17 126158 PLANNING FOR NEW AND INTEGRATED DEMAND-RESPONSIVE SYSTEMS. SPEAKER 4. The initial success and some problems faced by a demand-responsive transportation (DRT) service in Oakland, California, are briefly described. The passenger response has been 3 times that of other DRT operations of comparable size. Telephone tie-up was experienced when control room operators were instructed to call-back and verify calls for service. The DRT vehicle consisted of a conventional bus from which a 6 ft. section was cut out and then rejoined; this vehicle could then negotiate turns at some difficult intersections (minibuses were found unsatisfactory). The vehicle interiors were tastefully remodeled. Drivers were given an intensive 2-week training session and control room operators who ride with drivers derive the benefit of personal contact. DRT fares are 25 cents and no transfers are issued or accepted. The marketing of DRT services received assistance from the Model Cities Program and from the city of Richmond. The cost of operating the DRT system remains a problem and the question is asked whether the public is willing to pay the price through taxes, fares, or federal/state subsidies.

17 127633 TRIDIM AEROTRAIN--AN ECONOMIC ALTERNATIVE TO URBAN TRANSPORTATION. The Tridim system described uses air-cushion suspension and electric drive. It is intended for transportation traffic densities midway between buses and subway, as for urban traffic in medium-size cities, large suburban areas, or within airports or large business or manufacturing complexes. In such applications, distances between stations stay around a few hundred meters, exceptionally a few kilometers. Thus optimal cruising speed generally stands between 40 and 70 km/h, acceleration performances being often more significant than mere speed. An experimental Tridim program has been on trial since mid 1973. It consists of a short track illustrating lay-out difficulties (20 m radius bend--10 m curve switch--20% slope) and a 4/6 seats test vehicle equipped with a simple on-board automatic program. Motors are all electric, propulsion using pinions on a rack coated with synthetic rubber. The whole prototype installation, including design and testing, has been carried out within a budget of 2.5 million French francs, evidence of the favorable economics of the system.

Bertin, J ; International Electric Vehicle Symp & Expo, 3rd Proc Paper No. 7433, 1974, 12 pp; Symposium held February 19-21, 1974 and sponsored by the Electric Vehicle Council, New York, New York.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

17 127819 GROUND TRANSPORTATION SYSTEM FOR BRADLEY INTERNATIONAL AIRPORT. An automatically controlled transit system is being installed at Bradley International Airport. The system has two purposes: demonstration of automatic transit for urban applications, and transportation from a remote parking lot to the airport terminal. The 0.7 mile guideway includes both at-grade and elevated sections. A 550 ft bypass at the intermediate station simulates an off-line passenger terminal. Provisions for extension of the guideway to serve future facilities have been included. The two 25 ft long vehicles are each powered by two 60 ph electric motors. An on-board computer controls the operation of the vehicle. The vehicles are air-conditioned and have two-way communication capabilities. Design of the guideway began in November 1973. Construction of the guideway was begun in July 1974 and was essentially complete in December 1974. The construction was completed in April 1975 when the system was energized and testing begun.

17 129124 QUANTITATIVE ANALYSIS OF SYNCHRONOUS VS. QUASI-SYNCHRONOUS NETWORK OPERATIONS OF AUTOMATED TRANSIT SYSTEMS. This paper investigates the performance of the synchronous and quasi-synchronous network control policies proposed for modern automated transit systems. Performance is analyzed from the user point-of-view in terms of the expected travel time delay associated with each policy. Using an idealization of the network layout and uniform demand for service, analytic expressions for the expected delay are derived for each policy in terms of fundamental parameters (line spacing, trip rate, trip length distribution, maneuver region). Comparisons of the performance of each policy are presented in parametric form.

17 129282 THE DYNAMIC BEHAVIOUR OF A LOW-SPEED ELECTRO-MAGNETIC SUSPENSION. A control system has been designed, constructed and tested which provides a suspension for a low-speed transport vehicle. The technical concepts have been investigated in great depth. It has been shown that the effects of the non-linearities inherent in the hardware can be minimised. Over a track with irregularities characterised by a secondary railway line the ride in the vehicle is equivalent to that obtained in conventional, modern urban transport vehicles. The physical constraints on the control system specification of the track has been shown to be suitable. of the track has been shown to be suitable.

17 129283 DYNAMICS OF MAGNETICALLY LEVITATED VEHICLES ON FLEXIBLE GUIDEWAYS. Magnetically levitated vehicles have been discussed in recent years for application on personal rapid transit in highly populated areas and high speed transport over large distances. The magnetic suspension control of the vehicle has been usually designed assuming rigid guideways. On the other hand, the dynamics of the guideways has been investigated only for vehicles, with spring-dashpot suspension. However, the suspension control and the guideway dynamics are coupled resulting in a multivariable system. In this paper the complete vehicle-guideway system is considered.

17 129789 SIMULATION OF A NEW CONCEPT IN SHORT DISTANCE PASSENGER TRANSPORT SYSTEMS [Simulation von Personentransporten mit neuartigen Nahverkehrssystemen]. A cabin with a capacity of 18 persons was used for the simulation programme which is based on a normal timetable (vehicles stop at all stations), express vehicles and a community taxi service. A circular route, a double-track line and a Y-shaped network were examined. Consideration was also given to the number of passengers travelling between several large cities in Federal Germany. The simulation programme makes it possible to evaluate the attractiveness and the productivity of new cabin-type railways particularly as regards travel and stopping times. [German]

17 129974 FOCUS ON GUIDED URBAN TRANSPORT. MINITRAM IN SHEFFIELD: A CONSULTANT'S VIEW. An outline is given of the minitram demonstration project proposed for Sheffield by Robert Matthew, Johnson-Marshall and Partners, in consultation with TRRL. The aim is to test minitram in public use, and in particular to answer questions related to public acceptance, vandalism and reliability. After giving consideration to hardware, minitram vehicle dimensions, guideways and stations, the author indicates that: (1) the elimination of drivers by automation necessitates the use of new skills in the control room, and thus reduces the expected savings in costs; (2) the location of guideways close to buildings brings about problems of visual intrusion; and (3) if minitram is to be comparable with buses, stations have to be closely spaced and are hence fairly expensive to build. It is concluded that minitram might be suitable for some cities at present considering the introduction of rail rapid transit systems, but that only a public demonstration will reveal its true potential. /TRRL/

17 130855 PROGRESS IN SIGNALING FOR TRACK GUIDED SYSTEMS. The advantages of tracked systems over nontracked systems, e.g. the case of automation, are presented. Vehicle detection and communication are critical in automatic systems because of the safety, reliability, and cost factors. Current methods of tracked vehicle detection and communication are reviewed: fixed and moving block systems, the use of crossover wires and the choice of signaling frequencies. The advantages of using high frequencies and surface electromagnetic waves are given and current high frequency methods under investigation are reviewed. Because of the high cost of installing waveguides alongside the track, an innovative method is proposed in which the track is used as a surface waveguide. A block diagram of a headway control and collision avoidance system is illustrated. The results are presented for the analysis of a rail adapted to form a waveguide and these indicate the feasibility of this idea.

17 131592 NETWORK MODEL STUDIES FOR AUTOMATED GUIDEWAY TRANSIT: ADVANCED GROUP RAPID TRANSIT MODELS. The development is described of models which include basic network geometries and trip-making characteristics, provide a baseline for service policy/cost trade-off studies and provide for the design of the various system management algorithms required to implement a chosen service policy. Pertinent planning studies

were reviewed to determine special constraints considered in the urban implementation, and basic forms for the networks and travel patterns were determined. Conventional transit systems are reviewed for data on ridership, service quality, and operating parameters in order to provide a frame of reference for studying the performance of automated guideway systems. The design of the network models including the type of information and level of detail required, and format of the models is detailed, and five models (loop/shuttle, line-haul system, CBD circulation, limited urban network, full urban network) representative of potential urban applications of GRT are discussed.

17 131799 INNOVATIONAL GUIDEWAY SYSTEMS AND TECHNOLOGY IN EUROPE: NEW PRODUCT AND INVESTMENT OPPORTUNITIES. SUMMARY REPORT AND GUIDE. This summary report sets out and highlights the major findings of the investigation which has been fully reported elsewhere. The study covers innovative ground public transport systems that move passengers within and between cities. It is concerned with the "hardware" of the systems and geographically covers western Europe. In chapter 2 there is a lengthy tabulated summary of the various system developments and their status together with information on a number of projects e.g. personal rapid transit, line haul transit and intercity systems. The future prospects for and present trends of the new guideway systems and technology are considered in chapter 3 in the light of relevant factors such as energy, environment, materials and operating costs. The annexes contain a table of contents of the full report, system dossiers on "minitrans" and "pendair", and an index. /TRRL/

17 132049 THE 1975 INTERNATIONAL CONFERENCE ON PERSONAL RAPID TRANSIT. The 1975 International Conference on Personal Rapid Transit, held in Denver, Colorado, on September 16-19, brought together engineers, planners, architects, economists, politicians, transit-minded citizens, and students from six countries. Since PRT is in the formative stage, opinions differ greatly as to how and whether these systems should be built. Through presentation and discussion of 47 papers and several panels, the conference did much to clarify the characteristics of PRT. Particularly on the basis of economics, urban design, system operations, and public need, a strong case was made the PRT development should receive strong support.

17 132054 PERSONAL RAPID TRANSIT-HUMAN AND ENVIRONMENTAL SYNTHESIS. The Ford Motor Company's automatically controlled transportation system now installed in the Fairlane Town Center in Dearborn, Michigan and Bradley International Airport, Hartford, Connecticut, represent a coming together of a host of proven technical disciplines which form a mode of transportation that can move people effectively and efficiently within a confined urban setting. This paper reviews the design parameters of Ford's automatically controlled transportation (ACT) from the viewpoint of the traveling passenger and from the visual impact the system has on the surrounding environment in which it must live.

17 132218 ADVANCED URBAN TRANSPORT. The authors review various forms of automated transport. Types of track, stations, vehicles, methods of suspension and propulsion, control criteria and environmental factors are considered. An economic assessment, based on a study carried out at Coventry, is made and, as a result of the study, the future role of autotram is considered. Developments in the USA, Europe and Japan are outlined and details of nine systems of automated transport at present under development are described in an appendix. /TRRL/

17 132905 LIGHTER-THAN-AIR TRANSPORT. A study is planned of the use of lighter-than-air (LTA) technology in short-range commuter vehicles (possibly delivering passengers to and from an airport), or as a means of moving overweight or oversized cargo. In the present situation in which it is desirable to minimize the nations fuel consumption rate, it is pointed out that since power is not needed for lift, airships can move vast amounts of cargo more cheaply and efficiently than airplanes, and more quickly than ships. Airship designs and applica-

tions have been discussed which include a nuclear-powered dirigible, a giant dirigible packed with 75 million cubic feet of helium capable of lifting payloads of 75 tons, and hybrids which are paired with extra lifting devices such as helicopters or conventional aircraft. Missions envisioned for such craft include cargo movement, natural gas delivery disaster relief, and transportation of equipment too bulky to move over normal highways. Criticisms of the LTA concept are discussed. Safety is recognized as the prime concern. Accidents in which U.S. dirigibles fell apart have been attributed in part to the removal of critical keel reinforcement as a concession to weight reduction, in part to excessive stress suffered in turbulence, and in part to the continuous vibration of up to eight engines in perfect alignment on either side. It has been suggested that LTA development be directed through the military, and that a start be made with the modification of those ships built last by the addition of new technology. Only by an evolutionary program, can a reserve of manpower and experience, in the arts and skills which an operational LTA fleet demands, be developed.

17 132911 TRANSPORTATION, AUTOMATION AND THE QUALITY OF URBAN LIVING. This discussion of the contribution to be expected from a comprehensive application of modern automation and computer technology in the solution of serious urban traffic problems, pays special attention to the new possibilities provided by recently developed LSI (large scale integrated) electronic systems for control, computation and communications, especially by so-called mini-computers and microprocessors. It is shown that computerized urban traffic control systems play an important role in the improvement of existing transportation systems, especially of urban railway systems and freeway and street transportation systems. Demonstration projects in different countries indicate that automation and computer control may provide the possibility of fundamental changes in existing urban transportation systems during the next ten years. However, problems and conflicting opinions exist regarding the safety and reliability of totally automated systems, cost benefit analysis, risk evaluation, public acceptance, and the prediction of the effects of introducing new modes of transportation on the quality of urban living and city development. At present there is no certainty that automated transportation modes now being developed will bring the needed breakthrough to better urban transportation. However, there is a strong motivation to proceed in the development of new demand-responsive urban transportation systems. Concepts for the reduction of urban traffic problems are discussed and include control of demand and supply. Freeway and road traffic control, traffic control in urban street networks, and integrated urban automobile traffic control systems are discussed, urban railway systems control and new modes of urban transportation are considered.

17 132944 DYNAMICAL MODEL FOR VEHICLE ROUTING IN A TWO-WAY PRT NETWORK. The problem of routing automatically-controlled and guided vehicle through a closed two-way personal rapid transit PRT network is studied. Because of fluctuating passenger demands, a dynamical model is needed to describe the concentration of vehicles in the different network sections. Such a model is derived in this paper. The binary decision to be made at each divert junction is treated as a control variable in the system model. Using a suboptimal strategy to minimize the maximum congestion in the network sections served, the decision is made in a feedback manner based on the average concentrations in the sections. The model was used to study the transient behaviour of flows and concentrations in a simulation of a specific closed two-way PRT network. Some results are presented for this example.

17 133089 COMMAND AND CONTROL STUDIES FOR PERSONAL RAPID TRANSIT, PROGRAM STATUS, 1974. The document reviews the APL effort on command and control systems for circulation and distribution applications. A brief history of the program is given, together with the results of the work and its effects on system performance. The discussion is divided into an investigation of vehicle management (the controlling of a fleet of vehicles in terms of scheduling, dispatching, empty vehicle allocation, and station operation) and an investigation of vehicle regulation (the controlling of an individual vehicle either alone or within a string of vehicles). A bibliography of the reports, papers, and significant memoranda relating to this work is included, as well as summary descriptions of the major digital computer simulations that have been developed in support of these investigations.

17 133167 A SURVEY OF PROPULSION SYSTEMS FOR HIGH CAPACITY PERSONAL RAPID TRANSIT. The high-capacity personal rapid transit (HCPRT) system must operate with very short headways. To achieve safe operation at these headways, the propulsion system should meet certain unconventional requirements. They include reversible thrust capabilities, short response time, and peak thrust exceeding three times nominal thrust. These requirements were determined by analysis, computer simulations, and data provided by DOT/TSC. Five propulsion systems capable of meeting these requirements have been surveyed in this report. As background to the survey, several vehicle resistance curves were calculated for a baseline vehicle with assumed dimensions and weight. Four types of vehicle suspension methods were considered.

17 133188 THE OPERATION OF HOVERCRAFT IN THE NEW YORK CITY METROPOLITAN AREA. VOLUME I. A TECHNICAL EVALUATION [Final rept. Oct 2-4, 1973]. The report, Volume 1 of a two volume set, examines the technical feasibility of using air cushion vehicles (ACV) in the inland waterways of the New York City metropolitan area. This evaluation was based on 1973 tests with a Wellington Class BH.7 hovercraft along routes representing the main corridors of activity of the New York City regional waterways. The hovercraft was a military configuration without weapons, heavily instrumented for trial and testing for military purposes, and not intended for use as a commercial vehicle. During the 3-day trials, data were collected on speed, docking procedures, fueling requirements, airport access, operating noise levels, and operational flexibility; and observations were made of performance, comfort and convenience. Portions of this document are not fully legible.

17 133189 THE OPERATION OF HOVERCRAFT IN THE NEW YORK CITY METROPOLITAN AREA. VOLUME II. ECONOMIC FEASIBILITY. This report is Volume 2 of a two volume set on the feasibility of using air cushion vehicles (ACV) on the inland waterways of New York City. Recent changes in shipping practices have altered the pattern of waterfront use. Revived use of the waterways employing the technology in high speed marine transportation systems could revitalize the waterfront while relieving some congestion on land modes of transportation. The report assesses the value of the city's inland waterways related to a balanced, multimodal, mass transportation system. It identifies commuter corridors, and other routes, where water transportation offers an alternative, or complimentary, service to existing land transportation. A consumer survey was conducted to study human attitudes toward the use of water transportation in lieu of existing land systems.

17 133318 ANALYSIS OF MULTIPLE PARTY VEHICLE OCCUPANCY IN AN AUTOMATED GUIDEWAY SYSTEM. Many proposed new urban transit systems offer demand-actuated service between stations, vehicles being shared by several passengers. An analysis has been made of the operation of multiple-party occupancy systems in which the guideway network consists of a single loop or of several

interconnecting loops. Vehicles circulate freely around the loop or loops of the network. A vehicle enters a station only if it has passengers to discharge or the station has passengers waiting for service and the vehicle can accommodate them. Vehicles placed in storage at each station may be used whenever serious queuing of waiting passengers develops. A means for replenishing storages and a procedure for limiting the number of intermediate stops experienced by a passenger are described.

17 133451 LONGITUDINAL CONTROL AND CRASHWORTHINESS FOR SMALL AUTOMATED TRANSIT VEHICLES. This study is concerned with longitudinal control and crashworthiness for small, automated transit vehicles. Control system designs and hardware options for relatively short headway operation at moderate speeds are evaluated. Evaluation is based on performance during normal and emergency operations, sensing and communication requirements, and simplicity of design as a measure of cost and reliability. The study is restricted to the vehicle-follower control concept. Controllers are successfully designed for a variety of data sensing and transmission requirements and no problems are encountered in realizing constant safety factor, constant time headway, and constant spacing operational policies. Fundamental analytical results on collision dynamics and the effectiveness of passenger protective devices, shock absorbers, and interior configurations on occupant protection during fore and aft collisions are derived. /UMTA/

17 134067 ROUTING ALGORITHMS FOR URBAN RAPID TRANSIT. A basic routing algorithm is presented for finding optimal routes for cars in a rapid transit system. The algorithm uses predicted path cost, depth-first search, and threshold acceptance to minimize computation cost. It is applicable to synchronous, cycle-synchronous, and trans-synchronous control strategies, and will minimize either departure time, transit time, or arrival time as may be needed. Extensions of the algorithm to allow finding empty cars to answer service requests, to dynamically reroute cars in the system, and to handle multistation routes are presented. (A) /TRRL/

17 134235 "CRESTWALK"-A PASSENGER CONVEYOR SYSTEM. A passenger conveyor system is described which may be boarded at any point along its length but which transports pedestrians at speeds of the order of 15 km/h. The conveyor is made up of elements each of which moves forwards with a regular cycle of low and high speeds with intermediate acceleration and deceleration. The cycle of each element differs slightly in phase from those of its neighbours. The effect of this is to produce travelling velocity waves with phase velocity greater than that of the maximum speed of each element. A passenger by walking forwards may maintain himself in the region of maximum speed, but by stopping walking may be decelerated to a safe alighting speed. The system is suggested as a city passenger conveyor for use in the range of journey lengths 400 M-3 km. (A) /TRRL/

17 134237 AN INTERSECTION CONTROL STRATEGY FOR A SHORT-HEADWAY P.R.T. NETWORK. Much PRT development and research is currently being undertaken assuming quasi-synchronous longitudinal control of guideway vehicles. This method of control has the characteristic that intersection performance has a substantial influence on the efficiency of trip demand processing. An algorithm for the control of a PRT intersection is discussed here, which would appear to have significant advantages over all other known existing stratagems. The stratagem is not only efficient but its flexibility facilitates tailoring to diverse local conditions; furthermore, the algorithm does not require intractable computations or excessive computer memory requirements. The algorithm is described and simulation results are presented. A comparative study is also made between this algorithm and its fore-runner. (A) /TRRL/

17 134302 PASSENGER REQUIREMENTS IN AN AUTOMATED TRANSPORT SYSTEM. This report presents the results from an experimental study which provided human factors data on passenger behaviour in relation to certain aspects of vehicle design and station layout on an urban rapid transit system. An extensive series of tests was carried out using full scale mock-up vehicle and platforms to study, inter alia, the effects on vehicle dwell time of: 1 vehicle size; 2 vehicle door size and using separate doors for entry and exit; 3 the number of people in the vehicle, on the platform and inter-changing between the two; 4 overloading the vehicle with passengers; 5 platform size and layout, including the provision of barriers. The tests were mainly carried out using a static vehicle but in some cases the vehicle was moved in and out of the station to determine the effect of vehicle movement, particularly deceleration, on passenger behaviour at the station. The rapid transit system under study will serve as a proportion as possible of the urban community; the handicapped persons and those inconvenienced with luggage or pushchairs have been given special considerations in the experimental trials. The report also discusses the implication for passenger behaviour, and hence system performance, of choosing certain vehicle and station design features. (A) /TRRL/

17 137306 PRT IMPACT STUDY, A PRE-PRT PHASE. VOLUME I. TRAVEL ANALYSIS. Part of a three-volume work, this report describes the analysis performed on travel data collected for the Pre-PRT Impact Study. The data analyzed consist of travel behavior, travel patterns, model utilization and travel costs of various modes of travel in Morgantown before the revenue operation of the PRT in Morgantown. The analysis resulted in estimates of travel by various subpopulations by automobile, university bus and city-county bus systems in Morgantown. Further analysis conducted yielded estimates of traffic flow between various activity centers in Morgantown. Trip generation, trip distribution and modal split were estimated for Morgantown PRT corridor travel before the revenue operation of the PRT.

17 137307 PRT IMPACT STUDY, PRE-PRT PHASE. VOLUME II. DATA COLLECTION PROCEDURE AND CODING MANUAL. The report describes the procedures utilized for collection of data on transportation demand and supply prior to the revenue operation of the Personal Rapid Transit (PRT) System in Morgantown, West Virginia. Most of the report is devoted to describing various surveys which were conducted to obtain information about travel patterns,

attitudes, and demographic characteristics of residents of the Morgantown area. The report also discusses the collection of data reflecting the volume of transportation usage, such as traffic counts, bus ridership counts, and speeds of autos and buses. Also described are the costs of operating an automobile and costs and revenues of the bus systems operating in the Morgantown area. The report includes documentation of the format and codes used for placing the survey data on magnetic tape.

17 137438 FUNDAMENTAL STUDIES IN THE AUTOMATIC LONGITUDINAL CONTROL OF VEHICLES. The achievement of safe and efficient longitudinal control is probably the most significant technical problem associated with individual-vehicle transport systems such as PRT, dual-mode, and the automatic highway. The accomplishments over the first year of a two-year study include: (a) the development of a technique, which involves the use of discrete elements embedded in the guideway, for measuring vehicle position; (b) the development of an approach employing audio frequencies and helically wound transmission lines for providing continuous position reference information, to a string of moving vehicles; (c) the partial development of a promising technique for the accurate measurement of instantaneous velocity; (d) the development of a validated model for a vehicle's propulsion system dynamics; and (e) the design and testing of a vehicle controller which provides excellent tracking and a comfortable ride under all normal control conditions.

17 137454 THE DUNLOP S-TYPE (SPEEDAWAY): A HIGH SPEED PASSENGER CONVEYOR. There is an obvious need for a continuous system to transport large numbers of

passengers at speeds of up to 10 m.p.h. over distances of up to 1 mile. The disadvantages of various systems which have been proposed over the years to provide a high speed moving pavement are discussed. The principle of the operation of the s-type speedway is described together with the ways in which this design overcomes the disadvantages of earlier proposals. The development of the system began in 1968 and led to the building of a full scale prototype which has been operating since 1971. Aspects of the design and the particular attention paid to passenger acceptability and safety are discussed. The point to point s-type speedway has a short constant speed entry section, after which the passenger is accelerated smoothly in a curved path until the main high speed section is reached. The main travel speed is up to 5 times the entry speed and at the end of this zone the passenger is decelerated to step off the system at low speed. Capacity of a single unit is 10,000 people per hour. Applications and installations for high speed moving walkways are described. /Author/TRRL/

17 137736 INTERSECTION MERGE CONTROL IN AUTOMATED TRANSPORTATION SYSTEMS. Merging algorithms, capable of resolving conflicts in automated transit systems are studied. The effectiveness of five basic algorithms are compared via theoretical evaluations of the ability of each algorithm to resolve merge conflicts. The measure of efficiency is the miss-turn rate, the probability of successfully completing a desired merge. The miss-turn rate for each algorithm is calculated as a function of guideway density and turn rate. Four of these algorithms are sequential strategies while the fifth is a dependent maneuver philosophy. (a) /TRRL/

17 137963 THE SHAPE OF THINGS TO COME. The author outlines the history of the Toronto Transit Commission (TCC). Consideration is then given to surface transit and the subway system. Details are given of the demand-responsive dial-a-bus system. Further areas of experimentation are listed including automatic passenger counting, automatic vehicle monitoring, preferential treatment of buses at traffic signals and computerised scheduling. A brief description is given of the system by which operating staff could choose the mode on which to work and preferred time and it is suggested that there should be improvements not only in technology but also in operating techniques. The discussion which followed the paper is included. /TRRL/

17 138857 A SOLUTION TO URBAN TRANSPORT PROBLEMS? The article describes the design and operation of a minitram system constructed as part of a feasibility and project-definition study by easams Ltd. The vehicle was designed using railway practice utilising steel wheels on steel rails giving an estimated basic noise level of less than 70 dba compared with a range of 65 to 90 dba for A comparable rubber-tired vehicle. A central three-computer control system has been developed. Two paralleled computers carry out functions effecting the safety of the system providing a cross check on each other, the third computer carries out the scheduling of vehicles. The minitram system is shown to be capable of economic operation in urban and rural areas, offering a much improved public transport service. At peak hours a single line can carry up to 20000 passengers per hour using a three-train set, each vehicle carrying 24 passengers, the interval between successive trains falling as low as 12 seconds. Employing a high degree of automation the service can be made to operate continuously, a form of on-demand system would take over during the very quiet hours. /TRRL/ Howard, MG *Public Works, Construction and Transport* Dec. 1975, pp 6-9, 2 Fig.; ACKNOWLEDGMENT: TRRL (IRRD 220117)

17 138913 THE GEC MINITRAM. AUTOMATION IN URBAN TRANSPORTATION. This paper describes the minitram system of automatically controlled vehicles running on their own segregated track. In particular, the TRRL specification for a minitram vehicle is given, the aim of which was its application as A passenger-carrying public demonstration system in sheffield. Details are given of the traction motor which drives both axles, the use of steel wheels running on steel rails and associated noise levels, the guiding system, pneumatically operated disc brakes, and the computer control and signalling system. It is claimed that in peak hours, minitram can carry up to 20000 passengers per hour with the vehicles operating in three-tram sets, and, because of the lack of congestion, journey speeds are high. It is concluded that minitram offers an attractive solution to the problem of transporting people in cities. /TRRL/

17 138939 KINEMATIC RELATIONSHIPS AND ESTIMATES OF ENERGY REQUIREMENTS FOR MINITRAM. The basic equations which describe the motion and energy consumption of minitram are developed. These take account of limitations on maximum speed, acceleration, and jerk, and include the effects of wind on power requirements and energy consumption. The effects on trip time and/or energy consumption of limited power availability during acceleration, regenerative braking, and coasting are also investigated. Numerical examples are given based on the size of vehicle proposed for the Sheffield public demonstration system. For comparative purposes both vehicles with pneumatic tyres and vehicles with flanged steel wheels are considered. (a) /TRRL/

17 139350 GETTING AROUND TOWN: AUTOMATIC URBAN TRANSIT. This paper which holds that prospects for personal and group rapid transit hinge on technology, safety, politics and economics, discusses personal rapid transit (PRT) systems, group rapid transit (GRT), automatic individual-vehicle systems, and the advanced service concept demonstration project in Morgantown. The automatic, individual-vehicle transit system has found commercial application in many cities and is now being converted to use partial magnetic levitation (maglev) and linear motors. The 3-station Morgantown system includes 8.6 km of a single-lane guideway, most of it elevated, and 45 completely automatic vehicles with a capacity of 8 setting and 12 or 13 standing passengers. A second phase of the MORGantown project will add several miles of guideway, 2 new stations, and additional rubber-tired vehicles. When fully operative, the system will carry about 14.4 million persons per year and will cover its operation costs through 25-cent tickets and \$3.00 monthly passes. Transit systems in France, Germany and Japan are briefly outlined. The controversy about safety standards for large-scale PRTs are discussed and comments are made regarding their efficiency advantage over the automobile. Public acceptance of such systems and the role of politics are also discussed.

17 139355 RUBBER-TIRED RAPID TRANSIT. The results are presented of a technology survey which were carried out in an effort to evaluate the current state-of-the-art in rubber-tired rapid transit. The survey obtained data from transit properties that have had systems operating for a considerable period of time. Information from operating test tracks was included, as well as data from manufacturing plants and research agencies. The characteristics of 19 of the systems surveyed are tabulated. The systems are organized into 3 categories: medium capacity system (U.S.), medium capacity systems (Japan) and high capacity systems (Canada, Mexico, and Japan).

Sulkin, MA Miller, DR (Daniel, Mann, Johnson and Mendenhall) *ASME Journal of Mechanical Engineering* Vol. 98 No. 5, May 1976, pp 26-33, 15 Fig., 1 Tab.; Based on a paper presented at the 3rd Intersociety Conference on Transportation, Atlanta, Georgia.

17 141073 TRACK DESIGN CRITERIA FOR P.R.T. SYSTEMS IN URBAN AREAS. The potential of personalized rapid transit (PRT) systems is examined, such a system (a public transportation system with small-to-medium sized vehicles independently controlled and travelling on reserved tracks) is viewed against the background of the present urban transportation problems, and the situation is studied in relation to other possible solutions. Using the systems approach, planning goals and objectives are developed. The social economic and physical aspects of the various alternatives are evaluated against these objectives, and suggestions are made for arrangement, operation, and track design. There are four categories of solutions for the present urban situation: removal of congestion by resolving root causes; improvement of

existing transport facilities; new modes of transport; do-nothing option. The new form of public transport considered here are PRT systems and the factors influencing such systems are: social, physical and aesthetic, and economic (demand, cost, fares). The operational and track characteristics of alternatives are studied. The advantages and limitations are outlined of ground level tracks, elevated tracks and tracks in tunnels. Comments are also made on stations-their frequency, relation to track level, and costs.

Copsey, NR (Damas and Smith Limited) *High Speed Ground Transportation Journal* Vol. 10 No. 1, 1976, pp 59-84, 10 Fig., 1 Tab., 15 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

17 141106 BRINGING LOGIC TO URBAN TRANSPORTATION INNOVATION. To reduce the space needed for transportation, both the physically and the socially perceived size of urban transportation facilities must be reduced. This means reducing the time spacings between moving vehicles, as well as their space consumption when stopped. Reducing time spacings requires automating the driver function--with vehicles under automated operation short headways (time spacings between vehicles) on automated guideways. To equal an eight-lane expressway's capacity, a two-lane guideway would have to carry four times as many vehicles per hour. True personal rapid transit means personalized vehicle service and fraction-second headways. Without fraction-second headways, passengers must be assembled to boost line-haul capacity, service is degraded, and per-mile system costs are increased. Thus, significant improvement in urban transit service in general also requires very-short-headway systems. Fraction-second headways are the only way to lighten transit vehicles and reduce structure size and costs--both direct costs and the social costs of large guideway structures and, similarly, urban highways.

Brand, D (Harvard University) *Technology Review* Vol. 76 No. 3, Jan. 1976, pp 38-45; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

17 141339 AUTOMATED GUIDEWAYS URGED FOR CITY TRANSIT. High capacity, automated, dual mode guideways allowing the vehicle to travel over automated guideways and traditional roads is regarded as the key to improving urban transportation. Such a system would take up less room than the conventional superhighways and would free the city of massive traffic jams caused by our over crowded highways. The development of a reliable automated guideway that will permit vehicles to travel at speeds of up to 60 mph with only a fraction of a second time-spacing between vehicles, is the central technological problem that needs to be resolved before such a system could be implemented. Recent government trends have emphasized the need for a significant reduction in passenger car mileage in selected urban areas by 1977; these trends assume that public transit and car pooling will take the place of drive-alone auto travel. For certain types of trips, complex travel behavior indicates that proposals to reduce urban travel by private cars may cause serious distortions and diseconomies which will only compound the original problem.

Automotive News Vol. 51 No. 4583, Feb. 1976, p 58

17 142077 ADVANCED URBAN TRANSPORT. The working paper describes a number of advanced transport systems currently under development. The systems have several elements in common--they are automated systems. None of the vehicles need or are intended to carry a driver (although manual operation may be an option). Stations may or may not be manned depending on individual circumstances. They use a reserved track for safety and operational reasons. Their vehicles are generally smaller than those used in conventional urban transport. The largest vehicle described is 2.5 M wide 3.1 M high and carries about 50 passengers, while the smallest is 1.5 M wide 1.8 M high carrying 2-3 passengers. They are under serious development by or in association with large companies often with government assistance. The only exception is Cabtrack which was being developed by the U.K. Government, but whose development has now stopped. Chauvinism persuaded us to include it. A full list of all ideas and innovations, many of which have not reached the prototype stage is given by "Unconventional Passenger Transportation Systems" U.I.T.P. 1973 (306p). Some of the technical and economic features of the 24 systems included in the review are described. /TRRL/

17 142927 PUBLIC ACCEPTANCE OF NEW MASS TRANSIT SYSTEM. This paper presents attitudes of townspeople in the Morgantown, W.Va. area toward the Personal Rapid Transit (PRT) System just prior to its opening. The attitudes are derived from home interviews of a representative sample of 305 nonstudent household heads. Two aspects of community acceptance are identified and examined: (1) Whether the respondents think that the PRT will be an efficient means of transportation; and (2) whether the respondents believe that the PRT is an asset to the community. The data indicate that persons who perceive the new system as contributing to a progressive image for the community were generally favorable toward the PRT. In addition, respondents who now use buses or who anticipate using the PRT are especially favorable toward the system as an asset to the community's image.

17 143202 MORGANTOWN PERSONAL RAPID TRANSIT LONGITUDINAL CONTROL SYSTEM DESIGN SUMMARY. Experience with the longitudinal control system used on each vehicle in the Morgantown Personal Rapid Transit System has shown that nonlinearities and variations in control system parameters can significantly affect performance if such characteristics are not adequately considered in the system design. A design summary is provided that documents this experience and emphasizes the important analysis and hardware design problems encountered. The performance capability of the final design is computed on the basis of analysis and test results. A description of the detailed nonlinear analytical model developed is included for possible use in future studies. Poten-

tial system improvements are described that may be the objects of future research and development.

17 143227 PERSONAL RAPID TRANSIT RESEARCH CONDUCTED AT THE AEROSPACE CORPORATION. The report summarizes research conducted on the conceptual and experimental development of Personal Rapid Transit (PRT) during the period from 1968 to 1975. The work considered not only the technical and operational aspects of the PRT concept, but also included estimates of PRT capital and operating costs, analyses of system safety and reliability, analyses of urban applications and associated economics, evaluation of PRT energy utilization, development of PRT planning methodologies, and assessments of PRT deployment impacts. Technology shortfalls associated with the possible future implementation of the specific PRT concept are identified, and research and development activities to overcome these shortfalls are recommended.

17 143945 EXPERIMENTS IN GUIDEWAY-LEVITATION VEHICLE INTERACTION DYNAMICS. This investigation involves the design and interpretation of laboratory-scale dynamic experiments of vehicles traversing multiple-span or cable-stayed guideways. The nondimensional responses of such systems, including critical span bending moments and vehicle heave accelerations, depend on the system parameters derived in Chapter 2. A point load 'vehicle' and two vehicles closely resembling advanced operational prototypes were designed and tested: the 150 mph Prototype Tracked Air Cushion Vehicle (PTACV), and the 300 mph Tracked Levitated Research Vehicle (TLRV). In Chapter 3, general experiments are designed, all based on these dimensionless system parameters and the capability of instrumentation and data processing minicomputers to measure and interpret response data. The remaining chapters include discussions and comparisons of response data for critical six and three-span guideway moments and for rms vehicle heave accelerations.

17 143946 MODELS FOR ASSESSING TRIP DEPENDABILITY IN AUTOMATED GUIDEWAY TRANSIT NETWORKS. Equipment failures and how to correct them are significant factors affecting the quality of service of Automated Guideway Transit (AGT) systems.

The network configuration, subsystem failure rates, and recovery modes interact to provide the operational configuration that passengers ultimately view in terms of the ability of the AGT system to provide reliable service for their trip. This report describes a procedure that permits evaluation of the Group Rapid Transit networks in terms of trip dependability. The model uses a flow representation of vehicle traffic determined by network topography, demands for travel, and operational service policy. The model has its most useful application in the intermediate design stage where there are tradeoffs to be evaluated.

17 145153 DYNAMIC INTERACTIONS BETWEEN VEHICLES AND ELEVATED, FLEXIBLE RANDOMLY IRREGULAR GUIDEWAYS. A dynamic interaction model is formulated for the heave-pitch motion of vehicles crossing elevated flexible, randomly irregular spans. Span dynamic motion due to a vehicle passage is modeled using a Bernoulli-Euler beam model and modal analysis techniques. Four types of random irregularities characteristic of elevated guideways are modeled numerically including

vertical span offset, pier misalignment, camber, and surface roughness. Analytical expressions for each irregularity power spectral density are derived and the relative contributions of irregularities to vehicle excitation are examined. The limitations to vehicle passenger comfort levels posed by guideway deflection and irregularity are illustrated for personal and rapid transit types of vehicles.

17 145181 PERSONAL RAPID TRANSIT III: PROGRESS, PROBLEMS AND POTENTIAL OF A PROMISING NEW FORM OF PUBLIC TRANSPORTATION. An edited version is presented here of the 47 papers presented at the 1975 International Conference on Personal Rapid Transit, as well as of the several panel discussions and luncheon talks. The very informative session on political perspectives stressed the political aspects of the deployment of new transit options. The conference clarified the characteristics of automated guideway transit (AGT) systems and noted that support for the development and deployment of such systems is largely an educational process. Japanese systems highlighted here include 2 guided rapid transit systems and 3 personal rapid transit (PRT) systems. Papers on the economics of PRT systems cover the life cycle of new technologies, benefit-cost ratios, and the value of future savings. Three papers examine the problem of urban form for which PRT systems are most suitable and the kind of changes that could be initiated by these systems. Attention is also focused on the technology of PRT systems and their components.

Minnesota University, Minneapolis June 1976, 506 pp, Figs., Tabs.; This publication was originally reported at the 1975 International Conference on Personal Rapid Transit, Denver, Colorado, September 16-19, 1975.

17 145597 A PRELIMINARY EVALUATION OF ELECTRICAL PROPULSION BY MEANS OF IRON-CORED SYNCHRONOUSLY OPERATING LINEAR MOTORS. The report is a preliminary evaluation of the technical feasibility of using iron-cored, synchronously operating motors to propel ground transportation vehicles in the high cruise speed range. A second consideration is the possibility that the motor might also provide strong attractive and lateral forces. Three motor types, all realizable with passive track rails are investigated: (a) claw-pole synchronous motor, (b) homopolar inductor motor, and (c) heteropolar inductor motor. A rail clearance of 1.5 cm is specified. However, the effect of variations in this and other design parameters is also analyzed. All three types considered compare favorably with an equivalent single-sided induction motor, insofar as weight, efficiency, and power factor are concerned. The calculations are supported by analog simulation experiments.

17 147009 POSSIBILITIES OF ENERGY RECOVERY BY GRAVITY TRACTION IN PUBLIC TRANSIT SYSTEMS. About 70 or 80 percent of the traction energy employed in the operation of metropolitan and suburban railways on lines with the stops arranged at short intervals is used for the kinetic energy of the vehicles. If at all, this energy is recuperated only at a rate of approximately 30 percent. Gravity traction allows the kinetic energy of the vehicles to be recuperated at a rate of about 90 percent during deceleration, which would decrease the overall energy input by 63 to 72 percent. However, this requires the line to be arranged uphill and downhill, and a traction system not based on the interaction of forces between a wheel and a rail might be needed. The result would be high average speeds, without requiring more traction power. A relationship is established between the parameters of the trackway and the change of the vertical and horizontal acceleration values as a function of time. (Author) [German]

17 147396 LINEAR INDUCTION MOTOR ELECTRICAL BRAKING TEST. This report describes the electrical braking characteristics of

a 2500-hp (at 250 mph) linear induction motor (LIM), which is used to propel and brake the LIM research vehicle. Three methods of electrical braking were investigated: ac dynamic braking, dc eddy current braking, and plugging. From the data acquired the following information was derived and is presented herein for each of the braking methods investigated: (1) LIM electrical braking characteristics in terms of braking force developed as a function of vehicle speed, with all data referred to a 2000-A primary current, (2) powerplant characteristics, (3) the location and magnitude of the braking energy dissipated, and (4) power and control equipment requirements. Pertinent LIM design information is also included to enable independent investigators to correlate analytical predictions with the test data published herein.

Powell, RB ; AiResearch Manufacturing Company, Federal Railroad Administration Final Rpt. 75-11969-Rev-1, FRA/ORD-76/264, Apr. 1976, 115 pp; Contract DOT-FR-40016; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-261851/OST, DOTL NTIS

17 147397 LINEAR INDUCTION MOTOR ELECTRICAL PERFORMANCE TEST. This report describes the electrical performance characteristics of a 2500-hp (at 250 mph) linear induction motor (LIM), based on data acquired while propelling the LIM research vehicle over a 0-to-250-mph speed range. Pertinent LIM design information is included to enable independent investigators to correlate their mathematical models with the test data published herein. The principal end product of this effort is tabulated LIM performance, in terms of thrust, voltage, power factor, efficiency, input and output power, velocity, and percent slip at five excitation frequencies and at 1-Hz slip frequency increments, with all data referred to a 2000-A primary current. From the acquired data the following information was derived and included in this report: LIM performance characteristics (thrust vs slip at constant current, power factor vs slip, and efficiency vs slip), voltage-and current-source presentation of LIM data, influence of LIM end effects, and other LIM data relevant to future design activities.

17 147863 NATIONAL STUDIES OF URBAN ARTERIAL TRANSPORTATION. A RESEARCH FRAMEWORK. A research framework is presented for the estimation of the national markets and social, economic and environmental impacts of new systems of urban arterial transportation, such as automated guideway and rail and bus rapid transit systems. A statistical step-wise procedure, based upon the extrapolation of results from a limited number of analytical case studies to the set of all candidate metropolitan areas, is specified. Results are provided for the application of all steps in the procedure preceding the conducting of actual case studies: 80 candidate metropolitan areas are classified into nine relatively homogeneous groups with respect to their arterial transporta-

tion needs; the most representative areas within each group are identified as preferred case study locales; and guidelines are developed for the extrapolation of system costs, benefits and market estimates from the case studies to the remaining areas within the groups through sensitivity analyses. In addition, intermediate multivariate statistical results are interpreted as inputs to the development of hypotheses describing relationships between transportation and urban structure. /Author/TRRL/

17 148291 NETWORK DYNAMICS IN A LARGE PERSONAL RAPID TRANSIT SYSTEM FAILURE. The paper discusses the application of some control schemes and containment techniques and shows that methods exist which can reduce a patron's perception of vehicle failures to the category of minor nuisance. The operational workability of large PRT networks appears to be most sensitive to the most common system element the vehicle. In a well designed and maintained system, the remaining components are so relatively few or can be made so reliable as to be of minor concern. Methods exist which can minimize the operational impact of vehicle failures on the riding patron.

17 148311 ROLE OF NEW TECHNOLOGY IN URBAN TRANSPORTATION: AN HISTORICAL PERSPECTIVE. A framework presenting a broad perspective of technology innovations is developed from a study of past innovations in urban transportation. Observations are forwarded on the characteristic life-cycle of "new" technologies. Key determinants of past successful and unsuccessful innovation efforts are identified and relevant theories examined. The methodology is then used to evaluate the present innovation efforts towards automation of urban transportation, in particular Personal Rapid Transit.

17 149225 CONFERENCE SUMMARY. Papers were presented at this conference which dealt with: definitions and descriptions of a variety of alternative dual-mode transportation concepts; comparisons of dual mode with other transportation systems; results of analytical case studies of dual mode transportation system in representative urban locales; estimates of the social, economic, energy resource and environmental impacts of hypothesized implementations; technological considerations including lateral and longitudinal control, communications, propulsion, guideway design, and station design; institutional factors affecting new system implementation; and status reports on dual-mode transit programs in the U.S. and France. This broad category of systems can be operated in both of 2 modes: manually controlled and self-propelled on streets; and automatically controlled or externally propelled or powered on special guideways. Such systems can include both common carrier and private vehicles and provide transport for persons and freight. The most common example described at the conference employed a small bus controlled by a driver on the street system that could also be automatically controlled with or without a driver on a special guideway. An alternative form employs a fleet of transporter vehicles which are captive to the guideway network.

17 149226 LET'S DEMONSTRATE DUAL MODE. This paper which maintains that dual modes systems must be demonstrated in order to gain revenue operating experience and an indication of public acceptance, chides congress for cutting back on UMTA's funds which are necessary to implement demonstration programs. In 1966, Congress called for "National Leadership" in a program of research, development and demonstration of new transportation systems. Eight years later none of the new systems have been demonstrated. UMTA has failed to get any further than the system design stage, fearful of getting into the actual prototype testing, and later, demonstration programs. Procrastination by UMTA in conjunction with insufficient funds has caused this standstill in developing transportation systems for the future. In view of the present energy crisis and concern for environmental protection, new systems must soon replace the existing ones, which have been inadequate for some time and will not serve urban needs much longer.

Reuss, HS (United States House of Representatives) *Transportation Research Board Special Reports* No. 170, 1976, pp 15-17, 4 Ref.; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149227 ISSUES IN NEW TRANSPORTATION SYSTEMS AND TECHNOLOGY. This paper emphasizes that transportation system performance requirements should be defined in terms of level of service as perceived by the users instead of engineering characteristics. Although the management professionals in research and development have been aware of user needs. The problem is that because the research and development team define the service objectives to be attained, these level-of-service parameters go hand-in-hand with the engineering performance targets. It would be preferable to have service needs identified at the local level, where community desires can be accurately expressed. It is important that the initial testing of innovative transportation technologies could be achieved with substitute, lower cost technologies (e.g. an express bus being used to simulate the service characteristics and dual-mode behavior of automated guideway systems). It is also pointed out that the current trend to design vast, comprehensive transportation systems in order to draw a region together need not be the most effective solution. A better approach would be a phased, incremental implementation of a new system in which confidence and public acceptance could grow. Although new transportation systems are the promise of the future, they need to be implemented with restraint.

Orski, CK (Urban Mass Transportation Administration) *Transportation Research Board Special Reports* No. 170, 1976, pp 18-19; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149230 DUAL-MODE, CAPTIVE-VEHICLE PRT, AND PALLET SYSTEMS. This paper discusses the possible disadvantages of a

pure dual-mode system compared with captive-vehicle personal rapid transit systems. A way is presented for combining the desirable features of both systems in a pallet system.

17 149231 COMPARISON OF DUAL-MODE TRANSIT SYSTEM WITH VARIOUS TRANSIT BUS OPTIONS. The annual costs and level of service of a dual-mode transit system (DMTS) are compared with those of exclusive busway bus (EBB), exclusive busway with small bus feeder (EBB/SBF), expressway bus (EB), and conventional bus (CB) systems. Large-and small-bus versions are studied. The systems, defined for Milwaukee in 1990, all provide the same capacity and routes. The Milwaukee Dual-Mode Study base-line data are used. Trip time and transfer characteristics are used as measures of level of service. Construction of busways and creation of reserved lanes increase vehicle speed that, in turn, increases driver-vehicle productivity and decreases travel time. The use of small buses allows for shorter headways, more privacy, and demand-responsive service. Bus small-bus operations are not economical unless automated operations are used. Transfers may have an unacceptable effect on the ridership of the exclusive busway and small-bus feeder system. The small-bus dual-mode system and large-bus exclusive busway system are the two most comparable systems: Annual cost of the busway system is 21 percent less, but ridership is expected to be 17 percent lower than that of dual mode because the dual-mode perceived trip time is 27 percent shorter. The busway system can be provided at the lowest cost, and implementation does not involve the large capital investment and construction impact. However, the busway system is only practical in cities with extensive freeway networks and provides an unfavorable cost growth characteristics. /Author/

Lieb, JG (Mitre Corporation) *Transportation Research Board Special Reports* No. 170, 1976, p 36; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149233 PALLET RAIL-CARRIER DUAL-MODE TRANSPORTATION SYSTEM. One solution to urban transportation problems incorporates a pallet type of rail-carrier dual-mode transportation system. This system is technically feasible and incorporates a fully electrically propelled and controlled pallet rail-carrier vehicle applying ac drive with eddy current clutch and brakes. Present manual model components of automobiles and buses require limited interface equipment to operate. Automated-mode rail carrier permits speeds as high as 96 to 192 km/h (60 to 129 mph) and is applicable as a means of transportation in urban centers as well as between cities and cross country. Pallet rail-carrier dual-mode systems open the possibility of trans-

forming present automobiles and buses into battery-powered units for electric propelling, which will help reduce considerably the hydrocarbon and nitrogen oxide pollution as well as assist in fossil fuel conservation. The rail system guideway also permits automated operation of rapid transit vehicles or incorporates other mass transit systems with limited additional cost. Ferrying container cargo between cities or across countries could be performed within the system moving at the same high speeds resulting in an economical and effective distribution system throughout the country. /Author/

Adams, GJ (Mobility Systems and Equipment Company) *Transportation Research Board Special Reports* No. 170, 1976, pp 36-37; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149234 TOWARD DUAL-MODE USE OF BICYCLES IN PUBLIC RAPID TRANSIT. It is time to begin using the bicycle as a basic part of the transportation system of the United State. The need for improved public transportation is increasing daily. Because of time delays and funding limitations only a small part of this need can be met by completely new systems and guideways within the next 10 years. With a number of inexpensive changes the capabilities of the bicycle for short trips can be combined with those of existing (or new) public transit systems for longer trips. If a bicycle could be taken aboard public rapid transit, the speed, comfort, and safety of the transit vehicle could be combined with the versatility, energy efficiency, and door-to-door convenience of the bicycle. A car would then be necessary only for some trips, and the need for more than one car per family would be reduced. In this work the facilities and hardware needed for carrying bicycles on buses, planes, trains, and ships are discussed. Results of a bicycle-bus-trailer transportation study sponsored by the California Department of Transportation are presented, including demand analysis, prototype hardware, and operational experience. /Author/

Eggleston, DM (San Diego State University) *Transportation Research Board Special Reports* No. 170, 1976, pp 37; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149238 DUAL-MODE SYSTEM DEVELOPMENT PROGRAM OF THE URBAN MASS TRANSPORTATION ADMINISTRATION. This paper reviews an early study that compared dual-mode and conventional bus rapid transit and that served as background to a three-phase development program of the Urban Mass Transportation Administration. Phase 1 includes system concepts and design; phase 2 includes detailed design and system performance on a test facility; and phase 3 includes prototype development and tests and a demonstration in an urban area.

DeMarco, VR (Urban Mass Transportation Administration) *Transportation Research Board Special Reports* No. 170, 1976, pp 41-43; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a con-

ference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149249 EVALUATION OF DEMAND-RESPONSIVE SERVICE FOR DUAL-MODE BUS SYSTEMS. A basic requirement to be addressed in the development of dual-mode bus transportation is the selection of system operating policies. This decision is of immediate concern because of its influence on system hardware and software design requirements. This paper evaluates a station service policy in which the decision for vehicles to stop at stations is made on a real-time, demand-responsive basis. A steady-state analysis of the impacts of demand-responsive station stopping, from the perspective of the system and the passenger, was performed for an urban dual-mode system. The results of this analysis suggest that demand-responsive operation has a more significant impact on system measures of performance (e.g., CBD station flows, vehicle kilometers and hours of operation). These results imply that operating policies for on-guideway, demand-responsive service should give equal priority to system design and operational considerations and to passenger service goals. /Author/

Kershner, DL *Transportation Research Board Special Reports* No. 170, 1976, pp 80-81; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149251 DUAL-MODE SYSTEM MANAGEMENT. Aspects of construction and operation of an effective dual-mode transit system (DMTS) are considered in this paper. A general network geometry model is suggested for guideway configurations. A preliminary result suggests that the CBD guideway might best be a rectangular form. Off-guideway zoning, based on a modified Manhattan distance approach, provides possible zones with a theoretically minimal distance for vehicle dispatching. The present concept of medium-sized vehicles and liberal headways has reduced the degree of complexity of network control problems. However, future research in controls should concentrate on areas unique to dual-mode characteristics. There is a need for selecting a DMTS network configuration according to an optimal geometry to provide a system with minimum cost. Some methods that can be used to initiate such a study are suggested. However, physical constraints, such as land use and engineering, may yet dominate any changes in the network geometry. As for the command and control of DMTS, this paper emphasizes that future research should be directed toward topics that are particularly significant to the dual-mode characteristics, both in vehicular control and demand-responsive applications. /Author/

Yen, AM (Mitre Corporation) *Transportation Research Board Special Reports* No. 170, 1976, p 81; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149262 SIMULATION DESIGN, AND IMPACT OF DUAL-MODE ACCESS FACILITIES. An approach is described to the functional design and analysis of a typical access facility of a dual-mode system concept being researched at General Motors Research Laboratories. The procedure uses a discrete-event simulation model to analyze the performance capability of the facility during the peak demand period and to establish the design values of the critical elements of the access facility. After several design iterations and analyses, a typical access module was adopted. The most critical element was found to be the preinspection queuing area. The analysis revealed that the queuing area would require a storage capacity for 38 vehicles, given a maximum waiting time of 6 min and the requirement that all vehicles be stored off the feeder arterial street. The entrance module would have three vehicular inspection and automation bays, measure 29.6 x 310.9 m (97 x 1020 ft), require 9308 sq m (2.3 acres) of land, and have a processing capacity of 360 vehicles/hour. The performance and design characteristics of the entrance module would then be fed into a land requirement model, along with peak-hour loadings, to estimate land consumption effects of the access facilities on the affected communities in a case study area.

Camargo, HA Ventura, FL (General Motors Corporation) *Transportation Research Board Special Reports* No. 170, 1976, p 104; This paper appears in *Dual Mode Transportation*, which is a publication containing the proceedings of a conference conducted by the Transportation Research Board, May 29-31, 1974.; ORDER FROM: TRB Publications Off

17 149265 SYSTEM ASSURANCE FOR CURRENT AND FUTURE GUIDEWAY TRANSPORTATION SYSTEMS. System assurance may be defined as that process by which any system is made safe, reliable, and easy to maintain. Although system safety is not considered explicitly in this paper, a properly designed, reliable, and maintainable system will certainly be a safe system. The paper describes a plan for improving the reliability and maintainability of transportation systems. The reliability budgets for system hardware are presented, and estimates are made of total system performance. An analysis of the relations between system life-cycle cost and system assurance show that the reliability of commercially available subsystems must be improved significantly before planned PRT systems can operate with acceptable assurance. Some recommendations are made as to how such improvements can be accomplished. The paper deals with those factors that can be controlled by system planners and suppliers and that affect the service, comfort, public appeal, and economic feasibility of fully automated, guided transportation systems. Only fully automatic systems are considered, for those systems have been shown to be more economical during the design life than labor-intensive systems. A high degree of automation explains why the Lindenwold Line serving Philadelphia and its New Jersey suburbs is a profitable operation.

17 150468 A COMPARISON OF LIMRV LIM GUIDANCE SYSTEM EXPERIMENTAL DATA WITH MATHEMATICALLY PREDICTED VALUES USING REACTION RAIL SURVEY DATA. This document discusses the survey of 1,000 feet of Linear Induction Motor Research Vehicle (LIMRV) reaction rail at the Department of Transportation Test Center in Pueblo, Colo., and a comparison of experimental data from test runs of the LIMRV LIM guidance system with theoretical predictions using the survey data as an input to a mathematical model. While some deviations from predicted values were observed, in general the correspondence between experimental data and predictions was excellent.

Muhlenberg, JD ; Mitre Corporation, Federal Railroad Administration Tech. Rpt. MTR-6618, FRA/ORD-76/25, Oct. 1975, 52 pp; Contract DOT-FR-30015; ACKNOWLEDGMENT: NTIS, FRA; ORDER FROM: NTIS; PB-261921/1ST, DOTL NTIS

17 151149 VEHICLE OPERATING STRATEGIES FOR SMALL AUTOMATED GUIDEWAY TRANSIT NETWORK. The report discusses Automated Guideway Transit (AGT) systems that will offer demand-activated service using an on-line dispatching capability. The AGT system management is identified in this report as a large-scale, multi-criterion optimization problem, and the approach taken is to formulate the service optimization problem into a mathematical form so that known techniques could be used to arrive at solutions. Emphasis is on heuristic solutions by approximation rather than exact solutions through analysis. Actual operating strategies are constructed for point-to-point service with intermediate stops. The strategy involving squared terms of waiting time is found to be optimal for a wide range of demands. The computer simulation reveals that although non-controllable parameters, such as network topology and demand distribution, dominate the basic traffic pattern, service characteristics can be improved by selecting a best feasible strategy based upon the basic traffic pattern.

Yen, AM ; Mitre Corporation, Urban Mass Transportation Administration, (UMTA-VA-06-0025) UMTA-VA-06-0025-77-1, Aug. 1976, 116 pp; Contract DOT-UT-50016; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-262480/7ST, DOTL NTIS

17 151199 DYNAMIC INTERACTIONS AND OPTIMAL DESIGN OF PRT VEHICLES ON ELEVATED GUIDEWAYS. The report presents research completed on optimum (minimum cost) design of PRT vehicle guideway systems; analysis of periodic motions of PRT vehicles over straight flexible guideways; and continued investigations of vehicle motions over curved elastic guideways. These three areas represent essential ingredients of a mathematical study of the performance of candidate vehicle/guideway designs. The dynamics of PRT vehicles over flexible curved guideways have been investigated with the primary objective being to establish a computationally efficient method for studying this problem. A computer algorithm has been developed and tested in order to optimize its computational efficiency. The algorithm will be used to construct a test track which is made up of straight-transition-curved-transition-straight guideway seg-

ments. Candidate vehicle/guideway designs determined by the optimization algorithm will then be proof tested on this curved track in order to verify the fidelity of the system design.

17 151774 SEATTLE PRT STUDY. VOLUME I. SUMMARY. In 1969 and 1970, the City of Seattle became one of five selected medium sized cities to be included in the Center Cities Transportation Project (CCTP). Increased interest in PRT/people-mover technology culminated in a three-party agreement and ultimately led to the current investigation and analysis of automated transit technology. The feasibility of a PRT or people-mover system application is being evaluated in a two-phase study: Phase 1- Site-selection for a people-mover system, and Phase 2- System implementation for the locales selected in Phase 1 study. This is the Interim Report for Phase 1 of the PRT study and is presented in two volumes. This volume consists of a general overview of the total Phase 1 study.

17 151807 MORGANTOWN PERSONAL RAPID TRANSIT SYSTEM. The Urban Mass Transportation Administration (UMTA) of the U.S. Department of Transportation selected Mor-

gantown, West Virginia, as a site for a prototype personal rapid transit system demonstration because it presented the challenges that such a system must overcome to be successful in any location. This Morgantown Personal Rapid Transit (MPRT) system was funded by UMTA as a research and development task to provide a demonstration system with the following objectives: (1) Demonstrate the feasibility of an automatic, personalized urban transit system; (2) Demonstrate the applicability of the concept to national urban needs; and (3) Qualify the concept for other locations using the UMTA capital grant funds. This MPRT final report contains a description of the final delivered system and a summary of the activities undertaken in its development, including system and subsystem plans, specifications, drawings, test data, and test evaluation. This MPRT system connects downtown Morgantown with two West Virginia University locations, and also provides passengers with non-stop direct to destination service between the central business district and the Evansdale and downtown campuses of West Virginia University.

17 151863 VEHICLE FOLLOWER LONGITUDINAL CONTROL FOR AUTOMATED GUIDEWAY TRANSIT VEHICLES. Continuing interest in the use of public transit to help solve problems related to urban transportation has pointed to the use of relatively small automated transit vehicles as a method for providing expanded transit service without the labor costs and reliability problems associated with the bus and without the high capital costs associated with rapid rail systems. Two philosophies for longitudinal control for short headway automated guideway transit (AGT) systems have evolved-(1) the vehicle-following concept, and (2) the point-following concept. This study is concerned with vehicle-follower control at relatively short headways. The objective of this research is to examine basic considerations in vehicle-follower longitudinal control for small, automated transit vehicles operating at moderate speeds and short headways. The relationship between spacing policy, system nonlinearities, and dynamic response of strings of vehicles is discussed.

17 151961 NEW SYSTEMS OF TRANSPORTATION IN JAPAN. This paper discusses subways which use rubber tires, monorails, light guideway systems, personal rapid transit (PRT), compound types and other forms of land transportation. In Sapporo City, rubber tires on the wheels of subway trains reduce the noise level. For lateral guidance, each car is equipped with horizontal guide wheels in the middle of its body. Japanese experience regarding the utilization of monorails is very favorable. The VONA and the KRT light guideway systems are described. The

former is a small electric car of the unmanned type running on rubber tires. It may run alone or include several vehicles (up to 12) to form a train. In the PRT, an adoption of the Morgan Town System, horizontal guide wheels are used for steering. Tests are presently being carried out on the MAT which has a central guide system, and the KCV which has the side guide system. Comments are made on the Computer Controlled Vehicle System--a PRT system, and on the compound dual mode systems. The latter include the DMB, a vehicle similar to an ordinary bus but which can enter special guideways for driverless operation. Compound systems also include the Bellica--a moving way system with cabs.

17 152606 PENDAIR LIGHT RAPID TRANSIT. The paper sets out the reasons for choosing rapid transit as a first application for the Pendair suspension system and distinguishes between transit and other urban transport functions. A description of Pendair Light Rapid Transit, its performance, economics, and implementation programme, is given and some aspects of environmental intrusion are discussed. Attention is drawn to the relatively high conventional content of the Pendair system and its mode of operation which reduces development risks. Comparisons are made with conventional rail rapid transit and other innovational systems.

Bliss, DS ; International Hydrofoil Society Conf Paper 1976, 18 Ref.; Presented at the biennial International Conference of Hovercraft, Hydrofoils & Advanced Transit Systems, May 17-20, 1976, Amsterdam, Netherlands.; ACKNOWLEDGMENT: EI (EIX770300218); ORDER FROM: ESL

17 152609 US DEVELOPMENTS IN ADVANCED TRANSIT SYSTEMS. While fixed right-of-way transit systems of conventional rail type are technologically mature and ready for deployment, the high costs and low rate of traffic diversion are causing planners to rethink the feasibility of using such systems. The increasing social problems of the automobile as a mode, and the apparent difficulties with conventional transit pose a dilemma; this has encouraged several large US manufacturing firms to attempt to develop more advanced modes using full automation, small vehicles, short headways and demand-responsive operation. These developments have been fraught with enormous difficulties, and have not yet produced a truly advanced system that could begin to resolve the dilemma posed previously. Some institutional changes that might increase the rate of development of new systems are suggested.

17 152805 CONTROL CONSIDERATIONS FOR AUTOMATED GUIDEWAY TRANSIT SYSTEMS. The objective of the paper is to present a description of the various control functions necessary for the operation of advanced automated transit systems. These control functions are hierarchical in nature and range from scheduling and routing to control of velocity and spacing between individual vehicles. Proposed solutions to the various control problems which arise in advanced automated transit systems are discussed.

17 155738 PEOPLE MOVERS. A review of recently implemented public transit systems is presented. Among the projects described are the AIRTRANS system at the Dallas/Fort Worth Airport the Group Rapid Trans (GRT) system developed by the Boeing Aerospace Co. under the sponsorship of the Urban Mass Transportation Administration (UMTA) to link the two campuses of West Virginia University at Morgantown, and the Westinghouse, shuttle-loop transit system in use at several airports. Low-cost options to remedy urban transportation problems discussed include computer matching of car-pool riders, dial-a-ride and demand-response van and minibus services, and allocation of freeway lanes to cars carrying more than three passengers. Prototype vehicles incorporating linear induction motors magnetic levitation techniques, under development by Boeing, Otis, and Rohr in a UNTA-sponsored project to design an advanced group rapid transit system, are briefly described.

17 155757 ASTROGLIDE-THE ADVANCED AUTOMATIC GUIDEWAY TRANSIT SYSTEM. The technical and economic aspects of a people-moving overhead monorail system powered by linear induction motors or advanced transverse flux motors, of the type used at Braniff International, Dallas to move airline passengers between the terminal and the parking area, are discussed. The advantages such a transportation system would offer to people using mass transit systems are noted. A demand-responsive fully automatic transportation system, called astroglide, is described and is shown to be far superior to the monorail installation used at Braniff International.

17 155875 DFW AIRTRANS TRANSIT SYSTEM SIMULATION. Description of a mathematical model of an intra-airport rapid transit system designed to transport passengers and baggage at the new Dallas-Fort Worth International Airport. The proposed simulation model moves trains and passengers over a guideway by processing time as an independent variable. All events such as train and passenger movement are associated with a specific simulation time and are processed at that time. At a particular simulation time, a type of event to occur in the future and the time of occurrence are determined. When the simulation time is incremented to the event occurrence time the event is processed.

17 155880 AIRTRANS OPERATIONAL READINESS TEST--AIRPORT INTERNATIONAL TRANSPORTATION EVALUATION. Airtrans provides International Transportation at the Dallas-Fort Worth Regional Airport. Operational readiness of the

vehicles is assured by an automated departure test. The test plan was formulated in the conceptual stages of airtrans design. Main objectives of the plan were to make the vehicles testable using existing operational hardware and with no special test connector. Test design features had the same priority as other vehicle operating requirements. Merging test constraints with prime system operating requirements achieved an efficient and very thorough test. In addition, vehicle checkout features aided verification, production and maintenance testing. The results demonstrate that sufficient priority applied to test objectives, early, provides important contributions to overall system design.

17 155909 AIRPORT TERMINAL PLANNING. Using the Dallas/Forth Worth Airport as an example, it is necessary to point out that airport terminal planning must be done with a broad view of the future and an understanding of the problems of the past. A general criterion concerning expansibility and automation with passenger convenience as a goal is presented. An airport transit system is also described, pointing out the fact that distances between terminals must be traversable in a minimum of time. Moving passengers from their deplaning gate to another terminal or to a remote parking area is a prime consideration. This same transit system is used to move employees, baggage, mail and rubbish throughout its entire circulatory system, thus completely automating the airport. A future convenience for travellers of all kinds could be an inter-city transit system tied in with the airport transit system.

17 155916 THE TAMPA AND SEATTLE-TACOMA AIRPORT TRANSIT SYSTEMS. The Tampa and Seattle-Tacoma International Transit Systems have been in service long enough to judge the validity of their concepts and the success of their designs. These two systems have been accepted by the authorities that own and operate them. They have excellent safety and performance records. The public accepts their driverless cars routinely. The two systems are described and compared. They are similar in many respects but differ in their basic application to the airports, one being a shuttle and the other a loop system. As a result of their specific application, the automatic control systems differ. Operating and performance summaries are given. Both systems provide the same level of service and both have an availability over 99%.

17 156887 RESEARCH AND DEVELOPMENT POSITION OF ELECTROMAGNETIC SUSPENSION TECHNOLOGY IN THE FEDERAL GERMAN REPUBLIC [Forschungs-und Entwicklungsstand der Elektromagnetischen Schwebetechnik in der Bundesrepublik Deutschland]. The experimental vehicles and the test equipment brought into service to date include test rigs for stationary and rotational measurement of static and dynamic parameters as well as the detection of eddy currents. Performance tests on the experimental vehicles are reported, in which electromagnetic suspension technology is preferred to air cushion technology. The aims for the experimental vehicles are given as: V max = 400 km/h, 200 to 400 people working load, energy consumption in the region of comparable rail bound vehicles. Asynchronous short stator motors and synchronous long stator motors are compared. A comparison of the principal dimensions demonstrates the pronounced dependency of the actual power supplied on efficiency and phase displacement. /TRRL/ [German]

17 157240 VEHICLE MANAGEMENT SYSTEMS FOR HIGH PERFORMANCE PERSONAL RAPID TRANSIT SYSTEMS. The paper presents a class of vehicle dispatching policies predicated on the assumption that vehicle travel costs and passenger waiting costs can be related. The dispatching policies vary as the functions chosen to model passenger waiting costs vary. The computer execution time of each policy in family of policies is most reasonable and thus policies will handle systems with large demands. The dispatching policies are founded on

the results of the two-station models also contained in this work. Two-station model has presented a major result for batch service queues—namely the presentation of the optimal policy for batch service queues with nonlinear customer waiting costs.

17 157903 ADVANCED GROUND TRANSPORT ON THE MOVE AGAIN?. Two recent developments in this field are briefly reported, both using single-sided linear motors for propulsion. In Canada, a contract with Canadair is reported to complete the development of an intermediate capacity transit system (ICTS) with two-car units running on steel wheels, and without magnetic suspension. The Toronto firm of spar are to provide the propulsion system which includes a self-steering bogey and wheel assembly for the car, and provision is made for fully automatic control. A test track facility about 2 km long is to be built at Kingston, Ontario. In Japan, Japanese Air Lines (JAL) have accepted responsibility for the provision of a rapid transit link between Tokyo and the new international airport 40 miles away at Narita. A prototype vehicle is described as being in the building phase. It is expected to reach 125 mile/h, and financial support is being sought for the construction of A \$600 million track and system. The final vehicle is envisaged as 72 ft long, 12 ft wide and 10 ft high to carry 112 passengers at 190 mile/h, riding on a magnetic cushion produced by 8 electromagnets. /TRRL/

17 158053 A STUDY OF THE COSTS AND BENEFITS ASSOCIATED WITH AVM. Automatic Vehicle Monitoring (AVM) systems provide an information gathering and processing tool for the centralized management and control of urban vehicles. The potential benefits of AVM, namely, increased efficiency and productivity of transit operations, have led UMTA and the Transportation Systems Center (TSC) to explore the technical, operational, and economic feasibility of AVM. This study addresses AVM utilization by bus, police, and taxi operators, and by a cost sharing multiple user fleet. This benefit cost analysis looks beyond field experimentation and focuses on the probable costs and achievable benefits of an AVM system fully deployed in a major metropolitan area. The core of this analysis is a newly developed computerized benefit-cost accounting model. A literature review and AVM-related experience in the U.S., Europe, and Canada have been integrated with research at TSC to develop this cost-benefit model. This model calculates the total life cost of alternative AVM location systems, then determines the dollar value of cost reduction benefits made possible through use of AVM's real-time position location information. AVM payoffs and the sensitivity of the payoffs to the dimensions of the model and the base case fleets are also discussed. This cost-benefit study as a whole analyzes the probable achievability and value of the stated claims. The Appendices contain Base Case Data Inputs, User's Manual for Benefit Cost Model, and Input-Output Formats.

17 158085 PEOPLE MOVER PROFILE. As part of its ongoing commitment to the concept of technology sharing, the U.S. Department of Transportation has initiated a series of publications on transportation topics which focus on a variety of subject areas. This report is part of such a series. **PEOPLE MOVER PROFILE** acquaints readers with the subject of people movers in conjunction with UMTA's Downtown People Mover (DPM) Project. The project's aim is to demonstrate the benefits of fully automated people mover systems in downtown urban areas. To date, people movers, installed in controlled environments such as airports and recreation parks, have demonstrated that they are proven operational systems. The DPM Project will demonstrate the feasibility of installing a people mover system in the harsher and more demanding environment of downtown urban areas. This profile report is divided into three sections. The first, a narrative overview, briefly discusses the subject of people movers. The second section consists of detailed technical data and photographs of manufacturers and suppliers of existing people mover systems. The third section, the supplementary material, contains a glossary of terms used in this document in addition to the aforementioned UMTA DPM Project material. Technical data in this profile report were obtained from the people mover manufacturers and suppliers who are responsible for its accuracy.

17 158094 MPRT O & M PHASE OPERATING, AVAILABILITY AND MAINTENANCE HISTORY. This document describes the operating and maintenance characteristics of the Morgantown Personal Rapid Transit (MPRT) during the first year of passenger carrying service starting September 15, 1975. The Morgantown project is an Urban Mass Transportation Administration demonstration to provide personal rapid transit service between the central business district and the separated campuses of West Virginia University. West Virginia University operated the system with support from Boeing. The first year operation of the Morgantown PRT system successfully demonstrated the concept of an automatically controlled transit system. The purpose of this document is to provide a published account of the MPRT operating, availability, and maintenance history. Data was summarized from program reports compiled during this first year of MPRT operation and maintenance. Data included scheduled and actual operating hours; downtime and downtime events; mean downtime; daily passenger gate count; system availability; trip reliability; system dependability; daily fleet miles; daily fleet size; scheduled versus unscheduled maintenance actions; failures by part number; distribution of failures by time and subsystem; top 25 problem areas; spare parts used by quantity, part number and month; ECP change implementation during the O&M phase; and a summary of the first year's costs. The intent in presenting this MPRT data in this document is that future Automated Transportation Systems studies and designs will learn from the MPRT experience and make use of this data to optimize designs and systems.

17 159863 USE OF ENHANCEMENT PLATES FOR IMPROVED DOPPLER RADAR PERFORMANCE FOR GROUND TRANSPORT SYSTEMS. A method of improving the performance of X-Band Doppler radars for ground transport vehicles is presented. The technique utilizes small metallic reflectors placed directly below the guideway surface. From the results of preliminary laboratory and on-road tests it is concluded that improved accuracy of on-board position and velocity measurements result. In the safe operation of high-speed short time-headway automatically controlled ground transport systems, there is a need for highly accurate position and velocity sensors. Since the advent of low-cost solid-state X-band sources, much attention has been focused on the use of Doppler radars operating with the rough-surface backscattered signal from the roadway as velocity sensors for ground-based vehicles. The results to date indicate that, while the method may be adequate for conventional applications, some improvement is needed before these radars can be used in high-capacity automated transit systems.

17 163529 SYSTEMS AND ENVIRONMENTAL EMC CONTROL PROGRAM FOR THE AIRTRANS AUTOMATED GROUND TRANSPORTATION SYSTEM. This paper describes the EMC program implemented for the AIRTRANS ground transportation system installed at the Dallas-Fort Worth Regional Airport. A review of the EMI techniques applied at the equipment level for the automatic control, propulsion control and surveillance system is provided. A presentation is made concerning derivation of the limits for radiated and conducted emissions from the vehicles; limits which can be reasonably applied to commercial systems yet provide the necessary control to insure the system is operationally compatible and free from mutual interference. The system will operate without interference to adjacent aeronautical, safety and special, and broadcast radio services. Measurement data are provided showing the radiated and conducted emission characteristics of a vehicle operating on-site. These measurements, compared against the limits established for the system, show that the required conditions of electromagnetic compatibility have been achieved.

17 163758 MAGNETICALLY LEVITATED AND WHEELED MINITRAM COMPARISON STUDY. A programme of theoretical and experimental work has led to the successful demonstration of an electro-magnetic suspension unit for a small, driverless urban vehicle (minitram). The report describes the designs of both magnetically levitated and wheeled vehicles and their guideways and compares them in both technical and economic terms. The system based on magnetic suspension has been shown to be technically feasible with overall costs comparable with those for the equivalent wheeled vehicle system. The authors see more likelihood of cost reductions in a second generation magnetic suspension system than for a wheeled system which is already based on proven technology. They identify the narrower, lighter guideway and lower noise levels as further possible advantages of magnetic suspension over wheels. The authors also find that the magnetic suspension vehicle should have a higher reliability and availability than the wheeled vehicle which leads to a significant difference in maintenance requirements. The major disadvantage of a magnetically suspended vehicle is that the linear motor used for propulsion and braking is inefficient and requires heavy associated control gear. On balance, magnetic suspension does not at present have any outstanding advantage over wheels for the proposed application. /TRRL/

17 163759 STATE-BACKED BODIES COMPETE FOR MAG-LEV TRANSPORT PRIZE. The major Japanese rail (JNR) and airline (JAL) companies are independently developing similar high speed, noiseless pollution-free transport systems using magnetic levitation and the linear induction motor. It is hoped that the JAL system will be operational in 1982 running from Tokyo to the airport over an elevated guideway at 300km/h. Electric power for the linear induction motor is picked up from a third rail through a carbon shoe attached to the vehicle. The JNR development is designed to be a 500km/h inter-city system to supplement the present Shinkansen network providing direct competition with domestic airlines. A linear synchronous motor creating a repulsive force is used to levitate and propel the vehicle 300mm above a concrete inverted t-shaped track. The magnets, which are superconductive, also react with a current in track mounted coils to produce the repulsive force. Because the levitation and guidance only function at speeds above 80km/h a rail and wheel system is added for low speeds. However the JNR system has the advantages of greater gap control at high speeds and requires no "third rail" power supply. /TRRL/

17 165029 COST AND PERFORMANCE RELATIONSHIPS FOR RUBBER TIED AUTOMATED SYSTEM DESIGN. The paper discusses the cost sensitivity of the vehicle/elevated guideway system to the important vehicle operational and performance characteristics. For the vehicle system, relationships for obtaining a first cut cost estimate of an electrically driven automated rubber tired vehicle as a function of the vehicle's physical & operating characteristics are presented. Also presented are important vehicle performance characteristics that affect the fleet size and hence the vehicle system capital cost.

Putkian, J (Transportation Systems Center); Colorado University, Boulder Conf Paper Vol 2, Pap 34, 1975, 18 pp, 13 Ref.; Presented at the International Conference on Personal Rapid Transit, Denver, Colorado, September 16-19, 1975; ACKNOWLEDGMENT: EI; ORDER FROM: Colorado University, Boulder, Center for Urban Transportation Studies, Boulder, Colorado, 80302

17 165030 DEVELOPMENT AND EVALUATION OF SERVICE POLICIES FOR MEDIUM-HEADWAY AUTOMATED RAPID TRANSIT SYSTEMS. Two innovative service policies—the dynamically scheduled service and the advanced scheduled service—were developed for these systems combining the features of scheduled and demand services. These operate a large number of fixed service routes formed by connecting station groupings in the network. The level of service provided by these policies, the system operating and design requirements and the network performance characteristics were evaluated using three typical networks and a set of eight computer programs. Dynamic scheduling provided a high level of service with a low passenger waiting time at the stations and no requirement for passenger transfers. Advanced scheduling provided a marginally lower service level but resulted in higher vehicle occupancies and substantial reduction in fleet requirements.

17 165033 RUBBER-TIRED RAPID TRANSIT--1. SYSTEMS CONCEPTS. Rubber-tired transit technology is receiving much attention for application to medium capacity rapid transit systems due to superior traction capability and the potential for reduced noise generation. Data from a worldwide survey identify other surprising benefits. This technology appears to merit inclusion as an alternative in technological assessments for urban rapid transit application. Part I reviews the state-of-the-art in the world today and describes typical system concepts.

17 165034 RUBBER-TIRED RAPID TRANSIT--2. TECHNICAL CHARACTERS. This second article in a series provides a detailed look at some of the more important characteristics of today's rubber-tired rapid transit systems as described in Part 1. Data covering the wide variety of switching, guidance, and support concepts; tire loadings and operational capabilities are analyzed and correlated to provide a better understanding of the state-of-the-art. In the interest of energy conservation a comparative analysis of energy utilization of both steel-wheeled and rubber-tired vehicles is included.

17 165175 CONTROL OF LATERAL MOTIONS OF THE TERRAFOIL TRANSIT VEHICLE. The active ride control system for the TERRAFOIL vehicle is described. The passenger compartment of this vehicle is supported above the roadway by long flexible struts, and its undercarriage is enclosed in an underground guideway. Lateral loads are imposed on the vehicle by cornering maneuvers, winds, and guideway roughness. This study shows that electrohydraulic servomechanisms designed to apply control moments at the base of the supporting struts can adequately confine the lateral motions of the passenger compartment within specified limits, even with extreme load disturbances. A dynamic model including the flexible strut shows the system to be controllable through the servo-valve input signal and observable through feedback signals from the servopiston and an accelerometer mounted on the passenger compartment. Feedback control is achieved through a state estimator and an optimal control law matrix.

17 166500 POINT-FOLLOWER AUTOMATIC VEHICLE CONTROL: A GENERIC ANALYSIS [Final rept.]. The three-part study examines the generic characteristics of the point-follower approach to vehicle control for Automated Guideway Transit Systems, under which vehicles are constrained to follow electronic signals that move along the guideway with predetermined speeds and spacings. The first part of the study involves a kinematic analysis of point-follower control during speed transitions and point-transfer maneuvers that are generally required to resolve merge conflicts. The second part consists of a dynamic analysis of point-follower control, formulated as a problem in classic control theory. The final part addresses the traffic merging problem by development of quasi-synchronous control algorithms for resolution of merge conflicts at network intersections of various geometries.

17 167288 A STATE-CONSTRAINED APPROACH TO VEHICLE-FOLLOWER CONTROL FOR SHORT-HEADWAY AGT SYSTEMS [Final rept.]. Vehicle-following in an automated-guideway transit (AGT) system is a longitudinal control scheme where the state of a given vehicle is determined by the behavior of the preceding vehicle. The study represents the initial phase of an investigation that is to be continued in order to determine the feasibility of implementing a state-constrained vehicle-following controller into a real system. The report documents an investigation into the automatic longitudinal control of vehicles using a vehicle-follower strategy in the short-headway range operation (0.5 to 3 s). The study states that at short time headways a kinematic constraint on vehicle operation arises as a consequence of the velocity, acceleration, and jerk limits imposed to assure passenger comfort. This constraint requires a trailing vehicle to maintain a spacing such that it may react to nominal preceding-vehicle maneuvers without collisions and without exceeding service jerk and acceleration limits. A nonlinear feedback controller is designed to force the vehicle to follow the kinematically required spacing until the desired headway is attained. The design is based on a technique that uses an optimal feedback control with state constraints. Several suboptimal controls with reduced informational requirements are also presented, thus producing an easily instrumentable controller that properly responds to all possible nominal maneuvers of a preceding vehicle. This report concludes that the technique presented has shown to admit a workable solution to the vehicle-following problem at short headways.

Pue, AJ ; Johns Hopkins Univ., Laurel, Md. Applied Physics, Lab.*Urban Mass Transportation Administration., Washington, D.C. UMTA-MD-06-0022-77-2, Aug. 1977, 123p; See also report dated Jul 75, PB-255 953; Contract DOT-UT-60042T; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-272239/5ST

17 167298 ANALYSIS OF SHORT RAMPS FOR DUAL-MODE AND PRT STATIONS. The report is the result of continuing efforts to understand the safe-headway trade-offs for Personal Rapid Transit (PRT) and dual-mode systems. It adds a new dimension to the traditional interactions among control complexity, safety, and acceleration. Analyses and computer programs are developed to determine how short it is possible to make the ramps leading into and out of off-line PRT stations. Simplified reference solutions are obtained and results are presented for state-of-the-art, improved, and advanced system parameters. Potential savings in the costs of stations are very large, due to the high construction cost of station ramps. Both point-follower and vehicle-follower control systems are considered. For point-follower control systems, the acceleration ramp can usually be eliminated. For vehicle-follower control systems, small deviations in the speed of through cars allows both acceleration ramps and deceleration ramps to be appreciably shortened.

17 167545 DESIGN AND TESTING OF A LOW SPEED MAGNETICALLY SUSPENDED VEHICLE. Technologies of magnetic suspensions as applied to urban transport and a foundation for extension to high speed ground transport are presented. An experimental 5 place vehicle and a 100 m long test track are in the process of being tested on a dynamic laboratory rig. The test track incorporates a minimum radius lateral curve and a transition from a 1 in 20 rising gradient to a 1 in 20 falling gradient. Suspension performance and energy consumption are evaluated, and test results show technical viability of the principle.

17 167565 VARIATIONAL FINITE-ELEMENT SOLUTION FOR DISSIPATIVE WAVEGUIDES AND TRANSPORTATION APPLICATION. A procedure is developed for determining the complex propagation constants and associated complex electromagnetic fields as a function of frequency for electromagnetic waves propagating along an inhomogeneous waveguide composed of dissipative materials and having a complicated shape. The wave equation, which is complex because of the presence of dissipative materials, is transformed for computer solution into a matrix eigenvalue equation by the application of the Rayleigh-Ritz variational method in conjunction with the finite-element method. The results are reviewed for several simple dissipative waveguides for which analytical results are computed for comparison. A novel proposal is then investigated in which a railroad track acts as a surface waveguide for a rapid-transit collision-avoidance system. The results illustrate the usefulness of the numerical method developed and suggest that the modified steering rail warrants further investigation for rapid-transit systems.

17 167937 ELEVATED GUIDEWAY COST-RIDE QUALITY STUDIES. Automated transit system simple and continuous span concrete elevated guideway structures are analyzed to determine the influence of structural design properties and construction tolerances on vehicle ride-quality and guideway cost. Ride quality has been determined as a function of guideway rigidity, span surface roughness, span vertical misalignment, span camber and pier misalignment as well as vehicle speed and suspension properties. Guideway costs have been computed as a function of span length, cross-section shape, method of construction, degree of continuity and overall construction tolerances.

17 167972 MODEL EXPERIMENTS OF CABLE-STAYED GUIDEWAYS. With the advent of electrically driven and computer controlled rapid transit vehicles for mass intraurban use, it has become necessary to investigate the dynamic efficiency of different types of elevated spans for these vehicles. In previous work involving moving point forces on continuous span bridges with hard piers, dynamic moments of nearly five times the static response of its simple span counterpart were measured. This paper looks to the alternative of a continuous cable-stayed bridge for a reduction in the moment amplification. Energy is expected to be distributed in more vibrational modes and partially absorbed by the cable supports.

17 167991 STANDARDIZATION REQUIREMENTS FOR THE IMPLEMENTATION OF AGT SYSTEMS. The development of Automated Guideway Transit Systems has already followed the classical patterns exhibited by other transit technologies in the early stages of their development. It is important for AGT systems, and in particular for PRT that this evolutionary process should be condensed into as short a time frame as possible consistent with a full investigation of all practical options in technology. The object of this paper is to discuss those elements of AGT systems which are susceptible to standardization and to propose a course of action which would rationalize the wide range of hardware and software presently under development. The nature of this paper is necessarily philosophical; however, it is intended to produce a catalytic effect which will stimulate thought rather than present an analytical solution.

17 167999 MAGNETICALLY SUSPENDED VEHICLES FOR URBAN TRANSPORT SYSTEMS. Of the five different levitation technologies, two are likely to be applicable to low-speed operation. One system using controlled dc electromagnets to suspend large weights such as passenger carrying vehicles has become progressively more feasible technically, owing to advances in solid-state electronics. It is largely through these that a 1 t 4-passenger vehicle operating on a 30 m track has been built in the Applied Science Laboratories of the University of Sussex and has been demonstrated publicly. The operating experience of this vehicle has shown

clearly that the controlled electromagnetic suspension is capable of providing a transport system that possesses passenger-attraction potential. This is meant to be a system that provides a frequent and thus highly reliable operation; for city-center or urban application it must be noiseless, and, if it is fully automatic and operating on segregated tracks, the guideway structure must be visually nonintrusive. Although the principal aim of eliminating physical contact is not so much to save energy as to obtain very high reliability, it is worth noting that a vehicle carrying eight passengers at 30 mile/h and using controlled dc electromagnets for suspension is likely to require less power than that wasted in the transmission unit of a car.

17 168094 JAPAN AIR LINES' HIGH SPEED SURFACE TRANSPORT. Japan air lines plan to use a linear induction motor powered high speed surface transport (hsst) to provide a 14 minute journey over the 65 km between the new international airport at Nasita and central Tokyo. Aerospace technology has been used to give low drag and weight, good stability and reliability. The power consumption at cruising speed is 5 kw per passenger and it is thought that the system cost would be returned in the first five years of operation. Although the Japanese system caters for a captive market and is not suitable for the transport of heavy freight, it could be adapted for general urban mass transportation. The concept has very good environmental impact, producing little noise, exhaust and vibration. Attractive electro-magnets are used for levitation and guidance. The magnetic field created is similar to that of a normal electric train motor.

17 168985 COMPARISON OF EXPERIMENTAL AND THEORETICAL REACTION RAIL CURRENTS, RAIL VOLTAGES, AND AIRGAP FIELDS FOR THE LINEAR INDUCTION MOTOR RESEARCH VEHICLE. Measurements of reaction rail currents, reaction rail voltages, and airgap magnetic fields in tests of the Linear Induction Motor Research Vehicle (LIMRV) were compared with theoretical calculations from the mesh/matrix theory. It was found that the rail currents and magnetic fields predicted by the theory are within 20 percent of the measured currents and fields at most motor locations in most of the runs, but differ by as much as a factor of two in some cases. The most consistent difference is a higher experimental than theoretical magnetic field near the entrance of the motor, and a lower experimental than theoretical magnetic field near the exit. The observed differences between the theoretical and experimental magnetic fields and currents do not account for the differences of as much as 26 percent between the theoretical and experimental thrusts. (Color illustrations reproduced in black and white)

17 170466 NEW TRANSIT TECHNOLOGIES AND CONTROL OPTIONS. Automated guideway transit systems feature vehicles which are capable of fully automatic operation under computer control on separated running surfaces (guideways). While just emerging on the urban transit scene such systems offer the potential for improved service and cost effectiveness. Paramount to the successful implementation of automated transit are the control algorithms required to operate the vehicles. A description is given of some of the features of near term deployment configurations and applicable vehicle control options.

MacKinnon, D (Urban Mass Transportation Administration) ; Institute of Electrical and Electronics Engineers Proceeding Vol. 1 N77CH 1220-3CS, 1977, pp 388-394, 25 Ref.; Proc of the JT Autom Control Conf, San Francisco, California, June 22-24, 1977.; ACKNOWLEDGMENT: EI; ORDER FROM: IEEE

17 170467 EFFECTS OF PARAMETER VARIATIONS AND SENSOR NOISE ON THE LONGITUDINAL DYNAMIC RESPONSE OF AUTOMATED GUIDEWAY TRANSIT VEHICLES. Experience with existing automated guideway transit (AGT) vehicles has shown that variations in vehicle parameters can significantly affect dynamic response. A study is presented of the magnitude of headway errors resulting from variations in parameters such as mass, tire radius, and propulsion and control system gains. In addition, the effects of sensor bias and noise on dynamic response is determined. A typical rubber-tired, electrically-powered AGT vehicle operating at moderate speeds (15 m/s) and headways (15 s) is modeled for the purpose of establishing numerical estimates of headway errors. This vehicle model is based on the Morgantown, West Virginia AGT system.

Gerrard, WL (Minnesota University, Minneapolis) ; Institute of Electrical and Electronics Engineers Proceeding Vol. 1 N 77CH 1220-3CS, 1977, pp 395-400, 8 Ref.; Proc of the JT Autom Control Conf, San Francisco, California, June 22-24, 1977.; ACKNOWLEDGMENT: EI; ORDER FROM: IEEE

17 170468 STEERING CONTROLLER DESIGN FOR AUTOMATED GUIDEWAY TRANSIT VEHICLES. The fundamental lateral performance capabilities of rubber-tired automated guideway transit (AGT) vehicles operating under automatic steering control on exclusive guideways are discussed. Control is achieved by steering the front wheels in response to signals derived from the position errors between the vehicle and a guideway-based reference containing random irregularities. Optimal control techniques are used to synthesize controllers which

minimize a performance index consisting of mean square lateral acceleration and tracking error, defining a frontier which limits the performance of steering controllers. Simple single-sensor proportional steering controllers are found to offer performance comparable to the optimum for a typical AGT vehicle. The degradations in performance arising from dynamic lags in the steering actuator and operation at off-design speeds are shown.

Shladover, SE (Massachusetts Institute of Technology) Wormley, DN Richardson, HH Fish, R Institute of Electrical and Electronics Engineers Proceeding Vol. 1 N 77CH 1220-3CS, 1977, pp 408-414, 14 Ref.; Proc of the Jt Autom Control Conf, San Francisco, California, June 22-24, 1977.; ACKNOWLEDGMENT: EI; ORDER FROM: IEEE

17 170587 ON THE AUTOMATIC LONGITUDINAL CONTROL OF INDIVIDUAL GROUND VEHICLES. The achievement of safe and efficient longitudinal control is probably the most significant technical problem associated with individual-vehicle, automated ground transport systems such as automated guideway transit and the automatic highway. Four essential aspects of such control are considered: a) Sector-level operations; b) Communications between each controlled vehicle and the sector computer; c) The development of techniques for obtaining accurate estimates of a vehicle's state; and d) The control of each individual vehicle. Recent advances, pertaining to the design, development and testing of these facets will be described in the context of achieving safe and efficient operations under high-speed (to 93 ft/sec), small time-headway (1-2 sec) conditions.

17 172370 GETTING MOVING ON PEOPLE MOVERS. This article describes the growing market and popularity of people movers. Recent improvements of the Morgantown system has renewed the interests of the Urban Mass Transportation Administration (UMTA). In 1976, UMTA committed a total of \$220 million to build people movers in Cleveland, Houston, Los Angeles, and St. Paul. In addition, Baltimore and Miami were allowed to build people movers if funds could be appropriated from previous federal funding. In 1978 Congress asked that Baltimore, Indianapolis, Jacksonville, St. Louis, and Norfolk be permitted to apply for DPM capital grants. These seven second-tier cities will be asked for additional planning before requesting preliminary engineering money. A status report on the individual downtown people mover (DPM) projects in the first four-tier cities are included in this article. Although the systems are called downtown people movers, their use is not limited to the CBD. People movers could theoretically be installed wherever there is a sufficient demand for collecting and distributing people. The DPM's major advantages include total automation and low labor costs.

17 173990 HSST: A VIABLE ALTERNATIVE FOR RAPID AIRPORT-CITY CENTRE TRANSPORTATION. A radically improved High Speed Surface Transport (HSST) system is well along in development by Japan Air Lines. Speeds of nearly 230 km/h have been achieved and the goal is 300 km/h. The HSST resembles an aircraft without wings or landing gear "flying" noiselessly only millimeters above a guideway. The levitation is produced by magnetic attraction and a linear induction motor is used to propel the vehicle. The next phase will be to build a system prototype and operational guideway with commercial use between Tokyo and the new Narita Airport now slated for 1980. With its high cruising speed it will cut time between Tokyo and Narita Airport to 15 minutes instead of two to three hours by expressway.

Hayashi, A (Japan Air Lines) *ICAO Bulletin* Vol. 33 No. 1, Jan. 1978, pp 21-24, 2 Phot.; ORDER FROM: International Civil Aviation Organization, 1080 University Street, Montreal 101, Quebec, Canada

17 174396 LOW-SPEED VEHICLE DYNAMICS AND RIDE QUALITY USING CONTROLLED D.C. ELECTROMAGNETS. The aim of this paper is to establish that attraction type systems, i.e. with controlled d.c. electromagnets, can be successfully employed for the suspension of urban transit vehicles, having speeds around 70 km/hr, without the aid of secondary suspension. A single degree of freedom suspension system is considered. The methods of characterizing track roughness and acceptable ride qualities are outlined and the ride characteristics that can be achieved through the design of feedback control systems are considered. Some of the basic factors which influence the performance and stability of the system are briefly discussed and some experimental results from a vibrating test suspension system are presented to illustrate the performance of the proposed system.

17 175502 ASSESSMENT OF OPERATIONAL AUTOMATED GUIDEWAY SYSTEMS- JETRAIL. The report is an assessment and evaluation of the Braniff International Airlines Jetrail system located at Love Field in Dallas, Texas, the first operational completely automated, demand-responsive, group rapid, intra-airport transportation system. It connects a parking lot at the entrance to Love Field and the Braniff terminal with three-quarters of a mile of double-lane mono-rail and has ten suspended vehicles, a maintenance facility, and three stations. The system was intended to retain passengers in the face of increased congestion at Love Field. Jetrail operated successfully from April 1970 to January 1974, at which time Braniff moved to the new Dallas-Ft. Worth Regional Airport. Over six million passengers were carried 1.3 million miles during this period without a fatality or major mishap. The system did this in spite of the engineering novelty and early, low reliability of the propulsion and control system. The Jetrail system continues to be used as an engineering test-bed for a prototype linear induction motor propulsion system. This latter system,

Astroglide, is being developed by PRT Systems Inc. Since the motor has no moving parts, it is more simple than the rotary motor and drive train of the Jetrail system. This report provides information on the Jetrail operational experience and the Astroglide prototype for transportation planners, designers, developers, and operators of AGT systems for intra-airport, urban, recreational, and freight applications.

17 176137 PASSENGERS IN CONTAINERS. A futuristic vision of future passenger and cargo transport is presented. To speed up lengthy transit operations, passengers would be accommodated in comfortable, compartment-like containers. Several diagrams show how such containers can be accommodated aboard an aircraft or a helicopter, on a truck, or in a railroad car. A system would result in great economy in both cost and time. Of particular importance is such a system for cargo traffic.

17 176925 THROTTLE OPEN OR THROTTLE DOWN. SCENARIOS FOR THE FUTURE OF THE TRANSPORTATION SYSTEM PART I AND II [Gasgeven of afremmen. Toekomstscenarios voor ons vervoerssysteem. Band I en II]. The book is printed in two volumes. Volume I contains the text, Volume II tables, figures and references per chapter. After an introduction, Volume I is in three parts. Part I describes the methodological background for the study in two chapters: the nature and methods of future research and systems-analysis of mobility. Part II discusses the past, the present and the future of the separate subsystems that make up the passenger transportation system in the Netherlands. The systems are: the motor car system, the air industry, the railway system, local and regional public transport, new systems of public transport, the taxi system, and the unprotected systems. Part III integrates the subsystems into two scenarios for the future of the complete

transportation system and analyses the cost and external effects of each. The author prefers the scenario with the emphasis on walking, the two-wheeler and public transportation, and a slower rate of expansion of the motor car and air industry. [Dutch]

17 178149 QUANTITATIVE ANALYSIS OF QUASI-SYNCHRONOUS PRT FLOW CHARACTERISTICS. A flow-modeller has been developed which is believed to reproduce, faithfully and inexpensively, guideway flow characteristics. The combined interactions of stations, interchanges and trip-demand, necessary for modelling fidelity, are accurately represented at the car-by-car level. A description of the flow-modeller is presented. Flow-modelling has been undertaken for a number of flow conditions with interchange control, in each case, being provided by each of a pair of highly efficient algorithms. The approach adopted was to fit, using the method of maximum likelihood, a number of likely empirical distributions to observed vehicle bunch and gap frequency data. A new flow-generator is proposed.

17 179364 EVALUATION OF ALTERNATIVES: MORGANTOWN PRT: EVALUATION MATRIX AND SUPPORTING DOCUMENTATION. Ten alternatives for the Morgantown PRT system were evaluated. They were: operate the existing three-station, 2.2 mile system as designed; expand the system by adding one, two, or three more stations; operate the three-station system with (a) manual operation of the 45 vehicles currently in production or (b) replacement of the PRT vehicles with buses operating on a modified guideway as well as existing streets; remove the PRT and (a) operate the existing shuttle bus system, (b) make low-capital improvements to the street system, (c) include a high-capital group of roadway improvements, and (d) reduce total person-trip demand. Each alternative was evaluated on a number of criteria in six goal areas; mobility, practicality, research potential, financial aspects, environmental considerations, and development potential. The end product of the research was an unweighted goals-achievement matrix indicating the value of each alternative for each criterion measured. A method for continuing the evaluation process through the steps of weighting, normalizing, summing, and analyzing was presented. Traffic studies were undertaken and reported on. These studies were used to determine that composition of present auto users in the affected area and the potential of the PRT to divert traffic and reduce congestion. /Author/

17 180135 UNDER-APRON TRANSIT FOR ATLANTA TERMINAL. Expansion and passenger transit plans for the Hartsfield Atlanta International Airport are described. Construction on a terminal designed to accommodate 55 million passengers a year has begun, and beneficial occupancy of the building is anticipated in December 1980. Phase one will consist of 104 wide-body aircraft gates, which can eventually be increased to 130 gates. A fourth east-west parallel runway is planned. The airport transit system will normally operate as a continuous-loop system with 17 80-passenger rubber-tired vehicles in three car trains, although the system could convert to a shuttle system when necessary. Moving walkways are planned within the passenger mall. Concourses and the location of baggage handling facilities are also described.

17 180385 DIRECTIONAL CONTROL AND STABILITY OF CVS PASSENGER VEHICLES. The Computer-controlled Vehicle System (CVS) is a pure personal rapid transit system and is reported to make it possible to cope with present-day traffic conditions by providing good service quality and transit capacity of 15,000 passengers per hour for network transportation. This paper presents the results of experimental and theoretical analyses of the unique guide-mechanism by which the driverless operation of CVS vehicles has been made possible. It is shown from the results of the study that the designed vehicle has satisfactory ride comfort and stability at speeds lower than 60 km/h.

17 181322 FIRE DETECTION, EXTINGUISHMENT, AND MATERIAL TESTS FOR AN AUTOMATED GUIDEWAY TRANSIT VEHICLE. This report describes 27 fire tests performed in a mockup (modified school bus) of an automated guideway transit vehicle. There were a number of significant findings relative to fire safety in this type of vehicle. First, Halon 1301 was found to be effective in extinguishing typical seat fires, but generated extremely high noise levels during discharge; however, significant reductions in noise were achieved by modifying the discharge nozzle. Another important finding

was that in all tests fires, the photoelectric detector responded more quickly than did the ionization detector. Finally, by studying various seat fire ignition sources, it was concluded that the underseat fire was the most severe condition. (Author)

17 182002 VEHICLE LATERAL CONTROL AND SWITCHING TECHNOLOGY REVIEW STUDY PROGRESS REPORT. The Vehicle Lateral Control and Switching (VLACS) project has been established to investigate alternative steering and switching systems applicable to a wide variety of automated transit vehicle types. This project is part of the Automated Guideway Transit Technology (AGTT) development program derived from the Urban Mass Transportation Administration's experience with automated transportation systems. The objectives of the project are to: (1) reduce the cost, complexity and weight, and increase the life, reliability, maintainability, ride quality, and switching capability of VLACS systems; (2) develop specific performance requirements and guidelines for lateral control and switching systems for SLT, GRT, and PRT vehicles in trained and untrained configurations; (3) develop and evaluate baseline VLACS hardware designs reflecting project objectives; (4) provide experimental data to demonstrate capability of VLACS system and subsystem designs to meet performance requirements including line speed switching; (5) provide a comprehensive analytical evaluation of contact (mechanical) and non-contact (wire-follower) lateral guidance approaches; and (6) perform an assessment of the positive retention capabilities of automatic switching systems.

17 182060 INNOVATION IN PUBLIC TRANSPORTATION: A DIRECTORY OF RESEARCH, DEVELOPMENT AND DEMONSTRATION PROJECTS, FISCAL YEAR 1976 AND TRANSITION QUARTER, JULY 1, 1975-SEPTEMBER 30, 1976. The purpose of UMTA's Research, Development and Demonstration (RD&D) Program is to provide information about possible improvements to urban mass transportation systems which communities can use in selecting the best way to deal with their particular transportation requirements. The principal means of providing this information is to publish annually a compilation of reports on the status of UMTA's projects. Research projects are intended to produce information about possible improvements in urban mass transportation; development projects involve fabrication, testing and evaluation of new equipment; facilities, and systems or methods; and demonstration projects introduce, on an experimental basis, new methods, equipment or systems of urban mass trans-

portation into a representative urban environment. This publication is a supplement to the 1972 comprehensive volume and contains description of current RD&D projects sponsored and funded by UMTA. The directory is divided into the following subject areas: bus and paratransit, rail, new systems and automation, socio-economic and special projects, and safety and product qualification, service and methods demonstrations, and policy and program development.

17 183380 BUS-TRAINS-POSSIBLE PRINCIPLES [Busstaag-taenkbara loesningsprinciper]. In order to meet the variation in the demand for public transport during the day a possible solution is the formation of bus-trains by linking buses together. Each bus unit of the train is controlled by an electric cable in the roadway. This study deals with two principles for controlling the bus-trains: (1) controlled front and back wheel, (2) controlled front wheel. A theoretical discussion and a practical evaluation of the space requirement for both principles are presented. Finally, principles and design of bus-train couplings are described. /TRRL/ [Swedish]

17 183821 HYDROGEN-POWERED MASS TRANSIT SYSTEM. Hydrogen's application to mass transit systems is considered. A 21-passenger bus is converted to hydrogen using a Dodge engine which was modified for high compression operation. Backfiring and nitric oxide pollution formation are controlled by a water injection technique. Hydrogen fuel storage for the experimental prototype is accomplished by two metal hydride containers using an iron-titanium alloy. Data are presented regarding equipment conversion and design, energy resource utilization, economics, and safety.

17 184579 AUTOMATED MIXED TRAFFIC VEHICLE (AMTV) TECHNOLOGY AND SAFETY STUDY. This report discusses technology and safety related to the implementation of an Automated Mixed Traffic Vehicle (AMTV) System. An AMTV system is one which follows a buried cable and is used in areas that require low-speed vehicles. The purpose of this study is to review the technology used in an AMTV system, to identify areas where further development is required or desirable, and to conduct a safety analysis on an AMTV system. The results are intended as a guide for further efforts in AMTV system design and technology for both near and long-term applications. The systems discussed include a low-speed system and a hybrid system which can operate at the low speed and at a higher speed within a protected right-of-way. The

low-speed system is a candidate for a near-term demonstration and can be used in pedestrian malls, large campuses, and recreational parks. The hybrid system may have application, after further development, on urban streets, in airports, or in situations where longer distances may be involved. The report describes a comprehensive safety analysis which was conducted to examine potential hazards caused by hardware failure and by events unrelated to hardware failure. Corrective and preventive actions in terms of modification or operational procedures are suggested. The major findings are that development using current technology will make it possible to demonstrate a low-speed AMTV system in 2 to 5 years. With a prudent, fail-safe design, and appropriate right-of-way protection, the system can operate safely in an environment containing pedestrians. /UMTA/

17 186034 ANALYSIS OF OFF-GUIDEWAY ENERGY STORAGE/PROPULSION SYSTEMS FOR DUAL MODE TRANSIT SYSTEMS. Vehicles in dual mode systems may travel on civil streets in the densely populated central business districts and on dedicated fixed guideways on the runs to suburban areas. In the sparsely populated suburban districts, the vehicles in these dual mode systems have the option of returning to civil streets for flexible station access. Dual mode systems would be controlled by human operators off-guideway and be under automatic control on-guideway. Thus they offer the potential for flexible routing with the reduced cost of automated operation on long runs. In addition, on-guideway propulsion energy would be electrical and have all of the inherent advantages associated with central power supply systems. Some evaluation criteria and a method for combining these criteria for the selection of an energy storage/propulsion system for off-guideway operation of a dual mode transit system are presented. In addition, technical options for these energy storage/propulsion systems are discussed. These options are drawn from mechanical, chemical, and electrical energy storage systems. The selection criteria discussed are used to select "attractive" near term system option. (ERA citation 03:043226)

17 186107 ASSESSMENT OF THE AUTOMATICALLY CONTROLLED TRANSPORTATION (ACT) SYSTEM AT FAIRLANE TOWN CENTER. This report contains the interim findings of an assessment of the Automatically Controlled Transportation (ACT) System for passenger transport in the Fairlane Town Center at Dearborn, Michigan. SRI International conducted the assessment as part of a program sponsored by UMTA, and is under contract to

assess the systems at Sea-Tac International Airport, Fairlane Town Center, Tampa International Airport, Houston Intercontinental Airport, Walt Disney World, and King's Dominion Amusement Park. The purpose of the site reports is to provide a uniformly documented presentation of AGT installations for UMTA's AGT Socio-Economic Research Program, and to gain an in-depth understanding of existing domestic and foreign AGT systems. The overall objectives are to: (1) obtain factual engineering and operational data; (2) obtain descriptive economic, system performance, and user perception data; and (3) review the design, development, and implementation process. The findings are intended to establish the state of the art of AGT systems for ultimate use in planning, evaluating, producing, and deploying. This report addresses the approach used in the Fairlane assessment; the engineering systems description; operation, maintenance and reliability, and passenger-oriented system performance; systems economics; and the development history.

17 186111 VEHICLE LATERAL CONTROL AND SWITCHING TECHNOLOGY EVALUATION MODELS STUDY PROGRESS REPORT. COST AND WEIGHT MODEL. The Vehicle Lateral Control and Switching (VLACS) project has been established to investigate alternative steering and switching systems applicable to a variety of automated transit vehicles. The VLACS project tests include a review of existing lateral control and switching technology, detailed mathematical modeling analysis and simulation, detailed hardware studies, experimentation with alternative designs, and development of guideline specifications for VLACS systems. A usable life-cycle cost and weight model is available for immediate application to automated guideway transit (AGT) nominal designs and control alternatives from these designs. The model incorporates the design goals delineated herein; a test case has been successfully run. This document contains a description of the cost and weight model for VLACS systems. The model is a life-cycle cost and weight model which focuses on system components which vary with lateral control option. This model is to be used to evaluate the cost and weight of VLACS design for four classes of AGT vehicles: Shuttle Loop Transit (PRT), Group Rapid Transit (GRT) large and small, and Personal Rapid Transit (PRT). Numerous illustrations and tables related to the model, its programs and subroutines, as well as a list of references are contained herein. This report concludes that the model has been structured to allow for evolution to keep the model current and usable. Relative inflation rates will be added to this model in the immediate future, and a test case using data for the SLT nominal design will be run at General Research Corporation. The model will then be converted to Otis equipment and an updated version of this report will be prepared.

17 186150 ASSESSMENT OF THE TUNNEL TRAIN SYSTEM AT HOUSTON INTERCONTINENTAL AIRPORT. This report describes and assesses the Tunnel Train System at Houston Intercontinental Airport; it was installed in 1972 as a replacement of an earlier battery-powered tug system. It provides a good example of the problems associated with fitting an AGT system into an existing environment. Information and data were collected by the authors through surveys of technical literature; formal site visits; interviews with operators, management, and engineering personnel; and a visit to the system manufacturer. In the proposed extension of the terminal, the airport will have to decide whether to upgrade or extend the tunnel train or to install a new system. In terms of current demand, the system serves its purpose adequately.

Yen, AM ; SRI International, Urban Mass Transportation Administration Final Rpt. UMTA-IT-06-0135-77-3, Dec. 1977, 98 p.; See also PB-281820.; Contract DOT-UT-70034; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-286641/6ST, DOTL NTIS

17 186162 ASSESSMENT OF THE WEDWAY PEOPLEMOVER SYSTEM AT WALT DISNEY WORLD. SRI conducted this study as part of an assessment program sponsored by UMTA. The purpose of the program is to gain an in-depth understanding of the performance, capabilities, and limitations of the AGT systems at WALT DISNEY WORLD, Seattle-Tacoma International Airport, Fairlane Town Center, Tampa International Airport, Houston Intercontinental Airport, and King's Dominion Amusement Park, as well as to provide a uniformly documented presentation of automated guideway transit (AGT) installations for UMTA's AGT program and for use by other research groups and interested parties. This final report, one of six site reports, describes and assesses the WEDway PeopleMover System, an automated guideway transit system used for passenger transport at WALT DISNEY WORLD in Lake Buena Vista, Florida. Information and data were collected by the authors through surveys of technical literature; formal site visits; interviews with operators, management, and engineering personnel; and a visit to the system manufacturer. The WEDway system represents the state-of-the-art in passive vehicles; it is completely passive except for its mechanical running gear. WEDway consists of a single 4,600-ft closed loop with only one station. Although it carries more than 4.5 million passengers/yr, there have been no serious accidents. The system design has resulted in a very reliable system. The use of a linear induction motor as the prime mover has shown efficiencies both in operation and maintenance. The authors state that although the WEDway exceeds its operational requirements, future work is necessary to explore the advantages/disadvantages of a passive system before durability of the system is determined.

