwelling units, the data are sample data and, therefore, are subject to expansion error; (3) automobile tables do not contain precise counts for cases having more than 2 automobiles; (4) the small area geographic accuracy for employment coding is inadequate, i.e., too much emphasis is given to coding by zip code; and (5) given the above, part IV (Work-trip data by zone of residence to zone of work) should be deleted from the package for economic reasons. Overall it was considered that the package was good, but needed refining.

42 260856 EXPERIENCE IN USING CENSUS DATA FOR TRANSPORTATION PLANNING: THE TRI-STATE REGION. In order to show how the Tri-State Regional Planning Commission has used data from the 1970 census, the region is briefly defined and its role as a census processing center is described. The region's experience so far with the journey-to-work and the Urban Transportation Planning Package (UTPP) is then discussed. Since the UTPP was not considered flexible enough for the Tri-State region, the "Worker File" was developed, and a description of this set of records is included in this report.

Boswell, H (Tri-State Regional Planning Commission) *Transportation Research Board Special Reports Conf Paper No. 145, 1974, pp 57-61;* This article appeared in "Census Data and Urban Transportation Planning."; ORDER FROM: TRB, Orig. PC

42 260931 INTERACTIVE GRAPHICS AS A TOOL IN PLAN EVALUATION. INTRANS is a man-computer interactive graphics system designed for real-time analysis of transportation and urban data. During mid-1973, INTRANS was used by the Chicago Area Transportation

Study as an aid in the evaluation of alternative plans for the 1955 major review. This paper describes the project. INTRANS has been proved effective as a tool for choice and design of figures, as a convenient medium for retrieving planning data, and in analysis of specific problems. A number of problems and difficulties, some of them marginal, have prevented more extensive and effective use of the system. It is concluded that interactive graphics systems in general, and INTRANS in particular, are cost-effective tools for transportation planners. Increases in their effectiveness and capabilities will come mainly through more extensive use by practicing professionals.

42 260932 ASSESSING THE UTILITY OF AN INTERACTIVE GRAPHIC COMPUTING SYSTEM: A TRANSPORTATION SYSTEMS DESIGN PROBLEM. An experiment designed to assess the amount of improvement in the quality of a design that can be obtained by using an interactive graphic computing system was undertaken and is interpreted. The problem was design of a bus rapid transit system by five teams of students at the University of Washington. Each team used a man-computer system called UT-RANS to search for a design for a BRT system that would satisfy 11 performance measures. None of the teams found a wholly satisfactory design, but the average improvement in performance (design quality) for all teams was close to 50 percent (relative to their initial designs). Further experiments of this type are needed to assess the utility of interactive graphic design tools in the transportation systems field.

42 260968 OPERATING COST MODELS FOR URBAN PUBLIC TRANSPORTATION SYSTEMS AND THEIR USE IN ANALYSIS. Data concerning operating cost of bus and rail systems were collected from operating agencies and the American Transit Association. Operating cost models were prepared for individual rail rapid transit systems and bus systems. The use of these models in economic comparisons with highway and other transit alternatives is discussed and illustrated. Data deficiencies are discussed, and recommendations concerning accounting formats are made. /Author/

42 260974 CHARACTERISTICS OF URBAN TRANSPORTATION SYSTEMS--A HANDBOOK FOR TRANSPORTATION PLANNERS. This report consists of a handbook to be used by transportation planners and urban specialists for estimating system parameters for conventional transportation technology. Three modes are evaluated: rail transit, local bus and bus rapid transit, and highway systems. Each

mode contains an assessment of the following seven selected supply parameters: (1) speed-average, maximum; (2) capacity (service volume)-vehicle, person; (3) operating cost (vehicle); (4) energy consumption (vehicle or source); (5) pollutant emission (vehicle or source); (6) capital cost-land, construction, vehicle acquisition; and (7) accident frequency. These parameters are organized as proxy variables in describing the characteristics of each transport mode. Each mode has an analogous Appendix section whereby these parameters are evaluated in further detail and for particular geographic areas. Two additional Appendix sections contain all references used in the tables/figures and a general bibliography for further information. /UMTA/

42 260990 COORDINATION OF URBAN DEVELOPMENT AND THE PLANNING AND DEVELOPMENT OF TRANSPORTATION FACILITIES. This report presents the results of an investigation of planning practice in cities in England, Scotland, Spain, Switzerland, France, Germany, Denmark, Sweden, Australia, and Canada. The cities were selected not as necessarily representative of the general situation prevailing in those countries but as examples of effective practice in one or more aspects of the area of investigation: the manner in which the technical aspects of planning are coordinated or related, the coordination in timing and financing in areas of transportation and general planning as they are undertaken, the sources of funds for transportation improvements, the legal requirements and administrative practices that either require or permit desirable coordination, and the extent and manner of involving public (citizen) approval and support of programs in the decision making. /DOT/

42 261459 MASS TRANSIT SURVEY REPORT FOR THE 1971-72 RHODE ISLAND ORIGIN--DESTINATION UPDATE STUDY. The completion of a major portion of the Interstate Highway System in Rhode Island has changed travel patterns and travel characteristics. It therefore became necessary to do an update Origin-Destination study, in order to reflect these changes and to test the validity of various models. A small sample home interview survey was conducted. The O&D update study included an airport survey, a mass transit survey, a truck-taxi survey, an external and a goods movement survey. Methods of data collection are stated. Data collection for the mass transit survey was by questionnaires which were given to the riders themselves, in order to obtain detailed data not available through the home interview survey. Information was obtained concerning the characteristics of the trip maker, as well as O&D data.

Rhode Island Statewide Planning Program Tech Paper No. 42, Jan. 1974, 52 pp, 3 Fig., 10 Tab., 7 Ref., 6 App.

42 261681 TRANSIT IN THE ENERGY ERA. In his remarks to the 15th Highway Transportation Congress, Professor Wohl of the Carnegie-Mellon Institute exhorted government and industry to consider the energy shortage not as a crisis unto itself, but a problem in conjunction with the rest of today's problems: highway safety, air pollution, inflation. The danger ahead lies in not studying the problem as a whole, and jumping into so-called solutions that have not been thoroughly researched for their real value. Dr. Wohl does not see public transit as the immediate alternative to the use of private vehicles, thereby producing a reduction in energy consumption. The possibility of creating free transit in order to increase ridership is valueless, since it probably increases energy consumption, rather than the reverse. Other, more attractive alternatives must be sought, such as express bus service, and more efficient use of taxicabs. The main points to be kept in mind in working out solutions to this energy shortage are that individual agencies must work together, and that public transit is not the panacea that some have created it.

Wohl, M (Carnegie-Mellon University) ; Highway Users Federation for Safety and Mobility Conf Paper May 1974, 6 pp; Presented at the 15th Highway Transportation Congress, Washington, D.C., May 8, 1974.

42 261727 MANUAL OF TRANSIT OPERATIONS IN CIVIL EMERGENCIES. A case study of transit service in Wilkes-Barre, Pa., following the Hurricane Agnes flood of June 1972, reveals the need for improved nationwide transit disaster procedures. All phases of planning for transit support in civil emergencies require upgrading by Federal, state and local governments. This manual describes the actions necessary to accomplish contingency planning, emergency transit evacuation and relief services in a systematic manner. Recommendations are offered. These include the following: according to the author, Federal efforts should focus on incorporating disaster preparedness into the existing requirements for capital grants by, for example, expanding "Exhibit O--Evaluation of Flood Hazards" in the capital grant application to include fixed-facility vulnerability to the pertinent major disasters; states should avail themselves of Federal matching funds for disaster planning with the state department of transportation or highway department responsible for transit planning input; etc. Chapters discuss Federal, state and local emergency frameworks and emergency transit operations preparedness procedures. References are furnished. A sequel report, "Manual for Transit Operations in Civil Emergencies--Transition Period," documents return to normal operations after emergency transit service in the Wilkes-Barre area.

42 262183 BUS USE AND ATTITUDES IN MODAL CHOICE. This study, based on surveys of the Christchurch public transport system, sought to investigate the concept of "captive" bus passengers. The study is reported in two parts. Part I summarises the research and lists conclusions and recommendations. Part II provides background information, detailed results and

technical data. The investigation considers the results of surveys undertaken in 1968 and 1969 and tests variables including: (a) person characteristics; (b) trip purpose characteristics; (c) stated personal attitudes to public transport; (d) some aspects of the transport system. It is concluded that it is not possible to identify any particular group of this New Zealand community likely to use public transport. There is a growing tendency for the bus system to be used more specifically for the trip to work. Passengers, are however, drawn equally from all income groups and geographic areas and are representative of the general characteristics of the Christchurch population. The one exception to this representativeness is in the tendency towards greater use of buses by females, especially in the 15 to 24 year age group. There is little evidence as to the best policy that can be pursued to suit the existing users of public transport. Increased future use may result from planning urban development patterns better suited to higher levels of exposure to the public transport system. It is concluded that there is no advantage in including forced choice "attitude question" within future "on bus" self administered transport survey questionnaires. It is firmly recommended that there is a need for complementary sociological, personal interview studies, of attitudes, habits and situations which may affect the individual's choice to use public transport.

42 262432 DISCUSSION OF RESOURCE PAPER-WORKSHOP 2: POLICY PLANNING.

This discussion which covers such aspects as the definition of policy, the derivation of policy, the determinants of good or bad policy, and outlines a plan for solution of urban transportation problems, also presents a framework that might be applied to policies on statewide transportation planning. The basic policy of such planning will establish long-range systems and corridor development plans that are designed to: serve the states objectives for economic growth, energy conservation, land use, safety and preservation and enhancement of the environment; provide optimization of the service provided by all modes of transportation consistent with efficiency, cost effectiveness, environmental protection, and enhancement of the quality of life; and support national goals and objectives. A policy on systems planning is described in which all transportation agencies in the state shall: develop long-range transportation plans for a minimum period of 10 years; formulate such plans to show the target accomplishments toward which the current capital expenditures will be directed; estimate maintenance and operating expenditure for the period of the plans; show the relation of recommended expenditure provisions to projections of revenues in accordance with traditional sources and trends; describe and show values pertaining to the economic and environmental impacts of systems and systems configurations as related to environmental categories and situations that will be affected by the plan outlines; provide for continual development of plans with a minimum update of every 2 years; notify the agencies of changes in plans; and recommend priorities for development of the systems. The policy on corri-

dor or route planning sets forth that, based on priorities developed in the systems plan, the transportation agencies shall: analyze costs, economic effects and environmental impacts of alternative service concepts within corridors to the degree necessary to establish a fully supportable corridor plan; compare concepts utilizing other corridors or no corridors; select and fully document corridor plans; consult with government and private agencies having responsibilities related to the impacts of corridor development; conduct meetings with local officials, interest groups and the public; and develop environmental impact statements.

Johnson, RD (Jorgensen (Roy)and Associates, Incorporated) *Transportation Research Board Special Reports* No. 146, 1974, pp 88-90; This report is part of five workshops of a conference, Issues in Statewide Transportation Planning, held February 21-24, 1974 at Williamsburg, Virginia.; ORDER FROM: TRB, Orig. PC

42 262445 RESOURCE PAPER-WORKSHOP 2: POLICY PLANNING.

This paper which defines responsibilities and discusses how states meet the issues of transportation planning, recognizes that the prevailing national and state situation is one of a multiplicity of separate, uncoordinated and often conflicting modal policies. The product and the process of transportation planning are defined. The policy analysis or policy planning which precedes and follows policy determination, and the hierarchy in the levels of policy processes are discussed. Policy planning and statewide transportation planning are more than a delineation of facility and service plans for intercity passenger and freight systems at the statewide scale. They include recommendations for changes in federal, state, local and private transportation policies. It is observed that the consequences of existing and proposed policies must be examined. For the former, past and current trend data may be instructive. Consequences may be traced out by making illustrative plans under present or assumed constraints or, alternatively, by estimating plan output. Professional aid is emphasized in specifying the consequences and circumstances to provide the background against which evaluation can be made. Transportation policy issues are grouped in 6 classes. A discussion of the allocation of responsibilities for the provision of transportation facilities and services, covers the aspects of new responsibilities for the states; obsolete jurisdictions; construction versus operation; and federal-assistance policies. Traditional transportation decision-making, independent authorities, comprehensive planning, public participation, litigation, and pass-through funds are aspects of the decision-making process that are reviewed. The integration is reviewed of privately provided public transportation into the state system (traditional regulatory theory; railroad branch lines). Changing the demand for transportation facilities and services (land use and transportation, selective provision of transportation facilities and services, changing government control of development, changing government policies to affect land development; peaking characteristics; accidents and pollution; energy and transportation) is reviewed. Funds for transportation (transportation needs and plans; funding arrangements) and charging for transportation are also reviewed in detail.

PC

42 262447 RESOURCE PAPER-WORKSHOP 3A: SYSTEMS PLANNING AND PROGRAMMING METHODOLOGY-PASSENGER TRAVEL.

This paper on passenger travel demand forecasting methodology presents a brief survey of existing state methodologies, discusses the desirable attributes of a statewide passenger planning and programming methodology, outlines a program of long range research, and identifies what can be done immediately to improve the existing methodology available to state transportation agencies. Four major areas are reviewed: emerging issues facing statewide planning as background for methodology for statewide planning and programming; existing methodology for statewide planning and programming; proposed improvement to statewide planning and programming methodology; and continuing statewide planning process. Priority programming, citizen participation and other issues strongly related to statewide transportation planning must be interrelated with the methodological issues of passenger travel forecasting. Among the aspects discussed are the changing state role in transportation decision-making, modal competition, citizen and community participation, equity, the planning and programming processes, highway simulation model, modal models, travel forecasting and impact prediction techniques, master planning versus the strategic, and the time-staged investment approach. It is recommended that a flexible analysis environment be developed for each state as well as a variety of multimodal modeling tools (general and specialized), with the capacity to predict travel, environmental and economic impacts, and trade-offs and equity issues for a wide variety of spatially and temporally different investment programs. These investment programs must include short-run, low-capital highway options, low-capital transit or para transit alternatives, and the more traditional longer range capital-intensive investments. A more strategic planning approach is also recommended that can be used in the past. Staging strategies will be evaluated not only for economic and environmental impacts but also for the flexibility to adapt to a wide variety of conditions that may evolve in the future. This approach would provide for a more positive influence in the actual programming and implementation process inherent in statewide planning. It will also allow for flexibility to interact with regional plans in an interactive, participatory, and interative manner.

42 262487 BALANCED TRANSPORTATION. PART II. This second part of a three part paper, explores the imbalance in funding of the different

modes of travel within the urban areas, indicates the need for a national transportation policy and reviews the relationship between transportation and the environment, urban "holding capacity," energy consumption and public and private development. It is conceded by highway officials that cities must be aided in providing public transportation. The merits of a bus system and its high labor cost disadvantage are outlined. Highway funds for the physical facilities of a bus system are now available. However, the outcome of the administration's effort to tap the Highway Trust Fund for transit is as yet uncertain. The question is raised that if transit is essential for the self-supporting, should we not apply Federal aid from general funds rather than draw on an unrelated transportation program of national scope? The point is made that except of a small percentage of trips, transit is not an alternative to highways. Demands by environmentalists for measure to preserve the environment are now backed by strict interpretations in the executive and judicial branches, and in recent legislation. In an effort to limit the inflow of motor vehicles into the downtown area, suggestions have been made for "congestion taxing." Investigations of energy requirements and the relative efficiency of the highway mode in energy consumption, indicates little likelihood of waning dependence on highways. The need is emphasized for the establishment and maintenance of a balance between the growth of cities and the amount and form of transportation that serves that growth. Insurance of such a balance would require a degree of control over private development.

42 262537 GLC LAND USE TRIP GENERATION STUDIES. The author provides an introduction to the subject of trip generation, defining the technical terms involved, and describing a number of land use trip generation studies. Aspects such as trip time-patterns and choice of travel mode are discussed separately, and the way in which data from the studies are used to appraise the effects of a proposed development on the local transport system is illustrated. /TRRL/

Smyth, R *Greater London Council Intelligence Unit Quart Btm* No. 26, Mar. 1974, pp 19-30, 8 Fig., 1 Tab., 20 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 209565)

42 262538 SOME APPLICATIONS OF COMPUTER GRAPHICS TO TRANSPORTATION PLANNING. This article shows how contour maps of the spatial variation of urban parameters can be drawn by computer. A complementary program has been developed at the GLC which produces planar projections of the surfaces that have been mapped. Examples of the uses of these techniques are given, based on work with the GLC's transportation model. They include the graphic representation of travel time to the central area of London by public transport and by car, the difference in travel time between these two modes of transport, and the distribution of car ownership in the Greater London Conurbation. The advantages and disadvantages of the techniques are discussed, together with likely future developments in this field. /Author/

Hathaway, P *Greater London Council Intelligence Unit Quart Btm* No. 26, Mar. 1974, pp 31-8, 5 Fig., 14 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 209566)

42 262560 HUMAN RESPONSE IN THE EVALUATION OF MODAL CHOICE DECISIONS. This research is an attempt (1) to evaluate the existing modes of transportation available for mixtures of inter and intra (urban and rural) travel, in terms of perceptions of current users and non-users for each mode; (2) to recommend ways in which non-users may be attracted to high density modes through improvement of key elements of the transport system (comfort, flexibility, etc.), and/or through properly communicating the actual advantages of the modes to potential users; (3) to evaluate proposed future modes and concept, (specifically the new Dallas-Fort Worth Airport) as to their potential demand for key passenger groups; (4) to develop a method for evaluating the relative importance of various transportation features attractive to key passenger groups; and (5) to develop a method for estimating potential users of proposed transportation modes, as well as their usage dates. Validate the method by testing anticipated vs. actual use of the Dallas-Fort Worth Airport, and indicate those identification criteria which successfully discriminate users from non-users. The principal methodology to be used is magnitude estimation, which requires respondents to give estimates of their perceptions of stimuli in the real world. Other multivariate techniques (multiple regression, discriminant analysis and factor analysis) will be utilized. Groups studied will include whites, blacks, and chicanos stratified according to the usual social and economic constraints.

Davies, S Alpert, MA Hudson, WR ; Texas University, Austin, (DOT-OS-30093 RM1) Apr. 1973, 29 pp, Refs.; ORDER FROM: Texas University, Austin, Council for Advanced Transportation Studies, Austin, Texas, 78712 Repr. PC

42 262570 PADUCAH TRANSIT STUDY. Transit patronage in the Paducah, Kentucky metropolitan area has declined so that it is no longer profitable for a private firm to operate the public transit system. This report is developed to improve transit service in order to alleviate, to the greatest extent possible, traffic problems which now exist and to improve the mobility of those people particularly dependent upon public transportation. The basic purpose of this study is to define short-range transit needs in the Paducah metropolitan area and to make recommendations for improvements. The analysis and findings will provide a method for accelerated progress in providing needed mass transportation facilities. Chapters discuss community involvement, transit objectives, evaluation of pre-existing conditions, data collection, transit ridership survey results, the short-range improvement program, implementation, and continuing transit planning. Appendices include the transit attitude questionnaire, projected operating statements by alternate, Kentucky House Bill No. 414, and the legal opinion on establishment of a transit authority. Tables, figures, and maps complement the text.

Schimpler-Corradino, Associates, (KY-09-0003) Tech Rpt. UMTA-KY-09-0003-74-1, Feb. 1974, 170 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-235412

42 262692 USE OF PUBLIC TRANSPORT IN TOWNS AND CITIES OF BRITAIN AND IRELAND. It is suggested that, while the importance of public transport for journeys to work in

larger urban areas has been recognized, there is a tendency to underrate its importance for smaller towns and non-work journeys. This article argues that this would be a mistake. It is demonstrated that the decline in public transport trip rates is not less in larger urban areas. Although rates of usage are higher in larger urban areas, they are not markedly so and the proportion of motorized trips made by public transport is not necessarily higher in larger urban areas than smaller ones. A regression equation is outlined to predict the modal split between public and private transport in urban areas which does not require population as a parameter. The ratio of peak to non-peak travel is shown to be lower in the smaller towns and cities. Correspondingly, smaller operators appear to be more profitable. It is concluded that the future of public transport is as secure in smaller urban areas as in larger ones. /TRRL/

White, PR *Journal of Transport Economics and Policy* Vol. 8 No. 1, Apr. 1974, pp 26-39, 3 Fig., 5 Tab., 7 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 209584)

42 262694 TRANSPORT AND DEVELOPMENT. This book contains a series of papers, the headings of which are as follows:-Geography, Transportation and Regional Development, Gauthier, HL; Transport Expansion in Underdeveloped Countries, Taaffe, EJ., Morrill, RL., and Gould, PR., briefly presents a theoretical model for network development which is then expanded with detailed reference to Ghana and Nigeria; Transport and Economic Growth in Developing Countries, Hoyle, BS., applies the model used in the previous paper to East African railway development and describes a similar model for port development, with applications; Transport Expansion in Liberia, Stanley, WR., also uses the Taaffe (et al) model and notes three stages of transport expansion-scattered ports, modern period of port construction and consolidation and inter-connection of roads, this being applied to Liberia; Highway Improvements and Agricultural Production, Miller, T., Examines what sort of improvements are justifiable and makes a case-study of an area in Argentina, concluding in this case that alternative aid schemes may be better; The Importance of Passenger Transport in Nigeria, Hay, A., describes four types of passenger transport each with its own characteristic patterns in terms of cost, use, distance travelled and vehicle occupancy. It includes a survey of taxi traffic, identifying the residence and motivation of travellers. Recent Railway Construction in Tropical Africa O'Conner, AM, gives an account of the lines built in this region, the rationale for building, their impact and some suggested evaluation criteria. Container Potential of West African Ports, Hilling, D., gives a breakdown of imports and exports by commodity type, and assesses the potential of containers. Problems of seasonal trade variation, small political units and inadequate transport suggest low potential at present. Transportation and the Growth of the Sao Paulo Economy, Grauthier, HL., investigates the inter-relationships changes in accessibility to the highway network and the growth of urban centres from 1940 to 1960, using canonical analysis. Transportation and Urban development in West Africa, Reichmann, S., discusses route development and urban centre location and expansion and then relates transport to urban form and

urban activities, concluding with a study of urban systems. Towards a Theory of Transport and Development, Wilson, G., discusses the economic opportunity and responses to it, followed by conclusions on policy and investment.

42 262695 TRANSPORTATION PLANNING AND PUBLIC POLICY. This book reviews British transportation planning in recent years. The first chapter presents the framework in which transport planning is done: its purpose, scope and organisation. Examples of planning for parts and local airports are given. The second chapter suggests that planning policy should precede analysis and that in the past the MOT's approach was wrong. Chapter three describes the objectives of planning policy. Several examples of cost-benefit analysis show that the object of a planning exercise should be decided at the start, decisions being taken as to those items which should count as benefits, those which should count as costs, and the way in which they should be accounted. Recent transport plans have accounted for intangibles, non-user benefits, service levels, as well as profits and consumers' surplus. The fourth chapter shows how attitudes have changed to policies such as car restraint, and promotion of public transport. Such alternatives must be included in the planner's brief. Chapter five looks in detail at the methodology of transport planning. Trip generation, modal split, trip distribution and route assignment are discussed, with evidence of recent advances in each aspect. The last chapter presents the major problems facing transport planning in the future, such as how to define criteria for system-wide testing of a wide range of policies.

Starkie, DNM (Reading University) *Progress in Planning* Vol. 1 No. 4, 1973, pp 313-389, 11 Fig., 8 Tab., Refs.; ACKNOWLEDGMENT: TRRL (IRRD 208720)

42 262697 MODAL SPLIT THEORY AND PRACTICE. The paper opens with a brief survey of early modal split procedures, discussing the position of modal split in the model and comparing the use of regression and diversion curve techniques. Current practice involves a generalized cost function derived from multiple linear regression, and the problems associated with the function are outlined. Three applications of the model are considered: the twin cities model used time, cost and distance measures to develop a disutility function relating car use to transit use; the Tyne-Wear plan model is more reliable since it uses car ownership instead of income as a discriminant in the degree of choice, and also employs certain land-use variables. Further improvements to this model are outlined, involving the use of weighting and scaling; the Selneq model for the cost function and employs a more efficient calibration procedure. Concluding, the author finds the Selneq and Tyneside models produce similar parameters and it is suggested that further work is necessary on the cost function and on the problems of individual versus aggregate data. A discussion of the paper follows. The covering Abstract for the conference is IRRD Abstract No. 209251

42 263136 PUBLIC SCHOOL TRANSPORTATION AND LOCATION POLICIES: A SYSTEMS ANALYTIC APPROACH. The systems approach can bring to bear the combined expertise of diverse disciplines-to develop quantitative analyses of alternative policies. In the research reported in this paper, systems analysis is used to develop and examine optimal student assignment plans for the Durham junior high schools corresponding to arbitrary levels of racial integration and various organizations of physical plant. The assignment of students to schools is accomplished by repetitive application of a modified operational model for solution of the "transportation problem". The Durham, N. C., city and county school systems are analyzed separately to evaluate the impact of various desegregation policies on such factors as the total transportation effort (bussing mileage or cost), the trip length distribution and the level of compactness and racial disparity of the districting and assignment system which results in an optimal system. Optimality is defined in this model by the case of minimum transportation effort. The combination of the two optimal systems is then compared to an optimal merged system. Finally, the model is used to develop assignment plans assuming alternative sites for construction of a new county school and various enlargements of the existing facilities. The data are presented in such a way as to enable policy makers to objectively evaluate the consequences of such policies, and to enable voters to better understand these consequences and to pass educated judgments on their merits and demerits. The authors feel that the explicit formulation and presentation of supporting data of the type suggested in this paper will set the scene for a better informed decision process.

Dajani, JS Wright, D White, KP (Duke University) *High Speed Ground Transportation Journal* Vol. 8 No. 1, Mar. 1974, pp 25-40, 5 Fig., 4 Tab., 7 Ref.

42 263163 SECTION II: SPECIFIC ECONOMIC FEATURES OF RAILWAY PASSENGER SERVICES IN LARGE CONURBATIONS SITUATION IN THE PARIS REGION. In order to be able to make the correct choice between the various solutions available to the problems posed by daily commuter traffic in large conurbations, it is necessary that comparisons be made by means of the cost benefit technique. This requires detailed analysis, backed by statistical information where possible, of the advantages and disadvantages of each solution. The use of this method, is nevertheless frequent and instances may be quoted of its application in the field of suburban transport. All studies show that beyond a certain number of daily journeys on a given route, it is more economical to use public transport than private transport. Certain measures are, however, necessary to enable priority in favor of public transport: statutory or fiscal measures must be taken to limit the use of the motor car in some areas; public transportation undertakings will benefit from a "normalization" process which will enable them to balance their receipts and expenditures; the infrastructure and rolling stock investment should be the total or partial responsibility of the community to the extent that public transport users are not the only beneficiaries of such investments. The application of these principles

to the case of suburban services operated by railway administrations is discussed, as is also, the coordination of several undertakings in a conurbation. In a discussion of the economy of rail passenger transport in the Paris region, the basic features of commuter traffic are summarized, the organization of public transport in Paris is described, and consideration is given to the economic problems facing passenger transport. Suburban transport undertaking. The transportation networks in the suburban areas of provincial towns of France are briefly reviewed.

Fioc, A *Rail International* No. 4, Apr. 1973, pp 467-479, 3 Fig., 5 Tab.; IRCA/UIC ENLARGED MEETING OF THE MANAGEMENT COMMITTEE OF THE IRCA, Lausanne, 3-9 June, 1973.

42 263932 INTEGRATING SYSTEM AND PROJECT PLANNING FOR EFFECTIVE STATEWIDE PROGRAMMING OF INVESTMENTS. The need to address community and environmental issues in transportation planning has been widely recognized during the past few years. The initial response to these issues has been to include a broader segment of the public and to examine a wider range of impacts in the project planning process. However, a project-oriented approach has proved inadequate for a number of reasons. During system planning, decisions are made that determine many project-related social and environmental impacts, and there are some impacts that by their nature should be treated on a system bases (e.g., air quality, housing dislocations, land use). Uncertainty in funding levels, community preferences, and impacts, particularly during longer-range system studies, further complicate the ability of a planning process to address community and environmental concerns in a continuous manner throughout system and project studies. To address these issues requires planners to develop and approach to planning that provides for continuous coordination between system and project planning. A key to implementing such an approach is recognizing that during system studies attention can be focused on a range of project and system choices that are available, rather than limiting project studies to one set of potential projects. A key level in implementing this approach is to require a system format that includes capital and non-capital options (policy and operating changes), and describes implementation strategies rather than end-state plans. Supporting such a format should be a documentation of ongoing system as well as project environmental studies.

42 264033 SOFTWARE SYSTEMS DEVELOPMENT PROGRAM INTRODUCTION TO URBAN TRAVEL DEMAND FORECASTING-VOLUME I-DEMAND MODELLING. The UMTA Transportation Planning System (UTPS) provides a wide range of analytical and computerized tools for making travel forecasts for existing and proposed transportation systems. This manual is designed as an integral part of UTPS. The object of the manual is to provide an introduction to travel forecasting to enable trans-

portation planners and analysts to utilize UTPS effectively. It provides a comprehensive overview of the methodology of travel forecasting, the analytical tools available and their appropriateness for typical problems the transportation planner faces, input requirements, outputs needed for proper evaluation, and appropriate levels of effort for various stages of analysis. The manual is divided into three parts: the Summary; Volume I—"Demand Modelling;" and Volume II—"Evaluation." /UMTA/

42 264779 URBAN TRANSIT PLANNING GUIDELINES. Pennsylvania DOT's report provides technical information and policy guidelines that should be considered in developing both short range and long range transportation plans. It addresses the issues of: 1) What data are collected, by whom, how and when. 2) The relationship of this data to the process of urban mass transportation in accordance with the U.S. Code, the Urban Mass Transit Act and economic and environmental programs. 3) A comprehensive description of development programs including the plans, priorities, approach and administration. 4) The types of analytical procedures used for the different approaches. 5) Agency relationships. 6) Choice of target years, study area boundaries, contractual relations and consultant selection. 7) What products of planning should result and how they will be used. 8) The relationship between a transit development program and low-capital-intensive transportation programs improvements. 9) The role of capital intensive solutions. 10) Agency responsibility with regard to funding, engineering, construction, maintenance and operation of transit system. Typical transit study work programs are given for both short and long range planning along with a chapter on adopting and updating plans and programs.

42 264845 TRAVEL GROWTH IN WASHINGTON REGION HIGHLIGHTS NEED FOR MORE SMALL VEHICLE TRANSIT. This is a report of a research and information project on the impact of energy shortages on the Washington metropolitan area. It is based on interviews with officials involved with transportation planning and a scan of current plans. The population of this area is expected to increase from 3.2 million to 5 million by the year 2000. This means greatly increased travel within the area. Metro will provide some of the areas transportation needs but additional means will be

needed. Metrobus will meet some of this need but the problem of the need to maintain more equipment and personnel to meet rush hour demand than can be economically used during the rest of the day still remains. Any urban mass transit system including Metro and Metrobus impose heavy tax burdens on residents. This means that a wiser use of land, rail, highways and traffic management should be encouraged. Car pools, employer owned vans, jitneys, dial-a-ride buses and group taxis are transit initiatives that could have practical applications in this region. Walters, C ; Washington Center for Metropolitan Studies Report No. 2, Aug. 1974, 36 pp

42 264961 TESTING URBAN TRANSIT'S FUTURE. The Highway Users Federation has developed a sketch planning process for quick analysis of proposed improvements to urban transit. It gives procedures for analysis of broad policy of transit improvements. It includes information on calibration for a modal split model, data from the Nationwide Urban Transit Study and trip characteristics from the study, selecting test alternatives, how to induce demand program costs and revenues and Nationwide study results.

Reed, MF, Jr Difiglio, C ; Highway Users Federation For Safety and Mobility Tech Study Memo No. 10, Sept. 1974, 59 pp, 6 Fig., 40 Tab., 26 Ref.; Presented to the Transportation Convention of the American Society of Civil Engineers in Montreal, Canada, July 15, 1974.; ORDER FROM: Highway Users Federation, 1776 Massachusetts Avenue, NW, Technical Serv Div, Washington, D.C., 20036 Orig. PC

42 265358 FLEXIBILITY IN TRANSPORTATION DECISIONS. The traditional role of cities and of the highway program was dramatically altered by the 1973 Federal-Aid Highway Act. The shift in emphasis was indicated by such provisions as: permission to use highway funds for rail or bus transit equipment; allocation of funds to be used for metropolitan transportation planning purposes; local officials are able to determine their own transportation future through a state-local cooperative process. The means of implementing each of these provisions is discussed further in the article. The initiation of projects to achieve an effective balance in highway construction or reconstruction, bikeways, rail or bus systems, parking, etc., is now to come from local officials.

42 265590 A SIMPLIFIED FORM OF THE CRISTAL TRANSPORT PLANNING MODEL IN THE COURSE OF WORK ON THE CRISTAL TRANSPORT PLANNING MODEL OF GREATER LONDON, A GREATLY SIMPLIFIED "SINGLE-LINK" VERSION OF THE MODEL HAS BEEN DEVELOPED. IN THIS, VARIOUS PARTS OF THE AREA ARE TREATED AS IF TRAFFIC CONDITIONS WERE UNIFORM OVER THE AREA REPRESENTED; THIS LEADS TO A MODEL WHICH HAS DEFINITE LIMITATIONS BUT WHICH OVER A LIMITED RANGE OF APPLICATIONS CAN GIVE VERY RAPID ASSESSMENTS OF ALTERNATIVES. THIS PAPER DESCRIBES THE MODEL, THE DATA USED TO SET IT UP

AND THE RESULTS OF SOME APPLICATIONS TO RESTRAINT AND FARES POLICIES. THESE APPLICATIONS ARE MAINLY CONCERNED WITH SENSITIVITY TESTS, WITH ALTERNATIVE ASSUMPTIONS AND WITH VARIATIONS ON THE MAIN POLICY OPTIONS; THE MAIN POLICY OPTIONS THEMSELVES HAVE BEEN DEALT WITH MORE SATISFACTORILY BY THE NETWORK VERSION OF THE MODEL. LIKE THE NETWORK MODEL, THE SINGLE-LINK MODEL ONLY DEALS WITH TRAFFIC EFFECTS AND THEIR DIRECT ECONOMIC CONSEQUENCES, AND NOT WITH THE WIDER SOCIAL ENVIRONMENTAL OR POLITICAL CONSIDERATIONS. /AUTHOR/

42 267019 A SHORT-RANGE TRANSIT DEVELOPMENT STUDY. The study area that is the focus of this report includes the cities of Tuscaloosa and Northport, Alabama, and the unincorporated areas of Holt and Cottondale. Community and operational transit desires and requirements were set forth in the form of goals and objectives; and transit recommendations made in accordance with them. These recommendations include a five-year transit development program, an analysis of long-range transit potential in Tuscaloosa and recommendations for a shuttle bus system on the University of Alabama campus. Important recommendations include: (1) a replacement of all vehicular equipment now owned or leased by the Tuscaloosa County Parking and Transit Authority and the construction of new office and garage facilities; (2) an increase in all transit service and route coverage; (3) the implementation of a transit program that is cognizant of public attitudes; and (4) a shuttle bus system on the University campus to meet present short-range needs. Existing conditions and reestablishment of transit service in the area served by the Tuscaloosa County Parking and Transit Authority are discussed. Census and other available demographic data were studied and on-board bus survey conducted. Transit organization and operation were discussed and a recommended program delineated. Priorities, financial implications and funding alternatives were considered. Appendices include survey results, description of recommended route locations and the University of Alabama proposed shuttle schedule. Tables, figures and maps are numerous.

Bartholomew (Harland) and Associates Final Rpt. UMTA-AL-09-0003-74-1, Mar. 1974, 114 pp; Prepared for Tuscaloosa County Parking and Transit Authority. Technical Memoranda in report number UMTA-AL-09-0003-74-2.; ACKNOWLEDGMENT: UMTA (AL-09-0003); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-232332/AS

42 267027 A TRANSIT DEVELOPMENT PROGRAM FOR THE LYNCHBURG URBAN AREA. The report summarizes the findings and recommendations of a technical studies planning grant for the Lynchburg, Va. urban area. Using data and information gathered throughout

the study, the current status of transit service is described, trends over the past five years are provided and the financial prospects for the future operation of the Lynchburg Transit Co. are given. Using the information obtained in the community interviews, public transportation needs in the Lynchburg area are identified and transit goals and objectives are stated. Transit ownership and management alternatives are described indicating the possible advantages and disadvantages of each alternative. In response to the specific transit objectives identified earlier, a set of service modifications are presented and discussed for incorporation into a Transit Development Program.

Voorhees (Alan M) and Associates, Incorporated Tech Rpt. UMTA-VA-09-0006-74-1, Feb. 1974, 181 pp; ACKNOWLEDGMENT: UMTA (VA-09-0006); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-231436

42 267031 CHARACTERISTICS OF TRANSIT SUPPLY IN SMALL-AND MEDIUM-SIZED CITIES. This study proposes to demonstrate that with a small- or medium-sized community's given hardware systems, under-utilization of service and hence economic loss for the operator need not always be the case. Instead, by accessing the present ridership rates and route characteristics, analysis can be performed which will suggest a system that is both acceptable to passengers and economically viable to the bus operator. Frequency of service was used as the indicator of the relative quality or level of service. An attempt was made, therefore, to demonstrate the use of a methodological technique to aid transit operators in adjusting bus service using the financial resources available. Objectives were: (1) to test the service specification concept as a means for determining the economic conditions of bus transit operators; and (2) to establish a correlation between economically viable route characteristics and ridership rates. A bibliography is furnished. Appendices include an example of the questionnaire used to obtain data and summary statistics for linear regressions performed in the development of the study analysis. /UMTA/

42 272068 IMPLEMENTATION OF PUBLIC TRANSPORTATION SYSTEMS. The creation and activities of the Florida Department of Transportation are reviewed and the functions and major approaches to transportation planning are outlined. The organization is briefly described of the urban-oriented, multimodal, professional department of transportation which was evolved from a highly politically oriented highway department. The lessons and customs of the former operation have been carried over to the present. The revenue available to transportation is discussed in which three fourths may be used with flexibility. Florida has advocated the partnership concept in the development of its 11,000-mile primary highway systems with largely non-limited access. The department also designs and builds the secondary road system in cooperation with the counties. Resort to toll facilities is described, some of which are revenue based and others use a combination revenue and county

secondary funds. The budget has been built in all instances on matching available or expected-to-be available federal funds. In working with local government units, a simple mutually acceptable agreement is drawn up that commits the local funds and sets out what the state should do. The department is cooperating with local government and the Urban Mass Transportation Administration to salvage several failing systems, primarily by replacing worn out buses and by providing capital grants to publicly owned urban systems. The development of new systems are being considered and the need is indicated for additional legislation in the financial field. A preference is expressed for local transportation projects to originate at the local level and an attempt is made to anticipate such projects so that consideration may be given in the appropriation process. Good planning has the functions of objectives, establishment of funding commitment and justification of the expenditure program to the funding agencies. The three major planning approaches are: broadscale statewide system planning; specialized regional planning including rapid transit systems; and exclusive service tailored for specific urban area or sub group within the area.

42 272072 PUBLIC TRANSPORTATION PROBLEMS IN URBAN AREAS. A plea is made for reordering priorities that will bring the public transit element of the urban transportation system to its optimum role. This will mean the stabilization of the transit situation by provision of operating subsidies. Investment in transit systems must be increased and more community resources such as roads and terminal facilities must be committed to transit in preference to the private automobile. Heightened public awareness both of the nature of the transit's problems and of the objectives being sought as a solution to these problems is essential. Policy-makers themselves must reach a clear-cut decision as to what needs to be accomplished. The course of events are reviewed with regard to transit fares for the Washington D.C. Transit system. Publicly owned systems throughout the country face the same problems of increasing fares, decreasing ridership, and deteriorating service that gave rise to public ownership. The rate regulation of private utilities, and the aspect of labor relations is discussed. A clear understanding is required of the real causes of the constant upward pressure in transit fares and its attendant decline in ridership levels. The labor-intensive aspect of urban transit is emphasized. Transit management is seriously limited in its ability to absorb the impact of increasing labor cost. The role of the automobile in society is discussed. The stabilization of existing transit service cannot be achieved through conventional regulatory means. Subsidization of transit operating costs through public funds is an essential element of any program to make basic revision in our public transportation systems. The concept of public support raises basic problems such as provision for means to retain an incentive for

efficiency of operations. Bold and innovative programs such as giving priority movement to public transport, must be effected to give the public system competitive travel times and comforts. The question of the need for rail rapid transit systems is discussed.

Avery, GA (Wald, Harkrader and Ross) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 12-20, 1 Ref.; Appeared in *Issues in Public Transportation*, Proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB Publications Off

42 272078 PLANNING, RESEARCH, EDUCATION AND TRAINING, AND LEGISLATION (RESEARCH SEMINAR). The seminar addressed questions relating to the role of research in aiding in the solution of public transportation problems, the identification of high priority research areas, and the question of who should perform the research. Consideration must be given to a balance between technological research and institutional factors. The dissemination of the results of research that already exists, together with a better interchange of information is an important part of research activity. The taxi should be viewed as a transit mode and better integration with other transit facilities as well as innovations in security and surveillance should be considered as research areas. Questions relating to the definition of various strategies with respect to the application of different transit technologies are discussed. The impact of labor in urban transportation and its effect on new systems development is another research need. The effectiveness of non transportation alternatives in achieving stated objectives should be explored. The various aspects of subsidies for urban transit should be studied. A need was expressed for better understanding of the meaning of research and improved communication between the researcher, transit manager and user. A list is presented of suggestions for research submitted by participants at the seminar.

Hoel, LA (Carnegie-Mellon University) Schnell, JB (American Transit Association) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 117-119; Appeared in *Issues in Public Transportation*, proceeding of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB Publications Off

42 272079 IMPLEMENTATION OF PUBLIC TRANSPORTATION SYSTEMS. The effective coordination of urban transportation programs with other goals of metropolitan areas requires that comprehensive institutions exist not only for long-range planning purposes but also for implementation of plans. The enforcement of agreed-on priorities is an essential element of the planning process. Both kinds of decisions must be made by the same institution and, to be effective, that institution must have political power and the requisite technical skills. The problems inherent in long-range planning in U.S. metropolitan areas makes it important that the institution concerned must have legitimacy. The body that plans and sets the priorities must be capable of sensing changes in public attitudes requiring revision of those plans and programs. The most desirable path to follow to achieve the objectives is to

strengthen the present council of governments so that they have sufficient authority to enforce their transportation plans and decisions. States (with limited exceptions) should delegate their present decision-making power relative to highways to the councils but conditional to the latter's capability to act. Action to strengthen the councils must come from the state. However, there are a few instances (mostly small, highly urbanized states with no more than one major metropolitan area) where the state and not a council can do a better job and can also reasonably meet the legitimacy requirement. In such instances, the elaborate organizations of metropolitanism may be both unnecessary and unworkable. The paper discusses the problems posed by the unbalanced financing, the inherent difficulties of the American political system, and the inadequacy of the local institutional structure, with special emphasis on the last problem. The trend toward departments of transportation at the state level and the rapid growth of councils of governments in large urban areas are discussed in detail. The Metropolitan Transportation Commission in the Bay area of San Francisco and the subregional institutions of Los Angeles as well as the state level bodies of Maryland and Massachusetts are reviewed.

Colcord, FC (Tufts University) *Transportation Research Board Special Reports Proceeding No. 144, 1974, pp 105-111; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB*

42 291006 RURAL TRANSPORT IN CRISIS. This article discusses how accessibility to and from rural areas has changed as a result of the uncontrolled growth of car ownership and the lack of government policy in this field. The authors believe a fuller consideration of factors such as pollution, congestion, maintenance, emergency services and other social costs reveals the 'True' cost of car use. Increasing car use has led to reduced use of public transport, and subsequent network reductions and the re-structuring of finance have not arrested the decline. Case studies of the Scarborough-Hull Railway line and Midland Red Bus Co. illustrate the process. This has reduced country people's mobility, increased visitors and physically damaged the countryside. Rationalising the different accounting methods for roads and public transport would be a partial solution, and the authors suggest changes in investment, public transport modes and fare policy to encourage the use of public transport by visitors to the countryside.

Ramblers Association R&D Rpt. No. 4, 23 pp, 1 Fig., 1 Tab., 7 Phot., 42 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 207685)

42 291007 COMPACT A SIMPLE TRANSPORTATION PLANNING PACKAGE. The article describes compact, a single computer program developed by the mathematical advisory unit of the department of the environment to carry out the network building, trip distribution, modal split and assignment phases of a transportation model. The function of transportation models in forecasting travel demand is described with particular reference to the two main inputs: planning variables and transport vehicle descriptions, and the structure is illustrated by means of

a block diagram. The speed and low cost of compact is obtained by forcing users to adopt a coarse zoning system. The model is for two types of travel-car and public transport, and two types of person-car owners and non-car owners. Restrictions on the size of study when compact is used on a cdc 3300 computer are number of zones 98, nodes (including zone centroids) 135, links in each network 540, journey purposes per run 6. Most likely applications would be in small town studies, in structure plans, initial sifting of broad strategies, and as a training tool. The larger cdc 6600 version is being used for testing of land-use alternatives with 87 zones, 200 nodes and 600 links. Both are available to local authorities and others interested but it is pointed out that advice cannot be given on the use and interpretation of program. Versions of compact exist for the cd 6600, icl 1900 series, ibm 360 series and univac computers.

Mackinder, IH *Institution of Municipal Engineers. Journal of Vol. 100 No. 8, Aug. 1973, pp 230-232, 2 Fig., 3 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 207682)*

42 300014 MAP WORKS IN WARWICKSHIRE. Warwickshire County Council and the Midland Red Bus Company (a National Bus Company subsidiary) have cooperated in a Market Analysis Project (MAP) to ensure a viable network which would meet most needs and reduce the amount of revenue support required. The author traces the history of the rationalisation studies in Stratford-upon-Avon and Warwick-Leamington. In the MAP study, each area is treated separately and any surplus in one MAP is not normally transferred to another area to increase its size or subsidise its fares. A county-wide travel survey was undertaken to establish minimum needs for travel in urban areas based on village size and facilities. The methods used for conveying school children are important; Warwickshire Council "buys" passes on stage buses thereby reducing the revenue support which the County Council would otherwise have to pay to the Bus Company. The author regards it as being unfortunate that, as a result of a more efficient service, the government is reducing its revenue support to Warwickshire. /TRRL/

Cameron, GR (Warwickshire County Council) *Surveyor - Public Authority Technology Vol. 153 No. 4518, Jan. 1979, pp 13-15, 1 Fig., 1 Tab., 1 Phot.; ACKNOWLEDGMENT: TRRL (IRRD 241065)*

42 300041 PRIVATE TRANSPORT MODES ARE FAVOURITE IN COMMUTER TRAFFIC [Eigen vervoermiddelen favoriet in woon-werkverkeer]. The Dutch Institute for Statistics has studied commuter traffic. A comparison with the identical study in 1971 shows interesting modifications. Topics studied are the availability of private transport modes, the journey to work related to income and urbanization and how long the journey takes using public transport. In 1971 36% of the persons interviewed used their own car to travel to their work. In 1978 this number increased to 47%. In the lower social class the use of the private car increased from 28% to 43% and in the lowest social class from 16% to 30%. /TRRL/ [Dutch]

42 300068 A STUDY OF TRAVEL LINKAGES: IMPLICATIONS FOR URBAN TRANSPORT PLANNING. This paper outlines the importance of trip linking on the journey home from work, and the importance of relating it to the journey to work. It presents some empirical evidence from Canberra to quantify the significance of trip linking. Some implications for transport planning and policy, and for transport modelling, are discussed. These principally relate to trip generation, mode choice and car pooling. The paper was prepared for presentation at a workshop on Methods and Concepts in Transport Modelling, C.S.I.R.O., Division of Building Research, Melbourne, Feb 1979. /Author/ TRRL/

42 300072 TESTING THE DOGIT MODEL WITH AGGREGATE TIME-SERIES AND CROSS-SECTIONAL TRAVEL DATA. This paper compares dogit and logit specifications of market share models, taking into account the possibility that conclusions might depend on transformations of the explanatory variables of these models. Parameter estimates are obtained both for a time-series urban transit mode of payment model and for a cross-sectional intercity mode choice model. It is demonstrated, using current maximum likelihood techniques extended to take multiple-order autocorrelation of the residuals into account, that the logit specification is at least equal to, and sometimes clearly superior to, the logit specification irrespective of transformations of explanatory variables. /Author/ TRRL/

42 300089 TRANSPORTATION PLANNING IN LEEDS. Leeds is a commercial and business centre of regional importance. The basic principles of the Leeds approach to transportation planning still apply today. The original plan had to be modified. The recommended strategy now is a modest growth in car usage and an attractive public transport. Parking control, car pooling and staggered or flexible working hours are means of reducing the peaking of transport demand. By the urban traffic control system and an upgrading of the local rail system the demand is catered for. A light transit system could act as a back-up. The public prefers ground level footways. Reacting to and providing for perceived demand is replaced now by the principle of influencing transport demand. /TRRL/

Naylor, AE ; Koninklijk Instituut van Ingenieurs 1978, pp 43-57, 5 Fig.; From Verkeers-En Vervoersplanning in Enige Europese Steden.; ACKNOWLEDGMENT: TRRL (IRRD 240983), Institute for Road Safety Research

42 300139 BACKGROUND TO PRESENT DAY TRANSPORTATION IN THE LEEDS SUB REGION. Leeds was not a city of major importance until the industrial revolution when with the growth in industry and commerce the

population also grew. The major growth of the city took place before the second world war. Passenger transport developed. After the second world war motor car, motor bus and train were the transport modes. The rate of growth of traffic increased. Construction of the road network was part of an overall programme of comprehensive re-development. The city now needs a large scale renewal. The "Leeds approach" should be partially reassessed. There is now a much more restrictive approach towards capital investment in transportation infrastructure. /TRRL/

42 300146 CAR OWNERSHIP AND PUBLIC TRANSPORT. A number of studies of the interaction between car ownership and the availability and use of public transport in Great Britain and the United States are presented, based on time series, household level cross-sections and area-based cross-sections. The household level cross-sections show that public transport use increases with increasing income, at a fixed level of car ownership, but decreases with increasing car ownership. When car ownership levels in different areas are compared with public transport levels in the same areas, strong negative correlations are usually obtained. Usually these remain strong even when allowance is made for a number of non-transport variables. One study, however, shows a slight positive correlation. Some of the studies were designed to show particularly the effect of public transport level on car ownership, and these suggest that when for extraneous reasons public transport levels vary over a wide range, ownership may as a result vary by about 0.05 cars per person, mainly associated with second cars. Causality in the reverse direction is shown most clearly by time series data and by household level cross-sections. The effects in the two directions combine to produce the area-based correlations. /Author/TRRL/

42 300155 THE CONSEQUENCES OF "WHO GETS THE CAR" IN THE ONE-CAR FAMILY. Transport planning is still largely focused on the journey to work. Little consideration has been given to individuals not in the workforce. This paper draws attention to the mobility problems of women left at home without the family car as a consequence of the husband using it to commute to work. It is proposed that to improve transport efficiency the trend to leave the family car at home be encouraged, thereby reducing the pressure to acquire a second family car which many families can ill afford. The possibilities of increased car-pooling, improved access to public transport, new cross-country bus services and provision of community buses are discussed. /Author/TRRL/

42 300264 ACCESSIBILITY TO EMPLOYMENT AND THE JOURNEY TO WORK IN METROPOLITAN ADELAIDE. This paper examines measures of job accessibility and work trip behaviour in Adelaide. It compares patterns of accessibility to employment at Adelaide with those recently described in Sydney (ref: paper by J. Black titled Changing Accessibility to Employment) using the journey to work data available from the 1971 census. It then attempts to assess the importance of workers of variations in accessibility to job opportunities, using the results of a household survey carried out in Adelaide in 1975. /TRRL/

42 300281 CHANGING ACCESSIBILITY TO EMPLOYMENT. The purpose of this paper is to examine some consequences of changes in the location of economic activity and changes to transport on urban society. It is divided into four sections. In the first section, the inter-relationships between accessibility and the amount of travel are introduced in a theoretical way. The argument is that distributions of accessibility (over space), distributions of private vehicle (over space and within households) and distributions of trip-length (over space) are being modified over historical time. Section two explains various measures of accessibility to employment. Section three describes patterns of accessibility to jobs and travel in Sydney in 1971. Section four speculates on how these patterns have evolved in the post war period and how they might evolve in the future. /TRRL/

42 300365 STATE TRANSPORTATION PLANNING: PRELIMINARY TRANSPORTATION PLAN. This preliminary transportation plan contains the needs and suggested actions for each form of transportation in the State of Washington. The State and local system of highways, roads and streets is the basic transportation network of the State and will remain so in the future. To maintain this status, it is necessary to continue to replace or rehabilitate structurally deficient bridges and maintain serviceability of the roadway pavement as well as other highway maintenance and to complete the interstate highway system by 1990. In addition, it is necessary to improve and coordinate the various forms within that mode as well as improve level of service and coordination with the other transportation modes--water transportation, air transportation, and rail transportation--in an effort to reduce dependence on private automobiles and thus reduce traffic congestion and promote energy conservation. Thus, use of public transit, carpooling, park-and-ride lots, and

reserved lanes for high occupancy vehicles will be encouraged. Marketing support will be provided to private bus systems in an attempt to increase level of service and ridership of intercity bus transportation. Technical assistance will be provided in the development and operation of para-transit systems. Selected existing facilities will be modified and additional facilities developed to better accommodate bicycle and pedestrian travel. Additional technical and financial assistance will be extended to appropriate authorities to enable them to expand and make improvements to existing airports or construct new airports as necessary, and intrastate commuter airlines will be classified as "carriers of convenience and necessity" thereby making them eligible for tax exemptions. Level of service and levels of subsidy for the Ferry System will be maintained. Also, ferry service will be integrated with bus transportation; and incentives will be provided for use of ferries by walk-on transportation; and incentives will be provided for use of ferries by walk-on passengers and bicyclists, buses, and carpools. Finally, rail passenger service will be identified consistent with needs of the state and provisions supported to retain the level of service by AM-TRAK.

Washington State Department of Transportation Feb. 1979, 220 p., 42 Fig., 10 Tab., 1 App.; Prepared for the Washington State Legislative Transportation Committee, and the House and Senate Standing Committees on Transportation.

42 300690 OVERVIEW OF RURAL TRANSIT PLANNING AND IMPLEMENTATION. A typical planning and implementation process for rural transit systems is summarized. Specialized rural transit systems usually are initiated when local authorities perceive and define a transportation problem. The next step in the process is a needs and feasibility study in which efforts are made to determine whether or not a system should be started. After financial and political support are obtained, the system must then be designed and implemented. Finally, a continuous evaluation of whether the system is solving the perceived local transportation problems is necessary. The synthesis of the planning and implementation process that is described in this paper was developed from extensive information on special rural transit systems that was gathered by field visits to 12 systems and from data on other operations. /Author/

42 300704 DATA RECORDING AND EVALUATION: THE BARNSTABLE COUNTY EXPERIENCE. A mechanism for collecting data on rider and operating characteristics of regionwide public transportation services is described. The mechanism, a serially numbered rider identification pass, is being tested as part of an ongoing demonstration project in Barnstable County, Massachusetts. Service is provided on a prearranged demand-responsive basis by use of ten 12-passenger vehicles. Passengers acquire passes advance and complete a questionnaire on their socioeconomic characteristics and physical disabilities. When passholders telephone to schedule

a trip, the dispatcher records their pass number, pickup time, trip purpose, and origin and destination. Special attention has been given to minimizing the data are collected for all riders. These data may be used to (a) evaluate vehicle productivity and efficiency, (b) examine the impacts of local policy decisions, (c) assess the portion of a deficit to be paid by each town, (d) develop user charges and contractual agreements for use by social-service agencies, (e) identify those persons who are eligible for the services of a social-service agency, and (f) describe user characteristics. The uses of the pass in fare collection and marketing are discussed, and capital and operating costs of the pass are estimated. /Author/

42 301021 SEEMINGLY UNRELATED STATIC AND DYNAMIC URBAN TRAVEL DEMANDS. This paper examines the usefulness of grouping trip demand equations for estimation purposes using as examples two of the markets served by the Montreal Urban Community Transit Commission. The equations are estimated both under the assumption that consumers adjust immediately to changes in fare and service frequency, and under the assumption that their response varies over time. Single-equation estimates obtained by combining Box-Jenkins RTH Order Autoregressive Processes with the Cochran-Orcutt Maximum Likelihood Iterative Technique for non-linear equations are compared to estimates obtained by using a maximum likelihood iterate of parks' seemingly unrelated procedure generalized to higher order autoregressive schemes. Forecasting experience with both estimation methods is also summarized. /TRRL/

42 301243 THE URBAN TRANSPORTATION SYSTEM. This book is a comprehensive and original examination of the factors that have shaped the U.S. urban transportation system and of innovative options available to today's policy makers. It offers both a systematic, multidisciplinary analysis of the problems and available alternatives in urban transportation, and a political analysis of the ways in which policy makers actually choose among options. /Pergamon Press Library Service/

42 301277 URBAN TRANSPORTATION POLICY: NEW PERSPECTIVES. This book is a collection of essays, most of which were prepared for the Urban Transportation Policy Seminar held at Syracuse University during spring 1970. Sponsored by the Urban Transportation Institute, a part of the Metropolitan Studies Program at Syracuse University, the seminar presented a variety of perspectives on urban transport policy. Funds for the series were provided by the Urban Mass Transportation Administration, U.S. Department of Transportation, as part of the University Research and Training grant program. The seminar covered three major topics: The general relationship between policy and "the urban transportation problem." Examples of the impact of specific urban transport programs; and the relationship between transport policy and other aspects of urban growth and development. Each of these is the subject of a section of this volume. There is also a concluding section that presents one of the papers from the seminar series. In closing, the editor attempts to synthesize the conclusions of these papers and to bring the discussion up to date by considering some new developments in policy planning. The authors prepared their papers independently of one another. Nevertheless, several coherent themes emerged as the series progressed, and these themes may be taken to represent the leading edge of current issues in urban transport. The first theme concerns the role of urban transport systems in providing mobility for people. Strange as it may seem, this aspect of transport's role has been rather neglected by scholars and practitioners in the field. Only within the last two or three years has dialogue among them begun to emphasize movement of people rather than vehicles. A second theme is the nature of the relationship between transport facilities and urban growth. Three of the contributors were asked to deal with specific aspects of this issue; their papers comprise Section III. A number of the other contributors also touched on the same issue in their papers. The third theme, recurring perhaps more subtly than the preceding ones, is that "urban transport policy" is really a set of policies developed at various levels of political jurisdiction, concerned primarily with problems of particular modes (until very recently) and administered by a variety of techniques, among them the proverbial carrot and stick and sometimes even total inaction. /Author/

42 301310 GOVERNMENTAL AND PUBLIC CONSTRAINTS TO THE IMPLEMENTATION OF LIGHT-RAIL TRANSIT IN DAYTON, OHIO. This paper discusses the local, state, and federal governmental and institutional constraints to the implementation of light-rail transit. The experiences of the Dayton region are used in an attempt to draw broadbased conclusions and general recommendations applicable to other medium-sized urban areas. The planning process that led to the selection of the light-rail mode in Dayton is also described. /Authors/

42 301311 ANALYSIS OF TRANSIT ALTERNATIVES. The planning and implementation of major public works projects require the consideration of many engineering, social, environmental, political, and fiscal issues. In particular, the 1970s have seen nonengineering issues take precedence over engineering considerations in project planning and implementation. These issues are highlighted in a conceptual approach based on six tests of feasibility--physical, operational, institutional, social and environmental, financial, and economic feasibility. This paper describes the application of this approach and the nonengineering issues that were identified as having an effect on the planning of a light-rail transit system in Harrisburg, Pennsylvania. The feasibility tests were found to constitute a valuable approach because they lead to a formal or explicit recognition of several planning issues that are usually only implicitly recognized in planning studies. Once they were explicitly identified, these issues could be analyzed in terms of their impact on the planning process. /Author/

42 301312 JOINT-DEVELOPMENT POTENTIAL FOR LIGHT-RAIL SYSTEMS. In recent years, many cities have begun to question the universal application of conventional rapid transit (CRT) systems but have indicated a need for a fixed-guideway solution to their problems. During this period of technological reexamination, light-rail transit (LRT) systems are being evaluated in greater detail to determine their capacity to meet operational specifications. This paper isolates for discussion the potential of LRT systems to inspire joint-development opportunities like those that have been attributed to CRT systems. Current incentives are evaluated in terms of the similarities that exist between the development of CRT and LRT systems. LRT's operational flexibility is widely recognized. This flexibility also provides new dimensions for station-area development; the small scale (compared with CRT stations) provides opportunities for initiating development potential. The barriers to joint development for LRT systems are essentially the same as those for CRT systems. The most significant barrier to a full realization of joint-development potential is the lack of adequate private capital to realize the full opportunity of the public investment. Under the new policy directives for urban revitalization, several new financial assistance programs have been developed. The urban design action grants appear to have a significant potential for use in expanding the joint-development potential of LRT systems. Value-capture options for stimulating private investment in joint development are currently being given considerable attention in demonstrations of LRT and downtown people movers. Each rapid transit system currently under consideration must conduct an assessment of the value-capture potential as part of the requirements for federal funding. Implementation techniques are discussed in terms of development incentives and the control mechanisms that are necessary to guide development along the lines of community objectives. /Author/

42 301329 INTRODUCTION: LIGHT-RAIL TRANSIT: PLANNING AND TECHNOLOGY. The conference papers were presented in 5 sessions. The opening session relates accounts of light rail transit (LRT) successes in many cities. Problems and issues that have frustrated significant LRT development in the U.S. are explored in subsequent papers. A series of case studies examine where and how progress has been achieved. The basic dichotomy between socioeconomic and technological issues in the implementation of LRT is reflected in papers on such topics as network planning, joint development opportunities, and the formulation of functional specifica-

tions and fare collection, traffic engineering and power supply. The final session examines the future in the light of past experience. The session papers emphasize the overriding need to inform decision makers at all levels about the characteristics of LRT. Ignorance and bias must be removed before LRT can move forward on a broad front.

42 301456 STAGGERED WORK HOURS STUDY--DESIGN AND IMPLEMENTATION OF STAGGERED WORK HOURS IN MANHATTAN. This three-volume report is the product of a \$200,000 grant from the U.S. Department of Transportation to document and further implement staggered work hour programs in Manhattan. The concept of staggered work hours is a proven "low capital-intensive" method of reducing transportation congestion. Experience has shown that the staggered work hours program in Manhattan has not only reduced congestion on transportation systems, but has improved efficiency in business operations by reducing lobby congestion and improved employee attendance, punctuality and morale, all of which are additional non-cost benefits. Most individuals in cities throughout the world go to work at the same time in the morning and depart from work at the same time in the afternoon, which creates severe congestion on many transportation facilities. If this peak demand could be altered by inducing people to change at earlier or later work schedules, transportation systems could operate more efficiently and comfortably, and individuals would benefit in terms of reduced frustration. The objective of this study was not only to further the staggered work hours program in the New York-New Jersey region, but also to determine means and methods to assist other communities in establishing their own staggered work hours program.

Port Authority of New York and New Jersey, (IT-09-0023) Final Rpt. 42 301605 REDEVELOPMENT OF A COMPREHENSIVE APPROACH TO URBAN TRANSPORTATION PLANNING. An attempt is described that is under way in southeastern Wisconsin to convert the conventional urban transportation planning process into a more problem-centered planning process, one that considers and integrates short-range and long-range considerations and comprehensively examines alternative facility and systems management solutions. The key to this improved planning process is the use of a new short-range transportation system plan in place of the conventional short-range transportation systems management plan. The new plan would be aimed at existing

and short-range problems. Alternative solutions to be considered would include management and operations actions as well as facility improvements as staged and recommended in the long-range plan. The recommendations of the short-range plan should be appropriate for direct inclusion in the transportation improvement program. The short-range transportation planning process and its relation to long-range transportation planning, the steps that have been taken to apply the process, and some of the general principles used in developing the new short-range plan are discussed. /Author/

42 301606 LONG-RANGE TRANSPORTATION PLANNING IN SOUTHEASTERN WISCONSIN. The evolution of long-range transportation system planning at one planning agency, the Southeastern Wisconsin Regional Planning Commission (SEWRPC), is examined. Some conclusions about the continued role of long-range planning are drawn, and some directions for further evolution of such planning are suggested. After a brief historical review of long-range transportation system planning at SEWRPC, five recent criticisms of the planning process in southeastern Wisconsin and elsewhere are identified: (a) the need for short-range emphasis; (b) an inability to deal with uncertainty; (c) disregard of fiscal constraints; (d) excessive orientation toward facilities; and (e) neglect of local plan impacts. The eight fundamental principles of transportation planning used by SEWRPC are reviewed in light of these criticisms. Although they are found to be basically sound, they are shown to require expansion to (a) include a provision for subregional planning, (b) deal with uncertainty and explain the approach taken by SEWRPC and a possible method that is under development, (c) alter the planning process to consider all alternatives including system operation and management initiatives, and (d) develop an integrated transportation planning process that effectively brings together long-range and short-range transportation system planning and programming. /Author/

42 301608 PRELIMINARY SCREENING OF TRANSIT CORRIDOR ALTERNATIVES. Part of a major analysis of transit corridor alternatives done by the Chicago Area Transportation Study is presented. A method was developed to screen out, for further study, a limited number of proposed transit improvements from a large number of suggested alternatives for a corridor. The principles of this screening are (a) that some alternatives are not consistent with patronage in the corridor and (b) that some alternatives are dominated by others. The screen-

ing methodology is discussed, and the use of corridor supply and demand functions for evaluation and the estimation of these functions are presented. Demand and supply estimates prepared for several light rail alternatives for Chicago's Southwest Corridor are then subjected to preliminary screening. /Author/

42 301610 MACROANALYSIS FOR TRANSIT INTEGRATION, ABRIDGMENT. To investigate enough integration options to have some hope of finding a good solution, it is necessary to examine 20 or more alternatives. Even so modest a number of investigations is beyond reason if one is compelled to use the traditional network-based algorithms. The macroanalytic regionwide transportation (SMART) model of SYSTAN, Inc., has been specifically designed to explore large numbers of public transit alternatives. This model can provide the first coarse screen by which the number of transit options is reduced to manageable proportions. The model seeks breadth at the expense of detail. It does not take the place of more complex procedures but helps to focus the use of complex models on a small set of highly attractive alternatives. The SMART Model represents urban travel at three different levels: (a) local, (b) door to door, and (c) regionwide. Local transportation is concerned with trips that take place wholly within a local module and with those portions of longer trips that occur within the local module. Local transportation is studied for two types of modules: (a) residential and (b) major activity center. Residential and major activity center modules are connected by line-haul corridors that handle all interzonal traffic within an urban region. Line-haul corridors give form to the urban structure by establishing connecting routes between the different modules. Line-haul corridors are given a circular representation: Corridors are either radial or circumferential or they emanate from the CBD. Line-haul corridors do not originate or terminate traffic; they handle traffic that originates and terminates in residential or major activity center modules. Door-to-door trips cross module boundaries. A trip may originate in a residential module where it includes a local movement from a residential origin to an access point of a line-haul corridor. The trip continues on one or more line-haul corridors to the egress point nearest the destination. A local movement is then made from the egress point to the destination. A traveler can use a single mode between origin and destination, or modes can be changed at access or egress points of line-haul corridors or at transfer points between line-haul corridors. Door-to-door analysis takes the viewpoint of the traveler and traces the route from origin to destination, accounting for mode changes when they occur and the delays associated with them. The SMART model accumulates regionwide data and prints regionwide summaries. /Author/

42 301611 DISCRETE OPTIMIZATION IN TRANSPORTATION NETWORKS. In most cases, planning capital investment in transportation networks is an unwieldy job because the number of investment options grows so rapidly. The real situation faced by the transportation planner is, in general, when, where, and by how much to allocate available resources. The transportation investment problem can be characterized as the location and timing decisions to be made by the planner. A branch-and-backtrack algorithm is presented that tackles both location and timing aspects of the capital investment problem in small and medium transportation networks. The results presented are encouraging for future research in which the technique can be applied to larger, actual transportation networks. /Author/

42 301613 ETHICS OF POLITICALLY ORIENTED TRANSPORTATION PLANNING: CONGRUENCE AND CONFLICT OF ROLES. Some of the ethical implications of the involvement of transportation analysts in politically oriented planning processes, particularly in the context of urban transportation planning, are examined. The major point of departure is the concept of fragmentation of intellectual perspectives, which manifests itself among participants in the planning process, both professional and non-professional, and within the individual, who plays a variety of socially recognized roles. The pattern of congruences and conflicts created by the roles of professional transportation analyst, organization member, and participant in the political process is seen as the key to ethics for transportation analysts. Obligations imposed by each of these roles are identified and compared. The major conclusion is that these roles are, for the most part, congruent provided two key points are accepted: (a) that technical competence for transportation analysts consists of mastery of a variety of disciplinary perspectives and (b) that the professional's primary loyalty as a participant in the political process must be to the process itself and not to particular substantive outcomes. /Author/

42 301842 ROUTE INVESTMENTS WITHIN THE SCOPE OF THE NATIONAL TRANSPORT POLICY AS ILLUSTRATED IN THE FEDERAL REPUBLIC OF GERMANY. This report refers to the economic impact of investments in the differing transport modes and suggests that with financial resources becoming scarcer, such investments should not lead to

competition between modes but to transport policy targets within a national transport policy. These targets, related to present day conditions in the federal republic are stated to be: the maintenance and furtherance of the mobility of the inhabitant and of the economy; the maintenance of an appropriate transport structure for a steadily developing economy; the securing of the free choice of the means of transport in a controlled competitive system. The present national transport routes investment policy is reviewed, and information provided on the co-ordinated investment programme for the federal transport routes up to the year 1985 in respect of the German Federal Railway, federal trunk roads, federal waterways, air-traffic control and airports. The implementation (and continuing review) of planned investment strategy is discussed, and consideration given to the international aspects of the transport routes investment policy. /TRRL/ Haeusler, U *Rail International* No. 3, Mar. 1979, pp 223-235, 3 Fig., 2 Tab.; ACKNOWLEDGMENT: TRRL (IRRD 241530); ORDER FROM: ESL

42 301846 DETERMINING MODAL CHOICE AND STATION CHOICE FOR A RAIL TRANSIT LINE. This paper considers the problem of predicting station choice and modal choice for composite mode trips that involve a trip by private car to a rail transit station and the continuation of the trip to the final destination by a rail transit mode. The choice between car and transit, and between park'n ride and kiss'n ride are both taken into account. One of the models presented takes explicitly into account traffic congestion. The methodology proposed relies on entropy maximization with inequality constraints related to parking capacities at the rail transit stations. The numerical application of one of the models to the Lindenwold high speed line is reported.

42 301899 EMPIRICAL STUDIES OF JOURNEYS TO WORK BY MODES OF TRANSPORT IN GREATER LONDON: 1966 AND 1971. With the use of 1971 journey-to-work census data for London, the spatial distributions of home and workplace locations at different distances from the city centre were analysed for the main modes of transport. The relationships among the fundamental quantities such as density, trip length, modal split, and level of car ownership were also investigated. These analyses were compared with those of corresponding 1966 data. The comparisons show that although the home density in 1971 within the first 2 km from the city centre decreased by approximately 21%, while the workplace density decreased only by approximately 4%, the actual number of workplaces within this range of distance fell by about 2.5 times that of the homes. The overall decrease in homes and workplaces resulted in a 9% drop in the total number of internal trips for London as a whole. Resolving these trips by modes of transport shows that rail, bus, and walk trips had decreased while car trips had increased. As a result, the most common mode of transport to

work switched from bus in 1966 to car in 1971. This also contributed to the overall increase in the average trip length in 1971. The analysis on the level of car ownership for 1971 shows that more than 50% of the households located more than 12 km from the city centre had at least one car. On average, the number of cars per household in 1971 was approximately 0.64. /Author/TRRL/

42 301954 INTRAMETROPOLITAN TRAVEL DEMAND FORECASTING USING AN ABSTRACT MODES APPROACH. Comparatively little work has been done on utilizing the abstract modes approach, first pioneered by Quandt and Baumol, in an intrametropolitan travel demand forecasting effort. This is surprising because of the method's great flexibility. As urban transportation planning becomes evermore concerned with a variety of para-transit modes as well as the electric transport systems management policies, more powerful travel demand forecasting tools are required for effective planning. We augment the original model to include "second best" characteristics as predictor variables. This innovation is quite important because the urban situation is characterized by auto remaining "best" in most planning situations. Thus, demand changes can only be seen as a response to changes in some "second best" mode characteristic. Other minor innovations are also explored and the model is applied to a data file available from a survey of travel behavior in East Los Angeles, a predominantly mexican-american community. Despite the usual statistical problems, the results are seen to be useful to transportation planners who seek to reach a recommendation on the best transit/para-transit mix for that community.(a) /TRRL/

42 302120 WANTED: NATIONAL POLICY ON SUBURBAN TRANSIT. The questions are asked if transit operators serving low-to-medium density suburban areas should continue to be evaluated by the policies and standards designed for transit systems in the central city, and what standards should be used to evaluate suburban transit performance? The design of a transit system is dictated by the land-use characteristics of the market it serves. A flexible and multi-leveled transit system is needed to serve the dynamic nature of suburban land use. Paratransit systems such as dial-a-ride are effective in low-density residential areas. An effective combination of paratransit and fixed-route systems could significantly increase the modal split over that which fixed transit might achieve alone. One key to success of such a system lies at the transfer points. The Orange County Transit District (OCTD) has planned a series of transportation centers in response to this need. Experiences of OCTD in planning such centers are described. One obstacle that OCTD faces is the lack of coherent UMTA policy regarding suburban transit centers. Major issues regarding suburban transit which require UMTA attention are listed.

Reichert, JP (Orange County Transit District, California) *Transit Journal* Vol. 5 No. 3, 1979, pp 37-42

42 302173 URBAN TRANSPORTATION PLANNING IN TRANSITION: THE SOURCES AND PROSPECTS OF TSM. A recent federal transportation policy initiative has encouraged metropolitan and local transportation planners to place increased emphasis on near-term, service-oriented transportation problems. This policy, called Transportation System Management (TSM), was designed to affect not only the types of projects to be considered during the planning process, but also the institutional framework established to conduct and guide comprehensive transportation planning. A description is given of the emergence of TSM-type planning from a tradition of large-scale, facility-oriented planning. Characteristics of the TSM program that may significantly affect the process and politics of transportation planning are discussed. The characteristics of TSM program performance and their likely effect on transportation planning in general are identified. These include the greater emphasis on short-range actions and the need to resolve apparent conflicts between efficiency and amenity objectives.

42 302241 IMPACT OF POPULATION AND ENERGY ON TRANSPORTATION NEEDS: MULTIMODAL APPROACH. This paper documents a computer process developed to explore the potential diversion of automobile trips by purpose and length for various population growths and energy futures and the impact this diversion will have on transportation needs. The technique is a straightforward method of using the existing statewide transportation model to generate statewide highway trip tables for each possible future. These tables are split by trip purpose based on analysis of actual statewide origin-destination data and then split into modes based on trip purpose and length information gained in the survey of air, rail, and bus travel characteristics. Information on the modal split in other mass transit corridors in the United States is also used as a guide. The variables in this process are easily understood and thus may be quickly adjusted to reevaluate transportation needs and to reflect various planning policies. Once the modal trip tables are generated, they are assigned to a statewide air, rail, or bus network based on station accessibility; the remaining trips are assigned to the highway network. The end product is a computer plot that shows the potential travel volumes by mode and the probable impact of each population growth and energy future on state highway needs. This technique is being applied in rural portions of 13 of Michigan's 14 planning regions. (Author)

42 302254 SIMPLIFIED AIDS FOR TRANSPORTATION ANALYSIS: ESTIMATING RIDERSHIP AND COST. VOLUME 3. This is one of a series of six reports describing simplified aids to improve transportation decisions without resorting to computers or extensive data collection. In January 1976, the U.S. Department of Transportation issued Technical Notice DOT-1-76 requesting transportation planners, engineers, and transit operators to submit useful but not widely known manual techniques that could be developed and distributed as simplified aids for transportation analysis. Over 70 analytical aids were submitted in response to this request. Based on an evaluation process conducted to determine the most useful, easily applied, and generally applicable techniques, several of these analytical aids have been selected and documented in sufficient detail to permit their immediate use. In addition to these techniques, three additional analytical aids were developed as part of the Short Range Transportation Planning project, and an annotated bibliography of each analytical aid reviewed was prepared. These individual analytical aids and the annotated bibliography have been prepared as separate reports and have been brought together in this Manual of Simplified Aids for Transportation Analysis. In this report, an analytical aid is presented which provides a simple method for estimating the annual ridership and operating expenses of fixed-route bus system alternatives in urban areas with population of less than 300,000. This method is based on regression equations generated principally from 1974 operating data for 55 U.S. fixed-route bus systems. These equations can be used to develop preliminary estimates of the annual ridership and public financial operating assistance required for such systems in small urban areas. The equations can be solved using a hand calculator and readily available data inputs. (UMTA)

42 302256 SIMPLIFIED AIDS FOR TRANSPORTATION ANALYSIS: ESTIMATING PARKING ACCUMULATION. VOLUME 5. This is one of a series of six reports describing simplified aids to improve transportation decisions without resorting to computers or extensive data collection. The analytical aid described in this report provides a method for estimating the accumulation of parked vehicles within a study area over the course of a typical weekday. Parking accumulation and utilization of parking facilities may be estimated for all parkers, long-term parkers, and/or short-term parkers, based on an estimate of daily automobile trip destinations, an inventory of available parking supply, and a set of parking "accumulation factors" which may be derived from a parking survey within the study area or from default values provided in this report. The primary use of the parking accumulation estimation method is to analyze the adequacy of available parking supply in relation to expected parking demand. The method may also be used to monitor and suggest revisions to automobile travel impedance values used in transportation planning models. Modifications, embellishments,

and improvements to the procedures suggested in this report are encouraged should local data or previous analyses suggest a more appropriate method. (UMTA)

42 302258 SIMPLIFIED AIDS FOR TRANSPORTATION ANALYSIS: FORECASTING AUTO AVAILABILITY AND TRAVEL. VOLUME 2. This is one of a series of six reports describing simplified aids to improve transportation decisions without resorting to computers or extensive data collection. In this report, an analytical aid is described which provides a method for deriving and using the variable of automobile availability per household. This is an important socioeconomic variable in travel demand estimation. It is frequently not available, however, at the level desired, e.g., transportation planning zone, traffic zone, or census block, or for the current year at any level. In the course of the research in which this aid was developed, a strong correlation was found between auto availability per household and the product of two other variables: the average market price of homes and the percent of home ownership. Data for these two variables are generally more readily available at the block or zone level or may at least be forecast more precisely at this level than automobile availability. This report describes auto availability per household as a function of the product of the two variables. Estimates of automobile availability derived from this function can be applied to trip generation and modal split analysis in transit system studies, route patronage estimation, and sketch planning studies in urban areas of any size. Examples of trip generation and modal split applications of the variable are also presented in this report. It is pointed out in the report, that because of the intent to provide a simplified analysis aid, modifications, embellishments, and improvements to the suggested procedures and models are encouraged, provided local data or previous analyses suggest a more appropriate method. (UMTA)

42 302260 PROCEEDINGS OF THE THIRD UMTA R&D PRIORITIES CONFERENCE, CAMBRIDGE, MASSACHUSETTS, NOVEMBER 1978. VOLUME IX: URBAN TRANSPORTATION PLANNING WORKSHOP. This is a compilation of material that was presented at the Third UMTA R&D Priorities Conference Workshop on Urban Transportation Planning. It includes discussions of the needs and problems of the transit operating industry in planning for urban transportation and research in transportation planning methods. This volume contains three resource papers which can be found summarized in Volume I of this report along with summaries of other workshop sessions. Volume I also includes the proceedings of

the general sessions and a listing of conference participants. These proceedings (Rpt. Nos. UMTA-DC-06-0157-79-1 thru UMTA-DC-06-0157-9) consist of nine separately titled volumes, namely: Volume I: Proceedings of General Sessions and Summarized Reports of Workshops; Volume II: Bus and Paratransit Technology Workshops; Volume III: AGT and Advanced Systems Workshops; Volume IV: Service and Methods Demonstration Workshops; Volume V: UMTA Special Technology Programs Workshops; Volume VI: Rail and Construction Technology; Volume VII: Transit Management Workshops; Volume VIII: Access for Elderly and Handicapped Persons Workshops; and Volume IX: Urban Transportation Planning Workshop.

American Public Transit Association, Urban Mass Transportation Administration, (DC-06-0157) UMTA-DC-06-0157-79-9, Nov. 1978, 29 p.; Volume I, cited above, will be available in December 1979; all other volumes are available at NTIS; Contract DOT-UT-70026; ORDER FROM: NTIS; PB-300994

42 302263 PROCEEDINGS OF THE THIRD UMTA R&D PRIORITIES CONFERENCE, CAMBRIDGE, MASSACHUSETTS, NOVEMBER 1978. VOLUME IV: SERVICE AND METHODS DEMONSTRATIONS WORKSHOPS. This is a compilation of material that was presented at the Third UMTA R&D Priorities Conference Workshops on Service and Methods Demonstrations. Part I deals with pricing policy innovations and includes discussions of the general objectives of the program, where the emphasis in this program ought to be placed from the viewpoint of the transit operating industry, and the evaluation of this pricing policy innovation program. Part II, conventional transit and paratransit service innovations, includes discussions of conventional transit service demonstrations and the paratransit demonstration program. This volume contains five resource papers which can be found summarized in Volume I of this work along with summaries of other workshop sessions. Volume I also includes the proceedings of the general sessions and a listing of conference participants. These proceedings (Rpt. Nos. UMTA-DC-06-0157-79-1 thru UMTA-DC-06-0157-9) consist of nine separately titled volumes, namely: Volume I: Proceedings of General Sessions and Summarized Reports of Workshops; Volume II: Bus and Paratransit Technology Workshops; Volume III: AGT and Advanced Systems Workshops; Volume IV: Service and Methods Demonstration Workshops; Volume V: UMTA Special Technology Programs Workshops; Volume VI: Rail and Construction Technology; Volume VII: Transit Management Workshops; Volume VIII: Access for Elderly and Handicapped Persons Workshops; and Volume IX: Urban Transportation Planning Workshop.

42 302265 PROCEEDINGS OF THE THIRD UMTA R&D PRIORITIES CONFERENCE, CAMBRIDGE, MASSACHUSETTS, NOVEMBER 1978. VOLUME II: BUS AND PARATRANSIT TECHNOLOGY WORKSHOPS. This is a compilation of material that was presented at the Third UMTA R&D Priorities Conference Workshops on Bus and Paratransit Technology. Part I deals with paratransit integration and includes discussions of operational technologies (as distinct from vehicle and propulsion system development), experiences of the City of Cincinnati with their Urban Transportation Laboratory Program, the Logan Airport (Boston) Share-A-Cab Program, and the Rochester Dial-A-Ride Program. Part II (Bus Technology, Paratransit Vehicle Development, and Flywheel Energy Storage System) contains discussions of the vehicles themselves and the Flywheel Energy Storage Program. This volume contains six resource papers which can be found summarized in Volume I of this report along with summaries of other workshop sessions. Volume I also includes the proceedings of the general sessions and a listing of conference participants. These proceedings (Rpt. Nos. UMTA-DC-06-0157-79-1 thru UMTA-DC-06-0157-9) consist of nine separately titled volumes, namely: Volume I: Proceedings of General Sessions and Summarized Reports of Workshops; Volume II: Bus and Paratransit Technology Workshops; Volume III: AGT and Advanced Systems Workshops; Volume IV: Service and Methods Demonstration Workshops; Volume V: UMTA Special Technology Programs Workshops; Volume VI: Rail and Construction Technology; Volume VII: Transit Management Workshops; Volume VIII: Access for Elderly and Handicapped Persons Workshops; and Volume IX: Urban Transportation Planning Workshop.

American Public Transit Association, Urban Mass Transportation Administration, (DC-06-0157) UMTA-DC-06-0157-79-2, Nov. 1978, 67 p.; This report is a sequel to reports titled: Proceedings of the UMTA/APTA R&D Priorities Conference, February 1978 (PB 255-898); and Proceedings of the Second R&D Priorities Conference, December 1976 (PB 266-158); Contract DOT-UT-70026; ORDER FROM: NTIS; PB-300987

42 302277 MEASURING THE ACHIEVEMENT OF NATIONAL URBAN TRANSPORTATION GOALS AND OBJECTIVES: THE ROLE OF METROPOLITAN PLANNING ORGANIZATIONS. The U.S. Department of Transportation has issued a data reporting requirement for Metropolitan Planning Organizations (MPOs) to collect general transportation-related data to assess transportation goal achievement in a broad context. The institutionalization of the MPO data reporting requirement is the focus of this report. The purpose of this research is to assess the extent to which the MPO data reporting requirements can serve both local and national needs for quality data without burdening the MPO. The analysis consisted of four parts: 1) the status of urban transportation planning; 2) origins of transportation system management; 3) data collection and its influence on the "type" of planning being done; and 4) the impact of the Transportation Research Board's new data reporting set on two case study MPOs in Cedar Rapids, Iowa and Rock Island, Illinois.

The research in the report analyzed the impacts of financing procedures and constraints on the transportation systems in small urban areas, examined the effectiveness of public transportation planning, and developed and allocation procedure for state transit assistance programs. A case study methodology was employed to permit greater depth of analysis than would be possible with comparative data for all urban areas. Three cities in the state of Iowa were selected: Cedar Rapids, Davenport, and Iowa City. The lack of support for the MPO data reporting program at either the federal or local level might be attributed to the data itself, which resulted from compromise between federal data requirements to assess national policies and programs and local requirements for more location-specific data. Under voluntary compliance, the success of the program is dependent on MPO acceptance of the notion that the data items are useful for their own planning process.

42 302349 A TECHNOLOGY ASSESSMENT OF TRANSPORTATION SYSTEMS DESIGN IN THREE CASE STUDY COMMUNITIES. Described is a method of technology assessment capable of evaluating transportation alternatives for a variety of city sizes, land-use patterns and socioeconomic characteristics. It is an abstract technology assessment format capable of generic evaluation over a hierarchy of city sizes, shapes and modal transportation technology characteristics using unit cost and impact data. A research agency is able to rapidly examine sensitivities and boundaries of rational or optimal transportation investments. This examination may occur over a group of similar or different regions and may draw significant conclusions about the mix of transportation technology investments most likely needed and capable of compatible operation.

Box 405, Oxford, Indiana, 47971

42 302371 TRANSPORT TECHNOLOGY: INTRODUCTION TO ECONOMICS OF TRANSPORT [Ingeniería del transporte: introducción a la economía del transporte]. In order to establish the principles upon which the setting up of transport tariffs are based, it is necessary to state certain economic conditions of transport and to define the meaning of the term "transport" and certain other terms in relation to transport and to analyse briefly both the function and the effects of transport on the political, social and economic plan, where the transport sector leads to an increase in markets and a reduction in prices, establishing an equilibrium in the provision of articles and influencing their production and the distribution of the national revenue. A

rapid analysis of the different transport modes and their operation as a service to the community has led the researchers to stress the increasingly pronounced character of the transport sector as a public service, particularly the railways. This has led them to study the intervention of the government in this field and the related problems of competition and monopoly. On these bases, a study has been carried out of the problem of the fixing of railway tariffs, which is thought to be a question of establishing an equilibrium between supply and demand for transport. Thus an analysis of the supply (cost of production, specific charges and costs of each item) and demand in the transport service leads to the conclusion that the determination of a railway tariff may be based on the following considerations: (1) the individual tariff for each item and the general level of profits determining the value of service: equilibrium between supply-demand. (2) the general level of profits should balance with the cost of transport. (3) it is essential to know the costs of loading and transit services. (4) the basis for fixing particular tariffs and profits taken together should give the general level of profits. (5) the profits from special tariffs represent the distribution of the general level of profits between the different items. (TRRL) [Spanish]

42 302389 RAILWAYS INTO BUSWAYS WONT GO. A RE-EXAMINATION OF TWO CASE STUDIES. Reference is made to a 1976 publication entitled "Better Use of Rail Ways" which reported an evaluation of six case studies related to the conversion of existing rail links into general purpose roads. In this discussion paper the authors present a re-examination of two of the original six case studies in order to assess the validity of the assumptions and costings used in the 1976 study, and where found necessary to change them. The two cases described relate to the Crouch Valley line-a single track route linking Southminster and Wickford Station of the Southend to London main line; and the Colchester-Sudbury line on the Colchester-Liverpool Street main line. The economic evaluation and assessment of costs for each study is discussed, and traffic data are provided in a series of appendices. Economic rates of return are reported of 2.9 per cent and 1.6 per cent respectively, in contrast to values of 60 per cent and 30 per cent respectively quoted in the 1976 study. The reason for the marked contrast between the two findings is discussed, and on the basis of the new evidence the conclusion is reached that railway conversion into roads does not provide a general solution to the perennial problem of railway finance.

42 302733 ACCESSIBILITY TO EMPLOYMENT AND ANALYSIS AND MODELLING OF WORK TRIP LENGTHS IN SYDNEY. This thesis was submitted as partial requirement for the degree of Master of Engineering Science, School of Transport and Highways, University of New South Wales. It analyses journey-to-work trip lengths of workers in Sydney. The analysis involves the investigation of trip lengths and factors influencing trip lengths such as accessibility to employment and residential distance from the central business district (CBD), as well as the calibration of gravity models for journey-to-work. The analysis is based on the employment data extracted from the 1971 census of population and housing-the journey-to-work tabulation for Sydney. Trip lengths and accessibility to employment are investigated at the sub-regional (zonal) and the regional scale. The analysis has indicated that in Sydney male workers tend to travel further afield than female workers and that employment accessibility for males is about twice as high as that for females. 42 302751 CHOICE OF TRAVEL MODE FOR THE JOURNEY TO WORK: A DISAGGREGATE MODEL FOR SYDNEY. This thesis was submitted as partial requirement for the degree of Bachelor of Commerce (Honours), Department of Economics, University of New South Wales. The demand for the various methods of travelling and the factors influencing that demand are examined in this thesis. The various types of models available for this purpose are discussed together with the variables that are important in influencing demand. The estimation techniques available are also discussed. A survey of the literature on modal choice modelling is presented. A disaggregate modal choice model for the journey to work is estimated by discriminant analysis. Using this estimated model, predictions are made as to the effects of various policy changes which could be introduced by the transport authorities. The reaction to most of these policies are found to be relatively inelastic, a result which is in agreement with most other studies of this kind. (TRRL)

42 302924 RURAL ACCESSIBILITY: THE ROLE OF THE MOTOR CAR. Rising car ownership in rural Britain has greatly improved the accessibility enjoyed by some residents, while worsening that of others by undermining public transport and village services such as shops and pubs. Disadvantaged groups within the community are identified: they include many women, the elderly and the young. Still higher levels of car ownership are to be expected and this resource can, to some extent, be harnessed as a community resource. But devoting the bulk of available resources to road building and maintenance implies social inequities and a rigorous evaluation procedure embracing the full range of policy options is urgently needed. /Author/TRRL/

42 302928 TRANSPORT AND LAND USE-A NORDIC PROJECT. The Nordic countries of Sweden, Norway, Finland and Denmark are co-operating in a research project, Nordkolt, implemented to evaluate imaginable future public transport systems adapted to different types of Nordic Towns, making allowance for the requirements of traffic development, environment and traffic safety. The whole project is described as being divided into three stages (1) survey of research and analytical work-available as well as in operation-and a start on problem analysis. (2) accomplishment of the problem analysis and elaboration of solutions and consequential analysis models. (3) theoretical testing of the results in eight Nordic towns. The author discusses the results obtained so far from studies in the eight towns based on three traffic situations. One involves heavily increased car traffic, the other reduced car traffic and heavily increased public transport, while the third presupposes some increase of public transport with virtually unchanged car traffic. It is suggested that the results could have important consequences for land-use planning in general. A list of the 18 reports published so far is appended. /TRRL/

42 302963 (I) BACKGROUND TO THE OXFORDSHIRE COUNTY COUNCIL PUBLIC PASSENGER TRANSPORT PLAN. (II) DRAFT OXFORDSHIRE COUNTY COUNCIL PUBLIC PASSENGER TRANSPORT PLAN 1979/84. These two documents provide a complete account of the Oxfordshire County Council's public transport policies and proposals and the background to them. The background document discusses the Transport Act, 1978 in relation to public passenger transport services; national trends in public transport over the past 25 years; summarises government policy by particular reference to the 1977 Transport Policy White Paper; and discusses trends in Oxfordshire and the question of need for public transport- all these being factors which are stated to have influenced the council's attitudes. The draft transport plan provides a national view of prospects for public transport in the next decade, relates to transport strategy in the structure plan, presents the Council's policies and proposals for the next five years in the context of its wider land use and transport policies and covers the matters specified in the Transport Act, 1978. A series of appendices provides data on transport strategy; concessionary fares schemes; commercial stage services, supported services, express services and British rail services. (TRRL)

42 303282 43RD INTERNATIONAL CONGRESS-HELSINKI 1979. TRAFFIC EVALUATION METHODS. The members of the International Union of Public Transport were surveyed via questionnaires as to the different methods of estimating passenger traffic currently in use. The methods ranged from exhaustive counts (which require large staffs or numerous automatic devices) to statistical methods based solely on sample surveys of passengers and using elaborate and accurate statistical processes. As a

result of this survey, the authors come to several conclusions. To ensure accuracy, traffic data should be expressed in terms of journeys made rather than journeys paid, i.e. it is desirable to dissociate the statistical data from those obtained from revenue accounting. While exhaustive counting is not a panacea and may involve errors despite adjustments that may be made, counting, even if partial, can nevertheless be used, provided it is properly corrected, complemented and integrated into a carefully elaborated evaluation process. Statistical methods also produce acceptable accuracy, at least at network level (about 2 percent executed). Therefore, the choice between counting and statistical methods must not be made in isolation. The study leading to this choice should take into account other factors, in particular the transit organization's objectives as regards control of passengers and level of service.

42 303296 PUBLIC TRANSPORTATION POLICY MAKING IN FRANCE AS AN IMPLEMENTATION PROBLEM. Public transportation policy is analyzed as the output of a complex social system of interdependencies and power relationships linking the central state bodies to various economic and political organizations. The interest groups structure the system by controlling the implementation process. The system works because of cheating-violating the public regulations, but the interest groups need state regulation to protect their privileges. The paper demonstrates the importance of the implementation sequence of public policy, particularly in terms of its effects on the understanding of the definition of alternative solutions. We will concentrate on the way in which an ensemble of "system effects," induced by governmental action conditions both the perception of the problem to which this action is supposedly responding, and the elaboration of decisions to solve the problem. The method employed will be that of suggesting a form of analysis which will discern those fields of force and interaction processes with which decision makers, in this case public authorities, are confronted. The method employed should thus be useful in understanding the process of decision making. (Author)

42 303483 AN APPRAISAL OF AUSTRALIAN URBAN TRANSPORT STUDY DATA-HOME INTERVIEW SURVEY DATA. Some 28 large-scale home interview travel surveys of Australian cities have been conducted in the past 20 years as part of a traditional transportation study, or a follow-up or up-date of such a study. All of these surveys (HISS) are included in this project report apart from that of Darwin which was carried out prior to Cyclone Tracy. The project identified the seven major stages of an HIS-(a) establish sample frame; (b) design sampling procedures; (c) design checks for sample representativeness; (d) design questionnaire; (e) define each data item; (f) design coding proce-

dure; and (g) decide how to incorporate the spatial dimension-and at each stage the approaches of each his were compared and critically analysed from the point of view of internal consistency. Before proceeding with these analyses an attempt was made to ascertain a clear statement of the objectives underlying each his. Unfortunately, clear objectives were rarely to be found, resulting in an unsatisfactorily large degree of internal inconsistency. Also before the stage-by-stage review, the past, existing and potential uses of his data were discussed. It is shown that potential uses include-(1) estimation of individual choice models of travel demand; (2) investigation into the 'activity pattern' view of travel demand; and (3) identification of public transport market segments. 42 303489 ATTAINMENT AND UTILIZATION OF INFRASTRUCTURE FACILITIES [Erreichbarkeit und Nutzung von Infrastruktur Einrichtungen]. The correlation between demographic factors, car ownership and the use of municipal transport facilities are shown and empirically examined. An analysis of interviews reveals that users from various social groups travel different distances in order to make use of the available municipal facilities. Furthermore it is shown how, by transport systems (particularly that of the private car) the catchment area of a facility can be fundamentally increased and better used. In the end, however, this great advantage can be a disadvantage for those population groups who have no transport system at their disposal, since they are almost excluded from using the services because of the greater distances involved. As a result the empirical analysis shows the essential significance of transport systems for the use of a municipal infrastructure. (TRRL) [German]

42 303539 URBAN TRANSPORT PLANNING: THE CHANGING EMPHASIS. This paper traces the major events and issues that have influenced the environment of transport planning, and the implications for method. The central themes are the move from a "consensus" model of society to a "conflict" model, the influence of budget constraint and sources of finance, the misplaced emphasis on "transport systems management", and the need for change in the disciplinary mix of professional planners in transport institutions. The paper concludes with some speculations on the future directions of method in transport planning. (Author/TRRL)

42 303562 TRANSPORT STUDY FOR THE XII COMMONWEALTH GAMES. The study was prepared for the Metropolitan Transit Au-

thority. The prime objective of this study was to develop an appropriate transport strategy, embracing all land transport modes, for the 1982 Commonwealth Games. The study examined a broad range of options for transporting spectators, competitors, officials and VIP's to and from the events. The major physical components of the strategy include a series of peripheral car parks located to intercept motorists approaching the main venue from all directions, shuttle bus services operating between the car parks and the main stadium, special rail services with shuttle bus services, closure of major roads in the vicinity of the main stadium to give bus movements priority and protect the surrounding areas from a massive influx of vehicles parking on-street, provision of bus priority treatments on major approach routes, and the control of traffic at major intersections surrounding the site to allow only accredited vehicles (such as buses, taxis, residents' vehicles, VIP's etc) to pass. The operational components of the strategy anticipate the rail system being used to its maximum capacity, and the encouragement of high levels of car occupancy. (TRRL)

42 303829 PUBLIC TRANSPORT-EFFICIENCY AND EQUITY. This paper was presented at session 11-local government 1. It discusses basic public transport planning questions within a new-town context where land use is a major variable. The setting is Albury-Wodonga and the paper presents an historical record of public transport planning on that project. Three major aspects of planning are dealt with, namely, land use relationships, public transport system planning and public transport administration. The paper, as the title suggests, concentrates on efficiency and distributional evaluation commentary. (TRRL)

42 303918 REALITY OF COORDINATING TRANSPORTATION SERVICES: MAJOR ISSUES. The experiences of several communities in coordinating transportation services at the local level are analyzed, and a realistic assessment of both the potentials that can be realized through coordination and the barriers that participating agencies might face is urged. Key implementation variables--accurate data collection both before and during coordination efforts, resource assessment and coordination problems, organizational and institutional issues, and statutory and regulatory factors--are discussed. It is concluded that it is unwarranted to believe that simply coordinating social-service-agency and other providers' transportation services will solve the problems of resource utilization and cost. Policymakers must clearly identify three factors before beginning coordination attempts: realistic start-up costs, a realistic time frame, and realistic operational costs for coordinated systems. 42 303939 ESTIMATING THE EFFECTS OF ALTERNATIVE LEVELS OF SERVICE ON RURAL TRANSIT RIDERSHIP. This paper deals with the need to assess public response to alternative levels of service and travel flexibility on proposed rural transportation systems. A public opinion survey was conducted in rural Otsego County, New York, among 254 households, 30 of which had no telephones. The survey presented three public transportation options (fixed route, dial-a-bus, and mobility club) and asked questions about possible use of such services at different fare and service levels. The survey questionnaire was designed to minimize noncommitment bias and responses were separated on the basis of automobile availability to minimize the need for adjustment for noncommitment. Adjustment for noncommitment was necessary for the group that had an automobile available. This adjustment was based on the proportion of transit trips made by the automobile-available group on the existing dial-a-bus system (as determined by an on-board survey), which operates in Oneonta, the county's largest city. Estimates of potential ridership were made for each transit option at different fare levels, service levels, and travel-flexibility levels. Although it is not suggested that the demand estimates developed for Otsego County are transferable to other areas, the relative changes in demand resulting from changing fare, service, and travel-flexibility levels should be generally useful.

42 304720 TRANSIT CORRIDOR ANALYSIS-A MANUAL SKETCH PLANNING TECHNIQUE. This is a user's handbook. It describes a sketch planning technique for quick first evaluations of urban transportation planning proposals—a manual technique which does not require computers. It presents the technique's computational steps, which rely heavily on graphic aids, in an orderly manner and minute detail. The technique is useful in the analysis of

short and long range plans for urban line-haul transit systems. The manual technique does not provide a single, definitive solution, but it can provide, for each system, alternative measures of demand, performance (cost and travel times), and impact to help local decision making. The technique has three modular phases: demand estimate, cost analysis, and impact analysis. It is also modular within the phases, since the user is free at many points to substitute his own data or analytical techniques and to substitute local estimates for the default values supplied. This book has four divisions. The introduction describes the purposes and uses of the technique. The second chapter, an overview, discusses general parameters and assumptions, and identifies those situations in which the technique can be applied. The third chapter describes the method and computation procedures and gives examples of each step of the procedures as applied to a sample problem. The appendices contain nomographs and blank work sheets which can, at the user's option, be used to make some of the calculations.

42 304794 SERVICE AND METHODS DEMONSTRATION PROGRAM. EXECUTIVE SUMMARY. The objectives of the program are to: (1) provide more efficient and effective public transportation service; (2) bring about the use of local regulatory and pricing authority to encourage ridesharing and transit use; (3) develop a mix of innovative transit service models that appeal to a wide range of user groups; (4) integrate the use of private and public providers into a comprehensive set of public transportation services; (5) develop information to assist local, state, and Federal policy formulation; (6) guide an improved level of local response to UMTA regulations concerning transportation system management (TSM), elderly and handicapped, and Alternatives Analysis. This Executive Summary contains a summary of the contents of the Service and Methods Demonstration Program Annual Report for fiscal year 1978.

42 305402 THREE POINT PROGRAM TO REDUCE FUEL CONSUMPTION, TRAFFIC CONGESTION, AND AIR POLLUTION-STATUS REPORT (CONNECTICUT). The report presents information concerning the Three Point Program to reduce fuel consumption, traffic congestion, and air pollution. The three points of the program are as follows: Foster carpooling and charter express bus service (bus pooling) in private industry through the use of the Depart-

ment's Computer consultation services; Construct additional interchange parking facilities to facilitate carpooling; and Develop additional express commuter bus service between suburban areas and the central business districts of Connecticut cities.

42 305443 URBAN TRANSPORTATION: INTERMODAL CONSIDERATION AND EVALUATION OF SHORT DISTANCE TRANSPORT TECHNIQUES. The project is divided into four parts: (1) Requirements of Short-Distance Transport Systems; (2) Inventory; (3) Assessment and Comparison; and (4) Conclusions. Different groups of people have different requirements with regard to short-distance transport systems. The study examines the various requirements from the points of view of passengers, town and traffic planning, community/environment, and public transport operators. In each of the areas discussed, judgement criteria can be defined for the various requirements. The inventory is based on three elements: (1) brief system descriptions; (2) description of existing transport systems and their future development; and (3) description of new transport systems. Questionnaires for system data have been developed and annexed to the section containing the system descriptions. The section dealing with the description of existing short-distance transport systems and their future development covers rapid transit railways, tramways, motor buses as well as the system groups dual-mode and dial-a-bus; the difference between the latter two bus systems and the conventional bus consisting, in the first case, in an additional technical component (track-guidance), in the second case, in the operating concept (possibility of ordering or calling a bus). The assessment and comparison of short-distance transport systems can be effected by means of formalised assessment methods or by verbal comparison. Section 1 of chapter 3 outlines the three assessment approaches: (1) cost-benefit analysis; (2) cost-effectiveness analysis, and (3) multi-attribute utility analysis. The chapter "conclusions" describes cost developments of transport systems.

42 305444 URBAN TRAVEL FORECASTING. More often than not, today's urban transportation planner is being asked to determine the consequences of not making a certain transportation investment rather than to determine what investments need to be made to meet the otherwise unconstrained demand for transport services. By simplifying and achieving a degree of standardization in travel estimation procedures, benefits could accrue to the user nations in the form of time and cost savings as well as broadening the spectrum of conditions under which the forecasting procedure can be expected to operate. The first benefit could result from the application of a less sophisticated, and therefore less costly, forecasting procedure. The latter benefit could

result in a cross fertilization of knowledge regarding the consequences of various policy decisions. North American cities can be characterized as relatively low in density, high in auto ownership, and low to moderate in public transit usage. European cities, on the other hand, are generally higher in density, lower in auto ownership, and demonstrate a correspondingly higher transit usage. Under these circumstances, the desirability of a generalized simple and efficient forecasting procedure, suitable for application to a broad range of conditions has become greatly heightened.

42 305743 REPORT ON THE POTENTIAL FOR INTEGRATING RAIL SERVICE PROVIDED BY THE NATIONAL RAILROAD PASSENGER CORPORATION WITH OTHER MODES. The report is in response to Section 17 of the Amtrak Improvement Act of 1974 which directed the Secretary of Transportation to conduct a study "on the potential for integrating rail service provided by the National Railroad Passenger Corporation (Amtrak) with other modes of transportation including buses, with particular attention to the needs of rural areas." Relevant aspects of Amtrak and the intercity bus systems are examined to indicate the potential for integration growing out of the characteristic, performance, economic, social, and institutional arrangements of these two modes. Several significant areas of difficulty in developing an integrated system are uncovered; not the least of which is the costs to both modes which would result. The number of bus or rail passengers who would probably respond to the integrated rail-bus system is minimal based upon the concentration of populations within the appropriate concentric isotime zones required to get to the

railroad station. The length of time of access to the station may be only a small fraction of the total travel time or the passengers will not use the integrated rail-bus system.

42 305825 MASS TRANSIT METRICATION: A RECOMMENDED POLICY AND METRIC CONVERSION PLAN FOR UMTA. The study was undertaken in order to develop for the Urban Mass Transportation Administration (UMTA) a recommended policy and comprehensive plan for the orderly conversion to the uses of the International System of Units, or the metric system. This report suggests some actions which the Urban Mass Transportation Administration, the American Public Transit Association, and the Department of Transportation can take to best fill the perceived needs of members of the mass transit industry, and at the same time, use the proven techniques learned by those who have successfully converted to the metric system. This report includes a listing of recommendations to UMTA for the accomplishment of these actions. In particular, this report recommends the use of metric units on new designs based on the Cumulative Cost approach. It also details the metrication activities of some organizations and their problems and successes. With those companies which have already begun implementation of the metric system, it was found that engineering standards exist for virtually all the needs of the organizations impacted by UMTA.

42 307697 MICHIGAN STATEWIDE TRANSPORTATION MODELING SYSTEM, VOLUME XIII-A. MULTI-MODAL MOBILITY AND ACCESSIBILITY ANALYSIS, STATEWIDE RESEARCH AND DEVELOPMENT. This volume documents an analysis procedure which enables one to measure the accessibility of selected groups of the population to travel modes such as rail, bus and air. The process utilizes existing tools created for use with the statewide highway model, adjusting the analysis procedure so as to better deal with and resolve such multimodal transportation issues as improvement of public mobility and goods movement, abandonment of stations or lines, etc. In view of the growing concern for improved public transportation and freight service, such procedures should be of special interest to transportation planners. /Author/

42 307909 THE PLANNING OF RURAL PUBLIC TRANSPORT [Planering foer kollektiv landsbygdstrafik]. This report is a study on the structure of commuter traffic in Uppsala County.

Its purpose is to obtain material to be used as a basis for effective planning of (1) bus-tours for commuter traffic to and from work, (2) the connecting of an area and a working place through bus connections, (3) commuter traffic during energy crisis. A densely populated area was used as a basis for the study, and its connections with densely and sparsely populated areas as well as the connections within the areas themselves are described in the form of maps and tables. Also, the material is classified according to the commuters' branches of industry and their choices of transportation. In November 1975, of 18000 commuters only 12% used public transport. The explanation is thought to be that most bus schedules were not adapted to the commuter traffic, and the bus fares were too high. Thus, by using employers' enquiries the time of this traffic to and from work was mapped in order to determine bus-tours according to the commuters' need. By re-arranging the bus schedules the traffic output in Uppsala County increased by 35%. Through co-ordination this improvement could be obtained by only 5% increase of the resources in the form of buses and drivers. Preliminary estimations show that the total number of rural bus-tours has increased 50% during one year. If only commuter traffic is taken into account, the increase is even greater. 42 307967 TRANSIT CORRIDOR ANALYSIS-A MANUAL SKETCH PLANNING TECHNIQUE. The development of the manual sketch planning technique was undertaken for UMTA as part of its Software Systems Development Program (SSDP). This handbook is a revised version of the May 1976 draft final report. Modifications have been made to the transit impedance of nomographs based on experience gained through testing of the procedures. Additionally, the cost calculations have been updated to reflect unit costs as reported in the July 1977 release of the Characteristics of Urban Transportation Systems (CUTS) manual. The technique, in its final form, will become a module of the Urban Transportation Planning System (UTPS). Thus, it will be a useful addition to the set of planning tools now available. This user's handbook describes a sketch planning technique for quick first evaluations of urban transportation planning proposals--a manual technique which does not require computers--and presents the technique's computational steps, which rely heavily on graphic aids in an orderly manner and minute detail. The manual technique is useful in the analysis of short and long range plans for urban line-haul transit systems. The technique does not provide a single, definitive solution, but it can provide for each system, alternative measures of demand, performance (cost and travel times) and impact to help local decision making. The technique has three modular phases: demand estimates; cost analysis; and impact analysis. It is also modular within the phases, since the user is free at many points to substitute his or her own data or analytical techniques and to substitute local estimates for the default values supplied. This manual has four divisions. The introduction describes the purposes and uses of the technique. The second chapter, an overview, discusses gen-

eral parameters and assumptions and identifies those situations in which the technique can be applied. The third chapter describes the method and computation procedures and gives examples of each step of the procedures as applied to a sample problem. The appendices contain nomographs and blank work sheets which can, at the user's option, be used to make some of the calculations.

42 307972 CLASSIFICATION OF URBAN AREAS FOR TRAVEL FORECASTING. The common practice of classifying cities into large, medium, and small population sizes, while appealing at first sight, is not adequate for travel forecasting. Two large cities with similar population sizes, for example, may turn out to have drastically different urban structures, thus generating totally different travel patterns. A more refined classification scheme involving both urban size and structure is therefore discussed in this paper. Person-trip-hours-of-travel--as determined by the product of trip frequency and trip duration--is used as a classification criterion, since trip frequency measures the rate of trip-making while trip duration indicates the length of the journey. According to this scheme, a city is either identified as large/multinucleated, large/core-concentrated, medium/multinucleated, or medium/core-concentrated. The validity of such a taxonomy is tested and proven by the data compiled from over 50% of the cities in the United States.

42 307994 SWEDEN'S STATE OF THE ART REPORT TO THE INTERNATIONAL COLLABORATIVE STUDY ON FACTORS AFFECTING PUBLIC TRANSPORT PATRONAGE. The aim of this report is to collect and evaluate Swedish experiences from studies of factors affecting public transport patronage and to analyse factors affecting travel patterns and modal choice in urban areas. Development trends in urban areas and domestic travel are described together with a general framework

of factors affecting travel consumption in a 40-year context. Four different methods of analysing travel behaviour are discussed and aggregated and disaggregated models are compared. Results from Swedish cross-sectional studies are presented. An analysis of different factors such as modal choice and demand elasticities is performed. This analysis comprises disaggregate studies using the logit model and studies based on aggregate data (a car ownership model and a transportation market-equilibrium mode-TRAMA). The interdependence between urban structure and travel pattern is analysed by means of three different sensitivity studies. The first of these studies uses the Ic-S-model, based on a combined cross-sectional and time-series data set. The two following sensitivity studies utilize the TRAMA-model as a tool for evaluating travel pattern in different urban structures. /TRRL/

42 308012 URBAN TRANSPORT POLICY. Is it possible to spell out an urban transport policy for Australian cities in general or for the individual capital cities and metropolitan areas? Drawing on experience in South Australia, this paper describes the complexity of urban transport policy formulation and coordination, the significance of other factors of urban planning and development to transport, and the impact of statewide and national transport on the city. Current policy tools such as regulation and subsidy will increasingly be complemented or supplemented by measures influencing the demand for transport, some of which may not be popular. /TRRL/

42 308014 USE OF CARS FOR SUBURBAN WORK TRIPS. During July, August and September, 1978, The National Roads and Motorists' Association (N.R.M.A.) carried out a work trip survey in five industrial areas of Sydney--South Sydney, Botany, Bankstown, Auburn and Warringah. Almost ninety percent of the respondents travelled to and from work by motor vehicle and only 8 percent used public transport. Only 28 percent of drivers carried any passengers and less than 2% of the respondents were involved in a car pool. Restriction of personal freedom was seen as the major disadvantage of car pools and disadvantages of car pools were far more strongly supported than their advantages. The major reasons given for using a motor vehicle were 'quicker by motor vehicle', convenience' and 'no direct public transport'. The major reason given to effect a change to public transport was to make public transport more accessible. 86.5 percent of the respondents gave valid reasons for driving to work (use car during day, or no direct transport, etc). It is therefore concluded that A large majority of the suburban workforce travel to work by car and they mostly have valid reasons for so doing. There appears to be little opportunity for reducing the demand for road space by improving existing public transport (TRRL)

42 308039 RESOLVES OF THE ASPHEN CONFERENCE ON FUTURE URBAN TRANSPORTATION. This consensus statement from the Aspen Conference, which attempted to develop a statement of direction of policy and action, includes a description of the current scenario, the factors which will shape future urban transportation, and specific recommendations for public and private sector policy and action. The conference was organized around seven subject areas: mobility and accessibility, energy, environment, safety, social issues, transportation economics and the roles of major actors. Problems, opportunities, and some inevitabilities related to the above aspects are covered, and conference recommendations are presented. Among the resolves highlighted are the following: energy conservation efforts alone will not suffice and commitment must be made to the development of alternative fuels; prices of domestic crude oil and retail motor fuel should be deregulated and special programs should be developed to offset the economic effects; a cooperative study of the health effects of pollutants from mobile and stationary sources and current standards should be reviewed; specialized transportation services and subsidy programs for the special problems of the elderly and handicapped should be pursued; federal and state programs supporting urban transportation should be revised to be more receptive to different forms of local and metropolitan government organization; and national goals should be adopted to guide future transportation and urban land development.

Transport and Road Research Laboratory June 1979, 16 p., Photos.; This is the proceedings of a conference held at the Aspen Institute for Humanistic Studies, Aspen, Colorado, June 3-7, 1979. 42 308084 SPECIFICATIONS FOR A NEW LONG-RANGE URBAN TRANSPORTATION PLANNING PROCESS. This paper asserts the continuing need for a long-range component to urban transportation planning, citing particularly the relationships between short-and long-range planning and the dangers of a single-minded concentration on short-range planning. However, the nature of the long-range planning procedure that is required is substantively different from that of most extant approaches. Some of the specific requirements and capabilities of a new procedure are described, and existing procedures are compared against these. In the latter part of the paper, some of the elements of a new long-range planning procedure are characterized. It is suggested that the procedure be built around a scenario approach to confronting and bounding future uncertainty. Second, the need to incorporate financial forecasting in the process is laid out and related to the scenario concept. Third, the need for travel-and impact-forecasting procedures is recognized and a set of input, output and operating requirements for such procedures are specified. It is suggested that improved sketch-planning tools may fit the

requirements to a large extent. It is also suggested that some procedures or models in the process should be "synthetic" models, not needing calibration for each new application. Finally, a number of requirements are specified for the display and evaluation of planning proposals from this procedure. A major emphasis is placed here on transparency of the process and responsiveness to direct intervention by the decision-maker. (Transportation)

42 308093 MARKET OPPORTUNITY ANALYSIS FOR SHORT-RANGE PUBLIC TRANSPORTATION PLANNING: ECONOMIC, ENERGY, AND ENVIRONMENTAL IMPACTS. Environmental assessments of alternative public transportation proposals are required by federal regulations developed in response to the 1969 National Environmental Protection Act. Therefore, impact analysis will be specially interested in this report. Transit marketers, planners, and engineers, at state and local levels, will also find how impact analysis interrelates with policy, marketing, and engineering--the three primary activities of short-range public transportation planning. The report is oriented mainly to small-and medium-sized urban areas. It recommends that analyses be based on expected market utilization instead of theoretical system capacities. Information is provided for both the Engineering Data Base and the Service Design sections of the model. The findings described in the report will assist the analyst in structuring information to permit an analysis of various public transportation service alternatives in meeting specified objectives, even though objectives may be conflicting. /Author/

42 308094 MARKET OPPORTUNITY ANALYSIS FOR SHORT-RANGE PUBLIC TRANSPORTATION PLANNING: TRANSPORTATION SERVICES FOR THE TRANSPORTATION DISADVANTAGED. This report addresses issues arising from provision of transportation services to the transportation disadvantaged in response to recent legislation and regulations. Social and economic impacts are substantial. Recommendations are developed on the premise that existing legislation and regulations are susceptible to change. Through an elucidation of the issues and alternative courses of action, this report should help in the future selection of more efficient, economical, and socially acceptable approaches. (Author)

42 308095 MARKET OPPORTUNITY ANALYSIS FOR SHORT-RANGE PUBLIC TRANSPORTATION PLANNING: TRANSPORTATION SERVICES FOR THE ALTERNATIVE SERVICE CONCEPTS. This report contains a general procedure to match desirable service attributes resulting from a market segmentation study with alternative service concepts to determine which alternative services are appropriate for a local area. In addition, key legal, regulatory, and institutional issues of the model involved in the provision of the alternatives are incorporated into the discussion. The purpose of this report is to encourage local planners to consider the full range of alternative public transportation services available to an urban area. "Public transportation," as used herein, includes all forms of intraurban passenger transportation that are available to the public, even if they are not considered common carriers. Public transportation, as defined here, includes private, public, and nonprofit systems. The public transportation system may move masses of people or only one person at a time. Rail systems have been excluded because they are generally beyond the scope of short-term planning considerations. /Author/ 308094EEBAPC1000000

42 308097 MARKET OPPORTUNITY ANALYSIS FOR SHORT-RANGE PUBLIC TRANSPORTATION PLANNING: GOALS AND POLICY DEVELOPMENT INSTITUTIONAL CONSTRAINTS, AND ALTERNATIVE ORGANIZATIONAL ARRANGEMENTS. This report concerns the rationale and procedural steps necessary to develop workable goals for urban public transportation. Without such direction, little guidance is given to the decision-maker as to what markets to concentrate on and how to measure systemwide performance. The report addresses the task of determining goals and policies as well as the issues involved in preparing a goal/policy statement for public transportation in an urban community. The information developed should serve as a guide for planners responsible for coordinating goal/policy development activities in an urban community. This report also addresses critical institutional issues that transportation planners and decision-makers must face when attempting to provide new or improved public transportation services. Various federal, state, and local regulatory and institutional patterns have been developed for the provision of urban public transportation services. A thorough understanding of these issues is necessary in order to involve both public and private operators in the provision of public transportation services. A heavy emphasis on existing labor provisions in the supply of public transportation services and the opportunities for new private and minority firms to begin public transportation services has been

developed as an integral part of this report. The report provides information for which policy decisions can be made regarding appropriate organizational arrangements for providing public transportation services. A central concept stressed is that, with a market-oriented public transportation system management approach, the organizational structure must be tailored to the needs of the local area's needs political environment. /Author/

42 308102 THE NO-ACTION ALTERNATIVE: IMPACT ASSESSMENT GUIDELINES. These guidelines will be of special interest to Agency administrators, project managers, and impact analysis responsible for project-level planning and impact assessment; the guidelines are applicable to both highway and transit planning. The guidelines define the transportation planning and impact assessment process showing how the no-action alternative can provide a benchmark for assessment of impacts and evaluation of alternatives. The guidelines address the issues of: (1) legal requirements governing no-action alternatives; (2) the role of the no-action alternative in transportation planning; (3) definition of no-action, minor (TSM), and major alternatives; (4) social, economic, and environmental impact assessment techniques for the no-action alternative; and (5) use of the no-action alternative in project evaluation. Although the guidelines are oriented toward transportation planning, many of the principles and procedures can be readily applied to the evaluation of other types of development projects. /Author/

42 308113 SERVICE AND METHODS DEMONSTRATION PROGRAM ANNUAL REPORT: EXECUTIVE SUMMARY. The Urban Mass Transportation Administration (UMTA) Service and Methods Demonstration (SMD) Program was established in 1974 to provide a consistent and comprehensive framework within which innovative transportation management techniques and transit services could be developed, demonstrated and evaluated, and the resultant findings disseminated in a timely manner to transportation planners, policymakers, and transit operators. The program focuses on strategies that involve the imaginative use of traffic management, pricing and marketing techniques, transit service variations, and existing technology to produce improvements which require relatively low levels of capital investment, and which can be

implemented in a short time frame. The objectives of the SMD program are to: 1) provide more efficient and effective public transportation service; 2) bring about the use of local regulatory and pricing authority to encourage ridesharing and transit use; 3) develop a mix of innovative transit service models that appeal to a wide range of user groups; 4) integrate the services; 5) develop information to assist local, state, and Federal policy formulation; and (6) guide an improved level of local response to UMTA regulations concerning transportation system management (TSM), elderly and handicapped, and Alternatives Analysis. This Executive Summary contains a summary of the contents of the Service and Methods Demonstration Program Annual Report for fiscal year 1978. Program activities and accomplishments discussed in the Annual Report are reviewed, including findings and insights from current demonstration projects, descriptions of future projects, and support activities in the areas of evaluation methodology and information dissemination. 42 308630 PUBLIC TRANSPORT PLANS (1) FAIL 'NEEDS' TEST. The transport act 1968 requires non-metropolitan county councils to produce public transport plans stating the needs for public transport in their areas. This first article in the series discusses the concept of transport 'needs' and the means by which they are determined. Distinctions are drawn between mobility and access, also between assessment of needs and the means for satisfying them. Basic needs, where the emphasis is on the characteristic of the individual, and general need where the emphasis is on the characteristics of the transport and land use systems, are considered. The principal discussion is of the assessment of basic accessibility needs, and the author discusses the role of the individual, the elected member of local government and the professional officer who advises the council and implements its policies, in this assessment. The criteria upon which judgements are made, i.e. felt needs and normative needs, are considered. For parts 2, 3 and 4 of the series see TRIS Nos. 308631-33. (TRRL)

Holder, A *Surveyor - Public Authority Technology* Vol. 154 No. 4551, Aug. 1979, pp 7-9, 2 Phot., 9 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 244157)

42 308631 PUBLIC TRANSPORT PLANS (2)-AN EFFECTIVE PLANNING DISCIPLINE. Progress made by local authorities in policy development for the provision of co-ordinated and efficient public transport is considered. Reference is made to the value and purpose of annual Public Transport Plans (PTP's) considering the work and cost involved, the planning previously undertaken by local authorities, and their assessment of transport needs and how they may be met. The results of a survey into the effectiveness of PTP's in their first year are presented and analysed. It appears that policies have been affected little, although more comprehensive assessment of transport needs have been made. Instead of an annual plan, a three or five

yearly review of public transport is suggested with discussions of the document in the intervening years. The establishment of local authority transport units responsible for meeting the various public transport needs is recommended. For articles 1, 3 and 4 in this series see TRIS Nos 308630, 308632-33. 42 308645 PUBLIC TRANSPORTATION PLANNING, OPERATIONS AND MANAGEMENT. This book is presented in five parts which include a total of 35 chapters. The first part covers the historical development of public transportation in the U.S. The chapters (the development of public transportation in the city; the decline of transit; the decision-making environment) are in chronological order and tie the actual events to causes and effects. The second part (systems and technologies) exposes readers to the attributes of the various modes used presently to provide public transportation service and shows how the modes interrelate. Part II (comparing transit modes) concentrates on the factors to be considered in alternative analyses studies of transportation systems. Part IV (planning public transportation systems) covers the vital planning area, including the historical development of planning, significant current issues regarding the planning process, the newest planning tool-the TSM, planning for small systems as found in rural areas, and how system planning for public transportation differs from transportation planning per se. The fifth part deals with the management and operation of public transit systems. Part VI (policy considerations) goes into the specifics of various factors that influence public transit services and provides a good perspective of the factors to consider when establishing goals. Part VII looks at the future from several viewpoints including the improvement of existing facilities as well as new technology.