17 186166 ACCELERATING MOVING WALKWAY SYSTEMS. TECHNOLOGY ASSESSMENT. REPORT B. This report is part of a series that assesses the technology and development of Accelerated Moving Walkway Systems (AMWS). The system has the capacity to accelerate pedestrians to 4 to 5 times the conventional system speed through changing treadway configuration. The purpose of this assessment is to determine the current status of AMWS technology, to establish potential candidates for a public demonstration, to fix definitive cost and operational data, and to establish user acceptability and safety. The objective is to produce a system which will operate with a line speed of twice the speed of walking and which will provide a time and human saving advantage to extend the effective moving way system range. This report includes a history of moving way system development and summarizes the available information necessary to describe and assess the systems of five AMWS developers which are at, or near, the hardware prototype stage of development and testing. The systems are Speedway, Trax, Applied Physics Laboratory, Boeing, and Dean. The systems considered in this study vary in their dimensional environs, thus affecting their adaptability to site applications. The variations are between the designs forming a single linear configuration similar to existing moving way systems, and other designs forming loop or 'S' shaped configurations.

Fruin, J Marshall, R Zeigen, M ; Port Authority of New York and New Jersey, Urban Mass Transportation Administration, (UMTA-IT-06-0126) UMTA-IT-06-0126-78-2, Apr. 1978, 92 p.; See also PB-287 083.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS; PB-287082/2ST

17 186168 ACCELERATING MOVING WALKWAY SYSTEMS. SAFETY SEMINAR PROCEEDINGS. REPORT G. This report is part of a series that assess the technology and development of Accelerating Moving Walkway Systems (AMWS). The system is a pedestrian assist device with the capability through changing treadway configuration to accelerate pedestrians to 4 to 5 times the normal entrance speeds after boarding, and to decelerate prior to discharge. On April 18, 1977, a seminar devoted to the discussion of the safety and human factors associated with the development and public use of AMWS was held at the New York World Trade Center. The attendance included representatives of the escalator and moving walk industry, AMWS developers, safety consultants, physically handicapped persons, and representatives of government agencies. The objective of the seminar was to provide a forum for discussion on the potential problems that might be associated with the use of AMWS technology based on its current state-of-the-art. The proceedings included a presentation of films and photographic slides providing illustrative design details of several systems under development; presentations by four consultants concerning AMWS safety; and workshops in which all attendees participated. The four systems considered for a public demonstration program are: Dunlop Speedway; Trax; Applied Physics Laboratory; and the Boeing System. The

meetings closed with the understanding that most of the raised problems can be solved, provided that sufficient efforts are devoted to their study. It was agreed that the proposed demonstration project would be a valuable asset to the development of an acceptable AMWS research program. Appendices 1 and 2 in this report are: The Conference Program and List of Conference Attendees, respectively.

17 186214 AGT GUIDEWAY AND STATION TECHNOLOGY. VOLUME 3: GUIDEWAY AND STATION REVIEW. This report is one of eight volumes associated with the AGT Guideway and Station Technology Project. The project objective is to develop guideway, station, and weather-protection concepts which will reduce the cost and implementation time associated with AGT systems and improve performance. The outputs are intended to aid planners, designers, administrators, and others interested in AGT systems and their application to specific transportation needs in urban areas. Automated Guideway Transit (AGT) systems in the United States comprise more than 64 km (40 mi) of guideway, over 70 passenger stations, and nearly 700 vehicles. This report reviews the guideways and stations found at 30 AGT systems and purports to establish the existing state-of-the-art. Related conventional rail transit stations are briefly reviewed to supplement the AGT station material. Information presented was derived from a literature search, personal contact with system manufacturers, operators, and personal experience. This review summarizes the considerations in the design of AGT guideways and includes discussions of vehicle interface, power distribution, weather-related effects, structural alternatives, site-related effects, and ride comfort. For stations, the design considerations include station description, site relationships, and station elements. This coverage of design considerations for both guideways and stations gives an overview of the issues and illustrates them by examples from specific AGT installations. The review also includes a discussion of the codes used in the design of the structures, the construction techniques, and the contracting methods employed for the design and construction of existing AGT guideways and stations.

17 186850 PROCEEDINGS-CONFERENCE ON AUTOMATED GUIDEWAY TRANSIT TECHNOLOGY DEVELOPMENT.

Twenty-eight papers were presented by experts from government and industry on system operations, passenger security, vehicle control and reliability, guideway and station structures, all-weather operation, ride comfort, deployed system assessments, automated highways, and developments in Canada, France and West Germany. The formal presentation of papers was followed by working sessions in the areas of system operations, vehicle systems and reliability, safety and security, wayside systems and all-weather operation, innovative transit, and social and economic factors. This report contains the proceedings of the conference.

17 186851 INDEPENDENT STUDY OF PERSONAL RAPID TRANSIT, AUTOMATED GUIDEWAY TRANSIT TECHNOLOGY PROGRAM. The objectives of the Urban Mass Transportation Administration's Automated Guideway Transit (AGT) Technology Program are to: (1) develop estimates of the cost, service, reliability, safety and performance of AGT systems in representative urban deployments; (2) generate performance specifications for future AGT engineering development programs; (3) synthesize guideline standards for AGT systems to include safety and reliability; and (4) identify critical technology shortcomings that currently impede the implementation of viable AGT systems and develop the required technology. A portion of the Program consists of independent studies in specific areas by organizations that have expertise in those areas. This report summarizes the findings of an independent study in the area of Personal Rapid Transit (PRT) and was conducted by the Aerospace Corporation. This study consists of four Tasks which are presented separately. Existing hardware and software technology is reviewed for applicability to implementation of future U.S. PRT systems. The systems reviewed include Aerospace, Aramis, Cabtrack, Cabintaxi, and the Computer-Controlled Vehicle system. Environmental and energy impacts of PRT are estimated and compared with alternate forms of AGT and conventional urban transportation modes. A general methodology for establishing the feasibility of PRT in an urban area is defined and applied to the Los Angeles Basin for demonstration purposes. Areas where research and development are required to make a future PRT system deployment feasible are described, and an approach to fulfill the noted technology shortcomings is provided. The study concludes that further developments are required of the

PRT full-scale systems and in most of the critical subsystem areas as well.

17 186863 DYNAMIC EXPERIMENTS OF ALTERNATIVE GUIDEWAY-VEHICLE SYSTEMS, PART I. This is an experimental investigation of vehicle-elevated guideway response dynamics. First, descriptions are given of the laboratory system components, which are: the spans (single, multiple and cable-stayed); the vehicles (tandem point loads and an Automated Guideway Transit (AGT) vehicle model); the vehicles' linear induction motor propulsion system; and the span-vehicle data retrieval system. Second, data are presented for a variety of vehicle-guideway configurations. Measured moment responses of simple spans to tandem loads show reasonable agreements with theory. Also, the six-span configuration, for a variety of transit loadings, shows less dynamic response compared to its single-span counterpart, but only up to certain vehicle speeds (or passage frequency ratios). Further, experiments on three-and six-span cable stayed guideways with a transit point load and an AGT vehicle show the importance of designing with medium-stiff cables if both span responses and vehicle heave acceleration are to be minimized. The last study summarizes current analyses on horizontal guideways of constant radius of curvature, and the response of such guideways to transit loads. It is concluded that such model experiments are needed and preliminary tests show that they are feasible. As for the straight spans, such data can be presented in nondimensional forms, directly applicable in the full-scale dynamic design of urban transit systems.

17 189812 OPERATIONS CONTROL FOR THE H-BAHN RAPID TRANSIT SYSTEM [Betriebsleittechnik des Nahverkehrssystems H-Bahn]. The fully automatic H-Bahn overhead cabin system has been developed to help solve the urban rapid transit problem. The H-Bahn will offer a frequent service on scheduled routes and

will provide transport until late at night. To be able to solve the highly diversified automation problems of the H-Bahn system, the automatic control system has been structured into a three-level hierarchy comprising an operations control level, traffic control level and safety level. Siemens 300/16-Bit System process computers take charge of operations and traffic control. [German]

17 190280 PERFORMANCE OF STEERING CONTROLLERS FOR AUTOMATED GUIDEWAY TRANSIT VEHICLES. Automated Guideway Transit (AGT) is a class of urban transportation system in which vehicles are operated under automatic longitudinal and lateral control on exclusive guideways. This paper discusses the performance of automatically steered rubber-tired vehicles on both straight and curved guideway, subject to the conflicting requirements of tracking accuracy and passenger comfort. The optimal performance for operation on straight guideway containing random lateral reference errors is presented. This performance is the best achievable with any controller of the class considered and provides a standard against which simpler suboptimal controllers can be evaluated. A simple proportional controller using a single displacement sensor is shown to produce near-optimum performance for the typical vehicle studied when operated at the design speed. By appropriate location of the position sensor, steady-state errors in curving can be made small for the practical range of curve radii. Curve entry transients are simulated for a curve having no transition spiral and a steady-state lateral acceleration of 0.223 g at 13.4 m/sec. Acceleration and tracking error overshoots are both less than 13.3% for well-chosen gains.

17 190301 DYNAMIC ENTRAINMENT OF AUTOMATED GUIDEWAY TRANSIT VEHICLES. This paper explains the advantages when Automated Guideway Transit (AGT) vehicles are capable of operating both individually and entrained, either in mechanically-coupled trains or functionally-linked platoons. It is demonstrated that dynamic entrainment is a promising way to provide personal rapid transit service at a reasonable capacity level, and the advantages of entrainment for other, less advanced, forms of AGT operating at higher capacity are also shown. The reliability and safety implications of entrained operation are explained, and the operational advantages of dynamic en/entrainment (vehicles entering and leaving trains at cruise speed on the mainline guideway) are discussed. The paper concludes by demonstrating why

entrainment can be useful for promoting rational, timed-staged implementation of new AGT services under general conditions.

17 190971 AIRTRANS URBAN TECHNOLOGY PROGRAM. PHASE I. FINAL DESIGN REPORT. AIRTRANS is an Automated Guideway Transit (AGT) System which provides inter-terminal transit service for passengers at the Dallas/Ft. Worth Airport. The successful deployment of this system has prompted the investigation of the extension of AGT technology into the urban environment to relieve the congestion and pollution caused by increasing auto and bus transit. Phase I of the AIRTRANS Urban Technology Program (AUTP) covers the activities of the Vought Corporation, which tested the system for operation in an urban application. Independent assessments were made to determine what changes would be required, which were: (1) higher operating speeds; (2) better passenger acceptance; (3) reduced capital and operating costs; (4) increased reliability; (5) better all-weather capability; and (6) increased energy efficiency. The AUTP was structured into a two-phase program. Phase I was completed in 1977, and includes the development and demonstration of the subsystem improvements necessary for higher speed operations, while maintaining or improving reliability, availability, cost, and performance characteristics of the overall AIRTRANS system. This consisted of baseline tests with the test vehicle at speeds of 17 and 30 mph using the existing AIRTRANS propulsion, collector, steering, and control and communications systems. After a thorough analysis of the data from these tests, design changes were incorporated and new components were acquired or fabricated. This equipment was installed on the vehicle and guideway testing was again conducted. The overall conclusion reached in Phase I is that the existing AIRTRANS AGT system can be improved to make it a viable transit system for urban deployments. The basic design, with improvements expected from AUTP Phase II will provide for the successful deployment of urban AIRTRANS systems.

17 195532 REPORT OF A CONFERENCE ON ADVANCED TRANSIT AND URBAN REVITALIZATION, INDIANAPOLIS 25TH-28TH APRIL, 1978. This report on the three day conference organised by the U.S. Advanced Transit Association is on the application of advanced transit to U.S. and West German cities, including the UMTA downtown people mover (dpm) programme. "People mover" is described as a compact, automatic public transport system using driverless vehicles which run on their own segregated guideway. A description is given of some 80 formal technical and non-technical papers (including seventeen from West Germany), and reports on informal sessions involving local government, property developers, community groups and public transport operators. The first dpm is expected to be in operation in 1981/2, and several more by 1984. /TRRL/

17 196366 ENGINEERING, OPERATION AND STATE OF DEVELOPMENT OF THE H-BAHN SYSTEM. The H-Bahn is a track-bound rapid transit system arranged in the form of a suspension railway with vehicles of various sizes. By selecting suitable vehicles and the appropriate type of operation this adaptable system can solve the most varied traffic problems. The H-Bahn system can be operated automatically. The instrumentation and control equipment provided for this permits various degrees of automation and modes of operation. In all operating modes, railway safety requirements are maintained.

17 197319 DYNAMIC THEORIES AND EXPERIMENTS OF ALTERNATIVE GUIDEWAY-VEHICLE SYSTEMS, PART II. In both the companion report (Part I) and the present study, the broad purpose is to investigate theoretically and experimentally guideway-vehicle system dynamics. Four alternative systems are studied here in terms of nondimensional parameters. First, critical moment responses are predicted for simple, horizontally curved spans subjected to a variety of transit force distributions and torques. These results are validated with a series of laboratory-scale experiments. Second, measured moment responses are presented for curved, multiple spans with both even and uneven pier spacings and with several types of end constraints, all subjected to tandem vehicle loads. Results show that span dynamic responses may exceed 4 or 5 times those for vehicles at crawl speed. Third, dynamic responses are predicted for several three and six-span cable-stayed guideways subjected to a constant speed, vertical point force. These results are also validated with laboratory experiments. Finally, a statistical response analysis is presented for an AGT vehicle traversing a rigid, statistically rough, banked, curved guideway. With solutions of the covariant propagation equation, those design parameters are identified which strongly affect the lateral rms accelerations and mean suspension system strokes. The results obtained in all of these studies are directly applicable to the design of analogous intraurban and intercity transport systems.

17 197417 GUIDELINES FOR THE DESIGN AND EVALUATION OF HUMAN FACTORS ASPECTS OF AUTOMATED GUIDEWAY TRANSIT SYSTEMS. This document has been compiled to provide guidance in the planning, design, fabrication, and evaluation of human factors aspects of Automated Guideway Transit (AGT) Systems, including Downtown People Mover (DPM) systems. It is based on the present state of knowledge in the areas covered and as such it draws on: (1) past and ongoing research; (2) applicable national and international codes and standards; and (3) current practice in transportation construction, law enforcement, fire safety, and military operations. Design concepts such as passenger safety, security, comfort, and convenience are discussed in relation to various AGT subsystems, including the vehicle, the guideway, the command and control center, and the terminal. Potential interactions between AGT systems and the surrounding community are considered. The guidelines also address such issues as accommodation of elderly and handicapped passengers, design to facilitate emergency evacuation, determination of acceptable levels of ride quality, and the optimal assignment of command and control tasks to humans and machines. The appendix summarizes the major guidelines presented in the text in a convenient checklist format; it is intended for use in the planning and evaluation of existing and proposed

AGT systems. The bibliography provides references for the reader who needs more detailed information than that provided in the guide.

17 197459 AUTOMATED GUIDEWAY TRANSIT TECHNICAL DATA. The intent of this compendium is to provide background data for general, management-level discussions of Automated Guideway Transit (AGT) programs, systems, and other urban transportation modes. Data are presented on general system characteristics, cost, energy, and environmental issues for AGT, rapid rail, light rail, and transit bus systems. In addition, a summary of 19 Downtown People Mover (DPM) proposals is provided. Raw data and assumptions are supplied in an appendix to provide a base for additional study. Data are divided into four main sections: Section 1.0, AGT Overview, provides a perspective of AGT development through review of UMTA AGT programs, vehicles, guideway lane miles installed, and systems in use, proposed, or under construction; Section 2.0, Transportation System Economics, presents data on capital, operating and maintenance costs of various transportation modes (AGT, bus, rail, and light rail); Section 3.0, Energy and Environmental Issues, emphasize energy consumption and energy resource supply and production allocations; Section 4.0, Downtown People Mover Summary, presents data from the proposals of 19 cities selected by UMTA for detailed evaluation in the DPM Project. The information includes city estimates of DPM capital cost, operating and maintenance cost, ridership, and operating hours. Raw data and background information used in calculating the system economic parameters of Section 2.0 and the energy consumption of Section 3.0 are provided in the Appendix.

17 197658 INNOVATION IN PUBLIC TRANSPORTATION: A DIRECTORY OF RESEARCH, DEVELOPMENT AND DEMONSTRATION PROJECTS. The purpose of UMTA's RD&D program is to provide information about a wide spectrum of possible improvements to urban mass transportation systems which communities can use in selecting to best way to deal with their particular transportation requirements. The principle means of providing this information is to publish annually a compilation of reports on the status of UMTA's projects. The report contains the following sections: Bus and paratransit technology; Rail and construction technology; New systems and automation; Automated guideway transit (AGT) applications; Safety and product qualification; Socio-economic research and special projects; Service for special user groups; Fare and pricing policies; Conventional transit service innovations; Paratransit; Transportation planning and management; Policy and program development; and University research and training grant program.

17 197705 INVESTIGATION OF THE DYNAMICS OF A MAGLEV VEHICLE TRAVERSING A FLEXIBLE GUIDEWAY: THEORY AND EXPERIMENT. This report presents the results of a research program conducted jointly by the United States Department of Transportation and the Federal Republic of Germany Ministry for Research and Technology. The object of this program was to study the dynamics of a maglev vehicle traversing a flexible guideway. Work in the U.S. was carried out at MITRE/Metrek in McLean, Virginia; work in the FRG was carried out at Transrapid-EMS in Munich. Two types of experiments were conducted using the full-scale KOMET test track in Manching, Germany. In the first, sinusoidal guideway deviations were deliberately introduced, and the KOMET vehicle was run over these at various speeds up to 324 KM/HR. The second type of test involved removing pier supports from the test track in order to make it more flexible. Theoretical predictions of the dynamic motions from a MITRE computer program are compared to the experimental results.

17 199046 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. VOLUME 3. LONGITUDINAL CONTROL ANALYSIS AND DESIGN, PART A: SLT AND GRT SYSTEMS. Automated Guideway Transit (AGT) systems are a potential means of providing convenient, dependable, cost-effective urban transportation. Prior to deployment, technical obstacles in the areas of network operation, vehicle control, safety, reliability, and maintainability must be resolved. The Urban Mass Transportation Administration (UMTA) has established the Automated Guideway Transit Technology Program to overcome these obstacles. Since the longitudinal control system encompasses most of the essential vehicle subsystems, it

plays a critical role in the guideway operation. The VLCR project addresses those areas where technological improvements at the subsystem level can substantially improve the deployability of AGT systems. This report describes the activities performed in developing single-thread longitudinal control system designs which permit short-headway operation. The study relates to current systems which operate at headways greater than 20 seconds using fixed-block protection as well as systems which operate at headways in the 5-second regime, using moving-block protection. Conclusions and recommendations are included in this report.

Petrino, E ; Otis Elevator Company, Urban Mass Transportation Administration Final Rpt. OTIS/TTD/VLCR-061-1, UMTA-IT-06-0148-79-7, May 1979, 836 p.; See also PB-298767, Part B, RRIS 11 199047; Bulletin 8001.; Contract DOT-UT-70048; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-298766/7ST

17 199047 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. VOLUME 3. LONGITUDINAL CONTROL ANALYSIS AND DESIGN. PART B: PRT SYSTEMS. This report, Volume 3, Part B, documents the analytic design and simulation work performed for the Personal Rapid Transit (PRT) longitudinal control system. The objectives of this study were to develop and evaluate candidate longitudinal control systems for the very-short-headway operation of small transit vehicles. The study included a general view of the state-of-the-art in PRT systems, a detailed evaluation of applicable operating policies for such systems, an evaluation of available control design techniques, and an assessment of key hardware implementation issues. The major conclusion of this study is that PRT systems with time headways as low as 0.5 second appear to be feasible. It was found that conventional operating policies are not appropriate for such systems, but that alternate policies can be defined which assure safe and efficient system operation. One such alternative, the "safe-approach" policy, was developed in the course of the study. The study addresses the "safe-approach" policy develops a controller, and proceeds to analyze and test the controller via simulation. The longitudinal controller operated satisfactorily at a headway of 0.5 second for steady-state, overtake, and other maneuvers, as shown by the extensive simulation results which are included. Appendices are included which derive acceleration profiles, contain simulation source code, evaluate key PRT technology issues, and present and discuss a conceptual control system implementation.

Schumacher, P ; Otis Elevator Company, Urban Mass Transportation Administration Final Rpt. OTIS/TTD/VLCR-061-2, UMTA-IT-06-0148-79-8, May 1979, 178 p.; See also report dated Feb 79, PB-297129, and PB-298766.; Contract DOT-UT-70048; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-298767/5ST

17 199053 STUDY ON HYDROSTATIC DRIVES FOR SMALL AGT VEHICLES. This report presents an analysis of hydrostatic drives applicable as propelling units for Automated Guideway Transit (AGT) small vehicles. The study includes a comprehensive state-of-the-art survey of hydrostatic drive units and the develop-

ment, design, and performance requirements for a 15 HP hydrostatic drive propulsion system for an AGT system. The study included a series of testing on a 15 HP unitized hydrostatic unit to evaluate performance characteristics and acoustic noise. Acoustic noise of hydraulic equipment, especially the hydrostatic drive, has been studied and the findings reported herein. A series of tests were performed on the unitized 15 HP hydrostatic drive to simulate an AGT small vehicle duty cycle using a 20 and 29 GPM hydraulic motor. These tests were conducted on an eddy-current clutch dynamometer, 35 HP capacity, and utilized specially designed and developed processor to produce the simulated duty cycle during the tests. In addition, noise level tests were performed on the unitized hydrostatic drive with the 20 and 29 GPM hydrostatic motor and applied with and without shield constructed as a box to dampen hydrostatic drive noise. Also, a trade-off analysis comparing the hydrostatic drive unit with the AC electric drive motor with eddy-current clutch/-brake and DC electric motors for application as AGT vehicle propulsion system was done.

17 199111 AGT GUIDEWAY AND STATION TECHNOLOGY. VOLUME 7: GUIDEWAY AND STATION CONCEPTS. The objective of the project is to develop guideway, station and weather protection concepts which will reduce the cost and implementation time associated with AGT systems. The purpose of this report is to present concepts for AGT guideways and stations which will minimize overall costs and implementation time. The concepts presented fall into four areas: guideways, stations, power distribution, and contracting methods. The guideway concepts work includes a discussion of various materials and construction techniques and assesses their applicability to AGT. Selected existing AGT guideway designs are examined and modified to reduce costs. Power distribution concepts and costs compare AC and DC power, single versus multi-point incoming service, and basic versus dual-redundant substations. Four baseline station concepts are developed and costed, and sensitivity variations of these concepts are examined. A selected number of the developed guideway and station concepts are evaluated and illustrated through photomontages and models. Fifteen alternative contracting methods for guideways and stations are developed and evaluated.

17 199118 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. VOLUME 4. RELIABILITY ENHANCEMENT ANALYSIS AND DESIGN TEST REPORT. The Vehicle Longitudinal Control and Reliability (VLCR) Program is a part of the Automated

Guideway Transit (AGT) Technology Program that provides for reliability improvement to be considered a separate task. A summary of reliability enhancement techniques is a part of this task; it is intended to provide a comprehensive body of reliability enhancement information applicable to AGT systems. It is also a step in accomplishing the enhancement of the specific control systems that are being considered in the enhancement of the four generic control system designs. This document is the final report of the Reliability Enhancement Studies for the VLCR Project. It contains the results of the literature search, the development of reliability enhancement techniques, AGT component enhancement, the use of redundancy, enhanced AGT design, and a detailed implementation of selected VLC systems. In this report, techniques for enhancement are listed in terms of their applicability of a system's hardware tier level, beginning with those that are applicable to the component level, to the subsystem level, and to the systems level. The documents annotated in Appendix I (Annotated Bibliography of Applicable Reliability Documents) represent only those which have information directly applicable to the VLCR project. The objective of this Reliability Enhancement Task is to develop techniques to enhance the reliability of VLC systems, and it includes an extensive survey of reliability enhancement techniques previously employed by U.S. Government and Industry programs.

Womack, WC ; Otis Elevator Company, Urban Mass Transportation Administration, (UMTA-IT-06-0148) Final Rpt. 17 199119 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. LONGITUDINAL AND LATERAL CONTROL COST AND WEIGHT MODEL. UMTA's Automated Guideway Transit Technology (AGTT) Program is oriented toward the analyses of systems and the development of system elements which may be used in a variety of advanced urban transportation systems. The Vehicle Longitudinal Control and Reliability (VLCR) Project is the part of the AGTT program that focuses on the performance of longitudinal control systems. The project includes a review of the status of existing technology, specification of design goals and requirements, detailed mathematical modeling, analysis and simulation, development and specification of design concepts and their mechanizations, and experimental validation of the designs. This document describes an automated cost and weight model for Vehicle Longitudinal and Lateral Control (VLC) Systems. The model is a life-cycle cost and weight model which focuses on system components which vary with lateral control option. This model is to be used to evaluate the cost and weight of VLC designs for four classes of AGT (GRT) large and small, and Personal Rapid Transit (PRT). The report is organized in three technical sections: (1) Methodology and model description (includes design goals, model structure, basic equations, and a detailed description of the model); (2) Model use

(includes input requirements, output and factor selection; and (3) Model growth potential. Conclusions are provided in the last section with the model code reproduced in the Appendix. The authors state that a usable life-cycle cost and weight model is available for immediate application to AGT nominal designs and control alternatives.

17 199123 A QUANTITATIVE EVALUATION OF SERVICE-DEPENDABILITY MODELING APPROACHES FOR AUTOMATED GUIDEWAY TRANSIT. Automated guideway transit (AGT) systems, which are intended to operate without vehicle and station personnel, are controlled remotely from a central operations area. Such an operational concept has focused the attention of system planners and designers on the impact of equipment malfunctions and the means for adapting system operations to carry on service in the face of a malfunction, while simultaneously removing the cause of the malfunction and restoring normal service. Dependability modeling attempts to develop quantitative relationships that express the effects on passenger service brought about by network configuration, operations policy, equipment malfunction characteristics, and recovery-system design characteristics. The purpose of this study is to provide a quantitative assessment of several different types of models to identify their applicability, data requirements, and computational cost. A case-study approach was used whereby a specific test scenario was defined, and each model to be evaluated was applied to the scenario. Quantitative comparisons require that the models provide estimates of the same set of performance measures and be executed in a similar computer environment. The modeling approaches were modified to meet this requirement, were programmed in the PL/1 language, and were operated as executable load modules on the IBM 360/91 computer to obtain computational cost estimates.

17 199124 LIFE CYCLE COSTS AND APPLICATION ANALYSES FOR NEW SYSTEMS. This paper reflects the view that both the accelerating walkway (AW) and the automated mixed traffic vehicle (AMTV) system can provide service for short urban trips. In this paper, estimated life cycle costs of the two promising feeder and local circulation systems, AW and AMTV, are examined. Cost functions for the AW and the AMTV are described; their sensitivity to some of the design, operating and cost parameters is examined. The two systems are placed in the context of hypothetical applications to identify typical user costs.

17 260227 ANALYSIS OF SATELLITE AIR TERMINAL SYSTEM. A systems approach is used to analyze the satellite air terminal concept for large metropolitan areas. A mathematical model formulates the problem as a fixed charge selection-allocation problem, and computes optimum locations for the satellites in the megalopolis. The analysis also enables comparison among the transportation modes used to transfer passengers between the satellite collection ports and the main airport. A heuristic algorithm is used in conjunction with the model to compute locations for collection ports when a rapid transit network is used to transfer passengers to the main airport. To demonstrate the practical applicability of the models, a satellite air terminal system is "designed" for the San Francisco Bay Area. Depending upon parameters and 1980 traffic forecasts, up to seven satellite airports and four satellite collection ports connected to the San Francisco International Airport by rapid transit link extensions to the Bay Area Rapid Transit System, are found to constitute an optimum system.

Sud, IK (International Bank for Reconstruction and Develop) Gray, P (University of Southern California) *ASCE Journal of Transportation Engineering* Vol. 99 No. TE4, Proc. Paper 10174, Nov. 1973, pp 935-953, 2 Fig., 3 Tab., 22 Ref., Apps.

17 260283 THE BIMODAL SYSTEM. The Bimodal System currently under development is an answer to municipal transportation problems of jammed streets with consequently poor service, coupled with rising costs. The Bimodal System aims at improving comfort in the bus, building up the system for existing vehicle and expressway techniques and designing and building a nonpolluting engine fueled with liquified natural gas. It also plans the construction of private rights-of-way, leading to the possibility of electrifying the vehicles and automating driving functions with a guidance system, which would eventually eliminate the driver altogether over special route sections. /Author/

17 260567 NEW TRANSPORT SYSTEMS-A REVIEW 1970/1971. This summary first defines the elements of the new transport technology. Automatic vehicle control, which fully controls the movements of a vehicle by itself and in relation to others, can be applied to a public transport system of small vehicle units with close spacing. This calls for precise information between the vehicle and control units, and track selection capability. Electrical propulsion systems with a linear induction motor are being re-

searched, and have been applied in fast, inter-regional transport systems. New vehicle support principles include the air-cushion, magnetic cushion, and the opposite of the air cushion, where the lift is achieved by a vacuum. A definition of terms for the new transport technology is given along with a brief description of the types of systems included in the three categories. A manu-system is one where the vehicles are driver-controlled, and includes the omni-car, taxibus, and rapid transit train. An auto-system consists of automatically-controlled, driverless systems, including the moving platform, moving cab-system, autotaxis, and the autobus. Ambi-systems are composed of vehicles that can be operated both manually and automatically, such as the ambicar and ambibus. Only recently have countries been investing funds in the research of new transport systems, rather than on solving existing problems. Town planning can be affected by the new systems, which may allow greater freedom than the traditional star-shaped structure created by old public transport systems. Costs of these new systems cannot yet be accurately estimated. [Swedish]

17 262589 USE OF STATE OBSERVERS IN THE OPTIMAL FEEDBACK CONTROL OF AUTOMATED TRANSIT VEHICLES. The theory of optimal control and the theory of observers is applied to the design of feedback systems for longitudinal control of vehicles in automated, high-capacity transit systems. The resulting controllers require only measurement of position and velocity errors and excellent dynamic response is achieved for mainline operation, for merging and demerging from stations, for maneuvering at intersections, and for emergency stopping.

17 262964 WHAT ABOUT WITKAR?. THIS NOTE DESCRIBES THE WITKAR, WHICH IS A SMALL SELF-DRIVE ELECTRIC TAXI RECENTLY INTRODUCED INTO AMSTERDAM. THE CARS ARE POWERED BY A 2000 WATT, 24V ELECTRIC MOTOR RUNNING OFF A QUICK-CHARGING 55AH NICKEL-CADMIUM BATTERY. AN OVERHEAD CURRENT RAIL RECHARGES THE CARS WHEN THEY ARE PARKED AT A STATION. THE SYSTEM IS OPERATED BY INSERTING A MEMBERSHIP CARD IN A COMPUTER TERMINAL AT ANY STATION AND DIALING THE INTENDED DESTINATION. AFTER THE MEMBERS' RECORDS HAVE BEEN CHECKED, THE CAR IS BOOKED OUT AT A COST OF LESS THAN \$1/HOUR. A NETWORK OF STATIONS CONNECTED BY TELEPHONE TO A CENTRAL COMPUTERIZED CONTROL IS ENVISAGED. 35 CARS AND 5 STATIONS ARE AVAILABLE NOW BUT 125 CARS AND 15 STATIONS ARE

PLANNED. INSUFFICIENT RECHARGING TIME HAS LED TO SOME CARS STALLING. /TRRL/

17 264348 MORGANTOWN DEMONSTRATION RAISES DOUBTS ON FUTURE PRTS. UMTA's personalized rapid transit project in Morgantown, West Virginia, has been temporarily shut down due to higher than expected operating costs. Administration officials, however, are not disillusioned with PRT projects in themselves, only with the Morgantown demonstration project, which presented peculiar difficulties. The university is separated into two campuses on opposite sides of the city, so the PRT was designed to facilitate rapid transit between the two. The engineering problems involved in the construction of this particular guideway will not be encountered at other sites where the PRT system is proposed. Although the increased costs have forced UMTA to drop the project for awhile, there are plans to seek a federal grant in order to expand the system.

17 264594 THE PREDICTION OF SHRINKAGE FOR AUSTRALIAN CONCRETE. Shrinkage data for Australian concretes from all States is compared with shrinkage predictions from four codes. It is concluded that no very accurate prediction of shrinkage is possible and that predictions that include the effect of mix proportions are markedly worse than those that do not. In cases where a reasonably precise prediction of shrinkage is required it is necessary to carry out tests using the actual materials and mix proportions which will be used on the job. For other cases, a method of prediction is proposed which is believed to be the most precise possible at the present time. /Author/

17 264694 NEW TRANSIT TECHNOLOGIES: AN OBJECTIVE ANALYSIS IS OVERDUE. New urban transit systems incorporating inefficient and obsolete technical features are being promoted, discussed and funded. Typically they involve automatic operation with rubber tire guidance and very frequent headways. Rail systems which are clearly superior are concurrently ignored. The authors urge transit planners, operators and equipment manufacturers to exploit the great potential of rail technology rather than pursuing innovation for its own sake. The viable, proven concept of rail technology is neglected because of acceptance of irrational claims that "rail is obsolete" by those unaware of modern rail technology. Appropriate research and development for rail systems should include full automation for LRT, smaller rail vehicles, reduction of cost of construction and operation, and reduction of vehicle weight with consequent lower energy consumption and noise.

17 265105 DYNAMIC STABILITY AND STRESS ANALYSIS OF ALTERNATIVE GUIDEWAYS FOR LEVITATION VEHICLES. Responses are predicted for several kinds of guideways subjected to the constant, transit pressures of levitation-type vehicles. The studies include: Stresses in subterranean tunnel liners with alternative vehicle support structures; comparative dynamic efficiencies of simple and two-span elevated guideways with several distributions of transit loads; dynamics of multiple, flexible post and rigid panel guidance walls; dynamics of segmented (open-jointed) guidance plates and of continuous plate strips with arbitrary foundation restraints; responses to transit moments of plate-type levitation surfaces on elastic foundations; and applications of these dynamic theories in determining stresses for alternative at-grade guideways of current importance.

Wilson, JF ; Duke University Dec. 1973, 322 pp; Contract DOT-FR-30029; ACKNOWLEDGMENT: NTIS (PB-233643/6); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233643/6

17 265264 LINEARIZED MODELS, STABILITY CRITERIA AND EXPERIMENTAL VERIFICATION FOR PLENUM AIR CUSHIONS WITH COMPRESSOR-DUCT INTERACTIONS. An analytical and experimental investigation of the static and dynamic behavior of nearly full scale plenum-type air cushion suspensions is described, including the effects of compressor-duct dynamics and secondary suspension characteristics. The results indicate that cushion-duct interactions may strongly affect cushion stability unless the lowest resonant frequency of the duct is much higher than the cushion unsprung mass natural frequency. Criteria are suggested for selecting appropriate duct models for use in suspension dynamic analysis. For most practical systems a second- or at most fourth-order duct model will adequately represent the distributed duct dynamics. The report is the latest in a series of investigations whose goal is experimentally verified models, advanced concepts and design criteria for pressurized air cushions which will permit safe and comfortable operation of high speed tracked levitated vehicles over economically feasible guideways.

17 265478 HOUSTON AIRPORT'S LOW COST PEOPLE-MOVER. A description is given of the new automatic, electric powered transportation system linking the two airport terminals and hotel. It replaces a first generation, battery powered system which has been in opera-

tion since the airport was completed in 1969. Six trains, 36 passengers each, operate continuously on a 6,000-ft (1.830-m) loop, providing service at each of eight stations every 3 min. Cost, including new station gate sets and graphics, was less than \$1,000,000. Overall airport traffic circulation, including the role of the train system, is considered. A description is made of major components; vehicles, suspension, guidance, propulsion, braking, switching, station gates, power distribution, and controls. Figures are presented to illustrate the text.

17 267023 LOW SENSITIVITY DESIGN OF OPTIMAL FEEDBACK SYSTEMS FOR LONGITUDINAL CONTROL OF AUTOMATED TRANSIT VEHICLES. Many new urban transportation systems involve the use of automatically controlled vehicles. Some new systems, such as Personal Rapid Transit (PRT) and Dual Mode, are characterized by small automated transit vehicles traveling on exclusive guideways. The number of passengers per vehicle is small and short headways are necessary for high capacity. This requires a versatile, efficient and safe control system which maintains proper spacing between vehicles on guideways without causing passenger discomfort. The longitudinal control system is an essential part of the overall control system for automated transit vehicles. It must be capable of closely following the acceleration-deceleration profiles as commanded by wayside computers during merging, maneuvering to avoid conflicts at intersections, pushing a failing vehicle or stopping for an emergency. This report was devoted to the design of such a longitudinal control system by using modern control technology. A detailed mathematical model of the longitudinal motion of automated transit vehicles in an external-reference system is presented. The model is nondimensional so that results are applicable to a variety of systems. From the results of the study, it appears to the author that optimal control theory can be usefully applied to the design of a longitudinal control system for automated transit vehicles. A bibliography is included and appendices include "Flow Charts of Computer Programs" and "Derivation of Steady-State Behavior of the Observer."

17 301573 FUNDAMENTALS OF PERSONAL RAPID TRANSIT. This book summarizes the work on Personal Rapid Transit (PRT) carried out at the Aerospace Corporation from 1968 to 1976. It is intended as a reference for experts and a text for students of transportation engineering. Emphasis is on describing concepts rather than engineering details. PRT is an automated taxicab system, a public transit system of 3- to 6-passenger vehicles operating automatically on a network exclusive guideways separate from street and pedestrian traffic. The book reports on both theoretical studies about economics, networks, traffic management, vehicle propulsion and control and also on experiments testing concepts of propulsion and control.

17 301601 DEVELOPMENT OF EFFICIENT CENTRAL MANAGEMENT STRATEGIES FOR ADVANCED GROUP RAPID TRANSIT SYSTEMS. This paper presents a summary of a computer-aided method for developing efficient central management system strategies for advanced group rapid transit systems by use of medium-sized, automatically controlled vehicles that travel on dedicated guideways. Some efficient central management system strategies developed for a test network that uses the method are presented and discussed in detail. The method consists of an iterative process in which experienced transit system operators make complex,

judgmental decisions and a computer performs extensive and repetitive computations. This computer-aided method allows transit system operators to compare the consequences of various central management system strategies in terms of such measures as passenger wait times, number of passenger intermediate stops, vehicle fleet size, vehicle load factor, and vehicle flows in various guideway sections and at various passenger stations. After studying such measures, operators can develop a set of efficient and realistic central management system strategies. The computer-aided method and the associated computer simulation program are general in nature and can be used to develop central management system strategies for a variety of network configurations and trip demand data. /Author/

17 303201 SIMULATION OF A HIGH PERFORMANCE PRT CONTROL SYSTEM. In connection with the second phase of the Advanced Group Rapid Transit (AGRT) project, the design of a control system for a high-performance (3-second headway) Personal Rapid Transit (PRT) system has been refined. The control system utilizes a variable length moving block control algorithm, and features a combination of multiple wayside and vehicle-borne computers that are connected by a wide bandwidth data link to achieve the desired performance. In this phase of the project, a major effort was directed toward developing a highly detailed simulation of the entire control system. This simulation was undertaken to verify that the deployed system would meet previously defined performance specifications. This paper discusses the implementation of the simulation and describes its use in verifying system operation at both macroscopic and microscopic levels. Examples of microscopic operations studied include effects of communication delays and errors on system operation and scheduling of different processes on the same computer. Examples of macroscopic operations studied include the operation of several vehicles merging at a junction, the response of several vehicles in a string during normal station stopping maneuvers, and responses to various failures that require emergency action.

17 303203 MAG-TRANSIT--DEVELOPMENT AT BOEING. Mag transit is a combination of magnetic levitation and propulsion for people mover applications. Linear electric motors are used for levitation, propulsion, braking, guidance and suspension. Since there are a minimum of moving parts there is a potential for a substantial increase in system reliability and availability as compared to conventional systems. Modern solid state technology provides the capability to condition sufficient quantities of electrical energy to control motor excitation, and thereby levitation, within a closed loop servo system. Real time measurements of air gaps and vehicle accelerations are used to compute the desired levitation force. In addition the solid state electronics provides the ability to independently control the speed of the vehicle by a continuously variable excitation frequency to the motors.

17 303206 MORGANTOWN PEOPLE MOVER SERVICE AVAILABILITY AND O&M COSTS --HISTORY AND PROJECTIONS. The Morgantown People Mover System (MPM) was operated in public service from October 1975 to July 1978. Its fleet of fully automated 21 passenger cars has moved 4.5 million passengers without a single system related passenger injury. A fleet mileage of 1.66 million miles was accumulated during the 33 month Phase IB operational period. The system is now undergoing a substantial expansion and will emerge in July 1979 as the Morgantown People Mover Phase II. The purpose of this paper is to report on two aspects of the MPM System that have not received much attention in the technical literature, system reliability and operating costs. This paper summarizes system reliability in the form of operational availability and operating and maintenance costs for the Phase IB time period

and projections of these performance measures for Phase II.

17 304630 PRT (PERSONAL RAPID TRANSIT) IMPACT STUDY. THE PHASE 1 PRT IMPACT ON MORGANTOWN TRAVEL TRAFFIC AND ASSOCIATED ACTIVITIES. A new and revolutionary public transportation system, the Morgantown Personal Rapid Transit (PRT) System began regular passenger service operation in Morgantown, West Virginia, in October 1975. This is a study of the impact of Phase I Morgantown PRT, the first fully automated transportation system operational in a city environment. The study was designed to record the effect of the system operation on traffic and associated activities in the areas adjacent to the PRT. The intent of the study was to provide information useful to other areas contemplating the Automated Guideway Transit (AGT) type installations. The PRT system served approximately 38% of the Morgantown residents. During the course of the study, it was concluded that the system was a major force in influencing travel habits, and that residents of the service area used autos for their trips less often than they did prior to the PRT. Compared to the bus system, which it replaced, the PRT is carrying more than the bus's previous share of the total trips.

17 304631 PRT (PERSONAL RAPID TRANSIT) IMPACT STUDY. OPERATIONAL PHASE. VOLUME I: TRAVEL ANALYSIS. To study the impact of the Personal Rapid Transit (PRT) on Morgantown, a substantial amount of data was collected in an attempt to capture the state of transportation related conditions before and after passenger service. This report contains an analysis of the latter set of data; namely, that collected in the spring of 1977. The data described in this report, together with those reported in the Pre-PRT Phase, allows assessment of the PRT system impacts on the city of Morgantown. The completed assessment provides other cities considering implementation of AGT systems, sufficiently detailed information to determine whether they can effectively and efficiently utilize a Morgantown type PRT system to satisfy their transportation needs.

17 304635 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. A REVIEW OF ENTRAINMENT TECHNOLOGY. This report documents the results of a survey of entrainment technology conducted for the VLCR project. The technology review was conducted to evaluate the state-of-the-art in train formation and to identify those areas requiring special attention for Automated Guideway Transit (AGT) systems. The information which is sum-

marized herein was derived through: (1) a literature search and review; (2) discussions with coupler manufacturers; (3) a questionnaire to rapid transit operators; and (4) a study of transit authority coupler specifications. The methods and the results obtained within each of these activities are described within the report. The literature search involved both manual and computerized search techniques. The most applicable documents are listed in the Appendix: "Annotated Bibliography". The discussions with coupler manufacturers allowed the formation of a list of existing coupling equipment applicable to systems and the assessment of potential difficulties in the adaptation of coupling equipment to AGT vehicles. Areas probably requiring significant further development were also identified. A questionnaire dealing with automatic coupling equipment and techniques was then prepared and transmitted to seven transit system operators. Through automatic entrainment and extrainment (or train separation) of individual vehicles, it is hoped that the operational efficiency of AGT systems may be improved. The report concludes, in part, that due to the lack of information in the area of automatic vehicle longitudinal control, the formulation of appropriate concepts in this area will require more original and basic work. The report presents a number of preliminary conclusions.

17 304636 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. A REVIEW OF AGT PROPULSION, POWER CONDITIONING, BRAKING AND POWER DISTRIBUTION TECHNOLOGY. The report assesses the current state of the art of each technology. The review was performed to obtain top level information that can be used by system designers, specification writers, and regional planners as baseline considerations. The main sections of this report are: Section 2 discusses propulsion motor technology. It concludes information on both dc and ac motors; Section 3 discusses power conditioning options for converting guideway power to a suitable form for the motor being used; Section 4 presents the findings on electrical and mechanical braking; and Section 5 sets forth some power distribution and collection considerations.

17 304646 OPERATION OF AUTOMATED GUIDEWAY TRANSIT VEHICLES IN DYNAMICALLY RECONFIGURED TRAINS AND PLATOONS (EXTENDED SUMMARY). This project grew out of a conviction that an automated guideway transit (AGT) system had the flexibility of operating either with individual vehicles or with functional multi-vehicle trains, with the capability of forming (entraining) and splitting (extraining) trains during trips.

could offer significant advantages over either single vehicles or fixed train systems for some urban applications. The study serves as a broad-based preliminary evaluation of the potential advantages and disadvantages of entrained AGT. It includes an investigation of the applications for which entrained AGT is well suited, and an assessment of how much capacity improvement it can offer. The study shows that passenger capacity of AGT systems may be increased by operating vehicles in dynamically-reconfigured trains or platoons. It is estimated that a minimum lane capacity of 5,000 to 10,000 passengers per hour is needed to make single-party AGT economically competitive with buses and that this capacity requires the use of trains. The longitudinal control systems needed to effect dynamic en/extraintment with platoon operations at spacings of 30-60 cm are developed herein with particular attention to stability, jerk limiting requirements, safety and passenger comfort. The capacity advantage of entraining is demonstrated for a single guideway link and for merge junctions, using Monte Carlo simulation. Variable-slot-length point-follower control is shown to reduce merge delays and maneuver ramp lengths compared with fixed-slot methods. The "zero gap" merge scheme developed produces dramatic improvement compared with conventional merge strategies.

Shladover, SE ; Massachusetts Institute of Technology, Urban Mass Transportation Administration, (UMTA-MA-11-0029) Final Rpt. UMTA-MA-06-0085-79-1, Apr. 1979, 112 p.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-300513/9ST

17 304683 PROCEEDINGS OF THE UMTA R AND D PRIORITIES CONFERENCE (3RD) HELD AT CAMBRIDGE, MA., ON NOVEMBER 16-17, 1978. VOLUME III: AGT AND ADVANCED SYSTEMS WORKSHOPS. The document is a compilation of material that was presented at the Third UMTA R&D Priorities Conference Workshops on AGT and Advanced Systems. Part I of this report deals with AGT socio-economic research and AGT applications and includes discussions of the AGT Socio-Economic Research Program, the Morgantown and Airtrans People Movers, and the Downtown People Mover (DPM) Program. Part II-AGT and Advanced Systems and Technologies-contains discussions of the AGT R&D Program, the Advanced Group Rapid Transit (AGRT) Program, and the Automated Guideway Transit Technology (AGTT) program. This volume contains seven resource papers which can be found summarized in Volume I of this report along with summaries of other workshop sessions. Volume I also includes the proceedings of the general sessions and a listing of conference participants.

17 304723 DEVELOPMENT OF RESEARCH IN THE CONSTRUCTION OF TRANSPORTATION FACILITIES: A STUDY OF NEEDS, OBJECTIVES, RESOURCES, AND MECHANISMS FOR IMPLEMENTATION. This second-year report concentrates on two topics related to the subject matter of the study. One concerns the implementation of research results and innovative techniques. Incentives and obstacles to such implementation are identified. Proposals for more rapid and effective application of research results are made. Increased utilization of demonstration projects, bid alternates, turnkey contracts, and follow-up measures are discussed. A special study of measures by the Japanese construction industry to achieve cost reduction through innovation is included. The second topic concerns problems created by early planning, design, and organizational decisions. Experience originating in current or recent projects such as BART, WMATA, and MARTA is examined to identify such problems that have serious impact both on costs and the environment desirable for innovative efforts. This second-year report concludes with a number of recommendations that the researchers believe could be beneficial in achieving needed improvements in both topic areas.

17 305554 NETWORK ANALYSES OF ADVANCED GROUP RAPID TRANSIT SYSTEMS. The Advanced Group Rapid Transit (AGRT) system concept, currently under development by the Urban Mass Transportation Administration (UMTA), is characterized by moderate capacity (12 passenger), computer-controlled vehicles operating at headways as low as 3 seconds over a dedicated network of guideways with off-line stations. This report covers work conducted under the heading of network analyses for UMTA. The purpose of this work is to provide assessments of AGRT in various urban applications. AGRT is being designed and developed as a system capable of deployment in urban applications ranging from circulation systems to urban regional transportation systems. This report analyzes the operational and performance characteristics of AGRT for moderate-to-large network configurations. Three AGRT network scenarios, ranging in extent from 26 to 187 lane miles of guideway were evaluated. The evaluation of each scenario was performed by a computer network assessment model and includes studies of operating policy parameters, system capacity, life-cycle costs, and service dependability. The flow of vehicles, passenger service, system costs, and energy utilization characteristics of AGRT were computed and presented for each scenario.

17 305570 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. A REVIEW OF AGT (AUTOMATED GUIDEWAY TRANSIT) CONTROL AND MEASUREMENT SYSTEM TECHNOLOGY. VOLUME 2, PART A [Final rept.] The report discusses theoretical and implemented longitudinal control concepts as they apply to four categories of AGT vehicles: shuttle-loop transit, large and small group rapid transit, and personal rapid transit vehicles. This report is organized into two sections. Section 2 describes the theoretical aspects of longitudinal control and briefly describes the longitudinal systems for five state of the art AGT systems. The theoretical control review includes vehicle follower, point follower and fixed block systems along with the control of merging vehicles. Section 3 reviews the options available for measuring vehicle states. The measurement technology review includes sensors for measuring vehicle velocity, position and separation between vehicles. Appendix A of this report provides a classification matrix for ten operational AGT systems.

17 305803 OPERATIONAL CONCEPTS AND IMPLEMENTATION TECHNIQUES FOR VEHICLE-FOLLOWER CONTROL OF AGT SYSTEMS. This report presents a new baseline approach for the vehicle-follower for the longitudinal control of Automated Guideway Transit (AGT) vehicles. It is shown that for the short headways (0.5 to 3.0 s) contemplated for such systems, a kinematic constraint on the spacing between vehicles exists during speed transit maneuvers. This constraint is a nonlinear function of the service jerk and acceleration limits imposed on vehicle operation and also on the instantaneous values of the state variables of neighboring vehicles. The constraint is explicitly included in an analytical development of the control law, which is then shown to control satisfactorily vehicles during overtaking maneuvers and merging maneuvers up to full line capacity, and to regulate perturbations about nominal operating conditions. Modification of the kinematic constraint is then shown to generalize the approach to the problem of vehicle egress from an off-line station into main line traffic flow, including gap generation. Minimum required station egresslane lengths are then established as a function of headway. The station egress control is shown to be safe and effective even in the event of off-nominal behavior of vehicles in the main line traffic flow. Finally, the implementation requirements for the control are shown to be best satisfied by a "smart" vehicle control configuration, with state variables for vehicle spacing, velocity, and acceleration transmitted through wayside equipment at intervals of approximately one-fifth operational headway. Other headway-dependent factors determined in the implementation analysis are the permissible time delay for data transmission, the required on-board computation rate, and required levels of digital quantization. Results indicate that the control is compatible with existing microprocessor technology.

17 305812 MORGANTOWN PEOPLE MOVER (MPM) OPERATING, AVAILABILITY, AND MAINTENANCE HISTORY, OCTOBER 1976 THROUGH JUNE 1978. The report covers the period of operation, dependability, and maintenance history of the Morgantown system (now known as the Morgantown People Mover-MPM) from October 1976 through June 1978. System performance in general improved greatly during this period. System availability on an annual basis rose from .880 for the year 1975-76 to .977 for the year 1977-78. Single vehicle reliability, as expressed in terms of mean time between downtime events, rose from approximately 85 hours at the end of the first year to approximately 150 hours at the end of the second year. The graphs in the report show that performance varied from month to month, but the trend was upward. Sixty-nine component failure types or other causes accounted for all the downtime recorded during the last year. About 61 percent of all the downtime events were due to only 17 causes. The other 39 percent were spread over 53 causes. A complete computer printout of the entire Morgantown data base is found in the Appendix of the report.

Watt, CW ; Transportation Systems Center, Urban Mass Transportation Administration, (UMTA-MA-06-0081) Final Rpt. DOT-TSC-UMTA-79-45, UMTA-MA-06-0081-79-2, Oct. 1979, 100 p.; See also report dated Jan 77, PB-266 994.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-121460

17 305865 ASSESSMENT OF THE BUSCH GARDENS AUTOMATED ANHEUSER-BUSCH SHUTTLE SYSTEM. This report describes an independent assessment of the operation of the shuttle system at the Busch Gardens theme park in Williamsburg, which has been in operation since 1975, and is part of the ride system in the park. The system connects two stations, the Garden Station at the theme park, and the Hospitality Center at the brewery. It is a single lane loop with one two-car train which stops on-line at each station, and is capable of operating in either the clockwise or counterclockwise direction. The information and data presented in this report were collected through surveys of literature, site visits, a visit to the manufacturer, and interviews with site and manufacturer's personnel. The report presents a description of the technical subsystems, as well as a review of performance, reliability, and maintainability. Where important, the review of technical subsystems includes applicability and modifications and/or improvements for application in an urban environment.

17 305866 ASSESSMENT OF THE MUELLER AEROBUS SYSTEM: THE SYSTEM INSTALLED AND OPERATED FOR THE BUNDESGARTENSCHAU 1975, MANNHEIM, GERMANY. This report describes the results of an assessment of the Mueller Aerobus System as it was installed and operated for the Bundesgartenschau 1975 (Federal Garden Show 1975) in Mannheim, Germany. This was the first application of this new transportation system which is based on cableway technology. It provided dual direction, scheduled passenger service between two distant points of the Garden Show, from April 18, 1975 to October 19, 1975. The report provides factual engineering information concerning the technical subsystems. System operational performance, system assurance, human interface, and safety and security were assessed. An evaluation of the distribution of capital and operating and maintenance costs, unit costs of service, and equivalent costs is presented. System development and implementation history are also summarized. Information and data for this study were collected from site visits, visits to the developer/manufacturer, interviews with representatives of the operator and system developer and other literature.

17 305892 ROOSEVELT ISLAND TRAMWAY SYSTEM ASSESSMENT [Final rept. Mar 77-Mar 78]. The Roosevelt Island Tramway serves as an urban transit system in New York City. The system is based on conventional cable technology and connects a new urban community on Roosevelt Island in the East River to Manhattan. This system is the first urban transit application based on aerial tramway (cableway) technology and has been in service since May 1976. The goals and objectives of this assessment were to provide information with regard to: (1) factual engineering and operating data concerning the technology which can be used in the planning and implementation of similar cable systems; (2) descriptive information on system performance, economics and ergonomics, which can be used in planning for the assessment of the feasibility of subsequent system installations; and (3) design, development, and implementation experience with cable technology, to determine what has been learned and how future urban installations can most effectively be carried out. The report findings are based on literature searches, Roosevelt Island Tramway documentation, analyses of system records and logs, and observations and interviews during site visits. The report provides factual engineering information concerning the technical subsystems. System operational performance, system assurance, human interface, safety and security were assessed; an evaluation of the distribution of capital and operating maintenance costs is presented; and system development and implementation history are summarized.

17 305920 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. VOLUME 8: VLCR DATA BASE. This document provides a catalog of the data base material gathered and classified as part of the Vehicle Longitudinal Control and Reliability (VLCR) Project. The purpose of this effort is to assemble a comprehensive national data base which will help designers or developers, urban planners, program managers, and government officials evaluate and select automated guideway transit (AGT) systems. The VLCR data base incorporates the results of the VLCR Project, that is, final contractual deliverables, illustrated descriptions of domestic and foreign AGT systems, as well as reports describing the procedures and results of the VLCR experimental program. In addition, the data base encompasses a large number of other technical documents dealing with vehicle longitudinal control, command, control, and communication systems, propulsion, braking, reliability, and other related subjects. The basic organization of the VLCR data base catalog consists of two sections: (1) an annotated bibliography, and (2) a subject index. The annotated bibliography offers an alphabetical, sequentially numbered listing of all the documents contained in the data base. It gives complete bibliographical information of these documents so that they can be obtained with reasonable ease through any library service. The subject index is not a dictionary nor a thesaurus. It is an alphabetical compilation of the main concepts used in the base documents. It includes all the keywords listed in the annotated bibliography, as well as entries, subentries, and cross-references.

17 307704 CAB SIZE AND OPERATION OF NEW PUBLIC TRANSPORT SYSTEMS [Kabinengroesse und Betriebsablauf Neuer Nahverkehrssysteme]. The thesis considers 58 methods of transport with a view to their possible application in passenger public transport systems. The objective of the study was to research the influence of cab size in a new type of passenger public transport system on the characteristics of its operation. It transpired that the possible introduction of the small cab which allows a completely individual method of operation on demand cannot be introduced because of economic considerations. Instead the group containing the large cabs took precedence. /TRRL/ [German]

17 307722 IMPORTANT INCREASES IN PUBLIC PASSENGER TRANSPORT THROUGH THE USE OF NOVEL PUBLIC TRANSPORT SYSTEMS? [Erhebliche Zunahmen im Öffentlichen Personennahverkehr Durch Einsatz Neuartiger Nahverkehrssysteme?]. In the future allowance must be made for an increasing individual use of vehicular transport, which must be contrasted with a declining or at best stagnant demand for conventional public transport systems in many areas. By the introduction of novel public transport systems it should be possible to increase the number of passengers using public transport and at the same time achieve a more efficient use of the road network. Despite the many difficulties in predicting the public acceptability of novel modes of transport, it should be possible through further development of existing modal-split models in conjunction with special enquiries to estimate the future demand for various modes of transport taking into account the effect of introducing new public transport systems. [German]

17 308148 INNOVATION IN PUBLIC TRANSPORTATION. This annual directory contains descriptions of current research, development and demonstration projects sponsored and funded by the U.S. Department of Transportation's Urban Mass Transportation Administration (UMTA) in the fiscal year 1978. The projects are grouped into four sections. Section one on technology development and deployment, lists projects on bus and paratransit vehicle and operational technology, rail and construction technology, new systems and automation, automated guideway transit applications, safety and product qualification and socio-economic research and special projects. Section two on service and methods demonstrations includes projects on transportation services for special user groups, fare and pricing policies, conventional transit service innovations, and paratransit. The section (3) on transportation planning and management focuses on projects relating to planning methods and support, special planning studies, and transportation management. The last section (4) is on policy development and research. This section includes policy and program development projects and university and training grant program projects. The funding for major program areas is tabulated, and funding and other important information about UMTA projects are summarized in charts. Dates are listed to indicate when the project was approved and the expected completion. Other federal agencies which support and complement UMTA are also listed. Information for potential contractors and grantees on participation in UMTA R&D programs, the submission of proposals, proposal evaluation and university research grants are covered in an appendix.

17 309353 NEW TYPES OF TRANSPORTATION [Neuartige Verkehrssysteme]. The Environmental Conference 78, was concerned with the form of novel public transport that would best combat the trend towards private transport. This transport system must provide such advantages as short journey time, widespread availability, comfort, competitive cost and minimum adverse environmental effects. In addition to cabin-type vehicles, the dual-mode system and the demand-controlled bus, the magnetic suspension system (as opposed to rail bound systems) and the linear motor are the major innovations; the advantages and disadvantages of these are discussed in the light of the requirements listed above. It is pointed out that on the one hand in view of the increasingly restricted state funds available for investment-it is hardly possible to envisage the widespread introduction of a new transport system, and on the other hand that the beneficial effects of the new systems on the environment remain in question; so that in parallel with the research into new transport systems there will be a considerable stimulus to the further development of conventional public transport systems. (TRRL) [German]

17 309902 ECONOMICS OF ELECTRIC BUSWAYS. Busways have been proposed as alternatives to rail rapid transit in many cities. Diesel buses have always been assumed but electric vehicles, drawing power from wayside, live conductor rails are technically possible. Busways would be completely grade separated, eliminating any danger to pedestrian traffic in this arrangement. Using trolleybus cost data it is shown that electric busways could be competitive with diesel operated busways for peak hour volumes exceeding about 5,000 passengers per hour. It is argued that improving the comfort characteristics of buses for busway service, by eliminating steps and increasing vehicle width and seat pitch is an important first priority if the busway concept is to be successfully demonstrated in Australian cities (a). The number of the covering abstract of the conference is IRRD no. 239554.

17 309915 DEVELOPMENTS FOR MEDIUM-CAPACITY URBAN PUBLIC TRANSPORT. This paper has been written so as to be of wide interest and to summarise current situations, and is therefore not highly technical, although the subject of the currently evolving systems towards which the discussions lead provides considerable scope for high technology. The paper starts by briefly setting out the assumptions as to the longer-term requirements, basically electric propulsion and automation. Rail rapid transit is discarded because it is a high-capacity system and personal rapid transit because it is too futuristic. This leaves, for serious discussion in the context of the title, various existing systems and their

development as a background to the principal subject of the review, i.e. automated guided transit. Sources of energy are referred to briefly and some tentative conclusions are drawn from informed sources as to the likely fields for battery-powered vehicles, synthetic-fuel internal-combustion engine, mechanical storage of energy and hybrid vehicles. If electric vehicles using a wired supply are assumed, it is now necessary to consider automation, and this is discussed briefly in relation to trolleybuses, trams, light-rail systems and fully automated systems such as l.g.t. and personal rapid transit. Various mechanical and electrical concepts available for l.g.t. systems are enumerated and tabulations made of more than 30 systems currently under development. This leads to a broad picture of the development status and of preferences for different concepts as regards such features as support systems, vehicle guidance, type of drive and control. The advantages and disadvantages of some of these variants are discussed, e.g. wheels/air-cushion/magnetic-levitation, different forms of vehicle switching and different methods of headway control. Electrical power systems are discussed, a.c. and d.c. and different types of motor and of power control. Mechanical features and train-control systems are discussed in general terms with reference to safety and system capacity. Capital cost of l.g.t. as compared with l.r.t. and r.r.t. from various sources are compared and discussed. The likely trends of development, as suggested by the considerations set down in the paper, are finally summarised.(a)

17 310762 PROCEEDINGS OF THE THIRD UMTA R&D PRIORITIES CONFERENCE, CAMBRIDGE, MASSACHUSETTS, NOVEMBER 1978. VOLUME I: PROCEEDINGS OF GENERAL SESSIONS AND SUMMARIZED REPORTS OF WORKSHOPS. This is a compilation of material that was presented at the Third Urban Mass Transportation Administration Research and Development Priorities Conference. It contains proceedings of the General Sessions and Summarized reports of the eight workshop sessions as well as a listing of conference participants. Detailed proceedings of the workshop sessions may be found in Volumes II through IX (Reports No. UMTA-DC-06-0157-79-2 through UMTA-DC-06-0157-79-9), which consist of eight separately titled volumes, namely: Volume II, Bus and Paratransit Technology Workshops; Volume III, AFT and Advanced Systems Workshops; Volume IV, Service and Methods Demonstrations Workshops; Volume V, UMTA Special Technology Programs Workshop; Volume VI, Rail and Construction Technology Workshops; Volume VII, Transit Management Workshops; Volume VIII, Access for Elderly and Handicapped Persons Workshops; and Volume XIX, Urban Transportation Planning Workshop. All volumes are available through the National Technical Information Service and a listing of them with their Government accession numbers and costs is included as Appendix B to this volume. (UMTA)

17 311442 THE "TRANS UNION S 21" ELEVATED MONORAIL [El mono-rail elevado apoyado "Trans Union S 21"]. On an experimental circuit, an elevated monorail is being constructed for urban transport, with self-driven vehicles and pneumatic tyres both for traction and for control, on a rolling track of prestressed concrete, consisting of a single beam-rail in the form of an inverted "U". Amongst the advantages of this system are: (1) sufficient width of route to guarantee stability; (2) lowering of centres of gravity and of lateral wind force to approximately the plane of guidance or control, so that the capsizing moments produced by the horizontal forces are reduced to a minimum; (3) minimum height of the vehicle-beam system, at least of the surface presented to lateral wind force and forces on the supporting columns; (4) for the special case of rapid acceleration and jumping of ramps, the unit possesses a force of adherence which is independent of its own weight, with lateral traction; (5) its construction and maintenance are economical; (6) it has a large transport capacity; (7) speed of construction; (8) adaptability to very diverse conditions and minimum requirement of plan area; (9) total safety, the train is incapable of being de-railed. 17 312089 URBAN SERVICE AND ENVIRONMENTAL STRESSOR: THE IMPACT OF THE BAY AREA RAPID TRANSIT SYSTEM (BART) ON RESIDENTIAL MOBILITY. We examine the impact of a relatively new mass transit line on residential mobility, utilizing a survey of respondents living adjacent to the Bay Area Rapid Transit (BART). The hypothesis is that as perceived costs (e.g. Noise) of the system increase, preferences for outward mobility will increase, while as local benefits increase (e.g. Accessibility to the system), preferences for inward mobility will increase. Preferences for outward mobility per se were unrelated to BART's local attributes. However, BART-related reasons for moving varied as predicted. Residents near aerial trackways, which maximize local environmental costs, had greater preferences for outward mobility. Residents near stations, which maximize the service's local benefits, had the highest reports of inward mobility. We examine the mediating effects of local environmental and social circumstances and discuss the implications of this particular study for other metropolitan regions.(a)

17 312615 SENSITIVITY ADAPTIVE CONTROL OF A MAGNETIC SUSPENSION SYSTEM. This project is concerned with the study of the behavior of a particular stochastic system, the magnetic suspension system, under the application of the Sensitivity Adaptive Feedback with Estimation Redistribution (SAFER) Control Algorithm. Matrix factorization techniques are used in the controller and estimator design for the system. Simulation results indicate that the magnetic suspension system can operate satisfactorily under the SAFER control method; and factorization techniques indeed enhance the numerical stability of computations. However, due to the complex structure of the SAFER control method, real time application of the algorithm may require faster computing device or simplified mathematical model. Its application will be most pertinent to systems with slow time constants. (Author)

17 313120 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. A REVIEW OF AGT (AUTOMATED GUIDEWAY TRANSIT) COMMUNICATION SYSTEM TECHNOLOGY. PART B. This report assesses the current state-of-the-art. The review concentrates on the communication links used within the longitudinal control loop. It discusses the criteria for establishing data rate, and the major aspects of a communication system starting with the

transmission media modulation techniques, followed by noise and error considerations. The review is concluded with a brief summary of data communication in existing AGT systems.

17 313148 OPERATION OF AUTOMATED GUIDEWAY TRANSIT VEHICLES IN DYNAMICALLY RECONFIGURED TRAINS AND PLATOONS. VOLUME I. PART I. APPLICATIONS ANALYSIS. PART II. VEHICLE DYNAMICS. This study shows that the passenger capacity of AGT systems may be significantly increased by operating vehicles in dynamically reconfigured trains or platoons. It is estimated that a minimum lane capacity of 5,000 to 10,000 passengers per hour is needed to make single-party AGT economically competitive with buses and that this capacity requires the use of trains. Trains also offer several non-capacity-related operational advantages. In this report, the longitudinal control systems needed to effect dynamic entrainment with platoon operations at spacings of 30-60 cm are developed with particular attention to stability, jerk limiting requirements, safety and passenger comfort. The capacity advantage of entraining is demonstrated for a single guideway link and for merge junctions, using Monte Carlo simulation. Variable-slot-length point-follower control is shown to reduce merge delays and maneuver ramp lengths compared with fixed-slot-length methods. The "zero gap" merge scheme developed here produces dramatic improvements compared with conventional merge strategies. The study suggests that the concepts of dynamic entrainment and platooning deserve more detailed study and testing because of the significant advantages they offer.

17 313205 SUMMARY OF CAPITAL AND OPERATIONS AND MAINTENANCE COST EXPERIENCE OF AUTOMATED GUIDEWAY TRANSIT SYSTEMS COSTS AND TRENDS FOR THE PERIOD 1976-1978. SUPPLEMENT I. This costs supplement is presented in the form of a series of tables and figures which summarize the data obtained as well as the results of analysis. Comments and explanatory notes relative to tables/figures are made where appropriate. Also included herein is information on operating and maintenance and capital costs for bus and rail transit; it indicates how AGT cost experience compares with the conventional modes. This report summarizes operations and maintenance cost experience for the following Automated Guideway Transit systems for the period 1976-1978: Airtrans, Dallas/Fort Worth Airport, Texas; Morgantown People Mover, Morgantown, West Virginia; Satellite Transit System, Seattle-Tacoma International

Airport, Washington; Passenger Shuttle System, Tampa International Airport, Florida; and WEDway People Mover System, Disney World, Florida. Capital cost data on these and the following additional systems are also reviewed: People Mover, Atlanta-Hartsfield International Airport, Georgia; Busch Gardens People Mover, Williamsburg, Virginia; Satellite Transit Shuttle, Miami International Airport, Florida; AGT System, Fairlane Town Center, Dearborn, Michigan; and UMI Tourister AGT System, King's Dominion, Ashland, Virginia.

17 313414 HIGH SPEED GUIDED GROUND TRANSPORT OF PASSENGERS. The subject of the study was a comparison between the use of magnetic and other suspension systems, in particular wheel-on-rail, for the transport of passengers at speed higher than those currently used. The objectives of the study were firstly to investigate the technical problems associated with each technology, secondly to assess any differences in environmental impact and thirdly to make an economic comparison between the systems. 17 313897 IMPACT OF ADVANCED GROUP RAPID TRANSIT TECHNOLOGY. This assessment of advanced group rapid transit (AGRT) was made in response to a request of the House Committee on Appropriations to evaluate the need for this technology and its relationship to national mass transportation goals. Increases in traffic congestion, petroleum shortages, and decreasing mobility for the transit-dependent reflect a growing need for more efficient and effective transportation options. This report examines the need for further advances in automated guideway transit (AGT) technology and evaluates their potential impacts on various stakeholder groups.

17 313962 PASSENGER SAFETY AND CONVENIENCE SERVICES IN AUTOMATED GUIDEWAY TRANSIT. VOLUME I DATA COLLECTION, SCENARIOS, AND EVALUATION. The major objective was to produce a guidebook detailing the most effective methods and procedures for the accommodation of Systems Safety and Passenger Security. The primary intent of this document is to provide guidance associated with abnormal occurrences that have an impact on routine passenger services or safety. The report discusses literature and personal interview findings documenting methods and procedures for detecting and resolving Passenger Safety and Convenience Service (PS&CS) problems in current transit operations; scenarios depicting

potential PS&CS problems applicable to the AGT systems; selection of methods and procedures from current practices for detecting and resolving PS&CS problems in AGT; analysis and evaluation of the effectiveness of selected candidate methods and procedures; and recommended methods and procedures for accommodating PS&CS problems in AGT.

17 313963 PASSENGER SAFETY AND CONVENIENCE SERVICES IN AUTOMATED GUIDEWAY TRANSIT. VOLUME II. GUIDEBOOK. Current practices have been reviewed, analyzed, and evaluated for their effectiveness in accommodating Passenger Safety and Convenience Services (PS&CS) problems in AGT. These practices for providing PS&CS in both conventional and AGT have been assessed as applicable to highly automated transit systems. These guidelines have been developed suggesting methods and procedures to provide these services for AGT systems. The final objective of this guidebook is to provide the most effective methods and procedures for ensuring passenger safety and convenience services in AGT systems. Its contents provide guidance for AGT system planners, designers, operators, and evaluators in identifying potential problems and assessing proposed methods and procedures.

17 314010 AIRTRANS URBAN TECHNOLOGY PROGRAM-PHASE II. VOLUME 1: CONTROL SYSTEM IMPROVEMENTS. AIRTRANS, an Automated Guideway Transit

(AGT) system built by the Vought Corporation, has provided transit service for passengers at the Dallas/Fort Worth Airport since January 1974. This successful deployment of AGT technology prompted the investigation of the extension of the technology. Independent assessments were made by the Transportation Systems Center and by Vought to determine what changes or improvements would be required to operate AIRTRANS in an urban application. The recommendations were: higher operating speeds; better passenger acceptance; reduced capital and operating costs; increased reliability; enhanced all-weather capability; and increased energy efficiency. The AUTP was structured into a two-phase program. Phase I was completed in 1977. The first phase covered the development and demonstration of the improvements necessary for higher speed operation, while maintaining or improving reliability, availability, cost, and performance characteristics of the overall system. Using Phase I as a building block, other recommendations for improvements in AIRTRANS for urban applications were addressed in Phase II. This volume describes the control system improvements incorporated in the P40 vehicle and the AIRTRANS supervisory data system software additions for dual block occupancy alarm features and P40 passenger vehicle identity. Under the control system improvements, the objectives have been to continue development of the longitudinal velocity control systems as embodied in a new third generation Vehicle Control and Electronics Unit; implement improved functional design features in the areas of data communications, directional reversability, dual side doors, automatic test and checkout capability, built-in manual control, slip/slide detection, supervisory data system software and improved entrainment capability. Significant progress in the AIRTRANS control system's area has been demonstrated in simulation, laboratory tests, and guideway evaluation.

17 314011 AIRTRANS URBAN TECHNOLOGY PROGRAM-PHASE II. VOLUME 2: IMPROVED PASSENGER COMMUNICATIONS. AIRTRANS, an Automated Guideway Transit (AGT) system built by the Vought Corporation, has provided transit service for passengers at the Dallas/Fort Worth Airport since January 1974. This successful deployment of AGT technology prompted the investigation of the extension of the technology. Independent assessments were made by the Transportation Systems Center and by Vought to determine what changes or improvements would be required to operate AIRTRANS in an urban application. The recommendations were: higher operating speeds; better passenger acceptance; reduced capital and operating costs; increased reliability; enhanced all-weather capability; and increased energy efficiency. The AUTP was structured into a two-phase program. Phase I was completed in 1977. The first phase covered the development and demonstration of the improvements necessary for higher speed operation, while maintaining or improving reliability, cost, and

performance characteristics of the overall system. Using Phase I as a building block, other recommendations for improvements in AIRTRANS for urban applications were addressed in Phase II. This report, Volume 2, covers the Improved Passenger Communications Task activities of the Vought Corporation, during Phase II of the AIRTRANS AUTP. The primary objectives of the program were to design, build, and demonstrate: (1) an onboard television surveillance system; (2) a programmable audio-announcement unit; (3) a dynamic graphic system; and (4) a time-to-arrival display unit for passenger stations. All of these systems were built and successfully demonstrated as part of the operation of a prototype urban AGT vehicle in the Dallas/Fort Worth AIRTRANS system.

17 314051 ASSESSMENT OF THE PHASE I MORGANTOWN PEOPLE MOVER SYSTEM. This assessment describes the installation and operation of Phase I of the Morgantown People Mover System at West Virginia University in Morgantown, West Virginia. A detailed description of the technical subsystems is included as well as a review of performance, reliability, maintainability, and cost. A system implementation history is also provided. Where important, the review of technical subsystems includes applicability, modifications, and/or improvements for application in an urban environment. Information and data presented were collected through surveys of the literature, site visits, a visit to the manufacturer, interviews with site and manufacturer's personnel, site measurements, reviews of operating and maintenance logs, and compilations generated by the manufacturer, the operator, and the U.S. Department of Transportation. A draft of this report has been reviewed by the operator, the manufacturer, and UMTA. Their comments have been incorporated where it has been possible to do so without compromising the objectivity of the assessment.

17 314060 AIRTRANS URBAN TECHNOLOGY PROGRAM: EXECUTIVE SUMMARY. The AIRTRANS system at the Dallas/Fort Worth Airport, Texas, is representative of automated guideway transit (AGT) as it will likely develop in cities in the United States and around the world. AIRTRANS is composed of 13 single-lane miles of concrete guideway connecting 53 stations in 6 major terminal and parking areas of the airport. There is a fleet of 68 fully automatic electrically propelled vehicles, 59 of which currently operate over this guideway network. As of December 1979, the system had completed more than 19 million vehicle miles and carried 29 million passengers. The system is operating with a high percentage of availability and degree of passenger acceptance. This report summarizes the AIRTRANS Urban Technology Program (AUTP) performed under a federal grant from UMTA to the Dallas/Fort Worth Airport Board. Improvements to the AIRTRANS AGT technology in speed, passenger acceptance, cost, reliability, and all-weather capability for urban applications have been made and evaluated during the program.

17 314071 CONTROL LAW IMPLEMENTATION FOR SHORT HEADWAY VEHICLE-FOLLOWER AUTOMATED GUIDEWAY TRANSIT (AGT) SYSTEMS. Automated guideway transit (AGT) systems are a new class of urban transport in which automatically controlled vehicles operate on dedicated guideway networks. This report examines the implementation of a vehicle-follower control law for short headway AGT systems in terms of required sensor accuracy, controller structure, and data transmission requirements. In this report controller configurations are recommended for headways of 0.5 and 3.0 s that require an 8 bit uplink word at intervals of 0.1 and 0.5 s, respectively. Accomplishments, recommendations, and areas for further study are also presented.

17 314366 ACCELERATING WALKWAY SYSTEM ANALYSIS AT WASHINGTON NATIONAL AIRPORT. An accelerating walkway system (AWS) is a high capacity, continuously available mode of public transportation that has the potential of filling the service gap between walking or conventional moving walkways and conventional vehicular transit systems. This study examines the site and passenger

demand characteristics at the Washington National Airport and analyzes the physical, service, and economic feasibility of using an AWS to provide a pedestrian connection service between the Metro Rapid Rail Station and the air terminal. An economic feasibility of the AWS was performed that included investigation of the capital cost, operating and maintenance cost, and life cycle cost of five different AWS manufacturers (Dunlop, APL, Dean Research, TRAX, and Boeing). This report contains numerous charts illustrating the airport facilities, passenger demand, and the various costs associated with the AWS.

17 314455 SIMULATION MODELS FOR THE ELECTRIC POWER REQUIREMENTS IN AN AUTOMATED GUIDEWAY TRANSIT SYSTEM. This report describes a computer simulation model developed at the Transportation Systems Center to study the electrical power distribution characteristics of Automated Guideway Transit (AGT) systems. The objective of this simulation effort is to provide a means for determining the power distribution requirements of AGT systems and for evaluating their performances under varied operating conditions. Typical systems which could be modeled include the Morgantown Personal Rapid Transit System, the Dallas-Fort Worth Airtrans System, or one of the proposed Downtown People Movers. This report specifically describes a Fortran computer program which models the electric power requirements of a typical AGT system.

17 315021 OPERATIONAL SAFETY OF CABIN SYSTEMS. SEMINAR ON TRAFFIC, TECHNICAL AND LEGAL ASPECTS [Betriebssicherheit von Kabinenbahnen. Seminar Behandelte Verkehrliche, Technische und Juristische Aspekte]. The seminar on "cabin vehicles in German towns-aspects of practical use" took place at the end of January 1979 in Hamburg. The focal points were adaptation to the urban structure, legal principles, and technical and operational concepts. Trials undertaken so far have proved their greater attractiveness and environmental quality compared with conventional systems. Three different systems (cabin track, elevated railway and magnetically suspended railway) are presented, and details given of their step by step development and their particular features, particularly those which determined their practical application. [German]

17 315330 PASSENGER TRANSPORTATION IN THE YEAR 2000. Cost-and energy-efficiency will be an increasingly important factor in passenger transportation during the next few years. For example, the Amtrak intercity rail passenger system has proved to be inefficient compared to bus service over all and should be pruned and limited to those densely populated regions, such as the Northeastern corridor where it would be most cost effective. In the meantime, bus travel will be at a disadvantage due to the subsidy of rail transportation and will continue to lose ridership. This could be offset however, by increased fuel costs making private automobile travel less desirable. Due to decreased rates of economic growth, the emphasis of economic efficiency also obtains in the airline industry (Aviation users have demonstrated that low fares are more important to them than technological virtuosity). The latest models of aircraft tend to concentrate on more economical operation, improved energy efficiency, and reduced noise levels. As in the case with intercity travel, it is the author's opinion that local public transit planners should de-emphasize capital-intensive rail systems in favor of bus systems, particularly in low density suburbs which would also be more amenable to demand-responsive rather than fixed-route system.

17 316255 MODEL FOR THE TEST & EVALUATION OF ADVANCED GROUP RAPID TRANSIT (AGRT) SYSTEMS. The design and evaluation of the Central Management System (CMS) for an Advanced Group Rapid Transit (AGRT) system is a very complex undertaking. The CMS is responsible for the routing and scheduling of hundreds of vehicles and for the making of thousands of passenger-vehicle assignments per hour in order to transport passengers between the various guideway stations in the network. This volume of decision making, coupled with the level of detail and complexity commonly found in CMS algorithms, forces the system designer/evaluator to employ computational tools to assist him in his work. A description is given of such an analysis tool. The simulator actually encompasses two different systems. One system models the actual decision logic of the CMS algorithms. Thus, vehicle locations and waiting passengers are tracked at all

times, and the appropriate vehicle routings and passenger-vehicle assignments are made. The simulator is designed to accommodate a very broad range of network configurations, traffic loads, vehicle populations, and operating policies via parametric adjustments, so that this tool can be used by a broad community of investigators.

17 316589 PEOPLE MOVERS AND THE MARCH OF THE MICROCHIP. Details are given of the new vehicle automatic train control (VATC) system from Westinghouse. It is a microprocessor-based vehicle control system which is compatible with both steel wheel and rubber-tired people mover systems. The system is currently being manufactured for the Sao Paulo metro subway and for systems at the new Atlanta and Orlando airports in the USA. By 1982, a pair of rubber-tired cars holding about 30 people will be shuttling to and fro on a 300 M track between the main building at Gatwick and a satellite terminal on the northern Apron. A dual microprocessor control system approach has been followed in the design of the vehicle ATP (automatic train protection) system. The redundant control channels in this design have been implemented using 2 microprocessors in a checked redundant fashion to achieve safety. Train detection is accomplished by utilisation of two of the rails in the power collection system. This system is described with reference to the speed code generation system (a six bit, comma-free code). Other features described are: the overspeed detector circuit, the vehicle ATO system (automatic train operation) and the automatic line supervision.

17 318086 GUIDEWAY TRANSPORTATION. 1964-APRIL, 1980 (CITATIONS FROM THE NTIS DATA BASE). The bibliography cites research on automated guideway transportation (AGT), in which passengers can be transported along tubes or rails under automatic control. The carriers, termed personal rapid transit vehicles or people movers, can accommodate individuals or small or larger groups. The reports cover many aspects of technology, such as demand actuated service, networks, elevated structures, monorail, light rail, computer aided control, vehicle merging, headway safety, shuttle loops, guideway designs, magnetic levitation, suspended vehicles, and dual mode. Discussions are made of steering control, ride quality, airport services to move people or baggage, gravity assistance in accelerating and braking, test vehicles, and maintenance.

Other topics are cost comparisons of AGT with conventional transit, fares, and equipment failure. Air cushion vehicles are excluded. (This updated bibliography contains 234 abstracts, 49 of which are new entries to the previous edition.)

17 318170 PREDICTING AUTOMATED GUIDEWAY TRANSIT SYSTEM STATION SECURITY REQUIREMENTS. This study addresses the issues of personal security on Automated Guideway Transit (AGT) Systems, as they might be deployed in typical urban residential and non-residential settings. Based upon a literature review, it outlines basic characteristics of existing transit crime; compares station design concepts for AGT and conventional rail transit; reviews the key environmental characteristics of AGT stations which may influence crime potential; inventories both existing and proposed countermeasures for transit crime reduction; identifies additional neighborhood resources which might be mobilized as countermeasures; reviews available techniques for predicting transit crime; and reviews techniques available for both predicting transit crime and assessing countermeasure effectiveness and offers recommendations for analysis strategies to be employed in local AGT studies. Traditional as well as innovative analysis techniques are covered. This report recommends a general approach for AGT station security requirements analysis which can be used by localities in site-specific AGT planning and engineering studies. This report provides a list of references as well as an annotated bibliography.

17 318179 EVACUATION AND RESCUE IN AUTOMATED GUIDEWAY TRANSIT. VOLUME I: DATA COLLECTION, SCENARIOS, AND EVALUATION. The objective of one segment of this program, the Systems Safety and Passenger Security (SS&PS) Study, is the development of guidelines for the assurance of actual and perceived passenger safety and security in AGT systems. The evacuation and rescue task of the project has as its objective the production of a guidebook detailing the most effective methods and procedures for providing evacuation and rescue in AGT systems. In conventional transportation systems, transportation personnel can help to evacuate and rescue passengers. AGT systems, however, because of their unmanned nature and unique configurations, present a number of problems related to evacuation and rescue. Operation of AGT systems with elevated guideways also present significant problems. Serious injuries and loss of life can result from situations in which inadequate means of evacuating and rescuing passengers exist. The purpose of this portion of the SS&PS program was to identify these problems and where possible, recommend solutions. This document is Volume I of the final report on evacuation and rescue in AGT, and describes the methodology used in developing evacuation and rescue guidelines.

Benjamin, DE ; Vought Corporation, Transportation Systems Center, Urban Mass Transportation Administration, (UMTA-MA-06-0048) Final Rpt. DOT-TSC-UMTA-79-47-I, Dec. 1979, 84p; See also Volume 2, PB80-195779; Contract DOT-TSC-1314; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-195761

17 318180 EVACUATION AND RESCUE IN AUTOMATED GUIDEWAY TRANSIT. VOLUME II: GUIDEBOOK. The objective of one segment of the AGTT program, the Systems Safety and Passenger Security (SS&PS) Study, is the development of guidelines for the assurance of actual and perceived passenger safety and security in AGT systems. The evacuation and rescue task of the project has as its objective the production of a guidebook detailing the most effective methods and procedures for providing evacuation and rescue in AGT systems. In conventional transportation systems, transportation personnel can help to evacuate and rescue passengers. AGT systems, however, because of their unmanned nature and unique configurations, present a number of problems related to evacuation and rescue. Operation of AGT systems with elevated guideways also present significant problems. Serious injuries and loss of life can result from situations in which inadequate means of evacuating and rescuing passengers exist. The purpose of this portion of the SS&PS program was to identify these problems and where possible, recommend solutions. This Guidebook is Volume II of the final report on evacuation and rescue in AGT and provides guidelines and other information relative to evacuation and rescue of passengers from AGT systems. The report addresses a description of the problems and solutions as they exist on conventional and AGT systems, a discussion of the types of planning that are required to produce satisfactory evacuation and rescue solutions, and recommendations of suitable methods and procedures for AGT evacuation and rescue.

tion Administration, (UMTA-MA-06-0048) Final Rpt. DOT-TSC-UMTA-79-47II, Dec. 1979, 97p; See also Volume 1, PB80-195761; Contract DOT-TSC-1314; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-195779

17 318196 OPERATION OF AUTOMATED GUIDEWAY TRANSIT VEHICLES IN DYNAMICALLY RECONFIGURED TRAINS AND PLATOONS. VOLUME II. PART III. SYSTEMS OPERATIONS ANALYSIS. This study shows that the passenger capacity of AGT systems may be significantly increased by operating vehicles in dynamically reconfigured trains or platoons. It is estimated that a minimum lane capacity of 5,000 to 10,000 passengers per hour is needed to make single-party AGT economically competitive with buses and that this capacity requires the use of trains. Trains also offer several non-capacity-related operational advantages. The longitudinal control systems needed to effect dynamic en/entrainment with platoon operations at spacings of 30-60 cm are developed with particular attention to stability, jerk limiting requirements, safety and passenger comfort. The capacity advantage of entraining is demonstrated for a single guideway link and for merge junctions, using Monte Carlo simulation. Variable-slot-length point-follower control is shown to reduce merge delays and maneuver ramp lengths compared with fixed-slot-length methods. The "zero gap" merge scheme developed here produces dramatic improvements compared with conventional merge strategies. The concepts of dynamic entrainment and platooning are shown to deserve more detailed study and testing because of the significant advantages they offer.

17 318457 VEHICLE LATERAL CONTROL AND SWITCHING. VOLUME I. PROJECT SUMMARY. This report is one volume of a six-volume final report of the Vehicle Lateral Control and Switching (VLACS) Project sponsored by the Urban Mass Transportation Administration of the Department of Transportation. Volume I, this report, summarizes the results and significant findings of the project. The project objectives are to investigate and improve the steering and switching capabilities of automated transit vehicles through analysis, simulation, and test of lateral control of switching systems and to develop guidelines for the development of these systems. Three types of steering systems are investigated: (1) wire-follower power-assisted steering; (2) wall-follower power-assisted steering; and (3) passive wall-follower steering. The significant findings and major conclusions from each project task are included in this report. Also summarized and included in this report are the contents of the final project reports which describe the hardware studies, the design and simulation activities, the test program, and the data base report. Recommendations for future related studies are presented.

17 318458 VEHICLE LATERAL CONTROL AND SWITCHING. VOLUME II. DESIGN AND ANALYSIS. PART A. VLACS MODELS. This report contains design and analysis results from UMTA's Vehicle Lateral Control and Switching (VLACS) Project of the Automated Guideway Transit Technology (AGTT) Program. The objective of the VLACS project is to develop lateral control and switching systems which will reduce the cost and improve the performance of these systems on automated transit vehicles. The VLACS project tasks include a review of existing lateral control and switching technology, detailed mathematical modeling, analysis, simulation, detailed hardware studies, experimentation with alternative designs, and development of guideline specifications for VLACS systems. In this report, lateral control system models are developed for wire-follower, wall-follower active, and wall-follower passive lateral control systems, including the vehicle, lateral position sensors, and actuators. Vehicle dynamic models are developed for vehicles having Ackermann steering geometry and for vehicles with wagon-wheel steering. AGT vehicle models developed include ten-degree-of-freedom models used for ride quality analysis and simpler three-degree-of-freedom models used for lateral control system design and analysis. Part A of this report contains a description of VLACS model development.

17 318460 VEHICLE LATERAL CONTROL AND SWITCHING. VOLUME III. DETAILED HARDWARE STUDIES. Volume III, this report, contains a description of the hardware for the test vehicle and for nominal vehicle design for each of four vehicle classes (Shuttle Loop Transit, Group Rapid Transit Large, Group Rapid Transit Small, and Personal Rapid Transit) is described. The test vehicle which incorporates 2 or 4 wheel Ackerman steering and 2 or 4 wheel drive is configured to implement wire and wall-follower steering systems. Test data is used for mathematical model validation and for lateral control system evaluations. Nominal vehicle designs are described which are typical of lateral control system implementations used on AGT systems. Cost and weight estimates for the typical designs are presented.

17 318461 VEHICLE LATERAL CONTROL AND SWITCHING. VOLUME IV. TEST PROGRAM. In this report, major emphasis is given to the results of three alternative steering techniques using the VLACS test vehicle and simulations. Use of test data for mathematical model validation is discussed. The three types of steering systems for rubber-tired transit vehicles which have been investigated are: (1) mechanical sensing without power steering (herding); (2) mechanical sensing with power steering; and (3) electromagnetic (wire-follower) sensing.

17 318462 VEHICLE LATERAL CONTROL AND SWITCHING. VOLUME V. DATA BASE. Volume V, this report, provides a catalog of the data base material gathered and classified as part of the VLACS project. It contains (1) an annotated bibliography, which includes short summaries of the documents listed, a list of descriptors, and a series of user designators, and (2) a subject index, which includes numerous entries and subentries, and cross-references. The data base lists technical works dealing with vehicle lateral control, switching and steering systems, vehicle dynamics, ride quality, and other related topics. Its purpose is to help planners and designers find the material they need to evaluate and select automated guideway transit (AGT) systems.

17 318512 SUMMARY OF CAPITAL AND OPERATIONS AND MAINTENANCE COST EXPERIENCE OF AUTOMATED GUIDEWAY TRANSIT SYSTEMS. COSTS AND TRENDS FOR THE PERIOD 1976-1979. SUPPLEMENT II. This report summarizes O&M cost experience and trends for the following AGT systems for the period 1976-1979: AIRTRANS, Sea-Tac, Tampa, Disneyworld (WED-way), and Morgantown (O&M data on the Morgantown system is reported through 1978). Capital cost data is reviewed on Morgantown Phase I, AIRTRANS, Tampa, Sea-Tac, Miami, Busch Gardens, Disneyworld, King's Dominion, and Fairlane. New capital cost data has been obtained from the Atlanta and Orlando Airports and the Minnesota Zoological Gardens. In addition to presenting capital and operating and maintenance costs and trends, this report includes analysis of the factors influencing these costs. A section on the differences between urban and non-urban settings of AGT systems has also been included and shows how the costs of existing non-urban systems might relate to a system in an urban deployment in terms of site conditions and site requirements.

17 319698 MAGNETICALLY SUSPENDED VEHICLES FOR TRACKED HIGH-SPEED TRAFFIC. The author discusses the history of the development of magnetic levitation and the possible methods which could be used to power rapid transport systems. Development of a West German suspension system with permanent magnets was stopped due to the high cost of installing magnets on the guideway. The principles of the normal flux and zero flux procedures for electrodynamic magnetic suspensions are explained. Under the normal flux system, the vehicle has to start on wheels and does not levitate until a speed is reached where eddy-current braking forces are suitably reduced. The zero flux system has the advantage that brake losses were much less and it is more suited to positive guidance of the vehicle. Electrodynamic systems were considered to be uneconomical, and so electromagnetic systems using d.c. energized controlled electromagnets have been developed. The concept of the magnetic wheel, which improves the ride quality and reduces the dynamic requirements of the magnets is outlined.

Mayer, WT *Electric Vehicle Developments* No. 6, June 1980, pp 14-16, 2 Fig.; ACKNOWLEDGMENT: TRRL (IRRD 248461); ORDER FROM: Institution of Electrical Engineers, Savoy Place, London WC2R 0BL, England

17 322552 THE "H-BAHN": AN AUTOMATIC LOCAL TRANSPORT SYSTEM. In view of the worsening living conditions in towns and cities filled to overflowing with private cars, but also for economic reasons and to reduce great dependence on oil imports, there must be greater

use of local public transport. But only a much improved service can bring this about. The automatic "H-Bahn" (or suspended rail system) developed by Siemens A.G. and DUWAG Waggon-fabrik Uerdingen A.G. offers such an opportunity at a cost which is comparable with conventional local transport. Its features are a frequent service with comfortable vehicles not only during the busy times of day, fast connections on a track unobstructed by other traffic, and the safety which is inherent in a tracked system. Trials have been carried out with the "H-Bahn" on a 1.4-km-long test track with six cars and three halts built at the Siemens research centre in Erlangen. It was shown that the short construction and assembly times causes only minimal hindrance to road traffic and also that the investment is profitable. During the trials, with so far 180,000 vehicle-kilometres and continuous running lasting several days, full success was achieved with the hierarchic automation structure, the computers and their programmes, the safety level and the vehicles with their D.C. or asynchronous linear motors. The trials suggested some improvements in detail and these are now being incorporated into the system. The "H-Bahn" is thus ready for public transport service. The first layout is to be built for Dortmund University and is scheduled to go into service at the end of 1982. [German]

Ziegler, W *Eisenbahntechnische Rundschau* Vol. 29 No. 6, June 1980, p 415; ACKNOWLEDGMENT: British Railways; ORDER FROM: Hestra-Verlag, Holzhofallee 33, Postfach 4244, 6100 Darmstadt 1, West Germany

17 322805 WHY NEW TECHNOLOGIES CANNOT RADICALLY IMPROVE THE QUALITY OF URBAN TRANSPORTATION. In recent years a great deal of time and effort has been expended on the development of new modes of transport for cities. It is argued in this paper that this work is unlikely to be very productive because the major remaining flaw in the provision of transportation services—the inability of one mode to provide a good service to concentrated and dispersed trip ends—seems unavoidable. To make the required breakthrough a new mode must be frugal in its demands for space, flexible in its operation and fast. But an analysis of the performance of existing and prototype modes suggest that there is a fundamental technological barrier that precludes any one mode from performing well in more than two out of these three ways. This implies that any further improvements in travel for the urbanite must be made through existing modes and their derivatives and will be quite limited. It also suggests that the only possible way of substantially improving urban transportation is to build or rebuild towns so that one of the important mode attributes mentioned above is rendered superfluous. (a)

17 326270 SYSTEMS OPERATION STUDIES FOR AUTOMATED GUIDEWAY TRANSIT SYSTEMS: CLASSIFICATION AND DEFINITION OF AGT (AUTOMATED GUIDEWAY TRANSIT) SYSTEMS. The report describes the development of an AGT classification structure. Five classes are defined based on three system characteristics: service type, minimum travelling unit capacity, and maximum operating velocity. The five classes defined are: Personal Rapid Transit (PRT); Small Vehicle Group Rapid Transit (SGRT); Intermediate Vehicle GRT (IGRT); Large Vehicle GRT (LGRT); and Automated Rail Transit (ART). All classes except LGRT and ART are further stratified on the basis of speed, resulting in a total of eight subclasses. Forty-four existing and proposed AGT systems are summarized and used to define ten representative systems in terms of nominal values and ranges of selected characteristics. A summary of the system information compiled and used to complete this task is presented in Appendix A of this report. This report also provides a bibliography, list of text references, and a glossary of terms.

17 326294 SYSTEMS OPERATION STUDIES FOR AUTOMATED GUIDEWAY TRANSIT SYSTEMS. SUMMARY REPORT. In order to examine specific Automated Guideway Transit

(AGT) developments and concepts and to build a better knowledge base for future decision-making, UMTA has undertaken a new program of studies and technology investigations called the Urban Mass Transportation Administration (UMTA) Automated Guideway Transit Technology (AGTT) Program. The objectives of one segment of the AGTT program, the Systems Operation Studies (SOS), are: (1) to develop models for the analysis of system operations; (2) to evaluate AGT system performance and cost; and (3) to establish guidelines for the design and operation of AGT systems. The results of the SOS project are summarized in this final report. The characteristics of 43 existing or proposed AGT systems were inventoried, and the information was used to develop a system classification structure. Classes of metropolitan and activity center demand applications were defined and demand matrices based on survey data from representative locales were generated. A restricted number of combinations of system classes, demand types, and network types were developed as representative deployment scenarios for analysts. An extensive list of possible performance measures was developed and then condensed to an initial set of 14 system level measures. A comprehensive set of computer software has been developed and tested. The various computer programs permit the simulation of entire AGT systems as well as major subsystems, including stations, links, merges, and inter-sections.

Lee, RA Thompson, JF Oglesby, RN Bonderson, LS ; General Motors Technical Center, Transportation Systems Center, Urban Mass Transportation Administration, (UMTA-MA-06-0048) Final Rpt. UMTA-MA-06-0048-8012, Feb. 1980, 132p; Contract DOT-TSC-1220; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB81-101693

17 326449 STATIC AND DYNAMIC TESTS OF FULL SCALE DOUBLE-TEE GIRDERS FOR DADE COUNTY RAPID TRANSIT SYSTEM. Metropolitan Dade County, Florida, is now in the process of building a new rapid transit system of about 50 miles. The first-stage construction of this new system scheduled for completion in 1984, consists of 22.5 miles, and includes 21.5 miles of aerial guideways. The aerial structures to be used for the guideways are prestressed concrete double-tee girders, which is a first in the use of such a structure in a U.S. transit system. In view of large capital investment involved, and the fact that a double-tee has not been used on any rapid rail transit system, the Urban Mass Transportation Administration agreed to fund full-scale tests. These tests were to serve three purposes: (1) to prove the adequacy of all design methods; (2) to check some of the construction and reinforcement details; and (3) to verify the dynamic performance of the girders. Demonstration tests were carried out on three full-size 80 feet long by 5 feet deep by 12 feet wide precast prestressed double-tee girders proposed for the aerial guideways. Two of the three girders cast in Miami were shipped by rail to P.C.A. Laboratories in Skokie, Illinois for extensive static and dynamic testing, with the third girder kept in Miami to monitor camber and loss of prestress. Static test results of uncracked and deliberately precracked girders showed that ser-

vice torsional rotations, which were in close agreement with a theoretical mixed torsion analysis, were small enough to ensure rider comfort. Fatigue resistance of the girders was fully established by two separate test spectra involving 5 and 6 million cycles of loading representing the cumulative damage of sixty years of operational life. No deterioration whatsoever was observed in terms of flexural and torsional stiffness, crack propagation, or strand stresses. Post-cracking behavior of the girders showed adequate strength and ductility with an ultimate capacity of 1.6 times the required factored severe derailment loading including 100% impact. This test report concludes that the excellent behavior of the girders from serviceability and strength considerations, substantiated all the design analyses and details used.

Hsu, TTC ; Dade County Office of Transportation Admin, Urban Mass Transportation Administration, (UMTA-FL-06-0017) Final Rpt. UMTA-FL-06-0017-80-1, Oct. 1979, 164p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB81-115388

17 327743 AUTOMATED MIXED TRAFFIC TRANSIT MARKET ANALYSIS. This report addresses the need for an automated vehicle mode that could use existing rights-of-way with minor modification. This system concept, Automated Mixed Traffic Transit (AMTT) System, refers to a system of driverless electric vehicles for mixed traffic use. Such systems would significantly decrease the labor costs associated with transit operations. Their use of existing rights-of-way indicates that system capital costs would be relatively low compared to conventional modes. The AMTT system has now reached the stage where it has become necessary to examine and identify its potential market. This report examines the characteristics and associated costs of AMTT vis-a-vis its conventional transportation alternatives. A parametric analysis is performed between electrically powered driverless AMTT and internal combustion conventional bus transit to identify appropriate service and operating conditions for AMTT. In this report, an examination of potential application areas indicates that AMTT would be less costly on a total annual cost basis than conventional bus transit in areas where fleet requirements are relatively low and high amount of service, as measured in vehicle kilometers, is

desired. This report states that AMTTs may find potential application in medical centers, airports, CBD malls, some universities and colleges, new towns, large shopping centers, and in a number of recreation areas and amusement parks.

Chung, C Anyos, T ; Mitre Corporation, Urban Mass Transportation Administration MTR-80W00067, UMTA-VA-06-0056-80-3, Sept. 1980, 194p; Prepared in cooperation with SRI International, Menlo Park, CA.; Contract DTUM-60-80-C-71020; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB81-105801

17 328220 PASSIVE VEHICLE-AUTOMATED GUIDEWAY TRANSIT. DOCUMENTATION OF PREVIOUS WORK AND ASSESSMENT OF IMPACT OF NEW TECHNOLOGY ON THIS CONCEPT. In the early 1970s, the Vought Corporation developed a small vehicle (three to six passengers) Automated Guideway Transit (AGT) system called LectraVia which utilized passive vehicles (PV) operating on an active guideway. This report documents the development of this PV-AGT system and assesses its potential as a concept that could provide technology to improve AGT system operational costs. The documentation includes a full description of the system, the application and cost studies performed, details of the control system, the 1/5-scale operational model, the results of the full-scale LIM motor thrust verification tests, fullscale engineering prototype system and test results. A cost/benefit analysis relative to conventional AGT systems is presented. Application study results are given which show the effect of vehicle size on costs, service, and performance. The technical and economic feasibility of modular construction of the Active Guideway System is also explored. The critical technology required for full development and deployment of passive vehicle systems is identified and a plan for implementation of this development is presented. This report not only describes the PV-AGT system concept in detail but also evaluates the economics of the system through a comparative analysis of the passive vehicle (LectraVia) versus the active vehicle (AIRTRANS) proposals made for the Las Vegas application. The results indicate that the passive vehicle has the advantage of superior system availability at equal or slightly lower costs than can be expected for the active vehicle systems.

Larson, AR, Jr Jacobsen, RS Hall, VW Randolph, DG, Jr ; Vought Corporation, Urban Mass Transportation Administration, (UMTA-TX-06-0030) Final Rpt. UMTA-TX-06-0030-80-1, Aug. 1980, 133p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB81-117079

17 328335 OVERVIEW OF ESCALATOR APPLICATIONS IN RAIL TRANSIT. New rail transit systems have made extensive use of escalators, increasing the importance of escalator reliability and cost. The project objectives were to determine the difference in operating environment and in construction between escalators in transit and non-transit use, the impact of recent escalator innovations, and areas which could benefit from UMTA sponsored research and development. Several factors causing a more severe transit escalator operating environment were identified. There are no significant design differences between transit and non-transit escalators. Recent innovations that have affected performance and cost include outdoor escalators, extra flat steps at both landings, and modular escalators. Conventional escalators have one drive motor located at the top landing. Motors on a modular escalator are spaced at intervals along the truss. Data were collected by interviews at transit agencies.

17 329529 GAMBLING WITH A LOSER. A HISTORY OF THE LAS VEGAS PRT PROJECT. This paper compiles a history of the project derived from more than 90 newspaper articles and planning documents, supplemented by conversations with individuals close to the project. It is shown that problems in planning,

coordination and demand estimation were the primary causes for the defeat of the system.

Lutin, JM (Princeton University) Falls, MD *Transportation Research. Part A: General* Vol. 14A No. 3, June 1980, pp 185-196, 59 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

21 046833 SKIP STOP OPERATION AS A METHOD FOR TRANSIT SPEED INCREASE. The efficiency of Rapid Transit lies in its speed for short to medium distance trips in urban areas. However, for longer trips, particularly when there is a competing freeway facility, the requirement for speed is rather high. Since many station spacings are adopted on the basis of area coverage, high operating speed of the trains often cannot be achieved. Thus, typical lines of urban rapid transit with average interstation spacings of approximately one-half mile have only limited length on which their speeds are satisfactory; for distances longer than, typically, 5-7 miles, they often become too slow. This is becoming an increasing problem with the spatial spread of cities.

21 047879 TRAFFIC CONTROL, TIMETABLING AND ORGANISATIONAL PROBLEMS IN THE ESTABLISHMENT OF TRANSIT SYSTEMS IN CONURBATION AREAS. The article discussed the difficulties and problems encountered in the planning and operation of an S-Bahn system and the use of reduced crews by having the driver control door closing and train departure. Automatic computer-controlled trains, running in combination with a continuous control system and automatic driving and braking, can improve profitability by regulating the current consumption via the speed in relation to the timetable.

21 050691 DEVELOPMENT AND APPLICATIONS OF A SIMULATION MODEL FOR METROPOLITAN RAILWAY OPERATIONS. The Rotterdam metro authorities are currently extending the metro line. A simulation model has been developed in order to study the problems arising in the extended network. For the purpose of this study the existing line is investigated to determine the factors influencing train-running. Measurements carried out on the actual train-running have shown that regulation of train-running serves to limit the standard deviation of the travelling time. The measurements are used to dimension the simulation model. This model is described in detail. The validity of the model is tested by simulating the existing North-South line. Future developments and simulation experiments are indicated.

21 051951 ENLARGED MEETING OF THE MANAGEMENT COMMITTEE OF THE IRCA. SECTION 3: OPERATION AND AUTOMATION. CAPACITY OF SUBURBAN LINES. THE MEANS TO BE EMPLOYED TO ADAPT IT TO THE DEVELOPMENT OF TRAFFIC. The development of urbanisation, the manifold movements within the congested areas, the increase in distances between the town centres and their zones of influence, are characteristic phenomena of our times which one finds in every country of the world. They have, consequently, a growing importance for the railways, insofar as suburban traffic is concerned. It is thus that in

respect of the SNCF, in the outskirts of Paris, where this traffic covers 950 km of lines, one has in the course of the last ten years recorded an increase of 22% in passenger carryings and of 40% in passenger-kilometers, and the demographic and urbanisation prospects lead to the estimation that this trend will continue in the years to come. To meet the new needs effectively, the existing nets often prove insufficient and inapt and the difficulties experienced in their operation could result in an extension of these nets by the creation of new tracks. But in an urban area this solution would require works the cost of which is considerable and must be reserved for the zones where the railway is still absent or when no alternative more economical solution can be found.

21 071767 SCHEDULE AND TIMETABLE FOR COMMUTER RAILROAD. This paper describes a set of techniques developed to assist in planning the operations of a commuter railroad and similar types of public transport. Computer models are used for generating information and processing data with the planner making the value judgment decisions regarding the degree to which various objectives are achieved. The method attempts to balance the objectives of the user (travel time and comfort), the system operator (operating cost), and the owner-financier (capital investment). The first portion of the method deals with schedule planning, in which the overall trade offs between quality of service and costs are addressed, and the general plan of operations (such as whether or not to include express service) is developed. Once the general plan has been (tentatively) set, then the detailed construction of a specific timetable, including equipment and crew assignments, is addressed.

21 072464 THE CASE OF THE THREE ENGINEERS VS. BART. This article is intended to focus on the complexities of ethics and employment practices, not on the technical aspect of the Bay Area Rapid Transit system. Nevertheless, the two are related, so some of BART's history, as it is perceived by those interviewed, is included. A lawsuit was recently filed against BART by three of its former engineer-employees. As early as 1971 the three became concerned with the design of the system's Automatic Train control. These engineer's fears eventually became public and all three were fired. BART management apparently felt its three critics had made disclosures as the bugs were in the process of being worked out and such disclosures were unethical. The article is of special interest to engineering practitioners.

21 080306 HEURISTIC SCHEDULING PROCEDURES FOR PRT SYSTEM. While rapid transit systems have been suggested as alternatives to our automobile clogged cities, they have faced a problem in providing passengers with the type of service that they expect from their automobile. In an effort to provide for a rapid transit system that offers the advantages of the automobile but has greater capacity, the Morgantown Personal Rapid Transit System was conceived. A Personal Rapid Transit (PRT) system is characterized by relatively small vehicles that

provide direct station to station travel without intervening stops. Service is essentially provided on demand much the same way as an elevator operates. In order to compete with the automobile, the PRT must be operated as efficiently as possible in order to keep passenger waiting time to a minimum. This paper is concerned with the development of efficient scheduling algorithms which will keep passenger waiting times at an acceptable level while providing for efficient usage of the system. Before examining these procedures, a brief description of the Morgantown PRT system will be given.

Esposito, PR Byrd, J, Jr (West Virginia University) *ASCE Journal of Transportation Engineering* Vol. 100 No. TE4, Nov. 1974, pp 845-853, 2 Fig., 5 Tab., 7 Ref.; ACKNOWLEDGMENT: ASCE; ORDER FROM: ESL, Repr. PC, Microfilm

21 080354 ALGORITHM FOR MECHANOGRAPHIC DETERMINATION OF THE TIMETABLES OF URBAN TRANSPORT LINES [Un Algoritmo per la determinazione meccanografica degli orari delle linee urbane di trasporto]. An algorithm is proposed for the mechanized determination of the timetables of urban transport lines, which in contrast with the methods used in the past, makes use of manual techniques with the necessary schematization. The procedure, an example of which is given, eliminates the possibility of an increase in vehicles as compared with those strictly necessary and minimizes the periods of standing at terminals. 21 084986 URBAN CORRIDOR DEMONSTRATION PROGRAM. MANHATTAN CBD-NORTH JERSEY CORRIDOR CBD BUS ROUTE. The project concentrated on the implementation, demonstration, and evaluation efforts necessary to modify two existing CBD bus transit routes. This project linked the Port Authority Bus Terminal, the major transfer facility for commuter bus travel from New Jersey to midtown Manhattan, with destinations poorly served by the CBD transit system by diverting buses from portions of the existing routes with low patronage levels. This problem was previously identified by a planning study also performed for the Urban Corridor Demonstration Program. After 20 months of operation, the more successful reroute has 2100 peak-period passengers boarding at the Port Authority Bus Terminal. Passenger surveys revealed between one-quarter and one-third were new transit riders. Nearly three-quarters of all passengers felt their trips were faster or more enjoyable than their previous modes. Both reroutes are not permanent components of New York City's transit system. The project demonstrated that minor modifications to existing transit routes can produce significant patronage increases.

21 090535 TRANSIT PASSENGER COUNTS: ERRORS, CONTROLS, ANALYSIS. The paper reports work performed to determine the accuracy of two methods of counting bus riders (by onboard and by roadside observers), and to provide estimates of the errors inherent in the procedures. Bus riders were counted by both methods at selected locations on a screen line in San Francisco. Based on statistical estimates of error, it was concluded that the standard counting procedure, using roadside observers, contributed relatively little to the overall variability of the data. The largest source of variation, and the one that controlled required sample sizes, was the normal fluctuation of ridership between buses. It was estimated that five-day samples taken in two observation periods would be required to permit the detection, on the average, of a 10% change in total daily ridership crossing a single screen line station.

21 090561 PROVIDING INCREASED TRANSIT CAPACITY DURING PEAK PERIODS: EXAMINATION OF TWO TECHNIQUES. It is shown that reduction of bus route lengths increases the number of round trips per bus possible in a given time period. For bus routes accessed mainly by auto, it is shown that significant savings in energy due to reduced auto miles travelled are possible by decreasing the lengths of multistop bus routes. Little or no savings are achieved with express bus routes. Staggering work hours has the effect of greatly increasing the fraction of new transit demand that can be satisfied. It is shown that both the length of the peak period and the percentage travel in the peak hour affect potential transit utilization. Since staggering work hours has detrimental effects on carpooling potential, these effects are also examined. It is found that the benefits to transit of staggering work hours probably exceed the disadvantages to carpooling.

21 091365 VEHICLE SCHEDULING AND DRIVER RUN CUTTING. RUCUS PACKAGE OVERVIEW. This report describes the Run Cutting and Scheduling (RUCUS) package, which is a set of computer programs designed to assist in headway sheet development, vehicle scheduling and driver run cutting. The purpose of using computer programs for this task is to cut

down on the time involved in designing schedules while improving the accuracy of the finished product. The RUCUS package seeks to avoid the three major pitfalls which have been responsible for a lack of success in previous attempts to design a computer scheduling system. The RUCUS package attempts to cover all phases of the scheduling department's activities, yet still be suitable for stage or partial implementation.

Roberts, KR ; Mitre Corporation, Urban Mass Transportation Administration, (UMTA-VA-06-0004) M71-58-Rev-2, Nov. 1973, 25p; Supersedes Rept. no. PB-222 675.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-241501/6ST

21 091619 SOUTHERN CALIFORNIA RAPID TRANSIT DISTRICT 1974 STRIKE IMPACT STUDY. From August 12 until October 18, 1974, the Los Angeles area public transportation system was operationally shut down by a labor strike. The SCRTD system regularly operates some 1869 buses, serving about 650,000 daily riders, over a 2000 square mile area within the Los Angeles Basin. Although Los Angeles is correctly characterized as an auto oriented urban area, with mass transit carrying only 2 to 3% of weekday person trips, there were apparent impacts--on traffic congestion, on mobility, and on commerce. Nine strike-impact areas were evaluated, including effects on business, on auto traffic and occupancy rates, on unemployment and welfare benefits attributable to the strike, and various other resultant conditions.

21 093920 RUCUS (RUN CUTTING AND SCHEDULING) IMPLEMENTATION MANUAL. The Run Cutting and Scheduling (RUCUS) package is a set of computer programs designed to assist transit properties in developing headway sheets, scheduling vehicles, and making driver work assignments. RUCUS has been extensively field-tested and is currently supporting the scheduling activities at a number of properties. The package, which is now available to the transit industry (through the Transportation Systems Center in Cambridge, Massachusetts) includes detailed program documentation, descriptions of the required input data, output reports and messages, and the program source code. This handbook provides guidance in implementing the RUCUS systems at the user's property, outlining such steps as obtaining and organizing the necessary resources, constructing the initial data base, and using the RUCUS programs. This handbook is to be used as an adjunct to existing documentation which defines in detail the execution of the system programs.

21 095260 IMPROVEMENTS OF RAPID TRANSIT SYSTEM GOODNESS. The goodness of a rapid transit system depends on such factors as headway, average commercial speed through the system, capacity per unit train and safety. Improvement of system goodness can be achieved by optimizing each of these parameters. As they are interdependent, their relationships have to be analyzed. One method of improving system goodness is to use a double arrival track at each station. This configuration allows capability for future expansion and provides excellent system flexibility under track outage conditions. Use of this track configuration in downtown areas with optimized train routing strategies can provide maximum utilization of physical facilities and rolling stock, and provide the public with more transportation per dollar of cost. This paper discusses the relationship of the above factors and the advantages of using double arrival tracks at stations.

Kalra, P (Bechtel Corporation) Oswald, R *High Speed Ground Transportation Journal* Vol. 8 No. 3, 1974, pp 185-193, 3 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

21 095722 COMPILATION OF TIME TABLES, OPERATING SCHEDULES AND DUTY ROSTERS BY HEURISTIC PROCESS WITH THE AID OF EDP. The objective of this development was relieving scheduling offices of a periodic, expensive manual process, simultaneously optimizing criteria by complete integration of all related transport and operating requirements and restrictions and of legal and collective wage agreement regulations. The goals were minimizing of deadheading of equipment, minimizing of the crew costs and other means of reducing operating expenses. The eventual goals will be graphical production of timetables and the optimization of connections between different routes.

21 097283 LEVEL-OF-SERVICE CONCEPT FOR EVALUATING PUBLIC TRANSPORT. A system of evaluating service variables common to all public transport modes is proposed so that an existing system may be managed or improved and a new system may be built on the basis of its ability to fulfill a desired level of service. The variables discussed are those directly perceived by the user regardless of mode: overall trip speed and en route delay and comfort factors associated with the vehicle including density, acceleration, jerk, temperature, air flow, and noise. Improving one or more of these measurable variables bears an associated cost and design requirement. Since better service is desirable in certain situations while average service is sufficient in others, levels of service A through F are adopted for each variable. In the proposed system, level of service is determined by the use of a weighted average of rankings assigned to individual factors. Within tolerable limits, 40 percent of the overall ranking should be based on speed and delay and 60 percent on comfort factors. When an individual comfort variable becomes intolerable, the entire ride is at service level F. Application of the

procedure results in reasonable comparisons of both systems and individual trips within a system.

21 097676 THE INTERACTIVE GRAPHIC TRANSIT DESIGN SYSTEM: A BRIEF NON-TECHNICAL OVERVIEW OF ITS STRUCTURE AND OPERATION. The purpose of this paper is to present a brief summary of the structure and operation of a man-computer system for designing a bus transit system for many origin-to one destination travel patterns in an urban region. In its manual mode, the planner is asked to make eight decisions concerning park-ride lots, the type and frequency of the bus service and the pricing of the complete journey. A modal split model then determines the percentage of people taking the modes, walk bus, drive bus and drive. Visual displays enable the planner to evaluate the economic and socio-economic performance of his system. The system can also pre-set some of the eight decision variables in order to limit the number of combinatorial options available to the planner. The system will soon be applied to the problem of designing and evaluating a bus transit service to the campus of the University of Washington, its first test in a real-world setting. /TRRL/

Schneider, JB Gehner, CD (Washington University, Seattle) *Logistics and Transportation Review* Vol. 10 No. 1, 1974, pp 41-53, 2 Fig., 5 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 212143)

21 097868 VEHICLE IDENTIFICATION IN PUBLIC TRANSPORT [Voertuigidentificatie in Het Openbaar Vervoer]. This article is meant to prompt local and regional public transport to adopt a uniform attitude towards a standard coding. To that purpose a number of possible forms of organisation are juxtaposed and the consequences for the standard coding as well as the effects on the organisation are compared. For the time being a form of organisation for each transport area is preferred to one for each control area. However, the proposed standard coding provides for both forms of organisation. Attention is also paid to the equipment needed. The article gives a practical key to the organisation per transport area. /TRRL/ [Dutch]

21 098580 IMPROVING URBAN MOBILITY THROUGH BETTER TRANSPORTATION MANAGEMENT. Pressure is building in America to "do something" to improve urban mobility. Many treatments designed to relieve these combined pressures rely on the development and demonstration of new systems technology which usually requires long lead times and high capital costs. However, there are low-cost options available to use now which can significantly improve urban mobility, can be implemented quickly, and also offer environmental and energy conservation benefits. Some of these techniques concentrate on improving the people-moving efficiency of the

existing road systems through more effective management; some at improving transit operations. Others concentrate on improved utilization of the automobile through ride-sharing programs. Still other techniques attempt to reduce the demand for motor vehicle transportation services and facilities. The technique or combination of techniques used depends on the needs and resources available in the specific area, but each can be a positive response to the complex issues involved in urban transportation today. This publication illustrates what is being done and what can further be done to improve urban mobility.

21 099240 EVALUATING PUBLIC TRANSPORTATION FOR EFFECTIVE DECISION-MAKING. This paper views evaluation criteria in the transportation planning process from the operator's perspective. It is concluded that evaluation criteria for goals objectives, and responsibilities must be designed to permit innovation in organization structure, facilities, operating procedures and practices, and service promotion, merchandising, and marketing. A table is presented showing evaluation criteria from the operator's perspective. It is organized according to the following three major areas of concern: organization, facilities, and operations.

21 099245 WORKSHOP 4: THE OPERATOR'S ROLE. The purpose of Workshop 4, which viewed the evaluation of urban public transportation from the operator's perspective, was to examine the following 5 basic subject areas: the elderly and the handicapped, manpower, hardware and equipment, financial, and marketing and management. This report of the proceedings of Workshop 4 identified the following research projects as being necessary for an adequate evaluation of urban public transportation: (1) planning and design of mass transportation services to meet mobility needs of the elderly and handicapped; (2) study of the merits and problems of combining some transit, school transportation, and goods movement with transit vehicles; (3) evaluation of the purchase of new transit vehicles via the consideration of new-vehicle quality as measured through vehicle maintenance costs; (4) effectiveness of Federal and/or State operating subsidies for urban public transportation; (5) development of effective marketing disciplines for promotion of use of club buses, subscription bus service, special charter group trips, etc.; (6) effect of car pool promotions on transit; (7) evaluation of fare packaging procedures as a tool for inducing transit ridership and reducing the cost associated with the sale and collection of tickets; (8) use of retired and part-time personnel as transit employees; and (9) human resource and development needs for expanding transit services.

21 099301 ROLE AND EFFECTIVENESS OF CONTRACT MANAGEMENT IN THE TRANSIT INDUSTRY. During the past decade, there has been a growing trend toward public acquisition of failing private transit companies. Many cities recognized however, that they do not have city personnel with the expertise, knowledge, or experience to run the newly acquired systems. Public entities which are responsible for the transit operations of publicly owned transit systems often must be created and take the form of transit authorities, commissions or boards. Many public entities have turned to transit management companies to run the daily operations of their systems. A study of the three major contract management companies and 26 properties managed by them has been conducted. The purpose of the study was to: 1.) survey the three major transit management companies in terms of ownership and history, present size and operating scale, management philosophies and corporate perspective on transit management; 2.) survey the organizational structures of various transit systems operated by contract management, the decision making process and the organization effectiveness. Results and conclusions obtained from this research could be summarized in the following: 1) contract management companies perform a justifiable role in the current state of development in the transit industry; 2) there are three basic types of organization structures utilized by publicly owned-contract managed transit systems. Each of these types tends to have typical characteristics relative to the decision making process within the organization; 3) transit systems associated with each of the major transit management companies tend to have individual characteristics which reflect each company's own operating philosophies and perspective. At the end a number of recommendations have been made relative to contract management and future research.

Bakr, MM Robey, D Miller, TS (United States Marine Corps); Marquette University No Date, 51 pp, 2 Fig., 5 Tab., 13 Ref., 1 App.; Prepared as part of a program of Research and Training in Urban Transportation at Marquette University sponsored by the Urban Mass Transportation Administration.

21 099496 BUS PRIORITY STRATEGIES AND TRAFFIC SIMULATION. Simulation of corridor traffic (SCOT), a recently developed computer model that simulates traffic flow within a specified traffic system, has been used to predict the effect on bus service and general traffic performance of implementing candidate bus priority strategies. Numerical values of standard traffic performance measures were determined from computation of network vehicle trajectories. SCOT was calibrated to current peak-hour traffic conditions within an urban street grid representative of the central business district of Minneapolis. Data from city agencies were used in conjunction with field experiments to verify SCOT simulations. Various bus priority strategies designed to increase bus speeds by providing bus-only lanes were evaluated. The significant elements in bus travel time were shown to be frequency of station stops and red light signals. Further studies planned include identifying optimum bus station locations, developing bus progressive traffic signal timings, and evaluating various bus preemption of traffic signal strategies.

Demonstration projects are under consideration to evaluate the simulation technique as a transit operations tool.

21 125197 BINARY STATION CHOICE MODELS FOR A RAIL RAPID TRANSIT LINE. Using two independent data sets, alternative binary station choice models were successfully calibrated and tested. The regression and probit models are based on a two stage decision process: first the commuter selects his mode of travel, and then, given the use of rapid transit, he chooses a station. The station choice models focus on the second stage of the decision process. The models estimate the relative frequency a station will be selected by commuters from a census block group, given a modal choice of rapid transit. This proportion is a function of the trip cost difference between that station and the next least cost station. /TRRL/

21 125452 COMMON BUS LINES. In large cities operating an important public mass transit network, we are faced with the problem of "common bus lines:" some routes share common sections and the passenger must select the buses he will probably use. While most computer packages code the section as a unique link and disregard the precise assignment of passengers on the distinct routes, we give a solution to this operational assignment based on the "perceived" travel time. Formulated as an optimization problem within a probabilistic context, the optimal subset of routes "to be selected" is obtained. A more detailed treatment on uniform and exponential cases for the time of the first vehicle to arrive on a route concludes the paper. /Author/

21 125535 PASSENGER TRANSPORT OPERATIONS. RECOMMENDATIONS ON A STANDARD FINANCIAL STATEMENT AND A ROUTE COSTING SYSTEM. As part of their duties under the local government act 1972, the new county councils will have an overall responsibility for transportation, planning and their co-ordination. The new authorities will be expected to draw up transport policies and programmes for submission to the department of the environment. In order to do this they will need to know details of cost and revenue information for a wide variety of patterns and levels of bus operation. At present the various classifications of operators who provide public road transport vary widely in their accountability and information practices, and this paper gives recommendations for A standard financial statement and a route costing system. The layout of the standard financial statement is given and detailed notes are provided. The prime basis of the route costing

system is time, although specific items are costed solely on a mileage basis. Appendices are given showing suggested cost allocations, layout, recommendations for allocating revenue to services and peak vehicle allocations. /TRRL/

21 126086 OPTIMIZATION OF PUBLIC TRANSPORT SYSTEMS [Optimalisering av Openbaar Vervoerssystemen]. Little attention has been paid to the optimization of public transport systems having fixed routes and fixed schedules and with or without a specific infrastructure. Optimization in this case concerns traffic-dependent quantities, e.g. number of travellers, traveller-kilometrage, costs and revenues. A very important factor in optimizing a public transport system is the strong relation between transport demand and transport facilities (accessibility, speed, frequency). At present only partial solutions are available; the most relevant of these are described. In the long term the research by this author is aimed at solving this problem as far as possible. First, research is proposed on the interrelation of supply and demand by elaborating a particular method yielding partial solutions. For this purpose a computer program is being developed. /TRRL/ [Dutch]

21 127729 THE IMPACT OF TECHNOLOGY ON INTERNAL ORGANIZATION OF THE URBAN PASSENGER TRANSPORTATION ENTERPRISE. This paper introduces methodology, data analysis and results relating to work organization characteristics in three areas—taxi-cab companies, bus operations and rail rapid transit. Technology as an independent variable is quantitatively scaled according to vehicle loading capacity, service controllability and capital intensiveness. The model proposes two objective measures—Time Span of Discretion (TSD) and Discretionary Resource Rate (DRR) at various hierarchical levels, along with their product—the Position Power (PP). The organizational structures of the various urban transportation enterprises are appraised on this basis.

21 127901 PUBLIC TRANSPORTATION LINE POSITIONS AND HEADWAYS FOR MINIMUM USER AND SYSTEM COST IN A RADIAL CASE. In this paper, a model of a transit system is built in polar coordinates with radial transit lines in order to find the line positions and headways which minimize user (travel time) and transit agency (operating) costs in response to A general population density function. It is found that the optimum line location is related to the population density and the circumferential access. The optimum headway is found to be that which causes user waiting time cost to equal the operating cost. The simplification of a population density function varying only radially is introduced. A method for determining the optimum number of lines is developed. This number depends upon the ratio of the access cost to the sum of the waiting and operating costs. It is proven that, for optimality, lines should be located in the centers of corridors of uniform width and have equal headways. A fleet size constraint is also introduced for the simplified case. It is proven that for optimality, the fleet is divided equally between lines. (A) /TRRL/

21 128744 FEEDER BUS SERVICE FOR COMMUTER RAIL. A demand model for feeder bus ridership is developed (input variables: location of rail users, income of users, transit fare, level of transit service and walk time to bus route), and a cost-effectiveness framework is used to compare alternative systems. The main measure of effectiveness was the number of commuter rail users who would use the feeder bus service, and the cost was taken as the long run marginal cost, or the total average cost. Application of the methodology to a study area which included three commuter rail stations showed that all feeder bus systems would operate at a loss. Bus routes with loops in residential areas and direct service to the stations had the best ridership.

21 129295 THE OVERALL JOURNEY TIME AS COMPARED WITH TRAVELLING TIME IN LOCAL PUBLIC TRANSPORT [Die fahrzitatequivalente Reisezeit im oeffentlichen Personennahverkehr]. The journey time is composed of different elements, to which different weighting factors should be applied, so as to which different weighting factors should be applied, so as to give them a value corresponding to the passenger's psychological attitude to each different aspect of the journey. The author analyses weighting factors for walking time, waiting time, and time spent catching connections. He then illustrates with examples the influence of the weighting factor of these times and of frequency of the service on the overall journey.

21 129346 BUS CAPACITY ANALYSIS. This paper provides an initial input for updating the section on bus capacity in the Highway Capacity Manual and identifies parameters, principles, and procedures for estimating the capacity of bus facilities and systems. It reviews available data on bus capacities, suggests design assumptions for bus system planning and analysis, and outlines further research needs. The studies demonstrate that (a) the critical element governing system capacity is the bus station platform or bus stop rather than the busway; (b) at stations, capacity is determined by the number of door channels on the bus and fare collection practices; and (c) bus capacity should be viewed in terms of people transported rather than buses moved per hour.

21 129347 FRAMEWORK OF ROUTE SELECTION IN BUS NETWORK DESIGN. The purpose of this study is to establish a framework of route selection in bus network design, based on the proposed functional description and evaluation system. In the proposed framework, the network is classified into residential, activity, and transfer nodes. Routes connecting the transfer nodes serve as the regional system, and other routes constitute the local systems. The evaluation system designed is capable of reflecting both the connectivity of transfer nodes and the accessibility of the residential and activity nodes. To establish the priority of route selection, several attributes were tested against transit use at the neighborhood level. The level of transit service was the sole dominant factor in the traveler's determination of mode choice. Furthermore, the employment activity nodes were significantly correlated with route performance. If the work trips and route performance are given prior consideration, employment serves as a good index during the process of network development. If the provision of accesses to other activities is taken into consideration, employment can also serve as

a good indication by connecting those activity nodes to the other elements of the network. This framework will be especially useful when it is integrated in a heuristic algorithm for optimization of network design. A case study was carried out to demonstrate the use of this framework in four stages of bus network development in the Denver area.

21 129809 ROUTE LAYOUT PHILOSOPHY AND SERVICE COORDINATION PARTICULARLY FOR LIGHT RAIL TRANSIT. Peak-period and all-day service in public transportation are discussed with emphasis on light rail transit. Peak-period service treats each line as a separate entity operating from residential neighborhoods directly to the central business district. This type of service is typified by the American metro-mode motor-bus concept. Each route in an all-day service interacts with every other route enabling regionwide mobility. This integrated approach is found throughout Europe and is also well developed in a few U.S. and Canadian cities. Traditional network arrangements, such as radial and grid setups, and more recent concepts, such as the timed transfer focal point, are considered. Detailed aspects of service integration including schedules, passenger facilities, information, and fares are reviewed. That a widespread disinclination in North America to implement integrated systems exists because of limited funds and management disinterest is noted. The organizational structure successfully adopted in Europe to bring about service integration is described.

21 129969 SIMULATION OF URBAN RAILWAY TRANSPORT WITH COLOR GRAPHIC DISPLAY IN CONVERSATIONAL MODE [Utilisation d'une console de visualisation quadrichrome en mode conversationnel pour l'étude de la regulation d'un reseau ferre urbain]. General evolution of urban rapid transit is leading to a reduced headway between trains in order to increase the transport capacity during peak hours. Any traffic disturbance becomes rapidly more and more important and it is difficult to maintain the theoretical maximum capacity. A conversational mode system, consisting of a 4 color graphic display connected with a computer enables consultant engineers to simulate traffic. The display gives a space-time, or speed-space diagram and the operator can modify it, using light pen, function keys and keyboard. Introduction of a disturbance in traffic flow may result in different kinds of diagram, according to the selected corrective strategy. Automatic regulation may be tested on this system, and later applied on real-time system. [French]

21 131801 MORE CONVENIENT CHANGING AT PLACES WITH A CONCENTRATION OF BUS STOPS [Geriefellijker overstappen op een busseplein met halteconcentratie]. One of the measures which public transport companies can take to improve their product lies in the field of provisions for changing. This article deals with a system that has been developed with the purpose of reducing the inconvenience of changing at big stations with much bus movement and a large concentration of stops. It also pays attention to the arrival and departure platforms as well as the buffer space, the working out of the chance that the buses that arrive will outnumber the platforms is based on the method of elementary probability calculation. In the case of busy stations the application of formulae from the stochastic theory of processes is more suitable. /TRRL/ [Dutch]

21 132237 A COMPUTER PROGRAM FOR THE ANALYSIS OF WAITING TIME SURVEY DATA. This paper describes a computer program developed at the Traffic and Transport Survey division, PWD, Hong Kong. It begins with a brief review of methods used in the study of delays experienced by pedestrians at the kerbside, waiting times of bus passengers at a bus stop or those of vehicles at a vehicular ferry concourse. The tedious data analysis work has prompted the development of a computer program which, in addition to simplifying data analysis, helps to extract as much information as possible from the survey data. The input data include the numbers of bus passengers waiting at the commencement and the end of the survey, the numbers of passengers arriving or departing (by bus or otherwise) in subsequent specified short intervals. Assuming a proper queue formation, the computer evaluates the statistical distribution of passenger waiting times and presents the information in a histogram in bar chart form. (A) /TRRL/

21 133104 SCHEDULE CONTROL AND MANAGEMENT INFORMATION SYSTEM STUDY. The report describes a study performed for the Chicago Transit Authority (CTA) to develop recommendations and development plans for a Schedule Control and Management Information System. According to the authors, this system would be a further improvement upon and extension of the Automatic Vehicle/Bus Monitoring (AVM) System which was installed

by CTA in 1970 and was the first of its kind in the U.S. Sections 1, 2, and 4 of the report constitute the equivalent of an executive summary. Section 1 presents an overview of the system, giving the purpose, background data, and scope of the study. Section 2 gives system requirements, functional information flow, and a brief system description. Section 4 details the implementation plan with a breakout of functions and task objectives including a discussion of schedules and personnel organization and responsibilities, and a detailed discussion of potential benefits. Section 3 comprises a comprehensive system description by subsystem including bus control, communications, communications processing, main processing, operations control center, route control, street displays, customer information system, and radio maintenance.

21 134683 INTERACTIVE GRAPHICS SYSTEM FOR TRANSIT ROUTE OPTIMIZATION. A person-computer interactive graphics system for optimizing the routing structure on an urban transit network is presented. The system allows a user to design bus, streetcar, and subway routes on a display scope and to specify route frequencies and types of vehicles. The computer predicts the effects of the routing structure by assigning potential transit trips to the network and it displays the route loadings along with statistics on travel times, rolling stock use, and operating costs. After evaluation, the user can partially or totally modify his or her designs and thereby move toward routing schemes that come closest to planning objectives. The system is based on a multipath transit assignment model that is a further development of R. B. Dial's stochastic assignment algorithm. The model is implemented on a CDC 7326 series computer with a display scope, and it has been tested by being applied to the Lausanne, Switzerland,

public transit system. A second implementation of the model has been realized on a small computer environment and is being used productively for optimizing the 24-route tramway and bus network of Basel, Switzerland. The methodology and some results of these applications are described.

21 137057 DATA MANAGEMENT METHODS FOR URBAN MASS TRANSPORTATION SYSTEMS. The report describes a computer based Data Management and Retrieval System for the Urban Mass Transportation Industry. The System is designed to aid the transportation planner, engineer, and manager in solving recurring problems associated with (1) collection; (2) categorization and synthesis; (3) storage and (4) retrieval of urban mass transportation information. The system is designed to be used by personnel without formal computer training with the everyday vocabulary associated with many classes of rapid transit operation, evaluation, and studies. The features and use of an example system is described for rail rapid transit noise abatement studies. The example system combines (1) physical data describing the system and (2) measured noise levels as an aid in evaluating cost effective acoustic treatments for lowering rail rapid transit noise.

21 137349 DEVELOPMENT AND OPERATIONAL VALIDATION OF A TRANSIT BUS SIMULATION. A computer simulation incorporating the significant operational factors and transit bus characteristics has been developed to compute power, fuel consumption, and emissions over an arbitrarily prescribed mission profile. Factors considered include roadway grade, air density, aerodynamic drag, bus center-of-gravity location, front and rear tire inflation pressures, acceleration, weight, and torque converter characteristics. A portable instrumentation package was designed, constructed, and installed on a bus. Operational tests were conducted for a variety of velocity-time profiles for three gross weights. Continuous data recorded included engine speed, torque-converter output shaft speed, fuel flow, electrical load, wind speed and direction, and atmospheric data. Typical mission profiles for an urban transit bus were established by shadowing buses on two most typical routes. The results of the experimental program and mission profile analysis have been used to validate the computer simulation previously developed and to allow the determination of the relative importance of operational and design features on the fuel economy and emission characteristics of a transit bus operating on a realistic mission profile.

Fairchild, JE; Stephens, LW; Williams, T; Simmons, GAJ; Texas University, Arlington, Urban Mass Transportation Administration, (UMTA-TX-11-0001) UMTA-TX-11-0001-75-2, Nov. 1975, 99 pp; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-254891/5ST

21 137378 A PRELIMINARY SYSTEMS DESIGN FOR A MULTI-PURPOSE TRANSIT PLANNING AND MANAGEMENT INFORMATION SYSTEM. The report presents a preliminary systems design for a multi-purpose transit planning and management information system. It conceptualizes two such information systems: one for the automation of transit schedule data for the production of scheduling related reports, and the other for the automation of transit schedule data and street network data for a general transit information system. While the former system is designed to produce the types of reports currently manually produced and in use by the transit industry, the latter system is intended to provide an automated data base for the planning and marketing of transit services. The purpose of the report is to provide transit properties and others with an efficient file structure for organizing schedule data for the production of various types of output based on the concept of random access search.

21 137964 TECHNICAL APPROACHES IN CO-ORDINATING PUBLIC TRANSPORT. The author describes his work in Cleveland, Ohio which was concerned with quantifying the level of public transport service and personal mobility. The criteria chosen for calculations on the level of service are coverage, linkage, frequency and speed. Category analysis is carried out calculating public transport opportunities and accessibilities on four different types of trips. This shows up weaknesses in some areas such as inaccessibility for shopping. Given a desired level of public transport investment it can be seen how to allocate improvements. Some useful results are obtained from the study. The discussion which followed is included. /TRRL/

21 138131 LABOR IN THE TRANSIT INDUSTRY. This examination of employment and compensation trends, labor/management relations, government involvement and employee productivity, found that management (which comprises 15 percent of the workforce) receives inadequate attention, and that labor compensation comprises approximately 65 percent of the industry's operating costs. It urges that Congress should expand Urban Mass Transportation Administration funding of management related programs to remedy the situation regarding recruitment and training of management personnel. Transit union activity related to compensation should be closely monitored by UMTA. The implications of Section 13(C) of the Urban Mass Transportation Act of 1964 are covered and the role and impact of paratransit service is considered. Labor productivity is examined and it is noted that while neither system size nor ownership have a significant effect on labor productivity, work rules and compensation patterns exert a major influence on productivity.

21 138981 A MATHEMATICAL PROGRAMMING MODEL FOR OPTIMAL SCHEDULING OF BUSES DEPARTURES UNDER DETERMINISTIC CONDITIONS. The article formulates a mathematical model of a general public transportation network and suggests an optimization procedure to schedule the buses' departure times. It is assumed, as a reasonable approximation, that the network operates under known deterministic conditions; namely, the lines' routes, the stations' locations, the numbers of passengers and the traffic intensity are supposed to be given. In this general framework, however, no further restrictions are imposed. The proposed performance index of the system is the average waiting time of passengers, and it has to be minimized by a proper choice of the decision variables-i.e. The buses' departure times-without violating the constraints of prescribed numbers of buses and drivers. For the sake of lucidity the model is first developed under the assumption that the loading as well as the unloading times of passengers are zero. Afterwards the consequences of the relaxation of this supposition are investigated. (A) /TRRL/

21 139353 URBAN TRANSIT OPERATIONS: MANAGEMENT INFORMATION SYSTEMS AND COMPUTER APPLICATIONS. This selected, annotated bibliography which covers publications between 1970 and September 1975, places emphasis on information which may be of use to the transit operator. The 203 citations here relate to management information systems, scheduling, bus transit demand service bus transit priority operation, communications and control (bus transit, rapid transit taxicabs, urban transit), fare collection, traveler information, maintenance and security. An author index and geographic index are included, as well as addresses of periodicals and publishers.

Henry, MK; Northwestern University, Evanston Bibliog. 1975, 36 pp, 203 Ref.; Sponsored by an UMTA Grant.

21 141283 TRANSIT SYSTEM CIRCULATION SIMULATOR: A PRACTICAL DESIGN TOOL. This paper presents a transit circulation simulation model to be used heuristically for evaluating and choosing from alternative designs. The simulator measures changes in the performance of a trial transit system that result from variations in the design parameters. These include location of transit nodes, demand flows, vehicle capacity and speed, location of routes, and number of vehicles per route. The model output includes system, route, and vehicle performance characteristics, number of passengers served, and their average in-system travel and wait times. A monitoring capacity provides information, at any time interval, for the number and location of

passengers waiting for service, delivered, or en route. The time interval scanning technique is also used to trace the movement of vehicles through the transit system and to provide insight for the next trial scheme. The simulator is demonstrated through the analysis of a new transit system for a university activity center.

21 142317 METHODS TO SIMPLIFY NETWORK REPRESENTATION IN TRANSPORTATION PLANNING. The problem of Network Aggregation is defined as the simplification of the number of nodes and links in a transportation network. The objective of a network aggregation technique is to reproduce the level-of-service attributes (such as travel time) between any two points using a spider network as a proxy for the detailed. The aggregation procedure categorizes links into functional groups such as access, egress, line-haul, bypass and intra zonal circulation--which is a convenient classification in terms of transportation analysis. The technique presented has several distinguishing advantages. First, certain invariance properties are maintained--for example the total trip miles of travel is the same whether measured in the aggregate or detailed networks. Second, the method is systematic, rather than judgemental, which means the inaccuracies introduced as a result of network aggregation can be measured in a scientific way.

21 142367 STAGGERED WORK HOURS IN MANHATTAN. In April 1970, about 50,000 persons from 45 private firms and government agencies in the downtown area began a new program of staggered work hours designed to determine if a break from the 9 to 5 schedule would relieve transportation congestion. By September 1972, more than 70,000 persons from 116 firms and public agencies had shifted to a new schedule from 8:30 to 4:30 and some from 9:30 to 5:30. Analysis of this operation indicates that

people like the new schedule, congestion at the peak hours has been relieved, and transportation operations have improved their services. Project sponsors met with commuter rail and transit system operators to suggest certain schedule and service changes. Elevator operations in main lobbies of office buildings have also been improved. Productivity changes are also noted: supervisors reported gains under the new hours; and the punctuality of employees increased.

21 142727 A QUANTITATIVE MODEL FOR NUISANCE [Een kwantitatief model voor hinder]. The utility of a transportation system, such as a road structure or a public transport system, is affected greatly by the nuisance caused by the operation of the system. In this paper an attempt is made to quantify the nuisance. A model is suggested which describes the relation between the nuisance experienced and its origin. The model has been applied to several types of nuisance, namely the influence of the number of transfers and the walking distance on the appraisal of public transport, the influence of the noise level on the nuisance experienced and the influence of traffic density on the mean speed. 21 142959 PEAK-HOUR TRANSIT ROUTING. Transit routes radiating from the CBD are typical of most city bus operations. This type of routing has existed since the late 1920's with major changes primarily in the form of longer and more routes as the city grows. The major innovations away from this trend, the demand responsive systems, have met with varying degrees of success and in general have two undesirable characteristics, high cost and low ridership. The research reported here describes an alternative which incorporates both the advantages of the fixed route system and some of the advantages of demand responsive systems. The concept requires a residential clustering of employees who work at or near a single location. In this regard the six largest employers in Cedar Rapids, Iowa were analyzed. The 10 largest employee residence zones of each firm (99 total metropolitan area zones) accounted for 37.5%-52.7% of the total number of employees of each firm. The firms analyzed were dissimilar in location (CBD to fringe), and in employee characteristics (white to blue collar employees).

21 143038 A COMPUTERIZED BUS TRANSIT MANAGEMENT INFORMATION SYSTEM USING CREDIT CARD FARE COLLECTION DATA. This research indicates that development of a bus transit management information system that uses data from a bus credit card fare collection system is feasible from

a hardware and software standpoint. An assessment of the data available from the credit card system shows that valuable and timely ridership and revenue information, which would not be readily available otherwise, can be provided to assist in management decisions regarding changes in service. To match the large amount of available information to the transit manager's needs, a two level form of presentation is proposed with daily indicators for monitoring transit system performance and detailed reports available on demand.

21 144348 OPERATING STRATEGIES FOR BUS TRANSIT IN EDMONTON. This paper discusses the functions of public transit and what parameters determine the operating strategy to be followed. The physical considerations are then taken into account, both in relation to land use, inter-connectivity and the levels of service that are desired; keeping in mind what can be accomplished within budget constraints. The system of timed transfers as used in Edmonton is then discussed and how this system is being developed in stages and what impact the system has on patronage.

21 145179 ROUTE SELECTION IS CRITICAL FACTOR IN DESIGN OF RAPID TRANSIT SYSTEMS. This paper examines and compares the Washington METRO System and the BART System with respect to route selection, station location, and service to the metropolitan area. The Washington METRO, less restricted by geographical and political constraints, is a more flexible system and offers a more flexible service. BART is a commuter rail system that complements the local transit systems, while METRO will become the backbone of an integrated regional transit system.

21 146437 A MATHEMATICAL MODEL FOR THE OPTIMUM UTILISATION OF BUS ROUTE NETWORKS, AS APPLIED TO LINKOEPING [En matematisk modell foer optimal trafikering av busslinjernaet tillampad paa linkoeping]. This report, which refers to the project OPTKOLT (computerised optimisation methods for the allocation of public service buses in urban areas), describes a network model, formulated as a mathematical programming problem, the object of which is to find frequencies for the bus lines and the number of travellers between areas, broken down by mode (by bus and on foot) and by road, in such a way that the total generalised journey time is minimised without the capacity of the buses being exceeded. Input data are a given bus network and a certain number and types of buses, as well as the number of trips to

and from each area. The model is intended for use in planning situations in the medium term, and is useful for testing alternative networks. It has the advantages that it takes into account capacity restrictions, and that it does not employ a given trip matrix but allows the matrix to adapt to the supply of transport. The model has been applied to the bus network in Linköping with good results. /TRRL/ [Swedish]

21 146512 NORTHEAST CORRIDOR IMPROVEMENT PROGRAM. TASK 1: MANAGEMENT SURVEY SUMMARY REPORT. The summary report presents an overview of the organizational structure and construction management function of several, largely transportation oriented, construction projects. The nine organizations surveyed were: (1) Alyeska Pipeline Service Company, (2) Bay Area Rapid Transit District, (3) Chicago Transit Authority/Chicago Urban Transportation District, (4) Dallas-Fort Worth Regional Airport, (5) Federal Highway Administration/New York State Department of Transportation, (6) Metropolitan Atlanta Rapid Transit Authority, (7) Massachusetts Bay Transportation Authority (8) Naval Facilities Engineering Command/Trident Project, and (9) Washington Metropolitan Area Transit Authority. The data reported focuses on six major topics for each organization. They are: (1) project and organization background and overview, (2) funding and budgeting considerations, (3) project management and project monitoring, (4) construction project management, including cost and schedule controls, (5) management information systems, and (6) institutional considerations.

21 147295 THE OPERATION AND MANAGEMENT OF THE SHIRLEY HIGHWAY EXPRESS BUS-ON-FREEWAY DEMONSTRATION PROJECT. In September 1970, UMTA approved a demonstration grant to the

Northern Virginia Transportation Commission to design and implement transit service on an 11 mile exclusive busway from suburban Virginia to downtown Washington, D.C. The grant also called for development of fringe parking lots to serve the exclusive lanes. The success of the project both in terms of ridership and fare box revenues has been widely recognized in the transit industry. This document reports on the project from the viewpoint of the project sponsor. Thus, the report contains information which in all probability could not be obtained from other sources and which would not ordinarily be reported in any technical evaluation of the project. Also included in the report are some of the marketing and merchandising activities that contributed to the public's awareness and acceptance of the express lane concept.

21 147483 THE MODELLING OF PLATOONING TENDENCIES IN PUBLIC TRANSPORT. This article sets out the causes of vehicle platooning in a public transport system which operates without a fixed schedule. It demonstrates that the traditional model is inadequate in such cases. An alternative model based on a Markov chain is presented and both models compared with a simulation. It is shown that simulation must be adopted once near-even spacing of the vehicles is lost. (a) /TRRL/

21 147674 THE CONTROL AND ROUTING OF VEHICLES. The paper discusses the various forms of control systems at present applied to some existing form of road or rail transport. Control strategies for new systems such as never-stop railways, moving pavements and driverless vehicles on reserved track are examined. Active and passive forms of guidance are reviewed, expressions are derived for safe headway and the safety factor in asynchronous control. The merits of synchronous and asynchronous control are compared. Switches, merges and crossing points, the components of intersections are discussed from the control point of view. The problems of station design are examined. The author concludes that only in safety, and in the avoidance of congestion, is an automatic system likely at present to out-perform a system with drivers, and there is no evidence to date confirming the possibility of commercial operation at short headways of say 3 seconds. /TRRL/

21 147858 ON ESTIMATING EFFECTIVE FREQUENCIES AND AVERAGE WAITING TIMES FOR INDIRECT CONNECTIONS. This paper is concerned with the problem of

estimating two important service properties of transportation systems in which a traveler may have to use more than one vehicle to complete his journey, such as in urban public transport or intercity air, bus or rail systems. The service properties are waiting time for connections and effective frequency of service from origin to destination. These two service characteristics are among those five-cost, travel time in the vehicle, waiting, access time, and departure frequency-typically found to be most important in transportation planning models for estimating system usage. Despite their importance, there exist no methods for estimating waiting time and frequency which are compatible with the information available in transportation planning studies. In this paper theoretical models for estimating these are developed and then tested with actual data. They are found to be quite accurate in terms of quality of fit to the empirical data. Their use in urban and intercity transportation planning contexts is described, along with the data required, which consists simply of the number of vehicle trips on each of the links and for each of the time periods of interest. /Author/TRRL/

21 148091 PUBLIC TRANSPORT ASSIGNMENT CALCULATIONS WITH THE TRANSCOM SUITE. This consideration of the important features of Transcom describes the techniques for the computerized version of a network as well as the assignment calculations (as an example of the utilisation of the computerized version). The transit network information structure framework is described and the details are discussed of its principal concepts: zone, centroid, link, node, section and lines. The details are given of the assignment method which involves a minimum travel time tree where the travel time between 2 nodes is defined by an impedance function. The methods presented here have been implemented in the Montreal Urban Community Transportation Commission network which consists of 3 metro lines and 115 bus lines with 600 nodes in the network.

21 148293 DEVELOPMENT OF A MODEL FOR ANALYSIS OF THE COST EFFECTIVENESS OF ALTERNATIVE TRANSIT SYSTEMS. A theory has been developed for preliminary analysis of transit alternatives by which estimations of average performance, power use, and cost effectiveness of all types of transit alternatives (scheduled, demand-responsive, automated, manually driven) may be computed for given and varying population distributions and travel behavior. Computation on a digital computer for a specific set of input parameters is very rapid, therefore extensive parametric analysis of each alternative is possible with respect to variations in over 70 geometric, kinematic, dynamic, service and economic variables. A new method of application of mode-split theory is used, and the computation technique correctly accounts for all modes of access to and egress from transit stations or stops without use of ad hoc assumptions.

Anderson, JE (Minnesota University, Minneapolis); Colorado University, Denver Conf Paper Vol. 1, Paper 9, 1975, 42 pp, 12 Ref.; This paper was presented at the International Conference on Personal Rapid Transit held in Denver, Colorado, September 16-19, 1975.; ACKNOWLEDGMENT: EI; ORDER FROM: Colorado University, Denver, Center for Urban Transportation Studies, Denver, Colorado, 80202

21 149507 NEXT STEPS IN URBAN TRANSIT. The need for understanding Personal Rapid Transit (PRT) is noted, the associated environmental and financial problems are reviewed, and the use of data processing to improve both management and control fleet operations are discussed. The use of automatic train operation and program machines at intersections, the command subsystem and the safety subsystem of the Victoria subway line in London are described. The storage of an entire weeks time table on plastic tape, and human communication is also described. Transit planners now contemplate demand-responsive systems for urban trips of under 15 miles. The Group Rapid Transit (GRT) in which driverless vehicles run apart from regular street traffic on guideways are reviewed, and comments are made on the relatively simple Airtrans at Dallas-Fort Worth Airport and the sophisticated system in Morgantown. Details are given of the asynchronous (vehicle follower) or synchronous (spot follower) command and control used by both the PRT and GRT. The technical prospects of advanced transit technology are discussed and the observation is made that although such prospects are high, political prospects are low.

Carroll, H (International Business Machines Corporation) *Datamation* Vol. 22 No. 2, Feb. 1976, pp 86-94, 2 Fig., 2 Phot.

21 149733 PREPARING DUTY ROSTERS FOR BUS ROUTES BY COMPUTER [L'habillage par ordinateur des horaires des lignes d'auto-bus]. The authors recall that the rational running of a bus route requires a series of closely linked operations. If it is assumed that the route is known in detail, the first step is to set up an efficient system for the collection of data to learn

about demand and traffic conditions at various times of the day and at various points along the route. It is then necessary to anticipate (1 to 3 months before use) the operating schedule for the route. This being an allocation of resources in equipment and staff according to the tasks, it is composed of: first of all the graphic timetable or vehicle schedule for the buses; having established the frequency of the service to satisfy demand, one must set out, for each bus, the time of departure from the depot, the time of arrival at the terminus and the return to the depot; secondly the duty roster must be compiled, that is the shifts or duties complying with the statutory working conditions. It is during the following stage, with the establishment of staff schedules, that staff are allocated by name to the various shifts previously defined, after inserting the work days and rest days over a given period. Details are given of the studies carried out so that the user may avail himself of tools which enable him to improve the services offered and ensure better adaptation of the means available to the work to be done. /TRRL/ [French]

21 152138 A COMPARISON OF SEVERAL TECHNIQUES FOR SIMULATING BUS ROUTES. This report outlines the basis of simulation models of bus routes and the ways in which they may be used. It then compares several such models and the ways in which they have been used to represent various aspects of routes. It is found that although the models have many similarities, there are important differences, particularly concerning the movements of passengers, and it is often not clear which method of representation is preferable. Few models seem to have been validated to any great extent, and this has prevented a detailed assessment being made of the realism of the models. Suggestions are made about the features of the bus route which should be considered for representation in a model. (A) /TRRL/

21 152352 JOURNEY TIME AND OCCUPANCY CHARACTERISTICS OF THE HELSINKI METROPOLITAN PUBLIC TRANSPORT SYSTEM. This study which provides a method by which the Helsinki Metropolitan Public Transport System can be divided into homogeneous categories, also calculates the journey time and occupancy characteristics of these categories, and finds how journey time and occupancy characteristics depend on the characteristics of routes, the relationships between different journey time characteristics, and the dependence of journey time on occupancy. The study also compares different journey times with each other and different vehicles types with each other. The Helsinki public transportation system can be divided into 6 vehicle-route combinations which include 295 routes of the metropolitan total of 302 routes. District differences were found

between routes of different types, whereas the differences between vehicles were generally small. Models are presented which can be used for different stages of planning.

Himanen, V; Helsinki University of Technology, Finland Thesis Research Paper No 55, 1975, 189 pp, 35 Fig., 46 Tab., 9 App.

21 152913 MINIMUM FLEET SIZE MODELS FOR TRANSPORTATION SYSTEMS. There is an increasing interest in using computers for scheduling both fleet and crews of transportation systems. Programs that accomplish this have to be for a large part heuristic, however for some aspects an optimization approach is feasible and may improve the results. Moreover, the heuristic programs may benefit from theoretical studies that increase our knowledge of the processes involved. The purpose of this paper is to present a general fleet scheduling model together with a survey of applications to various modes of transportation. It will be shown that a general fleetsize formula for transportation systems, that expresses the transportation capacity needed in terms of vehicle departure and arrival patterns, can be applied to various situations: suburban railways, buses and airlines. In each of these models the passenger origin-destination statistics are assumed to be given, the vehicle arrivals and departures during the scheduling period (normally a day) constitute the variables. Basically these are dispatching models. Generally, there is room for another objective, apart from the fleet-size, as the number of schedules with minimum fleetsize is normally large. This approach leads to mathematical programming models for suburban railway and airline systems, which are applicable to practical situations, as is illustrated by computational results. The bus dispatching model leads to a theoretical model for optimal bus departure rates, as a function of the time of day; the model provides some clues concerning the construction of bus timetables. /TRRL/

21 152966 PATTERNS AND PROSPECTS; A RESOURCE BOOK FOR PREPARING TRANSPORTATION PROPOSALS. This compendium of papers dealing with the major components of a typical regional transportation system covers five specific areas: existing modes and their operational characteristics; paratransit; new technology; transportation system management; and transportation policies. Auto, bus, commuter railroad, rapid transit, taxicab, freight system, airport system, dial-a-bus, jitney, pooling, and school bus system are described. New technologies in auto, monorail, automated guideway transit gravity-vacuum transit, air-cushion vehicles as well as other fields are covered. System management elements such as reserved bus, transit security, guideway aesthetics and transit marketing are reviewed and comments are made on fare structure, auto restrictions, taxes, and other policy elements. The papers which state the

applications of all elements, also give specific examples as well as the advantages, disadvantages and issues surrounding each element.

21 154858 FACTORS INFLUENCING THE ADOPTION OF MANAGEMENT INNOVATIONS IN THE CTA. The process of management innovation in one transit property, the Chicago Transit Authority (CTA), is examined. The purpose of the study is to identify those factors of greatest relevance to innovation in organizations and to describe the extent to which those factors have helped the CTA to innovate successfully. Specifically, the research effort is designed to assess the environmental, organizational, linking, and attitudinal factors related to the recent adoption by the CTA of two management innovations: (1) Bus Utilization System, and (2) Microfiche viewers in the Travel Information Center. Both innovations significantly affect decision processes and have present and potential advantages for transit management. Data were collected from institutions and from structured interviews and questionnaires administered to persons closely involved with the development and use of the two innovations. (Data collection tools are contained in the Appendix.) Results show that the organization structure of the CTA had a positive influence on the adoption of both innovations.

21 155402 A SYSTEMS APPROACH OF OPTIMAL BUS NETWORK DESIGN [Research rept.]. This report reflects the view that one possible way to improve planning efficiency is to provide the planner with better coordination with decision-makers and with a systematic framework for the bus network design. The purpose of this research is to present a new approach for bus network design. The proposed framework is

comprised of four sub-models: attitude model, network generating model, prediction model, and evaluation model. This proposed framework is implemented on a macro-modeling basis. That is, a systems approach of bus network design in which a city is first modeled and bus routes are then fitted into this urban network of nodes and links. This macro-modeling approach is contrary to the street by street modeling of bus routes. Development priorities for various type of bus routes are derived from the socioeconomic characteristics of nodes along the route. In this report, sample applications of this new approach to bus network design are presented using both theoretical viewpoints and empirical analyses. An example of applying the proposed methodology to the Denver area is given to illustrate the operational characteristics of the framework. This study concludes that the proposed approach is a workable one and will be a help to planners in improving the efficiency of transit planning.

21 156208 IMPROVEMENT OF AN UNDERGROUND'S TRANSPORT CAPACITY WITH TWO DIFFERENT OBJECTIVES. The paper deals with optimization studies that looked into minimizing run time as train frequency increases, (this minimizes the number of trains necessary to run the service); and making the best use of the given theoretical transport capacity by looking for all servicing trains with balanced load. The studies were part of an investigation into connecting the Paris subway system with a suburban subway. They were carried out using new hierarchic simulation methods.

Castel, C (CERT/DERA, Toulouse, France) Gaillet, A Cervoni, M Hennebert, M ; International Federation of Automatic Control Proceeding 1976, pp 277-282; Proceedings of the INFAC/IFIP/IFORS International Symposium: Control in Transportation Systems, Columbus, Ohio, August 9-13, 1976.; ACKNOWLEDGMENT: EI (EIX770400439); ORDER FROM: Instrument Society of America, 400 Stanwix Street, Pittsburgh, Pennsylvania, 15222

21 156209 TRAFFIC CONTROL POLICIES FOR AN UNDERGROUND SYSTEM. On underground railway lines with low exploitation interval, when disturbances occur, the number of trains and stations involved increases rapidly in proportion to the size of the incident. The paper discusses a method for controlling the results of an incident by reabsorbing and distributing these disturbances in the entire traffic system. To do this, the regulation demands a new schedule for all trains and stations affected by the incident by acting upon the stop times and speeds controlled by the automatic train control.

21 156317 ANALYSIS OF TRANSIT OPERATIONS: FARE/FREQUENCY TRADEOFFS. The paper discusses modeling of transit operations on a route-by-route basis. In particular, explicit relationships between ridership, revenue, fare and frequency are sought. Functional forms for two models--demand and cost--are assumed. The forms--constant elasticity demand and linear cost--are simple enough to allow analytical solutions yet sufficiently rich to portray most of the essential tradeoffs. The models are not system aggregate but are intended to model a given route at a given time of day. The implications of these assumptions are shown on the "frequency-fare" plane. This plane is shown to be divided into two areas, one of excess capacity and one of excess demand.

21 156384 ELECTRONIC SYSTEM TO ASSIST THE MANAGEMENT OF BUS OPERATIONS. A public bus network is assigned two objectives: assure a good cover of the urban spread and offer sufficiently high quality service to capture permanently an important number of travelers. These two objectives can only be attained at the expense of a fundamental change in the methods and techniques of public transport. It is in this perspective that efforts are currently directed to development of electronic assistance in the management of bus networks. This development is a natural complement of other recent developments in public information,

in material comfort, in commercial techniques, in network restructuring and in productivity.

21 157171 A TSM TRAFFIC MANAGEMENT GUIDE FOR TRANSIT. Transportation System Management (TSM) attempts to balance improvements between highway & transit facilities to foster increased efficiencies in operations. Federal guidelines state that TSM, in addition to making efficient use of existing transportation resources for short-range needs of urbanized areas, should also identify traffic engineering, public transportation regulations, pricing, management, operational and other improvements to the existing urban transportation system. The author notes that if the TSM program is to have a lasting effect, it must be coordinated among all the transportation elements and be maintained by an agency with input from transit operators and traffic engineers. Working with the lead agency, the transit authority and traffic engineering agency will be responsible for evaluation of regional traffic as well as transit improvements. The author concludes with an analysis of the following task evaluations: An examination of existing route characteristics; the identification of areas of significant traffic impence; an analysis of alternative transit improvements; and, the development of a staged implementation plan for recommended improvements.

McCrosson, DF (Harrisburg Capitol Area Transit) *Transportation Engineering* May 1977, pp 47-48, 1 Fig.

21 157184 CONCENTRATE ON THAT BOTTOM LINE. This paper which notes that streamlining a transit agency must involve a close consideration of contracts, cash management, and customers, discusses control deficits, contracts, and cash, as well as paying customers. The first step toward controlling transit deficits is the recognition that transit management has a variety of tools to influence the bottom line which indicates how much one could lose. Transit agencies owe to their sponsors a realistic set of service, fare and efficiency options so that transit needs could be rationally weighed against other public funding priorities. The need for innovation in the labor contract is noted. One promising concept is a productivity allowance to share with employees a portion of the revenue increase due to new ridership. A commonality of purpose based on mutual survival should be stressed at the bargaining table. Public liability and property damage insurance, employee health insurance, shopping for fuel and oil, professional services and administrative costs, pensions, and marketing costs are also discussed. Comments are made on cash management, and the four phases of the Urban Mass Transportation Administration's operating grant cycle are reviewed. Comments are also made on the gaining of paying customers.

21 157209 TRANSIT DELAY REDUCTION PROJECT, PHASE I. Operating problems experience by transit buses in Seattle were analyzed and feasible improvements were developed. An express and one local bus service was studied to evaluate alternative routes and to identify problem locations. By analyzing available origin and destination data, it was determined that the number of CBD passengers would justify eleven more express buses during the peak period. The selection of the best express bus corridor was dependent on the fastest and best transit route within the CBD. Operating problems of the local bus service within the corridor were studied to identify the location which will provide the most reduction in transit delay. Several sources of information which identified the location of transit bus delay problems were studied and analyzed for potential traffic engineering solutions. Recommended improvement projects were prioritized and preliminary cost estimates were prepared.

Seattle Engineering Department July 1976, 28 pp, 5 Tab., 1 App.; The preparation of this report was financed in part through a Coordinated Support Program: Mass Transportation Technical Studies Grant.

21 157257 IMPROVING TRANSIT UTILIZATION THROUGH PULSE-SCHEDULING. Pulse-scheduling or coordinated transfer service is a technique for providing convenient service and thus increasing ridership without requiring undue operational expenditures or major changes in existing facilities. This is a special form of fixed-route operation which minimizes time loss due to transferring and thereby maximizes service convenience. In pulse-scheduled operation all buses in a given network begin service at the same time and place, circulate on their respective routes and return to the starting or terminal point simultaneously. Such a service permits successive cycles of operation and maximizes coordination among services offered. A typical example of pulse-scheduling is presented. Steps to be taken in the establishment of a pulse-scheduled service are listed. Pulse-scheduling appears to be a viable alternative to costly dial-a-ride service to many communities which cannot offer direct point-to-point service and are willing to accept coordinated transfers. Coordinated transferring would have great potential in: small communities, emerging suburban communities, urban subsystems, route deviation service, and point deviation service.

21 159479 VEHICLE MANAGEMENT POLICIES FOR AUTOMATED TRANSPORTATION SYSTEMS. A new approach to the problem of managing vehicles within a personalized automated transportation system is outlined. Two alternative vehicle management strategies are suggested; each is potentially applicable to either scheduled or demand responsive systems possessing large numbers of vehicles, topologically complicated guideway networks and capacitated stations. The proposed strategies take station capacity constraints into account by guaranteeing that under normal operating conditions (i.e., no emergencies) no vehicle is ever prevented from entering its destination station because of the unavailability of a berth.

21 159482 QUEUEING THEORY APPROACH TO RAILWAY CAPACITY IN URBAN COMMUTER RAILWAYS. The method proposed is a mixture of stochastic and diffusion type mathematical approximations to describe the queue length, delay and relaxation times found in the operation of the section. It is the perturbations in the times between trains and in the station stop times that give rise to queuing and the delays on the trains. The traffic intensity and a queue growth factor are key parameters in determining the practical capacity which is related to the deterministic or basic capacity, a concept derived entirely from the signaling characteristics of the station layout.

21 159785 PASSENGER RESISTANCE TO A RURAL BUS-BUS INTERCHANGE. Passenger resistance to the use of a rural bus-bus interchange facility in west Yorkshire has been investigated. When alternate through and transfer journeys were offered at hourly intervals a high proportion of travellers delayed or advanced their desired journey time to avoid the transfer. In the case of the transfer journeys the resistance which travellers displayed to using the interchange facility increased with trip length. For inter-urban trips, when through and transfer journeys were offered simultaneously by different routes, virtually all travellers took the through journey in spite of the fact that there was virtually no difference in journey time or fare. /Author/TRRL/

21 159817 FACTORS AFFECTING THE OPERATION OF URBAN BUS ROUTES. This report presents the findings of an investigation into the operation of urban bus routes. The operation is studied in terms of the times taken by passengers and buses in different stages of their journeys. The report consists of three main parts. In the first part the subject area is introduced, the terms are defined, a framework for assessment is proposed, and a description of the survey techniques is given. The second part contains results in terms of times associated with bus stops, with moving between stops, and with timing points and terminals. The ways in which these affect the route as a whole are discussed, and comment is made on the use of simulation techniques. The third main part draws together the findings of the earlier parts and points out the implications for the operator, the traffic engineer, and the passenger. The work is developed at three levels, by way of theoretical considerations, by descriptions and comments on methods for survey and analysis, and by presentations of results. Many of the results were obtained in one large city in the United Kingdom, but results from elsewhere in the country and from a smaller number of cities in other parts of the world are given to examine the generality of the findings. Many of the findings relate to the variations in the components of journey times and emphasise the importance of these variations for the reliability of the route.(a) /TRRL/

21 163157 SPREADING THE LOAD (OR HOW TO EXTEND THE PEAK HOUR WITHOUT REALLY TRYING!). A package of proposals is discussed which should result in a reduction in peak hour traffic and the problems of public transport without the need for new construction or large expenditure. It is suggested that car commuters could be persuaded to accept staggered or flexible working hours, an individual work programme, and a four-day working week spread over five or six days with increased daily hours. Other methods suggested include preferential routes and town-centre parking charges for cars with three or more occupants. A fare

surcharge could be levied on passengers arriving or leaving the centre at peak periods. Opening times of central car parks could be restricted to off-peak periods. The author discusses the sequence of introduction of the measures, giving examples of how this can be achieved. /TRRL/ Ball, RR (West Midlands County Council, England) *Institution of Municipal Engineers, Journal of Analytic* Vol. 104 No. 3, Mar. 1977, pp 40-41, 2 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 226166)

21 163162 SCHEDULING FOR DEPLETED SERVICES. Two mathematical models, one analytic and the other relying on computer simulation, were used to investigate the effects of cancelled buses on passenger waiting times, and also the improvements which could be brought about by rescheduling. Two rescheduling strategies were evaluated by the analytic model, the first to provide equal headways for available buses in a schedule changing daily, while the second provided a reserve pool of buses to replace cancelled buses in a new service scheduled at a lower frequency. The simulation model was used to represent two real bus services. It is estimated that in situations where services are consistently running behind complement, rescheduling could produce savings in passenger waiting time amounting to some 20000 hours per year for each bus missing from the original service. /TRRL/

21 163834 A MATHEMATICAL PROGRAMMING ALGORITHM FOR OPTIMAL BUS FREQUENCIES. Assume that we are given a network of streets on which certain bus lines have been set up. Let the total number of buses be given. Assume furthermore that the total demand for travel from certain origins as well as the total demand for travel to certain destinations is given. The requirement is to determine the complete travel pattern and decide which bus frequencies to use on the various lines. The problem is formulated as a non-linear programming problem. The model takes into account capacity constraints on the buses and the distribution of trips between different zones is influenced by the frequencies on the bus lines. The model also takes into account modal split between bus riding and walking. The model is intended for medium to long range planning. An iterative algorithm to solve this problem is developed. The algorithm is shown to converge to stationary points. As a part of the algorithm, an algorithm for the combined distribution-assignment problem in traffic planning is developed. The model has been used on the bus network in the town of Linköping (80000 inhabitants). /TRRL/

21 163929 TRANSFER OPTIMIZATION IN AN INTERACTIVE GRAPHIC SYSTEM FOR TRANSIT PLANNING. This paper describes a coordinated four-stage interactive

graphic process for operational transit planning. Stage 1 deals with route, headway, and vehicle-type optimization; stage 2 attempts to optimize transfer delays; stage 3 designs runs so that the service resulting from the previous stages can be operationalized; and stage 4 provides computer assistance in making manpower assignments. The network optimization procedure of stage 1 has been previously reported on, and the latter two stages are currently under development. This paper deals principally with the transfer optimization tool of stage 2. The operational tool to optimize transfer delays involves the automated-iterative modification of terminal departure times. An interactive graphic computer approach is used to increase the transparency of the tool to the planner. The analysis takes into account the calculation of expected waiting times for transfers between transit lines with different headways and the interdependence of terminal departure times. Within the interactive graphic optimization process, the user can request computer-generated and computer-drawn charts of transfer movements and delays, time-distance diagrams of individual routes, and computer-produced transfer statistics at individual stops as well as the entire system. The process has been applied to the Basel Transit System in Switzerland, which serves a population of 500,000. In comparison with the existing hand-generated timetable, the optimized timetable reduces the total transfer delays by approximately 20 percent with no increase in operating costs. /Author/

21 165926 STUDY OF STAGGERED WORK HOURS FOR THE CENTRAL EMPLOYMENT AREA IN WASHINGTON, D.C. This study was conducted to provide information on the probable impact of a staggered work hours program on transit capabilities, vehicle fuel consumption, traffic congestion and air quality in Washington, D.C. Underutilized bus capacity is identified as being available just before and after the peak intervals. A staggered program, along with proper incentives would make better use of available capacity and encourage new transit patronage, thus relieving the urban environmental and energy problem. The optimum impact of a staggered hours program on the transportation system would be achieved by inducing a change in work travel from automobile to transit. To achieve this, measures would be necessary to make transit travel more attractive relative to the automobile. The most noticeable effects in Washington, D. C. would be those related to traffic congestion. Key factors crucial to the success of the plans are discussed and evaluated including staggered work-hour-strategies, employee participation, and bus transit coordination. Based on studies of alternative techniques for implementing a staggered work hours plan, a final program was recommended. Incremental shift of starting times would be adopted for the central employment area; working hours of a quarter of the jobs in the area would be rescheduled; The plan would be initi-

ated in two stages, first the government employees and secondly the private sector; high level program endorsement is essential, particularly by the Executive branch; metro bus service should be increased by about 9 percent during the extended peak-periods; finally, a coordinated effort should be made to divert workers from their cars, continue bus priority treatments, and maintain fares at or near the present level.

21 167350 SAN DIEGO BUS TRANSIT STUDY [Data file]. The San Diego bus transit study data base comprises 16 files of data describing (on a monthly basis) the operations of the San Diego Transit Corporation bus system from January 1972 through April 1975. Many of the data items are available for individual bus routes. The major categories of data include: (1) Revenues and patronage, by type of fare and by type of ticket, for all routes and for the system as a whole; (2) supply data (vehicle miles, vehicle hours, and one-way trips operated) for all routes and for the system as a whole; (3) details of service quality, derived from the published schedules, for 32 routes; (4) systemwide operating costs, in total and disaggregated into 16 categories; (5) route descriptive data (length, bus stops, etc.) for 32 routes; and (6) other variables relevant to inter-route and inter-month variations in demand.

21 167524 A FLEET-SIZE MODEL FOR INTER-CITY SERVICES. This report describes an extension to the fleet-size model which was described in TRRL report Ir607. The model relates fleet-size, which has an important effect on system costs, to the number of departures per day on an inter-city transport service, taking into account in a simple but realistic way the constraints under which a transport operator must plan his timetable. In the first part of the report, the mathematical formulation of the extension to the model is derived. In the second, the extended model is used to predict the number of trains required to run various services on a major railway network, and it is shown that the model gives good agreement with actual practice. This report is a supplement to Ir607 (appendix 4) and should be read in conjunction with it.

21 167587 EFFECT OF AUTOMATIC VEHICLE MONITORING ERROR ON TRANSIT SCHEDULE ADHERENCE MONITORING. The timing accuracy required to support transit company use of an automatic vehicle monitoring system has been analyzed for the function of monitoring schedule adherence. Schedule deviation data from existing bus lines of the Southern California Rapid Transit District (a potential monitoring system user) were combined in a Monte Carlo analysis in which error distributions were chosen to limit the expected error behavior. Curves were obtained relating the percentage of false alarms and missed detections for each case. The monitoring system can be expected to perform satisfactorily with timing errors that meet a 95th percentile accuracy of plus or minus 15 s. However, allowance of an internal safety margin will be required to avoid an excessive number of false alarms. The size of the safety margin will depend on the actual error distribution. /Author/ Bruce, P Ludwick, JS Swetnam, GF, Jr (Mitre Corporation) *Transportation Research Record* No. 626, 1977, pp 1-6, 7 Fig., 3 Ref.; From *Transportation Research Record* No. 626, Bus Service Planning.; ORDER FROM: TRB Publications Off

21 168067 BUS TRANSIT ROUTE DEMAND MODEL (ABRIDGMENT). This paper describes a model that will predict the effects of fare changes, route relocations, and headway changes on either an existing or a proposed bus route. The model should be applicable on a single-route basis so that systemwide models would not be required every time a new route extension was being considered. The model is based on the fact that transit ridership is related directly to the existence of both population and employment within good access times of the route. The model has been calibrated twice, once for Austin, Texas, and once for Kitchner-Waterloo, Ontario. The calibration results were found to be similar in both cases. The author concludes that the calibration results thus far have been promising for the two cities studied. The transferability of coefficients from one city to another is not directly possible. The model, in controlling for differences in automobile ownership, population, access to route, headways, shows considerable promise in comparing the

performance of different routes and systems, and when sufficient route data have been gathered to allow for a more confident estimate of the parameters, it should be very useful for the planning, design, and operation of urban bus routes.

21 169300 UTILIZING GEOGRAPHIC BASEFILES FOR TRANSPORTATION ANALYSES: A NETWORK BASEFILE SYSTEM. The existence of geographic base files (GBF) for most large urban areas offers a significant resource for the network models required for many transportation studies. The thrust of the Network Basefile System (NETBASIS) development, underway at the University of Washington since 1974, is to build upon the existing GBF data resource (which has been operational for the city of Seattle for many years) and to provide a general purpose transportation network data base together with the required data manipulation and display software. The purpose of this paper is to present a status report on the NETBASIS development as of June 1977.

21 174165 THE TIMED TRANSFER FOCAL POINT: A REFINEMENT IN PUBLIC TRANSPORT SERVICE DESIGN. This paper describes the network design technique called the "timed transfer focal point" approach. This design method is employed to provide region-wide travel in low density suburban areas which have insufficient demand levels to support an untimed grid of routes. Some recent research into factors influencing consumers' decisions to use a transit service have identified the ability to make trips to a wide variety of destinations within the metropolitan area as a prime consideration. Transit planners can implement three kinds of service

feature that cater to this desire: (a) a "crosstown" route; (b) the use of a grid layout of transit routes rather than a radial network; and (c) more recently the "timed transfer focal point" approach, which has been used in three Canadian cities with success. There are two essential elements in a "timed transfer focal point" network: (a) the layout of transit lines such that they focus on community centres or some other geographically significant point; and (b) the arrangement of timed intervals on a route such that buses, streetcars, or other transport arriving at any given focal point do so at the same time, facilitating transfer movements. A transit system laid out in this fashion enables the person to travel in a reasonably direct manner from and to any place in the metropolitan area. /TRRL/

21 174644 A SURVEY ON THE STATE OF RESEARCH IN AUTOMATED SCHEDULING FOR URBAN PASSENGER TRANSPORTATION. This paper was prepared for Project 3, Management Systems for Urban Passenger Transportation, of the U.S.-U.S.S.R. Program for Scientific and Technical Cooperation on the Management of Large Cities. It includes a general description of three applications of the use of computers in urban mass transportation scheduling: (1) Urban Transportation Planning System (UTPS), a computerized aid for transportation planners; (2) the Run Cutting and Scheduling (RUCUS) package that assists operation scheduling departments in developing vehicle schedules and driver work assignments from a given set of trip schedules; (3) real-time control systems for demand-responsive transportation (Dial-A-Ride).

21 176571 RAM: A NORMATIVE TOOL FOR TRANSIT ROUTE PLANNING. This work deals with the development of a Route Allocation Model (RAM), a practical methodology to assist the transit planner in the development of transit

needs. RAM is a computerized transit route design tool which will sequentially allocate bus (or other) routes to an area under study. The model is multi-purpose in that it may be utilized for standard transit route planning or for transit route planning under a scenario of special interest. These scenarios may include such items as limited auto-environment planning, school bus planning, standard Transportation Systems Management Element applications, and the updating of currently outdated transit routes to reflect present day transportation needs. This document discusses such items as: the nature of the general transit routing problem; a disutility function; a definition of the network and the RAM approach. There are charts that illustrate the differences between the conventional approach of route planning and the RAM approach to transit route planning. The scope includes a case study application of the RAM methodology in Queens County, New York City. Results obtained for this case study are presented as well as recommendations for further research. The RAM methodology is developed within this text and complemented by the appendices of computer outputs which illustrate components of the methodology. The appendix material is not included herein, but it is available on request from the Transportation Research and Training Center, Polytechnic Institute of New York. /UMTA/

21 177128 SIMPLIFIED PROCEDURES FOR PRELIMINARY EVALUATION OF PUBLIC TRANSPORTATION ALTERNATIVES. A simplified approach is proposed to quickly evaluate at a gross level various alternatives for providing public transportation services. The alternatives, ranging from very simplified bus-oriented systems to high-speed rail facilities operating on dedicated rights-of-way, are reviewed in terms of meeting specified criteria for public transportation services. The sketch-planning procedure reviews and evaluates alternatives without substantial outlays in time or resources. Computer capabilities are not required. At this level of analysis, sketch planning enables the planner to differentiate between alternatives that have merit and those that should not be given a more detailed analysis. The data required for sketch planning come from two sources—the socioeconomic and demographic variables enumerated in census reports and origin-and-destination data available from metropolitan area transportation studies. Criteria for evaluation should be established for each area under study to provide for differences among urban areas. The planning procedures proposed here are generally more applicable to medium-sized and small urban areas.

21 177165 ZONE THEORY OF SUBURBAN RAIL TRANSIT OPERATIONS: REVISITED. Zone theory discussed deals primarily with the scheduling of trains. In combination the zone train schedules and zone fares affect most aspects of railroad operations and planning, including crew schedules and the use of railroad equipment, track, and manpower. The zonal concept of train operations applies to highly patronized suburban transit systems operated over the multitracked route of a heavy-duty main-line railroad. The basic theory has been tested and found to produce improvements.

21 177336 INTERACTIVE GRAPHIC TRANSIT PLANNING SYSTEM BASED ON INDIVIDUALS. With recent developments in disaggregated demand models and advances in low cost computer graphic systems, it is now reasonable to contemplate integrating these innovations together in an interactive graphic transit route design system. The authors outline the goals for such a system and propose a means for implementing those goals. The result is an analytical system which is more effective and economically efficient for transit planners to use than previous interactive systems while also having the capability to solve problems of a larger size, for cities up to one million population. Finally, the authors have developed an operational example of such a system to demonstrate the feasibility of the proposed approach.

21 178744 PASSENGER UTILIZATION OF LOCAL VS EXPRESS TRAINS FOR A NEW YORK CITY SUBWAY LINE: A CASE STUDY. A survey of over 5000 passengers on the IRT #1 line was conducted in New York City in order to examine passenger attitudes, perceptions and, most importantly, travel mode preferences (local vs express). Passengers were asked whether they prefer faster or more comfortable trains. It was found that they were evenly divided in their preference between faster trains and more comfortable ones, regardless of the distance travelled. However, it was found that significant numbers of passengers opted to transfer to crowded express trains, with little or no savings in travel time, while parallel local trains ran much less crowded.

Passengers were asked to estimate their travel time and the results were compared to measured travel times. Passengers consistently over-estimated their travel time and correlated their use of express trains with faster service. A major conclusion of this study is that the overall quality of service on the #1 line may be improved by inducing passengers to stay on local trains when travelling even moderate distances. This will promote a better passenger load distribution between the local and express and provide all passengers with a more comfortable level of service with no significant increase in travel time. /Author/

21 178749 CONTRACT MANAGEMENT IN THE TRANSIT INDUSTRY. During the past decade, there has been a growing trend toward public acquisition of failing private transit companies. Many government agencies and public entities have turned to transit management companies to run the daily operations of their systems. The transit management companies offer a range of services which include assistance in a number of functional areas in transit management. The purpose of the study was to examine the organizational structure, the decision making process and certain attributes of the organization performance for transit systems operated under contract management. The study has focused on 26 transit properties managed by three major contract management companies. The study showed that management companies mesh into three basic types of local organization structures. Each of these types possesses certain characteristics. Each management company was also found to be more associated with a certain type of property and local organization. The organization, often, reflected the company's own operating philosophy and perspective on transit management. Results of the study could also be used to look at the merits of contract management in situations similar to those experienced by the transit industry. /Author/

21 178916 THE SIGNIFICANCE OF STATION STOP TIMES IN URBAN RAPID TRANSIT SYSTEMS [Die Bedeutung der Haltezeit im Stadtschnellbahnbetrieb]. Station stop times in urban rapid transit systems can be divided into operating and traffic components. Their proper dimensioning calls for comprehensive analytic and synthetic studies of time and sequence for the method of train dispatching used, likewise extensive traffic surveys to provide information on the entry and exit situation at the stations. Also to be considered are the constructional features of both vehicle and platform, a

knowledge of which allows passenger exchange times to be determined. In order to avoid changes in timetable frequency during the day's working, the station stop times at rush hours provide a basis for arranging the timetable. The author illustrates his views with a calculated example. [German]

21 179089 MANAGING TRANSPORTATION DEMAND BY ALTERNATIVE WORK SCHEDULE TECHNIQUES. The management of urban transportation demand involves a number of techniques to reduce congestion by altering peak demand patterns. This paper discusses several transportation system management elements and focuses on alternative work schedule techniques such as staggered and flexible work hours and the shortened workweek. Alternative work schedules are deemed to be the most promising approach to managing transportation demand since such techniques are usually highly cost effective, are popularly received, entail non-transportation societal benefits, and can be implemented quickly. The effectiveness and state of practice of various alternative work schedule techniques are discussed, and a recommended approach for studying, implementing, and evaluating such techniques is presented. Brief case studies are given of programs in urban areas. /Author/

21 180631 THE ECONOMIC COST IMPACT OF THE LABOR PROTECTION PROVISIONS OF SECTION 13(C) OF THE URBAN MASS TRANSPORTATION ACT OF 1964. PART TWO: APPENDICES: SUMMARIES OF THE 13(C) EXPERIENCE IN THE THIRTEEN TRANSIT SYSTEMS INTERVIEWED FOR THE STUDY [Final rept]. This study identifies, describes, and attempts to estimate kinds of costs (with particular focus on costs imposed on management) that might occur as a result of Section 13(C). The first part of the study used a mail questionnaire to estimate the frequency and size of all 13(C) cash payments made to transit employees during the years 1964-1975. The second part of the study consisted of an evaluation of the probable size and extent of (1) increased wage and fringe benefit costs in take-over situations, (2) redundant worker costs, (3) uncertainty added to the planning process, (4) costs of delays in signing 13(C) agreements and (5) negotiation, arbitration, litigation, and record keeping costs. Information for this part of the study was obtained by conducting personal interviews with management and labor officials of 13 transit systems. (Portions of this document are not fully legible)

21 180660 COMPARISON OF THE PERFORMANCE OF THREE ALGORITHMS FOR USE IN AN AUTOMATED TRANSIT INFORMATION SYSTEM (ATIS). This paper compares the performance of three algorithms for computing trip itineraries for use in an automated transit information system. One of the approaches (TIMEXD) is based on a time-expanded network. The other two both compute paths in a bipartite route/stop network; one algorithm (LABCOR) is based on the label-correcting approach and the other (LABSET) on the label-setting approach. The transit networks upon which the performance comparison is based are of two types: a grid network with specified, possibly non-uniform, distances between streets, and a spider web type of network. TIMEXD is fastest on all the larger networks, but it requires most computer storage and outputs paths with more transfers. LABCOR is the slowest, but is guaranteed to produce the best routing, since it always outputs an optimal path with fewest transfers. Computation time estimates extrapolated to large transit networks indicate times of 1.5 to 2.5 seconds per itinerary for TIMEXD and LABSET respectively, well within the acceptable range for such networks.

21 182081 SEPTA MANAGEMENT STUDY. In 1964, State Act 450 created the Southeastern Pennsylvania Transportation Authority (SEPTA) with a mission to provide or arrange for the provision of effective and efficient public transportation services in the five-county Pennsylvania portion of the Philadelphia metropolitan area. The SEPTA Management Study was commissioned by SEPTA's funding governments to evaluate how well this mission was being performed in consideration of the agency's budget constraints, and to make specific improvement recommendations. The study uses a series of diagnostics (peer group comparison, case studies, flow charts, and organizational analysis) to identify areas where SEPTA performance appeared unusual. Serious deficiencies are identified in nine functional areas (Cash Handling, ConRail Purchase-of-Service Agreement, Surface Transit Operations Planning, Vehicle Utilization, Surface Transit Maintenance, Capital Project Management, and Regional Fare Integration) and seven additional improvement areas. A key question raised in this study relates to the roles of the SEPTA Board and SEPTA's funding agencies. Specific actions, including organizational changes, are recommended which will yield near-term benefits.

21 182460 NATIONAL VALIDATION OF A TEST BATTERY FOR MALE TRANSIT BUS OPERATORS. The major objectives of this research project were to establish valid procedures for the selection of applicants who would have the most potential for successful performance as bus operators in an urban transportation authority, to investigate the validity and equitability of the selection procedure for applicants from all racial groups represented in the study, and to investigate the applicability of the procedure for the five authorities which participated (the Metropolitan Atlanta Rapid Transit Authority, the Massachusetts Bay Transportation Authority, the Chicago Transit Authority, the Cleveland Transit System, and the Alameda-Contra Costa Transit District). The validity of the procedure for female drivers was not investigated because of the small number employed when the study was initiated. Therefore, the study was implemented for White, Black and Spanish-surnamed males. However, a follow-up study is presently underway to validate the test battery for female operators. Both concurrent and predictive performance-criterion validation models were employed, and within each model both primary and cross-validity coefficients were calculated. The results of the two validation models were essentially similar. Results of the implementation of the selection equation based on the total sample in the current validation model indicate that the test battery rejects approximately the same percentage of applicants from each of the three racial groups. The Appendix shows an agenda for the two-day Workshop conducted by the Industrial Relations Center, and the conclusion of the study is that most companies placed little, if any, emphasis on recruitment of minorities, and also that at present, there is a list of people waiting to be hired, and this surplus makes this validation study more imperative and urgent. /UMTA/

Baehr, ME ; Chicago University, (MA-06-0011) Final Rpt. UMTA-MA06-0011-77-1, June 1976, 367 pp; This report was sponsored by the DOT, Urban Mass Transportation Administration.; Contract DOT-UT-289; ORDER FROM: NTIS; PB-283709/ADS

21 184289 A SET OF PROGRAMS FOR TRAM AND BUS CONTROL [Programmapakket tram-en busbeheersing]. Within the Municipal Department of Traffic and Transportation of Amsterdam a series of compatible computer programs has been developed. The programs can calculate the effect of traffic management schemes and certain traffic management policies. This publication describes the state of the art of public transport programs. These programs will be coordinated with similar programs for non-public-transport traffic. This article gives a brief review of how the programs are to be used. Some examples of trip-time and regularity-measure-

ments of two running projects are given. The results show a considerable improvement in speed or regularity of public transport services, depending on the type of measurement such as the construction of free lanes and priority on traffic light controlled intersections. Improved regularity results in decrease of the average waiting times at the stops. A higher speed results in less in-vehicle-travel-time. /TRRL/ [Dutch]

21 189217 LEARNING TO MANAGE TRANSPORT SYSTEMS. The authors suggest that one of the problems confronting planning education in the transport planning field is that of providing students with a reasonably realistic planning experience. The most important consequences of a policy measure are considered to follow only after considerable time, leading to a need for learning aids that would enable students to become involved in a general comprehension of a system, rather than in the detailed information of such a system. The development of gaming-simulation techniques is discussed by reference to business games, in which it was shown that students who took part in such techniques learned more than those who did not, in particular about recognising problems that needed attention. In this article the authors provide a brief description of two games centred on transport systems analysis. The first, jutre—an inter-regional transport game, is concerned with inter-urban transport decision and policy making. It is built around a simplified model of the ground transport system of a relatively isolated developing country, in which there are eight major regions each with a major urban centre and linked by a simple network of roads of varying standards. The second, guts—an urban transport game, is concerned with the exploitation of the properties of a transport system in a circular city with perfect symmetry around its centre. It considers two modes, cars and buses, a network compatible with the symmetry conditions and a flexible set of trip-end parameters. /TRRL/

21 189835 RUCUS: A COMPREHENSIVE STATUS REPORT AND ASSESSMENT. Scheduling is identified as the one area that has perhaps the greatest potential for improving productivity. This article discusses the run cutting and scheduling (RUCUS) package of computer programs which allows schedule makers to improve the efficiency of the scheduling process and, in some cases, reduce the total cost of operating the transit system. Scheduling problems, background and history are covered, as well as the federal perspective, an overall assessment, implementation issues and future developments. The article is based on information from four surveys and site visits to five properties. The site visits included the Tri-County Metropolitan Transportation District of Oregon, Seattle Metro, the Metropolitan Transportation (Minneapolis/St. Paul), the Toronto Transit Commission, and the Mass Transit Administration of Maryland

(Baltimore). The most beneficial components of the package include the runs, data management, and report generation components; the spin-off applications such as computer-oriented timetables and UMTA Section 15 reports can also be valuable.

21 191322 HOW TO REDESIGN TRANSIT ROUTES AND SCHEDULES IN RESPONSE TO CHANGING RIDERSHIP TRENDS IN SMALLER SYSTEMS. A method is presented which can be applied to improve route and schedule design and existing level of service. This step-by-step procedure can be utilized by any small or medium sized transit system. In developing a method for analyzing transit route and schedule efficiency related to existing ridership demand, the Bellingham, Washington Transit System was selected for a pilot study. An on-board, line count survey was conducted: observers counted all passengers boarding the bus on all routes during operational hours. The observations were computer tabulated and then analyzed. Based on the analysis, specific recommendations were made. Ridership data from a municipal bus operation in California were obtained to analyze and demonstrate passenger overloading problems related to scheduling efficiency. Part I explains the method of analysis in a step-by-step procedure with facsimiles of the necessary forms. Part II is a Pilot Study report. Part III is a special problem analysis and report.

21 193844 ZONE SCHEDULING OF URBAN BUS ROUTES. A method is developed using dynamic programming for determination of optimal division of a bus route into zones, and allocation of buses to those zones. Such zone scheduling strategies are appropriate for bus routes with heavy orientation of riders to a common destination. An illustrative example demonstrates that substantial improvements in service and vehicle productivity are possible with zone schedules, and describes the properties of optimal solutions under varying conditions. A very significant finding is that the optimal zone structure is relatively independent of the number of buses used. It is also significant that the computational requirements for the procedure are quite modest.

21 194442 ASSIGNING BUSES TO SCHEDULES IN A METROPOLITAN AREA. The problem of scheduling a fleet of buses to a given set of trips is encountered by large bus companies performing thousands of trips per day. The time-tables for those trips are planned separately and reflect the passengers demand for transportation. These time-tables are inputs for the bus scheduling procedures. The scheduling problem is difficult due to its size and due to many operational constraints which are imposed. A mathematical formulation of the problem is presented and an efficient algorithm is developed. This paper presents results and computational experience that were obtained from implementing the model in a large bus company. /Author/TRRL/

21 194529 INTERACTIVE GRAPHICS IN EUROPE: THREE COMPUTER-AIDED TRANSPORTATION TOOLS. This article presents an overview of three interactive graphic transportation planning tools which have been and are being productively applied to planning problems in Europe--NOPTS, ICAM, and TSM. NOPTS has been developed as an aid for day-to-day operational planning in urban public transit. It can assist transit planners to: evaluate the impacts of changes in routing, schedules and vehicle allocations; examine a variety of routing schemes and compare their performance with respect to the objectives of both the transit agency and transit users; identify trade-offs between conflicting objectives; and optimally adjust the transit service to changing demand patterns. TSM--Simulation Program for Urban Transit Operations Objectives--is used for: analysis of movements of transit vehicles and queueing phenomena; estimation of system performance (time delays, vehicle throughput); evaluation of the impacts of alternative designs (geometric design, station layouts); and evaluation of the impacts of alternative operating strategies (line frequencies, signal timing, priority rules). It has been applied to urban public transit systems; to network, sub-network or line segment studies; and to rail transit or rubber-tired transit on exclusive rights of way. ICAM--Interactive Car (Highway) Assignment Model--was developed as a planning tool to assist in the evaluation of

alternative urban/regional highway networks. It consists basically of a multi-path traffic assignment model with which one or more projected origin-destination matrices can be assigned to existing and proposed highway links. It can assist planners to: quantitatively and qualitatively compare alternative highway networks; evaluate alternative highway designs; evaluate signalization and other transport technical solution strategies; adapt existing highways to further demand in an optimal fashion; isolate bottle-necks resulting from changes in the demand of changes in other parts of the highway network; and determine the capacity of the highway network as a function of varying demand patterns.

Rieple, RJ (W&J Rapp AG) Gehner, CD (Washington University, Seattle) *Computer Graphics* Vol. 1 No. 13, Dec. 1978, pp 18-25, 23 Fig.

21 194531 COMPUTER GRAPHICS FOR DEMONSTRATION OF TRANSPORTATION SYSTEM DYNAMICS. Due to the complexities of the many space/time interactions that may take place among the elements of a system, mathematical models are widely used in the planning and design of transportation systems to investigate alternative configurations with regard to performance and to provide a high level of assurance that the system will work efficiently over the anticipated range of passenger loading. Simulation models provide the most detailed and in-depth analyses in that they allow the analyst to incorporate into the model many of the practical details of operation specific to the particular system. The use of computer graphics enhances the visibility of the modeling process by allowing the manager to view the operation of the proposed system and thereby attain a better understanding of system dynamics and the impact of design parameters on system performance. Computer generated films can be produced to summarize and document the rationale behind key system configuration choices. They are also convenient for this purpose due to their ease of storage and distribution and to the ready availability of projectors at most locations. This report includes discussion of several existing applications of computer graphics to various transportation systems--which include airport runways, people movers, traffic situations, and rapid transit terminals.

Joline, ES, President (Aviation Simulations International) *Computer Graphics* Vol. 1 No. 13, Dec. 1978, pp 28-31, 9 Fig., 3 Ref.

21 195876 TRANSPORTATION SYSTEM MANAGEMENT: AN ASSESSMENT OF IMPACTS. Transportation Systems Management (TSM) actions include a wide range of transportation improvements, from basic traffic engineering to a variety of transit improvements, parking strategies, and pricing policies. Under Department of Transportation (DOT) regulations, urban areas with populations greater than 50,000, are required to develop TSM plans that document their strategy for improving air quality, conserving energy, and increasing the efficiency of the overall transportation system. This report summarizes interim results of research designed to quantify the impacts that TSM actions have on the system. Through the research methodology, all TSM actions are divided into four classes according to their impact on transportation supply and travel demand. The classes are: Class

A-Demand Reduced; Class B-Supply Increased; Class C-Demand Reduced and Supply Reduced; and Class D-Demand Reduced and Supply Increased. For each of these classes, computations are performed to determine how a major multi-year program applying these actions would affect the area's vehicle miles traveled and vehicle hours traveled. The results will serve to help local areas in developing appropriate transportation measures for use in local TSM plans as required by DOT regulations and the State Implementation Plans (SIPs), as mandated by the Environmental Protection Agency (EPA) pursuant to the Clean Air Act. This document contains working papers which describe experience with the impacts of some of the major TSM actions. These include impacts of ridesharing, routes and scheduling, Park-and-Ride and express bus, work rescheduling, and auto restricted zones. The Appendix: A Supply-Demand Approach to TSM, explains the development of the methodology that led to the findings in this report. /UMTA/

21 197286 DICOS, A TIME-TABLE COORDINATION SYSTEM [DICOS, een dienstregelings coördinatie systeem]. The Netherlands Ministry of Transport, the Amsterdam Public Transport Corporation and the Automatic Traffic Systems section of the Delft Technical University developed means of improving regularity, punctuality and synchronised running of public transport systems. They are being tried on tram line No. 1 in Amsterdam. The article gives the basic philosophy and details of vehicle location and identification methods, hard-and software plus the information system for drivers and passengers. Further reports on this project will follow. [Dutch]

21 239650 THE PERSPECTIVES OF MANAGEMENT INFORMATION TECHNIQUES (INFORMATIQUE) AND OF COMPUTERS IN PUBLIC TRANSPORT OPERATION. THIS REPORT IS THE RESULT OF A QUESTIONNAIRE SENT TO MEMBERS OF THE INTERNATIONAL UNION OF PUBLIC TRANSPORT. MEMBERS WERE INVITED TO INDICATE THE POSITION OF THEIR UNDERTAKINGS CONCERNING DATA PROCESSING APPLICATIONS AND MEANS USED IN 1967 AND 1972, TO DESCRIBE THE PROJECTS THAT ARE TO BE CARRIED OUT BY 1977, AND FINALLY TO INDICATE THE OBJECTIVES AIMED AT, FOR EACH ONE OF THE DEVELOPMENT STAGES OF THE DATA PROCESSING SYS-

TEMS INSIDE THE UNDERTAKINGS. THE FOLLOWING AREAS WERE ANALYZED: PRESENT STATE OF MANAGEMENT DATA PROCESSING AND PROSPECTS FOR THE FUTURE; INTRODUCTION OF DATA PROCESSING IN THE AUTOMATION OF THE OPERATION OF THE RAILWAY SYSTEMS (BOTH METROPOLITAN AND SUBURBAN); INTRODUCTION OF DATA PROCESSING IN THE AUTOMATION OF BUS SERVICE. THE RESULTS ARE PRESENTED IN TABULAR GRAPHICAL FORM AND SHOW THAT PUBLIC TRANSPORT SYSTEMS ARE ENTERING A PERIOD OF INTENSIVE USE OF DATA PROCESSING METHODS.

21 260166 MANAGERIAL RESOURCES AND PERSONNEL PRACTICES IN URBAN MASS TRANSPORTATION. The primary purpose of this project was to identify and evaluate policies, practices and other conditions relating to the supply of managerial personnel in the urban mass transit industry. The study, conducted during 1972-1973, sought to provide information concerning the following: (1) an inventory of management, technical, and supervisory personnel in the industry; (2) a current profile of management and technical personnel; (3) a summary of personnel practices and training methods now being used in the industry; (4) an assessment of manpower demand and supply in the industry by administrative levels; (5) a review of the roles of UMTA, universities and the industry in improving the training of personnel in the transit industry with respect to training methods, course contents, level of support for trainees and related matters. Questionnaires supplemented by personal interviews with transit property officials were used to obtain data. Ten Canadian and thirty-one U.S. transit properties were polled. The survey was designed to permit statistical inferences to be drawn for the industry as a whole. According to the author, little formal organization and planning concerning the development and utilization of human managerial resources were found to exist within the U.S. urban transit industry. Furthermore, according to the author, urgent action is needed to prevent deterioration of the industry's management structure. Data are presented.

21 264628 AN OPTIMIZATION MODEL FOR DETERMINING HEADWAYS FOR TRANSIT ROUTES. This report concentrates on the problem of headway determination, the first step in the scheduling process of transit service. The objective of the report is to develop a practical procedure for determining optimal headways, recognizing all of the relevant factors. Based on an optimization approach, a chance constrained programming model is developed. The scope of using vehicles of different sizes and operating costs is built into the model which attempts to minimize the total operating cost. The uncertainty associated with demand forecasts is expressed as a chance constraint that specifies the

desired level of reliability with respect to the satisfaction of demand. The model also includes a constraint related to the management policy regarding the minimum service to be provided on a transit route. The deterministic equivalent of the model is solved by linear programming. Its application is demonstrated with an example problem. The authors conclude that the model is simple in concept, practical, and the procedure is applicable to both conventional bus and rapid transit systems. The input data are realistic and usually available or can be obtained without any difficulty. Although this model does not actually schedule vehicles, its results are used in developing headway tables and subsequently vehicle and operator assignments.

21 300088 TRANSPORT SYSTEM MANAGEMENT-PROCESS AND APPLICATION. Transport system management (tsm) is a planning and design process for transport system improvements. Its key goal is conservation of economic and social resources, energy, environmental quality and the overall quality of urban life. This is achieved by means of the co-ordination of operating, regulatory and engineering programs. A formalised process for tsm is presented and practical applications illustrated. /TRRL/

21 300270 THE APPLICATION OF OPERATIONS RESEARCH TECHNIQUES TO TRANSPORTATION: A CASE STUDY. In this paper, a case study is presented of an operations research analysis of a sub-problem arising in the Adelaide bus system. The study was carried out in 1965 in conjunction with the South Australian Municipal Tramways Trust. This case study illustrates the complexity of public transport problems, the inherent difficulties in formulating mathematical models of them, the necessity to take proper account of employee preferences and finally the significant value of the scientific approach. In using a computer preparation of the roster index, management is seen to be minimizing costs while coping with unusual employee shifts and making due allowance for their preferences. It is one step in the direction of efficiency and good employer-employee relations in public transport. The solution technique demonstrates that operations research methods can cope with complex situations which cannot be resolved by other means, and indeed they have had wide application in transport problems. /TRRL/

21 302262 PROCEEDINGS OF THE THIRD UMTA R&D PRIORITIES CONFERENCE, CAMBRIDGE, MASSACHUSETTS, NOVEMBER 1978. VOLUME VII: TRANSIT MANAGEMENT WORKSHOPS. This is a compilation of material that was presented at the Third UMTA R&D Priorities Conference Workshops on Transit Management. Part I deals with management systems developments and includes discussions of transit operations and maintenance management support, automated scheduling of transit services, and development of the skills and techniques required by the transit operating industry. Part II, human resources development, includes discussions of human resources development programs, the national study for the validation of a selection test battery for bus operators, and a report by the AFL-CIO Appalachian Council on their transit employee training project. This volume contains six resource papers which can be found summarized in Volume I of this multi-volume work along with summaries of other workshop sessions. Volume I also includes the proceedings of the general sessions and a listing of conference participants. These proceedings (Rpt. Nos. UMTA-DC-06-0157-79-1 thru UMTA-DC-06-0157-79-9) consist of nine separately titled volumes, namely: Volume I: Proceedings of General Sessions and Summarized Reports of Workshops; Volume II: Bus and Paratransit Technology Workshops; Volume III: AGT and Advanced Systems Workshops; Volume IV: Service and Methods Demonstration Workshops; Volume V: UMTA Special Technology Programs Workshops; Volume VI: Rail and Construction Technology; Volume VII: Transit Management Workshops; Volume VIII: Access for Elderly and Handicapped Persons Workshops; and Volume IX: Urban Transportation Planning Workshop.

American Public Transit Association, Urban Mass Transportation Administration, (DC-06-0157) UMTA-DC-06-0157-79-7, Nov. 1978, 122 p.; This report is a sequel to reports: Proceedings of the UMTA/APTA R&D Priorities Conference, February 1978 (PB 255-898); and Proceedings of the Second R&D Priorities Conference, December 1976 (PB 266-158); Contract DOT-UT-70026; ORDER FROM: NTIS; PB-300992

21 303856 TYNE AND WEAR PUBLIC TRANSPORT IMPACT STUDY: STUDY DEFINITION REPORT. This report defines the content and method of a study of the effects of the introduction of the Tyne and Wear Metro and the reorganisation of bus services to complement the Metro and provide an integrated public transport system. The aim of the study is to identify and quantify the effects of changes in the public transport system on travel behaviour, activities and land use in the area concerned. The results of the study are intended to assist Central Government in future decisions on policy towards the public transport, the Tyne and Wear County Council in transport and land use planning and expenditure decisions within the County, the Tyne and Wear PTE with operating and marketing aspects of the system, the District Councils within the County when considering land use

planning and development decisions, and transport planners for local authorities elsewhere in the UK by providing information on the effects of improvements to public transport. The statistical reliability of the study is discussed: overall, it is hoped to detect changes in major factors (such as public transport trip rate) of 10 per cent with a confidence of at least 90 per cent.

21 303944 SEPTA MANAGEMENT STUDY: PROCESS AND RESULTS. A management study of Philadelphia's Southeastern Pennsylvania Transportation Authority (SEPTA) was completed in May 1978. The study process was designed to quickly focus investigative effort on apparent problem areas by means of a series of diagnostic techniques, including interviews, peer-group analysis, flowcharting, and organizational analysis. The in-depth studies that relied on independent data collection were specially designed to test hypotheses. The study revealed that among the areas where SEPTA performance was strong were rapid-transit crew scheduling, grant applications, employee absenteeism, and short-term investment management. The study identified nine priority areas for improvement: (a) cash handling, (b) Consolidated Rail Corporation's purchase-of-service agreement, (c) surface transit operations planning, (d) vehicle use, (e) surface transit maintenance, (f) capital project management, (g) pension management, (h) quality of transit service, and (i) regional fare integration. Funding agencies should expect large transit agencies to have at least a few serious problems that should be identified and studied by the agency. The number and phasing of improvement activities must be feasible for the transit agency to accomplish.

21 303952 ASSISTING SMALL TRANSIT OPERATORS IN CALIFORNIA (ABRIDGMENT). The paper describes the process and presents the results of ten workshops recently conducted by the California Department of Transportation (Caltrans) with transit operators throughout the state. The purpose of the workshops was to identify the needs of small transit operators, to determine the existing expertise of transit operators and others associated with transit (universities, consultants, etc.), and to discuss the role Caltrans should play in a transit management assistance program. The most frequently mentioned needs were summarized: accounting systems; grantmanship; marketing; management, planning, and technical assistance; scheduling and run cutting; information resources and information workshops; insurance; equipment maintenance; vehicle specifications and acquisition; driver training; management and supervision training and diesel mechanic training; ongoing system evaluation; transportation development act information; and methods of assistance. California's first-year transit management

assistance program will consist of six elements that fall into two categories. The first category is statewide management assistance and its elements are: a central transit information center, a bimonthly newsletter, and two three day workshops per year. The second category, local management assistance, is directed toward developing programs on specific topics and its elements are: on-site assistance, marketing presentation, and a driver training program.

21 305744 HANDBOOK FOR MANAGEMENT PERFORMANCE AUDITS. VOLUME I. A management performance audit is a comprehensive examination and evaluation of a transit system's goals and objectives and the procedures it uses to accomplish these goals and objectives. The audit takes into account the resources with which the system has to work and the constraints under which it must operate. The Handbook introduces decision makers in transit properties, municipalities, Metropolitan Planning Organizations, and State Departments of Transportation to the concepts and techniques involved in management performance audits. The Handbook shares the authors' experience in auditing with other organizations that may conduct audits of transit systems or that train future transit managers, and provides managers of small and medium-sized systems with tools for improving practices and procedures. The Handbook is comprised of two volumes. This volume, Volume I, describes the theory and technique of carrying out a management performance audit. The history and benefits of the audit are introduced; a description of the characteristics of a transit system including its social, political, and economic environment, its governing body, and its internal functions such as maintenance and transportation are addressed; and a discussion of the auditor's procedures from the planning of the audits to preparing the written report is presented.

Smerk, GM Dodge, SA Lee, CM Gunning, JI Babbitt, JH ; Indiana University, Bloomington, Urban Mass Transportation Administration, (UMTA-IN-11-0004) Final Rpt. UMTA-IN-11-0004-79-2, Oct. 1979, 100 p.; See also Volume 2, PB80-117492.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-117484

21 305745 HANDBOOK FOR MANAGEMENT PERFORMANCE AUDITS. VOLUME II. The Handbook introduces decision makers in transit properties, municipalities, Metropolitan Planning Organizations, and State Departments of Transportation to the concepts and techniques involved in management performance audits. Volume II, is a field guide consisting of outlines and questionnaires used in conducting an audit. The outlines and questionnaires are provided for each characteristic of a transit system including its external environment, its governing body, and its internal functions such as maintenance, transportation, accounting, and finance. The outlines give the auditor a guide for collecting data by way of interviewing employees and other

individuals involved with the transit system. The questions provide technical detail that an auditor must collect from each functional area.

21 309523 MANAGING SEPTA STRATEGICALLY. The purpose of this report is to present a way of more effectively managing a public transportation authority, specifically, the Southeastern Pennsylvania Transportation Authority (SEPTA), to enable it to better confront the problems and opportunities it is encountering through an approach which combines management-by-objectives with cost-effectiveness analysis. The approach presented is strategic in both method and scope. Its sweep is region-wide and long term; but it also deals with the local and the immediate. In doing so, it serves as a surrogate for the profit motive of private enterprise. A decision process is described, which involves expressing an organization's functions as discrete projects related to a clearly defined set of objectives, and then comparing the projects through cost-effectiveness analysis. The involvement of management, employees and citizens, along with the effect of responsibility and reward on job performance, is discussed. The environment in which SEPTA must function in the years to come is considered by examining a set of possible alternative regional futures, market share, and the land use-public transportation relationship. An attempt is made to compare the performance of a variety of SEPTA modes serving two different density-defined areas. The report presents a goals structure for SEPTA, consistent with this decision and encompassing the regional concerns identified earlier. Using this goals structure, the study tests various sample projects for cost-effectiveness. Throughout this report, an emphasis is placed on reinforcement—the pooling of resources by SEPTA and other parties to achieve mutual objectives. (FHWA)

21 309670 ACCELERATION OF PUBLIC TRANSPORT WITH PARTICULAR REFERENCE TO METHODS OF SPEEDING UP BUSES [Beschleunigung des Oeffentlichen Verkehrs mit Besonderer Beruecksichtigung von Beschleunigungsmassnahmen fuer Autobusse]. Well known measures for increasing the attractiveness of public transport are described. In addition to measures for speeding up buses to shorten journey times, the importance of coordinating the timetables to achieve minimum time losses when changing is stressed. Further methods of speeding up buses are described in the light of measures carried out in Vienna. In addition to a reduction in the stopping times by the use of automatic equipment when changing passengers, shorter journey times may be achieved by adapting signal switching at stops, changing traffic signals by radio, forbidding stopping at some stops during peak periods, the introduction of bus lanes and the use of bus areas at signal controlled junctions. 21 310365 AN ANALYSIS OF THE HEADWAY DISTRIBUTION OF AN URBAN BUS SERVICE. This paper deals with a quantitative evaluation of headway distribution. The analysis utilises numerical integration and statistical techniques on headway data collected for various bus routes in Evanston, Illinois, a Chicago suburb. An earlier analysis of this study concluded that the bus travel times can best be represented by a beta distribution, the parameters of which can be predicted separately-based on system characteristics for the peak and off-peak periods. This present study accepts the beta distribution hypothesis and suggests a model to predict bus headway behaviour. The parameters r and t of that model may be derived in terms of the length of the bus route under study. The theoretical model is examined and tested against actual headway data. It is concluded that the derived distribution, with the predicted parameters, may be a valid model for the description of actual headway behaviour. (a) (TRRL)

Polus, A (Technion - Israel Institute of Technology) *Traffic Engineering and Control* Vol. 20 No. 8/9, Aug. 1979, pp 419-421, 3 Fig., 1 Tab., 8 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 243579)

21 310374 A COMPARISON OF BUS OPERATIONS IN CITIES OF DEVELOPED AND DEVELOPING COUNTRIES. This article reviews the demand for public transport in third world cities. Some of the factors affecting demand are examined, comparing them with conditions in the developed world. Special problems facing public transport operators in developing countries and their economic climate are outlined. The low levels of car ownership in most cities of developing countries make it essential that an adequate public transport system exists particularly in urban areas where there is a heavy reliance on buses. The authors analyse trends in bus usage indicating a growing demand for public transport in cities during recent years. However, in many countries, governmental support has been minimal, and in some cases successful bus operators have been penalised by taxation. Although operating costs per kilometre are lower in the UK revenues are also much lower and a larger

demand is associated with a lower level of service. The total numbers of buses available per head in underdeveloped cities is much lower than that in those of Europe and North America. The aims of current research are outlined. (TRRL)

21 310557 TRIP ASSIGNMENT TECHNIQUES CURRENT IN THE UK. The paper summarises the main results of a survey carried out in April 1978 concerning the assignment methods used by local authorities in the UK for both road and public transport networks. Topics covered include size of the study area and networks, use of computers, objectives and uses of the results, network data and level of detail stored, procedures followed to deal with capacity restraint in road networks, level of accuracy expected and general level of satisfaction with the methods used. A number of areas where improvements might be made to current techniques are suggested. (a) (TRRL)

21 310761 EMPLOYMENT CENTER BUS SERVICE GUIDELINES FOR IMPLEMENTATION. A unique aspect of the Employment Center Bus Service (ECBS) is its ability to schedule the minimum bus fleet necessary to match staggered work shifts with essentially all worker commuting distances in either a "satellite employment center", or a central business district. This brochure summarizes an earlier study and includes some recent developments. An effort to develop techniques for applying the ECBS concept to various urban areas, (based on information obtained from a cross-section of the nations' operators and major employers) is also described. The ECBS scheduling methodology is illustrated by applying it to three typical work shift/commuter distance scenarios: one bus-tow shifts, two buses-three shifts, and two buses-four shifts. ECBS is amenable to the inclusion of several other features that appeal to the auto-oriented traveller. The fares could be proportional to trip length and competitive with auto operating costs. The ECBS is amenable to several fare payment plans that are convenient for the passengers and economical to implement and operate. The paper examines the urban transit void filled by ECBS and the benefits of the service. Guidelines on implementation are also provided.

21 311169 SIMPLIFIED MODELING OF TRANSIT CORRIDORS. A sketch planning model overcoming several drawbacks of the traditional models is developed. This model partitions the urban area into a corridor, in which a transport alternative is introduced, and the complementary part of the urban area. Prediction of travel demand is made separately for the corridor and its complement. Demand for trips

outside the corridor is estimated by aggregate methods, while travel demand in the corridor is estimated by a disaggregated model. A sample of 150-300 households is drawn from the corridor zones, and the model is applied to each observation, estimating its travel demand. The household socio-economic and level of service variables are computed or approximated on a disaggregated level. Total demand is estimated by factoring up the demand for each observation by the sampling rate. The trips are assigned to a highly abstracted network until equilibrium between assignment and mode split is reached.

21 311210 TRANSIT SERVICE STANDARDS, ROUTING, AND SCHEDULING. The governments of Eugene, Springfield, and Lane County, Oregon, recently adopted a multimodal transportation plan that has forecasts to the year 2000. Serving this area is the Lane Transit District. The board of this district recently developed short-range objectives for fixed-route service designed to interface with the year 2000 plan. These objectives include a goal of a ratio of fare-box revenue to operating cost of 25 percent by 1982. Lane Transit District offers three types of service: urban fixed route, nonurban fixed route, and urban dial-a-bus. The service standards considered most important to the development program include coverage, travel time, availability, and accessibility. Route and schedule adjustments originate from public and employee suggestions, which are considered as part of a periodic route-and-schedule review. Surveys and passenger-opinion data are collected regarding any proposed changes. Schedule changes are made three times a year, route changes are made annually. Routes and schedules are adjusted as necessary to achieve long-and short-range goals. The transportation plan for the Eugene-Springfield area calls for implementation of a bus rapid transit system supported by local buses. A key element of the plan is the construction of 10 major and 10 minor transit stations throughout the metropolitan area. (Author)

21 311323 MIDTOWN MANHATTAN CIRCULATION AND SURFACE TRANSIT STUDY-MIDTOWN CIRCULATION DEMONSTRATION AND EVALUATION PROGRAM. The Midtown Circulation and Surface Transit Study was initiated in order to reduce congestion, and thereby improve air quality; improve pedestrian and vehicular safety; improve surface transit service; and enhance the urban environment in midtown Manhattan. The objective of the study is to develop and demonstrate low-capital, surface transit and other circulation improvements--in addition to the various techniques currently employed in pursuit of solutions

to problems of congestion and the intense competition for street space—in midtown. The objective of this report (Interim Technical Report Number 3, "Midtown Circulation—Demonstration and Evaluation Program) is twofold: to report the findings of the early action demonstration program; and to develop and initiate additional demonstration projects and to recommend a program for the monitoring and evaluation of these projects. The demonstration projects generally involved such things as bus route changes, turn prohibitions at selected intersections contra-flow lane and priority and exclusive bus lanes. These usually resulted in increases in bus and vehicle speeds and a corresponding reduction in traffic congestion.

Edwards and Kelcey June 1979, 63 p., 14 Fig., 11 Tab.

21 313141 TRANSIT NETWORK ANALYSIS: INET. This report is a collection of five independently developed documents concerning the transit system analysis program INET (Integrated Transit Network). The five documents are titled: INET Tutorial, a technical introduction to INET functions and mechanics; INET Lecture Guide, a set of over 50 graphics suitable for overhead projection, along with an explanatory text for each; INET Coding Hints, some guidance on preparation of INET input from actual transit plans or operations; INET Case Study, a small, complete example of the use of INET with the Alexandria, Virginia, bus system; and INET Operating Instructions, the instructions for operation of the INET computer program. INET, a new computer program which is an integral part of UTPS (Urban Transportation Planning System), has been developed to aid planners in the analysis of urban transit systems. INET makes transit network coding quick and easy by exploiting data already available for highway networks. It maintains consistency between transit and highway levels of service, and it helps bridge the gap between transit planning and operations. Experience with actual highway and transit data has shown that INET performs with speed and accuracy even better than expected. INET is a substantial improvement over previous transit network programs and greatly facilitates transit systems analysis.