42 308681 CURRENT TRANSPORT ISSUES. In the context of a lack of defined transport objectives and of society's changing perception of its needs, the identification of issues is considered a practical way to cover transport in the future. Rather than attempt to cover the range of issues facing all transport modes providing national services, the paper summarises issues functionally: financial and economic; technological and modal; social; environmental and energy; developmental; institutional and organisational. Examples discussed are mainly from Australian domestic transport, with others from West European and North American practice. /TRRL/

42 309134 DEVELOPING TECHNIQUES FOR URBAN TRANSPORT PROJECT EVALUATION. The paper describes the conventional cost-benefit analysis as applied to urban transport project appraisal and focuses on areas where the existence of limitations have caused this

method of analysis to be criticised. It is concluded that cost-benefit analysis is the soundest theoretical urban transport investment evaluation procedure, since it enables the analyst to compare a wide variety of effects based on their resource cost which is determined as far as practical, from the market place. However, to overcome recent criticism, this method of analysis should be supplemented with information concerning those inputs not included or badly treated in conventional cost-benefit analysis. The supplementary information required for a particular project will depend upon the specific circumstances of the investment, and could include such aspects as a planning balance sheet, goals achievement matrix, cost-effectiveness analysis, financial analysis or levels of service indices. The application of the supplementary analysis indicated above would give a satisfactory appraisal of an urban transport improvement program. (TRRL)

42 309525 INCREASING TRANSIT'S SHARE OF THE REGIONAL SHOPPING CENTER TRAVEL MARKET: AN INITIAL INVESTIGATION. This report examines the explosive growth of the shopping center during the last 23 years as well as factors influencing travel to large regional malls, and the current trends that will affect regional malls in the future. The focus herein is on large shopping malls (ranging in size from 800,000-2,000,000 square feet of gross leasable area; having 4,000-15,000 auto parking spaces; and located 6-20 miles from "downtown" of the central city). The objectives of this study are to (1) examine current approaches to providing transit service to these malls, and (2) develop recommendations for gaining a larger share of this travel market for public transit. The results of 27 case studies in 18 U.S. and one Canadian City are presented. They describe what transit service is being provided, how and why it is being used (or ignored) at these 27 regional malls. Nine case studies describe innovative transit projects that are still in the planning stage. The case studies were written primarily for transit operators and should be of interest to others—urban planners, traffic engineers, mall developers and operators, architects, and both transit system and retailer marketing people. Recommendations are presented that would assist U.S. transit agencies in gaining a ten percent share of this huge (6-7 billion trips annually) travel market in the 1980's. The authors state that to achieve said objective, private/public sector cooperation is needed as well as experimentation with innovative transit provision techniques, development of improved analysis and planning methods, and basic data gathering efforts. 42 309533 REGIONAL PUBLIC TRANSPORT SCHEMES [Les schemas regionaux de transport collectif]. Regional public transport schemes are defined as reports outlining the medium-term trend of a number of proposals concerning the reorganization of and determining the level of service objectives for regional public transport services. Each element of the scheme is analyzed, and a description is given of the setting up of a regional scheme and of the role of pilot regions. A part of the article deals with the preliminary steps to take and the difficulties to solve when establishing a regional plan. (TRRL) [French]

42 309585 EFFECTS OF MEASURES IN TRAFFIC-A PRACTICAL PLANNING TOOL FOR AN ACTIVE TRAFFIC POLICY [Effekter av atgaerder inom trafikken-Ett praktiskt planeringsinstrument foer en aktiv trafikpolitik]. This report describes some models, describing the behaviour of the road-user in different choice situations. These models are based on modern behavioural science and the parameters of the models have been decided through studies of real behaviour of individuals. The models, called logit-models, describe the probability of choosing a certain alternative. Some other areas of use are also presented. Two examples of application are shown: (1) parking fees in business districts and (2) measures within public transport -no bus charges. (TRRL) [Swedish]

Colliander, J *Vag-Och Vattenbyggaren* Vol. 25 No. 5/6, 1979, pp 53-54, 3 Fig.; ACKNOWLEDGMENT: TRRL (IRRD 243196), National Swedish Road & Traffic Research Institute

42 309633 DEVELOPMENT OF FORECASTING MODELS FOR PASSENGER TRANSPORT IN URBAN AREAS [Entwicklung von Prognosemodellen fuer den Staedtischen Personenverkehr]. A conservative, generally useable traffic model was adapted for practical use in Hungarian cities. The model is restrictive, so that limited car park availability in the city centre means that a section of the private transport is transferred to public transport. The traffic event is a result of a prescribed city structure (if-then-forecast). Feedback regarding land use must be made available apart from the model. The author gives all theoretical formulae. Forecasts from the available data are clearly illustrated in diagrams. Theoretical proposals for solutions are shown, which may not, however, be practical in all cases. This paper demonstrates that traffic planning in Hungary has reached the same standard as in Western Europe. (TRRL) [German]

42 309671 ACCESSIBILITY AND BEHAVIOUR IN TWENTY AREAS OF MELBOURNE. Relationships are examined between (1) accessibility to local services (e.g. schools, shopping, public open space), (2) accessibility to metropolitan-scale services (e.g. employment, Tertiary education), and (3) residents' behavio-

ral responses to different levels of these accessibilities. Twenty case study areas in Melbourne are considered, representative of the range of residential areas occurring in the metropolitan area. Speculations are advanced on the social effects of present transport arrangements, of transport restrictions (e.g. due to the "energy crisis"), of ageing of the population, of population movements and of the value placed on accessibility. It is concluded (1) that the passenger transport system exhibits serious failures in the equitable distribution of opportunities and (2) that the secondary or "social ecological" effects of transport related changes are likely to be the most socially significant in the medium and long terms. The paper reports results of arb project 268, social impact of transport related changes; further analysis is expected to yield more detailed conclusions. (TRRL)

42 309753 TRANSPORT NEEDS FOR URBAN COMMUNITIES: TRANSPORT PLANNING [Besoins de transports pour les communautes urbaines; la planification des transports de personnes]. The research group for "Transport Needs for Urban Communities" has been set up to study urban transport planning methods based on a realistic assessment of community transport needs rather than on measured or estimated demand. The paper discusses successively certain urban transport fundamental parameters which influence the need for the transport of people; the traditional planning procedure for urban transport as well as an indication of the institutional background in which it must function; planning objectives and their hierarchical character; the identification of transport needs and the best way of effecting such determination; the evaluation of different possible systems of transport. A final chapter contains certain conclusions and recommendations of the group. [French]

42 309875 EXPERIENCE IN TRAVEL DEMAND SYNTHESIS IN URBAN AREAS OF QUEENSLAND. This paper was presented at Session 29-Transport Planning Case Studies. Over the last five years synthesis techniques have been used in Queensland for urban travel demand estimation. The applications ranged from a regional strategy study to traffic investigations in a small urban area. The use of these techniques results in considerable cost savings in field surveys. The paper indicates that these techniques can be used successfully for assessment of operational deficiencies, but problems exist when questions such as distributional equity with respect to incidence of transport costs, wish to be examined (a). 42 309881 THE REVOLUTION IN TRANSPORTATION ANALYSIS AND POLICY. This article, one from an issue devoted to "Economics: Progress and Prospects", describes the effects of transportation regulation on all segments of transport with special emphasis on railroads. It demonstrates the lagging interest in transportation economics into the 1950s and then portrays a revived attention to this subject as railroad fortunes declined in the face of competition from unregulated competitors and as a result of the absence of adequate return on investment. The topics include Penn Central collapse, the 3R and 4R Acts, subsidy action and state rail plans, rail cost behavior, the trucking industry, the air transport industry, shifting modal shares, Amtrak, urban transportation, the Canadian experience, and 1979 prospects.

42 309923 PROFILE OF A PTE: TYNE AND WEAR. In this profile an attempt is made to examine the progress of the Tyne and Wear Passenger Transport Executive during the ten years of its existence since it was established by the 1968 Transport Act. The original principles followed in setting up the various PTE's are discussed. Trends in car ownership are considered and it is pointed out that the predicted growth in car ownership, particularly as regards multi-car ownership by households, has not materialised. This has been coupled with the change in public opinion against major road construction. The Tyne and Wear Metro rapid transit system is briefly discussed-particularly its relationship with the other forms of public transport. An orderly progression towards standardised fare scales demonstrates the successful bus service integration in the area. The PTE's general policy on bus services has been to maintain attractive trunk frequencies through all areas, where applicable planned with eventual translation to metro.

42 309967 TRANSPORTATION PLANNING POLICY AND ANALYSIS. This work attempts to correlate transport policy with an analysis of transport planning, covering important areas such as financial management of transport, urban transport and an evaluation of transport proposals. Also the fundamental changes which have come about in transport policy are examined, especially governmental transport policy. The book also discusses the repercussions of computerization, the use of mathematical techniques and the systems planning approach introduced during the sixties.

42 309992 DETERMINING INTERMEDIATE ORIGIN-DESTINATION MATRICES FOR THE ANALYSIS OF COMPOSITE MODE TRIPS. The problem of determining intermediate origin-destination matrices for composite mode trips that involve a trip by private car to a parking facility and the continuation of the trip to the destination either by walking or by a transit mode is considered. The intermediate origin-destination matrices relate to each component of the composite mode trip: a matrix from the trip origins to intermediate destinations which are parking lots and a matrix from the parking lots to the final destinations. The approach proposed to solve this problem is to modify the entropy based trip distribution models to consider inequality constraints related to parking lot capacities.

42 310035 PLANNING GUIDELINES FOR PUBLIC TRANSPORT INTERCHANGES. Report was prepared for the Director General of Transport, South Australia, and sets out guidelines for the location, planning and evaluation of public transport interchanges with particular emphasis of application in Metropolitan Adelaide. It raises some of the issues which should be taken into account when considering the location, design and justification of the public transport interchange. It is important that broad strategic and location issues should be settled before detailed implementation planning proceeds too far. On the other hand, both strategic issues and detailed design issues are of importance in economic justification. The operation of one mode of public transport in one section of the city cannot be considered in isolation, nor can the location of an interchange-it is not an integral part of a total urban system. The cross influence of various public transport routes in a corridor or sector of Adelaide, through-running bus operations, and the degree of commitment to feeder/express modes of operation will all influence the location, design and justification of interchanges.

42 310039 THE PREDICTIVE ACCURACY OF BRITISH TRANSPORT STUDIES-A FEASIBILITY STUDY. Transport studies have been undertaken in this country for over fifteen years. During that time much criticism has been levelled against them, and yet to date there has been no serious attempt to evaluate their predictive accuracy. This report describes a feasibility study to investigate whether it would be practicable to examine the predictive accuracy of early British studies by comparing forecasts made in them with current information. The study has several parts. A desk study and review of literature identifies the main weaknesses and potential sources of error in the transport planning process. The main part, a review of past studies in a sample of local authorities, reveals that in most study areas recent transport data are available which might be used for reappraising the earlier study. Discussions with the local authorities indicate that though the models appear to perform satisfactorily in the forecast situation, the studies were generally very inaccurate in their predictions of growth in population, employment and real incomes. Finally, the report discusses methods and indicators that might be used to assess the predictive accuracy of past studies and concludes that a full study is both feasible and worthwhile. (a) (TRRL)

42 310047 PUBLIC TRANSPORT PLANS-A CHALLENGE. CONFERENCE ONE. PROCEEDINGS OF CONFERENCE HELD ON 10 MAY 1979 AT WOLFSON COLLEGE, OXFORD. The four papers presented at the conference are reported. The first paper concerns transport "needs" and their determination. How "needs" are assessed is discussed and the roles played by individuals, local government elected members and professional officers are considered. The second paper compares attitudes adopted towards the preparation of public transport plans, and criteria applied to determine "need", by various shire counties. Paper three contains notes on case studies in urban public transport, including a regression model of change in annual bus patronage. The final paper presents case studies in rural public transport-the approach adopted in Dyfed. Details are given of the transport survey, the results of the analysis and their implementation. Notes on public transport legislation are included in appendices. (TRRL)

42 310085 AN INITIAL APPRAISAL OF AUSTRALIAN HOME INTERVIEW SURVEY TRAVEL DATA. This paper was presented at session 26-transport planning techniques 1. Transportation studies have been conducted in most large Australian cities. During these studies information about the travel patterns of individuals was sought by means of a home interview survey (his). This paper is devoted to assessing aspects of home interview surveys, including the aims behind them, how they have been changing over time and whether the scope and type of data collected is consistent with these aims. It is found that in many cases consistency is not present, resulting in the collection of inappropriately defined data and in a restricted ability to compare travel behaviour from city to city. It is also found that much more socio-economic data have been amassed than have ever been utilised. It is suggested that these data, despite their inconsistencies, provide an excellent and cheap base upon which to research many aspects and theories of individual travel behaviour, collection of in appropriately defined data and in a paper suggests that thorough analyses of existing data could well lead to a vast reduction in future travel survey requirements. Finally, the evolution of home interview surveys is traced and future evolution speculated upon. A bibliography of transportation studies is included for completeness. (a) (TRRL)

42 310108 THE MANAGEMENT OF URBAN CORRIDOR ROADING STUDIES. This paper was presented at Session 26-Transport Planning Techniques 1. This paper briefly describes the basic management of selected examples of urban corridor roading studies in Melbourne, and discusses some of the lessons to be learned from them. Based on experience in these and other studies, various considerations relating to organisation and management of these types of studies are summarised. The information in the paper should be of use in the design of similar types of studies elsewhere (a.) (TRRL)

42 310130 NEW USES FOR OLD TRAVEL DATA. The basic requirement for good planning is reliable information. As planning emphasizes change, previous information is often discarded. In the case of travel data this abandonment is premature. This paper demonstrates that existing travel data are still extremely valuable for at least three distinguishable, and increasingly important, planning tasks. First, for the prediction of how individuals will react to specific policies, such as rising fuel prices or lower public transport fares, i.e. For travel demand modelling using individual choice models. It is shown that these models can be satisfactorily estimated using home interview survey data. The technique can be improved by market segmentation based on socio-economic characteristics or on the data itself, by using the travel section to partition the travellers into sets who really have a travel choice. Second, for the analysis of the existing urban public transport systems' performance, i.e. Who is using public transport, when and for what purposes. Third, for the analysis of individual's activity patterns and how these vary with the socio-economic and demographic characteristics of the individual (A). (TRRL)

42 310157 USE OF ACCESSIBILITY IN METROPOLITAN STRATEGIC PLANNING. This paper was presented at Session 29-Transport Planning Case Studies. The conceptual and experimental development of a relationship between accessibility and density, together with utility measures which can be derived from it, is summarised. This relationship and its utility measures can be used to illustrate or describe aspects of the transport-traffic-land use system, to examine the suitability of development proposals in terms of efficiency and equity and to evaluate alternative transport proposals. Examples are presented and discussed. Finally, by a suitable combination of transport supply, travel demand and Examples are presented and discussed. Finally, by an equilibrium in the transport-traffic-land use system can be determined both before and after some disturbance to the system. The utility measures allow the value of the disturbance to be assessed. A radically different approach to the transportation planning process is therefore suggested and this is discussed, using work done in Canberra as an example (TRRL)

42 310265 DARLINGTON URBAN STRUCTURE PLAN. This plan is presented in three parts. Part 1 describes the structure of the plan, dealing with its purpose, preparation, choice of policies and public consultation. Part 2 deals with the strategy of the plan regarding housing, population, employment, inner area sites, transport, the major centre, and the rural area. Part 3 outlines the policies and proposals affecting these and other aspects of the planning commitment including shopping and commerce, recreation, financial resources, minerals, physical environment, monitoring and review. 42 310277 MULTI-VARIABLE MODELS OF CAR OWNERSHIP. This paper reports two modelling exercises which used individual household choice models to investigate the effects of various household characteristics and public transport factors on car ownership levels within the broad constraints of conventional cross-sectional analysis. The data used to estimate the models were collected as disaggregate travel demand modelling data sets, using direct interview techniques, and comprised the results of 2253 interviews in Canberra in 1975 (a city of high affluence and car ownership) and 4400 interviews in Adelaide in 1977 (a less homogeneous, less affluent population than Canberra). Analysis results are presented in tabulated form and discussed in relation to the variables intro-

duced into the models such as household, trip, personal and locational characteristics. The performance of the Canberra and Adelaide models is compared, and it was found, for example, that household structure variables (size, workers) have a highly significant effect on car ownership. The conclusions drawn from this study include the suggestion that multi-variable models yield much better explanations of the factors affecting car ownership choices than do simple income-based models. 42 310278 THE NATIONAL BUS COMPANY "MAP" MARKET ANALYSIS PROJECT. Reference is made to social factors which have influenced the demand for bus services, and further decrease in the demand due to necessity for higher fares. The need for operational efficiency and use of public transport subsidies is stated. The National Bus Company policy of applying market analysis techniques to relate bus services to passenger demand, with rationalization of cross-subsidy and revenue support policies, is explained. A general outline of the "MAP" procedure is presented and illustrated, and its major tasks to be carried out at bus company level are summarised. A description is given of the data acquisition process by on-bus surveys, and an explanation follows of the bus system design procedure. The possible need of local authority traffic management schemes is discussed, and procedural details included for implementing revised bus services. (TRRL)

42 310388 AN APPROPRIATE APPROACH TO TRANSPORT PLANNING. The article compares the features of transport planning in developed countries with that in developing countries. In the developed world transportation studies are often held up due to changes in policy while such planning work in the third world countries tends to concentrate on practical achievement. A feature of third world transport is the prevalence of paratransit which offers flexibility, accessibility and relative low cost. In contrast, paratransit is excluded in the West and in Britain particularly by rigid licensing designed to protect established operators but thereby eliminating initiative in type of vehicle operated and route flexibility. In Britain transport planning has turned from road system development to support for public transport and environmental management so causing uncertainty about the role of transport planning. The article discusses the contribution and responsibility of the transport planner although it is considered that sometimes complexity is confused with correctness. Approaches to transport planning in the madras region are described where it is suggested that lessons might be learnt by planners in the West. (TRRL)

42 310406 AN EMPIRICAL ANALYSIS OF BEHAVIOURAL INTENTIONS OF SINGLE-OCCUPANT AUTO DRIVERS TO SHIFT TO HIGH OCCUPANCY VEHICLES. The emphasis in transportation planning has recently changed from long-range, high-capital investments to short-term, low-cost transportation system improvements. The development of incentives for bus riding and carpooling, particularly for the work trip, plays a major role in this resource management process. This study is specifically designed to uncover factors which influence the intentions of the single-occupant auto commuters to switch to buses and carpools and to suggest operating policies consistent with the intent to encourage the use of high-occupancy vehicles. The single-occupant auto commuters are segmented into several potential ridesharing markets on the basis of their expressed intention to take a bus or a carpool if certain transportation system modifications were effected. Three groups of switchers are identified: those who are positively oriented towards taking a bus, those who would only switch to a carpool, and those who would consider either of the ridesharing modes. Bus convenience is the most important variable associated with the shift intention. Perceptions of carpool comfort do not appear to be important, rather, perceptions of carpool schedule flexibility, cost, safety and a short wait in traffic are prime factors associated with potential carpool shifting. Additional models involving mode satisfaction are reviewed and policies which enhance bus convenience and minimize waiting in traffic for carpools are suggested to recruit the potential ridesharers. 42 310476 A THEORETICAL AND EMPIRICAL MODEL OF TRIP CHAINING BEHAVIOR. This paper addresses the theoretical and empirical issues involved in modeling complex travel patterns. Existing models have the shortcoming of not representing the interdependencies among trip links in trip chains with multiple non-home stops. A theoretical model based on utility theory and explicitly accounting for the trade-offs involved in the choice of multiple-stop chains is developed. Using this theoretical model, utility maximizing conditions for a household's choice of a daily travel pattern are derived. The optimum travel pattern is described in terms of the number of chairs (tours) traveled on a given day and in terms of the number of stops (sojourns) made on each of those chains. For a given household, the form of the optimum pattern is a function of the transportation expenditures (time, cost) required to reach potential destinations. Constraints on the conditions of optimality due to the limited and discrete nature of travel pattern alternatives are also considered. Parameters of the general utility function were estimated empirically using actual travel data derived from a home interview survey taken in Washington, DC. The multinomial logit model is used to relate utility scores for the alternative travel patterns to choice probabilities. The resulting parameter estimates agree with theoretical expectations and with empirical results obtained in other studies. In

order to demonstrate the empirical and theoretical implications of the model, forecasts for various transportation policies (e.g., gasoline price increases, transit fare reductions), as made by this model and by other less complex models, are compared. The results of these comparisons indicate the need for expanding the scope of existing travel forecasting models to explicit considerations of trip chaining behavior. (Author/TRRL)

Adler, T (Dartmouth College) Ben-akiva, M (Massachusetts Institute of Technology) *Transportation Research. Part B: Methodological* Vol. 13B No. 3, Sept. 1979, pp 243-257, 5 Tab., 17 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 243501)

42 310556 TRAVEL DEMAND. MODELS AND CALCULATION METHODS BASED ON ELASTICITIES [Resetterfragan. Modeller och berakningsmetoder baserade paa elasticitetstal]. There are basically two methods of analyzing how different factors affect travelling by public transport: (1) elasticity values, which means the value that specifies the sensitivity of travel demand to changes in a factor, (2) demand functions, which means total connections between the demand for journeys and the different factors that affect the demand. The second method is more used because of its simplicity. In this report the available knowledge of elasticities for public transport in built-up areas is summarized. The report partly deals with elasticities for changes in the fare level and partly with elasticities for changes in the offer (the service level). There is also a survey of the results that have been obtained in different foreign investigations. (TRRL) [Swedish]

42 310564 MANAGING TRANSPORT. MANAGING OF TRANSPORT SYSTEMS TO IMPROVE THE URBAN ENVIRONMENT. The experience of selected cities; Beasanccon (France), Brussels (Belgium), Geneva (Switzerland), Gothenburg (Sweden), Groningen (the Netherlands), London (United Kingdom), Madison (United States), Nagoya (Japan), Nottingham (United Kingdom), Ottawa (Canada), Paris (France) and Singapore which have implemented management-orientated transport policies is summarized, and the impact of these policies on transport system efficiency and urban environment, particularly air quality, noise, accidents, congestion, land use, and management of urban public space is assessed. Their implementation is also the object of careful evaluation. The second chapter of the report deals with the impact of such management-orientated transport policies on national concerns in the sectors of environment, energy, employment, inner city revitalization and financing. Subsequent chapters are devoted to edited versions of the case studies on which the opening chapter is based. (TRRL)

42 310613 WORK-TRIP MODE-CHOICE MODELS FOR SOUTH AFRICA. This paper describes a number of individual-choice models of work-trip mode-choice, calibrated in the course of a bus study in two communities of Metropolitan Johannesburg. First, it is found to be useful to reduce the alternative set from eight modes to four modes, without loss of estimation power. Second, a number of alternative specifications of costs and times are examined, from which the chosen model is selected as one containing five such variables. In addition, a variable of car competition is found to add significantly to the explanatory power of the model. Finally, recently-documented procedures are applied to the selected model specification to pool the results of two random subsamples and to correct the choice-based biases in the alternative-specific constants. It is found that the coefficients of the South African model fall well within the range of coefficients determined in the U. S.

42 310695 EQUILIBRIUM TRIP ASSIGNMENT: ADVANTAGES AND IMPLICATIONS FOR PRACTICE. During the past 10 years the problem of assignment of vehicles to large, congested urban transportation networks according to the principle of equal travel times has been solved and an efficient, convergent computer algorithm devised. Although the algorithm is available in the Urban Transportation Planning System, many practitioners continue to use the heuristic trip-assignment algorithms devised in the early 1960s. As in many other cases, this slow implementation of a new, improved algorithm appears to come from (a) a lack of understanding of its basic concepts, (b) an unfamiliarity with the computer program for applying the algorithm, and (c) a lack of evidence concerning the new algorithm's performance in large-scale applications. These three issues are addressed in this paper. Based on the experience with its implementation on a large network, it is recommended that equilibrium trip assignment should always be used instead of iterative assignment. Better results, as judged by the criterion of equalizing travel times for alternative paths be-

tween each origin-destination pair, will always be obtained with the equilibrium algorithm for any given amount of computational effort. Which method best replicates the observed vehicle flows may depend on the detail of the network, the adequacy of the capacity-restraint functions, and the time period of the assignment (24 h or peak period). (Author)

42 310697 VALIDATION AND APPLICATION OF AN EQUILIBRIUM-BASED TWO-MODE URBAN TRANSPORTATION PLANNING METHOD (EMME). The purpose of this paper is to report on the validation and application of the two-mode urban transportation planning technique called EMME. This method may be characterized as an integrated two-mode traffic equilibrium method. Roughly speaking, this method combines a zonal aggregate-demand model with an equilibrium-type road assignment and a transit-assignment method. We describe the validation and application of the model by using data from the city of Winnipeg, Manitoba, Canada. (Authors)

Florian, M Chapleau, R Nguyen, S Achim, C James-Lefebvre, L Galarneau, S Lefebvre, J Fisk, C (Montreal University, Canada) *Transportation Research Record* No. 728, 1979, pp 14-23, 4 Fig., 5 Tab., 10 Ref.; This paper appeared in TRB Research Record No. 728, Passenger Travel Forecasting.; ORDER FROM: TRB Publications Off

42 310699 DISCRETE MULTIVARIATE MODEL OF WORK-TRIP MODE CHOICE. This paper applies discrete multivariate analysis to the specification and estimation of factors that govern work-trip mode choice. Where large data sets are available, this technique is found to have two important advantages over conditional logit analysis: Better model specification is facilitated and parameters can typically be estimated at sharply lower cost. The study focuses on the mode-choice behavior of 9880 Washington, D.C., area households that made work trips in 1968. Perhaps the most striking result is that in-vehicle travel time seems to have a nonlinear impact on the mode-choice logit (log-odds of drive alone versus bus), which has potentially important consequences for policy. For the range in which bus is faster than automobile, changes in bus (or automobile) in-vehicle travel time have the well-known results reported by other studies. But for the interval within which driving is faster than bus, decreases in bus in-vehicle travel time that fall short of making the bus mode absolutely faster than driving will, if our estimates are correct, fail to increase ridership significantly. 42 310705 SAMPLING VEHICLE KILOMETERS OF TRAVEL. This paper develops sampling procedures for estimating vehicle kilometers of travel on urban streets. It shows how simple and stratified random sampling techniques can be applied to estimate sample-size requirements for estimating freeway, arterial-collector, and local-street vehicle kilometers of travel. The paper also presents and provides ranges in the parameters associated with the variations in traffic volumes in space and time. These estimates are then used as part of a practical, operational procedure. (Authors)

42 310706 EMPIRICAL COMPARISON OF VARIOUS FORMS OF ECONOMIC TRAVEL DEMAND MODELS (ABRIDGMENT). This study examines some of the popular demand equations available for assessing future conditions of intercity travel demands and in knowing the passenger's response to a fare hike. Planners need to be able to forecast correctly how a reduction in air fare would affect the passenger demand for airlines and other competing modes such as rails and buses. These demand equations are designed to satisfy three basic properties: homogeneity, summability, and symmetry. The five demand models discussed in this paper are: a double-log demand model, an inequality-constrained double-log demand model, a weighted Stone model, the Rotterdam system of demand equations, and a homogeneous translog demand model. The results of the study indicate that demand equations that are imposed by the homogeneity, summability, and symmetry conditions provide more stable results on the compensated cross elasticities than those equations that do not have such conditions imposed. In general, the market cross elasticities—the traditional means of assessing travel demand—are very unstable; and they vary depending on the choice of functional forms, even when we impose the three basic conditions on their demand equations.

42 310707 ESTIMATION OF DEMAND FOR PUBLIC TRANSPORTATION (ABRIDGMENT). This paper describes the mode-split model used by the Chicago Area Transportation Study, which was first used in mid-1973 for the evaluation of the 1995 regional transportation plan. It was concluded that the model possesses some highly desirable attributes such as: its compatibility with the conventional transportation process, its permission of application of disaggregate mode-choice models, and its provision of a detailed description of the access and egress transit service and a realistic account of its effect on transit ridership. The method for describing the service is flexible enough to support analyses of non-standard service, such as di-

al-a-ride. The model is fully operational and had been proven applicable for analyses of large-scale regional problems as well as for small-scale, subregional projects, including transportation system management strategies; and the resources required for data preparation and analysis are reasonable.

Gur, Y (Urban Systems, Incorporated) Kopec, D Lowe, E Ryan, E Vyas, A (Chicago Area Transportation Study) *Transportation Research Record* No. 728, 1979, pp 76-79, 1 Fig., 2 Tab., 9 Ref.; This paper appeared in TRB Research Record No. 728, Passenger Travel Forecasting.; ORDER FROM: TRB Publications Off

42 310708 SECOND ROLE OF THE WORK TRIP-VISITING NONWORK DESTINATIONS (ABRIDGMENT). This paper reviews findings of home interview origin-destination data collected from the Fresno-Clovis area, California in 1971 regarding additional roles of the work trip. It was found on a typical weekday that approximately one-third of the households in which the head is employed visit one or more nonwork destinations as part of a trip to or from the workplace. Although these findings seem to deviate from conventional wisdom, it is pointed out that the travel patterns found in Fresno are consistent with those found in studies of other cities conducted by Ginn and Horowitz. This shift from conventional work trip travel patterns—the sole function being to get people to and from the workplace—is explained by an emphasis on using transportation policy to help achieve air pollution goals and energy conservation goals. An understanding of the extent to which and the reasons why household members use workplace-related trips to visit nonwork destinations seems essential for effective transportation planning.

Oster, CV, Jr (Harvard University) *Transportation Research Record* No. 728, 1979, pp 79-82, 1 Tab., 5 Ref.; This paper appeared in TRB Research Record No. 728, Passenger Travel Forecasting.; ORDER FROM: TRB Publications Off

42 310709 GENERALIZED ATTRIBUTES AND SHOPPING TRIP BEHAVIOR. Attitudinal data obtained from an impact travel survey of the San Francisco area was analyzed to determine the composition of generalized attributes that identify an individual's cognitive structure of shopping behavior. Once it was determined (by employing two measures of factorability) that factor analysis was an appropriate analytical tool, the data (stratified by residence and trip destination) were factor analyzed. The results indicate that each population's cognitive structure is unique, although in all cases a common set of generalized attributes was found to be important. For the respective populations, an index of satisfaction was developed for each of the generalized attributes. The index was used to investigate the relation between a population's cognitive structure and its socioeconomic profile. Based on tests of independence and gamma measures of association, the following attributes were significantly related to a population's satisfaction relative to alternative attributes of the shopping excursion: travel, mode, length of residence at current address, and age distribution. Among the implications of the analysis is that a

set of attributes exists, independent of residence or trip destination, that should be incorporated into travel-demand models if shopping travel behavior is to be forecast accurately. Moreover, the extent of travel incurred in a shopping journey appears to significantly affect an individual's attitude structure of shopping activities. (Author)

42 310736 DEMAND-ESTIMATING MODEL FOR TRANSIT ROUTE AND SYSTEM PLANNING IN SMALL URBAN AREAS. A simplified model for directly estimating transit route and system patronage for small urban areas is presented. A category approach is used to determine basic transit trip generation by automobile-ownership classification. The basic rate is then modified by a series of adjustment relations for trip length, walking distance, and service frequency to arrive at an estimate of patronage for the service alternative under study. The model can be manually applied and used to assess new service, extension of existing service, or improvements in the existing level of service. (Author)

42 310759 TRANSPORTATION PROJECT EVALUATION AND PRIORITY PROGRAMMING: TECHNIQUES AND CRITERIA-ANNOTATED BIBLIOGRAPHY. This state-of-the-art paper presents a broad survey of the techniques used to program transportation improvements. Evaluation methodologies used to develop sufficiency ratings are listed, and the criteria for priority setting are examined. The following groups of criteria are detailed: needs parameter, physical criteria, fiscal criteria, impact analysis, technological suitability, and urban transportation performance. New federal requirements for transportation improvement program

(TIP) for metropolitan areas have necessitated a considerable reorientation in the formulation of the types of criteria used in transportation programming. Emphasis is now being placed on less capital intensive projects and on analyzing trade-off among modes. Transportation officials are becoming increasingly aware of performance of transportation systems in providing service, and there is a growing trend among states in using system performance indicators to allocate transit funds among regions. It can be expected that as resource constraints become increasingly severe because of inflation and revenue shortfalls, Performance criteria involving system efficiency and productivity will become more and more important in transportation decision-making.

42 310876 A SURVEY OF FERRY PASSENGERS. The Paper reports on a particular survey carried out on the passenger ferry services of the Brisbane River, Australia. Further details of the work are given in another paper by Pretty and Grigg referenced below. The project team was required, among other things, to find out the origins and destinations of passengers and their access and egress modes. There are 11 regular services for passengers (two carry motor vehicles as well) plying the Brisbane River for up to 18 hours a day, six or seven days a week. In a typical week in 1975 there were nearly 40,000 passengers, so the task of carrying out a comprehensive survey was a formidable one. A technique is described for obtaining nearly a 100 per cent return rate for a day's operations on a public transport service.

42 311079 TRANSPORTATION PLANNING FOR RURAL AMERICA. Transportation planning for rural areas is important in view of the fossil fuel shortage and its impact on the transportation of goods and services in low density areas. A systematic planning process must first determine the limits of the problem area, as well as the objectives of the people in the designated system Physical constraints (river, rail crossings, etc.) and legal requirements must also be defined. Possible economic and political resources to support alternative solutions should be investigated, and the decision maker and the decisions to be made should be identified. Aspects of planning which are stressed are continuity, flexibility, simplicity, and the reduction of intermodal conflict points. A primary purpose of planning is to relate service to maximum demand, which involves plotting maximum demand and the minimum resistance to it. This book discusses the wise use of land, planning for pedestrians, bicycles, pedal cars and mopeds, and planning for transit (routing, marketing and management). Problems related to the highway and parking in small urban areas are also discussed. The three

phases of plan implementation, citizen participation/public relations, developing a continuing planning program, and evaluation alternatives are also covered.

Markve, K ; Upper Great Plains Transportation Institute TES 5, Dec. 1979, 139 p., Figs., Tabs., Refs., Apps.

42 311145 CONSISTENCY OF ORIGIN-DESTINATION (O-D) CHARACTERISTICS THROUGH TIME. The report summarizes data from selected cities and examines the data to the fullest meaningful extent with respect to its limitations. A review of literature on land use and urban transportation indicates that travel patterns have changed substantially during the past few decades in American and European cities. This investigation attempts to summarize the changes in travel patterns as measured in two points in time for several urban areas in the United States, Canada, and Britain.

42 311166 REVISED CROSS-IMPACT METHOD AND ITS APPLICATIONS TO THE FORECAST OF URBAN TRANSPORTATION TECHNOLOGY. The urban transportation system of Japan today faces many difficulties such as slow-down of effective vehicle speed, increase in transportation and transit costs, and deterioration of environment by pollutants and exploitation of lands. Both new technological developments and effective policies, among which strong impacts are to be anticipated, are prerequisites for coping with these difficulties. The authors envisage scenarios for the future urban transportation system of Japan by a revised cross-impact method, an attempt to take explicitly into account impacts among separate future technologies. It comprises the estimation of probability of occurrence of each technological event, degrees of impacts among events, and revision of occurrence probabilities of events by Monte Carlo simulation, taking the mutual impacts into account.

42 311181 TRAFFIC-ASSIGNMENT TECHNIQUES FOR SMALLER CITIES. The primary purpose of the research was to determine which of the heuristic assignment techniques currently available to transportation planners in the United States provides the most accurate results for small and medium-sized cities and to assess the potential for future applications of equilibrium assignment techniques. A number of all-or-nothing, multipath, and capacity-restrained assignment techniques were applied to highway networks for Fond du Lac and Madison, Wisc., using common trip tables. Using the percentage of root mean squared error as the primary accuracy measure/percentage of the accuracy of the assignments in the order of increasing accuracy was all-or-nothing, multipath, and capacity-restrained. The accuracy of the capacity-restrained assignments appeared to be more sensitive to the assumptions made in computing the peak-hour assigned volumes and capacities than to differences in the capacity-restraint techniques. An equilibrium assignment for Winnipeg, Manitoba, Canada, was slightly less accurate than the most accurate assignment for Madison. A technique for assessing the behavioral validity of equilibrium assignments is proposed.

42 311201 TRANSPORTATION PLANNING FOR SMALL AND MEDIUM-SIZED COMMUNITIES. PROCEEDINGS OF A WORKSHOP. The proceedings are reported of a conference that was convened to provide for the exchange of experiences among practitioners of transportation planning for cities of fewer than 200,000 people, to provide guidance for transportation policies and programs, to foster the development of future activities in this area, and to provide a document that will reflect the proceedings of the conference and serve as a basic resource for practitioners, administrators, and policymakers. Forty four papers were presented in five areas: transit operations planning; traffic planning and operations, surveillance and socio-economic forecasting, and systems planning and plan implementation. The keynote address was on the federal perspective of planning for transportation in small and medium-sized communities which set the theme for the conference. Papers concerning the products of the transportation planning process from the state perspective and the appropriate level of planning effort in smaller cities provided the impetus for the workshops. The latter began by considering issues and levels of effort pertinent to the functional workshop area. Resource papers aided workshop deliberations. The second half of the conference was allocated to workshop activities on techniques. Plenary sessions followed each workshop session.

42 311203 TRANSPORTATION PLANNING IN SMALL AND MEDIUM-SIZED COMMUNITIES: GREATER FLEXIBILITY, IMPROVED COMMUNICATION, AND SIMPLIFIED REQUIREMENTS. The urban transportation planning process formalized in the early 1960s has become increasingly diversified in the 1970s. Recently, special attention has been focused on the planning needs, requirements, and processes for small and medium-sized communities. Because of the need to develop processes and techniques that will provide adequate guidance to transportation decision makers, the Federal Highway Administration has sponsored the development of series of manuals that address state and local concerns while being mutually supportive. The emphasis of transportation planning for small and medium-sized urban areas is focused on three precepts: (a) greater flexibility in organizational and administrative arrangements; (b) improved communication between the decision maker, the planner, and the general public; and (c) simplification of the administrative planning requirements as well as of the procedures. The role at the federal level will be to improve the planning of transportation systems by facilitating activities that respond to local goals and concerns. (Author)

42 311204 WHAT SHOULD WE BE TRYING TO DO IN THE TRANSPORTATION PLANNING PROCESS? This paper presents many of the issues and concerns surrounding the transportation planning process and products from a state perspective. The uniqueness of each urban area, including the small and medium-sized ones, dictates a process that is responsive to local needs and products that address the important issues. The regulations formulated at various governmental levels must work to the advantage of the local area; therefore, latitude must be an integral component implicit in this regulation. The long-range planning process cannot be ignored, but its de-emphasis may be required to effectively facilitate short-range programs. A survey of local public officials in Illinois has reaffirmed the need to simplify the administrative requirements of the planning process and increase its flexibility by allowing local transportation decision makers to define its direction. The enthusiasm for data and an ongoing data base is not valid in many instances. Suggestions are made as to the critical data elements needed to prepare most alternatives and analyses. The vitality of the transportation planning process rests with the effective union of local decision makers and transportation planners. Local determination and a responsible program that reflects local goals and priorities is the mandate of the transportation planning process. (Author)

42 311205 APPROPRIATE LEVEL OF EFFORT FOR PLANNING FOR SMALL AND MEDIUM-SIZED COMMUNITIES. Because of the need for a responsive local transportation planning process, the transportation planner is faced with the need to ascertain the appropriate level of effort. A uniform, highly structured study design is not appropriate in all cases nor is it always effective. This paper is an attempt to define the role of transportation planning in relation to the local general plan, thereby providing guidance for the integration of planning activities, elements, and products into an administrative process. Guidelines for the appropriate level of professional effort for transportation planning for small and medium-sized cities are given as a function of the growth characteristics and general transportation planning activities of the urban areas. 42 311206 ACHIEVING A BALANCE BETWEEN LONG-RANGE AND SHORT-RANGE PLANNING AT AN APPROPRIATE LEVEL OF EFFORT. Increasing concern is being focused on the need for an improved planning rationale for smaller (generally fewer than 200000 population) urbanized areas. It is also necessary to provide officials at federal, state, and local levels with a clearer picture of the appropriate balance between short-and long-range planning for such areas. This paper presents a process for identifying and considering relevant factors that affect transportation planning and describes the planning activities that would result from these factors and the relationship between long-and short-range planning activities. 42 311208 TRANSPORTATION AND TRANSIT PLANNING FOR SMALL AND MEDIUM-SIZED URBAN AREAS. Many of the factors that affect the planning of smaller transit systems also affect the successful operation of those systems. For example, the availability of qualified personnel in the area will affect both planning and management--there is often very little real expertise readily accessible to smaller cities. In terms of funding, operating aid to cities has only recently been appropriated, and smaller local governments are usually quite ignorant as to

what funds are actually available. Tradition plays an important part in that transit historically has been considered a private enterprise operated for profit. It is difficult for the public, and public officials, to consider transit as a service in the sense that libraries, police, and fire protection are services. Yet unlike most other municipal services, mass transportation has a direct competitor, the private automobile. Also unlike libraries or fire protection, public transit requires levying a charge each time it is used. Skillful management and marketing is particularly necessary in smaller urban areas to overcome public misgivings. Although the planning and provision of highways in these areas are apt to be handled quite effectively, transit is in many instances still handled badly. And this will continue until local planning and management can be upgraded and stronger local support can be developed. (Author)

42 311211 FORECASTING TRANSIT RIDERSHIP IN SMALLER COMMUNITIES. As the attention being given to transit planning for smaller communities increases, more accurate ridership forecasts are being required. In smaller areas, basic data for these forecasts remain scarce, but a number of successful techniques have been designed to overcome this lack of original data. Among the techniques developed for use by small cities and rural areas in Florida is a first-cut, sketch-planning estimate that roughly forecasts the annual numbers of riders, vehicles, and equipment kilometers. This technique can also be used to estimate capital costs and yearly operating costs. If, on the basis of the initial forecasts, a community decides to pursue a transit plan, additional ridership forecasts will be necessary. Particularly for fixed-route systems, the latent-demand and direct-demand forecasting techniques can be very useful. These two techniques and the results of the initial survey can provide a

cost-effective basis that local officials can use in deciding on the most appropriate transit plan for their area. (Author)

42 311212 ESTIMATING TRANSIT DEMAND, FLEET SIZE, AND COSTS FOR SMALL COMMUNITIES. Forecasting transit demand and estimating costs for transit systems in smaller communities is very difficult. The Ready Reckoner approach developed in 1974 has been used successfully in smaller urban and suburban areas throughout Canada. This approach can be used to estimate potential demand, system size, and cost parameters. It is a shortcut estimating tool intended primarily as assistance to policymakers in deciding whether or not more detailed analyses and feasibility studies are warranted rather than as a substitute for those necessary calculations. 42 311215 TRAFFIC OPERATIONS AND PLANNING. ISSUES. This paper contains definitions of and recommendations for the problem areas of the Traffic Operations and Planning Workshop. The scope and objectives of the workshop were defined as issues and problems related to traffic planning and operations in small and medium-sized communities and as recommendations related to improving the practice of traffic planning and the management of traffic operations. Five problem areas requiring attention were mentioned: a need for the traffic operations and planning process to be responsive to local needs; a need to bridge the credibility gap that traffic professionals have with local elected officials; insufficient money available at the local level for traffic planning and for traffic operation improvements; a need for system performance measures; and defects in the traffic planning process.

42 311217 TRAFFIC ENGINEERING SERVICES FOR SMALL POLITICAL JURISDICTIONS. When does a city need traffic engineering assistance? Is this need a function of population size or of number of traffic accidents? All communities regardless of size have traffic problems. This paper discusses methods that have been used to provide traffic engineering services in smaller communities, specifically the approximately 5670 U.S. jurisdictions having populations in the 2500 to 50000 range. These methods were surveyed during a study of the off-system highway network of local undesignated roads and streets in cities and counties having populations of fewer than 40000. One state and at least two local jurisdictions in each of the Federal Highway Administration regions were visited. The locations were selected after evaluation of responses to a questionnaire mailed to each state and a nationwide sample of 1350 cities and counties fitting the population criterion. The conclusions and recommendations resulting from this study are provided in this paper. (Author)

42 311219 SURVEILLANCE AND SOCIO-ECONOMIC FORECASTING. This paper contains discussion of issues in urban transportation planning identified in papers presented at the Workshop on Surveillance and Socioeconomic Forecasting. Also, it contains questions that resulted from the discussion; and it contains ideas that were presented in response to the questions. The discussion centered on three subjects: the need to identify the unique problems of smaller urbanized areas and to develop planning programs to evaluate those needs; the importance of timely information for decision makers on the potential consequences of official actions; and the middleman role that metropolitan planning organizations (MPO's) are experiencing in the long-established relationships between the state and local governments. Some of the questions that followed the discussion included: is the planning currently under way really a complex process?; what should the planning process accomplish?; what are the issues in the process?; and what are the important characteristics of an area that determine the level of effort needed? Those questions brought about the following ideas: the current planning process is not complex when subdivided into long-range and short-range projections; the process should be sensitive to the needs of local elected officials, should focus on realistic solutions, should consider projects that stimulate economic growth, and should address long-range issues on a sketch basis; the issues in the process are both technical and administrative; and the key characteristic of a smaller urbanized area that controls the types of planning and the degree of detail needed is the quality of the existing street and highway system.

42 311220 ISSUES AND LEVELS OF EFFORT. This paper lists the objectives and issues of the Workshop on Surveillance and Socioeconomic Forecasting. Particular emphasis was given to the frequency, level of detail, and geographic systems of data and forecast. The objectives are: identification of the transportation and land use problems faced by small and medium-sized communities; evaluation of the types of data that should be collected to identify these problems; identification of the frequency and costs of collecting these data; identification and evaluation of secondary-source data and geographic systems used in its forecasting process needed for both short-range and long-range planning. The issues are: how much of the data collected in the past has been useful?; what types of data should be collected now for problem identification and short-range and long-range planning?; are any of the data-collection procedures used in long-range systems planning useful for corridor or project planning purposes?; should any data be collected to satisfy the needs of local elected officials that is not needed for technical planning purposes?; how can models be simplified to require less-detailed and less-expensive data collection?; and what staff levels and type of staff are needed to ensure proper data collection, analysis, and forecasting?

Shiatte, KW (New York State Department of Transportation) *Transportation Research Board Special Report No. 187, 1980, p 52*; This paper appeared in TRB Special Report 187, Transportation Planning for Small and Medium-Sized Communities, Proceedings of a Workshop sponsored by UMTA and FHWA, conducted by TRB, Sarasota, Florida, 3-6 December 1978.; ORDER FROM: TRB Publications Off

42 311221 SURVEILLANCE AND SOCIO-ECONOMIC FORECASTING. Data collection in smaller urban areas can be minimized through the use of secondary sources. Quite a bit of work can often be accomplished with minimal data acquisition. To establish a surveillance or monitoring program, one must first establish an inventory of basic information that includes such data as travel counts, routes and schedules of the public transportation system, maps, numbers of employees, and characteristics of the population. The monitoring effort should, in turn, be based on sound procedures and methodologies that are inexpensive and provide quick turn-around information. Census data can often be very useful. Data items to be forecast should be limited to those actually required for systems analysis. In many instances, the issues that emerge in smaller urban areas are not very different from those in larger areas. The difference is that, in smaller areas, there is often more reliance on secondary data sources. If more work is needed in any area, it may be in educating local officials not to be afraid of the kinds of borrowed information that can save them money and be quite valuable for their planning efforts. 42 311224 COMMERCIAL DATA SOURCES FOR TRANSPORTATION PLANNING. There is no universal best source of data for transportation planning. In many instances, commercial data are less expensive, more current, and more quickly available than government data. Furthermore, commercial data sources are unaffected by government paperwork-reduction programs that are affecting many data-collection projects. Although there are still problems in using commercial data sources, they are of the same relative magnitude as those of public sources. Commercial data have been used with some success in compiling household, employment, and trip information. In particular, R.L. Polk and Dun and Bradstreet data have already seen considerable use in urban transportation planning. As commercial data sources become more competitive, transportation planners in small and medium-sized communities would be well advised to consider this information in deciding on the means of creating and maintaining data files. 42 311228 FORECASTING GROWTH PARAMETERS IN SMALLER URBAN AREAS. In considering the data needed for forecasting growth parameters for use in transportation planning in smaller urban areas, it is important to realize that certain aspects of the future are incapable of prediction under any circumstance. More socioeconomic data will not eliminate this problem. However, other aspects of the future are not only predictable but determinable if adequate public policy tools are used, and they should be sought through an evaluation of alternative plans

and implementation of the preferred plan. The socioeconomic data needed for this are different from and more modest than those needed for detailed forecasting. (Author)

42 311229 SYSTEM PLANNING. This paper contains a list of and discussion of the objectives and issues introduced at the Workshop on System Planning. The objectives were defined as: identification of the transportation and land-use problems faced by small and medium-sized communities that have growth potential; evaluation of the level of analysis that is necessary to address these problems; identification of procedures and techniques appropriate for system planning in small and medium-sized communities; evaluation of those procedures and techniques in terms of technical validity, response time, and cost-effectiveness; and development of recommendations relative to system planning. The issues are: should the transportation planning process be continued?; is it necessary to apply the traditional four-step procedure (i.e., trip generation, trip distribution, mode choice, and traffic assignment) or can a conceptual system planning approach be used?; how much effort should be devoted to long-range planning and to short-range planning?; and is it necessary to evaluate a variety of alternative land-use and transportation plans? The workshop participants concluded that the transportation planning process must be continued; however, it must effectively support the concerns of local decision makers, address the problems of the individual local community, and be responsive by providing the necessary information in a timely fashion. It was also concluded that traditional modeling procedures need not be used for system planning in small and medium-sized communities. It was noted that the time frame for appropriate and effective planning will vary from area to area; therefore, the amount of effort devoted to long-range planning versus that devoted to the short-range should be a function of the growth potential of the area and the nature of the problems to be analyzed. Finally, it was determined that there is no need to invest research money in developing new procedures or techniques; because the procedures and techniques are available. What is needed is a planner who has the ability to apply the techniques creatively.

42 311232 AN EXPLANATION OF WHY SYNTHETIC TRANSPORTATION STUDIES WORK (ABRIDGMENT). Although various validation studies have shown that synthetic urban-transportation-study techniques can achieve acceptable results when compared with conventional traffic assignments and ground counts, two questions have been frequently raised: does this favorable comparison indicate that the trip matrix developed by synthetic procedures reflects actual travel patterns?, and how sensitive is the assignment to the input data? This paper discusses a sensitivity analysis that used data from an urban transportation study in Tyler, Texas to help answer those questions. Four matrices were assigned to the same network and compared--the first three of which were assignment matrices and the last being the existing trip matrix: a stochastic trip matrix constrained only to the number of trips in the study area; a stochastic trip matrix constrained only to the number of trips in the study area; a stochastic trip matrix constrained to total trips, trip-length frequency, and trip ends at each external station; and the fully modeled trip matrix. Analysis of the results from the assignment indicates that, as long as an accurate trip-length frequency is used in generating the trip matrix, the assigned vehicle kilometers of travel will very closely match the counted vehicle kilometers of travel, even when the distribution of zonal trip ends is unrealistic. It

was concluded that acceptable assignment results can be expected if the following conditions are satisfied: the correct mean trip length is used, the total number of trips in the study area is correct, and a reasonable approximation of the geographical distribution of trip ends is achieved.

42 311233 A SIMPLIFIED TECHNIQUE FOR TRANSPORTATION PLANNING. Simplified techniques for transportation planning developed for several small urbanized areas in Texas are used to point out the need to design procedures that satisfy the requirements of the particular area. This approach has resulted in varying levels of effort for small urban area studies. These range from a comprehensive analysis of existing travel patterns and a manual forecast of travel to an analysis of existing travel patterns and the use of traditional models for forecasting traffic. In the studies described in this paper, primary emphasis is on solving current traffic problems and providing local planners and engineers with the information they want. The procedures are not necessarily cheaper or simpler than traditional ones but were designed to produce a specific product. The importance of developing procedures and techniques that provide useful and meaningful information to decision makers is emphasized. (Author)

42 311234 APPLICATION OF MANUAL TECHNIQUES FOR TRAVEL-DEMAND ESTIMATION. Manual techniques can be valuable in many aspects of transportation planning, especially for small and medium-sized cities. To effectively use these techniques, the planner must be aware of the procedures, assumptions, and, consequently, the utility of the outcome. The use of sensitivity surfaces often facilitates the planning product. This paper describes the use of manual techniques for travel-demand estimation through two scenarios, a site analysis in Boise, Idaho, and a corridor analysis in Columbus, Ohio. The quick-response advantage of manual techniques is emphasized. (Author)

42 311235 DWELLING-UNIT TO PARKING-STALL TRIP-GENERATION ANALYSIS (ABRIDGMENT). This report briefly summarizes a simplified method for relating zonal dwelling-unit and zonal parking-stall data to trip generation. This method has been used successfully by the Kansas Department of Transportation in studies in El Dorado, Dodge City, and Arkansas City. The results have proved surprisingly accurate in simulating existing conditions in small cities in Kansas and have required a minimum amount of time and money for data collection and tabulation.

Landman, ED (Kansas Department of Transportation) *Transportation Research Board Special Report No. 187, 1980, p 84*; This paper appeared in TRB Special Report 187, Transportation Planning for Small and Medium-Sized Communities, Proceedings of a Workshop sponsored by UMTA and FHWA, conducted by TRB, Sarasota, Florida, 3-6 December 1978.; ORDER FROM: TRB Publications Off

42 311236 SIMPLIFIED PROCEDURE FOR ESTIMATING FUTURE TRIP GENERATION (ABRIDGMENT). This procedure (which assumes that existing socioeconomic data are already completed) involves the following steps: develop the control total for the number of trip productions (P's) and attractions (A's) by purpose; add new developments by zone, that are known to be coming; divide the study area into developed area and undeveloped area; for developed areas, determine growth potential for each zone, adjust potential by using appropriate factors, and apply the factors directly to the existing P's and A's according to purpose; for undeveloped areas, flag zones that will be developed by target year according to percentage developed; apply average trip rate per developed unit according to purpose; add the total P's and A's compare with the control total, and adjust as necessary; and continue the distribution. The procedure makes the following assumptions: newly developed areas will be similar in characteristics to the typical existing developed areas, and the error in trip rates is probably less than that introduced by a zone-by-zone 20-year forecast.

42 311238 ISSUES AND LEVELS OF EFFORT. This paper contains the issues and research needs discussed at the Workshop on Plan Implementation. The participants identified thirty general problem areas related to transportation plan implementation in small and medium-sized communities. Of those issues, ten were cited as being of high-priority: poor overall management and coordination of the planning, programming, and implementation processes; areawide transportation planning that fails to address the broader needs of local decision makers; not making the best use of available staff resources; lack of appropriate attention to local regulatory powers for plan implementation; the

administrative burden on transportation planning and programming; lack of continuing information process for local decision makers; lack of planning support from local decision makers; transportation plans and programs that have been too far off target; and inability to protect financial resources. The one research need that was specifically recommended for further study relates to the problems and difficulties in planning for an uncertain future. Another need mentioned, which was not fully defined, was to establish appropriate levels of effort for transportation planning and programming in small and medium-sized urban areas.

Granum, JO Wilson, BB (Wisconsin Department of Transportation) *Transportation Research Board Special Report No. 187, 1980, pp 87-89*; This paper appeared in TRB Special Report 187, Transportation Planning for Small and Medium-Sized Communities, Proceedings of a Workshop sponsored by UMTA and FHWA, conducted by TRB, Sarasota, Florida, 3-6 December 1978.; ORDER FROM: TRB Publications Off

42 311239 ORGANIZATION STRUCTURE FOR PLAN IMPLEMENTATION. In addressing transportation planning for urban areas in the 5000 to 2000000 population range, it must be recognized that there is no single organizational structure universally suitable to administering transportation programs. In Tennessee, the A-95 organization is a major issue. This paper discusses the organizational structure that has been developed in Tennessee to implement the planning and programming of transportation systems. In this structure, the roles of state and local agencies and officials have been integrated. (Author)

Wilson, WH (Tennessee Department of Transportation) *Transportation Research Board Special Report No. 187, 1980, pp 89-91*; This paper appeared in TRB Special Report 187, Transportation Planning for Small and Medium-Sized Communities, Proceedings of a Workshop sponsored by UMTA and FHWA, conducted by TRB, Sarasota, Florida, 3-6 December 1978.; ORDER FROM: TRB Publications Off

42 311240 TRANSPORTATION PLANNERS AND LOCAL ELECTED DECISION MAKERS (ABRIDGMENT). This paper discusses the perspective of a city manager toward transportation planning. Discussion includes: various backgrounds of elected decision makers, the various areas of understanding involved in the local decision making process, the different levels of responsibility involved in the process, and the various relationships between transportation plans and planners and decision makers. It was concluded that the most important levels of responsibility for elected decision makers usually involve land use and zoning. Thus, it behooves transportation planners to work more effectively with local elected decision makers to improve the transportation planning and programming process.

Lykes, JE, Jr (Garland City Manager, Texas) *Transportation Research Board Special Report No. 187, 1980, p91*; This paper appeared in TRB Special Report 187, Transportation Planning for Small and Medium-Sized Communities, Proceedings of a Workshop sponsored by UMTA and FHWA, conducted by TRB, Sarasota, Florida, 3-6 December 1978.;

ORDER FROM: TRB Publications Off

42 311241 IMPLEMENTATION OF TRANSPORTATION PLANS (PARAPHRASED REMARKS FROM RD MORGAN). This paper discusses the various constraints to plan implementation. The plan itself may be a constraint; because sometimes planners recommend plans that have no reasonable chance of implementation. Finances specifically, reduced state and local revenues--are frequent constraints to plan implementation. Lack of political support at both the state and local level is a constraint, due to a credibility gap in the planning process with local decision makers. Lack of public support is also a constraint; because plans are not responsive to citizen problems, and there is not enough of public involvement. Lack of appropriate attention to local regulatory powers can be a constraint. Administrative burdens are also a common barrier. Other constraints mentioned include the lack of a continual information process for decision makers and the lack of support for them.

Transportation Research Board Special Report No. 187, 1980, p 92 This paper appeared in TRB Special Report 187, Transportation Planning for Small and Medium-Sized Communities, Proceedings of a Workshop sponsored by UMTA and FHWA, conducted by TRB, Sarasota, Florida, 3-6 December 1978.; ORDER FROM: TRB Publications Off

42 311242 TECHNIQUES. This paper details the issues and recommendations discussed at the Workshop on Plan Implementation. The principal issues were identified as: poor management of the planning and implementation process at all levels--planners, decision makers, and state and federal agencies; transportation planning that fails to address the broad needs of local decision makers and planners who do not provide information about the effects of transportation on other programs (such as social service, health, and education) in which decision makers are involved; and the quality of effort being more important than the quantity. The following recommendations were developed to deal with those issues: the emphasis of the planning process on long-range planning must give issues; local participants must be involved in identification of issues and problems in order to make the process responsive to local needs; communication between planners and decision makers must be improved; and reasonable levels of planning effort must be established.

42 311292 TAKING A TRANSFER TO MASS TRANSIT. Since the early 1970's California has been in the midst of a revolutionary shift in transportation policy. From an almost exclusive emphasis on the private automobile, the state has begun to support mass transit. In 1972, the sales tax was extended to gasoline, with most of the

revenues going to mass transit. A voter initiative in 1974 allowed up to 25 percent of the state's highway fund to be used for mass transit. A law passed in 1979 in response to the gasoline crisis allocated \$30 million for transit development over the next three years. Along with expanding and improving existing services, the allocation will aid the development of intercity and commuter rail service as well as of light-rail and rapid transit projects in several cities. However, because of the need to compromise with entrenched interest groups, this policy change should not be seen, as a shift from the automobile to mass transit but rather as an incremental adjustment to the status quo (dictated by political considerations) to form a multimodal system with the automobile still dominant. Furthermore, there still has not been the throughgoing appraisal of future transportation needs that the author feels is required, and which would include deciding how much of the highly valued goal of mobility is really necessary.

42 311302 HIGHWAY SKETCH PLANNING: CAPM THE COMMUNITY AGGREGATE PLANNING MODEL (CAPM) USERS' GUIDE. This report is an introduction to the Community Aggregate Planning Model (CAPM), and its potential uses. CAPM has recently been incorporated as a module of the Urban Transportation Planning System (UTPS) package of computer programs, and is a computerized transportation sketch planning model, which permits fast and inexpensive preliminary screening of highway improvement alternatives. It is useful in a number of sketch planning applications, such as the analysis of urban development patterns, alternative system investments, air quality, and energy consumption. This report incorporates two documents: the CAPM Users' Guide and the CAPM Program Writeup. The Writeup is included in this report as an Appendix. Together, these documents provide information of the program's capabilities, limitations, data needs, potential applications, and computer requirements. Both are now available on the UTPS tape. Included in this report are discussions of input requirements and output reports. Also presented is a fairly detailed description of the assumptions and algorithms upon which the model is based. The final section gives a number of coding examples which illustrate the use of CAPM in the analysis of various planning problems. (UMTA)

42 311713 ACCESSIBILITY MEASURES AND THEIR SUITABILITY FOR USE IN TRIP GENERATION MODELS. Accessibility measures which have been used in a number of previous studies are reviewed and their applicability for use in trip generation modelling appraised. The paper then outlines the ideal requirements of accessibility, measures for use in trip production modelling work and then proceeds to define a number of private transport, public transport and 'all modes' (private and public) accessibility measures. These are then tested using data collected in Middlesbrough, and the 'best' measures

together with the improvement in the explanatory power of the trip production models by the introduction of the accessibility measures, determined. (a) (TRRL)

42 312140 FORECASTING URBAN TRAVEL DEMAND FOR QUICK POLICY ANALYSIS WITH DISAGGREGATE CHOICE MODELS: A MONTE CARLO SIMULATION APPROACH. A spatial aggregation methodology based on continuous mathematical functions is employed in urban passenger travel demand prediction. The approach derives aggregate travel demand from disaggregate choice models in the form of multi-dimensional integrals which are solved by Monte Carlo simulation. Approximate empirical relationships are developed to examine the statistical properties of biases and random errors in Monte Carlo prediction. The methodology has been used in developing a comprehensive urban travel demand prediction model suitable for policy-sensitive sketch planning.

42 312645 URBAN CONSORTIUM FOR TECHNOLOGY INITIATIVES, 1978 [Annual rept]. An overview of the Urban Consortium for Technology's role in applying science and technology to solve urban problems, with emphasis on the achievements in 1978 are presented. The organization of the Urban Consortium is described and its 1978 committees and member jurisdictions listed. The sixfold objectives of the Consortium are to: seek new research resources,

continue refining agenda building strategies, accelerate development of quality products, communicate the Consortium's purpose and results, arouse Federal recognition of urban science and technology needs, and promote private sector recognition of urban needs. Highlights of the 1978 Consortium work program include procurement of funding for task forces in Energy and Human Resources, examination of neighborhood resource allocation strategies, a study of the use of tax incentives and regulatory controls to promote neighborhood maintenance and revitalization, community energy management plans, fire and safety disaster preparedness projects, studies of urban management, finances and personnel problems, and development of informational materials on urban transportation subjects. Expectations and the outlook for future activities of the Consortium are discussed.

42 312646 THE URBAN TRAVEL DEMAND FORECASTING PROJECT FINAL REPORT SERIES, VOLUME X. POLICY ANALYSIS OF A TRANSPORTATION CORRIDOR [Final rept]. The Urban Transportation Corridor Policy Analysis is one of the three practical applications of disaggregate travel demand models conducted as part of the Urban Travel Demand Forecasting Project. The policy study found that disaggregate travel demand models together with a synthesized sample of households are a very convenient and cost-effective way to predict demand for travel and for analyzing the consequences of alternative plans by market segments. Parametric transportation service models can be utilized together with the disaggregate travel demand models, and equilibrium of demand and service can be accomplished at low costs. The computational procedure employed in the study was that of approximating fixed points of a mapping. The costs of alternative transportation modes are a very complex problem for analysis. The analyses and calculations made show that substantial subsidies and cross-subsidies are made to and within the passenger transportation industry. The policy analysis of alternative plans in the I-580 corridor showed that a designated lane for high occupancy vehicles (HOV) improves the linehaul speeds in most cases even when it means reducing the capacity for single occupant cars. HOV lanes and express bus service were found to confer benefits mostly to the well-to-do suburbanites.

42 312869 URBAN TRAVEL DEMAND FORECASTING PROJECT, FINAL REPORT SERIES, VOLUME I: OVERVIEW AND SUMMARY. The project has been carried out to provide transportation engineers and planners with information necessary to select and policy-oriented travel demand models which were developed from observations on individual households. Emphasis focused on refining and testing

methods for applying models and determining the limits of their validity. Consideration has been given to all aspects of a transportation planning effort from survey and network data collection, through model specifications, calibration and validation, to issues of aggregation and policy forecasting as well as policy applications on region-wide, corridor, and local areas. Each phase has been explored at two levels: specific studies in each aspect of the project, and assessment of the merits and limitations of the methodologies employed with suggested preferable strategies for planning. The project focused on the introduction of rail rapid transit service (BART) in the San Francisco Bay Area.

42 312870 URBAN TRAVEL DEMAND FORECASTING PROJECT, FINAL REPORT SERIES, VOLUME IV: QUAIL 4.0 USER'S MANUAL. Instructions for using the QUAIL special computer program are detailed. QUAIL is the acronym for Qualitative, Intermittent, and Limited Dependent Variable Statistical Program employed to analyze statistical models involving non-continuous dependent variables and to manipulate storage of associated arrays of data. QUAIL is written in Fortran IV and is designed so that most errors in command statements are detected before data is recorded or results are compiled. Running a QUAIL program involves two steps--The QUAIL compiler scans the program for syntax errors and also creates a list of variables used but not created by the program; and the interpreter performs indicated operations, automatically loading any needed permanent variables from QUAIL tape or disk files. The manual describes selection of subsamples, the IDCASE/IDALT structure, manipulation of variables, input and output of variables, QUAIL files, stop, end, list, MACROS in QUAIL, advanced features in DIMEN and SMPL, logit estimation, other statistical procedures, matrix operations and QUAIL statements.

Berkman, J Brownstone, D ; California University, Berkeley, National Science Foundation Final Rpt. UCB-ITS-RR-79-8, NSF/RA-790257, June 1979, 162p; Grant NSF-GI-43740; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-125024

42 313231 INCREASING THE PRODUCTIVITY OF URBAN EXPRESSWAYS: COMBINING TSM (TRANSPORTATION SYSTEMS MANAGEMENT) TECHNIQUES AND TRANSIT IMPROVEMENTS. This is the second phase of a two-part study, which summarizes an analysis of Transportation Systems Management (TSM) and other low capital cost techniques to increase the productivity of urban expressways and streets in dense, built-up areas. Using CORSIM, a variant of the TASSIM land-use transportation model, this analysis examines the benefits and costs of implementing alternative combinations of TSM techniques and transit improvement policies. Of the composite policies tested, expressway ramp metering with an average delay of nine minutes, assuming an improved bus transit sys-

tem charges \$0.7 per mile, is the most feasible cost-effective option.

42 313621 LOGIT ANALYSIS OF RAPID TRANSIT ACCESS CHOICES. EXECUTIVE SUMMARY. The study examined the suitability of applying the program ULOGIT of the UTPS Package of Urban Transportation Planning Programs to forecast rapid transit access mode choices. This research provides a systematic methodology for analyzing and predicting rapid transit access mode travel behavior. Available data from the Parkham Express bus service in Richmond, Virginia, the Bay Area Rapid Transit (BART) System, and the Lindenwold Line are used. These data are critically evaluated so as to provide the needed information for modeling access mode choices; a survey procedure is designed to obtain complete descriptive information for access mode choice analysis in the future. In addition to model development, this study identifies and clarifies important practical considerations and issues associated with logit models of rapid transit access mode.

Korf, JL Demetsky, MJ Hoel, LA ; Virginia University, Urban Mass Transportation Administration, (UMTA-VA-11-0005) Final Rpt. UVA/529100/CE79101ES, UMTA-VA-11-0005-80-1, June 1979, 8 p.; See also PB80-159411.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-159403

42 313622 LOGIT ANALYSIS OF RAPID TRANSIT ACCESS CHOICES. The study examines the suitability of applying the program ULOGIT of the UTPS Package of Urban Transportation Planning Programs to forecast rapid transit access mode choices. Strategies and issues associated with logit modeling of submodal choices are examined and a specific modeling approach for this study is selected. The travel data are interpreted to develop descriptive aggregate measures of access mode supply characteristics so that only feasible access mode choices are used in developing the models. Also, rapid transit stations and access points are classified into groups to test hypotheses regarding the specification of service needs for station location types. Results show that models for classified station groups have coefficients that differ from each other, and from a model calibrated with data for all stations in a group.

42 313630 PROCEEDINGS OF THE UMTA R AND D PRIORITIES CONFERENCE (3RD) HELD AT CAMBRIDGE, MASSACHUSETTS ON NOVEMBER 16-17, 1978. VOLUME I. PROCEEDINGS OF GENERAL SESSIONS AND SUMMARIZED REPORTS OF WORKSHOPS. This is a compilation of material that was presented at the Third Urban Mass Transportation Administration Research and Development Priorities Conference. It contains proceedings of the General Sessions and summarized reports of the eight Workshop Sessions as well as a listing of conference participants.

American Public Transit Association, Urban Mass Transportation Administration, (UMTA-DC-06-0157) UMTA-DC-06-0157-79-1, Nov. 1978, 71p; See also Volume 2, PB-300987, and report dated March 77, PB-266158; Contract DOT-UT-70026; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-161532

42 313880 EVALUATION OF THE STATE IMPLEMENTATION PLAN REVISION SUBMITTED BY NEW YORK STATE IN FULFILLMENT OF THE MOYNIHAN-HOLTZMAN AMENDMENT. The objective of the study is to assist the U.S. Environmental Protection Agency in reviewing and evaluating the Submission by the State of New York in response to the Moynihan-Holtzman Amendment of the 1977 Clean Air Act. The Moynihan-Holtzman Amendment specifies that any alternative to bridge tolls in the State Implementation Plan must include comprehensive plans to 'establish, expand, or improve public transportation measures to meet basic transportation needs as expeditiously as practicable'. The submission is critically examined from various viewpoints- philosophical, technical, and sociological. A frame of reference for the evaluation was constructed based on four pertinent areas--industry-wide transit performance measures and standards, local public perceptions and priorities, local transit operator and planning agencies' projects and budgets, and comparable metropolitan transit system performance and budget data.

42 314054 THE UMTA RAIL MODERNIZATION PROGRAM: EVALUATION OF THE IMPACTS OF SECTION 3 CAPITAL GRANTS FOR RAIL REHABILITATION AND MODERNIZATION, 1965-1977. The report is an evaluation of the Urban Mass Transportation Administration grants for the modernization of existing rail systems. From the beginning of the Section 3 Capital Grant Program through May 31, 1977, Section 3 grant approvals amounted to approximately \$6.2 billion. Of this total, \$1.7 billion, or 28 percent was approved for the rehabilitation, replacement and upgrading of existing rail systems. The report contains an inventory of rail modernization projects by type, mode (rapid rail, light rail, and commuter rail), and city. Impacts of these funds are analyzed by examining several specific projects in detail. In addition to the examination of project impacts, the process used by two transit operators (NYCTA and PATH) to secure rail modernization funds and to select and implement projects is discussed.

Bennett, J ; Peat, Marwick, Mitchell and Company, Urban Mass Transportation Administration, (UMTA-IT-06-0118) Final Rpt. UMTA-IT-06-0118-80-1, May 1979, 282 p.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-178775

42 314216 TWO ESTIMATION METHODS FOR SINGLY CONSTRAINED SPATIAL DISTRIBUTION MODELS. Distribution models used the description of spatial phenomena like residential and shopping interactions are examined. A singly constrained distribution model is considered which can be used for the description of several relationships, such as home-shop interactions. Those interactions are influenced by several factors, e.g., attraction and distance variables. The influence of explanatory variables finds expression in the accessory parameters. The estimation of the values of these parameters, and the testing of their significance is called calibration. The two best known estimation procedures, i.e., the maximum likelihood and the least squares method are considered. For the singly constrained trip distribution model the linear least squares method is used directly after a special logarithmic transformation without taking into account additivity constraints and without an iterative procedure. The maximum likelihood method is also shown from a statistical point of view, to have useful properties.

42 314281 ADOPTION AND UTILIZATION OF URBAN TECHNOLOGY: A DECISION-MAKING STUDY. CASE STUDIES OF INNOVATION IN SYRACUSE, NEW YORK. PART 5. The report describes and analyzes the efforts made by a number of urban agencies to adopt and implement innovative strategies in delivering public services and solving local problems. The case studies include the following agencies and services: Syracuse Campus Plan, The Syracuse Fire Department, Housing, Syracuse

Police Department, Solid Waste Management, Syracuse Dial-A-Bus, Property Assessment, and Cable TV.

42 314331 DEMANDS AND NEEDS OF FUTURE TRANSPORTATION: SURFACE TRANSPORTATION. 1964-FEBRUARY, 1980 (CITATIONS FROM THE NTIS DATA BASE). This bibliography is divided into four sections, Urban, Rail, Marine, and General studies. The urban transportation section contains citations which cover such topics as passenger demand forecasting, future system requirements, needs for new types of transportation modes, planning to reduce future demand, and predictions of usage and feasibility of rapid transit railways, buses, taxicabs, and automobiles. The abstracts of rail transportation studies cover freight forecasting, future passenger usage, and revenue predictions. The last two sections, marine and general, cite reports on the future of the U.S. shipping industry and general freight and passenger projections. (This updated bibliography contains 460 abstracts, 30 of which are new entries to the previous edition.)

42 314534 TRANSPORT STUDIES GROUP UNIVERSITY COLLEGE LONDON PROGRESS REPORT 1979. The report outlines the activities of the group in 1979 and briefly

describes each research project. A list of thirty four new publications, conference papers and theses is included. Research projects are as follows: (a) transport policy and planning: effects of changes in land use on travel by public transport; trends in patterns of work trips in selected areas in London; change and adaptation in rural communities; further developments in the continuous modelling of commuter travel patterns in cities; standard errors of the estimated values in calibrated full and partial trip matrices; numerical calculation of the effects of a barrier on traffic intensity in a city: energy and transport. (b) public transport: a simple model for a radial bus route. (c) traffic management and control: modelling of area-wide traffic management and control; traffic signal calculations in relation to junction layout capacity and delay; the capacity of a signal-controlled junction where there is priority for buses; delay to a single vehicle crossing a two-lane traffic stream; simulation of delay to vehicles queueing to cross one or more lanes of traffic having priority; speeds and headways of vehicles on rural roads. (d) road safety: area-wide application of inexpensive countermeasures against urban road accidents; supplementing state 19 accident data with injury data from the hospital in-patient enquiry; susceptibility to injury in road accidents; analysis of road accident data allowing for variation in grading of injury severity; safety of medium sized goods vehicles; reference manual on road safety; the protection afforded by seat belts.

42 314610 MIDTOWN CIRCULATION PLAN--MIDTOWN MANHATTAN CIRCULATION AND SURFACE TRANSIT STUDY. The Midtown Circulation and Surface Transit Study was initiated in order to reduce congestion and thereby improve air quality, pedestrian and vehicular safety, and surface transit service and to enhance the urban environment in midtown Manhattan. The goal of the study was to develop and demonstrate low-capital cost, surface transit and other circulation improvements to relieve congestion resulting from the intense competition for street space in midtown. The objective of this report is to recommend a comprehensive circulation plan for midtown based on the findings of previously completed project tasks and the overall policy concepts as expressed by the project goals and objectives. In response to this objective, strategies are recommended herein for increasing the efficiency of the surface transportation system through improvements to the operational and physical elements of that system. It is concluded that low-cost capital improvement techniques such as exclusive bus lanes, turn restrictions, signal time revisions and parking restrictions, can be used in midtown to improve the efficiency of the surface transportation system. Since buses accommodate 48 percent of all midtown surface person miles traveled (PMT) it is also concluded that improvements to surface transit operations represent a primary method for increasing total system efficiency. Furthermore, to improve system efficiency to an optimum level given existing demand, a hierarchy of street use should be established. The strategies outlined above and described more fully in the body of this report are considered an incremental step in achieving such a street use hierarchy. (Author)

42 314728 DECISION THEORY. TRANSPORTATION PLANNING AND THE EVALUATION PROCESS. Transportation studies typically include a cost-benefit analysis of alternative plans or options before making recommendations. Although it is recognised that there are

many uncertainties about the future, little is done to deal with them other than a sensitivity analysis of the conclusions to variation in the values used in the cost-benefit analysis. Decision theory provides a formal mechanism for handling uncertainty by determining the probability of different demand states occurring, and, by explicitly introducing decision criteria, evaluating performance in each demand state. The article describes how techniques derived from decision theory can be usefully incorporated into the evaluation structure so as to improve the decision process. Two examples are provided to demonstrate the application of these procedures. The first discusses the planning strategies for inter-city travel in the Windsor-Guebec city corridor. Five alternatives are evaluated. The second example is based on a commuter rail transit line in the Lake-Shore corridor of Toronto. (TRRL)

42 315083 MOVEMENT IN CITIES: SPATIAL PERSPECTIVES ON URBAN TRAVEL AND TRANSPORT. The book describes and analyses urban travel in terms of the purpose, distance and frequency of journeys and the modes and routes used. It draws its material from numerous surveys of transport in British towns, with occasional reference to the US, Australia and other countries. The authors seek to elucidate the interrelations between the location of activities and the patterns of transport supply and use within towns. There is an introduction to the techniques of urban transport analysis and modelling and a discussion of the transport technology of the future.

42 315158 DELAWARE RIVER PORT AUTHORITY TRANSIT IMPROVEMENT PROGRAM. VOLUME I: PLANNING FOR PATCO EXTENSION AND IMPROVEMENT. TECHNICAL STUDY. The Delaware River Port Authority (DRPA) has been engaged, since June 1970 in progressing a comprehensive Mass Transit Study which was directed toward developing specific recommendations regarding the DRPA Mass Transportation Development Program. This three-volume study contains the eleven regional transportation-related technical studies conducted by the DRPA, and sponsored

by UMTA in coordination with the Delaware Valley Regional Planning Commission. Volume I, this report, contains the following project/final reports: 1) continuation of DRPA Transit Planning Program (I); 2) Justification of PATCO Extensions and Improvements (V); 3) Master Plan of Public Transportation Improvements for the DRPA Area of Responsibility (VI); 4) Relocation Program (VII); and 5) Advanced Land Acquisition Program (VIII). This report describes the work done to develop the governing criteria and basic design for continuation of public transportation planning activities by DRPA. It also analyzes the Consultants Rail Expansion Program in terms of regional implementation; least cost versus acceptable levels of service; support of land-use objectives and policies; and beneficial effects on social problems of mobility, poverty, and segregation. The Consultants' program recommended a total program of 32 miles of additions to the existing rapid transit system: a 14-mile extension from Broadway Station in Camden to the Interstate Route 295-New Jersey Route 38 Interchange in Mt. Laurel Township, and an 18-mile extension from Division Street in Camden to Glassboro.

42 315198 UNDERGROUND RAILWAY OR FEEDER BUS? SOCIAL ECONOMIC METHODS FOR ALTERNATIVE PUBLIC TRANSPORT INVESTMENTS [Tunnelbana eller matarbus? samhaellsekonomiska metoder vid alternativa kollertivtrafikinvesteringar]. The purpose of this report is to try to find a method to compare different investments in public transportation, and judge which alternative is most urgent from a social cost-benefit point of view. Experiences from other methods are used and attention is paid to all factors significant for the social cost-benefit evaluation. The method is formed as an example, and applied on a possible development of skarpnaecksfaeltet. Two different alternatives are compared, an extension of the underground railway and A feeder bus line. Calculations for two different levels of development were made. These correspond to two and three storey buildings respectively. During the work certain assumptions and simplifications were made. Because of this the result may not be looked upon as a correct numerical ground for decisions, but primarily as an illustration of the method. The factors which partly or not at all could be valued in money, were estimated by using a simple scale (0-) for the purpose. The two alternatives were compared with respect to noise, air pollution, changes in environment and nature, public security, possibilities for different groups to use the transport mode, punctuality, information, heating and ventilation, tidiness and comfort at stations and stops. Of these alternatives the bus seems to be most favourable. The valuation of the qualitative factors will be determined for the final decision. If the assumptions are changed, for instance by increasing the number of passengers, the underground alternative will be cheaper and more favourable compared with the bus. (TRRL) [Swedish]

42 315332 STATE TRANSPORTATION ISSUES AND ACTIONS. The second Conference on Statewide Transportation Planning and Programming, conducted by the Transportation Research Board at the request of the U.S. Department of Transportation and its modal administrations, sought to do the following: 1. Identify the challenges that will be faced by the states, now and in the next 20 years, particularly in the areas of the economy, energy, urban policy, and changes in transportation systems; 2. Report on the best available planning techniques and on research for new ones; 3. Recommend the optimum role for state departments of transportation in multimodal statewide transportation planning; 4. Identify techniques for optimum programming of scarce state resources, for example, between modes and categorical programs; 5. Discuss the proper content of a state transportation plan; and 6. Discuss ways of increasing the effectiveness of state departments of transportation in implementing state transportation plans. The conference, held April 29-May 2, 1979, in Warrenton, Virginia, attracted more than 100 participants,

representing various local, state, and federal governments, associations, consulting firms, and universities. This report contains the proceedings of the conference. Part 1 summarizes the meeting's highlights. Recommendations by participants are noted in Part 2. Part 3 contains the resource papers prepared for conference participants, along with reports of other presentations made during the meeting. Part 4 summarizes the workshop discussions on the various aspects of implementing statewide transportation plans and on the key elements of such plans. The participants and their affiliations are listed in Part 5. (Author)

42 315391 TRANSPORTATION SYSTEM MANAGEMENT: PROTOTYPE PLANNING STUDY, PORTLAND. This report documents the project in Portland and is designed to provide a summary of the procedures utilized in Portland to systematically develop a regionwide program for TSM delineated on a small area basis. The TSM process includes a statement of goals and objectives, evaluation of existing conditions, a set of proposed actions and justification for inclusion of those actions in the area's Transportation Improvement Program. The author states that the process described herein represents a good model for the way in which comprehensive, systematic TSM planning can be carried out. The approach described should be adaptable without major change to other urban areas. (UMTA)

42 316376 A REVIEW OF CANADIAN URBAN PASSENGER MODE CHOICE MODELS. This paper reviews modal split models developed in seven Canadian cities during the last ten years, with the aim of reporting on model design, input data requirements, output and the impact of modal structure and assumptions on transit planning. To establish the functional and structural relationships between the mode choice model and the remaining three steps of the transportation planning process, brief descriptions of the trip generation, distribution and assignment steps are provided. In addition, wherever mode choice model description supplied by individual cities contains explicit modal split formulae, estimates of direct and cross point elasticities are derived.

42 316551 MODELING PARK 'N RIDE AND KISS 'N RIDE AS SUBMODAL CHOICES. The logit modeling methodology is applied to include transit access mode choices in conjunction with the automobile vs. transit travel choice decision. The practical problems that arise when the choice set expands beyond two alternatives are identified and addressed. It is shown that if choice sets and homogeneous market segments are properly defined, the models can be transferred among different urban areas even though the urban areas exhibit different aggregate characteristics.

42 316585 COMPARING GUIDEWAY TRANSIT IMPLEMENTATION PLANS, INCLUDING THE IMPACT ON ROAD TRAFFIC. A methodology for comparing phased implementation plans for a new fixed guideway transit system in an urban area is presented. Four assumptions are made: (1) the guideway system replaces existing or planned bus service, (2) superior service on the new system results in increased ridership when compared to buses; (3) presence of the guideway facility redirects outward urban growth resulting in additional ridership, and (4) conversely, the absence of any action on the new guideway facility reinforces a diffuse urban growth pattern that creates an irreversible loss of transit ridership. The economic comparison of alternative plans includes total as well as "relative" inflation of principal cost components. A key feature of the proposed methodology is including in the comparisons the costs of private automobile mileage that could have been replaced by transit. These costs are expressed as "fuel" and "all other" automobile costs; favorable transit system implementation schedules can then be identified as a function of parametrically assumed values for these two unit costs. A hypothetical example demonstrates the proposed method. (Author/TRRL)

42 316661 ALTERNATIVE METHODOLOGIES FOR MEASURING TRANSIT BENEFITS-ABRIDGEMENT. In this analysis of alternative methodologies for measuring transit benefits, it is argued that the cost-savings approach that is commonly employed has restrictive limitations, which may be too restrictive for this approach to be practical. The rarely used method of estimating benefits directly from the demand functions is also pursued. Although measuring transit benefits by finding areas under transit demand curves does not have the limitations of the cost-savings approach, demand curves, themselves, are difficult to estimate. However, this paper has developed algorithms for measuring such areas that require minimal and easily obtained data. The required data are fare, fare elasticity, number of trips, and revenue.

42 316662 DEVELOPMENT OF TRANSIT DISTRICT BOUNDARIES FOR AN AREA-WIDE SMALL BUS PROGRAM-ABRIDGEMENT. The development of transit district service-area criteria by using travel demands for existing services was found appropriate in this study area as well as in other areas in the state of Michigan. The service-area concept produced a total of 62 possible transit districts within the study area that are likely to support a small bus program. The priority ranking procedure used in this study considered community values and is considered extremely significant in the analysis process. The data base used for this study, although 10 years old, proved a valid basis for analysis, since limited tests indicated that association economic and travel patterns in the study area followed similar trends. The priority analysis performed in this study will be updated continually as current trip and other data become available.

42 316791 NATIONAL POLICIES FOR MASS TRANSIT IN COLUMBIA [Politica nacional de transporte masivo en Columbia]. Columbia is a country of cities with almost 25 million inhabitants. Planning is underway to build mass transit systems in four principal urban centers: Bogota, the capital; Medellin; Cali; and Barranquilla. Because of this activity, a national policy for mass transit is needed to take into account the technical and financial help required for specific urban transit projects. For this reason a report has been assembled by the Colombian Road Association to study international precedents on similar development. It includes a brief analysis of world population growth, Latin American growth, and Colombian growth, with emphasis on concentration of population in the cities. Activities of the United States Urban Mass Transportation Administration (UMTA) is used as an example. The author includes a dissertation on Colombia's change from an exporter to an importer of fuel, and describes the construction of the subway system in Bogota. (Author) [Spanish]

42 316794 METROPOLITAN TRAFFIC ACCESS [Acceso del transito metropolitano (ensayo)]. The author describes the access system from the suburbs of Buenos Aires into the city center, evaluating the volume of traffic and subdividing it for peak periods into the three flow generators of the North, West, and South. He lists Buenos Aires' first priority in solving its traffic congestion flow as the modernization of interurban railroad services because of its ability to move large numbers of people. He also recommends establishment of regular helicopter services for commuters, which he maintains would be faster and less costly than the provision of toll highways. Five helicopters would be used in the North, four in the West, and three in the South. The author urges official organizations to study this advanced transportation concept in depth and establish its economic feasibility. (Author) [Spanish]

42 316882 THE CHANGING CONTEXT OF URBAN TRANSPORTATION PLANNING. This paper proposes a doctrine of maximum flexibility combined with minimum fixed commitment in urban transportation planning. This suggests a greater emphasis on comprehensive traffic management with a lesser emphasis on

highway construction. A more flexible approach involving joint working by professionals and politicians is advocated and it is argued that land use planning and transportation planning seem to be moving further apart, implying that extra resources may have to be expended to alleviate the effects of this breakdown.(a) (TRRL)

42 317193 URBAN TRANSPORT IN COLOMBIA: PROBLEMS AND SOLUTIONS [EL TRANSPORTE URBANO EN COLOMBIA: PROBLEMAS Y SOLUCIONES]. Urban development and the growth of motorized transport are the causes of social, economic and ecological problems which cannot be ignored. With a view to solving urban transport problems a review is made of the political measures (town planning, economic and technological measures) which must be taken. A comparative study of different public transport systems is conducted in order to select those which are best adapted to the Colombian environment. (TRRL) [Spanish]

42 317195 BETTER TRANSPORT IN YOUR TOWN [Aprovechamiento de subproductos en la construcción de carreteras]. The use of waste products in road construction is a people responsible for the production of a global transport policy. It presents, in an exhaustive fashion, in six parts, the various elements of urban transport: (1) urban journeys in the historic, economic and social context; (2) conception of a transport policy, comprising an inventory of the components of such a policy (urban and transport planning-traffic plans-promotion of public transport- parking policy-transport and town planning-extension of urban transport to rural areas; (3) quality of service, (TRRL) operations: road network-pedestrians-cyclists-public transport-private cars-parking-goods deliveries- rapid urban networks; equipment operations: fixed equipment, rolling stock, control equipment); (5) implementation and management, with an examination of the institutional problems; (6) economic and financial problems. The whole work presents ideas, procedures and practice and contains numerous recommendations arising from experience in this field. [Spanish]

42 318184 THE DEVELOPMENT OF SERVICE STANDARDS AND OPERATING GUIDELINES FOR THE DELAWARE AUTHORITY FOR REGIONAL TRANSIT. TASK B OF THE DART PLANNING PROGRAM. The service standards project is one aspect of the Delaware Authority for Regional Transit (DART) planning program in order to increase DART's patronage, improve DART's

operational efficiency, and increase the regional transit accessibility with the Wilmington urbanized area. Although these standards and guidelines are intended initially for application only to DART operations, they have been developed in such a way as to allow their application in any portion of the New Castle County, Delaware-Cecil County, Maryland-Salem County, New Jersey SMSA. This report presents an introduction and background of transit performance measurement, a detailed description of the transit service standards and operating guidelines proposed for adoption by DART, and an assessment of the degree to which DART's current operations are in compliance with the suggested standards and basic planning guidelines. In addition, a preliminary estimate of the costs required to have DART's service meet these proposed standards and guidelines is included.

42 318783 MULTIMODAL TRANSPORTATION PLANNING, 1972-JUNE, 1980 (A BIBLIOGRAPHY WITH ABSTRACTS). The bibliography presents many aspects of transportation planning-passenger and freight-for urban areas and intercity corridors. Multimodal systems, planning and programming, transportation models, forecasting and management is covered. This includes work travel patterns, trip generation, urban transportation demand, modal choice, and travel forecasting models. Urban and intercity freight transportation as regards modal choice, planning and intermodal systems, including intermodal consolidation terminals is also included. (This updated bibliography contains 102 abstracts, 15 of which are new entries to the previous edition.)

42 318904 REVIEW AND COMPILATION OF DEMAND FORECASTING EXPERIENCES: AN AGGREGATION OF ESTIMATION PROCEDURES. It has long been recognized that there is a need in urban transportation planning for the development of a "fast

response" procedure which would allow the determination of passenger travel on an urban areawide level. This report attempts to fill this critical knowledge gap, relying heavily on the historical performance of the various elements of the urban transport planning process developed over the past two decades. Demand-forecasting experiences were collected from over 60 percent of the urban areas in the U.S. cities were classified into four cells, based on their population size and urban structure. The delineation of the proper classification scheme was based on a statistical analysis on the base travel pattern of the various cities including their socioeconomic tabulations of demand elasticities, which are reported in conjunction with the base conditions under which they were obtained. In order to analyze the travel impacts of transportation system implementation, a detailed method of approximating the aggregate urban area total system supply curve is also presented. The city classification scheme, the tabulation of elasticities and the representation of an urban transportation system are verified through a limited number of case studies. Finally, the applications of the parameters and equations tabulated in this report are demonstrated via a step-by-step user-oriented procedure.

42 319365 FOUR YEARS LATER THE STATUS AND PROSPECTS OF TSM. TSM is a short-range element of a regional transportation planning process that addresses ways to improve overall transportation system performance through various low-capital or no-capital management actions. Such actions can be intramodal (e.g., improved transit scheduling techniques, bikeway or pedestrian facilities, express bus operations), intermodal (e.g., bus priorities on streets, parking restrictions, relocation of bus stops that impede traffic flow), or extramodal (e.g., staggered work hours, pricing strategies to discourage long-term parking, employer incentives for ride sharing). The heart of TSM is a concept in which the urban transportation system is a single entity and federal funds are transportation resources. The goal of TSM is to increase the systemwide efficiency of people and goods movement without significant new infrastructure investment, rather than to simply accommodate increasing vehicle travel. Ideally, TSM is regional in scope, goal-oriented, and intermodal and has its principal leadership and coordination provided through the MPO. In practice, such strategic approaches are rare; TSM is most commonly of a tactical nature involving site-specific actions that have marginal effects on systemwide performance. The recent corridor-study approaches, however, are a potential way to reconcile the practical advantages of tactical TSM with a basic thrust toward strategic planning, particularly to achieve air quality and energy-conservation goals. (Author)

Lee, DA (American Transit Association) Meyer, MD (Massachusetts Institute of Technology) *Transportation Research Board Special Report* No. 190, 1980, pp 12-15, 10 Ref.; This paper appeared in *Transportation Research Board Special Report No. 190: Transportation System Management in 1980*; ORDER FROM: TRB Publications Off

42 319368 INSTITUTIONAL DIMENSION OF TRANSPORTATION SYSTEM MANAGEMENT: A BOTTOMS-UP APPROACH. A number of arguments are made in this paper: 1. The TSM plans developed by MPOs have disappointed federal reviewers and rule makers. 2. The federal view of TSM is at variance with the planning practices and decision processes of metropolitan areas. 3. Successful TSM planning does not require an elaborate areawide process based on textbook-style systems planning. 4. The key to successful TSM planning is the people involved: their expertise, their access to the political process, and their sensitivity to community values and needs. 5. MPOs can foster TSM by subvention of planning funds and procurement of project design from action agencies. 6. TSM cannot deliver consequential energy savings or pollutant reductions; therefore, the planning process for TSM should not be structured around these objectives. 7. TSM should be coordinated with long-range planning, but this can be accomplished by adjusting long-range investment plans in light of local-level TSM accomplishments. 8. The number of regions and corridors that face trade-offs between rail transit and exclusive bus lanes is limited. The TSM process should not be structured around these exceptional cases but rather around the routine requirements of traffic management, parking management, and traffic mitigation. 9. Given the TSM measures most likely to be effective and command community support, the institutional objectives of TSM should be to (a) upgrade the traffic-operations expertise of transit agencies and state highway departments, (b) engage major employers in traffic mitigation (ride sharing, parking management, and work-hour rescheduling), (c) allow local communities to develop plans to protect neighborhoods and pedestrian areas from traffic intrusion, and (d) cultivate a concern with traffic mitigation in local land use planning and the environmental impact report process. 10. These objectives can be most effectively accomplished if MPOs procure planning from action agencies, rather than develop TSM plans at the systems level. (Author)

Jones, DW, Jr (California University, Berkeley) *Transportation Research Board Special Report* No. 190, 1980, pp 25-27, 8 Ref.; This paper appeared in *Transportation Research Board Special Report No. 190: Transportation System Management in 1980*; ORDER FROM: TRB Publications Off

42 319370 NEGLECTED HIGH-ACHIEVEMENT TSM ACTIONS. The purpose of this paper is to discuss ways in which the implementation of high-achievement TSM actions (e.g. ride sharing, staggered hours, parking management, high occupancy vehicle incentives, improved public transit scheduling, pricing) that have been neglected can be promoted. These strategies have not been implemented widely because of a lack of a constituency, the need for extensive interagency coordination, competition with capital projects, political sensitivity, and funding difficulties. However, there are a number of success stories that could be disseminated to serve as models for other metropolitan areas, with emphasis on the impressive energy effectiveness of these projects. Additional time and effort to assess economic and social effects is necessary to respond to political

and public concerns. State and federal legislatures should be made more aware of the benefits of these actions through more-effective contact or by direct lobbying. Federal leverage could also be used through categorical funding programs, added inducements in existing programs, specific TSM project goals or targets in each urbanized area, regulatory changes, or offers of technical assistance.

42 319372 ISSUES IN TSM METHODOLOGY. Several issues--(a) assembly of aggregated impacts of areawide TSM action for use by local elected officials, (b) evaluation of possible TSM strategies against major capital alternatives, (c) relationship between long-and short-range planning for TSM, and (d) incorporation of TSM actions in the urban transportation planning process--can be at least partially resolved through simplifications inherent in TSM. On the other hand, development of a truly integrated multimodal TSM process is not likely to occur until a pressing need appears that justifies the additional complexity involved. (Author)

42 319378 TRANSPORTATION REGULATIONS IN AN URBAN ECONOMY: A DYNAMIC MODEL OF THEIR IMPACTS (ABRIDGMENT). An effort to assess the various economic impacts of vehicle restrictions and transit incentives in an urban setting by using a dynamic, interactive simulation model is discussed. The Manhattan central business district (CBD) serves as a focus for the modeling effort. The transportation actions studied are strategies proposed for the local transportation control plan, as required for New York City and most urban areas under the Clean Air Act of 1970. Changes to the CBD business sector (volume of business and employment), the transportation sector (vehicle volumes and mode splits) and the residential sector are studied. The model, which uses the Dynamo structure, is dependent on key simplifying assumptions joined in a feedback relationship in such a way that the effects on one sector influence changes in another. The model finds that the traffic-reduction strategies accomplish their goals only at the expense of economic well-being and that transit inducements alone have the snowballing effect of increasing business and vehicle activity in the CBD. However, combining vehicle-restraint policies with transit inducements can relieve congestion, primarily through modal shifts rather than reduced customer activity, so that the economic consequences are less onerous. 42 319419 NORTH DAKOTA STATE TRANSPORT PLAN. The initial goal of this report is to create an awareness within the state relative to the condition of the state's passenger transportation "system". Included in this discussion is an identification of the transportation services presently available in North Dakota, an analysis of the state's role in the provision of these services, and a comparison of existing services and actual citizen travel needs. Within this broad framework, a general overview of the state's passenger transportation "system" is presented and problem areas identified. Recommendations for action based upon the problems will be developed. The overall goal of this effort is the establishment of a means to develop a more efficient and effective passenger transportation system for North Dakota's transportation deprived citizens. The suggested recommendations for action, which are accompanied by cost estimates for implementation, are divided into two broad categories. The first category involves primarily policy enactments and policy changes. The overall intent of these policies is to establish state-level goals and objectives relative to the provision of transportation services within the state, which will in-turn give direction to future state actions related to passengers transportation services and the administration of transportation programs. The second category involves legislative action. These recommendations are designed to both strengthen existing transportation services and to encourage and assist in the development of new and expanded services. Their enactment is directly related to the informal acceptance of the policy recommendations.

42 319568 TERTIARY PUBLIC TRANSPORT AND PUBLIC TRANSPORT PLANNING. The components discussed are the ambulance services, social service transport, education transport and voluntary transport. Works' buses are excluded. The paper shows that tertiary public transport is a small, but significant part of public transport, investigates planning methodology and discusses the practical role of tertiary services in county public transport plans. Although the relative number of trips by tertiary public transport is low, it attracts high levels of public expenditure and can offer large benefits to people who have no alternative means of transport. The author suggests that its efficiency could be improved, and that better integration and coordination with public transport as a whole could be achieved. Results from several experimental schemes are examined, and suggestions are made for future research. (TRRL)

42 319621 ORDINAL DATA ANALYSIS IN URBAN AND REGIONAL PLANNING. Modern spatial data analysis is often hampered by the lack of reliable quantitative information. Many variables and attributes are only measureable or measured on an ordinal or qualitative scale. Consequently, it is necessary to pay more attention to qualitative information systems and to a methodology that places less heavy demands on the quality of data. The purpose of this paper is to contribute to this new way of data management by paying more attention to a promising type of analysis, known as ordinal geometric scaling. The attractive feature of this approach is the ability to extract quantitative, cardinal information from ordinal data, without violating the ordinal characteristics of these data. This is extensively illustrated in this paper by means of three different empirical applications. First of all it is shown that ordinal geometric scaling is very appropriate to come to zonal or regional accessibility measures. In addition it is outlined that this type of scaling is extremely useful for a financial assessment of rather complex regional plans. The intriguing nature of this approach is also illustrated by means of a qualitative multicriteria evaluation of four different urbanization policies for the western part of the Netherlands. (TRRL)

42 322076 PUBLIC TRANSPORT PLAN 1980/1. This is the second of the public transport plans which the County Council is required to prepare under the provisions of the Transport Act 1978. The report mentions the major changes in circumstances since the publication of the Public Transport Plan 1979/80: increase in the price of fuel and new transport bill which are likely to affect public transport demands. The existing public transport services are reviewed (bus, rail and express coach services, taxi, and private hire cars, education transport, works buses, social and welfare transport). The accessibility to the public transport network is discussed together with the concessionary and reduced fares schemes financed by district councils. Public transport policies are considered as regards their objectives, basic fabric exercise, rail services, experimental operations, publicity, developing areas, efficiency and reliability of bus and coach services, bus shelters, and coordination of public transport provision. 42 322077 PUBLIC TRANSPORT PLANNING. WHY USAGE PATTERNS AND CONSUMER NEEDS ARE NOT NECESSARILY SYNONYMOUS. A criticism is made of the progress made in public transport planning following the 1968 transport act (which gives discretionary power to shire counties to subsidise socially desirable bus services) and the introduction of the transport policies and programmes (tpp) in 1974 and public transport plans (ptp) in 1978. Despite the large amount of published literature consuming many man-hours, in the author's opinion little expertise has been developed. Some of the achievements of the policies are discussed, e.g the formalization of transport coordination within a planning structure, together with failings and diversions. Criticism is made of the euphoria that has often surrounded the introduction of 'alternative transport'-community buses, dial-a-ride, social car schemes, rutex for which in practice the low operation cost belies a far higher subsidy per passenger than almost all conventional bus routes in most counties. It is felt that the outstanding issue in public transport planning is the clarification of "need" and a clear lead in accessibility planning coordinating decisions of key village policy, school closures etc with transport planning. (TRRL) (TRRL)

Kilvington, R (Loughborough University of Technology, England) *Planner* Vol. 66 No. 2, Mar. 1980, pp40-41, 4 Phot., 8 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 248715)

42 322228 ISSUES IN THE EVALUATION OF METROPOLITAN TRANSPORTATION ALTERNATIVES. This paper was prepared as part of a study by the Urban Institute to improve the cost-estimation methods and evaluation procedures for the Urban Mass Transportation Administration alternatives analysis process. Several important issues related to evaluation of alternatives are discussed. They include problems and advantages of several analytical evaluation techniques such as cost-benefit analysis, cost-effectiveness analysis, and project scoring. Issues in evaluating user benefits are also discussed. Much of the complexity in the evaluation of alternatives comes from the different interests or groups that must be involved and the differences between the federal and local viewpoints. This paper is not a handbook on evaluation and assumes a basic knowledge of analytical evaluation techniques. (AUTHOR)

42 322230 GENERATING ALTERNATIVES FOR ALTERNATIVES ANALYSIS. Alternatives analysis is the planning process mandated by the Urban Mass Transportation Administration for the assessment of major transit investments. The alternatives analysis process is a means of ensuring comparability between rapid transit planning studies across the nation. Up to now, the focus of attention has been on the results or products of the process. Interest has centered on the selection of a recommended alternative and its costs and impacts. This paper examines an earlier stage in the planning process that has critical importance in the validity of alternatives analysis studies. The basic concern is with the ways that alternatives are derived and described. If alternatives are the central feature of the process, we should know more about what they are and where they come from. The investigation reviews a group of alternatives analysis reports to establish the state of the art in generating alternatives for major transit studies. Ten potential inputs to alternatives generation are identified. In addition, the paper assesses the use of specific techniques or methodologies for the generation of alternatives. Specifications for alternatives and the properties of alternative sets are reviewed. The paper includes an examination of the ways that transportation system management and baseline alternatives have been defined and used in past studies. Conclusions on the state of the art in alternatives generation and its expression in alternatives analysis studies are presented as the results of the investigation. (Author)

42 322235 DEVELOPMENT OF YEAR-2000 ALTERNATIVE TRANSPORTATION PLANS FOR THE DELAWARE VALLEY REGION. This paper discusses the concept and methodology used to develop long-range alternative transportation plans for the Delaware Valley Region. Four year-2000 alternative plans, including the no-build alternative, were formulated for simulation and evaluation. After a comprehensive

evaluation of these alternatives, one of them will be selected and modified to be the year-2000 transportation plan. The alternatives were developed to achieve a set of regional goals prepared to deal with transportation issues and problems. The regional development pattern, travel demand and system deficiencies, short-range plans and programs, financial resources, administrative and legal requirements, and governmental and citizen recommendations were the major criteria considered in the formulation of the alternative plans. The alternatives were developed through an open two-way communication process between the staff of the Delaware Valley Regional Planning Commission and the various governmental agencies and private citizens involved in transportation planning. This process, which resulted in economical, feasible, practical and implementable alternatives, could be applied successfully to any urban region in the country. (Author)

42 322282 INCREASING THE PRODUCTIVITY OF URBAN EXPRESSWAYS: COMBINING TSM TECHNIQUES AND TRANSIT IMPROVEMENTS. EXECUTIVE SUMMARY. This is the second phase of a two-part study, which summarizes an analysis of Transportation Systems Management (TSM) and other low capital cost techniques to increase the productivity of urban expressways and streets in dense, built-up areas. Using CORSIM, a variant of the TASSIM land-use transportation model, this analysis examines the benefits and costs of implementing alternative combinations of TSM techniques and transit improvement policies. In Volume I, the costs and benefits of implementing four alternative TSM policies in Boston's central area were estimated. This volume focuses on expressway management policies and transit improvements for Boston's southeast Corridor. Four TSM techniques: a contra-flow lane for buses; a concurrent-flow lane, ramp metering with bus priority, and automobile tolls, are considered in conjunction with five alternative transit systems offering different combinations of travel times and fares. Also, the impacts of a parking surcharge were simulated for all central area commuters, along with the various toll and metering policies. Of the composite policies tested, expressway ramp metering with an average delay of nine minutes, assuming an improved bus transit system charges \$0.7 per mile, is the most feasible cost-effective option. While other composite policies would yield larger net benefits, they have little hope of achieving public, bureaucratic, and political acceptance at the present time. (UMTA)

42 322303 CAPTIVITY AND CHOICE IN TRAVEL-BEHAVIOR MODELS. The correct calibration of individual-choice models and the correct prediction of choices from such models can only be achieved by restricting data sets to those individuals who have choices. This paper discusses the ideas of choice and captivity with respect to travel choices, and explores the effects on calibration and prediction of including captives in the data. It is shown that the inclusion of captives causes biases in the coefficients and predictions that cannot be removed a posteriori and that these biases have important policy implications for highway and transit planning. Hence, the restriction of data to choosers alone is important in both the development and the use of individual-choice models of travel behavior.

42 322494 CHOICE MODEL CALIBRATED ON CURRENT BEHAVIOUR PREDICTS PUBLIC RESPONSE TO NEW POLICIES. The standard approach to predicting public response to possible changes in transportation policy is to describe the changed environmental conditions in a scenario and ask individuals what their choice would be. These stated intentions tend to mislead policy makers in the absolute sense because of the varying degrees of overestimation. Sophisticated attribute choice models which are calibrated in terms of the stated intentions also tend to be weak predictors of actual public response to new policies. Empirical

research is presented in which a logit model that is calibrated using the attribute ratings of the alternatives under the new policy conditions described in the scenario in relation to current behavior rather than stated intentions provides highly accurate predictions of the actual public reaction to new policies. 42 322547 ESTIMATION OF ORIGIN-DESTINATION MATRICES FROM OBSERVED FLOWS: SIMPLE SYSTEMS. Many transport planning and management tasks require an estimate of the pattern of trip making represented in the form of an Origin-Destination Matrix. This report describes the theoretical foundation and the practical application of an estimation technique which utilizes only relatively easily obtainable traffic counts. The technique is applied to several practical examples: flights between cities, freeway flows, a commuter rail line, a subway route and two urban streets. In each case, estimates are compared to observed flows in order to afford the reader an impression of the estimation accuracy.

42 322808 URBAN PUBLIC TRANSPORT IN THE USSR [Les transports publics urbains en URSS]. In the Soviet Union, the development and operation of public transport is carried out on the basis of general plans. For towns of more than 250000 inhabitants, the official organisations prepare schemes which determine the urban transport modes, the use of which will permit them to accomplish effectively the transport of passengers, the layout of lines, the distribution of different services, the order of urgency and the importance of the work involved in restructuring and modernising the existing systems. The standards which are applied to the drawing up of schemes are designed for local conditions, but they respect the general principles such as: journey to work times should not exceed 40 minutes, the rate of loading at rush hour should be limited to five or six passengers per sq M of free surface. The creation of underground railways, trams, buses, trolley buses should be a function of the size of the towns. A brief description of automatic operation and of rolling stock is provided. [French]

42 322820 METHOD OF DECIDING THE OPTIMAL SPECIFICATIONS OF TRANSIT SYSTEMS. The paper discusses a planning method to decide the optimal specifications of transit systems which fulfill the requirements of service levels within several boundary conditions, when the particular urban settings are given.

After the theoretical explanations of the model, a local urban center was selected and the method was applied to prove the usefulness of it under the existing urban conditions.

42 322822 GUIDELINES FOR PUBLIC TRANSIT PLANNING FOR U. S. METROPOLITAN AREAS IN THE DECADE OF THE 1980'S. This paper suggests guidelines and raises issues concerning the suitability of various technologies and service concepts for meeting the transit needs of U. S. metropolitan areas in the decade of the 1980's. The paper begins with certain assumptions and conclusions that form the basis for suggested guidelines. These assumptions and conclusions were developed by projecting current trends for the ten year period.

42 322900 CANADIAN TRANSIT HANDBOOK. The twenty three chapters of this book are presented in five sections. The first section, Overview covers the history of transit and the general characteristics of the modes including the supporting way, vehicles, power supply, power distribution and control systems, and the different types of service provided. The second section-Demand-covers demand characteristics (spatial and temporal characteristics and socioeconomic variables of transit users), surveys, and demand models (urban transportation model system: trip rate, elasticity, and mode split models). The third section-Supply-discusses capacity (indicates design rates of flow that can be achieved with various technologies and types of services, costs (monetary costs associated with the provision of public transit as opposed to operating accounting costs, and a variety of measures of social costs), routes and networks, bus stops and terminals, and human factors in vehicle design. The fourth section-Operations-considers transportation systems management, the operation of a bus system, scheduling, monitoring and control, maintenance, fare policy and collection, marketing, and accounting. The fifth section-Institutional factors-considers labor relations, the organizational framework, the legal, institutional and financial framework, and techniques for modal conversion.

42 323353 YEAR 1990: TRANSIT RIDERSHIP FORECASTS. This study developed transit ridership forecasts for the year 1990. To this end, a separate paradigm was calibrated for each of the twenty-four transit systems investigated. The models relate transit usage rate, measured in annual trips per capita, to a number of causal parameters, including: fare, level of service, gross personal income, and residential and transit network densities. Transit ridership was derived by multiplying the forecast transit usage rate by projected population size. Forecasts of ridership and ridership rates generated were based on a number of alternative fare and level of service policies postulated for the period 1976-1990. Conclusions outlining the impact of these operating policies of ridership and ridership rates are presented.

42 324322 THE EFFECT OF AN INTERCITY PUBLIC TRANSPORT NETWORK ON BUS PATRONAGE. The influence of a regional bus service network structure is measured and expressed by the level-of-service variable, on bus ridership. Bus ridership on a regional level is found to be inelastic with regard to bus network structure, but it is elastic on certain corridors when analyzed on a city-pair basis. Bus patronage is more elastic with regard to service improvement for social-recreation trips than for work trips. Higher elasticities and a relatively greater number of generated bus trips are found in city-pair corridors characterized by average values of service levels. Thus, bus patronage elasticity changes asymptotically with the change in the level-of-service. Given the probabilistic nature of mode choice, recommendations concerning planning policy are subject to some degree of risk. Therefore, results indicating that a specific corridor is one in which the addition of a bus per day is likely to be justifiable do not ensure success in reality, but they do imply a relatively high probability of success when the corridor service is varied. The data used represent average daily flow of both bus and auto trips. The bus daily flow is based on a weekly sample, and therefore, it is possible that an increase in the level-of-service on a recommended corridor may be defensible only on certain days of the week. This possibility is more realistically investigated by experimenting with the recommended corridor than by a purely theoretical investigation.

42 324323 AN EVALUATION OF URBAN TRANSPORTATION SYSTEMS USING BEHAVIORAL MODELS AND CONSUMER SURPLUS. This paper explains a procedure for evaluating improvements in urban transportation systems and illustrates its application. The procedure

takes into account the interests of two groups: the system's users and its operators. It evaluates the change in marginal consumer surplus which results from improvements in the transportation system studied and compares this change in surplus to the marginal cost of the change. This yields a marginal benefit-cost ratio which can be used to measure the viability of the improvement. Data from the City of Calgary, the case study area, provided the necessary information for the analysis. The proposed improvements in that City's transportation system involve the introduction of Light Rail Transit (LRT) to complement the City's bus system and road network. The effect of the change in the system is evaluated, from 1982, when the LRT is expected to start the first phase of operation, to 2007. (Authors)

42 324420 STUDY OF AGGREGATE BIMODAL URBAN TRAVEL SUPPLY, DEMAND AND NETWORK BEHAVIOR USING SIMULTANEOUS EQUATIONS WITH AUTOREGRESSIVE RESIDUALS. This paper emphasizes the existence of a difference among demand functions, which describe how consumers react, supply functions, which analyze the behavior of suppliers, and cost functions, which specify how prices and levels of service on a link or in a network vary with vehicle flows, ridership flows and other factors such as technology. Four aggregate demand, supply and cost models are formulated: each one regroups a subset of demand, supply and cost functions for two modes in Montreal, Quebec. A significant part of the analysis pertains to the study of a regulated transit supplier. The parameters of all models are estimated by at least two of four limited-information and full-information estimation techniques.

42 324877 POPULATION AND ECONOMIC DATA IN TRANSIT ANALYSIS. An investigation is made on the nature of impacts of public investment in a Light Rail Rapid Transit System in Buffalo, New York. In particular, the impact of the public investment is measured against population and employment declines that have occurred in the region in the last ten years. By assuming that the investment in rail is justified by more than the usual travel measures, associated redevelopment trends in the CBD, the focus of the transit development, are noted. While regional employment declines, service-oriented employment increases. This increase coupled with an increase in the number of women in the labor force, and increases in household income make private investment in the CBD more attractive. New construction, related to these trends (offices, hotels, retail space) has begun, reinforcing the transit decision.

42 325883 SAN DIEGO LIGHT RAIL STORY. The paper discusses the San Diego project, which afforded a unique opportunity for implementation of a transit system with a minimum of capital investment. This opportunity was presented with the acquisition of the San Diego & Arizona Eastern Railway. The total escalated capital cost for the project will be under 5 million per mile. This project represented a relatively low-risk investment strategy due to availability of right-of-way and the reliance on proven materials, equipment and techniques. The system will provide a more reliable and higher-speed service than other transit alternatives in the corridor. The project had a finite budget at the outset, therefore the necessity to build within the budget was mandatory.

42 326298 TRAVEL MODEL DEVELOPMENT PROJECT : PHASE 2 FINAL REPORT. VOLUME 1: SUMMARY REPORT. The report is in three volumes that document the travel demand models developed in the Travel Model Development Project (TMDP). Volume 1: Summary Report is an overview of the entire system of disaggregate travel demand models. It includes a presentation of the conceptual basis for its structure, the interrelationships of the compo-

nent models, the three general mathematical forms of these models, and a summary of the two computer program packages developed to implement the models. Finally, the volume provides a brief description of the function, form and coefficients of each model.

42 327758 EMERGING TRANSPORTATION PLANNING METHODS. The U.S. Department of Transportation has sponsored research on new transportation planning techniques for several years. A number of significant advances have been made both in manual and computer procedures. Many of the new techniques were developed at universities and have distinct advantages over traditional methods. In 1976 the Office of University Research organized and conducted a 4-day seminar to instruct transportation planners in the theory, utility, and application of emerging transportation planning techniques and to encourage their widespread use. Three basic subjects were chosen for indepth examination: (1) Transportation demand forecasting techniques; (2) Transportation evaluation methods; and (3) Transportation/land use interactions. This book contains six state-of-the-art presentations and three papers summarizing the workshop discussions and question-and-answer periods.

42 329733 EMCT. ROUND TABLE 47 (HAMBURG, 25 AND 26 JUNE 1979). SCOPE FOR RAILWAY TRANSPORT IN URBAN AREAS. A series of case studies of public transport in 14 European cities is followed by a summary of questionnaire answers given by the authors of the case studies. The cities did not include "agglomerations" of several million such as Paris and London with very special public transport problems but did include Amsterdam, Barcelona, Madrid, Brussels, Copenhagen, Hamburg, Lille, Liverpool, Milan, Munich, Naples, Newcastle, Oslo, and Vienna. Conclusions are drawn about

the role of rail transit in urban areas and a number of general principles are developed concerning typological description of an urban district; volume of traffic and modal split; form and organization of public transport (fares, service, parking); financing and maintenance of vehicles; and economics (operating costs, fares policy, and subsidy).

42 329962 PLANNING SURFACE PUBLIC TRANSPORT: THE CASE OF CARACAS [Planificación de transporte público superficial: el caso de Caracas]. A wide summary is presented of the study of public transport in the city of Caracas, Venezuela, which has made possible the development of a series of methodologies for the evaluation of urban public transport systems. By means of a computer simulation of the existing transport system, and using models, an analysis has been made of the transport operations of the system. The models were calibrated and the operations evaluated. Results are presented of the passenger traffic assignments for different surface public transport systems, and an analysis is made of proposals for integrating the underground railway system with the surface system. The analysis of the operations makes it possible to isolate a series of schematic planning techniques for evaluating the characteristics of the system: structure of lines, speed of journeys, bus priority, speeds, demand and length of express lines, charts of the indices of behaviour of the network, results of detailed breakdown of seats, number of changes etc. The different stages of development of the projects which are presented for correcting the deficiencies in the service, are discussed. 42 329964 VICTORIAN TRANSPORT STUDY : LAND TRANSPORT IN VICTORIA- HISTORICAL BACKGROUND. Throughout the history of Victoria there has been a direct interdependence between transport and the social and economic development of the state. The railways played a very significant role in the development of the state for close on its first hundred years (and in the metropolitan area this role was reinforced by the tramways during the city's second 50 years or so). By the 1930s, the motor vehicle was growing in numbers and was beginning to effectively compete with the railways for people and goods movement. Regulation of transport was introduced to protect the railways. This regulation, and the Second World War and petrol rationing, safeguarded the railways during the 1930s and 1940s. However, since the early 1950s, the position of the railways (and other public transport) has steadily declined to the stage where many parts of the transport task can now be much more effectively and economically performed by the motor vehicle. This dominance of the motor vehicle has had, and will continue to

have, a marked effect on the development of the state. This background paper briefly reviews the history of land transportation in Victoria, in order to give some insight into the relationship between each of the transport modes, and between transport and state development (A). TRRL

42 330169 RATIONALE FOR SELECTION OF LIGHT RAIL TRANSIT FOR PITTSBURGH'S SOUTH HILLS. A project to update the 70-year-old South Hills electric railway system in Allegheny County, Pennsylvania, was among the first such projects to be subjected to intense scrutiny as part of a federally mandated alternatives analysis. The rationale of the accepted solution is examined, and the technical process by which consensus was achieved is described. The data used was derived from the alternatives-analysis work of the consultants, from regional planning projections, and from the author's observations and experience in the area. The alternatives analysis did not include a final solution for the downtown Pittsburgh traffic problem, but the subsequent review process, based on good data, led to the conception and acceptance of the Sixth Avenue subway. 43 041614 WE SHOULD OPEN UP THE HIGHWAY TRUST FUND NOW. Public transit has been plagued by deteriorating service and rising fares. More than 268 mass-transportation companies have gone out of business since 1954, and 20 more are on the brink of bankruptcy. The passengers now commute by car. The one quarter of our population that is too poor, too old, or too handicapped to own a car needs public transportation. At the root of the problem is the Highway Trust Fund, each time a new highway is opened, it produces an increase in the revenue for the Highway Trust Fund, which thus increases the money available for building highways. Cities are forced to use highway funds for highways, or lose them. Cities need the flexibility to plan their own transit expenditures. It is proposed that the Federal Highway Act be amended to allow cities to use their share of the Trust Fund money for bus or rail transit. The automobile contributes to the increasing energy shortage. Automobiles are responsible for at least 39 percent of our air pollution, and up to 80 percent in some cities. Balanced transportation is needed.

Dear, A *Reader's Digest* Vol. 102 No. 612, Apr. 1973, 4 pp; Due to its publication in a national magazine, this article may influence public opinion.; ACKNOWLEDGMENT: Reader's Digest; ORDER FROM: Reader's Digest Association, Incorporated, Pleasantville, New York, 10570 Repr PC

43 046274 AN ANALYSIS OF URBAN MASS TRANSIT SUBSIDIES. The paper analyzes possible rationales for public subsidies to transit firms and discusses the validity of each argument. An abstract model relating subsidy formulas to social goals is developed and used to analyze cost subsidies such as capital grants. Estimates of the cost of several subsidy formulas are also presented. (Author)

43 046704 TRANSIT'S NEED FOR ASSURED FEDERAL AID. Transit faces a serious financial crisis, and thus needs greater governmental aid, especially from the Federal government. The inability of the automobile to fulfill all travel demands makes transit a necessity for the survival of large-city downtown areas. For the ideal of a balanced transportation system, transit should be considered as a complement to the automobile, not a competitor. The Federal government recognized the need for assisting transit in capital improvement projects with the enactment in 1964 of the Urban Mass Transportation Assistance Act, but such aid thus far has been far from sufficient to meet the needs. States and local governments also are not providing aid to transit. Transit, however, still needs these two types of financial assistance, particularly by the Federal government: (1) Greater governmental funding on a guaranteed continuing basis for capital improvements; and (2) governmental aid for operating costs.

43 048144 AN ESTIMATE OF THE 1970 U.S. URBAN TRANSIT DEFICIT. The paper provides estimates of operating and total deficits incurred in 1970 by urban public transportation properties classified by urbanized area and mode. The operating deficit for all properties incurring such deficits in 1970 is estimated to be \$190 million. Of this amount, the bus deficit was \$109 million and the rail rapid transit deficit was \$81 million. The total deficit for 1970 is estimated to be \$450 million, exclusive of way and structure costs. The largest bus deficits were incurred in urban areas with populations of one to five million people; the largest rail rapid transit deficits were incurred in urban areas with populations over five million people.

43 048172 WEST GERMANY TOPS EUROPEAN SPENDING. More money is being spent on rapid transit in the German Federal Republic than in any other European country. Within the next ten years most of the country's major cities will have U-Bahn systems operating or under construction. Construction of the Munich U-Bahn is continuing, following the opening of the first section in May last year (IRJ, May 1972, pp 18-21). In Hamburg, the last station of a new line is now under construction. And in Frankfurt a new 8.5-km tunnel is being built. Other cities now extending, building or planning U-Bahns include Nuremberg, Hanover, Stuttgart and Cologne.

43 048175 FEDERAL AID WILL PROVIDE BOOST FOR US CITY TRANSIT. The United States' Urban Mass Transportation Administration (UMTA) is to get \$1000 million under President Nixon's 1973-74 fiscal budget. That's less than US transit advocates had been asking for, but an increase on the \$980 million now budgeted for fiscal 1972/73. In fact, UMTA's present year's budget--due to be spent by July--was also originally \$1000 million, but a \$20 million personal-rapid transit item has now been scrapped. The 1973-74 budget includes \$80 million for research, demonstration and development programs.

43 050628 ECONOMIC AND FINANCIAL ASPECTS OF SUBURBAN LINE OPERATION [ASPECT ECONOMIQUE ET FINANCIER DE L'EXPLOITATION DES LIGNES DE BANLIEUE]. The author describes from the aspects stated the present situation and the obligations connected with the operation of Paris suburban lines. He then deals with the economic problems of passenger traffic in this area especially as a result of the use of the private car, how the financial equilibrium of public transport must be considered and how investment programmes are drawn up. He makes an assessment of suburban transport operations in a determined area where the SNCF is definitely providing a "public service" and of SNCF activities there, and explains how the "SNCF Paris Suburbs" traffic accounts are compiled; such traffic is also included in a special account for the Paris Transport Region. He then refers to financial compensation of the social or public service type. Finally he shows that the arrangements applied to suburban line operation are quite different from those applied to other SNCF activities. [French]

43 050859 COST COMPARISON OF BUSWAY AND RAILWAY RAPID TRANSIT. Costs of bus-on-busways and train rapid transit systems were compared at varying passenger capacities on hypothetical new routes using both

current and future vehicle equipment. The calculations indicated that fast transit service could currently be provided at comparable costs by either buses or trains at about 2,000 to 5,000 passengers per peak hour, based on equipment and facilities of recent design. Improved or enlarged designs of current bus and transit equipment tend to shift the bus-train equivalence or crossover region another 1,000 or 2,000 passengers per hour and to somewhat reduce the modal differences in costs between bus and train below that capacity. Above these capacities, rail systems provide lower total costs. The study concluded with a prognosis of future developments in transit and bus technology that will enhance the quality of service while affording some possibilities for cost reduction.

43 051463 CONSEQUENCES OF SERVICE REDUCTION IN MUNICIPAL TRANSIT: SAN FRANCISCO'S MUNI. The "Muni", in an effort to reduce costs and meet its budgeted deficit, attempted to reduce service by ten to fifteen percent. From an analysis of the data which could be obtained, it appears that neither efficiency nor equity in the City would have been served by the proposed cutbacks. The analysis draws from a variety of sources and methods in exploring the interactions within the transportation system and within the city budget.

43 051572 ALTERNATE FORMULAS FOR A FEDERAL OPERATING SUBSIDY PROGRAM FOR TRANSIT. The paper discusses the rationale for transit subsidies, and explores the implications of four simple transit-subsidy formulas. It reviews the several arguments that have been advanced to justify the subsidization of mass transit services; describes some of the many possible subsidy formulas for allocating funds under an operating subsidy program; and directs attention to four criteria that should be used in selecting a particular subsidy formula; efficacy, incentives for economic efficiency, distribution costs, and equity. Four simple transit-subsidy formulas are analyzed: subsidies proportional to urban populations, to transit revenue-passengers, to vehicle-miles of service, or to potential transit-riders.

43 053733 CO-OPERATION OF PUBLIC TRANSPORT UNDERTAKINGS IN CITY REGIONS: PROBLEMS OF COST ACCOUNTS, TARIFFS AND REVENUE SHARING, FROM THE GERMAN FEDERAL RAILWAY'S POINT OF VIEW. It has taken a long time—a far too long time—before it has come to be generally recognised that the enormous efforts made by our generation in order to cope with the traffic problems in large conurbations can by no means be confined to measures for private transport but that, at present and in future, it is public transport which must form the backbone of the transport systems. In the course of the long process which our society has undergone in appreciating the value of well-organised local public transport systems, there is today again some reason to hope that it may, after all, still be possible to master the traffic problem in the large city regions.

43 054345 FINANCING MASS TRANSIT: MOBILITY IS AMONG THE ASSETS. Federal and local roles in underwriting urban transportation systems are discussed. Mechanisms to subsidize capital cost, and output-related cost are analyzed. So far it has not been possible to devise a formula for giving out operating subsidies that are equitable, that will keep transit firms solvent and enable them to increase the mobility of city dwellers, that are efficient (in the economic sense of not leading to distortions in resource allocation), that will encourage innovation, and that can be administered at a reasonable cost. In curing the congestion problem, the issue is primarily resource allocation in the transportation sector. A program is needed to test service innovations to solve the mobility problem.

43 054664 UTAP: "ONE HAND GIVETH, AND ONE HAND TAKETH AWAY". On February 13, 1974 the White House passed the Unified Transportation Assistance Program (UTAP). The program makes available \$2.5 billion per year in three appropriations. The first part (\$700 million) will be capital grants devoted to major mass transit projects. The second (\$700 million) would be available for either capital investment or operating subsidies at local option. The third part (\$1.1 billion in Highway Trust Fund money) would be available for urban highways, streets or mass transit capital projects at local option. However, critics of the bill are afraid that the following might happen: a) the \$700 million transit capital grants would go to mass transit projects in the same way that UMTA money was distributed. But UMTA would have provided \$1.2 billion in 1975. b) The \$700 million transit operating and/or capital costs would be used by politicians to meet operating deficits and

keep fares down. c) The \$1.1 billion Highway Trust Fund would probably be taken over largely by the highway lobby. Many transit people believe that there is a better way to hand out transit funds. However, most agree that it is a step in the right direction.

43 054689 FINANCING TRANSIT: THE BOSTON EXPERIENCE. Operational and economic administrative experiences of a transit system are described. The history of the present Massachusetts Bay Transportation Authority is presented, and its operating expenses, which are the source of the major problems, are discussed in detail. A brief discussion of statutory issues and proposed legislation conclude the paper.

Cudahy, BJ *Highway Research Record* No. 476, 1973, pp 4-7; ORDER FROM: TRB, Repr PC

43 054690 ECONOMICS OF URBAN TRANSIT CAPITAL GRANTS. Four arguments support the restriction of federal grants to public transit: The transit industry is "capital poor"; a capital grant restricts the power of transit unions to dissipate most of the grant through wage gains; a capital grant limits the federal government's liability by avoiding an open-ended commitment such as an operating subsidy support for labor costs; and a capital grant is a highly visible means of showing federal concern for transit. Each of these arguments is shown to be without merit. The uneconomic incentives inherent in a capital subsidy suggest that, if the arguments for a federal subsidy to transit operations are accepted, the funds should be allocated as a generalized subsidy to transit service rather than restricted to capital expenses.

43 072561 OPERATING SUBSIDIES FOR URBAN MASS TRANSPORTATION. The principal issue is not whether urban mass transportation operations should be subsidized, but where the source of the subsidy should be. The author concludes that regardless of the method chosen, the problems of managing an operating subsidy should not be a barrier to the implementation of such a policy. Such subsidies seem vital so long as meeting pollution standards and conserving energy are matters of national importance. If these problems are brought under control, operating subsidies over a longer period may be justified if they are applied in an attempt to reach national workable objectives for urban mass transportation.

43 084749 FINANCING OPERATING SUBSIDIES FOR URBAN MASS TRANSIT SYSTEMS: AN ANALYSIS OF STATE AND LOCAL TAX OPTIONS. The purpose of this report is to analyze the various taxing alternatives open to state and local governments when faced with the problem of covering deficits of their urban mass transit systems. The format of the study is to: (1) outline the financial condition of the urban mass transit industry; (2) present the issue of operating subsidies; (3) present data on the state and local government response; (4) analyze state and local taxes used and not used for financing subsidies; and (5) provide a brief outline of the Federal role in the issue. According to the author, the financial condition of the urban transit industry guarantees that operating deficits will continue and increase at progressive rates. The author finds that state governments rely mainly on retail sales taxes and specific excise taxes to meet operating deficits of the transit industry, while local governments rely mainly on

property taxes. By definition these taxes tend to fall primarily upon a class of persons that are supposed to benefit from an urban transit subsidy program. Alternatives to the present taxing mechanisms are presented. Conclusions and recommendations are furnished. A bibliography is included. /UMTA/

43 084985 OPERATING SUBSIDIES FOR BUSES-THE CASE OF CONNECTICUT. This study took root during the "Connecticut Bus Crisis" of 1972-73. At that time, a massive strike crippled the privately-owned public transportation in the state. Only by the granting of an interim State subsidy was bus service resumed. Numerous questions were left unresolved relating not only to the organization of any future subsidy but also to the reasons behind the apparent need for subsidy funds. This study addresses itself to these questions. The reasons underlying the failure of the bus companies to earn a profit deal both with declining demand and with the stifling effects of state regulation of the industry. Company cost control and management do not appear to be at fault. While demand is an important factor in the fall of profits, the decline of demand is not a general phenomenon. A number of routes are still fully capable of generating healthy profits. These findings suggest that subsidy and a relaxation of regulatory constraints are among the appropriate bus transit policies which could be pursued. Of course, there are a number of possible subsidy schemes which could be adopted. This study argues the merits and faults of many of them. Both reimbursement and formula-based subsidies are found wanting either because they introduce perverse incentives to bus operations or because they fail to indicate the extent of the need bus operators have for subsidy. The one subsidy scheme which offers both theoretical and practical appeal is a scheme whereby individual routes are auctioned off to bus operators by a public coordinating agency. This route-by-route bidding scheme exhibits many advantages and few, if any incorrigible faults. A strategy for implementation is given.

43 095388 THE MUNICH TRANSPORT COMMUNITY-CONTRADICTION BETWEEN ECONOMIC THEORY AND POLITICAL ACTION? INVENTORY OF THE TRIAL YEAR AFTER THE OLYMPIC GAMES [Der Muenchner Verkehrsband-ein Widerspruch zwischen oekonomischem Denken und politischem Handeln? Bilanz des nacholympischen Bewaehrungsjahres]. The inventory for 1973 (after the 1972 Olympic Games) shows expenditure of 510 million DM against receipts of 212 million DM, hence the substantial deficit despite the increased traffic recorded during that year. Although some of the reasons behind this deficit do not originate with the community, one may well ask to what extent this massive tax burden is justified by social service obligations. Of course, there are tangible results, especially in terms of relief to road traffic and shorter travel times. Nevertheless, the community since 26 May 1974 has been reappraising the overall service pattern in order to better adapt it to requirements. [German]

43 095584 NATIONAL REQUIREMENTS FOR URBAN PUBLIC TRANSPORTATION FUNDS. The 1972 National Transportation Study was undertaken to assess the need and priorities for transportation capital funds for states and urban areas. This paper describes some of the results of that study with respect to urban public transportation. The results indicate that substantial funding is needed for urban public transportation in both the short and long term and that funding requirements vary widely between urban areas of different sizes and between urban areas of similar size. Capital funding requirements over time also vary. Major public transportation implementation programs peak in funding requirements midway in the programs. Operating costs as a proportion of total capital and operating costs are higher for existing public transportation systems than for new public transportation systems because existing systems are almost fully depreciated. Even with two-thirds federal funding for capital improvements, the state-local share of the 25-year cost to construct

and operate urban public transportation systems is likely to be substantial.

43 096672 TRANSPORTATION-PLANNING FOR THE FUTURE. The author discusses the effect of the reorganization of local government on transportation planning and makes special reference to the transport policy and programmes (TPP). It is pointed out that the single grant system enables all transportation elements to compete as equals for grant aid and that the local authorities are allowed greater independence. The discussion is illustrated with two figures: a simple flow chart illustrating the procedure required and a more detailed diagram showing the principal work areas of the transportation planning unit and the relationship of the unit to other bodies in each work area. An account is given of the work to be done which includes the development and testing of the transportation policies, the development of projects to implement these policies (involving feasibility studies and evaluation), the production of a project programme and monitoring. The advantages of integrating work areas are stressed together with a subdivision on a geographical basis. Separate sections should deal with planning for urban and rural areas. In conclusion the management of transport-based-sections are discussed and particular reference is made to the need for co-ordination, maximum delegation of responsibility, and sufficient flexibility of structure. /TRRL/

43 096987 PRICING INVESTMENT DECISIONS AND SUBSIDIES IN TRANSPORT. This paper argues against transport subsidies, and suggests a policy, based on a modified form of long-run marginal cost pricing, that would enable transport undertakings to break even. Previous debate is summarized, which concluded that price should equal short-run marginal cost, and gave criteria for investment. The problems of indivisibilities and peak loading modify these rules, which were derived for electricity generation. The author discusses ways in which transport differs from other undertakings, including diversity, indivisibilities, joint costs, externalities, policy constraints, and the short-run marginal cost curve. Three arguments for subsidies are presented. Transport can be viewed as a public good, whose investment costs cannot be allocated. Or transport can be seen to produce increasing returns. Thirdly, one can hope that a reduction in price, by attracting motorists, can create a net benefit for public transport. The author refutes all these, and adds that subsidies make optimal investment difficult. Finally, the author argues that fares should cover the marginal cost of a new unit of investment, which may, however, in transport be quite divisible. Road pricing and investment in roads are needed, not subsidized public transport. /TRRL/

43 097654 STATES AND NEW MASS TRANSIT AID. The key provisions of the 1974 National Mass Transportation Assistance Act are explained with emphasis on the role that state government must play. Some speculation is offered as to how Federal mass transportation policy will affect state government in the near future. The attention of the Governor is mandated in choosing the designated recipient of formula funds or in being the designated recipient himself in certain situations. Where necessary, state government will have to provide the means, either through state grants or by providing additional local taxing authority, so that the maintenance of effort of operating support on the local level is continued, as well as meeting the critical need for the local match of the federal formula money.

Smerk, GM *State Government* Vol. 48 No. 2, Mar. 1975, pp 73-78

43 099242 WORKSHOP 1: THE GRANTOR'S ROLE. The purpose of Workshop 1, which viewed the evaluation of urban public transportation from the grantor's perspective, was to seek answers to the following questions: (1) What is the appropriate distribution of transportation resources among the various transport modes? (2) What is a rational and equitable basis for allocating (and distributing) transit resources among client groups? (3) What are the appropriate measures of performance for transit systems, i.e., what does a grantor use to judge good and bad performance among client transit systems? (4) What are the attitudinal and motivational factors that influence transit patronage and what is the proper (ethical) use of these factors? (5) How does one design a financial aid program that appropriately encourages (rewards) service and discour-

ages (penalizes) inefficiency and resource waste? This report of the proceedings of Workshop 1 identified the following research projects as being necessary for an adequate evaluation of urban public transportation: (1) classification of urban areas; (2) development of methodologies for assessing and evaluating alternative mobility systems in urban areas; (3) identification of rural transit needs and methods of meeting these needs; (4) public transit operational and managerial training needs; (5) motivational research needs related to modal choice decisions; (6) investigation of the feasibility of establishing a "Transportation Broker" through a case study; (7) development of appropriate roles for various levels of government; and (8) identification of potential for private sector to satisfy public transportation needs.

43 099306 THE PUBLIC TRANSPORTATION INVESTMENT. The ways are examined in which transportation can contribute to the attainment of a number of national goals: namely, conservation of energy; the stabilization of the cost of living; the stabilization of employment; the productive utilization of land space resources; and the improvement of the environment. Comments are made on transportations increased use of energy. The importance of marketing and the inducement of riders to public transportation is discussed. Capital and maintenance cost savings realized in the Chicago metropolitan region as a result of public and private funding is discussed, and the opinion is expressed that the automobile and mass transit will increasingly become complementary. A program aimed at solving the existing challenges to mass transit should reach a funding level of \$6 billion annually by 1982. This amount would be needed by currently existing and planned transit systems to operate at optimum effectiveness in view of national goals.

43 099493 MAKING THE MOST OF WHAT WE HAVE. Because of the demands being placed on available funds, construction of new transportation facilities is rare. It is suggested that a separate Transit Trust Fund be set aside for development of public transit facilities. In the meantime, the solution to the problem is to make the most of what is already in existence. This paper discusses, first, the capacity and demand of highway and transit facilities in Phoenix and second how these are being improved with available funds. Programs to balance the expedient with the long term are addressed.

Hall, EM, Deputy City Manager (Phoenix, City of, Arizona) *Transportation Research Board Special Reports* No. 153, 1975, pp 19-25; Presented at the 7th Summer Mtg. of TRB in cooperation with Florida DOT, Jacksonville, Fla., Aug. 5-7, 1974.; ORDER FROM: TRB Publications Off, Repr. PC

43 125568 PUBLIC FINANCING OF METROPOLITAN TRANSPORTATION [Il finanziamento pubblico dei trasporti nelle aree metropolitane]. This article is presented in three sections as follows: 1- economic and financial aspects of the urban public transport crisis, possible causes and proposals; 2-institutional aspects of the urban public transport crisis; Italian legislation regarding public transport and the principal rules of state financing; and 3-regional authority in matters of local public transport. /TRRL/ [Italian]

43 127492 PRICING AND INVESTMENT IN TRANSPORTATION FACILITIES. The principal problem confronting Congress as it develops a public program is to ensure that the program does not treat the symptoms of inept pricing of existing facilities and the inappropriate economic organization of private industry that uses the public facilities. These conditions give rise to a political demand for excessive investment to deal with peak loads. Two principal examples are presented as illustration: airports and the building of roads. The pricing of runways and the allocation of runway space are discussed. To resolve the problems, a change should be made in the allocating runways. There is no reason why airports should be in the public sector of the economy. The "decartelization of the airline industry (by abolition of the Civil Aeronautics Board) would make it a competitive one which would reflect the varying user charges at varying hours of the day in differential fares. These changes would render the existing supply of airports adequate for several future decades and inhibit the proliferation of redundant airports (as in the case of Dulles Airport in Washington, D.C.). Several points are made with regard to the building of roads (especially freeways in urban areas and rail transit facilities in major cities), and the effort to review the transit industry. The pricing of roads, and the queuing on radial freeways and other radial routes in rush hours as a result of the nonprice rationing of roads are discussed. A consequence of the present organization of transit is that the industry is overly capital intensive. Capital grants are an incentive to build rail systems in major cities. A consequence of the Urban Mass Transportation Assistance Program is that it creates a demand for preservation of the Highway Trust Fund. Federal policy should be directed toward an effort to develop institutional arrangements for variable user charge on roads.

43 131701 A PROGRAM FOR SUB-ALLOCATING OPERATING ASSISTANCE FUNDS. The Delaware Valley Regional Planning Commission (DVRPC) formula is based on demand (annual revenue passenger miles), supply (annual revenue seat miles), and efficiency (annual revenue passenger miles divided by annual revenue seat miles) x annual revenue passengers.

The generalized formula was applied to the regionwide case and a boundary (state) case. They were then averaged and the resulting amounts served as the staff recommended apportionments of section 5 funds to operating entities in the Delaware valley. Data concerning public transportation operations trends are presented graphically with the intent of identifying the fiscal and operational realities faced by the local public transportation operators. As better data reporting systems are developed nationally, it is expected that the methodology will become nationally recognized for sub-apportionment of the Section 5 in metropolitan areas. An advantage of the formula is that operating entities compete against each other for subsidies. Greater patronage and a more efficient ratio of demand to supply should increase one operating entity's subsidy, all things being equal. The methodology commonly relies on data compiled by operating entities, and it is easily executed. The methodology does not require a detailed operating cost analysis of each mode and operating entity.

Pierce, IN Schwarzwald, J Brizell, EGú III Sergi, J (Delaware Valley Regional Planning Commission) *Transit Journal* Vol. 2 No. 1, Feb. 1976, pp 31-42, 2 Fig., 2 Tab.

43 134603 A FORMULA FOR SUB-ALLOCATING OPERATING ASSISTANCE FUNDS. The \$3.9 billion transit assistance program instituted after 1974 legislation requires that USDOT funds be apportioned by state and local officials for both operating and capital projects in urbanized areas. Urban funding is on the basis of population and population density without guidelines on distribution of the funds among operating entities. The public transportation operating entities serving Philadelphia, Pa. and Southern New Jersey and the interstate area at Trenton, N.J., were appraised by the Delaware Valley Regional Planning Commission and a general formula was constructed based on demand, supply and efficiency. A continuing effort to promote efficiency in public transit operations is essential. The formula and fund distribution to the entities are described. The methodology relies on data commonly compiled by operating agencies.

43 136502 AIRLIE XII CONFERENCE HELD AT WARRENTON, VIRGINIA ON 29-31 JANUARY 1976. The Airlie conference highlights the financial requirements of the operating and capital programs of Metro. The following points were emphasized at the conference. Public transportation, while essential to our economic, social, and economical well-being, is a major cost and one that must be effectively managed. Rail construction costs must be kept as far as possible within the current estimate. Bus and rail operating programs must be managed so as to take advantage of every opportunity for increasing efficiency and reducing marginal service. Adequate funds are available to meet the full rail construction costs. To the extent that the full level of costs cannot be budgeted, effective budgetary alternatives must be identified without sacrificing our end program alternatives.

43 137669 A REVIEW OF PUBLIC TRANSPORT INVESTMENT PROPOSALS FOR AUSTRALIAN CAPITAL CITIES, 1974-75. The Bureau of Transport Economics in a June, 1972 report to the Australian Transport Advisory Council concluded that public transport fulfilled a vital function in capital cities, that current levels of capital expenditure were inadequate, and that public transport authorities could not finance an appropriate level of investment from current revenue sources. As a result of this report the government approved in principle a scheme to provide two thirds of the cost of improving urban public transport, and also invited alterations to those projects previously submitted to the BTE. This third report by the BTE contains the results of evaluations of 25 projects commencing in 1974-75 with a total cost of \$93.18 M, which had not previously been evaluated or which are substantially altered versions of those submitted in 1972 and 1973. The methods used in this study are similar to those used previously, with some refinements, and all of the projects had benefit-cost ratios greater than 1.0 at a 7 percent discount rate, but 4 projects yielded benefit-cost ratios less than 1.0 at a 10 percent discount rate. /TRRL/

43 138139 ASSESSING THE ARGUMENTS FOR URBAN TRANSIT OPERATING SUBSIDIES. Operating subsidies to urban transit have been growing rapidly in recent years. In the near future they will probably pay one-third or more of the industry's operating expenses. Proponents argue that operating subsidies are desirable because (a) they alleviate problems with existing automobile and land use patterns (such as congestion, air pollution, energy consumption, and urban sprawl); (b) they create a more egalitarian distribution of income and mobility; and (c) they permit public transit to be priced at its marginal cost. Unfortunately, many of the arguments of subsidy proponents are implausible. The most plausible argument is not that operating subsidies should be used indiscriminately, but that they should be used to support only particular types of public transportation service. Local transportation authorities currently do not restrict their fare reductions to the appropriate types of service, and they are not likely to do so in the future.

43 138140 FEDERAL TRANSIT OPERATING SUBSIDY OPTIONS. This paper reviews the political and historical background of transit operating subsidies. The issue discussed is not whether there should be operating subsidies, but rather which levels of government should provide them and in what fashion. Three arguments are reviewed: the fiscal, federal role, and pragmatic

arguments. The fiscal argument is that the operating deficits of transit authorities represent a local government fiscal program and should be treated as such. The federal role argument states that federal operating subsidies would lead to an inappropriate degree of federal involvement in local government decision making. The pragmatic argument is that it would be extremely difficult to use federal operating subsidies as an effective tool for improving urban transit operations and that the subsidies carry a real chance of being counterproductive. This paper examines four categories of operating subsidy options: no operating subsidies, the pipeline approach (unrestricted flow of funds to the transit industry), the block grant approach (exemplified by the transportation revenue sharing bill and the federal-aid urban highway program in the 1973 highway act), and the quid pro quo approach (a grant program whereby specific quid pro quos in the form of definite improvements or innovations in an urban area transit system are demanded in return for federal subsidies).

43 138141 TRANSIT OPERATING SUBSIDIES FROM THE LOCAL PERSPECTIVE. Passage of the National Mass Transportation Assistance Act of 1974 created a source of federal funding that can be used to offset transit operating deficits and improve transit operations, among other things. As a result, transit agencies are now able to turn their attention from the overall problem of balancing revenues with expenses to other issues in transit planning. A key problem that transit agencies and planners must now confront is the question of allocation of service among competing subsectors of the transit market. This paper describes some of the issues in service allocation and suggests that evaluating alternatives may be of primary importance in solving the problem. It is suggested that, within the overall framework of analysis of alternatives, some specific techniques need further development.

43 138142 PROBLEMS AND POTENTIALS OF FEDERAL TRANSIT OPERATING SUBSIDIES. This paper addresses the problems caused by increasing escalation of transit subsidies in the face of long-term trends that are worsening transit finances and focuses attention on two issues: (a) the relationship between changes in the level of federal subsidy funding and the financial condition of the transit industry and (b) the question of why the transit industry is incurring deficits. It is emphasized that a long-run federal operating subsidy program should concentrate on understanding and controlling the transit deficit. Possible solutions to the industry's problems are offered. At the federal level the alternatives available are to (a) move the power to determine the level of deficit from local authorities to the federal government by having national fare and service standards; (b) determine precisely

what the federal subsidy is supposed to accomplish and focus the money directly toward these objectives rather than subsidize all transit service; (c) design the federal subsidy mechanism to encourage innovation and increased productivity; and (d) structure federal subsidy programs to increase fare box potential rather than penalize the fare box as a revenue source. Alternatives open at the state and local levels are to (a) penalize competitors to transit through taxes and controls; (b) encourage improvements in the productivity of transit in the off peak; (c) encourage more diversion of peak-hour transit demand to alternative modes; and (d) improve competitive advantage of transit through exclusive busways and lanes, priority in traffic, and so forth.

43 138143 WHAT PRIZES WHEN ONE SUBSIDIZES? SOME LESSONS FROM THE PAST. This paper reviews past U.S. subsidy programs in both agriculture and transportation to establish facts about federal subsidies and apply these facts to current federal transportation subsidy programs. Two points are made. First, traditional transportation subsidies paid by the federal government have been justified in terms of national advantage. Based on this assumption, the case for federal subsidization of urban public transportation would be in extreme difficulty. This point primarily establishes reasons why urban transportation subsidies should not exist. There is, however, another approach, which leads to the second point that a new case for federal subsidization can be made strictly in terms of local advantage. An argument is presented for this new case.

Nelson, JR (Amherst College) *Transportation Research Record* No. 573, 1976, pp 30-36; Presented at the 54th Annual Meeting of the Transportation Research Board.; ORDER FROM: TRB Publications Off

43 138144 THE SUBSIDY ISSUE REDEFINED. The preceding papers made no mention of the portion of the population that is transit dependent—those people who rely on the existence of a decent transit system at a reasonable cost. A more rounded perspective on the issues is needed since public transit subsidies are a necessity to the maintenance of the urban organism. The choice for the present is not whether to subsidize public transportation but whether to have it at all. The answer is that it must be maintained for the transit dependent groups (i.e. urban poor, elderly, etc.), and it must be maintained at a price they can afford. The issue addressed here, and the one that most profitably could have been addressed in the previous papers, is how to design a subsidy program that will maximize the return on the investment.

43 139596 MASS TRANSPORTATION NEEDS AND FINANCING IN THE UNITED STATES. The U.S. Department of Transportation (1974) recently completed a comprehensive study of mass transportation needs and methods for financing these needs. Using information from the 1974 National Transportation Study, the study determined the level of capital and operating funds that would be required to implement the 1972-90 long-range plans and 1972-80 short-range programs of the states and urbanized areas. It then analyzed various funding mechanisms at state and local levels for financing their portions of these plans and programs. It was found that urban areas, in general, not only plan to stabilize transit fares in the face of rising costs, but also intend to put \$23.6 billion into capital investments through 1980 and an additional \$34.6 billion through 1990. Of the total \$58.2 billion in capital expenditures by 1990, 63% would be expanded by the nine largest urbanized areas; 27.8% by the New York area alone. Rail transit and commuter railroad costs would account for 90% of the nine largest urbanized areas. States and localities would be able to carry the financial burden of mass transportation improvements, even if the proposed 1980 programs were implemented in their entirety, given current levels of Federal assistance. However, there would have to be a substantial financial commitment from the states and localities and some hard decisions made by them about public expenditure priorities, fare policies, and taxation levels, and policies to discourage automobile usage. This underscores the need for careful review of their overall plans and programs by state and local officials before making financial commitments. /Author/

43 141061 CAPITAL AND OPERATING COSTS FOR THE REPLACEMENT AND EXPANSION OF THE CHICAGO RAPID TRANSIT SYSTEM. Construction, maintenance and operating costs are discussed under the following headings: total capital cost—construction, vehicles, support facilities, staging, difficult construction, right of acquisition, and demolition

of acquisition, and demolition of old facilities; annual operating and maintaining cost, and capital cost required to keep existing facilities open. Construction cost estimates for conventional 2-track rail rapid transit are expressed as per mile costs exclusive of stations. The construction types covered are tunnel, cut and cover, elevated, at-grade, and depressed. The vehicle cost is \$456,000 per rapid transit car. The annual operating costs are calculated on a per vehicle-mile basis and include vehicle maintenance, fuel and power, reserve for injuries and damages, labor-operators and trainmen, and fixed costs. The costs of keeping in operation the existing transit structures, stations and bus routes are also reviewed.

43 142159 THE ECONOMIC USE OF SUBSIDIES FOR URBAN MASS TRANSPORTATION. The energy crisis and various urban problems stemming from auto congestion, pollution, and the cost of providing public highways have created enormous interest in revitalizing our urban mass transit systems. Currently much is being said and written regarding the efficacy of granting federal, state and/or local operating subsidies. In this article, the author reviews the transit industry's peak capacity problem, and questions the economic wisdom of providing operating subsidies, as some are now being provided, and how most will probably be administered in the near future. An alternative plan suggests the manner in which subsidies can eventually help the transit industry. The article concludes with an analysis of what research efforts are needed in many urban transit systems and how subsidies can be used to support such research. /TRRL/

43 142349 REDISTRIBUTIVE EFFECTS OF PUBLIC TRANSIT: FRAMEWORK AND CASE STUDY. Study of the redistributive effects of public policy, i.e., who pays and who benefits, is often lacking in economic analysis. This paper stresses the importance of including a redistributive focus and presents a procedure for analyzing redistributive effects in public transit. The main redistributive effect studied is due to varying profitabilities of transit lines. Ceteris paribus, the users of profitable lines subsidize the users of unprofitable lines. To measure this effect requires that the costs and revenues of the transit system be allocated to the individual lines. The means of accomplishing this allocation are considered. The results can then be correlated with socioeconomic data of the users of each line. Along with this, variables that seem important in explaining the variance in line profitability can be tested. This framework is applied in a case study of the Chicago transit system. /Author/

43 142351 CURRENT STATUS OF STATE-LEVEL SUPPORT FOR TRANSIT.

Data were gathered by means of questionnaires received from 49 states and personal interviews with state transit officials in 22 states concerning state programs for assisting local transit operations. Twenty-four states provide financial assistance for transit from state funds. Such support may be used for capital improvements, operating assistance, technical planning, or special projects. The states vary widely in the extent to which they participate in such programs. Most state funds are derived from general revenue sources, although some states have established a state transportation fund to finance transit assistance as well as programs for other modes. A few states use special tax sources that are earmarked for their transit programs. Four general methods of allocating funds among transit operations are in use: purchase of service agreements, formula allocations, the revenue generating base of a transit jurisdiction, and allocation on a first-come, first-served basis. Several forms of indirect assistance to local transit operators were also identified in the course of this research. /Author/

43 142352 TRANSIT DEFICITS: A PROJECTION FOR NEW YORK STATE.

This paper summarizes recent work at the New York State Department of Transportation on the future of transit operating deficits in the state. Transit cost projections are made for three inflation levels for each of 13 transit properties, which serve 95 percent of New York State riders. Based on 1964-1973 data, aggregate demand models relation ridership to fare and service levels are calibrated for each operation and are used to forecast ridership and revenues to 1980 under a series of fare and service assumptions. The analysis shows that (a) transit costs will about double during the 1974-1980 period, (b) fare elasticities for transit ridership are about 0.25 for large operations and 0.55 for smaller operations, (c) ridership will stabilize at about 2.0 billion riders annually if current fares and services are maintained, and (d) transit deficits (operating costs minus revenues) will rise from \$248 million in 1973 to \$1324 million by 1980. /Author/

43 142353 ALTERNATIVE SUBSIDY TECHNIQUES FOR URBAN PUBLIC TRANSPORTATION.

Subsidies for urban public transportation can be paid directly to transportation providers for supplying certain specified services or directly to transportation users in the form of discount transportation vouchers. These two subsidy mechanisms can be referred to as provider-side subsidies and user-side subsidies respectively. This paper discusses the likely advantages and disadvantages of three approaches urban communities can take to subsidizing public transportation: provider-side subsidies alone; user-side subsidies alone; and combined provider-side and user-side subsidies. Provider-side sub-

sidies may be easier to administer than user-side subsidies, but they have often resulted in increased costs and in public dependence on a relatively small number of providers and services. User-side subsidies appear to offer more flexibility and efficiency; subsidized users can choose those providers and services that best meet their needs. The paper outlines a program of case studies and experiments designed to test hypotheses and fill major information gaps associated with these alternative subsidy approaches. /Author/

43 142355 ANALYSIS OF STATE TRANSIT FUNDING METHODOLOGIES (ABIDGMENT).

State funding of transit, allocation criteria, allocation limitations, funding sources and alternative allocation methodologies are reviewed. Results of a survey of the allocation methods currently in use by 22 state departments of transportation indicates that almost every state surveyed uses state funds as matching funds for federal capital grants and to assist in the purchase of other transit property; very few states allocated funds for the evaluation or promotion of transit service; most states provided assistance to fixed-route transit systems; only a few states make funds available to jitney or taxi services, half of the states fund rail, and one-third fund demand responsive systems; publicly owned systems were most eligible for funds. The allocation methods currently in use indicate that they were probably initiated because of political acceptability rather than their effectiveness in addressing particular transportation objectives.

43 142356 PROCEDURES FOR FINANCIAL ANALYSIS OF TRANSIT OPERATING ASSISTANCE GRANT REQUESTS.

The increasing reliance of transit operations on financial support has caused funding agencies to begin to evaluate the operating expenses of transit operators seeking financial assistance. One possible evaluation approach involves comparing aggregate expenses estimates of individual transit properties with industry wide performance. This paper reports on the development of an evaluation framework that uses this approach. The evaluation technique is discussed, and specific administrative actions are illustrated in response to the operating expense performance of individual operators.

43 143926 EVALUATING REVENUE SOURCES FOR PUBLIC TRANSIT: A NEW FRONTIER FOR ENVIRONMENTAL PLANNERS.

The report identifies alternative sources of revenue for the support of public transportation and suggests a comprehensive

framework within which these alternative revenue sources may be evaluated. Particular attention is devoted to those sources of revenue (gasoline taxes, parking surcharges, congestion tolls, etc.) which positively impact on regional environmental and transportation planning objectives at the same time that they provide new revenue for transit support. The report draws on a limited number of existing studies to identify (1) the potential range of future revenue deficits facing U.S. transit operations; (2) the sources, amounts, and distribution of existing revenues going to support transit in the largest U.S. metropolitan areas; (3) alternative financing mechanisms available; (4) evaluation criteria which have previously been employed to select revenue sources for transit support; and (5) new criteria which could be employed to provide a more complete evaluation.

43 146461 LIFE CYCLE COST MODEL FOR COMPARING AGT AND CONVENTIONAL TRANSIT ALTERNATIVES.

Some recent cost comparisons of conventional and Automated Guideway Transit (AGT) have directly used data from experimental AGT systems. These results are biased in that comparisons are made between an immature AGT system and mature forms of conventional transit. In effect, the analysis has not captured the long term advantage of AGT, which results from the substitution of technology for labor. An operational computer model is described which make appropriate cost comparisons. It is a life-cycle cost model that time-phases costs, accounts for the time value of money, incorporates time phased efficiency gains and provides for the impact of relative and general inflation. The model has been tested with AIRTRANS data from the AIRTRANS Assessment Project. Results are illustrative only. Conclusions concerning AIRTRANS operation are not possible as the data used was preliminary and is already out of date with more recent data showing significant cost reductions.

43 147682 DESPERATE NEED TO SLASH CONSTRUCTION COSTS OF NEW SUBWAYS. Subways and subway stations cost far too much to build in the U.S. Whereas Londoners recently built 3-1/2 miles of subways and subway stations for only \$18 million, the Washington Metro is running \$50 to 60 million/mile. With costs like this, the U.S. simply cannot afford to build many miles of subways. Among ways to dramatically cut costs: (1) establish better contracting practices--e.g. having the consultant do a more thorough geotechnical investigation so subway contractors won't have to put large contingencies factors in their bids; (2) introduce new technologies such as slurry walls, secant pile walls, and precast concrete liners; (3) Remove the burden of risk from the shoulders of consultants, risks connected with the introduction of new technology; (4) More carefully study alternatives in the initial planning phases of a subway system--e.g. necessary for subway tunnels to be so large? Subway platforms need to be that long? Do stations have to be as large or as deep? Too much over-design? In sum: the U.S. DOT is unhappy with the designs of current subway systems; they are not as cost-effective as they could be. The U.S. must introduce technical and institutional innovations, as other countries have done, if costs are to be sharply reduced.

43 148256 DEVELOPMENT OF MULTI-MODAL COST ALLOCATION MODELS. Readily available operating and financial data for public transportation systems in Chicago urban area were used to construct multivariable cost allocation models for each of the region's eight commuter railroads and 10 major bus systems. A cost allocation model was also derived for the rapid transit operations of the Chicago Transit Authority. The cost allocation model is developed by assigning individual expense accounts to one of five transit system resources--vehicle (car) miles, vehicle hours, peak vehicle (car) needs, track miles and passenger revenue. By dividing the total cost allocated to each resource by the appropriate operating statistic, unit costs are computed for each resource. These unit costs represent the coefficients of the cost allocation model, which is then used to analyze the economics of the various transportation modes.

43 148258 COMPARISON OF THE CAPITAL COSTS OF BUILDING BART AND FREEWAY AND BUS ALTERNATIVE. The cost of building the Bay Area Rapid Transit (BART) system is compared to that of a hypothetical freeway and bus alternative. The alternative was developed by drawing from State Highway Department plans for freeways that parallel the BART system within the same approximate corridors. The ability of both systems in Fiscal Year 1978 to move the overall daily use of the freeways is considerably higher than that of BART. When BART reaches its design capacity it will have the ability to move significantly more people during the peak hour than will the highway alternative, but overall it still will not be used as fully as the highway system. The highway alternative, including the cost of cars and buses, costs slightly less than BART in constant 1972 dollars.

43 149874 THE RATIONALE OF PUBLIC TRANSPORT. In 1972 public-transport subsidies by local authorities totalled 13 million English pounds; in 1974-75 they were estimated at 102 million. It was first announced in 1974 that the 1978-79 subsidy would be reduced to 50 million (at November 1973 prices) and in September 1975 further reductions were notified to county councils. The author discusses the influence that subsidies can have both on public transport facilities provided, the use of such facilities in relation to mobility and land use planning objectives, and the need that will arise for county councils to work towards the integration of their transport policies and programmes (tpps) into the structure plan, whereby consistency can be achieved between objectives for both planning strategy and transport policy. The implications behind the reductions in subsidies are discussed in the context of the link that is considered to exist between such subsidies and planning objectives which can be effected through public transport policy objectives. A summary of the arguments is: (1) subsidies should lead to increased use of public transport by allowing the operation of a better and/or cheaper service than would be the case on commercial grounds; (2) increased use of public transport can, in certain circumstances, lead to increased efficiency in resource allocation in the transport sector by obtaining a given level of benefits at a lower resource cost; (3) an improved level of public transport provision can result in increased mobility for certain members of the community; (4) both (2) and (3) can influence location decisions and affect land use planning policies. This article is presented as an attempt to offer guidance on which county councils can formulate policies and determine rationales for their subsidy policies. /TRRL/

43 150409 GOVERNMENT TRANSPORT POLICY AND TECHNOLOGICAL PROGRESS. Along with regulation, government involvement in advancement of transportation technology involves direct investment, promotion, subsidy, technological spinoff, taxation and welfare. Two facets of technology are involved: the rate at which new technology is developed and the rate at which it is applied in industries to which it is applicable. The most direct effects upon transport technology may be those which stem from governmental influences upon availability of funding. Two examples are examined: The stagnation of rail development through inadequate capital flow, and the near demise of public urban transportation in consequence of the multiplication of funding for highway purposes and its substantial denial for other transport modes. Both reflect a readiness to enlarge commitments within the sphere of governmental control and to ignore the effects of that policy upon the private sector or upon concerns of presumed local character. There was little foresight in appraising the likely consequences. Regulatory reform is also required, but not complete deregulation.

Williams, EW, Jr (Columbia University, New York) *Transportation Journal* Conf Paper Vol. 16 No. 2, Dec. 1976, pp 86-91; Presented at the Annual Meeting of the American Society of Traffic and Transportation, Inc., in New York City, August 1976.; ORDER FROM: ESL

43 151159 FORECASTING BUS TRANSIT OPERATING COSTS. The study deals with forecasting the cost of operating bus transit systems in U.S. cities. The primary objective is to develop a practical forecasting model for use by transit planners, i.e., a tool that will provide quantitative estimates (forecasts) of operating costs for any proposed bus transit system. The final product is a composite of several models, each of which forecasts a different component of operating cost. Total operating cost is found by simply summing the component forecasts. These models are based on data supplied by the American Public Transit Association, plus a direct industry survey, undertaken as part of the research effort. The four resource categories for which models are developed are driver labor, bus repair labor, fuel consumption, and oil consumption. A single model is developed for all other operating cost.

43 151165 ESTIMATION OF THE OPERATING COST OF MASS TRANSIT SYSTEMS. A new model has been presented for estimating the operating cost of a proposed mass transit system in an intermediate to long-range planning

environment. The document is the final report on the development and implementation of scheduling, estimation and costing procedures for transportation planning. The project was sponsored by the Urban Mass Transportation Administration (UMTA) and has been closely related to the Urban Transportation Planning System (UTPS), a computer system developed by the Planning Methodology and Technical Support Division of UMTA to assist transportation planners in the analysis and costing of proposed transportation systems. The work presented was the outgrowth of the building of a cost model for UTPS based on actual vehicle schedules and accurate estimates of manpower requirements. This work includes a new cost model, procedures to form line schedules from UTPS input, vehicle schedules, and manpower estimates, and the development of computer program UCOST which is implemented within UTPS. The major goal of the work is the development of a cost model appropriate for long-range planning.

43 153116 STATUS OF OHIO'S CAPITAL AND OPERATING NEEDS FOR PUBLIC TRANSPORTATION, FY 1976-1980. An attempt is made to document the extent and type of the financial needs of Ohio's urban public transportation systems and to compare these needs with available financial resources. Tables and figures are used to present the information which is categorized in 3 groups: large urbanized areas over 200,000; urbanized areas under 200,000; and nonurbanized areas. The report indicates that 2 of the urbanized areas in Ohio will utilize all of their allocated UMTA Section 5 funds for operating expenses. Large urbanized areas will utilize all of their allocated Section 5 funds to fulfill capital and operating needs and will require additional Section 3 funds. Small urban areas will underutilize their allocated funds by a significant amount. If UMTA were to limit the allowable operating subsidy to 50 percent of the allocated Section 5 funds, it would have adverse consequences on the ability of 7 out of 8 of Ohio's major urbanized areas to maintain planned transit service. Operations in 5 of these major areas are forecast to have inadequate local funds to carry out their proposed program based upon their present sources of non-fare box revenue.

Jackson, RD ; Ohio Department of Transportation Aug. 1976, 41 pp, 7 Fig., 20 Tab.; The preparation of this study was financed in part through a Technical Studies Grant from DOT, Urban Mass Transportation Administration.; Grant Proj. No. OH-09-8001

43 153264 OWNERSHIP OF URBAN TRANSPORT UTILITIES IN THE UNITED STATES. The ownership status of urban transportation utilities was determined by questionnaire for 334 of the U.S. cities that had 1970 populations in excess of 50,000. (Of the 395 cities in this size category, 61 did not respond.) Of the 334 cities which reported, 85 had no public transportation. Seventy-seven utilities were owned by the city, 69 by other governmental units, and 103 by private investors. /GMRL/

43 154595 METROPOLITAN FISCAL ANALYSIS. VOLUME 5: OVERVIEW: LOCAL-STATE-FEDERAL FISCAL FLOWS AND FUNCTIONS IN THE NATIONAL CAPITAL REGION. The report summarizes a larger study which covers two major topics: local-state-federal fiscal flows in the Washington metropolitan area, and costs and benefits associated with non-resident use of local facilities and services. The first section of the report identifies the local-state-federal fiscal flows in the region and describes their concentrations, distributions, and comparative burdens. These fiscal flows are analyzed to determine how the region and its subdivisions are influenced by local-state-federal tax collections and outlays for local-serving facilities. Fiscal flows are compared with regard to local-state-federal sources and the three portions of the region. The second section of the report addresses costs related to two public services in the region: transportation--metrobus and metrorail, and social services. Costs and benefits are also analyzed for recreation and cultural opportunities, emergency health services, and fire mutual aid.

43 157191 CURRENT STATE PRACTICES IN TRANSIT FUNDING. In an effort toward refining a funding method which results in efficient, effective and equitable transit service, this paper focuses on the criteria and methods adopted by the states for allocation of funds. Twenty-two states responded to a questionnaire concerning state assistance for mass transit. The states identified the purpose, modes, recipients, allocation formulas, funding sources and other relevant information. The survey found that: states use state funds as match for federal capital grants and assist in the purchase of other transit property;

very few states have allocated state funds for the evaluation or promotion of mass transit service. The criteria for allocation of state funds vary considerably. The major distinction in funding is between that which is allocated to systems. Those of the latter type are primarily dependent upon whether the funds are intended for operating assistance or capital assistance. If states provide capital assistance to transportation systems, the proportion is usually 50 percent of the non-federal share. The allocation of funds for operating assistance is usually based upon the system's deficit or the systems performance. Very few states place requirements on the allocation of state funds. Seven different funding sources are identified and reviewed, and the goals and legislation governing funding are briefly discussed.

43 157776 URBAN TRANSPORTATION FINANCING: THE PHOENIX PROGRAM. This article which notes that the challenge is to achieve the most for the taxpayer through a cost-effective and well-balanced total transportation program, discusses the administrative problems of using federal aid and describes the Phoenix program with its 2 basic components: the street and transit programs. The sum of the street and transit programs (the programs are summarized in tables) is \$42.7 million. The expenditures and sources of funds for the major 6-year street program are also summarized. The legislative endeavor extended over 9 years, and the support of the city councils and community, and the joint cooperative efforts of the state, counties and cities were major factors in the success of the program. It is noted that the competition for the limited funds for various programs makes it necessary to carefully justify requests for funds. There must be cost effective use of these limited funds. There is also the need for balanced funding for all programs. The continuation of the separate Highway Trust Fund, Aviation Fund, and an identified funded transit program at the federal level will best contribute to the development of the total transportation programs at all levels of government. The need is indicated for a public that is informed on transportation requirements.

Hall, EM (Phoenix, City of, Arizona) *Traffic Quarterly* Vol. 31 No. 2, Apr. 1977, pp 275-286, 4 Tab.; This article was taken from a panel

presentation on Transportation Financing given by the author at the Annual Meeting of District 6 of the Institute of Transportation Engineers, San Diego, July 19, 1976.

43 163568 TRANSPORTATION FINANCIAL NEEDS DURING THE NEXT DECADE (1978-1987). This report which focuses on the areas of major federal responsibilities and interest, includes individual modal reports for airports, highways, pipelines, public transit, railroads and waterways. The specific areas for which needs estimates have been made are outlined and the data sources are indicated. The needs estimates include some private sector investment requirements, particularly in the area of railroads and pipelines. The needs study also considered equipment requirements. The figures indicate that Federal support should be increased from the level of approximately \$13 billion in Fiscal Year 1977 to an average level of \$22 billion in the next decade. The total transportation needs figure, including all sources of funding, average to \$64.79 billion per year during the next decade.

43 164019 COSTS AND BENEFICIARIES OF ATLANTA MASS TRANSIT. Research is reported which was designed to determine the beneficiaries of mass transportation in the Atlanta Region, and the point is made that MARTA (Metropolitan Atlanta Rapid Transit Authority) should offer a wider range of transportation services and costs to a consuming public within a complex geographic area. Mass transportation's appeal is affected by costs, quality of service and competition with other modes. In order to decrease the inequity of time costs between the automobile and mass transit, it is clear that mass transit must approach the service level of the automobile. The potential for increased transit ridership is greatest for high income suburbanites. It is recommended that the diversion of automobile use to mass transit should be encouraged through higher parking fees or other auto restrictions during peak hours. Collector bus service on a reservation basis should be available to suburban residences to minimize the time costs of transit travel. Further recommendations regarding the costs of services to higher income riders, exclusive bus lanes, a regional train system, the dissemination of information on the costs of modal choices are also presented.

43 164336 THE TRANSPORTATION STRUCTURE SCHEME; LOST OPPORTUNITIES [HET STRUCTUURSCHEMA VERKEER EN VERVOER: GEMISTE KANSEN]. The author analyses the main and sub objectives of the transportation structure scheme and concludes that comparison of the various alternatives is almost impossible because of the unequal specification of costs. Public participation therefore will lose a lot of opportunities. Another point of criticism is that there is confusion between policy and objectives before the details of the alternatives are clearly outlined. It appears that expenditure on public transport will have to remain at the present level or may even have to decrease. /TRRL/ [Dutch]

Hupkes, G *Verkeerskunde Analytic* Vol. 28 No. 6, June 1977, pp 277-283, 6 Phot., 8 Ref.; ACKNOWLEDGMENT: Institute for Road Safety Research (SWOV67004E), TRRL (IRRD 227379); ORDER FROM: PB12053

43 165814 SECTION 13(C): TO GRANT OR NOT TO GRANT. A discussion is presented on Section 13(c) of the Urban Mass Transportation Act of 1964. Section 13(c), the employee protection clause, requires a transit agency to assure that an employee's position will not worsen when a transit agency receives federal money. The Secretary of Labor also has the final say over any agreement or promise that the transit agency makes that employees will not be harmed by a federal grant. According to R. E. Patricelli, former UMTA Administrator, 13(c) has affected the process of awarding federal paratransit grants, and delayed the awarding of badly needed UMTA operating and capital assistance grants and fueled management-union hostilities. Remarks on 13(c) by local officials, transit executives and unions are presented. Recommendations by Mr. Patricelli and APTA include filing with the operating assistance grants a "negative declaration" that would have the transit agency agreeing that no employee would be harmed by the grant, and if they were, the situation would be corrected. There is uncertainty at present whether paratransit comes under 13(c), and concern with the possible complications that could arise if local transit competes with paratransit.

Crosby, T (Washington Star) *Mass Transit* Vol. 4 No. 5, May 1977, pp 10-13, 1 Phot.

43 166720 WHY URBAN SYSTEM FUNDS WERE SELDOM USED FOR MASS TRANSIT: FEDERAL HIGHWAY AND URBAN MASS TRANSPORTATION ADMINISTRATIONS, DEPARTMENT OF TRANSPORTATION [Report to the Congress]. The report discusses the reasons local communities seldom used Urban System highway funds for mass transit projects as authorized by the 1973 Highway Act, and contains several options which the Congress could take to provide additional incentives for using highway funds for mass transit projects.

43 169082 HINDRANCES TO COORDINATING TRANSPORTATION OF PEOPLE PARTICIPATING IN FEDERALLY FUNDED GRANT PROGRAMS, VOLUME I. GAO identified 114 Federal programs that provide financial assistance for the transportation of people. GAO did not identify any express statutory or regulatory restrictions that specifically prohibit coordination of transportation resources of these programs but did identify a number of hindrances to coordination. The most significant hindrance appears to be confusion at all government levels about the extent of transportation coordination federally funded projects may engage in. The Congress should reduce this confusion by endorsing transportation coordination when feasible, providing there is appropriate cost-sharing and cost and service accountability.

General Accounting Office CED-77-119-Vol-1, Oct. 1977, 158 pp; Volume II in RRIS 25 169081; RRIS Bulletin 7802.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-272837/6ST

43 172352 INTERRELATIONSHIP BETWEEN PLANNING AND FUNDING. Improved transportation begins with transportation planning which incorporates available funding. This is illustrated by the problems facing the Texas Department of Highway and Public Transportation which were: increasing traffic volume, rising costs, and leveling off of revenue growth. In cooperation with a consultant firm, a complete analysis was made to find solutions to the immediate problems and evaluate the financial situation. A system-oriented program is being developed to establish a balanced system within a foreseeable time that can be funded and controlled. This approach to highway planning should result in maximum benefits from available funds and a highway program with a realistic, solid foundation. Effective transportation planning must include consideration of funding limitations and must be accomplished by the parties who have the authority and responsibility for implementation. /Author/

Goode, MG (Texas State Department of Highways & Public Transp) *ASCE Journal of Transportation Engineering* Proceeding Vol. 103 No. TE6, ASCE 13354, Nov. 1977, pp 703-709; This paper was presented at the April 25-29, 1977, ASCE Spring Convention Exhibit and Continuing Education Courses, held at Dallas, Texas (Preprint 2828).

43 175695 PUBLIC HEARING BEFORE BUS SUBSIDY PROGRAM STUDY COMMISSION, HELD AT JERSEY CITY, NEW JERSEY, ON FEBRUARY 28, 1977. The Bus Subsidy Program originated in 1969 as a temporary program to preserve existing bus service while a permanent master plan for bus transportation could be developed. The aid program has increased from \$530,000 during the program's first year to assist six bus carriers to a subsidy of approximately \$45 million for the last fiscal year, with assistance being granted to 31 carriers. This has been an increase of over 8,000 percent in only seven years. The resolution asserts that some non-subsidized bus owners are operating at a profit while offering better service at lower fares than subsidized carriers; and it has been alleged that subsidy money is being applied by companies to underwrite large executive salaries and insurance policies. There is also a lack of incentives and

other deficiencies inherent in the program. Recent audits by the Department of Transportation and reports by the Office of Fiscal Affairs have highlighted the problems and abuses in the program. The purpose of these hearings is to investigate the abuses, to examine the problems and inadequacies in a system that permits the unintended use of citizen's tax dollars. The Department of Transportation is presently in the process of evaluating consultants' reports on how to restructure New Jersey's bus system and as regards what measures should be taken to change the operation of the bus subsidy program. 43 176474 INTRODUCTION: THE URBAN TRANSPORTATION PROBLEM UPDATED.

The major urban transportation policy issue today is how to achieve efficient, workable urban public transportation. The financial straits of public transportation, the structural weaknesses in the urban transportation market, the lack of understanding of the complex urban transportation market, and the lack of any attempt to interrelate the various aspects of urban transportation are noted. Nonmarket influences which exert strong forces on the behavior and performance of the urban transportation market include those relating to financial relations between the various levels of government, and local financial planning for transportation services. A study was initiated to examine the long-term forces in the urban transportation market that generate chronic transit deficits and to evaluate alternative courses of action to improve economic efficiency and financial viability at the local level. This study in addition to focusing on financial difficulties and the causes of deficits, also attempted to identify alternative programs to assist cities to reduce their dependence on federal financial assistance, and develop a framework to assist different levels of government to evaluate transportation costs versus revenue. The study will also summarize the state of the art which will contribute to a better understanding of the options available. Two-to three-day workshops were conducted on 5 topics: urban transportation pricing alternatives; the economic regulation of urban public transportation; issues in labor relations; the effectiveness of marketing; and government responsibilities for financing urban transportation.

43 176475 THE ROLE OF PRICE IN THE URBAN TRANSPORTATION MARKET. The concepts of industrial organization are used to

relate the characteristics of market structure and conduct in urban transportation to poor market performance. Particular emphasis is placed on price-cost distortions—a source of market failure. The performance of the urban transportation market is described, and the chief market imperfections are identified. These imperfections include: price cost distortions, economic regulations, labor work rules and collective bargaining, ineffectual transit management and marketing, and government programs which benefit private transportation. The reasons for advocating pricing of roads on a more economic basis are set forth. In addition to making it possible for the Transportation System Management program to perform at all levels that are consistent with its potential, better road pricing has other advantages: the costs of travel are made more explicit; gives a wider range of choice; prices are flexible; provides revenue, provides information on the value people place on types of services and on system charges. Anomalies in pricing urban transportation services are discussed.

43 176476 TRANSPORTATION PRICING PROGRAM OF THE URBAN MASS TRANSPORTATION ADMINISTRATION. This program

seeks to reduce severe traffic congestion in urban areas and to improve the environment by encouraging use of the public transportation system. The program promotes pricing strategies that directly improve the performance of the public transport system, i.e., speed, productivity, or reliability, and uses disincentives that discourage the use of low-occupancy modes of travel. Two general categories of demonstrations are being considered for implementation. The first, which consists of pricing measures that will discourage the use of low-occupancy vehicles, involves a supplementary license scheme that is used to charge low-occupancy vehicles for driving in highly congested areas. In the second category, pricing strategies are used as a means to achieve positive rider attitude and support toward the public transportation system, and to increase ridership and productivity. Included are demonstrations to investigate the major transit pricing issues ranging from pricing of various transit services for different user groups and mechanisms for prepayment of fares to the complete elimination of fares. Comments are made on the following demonstrations: fare-free transit, prepaid pass, congestion pricing, and demonstrations of price and service variations. UMTA plans to expand the congestion pricing effort and evaluate other alternatives. The question of parking charges will be reviewed, and an investigation will be made into corridor and spot pricing to deal with specific types of congestion problems.

Arrillaga, B (Urban Mass Transportation Administration) *Transportation Research Board Special Report* No. 181, 1978, pp 13-15; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 43 176477 SUMMARY OF OBJECTIVES OF PRICING.

It is noted that analyses of urban transportation problems and pricing strategy have been only incidentally expressed in terms of space and their intimate relation with the rest of the urban system. There has been no mention of what a rigorous and socially responsible transportation pricing policy would require in governmental reorganization. Current urban systems analysis is largely unidirectional. There may be a need to coordinate pricing policy with a complementary land use strategy. Sophisticated land use planning should be able to ensure the availability of low-income housing sites for a lesser subsidy than that required to run a nearly empty, too-big transit system. The present discussions have made little or no mention of the impact that the slowing rate of population growth might have on congestion and the need for stern road pricing policies. Another trend that seems to have been missed is the rising shove of urban movement accounted for by recreation, social, and shipping trips. The discussions considered here have all focussed exclusively on the metropolitan area.

43 176483 SUMMARY OF EXPERIENCE WITH TRANSIT PRICING.

It is noted that although the major concern in deciding on transit service and fare levels should be with the direct transportation consequences, there are many other less direct considerations that may also legitimately influence pricing decisions. Five influences on pricing decisions are noted and discussed; Efficiency, from the theoretical microeconomist viewpoint; management and political considerations; analysis of the travel behavior of individuals through the development of cross-sectional disaggregate behavioral models of travel demand and modal or route choice and through the application of the techniques of attitudinal survey research; experimentation by transit agencies of new pricing and service initiatives; and, the

increasing use of the more sophisticated analysis of transit patrons' response to changes in fare and service levels. The author notes that analysis must explicitly take into account such complex facts as that demands responses to a whole package of service features; that it is impossible to have a major fare adjustment without also affecting service quality in some way, and that there are many factors external to the transit system that lead to variations in patronage across routes or through time. Unless we are able to turn our efforts to investigating cause and effect in a logically rigorous fashion, it is likely that our model of what happens when the transit system is changed will be purious.

43 176485 TRANSIT AND PRICING POLICIES. The object of this paper is to present a personal view that pricing is not really a very important policy variable for transit and to present an approach to data collection for transit that permits monitoring and identifying the effects of policy changes. The recent trend towards heavy subsidies for transit systems has signaled a change in the underlying objective from one of economic efficiency to one of maximizing the number of users of transit, by time of day, within a reasonable level of subsidy. This shift in objective has resulted in a change in the methods of managing transit systems as well as in the nature of transit service operations. A transit demand model is needed as a policy tool to monitor the effects on ridership of policy changes in transit systems. The proposed model provides a framework for data collection that will ensure that the effects of policy changes can be detected. Feasibility studies to date indicate that the proposed model does provide a framework that is adequate to the task of measuring all the variables that affect transit ridership.

43 176486 USING SALES TAX TO SUPPORT LOW-FARE PRICING OF TRANSIT SERVICES IN ATLANTA. The primary income source for the implementation of MARTA; \$2.1 billion transit development program is a 1 percent sales and use tax levied in the two county implementation district. To overcome the inequity of a regressive sales tax, a policy of maintaining low fares was established, and both sales tax and fare revenues were applied to meet development and operating costs. A survey of riders indicated that the increase in ridership was 30 percent taking into account new riders and additional old-rider trips versus continuing old-rider trips. Characteristics of ridership and public economy aspects are discussed. The Atlanta low-fare and sales tax transit pricing experience leads to two primary conclusions. First, low systemwide fares attract additional transit riders, significantly from previously nontransit market. Second, with a low fare, subsidy drawn from sales tax results in a progressive tax structure with desirable income-transfer effects. Survey data indicated that low fares attracted riders who then discovered the quality of transit service that was already available.

43 176491 LEGAL CONSIDERATIONS IN URBAN TRANSPORTATION PRICING. This paper provides a checklist of the legal issues to be considered in reviewing pricing proposals. Four questions pose the basic legal issues that need to be considered before making a decision about implementing any pricing mechanism. Can the pricing technique be implemented as a regulatory measure under the police power in general or specific delegation of authority. Presuming there is authority to impose a pricing technique, is it a reasonable exercise of the police power? Does the pricing technique violate any constitutional principles (due process of law, equal protection of the laws, burden on interstate commerce, right to travel)? Can the pricing technique be implemented as a valid exercise of the taxing authority? Experience in the Washington metropolitan area with parking controls points out the need for strong interrelationship among technical, legal, and political analysis if any transportation measures are to be implemented.

Bosley, JJ Schaller, MB (Metropolitan Washington Council of Governments) *Transportation Research Board Special Report* No. 181, 1978, pp 57-61, 2 Ref.; This paper appeared in *Transportation Research Board Special Report* No. 181, *Urban Transportation Economics*. 43 176492 TOWARD BETTER URBAN TRANSPORT PRICING: USING WHAT IS KNOWN AND EXPLORING WHAT IS NOT KNOWN. This paper is directed to some concerns raised about the possible effects of road pricing on income distribution and on the existing pattern of activities, sale volumes, land values, and employment in the central area, particularly over the long run. In the author's opinion, a properly designed and implemented pricing scheme, would, contrary to the fears that have been expressed, increase rather than decrease activity and employment in the central area. Also, as is not the case with the present, more instances, from the poor would benefit, in most instances, from the improved accessibility and lower fares resulting from more rational pricing of private and public transportation. Because of the great uncertainty over whether the possible benefits are worth the political risks required of those making the key decisions, if new approaches to pricing are initiated, federal support may be necessary to encourage a demonstration of a restraint scheme representing a major departure from past tradition with potential for large gains nationally. Initially, it might be advisable to have a fairly simple program rather than a very elaborate one, so as to avoid a situation where ends (e.g. greater efficiency, reduced travel times, improved environment quality) are confused with means (i.e. pricing). In some instances, physical restraints might prove more efficient than pricing schemes. The need is felt for research on the price and service elasticities of travel demand of much wider scope than the many local studies that have been done so far. There is also a need for new institutional approaches since, while planning and implementation can only be done at the local level, the type of basic research necessary to improve analytical tools and the dissemination of improved methodologies, information, and data can only be done at the federal level.

43 176493 TOWARD IMPROVED URBAN TRANSPORT PRICING: SOME THOUGHTS ON NEXT STEPS. While improving the short-run economic efficiency of a transport system is often cited in the economic literature as reasons for shifts in pricing policy, in cities where major pricing shifts have occurred, the stated goals had much broader social policy implications than simple single-mode efficiency. Therefore, impacts of pricing ancillary from a

theoretical viewpoint may be of dominant importance in terms of policy acceptability. In terms of future research, greater emphasis should be placed on the identification and description of administrative difficulties, mode and route diversion, changes in peak timing and duration, and other descriptive measures, so that practitioners can better judge for themselves the net benefits of pricing schemes. However, no amount of paper research will satisfactorily answer certain questions (which are sources of great political risk) about possible effects on business viability, essential mobility, transport system disruption, and social welfare in general. A federally funded demonstration catch on. Existing transportation charges (e.g., transit fares, bridge tolls, gas taxes, parking fees, etc.) offer a more readily available way to increase the effectiveness of pricing instruments than do more radical new charges, although the disruptive effect of the latter can be minimized by their being introduced gradually. While urban transport pricing currently has little public support, it may become more acceptable if urban population and automobile use continue to increase. The federal government should plan for the contingency by continuing and extending its research on the wide range of effects implicit in urban transportation pricing changes.

43 176518 TRANSIT FINANCING TRENDS AND OUTLOOK. Recent trends in transit deficits and the forces behind the deficits are considered as well as the way federal, state and local government have responded to these trends in operating deficits. Comments are also made on future transit financing. It is noted that deficits are not completely self-generated; both past and future deficits are a result of public-policy choices concerning fares, levels of service, labor negotiations, and taxation. The momentum of current trends in rising costs, constant ridership, slowly rising fares, and gradually increasing levels of service will probably push deficits upward at a rate of about 15 percent/year, but this will vary greatly among types of cities. The probability that governments will take the initiative to reduce deficits through innovative types of service and new efficiency controls—rather than through service cutbacks—will be largely a function of the financial pressure on those cities and of their commitment to provide improved public transportation service in the face of that pressure.

ernment Financing Responsibilities held by Transportation Research Board. Sponsored by Office of the Secretary, Federal Highway Administration, and Urban Mass Transportation Administration of DOT; Environmental Protection Agency; and Federal Energy Administration.; ORDER FROM: TRB Publications Off

43 176519 OBJECTIVES OF PUBLIC TRANSPORTATION ASSISTANCE. Two aspects of transit programs are addressed; budgetary aspects, and questions raised by congress regarding the Urban Mass Transportation Administration (UMTA) programs. The ways in which the new budget process affects mass transit funding is discussed. The Congressional Budget Act of 1974 created budget committees, a congressional budget process, and the Congressional Budget Office (CBO). The Act makes it more difficult to get contract authority. A CBO report found that the distribution of UMTA was about 30 percent for assistance in purchasing buses and about 70 percent for rail systems. The level of emphasis on rail systems is indicated as an area of research that will determine how the UMTA program is evaluated. The question is asked whether rail systems can contribute to revitalization of the central-city areas. Areas are indicated in which research will help clarify some of the supposed benefits of transit programs.

Wheeler, P (Congressional Budget Office) *Transportation Research Board Special Report No. 181, 1978, pp 203-205, 2 Ref.*; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 43 176520 THE PROBLEM OF FUNDING TRANSIT. Careful analysis of the sources of funds and the justification for the various sources are urged. Whether the degree of social commission justifies the low-fare or no-fare financing arrangement for a transit authority is questioned, and the redistributive impacts of transit are discussed. The question of which levels of government are going to support public transportation is considered. Comments made by representatives from the Metropolitan Transportation Commission serving the nine counties of the San Francisco Bay area and the governors council on transportation (Richmond, Virginia) are presented.

Olson, D (United States House of Representatives) Giersch, L (Metropolitan Transportation Commission) Doom, I (Virginia Governor's Council on Transportation) Freeland, JR (Rockville, Maryland City Council) *Transportation Research Board Special Report No. 181, 1978, pp 205-208*; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 43 176525 FINDING REVENUE FOR URBAN TRANSPORTATION. Certain basic questions regarding alternative means of financing urban transportation are considered. These questions relate to: Who decides and how? What is to be financed? How much is needed? Where will the money come from? How is the program to be administered? The risks associated with certain answer are pointed out. A table is used to examine these and source subsidiary questions and how they have been answered in financing the interstate highway program, the capital program of the Bay Area Rapid Transit Systems, and the recent transit service program of the San Francisco Metropolitan Transportation Commission.

43 176526 STUDY ON TRANSIT REVENUE SOURCES: PART 1. A project is currently underway that will produce a handbook for the Urban Mass Transportation Administration on local government financing for public transportation. The book which will cover both existing methods that have been applied in public transportation as well as some innovative methods, will have 6 major sections. The introduction will discuss types of financing problems and set forth the framework of legislative and organizational actions and traditions within which specific financing steps are considered. The next section, on public organization for transit financing, will discuss the relative importance of specific organizational structures and, to some extent, different local institutional settings for transit financing. A section will then deal with key local policies. The section on nonfare sources of funds will consist of a general catalogue of local government fund sources other than transit operations, including advertising and terminal concessions. State transit subsidy programs will be reviewed in a further section. Other sections will discuss financing for special-service clientele, focusing on the elderly and handicapped. The final section will be examine prototype institutions and review the possibilities for setting up plans and packages with major emphasis on operating assistance at the local level.

43 176527 STUDY ON TRANSIT REVENUE

SOURCES: PART 2. The initial results are set forth of a study that was designed to assist local decision makers in indentifying the full range of transit financing techniques, more systematically assessing the pros and cons of each local case, and choosing among alternative courses of action. The report reviews innovative financing techniques, many of which entail joint development and the related notion of value capture, evaluates the financing potential, institutional feasibility, and apparent promise for widespread application in the transit field. The innovative financing techniques are grouped into 3 categories: land, taxes, assessments and charges; and public land acquisition. It appears that combination on innovative financing techniques could defray about 5 to 15 percent of the capital cost associated with certain fixed guideway facilities. The possible payoffs from innovative techniques include: broadening the financial base for transit establishing an equitable allocation of costs; and enhancing the cost, effective of transit involvement.

43 176528 CASE STUDIES ON INCREASING TRANSIT REVENUES: NORTHEASTERN ILLINOIS.

The Transportation Task Force was created to examine problems associated with developing and financing organizations that can meet expanding needs, and seeking a solution for legislative consideration. A wide variety of alternative revenue sources were seriously considered at various public hearings. They included: fares, fuel tax, sales tax, sales tax on gasoline, income tax, city contribution, parking tax, utility tax, and state lottery. The opinion is expressed that, regardless of the source of the funds, the presentation and improvement of the regions public transportation system would require sizable public funds. There is also agreement that Chicago's Regional Transit Authority (RTA) should have significant revenue collection powers and that these powers should be indigenous to the areas served. The key provisions of the RTA enabling act are discussed.

43 176530 CASE STUDIES ON INCREASING TRANSIT REVENUES: SOUTHERN CALIFORNIA.

The Southern California Rapid Transit District (SCTRD) operated out of the fare box in 1969, state funds came in 1970, local support in 1973, and federal operating funds in 1975. State funding has been and continues to be the most important source to supplement the fare box. Almost all state funds are derived from a 9.25 percent sales tax. There funds qualify as the local share to meet federal matching requirements. The county of Los Angeles is the primary provider of operating funds from within the area served, but the actual source of the county funds is federal revenue sharing. The SCTRD's experience in improving transit revenue is briefly discussed, and figures are used to illustrate annual operating revenues by source in actual dollars and in constant dollars.

Woodhull, J (Southern California Rapid Transit District) *Transportation Research Board Special Report No. 181, 1978, pp 232-234, 2 Fig*; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 43 176531 CASE STUDIES ON INCREASING TRANSIT REVENUES: ATLANTA.

The options which were considered in Atlanta included a 1 percent payroll tax, a 0.5 percent sales tax or a 1 percent sales tax or a 1 percent income tax. The state legislature voted for a 1 percent sales tax and free fare. Transit in Atlanta needed a great deal of planning: a legal plan, a financial plan to raise the money, a transit design plan for the rapid transit and the bus systems, a political plan and an informational plan, and an urban design plan. It was recognized that there was an opportunity for value capture by the Metropolitan Atlanta Rapid Transit Authority (MARTA) as the rapid transit system is built. It is noted that urban design was the key to the building of the Atlanta transit system.

43 176532 CASE STUDIES ON INCREASING TRANSIT REVENUES: COLUMBUS.

The experience of the Central Ohio Transit Authority (COTA) is briefly outlined. The number of revenue kilometers, the expenses, and the degree of efficiency of the Columbus transit system are discussed. The state of Ohio has set up a program of capital and operating assistance by which the state will fund part of the local share. By weighted formula based on distance travelled annually and population, COTA can receive 13.1 percent of the total state package. A campaign was also planned that may succeed in getting the major share of a 0.5 percent sales tax for transit. This would permit capturing the full share of state and federal funds. In the two completed years of COTA's operation, average ridership increased 7 percent per year.

43 176534 COST ALLOCATION, FORMS OF AID, AND FUND AND ADMINISTRATIVE STRUCTURES.

The Intergovernmental Relations Committee of the Transportation Research Board is in the process of building a consensus among its members on basic intergovernmental principles. In this process, it has developed a work sheet for helping to distinguish federal, state, areawide, and local transportation responsibilities. The work sheet provides for assignment by percentage of various planning, programming, and implementation responsibilities among the various units of federal, state, areawide, and local governments already involved in transportation and transportation-related programs. Changing the roles and relationships among the different levels of government and the different departments, agencies, and authorities at the same level is a highly controversial activity. Consolidating major grants, establishing effective intermodal departments of transportation, and further strengthening regional planning organizations will require thorough justification and take time and substantial adjustments in traditional practice. /Author/

43 176535 COST ALLOCATION AND FUNDING STRUCTURE FOR TRANSIT. The experience in Minneapolis is briefly outlined. The development of metropolitan councils and semidependent districts is examined for the standpoint of general government. Comments are made on the planning and the decision-making mechanisms. The Rockville, Maryland representative notes that it is desirable to coordinate the different federal programs, including those in the heavily related areas of transportation, energy, and environment. The desirability of subsidizing mass transit is indicated. Gasoline taxes, parking charges and taxes and the need for a national, coordinated, consolidated, federal grant program is discussed. Guidelines for block grant legislation are suggested in a further paper. Transportation related programs in California and Pennsylvania are briefly noted. Brief comments are also made on the political and institutional problems in the area of financing mass transit.

Graven, DL (Holmes, Kircher and Graven) Potter, N (Montgomery County Council, Maryland) Rivard, LA (United States House of Representatives) Baurer, A (California State Senate) Miller, JH (Pennsylvania State University, University Park) Beshers, EW (Department of Transportation) Watt, PC (Metropolitan Transportation Commission) *Transportation Research Board Special Report* No. 181, 1978, pp 244-252; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 43 176538 INCREASING TRANSIT REVENUES. The need is noted for a strategy to keep the existing flow of federal funding alive while finding new ways to tap local and state resources for the support of transit. Raising fares is one way to increase transit revenues but it involves public policy and political issues. The question of tax sources that can be used for transit purposes is also considered. Innovative forms of finance that appeared promising included a very limited application of tax-increment and special assessment funding. It is noted that some transit authorities have tapped sales tax for transit-purposes. Chicago and California imposed a retail sales tax on gasoline to finance transit. Transit decisions must consider what will work and what will not; i.e. it is often a contest between professional and political groups.

Dahms, LD (California Department of Transportation) *Transportation Research Board Special Report* No. 181, 1978, p 255; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 43 176539 ALLOCATING TRANSIT COSTS AND FUNDS. It is noted that the manner in which transit costs should be allocated, and guidelines as to how much money should come from fares or from any other source are a function of local conditions. The issue pragmatic versus rational approaches to generating financial mechanisms is discussed, as well as the issue of block grants as a financing mechanism for mass transportation. The need is indicated for research concerning institutional arrangements and the financing mechanisms at the local level.

43 176877 TOTAL DIRECT AND INDIRECT COSTS OF BART. This paper deals with the direct and indirect energy costs of BART system. These costs are categorized amongst: traction, station maintenance, construction, and impact energy. Energy Intensity comparison is made for several Electric Transit Systems (Philadelphia, Chicago, New York, Cleveland, Toronto). Major emphasis of the paper is upon the indirect energy cost (construction energy) which is nearly 50 percent of the overall energy utilized for the BART system. For a comprehensive energy comparison of a given transportation system, it is important to identify not only the operational energy but also the construction energy. The author also makes a note regarding the unavailability of good data for fair comparisons.

43 176919 PAYING FOR PUBLIC TRANSPORT-THE ETERNAL TRIANGLE. The paper discusses three variables in public transport planning-level of subsidy, quality of service and level of fares-and their application in London transport, the aim of management being to find the optimum balance of these three elements. The level of subsidy for public transport is often a

political decision and is not necessarily at the optimum level for reasons of public expenditure. The question of quality of service is discussed from two aspects, efficiency and effectiveness. Efficiency is defined as minimizing the rate at which resources are consumed while effectiveness is the ability to carry out tasks within the overall objective. The choice of fare level structure is one where political policies sometimes determine fares either as a source of revenue or as a means of encouraging use of public transport. The author discusses these variables of public transport planning in relation to London transport's corporate aims and the duality of decision-making within the Greater London Council.

43 177144 TRANSPORTATION FINANCE: CHOICES IN A PERIOD OF CHANGE. The Congress has a unique opportunity in this session to reconsider the ways in which federal transportation programs are financed. There are several reasons for this: Some Congressional action is required soon since the Highway Trust Fund expires in 1979, and the Airport and Airway Trust Fund expires in 1980. The Carter Administration has proposed major new highway and transit legislation that takes some important first steps toward a unified trust fund for all transportation modes. Proposals for specialized trust funds are proliferating in response to demands by many modes of transportation for additional federal funds. In a reversal of the trend of recent decades, maintenance costs are becoming the dominant factor in highway spending. The magnitude of these maintenance costs and the degree to which they are assumed to be a responsibility of the federal government--as opposed to the state or local government--must be addressed. Largely because of the Energy Policy and Conservation Act of 1975 and other legislation now pending before the Congress, gasoline consumption is expected to decline. Thus, Highway Trust Fund revenues, which depend greatly on excise taxes on motor fuels, will grow much more slowly than in the past. Inflation will further erode the purchasing power of these revenues. This is also a significant problem for the states because their highway financing depends primarily on gasoline taxes. /Author/

43 178514 USING EFFICIENCY INCENTIVES TO ALLOCATE TRANSIT-OPERATING DEFICITS. This article supports the notion of providing efficiency incentives within the process of allocating transit-operating deficits and identifies the particulars of such a system currently existing in Washington, D.C. Four traditional approaches to providing transit subsidies are noted. The most common procedure authorizes a uniform rate of dedicated taxation in the area served by the transit agency, the latter receiving the proceeds of the dedicated tax. The second and less common procedure uses operating and/or socioeconomic factors. A third type is employed when a multijurisdictional operator provides services outside the area of its charter. Fourth, several cases exist where the deficit is paid

out of general funds from a city or county budget. The Washington Area Metropolitan Transit Authority (WMATA) case study is discussed. A clear understanding of the necessity for combining various measures in developing an aggregate allocation formula emerged from the study. To induce higher levels of economic efficiency, deficit allocation should be based on separate cost and revenue allocations. A general series of steps to follow in undertaking separate allocations for a bus operation is presented. It is concluded that cities with large and increasing deficits, multijurisdictional transit service, substantial bus operations, and interjurisdictional disputes about service levels are prime candidates for a deficit allocation formula with built-in economic incentives.

43 178515 CAN HONOLULU MASS TRANSIT BE SELF-SUPPORTIVE? This article is based on an earlier study of feasible alternative modes for the city and county of Honolulu (CCH). This article presents a mathematical model for predicting ridership on the proposed fixed guideway transit system and analyses the system's costs and revenues. These findings are than compared to those of the CCH study report. The development of the model is explained, aggregate versus disaggregate approaches and projecting transit ridership are discussed. A discussion of variables such as price per transit ride, population, and personal income is included. The model proposed in this article maintains that, even at an average fare of 20 cents, the expected ridership will be far below that predicted in the CCH study. When factors such as limited accessibility, price sensitivity, and increased competition from highway services are considered, it is difficult to forecast a self-supportive fixed-guideway transit system. Furthermore, it is noted that there is good reason to believe that actual total costs of the rapid transit system will exceed the CCH report estimates and thereby reduce the possibility that the system will operate profitably.

43 178712 SAVING COMMUTER RAIL IN INDIANA. The Northern Indiana Commuter Transportation District is working to enable the electric interurban commuter railroad to continue to offer service between Chicago, Illinois and South Bend, Indiana. While the railroad has successfully maintained its right-of-way, it is unable to purchase new rolling stock. In 1976, the South Shore filed a petition requesting permission to discontinue its passenger service. Studies were made which considered the issue of whether or not state matching funds, under Indiana's program to match UMTA grants should go to the South Shore if the railroad was about to go out of passenger business. The study found that continuation of service was the lowest cost of nine alternatives that were considered, and provided the most benefits for such factors as energy use, environment, safety, travel time, economic impact with the corridor, highway congestion and parking in Chicago's loop. It was found that much of

the problem associated with operating aid is in determining exactly what the deficit is that would have to be reimbursed by a combination of state, local and federal funds.

43 178736 IMPACTS OF RURAL TRANSIT FUNDING OPTIONS. This paper summarizes a study undertaken to assist the Urban Mass Transportation Administration (UMTA) in programming non-urban transit funds available through the National Mass Transportation Act of 1974. The study produced estimates of the amount of transportation provided and probable assistance levels under a variety of possible funding options. It was found that the supply of rural transportation services available in the next few years will vary significantly according to the type and amount of financial assistance available from UMTA, that assumptions about the useful life-span of vehicles significantly affect overall costs and administrative burdens, and that the transit assistance program with the most benefit to rural areas would be flexible depending on local conditions and would include some assistance for operating costs. /Author/

43 180494 URBAN TRANSPORTATION ECONOMICS: PROCEEDINGS OF FIVE WORKSHOPS ON PRICING ALTERNATIVES, ECONOMIC REGULATIONS, LABOR ISSUES, MARKETING, AND GOVERNMENT FINANCING RESPONSIBILITIES [Special rept]. The purpose of the study was to examine the long-term forces in the urban transportation market that generate chronic transit deficits and to evaluate alternative courses of action to improve economic efficiency and financial viability at the local level. The resulting report is designed to synthesize theory and practice to produce a practical working program for both those who plan and implement policy at the local level and those who develop and administer financial programs at the state and federal levels. Its purpose is to (1) focus attention on the financial difficulties that contribute to the deterioration of service for users of both public and private transportation in cities, (b) identify the underlying causes of present urban public transportation deficits, (c) identify alternative programs to assist cities to reduce their

dependence on federal financial assistance (especially for operating costs), (d) develop a common framework to assist the different levels of government to evaluate urban transportation costs versus revenues, and (e) provide a volume that will summarize the state of the art and contribute to a better understanding of the options available to local government and to public transportation operators to improve the financial viability of public transportation.

43 181336 THE DISTRIBUTION OF THE TAX BURDEN OF FINANCING BART'S CONSTRUCTION AND OPERATIONS. The 71-mile Bay Area Rapid Transit (BART) system is the first regional scale rapid transit system to open in the United States in over 50 years. This technical memorandum assesses the impacts of financing BART's \$1.5 billion capital expenditures and \$60 million annual operating expenditures on the tax burden of the region's residents. This memorandum identifies the sources of BART's capital financing and assigns the burden of each revenue source geographically and to incidence sectors. It documents the same analysis for the difference between regional transit expenditures with BART and those that would occur without BART. The equity of the BART financing plans is reviewed in the context of their impact on representative household types. The differences between financing expectation and the reality are reviewed, in addition to policy implications to the financing plan. (Color illustrations reproduced in black and white)

43 183014 ALTERNATIVE STRATEGIES FOR FEDERAL MASS TRANSIT ASSISTANCE. Since the early 1960's Congress has authorized various federal programs to improve mass transportation, approving more than \$16 billion in spending authority to support them. The most important federal programs are directed by the Urban Mass Transportation Administration (UMTA). The debate over new legislation authorizing and funding UMTA programs provides an opportunity to review existing efforts and to consider other federal strategies for

improving urban transportation. This paper attempts to provide a framework for examining possible alternative strategies for federal assistance and for evaluating the budgetary needs of UMTA. /SASI/

43 183105 THE GOLDEN RULE OF URBAN TRANSPORTATION INVESTMENT. The purpose of this paper is to find an optimal taxation rule for transportation investment in an ever growing urban economy. First we dynamize a standard circular-city model with identical residents by introducing population growth and transportation improvements over time. Assuming that utility functions are of a constant-elasticity form and transportation investment is financed by an income tax, we prove the existence, uniqueness and stability of a balanced growth equilibrium for each given tax rate. Then, an optimal tax rate is determined so as to maximize the balance growth equilibrium level of utility for every resident in the city. It is also shown that our simple rule remains valid in the case of two income classes. /GMRL/

43 183373 ALLOCATION OF FUNDS TO PUBLIC TRANSPORT INVESTMENT AND OPERATING SUPPORT. This paper reviews the present levels of operating support to, and public investment in, public transport systems in western Europe. All internal bus, tram and rail services are included, and estimates made for total support in Britain, Sweden, West Germany, the Netherlands and France. To make comparison meaningful, these are shown in relation to gdp and traffic carried. Support levels in Britain are below average, but by no means the lowest as sometimes assumed. Reasons for providing support are considered, including existence of financial burdens arising historically, assistance to particular groups of users, problems in price discrimination and inability of other modes' charges to reflect costs. The extent to which support payments may merely subsidise inefficiency is outlined. A distinction is drawn between "productive" efficiency, i.e. The resources used to provide a specified level of service and fare, and "allocative" efficiency, i.e. The extent to which resources are allocated so as to maximise traffic, etc. The extent for reducing support yet retaining the present general level of service and fare is considered. Means of raising finance for support are outlined, including relative roles of central and local government. The scope of local taxes being raised to meet local objectives is considered, notably in the French "versement transport". In conclusion, it is suggested that trunk inter-city services should cover all costs from fares, by a discriminatory pricing policy, but central government provide a basic support level for rural areas. In urban areas, practical limits exist to price discrimination, and the best policy may be "collective purchase" of facilities through a local tax. /Author/TRRL/

43 183624 THE COSTING OF BUS SERVICES IN ADELAIDE. The paper describes a study conducted in Adelaide to develop a method of estimating the cost of bus services for planning studies. The study was in four sections. First a set of unit cost rates was established which related to the resources deployed within the bus system. Second, a method was produced to ascertain the level of each resource needed to operate any given future bus service. Third, the marginal costs of extra buses operating for different periods of the day were developed and fourth, the average costs of the existing bus routes were determined. The method planned to maintain up-to-date cost rates and resource estimates is also described. /Author/TRRL/

43 184586 SOURCES OF NON-FEDERAL SUPPORT FOR PUBLIC TRANSPORTATION PROGRAMS IN NON-URBANIZED AREAS. The purpose of this study was to find out the extent to which states and localities are spending nonfederal funds in support of public transportation in non-urbanized areas. A survey was administered to state officials in transportation or highway departments, to social service agencies of the state whose budgets include significant funding for client transportation, to ascertain current and projected expenditures. This report presents the results of a survey of twenty-five states, estimating the extent of nonfederal support for public transportation programs in rural areas. The survey found \$36 million dollars of state funds, and three million dollars of substate funds supporting public transportation in these areas. Based upon these figures, it is estimated that at least \$78 million are spent annually from nonfederal sources, and that the trend in such funding is upward. Passage by Congress of operating assistance programs for rural areas would enlarge the figure. The principal focus of nonfederal funding is to match social service based budgets used to enhance mobility of the transportation dependent in nonurbanized areas. Two dollars of "special service" transporta-

tion money is spent at the state level for every one dollar of "general service" public transportation in nonurbanized areas. /UMTA/

43 185842 NEED FOR MORE FEDERAL LEADERSHIP IN ADMINISTERING NONURBANIZED AREA PUBLIC TRANSIT ACTIVITIES. In 1974 the Congress authorized \$500 million for transit assistance in nonurbanized areas (less than 50,000 population) during fiscal years 1975 through 1980. According to state and local officials, demand for these funds, which are administered by the Urban Mass Transportation Administration, has been low because federal financial assistance for operating expenses is not available for nonurbanized areas, a clear federal policy is lacking for such areas, federal grant application procedures are complex, and some small towns are unaware of the federal financial assistance. Legislation is pending for operating assistance, but the Transportation Administration should provide specific policies and procedures for public transit assistance in nonurbanized areas. Transportation should also evaluate grant application procedures to determine how they can be simplified, and should evaluate whether current information dissemination methods are adequate.

43 186632 SUBSIDIES, CAPITAL FORMATION, AND TECHNOLOGICAL CHANGE: MASS TRANSIT. VOLUME 2. This volume is one of seven case studies. The tools of microeconomic analysis are applied to assess the responsiveness of both the supplier and the user of the subsidized product or service. Particular attention is given to the effects of the subsidies on capital formation and technological change, but general efficiency effects are also considered. Because the bulk of the stimulus to technological change in the transit industry represents a secondary impact, the main focus of the study is on the ways in which the subsidies affect the demand for inputs into the provision of transit service.

43 186634 SUBSIDIES, CAPITAL FORMATION, AND TECHNOLOGICAL CHANGE: LOCAL AIR TRANSPORT. VOLUME 7. The air transport system--air carriers, airports and airways--receives federal financial assistance through several federal programs. The total amount of funding is not a subsidy, since taxes are collected from system users, primarily in the form of fuel or passenger taxes. However, the portion of the funding which exceeds the taxes paid by users is a subsidy since this portion of the funding could have been used for other purposes and provides benefits in kind to users of the air system. These subsidies can change output levels, which can affect aircraft stock levels and consequently the level and possibly the rate of capital investment. This in turn can affect technological change. This study addresses the distribution of this subsidy among air transport user groups (general aviation, trunk and local carriers), and its impact, if any, on technological change.

43 186635 SUBSIDIES CAPITAL FORMATION, AND TECHNOLOGICAL CHANGE: SUMMARY AND CONCLUSIONS. VOLUME 8. The report is one of a series of eight volumes prepared for the Experimental Technology Incentives Program, National Bureau of Standards. The first seven volumes are case studies of the microeconomic impacts of subsidy programs in the following industries or segments of an industry: local service air transport, maritime transport, nuclear power, mass transit, health facilities, technical publishing, and municipal wastewater treatment facilities. Emphasis is placed on the impact of subsidies on technological change. The eighth volume provides a summary and analysis of the impact of the subsidies in the seven industries, and gives conclusions with respect to the differential effects of subsidy programs with different structures and methods of administration. It also provides operational guidelines for managers respecting the implementation and evaluation of subsidy programs when capital formation and technological change are either explicit objectives or important results of the programs.

43 193622 THE FEASIBILITY OF STATE-LEVEL MULTI-MODAL TRANSPORTATION TRUST FUNDS. Recent experience has shown that the slowdown in the growth of motor fuel tax revenues and rapid inflation in transportation construction and operations have created a serious challenge for states. The multi-modal trust fund would provide a method for expanding the fiscal base for transportation finance while increasing the flexibility that transportation planners have in their short-and long-term decision-making. This study analyzes the question of multi-modal trust funds in some detail. It presents and discusses the methodology and results of a survey of State Departments of Transportation regarding their present financial position and policy stances on both the concept of a multi-modal trust fund and a variety of other State and Federal Proposals for revising transportation financing and planning methods. Based on the thirty-six responses, the concept of such a trust fund was viewed favorably, but the problems that it might raise and the political battles that such a plan would face made its enactment

in most states highly unlikely. The respondents' views expressed strong support for the continuation of the Highway Trust Fund, but also that (a) a rapid completion of the Interstate Highway System was not a very high priority in many states, (b) greater flexibility in the use of Federal transportation assistance was needed, and (c) a stable, dependable source of Federal mass transit assistance received a strong mandate. This report provides conclusions regarding possible future policy changes in the transportation finance area, and raises some questions that deserve further attention. /UMTA/

43 195057 CAPITAL GRANTS AND RECURRENT SUBSIDIES: A DILEMMA IN AMERICAN TRANSPORTATION POLICY. Transportation policy in America distinguishes between capital expenditures and recurrent operating and maintenance costs. Federal policy and resources encourage capital-intensive projects, but traditionally have left to state and local governments the responsibility for maintaining and operating the facilities built with federal support. This has led to consistent underestimation of operating costs in the decision process leading to capital expenditures, and to overcapitalization of transportation networks. Today, faced with recurrent costs which strain local resources, there is pressure to broaden federal participation in operations and maintenance, and legislation is beginning to weaken the traditional distinctions between capital and recurrent expenditures.

43 196038 FINANCING BAY AREA TRANSIT, POLICY STUDY AND RECOMMENDATIONS. SUMMARY. The Bay Area's transit system is among the nation's most sophisticated and complex. Meeting its future large-scale financing needs will depend not only on concerted and coordinated funding efforts, but also on transit finance policies designed to make the best possible use of transit funds available to the region. Therefore, the Council's policy recommendations focus on the need to combine transit financing efforts with development of a regional transit finance policy designed to coordinate and plan all financial aspects of transit administration and operation. The Council has identified five essential elements of a regional transit finance policy, and has organized its recommendations accordingly. They are: planning for long-term needs, establishing criteria for effective allocations, improving transit productivity and efficiency, encouraging private-sector participation in transit, and expanding financial support for transit. /Author/

43 196040 PUBLIC TRANSPORTATION FINANCE BIBLIOGRAPHY. This bibliography lists books, journal articles, papers and reports dealing with local finance of public transit in nonurbanized areas. Besides material referring to transit finance in general, it lists material referring specifically to air, sea, ground and rail transportation.

Pun, CF Pun, CL ; North Carolina Agricultural and Technical State U, (NC-11-0004) Apr. 1977, n.p.; Prepared as a part of the Local Finance of Public Transit in Non-urbanized Areas Study for the Urban Mass Transportation Administration.

43 196045 FINANCING PUBLIC TRANSIT IN NEW YORK STATE. The problem of how to pay for transit services and who should cover these costs are questions of both equity and economic efficiency. In the framework of today's fiscal environment, it is no longer logical to only consider the direct benefits of transit accruing to users. The secondary benefits received by non-user groups, such as property owners and employers, must also be taken into account to achieve an appropriate allocation of the transit cost burden. This wider view enables broad-based tax sources to be seriously considered. In New York State, such issues may be pivotal in determining the future of transit finance. A workshop was held on September 20-22, 1976 in Albany, New York in an attempt to deal with these very difficult issues. This document summarizes the major points of interest from the many long hours of intense, frequently heated, discussion that occurred during that time. Summaries of the three workshop panels are followed by the four research papers presented at the workshop. /Author/

43 196047 TRANSPORTATION FUNDING: PRIVATE SECTOR VIEWPOINTS--PART 2. This is a report on the second part of a two-part ENO Foundation conference on funding of transportation systems. This second session was concerned with the viewpoints on transportation funding held by the private sector, representing the air, highway, rail, transit, and water modes. The funding needs and sources of funding for each mode were considered.

Traffic Quarterly Apr. 1978, pp 223-262, 3 Fig., 3 Tab. From the Joint Conference ENO Foundation Board of Directors and Board of Consultants, October 26 and 27, 1977.

43 196526 INVESTMENT PLANNING IN LONDON TRANSPORT USING NON-FINANCIAL DECISION CRITERIA PART 1 AND PART 2. This article is in two parts: Part I deals first with the requirements of the investment planning process in a corporate context, and then introduces the background and framework for London Transport's investment planning. Particular attention is given to the derivation of an appropriate corporate objective and decision criterion, the formal adoption of "maximising passenger miles subject to budget constraint" is

explained and justified. Part II deals specifically with the preparation of investment plans in London Transport, and illustrates the use of the "programme approach" by the case of station modernisation. Finally the presentation of the 10 year investment plan is described.

43 196585 FINANCIAL ANALYSIS METHODOLOGY FOR REGIONAL RAPID TRANSIT SYSTEM DEVELOPMENT. ABRIDGMENT. In planning large-scale transportation improvement projects, local, state, and federal governments all insist that a major consideration be the establishment of the financial workability of the proposed project. The financial commitments involved in such projects extend over long periods of time and can potentially impose untenable financial burdens on a community. It is therefore imperative that the financial requirements be identified early in the planning process. This requires an analysis over time of capital costs, operating and maintenance costs, revenues, and funds from local, state, and federal sources. Through such an analysis, the financial impact of various design parameters and policies, such as fare structures and levels, can be identified and evaluated. The computerized financial model described in this paper was developed for the metropolitan Dade County transportation improvement program--stage 1: rapid transit system. The costs presented here are for stage 1 (alternative), a 34.5-km (21.5-mile) conventional rail system. The financial model is being used in planning for the Dade County combined bus-rail transit system. This financial (or cash-flow) model was developed and is being used to assist in the financial analysis of various design parameters and alternatives and in the evaluation of policy decisions. The model provides a yearly analysis of capital-cost and operating-cost expenditures, capital-funding and operating-funding sources, operating revenues, and other funding sources. It also calculates the annual net cash flow and determines the extent of additional funding required. /Author/

43 196587 TRANSPORTATION PROGRAMMING IN TODAY'S RAPIDLY CHANGING FISCAL ENVIRONMENT. Because of decreasing rates of revenue growth, increasing inflation, and growing maintenance and operating costs, revenues for transportation are insufficient to satisfy public expectations. This paper summarizes a discussion of how several states are altering the programming process to meet changing financial conditions. Maryland is emphasizing smaller, less costly highway projects, designing for current rather than future service needs, and planning more projects than can currently be funded.

Texas, on the other hand, has embarked on an \$11.8 billion 20-year highway construction program. Pennsylvania, concerned over abandonment of railroad branch lines, is providing subsidies for commuter rail lines. To allocate limited resources for airport development, Illinois has instituted a systematic project-selection process. At the local level, the New York Metropolitan Transportation Authority is putting heavy reliance on federal-aid funds. Uncertainty in these funds causes a problem in programming. In an effort to hold local subsidies down, capital funds have been used for transit operations. /Author/ Reed, MF, Jr (Highway Users Federation) *Transportation Research Record* No. 680, 1978, pp 20-22; This paper appeared in TRB Research Record No. 680, Transportation Finance and Charges, Programming, and Costs.; ORDER FROM: TRB Publications Off

43 196976 IRCA/UTC CONGRESS. SECTION 1: INVESTMENT POLICY FOR TRANSPORT. ROUTE INVESTMENTS WITHIN THE SCOPE OF THE NATIONAL TRANSPORT POLICY AS ILLUSTRATED IN THE FEDERAL REPUBLIC OF GERMANY. The German Federal Republic has a Coordinated Investment Program for Federal Transport Routes Planning which requires that funding for through and local roads, waterways, local transport agencies and the German Federal Railway be examined simultaneously and in long term with consideration for not only primary benefits but also secondary effects on environment, energy consumption and labor. Competitive distortions between modes that can be reduced or intensified by route investments will also be considered. Effects on DB from implementation of this planning process are discussed.

Hausler, U *Rail International* No. 3, Mar. 1979, pp 223-253, 4 Fig.; Presented at the Twenty-second Session of the IRCA, IRCA/UTC Congress, Stockholm, 7-12 May 1979.; ORDER FROM: ESL

43 197330 SUMMARY OF CAPITAL AND OPERATIONS AND MAINTENANCE COST EXPERIENCE OF AUTOMATED GUIDEWAY TRANSIT SYSTEMS. This report presents, in summary form, the cost data developed from recent assessments of ten Automated Guideway Transit (AGT) systems conducted by the U.S. Department of Transportation, Transportation Systems Center, SRI International, and N. D. Lea and Associates, Inc. The AGT systems discussed are: (1) Morgantown People Mover, Morgantown, West Virginia; (2) AIRTRANS, Dallas-Fort Worth Airport, Texas; (3) JETRAIL, Love Field, Dallas, Texas; (4) Cabinlift, Ziegenhain Hospital, West Germany; (5) Passenger Shuttle, Tampa Airport, Florida; (6) Satellite Transit, Seattle-Tacoma Airport, Washington; (7) Tunnel Train, Houston Airport, Texas; (8) ACT, Fairlane Town Center, Dearborn, Michigan; (9) WEDway People Mover, Disney World, Florida; and (10) UMI Tourister, King's Dominion, Ashland, Virginia. Both Capital and Operations & Maintenance Costs have been examined in the context of each system's operational characteristics. Descriptive information on each system, together with a summary of performance measures, is also included. The report presents unit cost data and cost trends, and discusses the initial phase of an ongoing program to provide useful

information to cities and other public agencies, as well as private organizations considering or planning AGT installations. The report also compares certain cost data for AGT systems with summary cost information for conventional transit modes. However, it is pointed out in the report, that in consideration of the limitations of the data available and the scope of this analysis, these comparisons should be treated with caution.

43 197896 FINANCING URBAN TRANSPORTATION. PART 2. LOCAL STUDIES (A BIBLIOGRAPHY WITH ABSTRACTS). The financing of urban transportation in local areas is documented. Although these studies may be of interest to a number of metropolitan localities, they were originally prepared to study the fiscal planning of transit and travel systems for specific areas. Cities covered include Atlanta, New York City, Washington, D. C., Philadelphia, Houston, Baltimore, San Francisco, Minneapolis, Milwaukee, and many smaller localities. Among the systems involved are rapid transit rail, bus, shared taxicab, dial-a-bus, dial-a-ride, and subway. Some attention is given to metropolitan airports. (This updated bibliography contains 184 abstracts, 8 of which are new entries to the previous edition.)

43 260808 FEDERAL-AID FOR SURFACE TRANSPORTATION IN 1984. In this presentation of an ideal rather than a practical view, Federal aid for surface transportation in 1984 is seen to be set in an environment of a completed Interstate Highway System exclusive of a Federal Highway Trust Fund or Federal taxes on fuel. Simplicity and flexibility will be the basic characteristics of the program. The element of simplicity is the Federal funding for only two program categories, rural and urban, both of national significance. Flexibility is achieved by using federal general funds for both highway and public transportation within a Federal/State relationship allowing each state to administer the Federal transportation program in cooperation with its local governments. Six issues basic to such a program are set forth and discussed. (1) The Interstate Highway program, should be completed as rapidly as possible. (2) The Federal Highway Trust Fund should be abolished and the Federal tax on fuel eliminated. (3) The Federal aid for Highways and Federal aid for public transportation should be merged and funded from Federal general funds. General fund financing will provide congress with greater flexibility in determining national transportation priorities in relation to other national priorities. (4) It is suggested that the program include only 2 categories: rural transportation and urban transportation. (5) Federal funding should provide for meeting transportation needs of national significance only. Needs which may be considered to be of national significance are those which relate to both defense and interstate commerce, and to transportation

research and development. Resources of the national government should also be available in coping with major disasters affecting transportation facilities. A critical examination is urged of present transportation programs to see if they serve national goals. (6) The Federal Transportation Program should provide the administration flexibility to allow each state to develop appropriate state/local relationships.

Datel, RJ (California Department of Transportation) ; Western Association of State Highway & Transp Off June 1974, 14 pp; The report was presented at the Western Association of State Highway Officials meeting in Portland, Oregon on June 6, 1974.

43 261489 LEGAL ASPECTS OF FINANCING TRANSPORTATION: HIGHWAYS, MASS TRANSIT, MOTOR VEHICLE PARKING, RAILWAY AID, AIRPORTS, WATER TRAFFIC AND PORTS. The Senate and House Conference Committee decisions to recognize the interdependence of transportation modes is discussed, and the observation is made that the principle has been recognized by the Federal Government that funds developed from one mode of transportation may be utilized on a local option basis for another mode more suitable for that area. The flexibility of funding sources it is felt, is here to stay. Aspects such as automobile parking, capital costs for new rail systems, mass transit, airport facilities and water traffic are covered.

Zarin, MS *Urban Lawyer* Vol. 6 N Mar. 1974, pp 272-380

43 261518 URBAN TRANSPORT: STUDIES IN ECONOMIC POLICY, CHAPTER 10: SUBSIDIES FOR URBAN TRANSPORT.

This paper, first published in 1971, identifies four main areas of justification for subsidies macro-economic objectives, improving economic efficiency, the intent to benefit a particular section of the community, and finance for innovation. The author concentrates on the second and third of these areas. Studies by Fitch, et al, and Vickery are used to illustrate the need for analysis of propositions for subsidy in cost-benefit terms. The economics of scale suggested by the study of public transport in U.S. cities by Mayer, Kain and Wohl are questioned. Estimates of the gains from the restraint of private car travel suggest that any cost-benefit appraisal of public transport subsidies will be critically affected by congestion levels. Measures of elasticity and cross elasticity of demand for travel by public transport are also needed for these analyses. The way in which subsidies should be negotiated and controlled is discussed for competitive and monopolistic industries. Experience with British Rail suggests that the system of control can at best narrow the unintended consequences of specific grant-aided systems. /TRRL/

43 262345 A STUDY OF ALTERNATIVE MEANS OF FINANCING FUTURE TRANSPORT NEEDS OF THE MILWAUKEE URBAN AREA. An examination is made of sources of revenue for financing future transport needs with an emphasis on the needs of the Milwaukee area. Revenue sources are evaluated on the basis of four criteria: how much revenue is provided by

the source; how well the source encourages people to conserve transportation resources; how equitably the sources allocates burdens; and the extent to which the source provides demand signals for the adjustment of the scale of the transport system. The study concludes that: (1) at the federal level the most effective source of revenue is the funding provision of the Urban Mass Transit Act; (2) at the state level the two most effective revenue sources are increases in the excise tax on gasoline, increases in vehicle registration fees; and (3) at the local level in two most effective sources of revenue are a surcharge on all-day parking and an ad valorem tax on automobiles registered in the Milwaukee urban area. /UMTA/

Tucker, T Schenker, E ; Wisconsin University, Milwaukee, (WI-11-0003) UMTA-WI-11-0003-73-1, Nov. 1973, 56 pp; Grant DOT-UT-254; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-227246/AS

43 262358 EVOLVING FEDERAL ROLE IN TRANSIT PLANNING. Federal support for transit has increased significantly in recent years. Of even greater significance is the growth of the capital grant program, which for the fiscal year ending June 1973, is in excess of \$860 million. In 1972 UMTA issued guidelines intended to spell the criteria by which grant requests are evaluated. Three categories of urban areas are recognized: those with under 250,000 population those with 250,000-1,000,000 and those with more than 1,000,000 population. Transit investments are directed to objectives which relate to mobility for nondrivers, congestion and land use patterns, and environmental conditions. Effort is being made to relate comprehensive regional planning, including transit planning, to those capital projects for which assistance is requested. Major policy and system recommendations, together with supporting technical documentation is expected to emerge from the planning process. The observation is made that the planning process is not comprehensive and that it has been confined, for the most part, to highway planning. The meager influence wielded by elected officials and the lengthiness and costliness of the process is commented on. The background to UMTA's evolving participation in the planning process is reviewed. The important factors in structuring UMTA's study program policies in a comprehensive framework are outlined. Transit planning must be integrated into a region's comprehensive and transportation planning network. Transit planning must be supported on a continuing basis. The importance of cooperative arrangements is emphasized and FHWA and UMTA efforts which encourage cooperation in planning are reviewed.

Premo, JC *Highway Research Record* No. 475, 1973, pp 1-4

43 265208 A STUDY OF URBAN MASS TRANSPORTATION NEEDS AND FINANCING. The report evaluates portions of the 1972 National Transportation Report pertaining to urban mass transportation and addresses specific subjects which include the refinement of urban mass transportation needs and determination of system operating and maintenance cost, the development of a program to accomplish the needs

of each urban area for public mass transportation, the determination and comparison of fare structures of all urban mass transportation systems and their relationships to operating and maintenance costs, and the analysis of the financing capabilities of the Federal, State, and local governments for meeting urban mass transportation needs. Urban mass transportation needs as reported in the state long-range plans are expressed in terms of (1) capital investments from 1972 to 1990, (2) level of service in 1990, (3) projected system ridership in 1990, and (4) annual operating and maintenance costs and operating deficits in 1990. The development of a program to meet the needs is discussed, and the major findings of the analysis of the mid-range implementation programs (the 1980 programs) of the states and urban areas are presented. The planned capital outlay in rail per resident of urbanized areas served by rail is five times as large as the corresponding figure for bus over the period 1972 to 1992. Historical trends in fare structures and levels have been analyzed and the average fare nationwide of 34 cents is projected by the states to remain constant through 1990 in terms of 1971 constant dollars. Current state and local mass transportation financing programs are largely a mixture of direct appropriations from general funds often to provide support for transit system operating deficits; compensation for reduced fare programs; and a limited number of instances of special taxes. Two elements are proposed to meet the estimated financial mid-term (1980) program requirements of states and local governments: (1) on the Federal level, UTAP, and (2) state and local urban transportation financing programs based on farebox revenues and general revenues or specially designated taxes. Actions which could reduce the financial burden are discussed.

43 265209 FEDERAL TRANSIT SUBSIDIES. The experience is studied and reported of the Urban Mass Transportation Assistance Program. The demonstration projects listed in UMTA's Directory of Research, Development and Demonstration Projects are discussed in detail. The legislative background to the program is reviewed and its purpose and statutory authority are examined. In a discussion of research, development and demonstration grants, aspects of the bus program (management and operations bus priority, automatic vehicle monitoring, demand-responsive systems, bus technology, service development and improvement), rail program (management and operations, service improvements, tunneling and environment, technology, and rail car design), new systems program, and technical planning and evaluation are covered. The capital grant program is reviewed in detail (converting existing systems to public ownership; bus program; rail program, new rolling stock, new systems; loan programs). Criteria for investment are considered (new criteria are set forth in a document, "Capital Grants for Urban Mass Transportation: Information for applicants") as

well as estimated investments and technical study grants. Training programs for management personnel are discussed together with the program of grants to colleges and universities for research and education. An evaluation of the overall experience of the Assistance Program states that the program has not been successful. Comments are made on the decline of the transit industry, the financial performance of transit enterprises, the failure to develop viable alternatives to existing transport through the demonstration program and the increase of traffic congestion and pollutant output by rapid transit systems. Proposals which have been made for revision of the financial arrangements are reviewed.

Hilton, GW (California University, Los Angeles) American Enterprise Inst for Public Policy Res June 1974, 117 pp, 8 Tab., Refs.; The Urban Mass Transportation Assistance Program.

43 272059 FINANCING PUBLIC TRANSPORTATION. Programs of the Urban Mass Transportation Administration which have been authorized by legislation as well as actions taken during the session of Congress in 1972 are outlined, and the points at issue in managing UMTA programs are reviewed in a background statement. The principal objectives for UMTA programs that have emerged from consultation study with state and local authorities are stated. These objectives relate to reinvigoration of public transportation to provide service that will attract new riders; the provision of better general service and developing special services to provide greater mobility; and the promotion of transit as a positive force in influencing and supporting desired development patterns in urban areas and in improving environmental conditions. The directions are outlined which are currently being advocated for the capital grant and the research, development and demonstration programs (with respect to the operating subsidy issue) so that some judgements may be formed about how things are being sorted out. To ensure fair distribution of program resources, applications will be grouped by size categories. The existing priority for projects intended to prevent cessation of service will continue. In addition, for cities in the medium and large categories, priority will be given projects designed to effect traffic congestion in conjunction with the FHWA's TOPICS program. The aggressive posture for management of the research and development and demonstration program adopted by UMTA is discussed. The achievement of operational objectives associated with service improvements through an operational subsidy program is described. The relation between UMTA and state agencies is considered in a review of the role of the states.

McMamus, RH (Urban Mass Transportation Administration) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 30-38; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB Publications Off

43 272063 FINANCING PUBLIC TRANSPORTATION (INTRODUCTORY REMARKS). Mechanisms for implementing an operating expense subsidy are needed for the continued existence of urban transit systems.

Issues addressed in the papers presented here (on the subject of financing public transport) involve the question of whether the federal government should also be concerned in the operating expense and how deeply it should be involved. All authors recognize the fact that local governments are in a cost-revenue squeeze but the position is taken (by one) that it would be economically wise that transit financing should compete with all the other local needs. Specific topics discussed in the papers include management postures associated with federal programs and their delivery systems; role of state and local governments in setting standards, funding and administering a subsidy program; effect of subsidies on the bargaining process with labor; deficiencies in present subsidy efforts; interrelation of the service cost and the quantity and quality of the service; and public versus private ownership.

Fisher, RJ (Urban Mass Transportation Administration) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, p 30; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB

43 272077 IMPLEMENTATION OF PUBLIC TRANSPORTATION SYSTEMS. Under the provisions of the acts of 1964 and 1970, UMTA assists in the development of improved urban transportation systems through programs of financial aid for capital grants, research, development and demonstration projects and technical studies. Capital improvement grants are made to public bodies providing up to two-thirds the cost of new transit systems and modernization of existing transit equipment and facilities. Studies, tests, and demonstrations of new ideas, methods, systems and equipment for improved transportation planning are included in research, development and demonstration projects. Technical Studies grants are made to public bodies providing two-thirds of the cost for long-range transportation planning studies, short-range development programs, preliminary engineering activities and special studies. The greatest impact on regional transportation planning has been achieved through the technical studies program. Activities funded under this program are briefly outlined. Inclusions of project planning activities (plan refinement and preliminary engineering) under the UMTA planning program provides a unique opportunity for carrying the program from initial planning through detailed design to implementation. Short-range planning activities provide for the creation of a 5-year transit development program. A 5-year implementation program is outlined which consists of transit improvements (bus and rail) within the urban area and provides for the integration of capital, noncapital, and operational improvements that are consistent with the long-range comprehensive and transportation planning activities. Priority has been given in this program to the creation of a trial program for improved inter modal planning. In keeping with this, UMTA insists on the development of coordinated transportation programs before funds may be provided for long-range transportation activities in the region, UMTA's policy of making single grants to a regional planning agency to cover all long-range transportation activities, is considered of importance in providing the cooperation necessary to achieve meaningful intermodal planning.

43 300357 COST SHARING FOR INTER-MUNICIPAL TRANSIT. The development and testing of a method of dividing transit deficits between several municipalities served by a single, integrated, subsidized system is described. The method was developed for a group of municipalities on the South Shore of Montreal, served by a publicly owned bus commission. The costs of the transit service were analyzed by using a formula which takes account of vehicle hours, vehicle miles and vehicles in service at the peak period. This permitted allocation of costs to each municipality. Fare revenue, other revenues and expenses, and the Provincial subsidy were then incorporated in the formula to determine the contribution of each municipality to the deficit. The contribution per passenger was higher for municipalities with heavier traffic peaks. In tests of the suitability of various formulae in terms of equity and efficiency, it was found that the formula most closely reflecting the true distribution of costs was both most likely to encourage higher efficiency and the most equitable in terms of allocating subsidies to municipalities with the highest average incomes. /Author/

Fortin, G ; Canadian Surface Transportation Administration Summ Rpt. TP 1832, Feb. 1979, 20 p., 5 Tab.

43 300695 COSTS OF RURAL PUBLIC TRANSPORTATION SERVICES. Typical costs for rural transportation operations and the factors that influence such costs are examined. Until now, few hard data have been available for the purpose of describing rural transportation costs. The data used in this research are taken from applications for funding and actual operations performed under Section 147 of the Federal-Aid Highway Act of 1973, the Rural Highway Public Transportation Demonstration Program. The following aspects of rural transportation costs are investigated: (a) general cost ranges and what constitutes average and "good" costs, (b) factors that affect the cost of operations, and (c) the characteristics of the most economical and most expensive hypothetical system designs. /Author/

Burkhardt, JE (Ecosometrics, Incorporated) *Transportation Research Record* No. 696, 1978, pp 27-31, 7 Tab., 12 Ref.; This paper appeared in TRB Record No. 696, Rural Public Transportation.; ORDER FROM: TRB Publications Off

43 300696 NONFEDERAL FUNDS FOR PUBLIC TRANSPORTATION: SPECIAL REFERENCE TO NONURBAN AREAS. From a sample of 25 states, it was observed that only 3 percent of the nonfederal funds for public transportation that serve the general public are expended in nonurban areas. Furthermore, the extent of support for public transportation in rural areas varies widely; the more affluent states are more likely to support programs for the nonurban sectors. Thus, the more wealthy sections are likely to benefit from a federal support

program that requires substantial local contributions. Far more important from a dollar standpoint is the social service agency nonfederal support, which in many rural areas is the only source of funds for transportation, albeit client-oriented mobility. Evidently the need for mobility support for disadvantaged groups is recognized by state and local groups. However, there has been little coordination among social service funds for public transportation by state governments; congressional action to provide stronger incentives for such coordination would be advantageous. /Author/

43 300700 JOINT FUNDING AND DEPRECIATION, ABRIDGMENT. The problem of depreciation and the use of depreciation accounts involving public investments are discussed. Depreciation is typically used by private enterprise as the basis for taking into account two major factors: the capital replacement cost of plant and equipment as a cost of operation, and conversion of this capital cost into an annualized expense that reduces income and in turn lowers the amount of taxable income. The requirement for accounting for depreciation takes a different format in publicly owned transit systems. The use of a depreciation account in transportation operations operating under non-profit or public agency funded projects is also discussed. Federal regulations relating to depreciation, and the FMC 74-4 entitled Cost Principles Applicable to Grants and Contracts with State and Local Governments are discussed. The OMB Circulars A-102 (formerly FMC 74-7) and A-110 which address the issue of cost sharing implied by the practice of transportation coordination are also covered.

43 300716 ENGLAND'S TRANSPORT POLICIES AND PROGRAM SYSTEMS. The responsibility for transportation in England is shared between the central government represented by the Department of Transportation (DTp) and local authorities, primarily the 46 county councils. The DTp is responsible for a number of national transport grants and subsidies, for railways, and for the construction and maintenance of the 10060-km interurban highway

network including most of the motorways. Most other inland transportation programs are the responsibility of the counties. In general, the counties are responsible for policy, coordination, and financial support, while operating agencies provide the services. The responsibilities of the counties are collectively called "local transport" and they come within the transport policies and program (TPP) system. The DTp's main responsibility for local transport lies in the allocation of resources to counties. Much local transport finance comes from the rates or the block grant. The transport supplementary grant (TSG) is an additional grant which is paid by the DTp to counties at the rate of 70% of their proposed marginal expenditure on local transport above a threshold. In order to enable the DTp to decide on TSG borrowing approval, each county submits a comprehensive document called Transport Policies and Programs (TPP). The objectives of this TPP System are listed. Developments within the transport sector which have led to policy making changes are discussed. The planning process in the TPP system is briefly outlined. The way in which the system helps DTp in the allocation of resources is also described.

43 300743 A HYPOTHETICAL CASE: VALUE CAPTURE/JOINT DEVELOPMENT TECHNIQUES TO REDUCE THE PUBLIC COSTS OF PUBLIC IMPROVEMENTS. This article illustrates the use of value capture/joint development techniques by applying them to the hypothetical case of a city of 1,500,000 which must together with certain affected suburban areas and the state, set about devising a method of raising the \$120,000,000 local share of the costs for a proposed fifteen-mile fixed-guideway rapid transit system. Among the considerations addressed are: the choice of government agency to run the system and the legal problems associated with acquiring land for transit stations and leasing to the private sector that portion of the land not needed for current operations.

43 301073 POTENTIAL FOR MULTIMODAL TRANSPORTATION TRUST FUNDS ON THE STATE LEVEL: A RECENT SURVEY. This paper presents the results of a recent study of the feasibility of multimodal transportation trust funds on the state level. Recent experience has shown that the slowdown in the growth of motor fuel tax revenues and rapid inflation in transportation construction and operations have created a serious challenge for states. The multimodal trust fund would provide a method that expands the fiscal base for transportation finance while it increases the flexibility for transportation planners in their short-and long-term decision making. The transportation departments of all 50 states were asked to respond to a survey of their present financial positions and policy stances on both the concept of a multimodal trust fund and a variety of other state and federal proposals for revising transportation financing and planning methods. Based on the 36 responses received at

the time this article was written, the concept of such a trust fund is viewed favorably, but the problems that it might raise and the political battles that such a plan would face make its enactment in most states highly unlikely. The respondents expressed strong support for the continuation of the Highway Trust Fund and noted that (a) rapid completion of the Interstate highway system is not a very high priority in many states and (b) greater flexibility in the use of federal transportation assistance is needed. The respondents gave a strong mandate to the need for a stable, dependable source of federal mass transit assistance. /Author/

Crowell, WH (Polytechnic Institute of New York) *Transportation Research Record* No. 698, 1979, pp 29-34, 4 Tab., 8 Ref.; This paper appeared in TRB Research Record No. 698, Priority Programming, Finance, and Highway Investment Analysis.; ORDER FROM: TRB Publications Off

43 301274 TRANSPORTATION ECONOMIC ANALYSIS. The book is separated into six parts, each part appears a selected set of references pertaining to both classic and recent publications germane to the material in the preceding chapters. The remainder of Part I consists of eight chapters that discuss the economic analysis tools necessary for students as a basis for approaching problems and issues of transportation economics. Too often students either find themselves bored with review sessions on economic theory or discover that their prior training in economics has been inadequate (or both). To help alleviate some of these concerns, Part I is designed to provide an improved foundation for the student with a solid two-semester economic principles background (also including differential calculus). It also presents some new perspectives of the application of economic analyses to transportation for the more advanced student. Part II is a discussion of the major transportation industries in the United States. As indicated in the preface, the emphasis is on the structures of the motor trucking, railroad, and airline industries. The material in this part is intended to provide the reader with a sufficient understanding of the institutional (and particularly contemporary) features of the major transportation industries. Part III focuses on problems of urban transportation economics. No attempt is made in this part to discuss the wide body of material available in the general field of urban transportation. A tremendous amount of research has been conducted in the area of urban transportation, but mostly in the fields of urban and city planning, civil engineering, and regional science. The only attempt in this part is to synthesize the significant contributions that may be classified "urban transportation economics." In Part IV three chapters appear on intercity passenger transportation. Even though private automobile travel constitutes a large number of intercity trips, few data sets exist for examining the characteristics of this important segment of transportation. The emphasis then in this part is on intercity railroad and airline passenger service. In Part V is a series of chapters that discuss selected economic issues in commodity and freight transportation. Due to the general lack of empirical information on urban goods movements, most of the emphasis in this section is on the intercity and regional aspects of freight shipments. With an increasing significance at-

tached to the energy-related features of freight transportation, the material in this part deserves renewed and special attention. The final section of the book, Part VI, contains a set of interdependent analyses of selected topics in transportation economics. The principal intention of this part is to indicate certain areas of transportation in which statistical and econometric methods can be applied.

43 301871 THE CONSERVATION SOCIETY. REVENUE SUPPORT FOR RURAL BUS SERVICES. The author gives the background to rural bus services and the decline in their patronage. The latter is attributed (1) to the 1972 local government act whereby county councils were given the duty to control and develop their local public transport system within the county and (2) to a declining in coverage due to a reduction in the number of local facilities and increasing centralization. According to a survey carried out in two areas of Norfolk in 1975, rural families spend approximately one-third the amount on local bus travel that urban ones do and make one-ninth the number of trips (the average trip length being considerably greater). Mention is made of innovative schemes (minibus, car sharing, post buses, bus clubs). It is suggested that policies should be improved in two respects: more real work should be put into thoroughly understanding and developing rural public transport and there is a need for increasing revenue support for operators. /TRRL/

43 302174 COST-REVENUE SQUEEZE IN AMERICAN PUBLIC TRANSIT. A review is presented of the history of financial difficulties in the transit industry and finds that they are not of recent vintage, nor are they simply attributable to the increasing popularity of the automobile. Case studies of four large transit operators are employed to illustrate recent patterns of cost escalation, effectiveness, and efficiency in public transportation. Broad conclusions are drawn regarding potential areas for improvement in transit subsidy policy.

43 302270 IMPACTS OF TRANSIT SUBSIDIES ON MODAL EFFICIENCY. This research examines the effects of Federal transportation programs on small urban areas. The research analyzed the impacts of financing procedures and constraints on the transportation systems of small urban areas. Examined the effectiveness of public transportation planning, and developed an allocation procedure for state transit assistance programs. A case study methodology was employed. Three cities (small-to-medium sized areas) in the state of Iowa were selected, namely: Cedar Rapids, Davenport, and Iowa City. To investigate the impacts of Federal transit subsidies on transit patronage through effects on fares, a comprehensive comparative

framework was designed that placed transit in context with its primary competition, the automobile. This framework makes an analogy between the urban passenger transportation system and a private enterprise, thus using this analogy to define costs and prices in a consistent manner. Some of the conclusions reported herein are: 1) Elimination of transit subsidies would have a large percentage impact on transit ridership but small impact on total travel, because of the relative dominance of the private auto for passenger transport; 2) Further increases in transit subsidy are likely to have only miniscule impacts on aggregate travel patterns and modal balance; and 3) Elimination of the highway subsidy would result in very large percentage increases in transit usage as well as significant reductions in vehicle miles of auto travel. There is little reason to believe that any other policy will have significant aggregate effects on modal efficiency.

Lee, DB, Jr ; Iowa University, Urban Mass Transportation Administration, (FR 20) Final Rpt. UMTA-IA-11-0001-79-1, Oct. 1978, 105 p.; IA-11-0001 ORDER FROM: NTIS; PB-300416

43 302273 AN ASSESSMENT OF INSTITUTIONAL BARRIERS WHICH PROHIBIT PARTICIPATION AND THE PROJECTED COST ASSISTANCE NECESSARY TO PROVIDE EQUAL OPPORTUNITY TO COMPETITIVE AND NEGOTIATED CONTRACTS IN UMTA FEDERALLY ASSISTED PROJECTS. This report provides an assessment of and recommendations for the removal of barriers to Minority Business Enterprise (MBE) participation in transit construction. Institutional barriers to MBE participation were reviewed in seven cities/sites (Houston, Albuquerque, Cleveland, Chicago, Detroit, Los Angeles, and Pueblo Test Center), and assistance mechanisms were identified and assessed in terms of their effectiveness in providing MBE access to transit construction projects. In addition, the report outlines a goal setting process that UMTA can apply to construction oriented projects. The research effort identified nine overt barriers that all MBEs are confronted with in the day-to-day operation of their businesses, namely: Management Capability; Knowledge of and Aspects of Financing; Access to Industry; Estimating Costs; Marketing Strategy; Access to all Markets/Mobility; Size of Dollar Volume; Access to Bonding; and Procurement Process. Access to the heavy construction industry was perceived as the most crucial barrier by MBEs, majority contractors, assistance mechanisms (Contractor Assistance Organizations), and financial institutions. Data collection techniques included on-site surveys, interviews, inspection tours, printed materials, and follow-up interviews. The author recommends the establishment of a Demonstration MBE Construction Unit as an UMTA-funded assistance mechanism which will have the responsibility of fully utilizing all of the administrative and programmatic tools available within UMTA, to achieve a goal of twelve percent of the transit construction award dollars on an annual basis. 43 302335 INVESTMENT PLANNING AND CHECKS INTO RESULTS FOR SHORT DISTANCE PASSENGER TRAFFIC [Investition-splanung und Erfolgskontrolle im Personennahverkehr]. Since 1970 cost-benefit analyses have been carried out in Federal Germany to ensure that credit granted for transport in local communities is used properly. A standard method is to be used but it has some weak points and the article makes appropriate suggestions as to how to overcome these. Taking the example of the Munich and Stuttgart metropolitan railways, the authors show all the factors that should be taken into account in assessing all indirect costs and benefits. [German]

43 302570 THE SNCB AND INVESTMENTS IN TRANSPORT. A detailed theoretical study, based on recent statistics, is made of the situation in Belgium. Many of the aspects discussed are of a general character and have a wider application. Firstly there is a need for an overall view of transport infrastructure making it possible to assess the capabilities of each transport mode, forecast future demands and estimate the potential for meeting these demands. The infrastructure charges should be allocated to the users of each mode in order to judge their socio-economic benefits, their cost effectiveness and equalise conditions of competition between modes. The author concludes that where large national options are concerned, the final choice of investments are political. Political choices cannot be completely incorporated in cost-benefit studies. However, choice can be improved by classifying projects in degrees of socio-economic utility. It is considered essential that all investment projects are instigated and managed by a single state body. (TRRL)

43 302929 TRANSPORT POLICIES AND PROGRAMME SUBMISSIONS FOR THE 1980/81 TSG SETTLEMENT. This circular describes the arrangements for the Transport Supplementary Grant (TSG) with reference to the government policy for transport since the publication of the white paper (CMMD 6836). Counties, who were given general guidance, formed their own views on the appropriate level of expenditure. Advice is given on the bus and underground programmes, also local British rail services. The use of market analysis to review fares and services is discussed. Bus priorities and staggered working hours are considered. Proposals involving new rail investment require discussions with the railway board and regional offices. Environmental aspects of local roads and traffic

management are discussed. Better facilities should be provided for cyclists wherever possible. Advice is given on policies affecting the operation of car parking facilities. Freight transport is mentioned, emphasising the environmental advantages of rail carriage, and road safety is discussed. An index for the appropriate parts of the earlier circular is included in an annex. /TRRL/

43 303941 FORECASTING EXPERIMENTS FOR RURAL TRANSIT POLICYMAKERS (ABRIDGMENT). The paper addresses problems faced by transit managers and funding agencies. Such problems have been identified through the interaction of state and federal officials and during a review of rural transit systems in northern New England performed during the first part of 1978. Some of the first problems that transit managers face are in the initial application for funding and making plans based on socioeconomic and demographic characteristics of the service area. These problems are further complicated by the urgency with which funding agencies expect to see results in order to decide about funding continuation and budget approval, which ultimately results in system delay. The magnitude of this overall system delay depends on four individual delays, each of which is from four months to one year long. These delays have been identified during work on case studies of rural transit systems in northern New England: vehicle acquisition delay, schedule change delay, subsidy award delay, and ridership information delay. A simulation technique is used in the analysis of the effects of different policies on the development of a rural transit system. Results of policy experiments agree with the observed behavior of rural transit systems in northern New England. The technique is useful primarily as a quick turnaround policy-analysis tool. The technique has potential applications for policy analysis at two levels—the managerial level to help in project planning and operation and the fund allocation level to help in decisions about funding approval, funding allocation, and funding renewal.

43 303947 OPERATING ASSISTANCE FOR PUBLIC TRANSPORT SYSTEMS: A SURVEY OF STATE-LEVEL PROGRAMS. A survey of several state-level programs of operating assistance for public transportation systems was undertaken early in 1978 by the New York State Department of Transportation as part of its annual evaluation of the impact and effectiveness of its statewide aid program. Only three states did not respond, but they were subsequently determined not to have such programs. This paper describes existing programs in terms of eligible operations, local sponsorship, relationship to Urban Mass Transportation Administration funding programs, ability to use funds for capital purposes, sources of program funds, and the

scope of services assisted. Finally, it proposes a more in-depth review of the effectiveness of the programs designed to aid in policy development and implementation at both the state and the federal levels.

43 304766 USAGE OF REVENUE SHARING FOR PUBLIC TRANSPORTATION IN RURAL AREAS. The purpose of the current study is to explore whether rural towns and counties use portions of their revenue sharing monies in support of public transit operations, or other forms of public transportation such as road construction and maintenance in contrast to public transit. This topic is of interest because the current demonstrations of public transportation programs in rural areas are supported principally out of federal demonstration funds of the U.S. Department of Transportation, Federal Highway Administration, and face the possibility of funding termination unless sufficient local financial support is forthcoming. The topic is additionally relevant to discussions of the impact of new legislation making broader federal assistance available to public transportation in nonurbanized areas. The latter funds are dependent upon the availability of local matching funds to undergird federally supported programs.

43 305351 ANALYSIS OF THE ALLOCATION FORMULA FOR FEDERAL MASS TRANSIT SUBSIDIES. The Federal Government grants funds to urban areas to subsidize mass transit operating expenses. These funds are allocated among areas on the basis of a congressionally determined formula. This report devel-

ops criteria by which alternative factors that might be included in such a formula can be evaluated and then evaluates many potential factors according to these criteria. GAO suggests one possible formula that satisfies these criteria reasonably well. GAO also discusses the influence of the structure of the subsidy program on the extent to which transit service is financed through farebox revenues.

43 305765 INNOVATIVE TRANSIT FINANCING. The report describes a number of methods of exploiting development opportunities around transit stations. Twelve techniques are discussed in the report: incentive zoning, special district zoning, dedications and exactions, official maps, dedicated property taxes, tax increment financing, special benefit assessments, service charges, selling or leasing air rights, leasing or selling supplemental property, developing air rights/supplemental property, and participation in property development. The report evaluates these specific financing techniques in terms of revenue yield, institutional feasibility and promise for application to the transit field. The analysis concluded that a combination of these innovative financing techniques could defray from five to fifteen percent of the capital costs associated with fixed guideway facilities. The most promising techniques typically involve joint development, the concept of value capture, and private investment on land around transit facilities.

43 308632 PUBLIC TRANSPORT PLANS (3)-LAYING COSTS 'ON THE LINE'. This article considers the restraints under which local authorities operate in the promotion of local rail passenger services, including the overall control exerted by central government on local authority expenditure. A summary is presented of the investment made by Durham County Council in local rail and bus transport. Reference is made to the difficulties of financing cross-boundary local rail services and the existence of similar inter-regional problems in France is noted. Details are given of the improvements made to the Darlington to Bishop Auckland branch line, particularly to the new station at Newton Aycliffe New Town. Feasibility studies are to be carried out for the restoration of passenger services between Newcastle and Consett and for siting stations along the route. The initial and running costs of such a project are considered. For articles 1, 2 and 4 in this series TRIS Nos 308630-1 & 308633. (TRRL)

43 308843 FINANCING TRANSIT-ALTERNATIVES FOR LOCAL GOVERNMENT. The theme of this book is how to think about transit financing. The most crucial question, at least for the largest cities, is whether to invest in new rail

transit systems, which not only cost unpredictably large amounts but also disrupt communities physically and politically while under construction. A second major consideration, which confronts all cities, is whether transit should be regarded as a consumer good like other utility services--to be paid for primarily by charges--or a public good--to be paid for by taxes. It is concluded that the financial pressures on transit agencies and services can be expected to continue and increase, regardless of the looming energy crisis. The principal resource still available to transit is greater financial and operating efficiency, which entails an increase in the quantity and quality of services rendered with a less than proportionate increase in real costs. Achieving efficiency is quite uncommon largely because transit regulation historically has concentrated on preserving existing schedules and fare structures, and on the overall financial condition of transit properties, rather than on developmental objectives and service improvements. Modern transit management, on the other hand, must continually scrutinize patronage and costs of each segment of transit service with the requirement that each segment justify itself by a favorable ratio of benefits and costs.