21 313196 PUBLIC TRANSIT RISK MANAGEMENT: A HANDBOOK FOR PUBLIC TRANSIT EXECUTIVES. Transit is seen by insurers as a risk with high loss potential. Since people are transported in large numbers, a single accident may yield many claims. One solution to this insurance situation that has been employed by transit system operators is to assume some of the risk of potential loss themselves. The handbook introduces risk management to transit professionals and outlines the elements of the risk management concept and process.

21 314086 PROTOTYPE PLANNING STUDY, PORTLAND (OREGON). TRANSPORTATION SYSTEMS MANAGEMENT (TSM) [Final rept.]. Transportation System Management (TSM) is a concept that calls for the planning, programming, and implementation of low-capital, short-range improvements designed to increase the efficiency of existing transportation systems. TSM may also serve the goals of energy conservation, environmental protection, and urban revitalization. This report is one of five special studies of the TSM Planning Prototype Studies Program. The program was designed to demonstrate the capabilities of local agencies to undertake TSM planning in a systematic problem oriented manner. This report documents the project in Portland and is designed to provide a summary of the procedures utilized in Portland to systematically develop a regionwide program for TSM delineated on a small area basis. The TSM process includes a statement of goals and objectives, evaluation of existing conditions, a set of proposed action and justification for inclusion of those actions in the area's Transportation Improvement Program.

21 314706 BOTTLETHWAITE: A BUS NETWORK DESIGN EXERCISE. 1. THE PROBLEM. The exercise, developed for use in the training of bus system designers as part of the National Bus Company's market analysis project (map), is concerned with the design of an off-peak urban network. The problem, to maximize a demand related measure, using a fixed quantity of resources, is given in the article. Some solutions and their implications are to be discussed in the April 1980 issue of "Traffic Engineering and Control". The hypothetical town—Bottlethwaite, has six main roads radiating from its centre and a series of 12 estates between the main roads linked by a circular ring road. The potential trips from each estate to the town centre and the radial roads is given in a matrix. The object of the exercise is to design a regular-headway pattern of service, using 10 buses, for maximum patronage. The method of scoring is explained and details are given of the restraints imposed upon the designer such as the effects of passengers walking to the nearest radial route. (TRRL)

21 315056 MEASURES OF EFFECTIVENESS FOR MULTIMODAL URBAN TRAFFIC MANAGEMENT: VOLUME 2—DEVELOPMENT AND EVALUATION OF TSM STRATEGIES. This three-phase study has developed measures of effectiveness (MOE'S) for Transportation Systems Management (TSM) strategies. In Phase I, hierarchical schemes of TSM strategies and tactics and comprehensive goals and objectives were developed. MOE's were then identified which could measure the degree of attainment of each related objective through the

implementation of a given tactic. Data sources, field measurement procedures and modelling techniques were then identified for measuring or estimating each MOE. In Phase II four case studies were conducted to test and illustrate the methodology and to demonstrate the effectiveness of a variety of TSM strategies. In Phase III sampling and data collection procedures for some of the most commonly used MOE's were developed. Also, manual and computer modelling procedures for modal split and network analysis were studied and recommendations on their applicability to TSM analyses were developed. This volume has been written as a stand-alone guide for practicing engineers and planners who are engaged in the development and evaluation of urban area TSM plans. The guide provides a consistent framework for TSM strategy development, recommends measures of effectiveness for TSM strategy evaluation and identifies and demonstrates manual and computer techniques for TSM analysis. 21 315190 A SOLUTION METHOD FOR THE BUS ALLOCATION PROBLEM. The problem of allocating a given number of buses to a set of routes in order to minimize passengers waiting time is studied and a solution method is discussed. An extension of the problem where in-vehicle time is also taken into account is derived and it is shown that the suggested method can also be used to solve the extended problem. A small numerical example is also given. (TRRL)

21 315405 ALTERNATIVE WORK SCHEDULES. Organizational productivity should increase significantly with the 4 day/40 hour week strategy. Start up and shut down times could be reduced by 20%; and with equipment operating 50 hours per week instead of the traditional 40, capital costs may be also reduced. With the staggered hours—a fixed eight hour/day schedule within a range of starting times—and flextime—a variable time eight hour work day within a range of starting times—strategies, transit scheduling would be more difficult because of inability to predict workers' commuting times. Flextime may not work for production line situations, and it creates a problem in monitoring employees. Chapter Two lists contacts for information about alternative work schedule programs, and it lists several current programs. Chapter Three contains an annotated bibliography of alternative work schedule programs.

Public Technology, Incorporated, Department of Transportation Feb. 1978, 21 p, 1 Fig.

21 316254 METHODOLOGY FOR GENERATION OF OPTIMAL SCHEDULES FOR AN UNDERGROUND RAILWAY SYSTEM. A methodology is developed for the automatic

generation of optimal schedules for the North-South line of the METRO of Sao Paulo, Brazil. An analytical model was created to represent the system behavior: train and passenger movements. Based on the model characteristics, the goal-coordination method, due to Las don and Tamura, was utilized to produce the optimal reference schedule, by considering comfort levels for passengers, the number of trains in the line and the performance of trains. The optimal schedule for the morning peak period was generated and a great improvement over the current strategy was obtained.

21 316477 MONITORING AND SURVEILLANCE-SERVICE STANDARDS. This report documents a program developed by the Transit Authority of Northern Kentucky for the collection and analysis of operating data. A series of performance standards for existing and proposed new route service has been identified. Standards have also been developed for other aspects of TANK's operations. Data collection procedures have been delineated for the purpose of providing the raw statistics to be evaluated. The complete collection and analysis program is designed to help TANK meet its primary goal of "providing the best public transportation service possible within the limits of its financial resources." This program will be reviewed on a periodic basis as part of TANK's Management by Objectives Program. The dynamic environment in which transit systems operate today demand that inappropriate or outmoded performance measures cannot be tolerated. (Author)

21 317191 THE UNIVERSITY OF OTTAWA RUN-CUTTING PROGRAM [BENKELMAN-VERFAHREN UND PROOF-ROLLING...]. This report describes the runcut computer program developed at the University of Ottawa (Computer Science Department) for solving the run-cutting problem that exists in the urban transit industry. Runcut exists as three program modules and a description of the role and general organization of each of these is provided. Particular attention is given to the data structures used to manage the raw data and the runs which are created. The main run-cutting operation is carried out on a line-by-line basis; however the task of the final phase is to create multi-piece runs from the pieces of unassigned work that remain from the main procedure. Also included in the report are sample results generated by runcut from data provided by OC Transpo. (TRRL) deformation measurements that the "proof rolling" technique should be used only under limited conditions. In general, on the basis of a range of specimens, the above test of the relations between the testing techniques and the contract is recommended. [DEUTSCH]

21 319190 TRANSIT SYSTEM MANAGEMENT ELEMENT FOR SOUTHEASTERN CONNECTICUT. This report contains summary data and information on the status of transit in the Southeastern Connecticut area and makes certain recommendations for modifications utilizing low cost techniques to improve operating effectiveness, the primary objective of the Transit System Management Element process. The body of the report is divided into two sections. The first section deals with specific developments and accomplishments that occurred during Fiscal Year 1979-1980 as a result of Metropolitan Planning Organization efforts to help the Southeast Area Transit implement the transit plan. The second section is somewhat more technical and less descriptive in nature. It deals with very specific detail changes that have been made to the proposed transit system in order to increase its efficiency.

21 319324 VEHICLE INSURANCE STUDY. The objectives of this report are to present vehicle insurance/self-insurance programs of the 19 urban transit systems in Wisconsin and to provide recommendations for improvement of these programs, giving particular attention to group findings. The following are the principal recommendations derived from the findings of this study: transit vehicle insurance should be placed separately from other municipal insurance, where presently combined; responsibility for transit vehicle insurance procurement should be shifted to the transit manager, or the transit manager, or the transit manager must work closely with the city department responsible for insurance purchasing; the competition method should be used when obtaining competitive insurance bids, and insurers of transit systems should be subjected to price competition no more frequently than every three years; safety and training programs and internal claim reporting procedures should be documented in writing; transit management should streamline internal reporting procedures by forwarding to insurers each item of accident information as it becomes available; statements of transit system vehicle losses should be obtained from insurers quarterly during the coverage term and updated annually thereafter; transit systems should emphasize their emphasize their favorable loss records to insurers bidding vehicle insurance programs. Transit systems except Madison and Milwaukee should consider deductibles or should purchase liability coverage limits of no less than \$5 million, and should pursue a joint purchase program.

21 319334 DIAGNOSTIC TOOLS IN TRANSIT MANAGEMENT. Historically, transit management had to rely on a technique known as

peer-group comparison to identify strengths and weaknesses in the performance of their system. In this technique, performance indicators for the system under study are compared with the average performance of systems that have similar characteristics. This method, though useful, is deficient in that it does not totally reflect the differences in operating characteristics or environment among transit properties. This paper presents a diagnostic tool for comparing performance among transit systems by suggesting a method to eliminate deficiencies in the traditional approach. The paper suggests that combined uncontrolled and controlled comparisons be used to identify relative strengths and weaknesses in performance. The uncontrolled comparison is the traditional approach in which system performance is compared with average performance of the peer systems. The controlled comparison is performed by comparing that actual performance with the expected performance. The expected performance is calculated from models that can be developed from the experience of the peer systems. This paper presents a case study in which uncontrolled and controlled comparison concepts were used to identify strengths and weaknesses of 11 bus depots in the New York City Transit Authority. The paper presents 10 transportation and maintenance performance indicator models that were used to calculate the expected depot performance. The models were developed through stepwise multiple regression analysis of the New York City Transit Authority's actual operating statistics for fiscal year 1977. The paper also discusses how the uncontrolled and controlled comparisons were subsequently used to set priorities among depots for remedial action. The application of the performance comparison technique discussed in this paper to smaller systems would require comparison of the system's performance with that of other similar transit properties. 21 319336 EVALUATING POTENTIAL EFFECTIVENESS OF HEADWAY CONTROL STRATEGIES FOR TRANSIT SYSTEMS. Holding strategies for control of headways between transit vehicles are often considered as a means of improving the reliability of transit service. This paper describes simple tests that can be used to identify situations for which control is potentially attractive. These tests depend only on a simple measure of headway variability and the proportion of total passengers who will be delayed as a result of the holding strategy. Thus, this analysis provides transit operators with a simple screening model to evaluate potential effectiveness of controls. (Author)

21 319339 SYSTEMATIC PROCEDURE FOR ANALYSIS OF BUS GARAGE LOCATIONS. The overhead costs of transit operations represent one area in which economies can be achieved. For

a large system the costs of putting buses on routes and pulling them off (pull-on and pull-off) and driver relief can be substantial: up to 10 percent of the operating budget for the system studied. These costs are directly related to the route structure and the location and capacity of bus garages. This paper describes a procedure that uses generally available planning data in the analysis of the pull-on and pull-off and relief costs for alternative garage programs. Factors studied include the number of facilities, their location, their capacity, and the routes served from each garage. It is shown that the location of garages in relation to day-base routes is a determinant of relief costs and that the difference in operating costs for alternative programs can approach \$1 million per year. 21 319342 OPERATIONAL IMPROVEMENTS IN A TWO-CITY BUS TRANSIT CORRIDOR (ABIDGMENT). The Albany-Schenectady, New York, bus service corridor is the most heavily used corridor in the Capital District Transportation Authority's service area. The continuing decentralization of activities from the two cores out along the corridor and the increase in service demand has created the need for operational analysis of services to increase their effectiveness. The resultant study emphasized near-term operational improvements that could be implemented within fairly fixed operational support funding. A study of this nature deals with many situations that are site-specific. Of general interest will be the methodology of data collection and analysis and some of the detailed dynamics of a long, relatively high-density bus transit corridor that must consider interactions between line-haul and local services and between transit and the many factors that contribute to route delay. Of 14 problem areas originally enumerated in the study, general analytical conclusions on 7 are given. The corridor demonstrates that many of the operational inefficiencies for which separate right-of-way modes might be proposed manifest themselves at demand levels well below levels at which implementation of such modes is usually considered. 21 319344 HIERARCHICAL PROCEDURES FOR DETERMINING VEHICLE AND CREW REQUIREMENTS FOR MASS TRANSIT SYSTEMS. This paper presents procedures for determining vehicle and crew requirements for mass transit systems. Some of these procedures are very fast computationally but only give lower bounds, upper bounds, or estimates of resource requirements. Other procedures are slower computationally but give actual crew and vehicle schedules. Depending on the type of analysis being performed (long-range planning, short-range planning, or operational planning), all of these procedures play a useful role in the design and analysis of proposed mass transit

systems. The paper has two sections: (a) the first discusses techniques for determining vehicle requirements and (b) the second discusses techniques for determining crew requirements. Within each section are a set of procedures that range from the very simple to the complex, along with comments on their usefulness and shortcomings. (Author)

21 319364 TRANSPORTATION SYSTEM MANAGEMENT: OBSERVATIONS AND COMMENTS ON FUTURE DIRECTIONS.

The author notes that the TSM concept seems to have become thoroughly institutionalized in the transportation planning process. He attributes this to its compatibility with a set of values and concerns that have emerged in the U.S. in recent years: the emerging conservation ethic, the growing fiscal conservatism, a new emphasis on reusing the old rather than throwing it away, and a newfound awareness that the age of cheap, unlimited energy is over. Typical TSM activities—small-scale, incremental actions whose effects are confined to communities or neighborhoods—seem more suitable for local initiative and implementation and thus raise doubts in the author's mind of the importance of TSM at the regional level. The need is stressed for taking greater account of role of the private sector in TSM implementation. Many TSM initiatives (e.g. flexible working hours, vanpools, off-street parking management, pedestrian malls) are significantly dependent on the initiative, support and good will of private enterprise. Attention is called to such less galmourous TSM actions being introduced at the local level as residential parking programs, traffic diversion, commuter parking bans and street closings. Finally, the author calls for the use of TSM in rail planning (e.g. the joint use of rail facilities by freight and commuter services, i.e. tracking sharing).

Orski, CK (German Marshall Fund) *Transportation Research Board Special Report* No. 190, 1980, pp 10-11; This paper appeared in Transportation Research Board Special Report No. 190: Transportation System Management in 1980.

21 319418 TRANSPORTATION SYSTEMS MANAGEMENT ELEMENT. Transportation Systems Management (TSM) denotes a process designed to increase the efficiency of existing transportation facilities and resources by implementing low-capital measures which reduce the need for major capital improvements. In addition to fiscal economy, the TSM process insures that meaningful steps can be taken toward attaining broader local and national goals—energy conservation, environmental improvements, equity for transit dependents and urban preservation. In this fifth update of the TSM Element, greater emphasis is placed on: (1) developing a method for prioritizing projects; (2) developing monitoring and evaluation techniques to ascertain the effectiveness of implemented projects; (3) establishing a transportation technical committee to more completely involve local and state agencies in the total TSM program. 21 319643 IS PART-TIME LABOR A CURE FOR TRANSIT DEFICITS? This article examines the potential savings from part-time labor and concludes that part-time labor cannot make a substantial reduction in the size of the transit deficit. Also discussed are the factors responsible for producing transit deficits. It is concluded that broad social forces outside the control of the transit industry are the major factors.

21 322245 BUS ROUTE AND SCHEDULE PLANNING GUIDELINES. Bus transit service planning in most urban areas is largely an outgrowth of historic and geographic circumstances. Planning should reflect the specific needs and operating requirements of each urban area. Relevant planning factors include: past operating practices and procedures; the current operating authority and system extent; revenue requirements (i.e., reliance on fares); land-use, population density, ad employment features; street patterns; and the availability of off-street rail transit. These factors, singly and in combination, influence the pattern of bus services and the opportunities for change and expansion. The best possible service should be provided to the greatest number of people within the governing economic constraints. Planning must balance the amount and type of services provided with the net costs of providing the service. This trade-off underlies all service planning decisions. Bus services should be carefully related to existing and potential markets and concentrated in heavy travel corridors with the greatest service frequency and route coverage in the approaches to the city center. Route structure should be clear and understandable, and service duplication should be avoided. Changes in transit service must be coordinated with planning and traffic agencies to expedite bus flow and to assure that streets in nearby developing suburban areas are able to accommodate buses. These changes in service should minimize disruption of existing riding patterns. The greatest opportunities for major modifications to services or routes accompany (a) expansion of transit services from urban and regional carriers into integrated systems and (b) provision of new service to growing suburban areas. However, the alteration in service patterns usually represent small-scale, fine-grained adjustments. Such adjustments reflect changes in actual ridership due to population growth or decline; provision of service to new employment centers, schools, or residential areas; ability to operate on new streets or expressways; and "restructured" or reduced service to bring costs and revenues in better balance. In almost every case, the amount of financial support beyond fare-box revenues influences the amount and type of service. (Author)

21 322263 SYNCHRONIZED TRANSIT SYSTEMS: THE CHALLENGE OF THE 1980S. The way in which a transit system can be redesigned to better fit the polycentric city is described. A transit system which serves several high density destinations will be better utilized and supported and more economical to operate than one which serves only one major destination. Such a service should be structured around a set of strategically located major interchange points and would consist of good local service to a few centers of activity (including downtown), good express bus service between centers, and good internal circulation service in a few high density centers. The synchronized transit system (STS) concept is structured around a small number of transit centers and provides synchronized service at most or all of these centers. The synchronization of schedules at the transit centers makes transfers easy and quick. The design of an STS should begin with the identification and classification of the most promising set of locations for the transit centers. The next step is the defining of the transit service to be provided to and between each center. Ideally, the routing and scheduling of the transit service should change to fit the travel patterns at different times of the day or week. The dual route/schedule concept (two sets of fixed routes with one set serving major employment centers during peak periods and the other serving nonwork activity centers) is discussed. Actual experience with the application of STS concepts in Canada and the U.S. is discussed, and the problems encountered are noted. It is observed that the STS concept appears to be the transit solution to meeting the American City in the 1980's and 1990's.

Schneider, JB (American Public Transit Association) Smith, SP (Washington University, Seattle) *Transit Journal* Vol. 6 No. 2, 1980, p 39; ORDER FROM: American Public Transit Association, 1225 Connecticut Avenue, NW, Washington, D.C., 20036

21 322562 OPERATIONAL TECHNOLOGY IN PUBLIC RAIL-BOUND TRANSPORT [Betriebsleittechnik im Schienengebundenen Nahverkehr]. Operational technology as part of safety and railway automation process plays an important role in public transport. First, the area

of management operation technology is divided from the areas of signalling technology and train control technology. The basis of the structure of an urban railway network, the role of the three functional planes "areas", "line" and "control centre" are laid down. For the carrying out of these roles, a hierarchical system is proposed for the computer and is explained by means of an example of an actual system in use. [German]

21 322984 DEVELOPMENT AND TESTING OF AN INTERACTIVE TRANSIT STATION SIMULATION MODEL. USS is a transit station simulation computer program developed for the Urban Mass Transportation Administration. The program is intended as a design and evaluation tool for transit planners and engineers, to assist in developing alternative configurations for rapid transit stations. In its final version, USS will become a part of UMTA's Urban Transportation Planning System (UTPS), a series of related computer programs which permit planners to simulate and model both supply and demand characteristics of urban transportation systems.

Lutin, JM (Princeton University) ; American Federation of Info Processing Soc Press 1979, pp 936-941, 8 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: American Federation of Info Processing Soc Press, 210 Summit Avenue, Montvale, New Jersey, 07645

21 323358 THE HONG KONG MASS MOVEMENTS MIRACLE. The author reviews the administrative organisation concerned with the construction of the Hong Kong mass transit railway (MTR). The 26 km of railway under construction consists of 16 km of modified initial system already opened and the 10 km Tsuen Wan extension to be in operation by the end of 1982. Costs of the project and sources of finance are discussed. It is emphasised that the success of the project so far in opening on time and within the budget is due to the continuity of management

planning. Although revenue for the project is partially protected by property development, this might be equalled by increasing operating costs. A successful outcome of the MTR is of importance not only to Hong Kong but also to other urban areas of the world contemplating similar systems.

Ridley, T (Halcrow Fox and Associates) *Transport* Vol. 1 No. 3, July 1980, pp 19-22, 1 Fig., 1 Tab.; ACKNOWLEDGMENT: TRRL (IRRD 249625); ORDER FROM: City Press Limited, Fairfax House, Colchester, Essex, England

21 324469 MANAGING PEAK PERIOD TRANSIT DEMAND IN LOS ANGELES. This paper discusses cost and fare structure analysis at the Southern California Rapid Transit District, where in-depth studies of cost and fares have recently been performed. It has been found that off-peak fares tended to subsidize peak-hour service, particularly the express buses using the freeway. To compensate for this, a surcharge is added to the peak hour fare, while the express service utilizes a graduated fare system. A flat fare is retained for local service. The worst single inefficiency of the peak is having to run buses in two directions for travel in one direction. This imbalance has been eased somewhat by the increasing suburbanization of employment. Where reverse commutes are possible, ridership has grown spontaneously. Where the imbalance persists, load-shedding (i.e. actually encouraging car-or vanpool to relieve bus overcrowding) is recommended. Where peak occur at different times on different lines, some efficiency is gained through interlining. Other possibilities being explored include more sophisticated data collection and analysis, better means of tying costs and revenues to units of service provided, use of part-time drivers, automatic passenger counting and vehicle monitoring, and increasing computerization of scheduling process.

22 051405 DEVELOPMENT OF A FLEET MAINTENANCE POLICY. The preventive maintenance program may be defined by the period between maintenance actions, the time the vehicle is removed from service for preventive maintenance work, and the cost of the periodic preventive maintenance. Total maintenance cost is the sum of the cost of parts, labor, and material used for scheduled preventive maintenance; and the costs of parts, labor, and material used for unscheduled repairs of vehicles that break down between scheduled maintenance actions. Level of service is more difficult to define quantitatively, and is discussed in detail.

22 093359 SIMS IMPLEMENTATION HANDBOOK. SERVICE, INVENTORY AND MAINTENANCE SYSTEM. The Service, Inventory, and Maintenance System (SIMS) has been developed to aid urban bus transit properties in managing their servicing and maintenance activities. This automated information system is currently operational and consists of three components: the Service/Unit Change System, Inventory System, and Repair Cost System. General descriptions of the system's data requirements and the reports it produces have been published, and detailed software documentation is available for each of the three components. This handbook furnishes guidance to management in planning the implementation of the SIMS components at individual properties, by outlining such steps as data base generation, training, and acquisition of data processing services.

22 095224 ORGANIZATION OF A TRAINING CENTER FOR MAINTENANCE PERSONNEL. TABEC (Technical And Behavioral Education Center) was created in 1974 as a centralized training facility for Chicago Transit Authority maintenance personnel. The primary function at TABEC is to provide the training needed to enable maintenance personnel to efficiently and safely maintain all of CTA's equipment. Training includes both classroom and "on-the-job" instruction. This paper discusses the courses of job training that are handled at TABEC.

Bolech, J (Chicago Transit Authority); American Society of Mechanical Engineers 75-RT-6, Apr. 1975, 4 pp; Contributed by the Rail Transportation Division of The American Society of Mechanical Engineers for presentation at the IEEE-ASME Joint Railroad Conference, San Francisco, California, April 15-17, 1975; ACKNOWLEDGMENT: ASME; ORDER FROM: ESL, Repr. PC, Microfilm

22 095988 IMPLICATIONS OF THE RELATIONSHIP BETWEEN INVESTMENT AND MAINTENANCE. While a transport operator must be certain that his investment and operating plans will fit his community's needs, there are other basic considerations. Data is analyzed from a survey of some 20 railway and 40 single-deck bus operators. A reduction in required maintenance can be achieved by higher investment in design and quality of construction. The number of maintenance employees per vehicle appears to be a more crucial factor than fleet size. There is some evidence that, with the right choice of a maintenance method to minimize overheads, a bus life of less than 12 years has been shown to provide a balanced service performance at a most economical level of overall cost.

Glendinning, JG McKay, G; International Union of Public Transport Report 5A, 1975, 21 pp Presented at the 41st International Congress of the International Union of Public Transport.

22 097469 SIMS OVERVIEW. SERVICE, INVENTORY, AND MAINTENANCE SYSTEM. UMTA's Transit Operations and Management (TOMS) project includes the development of a maintenance management information system for use by the urban mass transportation industry in the maintenance of bus fleets. The Service, Inventory, and Maintenance System (SIMS) has been developed to operate as a software package at computer service bureaus or on computers operated by transit properties. SIMS consists of a package of computer programs written on ANSI COBOL language and currently operates on an IBM 360/50 or larger computer. Practical design has been enhanced by experience from field tests at the Dallas Transit System (DTS) of Dallas, Texas and Alameda-Contra Costa Transit District (ACTD) of Oakland, California. The system has been operating daily at both DTS and ACTD on a demonstration basis. This report provides an overview of the system using illustrations of the reports produced by SIMS. Information displayed on the reports allows management to plan repair actions, avoid road calls and control expenses. The Service module helps to identify consumption of oil and coolant. Transit property stock room supplies are monitored through the use of the SIMS Inventory module. The Maintenance (Repair Cost) module provides repair costs data for individual buses and divisions, segregating costs into subassemblies, inspections, accidents, and vandalism repairs, and provides information about total maintenance labor utilization. Appendices contain computer requirements and glossary.

Thurlow, VS; Mitre Corporation, (M73-218) UMTA-VA-06-0004-73-5, Oct. 1973, 56pp; This report was sponsored by the Urban Mass Transportation Administration, Department of Transportation.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB241-495/AS

22 099300 ELECTRONIC DATA PROCESSING AS AN AUXILIARY IN RELIABILITY AND PREVENTIVE MAINTENANCE STUDIES OF PUBLIC TRANSPORT VEHICLES. Studies reveal a tendency for transport undertakings to use procedures of the kind used by manufacturing industries for the organization of work on periodical maintenance and overhaul

operations. Completely new ground, however, has to be broken in this context as regards procedures and rates of production. The general concepts which form the basis of already existing systems must be adapted to the specific needs of transportation undertakings. The maintenance of vehicles comprises 3 operations (maintenance, overhauling, and repair) organization of the undertaking must be divided into 5 labor units and 3 managerial units. The programming and initiation of maintenance and overhaul work is discussed, and the technical and managerial control of maintenance and overhaul operation is detailed. Accident repairs and spare parts record are also discussed. The results and analysis of results of 86 replies to a questionnaire survey are presented.

Sasso, S (Azienda Tramvie e Autosiloviedi Napoli, Italy); International Union of Public Transport 6, 1975, 14 pp, 2 Fig., 1 App.; Presented at the 41st International Conference of the International Union of Public Transport, Nice, France, 1975.

22 132992 SERVICE, INVENTORY AND MAINTENANCE SYSTEM COMPUTER SYSTEM DESCRIPTION. VOLUME III: REPAIR COST SYSTEM. The Service, Inventory and Maintenance System (SIMS) is a computer-based information system designed to assist urban transit systems in the management of their bus service, maintenance and inventory operations. SIMS comprises three interrelated program modules: The Service/Unit-Change, Repair Cost and Inventory modules. This report describes the overall structure, inputs, reports, files and data processing functions of the SIMS Repair Cost system. /UMTA/

22 137373 LIFE CYCLE COSTING FOR CURRENT ROHR AND AM GENERAL BUSES AND GENERAL MOTORS RTS-II BUS. UMTA is considering the use of the life cycle costing concept in the procurement procedures for intracity buses. These relevant factors have been identified as the bus price, maintenance costs (including preventive maintenance), fuel costs, and tire costs. Evaluation of practices of bus operators and manufacturers indicates that they are in a position to agree mutually upon an evaluation process dependent upon: (1) maintenance cost data, (2) design-related maintenance elements, (3) fuel and tire costs, (4) useful life of a bus for evaluation purposes, and (5) initial bus purchase price. Inasmuch as the follow-on costs considered in the evaluation of bus bids exceed the cost of the bus itself, the life cycle costing approach highlights the follow-on costs. Of paramount importance is the flexibility to introduce design improvements that can result in savings during the life of the bus.

22 152721 SCHEDULING OF TRANSIT BUS MAINTENANCE. The study of current practice in bus maintenance has revealed that preventive maintenance schedules are initially based upon past experience, and are reviewed and adjusted according to the feedback regarding the cost of maintenance and the reliability of performance of a bus fleet. Maintenance management would normally institute changes in the maintenance periods and in the procedures followed, in an attempt to shift the system towards a better balance between the cost of maintenance and the reliability of service. The method proposed in this research takes a formal approach towards the determination of bus maintenance schedules. A cost function which takes into account the sum of the cost of periodical preventive maintenance and the cost of failures and unscheduled repairs has been developed. A computer method is used to derive the least-cost maintenance schedule, and an example is given to demonstrate the use of the method.

22 197441 USER'S GUIDE FOR THE INTERACTIVE SCHEDULING PROGRAM: PRELIMINARY CALENDAR VERSION. The Office of Transportation Management of the Urban Mass Transportation Administration (UMTA), in conjunction with the Transportation Systems Center (TSC), designed and developed the Interactive Scheduling Program (ISP) to assist rail-transit operators in the scheduling of preventive maintenance. The ISP was first applied to the scheduling of warranty inspections for the new Light-Rail Vehicles (LRV's) acquired by the Massachusetts Bay Transportation Authority (MBTA). The warranty for these vehicles covers a 2-year period, and requires scheduled inspections every 45 days. While the ISP is designed for the LRV's, its scope could easily be broadened to aid any property with equipment whose maintenance is conducted on a calendar basis. This document describes the user's guide for the preliminary calendar version of an ISP. A computerized scheduling system is described that is designed to operate on a real-time or on-line basis. By utilizing a set of program commands, the user is allowed to enter and extract data relative to vehicle warranty scheduling. A scheduling algorithm was developed for this program which incorporates a variable work window whose purpose is to minimize fluctuations in the daily workload. This minimization results in less required manpower and overtime, therefore resulting in a reduced maintenance cost. The program operates on a five consecutive year span for the years between 1976 and 2000.

Downey, PJ ; Transportation Systems Center, Urban Mass Transportation Administration Handbook DOT-TSC-UMTA-77-43, UMTA-MA-06-0074-78-1, Aug. 1978, 30 p.; Contract DOT-MA-06-0074; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-295021/OST, DOTL NTIS

22 198651 AN INFORMAL STUDY OF TRANSIT BUS TIRE PROCUREMENT AND RECYCLING IN MICHIGAN. The tire procurement practices of several Michigan public transit agencies are examined. Cost comparisons between tire purchasing costs and tire leasing costs are performed. It appears that Michigan public transit agencies can save significant amounts of money by purchasing their bus tires rather than leasing them. Tire recycling methods are reviewed. The use of recapped bus tires appears to be the most cost effective and energy efficient method of recycling used transit bus tires. Cost comparisons of tire use cost for all-new and recapped bus tires offer significant operating cost savings to those Michigan public transit agencies not using them now.

22 239476 THE URBAN MASS TRANSIT GRME (MAINTENANCE)-TECHNICAL REPORT PHASE IR: INSTRUCTIONS FOR PARTICIPANTS THE URBAN MASS TRANSIT GAME (MAINTENANCE)-TECHNICAL REPORT PHASE IB: ADMINISTRATIVE MANUEL. THE URBAN MASS TRANSIT GAME (MAINTENANCE) IS A COMPUTER-BASED SIMULATION EXERCISE OR MANAGEMENT GAME THAT IS FOCUSED UPON THE MAINTENANCE FUNCTION OF A MUNICIPAL BUS COMPANY. THE GAME PARTICIPANT IS REQUIRED TO MANAGE THIS DEPARTMENT-TO DIRECT A WORK FORCE TOWARDS THE COMPLETION OF A DAILY SCHEDULE OF WORK REQUIREMENTS. A UNIQUE FEATURE OF THE GAME IS THE INCLUSION OF DISTINCT PEOPLE-A WORK FORCE OF MECHANICS THAT ASSUMES SEPARATE AND DIVERSE IDENTITIES. THE PHASE IA REPORT INCLUDES A BRIEF IDENTITIES. THE PHASE IA REPORT INCLUDES A BRIEF GENERALLY, AND THEN TO THEIR APPLICATION IN THE MASS TRANSIT INDUSTRY. SPECIFIC INSTRUCTIONS TO GAME PARTICIPANTS AS WELL AS SOME AUXILIARY CASE PROBLEMS ARE CONTAINED. IN PHASE IB ADDITIONAL PROGRAM DOCUMENTATION AS WELL AS THE SPECIFIC FORTRAN COMPUTER PROGRAM IS INCLUDED. RESULTS OF A PILOT TEST CONDUCTED WITH THE NEW YORK CITY TRANSIT AUTHORITY ARE PRESENTED. IN OPERATION, THE GAME REQUIRES A 25-DAY SIMULATION PERIOD AND A COMPUTER SYSTEM WITH FORTRAN IV COMPILER CAPACITY. /UMTA/ Virginia Polytechnic Institute ; ACKNOWLEDGMENT: UMTA

22 260165 EVALUATION OF BUS MAINTENANCE PROCEDURES THROUGH SYSTEMS ANALYSIS: A CASE STUDY. Every transit company is faced with the maintenance operations of buses. Each bus in the garage is a loss of revenue. In order for the transit system to operate efficiently, maintenance procedures must be such that buses receive proper maintenance and repairs with minimum loss of time. The main

purpose of this study is to provide an analytical basis for a bus maintenance shop. Bus maintenance procedure is primarily based on the mileage of the buses and the life mileages of major parts on each bus. This procedure becomes complicated as the variety of bus types increases as well as when number of parts grows. To make formal analysis possible a generalized model was constructed. This model consisted of submodels of the inspection shop, the repair shop and a cost minimization submodel. The validity of the models was established through comparison between observed data and that produced by the model. Information made available by the Denver Metro Transit Company (DMT), which is owned and operated by the City and County of Denver, was used as the observed data base. Queuing theory plays a key role in the analysis of the inspection shop and repair shop. The relationship among the

various factors was examined and it was found that most of the characteristics of each part were determined by curve fitting to the life mileage curve, which can be determined by curve fitting to the actual data. The model, according to the authors, provides much insight into a maintenance shop. Figures, tables and references are furnished.

22 303942 MAINTENANCE PLANNING FOR SMALL TRANSIT SYSTEMS (ABRIDGMENT). This paper discusses a study of maintenance operations for small transit systems. The study, conducted in 1976, focuses attention on

two systems in Wisconsin--the Bell Urban System (BUS), which serves the Racine area, and the Sheboygan Transit System, which serves the city of Sheboygan and some of the surrounding communities. The study deals with the current maintenance facilities and procedures, as well as with expected future needs. A review of available maintenance reporting and planning systems such as the Service, Inventory, and Maintenance Systems (SIMS) and BUS reveals that such systems could not be supported efficiently in small transit systems.

23 054616 EDUCATION IN TRANSPORTATION SYSTEMS PLANNING. The past few years witnessed profound changes in the basic manner in which transportation services are viewed, developed and operated. The passage of the Federal-Aid Highway Act of 1968, the National Environmental Policy Act of 1969, and the Federal-Aid Highway Act of 1970, the expansion of programs in urban mass transit, and a rising level of concern on the part of the public have all led to a new set of rules and directions for those actively engaged in the provision of transportation services. These changes have led to protection of parklands, TOPICS studies, environmental impact statements, noise and air pollution studies, relocation assistance programs, capital grants for mass transit, citizen participation panels, joint use projects, demonstration projects for innovative transportation systems, and so on. These changes are having substantial impacts on transportation education programs at many universities, and have already created a need to incorporate a broader array of subjects into the curriculum.

23 080215 MASS TRANSIT TRAINING NEEDS. VOLUME I. EXECUTIVE SUMMARY. The report is the first of a five-volume series summarizing the findings, conclusions, and recommendations of a study of urban mass transit training needs. This study includes a detailed analysis of the training requirements; a discussion of the availability of training programs to meet the needs of the industry; an outline of supplementary material needed to bring training programs up to an acceptable standard; and proposals for programs to upgrade the standard of training as it currently exists. Specifically, this volume summarizes the results of an inquiry into industry needs for standardized programs regarding training of (1) bus operators, (2) bus operator instructors, (3) bus mechanics, (4) bus mechanic instructors, and (5) rapid transit rail car repairmen. Following a description of programs currently in use at transit properties, the general contents of the respective standardized programs are outlined, the role of the Federal government in funding is examined, alternative methods of delivering programs are discussed, and costs of development and demonstration are estimated.

23 080217 MASS TRANSIT TRAINING NEEDS. VOLUME V. RAILCAR REPAIRMAN TRAINING NEEDS. The report is the fifth of a five-volume series summarizing the findings, conclusions, and recommendations of a study of urban mass transit training needs. This volume is devoted to the railcar repairman. About half of the training is generalized enough to allow a standardized training course to be developed. An outline of such a course, and sources of training material which would be included are presented. One conclusion is that because of the financial difficulties of the mass transit industry, it is recommended that implementation be delayed until funds become available to cover the costs of training.

23 080228 MASS TRANSIT TRAINING NEEDS. VOLUME IV. BUS MECHANIC TRAINING PROGRAM. BUS MECHANIC INSTRUCTOR TRAINING PROGRAM. The report is the fourth of a five-volume series summarizing the findings, conclusions, and recommendations of a study of urban mass transit training needs. The training of mechanics and mechanic instructors is described in this volume. An outline of a general training program containing ten independent modules is presented, together with sources of material for use in the course. One conclusion reached is that because of the financial difficulties of the mass transit industry, it is recommended that implementation be delayed until funds become available to cover the cost of training.

23 083155 PROFESSIONAL EDUCATION IN URBAN PUBLIC TRANSPORTATION. A description is given of a 6 week program for practicing professionals, by which they may update knowledge and skills. Part 1 consists of graduate level lectures and assignments, a series of seminars planned and conducted by the participants, and several tours of local transit facilities. Part 2 consists of a lecture-study tour of major North American and European cities. The strong endorsement of the lecture-study tour segment by participants supports the view that practical field study is an essential element of such a program.

Two devices which have appeared helpful in defining the application of fundamental areas to specific problem situations are the case study and the seminar.

Hoel, LA Romualdi, JP Roszner, ES (Carnegie-Mellon University) *Transportation Research Board Special Reports* Conf Paper No. 150, 1974, pp 35-36; Presented at a conference conducted by the Transportation Research Board Sept. 7-8, 1973, at the University of Pennsylvania, Philadelphia, and cosponsored by the Transportation Studies Center, University of Pennsylvania, in cooperation with the 1907 Foundation.; ORDER FROM: TRB Publications Off, Repr. PC

23 098930 UNION WAGE RATES OF TRANSIT EMPLOYEES. A significant part of the union wage gains of 11.5 percent for local transit employees, resulted from contract stipulated cost-of-living adjustments based on changes in the national or local consumer Price Indexes. The average July 1973-1974 wage increase for operators of surface cars and buses was 11.3 percent compared with 12.8 percent for those on elevated and subway lines. Union wage rates for local transit operating employees averaged \$5.62 an hour on July 1, 1974. Slightly more than 33 percent of all operating employees earned at least \$6.00 an hour compared with fewer than one percent of the workers a year earlier. In three of the 6 cities reporting both types of workers, average wage rates were the same. In the remaining three cities, elevated and subway equipment operators averaged 8 to 16 cents an hour less than workers on surface cars and buses. The average wage for all operating employees was highest in the Middle Atlantic. Regionally, percentage increases in wage rates over the year ending July 1, 1974 were the largest in the midwest and southeast. An average wage rate of \$6.03 was recorded for workers in cities of 1 million inhabitants or more. Union contracts in all but three of the cities surveyed provided for wage rate progressions on the basis of length of service. Contract provisions for employer financed health, welfare, and pension plans applied to nearly all of the workers covered in the survey.

23 136986 THE EFFECTS OF THE 1972 TRENTON, NEW JERSEY BUS STRIKE ON THE MODAL CHOICE OF THE COMMUTERS. The drivers of the Transport of New Jersey (TNJ) Bus Company declared a strike against their employer in 1972 for seventy-five days, leaving about 350,000 daily riders with the problem for finding alternate modes of transportation. The objectives of this report are to establish 'what happened' in modal use during the strike-related periods and to attempt to identify how location and passenger characteristics may or may not affect such strike-related modal use changes.

Bata, AF ; Northwestern University, Evanston, Urban Mass Transportation Administration, (UMTA-IL-11-0005) MA Thesis UMTA-IL-11-0005-74-2, June 1974, 120 pp; Grant DOT-UT-495; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-253411/3ST

23 138153 EVALUATING THE RELEVANCE OF SPECIALIZED UNIVERSITY COURSES IN PUBLIC TRANSPORTATION (ABRIDGMENT). As the transit industry begins to attract more university graduates, it becomes important to examine the relation between university transportation course offerings and the transit industry's job requirements. From an evaluation of university transportation courses and programs can come information concerning the direction such programs must take to provide the most effective employees. Twelve public transit properties and five state departments of transportation were contacted by telephone and mail surveys to identify organizational needs and problem areas. Faculty members were contacted at several universities, and business, transportation, and civil engineering programs were reviewed. Recent university graduates employed in public transit activities were surveyed by a questionnaire regarding the relevance of their transportation education to their jobs. The results of the research show that, for most public transit industry jobs, universities are providing graduates with the proper training and capabilities. Also found was a strong demand for additional short courses and seminars that would enable industry personnel to keep abreast of the newest methods, techniques, and topics of interest to the industry. The data generated should be useful to universities and federal and state agencies in evaluating their position with respect to public transit education.

23 155430 THE EFFECTS OF LABOR STRIKES ON BUS TRANSIT USE. Strikes have become a major concern in the effort to reverse the long-term deterioration of public transportation services in this country. This study addresses the effects of strike-induced transit shutdowns on the short and long-run demand for mass transportation services. To shed light on the problem of post-strike passenger diversion, a nation-wide analysis of transit strike impacts is presented. The findings herein should prove useful to transportation planners and transit management. This study reviews the present day labor-management relationship and the collective bargaining process in the urban transit industry. Several case studies of urban transit strikes are also examined with the intent to establish the effects of the strike on the public and on its future travel patterns.

23 156122 ESTABLISHING CONTRACTUAL RELATIONSHIPS FOR DEMAND-RESPONSIVE TRANSPORTATION SERVICES. As interest in demand-responsive transportation systems has grown, increased attention has focused on making use of the experience and resources of the private sector in providing these services. Recent experiences have shown that establishing satisfactory relationships between public agencies that want to foster these services and private operations may be difficult because of the different constraints and objectives that characterize the public and private sectors. An important part of such relationships is the contract that binds the two parties. The authors review recent contracting experiences; identify the goals, objectives, and constraints that characterize each sector; and suggest a contract framework that seeks to reconcile potentially conflicting objectives of the two sectors. /Author/

23 167853 STUDY OF UNIONS, MANAGEMENT RIGHTS, AND THE PUBLIC INTEREST IN MASS TRANSIT. Results of the collective bargaining process are of central interest in the fields of industrial relations and mass transit. This research reports on an empirically based study of labor-management relations in a nine-state Southeastern area. Through an analysis of labor agreements on a provision-by-provision basis utilizing a list of 249 variables and in-depth, on-site interviews of both union and management representatives, this research provides the reader a better understanding of the dimensions of collective bargaining in mass transit. By identifying the significant parameters in negotiations, determining the collective bargaining environment, and quantitatively evaluating the involvement of organized labor in the bargaining relationship, the research provides a basis for examination of the underlying complexities of labor-management relationships. This report presents, along with a description and analysis of the collective bargaining environment in the Southeast for mass transit, the formulation and operationalization of a model of collective bargaining outcomes. Significant issues such as the nature of bargaining, employee protection provisions, wage determination, impasse resolutions, and technological change are discussed. An examination of the public interest and union influences is developed and a model to measure union involvement or power is formulated and analyzed. /Author/

Jennings, KM Smith, JA Traynham, EC ; University of North Florida Final Rpt. Jan. 1977, 276 pp, Tabs., Refs., 5 App.; Sponsored by the Department of Transportation, Office of University Research.; Contract DOT-OS-50116; ORDER FROM: NTIS

23 172047 LABOR RELATIONS IN URBAN TRANSIT. This study focuses on labor-management relations in the urban mass transit industry from 1960-1975, a period during which most of the major transit systems changed from private to public ownership and began receiving substantial funding from government. A major objective of this study was to evaluate how collective bargaining outcomes--transit wages, labor cost, and work rules--changed with the advent of public ownership and public subsidies. Two chapters of this study examine the development of Amalgamated Transit Union (ATU) policies and how they affect practices in the urban transit industry. The political, legal, and economic factors shaping the collective bargaining relationship are explored. Special attention is directed toward such factors

as; 1) the labor protection clause, Section 13 (c), of the Urban Mass Transportation Act, and 2) the reliance on "interest" arbitration for the settlement of the terms of new contracts during the past seventy years. Data on wage and selected fringe benefit changes in the 1960-75 period are reviewed. Because this is an exploratory study which relies in part on secondary data, conclusions, of necessity, are tentative. The findings herein are based on several data collection and analysis techniques. Chapter X is based on data primarily for APTA's TRANSIT OPERATING REPORTS; and Chapters V and VI reflect information from ATU publications and interviews with the national leadership of that union. The other chapters consist of personal interviews with union/management spokesmen of 25 transit systems in the U.S. /Author/

23 172063 A STUDY OF MINORITY BUSINESS PARTICIPATION IN THE URBAN MASS TRANSPORTATION INDUSTRY VOLUME I--ANALYSIS OF MINORITY BUSINESS PARTICIPATION. UMTA's Office of Civil Rights (UCR) commissioned this 3-volumed study to establish a data base on the current level of Minority Business Enterprises (MBE) participation in the planning, development, and implementation of transit systems and to recommend changes in enforcement strategies in order to substantially increase MBE participation. The purpose of this report, Volume I, was to examine the participation by and opportunities for MBE in the urban mass transportation industry. A national survey was conducted and the UMTA Minority Business Enterprise Information Sheet (Appendix A) was developed and distributed to twenty-one transit properties selected by UCR (Table 1). The survey revealed that participation by minority businesses in the urban mass transit industry is minimal. This study examined transit properties' procurement activities from 1974-76, affirmative action plans, and UMTA documents. The study recommends that UCR which monitors transit property minority business programs establish more stringent requirements of grantees, require proposed annual and quarterly transit property reports, institute a priority monitoring system, and take measures to more closely link the minority business program with the UMTA grant funding system. /Author/

23 172064 A STUDY OF MINORITY BUSINESS PARTICIPATION IN THE URBAN MASS TRANSPORTATION INDUSTRY VOLUME II--DEVELOPING SUCCESSFUL MINORITY BUSINESS ENTERPRISE PROGRAMS FOR PUBLIC TRANSIT PROPERTIES: A MANUAL. UMTA's Office of Civil Rights (UCR) commissioned this 3-volumed study to establish a data base on the current level of Minority Business Enterprises (MBE) participation in the planning, development, and implementation of transit systems and to recommend changes in enforcement strategies in order to substantially increase MBE participation. This manual, Volume II, provides guidelines for mass transit properties on developing an effective MBE program. Information and recommendations are provided on the use of transit planning and programming tools in planning the MBE program, goal setting mechanisms, MBE subcontract requirements of prime contractors, communications procedures, staffing needs, and recordkeeping and monitoring methods. This Manual reflects UMTA's Office of Civil Rights' requirements for transit property grantees. These requirements were instituted to implement the Revised Title VI Order issued in 1977. The Appendices contain: Annual Report Form, Quarterly Report Form, Sample Bid Work Sheet, List of MBE Liaison Officers, National Trade and Professional Associations, and Minority Contractors and Technical Assistance Organizations. /Author/

23 172065 A STUDY OF MINORITY BUSINESS PARTICIPATION IN THE URBAN MASS TRANSPORTATION INDUSTRY VOLUME III--PUBLIC TRANSIT CONTRACTING OPPORTUNITIES FOR MINORITY BUSINESS ENTERPRISES: A MANUAL. UMTA's Office of Civil Rights (UCR) commissioned this 3-volumed study to establish a data base on the current level of Minority Business Enterprises (MBE) participation in the planning, development, and implementation of transit systems and to recommend changes in enforcement strategies in order to substantially increase MBE participation. This Manual, volume III, provides information on procurement programs, the Title VI Regulations, the contracting procedures utilized by various transit properties, and the names and addresses of MBE Liaison Officers by region. This Manual also contains suggestions for doing business with transit properties relative to the transit/marketing contracting process. A study of MBE procurement activities with 21 transit properties indicated a need to develop this manual. This Manual reflects those elements MBE's need to successfully obtain business from transit properties. The ADDENDA herein contains: Definition of Transit Terms; Selected Active UMTA Grants by Amount and Purpose; Selected MBE Contract

Awards; List of MBE Liaison Officers; List of Commonly Procured Items; MBE Marketing Check List; National Trade and Professional Associations List; and Minority Contractors and Technical Assistance Organizations. /Author/ One America, Incorporated Final Rpt. 23 172152 PSE IS IN TRANSIT IN PHILADELPHIA. A project is described which employs 400 formerly unemployed persons to improve the appearance and cleanliness of South-eastern Pennsylvania Transportation Authority's (SEPTA) vehicles, stations, and depots. Since resources have been concentrated largely on keeping its vehicles rolling, uninviting conditions aboard public conveyances have contributed to a steady loss of SEPTA's riders. The project aims to make the SEPTA system presentable and to draw more people. The workers are paid through a \$4.7 million Comprehensive Employment and Training Act (CETA) title VI grant. The Authority's Rolling Stock and Shops Department in charge of vehicle maintenance, employ part of the SEPTA/CETA participants.

23 176509 SUMMARY VIEWPOINT OF ISSUES OF LABOR RELATIONS IN URBAN PUBLIC TRANSPORTATION. Discussions of issues in labor relations focussed on a range of subjects in the context of the decision-making process by which wages, hours and conditions of employment are determined. The importance of data relating to wages and to employment and operating costs is recognized, and the Urban Mass Transportation Administrations Financial Accounting and Reporting Element (FARE) system to compile nationally uniform data on operating costs is noted. The acceptance of the number of vehicle kilometers operated as a measure of productivity was urged. The issue of nationwide consistency on the legal status of collective bargaining was raised; labor supported this approach, and management generally opposed it. Paratransit was discussed. Labor indicated early enthusiasm for dial-a-ride but has become skeptical as paratransit has expanded particularly in regard to employee protection. The political impact of public transit bargaining is discussed and comments are made on the implementation of statutory requirements of section 13c.

23 176510 LABOR COSTS AND COLLECTIVE BARGAINING IN URBAN MASS TRANSIT: PROBLEMS OF DEFINITION, MEASUREMENT, AND RESOLUTION WITH DISCUSSION. This paper which discusses issues associated with labor costs in the urban transit industry, reports some preliminary results of current research in labor relations and discusses alternatives aimed, on the one hand, at improving both the validity and the accessibility of cost data and, on the other hand, at reducing the gap between operating expenses and revenue. An approach for modifying the bargaining approaches of transit labor and management is also suggested. The research project reported here consisted of 4 parts: the legal framework for collective bargaining in urban transit, including the role of 13c; an analysis of the Amalgamated Transit Union (ATU); the effects of bargaining of the transition from private to public ownership, the impact of subsidies, and the use of arbitration in settling interest disputes; and an examination of the determinants of wage rates and labor costs through cross-sectional and longitudinal statistical analysis. The measurement, determination and control of labor costs in transit are considered, and the inadequacy of current labor costs data is noted. Urban mass transit as a public-sector industry is discussed, as well as employment security and productivity committees.

23 176511 GROWTH OF PRODUCTIVITY AND LABOR RELATIONS IN URBAN MASS TRANSIT WITH DISCUSSION. Numerous potential opportunities to improve the productivity of urban mass transit can be identified. Many of these possibilities involve relatively small departures from standard industry practices and thus might be relatively quickly implemented. These more readily adopted changes include the use of more express services and bus-priority techniques, deployment of some buses larger and smaller than the standard model, negotiation of changes in split-shift work rules, adoption of computerized scheduling, and tailoring of fares, service quality, and schedules to conform better to transit's distinct markets. Other opportunities for productivity growth are clearly possibilities for implementation only in the more distant future, if at all, since they alter more fundamental and traditional procedures used in the industry. Although these opportuni-

ties will take much more time and effort to implement, they may ultimately prove more worthwhile because they address some of the more basic causes of transit's productivity problems. Probably the most important among these long-term possibilities is to find some productive off-peak tasks for employees who are needed as drivers in the peak hours only. A second important long-term change is to discontinue transit service in markets in which it is least competitive with the automobile. The industry's record of decline or relatively slow growth in productivity can not be sustained for long, since the cost of transit would increase in relation to the cost of other goods and services. Failure to implement innovations that improve productivity, like the ones suggested here, will result in some combination of rapid growth in the industry's deficits (and its dependence on public subsidies) and the slow but sure pricing of transit services out of the market. /Author/

23 176512 COLLECTIVE BARGAINING AS A PROBLEM-SOLVING PROCEDURE IN URBAN TRANSIT WITH DISCUSSION. The paper focuses on the areas of changes in collective bargaining in transit that could contribute to a better labor-management relationship. The findings from several studies are reviewed, and a series of questions which will stimulate discussion is raised. The parties and their objectives in collective bargaining are discussed, and the critical issues are explored. One study of collective bargaining in the Southeast found decentralization in publicly owned agencies, i.e., mass transit employees concerns are negotiated and included in a labor agreement that is separate from that of other municipal employees. Comments are made on such aspects as the power to make policy decisions, and on the differences between private and public systems. The Southeast study showed that the shift from private to public ownership had little impact on the collective bargaining process, and that the budget-making process exerted no influence on collective bargaining. It was also found that most of the mass transit properties appear to be relatively unaffected by state or federal labor laws. Institutional and economic issues are discussed. Comments are made on the resolution of impasses in industrial disputes.

Smith, JA, Jr (University of North Florida) *Transportation Research Board Special Report* No. 181, 1978, pp 157-162, 1 Fig., 1 Ref.; This paper appeared in *Transportation Research Board Special Report* No. 181, *Urban Transportation Economics*. 23 176514 POLITICS OF COLLECTIVE BARGAINING WITH DISCUSSION. The question of whether the collective bargaining procedures that have developed in the private sector fit the public sector is considered. The collective bargaining process is seen to consist of bargaining, lobbying, electioneering, exhorting and politicking (bleeping). In the transportation field, the process developed more and more toward the type of collective bargaining that exists in the private sector. As the bargaining or bleeping process develops, there is inevitable movement toward larger units or units that are more influenced by what occurs in other units. Also, the depth of the decision making process increases with the increasing number of political jurisdictions in the cities. The question of who is the decision maker is considered. The dominant factors in making collective bargaining work in the public sector are problems of decision making by the employer and the question of fare.

Kheel, T (Battle, Fowler, Lidstone, Jaffin, Pierce & Kheel) *Transportation Research Board Special Report* No. 181, 1978, pp 167-168; This paper appeared in *Transportation Research Board Special Report* No. 181, *Urban Transportation Economics*. 23 176515 EMPLOYEE PROTECTION: PERCEPTIONS OF SECTION 13C. An attempt is made to explain the factors behind section 13c. Section 13c represents labor's request for recognition that the transit worker had some legitimate interests and certain rights that had been damaged in the process of transition from private to public employment before 1964. In recognizing the need for fair and equitable treatment of labor, Congress recognized that the transit workers have rights that must be considered by the federal government and that they should be protected. The basic thrust against section 13c seems to be based on the fact that the movement to the public sector has focused a much broader dispute about the structure for wage determination in state and local public employment in general. There is also a great deal of opposition to collective bargaining from local governments. It is still an open question whether the U.S. Department of Transportation feels the need for section 13c protection in the area of operating assistance. There are legitimate differences of opinion as to the structure and application of section 13c.

23 178814 PARATRANSIT LABOR ISSUES. All paratransit services are labor intensive, second only to conventional taxis among transportation modes. As such, the manner in which the service is provided, the role of the labor force, and, in particular, the compensation afforded to drivers, have significant impact on the cost of system operation. This report looks into paratransit labor costs as they relate to type of service, union affiliation, management strategies, and characteristics of the system location. Labor costs are analyzed in terms of wage scales, benefits, incentive payments, work rules, scheduling practices, and job definitions. The Transit labor costs are analyzed separately from paratransit labor costs, and the relationship between the two is explored. Interwoven into this discussion of paratransit labor costs is a study of the cost impact of Section 13(c) of the Urban Mass Transportation Act. (This statute protects the employment conditions of transit employees against any adverse effects that may arise out of Federal transit assistance.) This report concludes that real growth in paratransit over the coming years could effect the establishment of dual union wage standards for paratransit and conventional operators. Although the future of paratransit in small rural communities appears secure, the uncertainty and the high labor costs found in the larger cities make its future there more tentative. Greater cooperation is recommended between all levels of government, transit managers, and transit labor unions to further the development of paratransit labor standards and of integrated paratransit services. /UMTA/

23 180633 THE ECONOMIC COST IMPACT OF THE LABOR PROTECTION PROVISIONS OF SECTION 13(C) OF THE URBAN MASS TRANSPORTATION ACT OF 1964. PART ONE: EXECUTIVE SUMMARY, DESCRIPTION OF STUDY METHODOLOGY, ANALYSIS AND CONCLUSIONS [Final rept]. This study identifies, describes, and attempts to estimate kinds of costs (with particular focus on costs imposed on management) that might occur as a result of Section 13(C). The first part of the study used a mail questionnaire to estimate the frequency and size of all 13(C) cash payments made to transit employees during the years 1964-1975. The second part of the study consisted of an evaluation of the probable size and extent of (1) increased wage and fringe benefit costs in takeover situations, (2) redundant worker costs, (3) uncertainty added to the planning

process, (4) costs of delays in signing 13(C) agreements and (5) negotiation, arbitration, litigation, and record keeping costs. Information for this part of the study was obtained by conducting personal interviews with management and labor officials of 13 transit systems.

23 190516 TRAINING PROGRAM FOR OPERATION OF EMERGENCY VEHICLES. The purpose of the contract was to train emergency-service personnel in the operation of Emergency Vehicles (EVs). The course requires five days to administer and includes both classroom and in-vehicle training. Classes can accommodate students from any one or a combination of the following emergency services: law enforcement; fire services; rescue; or, ambulance/EMS. The in-vehicle exercises work with emergency sedans, vans, or large fire apparatus. The report: (a) describes the functional analysis performed to derive the description of the tasks performed in EV operation; (b) describes the training analysis process used to delineate the training requirements, objectives, and course content; (c) dis-

cusses the Pilot Test and Revision process; and (d) presents conclusions and recommendations for improving the course. The major conclusion is that the flexibility of having one package for all services and vehicle types may not justify the added administrative burdens and the instructional compromises that were necessary to get the flexibility. The authors recommend that NHTSA consider re-packaging the program as separate courses for each Emergency Service.

23 193533 IMPACT OF THE TRANSIT STRIKE IN KNOXVILLE, TENNESSEE. The six-week strike from February 14, 1977 to March 28, 1977 of the Knoxville Transit Corporation (KTC) stranded 7,000 to 8,000 daily riders of regular bus routes and 600 daily riders of the express bus service. It provided an interesting and practical opportunity to assess the impact of a temporary interruption of public transportation service in a city of approximately 200,000 population. Small sample surveys were performed both during and after the strike; the surveys focused on specific target groups that were expected to be most severely affected by the strike. The study revealed that many discretionary trips of elderly and economically disadvantaged transit users were suppressed during the strike. However, few cases of severe hardships were reported and it was found that most individuals were able to satisfy their essential travel needs with the help of relatives, friends and social service agencies. Many of the downtown merchants who cater to transit dependents lost substantial business and some were forced to temporarily lay off sales personnel. The transit system itself felt the adverse and continuing impact from the strike. The decline in ridership on the regular routes was estimated to be in the range of 7.2 to 16 percent and in the case of the express buses, the ridership dropped by approximately 15 percent. The adverse impact of the strike on the downtown parking situation was noticeable. However, the general traffic situation was not affected appreciably. On an overall basis, it appears that all parties involved with public transportation--the city, labor union, transit users and downtown merchants--would have been better off by averting the strike. /Author/

23 195580 TRENDS IN CALIFORNIA TRANSIT LABOR CONTRACT SETTLEMENTS. This report reviews trends in transit labor contract settlements nationwide and documents transit operator wage rate increases in California between 1970 and 1976 in comparison to the consumers price index (CPI) increases. It concludes that operator wage rates in California follow national trends and are increasing faster than CPI. It documents the findings resulting

from a literature review pertaining to the transit labor contract settlement process, trends in transit wage rates, and possible government roles in the process. Details of these findings and references to the author's publications are included in the Annotated Bibliography in Appendix D. The report recommends that all involved parties should note the serious upward trend in transit wage rate increases in relation to the CPI and the implication this has on future public financial assistance. It further recommends that the California Department of Transportation should continue its present limited monitoring role until there is a clearer legislative mandate for active labor contract settlement process. /UMTA/

23 263363 MASS TRANSIT TRAINING NEEDS--VOLUME III. BUS OPERATOR TRAINING PROGRAM, BUS OPERATOR INSTRUCTOR TRAINING PROGRAM. This is the third of a five-volume series summarizing the finding, conclusions, and recommendations of a study of urban mass transit training needs. This study includes a detailed analysis of the training requirements; a discussion of the availability of training programs to meet the needs of the industry; an outline of supplementary material needed to bring training programs up to an acceptable standard; and proposals for programs to upgrade the standard of training as it currently exists. This volume is devoted to bus operators and bus operator instructors. A recommended standardized course for bus operators is presented, together with sources of suitable training materials. One significant conclusion reached is that it is considered that existing sources of training are adequate to meet the needs of operator instructors. /UMTA/

Thrasher, EJ ; Mitre Corporation, (MTR-6681) UMTA-VA-06-0004-74-3, July 1974, 182 pp; Contract DOT-UT-10005; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-236002

23 263766 TRANSIT INDUSTRY EDUCATIONAL INTERESTS. In order to facilitate communications between transit industry and academic institutions, a questionnaire was distributed to representatives of the transit industry in order to define the types of educational background and broad areas of program emphasis felt to be most desirable. As preparation to enter the transit industry, the majority of transit operators felt a four-year college education was suitable. Stress was placed on having the educational background span a broad interdisciplinary mix with emphasis in program areas such as management, business administration, public policy, economics and engineering. The present nature of involvement between educational institutions and transit operations centers on research and providing continuing education through part-time studies, seminars, and short courses.

Wegmann, FJ Beimbom, EA *ASCE Journal of Professional Activities* Vol. 100 No. E14, Proc. Paper 10863, Oct. 1974, pp 313-324

23 267026 U.S. AND CANADIAN URBAN MASS TRANSPORTATION SYSTEMS. The purpose of this study was to investigate U.S. and Canadian transit systems on a comparative basis. It was proposed that this investigation be confined to the study of three conceptual variables of organizational structure and personnel profiles, personnel process, and marketing strategies. The basic objective of the study was to provide knowledge that would be of use in establishing and implementing policies concerning the basis or rationale for investment in the development of U.S. transit personnel and the marketing of transit services. A major problem of those wishing to recommend investment in the development of human resources is the demonstration of tangible results. It is the authors belief that internal development of U.S. transit personnel and their policies is the most expedient route to revitalizing public transit in U.S. cities. The quality of individuals who serve in transit's managerial, technical, and supervisory positions

is a leading (if not single-most important) determinant of the extent to which mass transit will be improved. A bibliography is included. Among the appendices are the transit interview format, transit employee questionnaire, marketing practices in transit industry, and personnel process and marketing strategy worksheets.

Mundy, RA ; Pennsylvania Trans and Traffic Safety Center UMTA-PA-0010-74-2, Jan. 1974, 156 pp; ACKNOWLEDGMENT: UMTA (PA-11-0010); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-23290/AS

23 272053 PLANNING, RESEARCH, EDUCATION AND TRAINING, AND LEGISLATION (EDUCATION AND TRAINING SEMINAR). The educational and training needs of the public transportation industry are determined by first identifying the components of the industry and then examining in detail the specific needs of each component. The types of skill required are classified into management or operating (dispatchers, bus drivers). The demand for education to meet the needs of consultants and the urban or regional planning agencies has been provided by Universities. There are many University level programs which assist the professional in identifying data on which to base analysis and plan development. A distinction is made between demand and need for trained managers. It is estimated that transit companies need approximately 100 college-trained managers per year during the next 15 to 20 years. If the needs of various levels of government for such men are included, the number would be 200 per year. High school counselors and math and science teachers must be educated so that they may inform sophomores and juniors about opportunities in public transportation. A 4-year bachelor's program in either an engineering or business college within a university could provide the education for potential managers. Many universities have interdisciplinary degree programs where an educational program may be planned which involves persons in more than one college. A need exists for the development within the university or public transportation course content material such as course outlines, bibliographies, texts, case studies and audio-visual materials. Suggestions have been made for development of this material in cooperation with the transit companies, and for a clearinghouse for curriculum materials. The question of financial support for students is also discussed. During the on-the-job training periods, the student should be rotated from one department to another. The need is expressed for better communication and interaction between persons who are involved in providing public transportation and the faculty of the university teaching public transportation. Recommendations are presented.

Grecco, WL (Tennessee University, Knoxville) Satterly, GT, Jr (Purdue University) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 119-123; Appeared in Issues in Public Transportation, proceeding of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB Publications Off

23 272054 PLANNING, RESEARCH, EDUCATION AND TRAINING, AND LEGISLATION (LEGISLATION SEMINAR). This seminar which examined the question of what

should be done in the legislative area to aid in the solution of problems in public transportation, focused on the broadest scope of legislation. The seminar considered legislation to be synonymous with implementation. General problems encountered in this area are reviewed. The accountability of public transit agencies in their expanding of public funds is discussed. The specifics of reporting to grant-making agencies at the state and federal levels are within the realm of administrators' decision. However, administrators should take care not to overstep their jurisdictions. The size of the region at which the transit agency should exist was also discussed. The making up of deficits incurred by transit operations is reviewed. One proposal was that local communities make up the entire deficit incurred in providing transit service used by their residents. An improvement over existing property tax deficit funding methods that is consistent with the concept would be to separate the funding of deficits for local and regional service. The reliance for regional transit subsidies on local property taxes, the problem of "mobility", investment criteria and priorities, and the provision of federal transportation funds to urban areas are other aspects covered. There was no role for legislation in setting fixed operating standards. With respect to other actions of supplying transit service, the role of legislation was limited and indirect and for the most part concerned with funding. Federal legislation should take the lead in setting objectives and priorities in research, development and demonstration of new public transportation services and technology. The role played by legislation is the marketing of transit, was seen to be limited. Other ways in which legislation could influence transportation are outlined. They relate to the granting of passes to certain groups such as welfare recipients, improvement of the quality of transport, automobile restriction, and land use controls.

Brand, D (Harvard University) Haines, R (Purdue University) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 123-127; Appeared in *Issues in Public Transportation*, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB Publications Off

23 272055 PLANNING, RESEARCH, EDUCATION AND TRAINING, AND LEGISLATION (PLANNING SEMINAR). The seminar which addressed the question of what should be done in the area of planning to aid in the solution of problems in public transportation, focused on the different requirements that long-range and short-range transportation planning imposed on the planning process. Long-range planning, which should provide guidance to short-range planning and associated activity, is characterized by its comprehensiveness, particularly with respect to modal considerations, and by its concern for the relation of large-scale investment decisions to a broad array of social, environmental, and urban development goals. Specific problems common to both long and short-range planning are identified as the lack of planners' responsiveness of involvement in long-range policy making, the absence of qualified personnel, the inability to predict the land use development impact, and the lack of planning techniques permitting design of

desirable systems for the future. Issues specifically related to short-range planning are listed. Recommendations to meet the problems are presented. Manuals of the National Committee on Urban Transportation must be revised. The criteria presented here should be expanded to include social concerns, levels-of-service definitions and standards, and system continuity concepts. The manner in which this may be done is outlined. The recommendation is made that a workshop be held to assess the state-of-the-art in transit system sketch-planning techniques and to suggest ways of improvement. Lines of communication should be established between planners and consultants working with sophisticated techniques, and transit operators using pragmatic approaches. The need is indicated for better data particularly origin-destination data at the proper level of disaggregation in sufficient amounts and at reasonable costs. It is recommended that alternative techniques be explored for the collection of suitable origin-destination data. A general need exists for the improved dissemination of the results of research and planning studies in an accessible and understandable form.

23 300693 SECTION 13C: SOME CONCERNS AND CONSIDERATIONS. ABRIDGMENT. Protective provisions that must be included in Section 13c are noted and attention is focused on two areas of concern: paratransit and rural transportation. The provisions must include the preservation of rights, privileges and benefits under existing collective bargaining agreements or otherwise; continuation of collective bargaining rights; protection against a worsening of employment positions; assurances of employment to employees of acquired mass transportation systems and priority reemployment of employees terminated or laid off; and paid training or retraining programs.

23 301961 MEASUREMENT AND MANAGEMENT OF PERFORMANCE OF MAN-MACHINE SYSTEM. An apparatus has been developed to measure and record sudden acceleration (over .3 g), sudden deceleration (over .4 G) and sharp cornering (over .3 g) in order to evaluate driving fluency. The apparatus was installed on six taxicabs for the test. Driving behavior of drivers in each of the taxicabs was recorded for a distance of more than 10000 kilometers. From the test results it was found possible to grade the fluency of driving as well as to point out to individual drivers unsafe driving practices based on the data obtained. One particular driver to whom a feedback of his own unsafe driving habits was given showed a marked improvement in his driving performance. Discussion was made on the utilization of these data into daily management of drivers. /Author/TRRL/

23 303291 A SURVEY OF THE USE OF PART-TIME EMPLOYEES IN TRANSIT. The purpose of this study was to obtain data to determine the nature and extent of transit industry use of part-time labor. The data indicate that the use of part-time labor is widespread and is more likely to be found in public systems and in those systems not covered by collective bargaining agreements. There has been a significant increase in the number of public systems using part-time labor over the past five years. Further, there are strong indications that this matter will be a major bargaining issue for most transit properties during the next round of contract negotiations. It would seem that the most likely candidates for new part-time agreements are the larger systems which are subject to collective bargaining agreements. While these systems tend to be troubled by the most significant peak-hour problems, they have tended to be least successful in establishing part-time agreements. This could foreshadow an extremely interesting round of transit industry contract talks. (Authors)

23 303945 IMPACT OF THE 1977 TRANSIT STRIKE IN KNOXVILLE. The six-week strike from February 14 to March 28, 1977, of the Knoxville Transit Corporation (KTC) stranded 7000-8000 daily riders of regular bus routes and 600 daily riders of the express bus service. It also provided an opportunity to assess the impact of a temporary interruption of public transportation service on a city of 200,000 people. Small sample surveys performed during and after the strike focused on those groups expected to be most severely affected. The study revealed that, although many discretionary tips of elderly and economically disadvantaged transit users were not taken, few cases of severe hardship were reported. Most individuals were able to satisfy their needs with the help of relatives, friends, and social service agencies. Many of the downtown merchants lost substantial business, and some were forced to temporarily lay off sales personnel. The transit system itself felt the most adverse and continuing impact from the strike. The decline in ridership on the regular routes was estimated to range from 7.2 to 16 percent; for express buses the ridership dropped by approximately 15 percent. The adverse impact on downtown parking was noticeable, but general traffic was not affected appreciably. Overall, everyone involved with public transportation--the city, labor union, transit users, and downtown merchants--would have been better off by averting the strike.

23 305821 MANAGING SEPTA (SOUTH-EASTERN PENNSYLVANIA TRANSPORTATION AUTHORITY) STRATEGICALLY. A decision process is described, which involves expressing an organization's functions as discrete projects related to a clearly defined set of objectives, and then comparing the projects through cost-effectiveness analysis. The involvement of management, employees and citizens, along with the effect of responsibility and reward on job performance, is discussed. The environment in which SEPTA must function in the years to come is considered by examining a set of possible alternative regional futures, market share, and the land use-public transportation relationship. An attempt is made to compare the performance of a variety of SEPTA modes serving two different density-defined areas. The report presents a goals structure for SEPTA consistent with this decision and encompassing the regional concerns identified earlier. Using this goals structure, the study tests various sample projects for cost-effectiveness. Throughout the report, an emphasis is placed on reinforcement—the pooling of resources by SEPTA and other parties to achieve mutual objectives.

23 308520 BUS OPERATOR ABSENTEEISM: SOME CAUSES AND CURES. In an effort to develop ways of reducing the rate of absenteeism, this study assessed the scope and dimensions of the problem, constructed a profile of the so-called problem operators, identified major causes of absenteeism, and developed some absenteeism reduction strategies based on these findings. Because of its many contributing factors, no single solution can effectively deal with all facets of absenteeism. The solutions presented here range from being easy to implement to those requiring major labor contract revisions. An effective absence reduction program requires a coordinated and comprehensive effort aimed at the probable causes of excessive absenteeism. At the Southern California Rapid Transit District an attempt is being made to develop a program for monitoring and controlling absenteeism, highlighting the disruption and expense of the problem, involving first-line supervisors in identifying solutions, and evaluating major operational and work-rule changes.

23 310464 SICK-LEAVE AND PATTERNS OF DISEASE OF TRAFFIC PERSONNEL AT GREATER STOCKHOLM TRANSPORT COMPANY [Sjukfrånvaro och sjukdomsmönster hos trafikpersonal vid storstockholms lokaltrafik]. The aim of this report is to present how working conditions can contribute to disease for the group of full-time working public transport personnel. The report is based on investigations of the company's statistics concerning sick-leave during 1974. The parameters in the statistics are sex, age, category of personnel, who's classification of disease on 16 kinds of disease. The results show that the office staff are more healthy than the traffic personnel and that men are more healthy than women. The size of the differences vary for different groups of disease. Concerning diseases that are caused by the physical environment like inflammations in ears or eyes, the traffic personnel are more exposed than the office staff. (TRRL) [Swedish]

23 316659 THE TRANSPORTATION MANAGER: AN EVOLVING CONCEPT. Solutions to the new transportation needs of the United States require the development of problem-solving skills, which augment the historical role of the highway engineer and highway planner. This new role, the transportation manager, is the direct result of several factors in our environment and, more particularly, in our transportation systems. For example, although vehicle kilometers of travel are projected to increase by 39 percent by 1985, resistance to new highway construction is increasing, and mass transit is severely limited in its ability to serve peak-hour commuter needs by

using expensive vehicles and full-time labor. As a result, the focus of transportation activities is shifting to improved management techniques. The new transportation needs will require individuals who have a different perspective and approach than that of the traditional engineer or planner. The new management emphasis will address more day-to-day decision making and have the opportunity to initiate low-cost, incremental changes to systems that are reversible on short notice. Cost/benefit analyses of detailed planning efforts associated with such incremental efforts reveal that the transportation manager will consume less resources in examining the data and undertaking corrective action. The paper will trace the development of public involvement in transportation to demonstrate the evolving needs of transportation and the orientation toward the professional urban transportation manager. 23 319398 TRAINING AN EDUCATION IN TRANSPORTATION: FUTURED DIRECTIONS. The dramatic changes in the environment in which transportation professionals operate in the United States and the impact of these changes on transportation education and training are examined. Within a decade, the definition of the urban transportation "problem" has been expanded from one focused solely on congestion to one that includes at the very least the relationship between transportation and the following factors: energy, air quality, equity, safety, congestion, land use, noise, and more efficient use of scarce resources. These new problem definitions and the skills necessary to deal with them effectively have added to the responsibilities of transportation educators and represent forces of change in U.S. educational programs. Actions that could be taken to prepare for the future professional needs of the transportation sector are recommended. (Author)

23 319437 HUMAN RELATIONS TRAINING MANUAL FOR TRANSIT PERSONNEL. This manual was developed for the trained professional familiar with human relations training. Suggested uses for this manual are to review all included material and pick those instruments best suited to one's particular needs as a trainer. It is very important for any transit operation to have employees who are sensitive to and cognizant of the needs of the people served. Probably the most important people for seeing that meaningful public relations person. Their demeanor toward the passenger in any given situation will have a definite impact on the image which the transit company projects to the community as a whole. Consequently, good public relations are contingent upon the extent to personnel who are directly involved with the public. Good human relations and attitudes are as important to transit person-

nel as is operating the equipment. Attitudes come from within an individual and are very difficult to change. In order to change a person's attitudes, one must change his feelings and thoughts. New or changed attitudes can never be forced upon an individual; any attempt to force attitude changes can result in totally opposite results. This manual is made up of learning and training devices to teach individuals how to change their attitudes. Small group dynamics will be the training device most effective with these materials. Groups should never be smaller than five or larger than ten, excluding the leader. If a group is too small, there may be no extroverts in the group to break the ice. If a group is too large, only a few of the members will get involved and the rest may just occupy space. The ideal group has six or seven members plus a leader. Groups should be picked at random so that they include a variety of ages, experiences, and problems. The greater the vari-

ety, the better the chance of success. Remember that group members will learn from themselves and each other and not from the leader. The goals and objectives for this training program are to teach transit personnel how to develop effective and meaningful interpersonal communication skills; to develop skills in facilitative responding to others through small group dynamic; to develop effective listening skills; and to develop the abilities to engage in honest self-disclosures without fear of hurting others or themselves. 23 319850 DRIVER TRAINING AND OPERATING CHARACTERISTICS OF TRANSPORTATION SYSTEMS FOR THE ELDERLY AND HANDICAPPED. This research focused upon two problem areas in the

operation of transportation systems for the elderly and handicapped. The two areas were the training of vehicle operators and the analysis of operating data. The examination of these problem areas was designed to answer the following questions: What types of training should be provided to a vehicle operator in a system designed to transport the elderly and handicapped? What are the characteristics of operating data generated by systems can this data be utilized by system management? (A)

24 050366 BOSTON PLANS \$1 BILLION IMPROVEMENTS OVER 5 YEARS. Mass transit is important in Boston. The Massachusetts Bay Transportation Authority carries 150 million passengers annually (1972) on its rapid transit, street cars, trolley buses, and diesel buses. The commuter railroads, the Boston and Maine and the Penn Central, carry 7.5 million annually. These services are subsidized by the MBTA which makes up the net operating costs. Unfortunately, over the past seven years, commuter rail ridership has gradually declined. MBTA's overall ridership experienced a similar trend; however, it is now increasing. Continued improvements in service and equipment plus line extensions are expected to further increase ridership.

24 050632 A PROPOSED SNCF/RATP INNOVATION: THE INTERCONNECTION [UNE POSITION NOVATRICE S.N.C.F.-R.A.T.P: L'INTERCONNEXION]. The authors explain in this article how a standard structure gauge interconnection for rail traffic relations across Paris has been planned using as a basis an improved "Metro" underground railway and the construction of standard structure gauge lines in Paris and the Paris area: East-West Region Express Railway (RER) and a direct North-South connection via the Sceaux Line extended towards the North. This interconnection would mean in fact that parts of the lines would be used by both SNCF and RATP trains which would make traffic more flexible and enable certain SNCF trains to cross Paris, thereby overcoming the inconvenience for passengers of the present dead-end termini stations. They consider from various aspects the first interconnection planned on which work has already begun, namely the Paris-Lyon station and Paris-Nord station junction line via Chatelet through new tunnels, the first of which forms part of the East-West RER line from Paris-Lyon station to Chatelet, the second still being in the planning stage. 24 051417 ECONOMY OF SCALE FOR MASS TRANSIT SYSTEM. Mathematical models are developed for trips versus transit network length. It is shown that the number of trips captured per unit length of network is a

highly nonlinear phenomenon, occurring because of four major factors. These factors are: interzonal travel, modal split, nonuniformity in trip generation, and future growth factors. Sensitivity analysis is presented to understand the impact of various controllable and noncontrollable factors economies of scale.

24 071845 A REVIEW OF REPORTS RELATING TO THE EFFECT OF FARE AND SERVICE CHANGES IN METROPOLITAN PUBLIC TRANSPORTATION SYSTEMS. The report reviews articles and reports developed in the past ten years relating to demand elasticities for public ground intra-city transportation. It is designed to provide policy makers with a quick overview of the literature. Some major headings are: (1) an increase in fares will decrease patronage, but will result in a net increase in revenues; (2) the effect of fare increases differs depending on circumstances; (3) the relationships probably operate in the same manner with fare decreases, but in the opposite direction; (4) increased frequency will increase patronage, but no clear pattern has been found to suggest a method of numerical prediction; (5) it is difficult to judge the relative impact of each when improvements occur simultaneously; and (6) the attributes of speed, comfort, convenience, and wide choice of destination are as important as fare in attracting persons.

24 072468 LABOR COSTS AND PRODUCTIVITY FOR THE LINDENWOLD RAPID RAIL LINE AND THE SHIRLEY HIGHWAY RAPID BUS DEMONSTRATION PROJECT: SOME PRELIMINARY FINDINGS. An argument favoring a rail system rather than bus transit is that the rail mode will be less labor intensive. Since labor costs constitute the largest component of transit operating costs, the more capital intensive mode should be more productive and slow the increase of unit labor costs. This idea seems to be borne out by some of the results from the bus service in the Washington, D.C., suburbs and the rapid transit service in the Philadelphia, Pa., suburbs. Authors observe that much remains to be learned about the relative efficiency with which the modes provide passenger transportation service. They point to the need for a refined data base, better definition of transit output, and more exact identification of the capital input.

24 080259 DEVELOPMENT OF EXPERIMENTAL DESIGN METHODOLOGY FOR EVALUATING MASS TRANSIT DEMONSTRATIONS: AN APPLICATION TO THE SEATTLE EXPRESS BUS SERVICE DEMONSTRATION PROJECT. VOLUME 1. EXECUTIVE SUMMARY, MAIN REPORT. UMTA has been actively involved in the process of funding full-scale demonstration projects in select metropolitan areas throughout the country. These demonstrations are carried out for the purpose of research, testing and evaluation of transit concepts with potential nationwide implications. One major objective to be accomplished is the development of a systematic and effective means of evaluation which will enable UMTA to determine not only the effectiveness of the specific projects, but also the extent of applicability to other areas. The effort sought to accomplish this objective through three steps. The basic approach of the study was development of an experimental design, in Seattle, WA, where an express bus service demonstration project was initiated in 1970.

24 083827 EFFECTS OF A SERVICE INTERRUPTION ON BUS RIDERSHIP LEVELS IN A MIDDLE-SIZED COMMUNITY. A stochastic model of bus passenger ridership is applied to the problem of determining the effect of a service interruption on ridership levels in a middle-sized community. The work indicates that, despite the captive clientele of transit and the relatively short duration of the service discontinuance (63 days), large reductions (13.5-17.9 percent) in ridership resulted. These results suggest that government agencies should take an active role in preserving stable and reliable transit service if large future subsidies are to be avoided. The work indicates that the building of stochastic models of transit demand would aid in planning future transit services.

24 095252 SYSTEM OPTIMIZATION WITH DIFFERING DEMANDS FOR SERVICE. For a given objective function which can be used for a system serving a single demand point, this paper defines a technique by which that objective function can be used to define an aggregate objective function for optimizing a system which is required to serve several different demand

points. The objective function is defined for conditions under which demand is inelastic and all costs incurred by a group of users representing a single demand point must be paid by that group of users. The second condition is the same as the first, but with elastic demand. For the third condition, the problem of cross-subsidization among various users of the system is considered. The demand is considered to be elastic. Examples of the use of the technique for a commuter railroad are presented. In the examples, the objective function is the user cost where the cost includes fare, travel time, and the cost of inconvenience due to lack of service frequency.

24 097284 APPLICATION OF GUIDELINES FOR IMPROVING TRANSIT SERVICE AND OPERATING EFFICIENCY. Considerable public funds are being allocated for transit operations, and a method is needed to ensure improved quality of transit service and increased efficiency of operations. Operating guidelines and standards developed in Pennsylvania specify elements of service, such as speed, reliability, capacity, and comfort, that must be provided under different conditions. Transit agencies are also required to improve public information, undertake marketing, and collect technical, operating, and financial data and submit them to the state transportation department on a regular basis. The department uses the data to evaluate operations of each agency and bases distribution of funds among the applicants on their compliance with the guidelines. The department also provides all applicants with professional assistance for improvement of operations.

24 099237 EFFECTIVE TRANSIT POLICY-MAKING AT THE LOCAL LEVEL. This paper reviews the role of Transit Authority Boards in the urban transportation planning process. The Transit Authority Board is seen as having two major responsibilities: (1) it serves as the focal point of citizen input to the urban public transportation planning process; and (2) it is responsible for seeing that an adequate level of public transportation service is provided to the community. The various steps involved in making policy decisions in order to fulfill these responsibilities are discussed. It is emphasized that care must be taken to develop means of evaluating various combinations of public transportation instead of simply developing measures to justify current activities and vested interests. The Knoxville Transit Authority's efforts to solve the problems they have encountered are cited as an example of the need for evaluation measures that will help determine whether an adequate level of transportation service is being provided to the community and whether the service is being provided in the most effective way.

24 126196 A METHOD FOR STANDARD DESCRIPTION OF PUBLIC TRANSPORT SYSTEMS [Metod foer Standardbeskrivning av Kollektiva Transportsystem]. The standard of a transport system, its ability to satisfy a certain travel requirement, is defined by a multitude of factors. The principal components chosen in the report are accessibility, safety and convenience. Preferences between different factors vary depending on age, etc. Transport standard is a complex concept and the quality of a system is dependent on a large number of factors. Factors can be set out systematically or analysed graphically. Different evaluation methods are used in comparing transport systems. In choosing analytical methods, a balance must be struck between accuracy and ease of handling. Attempts have been made to set transport standards into a broader framework by making the transport apparatus an integral part of society. Travel is an expression of people's need to participate in different activities; recent surveys showed that a well-functioning transport apparatus must satisfy greatly varying travel needs. A model is presented for public travel standard; in a study at Lund, the model was applied and found in good agreement with intuitive assessments of the public transport system. /TRRL/ [Swedish]

24 127867 CHARTING THE LIMITS OF UNMANNED OPERATION. Introduction of full automation of rapid transit does require a radical change of views in which there can be no shrinking from technical, operating and legal challenges. Today's automation technology does allow rapid transit systems to be run with very few employees. Use of trains without operators and stations without attendants does not jeopardize safety, but in some cases improves it. Attractiveness of service can be improved at little expense. The author has described his efforts over 20 years in technical direction of efforts at automating West Germany's Hamburg transit system.

24 129819 OPERATING AND MAINTENANCE COSTS OF LIGHT RAIL TRANSIT. This paper explains the costs of operating light rail lines, and it explains how light rail can be more economical than other modes under certain conditions. Using 3 recent studies of proposed light rail lines as examples, the paper shows that new lines can be economically constructed and operated with a potential ridership of as little as 20,000 daily passengers. The self-service fare systems used on European light rail lines is explained, and an opinion is given recommending that such a system could be implemented on new light rail lines built in the United States. Relatively fixed maintenance costs, high passenger-to-operator ratios, and multiple-unit capabilities make traffic increases on light rail lines much more economical to accommodate than on bus lines. The paper details how light rail lines have high passenger carrying capabilities (as much as 20,000 passengers/h) yet need relatively low passenger loads (only 20,000 passengers/day) to economically justify implementation and still have sufficient revenue to cover all operating costs. Also discussed are the ease of implementation, the versatility of the mode, and passenger acceptance and preference.

24 130784 MEASURING TRANSPORTATION SYSTEM PERFORMANCE. Quantitative measures of several aspects of urban transportation system performance which are difficult to incorporate in a cost-benefit analysis are presented. Two major types of evaluations are presented, those based on linked trip data between origin-destination zone pairs and those based on traffic volumes on individual links of the transportation network. Several miscellaneous evaluation procedures are considered, as are the problems of presenting evaluation data in an effective manner. /ASCE/

24 131065 LEVELS OF SERVICE PROVIDED BY URBAN TRANSPORTATION SYSTEMS. A level of service measure has been developed which has expanded beyond the traditional bounds that concentrate on dollar values and which recognizes that the level of service is a qualitative measure. The process involves 6 basic procedures. (1) Development of a concise but comprehensive goal related to urban transportation systems. (2) The goal may be defined by a series of concise and inclusive objectives. (3) Each objective may be defined by one or more performance measures. (4) Ranking and

weighting procedures are suggested which would allow relative weights to be assigned to each objective and performance measure. (5) The utility concept is introduced which permits quantitative comparison of individual values of a single performance measure. (6) An evaluation is developed which facilitates the determination of the level of service of any one system or system element.

24 133170 PROGRAM TAXISTATS: A COMPUTERIZED SYSTEM FOR PROCESSING AND ANALYZING TAXICAB COMPANY STATISTICS. This report presents the results of a study designed to develop software for reporting taxicab company statistics. It provides a general description of the data processing and report generation systems and discusses certain problems and issues associated with the sample design and implementation of the system. Topics addressed in the chapter on system description are: data collection and preliminary file preparation; final file preparation; printing of final reports; schedule problems; and industrywide reports. Appendices contain sample input forms for program taxistats, sample printouts of tables generated by the taxistats program, and examples of industrywide analysis.

24 133313 EVALUATION GUIDELINES FOR SERVICE AND METHODS DEMONSTRATION PROJECTS. The document consists of evaluation guidelines for planning, implementing, and reporting the findings of the evaluation of Service and Methods Demonstration (SMD) projects sponsored by the Urban Mass Transportation Administration (UMTA). The objective of these guidelines is to foster consistency of evaluation philosophy and techniques, and comparability of results so as to improve the output of the UMTA demonstration program. In addition to describing procedures for developing and executing the evaluation of SMD projects, this document contains background information the SMD Program, a general discussion of the demonstration evaluation process, and appendixes on survey techniques and statistical methodology. Although these guidelines were prepared specifically for use in evaluating SMD projects, their potential applicability covers the evaluation of any type of transit innovation.

24 134301 A SUGGESTED MODEL FOR ESTIMATING THE PRACTICAL PERFORMANCE OF TRANSIT SYSTEMS. The model suggested is developed as an exploratory tool for estimating the practical performance of transit

systems of both existing and new technologies. A constant jerk-rate type of equation is shown to give excellent agreement with existing New South Wales suburban railway rolling stock. By development of the envelope, use of this equation may be extended to examine the effects of reduced station dwell, increased initial acceleration and increased maximum speed etc. It is shown that for initial accelerations above 5 km/h/s very little benefit is likely to accrue on suburban systems, but major benefits are likely to stem from increasing station separation, skip-stop scheduling and reduced station dwell, all of which are feasible with existing technology systems. The method is shown to be particularly useful in the estimation of journey speed, journey time and station-to-station time when coding transit networks for modal-split analysis. (A). /TRRL/

24 134375 THE DEMAND FOR URBAN BUS TRANSIT. A ROUTE-BY-ROUTE ANALYSIS. In this paper an analysis is made of the demand for bus transport in urban areas, in an attempt to identify those corridors of potential bus patronage which, with suitable price and level of service, can continue to support a bus service with little or no subsidy. To this end, an analysis is made of the demand for bus transport along specific routes, of the sensitivities of that demand to changes in a bus company's policies, of the characteristics of those routes within the system which are being subsidised. The sample developed for this study consists of bus routes in 3 medium sized cities in Connecticut: Hartford, New Haven and Stamford, and uses data over a 10-year period. The technique developed obviates the need for expensive origin-destination survey data which are generally not available for smaller cities. It is concluded that the bus transport demand model developed could be used successfully to isolate potentially profitable routes within

a metropolitan area and to forecast likely changes in ridership resulting from changes in route or neighbourhood characteristics. It is found that fare appears to be a stronger influence on demand than frequency of service. /TRRL/

24 134752 FACTORS AFFECTING REALIABILITY OF URBAN BUS SERVICES. Attitudinal surveys have indicated that travel time reliability is an important attribute of urban transportation services affecting choice of mode of travel. Yet there is no generally accepted measure of transport reliability, nor is much known about factors affecting this parameter. This study was conducted to test a particular measure of reliability, the inverse of the standard deviation of point-to-point travel times, using data from bus services in the Chicago area. The selected measure was found to be a useful and easily collected indicator of service reliability. Reliability measured in this form was found to be significantly degraded by increasing route length, increasing intensity of intersection control (particularly traffic signal density), increasing traffic volumes, and, with less certainty, increasing bus passenger loadings. Several strategies for increasing urban transit reliability are suggested.

Sterman, BP (Urban Mass Transportation Administration) Schofer, JL (Northwestern University) *ASCE Journal of Transportation Engineering* Vol. 102 No. TE1, ASCE #11930, Feb. 1976, pp 147-160, 3 Fig., 3 Tab., 7 Ref., 2 App.

24 136413 RELIABILITY AND AVAILABILITY ASSESSMENT CRITERIA, DATA INPUTS AND ANALYSIS METHODS FOR MASS TRANSIT SYSTEMS. The availability and reliability of a mass transit system is analyzed and assessed, and a fairly complete list of criteria for judging these characteristics of a mass transit system is presented. A discussion is also included of the analysis and data reduction methods involved and an interpretation is given of the resulting numerics noting the particular aspect of reliability or availability addressed by each within the context of previously determined management goals.

24 137346 TRANSPORTATION SYSTEM AS-SURANCE: TERMINOLOGY, PERFORMANCE INDICES, FAILURE ASSESSMENT AND MAINTENANCE MANAGEMENT. The paper addresses the need for and reports on the development of a methodology for consistent measurement of reliable performance in transportation operations which include intercity rail, urban commuter rail, rapid transit, bus and streetcar, light rail and small people movers. Performance indices and formulae for their computation are developed as a compromise between industry tradition and modern assurance science techniques. Equipment availability, a ge-

neric reference to the reliability, maintainability, and availability of the equipment to transport passengers is discussed as it relates to both service dependability and the cost of the maintenance operation. A comprehensive Failure Assessment and Maintenance Management System (FAMMS) which is directly applicable to transportation properties and which evolved from similar systems used on properties over the past five years is described in detail. The system can be completely computerized and data can either be batch or on-line processed.

24 137494 COMPUTING PASSENGER MILES IN LONDON TRANSPORT. This paper briefly describes the methods used by London transport for the calculation of its variety of complex fare scales which are based on passenger miles. London transport has two charging zones for graduated fares, one for journeys in Central London and one for the suburbs, both with a reduced maximum fare in the off peak. There are three types of flat fare routes-Central London red arrow services, certain suburban services, and a small number of minibuses services. More than 16% of passenger journeys are made with system passes of about a dozen varieties, all valid for different periods and for different types of travel. The methods of computing the passenger mileage figures for each main type of fare or payment structure are summarised and discussed under the headings of graduated fare routes, flat fare routes, period tickets purchased "off-bus", and tickets for free travel issued by local authorities. /TRRL/

24 139312 BUS RELIABILITY-DEFINITION AND MEASUREMENT. Several studies by other researchers to determine which aspects of a bus service are regarded by users as important are discussed. These usually show that reliability is high on list of people's preferences. Although reliability can be defined in a number of ways, the index of reliability most commonly used has been that of the average waiting time of passengers. This paper takes sixteen possible indices of reliability in three, not wholly distinct, groups: those pertaining to the operator, those of relevance to the passenger, and those which do not presuppose either standpoint. Each index is discussed separately and then compared with other indices to show which ones are different expressions of the same quantity and which can be thought of as fundamental. A selection of representative indices is then used in two ways: analytically, to show how a given change in the operation of a route would be indicated by several indices; empirically, by applying the indices to sets of data to show typical values; and by seeing how various indices have been used in a number of bus studies, mostly carried out in the 1970's. As a conclusion, it is pointed out that a number

of aspects of reliability may be treated by the same action on the part of the operator, but that in any assessment of this action, how much of an improvement is indicated will depend on which index is used. The essence of reliability lies in the principle well established in the bus industry, of keeping to a schedule, published or unpublished, which is usually designed to maintain even headways between buses where the service is at all frequent. /Author/

24 139556 GOAL PROGRAMMING APPROACH TO ASSESSING URBAN TRANSIT SYSTEM. Transportation systems often are evaluated to see whether they satisfy a variety of community goals. Of primary concern in this study is the development of a procedure for using the goal-programming technique, a modification and extension of linear programming, to evaluate urban transit systems for meeting the transportation-related goals of a community. These goals are intended to be general enough to permit adaptation of the goal-programming technique for the solution of a wide variety of urban problems. First, constraints are formulated from the inputs from a community; then the output variables are chosen to correlate with basic characteristics of urban transit systems to select a system or group of systems to fulfill the community transportation requirements. A computer program is employed to ease application of the goal programming and allow flexibility for a complex set of equations. A set of sample community goals are assumed to illustrate how the technique is practical in actual applications. /Author/

24 142270 COST MINIMIZING POSITIONS, LENGTHS AND HEADWAYS FOR PARALLEL PUBLIC TRANSIT LINES HAVING DIFFERENT SPEEDS. A model of a transit system is built to find for parallel lines in a rectangular city the lengths, positions, and headways which minimize user (travel time) and operating costs in response to a general population density function and differing line speeds. It is found that, at some point, low speed lines should be cut off, this point depending upon the relative positions, headways and speeds of adjacent lines. Further, it is found that the optimum position depends upon the tributary population and the changes in operating cost and the change in operating cost due to changes in headway.

24 147497 AIDS FOR THE PLANNING OF PUBLIC TRANSPORT [Hjælpedel foer Planering av Kollektivtrafik]. The travelling public wants a higher standard, i.e. shorter walking distances, waiting and journey times, few changes, comfort on buses and at stops, and low fares. Bus companies want to do their job as economically as possible, while local and national authorities which subsidise unprofitable services must consider quality in relation to cost. While assessment of conditions must be done by man, evaluation of alternatives must be done by computer since, for instance, the number of stop combinations increases with the square of the bus network. An analysis must evaluate travelling standard, traffic loading, productivity and costs. Models for the analysis of public transport are available. /TRRL/ [Swedish]

24 147503 A MACRO ANALYSIS OF VARIABLES INFLUENCING TRANSIT USAGE. The author discusses the measurement of the success of a transit system. The development of the following transit quality indicators is outlined: (1) average system speed; (2) average system frequency; (3) system speed variation along lines; (4) system frequency variation along lines; (5) degree of commuter orientation; (6) degree to which a system concentrates on the central business district; (7) coverage of metropolitan area by the system. Computations using the formulae developed for these indicators were made for transit systems in San Diego, New Orleans, Detroit, Seattle, Toronto and San Francisco, and the results are summarized. These indicate that transit patronage is strongly related to the orientation of the system and to the average system mid-day headway, and somewhat less related to population and system coverage. /TRRL/

24 148257 INCENTIVES IN A METROPOLITAN PUBLIC TRANSPORTATION SYSTEM. Existing public-transportation systems employ out-of-date, inefficient technology. This

situation has not arisen through the lack of improved technology. Rather, it is the result of inherent disincentives which act to force systems in a counter-productive direction. This is an account of a recent study of the finances and operation of the metropolitan-Boston public transportation system (the MBTA). The existing legislation, which has elements in common with that for many other communities around the nation, was found to have widespread disincentives to productivity for all participants. New legislation introducing strong incentives to maximize efficiency at all levels has been drafted and is reviewed here.

24 148261 RAPID TRANSIT SYSTEM DESIGN FOR HIGHER PRODUCTIVITY. The paper discusses ways to increase labor productivity and reduce labor costs. Centralized computer aided monitoring and control systems for trains, passengers, fare collection, electrification equipment, auxiliary equipment, security, yards, maintenance and management information should be provided. Also capability of running trains without operators and operating stations without agents are important. Some of the systems to improve productivity used on the Sao Paulo, Brazil metro or planned are also described.

Kalra, PS (Bechtel Corporation) Nakagawa, T ; American Society of Mechanical Engineers Conf Paper Paper D&O-24, 1976, 5 pp; Presented at the 4th Annual Intersociety Conference on Transportation, Los Angeles, California, July 18-23, 1976, see also RRIS 26 148247; ACKNOWLEDGMENT: EI; ORDER FROM: ASME

24 148294 INFLUENCE OF THE SIZE AND NUMBER OF VEHICLES ON THE PERFORMANCE AND SERVICE QUALITY OF GROUP RAPID TRANSIT SYSTEMS. The size of vehicles investigated ranges from 4 to 40 seats, the number of vehicles used is between 240 and 8. A demand-activated, fixed-route service was simulated. Parameters, such as waiting time and the passenger's trip velocity are used to characterize the user aspect, and such criteria as load factor of line and vehicles, vehicle kilometers, headway between consecutive vehicles and rate of vehicle stops at stations are employed as measures of the system's operating performance.

Bahm, G (Karlsruhe University, West Germany) Colorado University, Denver Conf Paper Vol. 1, Paper 18, 1975, 20 pp; This paper was presented at the International Conference on Personal Rapid Transit held in Denver, Colorado, September 16-19, 1975; ACKNOWLEDGMENT: EI; ORDER FROM: Colorado University, Denver, Center for Urban Transportation Studies, Denver, Colorado, 80202

24 148878 EFFICIENCY AND PRODUCTIVITY IN PUBLIC TRANSPORTATION. The difficulties in increasing productivity on the service side of the economy are noted, as well as the slow growth in productivity in the governmental area. Among the various factors, the provision for

retirement after 20 years of service is considered to have retarded the rate of productivity improvement. Other factors include the crisis of worker alienation, and the matter of work practices. The latter has created considerable amounts of non-productive time at very high costs. Management options for attacking the productivity problem includes the increasing of effectiveness of the labor by hiring higher quality employees and increasing skill requirements. Increased use of discipline is another technique, and some union leaders urge management to regulate the work force more aggressively. A new labor contract and a recently negotiated agreement which permits productivity bargaining are outlined. Examples of productivity improvements are described, and the opinion is expressed that productivity bargaining is a viable strategy in many situations.

24 149620 STATUS OF THE URBAN CORRIDOR DEMONSTRATION PROGRAM: NOVEMBER 1975. This review of the accomplishments of the Urban Corridor Demonstration Program (UCDP) by project type, also compares the similarities and differences of projects in each of the selected cities and documents a preliminary cost-impact evaluation of different improvement techniques. This report also summarizes what has been learned so far about the success or failure of various improvement concepts and discusses the remaining uncertainties. The UCDP projects were subdivided into 3 main groups: improved transit services and facilities, roadway and traffic control improvements, and other projects. Six of the 8 cities implemented some form of new bus service: express buses; expansion of preexisting express bus services; superimposition of new express services; and reorganization of routes and schedules. A variety of roadway and traffic control projects was developed including ones employing innovative preferential bus treatment concepts. A mixture of concepts were also employed in projects which included enforcement of parking regulations on surface streets, progressive parking raes in off-street facilities etc.

24 155404 TRENDS IN BUS TRANSIT OPERATIONS, 1960-1974. This report analyzes the historical patterns of bus transit operations from 1960 to 1974 using data from 50 bus operations. Because of limitations on the available data, the analyzed data do not represent the universe of bus operations, nor is it a random sample, and therefore do not necessarily represent the industry. However, the trends in this sample may be indicative of the industry trends. The various trends examined in this report are patronage, supply of services, resources employed, revenues, costs, utilization of employees and vehicles, and fuel consumption.

24 156097 EVALUATION OF PUBLIC TRANSIT SERVICES: THE LEVEL-OF-SERVICE CONCEPT (ABRIDGMENT). There are two key independent combinations of factors that can be directly controlled by transit policy makers: transportation hygiene factors and indicators of the level of service. Of these two, only the LOS indicators can motivate potential riders; transportation hygiene factors can only discourage. The following parameters are used to define transit LOS: a composite of basic accessibility, travel time, reliability, directness of service, frequency of service and passenger density. The operationalism of the concept must be evaluated according to whether it is (a) user oriented, (b) operations oriented, (c) trip or link specific rather than area related, (d) quantifiable by an independent observer, (e) independent of an evaluation of efficiency measures and effects or impacts, and exclusive of any transportation hygiene factors. Conceptual indicators and operational definitions are discussed, alternative conceptual indicators are listed, and aggregation of the indicators is detailed. This modal evaluation methodology appears to provide a useful framework for transit professionals and decision makers to evaluate public transit.

24 156098 TRANSIT SERVICE EVALUATION: PRELIMINARY IDENTIFICATION OF VARIABLES CHARACTERIZING LEVEL OF SERVICE. This paper is an introduction to transit service evaluation and its application to medium-sized bus transit systems. The concept of transit evaluation through the measurement of level of service is discussed in terms of usefulness, past work theory, and the presentation of a set of characteristic attributes. The need for performance evaluation, since transit is a public service that does not operate under the profit incentive, is presented. Its usefulness for management, governmental policy formulation, and determination of subsidy levels is discussed. The state of the art and practice, including the Pennsylvania Department of Transportation system, is reviewed. A methodology of transportation system evaluation developed by the Rand Corporation is summarized for its potential application to transit service. A preliminary list of service attributes, with the method of measurement identified, is given. It is concluded that transit service can be quantified and evaluated but that considerable effort is necessary to achieve a comprehensive and equitable system. /Author/

24 156469 ON MEASURING THE EFFICIENCY OF PUBLIC ENTERPRISES: BUS OPERATING COMPANIES IN THE SAN FRANCISCO BAY AREA. It is important to be able to say whether or not an enterprise in the public sector is efficient and to measure this aspect of its performance. Public enterprises sometimes have legitimate reason to treat efficiency as secondary, but they also may resist efficiency measurement for other reasons. Statistical cost functions containing experience from similar enterprises provide useful yardsticks for public administrators. A purported cost function can be inadequate, however, as is shown in one example. Statistical cost functions allow comparison of bus properties by giving a range within which costs of an efficient property should fall. While random influences cannot be excluded, if observed costs fall outside two standard errors of prediction, there is a good case to say the property is inefficient. The usefulness of the standard error of prediction as a measure of precision is explored. Nationally estimated cost functions were used to investigate the bus operations only of three San Francisco companies. Two were found within sampling error, one was significantly more costly on its motorbus operations than average experience in the nation. A closer look would then be in order by those funding this property. Several years' experience is explored showing changes over time as well as across companies.(a) /TRRL/

24 157176 TRANSIT ROUTE EVALUATION PLANNING PACKAGE (TREPP) USER MANUAL. This manual describe the organization and general information needs for using the TREPP software package for the evaluation of transit service provided by existing or modified fixed route transit networks. This manual is further supplemented by another report depicting the methodology and application of TREPP. Experience in using TREPP shows that the program is efficient when applied to midium size urban areas and small urban areas. This experience also suggests that the program is capable of analyzing larger urban areas with populations of approximately 1-2 million.

Milione, V Dueker, KJ Mattlin, S Coulter, B (Urban Mass Transportation Administration) ; Iowa University 0 Technical Rpt. No. 5, July 1976, 95 pp, 24 Fig., 12 Tab., 6 Ref., 1 App.

24 157190 EVALUATION OF FIXED ROUTE TRANSIT SERVICE PERFORMANCE: THE METHODOLOGY AND APPLICATION OF THE TRANSIT ROUTE EVALUATION PLANNING PACKAGE (TREPP). This manual complements a computerized simulation software package (TREPP) which was developed to organize and generate information needs required in transit planning projects. In this manual, the basis of TREPP analysis is set forth. An articulated impact taxonomy of transit service options based on a systems analysis paradigm is constructed. In addition, the terminology of TREPP analysis is defined, and the problem of transport systems analysis is palaced within the TREPP context. The need for a disaggregate or behavioral based evaluation process is indicated, and the idea of a user-based construct which complements existing planning paradigms is forwarded. The output of TREPP is presented, and an introductory overview of the TREPP algorithm is provided with special emphasis on data requirements. The manual also describes the application of TREPP; the measures generated by TREPP are operationalized in terms of efficiency, effectiveness, adequacy and equity indicators. TREPP's analytical framework begins by defining a study region in terms of (a) the transit network and operating policy, (b) the quantity and distribution of urban activities, and (c) its socio-economic profile. The evaluative framework of TREPP adopts a particular zone within the region. It's transit service is measured and evaluated in terms of the input and output dimesnions of service, and the access of opportunity provided by the interaction of the transit service with the land distribution. Access opportunity is measured in terms of the cummlative number of urban opportunities available within specified impedance intervals.

24 157382 ESTIMATING FUTURE COSTS OF OPERATING BUSES. The National Bus Company's system of bus route costing lays down a set of accounting conventions designed to bring order and logic to what would otherwise be diverse costing procedures. It provides a practical method of accounting for past costs and apportioning them to individual routes. It thereby puts on to a uniform footing all cost comparisons between routes that may be necessary for evaluat-

ing performance and substantiating claims for subsidy. However, the system is fundamentally retrospective in its application. Serious doubt must therefore be cast on any claim that it is a method of forecasting future costs. Such forecasts may be valid if all that is involved is financial indexation, as might be used for example to predict cost increases resulting from general inflation. But far more often, and more usefully, forecasts are needed that involve operational changes in the bus service. The NBC system is not appropriate for this kind of forecast because it contains no predictive relationships between operational variables and costs. To fill this gap, LOGORU has developed a model that enables bus operators to calculate the effect on costs of forecast small-scale changes in either financial variables (for example an increase in labour costs relative to capital), or operational variables (for example in the ratio of peak to off-peak buses), or both together. This model, which has been formulated in a computer program, TPTCOSTS, is the subject of this report. Some of the details of the inputs and outputs of the computer program are given in the appendices. For consistency, TPTCOSTS preserves as far as possible the conventions of the NBC costing system. However, it also incorporates some options that permit alternative assumptions to be made about the allocation of cost headings to cost categories, and that enable the cost changes likely to result from policy changes to be readily assessed. The program can also be used in conjunction with the LOGORU public transport analysis suite of computer programs, TRANSEPT, thus providing a powerful aid to the practical planning of bus services.(a) /TRRL/

24 157950 OPERATING AND MAINTENANCE COSTS FOR RAIL RAPID TRANSIT. The prediction of operating and maintenance costs for rail rapid transit systems is treated from two different approaches. A detailed model for estimating those operating and maintenance costs associated with vehicle operation was developed as part of a procedure to optimize rapid transit car design. The model involves the use of many underlying microscopic variables that must be provided as input data. For the early stages of alternative planning and evaluation, a more macroscopic technique, unit cost modeling, is presented and calibrated. While less precise than the first technique, these models can be used to provide quick "order of magnitude" estimates upon which first-cut comparisons may be reasonably based. The relationship between labor productivity indices and unit costs is also explored, although data did not permit a complete treatment of this area.

24 158107 IMPROVING URBAN MASS TRANSPORTATION PRODUCTIVITY. The purpose of this analysis is to assess the importance of productivity improvement to the transit

industry and to identify opportunities to enhance the industry's productivity record. This report discusses the steady decline in transit ridership during the post-war period and the industry's deficits and growing dependence on public subsidies. The postwar problems of industry are partly attributed to the failure of productivity growth in transit to keep pace with that in other industries. It is suggested that an improved productivity record would probably be necessary, although not sufficient, to reverse the industry's ridership decline and its growing dependence on public subsidies. This report discusses a variety of opportunities to improve transit productivity that are possible by changing current industry practices in such areas as marketing, labor relations, and work rules. These opportunities to improve transit productivity are sorted into three groups, each incorporating a distinct strategy for productivity gain. The first of these strategies is to alleviate the productivity problems associated with the peaking of transit use during weekday rush hours. Discontinuing less productive services is a second strategy for productivity growth that is discussed in this report. The third strategy to improve productivity involves specialization; that is, the tailoring of equipment, fares, and other practices to the peculiar needs of different transit services and situations.