43 309026 TRANSIT ASSISTANCE ALLOCATION. Providing public transit operating assistance is a recently acquired function in many states in the United States. Little standardization in disbursement criteria exists, and the criteria used often have serious drawbacks. These drawbacks, both conceptual and practical, are examined and an alternative allocation procedure is suggested which considers large urban, small urban, and rural or regional transit systems separately. Within each of these categories, efficiency and need are balanced in allocating available funds to individual properties. The suggested procedure is applied to data from the state of Iowa, and the potential for its implementation in other states is assessed. (TRRL)

43 309781 FINANCING: SUBSIDISATION OF URBAN PUBLIC TRANSPORT. Details are given of the ECMT Subsidisation Study conducted to investigate the current situation regarding subsidies and concessionary travel arrangements in member countries of ECMT, to compare objectives and practices, and to examine the likely effects of subsidies on the main factors affecting travel. Types of subsidy are classified into 2 categories: capital and operating. An analysis is presented of the objectives of subsidies: creation of a better and safer environment by achieving a modal split more favourable to public transport, creation of a more efficient, less costly and energy-saving solution to urban transport, preservation of existing form of towns, best use of existing public transport and services, maintenance of a viable public transport service for all

users, fulfilment of specific transport needs, prevention of a sense of "unfairness" felt by captive users. One part of the report is concerned mainly with how subsidies are raised and trends in subsidies. The remainder deals with the relation between subsidies and costs, fares, services, patronage and subsidy, trends in productivity, method of investigating the effect of subsidy, effect of subsidy on fares, service and patronage, effect of subsidy on productivity (e.g. indices of cost, effect on wages, indices of output per employee, (size of labour force). 43 312260 EFFECTS OF FEDERAL TRANSPORTATION FUNDING POLICIES AND STRUCTURES: OVERVIEW. Several recent policy developments in highways, airports and transit were analyzed in this study of the effects of federal funding policies and structures on transportation investment. Six discrete transportation analyses (Mass transit; highway matching requirement and funding levels, preliminary model; statistical analysis of the impact of federal highway and on state allocation decisions; Appalachian Development Highway System; Analysis of State highway projects by federal aid system and type of work; airport development aid program) were performed and the resulting conclusions were used to suggest basic principles which were investigated through interviews. This overview report sets forth the implications of manipulations of matching ratios, allocation mechanisms, and categorical restrictions in federal aid programs. Recommendations regarding the specification of these funding structures are cast as a function of funding intent. The four intent categories used are: compelling national interest; regional development; aim of motivating the recipient to expand more of his own funds on the program; and provision of financial relief on this program to the recipient. This overview paper also reports on interviews with transportation professionals. The perceived effects of the 1978 Surface Transportation Act as regards funding parameters are noted and recommendations are made.

43 312262 FARE BOX AND PUBLIC REVENUE: HOW TO FINANCE PUBLIC TRANSPORTATION. To be effective, governmental funds for public transit services must be based on

sound approaches for providing and distributing subsidies. This report provides a review of the impacts of current capital and operating grants programs. Recommendations are made for a combination of provider-side subsidies and user-side subsidies. This funding option would emphasize the strengths of both subsidies, that is, funding to transportation providers as well as direct assistance to individual users who are able to choose among competing providers. Based on rider surveys in four Texas cities, a reassessment of fare reductions for specific population segments is warranted, with fare subsidies geared more specifically to local opinion and local population characteristics. A differential fare structure was found to be acceptable to current transit patrons, based on market segments, type of transit service, and other features. These options for a discriminatory fare structure suggest that minor fare alternations would prove beneficial to local systems.

43 313229 ALLOCATING FUNDS UNDER THE CALIFORNIA TRANSPORTATION DEVELOPMENT ACT. The Transportation Development Act (TDA) establishes a local transportation fund from sales tax money returned to the county of source. The fund is controlled by the designating Regional Transportation Planning Agency (RTPA) which determines the accounts for 'off the top' expenses as well as amounts designated for public transportation service. This report deals with an analysis of the fund distribution process under the California TDA. The report discusses an analysis of the fund flow process to the Regional Transportation Planning Agencies (RTPAs), lists the State suballocation requirements in greater detail, and a survey report on regional suballocation of TDA monies to transit properties concludes the study. The purpose of this study is to show how transit money is distributed in California particularly as related to transit performance, what was intended by the legislation, and what were some of the results to date.

43 314395 A MODEL FOR MEASURING THE IMPACT OF SUBSIDIES ON MASS TRANSIT EFFICIENCY. The paper develops a theory for the relationship between subsidy and efficiency in mass transportation. Wage per vehicle hour is used as a representative efficiency measure. A theory for the evolution of efficiency levels in transit organizations is developed, and the theory is used to identify the differences in efficiency that could occur between systems identical in every way except for the proportions of their revenues which come from fares and subsidies.

Nebraska University, Omaha, Urban Mass Transportation Administration Spec Rpt. UMTA-NE-11-0002-S, May 1980, 20p; Prepared in cooperation with Indiana Univ. Northwest, Gary.; Grant DOT-UMTA-NE-11-0002; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-189277

43 314435 EXECUTIVE REPORT: MEASURING THE INFLUENCE OF SUBSIDIES ON TRANSIT EFFICIENCY AND EFFECTIVENESS. The research is devoted to model development and data analysis in an effort to identify relationships between subsidies and transit performance. The theory underlying the determinants of the relationships is developed, and a justification is presented for the efficiency and effectiveness indicators to be tested. Each indicator, serving as the dependent variable, is regressed on relevant control variables, and on subsidies classified by source, use and control. For the sample of 55 observations from 1975-76, current levels of subsidies have increased riders per capita by 93 percent and expenses per vehicle hour by 9 percent over what they would have been if no subsidies had been provided. Subsidies have minor and generally insignificant effects on the six efficiency indicators, but state and local operating subsidies have significantly favorable impacts on the one effectiveness measure, riders per capita, resulting in increases of one to five riders for each dollar of subsidy.

43 314661 MASS TRANSIT FINANCING ALTERNATIVES (ELEMENT 6). In order to quantify the benefits of public transit to non-users in the Manhattan Central Business District, several scenarios were developed. In one scenario where the CBD was entirely dependent on vehicle entries, the density of the CBD was limited to 20 percent of the present level. Therefore, 80 percent of the current business activity and tax revenues in the area could be ascribed to the public transit system. In the second scenarios, 10 percent shift of the current subway and bus commuters to automobile use occurred. This caused street and river crossings to be filled to near capacity during rush hours. Employing this assumption, it is possible to observe the impact of the public transit system on an entire class of street users (e.g. cabs, motorists, truckers) with regard to increased travel time, travel cost and fuel consumption and pedestrians and other street users with regard to air pollution. The third scenario analyzed the adverse effects on the metropolitan New York area (e.g. increased fuel consumption, higher accidents rate) caused by the dispersion of the Manhattan CBD assumed in the first scenario. The information generated by these scenarios tend to support the contention that general revenue subsidies should be utilized to support public transit.

43 316579 INNOVATIVE FINANCING TECHNIQUES: A CATALOG AND ANNOTATED BIBLIOGRAPHY. This detailed research report and catalog reviews innovative financing techniques for transit improvements, and estimates the financing potential of these approaches. The majority of the techniques covered entail the concepts of joint development and value capture, and are therefore of most relevance when dealing with fixed guideway systems such as light rail, rapid rail, people movers, or personal rapid transit. The report found the most promising techniques to be tax techniques (dedicated property taxes, tax increment financing, and special benefit assessment), lease or sale of air rights, and incentive zoning in areas served by transit. Such approaches could cover from five to fifteen percent of the costs of transit improvements.

43 316666 FINANCING URBAN MASS TRANSPORTATION SYSTEMS: A STUDY OF ALTERNATIVE METHODS TO ALLOCATE OPERATING DEFICITS. This study examines allocation procedures to apportion transit operating deficits among user communities. These allocations were formulated in terms of allocation plans that incorporate factors to identify, accumulate, and distribute costs to a final cost objective. For urban transit systems such a plan combines an allocation performed within the system for cost determination purposes with an allocation that assigns deficit amounts to parties external to the system. External deficit allocations consist only of an allocation base; internal allocations consist of a cost hierarchy, an accounting technique, and an allocation base. An experimental environment is created to apply alternative allocation methods under identical operating conditions by using a computer model to simulate a transit system. Deficit amounts assigned to each community served are then examined to determine the effects of alternative allocation plans for the computation and distribution of transit system operating deficits. An analysis that focuses on the amounts allocated to individual communities shows that a high degree of variation is produced by alternative plans for allocating a transit operating deficit. Another analysis, which views each allocation plan as a single variable, reveals that plans that employ only an external deficit allocation and plans that use a systemwide average operating cost produce results distinctly different from plans that do not employ such procedures. 43 318093 FINANCING URBAN TRANSPORTATION: GENERAL STUDIES. 1970-MARCH, 1980 (CITATIONS FROM THE NTIS DATA BASE). Financing methods are presented to show the various ways in which

urban transportation systems can be supported by communities, metropolitan areas, and regions. Systems such as bus lines, subways, rapid rail, and taxis are discussed, as well as dial-a-ride operations and transit for the elderly. Some attention is given to urban airports, fare structures, and ridership. A few case studies are reported for specific cities if they would be of general interest to other areas.

43 318094 FINANCING URBAN TRANSPORTATION: LOCAL STUDIES. 1970-MARCH, 1980 (CITATIONS FROM THE NTIS DATA BASE). The financing of urban transportation in local areas is documented. Although these studies may be of interest to a number of metropolitan localities, they were originally prepared to study the fiscal planning of transit and travel systems for specific areas. Cities covered include Atlanta, New York City, Washington, D.C., Philadelphia, Houston, Baltimore, San Francisco, Minneapolis, Milwaukee, and many smaller localities. Among the systems involved are rapid transit rail, bus, shared taxicab, dial-a-bus, dial-a-ride, and subway. Some attention is given to metropolitan airports. (This updated bibliography contains 190 abstracts, 6 of which are new entries to the previous edition.)

43 318183 SELF-SUSTAINING PUBLIC TRANSPORTATION SERVICES. VOLUME II. TECHNICAL REPORT. The study examines three systems of urban transportation services which are self-sustaining (cover at least operating costs from the farebox). The three systems selected for the study are: (1) the Philadelphia-Lindenwold Hi-Speed Line, a rail rapid transit line operated by the Port Authority Transit Corporation (PATCO); (2) the express bus services in the City of New York, with routes operated by both the Metropolitan Transit Authority as well as private bus companies; and (3) the suburban railroad service in the Chicago metropolitan area of the Chicago and Northwestern Transportation Company (formerly C&NW Railway). These services are characterized by high fares; high service quality including a high probability of obtaining a seat and attention to consumer comfort and safety; travel times comparable to those on alternative modes, including the private car; service between residential areas and CBDs; market areas composed primarily of middle-to upper-income inhabitants; and costs not necessarily lower than comparable service by other operators. All three, until recently, have covered at least operating costs from the farebox. That two of them no longer do so is attributable to explicit policy decisions, and not to a failure in the viability of the service. The research concludes that although self-sustaining services are clearly appropriate only for certain markets, within those markets they have potential as a means of relieving the increasing scale of transit deficits.

43 318428 EFFECTS OF FEDERAL TRANSPORTATION FUNDING POLICIES AND STRUCTURES. FINAL REPORT (APPENDIX A THROUGH F). The study focuses on the effects of Federal funding policies and structures of transportation investment. Several recent policy developments in highways, airports, and transit were analyzed toward this end. Procedurally, the work progressed by performing six discrete transportation analyses and then drawing together insights gained from these to suggest basic funding principles. These principles are then investigated through interviews on the 1978 Surface Transportation Act with 21 transportation professionals.

43 319560 SUBSIDISATION OF URBAN PUBLIC TRANSPORT. Because of the general trend of increasing costs of public transport operation and higher subsidies (in some cases accompanied by falling patronage) the ECMT initiated a study of subsidisation and sought the help of TRRL. The study, which involved 18 countries, was concerned with the aims of subsidy, the sources and conditions attached to subsidy, trends in subsidies and the effect of subsidies on patronage, fares, service levels, costs and productivity. The qualitative information concerning the aims of subsidy was analysed in relation to the likelihood of achieving such aims, with particular reference to current experience of attempts to switch car drivers to public transport. The quantitative information on trends referred to the countries as a whole and covered the period 1965 to 1977; these data were supplemented by data from 59 cities in 7 countries collected in the

course of a TRRL sponsored study of travel demand factors. The relationships between patronage and fares and service levels, and between subsidies and various operating factors, including costs and productivity, were studied using regression analysis and the general conclusion reached was that although the major part of the subsidy paid was reflected in reduced fares and improved service levels there may well have been some leakage into higher unit costs and manning levels.(a) (TRRL)

43 32276 THE FINANCING OF MULTIJURISDICTIONAL PUBLIC TRANSPORTATION SERVICES. This study summarizes the means of providing non-federal support for public transportation in eight cities where more than one political jurisdiction is in the service area of the public transportation system. The cities studied are: Albany, New York; Gary, Indiana (and the Northern Indiana Commuter Transportation District); Miami, Florida; Norfolk, Virginia; Sacramento, California; Seattle, Washington; St. Louis, Missouri; and Washington, D.C. The report shows the extent to which funding sources are earmarked, the basis for cost-allocation formulas, the sources of public subsidies, the trends in operating deficits, and the problems inherent in welding several independent political jurisdictions into one financing arrangement. Solutions varied from consolidating taxing authority into one unit of government (as the case of Dade County) to setting a price and allowing jurisdictions to buy the level of service each wants, (as in the case of Norfolk where costs of service to each jurisdiction are determined after netting out revenues). Other solutions included earmarking of already collected state taxes, of basing relative contributions on relative assessments, and pure legislative fiat in allocation of local shares. Deficits appeared to grow faster in systems with earmarked revenue sources, and all systems tended to look to higher levels of government for support. (UMTA)

43 324312 MOBILITY FOR AMERICANS IN AN ERA OF INCREASING ENERGY, ENVIRONMENTAL AND FINANCIAL CONSTRAINTS. This publication is a transcript of six hearings composed of testimony from various federal, state, and local transit officials as well as members of universities and the private sector. Among those who testified were top level representatives from U.S. Department of Energy, American Public Transit Association, National League of Cities, National Association of Counties, Atlanta Metropolitan Rapid Transit Authority, Los Angeles County Transit Commission, California Department of Transportation, German Marshall Fund, University of Tennessee, and First National Bank of Seattle. The major themes apparent in the various testimonies included: coordination among the various levels of governments for formulation and implementation of consistent transit policies, public transportation for rural areas, public transit for elderly and handicapped, urban transportation planning, levels of transit service, ways to increase transit ridership, ridesharing, application of computers for commuter services, energy conservation, and emission controls to satisfy Clean Air Act Standards.

43 326271 AN EXAMINATION OF THE TRANSIT FUNDING PROCESS AT THE LOCAL LEVEL. The study examines the transit funding process at the local level during the period of public ownership. In particular, the study focuses on what the recent injection of public funds has bought and on those features of the local decision making process which have led to the particular uses chosen for the funds. The study is organized around five types of decisions which encompass the key choices made in most localities since the time of public takeover. These are: (1) the decision to assume public operation and subsidization of the transit system; (2) decisions about the uses of federal capital assistance grants; (3) decisions about the use of formula funds from higher levels of government for capital and operating assistance; (4) decisions about the appropriate response to growing demands for attention to the special transportation needs of the elderly and handicapped; and (5) decisions about the appropriate response to the growing fiscal austerity of the late 1970s. The study findings are based on case studies in nine metropolitan areas. The study cities were selected to include a wide range of sizes, population densities and growth rates, mode splits for the journey to work, durations of transit deficits, and local government expenditures per capita.

Womack, JP Altshuler, AA ; Massachusetts Institute of Technology, Urban Mass Transportation Administration, (UMTA-MA-11-0030) Final Rpt. UMTA-MA-11-0030-80-1, May 1979, 70p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-226954

43 330625 SOARING TRANSIT SUBSIDIES MUST BE CONTROLLED. Demand for transit operating subsidies is approaching crisis proportions. Transit systems received \$2.2 billion in Federal, State, and local government operating subsidies in 1978—the latest actual figure available. By 1985 more than \$6 billion per year may be needed. This report tells why the demand for transit operating subsidies is growing, what can be done to control subsidy growth, and what improvements are needed in the Federal transit operating assistance program. Transit systems must control costs and increase productivity if their subsidies are to be kept within acceptable limits. Transit systems must also adopt more realistic, efficient, and equitable fare policies. The Urban Mass Transportation Administration, which administers the Federal program, should help transit systems achieve these goals and should improve its administration of the Federal operating assistance program. 44 046700 QUO VADIS, ASCE. Through a congressional testimony of its representatives, the ASCE officially took the position that transit improvements should be financed from the Highway Trust Fund only if they are "highway-related", while other modes should be excluded. This "hardware" rather than functional approach to different transportation modes is obsolete and obviously contrary to the current needs of our cities. Better financing of new transit systems and modernization tax, which ASCE did not even consider. Promulgating a of the existing highways and transit facilities can be achieved through virtually negligible increase in gasoline tax, which ASCE did not even consider. Promulgating a policy so severely and widely criticized will not help us in our serious efforts to attract young people to Transportation Engineering. It is time that ASCE reexamine its policies and coordinate them with the needs of our car society.

44 050075 THE LEGISLATION OF BALANCE. This paper explores various avenues of legislation that can be effective in rebalancing the nation's transportation modes, especially between Mass Transit and highway construction. The federal government is in a position to rebalance these modes by agreeing to pay the same 90% of mass transit projects as is paid for interstate highway construction, by exempting mass transit projects from elaborate comprehensive planning requirements, particularly with regard to replacement of capital equipment, when such extensive processes are not required for highway construction and to release mass transit funds which the Congress has appropriated but which are now held by executive impoundment. Local governing bodies should be given the right to decide which local transportation projects should be given priority with regard to allocation of the Highway Trust Fund. Historical background information and current transportation policy information are included.

44 057533 RESEARCH NOTE: ANALYSIS AND DEMAND IMPLICATIONS OF THE RAPID TRANSIT VOTE IN ATLANTA. In November 1971 the voters of two metropolitan Atlanta counties agreed to build a rail based rapid transit system, to levy an incremental one cent sales tax to defray the operating costs of the system, and to impose a 15, fare on all public rapid transit modes for the next 8 years. Some questions are raised concerning the demand conditions facing the future rail transit system. The purpose of this paper is to analyze the "Yes" vote in Fulton County and from the analysis suggest some marketing problems that rapid rail transit is likely to face.

44 072732 TECHNICAL ANALYSIS AND POLITICAL ACTIONS. It has become unnecessary to guess about the prospects for private enterprise funds to support transit. It is uncertain for most cities to know how much and what kind of public funds are going to be available from federal sources. Transit planning has often shifted from a long-term approach to a much more short-range orientation. The author notes that increased transit funds will need to be an act of faith, or at least a feeling that the near total automobile reliance of the past needs to be changed. Transit professionals will need to work with citizen and political leaders, steering them toward acceptance of funding that can assure local mobility without overwhelming dependence on the automobile.

44 080248 POLICING INTER-COMMUNITY MASS TRANSIT SYSTEMS: PROPOSED LEGISLATION FOR CHICAGO WITH A CONSIDERATION OF OTHER CITIES. The purpose of the report is to present model legislation that will require inter-community mass transit systems to be responsible for the safety of their passengers while using transit facilities. An effort is made to show why this legislation is necessary and how it is a solution to the present problem of high crime and low passenger safety on selected mass transit systems. In metropolitan Chicago, Illinois, as a selected example, the recent history is given (1967-1972) of the rise in transit crime and the apparent police response. The effects of the present multi-community policing are stated and explained. Some brief concluding remarks are presented.

44 080939 FOUNDATIONS FOR MASS TRANSIT PROGRAM DEVELOPMENT IN THE TAMPA BAY REGION. MANAGEMENT REPORT. Report is part of a work effort being performed for the "Coordinated Support Services" program of the Tampa Bay Regional Planning Council (TBROC) to the Tampa Bay Area Rapid Transit Authority (TBART) in Florida. Report reviews recent efforts of TBRPC to establish the Authority. Chart. I, "Organizing for Transit Development," covers steps taken by the Planning Council and TBART to establish the Authority and reviews issues related to securing the required local commitments to undertake a transit development planning project. Chapt. II describes the nature and source of existing State and Federal grant programs to financially support planning and preliminary engineering efforts of the Authority, and alternative sources of long-term local financial resources necessary to support system construction, operation and maintenance. The chapter on "TBART Pre-Referendum Intergovernmental Relations Program" addresses itself to the procedural requirements necessary in the planning process to secure approval of the adopted TBART system concepts by units of local government, the State of Florida, and UMTA. Chapt. IV reviews the organizational structure and staffing pattern of transit agencies similar to TBART in legal and transit development status, recommends on organizational framework and accompanying pre-referendum staffing pattern and estimates financial resources required to support the Authority in the pre-referendum period. Chapt. V deals with issues confronting the Authority as it moves from system design efforts to construction and operation of a proposed transit system. /UMTA/

44 080943 THE ROLES OF GOVERNMENT IN TRANSPORTATION PLANNING. Primary responsibility for transportation planning has moved from private industry to government. This shift has occurred as a result of growing awareness of the interdependence of transporta-

tion planning with all other aspects of the urban planning process. Decisions are no longer based solely on the economic advantage of the operator, but now are governed primarily by community-established acceptance criteria covering a wide range of social, economic, environmental and service impacts. The paper presents a discussion of governmental responsibility and strategy options, which may help to clarify some of the complex issues which face all levels of government as these new roles evolve.

44 082827 URBAN MASS TRANSPORTATION: A DOZEN YEARS OF FEDERAL POLICY. This book begins with a review of the development of federal policy in urban mass transportation and goes on to discuss some of the pros and cons regarding transit. There is a brief examination of the transit industry and the federal agency responsible for the execution of the national government's transit policy. A few chapters follow devoted to some of the findings, successes, and failures of federal policy. There are some suggestions for long-run and short-run policy and procedural changes that might lead to improvement in urban mass transportation. Among the innovations that the author proposes are a massive information and community relations program and a new emphasis on marketing--finding out specifically what people want in mass transit and then tailoring the product to fit these needs.

44 084214 CAPACITY UTILIZATION UNDER ALTERNATIVE REGULATORY RESTRAINTS: AN ANALYSIS OF TAXI MARKETS. Both the Averch-Johnson (A-J) model and the Chamberlin model fail to consider the value of excess capacity to consumers. Service industries, whether they are regulated or not, will usually have excess capacity in the Chamberlinian sense because this capacity conserves time for consumers. This paper examines a model of the taxi industry where allowance is made for capacity to affect the value or quality of the service through its effect on waiting time. The central issue is to determine equilibrium output, capacity, and the utilization of capacity when the market is organized as a franchised monopoly, through a medallion system, and when there is free entry, and to exhibit the relationship among these variables and prices, cost of capacity and output, and policies of the regulator. It is found that many of the characteristics of taxi markets that would appear to confirm the monopolistic-competition thesis arise because of the nature of regulation of these markets.

De Vany, AS *Journal of Political Economy* Vol. 83 No. 1, Feb. 1975, pp 83-94

44 084379 THE IMPACT OF TRANSIT SUBSIDY ON THE TAXI INDUSTRY. Evidence and arguments are presented concerning the existence and nature of an urban transportation problem of national scope, namely, the

taxi-transit competition. The background to the problem and the current situation are examined, and it is suggested that large-scale federal provision of capital for urban public transit systems has a detrimental impact on taxi operations in urban areas. The role of taxis in the urban transport system is significant in terms of numbers of passengers carried and revenue generated. Data examined that equipment grants for more than 100 buses have a detrimental effect on taxi operations. Possible solutions to the taxicab situation fall into five categories: technological improvements; regulatory legislation; financial assistance; legal action; and mergers of taxi companies.

Black, WR (Indiana University, Bloomington) *Traffic Quarterly* Vol. 28 No. 4, Oct. 1974, pp 619-633, 2 Fig., 2 Tab., 17 Ref.

44 084995 TRANSPORTATION FRAMEWORKS FOR THE CRITICAL DECISIONS TRANSPORTATION PLAN. To aid in focusing on those areas which need close evaluation (in arriving at the Critical Decisions Transportation Plan) the Southern California Association of Governments (SCAG) developed five alternative frameworks for the region, each of which supposes a different level of capital investment, and against which subregional proposals may be measured for consistency with an overall regional plan. The five frameworks are: status quo; minimal investment in transit; low capital investment in transit; high capital investment in transit; and investment in advanced technology. Each of the frameworks articulates the possible components of one 1990 air and ground transportation system, as well as implying a range of policy options. A report is also presented which contains the recommendations of SCAG for public transit development in the region and the technical documents supporting the recommendations. The recommendations were developed (using the adopted Critical Decisions Plan) as the basis for the transit element of the Regional Transit Plan.

Southern California Association of Governments 1974, 155 pp, Figs., Tabs., Refs., 3 App.

44 094125 SELLING RAPID TRANSIT TO THE VOTERS, THE LOS ANGELES EXPERIENCE. In 1968, an attempt was made to sell a sales tax and bond issue proposal to the voters of Los Angeles, California, for an 89 mile rapid transit system (Proposition A). The attempt failed to reach the required voter approval of 60% and even failed to achieve a simple majority. This report is an examination of that effort to learn what can be gained from the experience. The report includes a brief history of the various groups that preceded the final citizens group which undertook the promotion on behalf of the proposition. The report focuses on efforts to publicize the issue including actual sales techniques, the raising of funds, the separate roles of the transit district and citizen group, the opposition encountered, efforts to counteract specific opposition, and some retrospective insights as to why the issue ultimately lost at the ballot.

44 095362 FOUNDATIONS FOR MASS TRANSIT PROGRAM DEVELOPMENT IN THE TAMPA BAY REGION: MANAGEMENT REPORT. This report reviews efforts of the TBRPC to establish the Authority. It examines issues related to securing required local commitments to undertake transit development planning projects, financial support, preliminary engineering efforts, organizational framework and other related topics.

Research Group, Incorporated FL-09-0010, Dec. 1973; Prepared for Tampa Bay Regional Planning Council (TBRPC) in support of Tampa Bay Area Rapid Transit Authority (TBART) Abstract in UMTA Abstracts, Feb/March 1975, p. 3.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB 238-115/AS

44 095978 METROPOLITAN TRANSPORTATION IN AN AGE OF SUBSTATE REGIONALISM. The substate regional-level-that level below the states but above the cities and frequently the counties-is discussed as it relates to implementation of metropolitan transportation planning. The status of substate regional development is discussed, and the advantages of this reorganization are given. ACIR developed an umbrella multijurisdictional organization strategy, which is recommended as one means of reorganizing jurisdictions at the substate level. The role of the metropolitan transportation planner is related to the development of these substate regions.

44 096985 TRANSPORT ORGANIZATION IN A GREAT CITY. THE CASE OF LONDON. This study opens with an account of the growth of the transport infrastructure of London and of the institutions controlling the operation and development of that infrastructure. The present powers and roles of the main statutory bodies are discussed. There follows fifteen case studies concerning a wide variety of projects such as new underground lines, changes in the rail approaches from the south-east, bus priority schemes and the Heathrow link. These examine the formulation of schemes, their appraisal, problems encountered and action taken. This leads to a discussion of the problems of London's transport which contrasts the wishes and aspirations of the public with the choices open to decision-makers. A number of policy options are discussed ranging from the short-term, such as fixing fares, to the long-term where attention is paid to land-use planning. The performance of the present institutional arrangement is evaluated, illustrating the difficulties of decision-making and action, given the number of interested parties. Various changes are suggested such as grant alterations, the transfer of control of over trunk roads and British rail to the GLC and improved transport planning with greater public participation and more co-ordination in decision-making. /TRRL/

44 098884 LEGAL OBSTACLES TO THE USE OF TEXAS SCHOOL BUSES FOR PUBLIC TRANSPORTATION. The legal obstacles to the use of school buses for public transportation are created by three types of legal regulation (the implications of which are detailed in appendices) relating to the Texas education code, certification, and safety standards. Two courses of action are suggested for dealing with the core of the problem, namely, the education code which prohibits "unauthorized use" of school buses. Governmental units which possess the power to certify public transportation authorities are reviewed, and federal, state and local safety standards required of such vehicles are discussed.

Means, R Briggs, R Nelson, JE Thiemann, AJ ; Texas University, Austin, Department of Transportation No. 19, Jan. 1975, 24 pp, 3 Ref., 2 App.

44 099243 WORKSHOP 2: THE LOCAL POLICY-MAKER'S ROLE. The purpose of Workshop 2, which viewed the evaluation of urban public transportation from the local policy-maker's perspective, was to explore the following three research areas: (1) examination of organization forms to deliver adequate public transportation services; (2) determination of the current market for public transportation services and evaluation of existing services to ensure that services provided are in step with demands for service; and (3) review of the method of financing transit services that are needed or felt to be needed to meet community goals and objectives. This report of the proceedings of Workshop 2 identified the following research projects as being necessary for an adequate evaluation of urban public transportation: (1) financing of transit service to meet community goals and objectives; (2) examination of alternative organization forms for delivery of public transportation services; (3) use of marketing techniques to evaluate transit services; and (4) relation of transit service attributes and consumer preferences.

Echols, JC (Tidewater Transportation Commission) *Transportation Research Board Special Reports* No. 155, 1975, p 39; ORDER FROM: TRB Publications Off, Orig. PC

44 125386 TRANSPORTATION AT THE CROSSROADS. Present day transportation planners realize that along with implementing new policies, a corresponding shift in public attitudes and travel patterns must be effected as well. Accustomed emphasis on highway and air travel must be redirected toward more mass transit alternatives, including dial-a-rides, mono-rails, and people movers. The nearly completed interstate highway system brings home the message that funds previously earmarked for highway construction must be channeled into multimodal transportation planning. Society needs to take a hard look at itself and restructure its lifestyle according to the natural resources available. More rapid transit systems like BART do not seem to be the answer since the operating costs can never be balanced by fares. The ordinary, average income commuter cannot afford to use BART on a regular basis. In order to deal with the growing immediacy of these considerations, 27 states have now expanded their highway

departments into Departments of Transportation, giving attention to all modes of transport. More state aid for the promotion of air transportation in particular is being called for. As a result of this expansion in state transportation departments, the problem has arisen of placing competent personnel whose focus hitherto has been on highways. Talented people can be retrained for positions in mass transit, of course, and this can prove to be an economic benefit as well. Transportation organizations and policies have definitely shifted to encompass new technologies and orientations; it now remains to be seen if these developments can keep abreast of the current crises in the country that are rapidly necessitating change.

Wood, N *State Government Administration* Vol. 10 No. 5, July 1975, pp 14-18, Figs., Photos.

44 126192 POLITICAL AND PUBLIC POLICY ISSUES RELATED TO DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 2. The paper focuses on UMTA's view relating to the potential of paratransit or demand-responsive transportation (DRT), and discusses some of the policy implications. The future of community paratransit service, characterized by the flexible routing and scheduling of small vehicles to provide shared-occupancy, door-to-door, personalized transportation service within smaller communities and suburban neighborhoods is virtually assured. However, the biggest scope for the future expansion of paratransit lies in its becoming an element of integrated metropolitan transportation systems. An effective urban transportation system, one that will provide a high level of service at the least cost, requires a mix of vehicles, service levels, and operating regimens, tailored to the different demand conditions, widening densities, and travel patterns prevailing in particular corridors and subareas of the metropolitan region. UMTA will encourage applicants to be more mindful of the immediate and near-term transportation needs of metropolitan areas. UMTA will also want to know to what extent long-range transportation plans can be implemented in a more time-phased, incremental fashion. Examples of potential new paratransit applications are listed, and quoted as examples of the ways in which paratransit could complement (not compete with) existing transportation services. UMTA would like to know whether prearranged feeder service to line-haul commuter buses and trains could be provided by private operators at a cost that commuters could afford. It is emphasized that single-mode transportation systems, be it paratransit, rail, or freeway systems, cannot offer a solution to all transportation problems.

Orski, K (Urban Mass Transportation Administration) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 162-165

Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

44 126193 POLITICAL AND PUBLIC POLICY ISSUES RELATED TO DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 3. The UMTA Service and Methods Demonstration Program is described, the purpose of which is to bring about the imaginative use of traffic management and marketing techniques, pricing, service variations, and technology to attain clearly defined objectives. The objectives selected for program planning purposes are listed: reduce travel time for transit uses; increase coverage of transit service; improve reliability of service; improve transit vehicle system productivity; improve service for the elderly and handicapped; increase convenience of using transit; and reduce congestion. The question was also addressed: should it actively induce change and diffuse innovation or build a knowledge base and be more passive with respect to a change-agent role? To implement the change-agent role, a category of demonstrations termed "exemplary demonstrations" are being established. An experimental demonstration category which will help expand the knowledge base will use a part of the resource for analytical studies (e.g. attitudinal surveys may be conducted). UMTA will put together the project designs and assume responsibility and the full cost for evaluations for both types (exemplary and experimental) of demonstrations. The above described resource employed in conjunction with other UMTA programs will make possible the following: the identification of vanguard practices for emulation and diffusion of best practices through a change-agent role by collaterally using planning assistance program as a resource to help a much larger number of cities evaluate promising new ideas; development of services standards and determinations of costs to meet them; possible simulation of service levels of advanced technologies by using available systems, or, failing that, establishing service levels approximating those of advanced technologies to judge the merits of incurring the incremental costs to achieve the higher service levels.

44 127489 STATE ROLE IN PROGRAMMING. The need for a redefinition of the federal-state relation and a more effective federal role is emphasized. The state would like to see a recognition of the differences existing among states. Such recognition would lead to the establishment of planning and programming procedures that are truly multimodal and of one set of requirements for highways, aviation and transit. Federal guidelines should allow states to tailor their planning and programming processes to fit their own unique institutions and needs. The recent federal programming regulations blur the role of the states and diminish their importance in the planning and programming of highways and metropolitan transportation systems. Transportation guidelines should be directed primarily

toward the establishment of broad, overall performance goals rather than the specifications of narrow technical procedures. The essence of programming is the matching of limited resources to achieve a planned improvement. Programming deals with the basic problems related to determining the timing, the cost, and the funding methods of each transportation improvement.

44 131194 MARYLAND AGENCY SOLVES VANPOOL LEGAL SNAG. The Maryland Public Service Commission encountered a legal problem recently when petitioned to waive requirements that information on routes, fares, and schedules must be filed for company-sponsored vanpool programs. Commission law prohibits the waiving of these requirements. To solve this problem legislation has been introduced in the present session of the Maryland General Assembly calling for the Commission to issue an operating license to the sponsoring organization without public notice or hearings. In exchange for the operating license, the company must supply the Commission with a sworn affidavit including the identification of the work location being served, a description of the vehicles to be used, and statements that all persons who will operate the vehicles hold a chauffeur's license, and that the program will run on a not-for-profit basis. The proposed legislation also requires all employers to have evidence that each vehicle is insured and that the vehicles will be inspected annually.

44 133228 BART IMPACT PROGRAM. PUBLIC POLICY PROJECT: RESEARCH PLAN. The report defines the scope of the Public Policy Project, identifies specific research issues, and outlines methods for performing the work. A theoretical framework encompassing the various anticipated public policy impacts outlines the impact process and defines the basic concepts used in formulating the research approach. The Work Elements describing the specific work to be done are closely tied to the research issues identified in the theoretical framework. Details of data collection and analysis are contained in the Work Elements. The Research Plan outlines how the work will be performed by proposing a preliminary schedule, staffing requirements and estimates of level of effort.

44 136980 REPORT ON THE RAILROAD TECHNOLOGY PROGRAM (9TH), 1975, BY THE SECRETARY OF TRANSPORTATION TO THE PRESIDENT, THE SENATE, AND THE HOUSE OF REPRESENTATIVES [Rept. for 1 Oct 74-30 Sep 75]. The document contains the report on the Federal Railroad Administration's activities carried out under the

High Speed Ground Transportation (HSGT) Act of 1965 as amended and extended, for the Secretary of Transportation to report annually to the President and the Congress on activities performed under the Act. This report covers the HSGT-funded research, development and demonstrations programs administered by the Office of Research and Development (OR&D) and the Transportation Test Center (TTC) of the Federal Railroad Administration (FRA) in accordance with Section 10(a) of the Act and also encompasses related work performed under appropriations for advancing railroad technology and safety including the activities of the Transportation Test Center. The report covers program activities for the period October 1, 1974, to September 30, 1975. The report is designed to serve as a source of information for those having an interest in FRA's research, development and demonstration activities. A limited number of copies are made available to Committees of Congress, other Department of Transportation (DOT) organizations, academicians, prospective contractors, industry organizations and others who have an interest in FRA's R&D results.

44 137960 THE ROLE OF THE LOCAL AUTHORITY ENGINEER. The author sees the contribution of the local authority engineer as being his systematic approach to and application of public transport co-ordination, but prefers to consider the overall role of the local authority in transport co-ordination. A progression from the structure plan to A transport policy and programme (tpp) for day to day use is described. The tpp would provide a statement of policies and short-term programmes broken up into urban and rural needs and reviewed annually. It is suggested that within a county all the various operators should combine to schedule public transport services. The duties of the transport co-ordination team are listed in an appendix. The discussion which follows covers aspects including the transportation input into structure plans, industrial relations in co-ordination schemes, lack of forward planning in public transport and the need for increased marketing of public transport. /TRRL/

Madelin, KB (Cleveland County Council, England) Ennor, PI; New Castle-Upon-Tyne University Monograph 1974, pp 13-23; Proceedings of the symposium of co-ordinating Public Transport.; ACKNOWLEDGMENT: TRRL (IRRD 219541)

44 137962 THE ROLE OF THE PASSENGER TRANSPORT EXECUTIVE. The author emphasizes the importance of the role of the Passenger Transport Executive (PTE's) in the conurbations. Some of the objectives of a PTE are then outlined. A PTE should achieve complete co-ordination of all forms of passenger transport within an area. It can manipulate rail services and alter the balance between road and rail in order to optimise resources. Its duty is to provide a system which is a practical alternative to the private car and to which citizens will be attracted. The Greater Glasgow PTE is used as an example and details of committees involved given in

appendices. The discussion which followed the paper is included. /TRRL/

44 138146 LEGISLATIVE PERSPECTIVES ON THE STATE TRANSPORTATION PLANNING PROCESS AND TRANSIT PLANNING IN CALIFORNIA. The state of California has created a multimodal Department of Transportation and has embarked on a major statewide transportation planning effort. Although the legislation gives much of the responsibility for planning to regional agencies in the major metropolitan area, both the California Department of Transportation and the California legislature have important roles in the first iteration of a plan to be developed by 1976. This paper points out several concerns that the legislature may pursue in reviewing and guiding the planning process. These concerns deal with the issues of goal setting, decision making, and conflict resolution rather than with the technical details of planning. Four concerns about multimodal planning are examined in this paper: (a) planning for operations versus planning for facilities; (b) corridor versus local travel needs; (c) planning bases in technical expertise and analytical technique versus public openness and broad participation; and (d) programming versus master planning. Because transit planning has been largely absent from past state-level transportation concerns, several conceptual transit planning issues are raised in this paper as well. Examples from the recent Los Angeles planning experience illustrate legislative interest in staged decision-making and multimode transit solutions.

Burco, RA (Public Policy Research Associates) *Transportation Research Record* No. 563, 1976, pp 13-21, 4 Fig., 16 Ref.; Presented at the 54th Annual Meeting of the Transportation Research Board.; ORDER FROM: TRB Publications Off

44 142928 INTEGRATED EVALUATION FROM A REGIONAL PERSPECTIVE. Congestion in the Washington area is examined and statistical data on population are reviewed to show the number of people and vehicles in the Washington area. Local governments of the Washington area have been among the leaders in the national trend toward the development of growth management programs. The fact that local governments, regional planning agencies, citizen organizations, and private enterprise groups have expressed support for the development of metropolitan growth policy is analyzed. The impact of the different growth patterns and policies are viewed along with the varied social indicators used in impact analysis.

44 147862 THE 'NEW' TRANSPORTATION POLICY AND THE PUBLIC INTEREST. In June 1975, the Minister of Transport released a set of proposals for revisions of Canada's transport policy. The author explains that although as this is written, the proposed revisions have not

been embodied in new legislation, their appearance marks the end of a year's re-thinking of the federal government's role in Canadian transportation and, more importantly, an ostensible shift from the policy principles adopted so confidently in the 1967 National Transportation Act. The purpose of this paper is to review the Minister's transport policy proposals and to assess their impact on the public interest. Canada's transportation system is described as being 55 percent passenger transport and 45 percent freight. The split between intercity and urban is about 50-50, with intercity transport having a slight edge. An estimated two-thirds of the expenditures are made for private transportation and only one-third for commercial transportation. The role of the federal government in monitoring the operation and evolution of the system is described, a definition of the term "public interest" follows, and the policy proposals are then summarized and evaluated. /TRRL/

Munro, JM (Simon Fraser University, Canada) *Logistics and Transportation Review* Vol. 12 No. 1, 1976, pp 3-23, 2 Tab., 38 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-223045); ORDER FROM: British Columbia University, Canada, Faculty of Commerce, Vancouver 8, British Columbia, Canada

44 148243 CONSEQUENCES AND CAUSES OF PUBLIC OWNERSHIP OF URBAN TRANSIT FACILITIES. The reasons for the shift from private to public ownership of urban transit facilities are the subject of the paper. The regulation theory suggests that this shift is due to the increasing severity of regulation, while the declining-market and externalities hypotheses suggest that increases in automobile ownership are the reason for reduced profits and public ownership. Regression results indicate that profit margins of privately owned systems are higher when regulation is by a state rather than a local agency. Changes in profit margins over time are found to be directly related to increases in automobile ownership. /Author/

Pashigian, BP (Chicago University) *Journal of Political Economy* Vol. 84 No. 6, Dec. 1976, pp 1239-59, 7 Tab., 7 Ref., 1 App.

44 148877 TRANSIT REGULATION: IMPROVE IT, DECREASE IT OR ELIMINATE IT? It is pointed out that a serious problem in improving urban transportation is the lack of understanding of the complex economic, social and technical relationships, and it is shown that urban passenger transport is one of the activities in which free market cannot be applied. Although discussions of regulation in urban transportation often imply that they are relevant to all cities and all modes, actually they focus on paratransit only and are therefore relevant only to small cities and low density areas, with the exception of taxis applicable to all cities. Revision of some regulatory practices is desirable; in some areas revision should mean a decrease of regulation, in others an improvement and increase in regulation. The relevance of European experience in this area is noted. The goal of public regulation is not to maximize profits of operators but to ensure adequate public service. Transportation systems which meet these goals and are economically sound are best achieved by full coordination among modes, particularly between private and public transportation, as well as by closer coordi-

nation of regulation with short and long-range planning for communities and their transportation.

Vuchic, VR (Pennsylvania University, Philadelphia) *Transit Journal* Vol. 2 No. 4, Nov. 1976, pp 5-14, 1 Phot.

44 149948 THE ROLE OF TRANSIT OPERATING AGENCIES. By 1973, over 100,000 people were commuting daily into metro Toronto. Rush-hour congestion was no longer a purely local problem that could be solved by one region acting alone. It was realized that the needs of the commuter cannot be met without the co-operation and co-ordination of all transit properties in an urban area. This paper describes the formation of the Transit Operating Authority for the Toronto area, the first attempt by the province of Ontario to establish an appropriate agency to carry out the functions necessary to achieve an integrated network of transit operations. /TRRL/

44 150446 IMPACT OF RECENT FEDERAL TRANSPORTATION POLICIES AND REGULATIONS ON LOCAL TRANSPORTATION PLANNING. A description of how the policies of transportation systems management (TSM) evolved, the role of traffic engineers in TSM, and the relationship of these policies to the TOPICS program are examined. A Federal Highway Administration and Urban Mass Transportation Administration task force developed a concept in which capital and non capital policy actions designed to improve the Management and operations of highway and transit systems were unified to form a single major element of the planning process. TSM provides the opportunity for various participants to work together in a coordinated process of planning and programming. The planning process consists of two major elements. The first is a set of major long-range highway and transit facilities which can expect to be implemented during the planning period. The second element is the TSM element which identifies policies and programs relating to traffic engineering, public transportation, regulations and pricing. In order to have an effective planning process, there must be a drastic shift from the traditional long-range, 20-year forecasts to planning for short-term issues in order to encompass more traffic engineering and transit development. With the elimination of separate categorical funding by TOPICS, most TOPICS projects will be funded under the urban system where there is competition from major new facilities and public transportation projects also eligible under the system, as well as competition for urban system funds between jurisdictions.

Heanue, KE (Federal Highway Administration); Institute of Transportation Engineers, Inc Proceeding 1976, pp 48-50 1, Fig.; Proceedings of the 46th Annual Meeting, Baltimore, Mary-

land August 15-19, 1976.

44 150447 A STATE PERSPECTIVE ON THE IMPACTS OF RECENT FEDERAL TRANSPORTATION: POLICIES AND REGULATIONS ON LOCAL TRANSPORTATION PLANNING. This paper discusses the opportunities and problems that have resulted from Federal policies and regulations and propose solutions to those problems. A major problem which has been highlighted by the DOT planning regulations, is the degree to which the Federal Government should become involved in the promulgation of regulations that intrude upon the responsibilities of state, county, regional and local levels of government. Another related problem from the states' perspective is the apparent complexity in the administration of Federal transportation programs that result from single laws passed by Congress. Furthermore, the use of the Federal Register as a vehicle for promulgating such complex regulations makes it hard to keep up with the new regulations and changes to existing ones. The Massachusetts case is examined as a possible approach and solution to working within the confines of the Federal regulations, but in a manner that best fits the requirements, conditions and traditions of Massachusetts. The following courses of action were suggested as a means of resolving the issues: States should try and take every advantage of the positive aspects of the regulations and concentrate on them; states should avoid strict interpretation of the regulations which result in administrative and institutional procedures that are not compatible with existing traditions and laws; there should be a single DOT field structure which would allow for regulations to be interpreted and implemented with greater ease; and lastly, a coordination between agencies within DOT and between DOT and other Federal departments.

Humphrey, TF (Massachusetts Department of Public Works); Institute of Transportation Engineers, Inc Proceeding 1976, pp 51-54, 1 Fig.; Proceedings of the 46th Annual Meeting, Baltimore, Maryland, August 15-19, 1976.

44 150448 NEW REQUIREMENTS FOR THE METROPOLITAN PLANNING ORGANIZATION (MPO); A FORUM FOR COOPERATIVE DECISION-MAKING OR AN IMPOSSIBLE MANDATE? The significance of the Federal Urban Transportation Planning Regulations with respect to the Metropolitan Planning Organization are reviewed. Also, a description of the issues and problems confronting the MPO and the possibilities of integrating long and short-range planning are included. The new Federal Regulations have several important significances. Because the regulations have emphasized the link between planning and programming, the activities of the MPO will necessarily become more meaningful and relevant. The planning process must also be carried out in at least two dimensions, short-term and long-term. New considerations must be made in the planning process to ensure for the efficiency of the system, air quality improvement and mobility needs of the elderly and handicapped. Some urban regions will have continuing problems in establishing acceptable MPO's which are able to meet their responsibilities. It is suggested that there be a simple MPO

for each urbanized area, established under State law, eligible to receive both highway planning and transit planning funds from DOT, and be recognized by the Office of Management and Budget to perform Federal Aid Review functions. Professional transportation planners also face a major challenge in demonstrating that adequate technical tools can be developed and applied to meet the new Federal mandates. The significance of both long and short-range planning necessitates a conscious policy decision to fix some long-range goals as inputs to the short-term decision making process. In so doing, long-term transportation commitments can be identified and worked toward within a process that will give primary consideration to short-term consequences.

Kochanawski, R (Southwestern Pennsylvania Regional Planning Comm); Institute of Transportation Engineers, Inc Proceeding 1976, pp 55-57; Proceedings of the 46th Annual Meeting, Baltimore, Maryland, August 15-19, 1976.

44 150758 IMPEDIMENTS TO THE IMPLEMENTATION OF DESIRABLE CHANGES IN THE REGULATION OF URBAN PUBLIC TRANSPORTATION. Economic and sociological aspects of transportation regulations are discussed. Impediments to change in regulations are considered to be legal, moral and intellectual in nature. Problems of deregulation, subsidizing and compensation involved in changes in regulation of urban public transportation are discussed.

44 154803 TRANSIT AUTHORITY BOARDS OF DIRECTORS: MEMBERSHIP, ORGANIZATION, FUNCTIONS, AND PERFORMANCE. The study was designed to investigate the composition and function of boards of directors of public transit authorities. The objective was not only to identify the sources, education, and experience of transit directors and record the tasks that were within the purview of the board under its policy-making and overseeing roles, but also to compare the boards of directors of different sized transit properties and determine the degree to which the role of the board was altered under different forms of management input. The research tools consisted of structured interviews with the chairman of the board and questionnaires completed by individual directors. Statistical tests consisted mainly of Chi-square measures of association between the questionnaire responses of directors from transit authorities of different sizes and types of management input. The principal findings documented the differences between board members from authorities utilizing a management contract firm versus those authorities having internally developed management.

44 155983 ADMINISTERING STATE MASS TRANSPORTATION PROGRAMS IN PENNSYLVANIA. Since Pennsylvania has taken an early lead in assisting local public

transportation systems, its experience in this area should be of interest to other states. This paper presents the findings of a review of the transit related activities carried on by the Pennsylvania Department of Transportation, looking at both institutional arrangements and administrative processes. It points out a number of policy issues concerning the range of functional responsibilities, planning and programming processes, intermodal considerations, funding sources, and intergovernmental relations that may be facing other states in the development of transit programs. /Author/

44 156460 PSV'S AND THE LAW. The origins of licensing for public service vehicles are considered, together with the reasons for which it was first introduced: the securing of public safety and elimination of wasteful competition between transport operators. The social and legislative changes that have taken place since licensing was introduced are discussed, and the extent to which the system still satisfies its original objective is examined. /TRRL/

44 157177 ECONOMIC EVALUATION OF TAXICAB REGULATION. Economic efficiency and equity are evaluated by comparing a theoretical ideal market for taxi services with apparent actual performance, based upon an examination of the codes of a selected sample of cities along with other supplementary information. Two general conclusions reinforce the results of previous studies of taxi regulation: (1) market behavior is readily explainable—at least at the level presented here—in terms of economic analysis, including the organizational structure of the industry and the consequences of monopoly power; and (2) regulation of the industry, while probably necessary, has contributed greatly to the demonstrable inefficiencies that lead to higher prices and lower service than is desirable. /Author/

44 157194 CITIZEN SUITS AND THE SHIFTING FOCUS OF TRANSPORTATION PLANNING. This paper attempts to present case interpretations of federal planning statutes in a more easily understandable form. The objectives of this paper are first, to clarify the meaning of the transportation planning process condition as well as several other provisions, and second, to demonstrate some of the ways in which recent federal legislation has contributed to changing the premises and procedures of transportation decision making. Emphasis is placed upon how local citizens have affected this decision-making process by seeking to halt transportation construction. This paper is separated into the following five sections: A historical development of the federal highway and mass transit programs; the requirement of standing and the scope of judicial

review; clarification of the transportation planning process requirement of the federal highway and mass transit act; federal statutory requirements for public hearings; and, an analysis of the effects of these statutory provisions upon the urban and mass transit decision-making process. 44 167084 THE URBAN CONSORTIUM AND ITS TRANSPORTATION TASK FORCE-A FEDERAL PERSPECTIVE. The report provides an overview of the U. S. Department of Transportation's cooperative interactions with the Transportation Task Force of the Urban Consortium for Technology Initiatives. The Consortium is a coalition of 34 major urban governments which is developing an agenda of research, development, and demonstration needs and data packages in priority need areas. The report describes the logic which led to the formation of the Consortium, the various management mechanisms which evolved, the procurement and administrative approaches used, and the types of outputs which are being produced.

44 168902 THE IMPACT OF BART'S BOND ISSUE ON REGIONAL PUBLIC FINANCING. This report documents the study of the impact of BART's General Obligation bond financing on the cost of public borrowing in the San Francisco Bay Area and the study of the magnitude of the debt on the financing of other public projects. The study comprises a statistical search to see if borrowing cost changes appear related to the level of BART debt, and a series of interviews and surveys among leaders in the municipal bond industry to see what, if any, impact they perceived in the 1962-1972 period. Methodology, results and findings are reported. (Color illustrations reproduced in black and white)

44 170920 MASS TRANSIT REGULATION: PROCEDURE GOVERNS SUBSTANCE. The question is asked: if public ownership is in the public interest, then why does regulatory activity proliferate? The observation is made that instead of assuming that the public transit manager knows the task, governments layer him with constraints—often conflicting and unreasonable. It is noted that regulation is inevitable but more rational applications can be expected in the future. The Federal aspect of regulation is discussed as well as that of labor. The effect of standards promulgated by the Occupational Safety and Health Administration and by the Environmental Protection Agency are discussed as well as interstate acts and the state regulatory activities. It is noted that the situation should improve in the future as UMTA is simplifying its grant administration procedures. The agency is being restructured to place more authority in its regional offices, which will mean closer coordination between transit authorities and UMTA officials. Regulatory reform is well underway with the Rail Revitalization and Regulatory Reform Act of 1976. State governments are becoming more active in transit matters and are also recognizing the need for uniform regulatory control.

44 172907 UNIFYING TRANSPORTATION MANAGEMENT IN URBAN AREAS. The transportation areas that would need management (traffic engineering, traffic regulation, traffic enforcement, traffic restraint, transit operations, zoning and land-use control, high occupancy vehicles, construction of new or reconstruction of old facilities) are identified, and developments which have led to the recognition for the need for unification of urban transportation are listed. It is noted that an integrated approach to transportation management is not only possible but overdue. To bring about the necessary unification, some elements are essential. Thus, local officials must be permitted a strong voice in developing plans; they must set the goals for the community. State and federal officials must be flexible in enforcing their regulations, and the public must be involved in the plan development and to some extent, implementation process. The public, business community, transit operators, traffic engineers, and other major street users—all should be informed and consulted. Plan elements must be coordinated to avoid abruptness in implementation. The plan must have specific objectives and priorities for each objective. Tools and techniques must be developed to measure progress. It is important that real problems that need solution be addressed and not problems that may only seem to exist.

44 175970 EQUITY OF TRANSIT SERVICE. VOLUME I [Final rept. Sep 75-Jan 77]. Recipients of grants from the Urban Mass Transportation Administration (UMTA) are required to comply with Title VI of the Civil Rights Act of 1964, as amended. The purpose of this research project, conducted for UMTA's Office of Civil Rights, was to develop a set of guidelines for UMTA grant recipients to use in applying for certification of compliance with Title VI. This study presents guidelines for grant recipients to use in submitting proof of compliance with Title VI, and it provides standards for Office of Civil Rights' reviewers to apply to the material submitted to make a determination of compliance. The guidelines and standards were developed after field surveys and pilot testing.

44 176473 URBAN TRANSPORTATION ECONOMICS. An attempt has been made to examine long-term forces in the urban transportation market that generate chronic transit deficits and to evaluate alternative courses of action to improve economic efficiency and financial viability at the local level. This report synthesizes theory and practice to produce a practical working program for planning, implementing and administering programs at the local, state, and federal levels. The study focuses on the financial difficulties that contribute to the deterioration of services, the causes of deficits, alternative programs to assist cities to reduce their dependence on federal financial assistance, the development of a framework to assist different levels of government to evaluate urban transportation costs versus revenues, and the summarizing of the state

of the art in this area. The proceedings are presented of five 2-to 3-day workshops. The workshop on urban transportation pricing considered several aspects of various alternatives. The workshop on economic regulation of urban public transportation considered how current regulations may be amended to facilitate more efficient workable public transportation. The workshop on labor relations issues was designed to identify problems and alternatives to current labor practices, explore increased labor involvement, as well as other aspects of labor relations. The workshop on measuring the effectiveness of transit marketing considered how public transportation may be managed, planned, and operated to provide the desired service and be financially healthy. The workshop on government responsibilities for financing efficient transportation examined the means available to local government to bring about the changes recommended in earlier workshops.

44 176478 WHY PRICE URBAN TRANSPORTATION SERVICES? This discussion of transportation subsidies and free transportation also lists the assumptions that underlie the prescription to price any service and particularly to price the marginal unit or incremental quality of any such service at the marginal or incremental cost of supplying it. It is noted that the strongest case for assigning any price presupposes determining the economically efficient price. The arguments for transport subsidies are discussed. Assuming that there is subsidization, at least to some degree, the question is asked if there is any possible aspect of free transportation that could maximize the benefit to be derived from a given subsidy. The two most likely candidates for this kind of freedom appear to be marginal free transportation and differential free transportation.

44 176482 SUPPLEMENTARY LICENSING: AN EVALUATION. The Greater London Council (GLC) recently published the results of a study on supplementary licensing, a proposed new method of traffic restraint that would require drivers of certain vehicles to purchase special licenses to use their vehicles at specified times in designated areas. The study considered the pro-

posal as a means of providing traffic restraint in inner London; reviewed the effects of a number of alternative schemes on traffic patterns, on the environment and on the social and commercial framework of London; and determined the practical requirements of these alternatives. This article summarizes the methods used and the results obtained. The study concluded that all-day control in the central area would be the most efficient form of control, unless environmental gains from the extension of control to the inner area in the peak could be shown to outweigh the reduction in other benefits and the increased staffing problems. The GLC decided in July 1975 not to proceed with the supplementary licensing but to seek legislation to allow it to tax private parking spaces. The reasons given for rejecting the supplementary licensing were the adverse effect on the lower income motorist and on those with special needs and the problems of enforcement. The GLC has asked for information on similar schemes being considered or implemented elsewhere and for further evaluation of alternative measures that would overcome the problems it had identified.

44 176487 SUMMARY OF BARRIERS TO IMPLEMENTING PRICING INNOVATION. This article summarizes the barriers to implementing pricing innovation. The main barrier that is noted is on the political front. Although the federal government has provided incentive funds to explore the potentials and DOT has urged cities to adopt measures of restraint by pricing, there is still a great deal of reluctance to do so. The reason for this is that although the overall appeal of road pricing is efficiency and avoidance of waste, the benefits are to the community at large, at the expense of a small vocal minority. A solution to this problem is to identify the negative impacts that might be due to misunderstanding, bad planning or unforeseen contingencies. A more lasting solution is to develop a system such that the disaffected motorists would be better off than under the unpriced system. The majority opinion, it is noted, favors the approach of trying to persuade the majority that it is in their best interests to have some constraints. Many doubt however, that such persuasion will be effective.

44 176494 ISSUES IN THE ECONOMIC REGULATION OF URBAN PUBLIC TRANSPORTATION. This paper considers the question of more versus less regulation and the role of alternative institutional approaches. Provisions for entry and exit from urban transportation markets are discussed, as well as the constraints and incentives experienced by existing carriers. A fundamental difference is noted regarding the potential of competition as an alternative to regulation and planning as an incentive in present institutions for decision making in urban transportation. The issue of entry and exit in the provision of urban transportation service is closely related to the issue of the desirability of competition. The potential of competitive alternatives to conventional fixed-route transit-systems was discussed, and ride-sharing systems, jitneys, fee-paid carpooling, commuter bus operations and special paratransit services were considered. Both public and private operators expressed the view that regulation unduly restricted the prerogatives of management and was unresponsive to public needs. Support was expressed for greater flexibility for existing operators both transit and taxi, to experiment with changes in fares and service without being locked into the change. Comments are made on the brokerage concept. It is noted that dissatisfaction with the regulatory system appears to reflect the inherent, irreconcilable contradictions of competing objectives by participants in the regulatory process as well as the limitations of the institutional structures. Much of the disagreement about desirable institutional structures is based in part on significant differences in objective for urban transportation. New mechanisms must be developed to resolve the conflicts between certificated carriers and new entrants and for addressing the problem of how to regulate new modal alternatives.

44 176495 ISSUES OF REGULATION UNDER PRIVATE AND PUBLIC OWNERSHIP. This paper discusses the transition from private to public ownership, and comments on the regulation under private and public ownership. The shift from private to public operations changed the focus and the standards for the evaluation of systems. The question that is now raised related to how many people the system serves, how well it serves them, and the capacity of the policy, regulatory and management structure to meet the objectives established for public transportation

within the community. Regulation under private ownership involved regulation related to fare and the service (quantity, quality, safety) provided by private transit companies. When privately owned systems become public, the authorities in many situations were vested with the power, authority, and jurisdiction to exercise the functions necessary for maintaining public transportation as an ongoing function, sometimes restricted only by the intent that the system should be self-financing and self-liquidating. Many regional authorities have been given the power to regulate not only their own operations but also those of other systems that operate in their areas. Some transit systems suffer from the requirement that permission be requested from several levels of authority before decisions are made. Many authorities have been faced with making major regulatory decisions without having the needed expertise and data to handle the question adequately.

44 176496 REGULATION OF URBAN TRANSPORTATION. It is proposed here that the appropriate course for public policy is to undo the damage done in the past (by regulation of transit) by abolishing the transit authorities, ending the Urban Mass Transportation Assistance Program, and allowing competitive markets in urban transportation. Regulation of the electric street railway operation is discussed. The power of the regulatory commissions depended in part on their statutory authorities and in part on their common-law obligations to provide due process of law to the regulated firms. The question of determining what was due process is discussed with reference to the case of *Smith v. Ames* (1898). The emergence of the jitney in 1914 in Los Angeles is described as well as its subsequent demise. Putting down the jitney meant that the public would turn to the automobile as a private carrier rather than as a common carrier. It also caused the conversion from streetcar to bus to be made within the economic organization of the street railways. Increasingly, the regulatory commissions were confronted with problems of simply keeping the transit companies in business. The conversion of most major transit systems to public ownership has reduced the significance of regulation. It is noted that American transit enterprises remain a monopolistic organization; the transit industry is overcapitalized—a situation which the federal transit subsidy program tends to make worse. Also, rate-base regulation tends to make regulated industries more capital intensive than they would otherwise be.

44 176497 ELIMINATE, DECREASE, OR IMPROVE REGULATION OF URBAN PUBLIC TRANSPORTATION? The constraints that regulation represents and the concepts on which they are based are discussed, and the merits and limitations of the free market in urban transportation are evaluated. The family of urban transportation modes, the characteristics of each mode and the regulatory conditions necessary to yield the best service are reviewed. The paper noted that discussions of regulation in urban transportation actually focus only on paratransit and are therefore relevant only to small cities and low-density areas, with the exception of taxis, which are applicable to all cities. Urban transportation is an area where free market does not exist. The paper also notes that revision of some regulatory practices (decrease in some areas and increase in other areas) is desirable. It is pointed out that conditions in Western European cities are very similar to our cities, and therefore experiences in cities with better transportation than ours are highly relevant to us. The goal of public regulation is to ensure adequate public service and protect public interest; this can be achieved by full coordination between modes, between public and private transportation, as well as coordination of regulation with short-and long-range planning.

Vuchic, VR (Pennsylvania University, Philadelphia) *Transportation Research Board Special Report No. 181, 1978, pp 76-79, 11 Ref.*; This paper appeared in *Transportation Research Board Special Report No. 181, Urban Transportation Economics*. 44 176498 ECONOMIC REGULATION OF URBAN PUBLIC TRANSPORTATION: AN OPERATOR'S PERSPECTIVE. The use of the term economic regulation is here broadened to encompass the application of rules or regulations from any source that affects the allocation of economic resources committed to public transportation in urban areas. It is noted that economic regulation as applied to public transportation has failed and that there are 2 reasons for the failure: the regulatory frame of reference has been too narrow; the application of the rules and regulations has been too fragmented. Control of competition is also regarded to be ineffective because the concept of the competitive universe is too restrictive. The determination of what is to be regulated, by whom, in

what frame of reference, and within what guidelines is discussed, and concern is expressed for whether such an evaluation is for or against the public interest. Actions in the right direction are listed: UMTA could sponsor a project to inventory and analyze direct and indirect regulatory constraints; UMTA could be the clearinghouse for changes or proposed changes in the regulations to attempt to determine costs and other impacts; These regulatory constraints should be analyzed to determine whether they are complementary with or contrary to the objectives of providing mobility in urban areas; UMTA's research programs and budget could be used to acquire better information and understanding of the interrelationships between transportation and nontransportation goals and criteria.

44 176500 REGULATORY CONSIDERATIONS FOR ALTERNATIVES TO CONVENTIONAL TRANSIT SYSTEMS. The Reston Commuter Bus System is described as an example of a technically and financially sound transportation system being threatened by institutional policies that were originally designed to preserve public transportation. Details of the start of the service are given. The service was started in 1968 and was designed to serve commuters effectively and provide a realistic alternative to driving. By 1972 the service attracted more than 1,000 people (2,000 daily trips). However, transit ridership in the Washington area was declining and public acquisition was imminent. In 1973, the private carrier that served Reston was taken over by the Washington Metropolitan Area Transit Authority (WMATA). The WMATA pricing policies and the subsidizing of the Commuter System by Fairfax County are described. In 1975 the Reston Commuter Bus found a private carrier, Colonial Transit, which proposed to provide buses at only 62 percent of WMATA's price. Reston Commuter Bus had to prove to the Washington Metropolitan Area Transit Commission (WMATC) that there was a public need for Colonial to provide the service. The arguments for and against this contention are presented. The certificate of public convenience and necessity was issued in September 1975. It is noted in conclusion that regulatory procedures can serve to promote as well as serve as a check and balance on transit authorities. Also, since the justification for WMATA's opposition to Colonial Transit was based on the concept of a regional approach to public transit, this concept needs to be reexamined.

44 176501 CASE STUDIES OF TAXICAB REGULATION IN THE UNITED STATES.

The three traditional aspects of municipal taxi regulation (entry control, ownership and service standards) are considered, and the empirical evidence available on the actual relationships among these three variables in operation at the local level are reviewed. A comparison of the number of taxis per 1,000 people for 11 American cities (8 that have and 3 that do not have entry restrictions) is tabulated and discussed. Empirical analyses have prompted transportation planners to argue for deregulation of entry into the taxi industry at the local level. Arguments by the organized taxi industry against such deregulation are presented. Police departments and regulatory agencies agree with the industry position on deregulation. Some cities are considering permitting leasing arrangements as a way to: (1) find a middle position between free entry and tight control; (2) meet the demands of the organized taxi industry. These lead to new issues about the significance of vehicle-leasing restrictions in the cities. Many cities are also facing a different but complementary set of institutional issues because of a concern for the transportation disadvantage.

Rosenbloom, S (Texas University, Austin) *Transportation Research Board Special Report* No. 181, 1978, pp 97-101, 2 Tab., 9 Ref.; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 44 176502 INSTITUTIONAL ISSUES IN COMMUTER RIDE SHARING.

Successful commuter programs (Tennessee Valley Authority, TVA; 3M Company, Minneapolis; Continental Oil Company, (CONCO) are described, and the institutional issues involved are discussed. Updating laws and working toward systematic resolution of institutional issues the affect ride sharing is now established. For example, states have passed new laws that classify van pools as car pools which permit churches to donate parking facilities for park and ride lots without risking their tax-exempt status, and laws that require parking garages to provide the needed height for commuter vans. The liabilities of car poolers and van poolers, the exchange of money, driver compensation, and van pool insurance are discussed. In Minnesota, commuter vans are exempted from regulation by the Public Service

Commission. At present, adequate private capital to promote and capitalize on commuter ride sharing may be severely affected by regulations that limit legal operations.

Pratsch, LW (Federal Energy Administration) *Transportation Research Board Special Report* No. 181, 1978, pp 101-104, 3 Tab., 4 Ref.; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 44 176503 REGULATING AND INSURING PREARRANGED RIDE SHARING.

An attempt is made here to: describe the range of approaches to regulating and insuring prearranged ride sharing; summarize the arguments that have been put forward on behalf of various approaches; and to determine which approaches are being adopted at the state level where most of the decisions on regulatory practice are made. Four key characteristics are used to classify ride-sharing arrangements and the regulatory status of those arrangements are described. The range of possible regulatory approaches are considered, as well as the arguments for and against regulation. A survey of the regulatory and insurance status of car pools, van pools and subscription buses in 12 states, indicates a very mixed situation. A sensitivity to the interests of existing common carriers is noted. The problems presented by regulation under the best conditions, have led to a trend to deregulate van pools. Discount and liability premium for car pools are noted. The van pool insurance situation is very confused. There are several approaches to the van-pool insurance problem. The most promising is to develop a new insurance classification especially for van pools. The relationship between the vehicle owner and rider, and the degree of control the owner-operator and the insurer have over the driver are also discussed. Other approaches discussed here include: self-insurance for large employers programs; and (as in Minnesota) the amendment of the no-fault statute so that van pools will be classified as private automobiles for purposes of insurance.

44 176504 CASE STUDY OF THE PROBLEMS OF TRANSIT REGULATION IN WASHINGTON, D.C.. The enactment of the statute and agency, the Washington Metropolitan Area Transit Regulation compact and the Washington Metropolitan Area Transit Commission (WMATC) are described, and the WMATC's regulatory performance is reviewed. It is noted that Washington's transit regulatory scheme excludes essential transportation elements from the scheme, has inappropriate protection for existing operators, and provides only limited enforcement capability to the responsible regulatory agency. The regulatory agency for the implementation of the scheme was limited in its outlook and the capabilities of its staff. Its activities were further narrowed by events to a concentration on rate matters to the exclusion of the pursuit of service improvements. Without the cooperation of the regulated companies, it is powerless to effect service improvements. Those segments of the for-hire transportation operations that come under the most active (though still limited) regulation, i.e. regular-route bus operators, collapsed within a decade. Those that did not, i.e., taxicabs, charter bus operators, and sightseeing companies, survived as private operators.

44 176505 WHY IS IT DIFFICULT TO CHANGE REGULATION.

This discussion of obstacles to change regulations focuses on factors related to law, morality (problem of vested interests), and the intellectual problem of the desire for order. It is noted that one way to promote progress is to try to pay off vested interest; for example, compensating medallion holders for the fall in medallion price resulting from allowing free entry into taxicab operations in New York. It is a mistake to assume that the regulated firms have benefited long enough to call for deregulation without compensation. If entry leads to the end of publicly operated buses, the only organized interest group associated with the industry will be labor. If change results in loss to some workers, then they could be compensated. The case of subsidized riders is discussed, and it is stressed that the few who are subsidized are supported by the public at large, and it is the public that must be satisfied that the few are being treated fairly.

44 176507 REGULATORY BARRIERS TO INNOVATION AND THE KNOXVILLE EXPERIENCE. This paper makes the point that urban transportation is shifting to services that are more flexible and labor intensive and that use smaller vehicles. It is also noted that existing regulation was designed to protect those who are dependent on public transportation with little regard for fuel and highway efficiency. The transportation regulatory commissions have no power or authority other than that of prohibiting the operation of for-hire carriage that is not consistent with the desires of the regulatory agency. The regulatory agencies are virtually powerless to ensure passenger service to the public, and they are reluctant to allow experimental demonstrations for fear the public will be left without even the minimal service after funding for the demonstration is terminated. Since regulatory authorities are bound by very specific laws, regulatory exemptions must come from the state legislature rather than from the regulatory bodies themselves. Perhaps the most restrictive regulatory bodies currently in existence are the regional transportation authorities, which may have very broad regulatory powers as well as operational authority. The development of simpler more specialized services is traced in 3 overlapping stages. The ways in which regulations strived to achieve their goals are described, and the regulatory power of local transport authorities is discussed. In Knoxville, Tennessee, a brokerage concept is in operation in which the role of transit is to meet public needs rather than promote one type of service. This concept developed because of the close cooperation between the Knoxville Transit Authority (KTA), several firms in the city and the University of Tennessee.

Davis, FW, Jr (Tennessee University, Knoxville) *Transportation Research Board Special Report* No. 181, 1978, pp 129-133, 6 Ref.; This paper appeared in Transportation Research Board Special Report No. 181, Urban Transportation Economics. 44 176508 THE ROLE OF PUBLIC UTILITY COMMISSIONS IN TRANSIT REGULATION. The opinion is expressed that there is no longer a significant role for public utility commissions (BUCs) in the daily operations of transit authorities. The PUCs must continue to exercise controls over the right of entry into the business and the right of exit. The operations of transit authorities should be subjected to specific controls in the form of service goals, service standard, and performance standards. Such standards should address every aspect of transit service: the number of standing passengers, owl service, the

spacing of routes and bus stops, the percentage of direct and transfer services, new service, and the cleaning and maintenance of buses. Performance and policy aspects that must be addressed are also listed.

44 176523 CONTROLLING TRANSIT COSTS IN MEDIUM-SIZED CITIES. It is noted that there are areas of potential productivity gain and cost control in every transit operation. Some examples of these areas include: transportation, maintenance, labor relations, and personnel budget and finance and marketing and planning. Examples of areas in which significant cost reductions were achieved are briefly worked. The development of a better servicing plan, the bringing back, after cutback, of some operators for part-time work and analysis of absenteeism and overtime pay, are outlined, as well as the refining of the scope of a marketing budget, checking dishonesty in the collection of fares and cost, reducing operator's platform time following a study of servicing time, and changing dispatching procedures. Other successful cases outlined here relate to promotional and marketing programs, analysis of accident data, retention of operators, reclamation of wash and rinse water, a lower initial wage rate with periodic progression, and programs for the undisciplined use of sick leave and habitual late comers. Basic tenets that should be considered in these programs are listed.

44 176536 TRANSIT DEFICITS AND PUBLIC POLICY. Three conclusions are drawn from the survey of the transit deficit situation: The transit deficits reflect public-policy that fares should not bear the full burden of transit costs, that levels of service should be maintained or raised, and the transit is a public service that should be supported through taxes rather than user charges alone; given certain assumptions about the course of inflation and other factors, transit deficits will probably rise about 15 percent per year in the next few years; the cities have a

continuing commitment to public transportation and to improved transportation service. Current and impending issues discussed against this backdrop are: the effect of the residents balance budget policy, the social benefits of the transit systems, the increase of the local share of the transit deficits, the role of political leaders in making public transportation decisions, and the fact that money does not solve all problems-poor design may be the foremost problem.

44 178772 EQUITY OF TRANSIT SERVICE: VOLUMES I AND II. Recipients of grants from the Urban Mass Transportation Administration (UMTA) are required to comply with Title VI of the Civil Rights Act of 1964, as amended. The purpose of this research project, conducted for UMTA's Office of Civil Rights, was to develop a set of guidelines for UMTA grant recipients to use in applying for certification of compliance with Title VI. This study presents guidelines for grant recipients to use in submitting proof of compliance with Title VI, and it provides standards for Office of Civil Rights' reviewers to apply to the material submitted to make a determination of compliance. The guidelines and standards were developed after field surveys and pilot testing. This study consists of two volumes. Volume I contains an Executive Summary and Guidelines for Applicants. Volume I summarizes the project, that is, it summarizes the history, scope, and findings of research conducted on the subject of equity in transit service during the period from September 1975 to January 1977. Guidelines in Volume I are to be used by urbanized areas applying for annual certification of compliance with Title VI. There are four sections to the guidelines with instructions preceding each section. Volume II, a separate report, gives detailed information on the field studies and their results. Volume II presents the rationale for each data item requested and compares the guidelines with the previously requested material (Exhibit N). Review standards are also in Volume II. The Appendixes in Volume II contain a detailed discussion of the field tests and a listing of the 5 cities visited as well as the persons contacted during the field visits.

44 179363 TRANSPORTATION SYSTEM MANAGEMENT ELEMENT OF THE RHODE ISLAND GROUND TRANSPORTATION PLAN, AND APPENDIX I. This report presents the short-range ground transportation development for the state of Rhode Island. The recommendations are based on an in-depth analysis of existing statewide transportation conditions, and are consistent with other related Statewide Planning Program publications. It is designed to guide and assist the efforts of the state Department of Transportation and the Rhode Island Public Transit Authority to make efficient use of existing transportation resources through improved traffic engineering, public transportation, regulation, pricing, management, operations and other means not including new facilities, and to qualify the state for federal financing under Urban Mass Transportation Administration and Federal Highway Administration programs. /Author/

44 179527 THE ROLE OF BRITISH RAIL IN PUBLIC TRANSPORT. THE GOVERNMENT'S RESPONSE TO THE FIRST REPORT FROM THE SELECT COMMITTEE ON NATIONALISED INDUSTRIES: SESSION 1976-77 HC305. This report is the response by the government to the first report from the select committee on nationalised industries (HC305) on the role of British rail in public transport. The first part of the response gives a summary of the government's view of the report as a whole. Part II is a commentary on the various groups of themes and recommendations which emerge from the report and includes comment on the following topics: demand for rail services, Forecasting demand, international comparisons, inter-urban passenger transport, freight and parcels, capital structures, pricing, coordination, manpower and productivity, investment. Part III deals with further recommendations. The British Railways Board's own observations are also included as an annex to the government's response to facilitate discussion of the report.

44 183101 APTA LEGISLATIVE PROGRAM. A five-year public transit assistance program that would cost \$20-billion has been proposed by the American Public Transit Association (APTA) Board of Directors as part of a comprehensive legislative policy statement. The board, meeting at the APTA's national convention in Atlanta recently, also outlined a five-year, \$5-billion urban streets and highway program and called on the federal government to provide 100-percent funding for all public transit costs associated with providing services and accessibility to elderly and handicapped persons. The APTA circulated an overview of the policy statement to members and asked them to lobby on its behalf. /GMRL/

44 186189 OPERATING MULTI-MODAL URBAN TRANSPORTATION SYSTEMS. The project examines the state-of-the-art in multi-modal urban transportation system operations, proposes and assesses eight model institutional arrangements for more efficient and effective urban transportation operations, assesses the influence of Federal policies in this area, and proposes possible changes to enhance coordination of urban transportation services. The report concludes that some of the more important elements determining the success of efforts to coordinate urban transportation operations are institutional structure, responsibility for coordination, incentives operating on each agency and individual, patterns of personal relationships, and specific mechanisms for coordination. Potential Federal actions and incentives for promoting coordinated urban transportation operations are proposed.

44 191910 CONSOLIDATED AGENCIES TRANSPORTATION SYSTEM. The Consolidated Agencies Transportation System, a department of the Brevard County, Fla., Board of County Commissioners providing free transportation to the elderly, the handicapped, and the indigent is described. The philosophy of the system is to supply specialized transportation according to individual need at a low cost. The system began in 1971 as a limited service for teenaged mothers and expanded gradually until 1974, when the county assumed control of the system, taking over vehicles from separate county agencies. Service by an 11-bus fleet of small, wheel-chair accessible vehicles is offered 10 hours a day, with regular subscription service and with flexible routes in the middle of the day for nonregular riders; buses are radio-equipped. Administrative and planning functions are assumed by the director and business office staff, and operations functions, by a supervisor responsible to the director, a radio dispatcher, drivers, and assistant drivers; an external advisory committee assists in assurance of quality service. Drivers and assistants must be State-licensed and have completed a defensive driver course and basic first aid training. Funds derive from the Federal Government, the State of Florida, the Board of County Commissioners, United Way, and local donations; costs for sponsored riders, i.e., clients of a particular program, are reimbursed through a service contract with a specific agency. Such multiple-source funding protects against fund cuts, but creates complex guideline problems. Although private taxis, private bus lines, and public bus lines serve the same area, two studies show that little overlapping occurs and that conflicts should be resolved through the Metropolitan Planning Organization.

44 261519 URBAN TRANSPORT: STUDIES IN ECONOMIC POLICY. CHAPTER 11: REGULATION OF TAXIS. This paper, first published in 1973, discusses in the context of the London trade, how far the regulation of taxis is desirable. Regulatory instruments fall into three broad classes-monopoly rights, entry conditions and fare control. The London industry which has free entry, i.e. no restriction on numbers of drivers and cabs, is compared with the industries of Liverpool, Manchester and Birmingham, all having a restriction on numbers. There is some evidence that where entry restriction is combined with control of fare structure, the quality of service offered to the customer is lower. Problems arise as supply of taxis cannot adjust to changes in real costs over any lengthy period when fares are held constant and the value of money falls. The case for a second type of cab offering a less efficient service at lower cost is argued. The author concludes that no limit should be introduced on the numbers of cabs and drivers operating in London; he suggests that the current limits in provincial cities might beneficially be removed. /TRRL/

44 261537 WILLIAMSPORT AREA TRANSIT STUDY: TRANSIT DEVELOPMENT PROGRAM. On Aug. 7, 1969, the City of Williamsport, Pa., purchased, with the aid of a Federal grant, the Williamsport City Bus Lines. This action preserved transit service in the area since the private operator had been suffering losses which precluded continuation of operations. Despite progressive actions, however, performance of bus operations has been declining. Questions have been raised as to whether existing service should be increased or decreased, fares raised or lowered, routes changed, apportionment of operating losses to service municipalities be re-evaluated, and whether the ever-increasing deficit can be decreased. In addition, the issue of the most suitable form of public ownership has been raised by the problems which have developed in attempts to secure regional support for city operation. This study was undertaken to answer the above questions and to develop a short-range transit development program covering the five-year period of 1973-77. Observations of the long-range implications of present trends are also included. Recommendations are presented and include the formation of a City-County Transit Authority or a County Transportation Department as the first step in carrying out the transit development program. Appendices include transit analysis zones and tables of total person trips and transit trips. /UMTA/

44 261654 LEGAL AND INSTITUTIONAL ISSUES OF CARPOOLING. Legal and institutional issues must be identified before implementing carpool programs. Four areas that should be studied are: legal issues, security programs, compensation and Internal Revenue Service issues and insurance considerations. Some of the legal issues are incentives to encourage carpooling the regulatory status of a carpool or share-the-expense arrangement, the applicability of sponsors of carpooling programs and competitive aspects of carpooling. Security problems include control of information and controlling the processing and distribution phase. Compensation factors should be carefully questioned; are they tax deductible? Is the car depreciated because of carpool use? Questions on the status of the passengers, the car and the carpool as a group need examining.

44 262359 AN ADVENTURE IN CREATIVE FEDERALISM: THE TRI-STATE-URBAN MASS TRANSPORTATION ADMINISTRATION STORY. Transportation planning activity of the Tri-State Regional Planning Commission, which is both the comprehensive and transportation planning agency for the metropolitan region surrounding New York City, is reviewed. The Tri-State region presents many transit problems requiring complicated and extensive coordination (caused by it's more than 600 incorporated areas). The delivery of technical studies funding through

a single agency was welcomed but has proved to be a complicated task. The Commission undertook all or part of a particular study by providing staff and support to involved local governments. Difficulties encountered in administration were the question of priorities, and the difficulty of inserting a planning agency between eligible public agencies and federal grants. Procedures that give greater assurance of project success include techniques such as establishment of policy or steering committees that include representatives of the financing and working agencies as well as the planning and implementing agencies. The possession of substantial data supplies ensures that localities do not have to go to a consultant for information. Technical studies are evaluated according to the likelihood that they can lead to improvement of transit service. The cooperative effort is considered highly successful and extensions to the program are planned. The relation between transit planning and localities and land use planning is reviewed. An outline is presented of how a closer wearing of these concepts may be effected. Such a plan may be a means for increasing participation by local officials and also a means for implementing and coordinating region-wide plans.

44 300692 STATUTORY BARRIERS TO COORDINATION. This paper reports on an initial investigation of statutory barriers to coordination, especially concerning transportation, evident in seven pieces of federal legislation. Using data collected from three American cities, the study found that most of these statutes encouraged or mandated various forms of coordination. All included provisions that could prove to be barriers to coordination, such as inconsistent federal-local matching ratios, differing definitions of a handicapped individual, differing planning cycles among the programs included in this study, and state and local interpretations of federal audit provisions. /Author/

Cutler, DA (Ecosometrics, Incorporated) *Transportation Research Record* No. 696, 1978, pp 20-24; This paper appeared in TRB Record No. 696, Rural Public Transportation.; ORDER FROM: TRB Publications Off

44 300694 IMPLICATIONS OF DOT DRAFT SECTION 504 REGULATIONS FOR RURAL AND SMALL URBAN AREAS. The regulation that bans discrimination against handicapped persons is briefly reviewed. It is noted that the regulation places emphasis on large urban bus and rail systems and metropolitan planning organizations, and not on the institutions and conditions that the handicapped encounter. The development of accessibility guidelines by the Department of Transportation (DOT) is discussed, as well as the debate on how to provide accessibility. Fully accessible systems have been supported by some, while others argue that ridership is low on accessible systems, and costs do not justify investment. Some key points in the DOT response to the regulations (Section 504) are briefly reviewed, and attention is directed to the sections relevant to bus and paratransit, and to rural paratransit. Bus operations must make 50% of the service accessible to the handicapped, and speedy compliance is emphasized. Urban and rural paratransit operators who receive UMTA funding will be required to provide accessible services within 3 years. Other considerations associated with complying with Section 504 regulations are noted.

Gurin, DB (Urban Mass Transportation Administration) *Transportation Research Record* No. 696, 1978, pp 26-27; This paper appeared in TRB Record No. 696, Rural Public Transportation.; ORDER FROM: TRB Publications Off

44 301147 THE CONTROL OF REGIONAL DEVELOPMENTS IN THE RHEIN-NECKAR CONURBATION BY THE REORGANISATION OF PUBLIC TRANSPORT [Steuerung Raumbedeutsamer Entwicklungen im Verdichtungsraum Rhein-Neckar durch Neuordnung des Oeffentlichen Personennahverkehrs]. Although the Rhein-Neckar region, with around 1.8 million inhabitants, is the sixth largest conurbation in the federal republic, it ranks much lower in terms of the quality of service offered by its public transport (OEPNV). The aim is to expand rail-bound transport in order to regulate the processes of development in the areas of ecology, housing and traffic. So far the Rhein-Neckar region has not been included in the investment programmes of federation and states with regard to transport. Therefore an attempt must be made to remedy this situation by compensatory measures. Above all the new rail construction programme of the GFR which is already under way is to be utilized by consistently taking the long-distance traffic out of the existing network in order to improve the local transport service. In addition, individual measures are to be taken to remove persistent bottlenecks. Finally, the cooperation and integration of the eight transport authorities in the Rhein-Neckar region must be brought about by organizational measures; for this purpose a public transport commission is to be appointed, to lay the foundations for a transport and tariff authority within the framework of the three-dimensional model. /TRRL/ [German]

44 301224 NEW YORK STATE TRANSPORTATION PART 1. MASS TRANSIT IN NEW YORK STATE: WHERE DO WE GO FROM HERE? This paper discusses the advantages and problems of mass transit in New York State as well as its administration. Public transit saves oil, reduces pollution by carbon monoxides and hydrocarbons, reduces noise levels, and saves land by reducing the need for highways. However, there are several problems facing public transit such as: rapidly rising costs, largely caused by increased outlays for energy and labor; substantially reduced ridership, caused partly by higher fares and the lower quality and quantity of service, and partly by the availability of new highways; aging of physical plant and equipment, aggravated by lack of preventive maintenance; poor communication by transit authorities with the public; and public reluctance to accept higher expenditures for mass transit, rising out of public attitudes that transit authorities operate inefficiently and without regard for service quality. Operation of mass transit has been delegated to "public authorities" due to unwillingness inability of both private industry and local government to operate the systems.

44 301309 PRE-METRO: CONVERSION NOW OR NEVER. This paper develops as a case study the 60-year experience of a light-rail transit system that was conceived as a pre-metro line with the option for eventual conversion to full metro or semi-metro status. It describes the metro features originally included and the added facilities aimed toward upgrading to metro. It explains the opportunities for full conversion that were passed by and the conflicts between incompatible regional rapid transit plans and competing rail technologies. The accumulation of factors both physical and political that finally arrested the development of this light-rail operation are laid out step by step. Forces and counterforces that acted on this system as the wider community worked slowly toward regionalization of transit are described. Special attention is given to those local community concerns that finally closed the door to metro conversion when at last the opportunity and funding to convert seemed to be available. Guidelines are developed for planners, designers, and civic and transit leaders. /Author/ Landgraf, RJ (Greater Cleveland Regional Transit Authority) *Transportation Research Board Special Report Conf Paper* No. 182, 1978, pp 62-67, 3 Fig., 10 Ref.; This paper appeared in TRB Special Report No. 182, Light-Rail Transit: Planning and Technology.; ORDER FROM: TRB Publications Off

44 301440 ISSUES BEING FACED BY THE WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY. Cost estimates for constructing the national capital's rapid-rail transit system have increased from \$2.5 billion in 1969 to \$6.8 billion at the end of 1978. Metro attributes almost half of the increased cost to schedule delays and cost escalation. Neither of the figures includes \$3 billion of estimated financing costs associated with the revenue bonds sold to help finance construction and some other adjustments. The Federal Government's share of all costs is projected at \$7.4 billion and the state/local share

at \$2.7 billion. This report discusses whether costs should be paid through fares or area taxes; the effect of Federal funding being less than Metro says it needs; the need for a revenue source dedicated to pay the costs of mass transportation; the issues surrounding parking at rail stations and subsidized employee parking; handicapped accessibility.

General Accounting Office CED-79-52, Apr. 1979, 82 p., 3 App.; ORDER FROM: General Accounting Office, Distribution Section, Room 1518, 441 G Street, NW, Washington, D.C., 20548 NTIS: PB-293959/3ST

44 303293 BART/BUS COORDINATION: INSTITUTIONAL AND POLITICAL CONSIDERATIONS. An attempt is made to point out the more subtle political and institutional aspects of coordination negotiations which tend to be overlooked by parties involved in the complex process of attempting to provide comprehensive public transit service. The article emphasizes the process of service coordination planning among the Bay Area Rapid Transit District, the San Francisco Municipal Railway, and AC Transit (Alameda-Contra Costa Transit) and later the Metropolitan Transportation Commission, since the early stages of BART development. The Bay Area with its strong political fragmentation and diversity of transit operators and their constituencies, is a unique example of institutional constraints which have hampered the long-term objective of achieving cost-effective and efficient coordination of transit services. A number of policy implications can be deduced from the Bay Area experience of attempting to coordinate the transit services of two existing local public transit operators with a new regional rapid rail transit operator. These implications relate to the organizational structure, the rapid rail system design, the transit service policy coordination, and the role of the regional authority.

44 303594 PRINCIPLES ON OFFICIAL CONTRIBUTIONS TO UNPROFITABLE PUBLIC TRANSPORT [Principer foer samhallsstodet till olonesam kollektiv persontrafik]. The aim of this report is to analyse the present system of official contributions to the collective passenger transport in Sweden, how the responsibility for this transport is divided between the state, the county administrations and the communities, and to give an outline for a possible alternative. The report limits itself to the unprofitable regional and local collective transport with the main emphasis on the railway traffic. The division of responsibility means a possible risk of factors other than traffic or socially economic governing the choice of transport means in the regional and local transport, as well as making the integration of a transport system within a region difficult. Also, the present system of contributions does not make possible a separation of different transport forms. The main advantages of the suggested alternative are: the same body decides the standard, the volume and the rates for the bus and the railway traffic. The head of the institution is responsible both for the planning and the expenditure, and the bus and the railway traffic have similar responsibilities re-

garding expenses. The contribution system becomes more neutral regarding choice of transport means and will be in harmony with the demand for the provision of transport. Unprofitable traffic on the two railway nets will be treated in a similar way. [Swedish]

44 303955 INSTITUTIONAL AND POLITICAL CONSIDERATIONS OF BART AND BUS COORDINATION IN THE SAN FRANCISCO BAY AREA. The experience of the San Francisco Bay Area with discussions and negotiations regarding coordinating bus and Bay Area Rapid Transit (BART) should be of interest to other metropolitan areas currently operating or constructing new rapid transit systems. While the technical aspects of implementing such service, for example, mutual fare-collection systems and realignments of routes and schedules, tend to be the more frequent subject of discussion among transportation professionals, the subtler political and institutional aspects of consideration negotiations can be the deciding factors leading to implementation or, conversely, to the continuation of duplicated transit service and inadequate feeder-bus service to rail transit stations. The service-coordination issue, then, calls for politically acceptable and institutionally feasible responses as well as technical studies. The Metropolitan Transportation Commission, a regional transportation planning agency for the San Francisco Bay Area, armed with the authority to allocate local and federal discretionary transportation funds, has established a framework that acknowledges the political and institutional constraints to BART-bus coordination and facilitates negotiations among the transit operators. While a resolution to the service-coordination issue is still off in the future, the Bay Area experience thus far has implications for other regions faced with similar transit problems.

44 310371 CAN BUS REPLACE TRAIN OR WILL THEY NEVER LEARN? This booklet is intended as an appeal to the government not to repeat policies made in the "Beeching era" during which time many railway lines were closed and replaced by bus services. The arguments for and against replacement buses are presented. Some case histories of lines that have closed together with the fate of their replacement buses are described. Some of the lines which might be considered as possible candidates for bus replacements are considered. A final chapter discusses some of the possible future developments for buses and trains touching on the following topics: urban buses, rural buses, post buses, community minibuses, car-sharing, minibuses, fuel, coaches, integration and community involvement. An appendix lists services, which in the publishers view are threatened. (TRRL)

44 310386 FREE COMPETITION OR POLITICAL CONTROL [Fri konkurrens eller politisk styrning]. This dissertation constitutes a study of Swedish transportation policy. Its point of departure is the decision on transportation policy passed by the Swedish parliament in 1963. There was broad consensus on this decision, yet it would later become the subject of much controversy. The object of study is the 1963 decision, its implementation and effects, as well as the ensuing debate. This implies a study at two levels: the reality level and the debate level. The decision has for fifteen years decreed the development of the transport sector. It implied that there would be free competition of the transport market: cars and trains would compete on the same conditions. Gradually as motorization has increased and public transport has developed more and more problems, the decision of 1963 has become one of the most criticized, political decisions in Sweden. The debate of transport policy has to a considerable extent concerned the question of free competition or political control on the transport market. In this book, a survey of this debate is given. More than 2000 contributions to the debate have been analyzed concerning the questions: (1) Was the decision of 1963 a good decision? (2) Has the decision been practiced in accordance with the guidelines? (3) What are the effects of this decision? After a description of how the decision is practiced and a discussion of the effects of the decision the results are appended to a general picture. (TRRL) [Swedish]

44 312258 COORDINATION OF TRANSPORTATION BY HUMAN SERVICE AGENCIES: AN INTERORGANIZATIONAL PERSPECTIVE. Human service agency transportation systems are studied and the coordination of public transit and human services is studied in detail. A review of the literature of interorganizational behavior led to the development of a model of the coordination process which studied the entire process including the factors which influence an agency's willingness to coordinate. Characteristics of sets of agencies which facilitate or impede coordination, and the external forces which may influence the process were also studied. It was found that the most significant factor which affected the agency's willingness to coordinate was whether they perceived that the potential financial benefits were worth the loss of control which might result from coordinating with other units. Willingness to coordinate was also related to the nature of the agencies' commitment to transportation. Agency directors were sensitive to the fact that coordination needs some administrative effort and were more willing to coordinate if they had the time to enter into the necessary negotiations.

44 313909 HOUSE SELECT COMMITTEE TO INVESTIGATE SEPTA. Under mandate of House Resolution 118, passed on July 11, 1979, the Pennsylvania House of Representatives established a Select Committee to Investigate the Southeastern Pennsylvania Transportation Authority. During the ensuing six months the Committee conducted public hearings, toured SEPTA facilities throughout the service region, and analyzed data submitted by SEPTA and other witnesses. The result of this work is the Committee's completed 152 page report. The

major areas of concentration in the study are accountability by the authority to other governmental agencies and the public, public transportation financing, organization and powers of the SEPTA board, and the management of the authority. The report describes the most severe problems of SEPTA and makes recommendation for the alleviation of these conditions.

44 314379 ACCELERATED IMPLEMENTATION PROCEDURES. The bulletin describes the adverse effects of procedural delays and difficulties on the implementation of new transportation technologies, and suggests some practical solutions to this problem. Two Federal activities of special concern are the Urban Mass Transportation Administration's demonstration, capital and operating assistance, and the Federal Highway Administration's Federal-Aid Urban-System Program. Questions examined include program flexibility, local credibility, matching policies, and the overall complexity of the process.

44 319563 TAXICAB DEREGULATION: ECONOMIC CONSEQUENCES AND REGULATORY CHOICES. The regulation of taxicab services is receiving an increasing amount of attention by city governments. At issue are the questions of whether local regulations should limit the supply of taxicabs and whether the regulations should control taxi fares. Recently, deregulation has become a popular suggestion; however, little empirical or theoretical evidence has existed to indicate the effects of taxi deregulations. This paper discusses these effects within a framework of eight regulatory scenarios involving different price, entry, and industry concentration factors. The analysis provides support for a public brokerage function.(a) (TRRL) various traffic volumes and compositions.

45 050335 ON RIPUPS, RIPOFFS, AND RESURRECTIONS. The case is made for preservation of railroad rights-of-way for future use both for freight service and for rapid transit in urban areas. It is pointed out that BART is to a great extent a replacement of the abandoned Key System. It is also noted that the Chicago area lost the Chicago, Aurora & Elgin and the North Shore Line only recently. It is suggested that the energy crisis may force more freight back on to the rails. Even if current operations are to be suspended, total loss of the right-of-way should be prevented by a 'soil bank' for railroad routes.

45 050745 TRANSIT STATION JOINT DEVELOPMENT. Research was conducted to survey the problems and opportunities relating to joint development around transit stations of existing or proposed transit systems. The six sites selected for case study include the San Francisco Bay Area, Boston Metropolitan Area, Buffalo, Chicago, New York, and Washington, D.C. The objectives of the project were to assist representatives of local agencies in the preparation of draft applications to UMTA for funds to do joint development planning, and to provide a report identifying possibilities for and constraints to transit station joint development. The city applications are included in an appendix. The report discusses six major general categories of constraints to joint development with respect to legal, economic, institutional, and engineering and design factors. The recommendations of the report to provide a stronger basis for joint development relate to changes in the approach to transit station planning and implementation, Federal financing, Federal coordination and evaluation of transit station planning, and changes in State legislation. The text includes 20 illustrations, which includes a suggested organization diagram for transit station area planning.

45 051420 ON THE ALLOCATION OF LAND TO URBAN TRANSPORTATION. Land is one of the more important inputs in urban transportation. The purposes of this paper are: (a) to present a theoretical model of a city that will explain the amount of land devoted to transportation in various parts of a city, and in cities of different sizes; (b) to try and examine whether the available data on the amount of land used for transportation in various cities, and in various parts of the same city conform to what is expected according to the model. The model that is presented is a fixed coefficients model. The main feature of the model is that it allows explicitly for the use of land in transportation.

45 051912 SPATIAL AND TEMPORAL EFFECTS IN RESIDENTIAL SALE PRICES. To assess the extent of the impact upon housing prices of the introduction of a modern suburban rapid transit service, a two-way unbalanced analysis of variance model is estimated with residential sales price data. Inflationary and time stable neighborhood effects are accounted for in this manner. The first term of the singular decomposition of the interaction matrix summarizes the interaction, and may indicate the nature of the impact. Since the residuals from the additive model are too dispersed and negatively skewed to be normally distributed, the application of outlier-editing and robust estimation procedures is discussed.

45 057033 SUBWAYS AND LAND USE. This paper develops a general equilibrium model of a city with two transportation modes. One mode is land intensive, that is, roads, while the second is land economizing, that is, subways. The effects of subway construction on land values and land uses in a metropolitan area are discussed. An important implication is that, if a subway system is worth constructing, it will have a suburbanizing effect on the city. In addition there will be considerable impact on housing prices and land values, but these changes will not totally offset each other.

45 071623 URBAN TRANSPORTATION ACCESSIBILITY MEASURES: MODIFICATIONS AND USES. The interaction between land-use activities and the transportation system is usually estimated by means of accessibility measures. This article discusses in general terms, the concepts, uses and mathematical formulation of accessibility measures. A new formulation of accessibility, measured by the travel impedance and the interaction between land-use activities is proposed. This measure would then be used for evaluating alternative transportation plans. It is claimed such evaluation is superior to methods of cost benefit analysis, since it takes into account not only the transportation costs but also the number of interacting land-use opportunities.

45 071770 SOCIAL IMPLICATIONS OF LAND USE AND MODE CHOICE. Three sets of analysis are described which suggest that the choice of public transportation is related to higher

land use density. The first analysis is based on the New York Region's journey-to-work data of the 1960 census, concluding that higher employment and residential density will increase the proportion of transit users and that the proximity of jobs and housing to one another has important advantages for the low income worker because of shorter trip length. The second analysis, a theoretical examination of a hypothetical suburban area based on models developed in the first analysis, suggests that the clustering of housing around a large job concentration has benefits with regard to limiting highway construction. The third analysis suggests the residential densities at which public transportation can work. The trend today is away from the high densities that can support public transportation. The dilemma can be solved if higher densities of development are built.

45 081008 GROWTH MANAGEMENT: A NEW FRAMEWORK FOR LAND USE AND TRANSPORTATION PLANNING. This paper examines the role of the "growth management" framework being built at the local level and its effect on land use and transportation planning. Two considerations, fiscal and environmental, are basic to the position of local leaders who advocate managing or controlling growth along some rational lines. The key elements of growth management presented in this paper include tight controls over capital expenditures for water and sewer facilities and for transportation (both highways and transit); innovative revisions of zoning and subdivision regulations; coordinated administration of open space and park development programs; and initiation of new public mechanisms for joint public-private efforts in land development. Beyond these basic considerations, there are two other trends of particular significance. One is that the role of land use planning is taking on increasing significance as an integral part of the movement to manage growth. The other is the highway planning, which has dominated the transportation field, is losing its prominence in the local arena. This paper identifies three implications for transportation planning: Highway planning, as such, will come to have a new relationship to the local land use planning process; highway planning will be more fully integrated into a broader discipline of transportation planning based on multimodal movement of people and goods within growing urban areas; the linkage between transportation and land use planning will become a great deal closer in the future, with a set of relationships and feedbacks that will substantially cement the two disciplines.

45 096103 IMPACT OF A HIGH SPEED RAPID TRANSIT FACILITY ON RESIDENTIAL PROPERTY VALUES. A very simple model of a radial transport investment impact is developed from the economic law of market areas. The model delineates spatially the areas that will be served by competing modes and by competing stations under Von Thunen assumptions that all economic activity takes place at the city center. The market area of the investment is shown to be also impact area of the investment. Benefits of the investment are in the form of transport costs saved by the users of the investment. Contours of equal benefit are easily derived from the analysis and shown to be hyperbolas. These savings will tend to be capitalized into the price of the properties in the impact area of the investment. The model is empirically estimated in the context of the Philadelphia-Lindenwold High-Speed Line. A regression model indicates that the savings variable is significant, has the correct sign, and represents an increase of \$149 in the sales price of a property for each dollar of daily savings that a commuter residing on the property receives. Overall, the benefit to the property owners in the Lindenwold Line's impact area is approximately \$34 million dollars.

Allen, WB Boyce, DE (Pennsylvania University, Philadelphia) *High Speed Ground Transportation Journal* Vol. 8 No. 2, June 1974, pp 53-60, 3 Fig., 1 Tab., 9 Ref.

45 096148 TOOLS FOR URBAN LAND USE-TRANSPORT STRATEGY PLANNING. Urban strategy planning studies are directed towards the estimation of the transport demand and other servicing implications of a range of urban development alternatives. A land use-transport model is described which may be used to estimate the implications of alternative public development policies. These policies may include servicing and transportation options, basic and service employment location alternatives, and zoning. The model calculates an internally consistent co-distribution of population and employment along with the associated travel demands for set of public policies. A corridor-level traffic assignment technique is described which may be used along with the land use-transport model to develop corridor travel demand estimates for each development concept. Computer-based procedures for estimating the servicing requirements of alternative development concepts are also described. These procedures directly employ the land use allocations calculated by the land use model. The use of the analytical tools is illustrated with information from the Hamilton area.

Hutchinson, BG *Canadian Journal of Civil Engineering* Vol. 2 No. 1, Mar. 1975, pp 85-97

45 096660 PRELIMINARY RESULTS FROM AN INTEGRATED TRANSPORTATION AND LAND USE MODELS PACKAGE. This paper describes the results, to date, of an effort to integrate a land use model with a transportation network model for the purpose of analyzing the inter-relationships of transportation facility development and land development. In the system which has been developed each model provides input to, and receives feedbacks from, each other model. To the author's knowledge, the effort described here represents the first successful attempt to develop and test an integrated model package involving these reciprocal relationships. The results obtained from preliminary runs of this package should be of considerable interest to both transportation planners and land use planners. With this integrated system it has been possible to observe the interrelationships, and in particular the feedbacks, between land use and levels of traffic on the networks. Preliminary results indicate that congested networks produce tendencies toward metropolitan centralization. Attempts to relieve congestion seem to produce metropolitan decentralization and increased travel which lead, in turn, to metropolitan sprawl and increased spread of congestion. /Author/TRRL/

45 096891 URBAN TRAFFIC MODELS, VOLUME 1. Ten papers are presented which cover aspects such as the policy modelling interface, design in urban simulation, land use, prediction of planning parameters, parallel rail services and future development in this field of transportation studies. The problems of daily travel are covered in the paper on "The Future of Transportation Studies". Changes of emphasis in policy, the

implications for modelling and the impact of methodology are examined in "The Policy-Modelling Interface." The paper on the Polis Simulation Model describes a computer planning instrument which combines dynamic simulation of spatial urban development, advanced transportation modelling techniques, and multiattributed evaluation methodology. A unified approach to a class of iterative equilibrium methods based on the general approach of feasible-direction methods in non-linear programming is presented and incremental methods of the assignments problem are discussed in another paper. "Land Use and Transport Interaction" examines patterns of the trip length distributions by mode analyzed by distance of one end of the trip from the conurbation center. The structure of a city of a macro or conurbation level is considered in the paper. "Urban Land Use and the Derived Demand for Transportation". Another paper describes the matching of input requirements of a transportation model in terms of the land use data predictions (in terms of population and employment). Other papers included here are: "Some Considerations Concerning Technological and Economic Capabilities of New Urban Transportation Systems and their Influence on City Structure;" "Methods of Relating the Provision of Public Transport to the Planning of Land Use Development;" and "Reduced of Road-Traffic Volumes by Parallel Rail Services."

45 096910 TECHNIQUES OF LAND USE/TRANSPORTATION PLANNING IN AUSTRALIAN CITIES. With the publication of the Sydney area transportation study, land-use/transportation studies now have been conducted in all capital cities as well as in the majority of other urban areas with populations in excess of 40,000. A review of these studies is made and a qualitative assessment is attempted of the technical phases-land-use planning, trip-generation, trip-distribution, modal-split, traffic assignment and evaluation. Full summary results of this comparative survey are presented in tabular form, although themes developed in the text are illustrated with specific examples from individual studies. The methodology of land-use/transportation studies has been attacked by some Australian writers. An attempt is made to assess the relevance of these criticisms when applied to the practical planning process in Australia. /Author/TRRL/

45 097122 INTERACTION BETWEEN PUBLIC TRANSPORT AND URBAN DEVELOPMENT. It is essential to abandon the concept of the city as a separate element and to plan for whole regions involving a number of metropolitan areas and transportation networks. Public transportation will be a vital element in the implemen-

tation of planning to restore a balance between the center and the rest of the city. The further demands for mobility, which economic growth will inevitably continue to generate, will have to be met by giving priority to public transportation. Efficient integration of all transportation systems through complementary services, is the only way of ensuring continued movement.

Paschetto, A ; International Union of Public Transport Report 1, 1975, 57 pp; Presented at the 41st Annual Congress of the International Union of Public Transport.

45 098579 EFFECTS OF PUBLIC PROVISION OF ROADS ON THE STRUCTURE AND SIZE OF CITIES. It is argued that public provision of city streets introduces an illusionary reduction in the costs of urban transportation, and that this distorts the spatial pattern of land use and land prices in cities. The direction of this distortion is such that it favors use of peripheral land at the expense of land in central locations. The downward bias in the price of urban transportation introduces an upward bias in the size of cities. Because the prices that people face do not reflect the full cost of transportation, too many people are attracted to big cities. The phenomenon discussed here is a long-term one—an externality which is imposed in the long run when the capacity of the roads is variable.

Borukhov, E *Environment and Planning* Vol. 7 No. 3, May 1975, pp 349-355

45 126318 TRANSPORT CONTROLS, TRAVEL COSTS, AND URBAN SPATIAL STRUCTURE. This paper explores the implications of a number of different types of transportation strategies designed to reduce auto travel. Two kinds of policies are compared: those that increase the cost of travel by car, and those that improve the quality or reduce the price of public transportation. The first part of the paper deals with the instant or market period and the short run—that period of time in which households can change their method or travel but not their place of residence or work. A simple model of work-trip mode choice is developed for households. Using this model, individual responses to various transportation control strategies are explored. The second part deals with the long run, the time period in which households can adapt to changes in the relative cost and attractiveness of different modes of travel by moving their residence and/or their place of work. Similarly, firms can alter their locations. A basic urban land-use model developed by urban economists is adapted to explore the long-run changing patterns of land use. /GWU/

Goldstein, GS Moses, LN *Public Policy* Vol. 23 No. 3, June 1975, pp 355-380

45 128752 TRAVEL COST, TRANSIT, AND CONTROL OF URBAN MOTORING. Three issues relating to mass transit, motoring and land use are examined to ascertain the probable effects of policies designed to reduce vehicle miles travelled. The performance of various transit modes is analyzed, as are the effects of mass transit construction or subsidization on transit usage, motoring and land use. Consideration is also given to those policies which can be expected to reduce motoring and effect transit patronage. It is concluded that mass transit construction and subsidy have not substantially reduced automot-

bile travel. The importance attached to travel time is reflected in the tendency for transit usage to increase only until congestion is reduced. The most effective deterrent to increased private transportation appears to be imposition of social costs of private transportation upon the motorist.

Deweese, DN *Public Policy* Vol. 24 No. 1, Jan. 1976, pp 59-79, 2 Tab.; Presented to the Caltech Seminar series on Energy Consumption in Private Transportation Program VI: Land Use and Transportation: Future Patterns of Living, April 29-30, 1971.

45 128815 ESSAYS ON URBAN SPATIAL STRUCTURE. Seventeen essays are presented which summarize more than a decade of research on various aspects of urban economic analysis and policy. The essays are categorized in five parts: (I) residential and commuting decisions; (II) the location of jobs; (III) effects of racial discrimination; (IV) analysis of urban housing markets; and (V) urban transportation. Three essays analyze decisions by urban households on how much residential space to consume, i.e. at what residential density to reside, where to live within the metropolitan area, how far to commute, and what travel modes to use. The principal feature of analyses of the residential and commuting choices of urban household is the emphasis on the importance of specific workplace location as a determinant of housing, residential location and commuting choices. Research on employment location and the determinants of industry location are summarized. Essays are also presented which identify, trace and quantify the effects of urban discrimination and segregation in urban housing markets on the pattern of urban development and on black welfare. Partial equilibrium models, theoretical explanation of urban density functions, the various dimensions of housing bundles, and housing services for the behavior of housing suppliers are considered in an analysis of housing markets. Research findings are presented related to costs serving peak hour commuters by alternative technologies. The essay on the future of urban economics, identifies the forces influencing developments in the 30 years following the end of World War II, and places the essays presented here in the overall context of urban economics.

45 128819 COORDINATING LAND USE AND TRANSPORTATION: HOW IT WAS DONE AT THE COMMUNITY SCALE IN COVENTRY, CONNECTICUT. Methodology is described and a case study is presented for micro of community scale transportation planning. The plan for the new community in Coventry called for the construction of 400 and 500 dwelling units per year over a 15 year period, which would result in approximately 6000 units completed by 1990. The projected population for this new community was 20,000 persons. The goals for the new community from the inception of planning, had a direct and practical bearing upon the physical design of the new community's road system and upon planning for other transportation services. There are 6 basic elements in the micro scale planning process. (1) Initial plans—the outputs of this stage are a tentative land use plan, a tentative circulation system and

transit policy. (2) Internal zoning—a zone structure based upon internal street circulation must be established. (3) Trip generation—for each zone estimates should be prepared of two way residential trips. (4) External zones and opportunities. (5) Trip distribution and (6) traffic volumes and highway requirements.

45 131661 FISCAL IMPACT OF NEW TOWN AND SUBURBAN DEVELOPMENT. AN EMPIRICAL STUDY OF RESTON, WEST SPRINGFIELD AND FAIRFAX COUNTY, VIRGINIA. Over the past few years several new techniques have been incorporated into the process of planning for land development. One of significant interest is analysis of fiscal impact—the effect a community has on a local government's revenues and expenditures. Used primarily to predict the fiscal effect of a proposed land use change, fiscal impact analysis rarely describes what actually happens; more often it is used to compare alternative proposals for development. This article includes both: it is an empirical fiscal impact study which compares effects on finances of a single local government caused by a new town and a conventional suburb. According to data analyzed for Fairfax County, Virginia, the new town of Reston more than paid its own way in fiscal year 1971, while a conventional suburb, West Springfield, failed to do so. This outcome is due to several factors discussed below. Both communities are unincorporated places with similar populations. These two communities differ most obviously in their form: West Springfield (as designated in this study) is a typical Washington, D.C. suburban of single-family homes on quarter-acre lots, with a small townhouse cluster; Reston is a new town designed for commercial and industrial development concurrent with a variety of residential types and recreational open spaces. Fairfax County, located west of Washington, D.C., experienced rapid (350 percent) growth between 1950 and 1970. Both communities selected for this study developed during the 1960s; had approximately equal population in the 1970 U.S. census; are located outside the interest beltway which rings the District; had sanitary sewer service available during development; and are not centered by a pre-existent community. Fairfax County is the single local taxing jurisdiction for both communities and supplies the usual local government services such as education, library, and public safety. Fairfax County income from and outlay for both places are reconciled and observations are offered in this report. /Author/

45 132255 LAND USE AND TRANSPORTATION INTEGRATION IN IRVINE NEW TOWN. The paper starts with the description of the original planning proposals for Irvine New Town and the need, because of sub-regional developments and additional information, to revise the plan and the opportunity taken by the development corporation officials to integrate land use and transportation in conjunction with the public transport operators. Intrinsically

linked with the planning and construction of the new town is the financing method for the infrastructure provision and the shortcomings of this are highlighted and suggestions made as to how this might be improved following local government reorganisation. The paper was one of four presented at a conference in Edinburgh in January 1975. Arranged by the Scottish Association for Public Transport, and entitled "Public Transport and the New Regional Authorities", the conference was held against a background of local government reorganisation in Scotland which took place in May 1975. /Author/ /TRRL/

45 132277 THE INTERDEPENDENCE OF TRANSPORT DEMAND, PLANNING DEVELOPMENTS AND TRAFFIC PLANNING [Onderlinge afhankelijkheid van vervoervraag, planologische ontwikkeling en verkeersplanning]. This article deals with a model defining the interaction between transport demand, planning developments and traffic planning. The model is a general form of traffic model without any, with one and with two fringe conditions. With the help of the dynamic version of the model and simple exogene assumptions it is possible to stimulate developments, such as: urbanisation and suburbanisation; the springing up of a central town or agglomeration; the shifting of activities to the periphery of big cities under the influence of increasing car ownership. The article contains a few remarks about further evaluation of the model. /TRRL/ [Dutch]

Hamerslag, R. *Verkeerskunde* Vol. 26 No. 9, Sept. 1975, pp 440-451, 5 Fig., 4 Tab., 27 Ref.; ACKNOWLEDGMENT: Institute for Road Safety Research, TRRL (IRRD-216261)

45 134328 JOINT DEVELOPMENT IN URBAN TRANSPORT CORRIDORS. The concept of corridor development (in its several guises) embraces three main ideas: (a) the planned and complementary functional relationship between one or a number of modes of transport and the surrounding development, (b) the desire to obtain optimum economic rent from land within the immediate influence of transport routes involving, where desirable, the multiple use of transport lands, and (c) an embracing management framework for conceiving, implementing and monitoring the effects of corridor developments. The essential elements in jointly developing transport routes with adjoining land uses are securing land early, buying more than is immediately required, and managing it soundly before obsolescent property is demolished and re-developed, and replacing the acquired property with a diversity of new complementary uses. /Author/ /TRRL/

45 134763 TRANSPORTATION AND THE RECYCLING OF URBAN LAND. The current trend toward declining numerical growth, leveling off of economic standards, and the deterioration of the urbanized areas are reviewed, evidence that the limits of the urban system will be

determined by the travel time of citizens from residence to work is discussed, the need for shifting priorities and resources from the private car to transit and express busways is noted, and the need for recycling land use and the problems of transportation investment are emphasized and illustrated with two alternative scenarios. The first Scenario projects into the future by extension of current trends, instrumentalities and resources. Without a positive policy of disincentive for outward expansion, the trend of outward growth and migration from the older neighborhoods will continue. The second scenario anticipates the emergence of a high level of political sophistication, of a willingness to formulate and provide support for anticipatory interventions in preference to remedial ones, and the emergence of a high level of comprehensive rather than fragmented exploration, planning, and programming. This scenario has no categorical distinctions between plans for transportation and plans for recycling. Arbitrary divisions and allocations of responsibilities have been liquidated, and a single coordinated governance of the process of functioning and change within the urban system has been instituted. Details are briefly outlined of economic disincentives for outward expansion, a continuously updated master plan of urban processes, new systems of public transportation, a new implementation instrument—a neighborhood recycling corporation, and short-term, low cost improvements.

Contini, E (Gruen Associates) *Urban Land* Vol. 35 No. 4, Apr. 1976, pp 6-11, 1 Fig.

45 134878 JOINT DEVELOPMENT: INSTITUTIONAL CONSTRAINTS AND POTENTIALS. The need and the opportunity to achieve joint development of various transportation facilities and such facilities and land use are now greater than ever. However, if joint development is to occur on a significant scale, a number of financing, organizational, legal, and other institutional techniques must be developed and applied. A recent amendment to the National Mass Transportation Assistance Act of 1974 appears to be a step in the right direction. A number of other steps, some of which are described in this paper, should be pursued. For example, legislation should be pursued. For example, legislation should be adopted by states that will permit agencies and corporations to undertake developments that span several modes or functions. In many situations, too, legislation is needed to permit "tax increment" and other innovative forms of financing to be used to stimulate needed development. It is important that further work be done soon to refine these techniques so that they can be applied to the many highway, rail, transit, airport, and similar projects where they are needed.

45 134885 DIRECTING THE EVALUATION OF URBAN LAND USE TO ACHIEVE IMPROVED TRANSPORTATION SYSTEM PERFORMANCE. This paper investigates the potential for directing the growth of an urban region so that the evolving urban form contributes to high levels of access opportunity with

minimum travel requirements. Measures of total travel, accessibility, and spatial equity are defined for use in the evaluation of alternative urban spatial patterns. A computer-aided investigation determines optimum locations within the urban region for expected growth. Repeated application of a technique for assigning small increments of growth results in the definition of a high-performance growth path for a 10-to 20-year period. As a case study, the population and employment growth forecast for 1970 to 1990 for the Puget Sound region in the state of Washington is assigned to subregions. Contrast of the study results with current growth trends reveals that new travel requirements could be reduced by two-thirds, access levels could be improved 4 times, and distributional equity could be improved 3 times. These results are judged to be significant enough to warrant further intensive investigation into the feasibility and desirability of actually trying to achieve an urban form that could produce such dramatic improvements in transportation system performance without further substantial investments in capital-intensive transportation facilities or highly subsidized transportation services.

45 137505 THE DESIGN OF URBAN GROWTH MODELS FOR STRATEGIC LAND USE TRANSPORTATION STUDIES. In the design of urban growth models for use in strategic land-use transportation studies, it is suggested that such models have a more important role to play in the initial testing and evaluation of land-use transportation options than has hitherto been recognized. This proposition is illustrated by reference to the development of one such model, the urban systems model (usm) which has recently been adopted by the United States Department of Transportation and which is currently being applied to the Dallas-Fort Worth metropolitan region of Texas as part of an ongoing regional public transportation

study. Conclusions are drawn on the direction in which the design of urban growth models should be moving if their potential in this area is to be fully realized; and on the particular implications of this for conventional transportation models. /TRRL/

Turner, CG *Regional Studies* Vol. 9 No. 3, Nov. 1975, pp 251-264, 10 Fig., 2 Tab., 36 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 218806)

45 137670 URBAN ACTIVITY PATTERNS AND MODAL SPLIT IN THE JOURNEY TO WORK. Relationships between modal split for the journey to work and patterns of social and economic activity in large urban areas are investigated in this paper. Small zone data from six major land-use transportation studies were used as a basis for a systematic comparative analysis of these relationships. Three of the studies were British-London, West Midlands and Selne-and three American-Tri-State, Penn-Jersey and Los Angeles. Standard correlation and regression programmes were employed on a wide range of data, using three distinct approaches. Our first models were based on all trip origins and destinations for each zone, while the second set analyzed the major inter-zonal traffic flows. A third group of models assigning all trips to a shortest route network and investigating the modal split along each link was attempted, though not fully explored due to computer limitations. The results reveal the overriding influence of car-ownership on modal split, but also demonstrate the limitations imposed by urban structure in the form of employment and population densities. Sammons, R Hall, P ; Reading University, England. (0 7049 0337 7) Monograph Paper No. 32, Nov. 1974, 60 pp, 6 Fig., 19 Tab., 12 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 218730)

45 137959 THE ROLE OF THE LOCAL AUTHORITY PLANNER. An account is given of transport problems emphasizing the conflict between availability of cars and limitations on fuel resources. Past planning policies and the increase in movement they caused are described and future policies suggested. Broader issues are reviewed including the use of other non-renewable resources and the problems of noise, pollution and visual intrusion. It is suggested that the role of the town planner would be in working in collaboration with the engineer and public transport operators where he would be able to contribute in fields where intangible environmental considerations are involved. In the discussion which follows, the effect of the fuel crisis on transport planning is considered and delegates describe experiences of teamwork. Other topics covered included segregation by time and the problems of public transport in residential areas, particularly new towns. /TRRL/

Wood, AA (West Midlands Metropolitan County Council, England) Ennor, PD ; New Castle-Upon-Tyne University Monograph 1974, pp 3-12; Proceedings of the symposium of Co-ordinating Public Transport.; ACKNOWLEDGMENT: TRRL (IRRD 219540)

45 138173 OF LAND, LEISURE AND ENERGY. Replanning land use to include accessible recreation areas for all will require coordination of park and transportation policies and a change in American life style. Public transit systems have

been geared to getting commuters to and from their jobs and tend to stop functioning at times when recreation demands could be made on them. Walk-to parks are of great importance to inner city residents because regional parks have been designed to serve the mobile middle and upper classes. Federal and state policies can make regional parks available to urban dwellers with preferential funding, setting top priority on projects with transportation resources. /DCK/

45 139634 DEVELOPING TRANSPORTATION AND LAND USE ALTERNATIVES IN TORONTO. The Metropolitan Toronto Transportation Plan Review is discussed with special reference to public participation, developing transportation and land use alternatives, and the testing and evaluation of alternative systems. An attempt is then made to highlight some conclusions which may have general relevance to transportation planning in any urban area. The Toronto Review did not recommend a single transportation plan but described a number of alternatives for different development alternatives. An attempt was made to point out the degree of commonality associated with specific transportation decisions sufficient information was provided for each of the transportation components to evaluate their effectiveness and desirability in terms of the measures related to demand satisfaction, economics and other criteria. Based on the commonality aspects of specific transportation projects and the ways in which they contribute as part of an overall system to long-range development objectives, individual transportation decisions were categorized into those that were neutral and those that had a high degree of impact on development. An attempt was also made to indicate how certain short-term improvements could be made to the existing transportation system in ways that would ensure that subsequent investment in major projects would produce the highest payoff possible in terms of effectiveness.

45 139638 NEIGHBORHOOD AND OTHER LAND USE CONSIDERATIONS. Comments are made on 4 papers relating to transportation and land use alternatives, public participation in transportation planning, neighborhood traffic management, and the effectiveness of pricing in restraining city traffic. It is noted that urban needs and the ways in which they may be satisfied require greater study. The question is asked if the methods used to generate public participation are getting at the fundamental issue: is the public participating in planning the transportation it wants? It is noted that most transportation efforts are at the systems level while people's concerns are at the local level. Another point which is

raised concerns the degree to which we accept current travel patterns and trip habits as a basis for predicting future travel patterns. The observation is made that transportation is essentially a political process. This must be recognized and the choices implied in land use and process. This must be recognized and the choices for local politicians and decision makers. Comments are also made regarding the sociological implications of urban planning.

45 144014 THE IMPACTS OF BART ON PROPERTY VALUES-A CASE STUDY OF THE ROCKRIDGE NEIGHBORHOOD. This report describes BART's impact on the sales price of single-family houses in the Rockridge neighborhood. The Rockridge area of Oakland and its recent history are described as the hypotheses to be tested, and the general research strategy. Four specifications of an econometric model are discussed, and the variables used in the regression equations are identified. The before-after, the cross-sectional and the cross-sectional-longitudinal approaches are evaluated. The four models were used to test the null hypothesis that changes in sales prices of comparable houses did not correlate with distance to the BART station.

45 153313 URBAN ECONOMICS, THEORY AND POLICY. The book deals with the financing of local government expenditure, regulation of urban land-use patterns, limitation of traffic congestion and control of urban environmental decay. The theoretical background is given, followed by a more detailed discussion of current urban problems from the economist's view point. Chapters are included on: the economics of geographical concentration, intra-urban location and land use, the urban labour market, the dynamic urban economy, the theory of city size and spacing, the urban environment, the urban transport problem, urban housing, the urban public economy, urban planning. /TRRL/

Button, KJ (Loughborough University of Technology, England) ; Macmillan Press, Limited, (33185943) Monograph 1976, 218 pp, Figs., Tabs., Refs.; ACKNOWLEDGMENT: TRRL (IRRD 224386)

45 153991 URBAN TRANSPORTATION AND LAND USE: A BIBLIOGRAPHY. This bibliographic reference guide to urban transportation and land use literature contains publications that synthesize the relationships among people, movement systems, and land uses in medium-size urban areas. It also samples literature on diverse topics such as car pooling, travel disincentives, pedestrian movement, zoning, traffic restraints, bus lanes, and travel behavior. The primary emphasis is on qualitative knowledge regarding the land use-transportation interface. As such, it is designed for public policy makers, interested citizens, and professionals in the planning and design disciplines. The 1107 citations are categorized into eight general areas: transportation, urban areas, activity and travel, urban form, land use, urban development processes, bibliographies, and miscellany. Author and subject indexes are included.