24 163559 A STUDY OF EFFICIENCY INDICATORS OF URBAN PUBLIC TRANSPORTATION SYSTEMS. This report presents the efforts of a research project on efficiency problems of urban public transportation systems (UPTS). Three test regions were selected in an effort to discover, clarify, and understand the efficiency relationships within UPTS. The test regions vary from a small one-mode region to a large multimode region. The UPTS are first divided into three major system components i.e. primary services, support functions, and the network. Then each system is divided by mode, and each component by each distinct function carried within the system component. The inputs to the system are also divided by type, i.e. labor,

capital, and energy, and according to the contributor i.e. the operator, the direct user, the society at large, and the government at all levels. Input units are also traced in terms of many costs (Fiscal Inputs Matrix) and physical units (Physical Inputs Matrix). System outputs are also separated by the receiver and the nature of the outputs. Efficiency analysis is then explored in a hierarchical manner exploring three types of relationships, i.e. system inputs vs. system outputs; component inputs vs. component outputs; and component outputs vs. component outputs. Efficiency indicators are then discussed as to the type of useful service they may offer in various types of efficiency analysis problems. /Author/

24 163632 THE TRANSIT SYSTEMS OF SMALL CITIES IN ONTARIO. This report presents a description of the management and operating characteristics of transit systems in the small cities of Ontario. Cities with less than 120,000 in population are considered as small for the purpose of this study. The information for the study was obtained from the system by means of a Management Questionnaire, visits to the systems, and discussions with persons in transit management and operation. Three main divisions of transit management and operation are recognized and described in detail. These are: (1) Systems Management (i.e. covering items such as types of administration, management procedures, management information needs, etc.) (2) Systems Operation (i.e. characteristics of system operation, system operations procedures, and manpower utilization) (3) Finance (i.e. aspects of revenue generation, operating costs and its components, costs and financial records, and operating subsidies are described). Where data were available the range and average of each selected measure of effectiveness for groupings of cities by size are tabulated. Special emphasis has been given to those items where methods of management and operation are weak. Model formulations for some transit measures of effectiveness are also presented. The study should be helpful in gaining an understanding of both small and large city transit systems in the Province of Ontario.

24 164254 MEASUREMENT OF WAITING TIMES IN ASSESSMENTS OF OPERATIONAL CHANGES IN BUS SERVICES. This report is intended to indicate some of the difficulties which are likely to be encountered in survey studies of urban bus services, when the objective is to measure the changes in passenger waiting times which are brought about by an operational change. Methods of determining

waiting times that have been used in previous work, and their limitations, are described. The day to day variability of bus operations, which acts as a source of 'random errors' in such work, is illustrated by measurements from surveys carried out by TRRL and London transport. (A) /TRRL/

24 164398 OBSTACLES TO COMPARATIVE EVALUATION OF TRANSIT PERFORMANCE. The problems encountered and the issues raised in efforts to collect reliable and uniform operating and financial data from transit operators in California are detailed. The data was collected in an attempt to test the usefulness of performance indicators which were specified for criteria for evaluating public transit-performance. The problems discussed include those relating to why the data is not reported, the meaning of the data, and if the data is outdated. It is recommended that data requirements and data reporting channels be simplified. The required data items must be clearly defined and the generation techniques must be specified. It is noted that the area of data requirements, collection, and use, needs the combined and cooperative attention of the transit industry, government, and the research community.

24 165631 THE OPERATION OF URBAN BUS ROUTES-2. SOURCES OF IRREGULARITY. This is the second in a series of three articles describing factors affecting the operation of urban bus routes. The operation is studied in terms of the times spent by passengers and buses in different stages of their journeys. The first article provided an introduction to the subject area and a framework for assessing route performance. It also described an analysis of factors affecting average bus speeds. This article deals with sources of irregularity in bus route operation and compares the magnitude of the variations of times buses spend in the different stages of their journeys. The effects of the variations on the working of a bus route are assessed and possible reductions are discussed. /Author/TRRL/ [French]

Chapman, RA Gault, HE Jenkins, IA (Newcastle upon Tyne University, England) *Traffic Engineering and Control Analytic* Vol. 18 No. 7/8, July 1977, pp 364-367, 3 Fig., 3 Tab., 6 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-227770)

24 167588 TRANSIT PERFORMANCE IN THE I-35W URBAN CORRIDOR DEMONSTRATION PROJECT. The I-35W Minneapolis-St. Paul Urban Corridor Demonstration Project was designed to test (a) the effectiveness of expanding express bus route coverage and service frequency and (b) the potential of ramp

metering to produce higher operating speeds. To evaluate expanding bus service and ramp metering of the I-35W project required an extensive data collection and monitoring program throughout the project. The results of this analysis clearly indicate the ability of both express bus service and ramp metering to substantially increase transit use. Further, we concluded that the freeway must have complete access control, both inbound and outbound, for ramp metering to produce high transit operation speeds. In addition, we found that express bus service exhibits a lower unit cost per kilometer than local service and, to the extent that ramp metering increases express bus-operating speeds, ramp metering produces further reductions in transit unit cost. The major conclusion of the I-35W project is that expanded bus service and ramp metering can provide a relatively low-cost technique to increase use of existing freeways and encourage diversion of travelers to environmentally desirable and energy-efficient modes of travel. /Author/

24 167595 EVALUATION OF BUS-PRIORITY STRATEGIES ON NORTHWEST SEVENTH AVENUE IN MIAMI-ABRIDGMENT. A 3 1/2-year demonstration project was established in Miami in 1973 to develop more efficient people-moving capabilities along a 10 mile corridor. The basic transit concept was to provide fast, peak-period service by express buses. Various combinations of the following three bus priority treatments were evaluated: A reversible express bus lane. A traffic signal preemption system that allowed express-bus drivers to preempt traffic signals to give themselves the green signal. And, a coordinated signal system designed to favor the movement of express buses in the peak-period direction. Effect of bus priority treatments on bus operations, on traffic signal performance, on traffic stream, and on evaluation of the transit service is included. The study concluded, that the project was successful in demonstrating that express buses can be given priority treatment on urban arterial streets and cause little or no adverse effect on the general traffic stream. A park-and-ride express-bus combination that provides a high level of service can attract automobile riders, although such service is expensive for the public to support. The park-and-ride facility was found to be an essential element of the transit service, and a majority of the bus passengers would have been last to the automobile if the facility had not been provided. Lastley, the bus preemption system did not appear to have an adverse effect on traffic signal operations.

24 169784 TRANSIT PERFORMANCE MEASURES: THEIR SIGNIFICANCE IN LOCAL FUNDING ALLOCATION. Transit performance measures (TPM's) are the values of vari-

ables associated with transit performance, with respect to the vehicle, the service, use of the service, the costs of the service, and the social, economic and environmental impacts of the various elements of the physical systems. Urban transportation issues of interest in this study relate to the subvention of tax monies, whether state or federally collected. The main problem addressed is the development of meaningful TPM's for funding allocation. Other problems deal with difficulties in the use of TPM's, once evolved. This report should interest policy-makers dealing with the subvention of funds to local transit properties. A case study (CalTrans) is presented that provides a pragmatic feedback to the TPM evaluation presented. The report concludes that the utility of TPM's has been overestimated, particularly with regard to their use in allocating funds to individual transit properties.

24 170785 BART NEARS THE END OF THE LONG HAUL. Bay Area Rapid Transit is striving for a reliability that will permit full-time operation. Problems are identified as train performance planned beyond physical limits and attempts to innovate in too many areas simultaneously without planning for adequate system performance when inevitable equipment failures occurred. Strengthened maintenance techniques and engineering efforts are improving car availability. Problems with the automatic train control have been compounded by the need to resignal the entire network for lower rates of deceleration than originally designed. The evolution of the automatic train protection system is described.

24 174111 MEASURING THE PERFORMANCE OF TRANSIT SYSTEMS. This paper reviews the need for the development of transit performance measures, in the light of recent legislation and public subsidy issues for public transportation in the United States. An evaluation framework is presented, which defines and distinguishes between the efficiency, effectiveness and impact of public transit efforts. The application of this framework in evaluating public transit investments, and the use of the performance measures obtained through the application of this framework, in the allocation of funds among systems is then discussed. Research needs with respect to data collection requirements,

cross-jurisdictional comparability, and the utility of the proposed performance measures for decision-making are finally addressed. /TRRL/

24 176506 THE EVALUATION OF BENEFITS FROM MEASURES TO INCREASE URBAN TRANSPORT EFFICIENCY. This paper closely and comprehensively examines the phenomena of urban transportation improvement and makes estimates of the order of magnitude of the benefits that might reasonably be expected to accrue from the relaxation of economic regulation in the Washington D.C. area. Calculations are made to indicate the effects of: the reduction of the number of private automobiles by 10 percent, due to an increase in car pooling, with a consequent increase in traffic speed due to a reduction in congestion; substitution of subscription bus services for conventional ones, with consequent increases in public transport speeds and a reduction in operating costs; substitution of subscription bus services for 10 percent of private automobile trips, with a consequent increase in traffic speeds due to the reduction in the number of automobiles but a decline in the speed of trips transferred from automobiles to subscription bus services. The calculation of benefits uses a methodology which depends on the finding that both the time and money allocated by groups of trip makers for urban travel tend to be stable and therefore predictable. This methodology was used to study 4 alternatives: shift from automobiles to car pools; replacement of peak-period regular bus services by subscription services; combination of the two former alternatives; and shift from automobiles to subscription buses. The combination benefits to the trip makers and to the providers of the transport are evaluated. It was found that in this area in which 80 percent of travel is by automobile, increased car pooling appears to offer greater promise for improving urban transport conditions than for inducing shifts from automobiles to transit.

24 176522 CASE STUDY OF NEW YORK CITY TRANSIT SYSTEM: PART 2. In this study of ways in which costs may be reduced, the Metropolitan Transit Authority's management has three criteria for selecting cost saving projects: potential for cost reducing; likelihood of

implementation; time required implementation. The major areas of expenses are being studied, namely, planning activities, capital improvements, bus and rail operations, and the more subjective areas of management and organization. Cost reduction and the control of the rate of cost increase are the key objectives of the study. The improvements proposed should have a minimal negative impact on the quantity of service, and cost savings should not be in the form of deferred expense that make today a problems become tomorrow's crisis.

24 176537 REDUCING TRANSIT COSTS. Although study data indicate that substantial cost reductions can be made in New York, some permanent financing mechanism must be developed to supplement existing, federal, state, and local assistance programs. A list of about 30 areas for potential costs reduction in medium sized transit systems was presented. It is noted that complementary systems to provide for public transportation needs is proving to be a successful cost-saving innovation in some areas.

24 176552 DEVELOPMENT OF PERFORMANCE INDICATORS FOR TRANSIT. The objective of this research is to establish a rationale for the development of performance indicators for transit; to analyze potential indicators; and to apply a limited set of indicators to data collected from transit properties in the states of California and Washington. The focus herein is on the federal and state levels of government. The procedure is designed to develop and test criteria for the evaluation of performance of transit properties in different locations, of differing size, and with different operational procedures. This report presents the rationale and developmental structure for the evaluation of transit performance through quantitative performance indicators. It specifies efficient and effective transit service as appropriate goals to be encouraged by federal and state governments and identifies three

efficiency and six effectiveness indicators which focus on significant aspects of performance. Using operating and financial data collected from 47 public transit operators in California and 5 operators in Washington, the selected performance indicators are analyzed for comparability of values between different modes of transit, different service area population densities, and different organizational types. The performance indicator values for selected transit properties are individually interpreted to demonstrate the analytic use and limitations of indicators. Potential uses of performance indicators are identified and areas requiring additional research described. The Appendices include: a literature search; a listing of properties; operating and financial data; and a glossary.

24 176773 CHOOSING PERFORMANCE INDICATORS FOR SMALL TRANSIT SYSTEMS. Providing adequate system deficit financing for publicly-owned and operated transit systems has been a source of great concern for federal, state and local funding agencies. Marginal increases in tax revenues coupled with increased competition for existing financial resources has forced government agencies to search out the best investment for scarce funds and to insure that the greatest public good may be accomplished at the least cost to the taxpayer. Urban transportation systems, and their mass transit components in particular, have often been regarded as important cornerstones in the economic viability of urbanized areas. The focus of this review, therefore, is on the identification of select performance measures that would provide to the operators of Pennsylvania's small transit system, a simplistic means of measuring the impact of low-capital intensive system improvements as well as highlight existing or emerging operating problems. /Author/

24 177123 DEVELOPMENT AND APPLICATION OF A MODEL TO EVALUATE TRANSPORTATION IMPROVEMENTS IN URBAN CORRIDORS. This paper introduces the linear program model developed at the University of Pennsylvania for evaluating transportation improvements in a high-travel-demand urban corridor. Variables included in the linear program are discussed, and the linear objective function and the constraint equations of the model are outlined. Application to a radial travel corridor in Chicago, Illinois, illustrates the capability of the model; an analysis is made of existing corridor bus service and several corridor capital investments to improve that service. In the analysis of existing bus service, several alternatives to the existing price structure of bus transportation in the corridor were studied; the major result was an evaluation of the shift in mode choice caused by the different pricing schemes and the effects of a change in patronage on bus

operating and capital costs. For the study of alternative capital investments, the corridor model computes the patronage attracted by the improvements and adjusts operating and bus capital costs of bus lines serving the corridor.

24 178748 PEAK-OFF PEAK REVENUE AND COST ALLOCATION MODEL. This paper develops an approach for allocating bus service operating costs and revenues between peak and off-peak periods. It shows how the economic performance (relative profitability) of peak-period bus service depends on three relative measures--relative peaking, load factors, and schedule efficiency-labor practices. As an example, when the ratio of additional peak buses to base buses is 1.0 and the pay hours per bus hour for the additional buses are double those for the base buses, each bus in the peak would have to carry more than 1.5 times the base period ridership. When this ratio rises to 3, peak buses would have to carry double the passengers carried on each bus in the base period for the peaks to be as profitably. /Author/

24 178758 INCENTIVE PROGRAM FOR BUS CARRIERS. One of the most elusive aspects of public assistance to independently operated transit services has been the development of incentives to the operator to provide quality service on a cost-effective basis. To deal with this, the New Jersey Department of Transportation intends to implement an incentive program which will result in monetary rewards or penalties to companies depending on the quality of service provided. This paper presents the essential elements of that program which were developed as part of an overall study to revamp the method that NJDOT follows in providing operating assistance to independent carriers in the state. The incentive system recommended is keyed to three principal areas that are perceived by transit users to be important--1) condition and cleanliness of the bus, 2) courtesy and driving skills exhibited by the bus operator, and 3) on-time performance. For each of these areas, surveillance procedures have been developed and rating forms designed to relate field observations to a numerical scoring system. The scoring system weights each survey element by its estimated relative importance as compared to all other elements. The program calls for each carrier to be rated quarterly in all three areas, and a method is described for translating a company's overall score for a quarter into a monetary reward or penalty. /Author/

24 179032 FACTORS INFLUENCING TRANSIT PRODUCTIVITY. Data from 66 public and private transit operations in New York State was analyzed for fiscal years, 1974, 1975, 1976 to explore the underlying factors influencing transit productivity over the three year period and to determine why some transit operations perform more or less efficiently than others. Using a statistical tool known as automatic interaction detection (AID), four aggregate measures of transit productivity (passengers/vehicle mile, revenue/vehicle mile, cost/vehicle mile, and revenue/cost), were related to background factors describing: system ownership, service area, service configuration and service types provided. Results show that situational variables, such as city size (population) and the types of service provided markedly affect the relative performance of transit operations, while public or private ownership has a moderate but less important effect. Policy implications are drawn. Additionally, existing or proposed transit services may be compared against the range of values for the four productivity measures, to determine their relative performance with respect to other transit systems providing similar services in similar situational contexts. /Author/

24 179041 COST INCREASES, COST DIFFERENCES, AND PRODUCTIVITY OF TRANSIT OPERATIONS IN NEW YORK STATE. Public transit operations in New York State were analyzed to explore transit costs and operational productivity. Three transit systems were examined over time to determine what cost component(s) are causing the rapid increases in operating cost which have occurred in the past seven years. Twelve bus operations were analyzed to explore why some transit operations cost more to operate than others, and if similar transit operations are equally productive. The results showed that employee costs (wage and salary, pension, and other employee-related costs) constitute 70-90% of all operating costs, and that increases in employee costs are almost entirely responsible for past increases in operating cost. Increases in fuel, power, and other non-employee related costs were found to have little effect on operating cost increases. Differences in operating cost per vehicle-mile between operations are accounted for by differences in average vehicle speed, employee average earnings, and in some cases productivity. Cost savings of between 8% to 19% could be obtained by increasing the average vehicle speed of a bus operation by 1 mph. Operating speed is generally not very difficult to produce substantial improvements in operating speed. /Author/

24 179084 TRAFFIC OPERATION IMPROVEMENTS. Transportation system management applied to traffic engineering operations requires reevaluating basic transportation needs of those who walk, use public transportation, or drive automobiles. Replacing existing control mechanisms is not adequate. New ways must be

devised for optimally sharing limited rights-of-way. Signs, channelization, traffic signals, reversible lanes, and ramp-metering policies are discussed in this paper. /Author/

24 179092 IMPROVING SERVICE QUALITY AND EFFICIENCY THROUGH THE USE OF SERVICE STANDARDS. This paper describes the service policy of the Massachusetts Bay Transportation Authority for surface public transportation and its use in urban transportation system management. The establishment and use of a comprehensive statement of service policy are discussed in the context of TSM objectives. Such a service policy, which contains service goals and objectives, service standards and guidelines, and planning and evaluation procedures, provides the transit manager with a management control framework for monitoring service performance and identifying remedial actions that will improve the quality of service and the efficiency and effectiveness of resource allocation. The paper describes how MBTA uses the control framework embodied in its service policy to identify both general service improvements and some specific TSM service improvements such as reserved bus lanes on arterial streets. The paper concludes by discussing how the MBTA service policy through cooperative planning has begun to make local city and town policy makers more sensitive to transit operations, thereby enhancing the prospects for successful implementation of potentially controversial TSM projects. /Author/

24 182767 ADELAIDE BUS COSTING STUDY; FINAL REPORT. In 1976, R. Travers Morgan were appointed by the South Australian Director-General of Transport to carry out a preliminary investigation of possible improvements to the method of bus costing. Recommendations included a further study covering basic costs, scheduling and marginal costs. This study has provided estimates of both current costs and the extra costs (or savings) associated with any changes in bus and tram operations in Adelaide. It shows variations in costs of operations during different periods of the day, different days of the week and for different routes. It also has developed computer programs to enable regular updat-

ing of basic costs from data routinely collected and manipulated within the State Transport Authority's computerised accounts system. /TRRL/

24 182782 A BUS FOR THE COMMUNITY. The background and operation of the Norfolk village bus, operated as a three-way partnership between the local community, the national bus company and the county council is described. The local village bus committee operates the bus from day to day, staffed by volunteer drivers. The local authority purchased the bus, a 12 seat ford transit, which is maintained by the bus company who also supply professional back-up facilities. Fares collected by the driver are paid to the county council. The bus, which apart from the starting up cost, is self-financing, works both timetabled and excursion duties, including school runs and trips to a local doctor's surgery. Since half the revenue is obtained from excursions, a larger bus would be useful, but this would be awkward in the narrow lanes. The recruiting of drivers could be made easier if the psv licence were not required. Other community bus schemes are summarized, demonstrating that they can provide an invaluable adjunct to the basic network of stage buses and local rail services. /TRRL/

24 184705 OPERATING COST MODEL FOR TRANSIT BASED ON DIRECT SYSTEM CHARACTERISTICS (ABRIDGEMENT). An approach is presented which estimates operating costs based on accurate estimates of the underlying physical characteristics of the system. This approach can be transferred among systems without loss of accuracy and is an extremely fast computational approach. The cost model produces estimates of worker requirements over the day and actual vehicle schedules for the proposed systems. The model separates operating costs of proposed multimodal transportation system into 15 categories. Each category is either a financial accounting and reporting elements (FARE) category, an aggregation of FARE categories, or part of a FARE category. Although costs for many of the categories are based on unit cost, the cost for several cost categories are based on temporal characteristics of the vehicle schedule and crew estimates. These cost categories constitute most of the operating costs for transit systems. Procedures are described for determining the costs of the cost categories. Manpower and vehicle requirements are discussed and the operating cost model is described.

24 188431 TRANSFORMING EXISTING FACILITIES INTO MORE EFFECTIVE TRANSPORTATION SYSTEMS (INTEGRATION OF DEMAND REDUCTION, OPERATIONAL/SERVICE CHANGES AND CAPITAL INVESTMENTS). The paper reviews experience with several types of demand-reducing, operational/service and capital programs, generally noting how they relate to guidelines, discussed in the paper, for getting additional use from existing highway systems. The various programs encompass such concepts as staggered hours/flexible hours, parking charge differentials; contra-flow bus lanes, same-direction bus lanes, one-way tolls, driver information systems, transit information systems, modal interconnectivity; examples of introducing high quality bus rapid transit service into existing corridors under differing right-of-way and institutional constraints.

24 189833 THE NEED FOR AND USE OF PERFORMANCE INDICATORS IN URBAN TRANSIT. Basic efficiency indicators relate units of cost or work by employees or vehicles to units of service or other types of input. However, it is noted that no one indicator will reveal the relative or absolute performance of a system's management. In order to respond to changing priorities, all levels of government have become aware of the need to develop uniform indicators of transit performance. Such indicators can assist in the establishment and evaluation of public policy with regard to transit. This article reviews the current state of transit performance, and discusses the transit communities role in developing performance indicators.

Stokes, BR (American Public Transit Association) *Transit Journal* 1979, pp 3-10

24 189834 PERFORMANCE INDICATORS: A NECESSARY MANAGEMENT TOOL?. The article notes the need for the measurement and evaluation of transit performance within policy and financial constraints, and discussed the Pennsylvania Department of Transportation's efforts to improve transit service and to increase operating efficiencies in return for the public tax dollars committed for transit. These efforts included: the adoption of operating guidelines that specify elements of service such as speed, reliability, etc.; financial guidelines to compare the financial data of individual properties; a standardized reporting system for operating and financial data; a methodology for determining service changes based upon performance criteria and financial criteria; and a new formula grant allocation methodology. Some of the key data that might be developed and used as part of performance evaluation programs are listed.

24 193615 TRANSIT SERVICE RELIABILITY. This report presents a comprehensive overview of the subject of transit service reliability and provides a framework for a program of demonstrations and research studies which could be carried out under the Service and Methods Demonstration program. Major subject areas included the impact of service reliability from the operator's perspective, empirical measures of service reliability, causes of service reliability problems, techniques for improving service reliability, and recommendations for further research. Several findings are reported herein, namely: (1) transit service reliability is a significant determinant of traveler mode and departure time choices; (2) service reliability is crucial in influencing the costs of providing transit service; and (3) current evaluation measures are not able to capture the variety of impacts of service reliability on travel behavior and operator costs. Several proposed measures are recommended herein for use in future evaluation studies. Numerous causes of reliability problems are identified, some which appear to be inherent in the specific transit service concept, and others which are more environmental in nature. A review of previous and current analyses reveals inconclusive findings in determining the relative importance and magnitude of each cause. Several strategies are considered to improve service reliability of fixed route and demand responsive transit systems. These strategies are directed at alleviating the initial cause of unreliability or serve as a corrective measure when the reliability problem has already developed. /UMTA/

24 193971 PERFORMANCE INDICATORS FOR TRANSIT MANAGEMENT. Transit performance can be evaluated through quantitative indicators. As the provision of efficient and effective transit service an appropriate goals to be encouraged by federal and state governments, these goals are used to develop performance indicators. Three efficiency and four effectiveness indicators are described, together with two overall indicators. These nine indicators are analyzed for comparability utilizing operating and financial data collected from public transit agencies in California. Performance indicators selected for this study should not be viewed as final. Twenty-one performance indicators proposed by previous studies were reviewed. Theoretical considerations and unavailability or unreliability of data caused omission of several useful measures like passenger-miles. Circumstances such as improved data, emphasis upon goals other than efficiency and effectiveness, and local conditions might warrant the inclusion of indicators deleted from this research. /Author/TRRL/

24 195579 METROPOLITAN EVANSVILLE TRANSIT SYSTEM: MANAGEMENT PERFORMANCE AUDIT. This document is the management performance audit of the Metropolitan Evansville Transit System (METS), and it evaluates the transit system in the context of its goals and objectives and its resources and constraints. The scope of this performance evaluation report includes: 1) the resources and constraints of METS internal/external environment; 2) the organization's governing body--the Public Transit Department Board; and 3) the functional areas that define METS activities. This study of METS management of the transit system employs the use of statistical indicators, random samples, and interviews with key personnel to identify areas for detailed analysis. Resulting recommendations aim to assist METS management to improve the effectiveness and efficiency of the system. Among the major recommendations are 1) that METS, Public Transit Department Board, and Evansville Urban Transportation Study's (EUTS) planners should jointly develop goals and objectives, and 2) that METS management and EUTS planners work more closely together. The auditors also recommend that METS install a two-way radio system in the buses and hire a radio dispatcher to improve METS reliability. /UMTA/

24 195969 OPTIMIZING URBAN MASS TRANSIT SYSTEMS: A GENERAL MODEL. This paper describes a model for determining the general dimensions of an optimal mass transit system for an idealized urban area. The model is based on a circular city with a definite center and with density declining uniformly from the center

in all directions according to the negative exponential function. The transit system consists of radial routes that emanate from the center and contain discrete stops. Only trips to or from the center are considered, and travel is assumed to occur only in radial and circumferential directions. The model represents total community costs of the system, defined to include travel time, operating costs, equipment, and construction. A recursive procedure was devised to find a simultaneous minimum with respect to the spacing of routes, number and spacing of stops on each route, and average headway. Numerical analyses were conducted for six hypothetical cities by using varying values for the parameters of the density function. In each case, three types of transit systems were compared: conventional bus service, buses on exclusive lanes, and rail rapid transit. The optimal system in the largest city examined was exclusive bus lanes; in the other five cases, the optimal system was conventional bus service. Other interesting relations that appeared in the results are summarized. /Author/

24 196415 TRANSIT ACTIONS--TECHNIQUES FOR IMPROVING PRODUCTIVITY AND PERFORMANCE. This workbook contains actions which can cut the costs of providing transit services or improve system operating efficiency and effectiveness. The included actions represent only a few of the many steps which will have to be taken over the next few years to narrow the growing gap between farebox revenues and operating expenses. Some of the actions are innovative, others, such as the use of part-time labor, and the designation of free-fare zones, have been considered for a long while but are now being tried on a large scale. The 41 actions included here are representative of the 110 actions submitted by 31 agencies. They are included because they required a low capital investment, had short-term payoffs, required minimal staff time, or involved minimal institutional approval. The remaining actions may be clarified or expanded during the Transit Actions Regional Meetings so that they might be included in the final Transit Actions Workbook. This preliminary workbook will be the starting point for five workshops at the regional meetings, covering: service levels, transit financing policies, internal management, labor-management relations, and performance measures. /Author/

24 196682 BUS SERVICE EVALUATION PROCEDURES: A REVIEW. Over the past few years, rising costs and limited budgets have encouraged transit authorities to evaluate the cost-effectiveness of the services they provide. The Massachusetts Bay Transportation Authority (MBTA) and the Tidewater Transportation District Commission (TTDC) are among many properties interested in updating and improving bus service evaluation programs. These programs include a joint review of the state-of-the-art in bus service evaluation techniques across the country. This information will be used to develop bus service evaluating programs for both the MBTA and the TTDC. This report presents the results of a literature review and survey of 17 transit properties in the United States and Canada regarding the evaluation procedures currently in use. The focus of the study was to identify service performance indicators and criteria used to evaluate bus service on a route-by-route basis. Three types of evaluation indicators: service design measures; operating performance measures; and economic or productivity measures, were identified. The range of standards developed for each indicator are reported. Results are presented separately for transit properties owning less than 400 buses and for those owning more than 400 buses. Detailed appendices provide more complete information on the survey response. These appendices also provide the transit operator and the regional transit planner with a compendium of a wide range of performance measures, descriptions of how they are used and how the needed data is collected, a listing of contact persons in each property, and detailed information on available literature. The conclusions herein show that bus transit operators in the United States and Canada are aware that useful evaluation techniques are currently available, and that most systems recognize the importance of such techniques to ensure a more efficient and effective delivery of service. /UMTA/

24 197139 REVIEW OF ELECTRONIC DATA PROCESSING REQUIREMENTS AT DART AND DAST. This report is the result of a project to assist the Delaware Transportation Authority in determining the electronic data processing requirements of Delaware Transportation Authority for Regional Transit (DART) and Delaware Transportation Authority for Specialized Transit (DAST). The report provides an overview of the project, and preliminary information requirements for each of the Authorities proposed computer applications systems, cost estimates and an implementation plan. Comments provided by the Authorities have been incorporated into this report. The principal recommendation is, based on the estimated volumes outlined in the report, to use a small business computer, to be located at DART, with a communication line to link the Authorities.

24 197440 CHARACTERISTICS OF URBAN TRANSPORTATION DEMAND; APPENDIX. To assist the urban transportation planner, the Urban Mass Transportation Administration's Planning Methods and Support Program researches, develops, and distributes planning tools, including the documentation of novel planning studies, new design and forecasting techniques, and germane research results. This report is an example. Its contents clearly present usable planning concepts and constitute a valuable addition to the growing set of computerized and manual techniques comprising the UMTA/FHWA Urban Transportation Planning System (UTPS). This report is an Appendix to CUTD handbook. It offers detailed data on individual cities, roads, routes, stations, etc. These are not in a form that is comparable from place-to-place, but may be of interest from an historical perspective for the urban areas concerned.

24 197476 A COMPREHENSIVE ANALYSIS OF URBAN BUS TRANSIT EFFICIENCY AND PRODUCTIVITY. PART III. ANALYSIS OF OPTIONS TO IMPROVE URBAN TRANSIT PERFORMANCE. This document is the third part of a study undertaken to analyze options for improving transit performance with particular emphasis upon bus transit systems in small to medium-sized urban areas. A methodology is developed to evaluate the impact of small changes in three operational policy variables, namely: frequency, number of bus stops, and fare along a fixed bus route. Analytical expressions are derived that trace the impact of each variable upon various other system variables leading finally to an assessment of changes in selected measures of efficiency and effectiveness. The application of the methodology is demonstrated with a case study of a selected bus route in a medium-sized Indiana city. The results indicate that significant improvements can be achieved in most of the efficiency and effectiveness measures considered. Finally, the reliability and maintenance aspects of a bus transit system are investigated using repair data from the City of Anderson Transportation System, Indiana. This data is subsequently used in a simulation model using GASP IV to investigate the effect of increasing the number of mechanics and the number of spare buses upon the overall dependability of the transit system.

Sinha, KC Bhandari, AS ; Purdue University, Urban Mass Transportation Administration Final Rpt. UMTA-IN-11-0003-79-4, CE-TRA-78-2, Dec. 1978, 198 p.; See also Part 2, PB-295222. 24 198194 THE EFFECT OF ORGANIZATION SIZE AND STRUCTURE ON TRANSIT PERFORMANCE AND EMPLOYEE SATISFACTION. The report summarizes the objectives and results of research designed to

assess the relationships between structural, attitudinal, and performance variables in 16 selected California public mass transit (fixed-route bus) systems representing various sizes and organizational types. The structural variables were organizational size, span of control, number of specialties, administrative intensity, formalization, standardization, and centralization. Their relationship was analyzed with attitude variables (job satisfaction and employee commitment) and organizational performance (service efficiency and effectiveness measures and employee withdrawal). Implications for the design of transit organizations are also discussed. The most important result of this analyses is that the impacts of structural variables upon employee attitudes and organizational performance need to be assessed in an interactive framework. Several structural variables, when considered together or as influenced by some moderating variable may have more significant impacts on organizational outcomes than the impact of these same variables considered individually.

Fielding, GJ Porter, LW Spendolini, MJ Todor, WD Dalton, DR ; California University, Irvine, Urban Mass Transportation Administration Final Rpt. UMTA-CA-11-0016-79-1, Dec. 1978, 182 p.; Grant DOT-UMTA-CA-11-0016; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-296629/9ST

24 198749 THE PRODUCTIVITY AND EFFICIENCY OF INPUTS IN THE PROVISION OF TRANSPORTATION SERVICES OF THE SOUTHEASTERN PENNSYLVANIA TRANSPORTATION AUTHORITY. The project was developed as part of a larger program of research, namely, a study of human resource development in the Southeastern Pennsylvania Transportation Authority. The objectives of this paper are to express some elementary theory (appendix) about productivity, efficiency, and performance standards so that the case study of SEPTA has a basis in accepted theory. Simple concepts are developed which underlie the understanding of the analysis of the SEPTA system. The paper empirically examines the performance of SEPTA vis a vis other transit operations in the United States and Canada (the peer group) on the basis of a number of performance measures. In addition, more complex comparisons are made by statistical techniques. The major insight gleaned from such comparisons is that the simple comparisons, i.e., not controlling for other factors, yield a different view of the system than do the controlled comparisons.

Allen, WB ; Wharton School, Urban Mass Transportation Administration, (UMTA-IT-09-0073) Final Rpt. UMTA-IT-09-0073-79-1, May 1979, 51 p.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-298161/1ST

24 239489 AN INITIAL CHICAGO NORTH SUBURBAN TRANSIT IMPROVEMENT PROGRAM, 1971-1975-VOLUME 1: REPORT AND EXHIBITS. EXISTING MASS TRANSPORTATION SYSTEMS ARE EXAMINED IN DETAIL AND BROKEN DOWN BETWEEN RAIL AND BUS MODES. EXISTING PARKING FACILITIES ARE EVALUATED, AND SPECIFIC RECOMMENDATIONS FOR ADDITIONAL PARKING FACILITIES ARE ADVANCED.

EXISTING BUS SERVICE IS ALSO ANALYZED AT LENGTH WITH REFERENCE TO ROUTES, SCHEDULES, FARE STRUCTURE, EQUIPMENT AND FACILITIES, OPERATING EXPENSES, AND PROJECTED RIDERSHIP TRENDS. AN EVALUATION OF EXPANDED SUBURBAN BUS SERVICE IS PROVIDED WHICH FORECASTS POTENTIAL RIDERSHIP AND IMPACT ON OTHER MODES. A DETAILED SCHEDULE OF PROPOSED SERVICE IMPROVEMENTS ARE PRESENTED: (1) EXPANSION OF COMMUTER PARKING FACILITIES AT RAIL STATIONS; (2) CONSTRUCTION OF A NEW STOP ON THE SKOKIE SWIFT RAPID TRANSIT ROUTE; (3) POSSIBLE PARTICIPATION IN FEDERAL GRANT PROGRAMS TO SUBSIDIZE CAPITAL IMPROVEMENTS FOR THE MILWAUKEE ROAD COMMUTER RAILROAD; (4) WIDELY EXPANDED BUS OPERATIONS DESIGNED TO ULTIMATELY INCREASE RIDERSHIP BY 62% THROUGHOUT THE SUBURBAN AREA; AND (5) COORDINATION OF ALL MASS TRANSIT SERVICES AND FARES BY A SINGLE AGENCY. A DETAILED IMPLEMENTATION PROGRAM COVERS SUCH SPECIFIC AREAS AS FINANCING, CREATION OF A TRANSIT DISTRICT, PROGRAM STAGING, AND IMMEDIATE PROGRAM TASK DESCRIPTIONS. /UMTA/

24 260152 EVALUATION OF URBAN PUBLIC TRANSPORTATION. Many attempts are now being made to evaluate public transportation. This is brought about by the large public expenditures for mass transit services. The evaluation procedures now employed provide only for a superficial treatment. It is time that clear, concise, quantifiable objectives be defined for public transportation. Unless this quantification can occur, the evaluation process will remain meaningless.

24 262571 DEVELOPMENT OF EXPERIMENTAL DESIGN METHODOLOGY FOR EVALUATING MASS TRANSIT DEMONSTRATIONS: AN APPLICATION TO THE SEATTLE EXPRESS BUS SERVICE DEMONSTRATION PROJECT VOLUME II-APPENDICES. One major objective of UMTA demonstration projects is to develop a systematic and effective means of evaluation of the projects which will enable determination not only of effectiveness of specific projects but also the extent of applicability to other areas in the country. This report sought to accomplish this objective through 3 steps: (1) determining the feasibility of using experimental design methodology to evaluate transit demonstration projects; (2) utilizing the methodology in assessing the impact of transit innovations; and (3) determining the implications and applications of the demonstration findings to other locales. The setting was established as Seattle, Washington, where an express bus service demonstration project was

initiated in 1970, supported by UMTA R&D funds. This report contains the appendices of the Volume I Main Report. These appendices are: Magnitude of Ridership on Blue Streak Routes, Data from the Origin and Destination Surveys, Magnitude of Vehicles Using Expressway Facilities, Evaluation of Methods for Counting Bus Passengers, and Issues Arising in the Conduct of the Study.

Northwestern University, Evanston UMTA-IL-06-0021-73-2, Sept. 1973, 105 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-235510

24 262572 DEVELOPMENT OF EXPERIMENTAL DESIGN METHODOLOGY FOR EVALUATING MASS TRANSIT DEMONSTRATIONS: AN APPLICATION TO THE SEATTLE EXPRESS BUS SERVICE DEMONSTRATION PROJECT VOLUME I-MAIN REPORT. UMTA has been actively involved in the process of funding full-scale demonstration projects in select metropolitan areas throughout the country. These demonstrations are carried out for the purpose of research, testing and evaluation of transit concepts with potential nationwide implications. One major objective to be accomplished is the development of a systematic and effective means of evaluation which will enable UMTA to determine not only the effectiveness of the specific projects, but also the extent of applicability to other areas. This report sought to accomplish this objective through 3 steps: (1) determining the feasibility of using experimental design methodology to evaluate transit demonstration projects; (2) utilizing the methodology in assessing the impact of transit innovations; and (3) determining the implications and applications of the demonstration findings in other locales. The basic approach of the study was development of an experimental design, testing design methodology and evaluation of results. The setting was established in Seattle, Washington, where an express bus service demonstration project was initiated in 1970, supported by UMTA R&D funds. It was concluded, among other things, that the utilization of the methodology is an effective and economical means of evaluating projects on a micro-level where differences in effectiveness and estimates of performance potential can be measured. Tables complement the text. Appendices are in Volume II.

24 264902 PRODUCTIVITY, EFFICIENCY AND QUALITY OF SERVICE OF URBAN TRANSPORTATION SYSTEMS. A comprehensive Societal Productivity Matrix is developed, within the framework of which an all inclusive productivity analysis of an urban transportation system can take place. For efficiency analysis the study finds that the urban transportation system should be divided into three major components, the network, the primary services, and the support functions. Efficiency analysis should be performed for each one separately, and, then, for all three of them together, to specify the contribution of each one towards higher efficiency rates. It is also concluded that for both productivity and efficiency analysis it is imperative that the

work proceed including the points of view of four major actors, i.e., the supplier-operator, the user-consumer, the society at large, and the government at all levels. Issues of quality of service can best be taken care of in this framework as concerns of the user-consumer and society at large which should be achieved efficiently.

Tomazinis, AR ; Pennsylvania University, Philadelphia Rept No TSC-101 (74), Sept. 1974

24 272056 PUBLIC TRANSPORTATION OPERATING STANDARDS. Public transportation operating standards are a body of guidelines concerning the manner in which operators provide service to the public. Most of these guidelines relate to routes, frequency of service, and, to some degree, financing. There is a need for a concerted effort to develop and codify a universal set of standards against which all transit systems can be measured and to provide the means by which data can be secured so that measurements can be made. The standards must be high, specific and quantifiable. Both maximum and minimum standards must be established. The standards must be classifiable into passenger related, regulatory body related, operation, mechanical and route specific classes. The manner of collection of data is discussed. System internal information can be supplied directly by the system, but the external information may be gathered by an independent body under ground rules that ensure similar methods throughout the country. The standards that require public opinion may best be handled by having the general public submit an annual report card on the performance of the system. A table illustrates how standards may be set up. The development of minimum standards will require the initial determination of averages and any program for the development of standards must start with definitions. The general standards currently in the most widespread use are those promulgated by the National Committee on Urban Transportation. Those guidelines relating to routing are examined. Compromises and inadequacies evident in these are noted.

James, DH *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 67-72, 1 Tab., 2 Ref.; Appeared in Issues in Public Transportation, Proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB

24 272057 PUBLIC TRANSPORTATION OPERATING STANDARDS. The city of San Antonio is described, the history of its successful transit system is briefly reviewed, and the development is outlined of operating standards that served as a basis for the rendering of the present service and the extension of the service into new developments with new lines. Aerial maps of the city were used to study its geographical and physical layout and plot routes for transit service. A set of minimum standards were then adopted which had to be satisfied before an extension of the bus service is made. This plan, keyed to provide an economic basis for the operation of the system, is set forth here. A decision was also made to establish and maintain, as long as possible, a low basic-fare structure. The application of these criteria to the system has resulted in 59 major extensions and the removal of only 3 such extensions. In establishing the frequency of service, the load factor was not to exceed 150

percent of the seating capacity in peak periods. Emphasis is placed on schedule adherence and operators are checked to the half minute at check points. In planning new service or changes in service, the director of research and schedules and the director of operations share the responsibility. The criteria established in the first year of service has permitted growth of the system and the meeting of all operating costs and other obligations. The low basic fare and zone system have been very meaningful and attractive in maintaining patronage.

Hill, FN (San Antonio Transit System) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 63-67; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB

24 272058 PUBLIC TRANSPORTATION OPERATING STANDARDS (INTRODUCTORY REMARKS). Clear statements of transit service operating standards would be helpful both to industry and to government agencies in making judgements on the relative merits of transit operations, and in the measurement and comparison of the performance of individual systems. They could help set performance levels for transit services. Four papers are presented here which present different views of operating standards. The views are presented of a manager of an all-bus transit system in a medium-sized metropolitan area. A private consultant and the manager of a regional transit authority that acquired a privately owned bus company present their views. A multimodal transit operator from a large metropolitan area also presents his views. The reasons are listed why transportation system managers view operating standards with skepticism: (1) the managers are concerned that any service standard that is explicitly adopted will be too rigidly applied; (2) different operation standards apply to different modes and to different-sized metropolitan areas; (3) transit operating standards that are currently being used were determined by the society of another period; (4) the concentrated city of a few years ago is now a suburbanized metropolitan complex.

Echols, JC (Metropolitan Washington Council of Governments) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, p 63

24 272062 PUBLIC TRANSPORTATION OPERATING STANDARDS. Some of the standards employed by the Chicago Transit Authority (CTA) are discussed here. Practically every aspect of transit service is codified with standards, most of them unwritten, but no less effective. A review of such standards serves to emphasize the need for flexibility over rigidity. At operating levels, standards are applied to employee selection, training and performance. Design standards relating to maximum number of passengers per vehicle, and the schedule policy which establishes a range for the selection of service frequencies or the reciprocal, headways are discussed. The maximum service is determined from the allowable crowding standard for

passengers per vehicle, and the base or minimum service is determined from the headway so that the time between trips will meet the policy criteria for the transit system involved. The maximum workable length of a bus route, a standard relating to Chicago, is also discussed. Maximum fleet requirements constitute a common control on service standards, as do the vehicle characteristics: length, width, door width, and seating and standing capacity. The gridiron route pattern and some radial routes ensures that most of the population is within 0.375 mile of more than one CTA service. Policy standards are followed to provide the broadest possible period of service for those who need it at night. Some of the security measures adopted by the CTA (such as the exact fare procedure etc) are outlined. Fare collection, which in a rapid transit system, can involve as much as 16 percent of the operating costs, is reviewed. Standards are essential in planning route changes, extensions or cutbacks. The use of aerial surveys, the problem of the terminal, physical and geometric characteristics of pavements, potential traffic and questionnaire surveys of industries along the route are all aspects to be considered in planning route changes.

Krambles, G (Chicago Transit Authority) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 76-79; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB

24 272064 PUBLIC TRANSPORTATION OPERATING STANDARDS. Objectives and standards including threshold service warrants for rapid transit service and the supporting cost data are described here, which were developed for long-range area-wide planning purposes. The objectives were refined by the formulation of a corresponding set of guiding planning principles and a supporting set of specific development standards for each objective. This refinement allowed the objectives to be related to physical development plan proposals and thus used in the processes of plan design, test and evaluation. The purpose of each of the elements (objective, principle, standards and plan) are defined and transportation system development standards (comparative and absolute) are discussed. The four questions considered in the formulation of transit system development objectives and standards are: (1) where should new transit routes be provided? (2) What types of service should be provided for each route? (3) What quality of service should be provided for each route? (4) How much will the service cost? The standards in support of the basic transit system development objective which guided the planning for local transit are set forth. Details are given of the standards which were formulated to aid in the rapid transit plan design, test and evaluation. The derivation is described of rapid transit threshold service warrants which involved two cases. The case concerning the preemption of freeway lanes was analyzed on a rational basis and the case concerning the construction of exclusive facilities was analyzed on an economic basis. The construction, maintenance and operating costs are presented which were used in the development of the threshold service warrant curves for a bus rapid transit system. The rail rapid transit threshold service warrant curves were computed by using

the same basic equations used in computation of the bus rapid transit curves. The cost data used in the development of these curves are detailed.

Weiner, E (Department of Transportation) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 79-92, 5 Fig., 5 Ref.; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB

24 272071 PUBLIC TRANSPORTATION PROBLEMS IN URBAN AREAS. It is proposed that public transit be operated on a completely fare-free basis and that costs for providing such transportation be prepaid by the taxpayer. The inability of the transit industry to provide steady jobs paying adequate wages and other conditions of employment is the most serious problems confronted by transit workers. This situation is traced to the industry's worsening economic position. This is a result of the declining productivity of labor and equipment caused by the ever decreasing number of passengers that are carried for each mile or hour of service. Studies reveal that no-fare transit will produce greatly increased ridership. Increased ridership enables transit labor and equipment to become much more productive when measured in terms of number of passengers carried per vehicle-mile and cost per ride. Operating economies and efficiencies and other advantages inherent in such a system are reviewed. The ever-growing number of state and communities already providing public funds in aid of transit are cited as proof that tax support for such a plan is not impossible. The success of a no-fare transit system will work only if it is adequately preplanned, budgeted and managed efficiently and the cost of its operation are collected in regular cost per ride. Operating economies and efficiencies and The no-fare public transit must operate within a definite financial budget not exceeding the anticipated amount of tax funding available. System management should be expected to operate within budget and policy guidelines and to provide only the amounts and kinds of transportation that the local community desires and is willing to finance. A suitable system of incentives and penalties should be devised that should ensure effective management.

Elliot, JM (Amalgamated Transit Union) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 23-29, 2 Ref.; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB

24 300012 LOW COST PUBLIC TRANSPORT IMPROVEMENTS. Concern has been expressed about the massive capital investment programmes and deficits of public transport undertakings now being financed by Australian governments and the continued decline in passengers carried. This paper reviews the investment programmes of the undertakings and compares them with other cities abroad. It concludes that investment in Australian public transport systems has not been directed towards significant service improvements that could be expected to attract passengers. Nor have labour-saving devices been developed to the extent abroad. It is argued that better value for money could be

obtained from low cost public transport improvements. However, the limitations placed on management by the strength of the Australian union movement is recognised. /Author/TRRL/

24 300126 IN SEARCH OF STANDARDS OF SERVICE FOR URBAN PUBLIC TRANSPORT. This paper provides a review of the reasons for the development of standards of service and operation for urban public transport, the kinds of standards that can be struck, how they can be quantified and their impact upon a community. It places public transport services in the context of what a community might expect from them and then presents a reasonably comprehensive explanation and summary of those standards proposed for action, Canberra's bus service. Finally it points out areas where research effort would provide communities with a greater understanding of the roles their public transport services play. /TRRL/

24 300361 EVALUATION OF TRANSIT SERVICE IMPROVEMENTS: MEASURES OF SYSTEM EFFECTIVENESS. This final report encompasses what is perhaps the broadest dimension of transit marketing—analysis of service development. The report suggests that evaluative techniques, specifically twelve evaluation designs, are available to local transit management and city representatives to assess service improvements, based on (1) ridership response; (2) changes in awareness and knowledge of the system; and (3) evaluation of local bus operations. Thus the efficacy of planned and implemented service improvements at the local level can be ascertained. The evaluation design and evaluative studies presented in the report can be utilized by the State Department of Highways and Public Transportation for deriving more comprehensive performance indicators, as a means of assessing system effectiveness for local bus operations, and for comparative appraisals across systems. Unlike other system accounts or approaches for measuring local transit performance which emphasize measures of cost efficiency, this report presents procedures for appraising system effectiveness—to current patrons and the public-at-large.

Guseman, PK Womack, KN ; Texas Transportation Institute, (Res Rpt. 1052-5F) Final Rpt. UMTATX7810525F, Nov. 1978, 89 p., 5 Fig., 17 Tab., Photos., Refs.; Sponsored by State Department of Highways and Public Transportation, in cooperation with Urban Mass Transportation Administration.; Contract Study 2-10-76-1052; ORDER FROM: NTIS

24 300362 PERFORMANCE MEASURES FOR PUBLIC TRANSIT SERVICE. This report which evaluates existing and proposed transit systems identifies definitional, institutional, and technical difficulties associated with developing Transit Performance Measures (TPM's) for use in evaluating public transit service. A survey is made of contemporary evaluation process and their purposes. The procedures used by the Division of Mass Transportation of the California Department of Transportation in developing its list of TPM's and methods for developing performance standards are described. The necessity for linking TPM's to funding strategies is also discussed. The report recommends that further refinement and verification of the research methodology used in this research project is needed. It is pointed out that if public transit service evaluation can be developed effectively, it will greatly enhance the efficiency and effectiveness of public transit service.

Fuller, E ; California Department of Transportation, (DMT-033) Final Rpt. UMTA-CA-09-8001-79-1, Dec. 1978, 115 p., Figs., Tabs., Apps.; Sponsored by Department of Transportation, Urban Mass Transportation Administration; Contract CA-09-8001; ORDER FROM: NTIS; PB-294955/AS

24 300701 COORDINATION, COSTS, AND CONTRACTING FOR TRANSPORTATION SERVICES. Studies of contractual and cooperative agreements among U.S. social-service agencies that provide transportation services have shown that one of the most serious barriers to coordination among agencies is lack of knowledge about transportation costs. In this paper, categories of transportation costs and services developed by the Institute of Public Administration as cost-accounting guidelines for transportation projects are identified and defined. The issue of allocation of data collection responsibilities among the personnel of transportation projects is discussed. Cost accounting and reporting systems developed under Section 15 of the Urban Mass Transportation Act of 1964 (as amended) are related to the Institute of Public Administration guidelines to provide a basis for cost-sharing agreements among transportation agencies. /Author/

Revis, JS (Institute of Public Administration) *Transportation Research Record* No. 696, 1978, pp 46-55, 1 Fig., 4 Tab., 2 Ref.; This paper appeared in TRB Record No. 696, Rural Public Transportation.; ORDER FROM: TRB Publications Off

24 300703 FEDERAL REGIONAL COUNCILS AND THE UNIFORM COST-ACCOUNTING PROJECT. ABRIDGMENT. This paper describes the development of a common cost system that should increase coordination between agencies and providers of transportation. The Federal Regional Council System (the interagency coordinating mechanism) is described. The cost categories of the common cost system include administration, operations, and maintenance. Costs reflect total real costs and include such items as depreciation schedules for capital acquisitions, donated resources, and volunteer time. The four basic units of service selected are (a) total vehicle distance travelled, (b) vehicle distance travelled in revenue service, (c) vehicle hours, (d) one-way passenger

trips. If the system becomes more sophisticated, it may become necessary to go beyond these minimums. Performance measures will relate units of service to costs. The uniform cost-accounting system was tested on two rural transportation projects.

Kemp, JB (Mid-Continent Federal Regional Council) *Transportation Research Record* No. 696, 1978, pp 57-58, 1 Ref.; This paper appeared in TRB Record No. 696, Rural Public Transportation.; ORDER FROM: TRB Publications Off

24 300705 RECORD KEEPING AND EVALUATION. This paper identifies major sources of information, record-keeping issues, and evaluation methodologies. Much is being learned about developing a unified reporting system. Record-keeping needs are addressed in terms of data availability, problems in data collection, and the potential impact of a federal operating subsidy. A systems approach to system evaluation is outlined together with the trade-off or balance sheet evaluation methodology. Service standards are proposed as a means of institutionalizing system evaluation. /Author/

24 301704 MATHEMATICAL MODELS OF ROAD TRAVEL DISTANCES. Some management science models require estimates of distances between points in a road network based on the point coordinates. This study evaluates the accuracy of a range of reasonable forms for distance estimating functions using samples of urban and rural road distances. The intent is to derive better distance estimating functions for analyzing systems with distance related performance measures. Contrary to a standard assumption, the rectangular distance function is inferior to the simple Euclidean metric in the urban samples. More general functions provide still greater improvement over the rectangular metric. Statistical significance accompanies these conclusions. One of the more general functions appears particularly suited to rural distances.

24 302259 PUBLIC TRANSPORTATION PLANNING EFFECTIVENESS: CASE STUDIES. Federal Transportation Programs and their planning and reporting requirements are largely oriented to large urban areas. This research examined the effectiveness of federal transportation planning requirements and programs on small urban areas. The research analyzed the impacts of financing procedures and constraints on the transportation systems of small urban areas, examined the effectiveness of public transportation planning, and developed an allocation procedure for state transit assistance programs. A case study methodology was employed to permit greater depth and insight to the planning process than would be possible with comparative data for all urban areas. Three cities in the state of Iowa were selected: Cedar Rapids, Davenport, and Iowa City. The conclusions drawn from the analyses were that: 1) UMTA technical study grants have resulted in realistic short-range transit plans in all three case study cities; 2) UMTA Capital and Operating Assistance has led to the implementation of many of the improvements recommended in the short-range plans; 3) planning to achieve integration of transit services has not been fruitful in the three urban areas; and 4) municipal operation of transit appears to be the most viable and politically responsive method in small urban areas. (UMTA)

24 303021 MEASUREMENT OF THE PERFORMANCE OF BUS SERVICES. A study has been made of methods of assessing the performance of bus services from the passengers' point of view. In the light of the results of surveys of passengers' attitudes to the performance of bus services, reliability was chosen as the attribute most likely to reflect their views. Accordingly, three 'unreliability measures' (um) are examined in detail. These relate to-average waiting time (um awt)-excessively long waits (um ewt/p)-excessively long in-vehicle journey times (um ejt/p). The unreliability measures are designed for use on a route-by-route basis and care has been taken in their definition to ensure that they can be applied to services of both short and long scheduled headways and to journeys of different lengths. Data collected in surveys in Newcastle Upon Tyne and south shields are used to examine the day-by-day variations in the unreliability measures. On the basis of these data, it is concluded that a survey period of 4 weeks is likely to show up services whose passengers wait or ride for about 10 per cent longer than might be considered acceptable. These data were also used to investigate the validity of using 'lost mileage' data to give an indication of the performance of a bus service. Despite evidence of a broad dependence of passenger waiting times on lost mileage, it was found that lost mileage does not provide a good indication of the performance of bus services. With the increasing use of automatic vehicle-location systems and selective vehicle detection equipment for bus priorities, there is scope for introducing

automatic reliability monitoring along the lines proposed in this report. The potential for the use of such equipment for this purpose is discussed. (TRRL)

24 303286 TRANSIT PRODUCTIVITY: IMPROVEMENT THROUGH MANAGEMENT TRAINING AND DEVELOPMENT. The Center for Productive Public Management undertook this project in response to an increased concern for mass transit productivity. This final report analyzes transit productivity and discusses the transit management/productivity relationship in detail. It delineates specific transit management problems and discusses the value and validity of management training and development programs as solutions to these problems. More specifically, the report serves as a handbook for the implementation and evaluation of transit management/productivity training programs for both large and small properties. It is written for transit managers, policy makers, and academics as a resource tool and guidebook to an improved understanding and application of productivity principles in transit management. This final report is based on independent research and input from managers of transit properties across the country, as well as on input from transit academics, transit users, elected officials, and attendance at transit performance conferences and seminars. The report concludes that efficient and effective internal transit management, attained through training and development, is the key of improved transit productivity. This report provides appendices titled: Appendix A-Annotated Bibliography: Transit Management/Productivity; and Appendix B-Annotated Bibliography: General Management/Productivity. (UMTA)

Goldberg, J ; City University of New York, Urban Mass Transportation Administration, (NY-11-0019) Final Rpt. UMTA-NY-11-0019-79-1, June 1979, 229 p.; ORDER FROM: NTIS; PB-299369

24 303292 EVALUATING INDIVIDUAL TRANSIT ROUTE PERFORMANCE. This investigation of the use of internal route evaluation techniques by transit properties, includes a discussion of the need for such evaluation schemes and their inherent weaknesses or problems, the development of route evaluation procedures, and the route evaluation techniques presently in use by three public transit properties in California and two transit properties outside of California. The developmental relationship between goals, objectives and performance indicators is emphasized. A major advantage in progressively developed goals, objectives and indicators is that conflict between the various elements is prevented. Clearly stated policy not only eases the problems of management in the public sector but provides for varying degrees of political control and input necessary in such a multi-governmental area such as transit. The utilization of well-defined evaluation processes similarly eases the task of public management administratively as well as politically. Route evaluation schemes provide a means for simplification of data analysis through predetermined performance indicators.

24 305814 APPLICATION OF TRANSIT PERFORMANCE INDICATORS. Decreasing transit ridership and increasing operating and capital costs have resulted in a situation whereby the Urban Mass Transportation Administration (UMTA) is requiring transit operators to develop comprehensive data reporting schemes. Transit operators are realizing the need for measurement of transit system productivity, efficiency, and effectiveness, in order to make decisions on where to add, modify, or delete service. The research provides an internal route-specific, performance monitoring tool, and aimed at bus transit performance. The research was devised to yield a specific product, which is a comprehensive decision framework for applying transit performance indicators. Two performance indicators were selected for use in the research, namely, passengers per bus mile and passengers per bus hour. These indicators are used primarily because the data are relatively easy to obtain. The application methodology is general, however, in that it can also be used for other route-specific indicators. The decision framework is based upon the statistical decision-making techniques which are used in other fields such as quality control. Two case studies were used in this framework to apply indicators to the measurement of performance of the bus transit systems of the Regional Transportation District of Denver, Colorado, and the Utah Transit Authority of the Salt Lake City, Utah region. Guidelines are given to assist transit operator programs.

24 310463 SCALING PERCEPTIONS OF RELIABILITY OF URBAN TRAVEL MODES USING INDSICAL AND FACTOR ANALYSIS METHODS. In several attitudinal investigations, travel modes' reliability was found to be the most important characteristic of the transportation system. This research is concerned with the individual subjective evaluation of different reliability attributes. Two scaling techniques-indsical and factor analysis-were used to investigate travel modes' reliability; these techniques aided in the identification of perceptual performance measures of reliability. The scaling techniques were also evaluated and compared for their usefulness and the reliability performance measures were validated using a preference model. (Author/TRRL)

24 311213 A VITAL PHASE OF TRANSIT EVOLUTION: MANAGEMENT INFORMATION SYSTEMS. Passage of the Urban Mass Transportation Act of 1964 signaled a new era for the transit industry by facilitating the public

acquisition of private operations as well as capital purchases of equipment. In 1974, operating assistance was provided under the National Mass Transportation Act. The increase in federal funding, however, has resulted in significant increases in federal regulations and reporting requirements. This has caused an intensive effort to provide sound system management and internal controls at the local level. To give transit managers the information essential to fully utilize available funds, management information systems have been developed. Successful management information systems are based on, first, the identification of the particular information needs of a transit system and, second, the development of performance criteria from an in-depth statistical analysis of the management provided. Although the management information systems are continually being updated, the performance criteria are still in the formative stages. Yet it is these performance criteria, based on sound management information, that will help transit to become more cost-effective and to provide better service. (Author)

24 311318 MIDTOWN MANHATTAN CIRCULATION AND SURFACE TRANSIT STUDY. The goal of the Midtown Circulation and Surface Transit Study was "to develop and demonstrate short-range, low-cost surface transit and traffic operational improvements and to formulate these improvement techniques into an overall circulation plan and policies for midtown." The objectives of the project generally included improvements in air quality, surface transit system performance, and the pedestrian environment, and increased efficiency of taxi and truck operations. Towards accomplishing these objectives, the following reports have been prepared: a series of technical memoranda addressing various detailed aspects of midtown circulation and surface transit operations, Midtown Transportation Factbook, Proposed Midtown Circulation and Surface Transit Improvement Program, Midtown Circulation Demonstration and Evaluation Program, and Midtown Circulation Plan. Improvements recommended within these reports encompass transit operations, traffic operations, on-street parking and loading, pedestrian safety, and enforcement within both general policy strategies and specific physical and operational measures. The impacts anticipated as a result of implementing each improvement measure were assessed. (Author)

24 313627 BUS TRANSIT MONITORING STUDY: DATA REQUIREMENTS AND COLLECTION TECHNIQUES [Interim rept. no. 1]. The purpose of the study is to develop a comprehensive statistically-based data collection manual that will enable transit operators to collect passenger-related data in a cost-effective manner which maximizes the usefulness of the overall data base. This first interim report presents the results of the first two tasks of the study, which were to identify current data collection techniques and data requirements. These two closely related tasks were conducted in parallel through three major activities: (1) a literature review; (2) a review of material collected by the Massachusetts Bay Transportation Authority and the Tidewater Transportation Commission in Norfolk, Virginia in a study for UMTA, focusing on service evaluation techniques; and (3) discussions with forty-one transit properties in the United States and Canada.

24 316496 ARE STANDARDS FOR RURAL PUBLIC TRANSPORT PERFORMANCE MEASURES APPLICABLE? [Is een normeringssysteem voor het voorzieningsniveau van het streekvervoer toepasbaar?]. This report on an extensive literature search discusses standards for efficiency of public transport based on other than financial criteria. Several definitions of the concept of transit performance measures are considered. An overview is given of the transit service standards which were found in theoretical literature. The applications of such standards in several countries, especially in the Netherlands, are summed up and the problems of these applications are analysed. The conclusion is that transport services can indeed be measured, but it is not easy to develop a clear and comprehensible standard. (TRRL) [Dutch]

24 316991 ACCESSIBILITY MEASURES USED TO APPRAISE TRANSPORT SYSTEM PERFORMANCE. This article reviews a wide range of approaches to accessibility found in various environmental and urban planning disciplines. It attempts to find a common ground that will provide a basis for the formulation of a general theory or definition of the accessibility concept. The discussion reviews the concept of accessibility as defined in traffic engineering, transportation planning, environmental planning, urban economics, and comprehensive urban planning.

24 318195 BERKSHIRE REGIONAL TRANSIT AUTHORITY: TRANSPORTATION SYSTEM MANAGEMENT EVALUATION REPORT. Many transit operators have a need for an evaluation system which can measure existing service performance. To assist these operators, UMTA has been funding, through its Section 8 Technical Studies Program, local studies in service evaluations. The purpose of these studies is to evaluate existing transit service and to develop recommendations and plans for service improvements. This document summarizes the local evaluation study of the transit service provided by the Berkshire Regional Transit Authority (BRTA) in Pittsfield, Massachusetts. The purpose of the study was to review and evaluate the current transit services provided by the BRTA and to develop recommendations for service modifications which utilize low cost techniques to improve operating effectiveness. In this study, emphasis is on the three new routes in Pittsfield, the overall fare structure, and the priority locations for bus stop shelters. To collect the necessary information for this evaluation, a loading survey was conducted. This survey provided information on maximum loading, hourly ridership, passenger miles of travel and average trip length by route. The report serves as an excellent example of service evaluation within a small transit system.

24 319333 DEVELOPMENT AND APPLICATION OF PERFORMANCE MEASURES FOR A MEDIUM-SIZED TRANSIT SYSTEM. This paper summarizes the results of a study of service performance measurement and operating guidelines for the Delaware Authority for Regional Transit (DART) system. This fleet of 100 buses serves the Wilmington metropolitan area and is typical in many respects of many medium-sized bus systems across the country. The project consisted of several elements. First, a brief overview was presented of the historical perspectives on transit performance standards and the current state of the art, specifically noting activities at the state and regional level over the past few years. Next, a preliminary set of transit performance measures and operating guidelines was formulated for local review and comment. To assist in the evaluation of the adequacy of the preliminary performance measures and service standards, the draft standards were used to assess DART's existing operations. This assessment was hampered by a number of data inconsistencies, due primarily to the fact that much of the data required had been collected over a period of several years by using different data collection and analysis procedures. Efforts were made to minimize these inconsistencies and, where this could not be done, recommendations were made for improved data collection procedures to eliminate this problem in future years. As part of the service assessment, order-of-magnitude cost estimates were prepared to define the general range of capital and operating investment that would be required by DART to modify its current services so as to be in greater compliance with the proposed service standards

and operating guidelines. The last step of the project was the preparation of guidelines to assist local agencies in the implementation of the service standards and operating guidelines and the continuous monitoring of DART's performance relative to these standards. This element of the project addressed the manner in which the current infrastructure for transit planning could be improved and described the appropriate level of detail and methodology for the continual evaluation of DART's performance. A discussion was presented of the basic procedures by which to amend or modify the service standards and operating guidelines. (Author)

Allen, WG, Jr Grimm, LG *Transportation Research Record* No. 746, 1980, pp 8-13, 1 Tab., 7 Ref.; This paper appeared in TRB Record No. 746, Bus Transit Management and Performance.; ORDER FROM: TRB Publications Off

24 319338 USE OF FEDERAL SECTION 15 DATA IN TRANSIT PERFORMANCE EVALUATION: MICHIGAN PROGRAM (ABRIDGMENT). In the first application of its kind, the reporting system of Section 15 of the Urban Mass Transportation Act, as amended, is being used to support the development of a straightforward, routine, and comprehensive transit performance evaluation program in the state of Michigan. The methodology developed for Michigan satisfies the complementary needs to account for public funds invested in transit operation and development and to promote the efficient and effective use of these funds in the delivery of transit services. At the same time, the methodology avoids placing an additional burden of record keeping and reporting on individual transit operators. In the rapidly developing field of transit performance evaluation, these features are essential for state and local funding agencies to consider as part of any plans to develop a continuing evaluation program. In this paper, the Michigan program is described, and the features of the program that have general applicability for other areas concerned with transit performance measurement and evaluation are highlighted. 24 322264 DESIGNING A TRANSIT PERFORMANCE MEASUREMENT SYSTEM. An attempt is made to lay the basis for the development of a framework to guide the design and implementation of performance measurement systems. The three major issues to be considered in designing a transit performance measurement scheme are the intended uses of the measurement system, the relationship of the measurement system to transit system goals, objectives and constraints, and the level of resources and expertise available for the data collection and information processing. A number of potential uses of the performance measurement system are cited. Existing performance measurement systems exhibit a considerable diversity with respect to the number and types of measures being monitored and the nature and extent of utilization of these measures for various purposes. A practical con-

sideration affecting the comprehensiveness and sophistication of a transit performance measurement system is the level of resources and staff expertise available for data collection and data processing. A simple, incremental approach is the soundest course of implementation. The approach would allow transit managers and operating personnel to learn through experience the strengths, limitations, and best applications of the transit performance measurement system.

24 322265 PERFORMANCE MEASUREMENT: EXTERNAL AND INTERNAL. In an effort to make the countywide transit system produce the most useful service at the lowest cost to the consumer and taxpayer, the San Mateo County Transit (SamTrans system) district is trying out a new system of evaluating bus services. The program consists of the collection and analysis of key ridership and economic data which measure the performance of each route in the SamTrans system. Five measurable factors (average number of passengers carried daily on each route, passengers per vehicle mile, passengers per scheduled trip, net cost per passenger and percent of operating costs recovered from fares) were identified. The combination of economic and ridership data has enabled SamTrans to reflag the least efficient and least effective service, establish priorities for remedial action, measure and record the impact of route and schedule adjustments, identify and serve growth opportunities essentially with miles and hours salvaged from less productive routes, and achieve productivity by addressing one route or a related group of routes at a time.

24 326378 DRAWBACKS INHERENT IN CURRENTLY USED MEASURES OF MASS TRANSIT PERFORMANCE. The paper examines weakness and biases inherent in certain measures of urban mass transit performance. The concepts of effectiveness and efficiency in transit are discussed, and the shortcomings of some currently used effectiveness ratios are examined. It is noted that many of the effectiveness measures should more properly be classified as efficiency measures. Weaknesses of certain efficiency measures are also examined. The performance measures examined are cost per passenger, passengers per bus hour, vehicle miles per operator, and cost per vehicle hour.

24 326473 BART'S (BAY AREA RAPID TRANSIT'S) FIRST FIVE YEARS: TRANSPORTATION AND TRAVEL IMPACTS. A final report is presented assessing the San Francisco Bay Area Rapid Transit System (BART) on transportation and travel in California. The 71-mile BART began passenger service in 1972. The final section, the transbay link between San Francisco and Oakland, opened in 1974. Ridership has grown to about 140,000 passenger trips per day, 60,000 of them transbay. BART's ridership and impacts have been less than predicted, which reflects the optimism of the predictions and the shortcomings of BART's current service. As intended, BART's most significant improvements in travel times have been for long-distance trips by transit, particularly transbay, to downtown San Francisco. BART carries 21 percent of transbay commuter trips. Area-wide, BART's share of trips for all purposes is between 2 and 3 percent. Total bus ridership has changed

little because the loss of riders from services paralleling BART has been offset by the use of buses to get to and from BART. Impacts on San Francisco-Oakland Bay bridge traffic have been less than expected, because new trips by car have appeared to replace those removed by BART. Implications for planning rail transit elsewhere are drawn.

25 047880 SOME DATA ON THE EFFECTS OF FREE PUBLIC TRANSPORT. Results indicate that if the existing tube and bus service were free and the existing British Rail service was operated at 25 percent of the present level of fares, the expected proportion of work journeys to central London by car would be about a third of its present level, if commuters reacted in the way indicated by these analyses. Expected British Rail use would be about three-quarters of third more than the present level. The estimates do not take account of feedback effects, which could be substantial.

25 054343 HOW MANY PEOPLE PAY THEIR TRAM FARES? Many experimental situations lead to inverse sampling schemes with some random or non-random stopping rule, since at each experiment only a bounded number of observations can be made. This note discusses the problem of estimating the unknown probability in the underlying geometric distribution of such schemes. The author encountered this problem in a very special context, that of estimating the proportion of non-fare-paying passengers in a local transportation system. The methods derived were used on material collected during 1 month by the non-uniformed ticket controllers of the Gothenburg, Sweden, transportation system. Some 3,079 cars and 40,786 passengers were checked; 982 free passengers and 132 stowaways were found, yielding the estimates.

25 054450 EVALUATION OF A NO-FARE SYSTEM OF PUBLIC TRANSIT. The paper evaluates the operation of public transit services in Rhode Island on a 'no-fare' basis. The concept of a no-fare operation was selected as meriting further study since it combines aspects of several

problems confronting both the Authority and the state as a whole: declining or stable ridership, costs of operation increasing more rapidly than revenues, congestion of principal arterials in and around central business districts, use of large amounts of land for off-street, non-structural parking within central business districts, and a range of environmental problems associated with increasing use of private automobile transportation.

25 054513 SUBSIDIZATION OF TRANSIT OPERATING COSTS: A CASE STUDY OF METRO. The report discusses the reasons why public assistance to urban transit properties is often very necessary. A financial analysis is made of the Washington Metropolitan Area Transit Authority's (WMATA or METRO) rail system presently under construction. Ways to relieve deficits are identified. A formula is devised to see how the financing of such deficits might be allocated among the 3 major political jurisdictions in the area: the District of Columbia, Virginia and Maryland. The proposed formula is based on service, ridership and population characteristics of each of these areas. The analysis is theoretical and designed to offer local transportation planners thought and tools in case operating deficits arise. Political problems and jurisdictional conflicts are alluded to but not discussed in detail.

25 056835 SOME EVIDENCE OF TRANSIT DEMAND ELASTICITIES. In general, all of the limited evidence available suggests that transit demand is inelastic with respect to money price. Typically, ridership is significantly more sensitive to changes in the level of service (particularly door-to-door journey time) than to changes in fare, although service elasticities also are usually numerically less than unity. In broad terms, short-run direct fare elasticities are characteristically observed to lie within the range of 0.1 to 0.7. A more precise value in a particular instance will depend on a variety of factors in ways which largely support a priori notions. Thus in very large cities, central city areas, at peak hours, and in other circumstances where the prices of alternative modes are high, transit fare elasticities are usually numerically at the lower end of the range.

25 080213 DESIGN AND ANALYSIS OF AN AUTOMATIC CREDIT CARD FARE COLLECTION SYSTEM. The concept of an automatic fare collection system that accepts bank credit cards for payment of fares is examined. The fare collection system is composed of two major

sub-systems. The on-vehicle system includes all fare-related activities conducted inside the vehicle. The off-vehicle system is all fare-related activities that are separated from user transactions in the vehicle, by time and space. There are four areas of interest in the design of the off-vehicle system. The fare structure of the transit system is one determining factor in the system design. The needs of management for data, in addition to that required for computation of user fares, is also an important consideration. The data processing system uses data inputs from the on-vehicle system to generate management reports. Lastly, billing involves the generation of billing information on magnetic computer tapes which are then delivered to the respective banks for customer billing. Various possible configurations of on-vehicle hardware are studied.

25 080759 PATRONAGE EFFECTS OF FREE-FARE TRANSIT. Data from the free transit demonstration in the Wilkes-Barre, Pennsylvania area following the recovery from hurricane Agnes in 1972 suggest that the offering of free transit will immediately attract significant numbers of additional patrons, with the percentage patronage increase dependent on the current average fare of the particular transit system. Based on the analysis reported in this article, patronage increases due to free fare, with service and other factors remaining constant, range from 13 percent for a system with 10 cents average fare per boarding passenger to 86 percent for a system with 50 cents average fare. A typical transit system, with an average fare in the 30-to 35-cent range, could expect ridership to immediately increase 50 percent with the institution of free fare.

25 081502 LOW FARE TRANSIT PLANS GAIN NATIONWIDE TRIALS. Low fare transit is being experimented with as a means of creating a higher demand for public transportation. It can potentially get more people out of their cars, reducing traffic and pollution, help senior citizens and handicapped people, and encourage use of downtown areas. This article reviews various ways of implementing low fare service; total low fare, specific time low fare, specific location low fare and specific group low fare. Systems in urban areas, such as Los Angeles, San Francisco, New York, Baltimore, Boston and Atlanta, utilizing low fares are described and their performance discussed.

Metropolitan Vol. 70 No. 3, June 1974, pp 24-27, 3 Phot., 2 Ref.

25 082824 TRANSIT FARE AND RIDERSHIP: A REVIEW. One of the most frequently mentioned approaches to increase transit ridership is lowered or free transit fares. However, the proportional increase in ridership resulting from a given reduction in fare is estimated to be small. Several statistical studies support the finding that the fare elasticity of transit demand is low, while

simultaneously demonstrating that the sensitivity of transit demand to service improvements is relatively high. There exist few studies which bridge these two findings with cost data to reach a definite conclusion, but the evidence currently available strongly supports the policy of spending transit funds to improve transit service rather than to reduce transit fares. 26 references. /Author/

Difiglio, C ; Highway Users Federation for Safety and Mobility Dec. 1974, 26 pp

25 082825 CASE FOR PREPAID TRANSIT. The foundation of no-fare transit is the financing of public transportation by a specific transportation tax placed on all who draw an income from, or live within the city. A better and even more accurate description than tax is prepayment for transportation services and facilities provided by the city. It is not free transportation. Yearly revenue that is adequate and assured allows for long-term planning and the financing of improvements which will make public transportation more attractive and convenient for passengers and businesses. In response to critics' objections advocates of prepaid transit attest that attracting still more riders by improving service is the primary goal, and not a consequence to be dreaded or avoided. Coupling the top administration more closely to the electoral process might be an appropriate safeguard to prevent the decline of efficiency in management when revenue from fares is no longer juxtaposed with operating costs.

Greenspan, HP *Transit Journal* Vol. 1 No. 1, Feb. 1975, pp 57-63

25 083717 FREE RIDE. The value has been proved of an 18-month experiment providing free bus rides within the large downtown area which covers a 105-block section and includes the city's governmental, financial and retail districts. The system is operated by the municipality of Metropolitan Seattle, a federation of local governments known as Metro responsible for regional environmental problems and mass transit. The City of Seattle paid \$64,000 (the first year) and tax funds to make the free rides possible. Within a few weeks of the project's inauguration the bus riders more than doubled, business increased notably, traffic congestion was eased, and gasoline consumption was reduced. A survey (a year after the service began) revealed that more than half of all downtown employees were using the buses more often. A third of all boardings were for trips within the free-ride zone, and amounted to 12,000 daily trips. More than 1000 workers reported they were now taking a bus rather than their cars to get to the job. Some 2,500 daily auto trips are believed to have been eliminated by the Metro system.

Lamp Vol. 57 No. 1, Mar. 1975, pp 28-29

25 092426 THE EFFECT OF FARE REDUCTIONS ON PUBLIC TRANSIT RIDERSHIP. The study was undertaken to determine the effects of various reduced fare programs on transit ridership. A listing of all reduced fare programs in North America is provided. The concept of fare elasticity was defined and determined for the various programs. Empirical evidence was obtained and analyzed from senior citizen programs. Reduced base fare programs, free fare programs and promotional programs. These programs have

been successful in achieving their particular social and environmental objectives.

25 092723 TRANSIT IMPROVEMENTS IN ATLANTA-THE EFFECTS OF FARE AND SERVICE CHANGES. Free transit and reduced transit fares have been proposed as a solution to many of the problems of automobile use. Using a sales tax to finance the deficit, Atlanta reduced fares to fifteen cents on its bus system while increasing route coverage and schedule frequency. The study examines the impact of these changes on transit ridership in the Atlanta area. Several longitudinal models of system-wide passenger volumes are developed. Estimates are made of the additional patronage attracted to the system by the fare and service changes.

25 097405 TRAVELER PREFERENCE FOR FARE ALTERNATIVES AS A TRANSPORTATION PLANNING INPUT. This paper deals with the effect of fare policy and transit service plans on mode-choice behavior. These issues were studied in the context of coordinating a new rail rapid transit service in San Francisco with the existing surface bus system in order to maximize the overall service level. To aid the process of simulating the effects of various bus and rail service plans and joint fare structures under study, a disaggregate model of sub-modal-choice behavior was developed. The model was calibrated with data collected in a field survey of bus patrons. These data were used to estimate the relative influence of fare level and time savings on sub-modal-choice behavior and to forecast the probable extent of rail rapid transit usage by current bus riders. Although the specific questions posed in this study were geographically unique, the underlying technical and policy issues could be applied to other similar situations involving the introduction of a new transportation service or facility.

25 098657 SOME OBSERVATIONS ON URBAN TRANSPORT PRICING AND ITS RELATIONSHIP TO COMPREHENSIVE TRANSPORT PLANNING. Principles which have suggested current pricing policies are examined, and the economic analysis of urban transport policy as it has developed to date from the perspective of comprehensive regional planning is reviewed. The proposition is discussed that conditions are more favorable than in the early 1960's for the use of pricing techniques intended to control or induce transport system usage. The argument for, and criticism of marginal cost

pricing are presented. Urban pricing and planning objectives are examined as related to transport system development and user charges, toll bridge policy, transit fares and subsidies, and transportation control. The observation is made that prices are for rationing and that prices for financing are open to question. However, the rationing purpose is considered uncertain. While pricing may perform an important role, the trend in the institutional environment is toward de-emphasizing dependence on prices, at least those toward individual transport programs or operations.

25 127466 REPORT TO CONGRESS CONCERNING THE DEMONSTRATION OF FARE-FREE MASS TRANSPORTATION. This report provides information consistent with that required in Sections 204 and 205 of Title II of the National Mass Transportation Assistance Act of 1974. It surveys briefly the current state of knowledge with regard to the benefits and costs of fare-free transit, and describes the essential elements of a demonstration program. Advocates of fare-free transit claim that it would improve the efficiency of the transportation system as a whole, would help transit systems (in particular) operate more efficiently, and would assist certain groups within the population. Others are skeptical about the ability of across-the-board fare subsidies alone to encourage people to forsake private automobiles in favor of public transit. They are also doubtful of the magnitude of potential transit system efficiency gains and the relative effectiveness of low fares in assisting certain population groups. Thus, the overriding objectives of publicly-funded demonstrations of transit fare abolition is to provide definitive answers about the costs and the efficacy of fare cuts in achieving their goals, such as increased ridership. This objective has two important implications. The first concerns the experimental content of a demonstration program. In particular, the programs should not be concerned solely with the feasibility of financing transit through means other than the farebox; they must address a much wider range of concerns, including such questions as: what is the patronage response to fare elimination, how does fare abolition impact on the transportation system as a whole (speed, congestion, emissions, fuel consumption, etc.), what groups of the population benefit from fare-free service and to what degree, and what are the impacts on local employment levels, on retail trade, and on local firms. The second implication is that experiments should be designed so as to test the concept under those circumstances in which it is thought to stand its greatest chance of success.

Urban Mass Transportation Administration July 1975, 30 pp, Tabs., Refs., 2 App.

25 128255 DISTRIBUTIONAL EQUITY AND OPTIMAL PRICING OF URBAN TRANSPORT. A theoretical model is developed for the pricing of urban transport that takes into account the three related problems of rationing, investment and income distribution. Feldstein's technique is used and it is shown that when the distributional aspect of pricing is considered

pricing deviates from marginal cost pricing. It is shown that price also deviates from marginal cost when various "second best" constraints are introduced. Four cases of urban transport, which has two alternative modes, automobile and bus transit, are considered. In the first case marginal cost pricing yields Paretian efficiency, but concern for distributional equity requires price to deviate from marginal cost. The second case introduces a budget constraint. The third case considers a situation where automobile users pay only average cost; in this case a bus subsidy is justified on grounds of efficiency as well as equity. The last case considers the capacity constraint of the highway system.

Abe, MA (Marquette University) *Journal of Transport Economics and Policy* Vol. 9 No. 2, May 1975, pp 178-185, 10 Ref.

25 128958 TRANSPORT PRICING POLICIES AND EFFICIENT URBAN GROWTH. Urban growth is assumed to depend on the balance between advantages of urban employment and the costs of public and private transport. With constant money prices or average cost pricing of buses (free competition), growth is towards a small congested city, with a period of urban decay when congestion and all travel costs are increasing although the city is shrinking. Marginal social cost pricing of both modes removes this dynamic inefficiency and leads to much larger cities with faster transport services. Short-run effects and profitability are found to be poor indicators of the long-run implications of policies. /Author/

Glaister, S (London School of Economics and Political Science) *Journal of Public Economics* Vol. 5 No. 1,2, Jan. 1976, pp 103-117, 2 Fig., 1 Tab., 24 Ref.

25 129518 RED ARROWS-BOARDING TIMES WITH ALTERNATIVE FARE COLLECTION SYSTEMS. The planned introduction of new buses on red arrow routes provides an opportunity to adopt a more standard method of fare collection. Various alternatives are being evaluated for bus management, and as part of this exercise the boarding times are estimated here for each alternative. The sensitivity of boarding times to the "easiness" of the fare, and to change giving is shown. The range in marginal boarding time is from 1.5 to 4.2 seconds per passenger- compared with 2.4 per present red arrows. The corresponding effect on round trip time in the evening peak is from A saving of about 1 1/4 minutes to an increase of nearly 2 1/2 minutes in a total round trip time of 35 to 40 minutes. The results are summarised in the table at the end of the memorandum. (A) /TRRL/

25 129598 FARE DEAL. YOUR CHOICE. The aim of this consultation paper is to give information on London transport's rising costs and to ask the general public for comments on the future running of the system. The three alternatives which can secure extra money to maintain and improve existing bus and underground services are listed: (1) fares to go up to meet all increases in costs, (2) rates and fares to go up to meet increases in costs, and (3) fares to be kept steady

and rates alone to go up. A further choice between different ways of structuring fares has also to be made; this applies particularly to buses as there is very little opportunity for further simplification of underground fares. The three alternative fare structures are: flat fare, simplified fares, and graduated fares. /TRRL/

25 131702 EXPLODING THE MYTHS OF PREPAID TRANSIT. The legislative framework for prepaid transit is presented, some inaccurate conceptions regarding such transit are clarified, and the potential applications of prepaid transit to solve local transportation problems are discussed. The National Mass Transportation Assistance Act of 1974 provides federal operating assistance for public transportation and sponsors prepaid transit demonstrations. An excerpt from the Act is presented. Demonstrations have shown that prepaid transit is a promising pricing alternative in the urban transportation environment. It may be used as a transportation habit breaker, and could even be part of a long-term plan to minimize operating deficits through reimposition of fares after free service. In conventional rapid transit systems, free transit might find an application as a cost-cutter. During some periods of the week, it sometimes costs more to staff the collection booth than the revenue generated; prepaid transit is better than the 2 alternatives, namely closing the station or provision of normal service. Prepaid transit can also find application as a method of income distribution. The question of long-term operation of a free public transit service, however, should be tried on a demonstration basis. In such a demonstration, the full potential of such transit can only be realized if it is coordinated with extensive service improvements, capital improvement and marketing.

Scheiner, JI (Simpson and Curtin) *Transit Journal* Vol. 2 No. 1, Feb. 1976, pp 57-64, 2 Tab., 10 Ref.

25 132641 THE IMPACT OF FARES-FREE PUBLIC TRANSPORT UPON URBAN LAND USE AND ACTIVITY PATTERNS. This paper investigates the possible changes in the structure of a city arising from the introduction of free public transport. In general, it can be argued that land rents fall as one moves away from the city centre, at a rate corresponding to the extra cost of transport to the centre, while density of development also decreases because more space is available at larger distances from the centre. If travel costs decrease because fares are eliminated, the rent gradient will tend to flatten, and this will eventually lead to a general decrease in density of development, and the further spread of the city. The authors discuss various extensions to this basic principle, taking into account, for example, that travel costs involve time as well as money, so that choice of where to live involves a consideration of how much time, from an available time budget, can be spent on travel. The model uses an expression for generalised cost which is proportional to distance travelled; setting of fares to zero halves this travel cost for public transport passengers. The model, which is of the "gravity" type, has been calibrated for the west midlands conurbation, where a fares-free policy is being consid-

ered, and construction and validation of the model is described briefly. Introduction of zero fares into the model produced an appreciable shift of population from the core of the conurbation to the periphery, with inner Birmingham losing most residents, while central Wolverhampton and Walsall suffered smaller losses, and the outer suburbs making the greatest gains, with a smaller amount of resettlement in the area between the different city centres. On the assumption that zero fares reduce public transport generalised travel costs by 50%, about 10% of those workers who use public transport will be involved in the ensuing relocation (i.e. About 5% of the total population); for a smaller reduction in generalised travel cost the amount of relocation is proportionately smaller.

25 134023 FARE COLLECTION SYSTEMS: A REVIEW AND PROGNOSIS. Up to the mid 1960's subway fare collection was restricted to the single coin (or token) operated turnstile. About 1965 several major companies with backgrounds in electronics and computer technologies entered the market to develop new types of equipment. In 1909 the Johnson Fare Box Company installed the first patented recording fare boxes. In 1922 the same company developed the automatic fare box which provided visible and audible registration and inspection. The floor-mounted system came with the inception of the exact fare system. The operation of the vacuum revenue processing system is described, as well as the Keene registering fare box. Details are outlined of the Duncan Faretronic Registering Bus Farebox, Cubic Corporation's automatic system, the Abbott Coin Counter, Diamond Manufacturing Inc's fare boxes, and Perey Turnstiles. The collection of statistical ridership data on magnetic tape cassettes while issuing tickets and cancelling coupons is also described. The use of tokens is reviewed.

Metropolitan Vol. 71 No. 6, Nov. 1975, pp 14-28

25 134060 WILL MTR PAY FOR ITSELF? The article discusses the new Hong Kong rapid transit network that is now under construction. The development of the plans for the system are outlined and the network is explained briefly. Comparisons with other rapid transit systems are made with regard to viability. It is suggested that the line will be profitable because of the very high residential densities and ribbon development. The simultaneous development of housing and other property along the route is aimed at further enhancing profitability. The financing of the project and the contracting arrangements are given particular attention. There is a final note concerning the increasing role of the minibus in providing for Hong Kong's travel needs. /TRRL/

25 136974 THE CONSEQUENCES OF TRANSIT FARE AND SERVICE POLICIES: A CLASSIFIED BIBLIOGRAPHY. The bibliography is concerned with the consequences—

specifically the ridership and cost implications—of various policies regarding service and fare levels for urban public transit. Cited publications are classified under separate headings for ease in reference. These are: the demand for transit service; fare and service elasticities of demand; transit operating costs; the economics of transit pricing; public subsidies for transit operations; low-fare and no-fare transit; transit fare structures; transit fare and the distribution of income; transit and the transportation disadvantaged; transit planning, operation and evaluation; marketing transit; and general reference material.

Kemp, MA Rea, RL ; Urban Institute, Urban Mass Transportation Administration, (UMTA-DC-06-0120) Working Paper-505012, UMTA-DC-06-0120-76-3, Apr. 1976, 40 pp; Contract DC-06-0120; ACKNOWLEDGMENT: NTIS, Highway Safety Research Institute (HSRI-36016); ORDER FROM: NTIS; PB-253101/OST, DOTL NTIS

25 137789 FREE PUBLIC TRANSPORT-CAN IT WORK? Arguments for and against free or reduced rate transport policy are put forward. The aim described is to reduce the use of private cars and thus the need for large road investment programmes. An account is given of recent legislation in connection with public transport. The economic factors affecting transport in London are reviewed and figures given include changes in population and car-ownership. The advantages of cheap public transport are discussed including its social desirability and resulting reduction in congestion. Problems include the overall costs, through traffic and integration with other fare-paying services. When other factors are considered, cost is found to be low on the transport-user's list of priorities. It is concluded that a dogmatic approach to cheap fares will not provide an adequate solution to the conurbation transport problem. /TRRL/

25 142363 FAIRTRAN: OPERATION OF A CREDIT-CARD TRANSIT FARE SYSTEM. An Urban Mass Transportation Administration demonstration project has been implemented in the Lower Naugatuck Valley of Connecticut. The purpose of the demonstration was to provide a unified public transport service aimed primarily at the needs of health and social services and their clients. An entirely new fare system was devised to overcome problems in the pricing of multiple, coordinated service modes, to provide for accountability to third-party fare support sources, and to put into practice new ideas on fare equity and pricing. The fare system, FAIRTRAN, involves use of punch-coded credit cards specially issued for the project. Ride data are recorded on magnetic tape cassettes on board the vehicles and are processed remotely at a central computer; rides are billed monthly. An option, Fareshare, allows selective financial support of individual riders in contrast to shotgun subsidies now in practice. The demonstration has shown the system to be workable. Operational changes in hardware and software will be made in a second 3-year demonstration. As yet, fare system costs appear to be several times higher than conventional coin system costs, but benefits of data

collection, elimination of coin handling (and out-of-pocket bias), pricing flexibility, and Fare-share have to be considered on balance. /Author/ Nelson, G (RRC International, Incorporated) *Transportation Research Record* No. 590, 1976, pp 26-30, 3 Fig.; ORDER FROM: TRB Publications Off

25 142958 SYNTHESIZING TAXICAB IMPROVEMENTS. Dade County, Florida has taken major steps to address all components of its public transportation system. This includes a recent study of the administrative and operational aspects of the area's taxicab system--the first project of this type in the country. As part of the study, a submodal split model was developed to quantify the relationship of taxicab ridership to that of all public transportation modes. The model was employed to test operational improvements such as taxicab pooling, advantaged flow taxicab service, central dispatch of all taxicab operators (with and without computer assistance), and various fare reductions. The results indicate possible expansions in 1985 taxicab patronage of between 5% and 10% over that expected without any improvements in the Dade County taxicab system. Significantly, if nothing is done to improve taxicab operations, by 1985, the soon-to-be-developed rapid transit system will limit taxicab service to no growth in its percentage share of the trip market and, in fact, divert a number of longer trips from this latter mode.

Corradino, JC Schimpeler, CC Sexton, BJ (Schimpeler-Corradino Associates) *ASCE Journal of Transportation Engineering* Vol. 102 No. TE4, Nov. 1976, pp 793-804, 2 Fig., 6 Tab., 2 Ref., 1 App.

25 145426 SEASON TICKETS ON REGIONAL PUBLIC TRANSPORT [Laenskort i kollektivtrafiken]. In order that all members of society may have the same access to transport facilities, both local and regional public transport should operate on the basis of subsidized fixed-price monthly season tickets. About 50% of Sweden's population lives in municipalities where this system has been introduced. Season tickets usually cost skr. 50 (skr. 70 in Stockholm County). In order that such a system should work, all local and regional traffic in a county should come under one undertaking, to be made up in variable proportions by the county and the primary municipalities in the county, which will also apportion the deficit in travel costs due to the introduction of the season ticket. These undertakings should be established over a 3-year period; if no agreement is reached by the end of 3 years, they are to be constituted in a stipulated manner. Counties usually constitute a natural traffic area; however, if the population of a municipality must travel to another county, provision can be made for the municipality to come under that county. Guidelines are given on agreements between the bus companies regarding payment of the subsidy. Finance for the system is now being investigated by another commission. /TRRL/ [Swedish]

25 148724 REDUCED FARE AND FARE-FREE URBAN TRANSIT SERVICES--SOME CASE STUDIES. This paper present case studies of the effects of low-fare and fare-free policies adopted in several American and European cities. There is a general introduction to the concept of travel demand elasticities, and it is pointed out that because the elasticity with respect to fare is usually small, any reduction in fares will lead to loss of gross revenues and small ridership increases. Elasticity with respect to level of service offered is generally higher, and service improvements may have a relatively greater effect on patronage. /GMRL/

Kemp, MA; Urban Institute Paper No. 1212-3, July 1974, 37 pp; ACKNOWLEDGMENT:

25 149010 HIGHER RAIL FARES WILL HIT LONDON JOBS-PLANNERS. The authors develop the arguments put forward by the Standing Conference on London and South East Regional Planning against the green paper suggestion of eliminating rail subsidies in the south east on all but London inner suburban services. It is disputed that the majority of commuters can afford to pay more and suggested that they often commute long distances from areas where they have been able to obtain cheap housing. A detailed discussion is given of the importance of commuter railways to the economic activity of London and the effects that any price rises would have particularly in encouraging the trend of decentralization. /TRRL/

25 149059 FARE POLICIES FOR MASS TRANSIT DEFICIT CONTROL: ANALYSIS BY OPTIMIZATION. This paper reports on the analysis of a substantive problem in public policy planning. A dynamic model of demand, supply, cost and revenue relationships in the market for mass transit services in New York City is developed. This behavioral model is then placed in a deterministic optimal control framework to solve for the dynamic sequence of transit fares which optimize several plausible policy objective functions. Among the objective functions used are minimization of operating deficits and fare minimization subject to deficit constraints. The importance of multi-year planning for mass transit pricing policy is clearly established. We also present one way of describing efficient sequences of transit fares in the presence of ignorance of the policy-makers' ultimate objective function. Although the empirical results pertain to New York the analytical techniques seem to have general applicability to other mass transit systems. /Author/ /TRRL/

25 149868 THE EFFECT OF FARES ON BUS PATRONAGE. This report reviews the information available on the elasticity of bus patronage with respect to the fares charged, both in the UK and in other countries. Estimates of overall fares elasticity obtained across individual fares changes, from time-series analysis and from cross-sectional data are all consistent with a typical mean value of -0.3 in a range from -0.1 to -0.6. These values appear to be much the same in the different countries from which the data was obtained, and they have been stable over time. Elasticities at off-peak travel times seem to be about twice those in the peak, short-distance elasticities are larger than those for long journeys, demand from 'non-captive' passengers may be twice as elastic as that from 'captive' passengers, and urban rail travel is found to be only half as elastic as bus travel. 25 153330 DECLINING PUBLIC TRANSPORT: IS CAR OWNERSHIP TO BLAME? The authors give reasons for their disagreement with the generally held principle; they contend that changes in fare levels have been far more influential and that Department of Transport's fare index underestimates real increases. The relationship between car ownership and the usage of road public transport when compared with the expected change in stage passenger journeys using the D.T.P formula shows that increasing car ownership explains only a relatively small proportion of the decline. Analysis of the national travel surveys indicate that about two thirds of the loss in patronage is due to other factors. The authors claim that the estimated 11 per cent decline in patronage due to the increased fares in real terms amounts to another 30 per cent of the observed decline. The evidence given in the paper suggests that more weight should be given to the effects of price on bus travel as opposed to changes in its quality. /TRRL/

25 154043 TRANSIT FARE PREPAYMENT. Fare prepayment encompasses all methods of paying for transit rides other than by cash, namely, tickets, tokens, punch cards, passes, and permits. The purpose of this study is the examination of the overall ridership and revenue impacts of ongoing and completed prepayment programs. The study examines past and current experience with fare prepayment programs and draws conclusions concerning their potential. The major objectives of this study are the following: (1) To survey ongoing and completed transit fare prepayment programs; (2) to identify key features and problems related to prepayment; (3) to measure public response to fare prepayment; (4) to assess advantages and market potential of fare prepayment; (5) to analyze cost-effectiveness of fare prepayment; and (6) to identify the best application of and implementation structures for fare prepayment.

25 156504 A FARE DEAL FOR PASSENGERS. Problems arising from the reorganization of local government regarding public transport are discussed. The main problem is that bus operating territories were not considered and municipal operators are still confined to the boundaries prior to reorganisation. This means that in a district there are often differing fare scales and differing rates of concession. The

article uses the borough of Blackburn as an example, where there are three different fare structures within the borough. The formation and structure of the present transport undertaking, which is within the operating areas of greater Manchester and Ribblesdale (nbc) is described. The undertaking believes in making small but fairly frequent increases in fares. By using this method, passenger resistance within the borough is about half that of many operations in Lancashire. Mention is made of concessions granted to old and disabled people and of the problem of congestion at heavy schools peaks. Traffic congestion problems have been relieved by the redevelopment of the town centre and the introduction of some one-way traffic management schemes. Details are given of the size of the fleet and of the efforts made by the borough transport committee to rationalise fares and coordinate services. /TRRL/

25 157963 OPTIMAL TRANSIT PRICES UNDER INCREASING RETURNS TO SCALE AND A LOSS CONSTRAINT. The optimal/pricing for transport on different modes uses as examples the Bay Area Rapid Transit and the Alameda-Contra Costa Transit which provide rail transit and bus service, respectively, to a portion of the San Francisco region. The welfare maximization process developed by Bioteux for the French National Railways is followed by a modal choice procedure to estimate marginal and average costs. The cost estimates are used to estimate prices which should be charged by BART and AC Transit.

25 158354 USE OF COMPLIMENTARY PASSES TO IMPROVE RIDERSHIP ON BUS TRANSIT SYSTEMS. The research described examines a complimentary pass package distribution in terms of its ability to attract new passengers to urban bus transit lines. Part one of the study examines, by means of a survey of transit operators, any past uses of complimentary pass packages to a random sample in a selected city and determined subsequent pass utilization by various market subgroups. An attitudinal survey of pass recipients' feeling toward various transportation issues is also conducted.

25 159599 NO-BARRIER FARE COLLECTION. This paper reviews a study performed by the Metropolitan Atlanta Rapid Transit Authority on the feasibility of a no-barrier fare-collection system and discusses the potential of this self-service concept in the United States. No-barrier fare collection (often referred to as self-service or

automatic) is widely used in Western and Eastern Europe to handle fare-collection requirements. It is not used anywhere in North America, and good information on European experience with it is sparse at best. The assumption that cheating would be rampant in the United States if this concept were employed has unrealistically dominated discussions of it and overwhelmed any rational analysis of its benefits. This study found no large propensity to defraud; it estimated that 3 to 5 percent of daily passengers could be expected to evade fares. This figure is larger than that found in European cities, but can nevertheless easily be handled. The no-barrier fare-collection concept thus appears to have a good potential in the United States, particularly for certain applications. One of these is for integrated bus-rail systems using zone fare structures and another is for light rail systems.

25 159718 TWO-TIER FARE TARIFFS-A NEW MARKETING CONCEPT IN PUBLIC PASSENGER TRANSPORT? [Zweitellige Fahrpreise--Ein Neues Marketinginstrument im Personennahverkehr?]. In analogy with electricity and telephone users who pay a monthly fee for connection to the system together with a relatively low price per unit used, while the customer who does not pay a connection charge pays more for his consumption, a two-tier fare structure for passengers using public transport has been suggested. Although a long term experiment in a particular town was discontinued after initially favourable reaction from customers, the two-tier tariff is again being discussed. It is now even less likely to be well received by passengers or to offer any advantages for transport undertakings. /TRRL/ [German]

25 163127 FARE ELASTICITIES ON INTER URBAN AND RURAL BUS SERVICES. The principal aim of this study was to establish a series of values for fare elasticity for different types of bus service outside major urban areas. A selection of routes were sampled and surveys are described in the Sheffield-Doncaster area and the Morpeth area. The routes were chosen to include inter-urban, rural and small town services, to determine the short and medium term effects of a fare increase. The study was to examine not only the number of journeys, but also the changes in journey length and purpose. /TRRL/

25 163543 USER-SIDE SUBSIDIES FOR SHARED RIDE TAXI SERVICE IN DANVILLE, ILLINOIS: PHASE I. An UMTA Service and Methods Demonstration has been implemented in Danville, Illinois. The purpose of the demonstration is to test the use of a user-side subsidy on a shared ride taxi service for handi-

capped and elderly persons. This report presents time series and survey data analysis on the workability, cost-effectiveness and impacts of the project during Phase I. The demonstration has proven that a user-side subsidy can be workable and cost effective. Project demand has been moderate and costs per passenger trip have proven to be very low. Members of the target group and general public have responded very favorably to the project. UMTA and the Project Staff are now planning an expansion of the demonstration to include a user-side subsidy for all persons on privately operated regularly scheduled fixed route service. /UMTA/

25 164023 LOW FARE AND FARE-FREE TRANSIT; SOME RECENT APPLICATIONS BY U.S. TRANSIT SYSTEMS. The purpose of this report is to provide a reference document describing succinct case studies of the experience accrued by more than 40 U.S. transit systems which have introduced fare-free of reduced-fare services of one form or another in recent years. The report is a useful reference document for decision makers contemplating similar pricing policies as well as a preliminary planning guide to the UMTA for the development of demonstration programs to evaluate various transit pricing and service strategies. Many different types of fare reductions were identified. They are classified into five broad divisions: (a) systemwide fare reductions without any restrictions; (b) fare reductions applicable to specific geographical areas only--typically the CBD; (c) fare reductions which are operable only during limited hours--typically the off-peak hours; (d) fare reductions subject to both geographical and time-of-day restrictions; and (e) fare reductions of short duration implemented chiefly for promotional purposes. When viewed from the limited perspective of financial aspects of transit system operations it does not appear that fare reductions alone have had a favorable impact on the overall economic conditions of transit systems.

Goodman, KM Green, MA ; Urban Institute, (UI-5050-54) UMTA-DC-52-0002-77-1, Feb. 1977, 156 pp, 5 Tab., Refs., 1 App.; Prepared for the Department of Transportation, Urban Mass Transportation Administration.; Contract DC-52-0002; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-271077/05T

25 164289 REDUCED FARES OR INCREASED FREQUENCY? The report comments on the argument for using bus service subsidies to increase vehicle mileage and quality of service rather than reduce fares. This course of action, it is argued, will lead to a larger increase in passenger demand than reducing fares. This conclusion is partly based on a simple model of the bus industry which suggests that a subsidy used to reduce fares by 10% will lead to a 3% increase in passenger demand (either number of journeys or passenger km), whereas if it was used to increase vehicle km by 10% it will lead to a 7% increase in passenger demand. This paper casts

doubt on the simple model used and the parameter estimates, especially the elasticity of passenger demand to vehicle km. /TRRL/

25 165748 EVALUATION OF REDUCED CARPOOL COMMUTER TOLLS ON THE CONNECTICUT TURNPIKE. This report presents the results of a study to evaluate the effects of reduced commuter tolls on the formation of carpools on the Connecticut Turnpike. The evaluation was conducted by surveying present carpool ticket users and incorporating the results of a previous survey conducted in 1975. It was determined that the economic incentive associated with the present tolls was too small to attract a significant number of carpools. The present toll structure and ticket system has resulted in a significant growth in the use of regular commuter tickets as opposed to carpool tickets. However, the present carpool ticket users perceive a substantial benefit from the plan in light of the fact that the actual economic benefit is small. /FHWA/

Rothenberg, MJ Henry, RD Royer, DE ; JHK and Associates Final Rpt. FHWA-RD-77-30, Mar. 1977, 55 pp; Sponsored by DOT, Federal Highway Administration.; Contract DOT-FH-11-8242; ACKNOWLEDGMENT: Federal Highway Administration, NTIS; ORDER FROM: NTIS; PB-270517/AS

25 165767 MAGIC CARPET EVALUATION STUDY. MAGIC CARPET is the name of the Seattle fare-free CBD bus service that was initiated in a 105 block area of the CBD on September 9, 1973, and it is available 24-hours a day, seven days a week. The fare-free zone was initially proposed as a one year experiment to demonstrate whether or not the concept of free downtown bus service was desirable. The overall objective of Magic Carpet service is to attract auto person trips to the transit bus. This report presents the fare-free zone, Magic Carpet, evaluation project. It consists of a series of surveys aimed at measuring the effectiveness of downtown free buses in achieving the following objectives: 1) Improvement of downtown air quality; 2) Reduction of traffic congestion; 3) Conservation of gasoline; 4) Encouragement of peripheral parking; 5) Increase mobility; 6) Increase midday patronage (transit shopping trips); and 7) Stimulation of retail trade. Surveys in this report indicate that fare-free bus service is responsible for attracting at least \$5,000,000 in retail sales. The number of daily fare-free bus trips counted in June 1974 was 12,258, as opposed to the 4,100 daily bus trips made in the same area in 1973. The findings herein have encouraged the Seattle and Metro Councils to continue this service for at least two more years, at a cost to the City of \$100,000 per year. The Seattle experience emphasizes that downtown transportation systems can be designed and operated to give greater emphasis to within-CBD circulation as opposed to the traditional emphasis, namely, to and from downtown. The data herein should enable other cities to estimate how fare-free service would fit in their communities. /FHWA/

25 167863 COSTS OF URBAN AND SUBURBAN PASSENGER TRANSPORTATION MODES. Data from previous studies are used in this study of metropolitan Washington, D.C., which presents conclusions based on a qualitative evaluation of full costs of urban transportation modes, and upon the extensive list of assumptions required to generate them. An estimate is made of the full costs of alternative transportation strategies on a comparable basis, with emphasis primarily on the line haul portion of the system. It is assumed that the important parameters (e.g. travel time) are subject to policy control that is necessary to achieve a satisfactory balance in usage between modes. Intermodal cost comparisons presented here include: long run average costs, peak-period costs, costs under conditions of high vehicle occupancy, and some low-cost marginal alternatives. The financing of urban transportation is discussed with special reference to pricing and subsidies, public versus private costs, participation by nonlocal governments, and probable cost to a typical resident.

25 168065 TRANSIT COSTS DURING PEAK AND OFF-PEAK HOURS. This paper discusses the relative costs of providing peak-hour and base transit service in Albany, New York, during a 3-month period between January and March 1976. It concludes that the total cost (operating and capital) per passenger was \$0.480 during the peak period and \$0.746 during the base period. It cautions against the application of these results to other properties because of differences in peak and base service requirements, demand profiles, and union work rules and concludes with a discussion of the implication of the results for transit fares by contrasting an economic viewpoint and a transit-operator viewpoint. /Author/

25 168070 DIFFERENTIAL TIME-OF-DAY TRANSIT-FARE POLICIES: REVENUE, RIDERSHIP, AND EQUITY. This paper examines the financial, ridership, and equity implications of premium rush-hour fares of seven transit systems in New York State. Using 1973 data and demand equations that establish a relation between fare and ridership calculations are made to estimate changes in ridership and revenue in each of the cities for various peak and off-peak fare combinations. Graphs are plotted for each of the cities to determine the fare combinations that maximize ridership without decreasing revenue more than 5 percent and still improve equity. The results showed that, in all of the cities studied, no differential fare combination increases both revenue and ridership simultaneously. Certain combinations improve equity while increasing either ridership or revenue with a less than 5 percent loss

in the other. In Albany-Schenectady-Troy, Rochester, Syracuse, and Binghamton, combinations that increase passengers at the expense of a less than 5 percent decrease in revenue are attractive because of their flexibility. In New York City and Buffalo, combinations that increase revenue rather than passengers are attractive because no fare combination would increase passengers more than 5 percent without a loss of 15 percent or more in revenue. /Author/

25 169257 THE SAN DIEGO TRANSIT CORPORATION: THE IMPACTS OF FARE AND SERVICE CHANGES ON RIDERSHIP AND DEFICITS, 1972-1975. This paper is one of a series arising from a study of forty months' operating experience of the San Diego Transit Corporation (SDTC) bus system between 1972 and 1975. It reflects a concern with the increasing deficits of transit operators as well as the diversity contained within a single bus system such as that in San Diego. The principal objectives of this report are: (1) to provide a brief overview description of the bus system and of the data available for analysis; and (2) to present initial estimates of fare and service level elasticities for comparison with the many other estimates in common use among transportation planners, and examines SDTC's financial performance over this period. San Diego's experience of an expanding system at an approximately constant real cost per passenger were very unusual among transit operators in this period. Limited disaggregation of the systemwide data into major groupings of routes shows clearly that the systemwide analysis masks a great deal of heterogeneity within the system.

25 170792 PRE-PAID FARE COLLECTION. There are various means to collect revenues from users of transportation services. One of the most convenient and cost-effective manner is by pre-collecting revenues. When revenues are pre-collected, there are several benefits to be gained. Quicker boarding and alighting times,

reduced manpower costs to collect and count revenue, increased security and public convenience are several key benefits derived when pre-paid, self-service systems are implemented.

25 172567 THE RELATIONSHIP BETWEEN DEMAND FOR URBAN BUS TRANSPORT IN HOBART AND BUS FARES. The optimum fare structure of a public transport undertaking depends on cost structure of the undertaking and the demand for public transport which the organisation is attempting to satisfy. This study derives from a consideration of these two factors. The first two sections of the study examine the demand characteristics of the market for urban bus travel and the relationship between these characteristics and the price of bus transport. The third section looks at the cost structure of the metropolitan transport trust, and the final two sections examine the various fare structures in common usage and suggest the most appropriate fare structure for Hobart's bus transport system. /Author/TRRL/

25 175334 TRAVEL PATTERNS OF ELDERLY PEOPLE UNDER A CONCESSIONARY FARES SCHEME. This report investigates the movements of elderly people living on Tyne-side. It is based on four similar travel surveys conducted over a period of 16 months. Initially, old-age pensioners were entitled to a half-fare concession on buses in off-peak hours from Monday to Friday and all day Sunday. The last three surveys were carried out after the concession had been changed to zero-fare and extended to include Saturdays. The work investigates the overall patterns of travel by different modes and for different purposes, in relation to various personal and household characteristics, the effects of changing from a half-fare to a zero-fare concession; and the seasonal differences in travel patterns. It is estimated that the change in concession generated a 34 percent increase in the number of bus trips made. In early summer, 8 percent more trips were made than in early spring, the difference being mainly in recreational trips.

25 176484 ELASTICITY OF TRANSIT DEMAND WITH RESPECT TO PRICE: A CASE STUDY IN NORTHERN VIRGINIA. The objectives of this research were to observe and report the elasticity of transit demand with respect to price (fare), to identify and quantify the

impact of a peak-period transit fare increase on automobile use in general and on car pools in particular, to determine whether a peak-period transit fare increase caused any measurable shift in passenger travel from peak to off-peak times, and to compare the point elasticities observed on the Shirley Highway express buses with those observed on traditional bus service in the same metropolitan area, as well as to determine whether elasticities observed for two qualities of transit service were significantly different. In addition, the observed elasticities of transit demand with respect to price will subsequently be compared with elasticities calculated from mode-choice models calibrated within the same environment. The comparison will serve as one validation procedure for the mode-choice models and, it is hoped, will provide useful insights into the question of model transferability. This report presents those preliminary and partial results that are currently available. The forthcoming final report will address the four objectives in greater detail. /Author/

25 176488 THE USES AND LIMITS OF BRIDGE PRICING IN THE SAN FRANCISCO BAY AREA. Bridge pricing as a policy alternative and operating tool has only recently become a matter of serious consideration. Previously, travel behaviour was influenced primarily through regulation of available transit, that is, convenient, comfortable, and inexpensive transit was provided to reduce automotive travel, and then transit growth was restrained to maintain a desired balance. Because of increasing transit operating costs, ways of increasing Golden Gate Bridge District revenues become important in early 1975. It is noted that there are two corridors in which bridge pricing can be used as a tool to influence automobile and transit use. Public input on the concept of bridge pricing revealed a high degree of suspicion and the surcharge on single occupant cars was considered discriminatory and unconstitutional. Only through an effective pricing policy can the Golden Gate District financially support a balanced and integrated transportation system. Without an incentive policy, the district cannot as effectively influence automobile and private car or van poolers. It must rely on highly attractive transit systems to control automobile use and balance its systems. The key to moving forward, it is noted, is wide spread public discussion of the potential benefits that a pricing policy can produce when it is properly integrated with an overall transportation strategy.

25 176524 COMPLEMENTARY SYSTEMS: INTEGRATING TRANSIT AND PARATRANSIT. Finds that the Knoxville, Tennessee transit deficit was budgeted for \$150,000 but was going to be \$500,000, the city considered a whole range of alternative transportation programs. One approach was to consider urban transportation in general, rather than just the transit operation. By working with several industries around Knoxville, a fairly sophisticated matching program was developed. Van pool, express bus, car pool, regular transit service, taxis, airport limousines were all drawn into the system. Knoxville also developed the brokerage concept. The concept attempts to determine which transportation sources could be contracted for at a reasonable cost. As a result of this program, a fairly large fleet of church buses, vans, and other private vehicles is integrated into the services that transit can offer in the area one of the area's longest employees, TVA which has the largest ongoing private program, is spending about \$125,000 per year to provide transit services to its employees. A new service has also been proposed for the downtown area, i.e., a circulation system which will mesh all the brokered services that are coming into the downtown area. The benefits derived from these programs are discussed. Programs attempted in Sackeon are also outlined and discussed.

25 176529 CASE STUDIES ON INCREASING TRANSIT REVENUES: BALTIMORE. Baltimore's experiences in attempting to increase revenue in transit operations are discussed. Fares were increased and a new tariff system was proposed that was based on a concentric-ring zone system. The original 30 cent flat fare in the rather irregular zone was raised to a 35 cent off-peak fare and a 40 cent peak fare, with a 10-cent additional fare for each zone. Premium service was also made available. Special 15-cent tokens for senior citizens and handicapped persons were sold at various outlets. Careful fare-box control to assure that fares were collected, and checks are made to on how the driver handles the

fare-box system. Another source of revenue in Baltimore is the charter service and special service.

25 176581 TRI-MET AUTOMATED FARE BILLING SYSTEM. The fare collection technique studied in this report is that of automated billing, where information on each ride is recorded and a passenger is billed at the end of the month for the ride. The first use and successful operation of an automated billing system was in the Valley Transit District, serving the Naugatuck Valley, Connecticut. Hence, UMTA has decided that a similar system should be implemented in conjunction with a demonstration of special transportation services for the elderly and handicapped in a medium sized city. Portland, Oregon, was the site chosen for this demonstration; the Tri-County Metropolitan Transportation District of Oregon (TRI-MET) is the operating agency. This report describes the TRI-MET Automated Billing System that has been successfully introduced into service in Portland, TRI-MET is using an automated billing system as part of its Special Needs Transportation Project (The Lift) serving the elderly and handicapped. Users of the service are issued an encoded credit-card-sized plastic bus pass. Each

time a passenger rides the bus the card is inserted in an on-board car reader unit which records the code and other appropriate data on a tape cassette. At the end of each day's operation, data on the cassettes are transmitted to a computer center. Itemized billings and statistical reports are produced monthly. The authors state that the TRI-MET Credit Card Fare Collection is a major step forward in the introduction of cashless systems. /UMTA/

25 178632 MANAGEMENT OBJECTIVES, FARES AND SERVICE LEVELS IN BUS TRANSPORT. The author suggests that there appears to be a widespread assumption that public transport should, in the absence of any specific reasons for subsidy, be operated commercially in some sense. This suggestion, in relation to the task of the bus transport operator is discussed, and consideration is given to the implications of alternative management objectives for public transport in terms of fares, service levels and financial results. The discussion is developed in terms of a grossly simplified model of a bus company, and for the purposes of the discussion the internal efficiency of the operator is not considered. It is assumed that demand in terms of passenger miles is a function of price per passenger mile and the number of bus miles operated, but in a consideration of the cost function differences between routes and the problem of peak demand are ignored. The choice of alternative objectives for nationalised industries to price and output policies is discussed, and alternative commercial criteria subject to a budget constraint examined. A specific numerical example is presented to illustrate the discussion. /TRRL/

25 178759 PEAK-BASE COST ALLOCATION MODELS. During the past several years, most transit agencies have been faced with the problem of rising deficits and limited tax resources to meet operating subsidies. For this reason, renewed emphasis has been placed on examination of the system's financial performance on a route-by-route basis. While route revenues can be determined by surveys and field counts, operating costs are more difficult to ascertain by route. Typically, the cost analysis has been conducted utilizing multivariable cost allocation models in which each expense account in a system is attributed to a particular resource (e.g., vehicle kilometers). This paper presents the cost analysis performed for the Metropolitan Transit Commission (Minneapolis-St. Paul) as part of the monitoring and evaluation program of the I-35W Urban Corridor Demonstration Project which tested the feasibility of express bus service on a metered freeway. The paper calls for the development of cost formulae that are sensitive to peak and base conditions rather than a single system-wide model. Also described in the paper is the development of labor productivity and service

indices which can be used to compute both peak and base unit cost factors. The theoretical derivation of the relationship between the unit cost factors with systemwide costs and the indices, as well as the application of this theoretical concept, are presented. /Author/

25 178761 COST ANALYSIS OF CURRENT U.S. SURFACE TRANSIT FARE COLLECTION SYSTEMS (ABRIDGMENT). The objective of this analysis is to measure capital and operating costs associated with collecting fares. Six transit systems were visited to obtain data. This discussion addresses two broad categories of cost-direct and indirect. Direct costs are the quantifiable capital and operating costs. Indirect costs, not easy to quantify, are related to system-wide revenue loss, operator involvement in fare-related activities, and impact of fare collection procedure on the system's insurance liabilities. It is concluded that while the transit industry's current fare collection costs are inexpensive relative to total operating costs (less than two percent), its fare collection methods may not be efficient. By requiring exact change in the farebox for each and every ride, the patron must bear the administrative burden of payment, contrary to the dominant trend in private industry toward credit cards and other "convenience" payment forms. It remains to be investigated whether a more convenient fare collection system would generate enough additional revenue to offset higher transit agency fare collection costs.

25 179023 DEMAND ELASTICITIES OF PER-MILE TRANSIT FARES. Distance-based transit fares are often proposed as a method of generating additional transit revenues while equalizing the costs patrons pay for service. This paper documents efforts undertaken by NYS-DOT's Planning Research Unit to estimate the demand elasticities of pre-mile transit fares. Using a 1975 on-board survey from Albany, N.Y., and the statistical tool, AID, five market partitions are developed which best explain the variation in frequency of bus use. These partitions are based on destination purpose, fare type, and county of residence. Disaggregate linear models are then constructed for each partition, relation frequency of bus use to fare-per-mile. Results show far-per-mile elasticities to be very low, ranging from 0 to -0.41, and showing greater sensitivity by discretionary non-habitual bus users. /Author/

25 179047 PREFERENCE ELASTICITIES OF TRANSIT FARE INCREASES AND DECREASES BY DEMOGRAPHIC GROUPS. Using a technique known as trade-off analysis, this paper shows how preference elasticities for transit fare increase and decreases can be estimated for different socioeconomic groups. Data for the analysis is drawn from a NYSDOT-sponsored survey of 1,000 households in the State, conducted in November 1974. Two notable conclusions are drawn: (1) preference elasticities for fare decreases are significantly lower than preference elasticities for fare increases; (2) fare-decrease elasticities vary for different stratifications of the population, while fare-increase elasticities are very nearly the same for all socioeconomic groups. /Author/

Donnelly, EP ; New York State Department of Transportation Res. Rpt. 89, Aug. 1975, 15 pp, 8 Fig., 1 Tab.; This paper was submitted for presentation at the 55th Annual Meeting of the Transportation Research Board, Washington, D.C., January 1976.

25 182600 AN INTEGRATED FARES POLICY FOR TRANSPORT IN LONDON. A common but disputed justification of public transport subsidy is that lower fares will encourage transfer from private vehicles, alleviating the congestion externality. A quantitative method is developed to judge the validity of this "second best pricing" argument and it is applied to the best available evidence on peak and off-peak bus, rail and private car models in Greater London.

25 183026 EVALUATION: IOWA CITY BUS PASS SYSTEM. In July of 1976, the City Council of Iowa City raised the transit system fare to 25¢ per trip. At the same time the Iowa City Council approved a monthly bus pass system to ameliorate the impact of the increased bus fare. The user pass costs \$8.00 per month and allows for an unlimited number of trips during the month for which the pass is purchased. A survey was conducted to ascertain: who is using the pass, why they are using the pass and pass user opinions concerning the bus pass system. Who might benefit from purchasing the pass, but are not taking advantage of the bus pass system. /GMRL/

25 183030 FREE TRANSIT FOR SENIOR CITIZENS IN PENNSYLVANIA. On July 1, 1973, the Commonwealth of Pennsylvania initiated a free transit program for senior citizens, representing the first commitment by any state to provide free public transportation for all older persons. With the voluntary cooperation of more than 70 private and public local transit carriers, serving more than 95 percent of all local-transit patronage in the state, the program provided an estimated 49 million free rides at a cost to the state of \$10.8 million during its first year of operation. Funded by the state lottery, these costs are the amounts that the participating transit properties receive for the estimated transit losses

incurred as a result of carrying senior citizens free of charge. The purpose of this article is to describe the results of a research study to assess the impacts of this senior citizens' free-transit program. The results are significant to the commonwealth and to other states that may be considering this means of increasing the mobility of its elderly citizens. /GMRL/

25 183407 THE DIFFERENTIAL EFFECT OF TWO FREE RIDE DISSEMINATION PROCEDURES ON BUS RIDERSHIP. In an attempt to isolate the operating variables that increase transit ridership under conditions of free transit, the following experimental conditions were instituted on a university campus bus system: (1) dissemination of free transit tokens regardless of the subject's bus riding behavior (non-contingent free transit), (2) dissemination of one free token for each bus ride made by the subject (one-for-one contingent free transit), and (3) dissemination of three free transit tokens for each bus ride made by the subject (three-for-one contingent free transit). It was found that the requirement of a response contingency (i.e. a subject must ride to get additional free transit) produced greater transit usage than the dissemination of free transit regardless of the subject's bus riding behavior. Of the two response contingent conditions, the one-for-one contingent free transit condition produced ridership levels greater than the three-for-one contingent free transit condition. Additionally, trading of free transit tokens was highest under the non-contingent free transit condition. /Author/TRRL/

25 183484 GUIDELINES TO ZONE FARE SYSTEMS. This is the Transport (Planning and Research) Act 1974 final report NMT 74/20. It examines the present methods of fare system (in Sydney) of public transport (both public and private enterprise) in which more than one mode of transport or breaks within a single mode of transport is involved. It then identifies problems if a single fare was to be charged. Modelling techniques are carried out using a single case not providing attraction from other modes. The model is tested on Sydney data to determine benefits disadvantages, social costs and feasibility of the single fare system. Further modelling was carried out for more complicated cases and again tested. Finally, guidelines were set out for zone fare system by way of models and methods to evaluate possible problems. /TRRL/

25 184600 TRANSIT PRICE ELASTICITIES IN ST LOUIS. An elasticity analysis of a sample of 65 express and local transit routes in the St.

Louis area, in both Missouri and Illinois, was undertaken to determine the effect of a November 1973 decrease in fares. (The zone system remained unchanged, and there was no change in level of service on the routes selected, so the fare decrease could be isolated as the factor in the any changes in ridership levels.) Two elasticity measures were used: arc elasticity (the ratio of the percentage change in transit utilization to that in price) and shrinkage ratio (the percentage change in ridership resulting from a one percent change in price). Although riders on four routes exhibited elastic behaviour, transit demand as a whole in the Bi-State region was inelastic to the fare reduction, perhaps because substantial ridership from the transit-dependent areas were already being attracted. In contrast to other urban areas, express riders in St. Louis exhibited more sensitivity to fare reduction than local riders. Ridership in Missouri was less responsive than that in Illinois, perhaps because the bus company operates far more service in Missouri and hence had already captured a substantial proportion of the market there. However, express transit demand in Illinois exhibited a composite arc elasticity of -1.0, the threshold between inelastic and elastic demand. (It should be noted, in that instance, that the sample size of four routes was too small to draw reliable conclusion.) The composite arc elasticity for all routes was -0.30, i.e. within the range observed in other cities. However, the conclusion of this study most important to those planning changes in an area's transit service is that ridership elasticity will vary with the type of route.

25 184664 THE PUBLIC TRANSPORT TICKET EXPERIMENT [Het experiment openbaar vervoerkaart]. The "openbaar vervoerkaart" (public transport ticket) has been used by a number of persons for a trial period of a year. The ticket allowed unrestricted travel by all means of public transport for a low price. The experiment was accompanied by a number of inquiries. From these it has become clear that the ticket appeals especially to people already having relatively high public transport usage. As an effect of the ticket, the mobility of this group (in kilometres) rises sharply. Making the ticket available to the general public would lead to a large increase in the demand for public transport. Railway passenger kilometres would even double. As a result, the public transport deficit would increase by 700 to 900 million guilders a year (decrease of receipts and increase of running costs. /Author/TRRL/ [Dutch]

25 185388 SAN DIEGO TRANSIT'S FARE INCREASE IN FISCAL 1976. THE CAUSE AND EFFECT. Changes designed to generate revenue through the farebox are reviewed and a judgement is made on the effectiveness of the proposals and their results in terms of ridership and revenues. The new fare structure was designed to: encourage an 18% increase in senior citizen ridership, essentially maintain the same level of youth riders allowing for a modest increase due to normal growth, reduce the number of regular riders by 13.2%, an average fare of 29 cents, and produce an additional \$2,086,000 revenue. It was found that ridership showed a steady 6% increase throughout the year (even though less than the increases realized in FY 73, 74 and 76). Senior citizen and handicapped riders increased substantially youth ridership also showed a very large increase. Saverpass sales increased 20.7% over last year and Saverpass ridership increased by 22.5%. The Saverpass, the lowering of the age of senior citizens' Goldfare eligibility to 60 and allowing college youths to rider on monthly passes all contributed to a lower than average fare. These factors caused the revenue to fall short of projected totals while ridership was 0.8% above projection. The loss of ridership due to fare increases was projected to occur at an elasticity -0.33. This proved to be correct for the basic fare category, while the positive elasticity for fare reductions proved to be below reality.

25 186194 PUBLIC TRANSPORTATION FARE POLICY. The factors which affect transit fare policy can be grouped into three categories: institutional, demand, and pricing rationale. Institutional factors include fare trends, types of fares, fare collection techniques, and the role and objectives of the various groups involved in pricing transit. Demand factors are concerned especially with the responsiveness of transit users and potential users to changes in fares, in transit service characteristics, and in the perceived price of urban automobile trips. Pricing rationale or cost factors are concerned particularly with the cost characteristics of the production of transit services. This report identifies the issues with which any fare policy must deal, and presents information that will aid individual transit operators to resolve those issues in their own operations.

25 189344 TRENTON FREE-FARE DEMONSTRATION PROJECT. The "Trenton Free-Fare Demonstration" is the first large-scale test of free transit in the U.S. The New Jersey Department of Transportation, in cooperation with UMTA, Mercer County, and Mercer County Improvement Authority, is administering an Off-Peak Free-Fare Demonstration Project on the Mercer Metro bus system. The demonstration involves the implementation of a fare-free service on all intra-county routes from 10 am to 2 pm and after 6 pm Monday through Saturday, and all day on Sundays and holidays. The free-fare operation is planned for one year, beginning March 1978. The demonstration is intended as a model for possible use elsewhere across the country as well as for further policy and program development in Mercer County. This document presents a plan for evaluating the impacts of a free-fare off-peak transit demonstration in Mercer County, New Jersey. The evaluation plan describes the demonstration setting, the details of the project, the evaluation issues (travel behavior, transportation supply and costs, secondary effects, and the implementation process), the evaluation strategy, the data collection plan, and the techniques to be used in analyzing the results. The central concern is ridership impact. A list of free-fare references and seven appendixes are included in this report. The appendixes display data collection tools already employed (Appendixes A-E), outline a related research effort of the National Bureau of Standards in which this project's data are to be used (F), and describe the DeLew, Cather evaluating staffing and management approach (G). /UMTA/

25 190540 FARE POLICY AND STRUCTURE. The overall objective of this research effort is to relate fare policies and fare structures to passenger demand characteristics as well as to operating expenses and to determine appropriate methods of addressing fare in transit financing. This report presents the findings of a three year research effort. It includes a survey of literature on fare policies and structures throughout the nation. In addition, the report presents the findings of a nation-wide survey of transit properties and deals with fares, ridership, financing, and policy making. Analysis of acquired information show that fare revenues are producing an ever decreasing percentage of operating expenses and, by 1980 will account for less than 40 percent of operating expenses for transit properties nation-wide. The report puts forth arguments for the study of time-varied fares as the most beneficial policy for reducing the financial problems of transit properties while still increasing ridership and also shows that using fare policy/structures to reduce peak vehicles can result in operating cost savings.

25 191376 ELASTICITY OF TRANSIT DEMAND WITH RESPECT TO PRICE: A CASE STUDY [Final rept.]. The report describes the methodology and the results of an empirical study of peak-period transit demand elasticity with respect to price (fare). Field observations were structured to capture the reactions of morning (inbound) commuters to a peak-period fare increase introduced on September 1, 1975. The study is limited to bus and automobile travelers on the Shirley Highway and bus passengers on the Lee Highway, both in Northern Virginia. The Shirley buses provide express service on exclusive freeway lanes, whereas the Lee Highway buses provide traditional service on a signalized radial arterial. Various impacts are identified, quantified and compared. Demand for service on the Shirley Highway Express buses is less elastic (-0.274 to -0.218) than that for the traditional Lee Highway bus service (-0.535 to -0.273). There was little evidence of passengers on either service shifting travel outside the peak-periods to avoid higher fares. The fare increase had no effect on auto travel. These results suggest applying different pricing policies to different types of transit service.

25 193613 TOLLS PRICING STUDY. An attempt is made to present a comprehensive feasibility study and recommendations for peak-hour

charges and the impact that carpooling and commuter discounts have upon congestion. Coefficients of elasticity were derived that would reflect a motorists reaction to any toll charge, peak period or otherwise. Elasticities for automobiles and for commercial vehicles were developed by market group. Also developed was a unique and complex simulation model which, in addition to providing the estimated traffic and revenue resulting from a given toll schedule, also generated estimates of delay time, the various energy and environmental impacts of delay, vehicle miles travelled and other pertinent data. As a means of evaluating toll schedules, specific yardsticks or measures were developed to determine their impact on various factors such as transit patronage, pollution, congestion, energy consumption, etc. The selection and evaluation of candidate toll schedules are also covered. The major conclusions drawn from the study and the recommendations made are given. Details are also given of the study method (including the computer program, the data base, models, capacity restraints, etc.), elasticities and patterns of travel behavior, and the analysis of the final candidate toll schedules. Data and detailed descriptions mentioned in or expanding the main report are included in 3 appendices.

25 194131 SNCF ATTACKS PARIS AREA REVENUE COLLECTION PROBLEMS. Heavy suburban passenger flows in greater Paris present difficult ticket control problems, with complex ticketing rendering effective manual inspection, impossible. With the Interconnexion project with the Paris Regional Transit (RATP) to become operational in 1981-82, the French National Railways has been faced with introduction of a compatible automatic fare collection system. Starting in 1979 a full-scale experiment has been under way on Montparnasse suburban lines with the goal of extending it or a similar system to most of the Paris suburban area by the late 1980s.

25 195567 THE CONSEQUENCES OF SHORT-RANGE TRANSIT IMPROVEMENTS: AN OVERVIEW OF A RESEARCH PROGRAM. Because of Congressional interest evidenced in 1974 legislation, special emphasis is placed on the evaluation of fare-free transit services. This paper presents an overview of a research program designed to improve understanding of the costs and consequences of various transit fare and service level policies, and focuses particularly on objectives and methods. The principal questions for research concern the existence and magnitude of various possible outcomes from short-range improvements. Broadly categorized, these outcomes relate to: 1) the demand for transit service; 2) the quality of service experienced by the user; 3) operating costs; 4) the transit industry; 5) broader urban transportation; 6) the incidence of impacts; and 7) other longer-term considerations. Forty-seven different types of potential consequence are discussed, and priorities are suggested for their investigation. The paper explores the appropriateness of four different general research activities to appraising the most important of the potential

outcomes. These four activities are the analysis of existing transit operating experience, with and without the collection of new data, and the mounting of social experiments, either in a "real world" operating environment, or in a simulated setting. In each of the general categories, certain specific research studies are suggested, and their advantages and disadvantages are discussed. The paper concludes by placing partially subjective priorities for Federal support on the thirteen different research studies proposed. /UMTA/

25 196892 CONCESSIONARY FARES FOR ELDERLY, BLIND AND DISABLED PEOPLE. This green paper sets out the government's proposals for a national scheme providing a minimum half-fare concession on local public transport for the elderly, blind and disabled. The proposals include for the first time full transferability so that concessions would be available on local journeys everywhere and not just in the area where the eligible person lives. They would cover local rail journeys as well as buses. Local authorities would be obliged to operate the national scheme, but would retain the discretion to run more generous local schemes as well in parallel to the national scheme. The special cases of Scotland, Wales and Northern Ireland are dealt with. /TRRL/

25 197590 FARE ELASTICITIES FOR EXCLUSIVE-RIDE TAXI SERVICES. The increased awareness of taxicabs as an important public transportation mode has also increased the need to know how taxi usage changes in response to fare increases. This usage change, or fare elasticity, is important for several reasons, not the least of which is that it indicates whether fare increases will increase or decrease total revenue. In this research a unique data set was assembled to test eight hypothesis regarding taxi fare elasticities. Operatory data were collected from 24 taxi operators in different cities across the United States. Data were also collected in the socio-economic, demographic, and transit service characteristics of these cities. The data cover twenty-two months beginning January, 1976. The hypothesis tests showed that demand for taxi service is primarily inelastic with respect to fare increases. Some evidence was found to substantiate the hypothesis that higher fare levels produce more elastic responses to fare increases; however, this hypothesis could only be tested in a tentative way. Two major conclusions emerge from this project. The first of these is that taxi demand is inelastic with respect to fare changes. The second is that fare changes are not very important in explaining ridership changes.

25 197651 AMHERST, MASSACHUSETTS FARE-FREE BUS RESEARCH AND DEMONSTRATION PROJECT. This final report on the Amherst, Massachusetts Fare-Free Bus Research and Demonstration Project reviews the project background and scope, details its conduct and extensive data collection and analysis, presents findings and conclusions, and discusses the transferability of these findings and conclusions to other urban areas. The major objectives of the project was to determine to what extent at first providing a fare-free bus service, and later, increasing restrictions on intra-campus automobile use would have in a shift away from commuting by automobile in favor of commuting by bus. There was also concern as to how changes in transportation services would affect community attitudes toward public transportation. Significant findings were that: (1) introducing high frequency, fare-free transit services attracts high levels of ridership of low income groups, while only slightly reducing automobile usage and traffic congestion; (2) increased parking fees are not as effective a deterrent to automobile use as are reduced parking availability and strict parking regulations enforcement; (3) increases in parking fees that are perceived as relatively large, will be met with strong opposition from lower income workers for whom the automobile is the only available mode; and (4) fare-free transit will have significantly positive impact on the demand for multi-family housing and sales volumes of retail establishments, depending upon their relative proximity to transit bus stops.

25 199003 DENVER OFF-PEAK FREE FARE PUBLIC TRANSIT EXPERIMENT. The Denver project investigates the effects of the elimination of off-peak fares on transit operations and costs, ridership, public attitudes, and regional travel patterns. The Denver experiment indicates that a systemwide free-fare program can be implemented with fairly minimal disruption and attract many new riders to transit during low-productivity hours. The distribution of the benefits of such a program among socio-economic and racial groups appears to be similar to that of the prior transit service. The cost of such free service is very high, constituting a major obstacle to implementation in most cities. However, if further study in Denver supports early indications, temporary free fare programs may be more successful in increasing the permanent ridership base than any other strategy yet attempted.

Swan, S McKnight, R ; De Leuw, Cather and Company, Transportation Systems Center, Urban Mass Transportation Administration Intrm Rpt. UMTA-CO-06-0010-79-1, May 1979, 59 p.; Contract DOT-TSC-1409; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-298783/2ST

25 199010 FINDINGS OF PRELIMINARY ANALYSES OF THE TRENTON OFF-PEAK FARE-FREE TRANSIT DEMONSTRATION. The report was prepared as an interim informational summary of the progress of the Trenton

Fare-Free Demonstration. It presents findings of interim analyses regarding ridership impacts; passenger profiles and trip characteristics; and transportation supply and cost impacts. Given the limitation of this report, it can be useful as an interim informational summary pending completion of the full evaluation and preparation of the final project report. The report concludes that: Mercer Metro off-peak ridership has increased 45-50 percent during all free-fare periods; the Bus drivers have complained that the program has caused them to be late more often and to miss breaks because of more passengers and additional stops; and the cost of additional bus and driver service has increased but has not yet been estimated.

25 260125 FREE PUBLIC TRANSPORT. After reviewing transport studies in Germany and elsewhere, the author examines the demand for private transport by investigating the costs of journeys by private and by public transport, sounding the opinion of motorists to suggested reductions in fares by means of opinion surveys, and conducting empirical demand studies. A study is made of the relative importance of the price factor in determining demand. The annual costs of free public transport are estimated for a number of German towns together with the social rate of return on free transit. The author concludes that the possible diversion from private to public transport has been over estimated and the cost under estimated, and that the benefit derived from free transport may not go entirely to those in need of it.

25 262388 NO FARE PUBLIC TRANSIT: SEATTLE'S \$64,000 QUESTION. A congested area of central Seattle is now the site of a no fare bus service experiment. The reaction to the

project so far has been enthusiastic with greatly increased patronage on some routes. Data is now being collected on how increased usage has effected automobile use and pollution. The article also describes four types of no fare operations; total no fare, no fare for specific groups, no fare in special locations and examples of each in various cities. No fare transit is becoming increasingly popular in light of the energy crisis. The cost of implementing such systems is compensated for by the social, economic and environmental benefits of increased public transit usage.

25 263926 EFFECT OF FARE REDUCTION ON TRANSIT RIDERSHIP IN THE ATLANTA REGION: SUMMARY OF TRANSIT PASSENGER DATA. This paper presents in summary form the findings from an intensive onboard survey conducted by the Metropolitan Atlanta Rapid Transit Authority during November 1972. On March 1, 1972, transit fares in Atlanta were reduced from 40 cents to 15 cents, with free transfers. Patronage immediately increased significantly and continued to increase as the Authority initiated implementation of service improvements as part of its short-range transit improvements program. The research was designed to answer specific questions generated after the ridership increase was observed, including the magnitude of the increase and the distribution of increase between new transit riders and additional tripmaking by previous riders, the magnitude of diversion from automobile users, and characteristics of new and old riders. This is one of a series of reports from the overall research effort, which includes the on-board study to determine rider characteristics as well as an in-home study to determine attitudes of nonriders and the reasons they do not use transit.

25 264762 AN EVALUATION OF A COMPLIMENTARY PASS PACKAGE AS AN ACCEPTABLE MARKETING TECHNIQUE FOR ATTRACTING NEW PASSENGERS TO URBAN BUS TRANSIT LINES. The urban bus transportation industry's dramatic patronage decline since the Second World War has resulted, in part, from transit management's lack of a marketing awareness. Only through a complete marketing program can the industry determine and

provide various services to meet the diverse needs of the community. This research examines a complimentary pass package distribution, one of several marketing "tools" available to transit management, in terms of its ability to attract new passengers to urban bus transit lines. Part one of the study examines, by means of a survey of transit operators, any past uses of complimentary pass packages in ridership promotion campaigns. Part two distributes complimentary pass packages to a random sample in a selected city and determines subsequent pass utilization by various market subgroups. An attitudinal survey of pass recipients' feelings toward various transportation issues is also conducted.

25 265327 DO OUTSIDERS PAY THEIR OWN WAY ON MARTA? This article studies the Metropolitan Atlanta Rapid Transit Authority public transit system which integrates rail and bus transportation into one unified, complementary system. It is financed in part by taxes collected in the two counties it serves; however no attempt is made to discriminate against passengers from outside the area who may not have paid as much in MARTA taxes as have residents of the taxpaying area. Some such costs are under consideration, focusing specifically on applying special charges to nonresident autos parking in the park-and-ride facilities. This analysis shows that it is likely that residents of the MARTA area will be somewhat better off to encourage outsiders to use system, especially when it is noted that the job of policing outsider use is, in itself, a fairly costly exercise if it is to be effective.

25 301225 THE EFFECT OF FARE REDUCTION ON TRANSIT RIDERSHIP IN THE ATLANTA REGION. SUMMARY REPORT NO. 2--ANALYSIS OF NON-TRANSIT USER DATA. This paper discusses the results of interviews of Fulton and Dekalb County, Georgia residents concerning ridership of the Atlanta Region Bus System. Nonusers of the bus system generally expressed a favorable opinion of the quality of service. However, it was found that public awareness of the fare reduction of 15 cents was quite low: although, it had been publicized for several months prior to the start of the survey. More than one-half of the new riders interviewed in the on-board survey stated that reduced fare was the reason they began riding the bus.

Metropolitan Atlanta Rapid Transit Authority, Atlanta Regional Commission, Urban Mass Transportation Administration GA-09-0009, Dec. 1974, 17 p., Figs., Tabs.; In cooperation with Atlanta Regional Commission and Georgia State Department of Transportation.

25 301228 THE EFFECT OF FARE REDUCTION ON TRANSIT RIDERSHIP IN THE ATLANTA REGION. The ridership for the first 12 months of operation under the reduced fare of 15 cents (3/1/72 to 2/28/73) was 14.6 percent over that of the preceding year and 20.6 percent greater than the ridership estimated under continued Atlanta Transit System operation. However, based on data from the on-board survey, the indicated increase in ridership for the twelve months ending June 30, 1973, was 30.2 percent taking into account additional fare-induced trips made by old riders, new rider trips, and using continuing old rider trips as a base. During the initial months of reduced fare service, trips by new riders comprised 90 percent of the additional ridership with virtually all induced tripmaking by old riders taking place on weekends. Almost two-thirds of weekday new riders previously made the trip in an automobile--nearly two-thirds of which were drivers. New drivers are generally younger and wealthier than old riders, with a high proportion of males and whites; and a greater percentage of them use transit for making non-work trips.

25 301268 URBAN FARES POLICY. This book explores a number of issues concerned with how public transport services in towns should be charged for. Rural and inter-city services are not considered in their own right, though many of the arguments and conclusions might be applicable there as well. Although written from a practical standpoint, an attempt has been made to unravel certain theoretical issues as well, with the aim of at least partly narrowing the gap between theory and practice that exists in so many disciplines. The earlier chapters review the practical and theoretical difficulties of taking decisions in a complicated environment and in the face of multiple and conflicting objectives. Some new management solutions are suggested which take account of inflation and of the constitutional and organisational framework within which fares policy decisions have to be taken in many industrialised cities. Current fares initiatives round the world are then described and their implications considered. Finally, by way of example, the impact of different fares policies is analysed in detail for London, concentrating particularly on their social implications. /Author/

25 301455 DENVER OFF-PEAK FREE PUBLIC TRANSIT EXPERIMENT. This report presents an initial evaluation of the Denver, Colorado systemwide off-peak free-fare transit demonstration project. The demonstration began in February 1978, with "Transit Awareness Month", sponsored by the Denver, Colorado Regional Transportation District (RTD). In March 1978, the Urban Mass Transportation Administration provided assistance to continue the program for an additional eleven months. The Denver project investigates the effects of the elimination of off-peak fares on transit operations and costs, ridership, public attitudes, and regional travel patterns. This study relies solely on data available from RTD, which included operations management reports, two on-board surveys done in February and July by the RTD and various routine systemwide ridership counts. The Denver experiment indicates that a systemwide free-fare program can be implemented with fairly minimal disruption and attract many new riders to transit during low-productivity hours. The distribution of the benefits of such a program among socio-economic and racial groups appears to be similar to that of the prior transit service. The cost of such free service is very high, constituting a major obstacle to implementation in most cities. However, if further study in Denver supports early indications, temporary free fare programs may be more successful in increasing the permanent ridership base than any other strategy yet attempted. The limited scope and quality of these data make possible only the most general findings. A major UMTA/TSC evaluation now in progress will include the development of more complete and reliable data, and may produce results which differ significantly from these early observations. /UMTA/

25 301836 A STUDY OF TRANSIT FARE POLICIES, FARE STRUCTURES, AND FARE COLLECTION METHODS. The project involves the studying and bringing together of material on the three elements of transit revenue collection: fare policies, fare structures, and fare collection methods. Theoretical aspects and practical experiences are both examined. Another objective of the project is to determine whether or not there are deficiencies in existing fare collection methods which constrain their usefulness. The authors find a significant lack of uniformity in fare policies. /TRRL/

25 302804 METHODOLOGY FOR THE SETTING UP OF TARIFFS FOR THE TRANSPORT OF PASSENGERS BY ROAD [Metodología para la fijación de tarifas de transporte de pasajeros por carretera]. In order to obtain greater coordination between the various transport modes, the Colombian government has proposed a study of the methodologies for establishing tariffs for the public transport of passengers by road. The proposed aim requires a preliminary definition by the government, of a series of policy aspects which influence the tariff system, these aspects being defined as follows: the economic efficiency of investment in this sector, professional aspects concerning the workers in the transport companies, level of service offered, mean duration of investments, systems of financing and periods between revisions of tariffs. It is also necessary to take into account in the cost evaluation, the characteristics of the highway infrastructure and the prevailing environmental conditions. A mathematical model is proposed which gives the tariff for each level of service, as a function of cost and benefits. (TRRL) [Spanish]

25 303281 43RD INTERNATIONAL CONGRESS-HELSINKI 1979. RATIONALISATION OF FARE COLLECTION-SCOPE AND LIMITATIONS. A survey was made of 103 transit organizations world-wide that have been employing automated fare collection methods. They were asked about the types of equipment and methods they were using and their experiences with them. This report is based on their replies. After an introduction, several sections deal with technical data from the questionnaires regarding operating peculiarities, the fare system, payment principles, methods of issuing tickets and control of right of access to transport system, and the constraints of automatic fare collection. Other sections deal with the effects of such systems on both staff and passengers and attempt to weight their benefits against their costs, as to speculate on future trends. (In general, modifications of current systems, rather than wholesale conversions, are seen to be the trend for the immediate future).

25 303946 INTERIM ANALYSIS OF THE FREE-FARE TRANSIT EXPERIMENTS. This paper summarizes the early results of the two systemwide off-peak free-fare transit experiments being conducted in Trenton, New Jersey, and Denver, Colorado. These experiments, which are sponsored by the Urban Mass Transportation Administration (UMTA) under its Service and Methods Demonstration Program, are the first free-fare programs of such size and comprehensiveness. The demonstrations have already provided a number of interesting, if still tentative, conclusions. The first major conclusion is that, while free fare induces large and sustainable

ridership gains (19 percent in Trenton and 34 percent in Denver), the general aggregate behavior of the population in making their modal choices is not significantly different from what it would be with any other absolute change of an equal amount. The price elasticity of demand for transit implied by the Trenton results was -0.42, which is virtually identical to the transit industry's experience. Saturday evening youth riders and walk trips made up fully 7 percent of the ridership in the free-fare system in Trenton. The demonstration appears to have reduced the peak-load capacity requirements in Trenton's transit system and caused a dramatic shift from the peak to the off-peak. The most surprising finding was that complaints of rowdiness, vandalism, and other incidents increased at both sites to such an extent that some groups called for the abandonment of the experiments.

25 303948 REVENUE AND RIDERSHIP CHANGES IN ONTARIO CITIES CAUSED BY TRANSIT FARE INCREASES. This report describes the development, accuracy, and application of a simple method for predicting changes in transit-system revenue (ridership) caused by an increase in fares. The method is based on an empirical cross-sectional model and on data obtained from 29 Ontario transit systems for which all necessary ridership, revenue, and vehicle kilometer data were available. Analysis covered the period of the first nine months after the fare increase. Results show that revenue change caused by a fare increase is predictable and is a function not only of the increase but also of the distance (service level) change, past ridership trends, city size, level of transit service, and time elapsed after the increase. A change in vehicle kilometers can be expected to have a greater effect on revenue than an equivalent percentage change in fares would. The effectiveness of a fare change in producing increased revenue apparently decreases with the time elapsed since the increase.

Hajek, JJ (Ontario Ministry of Transportation & Communic, Can) *Transportation Research Record* No. 719, 1979, pp 26-32, 4 Fig., 4 Tab., 8 Ref.; This paper appeared in *TRB Research Record* No. 719, Transit Development.; ORDER FROM: TRB Publications Off

25 303949 WHO PAYS THE HIGHEST AND THE LOWEST PER-KILOMETER TRANSIT FARES (ABRIDGMENT). This paper takes a close look at fare equity, from the standpoint of the transit user, by investigating fares per kilometer paid by different groups of bus riders. The research consisted of an examination of the ridership profile of the transit system operating in the capital district of Albany, New York. The study showed that fares per kilometer vary greatly among different transit users and that, even when incremental fares are charged in addition to basic flat fares on longer intercity and intraurban routes, the fares per kilometer of bus trips tend to be inversely proportional to the length of bus trips. Work-to-home trips costs less per kilometer than non-work-related trips, and

people without cars or unable to use cars pay higher fares per kilometer on the average than those with cars available. The average fare per kilometer of peak-hour riders is less than that of off-peak riders. In addition, it was found that there was no appreciable difference in fares per kilometer paid by men versus women but that there is a tendency for fares per kilometer to rise as age increases from 18 to 65. Thus, current basically flat-fare systems tend to emphasize inequities already existing in society.

25 303950 FORECASTING DEMAND AND REVENUE FOR TRANSIT PREPAID PASS AND FARE ALTERNATIVES. This paper presents a relatively low-cost, easily implemented method for forecasting the demand and revenue impacts of alternative transit-fare prepayment (TFP) instruments and transit fares. In addition, alternative TFP strategies and their price implications are derived in some detail from basic TFP objectives. The forecasting technique focuses on computing price elasticities by individual market segments by using data from previous fare and service changes and then applying these results to forecast changes in the present transit system. The market segments are chosen to correspond with the issues being analyzed, thereby increasing the usefulness and accuracy of the procedure. To illustrate how the technique can be used to forecast the impacts of different monthly transit pass programs along with increases in transit fares, a case-study approach that uses local data from the Jacksonville, Florida, transit system was chosen. The data required in the analyses are typically available from most transit properties; therefore, the method is readily transferable to other areas.

25 307845 SUNDSVALLS TRAFIK AB-A STUDY OF INCOME FROM TICKETS AND FARES FOLLOWED BY A PLAN FOR A NEW TICKET AND FARE SYSTEM [Sundsvalls Trafik AB-studium av biljett-och taxeininkter med foerslag till nytt biljett-och taxestystem]. Sundsvalls trafik ab (stab) is owned by the commune and takes care of the public transport in the sundsvall area. The company has been greatly affected by increased expenses, which it has not been able to manage. It was decided that this transport business should be investigated and the expenses and their development were one part of the investigation. The purpose was to obtain facts about the income from the ticket sale and fares, to simplify the ticket sale, and to study the effects of the fare changes regarding passenger number and income. Background material was gained from interviews and statistics, the company's bookkeeping and earlier investigations in this field. The result is that stab is in a similar situation as most transport companies. The distribution of the income is not noticeably different from the average. STAB has more ticket types than other companies and the prices are among the highest in the country. The ticket variety could be simplified. The zone-division has been unified. Seasonal variations have been established. Immediately after the fare changes the ticket sale went down, but gradually it reached a level just below the level before the changes. (TRRL) [Swedish]

25 308037 AUTOMATIC FARE COLLECTION, TACKLING THE PROBLEMS. There are numerous advantages in the automated fare collection system, but is also has problems. Fare collection equipment built by Cubic Western Data as installed in the Washington, D.C. Metro System allowing the system to establish a variable rate fare structure based on distance travelled. The machines have produced higher revenues per passenger and lower operating costs. Other benefits are also noted. Problems which have arisen in the operation of these machines are described. A recent check at one station showed a third of the machines were out-of-order. The detrimental effects of cold weather and malfunctioning exit gates (also provided by the same manufacturer) are noted. The Cubic company soon instituted a program to minimize or correct fare collection problems. Additional equipment was installed, additional maintenance personnel were assigned, and the company began to develop better bill and coin handling equipment. Reliability analysis is also being performed as more operational data is obtained. Cubic's expanding export business is noted.

25 309105 THE REDISTRIBUTIVE EFFECTS OF REDUCED TRANSIT FARES FOR THE ELDERLY. Redistributive effects concern which socioeconomic groups pay for a particular program and which socioeconomic groups benefit from it. Considering the off-peak reduced fare for senior citizens required by UMTA section 5 funding, an analysis of the resulting financial implication is the first step in examining any redistribution. Knowledge of the number of rides switched from peak to off-peak times, the number of new off-peak rides generated and any cost changes are necessary. It appears that such a policy will likely lower net revenue. If the loss is not reimbursed, a redistribution from non-elderly and peak riders to the elderly users will result; if reimbursement is available, a different result will be obtained. A survey of the literature fails to establish whether reducing fares is preferable to directly transferred income as a means of redistribution. It is concluded that off-peak reduced fare is more efficient than reduced fare at all hours. Finally, the redistribution due to the reduced fare funding mechanism used in Illinois appears to favor the poor. (a)/TRRL/

Rock, SM (Illinois Institute of Technology) *Transportation Research. Part A: General* Vol. 13A No. 5, Oct. 1979, pp 361-365, 1 Fig., 1 Tab., 17 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 244300)

25 309526 SELF-SERVICE FARE COLLECTION, VOLUME I: REVIEW AND SUMMARY. Interest in the European system of fare collection for urban transit broadly known as Self-Service Fare Collection (SSFC) has been growing in the U.S. The European experience indicates the SSFC promotes greater operating efficiency and improved service delivery. The common features of SSFC--self-monitoring, fare payment, receipts, ticket inspection and penalties--represent substantial departures from the current operating procedures and existing

legal powers of U.S. transit systems. This 4-volume study, sponsored by the Urban Mass Transportation Administration, discusses the European SSFC system and the relative merits of the alternative approaches to self-service with respect to their application in the United States. Volume I of this study describes the European approach to and rationale for self-service fare collection; documents the experience European approach to and rationale for self-service fare collection; documents the experience European transit systems have had with using and enforcing these procedures; and discusses the relative merits of the alternative approaches to self-service with respect to their application in the United States. Volume II summarizes the information obtained from eleven European transit properties and one Canadian property. Volume III describes the equipment commonly used to support self-service operations in Europe and discusses the policy and design options which are presented during the selection and specification of equipment for self-service operations. Volume IV summarizes the legal issues of self-service operations in the U.S. transit environment; it also addresses labor, economic, liability, and accessibility issues of self-service in U.S. applications. 25 309859 THE ECONOMICS OF CONTRACT BUS SERVICES. An analysis is made of the prices charged by privately owned bus and coach companies for works and school contract services in a particular area. A regression equation is obtained which relates the contract price to the type of contract (works or school), vehicle size and distance run. This equation is used to compute the fare required for a works contract service to break-even at varying loads and journey lengths. This shows that it is unlikely that, because of their low capacity, break-even services could be operated with minibuses. In order to break-even at stage bus fares, a contract coach service would need to attract about 25 passengers. Increased loads would result in proportionally lower fares. To become financially attractive to car drivers a service would need to carry 40 passengers for an average journey length of at least 10 km. It is shown that, on average, each vehicle earned about ,150 per week from its peak hour contracts. Standard costing indicates that an equivalent period of stage-carriage operation would cost at least ,200 per week. (Author/TRRL)

25 310572 MARGINAL COST PRICING OF SCHEDULED TRANSPORT SERVICES. A DEVELOPMENT AND GENERALISATION OF TURVEY AND MOHRING'S THEORY OF OPTIMAL BUS FARES. Turvey and Mohring's theory is that the optimal price for scheduled transport services consists of (1) producer marginal cost plus (2) the difference between user marginal cost and user average cost. In the present paper it is argued that the "medium run" is pricing-relevant. In the medium run item (2) is generally negative because of "vehicle number economies" in user costs. Given co-existing "vehicle size economies" in producer costs, it follows that optimal pricing yields a financial deficit. The size of the deficit depends on the relative importance of the user costs and sensitivity for service accessibility in time and space. (a) (TRRL) [French]

25 310731 SELF-SERVICE FARE COLLECTION-LEGAL AND LABOR ISSUES. VOLUME IV. Self-service fare collection makes the passenger responsible for determining and paying the proper fare prior to taking a trip. Complete monitoring or control of the payment of the proper fare is not performed by vehicle drivers, station attendants, or automatic equipment; all or nearly all responsibility for fare enforcement falls to special personnel who randomly check compliance. This method of fare collection is frequently referred to as an "honor" system. However, self-service does not completely transfer responsibility to the passenger since random inspection by roving checkers is a necessary feature of self-service. The typical features of self-service represent substantial departures from the current operating procedures and existing legal powers of U.S. transit systems. This paper summarizes the legal issues of self-service operations in the U.S. transit environment. Also addressed are labor, economic, liability, and accessibility issues of self-service in U.S. applications. Volume I describes the European approach to and rationale for SSFC, documents the European experience, and discusses the relative merits of the alternative approaches to self-service with respect to their application in the U.S. Volume II summarizes the information obtained from a survey of European properties. Volume III describes the hardware required to support self-service fare collection and discusses the trade-offs associated with the various options for its deployment and with the numerous features available through the hardware. 25 310764 SELF-SERVICE FARE COLLECTION-HARDWARE CONSIDERATIONS VOLUME III. European applications of self-service fare collection are typically supported by a variety of automated equipment to facilitate ticket purchase and validation by passengers and ticket sales by drivers and station attendants. This report describes the common hardware

features employed by these ticket vending the validation devices and examines the general policy and hardware design trade-offs which need to be addressed by properties contemplating self-service implementation. Other volumes in this series cover various aspects of the self-service demonstration project being sponsored by the Office of Service and Methods Demonstrations, Urban Mass Transportation Administration. Volume I provides an overview of the European approach to the rationale for self-service fare collection; documents the experience European transit systems have had with using and enforcing these procedures; and discusses the relative merits of alternative approaches to self-service and respect to their application in the U.S. Volume II summarizes the information obtained from a survey of European properties. Volume IV reviews the legal and labor issues associated with self-service fare collection. (UMTA)

25 312087 AUTOMATIC TICKET BARRIERS-A SUMMARY RESEARCH REPORT. A programme of research with the aim of gathering information potentially useful for the specification of automatic ticket barrier systems was commissioned by the Transport and Road Research Laboratory, Departments of Transport and Environment. The programme had three main areas of research, namely: (I) field observations of three types of automatic ticket barriers in use by the public; (II) laboratory evaluations of five types of ticket barriers; (III) a ticket barrier engineering design appraisal. The studies have revealed useful information concerning the problems that face barrier users. The field observations quantified several user characteristics, including the quantity and type of luggage carried by passengers. The laboratory trials involved the evaluation of tripod, paddle and pneumatically operated barriers which included three different ticketing systems. The trials obtained data ranging from the impressions of subjects using the barriers for the first time to measuring flow rates for experienced users. All the trials included subjects ranging from the young and fit to the elderly and mothers with children. The research has shown that the barrier ticketing system is currently the major limiting factor of barrier performance. It can also cause a great deal of frustration and inconvenience to the user which could result in alienating the person from the system. The engineering appraisal of ticket barriers provided guidelines for the specification of technical performance. It also raised factors that should be given careful consideration during the early stages of specification formulation. This report summarises the work and main findings of the project.(a) see also IRRD abstract no 246161.

25 312088 AUTOMATIC TICKET BARRIERS-FIELD OBSERVATIONS, LABORATORY EVALUATION AND AN ENGINEERING APPRAISAL. A programme of research to gather information potentially useful for ticket barrier specifications was commissioned by the Transport and Road Research Laboratory from the Institute for Consumer Ergonomics and Department of Transport Technology, Loughborough University. The research comprised three main areas, these were: (I) field observations of three different types of ticket barrier; (II) laboratory evaluation of five selected ticket barriers; (III) an engineering appraisal of ticket barrier design. The field observations were taken from film of tripod and automatic barriers in use at London Transport underground stations and bi-directional tripod barriers at Glasgow central railway station. A description of the passenger sample was derived from the analysis of the film from each site. Analysis of the passengers' luggage showed that over 65% were carrying at least one item of luggage. Incidents of barrier misuse were categorised to obtain information about the problems encountered by passengers in the three transport systems. The proportion of passengers involved in misuse varied between the sites (from 3% to 16%) but problems concerning the ticket operation were the most frequent at each site. The laboratory trials to evaluate three manual barriers and two automatic (pneumatic) barriers were conducted using volunteer members of the public as subjects. The main areas investigated were; the problems encountered by first time users, the subjects' preferences for different aspects of the ticket barriers, (e.g. Ticket operation, perceived safety) and the flow rates for different subject groups and barrier operation conditions. Following the series of trials, subjects gave suggestions for improvements to the tested barrier designs. See also IRRD abstract no 246162.

25 312457 TRANSIT PASSES.....INNOVATIONS FROM BUSINESS AND TRANSIT. PART I: EMPLOYER-SPONSORED TRANSIT PASS PROGRAMS. PART II: EMPLOYER TRANSIT PASS PROGRAMS. This preliminary report has been compiled to disseminate information to those who use and benefit from promoting transit usage among employees. Part I of the report describes eleven representative employer-sponsored pass programs. Three types of pricing arrangements are described: employers purchase passes at regular prices and then offer them to employees at a discount; transit authorities sell at a discount to employers if the firm offers a subsidy to the employees; both employers and employees purchase passes at regular monthly prices. Aggressive marketing of programs can produce dramatic increases in monthly pass sales. This is illustrated by an effective campaign in Portland, Oregon. Preliminary results from the demonstration evaluation program show that transit pass programs sponsored by employers can be very effective in encouraging

transit ridership. In some cases, to 30% of those who have purchased passes have been diverted from the auto. Part II of this report briefly outlines the operations of the programs.

25 312461 POTENTIAL OF PRICING SOLUTIONS FOR URBAN TRANSPORTATION PROBLEMS: AN EMPIRICAL ASSESSMENT. This paper surveys the available empirical evidence on the elasticity of travel demand to assess the potential of pricing policies to alter travel behavior and thereby to solve various urban transportation problems. The first set of studies considers the responsiveness of fuel use to changes in gasoline price. The second set, econometric models of urban travel demand, estimates the direct and cross-price elasticities of the use of different modes with respect to different components of trip cost. The third set of evidence is composed of arc elasticity estimates based on the impacts on travel behavior of actual changes in the levels of roadway user charges and transit fares. For each study dealt with, the paper briefly summarizes its methodology, data base, and findings and subjects these to critical evaluation. The paper concludes with an evaluation of the body of results for the usefulness of pricing policies in urban transportation. (Authors)

25 313181 SHARE A FARE: A USER-SIDE SUBSIDY TRANSPORTATION PROGRAM FOR ELDERLY AND HANDICAPPED PERSONS IN KANSAS CITY, MISSOURI. The Share A Fare (SAF) program in Kansas City, Missouri, is a user-side subsidy program designed by the City to provide low-cost door-to-door transportation for the City's elderly and handicapped citizens. The City, acting as broker, coordinated between user and provider by enrolling participants, enlisting providers, and matching the two through the trip scheduling process. Share A Fare began operation in May 1977 and is totally funded through a 1/2 cent city sales tax designated for transportation purposes. After 20 months of service, SAF has 13,182 enrollees and subsidizes almost 11,000 trips a month. The transportation service is provided by three not-for-profit agencies, two taxicab companies, one for-profit medical provider, and three city-owned vans. The service is available for any Kansas City resident who is 65 years of age or older or physically disabled. SAF participants fall into two major categories: the affiliated rider, who is a client of a social service agency carrier, and the unaffiliated rider, who is a non-client. This final report documents the Share a Fare project during its first 20 months of operation.

25 313212 EVALUATION OF RIDERSHIP, REVENUE AND EQUITY IMPLICATIONS OF DISTANCE-BASED FARES FOR TRANSIT SYSTEMS. EXECUTIVE SUMMARY. The purpose of this project was to develop a micro-simulation model to evaluate the impact of selected distance-based fare policies on various sub-groups of the population in terms of revenue, ridership, and average fare paid in the Albany, New York Metropolitan Area, using data from an on-board ridership survey conducted by the local transit agency. The fare structure currently employed by most local or regional transit agencies consists of large zones within which passengers are charged the same amount regardless of the distance traveled. The micro-simulation technique was adopted because of the need to capture considerable detail at the level of the individual rider, which will permit subsequent aggregation by any desired characteristic such as age, sex, and trip purpose, for the equity analysis. The use of a disaggregate methodology also increases the model's potential for transferability. An interactive software package has been developed to implement the micro-simulation model.

25 314454 TRANSIT FARE PREPAYMENT DEMONSTRATIONS IN AUSTIN, TEXAS AND PHOENIX, ARIZONA. The report covers two demonstration projects, testing transit fare prepayment (TFP) innovations in Austin, Texas, and Phoenix, Arizona. The innovations consisted of two consecutive sales of prepaid tickets and passes at discounts of 20% and 40%, accompanied by expansion of sales outlet networks and intensive advertising and promotional campaigns. The purpose of the demonstrations was to measure the impacts of these innovations on: (1) the volume and mix of sales of the various TFP instruments; (2) the transit-riding levels; and (3) the transit costs and operations. In addition, special attention was given to evaluating the relative cost-effectiveness of the special advertising and promotional campaigns conducted in both sites.

25 316665 PLAN FOR TRANSIT FARE PREPAYMENT PROMOTED BY EMPLOYERS. This paper outlines a plan for the marketing program and the selection and solicitation of employers and their employees for participation in a transit-fare-prepayment program. Participating employers will make monthly transit passes available to their employees at their workplaces. The information in this paper was gathered from the experience of four transit systems and was applied to transit-fare-prepayment programs aimed at promoting a monthly transit pass through employers for single mode and multi-mode systems. The methods described in this paper yielded the most positive response, from employers and their employees, of the methods

tested. The plan described can be used as an aid for assisting transit systems in initiating similar programs. (Author)

25 319337 WHAT PUBLIC TRANSPORTATION MANAGEMENT SHOULD KNOW ABOUT POSSIBLE USER REACTIONS, AS SHOWN BY THE EXAMPLE OF PRICE SENSITIVITY. This paper shows that the decrease in demand for urban public transportation if fares are increased can only be predicted accurately by studying the users of public transportation and the possible ways they might react to fare increases. In order to do this, the paper categorizes the users of public transportation according to factors that influence their demand for public transportation. Those persons who have alternative modes of transportation available to them are identified and divided into groups that are sensitive or not sensitive to price increases. These different factors make it possible to estimate the decrease in demand for public transportation if fares are increased. Furthermore, the paper stresses the importance of two groups of persons who do not directly cause a decrease in demand for public transportation. The first group are those persons who have no alternative to the use of public transportation but would be severely hurt economically by fare increases. The second group are those persons who would complain about price increases but would continue to use public transportation. The former group gives useful information on the public's ability to pay, and the latter group indicates the probable public reaction to a fare increase. (Author)

25 319587 PEAK-PERIOD SUPPLEMENTS: THE CONTEMPORARY ECONOMICS OF URBAN BUS TRANSPORT IN THE UK AND USA. This report is concerned with the worsening economic viability of bus public transport in the US and Britain, and the constraints of management and regulatory attitudes and practices that

have kept the industry from efficiently adjusting to its changing market. The report considers the growing orientation of transit service to peak periods, most prominently a result of the larger decline of off-peak demand relative to that of the peak. It is proposed that established public transit authorities (pta's) begin to divest of their sole (monopoly) responsibility for peak-period service provision, and develop a role for coordinated peak-period supplement services. The first chapter describes the industry's present dilemma, that expansion of service in peak-periods requires inordinate subsidy. The supplement innovation is shown to represent a fundamentally different operating framework than has been dominant in the industry. Chapter 2 describes the role and function of supplements. Chapter 3 reviews a variety of trends, observations, and assessments of the industry. It documents the evolution of a more difficult demand structure and operating environment, and reviews findings of recent (primarily UK) studies of public transport service provision and cost allocation, showing that deficits are primarily attributable to excessive peak-period orientation. The industry's poor and worsening productivity record, and the growth of deficit are assessed. Chapter 4 overviews recent UK developments in cost allocation methodology for bus transport, which provide enormous improvement over the long-used average cost assessment methods. Chapter 5 discusses the inefficiency-inducing effects of dated industry practices, and concludes that supplements are a practical and feasible approach to improved efficiency, as a surrogate application of marginal cost pricing. Chapter 6 briefly describes some examples, mostly recent us innovations, that support the supplement concept. The concluding chapter argues that efficiency and service maximization must become central objectives of modern public transport provision. Appendices, references, and bibliographies are included. 25 322262 TRENDS IN FAREBOX RECOVERY. Fare revenue is closely intertwined with two other areas of transit policy: the level of service and the level of the operating subsidy. The fare revenue plus operating subsidy must equal operating expenditures. At any given level of operating subsidy, a transit system has a wide range of options in fare policy and service policy. The article concludes that fare reductions would not be an effective means of helping transit conserve energy; stability in fare and subsidy policy can help enhance long-range planning in facing the 1980's; external factors have a great influence on farebox recovery; transit orientation in a community is a matter of history, and it cannot be changed in a short period of time--fare policy alone will not do it, and there is a need to look beyond money issues at the attitudes and assumptions about transit in a community.

Warren, RM (Toronto Transit Commission, Canada) *Transit Journal* Vol. 6 No. 2, 1980, p 35; ORDER FROM: American Public Transit Association, 1225 Connecticut Avenue, NW, Washington, D.C., 20036

25 324328 REPORT OF THE REGIONAL TASK FORCE TO REVIEW THE METRO FARE SYSTEM. This report was prepared by a task force directed to evaluate the advantages and disadvantages of the existing fare collection equipment and the present fare structure, including their impact on transit riders and jurisdictions, and to consider other collection systems and fare structures including those using turnstiles. The findings of the task force are summarized. These findings relate to the following areas: capital, operating and maintenance costs; adaptability to a mileage-based fare structure; interface capability between Metrobus and Metrorail, flexibility of the system, susceptibility to abuse, subsidy formulae, distribution of revenues, equity among jurisdictions, effect of fare collection system on patronage and rider attitude, and ability to serve Metrorail beyond the 101-mile system. Details are given of the alternative evaluation criteria and assumptions, the evaluation of alternative fare collection systems, as well as other considerations.

25 328240 FREE PARKING AS A TRANSPORTATION PROBLEM. As many as 40 percent of all those commuting by auto to the downtown areas of U.S. and Canadian cities appear to park free at their destinations. This surprisingly widespread practice is a significant but overlooked determinant of mode choice. The study attempts to estimate how many of those who are offered employer subsidized parking decide to drive alone rather than commute by carpool, transit, or another means. The best estimate appears to be that approximately 20 percent of those who now drive alone and receive free parking would form carpools or begin using transit for the trip to work if required to pay for parking. This estimate reflects the results of a variety of mode choice models, as well as comparisons of the behavior of similar commuters who park free and who pay for parking, and the results of imposing charges for parking formerly provided free. The major incentive for employers to provide free parking appears to be the fact that as a fringe benefit, free parking escapes income taxation. Enforcing the reporting and taxation of its cash value, however, is a difficult and predictably unpopular approach. Instead, this study recommends two policies intended to extend the subsidy for work travel now enjoyed by many drivers, in the form of free parking, to travel by other modes: (1) amend the Internal Revenue Code to permit employers to pay employees a tax-exempt travel allowance in lieu of free or subsidized parking; and (2) extend free parking only to drivers who carpool (e.g., only to autos with three or more occupants). Both policies promise significant increases in carpooling and transit use at very low or no public expense.

25 330174 RELIABILITY OF FARE-COLLECTION SYSTEMS FOR RAIL TRANSIT: AN OVERVIEW. The present performance of graduated-fare automatic collection equipment is compared with that of similar fare-collection systems, desirable performance is estimated, and research and development needs are identified. A series of flowcharts for three actual rail systems that indicated the range of functions and approaches that could be incorporated into a fare-collection system were developed. Queuing models could not be used directly to estimate the impact of the collection system on passenger flow without developing a two-stage model by use of the binomial probability distribution. Reliability data were collected by using interviews and the review of operating records. The data-collection methods varied greatly. Mean transactions between failures was found to be a useful and practical measure for comparing equipment reliability. The operating costs of rail transit fare-collection systems vary between 7 and 31 percent of revenues collected. The reliability of fare-collection equipment varies between 40,000 transactions/failure for a token-accepting turnstile to several hundred transactions per failure for a stored-value farecard vendor. Improved performance is obtainable, but the potential extent is unclear. Systems with a combined reliability of 0.22 percent failures/passenger can function without station attendants. It is important to specify failures in terms of component replacement and in terms of clearing of jammed tickets or money. The results provide an initial basis for comparing the performance of alternate fare-collection systems and focusing development resources.

Rubenstein, L (Jet Propulsion Laboratory) *Transportation Research Record* No. 760, 1980, pp 46-53, 3 Fig., 5 Tab., 8 Ref.; This paper appeared in TRB Research Record No. 760, Rail Transit Planning and Rail Stations.; ORDER FROM: TRB Publications Off

25 345230 SELF-SUSTAINING PUBLIC TRANSPORTATION SERVICES. Between 1970 and 1978, transit deficits in the United States grew by over 700%. The rapidly mounting deficits are of great concern because governmental outlays for transit cannot be expected to grow indefinitely. If transit service is to continue to expand, it is likely that means will have to be found to narrow the gap between revenues and expenses. This paper surveys three U.S. transit systems which have been self-supporting in the sense of passenger revenues covering operating costs. From a detailed examination of fares, level of service, costs and characteristics of areas served by these systems, in comparison with the same descriptors of conventional loss-incurring transit systems, there emerges an overall concept of a self-supporting transit service. It is characterized by high quality of service, a relatively high fare, a targeting of the service toward users who are willing to pay for the high level of service provided; and finally, providing information that is readily available to both regular transit users as well as prospective new riders. The final section of the paper considers whether the concept is generalizable, and discusses some possible objections to the institution of such service. (Author/TRRL)

26 041295 MOVING PEOPLE SAFELY. The 166-page paperback was prepared as a means of enhancing the already enviable safety record of the rail transit industry. It contains guidelines in a number of areas of safety and is intended not only for those systems now operating but also for the systems which are now building or are being planned. From the guidelines in this volume it is intended that specific safety rules can be prepared for each system. The seven chapters cover Safety First, Inspections: Facilities; Inspections: Cars; Inspections: Communications; Power; Uniform Code of Operating Rules; and Emergency. There is also a section on uniform accident reporting.

26 051401 SYSTEM SAFETY AND RAPID TRANSIT PROJECTS. This paper is a brief review of Systems Safety and its relationships to transit projects. Hopefully, it will lead to a better understanding of the unique problems presented by the transit industry. System Safety is now and

will continue to play a significant role in the transit industry. Its value, in proper perspective, is obvious. However, its success in the future will depend on how well we keep in mind the relative importance to society of pursuing the elusive goal of a perfect safety record versus accomplishing the mission at hand, which is to review the vehicular congestion of our urban areas.

26 051404 BART SCALE MODEL SAND BUMPER ARRESTOR TESTS. Scale model tests were performed to evaluate the effectiveness of an end-of-track sand bumper arrestor. The tests were conducted using a 1/15 replica of the BART A car at scale speeds to 80 mph. A second dummy car was used to model a two-car train and scale speeds to 60 mph were tested. The results indicate that a 24-ft sand bumper would be effective to approximately 20 mph with a two-car train and speeds below that with longer trains. Increasing the bumper length will improve the stopping power, but beyond 50 ft the first car has risen above the 3-1/2 ft high sand bumper and is unstable. A scale model sled-sand braking system was tested with a single BART car and was found to be effective up to 80 mph.

Krachman, HE (Developmental Sciences, Incorporated) McCutchen, WR (Bay Area Rapid Transit District); American Society of Mechanical Engineers Paper 73-ICT-75, Sept. 1973, 8 pp, 6 Fig; Contributed by the Intersociety Committee on Transportation for presentation at the Intersociety Conference on Transportation, Denver, Colo., Sept. 23-27, 1973.; ACKNOWLEDGMENT: ASME Journal of Mechanical Engineering; ORDER FROM: ESL, Repr PC, Microfilm

26 051939 LOW-SMOKE CABLE MADE FOR SUBWAYS. The Okonite Corporation has started production of its new Okonite-Okoprene VFR/LS (Very Flame Resistant/Low Smoke) jacketed control cable. The cable uses the standard Okoprene insulation, retaining the physical and electrical characteristics of regular railroad signal cable. Smoke emission from either the control or power cable is reduced by approximately 55%, compared with the standard design, when subjected to external flame. The small amount of smoke given off is white and translucent but seems to be of sufficient density to actuate smoke detecting equipment. The new organic jacketing approximately doubles the time required to short-circuit a control cable during flame testing. The new cable is also noted for not showing any candlewick effect.

26 054310 MONTREAL TIGHTENS UP FIRE PRECAUTIONS. Tenders to be opened on March 21 for 423 pneumatic-tyred cars required as part on Montreal's 1976-78 metro expansion programme must comply with a new specification designed to reduce heat build-up in tunnels and the associated risks of fire. Floors, walls and

ceilings must be of material which does not release noxious gases when heated, and each car must carry fire extinguishers and emergency tools. Choppers with provision for regenerative braking will reduce the amount of waste heat generated, but ventilation inside the cars will also be improved.

26 057860 LIGHTING EFFECT IN THE SMOKE OF TUNNEL FIRE. To investigate an appropriate lighting system for safe evacuation of passengers from tunnels and to compare three types of lamps--fluorescent, high-pressure mercury and high-efficiency sodium--in transmittance through fire and smoke and as normal tunnel illumination, measurements were carried out. Also checked was the visibility in smoke of indicator lamps showing location of telephones and other facilities. As a result of test, a 40-watt fluorescent lamp was chosen for tunnel illumination and a 20-watt fluorescent for indicator lamps. Through these tests, it has been made clear that even if surface luminance of an indicator lamp exceeds 1000 cd/sq m, the threshold smoke density does not increase correspondingly.

26 057881 RAILROAD ACCIDENT REPORT. COLLISION OF THE STATE-OF-THE-ART TRANSIT CARS WITH A STANDING CAR, HIGH SPEED GROUND TEST CENTER, PUEBLO, COLORADO, AUGUST 11, 1973. On August 11, 1973, the UMTA state-of-the-art rail rapid transit cars (SOAC's) collided with a standing railroad gondola car at the U.S. Department of Transportation's High Speed Ground Test Center near Pueblo, Colo. The SOAC's were being operated on the transit test track when they were inadvertently diverted through a switch onto an adjacent track and into the gondola. The motorman on the SOAC was killed. The National Transportation Safety Board determines that the probable cause of this crash was the failure of a locomotive crewmember to align a switch properly and the failure of the motorman to detect the open switch in sufficient time to stop the SOAC's short of a gondola standing on the track. Contributing to the accident were the failure of the Transportation Systems Center's representatives (UMTA's systems manager) to implement operating procedures that would secure the intended pathway and the absence of a systematic risk management program at the Highway Speed Ground Test Center. This report examines the crashworthiness of the SOAC's and the institutional errors that led to the accident. Recommendations intended to prevent a recurrence of the accident and to improve crashworthiness of rail transit cars are directed to the Federal Railroad Administration and the Urban Mass Transportation Administration.

26 072083 SAFETY IN PUBLIC TRANSPORTATION. Safety is an important consideration in public transportation both economically in terms of equipment repair and medical costs, and psychologically in terms of public acceptance. Accidents result primarily from human failures, both of operating personnel and passengers. Less than ten per cent are due to equipment failure of abnormal conditions. Accidents are more likely where a roadway is shared. The calculation of accident seriousness is quite complicated. The numbers of injured, the gravity of the injuries, and the cost of the injuries are possible measures, expressed per passenger-trip, -hour or -kilometer. Figures also vary depending on whether or not suicide attempts and illnesses are counted. Safety regulations cover equipment, operations, personnel, and passengers, but are usually created in response to the occurrence of some accident, rather than as a result of foresight.

26 072559 SAFETY AND AUTOMATIC TRAIN CONTROL FOR RAIL RAPID TRANSIT SYSTEMS. The anticipated construction and expansion of rail rapid transit systems in the United States over the next 10-15 years implies major capital expenditures. A significant level of automation in train control is likely to be central to these systems. The potential safety problems associated with various implementation alternatives, several possible levels of automation, and uncertainty in the corresponding proper role of the human operator raise issues requiring timely resolution. This report describes the state-of-the-art in rail rapid transit system automatic train control, assesses the safety related interrelations between the train control system, functions of the human operator and other portions of the total system, and makes recommendations, based on current experience, to aid the process of planning, funding approval, design, implementation, test, safety certification and operation of new systems or modifications of existing systems. The Study suggests that the Federal Government develop safety criteria by which to evaluate future proposals and establish guidelines for safety certification procedures. It also concludes that knowledgeable application of system engineering skills and advanced development program techniques together as a process, are probably more important to achieving a successful new rail rapid transit system than are individual design decisions or application of advanced technology.

26 080091 FIRE EXPERIMENTS OF COACH. As part of the equipment development program of the Japanese National Railways, steps are being taken to step up the fire prevention and protection qualities of passenger cars. Because of

the high speeds, long tunnels and subways in which trains operate, and the large amount of new rolling stock which is planned, preventing train fires is given high priority. The resistance of various seat upholstery materials to ignition from a burning newspaper were checked initially. Subsequently the same second class coach was ignited and the fire allowed to burn fiercely with smoke concentrations, gasses and temperatures monitored as the conflagration continued inside the standing car. Further work on fire suppression is planned.

26 080349 SAFETY EVALUATION OF MASS TRANSIT SYSTEMS BY RELIABILITY ANALYSIS. A problem-independent concept for the reliability analysis of complex systems is presented. A method of system reliability analysis which is based on a selection of generally applicable mathematical models and computer programs for efficient numerical evaluation of the models emerges from this concept, general safety model based on the same reliability analysis techniques and procedures is presented. A case study shows the application of the safety models and the methods of reliability analysis.

26 080793 A STUDY OF THE DYNAMICS OF PEDESTRIANS AND GENERALLY UNSUPPORTED TRANSIT SYSTEM OCCUPANTS IN SELECTED ACCIDENT MODES. Pedestrian impact accounts for approximately 20 percent of the motor-vehicle-related fatalities in the U. S. and over 40 percent in some European countries. Despite the magnitude of this problem, however, until recently virtually all experimental research in the area of crash injury reduction has been concentrated on developing knowledge systems, and devices which will increase the probability for survival or reduced injury of conventionally seated vehicle occupants. An in-house program to study the pedestrian/vehicle impact problem indicated that one of the factors responsible for the relative lack of experimental effort on pedestrian impact injury attenuation was a basic lack of an experimental methodology which could treat this complex accident mode in a highly controllable-repeatable manner (e. g., in a manner similar to the crash simulation procedures utilized extensively in the development of seat belts, energy-absorbing steering columns, etc.). The subject study, therefore, proceeded to develop an experimental test methodology which could utilize actual or "stylized" vehicle front end structures mounted on a Hyge sled to impact "pedestrians" simulated by instrumented anthropomorphic adult and child dummies. A total of 22 fully-instrumented pedestrian-vehicle sled shots were conducted, and the results indicate that a very viable methodology has been developed. The results also indicate that (1) work on vehicle profile modifications and/or energy absorbing schemes should be fruitful and (2) the same basic test methodology should prove useful

in addressing the problem of crashes involving generally unsupported occupants such as standees riding in a mass transit vehicle.

26 082729 SAFETY IN MASS TRANSIT: A CASE STUDY OF BUS ACCIDENTS IN WASHINGTON, D.C. The purpose of this report was to obtain an increased understanding of the variables involved in transit bus accidents. It is a case study of bus accidents in Washington, D.C. The methodology is an analysis of 1971 District of Columbia police accident reports that have a bus coded as one of the vehicles involved in the accident. To give the research perspective and facilitate the development of a research design, the future role of transit buses in urban transportation and traffic safety was analyzed and a review of relevant traffic safety research and programs was conducted. It is in the area of injuries that transit buses have their greatest safety problems. Factors in the operating environment such as traffic congestion, intersection width, differences in maneuverability between vehicle types, and route design were found to have an important role in the frequency and severity of transit bus accidents. Because vehicle design is significantly circumscribed by the requirements of intracity bus service, improved bus safety requires, according to the author, a reduction of safety hazards in the operating environment in addition to vehicle design innovation. Recommendations for reducing safety hazards in the operating environment are made and an inexpensive safety program for implementing these recommendations in different metropolitan areas is proposed. /UMTA/

26 093610 CRASHWORTHINESS ANALYSIS OF THE UMTA STATE-OF-THE-ART CARS. An engineering assessment of the crashworthiness of the UMTA State-of-the-Art Car (SOAC) has been conducted as part of a program to provide safer transportation to urban rail vehicles. Crash dynamics and crashworthiness methodology based on post-yield energy absorption characteristics and a 'weighted acceleration' severity index has been applied. Sensitivity studies have been conducted to show the effect of car buff strength, passenger relative velocity, passenger spacing, and cushioning on casualties as defined by the severity index. Major gains in injury reduction through improved internal cushioning are indicated. The prevention of car penetration by override is treated. The SOAC collision dynamics model is validated by comparison to the SOAC-gondola accident of August 11, 1973, and by comparison to a nonlinear finite element mathematical simulation of the SOAC in crash conditions.

26 094558 HIGHWAY ACCIDENT REPORT: SISKIYOU UNION HIGH SCHOOL DISTRICT SCHOOLBUS/AUTOMOBILE COLLISION AND ROLLOVER, I-5, ASHLAND, OREGON, MAY 9, 1975. On May 9, 1975, a 1972 schoolbus carrying 20 persons crashed through a section of guardrail on the northbound portion of Interstate 5 in Ashland, Oregon. The vehicle fell down a steep slope and rolled about its longitudinal axis before it came to rest in an upright position about 213 feet from the edge of the pavement. Except for one sidepost-roof bow connection, the roof separated from the bus body. Nineteen of the 20 occupants were ejected through the gap created by the roof separation. Of the 19 occupants ejected, 3 were killed and 15 were injured. The only occupant who remained in the bus was not injured. The National Transportation Safety Board determines that the probable cause of this accident was: (1) The failure of the schoolbus driver to select the proper gear to descend the steep grade, and (2) the maladjustment of the brakes on the bus.

26 094690 A FIRE HAZARD EVALUATION OF THE INTERIOR OF WMATA METRORAIL CARS. A series of fire tests was conducted for the Washington Metropolitan Area Transit Authority to assist them in assessing the potential for fire hazard in the new Metrorail subway cars. Results of small-scale laboratory tests were found inadequate for this assessment. Results of full-scale tests on mock-ups of the interior (and on a real car for a smoke penetration test) show that the potential for hazard arises primarily from the seat padding and covering and from the plastic wall lining. The hazard arises both from smoke development and from spread of flame and heat. The times to reach unacceptable conditions has been determined for several test conditions. It is recommended that the authorities review these times in the context of what they consider to be appropriate times for safe escape. Recommendations are made for increasing the amount of time available for escape. These would require changes in the seating and wall lining materials.

26 096326 SAFETY PRIORITIES IN RAIL RAPID TRANSIT-VOLUME I REPORT. VOLUME II-EXHIBITS. Rail rapid transit enjoys an enviable safety record in the field of transportation. It produces the lowest number of fatalities of any of the major passenger transportation modes. Despite the position that rail rapid transit enjoys with respect to other public carriers, accidents have happened, and it is this fact that prompted the Urban Mass Transportation Administration (UMTA) in 1973 to fund a Grant Project (DC-06-0091) on Rapid Rail System Safety. The grant recipient was the Transit Development Corporation (TDC) who was assigned the task of developing and designing a plan reflecting the safety priorities and requirements of the rail rapid transit operating properties. This report describes the techniques and procedures used in fulfilling the task assignment and the results. TDC utilized the contributed services of rail rapid transit industry experts in developing a program that identified what should be done to aid in assuring that rail rapid safety continues. All aspects of rail rapid transit safety were reviewed, hazards were identified, priorities established and suggested remedial action endorsed.

Connell, WM ; Transit Development Corporation, Incorporated Final Rpt. UMTA-DC-06-0091-75-1, Mar. 1975, 316 pp, Figs., 27 Ref.; Contract DC-06-0091; ORDER FROM: NTIS, Repr. PC, Microfiche

26 097324 FIRE-RETARDANT CABLE SYSTEMS. The increasing use of nonmetallic cables in cable trays for industrial applications as recognized in the 1975 National Electrical Code, Article 340, mandates that these cables be suitable for this application and that the outer sheath be flame-retardant. The significance of various flame tests is discussed, and data obtained following procedure and modifications of IEEE Standard 383-1974, Section 2.5, are presented. It is evident that nonmetallic sheathed tray cables are available that will comply. Furthermore, when a flame-resistant jacket is applied over type ALS, MC, or AC armored assemblies, it results in an exceptionally rugged, corrosion, and flame-resistant nonpropagating construction.

26 099009 ACCIDENT PREVENTION IN RAIL TRANSIT. Rail Transit, one of the safest modes of transporting people, will carry more and more passengers in the next decade as metropolitan areas expand transit facilities to offset combustion engine pollution and automobile congestion. This paper discusses the need for system safety emphasis in this expansion, who must contribute, and a manufacturer's approach to fulfilling his responsibility in the effort. A summary of current and anticipated transit systems in areas such as New York, Philadelphia,

Boston, Chicago and San Francisco is given for background. Then the roles of the passenger, transit authorities, manufacturers, government and public in enhancing the safety of these systems is postulated. Within this framework the author's approach to conducting an effective yet practical application of system safety in car building is described. The basic elements include: 1) judicious combination of management and technical resources, 2) qualitative hazard identification, criticality ranking, and reduction efforts, 3) design reviews (broad perspective) 4) manufacturing practices (quality), 5) awareness, training and credibility, and 6) accident data feedback. However, in the end, a minimum risk transit system depends on the cooperation and contribution of owners, builders, passengers and the public. /Author/

26 125502 SCIENTIFIC FREEDOM AND RESPONSIBILITY. Science and its applications now affect the quality of life for everyone, largely technological developments that can bring great benefits but can also expose us, and our environment, to grave and often unforeseen hazards. Scientific experts who feel an obligation to speak out on such issues may come into sharp conflict with their employers, or with other vested interests. This report maintains that the professional societies should assume a greatly increased responsibility for their members, in conflicts that involve defense of the public interest on issues related to the professional competence of the members of the society. The difficulties associated with this proposal, and possible ways of solving them are discussed. Some of these problems are illustrated by the case of the three Bay Area Rapid Transit engineers who warned of dangerous deficiencies in the BART automatic control system. /HRIS/

26 126404 STATISTICAL STUDY OF TRAM DRIVER ACCIDENTS. Two basic hypotheses are considered; The accident proneness theory

and the spell theory. These hypotheses were tested on the basis of a correlation analysis of accident distribution in a group of tram drivers over a five year observation period. The analysis showed the negative binomial distribution and the "short" distribution were successfully fitted, while the Poisson distribution significantly differed from the observations. Correlation analysis showed a significant correlation between the number of tram driver accidents over different periods, and that this correlation, although decreasing with an increase of the interval between observation periods, remained significant. The conclusion is that the proneness hypothesis explains more satisfactorily than the spell hypothesis, the occurrence of accidents in tram drivers during the observation period.

26 127048 SAFETY IN URBAN TRANSPORTATION: GUIDELINES MANUAL AND RESEARCH REPORT SUMMARY. An investigation was carried out with the purpose of providing information and reporting the results of analyses about the current level of safety and the need for additional safety effort in urban mass transit. The Research Report Summary outlines the steps followed in the investigation, and serves as an introduction to the final report which is now in preparation and will contain a full presentation of data on the safety performance of all passenger transportation modes, comparative analyses of their safety problems, and the rationale underlying the strategy and practice of safety management recommended in the report and reflected in the guidelines manual. The manual presents a series of organizational and technical safety guidelines designed for use of the transit management community. The guidelines are intended to show how the transit industry--supplier firms and operators--can develop programs that will assure satisfactory operational safety levels. By describing ways in which suppliers and operators can set logical safety goals and establish organizations and engineering procedures to attain them, the manual sets forth a model for industry management and for basing the interaction, regarding safety, between pertinent Government agencies and the transit industry. The manual covers the following topics in separate chapters: foundations of safety in urban mass transportation; safety management and planning; techniques for safety analysis; trade-off considerations; system safety data base; safety standards and specifications; and intermodal interface safety considerations. These guidelines are in the form of suggested or recommended practices accompanied by explanation. They are designed to have a considerable latitude of user interpretation so they can fit the wide variety of specific situations found in the transit industry.

26 127700 FIRE SAFETY AND FIRE HAZARDS RELATED TO POLYMERIC MATERIALS IN CARS OF WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY. This report by the National Materials Advisory Board of the National Research Council represents a review of the technical decisions made by WMATA in selection of materials and design for car interiors from the viewpoint of fire safety. It is concluded that electrical fires are a continuing threat to rapid transit system safety and that awareness of fire safety in transport vehicles was only emerging when the WMATA cars were planned. Review of prior fire experiences was not made; emphasis on comfort and styling have increased fire load in car interiors; hydraulic brake systems increase the probability of electrical fires; choice of polymeric interior materials and wool carpeting should be reevaluated.

26 127835 MOORGATE TUBE TRAIN DISASTER. This two-part article describes the medical aspects of the crash of a London Underground transit train in a dead end tunnel which resulted in 43 deaths and 72 injuries requiring hospital treatment. Part I describes the experience of the medical staff and reports a substantial advantage in using on-site medical teams that could offer anaesthetic facilities. Adequate communication between the accident site and hospital is important. Part 2 reviews injuries sustained by 113 casualties, showing the need for rapid evacuation. Recognition of the "crush syndrome" is important and a radical surgical approach is suggested. Chest injuries were common and contributed to many of the deaths.

26 130909 SAFETY-AVAILABILITY STUDY METHODS APPLIED TO BART. The paper describes the San Francisco Bay Area Rapid Transit (BART) system with emphasis of its underlying safety and availability concepts. The novel characteristics of this system which differentiate it from transit systems in other locations are pointed out.

Welker, EL (TRW Systems Group) Buchanan, HN *Annual Reliab Maintainability Symp. Proceedings* Proc Paper #1263, 1975, pp 269-275; Presented Jan 28-30, 1975.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

26 132900 MANAGEMENT'S ROLE IN SAFETY. The point is made that management's role in improving safety performance encompasses the recognition of the importance of safety, search for innovative new techniques and, a well-reasoned evaluation of all dilemmas faced in optimizing safety. It is pointed out that large transit systems must be involved not only with safety in moving people but also with industrial safety because of manufacturing type activities. Experiences at the Chicago Transit Authority (CTA) are described. Concern for safety at CTA led to the

reorganization of the safety related staff functions into a group raised to department level, and safety functions at line level within the transportation and maintenance departments were strengthened. The responsibilities of the staff safety officer, and the safety department are outlined, and funding assistance for safety improvements are discussed. Two-way voice communication, lighting of vehicles and stations, handrails and personal security for riders are also described.

26 134563 AIRCRAFT-TYPE CRASH INJURY INVESTIGATION OF A COMMUTER TRAIN COLLISION. Methodology for investigating the causes and circumstances of rail accidents. An aircraft-type investigation conducted following a collision between two commuter trains in the Chicago area, was able to identify the weaker points in the organization of public transport in heavy-traffic zones and fix technical safety standards for the construction of rolling stock.

Braden, GE *Wesleyan University* Vol. 46 No. 9, Sept. 1975, pp 1157-60, 1 Tab., 2 Phot., 1 Ref.; ACKNOWLEDGMENT: UIC; ORDER FROM: Aerospace Medical Association, Washington National Airport, Washington, D.C., 20001

26 136400 FIRE HAZARD EVALUATION OF CABLES AND MATERIALS. Test methods currently used for testing cables and cable materials are discussed and improved techniques are proposed. The virtues of the proposed techniques are illustrated by means of a typical fire retardant cable compound development. Finally the concept of a fire hazard rating system is introduced as a rationalization of the interpretation of cable and materials flammability testing.

26 136411 HAZARD ANALYSIS--SPACE APPLICATIONS TO MASS TRANSIT. The paper describes an aerospace hazard analysis method practiced by Martin Marietta for National Aeronautics and Space Administration (NASA)/United States Air Force (USAF) Shuttle programs and presents an example of how this method is directly applicable to a mass transit system. Emphasis is given to the incorporation of an active and methodical hazard analysis program from the earliest possible design phase of a new system through the initial revenue years of the operational system, including maintenance activities.

Mumma, GB (Martin Marietta Corporation) O'Halloran, WR ; Institute of Electrical and Electronics Engineers Proc Paper No. 1360, 1976, pp 251-256, 9 Ref.; Presented at the Annual Reliab Maintainability Symp., Las Vegas, Nev., Jan. 20-22, 1976 sponsored by ASME and IEEE.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

26 136567 LBL ROLE AND RECOMMENDATIONS WITH RESPECT TO PUC HEARINGS ON BART SAFETY APPLIANCES AND PROCEDURES. Methods are discussed for increasing the level of safety of the Bay Area Rapid Transit (BART) by reducing the susceptibility of the BART system to human error. Recent incidents clearly demonstrated the vulnerability of operations carried on in the manual mode. The recommendations emphasize that: (1) the potential of the automatic systems be more fully used, particularly with respect to maintenance vehicle detection; (2) the safety regulations for manual operations be analyzed thoroughly; and (3) an intense task force be assigned to address high-priority problems.

26 137030 RAILROAD ACCIDENT REPORT: REAR END COLLISION OF THREE MASSACHUSETTS BAY TRANSPORTATION AUTHORITY TRAINS, BOSTON, MASSACHUSETTS, AUGUST 1, 1975. On August 1, 1975, during the evening rush hour, southbound traffic on the Red Line of the Massachusetts Bay Transportation Authority in Boston backed up because of a train standing at a stop signal in the tunnel south of Charles Street Station. Train 1402, a four-car 'Bluebird' train, stopped at signal 236 because of the backup. Train 1604, a four-car 'Silverbird' train, was keyed by signal 234 and crashed into 1402 about 4:58 p.m. About 3 minutes later, a four-car 'Bluebird' train, 1431, crashed into the rear of train 1604. One hundred and fifty-four persons were injured; total damage to equipment was estimated to be \$425,000. The National Transportation Safety Board determines that the probable cause of this accident was the malfunction of the train-stop tripper and the subsequent operation of trains 1604 and 1431 in violation of the rules and in excess of the speed at which they could stop short of collisions in the available sight distances.

26 141582 AN OPERATIONAL DEMONSTRATION OF TRAILING END VISIBILITY ENHANCEMENT DEVICES FOR COMMUTER RAILROAD TRAINS. This report describes the demonstration which compared under actual operating conditions various means of enhancing the visibility of commuter train ends. The visibility enhancement devices included in the demonstration were: 1) Xenon strobe lights; 2) Large and small red market lights; 3) Amber flashing beacons and 4) Various patterns of brightly colored paints and fluorescent/reflective tapes on car ends. Data concerning the visibility and other attributes of the above devices was collected by means of a series of questionnaires directed at groups of people considered to be significantly impacted by the devices. The groups surveyed were: 1) Train crew members; 2) Independent observers; 3) Residents along various rail rights-of-way; 4) Commuters and 5) Motorists. The survey results are discussed and the conclusions arrived at are used to make recommendations regarding which devices are most appropriate for inclusion in a regulation to govern the visibility enhancement of passenger train ends. In addition, performance specifications and guidelines for the use of these devices are given.

Englund, DB ; Illinois Department of Transportation Final Rpt. FRA-ORD-76-292, June 1976, 129 pp, 12 Fig., 5 Tab., 11 Ref., 1 App.; This demonstration was conducted by the Illinois DOT with the support and cooperation of the Federal Railroad Administration and three Chicago area commuter railroads: Burlington Northern, Chicago & Northwestern, Illinois Central Gulf.; ACKNOWLEDGMENT: Illinois Department of Transportation, NTIS; ORDER FROM: NTIS; PB-259901/7ST, DOTL NTIS

26 143329 RAILROAD ACCIDENT REPORT: CHICAGO TRANSIT AUTHORITY COLLISION OF TRAINS NO. 104 AND NO. 315 AT ADDISON STREET STATION, CHICAGO, ILLINOIS, JANUARY 9, 1976. On January 9, 1976, at 8:06 a.m., Chicago Transit Authority (CTA) train No. 315 struck the rear end of train No. 104 while it was standing at the Addison Street Station platform in Chicago, Illinois. The impact forces extensively damaged the lead car of the moving train and the rear car of the standing train, and slightly damaged the other cars in both trains. Damage to the equipment and track was estimated to be \$267,000. Of the 381 passengers who were injured in the collision, 1 passenger died. The National Transportation Safety Board determines that the probable cause of this accident was the failure of the motorman of train No. 315 to perceive standing train No. 104 at a sufficient distance to permit him to stop his train before striking No. 104. Contributing to the collision were the rule that permitted the operation of the train with the automatic train control and the cab signals inoperative, the lack of consistent enforcement of operating rules, the absence of flag protection against following trains, the failure of the train phone system to provide reliable communications, and the violation of the 25-mph speed limit required by Rule 178B.

26 144227 DECELERATION SIGNAL SYSTEM STUDY (AS REQUIRED BY AB 1260, 1972 LEGISLATIVE SESSION). The results of the experimental study of the Cyberlite deceleration signal on Yellow Cabs in San Francisco are as follows: 1. Collisions with the rear of cabs were reduced by 60% during the 4-month study period. 2. Complaints in 48 letters stated that the Cyberlite was too bright, was particularly irritating at night, in dark wet weather, and gave an aggravating signal because of cab drivers riding the brakes. 3. Opinion surveys of traffic officers paralleled the comments in the letters. They expressed concern about peripheral accident hazards due to lane changes of drivers escaping from behind the bright lights and about the irritating sea of lights that could occur in congested traffic if many vehicles were so equipped. 4. Specific requests to three Bay Area Police Departments for a report of each collision in which Cyberlite was mentioned as a peripheral cause resulted in zero reports. Recommendations relating to deceleration signals are also presented.

26 146447 HOW BIG IS THE FIRE HAZARD IN OUR PUBLIC SERVICE VEHICLES? [Hur brandfarliga aer vaara kollektiva transportmedel?]. Fire safety precautions in public service vehicles are based on the same requirements as in buildings. The risk of fire in a vehicle is due to technical malfunctions or to vandalism in unmanned vehicles. As the overall weight of vehicles has been reduced over the past few years, so has the proportion of combustible materials. In a bus the total weight of combustible materials is about 10% of gross bus weight, in a modern underground car 7-8% of overall weight and 10% of car weight. Actual weight is 1-1.5 ton. Foamed plastics have replaced the old horsehair upholstery in seats to improve comfort, but this has increased the fire risk. Since traction and auxiliary equipment is separated from the passenger compartment, fire risks due to technical malfunctions are reduced. The greatest risk of fire in public service vehicles is due to vandalism and sabotage. Evacuation of buses and underground cars is easy. Fire fighting is dependent on external conditions; in underground trains extinguishers have had to be put in the driver's cab because of theft and misuse. /TRRL/ [Swedish]

26 147827 WITH LOW SMOKE, TOXICITY, BURNING RATE, CAN PLASTICS FILL AIRCRAFT AND TRANSIT NEEDS. Government pressure, in the form of guidelines, proposed rules and actual requirements, is forcing companies building airplanes, subways and buses to look for materials that provide better burning characteristics. A number of plastics producers either have announced or are planning to announce grades that are substantial improvements over existing ones for panelling, seating and glazing. The question is-are these plastics adequate? Beyond this question, extensive research in

many areas such as toxicity may change existing requirements and thus again the status of materials being considered.

26 148297 SOME RELIABILITY, DEPENDABILITY AND SAFETY CONSIDERATIONS FOR HIGH-CAPACITY PRT SYSTEMS. Safety is a consideration of major importance in the planning and implementation of an automated small-vehicle fixed-guideway transit system. Analysis of safety considerations necessarily entails identification of the spectrum of possible failure modes and the definition of procedural and design responses thereto. Procedural responses must consider not only the attainment of a high degree of passenger safety, but also a high level of service dependability; e.g., responses to emergency situations which result in significant service disruptions must be avoided if it is possible to do so without significantly jeopardizing passenger safety.

Olson, CL (Aerospace Corporation) Fuller, GH Fling, RB ; Colorado University, Denver Conf Paper Vol. 2, Paper 45, 1975, 19 pp, 19 Ref.; This paper was presented at the International Conference on Personal Rapid Transit held in Denver, Colorado, September 16-19, 1975.; ACKNOWLEDGMENT: EI; ORDER FROM: Colorado University, Denver, Center for Urban Transportation Studies, Denver, Colorado, 80202

26 148310 REVIEW OF AUTOMOBILE CRASHWORTHINESS EXPERIMENTS WITH RESPECT TO PRT SYSTEMS. The basic concept of crashworthiness relative to human transport systems is discussed. Experimental testing methodology which has been developed over several years is reviewed with special emphasis on automotive crashworthiness. Common elements between automotive and PRT system crashworthiness are identified and pertinent, existing experimental data noted. Methods that would permit future PRT system crashworthiness research to take advantage of automotive technology are considered and appropriate recommendations are developed.

26 148312 SAFETY ESTIMATES FOR URBAN TRANSIT SYSTEMS. The paper presents the methodology and results of the safety analysis conducted for each of the transit alternatives being considered for Denver, Colo. It contains the historical data, methodology, and various assumptions used to develop the appropriate accident, and accident severity rates to forecast the safety status of various transit alternatives for the year 2000. The expected accident rates for the various concepts are summarized by hazard category and by the system's section. The comparison of total annual fatalities for the concepts is presented in terms of lives saved. The line haul

sections of various concepts, and typical auto fatality rates are also compared to the domestic scheduled airline annual fatality rate.

26 148581 A SOLUTION TO TRAIN FIRES. In the wake of a disastrous tunnel fire in 1972, Japanese National Railways undertook actual train fire tests, first on open line and then in a tunnel. Extensive instrumentation was installed on the car in which fire was ignited and in the adjacent cars. Determined were relation between train speed and fire conditions, difference between ordinary and fire-resistant cars and the conditions existing in cars adjacent to the car on fire. It has been concluded that even a substantial fire on a train running in a tunnel can be countered by evacuating passengers to other cars, continuing to operate until the train is in the open, but that other problems remain to be solved.

26 153273 SYSTEM SAFETY/RISK ANALYSIS TECHNIQUES APPLIED TO MOTOR VEHICLES AND RAPID TRANSIT SYSTEMS. Since 1969 Booz, Allen & Hamilton Inc. has performed safety analyses of a number of ground transportation systems. The analyses were directed at the automobile, the transit bus, and the rail rapid transit system. Fault tree analysis techniques were used in all three cases. This paper discusses the utility of fault tree analysis techniques in setting safety requirements and goals for new equipment designers and system managers. The prioritization of safety requirements and goals was obtained through effects or cost benefit analyses and was an integral part of the fault tree analysis technique. The safety analysis of the automobile was confined to component degradation as a causation factor in automobile accidents. The transit us safety work analyzed over 92 types of accidents, both onboard and offboard. Two major outputs were derived from the safety analysis of rail rapid transit systems; these were safety criteria and a system safety program plan for the future design and development of such systems. In all three transit modes the analytical methodology, results, and conclusions are presented. /Author/

Mayteyka, JA (Booz-Allen and Hamilton, Incorporated) Talley, J *Journal of Safety Research* Vol. 9 No. 1, Mar. 1977, pp 2-14, 5 Fig., 2 Tab., 9 Ref.; ACKNOWLEDGMENT: National Safety Council, Safety Research Info Serv (SRIS-770201); ORDER FROM: ESL

26 154586 TRANSIT VEHICLE MATERIAL SPECIFICATION USING RELEASE RATE TESTS FOR FLAMMABILITY AND SMOKE. PHASE I REPORT. The report relates to two of the most important features in fire safety design of a transit vehicle's interior finishes and furnishings: to allow time for evacuation, and prevent a self-propagating fire. Comparative eval-

uation of fire performance of a fire system (as contrasted with the evaluation of the individual materials in the system) are discussed in terms of a model in which the interdependence of materials and the system are mathematically simulated to give an absolute (as compared to comparative) evaluation of a fire system and to predict what limits on loading will prevent fully developed fires in a specific situation.

26 165694 SCHOOL BUS STOPS-PLANNING FOR SAFETY. Accidents involving buses and child pedestrians at school bus stops in New South Wales were investigated. It was found that the most common accident type was where a child alighted from a school bus then ran from behind it into the path of another vehicle. An examination was made of various countermeasures for this type of accident, with particular attention being paid to the use of flashing warning lights on the school buses. It was concluded that the utilization of hazard warning flashing lights to inform approaching drivers that children were alighting, was worthy of consideration as a countermeasure. It was also suggested that school bus stops should be positioned on the departure sides of pedestrian crossings and that due consideration should be given to the school bus stop accident problem in the planning of school bus routes. /Author/TRRL/

26 167063 GUIDELINES FOR IMPROVED RAPID TRANSIT TUNNELING SAFETY AND ENVIRONMENTAL IMPACT. VOLUME I. SAFETY. Two of the major objectives of the Urban Mass Transportation Administration Tunneling Program are to lower subway construction costs and reduce construction hazards and damage to the environment. This study consists of a two-volume report and aims to develop guidelines for improved rapid transit

tunneling safety and environmental impact, that is, this effort is directed toward underground construction applicable to modern transit subway systems in urban areas. Examination of construction safety regulations, tunnel construction accident data, and features of underground construction leading to unsafe work show that a systems approach to safety is required. Ten guidelines were drafted to supplement current construction safety regulations (OSHA 29CFR1926). Recommendations for further study and evaluation were made to complete the systems safety approach.

26 170073 RAILROAD ACCIDENT REPORT: REAR END COLLISION OF TWO GREATER CLEVELAND REGIONAL TRANSIT AUTHORITY TRAINS, CLEVELAND, OHIO, AUGUST 18, 1976. About 11:35 a.m., on August 18, 1976, Greater Cleveland Regional Transit Authority train No. 461 struck the rear of train No. 409 which was standing near the East 79th Street Station in Cleveland, Ohio. Twenty persons were injured and property damage was estimated to be \$61,000. The National Transportation Safety Board determines that the probable cause of the accident was the failure of the operator of train No. 461 to comply with the mandatory stop signal indication and to apply the brakes in emergency promptly after the train ahead had been sighted, and operation of the train at an excessive speed. Contributing to the probable cause was the lack of an effective operator training program and the ineffectiveness of the protective devices and procedures to prevent a following train from entering an occupied block. As a result of its investigation of the accident, the National Transportation Safety Board made four recommendations to the Greater Cleveland Regional Transit Authority concerning the operation of the system, and one to the Federal Railroad Administration.

26 173582 FIRE PROTECTION SYSTEMS ON (WMATA) METRO. Smoke and fire detection, fire alarm and fire fighting systems for the Washington Metropolitan Area Transit Authority (WMATA) Mass Rapid Transit System, including some alternate fire fighting system designs, are presented. A combined rate-of-rise/-fixed temperature fire detector is used in areas where rapid temperature changes are abnormal. Fixed temperature fire detectors are used in the other areas requiring protection. The below grade passenger stations have a wet pipe standpipe system. This system also includes a dry pipe and siamese connection to increase the volume and pressure of the water above the nominal city water pressure. The aerial and surface stations have a dry pipe standpipe system. All passenger

station standpipe systems provide water to a hose valve within each fire equipment cabinet and to each angle hose valve located under manhole covers on the platform. The train tunnels also have a dry standpipe system.

Ell, WM (De Leuw, Cather and Company) *ASCE Journal of Transportation Engineering* Vol. 104 No. 1, Jan. 1978, pp 69-74; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

26 175793 RAILROAD ACCIDENT REPORT. HEAD-ON COLLISION OF TWO GREATER CLEVELAND REGIONAL TRANSIT AUTHORITY TRAINS, CLEVELAND, OHIO, JULY 8, 1977. About 10:05 a.m., E.D.T., on July 8, 1977, two trains of the Greater Cleveland Regional Transit Authority collided head-on on the eastbound track of the Shaker Heights Line, near 92nd and Holton Streets in Cleveland, Ohio. Sixty persons were injured and property damage was estimated to be \$100,000. The National Transportation Safety Board determines that the probable cause of the accident was the failure of the Greater Cleveland Regional Transit Authority to have established rules and procedures, and special instructions to assure safe train operations. Contributing to this accident were the failure of both supervisors to establish and coordinate adequate local procedures for operating trains in both directions on a single track, and, further, the vegetation along the curve which was allowed to grow to the extent that the view was blocked.

National Transportation Safety Board NTSB-RAR-78-2, Feb. 1978, 23 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-278191/2ST, DOTL NTIS

26 175810 RAILROAD ACCIDENT REPORT. REAR END COLLISION OF TWO CHICAGO TRANSIT AUTHORITY TRAINS, CHICAGO, ILLINOIS, FEBRUARY 4, 1977. About 5:27 p.m., C.S.T., on February 4, 1977, Chicago Transit Authority Lake-Dan Ryan train No. 930 struck the rear of Ravenswood train No. 415, which was standing on the elevated rail structure at the intersection of Wabash Avenue and Lake Street. The four lead cars of the eight-car Lake-Dan Ryan train overturned and fell from the elevated structure to the street. One end of each of the two rear cars of the Ravenswood train derailed. Eleven persons were killed and 266 persons were injured. Property damage was estimated to be \$1.2 million. The National Transportation Safety Board determines that the probable cause of this accident was the failure of the motorman to exercise due care in meeting his responsibilities and the unauthorized operation of the Lake-Dan Ryan train into a signal block occupied by the standing Ravenswood train, at a speed that was too fast to stop after the operator sighted the standing train.

National Transportation Safety Board NTSB-RAR-77-10, Nov. 1977, 38 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-277961/9ST, DOTL NTIS

26 176291 FIRE HAZARD EVALUATION OF BART VEHICLES. A fire hazard evaluation of the subway cars used on the San Francisco Bay Area Rapid Transit District was performed. After analyzing the cars' interior and exterior design, five recommendations were made that, if implemented, would improve passenger safety by de-

creasing the probability of developing a hazardous fire situation. Among these recommendations were the upgrading of current upholstered urethane seat assemblies and the need for the development of a fire detection system appropriate for rapid rail transit vehicles. Those system improvements would not only provide passengers a safer traveling environment but would also provide a modest level of protection for the heavy investment in rail vehicles.

26 178784 DEVELOPMENT OF A SAFETY PROGRAM PLAN FOR THE OFFICE OF SAFETY AND PRODUCT QUALIFICATION: VOLUME I AND VOLUME II--APPENDIX D. The Institute of Safety and System Management of the University of Southern California under a grant from UMTA undertook a four month development of information to be used in the development of a Safety Program Plan for the Office of Safety and Product Qualification (OSPO). This report contains the results of the research project. The purpose of this project was to identify and describe the critical safety issues which should be included in the Safety Plan for OSPO. Six Key Objectives were developed from a review of legislative acts, administrative directives, past and present programs, goals of UMTA, and recommendations of associated agencies. The Six interrelated Key Objectives are the following: Decrease Accident Rates; Eliminate Catastrophic Accident Conditions; Prevent "Unsafe" Conditions; Assure Use of "Best" Technology; Accomplish Objectives in a Cost-Effective Manner; and Determine and Correct "Unsafe" Conditions. In addition twenty-nine Critical Objectives and over ninety Specific Objectives were developed. This report recommends 16 specific programs for top priority consideration. The Appendixes herein are: Accident Data Base Forms (from Federal Railroad Administration, Bureau of Motor Carrier Safety, National Highway Traffic Safety Administration, American Public Transit Association, and UMTA); Data and Statistics; References; and On-Going Research by Mitigation Type (Appendix D--Volume II).

26 180338 METROPOLITAN ATLANTA RAPID TRANSIT AUTHORITY SYSTEMS SAFETY, FIRE PROTECTION, AND CODE DOCUMENTATION FOR STATIONS. The intent of this phase of MARTA systems safety is

to (1) prevent fires; (2) protect the general public, employees and fire department personnel from injury due to fire, smoke, explosion or panic; and (3) protect structures and equipment from damage due to fire. This has necessitated trade-offs between subsystems, and required consideration of state and local codes within jurisdictions in which MARTA operates.

Gooden, WE (Parsons, Brinckerhoff, Quade and Douglas, Inc) Troy, JJ (Gage-Babcock and Associates, Incorporated); System Safety Society Proceeding 1977, pp 517-527; Third International System Safety Conference, October 17-21, 1977, Stouffer's National Center Inn, Washington, D.C.; ACKNOWLEDGMENT: System Safety Society; ORDER FROM: System Safety Society, P.O. Box 165, Washington, D.C., 20044

26 180340 EXPANSION OF SYSTEM SAFETY PROGRAM PLANNING TO THE RAILROAD INDUSTRY, SYSTEM SAFETY IN SIGNAL APPLICATIONS. The special problems involved with safety analysis of railroad and rapid transit signaling installations are discussed.

McNenny, PJS (General Railway Signal Company); System Safety Society Proceeding 1977, pp 657-664, 1 App.; Third International System Safety Conference, October 17-21, 1977, Stouffer's National Center Inn, Washington D.C.; ACKNOWLEDGMENT: System Safety Society; ORDER FROM: System Safety Society, P.O. Box 165, Washington, D.C., 20044

26 180342 SAFETY AND SYSTEM ASSURANCE RESOURCES APPLIED TO THE DESIGN AND DEVELOPMENT OF A RAIL RAPID TRANSIT SYSTEM. MARTA management is committed to a formalized research, review and systematic approach to implementation of a safety and system assurance program. The procedures and manpower involved are described.

Gooden, WE (Parsons, Brinckerhoff, Quade and Douglas, Inc) Lock, AM (Metropolitan Atlanta Rapid Transit Authority); System Safety Society Proceeding 1977, pp 687-698, 5 Fig.; Third International System Safety Conference, October 17-21, 1977, Stouffer's National Center Inn, Washington, D.C.; ACKNOWLEDGMENT: System Safety Society; ORDER FROM: System Safety Society, P.O. Box 165, Washington, D.C., 20044

26 180343 THE SAFETY PROGRAM FOR THE BALTIMORE REGION RAPID TRANSIT SYSTEM. This paper describes the overall safety program in the Baltimore Rapid Transit System. The emphasis is on the safety aspects in facility design which is essentially complete, whereas the specifications for the vehicle and train control have not progressed as far.

Hunt, H (Daniel, Mann, Johnson and Mendenhall); System Safety Society Proceeding 1977, pp 699-714; Third International System Safety Conference, October 17-21, 1977, Stouffer's National Center Inn, Washington, D.C.; ACKNOWLEDGMENT: System Safety Society; ORDER FROM: System Safety Society, P.O. Box 165, Washington, D.C., 20044

26 180344 OPERATIONAL SAFETY OF TRANSPORTATION SYSTEMS. It is essential for public acceptance that the mass transit com-

puter systems (i.e., software), electrical systems, and the systems they control be operationally safe and reliable. "Sneak Analysis" assures system operability by identifying all potential anomalies which can be caused by unplanned operational modes inherent in the system design. The correction or avoidance of these modes will then lead to a safer, more reliable system. Boeing Aerospace Company has found that "network trees" containing combinations of four basic topological patterns constitute all electrical systems and their analogs. Utilizing these topological trees, all latent signal paths which can inadvertently initiate a function or inhibit a desired one--independent of component failure--are detected. Sneak Analysis has found latent operational capabilities in every system analyzed, including parts of the San Francisco Bay Area Rapid Transit and Morgantown Personal Rapid Transit systems. The technique also aids in locating areas of weak design. The resulting network trees can aid in shortening test and troubleshooting time. These also simplify the work required and accuracy of other analysis techniques which specifically examine component, environmental, and human related operational problems. The ability of the analysis technique to disclose unsafe operational modes after other techniques have certified reliability and even after years of normal operation indicates that Sneak Analysis is almost essential in critical areas of transportation systems.