45 155577 DFW GETS IT ALL TOGETHER FOR DEDICATION THIS MONTH. This article comments on the planning of the Dallas/Fort Worth facility and the related land use planning factors. The construction innovations implemented at DFW are briefly discussed, the special features of the central utility plant are described, and the ground transportation and planning aspects are reviewed. Comments are also made on the economic impact of the airport, and the

financing of the construction. The airport which was 3 runways and 2 additional preplanned primary runways, is designed to accommodate the wing spread and fuselage lengths for any foreseeable future aircraft. Among the construction innovations developed here was the construction of runways and taxiways with a new mechanized system for installing expansion and contraction bars. Terminal facilities are based on a circular design. Steam and chilled water are generated from a central utility plant located in the center of the terminal complex and midway through the spine tunnel. It is expected that the airport will contribute almost \$267 million in direct purchases of goods and services.

Airport Services Management Vol. 14 No. 9, Sept. 1973, pp 16-21 ACKNOWLEDGMENT: Federal Aviation Administration Library

45 155980 A REVIEW OF TRB ACTIVITIES: JOINT DEVELOPMENT AND VALUE CAPTURE. The concepts of joint development and value capture are summarized and the highlights of the TRB Committee conference are presented. Joint development is the use of corridors, station and stop areas to gain greater economic return on public transit investment and to achieve an improved environmental relation between transportation and land uses. Value capture is the returning to the public a portion of the increased value that attaches to private property by virtue of the development, with public tax money, of a public facility. The role that joint development and value capture will play in the financing and implementation of Dade county's regional transit system development program is described. An alternative analysis that takes into account detailed socioeconomic impact criteria, including joint development is presented and the need for close coordination between the transit system development activities and the local community planning process is addressed. The enabling statutes and constraints of planning joint development are discussed as well as the importance of joint development to the achievement of CBD development plans in Miami. A review of the historical land development changes that have occurred in the Toronto region as a result of the transit planning program are included, as well as the evolution and various results of joint development planning and activity in the U.S. and Canada during the past 15 years. Differing views of the best course of legislative and administrative action to encourage joint development were presented. UMTA emphasized that the entire exchange among local, state, and federal officials was critically needed.

45 157192 MODELING MASS TRANSIT ON URBAN LAND VALUES. In this effort to develop a multiple regression model for the study of the impact of mass transit on proximate land values, the major concepts which provide the basis for the model are first examined. These concepts include the land value and mass transit gradients. The property value model and the concept of housing and housing value are also detailed. The model formulated recognizes the relationship between property value and transportation costs. The impact of mass transit on

property values represents the capitalization of the reductions in travel costs (travel savings) afforded by a new transportation alternative, and therefore is a function of proximity of the improvement and to the CBD. The model provides for 4-fold improvement over similar models currently in use: the property value gradient is derived from empirical estimations; two property value gradients (the traditional value gradient to the CBD; and the mass transit gradient which is more sensitive to transportation improvements) were incorporated into the model; a residualization process was applied to control multi-collinearity by adjusting the effects of intercorrelation among the independent variables; a statistical method was employed to hold constant the factors that might effect property values other than the transportation improvement.

45 158065 TRANSIT STATION AREA JOINT DEVELOPMENT: STRATEGIES FOR IMPLEMENTATION. VOLUME 1. Joint development strategies seek to create three conditions in station areas: improved design, integrated transit and land development, and value capture. This study constitutes one part of an overall effort by UMTA to promote joint development (multiple use of transportation corridors and stops). This study addresses the practical means of implementing joint development. A major focus of this effort is to develop methods which could be used to make accurate estimates of the value capture potential of transit station areas. This report presents the results of a two years analysis of joint development and contains: (1) an analysis of 19 case studies of examples of transit/land use joint development; (2) an analysis of the impacts of transit on property values; (3) an analysis of 28 techniques—including regulatory mechanisms, taxation, land acquisition, and public assumption of risk strategies—available to local governments which can be used to foster station area development; and (4) a proposed model legislation for the creation of Transit Corridor Development Agencies. Three categories of constraints on joint development are identified: limited station area development and value capture potential; multiple ownership of land; and inadequate public/private and interagency coordination. Recommendations resulting from this study include suggestions for program revisions, more coordination among Federal departments, and better Federal-local relationships. This study indicates that the recapture of land values will prove an important but limited source of transit financing.

45 158066 TRANSIT STATION AREA JOINT DEVELOPMENT: STRATEGIES FOR IMPLEMENTATION ECONOMIC CASE STUDIES. VOLUME 2. Case studies is a separate and supplement volume to the Final Report of the Joint Development Study and contains the

complete reports on each of the station areas discussed in the Final Report. Case Studies reviews specific examples of joint development. Such an analysis permits an investigation of practical problems faced in creating joint development projects, and it provides a laboratory for testing the usefulness of alternative implementation techniques. Information in this report should be useful to planners. Thus far, transit planners have not included property value impacts as one of the variables used to determine route alignment and station locations. Case studies focuses on the economic analysis of land values in specific transit areas and purports to develop a simple and inexpensive methodology for estimating transit impact and providing a basis for value capture policy. The methodology used in the empirical research (described in Final Report) is conceptually simple and has been designed to be easily applicable by individuals who possess a good working knowledge of development conditions within a given station area. In this report the methodology was applied to the study of land values in fourteen different station areas in four cities: Washington, D.C., San Francisco, Baltimore, and Atlanta. Case Studies are "live" examples of joint development representing a variety of situations and reflecting diverse attempts to deal with actual obstacles. Work in this area covers historical examples as far back as 1900, as well as current projects and proposed developments.

45 164192 URBAN LAND USE AND TRANSPORT POLICIES. Cities are adaptive, and all cities work. An opportunity was recently available to examine the adaptation of various cities in both Britain and the United States, to different land use and transport policies, given differences in: (A) the access of the population to private motor vehicles, (B) the ability of the population to make residential location choice, and (C) the strength of controls on land use development. Three factors that (apart from fund shortages) seem to be encouraging similar transport policies in both countries are: (a) energy consumed in the transport task, (b) environment--pollutants generated in the transport task, and (C) equity--the relative opportunities available to different segments of the population. Because of the adaptability of the city, we are caught in something of a democratic dilemma, where the aggregations of our individual optimum actions cause a departure from our corporate optimum. Some implications of these factors for urban transport planning are examined. /Author/TRRL/

45 164436 EVIDENCE OF LAND USE IMPACTS OF RAPID TRANSIT SYSTEMS. This paper draws from the findings of published

empirical studies and observations of the impacts of rapid transit systems on urban development. Analysis is based on comparisons of impact findings by different researchers and for different cities. An initial set of key issues is proposed, against which available information is arrayed and compared. It is concluded that rapid transit can have substantial growth-focusing impacts, but only if other supporting factors are present.

45 165493 ACQUISITION OF LAND FOR JOINT HIGHWAY AND COMMUNITY DEVELOPMENT-EXECUTIVE SUMMARY AND MAIN REPORT. Excess or expanded acquisition by public agencies to provide sites for public and/or private development projects adjacent to transportation facilities is limited. This report examines legal, financial, political, and administrative parameters of four types of takings: remnants or remainders, acquisition for protection of the facility or adjacent land from adverse impacts, recoupment of project costs, and acquisition expressly for joint development. Case studies are made of actual projects in six States (Arizona, Florida, Kentucky, Maryland, New Jersey, and Nevada) and on the Toronto subway system. In several cases the highway or transportation agency was used as an arm of the local government to undertake expanded acquisition. Few acquired properties were sold; typically the highway agency or local government leased the sites on a long-or short-term basis. In most cases a formal inter-agency group coordinated and directed the process from acquisition through site development, and there was significant public support and high quality technical and political leadership. The study recommends that highway agencies broaden their financial and administrative support to highway corridor planning by: (1) identifying surplus land already in their ownership and working with communities and community groups to determine where and how this land could be used for mutually beneficial joint development projects, (2) offering the services of their skilled personnel to communities interested in joint development, and (3) encouraging local communities to adopt their own acquisition programs and regulatory techniques to capture the wide range of public benefits of highway development.

45 167487 LAND USE AND TRANSPORTATION MODES. The first part of this report addresses the question of whether multi-activity clustering is the emergent land use pattern. One urban area, Atlanta, Georgia, is examined. The purpose of the analysis reported in part I is to see if concentrations that are not so easily visible are emerging. The second part of the report starts from the premise that such localized clustering exists, but that the clusters are less concentrated than is desirable or possible. The study examines how the excessive spreading of high intensity activities, such as stores and offices, along arterial frontage came about, and how this spreading-out can be reduced. The study findings contain some significant implications for metropolitan transportation and development planning. One is that the conventional orientation of high-speed, high capacity transit towards a single core makes sense. The expansion of the area of intensive development indicates another possible transportation need. A high-frequency, short-haul public transit distribution system, one that could be insulated from competition with private autos for congested street space, is considered to be very desirable. In this research, three forms of analysis were used: Factor and principal component analysis, regression analysis, computer map analysis. The computer mapping was found to be more informative, convincing and interpretable. It also gave very useful spatial information to guide initial strategy development for transit.

Fredland, DR ; Florida State University, Tallahassee, (FL-11-0003-14) UMTA-FL-11-0003, Sept. 1974, 115 pp, 21 Fig., 6 Tab., 33 Ref.; This report was made possible through the support of DOT, U.S. Urban Mass Transportation Administration.

45 167601 IMPACT OF TRANSIT LINE EXTENSION ON RESIDENTIAL LAND USE. ABRIDGMENT. The purpose of this paper is to investigate the effectiveness of zoning regulations in controlling residential land development in a community that is served by a new extension line of a high-speed rail rapid transit system. A mathematical model was established to determine the significant variables that explained the rapid development that took place in Quincy, a suburb of Boston. In the transit impact study, travel time, zoning policy and public transportation service variables were used in this model. Data was also collected for the period 1963-1973 and stratified by traffic analysis zone. The impact of transportation on each analysis zone was measured by the transportation service variables. Multiple linear regression analyses were performed on various linear and log-linear transformations for the variables. The mathematical model for the city of Quincy illustrated that residential land development will be stimulated by the construction of the new extension line of the rapid transit system. Land developers will begin construction of new housing units with construction of the new transit

line if initiated, and will not wait until the line is open for service. Zoning regulation is a significant mechanism for controlling the location and type of land development. Neighborhoods that are primarily zoned for single and two-family dwelling units are particularly vulnerable to rapid change in neighborhood character, if zoning a regulation permits construction of medium and high-density units. Since transit service variables are not statistically significant variables, they have no quantifiable impact on land development.

45 167967 BUSWAY VERSUS RAIL TRANSIT--A LAND-USE PERSPECTIVE. Inherent in the decision between implementing a busway and rail branch are "perceived" or expected land-use impacts attributed to each mode. External to the decision-maker, time and market generally influence land patterns more than modal choice. Unfortunately, perceived impacts related to mode choice exist in the mind of decision-makers and frequently control the mode selection process. This paper examines the land-use assumptions and perceived impacts formulated during a busway versus rail branch alternative analysis in Atlanta, Ga. The principal assumptions utilized in the decision-making process are described and analyzed. Deficiencies in the process are identified and means of improvement are presented.

45 168032 THE GROWTH SHAPERS--THE LAND USE IMPACTS OF INFRASTRUCTURE INVESTMENTS. This book examines the major role which many public facilities, termed "infrastructure" investments, play in the local development process. It covers such facilities as water and wastewater systems, power supplies, highway and secondary road networks, mass transit systems, and airports. Such investments affect local growth by influencing the location and costs of new construction, and can have a powerful effect on the density, timing, and amount of new development. This handbook is intended to improve understanding of the link between infrastructure and land use. /GMRL/ Urban Systems Research & Engineering, Incorporated May 1976, 71 pp; ACKNOWLEDGMENT:

45 169227 POTENTIAL FOR BETTERMENT--DISTRICT FINANCING AND JOINT DEVELOPMENT APPLICATIONS TO SURFACE TRANSIT. The report proposes a general methodology for evaluating land use and investment activity with respect to land in the vicinity of surface transit facilities. The three major objectives were: (1) to determine if there are incremental benefits accruing to land near bus, trolley, and by inference light rail facilities; (2) to examine equity issues in potential tax benefit districts serving such facilities; and (3) to examine the potential of joint development with respect to surface transit. An underlying objective was the presentation of an interactive spatial analysis system suited to the small-scale study of transit system impacts and relationship to their environment. Primary focus was directed to exploring locations in the vicinity of multiple routes where levels of commercial and multi-family new investment might be particularly high. The study concludes that the use of special benefit districts would be difficult to operationalize and that joint development opportunities are encouraging.

45 169261 TRANSIT'S ROLE IN THE CREATION OF THE POLYCENTRIC CITY: AN INITIAL ASSESSMENT. The report investigates the role of transit in aiding the implementation of land use plans that call for the creation of major diversified centers in the outer city. The polycentric city concept is defined and illustrated by reference to regional planning work in the Twin Cities of Minnesota. Arguments for and against the concept are outlined and the results of a survey relating to the present status of the concept are presented. An evaluation framework is developed and applied in visits to ten American and two Canadian urban regions. The most interesting work on this topic was found in Vancouver, B.C., and Toronto, Ontario. Other interesting work has been done in the Twin Cities and San Diego. The results of the field work are summarized and seven specific examples of noteworthy progress toward the development of outer city centers of significant scale are described.

Schneider, JB Noguchi, T ; Washington University, Seattle, Urban Mass Transportation Administration, (UMTA-WA-11-0005) Res Rpt. UMTA-WA-11-0005-77-2, RR-77-6, Aug. 1977, 256 pp; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-275043/8ST

45 170568 RAILROAD RIGHT-OF-WAY USE AND ECONOMIC VALUE. The economic value associated with the use of railroad rights of way is defined and its measurement is discussed. As long as existing uses are unchanged, the value of a right of way may be substantial but there is no compelling reason to know what it is. Changes in such use arising from causes such as abandonments, supplementary uses by others seeking transmission facilities or new public transport

corridors, or assumption of private rail facilities by governments can make valuation important. Assembled rights of way represent a resource for society that should not be discarded lightly and efforts to avoid dismemberment should be stressed.

45 173186 INSIGHTS INTO THE PRACTICE OF JOINT DEVELOPMENT: LESSONS FROM EXPERIENCE. Case studies of joint-development projects in six states and one Canadian metropolitan area were conducted for the Federal Highway Administration. Land acquisition associated with joint development, the extent to which highway agencies and other public bodies acquire more land than is actually needed for specific facility sitings and the incidence of complementary public and private development projects on the surplus land were evaluated. Examination of the literature showed severe legal, financial, political, and institutional constraints that restrict this form of expanded acquisition and subsequent joint development. At the same time, however, numerous individual projects are being undertaken and somehow circumventing the constraints. The case studies examined over 35 specific projects completed or planned in Arizona, Florida, Kentucky, Maryland, New Jersey, and Nevada and a large number of developments on surplus land of the Toronto subway system. The studies showed situations where the highway or transportation agency was used as an arm of general-purpose local government in undertaking expanded acquisition. Many of the successful examples illus-

trated special administrative and financial arrangements between local government and the transportation agency for the acquisition and disposition of the land, unique institutional solutions for planning and implementing projects, significant support from public opinion, and a high quality of technical and political leadership. /Author/

45 176922 SHEFFIELD AND ROTHERHAM LAND-USE/TRANSPORTATION STUDY. 3. TRAMS FOR SHEFFIELD? This paper deals specifically with the development and testing of a modern tramways system for operation within the city of Sheffield. The main reasons for the initial examination of such a system arose firstly, from the fact that the city planned a rapidly-expanding commercial centre in a region of 800000 people; secondly, because there was limited space for highway expansion radial to the city centre and strong environmental objectives to such; and finally, due to the growing uncertainty over the long-term availability of oil. The paper looks initially at the two main stages in the development of the tramway system. Stage 1, as a preliminary analysis, concentrated on examining the potential, corridor by corridor, of a system based on the concept of the light articulated tramcar presently in use in a large number of continental cities. Stage 2, investigated a specific system in depth using the full transportation model to forecast peak and off-peak flows and benefits for 1986, the study's forecast year. The system, as described, was assumed to be low voltage, say 600 V d.c., overhead pick-up, 2.2 or 2.5 M wide, articulated or car-and-trailer stock running on a network of 110 km, with on-vehicle fare collection or pre-purchase fares and an average stop spacing of 300-400 M. The paper examines the derivation of operating costs and capital costs, the effect of such a system on other 'on-street' traffic and a comparative assessment of bus and tram systems. Final recommendations are defined by reference to a proposed, reduced, 60 km system at a capital cost of 20 M pounds, and the recommendation that rights-of-way be reserved immediately in order that construction of a fixed-track system could be undertaken during the later 1980's. For abstracts of parts 1, 2, 4 and 5, see IRRD Abstract Nos. 227772, 228768, 231331 and 231332 respectively.

45 177352 ACCESSIBILITY IN TRANSPORT/LAND-USE MODELLING AND ASSESSMENT. The relationship between accessibility and urban density is examined both conceptually and experimentally. A linear relationship between the logarithm of density and centrality, a derivative of accessibility, is calibrated. It is shown that centrality can be used to measure the utility of location in the context of the land-use/transport system. This provides a basis for evaluating land-use/transport changes by using only data readily available from transportation studies. /Author/TRRL/

45 178455 LAND USE PLANNING AND TRANSPORTATION [Raumplanung und Verkehr]. The premise is made that all mechanical forms of transport constitute a nuisance and bring about damage and that an inequitable degree of transport will lead to collective immobility. In four theses the aims for land use planning in relation to transportation are formulated. A reduction in the need for mechanical transport is demanded and of forced travel or else a promotion of voluntary mobility. Similarly there should be a demand for collective transport or, where this is unsuitable, for community transport (e.g. Taxis). Individual transport should become excluded in all but extremely thinly populated areas. The then employed form of energy and its environmental benefit deserves great consideration in these problems. A further aim in land use planning should be the preservation of unpopulated and thinly populated areas by the appropriate configuration of the populated areas. One must understand by this a "small centre" interaction based upon sociologically and functionally different areas of life. By reducing the size of settlement or by raising the density of population it will be possible to forego the use of mechanical transport within each unit. Finally a plea is made for human rights in planning rather than for traffic rights. /TRRL/ [German]

45 179977 EFFECTS OF BART ON URBAN DEVELOPMENT. The research objectives of the BART Impact Program Land Use and Urban Development Project are summarized, and the results of studies of BART's accessibility impacts and their importance in explaining: (1) Regional shifts in employment and population; and (2) BART's effects on the office construction and

housing industries are presented. A preliminary analysis of regional trends since 1950 indicates that BART has not measurably affected population and employment growth within the corridors it serves. Changes in the office construction and housing industries within the three-county BART service area are covered, and BART's role in timing and location decisions is analyzed. Topics yet to be addressed in the research project are highlighted and the implications of these preliminary findings are described.

45 180019 A REVIEW OF URBAN LAND USE MODELS. Standard transport planning procedures developed in the United States of America have been used to estimate travel demands within transport studies in Indian metropolitan areas. This has led to an awareness of land use-transport planning models which attempt to minimize travel demands through manipulation of land use patterns. The author reviews urban land use models which have been developed in many countries, and in particular discusses activity or operational allocation models where future development is estimated relative to a set of zones within the region. The models are classified and examined as follows: (1) trend models, which project the location of activities within a region by calibrating a model to base year information, and using the model to predict the change in activities between the base and horizon year in each zone given some exogenously prepared estimates of the future urban activities. (2) equilibrium models, which predict the activity locations of a set of inter-related urban activities at some point in time, given information about the locations of at least one set of the activities. (3) land use design models, which allocate activities to zones in an urban area so as to optimize a given objective function. This examination established a number of criteria for identifying the type of model that would be most useful for land use-transport planning analyses of urban areas and regions in India. The author discusses these criteria, and the resulting selection of the Lowry model for development for application in India. This model is described, an important feature of which is considered to be its ability to estimate distributions of population and employment, and the associated travel demands. /TRRL/

Sarna, AC (Central Road Research Institute, India) *Indian Highways* Vol. 5 No. 6, June 1977, pp 9-16, 1 Fig., 1 Tab., 20 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 232075)

45 180094 LAND-USE DENSITY, PATTERN, AND SCALE AS FACTORS IN URBAN TRANSPORTATION. This article considers the density and pattern of urban land use in subjective terms to demonstrate the difference between them, illustrate land-use patterns not normally considered, and relate these variables and urban scale to transportation technology. This framework was then expanded into the two-function situation that is most prevalent in the determination of urban transportation demand. From theoretical considerations 10 basic combinations of trip origins and destinations were identified.

The relationship of these to transportation technology and especially to the relative importance of line-haul transport is discussed.

45 181222 LAND USE, ENERGY FLOW AND DECISION MAKING IN HUMAN SOCIETY--THE TRANSPORTATION-ENERGY-EMISSIONS MODEL. The Transportation-Energy-Emissions Model (TEEM) was developed to study the varying effects upon energy use and air quality due to the implementation of several alternate traffic systems in a metropolitan area. Given certain information on number of persons using each part of the transportation system, time allocation of use, modal split, and certain characteristics of the transportation system, it estimates energy use and emission of SO_x, NO_x, CO, and HC. Emphasis of this study is based on the fact that the way a system is used affects energy use and pollutant emissions, and demonstrates how the volume of flow affects energy-emission rates by automobile, bus, and BART-type train use. Tentative results indicate that: (1) during peak congestion periods, arterial road use implies higher rates of fuel consumption than freeway, but during off-peak periods the situation is reversed; and (2) switching 30 percent of passenger miles from auto to either buses or trains improves the energy use and emissions situation significantly.

45 181337 STATION AREA LAND USE. BART IMPACT PROGRAM. LAND USE AND URBAN DEVELOPMENT PROJECT. The report summarizes time series data on BART stations compiled for the Land Use and Urban Development Project. Data collection and classification methods are described, and data sources are documented. Station area land use changes during the period 1965-77 also are summarized. (Color illustrations reproduced in black and white)

45 182110 STUDY OF WORKERS' LOCATION DECISIONS. LAND USE AND URBAN DEVELOPMENT PROJECT. BART IMPACT PROGRAM. BART's effects on workers' location decisions in San Francisco and Oakland are investigated. BART's effect on residential location decisions, as influenced by job location decisions, also are examined. The principal means of investigation is computer analysis of the results of a survey of downtown workers

recently changing jobs and a survey of employees working in the BART corridors. The paper concludes with an assessment of the policy implications of this research.

45 184709 TRANSPORTATION AND LAND USE PLANNING TO ACHIEVE NATIONAL GOALS: THE NETHERLANDS. The Netherlands is one of the most densely populated countries in the world. The Dutch people have a long history of rigid land use controls; urban sprawl is unknown there. High-rise apartment complexes generally mark the boundary between urban and agricultural land uses. Urban expansion and some decentralization of urban activities since World War II have placed a difficult burden on transportation. The number of passenger automobiles has increased fivefold between 1960 and 1970. Transportation policy goals for the Amsterdam region call for public transportation in the future to accommodate about 60 percent of the journey to work traffic (it now accommodates about 25 percent), bicycle and pedestrian trips will be 30 percent, and the private automobile will account for the remaining 10 percent. To help achieve the latter goal, parking will be provided for no more than 10 percent of central city employees. The key to land use control in the Netherlands is municipal expropriation of land ripe for development. The three-tiered land use planning process (national, provincial, municipal) is described in some detail, as well as the process of land acquisition, the provision of funding, and the installation of public facilities prior to private development. The manner in which highway planning is incorporated into and becomes an integral part of the overall planning process is described. The nature and degree of public participation in highway planning and the method of resolving disputes is discussed. The moderate effectiveness in coordinating highway development and land use activities to minimize adverse effects and enhance beneficial effects of highways is more an indirect result of the intensive overall land use planning process than the result of specific controls for such purposes. The Netherlands system of land use controls might not be as effective if not for the extremely high financial costs involved in preparing sites for construction (draining, removing peat and top soil, sand layering, and installing piles). Moreover, their land use control system does not appear to be politically or institutionally acceptable in the United States at this time. The remarkable success of the Netherlands in controlling a very scarce and valuable resource, land, has probably led to a more stable economic and social system for the country as a whole, but it has not been without some trade-off costs--restrictions of free-

dom of private land ownership and an almost total constraint on private gains from land value appreciation. /Author/

45 186187 LAND USE IMPACTS OF RAPID TRANSIT: IMPLICATIONS OF RECENT EXPERIENCE. The report seeks to display available evidence on the extent to which recent (post-World War II) major rapid transit improvements in the United States and Canada have influenced urban land use. From this compilation are derived several types of conclusions. The factors governing the size and nature of land use impacts of transit are determined; implications for appropriate Federal policy are drawn; and specific needs for related future research are identified. The report's intended use is as a resource for those involved in the planning and evaluation of possible improvements in urban transit systems.

45 186188 LAND USE IMPACTS OF RAPID TRANSIT: IMPLICATIONS OF RECENT EXPERIENCE. EXECUTIVE SUMMARY. The report reviews evidence of land use impacts of recent major rapid transit improvements and draws conclusions concerning the extent and nature of such impacts and the conditions under which they have occurred. Transit improvements studied are primarily post-World War II in origin. American and Canadian examples are stressed, although European experience is treated briefly. Virtually all major modern American and Canadian rapid transit improvements are included, covering conventional rapid rail, commuter rail, light rail and bus/busway. In addition to conclusions on general patterns of land use impact causes, research recommendations and Federal policy implications are drawn.

45 186225 STUDY OF BART'S CONSUMPTION OF LAND AND PROPERTY. LAND USE AND URBAN DEVELOPMENT PROJECT. The paper documents BART's consumption of land and property in terms of the characteristics of business and people displaced, describes the relocation process, and examines development on surplus land BART acquired and subsequently sold. Study methods included statistical analysis of parcel data obtained from the BART Real Estate Department and the California Department of Transportation, a small survey of households and firms receiving relocation payments from BART, and key informant interviews with persons knowledgeable about BART's real estate activities. The paper closes with assessment of policy implications. (Color illustrations reproduced in black and white)

45 188405 A ZERO-ONE INTEGER-PROGRAMMING FORMULATION OF THE PROBLEM OF LAND-USE ASSIGNMENT AND TRANSPORTATION NETWORK DESIGN. A zero-one integer-programming formulation of the simultaneous optimization of the problems of land-use assignment and transportation-network design is presented. The problem is modeled through a set-partitioning approach and incorporates a multiple-criteria objective function, appropriate upper-and lower-bound constraints on area assignments, and construction costs. A simple example and a more complicated urban-design case study are included to demonstrate the viability of this approach in solving the simultaneous-optimization problem. As a secondary benefit, this set-partitioning model can be reformulated as an integer, generalized-network, flow problem for which new efficient computer codes, capable of solving networks with thousands of nodes and variables, are available.(a)

45 188418 LAND USE AND ENERGY UTILIZATION FOR THE ST. LOUIS SMSA. The sensitivity of energy consumption to the residential patterns of the population growth in the St. Louis region between 1970 and 1995 is investigated. Methodology is presented for computing transportation and residential energy consumption, making maximum use of local data in a manner which is intimately tied to land use. Results of energy computations for a 1995 land use plan developed by East-West Gateway Coordinating Council and four alternatives are presented. The results are put into perspective with other related energy conservation measures.

45 190214 URBAN TRANSPORTATION AND NEIGHBORHOOD PRESERVATION. During the past decade neighborhood preservation has become an integral component of urban programs to preserve older cities as desirable residential locations. The purpose of this report/analysis is to increase the understanding of the relationship between transportation and neighborhood preservation. The materials upon which it is based include general literature on transportation and the history of cities and three specific studies undertaken as part of this project. Two of

the studies are detailed transportation studies of neighborhoods in Baltimore and Pittsburgh-neighborhoods typical of those with stabilization and preservation programs. The third study is a national survey of neighborhood-oriented organizations, including community groups, church organizations, senior citizens and social clubs, regarding transportation related problems and their identification and resolution. Major problems identified herein are: streets in poor repair, insufficient parking; excessive through traffic; a lack of transportation for the elderly and those without automobiles. Questionnaire returns of 104 leaders of neighborhood organizations revealed that the most common and major problems encountered include: streets not repaired (49%); not enough off-street parking (49%); traffic passing through neighborhood (41%); streets not cleaned (41%); parking for residents (40%); and transportation for elderly (39%). This report states that an important role for UMTA, regional and city transportation agencies is to be sure that recent programs such as on-street parking to neighborhood residents be rigorously evaluated and information on successful programs be disseminated widely. /UMTA/

Bish, RL ; Maryland University, College Park, (MD-11-0003) Final Rpt. UMTA-MD-11-0003-79-2, Sept. 1978, 26 p.; Sponsored by the Urban Mass Transportation Administration. 45 190217 PITTSBURGH'S CENTRAL NORTHSIDE NEIGHBORHOOD: A TRANSPORTATION CASE STUDY. Pittsburgh's Central Northside neighborhood is typical of inner-city neighborhoods with established neighborhood stabilization and preservation programs. This study provides an analysis of the transportation system and transportation problems in the neighborhood. The results are useful for understanding transportation problems in the neighborhood as well as contributing to a larger study of the relationship between neighborhood preservation and transportation underway at the University of Maryland. One hundred and fifty families were interviewed for this study, and an analysis of streets, bus service, taxi service, jitney service, and services for the elderly and handicapped were examined. Almost half (47%) of the residents surveyed owned one (37%) or more (10%) cars and 78% of the car owners parked on the street. Results show major problems are: 1) parking in the renewed section of the neighborhood; 2) long waiting times for buses at night; 3) knowledge of transportation for the elderly; and 4) personal safety at night. This report concludes that the residents of the Central Northside neighborhood do not seem to face any severe problems even though parking is a definite problem in the Mexican War Streets areas. Most respondents feel satisfied with the neighborhood and only a few felt that transportation problems contributed significantly to their dissatisfaction with the neighborhood's living conditions. The appendix herein provides a summary of survey results of the

163 respondents as well as the survey form. /UMTA/

45 190224 BALTIMORE'S HOLLINS PARK NEIGHBORHOOD: A TRANSPORTATION CASE STUDY. The revitalization of central cities has been recognized by both Federal and State governments as an important national objective. Earlier programs that concentrated on central business districts are now being joined by programs which reflect the government's increasing concern with the various subareas of the central city. The Hollins Park Transportation Study is a small but comprehensive analysis of the transportation facilities that serve the Hollins Park neighborhood and identifies the transportation problems that the residents face. The information presented was obtained from various city agencies, and also from visits to the neighborhood to collect data on parking regulations, location of vacant lots and parking lots, and other information which is presented in Appendix A. A Home Interview Survey was conducted in the neighborhood and 151 families were interviewed. An analysis of streets, public transit, and alternative transportation services was also undertaken. The information obtained concerned the residents' travel patterns, automobile ownership and usage, bus and taxi usage as well as any other available forms of transportation and information concerning the quality of life and residential desirability of the neighborhood. A summary of the survey results are presented in Section IV, and the complete survey is presented in Appendix B of this report. The transportation problems identified in this study which affect the quality of life in the neighborhood are: parking problems; bus scheduling; transportation for the elderly and handicapped; and noise on Lombard Street. It is suggested that City government work with neighborhood organizations in order to solve these problems. /UMTA/

45 190263 LAND USE AND TRANSPORT IN SYDNEY AND TORONTO. Land use patterns and journey to work characteristics are compared for the Sydney and Toronto metropolitan areas using information collected in 1971. Both regions

had populations of 2,780,000 as well as very similar socio-economic characteristics. Sydney is served by a comprehensive radially-focussed commuter rail network while Toronto is served by an underground rapid transit system in the central area and a comprehensive freeway network in the outer suburbs. Gross residential densities in Sydney are about one-half those in Toronto while employment densities tend to be higher in Sydney. Employment distributions in Toronto are influenced strongly by the freeway network while commercial employment locations in Sydney are influenced by the rail network. While the majority of travel in Sydney is by private automobile the dominant orientation of home-work travel is along radial corridors focussed on the CBD. In Toronto the spatial orientation is along the subway system in the inner areas while the freeway system is the dominant influence in the outer suburbs. Daily home-based work travel in Toronto exceeds that of Sydney by 5,000,000 km. The use of public transport for the journey to work is marginally higher in Sydney.

45 190485 STUDY OF BART'S CONSTRUCTION IMPACTS. LAND USE AND URBAN DEVELOPMENT PROJECT. BART IMPACT PROGRAM. The study examines the effects that BART's construction activities had upon retail sales and services and upon real property. Key informant interviews were supplemented by longitudinal data on taxable retail sales and on permits for construction in areas near BART. Many retail merchants near the sites of BART cut-and-cover construction claimed to have suffered losses in sales during the period. The Mission District (San Francisco) and the Ashby station area (Berkeley) show the most distinct signs of losses linked to BART construction. Property owners and builders were found not to have deferred or eliminated maintenance, rehabilitation or new construction near BART construction. (Color illustrations reproduced in black and white)

45 190582 LAND USE AND URBAN DEVELOPMENT PROJECT STUDY OF OFFICE CONSTRUCTION INDUSTRY. The study addresses BART's effects on the three-county BART service area office construction industry. Building permit data for new and rehabilitated offices throughout the three-county BART area were compiled for the period from 1960 through

early 1977. Eighteen-year trends in regional and local office patterns were analyzed and specific office construction industry hypotheses were investigated. The hypotheses addressed specific issues of BART effects on regional office patterns, local office location shifts to BART station areas, and the timing of BART-induced changes in office location patterns. Key informants were interviewed to supplement the building permit data analysis. Information from the interviews provided insight into office location decisions and aided the interpretation of the building permit data. (Portions of this document are not fully legible) (Color illustrations reproduced in black and white)

45 190848 ENVIRONMENTAL ANALYSIS FOR DEVELOPMENT PLANNING IN CHAMBERS COUNTY, TEXAS, LAND USE POLICY COMPONENT, INTERIM SUMMARY OF FEDERAL INFLUENCE OVER LAND USE. This summary covers major Federal programs that affect land use and indicates some of the influence which these programs may have on Chambers County, Texas. The first part is divided into specific areas of study and includes the history of Federal assistance programs to date. These areas are housing and urban development, the Rural Development Act of 1972, transportation, mass transit, energy, air pollution controls, the National Environmental Policy Act of 1969; power plant siting, the Environmental Protection Agency (EPA), Coastal Zone Management (CZM), the National Land Use Policy (NLUP) and Planning Assistance Act, and the interrelation of EPA, CZM, and NLUP. The second part deals with constitutional power in relation to transportation, housing and slum clearance, urban renewal, Federal assistance for new communities and open space acquisition, the Rural Development Act of 1972, the EPA, CZM, NLUP and Planning Assistance Act, and power plant siting bills. Included are the legislative history of these land use acts and their actual terminology, control and enforcement procedures and research and developing funding. Specific references to Texas, and especially Chambers County, in relation to these programs are made throughout the report.

45 190905 THE IMPLICATIONS OF BART'S LAND USE AND URBAN DEVELOPMENT IMPACTS FOR THE TRANSPORTATION DISADVANTAGED. The report examines the land use and urban development impacts that the 71 mile Bay Area Rapid Transit System has had to date on the transportation disadvantaged. Three special population groups are the focus of analysis-- ethnic minorities, the elderly and handicapped. These groups are of special concern for transportation planning and policy because of either low-income status or mobility related impairments. Findings are reported from the investigation of six issues related to BART's impacts for the transportation disadvantaged in terms of population distribution effects, residential location decisions, and station area neighborhood level impacts. Evaluation of these findings is made in the context of the level, nature, and degree of equity in the incidence of BART's economic impacts. Based on the findings of the study, the land use implications for the transportation disadvantaged of a regional rapid rail transit investment are presented in terms of policy considerations for other areas in which similar systems may be considered.

45 190906 STUDY OF DEVELOPMENT PATTERNS. The working paper examines BART's effects on Bay Area, corridor, and station area land use and development patterns. BART's effects on the supply and demand for housing, commercial, and institutional uses are evaluated, using a variety of analysis techniques. These include regional regression analysis of BART's influence on population, housing, and employment; statistical analyses of survey results; and key informant interviews. Particular emphasis is placed on effects on minorities. The paper also synthesizes earlier work elements of the BART Impact Program Land Use and Urban Development Project. Study conclusions are that BART has not affected regional development patterns, but has had effects on station area (mostly commercial and institutional) and corridor development patterns. These effects, however, have been less than the anticipated level of influence. The policy implications of these findings also are addressed. (Color illustrations reproduced in black and white)

45 190968 STUDY OF PROPERTY ACQUISITION AND OCCUPANCY, BART'S EFFECT ON SPECULATION, LAND USE AND URBAN DEVELOPMENT PROJECT. BART IMPACT PROGRAM. The working paper addresses BART's effects on speculation in real estate in the three-county BART service area. Information from interviews with key informants was combined with quantitative analyses of data assumed to be indicative of speculation at eight study sites throughout the service area. The resultant station-specific syntheses were further synthesized to deduce observations applicable to more than one station area. The study addresses specific issues of the timing and the extent as well as the character of BART-induced speculation. (Color illustrations reproduced in black and white)

45 190970 RECOMMENDATIONS FOR LONG-TERM MONITORING. Options for monitoring the impacts of the Bay Area Rapid Transit (BART) system on land use and urban development are examined and evaluated in terms of the importance for policy making, the probability of impact and the measurement feasibility. Analysis techniques are discussed, and monitoring issues in each station area summarized. A recommended long-term monitoring program is presented, including a cost estimate for the first five years.

45 191029 PROGRAM-WIDE CASE STUDIES. LAND USE AND URBAN DEVELOPMENT PROJECT. BART IMPACT PROGRAM. The paper consists of in-depth, policy-oriented case studies of BART's impacts on selected communities, synthesizing all case study work in the BART Impact Program. The variety of BART impacts are described for downtown San Francisco and downtown Oakland, representing urban core areas; the Mission District of San Francisco, the Rockridge neighborhood of north Oakland, and Richmond, representing urban residential areas; and Walnut Creek and Fremont, selected as typical suburban residential communities. BART impacts on the natural environment, public policy, institutions and lifes-

tyles, transportation service and travel behavior, as well as land use and urban development are evaluated in terms of pre-BART and no-BART alternatives. Comparative statistics on population, employment, housing, land use and travel behavior are presented, and pre-and post-BART land use and zoning are mapped for each study area. Each case study concludes with an analysis of similarities and differences, and an assessment of the policy implications of the BART experience to date. (Color illustrations reproduced in black and white)

45 191362 THE IMPACT OF BART ON LAND USE AND DEVELOPMENT POLICY. The working paper assesses the relationship between the construction and operation of BART and changes in local land use policy and resulting changes in actual land use and development. This study presents findings in four areas: (1) Local government involvement in BART station location and design decisions related to land use policy; (2) BART impacts on local government planning studies, rezonings and use of special development incentives or controls; (3) BART impacts on local government policy regarding BART-related joint development, particularly public improvements, redevelopment and marketing; (4) The impact of BART-related land use policy upon actual changes in land use and development.

45 191659 STUDY OF BART'S EFFECTS ON PROPERTY PRICES AND RENTS. The paper addresses BART's effects on residential and commercial property prices and rents. Multiple regression analyses were carried out on eight study sites throughout the service area. The separate study site analyses were synthesized to derive observations applicable to more than one station area. At most sites, the data permitted separate analyses of pre-service (anticipatory) effects, immediate, and longer term (post-service) impacts. The study addresses specific issues of the timing of BART impacts as well as joint distribution effects. Information from key informants was used in specifying study areas, determining vari-

ables to be included in the models, and in corroborating analytical results.

Falcke, CO ; Metropolitan Transportation Commission, Blayney (John) Associates, Dornbusch (David M) and Company, Incorporated, Department of Transportation, Department of Housing and Urban Development DOT-BIP-WP-52-5-78, July 1978, 142 p.; Prepared by Blayney (John) Associates/David M. 45 192212 THE EFFECT OF THE WASHINGTON METRO ON URBAN PROPERTY VALUES. As with other forms of urban infrastructure, public mass transit systems can alter the spatial distribution of urban property values. The magnitude of this effect is likely to be highly parcel-specific, and changes in real estate values may occur both prior to and after a transit system's construction. The report describes a series of econometric models of real estate values estimated for parcels in Washington, DC., over the period of the Metro system's development. Separate models are estimated for single family dwellings, multi-family structures and retail stores. Access to the transit system and the implementation schedule of Metro are both found to be significant determinants of parcel transaction prices. Studies of five separate transit stations are described. For each case study, results and forecasts of property value changes under different conditions are given.

45 193387 AN INTRODUCTION TO TRANSPORTATION AND URBAN LAND POLICY IN DEVELOPING COUNTRIES. The papers presented at this session dealt with the relationships between urban travel, urbanization of land, and land use policies in developing countries. It is necessary to make such information available because conclusions reached in the post-industrialized world are not applicable to developing countries due to entirely different tripmaking patterns, several additional forms of formal and informal public transit, a low rate of auto ownership, and population subgroups of qualitatively different cultures and life styles. For example, the most effective means to affect congestion in most developing countries is the control of auto ownership by regulating import tariffs and restricting assembly and manufacture of automobiles. Such a policy would be unthinkable in post-industrialized countries. Another problem that faces planners and policy makers in developing countries is the transfer of solution modes from one country to another, for each time a method is transferred from one environment to another it brings with it features that were required for the previous situations which are unapplicable to the next one.

45 193390 AN OPERATIONAL LAND USE TRANSPORT MODEL FOR THE TEHRAN REGION, IRAN. The land use and transportation model developed for the Tehran region, Iran, unlike most models, seems to meet the needs of the real world of professional and political planning in that it was completed in seven to eight months at a maximum cost of \$150,000; while models for most cities have cost millions of dollars and have taken two to three years to complete. The Tehran program was divided into two parts: phase one for development and calibration of the model and phase two for the testing of existing and proposed policies and programs. The model contains three interdependent components: the regional growth submodel, which predicts the growth of economic and residential activities for the region as a whole; the land use submodel, which predicts the locations of these activities within zones and regions; and the transport submodel, which predicts the travel between zones and activities. In addition to being pleased about its completion in record time at the lowest possible cost, the authors are convinced that the Tehran model is a useful and important tool to aid in the planning process and to develop and test various policies affecting growth and development.

45 193391 TRANSPORTATION, LAND POLICY AND THE URBAN POOR IN THE DEVELOPING COUNTRIES. The paper addresses the necessity for development of a transportation and land policy that is responsive to the needs of the urban poor in developing countries. Most transport studies tend to address the top 50% of the population in income terms and in many cases the top 25%, because planning is done for a level of affluence and affordability that is found mainly in developed countries and not in developing ones. Since the number of urban poor in developing countries is estimated at 250 million at present and to increase by 450 million more people in the next 25 years, it is essential that policy makers focus attention to the needs of such people. The high cost of land in the central areas of cities in developing countries prohibits poor people from living near their places of work. Since public transport is not available to most of these people, they must walk as long as two hours each way to work. Thus, any land development policy should stress the location of housing close to jobs and services, especially for the poor. In an effort to substantiate the arguments made in this paper, the authors have included a case study of metropolitan Manila.

45 193392 THE DISCUSSION ON THE SESSION ON TRANSPORTATION AND URBAN LAND POLICY IN DEVELOPING COUNTRIES. In his discussion, Thomas B. Deen reviews the four papers submitted at a session on Transportation and Urban Land Pol-

icy in Developing Countries. He feels that each of the papers approaches the problem from an entirely different perspective: one on basic travel demand characteristics; another with a rather comprehensive land use transportation model that almost makes an effort at embracing the entire urban system; the third paper addresses the physical planning and design of a new town; while the fourth addresses the urban issue as fundamentally one of income re-distribution and ways to carry it out. He recommends the paper by Byrne, Tadross, and Grava, particularly the discussion of the background of the several new towns that have been built in the last two decades. It is the author's opinion that the Zahavi paper has a unique and innovative method of data analyses, but its conclusion that the population in a compact city requires more motorized mobility than in a dispersed city is not supported by the data. Deen views the Horten and Echenique paper as a well written straight forward description of the background, development, and application of a very comprehensive macro urban model system developed in a remarkably short time; although, he feels it would be even more impressive if additional examples were given on how well the model was able to perform. Deen's major criticism of the fourth paper is that the author, Courtney, states that the urban problem is a poverty problem; while although it is definitely one of the major ones, the emphasis from the other papers suggests that there are some other aspects of the problem as well.

45 193458 TRANSPORTATION AND LAND DEVELOPMENT. CONFERENCE FINDINGS. The findings summarized here represent points of emphasis, considerations that served as threads linking several sessions and informal conversations, and observations useful in judging needed actions and in assessing impacts. Among recurring themes were those related to conserving energy, improving the environment and the quality of life, and revitalizing cities. Although several speakers referred to the role of transportation in the economic and social revival of downtown areas, there was a wide recognition that development does not necessarily accompany transportation improvement alone. Since most urban places are already connected with other places, at least by automobiles, improvements in transit may have little effect on development nearby. For economic development and urban revitalization to accompany improvements in transportation, several speakers emphasized that transportation and other key ingredients such as housing must be tied together in an integrated, coordinated program realized through a public and private partnership. The city as the "new frontier" and the issues of efficiency and equity emerged as top candidates for priority attention. /Author/

45 193459 TRANSPORTATION AND LAND USE POLICY. PART 1--PRINCIPAL. This paper discusses an agenda essential to the achievement of a national urban policy and a national transportation policy, efforts that are "the moral equivalent of the space program." The agenda consists of four items: to talk to elected officials, i.e., to inform and guide them; to learn what is happening, for example, in bills affecting transportation; to develop an urban policy that gives adequate consideration to transportation modes and how they relate to population density; and to work on an urban policy and a transportation policy that have interdisciplinary dimensions, i.e., that recognize economics, energy, housing, land use, taxes, and sewer and water policies as they relate to a comprehensive urban policy that includes transportation. /Author/

45 193460 PUBLIC TRANSPORTATION AND LAND USE: A DEVELOPER'S PERSPECTIVE. Transit and land use impacts have had a questionable linkage. Public transportation does not work automatically as a tool to assist and enhance the viability of a city. Transit can be a very special economic development tool that cannot stand by itself but that, if coordinated with other leverage mechanisms and if tuned to the strengths of the city, can be instrumental in the rebirth of central cities. Cooperative detailed planning before the route and mode are set and a created capacity to carry out these developments through a public and private partnership are needed. /Author/

45 193461 LAND USE AND TRANSPORTATION IN AN ENERGY EFFICIENT SOCIETY. Most people are aware of the close relationship between land use and transportation. However, little is known of how to apply this conceptual knowledge in achieving the goal of a mobile and energy efficient region and nation. Despite the research studies and publicity to the contrary, transit can be an energy saver; energy savings can be an argument for transit. The comparison should not be made simply between a bus and a van pool or between a streetcar and a heavy-rail vehicle but between transit-oriented environments and automobile-oriented environments. /Author/

45 193462 TRANSPORTATION PROGRAMS AND INVESTMENTS TO DEAL WITH CRITICAL NEEDS. Revitalization of the inner city--or perhaps of the older city--is the most

critical economic need that faces us today. We are not going to solve that problem by dreaming up some program and imposing it from the top. Rather, we need programs that will respond to and will encourage local initiative; the stimulus for improving the economy must come from the bottom. What is needed is flexible joint development. While the money may come from the top, work with local government and with private investors in realizing whatever potentials may exist at local levels is also necessary. /Author/

45 193463 TECHNICS AND ETHICS IN TRANSPORT DECISIONS. Long-term trends rather than shifts in fashion or fad should be sought in developing principles for research and policy. The demonstrations of the 1960s led to some new concerns for personal liberties and for the needs of our multiple-minority society. The demonstrations prompted unusual roles for citizens in transportation and in other matters that had been considered technical and the province of specialists. Engineers' or economists' concerns for efficiency yielded to public concerns for equity. There is also a trend toward a high level of accessibility throughout metropolitan areas. Since virtually every place in the metropolitan area is connected to every other place, the influence of a new fixed-route transit system does not affect location decisions very much. However, high accessibility in metropolitan areas is not available to those who do not have automobiles; other systems are needed for these people. /Author/

45 193466 EFFECTS OF QUESTIONS OF EQUITY, EFFICIENCY, AND REVITALIZATION OF CITIES ON TRANSPORTATION POLICIES. A critical problem for society is the social injustice that maintains poverty and rac-

ism. There is no decent solution possible to the urban problem so long as poverty and racism exist. These issues must be tackled. They are the basis of a sound urban policy of which transportation is an essential part. Since mobility is one of the fundamental rights in our society, transportation plans should be checked to see whether some people have been neglected or have been deprived of this right. /Author/

45 193467 NATIONAL LAND POLICIES AND PROGRAMS AFFECTING TRANSPORTATION: SESSION 1. The relationship between transportation and urban development is central. The revival of cities as places to live as well as to work does not mean that the abandonment of the suburbs is imminent or even desirable. Instead, it means pursuing an equalization of city and suburb as residential, social, and economic centers. The present Administration seeks to revitalize central cities, to equalize cities and suburbs as residential environments and as economic centers, and to conserve energy. To take advantage of benefits that transit can provide in these areas, preference will be given to cities that accent public transit as an expression of coordinated transportation and land development planning and action. Transportation priorities will change from highway construction to maintenance and to making the best use possible of existing facilities. The process of developing policy is as important in staying abreast of trends as the policy and its resulting programs. Reform of current programs is necessary in making more effective tools to reach policy objectives. /Author/

45 193471 PATTERNING CITIES AND CHANGE: CHOICES AND IMPLICATIONS. The growing ascendancy of multicentered or nodal cities--urban centers within the metro region--is an unmistakable trend. Urban transportation planning should take this pattern into account and not attempt to return cities to their 19th century mold. However, it will still be for planners to decrease dependence on the private automobile by encouraging people to live, work, and shop in a given subregion and by improving mass transit facilities between satellite urban centers.

45 195496 AN INTEGRATED LAND USE AND TRANSPORT MODEL. This paper presents an integrated land use and transport model. The fundamental idea behind the paper is that land uses determine the traffic generation and hence the transport demand in a city, and the transport, in turn, influences the further location of land uses. The paper first gives a conceptual framework which argues the need for a systems view of the city in which all the components interact. This is followed by the mathematical formulation of a system model, and finally the calibration principles of the model are presented. This model has been implemented for Sao Paulo metropolitan area and has been used since 1975 to study transport and land use policies for this city.(a) /TRRL/

45 195967 HOW TO DO A TRANSIT STATION LAND-USE IMPACT STUDY. Several improvements in the conceptual basis and methodology for studies of land-use impacts have occurred over the past two decades, but the framework is still incomplete because the need to incorporate the policy context into the study design has not been fully recognized. A revised model for impact studies is proposed, and the approach is illustrated by a case study of a planned rail rapid transit station. One of the major differences between this and previous methods is that the method described in this paper acknowledges several possible outcomes or impacts as a function of alternative public policies in addition to the transit station itself. Five categories of impacts are evaluated: public facilities, environment, market, neighbourhood, and costs and revenues. /Author/

45 196493 AIRPORT PLANNING MANUAL. PART 1 MASTER PLANNING. This manual consists of 4 principal sections. The section on airport planning outlines the planning process and the important factors in an airport master plan. It explains the importance of consultation and cooperative planning and the need to develop a systematic approach to determining future airport requirements. The purpose and objectives of an airport master plan are described, and guidance is provided as to how the master plan should be used. Section 2 outlines the factors to be considered in air side development. Runways and taxiways are considered. The determination of the dimensional criteria, pavement strength and airfield capacity and configuration are considered as well as their elements. Such as the apron the navigational and traffic control aids. Section 3 provides specific guidelines from airport areas to which the non-travelling public has free access, as well as the non-public portions of airline operations and cargo facilities, airport administration and government facilities. The major elements of land side development include the passenger building, cargo facilities, and ground transport and vehicle circulation and parking. Special purpose buildings necessary to support the operation of an airport are considered in Section 4.

45 197283 THE IMPACT OF TRANSIT INVESTMENT ON HOUSING VALUES: A SIMULATION EXPERIMENT. This paper uses a joint-choice logit model of travel demand and residential location to simulate the impact of urban rapid-transit investment on housing values within a radial corridor. The model developed is a clean break with the traditional urban economic theory. Instead the heterogeneous nature of travel and location decisions is recognized and the logit model, consistent with stochastic utility maximization, is employed. Simulation experiments reveal that the aggregate increase in property values caused by transit's impact on work trips is highly sensitive to the aggregate number of vacancies within the corridor. Under reasonable assumptions, transit investment tends to lower central-city property values, to increase central-city vacancies, and to raise suburban property values. It tends to help the poor move further away from the center and penetrate the inner suburbs. Depending on several influences, aggregate property values can increase or decrease and the change can often be statistically insignificant. Calculations show that an equitable taxation (and compensation) of property-value changes may raise a small to modest proportion of a transit system's construction cost. Several considerations suggest that even these modest estimates might be

optimistic. These results help develop an improved perspective on "value-capture policy" which has not, up to now, benefited from quantitative analysis. Major extensions of the model are briefly considered.(a)

45 197653 FEASIBILITY ANALYSIS OF JOINT DEVELOPMENT FOR TRANSIT STATIONS IN THE DETROIT AREA. The concept of Joint Development(JD) embodies various forms of public/private sector coordination relative to physical, fiscal, and institutional aspects of transit station development. The objective of this study is to analyze the feasibility of joint development in conjunction with transit station area planning in the Detroit area where the planning of a high-level transit system is underway. The report is organized in three parts. In the first part, the basic concepts of JD are initially presented with a brief state-of-the-art review and a discussion of opportunities, incentives, and constraints. In the second part, the feasibility of joint development in the Detroit area is examined relative to the legal, institutional, and fiscal framework. The development and application of an analytic technique for prioritizing station locations based upon development potential is also presented in Part two. The last part of the report provides the conclusions and recommendations, along with a series of guidelines that may be applied for planning joint development studies in transit stations in other urban areas.

45 199138 SIMPLIFIED AIDS FOR TRANSPORTATION ANALYSIS: FRINGE PARKING SITE REQUIREMENTS [Final rept]. This is one of a series of six reports describing simplified aids to improve transportation decisions without resorting to computers or extensive data collection. The analytical aid described in this report provides a method to: (1) identify candidate sites for change-of-mode fringe parking facilities; (2) estimate specific parking facility requirements at these candidate sites; and (3) estimate highway access requirements for the sites.

Peat, Marwick, Mitchell and Co., Washington, DC.*Urban Mass Transportation Administration, Washington, DC., (UMTA-IT-06-9020) UMTA-IT-06-9020-79-6, Jan. 1979, 64p; nSee also PB-299 984. n Also available in set of 6 reports PC E11, PB-299 979-SET.; Contract DOT-UT-50021; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-299985/2ST

45 261398 INNOVATION IS NEEDED IN THINKING ABOUT TRANSPORTATION AS IT RELATES TO URBAN DEVELOPMENT VALUES. The opportunity for structuring growth patterns and for coordinating community development objectives with transportation facilities has greatly increased in the past few years as a result of transportation

legislation and administrative policies that have been evolving since 1962. The emphasis has been on flexible use of federal funds for improving local transportation decisions. As a result, the potential for joint development is great. But, state and local redevelopment laws must be structured to permit the designation of redevelopment projects along corridors and at transit stations and also permit the use of "tax increment" or "tax recapture" financing.

Hirten, JE *Journal of Housing* Vol. 31 No. 5, May 1974, pp 214-219

45 262606 TRANSPORT AND URBAN STRUCTURE. Transport planning and the design of urban transport facilities requires accurate predictions of future urban structure and the residential density and demographic composition of zones in the urban region. In turn improvements to the urban transport system can affect the distribution of population in the urban region. Some results of a current research program in Melbourne University, Australia on the effect of accessibility and traffic density on urban structure are described. A new accessibility model for residential development is proposed and techniques described for determining the likelihood of changes in residential density and demographic composition of zones. A definition of environmental capacity is proposed. /Author/

Clark, N *Transportation Planning and Technology* Apr. 1973, pp 249-268, 10 Fig., 14 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 208109)

45 262882 URBAN CENTER DEVELOPMENT AND MASS TRANSPORTATION. Creating new transit systems in a retail and commercial setting can be instrumental in the activation of additional "street" levels. The author discusses the case of the planned construction in New York City of a new subway line, the Second Avenue subway. Essentially the legislative proposal would extend the public domain below-grade and into the ground floor area by establishing easements for the movement of people within the property line of new projects in the Special Transit use Districts. A full realization of American urban-planning potential will create new instruments of ownership, liability, profit participation, and planning incentives.

Croxtan, RR *Real Estate Review* Vol. 4 No. 2, July 1974, pp 87-94

45 263153 AIR RIGHTS, SUBSURFACE EASEMENT, AND OTHER FRACTIONAL EASEMENTS. The author analyzes air space uses over existing rights of way and beneath viaducts and bridges and advises rule of thumb tests for feasibility and appraisal approaches. Using the bay area rapid transit tunnel esements in Berkeley, California, as his example, he describes the valuation problems involved in its construction and the appraisal method that was employed successfully. The value of the actual easement taken was estimated to be the present worth of future extraordinary engineering, architectural, and construction costs for foundation work.

Rhodes, RM *Appraisal Journal* Vol. 42 No. 2, Apr. 1974, pp 261-272

45 263779 CRITERIA USED BY TRANSIT OPERATORS AND PLANNING AGENCIES IN SELECTED CITIES TO EXTEND SERVICE TO NEWLY DEVELOPING AREAS. Public planning agencies and transit operators responded to a questionnaire designed to indicate general opinions and attitudes towards the extension of transit service to newly developing areas within their communities. Economic feasibility seems to be the major determinant. There was little indication, in the responses from the planning agencies, of any well-conceived and positive coordination of land development policies and transit system planning policies in order to achieve mutually complementary results. While there were some indications that trial service was used by the transit operators as a means of measuring demand, policies were not clearly defined.

Niklaus, JL ; Tulane University Rept. 2, 1974, 76 pp

45 263838 DEVELOPMENT POLICIES FOR URBAN MASS TRANSIT STATION AREAS. More than 20 metropolitan areas in the country are presently considering the construction of fixed-rail mass transit systems. It is estimated that these new systems would entail approximately 600-700 new transit stations, each with an immediate impact on land use development opportunities within a radius of approximately one-half mile. One means of taking advantage of these opportunities is through application of the joint development concept. "Joint development" is defined to include coordinated planning and development of transportation facilities and changes in land use over, under, or in the immediate vicinity (one-half mile radius) of the facility. It includes public and private development activity. Some recognized advantages include better use of scarce and expensive urban land through multiple use of rights-of-way and encouragement of land use arrangements which enhance and make more efficient use of transportation facilities. /Author/

Urban Land Vol. 33 No. 8, Sept. 1974, pp 3-10

45 263899 ENERGY, URBAN FORM AND TRANSPORTATION POLICY. A frequently suggested strategy for alleviating transportation energy shortage is to reduce travel demands by altering the patterns of land uses in cities. This paper examines this strategy by exploring the interface between urban structure, transportation energy consumption, and transportation policy. The interrelationships between travel demand and urban form are first examined, and research attempts to clarify and model these relationships are reviewed. The role of transportation as a land use development control is discussed, and the use of "transportation performance standards" is proposed as a method for integrating transportation energy considerations into land development controls and decisions. /Author Abstract/

45 267002 LAND ACQUISITION AND CONVEYANCING BY URBAN TRANSPORTATION AUTHORITIES: A CASE STUDY OF METRO. In recognition of the need to relieve traffic congestion and improve the physical character, economic growth and well-being of the National Capitol region, the Washington Metropolitan Area Transit Authority (WMATA) was created in 1967. On December 9, 1969, a bill authorizing Federal participation in the 98-mile regional system (METRO) was signed by the President authorizing \$1.1 billion in Federal funds to be expended over a 10 year period. METRO will be a modern rapid rail transit system, utilizing its own exclusive right-of-way with 47 of the 98 miles and 53 of the 86 stations underground. Some 42 miles will be on the surface and 30 miles will be along existing railroad rights-of-way or in medians of highways. The remaining 8 miles will be on aerial structure, mainly grade separations and bridges. As of September 25, 1972, a total of \$81.2 million had been committed to real estate and rights-of-way acquisition. The primary objective of this study has been to investigate the plans, programs and operations of WMATA with regard to real estate acquisitions with special emphasis placed on the preparation and conveyancing of title to WMATA. In order to accurately investigate the preparation and conveyancing practices, it was necessary to work closely with Land Title Insurance Company and attorneys with whom WMATA had contracted to do this work. As a direct result of the investigation and analysis, included in this report are guidelines which should be of assistance to other urban transportation authorities involved in the acquisition of real estate. A bibliography is included.

45 300113 EVALUATION OF THE SEVERANCE EFFECTS OF A PROPOSED RAPID TRANSIT CORRIDOR. The paper describes a study of potential trip severance and disruption to the residential environment by a proposed rapid transit public transport route through suburbs in Adelaide. The study showed that physical severance can be avoided, and in some places access can be improved, if appropriate route crossings are provided. Evaluation of a number of research methods used in the study suggests that more consideration of the behaviour underlying trip-making will lead to better solutions than simple trip-counting procedures in this and perhaps in other aspects of transport planning. Study data on pedestrian movement around suburban areas have important implications for residential subdivision and associated transport planning. /Author/TRRL/

45 300369 WHAT FOREIGN CITIES CAN TEACH AMERICAN CITIES. This paper discusses the benefits to be derived by the United States from exchanges of information with European countries. There is a detailed discussion of three areas of European experience from which Americans could learn and profit--management of urban open spaces, public transportation, and urban conservation. Other subjects mentioned as suitable themes for international exchange include: public/private partnership in urban redevelopment, urban impact analysis, urban financing, and metropolitan growth management. The exchanges will take the form of reciprocal visits of transfer teams composed of local officials, community leaders, and urban professionals from the United States, Germany, and the United Kingdom. The teams will examine urban conditions and practices in selected cities on both sides of the Atlantic with a view to transferring lessons of successful experience to their own countries.

45 300967 COMMUTING AND AVERAGE JOURNEY TIMES. EVALUATION OF FOUR LAND USE ALTERNATIVES [Pendling och medelresettider. Utvärdering av fyra fysiska regionsstrukturer]. In a study by the Stockholm Regional Planning office (1975-1976), six land use alternatives for the year 2000 are presented. This paper presents an extensive evaluation of four of the alternatives in regard to the development of commuting within the region. Three forecasting methods are used: a neutral forecast (based on a neutral assessment of present commuting situation), a forecast based on random selection and a forecast based on minimization of mean travel time. The alternatives are then compared in three ways. First in regard to estimated mean travel time (both by private car and public transport system), and then in regard to the resulting modal split between the different housing areas. A detailed presentation is given of the results of the study together with a demonstration of the method used. /TRRL/ [Swedish] Snickars, F ; Royal Institute of Technology, Sweden Monograph June 1977, 53 p., 22 Fig., 5 Tab.; ACKNOWLEDGMENT: TRRL (IRRD 241301), National Swedish Road & Traffic Research Institute

45 301612 RESIDENTIAL AREA LOCATION PREFERENCE SURFACES. Although an understanding of the interaction between land use and transportation is essential to a rational evaluation of urban and regional policy, it is frequently complicated by the introduction of sophisticated mathematical techniques. In an effort to make this interaction more visible to the decision maker, two of the more advanced techniques--multinomial logit analysis and mental maps--are placed in a common framework of analysis and presentation. The strength of a rigorous theoretical background is thus combined with the simplicity of a visual presentation. The theory and development of the technique are outlined, and its use in a case study of the residential location preferences of residents of the inner suburbs of Melbourne, Australia, is described. /Author/

45 302274 AN ANALYSIS OF JOINT DEVELOPMENT PROJECTS: FINAL REPORT ON FIRST YEAR TASKS. This report presents the results of the first year of study into a number of characteristics of an urban area in which joint development is taking place. The objectives of this study are to: 1) investigate the economic and population trends that influence economic and location decisions within the region; 2) investigate ways in which transit serves as a catalyst for development and in particular, delineate and quantify these ways; 3) determine the relative attractiveness of downtown as a retail attractor when compared with suburban regions; and 4) investigate analytic techniques that may help delineate the success of particular joint development projects. The study was carried out in the Buffalo, New York SMSA. Construction has recently begun on a six-mile Light Rail Rapid Transit System (LRRT). This study focuses on Central Business District and Regional development concerns with specific attention to the LRRT. The results of a number of tasks accomplished during the first year of analysis are discussed and brief summaries of discussions with local planners or policy makers are presented. The findings of the study found to be most significant are: 1) the phenomenon of suburbanization is so strong that competing redevelopment strategies, even those of major proportions may not succeed, except under the most focused and intense development conditions; 2) the importance of the combination of population decline and job category shifts must be realized; 3) accessibility is not the only, nor even the most important variable that should be measured by transit improvements; 4) variables that control retail activity linked to transit include quality of the activity, parking, and safety, and that currently, the CBD in Buffalo is not "attractive" enough to offer competitive pull to the suburban malls; and 5) the new LRRT is perceived of, together with a proposed joint development mall, as a positive gain for the CBD.

45 305353 THE INTERACTION BETWEEN URBANIZATION AND LAND QUALITY AND QUANTITY IN ENVIRONMENTAL PLANNING AND DESIGN. THE TRANSPORTATION MODEL TECHNICAL DOCUMENTATION. The objective of the transportation model is the projection of travel demand on transportation facilities in the study area. These projections provide data for the evaluation of the transportation network and are linked to other models such as fiscal, air and noise. The model is composed of a travel demand and a supply or volume/performance component. The demand submodel projects travel demand between internal zones in the study area and between internal and external zones. The supply model is implemented by adding each projected origin destination pair into the network incrementally and recalculating the network equilibrium after each increment using the least time rule. In this manner, travel demand is allocated over alternative routes as a function of the level of demand.

45 305843 URBAN TRANSPORTATION PLANNING SYSTEM (UTPS), THE COMMUNITY AGGREGATE PLANNING MODEL (CAPM) USERS' GUIDE. HIGHWAY SKETCH PLANNING. The report is an introduction to the Community Aggregate Planning Model (CAPM), and its potential uses. CAPM has recently been incorporated as a module of the Urban Transportation Planning System (UTPS) package of computer programs, and is a computerized transportation sketch planning model, which permits fast and inexpensive preliminary screening of highway improvement alternatives. It is useful in a number of sketch planning applications, such as the analysis of urban development patterns, alternative system investments, air quality, and energy consumption. The report incorporates two documents--the CAPM Users' Guide and the CAPM Program Writeup. The Writeup is included in this report as an Appendix. Together, these documents provide information of the program's capabilities, limitations, data needs, potential applications, and computer requirements. Both are now available on the UTPS tape.

45 307769 A RECREATION NEEDS ASSESSMENT PROCESS-AN ORIGIN-DESTINATION APPROACH. Presented here is a process that communities can use to plan improvements in their recreation system which are responsive to the expressed needs of their residents. It is particularly useful for demonstrating the optimum locations for urban parks to maximize energy conservation and social service return on capital investment. Central to the process is a comparison of projected recreation needs and desires, based on an attitude survey, with the capacity of the existing local park systems, to identify future deficiency problems. The process employed a regional origin-destination travel model to distribute demand. A citizens' advisory committee to the planning program, along with the parks and recreation commission, reviewed and made recommendations for each task in the process. /Author/TRRL/

45 308080 PUBLIC TRANSIT AND DOWNTOWN DEVELOPMENT. The findings and conclusions are discussed of recent research related to transit and urban development, including a study of transit-related joint development projects in the U.S. and Canada, an analysis of the changing economic role of central cities, and a current study of downtown office growth. Houston is described as a good example of the need for downtown access improvements. Surveys of the Urban Land Institute found that downtown office space in 20 selected cities has increased an average of 41.4% between 1970 and 1978. Office space expansion leads to new demands on urban transportation systems. Mass transit could add significant capacity to urban transportation services and prevent highway and local street capacity from limiting urban accessibility. Transportation improvement programs of seven major North American cities are used to illustrate the range of strategies for linking transit and downtown development. These cities include Toronto, Montreal, San Francisco and Oakland, Washington, D.C., Los Angeles, Portland and Denver. The most land use benefits have been realized by cities that have carefully coordinated land use and transportation planning.

45 309181 STRUCTURING THE URBAN AREA TO MAKE BETTER USE OF PUBLIC TRANSPORT. A study is made of changes which might be made to urban development patterns and trends, to facilitate improvement to public transport services. The implications of encouraging higher densities around existing railway stations are analysed. Alternative urban forms, appropriate to the characteristics of demand bus and fixed-route bus services, are proposed and discussed. Major diversified centres are postulated as potentially useful components of an urban structure suited to public transport systems. (TRRL)

45 310170 ACCESSIBILITY AND THE EVALUATION OF LAND USE / TRANSPORT PLANS. This paper was presented at Session 25-Transport and Accessibility. A systems approach is used to analyse the faults of the conventional evaluation methods used in the land use/transport planning process. The approach shows six features which are essential for an improved evaluation process, including the use of objectives relating to all relevant community goals, the avoidance of sub-optimal objectives and the investigation of distributional impacts. Accessibility indices are appropriate measures of performance in such an approach because they measure the choice of opportunities available rather than traffic demands. They measure an output of the urban system, not just the transport sub-system. Two accessibility indices have been developed and compared using data from the Sydney area transportation study and the 1971 census of population and housing. The two measures were found to be highly correlated, although one measure contains behavioural elements whereas the other is a measure of physical accessibility. There was found to be as much variation in accessibility between occupation groups as there is between municipalities in inner Sydney suburbs. Improvements in the road system would exacerbate the inequality of access to job opportunities in the inner suburbs, because the majority of non-professional workers do not have cars available for the journey to work (a). 45 312556 IMPACT OF INTENSIVE HIGH-RISE DEVELOPMENT IN SAN FRANCISCO. A SUMMARY [Final rept]. The effects of alternative patterns or scenarios of intensive high-rise development are analyzed with respect to the amount and distribution of growth in San Francisco, Calif., in or around the year 1990. The scenarios consist of maps and photographs of the commercial sector of the city; the first outlines the existing skylines and oblique projections, while four subsequent scenarios illustrate and chart expected changes wrought by committed and proposed office and hotel site development. The selected scenarios are discussed in terms of policy issues relating to environmental, transportation, municipal finance, and urban economic considerations. Study findings and conclusions, presented individually for each of these policy areas, discuss, among other things, the city's dependence on offices and hotels as an "industry," describe prototypical "industry" workers, and analyze the economic effects of an increase in the work force. Intensive high-rise development will, in addition to increasing city revenues, necessitate increased expenditures for municipal services, particularly those relating to mass transit. Increased building heights are not

seen as creating necessarily commensurate increases in environmental problems relating to noise levels, air quality, views and visual impact, park use, and livability. Summary tables present the actual amounts of space, persons, revenues, and costs for 1974 and for the projected scenarios.

45 313230 JOINT DEVELOPMENT REPORT. This report is a status report of joint development activity in cities across the nation, documenting research conducted between July 1976 and June 1979. This document is in three parts. Part One discusses legal, organizational, and procedural issues which were observed in the case study research documented in Part Two. Part Two is a status report of national joint development activities, current as of May 1979, and includes seven city summaries and 26 project case studies. Part Three presents brief status reports of 29 projects. This report also contains a public/private process chart which illustrates the steps necessary for joint development and an examination of the Transportation Corridor Development Corporation (TCDC). The city and project cases discussed in this report are presented in a case study format. Each study presents the kind and size of the project(s), the actors involved, a description of the area immediately surrounding the stop, and the contributions and payoffs of both the public and private sectors.

45 313640 JOINT DEVELOPMENT: MAKING THE REAL ESTATE-TRANSIT CONNECTION. EXECUTIVE SUMMARY. The publication describes the public and private sectors' roles in joint development-real estate that is closely linked to public transportation station facilities. It includes general conclusions about transit planning, joint development ventures, and joint development deal making. The Summary Guide highlights implementation techniques by focusing on four key issues: (1) What agreements and arrangements are necessary among developers, transit authorities, and other public agencies; (2) How these arrangements, or "deals," are made; (3) How improved transit planning can lead to more frequent and efficient implementation of joint development projects, and (4) How communities can use transit to guide or encourage development. The Guide is designed to provide information to both public and private sectors, and aid practitioners in maximizing the benefits of the Nation's investments in public transportation facilities.

45 313664 JOINT DEVELOPMENT: MAKING THE REAL ESTATE-TRANSIT CONNECTION. The purpose of this report is to inform new and potential participants in joint development (JD) of the financial, legal, organizational, and operational aspects of the deals involved in the implementation of JD projects. Basically, this book is designed for use by decision-makers and practitioners in the land use and development fields, by those in both the public and private sectors who are responsible for planning and implementing JD projects. Through case studies, this report reviews the planning and deal-making involved in the execution of seven major projects in five cities in the United States and Canada (Boston, Philadelphia, Washington D.C., Montreal, and Toronto). The case studies include reactions from developers and transit authorities and recommendations on improvements to the JD process from transit planning and physical design stages through construction to the operation of the projects.

45 314804 TRANSPORTATION IN CITIES. This book introduces some basic aspects and problems of urban transportation, beginning with a historical survey. A major theme is the relationship between land use and transportation, and much of the book is an examination of how changing transportation needs require land use change and vice versa. The cost of transportation and who pays for it is analyzed. The author compares transportation systems in developed nations with the needs of Third World nations and concludes that Third World transportation problems are much more difficult, and likely to remain severe for many years. 45 315290 TRANSTEP USER MANUAL: A LAND-USE / TRANSPORT MODELLING SUITE. TRANSTEP is a suite of programs designed to assist land-use planners and transportation planners model land-use / transport interaction problems. This latest version of transtep, which is currently available for UNIVAC 1100 computers, has been revised from earlier CDC/TRANLAN or IBM/UTPS versions to simplify and accelerate both operational and user aspects of the suite and does not incorporate the more seldom used models for mode split and economic evaluation. Transtep is designed to operate (optionally) with a public transport passenger assignment suite called PTIS. Incorporating the ability to preload public transport link volumes on the highway network. In this form transtep provides most of the facilities available within the CDC/TRANPLAN or IBM/UTPS suites, together with its new facilities, but is not

bound by commercial availability considerations to either CDC or IBM user bureaus and is, therefore, available for conversion or transfer to any suitable computer. (TRRL)

45 315403 JOINT DEVELOPMENT MARKETPLACE. On June 25, 26, and 27, 1978, more than 600 persons met in Washington, D.C. to learn about and discuss emerging joint public-private development opportunities throughout the United States. One hundred forty-six private companies and firms were represented. Seventy-eight cities and urban counties sent their mayors or other senior officials. Thirty-six of these cities and counties exhibited plans for more than 100 joint development projects, and their representatives were available—in formal site marketing sessions and informally—to answer questions about them. Top Federal officials, including Secretary of Transportation Brock Adams and Assistant to the President Jack Watson, emphasized the opportunity for a creative partnership among all levels of government and the private sector in the revitalization of our cities. Nationally recognized leaders in the fields of urban planning and economic development, development, urban transportation, land development, and real estate investment discussed joint development from their particular perspectives and took part in a series of workshops relating to public-private negotiations and the planning of joint development projects. The JOINT DEVELOPMENT MARKETPLACE—as the title indicates—was designed to be a marketplace for projects ready for development and a marketplace for ideas. In this respect it differed from the traditional Federally sponsored activity, at the conclusion of which is brought forth a transcript of the proceedings and a series of recommendations. The value of the JOINT DEVELOPMENT MARKETPLACE was in being there, seeing what others had to offer, exchanging experiences, and making contacts.

Public Technology, Incorporated Proceeding June 1978, 217 p, Tabs., 2 App.; Proceeding from the Joint Development Marketplace, held at the Shoreham Americana Hotel, Washington, D.C., June 25-27, 1978.

45 316932 PUBLIC TRANSPORTATION AND LAND USE POLICY. This book studies the relations between the supply of transport service, the demand for it and urban density. Four aspects of this relationship are examined: response of ridership to improvements in public transport service, effect of different densities on ridership, in particular the role of the automobile, costs of different public transport modes, and influence of density on the provision of service. The relations developed are used to illustrate the suitability of different urban densities to 8 types of public transport: taxi, dial-a-bus, local bus, express bus, light rail, light guideway transit, rapid transit, and commuter rail. 45 319939 JOINT DEVELOPMENT: MAKING THE REAL ESTATE-TRANSIT CONNECTION. This book, consisting of an overview of the potential and problems of developing real estate in conjunction with rapid transit stations and then seven case studies, identifies for public and private participants the financial, legal, organizational and operational aspects. In order for joint development to enhance economic development related to transit investments, deal making between public and private parties is a necessity. Even experienced practitioners can learn of new arrangements for transit-related property development. The case studies about Philadelphia, Washington, Montreal, Boston and Toronto are presented in a rather consistent manner with special issues and innovative features of each project being highlighted.

45 322034 IMPACT OF RAIL TRANSIT ON LAND USE: EVIDENCE AND A CHANGE OF PERSPECTIVE. The paper reviews the experience of the post-World War II period in rapid transit investment and its apparent effects on urban development. The intent of this review is to draw inferences concerning the potential strength of that relationship and to indicate why success in achieving such effects on land use seems to have varied so much between places such as Toronto, Ontario and San Francisco, California.

45 322827 OPTIMIZING JOINT DEVELOPMENT AT TRANSIT STATIONS. The Detroit Metropolitan Area was used as the experimental site for such feasibility testing. Two priority ranking methodologies were developed based upon provisions of rating and ranking methods. Station development potential was identified by a set of socio-economic and land use indicators, and the viewpoints of local professionals were solicited in assessing the relative importance of the indicators identified. Next, the relative rankings for 37 proposed transit stations on two travel corridors were developed using the indicators and the viewpoints of the local professionals. The study shows that it is possible to prioritize station locations for joint development based upon selected socio-economic and land use indicators. The results also suggest that the station ranks obtained by the two methods are not likely to be affected by input solicited from local professionals. Lastly, the procedures developed are found to be sensitive to selection of the indicators.

45 324878 APPLICABILITY OF JOINT DEVELOPMENT TOOLS IN DETROIT. Joint development (JD) is a process by which major public facilities are constructed in concert with other projects through the coordinated efforts of public or private agencies, or both. This paper focuses upon the identification and analysis of JD mechanisms for use in the Detroit area where major transit investments are anticipated. A total of nine basic types of JD mechanisms were identified and evaluated in the context of the institutional structure of the area. The mechanisms were evaluated for feasibility by considering statutory basis, taxation issues, revenue sources, bonding authority, public approval, jurisdiction, organizational basis, and other relevant aspects. The evaluation indicated that many JD mechanisms could be considered feasible for use in the Detroit area. In some cases, precedents existed for the use of particular tools. In addition, several local agencies were found to have the authority and capabilities to administer JD programs.

45 325872 RESPONSE OF URBAN REAL ESTATE VALUES IN ANTICIPATION OF THE WASHINGTON METRO. The effect of public mass transit systems on the spatial distribution of urban property values is likely to be highly parcel-specific. Changes in real estate values may occur both before and after construction of a transit system. This article describes a series of econometric models of real estate values estimated for parcels in Washington, DC, over the period of the planning and initial construction of the metro system. Separate models are estimated for single-family dwellings, multi-family structures and retail stores. Access to Metro and its implementation schedule are both found to be significant determinants of parcel transaction prices.(a)

45 326472 THE LOCAL IMPLICATIONS OF BART (BAY AREA RAPID TRANSIT) DEVELOPMENT. The report presents the final results of the Local Policy Implications Work Element. The report assesses whether BART has achieved the original objectives of local communities. The report also outlines local policy implications in the form of practical guidelines for local government officials either considering an investment in rapid rail transit or in the process of designing and constructing a rapid rail transit system. Implications are presented for each of nine original community objectives for the BART system. This material is further organized into five chapters relating to major areas of local policy--transportation, land use, finance, economic development and environment.

45 326479 LAND USE AND URBAN DEVELOPMENT IMPACTS OF BART (BAY AREA RAPID TRANSIT). The report assesses the land use and urban development impacts of the 71-mile Bay Area Rapid Transit (BART) system, the first rail transit system to be built in the United States in 50 years. How and to what extent BART has influenced the spatial arrangement of people and activities in the San Francisco Bay Area is documented. All aspects of development that BART may have affected or potentially could affect are examined--including households' and workers' location decisions, development decisions of housing and commercial developers, retail trade and shopping patterns, and property values and rents. Changes attributable to BART

are measured against pre-BART and no-BART alternatives using a variety of analytical techniques, surveys, statistical analyses and case studies. The report concludes with an assessment of the policy implications of the BART experience to date.

45 330171 JOINT DEVELOPMENT AROUND INTERMODAL TRANSFER FACILITIES. Efforts undertaken in the city of Baltimore to initiate joint development around transit stations are examined. Under the provisions of the 1974 amendment to the Urban Mass Transportation Act of 1964, the U.S. Department of Transportation could make grants or loans for the establishment of transit corridor development corporations and for the purchase of land and the development of property adjacent to transit stations. Baltimore was one of the first cities to apply for funds under the new legislation. Although the Urban Mass Transportation Act of 1964 has since been amended to remove specific authorization for the funding of transit-corridor development corporations, the Urban Initiatives Program, established in 1979, provided funding for the Baltimore program. The key factors underlying the successful development of the Baltimore program are identified. Specific joint-development projects are examined, and the main points of the joint-development application are discussed. Observations are offered on the nature of contemporary joint development and the involvement of the public sector. (Authors)

46 072118 STRESS FOR PEOPLE. A number of OECD countries are experimenting with various ways to limit the number of vehicles crowding into downtown areas. The factors contributing to the success of a car-free area are analysed on actual cases. Experience proves that such bans on general traffic definitely improve the quality of the environment and dramatically reduces pollution. Usually welcome by the pedestrians, they are commercially successful. Buses and taxis may be allowed if the concerned area is large enough. Their efficiency is than very much increased. Problems come from the cost of the program (park and drive services, special vehicles), some accessibility difficulties (deliveries, transportation of heavy items), and uncertainty about the long-term influence on the use, of land and the character of the area.

46 083970 PARKING PATTERNS AND PRICES IN THE CBD. This paper shows how the flow of automobile traffic from residential areas is allocated among downtown parking facilities by a pattern of prices that acts to minimize the total driving and subsequent walking costs for the drivers as a group. These prices also provide the maximum revenue that can be collected each parking facility when competing freely. A set of data from a central business district with more than 10,000 parking spaces demonstrates the validity of the analysis and shows that the parking patterns and prices can be determined inexpensively by computer. The model should be useful to traffic engineers and urban planners in their design of more efficient urban transportation systems.

46 084304 EFFECTIVENESS OF NEAR-TERM TACTICS FOR REDUCING VEHICLE MILES TRAVELED: A CASE STUDY OF THE LOS ANGELES REGION. An analysis of near-term transportation alternatives for the Los Angeles region using the Policy-Oriented Urban Transportation Model developed by Rand is presented. The predicted effect on regional vehicle miles traveled of various levels of bus system improvements, carpooling incentives, and economic disincentives (i.e., mileage surcharges or increasing gasoline prices, and parking surcharges) are shown. Changes in personal mobility as reflected in changes in the total number of person trips are also included. The analysis indicates that a number of transportation management alternatives are available that could potentially reduce vehicle miles traveled in the Los Angeles region by approximately 20 percent, or more, while minimizing adverse impacts on personal mobility. /Author/

46 084756 DOWNTOWNER BUS SERVICE. The Washington, D.C. Downtowner "Midibus"

Demonstration Project has for its goals: (1) reduction of downtown congestion; (2) reduction in size of transit coaches in the city core area; (3) reduced air pollution; (4) assistance and support of downtown revitalization efforts; (5) a revenue-cost ratio of 0.5; and (6) optimum routing of downtown circulation vehicles. The medium-sized bus, 25' long and 8' wide, has peripheral seating for 25 and standing capacity of 15. The Daytime Connector Route proved to be optimum by all performance measures as indicated. By completion of the program in June '74, more than 1,200,00 passengers has been carried on all routes, nearly all on the Connector route. In July '74 the service was taken over by the Washington Metropolitan Area Transit Authority in consonance with an agreement with the District Government to continue service if the demonstration proved utilitarian and well patronized. A modified-zone fare structure proved acceptable and the service-cost ratio of 0.5 was exceeded by a wide margin. Both low fare and convenience of movement within the CBD encouraged public use of mass transit to circulate around the CBD for shopping and other errands. The net result was a reduction of downtown traffic with consequent lowered air pollution and progress in efforts to revitalize the downtown area. Chapters address the project in terms of financing, management, publicity, vehicles, liquified natural gas fuel system and ridership. /UMTA/

46 093683 ROAD USER CHARGES. SOME PRACTICAL CONSIDERATIONS. While a number of proposals for applying road user charges have been considered by analysts and policy makers, little unanimity currently exists on the most appropriate scheme. Much of the difficulty stems from the fact that transportation systems interact in a complex manner with many facets of urban life, and any particular scheme of user charges is likely to have some undesirable impacts which will make it difficult to implement. This paper reviews past experience with road user charges, principally automobile tolls, and estimates the changes in traveler behavior which are likely to result from use of congestion tolls. It concludes with some general observations on how congestion pricing policies might be made more palatable politically.

46 096920 TRAVEL MODE CHOICE IMPACT OF POTENTIAL PARKING TAXES IN DOWNTOWN CHICAGO. The likely travel mode choice effects of a potential parking tax increase ranging up to \$10.00 per day was investigated in Chicago Central Area which covers approximately 15 square miles and includes the most dense square mile of downtown Chicago, the Chicago Loop. Details are given of the

analysis which consisted of determining the mode split between auto and transit trips for each zone in the central area, dividing the area by rings into separate subareas which include zones with similar modal splits, and applying a travel mode choice estimation procedure to each subarea to determine the effects of possible tax increases on the existing modal splits. The data for the analysis were obtained from a 1970 home interview survey. It is noted that the degree to which parking taxes would eventually change modal shares would depend on the boundaries of the area indicated and include the study of shift of auto drivers to areas outside tax area boundaries, shift of non-work trips to alternative activity centers (such as shopping centers), and parking tax revenue estimation.

46 097227 PARKING IN AMSTERDAM. At noon some 29,000 cars are parked on the public road in the City Centre of Amsterdam, 20,000 of which occupy legal parking lots. The parking garages in this part of the city have a capacity of 3,000 lots. There are no plans to further extend the total parking capacity of the City Centre. Studies have been conducted to see whether so-called parking-districts could be introduced, in which case their street area would be regarded as one big parking-area and the control would take place at the periphery of the district. At night and at the weekends the regular parking-capacity of the public road in the old residential zone around the City Centre is exceeded by 14%. The solution to the parking problem in this area has to be found within the framework of urban renovation. /TRRL/ [Dutch]

46 097681 LONDON IN THE 1970'S. THE BRITISH ROAD FEDERATIONS REPLY TO THE GLC GREEN PAPER TRAFFIC AND ENVIRONMENT. This document is a reply to the G.L.C.'s green paper-traffic and the Environment. It begins by examining the balance, between the demand for movement and the supply of facilities to enable movement to take place. It notes that there is A lack of emphasis on road-building in transport policy. There is a general discussion of potential methods of restraint on traffic flow and speeds, and the bulk of the report compares the different methods. These methods include parking controls, supplementary licencing and road pricing. The extent of on-and off-street parking is indicated and estimates of its potential contribution to reducing congestion are given. Supplementary licencing is evaluated with particular reference to goods vehicle movements and work journeys. Administrative problems are suggested and the effects on the economic and social life of the city noted. Road pricing is limited by it being a national development. Shorter sections on traffic management, buses and heavy lorries examine the potential improvement in flow, safety and the general environment but note that drawbacks exist with each policy. Conclusions emphasize the need for road building and accept that extensions of parking control and

the banning of through heavy lorries are feasible and desirable. /TRRL/

46 099491 COMPARTMENTATION AS A TOOL TO REDUCE TRAFFIC CONGESTION AND IMPROVE THE ENVIRONMENT. A system of compartmentation or zoning used in Gothenburg, Sweden, to reduce traffic congestion, to improve public transit operation, and to improve environmental quality in the central core of the city. This system is described, and the effects it has had on vehicle flow, parking, public transit operation, accidents, and noise and air quality are discussed. Polls of citizen reaction to the compartmentation revealed that two out of three citizens had favorable reactions to the system. Although Gothenburg has had difficulty securing funds for follow-up studies, several other Swedish cities have been impressed with the Gothenburg system and have adopted a similar compartmentation system.

46 125034 IMPLEMENTATION AND ENFORCEMENT OF RESTRAINTS. The assumption of the need for constraints underlies discussion of congestion in cities, but local authorities appear reluctant to extend restriction for fear of alienating the public. The main instrument of restraint is likely to be intensification of existing parking control and pricing. Enforcement is a separate and major problem with existing methods and new techniques of restraint offer little scope for reducing the difficulties of enforcement. Land use planning can be important, but the most effective and acceptable policy is likely to be a combination of constraints and incentives (particularly in the form of improved public transport). The number of the covering abstract of the textbook is irrd abstract no 212297. /TRRL/

46 125540 THE ENGINEER'S ROLE IN TOWN CENTRE DEVELOPMENT. This paper gives an outline of the part played by the municipal engineer in town centre development. The author illustrates it with examples taken from the city of Swansea. He first gives a brief account of the city's quadrant scheme to re-develop its war-damaged centre. The scheme has been prepared by consultants and after 15 revisions has been finalized. The author discusses the various problems that have had to be resolved. These include building line problems which were complicated by the siting of an old rising main; the extinguishment of highways and their pedestrianization; and problems associated with sewers, both old and new. Problems arising from public transport services are discussed at rather greater length, and in particular the routes of bus services. He then deals with mains and services, realignment of which has been strongly opposed by the consultants because of the effect of possible faults on traders. The author concludes by briefly discussing the future, in which the engineer will be concerned with the demolition of buildings, the construction of bridges and underpasses, and possibly with the design and construction of a multi-storey car park. /TRRL/

46 125579 TRANSPORT AND CENTRAL AREAS. The author introduces this brief article by contrasting the large shopping developments in the central areas of Singapore with equivalent British developments, and pointing out the need for flexibility in design. Urban transport policies are discussed in general terms and particularly in relation to the restraint of personal transport. After a brief reference to land use the different traffic-generating characteristics of each use are examined. Roads and parking policies are dealt with, reference being made to the capacity of roads (which may be physical or environmental), the locations of car parks and park-and-ride schemes. Mention is made of the different types of public transport that are available and proposals for siting office blocks close to public transport interchanges. After commenting on vehicle access to buildings for servicing and refuse collection, particularly in relation to shops, the author concludes the article by discussing facilities for pedestrians, including grade-separated crossings, covered areas, the use of walkways, lifts and escalators and the minimization of movement distances and travel times. /TRRL/

46 125648 CARS IN CITIES-CAN THEIR USE BE LIMITED?. This article briefly summarizes recent changes of attitude towards car restraint and promotion of public transport. Many factors, including the rise in oil prices and increased public opposition to urban highway building, have led to a change from pro-highway to pro-public transport policies. This change was recommended in November 1974 by the OECD Council and by its ministers of the environment. A group of OECD countries then met to organise a conference on "better towns with less traffic", for

April 1975. The secretariat, in preparation, surveyed 444 cities of over 100,000 population, and found that control of car parking is now being supplemented by efforts to improve public transport. Progress in three cities is described: in Nagoya, traffic management, parking control and bus priority have halved commuting by car and increased by 1/3 bus speeds. Besancon has restricted central access to buses or cars with permits, and replaced buses with shared taxis on some routes in the evening. In Nottingham there are pedestrian malls and bus-only streets, while use of cars to the centre will be limited by "controlled congestion" created by traffic signals. The conference will include sessions on express buses, sharing of cars and taxis, improved safety for cyclists and supplementary licences. Reports will be presented on energy conservation in transport, and on reduction of travel by land-use planning and by staggered working hours. /TRRL/

46 127231 TRANSPORTATION STUDY TOUR TO MUNICH AND PARIS-SEPTEMBER, 1974. The cities of Munich and Paris are both vigorously attacking the problems of street congestion and environmental pollution created by the unrestricted use of private cars and heavy lorry traffic. It is recognised in both cities that through traffic must be kept out of the centres by the provision of ring roads, but as these go through mainly suburban areas, special steps must be taken to protect residents from noise. So far as the private car user is concerned both cities have adopted policies of heavy investment in providing an efficient and reliable public transport system which will persuade the public to accept restrictions in the use of private cars. In neither city is public transport expected to pay its way in normal commercial terms but is supported by payments from the central or local government. Other means of reducing pressure on the city centres is to construct new towns or expand existing ones round the perimeter in such a manner that the employment and shopping requirements of the residents can be met without the need to commute to the city itself. The one week visit to Munich and Paris, which took place from September 15th-21st, 1974, and was initiated and organised by the institution's transportation board, was designed to examine the ways in which these policies had been planned and carried out. The amount of time available was insufficient to enable enough information to be obtained for a detailed report, but a general description of the public transport systems in the two cities is included, as well as some information on town planning policy, and on measures to reduce the noise and visual impact of major roads in urban areas. The article also includes descriptions of visits to some large new shopping areas on the outskirts of Paris, and to the big office and residential complex at La Defense to /TRRL/

46 127759 CONTROLLED MOBILITY? ASPECTS OF TRANSPORTATION GEOGRAPHY IN THE ORIENTATION REPORT [Beheerste Mobiliteit? Verkeers-en Vervoers-Geografische Beschouwingen naar Aanleiding van de Oriënteringsnota]. One of the central goals of the physical planning orientation report of 1974 is the future restriction of mobility in the Netherlands. It is in conflict with many forces in present society, which rather stimulate the increase of personal mobility. Consequently limited use of private cars can only be realized if alternative mobility opportunities are strongly promoted, e.g. fail transport for commuting and other public transport facilities. The orientation report, however, is very indefinite on this point. That a brake should be put on the further growth of motor traffic is shown by a calculation of the total areal occupation of this kind of mobility. It appears that by the year 2000 as much space will be needed for motorways and their noise zones as for all residential areas. Therefore, promotion of public transport is necessary to secure urban renewal as well as rural open areas. /TRRL/ [Dutch]

46 128805 REPORTS ON OECD CONFERENCE ON "BETTER TOWNS WITH LESS TRAFFIC" AND FIELD VISITS TO VARIOUS WESTERN EUROPEAN CITIES--APRIL 1975. Field trip reports are presented which highlight current practice in urban transportation in Europe. The report of visits to 3 case study cities (Munich, Bern, Besancon) notes many innovative concepts, and the European emphasis on mid-range programming (6-10 years). The importance of form, size, population density, dispersal characteristics, and historical and cultural restraints in relation to transportation is emphasized. The European countries which submitted case studies at the Conference reported measures to restrict the use of the private auto, and measures to promote the use of public transit. A visit to Nottingham, Leeds and London has shown that where pedestrianization has taken place, business has improved; community groups must be included in the planning process; and good public relation schemes must be implemented. The conference also provided for exchange of information related to systematic problems that arise when a traffic restraint is undertaken. A report is made of a visit to several European cities (in England, West Germany, and Netherlands) engaged in the use of public transportation and/or traffic management to reduce the adverse impacts of automobile traffic. A report of general and specific observations, notes that European programs are geared to a total system concept, and are much less inhibited by transfers or constrained by safety hazards. Specific observations made in Munich, Bern and Besancon are discussed. A report on a visit to Sweden notes the success of traffic restraint schemes. Such restraints are part of a larger process of city planning, citizen involvement and traffic management whose goal is to gradually alter the traffic flow so as to achieve the same

standards of safety and environmental quality as is achieved when planning new developments.

46 129641 "FOOT STREETS" HELP WITH LONDON'S TRAFFIC PROBLEM. A scheme is described where 1 km west of Oxford Circus (London's primary shopping street) was closed to ordinary traffic between 1100 and 1900 hours on Mondays to Saturdays, and only buses, taxis and service vehicles were admitted. Surveys indicate the scheme is very successful. The scheme is being experimentally extended to other areas. Nearly 20 years ago, a scheme (Barbican) was begun which was aimed at restoring life to the heart of the city by providing accommodation plus new facilities for work and leisure on the basis of complete pedestrian/vehicle separation principle. By adopting the principle of a podium, with connecting elevated walkways within the site, and linking it to adjacent office areas, the residential neighborhood is made into a pedestrian precinct free from noise and safe from traffic. Streets, service roads and access to garages and parking are either underground or below the podium.

Tiffen, CE *Shire and Municipal Record* Vol. 68 No. 8, Nov. 1975, pp 551-553

46 131404 THE EUROPEAN PICTURE: BETTER TOWNS WITH LESS TRAFFIC. Case studies are outlined of European cities which have implemented automobile management measures. The importance is recognized of conditions by which automobile restraint measures are developed, and it is pointed out that in the European cities, such restraints marked a reflection of public policy that automobile use in urban areas needed to be controlled. Comprehensive planning objectives were established, and the benefits derived from implementing automobile restraints were measured in numerous terms--thus making strategies politically acceptable and therefore more feasible to implement. In Uppsala (Sweden), the program which was implemented in successive phases, attempted to restore the factor of the human scale as the primary planning element. Bologna, Italy, adopted a development program intended to further the government policy of decentralization and restoration of regional equilibrium. Proposed or implemented schemes in Singapore, Nagoya (Japan), Besancon (France) and Nottingham, England are outlined. Points which should be considered in the design of restraints include those relating to the psychological resistance of drivers, the inclusion of the area's merchants in the preparatory plans, planning in conjunction with urban goods delivery, and the improvement of transit levels of service. The transferability of projects is discussed and certain measures were singled out for implementation within a short time frame: priority scheme for buses; metering schemes; bypass and cell schemes; and exchange of information would be useful are noted.

46 132308 NOTTINGHAM PUTS ON A NEW COLLAR. A brief outline is given of the peak-hour traffic control experiment being carried out by Nottinghamshire CC's planning and transportation department. A "collar zone" extends for more than two miles on the city side of the ring road in the western part of Nottingham, access to the main roads within the zone being limited by traffic lights. There are restrictions on cars leaving the ring road and entering the inner city area. Car commuters are encouraged to park their cars free at "park and ride" sites and to use buses. /TRRL/

Highways and Road Construction Vol. 43 No. 1789, Sept. 1975, p 18, 1 Fig. ACKNOWLEDGMENT: TRRL (IRRD-215423)

46 133655 WILL BRISTOLIANS TAKE TO THE TOLLS IN 1986. The article describes proposals given in the Bristol area Land Transportation Study by Jamieson, Mackay and Partners to relieve the growing congestion in the city of Bristol. The study recommends the setting up of a car restraint cordon about the city centre where motorists will be charged for journeys in or out of the central area during peak hours. Various forms of car restraint were considered in the study with two other strategies based on highways and bus priorities; but it was decided that the highways strategy could not cope with the increased traffic, and the bus priority scheme would not significantly alter the mode of travel. The team concluded that the cordon was the only method which would avoid long delays and discourage through traffic, giving equality to those who at present enjoyed free parking and those who had to pay; inside the cordon parking would be free. The toll cordon would have to be accompanied by road building to carry the increased circumferal traffic. Bus priority lanes should be introduced on all routes into the city centre through the cordon. /TRRL/

Merchant, M *Surveyor - Public Authority Technology* Vol. 146 No. 4347, Oct. 1975, pp 14-16, 3 Fig., 1 Phot.; ACKNOWLEDGMENT: TRRL (TRRL49095E)

46 133696 THE DESIGN AND EVALUATION OF AN URBAN PARK-AND-RIDE SYSTEM: SOME METHODOLOGICAL ISSUES. This paper presents a summary of findings on the design and evaluation of an urban park-and-ride system. Three main aspects are presented: the construction of mixed-mode demand models; the calculation of user benefits; and the consideration of optimization procedures for the design process. The problems of determining the optimal number, location, parking charges, and sizes of car parks are considered. Discussion is appropriate to car-bus and car-rail interchange. (A) /TRRL/

46 133710 CAR FEES IN THE CITY OF STOCKHOLM. AN ECONOMIC STUDY OF A LICENCE FEE AS A MEANS TO LIMITATION OF CAR TRAFFIC IN THE CITY OF STOCKHOLM [Bilavgift: Stockholms innerstad. En samhaellsekonomisk studie av licensavtift som medel foer begrænsning av biltrafiken i Stockholms innerstad]. An excessive number of cars in towns gives rise to environmental damage and congestion. Of the possible physical restrictions such as traffic planning measures, introduction of bus lanes, parking fees, better public transport and a licence system during rush periods, this report discusses the one mentioned last. The analysis suggests that the net overall economic gains of such a system would range between skr. 0.2 and 1.5M annually. Reduction of traffic would also have favourable environmental effects, and total gains would thus be greater if this plus the improvement in road safety were considered. Licence revenue can be redistributed between groups of road users or between modes. The effects of a licence system over the whole day should be investigated, and the effects of changes in traffic conditions should also be examined. /TRRL/ [Swedish]

Jansson, K ; Stockholms Laens Landstings Kollektivtrafik No. 20, 1975, 34 pp, 2 Fig., 5 Tab.; ACKNOWLEDGMENT: National Swedish Road & Traffic Research Institute, TRRL (IRRD-216970)

46 134037 THE RESTRAINT OF VEHICULAR TRAFFIC. The need for traffic restraint is identified by the inefficiency with which the existing road system operates, the pressure for reduction in traffic in sensitive areas, and the impossibility of meeting future demands for travel. Traffic restraint methods must meet the identified restraint needs, be flexible, selective, fair, adaptable, simple and inexpensive and easy to comply with. Methods to assess the desired level of restraint and methods to achieve that level are outlined. Existing (parking controls) and new methods of restraint on the private car are discussed. Private parking reduction by legislation (to reduce the number of spaces, taxiing ownership of spaces, and charging for spaces), control of through traffic, supplementary licensing by price, supplementary licensing by permit and physical controls are outlined. The restraint on commercial vehicles and the problems in implementing new measures are discussed.

May, AD *Traffic Engineering* Vol. 46 No. 2, Mar. 1976, pp 15-18, 2 Fig., 1 Tab.

46 134250 ILL FITTING COLLAR HAM-PERS NOTTS EXPERIMENT. The progress made in the Nottingham zone and collar experiment for controlling the traffic flow in the city centre across a cordon is reviewed. The control is achieved by installing traffic signals on all radial roads where they cross the collar and adjusting the signal settings to limit the flow. At each set of signals a reserved lane enables buses to bypass the queues. It is said that the park and ride scheme offered as an alternative to private cars has so far

been unsuccessful. The controls have not yet been fully tested as they will not be fully operational until autumn 1976 when the computer linked area traffic control will be in operation. /TRRL/

46 137652 GOALS FOR THE DEVELOPMENT OF THE CITY CENTRE WITH SPECIAL REGARD TO TRAFFIC PROBLEMS. The Standing Committee on Traffic Problems of the International Federation for Housing and Planning studies the problem of the aims of development of city centres. It asked members to prepare reports for one or two cities in their country, and also to fill in a questionnaire concerning statistics on centre development in the cities. 16 reports were received and were discussed at a committee meeting in Copenhagen in September 1970. The problem was also discussed at a committee meeting in Belgrade in 1971. The general reported was Mr. Hans B. Barbe, Zurich. Recommendations and conclusions concerning "goals for the development of the city centre" were adopted unanimously by the meeting in Belgrade. A comparison of the statistics of the various city centres has been worked out and may be of help in work with city centre problems in other cities. (A) /TRRL/

46 138867 PEAK HOUR RESTRAINT CAN BE MADE TO WORK. The author argues that peak hour car restraint would further erode off peak bus services. He suggests that priority be given to buses because they are the means of most journeys to work in urban areas. Buses at peak periods, because of their high load factors, use energy and road space more efficiently than the private car. There is also a large bias towards low income earners amongst bus passengers. Evidence is given that only in some medium sized urban areas are more than half the work trips made by car, and that high levels of car commuting can only be achieved by increasing road capacity or by planning the location of industry to facilitate car movement. Although peak hour car restraint may have some undesirable side effects, these can be minimised by a number of mechanisms available to local authorities. Before it can be given a fair trial, the political will is needed to pursue the policy of car restraint. /TRRL/

46 141303 UNCROWDING CROWDED STREET. In order to relieve the congestion that characterizes State Street, Chicago's busiest street, a transit mall is scheduled to be created in 1977. An interagency task force came up with a plan calling for the restriction of vehicular traffic, allowing only pedestrians and buses and emergency vehicles. Three basic objectives are behind the mall scheme: the improvement of State Street's pedestrian environment, the improvement of public transportation services in downtown Chicago, and the provision of an economic stimulus to the State Street business community. Several useful, as well as esthetic, improvements

will be made such as shelters, escalators leading to subways, trees, etc. The bus system will be systematized, and provision for taxi stands will be made on the cross streets, which will still be open to traffic. Side street loading for delivery trucks will be designated, and traffic control measures are planned for the traffic that must be rerouted from State Street. The area computerized traffic signal system, a parking ban on streets in the Loop area, and exclusive reverse flow bus lanes are all measures that will increase traffic flow speed and vehicle capacity on the streets. The idea of a "mall" is descended from the Middle Ages, where its purpose was to promote interaction and communication. Today's transit malls have begun to do that again, as well as promote transportation and economic improvements. After grant applications are filed and the final design stage completed, construction on the Chicago Transit Mall will get under way.

Chicago Public Works Vol. 5 No. 3, 1975, pp 10-13, Figs.

46 142796 CAR PARKING. This report has outlined the growing need for traffic restraint, especially during the peak periods, and has noted some of the problems that might arise from the imposition of such restraint by the restriction of parking spaces in new developments. The standards suggested reflect the following 5 main policy criteria: (1), the need for more restraint orientated control over the movement of private cars during peak periods, particularly with regard to office commuter trips to those parts of the borough that are comparatively well served by public transport. (2), the standard of provision for commuters' cars to industrial/warehousing areas remote from public transport should be demand orientated. (3), journeys which can be made by car during the off-peak period, i.e. Shopping trips, pose no great problem and merit more generous standards than advocated by the glc. (4), the need for one space per dwelling as a minimum requirement with certain exceptions. (5), the parking requirements for other categories of development be treated on the merits of each case. Proposed car parking standards are summarised in an appendix. /TRRL/

46 146633 PARKING MANAGEMENT STRATEGIES FOR REDUCING AUTOMOBILE EMISSIONS. This report defines the concept of parking management and explores how parking management can be used to improve air quality, support mass transit, reduce energy consumption and improve the amenities of life in urban areas. Specific aspects of this analysis were developments of a prototype parking management plan for the Washington, D.C. metropolitan area illustrating types of measures which can be used for parking management; evaluation of the socioeconomic impacts of parking measures in the plan and their effectiveness in reducing vehicle miles traveled (VMT) and improving air quality; development of a parking management planning process which integrates local and regionwide planning through the use of regional guidelines. Four target areas in the D.C. region were studied in detail: the D.C. Core, Rosslyn, Va., Silver

Spring, Md., and Centreville, Va. A regional plan was then developed from information gathered in the target area studies, including an analysis of regionwide parking related goals and problems.

46 147489 PARKING RESTRAINT AND PARK-AND-RIDE MODELLING. The article discusses parking restraint and park-and-ride travel in the context of a transportation model. The model was developed to test and evaluate a number of 1986 transportation strategies for the Doncaster Metropolitan Borough Council. Details are given of the use of subzones to account for different types of parking facilities within a zone, and to model park-and-ride movements to a central area. An assessment is made of the effect of the split between public and private transport when there are some privately owned car parking spaces available in the area. Park-and-ride trips are modelled as a separate mode. The split between private, public and park-and-ride modes is carried out in one operation at the distribution stage so that all constraints and trip opportunities interact simultaneously. The authors claim that little program development is needed to incorporate these facilities into standard transportation planning programs. /TRRL/

46 147628 EVALUATION METHODS IN URBAN TRANSPORT PLANNING. Evaluation methods, particularly with regard to measures and facilities which are directed to a limitation of car traffic and an improvement of public transport in the cities, are described. The paper deals with some problems concerning the evaluation of alternative plans. Next it reviews some examples of evaluation methods which are in use. It also gives an example of a so-called "evaluation after", viz. An examination of the effectiveness of certain instruments with activities to match. The evaluation methods described are applied to projects, which are all directed to an improvement of public transport in or around Amsterdam. /TRRL/

46 147866 WILL RAIL INTERCHANGES LEAD LIVERPOOL CITY CENTRE REVIVAL? An outline of the new Merseyside Underground railway system due for completion by summer 1977 is given. The idea of the 'loop and link' system is to give people easy access to all parts of Liverpool city centre by getting people to make the change from bus to rail out in the suburbs. At the moment the number of potential users of the new system is thought not to be very great but the planners hope that the new system itself will help to initiate a revival in the city's economic fortunes and hence lead to a greater demand for public transport. /TRRL/

46 149099 TRANSPORT POLICY. THE CONTROL OF PRIVATE NON-RESIDENTIAL PARKING, A CONSULTATION PAPER. This document is issued as a part of the consultation document on transport policy and shows the various means by which parking generally, and private non-residential parking (pnr) in particular, might be controlled and what would be involved in operating such controls. It discusses the need for control and gives various reasons for the control of pnr. Some of the problems involved in the operation of the two most feasible methods; taxation and parking permits are discussed. It is emphasised that pnr control alone would not solve congestion problems; it would be one of a number of measures and would only be used where more orthodox restraint and traffic management were not suitable and adequate public transport was available. Although alternative methods of restraint may prove to be unacceptable or unpopular, the control of parking on private property raises controversial points of principle. The document invites the views of organisations and individuals on the need for pnr control, its method of enforcement, and possible alternatives. /TRRL/

46 150445 IMPLEMENTING A PARKING FREEZE IN DOWNTOWN BOSTON. An analysis is presented of the parking freeze procedures in downtown Boston. The freeze, initiated locally, translated into Federal Law and returned to the local level for administration is complicated and unprecedented. The freeze resulted from Boston's violation of the air quality standards set forth in the Clean Air Act, and the state's subsequent failure to comply with such corrective measures as indirect land use and transportation controls. The policy background, prior to the EPA's intervention, is discussed, as well as a description of the various agencies involved in implementing the freeze. "The freeze bank" (to determine how many spaces were available to trade off against new spaces planned for downtown) is discussed and permit procedures and permit criteria are explained. Several implications of the freeze for the downtown Boston area are reviewed.

46 152354 THE POTENTIAL APPLICATION OF TRAFFIC RESTRAINT IN CONNECTICUT. This discussion of the transportation and urban planning issues within Connecticut and their relationship to controlling automobile usage, also documents a study which evaluates the possible application of traffic restraint concepts within the state. The feasibility of traffic restraint is achieved by comparing the knowledge about restraint measures from a literature review (first phase of the study), with situations in Connecticut.

The study considered the automobile related problems of congestion and parking, as well as regional land-use plans, environmental objectives, and public transportation plans. The project focused on where restraint might be considered in transportation planning.

46 152919 RESTRAINING TRAFFIC-A STUDY OF SOME POSSIBLE METHODS. The paper summarizes the results of a study in which the effects of the following five methods of traffic restraint in a medium-sized city were studied: parking control, supplementary licensing, road pricing, cordon pricing, physical restraint. It was found that: (1) a comprehensive parking policy could be as effective as more sophisticated fiscal restraint systems until at least the early 1980S. (2) physical restraint, associated with comprehensive traffic management including priority provision for public vehicles, appears to be feasible. (3) general restraint of traffic volumes is not likely in itself to reduce perceived noise, although it would reduce air pollution; noise exposure could probably be reduced by traffic management. (4) peak-period traffic restraint (unless applied very severely) is unlikely to have any general adverse effect on shopping or business activities, but there could be certain exceptions. (5) fiscal restraint systems would be likely to bear most heavily on the above average income groups. On balance, lower income groups would be expected to gain, particularly from improved bus services. /TRRL/

46 157189 PEOPLE MOVEMENT FOR DOWNTOWN IMPROVEMENT. Information on the range of pedestrian and transportation

improvements available for the improvement of the downtown movement system is presented. These improvements include simple and low cost innovations such as temporary street closing (closed to vehicles), sidewalk widening, and pedestrian and bus passenger shelters, as well as more expensive propositions. Escalators, elevated skyways or public walkways below street level, and moving walkways for conveying standing or walking passengers in a straight line either level or up a moderate grade are also suggested. Free or reduced fare bus service is appropriate in large business and recreational areas. Traffic lanes along curb or within the center median may be used exclusively by buses or shared with taxis or carpools. Park and ride facilities at the edge of the city center and paratransit services like the jitney and the minibus will also help movement within the CBD. People movers consisting of separated or entrained driverless electric cars (of 6 to 60 passenger capacity) which operate on exclusive guideways, and other fixed guideway systems (aerial tramways, electric trolley buses, Light Rail Transit) are also discussed. The pedestrian mall (closed to vehicles) and transit malls (for exclusive use by transit and pedestrians) are further possible innovations. Examples of the successful use of these improvements are described, and their typical operation, range of capacity and capital, and operation and maintenance costs are summarized.

46 159598 PUBLIC POLICY AND OPTIMAL TRANSPORTATION PLANNING STRATEGIES. Restrictions on metropolitan core area travel by private vehicles to limit air pollution and to reduce fuel consumption will necessitate extensive programs for change-of-mode facilities on line-haul public transport routes. The parking spaces in the core area must be transferred so as to minimize the total vehicle-kilometers traveled throughout the area subject to technical, public policy, and economic constraints. This creates a need for a master plan that will identify the apportionment and extent of parking and other change-of-mode facilities, including feeder bus service at line-haul public transport routes. This paper briefly describes the salient transportation and parking features in Boston as a background to formulating a generalized public policy and a linear programming approach for the preparation of optimal plans incorporating a defined range of objectives and constraints.

46 163922 INTERFACING TRANSPORTATION MODES FOR ACCESS TO A CENTRAL BUSINESS DISTRICT (ABRIDGMENT). The objectives of this study were to estimate the desires of travelers in the CBD area of Alexandria, Virginia in relation to the two Metro stations; to investigate various small-scale transit systems that would interface between the primary and access modes, and select a vehicle that is based on the level of demand,

urban design, and operational, environmental, and community acceptance; and to recommend a series of preliminary corridors for the proposed mini transit system. Land use modeling, travel forecasting model, and trip desires relative to the mini transit system were examined. System analysis include urban design and community impact factors, technological analysis, and evaluation criteria. The authors conclude that the range of demand indicates a sufficient number of trips to justify a mini transit system in the CBD of Alexandria; a small fleet of mini buses is well suited to accommodate the peak hour volumes; an elevated guideway would be incompatible with the historic and residential environments; the selection of a minitransit vehicle will give weight to considerations of carport, interior design and the attractiveness of the vehicle as it contributes to the city street scope.

46 165219 DOWNTOWN RESIDENTIAL-TRANSPORTATION DEVELOPMENT. A single general equation useful in estimating the residential development potential has been developed. The method relates the road capacity to the residential development. The variables in the road capacity include the percentage of travel during the peak period by both auto and transit, the efficiency of this travel, and the relative effectiveness of each mode. The methodology developed includes a representation of the interaction of the variables used in the estimating equation and the degree of control various agencies exercise over them. The methodology was applied to downtown Vancouver, British Columbia. The results indicate that some of the proposals for residential development in the downtown area may in fact be high.

46 172158 STREETS FOR PEDESTRIANS AND TRANSIT: EXAMPLES OF TRANSIT MALLS IN THE UNITED STATES. This Transit Malls Site Report is intended to acquaint the planning community with the concept of transit malls and to provide information about several of the most important and interesting transit mall projects to a wider audience. Details of six transit malls are presented, based on interviews, site inspections, and available written data. This report contains the following elements: site descriptions including general geographic and demographic conditions; general traffic/transit characteristics; description of project streets before and after the malls including design characteristics, traffic/transit/pedestrian use, and funding; and project histories. Where available, results such as indicators of transportation service and economic impact are presented. A second report that is more analytical in nature is being prepared. It seeks to quantify the potential benefits and disbenefits of transit malls and

identify the circumstances which justify their construction. /Author/

46 172368 CONGESTED STATE STREET OPTS FOR CONSTRUCTION OF TRANSITWAY MALL. This article describes the planning and development of a Transitway Mall for Chicago's Central Business District. The plan provides for narrowing the existing State Street roadway from six, open-traffic lanes to two exclusive busways. Sidewalks will be broadened to accommodate landscaping, benches, and other amenities. The mall plan is founded on three basic objectives: The improvement of public transportation service in downtown Chicago; the improvement of State Street's pedestrian environment; and, the provision of an economic stimulus to the State Street business community. The Mall, in addition to providing a more attractive shopping environment and an increase in sales, will also be affected by the construction of new residential projects designed to revitalize and repopulate the city's CBD, the construction of new office buildings will increase the number of individuals working downtown who would patronize downtown stores, and the increasing emphasis placed on convention and tourism business in the CBD could mean more evening activity downtown. The Nicollet Mall in downtown Minneapolis is cited as an outstanding example of a mall that has worked. It is aesthetically pleasing and has influenced and attracted new investment in the downtown area. It is noted that one of the biggest problems for Chicago will be the diversion of regular traffic now utilizing State Street. To accommodate the necessary altered vehicle patterns, three traffic control measures will be implemented. A computerized traffic signal which will respond to changing volumes of traffic by providing longer green time in the direction of the heavier flow; parking bans on one side of the street, thus increasing the vehicle capacity; and, the implementation of exclusive reverse flow bus lanes.

Midwest Engineer Vol. 30 No. 4, Dec. 1977, pp 3-5, 5 Fig.

46 172921 PRELIMINARY DESIGN STUDY: FIFTH AND SIXTH AVENUES TRANSIT MALL, PORTLAND, OREGON. The project described in this study consists of the preliminary designs of a mass transit mall along 5th and 6th Avenues in downtown Portland, a distance of approximately 11 blocks for each Avenue. The mall is designed to make mass transit an attractive and compelling alternative to the automobile. Almost all buses operating in the downtown area will be routed to and through the transit mall. In addition, the mall is expected to provide convenient transfers between lines and serve as a link between suburban transit stations, shuttle buses, inter-city buses and, heavy and light rail transportation. Included in this study are construction cost estimates, preliminary engineering design plans, traffic design plans, landscape architecture designs, traffic improvement plans, an environmental impact analysis.

46 176458 EFFECTS OF PARKING COSTS ON URBAN TRANSPORT MODAL CHOICE. The effects of parking costs on urban modal choice are investigated by using a standard binary-choice model and estimated by using the logit technique. Previous studies have misspecified the form of the parking-cost variable and the model normally estimated. After estimating the traditional and correctly specified models, the claim that parking taxes are an effective substitute for roadway pricing in influencing congestion is only partially supported. Aggregate elasticities for four policy-oriented variables are calculated. The elasticities provide a measure of the bias from misspecification and indicate the most effective policy variable for the reduction of automobile use. /Author/

46 176480 SUMMARY OF EXPERIENCE WITH ROAD PRICING. From the standpoint of politically feasible public policy, road pricing currently appears to hold promise not so much as the marginal-cost pricing measure for efficient road use but rather as an automobile-disincentive component of overall transportation improvement programs. Road pricing that levies special charges on low-occupancy vehicles appears to be more effective in improving mobility than other more general changes in prices or taxes. Of several alternative forms of road pricing, the most effective form available today is the use of a supplementary license to enter the zone or travel in the zone. However, actual experience with road pricing in the U.S. is very limited. Proposals have been developed for Caracas, Bristol, London and Singapore and desk studies have taken an in-depth look at planning, marketing, and implementation aspects of road pricing, and have evaluated the impacts of such strategies. Evaluation results from the Bristol study suggest that a cordon-crossing supplementary licensing scheme would be more efficient in achieving the modal shift and increased mobility than areawide licenses, exclusive bus lanes, parking surcharges and parking restrictions. The highly successful Singapore plan includes road pricing and expansion of public transportation. It produces revenues far in excess of the expenditures. In spite of the relatively positive information from abroad, however, it is hazardous to make definitive estimates of the major impacts of road pricing in the American context.

46 176481 CONGESTION PRICING: THE EXAMPLE OF SINGAPORE. The Singapore government has adopted a policy, the short-run objective of which was to relieve congestion in the central city, and the long-run objective, to persuade motorists to reconsider their attitudes toward automobile ownership and use. The policy instrument selected was a form of congestion pricing called area licensing, and its goal was to reduce peak-hour traffic by 25-30%. Underlying the license scheme was the concept that a special supplementary license had to be obtained and displayed if a motorist wished to enter a designated restricted area within which congestion was to be reduced. The first task was to delimit the boundary of the restricted zone; the second, to set the license fee. The license requirement does not apply to buses or commercial vehicles. A park-and-ride scheme was designed to complement the area license scheme. The third element of the scheme was an increase of about 100% in public parking charges within the restricted zone, and a surcharge on private parking lot operators. The monitoring of the impact of the scheme is described as well as the effect on unrestricted traffic. Comments are also made on some of the problems that were encountered in the implementation of the plan. All preliminary observations and analyses indicate that the scheme has been very successful in reducing traffic in restricted zones during hours of restriction. Benefits have accrued to some car drivers, and the administration and enforcement of the scheme has been manageable.

46 176489 IMPLEMENTING A CITY CONGESTION-PRICING DEMONSTRATION: OVERCOMING THE HURDLES. This article highlights some of the ideas for coping with the many concerns of localities with city congestion pricing and making implementation of an UMTA pricing demonstration more likely. Four major points are highlighted. First, the need to recognize that the problems of implementing a congestion-pricing demonstration will not be overcome by continued talk of efficiency, optimization, and maximization of social benefits. Second, a first requirement for the implementation of any pricing scheme is that it attack a problem perceived by motorists and decision makers. Third, the fact that a downtown cordon or areawide scheme

might have disadvantages for business and the poor is one of several adverse effects that need to be recognized and allowed for rather than sidelined. Fourth, unforeseen and unlikely failure and adverse outcomes must be insured against. The author concludes that analysts, economists, and program managers need to be aware of the policies of implementation as well as the policies of pricing in particular. Decision makers need to be queried on what trade-offs should enter into the discussion of a pricing demonstration to make such a demonstration likely. Lastly, UMTA should be prepared to institute short-term renewable contracts for demonstrations, share veto control over certain project variables with the sponsor, and develop policies with sponsors to ensure against possible failures and adverse outcomes.

46 177150 AUTO RESTRICTED ZONES--BACKGROUND AND FEASIBILITY. This report was prepared as part of the Auto Restricted Zone/Multi-User Vehicle Systems Study of the Service and Methods Demonstration Program of the Urban Mass Transportation Administration. The purpose of the study is to (1) investigate existing experience with auto restricted zones and multi-user vehicle systems, (2) evaluate their feasibility as concepts applicable to urban transportation systems, (3) identify and evaluate potential sites for demonstration, and (4) design demonstration programs. This volume examines the concept of auto restriction, investigates its application in both Europe and the U.S. Auto restricted zones were found to be feasible for application to U.S. cities, and a number of key factors were identified in their successful implementation. /UMTA/

Herald, WS; Voorhees (Alan M) and Associates, Incorporated Final Rpt. UMTA-VA-06-0042-78-1, Dec. 1977, 88 pp, 11 Fig., 12 Tab., 2 App.; Sponsored by DOT, Urban Mass Transportation Administration.; Contract DOT-TSC-1057; ORDER FROM: NTIS

46 178321 AUTO RESTRICTED ZONES: PLANS FOR FIVE CITIES--BOSTON, BURLINGTON, MEMPHIS, PROVIDENCE AND TUCSON. This volume documents Auto Restricted Zone (ARZ) demonstration program designs for five selected cities: Boston, Mass; Burlington, Vt.; Providence, R.I.; Memphis, Tenn.; and Tucson, Ariz. Plans were drawn up in response to the specific characteristics of a given city. These plans illustrate the adaptability of the ARZ concept to different conditions and support the conclusion that city size is not critical to ARZ success and that complete prohibition of traffic is not the only option. The emphasis in these

proposals is primarily on enhancement of existing auto restricted areas through improvement of public transit and extension of pedestrian malls.

46 179090 ACTIONS TO REDUCE VEHICLE USE IN CONGESTED AREAS. Federal TSM guidelines are used as a basis for four broad groups of measures for reducing vehicle use in congested areas. Within each group, examples of specific measures now in use or planned for implementation are presented. These are classified according to their important operational features; their advantages and problems are discussed. The four groups are (a) voluntary measures to increase vehicle occupancy, such as single-destination or regionwide car pooling, subscription buses, van pooling, and shared-ride taxi; (b) pricing mechanisms using supplementary or area licenses, parking surcharges, automatic vehicle identification, on-vehicle meters, and manual toll collection; (c) physical and operational restraint of vehicles by means of complete or partial street closures, traffic cells, traffic signals, and intersection modifications; and (d) peak-hour truck restrictions using permits or vehicle-size limitations. /Author/

46 180653 NOTTINGHAM ZONES AND COLLAR STUDY-RESULTS OF THE 'BEFORE' SURVEYS. This report describes the first part of a 'before' and 'after' study which will evaluate the effects of the introduction, in August 1975, of an experimental traffic control scheme in the western sector of the city. It details the measurement techniques used and the results obtained from surveys held in Nottingham during April and May 1975. Similar measurements will be made, during the second part of the study in April and May 1976. The experimental traffic control scheme called 'Zones and Collar', aims to make travel by bus more attractive and to reduce the need for major urban highway construction. Private traffic leaving the residential zones and entering the inner city area will be controlled at locations where buses can be given priority. (Copyright (c) Crown Copyright 1977.)

46 183623 CLEARWAYS: THEIR EFFECTS ON TRAFFIC AND TRADERS. This report was submitted in partial fulfillment of the requirements for the graduate diploma in town planning, South Australian Institute of Technology. In order to aid the assessment of the effects of proposed 12-hour clearways on arterial roads in Adelaide, an investigation was made into the customer parking requirements of various types of retail establishment. A questionnaire survey was used to obtain from shopkeepers certain basic data, which were then used to formulate a simple parking demand model. A method was developed to apply the model to real situations, in order to compare parking requirements with parking availability both with and without clearway conditions. The conclusion was reached that on arterial roads with a high level of shopping activity, the imposition of a 12-hour clearway could have serious detrimental effects on traders and on the amenity of areas adjacent to the shopping areas, with little overall benefit to through traffic. However, because of small sample sizes in the original survey the above conclusion should be regarded as indicative only, pending further more detailed research to validate the findings of this study. /TRRL/

46 184073 EFFECTS OF LIMITATIONS IN THE USE OF CARS IN TOWNS ON THE INDUSTRY AND EMPLOYMENT [Effets sur l'industrie et sur l'emploi de la limitation de l'usage de l'automobile dans les villes]. Increased growth in vehicle ownership leads to a reorganization of transport policies, introducing private traffic restraint in urban areas and improvements in public transport. This article studies the possible effects of such measures in the future, and in France on the automobile industry and employment. These effects could influence the demand for new private cars thus bringing changes to the market of public transport vehicles, and to the car manufacturing industry. The latter usually results in modifications in the level of employment. /TRRL/ [French]

46 184202 REDUCTIONS IN AUTOMOBILE USE IN FOUR MAJOR CITIES AS A RESULT OF CAR POOLING AND IMPROVED TRANSIT. Voluntary car-pool matching programs and improvements in transit services are two transportation control policies that have received wide support from environmentalists, energy-conservation groups, and the public. This paper presents estimates of how these two policies would affect vehicle kilometers of travel and automobile emissions in Boston, Los Angeles, Chicago, and Washington, D.C. Because the four cities differ widely in terms of their spatial structure and their transportation systems, the estimates should cover the range of impacts expected in many large cities. The results indicate

that car pooling will reduce vehicle kilometers of travel and automobile emissions by roughly 0.1 percent if pessimistic responses to employer-based car-pool matching programs are used and by as much as 1.5 percent if optimistic levels of participation are used. Improvement in transit performance, represented as a 20 percent reduction in travel time, is projected to reduce vehicle kilometers of travel by 0.5 to 1 percent and automobile emissions somewhat less. Crude cost-effectiveness analyses suggest that voluntary employer-based car-pool matching programs are attractive even if they only reduce vehicle kilometers of travel by 0.1 or 0.2 percent. The costs of improved transit service are difficult to estimate, but some bus-lane proposals are likely to be cost effective. However, savings that result from reductions in vehicle kilometers of travel attributable to improved transit performance are unlikely to justify investments in fixed-rail systems. /Author/

46 184333 PATTERNS OF CAR USAGE AND RESTRAINT MODELLING. Transport demand forecasting procedures have traditionally employed household based modal split models implicitly assuming a selection of mode for each trip based on relative generalised cost. A detailed examination of the trip patterns of a sample of household in West Yorkshire shows that in fact there is little discretionary choice of public transport; public transport trips in car owning households generally being explained in terms of the specific unavailability of the car for such trips. Two versions of a category analysis model for modal split are based on this observation and applied to household data for Glamorgan and Monmouthshire to show that such a procedure is workable and produces results comparing favourably with traditional approaches. The likely implications of three types of restraint policy are examined and it is concluded that the existing interdependence in trip patterns and modal choice within the household is of great significance in determining their effects. In particular it appears that positive attempts to increase vehicle occupancy at the peak are likely to be more favourable to public transport finances than the more negative policies to restrain use of the car for journey to work, or second car ownership. /Author/TRRL/

46 184409 TRAFFIC ASPECTS OF PEDESTRIAN MALLS AND PEDESTRIAN MALLS SEMINAR REPORT. The conversion of existing streets into pedestrian shopping precincts, and the construction of regional shopping malls, both require consideration of and design for traffic movements in the area surrounding the mall. Traffic destined for the mall, as well as through traffic, must be catered for in a manner that provides for ease and safety of movement and retention of the opportunities of mobility and

access afforded by the automobile. Care should be taken that the formation of a pedestrian shopping precinct, or the construction of a regional shopping mall, does not reduce the accident record at the site of the new mall at the expense of increasing the accident record at another location. Not only is the design for automobile movements important in the development of a pedestrian mall, but also other traffic aspects such as the provision for public transport, the construction of satisfactory parking, the requirements of service and emergency vehicles and, most importantly, the safe and efficient movement of pedestrians must be considered. Case studies provide examples of the effectiveness of existing malls and highlight some of the features which should be considered at the design stage.(a) /TRRL/

46 186086 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. VOLUME I. AUTO RESTRICTED ZONES: BACKGROUND AND FEASIBILITY. The general goals of such zones are to preserve and enhance the attractiveness and vitality of urban centers, to improve environmental quality of urban areas, and to encourage increased utilization of non-auto modes of transport. The underlying characteristic of an auto restricted zone (ARZ) as discussed in this study is that of a district or zone distinguished by a higher degree of control over vehicular traffic than the surrounding area. The report discusses techniques for ARZ which have been identified and categorized as physical, operational, economic, and regulatory control measures. The investigation of existing experience with ARZ focuses on U.S. cities and on European cities where the concept is most advanced, such as in Copenhagen, Amsterdam and Vienna, and discusses its similarities and differences. The investigation indicated that there are substantial opportunities for ARZ in American cities. A number of key factors are identified for its successful implementation, such as urban activity patterns, urban design issues, transportation infrastructure, accessibility maintenance, ARZ size, transportation policy impacts, and institutional and legal factors. The report contains Appendix A: 'Bibliography' and Appendix B: 'Characteristics of Pedestrian Areas in European Cities'.

46 186087 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. VOLUME II. MULTI-USER VEHICLE SYSTEMS: FEASIBILITY ASSESSMENT. Volume II documents the results of an investigation into the feasibility of Multi-User Vehicle Systems (MUVS) as a mode of urban transportation and which is often suggested as one solution to the

problem of transportation within congested urban areas. A review of existing experience, an examination of key factors, and an assessment of MUVS feasibility was conducted as the first stage in a potentially in-depth research and experimental effort. MUVS is a paratransit mode of transportation which consists of a fleet of small user-operated vehicles available for rental between terminals within a well-defined service area. Although this study considered a wide array of potential vehicles, the basic concept examined herein is similar to the various short-term rental cars. The goals and objectives of MUVS are to: (1) alleviate congestion and improve traffic flow; (2) increase mobility; (3) provide an additional choice of mode; (4) reduce air pollution from vehicle emissions; (5) reduce noise; (6) conserve energy; and (7) reduce land requirements for parking. A detailed examination of a MUVS as a Central Business District (CBD) circulation service in Amsterdam and in Montpellier, France is presented. Various characteristics of each system are identified and compared.

46 186088 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. VOLUME III. AUTO RESTRICTED ZONES: PLANS FOR FIVE CITIES. The report discusses the application of some of the auto restricted zones (ARZ) techniques to downtown areas of five U.S. cities: Boston; Burlington; Memphis; Providence; and Tucson. While these cities were not selected as being representative samples of American cities, they do cover a wide range of sizes and conditions and have many characteristics which are shared by other cities. This shows the adaptability of the ARZ concept to different conditions and reinforces the conclusion that city size is not critical to ARZ success and that complete prohibition of traffic is not the only option. In each city, the approach of the ARZ planning team was keyed to local plans and problems. Emphasis was on tailoring an ARZ plan to each specific urban environment rather than imposing a preselected strategy. The process began with a systematic examination of the existing downtown infrastructure and current plans and projects already underway were also assessed for impact toward ARZ planning.

46 186089 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. VOLUME IV. SITE SELECTION METHODOLOGY. Volume IV presents methodology followed in the selection of sites for auto restricted zones (ARZ) demonstrations. Of more than 75 applicants, five cities were selected for participation: Boston; Burlington; Memphis; Providence; and Tucson. The report includes the design of site specific programs to demonstrate this methodology in the five selected cities. The program was structured into seven major work elements which are outlined in the study. In the review process for each city, indicators of past performance, present commitment, future planning in institutional performance, transportation factors, and urban form and opportunities were examined. Six basic criteria were submitted to each city and are presented in this report.

46 186090 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. TECHNICAL APPENDIX: BOSTON AUTO RESTRICTED ZONE STUDY. The report examines a proposal for an auto restricted zone (ARZ) and revised circulation patterns in downtown Boston. In the City of Boston, the main problems can be summarized as congestion, conflict of pedestrian and traffic, and confusion, rather than a lack of basic vitality. This study seeks to remedy the current imbalance of pedestrian versus auto use, and to reduce the prevailing congestion in the older downtown. The objective is not to eliminate vehicles, but to promote a more appropriate balance in the use of public spaces, which would enhance the long-range economic future as well as the environment of the downtown area. The need to eliminate these problems, to create an appropriate environment for the existing or potential activities, and to improve connections among major activity areas are the basic factors for an Urban Design Plan. The goal for undertaking this proposed ARZ plan is to encourage the continued physical and economic revitalization of downtown Boston.

46 186091 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. TECHNICAL APPENDIX: BURLINGTON AUTO RESTRICTED ZONE STUDY. The report examines a proposal for an auto restricted zone (ARZ) for the City of Burlington. The City is faced with increased competition from a proposal for a major suburban shopping mall, as well as internal competition from a recently completed shopping arcade in the downtown area. Such competition pressure has been a primary incentive for local efforts to improve the character of the existing downtown retail area through auto restriction and pedestrian improvements. The increases in the economic health of the City have also created strong pressures for physical change and for improving the quality of public space. This concern has culminated in the current proposal for construction of a 4-block pedestrian mall. A further issue facing the City is the quality of transit facilities in the downtown. Several of Burlington's earlier Urban Design Plans now comprise the main urban design components of the proposed ARZ plan. Four existing characteristics were assessed to test potential of an ARZ. The Urban Design Plan consists of two elements: a circulation framework and a street improvement program. These elements are described in detail in the text.

Herald, WS ; Voorhees (Alan M) and Associates, Incorporated, Cambridge Systematics, Incorporated, Moore-Heder Architects, Kearney (AT) and Company, Incorporated, Urban Mass Transportation Administration Final Rpt. UMTA-VA-06-0042-78-6, Dec. 1977, 128 p.; Prepared in cooperation with Cambridge Systematics, Inc., MA., Moore-Heder Architects, Cambridge, MA., and Kearney (A. T.), Inc., Chicago, IL. See also PB-283317, and PB-286319. Also available in set of 9 reports PC E20, PB-286 312-SET.; Contract DOT-TSC-1057; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-286318/1ST

46 186092 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. TECHNICAL APPENDIX: MEMPHIS AUTO RESTRICTED ZONE STUDY. The report presents analysis, data and supplementary information developed in the preparation of the Memphis auto restricted zone (ARZ) Demonstration Plan. The general approach of the ARZ study has centered on the identification and development of opportunities existing in U.S. cities for a reorientation to transit and pedestrian travel. Much of that opportunity is defined by characteristics of the vehicular and pedestrian networks and the traffic that uses them. The circulation framework that is eventually developed as a principal element of the ARZ plan requires coordination in the reallocation of street space among transit riders, pedestrians, auto users, and goods movements. The approach taken in planning the circulation framework for the Memphis ARZ was somewhat different than that used in the other cities. Memphis had recently implemented a major change in its downtown circulation system by closing ten blocks and creating the Mid-America Mall. The Mall is active at midday during the week, but the evenings and weekends are quiet. Given the density, auto orientation, and customary use patterns of its citizens, the downtown is not likely to benefit from major street closings or changes

in traffic patterns. However, selective and modest additions could extend the Mall to a larger district, provide better facilities for the now disadvantaged transit riders, and encourage development projects that could improve street environment and support conversion of now-vacant buildings.

Herald, WS ; Voorhees (Alan M) and Associates, Incorporated, Cambridge Systematics, Incorporated, Moore-Heder Architects, Kearney (AT) and Company, Incorporated, Urban Mass Transportation Administration Final Rpt. UMTA-VA-06-0042-78-7, Dec. 1977, 184 p.; Prepared in cooperation with Cambridge Systematics, Inc., MA., Moore-Heder Architects, Cambridge, MA., and Kearney (A. T.), Inc., Chicago, IL. See also PB-286318, and PB-283320. Also available in set of 9 reports PC E20, PB-286 312-SET.; Contract DOT-TSC-1057; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-286319/9ST

46 186093 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. TECHNICAL APPENDIX: PROVIDENCE AUTO RESTRICTED ZONE STUDY. The report presents technical analysis, data and supplementary information developed in the preparation of the Providence auto restricted zone (ARZ) demonstration plan. Several existing urban design factors are critical to assess the potential for an ARZ in Providence: pedestrian environment; connections between downtown districts; quality of transit environment; historical quality and development potential; quality of economic environment; and management of public spaces. These issues are discussed in the text and the urban design proposals address these as problems that the ARZ should help resolve. The city built a shopping mall, which was intended to compete with the increasing number of suburban shopping centers and to reestablish the downtown as the activity center of the city. However, while pedestrian volumes still remain high, several stores on the mall have closed. This trend suggests that the downtown may need solutions other than just pedestrianization. Several plans and developments that relate to the ARZ study have been proposed or are being prepared. The city has advanced proposals to expand the mall along with a major rehabilitation of its existing ARZ. This report addresses these proposals and the feasibility of creating a major expanded ARZ in the downtown.

Herald, WS ; Voorhees (Alan M) and Associates, Incorporated, Cambridge Systematics, Incorporated, Moore-Heder Architects, Kearney (AT) and Company, Incorporated, Urban Mass Transportation Administration Final Rpt. UMTA-VA-06-0042-78-8, Dec. 1977, 207 p.; Prepared in cooperation with Cambridge Systematics, Inc., MA., Moore-Heder Architects, Cambridge, MA., and Kearney (A. T.), Inc., Chicago, IL. See also PB-286321. Also available in set of 9 reports PC E20, PB-286 312-SET.; Contract DOT-TSC-1057; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-286320/7ST

46 186094 AUTO RESTRICTED ZONE/MULTI-USER VEHICLE SYSTEM STUDY. TECHNICAL APPENDIX: TUCSON AUTO RESTRICTED ZONE STUDY. The report examines a proposal for the preparation of an auto

restricted zone (ARZ) in Tucson. In order to revitalize the downtown, the City plans include reinforcement of the public transit system, construction of a major private office building and a public library, studies for rehabilitation of in-town historic residential neighborhoods, and attempts to attract new residential development downtown. The revitalization has made considerable progress, but has not yet succeeded in the critical area of attracting people downtown or keeping workers there for other activities. The government center and the financial district are active during the work day, but are deserted in the evenings; the new Civic Center is underused; and the shopping areas are declining. In considering an ARZ for Tucson, the main questions that had to be answered were whether it could help in overcoming downtown's negative image, in attracting and keeping people there, in unifying and clarifying the new and old districts, and in creating economic activity.

46 188001 AUTO RESTRICTED ZONES FOR NORTH AMERICAN CITIES. Concept plans have been developed for auto restricted zones (ARZ) in five cities, and one or more demonstrations will soon be implemented. Impetus for development of an ARZ arises from inefficient use of street space, environmental considerations and concern for pedestrians. Each ARZ must be individually designed. No one pattern will fit all sites. Key design factors are activity within the area, the intrinsic attractiveness of the area, transit service, parking policies, size of the area, maintenance of accessibility, the street pattern, institutional inclination and coordination with areawide transportation systems management strategies.

Spielberg, F ; Institute of Transportation Engineers 1977; Compendium of Technical Papers of the 47th Annual Meeting of the Institute of Transportation Engineers at the Fourth World Transportation Engineers Conference, Mexico City, October 2-6, 1977. 711B (ARZ) in five cities, and one or more demonstrations will; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

46 188005 EFFECTIVE LOW COST TRAFFIC ENGINEERING. The City of Hamilton, Ontario, Canada, has implemented transportation policies of low cost with dramatic results in accident reduction for pedestrians and vehicles, increased speed of vehicular flow, increased capacity for some arterial streets, and reduction of vehicular stops. Two major policies were adopted in traffic operations. The first covered the development of an extensive one-way arterial street system, covering the Central Business District and surrounding residential areas and a major industrial area. The second significant policy was

in parking regulations. The two policies have been accepted by the decision makers many years ago and are supported by evidence documented from time to time, to indicate the value of such traffic engineering techniques, together with dramatic and visual results on the streets recognized by the citizens themselves.

Desjardins, RJ ; Institute of Transportation Engineers 1977, pp 648-660; Compendium of Technical Papers of the 47th Annual Meeting of the Institute of Transportation Engineers at the Fourth World Transportation Engineers Conference, Mexico City, October 2-6, 1977.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

46 188020 TRAFFIC ZONE SYSTEM IN THE CITY CORE OF GOTHENBURG, SWEDEN. The paper discusses a case history in solving a problem to minimize the traffic on the streets and plan for well situated parking facilities. The CBD was divided in five zones. Each one has its own enter-and exit connection to the ringroad. There are no connections between neighboring zones. All-day-parkers are directed to parking facilities outside the ringroad. Short-time-parking is arranged in parking-houses in each zone, with access direct to the ring-road. Public transport has its own lanes. These lanes are the borderlines between the zones. The solution turned out as estimated. In the hardest loaded street the traffic volume was reduced to 30%. All congestion in CBD-streets disappeared. Carbon monoxide was in several points reduced from 60-70 ppm to 2-5 ppm, measured as a 30-minute value. The noise-level was half of the value before. Traffic-accidents decreased 50% in the CBD and 26% in the ringroad.

Lindqvist, S (Gothenburg Parking Company) ; Institute of Transportation Engineers 1977, pp 53-60; Compendium of Technical Papers of the 47th Annual Meeting of the Institute of Transportation Engineers at the Fourth World Transportation Engineers Conference, Mexico City, October 2-6, 1977.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

46 188021 TRANSPORTATION INNOVATIONS IN CHICAGO'S CENTRAL BUSINESS DISTRICT. The City of Chicago is now in the process of implementing a major anti-pollution and transit improvement program in the City's CBD. An exciting aspect of the current City plan is the nine-block State Street Transit Mall through the heart of the CBD. This Mall will upgrade public transportation by speeding up bus movements, providing bus shelters, and adding escalators to the subway; it will improve the pedestrian environment, and it will provide an economic stimulus to State Street businesses. The on-street parking restrictions required by the EPA Transportation Control Plan will increase the capacity and efficiency of eight east-west streets crossing the Mall and the north-south one-way pair paralleling State Street, thus providing the additional capacity necessary to handle the traffic diverted from the Mall. All of these improvements are tied into a broader overall Central Area plan.

46 189551 THE EFFECTS OF PARKING FEES-A RETROSPECTIVE STUDY [Effekter av parkeringsavgifter vid Lunds Universitet-ens efterstudie]. The aim of the study was to evaluate the effects of parking fees on modal choice, car-bicycle and car-public transport. In a preliminary study (see IRRD 236471) a forecast model was developed. This report compares the forecast with results of a subsequent study. The results are as follows: (1) car-bicycle: the results of the second study show a larger reduction of car use than the forecast model except for centrally located buildings. The differences are not significant. (2) car-public transport: the actual results show overall a larger reduction than predicted. The differences are not significant. /TRRL/ [Swedish]

Andersson, B Johansson, I ; Lund University of Technology, Sweden Monograph Bulletin 22, 1978, 39 p., Figs., 10 Tab., 3 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 236492), National Swedish Road & Traffic Research Institute

46 189604 PRISONERS OF THE MOTORIZED SOCIETY [Bilsambaellets Faangar]. Urban districts will need to be zoned off in the future so as to cut down sharply on the volume of motor traffic. The quantity of cars must be reduced within the neighbourhood so that they can exist side by side with pedestrian traffic and be driven under terms dictated by the pedestrians. On the perimeter streets around these tranquil islands motor traffic should not be accepted on the scale it has been today. Even the main streets have limited "traffic tolerance". It is by defining clear-cut limits for traffic tolerance in the street environment, as well as for the interference of motor traffic with pedestrian and bicycle traffic,

that we can get useful measuring instruments towards transformation of the city's traffic network, which is bound to happen in any case. Although the instruments that must be used are largely provided by traffic legislation and other administrative measures, the potentials of physical planning for controlling land use and the establishment of activities also must be exploited. /TRRL/ [Swedish]

46 191351 CENTRAL AREA AUTO RESTRAINT: A BOSTON CASE STUDY. Convenience, travel patterns, and transportation facilities of the Boston metropolitan area served to elect Boston as a case study for auto restraint schemes. This report analyzes the benefits and costs, and political and administrative feasibility of several measures designed to restrain auto use and reduce traffic congestion in the central area. Specific restraint policies examined herein include: increases in central area parking charges, special area licenses for the use of central area streets, and a small auto-free zone. Applications of these measures during morning, midday, and evening peak periods are considered. All restraint measures produced positive net benefits. The highest net benefits were generated by parking surcharges and area license schemes, with estimated gains of \$15 to \$24 million in 1975 and perhaps a doubling of annual benefits over 10 to 20 years. The optimal parking surcharge or license fee is in the range of \$0.50 to \$1.00 per vehicle, which reduces the number of autos entering Boston's central area by 15 to 35 percent. This report not only provides a summary of the results of both the cost/benefit and travel impact analysis and the political analysis, but also presents recommendations for restraint measures that are both socially beneficial and easily implemented.

46 194618 AN URBAN MASS TRANSPORTATION ADMINISTRATOR'S EXPERIENCE WITH PRICING TO CONTROL TRAFFIC. The presentation provides an overview of UMTA's experiences in implementing roads and parking pricing techniques and describes innovations developed since the start of the program (e.g. corridor, spot and parking pricing). Some existing projects designs underway in various cities are summarized. This presentation also addresses the factor which influence whether or not the public will support these projects' implementation.

46 195077 ANALYSIS OF INTERNAL TRANSIT SYSTEMS REQUIREMENTS FOR CENTRAL CITIES. This paper has two principal objectives. First, it describes an approach entitled Performance Requirements Analysis for developing a set of requirements or standards that a downtown transit system should satisfy and structuring these requirements so as to generate a small set of alternative generic systems for detailed evaluation. Second, it provides a preliminary assessment of performance requirements for distribution systems in 19 of the largest cities in the United States.

46 195512 NOTES ON THE PREPARATION OF PEDESTRIANISATION SCHEMES. Many towns and cities throughout the country have now implemented schemes which wholly or partially close streets or areas to vehicular traffic. This note draws together the experience gained by local authorities in the past five years or so and puts forward ideas that might be helpful to authorities intending to undertake projects of this kind for the first time. Schemes are considered firstly as parts of comprehensive planning, possibly for gradual adoption, secondly as purpose built pedestrian areas and thirdly where there are varying degrees of traffic restraint. Some general points on signing are included and mention is made of special provisions required for e.g. emergency vehicles. /TRRL/

46 197689 STREETS FOR PEDESTRIANS AND TRANSIT: AN EVALUATION OF THREE TRANSIT MALLS IN THE UNITED STATES. The report represents the second phase of a two-phase project designed to acquaint the planning community with the concept of transit malls and to provide information about three of the most important and interesting transit mall projects to a wider audience. The first phase of the study consisted of a site report: *Streets For Pedestrians and Transit: Examples of Transit Malls in the United States* (PB-278 487), which described the characteristics and histories of six transit malls. This second evaluation phase is more analytic in nature and quantifies the benefits and disbenefits of the three major transit malls in Philadelphia, Pennsylvania; in Minneapolis, Minnesota; and in Portland, Oregon. The transit malls in each of these cities was first reviewed in the site report. This evaluation is concerned with the impact of the three malls on pedestrians, on transit service, on excluded or restricted general traffic, and on economic conditions, particularly on retail sales in the immediate vicinity of the mall. This report contains the results of analysis on the following topics: maintenance and construction costs; transit service improvement including bus speed, reliability, coverage, capacity, ridership, productivity, and system understanding; the level of service provided pedestrians and waiting transit patrons; environmental impacts; pedestrian and bicyclist safety; traffic diversion; parking; goods delivery; and economic impacts. This report documents fifteen major conclusions regarding the transit malls.

46 260588 A RATIONAL APPROACH TO ROAD CONGESTION AND THE PARKING PROBLEM. A possible method of reducing road congestion by instituting a complex system of parking charges is outlined. sophisticated equipment and administration would be required to ensure that the private motorist pays a realistic parking charge related both to the true value of the land used for parking (assessed by opportunity costing) and to his contribution to local traffic congestion then travelling to and from the car park or roadside parking area. In order to assess the fairest charges consistent with maintaining optimum traffic conditions and to give some attention to the wishes of local traders while obtaining the appropriate revenue associated with the opportunity cost of the parking site, the equipment would have a price adjustment facility so that various schedules could be tried. This type of system would be expected to increase parking charges considerably in some towns so that many private motorists would change to public transport. Thus a fair economic balance between public and private transport would be achieved by ensuring that the car user pays all the costs associated with private motoring.

46 261400 NEW CONCEPT IN URBAN PARKING. This paper reviews parking policy options for major metropolitan areas as they relate to demonstrated demands, transit-service extensions, and community preferences. It identifies approaches to dealing with community concerns through a participatory process which involves continuous review of alternatives and programs. Attitudes and characteristics of parkers and other downtown travelers in the Boston metropolitan area are related to downtown and transit parking supply and demand. The range of available transportation policy options imply combinations of increased, stabilized, or reduced supply within the city center with complimentary adjustments in transit-related parking.

Schoon, JG Levinson, HS *ASCE Journal of Transportation Engineering* Vol. 100 No. TE3, Proc. Paper 10731, Aug. 1974, pp 611-623

46 261642 ENVIRONMENTAL IMPLICATIONS OF AUTOMOBILE-FREE ZONES. The purpose of this paper is to clarify some of the environmental issues associated with automobile-free zones and to determine whether automobile-free zones can reduce environmental problems. It is designed to give planners an overview of the subject and to suggest some procedures for future studies. Past experience with automobile-free zones has indicated that noise and air pollution are significantly reduced on streets where automobiles are banned. As to the wider, external effect of automobile-free zones, few or no data exist, but an analytical procedure is suggested to assess this effect:

compare trips to a target area, with and without the automobile-free zone, and convert this trip information into pollution-emission data. Although the relationship between automobile-free zones and nonautomobile modes is not certain, it appears that these modes conserve more energy than do automobiles and that they emit lower levels of certain pollutants. To reduce area-wide environmental problems, it is suggested that automobile-free zones be centrally located in relation to market areas and transit systems, that provisions be made to handle re-routed traffic, and that use of nonautomobile modes to automobile-free zones be encouraged.

Lieberman, W (Barton-Aschman Associates, Incorporated) *Transportation Research Record* No. 492, 1974, pp 17-26, 1 Fig., 6 Tab., 14 Ref.; Presented at 53rd Annual Meeting of the Highway Research Board.; ORDER FROM: TRB, Orig. PC

46 261787 PEDESTRIAN STREETS IN CENTRAL COPENHAGEN. This article surveys the effects of the pedestrianisation of several streets in the central business district (CBD) of Copenhagen. Air pollution and noise levels fell, and pedestrian traffic increased. Not all of the former vehicular traffic was diverted to adjacent streets. Rush hour public transport patronage declined, daily patronage less than for the city on a whole. There was a tendency for accidents to shift from the CBD to the surrounding streets. The concluding section examines the future transport strategy for Copenhagen. /TRRL/

Lemberg, K *Ekistics* Vol. 37 No. 219, Feb. 1974, pp 129-133, 3 Fig., 4 Tab.; ACKNOWLEDGMENT: TRRL (IRRD 209545)

46 261991 PEDESTRIAN MALL: ITS ROLE IN REVITALIZATION OF DOWNTOWN AREAS. Overall experience patterns of the 25 permanent pedestrian malls in the U. S. indicate that sales generally increase, some new construction is generated, and property values and subsequent tax revenues to the city have increased over pre-mall levels. A number of key elements in mall development are defined here as the need for adequate off-street parking, workable vehicular patterns around the mall, improved loading facilities, better merchandise and merchandising, and improved public transportation to and within the mall. Surveys of shoppers on the F Street Mall in Washington, D. C. reveal their feelings that shopping on F Street is safer than shopping in other parts of downtown. A pedestrian mall becomes especially worthy of consideration when cities realize that most of their other options for revitalizing their CBDs are becoming foreclosed. /DOT/

46 262007 EUROPEAN PRACTICES-WHAT WE CAN LEARN. This paper presents a summary of observations concerning European practices which are pertinent and have potential application in the U.S. to the following four problem areas: (1) parking; (2) traffic restraint; (3) urban development; and (4) public transportation. Because the Europeans have been faced with resource constraints which are only beginning to be addressed in the U.S., it is possible for traffic and transportation engineers to learn from these European approaches to these problems.

Wortman, RH *Arizona Conference on Roads & Streets Proc (22nd) Apr. 1973, pp 1-7*

46 262010 APPROACHES FOR EVALUATING ALTERNATIVE METHODS OF RESTRAINT. This paper examines various methods for restraining city traffic including an electronic point-pricing system; peak and off-peak prices for crossing boundaries of a few large zones; and parking charges, which could be varied according to location and time of day. It is necessary to devise specific design patterns for a particular city and analyze the costs, problems, and performance in a specific network rather than try to choose among different methods of pricing in terms of abstract characteristics. A model similar to those presently in use in traffic and public transport studies is examined in comparison with the performance of other suggested pricing systems. The simulation model would set standard levels and match individual costs with marginal social costs all over the network.

46 262501 OECD-STUDY OF TRAFFIC REDUCTION EFFORTS. OECD is currently engaged in a project to reduce the use of private vehicles and in conjunction with this, to improve public transportation. The emphasis will be on better use of existing facilities: e.g. parking restrictions, bus priority and exclusive bus lanes, promotion of car-pools, and encouraging bicycle use. Data from these investigations will be summarized and presented at an Advisory Conference to be held late in 1974.

Department of Housing and Urban Development No. 29, Aug. 1974, p 3; HUD International Information Series.

46 262801 PARKING POLICY AS A TRAFFIC MANAGEMENT TOOL. This paper applies traffic management to planning for parking. Traffic management relies on the interaction of traffic engineering methods, separation of road users, especially pedestrians from vehicles, establishment of public transport priorities and restriction of car parking. These same elements of traffic management must be applied to parking policy. A successful parking policy should consider the conflicting desires of the road users; it should consider parking as part of a complete journey rather than as just a vehicle at rest.

46 262928 WHY RESTRAIN TRAFFIC? The author puts the case for restraining traffic in town centers, briefly mentioning the main benefits which can be derived from restraint measures, including reduced delays to other road users and to public transport services. The various restraint techniques, such as changes to street network, special licences to enter certain areas, control of parking, and road pricing are summarized and the political significance of such methods is discussed.

46 262935 METHODS OF EVALUATION OF TRAFFIC RESTRAINT TECHNIQUES SIGNALS. In order to determine the "best" level of restraint to achieve optimal use of a given resource, it is necessary to decide on the objective function to be maximized (or minimized). As restraint operates by affecting behavior, such a function must include valuations of the changes in behavior observed. A measure of consumers' surplus must therefore be included and valuations obtained for comfort convenience, and similar variables affecting behavior. This approach to the evaluation of restraint systems is illustrated by two examples: (a) Average link model, in which a homogeneous urban area is represented by the average major road in the area. Total flow of car and bus travelers along this average road is fixed, although present car travelers change their travel mode when relative travel costs alter (due, for example, to introduction of road pricing). All-day travel costs for all travelers and vehicles (cars, buses, taxis and goods vehicles) were obtained and a minimum overall travel cost was computed by optimising items such as bus loadings, bus stop frequency, relative density of bus routes and amounts of private car restraint. The losses in comfort and convenience associated with a switch from car to bus travel are estimated by considering the present situation and then imposing a rising road pricing charge. Using this method of representing comfort and convenience costs, an optimum level of private car restraint was obtained. (b) A network approach—a model designed to reproduce the behavior of travelers

moving over a company network. Here, travelers are offered a choice of routes for a given trip, over roads with widely different characteristics. The pattern of traffic flow produced is therefore a direct consequence of the balance between money time, and distance that the average traveler can be observed to accept. The valuation of any specific fiscal policy is then a matter of applying the charges and tracing the behavioral effects through to the new situation provided.

46 263420 PEDESTRIANISATION IN LEEDS-AN ASSESSMENT. The paper describes how paved pedestrian streets fit into transportation policy for Leeds by providing a comprehensive system of tinted pedestrian ranks through commercial and shopping areas. An assessment is made of the scheme which includes restraint on car use in the central area, and the use of minibuses to link the pedestrian area with the central rail and bus stations. It is concluded that the scheme is successful because of an increase in the popularity of the area indicated by greater pedestrian volumes and increased made.

46 265497 THE EDINBURGH TRANSPORT MODEL. THIS ARTICLE IS CONCERNED WITH THE TRANSPORT MODEL EMPLOYED IN PREPARING THE TRANSPORT PLAN FOR THE CENTRAL AREA OF EDINBURGH WHICH WAS COMPLETED IN OCTOBER 1972. THE AUTHOR DISCUSSES THE REQUIREMENTS OF THE MODEL, WHICH WERE THAT IT SHOULD ALLOW REALISTIC COMPARISONS TO BE MADE BETWEEN DIFFERENT TRANSPORT SYSTEMS WHILE ALLOWING BOTH PEAK AND OFF-PEAK FLOWS, SPEED/FLOW RELATIONSHIPS AND RESTRAINT IN CAR USAGE TO BE STUDIED. A DIAGRAM SHOWS THE ELEMENTS OF THE TRANSPORT MODEL AND FOUR FEATURES OF PARTICULAR INTEREST ARE DESCRIBED IN MORE DETAIL. THESE WERE (1) THE PEAK AND OFF-PEAK TRIP MATRICES WHICH ALLOWED MODIFICATIONS TO PEAK FACTORS ACCORDING TO A NUMBER OF POSSIBLE CHANGES THAT ARE LIKELY TO OCCUR IN THE FUTURE; (2) SPEED/FLOW ADJUSTMENTS AND MULTIPLE ROUTING TECHNIQUES; (3) RESTRAINT ON CAR USAGE BY MEANS OF PARKING CONTROLS; AND (4) ESTIMATES OF DEMAND FOR PARKING DIVIDED INTO DISTANT PARKING AND LOCAL PARKING. THE AUTHOR CONCLUDES BY COMPARING THE TECHNIQUES USED WITH EARLIER STUDIES AND POINTING OUT THAT THE INCLUSION OF OFF-PEAK TRAVEL FACILITIES RESULTED IN A MUCH MORE REALISTIC INTERPRETATION OF THE PROBLEMS TO BE FACED THAN MODELS

STUDYING PEAK PERIOD TRAVEL ALONE.

Foyster, MJ (Freeman Fox and Associates) *Traffic Engineering and Control* Vol. 15 No. 12/1, Apr. 1974, pp 571-574, 3 Fig., 5 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 210255)

46 300076 TRAFFIC AND TRANSPORT IN THE DUTCH TOWN PLANNING [Verkeer en Vervoer in de Nederlandse Stadsplanning]. The different countries have the same problems and solutions. Traffic and transport must not be separated from the other components of urban planning, namely housing, work and amenities. More bicycles and cars are bought in the Netherlands. Bicycles, however, are used less frequently and cars cover shorter distances per year. Cars used to be parked in a higher density. Areas of traffic restraint with motor traffic on surrounding roads are required. Traffic rules are increasingly being broken. Public transport suffers great shortages. The Dutch government is trying to reduce mobility and to promote the bicycle and public transport. /TRRL/ [Dutch]

46 300077 TRAFFIC AND TRANSPORT PLANNING IN ANTWERP [Verkeers-en Vervoersplanning te Antwerpen]. During the 19th century Antwerp expanded greatly. Now it is trying to restore, by limitation of parking facilities and traffic, the residential functions of the inner town, which were lost with suburbanization. A circular motorway around the city has improved the traffic circulation, despite some shortcomings. Dispersion of authority makes rational planning difficult. Until recently, there had always been a lack of traffic planning. /TRRL/ [Dutch]

46 300080 TRAFFIC PLANNING ACTIONS IN GOTHENBURG. The traffic zone system, by which the central business area was divided into 5 separate zones, resulted in fewer accidents, noise and air pollution. Regularity in public transport improved and ridership increased. Vehicle volume but also travel speed on the ring road increased. The implementation of the system cost nearly 5.5 million Swedish crowns. The system is to be extended to other parts of the city. Other traffic policy actions concern signalization, retired people, the handicapped and express bus routes. /TRRL/

Refsnes, B ; Koninklijk Instituut van Ingenieurs 1978, pp 59-77, 8 Fig.; ACKNOWLEDGMENT: TRRL (IRRD 240984), Institute for Road Safety Research

46 300082 TRAFFIC PLANNING IN DUSSELDORF [Verkehrsplanung in Duesseldorf]. The population had decreased while the number of commuters increased. The necessary extension of the road network and of parking space in the inner zone will not be made. A dense radial network of railways and underground railways is planned, and car-free pedestrian zones. Apart

from a bus network through it, the outer zone is intended for private transport, with tangential highways and parking space, and conjunctions with the railways. Between these two lies a transitional zone. There has been civil opposition against the building of the eastern tangent. Roads will therefore now be built in such a way that noise and pollution are minimized. /TRRL/ [Dutch]

Meyer, HJ ; Koninklijk Instituut van Ingenieurs 1978, pp 79-89; ACKNOWLEDGMENT: TRRL (IRRD 240985), Institute for Road Safety Research

46 300116 FINDING WAYS OF HOLDING BACK THE TRAFFIC AVALANCHE. The article summarises the findings of the West Yorkshire transportation study. A wide variety of communities and aspects of transportation were studied. The Leeds forecast for the 1990's showed that increased car ownership and centralisation of jobs would cause severe congestion if counteractive measures were not taken. Although the study considered the effect of traffic constraint, car pooling and the staggering of working and school hours, the article compares only the effectiveness of the five main forms of restraint: parking and physical controls, road pricing, cordon pricing and supplementary licensing. The efficiency, practicality and fairness of each restraint mechanism is considered separately and compared with criteria of performance laid down in the article. No one method has a clear advantage over any other. /TRRL/

46 300117 FIVE MYTHS OF PARKING POLICY. This paper discusses five commonly held myths concerning parking policies in central cities in Australia. 1) parking policies and objectives are articulated in a meaningful way; 2) central city councils have substantial control over the stock of parking spaces; 3) parking costs are high in central cities; 4) acceptable changes to the price and stock of parking spaces can have a significant impact on mode choice; 5) the primacy of the central city can be maintained through the provision of adequate short-term spaces. (A) /TRRL/ Segal, L MacLean, S (Clark (Nicolas) and Associates) ; New South Wales Ministry of Transport, Australia, (0313-6655) Conf Paper 1979, pp 274-286, 1 Tab.; From the Papers of the Fifth Australian Transport Research Forum, Sydney, 18-20 April 1979; ACKNOWLEDGMENT: TRRL (IRRD 239197), Australian Road Research Board

46 300742 IMPLEMENTING PACKAGES OF CONGESTION-REDUCING TECHNIQUES. STRATEGIES FOR DEALING WITH INSTITUTIONAL PROBLEMS OF COOPERATIVE PROGRAMS. Institutional problems have been identified as being the most serious obstacles to implementing programs to reduce traffic congestion, reduce air pollution, and conserve energy. This report, therefore, will be of special interest to transportation professionals and administrators, at all levels of government, who are attempting to implement programs to

meet these goals. Institutional barriers to cooperative programs for implementing complex packages of congestion-reducing techniques are identified. Incentives and penalties are suggested to obtain essential participation of existing institutions. Peak-period traffic congestion continues to be a widespread urban transportation problem despite the availability of technologically feasible solutions. Research reported in NCHRP Report 169 revealed that the most effective congestion-reducing (C-R) programs were those combining several of these techniques into coordinated implementation packages. These packages, designated by the names of their primary techniques, were (1) Changes in Work Hours, (2) Pricing Techniques, (3) Restriction of Access, (4) Changes in Land Use, (5) Prearranged Ride Sharing, (6) Communications Substitutes for Travel, (7) Traffic Engineering, and (8) Transit Treatment. Implementing these C-R packages and similar packages to obtain compliance with the Clean Air Act Amendments of 1977 calls for the cooperation of a number of independent public agencies and private organizations. Barriers to such cooperation are vested interests, inadequate funds, legal and regulatory constraints, and failure to provide an effective organizational structure for joint implementation. The research agency, Remak/Rosenbloom, documented experiences of 18 cities in carrying out joint-agency transportation projects. In addition, case studies in Jacksonville, Seattle, Houston, and Dallas were conducted. Institutional problems found were grouped into three categories as they relate to (1) individual techniques selected for the package, (2) needs to coordinate activities of independent agencies, and (3) site-related problems. Findings and recommendations in the form of incentives and penalties are presented in tabular form for respective techniques in category 1. For categories 2 and 3, general guidelines are presented. An example application of these results to a metropolitan planning organization is provided. /Author/

46 300755 FLEXIBLE WORKING HOURS AND ITS EFFECT ON COMMUTING PATTERNS. The development of flexible working hours in the Public Service, the Post Office and private industry within Wellington City is reviewed. The effect flexible working hours had on the commuting patterns of employees from two Government Departments was analysed from information given in two questionnaires. It was found that the resulting shifts in working hours tended to decrease the number travelling to and from work at times when the roads were congested. An increase in private transport (car passengers and drivers) at the expense of public transport (buses and trains) was also noted. /Author/

46 302110 AUTO-USE DISINCENTIVES. Reduction of automobile use in urban transportation is an important measure in improving urban environments. This study attempts to identify and

provide guide-lines for politically feasible measures termed auto-use disincentives. The objective of such measures is not to ban people from using private cars, but rather to persuade them to use more efficient and less environmentally-detrimental forms of transport whenever possible. In this report, a select group of disincentive measures, which have either experienced the most success or shown great potential, are analyzed. The group is divided into five categories: Exclusive Lanes (transit and carpool); Other Preferential Treatment (including ramp metering, toll treatment, and signal preemption); Traffic Re-Direction; Auto-Free Zones and Streets; and Pricing Disincentives. In each of these five discussed areas of auto-use disincentives, planning and design guidelines for the included measures are outlined and explained. This paper also presents case study reviews for the five major topics. Within each case study review, the procedures contributing to the success of the particular project are highlighted. A number of applications of these auto-use disincentive measures are presented, evaluated, and their applicability to different conditions and coordination with other Transportation System Management (TSM) measures are discussed. Data sources for this report include journals, reports, dissertations, and books from various libraries. This report provides a list of available material on the subject, as well as a description of references actually used for this report.

46 302253 SIMPLIFIED AIDS FOR TRANSPORTATION ANALYSIS: FRINGE PARKING SITE REQUIREMENTS. VOLUME 6. This is one of a series of six reports describing simplified aids to improve transportation decisions without resorting to computers or extensive data collection. In January 1976, the U.S. Department of Transportation issued Technical Notice DOT-1-76 requesting transportation planners, engineers, and transit operators to submit useful, but not widely known manual techniques that could be developed and distributed as simplified aids for transportation analysis. Over 70 analytical aids were submitted in response to this request. Based on an evaluation process conducted to determine the most useful, easily applied, and generally applicable techniques, several of these analytical aids have been selected and documented in sufficient detail to permit their immediate use. In addition to these techniques, three additional analytical aids were developed as part of the Short Range Transportation Planning project, and an annotated bibliography of each analytical aid reviewed was prepared. These individual analytical aids and the annotated bibliography have been prepared as separate technical reports and have been brought together in this Manual of Simplified Aids for Transportation Analysis. The analytical aid described in this report provides a method to: 1) identify candidate sites for change-of-mode fringe parking facilities; 2) estimate specific parking facility requirements at these candidate sites; and 3) estimate highway access requirements for the sites. Because the intent of this report is to provide a simplified analysis aid, modifications, embellishments, and improvements to the suggested procedures and models are encouraged should local data or

previous analyses suggest a more appropriate method.

Peat, Marwick, Mitchell and Company, Urban Mass Transportation Administration, (UTP.PMM.77.1.1) Final Rpt. UMTA-IT-06-9020-79-6, Jan. 1979, 64 p.; Contract DOT-UT-50021; ORDER FROM: NTIS; PB-299985/AS

46 302266 PARKING POLICY AS A TRANSPORTATION SYSTEM MANAGEMENT MEASURE. In many cities, parking is considered as an independent component of the transportation system, and often without public control. With the increasing need to treat transportation in cities as one system, which is the basic rationale for Transportation System Management (TSM), parking emerges as a very important system component, since it can be used effectively for influencing travel patterns and for restraining automobile use, particularly in congested areas. The main purposes of this study are: 1) to show that parking policy represents a potentially effective tool for regulation of urban transportation under the TSM program; 2) to define the relationship between the parking policy with other complementary or alternative TSM measures; 3) to present and evaluate various aspects of a parking policy and illustrating these by various applications in different cities; and 4) to recommend the potential parking policies which cities can apply as a part of their TSM Measures. This study presents different types of parking restraints in the forms of regulatory measures, limits on parking supply, and pricing. Applicability and effectiveness of each measure is discussed. Groups affected, whether positively or negatively, by various parking measures are defined. Experiments undertaken in several cities with different types of parking regulations and pricing are described. The report recommends that parking be included in analyses and planning of urban transportation systems and used as a very effective tool of traffic regulation, modal split change, and improvements of both urban travel conditions and urban environment in general. (UMTA)

46 308023 WORKSHOP ON AREA TRAFFIC CONTROL. BRISBANE, AUGUST 1978. PROCEEDINGS. This report contains the papers presented at and discussion record of a workshop on area traffic control held in Brisbane in August 1978 as part of the 9th ARRB Conference. The theme was devoted to current problems and research priorities in ATC. Amongst the topics discussed were: the merits of the Sydney Co-ordinated Adoptive Traffic (SCAT) system; the need for on-line measurement of effectiveness; the importance of catering for various road user groups; the use of transit as an evaluation tool with user-defined performance indices; and a discussion of modern traffic control equipment and application in an ATC system to be installed in Manila. It was recognised that there is a need for a second appraisal of scat's improvement over a fixed-time control system on a grid type network. Priority should be given to research in the feedback of traffic flow information through vehicle detectors to a central site for accurate monitoring and improvement of the performance of an ATC system. (TRRL)

Luk, JYK, Editor ; Australian Road Research Board Monograph ARR No. 92, May 1979, 118 p.; Proceedings from Workshop on Area Traffic Control, Brisbane, August 1978.; ACKNOWLEDGMENT: TRRL (IRRD 239301)

46 308063 TRAFFIC CONTROL-OBJECTIVES AND METHODS. The history of traffic management is briefly reviewed, the currently available facilities are listed and ways in which they may be used to achieve particular objectives are described. The objectives of urban traffic control are to reduce journey time, improve utilization of the road network, minimize waste of energy resources, reduce pollution and improve safety. The coordination of traffic signals is discussed and details of the following are briefly reviewed: real-time or predetermined modes of control, central compiler or hierarchical systems, pedestrians and bicycle problems, priority to public transport and emergency service vehicles, and special programs for congestion. An assessment of urban traffic control systems in Great Britain is summarized. Other control systems outlined have included broadcasting, route guidance, and safety measures. Restraint of access to urban areas is also discussed and include physical restraint, parking restraint, and fiscal restraint.

Permanent International Association of Road Congr Sept. 1979, pp 35-51; Technical Committee Report on Roads in Urban Areas presented at the 16th World Road Congress held in Vienna, September 16-21, 1979.

46 308085 CONSUMER PREFERENCES RELATIVE TO THE PRICE AND NETWORK CAPABILITY OF SMALL URBAN VEHICLES. Preferences of consumers for small urban vehicle concepts differing only with respect to their hypothetical purchase prices and network capabilities (i.e., whether they are capable of operating on expressways, major arterials or local streets) are analyzed using statistical techniques based on psychological scaling theories. Results from these analyses indicate that a vast majority of consumers are not readily willing to give up the accessibility provided by conventional automobiles. More specifically, over the range of hypothetical prices considered here, network capability dominates as a determinant of preferences for vehicle concepts. Also, the ability to operate vehicles on expressways is of utmost importance to consumers. (Transportation)

46 308580 EMPIRICAL ANALYSIS OF THE INTER DEPENDENCE OF PARKING RESTRICTIONS AND MODAL USE. The relation between modal use and parking restrictions was analyzed by examining changes in travel behavior over time during a period of substantial change in parking restrictions, transit service, and transit fares. The situation examined was choice of travel modes to a major trip generator, the campus of the University of Wisconsin-Milwaukee. This area has major parking-congestion problems that have been partially alleviated by special transit services and remote parking lots. These systems have also been developed in conjunction with changes in parking restrictions. From an analysis of modal choices over time, it was found that shifts to transit use have occurred as a result of tighter parking restrictions and the shifts away from transit have occurred as a result of fare changes. Carpoolers seem to be most sensitive to changes, while the drive-along category showed less sensitivity. An analysis of respondents' reactions to probable future situations also indicated similar results. /Author/

46 309574 CONTROL INSTRUMENTS FOR TRAFFIC RESTRAINT IN THE CITY CENTRE OF STOCKHOLM [Styrmedel foer begransning av biltrafiken i stockholms innerstad]. This report describes the motives for decreasing the traffic flow in Stockholm and how much it has to be decreased to obtain certain purposes. Available control means, how they can be used and their effects on the traffic flow of the city centre are also described. Every day about 230000 vehicles pass in to and out of the city centre. The traffic causes noise, air pollution, accidents, sometimes queues and difficulties for the commercial traffic to operate. A reduction of the traffic flow would mean longer trips and that suburban road users accessibility to the city centre's service, culture and commercial offer would decrease. The report presents how a successive decrease of the traffic flow in the city centre of 20 per cent can be realized, the measures that have to be taken and what the traffic reducing effects are. Some of the measures that already have been taken, are for example supervision of parking areas, moving of vehicles and raised parking fees. The parking control measures only give less improvements of the environment in the city centre. The traffic flow can be further reduced by introducing journey charges, relieving traffic routes, raising of the contributions for the public transport, etc. The effects of the desirable reduction of the traffic flow by 20 per cent are expected to be: the air pollution will be reduced. The traffic safety will increase. The buses to and in the city centre will get higher trafficability. People, who change over to public transport, will have lower costs but the journey time will be longer. The energy consumption will decrease by 10 per cent for the journeys to work. The municipality of Stockholm will have a profit of at least 60 million skr per year. (TRRL [Swedish])

46 310162 VILLAGES WHERE WALKERS ARE VIP'S. The author traces the history of two pedestrianisation schemes in Cornwall. One park-and-ride scheme has been operating in Polperro for the last 12 years, the other in St Ives has been operating since 1974. The schemes have been adopted to remove congestion in main streets which were designed for pack animals and could not cope with the demands made on them by tourist traffic. After initial opposition from local traders, the scheme at Polperro has been very successful. Vehicles were restricted in the town centre of St Ives between the hours of 9 am to 5 pm, from 1st June to August 31st. Signs are provided at the main cordon points directing traffic to peripheral car parks. In 1975, a park-and-ride service was operated using four midi-buses from the largest car park. A successful rail park-and-ride service has been operating since 1978 from a car park some three miles east of the

town centre. Revenue is shared between rail and the car park operators. (TRRL)

46 310703 USE OF THE GRAVITY MODEL FOR PEDESTRIAN TRAVEL DISTRIBUTION. Knowledge of pedestrian travel behavior is very important to attempts to improve congestion problems in central business districts. This paper describes the results of the use of a traditional gravity model for predicting pedestrian trip distribution. The model is calibrated by using a data set from downtown Chicago. The results indicate that the traditional gravity model closely reproduces the characteristics of pedestrian trip distribution and might be a useful tool in the analysis of downtown travel. (Author)

46 312256 URBAN TRANSPORTATION INNOVATION: ADOPTING AND IMPLEMENTING AUTO RESTRAINT POLICIES. To explain political and institutional opposition to auto restraint measures, this paper argues that they are "fragile" policy initiatives which face particularly difficult obstacles in (1) building a supportive political constituency, (2) securing necessary approvals from decisionmakers, and (3) being implemented by public agencies. Although these problems afflict any auto restriction proposal to some degree, specific restraint options vary in feasibility depending on features of the policy design, the restrictions already in force, and the requirements of state and local law. 46 312467 INSTITUTIONAL FACTORS IN THE IMPLEMENTATION OF AUTOMOBILE-RESTRICTIVE MEASURES. PART 2: TRAFFIC RESTRAINTS IN THE SAN FRANCISCO BAY AREA. Implementation experience with five different transportation system management measures in the San Francisco Bay Area is examined: neighborhood traffic restrictions, road and congestion pricing, toll increases, parking management, and ramp metering. The conclusions are that proposals to restrain automobile use have had little success when proposed by planning agencies, but when implemented at the initiative of local government, they have gained substantial (if not unanimous) acceptance. Although automobile-restraint measures may have adverse differential community impacts, it should not be assumed that automobile restraints are always unacceptable to the public and that it will not be possible to develop the community support necessary to succeed. 46 312468 INSTITUTIONAL FACTORS IN THE IMPLEMENTATION OF AUTOMOBILE-RESTRICTIVE MEASURES. PART 3: EXPERIENCE OF THE SERVICE AND METHODS DEMONSTRATION PROGRAM WITH AUTOMOBILE-RESTRICTIVE MEASURES. Findings are presented from the perspective of the Urban Mass Transportation Administration's Service and Methods Demonstration Program on the implementation of various physical or operational strategies designed to either alter the supply of road space available to vehicular traffic or to reallocate the supply of road space among different classes of vehicles. These findings include the need for objective technical information on the impacts of similar strategies in other locales and the early and continuous involvement of potentially affected groups, the importance of a quick response to any early construction or operational problems, and the importance of the relationship of enforcement to the political feasibility of a project. 46 312553 THE REDISCOVERY OF THE PEDESTRIAN. TWELVE EUROPEAN CITIES. This book, an outgrowth of the More Streets for People public information program, evaluates pedestrian experiments in 12 selected European cities. It is addressed to community groups and individuals involved in promoting the creation of traffic-free areas in their cities. The cross section of European experiments represents a variety of goals and a diversity of urban scales. While the creation of urban pedestrian malls in America has focused primarily on downtown economic revitalization, a close look at European efforts reveals a number of reasons for implementing traffic free zones. The goals sought by European planners have ranged from strictly functional ones dealing with traffic control strategies to improve downtown mobility to humanistic ones dealing with conservation of urban areas and improvement of residential conditions in central areas. The scale of the cities with pedestrian precincts also provides a useful overview for the advocate. Cars have been banned from central areas of small villages to increase tourist appeal or simply to preserve traditions of outdoor living. They have also been banned from the congested cores of cities with over a million inhabitants that possess national commercial prominence. The diverse planning context, legal methodology, and financial strategy of each specific case also provide a broad, critical picture of the process of converting vehicular roads to pedestrian thoroughfares. Some cities were chosen for their historic relevance because they clearly illustrate a variety of goals for their traffic strategies, for their focus on historic preservation, or for their innovative approach to planning and design. Although this book is not intended to furnish methodological indications tailored to the American reality, it does provide a viable

46 312555 BANNING THE CAR DOWNTOWN. SELECTED AMERICAN CITIES. This book presents an indepth analysis of 16 North American pedestrianization experiments, providing information on the process which each city underwent in converting vehicular roads into malls. Some of the projects were very successful, while others represent failures. The range of results has been examined within the context of the complexity of pedestrian planning. The physical factors to be considered in the creation of a traffic-free area relate to the design of the mall and to the solution of city circulation and parking problems. These factors must be viewed in light of creating a traffic-free zone that increases not only the quality of the shopping environment but the social and recreational appeal of the area as well. The institutional side of mall implementation also affects the success of the project, because legal problems may arise in changing the use of an existing right-of-way. Legislation, which may be necessary at the local or State level, can also relate directly to financing methods. The major goal of almost every North American pedestrianization effort has been the revitalization of declining downtown retail economy. The reasons for such decline have varied from city to city. The cities considered here were selected because they represent a cross section of sizes and geographic locations. They also provide examples of the various reasons for and approaches to the implementation of traffic-free areas. Taken together, these 16 case studies offer a broad view of the aspects of pedestrian zoning in North America. Each city is considered individually, and photographs are included.

46 313010 PARKING. NORTH SIDE NEIGHBORHOOD PRESERVATION STUDY. Part of the Iowa City, Iowa, North Side Neighborhood Preservation Study, this report focuses on parking problems in the north side area and suggests and evaluates possible remedies. Because the north side is located near the downtown area and the University of Iowa, there is a large demand for parking space in the neighborhood. Multifamily structures often contain several car owners per dwelling, and this coupled with the demands of other competing parkers has led to overcrowding of the available parking and other negative effects. The study found several factors to be primarily responsible for the excess of parking demand: (1) commuter parking due to the neighborhood's convenient location in relation to downtown, Mercy Hospital, the university, and bus lines; (2) storage of cars belonging to students living in nearby university dormitories; and (3) inadequate off-street parking space for area apartment units, rooming houses, fraternities, and single family residences. The most innovative of several possi-

ble remedies are: (1) a parking permit system--attaching a price to curbside parking or allowing preferential parking for residents and charging a small fee would serve a dual purpose of channeling some parkers back into municipal and university-provided facilities and forcing those who continue to park on the street to assume the costs of its undesirable side effects; (2) a usable open space requirement--specified amounts of usable space, incorporated into site requirements, would work together with parking and building area specifications to indirectly control the number of dwelling units that could feasibly share a lot; and (3) the reduction of parking demand at Mercy Hospital--because parking is a free benefit at the hospital, removal of this incentive would encourage employees to carpool or seek alternative transportation. Maps, tables, and references are included.

46 313209 BOSTON AUTO RESTRICTED ZONE DEMONSTRATION EVALUATION PLAN. The Boston Auto Restricted Zone Demonstration Project, to be implemented in September 1978, represents an attempt to rationalize auto, transit and pedestrian circulation patterns in the central business district of a major U.S. city. The demonstration includes such elements as the restriction of autos from certain streets, major re-routing of traffic, improved bus service into the area, improved sidewalk facilities, additional goods movement and loading areas, and a relocation of taxi stands. The demonstration site is located in the Boston central business district, in which roughly 120,000 people are employed and in which roughly 25% of the city's retail trade is conducted. There are a number of objectives associated with the Boston ARZ project, which includes increased retail sales, increased transit ridership, increased transit productivity, increased pedestrian activity, and improved environmental quality.

46 315189 SIMULATION OF THE PARKING SYSTEM [Parkeren gesimuleerd]. The impact of parking infrastructure on urban transport and development seems so important that a study of the parking process itself is desirable. Parking can be defined as the search for a parking place by visitors to an area, positioning the car on the chosen facility and leaving the parking place again after the duration of stay. The parking system is described by a simulation model which makes it possible to test parking policies such as changing parking rates, increasing or decreasing capacity, the development of parking structures or the introduction of park and ride. The description does not cover impacts of the parking situation on modal split, distribution or urban development. However, the resulting picture of the parking situation and the difficulties of finding a parking place, expressed in searching times, costs and walking times, are an indication of the effects on other aspects of transport like mode choice and distribution. 46 319340 INITIAL REACTIONS TO A CENTRAL BUSINESS DISTRICT BUS TRANSIT MALL IN HONOLULU. The city and county of Honolulu have recently adopted a plan designed to eventually convert a central business district street to a bus transit mall. The first phase of the plan, which was the imposition of turning restrictions on private automobiles, was implemented in February 1979. This paper presents the results of a study that investigated the reactions of the daytime population of the central business district toward the mall and that population's perceptions of the mall's impact on congestion, noise, air quality, safety, convenience, speed, pedestrian circulation, and the general downtown environment. The study was based on an interview survey administered to 170 persons. The major findings of the study were as follows. The mall has caused 26 percent of the automobile users to change their circulation patterns. All factors examined were thought to be enhanced by the mall. Chi-square tests showed that, at the 0.05 level, purpose and arrival time explain the perceptions of congestion and safety impacts but in different ways; mode of travel strongly affects the experience of convenience and speed; the vast majority (85 percent) of the respondents were favorably disposed toward the mall concept. These findings should be useful to urban transportation planners and decision makers because they may represent a shifting of public attitudes toward favoring the preferential treatment of high-occupancy vehicles, in general, and urban bus systems, in particular. 46 319379 AUTOMOBILE-RESTRICTIVE MEASURES IN CENTRAL BUSINESS DISTRICTS: SOME RECENT FINDINGS AND VIEWS. Increasing concern about the need to enhance the quality and economic vitality of urban areas, especially the downtown, has fostered interest in a broad set of transportation strategies that involve the restriction of automobile traffic. The Service and Methods Demonstration Program of the Urban Mass Transportation Administration has been examining two concepts of this type: automobile-restricted zones and transit malls. Background information is presented on various traffic-restriction projects that have been sponsored and/or evaluated under the program, and selected findings regarding the planning and implementation process, operations, and impacts of the projects are discussed. Experience with these concepts has been generally positive and encouraging. They have proved to be feasible to implement, workable in terms of traffic circulation and other operational aspects, and beneficial to transit users and pedestrians and have been well received by the public. They also appear to be compatible with broader public and private efforts aimed at revitalizing the downtown. (Author)

46 322260 BOSTON'S DOWNTOWN CROSSING: ITS EFFECTS ON DOWNTOWN RE-TAILING. The effects of an Urban Mass Transportation Administration's (UMTA)

project on the fabric of downtown are beginning to surface both in physical and psychological terms: auto traffic has been removed from 11 blocks; four blocks have been resurfaced in brick; lighting fixtures have been installed; banners defining the area have been placed at 4 entry points; 6 bus routes have been extended into the heart of downtown; pedestrian volumes were up 5%; sales volumes went up 5% to 10%; auto use decreased and transit use increased; traffic has been rerouted with no appreciable increase in congestion; and merchant, press and public attitudes have been positive. The new shopping environment is examined more closely and the increased convenience, new shopping environment is examined more closely and the the new merchandising image, and the importance of foot traffic and market research are noted. noted.

46 323068 FINAL REPORT: LIVING WITH TRAFFIC IN TOWNS AND VILLAGES [Eindrappport verkeersleefbaarheid in steden en dorpen]. When houses and other buildings are constructed, the situation and layout must consider the mixing of residents and traffic. This takes place in an area for pedestrians, cyclists, residents and traffic within a residential area. Local authorities must clearly indicate where the residential areas are and where the vehicle traffic can drive unhindered. The residential area appears to full advantage as a "Woonerf". In two Dutch cities, Rijswijk and Eindhoven, demonstration projects have been started. In cooperation with the residents some residential areas have been given a new layout. Furthermore research will be undertaken in fourteen cities on the quality of living in the vicinity. The reconstruction of the main road network, the division into regions, the construction of cycle tracks and footways, the construction of a route for public transport, the need for parking and the possibilities for parking in existing streets are discussed. 47 052072 IN PLACE OF CONGESTION. The likely developments in freight transport technology in Britain during the coming 10-15 years are investigated by the author. Emphasis is placed on the need for careful planning to prevent further congestion. It is suggested that the distribution of freight in urban areas would be facilitated by the setting up of consolidation centers at strategic peripheral locations within urban areas, with the use of rapid transit routes in off peak hours. The author further subscribes to the widely held view that technology readily available at the present time could be more freely applied to the railways.

47 071752 URBAN GOODS MOVEMENT. A wide range of topics involving the broad field of urban goods movement is covered in this series of 12 papers. The role of trucking is undisputed and various facets of the local distribution problem are examined. Included are demand for urban goods movement, desirability of terminal consolidations, the volume of vehicles and their emission production, the location of distribution centers, and identification of the data needed for urban goods transportation analysis.

Transportation Research Record Vol. N No. 96, 1974, 114 pp, Figs., Tabs., Refs. Twelve reports prepared for the 52nd and 53rd Annual meeting of the Highway Research Board. This also available from NTIS, PB-235948/7ST, pricing is PC \$5.25 and Microfiche \$2.25.; ORDER FROM: TRB, Repr. PC

47 072283 THE URBAN COMMODITY FLOW DATA COLLECTION PROJECT. Relatively little research has been devoted to the Urban goods movement industry, which is responsible for 40 percent to 50 percent of all urban transportation costs. Costs in Canada are expected to rise from \$2 billion in 1966 to \$10 billion annually by the year 2000. Estimates predict that cost can be reduced up to 15 percent, representing an annual national savings of \$1.5 billion. More than 70 percent of this can be realized through direct improvements to the urban trucking system. TDA has developed a multi-phase plan whose primary objective is to obtain input data for simulation of goods distribution at Marco (network) and Micro (endpoint) levels. The phases are (1) description of problem, background information, preparation of initial computer mathematical simulation models (completed 9/72); (2) collection of field data of goods movements and truck operations in Calgary; (3) application of Calgary data to computer model for testing and calibration, improvement and refinement; and (4) collection and testing of additional data to ensure general usefulness of model and integrate in with larger network approach for entire Canada. Figures include generalized land-use map of Calgary, major links in its transportation system, and a plan of transportation system, and a plan of transportation districts.

47 080247 FACTORS AFFECTING CARGO LIABILITY PROBLEMS IN URBAN GOODS MOVEMENT AND PROPOSED SOLUTIONS. The report explores the liability problems associated with the intermodal movement of goods into, out of, and through urban areas. It focuses on loss, damage, delay of shipments, and stresses the susceptibility of small shipments to loss, damage and delay. The relationship of liability to the urban area is particularly strong since approximately 85 percent of the loss and damage occurs at the interfacing terminals in the urban area. The inadequacies of present recovery practices and procedures are discussed, as well as the need for uniform standards of liability for intermodal cargo shipments.

47 081635 RAIL AND RAIL-TRUCK TERMINALS: AN OPPORTUNITY IN URBAN TRANSPORTATION PLANNING. This paper examines the rail plant and traffic trends in city areas. The 4,800-square mile Chicago region is used as a case study for railroads in urban markets. The location of railroad piggyback facilities is the principal topic covered since it is the author's hypothesis that the modernization of urban railplant can best be planned by the conscious implementation of stronger intermodal rail services and government policies toward such services.

Blaze, JR (Chicago Area Transportation Study) *Transportation Research Record* No. 511, 1974, pp 20-28, 3 Fig., 1 Tab., 9 Ref.; This is one of four articles contained in the TRB publication "Intercity Freight Movement by Rail and Highway", RRIS #081631.; ORDER FROM: TRB, Repr. PC

47 094142 URBAN GOODS MOVEMENT DEMONSTRATION PROJECT DESIGN. A PRIMER ON URBAN GOODS MOVEMENT. The study examines problems encountered in urban goods movement. The report is divided into 7 sections. Section I presents a discussion of urban goods related transportation as compared to the nation's total transportation. Section II provides estimates, of the characteristics and amounts of transportation currently used to move goods in our major cities. Section III presents estimates of the impact of this transportation on cities in terms of cost, congestion, energy consumption, air pollution, noise pollution and land use. Section IV focuses on each of these impacts as viewed by several identifiable interest groups in the community: commuters, consumers, goods haulers, shippers/receivers, etc. Section V presents an attempt to isolate fundamental causes of urban goods movement related problems and Section VI discusses nearly 100 possible solutions to them. Section VII presents several recommendations for further action.

47 094144 URBAN GOODS MOVEMENT DEMONSTRATION PROJECT DESIGN. APPENDIX C. DISTRIBUTION LOGISTICS ANALYSIS AND FINDINGS. The purpose of the Urban Goods Movement Demonstration Project Design study was to identify and test solutions to urban goods movement problems. In order to effectively accomplish this, it was first necessary to expand the existing knowledge and understanding of urban goods movement characteristics. One part of this effort was to break urban goods movement into logical parts, called 'segments,' and to analyze each segment's physical distribution process and the associated logistics of providing its goods or services to urbanized consumers. That analytical process, known as 'segment analysis,' is reported in this Appendix.

47 094145 URBAN GOODS MOVEMENT DEMONSTRATION PROJECT DESIGN STUDY. APPENDIX D. CONGESTION ANALYSIS. APPENDIX E. ENERGY ANALYSIS. APPENDIX F. AIR POLLUTION ANALYSIS. APPENDIX G. NOISE ANALYSIS. The report contains four technical appendices developed as part of Phase I and Phase II of the Urban Goods Movement Demonstration Project Design. In the first task phases of the study, the primary objectives were to define qualitatively and quantitatively the contribution and impact of goods movement in urbanized areas to: traffic congestion, energy consumption, air pollution, noise pollution, inefficient land use, and cost of urban goods movement. From the analysis, problems associated with urban goods movement and their fundamental causes were identified and plausible solution to the problems were generated. Primary attention was focused on solutions which could be demonstrated and implemented in a 5-year timeframe and would require modest capital investment.

47 094146 URBAN GOODS MOVEMENT DEMONSTRATION PROJECT DESIGN. APPENDIX H. POTENTIAL SOLUTIONS TO URBAN GOODS MOVEMENT PROBLEMS. The Appendix presents the findings of the Phase II process of the study. Solutions to urban goods movement problems are grouped according to the fundamental or secondary cause of each problem. The solutions are grouped into the following sections: Fundamental causes of cost; secondary causes of cost; fundamental causes of congestion; secondary causes of congestion; fundamental causes of energy consumption; secondary causes of energy consumption; fundamental causes of air pollution; secondary causes of air pollution; fundamental causes of noise pollution; secondary causes of noise pollution; fundamental and secondary causes of inefficient land use; miscellaneous solutions.

47 099840 DEPARTMENTAL ACTION PLAN AND REPORT TO THE SECRETARY. This report on urban goods movement contains two main sections (1) a "Departmental Action Plan" and (2) a "Report to the Secretary," which were prepared by the Urban Goods Movement Task Force established in 1972. The "Department Action Plan" has been approved by the Secretary and is intended to deal with the organizational and structural aspects of the Department's role in urban goods movement. It addresses the questions of decentralization, intergovernmental and interagency relations, and the broad responsibility for initiative and oversight to insure continued momentum and coordination in urban goods movement activities at all levels. The "Report to the Secretary" is intended to provide an overview of urban goods movement, the associated problems, and related Department of Transportation activities.

47 099843 GOODS TRANSPORTATION IN URBAN AREAS. A five-day conference to explore issues in urban goods movement was organized by representatives of the American Society of Civil Engineers, Highway Research Board, Institute of Traffic Engineers, and the U.S. Department of Transportation. Five areas were studied and reported by Probe Groups, namely (1) urban goods movement considerations in urban transportation planning, (2) use of local regulatory and police power in facilitating goods movements, (3) freight terminal relocation, (4) issues in urban rail relocation, and (5) consolidation of pickup and delivery services. Each Probe

Group report presents recommendations for action to improve urban goods movement. Eleven keynote, summary, and resource papers are presented covering such topics as Federal, State, and local programs for goods movement facilitation; terminal location and consolidation; improvement of intermodal transfer; regulation; and energy requirements for trucking. Five case studies describe ongoing regional programs in Dallas-Fort Worth, St. Louis, New England (Boston and Maine Railroad regional impact), northern New Jersey, and the New York City Garment Center.

47 130896 SIMULATION STUDY EXAMINING THE BENEFITS OF AN URBAN CONSOLIDATED TERMINAL. This paper is concerned with the movement of commercial vehicles in central cities and examines the potential benefits of the establishment of a consolidated freight terminal in a medium sized city: Syracuse, New York. Using original data on the movement of freight shipments within the central business district of Syracuse, simulation analysis is employed to estimate the efficiency gains and cost reduction which could be anticipated by central city freight movers as a result of their use of a consolidated freight terminal. Principal among the findings reported are a possible annual savings of \$1.6 million, and a 93 percent reduction in freight vehicle movement time.

47 134326 ISSUES IN URBAN GOODS MOVEMENT PLANNING. Urban goods movement has not been subjected to a significant amount of investigation and research until very recently. In this paper, the main issues and problems associated with urban goods movement are reviewed and discussed from the viewpoint of urban transport planning. Nine types of issues which are relevant from this viewpoint are identified: (A) the characteristics of urban goods movement, (b) the interaction between goods and passenger traffic, (C) social and environmental effects, (D) the interaction between goods movement and urban development, (e) the technology of goods movement, (F) terminal and shipping facilities, (g) vehicle operating costs, (h) the operation and management of the transport industry, and (I) the regulation and control of the transport industry. Some preliminary results of an investigation of the characteristics of urban goods movement in Melbourne in 1964 are presented. The investigation is concerned with analysing truck characteristics, truck trip characteristics, and the characteristics of consignments of goods. /Author/TRRL/

47 137348 URBAN GOODS MOVEMENT DEMONSTRATION PROJECT DESIGN PHASES I AND II. EXECUTIVE SUMMARY. The specific tasks of the Urban Goods Movement Demonstration Project Design Study which are addressed in this report are: (1) To define quantitatively and qualitatively the impact of goods movement in urban areas on goods movement cost, traffic congestion, energy consumption, air pollution, noise pollution, and land use; (2) to identify problems associated with urban goods movement and their basic or fundamental causes; and (3) to generate plausible solutions to these problems. Other tasks of the study, not yet complete, are to analyze the potential solutions, to identify those which are particularly desirable and to propose and design demonstration projects to test and/or implement the proposed solutions. This executive summary provides a brief overview of the entire study.

47 139311 CONSTRAINTS AFFECTING THE USE OF A PUBLIC TRANSHIPMENT DEPOT. A group of 172 companies selected from the "Time Top 1000 Companies" were asked to complete a questionnaire concerning possible constraints on the use of a public transshipment depot. The group was not necessarily representative of the "Top 1000" but included manufacturers, wholesalers and retailers. The 93 completed questionnaires received have been analysed to help to improve understanding of the decisions of potential users. The study also indicates the very wide range of services that would need to be provided by a public transshipment depot, and argues that there should be increased liaison between local authorities and industry, in order to ensure practical solutions to the problems of HGVs in towns. /Author/

47 146463 MOBILITY OF PEOPLE AND GOODS IN THE URBAN ENVIRONMENT FACILITATION OF URBAN GOODS MOVEMENT. Field data and interviews performed indicate that goods movement in the city center is constrained by several factors, and distinct goods-movement patterns were identified and documented. For typical downtown land uses, goods activity, truck activity, internal distribution and other facets of goods distribution were evaluated. These evaluations documented several aspects of downtown goods movement including: trip generation rates, operating characteristics, parking patterns, dwell-time components, goods descriptions, delays, arrival patterns, engine idling, and others. Preliminary procedures are included to suggest methods of using the data in

this report to facilitate local goods movement in downtown areas.

47 147620 THE SASKATCHEWAN COMMON-FOR-HIRE CARRIER INDUSTRY: A RATIONALIZATION APPROACH. The purpose of this paper is to describe the Saskatchewan portion of a national study to evaluate urban trucking rationalization techniques. The objective of the study is to establish a methodology for the evaluation of truck rationalization and locally it is intended to evaluate the possibilities of applying various rationalizing techniques to problems in the local-for-hire trucking industry.

47 167103 URBAN GOODS MOVEMENT SPACE ALLOCATION GUIDELINES [Final rept.]. Detailed goods vehicle-related data was collected for a range of typical city center land uses. Information acquired included goods vehicle trip generation rates, dwell time patterns, parking patterns, etc. Using this information, augmented by the literature, cost-effective space allocation methodologies were developed for planning for space allocation both on and

off-street. Space allocation methodologies have been exercised to provide tables of recommended curbside and off-street goods vehicle space allocation guidelines. This report can assist in the rational, objective provision of the appropriate number of spaces, at the curb or at loading docks, which will minimize total costs.

47 169217 MOBILITY OF PEOPLE AND GOODS IN THE URBAN ENVIRONMENT. FACILITATION OF URBAN GOODS MOVEMENT. Conflicts between trucks and other vehicles in the downtown area cause delays to the motoring public and result in inefficient goods movement. Reducing these conflicts requires a quantitative understanding of the operating procedures of goods movement vehicles as well as a qualitative appreciation of why they occur as they do. Field data and interviews performed in both years of this study indicate that, land use is the dominant variable controlling goods movement patterns in the City Center. Goods activity, truck activity, internal distribution and other facets of goods distribution were conducted for a range of typical urban center land uses. The study documented several aspects of urban goods movement including: goods vehicle trip generation rates, generating characteristics, parking patterns, dwell-time, delays, etc. Based on the results of the two years of study general guidelines have been developed for facilitating goods movement in the urban center.

47 173552 ANALYSIS OF URBAN COMMODITY FLOW. The author discusses that most analyses of urban freight have been concerned with aspects of the supply of freight transport services, such as truck trip or truck fleet characteristics. This paper is concerned with the demand for urban freight, and presents an analysis of the characteristics of commodity consignments. These characteristics are analyzed using data for Melbourne, Australia. It is shown that over one-half of internal freight tonnage was accounted for by six commodity groups: sand, rock, soil and gravel; bricks, pottery, glass and cement products; waste; processed food and beverages; metals and metal products; and petroleum products. The balance was spread over a wide range of commodity items. The paper also reviews the characteristics of the mass of consignments and the length of consignments, by commodity and land use.

47 179085 FREIGHT MOVEMENT: A CRUCIAL COMPONENT OF TRANSPORTATION SYSTEM MANAGEMENT. This paper points out how important freight movement is to the functioning of the urban economy, how urban development can be encouraged by including freight movement in the urban transportation planning process, and how the inclusion of freight movement is both logically and legally supported. It is appropriate to apply planning funds to freight movements if these activities are included in the unified planning work program. Thus, the types of freight planning activities considered appropriate can be as varied as the cities that apply for those funds as a portion of their unified planning work programs. The important role of freight planning in the transportation system management (TSM) element is explored. Examples are given of TSM actions that can significantly improve the flow of both freight and people by reducing the conflicts between these essential activities. /Author/

47 182975 GOODS TRANSPORTATION IN URBAN AREAS--GTUA III. A five-day conference to explore contemporary issue in urban goods movement (UGM) was organized by representatives of the Transportation Research Board, American Society of Civil Engineers, Institute of Transportation Engineers, and the Federal Highway Administration. Five specific topics were probed and reported upon by work-teams, namely (1) traffic engineering and design to facilitate UGM, (2) impact of local government regulations, (3) interface between Federal regulation and UGM, (4) UGM in regional system planning, and (5) locating and servicing major urban freight generators. In addition to Probe Group reports and recommendations, there are presented 40 keynote, summary and resource papers covering such topics as data requirements, time value of cargo, service trucks, terminal design and location, transportation system management, planning methodology and case studies, intermodal transfer, freight regulation and economics. /FHWA/

47 183440 A NOTE ON THE ROAD PRICING OF COMMERCIAL TRAFFIC. With renewed interest being shown in the UK in the introduction of road pricing as a means of restraining urban traffic, the article assesses its possible effect on urban freight transport. Two cases are examined in which (1) the only effect of road pricing is

to increase haulage costs, and (2) any beneficial effects of reduced congestion resulting from road pricing are also considered. Although comprehensive road pricing may have little effect on total urban freight traffic flow, it might encourage more efficient methods and the retiming of deliveries and collections. The long-term effects of a road-pricing policy are considered as well as criticisms of its application such as increased haulage rates and the possibility of causing more frequent trips by smaller vehicles. /TRRL/

47 188006 EFFORTS TO IMPROVE GOODS MOVEMENT IN DALLAS. The paper discusses a study that developed alternative solutions to the goods distribution problem in the CBD. The project was specifically designed to: provide immediate solutions for some of the problems encountered by delivery and service vehicles presently serving downtown Dallas, and identify alternative means of serving those vehicles whose function may not be compatible with the long-range truck tunnel plan. The project was an effort designed to identify solutions, evaluate those alternatives, and implement some of the more viable solutions.

47 188010 INNOVATIONS IN URBAN GOODS MOVEMENT. This paper looks at innovations in urban goods movement in the context of economic and political reality. It overviews dimensions of the urban goods movement problem as it relates to urban growth and economy; identifies impacted groups; and analyzes real and pseudo-solutions. The paper suggests better street traffic management; auto-free zones rather than truck-free zones; and selective construction of truckways and truck streets. It calls for consolidated shipping and receiving areas in office buildings; increased cargo containerization; and strategic development of transportation facilitation centers.

47 189342 URBAN FREIGHT CONSOLIDATION: LEGAL ATTITUDINAL, AND OPERATIONAL CONSIDERATIONS ASSOCIATED WITH IMPLEMENTATION. The problem of transporting small shipment of general freight by motor carrier within an urban center has become an important U.S. transportation problem today. Of the several alternatives proposed to solve the urban congestion/small shipment problem, the concept of freight consolidations is pointed out herein as having the greatest merit. This study examines the issues associated with implementing the concept of urban freight consolidation. It includes an analysis of the legal implications of alternative forms of ownership and the impact which ownership might have on operating rights. In addition, it reports the findings of a national survey conducted to determine the attitudes toward urban freight consolidation held by consignees, consignors, transport agents, public warehousemen, and planning agents. It also examines the concerns expressed by each of the proceeding publics relative to implementing and operating a consolidation terminal or series of terminals. The primary focus of this research is to investigate the economic and social impact which an urban small shipment consolidation terminal might have on a typical metropolitan area such as Columbus, Ohio. This report concludes that: urban goods consolidation is economically feasible and socially desirable; there are no apparent legal restrictions that cannot be overcome; and the attitudes toward consolidation by the publics are favorable. A set of conclusions stating how urban terminal consolidation might best proceed is also included. /UMTA/

47 189343 THE LOCATION AND SIZING OF URBAN FREIGHT TERMINALS WITH MULTIPLE PLANNING PERIODS: THE URBAN TERMINAL INVESTMENT MODEL (UTIM). The purpose of this research was to develop and test an Urban Terminal Investment Model (UTIM) for use in the design decisions required to locate, construct, and operate a network of terminal facilities. Several overall criteria are presented as guidelines to produce a model and a solution procedure which permits terminal planning on a routine basis. This research has led to a design methodology which is currently operational for use by transportation planners. The methodology is implemented with computer programs collectively called UTIM. This document contains an investigation of the economic advantages of consolidation terminals for the distribution of small-shipment freight in large metropolitan areas. Planning models for two different system operating rules which assign freight flows to terminals are developed. The models are designed to identify least cost terminal system configuration which are valuable in assessing the economic attractiveness of freight consolidation relative to other goods movement methods. The UTIM models are nonlinear integer programs which are solved with new partial enumeration methods developed in this research. The research results included realistic evidence for potential economic superiority of multiple terminal networks over a single facility, namely, for cities whose metropolitan areas are characterized by spread out commercial zones and concentrated truck carrier locations. Application of the UTIM models was tested, using data for the Columbus, Ohio, area. For this analysis, the least cost configuration was a single consolidation facility which was estimated to permit significant cost savings over the current goods movement system. /UMTA/

47 189858 SPACE ALLOCATION GUIDELINES FOR OFF-STREET LOADING FACILITIES. ABRIDGMENT. This report summarizes the results of the third and final year of a study related to the facilitation of urban goods movement. The first year of study dealt with data acquisition, the second year developed and validated the methodology, and the third

year sought to develop guidelines for the efficient allocation of curbside and off-street space for urban goods movement. Brief descriptions of the data sources and the developed methodologies and a detailed description of the guidelines with application examples for off-street loading requirements, primarily in downtown areas, are presented here. The basic premise in the space allocation guidelines is that goods movement is a part of a total transportation system. Space allocation for goods movement must recognize and accommodate other urban transportation needs. Consequently, the procedure in this space allocation model is to find the number of off-street berths that minimize total annualized cost in dollars for all impartial groups.

47 196895 CONSOLIDATED GOODS DISTRIBUTION SYSTEMS IN URBAN AREAS [Varudistribution i taetort. System foer samordnad varudistribution]. The objective of this work was to analyse possible systems for consolidation of goods distribution. Mainly the study has been limited to the link of distribution between wholesaler and retailer. The present structure of goods distribution and connected problems are reported together with distribution statistics and deficiencies in data. Development trends are dealt with and criteria which concern the construction of and choice between consolidation alternatives. Properly, there are only two theoretical principles for the consolidation of physical distribution of goods: route driving and transfer terminals. These two principles have resulted in consolidation models. The models were tested regarding required number of vehicles, driving distance with load and empty, ton-kilometres produced, capacity ton-kilometres utilized, time used on route and at terminal, costs on route and at terminal. The calculations show that the most economical model is a "mobile terminal", i.e. sorting on the vehicle. Nevertheless, models with stationary terminal and separate or combined routes for pick-up and delivery are more interesting in practice. Also more complex models with practical connections have been designed and calculated. One result indicates that a relatively great number of destinations and delivery sizes under 50 kilograms are required as a basis for a profitable transfer terminal. /TRRL/ [SWEDISH]

47 263352 SOME FALLACIES IN URBAN GOODS MOVEMENT (ABRIDGMENT). This paper explores some misconceptions in the field of urban goods movement. These fallacies include the following: (1) All trucks are used to move goods; (2) Goods movement-generated congestion in the CBD is on the increase; (3) Consolidation of urban goods movement will produce major benefits to all concerned; (4) Consolidation of urban goods movement will relieve downtown congestion; and (5) Urban goods movement can be improved by using rail rapid transit facilities during off-peak hours.

47 300128 INNER SYDNEY TRUCK ROUTE STUDY. The adverse environmental impacts of motor vehicles and particularly heavy trucks have increasingly become a matter of public concern. In Sydney some local councils have reacted by restricting heavy vehicles or through traffic from using local streets. Yet trucks perform an important commercial duty and an efficiently functioning road system is important to the entire community. This trade-off between environmental and road user needs is most pronounced in the inner Sydney area. Prohibiting trucks from using all but classified roads in this area is a possible extension of present programs. The expected results and implications of such an action are discussed. /Author/TRRL/

47 300255 URBAN GOODS MOVEMENT IN SYDNEY. Urban goods movement has been disregarded in transport planning and policy formulation within Australia. As a result there is little information available on which to base a case for reducing the generalised social cost of urban goods movement. While this composite figure can be separated into costs associated with transport operation, externalities, the community and urban structure, we lack knowledge on these cost components and how they interact with each other in a system setting. These inadequacies prompted this study to focus on an understanding of the urban goods process as its prime objective; they also suggested the adoption of an incremental planning approach as its context. Within this general framework the Sydney case study is directed to identifying and locating the urban goods movement system's deficiencies, after a preliminary assessment of the magnitude of the task in terms of commercial vehicle trips. These shortcomings are separated into operational, spot network and major network deficiencies and a matching set of strategies are developed including projects that can be implemented with certainty of success-an emphasis that results in most of the suggestions being characterised by flexibility and low cost positive benefits. /TRRL/

47 301288 URBAN GOODS MOVEMENT. A DISAGGREGATE APPROACH. The recommended approach to the developing of techniques which will allow urban goods movements to be adequately included in the urban transportation planning process is two-pronged. First, research should begin by using all the available knowledge that has been developed in the analysis of the movements of people. The model system developed to represent and forecast passenger movements is a logical point of departure for an attempt to design a model system to represent the movements of goods. Second, since we start in a state of extreme ignorance, a detailed analysis of goods movements is called for. This detail will be preserved if a disaggregate approach is taken. The remainder of the book is devoted to a description of a study which takes this approach in a preliminary attempt to build a goods movement generation model. Chapter 2 presents background material on both the disaggregate approach and previous work on commercial trip generation. Chapter 3 describes the objectives of the study, the study area, and the data collection effort. Chapter 4 presents and describes the data in a case study type analysis of the firms observed and their goods movements. Chapters 5 and 6 describe the statistical analysis of the truck and shipment movements, respectively. Chapter 7 examines relationships between the truck and shipment models. Chapter 8 is a digression on the application of disaggregate techniques to intercity freight movements. Chapter 9 is a summary of the conclusions of the study and recommendations for further research. /Author/

47 301699 ESTIMATING TRUCK TRAFFIC FOR ANALYZING UGM PROBLEMS AND OPPORTUNITIES. Based upon an assessment of the nature of urban goods movement (UGM) problems and opportunities identified in small urban areas, the paper examines simplified demand estimation techniques. The potential usefulness of several truck travel estimation techniques for evaluating different types of UGM problems and opportunities are discussed.

47 302524 URBAN TRANSPORTATION PLANNING FOR URBAN GOODS AND SERVICES. A REFERENCE GUIDE. The urban transportation of goods and services can be defined as the movement of things (as distinct from people) within urban areas. Virtually all of this movement is accomplished by motor truck. Traffic engineers and planners have not given extensive attention to truck operations in urban areas. It is the primary intent of this reference guide to address short-range traffic engineering and transportation planning needs associated with urban trucking. Incorporating urban goods movement into the urban transportation planning process can result in significant improvements in the transportation system and can create corresponding benefits to the community. Currently, the procedures and data needed to evaluate urban trucking problems are generally not available. This guide documents data, techniques, and methodologies that can be used by traffic engineers and planners to both identify the nature of the problems and to evaluate alternative problem solutions. In addition to presenting data pertaining to urban trucking, techniques are documented that can be used to collect site-specific data for use in "spot-checking" the applicability of the data presented to the problem being evaluated. 47 303078 A FRAMEWORK FOR URBAN GOODS MOVEMENT INFORMATION IN CANADA. This volume is the last in a series of nine volumes on urban goods movement (UGM). The study reported here identifies the available research projects in Canada on UGM issues, develops a classification scheme on the basis of identified UGM projects, and assesses the Canadian UGM as consistent with the classification scheme. The study attempts to devise a unified UGM information framework in Canada, in a comprehensive manner sufficient to disseminate to all interested groups. A data-identification survey collected all available study reports together with some notes and verbal information. Each study was then summarized and data classifications were prepared. This report presents the data classification structure and describes the motivation for its form. It also presents the actual inventory of the available data. Urban goods movement research information is discussed in the light of the data inventory. Reviews of the UGM studies are appended. The title of the eight other volumes are: Urban Goods Movement Research-A Framework and Results; Urban Goods Movement in Canadian Cities; A Profile of Urban Goods Flow in Calgary; Myths and Realities of Urban Pickup and Delivery Operations; Evaluation of Urban Trucking Rationalization in Vancouver; Potential Energy Conservation in Urban Commodity Flow; Consolidated Building Receiver Demonstration; and Study of Off Street Urban Trucking Endpoint Facilities.

47 304174 GREENWICH-LEWISHAM FREIGHT STUDY. The study was undertaken to obtain a clear understanding of the working of the freight transport system in a sample sector of London. The study area chosen contains a wide variety of land uses and suffers many of the environmental and traffic problems common in conurbations. The surveys were designed to provide a general description of freight movements and the activities giving rise to them together with an understanding of the transport requirements and objectives of firms and their likely reactions to possible controls on goods vehicle movements. The data collected demonstrate the complexity of conurbation freight operations and have been used by the Greater London Council in its study of lorry routing and large-area controls. The results indicate that such restrictions can only be supported if adequate alternative roads are available to accommodate the diverted traffic.

47 304749 REQUIREMENTS AND SPECIFICATIONS FOR OFF-HOURS DELIVERY. The research examines the feasibility of off-hours delivery- delivery of goods and services between 6 p.m. and 6 a.m.- as a technique for reducing the adverse impact of delivery vehicles on urban traffic. The state-of-the-art of off-hours delivery and its financial and institutional constraints are presented. The information analyzed in this report was obtained through personal interviews with elected officials, planning officials, traffic engineers, union representatives, and a broad cross-section of businesses which serve the central business districts of Washington, D.C.; Denver, Colorado; Atlanta, Georgia; and San Francisco, California. Many businesses already use off-hours pickups and deliveries and are quite content with such operations. Enough carriers provide off-hours service that there is little difficulty in obtaining such pickups and deliveries. Should there be a gradual shift toward more off-hours operations, the carriers would probably continue to maintain adequate service. Most of the interviewees recognized the advantages of efficiency and avoidance of congestion that are inherent with off-hours operation but felt that they are offset by increased labor and management costs. The interviewees could foresee no certain economic advantages to be gained with off-hours pickups and deliveries; the societal advantages associates with reduced congestion were viewed as remote.

47 307680 RESEARCH CONDUCTED IN A LARGE CITY SELECTED WITH A VIEW TO SETTING UP AN INNER-CITY GOODS SUPPLY SYSTEM USING THE RAPID TRANSIT RAILWAY [Untersuchungen in einer ausgewählten Grosstadt zur Realisierung eines innerstädtischen Güterversorgungssystems unter Einbeziehung von Stadtschnellbahnen]. The article describes the results of a study of a system to supply 520 t of goods a day to the centre of Hamburg using 2 metropolitan railway lines. Due to the volume of passenger traffic in existing metropolitan stations, it would be necessary to envisage new construction. For the transport of goods, special containers are used, whilst the transport between station and ships is carried out either by underground conveyors, or by electric vehicles at street level. The cost of such a system is only slightly higher than transport by lorry, but it appears that the particularly favorable conditions encountered in Hamburg cannot easily be provided in other cities. [German]

Heckler, W *Internationales Verkehrswesen* Vol. 31 No. 4, July 1979, pp 195-197; ACKNOWLEDGMENT: International Union of Railways, BD; ORDER FROM: Tetzlaff-Verlag GmbH, Havelstrasse 9, Postfach 4006, 6100 Darmstadt 1, West Germany

47 308074 EVALUATION OF URBAN TRUCKING RATIONALIZATION IN VANCOUVER-PHASE 1 AND PHASE 2, VOLUME 5. A 2-part-study was performed to provide an overview of the goods distribution system throughout the city and to provide a detailed examination of the benefits and costs of establishing a consolidated terminal and consolidated delivery to serve a certain range of commodities to and from certain specified areas. The study estimated the total quantity of goods and the approximate breakdown among a range of goods categories, determined the number of truck trips, their origin and destination and trip distribution, evaluated the city truck route system, provided a new data base, and formulated a transportation model which could be used to test alternative solutions to specific problems. The second phase of the study used the data produced by the model in evaluating a consolidated terminal and delivery system, analysed the benefits and cost of the above innovative solution, and evaluated the objectivity and effectiveness of regulations governing the urban goods transportation industry. The transportation model consists of logical statements grouped into components and embedded in computer programs. It was concluded from use of the model that the results from the sample of truck movements represent a fraction of the total truck traffic. Expansion factors were used to transform sample data. A comparison of screen line counts with the factored values in the trip table showed a maximum difference of 15%. A generation component was calibrated. Further conclusions and recommendations regarding the model are included. Details of the existing freight transport infrastructure in greater Vancouver, the data collection procedures, the transportation model, overview of the truck system, and the evaluation of the truck routes are also included.

47 311942 DELIVERY TRANSPORT--AN ESSENTIAL ELEMENT IN URBAN TRAFFIC. Roads to and from towns must be readily accessible to all, for it is only in this way that economy and trade can flourish. It may be said with justification that the quality of life of a city stands or falls by its traffic flow. The logical meaning of the flow of goods is an uninterrupted transport chain extending from the producer to the consumer, and city officials have a duty to ensure that the flow of goods does not come to a halt, and that delivery and distribution traffic has enough time to fully satisfy the requirements of customers. The author applauds the efforts of city authorities to clear city centers of traffic as far as possible, but warns that it is possible to go too far. City centers must not always consist of prohibitions, he says, advocating that priority should be allocated to commercial transport, with "no parking" and "no stopping" areas for other traffic, and specified loading areas or loading streets, provided that such measures are well thought out and provision made for maintenance of commercial traffic. 47 317025 SHORT-RANGE PLANNING FOR URBAN GOODS MOVEMENT. This article presents an overview of urban goods movement (UGM) problems and opportunities and focuses on short-range, low-cost opportunities for improving the UGM system. A strategy for identifying short-range opportunities and their implementation is discussed. The facts and findings are applicable primarily, although not limited to, small-and medium-sized urban areas of less than 750,000 population.

47 319701 STUDIES IN A SELECTED CITY ON THE REALISATION OF AN INNER CITY FREIGHT TRANSPORT SYSTEM WHICH UTILIZES RAPID TRANSIT RAILWAYS [Untersuchungen in einer ausgewählten gross-stadt zur realisierung eines innerstädtischen güterversorgungssystems unter einbeziehung von stadtschnellbahnen]. An attempt was made, by means of a model, to show the possibilities of using an existing rapid railway in inner city freight transport. The example is the city area of Hamburg where two underground railway lines are being used to deliver about 529 tons of goods daily. It is necessary to fit this into dense passenger transport without disturbing operations. The existing underground railway stations cannot be used because they are used to capacity by passenger transport; this means that new structures are necessary. Control of operations is by electronic data processing. Special

containers are used for the freight transport, and either subterranean transport or surface electric vehicles are used to transport the goods from the stations to the city shops. The total costs of this type of alternative delivery system are only a little higher than the costs of conventional lorry transport. This however implies complete transition from lorries to the rapid railway system. The particularly favourable conditions in Hamburg cannot be generally applied to the solution of similar problems in other towns. [German]

47 322573 URBAN ACTIVITY ALLOCATION UNDER CRITERIA OF TRANSPORTATION ENERGY EFFICIENCY. A linear programming optimization technique is applied to the problem of allocating new land using activities in an existing urban area. While it is recognized that energy is not yet as decisive a factor in the determination of household and firm locational patterns as other factors such as accessibility and time costs, the model attempts to resolve land allocation problems by means of minimizing total transportation energy costs alone. Such an analysis may serve as a benchmark against which other policies and their energy repercussions could and should be measured.

47 326373 MANHATTAN GARMENT CENTER URBAN GOODS MOVEMENT STUDY. PHASE I [Final rept]. The City of New York, with the U.S. Department of Transportation and the U.S. Environmental Protection Agency, has embarked on the Manhattan Garment Center Urban Goods Movement Study in order to better understand the goods movement process, to develop techniques to alleviate the difficulties of urban goods movement, and to implement these techniques. This Garment Center study represents the first major effort to investigate the goods movement problems existing in a major, highly urbanized environment. The project is a comprehensive study of urban goods movement and is organized to meet several objectives: (1) to be accessible and responsive to the community; (2) to develop, design, evaluate, and implement short-term, low capital improvements for the goods movement system; and (3) to identify long-term solutions to goods movement difficulties. This report presents a summary of Phase I of the Manhattan Garment Center Urban Goods Movement Study. Phase I consists of the development of a data base, analysis of the goods movement problem, and the implementation of short-range proposals to improve the movement of goods and people. It addresses such issues as the economic structure of the garment industry; pattern of land use; volume and patterns of traffic and curbside parking; air and noise pollution levels associated with the garment industry; and the implementation of a program of short-range low capital improvements. This Phase I report

states that the analyses, policy recommendations, and experiences of this project are appropriate for a study of urban goods movement in any area, particularly small metropolitan areas.

47 326374 MANHATTAN GARMENT CENTER URBAN GOODS MOVEMENT STUDY. PHASE I. APPENDIX VOLUME I. The Appendix Volume I, provides a detailed description of the activities and analyses conducted during Phase I of the Manhattan Garment Center Urban Goods Movement Study. Volume I provides an overview of the Garment Center including goods movement and the apparel industry; basic traits and industry trends of the apparel industry; outward movement of contractors; future trends; and an appendix discussing the Standard Industrial Classification System. The report also discusses the apparel industry questionnaire including method of data collection; summary of observations; general characteristics; location of contractor's facilities; characteristics of freight; and exhibits charting the apparel industry questionnaires. The third part of this volume discusses land use and economic data, including building analysis; zoning; assessed value; employment; rents and vacancy rates; and sample block segments.

47 326375 MANHATTAN GARMENT CENTER URBAN GOODS MOVEMENT STUDY. PHASE I. APPENDIX VOLUME II. This

report is Appendix Volume II of the Phase I Final Report of the Manhattan Garment Center Urban Goods Movement Study. In this report, the observations made about the difficulties of goods movement in the Garment Center are manifested in the traffic volumes and the characteristics observed, namely, the high traffic volumes (185,000 vehicles traverse the district daily). This report deals with the characteristics of vehicular traffic in the area, including apparel-related and non-apparel related traffic, pedestrian and hand-cart movements, and their relationship on vehicular activity and congestion. Two graphic models are also presented in this report. The micro model shows the volumes, modes, and times spent per segment of the apparel making process by the typical firm; and the macro model indicates the type and volume of commodities entering, leaving, and circulating within the Center. Costs of the Goods Movement System are also presented, including direct/indirect transportation costs, service costs, and potential cost reductions.

47 326376 MANHATTAN GARMENT CENTER URBAN GOODS MOVEMENT STUDY. PHASE I. APPENDIX VOLUME III. The report is Appendix Volume III of the Phase I Final Report of the Manhattan Garment Center Urban Goods Movement Study. The environmental effort of this study includes an analysis of the public costs of goods movement in terms of air and noise pollution and accidents. The public costs of goods movement also include an analysis of carbon monoxide emissions; estimation of the health costs of air pollution; ambient noise conditions; and the relationship of vehicular activity and congestion to accident costs in the New York City Garment Center. This report also presents some of the tools developed during the course of this study for the collection of data. The

report contains a bibliography that includes previous Garment Center studies as well as a list of readings.

47 326377 MANHATTAN GARMENT CENTER URBAN GOODS MOVEMENT STUDY. PHASE II [Final rept]. This Final Report is the culmination of a pioneering effort in the field of urban goods movement (UGM). It is an intensive study of the character and the transportation aspects of New York City's premier manufacturing industry. The study was undertaken to examine and recommend goods movement improvements in the Manhattan Garment Center. The purpose was to relieve traffic congestion and its harmful effects, and thereby strengthen the garment industry's economic ability to function. Many of the proposals examined in the course of this pioneering effort in the field of UGM are potentially applicable to other apparel manufacturing areas as possible solutions to goods movement problems in general. Phase I of this study developed an understanding of the Garment Center's goods movement problems, as well as the implementation of several low capital improvements. Phase II, this report, expanded the knowledge and experience gained to Phase I and developed and recommended a series of significant improvements, both short and long-range.

48 041668 THE OIL CRISIS: THIS TIME THE WOLF IS HERE. It was a popular belief in the 1960s that the supply of oil was abundant. As late as 1970, it was believed that the U.S. could remain essentially self-sufficient in oil. Recognizing the dangers of dependence on oil from the Eastern Hemisphere, a Presidential Task Force recommended that imports from the Eastern Hemisphere be limited to 10% of total U.S. oil consumption, a level expected to be reached in the mid-1980s. These projections were spectacularly wrong. Imports from the Eastern Hemisphere amounted to 15% of consumption in 1972, and are expected to rise to 20% in 1973. The source of these errors were: (1) overestimates of domestic capacity, and (2) the decline of natural gas supplies and its impact on oil demand. Most of the world's proven oil reserves are in Arab hands. We must recognize that previous political threats on restriction of oil have been directed against the U.S. alone, not against our allies. By 1980, we will be even more dependent on oil from the Middle East. The present price agreements are defined only through 1975. Production is leveling off in the Middle East. The only alternative to shortfall before 1980 will be Saudi Arabia, and its projected production seems improbably high. The U.S. has discussed a two-pronged approach to consumer cooperation: (1) development of new forms of energy, and (2) an international authority to avoid cutthroat competition in times of shortage. In the long run, the only satisfactory position for the U.S. must be alternative sources of energy. Effective mass-transit systems could do much to limit our present profligate use of energy in the form of oil.

48 043884 LECTURES IN TRANSPORTATION NOISE. This textbook comprehensively reviews the theory and practice in assessment of transportation noise problems at a level geared to the needs of practicing acousticians and transportation engineers. Starting from a traditional source-path-receiver analysis of sound, the author develops these concepts in relation to today's major transportation noise sources-aircraft, sonic boom, automobiles, trucks, and rail vehicles. This book is designed to be a self-study introduction to a field of growing importance, a textbook at the level of college seniors or graduate students, or a source book of data and engineering formulae for the practicing professional. Along with outdoor sound and sonic boom, propagation, interior noise in aircraft cabins, automobiles, trucks, and rail transit vehicles, and transmission into rooms and buildings are treated.

48 046380 ENERGY-INTENSIVENESS OF TRANSPORTATION. Historical, present, and possible future patterns of energy consumption in the transportation sector are examined for intercity freight and passenger traffic and for urban passenger traffic. The energy-efficiencies among

the various transport modes are quite variable. Airplanes are relatively inefficient; cars and trucks are slightly more efficient; and railroads, waterways, pipelines, mass transit, and buses are quite efficient. The energy implications of changes in modal mix for freight and passenger transport are explored using two hypothetical futures.

48 046702 ENVIRONMENT AND RAPID TRANSIT CONSTRUCTION. Rapid transit systems must be constructed in a hostile environment. The space required for construction is already crowded. Hinderance of traffic must be avoided or minimized. Existing utility systems and adjacent structures must be maintained and remain useful during construction and must be restored to as good as, or better than, original condition upon completion. Care must be exercised to minimize imitation or harm to the public. All these factors cost extra expense and time, but the effect may be lessened by preparatory work, by vigorous public relations, by working closely with governing officials, and by timely acquisition of real estate.

Kline, GO *ASCE Journal of Transportation Engineering* Proceeding Vol. 99 No. TE2, 9751, May 1973, pp 367-70; ACKNOWLEDGMENT: ASCE; ORDER FROM: ESL, Repr PC, Microfilm

48 046831 TRANSPORTATION AND ENVIRONMENTAL PROTECTION. A change is coming in American transportation. Some optimists say that by the end of this century, 16-year-olds becoming eligible to drive may not even want to because mass transit will offer far greater convenience. And those vast parking lots that pave over many of our cities will have been replaced by green urban gardens. During the last several years the American people have embraced a new environmental ethic inspiring serious, hard, unprecedented planning and also to a greater willingness to accept innovation. Much of this new effort at grappling with the pervasive with the pervasive transportation problem results from federal legislation requiring controls on air pollution.

48 046887 RELATIONSHIP OF TRANSPORTATION AND LAND USE TO AIR QUALITY: A SYSTEMS APPROACH. A systems framework for investigating the relationship of urban transportation and land use to air quality is set forth in this paper. The nature and interrelationships of the major components of the flow of airborne residuals are outlined, and the residuals management process is examined in terms of its components and their attributes. Part II consists of the analysis of the problem of mobile source emissions in the context of the general framework suggested in Part I. Possibilities for modeling the emissions-transportation system-land use interface are briefly explored and some alternative solutions are suggested.

48 047535 NOISE IN TRANSIT SYSTEMS. The Hamburg (80 decibels) and Toronto (85 decibels) transit systems, both of which are "steel-on-steel," prove that proper design and maintenance can provide a pleasantly quiet system and, in fact, can be quieter than a rubber-tired system. The average levels in New York trains, by contrast, are between 95 and 100 decibels. Some of the techniques used successfully to reduce noise levels are sound-absorbing materials on ceilings and walls in stations; sound-absorbing concrete blocks between rails in stations; lubricated rails on curves; rubber suspensions on cars; damped and isolated car-body design; continuous welded rail; special wheels, either damped or resilient; and air springs.

48 050058 ENERGY REQUIREMENTS FOR PASSENGER GROUND TRANSPORTATION SYSTEMS. A study is made of the amount of energy expended by an individual traveling by different ground transportation modes. Three typical trips are examined, namely: the Intraurban Commute, the Suburban/Urban Commute, and the Intercity Trip. The study begins with a look into the current and potential transportation energy resource situation, followed by a presentation of the transportation/energy efficiencies of a wide variety of ground transportation systems. Finally, a breakdown of the energy consumed by an individual making the three typical trips is presented. A variety of multimodal trips are compared with single modal trips from the basis of energy consumed. It is concluded that information of this type should be made available to the general public to illustrate an individual's impact upon our limited petroleum based energy resources.

48 051399 INTEGRATION OF ENVIRONMENTAL ISSUES IN THE URBAN TRANSPORTATION PLANNING PROCESS. During the past decade, environmental degradation has been increasing in our urban areas at a fast pace. A major cause of this degradation is attributed to our transportation systems and to the lack of perception and consideration of the environmental issues in the transportation planning process. These issues and problems are analyzed and suggestions are made as to how solutions can be integrated in the different phases of the planning process. These suggestions are in the form of institutional and methodological changes dealing with the planning process.

48 052073 TRANSIT PLANTING: A MANUAL. Public transportation environments in urban areas could look more attractive and function more efficiently by careful attention to ecological and horticultural factors. Various landscapes are introduced in which highly reliable, all-season plants would be a prime contributor to the design. The manual can strengthen citizen support and stimulate local action aimed at "greening up" urban environments. Judgments on the suitability of specific plants in specific environments are based on ecological adaptability, taking into account such factors as climate, the plant's ability to resist pollution, and the amount of care required to maintain the specific plant. Besides an analysis of national zones and alphabetical lists of plants according to scientific and common names, specific applications are discussed in relation to bus stops, suburban terminals, and downtown stations.

48 053988 ENERGY INTENSIVENESS OF PASSENGER AND FREIGHT TRANSPORT MODES: 1950-1970. Previous work at ORNL evaluated the energy consequences of changes in freight and passenger traffic levels and shifts in modal mix for the period 1950 to 1970. The research reported here extends this work to include an analysis of changes in energy intensiveness for individual modes during this period. Examination of individual modes shows that airplanes are energy-intensive and that cars and trucks are less so. Buses, mass transit, railroads, pipelines, and boats are relatively energy-efficient. Railroad energy intensiveness dropped sharply during this 20-year period because of the shift from steam engines to diesel engines. On the other hand, airplane energy intensiveness increased rapidly because of increased speed. Other modes generally showed slight increases in energy intensiveness. Energy intensiveness of inter-city freight declined during this period because of the large drop in railroad energy intensiveness. However, passenger transport became more energy intensive because of shifts to airplanes and autos and because of a general increase in energy intensiveness for all passenger modes. Results derived here are summarized in a number of ways to highlight important shifts in energy use patterns for transportation.

48 054348 MEASUREMENT OF SOUND PROPAGATION IN BODIES AND THE AIR ON UNDERGROUND RAILWAY LINES [KORPERSCHALL UND LUFTSCHALLMESSUNGEN AN UNTERIRDISCHEN SCHIENENBAHNEN]. The results obtained from these tests to measure sound propagation in bodies, carried out with various types of track construction, show that sound propagation in bodies is reduced in neighbouring buildings as well as by special track constructions, and building methods used for tunnel construction. Details are given about the various factors affecting the extent of propagation, in the air, of sounds coming from vehicles passing through tunnels. To reduce traffic noise in stations, it is recommended that they be equipped with special noise absorbing material. [German]

48 054758 TOWARD MORE TRANSPORTATION WITH LESS ENERGY. Proposals for shifting intercity and urban traffic to modified systems with better energy efficiency are developed. With these, per capita transportation could be maintained or increased and door-to-door travel convenience could be maintained or improved within the hypothesized constraint. A table shows how the author would provide under what he calls a "semi-austerity" transport energy budget nearly twice the total of passenger-and ton-miles of transport by 1995 with no increase in petroleum consumption. The plan calls for considerable increase in the traffic carried by intercity passenger buses and trains, urban buses, and railway piggy-backing of road trailers. Two new developments are projected--a sizable fleet of urban passenger automobiles and a fleet of intercity passenger-carrier auto-trains to give these urban automobiles intercity capability.

48 056809 NOISE IN GROUND TRANSPORTATION SYSTEMS. Passage of the Noise Control Act of 1972 has given added impetus to the drive for noise reduction. Section 17 of the Act empowers the Environmental Protection Agency to issue railroad noise standards which will be enforced by the Federal Railroad Administration (FRA). FRA's High Speed Ground Transportation R&D program has a goal of substantially increasing the speed of ground passenger travel. Without improvements in the state-of-the-art of noise suppression and noise avoidance higher speeds will inevitably mean higher noise levels. Therefore, the new systems developments are forced to include good acoustic designs by specifications of maximum permissible noise levels. Data on the wayside noise levels of various rail, transit and tracked air cushion vehicle systems are tabulated, and for comparison the noise specification used for developing the DOT ground vehicles is shown. Noise sources for guided ground transportation are discussed with respect to steel wheels, railroad yards, tunnels, elevated guideways, aerodynamics, propulsion, tracked air-cushion vehicles, tracked magnetically levitated vehicles, and tube vehicles. It is indicated where research and development can contribute to noise abatement.

48 056953 DEVELOPMENT OF AN ACOUSTIC RATING SCALE FOR ASSESSING ANNOYANCE CAUSED BY WHEEL/RAIL NOISE IN URBAN MASS TRANSIT. A number of recent studies of the impact of train noise on the community are reviewed. From this information and the results of other noise-annoyance studies, a scale for rating the annoyance of urban transit system operators and patrons, as well as the surrounding community, caused by wheel/rail noise is recommended. In general, the peak A-weighted sound-pressure level for the

given exposure should be used, with an additional 5 dB if there are pure tones present (squeal). If in comparing the different kinds of train noise (squeal, impact, wheel roar, etc.) the total exposure is to be assessed, an additional term, 10 log T, should be added to the mean peak noise (where T is the total exposure in seconds during any 24-hour period).

48 057649 TASSIM: A TRANSPORTATION AND AIR SHED SIMULATION MODEL, VOLUME 1. CASE STUDY OF THE BOSTON REGION. The TASSIM model integrates an urban transportation planning model, vehicle emission factors, and simple air diffusion models in a simulation framework that can be used to analyze the air quality effects of transportation policies. The model is spatially disaggregated, and it is compatible with data sources available in many metropolitan areas. This volume briefly describes the structure of the model and then analyzes several model applications that simulate for Boston the air quality effects of transportation control land use, and stationary source policies. The transportation control policies are evaluated in a cost effectiveness framework. The final sections consider possible extensions of the model and outline the model's computational aspects.

48 057877 BART: A POSITIVE ENVIRONMENTAL IMPACT. Bay Area Rapid Transit is having a significant effect on the environment in four areas--energy consumption, air pollution, noise production and in its impact on the develop-

ment of the land. BART offers substantial advantages or savings over the automobile in all but one of these--noise production, and even here, though a well-muffled automobile will produce slightly less noise than a BART train, the train is less noisy than freeway traffic. In terms of overall energy consumed, the savings over the automobile transportation will be large.

48 071840 NOISE IN RAIL TRANSIT CARS: INCREMENTAL COSTS OF QUIETER CARS. U.S. rail rapid transit systems, car operations, and the car building industry are described in relation to the procurement of quieter cars. The noise environment of passengers in rapid transit cars is discussed and the major noise sources and paths of noise transmission into cars are delineated. For essentially all combinations of car noise-control modifications deemed technically and economically feasible for implementation in new vehicles, estimates are presented of the associated noise reductions, initial costs, and operating costs. It is concluded that significant reductions in in-car noise under typical operating conditions can be achieved at incremental costs that are small percentages of the total car costs.

48 072184 THE ENERGY CONSUMPTION OF MEANS OF TRANSPORT. A COMPARATIVE SURVEY. This report offers information on the energy consumed by various means of transport currently used for transporting people and goods. It briefly considers the energy consumption of some new and future transport systems. As regards passenger transport, a distinction is made between urban and inter-city transport. Where passenger transport in urban areas is concerned, a comparison is made between walking, using a bicycle, moped, car or bus and travel by rail. Where goods transport is concerned, no distinction is made between urban and inter-city transport. The comparison here refers to carriage by waterway, pipeline, rail, road, and air. With regard to road transport, consideration will be given to the effect of weight, speed and load factor. Little information is as yet available on the energy consumption of new means of transport. As regards new means of urban transport, the forecasts of energy consumption are relatively optimistic, especially if they are compared with the energy consumption of current urban systems. A comparative table shows the various characteristics of current and future energy sources. The calorific value of the various fuels and the specific density and total efficiency as a function of the type of motor are given.

48 080416 AMERICAN TRANSIT ASSOCIATION RAIL TRANSIT CONFERENCE. WAYS AND STRUCTURES DIVISION SESSION. NOISE AND VIBRATION CONTROL PROGRAM. Noise and vibration control has been a primary consideration in the design of the Metro system. Consultants were engaged to provide basic acoustical designs and guidelines to assure patrons of quiet and comfortable environment on and off cars. Minimal impact of system construction on the community is planned. Operation through continuous maintenance program and good acoustical design is planned. WMA-TA's noise and vibration control objectives are to minimize transmission of noise and vibration to adjacent buildings and structures, and to maintain noise levels in transit vehicles and stations within acceptable limits. Notable acoustical improvements have been made since the building of early transit systems and these are listed.

48 080418 STUDIES IN URBAN TRANSPORTATION. TRANSPORTATION SYSTEMS: NOISE GENERATION AND ABATEMENT. This report deals with the amount and intensity

of transportation systems noise generation, along with efforts used to lessen the impact of noise. An introductory discussion of the physics of noise and noise measurement is given to help the reader in understanding how noise impact is analyzed. Transportation planners and designers must be aware of noise assault any proposed system will have on environment. The mandate for this stems from the National Environmental Policy Act of 1969 and the Federal-Aid Highway Act of 1970; the first requires assessment of all Federally funded projects to determine any adverse impacts on environment and the second, aimed at highways that are Federally funded, requires noise abatement of any proposed road that hasn't received approval before July 1, 1972. (Modified author abstract)

48 081394 THE FUEL CONSUMPTION OF AUTOMOBILES. The necessity for fuel consumption is clear. Automobiles, as users of nearly 60% of transportation energy (1/4 of total energy consumption), is a prime target for consumption measures. The author here suggests ways by which auto efficiency can be increased at least 40% by 1980. Use of mass transit would reduce the fuel used on short trips (those less than 10 miles), which account for nearly 1/3 of vehicle miles traveled. Use of freeways and computerized signal control reduces traffic delay, a cause of poor mileage. Apart from enforcement of the 55-mph limit and the essentially voluntary measures listed above, more efficient autos are the best source for fuel savings. The author cites statistics regarding fuel consumption of the various weight classes of cars. Weight is a factor both at low and high speeds: in the former tire pressure and suspension systems contribute to rolling resistance, which absorbs approximately 24.7% of engine power; at higher speeds, approximately 25% of engine output is absorbed by aerodynamic drag. Exterior design of autos can reduce the impact of these factors. The author also considers more efficient accessories and warm-up. In the area of engine efficiency, the author discusses diesel, stratified-charge and hydrogen admixture engines, with attention given to emission standards. The use of catalytic converters and subsequent lowered compression ratios due to the use of unleaded fuels is considered, as is the possibility of electric cars. The DOT-EPA report "Potential for Motor Vehicle Fuel Economy Improvement" is cited, and graphs and charts accompany the article.

48 082954 TASSIM: AN APPLICATION TO LOS ANGELES. The TASSIM model integrates an urban transportation planning model, vehicle emission factors, and simple air diffusion models in a simulation framework that can be used to analyze the air quality effects of transportation policies. This report briefly reviews the structure of the model and then describes how it was applied to the Los Angeles region. The application required the tailoring of certain components of TASSIM to the peculiarities of the Los Angeles area and the calibration of the model to the regional data. The performance of the model in Los Angeles was then compared with previous experience with Boston for the simulation of the air quality effects of policies that alter the

emission rates of automobiles, the character of the transportation system, and the pattern of land use.

48 082996 SUBURBAN SPRAWL AND THE ENERGY SITUATION. The energy situation may produce extremely significant, long-reaching effects upon the country's population movement history. An examination of population movements in the United States indicates three major trends. The first of these is the migration from the central portions of the country to the coasts. The second is the increasing move toward metropolitan areas away from rural areas, which has skyrocketed since 1920. The final trend is the migration from the center city to the suburbs, which has been in increasing evidence since 1940. Since travel and home heating costs are basically the same in all sections of the country, the effect of the energy-situation on the first of the migration trends mentioned is likely to be inconsequential. The trend toward choosing urban living over rural should not be affected in any greater degree either, since the higher cost of commuting puts pressure transportation. Statistics show that the impact upon the trend of moving from center city to suburbs will also be moderate. A possible trend toward increasing employment opportunities in the suburbs may occur. This would provide jobs located near residences, which would be as effective in cutting work trip costs as a return to the center city to be near employment.

Brown, GH *Conference Board Record* Vol. 11 No. 11, Nov. 1974, pp 35-38

48 082999 THE BIG OIL SQUEEZE AND MASS TRANSIT. The need is indicated for a unified energy policy, and one of the first sectors targeted for change by policymakers is transportation. The price of oil is seen as an incentive for mass transport must, however, be considered carefully and always on a "benefit-cost" basis. Not only is an increase in efficiency of the automobile called for, but also a reduction in its reliance by improving transportation alternatives. The latter could be realized by building or upgrading subways, reviving tracked trolley systems, making bus routes speedier and more flexible, and curbing unneeded expressway construction. Selling the services to the public would call for price incentives, and advertising. To upgrade the quality of the transit systems, a reevaluation of the cost accounting for automobile transportation would be necessary. The federal government, it is expected, will push rigorously with efforts to increase the use of carpools and mass transit. A conservation program which relies on the voluntary reduction of unnecessary driving and turning the automobile into a mass transit vehicle is put forward, and the opinion is expressed that for the bulk of U.S. cities, the mass transit solution lies in better bus systems and better traffic management than in massive hardware building programs.

Wiese, NA *Mass Transit* Vol. 2 Feb. 1975, pp 7-9, 2 Phot.

48 083290 ACOUSTICAL STUDY OF A RAPID TRANSIT SYSTEM. Noises generated by trains of the Chicago Transit Authority (CTA) were recorded and analyzed. The over-all sound pressure levels of the noises within the moving cars of the CTA trains vary from 60 to 115 dB. The characteristics of these noises depend on a number of factors, including: type of car, type of tracked construction, time of operation, window conditions, shape of track, and train speed. The data was used to evaluate the hazard of noise exposure among crew members and passengers and the extent of speech interference between passengers. The results indicated that some crew members and passengers may develop small amounts of temporary threshold shift in hearing sensitivity and that the probability of incurring permanent hearing loss from exposure to this source is very low. Speech interference among passengers was extensive in most cases.

48 083709 ENERGY UPDATE: ECOLOGY TAKES BACK SEAT. In this review of the ninth World Energy Conference (WEC), several interesting developments which took place at the WEC are discussed. One such development was the decidedly back seat which was taken by the auto industry, although sessions were devoted specifically to auto problems. When automobiles were discussed at the WEC, it was largely in the context of an assumed switch to more public transit. Another development concerned President Gerald R. Ford's statement on energy policy where he called for a combination of independence and interdependence, terms which were left open to interpretation by the Organization of Petroleum Exporting Countries (OPEC). This statement, coupled with an earlier speech and that of Secretary of State Henry A. Kissinger to the United Nations (in which they linked U.S. food policy to OPEC oil policy), were interpreted by the Arab nations as threats of concerted action against OPEC rather than real attempts as international cooperation. Another development was the arrangement of priorities, whereby environmental considerations took second place to energy matters. This was apparent by the call for less environmental constraints. Secretary of Interior Rogers Morton indicated that the U.S. government was softening its stand on strip mining and moving to increase leasing rights to oil on federal lands and for off-shore drilling. An auto industry delegate, John J. Ricca, indicated that attention at the WEC was directed to the technical aspects of the best ways to utilize energy and take advantage of coal and nuclear power resources.

48 083813 PROGRAMMING ENVIRONMENTAL IMPROVEMENTS IN URBAN TRANSPORTATION PLANNING (1930-1973) A SELECTED RESEARCH BIBLIOGRAPHY. This bibliography contains 175 selected references published chiefly during the period 1930-1973. Part one contains the listing of books and monographs, and part two is a listing of articles and periodicals. The references cover such topics as urban land use, traffic engineering, planning for pedestrians, socioeconomics and

urban transportation, decision making, and various other factors involved when taking environmental considerations into account in urban transportation planning.

48 084116 ENVIRONMENTAL IMPACT OF SUBWAY RAPID TRANSIT SYSTEMS. This paper presents a discussion of the general levels of noise and vibration impact to be expected from new underground rail transit system facilities with examples of the typical levels newer facilities are producing. Also presented is some specific information on the spectrum and level of ground-borne vibration and noise produced by underground transit trains and a proposed procedure for reducing the ground-borne noise from new subway systems.

Box 1758, Poughkeepsie, New York, 12601 Repr. PC

48 084117 PREDICTION OF WAYSIDE NOISE FROM RAIL TRANSIT VEHICLES. This paper focuses on the prediction of wayside noise from rail vehicles. The prediction procedure, taken from work sponsored by the Urban Mass Transportation Administration, consists of: (1) prediction of the maximum A-weighted pass-by noise level at a distance of 50 ft (15 m) from the center line of a continuously welded at-grade track; (2) application of correction factors that take into account wheel and rail condition, radiation from elevated structures, and track design; and (3) application of correction factors that take into account the distance from the track to the observer, the train length, and the intervening terrain.

48 084135 ASSESSMENT OF COMMUNITY NOISE IMPACT WITH THE INTRODUCTION OF A SUBSIDIZED BUS TRANSIT SYSTEM. A subsidized bus transit system was the main feature of a federally funded demonstration project carried out at the University of Massachusetts in Amherst. A fleet of 13 buses were used for no-fare service on headways of from 5 to 10 minutes on intracampus circulation routes serving dormitories, commuter parking lots, and housing adjacent to the campus. On the basis of measurements taken and analyses made, it appears that truck noise dominates and tends to mask the effects of large increases in either automobile or bus traffic. It also may be seen that increased bus service, even at a 30:1 utilization

rate, tends to increase the L10 noise level. This in turn suggests that while buses may have a negative air pollution environmental impact on a gram per passenger mile basis, they may well have a noise pollution impact in terms of L10 levels. /HRIS/

48 084299 FHWA AND UMTA CONTRIBUTE TO THE NATIONAL ENERGY CONSERVATION ACTION PLAN. The Federal Highway and Urban Mass Transportation Administrations are emphasising low cost improvements in urban transportation. This means full use of existing facilities and reduced urban congestion. These projects are the basis for the FHWA-UMTA action plan for energy conservation. The plan has three parts; encouragement by local authorities by immediate development of carpool transit and taxi services. The second part is aimed to continue annual preparation of short range multiyear transportation programs containing DOT funded projects. The third part involves development of ways to provide funding and other incentives. Optimizing the use of existing urban transportation can be done by applying traffic management techniques to person trips on the transportation system, encouraging the use of buses on freeways, providing downtown parking strategies and making street improvements. FHWA and UMTA funds are available. Programs have shown progress, some examples are the exclusive bus lane on Shirley Highway in Virginia and contra-flow lanes on 495 to the Lincoln Tunnel in New Jersey.

Highway and Urban Mass Transport Sept. 1974, pp 2-4, 2 Phot.

48 090101 A COMPARATIVE ANALYSIS OF THE ENERGY CONSUMPTION FOR SEVERAL URBAN PASSENGER GROUND TRANSPORTATION SYSTEMS. The energy consumption rates, or efficiency, of the urban passenger ground transportation modes are compared. In addition, the efficiency of new transit systems being developed including large and small-vehicle PRT's and Dual Mode, are estimated. Various measures of actual and potential efficiency are used. On an average load basis, mass transit (transit bus and rapid rail) is from 2 to 3 times more efficient than the predominant personal modes (light truck and passenger car) and on a crush load basis, 4 times more efficient.

Lieb, JG ; Mitre Corporation, Urban Mass Transportation Administration Final Rpt. MTR-6606, Feb. 1974, 95 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-238041/8ST, DOTL NTIS

48 090103 NOISE ASSESSMENT AND ABATEMENT IN RAPID TRANSIT SYSTEMS. REPORT ON THE MBTA PILOT STUDY. A methodology is described for assessing the noise climate and for selecting the combination of abatement techniques which reduces the existing noise to user specified levels for minimum cost. This methodology, developed in a pilot study of the Massachusetts Bay Transportation Authority (MBTA) rapid transit lines, takes into account the large number of interrelated

acoustic and economic considerations present in rail transit systems. Noise sources include several types of wheel-rail noise, propulsion, power pick-up, auxiliary equipment and braking noise. Noise propagation paths include airborne and structure-borne components establishing both direct and reverberant sound fields in tunnels, stations, transit cars, and communities. In the pilot application to the MBTA, minimum-cost noise control options were determined for noise level goals in the range 75 to 90 dBA.

48 090164 A PROCEDURE FOR ESTIMATING AUTOMOBILE FUEL CONSUMPTION ON CONGESTED URBAN ROADS. An estimated procedure is proposed that is designed to be particularly sensitive to automobile fuel consumption in congested, peak hour traffic. This procedure is based upon vehicle attributes and roadway operating conditions. Vehicles are classified by weight and model year. The proposed roadway classifications are expressway, arterial, and local street. For each vehicle type category, base fuel consumption rates are determined. These base consumption rates are then modified by adjustment factors which reflect the roadway operating conditions. The rates are multiplied by the vehicle miles of each vehicle category and summed over all categories to compute the total fuel consumption on the road under analysis. An example application of the procedure including sensitivity analyses is presented.

48 090173 ENERGY STATISTICS. A SUPPLEMENT TO THE SUMMARY OF NATIONAL TRANSPORTATION STATISTICS. This annual report is a compendium of selected time-series data describing the transportation, production, processing, and consumption of energy. The report is divided into three main sections. The first, entitled Energy Transport, contains such items as the revenues and expenses of oil pipeline companies, number and capacities of U.S. tank ships, and the total crude oil transported in the U.S. by method of transportation. The second section, entitled Reserves, Production, and Refining, reveals the growth over time of the U.S. oil and natural gas reserves, refinery capacity, and yields. Trends in the demand for fuel and power are displayed in the third section, entitled Energy Consumption. Throughout this part, the transportation sector is emphasized. Included are the gasoline and oil costs of automobiles of different sizes, the consumption of petroleum by type of product, the electrical energy consumed by the local transit industry, and other important statistics describing the supply and demand for energy.