26 180345 MARTA SYSTEMS SAFETY VERIFICATION. A RAIL RAPID TRANSIT APPLICATION OF SYSTEMS SAFETY TECHNOLOGY. This program assures that system safety goals and criteria are established and implemented; that safety hazards are identified and assessed as early as possible during design; that actions will be taken to eliminate or control identified critical/catastrophic hazards; and that the system will be verified to be safe for revenue service prior to opening.

26 181341 EVALUATION METHODOLOGIES FOR NINE FEDERAL MOTOR VEHICLE SAFETY STANDARDS: FMVSS 105, 108, 122, 202, 207, 213, 220, 221, 222. This is one of two studies to develop methodologies for evaluating a total of nine Federal Motor Vehicle Safety Standards: Hydraulic brake systems in passenger cars, Side marker lamps and high intensity headlamps, Motorcycle brake systems, Head restraints, Seating systems, Child seating

systems, School bus rollover protection, School bus body joint strength, and School bus seating and crash protection. This report provides a summary and overview of the sixteen preceding reports, and an integration of the individual approaches for evaluating each Standard as presented in the earlier reports. The report includes conclusions and recommendations, and it briefly reviews the nine Standards, and the approaches to evaluating the Standards. It discusses the statistical analyses of accident data, field and mail surveys, and laboratory testing which comprise the methodologies for evaluating the effectiveness of each Standard, and presents Work Plans with clearly-defined decision points between various tasks in each evaluation program. The evaluation programs may require from three to six years to complete.

Northrop, GM Ball, JT Bancroft, DRE Reidy, JCJ; Center for the Environment and Man, Incorporated, National Highway Traffic Safety Administration Final Rpt. DOT-HS-803-388, CEM-4228-4229-600, Mar. 1978, 202 pp; Contract DOT-HS-7-01674; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-283034/7ST

26 183702 RELIABILITY DATA AND ANALYSIS FOR TRANSIT VEHICLES. This report provides a data base for the reliability of transit vehicles and their components. This data is essential for the successful implementation of quantitative reliability methods. Failure data on approximately 500 subway cars, 400 streetcars and 1100 buses was obtained from the Toronto Transit Commission for a period of 28 weeks. This results of the analysis of this data are presented in this report. For each category, viz. subway cars, streetcars and buses, the vehicles have been grouped according to the year of acquisition to minimize the differences due to age and design. The available failure data is a combination of complete and censored observations and, therefore, the method of hazard plotting has been used for the analysis. The computed measures of reliability of the vehicles and their components are the Mean Miles Between Defects (MMBD), Miles Per Defect (MPD), and the probability density function (pdf) of the miles between defects. The Miles Per Defect are further calculated for the different levels of severity of the impact on revenue service. It has been found that the more recently acquired subway cars and their components have generally lower reliability than the older stock. For buses the newer ones are more reliable than the older ones and the failure rate tends to stabilize after the fourth year of operation. Exponential and Weibull distributions with a shape parameter less than unity appear to fit the data for the miles between defects of the components. The possible reasons for this phenomenon are discussed. The possible uses of hazard plots for obtaining estimates of the cumulative distribution function, percentiles of the distributions, reliability and conditional probability of failure are also described. The results contained in this report can be usefully applied in planning, operation, design, reliability demonstration and life-cycle costing studies. The relevance of this data analysis to these areas is briefly discussed. The study indicates a need for further investigations and the desirability of collecting more detailed failure data, and also data for the lower level of components. /Author/

26 186163 FIELD TEST EVALUATION OF REAR LIGHTING SYSTEMS. The objective of this study was to establish the effectiveness of different rear lighting and signalling systems in reducing rear-end collisions. The most significant finding of the study was that the taxicabs equipped with a single center, high-mounted stoplight had less than half the rear-end collisions experienced by a control group consisting of cabs having manufacturer's configurations of taillights. This reduction was achieved whether measured in terms of absolute number or frequency of accidents or in terms of accident rate per million vehicle miles. In addition, the effectiveness of the single light configuration increased during nighttime operation and also under conditions where there was almost complete certainty that the stoplights were illuminated just prior to or at the time of impact. Finally, the mean cost to repair cabs with this rear lighting system was lowest, by an order of magnitude, among the systems tested, indicating that these accidents were less severe than accidents involving other stoplight configurations.

26 186852 SAFETY IN URBAN MASS TRANSPORTATION: RESEARCH REPORT. The Research Report covers three major topics: (1) an analysis of the current state of safety; (2) determination of acceptable safety levels; and (3) development of the Safety Guidelines Manual. Safety performance in several modes of transportation are compared as a basis for assessing the safety situation. Methods of establishing acceptable safety levels and setting safety goals are analyzed. A safety program is formulated for the urban mass transportation industry wherein system safety principles are applied in this industry's technical and institutional environment. Conclusions are drawn that urban mass transportation, although inherently hazardous, is not troubled by immediate, severe safety problems. However, these problems will confront the industry as it moves into use of new high-performance technology. Also, problems with injuries and fatalities concern the industry today and merit remedial action. Management approaches are recommended for meeting these safety problem areas.

26 188701 RAILROAD ACCIDENT REPORT--COLLISION OF PORT AUTHORITY OF ALLEGHENY COUNTY TROLLEY CAR NO. 1790 AND BUS NO. 2413, PITTSBURGH, PENNSYLVANIA, FEBRUARY 10, 1978. About 8:03 a.m., on February 10, 1978, a trolley car and a bus owned by the Port Authority of Allegheny County collided in Pittsburgh, Pennsylvania, when the trolley car suddenly turned into the path of the oncoming bus. Four persons were killed, 37 persons were injured, and damage was estimated to be \$48,000. The National Transportation Safety Board determines that the probable cause of this accident was the operator's inadvertent and untimely operation of an unprotected track switch, which caused the trolley car to be routed into the path of the approaching bus. Contributing to the accident was the operator's operation of the car at a speed too great to permit stopping when he detected the turning movement of the car, and the lack of protective devices to control the switch operation. Two recommendations were made to the Port Authority of Allegheny County, Pennsylvania, about the means by which the track switch can be operated from the trolley car and about providing protection against the switch operating when another vehicle is in a danger zone. A recommendation was also made to the Governor of the Commonwealth of Pennsylvania, urging the State to encourage communities that have emergency response facilities to establish emergency procedures for disasters.

26 190479 IMPROVED VISIBILITY FOR SCHOOL BUSES DURING ADVERSE WEATHER. VOLUME I. The objectives of the program were to develop realistic performance requirements and compliance test procedures which could be used by school bus manufacturers as well as testing agencies to assure that school bus defogging equipment will meet vehicle drivers' visual requirements for forward, sideward, and rearward views under conditions of fog formation on the interior surfaces of the vehicle's glazing during adverse weather. Several buses, including Type I, Type II, and Transit-type buses, were tested utilizing normal engine operation and also with an auxiliary hot water system. Results of these tests were used in preparing a detailed defogging test procedure and recommended performance requirements.

26 190481 IMPROVED VISIBILITY FOR SCHOOL BUSES DURING ADVERSE WEATHER. SUMMARY REPORT. The objectives of the program were to: (1) Develop performance requirements for school bus defogging equipment, (2) develop test procedures to determine whether or not the defogging system of any specific school bus meets the performance requirements, (3) select a range of school buses which are representative of the school bus population, (4) develop a methodology for repeatably documenting cleared glazing areas, and (5) verify that the performance requirements and test procedures are realistic through verification testing of the school buses.

26 192146 FIRE SAFETY GUIDELINES FOR VEHICLES IN A DOWNTOWN PEOPLE MOVER SYSTEM. The results of a study to formulate fire safety guidelines to be required for vehicles used in Downtown People Mover (DPM) systems for the movement of people in a congested urban area are presented. Through a review of the design features of existing people mover vehicles and systems, and a review of proposed new systems, fire scenarios are developed and guidelines suggested to minimize the fire risk to passengers. Methods and criteria, based on established test procedures, are proposed for assessing the flammability and smoke generation of interior finish and furnishing materials. Fire and smoke detection and suppression equipment are recommended, along with proposed guidelines for emergency evacuation provisions and emergency communication requirements. An extensive bibliography of flammability in fixed guideway transit systems is included.

Peacock, RD ; National Bureau of Standards, Urban Mass Transportation Administration Final Rpt. NBSIR-78-1586, Jan. 1979, 56 p.; Sponsored in part by Urban Mass Transportation Administration, Washington, DC.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-292600/4ST

26 192228 ANALYSIS OF BART CAPITAL COSTS. BART, the 71-mile Bay Area Rapid Transit System, serving San Francisco, Oakland, Berkeley, and their suburbs, is the first regional-scale rapid transit system to open in the United States in over 50 years. This report is one of a series assessing the impact of BART on transportation and travel in the Bay Area. The report documents the capital costs of BART and its components and analyzes the difference between

the actual capital cost of the System (\$1,636 million) and the cost predicted by the 1962 planning report (\$994 million). The apparent 65% cost overrun is shown to be explained almost entirely by (1) increases in scope, (2) inflation at higher rates than anticipated, and (3) inflation associated with delays to the construction schedule.

26 195677 FIRE BLACKENS BART IMAGE. A loose equipment cover that fell from beneath a Bay Area Rapid Transit train and damaged the third rail in the TransBay Tube stalled and damaged a subsequent train that then caught fire in the 3.6 mile tunnel. The emergency procedures of BART and city fire departments proved inadequate as the seven cars were destroyed or damaged by the fire. Recounted are the events of January 17-18, 1979, as well as subsequent investigations while the most important segment of BART was shut down for 2.5 months.

Demoro, HE, Technical Editor *Mass Transit* Vol. 6 No. 7, July 1979, p 12, 3 Phot.; ORDER FROM: Carter (C Carroll), 538 National Press Building, Washington, D.C., 20004

26 197358 AIRTRANS URBAN TECHNOLOGY PROGRAM, PHASE II: IRAN PROGRAM. INSPECT, REPAIR AS NECESSARY ON THE AIRTRANS AGT VEHICLE. This is a report on the AIRTRANS Inspect Repair as Necessary (IRAN) project performed under the AIRTRANS Urban Technology Program, Phase II. The main objective was to critically evaluate the condition of an AGT vehicle after 268,000 miles and five years of operation and to provide a guide for the establishment of IRAN plans for future AGT systems as they are deployed in an urban environment. A program plan was developed to systematically inspect, and repair as required, the structural and other subsystems of the vehicle in operation at the Dallas/Ft. Worth Airport. The approach included Non-Destructive Tests (NDT) procedures, including radiograph, and dye penetration. The use of a high-powered magnifying lens with bright lighting conditions was also employed in the inspection procedures. The detailed inspection revealed a sound frame and chassis construction with no evidence of cracking in the welded structure. The other subsystems that were inspected, such as the suspension and drivetrain, displayed the normal wear patterns. Repairs were made on the acrylic/fiberglass exterior body panels. Subsequent followup revealed these repairs generally failed, as have previous repair attempts. Repairs were made to the vehicle roof because of a temperature related problem with the acrylic/fiberglass construction. The result of the project indicates that the maintenance procedures developed for this system are excellent. With the exception of the

exterior body panels, the vehicle appears capable of attaining the 20-year service life. A five-year IRAN program is recommended to assure continued high performance.

26 197359 SYSTEM SAFETY PROGRAM PLAN. The report contains a recommended System Safety Program Plan for the Chicago Transit Authority (CTA) rail system. It contains a recommended policy statement, recommendations for specific actions to improve CTA system safety management practices and processes, and finally, recommendations for a process for up-dating and re-evaluating the Program Plan. The suggestions presented build upon substantial foundation established previously by the CTA in its current system safety efforts. The Plan is divided into four sections: (1) Safety Policy Statement; (2) Current CTA Safety Activities; (3) Recommendations to Strengthen Current CTA Safety Management Practices and Processes; and (4) Recommendations for Re-Evaluation and Modification of the System Safety Program. These recommendations are to a great extent tailored to the specific facilities, personnel, and philosophy of the organization of the CTA, and are not intended as a set of general guidelines for the rail transit industry.

26 197371 SAFETY AND SYSTEM ASSURANCE STUDY. The report contains the results of a study of safety and systems assurance-related technical management practices and processes of the Chicago Transit Authority (CTA) rail system. The study involved an evaluation of technical management practices associated with system safety, equipment reliability/maintainability, system availability/dependability, and quality assurance. Special studies of human factors and train protection were also performed. While the overall scope of the project was broad, the primary objective was to develop and recommend improvements in safety and systems assurance technical management process and practices.

26 198274 SAFETY EVALUATION OF PRIORITY TECHNIQUES FOR HIGH-OCCUPANCY VEHICLES. Priority treatments for high-occupancy vehicles (HOV) can introduce

new safety problems due to operational or geometric modifications. At the same time, they can reduce the accident potential by improving overall traffic operations. The research focused on five major areas of HOV projects: (1) an examination of the pertinent accident rates, (2) an analysis of causative factors influencing safety, (3) an identification of difficult maneuvers and potential safety problems, (4) the development of recommendations to improve safety, and (5) a review of the legal authority and legal liability issues faced by HOV projects.

Miller, C Deuser, RB Wattleworth, J Wallace, C Beiswenger, Hoch and Associates, Florida University, Gainesville, Federal Highway Administration Final Rpt. 26 198581 SAFETY OF MULTIPURPOSE VANS. Since 1970, the sales of multipurpose vans have increased threefold. Vans are popular because of their versatility; outdoorsmen, small businessmen, service technicians, and the 'week-end vanner' are using vans for personal transportation, business operations, and weekend outings. In fact, in the near future, vans are expected to replace the station wagon. Many owners have customized the interiors of their vans with sinks, bars, refrigerators, beds, and paneling to make them more convenient. Currently, there are no standards or voluntary specifications on how to install these types of items to the van structure. As a result, in a crash environment, they often break loose and injure or kill the van occupants. The National Transportation Safety Board has investigated 18 low-to-moderate speed crashes involving vans to collect data for this study. We have evaluated the crashworthiness of vans from the following standpoints: Injury-producing environments, occupant restraints, crashworthiness, postcrash fires, and ease or difficulty of escape. Further, several existing Federal Motor Vehicle Safety Standards do not apply to vans. These include Standards 201, 202, 203, 204, 212, 214, 215, and 216. In addition the Safety Board has evaluated the standards listed above as they affect each of the five main areas of investigation.

26 260377 SAFETY METHODOLOGY IN RAIL TRANSIT SYSTEM DEVELOPMENT. The report records the results of a study by the National Transportation Safety Board of the October 2, 1972, accidental derailment of a BART train and of the significant management and institutional approaches used to achieve safety as they influenced this system. The purpose of focusing attention on the cause and effect impact of this subject matter on the safety of the BART hardware system is to make this experience available to other municipalities who are implementing or are contemplating the development of a new rail rapid transit system. The report recommends abandonment of the fail-safe concept, and an organized disciplined approach to accomplishing rapid transit system safety,

through the application of current safety management and engineering concepts. /NTIS/

26 264972 REAR-END COLLISIONS REDUCED: A LARGE-SCALE EXPERIMENT UNDER NATURAL CONDITIONS. A deceleration warning light system installed on taxicabs in San Francisco for 12.3 million miles of normal on-road driving reduced the rear-end collision rate by 60.6% compared to the rate for a concurrent control group of cabs which traveled 7.2 million miles. Comparing the experimental group with the concurrent control group revealed that the warning light prevented 5.4 collisions per million miles, 1.02 cab driver injuries per million miles, and 643 dollars of taxicab damage per million miles. An amber light was center mounted on the rear of several hundred taxicab and was designed to communicate information about the tax's deceleration to following drivers. /HSRI/ Voevodsky, J (Voevodsky Associates, Incorporated); Society of Automotive Engineers SAE 740614, Aug. 1974, 11 pp, Figs., Tabs., 31 Ref.; This report was presented to the Society of Automotive Engineers, West Coast Meeting, August 12-16, 1974, Anaheim, California.; ACKNOWLEDGMENT: Highway Safety Research Institute (HSRI-30683)

26 301439 BETTER MANAGEMENT OF METRO SUBWAY EQUIPMENT WARRANTIES NEEDED. Washington Metropolitan Area Transit Authority has acquired \$300 million in rolling stock, train controls, communications, fare collection equipment and escalators for which contract provisions covering warranty and reliability were not effectively administered. Methods for assessing reliability and collecting for warranty work necessary to keep subsystems operable were not established. It is recommended that future contracts include provision for bill-back when operating conditions require in-house repairs; that clear and consistent interpretations be made of warranty classes; and that clear lines of authority be established for enforcing warranty provisions and for making repairs to items so covered.

General Accounting Office PSAD-79-41, Feb. 1979, 41 p., 6 App.; ORDER FROM: General Accounting Office, Distribution Section, Room 1518, 441 G Street, NW, Washington, D.C., 20548

26 302011 ASSESSMENT OF CURRENT U.S. DEPARTMENT OF TRANSPORTATION FIRE SAFETY EFFORTS. The Urban Mass Transportation Administration (UMTA), has undertaken the task of assessing the entire area of fire research to determine how to provide means to reduce the fire threat in transit systems, and thus, to provide a safer means of transportation for the traveling and commuting public. This report presents the results of that assessment by the Transportation System Center (TSC). The study identifies and recommends suitable remedial actions and reflects the present state of transportation fire safety efforts. Emphasis has been placed on Federal Government efforts, and particularly those by the Department of Trans-

portation (DOT). Although the assigned task is directed at fire safety in transit systems, the assessment encompasses all transportation-related fire safety. The intent of this approach has been to emphasize the similarities which exist among the problems and in the programs of the modes. In many instances, the programs of one mode will benefit one or more of the other modes. In conducting this assessment, TSC has reviewed and incorporated into this report the pertinent information resulting from the following efforts: 1) a search and review of public and private sector programs; 2) identification and review of existing data banks (materials and accident statistics); and 3) identification and review of existing regulations, standards, specifications, and guidelines. Each of these efforts is discussed in detail in the report, and where necessary, in Appendix A: Bibliography of Fire Safety Literature and Appendix B: Survey of Dot Fire Safety Products. /UMTA/

26 302103 NEW MEASURING METHOD FOR RIDE COMFORT IN TRANSIT VEHICLES. Principles of several ride comfort criteria in use are presented and compared. The proposed criterion of exposure duration for given vibration levels by the International Organization for Standardization (ISO) were selected for ride comfort measurements. The portable Ride Comfort Meter provides single value measurements which correspond to ISO weighted rms values of effective accelerations. Each measurement takes 15 seconds and is called the Ride Index (RI). Statistical methods were used to analyze the ride comfort data obtained. Resultant statistical means for vertical and lateral RIs versus vehicle speeds in guideway curves and on straight sections are shown. Linear regression using all data points yielded RI equations for describing the relation of vertical and lateral RI to vehicle speed. Results of ride comfort are shown as the percentage of trip time which the vertical and lateral RIs were exceeded. The ISO reduced comfort boundary is used as a basis for comparison between the Morgantown system and other transit systems, additional ride comfort measurements were made at three other automated guideway systems and five conventional transit systems. All ride comfort measurements were performed, employing the new Ride Comfort Meter Type II developed and built by Delft University of Technology in Holland.

26 304678 REVIEW OF POSSIBLE EFFECTS OF SOME SELECTED FEDERAL ACTIONS ON NEW TRANSIT PRODUCT INTRODUCTION. The main concern of the study is to evaluate the feasibility and effectiveness of new

concepts and modification of existing concepts by which the Federal government can encourage the deployment of the most appropriate innovation in urban mass transit. In order to perform the study, information was gathered on the problems facing the innovation process and possible methods that could alleviate these problems. Fifteen concepts were examined by which UMTA could strengthen its role in the technology deployment phase of the innovation process. From the in-depth discussions based on a questionnaire with nine members of the transit industry, the transit operators identified uncertainty over future Federal design and performance guidelines as the single major barrier to new product introduction. The transit suppliers cited uncertainties over the stability and volume of annual product sales, opportunity costs of foregone investments, and lowest-bid procurement as their barriers. Of the 15 concepts, six were ranked as highly feasible and effective: (1) standard set of performance guidelines; (2) lowest life-cycle cost procurements; (3) Federal grants for the purchase and test of limited production quantities; (4) coordination of transit products orders by UMTA; (5) use of Federal capital incentives to influence local authorities to adopt regulations to encourage transit use; and (6) formation of a transit operators and supplies committee to facilitate greater cooperation in the development cycle. In-depth analysis was performed on the six selected concepts and examples of UMTA programs incorporating recommended concepts were discussed.

26 305182 RAILROAD ACCIDENT REPORT-DERAILED OF NEW YORK CITY TRANSIT AUTHORITY SUBWAY TRAIN, NEW YORK, NEW YORK, DECEMBER 12, 1978. About 4:38 p.m., on December 12, 1978, the sixth and seventh cars of a New York City Transit Authority subway train designated "CC" 4:06 p.m. derailed within moments after departing 59th Street station. Twenty-two persons were injured, and property damage was estimated to be \$667,500. While the Safety Board was investigating this accident, three other trains derailed from what appeared to be similar causes. Therefore, the investigation was expanded to include all four accidents. The National Transportation Safety Board determines that the probable cause of each of the four accidents was a cracked wheel which had resulted from extensive overheating. Contributing to the cause of the overheating of the wheels was the partial application of a handbrake. Because of a lack of adequate inspection procedures, the New York City Transit Authority employees failed to detect the partially applied handbrake and the thermally damaged wheels before they cracked.

26 312440 NEW COLLISION AVOIDANCE SYSTEM USING BASEBAND REFLECTOMETRY. This paper describes a guided wave, baseband radar-type sensor for protecting automated rapid transit vehicles traveling in dedicated guideways. The system has been given the acronym CASBAR for Collision avoidance System using Baseband Reflectometry. A baseband pulse signal, 2 nanoseconds wide, is transmitted through a surface waveguide (Goubau line) supported alongside the guideway. Reflections from a passive target located on an adjacent vehicle down the track are processed in a receiver. One output of the receiver controls the brakes which can be applied in dangerous situations. The maximum range of the system is 300 feet and its range and range rate resolutions are 1 foot and 0.5 feet/sec. respectively.

26 313245 HIGHWAY SAFETY RESEARCH, DEVELOPMENT, AND DEMONSTRATION. CONFERENCE PROCEEDINGS HELD AT THE DULLES MARRIOTT CONFERENCE CENTER, CHANTILLY, VIRGINIA ON APRIL 22-26, 1979 [Final rept]. The 1979 Conference on Highway Safety Research, Development, and Demonstration was held to review proposed activities to be undertaken by the National Highway Traffic Safety Administration over a five-year period, FY1980-FY1984. The report contains the proceedings of the conference. Program plans reviewed include 55 mph noncompliance and other unsafe driving acts; occupant restraints; alcohol and drugs; pedestrian, bicyclist, public transportation; driver licensing; motorcycle and moped safety; young driver; Emergency Medical Services; state traffic records; state program management; traffic law adjudication; police traffic services; motor vehicle registration, titling, and antitheft; and the National Driver Register. In addition to specific program elements, the report reviews issues related to program priorities, the basis for their selection,

the transfer of program results, and their responsiveness to the needs of the national highway safety community.

26 315017 TUNNEL FIRE SPECTER SPARKS MANY SAFETY PROGRAMS. After the major fire in the Transbay tunnel of Bay Area Rapid Transit in 1979, all North American subway systems are giving increased attention to fire prevention and fire fighting. These have included changes in tunnel cables, water supply and venting, in emergency training for transit employees, and in new coordination with municipal emergency services. Two handbooks for design, UMTA's Subway Environmental Design Handbook and APTA's Guidelines for Design of Rapid Transit Facilities, will soon be supplemented by a new water piping standard for fixed guideway transit by National Fire Protection Association.

26 315117 FIRE SAFETY ASPECTS OF POLYMERIC MATERIALS. VOLUME 8-LAND TRANSPORTATION VEHICLES. This is the eighth volume in a series. The fire safety aspects of polymers are examined with primary emphasis on human survival. This volume is concerned with the polymeric materials used in subway, surface, and elevated urban railway vehicles; railroad vehicles; other rail vehicles (including unattended and semicontrolled type); buses, trucks; passenger automobiles; and miscellaneous vehicle types (including motorcycles and snowmobiles). Other volumes in the series deal with materials (state of the art); test methods, specifications, and standards; smoke and toxicity; fire dynamics and scenarios; aircraft (civil and military); buildings; ships, and mines and bunkers. A volume on elements of polymer fire safety and guide to the designer has been added to the series to pull together the disciplinary material of the first four volumes. This report examines the fire safety aspects of those polymeric materials currently used, or expected to be used, in land vehicles that transport people and materials. Excluded from consideration are specific materials such as fuels, engine lubricants and other engine polymers and hydraulic fluids.

26 318972 PERSONNEL SAFETY ON ELECTRIFIED RAILROADS. Potential electrical hazards to fire, police, and rescue personnel responding to emergencies on electrified railways are examined. Data on descriptions of electrical facilities, types of accidents and danger to emergency personnel, and reviews of operating procedures have been obtained during a series of visits to electrified rail and transit systems. Programs to reduce electrical hazards to emergency personnel are proposed. These programs are evaluated by a

cost-benefit comparison, and recommendations are selectively made. Joint development of emergency operating plans by rescue and railroad organizations, and installation of direct telephone lines to the power director are recommended as being most cost-effective.

26 322837 SAFETY OR RELIABILITY MUST WE CHOOSE? The transit industry has traditionally depended upon fail-safe design techniques and practices to achieve safety in the application of its control and communications systems. The ability to produce a reliable design using these techniques is somewhat limited, particularly as the level of automation increases. The aerospace industry has provided safety in the systems they have developed through disciplined programs of hazard analysis and risk assessment, combined with design techniques which enhance the reliability of the systems. It would appear that an amalgamation of some of these techniques and practices into the transit design processes holds some promise of helping to provide reliable automated ground transportation while maintaining the safety of the riding public at an acceptably high level.

26 324996 MAN-MADE POLYMERS--THE FIRE SAFETY ISSUE REACHES FLASH-POINT. The National Academy of Sciences will issue recommendations in mid-January designed to halt "improper, unsafe use of polymers" Pointing to marked increases in the use of manmade polymers in virtually every transportation vehicle, the unpublished report says, "the sharply increased fire load, with relatively unknown fire characteristics, poses a substantial problem that has not yet been fully realized, much less evaluated". The Academy will urge an immediate ban on the use of polyurethane in new mass transit vehicles and its replacement in operating equipment. The Academy notes that passenger compartment furnishings are now almost 100% polymeric material (predominantly flexible polyurethane, polyvinyl chloride, poly-

propylene, and SBF elastomers) which are "major contributors to the high frequency of passenger compartment fires". The Academy warns that although these materials are required to pass Federal Motor Vehicle Safety Standard (FMVSS) 302 with a horizontal burning rate of 4-in. (10.2 cm) per minute, most of them are used in a vertical configuration where the actual burning rate would be expected to reach several times that exhibited in the horizontal configuration.

26 325734 A REPORT ON INVESTIGATIONS INTO RAIL PASSENGER SAFETY. Investigations are made into issues affecting rail passenger safety in intercity and commuter rail service. The objectives of the study were to identify important safety issues that need resolution, to describe means for resolving these issues, and to describe further research that is critically needed. Special attention was given to those issues highlighted by the National Transportation Safety Board (NTSB) in recent recommendations. The important safety issues identified are briefly described as communications, train control systems, vehicle crashworthiness, vehicle interior design, emergency regress and lighting, equipment maintenance and inspection, and employee training.

26 326035 IDENTIFICATION OF THE FIRE THREAT IN URBAN TRANSIT VEHICLES. To improve mass transportation, UMTA tasked the Transportation Systems Center (TSC) to assess the overall fire threat in transit systems and to identify and recommend suitable remedial actions. This report presents the identification of the fire threat in urban transit vehicles. The study is based on site visits/surveys to nine representative U.S. transit properties, namely: Massachusetts Bay Transportation Authority (MBTA);

Bay Area Rapid Transit District (BART); New York City Transit Authority (NYCTA); San Francisco Municipal Railway (MUNI); Southern California Rapid Transit District (RTD-Los Angeles); Denver Rapid Transit District (RTD-Denver); Metropolitan Atlanta Rapid Transit Authority (MARTA); Washington Metropolitan Area Transit Authority (WMATA); and Chicago Transit Authority (CTA). The data collected from the nine transit properties represented all bus and rail rapid transit fire and smoke incidents which occurred at those transit properties during the calendar year 1978. Data was obtained from daily logs, operator reports, accident reports, police reports, and maintenance reports. These data are supplemented by fault tree diagrams and scenarios in identification of the fire threat. These are based on actual transportation fire and smoke incidents in TSC files, data analysis, interviews with transit personnel, and the use of maintenance manuals. Following a description of the TSC data acquisition methodology, the data are analyzed and discussed along with the relationship of the fault trees and scenarios to the identification of countermeasures.

Hathaway, WT Flores, AL ; Transportation Systems Center, Urban Mass Transportation Administration Final Rpt. DOT-TSC-UMTA-80-8, UMTA-MA-06-0051-80-1, June 1980, 109p; Contract DOT-MA-06-0051; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-217631

26 328279 IDENTIFICATION AND EVALUATION OF OPERATIONAL ALTERNATIVES FOR MATERIALS DATA BANK. The Urban Mass Transportation Administration (UMTA) has expended considerable effort in assessing the fire performance characteristics of materials used in transit vehicles. The collection and dissemination of pertinent flammability information are an important part of this research. The large volume of data associated with the flammability characteristics necessitated the establishment of a system for storing the data in such a manner that it would be easily available upon request. In the past, a request for such data required a search of files, journal articles, and manufacturers' litera-

ture. To address these problems, a plan for a computerized information storage and retrieval system was devised to accommodate such data queries. This report is intended to provide a review of the organization and operation of UMTA's Materials Data Bank which was established and is maintained by the Transportation Systems Center (TSC). Contained within the Materials Data Bank are two basic categories of information: (1) non-metallic materials flammability data, and (2) fire extinguisher data. Included in this review are the reasons for the Bank's establishment, details of its contents, present operational status, and the identification and evaluation of operational alternatives directed at improving its visibility and its usefulness to the technical community. It is recommended that the best method for managing and disseminating the technical data will be accomplished through TSC. A notice of the availability of this system will be published in the Federal Register.

27 048186 VANDALISM AND PASSENGER SECURITY IN THE TRANSIT INDUSTRY. This paper summarizes the goals and objectives of an Urban Mass Transportation Administration project designed to measure the scope of transit-related vandalism and crime in terms of its characteristics and costs. The discussion includes all current efforts to reduce vandalism, passenger harassment, and crime in terms of vandal-resistant materials and equipment; community, social, and educational programs; and deterrent, protection, surveillance, and apprehension systems. The paper also discusses problems of institutional cooperation and conflict as well as current and planned demonstration projects designed to measure the effectiveness and costs of particular procedures and techniques for deterring vandalism and crime.

Schnell, JB Smith, AJ (American Transit Association) *Highway Research Record* No. 449, 1973, pp 21-33, 2 Ref.; ORDER FROM: Highway Research Board, 2101 Constitution Avenue, NW, Washington, D.C., 20418 Repr. PC

27 057337 SUMMARY REPORT ON VANDALISM AND PASSENGER SECURITY IN THE TRANSIT INDUSTRY. This paper summarizes the findings of a study on crime, vandalism, and passenger security on urban transit systems. The study's major goals were to appraise the national scope of transit crime and vandalism and to explore means of controlling the problems and make suggestions on the basis of the research findings. The emphasis in this summary is on means of controlling the problems. Several ideas to control transit crime and vandalism are discussed: the use of materials that are specially fashioned to withstand criminal and vandal acts on transit; procedures and tactics to protect transit passengers, employees, and properties and ways to detect and deter offenders, keep them under surveillance, and apprehend them when necessary; mechanical and electronic devices, as well as features of stationary sites, for assisting police and security forces in their duties; programs for involving the community in formulating anticrime and vandalism measures and programs for maintaining a liaison with educational authorities and personnel; the methodical cultivation of good relations with police, courts, and the media; and the attitudes of the public toward transit crime and vandalism to ascertain whether fear of crime and vandalism influences passenger decisions to use urban transit. Suggestions for further research on transit crime, vandalism, and passenger security are also given.

Thrasher, EJ Schnell, JB (American Transit Association) *Transportation Research Record* No. 487, 1974, pp 46-54, 3 Ref.; ORDER FROM: TRB, Repr. PC

27 057338 STUDIES OF PUBLIC ATTITUDES TOWARD TRANSIT CRIME AND VANDALISM. This paper describes the findings of six studies in five cities on the question of whether fear of transit crime and vandalism affects a person's decisions to use urban transit systems. Although the studies do not give a firm answer, they offer some tentative conclusions: Transit crime and vandalism can exert strong influence on decisions concerning use of urban transit, but there are many variations depending on the volume of crime or vandalism in the area served by a particular route, the transportation alternatives available to passengers, the hours at which they must ride, and other factors. In general, transit crime and vandalism are more likely to influence passenger decisions concerning riding on rapid transit than on buses. Riders are more likely to view with serious concern the potentially menacing aspects of rowdiness such as verbal threats and vandalism than "nuisance" aspects such as the pushing and shoving involved in horseplay. Riders' concern is likely to be more intense when they personally witness crime or serious rowdiness than when they are not personally involved. Those who are reluctant to ride urban transit because of personal security considerations least favor riding after 7:00 p.m. Transit crime and vandalism may have a potential influence on all classes of riders regardless of age or sex, although possibly not in the same degree. It is extremely difficult to establish that a given change in ridership is caused by a single factor such as crime or vandalism. In any situation, there may be a combination of factors that influence ridership and make it all but impossible to determine the degree of influence of any one factor.

Thrasher, EJ Schnell, JB (American Transit Association) *Transportation Research Record* No. 487, 1974, pp 26-33, 3 Ref.; ORDER FROM: TRB, Repr. PC

27 057339 SCOPE OF CRIME AND VANDALISM ON URBAN TRANSIT SYSTEMS. This paper reports on an attempt to quantify the extent and seriousness of crime and vandalism on urban transit systems. Although many imprecisions in the recording of criminal incidents and the computing of vandalism costs impose limitations on the data, the authors believe that the findings constitute a significant first step toward knowledge of the incidence of transit crime and the monetary costs of transit vandalism. On the basis of data obtained from 37 U.S. transit systems, the total number of criminal incidents on all systems in 1971 is estimated at approximately 33,000 to 39,000. No functional relationships were found between various factors such as total crime indexes and total crime per 100,000 vehicle-miles or 100,000 revenue-passengers. A computed transit exposure index led to the tentative conclusion that the risk of being involved in a criminal incident could be at least twice as great when riding on urban transit vehicles as in nontransit circumstances. If this conclusion is sound, the problem of crime on transit systems may be proportionately more serious than has been generally credited. The total national transit vandalism costs for 1971 are estimated at \$7.7 million. Direct transit vandalism costs on the average amounted to less than 0.5 percent of operating costs in 1971, but the problem assumes

greater dimensions when indirect costs are also considered. Window breakage was the largest component, followed by damage to seats, damage to stationary facilities, and graffiti. National transit system costs of liability claims resulting from incidents of crime and vandalism in 1971 are estimated at \$1.85 million to \$2.33 million.

Thrasher, EJ Schnell, JB (American Transit Association) *Transportation Research Record* No. 487, 1974, pp 34-45, 7 Tab.; ORDER FROM: TRB, Repr. PC

27 072729 PERSONAL SECURITY ON PUBLIC TRANSIT. While conventional modal choice models consider time and cost, safety has been largely ignored. This study examined the safety aspect of a public transit facility through user-perception survey. A bus and elevated line of the Chicago Transit Authority were chosen as the survey areas. It was found that the variable most frequently cited as decisive in using, or not using, the bus or elevated is freedom from personal attack or harassment. The users' perception of safety is examined. The study cites some shortcomings of the survey method and notes that system design should have a major role in persuading potential riders that safety is assured.

27 080627 CITIZEN SAFETY AND BUS TRANSIT. This report investigates all of the major factors which effect the relationships between bus transit, crime and the citizen in the Washington, D.C. area. These factors include: (1) actual reported on-bus incidents; (2) reported incidents that occur at local bus stop intersections and bus stop approaches; (3) incidents observed by bus riders; and (4) attitudes of bus riders and non-riders about bus related personal safety. The report documents the current methods of transit crime reporting and investigates obstacles to the provision of thorough accounting and reporting of transit crimes. Major related issues such as passenger victimization, public perception of transit crime vs. actual reported incidence levels, and prerequisites to maintaining the public confidence are discussed in conjunction with recommendations for agencies involved. /UMTA/

27 081948 THE IMPACT OF POLICE ACTIVITY ON SUBWAY CRIME. The impact of police manning and apprehension activities on New York City subway crime, with emphasis on robbery, is analyzed for the period 1965-1971. With increased uniformed patrol between 8 p.m. and 4 a.m., the number of felonies decreased both during the hours of increased manning (a deterrent effect) and during the rest of the day (a phantom effect). Displacement of crime is ana-

lyzed via the relationship between subway and bus robberies.

27 092224 VANDALISM SUPPRESSION BY HELICOPTER. PRELIMINARY EXPLORATION. The research project is a preliminary exploration into procedures, applications and effects of helicopter surveillance of commuter and freight railroad facilities in an urban environment. The project was conducted in the Philadelphia Metropolitan Area in the Spring and Summer of 1972 for the Federal Railroad Administration and with the cooperation of the Penn Central Transportation Company and the Reading Railroad. An attempt was made to document effects of the helicopter patrol and to provide insight into the requirements of a more exhaustive program to attain statistical validation of observed impact of helicopter use.

Aylworth, CE ; Naval Ammunition Depot, Federal Railroad Administration Final Rpt. FRA-OPPD-74-1, Jan. 1973; See also RRIS 12 052071 7402 and 153082 7702.; Contract DOT-AR-20013; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-244099/8ST, DOTL NTIS

27 128947 SECURITY OF PATRONS ON URBAN PUBLIC TRANSPORTATION SYSTEMS. This report presents a wide range of current thinking on the nature of the crime problem on public transit system, its effect on transit patronage, measures taken to meet the problem, projections about what the problem will be in the future, and the kind of research required to meet future needs. The citizen's perception of crime on public transit and its effect on ridership will be an essential factor in the planning and operating of public transportation. These basic crime control strategies are: increase of police manpower including flexible deployment strategies; expansion of electronic devices to complement police patrol; and operational strategies such as the elimination of stops in high crime areas. The application of current knowledge to automated small vehicle systems in discussed.

Carnegie-Mellon University Res. Rept. Feb. 1975, 68 pp, Tabs., 13 Ref., 3 App.; Report on the Workshop on Transit Security, Feb. 24-25, 1975.

27 139383 ST LOUIS HELICOPTER PROJECT-A COOPERATIVE EFFORT AMONG FOURTEEN RAILROAD DEPARTMENTS. The specific objective of the project, undertaken and funded by the Department of Transportation, was to test and demonstrate the effectiveness of a collective approach to railroad security by coordinating the efforts of all security resources within the railyards at St. Louis-East St. Louis. These resources included a helicopter and special communications equipment for common use among several railroad companies. The report describes the Railroad Police System in Greater Metropolitan St. Louis and then deals with the implementation of the project including securing equipment, insurance, and training. The operation of the system is documented including the

determination of flight schedules, radio procedures, surveillance, and apprehension procedures used by the helicopter. The impact of the project is evaluated and nineteen recommendations on how a permanent airborne surveillance program should be organized and operated are set forth. The findings support the conclusion that helicopters can be an effective component of a railroad security system. The project also demonstrated the effectiveness of coordinating and pooling all available law enforcement resources in reducing vandalism, trespassing, and cargo theft. There was a marked increase in joint police ventures and the concept of a common radio frequency was almost universally endorsed by the participating railroad police. Appended to the report are a copy of the helicopter services contract, a personal injury liability agreement, and the project evaluation forms used by the participants.

27 143214 TRANSIT SAFETY AND SECURITY: A DESIGN FRAMEWORK. The study is an analysis of transit crime data for the Southern California region. It examines safety and security deficiencies in transit design and recommends ways in which they can be ameliorated. The study contains the following: (1) development of security and safety objectives in the operation of major transit systems, (2) assessment of crime patterns and safety problems for selected regional transit corridors, (3) examination of the effectiveness of crime prevention by physical design of transit facilities, and (4) development of a reference document for safety and security design criteria in transit facilities. Some specific design areas examined include the following: park-and-ride facilities, parking structures; site planning and landscaping; illumination levels; passenger boarding safety; subway and elevated systems; station visibility; closure and monitoring; traffic and parking criteria; and the special needs of the elderly and handicapped.

27 152787 CRIME AND PERCEPTION OF CRIME ON A METROPOLITAN MASS TRANSIT SYSTEM. Crime on transit systems has become a serious problem. Besides the hardship placed on those who are victimized, crime also seems to be a cause of decreasing patronage. Expansion of present systems or construction of new ones will alleviate the energy-environmental crunch only if commuters can be recruited away from their use of private automobiles. A study of transit crime coupled with a telephone survey reveal that transit crime is perceived differently from street crime. The results indicate that transit systems require uniquely designed security systems to reduce crime and increase public confidence in the system.

27 152788 ELECTRONIC SURVEILLANCE/-RESPONSE SYSTEM TO REDUCE CRIME ON A MASS TRANSIT FACILITY. This paper covers Carnegie-Mellon University's design of a surveillance response system to reduce crime on the City of Chicago's transit system. It includes a brief review of the possible electronic devices applicable to a public transit system security network. The "Television Alert System", which has been accepted and is being installed in Chicago is described in detail.

27 168934 PROCEEDINGS OF WORKSHOP ON METHODOLOGY FOR EVALUATING THE EFFECTIVENESS OF TRANSIT CRIME REDUCTION MEASURES IN AUTOMATED GUIDEWAY TRANSIT SYSTEMS, HELD AT CAMBRIDGE, MASSACHUSETTS ON MAY 25-28, 1976. The workshop focused on current methods of assessing the effectiveness of crime and vandalism reduction methods that are used in conventional urban mass transit systems, and on how they might be applied to new AGT systems. Conventional as well as novel methods of assessment were presented and discussed. Among the major issues discussed were the use of critical incident techniques to assess the community's needs with regard to transit security; the establishment of a board similar to the National Transportation Safety Board, which will focus on security issues; and the role of security specialists and management in transit planning. The information herein should be of interest to transit security planners and researchers, law enforcement agencies, planners of AGT systems, and in general those people who are concerned with the problems of crime and vandalism in transit systems.

27 174409 CRIME IN NEW YORK, PHILADELPHIA, LOS ANGELES, AND WASHINGTON, D.C. This article discusses the safety aspects of public transportation systems in four major cities: New York, Philadelphia, Los Angeles, and Washington, D.C. New York's safety program includes the use of decoy policeman on the subway trains and platforms, uniformed officers near turnstiles at key stations, and juvenile programs for offending youths. This year a T.V. surveillance camera will be installed in certain stations as part of a federal demonstration project. Philadelphia's system includes a transit police unit, radio communication on all trains, a

K-9 Corp, plainclothes police officers, and closed-circuit T.V. On the Lindenwold Line, the police force patrols the parking lots where there has been a high rate of stolen cars. Also, officers on that line have jurisdiction in both Pennsylvania and New Jersey. The Southern California Rapid Transit District (SCRTD) attribute the drop in serious crime to greater law enforcement cooperation and an increasing number of radio equipped buses. Of all the serious accidents, thefts from operators have been the most prevalent. About 800 of SCRTD's buses are equipped with two-way radios, silent alarms, four-way flashing lights, and numbers painted on their roofs for easy aerial identification. Washington's rapid rail system to date has had a very good safety record. This can be attributed to patrol cars near station entrances, uniform and plainclothes District police riding the system, a well trained and experienced police force, a safety oriented subway system design, a "no cash" fare policy, and the high-quality of its riders. Metro officials are worried, however, about opening the system until 11 PM and the additional seven-mile link. Both of these factors will put an additional strain on Metro's police-force.

Mazza, F (New York Daily News) Hackney, DC (Philadelphia Bulletin) Hebert, R (Los Angeles Times) Crosby, T (Washington Star) *Mass Transit* Vol. 5 No. 3, Mar. 1978, pp 12-19, 13 Phot.

27 178150 ROLE OF SECURITY IN MARKETING URBAN MASS TRANSPORTATION. The study reported was conducted to provide input on the security-oriented attitudes and perceptions of users and non-users of public transportation for use in a large scale transit marketing study of the Chicago metropolitan area. Consideration is given to the saliency of security among these different groups, to various dimensions of the security problem as perceived by the respondents, and the implications of these perceptions for the marketing of urban mass transit.

27 190881 TRANSIT CRIME STUDY. This report presents statistic data and information which enabled a determination that the northeast region of New Jersey is the only location in the state where transit crime statistics are collected and tabulated. Security systems and techniques are evaluated and several systems are chosen as possible successful countermeasures for the high transit crime locations in the region. Two-way radio communication is suggested for the bus and subway locations. Helicopter Track Patrols are suggested for the commuter rail locations. All these systems are examined and funding priorities are established. Activities necessary for evaluation of the recommended security systems are included. (Portions of this document are not fully legible)

27 272002 CRIME ON TRANSIT SYSTEMS MAY DETER MOTORISTS FROM SWITCHING FROM CARS. Robert Shellow, professor of urban affairs in Carnegie-Mellon University's School of Urban and Public Affairs, speaking at the recent 53rd Annual Meeting of the Highway Research Board, states the anxiety over crime on mass transit systems may generate a political whirlwind as fuel shortages force the affluent and politically powerful auto commuters into the ranks of captive riders. He describes a system designed to protect riders from crime and harassment. The system features a security-surveillance system called "Televue Alert System." This system is seen as cheaper than police patrols and as effective. The findings of the survey and study also indicated that perceived security is at least as important as the reality of crime.

Highway Research News, Hwy Res Board No. 54, 1974, pp 50-51 ORDER FROM: TRB, Repr. PC

27 272041 CRIME IN RAPID TRANSIT SYSTEMS: AN ANALYSIS AND A RECOMMENDED SECURITY AND SURVEILLANCE SYSTEM. This study is directed toward identifying the influence that crime has on transit ridership and toward developing measures for increasing patron and system security on a major transit network. Because of the preponderance of crime and harassment on rapid transit as opposed to surface transit, recommendations are directed toward test demonstrations on the rapid transit segment of the system. All suggested improvements are based on systematic analyses of transit crime patterns, ridership trends, a survey of public perception of transit crime, present security measures, and general operating procedures. Profiles of transit crime are derived from an 18-month series of crime data collected on the system. A crime-ridership index is employed to measure risk to patrons on various parts of the transit system. Present inadequacies in surveillance and response capability of police are described. The question of increasing manned patrols as opposed to substituting electronic or mechanical systems is examined from the viewpoint of assuring patrons of rapid protective response should an emergency arise. A publicly activated closed-circuit television system is offered as one means of addressing the security needs on highrisk portions of the rapid transit network.

27 272042 PERSONAL SECURITY IN BUSES AND ITS EFFECTS ON RIDERSHIP IN MILWAUKEE. This paper deals with the problem of personal security on bus transit vehicles and its effects on transit ridership. A survey was conducted in Milwaukee along a transit route that has a high degree of transit crime and vandalism. The route chosen traversed a cross section of land uses and neighborhoods of widely different socioeconomic levels. A sample of bus riders and a group of randomly selected households along the chosen corridor were asked to complete questionnaires. The survey result gives an indication of the relationship between and the relative degrees of passenger perceptions of destructive and personally hostile acts as well as the actual

occurrence of such acts. The survey results are analyzed according to the respondents' rates of use of transit service as well as their ages and sexes. The responses are evaluated separately for crime and vandalism. The responses about personal security are further examined in relation to the various service characteristics. The survey results are also analyzed according to the land use and socioeconomic characteristics of the identified zones. It is determined that the degree to which transit crime and vandalism affects transit patronage is related to land use and socioeconomic characteristics of the neighborhoods, but the problem of personal security is less important than such service factors as frequency of service, convenience of routes, fare level, and travel time.

27 309107 REPORT ON THE SITUATION RELATING TO THE DISTURBANCE OF ORDER AND SAFETY IN THE URBAN AND REGIONAL TRANSPORT [Rapport over de situatie met betrekking tot de verstoring van orde en veiligheid bij het stads-en streekvervoer]. An inventory is made of delinquent behaviour in public transport in the Netherlands. An evaluation is given of the efficiency of countermeasures and proposals for improvements are presented. The data are relevant to the first nine months of 1978. Urban transport is relatively most frequently confronted with non-paying passengers and damage, regional transport with damage only. Recommendations are: to bring about an amelioration of mental attitude, supporting control-staff, to bring the offenders to trial immediately, replacement of vulnerable materials, increasing the number of vehicles equipped with walkie-talkie. /TRRL/ [Dutch]

27 310542 SUBWAY LIGHTING-AN OVERALL CONCEPT. A footpath network to segregate pedestrians from traffic needs to be attractive, and subways should be safer, have easy access, and be of good overall design. This article describes a mini-bridge type subway consisting of two trapezium shaped blocks of in situ concrete carrying a monolithic deck slab. The importance of surface finishes is stressed and the overall design and standard of lighting is considered. The aesthetic appearance of installations and their location to prevent vandalism is emphasised. The design and construction of the luminaires, and the materials used are considered in some detail, noting the need for protection against weather, corrosion and vandalism. (TRRL)

27 313134 URBAN MASS TRANSIT: CRIME AND RELATED PROBLEMS-A BRIEF HISTORICAL REVIEW, 1850-1977, WITH ANNOTATED BIBLIOGRAPHY. The paper reviews criminal activity involving public transit systems from 1850-1977. It shows that the type of

crime evolved from primarily non-violent, e.g., pickpocketing, prior to 1930 to violent, e.g., assaults-robbery after 1930. Attempts by transit systems to cope with the problem through legislation, police, public relations, and modern technology is described herein. The bibliography presents in one document references to data associated with urban transit security. Bibliographical entries, in this report, are annotated, and indexed by author, periodical, subject, title, and foreign references. It is organized into eight parts: (1) Theses and Books; (2) Government Reports; (3) Private Reports; (4) Periodical Articles; (5) Newspaper Articles; (6) Unpublished Papers, Reports, and Speeches; (7) Legislative and Legal Documents; and (8) Suggested Readings. Instructions for obtaining cited items is included.

27 322246 AMERICA'S FIRST TRISTATE, MULTI-JURISDICTIONAL POLICE

FORCE. This article is an overview of the police force established by the Washington, D.C. Metropolitan Area Transit Authority for surveillance of the recently constructed subway system in the Washington metropolitan area. The transit authority was formed by an interstate compact adopted by Maryland, Virginia, and the District of Columbia City Council with the consent of the U.S. Congress. The organizational structure and training requirements of the police force and summarized. The department's view of its primary rail mission focuses on high-visibility patrol for trains and station platform areas to create an aura of passenger safety through conspicuous police presence. Toward this objective, patrol manpower is deployed in a variety of ways, overtly and covertly. The following strategies are employed to combat crime: the assignment of patrol officers to a given station, train patrols, coverage of multiple stations, substantial increase in patrol manpower at a given location to maximize visibility, the deployment of officers posing as potential crime victims, and covert surveillance. Although some local residents had expressed a fear that crime might increase in the vicinity of the

Metrorail stations, statistics indicate to the contrary. It would appear that criminals prefer to operate where people and police are not visible.

27 328236 CLOSED CIRCUIT TELEVISION IN TRANSIT STATIONS: APPLICATION GUIDELINES. It is intended that readers will acquire information from this document that will help in planning, designing, installing, operating, and evaluating the most appropriate CCTV transit surveillance system for their own purposes. This report is arranged to first identify key concepts in the main areas associated with CCTV transit station security systems, and then are focused individually on those main areas which include equipment, personnel, procedures, evaluation, and costs. Appendices which include lists of manufacturers of CCTV components, glossaries of terms and abbreviations, and a comprehensive bibliography are included in this report. The information for this study was obtained from literature surveys, suppliers, visits to existing transit CCTV installations, consultations with subject-matter experts, and the prior experience of the project staff.

27 330173 SECURITY CONSIDERATIONS IN THE DESIGN AND OPERATION OF RAPID TRANSIT STATIONS (ABRIDGMENT). Design principles for rapid transit stations and off-peak transit ridership as a function of personal security are discussed. A survey was conducted at two rapid transit stations in Cleveland, Ohio, for the purpose of determining user attitudes toward personal security and developing station design principles based on the findings. The major finding is that a "critical mass" of station patronage seems to be required before people feel secure in rapid transit stations. People avoid underused stations (which exacerbates the problem of poor patronage) and avoid riding in off-peak time periods at all stations. In both cases, survey respondents stated that they feel vulnerable in a transit station when there are few people around. Ironically, poor station patronage, which is considered to be a security problem, is largely a marketing problem, and improving off-peak ridership, which is generally considered a marketing problem, is largely a security problem. People provide the best security. It is concluded that, although traditional security measures such as good lighting, well marked stations, and security patrols are beneficial, improved security and improved transit marketing are closely associated and should be considered together in transit planning.

28 047307 CONSUMER ORIENTED APPROACHES TO MARKETING URBAN TRANSIT. The study sees marketing as playing a key role in urban transit operations because of its focus on understanding and satisfying consumer needs. Marketing strategy is discussed on the basis of detailed knowledge of the consumer, how he goes about deciding to make a trip, and how he selects a mode of transportation. To facilitate understanding of this decision process and how it may be influenced, a microanalytic model of modal choice behavior was developed in flow chart form. To improve knowledge of these variables, a large scale consumer survey was undertaken in the San Francisco Bay area. Various multivariate statistical techniques are used to analyze the resulting survey data. The study concludes with several proposed strategies to use in the marketing mix.

28 050746 MARKETING TECHNIQUES AND THE MASS TRANSIT SYSTEM. The report, a transit information and marketing study, was performed with two objectives in mind: To identify marketing and information techniques being used successfully by mass transit systems to increase patronage and to make their systems more accessible to the public; and to develop a model for evaluating transit information and marketing systems and to develop methods to increase the effectiveness of these systems. Three methods were used to gather the information in the report: a literature search, a written questionnaire to transit systems, and visits to five cities for personal interviews with transit system officials. The main problems are found to be competition with other transit modes (especially automobiles), increasing costs, and communications barriers between the transit service and the public. Recommendations are made and areas where further work and research may be useful are suggested. A companion handbook to the report includes specific examples of advertisements and promotional pamphlets for use by all media.

National Urban League, Incorporated, (UMTA-DC-06-0020) Final Rpt. UMTA-DC-06-0020, July 1973, 107 pp; Prepared in cooperation with Mark Battle Associates, Inc., Washington, D.C. 28 050747 MARKETING TECHNIQUES AND THE MASS TRANSIT SYSTEM-A HANDBOOK. The handbook contains a selection of materials that have been used by transit systems to promote their service or to provide the public with information about using their service. The samples represent some of the more creative pieces that were provided by the 58 transit systems covered in the research on the companion report, 'Marketing Techniques and Mass Transit Systems'. The volume is designed as a guide to aid other transit systems in the selection of materials for their own marketing campaigns. Contents include pamphlets on video reinforcement, newspaper advertisements on rider reinforcement, encouraging modal switch and notices of systems

changes, special information tools, schedules, maps, news releases, radio-spot advertising, multi-lingual announcements and announcements of special public relations activities. The format is largely graphic. Portions of this document are not fully legible.

28 081175 PITTSBURGH'S NEW RIDERSHIP PROGRAM. The New Ridership Program is based on improved service and equipment to the passenger at attractive fares with expanded information and promotion. The first step has been to improve service. The new system operates 95 Light Rail PCC Cars and 915 Diesel Buses on 171 routes traveling over 1,932 miles of route. In 1973, 91,753,819 passengers used the system.

Geissenheimer, HH ; Port Authority of Allegheny County Apr. 1974, 9 pp; Presented at the ATA Rail Transit Conference, San Francisco, Calif., 18 April 1974.; ACKNOWLEDGMENT: NTIS (PB-232775/7); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-232775/7

28 084699 SELLING URBAN TRANSIT. This article provides transit managers with a conceptual format for designing useful marketing programs, focusing on short-run alternatives available in marketing vehicular modes of mass transit. A flow model for transit marketing programming is presented, and customer profiles developed. Five customer segments are discussed: manager/professional, clerical, inner city residents, elderly, and suburban housewives. Marketing strategy involves the integration of the various components of the marketing mix-product, price, promotion, and distribution to tap opportunities uncovered by segmentation analysis.

Kangun, N Staples, WA *Business Horizons* Vol. 18 No. 1, Feb. 1975, pp 57-66

28 084708 TRANSIT MARKETING: DO'S AND DON'TS FOR A SUCCESSFUL PROGRAM. Marketing in the transit industry has two main goals: 1) increased patronage, and 2) public support for transit service. Management is a most important factor to consider in a marketing program seeking to promote transit. Public information procedures such as news media and customer information services can be most effective in encouraging patronage. In regard to

promoting transit's image, and eye-catching logo and color scheme for the vehicle is an effective device. Transit stops should be more clearly marked, and the provision of benches and shelters is a convincing aspect of the claim of providing better service. Color-coded maps of the system and telephone inquiry answering services are other indications of improved service. Community participation should be encouraged to obtain public reaction and possible suggestions for further improvement. A concern often ignored is that of driver courtesy. A training program for drivers should be provided so that all the other improvements won't appear worthless because of an inconsiderate driver. One of the most innovative marketing features is the use of promotional programs to increase ridership and keep the system in the news. These include ride home free, special family fare, ride all day, low-fare special, park-n-ride, bus decoration, special passes, charter service, and bus lanes. Transit marketing techniques are being reviewed and updated constantly, and many ideas are borrowed from consumer product marketing. Only experimentation will tell what is most effective. In any case, transit systems are on the rise today as a result of both ecological and energy concerns.

Walbrecker, R (Voorhees (Alan M) and Associates, Incorporated) *Metropolitan* Vol. 71 No. 1, Jan. 1975, pp 9-12, 1 Phot.; Excerpted from a monograph in "Short-Range Transit Planning", published by Urban Mass Transit Administration.

28 095588 MARKETING CONVENTIONAL TRANSIT: INFORMATION PROVISION AND INTRODUCTORY REWARDS. This paper addresses one aspect of a complex issue: the attempt to develop viable transit systems through the generation of noncaptive patronage. Two general premises underlie the action-oriented study on which this report is based. The first is that middle-income and upper-middle-income residents do not consider public bus transportation as a reasonable mode for intracity travel and in fact do not possess sufficient information to do so. The second is that the best promotion is an actual "initiation" to the services of the bus system. Results from a study involving a small section of Cedar Rapids, Iowa, seem to substantiate the assumptions. In the study, promotional materials and free bus trips were combined with several questionnaires, both before and after a free-trip period.

Wilson, EM Hultquist, JT Peterson, SJ Kendall, KW (Iowa University, Iowa City) *Transportation Research Record* No. 519, 1974, pp 46-55, 1 Fig., 2 Tab., 9 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

28 097123 MARKETING AND THE MANAGEMENT ATTITUDE. While it is true that we must serve those who have no other way of getting around, it is also true that, in the long run, there is no such thing as a captive transit rider. The captive rider dies, moves, or scrapes together the down payment on an automobile, and we lose him the instant we are no longer competitive. In fact, we lose current riders every day. To improve transit, we must build on the base of present ridership, and that can only be done by attracting riders who are now choosing another form of transportation. Transit ridership will increase only if: people are persuaded, one by one, to try

the transit system as a solution to individual transportation problems; and people, having tried transit, find that the service is, in fact, one "worth using."

Weiglin, PC *Transit Journal* Vol. 1 No. 2, May 1975, pp 35-44

28 097467 A PROMOTIONAL STUDY FOR PUBLIC BUS TRANSPORTATION TO IMPROVE KNOWLEDGE AND RIDERSHIP BY NON-CAPTIVE, MIDDLE-INCOME HOUSEHOLDS. This study involves an investigation of the information currently available and of the means and effects of supplying transportation information to middle-income households. The main objectives of the study were: (1) to determine the level of knowledge the public presently has about the city's transit systems; (2) to determine what effect a change in the level of knowledge would have on daily ridership; (3) to induce people to ride the city bus system through different promotional materials; and (4) to measure the effectiveness of the promotional materials used in the study. Cedar Rapids, Iowa, an urban region with approximately 125,000 inhabitants, was the study area. The purpose of the study was to determine how the limited resources of smaller cities and towns might be effectively applied to transit promotion. Pre-and post-treatment of transit related knowledge, combined with monitoring of patronage to and from the sampling area, were employed. General characteristics of two respondent groups as obtained from home interviews were presented. Among the conclusions are that the majority of trips from middle-income areas are made without regard to potentialities of existing transit systems and that informational levels regarding existing systems can be improved through relatively inexpensive promotional materials. References are furnished. The appendix contains the study questionnaire.

Wilson, E Hultquist, J Peterson, S Kendall, K ; Iowa University, Iowa City, (IA-11-0002) UMTA-IA-11-002-73-1, Jan. 1973, 57pp; This report was sponsored by the Urban Mass Transportation Administration, Department of Transportation.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB237147/AS, PB-221435/LK

28 098931 THE MARKETING OF PUBLIC TRANSPORTATION METHOD AND APPLICATION. Methodology is described for determining community desires and attitudes concerning transportation mode selection and design, with an emphasis on improving and marketing public transportation modes. Data drawn from questionnaires administered to a general sample of adults and a "city leaders" sample in the Austin, Texas area are analyzed. The information obtained related to travelling frequency for work trips, the mode selected and the criteria, and ratings for a car and a bus for these trips. This data was used to identify key target switchers to mass transit as well as needed improvement in their perceptions of mass transit. Determinant attribute analysis for shopping and personal business trips, measurement of attitudes toward financing public transportation, as well as transportation's role in city planning, pollution etc., measurement of respondents' exposure to various general media, and the measurement of basic demographic information are the other tasks accomplished.

Alpert, M Davies, S ; Texas University, Austin, (RR19) DOT/TST-75/142, Jan. 1975, 60 pp, Tabs., 12 Ref., 2 App.; Contract DOT-OS-30093; ORDER FROM: NTIS, Repr. PC, Microfiche

28 126185 MARKETING AND PROMOTION OF DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 2. Marketing demand-responsive transportation (DRT) is discussed largely on the basis of experiences in Rochester, New York (implemented in 1973) and a new service in Denver. Marketing is viewed as the dynamics of making a beneficial service available to the communities served for value received. In Rochester, a flexible fare policy was developed to offset the rather high fares (the system was entirely locally financed). Discounted weekly passes, home-to-work, home-to-school, feed-a-bus, and dial-a-bus rates were established. Groups of 2 or more can ride for reduced rates provided everyone in the group have a common origin and destination. Other promotional fares included Rider Appreciation Week, when home-to-work passes were reduced. Another fare promotion called "Lets Split" was designed to introduce DRT to residents of a new service area by splitting the \$1 fare with them. A flexible fare policy is planned in the Denver Regional Transportation District's DRT service planned for the elderly and handicapped. The newly designed buses (of this door-to-door service) have lower floors, wheelchair lifts and tie downs, and an extending entrance step.

Reading, JE (Regional Transportation District) *Transportation Research Board Special Reports Conf Paper No. 154, 1975, pp 131-132;* Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

28 126186 MARKETING AND PROMOTION OF DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 3. The successful marketing program of the CNY Centro which registered substantial increases in ridership and revenues is described. Marketing functions have included the following: researching group transportation needs (which uncovered a great deal of latent demand) and elderly and handicapped transportation needs; the establishment of reasonable pricing policies; modification of bus design and equipment of minibuses for the elderly and handicapped (equipped with a wheelchair); monthly call-a-bus newsletter and literature; programming activities (guidelines are issued by a policy making advisory committee) which include the elderly and disabled, and involving social agencies; and instituting special promotions and services involving reduced rates. Projects which have improved the image of the total system and have become responsive and responsible to the social services and commercial enterprises in the region are listed and discussed. These include the a super shopper's special, a farmers market bus, a cooperative arrangement with a restaurant corporation, a park-and-ride venture operating 5 parking lots, a subscription service, major techni-

cal improvements in equipment and service, winning of a maintenance efficiency award, a driver patrolling service, and newspaper sales on buses.

Frank, WH (Central New York Regional Transportation Authority) *Transportation Research Board Special Reports Conf Paper No. 154, 1975, pp 132-136;* Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

28 127668 PERCEIVED RISK: THE KEY TO TRANSIT TRIAL. Increasing public transit ridership must involve creative marketing that will reduce the non-users perceived risk of using public transit. Perceived risks in transit riding include the possible risk of time loss, of hazards, of ego loss and of money loss. These can be off set by marketing techniques of endorsements, brand loyalty, private testing, free samples, money back guarantees and word of mouth. A blunt attack on misconceptions about public transit is not advocated but rather a less direct marketing approach is needed if the perceived risk can be reduced, more people might make the decision to try public transit.

28 129820 ATTRACTING LIGHT RAIL TRANSIT RIDERSHIP. This paper addresses the complex planning considerations for attracting ridership to transit systems, particularly light rail transit systems. Taking the viewpoint of a potential rider, the authors present some observations that lay the foundation for understanding ridership response. Users are not interested in technology per se but in the level of service the system provides. Level of service is a complex combination of many system attributes such as travel time, cost, comfort, and convenience. Different user groups (market segments) make different trade-offs among these attributes. They assign different relative weights or importance to each attribute. To attract maximum ridership, the system should be tailored to the particular needs and constraints of the market segments it is serving. No single system is superior for all market segments. The paper discusses the various level-of-service attributes and their relative importance to different market segments based on empirical evidence and attitude surveys. Although one cannot generalize because different market segments assign different relative weights to level-of-service attributes, the following rank ordering of attributes from most influential to least influential is most typically the case: out-of-vehicle travel time, in-vehicle travel time, cost, comfort, and safety. For work trips travel time reliability should be added as either the first or second most important attribute. The characteristic convenience is dismissed from this list as being too broad to be specifically and universally defined. The paper goes on to introduce disaggregate, behavioral, travel-demand models as an emerging analytical technique that the transit planner can use to more precisely address the

problem of the ridership response of different market segments to different level-of-service packages. Examples of these models are then used to demonstrate how different prototypical households would respond to various technologies under various representative operating policies. Some conclusions are drawn on the situations in which light rail transit would appear to be the most attractive form of public transportation from the rider's point of view, and some suggestions are made on how to improve attraction of light rail transit ridership.

28 131850 TRANSIT MARKETING MANAGEMENT HANDBOOK: USER INFORMATION AIDS. This handbook which is designed to aid the public transportation professional in the development or improvement of user information systems, presents the community perspective and discusses the creation of conceptual objectives. A systems approach to user information is examined, and working with elements, modules and components is described. The various communication channels (mass media, face-to-face, public speakers, on board the bus, on the street, and distribution network channels) are reviewed, and the total system is outlined. This manual was developed on the basis of evaluation of potential aids by three hundred participants in laboratory research activities. The results of these research activities are summarized.

28 132275 THE FORMULATION OF MARKETING STRATEGY IN URBAN PUBLIC TRANSPORT. This paper prescribes the parameters of marketing strategy formulation in the context of urban public transport and emphasizes in particular the usefulness of the marketing mix and segmentation concepts. A marketing mix comprising the two primary dimensions of service attributes and promotion is advocated, the service attributes to include price, in-vehicle time, mesh density, frequency, reliability and comfort. Three primary trip purpose segments are identified viz. Journey-to-work, shopping, and leisure/social trip segments, but these may be expanded into a twenty-four cell matrix once origin-destination and car access factors are included. The sensitivity of demand in these segments is examined mostly by reference to demonstration and experimental project data drawn from the United States and the United Kingdom. For the three primary trip purpose segments demand elasticity is shown to be greater for non-price than for price features; for both price and non-price service features elasticity is shown to be a function of journey purpose being least elastic for journey-to-work trips and most elastic for social-leisure trips. The role of promotion is examined and its importance to the successful marketing of public transport clearly demonstrated. (A) /TRRL/

28 134642 TRANSIT MARKETING MANAGEMENT HANDBOOK: MARKETING ORGANIZATION. The findings are presented of an evaluatory study of the effectiveness of alternative organizational structures and its ultimate impact on the quality of service provided. The study also included an examination of the marketing function in certain non-transit organizational structure which are potential applicable and transferable to the transit industry. Marketing as it pertains to the transit industry is discussed, and the state-of-the-art of marketing in the mass transit industry is reviewed. Guidelines and a checklist are provided for evaluating the nature of a transit system's marketing structure, capabilities, and orientation. The four basic ways (product or service; market territory; by market customers; and function) a marketing unit may be organized are detailed, and the functional descriptions of organizational units and descriptions for marketing staff positions are presented. After the evaluation process, the actual reorganization process is accomplished in 4 interrelated steps: planning; initial implementation; transition; and full operation. Three distinct levels of formal planning are employed by most large commercial firms. They are: policy planning; program planning; and implementation planning. The organizational structure, functional descriptions and position descriptions are prepared and approved during the initial implementation step. The transition step of the reorganization proceeds simultaneously on two fronts: operation of the new marketing department commences and the reorganization process continues. The full operation step of the reorganization process begins upon final approval by the marketing reorganization committee.

28 142359 STARTING THE TRANSIT INDUSTRY ON A SEARCH FOR AFFLUENT MARKETS. This paper describes the logic behind the design of a state-level government program to assist the transit industry in the adoption of marketing practices. Marketing is seen as essential, given the awkward standing of transit in the travel market and the tentative nature of its political support. In marketing, the diffusion of innovation model postulates that the industry will accept marketing practices in a series of stages. Each stage, while growing less experimental, will draw new adherents who need increasing experimental, will draw new adherents who need increasing earlier stage. The opportunity for government is to manage this process by creating the material and environment that stimulate the maximum participation of those in transportation who are able to move in each stage. The emerging California Department of Transportation program, tailored to the existing stage of early adopter behavior, is to highlight the concept of market segmentation and its corollary strategy of offering specialized services at different fares to distinct affluent groups identified by market research. /Author/

28 142361 ANALYSIS OF SUBURBAN SHOPPER MARKET FOR PUBLIC TRANSIT: A CASE STUDY (ABRIDGMENT). The feasibility of applying marketing techniques to urban public transit to influence shoppers to use transit are examined. Two major aspects are reviewed: The feasibility of instituting local shopper-oriented transit service, to major shopping centers or districts, comparable to that provided for CBD's; and, special features incorporated into the service as a means of attracting shoppers to public transit. Methods of data collection and analysis, and results of the study are examined. Conclusions and recommendations highlight the feasibility of shopper service and special features of shopper oriented service.

28 149160 URBAN TRANSPORTATION AND THE PRESS: A SURVEY OF EDITORIAL OPINION. The editorial opinions expressed in the news press can provide information on which issues are currently prominent concerns of the public, and on how public opinion may be aligned on those issues. A survey of all urban transportation-related editorials appearing in a sample of 155 U.S. newspapers during a period of 19 months in 1973-74 revealed that a number of issues, related to transit financing, transit and highway investment, bicycles, and the transportation planning process were currently under debate in the urban press. This paper presents the survey's findings regarding the incidence and viewpoint of articles on these and other issues. Transit financing concerns clearly emerged as the most frequently discussed, and some agreement in editorial viewpoint was also found. The paper concludes with the authors' subjective observations on the scope and style of editorial discussion of urban transportation issues. /Author/

28 157259 SURVEYING THE BUS TRANSIT MARKET RESEARCH SCENE. A study is reported in which information was solicited from 300 bus operators on market investigations that they may have been or are conducting. Projects undertaken in Atlanta, Georgia and various other cities were examined, and it was found that their objectives were to determine ridership patterns and increasing transit patronage. The methods of data collection in the various studies are reviewed. The on-board survey was the most popular method. Data analysis is discussed, and the types of variables investigated by transit surveys are tabulated. It was found that the common pattern is for the researchers to present tabulations and cross-tabulations of data and to draw conclusions from these relatively simple statistical computations. The results thus run the risk of being misrepresentative of what the actual underlying relationships between variables may be.

28 163378 THE BRADFORD BUS STUDY 3. THE RESULTS: BUS PROMOTION. The author refers to early stages of the Bradford bus study project which consisted of a series of research topics including, for example, system accessibility, cross-subsidisation and one-man op-

erations. Research results led to the development of models to provide a consistent basis upon which to examine proposals for development of the bus system, not only during the course of the study, but also following it. The development of the passenger demand model is described which assumed that the number of passengers depends on the quality of service as reflected in the effort, time and money cost involved in travelling. The main elements of journey cost were assumed to be ride time, walking distance, waiting time and fare; and by adopting a minute of ride time as the basic unit of journey cost it is shown that a penny fare (September 1975 prices) was the equivalent of 1.58 generalised cost minutes (gcm). Behavioural values of time assumed in the demand model were thus taken, ride time at 38.0 pence per hour, walking time at 66.5 and waiting time at 85.5. These components of cost are analyzed. Service improvements are discussed relative to passenger demand in both peak periods (0700-0900, 1600-1800 h) and off-peak periods, and the economic effects of selected hypothetical measures of improvement to both passengers and operator are tabulated. Various types of economy measures which were examined from the point of view of net savings to operators and disbenefits to passengers are described. The main results are summarised, from which it was found that the most effective way to make economies is to reduce service levels at peak periods. Pricing and subsidisation policies in relation to the Bradford pte are discussed. /TRRL/

28 163692 TIDEWATER TRANSPORTATION COMMISSION MARKETING. This report which covers the most important marketing elements, discusses the marketing background (definition of consumer markets, market size and demand statistics, marketing cost history and major problems), states the primary objectives, describes the overall strategy, discusses functional objectives and budgets, and makes strategic recommendations. The Commission's objectives are to sustain ridership within the choice market by 10 percent. The Commission will also seek to improve the image of public transportation, develop a more unified rate structure, increase off-peak daily and weekend ridership, and provide a greater level of public information on the system. It is noted that marketing includes product design, place of availability, price or amount of method of payment, and promotion with advertising and information services. Four major marketing strategic considerations are discussed: positioning of the product, marketing mix, target market, and buying incentive. The implementation of the recommendations in each of these areas will be executed in 2 phases. The actions to be taken in each phase are briefly outlined.

28 165564 APPLICATION OF CONSUMER BEHAVIOUR THEORY TO PUBLIC TRANSPORT MARKETING. This paper begins with a brief description of a general model of consumer behaviour and a more specific model of transport mode choice. The key element in the latter is the concept of the 'modal pool'. When people plan a trip they bring into their modal choice decision only those modes which they regard as suitable and available to them for that trip. Their perception of what is suitable and available may or may not correspond with what actually exists. A mode cannot be chosen if it is not in a person's modal pool. The paper goes on to report a study conducted in Adelaide in which the processes of formation and change in modal pools were investigated. The conclusions reached are applied to market segmentation, with the market for travel to work examined in detail as an example. The application of consumer behaviour theory to practical marketing planning is illustrated by discussion of development and promotion of new services in outer suburban areas. /Author/TRRL/

28 168033 MARKETING: TRANSIT'S DELIVERANCE OR PASSING FAD? Marketing can ultimately strengthen understanding of local transportation needs between the citizenry, governmental officials, planners, highway engineers, and transit operators. After all, its unique tools for gathering and analyzing attitudinal data as well as behavioral information from the entire community offer a way to identify the total community's mobility needs--as the public sees them. Ultimately, then, marketing could be the catalyst pulling highway and transit-development projects together into a total transportation program that fully meets today's urban needs. But it all starts with marketing's fundamental principle: Identify and satisfy people's needs. /GMRL/

28 168061 MARKETING APPROACH USING PRODUCT DIFFUSION KNOWLEDGE TO MEASURE CONSUMER TRANSIT ATTITUDES (ABRIDGMENT). This paper describes a method that can be used to develop a measuring instrument that will determine specifically why

shoppers do not use the urban bus system, and be sufficiently sensitive to identify whether the problem is a bus system design problem or a promotion problem. Such an instrument could be used by transit marketing managers to more effectively allocate their resources towards the goal of increasing bus patronage. The measuring instrument should be capable of providing information on all items and in the trade-off except the capital investment. The theoretical construct, questionnaire design, and validation of the questionnaire are also discussed. The author concludes that the measuring instrument developed and tested can be used to: Identify why many customers have never tried to use an urban bus; Identify the specific causes for consumer rejection; Identify the specific causes for consumer discontinuance after having adopted the bus for an extended period of time; Identify why occasional users do not use the bus more frequently; Determine which barriers to adoption of the bus system can be removed by promotion alone and which require system redesign; And, assist in determining how to best allocate resources in order to increase bus patronage.

28 168062 CONSUMER REACTION TO TRANSIT MARKETING IN BOULDER, COLORADO. The results of a questionnaire used to measure resistances to the adoption of urban transit during off-peak hours in Boulder, Colorado, are discussed. The findings have implications for transit marketing managers regardless of the cities in which they are located. The questionnaire was administered to middle-class women, aged 20 to 65. A systematic cluster sample was used to identify potential respondents, and a 55 percent usable response rate was obtained. The results suggest that the barriers to trial of transit are different from the causes of rejection of transit after trial, from the causes of discontinuance of transit after adoption, and from the causes of low-frequency use by occasional users. The causes of rejection after trial are also different from the causes of discontinuance after adoption of transit. Although the specific barriers to adoption will differ among cities, depending on the structure of the city and of the transit system, the Boulder results illustrate the fact that differences do occur among different user groups within at least one market segment and that different marketing strategies may be needed to obtain increased transit ridership within each group. /Author/

28 168128 MASS TRANSIT: DEVISING A RESEARCH BASED MARKETING PLAN. This study presents a marketing planning procedural model that can be operationally used by marketing managers. The model enables the user to assess his company's performance on the various attributes of the marketing mix and to

design a marketing program that caters to the needs of his marketplace. The model is applied here specifically to mass transit and is tested empirically. Within this context, it permits transit marketing to aim at increasing the probabilities of (I) greater usage on the part of existing riders and (II) attracting prospects and converting them into actual customers. /Author/TRRL/

28 170278 AGGRESSIVE AND MEASURABLE MARKETING PROGRAMS FOR THE NATIONS LARGEST FERRY SYSTEM. The tools of private business—namely the tools of marketing—can and are helping the Washington State Ferry System to better control the numerous, disparate issues which arise in handling 16,000,000 rides annually. The WSFS, as with other land-based transit systems which serve a large commuter audience twice daily, suffers a significant operational disutility during off-peak periods each day. Increased tourism during the prime summer months can be actively stimulated through the mass and other media to compensate for the off-peak maintenance costs of a commute-designed system. However, during the other nine months of each year, there is the further, more requiring need to create other, discretionary ridership from among those residents of the operations area—Puget Sound—to help reduce the operational deficit of the USFS. Furthermore, those Washington State citizens who are not conveniently situated to Puget Sound, yet who contribute to the tax funds which underwrite the system deficit, must be considered as a critically important audience for the overall communications and marketing program for the WSFS; a primary message element which must be communicated to this latter audience is the ability of the marketing program to actually offset (or at least attempt to hold level) the operational subsidy. The paper will consist of two highly practical parts: (1) the 1977 marketing plan, and (2) the 1978-79 marketing plan, both with budgets, work timetables, research, rationales, etc. The first of these parts is a "pioneering" effort, while the second part will summarize the practical achievements and marketing plan adjustments which stem from marketplace reaction and result.

28 170921 PROMOTING TRANSIT: A MARKETING HANDBOOK. This handbook presents the basic components of a marketing program and provides specific examples of promotional tools and campaign ideas. Statistical findings are presented which provide an objective basis for decisions regarding the effectiveness of marketing strategies and promotional campaigns, and facilitates the identification of service requirements and media preferences within the

transit market. The data could also be used for future research. Alternative strategies (undifferentiated, differentiated and concentrated marketing), market research and market segmentation are covered, as well as customer services/ public relations, service development, and promotional strategies. Other aspects considered here include: increasing public awareness, reinforcing positive attitudes of current riders, encouraging a modal switch away from the automobile, promoting new services, facilities and conveniences, and measures of marketing effectiveness. Demand for transit among the elderly, blue collar and white collar females, housewives, blue and white collar males are also considered.

28 184201 USE OF A QUANTITATIVE MARKETING MODEL TO ESTIMATE IMPACTS OF CAR-POOLING POLICIES. This paper discusses a quantitative marketing approach applied in a study designed to estimate the impacts on work travel of various proposed policies for encouraging car pooling. The decision to commute by car pool is influenced by a number of "soft" factors, such as comfort, safety, and midday mobility, that are not easily handled by traditional modal-split techniques. This study provided an opportunity to test the feasibility of adapting and applying quantitative marketing techniques to the projection of modal split under various car-pooling policies. A trade-off model, previously used primarily in traditional product market research, was adapted for modal-split estimation. The model estimates modal split on the basis of quantitative preference (utility) levels calculated for each of the competing modes, which distinguish between car pool and solo driver. The utilities are obtained from responses to paired-comparison questions on work-trip preferences asked of a representative sample of commuters. Modal split and other travel impacts were estimated for each of 14 proposed car-pooling policies. The marketing approach produced useful quantitative results. Additional efforts in the development of this approach are warranted, however, to improve the overall quality of the results and enhance the usefulness of the approach as a tool in transportation research. /Author/

28 188494 MASS TRANSIT ISSUES FROM A MARKETING PERSPECTIVE. In the long run, the restoration of mass transit system to their former demand levels of some 25 years ago will depend on changed life styles and land-use patterns in the United States. If housing patterns, for example, become more dense, then fixed-route transit systems can become feasible. Meanwhile, much can be done in the area of aggressively marketing mass transit services to specific consumer segments by recognizing the need for strategic planning and effective controlling of marketing decisions. Strategic considerations of mass transit services requires the assessment of consumer profiles, competitive profiles, and market trends in order to conduct sensitivity and contingency analyses regarding present and future demand. These data serve to identify the service factors within the control of transit decision makers which are most critical to both users and non-users, and which market trends beyond their control need to be anticipated. Through effective controlling of mass transit decisions by

developing marketing objectives and continuously monitoring market reactions, the productivity and efficiency of these services can be increased to acceptable levels. /Author/

28 193704 SERVICE PLANNING AND MARKETING. Two models are discussed for predicting the demand estimate for new transit services or service modification--macroscopic mathematical models based on land-use and population characteristics and marketing models based on consumer awareness of and attitude toward service. The way consumer marketing was applied to the Nashville marketing demonstration project sponsored by the Urban Mass Transportation Administration is described. Attitudinal change was more predictive of increased ridership than any other factor. A methodology and a predictive equation based on theoretical data for quantifying the relation between consumer attitudes and transportation ridership is proposed. /Author/

28 197431 AN INTRODUCTION TO TRANSIT MARKETING. The report presents a general overview of the marketing process as applied to transit, to the value of marketing, and to the marketing plan and its components. It also presents some cautionary remarks about transit marketing. The report contains a selected bibliography of marketing publications as well as a list of marketing assistance sources for transit operators.

28 197455 BASIC MARKET RESEARCH TECHNIQUES FOR TRANSIT SYSTEMS. Market research provides the foundation for effective transit service delivery. Acceptance or rejection of the system and mandated service modifications are dependent on the public's evaluation. The critical importance of sound marketing efforts emphasized the need for a basic guidebook, geared specifically to the transit industry, outlining the principles and procedures of market research. The major responsibilities of a transit market research activity are to collect data, analyze the needs and preferences of the various target markets, and, subsequently, to forecast the potential demand for transit services. Other key functions of market research within the transit field include assessing needs for services by specific target population segments, evaluating the effectiveness of service improvements and alterations, determining the public's attitude toward the transit system, and measuring the effectiveness of specific advertising campaigns and themes. Three general approaches to be used in a transit marketing capacity were discussed: (1) Sample surveys, (2) Field observation, and (3) Secondary data analysis. In comparing these

three broad procedures, each has strengths and weaknesses which make them distinct methods.

28 198179 NATIONAL TRANSIT MARKETING CONFERENCE-PROCEEDINGS, HELD AT ARLINGTON, VIRGINIA ON JUNE 9-11, 1975. Marketing increasingly is being recognized as a key element in revitalizing urban public transportation, and is a significant transit management tool. Technical sessions centered on an in-depth examination of marketing's tools and components as they apply to transit. Case histories and workshops were among the approaches used to familiarize participants with the marketing concept. The report offers an excellent resource for those interested in transit marketing.

28 260171 LONG BEACH TRANSIT MARKETING PROJECT. The Long Beach Public Transportation Company received an UMTA demonstration grant to fund a program which, through innovative marketing, would attempt to focus on increased ridership among traditional "non-transit users", specifically those in moderate income categories and others not considered "transit captives." The foremost goal of the Transit Marketing Project was to familiarize the citizens with the advantages of bus travel and the services of the city-owned Long Beach Public Transportation Company. An extensive public information campaign was launched in the community. Augmenting the community outreach efforts were a newspaper-radio campaign and special on-board services such as free coffee. It was felt that these measures would do much to increase "middle class" acceptance of transit as a socially acceptable form of mobility, as well as increase awareness of the availability of public transportation among lower income persons. Statistical analysis enabled the determination of changes in 5 basic variables: ridership patterns; attitude toward riding the bus; trip frequency; source of bus information; and revenue data. Results of the evaluation are in table form. Appendices include the survey instrument and examples of newspaper advertisements. / UMTA/

28 262286 PROMOTION OF URBAN PUBLIC TRANSPORT. The Urban Transport Group studied methods and projects attracting

more patrons to public transportation services and then assessed the main results achieved. Emphasis was on experimental measures taken to promote public transport to show what might be done in the future, demonstrate its feasibility and thus pave the way for a new general policy for the organization of traffic. Promotional experiments, such as reserved or reversible bus lanes, demand-responsive systems, flexible route planning, and redesigning of buses, are described. Basic criteria for application include before and after studies for measurement of improvements in the quality of service, increases in patronage, changes in modal split, public reaction, and financial results. Annexes to this paper illustrate public service transport activities, including informational activities in 14 European cities and describe similar policies for cities in Japan.

28 262387 THE MARKETING APPROACH TO MODERN TRANSIT. The flexibility of bus transit is not being used to the full extent. The planning and implementing of efficient bus transit services could benefit from a marketing approach; an approach oriented to what the customer wants. This article breaks down the applicable phases of the marketing approach. Consumer research needs to be done to identify what motivates people in selecting a particular mode of transportation. That will then help in the choice scheduling, routing and subscriptions, decisions and in hardware related decisions. Promotion of the transit service by public information services like newspapers, information centers at key places would encourage use. Also simplified timetables and maps would make bus transit more marketable. Bus operations should be consumer oriented rather than product or operations oriented.

28 267007 MARKETING URBAN MASS TRANSIT-1973. In 1962, Dr. Lewis M. Schneider collected data on the marketing practices of 12 U.S. transit systems (Marketing Urban Mass Transit, Harvard University Press, Boston, 1965). This 1974 report is an update of the marketing progress that has been made in the 10 years since Schneider's study. Forty-one transit systems are

examined in this study. Eighteen of the 41 polled now have formal departments of marketing and the vast majority of marketing officers are considered members of the top management team. In terms of marketing activity, the decision to create or expand the marketing role has occurred more frequently in medium and a few small transit systems rather than in large systems. It was found that the average expenditure for marketing by transit systems was not different from that determined by Schneider. Smaller systems appear to lead the shift from a product to a market-oriented transit industry. Internal problems of marketers are delineated and include line vs. staff conflicts. According to the author, development and implementation of an integrated marketing strategy designed to attract different classes of riders has not yet been accomplished although the past 10 years have been ones of marketing awareness for some. Tables and figures support the text. Appendices are "Marketing Practices in Transit Industry" questionnaire and a worksheet of results of the survey. References are included.

28 272051 MARKETING PUBLIC TRANSPORTATION. The marketing of transit is defined as the dynamics of making a beneficial service available to the public for value received. A five step procedure for marketing transit is outlined: establish a reasonable goal by identifying the segment of the public to whom you are going to market which aspect of transit; determine the peculiarities of both the market and the environment in which the two must meet; establish a plan of procedure; implement the plan; analyze the results, and based on this analysis, establish another goal and start over again. The 6 groups of people who must be addressed in marketing campaigns are: transit employees, labor union leaders and members, transit passengers, local government officials, employers and residents. Successful marketing experiences of the Rochester Regional Transit Service (RTS) are reviewed. A 30-hour effective management course is required of all management employees and of those other employees expecting promotion. Work by employees above and beyond the normal call of duty is rewarded by a certificate for community service. A handrail has been added and other modifications have been effected for the convenience of handicapped passengers. A training program for blind persons is sponsored by the transit service. Information is disseminated in booths located in shopping centers, hotels and offices. The RTS and General Motors are working together on the development and demonstration of a passenger information system which will be couple with the platooning system of moving buses rapidly through the downtown. Brochures have been put out which give information on historical sites and charter services. Other factors such as free downtown shopping ride and color-coordinated route maps with points of interest listed on them, have encouraged ridership.

Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB Publications Off

28 272052 MARKETING PUBLIC TRANSPORTATION. The paper answers certain questions regarding the marketing of transit service (what are good marketing strategies, can these be applied and how?) as it applies to an airline company. Airline marketing has been directed to the entire market in order to sell to the greatest possible number. Every carrier talks of the same aspects of air travel. This makes it difficult for the consumer to differentiate among carriers, and customer usage becomes a function of advertising and promotion weight. In planning marketing strategy, the types of consumers are first identified. Radio is used as the primary medium for communicating with business people. Unusual and interesting aspects of cities are created into stories and used to publicize them. The radio which provides a low price medium and the required local flexibility, was also used to disseminate flight information (frequency and times) and run commercials. The newspapers have been used to disseminate flight and service information. New products that will appeal to business people and personal travelers are being continually pursued. Cost saving for off-peak travel and free flights on leisure class are some products offered by the airline. The new patterns of leisure and recreation time were studied and promotion campaigns were built around low weekend air fare and other special packages. A spring promotion campaign in newspaper and television was successful. In sales promotion, advertising was backed up with brochures giving details of special packages. Special products were developed for families. The success of these advertising campaigns may be related to the consistency in tone of voice and style in radio and television, and in the graphic and logo treatment. Research indicated that the size of advertisements was associated with multiplicity of destinations. An important element in the marketing campaign has been the commitment that was originally made to the theme of "wings of man."

Kelley, ML, Jr (Eastern Airlines Incorporated) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 97-101; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB Publications Off

28 272065 MARKETING PUBLIC TRANSPORTATION. A few examples are described of the many types of advertising and promotional means that have been used by the marketing department of a transit system. A color-the-bus contest sponsored by the San Diego Transit brought much free newspaper publicity. Publicity was also achieved when arrangements were made for bus drivers to drive some new buses to the city from Pontiac, Michigan. The bus system's concern for the populace was brought home by its reduction of fares for senior citizens and extension of student passes for 24 hours a day, 7 days a week and all year long. Other advertising campaigns included a reduced fare program for family tours on Sunday. The closure of a ferry service and the introduction of exact-fare also brought with it much advance publicity. The celebration

for receiving a grant for an office facility was well publicized. Catchy phraseology and good humor evident in slogans used on the sides of buses have been a great success in increasing ridership. Innovative advertising and promotion have also been used in Toronto.

Schnell, JB (American Transit Association) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 93-95; Appeared in *Issues in Public Transportation*, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB

28 272066 MARKETING PUBLIC TRANSPORTATION (INTRODUCTORY REMARKS). The focus in this session has been on the current use and effectiveness of marketing and advertising programs for transit industry. The issues that were addressed are: how much money should be budgeted for marketing; can it be a positive force in attracting riders; how can information on successful new types of service be disseminated; is it important to wait for a better product before marketing; and what are good marketing strategies? In the papers presented here, the promotional devices used in San Diego, Los Angeles and Toronto are cited and the need is emphasized for understanding the dynamics of making available a beneficial service. The approach is one of determining the goal, conducting the research on methods, developing a plan for proceeding and an action program to implement it and evaluate the result. In the discussion of an airline company's approach to marketing, the need is noted for the advertising agency to be used as a full partner is the firm's activities rather than be called in for advertisement preparation. The need is also emphasized for identifying the different consumer markets and tailoring media and material to effectively influence each of them.

28 300702 IOWA'S APPROACH TO TRANSIT MARKETING. ABRIDGMENT. Rural transit marketing in Iowa is described. Several approaches were used in basic market research. All of the data collected were organized, tabulated and used in each region's transit plan to provide direction on how to improve existing services and make more transportation available. The program also included communication and awareness efforts. Television and radio public service announcements were produced on energy, economy, planning and public service. A marketing tool was developed for transit systems through a project called Focus on Transit, which consists of a package to be used for presentation to fourth through sixth graders. Regional systems in Iowa find that advertising, promotion, system image, and public relations are critical to success. Pricing strategies are also receiving attention. Telephone information systems are being organized. Regional administrative agencies are designing comprehensive local marketing programs. The Iowa DOT is working with state regions to develop transit plans; is helping regional systems improve their management skills; is providing

training programs for drivers, mechanics and service persons; is making financial requirements easier by simplifying applications, developing a single reporting package, and coordinating with other state agencies.

28 308035 MARKETING RESEARCH PROJECT FOR THE DELAWARE AUTHORITY FOR REGIONAL TRANSIT. The DART Planning Program was designed to define and coordinate future requirements for the Delaware Authority for Regional Transit (DART). The program consists of ten separate tasks (Tasks A through J) and will result in ten separate reports. This Marketing Research Project (Task C of the DART Planning Program) purports to gather the necessary data to determine how DART can best promote their services to the public, as well as, to relate the data gathering process and the formats in which that data is available, and the general level of acceptability and implications associated with the data. The object of this data gathering phase was to obtain a one percent sample of the population within the entire New Castle County portion of the Wilmington Urbanized Area plus selected contiguous areas, and to compare their needs and opinions to those of the general public. Data was gathered through Mail-Out Surveys and On-Board Bus Surveys. Survey data was processed by the College of Urban Affairs and Public Policy/University of Delaware; this processing resulted in numerous formats of data presentation. The report concludes that results of both surveys indicate a high rate of "choice" transit riders, those who have the available income and available automobile to make the trip when the bus option was chosen. The WILMAPCO staff is of the opinion that this data collection phase was successful with very limited exceptions. /UMTA/ Wilmington Metropolitan Area Plng Coord Council, (IT-09-0066) UMTA-IT-09-0066-79-1, Nov. 1979, 90 p.; Sponsored by the Department of Transportation, Urban Mass Transportation Administration, Region III.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS; PB 80-112238

28 308075 CREATING AN UPWARD CYCLE IN URBAN TRANSIT RIDERSHIP: A CASE STUDY. The Champaigne-Urbana (Illinois) Mass Transit District (CUMTD) is analyzed in an

attempt to identify the initial as well as sequential factors influencing ridership increases. The CUMTD achieved the largest percentage of ridership growth (42 percent) among all transit systems in North America in 1974. The population size served by the CUMTD is approximately 100,000, making it representative of a number of communities experiencing transit growth problems. Factors which contribute to ridership increases are identified. Shift in management strategies by CUMTD led to the initial increase in ridership. The implemented strategies are summarized under the headings, "Efforts towards building a favourable public image", and "Increased quality of service". Comments are made on the take-off stage and the (3rd) upward cycle stage. The CUMTD experience lends emphasis to certain target areas on which management strategies must focus. Efforts to build a positive community image toward public transportation, coupled with increases in service quality (dependability, cleanliness, driver education) are critical factors in achieving initial ridership increases, which in turn, attract the necessary public support. Once these factors are present, they form a basis for promoting an upward cycle that has a multiplier effect for further ridership increases.

Kim, TJ (Illinois University, Urbana) Wolk, WL (Champaign Urbana Mass Transit District) *Traffic Quarterly* Vol. 33 No. 4, Oct. 1979, pp 501-510, 4 Fig., 2 Tab.

28 310046 PUBLIC TRANSPORT AWARENESS IN BASILDON. Bus services within Basildon New Town were significantly revised during May 1978. To accompany this revision, an extensive publicity campaign was mounted. Each household within the town received the following: (a) a full colour schematic town route map; (b) an area timetable; (c) details of a new travel card scheme; and (D) a railway timetable. In conjunction with this, each bus stop was allocated a name and identification code which appeared on the bus stop plate at the roadside. The code and stop name also appeared on the route map, bus timetable cards and county bus timetable. Following the introduction of the services and the distribution of the publicity material, a survey of 1016 households was carried out to assess the ease of understanding and usefulness of the publicity. Additional data was also obtained on the demographic characteristics, bus ridership and awareness of the travel card for all households interviewed. The numerical and statistical results of the survey are detailed in this report.(a) (TRRL)

Basildon Development Corporation Monograph 1979, 37 p., Figs.; ACKNOWLEDGMENT: TRRL (IRRD 244489)

28 310763 THE MARKETING OF MASS TRANSPORTATION TO DIVERSE GROUPS WITHIN A COMMUNITY. Recent "broadening" trends in marketing and an awakened stress on public transportation have combined to evoke developments in the marketing of public transportation. This article discusses these trends and presents a research method for identifying persons likely to switch to improved public transportation systems. Market segmentation strategies are developed for this group, as well as a community "leaders" segment, whose support is also required for effective transportation im-

provement. Attributes of transportation which may determine modal choice were investigated for a general adult sample, potential switchers to public transportation and community leaders. These determinant attributes for modal choices and the demographic profiles were significantly different among these different groups. This suggests that advertisements directed toward the general public (or to potential switchers) are not likely to appeal as strongly to the leaders. Two distinct operationally meaningful, market segments have been identified and they should be treated as such. (AUTHORS)

Alpert, MF Golden, LL (Texas University, Austin) *Journal of Urban Analysis* Vol. 5 No. 2, 1978, pp 285-302, 5 Tab., 10 Ref.

28 311158 IMPROVING PARKING EFFICIENCY THROUGH TSM. The hypothesis is present that certain transportation systems management techniques that rely on human behavior might be more effective if developed in a "marketing" approach using the concept of market research, product development, and promotion and advertising. The concept was illustrated through the development of a parking plan for a major destination ski area of the western United States. Market surveys consisting of an origin-destination survey, bus surveys, parking patron surveys, and "ski lift" surveys provided the market data for the program development. TSM techniques that were integrated into the program include transit service improvement, congestion pricing, preferential parking treatment to high occupancy vehicles, and promotion and advertising. A number of the strategies are currently being implemented. Analysis of the results await complete implementation, two to three years in the future.

28 311787 THE NATIONAL BUS COMPANY 'MAP' MARKET ANALYSIS PROJECT. 3. SYSTEM DESIGN. This article, the third in a series of four, deals with the processing and use of survey data to revise existing bus operations. The authors give details of the design processes at individual study level, and indicate the requirements for certain central studies of costs, patronage and revenues. Considerations associated with the selection of new services are outlined together with the implementation of results. The effects on the analysis of bus system parameters, externalities and patronage are described. Examples are given of bus running time problems, and the distribution of passenger journeys related to car ownership, sex, time of day and purpose. Costs are analysed to suggest relationships that could be used to determine the effect of changes in route, service levels and fares. Part 1 was published in *Traffic Eng Control*, October 1979, 20 (10), 471-4, Part 2 in *Traffic Eng Control*, November 1979, 20 (11), 541-5, Part 4 in *Traffic Eng Control*, January 1980, 21 (1), 14-20.

28 314083 A SECTION 147 RURAL PUBLIC TRANSPORTATION DEMONSTRATION MANUAL. NUMBER 5. MARKETING RURAL PUBLIC TRANSPORTATION [Final rept.]. The report describes how to market transit services in rural and small urban areas. It covers how to set goals and objectives for a marketing program, developing and costing such a program, market research techniques, advertising and promotion approaches, and community relations. The report emphasizes the need to select the correct communications medium in developing a promotion strategy. Techniques described include system maps, discount fares and passes, development of printed schedules, how to ride brochures, and use of radio announcements.

28 314649 NEW YORK CITY TRANSIT MARKETING PROJECT. The Project's overall objective was to develop a marketing and communications program that would result in increased revenues for the New York City transit system. Since the system is already operating at near-capacity during rush hours, the project was oriented toward increasing off-peak ridership particularly for shopping trips. Available ridership and attitudinal data was analyzed to determine the important attitudinal barriers and incentives to increased ridership. A marketing strategy was developed which would emphasize low cost, and convenience for buses and subways, as well as speed in the case of subways and which would take advantage of the potential for retail promotion tie-ins for off-peak shopping trips, geographic concentration and the use of localized media. Several sample advertisements and radio and television scripts fulfilling the programs objective were then written and are included in this report.

28 316658 ATTITUDINAL MARKET SEGMENTATION FOR TRANSIT DESIGN, MARKETING, AND POLICY ANALYSIS. The segmentation of a population into groups that have similar perceptions of transit attributes or similar outlooks on transportation issues could be very useful in the design, marketing, and operation of transit systems and in the analysis of transit policies. This paper uses a variety of statistical methodologies in the development of such market segments. The data are from a representative sample of households in the Sacramento metropolitan region. A set of 23 general transportation attitude items and a set of 30 specific transit attributes are the basic inputs into the analysis. Responses to items in each set are factor analyzed, and the resulting factor scores are input into a hierarchical cluster-analysis program. The outputs are the market segments. The segments are then examined for differences in objective characteristics and travel behavior patterns. Groups that have similar patterns of

general or specific attitudes were found to emerge, and these groups differ in some objective characteristics and travel behavior. The market segmentation based on specific transit attributes appears to be useful for design and marketing decisions; the general market segments are primarily useful for analyzing support for transportation policies. Tardiff, TJ (California University, Davis) *Transportation Research Record* No. 735, 1979, pp 1-7, 4 Tab., 14 Ref.; This paper appeared in *Transportation Research Record* No. 735: Public Transportation Planning and Development.; ORDER FROM: TRB Publications Off

28 316660 COMPONENTS OF A TRANSIT MARKETING PROGRAM-ABRIDGEMENT. A general framework for building a unified transit marketing program is provided. The first step in coordination of the marketing program is organization of its components: market research, market planning, service planning and development, pricing strategies, communication channels, public relations, passenger amenities, and other services. Each of these components is discussed. Each marketing element must be treated as part of a larger program instead of an independent project. The way in which the different element in a short-term price discount promotion might be coordinated is illustrated schematically and general descriptions of the different price categories are given. Investigations and preparative research provide data that guide the promotional program. Research needs in this area are noted.

28 317281 THE MARKET POSITION OF PUBLIC TRANSPORT ON THE MOVE. The necessity for a satisfactorily functioning public transport is increasingly appreciated. It is also clear that public transport has difficulty in maintaining and improving its market position. This article attempts to gather the factors which influence this difficulty and aims to give an order for the whole area of road public transport; thereafter it is studied which factors are essential and what are the priorities for a more successful market promotion to be proposed. (TRRL) treat the smallest of areas as well as very large surfaces in a continuous manner. Daily outputs of up to 20000 M2 have been achieved, and the economy of the maintenance train has been proved during many years of use.

Bakker, P (Adviesgroep Voor Verkeer En Vervoer, Utrecht) *Magazine for Transport Science* Vol. 15 No. 4, 1979, pp417-433, 5 Fig.; ACKNOWLEDGMENT: TRRL (IRRD 247046), Institute for Road Safety Research

28 319184 GREATER PORTLAND TRANSIT DISTRICT MARKETING STUDY. This report provides recommendations to improve the Greater Portland Transit District (GPTD) service in the Portland, Maine area according to perceived needs identified in surveys of users and non-users. The recommendations were based on survey data, an analysis of the demographics of Portland's population, and transit marketing

experience in other New England cities. Transit marketing includes: designing the product, providing (creating) the product, pricing the product, making the product reliable, and promoting the product. The first recommended step in any improvement program is to establish service and marketing goals. Then, the following more specific steps can be taken: creation of a marketing program; delegation of the implementation of the marketing program to staff; establishment of a GPTD promotion budget each year; strengthening of GPTD's information program by developing "take one" posters, installing information centers, printing more informative schedules, and promoting GPTD's telephone number; development of a "bus tour" program to educate people about transit, a sensitivity program in driver training, and a mystery ride program and rewards for drivers; to find promotional partners, in the private sector and develop joint program promotion; building on ongoing sustained public relations program by visiting editors and news directors, planning a series of news releases, and developing feature stories; and feasibility study of service improvements--increased night service, increased weekend service, additional shelters, miscellaneous route improvements, improved bus maintenance and cleaning, and a park-and-ride program.

28 322259 LET'S ALL LEAVE OUR CARS AT HOME HALF THE TIME AND SAVE \$520. The changing attitudes to public transit are noted, and comments are made on the experience in Europe, and on marketing and community relations. Automobile sales figures indicate that the commuter is beginning alter his attitudes and travel habits. This change is being reinforced by government action. Actions taken in Europe, Asia, and Africa to discourage automobile use include the implementation of car-less downtown malls, special licenses to enter downtown, tariffs to discourage import of autos, and the introduc-

tion of car-less days. Governments in Europe provide a greater share of the costs of public transportation than in North America. The importance of marketing and consumer behavior is noted and the concept of marketing mix is discussed. The latter concept is composed of controllable (product, price and promotion) and uncontrollable (consumer attitudes, weather, economic conditions, legal and social constraints, company resources and competition) factors. Highlights of the Toronto Transit Commission's (TTC) strategy are noted. The strategy stresses the economy of taking TTC and potential savings by leaving cars at home half the time. TTC is also using strategies to promote off-peak ridership. It is noted that it is important to inform and convince citizens before projects are implemented. The TTC holds a bi-weekly meeting at which the public and politicians may voice their opinions, and conducts attitudinal research. Equipment maintenance is also considered a critical element in TTC's marketing mix.

28 322651 MARKETING GUIDELINES. This article outlines and discusses the areas that ATE addresses when reviewing a transit system's marketing activities, which include: organization and management of the marketing function, the marketing plan, the marketing budget, market research, advertising and promotion, the customer service program, user information aids, internal marketing charter sales, and transit advertising. Guidelines for the marketing budget specify the following: it should encompass 1.8% to 2.2% of the total operating budget; it should allow \$800-\$1,200 per peak vehicle; for each marketing dollar spent, \$13 to \$16 of line revenue should be generated; the amount of marketing budget spent per rider, excluding transfers, should be 1.5, to 2.0; and the amount spent per person in the system's service area should be 22, to 25. The transit advertising monthly financial reports

should contain the following information: names of all clients, agency for client, dates when client contract begins and ends, amount of contract showing, rate card for the showing, amount of monthly billing by client and total, amount of monthly commission by client and total, net monthly billing by client and total, total account receivable by client and total, and date of last payment by client.

Lang, JM *Transitions* 1980, pp 33-39

28 322672 A MARKETING ANALYSIS OF THE KINGSTON TRANSIT SYSTEM. This report analyzes the appropriateness of the operating deficit of the Kingston Transit System, in addition to identifying opportunities for increasing bus ridership. Of interest to researchers concerned with the modal choice process are the results of a probability sample of metropolitan Kingston residents. Cognitive, affective and conative responses to alternative modes are analyzed within the context of Fishbein's multiattribute attitude model. Of interest to transportation marketers are the results of a longitudinal comparison of Kingston respondents before and after the implementation of a marketing strategy for the Kingston Transit System. The strategy was based upon an analysis of consumer needs and perceptions and attempted to correct perceptual problems through an extensive program of advertising and promotion. Illustrations of the advertising are included in a case study which accompanies the report. The case can be used as a vehicle for implementing a discussion on the marketing of public transportation. Of particular interest are the results which appear to indicate that marketing had little or no effect on travellers' responses to the bus system. (Author)

29 081298 PUBLIC TRANSIT INFORMATION SYSTEMS: WHAT LEVEL OF SOPHISTICATED? This report describes a transportation information center which is designed to perform the following functions: (1) provide simple route and schedule information, (2) provide information on special transit offerings such as commuter specials, holiday specials, etc., (3) provide a public transit sightseeing trip planning service, and (4) refer calls to other transit district services such as a community representative. The system is to be telephone based staffed by multilingual operators and would be open twenty-four hours. Three different information retrieval systems are discussed. System A is a manual, hardcopy file system containing maps and schedules color coded for rapid use. System B utilizes a microfiche video display with the route and schedule information on slides. System C is an interactive computer system with video display and light pen interaction. Operators and phone lines required as well as the annual cost of each system are analyzed. The author concludes that the computer system would be much more costly than either of the other two systems and that the volume of information would not be so large that it could not be handled just as efficiently by a trained operator.

29 090515 POINT-TO-POINT TRIP MANAGEMENT PROGRAM (PRELIMINARY ANALYSIS). The preliminary analysis of Point-To-Point Trip Management (PTPTM) was prepared for the Urban Mass Transit Administration in Washington, D.C. PTPTM is concerned with providing prospective riders of mass transit with the necessary detailed information for particular trips. This report contains the results of a literature search on automation in the telephone information center, and analyzes the data collected from 29 existing centers. Additionally, on-site visits were made to three operational centers, and tapes of actual telephone inquiries and responses were obtained and analyzed. The use of microfiche and computers are examined as an aid to the operators in these centers. Total automation of these centers is also discussed. Conclusions and recommendations for further study in this area, and an annotated bibliography, are also part of this report.

29 092150 AUTOMATION OF PERIODIC REPORTS. The manual is a user's guide to the automation of the 'Summary of National Transportation Statistics.' The System is stored on the in-house PDP-10 computer to provide ready access and retrieval of the data. The information stored in the system includes cost, inventory, and performance data describing the passenger and

cargo operations of the following modes; air carrier, general aviation, automobile, bus, truck, local transit, rail, water and oil pipeline, as well as supplementary data on transportation and the economy. Included in the user's guide is: an explanation of the coding system developed for the different transportation modes; sample outputs and instruction on the use of the reports and plots developed; a listing of the information contained in the system.

29 092627 TECHNOLOGY TRANSFER-TRANSPORTATION. The application of aerospace technology to the solution of urban public transportation problems is considered. Data are given on highway and railway systems with particular attention given to safety devices, fuel economy, and measures for profiling railways and highways. The development of streamlined truck bodies, to reduce air drag, and efficient brake systems for light trucks and other vehicles was also dealt with.

29 095645 PASSENGER INFORMATION IN URBAN RAILWAYS [Fahrgastinformation Im S-Bahnbereich]. The existence of information facilities is a decisive factor in the attraction of mass transit systems. The author, using the example of the Munich urban railway, explains how passengers obtain information about the journey, fare, departure time and platform, special services provided, etc. Train arrival and any interesting item of information are given over the public address system. Other features quite useful to passengers are: network map on the train, adequate signposting in stations, indications regarding connection possibilities and the geographical position of the station in the town, etc. [German]

29 098946 DISSEMINATION OF INFORMATION TO INCREASE USE OF AUSTIN MASS TRANSIT: A PRELIMINARY STUDY IN THE AREA OF URBAN TRANSPORTATION AND COMMUNICATION. This study of the relationship of information to mass transit usage (of city buses in the context of environmental crisis, air pollution and fuel shortages) includes a survey of efforts by cities to use information and education to increase mass transit usage, an observation of the traditional coverage of transportation news by mass media, and a brief account of the recent research on communications and transportation. The project tested the use of a new fleet of buses and a customer service center. The results indicate that the print media were most responsive to promotion of mass transit; that public phone calls to the transit offices increased; and that total city bus ridership continued to increase. Some recommendations are made relating to: press coverage; public education and the mass media; future communication and transport projects; and potential support by local agencies and groups.