48 090855 TRANSPORTATION ENERGY CONSERVATION: A PROGRAM PLAN OF POLICY-ORIENTED RESEARCH. The Office of Transportation Research (OTR) of the Federal Energy Administration (FEA) is responsible for developing, coordinating, and managing a research program to explore transportation energy use and alternative government policies related to transportation energy conservation. This report reviews transportation's role in energy conservation, describes the role of OTR, and presents OTR's proposed research program, totalling 31 projects in six research areas for three fiscal years. Project descriptions include estimated cost, suggested scheduling, priority designation, interrelationships with other projects and programs, and detailed task descriptions.

48 090857 ENVIRONMENTAL REGULATIONS AND URBAN TRAFFIC. The study considers four broad categories of emission control programs: Federal Emission Standards; local emission control for vehicles; traffic flow improvements; and mass transit incentives. Local automotive pollution control options are analyzed and compared in terms of their cost and their emission reductions in a sample urban area. The Chicago metropolitan area is the sample region selected for the study.

48 091164 IMPACT OF FUTURE USE OF ELECTRIC CARS IN THE LOS ANGELES REGION. VOLUME I. EXECUTIVE SUMMARY AND TECHNICAL REPORT. Impacts of the use of electric cars in the Los Angeles region in 1980-2000 were projected for four-passenger subcompact electric cars using lead-acid and advanced batteries, with urban driving ranges of about 55 to 140 miles, respectively. Data from Los Angeles travel surveys shows that such cars could replace 17-74 percent of future Los Angeles autos with little sacrifice of urban driving. Adequate raw materials and night-time recharging power should be available for such use in the Los Angeles Region. The electric subcompacts would appear to be 20-60% more expensive overall than conventional subcompacts until battery development significantly reduces battery depreciation costs. This volume makes an overall review.

48 091310 BART IMPACT PROGRAM: ENVIRONMENT PROJECT PRELIMINARY FINDINGS-BARRIERS. The construction of the BART system inevitably resulted in changes to patterns of vehicular and pedestrian movement. This preliminary analysis assesses the effect of BART facilities on the ease and hindrance of vehicular and pedestrian movement in areas adjacent to BART lines and stations. The assessment describes and quantifies the relationship between BART and other transportation facilities (freeways, railroads and arterials) acting as barriers. It also includes a description of the extent and locations where BART has created new barriers to pedestrian and vehicular movement patterns, and goes on to describe how BART has tried to mitigate barrier impact.

48 091620 ENERGY USE OF PUBLIC TRANSIT SYSTEMS. The amount of energy used by a variety of transit modes operating under different conditions is determined. Projections of energy availability in California through 1985 and 1990 are reviewed and the implications for transportation are discussed. A short summary of the ways in which vehicles use energy, and an analysis of the resulting implications for energy-limiting or conserving strategies are given. Energy consumption data for a wide variety of vehicles operating in a number of modes are compared in a way that allows the reader (planner) to know relative energy requirements of different systems.

48 092327 VISUAL IMPACT OF PERSONAL RAPID TRANSIT. PRT systems offer on-demand, non-stop service from origin to destination over extensive networks of guideways. To date, these guideways have been portrayed as elevated above grade, minimizing network costs and interference with other circulation systems, but maximizing the visual impact on neighborhoods they pass through. This study does not attempt to present a design solution to these problems, but rather it lays a foundation for developing PRT visual impact design criteria on which future design decisions can be predicted. The key lies in finding effective communications media through which the visual impact of PRT can be conveyed to the public at large. The study explores the effectiveness of three graphic communication techniques.

48 092332 JOINT STRATEGIES FOR URBAN TRANSPORTATION, AIR QUALITY AND ENERGY CONSERVATION. JOINT ACTION PROGRAMS. This report develops an integrated approach for resolving problems created by traffic congestion, air pollution, and petroleum shortages. In Part I, the basic relationships among the strategies and actions are summarized in a matrix display. Each item is ranked to access its impact on six subgoals, or phenomena, in the near or long term: improved auto alternative, improved vehicular flow; reduced auto use; reduced travel demand; reduced vehicular emissions; and reduced vehicular petroleum consumption. Two synergistic joint action programs are presented. Part II contains an information review of experience, impacts on goals (mobility, air quality, energy conservation), and an overall evaluation of 54 specific actions.

PC, Microfiche; PB-244473/5ST, DOTL NTIS

48 092337 NOISE PREDICTION MODELS FOR ELEVATED RAIL TRANSIT STRUCTURES. The report presents the theoretical development of a model for the prediction of noise radiated by elevated structures on rail transit lines. In particular it deals with noise and vibration control for urban rail transit track and elevated noise and vibration control for urban rail transit track and elevated structures. The model allows for the prediction of both the vibration transmission between elements of the structure and the resulting noise radiation from each major structural element, in terms of design parameters for the different elements. Thus the potential effectiveness of various alternative methods for noise control can be evaluated. Results of a field study of three different types of elevated structure on the MBTA Rapid Transit System are also summarized. These results support the validity of the prediction model. The engineering application of the prediction model is discussed in another report.

48 092419 STATE-OF-THE-ART OF ENVIRONMENTAL IMPACT STATEMENTS IN TRANSPORTATION. The National Environmental Policy Act of 1969 (NEPA) is a direct outgrowth of the significance Congress has attached to environmental impacts of government actions and policies. The Council on Environmental Quality (CEQ) has written guidelines for Federal agencies to follow when establishing policies concerning the environment. These guidelines also instruct agencies as to the content of impact statements, which may have a wide variation of content. In order to determine how well transportation impact statements conform to NEPA, forty statements were randomly selected, reviewed and summarized in this report. Sites chosen were both urban and rural, magnitudes ranged from statewide to local, modes included highway and mass transit, and report sizes were from a few pages to a few hundred.

48 092729 FUEL CONSERVATION MEASURES: THE TRANSPORTATION SECTOR. VOLUME II. The magnitude of total transportation fuel consumption in Texas is discussed and that portion of total transportation fuel used for intercity travel is identified. Intercity movement of people and goods is covered along with the fuel efficiency of the intercity travel modes. An estimate is provided of existing and future passenger-miles and ton-miles of intercity travel in Texas. From these data, estimates of fuel consumption are formulated. Indications of the magnitude of fuel savings that might result from modal shifts are also presented.

Holder, R ; Texas Governor's Energy Advisory Council, National Science Foundation, Texas Transportation Institute, (S/D-9) Final Rpt. 48 093945 ANALYSIS OF BART'S ENERGY CONSUMPTION FOR INTERIM SYSTEM OPERATIONS. The Bay Area Rapid Transit (BART) System is the first areawide rail rapid transit system to be built in the United States in 50 years. This system includes 71 miles of track, 34 stations, and such technological advancements as a regenerative braking system plus light, all aluminum cars designed for high acceleration and maximum speeds of 80 miles per hour. This study investigates the historical energy consumption of the BART System, estimates BART's energy consumption for ultimate design service levels (approximately twice the present level), and compares BART's energy consumption to that of other rail rapid transit systems and alternate modes.

48 094405 VENT AND STATION TEST (VST) FACILITY-SPECIAL AND COMPLEX VENT SHAFT TESTING. This report has been prepared under the Transit Development Corpo-

ration, Inc. (TDC) project, 'Ventilation and Environmental Control in Subway Rapid Transit System' and is one of many such reports leading to the final product a 'Subway Environmental Design Handbook.' The purpose of this particular report is to present and describe the testing of special and more complex vent shafts. A generalized theory is formulated as an extension of this and previous VST work. Comparison between theory and experiment, according to the authors, is good.

48 094412 COMPARISONS OF COMPUTER MODEL PREDICTIONS AND FIELD MEASUREMENTS OF SUBWAY ENVIRONMENT IN THE MONTREAL METRO. This technical report has been prepared under the Transit Development Corporation (TDC) project 'Ventilation and Environmental Control in Subway Rapid Transit Systems.' This report describes a series of field tests conducted in the Montreal METRO system for the purpose of validating the Subway Environment Simulation (SES) Computer Program developed pursuant to the TDC project. The report also presents direct comparisons of experiment and theory, demonstrating the applicability of the SES computer program to full scale, multiple-track, bi-directional rapid transit systems.

48 095282 TRANSIT SYSTEM ENERGY REQUIREMENTS. The importance of energy conservation has been recognized by the engineering profession for some time, although this has been apparent to the general public only in recent months. As an alternative to the private automobile, the more extensive use of public transit is recognized as a conservation measure. This paper

analyzes various transit systems as to energy required per Passenger-kilometer, based on average trip length, both on a theoretical basis and from operating statistics. An equivalent is developed for comparing energy from fuels and electrical power supplies.

48 095851 ENERGY CONSERVATION THROUGH URBAN TRANSPORTATION PLANNING. A large number of techniques for conserving energy in urban passenger transport are described. A systems approach for evaluating these simultaneously in order to formulate area-wide passenger transportation energy policy is presented. It consists of a simple computer technique for estimating the conservation value of various schemes. The program is also of value in assessing the energy impact of individual energy conserving programs. Because only local planners are familiar with the economic, environmental, and political constraints on policy and programs, the tool is intended for use in urban regions. It is, however, written in general terms and as such, if used in all urban areas in the U.S. Could offer realistic national estimates of urban passenger transportation energy requirements in the short term (0-10 yr). /Author/TRRL/

48 095853 THE EFFECTS OF ENERGY PRICE ESCALATIONS ON URBAN TRANSIT BALANCE. The forthcoming shortages in transit fuels and electricity resources were the basis for forecasts that bus fuel prices will quadruple by 1980, while transit electricity will have doubled in cost. One effect of these energy price escalations on urban transit planning is to shift downward the economic balance between buses-on busways and trains-on rails, from the current 12,000 passengers per hour to half of this value by the beginning of the 1980's. A program is proposed to achieve better balanced, all-electric bus/rail urban transit systems that minimize capital and energy consumption. /Author/TRRL/

48 096048 POTENTIAL FOR ENERGY CONSERVATION IN THE UNITED STATES: 1974-1978, TRANSPORTATION. This report is the result of a study conducted by six task groups under the Coordinating Subcommittee of the Committee on Energy Conservation which was established by the National Petroleum Council. Four of the task groups represent end-use sectors: Industrial, Residential/Commercial,

Transportation, and Electric Utility. The other two are a Patterns of Consumer/Energy Demand Task Group and a Consumer Task Group. The end-use sector task groups made analyses of potential energy conservation measures or procedures in the immediate short term period through 1978. The findings the Transportation Task Group are presented in chapter four of this report. In summation, this group determined that areas offering major conservation opportunities, in relative order of importance, are: (1) more small cars; (2) increased car-pooling; (3) modified exhaust emissions and gasoline regulations; (4) improved auto design; (5) reduced speed limits; and (6) improved vehicle maintenance. As far as air transportation is concerned, reduced flights to increase the load factor offers the best potential savings, followed by improvement of operating inefficiencies. Other observations made by the Transportation Task Group are that: (1) Total railway, waterway, mass transit, pipeline and other miscellaneous transportation uses account for less than 20 percent of the energy consumed by the transportation sector, thus offering a more limited potential for energy conservation over the short term; (2) mass transit systems will not contribute significantly to conservation in the near-term period, and evaluation of such systems should commence immediately in order to have longer-term effects; and (3) Individual choice in transportation should be maintained, but a compromise must be effected wherein the individual motor fuel-burning unit becomes more efficient and at the same time the individual exercises more judicious choice in the utilization of the unit.

Heydinger, ER; National Petroleum Council Sept. 1974, 129 pp, 14 Fig., 24 Tab., 4 App; ORDER FROM: National Petroleum Council, 1625 K Street, NW, Washington, D.C., 20006 Repr. PC

48 096526 FUEL IN TRANSPORT. The types of fuel used to provide energy for transport are discussed and measures of the efficiency of fuel use of different modes of transport are presented. Probable trends in fuel costs are outlined and predictions made of the effects of different rates of increase on perceived motoring costs and public transport fares. Various uses of oil are then discussed. In conclusion, some implications for transport planning are discussed: the greater the fuel efficiency of public transport, the likelihood that the cost of electricity will rise less than that of oil, and the effect of large increases in the cost of fuel on modal split. /TRRL/

48 097031 PARK-AND-RIDE LOCATION STUDIES. This park-n-ride study represents a joint effort of Federal, State, Regional, and local governmental bodies to improve mass transit and to demonstrate their commitment to achieving federal air quality standards in the Denver area. The feasibility study for the development of park-n-ride sites included looking at similar facilities in other cities: Seattle, Washington; Rochester, New York; Atlanta, Georgia; Los Angeles, California; Milwaukee, Wisconsin; and Miami,

Florida. Planning guidelines for initial site selection in the Denver region have been developed; listed are macro criteria to be used in determining the areas to be served by park-and-ride facilities and micro criteria used to identify a specific site, sites will be chosen which afford maximum reduction in VMT and thereby improve regional air quality. Future transportation plans and future growth areas will be identified and included as factors in location analysis. Park-and-ride lots will be designated to accommodate the bicyclist, pedestrians, and the handicapped.

Kohrs, S ; Regional Transportation District
Tech Memo Task 8.426, Feb. 1975, 23 pp

48 098055 ENERGY FOR TRACTION. Transport is a key industry in the health of any nation and it is important that scarce and costly resources are used to the best advantage in advancing transport services by land, on the sea or in the air. Since oil supplies 97% of all transport energy it is vital that maximum efficiency must be achieved in use of energy in this sector in view of declining oil reserves. Fuel price escalation, the evolution of transport, consumption by various modes, and matching of mode to requirement are all discussed. The remaining quarter of the century must be concerned with conversion of transportation from oil power to electric operation based on non-fossil fuels. Some of the new energy sources are considered, but electrified railroads are seen as having a major role in any case.

48 099734 THE WORLD ENERGY CRISIS AND ITS EFFECT ON THE OPERATION OF PUBLIC TRANSPORT. The historical background to the crisis is briefly reviewed (with special reference to the impact of crude oil prices, the balance of payments and the role of public transport) and its impact on public transit is examined with reference to transit usage, capacity, operating cost, construction costs and environmental concerns. Public transport's short term and long term responses to the crisis are discussed. Significant usage increases were noted in the height of the crisis, and no system was subject to capacity restraints in accommodating the passengers. High operating and construction costs have also stemmed from the energy crisis. Internal conservation efforts, technological improvements, improved service with maximum penetration into target markets, incentive fares, informational services to promote ridership, and public policy steps to discourage automobile usage are identified as short term responses to the crisis. Established standards on energy usage, vehicle (public transit and automobile) design, elimination of redundant services, and standardization of equipment could be among several other longer term effects of the crisis.

Ronan, WJ (Port Authority of New York and New Jersey) ; International Union of Public Transport No. 7a, 1975, 13 pp

48 099735 URBAN TRANSPORT IN THE PARIS REGION AND THE INCREASED COST OF PETROLEUM PRODUCTS. The total consumption of light fuels and diesel oil in

the Paris region and the RATP motorbus network consumption are examined, and a comparison is made of the unit consumption of private cars (in towns) and of motorbuses. The consequences of a continuing crisis in the supply of petroleum products are discussed, and steps that could be taken to reduce fuel consumption in the Paris region are set forth. These include the increase of light fuel prices, the restriction of parking and the increase of parking charges. Short-term actions that could be adopted by the bus network and rail network, and short term measures to be taken as part of a medium-term plan of action are outlined. The possible reduction of energy consumption by the RATP is also considered.

Bourgoin, M ; International Union of Public Transport No. 76, 1975, 7 pp, Tabs.

48 099745 THE REVIEW AND EVALUATION OF THE ECONOMIC AND TECHNICAL RESULTS OF THE AUTOMATION OF METROPOLITAN RAILWAYS. EFFECT OF THE ENERGY CRISIS ON THEIR OPERATION. A summary is presented of a questionnaire survey relating to the degree of automation attained in signalling, track equipment and local signal boxes, termini operations, timetable compensation for disturbances, monitoring and control posts, and rolling stock. Automation seems inevitable in the management of station operations. The objectives in the automation of metropolitan railways are examined with reference to economics, quality of service, working conditions, and employment problems. The need is indicated for analyses based on multiple criteria. A study of the possible repercussions of the energy crisis on the running of metropolitan railways in London, New York, Paris, Stockholm and Munich, involved the analysis of replies to a questionnaire survey. The questionnaire investigated the impact, of the crisis on urban transport, and the combined effect on road traffic and traffic on public transport networks. The study concludes that the decision to automate cannot be based solely on economic criteria. Precise evaluatory methods, modern management and operation techniques and analysis of the extent to which the undertaking's objectives are attained must determine the expediency of automation.

Essig, P (Regie Autonome des Transports Parisiens, France) Berry, FT (New York City Transit Authority) ; International Union of Public Transport Conf Paper 3a, 1975, 11 pp; Presented at 41st International Congress of the International Union of Public Transport, Nice, France, 1975.

48 125010 TRANSPORTATION SOLUTIONS TO THE ENERGY "CRISIS". Several suggestions are discussed for increasing transportation efficiency and improving fuel economy. These suggestions include the following: expand rail transit; expand transit bus services; improve traffic controls on major urban expressways; commuter carpooling; use smaller automobiles; eliminate inefficiency in commercial airline operations; expand intercity rail passenger service; expand intercity bus service; substitute rail for trucks on longer distance intercity freight hauls; and remove other regulatory restrictions of transport.

(February 1975).

48 125023 FUTURE TRANSPORT-THE IMPORTANCE OF SAVING FUEL. In an article on future forms of public transportation, the author presents his views on a possible course of transport development in the UK. Systems now being developed for long-term use should in general be based on more efficient use of fuel and environmental improvement. Potentially the railways could be the most advanced form of transport and, within the next decade, this method of transport is likely to be developed as an energy-conserving, computer-controlled way of moving people and freight, thus reducing dependence on road transport. In such a system the car would cease to be privately owned and would be used only at the beginning and end of long rail journeys on a hire basis and would probably be electrically propelled. Following a brief discussion of the economics of high-speed flight and whether the energy so used is fully justified, the author advocates the use of more efficient and accessible energy conserving forms of public transport such as a form of tramcar for city centre use. /TRRL/

48 125029 A LOOK AT THE FUTURE OF FUELS AND MOTOR-CARS, AND ITS INFLUENCE ON ROAD SAFETY. The present fuel crisis has given the world timely warning that its fossil fuel reserves are limited. Over the long term alternative sources of energy must be developed. Any alternative must, however, cope with the many decades of refinement of today's motor-car, psychological factors involved in car ownership, and massive investment in both the public and private sectors. At present public attention is focussed largely on technological developments for decreasing dependence on oil based fuels. These include electrically driven cars, and alternative portable fuels such as hydrogen. Another development avenue is increasing the availability of petrol for motor-cars by exploitation of new oil sources producing oil from coal and using other energy sources, particularly nuclear energy, for generating electricity, and so release more oil for transportation. The really spectacular developments in electronics and computers could have a major impact on control systems and communications. An interlocking system of public transport could provide much of the versatility and usefulness of the private motor-car which could appreciably diminish in number. Implications for road safety are technological changes will be influenced by conditions in overseas countries rather than in south Africa; petrol could become plentiful again over the medium term and speed restrictions will need another justification if it is to be continued; electronic innovations could reduce accidents significantly; replacement of private motor-cars with public transport will depend on a complex system of interrelationships. (A) this paper was presented at the 1974 symposium on "the Impact of Fuel Saving Laws on Road Safety", held in Pretoria, South Africa. The covering abstract for the symposium is IRRD abstract no. 213021. /TRRL/

48 125030 THE EFFECTS OF FUEL CONSERVATION MEASURES ON TRAFFIC LAW ENFORCEMENT AND COLLISIONS IN PRETORIA. The recently introduced fuel-conservation measures in the form of lower speed limits have undoubtedly had an enormous impact on all facets of road traffic in South Africa. Initially intended solely to cut down on the use of oil and petroleum products, it appears that these measures have been the major contributing factor responsible for the reduction in traffic collisions recorded, particularly those mishaps which involve serious injury and death. The purpose of this paper is mainly to present the available data and to venture a few personal opinions, whereafter it will be left to the applicable panel to attempt to formulate any possible conclusions. Basic collision totals for Pretoria for the period immediately before and after the introduction of these measures are examined, and these are then compared to the figures for the present situation. A close look is taken at some of the types of collisions to determine whether there has been any significant reduction in collisions of one or two specific types only, with a possible increase in others, or whether there has been an overall reduction in collisions of all types and degrees. Figures relating to public transport usage in Pretoria, are presented, in order to ascertain whether there has been any significant change. The influence of the new measures on traffic law enforcement activities has undoubtedly been the placing of extra emphasis on speed checking. The paper will deal with the result of stricter speed limit enforcement measures and heavier penalties, and simultaneously look at the possible influence on some other driving offences such as traffic light and stop sign disobedience, etc. Finally the findings of a public opinion and attitude survey, dealing with a number of related issues including the lower speed limit(s) and reduced collision rate, are included. (a) this paper was presented at the 1974 Symposium on "the Impact of Fuel Saving Laws on Road Safety," held in Pretoria, South Africa. The covering abstract for the symposium is IRRD abstract no. 213021. /TRRL/

Bolhuis, H (Pretoria City Council, South Africa) *Robot* No. 74, June 1974, pp 53-84, 17 Fig., 10 Tab., 9 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 213036)

48 125078 THE EFFICIENT AND ECONOMIC USE OF EXISTING URBAN ROAD NETWORKS HAVING REGARD TO CONSIDERATION OF THE ENVIRONMENT. This thesis examines the implications of congestion and the means by which it may be avoided. It begins by examining current urban transport planning philosophy, which the author writes is derived largely from the Buchanan report. The focus is on methods of influencing demand and the advantages and disadvantages of each are examined in turn. These include permits and licences, road pricing, parking control, and improving public transport along with land use controls. Concluding that none of these will be practical or effective the author suggests that the results of unplanned restraint or congestion should be explored. A theory of congestion is given which includes personal characteristics,

activities, trip characteristics, the subjective assessment of congestion and costs and benefits. A number of options that individuals may take to avoid congestion follow from this and these are listed. Decision levels are identified and the interrelationships between the options explored in detail with an assessment of the ability to control the options added. A section on implications examines the effects of altering design standards from peak to average daily flow and the potential of environmental management. The author argues that the latter type of scheme has been unsuccessful for a variety of reasons. Research is suggested so that the implications and characteristics of congestion may be better understood. The author concludes that a problem which is national and social in nature is being tackled with solutions which are local and technical. /TRRL/

Collins, MS (Norwick Planning Department, England) *Institution of Municipal Engineers, Journal of* Vol. 101 No. 10, Oct. 1974, pp 262-268, 1 Fig., 19 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 212669)

48 125572 TOMORROW'S TRANSPORT. The energy crisis and its effects on transport is examined by each of the two authors from a different viewpoint. The practical questions of the pattern of fuel consumption, the sensitivity of travel modes to fuel price, and alternative fuels are discussed. In addition each author looks at planning objectives and the measures to be taken to achieve them in both the long and short-term. The long-term goals of both authors are similar but their suggestions for short-term measures are divergent with regard, for example, to both company cars and taxation. Both however see the day of bicycles and public transport to be near at hand. They conclude that transport policies and programmes are, as yet, ineffective but see hope that energy crises will stimulate government and regional policy makers to a more radical approach to transport planning investment. /TRRL/

48 126313 EFFICIENCY AND EQUITY CONSIDERATIONS IN THE FINANCING OF NOISE ABATEMENT ACTIVITIES AT AIRPORTS. This paper reviews a set of taxing alternatives to finance actions intended to reduce noise around airports and discusses cost differences in administering these alternatives as well as the various degrees of their incidence. In evaluating these alternatives, particular attention is devoted to their economic efficiency and equity implications. Assuming that the price system can provide incentives for airlines, airport authorities or public agencies at different levels to reduce noise exposure, the author states that a better approximation to efficiency and an equity standard which imposed the costs on the offending parties could be achieved by use of a marginal cost pricing scheme thus favoring a form of financial arrangement which includes the efficiency gains of a decibel landing charge and the relatively modest administration costs of an impacted airport head tax. /DOT/

Straszheim, M *Revista Internazionale di Economia dei Trasporti* Vol. 2 No. 1, Apr. 1975, pp 3-15

48 126314 COST AND EFFECTIVENESS OF EMISSION REDUCTION AND TRANSPORTATION CONTROL POLICIES. This paper analyzes a variety of transportation control policies which include expanded use of public transportation, better traffic controls in central areas, relocation of workplaces and residences, restrictions on automobile parking and use in central business districts. An attempt is made to predict the potential impact of such policies in Boston and Los Angeles, two cities with significantly different transportation systems and land use patterns. The aim of the study is to clarify the potential role of transportation control policies in air quality improvement programs, comparing them—within a cost effectiveness framework—with programs for achieving emission rate reductions from automobiles. By using the Transportation and Air Shed Simulation Model (TASSIM) the analysis shows that the effectiveness of several of the transportation control policies is somewhat similar in the two cities. A major conclusion suggests that although transportation controls can achieve significant improvements in air quality in limited portions of an air quality region they probably cannot yield an air quality improvement as large as that resulting from the reduction in emission rates presently envisaged. /DOT/

48 127859 ENERGY CONSIDERATIONS IN URBAN TRANSPORTATION PLANNING. Energy consumption of urban transportation systems may soon be a major factor in planning—a situation which has not been explicitly considered to the present. Urban transportation energy demand is expected to increase substantially and remain heavily dependent upon petroleum-based fuels. The modal-split models in this article establish what the choice should be to achieve a specified level of energy consumption and to define modal split to minimize energy consumption while satisfying accessibility standards. The article also proposed use of curves of energy use which vary with passenger load factors and modal-splits to analyze the energy consequences of alternative transportation plans, policies and programs.

Yunker, KR Sinha, KC *Traffic Quarterly* Vol. 29 No. 4, Oct. 1975, pp 571-592, 6 Fig., 4 Tab.; ACKNOWLEDGMENT: Traffic Quarterly; ORDER FROM: ESL, Repr. PC, Microfilm

48 128572 ENERGY, LAND USE AND THE ENVIRONMENT: THE IMPACT ON TRANSIT. The worldwide origins of the transportation energy shortage are reviewed, the direct impact of these energy developments on the consumer and by implication on transit are examined, and the long-term impact of higher energy prices on travel are discussed. Acting through transportation costs, energy costs might directly effect model splits because of economic pressure to reduce trips for energy-saving reasons. This primary effect will boost transit ridership. The secondary effect, which will take a decade or more to realize its full potential, is that transportation energy costs will influence land use patterns. Traffic count data on rural, suburban and urban travel during the energy crisis period is reported, and comments are made on the elasticity of demand for gasoline. Data show that if Americans cut back on travel, it will be the commute trip, not the shopping trip that gets cut. Future land use planning and zoning processes will develop cities so that citizens are able to utilize transit, and powerful factors will impact favorably on public transportation.

Sansom, RL (Energy and Environmental Analysis, Incorporated) *Transit Journal* Vol. 1 No. 4, Nov. 1975, pp 6-20, 1 Fig., 8 Tab.

48 128812 TRAVEL IMPACTS OF FUEL SHORTAGES AND PRICE INCREASES. This attempt to document the impact of the energy crisis on travel behavior in 3 cities, studied trends in values for each variable by calculating absolute changes and percent changes for corresponding months of previous years, and predicted 1974 values by extrapolation of the trends where possible. Where no data existed before 1973, or where there were only weak trends, 1973 data were used as the projected 1974 values and other times only absolute comparisons to 1973 were made. Changes in air quality, gasoline sales, auto volumes, mass transit ridership, gasoline price, and auto occupancy are correlated with vehicle miles traveled. After each variable was collected. Price elasticity and cross-elasticity were used to determine the data relationships where possible. The study results for Washington, D.C., Boston and Denver are detailed. It was found that the above mentioned variables are adequate to describe short term reactions to increased gasoline taxes and/or gasoline allocations. These variables are currently reported at different states of aggregation with localized conditions masking the relationships. It was also noted that these variables are not adequate for formulation of air quality programs.

48 129368 PARKING AND THE ENVIRONMENT: WHERE ARE WE NOW? The Clean Air Act of 1970, is discussed particularly as related to the parking regulations which were proposed soon after passage of the act. Two types of regulations were planned: indirect source review, and parking management regulations. The Clean Air Act required that each state implement its own plans for both the attainment of ambient air quality standards by certain deadline dates

and continue to maintain such standards once attained. Studies indicate that rigid indirect source review regulations are required, as well as further transportation plans to accomplish the task. Such plans include parking management regulations, mass transit improvements, inspection and maintenance programs, carpool matching programs, exclusive bus and carpool lanes, incentive programs, and the retrofit of older automobiles with emission control devices. Opposition to the act and resultant regulation proposals are reviewed and congressional action in this area is briefly discussed.

48 129638 GETTING AT THE BIG FACTS IN TRANSPORTATION. Since the private automobile has been found to be responsible for the greatest oil energy consumption among the various travel modes, a suitable alternative must be found. The potential of public transit to reduce this oil consumption has thus far been underestimated by engineers. Studies of certain transit efficiencies fail to point out the real capabilities of public transit in that they tend to ignore certain time periods that are more efficient, and ignore the ability to effect large oil savings. Besides the fact of concealing the potential of public transit to save energy, these accounting methods conceal a greater fact the need for engineering improvements to effect energy savings. The computing of energy consumption by commuter trains is another area that is guilty of concealing the need for technological improvement. Planning for optimum use of public transit should include route selection by computer mapping based on census data. Where potential for energy savings is found, public transit must be expanded. Reluctance to do this is partly due to transit deficits. This can be avoided, however, by increasing operations during the most energy-conserving period-rush hour. If the Federal government becomes more involved in this need for development, and engineers become involved in technological research to avoid energy waste, public transit can become the most effective means of energy-conserving transportation.

48 129952 THE URBAN TRANSPORTATION PROBLEM. This critical examination of the Urban Mass Transportation Act of 1964 attempts to identify the urban transportation problem and focuses on 3 aspects of the Act: the plight of the transportation disadvantaged; congestion; and the "journey to work". The social costs of automobile commuting are analyzed with particular reference to the social evils of pollution, energy waste, accidents and the misallocation of urban land. The optimal solution to the problem would discourage automobile commuting and would act to improve the attractiveness of the urban area. Such a solution implies the problem is one of land planning. The adoption of a system of zoning streets for particular categories of use with a view toward discouraging automobile commuting and improving the attractiveness of the urban area is seen as the present task. Implementation of the land planning solution will require a lawyer's skills and mastery of a complex body of real property law.

48 129975 ENERGY-CONSUMPTION OF DIFFERENT TRANSPORT SYSTEMS [ENERGIEVERBRUIK VAN VERSCHILLENDE TRANSPORTSYSTEMEN]. The transport sector depends on fifty-nine percent of oil products for fuel. Until recently the consumption of fuel was a relatively unimportant factor of cost in the exploitation of transport vehicles. Currently, however, interest in the energy components of transport systems is markedly increasing. With the help of a literature survey a comparison is made of the fuel consumption of different transport systems, for instance lorry, bus, metro, railway, rapid transit system, aerotrain, hovertrain and future transport modes. /TRRL/ [Dutch]

48 130416 ENERGY OPTIMIZATION FOR RAIL PUBLIC TRANSIT SYSTEMS. Energy optimization for rail public transit systems is discussed from the viewpoint of an integrated systems approach. This approach considers the interaction of all the major subsystems of a total rapid transit system rather than each subsystem independently as has often been done previously. Some of the major subsystems examined include vehicles and their major propulsion, braking and auxiliary systems, train operations, environmental control facilities, and civil and structural facilities. The major factors that may significantly affect an overall energy evaluation are identified, and the ways in which each of these factors may be controlled to effect overall maximum efficiency of energy use are discussed. Energy evaluation

techniques include a new strain performance simulation computer program developed by Parsons, Brinckerhoff, Quade and Douglas, Inc., as part of a 4-year subway environment research project. This paper notes that the procedures for evaluation on a total systemwide basis are applicable for any rail transit system and can be used to extend or modify existing rail transit systems and the design of new systems.

48 130417 TOTAL ENERGY REQUIREMENTS OF THE BAY AREA RAPID TRANSIT SYSTEM. The paper concerns the energy requirements of the Bay Area Rapid Transit system in five areas: traction energy, station energy, maintenance energy, construction energy, and impact energy. Vehicle traction energy is bounded by a probable lower bound of 3.2 kW-h/car-mile (7.2 MJ/km) and a probable upper bound of 5.5 kW-h/car-mile (12.4 MJ/km). When the station and maintenance energies are added, it is expected that the eventual total operating energy cost will lie between 6 and 7 kW-h/car-mile (13.5 and 15.7 MJ/km). The construction energy is calculated through the use of energy input-output analyses and is approximately equal to the total operation energy over a 50-year projected system life. The impact energy of Bay Area Rapid Transit, that is, the energy associated with other systems built because of the existence of Bay Area Rapid Transit, is discussed. There are not as yet sufficient data available to make an estimate of this energy. The important problem of energy dependence on loading is studied, and it is found that there is a nearly inverse (hyperbolic) relation between energy intensity (kW-h/passenger-mile (joule/kilometer)) and the vehicle loading factor.

48 130838 THE CURRENT STATUS OF MEASUREMENT AND EVALUATION TECHNIQUE FOR STRUCTURE-BORNE SOUND MEASURED AT THE TRACK. This paper described the investigation which has led to the suppression of noise pollution produced by rail transport systems. A common noise problem for subway systems lies in the production of structure-borne sound in structures erected in the vicinity of the tunnel. Suppression of noise transmission begins at the point of origin of structure-borne sound, i.e., at the railroad track. The problem for the track engineer is thus one of developing track types with maximum sound-insulation properties. Dr. Steinbeisser described a solution proposed, and the methods and instrumentation utilized, in a tunnel of the S-Bahn (rapid transit system) in Frankfurt. Insulating effects were based upon the insertion of a buffer mass between the floor of the tunnel and the vehicle. It was indicated that great influence can be exerted on the suppression of structure-borne sound by structural measures. The paper discussed the tools of measurement technology which provide a comparison of various track structures with regard to their sound insulating properties.

48 130861 EVALUATING AIR POLLUTION IMPACTS OF TRANSPORTATION. The transportation literature of the past few years contains much on air pollution. While the majority of articles deal with the subject qualitatively, there is a significant amount of material concerned with quantitative analysis. The quantity and great diversity of this material makes it difficult to determine the extent to which existing methodology actually provides useful tools for use by transportation planners. Recognizing this difficulty, the ASCE Urban Transportation Division Task Committee on Urban Transportation Economics undertook this state-of-the-art survey of air pollution impact evaluation. The major conclusion is that there now exist a number of useful analysis tools that should be adopted for regular use by transportation planning agencies. However, more attention should be given to strengthening the role of formal evaluation methodologies, such as cost effectiveness analysis, in dealing with these issues.

Sullivan, EC (California University, Berkeley) *ASCE Journal of Transportation Engineering* Proceeding Vol. 101 No. TE4, ASCE #11721, Nov. 1975, pp 763-780, 8 Fig., 46 Ref.

48 131053 OTA REPORT ASSESSES IMPACT OF MASS TRANSIT STRATEGIES IN DEALING WITH ENERGY AND ECONOMIC PROBLEMS. This news release summarizes the findings of an OTA report entitled "Energy, the Economy, and Mass Transit." Among the findings in the report are the following: the most effective way to promote energy conservation in urban transportation is a combined strategy incorporating both transit incentives and automobile disincentives; investment in mass transit results in about 80 man-years of employment per million dollars invested; and it is not likely that increased expenditures on rapid transit construction will have significant employment effects within two years due to the long lead time required for planning, design and financing.

United States Congress Feb. 1976, 3 pp; Copies of "Energy, the Economy, and Mass Transit" are available at the Government Printing Office, \$2.00, 052-003-000132-2.

48 131232 ENERGY STATISTICS. The supplemental report, Energy Statistics is a compendium of selected time-series data describing the transportation, production, processing, and consumption of energy. The statistics have been assembled from a wide variety of sources, such as the U.S. Department of the Interior, the Interstate Commerce Commission, and the American Petroleum Institute. The report is divided into three main sections. The first, entitled "Energy Transport", contains such items as the revenues and expenses of oil pipeline companies, number and capacities of U.S. tank ships, and the total crude oil transported in the U.S. by method of transportation. The second section, entitled "Reserves,

Production, and Refining", reveals the growth over time of the U.S. oil and natural gas reserves, refinery capacity, and yields. Trends in the demand for fuel and power are displayed in the third section, entitled "Energy Consumption". Throughout this part, the transportation sector is emphasized.

48 131580 TRANSPORTATION ENERGY CONSERVATION POLICIES. This exploration of the extent to which certain significant forces (the oil embargo, gasoline and automobile prices, federal mass transit programs and funds) will operate on traditional forms of personal travel and land use, examines the period 1950 to 1972, reviews the relative energy efficiencies of different urban and intercity passenger systems, discusses several policies for reducing transportation fuel use, and compares the energy savings likely with each of these policies in 1980 and 1985. Four policies are discussed: improving mass transit, increasing carpooling, raising gasoline prices, and improving new car fuel economy standards. It is pointed out that although the short term energy conservation potential of increased mass transit is slight, it should not be abandoned; changes in urban travel patterns require about a decade. Studies have shown that parking incentives for car pools and major increases in parking costs substantially reduce the amount of solo driving and increase both carpooling and mass transit use. It is also shown that the major response to higher gasoline prices is an increase in new car fuel economy rather than a decline in auto travel. Gasoline savings due to improvements in new car fuel economy are substantial and even higher than those due to the 20 percent gasoline price increase. The studies suggest that in the next decade, attention should be focused on technological means to reduce transportation fuel use.

Hirst, E *Science* Vol. 192 No. 4234, Apr. 1976, pp 15-20, 5 Fig., 4 Tab., 19 Ref.

48 131593 SAVING HIGHWAY FUEL-THE ENGINEER'S ROLE. The dilemmas of the current energy shortage are identified, approaches directed toward reduction of oil imports are outlined, and the engineers responsibilities in this area are pointed out. Administration proposals for reduced oil consumption are based on price mechanisms while congressional proposals favor import quotas, allocation, rationing and massive taxes on automotive gasoline. The principal difference in the two approaches is that the administration would spread the cost and thus the incentive to conservation across all petroleum uses, while the congress would concentrate all conservation efforts on automotive travel. If the administrations goals are to be realized by a reduction in automotive travel, it would require a 30 percent decrease in auto use. The largest single use of automotive fuel is commuting from home to work. Work trip carpooling is a proven, effective energy conservation measure that can be implemented at little or no cost. Typical of the successful carpool programs is the vanpool program initiated by the 3M Company in St. Paul (Minn.). Roadway incentives for carpools and programs to improve urban traffic flow also merit consideration as fuel conservation measures. Factor (tune-ups, speed reduction) which aid better

mileage are noted, and fuel efficiency factors which affect various urban passenger transportation modes are reviewed. It is the highway and traffic engineers responsibility to see that these conservation efforts are implemented.

Robinson, CC, Executive Vice President (Highway Users Federation for Safety and Mobility) *Purdue University Engineering Bulletin* No. 146, 1975, pp 99-112, 7 Fig.; Proceedings of the 61st Annual Road School, Purdue University, March 11-13, 1975.

48 133109 ADDITIONAL TRAFFIC ASSIGNMENT OPTIONS FOR THE TASSIM MODEL. The TASSIM model integrates an urban transportation planning model, vehicle emission factors, and simple air diffusion models in a simulation framework that can be used to analyze the air quality effects of transportation policies. The model is spatially disaggregated, and it is compatible with data sources available in many metropolitan areas. This report evaluates extensions of the basic model, including several alternative capacity-restrained assignment procedures and the addition of a more detailed spider network. The costs and impacts of the modifications are explored by examining simulations of several air quality improvement policies.

Fauth, GR Kroch, E; Harvard University, Office of the Secretary of Transportation Final Rpt. DOT-TST-76-53, Nov. 1975, 183 pp; Contract DOT-OS-30099; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-251065/9ST

48 133222 BART IMPACT PROGRAM. IMPACTS OF BART ON THE NATURAL ENVIRONMENT; INTERIM SERVICE FINDINGS. The report documents the study done on the impacts of BART on the natural environment. The general subject area is divided into three categories which define its limits and organize its many aspects. The categories are: (a) Biota (Wildlife and Vegetation) (b) Soils and Geology, and (c) Drainage and Water Systems. Since almost the entire area traversed by BART is urbanized and fully developed, this natural environment was not a major topic of study. However, a comprehensive review of BART's possible impacts was performed because impacts on the natural environment are often not apparent even when they are quite significant from an ecological point of view.

48 133304 UNDERPLATFORM EXHAUST TESTS IN THE TORONTO SUBWAY. The technical report has been prepared under the Transit Development Corporation (TDC) project 'Ventilation and Environmental Control in Subway Rapid Transit Systems.' The underplatform exhaust system is a subway environmental control feature designed to remove train generated heat within the confines of stations and thereby improve environmental conditions. To evaluate the performance of this system, a full-scale test

facility was constructed in a station of the Toronto subway. This report describes the facility design and the experimental program. A presentation of test results and interpretations is included, leading to the development of a quantitative design versus performance relationship for use by subway environmental engineers.

48 133707 WEIGHTED DIGRAPH MODELS FOR THE ASSESSMENT OF ENERGY USE AND AIR POLLUTION IN TRANSPORTATION SYSTEMS. This paper describes extensions, to weighted and double-weighted digraphs, of the author's earlier work on building and analyzing energy-demand signed digraphs. Several weighted and double-weighted digraphs are built to provide a test of the construction methodology, to provide a test of the methods of analysis of such digraphs, and to illustrate the type of analysis one can make using such digraphs as models of complex systems. The digraphs are constructed within the context of the transportation system of a hypothetical metropolitan area, similar to the county of San Diego, California. The digraphs are used to compare fuel consumption and air pollution under two scenarios: the nominal case, where clean air standards are met by some retrofitting of cars with smog control devices; and the bus case, where cars are banned and an expensive wide-ranging bus system is introduced. It is concluded that weighted and double-weighted digraphs can be constructed relatively inexpensively and that at least weighted, and probably double-weighted, digraphs can be used at an early stage of a policy-making task to set directions for further research. 48 134003 IMPACT OF THE ENERGY SHORTAGE ON TRAVEL PATTERNS AND ATTITUDES. This paper examines the effect of the energy shortage on transportation patterns and attitudes in the automobile-oriented, suburban Dutch Fork area in Columbia, South Carolina. Data from several nationwide surveys and selected transit operations are also used. The findings from the Dutch Fork area show that the energy shortage did not appreciably reduce (10 to 15 percent) the amount of automobile travel and did not substantially affect transit patterns or attitudes. Traffic volumes decreased primarily on weekends; there was less decline on weekdays. Travel was reduced by driving slower and limiting social-recreational and shopping trips. Shifts in travel behavior were moderate, although people expressed an interest in public transit. Gasoline supply more than price appears to have greatly affected travel habits, although the effect of price appears to be reflected in the buying of more

small cars. In other words, people did not move away from relying on the car but rather adjusted their driving behavior to conserve gasoline. Data from national surveys also show this pattern. Possibly, local public transit will not realize appreciable comparative advantage against the automobile on the basis of price, and this further emphasizes the inability of transit to serve a substantial ridership. In addition, failures of public transit to capture and hold a greater part of the market during the energy shortage are a product of poor service quality. The one favorable result for public transit is the verbal support given to transit as a method for dealing with the energy shortage. Public transit can benefit from this support by garnering greater governmental resources, although there are still many reservations about the likelihood of converting public support and governmental investment into substantial patronage increases.

48 134005 ENERGY SAVINGS FOR WORK TRIPS: ANALYSIS OF ALTERNATIVE COMMUTING PATTERNS FOR NEW JERSEY. This paper analyzes energy consumption for work trips in New Jersey. Prepared as an aid to the New Jersey Task Force on Energy, it develops a methodology to quantitatively compare alternative transportation policies intended to reduce energy consumption. Data were obtained on work trip distribution, transit patronage, and modal split for each of the 21 counties in New Jersey for 1970. From these data, work trip lengths and automobile and transit occupancy rates were calculated. Based on these as inputs to a model that predicted total work trip energy utilization, the total daily energy consumption was computed for work trips of New Jersey residents. Modal split, energy per vehicle mile (kilometer), and vehicle occupancy rates were then varied to test alternative strategies for reducing energy consumption. In general, the results of this analysis showed that, given current work trip patterns, greater savings in energy could be achieved by using automobiles than by increasing public transit patronage. Specific policy recommendations were then outlined for automobile and public transit planning.

48 134054 COMPARATIVE ENERGY COSTS OF URBAN TRANSPORTATION SYSTEMS. Several urban transportation systems are compared on the basis of the energy resources consumed in the manufacture of their vehicle and guideway systems and in their operation. Four systems, the auto, bus, rapid rail and personal rapid transit, are extensively analysed, while the energy characteristics of dial-a-ride systems and the motorcycle are estimated. Analyses of bicycling and walking are also included for a comparison of motorized modes with human propulsion systems. For each system the energy required to manufacture a vehicle, the energy required to manufacture the guideway, and energy of operation are estimated. The manufacture contribu-

tions are amortized over component lifetimes and added to the energy of operation to give an estimate of total energy consumed per vehicle-mile by a system. To provide a measure of the potential energy efficiency of the systems, the average energy consumed per available seat-mile is calculated to compare the systems when they are operating at capacity. An example containing assumed average occupancy levels gives a more realistic comparison on the basis of energy consumed per passenger-mile. (A) /TRRL/

48 134730 ENERGY CONSERVATION IN URBAN TRANSIT SYSTEMS. Though urban transit systems are currently an energy efficient means of transporting people, this presentation will outline strategies to make these systems more efficient as well as to reduce total regional transportation energy consumption through greater reliance on these systems. This paper focuses on near-term improvements and on the initial steps essential for far-term solutions. Because of this focus, the improvements suggested work with current technologies and modifications of these technologies. In any transportation system the strategies for saving energy can be broken into five categories. They are network improvements, operational changes, demand reductions, modal shifts and vehicel technology. This presentation suggests improvements within the framework of these categories and demonstrates their potential energy savings.

48 134743 URBAN TRANSPORTATION PLANNING AND AIR QUALITY. This report discusses four main areas of interest concerning air pollution: legislation, information, standards, and analysis techniques. It briefly discusses the Clean Air Act Amendments of 1970 and summarizes general information on the pollutants: carbon monoxide, hydrocarbons, nitrogen oxides, lead, particulates, and photochemical oxidants which result from highway vehicles. A discussion of the relationship between the vehicle emission standards and national ambient air quality standards is included with comments on how transportation planning is involved in meeting the air quality standards. Various techniques for analyzing the effects of highway travel on air quality including emission and diffusion models are presented.

48 136577 POLICIES TO REDUCE TRANSPORTATION FUEL USE. This paper reviews historical trends in passenger traffic and energy use since 1950. Overall, transportation fuel use grew from 8.9 Qbtu in 1950 to 18.3 Qbtu in 1974

with an average annual growth rate of 3.0%. Energy use grew more rapidly than did traffic during this period because of shifts from energy-efficient to energy-intensive modes and increases in energy-intensiveness for most modes (due both to declining load factors and reduced vehicle fuel economy). A number of alternatives exist for reducing transportation fuel use. This paper discusses the energy savings possible due to expanded and improved urban mass-transit services, increases in new car fuel economy, increases in the price of gasoline, and increases in commute-auto occupancy (carpooling). Expanded mass transit is likely to save only small quantities of energy during the next five to ten years, primarily because of the very low fraction of urban passenger travel now carried by transit. Legislating increases in new-car fuel economy and/or higher gasoline prices can save substantial quantities of fuel both in the short and long run. Policies to induce higher auto occupancy during peak periods are unlikely to save much energy both because of their political infeasibility and individual reluctance to change habits.

48 137367 ASSESSING THE RELATIONSHIP BETWEEN URBAN FORM AND TRAVEL REQUIREMENTS: A LITERATURE REVIEW AND CONCEPTUAL FRAMEWORK. An interest in the development of long-range policy for energy conservation motivates the investigation into the relationship between urban form and transportation energy consumption. The report reviews previous studies which have attempted, either directly or indirectly, to cast some light on this relationship. A thesis of the paper is that study of the relationship has been hampered by a lack of an operational definition for the concept of urban form. Addressing itself to this need, it is proposed that urban spatial structure be measured in terms of size, shape, and activity distribution of the urbanized area. The review of literature classifies previous studies according to the aspect of urban form

which was investigated. Travel requirements appear to increase as urban area population increases, but beyond this finding, no clear relationship between urban form and total urban travel requirements has yet been established in the literature.

48 137553 TIME TO REDUCE THE TRAFFIC! WE CANNOT MANAGE THE AIR POLLUTION [Dags att Daempa Trafiken! Luftfoeroreningarna Klarar vi Inte AV]. Carbon monoxide mainly occurs in petrol exhaust. Its long-term effects such as increased frequency of heart attacks and effects on the central nervous system can be proved at concentrations as small as 5-10 ppm, i.e. along moderately trafficked roads. Oxides of nitrogen attack lung tissue and weaken the defence mechanism of the lungs. Nox are very active in acidification of precipitation. Sulphur dioxide has similar effects but only at concentrations much higher than those due to vehicular traffic. Hydrocarbons and nox are involved in reactions which form photochemical smog. Polyaromatics, particularly 3, 4-benzopyrene, are highly carcinogenic. The sizes of polyaromatic particles in diesel exhaust are particularly unfavourable from the cancer viewpoint. Problems due to polyaromatics will increase due to rise in diesel traffic. Lead is an environmental problem, but may be subordinate to polyaromatics and nox. Since cuts in one exhaust component usually result in an increase in some other component, traffic must be restricted, particularly in towns. Public transport must be made electric in the form of trolley-buses and trams, which are environmentally favourable. For the present, heavy traffic must be kept out of towns and parts of town centres must be set aside for pedestrians only. /TRRL/ [Sweden]

Gunnarsson, SO Persson, B *Kommunal Tidskrift* Vol. 9 No. 18, 1975, pp 812-814, 2 Fig., 1 Phot., 11 Ref.; ACKNOWLEDGMENT: National Swedish Road & Traffic Research Institute, TRRL (IRRD-218382); ORDER FROM: National Swedish Road & Traffic Research Institute, Fack, S-581 01 Linköping, Sweden

48 137573 THE FUTURE ENERGY SUPPLY OF TRANSPORT [Transporternas Framtida Energifoersorjning]. Energy consumption in the transport sector is dominated by the car. According to OECD forecasts, in 1980 there will be 373M cars in the world, and in 2000, 524M. A car weighing 1300 kg needs about 30000 kwh in manufacture, and uses about the same in two years. World oil production in 1974 was 27000 twh. The size of reserves is open to discussion, but one estimate says oil reserves will suffice for 40 years. Alternative forms of energy are coal and oil in shale; the latter is expensive to exploit and environmentally inimical. Methyl alcohol, which can be made from coal, refuse, wood etc, has good potential as fuel. Road traffic can be made more efficient in its use of fuel by: 1. Greater use of public transport, 2. Lower specific fuel consumption, 3. Improvement of the conventional car's fuel efficiency, 4. New types of engine or transmission. 3 and 4 have greater practical potential than

1 and 2. 20% of total energy consumption goes on transport. In the USA where 50% of oil consumption is in the transport sector, improvements will have a great effect on total oil consumption; in Sweden where the corresponding figure is 15%, the benefits will not be so great. /TRRL/ [Swedish]

48 137800 CONTROL OF NOISE FROM CONVENTIONAL DIESEL ENGINES. The noise from diesel engines fitted to trucks and public service vehicles may be reduced in 3 ways: (1) control rapid rise of cylinder pressure upon combustion, plus reduction of mechanical noise; (2) reduce response of engine structure to vibration exciting forces of mechanical impact and combustion; (3) install engine in a soundproof box with suitable ventilation. A study of the vibration mode shapes of the crankcase and cylinder block castings of several in-line engines has shown that there are certain modifications which may be incorporated into conventional engine crankcases which will reduce the noise emitted by their surfaces, and yet allow these castings to be machined on the existing transfer line. Such modifications, combined with isolation and damping treatments applied to the sump, valve gear covers, crankshaft pulley and all other noise-emitting areas of the engine, have given noise reductions of 5 dba on the four engines treated to date.(a). /TRRL/

48 139348 TRANSPORT ENERGY USE ARGUMENTS QUESTIONED. A study of pollution and energy use by transportation has found that the automobile is not as it is frequently thought to be. The study which focused on the load factor in transportation, found that the automobile with a nationwide average of 2.2 persons has a load factor of 25 to 30 percent while on buses and electric transit, it is somewhat less. Statistical performance records, however, show that the urban bus is roughly twice as energy efficient as the typical auto. The main reason for this is that buses use high-pressure tires and are powered by efficient diesel engines. It is suggested that the energy efficiency of autos with small engines and high pressure tires would be almost equal to that of buses.

World Highways Vol. 27 No. 3, Mar. 1976, p 8

48 139504 ENERGY THRIFT IN URBAN TRANSPORTATION: OPTIONS FOR THE FUTURE. Various energy-reducing strategies are examined and presented in tabular and graphical form. Travel data, decentralization patterns, and

weight-engine type-energy consumption relationships are considered in appendices.

48 139647 ISSUES IN OXIDANT MODELING. Basic questions about oxidant control facing transportation planners and others responsible for formulating and implementing public options are considered, the problems of estimating the magnitudes of the directionality of oxidant changes are discussed, and issues relating to urban-based oxidant models and control strategies are addressed. The questions relating to what kind of emissions should be reduced in order to reduce oxidant concentrations, are addressed in papers presented in this special report. The papers conclude that ambient air quality standard for oxidant in urban areas requires substantial reductions of emissions of hydrocarbons and other reactive organics in the area. Although reduction in nitrogen oxide emissions may be needed in urban areas, excessive reduction may increase the difficulty of controlling urban oxidant concentrations. Papers are also presented which describe 4 techniques for the estimation of changes in oxidant concentrations resulting from changes in precursor emissions: linear or nonlinear rollback methods; smog chamber models; statistical models; and diffusion models. Recent findings that oxidant can be transported over distances of at least 30 miles and that high concentrations exist in rural areas have led to questions regarding urban oxidant models and control strategies. These questions are addressed in papers which conclude that elevated rural oxidant concentrations are attributable to man-made emission sources. However it was suggested at a workshop that the natural contribution may be a significant factor.

Horowitz, JL (Environmental Protection Agency) *Transportation Research Board Special Reports* No. 167, 1976, pp 5-7; Presented at the Conference on the State of Art of Assessing Transportation-Related Air Quality Impacts, Washington, D.C., October 22-24, 1975.; ORDER FROM: TRB Publications Off

48 139650 ACCURACY OF PREDICTION OF URBAN AIR POLLUTANT CONCENTRATIONS BY DIFFUSION MODELS. Projections of future transportation-related air quality impacts require the use of mathematical models that relate emissions to air quality. Whereas the derivation and use of such models have received much attention (at least for inert pollutants, such as CO), much less attention has been paid to questions of the interpretation of the concentrations these models predict and how the predictions relate to real atmospheric quantities. Concepts of validity and accuracy must be carefully defined for any model that is to be used in order that the predictions from the model can be properly evaluated. The purpose of this paper is to formulate the concepts of validity and accuracy for atmospheric air pollutant diffusion models and to suggest numerical experiments that can be used to test both the validity and the accuracy of the models. /Author/

48 141065 TRANSPORTATION ENERGY CONSIDERATION IN THE URBAN ENVIRONMENT. A number of means for conserving fuel including alternative fuels, alternative modes, and various economic incentives are discussed. The discussion and graphic representations of present energy uses and future energy demand point out that petroleum consumption rates must be reduced, and raise questions concerning how much total reduction is required, where different proportions should occur, and the consequences of different procedures. It is noted that there are a large number of possibilities with significant potential for fuel saving, and that it is important that each be developed promptly and to the fullest extent. Transportation fuel efficiency is discussed and figures are used to show the percentages of highway fuel that would be saved compared to the proportion of usage of various conservation means. Improving auto miles per gallon is one of the means for conservation having the highest potential. In the short run, improvement in consolidation (car pooling or combining truck shipments) of trips has a high potential. Other possibilities include switching to a motorcycle or transit for the trip to work. The management of highway finances and other resources for projects which encourage fuel conservation such as car-pool-bus lanes, and which reduce fuel wasting congestion, grades and stops can achieve quick results at moderate cost.

French, A ; Federal Highway Administration Oct. 1975, 31 pp, Figs., 3 Tab., 18 Ref.; Presented at Session 4, Urban Transportation, the Urban Environment, Annual Meeting of the American Society of Civil Engineers, Kansas City, Missouri, October 21, 1974.; Contract HPR-40; ORDER FROM: GPO

48 141403 ISSUE-ORIENTED APPROACH TO ENVIRONMENTAL IMPACT ANALYSIS. An approach for better organization of significant portions of the urban transportation planning process is presented. A corridor-plan-

ning project from the Dallas-Fort Worth region in the form of an environmental impact analysis for a proposed urban tracked air-cushion vehicle facility is used as a case study. The issue-oriented approach is built on 3 broad concepts. First, the early identification and analysis of major impact issues in relation to regional or local goals and objectives should be a major element on which transportation planning studies are structured. Second, the planning and evaluation process should be phased, and each successive phase or cycle should address additional, more detailed service and impact variables, but for a smaller number of alternatives. Third, required environmental impact statements should be viewed as a reorganization of the results of environmental impact analyses already well integrated in the planning process.

48 141502 WHEEL/RAIL NOISE-PART 1: CHARACTERIZATION OF THE WHEEL/RAIL DYNAMIC SYSTEM. Field and laboratory measurements of the point impedance, response, radiation efficiency, and directivity of rapid transit steel wheels and rails are presented and compared with appropriate analytical models. The rail impedance can be well modeled by the impedance of an infinitely long beam with the same bending stiffness. Measurements of the wheel impedance in the radial direction are closely approximated (up to about 1000 Hz) by the impedance of a mass equivalent to that of the wheel plus one-third of the axle mass. Above 100 Hz, the wheel impedance is approximated by the impedance of an infinite beam with the same cross-section as the wheel tread without the web. At low frequencies (below 1000 Hz), the decay of vibration along the length of a rail away from the point of excitation is rapid enough so that most rail vibration occurs within a few feet of the exciting wheel. Measurements of the wheel radiation efficiency agree with predictions that are based on the radiation efficiency of a rigid disk with the same radius vibrating in the axial direction. The directivity of radiation from the wheel and rail is approximately uniform. TRRL/

Remington, PJ (Bolt, Beranek and Newman, Incorporated) *Journal of Sound and Vibration* Vol. 46 No. 3, June 1976, pp 359-370, 17 Fig., 2 Tab., 7 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 220736); ORDER FROM: ESL

48 141503 WHEEL/RAIL NOISE-PART 2: WHEEL SQUEAL. A model is presented for the intense pure-tone noise generated by American subway cars and German trams when traversing tight curves. Squeal is presumed to arise from lateral crabbing of the wheels across the rail head, which results from the finite length of the truck (or bogie). This lateral sticking and slipping causes vibrations in the wheel to increase until a stable amplitude is reached. The stick-slip mechanism is described by a negative damping coefficient that varies with vibration amplitude. The model is used to predict the intensity of wheel squeal as a function of train speed, curve radius,

and truck length. Damped and resilient wheels were tested and found effective at reducing wheel squeal. /TRRL/

48 141505 WHEEL/RAIL NOISE-PART 4: ROLLING NOISE. In this paper (part IV of a series on "wheel/rail noise") analytical formulas for predicting wheel/rail rolling noise in urban rail transit systems are developed based on the characterization of the wheel/rail dynamic system developed in part I and the roughness spectra on the running surfaces of the wheels and rails. Measured values of wheel and rail roughness spectra taken on an operating rapid transit system are used with these formulas to predict the rolling noise at the wayside. These predictions prove to agree well with published data on the wayside noise from that system. In addition, measurements of the wheel roughness spectra on a small personalized rapid transit (PRT) vehicle and the rail roughness spectra on a section of the test track for that vehicle, when used in the analytical formulas, yield predictions of the wayside noise during passage of the PRT vehicle that agree well with field measurements of that noise. /TRRL/ Remington, PJ (Bolt, Beranek and Newman, Incorporated) *Journal of Sound and Vibration* Vol. 46 No. 3, June 1976, pp 419-36, 14 Fig., 2 Tab., 1 Phot., 5 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 110733); ORDER FROM: ESL

48 141566 RAPID TRANSIT ENERGY DEMAND. This article describes the effect of rapid transit train performance on power and energy demands to put into perspective how important the cost of energy may be in determining the basic design and operation of any rapid transit system. High acceleration requires greater energy with limited service advantage as station intervals increase. Strict control of station stop times can effectively reduce overall journey timing. Optimum steepness of grades is defined in relation to energy demand and to stopping at stations.

48 141871 ENERGY CONSUMPTION, POLLUTANT PRODUCTION, AND DOLLAR COSTS. The results presented in this report are based on data obtained from Chicago's three largest diesel commuter railroads. Those aspects of their operations that relate to energy and pollution are described. Service characteristics, such as average occupancy and average trip distance, are presented. Energy consumption results are presented and discussed. With energy efficiency measured in passenger-miles per Btu, it is found that trips by diesel commuter train are 3.5 times more energy efficient than Chicago Central Area auto trips. The total trip from home to suburban station, then by train to a downtown terminal, is found to be 2.2 times more energy efficient than Chicago Central Area auto trips. Pollutant production rates are presented for five

pollutants. For every pollutant except sulfur oxides, trains are found to be less polluting per passenger-mile than autos. Per passenger-mile pollutant emissions from trains are, overall, less damaging by a factor of 5.5 than the per passenger-mile emissions from autos. Travel on these diesel commuter trains is less costly to society than auto travel (1972 suburban-based autos). This is the case whether one compares the train trip alone with an auto trip or the home-to-suburban-station-then-to-a-downtown-terminal trip with a home-to-downtown auto trip. /Author/ Walbridge, EW (Illinois University, Chicago) *Transportation (Netherlands)* Vol. 5 No. 3, Sept. 1976, pp 285-307, 2 Fig., 5 Tab., 42 Ref.

48 142368 ASSESSMENT OF TRANSPORTATION SYSTEM PERFORMANCE IN 1980. The interrelationship of changes in regional land development, transportation systems and air quality was explored in a 1972-1982 time frame. The study assessed the transportation impacts of the interim 1980 households and employment forecasts, assessed the effectiveness of the current Transportation Improvement Program in satisfying demand, and analyzed the transportation-related air quality impacts for 1980. Between 1972 and 1980, the regional employment and households are anticipated to grow by 21 and 18 percent respectively; more than 95 percent of this will occur in the suburbs. The Metrorail System which is scheduled for significant operations in the 1980's will improve job access throughout the metropolitan area, particularly in suburban employment centers. Household growth in the suburbs will result in large increases in intrasuburban travel. The need for research in this area is indicated. Urban background concentrations of carbon monoxide (CO) will be at or below standards in 1980. The study concludes that in order to maximize the investment in the regional rail system, the potential for development around Metro stations needs to be encouraged.

Metropolitan Washington Council of Governments Aug. 1976, 56 pp, 23 Fig., 19 Tab., 3 App.

48 142567 THE ROLE OF URBAN TRANSPORTATION AIR QUALITY CONTROL PLANS IN IMPROVED TRANSPORTATION. Transportation air quality control plans has helped improve the decision making process and management policies of government transportation officials, who moved quickly and positively, shifting emphasis from one area to another, and obtaining new legislation and additional funding. Some policies adopted by Federal government transportation officials to decrease mobile air pollution emissions call for improvement of, and greater funding for public transit facilities: better utilization of highway capacity; more emphasis on paratransit modes; increased technical assistance; encouragement of car pooling; greater emphasis on short-range and intermodal planning; and greater funding for research and development activities, among other policies, strategies, and tactics.

48 143641 ECONOMIC WELFARE IMPACTS OF URBAN NOISE. The basic purpose of this project was to develop a conceptual framework

for estimating the social welfare gains or benefits of reducing current noise levels in urban environments. The project has concentrated on developing economic welfare theory and empirical techniques to assess willingness-to-pay by individuals for noise avoidance. Particular attention was paid to noise produced by motor vehicles and noise produced by operations at construction sites. The theoretical effect of the localized nature of noise on people's willingness-to-pay to control noise was investigated. An efficient pricing scheme for aggregate noise disturbance was devised, based on people's willingness-to-pay for noise reduction. A questionnaire was developed to elicit responses on the physical and psychic costs of noise in urban areas. The attempts to assign dollar values to the costs of noise pollution by determining people's willingness-to-pay to control or reduce noise.

48 144191 EFFICIENT ENERGY USE AND WELL-BEING: THE SWEDISH EXAMPLE. Energy use has always been related to a country's standard of living as measured by the Gross National Product (GNP) ratios of several countries, however, it was found that Sweden maintains as high a standard of living as the U.S. while at the same time using only 60 percent as much energy. This article takes a look at both countries in detail in an attempt to define energy-savings strategies. Physical and economic comparisons are made between the two countries, as well as a comparison of energy use, with tables to illustrate the factual data. In analyzing the differences in energy consumption, the following conclusions are reached: higher energy prices in Sweden contribute to more efficient use of energy; energy-conserving construction is reflected in Swedish building codes; public passenger transport is better in Sweden and costs of owning an automobile are high. This maintains the standards of public transport and affects living patterns: people tend to concentrate in cities, making apartment living more common which saves fuel through more efficient heating systems, and makes trips shorter. So although higher energy prices are an important factor, institutional and social factors cannot be overlooked. It is also necessary to consider the levels of energy intensive activity. Sweden is now operating in a more energy-efficient manner than the U.S., but the U.S. can increase its efficiency without damaging its economy by optimizing to higher energy prices. Swedish methods of conservation could possibly bring about a savings of about 30% in the energy of the U.S. while still allowing it to maintain its standard of living.

Schipper, L Lichtenberg, AJ (California University, Berkeley) *Science* Vol. 194 No. 4269, 761203, pp 1001-13, 5 Fig., 12 Tab., 70 Ref.

48 145328 PUBLIC POLICY DEVELOPMENT: THE MATRIX FOR DECISION MAKING (ABRIDGMENT). This paper is concerned with policy analysis and largely with the social acceptability dimension. It focuses on a specific policy issue: energy conservation in urban

transportation. The purpose is to examine the implications of the more subjective considerations in policy development and to suggest a means for including these dimensions in the larger policy development process. The process described, furthermore, represents an attempt to provide evaluative information to public decision makers in a form and content responsive to their needs. The process is based on two assumptions. One is that data and their analysis should be open rather than closed. The second assumption is that public policy making has an essential linking function between the society and its decision making. Because of matters of social concern attitudes and values determine the acceptability of policy alternatives, some measures of these attitudes and values are essential criteria for the policy making process.

48 146598 BIBLIOGRAPHY FOR TRANSPORTATION ENERGY CONSERVATION. A listing is given of 578 reports, books, articles, and conference papers on transportation and energy. Coverage is primarily on U. S. developments and research from 1970 to 1975. Following a section of citations of general works on energy, the bibliography contains two main parts: "Energy for Transportation" and "Transportation of Energy." Within each of these topics the arrangement is multimodal (at the urban, regional, national, or international level), then by mode. Selected information sources are listed in the last part. Within each section, entries are arranged alphabetically by author or, lacking an author, by

title. References were drawn from the Transportation Center Library collection and other libraries in the Northwestern University system. An earlier bibliography, *Transportation and Energy*, compiled by the Transportation Center Library in March 1974, forms the basis for the arrangement and provides coverage from 1970 to 1973. (ERA citation 01:026008)

48 147505 URBAN TRANSPORT PLANNING AND ENERGY: A REVIEW. This paper examines the way in which policy making and planning for urban transport are affected by the previously neglected relationship of transport and energy. It is centrally concerned with appraising the existing methodology in the light of energy considerations. There are four main sections: section 2 examines in general terms the transport-energy relationship, section 3 outlines the methodology normally used in urban transport policy-making at present, and a critique of this is given in section 4. Some conclusions are presented in the final section. /TRRL/

48 148659 STATE AND LOCAL ROLES IN TRANSPORTATION CONTROL PLANNING. Numerous problems have arisen in the planning and implementation of transportation controls developed under the Clean Air Act. These problems include constraints imposed on the planning process by strict statutory deadlines and limited resources; uncertainties about the nature and severity of the air pollution problems facing metropolitan areas and about the effects on health and welfare of air pollution; incomplete information about the effectiveness, costs, and implementability of transportation control options; lack of explicit investigation of social and economic effects of proposed transportation control strategies; insufficient public involvement in,

and understanding of, transportation control planning; and failure to adapt the transportation control planning process to the existing institutional framework. Despite these problems, transportation controls can have multiple benefits, not only improvement of air quality but also more efficient use of the existing transportation system, energy conservation, increased safety, spurred transit development and better transit services, and more rational use of scarce urban land. Thus, carefully planned transportation controls can meet multiple objectives and support community goals. Steps that can be taken by states and localities now include (a) requiring that certain decisions be made by the organization responsible for adopting a regional transportation plan; (b) coordinating the roles of all levels of government in development of transportation plans; (c) facilitating public involvement in transportation control planning; (d) requiring full impact analysis; (e) undertaking and monitoring experiments and innovations in transportation controls; and (f) requiring periodic evaluation and update of transportation control plans.

48 148664 ENERGY ANALYSIS FOR URBAN TRANSPORTATION SYSTEMS: A PRELIMINARY ASSESSMENT. This paper discusses and evaluates the capability of conventional urban transportation planning system (UTPS) procedures in dealing with energy issues. Central energy-related issues for planning are identified as (a) reevaluation of long-range plans, (b) modal alternatives, (c) investment needs, and (d) funding flow. The UTPS process is capable of dealing quite well with certain energy policies (e.g., speed reductions, increased vehicle efficiency) but generally is a weak tool for addressing other policies (e.g., rationing, Sunday driving bans, urban activity redistributions). Generally the sensitivity analysis capability of UTPS appears stronger than its ability to predict actual impacts. Specific information on gasoline price elasticity of travel by trip purpose, as well as trip priorities, would greatly increase the prediction power of the system.

48 148668 RELATIONSHIPS BETWEEN TRANSPORTATION ENERGY CONSUMPTION AND URBAN STRUCTURE: RESULTS OF SIMULATION STUDIES. If the urban transportation planning process is to deal with the problem of providing transportation in a future characterized by fuel shortages, a long-term perspective is needed. The study described documents the relationships between energy consumption in urban passenger travel and the spatial structure of cities, which is an important determinant of travel demand. Experiments were conducted with 37 hypothetical cities in which combinations of urban form, transport network, and resulting travel patterns were varied

in order to identify structural characteristics contributing to increased energy consumption. Preliminary findings suggest that structural changes in transportation and land use patterns can produce significant reductions in energy consumption for urban passenger travel.

48 149018 KEEP SETTLEMENT OUT OF THE TRANSPORT TRAP. The author states that if car ownership continues to increase and population densities to fall, the dispersed development pattern which results will require a great deal of energy to service it. If energy supply problems occurred in Britain in the 1990s, the changes in land use could not be reversed quickly and individual hardship would be suffered by people living in areas of low population density. It is suggested that the need to move out of areas of high population density should be minimised, an essential part of such an approach being the support of alternatives /TRRL/

48 149049 ADVISORY COUNCIL ON ENERGY CONSERVATION. PAPER 2 PASSENGER TRANSPORT: SHORT AND MEDIUM TERM CONSIDERATIONS. This discussion paper is a survey of passenger traffic, its energy usage, and their bearing on transport and energy policies. Energy usage is illustrated by some new statistics giving the primary energy consumption by passenger modes and types of traffic. Generally energy savings would result if passengers transferred to public transport. However the great superiority of the private car in terms of availability, convenience and flexibility counteracts this. Transport environmental and fiscal policies related to passenger transport often help to conserve energy. Some environmental pressures however tend to go the other way. Policies restricting financial help for public transport may result in short term transfer of passenger journeys to car using more energy. The private use of business cars on a subsidised basis is often likely to lead to a greater use of the car. /TRRL/

48 149273 POTENTIAL OF THE DUAL-MODE TRANSIT SYSTEM TO CONSERVE ENERGY. The energy efficiency of the dual-mode transit system is compared with that of the following urban passenger transportation vehicles: motorcycle, light truck, passenger automobile, school bus, commercial bus, trolley bus, streetcar, and rail rapid transit vehicle. These modes account for 33 percent of the total energy consumed by the transportation sector in the United States in 1971 and 8 percent of the total energy consumed by the entire country. The automobile consumes 95 percent of urban trans-

portation energy. The transit bus and rail rapid transit vehicles are from 2.4 to 2.6 times as efficient as the standard-sized passenger automobile, but, because these modes consume only 1.5 percent of the total energy, they have little effect on the energy situation. The estimate of dual-mode transit efficiency is based on simplified dynamic equations and an assumed vehicle duty cycle. Dual-mode transit is expected to be from 10 to 20 percent less efficient than the transit bus and rail rapid transit vehicle and, by providing a high level of service, has the potential of attracting significant numbers of people who are currently using the energy-intensive automobile. To achieve this promise, a dual mode system must be designed with careful attention to energy-related design details (particularly vehicle weight and must provide the type of service necessary to produce high average vehicle load factors. /Author/

48 149364 NEGATIVE ENERGY IMPACT OF MODERN RAIL TRANSIT SYSTEMS. An analysis of data from the Bay Area Rapid Transit (BART) System is outlined, and it is concluded that rail transit is an energy waster. Improvement of the efficiency of transportation systems could only be achieved by emphasis on the development of more efficient automobiles and the development of bus-oriented transit systems. In this analysis, the criterion of passenger-miles per British thermal unit (PM/Btu) is used to evaluate the relative efficiencies of rail transit and highways. A comparison of construction energy costs reveals that BART used 25.2 times as much energy as required to construct an urban freeway. The operating-energies of BART, buses, and cars are 4740, 2900, and 8310 Btu/PM respectively including both propulsion energy and a pro rata share of the energy involved in constructing the vehicle. BART like all rail transit systems attracts passengers from existing bus systems. Although BART has a high auto-diversion, its net energy saving is only 680 Btu/PM.

48 149946 A NOTE ON THE ENERGY EFFICIENCY OF VARIOUS MEANS OF TRANSPORT. Briefly summarizes the results of an investigation of the energy efficiency of various means of transport, based on statistics from Goeteborg, Sweden for 1970-1974. Tables give the data, energy consumption per place kilometre, energy efficiency and actual energy efficiency (in terms of imported oil) for tramways, buses and cars. The period covered is from 1970 to 1974. Figures illustrate losses in the course of energy flow from source to consumer for electricity (and hot water), diesel oil and petrol. The investigation shows that public transport is the most energy-efficient means of transport in Goeteborg. The relative proportions being 1:3:6 respectively for tramways, buses and cars. Decreases in the energy consumption of trams and buses over the period (1970 to 1974) is attributed to improved rights-of-way for trams and new faster bus ser-

vices. It is also concluded that the increased use of public transport and the replacement of buses on the major routes by trams will result in substantial savings in energy. /TRRL/

48 149987 URBAN MASS TRANSIT ENERGY USE AND CONSERVATION POTENTIAL. Presently bus and rail systems carry only 2.5% of the urban passenger traffic. Although mass transit carries only a tiny fraction of urban traffic, existing bus and rail systems are two to three times as energy efficient as automobiles. Transit efficiencies vary widely depending on city size, time of day, and type of route. Based on the limited data presented here, it appears that transit efficiency improves with increasing metropolitan area population. Bus system efficiency also depends strongly on both time of day and direction of flow. The energy implications of a number of recent transit improvements are discussed. Unfortunately, the energy impacts are slight-in part because transit now carries so few people relative to the total and in part because the increased ridership only slightly reduces automobile traffic. Thus the short-term energy-saving potential of improved and expanded transit service is small relative to the savings possible through measures that directly affect the automobile and its use.

48 151216 AESTHETIC AND ENVIRONMENTAL CONSIDERATIONS IN THE DESIGN OF ELEVATED TRANSPORTATION STRUCTURES. This report addresses issues related to assessing or anticipating visual impacts of elevated transportation structures upon urban settings. Two alternative approaches are outlined for assessing negative impacts of elevated structures upon different settings. The compatibility matrix approach cross-references characteristics of an existing or proposed structure with features of a particular setting to identify conflicts. The case study approach graphically portrays each setting with and without the existing or proposed structure in place to illustrate comparative changes (impacts). Nine hypothetical case studies are presented as examples. Various considerations of ways to improve existing elevated transportation structures are offered, including general restoration noise control and lighting. Considerations are also offered for ways to improve the conditions of elevated train stations and pedestrian skyways. Recommendations for planning new elevated structures are presented.

48 151322 ASSESSMENT OF FUEL-CONSERVATION POTENTIAL OF A GROUND-TRANSPORTATION SYSTEM DUE TO FULL UTILIZATION OF ITS MASS TRANSPORTATION CAPABILITIES. During a fuel shortage situation, low production/fuel consumption areas must be identified and their fuel saving capability (quantitative) must be estimated in order that correct and effective emergency relief measures be proposed. This study first discusses an overall fuel-conservation potential model of a ground transportation system, then focuses its attention on a less comprehensive and manageable problem of assessing the fuel conservation capability of a ground transportation system due to full utilization of its mass transportation mode. The approach is experimental rather than theoretical. A selected city, in this case Kansas City, Kansas was evaluated. The specific works include the estimation of existing excessive mass transit capacity, the auto trips that potentially can be diverted to use mass transit, and the fuel savings due to such diversions. Results are felt to have an acceptable accuracy, and the procedures developed are felt to be useful for assessing fuel saving capability of a ground transportation system under an emergency situation. A manual describing the general use of the developed procedures is included.

48 151721 JOINT EPA/UMTA/FEA STRATEGY FOR URBAN TRANSPORTATION AND AIR QUALITY. VOLUME 2. PUBLIC-PRIVATE URBAN TRANSPORTATION MODAL MIXES. The objective of this four-volume study is to formulate a basis for the design of a joint interagency action program which would simultaneously improve urban mobility and air quality and conserve petroleum resources. This second volume presents an algorithm for calculating the impacts on transportation energy use and pollutant emissions of alternative urban transportation mixes. The algorithm is used to compare the change in national urban energy use and pollutant emissions implied by the maximum conceivable diversion of 1990 urban auto travel to bus, rail and para-transit compared to the no-diversion case. This exercise is supported by appendices showing the derivation of the methodology and of the database. The volume also includes a discussion of issues, tradeoffs, and methodologies relevant to the local determination of a balanced modal mix in an individual metropolitan area.

48 151723 JOINT EPA/UMTA/FEA STRATEGY FOR URBAN TRANSPORTATION AND AIR QUALITY. VOLUME 4. INFORMATION DATA BASE: STATUS OF URBAN CONGESTION, AIR POLLUTION, AND ENERGY USE. The objective of the study is to formulate a basis for the design of a joint program which would simultaneously improve urban mobility and air quality and conserve petroleum resources. This fourth volume contains INTERPLAN's initial definition of the transportation-related urban problems now faced by UMTA, EPA, and FEA, and their authority to cope with these problems. The current status of transportation-related urban congestion, air pollution, and energy usage is analyzed on a national level, and the future status likely to obtain if present trends continue unchecked is projected. Congestion and air pollution is also examined in four cities: Los Angeles, Philadelphia, Seattle, and Baltimore.

48 151766 TRANSPORTATION FACILITY PROXIMITY IMPACT ASSESSMENT. This study provides techniques for the assessment of proximity impacts related to transportation facilities. The examination of proximity impacts included those related to highways and freeways, busways, and special operational improvements, transit, and new modes of transit. Proximity impacts are those direct and indirect effects which represent a significant change from existing or future community conditions. A two-stage evaluation was developed for the assessment of the following impact indicators: noise, air quality, traffic volume and accident experience, parking availability, pedestrian safety, land use, local fiscal effects, aesthetics, access/barrier, and neighborhood/community disruption. The report also includes an illustrative application of the assessment procedures to a candidate transportation project.

48 152439 COMPUTER-ASSISTED PLANNING FOR RAIL TRANSIT NOISE CONTROL. This paper describes a computer assisted methodology for planning rail system noise control. Noise control usually involves several sequential stages of planning and design. At each stage, interactions with other design factors are clarified, the number of design options is usually reduced, and the level of detail is increased for analysis of costs and performance. In contrast with highway planning, urban rail system planners and managers can control a very wide range of system design elements, e.g. both on vehicle and guideway.

Lotz, R (Transportation Systems Center); Institute of Noise Control Engineering Proceeding 1976, pp 221-224, 3 Fig., 2 Tab., 2 Ref.; Presented at the 1976 International Conference on Noise Control Engineering, Washington, D.C., 5-7 April 1976.; ACKNOWLEDGMENT: Institute of Noise Control Engineering; ORDER FROM: Noise/News, P.O. Box 1758, Poughkeepsie, New York, 12601

48 152441 THE ANALYSIS AND CONTROL OF ROLLING NOISE IN URBAN RAIL TRANSIT SYSTEMS. When an electric-powered steel wheel transit vehicle moving on straight, continuously welded rail passes an observer, the predominant noise heard is rolling noise. This is the noise produced by small-scale roughness on the running surfaces of the wheels and rails. The minute peaks and valleys of the surface roughness excite both the wheels and the rails, which in turn radiate a characteristics broadband noise. Before cost-effective control of this noise can be developed, the mechanism for its generation must be clearly understood. The study reported here undertook to develop analytical empirical formulas for the prediction of rolling noise that contain all the important parameters describing the wheel/rail dynamic system.

48 152442 SUBWAY TUNNEL ACOUSTICS-INFLUENCE OF SOUND ABSORPTION TREATMENT OF TUNNEL WALLS. One way of decreasing the noise level in subway systems is to treat the subway tunnel walls with sound absorption material. This has been done in some sections of the Washington Metropolitan Area Transportation System. The treatment has consisted of Pyrok spray-on on the lower parts of the walls. Totally the treatment covers approximately 20% of the circumference. To study the benefit of the treatment tests have been performed with a cannon as a sound source. The time history of cannon shots at different distances from the source has been evaluated.

48 152444 RAIL RAPID TRANSIT ASSOCIATED NOISE ANALYSIS. This paper presents a simple analytical model for predicting wayside noise levels attributed to moving rail rapid transit trains. The physical problem treated by the model is defined as follows: given the receptor location relative to the rail track, the characteristics of passing trains (e.g., speed, length, headway, and the type of train), the rail track configuration (e.g., with or without sound barrier, and at-grade, elevated, or depressed roadbed), and the time period of interest, find the cumulative noise distribution at the receptor. The model provides a convenient method for analyzing potential community rail noise impacts for use in the planning and design of rapid transit projects.

48 152975 TRANSPORTATION, ENERGY, AND COMMUNITY DESIGN. This article which notes that 25-30 percent of the world population lives in urban areas, and consumes a disproportionate amount of energy, also points out that by the year 2000, most of that population will be more urban than rural. The activities to which the urban population desires to gain access are considered, and it is emphasized that if the possibilities of urban design are fully exploited, travel volumes can be reduced, material and human energies conserved, time and other resources saved, and a more desirable urban community can be achieved. Current trends in transportation are considered and examples of planned communities are described. A national policy for urban growth is discussed and experience in foreign countries is quoted. The need is expressed for a global programme of city-building and cooperative research and development aimed at bringing about the integration of urban design and transport.

48 153120 ENERGY: VIEWS OF A STATE DEPARTMENT OF TRANSPORTATION. This description of the impact of the recent energy crisis on New York State identifies the actions taken by the State Department of Transportation (NYDOT) as a supplier of transportation facilities (and as a consumer of energy), discusses the transportation planning under energy constraints, and points out needed improvements in the planning process for both short-and

long-term decision making. The improvement and expansion of public transportation systems, faster and more extensive intercity and rural bus service, improved rail service, carpooling and vanpooling, and traffic operational projects are among the NYDOT's approaches to reduce energy usage. The NYDOT has also implemented several changes in its highway construction specifications resulting in fuel conservation and the improvement of the quality of the road.

Campbell, EW (New York State Department of Transportation) *Traffic Quarterly* Vol. 31 No. 1, Jan. 1977, pp 21-31

48 153205 LOAD LEVELING WITH ELECTRIC VEHICLES IN THE URBAN ENVIRONMENT. Forecasts of vehicle populations and degree of electrification are made. Also, electrical load curves, for the two seasons of summer and winter are forecast upon which vehicles recharge is superimposed. It is shown that unless very significant changes in mass transit occur, the personal automobile will dominate any load-leveling effect a city might experience, by 1990, this paper forecasts 52 percent conversion of personal cars to electric propulsion. The study shows the possibility of increasing the daily load factor or low/high power ratio by 10-20 percentage points which could cause a reduction in the production cost of electricity since the most efficient units are used. However, this does not require the addition of new generation capacity since the need comes during off-peak hours and would not seriously exceed, if at all, daytime peaks, at least through 1990.

Jerabek, EC ; Society of Automotive Engineers SAE 769065, Sept. 1976, pp 382-389, 14 Ref.; Proceedings of the 11th Intersociety Energy Conversion Engineering Conference, September 12-17, 1976.; ACKNOWLEDGMENT: EI (EIX770300161); ORDER FROM: ESL

48 153393 AERODYNAMICS AS A SUBWAY DESIGN PARAMETER. A parametric sensitivity study has been performed on the system operational energy requirement in order to guide subway design strategy. Aerodynamics can play a dominant or trivial role, depending upon the system characteristics. Optimization of the aerodynamic parameters may not minimize the total operational energy. Isolation of the station box from the tunnel and reduction of the inertial power requirements pay the largest dividends in terms of the operational energy requirement.

48 154081 PERFORMANCE CHARACTERISTICS OF A DIESEL ENGINE USING LOW- AND MEDIUM-ENERGY GASES AS A FUEL SUPPLEMENT (FUMIGATION). The use of low-and medium-energy gases derived from solid waste is investigated. Gases that simulate those gases that could be derived from refuse were injected into the air inlet of a 298-kilowatt (400 horsepower) diesel engine as a fuel supplement. This process is called fumigation. Three different gases with thermal-energy contents of 6.11 MJ/cu m (164 Btu/cu ft), 18.1 MJ/cu m (485 Btu/cu ft), and 18.8 MJ/cu m (505 Btu/cu ft, respectively, were used at rates ranging

as high as 20 percent of the normal fuel oil energy at four different engine load points. The test results indicated approximately 100 percent gas energy utilization with no observable deleterious effect on the engine.

48 154401 IMPACT OF A SUBURBAN RAPID TRANSIT LINE ON FUEL CONSUMPTION AND COST FOR THE JOURNEY-TO-WORK. ANALYSIS OF THE PHILADELPHIA-LINDENWOLD HIGH-SPEED LINE. The Philadelphia-Lindenwold High-Speed Line, a modern park-n-ride rail rapid transit system, may be regarded as a prototype of transit systems being evaluated by several U.S. metropolitan areas. Two analyses of the line are presented which are potentially useful for evaluating the potential of similar transit systems for conserving energy. First, the electrical energy consumption, fuel consumption and fuel cost per passenger-mile and car-mile are estimated from operating data, and compared with estimates for auto and bus modes. Second, these estimates are applied to the 1970 Census journey-to-work data to estimate person-miles of travel, fuel consumption and fuel cost by mode, origin and destination for an actual commuting situation. Interpretation of the results and a brief policy assessment of the role of such systems in energy conservation conclude the report.

48 157256 TRANSIT'S ENERGY EFFICIENCY: MAKING A GOOD THING BETTER. An attempt is made to point out several areas where energy conservation is possible, specifically, in existing public transit systems and in general urban passenger transportation systems, through the more effective use of these systems. The paper focuses on short-term solutions and the initial, but essential steps to long-term solutions. Current direct energy consumption statistics for the standard transit modes (city/suburban transit bus-usually diesel fueled, and the rail modes such as light rail, rapid transit and commuter rail) as compared to the urban automobile. Three changes that can be made to the transit system itself to improve its efficiency are discussed. These changes include vehicle technology improvement and two types of relatively low-cost network improvements. It is noted

that current technology allows a shift to electrical power. Staggered working hours would allow system utilization to rise greatly without heavy capital expenditures. Traffic management schemes and proper pricing of energy intensive modes will increase transit ridership levels of service which will create a feedback loop to further increase ridership, levels of service, and reduce regional energy consumption.

Bernard, MJ, III (Regional Transportation Authority) LaBelle, SJ (Argonne National Laboratory) *Transit Journal* Vol. 3 No. 2, 1977, pp 41-52, 4 Fig., 2 Tab.

48 157676 RAILROAD AND RAIL TRANSIT NOISE SOURCES. The railroad or rail transit system design team must predict A-weighted, or preferably, octave band sound pressure levels near passing trains. This is the first step in estimating noise over any area of potential impact and in subsequent selection among noise abatement design alternatives. In this paper recently reported measurements of locomotive and railcar noise emission are reviewed and presented for use in making such design predictions.

48 157685 PREDICTION AND CONTROL OF NOISE FROM RAILWAY BRIDGES AND TRACKED TRANSIT ELEVATED STRUCTURES. This paper reviews the current approaches to the prediction and control of noise radiation from railroad bridges and elevated rail transit structures. The results of noise measurements near a variety of bridge and elevated rail structures are summarized and these structures are rank ordered according to their sideline noise levels. Methods for the control of elevated structure noise are discussed and the results of actual field applications of these treatments are summarized. This article also describes a new analytical model capable of estimating the effects of structural parameters on both vibration transmission within, and noise radiation from, an elevated structure. A sample application of this model is used to evaluate several methods for noise abatement on a composite concrete deck, steel plate girder structure. The paper concludes with a set of recommendations for further research.

48 157790 PROVIDING FOR AIR QUALITY AND URBAN MOBILITY. The process of incorporating air quality considerations in planning, the basic relations between transportation and air pollution, techniques for achieving air quality, and the institutional difficulties of implementing transportation control techniques are discussed in this exploration of ways in which air pollution considerations might be incorporated in the decision-making process. The air quality problem related to transportation is not solely a function of vehicle emissions, and the planner must understand how factors such as direction and speed of wind, time of day, and physical barriers affect the problem. Primary and secondary air quality standards established by federal and state governments are discussed and tabulated. The relation of vehicle technology and the effects of speed, travel mode, and operation mode on the emission of pollutants are set forth. Techniques of air quality control are grouped into programs oriented toward vehicles, traffic flow, and reduction of pollution concentration. There is a need for improvement of communications between DOT and EPA, and obstacles that may arise are noted. The report shows that transportation control techniques may be used to achieve air quality (some of these may infringe on mobility goals and others may not). It is suggested that short-term actions aimed at ameliorating air pollution must aim at fostering communication among responsible agencies. Long-term actions require research and more analytical information. /Author/

48 157792 SHORT-TERM TRANSPORTATION CONTROL STRATEGIES FOR AIR POLLUTION CONTROL. Seven short-term transportation control strategies are identified as likely candidates to provide for short-term reductions in carbon monoxide emissions for motor vehicles and attainment of primary standards for carbon monoxide for the 1975 deadline: inspection, maintenance, and retrofit; conversion to gaseous fuels; traffic flow techniques; bypassing through traffic; improvements in public transportation; motor vehicle restraints; and workschedule changes. For each of these candidates, the paper describes the air pollution control potential, the maximum feasible emission reduction, and the institutional feasibility. The findings are based on an EPA-sponsored study of Chicago, Denver, Los Angeles, New York, San Francisco, and Washington, D.C. Emphasis was placed on identifying transportation controls that could be available within a period of 3 years, realistically subject to implementation by state and county governments and institutionally and technically feasible. In addition, three of the control strategies (inspection, maintenance, and retrofit; traffic flow controls; and motor vehicle and public transport improvements) were tested through simulation methods applied to each of the six cities. The paper summarizes the primary results of these tests as isopleths of pollution concentration for carbon monoxide, hydrocarbons, and oxide of nitrogen for the 1-and 8-hour

periods of maximum VMT for a base year projected to 1977 under both uncontrolled (no transportation control strategy) and controlled conditions. /Author/

48 157911 VENTILATION IN THE METRO [L'atmosphère du métro]. The Paris Transport Authority, which conveys 4 million passengers per day on lines most of which are underground, has set 4 objectives for air-conditioning its installations. In summer, the temperature should not be more than 5 deg C higher than outside temperatures, air in tunnels should be renewed 4 times every hour, the speed of air currents must not exceed 5 m/s, and humidity must remain between 30 and 70 percent. Better ventilation systems will be installed, as well as air vents, equipment for air renewal and for ventilation in vehicles; biological climatic, thermal and aerodynamic studies will be carried out with the view to energy retrieval. 48 163018 BERKELEY ENVIRONMENTAL SIMULATION LABORATORY: A TOOL FOR TRANSPORTATION PLANNING (ABRIDGEMENT). This laboratory was designed to improve the general quality of environmental simulation and to carry out basic research on the issues of public communication facing the environmental and planning professions. The laboratory uses a dynamic environmental simulator that enables one to visually walk or drive through small 3-dimensional scale models of urban and natural environments. A remote-controlled television camera that is equipped with tiny viewing attachments moves through scale

models of the environment and continuously projects eye-level views on closed circuit television screens. Trips through miniature environments can be displayed live to a large audience. Color films and videotape can also be made for comparative feedback, permanent records, and later presentation. The laboratory has model and film-making facilities. Five potential uses of the simulator are described. The development of realistic simulations, and the environmental qualities that could be simulated are discussed, and comments are made on truth and deception in simulation.

48 163297 ENERGY SAVING PUBLIC TRANSPORT. The extent of the current British Rail Great Northern suburban electrification scheme comprises 111 route km and 365 single track km. The Outer Suburban part of the system uses a 25 kv single-phase overhead system; the Inner Suburban part, which must run in tunnels, is equipped with a 750 v dc third-rail system. The rolling stock consists of Class 312 four-car electric multiple units for the Outer Suburban service from King's Cross to Royston and Class 313 three-car electric multiple units providing the Inner Suburban service between Moorgate and either Hertford North or Welwyn Garden City. The Class 312 cars have a maximum speed of 90 mph, and a maximum acceleration of 0.9 mph/sec. Normal braking is about 1.8 mph/sec, with 2.2 mph/sec for emergency application. The Class 313 units have a maximum speed of 75 mph with rheostatic braking to 12-16 mph, using air-operated disc brakes to effect the final stop. Waste heat from rheostatic braking is used for warming the passenger accommodation. The Class 313 design enables electric current to be collected from either the 25 kV ac. overhead line equipment or from the 750 volts dc third rail systems. Changeover between overhead contact and conductor rail operation is controlled manually by the driver from the operative driving cab. When the 750 volts D.C. system is selected, the vacuum circuit breaker is locked open and the pantograph system physically locked in the down position. Indicator lamps show the system selected. If a train should run on to a live conductor rail section with the overhead contact equipment

connected, or vice-versa, a buzzer sounds continuously until all the train equipments are correctly switched to the appropriate system.

48 163869 THE IMPLICATIONS OF OIL RESOURCES DEPLETION FOR URBAN PASSENGER TRANSPORT INVESTMENT. An investigation into the implications of energy consideration for long-term urban transport planning is reviewed. The results obtained were reported in a series of working papers on urban transport planning and energy, and a monitoring study of rail commuting on Merseyside with particular reference to the effects of increases in the price of petrol. These working papers are discussed. It is suggested that of the many areas considered for further study, long-term aspects of transport energy should be investigated with a view to developing the techniques employed in the study. For the work into short-term aspects, it is considered that monitoring could be further developed as an addition to the formulation of urban transport policy. /TRRL/

48 163873 HOW MUCH FUEL DOES A TRAVELLER USE? A COMPARATIVE STUDY OF THE ENERGY REQUIRED FOR PASSENGER TRANSPORT BY CAR, BUS AND RAILWAY [Hoeveel brandstof gebruikt een reiziger? Een vergelijkende studie van het benodigde energieverbruik voor reizigersvervoer per auto, bus en trein]. The energy consumption of different types of trains, buses and five cars of different price categories is studied. The question is directed towards the comparison of the energy consumption per traveller kilometer in certain traffic situations. For this reason a division is made between transport in urban areas and transport over long distances. The results presented are obtained by a computer simulation, from which the model is obtained. /TRRL/ [Dutch]

48 164195 THE EFFICIENT USE OF ENERGY IN TRANSPORT. THE CONTRIBUTION OF URBAN TRANSPORT PLANNING TECHNIQUES. Transport, either urban, inter-city or rural is a necessary though unproductive daily activity. Very large quantities of energy are used in moving people and goods from place to place. This energy consumption may be reduced through: (a) transport vehicles having increased efficiency in their use of energy, (b) maximum use of the more efficient vehicles, (c) the planned distribution of population and land use to minimize travel, and (d) the substitution of alternative means of communication to reduce the need for travel. While much is known about (a) and (b), it is only in recent years that the problems

of (c) and (d) have been tackled on a comprehensive scale. Processes used in urban transportation studies are well suited for use in this type of planning. A comprehensive transportation study is an interdisciplinary study involving analysis of the relationships between the distribution of population and land use and the resulting movements of people and goods through an area. The relationships being basic are relatively stable and suitable for forecasting travel. With this type of study several different population and land use forecasts and their transport implications can be simulated and examined. As a result, it is possible to determine which types of population distribution are likely to encourage the least travel. /Author/TRRL/

48 164250 USE OF A LOWRY-TYPE SPATIAL ALLOCATION MODEL IN AN URBAN TRANSPORTATION ENERGY STUDY. This paper describes the structure of a lowry-type spatial allocation model and the results of using the model to evaluate several different hypothetical urban forms with respect to the level of transportation energy consumed in urban passenger travel. The lowry-type model was used together with simple models of trip generation, mode choice and trip assignment to produce realistic land-use patterns and characteristic travel behavior in each city. Interzonal trip matrices were computed for each of five trip purposes (work, two types of shopping or service, non-home based and social) and following the assignment of trips to the network, energy models for automobile as well as transit were utilized to assess the transportation energy consumed over all trip purposes in each of several different urban spatial structures. /TRRL/

48 164273 PERCEIVED ENVIRONMENTAL UTILITY UNDER THE INFLUENCE OF ALTERNATIVE TRANSPORTATION SYSTEMS: A FRAMEWORK FOR ANALYSIS. The view that citizens should be involved in transportation planning is now widely accepted. However, there have been few attempts to measure residents' perceptions of the effect of alternative transportation proposals on their environment. The study reported here draws up a conceptual framework for measuring firstly the perceived attributes of a residential environment, and secondly how a population evaluates such an environment under different transportation options. In each instance the conceptual framework is tested by making use of case study data. At the first stage it is demonstrated how Kelly's personal construct theory and related procedures can be applied to elicit cognised environmental components of urban places. One urban place is selected and population clusters which are "homogeneous" in socioeconomic characteristics and activity patterns are defined. The indscal model is then

specified and applied to determine whether members of each population cluster evaluate the attributes of their environment in the same way under alternative transportation proposals. The measures of environmental utility for each proposal which the model produces show considerable variation within the groups. However, the model successfully defines each group's response to the effects of different transportation options. /Author/TRRL/

48 164426 STUDY OF RAILROAD NOISE REDUCTION BY NOISE-PROOF WHEELS.

In recent years, noise pollution created by railroad vehicles has become a major problem that must be solved urgently. The Teito Rapid Transit Authority and Sumitomo Metal Industries Ltd. have received a subsidy from the Transportation Ministry of Japan to investigate the vibration and noise characteristics of several types of soundproof wheels. This paper presents the results of laboratory and field tests on the soundproof wheels, comparing them with conventional steel wheels. It is concluded that the resilient soundproof wheel can reduce noise under the car-body floor from 3 to 5 decibels, while the damping soundproof wheel can reduce it from 1 to 3 decibels. [Japanese]

48 164997 **EVERGY CONSERVATION IN URBAN TRANSIT SYSTEMS.** Though urban transit systems are currently an energy efficient means of transporting people, this presentation will outline strategies to make these systems more efficient as well as to reduce total regional transportation energy consumption through greater reliance on these systems. This paper focuses on near-term improvements and on the initial steps essential for far-term solutions. Because of this focus, the improvements suggested work with current technologies and modifications of these technologies. In any transportation system the strategies for saving energy can be broken into five categories. They are network improvements, operational changes, demand reductions, modal shifts and vehicle technology. This presentation suggests improvements within the framework of these categories and demonstrated their potential energy savings. /Author/

48 165566 **AUSTRALIA'S ENERGY OPTIONS IN THE TRANSPORT SECTOR.** The paper reviews Australia's total energy requirements under a number of scenarios through to 1990. Particular attention is paid to the demand for transport fuels in the context of these economic scenarios. In spite of the oil crisis of 1973 and the efforts since then by countries such as Australia to reduce this dependence on imported oil, our continued dependence on oil in this period is shown. Within the transport sector the signifi-

cance of the energy requirements of road transport (private and commercial) is noted under all scenarios. The growth pattern of this transport fuel market is examined in the light of a number of possible changes which could occur in the use of cars, their design and the fuels they use e.g. Increased use of smaller cars, increased use of diesel engines, introduction of electric cars, pollution controls, fuel quality changes, increased use of public transport, use of non-oil based fuels. Particular attention is paid to the period up to 1990 and the impact that these changes could have together with the effect of delaying the date of their implementation. /Author/TRRL/

48 165580 FUEL ECONOMY IN PEAK HOUR TRAVEL.

The significance of urban road vehicles as the largest user of liquid transport fuel is pointed out. In an investigation aimed at assessing the fuel used against inertia forces (which together with rolling resistance form the most important components of energy usage in urban driving), fuel consumption and speed/time data have been obtained for a passenger vehicle travelling over a variety of routes in urban Melbourne. Fuel consumption has been related to an acceleration index (derived from the speed/time trace) which represents the acceleration conditions experienced by the vehicle. This index is proposed as a basis for a road fuel consumption test under "floating car" conditions and for determining aggregate fuel consumption on a section of arterial road. The acceleration conditions experienced by the test car were found to differ from those which would occur in the saa draft standard city cycle for petrol consumption (i.e. That prescribed by adr.27a for emissions) and these differences are illustrated. /TRRL/

48 165581 ASPECTS OF ENERGY INTERACTIONS AND EMISSIONS IN URBAN TRAFFIC.

A vehicle emissions model has been developed which has been used in conjunction with a study of traffic patterns for four city driving types. The driving patterns are most closely explained by the halts per kilometre and average speed. Hydrocarbon emissions are closely related to average speed. The influence of acceleration/deceleration rates and frequency is a second order effect which can cause a -30% additional variation in hydrocarbon emissions. The dependence of nitrogen oxide on speed is small and acceleration variations can cause -70% variation in emissions at same speed. Traffic management as a primary nitrogen oxide control strategy

appears practical. Steady state driving would reduce nitrogen oxide emission by 90%. Reductions of 60% have been achieved in the CBD area where traffic speeds are very low 12.9-19.3 kph. A queue and cruise system involving simple traffic signalization could accomplish this. /Author/TRRL/

48 165636 TRAFFIC AND ENVIRONMENT-CASH VALUES.

The incentive for producing a cash value of the environmental impact of traffic is in order to compare it with travel benefits and scheme costs in common units. This paper describes some early work on a new method of assessing such a cash value. The method consists of assessing the value of a place to its residents and visitors by studying people's behavioural patterns in relation to property values and trip-making respectively. The visitors value is calculated using a transportation model. Several case studies are described illustrating both the beneficial effect of traffic relief and injurious effect of "new" traffic. /TRRL/

48 165677 TRANSPORTATION AND THE ENVIRONMENT.

The book examines the long term sociological effect of changes in transportation on the environment. The subject is viewed from two aspects. The first is the generation of problems such as traffic congestion, lack of parking space and the financial problems of providing bus and rail services, while the second is the changes in society due to fundamental changes in transport systems. The author discusses this aspect in the following chapters: (1) Introduction to the transport problem, (2) Some effects of transport on the environment—a historical point of view, (3) Transport investment and the environment, (4) Transport organisation and the environment, (5) Personal transport and the environment, and (6) Transport and the environment: some possibilities of the future.

48 166149 FUEL CONSUMPTION; TRANSPORTATION (A BIBLIOGRAPHY WITH ABSTRACTS).

Fuel consumption by automobiles, trucks, buses, and general aviation aircraft is discussed. Topic areas cover the effect of road conditions, traffic conditions, and emission controls on fuel economy; projected growth and problems facing air transportation; energy efficiency of various urban transportation modes; energy use forecasts; and projections of supply and demand in the transportation sector. Bibliographies on fuel consumption in the industrial, residential, and commercial sectors and on electric power consumption are also available. (This

updated bibliography contains 230 abstracts, 95 of which are new entries to the previous edition.)

48 167064 GUIDELINES FOR IMPROVED RAPID TRANSIT TUNNELING SAFETY AND ENVIRONMENTAL IMPACT. VOLUME II. ENVIRONMENTAL IMPACT. Two of the major objectives of the Urban Mass Transportation Administration Tunneling Program are to lower subway construction costs and reduce construction hazards and damage to the environment. This study consists of a two-volume report and aims to develop guidelines for improved rapid transit tunneling safety and environmental impact, that is, this effort is directed toward underground construction applicable to modern transit subway systems in urban areas. Investigation of subway construction jobs shows that at least two principles underlie treatment of environmental problems. First, planning and design should consider both short-term and permanent damage to environment, and second, a need for better communication of contractor's

planned activities and public concerns so that disruptions can be minimized. Guidelines were developed along these principles and are grouped into the following categories: general, community relations, and specific environmental control techniques.

48 167323 IN-SERVICE PERFORMANCE AND COSTS OF METHODS TO CONTROL URBAN RAIL SYSTEM NOISE. TEST AND EVALUATION PLAN. This interim report is the test and evaluation plan, the second report of a study to investigate the effectiveness of four techniques for reducing wheel/rail noise in rail rapid-transit systems (resilient wheels, damped wheels, wheel truing, and rail grinding). The previous report covered experimental design. The ultimate goal is to provide sufficient information to allow a transit system with given track and car conditions and budgetary constraints to determine the mix of the available methods of control of wheel/rail noise which will result in the greatest overall benefit. The purpose of this report is to detail the methods and equipment that will be used to collect, manage, and reduce the data on both acoustic performance and costs of the four noise control methods.

48 167613 CARS AND KILOWATTS. This brief review of electric and hybrid vehicle development in the U.S. and abroad, notes that while U.S. manufacturers remain uncommitted, private industry in Europe and Japan has already taken the initiative in this area. The Department of Energy is currently developing data relating to the present state of the art of electric and hybrid vehicles. Commercial vehicles such as the English Electric light delivery truck and the British-built Harbilt vans the described, and comments are made on hybrid vehicles such as the Volkswagen taxi. Electric vehicle development programs conducted in Europe and Japan contrast with approaches favored in the U.S. German projects emphasize the systems approach in which attention is divided between vehicles, batteries and support systems. The Europeans believe that urban transportation (delivery vehicles, buses) is the logical first role for these vehicles. The thrust of the Japanese national effort in this field is toward evaluating new construction and propulsion technologies. Experimental batteries and their performances are discussed. It is pointed out

that the success of future vehicles could hinge on the availability of spare parts and trained service personnel.

48 167865 PRESIDENT CARTER'S ENERGY PROPOSALS: A PERSPECTIVE. This analysis of the Administration's energy plan concludes that the strategies proposed would be effective in reducing energy use and dependence on oil imports, but that the estimate of the magnitudes of import savings are overoptimistic. This report analyzes 5 major sets of proposals: pricing of crude oil; pricing of natural gas; conversion to coal; automobile-related proposals, and tax credits for home insulation and solar heating equipment. The long-run (the growth in oil and gas consumption exceeds the growth in reserves) and short-run problems (U.S. imports of oil have increased substantially) have created the need for a national energy plan. The major reason for dependence on imports is the system of price controls on oil and gas which have kept the domestic price of these fuels below world levels. Three strategies have been proposed to reduce dependence on imports: reduce long-term growth in energy demand by imposing excise taxes that would raise the price of petroleum; increase large industries' and utilities' use of coal instead of oil or natural gas by taxing their use of the latter fuels; and increase domestic supplies by reintroducing market pricing or near market pricing for truly new energy supplies. An important element of the proposal is the effort to raise the price of petroleum and natural gas by predictable increments so that consumers and businesses can make decisions on the basis of higher future energy prices. Energy price increases under the plan would be achieved mainly by a system of taxes to be rebated to customers.

48 167922 THE STORM OVER THE CBO REPORT. Rebuttal is given to the Congressional Budget Office report, "Urban Transportation and Energy: The potential Savings of Different Modes." Administration spokesmen, industry officials, state transportation officers and members of the academic community refute the allegation that new rail-transit systems rate poorly in terms of energy efficiency.

Ichniowski, T *Railway Age* Vol. 178 No. 21, Nov. 1977, p 32, 1 Phot.; ACKNOWLEDGMENT: Railway Age; ORDER FROM: ESL

48 168020 URBAN TRANSPORTATION AND ENERGY: THE POTENTIAL SAVINGS OF DIFFERENT MODES. Transportation in cities consumes about 10 percent of all the nation's fuel. Potential savings through shifts in urban transportation policies have generated interest in Congress and elsewhere. This paper describes the energy requirements of alternative urban transport technologies and assesses the effects on urban transport fuel consumption of various programs Congress might consider in order to save fuel. This analysis presents several measures of energy use, ranging from a narrow index of propulsion needs to a broad index of program energy savings. Attempts are made to consider energy needed to build and maintain roads and

tracks, vehicles, stations and other facilities. Considered are vanpool, carpool, bus, automobile, rapid transit, light-rail transit and commuter railroad. The authors conclude that rapid transit offers little to aid the nation's efforts to save fuel. This is based on such assumptions as the use of automobiles to reach the rapid transit station by most riders, and circuitous routings of fixed-guideway systems.

48 168086 NOISE LEVELS ASSOCIATED WITH METROPOLITAN RAILWAYS OR URBAN RAPID TRANSPORT SYSTEMS. VDI-SPECIFICATION 2716 [Geraeusssituationen bei Stadtbahnen. VID-Richtlinie 2716]. The purpose of the specification is to provide a basis for determining the noise levels under various local operating conditions and track alignments, for use in the planning of metropolitan railway systems. The terms are first defined: metropolitan railway sound level: maximum and minimum sound levels. Both the maximum sound level for the passage of a train at a distance of 7.5 M from the track centre line under normal conditions and also the influences on the maximum level of variations in the measurements specified in the specification are described to illustrate the problems of external noise from metropolitan railway vehicles (or rapid transit vehicles) on elevated stretches. The influences covered include: speed; acceleration and braking noises; elevated construction, wheel, tires or rims; wheel construction; rails; layout of stretch; the relationship of the direction of the noise waves to the vertical plane; building development at the side of the track; acoustic screens and curves in the track. The problem of internal noise is also treated and the influences on the internal noise level caused by deviations from the specified measurement conditions of several parameters are covered: speed; tunnels; elevated construction; coach occupancy; wheel, tire or rims; construction of wheels and rails. Other factors covered are the problems of noise at underground stations, both for incoming and departing trains, the noise from moving trains in tunnels, in sections directly underneath the tracks as well as in houses near stretches of tunnel. Finally, in an appendix, mathematical formulae are developed for the calculation of maximum and median noise levels. [German]

48 168765 STATE ENERGY CONSERVATION PLANS: GUIDELINES FOR TRAVEL DEMAND ANALYSES OF PROGRAM MEASURES TO PROMOTE CARPOOLS, VANPOOLS, AND PUBLIC TRANSPORTATION. The manual provides worksheets and a set of simple procedures for analyzing the energy conservation potential of transportation-related measures being considered to increase carpooling, vanpooling and transit. It is intended for use by states and metropolitan planning organizations to calculate their localized energy impacts from implementation of various transportation policies.

48 170020 INVESTIGATION INTO THE NOISE EMISSION OF OVERHEAD RAILWAYS [Untersuchungen der Geraeussschabstrahlung von Hochbahnen]. The noise emission from overhead railways in the vertical plane shows a reduction of about 5 to 7 dba independent of vehicle speed compared to the highest emission levels for angles between 0 deg and 30 deg from the horizontal and a reduction of about 8 dba to the area below 45 deg from the horizontal shielded by the fly-over structure. Vehicle speed has the greatest influence upon noise, so that an increase of 10 km/hour in the 20 km/hour to 60 km/hour band effects an increase of 4 to 5 dba in the noise level. Above 60 km/hour the noise increase per 10 km/hour speed increase is 1 to 3 dba less than at the lower speeds. With a tram system using rails set in an aggregate bed there is about 3 dba noise increase per 10 km/hour speed increase--a lower increase than for the Rotterdam metro (4 to 5 dba)--in the 22 km/hour to 50 km/hour band. Where both sides of an overhead railway are built up, the noise level on the eleventh floor of adjoining property rises by 3 to 5 dba. An increase in the clearance to each side of the structure, from 10 m to 20 m reduces the level of noise on the eleventh floor by 1 to 2 dba. In open areas, however, the noise reduction by doubling the clearance up to 25 M is 4 dba, from 25 M to 50 M it is 5 dba and at great distances the metro acts as a point noise source with 6 dba noise reduction for each doubling of the clearance. Trams with unground wheels on unground track emit up to 3 dba higher noise levels than the same with ground wheels on ground track. [German]

48 172146 AIR QUALITY CONTROL STRATEGIES: THE PUBLIC VIEWPOINT. An attempt is made to determine the amount of public support some proposed TCP (transportation control plan) strategies might receive among residents of the New York section of the Tri-State region. Existing information is assembled to show how citizen feedback can be useful in examining the wide range of issues involved in implementing air quality control measures. The study shows that the intensity of public concern for pollution in relation to other social problems has declined in the last 5 years. The public seems to prefer limitations on how and where they can drive, to the burden of financial penalties in support of traffic control strategies. The highest support is for improving public transport. Suburbanites and city residents view pollution somewhat differently, and it was observed that no single carpool incentive program stood out as being most effective. The study concludes that implementation of TCP strategies require political and administrative decision by various levels of government. The public, government, private industry and special interest groups all play a part in the implementation of TCP strategies. It is incumbent on planners and administrators to examine thoroughly the package of services offered to the public. The planner must propose strategies that meet public acceptance, or educate the public about effectiveness and desirability of his proposals.

48 173314 ENERGY AND RESOURCE CONSERVATION. The author suggests that one of the most distressing aspects of society's use of our resources is the enormous waste often resulting from a lack of control, inefficient operation and management, or pure indifference to their value; and that this can be seen in the use of minerals, energy, dereliction of land, and the use of water and construction materials. The municipal engineer is considered to be uniquely placed to play a major role in combating resource problems through his position in public service, responsible for many of the technical and managerial aspects of energy and resource conservation. The municipal engineer's involvement in energy and resource conservation is discussed in relation to known sources of energy, and the utilisation of such energy in buildings, industry and transport. Information is presented on methods that can be applied to improve efficiency and reduce wastage and consumption. Examples are given of projects that have shown worthwhile savings in energy consumption both in the fields of buildings and transport; such as the utilisation of heat generated by the continuous operation of computers, priority lanes for carpools and buses, the recycling of water and waste. It is considered that the control of development and land use planning is of particular importance, and that the municipal engineer should be in a position to deal with such problems within a programme of planned energy and resource conservation. /TRRL/

48 173574 IF TUBE TRAINS AFFECT TREES, WHAT DO THEY DO TO US? Underground trains in San Francisco generate magnetic fields that are 1000 times stronger than the natural background. They are so strong that they set up measurable electric currents in trees. They must also generate electric fields in people, points out the Stanford University researchers who discovered them, and may well have long-term effects. He also wonders what their effect is on migrating birds, which may use magnetic fields to navigate.

48 174385 CONTROLLING ENVIRONMENT IN HONG KONG'S SUBWAY SYSTEM. The transit system proposed for Hong Kong presents factors that make proper engineering of the environmental control system (ECS) critical. Hong Kong experiences severe temperature and humidity conditions many months of the year, and the urban railway is designed to carry almost twice the maximum passenger loading of other comparable systems. The objective of the environmental control system is to provide for the comfort and safety of people and protection of equipment. Generally stated, the ECS should maintain temperature and humidity within prescribed tolerances; achieve effective control of airflow (both velocity and direction), air-quality and air-pressure transients; protect against condensation; and operate acceptable noise levels in stations, tunnels and to the external environment. The several concepts investigated by the design team are described and evaluated.

48 174439 PUBLIC OPINION SURVEY ON ENERGY AND TRANSPORTATION. A statewide telephone opinion poll of NYS residents on energy and transportation issues was conducted during the Fall of 1977. The survey dealt primarily with issues in planning energy-saving actions in transportation. Opinions were collected on general approaches for conserving energy and specific conservation policies. The responses were analyzed along three characteristics: residential location (NYC, large metro, small metro, rural), sex, and age. The key results are as follows: Most people feel there is, or will be, an energy problem in the U.S. NYS residents do not believe any one sector should be given the most concentration in energy planning. The support is equally split among homes, industry, business, transportation, and government. The encouragement of transit use with cities is the most preferred approach to save transportation energy. Encouraging train and intercity bus travel is the next most preferred approach, followed by getting drivers to cut gas use. NYS residents strongly support incentive programs for encouraging conservation, and do not favor tax and rebate programs. This is the case for policies in all three general approaches. Most respondents feel that the elderly and handi-

capped should be given special attention when planning energy-saving action in transportation. This group received far more support than any other group considered. /Author/

48 174442 FOURTH NATIONAL CONFERENCE EFFECTS OF ENERGY CONSTRAINTS ON TRANSPORTATION SYSTEMS: PROCEEDINGS. The major goal of the conference was to bring experts and interested participants together so that necessary information could be freely exchanged. Topics of discussion included: Energy and Transportation Facts and Figures; Long Range Planning Under Energy Constraints; Technology Assessment of Alternative Fuels; Energy Efficiency of Intercity Passenger and Freight Movement; Energy Efficiency of Intracity Passenger Movement; Federal Role; Electrification of Railroads; Energy Impact of Electric Car in an Urban Environment; Research Needs and Projects in Progress--Federal Viewpoint; Research Needs in Transportation Energy Conservation--Data Needs; Energy Intensity of Various Transportation Modes--An Overview. The conference was composed of a series of lectures, panel discussions and question and answer sessions. It is expected that the conference will help to disseminate energy data and find ways for conserving energy within the transportation sector.

48 176920 POLICY ON ENERGY FOR TRANSPORTATION. The paper discusses guidelines for the development of a policy for transportation designed to satisfy a future society. Present day forms of transportation relying on an exhaustible source of energy must ultimately come to a halt. With forecasts of world oil production declining after about the year 2000, an alternative energy source is necessary with hydro- or nuclear-produced electricity an obvious choice. This would allow dwindling oil stocks to be used by petrochemical industries and air transport until converted to other forms of energy. The paper sets out guidelines for phasing out transportation by petrol-and oil-burning engines and the development of intra-city and inter-city forms of public transport.

48 178743 ENERGY EFFICIENT RAIL TRANSIT OPERATION. The paper investigates the energy consumption characteristics of modern rail rapid transit. The paper shows the variation in energy consumption caused by different operating policies and design characteristics of the rail transit mode, and points out the energy economies of improved design and operation. Five variables are analyzed using a rail transit performance computer model that simulates the performance of a rail transit train whose operating characteristics are specified by the program user. The simulated train runs over a track segment established by the user and a performance log of train speed and acceleration along the track segment plus the rate of energy consumption and cumulative energy used are output by the train performance program. The analysis indicates that of the variables studied, the most promising ways of reducing rail transit energy consumption are to include a coasting phase with reduced maximum speeds in the trains' performance cycle and to adjust the track vertical profile. /Author/

48 179030 THE 1973-74 ENERGY CRISIS: IMPACT ON TRAVEL. A description of urban travel behavior before and during the energy crisis of 1973-74 is developed in this paper. Using a home interview survey taken in Buffalo in the fall of 1973, just before the crisis, a view of pre-crisis urban travel patterns is developed, emphasizing the differences in gasoline use by demographic groups, in order to recognize potential hardship. Three results were uncovered: (1) men travel about 2 times as far per day as do women; (2) travel increases at a decreasing rate as auto ownership increases; (3) the middleage groups (21-50) travel significantly more than the young or elderly. A review of travel behavior changes during the energy crisis is also conducted. Several general conclusions are evident from the studies reviewed: (1) the availability of gasoline is a more important factor in determining travel demand than its price; (2) only those persons with some flexibility in travel behavior do the conserving and those travelers usually have high levels of auto ownership and income; (3) although transit ridership rose during the crisis, for most people it was not an important alternative in combatting the gasoline shortage, even in areas with good transit service. These results seem to indicate that policies using price to reduce gasoline consumption will be ineffective among the higher income households (those with the greatest potential to conserve) and severely impact the lower income families. Policies aimed at travelers with some flexibility in travel choices would be the most effective in conserving fuel, and would not impose severe hardships on any one group. /Author/

48 179173 CONTINGENCY PLAN IN SUPPORT OF A TRANSPORTATION ENERGY CONSERVATION PROGRAM FOR THE CENTRAL MISSISSIPPI PLANNING AND DEVELOPMENT DISTRICT WITH EMPHASIS UPON THE JACKSON URBANIZED AREA. The primary purpose of this proposed project is to develop a contingency plan which can be implemented to serve the transportation energy needs of Central Mississippi in the event of another major oil embargo or fuel energy shortage. The project is intended to assist in expanding the Ridersharing Program. The program is designed to promote the use of carpools and vanpools. The ultimate goal of the plan is its applicability on a statewide basis whereby such a comprehensive approach could prove to be substantially beneficial to all State entities in their transportation energy conservation endeavors during a major fuel energy crisis. Public apathy towards the energy issue, the dependency of commuters upon the private automobile and their attitudes towards ridersharing, and the prevailing conditions of parking facilities and traffic flow within urban areas significantly jeopardizes the viability and likelihood of the region in the event

of another major fuel shortage. The proposed plan could be an integral component of the ridersharing program currently underway, and could provide an effective means to accommodate transportation energy demands during a state of emergency such as a fuel shortage.

Central Mississippi Plann & Development District Mar. 1978, 18 pp, 2 Fig., 1 Tab.; Prepared in cooperation with Mississippi State Highway Department and Mississippi Fuel and Energy Management Commission.

48 180378 CASE STUDIES OF TRANSIT ENERGY AND AIR POLLUTION IMPACTS. This report summarizes an analysis of the energy consumption and air pollution impacts of eight case studies of new or improved transit services. The case studies include (a) areawide bus service improvement programs involving route extensions, increased frequencies, new lines, demand responsive service, and fare reductions; (b) new corridor exclusive busway service on the Shirley Highway and San Bernardino Freeway; and (c) new rail transit service in the Philadelphia-Lindenwold corridor. Probabilistic models were developed for each of these three service improvement scenarios to account for key travel demand and transportation system factors affecting energy consumption and air pollution impact levels. Results showed that low patronage response to areawide bus improvements as well as diversion from prior bus service, carpools, etc. and extensive auto access (park-and-ride, kiss-and-ride) to corridor systems reduce expected energy and air pollution gains and may, under certain conditions found in four case studies, result in possible energy use increases. Additionally, it was found that auto use for corridor system access may worsen air quality conditions in suburban areas in the vicinity of corridor transit terminal locations.

Curry, JP (De Leuw, Cather and Company) ; Environmental Protection Agency n 60015-76-003, May 1976, 198 pp, 49 Ref.; EPA Socioeconomic Environmental Studies Series.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 180443 ENERGY PROBLEMS AND URBAN AND SUBURBAN TRANSPORT. This report is mainly concerned with measures which may bring about energy savings in the short and medium terms without significant adverse effects as regards to mobility and quality of service to the user. Three types of measures can be taken to reduce energy consumption in urban transport: Measures which have been adopted in member countries; measures which have been considered for adoption but which were not implemented; and, those measures which are currently under study for future adoption. The potential for energy conservation in road transport in view of current travel habits and the desire to retain or improve current levels of mobility are examined. The effect of energy conservation measures upon other spheres of activity and the effects of efforts to conserve energy in certain related activities upon road transport are also briefly studied. Energy conservation may also be achieved through engineering measures related to vehicle design and operations and also through long-range land use and socio-economic activity arrangements. A ranking of energy conservation measures on the basis of their impact. This information, together with conclusions and rec-

ommendations for future work, is directed toward providing policy makers with factual information regarding future actions to be taken to conserve the limited petroleum resources.

Organization for Economic Cooperation and Devel. Dec. 1977, 60 pp, 14 Tab., 53 Ref., 1 App. Prepared by an OCED Road Research Group.

48 180538 ENERGY CONSERVATION: TRANSPORTATION (A BIBLIOGRAPHY WITH ABSTRACTS). The potential to achieve fuel conservation through technology, management, and planning is discussed. Transportation as covered include urban mass transit, aviation, marine transportation, automobiles, trucks, and railroads. A few abstracts discuss public attitudes concerning conservation measures. (This updated bibliography contains 273 abstracts, 70 of which are new entries to the previous edition.)

48 180795 THE IMPACTS OF URBAN TRANSPORTATION AND LAND USE POLICIES ON TRANSPORTATION ENERGY CONSUMPTION. VOLUME 1. This report explores relationships between energy consumption in urban passenger travel, land use, transportation system characteristics, and travel behavior. Findings are based on 112 experiments conducted with an integrated, equilibrium transportation-land use simulation model. This model simulates urban growth, is sensitive to a broad range of transportation and land use actions, accounts for congestion, accommodates auto and transit modes, and responds to the generalized costs of travel. Three city shapes, concentric ring, one-sided, and polynucleated, were tested.

48 181221 LAND USE, ENERGY FLOW, AND DECISION MAKING IN HUMAN SOCIETY--TRANSPORTATION IN A SUBURBAN AREA: A CASE STUDY OF THE NORTH-EAST SACRAMENTO COUNTY AREA. The purpose of the study is to review the transportation needs of the Northeast Sacramento County region and to analyze the various modes of transportation. In 1963, a network of freeways was proposed for this region, however construction was postponed to the 1980's. Citizens' groups have attempted to block future construction of the freeways, and as a result of this opposition a review of these proposed freeways was recommended. Because of this dissention, and because Sacramento County is representative of many suburban regions, it was selected as a study site. The study consists of four major elements: a brief review of the relationships between land use and transportation systems; a transportation model which permits the analysis of the broad impacts of policy decisions with respect to transportation alternatives; an analysis of incremental atmospheric and noise pollution levels due to proposed freeways; and an analysis of the fiscal impact of the freeway alternative upon the local tax base.

48 181223 LAND USE, ENERGY FLOW, AND DECISION MAKING IN HUMAN SOCIETY--TRANSPORTATION-ENERGY-EMISSIONS MODEL TEEM AND TEEM/TEST, TECHNICAL DESCRIPTION AND USER'S MANUAL. The Transportation-Energy-Emissions Model (TEEM) was developed to study the varying effects upon energy use and air quality due to the implementation of several alternate traffic systems in a metropolitan area. It estimates energy use and emission of SO_x, NO_x, CO, and HC. Described are the current versions of the models (TEEM and TEEM/TEST). The program TEEM is written in FORTRAN. It consists of a main program (two subroutines, an input routine CARD and an output routine DIAG) and two function sub-programs, DELAY and GCSTCY. The program TEEM/TEST considers only one link but considers it under different levels of use.

48 182808 ENERGY CONSERVATION IN SUBWAY SYSTEMS BY CONTROLLED ACCELERATION AND DECELERATION. The 1975 electric bill for propulsion in the New York City subway system was close to 90 million dollars. This paper addresses the question of how a subway motorman should run his train in order to minimize this energy consumption. It is shown that using maximum acceleration followed at the appropriate time by coasting, and then braking at the maximum acceptable rate, gives a particularly low energy consumption for typical subway trains (although slightly different velocity profiles can be better under appropriate circumstances). This velocity profile is relatively easy to implement, and has now been proven effective in experimental tests. As a result of recommendations reported here, the New York City Transit Authority ran idealized tests of the profile, followed by recently completed tests in revenue service which demonstrated an 18.4 percent decrease in energy consumption using a daily weighted increase of 4.25 per cent in trip time. This paper also evaluates the energy saved using an alternative method involving equipment modification for field shunting in the series mode.

48 183102 ENERGY FORCING MAJOR CHANGES IN TRANSPORTATION MARKET BY 1995. The need to reduce energy use in transportation and changing travel habits should cause a decided shift from the plane and car to rail and local mass transit, concluded a new market research report by Frost & Sullivan, Inc. on the U.S. transportation market to 1995. /GMRL/ *Metro* Vol. 73 No. 5, Sept. 1977, pp 89-90 ACKNOWLEDGMENT:

48 183256 HOW DO ALTERNATIVE POWERPLANT COSTS COMPARE? Four power systems were studied: an advanced spark ignition engine; a battery-powered electric motor; a diesel engine; and a diesel-electric hybrid. These systems were studied via computer simulations of vehicle operation over a specific driving cycle which yielded energy consumption estimates. Two types of vehicles were considered. One was a subcompact passenger car designed primarily for urban/suburban use but capable of cruising at 100 km/h and mixing safely with suburban traffic. The second type of vehicle was a full-size car designed for comfortable interstate-highway operation as well as local driving. The electrics were based on the assumed availability of an advanced battery with an energy density about four times greater than that of present-day lead-acid traction batteries. The same type of advanced battery, reconfigured to provide maximum power, is assumed to be available for the diesel-electric hybrid. However, in the hybrid, the battery only supplements the power available from a small diesel engine during peak power demand periods (the battery is recharged from the engine through a motor/alternator). It is concluded that, for subcompacts, the all-electric propulsion system could provide an attractive vehicle for local transportation. However, the diesel and the diesel-electric hybrid may provide an alternative to the spark-ignition engine: they would be almost as inexpensive to

operate as the electric, yet would not be confined by range limitations. For full-size cars, the diesel and diesel-electric hybrid's fuel savings make them economically attractive: for example, the diesel-electric's projected fuel savings amount to more than over an advanced spark ignition engine.

48 183323 ENERGY SAVINGS IN THE TRANSPORT SECTOR. This report deals with energy savings at two levels for private cars, lorries, domestic aviation and other transport modes in Sweden. Level 1 comprises measures which are judged to be feasible up to 1990 without negative effects on people's transport situation (stimulants, information, campaigns). At level 2 fairly strict control measures may be considered, but these measures must not affect employment and necessary travel or include fuel rationing. An assessment of these two alternatives indicates that total energy savings in the transport sector will amount to 3% (level 1) and 14% (level 2). An energy-saving program set at the level of 7% is proposed. The measures discussed in this program are directed to reducing the energy consumption by private motoring and to some extent by lorry transport. The measures considered in the program are the following: (1) information to motorists; (2) training at driving schools; (3) improved compliance with speed regulations; (4) extension of public transport in combination with reorganization of traffic environment and restrictions on use of cars, especially in larger towns; (5) increased car pooling; (6) standards for maximum permissible specific fuel consumption; (7) strictly differentiated motor vehicle tax; (8) voluntary savings program for lorry transport and (9) reinforcement of competitiveness of Swedish railways. /TRRL/

48 183462 REGIONAL CONSEQUENCES OF INCREASED ENERGY CONSERVATION. CHAPTER 4. TRANSPORT [Regionala konsekvenser av en ökad energihushållning kapitel 4. Transporter]. The aim of this chapter is to study the long term effects of energy conservation on regional transport, under the headings of freight and passenger transport. The analysis was

carried out with present statistics and forecasts as a basis. The analysis shows for (a) freight transport: (1) it is doubtful whether a decrease in freight transport as a consequence of decreased production affects the various regions, (2) a change from lorry to railway transport is not shown to have any marked effect, (3) relocation as a consequence of increased energy costs is likely to be inconsiderable as the transport costs tend to play a minor part in the choice of location. (b) passenger transport: a moderate increase of transport costs will have the following effects: (1) the extent of passenger transport would not be affected and consequently the regional effects would be small, (2) a change to more energy saving transport modes would have no considerable regional effects and (3) that the effect on relocation would be small. /TRRL/ [Swedish]

48 183511 ENERGY-SAVING POTENTIAL OF TRANSIT. In a study initiated by the Federal Energy Administration in response to growing national concern over the rapidly expanding rate of energy use and possible fuel shortages, and analysis was done of the energy efficiencies of various urban passenger transportation modes, including automobile and bus, rail rapid and commuter rail transit, and dial-a-ride. The study was primarily concerned with the potential impacts and energy efficiencies of short-term policies designed to induce automobile drivers to shift to transit. Policies to induce such mode shifts were grouped as scenarios for evaluation. Possible transportation energy savings for urbanized areas as well as reductions in vehicle kilometers of travel were first estimated for individual representative cities and then expanded to provide a national estimate for each of four tested scenarios. /Author/

48 183518 PHILADELPHIA AIR QUALITY CONTROL REGION: NEED AND RECOMMENDATIONS FOR REVISION OF TRANSPORTATION CONTROL PLAN. The Philadelphia transportation control plan, its status and evaluation process, and the technical background on which it was based are evaluated. A summary of transportation control plan strategies is presented as well as review of their status and the major implementation problems of the plan. Legal, administrative, and technical problems are found to exist. A review and an analysis of the latest available air quality data for the Philadelphia central business district are presented. Air quality standards were found to be based on limited studies and did not take into account time of day, frequency, or duration of high concentrations of pollutants. The power of the U.S. Environmental Protection Agency to regulate the states or to require them to enforce

a regulation has been questioned. A need for revising the Philadelphia plan is established, and it is recommended that the metropolitan planning organization be involved in the revision process. Possible strategies that could be considered in revising the plan and the place of such a plan in the transportation planning process are discussed. /Author/

48 184194 IMPACT OF DIAL-A-RIDE ON TRANSPORTATION-RELATED ENERGY CONSUMPTION IN SMALL CITIES. Dial-a-ride is a door-to-door public transportation concept similar to taxi service except that passengers share the vehicle (usually a 12 to 20-passenger bus) with other riders. This paper examines energy consumption of dial-a-ride systems in three small Michigan cities. Fuel consumption per effective passenger kilometer (shortest distance between a passenger's origin and destination) is derived from aggregate fuel and ridership data and average trip-length data in the test cities. The analysis also predicts dial-a-ride user behavior and energy consumption in the absence of dial-a-ride. Results show that the introduction of dial-a-ride into test communities in Michigan has caused a net increase in transportation-related fuel consumption. Inducement of new trips, low vehicle occupancies, circuitous routing, poor vehicle fuel economy, and diversion of passengers from more energy-efficient modes are seen to be principal reasons for the significant energy costs of dial-a-ride. The future potential of dial-a-ride is discussed in the context of increasing energy prices, and several methods of reducing its energy intensiveness are presented. Despite the pessimistic estimates presented, energy consumption is only one of many factors that must be considered in determining the feasibility and desirability of dial-a-ride for a particular site. /Author/

48 184332 ENVIRONMENTAL TRAFFIC MANAGEMENT-THE END OF THE ROAD? This paper questions some aspects of the technical soundness and public acceptability of environmental traffic management scheme of the kind advocated in the Buchanan report, "traffic in towns". Practical studies have shown that in inner city areas in particular, and perhaps older built-up areas in general, the concept cannot be adequately defended against a wealth of variety of criticism from those whom it most directly affects, i.e. The public. Participation exercises have revealed public fears that the road closures associated with schemes will ruin the viability of local shops, worsen the environmental conditions along local roads chosen as distributors, cause even greater congestion on the main road network due to displaced traffic, and impede the accessibility of local people to their homes. In the light of

these, it is suggested a flexible policy be adopted incorporating changes to the forms of vehicles and the manner in which they are used as well as changes to the physical form of the road network. /Author/TRRL/

48 184945 NOISE-CON 77 PROCEEDINGS: NATIONAL CONFERENCE ON NOISE CONTROL ENGINEERING, 1977. Thirty-six papers are presented. The first section of this Proceedings is devoted to reports from several organizations on the status of programs on the Federal, State and local levels. The second section deals with environmental impact and on the noise environment created by both air and surface transportation systems. The first group of papers deals with environmental impact, cost-effectiveness analysis and safety and economic considerations in tire noise control. The second group of papers deals primarily with noise environments created by rail transit systems and aircraft. The third section has been devoted to the prediction of noise levels, propagation effects and the effects of barriers and earth berms. Several papers are included on the state-of-the-art in rail transit noise, highway noise and aircraft noise. The

proceedings also include papers devoted to standards and measurements of the noise generated by transportation systems.

48 186430 POTENTIAL FOR TRANSIT AS AN ENERGY SAVING OPTION. This study was instigated in response to the growing national concern over the rapidly expanding rate of energy use in the face of possible fuel shortages. It is primarily concerned with the potential impacts and energy efficiencies of short-term policies designed to induce auto drivers to shift to public transit. The energy efficiencies of various urban passenger transportation modes are analyzed, including automobile, bus, rapid rail, commuter rail, and Dial-a-Ride transit. Policies to induce mode shifts to public transit are structured into alternative scenarios for evaluation. Possible urbanized area transportation energy savings as well as reductions in vehicle miles of travel are estimated first for individual representative cities and then expanded to a national level. Representative cost evaluations of policy actions are included as well. Finally, note is made of projected secondary or indirect impacts of policy design and implementation. Four scenarios were constructed for evaluation. Scenario I consists of modest transit enhancements, Scenario II major transit enhancements, Scenario III the same major transit enhancements combined with auto disincentives, and Scenario IV automobile disincentives alone. The analytical procedures used to estimate the travel mode shifts and energy savings that could be achieved with alternative strategies were applied in the context of actual urban conditions. As it was clearly impractical to prepare separate analyses for all urbanized areas, one representative city was chosen from each of four groupings. Collectively, these four groups covered all urbanized areas in the country. The groupings were made on the basis of transit utilization for journey-to-work purposes and the presence or lack of an extensive rail system. Four representative cities chosen for this study were Albuquerque, San Diego, Chicago, and Baltimore. (ERA citation 03:048237)

48 186447 GUIDE TO REDUCING ENERGY-USE BUDGET COSTS. Conservation is a means for making good use of taxpayers' money. As the cost of energy increases, the value of conservation increases equivalently. Local government officials are not only responsible for using tax money wisely, but also have plans ready for emergency energy supplies. In this guide, the emphasis is on buildings and vehicle fleets. According to a study by ASHRAE, a 48.1% saving in school buildings and a 59.7% saving in office buildings can be achieved with modifications of insulation, wiring, ventilation, and lighting systems. An average 30% saving can be achieved by lowering driving speeds from 70 to 50 mph. Energy-saving driving habits can cut fuel consumption by as much as 20%. Chapters are entitled: The Commitment to Energy Manage-

ment; Employee Programs; Vehicle Fleets; New Buildings; and Existing Buildings. 43 references. (ERA citation 03:048131)

48 186471 ENERGY IN TRANSPORT. VOLUME 2. POLICIES. REPORT NO. 27. The study identifies and evaluates realistic and practical transport policy changes in New Zealand related to fuel saving. Covered briefly in a background chapter are: transport fuel users; fuel conservation in rail, sea, and air transport; social aspects of saving fuel; policy definition and summary of results; and cost-effectiveness of short-term conservation policies. Then the report addresses in detail road-transport policies that might save fuel since, in New Zealand, 89 percent of domestic fuel consumption is for road transport; 3 percent for rail, 3 percent for sea; and 5 percent for air transport. The road-transport policies are divided into five groups, with each successive group involving measures with greater restraints on personal mobility and lifestyle. Group I merely involves increased vehicle efficiency; Group II transfers to a different vehicle type or mode of travel; Group III increases vehicle loading; Group IV suppresses trip making, such as by substitution of personal travel with remote forms of communication; and Group V changes to urban and regional land use and transport structure to reduce transport volumes. (ERA citation 03:048189)

48 188015 REALISTIC APPRAISAL OF MASS TRANSIT IN REDUCING AUTOMOBILE USE, ENERGY CONSUMPTION AND AIR POLLUTION IN AMERICAN CITIES. The paper presents a methodology that provides for a regional assessment of the expectations placed on the development of transit facilities in urban areas. The methodology provides a simple analysis tool for assessing the impacts of regional transit development policies on: traffic congestion, modal split, air pollution, energy consumption, and financial requirements. It establishes an analytical relationship between the transit usage rate in a region, and the levels of exposure of the population to transit services, density of urban development, and exposure to automobile ownership. Two multiple linear regression models have been developed, using data from a number of cities in the United States.

48 188018 SYSTEMATIC IMPLEMENTATION OF LOCAL, STATE AND FEDERAL REGULATIONS TO CONTROL TRANSPORTATION AND LAND USE CAN REDUCE ENERGY REQUIRED FOR TRANSPORTATION. This paper addresses the problem of conserving fossil fuel reserves by a program of regulations to be applied to land use and transportation. More effective city planning, improved traffic operations, less fuel waste by improved vehicle design and maintenance, and methods to increase the usage of public transportation are discussed as possible means to save fuel. Regulations to force implementation of these energy saving procedures are also reviewed.

48 188216 TRANSPORTATION AND THE URBAN ENVIRONMENT. This is a joint US-USSR report on the rational relationship between automobile and public transit development. It was developed by the US-USSR Urban Transportation Team, under a 1972 agreement on cooperation in the field of environmental protection. The US sponsors are the Department of Transportation and the Department of Housing and Urban Development. Soviet sponsors are the State Committee on Civil Engineering and Architecture (Gosstroy) and the Central Scientific Research and Design Institute (Gosgrazhdanstroy). The report notes the great difference between the urban trips mixture of automobile and public transit in the two nations. In the US, 90 percent of the urban trips are made by car and 10 percent by public transit. In the Soviet Union, the mixture is 90 percent public transit and only 10 percent car use. The report concludes that despite these significant differences, the continued development and improvement of public transport systems is an important element in preserving the urban environment in both the US and Soviet Union. The joint report is divided into two major sections, one by the US members of the project, the other by the Soviet members, together with joint conclusions. /Author/

48 188395 URBAN FUEL ECONOMY: AN ALTERNATE INTERPRETATION OF RECENT COMPUTER SIMULATION CALCULATIONS. Estimates of the effect of different traffic control scenarios on vehicular fuel consumption in an urban network were obtained in a recent report using detailed computer simulation. In the present work it is shown that these computer simulation results are consistent with a previously developed model of fuel consumption in urban traffic systems derived by conducting experiments in street traffic.

48 188931 AUTOMOBILE FUEL ECONOMY ON FIXED URBAN DRIVING SCHEDULES. Various fixed urban driving schedules have been defined to represent the speed-time characteristics of urban traffic. When the fuel economy of a particular vehicle is measured using a fixed urban driving schedule, the result depends on the particular schedule chosen. The paper shows that the differences in fuel economy measured using different schedules can be satisfactorily explained in terms of a simple model, relating fuel consumption to the average speed of urban traffic, previously derived by driving instrumented vehicles in actual street traffic.

48 189466 ENERGY EFFICIENCY OF PASSENGER TRANSPORTATION MODES: A SURVEY. A survey was made to compare the energy efficiency of various modes of passenger transportation, specifically automobiles and airplanes vis-a-vis modes supported by the Public Transportation Fund Program, bus and rail. The survey is limited to domestic (usually contiguous 48 states) operations for intercity and urban transportation. The study shows that the buses and trains are potentially more fuel efficient than airplanes and automobiles in intercity and urban passenger transportation. Thirteen independent studies regarding the propulsion energy efficiency of intercity modes were surveyed and the results are summarized in figures and tables. The results of studies by the Congressional Budget Office, the Metropolitan Transit Commission (Minneapolis)

and the Pennsylvania Department of Transportation come to similar conclusions with regard to urban passenger modes, regardless of assumptions used. All forms of public transportation are ranked as more fuel efficient than automobiles except Dial-A-Ride which is ranked the lowest.

Michigan Department of State Highways & Transport Nov. 1978, 11 p., 1 Fig., 4 Tab., 6 Ref.

48 189811 ENERGY EVALUATION OF URBAN MODES AND SYSTEMS: IT ALL DEPENDS ON HOW YOU MEASURE IT. Pitfalls encountered in energy analysis are identified in this introductory overview to a conference session on Urban Transport Modes and Systems. Examples are presented both for the comparison of modes or systems, and for divergent results from different analyses. Some working definitions of urban modes and systems are suggested, along with several different criteria of comparison with caveats for what is or is not included. Requirements for the energy assessment of an urban area's transportation system--present--are summarized.

48 190264 NORTH EAST AREA LIGHT RAIL LINE-ENVIRONMENTAL IMPACT STATEMENT. DRAFT. The primary objective of the north east area public transport review was to determine the steps that must be taken in the next five or ten years to provide the basis of a public transport system to serve the needs of the north east suburbs of Adelaide at least until the end of the century. With this objective in mind and taking into account specific engineering, social, environmental, economics and land use criteria, the objectives of the proposed action, a light rail transit line, were developed. The study findings demonstrate the need for a major improvement to the transport system in the north east area. A number of options are described and some selected for detailed evaluation. Details of the preferred action in terms of the selected route and technical and other characteristics of the system, and a summary of probable environmental effects in terms of adverse and beneficial impacts are given. In a majority of the areas an LRT system or busway all or part of the Modbury transport corridor would best meet the required criteria and offer significant advantages over other transportation systems examined.

48 193808 EXTERIOR-RADIATED AERODYNAMIC NOISE OF VEHICLES AT HIGHWAY SPEEDS. Aerodynamic noise due to airflow over a vehicle moving at highway speeds has usually either been ignored, or postulated to be a negligible part of the total exterior noise of the vehicle. In part, this may have been

due to the difficulty in separating aerodynamic noise from the other components of vehicle noise. In the investigations discussed here, a technique was developed to make this separation possible. The technique was applied to a sampling of six light vehicles: four different sizes and shapes of passenger cars, a pickup truck, and a window van. The noise data for each of three major components is presented in the form of A-weighted levels as a function of vehicle type, ground-speed, and directivity. It is shown that the aerodynamic noise component is not negligible in comparison to the other two components. Various implications of this newly defined importance of aerodynamic noise are discussed including those relating to tire noise testing.

48 193821 ANALYSIS OF BUS NOISE LEVELS FROM THE LINCOLN TUNNEL EXCLUSIVE BUS LANE IN METROPOLITAN NEW YORK. While buses ordinarily make up a very small percentage of total volume in most highway traffic streams, there are certain urban conditions where very heavy concentrations of buses dominate the noise environment. Several examples typify this condition, including the terminal garage for a transit system during the early morning hours, a large metropolitan school complex operating its own fleet of buses during the morning and afternoon hours, and a mass transit situation where special consideration has been accorded the movement of bus traffic, usually through the designation of an Exclusive Bus Lane (XBL). It is a unique example of this XBL concept that has provided a data base for the analysis of bus noise emissions and flow rates. The paper discusses measurements and analysis of bus noise emissions made at the Lincoln Tunnel XBL in northern New Jersey immediately west of New York City.

48 194036 ENERGY CONSERVATION IN LAND USE AND TRANSPORTATION. This paper describes the use of the TOPAZ (Technique for the Optimum Placement of Activities into Zones) urban planning model in a study of Melbourne to compare energy consumption patterns in 1976 and 2000 under various scenarios. Topaz is a sketch planning model developed to evaluate alternative forms of urban systems in terms of infrastructure and transportation costs and benefits. A number of policy implications arise, including the need to give more attention to the possible implications of future shortages and price rises in natural crude oil. Most of the more immediately effective savings in fuel are likely to arise from modifications to existing transportation technology and its more effective use. How-

ever, urban form, density and accessibility could have an important role to play in the long term, even if the extent of this role is unclear at this stage. The fostering of changes in land-use patterns must be commenced now if they are to make an effective contribution. The modelling approach presented provides a means of studying the interactions between land use and transport and determining urban forms and transport networks of energy consumption that it can afford. The paper was presented at the Energy Conservation in the Built Environment Conference, Sydney, 15-16 March 1978. Environment Conference, Sydney, 15-16 March 1978. /TRRL/ Sharpe, R Brotchie, JF Toakley, AR ; Commonwealth Scientific & Indus Res Org, Australia Monograph 1978, 31 p., 3 Fig., 25 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 236799), Australian Road Research Board

48 194049 TRANSPORT AND ENERGY OVERVIEW. This report was prepared at the request of the Australian Transport Advisory Council. The world has entered an era of higher priced energy and, in particular, higher priced oil. The world oil supply outlook is also uncertain. Australia is expected to become increasingly dependent on imports of crude oil during the 1980's. Given that after the mid-1980's there will be an escalating risk of supply disruptions and price increases and given that effective responses require long lead times, plans must be formulated now to ameliorate these risks. The most promising measures are conservation and the development of alternative liquid fuel supplies. The transport sector, as the largest consumer of oil energy, will provide a central focus for fuel conservation measures. A fuel conservation strategy should include measures encouraging more efficient design and use of cars in addition to an appropriate fuel pricing policy. Investment in public transport facilities, particularly in urban areas, is not likely to be cost effective as a fuel conservation measure.

48 194868 THE ENERGY EFFICIENCY OF THE SWEDISH TRANSPORTATION SYSTEM- AN INTERNAL COMPARISON. When discussing energy efficiency of the various modes of transportation one has to be very cautious about what to compare. It is obvious that there exist differences with respect to energy efficiencies, but differences also occur in the general patterns of utilization. This paper focuses on intercity transportation, of goods and passengers respectively. It contains a general discussion of what comparisons on energy efficiency ought to comprise. In short, any comparisons of the energy efficiencies of the various modes of transportation have to apply to transportation services that usually are, or at least could be, carried out by all the modes. It is also important that the energy forms used for propulsion are measured at compatible points in the applicable chains of transformations and transmissions. Further, any analyses are incomplete unless one includes energy requirements for manufacturing and maintaining carriers. Also energy requirements for constructing and maintaining infrastructures have to be considered. The results of some calculations are

demonstrated, which include all the aspects mentioned. Data that are used apply to the Swedish transportation system. The comparisons involve for freight transportation: truck, railway, and coastal shipping; and for passenger transportation: passenger cars, bus, railway, and airplane. It is difficult to draw some simple conclusions of the results obtained. The results indicate, however, that variations within each mode, under certain circumstances that are related to existing background data, are even greater than the differences between the modal averages with respect to energy efficiencies. (a) /TRRL/

48 195127 THE ENERGY-SAVING ELECTRIC CAR [Der stromsparende Triebwagen]. The three-phase electronic control motor is replacing the d.c. motor used for more than a century for suburban traffic. It has been tested since 1975 with trains in Nurnberg and since 1978 on the Vienna metro. The advantages of this motor are energy savings (up to 25%), smooth running, regenerative braking, less wear and easier maintenance because there are no collectors or carbon brushes. [German]

48 195410 TRANSPORTATION ENERGY CONTINGENCY PROJECT. CTS and the MIT Energy Laboratory have initiated a joint project with the US Department of Energy, to develop national energy contingency plans dealing with transportation. These plans would be put into effect in the event of a serious interruption of supplies, such as an oil embargo. The development of such plans was requested by Congress as part of the Energy Policy and Conservation Act of 1975. The project is taking a comprehensive approach to transportation contingency planning. Researchers are systematically examining a variety of contingency measures, the likely scenarios under which such measures would be taken, and the mechanisms and resources necessary to implement and enforce the plans. A set of criteria has been established to screen and evaluate possible contingency measures. These criteria refer to the following issues: impact on travel and fuel use, economic and social impacts, equitable distribution of effects, legal feasibility, resources required for implementation and political and public acceptability. Given special merit in the evaluation are strategies which could be used to achieve several aims at once, and those which would connect Federal contingency planning to related efforts already supported or underway in states and local areas. The project's evaluations have produced a group of related measures focussed on two major categories or travel: the work trip (or commuter travel) which is highly concentrated and can thus utilize public transit and ride sharing in place of private automobiles, and inessential (or discretionary) travel which can be eliminated or sharply curtailed without causing as much hardship.

CTS Newsletter 1979, pp 2-3

48 195473 DIRECT ENERGY USE IN URBAN PASSENGER TRAFFIC AND TRANSPORT IN THE NETHERLANDS AND THE UNITED KINGDOM. For a study on energy use by traffic and transport in the Netherlands a quantification is needed of the current energy consumption. In this report data are given of the 1972 direct (fuel use) consumption of energy in urban passenger traffic and transport in the Netherlands. The data of the United Kingdom are also included to make a comparison possible. The purpose of the quantification is to collect basic data on which governmental energy policies can be based. The kind of policies possible determined the level of disaggregation of the data to be collected. This level has been chosen as follows: type of energy; mode of transport; urban area and journey purpose. /TRRL/

48 195495 INNOVATIVE MANAGEMENT OF URBAN TRANSPORT FOR A BETTER ENVIRONMENT. This paper indicates that noise, fumes, the dangers of walking, the irregularity of bus services and other aspects of city life are increasingly the subject of complaints on the part of city dwellers. It is suggested that instead of building expensive metro systems and free-ways, the new approach to urban transport policy is to make better use of existing transport facilities—roads, buses, taxis, light rail etc.—through comprehensive and innovative management, building heavy infrastructure only as a last resort. Case studies carried out by OECD in Besancon (France), Brussels, Geneva, Gothenburg (Sweden), Groningen (Netherlands), London, Madison (USA), Nagoya (Japan), Nottingham (UK), Ottawa, Paris and Singapore which have adopted such comprehensive policies are reported. It is considered that scrutiny of these studies has made clear that management oriented urban transport policies, though local in inception, have implications for national policy-makers in many diverse fields—environmental protection, energy conservation, inner city revitalisation, institutional reform and finance. Reference is made to traffic management policies allied to traffic cells, zone and collar schemes, pre-metro systems, supplementary licensing and Nottingham's central zone and collar scheme is illustrated and discussed. Questions of energy use, revitalising inner cities, institutional adaptation and finance are also discussed. /TRRL/

48 195623 ENERGY IMPACTS OF TRANSPORTATION SYSTEMS MANAGEMENT ACTIONS IN NEW YORK, 1978-1980. This report documents the findings of a recent extensive study to determine the energy savings of TSM actions taken or planned in New York State of 1978-80. For those actions planned for implementation by 1980, both the direct energy savings and energy costs of construction and maintenance were quantified. The main determinants of an action's savings are its effect on vehicle-miles-of-travel and travel speeds. These changes were determined through various methods, including assignment-based techniques, traffic flow

approaches, use of transit fare and service elasticities, and case study reviews. For those categories of actions which result in a mode shift by vehicle drivers, the impact of the use of the car left home was included in the calculations. Energy costs resulted from the manufacture, construction, installation, operation and/or maintenance of the facilities and equipment required of each action. The analysis found net energy savings of 22.9, 25.5, and 28.1 million equivalent gallons of gasoline for 1978, 1979, and 1980, respectively. These figures represent approximately 0.5% of the total annual gasoline consumption in the State. Those actions which conserve the overall largest amounts of energy are: traffic operational improvements; ridersharing activities; amenities for transit passengers; computerized traffic control systems; improved transit marketing; reduced off-peak transit fares; and park-and-ride services. Certain other TSM actions, including demand responsive transit services and express bus services, have a negative net energy impact. On the average, energy costs represent approximately 15% of energy savings. Energy savings occur in all urban areas of the State with 65% of the savings found in the New York City Region. /Author/ Gross, JM Boyle, DK Cohen, GS Erlbaum, NS Kocis, MA Koepfel, KWP ; New York State Department of Transportation PRR 151, May 1979, 415 p., Figs., Tabs., Refs., 3 App.

48 195953 USING MATERIALS TO MUFFLE NOISE. Several case histories are presented, showing how appropriate use of select materials can markedly reduce noise levels of many products and, of course, its adverse effects. Extensive use of damping materials such as polyamide trim cloth, fiberglass batting, ABS plastic sheet, fiberglass insulation, and foams in helicopters, aircraft, Diesel cars and trucks, subway wheels, and office machines is shown to be quite effective in noise reduction.

48 196784 ENERGY CONSUMPTION BY CATEGORIES OF AUSTRALIAN TRANSPORT. In this paper the results of a study, undertaken for the Bureau of Transport Economics, of the energy consumption by transport in Australia are reported. The role of the transport sector in the national energy economy are reviewed, and estimates are made of the primary energy consumption by its various modes and their sub-categories. Conclusions are drawn on the efficiency with which the various modes utilize primary energy in the performance of their transport task. /Author/TRRL/

48 196815 NATURE OF THE ENVIRONMENTAL PROBLEMS. The internal combustion engine is the major source of pollutants in urban air masses. Data from continuous monitoring programs are best expressed as an average pollutant concentration for some appropriate interval and follow a log normal frequency distribution. Accordingly, the frequency with which a selected concentration is exceeded can be calculated. Epidemiological studies in several countries have generated similar air quality standards and these are expressed as a limit for frequency of occurrence of concentration averaged over a stated interval. Results of monitoring programs in Canberra, Sydney and Melbourne are compared with international standards. Approaches to computer-simulation of the urban air-mass for Canberra are discussed and the future pollutant levels predicted. /Author/TRRL/

48 197124 ENERGY INTENSITY OF VARIOUS TRANSPORTATION MODES. This paper is an overview of the existing literature related to the energy intensity of various transportation modes, including intracity (automobiles, buses, automated guideway transit systems, vans, and heavy and light rail transit) and intercity (airplanes, automobiles, buses, trucks, rail, waterways, and pipelines) modes for passenger and freight movement. Energy intensity has been correlated with operating conditions such as speed, load factor, and type of commodities being moved. Statistical and engineering approaches have been used to estimate energy intensity. Energy intensity values vary considerably according to operating conditions, types of hardware,

trip characteristics, load factors, and types of commodities being shipped. Suggested energy intensity values for several transportation modes are discussed. /Author/

48 197125 ONE APPROACH TO LOCAL TRANSPORTATION PLANNING FOR NATIONAL ENERGY CONTINGENCIES. Because of the uncertainties associated with the nation's petroleum supply and the possible effects of federally imposed fuel contingency measures on transportation, the steering committee of the Metropolitan Planning Organization in the north central Texas region directed the development of a plan to minimize the impact of federal fuel contingencies on transportation in the Dallas-Fort Worth metropolitan area. This paper summarizes the planning effort that resulted. The major objective of the plan was to minimize the impact of fuel allocation and rationing on local mobility, especially work trips, and thereby to reduce the adverse effects of a near-term energy shortage on the local economy. Through an examination of these federal regulations, the impact of the 1973/1974 Arab oil embargo, and projections of future petroleum supply and demand characteristics, alternate fuel shortage scenarios were developed and transportation-related problems identified. Potential solutions of these problems were analyzed as to their effectiveness and applicability. A set of recommendations for actions by local governments, public transit systems, and the private sector was developed from the results of these analyses. /Author/

48 197126 ENERGY CONSUMPTION OF THE JOURNEY TO WORK WITH AND WITHOUT A SUBURBAN RAPID TRANSIT LINE. In an effort to provide an improved framework for evaluating alternative transportation systems with respect to energy conservation, the Philadelphia-Lindenwold rail rapid transit line was studied. The energy consumed by journey-to-work trips on the Lindenwold Line in 1970—including not only the energy required to operate the line but also the energy required for access and egress—was estimated (along with the cost of the fuel consumed by these trips). The energy that would have been consumed by these trips if the former modes of travel were used was also estimated. Comparison of these two amounts of energy consumption provides a basis for evaluating the energy conservation potential of the Lindenwold Line. It is found that (a) the slightly indirect nature of the park-and-ride mode results in longer travel distances than did the automobile and bus modes it replaced and (b) the lower energy intensiveness of park-and-ride relative to the automobile does not offset these longer travel distances because many users of the line are

former bus riders. Thus, the park-and-ride system consumes slightly more energy than did the former travel modes. It is concluded that the added travel distance of park-and-ride systems and the extent to which users of such systems are attracted from buses rather than from automobiles should be considered in evaluating rapid transit park-and-ride systems with respect to energy conservation. /Author/

48 197148 EFFECT OF SMALL-SCALE TRANSIT IMPROVEMENTS ON SAVING ENERGY. This report examines the energy effects of small-scale transit improvements in New York State's 8 Metropolitan areas. Actions included in the TSM plans of the 8 MPOs are analyzed for their effects on ridership, mode shifts and energy savings, as well as the energy costs of development, implementation and operation. Each of eleven transit-related TSM actions is analyzed separately. These transit improvements result in average annual energy savings of slightly under 7 million equivalent gallons of gasoline over the period 1978-80. This is about 0.1% of the total annual gasoline consumption in New York State, but is over 2.6% of transit energy consumption in the 8 metropolitan areas. When demand-responsive services, which have high energy costs associated with them, are excluded, the average annual savings increase to 8.3 million equivalent gallons of gasoline, or 3.1% of transit energy consumption. Small-scale transit improvements can thus play a role in the energy conservation efforts in New York State but cannot be expected to have a major impact on the State's energy situation. /Author/

48 197150 TSM ACTIONS: A STUDY OF THE ENERGY COSTS. While TSM actions often save energy, primarily through diversion, they also incur energy costs of construction, maintenance and operation. This paper examines the magnitude of such costs. Selected TSM actions, scheduled for implementation in New York State are examined to determine the aspects of the projects that generate energy costs. Appropriate energy factors (equivalent gallons of gasoline/\$ of project cost) are given for many types of actions and there is a brief discussion of procedures for determining these factors. Estimates are provided for the cost of typical TSM projects. On the average energy costs represent approximately 15% of energy savings with actions such as encouragement of ridesharing having the smallest energy costs and actions resulting in additional transit VMT the largest. /Author/

48 197272 METROPOLITAN WORK-TRIP ENERGY CONSUMPTION PATTERNS. This study examines the patterns of energy consumption for journeys-to-work in a metropolitan area and demonstrates the relationship between these patterns and urban structure. The study also identifies population and geographic variables that affect energy use. Cartographic and statistical analyses are performed on census data relating to distances of work trips and choice of mode in the Chicago, Illinois, area. A review of the literature on the related studies is given. Explanations of the mapping and regression techniques are provided, along with an analysis of the study results.

48 197420 BART'S OPERATING ENERGY CONSUMPTION. BART, the 71-mile Bay Area Rapid Transit System, serving San Francisco, Oakland, and other cities and communities, is the first regional-scale rapid transit system to open in the United States in over 50 years. Service began in 1972. This report is one of a series assessing the impact of BART on transportation and travel in the Bay Area. The report gives information on BART's operating energy consumption and incorporates an earlier BART Impact Program Report ('Analysis of BART's Energy Consumption for Interim System Operations', June 1975). The updated report was presented as a paper to the January 1977 annual meeting of the Transportation Research Board. It gives a historic analysis of BART'S operating energy consumption per

passenger-mile and per car-mile. BART's traction energy consumption is compared with that of (1) other rail transit systems, and (2) bus and automobile, in terms of equivalent gallons of petroleum fuel. BART's impacts on total energy consumed by BART, bus and automobile for transbay travel between San Francisco and Oakland is analyzed using data on travel patterns with and without BART. Although BART carries 20% of all passenger-trips in the transbay corridor, it has reduced overall energy consumption by only 5%. This saving is relatively small because, although BART consumes less energy per passenger-mile than automobile, it consumes more than bus. BART's ridership is drawn about equally from automobile and bus. BART has also had the effect of inducing new trips by automobile.

48 197522 URBAN RAIL NOISE ABATEMENT PROGRAM: A DESCRIPTION. This report presents the background, current activities, and future plans for the Urban Rail Noise Abatement Program. This program, sponsored by the Office of Technology Development and Deployment of the Urban Mass Transportation Administration (UMTA) was initiated in 1972 and has been technically managed since its inception by the Transportation Systems Center. The problem of urban rail noise and vibration is described and the rationale for the UMTA funded program is given. The body of the report presents a definition of the program objectives, a discussion of the program organization, and a description of past, current, and future program activities. Major accomplishments of the program to date are listed in the final section.

48 198273 NOISE RATING CRITERIA FOR ELEVATED RAPID TRANSIT STRUCTURES. The purpose of this report is to recommend criteria for rating the noise radiated from elevated rapid transit structures during train passages, so that different types of structures can be inter-compared with respect to their noise impact on the immediate neighborhood, or alternatively, so that noise abatement programs for elevated structures may be developed on a rational basis. In developing these criteria, the report also summarizes information that is applicable to the rating of rail transportation noise in general. The report examines the requirements for descriptors that would be suitable for rating elevated structure noise, reviews existing noise ratings, concludes that the only suitable candidates are the average sound level (Leq) and the day-night average sound level (Ldn) and examines and resolves the possible disadvantages of these choices. The report also reviews studies that have been made to determine the impact of rail transportation noise on the community, compares subjective response to rail noise with that due to road traffic and aircraft noise, and finds these responses to be nearly the same. Finally, the report delineates and illustrates application of the so-called Fractional Impact Method to assessment of the community impact of elevated structure noise, based on the results of numerous social surveys on noise, and widely used by the Environmental Protection Agency for environment impact statements.

48 198828 ENERGY CONSERVATION AND TRAVEL BEHAVIOR. Americans use one quarter of all energy consumed in the U.S. in automobile passenger travel. This paper describes the ways Americans could reduce this energy consumption, and, using empirical data, describes the extent to which these energy-conserving behaviors are or are not being practiced. It is concluded that Americans appear to be making some progress in conserving energy in such areas as buying more-efficient cars and driving slower on the highways, but little or no progress in such other important areas as carpooling, using public transit, and reducing vacation travel. This challenge is of enormous international and domestic economic and political importance. (ERA citation 04:034023)

48 198833 ENERGY CONSERVATION: POLICY ISSUES AND END-USE SCENARIOS OF SAVINGS POTENTIAL. PART 6. END-USE ENERGY CONSERVATION DATA BASE AND SCENARIOS. End-use energy conservation scenarios discussed show the combined effect on energy consumption of implementing a number of conservation measures. The scenarios serve two overall purposes. First, they provide a contrast of a series of nonconservation cases based on assumption of growth rate and appliance saturation with conservation cases based on similar assumptions. Second, they provide detailed data and documentation for the savings potential for each conservation measure, the stock affected, and the calculation of total energy savings. Included are conservation measures of both a behavioral nature and technological nature. Quantitative estimates of energy consumption and conservation potential in the major residential and commercial end uses, transportation modes, and industrial subsectors have been made. For each measure and for the total scenario, a base case and a conservation case were computed. The subsectors for which the scenarios are constructed are: residential (electric and gas appliances); commercial end uses (heating, cooling, water heating, lighting); building types retail-wholesale, office, auto-repair, education services, health services, hotel-motel); transportation (auto, truck, van, airplane, bus, railway, motorcycle); freight (truck, rail, air); and industrial subsectors (17 industries). 48 199096 PATH ENERGY CONSERVATION STUDY. The national policy on conservation of energy and related resources brought about by the energy crisis of 1973 prompted the Port Authority Trans-Hudson Corporation (PATH) to develop an energy conservation program. In the accomplishment of the technical study, PATH was to review and evaluate current energy conservation practices instituted on the PATH system and to perform extensive operational planning and comparative analysis required for the implementation of additional potential energy savings measures. This report discusses in detail the five tasks which were used in carrying out the work required in the project: (1) investigation of current practices; (2) potential service modifications; (3) rail car power investigation; (4) potential long-range improvements; and (5) preparation of a final report describing the work accomplished during the project.

48 199098 ALLEVIATION OF PRESSURE PULSE EFFECTS FOR TRAINS ENTERING TUNNELS. This study was carried out for the Transportation Systems Center of the U.S. Department of Transportation on behalf of the Urban Mass Transportation Administration in order to determine to what degree it is possible to attenuate the effects of pressure pulses on the passengers in trains entering tunnels. The emphasis of this study is on the approach of modifying the normal, abrupt entry portal of the constant diameter single-track tunnel. In order to understand this approach, which requires the tailoring of a tunnel portal, it was first necessary to have an analytical model in which confidence exists in its capability to predict realistic pressure pulse histories of trains entering tunnels having porous and/or flared entry portals. To accomplish this, the best available theoretical information along with small-scale laboratory experiments were used to update an existing computer program. Then, this program was used to demonstrate effective portal configurations. Although reasonable modifications to the tunnel entrance portal may not decrease the magnitude of the pressure

rise, they are very effective in reducing the discomfort to the human ear by decreasing the rate of pressure rise to what the normal ear can accommodate. A brief qualitative comparison was made of this portal modification approach with other approaches: decreasing the train speed during the tunnel entry and sealing the cars. The optimum approach, which is dependent upon the conditions and requirements of each particular rail system, is likely to be the portal modification one for the subway transit system.

Dayman, BJ Holway, HP Hammitt, AG Tucker, CE, Jr Vardy, AE ; Jet Propulsion Laboratory, Transportation Systems Center, Urban Mass Transportation Administration Final Rpt. DOT/TSC/UMTA-79/28, UMTA-MA-06-0100-7910, June 1979, 235 p.; Contract DOT-RA-N-02-612-0397; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-299155/2ST

48 260271 ENERGY USE. Petroleum supplies 96% of the fuel needed by the transportation industry. Automobiles consume 55% of transportation energy with trucks second, 21%, aircraft 8% and railroads 3.3%. Most freight is moved by trucks rather than rail. The use of aircraft for passengers and freight has increased. The automobile is still the primary mode of passenger transportation. Transportation does not follow the most energy efficient path. The government aggravates the problem by favoring air and highway transport and not adequately overseeing emission control. Actions that can be taken to ease the problem include increased public awareness of energy conservation needs and transportation planning via industry, citizens groups and national programs. Promotion must be given to energy efficient transportation. A decrease in transportation demand would lighten the drain on energy. An energy efficient scenario that would reduce transportation energy by 50% anticipates shifting half the intercity freight to rail rather than truck, half the intercity passenger traffic carried by air and one third carried by automobile to bus and train and half of urban transportation shifted to mass transit. With good leadership, the support of congress and full citizen participation the task of becoming energy independent is possible.

Patterson, AG ; Western Association of State Highway & Transp Off Proceeding June 1974, pp 2-14; This report is from the WASHO Conference held in Portland, Oregon from June 2-6, 1974.

48 261577 DIESEL EXHAUST EMISSION CONTROL PROGRAM. The purpose of the report was to demonstrate a prototype of the atomic International diesel exhaust control system in a Southern California Rapid Transit District bus (a flexible coach equipped with a Detroit Diesel 6V-71N engine). The program objectives were to meet the California 1975 heavy-duty vehicle standards and to establish the economics of the system. Emission reduction objectives were attained except for the reduction of NO sub x. To meet California requirements of less than 5 gm/B-Hp-Hr of combined HC and NO sub x, larger residence times were required. The resulting muffler size may not be compatible with bus installation constraints. Alternative technologies of NO sub x control under development by diesel engine manufacturers may prove to be more cost effective. Advantages and disad-

vantages of the Atomics International diesel exhaust emission control system (DEEC) in vehicle application are discussed. Recommendations are offered and conclusions reached. Tables and figures are numerous. Appendices include the tabulation of laboratory test data, muffler performance test reports provided by the California Air Resources Board, Air Resources Laboratory, and a market analysis for the DEEC muffler.

Sudar, S Grantham, L ; Atomics International, (CA-06-0035) Final Rpt. UMTA-CA-06-0035-74-1, Jan. 1974, 150 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-234752/AS

48 261665 TRANSPORTATION AND THE ENERGY CRISIS. The energy crisis of 1973 had a major effect on transportation. The authors cite countermeasures and alternatives, such as mass transit and carpooling. Statistics of energy savings from these measures are given. Environmental standards, new energy sources and small cars are commented upon, and some suggestions are put forth concerning necessary research.

Cook, KE Blake, SE *Transportation Research News* No. 55, June 1974, pp 17-19; ORDER FROM: TRB Publications Off

48 261680 MOBILITY IN THE ENERGY ERA. Energy and conservation was one of the topics touched upon by the Chairman of the General Motors Corporation in his remarks to the 15th Highway Transportation Congress. He stressed the fact that while new sources of energy must be explored, those already existing must not be wasted. A balance must be achieved between energy conservation measures and the undesirable side-effects that might evolve. In the area of highway safety, much work still needs to be done to improve travelling safety on the highways. The reduction in accidents that occurred as a result of the lowering of speed limits in an effort to conserve gasoline must not be taken as an indication that safety measures can receive less attention. Public transportation has been revived in recent years and projects for the future are concerned with as many and the best modes possible to serve the needs of the public. The energy crisis has forced changes in the automobile industry, and General Motors has responded to the public's demand for more gasoline-economic cars, but at the same time pointing out the importance of having a choice of transportation mode. Growth in mobility will continue in the years ahead, and the beneficial effect of the energy crisis will be more careful planning and conservation.

Gerstenberg, RC (General Motors Corporation) Highway Users Federation for Safety and Mobility Conf Paper May 1974, 7 pp; Presented at the 15th Highway Transportation Congress, Washington, D.C., May 8, 1974.

48 261684 ENERGY, MANPOWER, AND THE HIGHWAY TRUST FUND. This article presents the net impacts on energy consumption and manpower that are likely to result from a relocation of the projected 1975 highway trust fund (\$5 billion) to six other types of government programs: railroad and mass transit development, educational facilities construction, water and waste treatment facilities construction, the law enforcement program, national health insurance

program, and tax relief program. Energy conservation could be achieved by reinvesting the highway trust fund in any of several other alternative federal programs. Total employment would increase in each alternative program examined. For example, if construction monies were shifted from highways to railroads, the energy required for construction would be reduced by about 62 percent and employment would increase by 3.2 percent. The consequences, in terms of energy consumption and employment, of shifting from car and truck transportation to railroad transportation in 1963 are also calculated.

48 261688 GUIDELINES TO REDUCE ENERGY CONSUMPTION THROUGH TRANSPORTATION ACTIONS. This study has been put together as an aid to local planners, traffic engineers and administrators in incorporating energy conservation into the planning process especially for short range transportation planning. Ten major groups of transportation related actions to reduce energy consumption are discussed: measures to improve the flow of high occupancy vehicles, to improve total vehicular traffic flow, to increase transit patronage, to encourage use of walk and bicycle modes, to improve the efficiency of taxi service and goods movement, to restrict prices, to reduce the need to travel and transportation and energy restriction measures. The interrelationships between these actions are analyzed; what works well together and what cancels each other out. Evaluation criteria include; short lead time, minimal institutional obstacles to implementation, favorable public reaction and high energy reduction. Three sample packages are presented for different urban areas. Some of the conclusions are: carpool actions and restriction of the quantity of gasoline sales are effective measures for any size city. Carpooling may overlap with transit actions however carpooling is often easier to implement. Incentive type actions are also effective because of easy implementation. Improvements in vehicular flow can be counter productive. Taxi and truck related actions are only applicable in large urban areas. Local policies are always a factor in implementing energy conservation. Tables for this data are given.

48 261697 TASSIM: A TRANSPORTATION AND AIR SHED MODEL, VOLUME 1. CASE STUDY OF THE BOSTON REGION. The TASSIM model integrates an urban transportation planning model, vehicle emission factors, and simple air diffusion models in a simulation framework that can be used to analyze the air quality effects of transportation policies. The model is spatially disaggregated, and it is compatible with data sources available in many metropolitan areas. This volume briefly describes the structure of the model and then analyzes several model applications that simulate for Boston the air quality effects of transportation control land use, and stationary source policies. The transportation control policies are evaluated in a cost effective-

ness framework. The final sections consider possible extensions of the model and outline the model's computational aspects.

48 262374 TASSIM: A TRANSPORTATION AND AIR SHED SIMULATION MODEL. VOLUME 2: PROGRAM USER'S GUIDE. The TASSIM model integrates an urban transportation planning model, vehicle emission factors, and simple air diffusion models in a simulation framework that can be used to analyze the air quality effects of transportation policies. The model is spatially disaggregated, and it is compatible with data sources available in many metropolitan areas. Designed to aid others in using TASSIM, this volume describes the computer programming steps in the model, the input data required by various subprograms, and the procedures used to calibrate the model to a metropolitan area. The volume also includes an outline of the programming changes needed to simulate various policies, and a listing of the model's FORTRAN code. Volume 1 describes and analyzes the simulated effects of transportation control, land use, and stationary source policies in Boston, generated with the TASSIM model.

48 262693 HIGHWAYS AND ENVIRONMENT: A STRATEGIC OPPORTUNITY. The opportunities open to highway engineers planning for urban areas are discussed. The scope for improved co-ordination between architectural and engineering skills, and a need for more effective communication between engineers and the public is stressed. Potential highway development cannot be considered in isolation and comprehensive analyses of traffic, economic and environmental factors are as important as route location and pavement design. Planners should demonstrate clearly the case for channelling vehicles onto routes catering adequately to their needs, with commercial traffic meriting as much attention as the commuter. As the efficiency of a road network is normally controlled by its inter-sections, continuity and consistency of design are as important as capacity. The need for a better balance of public and private traffic is recognised. While fixed-track "rapid transit" systems will be of value in selected areas in the future, most public transport will still be dependent on roads. Critical modes will be formed at interchanges between different modes, with the generation of major traffic flows. The police should be involved in discussions of design and methods of dealing with traffic problems. Highway engineers should demonstrate the economic and environmental value of the total transportation approach to the movement of people and goods.

48 262951 KINETIC ENERGY STORAGE FOR MASS TRANSPORTATION. The flywheel can provide highly acceptable energy density levels that favorably influence vehicle weight and operating range. At the same time, the flywheel can provide high levels of power to propel vehicles with desirable high-acceleration performance. The overall conclusion of the flywheel study and demonstration programs is that flywheel energy storage in flywheel hybrid vehicles and pure flywheel vehicles is a practical means of propulsion suitable for many types of urban vehicles. The specific energy of present-day flywheels is sufficient to make flywheel-only vehicles practical for urban route applications with ranges up to 30 km (18.6 mi). Flywheel/heat-engine hybrid vehicles are entirely feasible for family and commuter-car applications.

48 263211 ENVIRONMENTAL PROTECTION AGENCY RULES FOR NEW "INDIRECT SOURCES" EMPHASIZE TRAFFIC IMPROVEMENTS. EPA's rules for "Review of Indirect Sources", published in the Federal Register recently, make it mandatory that all proposed facilities that will attract substantial numbers of automobiles and thus indirectly pollute the air, must be reviewed. This article discusses the types of facilities that will come under scrutiny, and the factors, such as location and number of users that will be important. Types of chemical pollutants and delegation of responsibility are also discussed. Other forms of control of indirect sources are included; strict control in the design of new towns, methods of providing smooth traffic flow from congested areas and alternate forms of transit.

Reed, MF, Jr ; Highway Users Federation for Safety and Mobility Apr. 1974, 6 pp

48 263773 ESTIMATES OF POLLUTION FROM US NONFREIGHT HIGHWAY TRANSPORTATION. Forecasts to the end of the century on the future use of resources and the future generation of various pollutants as a result of different proportions of the use of private automobiles and public transportation are made. The effects are extended to supporting industries such as steel, cement and coal. Relative transportation pollution costs for an urban area are modeled. It is shown that even a 50% diversion of automobile commuting to bus commuting would not have a dramatic effect on overall resource utilization and pollution, but would have a marked effect on the heavy pollution costs of

central cities. A system of road-use charges is proposed. (Author)

48 263900 IMPLICATIONS OF OIL RESOURCES SHORTAGE FOR URBAN TRANSPORT INVESTMENT. The paper describes an investigation, recently commenced, into the implications for urban passenger transport investment of an oil resources shortage. The investigation is financed by the U.K. Science Research Council. The paper has three main sections, each devoted to one of the objectives of the investigation namely: The effects of higher crude oil prices on passenger travel in urban areas; The energy consumption characteristics of existing and potential urban passenger transport systems; The implications for investment in urban passenger transport of an oil resources shortage. The third objective is being examined for actual investment proposals in Merseyside Metropolitan County Council, England, in co-operation with the local transport and planning authorities. Conclusions are drawn from discussion of these objectives. Finally the implications for urban passenger transport of the oil resources shortage is discussed briefly within the perspective of the division of financial resources between roads and public transport at urban level, and between transport and other sectors at national level. /Author Abstract/

48 263902 THE IMPACT OF THE ENERGY CRISIS ON AMERICAN CITIES BASED ON DISPERSION OF EMPLOYMENT, UTILIZATION OF TRANSIT, AND CAR POOLING. The impact of the energy crisis on transportation within selected American cities is analyzed. Using Journey to Work data from the 1970 U.S. Census of Population, changes are estimated in car pooling and in the use of alternative transportation modes for commutation travel. Suggestions are provided for the analysis of specific cities, and transportation planning in the Baltimore, Maryland, area is reviewed in some depth. Conclusions are drawn that, on average, limited energy shortfalls (of approximately 10 percent) should have no severe adverse impact on commutation activity. /Author Abstract/

48 263903 URBAN TRANSIT RIDERSHIP IN AN ENERGY SUPPLY SHORTAGE. The capabilities of a transit company to provide service is usually based on the existing commuter traffic. Rapid increases in commuter ridership will cause transit service to deteriorate. The transit companies' ability to respond to increased ridership is controlled by the length of travel by the new riders, the availability of additional buses and trained staff. This study found that under a situation where fuel was allowed to price itself in a free market, the transit company could face a situation of declining revenue per bus mile with increasing patronage. This comes about because those with longer commuter trips find it more

advantageous to use transit. The transit patronage increase to be expected with a five percent reduction in fuel supply is similar to that experienced by a doubling of fuel price. The more uniform change in the trips made throughout the urban area will probably not alter the average length of trip. The transit company should be able to keep the same ratio of passenger revenues to operating costs. The models used to estimate the changes in transit ridership appear to be generally applicable. The model used for the pricing scheme is similar to one used in the Tyneside-Westside Transportation Study. The experience of Seattle's Transit System over the last year and a half tends to confirm the estimates found in the gasoline rationing model. /Author Abstract/

48 263904 A SYSTEM MODEL FOR PREDICTING THE EFFECT OF ENERGY RESOURCES ON URBAN MODAL SPLIT. Using regional and state level data, including observations during the recent energy crisis, the methodology and first generation of a system model for predicting impact levels of fuel shortages upon modal split are reported. The data to such a system model has the characteristics of an input disturbance in a steady-state trend. Of importance is the long term effect if the disturbance becomes a regular input. The specific case reported is an analysis in the Tucson (Arizona) region of the fluctuations in travel demand in relation to population, economic condition and fuel availability indicators. Of major significance is the modeling techniques' ability to detect differential shifts to public transit during the recent reduction in gasoline availability. /Author Abstract/

Nizlek, MC Duckstein, L (Arizona University) *Transportation Research* Vol. 8 No. 4/5, Oct. 1974, pp 329-334, 4 Tab., Refs.

48 263906 THE EFFECTS OF ENERGY PRICE ESCALATIONS ON URBAN TRANSIT BALANCE. The forthcoming shortages in transit fuels and electricity resources were the basis for forecasts that bus fuel prices will quadruple by 1980, while transit electricity will have doubled in cost. One effect of these energy price escalations on urban transit planning is to shift downward the economic balance between buses-on-busways and trains-on rails, from the current 12,000 passengers per hour to half of this value by the beginning of the 1980's. A program is proposed to achieve better balanced, all-electric bus/rail urban transit systems that minimize capital and energy consumption. /Author Abstract/

Hoffman, GA (University of Southern California) *Transportation Research* Vol. 8 No. 4/5, Oct. 1974, pp 343-348, 4 Fig., 2 Tab.

48 263919 ENERGY, ALUMINUM AND THE AUTOMOBILE. The aluminum industry is attacked because of its large consumption of electricity. While it takes a large amount of energy to produce aluminum, this material, because of its light weight reduces the need for energy when used in the manufacture of transportation vehicles. Using aluminum instead of steel in parts of an automobile that carry less load (hood, trunk, lid, doors, front fender etc.) would cut down the

average weight of a car from 3,600 lb to 2,925 lb resulting in an increase in fuel economy. Aluminum is an attractive alternative to steel because of its lesser cost. Lighter cars also need smaller engines so emission control devices would be easier to install. Aluminum could be used for trucks, ships, air transport and rapid transit cars. The energy required to produce aluminum is derived from domestic oil, gas and hydropower while the savings it provides is in oil from overseas, the the fuel with least reserves. Aluminum also have energy saving qualities of being heat reflective, and corrosion resistant. Aluminum production should be expanded rather than reduced as some environmentalists advocate.

Cochran, CN ; Aluminum Company of America June 1973, 3 pp; Synopsis of a study published in the June 1973 issue of *Automotive Engineering*, under the title "Aluminum-Villain or Hero in the Energy Crisis."

48 264168 CARS FOUND MORE ENERGY EFFICIENT THAN MASS TRANSIT. A study conducted by the Massachusetts Transportation Systems Center of DOT revealed that overall, the efficiency of cars and trucks would result in a combined energy saving of 46.3 percent in 20 years at a cost of 13 billion dollars. On the other hand, a massive shift to rail and bus transit would save only 8.1 percent in fuel over a 15-year period and cost 29.2 billion dollars. It was concluded that better utilization of buses, increased car efficiency, greater truck efficiency, car pools, and reduced travel speeds offer the best potential energy savings and at the same time require the least amount of public investment.

Automotive Information Vol. 3 No. 1, Aug. 1974, pp 1-2

48 265168 SELECTED APPROACHES TO ENVIRONMENTAL IMPACT EVALUATION OF REGIONAL ALTERNATIVES. A regional assessment of environmental impacts requires a macro-level overview of alternative policies. An integrated study program of subareas by multi-disciplinary teams is essential. Consideration should be given to the adequacy of the existing data base, the political process, the jurisdictions involved and their relationship to land use and the transportation planning process along with Federal, state and local legal actions. Community participation should be an important element. This paper discusses the complexities of the relationships involved in transportation planning at the regional level and presents two case studies. It uses Boston and Baltimore as examples of two cities who are re-evaluating their needs by making environmental impact assessment of transportation and land use programs.

48 300384 REGIONAL ENERGY REQUIREMENTS ENERGY USAGE IN TRANSPORTATION. The performance and fuel consumption by mode of travel (translated in some cases into equivalent energy usage) are tabulated, comparisons are made of transportation activity in the same sample years as are used in the study, and comparative tables are presented of energy and transportation relative to GDP per head. Transportation as an indicator of urban activity is examined, and an attempt is made to distinguish between the use of transport for "production" and for social and recreational purposes. The paper presents information on fuel consumptions in the West Midlands of England.

48 301604 URBAN TRANSPORTATION PLANNING UNDER ENERGY CONSTRAINTS. Current knowledge concerning the impact of limited fuel availability on urban travel behavior is reviewed, and the application of this information to urban transportation planning is discussed. The 1973-1974 oil embargo is viewed as a short-term perturbation in the energy-transportation system that resulted in temporary changes in travel behavior. Short-range energy contingency planning can benefit most from the knowledge gained during this period. Energy

contingency planning should emphasize non-capital-intensive policies that can be easily and quickly implemented to conserve fuel. The information gained during the embargo does not appear to be directly applicable to long-range urban transportation plans do not appear practical at this time because of the lack of information concerning the impacts of fuel availability on travel and living patterns. It may therefore be more beneficial to develop plans that have the flexibility to include this information as it becomes available. A standardized definition of fuel availability should be determined, and a mechanism for capturing fuel allocation and consumption statistics on a disaggregate level should be established. Trends in the attitudes of consumers toward the energy situation and transportation-related behavioral changes that result from these perceptions should also be monitored. /Author/

48 301897 THE ECONOMIC USE OF ELECTRIC ROAD VEHICLES IN A CHANGING ENVIRONMENT. The president of the Electric Vehicle Development Group explained in his opening address that the conference/demonstration for electric road vehicles had been called to examine the factors involved in the implementation of large numbers of high performance vehicles, and to draw upon the experience to date of those now operating delivery and public passenger electric vehicles. Reference was made to rising costs of fuel and shortages, alterations in patterns of land use and the need with such new technology to make sure that it is supported by thorough research, test-bed experience and cooperation between manufacturers, users and planners. Divided into five sessions papers were presented on-estimated supplies of transport fuels to the end of the century; an operator's requirements and operational experience with battery electric buses and a consideration of future developments; towards a more versatile public passenger transport system based on experience with the Leyland/Bosch/Chloride bus at Runcorn, Cheshire; the United States electric and hybrid vehicle program; operational experience with the silent karrrier delivery van and a review of marketing prospects related to total costs; potential use of vans powered by electric wheel motor units; economic prospects for electric traction for public transport operation; an outline investigation of a hybrid (combat) trolley bus; operational data and running experience in the city of Esslingen of the "duo-bus"; electric road vehicles in a changing environment; transshipment depots-a retailer's approach; some experience with electric vehicles; international activities. The discussion following each session is appended. /TRRL/

48 301902 ENERGY USAGE AND CONSERVATION. The paper examines the present position concerning energy consumption in New Zealand. Transport services depend entirely on liquid fuels and account for 70% of all oil consumption. A study funded by the New Zealand Energy Research and Development Committee (NZERDC) is to consider policies for medium-and long-term savings in energy use in transport. The scope for energy saving or conservation measures is likely to be small due to zero rate of economic growth. To achieve a reduction in energy use measures for the use of alternative fuels and land use and energy conservation planning policies are needed. Limits are being placed on peripheral growth of residential development and urban areas are being consolidated to reduce present energy consumption. /TRRL/

48 302108 WHAT HAPPENS TO CITIES WHEN THE GAS RUNS OUT? Many suburban-urban areas will be crippled by gas rationing; commuters may be unable to get to work until emergency procedures are in place. Some far-sighted communities, however, have already created energy contingency plans. One of these areas, Dallas/Fort Worth, developed a plan in 1977 after an extensive study of commuting habits, average commutes, mass transit capabilities and alternative commuting methods. As a result, energy coordinators for 20 communities are appointed, mass transit is geared up to absorb increased ridership (which could double almost overnight) and some laws have been modified to facilitate emergency measures.

Cooper, LC (North Central Texas Council of Government) *ASCE Civil Engineering* Vol. 49 No. 8, Aug. 1979, pp 71-73; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 302117 PUBLIC TRANSPORTATION AND THE LAST DECADES OF PETROLEUM. The U.S. is now facing, and will face in the future, a petroleum supply crisis. The U.S. will face changes which will require broad political support for governmental actions. The ways in which transportation needs could be substantially reduced and ways in which transportation's dependence on petroleum could be converted to some other energy need to be examined. This article briefly examines this century's substantive changes which have affected urban transportation and petroleum usage, and discussed the future need to focus on urban transportation as the heart of a comprehensive self-help conservation strategy. During the early stages of the overall self-help strategy, the automobile will be the major target for conservation and the adroit reduction of petroleum usage for autos will be a prime achievement. Petroleum savings could also be realized by improving the traffic flow in urban areas. Long-term, self-help conservation strategies are discussed and it is observed that a stable, energy-efficient society depends on the relationship of urban living pattern and public transit. The importance of urban land use planning is noted and urban revitalization is discussed, as well as the total efficiency of the urban area and its complete transportation system. Public transportation elements of the self-help strategy must be integrated concurrently with the new direc-

tions in land management and revitalization and redesign.

Gambaccini, LJ (New Jersey Department of Transportation) *Transit Journal* Vol. 5 No. 3, 1979, pp 3-16

48 302118 ENERGY CONTINGENCY PLANNING FOR TRANSIT SYSTEMS. Transit systems must meet the basic transportation needs of the community in the event of fuel shortages. Given the likelihood of such shortages, it is prudent to now begin the preparation of energy contingency plans for transit systems. Two basic aspects must be included in any contingency plan: the transit system must have enough fuel to operate not only a normal schedule but probably an increased schedule requiring greater fuel demands; and provisions for vehicles to accommodate significant increases in ridership must be made very quickly. Some measures such as increasing fuel storage and changing fuel supplier contracts, will require relatively long lead times. Routinely made decisions such as new equipment purchases can be made such that the transit property is in a better position during a fuel crisis.

Barker, WG Cooper, LC (North Central Texas Council of Governments) *Transit Journal* Vol. 5 No. 3, 1979, pp 17-24, 1 Fig., 1 Tab.

48 302131 OECD CONFERENCE ON TRANSPORT AND ENVIRONMENT REVIEWED. Energy conservation, fiscal policy, and environmental concerns seemed to dominate the thinking at this conference; therefore, efforts to improve bicycle and foot transportation received the most attention, due to their potential as a practical and environmentally desirable method of moving in the city. At the first session, it was concluded that the most serious obstacle to the widespread use of bicycles in urban areas is their vulnerability in mixed traffic. Although, ideally, bicycles should have separate rights-of-way, separate bikeways are not always logistically possible or economically feasible. Progress has been more impressive in the area of pedestrian improvements with the advent and almost total acceptance of pedestrian streets and pedestrian malls in downtown areas. These improvements, which originated in Europe in the mid-1960's, have now been extended to cities in North America, Japan, Australia, New Zealand, and South America. The conference also included discussion of extending such traffic restrictions to residential areas. Paratransit received a significant amount of attention as a means of providing special transportation services amount of attention as a means of providing special transportation services to handicapped persons and others who are unable to use private automobiles or conventional public transportation. Also, it provides public transportation in low-density rural areas where private automobile ownership is low and it provides an alternative to the solo use of the private automobile for commuting purposes. The final sessions addressed management of transportation demand, financing, and energy.

48 302275 ANALYSIS OF LIFE-CYCLE COSTS AND MARKET APPLICATIONS OF FLYWHEEL ENERGY-STORAGE TRANSIT VEHICLES. The Urban Mass Transportation Administration (UMTA) has recently completed the Phase I activities of its Flywheel Energy Storage Program involving an analysis of the operational requirements and the conceptual design of flywheel energy storage vehicles for transit service. Flywheel energy storage systems are being proposed as a means of reducing the energy requirements of fixed-route, multi-stop, urban transit vehicles. The Phase I studies have paved the groundwork for the succeeding program phase which include the design, fabrication, test, and evaluation of prototype flywheel storage vehicles within the urban transit industry. This report documents the results of these analyses. It examines the economic viability and the potential market applications of these proposed concepts within urban transit operations. The report presents a description of the structure, the approach, and the costs, and the annual recurring operations/maintenance costs associated with the conventional diesel bus, the trolley bus, and the three flywheel-powered vehicle systems considered in the study; describes the results of the life-cycle analysis and the sensitivity of these results due to variations of key assumed input variables; and discusses the potential demand and the market applications of flywheel energy storage vehicles within transit service operations.

48 302413 ENVIRONMENTAL PLANNING AND DESIGN FOR RAPID TRANSIT FACILITIES. The National Environmental Policy Act of 1969 and related environmental laws mandated certain environmental considerations for major federal actions. The principal tool for documenting these considerations was the environmental impact statement. This requirement, interpreted and implemented by each federal agency, has given environmental planning concerning federally funded public improvements, such as transit facilities, its scope. This paper discusses the environmental planning studies and methodologies involved in preparing an impact statement for rapid-transit projects under the Urban Mass Transportation Administration. Emphasis is given to major issues, including alternatives analysis, environmental-impact analysis, and analysis of parklands and historic properties. The primary considerations in each subject area and specific approaches to an analysis that would satisfy the requirements of the National Environmental Policy Act of 1969 and related environmental directives are examined. The Metropolitan Dade County Rail Rapid Transit System is used as an example. (Author)

48 302705 EFFICIENCY OF UTILIZATION OF TRACTION ENERGY IN URBAN PUBLIC TRANSPORTATION [Efficienza di utilizzazione dell'energia di trazione nei trasporti pubblici urbani]. The relative efficiency of utilization of traction energy by three most important means of public transportation: subway, streetcar, and bus, is considered and compared. The data on urban transportation services in Milan are analyzed. Formulas for the evaluation of efficiency of energy utilization by different modes of urban transportation are derived. It is found that the efficiencies of the bus and streetcar are about equal and amounting to about a half of that of the subway. On the other hand, the bus is the most flexible means of urban transportation. [Italian]

48 302716 IMPACTS OF URBAN RAILWAYS. Developmental and environmental impacts of railroad construction and operation in Canadian urban centres increasingly are expected to present difficult issues for planners, decision-makers and administrators. Three categories of railroad/urban development concern exists: allocation of outmoded or poorly-located rail facilities, encroachment of urban development on existing railways, and in the largest metropolitan areas, development of new light rail rapid transit. Addressing these concerns means confronting: (a) poorly developed concepts and methods for the assessment of developmental and environmental impacts; (b) inadequate integration of rail transport with land use planning and decision-making at municipal, regional and provincial levels; and (c) inadequate community consultation during such planning and decision-making, contributing to community opposition to specific project proposals. Phase I of the research examined the extent to which developmental and environmental impacts present/will present problems for urban areas in Canada; how these problems are being perceived and tackled in key centres, the state-of-the-art of assessing railway impacts, and community concerns with respect to urban railroads.

48 302984 ENERGY AND TRANSPORT: STRATEGIES FOR ENERGY CONSERVATION IN URBAN PASSENGER TRANSPORT. Before proceeding to explore potential strategies for energy conservation in urban passenger transport, this paper presents some evidence on energy efficiencies of various transport modes and on travel behaviour under energy constraints. Knowledge of the relative energy efficiencies of different modes of transport is evidently necessary for analysing and developing policies for fuel conservation. Although the automobile does appear to be significantly more energy-intensive than public transport modes, this does not automatically indicate that a policy to attract people to public transport would lead to the maximum possible fuel savings. Available evidence on travel behaviour under energy constraints indicates that the elasticity of travel demand is very small. Increasing prices, within the range expected, are not likely to result in satisfactory fuel savings, and it is therefore necessary to consider alternative strategies. The strategies to be considered here may be outlined as follows: (1) improving fuel efficiency of automobiles by modifying driving habits, reducing speeds, improving traffic flows, and keeping vehicles properly maintained; (2) increasing efficiency of automobile travel by promoting higher occupancies; (3) attracting car travellers to public transport; (4) shifting to smaller, more fuel-efficient vehicles, changing vehicle and engine designs such as to improve the inherent fuel efficiency of the automobile; (5) technological change: new propulsion systems, alternative fuels, and rapid personal transport; (6) reducing travel needs by changing land-use patterns and improving communications. These strategies are discussed in turn and, given the available information about travel patterns and behaviour, an attempt is made to assess their likely impact. Clearly those strategies should be selected which offer the maximum potential fuel savings and which can be introduced with minimum sacrifice. (a) (TRRL)

48 302992 THE FORECASTING MODEL OF FUTURE TRAFFIC DEMAND-SUMMARY. Background information on the Japanese economy is provided, indicating a fourfold increase (1970 prices) in GNP over the 15 years 1955 to 1970. Similarly, the volume of domestic freight transport and domestic passenger transport is shown to have increased by a factor of 3.5 to 4 over the same time period. The relationship between economic structure, transport structure and investment strategies in each case is discussed, and the consequences following imbalance in investment policies described. The reasons behind the decision to formulate forecasting models of future traffic demand, related as they are to the energy crisis in the latter half of 1973 and the geographical nature of the country are discussed. A series of charts, tables and maps provide statistical data, and details of the model(s) are presented. (TRRL)

48 303561 TRANSPORT AND ENERGY IN AUSTRALIA. This report was prepared for the South Australian Department of Transport. This paper reviews the current energy situation in Australia and concludes that Australia is not short of energy in any overall sense. In providing supplies of energy for transport, however, Australia is faced with both short term problems which are unique to Australia and with longer term problems which are similar to the world-wide problem. In the short term, Australia will be short of indigenous petroleum energy supplies so vital to transport while in the long term the world is heading towards a petroleum energy shortage. In the longer term, in the face of the global pool crude oil shortage, Australia must look to the availability of alternative primary sources of energy for transport. It is recommended that a) technologies such as oil from coal or methanol from natural gas for producing alternative energy sources to crude pool oil be assessed and a decision made to implement a production plant of at least pilot scale with the aim of gaining experience in their operations economies, b) the future high cost of private transport and the desirability of providing public transport be taken into account as a major factor in the planning of urban developments in Australia. 48 304691 A COMPUTER PROGRAM (POWREQ) FOR POWER REQUIREMENTS OF MASS TRANSIT VEHICLES. This project was performed to develop a computer program suitable for use in systematic analyses requiring estimates of the energy requirements of mass transit vehicles as a function of driving schedules and vehicle size, shape, and gross weight. The Power Requirements (POWREQ) Simulation Model is a computer program that simulates the energy requirements of a transit vehicle during its execution of a given driving schedule, and was designed to operate on the TSC DEC-10 Operating System either in batch mode or in time-sharing mode via remote terminals. The POWREQ Simulation Program was programmed in the Fortran IV compiler language for execution on the DEC-10 by a series of commands input by the user. The user is provided the capability of analyzing the effects of various types of driving schedules and road profiles on energy requirements. A CALCOMP plotting routine is provided so that the user, if desired, can request graphs illustrating the time variation of the important parameters. The graphs will be generated off-line.

48 308005 THE TRANSPORT FUEL DILEMMA: PATTERNS OF CONSUMPTION WE CANNOT SUSTAIN. Projections of future oil supplies indicate that a tight supply situation will develop within the decade ahead. Prices of oil are expected to continue to rise, initially to levels of costs of new oil in difficult areas (e.g., deep offshore) and later to costs of substitute liquid fuels from coal, oil shale and possibly crops. This article surveys the possibilities for increasing the energy-efficiency of transport systems. Considerable improvements are possible without radical departures from the present overall pattern of vehicle use. Nevertheless future energy costs should be allowed for in urban land-use and transport planning. (TRRL)

48 308157 FACTORS AFFECTING WILLINGNESS TO CONSERVE GASOLINE. This paper explores the role of travel behavior, demographics and attitudes toward energy conservation to explain consumer willingness to conserve gasoline. Data from a telephone survey of 500 New York households were analyzed on several measures of willingness to conserve, using a statistical analysis procedure called AID (Automatic Interaction Detection). It was found that willingness to conserve gasoline is generally independent of demographics, travel behavior, and other attitudes toward energy. The mildly important factors included residence locations (NYC residents more willing to conserve) and attitudes toward U.S. use of energy. Generally, those New Yorkers most willing to conserve were those with (a) the least to lose if gasoline were curtailed, (b) the most flexibility in present travel behavior, and (c) the most additional service options available. A brief review of other recent surveys shows that the public is consistently receptive to policy which encourages gasoline conservation by increasing travel options and offering incentives for their use; punitive or restrictive measures are met with strong disfavor. Based on the specific results of this and other studies, policy suggestions include increased perception of travel options and their true costs, increased transit services, and stabilized fares. 48 308484 TRANSPORTATION ENERGY CONSERVATION DATA BOOK: A SELECTED BIBLIOGRAPHY. EDITION 3. This bibliography, the second in a series of reports on energy conservation and consumption in the transportation sector, was compiled as part of the continuing technical information support provided by the Energy and Environmental Response Center (EERC) to the Energy Division of the Oak Ridge National Laboratory. The EERC maintains an on-line bibliographic data base documenting energy conservation and consumption in various economic sectors. The citations in this bibliography were selected from a comprehensive file of transportation materials. A companion volume, *Transportation Energy*

Conservation Data Book, Edition 3 (ORNL-5493), is an encyclopedia of statistical data on energy utilization by major transportation modes, research and development of alternate transportation modes and fuels (electric vehicles and alcohol fuels), and other pertinent factors influencing energy consumption in the transportation sector. These same subjects are included in this bibliography, which is a desk-top compilation of references. The data in the data book were taken from certain key research studies. Reviews of these studies are included in this bibliography: Comparison of U.S. Environmental Protection Agency Fuel Economy Ratings with On-the-Road Experience; The Congressional Budget Office's Report on Energy Used by Urban Transportation Modes; The Energy Information Administration's 1977 Annual Report to Congress; the National Cooperative Highway Research Program's Report on Energy Intensity of Transportation Modes; Oak Ridge Laboratory's Reports on Gasoline Demand; SRI's Report on Diesel Cars in the United States; SRI's Reports on Railroad Passenger and Freight Transportation; TECNET Transportation Energy Use Model, TRW's Study of Increased Diesel Car Production; and the Warton EFA Automobile Demand Model. All references are keyworded and arranged alphabetically by author or corporate author if individual authors are not cited in the document. Reports sponsored by the Transportation Energy Conservation Division of the Department of Energy are listed in a separate section. Author, corporate author, sponsor, report number, keyword, and permuted title indexes are provided. (Author)

48 308571 SURVEY AND ANALYSIS OF ENERGY INTENSITY ESTIMATES FOR URBAN TRANSPORTATION MODES. Current interest in energy conservation has resulted in a spate of divergent estimates of the energy intensity of urban transit modes. This paper critically reviews the methodologies and data sources employed by these estimates. It is shown that a very small repertory of sources and methodologies underlie the energy intensity estimates and that variance among them is primarily attributable to contradictory load-factor assumptions. Energy intensity estimates for bus and rail transit are developed, and the inadequacies of automobile data are discussed. Bus transit is shown to be more efficient than rail transit, and it is shown that the energy advantage of light rail over heavy rail lies in construction, not operation. /Author/

48 308787 OIL PUTS CARS ON THE SPOT. This article, adapted from the author's book "Running on Empty: The Lure of the Automobile in an Oil-Short World" discusses the lack of practical alternatives available to car manufactur-

ers. Factors affecting the supply of oil and future trends in vehicle ownership are examined. Recent oil production and pricing policies have brought about a fundamental change compared with previous trends. Oil producing countries are determined to make their resources last as long as possible. It is considered unlikely that alternative sources of fuel will take the place of petrol in the short term. The impact of oil price rises on the economies and developing car utilisation of third world countries is examined. There are serious doubts that the third world will be an expanding market. It is anticipated that a shift towards the production of smaller, lighter and less powerful cars over the next few years would reduce the fuel consumption of passenger cars in the United States by 15 per cent. The authors visualise an increased usage of public transport, which will probably need to be subsidised by the state. (TRRL)

48 308853 CHANGES IN TRAVEL IN RESPONSE TO THE 1979 ENERGY CRISIS. This paper describes recent work by the Planning Research Unit, NYSDOT, to prepare a comprehensive review of the energy-related events of 1979 and their impact on travel. The paper reviews the events of 1979 in chronological order, and then describes trends in energy and travel. These include oil and gasoline supply; prices; highway travel; transit, rail and air travel; and trends in business and the economy. Data is provided for generally 3 years by month/quarter and focuses on trends in N.Y. with appropriate parallel trends for the U.S. Two household level surveys are also reviewed, one based on a telephone sample of 1520 N.Y. residents, the other based on a sample of 712 N.Y. State Government workers living in the Albany Area. In N.Y. the 1979 shortfall peaked during the 3rd quarter at 11% and prices rose 30/gallon over the year. Traffic declined 10% in metropolitan areas, 18-20% on major rural facilities. Intercity rail traffic rose 30% while transit rose 20-25% (10% in NYC); domestic car sales fell 15% but sales of imports rose 32%. Consumer responses focused on "small but frequent" actions including driving slower, trip combining, and cuts in shop travel;

more than 40% of respondents indicated they had taken such actions. Certain major actions (fuel-efficient car purchases, vacation mode and destination shifts, carpooling, and transit use in large cities) were taken with less frequency (10-15%) but the energy saved in such actions was substantial. At higher prices or significant shortfalls (20% shortfall or more) consumers would increase focus on major actions; selection of certain minor actions (driving slower and tune-ups) would actually decline. The findings suggest that consumer responses to energy "events" will be internally rational but not necessarily consistent with planners' views. Since wide variations in response were observed by geographic and demographic groups, policy makers must take particular care to understand the nature of present and future of public responses. 48 309586 ENERGY EFFICIENCY IN THE TRANSPORTATION OF GOODS AND PASSENGERS IN SWEDEN [Energieeffektiviteten foer person-och godstransporter i Sverige]. The study compared the energy efficiency of the most used transport means in Sweden. The basic material has been obtained from a great number of companies and organizations. The study was done against the background of the present political debate on energy which inevitably influences its aim. First the report discusses a number of American studies in this field in order to give a general view of existing results and methods. Following is a description on considerations regarding the methods and calculations the study is based on. As far as possible all important factors concerning energy consumption have been considered, and the comparison is based on as equivalent presumptions as possible. The transportation analysis has been done according to how the energy contribution in Sweden is divided between energy for propelling, energy for production and maintenance of movable material, and energy for the construction and maintenance of infrastructure. Calculations refer to the middle of the 1970's and include conversion losses in order to obtain the results as quantities of the original energy which is expressed as energy content in crude oil imported to Sweden. The transport means studied are: the private car, buses, the commuter train, underground railway, the aeroplane, lorries, trains, coastal shipping freight. The results are only applicable in context. Detailed appendices on energy consumption accompany the report in a separate publication. (TRRL) [Swedish]

48 309642 ENVIRONMENTAL DETERIORATION DUE TO TRAFFIC [Umweltbeeinträchtigung durch Verkehr]. Starting with an analysis of the shelved traffic routes and underlying trip purposes, the requirements for the small scale mixing of urban functions (dwelling, shopping, working, recreation) are stated and an investigation made into the possibility of realizing these requirements in the Vienna area. It is suggested that there should be a better relation between working places and residential areas by the decentralisation of service and utility organisations. Noise sources from road traffic and the existing measurement and estimation procedures for motor vehicles and rail traffic are analysed and the noise from public and private transport is compared. Various possibilities of reducing exhaust emission are considered (speed, diesel-and gas-operation) and their effects upon the various exhaust components are investigated. As the third largest of the environmental burdens, the heat output and the efficiency of vehicles is investigated and it is recommended that there should be increased use of diesel vehicles and electrically driven vehicles on tracks (trams) because of their better efficiency and lesser energy requirements. Finally the suggested measures are applied to an example of a possible transportation organisation for the 6th and 7th districts in Vienna. (TRRL) [German]

48 309803 EFFECTS OF MOTORIZED TRAFFIC NOISE. PSYCHOPHYSIOLOGICAL AND ECONOMIC DATA [Effets du bruit de circulation automobile, donnees psychophysiologiques et economiques]. After a review of general knowledge gathered by acoustics specialists/physiologists on noise in general, the paper describes the results of physiological, psychosociological and economics studies carried out by IRT-CERN since 1972 on the effects of motorized traffic noise. Physiological effects are initially examined (hearing acuity risks, sleep disturbance), then activity disturbance (vigilance, performance, intelligibility) and the psychosociological impact of traffic noise (noise and discomfort, survey and evaluation methods, tolerance). The results of an enquiry, carried out by IRT-CERN among 965 frontagers in urban units of more than 50000 inhabitants, are then discussed. Finally the analysis elements of eco-

nomics and social costs are described (price variation of buildings and land, sound insulation and repair costs, loss of investment, estimated figures for noise impact). In conclusion noise levels and proposals for orientating the reduction of the impact of traffic noise are defined. (TRRL) [French]

48 310076 SEMINAR 1979. URBAN TRANSPORT AND THE ENVIRONMENT, 10-12 JULY 1979. 3. OVERVIEW OF 16 CITY CASE STUDIES. This volume provides a synoptic chart of 16 city case studies of innovative urban transport schemes implemented to improve the environment in the face of the rising car ownership and use characteristic of the 1970s. This chart gives an overview of all the case studies undertaken by the OECD environment directorate in the period 1976 to 1979 including those prepared for the 1979 seminar on "urban transport and the environment". 48 310616 TRANSPORTATION PLANNERS JOIN BATTLE FOR CLEANER AIR. Under the terms of the '77 Clean Air Act Amendments, transportation planners must find ways to reduce air pollution from mobile sources. Actions must begin in 1980. The article, based on interviews with transportation planners in Los Angeles, Boston, Baltimore and Denver, discusses common actions planned, including vehicle inspection and maintenance programs, car and van pools, priority lanes, flextime and improving mass transit. Case history of New Jersey's inspection and maintenance program included.

48 310622 SPATIAL FORM AND STRUCTURE IN A POSSIBLE FUTURE--SOME IMPLICATIONS OF ENERGY SHORTFALL FOR URBAN PLANNING. Five alternate scenarios for future energy supply are developed, ranging from steady growth in supply to a decline to 75 percent of 1977 levels by the year 2000. These scenarios are applied to four models of spatial form and structure: present trends projected; general dispersion; concentrated super-city; and diversified-integrated cities. It is concluded that only the last form will be viable in the energy-short scenarios. Implications for social organization include strict limits on new construction and on the personal use of fuel-powered transportation, as well as the development of urban and suburban nodes as the prevailing spatial form. Planners are urged to consider the implications of the argument in developing plans for future spatial development.

48 310647 NORTHEASTERN ENERGY AND TRANSPORTATION PROBLEMS: A REGIONAL PERSPECTIVE. This study compares energy and transportation problems of Northeastern States with nationwide or regional statistics and studies. Energy and transportation were selected because Federal Government policy and financing plays a leading role in these matters. The five problems most often mentioned by State officials in the Northeast were highway deterioration, high and rising mass transit operating deficits, financial and physical deterioration of freight railroads, increasing cost of energy relative to cost in other regions, and vulnerability to energy supply disruptions. These problems are complicated by factors such as the age of the region's public resources and the shrinking tax base of its cities. There are many ways to alleviate regional concerns. This study discusses some of them.

General Accounting Office PAD-79-12, Aug. 1979, 55 p., 1 App.; ORDER FROM: General Accounting Office, Distribution Section, Room 1518, 441 G Street, NW, Washington, D.C., 20548

48 311028 ENERGY CONSUMPTION ON DIFFERENT MODES OF TRANSPORT [Der Energieverbrauch der Verkehrstraeger]. Energy consumption for rail transport represents at most half of that used on road transport. This is due to

the low level of resistance of steel wheels running on rails compared to rubber wheels on a road surface. In air traffic energy consumption over a distance of 1500 km when working at full capacity is equal to the value of one private car. For short distance traffic petrol consumption for a private car is 10 times higher than that of public transport. Energy consumption for river transport is roughly equal to railways whereas on canals, for example in the transport of coal, it is four and a half times higher than for rail transport by electric traction. [German]

48 311051 ROLE OF ENERGY CONSUMPTION IN CHOICE OF TRANSPORT MOTIVE POWER. The paper examines energy consumption of various common urban transport vehicles, and examines other factors which may influence a move to electric transport. The vehicles considered are electric trains, trolley cars, trolley buses, and private electric vehicles.

48 311251 EXHAUST FUMES IN VEHICLES AND STREET ENVIRONMENT. EXPOSURE AND MEASURES [Bilavgaser i fordon och gatumljoe. Expositionslaege och atgaerd-sunderlag]. Comparative measurements of exposure to benzene, toluene, xylene and other hydrocarbons were carried out in various traffic environments. Car exhausts dominate air pollution and give characteristic patterns of analysis of different hydrocarbons. Exhaust concentrations inside cars are considerably higher than at roadsides. The concentrations rise with shorter gaps. Increased vehicle gaps in car queues at e.g. traffic signals will lower the concentrations. The exposure to exhausts in buses and trams is less than half of the exposure in taxis but considerable compared to other urban environments. Buses, and especially articulated buses show rises in concentrations of diesel hydrocarbon from their own exhausts. At pedestrian crossings the exhaust exposure could be halved by introduction of zones for vehicle spacing of 20-30 M before traffic signals. Prohibition of car traffic 50-100 M from a traffic environment exposed to exhaust will lower the concentrations to 10%. Considerable reductions of exposure would therefore be obtained by a systematic separation of car traffic from work places, bus stops, cycle tracks, footways, child nurseries, schools and residents. Individuals could also lower their exposure by avoiding car traffic and driving in urban areas. (TRRL) [Swedish]

48 312466 INSTITUTIONAL FACTORS IN THE IMPLEMENTATION OF AUTOMOBILE-RESTRICTIVE MEASURES. PART 1: IMPLEMENTATION EXPERIENCE WITH TRANSPORTATION AIR QUALITY MEASURES IN THE DENVER, COLORADO, URBAN AREA. In recent years, Denver's high altitude, topography, rapid growth, and heavy reliance on the automobile have combined to cause a severe air pollution problem. According to the Colorado Air Pollution Control Commission, the principal cause of the pollutant is the use of motor vehicles. The Denver region developed an air quality plan that was submitted to the U.S. Environmental Protection Agency as part of the state implementation plan for air quality. The Denver element of the plan relies on strategies that reduce emissions at the tailpipe rather than strategies to restrict automobile use. Several institutional and attitudinal factors played a role in determining that automobile-restriction measures were not acceptable: (a) the no-problem syndrome, (b) the no-solution syndrome, (c) lack of public acceptance, (d) possibility of unequal burdens, (e) changing economic impact, (f) agency priorities, and (g) difficulty in resolving conflicts. As the Denver region moves from planning to implementation of air quality strategies, it will be important for the state to transcend parochial political interests and take the difficult stands necessary. The state must also be careful not to make decisions in a vacuum. Ascertaining the public's opinion on air quality strategies will be critical to their successful planning and implementation. 48 312518 TESTS OF TRANSFERABILITY AND VALIDATION OF DISAGGREGATE BEHAVIORAL DEMAND MODELS FOR EVALUATING THE ENERGY CONSERVATION POTENTIAL OF ALTERNATIVE TRANSPORTATION POLICIES IN NINE US CITIES. FINAL REPORT. A transportation policy analysis methodology described in Guidelines for Travel Demand Analyses of Program Measures to Promote Carpools, Vanpools, and Public Transportation, November, 1976 (EAPA 4:1921) is demonstrated. The results reported build upon the two levels of analysis capabilities (a fully calibrated and operational computer package based on a set of disaggregate travel demand models that were estimated on a random sample of urban travelers and a manual procedure or sketch planning pivot-point version of the above methodology) and have undertaken to accomplish the following objectives: transfer-

ability, testing the manual approach on actual applications, and validating the method. The first objective was investigated by examining and comparing disaggregate models that were estimated in 7 US cities by eight different organizations. The next two objectives were investigated using separate case studies: the Washington, DC, Shirley Highway preferential transit and carpool lanes; the Portland, Oregon, Banfield Highway Expressway preferential transit and carpool lanes; the Los Angeles, Santa Monica Freeway preferential Diamond Lane and ramp metering facilities for transit and carpools; the Minneapolis, express bus on metered freeway project; and the Portland, Oregon, carpool matching and promotion programs for the general public and for employer-based groups. Principal findings are summarized and results consolidated.

48 313207 BICYCLING AND AIR QUALITY INFORMATION DOCUMENT. The document summarizes major factors affecting the level of bicycle use at the local level, and outlines measures to be considered for inclusion in a comprehensive bicycle transportation strategy. Quantitative data on bicycle program effectiveness is reviewed, and evaluation of potential air quality and energy impacts of bicycle strategies is discussed. Implementation considerations are included, such as legislation, institutional structure, and funding sources. Finally, brief case studies of programs implementing bicycle strategies are presented for Davis (California), Madison (Wisconsin), Denver (Colorado), and the states of North Carolina and California.

48 314219 TRANSPORTATION IN UNDER-DEVELOPED COUNTRIES. These papers were presented in one of the Work-Sessions at the Second International Symposium of Engineering

held at 'Universidad Centroamericana Jose Simeon Canas' from the 19th to the 23rd of February 1979. The document describes problems in under-developed countries related to transportation; rapid urbanization, which leads to the development of high residential areas, and often bad-planned transportation systems. Energy expenditure in transportation is usually a high percentage of total Energy consumption; therefore, the necessity of evaluating transportation programs and planning transportation alternatives is of prime importance, especially because present trends indicate that such energy consumption is increasing.

48 314374 INTERACTIONS BETWEEN ENERGY SUPPLY AND TRANSPORTATION-RELATED ENERGY USE. VOLUME I. This report describes the structure of ENTRANS and some of its policy analysis applications. ENTRANS is a computer simulation model of the interactions between energy supply and transportation-related energy use. It includes a complete representation of the characteristics of transportation supply (public transit, carpooling, highways, and autos) and of households' travel-related decisions (car type, travel mode, trip length, and frequency choices). The model is capable of analyzing a wide range of policies designed to change automobile fuel use. The results of several detailed policy analyses are described in this report.

48 315149 EXPOSURE TO HYDROCARBONS IN TRAMS [Exposition foer kolvaeten i spaarvagnar]. A series of tests to analyse exposure to air pollution in various traffic conditions in central and urban districts (Gothenburg) has been made. The air has been analysed with regard to certain components in vehicle exhaust fumes. The components concerned were benzene, alkylbenzenes and n-alkanes. Comparisons of concentration levels of these pollutants on trams on a major road at peak and low traffic showed up to 4 times higher concentrations at rush hour times. On tram routes of little traffic and interspersed long stretches of no traffic a result of 5-6 times lower concentrations was found in comparison to routes of dense traffic. Tests carried out on all three transport mediums simultaneously for the same route, including traffic queues, showed that benzene and alkylbenzenes reached levels of up to 4 times higher in cars than in the other two types of transport. Samples taken from a tram stop where other traffic is fairly limited in the city centre and samples from a tram stop where other traffic is close and concentrated showed a differential factor of 10 in the benzene and alkylbenzene levels. Weather conditions, especially rainfall and wind strength proved to be of major importance for the pollution concentrations. Results showed the importance of the need of measures

which must be taken in both the short and long terms. In the short term actions such as avoiding traffic lights which cause traffic queues in the vicinity of tram stops can be taken. If tram doors opened on the side away from other traffic this already has a positive effect. If tramways could be routed to one side of other traffic this would be a great advantage. Another large improvement for the tram driver and his passengers can be achieved by keeping tram routes a whole block away from the busy roads. [Swedish]

48 317701 ANALYTIC PROCEDURES FOR URBAN TRANSPORTATION ENERGY CONSERVATION: SUMMARY OF FINDINGS AND METHODOLOGIES. FINAL REPORT, VOLUME I. Analytical methodologies are described and illustrated for use by metropolitan planning organizations and other state and local transportation agencies in analyzing the energy conservation potential of candidate urban transportation measures. Quantitative methodologies oriented to carpooling, vanpooling, transit, pricing, traffic regulation and control, and auto ownership are provided based on the use of disaggregate behavioral travel demand models. Changes are indicated in trip frequency and distribution as well as in travel model, operating conditions, and vehicle miles of travel. Trip-based estimates of fuel consumption and vehicle emissions are included. The methodologies can be adapted to different levels and types of data availability, and can employ manual sketch planning procedures, a programmable calculator, or a fully-calibrated computer program utilizing a random sample household enumeration forecasting technique. Application of the developed methodologies has been performed in cooperation with metropolitan planning organizations representing the Dallas-Fort Worth, San Francisco, and Denver urban areas.

48 317729 URBAN TRANSPORTATION ENERGY CONSERVATION: CASE CITY APPLICATIONS OF ANALYSIS METHODOLOGIES. This report demonstrates the application of a set of disaggregate travel demand methodologies to the analysis of potential energy conservation strategies in three urban areas: Denver, Colorado; Fort Worth, Texas; and San Francisco, California. The methodologies are sketch planning in nature and include the forecasting of changes in automobile ownership; work trip model shares by drive alone, shared ride, and transit; non-work trip frequency, destination, and mode choice; fuel consumption and vehicle emissions. Using concepts of market segmentation and random sample household aggregation, both computer system and manual worksheet versions of the basic approach are applied. Policies ana-

lyzed include those related as employer based ride sharing, parking management, transit, pricing, and traffic operations. Considerable variations in the potential effectiveness was found, among the three urban areas, depending in large part on the availability of alternative travel modes such as transit. Descriptions are provided of the individual policy analyses performed, the methods by which example policies were analyzed, the necessary data preparation activities, and the procedures used to adapt the set of travel demand models to the unique conditions of each of the three metropolitan areas. 48 317731 URBAN TRANSPORTATION ENERGY CONSERVATION. SRGP OPERATING INSTRUCTIONS AND PROGRAM DOCUMENTATION. FINAL REPORT. SRGP is a computer program for Short Range Generalized transportation Policy analysis for use in analyzing the energy conservation potential of a broad spectrum of transit, carpooling, vanpooling, parking, pricing, and other transportation system management measures. It is intended for use in either an areawide or corridor context and in what is referred to as a sketch planning style of analysis. Outputs include changes in fuel consumption, vehicle emissions, vehicle miles of travel and modal shares for drive alone, shared ride, and transit. Changes in travel behavior are forecast relating to auto ownership, work trip mode choice, and the frequency, destination, and mode choice for both shopping and social/recreational non-work travel. Using a random sample household forecasting procedure, SRGP is a modified version of the program UMODEL, distributed by the US Urban Mass Transportation Administration as part of UTPS, the Urban Transportation Planning System.

48 317934 TRANSPORTATION AIR QUALITY ANALYSIS-SKETCH PLANNING METHODS. VOLUME I: ANALYSIS METHODS. Analytical methodologies are described (in Volume I) and illustrated (in Volume II) for use by metropolitan planning organizations and other state and local transportation agencies in analyzing the air quality potential of candidate urban transportation measures. As sketch planning techniques, the methods are designed to produce first-cut estimates of a proposed transportation measure's impact for a relatively small investment of time and effort. Quantitative methods oriented to auto restricted zones, high occupancy vehicle priorities, transit improvements, parking programs, carpool/vanpool incentives, and staggered work hours are provided. The methods use worksheet, programmable calculator, and computerized approaches to apply disaggregate behavioral models. They can be used to predict traveller demand as a function of transportation system characteristics, transportation facility operations as a function of their usage and

their physical characteristics, and special impacts including vehicular emissions, fuel consumption, and operating costs. Guidelines are provided both to those responsible for designing the transportation-air quality analysis approaches in specific local areas, and to those who will carry out these analyses. In addition, references are provided to documents which provide additional detail on the methods.

Cambridge Systematics, Incorporated, Environmental Protection Agency, Urban Mass Transportation Administration Final Rpt. EPA-400/1-80-001A, Dec. 1979, 284p; Contract EPA-68-01-4977; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-158702

48 317935 BLUEPRINT FOR SURVIVAL. A blueprint for survival through curtailment of demand is outlined using a transportation model system. Techniques available for reducing total energy demand in transportation include decreasing population size, increasing the price of gasoline, changing the "modal mix", or relative availability of different types of transportation systems, changing the spatial design of society to increase population density, increasing the interposition of places of work, living, shopping, and leisure by encouraging high-rise construction, and more efficient interaction between transportation systems and the structure and dynamics of society. Sensitivity analysis of energy consumption in transportation systems to different conservation strategies was examined using a statistical model that explains data and reflects plausible interactions.

48 318631 TECHNOLOGY ASSESSMENT OF PRODUCTIVE CONSERVATION IN URBAN TRANSPORTATION. PROJECT DESCRIPTION FOR FISCAL YEARS 1980, 1981. An investigation of the potential environmental, health, and safety impacts of various alternative productive conservation strategies is presented. The technology assessment identifies internally consistent (mutually reinforcing policy or technology elements following a specific theme) productive conservation strategies which will aid in the reduction of the US dependence on petroleum in urban transportation; compares analytically the energy savings and environmental impacts of the various productive conservation strategies; and analyzes the issues and the barriers which may constrain these productive conservation strategies from becoming effective. Each strategy is discussed. Major tasks that occur during 4 phases are discussed, e.g., data collection, model assembly, impact criteria; in-place policy analysis; analysis of alternative strategies; and documentation. (ERA citation 05:019015)

48 318698 REGIONAL ANALYSES OF HIGHWAY ENERGY USE. Regional variation among selected factors affecting energy use in highway transportation is described and analyzed. Highway vehicle use accounts for about

95% of all motor gasoline used and a substantial portion of the diesel fuel consumed in the US. For the purposes of analysis, highway energy use can be divided into three sectoral users: household, commercial, and government. Chapter 1, Non-highway Use of Gasoline, covers agriculture, marine, aviation, industrial and commercial, construction, snowmobiles, and motorcycles. Chapter 2, Topics in Commercial Highway Energy Use, includes the following: Commercial Use of Gasoline in Highway Transportation, Automotive Fleets and Electric Vehicle Applicability; Local and Short-Haul Commercial Trucking; Inter-city Trucking; and Intracity Bus Service. Chapter 3, Selected Characteristics of Highway Energy Use by the Household Sector, includes sections entitled: Regional Gasoline Use; Ownership of New and Used Vehicles; Fuel Efficiencies and Market Shares of New Vehicle Registrations; Regional Trends in Import Passenger Car Sales and in Light Truck and Van Sales; Regional Variations in Recreational Vehicle Shipments and in Gasoline Consumption, 1977; Regional Patterns of Motorcycle and Moped Use; and An Analysis of the Differences in Carpooling Across Metropolitan Areas. 48 319320 THE GASOLINE SHORTFALL: SHARED CULPABILITY. The gasoline shortage of 1979 can be attributed to a number of factors. In 1977, in anticipation of a 1978 OPEC price increase, oil companies built up their crude stocks to higher levels. By January 1978, gasoline stocks were up 7.8 percent above levels in 1977. The oil companies then began to reduce inventories and run their refineries at rates below 1976 and 1977 levels. In spite of making hints at decontrolling gasoline prices, the Federal Go-

vernment did not. Refiners were probably waiting for higher prices and did not therefore increase their capacity. Furthermore, the government banned the use in gasoline of MMT, an octane boosting lead substitute, forcing refiners to use more crude oil per gallon of gasoline. This all backfired when a mild autumn spurred larger use of gasoline, a cold winter increased heating oil, and, by the end of December, Iranian exports ceased. To prevent future shortages, a number of steps can be taken to decrease demand. The improvements in automobile fuel efficiency mandated by the Federal Government (27.5 mpg by 1985) could conceivably cut total gasoline consumption by 15 percent. Higher prices and curtailment of pleasure driving could reduce demand another 10 percent, depending on how elastic the demand is. Increased use of mass transit could reduce gasoline use by 7 percent, and energy alternatives such as electric vehicles and gasohol could account for another 7 percent, for a total reduction of 39 percent.

48 319637 VIBRATION AND STRUCTURE-BORNE SOUND IN THE VICINITY OF ROAD TUNNELS. The results of measuring the vibration and structure-borne sound in the vicinity of a large motorway tunnel are presented including measurements during the construction of the tunnel.

Koch, HW (Hannover University, West Germany) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 381-388, 6 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319652 NOISE GENERATION BY RAILROAD COACHES. A systematic analysis was carried out on the acoustic behavior of railroad coaches. Radiation of air-borne sound as well as structure-borne sound transmission from the wheel/rail contact area to the car body was investigated in laboratory and stationary tests and during test runs at high speeds (160-250 km/h). The aim of the experiments was to find out how much the individual components of the trailing bogie contribute to the transmission of structure-borne sound and the radiation of air-borne sound. A rank ordering of the individual transmission paths from the axle bearing to the bogie frame was set up. An identification of the main noise sources and an indication of the frequency range in which they are important was possible.

Fischer, HM (Technical University of Berlin, West Germany) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 333-349, 14 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319653 GROUND VIBRATIONS FROM PASSING TRAINS. The residual problems of ground-borne vibration, the vehicle and track features which might be responsible for generation, its propagation, and its effects on wayside buildings are examined. Experimental work suggested various significant features of railway design which might merit attention.

Dawn, TM (British Railways Board) Stanworth, CG *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 355-362, 7 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319654 GROUND-BORNE NOISE AND VIBRATION FROM UNDERGROUND RAIL SYSTEMS. Ground-borne noise is one of the main causes of environmental impact from urban rail transit systems. The vibration resulting from track-train interaction is transmitted through the tunnel structure and the surrounding ground to adjacent buildings. The resulting vibrations of the walls and floors of these buildings cause secondary radiation of noise. This paper presents a method for estimating A-weighted sound levels as well as noise and vibration spectra due to ground-transmitted vibration in buildings near subways.

Kurzweil, LG (Department of Transportation) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 363-370, 24 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319655 COMPARATIVE VALUES OF STRUCTURE-BORNE SOUND LEVELS IN TRACK TUNNELS. Comparative figures for the structure-borne sound levels in underground train tunnels are given by the results of measurements made by the Curt-Risch-Institut as published in a series of internal reports.

Koch, HW (Hannover University, West Germany) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 377-380, 4 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319656 PROPAGATION OF NOISE FROM RAIL LINES. The author presents models for predicting the effects of geometric attenuation, air absorption, ground attenuation, and barrier insertion loss on the propagation of noise from railcars and locomotives. Predictions based on these models are compared with available field data.

Kurzweil, LG (Department of Transportation) Cobb, WN Kendig, RP *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 389-405, 30 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319657 PILOT STUDY ON RAILWAY NOISE ATTENUATION BY BELTS OF TREES. A pilot study was carried out to obtain an indication of the order of magnitude of attenuation of noise from passing trains by belts of trees and bushes 25 to 50 m wide. Pass-by noise was recorded in level grass-covered country and behind a belt of trees and bushes close by at two measurement sites.

48 319658 RAILWAY NOISE AND VIBRATION ANNOYANCE IN RESIDENTIAL AREAS. The 1975/76 I. S. V. R. national study of railway noise in Great Britain combined a noise measurement program and a social survey of the reactions to railway noise of residents within an estimated 65 dB(A) (peak) railway noise contour. A complex probability sample of 2010 addresses grouped in sets of 5 adjacent addresses within 403 compact segments in 75 areas each approximately one mile long was utilized in the study. Each of the 403 clusters of dwelling units became a physical noise measurement site. The results indicate that through train noise, maintenance noise and vibration are the most widely noticed problems associated with railways in residential areas.

Fields, JM (Southampton University, England) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 445-458, 17 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319659 RAILWAY TRAFFIC: ENVIRONMENTAL NOISE CONTROLS FOR NEW HOUSING SITES. The absence of an established criterion for housing site design against railway noise presents problems for environmental health officers who are consulted at the planning stage of housing sites. A guidance standard is suggested and experiences of a recent housing development are described.

Clegg, JD (Environmental Health Department, England) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 463-467, 10 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319662 OVERALL RAILWAY NOISE IMPACT IN THE U. K. As part of a British Rail (BR) "Environmental and Social Impact" study in 1975, an attempt at assessing the relative noise impact of rail and road transport was made; 24 hour $L_{1/e}/q$ in dB(A) units was adopted for the noise measure, as this appeared to give good correlation with "dissatisfaction" and permitted simple estimation of levels from traffic and location data. Five train types were defined, two classes of line, three regions of population density and three standard topographies. The base $L_{1/e}/q$ value for each traffic mix, line and population region could be established from BR survey data, and the propagation from topography and population (house) densities, to give the population subjected to each $L_{1/e}/q$. The percentage "dissatisfied" at each $L_{1/e}/q$ was then applied to arrive at the total population "dissatisfied", which was found to be 106,000. A similar approach applied to motorways and principal "A" roads gave 4,480,000 "dissatisfied".

Waters, DM (Loughborough University of Technology, England) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 477-481, 8 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDG-

48 319663 IMPORTANCE OF RAILWAY NOISE IN FRANCE. A national survey on environmental nuisances due to all forms of transport was made in France during 1977. From among the data gathered, it is possible to extract results concerning the impact of nuisance due to railways, partly from results of questionnaires and partly from results of acoustical measurements. Interviews and measurements were made in several towns, at randomly selected dwellings. Rail and air transport noise nuisance impacts appeared to be of comparable importance, with that of road transport very much larger than either.

Maurin, M (Institute of Transport Research) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 493-496; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319664 DUTCH STUDY ON RAILROAD TRAFFIC NOISE. A Dutch study on the community response to noise is presented. The set-up of the study is described broadly. Some details are given about the comprehensive sound level measurement program. Some preliminary results from the social survey are given. A major finding is that annoyance is caused less by the sound of trains running through than by other sounds from the track.

Jong, RG de *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 497-502, 2 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319676 EFFECT OF TRAIN NOISE ON SLEEP FOR PEOPLE LIVING IN HOUSES BORDERING THE RAILWAY LINE. Disturbance of sleep by train and road noises was studied through in situ physiological recordings. For the same value of $L_{1/e}/q$ three times as many disturbances due to the noise from road traffic were found as there were due to the train noise. The data on sleep reactions for all the noise events does not show a better train noise adaptation than that for the road noise.

Vernet, M (Institute of Transport Research) *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 483-492, 8 Ref.; Proceedings of the Workshop on Railway and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319677 ON THE SOURCES OF WAYSIDE NOISE GENERATED BY HIGH-SPEED TRAINS. A linear array of 14 microphones was used to measure radiated noise generated by a four-carriage electric train traveling at speeds between 160 and 250 km/h. Most of the results given pertain to apparent source locations of wheel/rail interaction noise, although preliminary data collected in a concurrent study of railway aerodynamic noise are briefly mentioned. An analysis of the measurements suggests that apparent sources of wheel/rail interaction noise are located (i) in the rail or substructure at low

frequencies, (ii) on the wheel rim just below the axle at intermediate or peak frequencies, and (iii) on the lower part of the wheel and possibly in the rail at high frequencies.

King, WF, II Bechert, D *Journal of Sound and Vibration* Vol. 66 No. 3, Oct. 1979, pp 311-332, 37 Ref.; Proceedings of the Workshop on Railways and Tracked Transit System Noise, 2nd, Lyon, France, October 17-19, 1978.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

48 319678 PREDICTION OF THE PROPAGATION OF TRAIN-INDUCED GROUND VIBRATION. The author presents models for prediction of the propagation of train-induced ground vibration. Three models are presented: the line source model, the point source model and the superposed model, and each of these models is discussed in regard to available measurement data.

48 320004 1975 HIGHLIGHT REPORT: VOLUME XXI, DRIVING AND ENERGY CONSERVATION. A nationwide probability sample survey of 1207 respondents was conducted by ORC by telephone during the period November 26 through December 21, 1975. The data indicate that most drivers drive in ways that save gasoline. Ninety-six percent stop pressing gas pedals when they see a red light; 84% plan several errands for one trip; 84% have car engines tuned once a year (increases mileage); and 84% drive 55 mph on major highways (this speed saves gasoline). The exception is that 69% drive themselves to work; only 10% carpool or take passengers, 8% take public transit, and 5% walk to work.

48 322032 ENERGY AND THE TRANSPORT SECTOR. This article describes the current energy situation from both the global viewpoint and the viewpoint of countries with no indigenous sources of fossil fuels. In Sweden, for example, the main energy reserves of the future are hydro power and uranium. Electricity therefore becomes a natural means of distribution of energy. The lack of fossil fuels necessitates a substitution with indigenous sources of energy, where feasible. Long-distance railway transport is a self-evident element in the expanding transport sector. In view of the proven high energy efficiency of electric railway systems, there is every incentive for a more active investment policy in railway electrification. This applies to both medium-distance transportation of freight and passengers and different electric mass transit systems.

48 322231 FACTORS AFFECTING WILLINGNESS TO CONSERVE GASOLINE (ABRIDGMENT). This paper explores the role of travel behavior, demographics, and attitudes toward energy conservation to explain consumer willingness to conserve gasoline. Data from a telephone survey of 500 New York households were analyzed on several-measures of willingness to conserve by using a statistical analysis procedure called automatic interaction detection. It was found that willingness to conserve gasoline is generally independent of demographics, travel behavior, and other attitudes toward energy. The factors of mild importance included residence location (New York City residents were more willing to conserve) and attitudes toward use of energy in the United States. Generally, those New Yorkers most willing to conserve were those who had (a) the least to lose if gasoline were curtailed, (b) the most flexibility in current travel behavior and (c) the most additional service options available. A brief review of other recent surveys shows that the public is consistently receptive to policy that encourages gasoline conservation by increasing travel options and offering incentives for their use. Punitive or restrictive measures are met with strong disfavor. Based on the results of this and other studies, policy suggestions include increased perception of travel options and their true costs, increased transit services, and stabilized fares. (Author)

48 322250 ENERGY EMERGENCY CONTINGENCY PLANS FOR THE PORT AUTHORITY OF NY AND NJ. This report begins with a summary of contingency plan measures, presented in tabular form, to represent the major actions which would be contemplated by the Port Authority in the event of future severe gasoline shortages. The next section discusses transportation impacts at Port Authority facilities of past gasoline shortages. Its purpose is to examine the various travel pattern changes which resulted from the severe gasoline shortage that occurred during the summer of 1979. The following section contains energy emergency plans for PATH--a 13.8 mile rapid rail transit system, connecting Newark, Jersey City, Harrison and Hoboken with lower and midtown Manhattan. The objective of the next portion, an emergency contingency plan, is to establish action programs to assure that the Port Authority's Information Section at the Port Authority Bus Terminal will be adequately staffed and sufficiently informed to handle telephone requests from the public concerning revised operating plans of the regions' intercity bus and rail carriers that may be implemented as a result of a severe energy shortage. The final section reviews energy emergency contingency plans for public transportation to the region's airports. Its purpose is to identify travel markets which will be severely impacted by a significant shortage (30%) of gasoline and diesel fuel and to develop appropriate measures which will insure that adequate services are available to maintain essential public mobility.

Port Authority of New York and New Jersey, Urban Mass Transportation Administration NY-09-0054 TS-G-250, Dec. 1979, 78p

48 322253 DUTCHESS COUNTY ENERGY CONTINGENCY PLAN. The purpose of the plan is to provide for the mobilization of mass transit resources in the event of an energy emergency. This paper describes the current energy situation in Dutchess County. It also estimates potential mass transit needs during energy crises where gasoline availability is reduced by 10, 20, or 30 percent as well as data on available transit resources to meet those needs. The transit systems in Dutchess County are: the County's loop bus system, Mountain View Coach Lines, Inc., the Dutchess Assisted Rural Transit System, and the City of Poughkeepsie Bus System. The plan is divided into three contingency strategies: Executive Leadership Actions-encompassing those actions that the County Executive will perform or delegate to be performed; Emergency Service Actions-including specific plans for increasing transit resources; and Suggested Citizen Action--those actions which provide citizens with information and assistance during a crisis. Non-mass transit aspects of the plan include ideas on carpooling, vanpools, altered work hours, bikeway usage, and emergency park and ride lots. The plan is designed to be put into effect within a two to four week period from the declaration of a crisis.

Dutchess County Department of Planning Mar. 1980, 43p, Figs., Tabs., 5 App.

48 322255 ENERGY EMERGENCY CONTINGENCY PLAN: WESTPORT TRANSIT DISTRICT. This plan is the result of a short term feasibility study which focused on the development and evaluation of effective short range strategies to expand existing transit services following an interruption of automotive fuel supplies, and it will enable the Westport Transit District to respond to energy induced ridership increases in a timely and effective manner. The report begins with a description of present level of service and inventory of present equipment and resources. The next section contains an analysis of demand for transit services under three fuel reduction scenarios and system capacity analysis to identify excess capacity or capacity restraints under three demand scenarios. It is followed by a description of actions to be taken immediately by the district under energy emergency (short-term) and those actions to be taken under a sustained and slowly developed fuel reduction over a longer period of time (long-term plan). The final section contains a discussion of institutional and financial requirements to implement the Energy Emergency Contingency Plan.

Connecticut Department of Transportation Mar. 1980, v.p., Figs., Tabs.

48 322261 TRANSIT MANAGEMENT IN AN ENERGY-SCARCE ENVIRONMENT. The energy shortage, the expanding transit use and the need to make better use of the economic and human resources entrusted to transit presents a challenge to transit management. Although carrying capacity causes concern, one of the main problems facing management will be the forming of the proper frame of reference to understand this new environment. A strong, broad marketing commitment will be required. Potential customers will require information oriented to the future. Changing costs will require better information, better management and flexibility in thinking.

The development of human resources for transit is a matter of urgency. Surveys show that the demographic pattern of new riders differs from present or past riders. The transit service provided will have to be more accessible and convenient. The needs of new riders may require new kinds of services. These new services will create short-run peak capacity problems and place burdens on equipment and personnel. Better cost management will be needed to effectively control rising costs and cost-control will require better trained and better educated managers.

Smerk, GM (Indiana University, Bloomington) *Transit Journal* Vol. 6 No. 2, 1980, p 27; ORDER FROM: American Public Transit Association, 1225 Connecticut Avenue, NW, Washington, D.C., 20036

48 322269 THE 1979 ENERGY CRISIS: WHO CONSERVED HOW MUCH?. The gasoline shortage during the summer of 1979 prompted New York State residents to adopt a series of conservation actions. 1,520 New York residents were surveyed to determine what action the public took, and what actions they would take under two energy futures: gas at \$1.50/ gallon; and a 20% shortfall. To quantify the energy savings implied by these actions, trip length, trip rate, and energy use data were applied to the responses. Results showed that residents did respond significantly to the 1979 energy crisis, saving over 6% of gasoline use in the first three quarters. The actions taken were varied and extensive, cutting across all facets of travel. Most conservation (44%) was accomplished through car-related actions, particularly by a fuel-efficient car (20%) and car selling (16%). Carpooling, transit, and driving slower accounted for 8, 16, and 2% respectively, of the gasoline conserved in New York State. In cities with good transit accounted for up to 31% of the savings. Other wide differences were observed by age, income, auto ownership and location of respondents. The study concludes that since most savings was achieved by voluntary actions, government's role should be to expand and promote travel options and make them available to more people, rather than constrain or coerce behavior.

48 322817 HYDROGEN FUEL APPLICATIONS FOR URBAN TRANSIT. With the growing scarcity of fossil fuels and continuing concern about air quality, an increased need for viable urban transit solutions has become apparent. Hydrogen, a synthetic fuel which may be used to power internal combustion engines, provides an exceptional alternative to gasoline or diesel fuel in urban transit applications. A bus or light rail system utilizing hydrogen would be independent of oil supplies and virtually non-polluting. NASA and the aerospace industry have contributed significantly to an increased understanding of the fuel properties of hydrogen, and its increased range of applications. Technology now exists for conversion of city buses, trucks, and rail systems to hydrogen fuel. This study considers the technical aspects of hydrogen vehicle systems, summarizes past and present working examples, and describes a proposed integrated refuse disposal-hydrogen fueled transit system for the City of Denver, Colorado.

48 322964 ENERGY STUDY OF RAIL PASSENGER TRANSPORTATION. VOLUME 2. DESCRIPTION OF OPERATING SYSTEMS. FINAL REPORT. The rail passenger systems of the US are described in terms of selected physical, operating, and economic characteristics, and services rendered are related to energy usage and costs. Rail passenger transportation exists in 4 distinct forms: intercity railroads, suburban railroads, heavy-rail transit, and light-rail transit. Each form varies in technical equipment, design of facilities, operating practices, size of systems. Specific data for the national rail passenger network and the Boston, Chicago, Cleveland, New York, Philadelphia, Pittsburgh, and San Francisco regions and the Washington Metropolitan area transit authority are presented.

48 322973 PREDICTION OF COMMUNITY NOISE FROM RAIL SYSTEMS. This paper presents a simple procedure for predicting noise in the vicinity of rail lines including intercity freight and passenger services and metropolitan systems. The procedure accounts for the effects of speed; wheel and rail condition; travel on bridges and elevated transit structures; geometrical spreading of sound energy; excess attenuation due to propagation over the ground and through the air; and barrier attenuation by sound screens, cuttings, embankments, and houses. A-weighted sound pressure level is the basic quantity predicted; equations are given to determine various noise exposure measures such as the 24-hour energy equivalent sound level, the day-night average sound level and the community noise equivalent level.

48 326008 ANALYSIS OF TRANSIT ENERGY CONSUMPTION AND FEDERAL POLICY. VOLUME 1: SUMMARY REPORT. This report presents an analysis of Transit Energy Consumption in several urban areas. A total of ten urban areas were selected for individual case studies. In each of these ten areas, an analysis was made of the existing transit system, planned systems, and the transit planning process in that region. Separate studies were made of Construction Energy Consumption and of the DOT Capital Grant Application Process and the type of energy analysis used in that process. The analysis of the current and planned systems was directed at finding the source and amount of

energy consumed for each of several factors in operation- such as traction power, control power, and in maintenance and construction.

48 326018 ANALYSIS OF TRANSIT ENERGY CONSUMPTION AND FEDERAL POLICY. VOLUME 11: ANALYSIS OF TORONTO, ONTARIO, CANADA. This report is part of the Transit Energy Consumption and Federal Policy Study that analyzes the way in which energy consumption and conservation has been considered in the planning, development, and operation of public transit systems in selected cities. Although Toronto, Canada, is not subject to U.S. Federal policy, it is pertinent to observe this system as an example and comparative element in this study. Toronto has a successful transit system, and it is useful to observe the differences in policy and planning. The report discusses each and all of the transit operators and the general characteristics of the Toronto Metropolitan Area. Each transit operator is discussed in terms of function, structure, facilities and equipment, and utilization and operations.

48 326019 ANALYSIS OF TRANSIT ENERGY CONSUMPTION AND FEDERAL POLICY. VOLUME 12: ANALYSIS OF THE CAPITAL GRANT APPLICATION DECISION PROCESS. This report presents an analysis of Transit Energy Consumption in several urban areas. A total of ten urban areas were selected for individual case studies. In each of these ten areas, an analysis was made of the existing transit system, planned systems, and the transit planning process in that region. Separate studies were made of Construction Energy Consumption and of the DOT Capital Grant Application Process and the type of energy analysis used in that process. The analysis of the current and planned systems was directed at finding the source and amount of energy consumed for each of several factors in operation—such as traction power, control power, and in maintenance and construction.

48 326266 THE ENERGY ADVANTAGES OF PUBLIC TRANSPORTATION. EXECUTIVE SUMMARY. This report addresses the total energy advantage of public transportation, considering both auto and transit energy consumption as well as residential energy consumption and residential mix. The relative modal efficiencies, spatial structure, and residential energy consumption are considered in some detail. The focus is on petroleum-based energy. Regional variations are noted.

48 326474 ENVIRONMENTAL IMPACTS OF BART (BAY AREA RAPID TRANSIT). This final report is one of a series and gives an overview of the San Francisco Bay Area Rapid Transit System's (BART) environmental impacts. The disruption of traffic and other activities during subway construction, traffic and parking problems at suburban stations, and train noise along aerial lines have been the most serious environmental impacts of the BART system. Beneficial impacts include its landscaping, linear park, encouragement of downtown street improvements, and generally excellent provisions for its riders. BART's future operational impacts, both beneficial and adverse, are not expected to change much from those to date. Contrary to some fears expressed during the planning process, BART has not generated significant automobile-related air pollution or noise at its suburban stations. Crime has not been a significant problem, either to patrons or station-area neighborhoods. Also, above-ground trackway functions do not apparently pose a serious barrier to cross-line movement. The natural ecosystems near BART facilities have not suffered; vibration from passing trains is not a problem; and the visual impacts of BART facilities have not been significant.

48 327058 URBAN AIR POLLUTION. AUGUST, 1979-JULY, 1980 (CITATIONS FROM THE NTIS DATA BASE) [Rept. for Aug 79-Jul 80]. Selected reports are cited on urban air pollution and its abatement. These citations were selected because of their general interest to urban planners, which will enable them to become aware of new abatement strategies and techniques. The majority of the studies cover various aspects of transportation emissions. Other topics include health standards, atmospheric models to aid in planning, law enforcement, abatement policies, and the effects of new modes of transportation. (This updated bibliography contains 57 citations, all of which are new entries to the previous edition.)

ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-814429

48 327059 URBAN AIR POLLUTION, 1978-JULY, 1979 (CITATIONS FROM THE NTIS DATA BASE) [Rept. for 1978-Jul 79]. This bibliography discusses urban air pollution and its abatement. These citations were selected because of their general interest to urban planners which will enable them to become aware of new abatement strategies and techniques. The majority of the studies cover various aspects of transportation emissions. Other topics include health standards, atmospheric models to aid in planning, law enforcement, abatement policies, and the effects of new modes of transportation. (This updated bibliography contains 221 citations, none of which are new entries to the previous edition.)

48 327060 ENERGY CONSERVATION: TRANSPORTATION, 1978-JULY, 1980 (CITATIONS FROM THE NTIS DATA BASE). The potential to achieve fuel conservation through technology, management, and planning is discussed. Transportation areas covered include urban mass transit, aviation, marine transportation, automobiles, trucks, and railroads. A few abstracts discuss public attitudes concerning conservation measures. (This updated bibliography contains 136 citations, 67 of which are new entries to the previous edition.)

48 328229 NOISE IMPACT INVENTORY OF ELEVATED STRUCTURES IN U.S. URBAN RAIL RAPID TRANSIT SYSTEMS. This report presents the results of the third task of a five-task program dealing with the reduction of noise from elevated structures in use in U.S. rail rapid transit systems. This report is an inventory and impact assessment of the noise radiated by trains passing on these structures, insofar as this noise is experienced by nearby community residents. An overview is provided of the noise contributions from the various types of structures in nine existing or planned U.S. transit systems operating on 253 km (157 miles). These systems are: Metropolitan Atlanta Rapid Transit Authority (MARTA); Bay Area Rapid Transit District (BART); Chicago Transit Authority (CTA); Metropolitan Dade County (Metrorail-under construction); Massachusetts Bay Transportation Authority (MBTA); New York City Transit Authority (NYCTA); Port Authority Transit Corporation of Pennsylvania and New Jersey (PATCO); Southeastern Pennsylvania Transportation Authority (SEPTA); and Washington Metropolitan Area Transit Authority (WMATA).

These structures are classified into 17 different categories, and noise emission characteristics are determined for each type, based on field measurements and/or published data. Day-night average sound levels are estimated for wayside locations near the elevated structures, and population data are used to evaluate noise impact in terms of the Sound Level Weighted Population (LWP).

48 329961 THE INFLUENCE OF UNDERGROUND RAILWAYS ON THE ENVIRONMENT: EXPERIENCES OF BERLIN'S UNDERGROUND. Public transport services are called upon to make greater efforts to reduce as far as possible the effects on the environment caused by them. With a measure of financial support from the Federal Ministry of Research and Technology (BMFT), extensive measurements and tests to this end are being carried out by the Berlin Transport Authority (BVG). The first priority is the diminution of the rolling noises caused by wheel and rail action, on the causes of which interesting new knowledge has been obtained. Progress has also been made toward the prevention of screeching noises on tight curves. Other subjects of study are solid-borne noise and vibration in tunnels and the environmental nuisance created by work-shops and pollution. [German]

48 341561 PROPAGATION OF VIBRATIONS AND NOISE FROM NEW YORK SUBWAY TUNNELS INTO NEARBY BUILDINGS. Vibrations associated with subway train passages were measured simultaneously at several points in a two-level tunnel and on the floors and walls of rooms in a building over the tunnel. The corresponding sound in the rooms was also recorded. Results are presented that illustrate the observed invert vibration spectra, the vibration distributions in the tunnel, the dependence of the vibrations of the room surfaces on the tunnel vibrations, and the relation between sound in the rooms and the vibrations of their surfaces.