29 126316 STATE-OF-THE-ART OF MOTORIST AID SYSTEMS. This report presents the analysis of a questionnaire survey administered to the governmental agencies which have or have had motorist aid systems (MAS) and those manufacturers of recent MAS equipment. There are 13 states which have 40 operational motorist aid systems with a total of approximately 5,200 aid stations. The costs and benefits of all motorist aid systems have not been fully determined. Changes to the present MAS, as indicated by the states, to improve operations included: providing illumination at aid stations for nighttime use; establishing uniform signing; redesigning field communications facilities; and incorporating in the pre-planning stage all participating agencies.

Maintenance of motorist aid systems indicated problems caused by vandalism at the aid stations, and severance of buried cables. Trends, as indicated by both the users and suppliers of MAS, are toward voice communications and radio equipment. The concept of in-vehicle communications is anticipated to replace or complement the present motorist aid systems.

29 128291 THE USE OF COMPUTERS FOR PROVIDING INFORMATION TO BUS PASSENGERS. An L.T. Working party report published in 1973 made various proposals for improving information for bus passengers. These included more detailed bus stop displays, the re-introduction of pocket timetables and, if practicable, the production of local bus maps for selected suburban centres. Providing this information on a large scale would require routine manipulation of large amounts of data and is probably beyond the scope of existing resources and is therefore a candidate for computerisation. This memorandum describes an initial investigation into what can be done and demonstrates the potential for producing bus maps and bus stop displays by computer. (A) /TRRL/

29 132943 COMPUTER GENERATED PASSENGER ROUTING INFORMATION. An innovative passenger routing information system for public transit lines has been developed. Named PARIS (Passenger Routing Information System), the system provides detailed information on optimal point-to-point itineraries in a scheduled transit system quickly enough to produce cost savings as well as passenger benefits. PARIS uses transit system data including, headway sheets (times), routings, incremental distances between stops, fare zones, landmark information and transfer data. The system features an itinerary defined by the arrival time, route numbers and direction of each bus; arrival and departure times and location of each transfer point along the route, arrival time at the destination, total elapsed time, and fare. Average processing time does not exceed five seconds for a bus system of up to 15,000 stops.

29 137333 COMPUTER GRAPHICS APPLICATIONS IN TRANSPORTATION INFORMATION SYSTEMS. This paper reports on the results of the application of interactive computer graphics to those public transportation information systems which answer inquiries from the general public. Primary emphasis was placed on development of a graphics application package to control the existing Transit Information System developed by the Stanford/UMTA research group in the Stanford Industrial Engineering

Department. Other areas of investigation included operator interaction with the computer display; sorting and searching a large geographic data base; and the practical limitations of geographic displays on a CRT. The U.S. Census Bureau's DIME data base was analyzed, and an interactive graphics map editor was developed.

29 139598 PUBLIC AWARENESS OF TRANSPORT AGENCIES AND INFORMATION: A SMALL-SCALE STUDY IN SUNDERLAND. This report presents and discusses the results of a small-scale survey undertaken in Sunderland to investigate the public awareness of public transport agencies and sources of public transport information, in the context of a particular situation in which this awareness might be expected to alter. Interviews were carried out in a pedestrian precinct in the town centre one week before and at varying intervals after the Tyneside Passenger Transport Executive had assumed responsibility for the operation of the Sunderland Corporation buses. The takeover had been accompanied by a publicity programme, the aim of which was to inform the public of the change of operator and to publicise the provision of a pocket timetable which was to be put on sale. The report concludes that the public's awareness of public transport agencies was not high and that the publicity programme did not have a marked effect in increasing this awareness. There was some evidence that the new timetable would be helpful to members of the public seeking public transport information. /Author/

29 156890 SPATIAL ORIENTATION IN A SUBWAY SYSTEM. The absence of a clear structural legibility within the New York City subway system tends to make its users dependent on other informational aids about its structural design and operations-such as signs, announcements, and especially the official New York City subway map and guide. The effectiveness of the New York City subway guide was tested by assigning 20 subjects a travel route which consisted of four trip-segments of varying difficulty. Of the total 80 trip segments, only 37 were traveled via acceptable (as determined by authors) solutions, with subjects having more difficulty planning acceptable solutions for more complex trip-segments. Interviews revealed that subjects felt insecure traveling the subway because the graphics in the system did not serve to reinforce their train selections. The findings suggest that the New York City subway system needs an improved map to guide its passengers as well as better systemwide graphics. /Author/ TRRL/

29 159321 COST/BENEFIT ANALYSIS OF AUTOMATED TRANSIT INFORMATION SYSTEMS. This report discusses the costs and benefits associated with automating the route-finding portion of a telephone transit information system. The various costs of implementing such a system are categorized and compared with those of a manual system over an appropriate time span using a present value approach. A queuing model, described in the report, is used for computing manpower requirements of the two systems, manual and automated. Outputs of the queuing model for a wide range of input parameters are tabulated in an appendix. Benefits from automating transit information route-finding are discussed, and measures of performance improvement available as output from the queuing model are provided.

29 170000 HIGHWAY RESEARCH IN PROGRESS (HRIP). Two developmental issues (September 1965 and April 1976) and eight annual issues (January 1968-July 1975) were published. The first seven annual issues contained HRIS summaries of on-going research projects from the U.S. and non-U.S. countries. The eighth and final issue (1975) contained only HRIS summaries of on-going research projects in the U.S. The subjects of the research projects cited by the summaries pertain to highways and highway transport; to rural and urban non-rail transit; and to urban transportation planning. Topics included in each issue range from planning, financing, design, construction, operation and maintenance, to energy, environment, safety and human factors. In addition to project summaries each issue contains an index to the summaries by retrieval

subject terms, an alphabetical index of funding and performing agencies. The summaries in each issue are arranged according to the HRIS classification scheme of 34 subject areas. The price of the 1973, 1974 and 1975 issues is \$40.00 each. Additional information about the projects cited by the summaries may be obtained by writing to the project investigator at the performing agency. Additional information about HRIS can be obtained by writing to HRIS at the address given above. HRIP information gathered subsequent to 1975 has been published by the International Road Federation in its World Survey of Current Research and Development on Roads and Road Transport, which is available for purchase from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161.

29 170001 HRIS ABSTRACTS. A PUBLICATION OF THE HIGHWAY RESEARCH INFORMATION SERVICE. HRIS Abstracts is published quarterly during the Spring, Summer, Fall and Winter of the year. Each issue contains from 800 to 1100 abstracts of journal articles, technical papers in conference proceedings and research reports; and announcements of bibliographies. The subject content of the published works cited by the abstracts pertain to highways and highway transport; to rural and urban non-rail transit; and to urban transportation planning. Topics included in each issue range from planning, financing, design, construction, operation and maintenance to energy, environment, safety, and human factors. In addition to abstracts each of the 200 to 300 page issues contain indexes to the abstracts by retrieval subject terms, personal authors and publication sources. The Winter issue contains cumulative indexes to the four issues of abstracts that comprise an annual volume. The abstracts in each issue are arranged according to the HRIS classification scheme of 34 subject areas. The annual subscription price of HRIS Abstracts for 1977 was \$40.00. Selection are made from more than 400 periodicals. Coverage of the transportation literature is world wide. All of the abstracts published in HRIS Abstracts are in the English language, however the source document for the abstract is usually written in the language of the country of origin. Each issue contains availability information for acquisition of full text documents including addresses of document delivery centers, publishers and publications. Individual issues of volume 10 (1977) could be purchased for \$12.00. Additional information about HRIS can be obtained by writing to HRIS at the address given above.

29 184193 COMMUTER INFORMATION SYSTEM: A NEW RIDER-SHARING TOOL. The Commuter Information System is a new package of computer programs, for use by local agencies or organizations, that provides ridesharing information to commuters on an individual basis. The system includes three functional components: (a) a state-of-the-art car-pool matching program; (b) a bus-pool and van-pool planning program; and (c) a transit information system that informs applicants of transit routes that can serve their commuting needs. Because the system is modular, any component can be used independently, and because it is highly user oriented, it is applicable to a wide range of local situations. All programs were written in COBOL. The development effort was based on a nation-wide survey of major ride-sharing efforts. Before the system was distributed, the city of Dallas tested and evaluated the entire package using live data. The Commuter Information System is being distributed by the Federal Highway Administration. It is intended to be a standardized data-processing tool for ride-sharing agencies as the Urban Transportation Planning System is for transportation planning agencies. It is applicable to transportation system management projects, U.S. Environmental Protection Agency regulations, and energy conservation efforts. /Author/

29 184428 COSTS AND BENEFITS OF A BUS-SERVICE INFORMATION LEAFLET. TRRL has studied the effects of a distribution of bus service information leaflets, to determine whether expenditure on such activities can be justified by resultant increases in traffic. A well-established network of eight rural services in south and west Yorkshire was chosen for the study. Principal findings were that the extra revenue attributable directly to the information leaflet was some four times the cost of production and distribution. Patronage on the bus services in the area covered by the information leaflet was up by 13 per cent four weeks after distribution and was still detectably above the pre-distribution level 17 weeks after distribution. Additionally, extra rural interchange traffic was generated at points where the services connected. (a) /TRRL/ Ellson, PB Tebb, RGP ; Transport and Road Research Laboratory Monograph Lab Rpt. 825, 1978, 21 p., 4 Fig., 7 Tab., 3 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-234610)

29 184451 ATTRACTIVE PUBLIC TRANSPORT-PASSENGER INFORMATION [Attraktive kollektivtrafik-Trafikantinformation]. This report comprises three studies dealing with various aspects of information to passengers used by public transport companies. The first study is a survey of requirements and needs of different groups of road users (public transport passengers, car travellers, newcomers). The following opinions of the passengers were expressed: (1) the information at bus stops could be more detailed, (2) the information on regulations concerning fares and changing routes is insufficient, (3) the next stop should always be announced. The second study is an inventory of Swedish and foreign information material for passengers. The study resulted in an evaluation of various information components. The third study, practical design and testing of information material, was aimed at bus stop information. Typical examples of various information components were compiled, tested and evaluated. With the test as a basis a proposal for the design of passenger information at bus stops is presented. /TRRL/ [Swedish]

29 189153 CURRENT PRACTICE IN THE FIELD OF INFORMATION FOR BUS NETWORKS [Pratiques actuelles des reseaux d'autobus en matiere d'information]. User information is one of the current preoccupations of those involved in the promotion of public transport. This study attempts to outline and to analyse current practice in the field of user information. It defines: the modes of diffusion adopted, the media used, the contents and the form of the proposed information. These information practices will be examined with respect to the result of surveys carried out amongst users of certain networks. A synthesis and commentary are presented, which attempt to take into account the problems arising from the presentation of different information contents as regards their use by users. /TRRL/ [French]

29 301037 TRANSIT MAPPING PRACTICES IN CANADA. This illustrated report contains examples of the techniques and styles used in transit system maps for public distribution. The examples are drawn from thirty-five maps issued

by Canadian transit operations, representing thirty-two cities with populations ranging from less than fifty thousand to several million people. The report is divided into three parts, the first of which features an analysis of the characteristics of the maps surveyed, the cities and systems they represent, and a list of thirty-one recommendations for use in map preparation. The second part deals with the purpose of maps to the public. This includes discussion of geographical coverage, map scales, schematic and topographical alternatives and their uses. The third part of the report is concerned with the technicalities of map production. Some general cost characteristics are given, and distribution strategies are evaluated. /TRRL/

29 302121 SUPPORTING INFORMATION AID SYSTEMS. Management support is essential for a productive consumer-oriented transit system, and it should be possible to translate this orientation into a viable consumer information system. A uniform consumer information system requires a great deal of marshalling of support and cooperation. The number of variables within a transit system's organization is listed, and it is noted that marketing's placement within the organization indicates the degree of the system's commitment to consumers. Actual practice at the Twin Cities Metropolitan Transit Commission is described. The first step in the development of a consumer information program is comprehensive planning involving the integrating of timetables, maps, bus and street signs, etc, and the setting of criteria for specific information elements. Prototypes for consumer testing should then be developed. Next, the process of ongoing production and distribution must be initiated. Coordination is most critical at this stage. A process for periodic updating, production and distribution of information must also be developed. Emphasis must be placed on accuracy. Marketing should play a prime role in distributing information aids via a carefully managed network agency and nonagency outlets. The area of street signs is of great importance and requires coordination. The effectiveness of the information program must be evaluated through ongoing marketing research.

29 307537 OFF-PEAK AD IMPACT STUDY. The Methodology, analytical framework, study

findings and media strategy implications of a study to assess the impact of the Queen City Metro's (QCM) "Off-peak" advertising campaign are presented. Data tables and survey questionnaire are also included. Telephone interviews (300) were conducted among 3 groups of off-peak respondents age 18 and over: students; odd-hour workers; and housepersons. A 2-stage random digit dialing sampling procedure was employed. Questions concerning the carrying medium, message recall, perceived communication intent, credibility for medium were asked, as well as OCM usage likelihood and the importance of metro benefits. The study found that future research should involve a 3-stage process consisting of copy development evaluation, pre-, and post-campaign measurements. The study indicated that within a constant level of gross rating points (GRP), greater communication impact may be achieved by varying reach and frequency strategies. It was concluded that frequency needs to be strengthened at the expense of reach within the same overall GRP Levels.

29 310687 PASSENGER INFORMATION SYSTEM FOR THE URBAN RAPID TRANSIT SYSTEM IN STUTTGART, WEST GERMANY [Fahrgastinformationssystem fuer die S-Bahn Stuttgart]. A passenger information system is described which comprises in its first stage 14 stations with 61 mobile train-service indicators and eight special indicators. The installation is fully automatic. By means of route tracking, the actual situations are covered. The whole system is divided into five self-sufficient working areas, the respective core of which is formed by the area control unit. With the aid of the information system, fully automatic and comprehensive information for passengers is guaranteed at any time depending on the actual operational situation. [German]

29 311317 TRANSIT USER INFORMATION AIDS: AN EVALUATION OF CONSUMER ATTITUDES. The overall purpose of the Transit User Information Project has been to identify the necessary components (both currently used and potential) of an effective transit information program which will provide the appropriate types and levels of information for persons to successfully use a transit system. A major output of this project is a handbook of transit user information aids which will provide transit operators with guidelines for developing an effective set of information aids. This handbook is based on an extensive inventory of currently used user information aids, interviews with a selected sample of transit operators, development of new potential information aids (form, design, etc.), and evaluation of existing and proposed transit user information aids through a series of laboratory group activity sessions. The laboratory evaluation was a means of objectively studying the impacts of the alternative techniques for providing transit information. As stated in the proposal for this project, the evaluation goals are "to determine what user

information aids and dissemination techniques work best to satisfy existing and potential rider needs, physical and psychological, in specific test situations considering multiple influence forces". In short, the laboratory sessions have been a primary mechanism for testing how accurately information aids and techniques reflect the perceived information needs of transit users. More specific objectives of the laboratory evaluations have been to test: 1. degrees of information levels required by specific information aid types to supply necessary information; 2. the level of information and design content at which complexity and mass becomes unclear, confusing, and counterproductive to purpose; 3. importance of specific information aids and dissemination techniques and their ability to satisfy rider needs and stimulate ridership; 4. user information's ability to satisfy certain psychological, as well as physical, components of the urban transportation trip, specifically: treatment, predictability, individualization, security, and accessibility; and 5. the effect that brief exposure to information aids may have on attitudes and/or propensity to ride transit. 29 311803 ROAD PASSENGER TRANSPORT AND ROAD GOODS TRANSPORT. The book contains two reviews concerned with road transport and gives references to sources of statistical material, where data may be obtained and what are the limitations to their use. Each review presents a brief summary of the activity and detailed information on statistical sources. A subject index to each review lists textual references. The first review "Road Passenger Transport" (Munby,D) covers all inland transport on land in Great Britain except railways. The review is in four sections: the organization of passenger transport; sources of road passenger statistics; information on pedestrians, bicycles, cars, motorcycles, taxis, public transport and regional statistics; and, comments on the adequacy of the statistics. The second review "Road goods Transport" (Watson,A) reviews sources of information on goods transport covering carriage for reward and carriage 'on own account'. The data review covers characteristics and organization; licensing and regulations; trade associations; importance relative to other transport; and, statistical reporting. (TRRL)

29 312269 MICHIGAN SMALL BUS PROGRAM MANAGEMENT HANDBOOK. The State of Michigan has successfully provided small bus public transportation in small and medium-sized cities as well as in entire counties. The program has three components: interim elderly and handicapped program, transportation services consolidation program, and the general public transportation program including the small bus county incentive program and the urban and rural small bus program. This handbook which is intended to be a practical guide for system managers focuses on personnel relations, operations, management, marketing and funding. Procedures for getting through the State's grant and contract process are also included. The various chapters are as follow: Project Management (small bus start-up process, transition process: demonstration to ongoing); Operations (administrative and operating alternatives, operating procedures and forms); Contracts (state-local first party contracts, operating contracts (third party contract), stte contract development procedure); financial management (accounting guidelines, charts of accounts, accounting process); Purchasing Equipment (selecting equipment, bus specifications, lift specifications, transit radio systems); Equipment Management (preventive maintenance, state accident reporting requirements); Marketing (goals and objectives, advertising, public relations, system information program, community and employee relations, evaluation, start-up activities); Personnel Management (job descriptions, driver training/retraining, personnel selection, policies and procedures); and Monitoring & Evaluation (standards of performance, surveys, use of results).

29 314025 MOVING PEOPLE: THE CASE FOR PUBLIC TRANSPORTATION. The report is a Handbook on public transportation for the general public. The issues that it covers include: transportation planning; transportation costs and financing; user benefits of public transportation; social benefits of public transportation; public perceptions of public transportation; and marketing of public transportation. The purpose of this Handbook is to explain how public transportation is planned, how the individual citizen can make his views heard, why subsidies are necessary, and finally, what is being done to improve public transportation. These issues are explored in a question and answer format and several case studies are included to illustrate complex issues and explore topics in greater detail.

29 316381 USERS OF TRANSPORTATION RESEARCH INFORMATION NOW HAVE ON-LINE ACCESS TO THE TRIS DATA BASE. The TRB information service files are now part of the Transportation Research Information (TRIS) on-line data base at Lockheed Systems in California. Individual records in the TRIS data base are either (a) abstracts of reports, articles and other documents that include descriptions of statistical data holdings and computer programs, or (b) resumes of on-going or recently completed research projects that are relevant to the planning, development, operation and maintenance of transport systems and their components. Under an agreement with the U.S. Department of Transportation, the TRB supplies records that have been selected and stored by five of its information services (relating to Highway, Maritime, Railroad, Air, and Urban Mass Transportation systems) on behalf of modal sectors of the transportation research community. The TRB maintains a number of exchange agreements between the information services and other transportation related information services in the U.S. and abroad. The preparation of records for TRIS supply includes checking for duplicates as well as the addition of codes and reformatting of records into a common set of data elements. Approximately 133,000 records were stored in the five TRIS Subfiles in June 1980, and it is estimated that an average of about 2000 records permonth will be included in monthly updates. The Subject coverage, data elements for TRIS records, search and output procedures with illustrative examples are briefly outlined in the article.

29 316663 STUDY OF COMMUTER CHOICE OF INFORMATION SOURCE TO IMPROVE TRANSIT INFORMATION SYSTEMS-ABRIDGEMENT. In an effort to gain a better understanding of information-source choice behavior and to suggest a way it could be

applied to the improvement of transit information system design, a study was made which was based on the results of a demonstration project conducted to develop more informative bus stop signs. The project consisted of three parts: development, field demonstration, and evaluation of experimental bus stop signs. A before-demonstration survey of bus riders on three routes was designed to determine the commuter information-retrieval pattern for the existing transit information system. Based on survey results, an experimental bus stop sign was developed. After the sign was installed, a second survey of bus users was performed to obtain feedback on specific evaluation dimensions. The results of the survey are discussed. The information source choice model developed from the results is presented. In the model, relationships between the trip and personal characteristics and choice of information source were established. The model expands on these relationships to develop a dynamic framework, which depicts the normative behavior of a transit consumer. The implications for transit system management are examined.

29 316664 COMMUNICATION CONSIDERATIONS FOR TRANSIT ROUTE AND SCHEDULE BROCHURES. Route and schedule brochures provide information on the specific service features of fixed-route transit. Clear, concise, and easy to understand information on these pamphlets is important to both users and prospective users of transit services. To date, insufficient attention has been directed toward development of effective communication techniques on these pamphlets. Many are difficult to interpret, incomplete, or poorly formatted, which makes them of marginal value to prospective users. The assumption that the reader is familiar with transit service characteristics, and thus able to translate any printed information, can make the brochures difficult to comprehend for automobile-oriented individuals. Nonusers cannot be expected to use the transit mode if they are uncertain about the characteristics of a specific service. The paper outlines methods by which communication techniques can be improved for route and schedule brochures. The design process should be governed by rational and systematic design principles, which are proposed and explained. The principles have been applied to the redesign of Knoxville Transit's route and schedule brochures. Each element on the brochure cover, timetable, and route map is briefly discussed in terms of desirable design practices and the rationale for each. (Author)

29 317269 INFORMATION FOR USERS OF BUS NETWORKS. INFORMATION PROCESS AND THE NEEDS OF THE USER [Information des usagers des reseaux d'autobus. Processus d'information et besoins de l'usager]. A qualitative enquiry has been carried out amongst the population (users and non-users of public transport) of le mans and nice to determine the level of knowledge regarding the availability of transport on the part of the residents, to analyse the manner in which this knowledge is developed and to identify the role of different means of information in this regard. Attempts are made to identify the principal difficulties in comprehension which are posed by written information to the users. Results of this enquiry, carried out amongst 130 people in october/november 1977, show problems as regards current practice in the field of information regarding bus networks; these, in effect, are centred almost exclusively on providing information on the network whilst the population requires information regarding the city and the public facilities. The survey also provides evidence regarding the considerable difficulties in comprehension of the written information. (TRRL) [French]

29 319569 TICKET TO RIDE. A GUIDE TO PUBLIC TRANSPORT IN SCOTLAND STATISTICS AND TRANSPORT STATISTICS. 1977 AND 1978. The report presents a guide to public transport in Scotland where such services are more essential than is generally appreciated. Only 46% of Scottish families have a car, often only used by one member of the family. The planning emphasis should be on improving and extending forms of public transport not superseding them with expensive facilities needed for individual private transport. The aim of the booklet is to improve public awareness at a time of change in transport policy. With the focus on passenger transport, the intention is to clarify the legal and financial position, to outline government policy and to detail responsibilities of the authorities involved. (TRRL)

29 322284 MOVING PEOPLE--THE CASE FOR PUBLIC TRANSPORTATION. After several decades of neglect, the United States is showing a renewed interest in public transportation. In 1964, congress passed the Urban Mass Transportation Act, which sets out national public transportation policy and provides a means for the Federal government to assist local communities in planning and financing public transportation. While support for public transportation is growing, many people question the large subsidies from Federal and local taxes that have been necessary to maintain and expand transportation systems. This report is a Handbook on public transportation for the general public. The issues that it covers include: transportation planning; transportation costs and financing; user benefits of public transportation; social benefits of public transportation; public perceptions of public transportation; and marketing of public transportation. The purpose of this Handbook is to explain how public transportation is planned, how the individual citizen can make his views heard, why subsidies are necessary, and finally, what is being done to improve public transportation. These issues are explored in a question and answer format and several case studies are included to illustrate complex issues and explore topics in greater detail. (UMTA)

29 322289 INNOVATION IN PUBLIC TRANSPORTATION. A DIRECTORY OF RESEARCH, DEVELOPMENT AND DEMONSTRATION PROJECTS. This eighth annual directory contains descriptions of current research development and demonstration (RD&D) projects sponsored and funded by the Urban Mass Transportation. The intent herein is to make public information regarding UMTA's RD&D activities. The directory focuses on activity that took place in fiscal year 1979. All projects described herein are funded under Sections 6, 9, and 11 of the Urban Mass Transportation Act of 1964, as amended. Section 6 programs relate mainly to technology development and deployment, service and methods demonstrations, transportation (Technical Studies) and special planning studies; and Section 11 programs relate mainly to policy development and research (including University Research and Training Grant Program). The appendixes provide information about federal research and development in urban mass transportation grants and contracts. This document also provides an index of agencies/contractors, a project index, and a subject index. (UMTA)

31 044515 HOW TO SAVE URBAN AMERICA. This book, prepared by the Regional Plan Association, covers several of the critical issues facing the New York City metropolitan area. The issues covered are housing, transportation, environment, poverty, and cities and suburbs. To the extent that some of the proposed solutions are followed, they have implications for rapid transit, for commuter services, for the movement of building materials, and for the movement of fuels for utilities. To the extent that the proposed solutions may be adopted by other metropolitan areas, they may have implications for transportation far beyond New York.

31 046015 METROPOLITAN ATLANTA RAPID TRANSIT SYSTEM. The Metropolitan Atlanta Rapid Transit Authority (MARTA) has filed an application for Federal capital grant assistance to construct a rapid transit system (50-mile rapid rail) which will include 9 miles of subway, 16 miles of elevated rail and 25 miles of surface rail. In addition, there will be 14 miles of new exclusive busway included in the system. The project affects the total 50-mile system of the City of Atlanta, from the CBD to the Fulton and DeKalb County limits. The permanent adverse environmental impacts for this project include community disruption, family and business displacement and relocation, inappropriate land use changes traffic intrusions, severance of neighborhoods, noise and visual intrusions. Also, there will be acquisition of comparatively small amounts of parks and ecological areas. The historical markers will be relocated.

31 047475 URBAN RAILWAY MAPS. 'Integration' of urban public passenger transport is all the rage. With few exceptions, the urban (and usually underground) lines in big cities and the suburban routes of the main-line railways are under separate managements. Many municipal and other urban transport authorities publish maps showing bus, tram, pre-metro and their own urban railway railway networks. Despite the need for co-operation in all modes of transport and indeed active co-operation in fare fixing and through-ticket issue, one seldom sees maps that show all transport routes. In many cases, more particularly in such vast networks as those of London, New York and Tokyo, it is hard enough to show all rail routes, let alone buses or trams. Few system maps issued by urban railway operators show in any detail the suburban routes and stations of the main-line railways. The best exception to date is a new London Transport map in poster and pocket and pocket folder form that shows all LT and British Rail suburban lines and all the more than 600 passenger stations in an area extending 25 miles from the centre.

31 047756 PUBLIC TRANSPORT INNOVATIONS IN PRINCIPAL EUROPEAN CITIES. The report describes several innovations in European public transport which have been adopted as solutions to urban transportation problems. These recent developments in European transport are of particular relevance to the United States as they illustrate the range of viable alternatives that have been considered and the results achieved. Discussion of the results of planning and technology for several European cities includes both incremental and institutional improvements as well as new system and network innovations. The cities selected for evaluation are Hamburg, Gothenburg, London, Paris, and Run-corn, as each furnished a significant illustration of public transport responses to major urban problems.

31 047980 HOWARD STREET RAPID TRANSIT STATION PASSENGER SURVEY. During the summer of 1972, the New Trier High School of Northfield, Illinois conducted their sixth annual seminar in community affairs. The seminar began on June 19th and ended on August 4, 1972. Participants included junior and senior high school students from all walks of life and from numerous geographic sections of the Chicago Metropolitan Area. During the seminar among their activities was a survey of Rapid Transit passengers who boarded the Chicago Transit Authority El lines at the Howard Street Northline Station. The survey was conducted entirely by the seminar students under the leadership and guidance of their director Mr. Jamie McClendon.

31 048181 THE LINDENWOLD LINE. A CASE STUDY OF THE NEWEST RAIL RAPID TRANSIT. A new rail rapid transit line has been brought into operation as the foundation of the Southern New Jersey Rapid Transit System. This System, operated by the Port Authority Transit Corporation (PATCO), a subsidiary of the Delaware River Port Authority, presently consists of a rail transit line between Philadelphia and the suburban community of Lindenwold, New Jersey. Popularly known as the Lindenwold Line, it has been operating for over two years and is promoted as the predecessor of "a new era of mass transportation." Indeed, the transit line already includes many innovative features that are being planned and developed for new rail rapid transit systems in other metropolitan areas. As a new system, the Lindenwold Line also presents an opportunity to study the impact of rail rapid transit in an urban setting to get an idea of what similar systems might be able to do for other cities. This case study examines the development of the Lindenwold Line, its financing, and its effectiveness in improving transportation in the Philadelphia urban area.

31 048185 PREDICTING PARK-AND-RIDE PARKING DEMAND. This study is concerned with the determination of design criteria for prediction of parking demand at park-and-ride facilities in medium-to-large cities in the United States. Ninety-three change-of-mode parking facilities in 10 cities were used in the study. Data were collected through a mail survey. The report includes an analysis of important physical, operational, and locational characteristics of change-of-mode parking facilities experienced by 26 agencies operating 73 rail and 20 bus facilities. The change-of-mode demand is estimated through a prediction equation developed by linear regression analysis. The prediction model was tested for its applicability by using separately supplied data from a committee of the institute of Traffic Engineers. Input to the model consists mainly of characteristics of the city, the transit system, and the location of the parking facility.

31 048189 THE POTENTIAL OF A RAIL RAPID TRANSIT SYSTEM. The potential of rapid transit lies in its ability to move large numbers of people comparatively quickly along a given corridor with minimum disturbance to the surrounding environment. The term mass transit is more correct because such a system is not economically justifiable unless it is moving a large mass of people. The cost of providing the basic structure is invariably high and so is the cost of running the minimum acceptable level of service. To cover these costs alone a large number of passengers must be carried, but the extra cost to cater for more passengers is quite small. In accountancy terms, the break-even point is high but once it is reached the marginal cost incurred by extra services is small and hence profitability increases rapidly above the break-even point.

31 050551 STUDIES OF PEDESTRIAN MOVEMENT IN RAILWAY STATIONS WITH DENSE SUBURBAN TRAFFIC. Observations were made of pedestrian streams in one-way traffic in stations of the Deutsche Bundesbahn and of the Berlin (Underground) Transport Services. The findings are outlined in the form of functions and survey diagrams. The following are considered worthy of special mention: walking speed and walking time on plat-

forms of detraining passengers; platform clearance times for various types of platform exits, contingent on the dispersing crowd; simulation of overlapping passenger streams detraining from 2 trains at the same platform; capacity of platform exits and surveys of congestion in front of stairways; surveys of density speed during movement on stationary stairways; and movement phenomena in subways and at barriers. Results of these surveys serve as a practical aid for the planning engineer in designing station facilities with dense passenger traffic. [German]

31 050860 LINDENWOLD RAIL LINE AND SHIRLEY BUSWAY: A COMPARISON. Comparisons of different transit modes have seldom given sufficient attention to service parameters. Rather, costs were compared for modes that optimally provide different types of operations. This study utilizes 2 existing systems for a comprehensive comparative study of bus and rail technologies and their different types of operations. It differs from previous studies in 2 respects: First, it performs the analysis on 2 actual systems and thus does not utilize any hypothetical assumptions. Second, it includes more system characteristics than any of the previous studies. The Lindenwold "Hi-Speed Line" offers all-day, high-frequency, reliable service among its 12 stations; it depends heavily (80 percent) on access by automobile. The Shirley Busway provides mostly peak-hour service on very many lines with different routings, but with a lower frequency and reliability than Lindenwold; it relies mostly (84 percent) on access by walking. Lindenwold required very high investment and was completed as one project; its revenues exceed operating costs by a significant amount. The line is extremely well operated and managed. Shirley was introduced with considerably lower investment, but it requires at least a 3 to 5 times higher labor force per passenger than Lindenwold. Its revenues closely cover the operating costs. Lindenwold attracts a 70 percent higher ridership than Shirley. Shirley

can be improved by the introduction of all-day high-frequency service on some of its routes. The main deficiency of the busway concept will remain street operation in the CBD. Both systems are very successful. Their attraction of new riders proves that there is a considerable latent demand for transit, even in low-density auto-oriented suburban areas, and an underutilized potential of modern bus and rail modes.

31 051017 THE WAY TO GO: THE COMING REVIVAL OF US RAIL PASSENGER SERVICES. Here is a very different book about public transportation, a book which for the first time gives Americans realistic hope that a new day may be dawning for rail passenger service. It has, in fact, begun; the new Lindenwold Line from Philadelphia to the South New Jersey suburbs; the Bay Area Rapid Transit System for San Francisco and its sister cities; new developments on the Washington-New York-Boston run. These developments and more are recounted, along with a history of how and why rail passenger service has been dying out in the U.S., what it is like in other countries, how we can overcome the problems that have been holding up improvement here, and what is new beginning to happen. Here is an optimistic book about railroads that will be good news to harassed commuters and long-distance travelers, as well as to those concerned with our national ecology.

31 051363 A RAPID TRANSIT LINK FOR NEW CITIES DEVELOPMENT. A new city concept, specifically the "village cluster" concept, is reviewed and presented as an alternative to the present trend toward urban sprawl and environmental deterioration. A fundamental requirement for the success of a new cities project is noted to be a rapid transit link between the new cities and an existing urban center.

31 051466 AIRPORT ACCESS/EGRESS SYSTEMS STUDY. VOLUME I. TEXT. Studies of airport activities and user characteristics at 34 high volume U. S. airports indicate that disbursed trip origins cannot economically justify rapid transit corridor investments dedicated to airport access travel. Generally, airports have too much off-roadway parking in central terminal areas and this concentration of vehicular activities near terminal buildings congest internal roadways. The study proposes a number of low-capital improvement concepts to airport access/egress. These improvements are generally directed towards improving the traffic flow in the central terminal area through better flow controls, diversion of automobile traffic from the central terminal area, and changes in travel patterns. The latter can be changes in mode and/or time of travel. Three specific operational experiments are proposed to evaluate the effectiveness of the proposed concepts. The experiments are a remote parking experiment at Detroit Metropolitan Airport, bus-rail links from La Guardia and Kennedy Airports in New York and evaluation of a garage-baggage handling system at Seattle-Tacoma Airport. Cost of implementing all these experiments is estimated to be \$1.444 million.

31 051890 PASSENGER REACTIONS TO LONDON'S VICTORIA LINE. The London Underground's rapid transit Victoria Line, 13-1/2 miles long, which was opened in stages between 1968 and 1971, provides a new northeast-center-south link supplementing the network already existing (in the central area for over sixty years) in London. Two detailed surveys were mounted to assess the impact of the new line on passenger ride patterns and on generation of new traffic, and to monitor forecasts made at different dates during the preceding fifteen years.

31 052026 STATUS OF DOMESTIC HIGH-SPEED MARINE VEHICLES FOR MASS-TRANSIT. There are some very significant benefits available to commuters, taxpayers and communities from the introduction of a truly effective high-speed marine vehicle into local transit applications, where the origin and destination movement of the people can be accommodated by a water route structure. Any such service must be fully inter-modal to be a success. The marine vehicle must have certain features and these are discussed. Of particular importance is acceptable craft behavior (with regard to speed and ride quality) when the weather deteriorates and the water gets rough, a situation which occurs more often and to a worse degree in protected bodies of water than most people appreciate. Environmental considerations are also covered in some detail. There is currently one vehicle in production for passenger service in the United States, based on proven advanced high-speed technology, the Boeing JETFOIL. The features of this vehicle are discussed and its characteristics compared with other advanced marine vehicles. Finally an excerpt is presented from a report that summarizes the actual experiences of a head-to-head competition between hydrofoils and hovercraft during the summer of 1972 between Copenhagen, Denmark and Malmo, Sweden.

31 052027 DISCUSSION ON THE POTENTIAL OF WATER TRANSPORTATION SYSTEMS TO TRANSPORT COMMUTERS WHILE REDUCING NOISE/AIR POLLUTION AND HAVING MINIMUM ADVERSE IMPACT ON LAND AREAS. The purpose of this presentation is to examine the utilization of existing waterways in the Washington, D.C. and Honolulu, Hawaii areas to reduce the urban traffic congestion and associated air and noise pollution. The practical, technical, and economic feasibility have been examined and the potential advantages of water transportation are explained. A network of possible water transportation routes is designed, a potential commuter market is developed, and then the implementation and operating costs of these water transportation systems are evaluated. The ability of a water transportation system to reduce noise and air pollution, and not impact adversely on current use of land areas are of particular interest.

31 052112 ARRIVAL OF LOCAL TRAINS AT LARGE PASSENGER STATIONS OF THE DEUTSCHE BUNDESBAHN [DIE ANKUNFT VON NAHVERKEHRZUGEN IN GROSSEN PERSONENBAHNHOFEN DER DEUTSCHEN BUNDESBAHN]. In connection with the investigation of the station-oriented pedestrian traffic at large junction stations of Deutsche Bundesbahn the arrival of short-distance trains was recorded in temporal and local respect by means of a time-dependent tape recording method. The empirically determined asymmetrical distribution of unpunctual arrivals of such commuter trains during the morning rush hours (6:00 to 9:00 a.m.) exhibits no significant differences between through stations and railheads. The distributions are not comparable to standard distributions. For the stopping eccentricity of short-distance trains in DB's through stations, as referred to the centrally arranged platform stairs, a symmetrical distribution was obtained, which can be considered as normal.

Westphal, J *Glaser's Annalen ZEV* Vol. 97 No. 5, 1973, pp 185-191; ORDER FROM: ESL, Repr PC, Microfilm

31 052113 SURVEYS AT UNMANNED EXIT BARRIERS OF THE DEUTSCHE BUNDESBAHN [UNTERSUCHUNGEN AN UNBESETZTEN AUSGANGSPERREN DER DEUTSCHEN BUNDESBAHN]. A study dealing with pedestrian traffic in railway stations with heavy local traffic included also walking at barriers. At unattended exit barriers of large passenger stations of Deutsche Bundesbahn, through which considerable passenger flows pass in one direction on leaving the trains during the morning rush hours (6:00 to 9:00 a.m.), extensive counts were made by applying a time-dependent tape recording method under actual service conditions. The data material was evaluated by electronic data processing, applying the methods of statistics and in particular of correlations calculus. The results have been compiled in tables and diagrams as far as practicable.

31 053749 OIL AND THE FUTURE OF PERSONAL MOBILITY. The implications of the worsening oil situation for surface passenger transport in Britain are set forth clearly and coolly. This alone in the present spate of hasty and confused topical writing makes Mr. Pole's pamphlet a ready source of facts and of plausible estimates--as might be expected from the Director of the Cambridge University Conservation Society's transport research project. In considering passenger transport that does not use fuel oil the author stresses the advantages of electrifying conventional railways, both urban and main-line. In a continued oil shortage the electric APT will have an importance not until recently foreseen, as will new and revived urban electric railways including the Tyneside rapid transit system, shop window for vehicle (Metro Cammell) and other British technology. In view of constant additions to concepts and plans for less conventional guided passenger transport systems (most of which disregard the problems of mass passenger movement at peak periods) the summary of these as substitutes for oil-consuming road vehicles is as comprehensive as can be expected.

31 054128 NEW CONCEPTS IN RAIL-BUS INTERCHANGE. To plan and design a bus-rail mode-transfer facility within a freeway inter-

change of a transit-freeway transportation corridor, planners and engineers must consider the integration of all transportation facilities. In particular attention should be paid to: (1) The relationship of traffic access location and the freeway interchange; (2) interchange-intersection traffic operational efficiency; and (3) mode-transfer facility access concepts and internal circulation concepts. Major cities in North America have constructed multimode transportation corridors and with them has come the need to provide good access and efficient bus-rail intermodal transfer developed on sound planning, design and operational concepts. To establish these concepts, "Planning Considerations" are presented, including: (1) Interchange configuration influencing mode-transfer facility location and access; (2) multimode transportation corridor system design; (3) integration with arterial street systems; and (4) bus, auto, and passenger traffic generation.

31 057170 HIGH SPEED TRANSPORTATION--LONG DISTANCE AND URBAN. The paper examines the impact of population growth and increased quality of living on the transportation problem, on a national and global basis. It assesses existing trends and considers future problems of long distance and urban transportation. Evidence is adduced showing that the road system in urban areas is at full stretch with the consequence that it is virtually impossible to implement an "all roads" policy. Modern developments, such as high speed rail and hovercraft vehicles, are considered in the belief that they could make an effective contribution towards a more comprehensive transportation strategy.

31 057509 UNDERGROUND RAILWAYS OF THE WORLD. The story of the underground railway system is the story of the growth of the modern city. The tremendous upsurge in trade and communications, which began in Victorian times, led to a situation where the main line railway stations of our cities rapidly became isolated from the centres of business, and the idea of small linking railways between terminals came into being. The first part of Mr. Nock's book deals with general principles and concentrates on the development of the underground railway in London, but as the title of the book suggests, it goes on to include systems from all over the world--the Paris Metro, the New York system, the Madrid Metro, the Moscow Metro, the San Francisco system, the Canadian subways and European development in general. Signalling, automation and such fascinating and little-known sidelights as a Post Office Tube system are also fully covered.

31 057566 GEMS OF SYMMETRY AND CONVENIENCE: SO RICHMOND PROUDLY DESCRIBED ITS ELECTRIC TROLLEYS, THE FIRST TRULY SUCCESSFUL SYSTEM IN THE WORLD. Initiated in 1888, Richmond, Virginia's trolley system, featuring four-wheeled electric cars, was the pride of the city. Within scarcely three months after the system opened, it was transporting 12,000 passengers daily at speeds up to 15 miles per hour. Not only was it, for its time, the largest street railway in the world, it was also "the first trolley system anywhere to operate with a sufficient degree of reliability and economy to represent a truly practical means of urban transportation". The author places operation of this system in historical perspective and provides a fascinating account of early street railway transportation. As one might expect, there are excellent illustrations for the article. Accompanying the article is a column "Vanishing Americans", which gives location of still-operational trolley lines and trolley museums and a description of them. Also featured in this issue is a section in color titled "Old Post Cards Bring Back The Age of the Trolley" (pp. 25-32). The nostalgia power of this section is almost overwhelming, especially the tranquillity of "Rush Hour on West Superior Street, Cleveland, Ohio". Trolley enthusiasts should make this issue a collector's item.

31 071753 CONSOLIDATION OF URBAN RAIL FACILITIES. Our present urban rail systems were developed by a number of independent competitive companies without coordination or overall planning, resulting in a considerably overbuilt plant. Changing patterns in distribution have not been reflected in changes in our urban rail systems. Past experience with facility consolidation through such methods as the joint terminal operating company have been unsatisfactory due to resultant high costs and poor service. These proposals have also failed to recognize many of the interests involved in facility changes and have consequently engendered substantial opposition. This paper proposes a method whereby the deficiencies of past terminal companies can be corrected and deals with overcoming opposition from those interests which may be expected to oppose rationalization of the urban rail plant.

31 072036 TRANSPORT SYSTEMS IN NEW TOWNS. A new town one which is created deliberately too far from an existing city to be considered a regular suburb. It is designed to expand the region economically without contributing to further congestion in the parent town. Because the town is just being developed, there are no existing transportation patterns upon which projections can be based, and consequently estimates must be used. Besides internal transportation, the link between the new and the parent town is considered. This report considers the determination of transport demand, and approaches for research and planning. It gives some of the systems used and an evaluation of them. Elements common to most new towns are found to include use of buses, short walking distances to transit, use of rail to connect with the parent town, continued dependence on automobiles, and

acceptance of static urban transport pattern determined for existing cities. It is recommended that future planning be based on a dynamic approach, building on a well-dimensioned infrastructure considering location of external and internal traffic generating points.

31 072127 RESEARCH CONCERNING OVERALL TRAFFIC AND COST BENEFITS. This report deals with the problem of over-congestion in Tokyo traffic and the redevelopment of public transportation. As it is not possible to widen streets and highways due to space shortage, the authors suggested the following solutions: 1) Restrict the number of private vehicles and increase public transportation services. 2) Centralize the existing public transportation system: trains, buses, and subways. This will hopefully cut out any duplication of services created by business competition among these three major means of public transportation. 3) A shift of attitude toward public transportation from profit oriented to nonprofit oriented is recommended. 4) The commercial firms who use public highways and roads should share the cost of construction and maintenance. 5) Further government subsidy. [Japanese]

31 072231 TRAFFIC REGULATION IN FOURTEEN SWEDISH POPULATION CENTERS [Trafiksanering i 14 svenska tätorter Kartläggning utförd av Anders]. Implemented traffic control measures, their goals, and their effects were discussed with government officials and technical experts in 14 Swedish population centers with populations ranging from 4,900 to 119,900. All had undertaken some form of traffic control; in the three smallest, the measures were sketchy, consisting mainly of parking restrictions, one-way streets, walking and bicycling paths under large thoroughfares, etc., while in the five largest cities, more thorough programs were attempted, such as comprehensive traffic redirection and large investments in new streets. Only the largest city, Uppsala, had a complete official set of goals for traffic control policy, while two communities had no official goals at all. Generally espoused goals were to reduce traffic within the CBD and to promote bicycling, walking, and the use of public transportation. A goal adopted by three cities was to reduce traffic to the CBD. The most common justification for these goals was lack of space in the CBD, while another common reason was the desire to increase traffic safety, reduce noise, and protect the cultural historical environment. In general, traffic control is not regarded as urgent compared to other communal tasks, especially if it requires sizeable monetary expenditures. The effects include increased traffic safety, reduced noise and air pollution, and improvements or public transportation. Success is usually limited in each area, but the total effect is generally positive. This opinion is shared by the inhabitants of the cities. The officials interviewed suggest that research on traffic control be broadened to include questions of behaviors and economic consequences.

31 080044 ROLE OF PERSONAL RAPID TRANSIT IN MASS TRANSIT. With the nation looking more and more to mass transit to solve its urban transportation problems, the innovative Personal Rapid Transit (PRT) systems with their "second car" characteristics can be expected to complement bus and rail services, especially in medium-density population areas. After summarizing the role each of these three forms of public transit plays and is projected to play by 1990, the paper describes current specialized PRT applications in the United States and abroad.

31 080110 INTERMODAL TRANSFER FACILITIES. The papers describe various aspects of passenger terminals, interchanges whose scope includes anything from a transit platform to a multimodal regional transportation center. Despite this broad spectrum, passenger terminals have common design elements which these five papers address. The first describes principles of different modes to have access to outlying rapid transit terminals. The second describes studies on boarding the alighting time requirements for bus and trolley services. The next paper contains an analysis of park-and-ride lots. The movements of pedestrians in transit stations is next discussed. TRB's Committee on Intermodal Transfer Facilities has developed a general outline and classification for the elements in a typical passenger transfer facility.

31 080637 APPROACHES FOR IMPROVING AIRPORT ACCESS. There are two airport access travel markets: (1) the Central Business District-to-airport market; (2) the suburban-to-airport market. Approaches for improving airport access include: (1) improvements in existing limousine service; (2) demand-activated transportation service; (3) priority access routes for public transportation; (4) satellite terminals; and (5) extension of the regional rapid transit systems to airports. An economic analysis of the first four of these alternatives leads to the following conclusions: (1) it is possible to provide economically viable service both to low and high-density areas; and (2) increased service to low-density areas may be provided by either extending reservation routes to transfer points where free parking and taxi services are available or by operation of group-riding service.

Ellis, RH Bennett, JC Rassam, PR (Peat, Marwick, Mitchell and Company) *ASCE Journal of Transportation Engineering* Vol. 100 No. TE3, Proc. Paper 10737, Aug. 1974, pp 661-673, 7 Fig., 5 Tab., 4 Ref., 2 App.; ORDER FROM: ESL

31 080656 DESIGN AND DETAIL OF 1974/75 BUS PLAN. The bus plan for the Washington, D.C. metropolitan area is a near-term improvement which integrates services previously oper-

ated by four privately-owned bus companies and now owned by one public organization. It contains many substantial improvements and services and extends new services into growing suburban areas. The additional fleet and operating cost requirements are presented. A major consideration in planning was to maintain a balance between modest modification and extensive change. Needless disruption to existing ridership patterns was avoided. Main features of the plan are: simplification of route structure, extension of the service area, additional crosstown and cross-county routes, service in peaks tailored to meet existing and potential demand, strengthened midday service, and major service improvements to the disadvantaged.

31 081006 A FRAMEWORK FOR INVESTING IN URBAN BICYCLE FACILITIES. The bicycle as a transportation and recreation mode has explosively entered the public's consciousness. Accompanying this phenomenon has been a rash of problems including a sharp increase in accident rates and thievery. There is a need to provide facilities that will reduce these problems and accommodate the expected increase in bicycling popularity. This paper raises four basic questions, the answers to which will assist in planning urban bicycle facilities on a more organized basis with a minimum of misdirected effort and a maximum amount of coordination. How much money should be invested in bicycle facilities? What types of trips are the best candidates for bicycling? What type of bicycle facilities should be provided? Where should these bicycle facilities be placed? At this stage of urban bicycle facility planning, these questions are only beginning to be asked and are far from being resolved. Planning and engineering of bicycle facilities are essentially in a shakedown period in which many good and bad ideas will be tested before the best solutions surface and become the norm.

Ohrn, CE Podolske, RC (Barton-Aschman Associates, Incorporated) *Transportation Research Record* No. 508, 1974, pp 60-72, 2 Fig., 7 Tab., 9 Ref.; ORDER FROM: TRB Publications Off, Repr. PC

31 081012 COORDINATED BUS STUDY. Purpose of this report, a summary of 3 individual consultant studies, was to analyze the need for local and feeder transit services in the East Bay communities of Contra Costa County, Livermore-Amador Valley, and the Tri-Cities of Fremont, Newark, and Union City, California. These 3 areas are inside the BART District but outside of the service area of the Alameda-Contra Costa Transit District (AC Transit). In each of the 3 study areas, similar findings and recommendations were made. Recommendations include: transit service along the major corridors should be developed and expanded; local service by itself would not significantly reduce the dominance of the auto; and local transit should be provided to serve the limited mobility population. Feeder and local services were recommended. These systems proposed include conventional bus routes, flexi-

bly routed buses and demand activated bused (dial-a-bus). In addition to dial-a-bus services in the Contra Costa study area, electrically powered, publicly owned automobiles (PAS) were recommended for development. Report also provides an overview of the Bay Area setting for these studies, reviews need for transit, summarizes recommendations regarding transit alternatives, gives a brief overview of impacts of transit alternatives, and describes the implementation procedures, including the institutional, financial, and management arrangements. Maps, charts, tables, illustrations and appendices are included. /UMTA/

31 081828 RESERVED BUS LANES ON URBAN FREEWAYS: A MACROMODEL. An increasing number of cities are becoming interested in operating buses on reserved lanes so that people can be moved more effectively. This paper develops a person-delay model that can be used in determining the feasibility and practicality for implementing a contraflow freeway bus lane in urban areas. The model deals with peak-hour trips on a six-lane, two-direction freeway, and it uses certain relationships to demonstrate its applicability. The derivation of the model is shown, and the paper discusses, by a step-by-step procedure, how transportation planners can easily use it.

31 081857 PROCEEDINGS OF THE SEMINAR ON BICYCLE/PEDESTRIAN PLANNING & DESIGN. The many facts of planning for bicyclists and pedestrians are considered in these Proceedings. Accident prevention is discussed in detail, including such aspects as the dangers to cyclists of parallel sewer grates, pedestrian regulation, and surfacing to be used on pedestrian walkways. Also considered are: age; mobility; planning for handicapped persons; health aspects such as air pollution and recreation; parking facilities; dual-mode buses; side-walks; energy crisis; and regulations, both Federal and local. Crime and hazardous locations, traffic signals, moving sidewalks and personal rapid transit are also discussed, as is the use of time lapse photography for data collection. School child traffic safety and urban play areas are considered, as are benefit cost analyses of bikeways and bikeway and pedestrian facilities.

31 083037 TROUBLE IN MASS TRANSIT: WHY CAN'T THE PEOPLE WHO PUT A MAN ON THE MOON GET YOU DOWN-TOWN? While the primary subject of this article is the Bay Area Rapid Transit and its technological and political problems, other problems associated with advanced transit technology are also illustrated with the experiences of the Pittsburgh Skybus project and the Personal Rapid Transit

installed at Morgantown, W.V. The report cites the success of more conventional rapid transit systems--Toronto Transit and the Lindenwold Line out of Philadelphia. The article concludes that BART experience does not argue against fixed-guideway transit and does not doom new transit technology. It does, however, list some recommendations to avoid future problems of this type.

Consumer Reports Mar. 1975, pp 190-195, 2 Phot. ORDER FROM: XUM, Repr. PC

31 083063 THE ROTTERDAM METRO. In six years' operation, the Rotterdam Metro has fulfilled the expectations placed on it and assumed an importance in that urban area inversely proportional to its relatively short length. The original section has had a major role in alleviating traffic congestion on the two highway crossings of the Maas River and is being extended. Plans are progressing for a second rapid transit line across the city in another direction. Municipal authorities have consistently followed the master plan, implementing segments on schedule and within the cost limits established for each. This article describes the planning, construction and operation of the Netherland's first rapid transit line.

Union Internationale des Transports Publics, Revue Vol. 23 No. 4, 1974, pp 264-271 ORDER FROM: Union Internationale des Transports Publics, Avenue de l'Uruguay 19, B-1050 Brussels, Belgium Repr. PC

31 084377 COMMUTER DEMAND FOR BICYCLE TRANSPORTATION IN THE UNITED STATES. The demand for bicycle transportation is analyzed, and the observation is made that bike-routes must be planned and constructed as part of an overall transportation system so that the total cost of cycling is less than that of driving for the majority of commuters. The cost of owning and using a vehicle and costs of commuting by car or bicycle are examined, and simulated models are used to predict the demand for bicycle transportation. The use of bicycle facilities is discussed, and public policy in this area is examined. Guidelines to be observed in the planning of bike-routes (which will stimulate heavy bicycle usage) are listed.

Everett, M (University of Southern Mississippi) *Traffic Quarterly* Vol. 28 No. 4, Oct. 1974, pp 585-601, 2 Fig., 5 Tab., 24 Ref.

31 084778 THE RELATIVE EFFICIENCY OF ROAD AND RAIL BASED MOVEMENT SYSTEMS. The problem of the private car is discussed, and the return to public transport by bus and rail is reviewed. The costs of these services is examined, and it is observed that the carriage of urban commuters for which railways were considered the ideal, is perhaps economically the role for which they are least suited. The cost advantage of buses are set forth. Priority for buses is considered, as well as the potential benefits from a change from rail to bus in Great Britain.

31 090320 TERMINAL AREA FORECAST, 1976-1986. This document presents forecasts of key aviation activity measures for fiscal years 1976, 1977, 1978, 1981, and 1986 for 808 airports, RAPCON's, and RATCC's. The forecasts are prepared to meet the needs of planning personnel concerned with future traffic levels at these facilities. The airports selected for inclusion in this publication met at least one of the following criteria: Existing tower, candidate for a tower, currently receiving or forecast to receive certificated route air carrier or air taxi service, and any general aviation airport which will exceed 60,000 itinerant and/or 100,000 total operations annually by 1977. The report is organized by FAA region and within each region by state.

Federal Aviation Administration Sept. 1974, 296p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; AD/A-006504/5ST

31 090463 PUBLIC TRANSPORTATION FOR FLORIDA'S GOLD COAST. DADE, BROWARD, PALM BEACH, TRI-COUNTY, FLORIDA. The report is the culmination of a 4 year transit planning effort in which the entire Florida Gold Coast was viewed from a comprehensive regional perspective. In a series of 22 technical reports (described in the Appendix) the need, feasibility and detailed description of the following Florida Gold Coast transit improvements were documented. The regional perspective enabled the location of rapid transit to accommodate heavy travel demand across the Dade-Broward line. South Palm Beach/North Broward Co. local travel market was considered for dial-a-ride service. Transit from Palm Beach Co. to Broward and Dade is recommended by interfacing express buses with regional rapid transit.

31 091166 A SIMULATION MODEL OF MULTIDIRECTIONAL PEDESTRIAN MOVEMENT WITHIN PHYSICALLY BOUNDED ENVIRONMENTS. In the design of built environments, such as transportation facilities, theaters and shopping malls, little information about pedestrian traffic is available. Although some theories have been developed for certain types of pedestrian movement, they do not include the most frequent form, namely multidirectional or free flow. A major restriction on such models is the fact that they deal only with aggregate flows and thus do not allow comprehensive investigation of environmental influences on movement characteristics. The model presented here is a research tool rather than an application program. It reproduces individual pedestrian navigation, both with respect to the

built and the behavioral environment. It is written as a batch program in SIMULA and is currently being implemented on the UNIVAC 1108 system at Carnegie-Mellon University. In its final form it will provide methods for analysis and prediction of actual moving behavior in an existing or planned environment.

31 091411 VARIABLE CYCLE SIGNAL TIMING PROGRAM. VOLUME 2. PHASE I. OPTIMIZATION OF TRAFFIC SIGNALS IN NETWORKS BY MIXED INTEGER LINEAR PROGRAMMING. The objective of the effort was to develop advanced, 'Third Generation' Traffic Control Policies as part of the Urban Traffic Control Systems (UTCS) Project. These policies are designed to be implemented on a system of urban streets by a digital computer, in real-time. Volume 2 presents two mixed-integer linear programming formulations developed to optimize cycle-based traffic signal timing patterns to service the moderate flow-regime. The more appealing formulation addresses the coupling of all control variables: split offset and cycle length.

31 091480 URBAN TRAFFIC CONTROL SYSTEM AND BUS PRIORITY SYSTEM (UTCS/BPS): TRAFFIC ADAPTIVE NETWORK SIGNAL TIMING PROGRAM (TANSTP). SOFTWARE DESCRIPTION. The document describes the Traffic Adaptive Network Signal Timing Program (TANSTP) of the Urban Traffic Control System/Bus Priority System. The TANSTP software package uses the executive structure, the surveillance data, and the command software of the first generation package, which was installed in the original UTCS System. (The first generation uses a pre-stored timing pattern). TANSTP is a second generation on-line optimization of signal timing patterns using real-time predictions of volume patterns and on-line subnetwork determination. This document contains an overview of the entire UTCS/-TANSTP software system; provides a description of the software routines; includes a description of the subroutines which were constructed to interface the second generation software with the first generation data base; gives a description of the modifications made to the first generation routines to support the second generation package; discusses the procedures to be used in operating the UTCS/TANSTP System; and describes the data base. The Appendix contains a description of two off-line programs used to support the prediction.

31 091885 TELECOMMUNICATIONS-TRANSPORTATION TRADEOFFS. The report evaluates the implications of potential communications and computer technology alternatives to urban transportation, particularly the commute to work. Three criteria for successful telecommunications alternatives to transportation were used to evaluate the feasibility of 'telecommuting' in various situations. These criteria are: (1) economic benefits, (2) adequate technological base, (3) semantic and psychological effectiveness. Emphasis was placed on the utility of telecommuting in the information industry. The study concluded that existing and near term technologies provide a suitable economic basis for allowing organizations to decentralize using telecommuting. Potential impacts on energy consumption, transportation and urban development are discussed.

31 092106 MASS TRANSIT DEVELOPMENT FOR SMALL URBAN AREAS: A CASE STUDY, TOMPKINS COUNTY, NEW YORK. REPORT ON FIRST YEAR. The report presents transportation planning methodology for small urban areas, and establishes a complete inventory of data on travel patterns and preferences on transportation services and facilities, on land-use, employment and socio-economic characteristics of the population of Tompkins County, New York. The conduct and the results of an extensive household travel and origin-destination survey are reported. Mass transit developments for small urban and rural areas, such as Tompkins County, are outlined in terms of the specifications of objectives for a county-wide system. An example of service area expansion for public transportation is presented.

Meyburg, AH Stopher, PR Ryan, JM Coulter, JW ; Cornell University, Department of Transportation Final Rpt. DOT/TST-75/48, Oct. 1974, 251 pp; Contract DOT-OS-40003; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-242989/2ST

31 092175 AIRPORT SURFACE TRAFFIC CONTROL SYSTEMS DEVELOPMENT ANALYSIS -EXPANDED. A previous MITRE Technical Report, Airport Surface Traffic Control Systems Deployment Analysis, FAA-RD-74-6, presented an analysis of ASTC (Airport Surface Traffic Control) system requirements and developed estimates of the deployment potential of proposed ASTC system alternatives for 19 air carrier airports. The primary requirement was determined to be improved surveillance which resulted in an estimated deployment of one of two surveillance systems at 16 airports by 1980. This report presents an expansion of that deployment analysis to include a total of 39 air carrier airports. The methods and assumptions for the deployment analysis of the 20 airports presented in this report are essentially the same as in the initial report. The overall result of the analysis is that by the initial deployment date (1976-1980) of the two alternative surveillance systems, the total potential market will be for 20-25 systems. By the end of the century, the total potential market for ASTC surveillance systems will exceed 30.

31 092399 URBAN CORRIDOR DEMONSTRATION PROGRAM MANHATTAN CBD-NORTH JERSEY CORRIDOR. JOINT USE PARK-AND-RIDE. The report summarizes the work performed for one of the five projects conducted in the Manhattan CBD-North Jersey Corridor under the Urban Corridor Demonstration Program. Information is given concerning the methods used to attempt a successful demonstration of the concept of using parking lots used for other activities as park-and-ride sites. Types of facilities investigated include shopping centers, drive-in theatres, and factories. Requirements for joint use park-and-ride facilities were determined and are presented.

New Jersey Department of Transportation, Federal Highway Administration, New Jersey Turnpike Authority, Port Authority of New York and New Jersey, Tri-State Regional Planning Commission Final Rpt. Feb. 1975, 37 pp; Also pub. as Tri-State Regional Planning Commission, New York. Rept. no. TS-7910.; Contract DOT-FH-11-7778; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-244475/0ST

31 093073 BICYCLE TRANSPORTATION. Some of the findings of the study are the following. America is experiencing an unprecedented boom in bicycle sales and uses. Although there are advantages to bicycling, major deterrents are high accident rates, bicycle theft, exposure to automotive air pollutants, insufficient support

facilities (i.e., lack of bikeways, secure parking facilities, showers at places of work), and bad weather conditions. The above problems could be greatly reduced through better support facilities, both segregated bikeways and secure parking arrangements. The Federal Government is beginning to recognize bicycles as a viable form of transportation. DOT has allowed states to fund bikeways along federally funded roads with money from the highway trust funds. Other significant Federal agency activities are also underway. Europe is currently experiencing a resurgence in bicycle use after a marked decline during the postwar years. Environmental concerns, urban congestion, and high fuel costs are contributing to the new bicycle boom. European countries—particularly Sweden, Denmark, Germany, and Holland—are actively promoting bicycle transportation by establishing separate rights-of-way, bicycle traffic lights, and pedestrian malls. Cyclists in Japan and China also enjoy nice facilities for bicycle transportation.

31 093414 AVIATION FORECASTS. FISCAL YEARS 1976-1987. This report contains the latest Federal Aviation Administration forecast of measures of workload and activity at towered airports, air route traffic control centers, and flight service stations for Fiscal Years 1976 to 1987. The forecasts were made for the four major users of the system; air carriers, air taxi, general aviation and the military. The report has been prepared to meet the budget and planning needs of the various offices and services of FAA for data concerning future trends in aviation activity. This report reflects the impact on aviation activity of a more rapid rate of price increase, especially for fuel, and a slower rate of real income growth than had been assumed in previous forecasts.

Federal Aviation Administration, Federal Highway Administration FAA-AVP-75-7, Sept. 1975, 76 pp, 10 Fig., 21 Tab., 2 App.; See also report dated Sep 74, AD-A002 618.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; AD-A017095/1ST

31 093620 I-35W URBAN CORRIDOR DEMONSTRATION PROJECT. The purpose of the I-35W Urban Corridor Demonstration Project is to implement and evaluate the Bus-on-Metered

Freeway System. The system includes the following elements: Metering of an urban radial freeway; a real-time surveillance, command and control system; extensive express bus service in the corridor; priority access to the freeway via express bus ramps; and provision of transit passenger amenities, i.e., bus shelters, signs, and park-and-ride facilities. The complete system, located in the Minneapolis-St. Paul area, became operational in April 1974. Goals of the Urban Corridor Demonstration Program include: demonstrating the impact of a coordinated use of FHWA and UMTA programs in alleviating peak hour congestion in heavily used traffic corridors; improving the efficiency of existing transportation facilities in terms of people moving capability; encouragement of urban areas to coordinate planning of highway and transit improvements to obtain maximum impact; and improvement of peak hour traffic flow in the project cities and documentation of results for national application.

Metropolitan Council of Twin Cities, Urban Mass Transportation Administration, Bather-Ringrose-Wolsfeld, Incorporated Final Rpt. UMTA-DC-06-0062-75-1, Aug. 1975, 445 pp; Prepared by Bather-Ringrose-Wolsfeld, Inc., Edina, Minn.; Contract DOT-FH-11-7953; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-247663/8ST

31 093628 OVERVIEW OF EXPERIMENTAL BUS PRIORITY SYSTEMS. The bus priority strategies tested in eight different cities (Washington, D. C.; Leicester, England; Derby, England; Kent, Ohio; Louisville, Kentucky; Miami, Florida; Bern, Switzerland; Alkmaar, Netherlands) used a variety of signal control techniques to award priority to buses at traffic control intersections. The report results range from seven seconds reduction in average bus delay at one intersection in Leicester, to 24 seconds reduction at an intersection in Bern. More importantly, the range of travel time through an intersection in Derby was reduced by more than one half. Such reduction in range of travel time has a significant impact on reducing run time variation along a bus route. In Washington, 34 intersections were equipped with bus detectors which fed bus arrival information to the central Urban Traffic Control System/Bus Priority System computers. The U.S. and European approaches to BPS demonstrations differ. U.S. demonstrations range in size from three to 34 intersections and emphasize hardware and software development. In contrast, demonstrations outside of the U.S. typically include one intersection and stress studies of how the mean travel time and the range of travel time through the intersection have improved with priority as compared to buses operating without priority.

Lovett, CD ; Mitre Corporation, Urban Mass Transportation Administration, (UMTA-VA-06-0027) Final Rpt. MTR-6873-Rev-1, UMTA-VA-06-0027-75-1, Mar. 1975, 69 pp; Contract DOT-UT-0027; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-247742/0ST

31 093633 SIMPLIFIED ESTIMATORS FOR BENEFIT ASSESSMENT OF BUS PRIORITY SYSTEMS. Simulation studies indicate that a Bus Priority System (BPS) that guarantees a green traffic signal to buses approaching an instrumented intersection provides substantial

benefits to buses with little detriment to other traffic. Simplified estimators that correlate well with many aspects of the simulation results provide a better understanding of the BPS process and a means of analyzing the effects of BPS in applications other than that simulated. A bus travel time estimator predicts values within 10 percent for local buses, although the accuracy is less for buses with less frequent stops. An intersection capacity estimator reflects how certain conditions lead to greatly increased travel times for other vehicles in the simulation network and how far-side bus stops are superior to near-side bus stops at short bus headways.

Ludwick, JSJ ; Urban Mass Transportation Administration, Administration, Washington, D.C., (UMTA-VA-06-0026) MTR-7041, UMTA-VA-06-0026-75-2, Aug. 1975, 48 pp; Contract DOT-UT-50016; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-247795/8ST

31 093938 UNCONDITIONALLY PREEMPTIVE BUS PRIORITY SYSTEM: SUMMARY OF SIMULATION RESULTS. A large number of simulation runs of an urban network traffic model have been used to evaluate a Bus Priority System (BPS) algorithm that automatically grants a green signal to buses as they approach an intersection. BPS was found to provide substantial travel time improvements (20 to 30 percent) to buses in local service (frequent stops) at all headways, to buses in limited service (infrequent bus stops), and to express service (no bus stops) at headways of one minute and less. The disrupting effect of BPS on cross-street traffic is much less when far-side bus stops instead of near-side bus stops are used. The use of BPS also reduced the delaying effect of buses on other bus-street traffic. For all conditions tested, total passenger travel time per hour of system operation improved when BPS was used.

31 094014 URBAN TRANSPORTATION INFORMATION HANDBOOK. This handbook is intended to provide a ready reference tool which offers an initial orientation to the sources of information in the field of urban transportation. It concentrates on sources of information rather than a listing of published research. These sources include: (1) Basic books and reports; (2) bibliography, directories and services; (3) statistics and fact books; (4) periodicals; (5) research organizations, university programs and transportation libraries; (6) industry and professional organizations; (7) conferences; and (8) the government role, a section which contains an overview of the structure and organization of the U.S. Department of Transportation as well as a review of key legislation and legislative processes that operate to develop national transportation policy. A glossary of acronyms is provided.

31 094161 ENGINEERING INVESTIGATION OF MARINE ALTERNATIVES FOR RAPID TRANSIT IN OAHU, HAWAII [Technical rept]. The report covers the preliminary study of the Marine alternative to the land-based rapid transit system for the city and county of Honolulu to be operational by 1979. The objective of this study is to determine, particularly from engineering viewpoints, the feasibility of the inland waterways system which will convert the existing canals and drainage streams into navigable channels. Major efforts under this study include study of: The hydrological and oceanographic constraints; dredging requirements; canal feeder boat requirements; and preliminary cost data involving initial construction, operation, and maintenance of the waterway potential of four selected drainageways on Oahu--Ala Wai Canal and Manoa-Palolo Stream, Nuuanu Stream, Kapalama Drainage Channel, and Kalihi Stream. These waterways will be related to four local route systems, namely Hawaii Kai, Kahala, Ala Wai, and Moanalua-Kapalama-Nuuanu. It was concluded that the construction, operation, and maintenance of the four selected waterways seem to be technically feasible; but their economic feasibility cannot be determined until the entire Oceanic Express System is thoroughly analyzed.

31 094293 SHIRLEY HIGHWAY BUS-ON-FREEWAY PROJECT EVALUATION STUDY. The Shirley Highway Bus-on-Freeway Demonstration Project seeks to ease traffic congestion and shorten travel times for bus and auto travelers commuting during rush hour periods via the Shirley Highway Corridor from Northern Virginia suburbs to employment centers in Washington, D. C. This and other project goals, which include reducing vehicle-caused air pollution and improving bus service, can be attained by effecting an auto-to-bus modal shift by persons commuting via the Corridor area. Three project elements--(1) an exclusive bus lane on the Shirley Highway and bus priority lanes within the District of Columbia; (2) improved bus service including new-look/new-feature buses; and (3)

park-and-ride facilities will, according to the premise under which the project was conceived, effect this modal shift and achieve a substantially increased bus market share. The Technical Analysis Division, National Bureau of Standards, is evaluating project performance with emphasis on the effectiveness of the three project elements. This paper describes evaluation procedures used during the first year and identifies difficulties encountered with various monitoring procedures, as well as presenting preliminary conclusions and plans for future activities.

31 095042 TECHNICAL REPORT FOR COTA TRANSIT DEVELOPMENT PROGRAM. The purpose of the study of which this report is part is to evaluate and to set before the Central Ohio Transit Authority all meaningful short-term (five year) options to be used in its transit development program. While the primary purpose of this report is to recommend new transit service, it considers the many related services that are essential in achieving quality service and in developing strong consumer response. The first three chapters present a background on the existing service with a summary of recommendations. The present Columbus Transit Company routes are thoroughly evaluated with a revenue/cost analysis as a basis for suggesting adjustments to existing lines. Chapter four discusses new bus service in which twenty-nine new routes and extensions are studied and set according to priority. Chapter five points out ways to achieve faster transit service on existing streets and freeways and recommends a new concept--the reverse direction freeway bus lane. Chapter six reviews existing neighborhood service provided in the Model Cities area and in other areas by crosstown routes. COTA's relationship to the other two local private carriers is discussed in Chapter seven. Chapter eight outlines capital equipment needs including bus stop shelters, a radio system, information system and a centralized maintenance facility. Chapter nine recommends an evaluation to rapid transit beginning with fringe parking, through acquisition of space along rail right-of-way for busways, culminating in the development of a separate right-of-way new technology system. There is much documentation in the form of tables, maps of the system, and a bibliography.

Mid-Ohio Regional Planning Commission Intrm Rpt. Feb. 1973, 95 pp; Prepared for the Central Ohio Transit Authority; Contract OH-09-0011; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche

31 095381 RAILWAY SERVICES COVERING THE NEW TOWN OF EVRY [Desserte ferroviaire de la ville nouvelle d'Evry]. This detailed memorandum explains the stage reached in the infrastructure work for construction of the line from Grigny to Corbeil via Evry. Electrified with 1500 V direct current, this 10.7 km line, which is a diversion from the main Paris-Corbeil route, is designed to serve 14 localities through 4 stations.

The report includes numerous statistical data on the geological studies covering the site, the constraints imposed by urbanization of the region served and various details relating to the civil engineering work and the buildings intended for passengers and operation of the line. [French]

31 096322 TEMPORARY CAR POOL LANE IN THE EL MONTE BUSWAY. Transportation planners had a unique opportunity to study the operation of a car pool lane during the recent bus strike in Los Angeles. Drivers and mechanics for the Southern California Rapid Transit District (SCRTD) went off the job on August 12, 1974 in a strike that lasted ten weeks. The impact of the strike on the travelling public was most pronounced on the San Bernardino Freeway, where the added numbers of automobiles, primarily from passengers of the El Monte Busway, resulted in additional travel delays of 10 to 15 minutes. To relieve congestion, the Busway lanes were opened for carpools of three or more persons beginning with the second week of the strike. Some of the important observations and conclusions from the study of the car pool lane follow: the bus strike caused 10 to 15 minutes additional delay in the morning (Westbound) and 5 minutes in the evening (Eastbound); carpools of 3 or more persons were allowed to use the Busway lanes if they obtained and displayed a permit-1,620 permits were issued; opening of the busway lanes to car pools caused an improvement of about 6 minutes travel time on the regular freeway lanes in the morning, but none in the afternoon; with the heavier traffic in Autumn, car pools using the special lane were able to save up to 20-30 minutes one-way; a level of usage of 700 car pools (about 2,300 persons) per peak period was attained; an average of 33 or 5.7% of those using the lane were violators; less than one-fourth of bus commuters regularly used the exclusive lanes during the strike and almost one-half drove alone; at the time of the survey almost one-half of the car pool lane users had been in car pools before the strike; busway signing and striping was adequate for its safe and efficient operation; only one accident was recorded by the California Highway patrol on the exclusive lanes during peak period operation.

31 096717 PASSENGER TRANSPORT INTERCHANGES ON MERSEYSIDE: RESULTS AND CONCLUSIONS. The article discusses the results of a package of car/rail and bus/rail experiments carried out on Merseyside, levels of patronage, modal changes and financial results are shown and the role which such facilities can play in the overall transport system is described. Resulting recommendations are discussed and their overall impact is estimated. Finally, recommended plans for future studies and implementation on Merseyside are described. /Author/TRRL/

31 096725 TRAFFIC PROBLEMS IN A LARGE CITY [Problemi di una Grande Citta. La Circolazione Veicolare]. This article discusses the pedestrian precinct of Milan's city centre. It is pointed out that whilst the experiment has appreciably reduced traffic congestion in the area, it does not by any means solve the traffic problems of the city as a whole. Milan's population has doubled since 1925 and the built up area has exceeded the city boundaries. In social and community costs, traffic congestion accounted for 160 billion lira in 1970. The author suggests that the solution to the traffic problem would be a financial plan for the whole urban area, to finance the construction of roads, over-and under-passes, and underground railways. /TRRL/ [Italian]

31 096745 THE ECONOMIC, FUNCTIONAL AND TECHNICAL DEMARCATION OF THE RAILWAY, ITS LINK WITH OTHER TRANSPORT SYSTEMS, AND THE CO-OPERATION BETWEEN INDIVIDUAL TRANSPORT UNDERTAKINGS IN CITY REGIONS. The author begins by sketching the growth of large conurbations in West Germany and links this to the development of the transport infrastructure. Future increases in car ownership and trip-making will, it is postulated, lead to considerable increases in congestion which can only be avoided by greater usage of public transport. This requires improvements in comfort, speed, convenience and cost, if people are to be attracted. The desirable qualities of such a system must include low headway involving few interchanges, with high capacity, flexibility for fluctuating demand, low environmental impact and high degrees of automation and safety. Different modes are compared for their capacity and roles in urban travel, particular attention being paid to the S-Bahn, which is for short distance rail travel. Transport communities have been established in Munich and Hamburg to provide comprehensive planning and co-ordinated routes and decide on fares policy and revenue distribution. Revenue from the joint tariff is distributed to the different operating companies according to operating cost, but with an allowance for performance. Deficits are covered at the Federal, regional and local level. /TRRL/

31 097202 FINANCIAL PLANNING FOR THE CONSTRUCTION OF A REGIONAL AIRPORT. This paper describes a key implementation tool for financial planning applied to a major expansion of the metropolitan airport system in Louisville, Kentucky. The tool is a financial model including detailed forecasts and regional and national economic assumptions. The methodology developed airport facility requirements, implementation phasing, activity forecasts, and facility requirements in response to the defined need. A cash flow model was developed, and consideration was given to land acquisition, relocation, a passenger terminal, parking facility, runway and taxiway construction, and other project development costs. A technique for scheduling capital costs consistent with annual

assessment of demand was developed. Revenues and costs anticipated for airport operation were defined, and the contributions to project revenues of the Federal Aviation Administration through the Airport Development Aid Program and the Federal Highway Administration were analyzed and projected. The model places major emphasis on inputs, outputs, and mathematical logic. Pessimistic, likely, and optimistic ranges of parametric values input to the cash flow model were used to treat conditions of uncertainty. The final results of the fiscal planning exercise became an input to the site selection process.

31 097471 INTEGRATION OF TRANSIT SYSTEMS. SUMMARY. This summary volume contains conclusions reached in the three main volumes of the report, "Intergration of Transit Systems." The objective of the report is to assess the potential for interagency and intermodal intergration of transit systems in U.S. urban areas, drawing on an analysis of the successful experience of European transit systems. Vol. I documents the need for transit intergration in U.S. urban areas, presents the conceptual and evaluative framework, and reviews current transit intergration efforts by Federal, State, and local governments. Vol. II describes in detail four major European transit systems (London, Hamburg, Paris, Munich); gives brief descriptions of six others; and summarizes and appraises the applicability to U.S. systems of European successes. Vol. III deals with the application of these techniques to Philadelphia, San Francisco and Seattle, to an archetypal smaller urban area, and makes a brief assessment of the potential for application in six other U.S. cities. This summary volume serves as a guide to the location of detailed factual information upon which conclusions presented here are based, as well as a summary of the study's findings. An outline of the study and the steps in its execution are presented. The salient points of each volume are brought together, including definition of the forms which intergration may take, evaluation of U.S. deficiencies, an approach to identifying systems ready for intergration and estimates of costs of U.S. expansion and improvement.

31 097472 INTEGRATION OF TRANSIT SYSTEMS. VOLUME III-TRANSIT INTEGRATION IN THE U.S. URBAN AREAS. This is the third of a three volume report designed to assess the potential for interagency and intermodal integration of transit systems in U.S. urban areas, drawing on an analysis of the successful experience of European systems. This volume deals with the application of techniques which have contributed to the success of European systems to three major U.S. cities: Philadelphia,

San Francisco, and Seattle. This application of techniques was also tested in an archetypal smaller urban area, "Middletown." The procedure is described by which a selection was made of representative areas for investigation from the 243 SMSA'S in the U.S. Also described is a preliminary investigation of 30 major metropolitan areas and the further investigation of 17 others by means of literature searches, questionnaires, wish lists, and field investigations. The report then reviews the final selection of three areas where different European approaches to intergration could be applied. The report contains a number of profiles and includes an assessment of the transit intergration potential in Baltimore, Cleveland, Los Angeles, Miami, New Orleans, and San Diego. Suggested programs for transit intergration are presented for the three major U.S. cities and "Middletown." Discussions present descriptions of area characteristics, existing public transit services, Local transportation planning and efforts at transit intergration, and a program outline to integrate the metropolitan area public transit services. Appendices are included.

31 097484 BUS ONLY STREETS IN CENTRAL TOWN AREAS [Bussgator i Centrala Stadsomraaden]. The study is intended to examine the effects of the introduction of bus only streets on different groups of the population and is being carried out through a survey of reports and other material from municipal authorities etc, and by means of specific studies, in eight Swedish towns. Several of the streets being examined are transfer points for bus routes in the town centres and have heavy bus traffic. Other motor traffic has been reduced by 70-90% in the bus only streets. Ease of thoroughfare has increased for buses but not changed appreciably for other motor vehicles. The number of accidents has been reduced by 20-40%. Traffic noise has been reduced. Air pollution has not changed consistently; in one case only has a reduction in carbon monoxide been noticed. In all other cases no significant changes have appeared for carbon monoxide, sulphur dioxide and soot content. Retail trade seems to have declined somewhat in towns where comparatively great changes in traffic regulations have appeared. An attitude survey shows that the majority of those interviewed are in favour of bus only streets. /TRRL/ [Swedish]

31 097876 ROLE OF PSYCHOLOGICAL NEEDS IN MASS TRANSIT. This paper discusses the need for the use of psychological considerations in the planning of mass transit. The authors develop a set of basic psychological human needs and discuss how they might be applied to improve the image and quality of mass transit. These needs are also used to evaluate present-day bus operations as well as two modes

of personal rapid transit vehicles. A section is also devoted to discussing how such a psychologically-oriented approach might influence transit marketing in order to achieve maximum effectiveness. (Author)

31 098117 AREA TRAFFIC CONTROL IN LEICESTERSHIRE. This article describes the wide area traffic control system which has been installed in Leicester to control the complete city's traffic flow from one central office. The objects of the system are to minimize journey time by co-ordinating traffic signals (but still allowing for alternative plans favouring public transport or special vehicles) and the provision of a continuous and automatic signal fault monitoring system. An outline of the method of operation is given which uses a Honeywell computer and the Transyt program. Automatically selected plans (each junction can have as many as 20) will cater for the majority of traffic patterns, but the operator can over-ride the automatic system if necessary or can alter the timings at junctions. Special detector units are used to monitor traffic supplemented by 12 closed circuit television systems. The article includes a summary of contract details (the overall cost was 524,000 pounds) & future developments are discussed. /TRRL/

31 098480 THE ROLE OF REGIONAL TRANSPORT TODAY AND IN THE FUTURE. Regional transport is defined (as all transport which does not form part of the major urban transport system of intermeshing areas or of long-distance transport) and categorized into public road and rail passenger transport, and rail freight services. The development of these undertakings is considered in some detail, and the role of regional transport and its ability to fulfill it is examined. The traffic in each of the above areas of regional transport is reviewed. Employment figures are examined, and operating ratios are considered. The question is discussed whether transport undertakings are in a financial position to meet requirements imposed on them. The results of a questionnaire survey on this subject are analyzed. Reasons for the unsatisfactory financial situation of regional transport are listed and discussed, and the present and future tasks of regional transport are outlined. Measures to improve regional transport (collaboration with public authorities; horizontal cooperation, complementary cooperation and vertical cooperation; and internal measures by regional transport) are detailed. Regional transport policies and the basis for a positive future for regional transport are also discussed.

31 098668 BUS USE OF HIGHWAYS: PLANNING AND DESIGN GUIDELINES. Over 200 bus priority treatments in the U.S. and abroad

were reviewed in the preparation of these guidelines for efficient bus utilization of urban highway facilities. This report which complements an intensive report on the state of the art of bus use of highways, presents the principal findings of 10 study tasks and contains significant bus design parameters, concept and criteria, planning and design guidelines for principal bus priority measures, and measures of effectiveness associated with bus highway facilities. The dimensions of bus use are reviewed, the types of priority treatments are categorized (relating to freeways, arterials and terminals), characteristics of successful treatments are described, and the policy perspective is discussed. The selection and application of appropriate types of treatment of specific urban situations calls for realistic assessment of demands, costs and impact. Factors implicit in the selection process are listed. Factors which contribute to achieving bus priority objectives are discussed, and the general sequence of bus priority treatments are set forth. The principals in formulating warrants and the measurement of effectiveness and impacts are discussed. Freeway, arterial, and terminal planning guidelines are detailed. The overall research program of this study included 10 basic studies segregated into four principal phases: orientation; review analysis of current treatments, experiments, and proposals; concept and guideline formulation; and final report preparation. This report recognizes that bus priority facilities become important when (1) economic or environmental conditions make it infeasible to provide additional highway capacity, and (2) there is an expressed desire to encourage public transport use.

31 099151 THE BRADFORD BUS STUDY. 1. PROPOSALS AND PROGRESS. Arising from the decision many years ago to build a transport interchange in Bradford, the Bradford bus study has been designed to fulfil a much wider need. The purpose of this article is to outline the basic form of the study and the progress up to the middle of 1974. A discussion of the background to the study design is given. From the outset it was considered that the planning of public transport should not be based solely upon the assumption of restraints on the use of cars. The study is being carried out

in four parts; bus role study; bus costing study; bus routing study; and bus promotion study. The inter-relationship between these studies is shown and a description of their objectives and progress is given. By this detailed examination of the many facets of bus operations, costs and use, the study is expected to produce results useful not only to Bradford, but also to West Yorkshire and the nation. /TRRL/

31 099697 SIMULATION OF A METROPOLITAN BUS SYSTEM. This paper discusses the use of a GPSS/360 simulation model to analyze the bus service of the metropolitan bus system in Madras, India. The system has been unable to obtain enough buses to keep pace with demand and has waged a constant battle to keep its existing buses rolling. The factors contributing to the system's major operational problems have been identified and incorporated in the model. A comparison of the model's output with historical data shows that it is suitable for analyzing

operational problems, and it is expected to be useful for tactical planning and for improving future operations. /Author/

31 099720 BUS DEMONSTRATION PROJECT. SUMMARY REPORT NO. 6 FORMBY, BUS FEEDER SERVICE TO THE LOCAL RAILWAY STATION. This report describes a bus feeder service introduced at Formby in November 1970, to provide commuters with a bus service to the local railway station. The service initially connected with four morning trains to Liverpool and four returning trains in the evening and was designed to minimise, within reason, the interchange times between the bus and train. The purpose of the scheme was to test, firstly, the willingness of the public to accept a bus-rail transfer during their journey and, secondly, the attractiveness of an integrated bus-rail mode to car commuters. It was also intended to measure the net costs and benefits that might accrue to the overall public transport system. The service, which was launched after market research surveys had estimated the potential demand, was monitored to determine patronage and the modes previously used by passengers. It has been evaluated in terms of the net gains and benefits to the public transport network; attitudes to the service were also studied. Detailed attention was given to marketing; many of the pricing and promotional strategies in particular have included innovative features. Passenger volumes have been increasing steadily since inauguration and the forecast demand was achieved in the second full year of operation. A sufficient number of car commuters have been attracted to the service for there to be a net financial gain, although the bus feeder revenue taken alone does not cover the operating costs. The scheme has indicated the value of market research, which forecast adequate demand in an estate which might have seemed too close to the station to justify such a service. Three more detailed reports under the series title 'The Formby Bus-Rail Demonstration Project' have been prepared by the school of business studies, Liverpool University and are available from the Transport and Road Research Laboratory. (a). For abstracts of the 3 reports in the series "the formby bus-rail demonstration project", see IRRD abstracts nos 58583, 210664, and 203548. /TRRL/

31 125102 GREATER LONDON TRANSPORTATION SURVEY (GLTS). A STUDY OF TAXI TRIPS. This memorandum reports on investigation into characteristics of taxi trips as part of GLTS. It details sources of data, method used to prepare data for analysis, validation against Thames screenline counts and expansion to 1972 traffic levels. It presents results of analysis of trips with origin to destination (o-d) matrices for taxi-cabs and passengers, with additional matrices for British Rail termini in the central area. It gives trip length distribution by time and distance, distribution of trips during the day, variations in passenger occupancy by time of day and length of trip, and the distribution of shift working hours. Results are compared with those

from lts in terms of total trips, distribution within the day and distribution between areas of London. /TRRL/

31 125220 KINGSWAY ISLAND PEDESTRIAN SUBWAYS. This article gives an outline of the design and construction of a subway system which has been constructed at the junction of the Kingsway with Princess Way and other streets. It consists of a sunken island linked with five radial subways and two perimeter subways, designed to provide for a flow of 3400 pedestrians per hour. The author gives a brief account of the main construction work. The first stage of this work, commenced in 1972, involved excavation of the outer grass verges, cutting of the existing concrete road and excavation of the radial subways and placing of 3.1m by 2.4m by 1.2m precast concrete subway units, each weighing 8 tons. The author follows this with an outline of the joining of the radial and peripheral subways, the excavation of the central island and the construction of the ramps and steps. He then gives an outline of the accommodation works and finishing. This involved lining the walls with tiles, the provision of adequate drainage and lighting, the provision of a wall to prevent exhaust gases entering the pedestrian area; the use of coloured paving slabs, trees, bushes and shingle to improve its appearance, and the provision of seats for weary pedestrians. The author reports that good use is being made of the subways, which were opened in 1973. /TRRL/

31 125629 STEVENAGE SUPERBUS EXPERIMENT. SUMMARY REPORT. A cost benefit study made in 1969 concluded that if a sufficient proportion of the working population of Stevenage who used cars for their work journey could be attracted to bus travel, then a community benefit would be gained by avoiding the need for increased road capacity at major intersections. An experiment was carried out in Stevenage to test the conclusions of the study by improvements in bus services and fare reductions, and in particular to investigate the possibility of attracting car users to improved public transport. This report is based primarily on results recorded between March 1971 and the end of July 1972. The experiment continues and notes on the service since July 1972 are appended. The phased changes made in the service between March 1971 and February 1972 and their effect upon patronage, are summarized. These changes included introduction of one-man operated single deck buses improvement in service frequency during both off-peak and peak periods, and further reductions in fares. Household interviews before and after the service changes showed that of the people working in areas directly served by superbus, 10% fewer were driving to work after the improvements. In other areas not served by superbus there was an increase in the number of people driving cars to work during the same period. The financial deficit on the services in the summer of 1972 was ,660 per week, which was approximately

30% of the running costs of the service (including an allocation for overheads). In summer 1973 the deficit was ,738. In monetary terms, the benefit to bus travellers due to reduced waiting time and increased travel is estimated at ,2,000 per week, assuming current department of the environment values. /TRRL/

31 125896 THE RAPID BUSWAY OR THE RAPID TRANSIT RAILROAD? The author counters the recent arguments favoring the busway as an economical alternative to full-scale rapid rail transit. It is argued that bus operation introduces high labor costs and a subway-type busway in a center city could actually cost more than a rail subway in the same site. The costs of the Lindenwold line are analyzed and a fully equivalent busway operation is estimated.

31 126059 MUCH WE CAN LEARN FROM U.S. ON TRANSPORTATION. The author describes one rail-based, and one bus rapid transit system, as seen on a visit to North America in 1974. He first outlines the scope of American transport problems, as seen by the Federal Secretary of Transportation. Poor coordination of transportation planning and management are blamed. Peak-hour capacity creates the greatest operational difficulties; fewer than 25% of seat-miles are used. Responsibility for administration is shared among federal, state, county, city and town councils, which are often at odds. Recent progress has been made, with the unified transportation assistance programme (\$19.3 billion). This is a six-year plan, coordinating highway and urban mass transit expenditure, under each state Governor's control. Progress on the 98-mile Washington Metro is described. It is proving more expensive than planned, but is proceeding on schedule. Automated service every 2 minutes, in peak hours, is planned. Generous park-and-ride provision is planned, but coordinated bus feeders should provide 2/3 of riders. The automated fare collection system, using magnetic cards, and the design of stations, vehicles, and a novel railbed, are described. Also discussed is the Shirley Highway metrobus service. This collects from Virginia suburbs, and runs on special way up the central reservation of a very congested dual carriageway, 19 miles into

Washington. Ridership has increased 450% since the first year of operation. The average passenger load is 50, and the service is generally very successful. /TRRL/

31 126061 A TYPOLOGICAL APPROACH TO INDIVIDUAL URBAN TRAVEL BEHAVIOR PREDICTION. With the use of cluster analysis a sample of 1018 residents of the San Francisco bay area was classified into eleven types of urban residents on the basis of overall similarity of personal and environmental characteristics, and independently into nine types of travel behavior. The relations between the two typologies, and the comparative travel behavior of the types of urban resident were investigated in an attempt to gain insight into the determinants of urban travel. The probability of the correct assignment of a travel behavior type to an urban resident type was of the order of 0.30. Monte Carlo simulation methods were used to test empirically whether the value of a given travel behavior characteristic for a given urban resident type can be assumed to be higher (or lower) than the value in the general population, thus testing the predictability of the travel behavior of the various urban resident types. Conversely, the prediction of the urban traveler's personal characteristics his travel behavior type was also evaluated. This typological approach made the prediction of the usage of the San Francisco Bay Area rapid transit system (for going to work, for going to shop, for going out for leisure, or for some other purpose) possible, in about 15% of the cases, from the knowledge of the urban resident type and, in about 25% of the cases, from the knowledge of the travel behavior type. /Author/TRRL/

31 126197 THE INFLUENCE OF SERVICE FREQUENCY ON TRAFFIC VOLUMES IN MASS TRANSIT [Turtaethetens Inverkan paa Trafikmaengden i Kollektiv Lokaltrafik]. This paper deals with the problems of separating the influence of frequency from a great number of other parameters which also affect traffic volume. The investigation area is close to the central business district of Stockholm with an underground line which had its time table intervals changed from 10 to 15 and from 15 to 7.5 minutes. This area is compared with similar areas served by other underground lines with no change in frequency. Similarity and constancy or co-variation of most parameters whose influence cannot be correctly compensated for or avoided by the layout of this investigation is checked for all areas. After 2 years there is an increase in traffic with at least 16% during 0900-1500 hours and at least 10% during late evening traffic. /TRRL/ [Swedish]

31 126479 WASHINGTON METRO ACCESS FACILITIES. The 98 mile (158 km) Metro system will have 82 stations. There will be an off-street bus terminal at 54 of the stations with an average of six modified saw-tooth off-street bus bays at each terminal. There will be 26,000 parking spaces located at 32 stations. Forty-six stations will have kiss and ride spaces. Each of the 1,650 flow-through kiss and ride spaces will be designed so that the auto will not have to back up while picking up or discharging a passenger. Sixty-six of the stations will have rental bicycle lockers and free chain-rack type facilities for locking the frame and wheels. Access to the Washington Metro rail system is the key to its success. Parking is an integral portion of the entire access design. /CE-ASCE/

31 126855 ARCO'S SEARCH FOR IDEAS ON PUBLIC TRANSPORTATION. An attempt is made to distill conclusions from over 30,000 responses (from 50 states and 21 foreign countries) to the Atlantic Richfield Company's public call for ideas on public transportation. The responses were categorized into 29 classes and tabulated according to ideas and cities (chosen to reflect a number of important dimensions such as age of city, existing facilities etc.). Fare structure attracted more attention in Chicago, New York and Philadelphia, and a significant number of letters discussed limitation of automobile traffic. The design of new systems, and transit union's role was more important in Los Angeles. The responses were again categorized in terms of basic approach to improve public transportation: quality of service, finance and organization, and technology. Comparison of the relative frequency of the 3 basic approaches indicates that a high degree of conflict will be generated by any proposed improvement. Few people understand the complexities and many "trafe-offs" that have to be made in planning public transportation. The study leads to the conclusion that the general public is relatively uninformed on many aspects of public transportation.

31 127381 1970 TRAVEL CHARACTERISTICS: TRIP LENGTH. This report is one of a series summarizing 1970 Travel Characteristics in the Chicago-Northwestern Indiana Region. One of the most important characteristics of urban travel is trip length. A knowledge of current trip lengths, as well as an understanding of how trip lengths may be altered by changing urban travel environment, are vital to the travel forecasting process. While most trips tend to be short, the longer ones have the greatest impact on transportation facilities. Trips over 5 miles in length constitute less than 30 percent of all trips but account for 75 percent of all passenger miles of travel.

31 127764 TRAFFIC IN GENERAL IMPROVEMENT AREAS. This document acts as a guide for local authorities in resolving conflicts of traffic and the environment in general improvement areas. It begins by discussing the general nature of G.I.A.'s and their relationship to the road hierarchy. Various surveys concerning noise, traffic and the street pattern are suggested to provide information for improving the area. A number of principles governing design are listed and these emphasize the need to share benefits across the area and to have self-regulating traffic controls. Design is examined under the headings of "roads on the perimeter of the G.I.A." and "local distributors" and the different problems of each situation are analysed in detail. Consideration is given to entry restrictions, speed control, bus operations, the maintenance of access for residents, parking, pedestrians, cyclists and goods vehicles. Short sections are added on the consultative processes, the sequence of the implementation of proposals and the methods used for monitoring results. Appendices on the road hierarchy and statutory powers are included along with an extensive bibliography. /TRRL/

31 127976 PROVISIONS FOR CYCLISTS AND MOPED-RIDERS [Voorzieningen voor Fietzers en Bromfietzers]. The traffic department of the Royal Dutch Touring Club has made an investigation into the presence and planning of provisions for bicycle and moped riders in Dutch municipalities. The results, published in this article, relate to 538 municipalities (the response was 81%) with a total of 10.7 million inhabitants. The results are given per group of municipalities, on the basis of a classification by population. It appears that there are hardly any regional differences. Adjacent side paths for cyclists and moped riders are often found, especially in larger municipalities, and are still being designed as a new provision; however separate paths are more popular in all groups of municipalities. This is obvious from the number of existing as well as from the number of planned provisions of this kind. Bike-ways are much in evidence, especially in larger

towns, and are planned in many towns (for the coming five years). Special routes are found in all municipalities. There is no special preference for a certain combination of cyclists, moped riders and/or pedestrians. Attention is paid to traffic control systems which can be actuated by cyclists and moped riders. Cycle parks at shopping centers and at train, underground and bus stations are available. At bus and mass transit stops the possibilities for parking a cycle or moped are very small. In 18% of the municipalities there is a scheme for cycle routes or cycle paths. /TRRL/ [Dutch]

Verkeerskunde Vol. 26 No. 6, June 1975, pp 289-295, 13 Tab., 11 Phot. ACKNOWLEDGMENT: Institute for Road Safety Research, TRRL (IRRD-214753)

31 128158 1974 UTRECHT TRAFFIC MANAGEMENT PLAN [Verkeerscirculatieplan Utrecht 1974]. The deficiencies in the quality of the traffic system can be accounted for by the existence of discrepancies between land use, road network, traffic control, traffic volume and composition and behaviour of traffic. This short-term plan is meant to remove these deficiencies by means of an evaluation of the current situation as regards traffic flow and safety as well as its "tolerability". Much value is attached to the maintenance of the general level of accessibility. The proposed measures relate mainly to bicycle traffic and public transport. /TRRL/ [Dutch]

Slop, M *Verkeerskunde* Vol. 26 No. 4, Apr. 1975, pp 162-169, 8 Fig., 1 Tab., 2 Ref.; ACKNOWLEDGMENT: Institute for Road Safety Research, TRRL (IRRD-213413)

31 128564 EXCLUSIVE BUS LANES FOR CLEANER AIR. Many benefits have been identified in planning for the exclusive bus lanes (EBL) and other transportation proposals for Seattle's central business district. The contraflow dual EBL will improve bus service, reduce pollution and save energy by swifter traffic flow in the high volume areas. Bus stops could be relocated so that buses could load simultaneously with the red signal. It is estimated that with the new contraflow EBL system, the average transit speeds of all buses in the CBD will increase from 4.48 to 10.40 mph in peak hours. Travel times will also improve. The average speed of with-flow buses would be improved by over 2 minutes. Dual contra flow lanes can have a capacity of 180 buses per hour. Acceptable levels of service, savings in time, added revenue due to increase in modal split for transit and reduction in personal travel cost are other benefits of the new EBL system.

Carr, DH (Seattle, City of, Washington) *Traffic Engineering* Vol. 45 No. 7, July 1975, pp 26-29, 5 Fig., 4 Tab.

31 128565 A PROGRAM FOR SAFE CYCLOMUTING. In an effort to cut pollution and to reduce parking requirements, the city of Seattle has started construction of about 20 miles of bikeways on existing roadway and has come up with some unique design features. A Demonstration Bikeway Program was initiated which tested nationally used and new techniques of bikeway design. A Bicycle Spot-Safety Improvement Program has also been initiated. The novel bikeway design features include the placement of the bikeway adjacent to the median; this placement

moved the point of conflict closer to the intersection where the motorists attention would normally be concentrated. Bikeway placement must minimize the impediment to left-turning motorists. Where the possibility of a designated bicycle lane is eliminated, signing is used to establish the bicycle as having preference to motor vehicles on the entire roadway. Strong yellow/green boundary line paint was chosen to draw the attention of motorists.

Theisen, RD (Seattle Engineering Department, Washington) *Traffic Engineering* Vol. 45 No. 7, July 1975, pp 30-31, Figs.

31 128702 TRAFFIC LANES RESERVED FOR BUSES [Vias exclusivas para buses]. A study is presented of the congestion in the centre of the town of Bogota and of the resulting number of accidents. The author suggests a system of traffic segregation as a solution to the problem. This could take the form of traffic lanes exclusively reserved for buses, or roads, avenues or motorways exclusively used by buses. The implementation of such systems would be justified, and examples are given of towns already successfully operating a traffic segregation system. /TRRL/ [Spanish]

31 129129 STATION PLANNING AND DESIGN: WHERE TO START. The paper discusses Chicago's approach to meeting the needs of consumers by expanding the rapid transit system wherever possible, and making it conveniently accessible to a greater number of riders without compromising its high average speed. This has been accomplished by changing or instituting bus routes to act as feeders to the rail lines from as many tributary areas as possible. There exists a need to improve the interface between the bus and rail modes and to bring them both up to the highest standards possible to encourage patronage. However, closely spaced stations provide a convenience for nearby users but reduce the speed of operation. Other considerations include the security of passengers and station employees, and the economics of station spacing. Criteria are included for station design and bus interchange facilities.

Misek, FJ ; American Society of Civil Engineers Proc Paper 1975, pp 150-162; Presented at the Transportation Facilities Workshop: Passenger, Freight and Parking, New York, N.Y., May 22-24, 1974.; ACKNOWLEDGMENT: EI; ORDER FROM: ASCE, Repr. PC

31 129130 SOME ASPECTS OF RAPID TRANSIT STATION DESIGN. The careful consideration of the various interfaces with other

modes of transportation in rapid transit station design, is an important aspect in increasing the attractiveness of public transit. Station stops increase the overall travel time and should occur only at points of significant passenger demand as indicated by the transit planning processes. Stations may also be used as a generative factor, located purposely to force development in specific areas as related to land use planning. The types of interfaces include pedestrian, surface public transit vehicles, private automobile, and bicycle. The complexity and layout of a rapid transit station and the nature and efficiency of its interfaces depends to a great extent on several nonengineering factors: the operating philosophy; the fare policy, and the location of the station.

Harvey, JT (Toronto Transportation Commission); American Society of Civil Engineers Proc Paper 1975, pp 100-118; Presented at the Transportation Facilities Workshop: Passenger, Freight and Parking, New York, N.Y., May 22-24, 1974.; ACKNOWLEDGMENT: EI; ORDER FROM: ASCE, Repr. PC

31 129132 TRANSIT STATION PLANNING AND DESIGN METHODOLOGY. Station facilities may range from various kinds of bus stops to bus stations, rail transit stations, complex interline transit terminals, and station complexes integrated in varying degrees with other developments and functions. The planning and design of transit stations is intimately linked in space with the planning and design of line-haul, storage-maintenance, and other fixed transit facilities, with the vehicles and trains providing the moving elements of the service, and with the neighborhoods in which such stations are located. In the scheduled sequence of transit system development, the planning and design of transit stations occupy a certain place, generally following on early or preliminary overall planning and before construction of designed facilities.

Quinby, HD (Parsons, Brinckerhoff, Quade and Douglas, Inc) ; American Society of Civil Engineers Proc Paper 1975, pp 77-90, 33 Ref.; Presented at the Transportation Facilities Workshop: Passenger, Freight and Parking, New York, N.Y., May 22-24, 1974.; ACKNOWLEDGMENT: EI; ORDER FROM: ASCE, Repr. PC

31 129160 UNDERGROUND IN LIVERPOOL. Liverpool has had an underground railway for almost 90 years, joining two densely-populated areas on either side of a wide estuary. The whole system is now being greatly expanded, and services linked, stations rebuilt, etc. to meet modern needs.

31 129269 CURRENT PROBLEMS IN SHORT-DISTANCE TRAFFIC [Aktuelle Fragen der Nahverkehrspolitik]. Short-distance transport modes have a limited ability to adapt to market fluctuations, there are fewer possibilities for increasing capacity and they must cooperate with other transport modes. One of the aims of the German Federal Republic's Ministry of Transport is to find new sources for financing projects by levying special taxes on regional or inter-community groups. To reach these aims, the

financial capacity of transport bodies should be combined, public transport should be given full support and priority and towns with a population of more than 1,000,000 should be encouraged to build underground transport systems. [German]

31 129343 REGIONAL PLAN OF PREFERENTIAL FACILITIES FOR HIGH-OCCUPANCY VEHICLES. Research and planning were undertaken to identify opportunities and potential demand for the development of preferential facilities for high-occupancy vehicles in Southern California. Preferential facilities include normal or contraflow preferential lanes on existing freeways; exclusive curb, median, contraflow, or reversible lanes on arterials; freeway ramp metering; and associated park-and-ride sites. The treatments were evaluated according to time and cost savings for bus and car-pool users; service deterioration of vehicles with low occupancy; highway agency benefits of capacity improvements and added costs; transit operator patronage, reliability benefits, and increased costs; and community benefits in vehicle mile (vehicle kilometer) and person-minute reductions. Additional objectives were to prepare a comprehensive plan and to supply guidelines for design implementation. A short-range demand forecasting procedure is described, focusing on travel market segmentation and time savings estimates. Results of an impact measurement procedure for a detailed preferential treatment are shown to support recommendations for pilot implementation of a total plan covering 28 service areas, 16 preferential lane treatments, and 485 additional buses.

Brothers, BT Benson, DE Sheppard, WV (Smith (Wilbur) and Associates) *Transportation Research Record* No. 546, 1975, pp 1-12, 3 Fig., 2 Tab., 6 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

31 129344 PUBLIC TRANSIT RIGHT-OF-WAY. This paper deals basically with when, where, and how priority treatment for transit should be provided. It is suggested that total people delay be used as the criterion for developing standards. Several examples are cited of exclusive transit rights-of-way, particularly in Europe and western Canada. In addition, some examples are given of exclusive signals used in Europe and in Edmonton, Alberta. The Edmonton experience is described including public participation before and after an exclusive lane was implemented. The paper concludes that there is a need in transportation agencies for a more uniform basis of data collection before and after implementation so that better standards can be developed.

31 129522 BUS PRIORITY AND MODAL SPLIT. To maintain an acceptable level of mobility in our cities many potential and actual car users must use public transport. Therefore it must be axiomatic that a main aim of the provision of bus priorities is to make public transport more attractive to car users. How well bus priorities achieve this objective is examined in this article. The behavioural or generalised cost of a journey is used to understand the choice of mode of travel. This cost relates the actual cost of travel with the time taken on the journey and then these in turn are related to the income of the traveller. The 'cost' of making a journey is then expressed in compatible units, which are dequivalent minutes. If a typical commuter journey-to-work is examined using this method it is found that the 'cost' for bus travel always exceeds that for car travel. Priorities for buses in the form of exemptions at traffic signals will reduce this cost by, at best, fourteen per cent. This, however, is unlikely to influence car users to use public transport and other measures would be necessary. /TRRL/

31 129621 INNOVATION IN TRANSIT IN MEDIUM SIZE CANADIAN CITIES. The state of transit is studied in twelve medium sized Canadian cities. Two trends are discussed. The first, the decline in transit since world war two, particularly since 1960, was self-perpetuating. As ridership decreased so did service, thus encouraging further decreases in ridership. There is a correlation with this increase and a decrease in automobile ownership. Also the cities have begun to study and improve their transit systems since 1970 and hence attract new riders. Transit in medium size cities, despite problems of financing and administration is improving. Technological innovations are also discussed.

Levy, D (York University, Canada) ; Toronto-York University Joint Program in Transp, (31) Res. Rept. ISSN 0316-9456, Jan. 1976, 62 pp, 45 Ref.

31 129686 AUTOMATIC TRAFFIC CONTROL SYSTEM APPLIED TO URBAN ELECTRIC TRANSPORT. In the cities of the USSR, electric transport (tram, trolleybus) is one of the principal means of passenger transportation. The control of its functioning is complicated by a number of factors such as the existence of tram tracks, a contact wire network, etc. The synthesis of the control system is performed on the basis of the object of control analysis, including: passenger flows, electric vehicles, route networks. From the point of view of its functioning the automated traffic control system solves problems of two types: 1. Distribution by routes of limited resources of vehicles and drawing up of their service timetables; 2. Operational control of vehicles movement on routes, elaboration of recommendations for the operator in case of service disturbances and communication of the operator's orders to vehicle drivers. The matter under discussion is the control of vehicles running according to A timetable or to service schedules, that is according to intervals between vehicles. As a criterion for the choice of one or another method a minimum passenger waiting time is taken. In conclusion certain considerations of the economic efficiency of the system are given. (a) the covering abstract for the conference is IRRD no. 215903. /TRRL/

31 129810 LIGHT RAIL AND RAPID TRANSIT. Light rail transit can be considered as an advanced form of the conventional streetcar. Its tracks lie primarily on separated rights-of-way. In areas where there is heavy congestion, they are often in tunnels. Like rapid transit, which is independent from surface traffic on its entire length, light rail transit with modern vehicles can undertake the role of the primary transit carrier in medium and large urban areas, supplemented by and coordinated with a secondary feeder system. The most common application of light rail is in medium-sized cities. Rapid transit serves large cities. With respect to its service quality, capacity, productivity, and efficiency, rapid transit is superior to light rail transit in various degrees. However, a particularly important advantage of light rail transit is that its network can be constructed with lower investment costs and in a shorter period of time than can a rapid transit network. Moreover, individual sections can be used immediately after completion. When light rail transit has under ground sections in central urban areas, it can be a transitional system to later rapid transit as long as adequate alignment standards are applied in construction. The requirement for an integration of transportation and urban design is particularly important for light rail and rapid transit. Their radial lines from the central cities should form the axes of residential corridors. Thus they perform 2 roles: To the corridor residents and commuters from the region, through park-and-ride, they represent an attractive alternative to the private automobile; at the same time, they reduce traffic loads on urban arterials and streets.

31 129811 COMPARISON OF BUSWAY AND LIGHT RAIL MODES. Much has been offered to convince decision makers that busways are the least costly of fixed-guideway services in medium-density urban corridors. Until recently, these claims could be questioned but not refuted because a thorough analysis of comparable busway and light rail transit (LRT) systems did not exist. However, such a work was completed in late 1974. The Rochester, New York, Charlotte-Henrietta corridor studies are a detailed busway-versus-LRT mode comparison for a specific corridor. The studies show that, although LRT and busway investment costs are similar for equal facilities, LRT exhibits substantial operating costs, operation, and service advantages.

31 130414 RAIL TRANSIT-CHARACTERISTICS, INNOVATIONS, AND TRENDS. Rail transit, including streetcar, light rail, rapid transit, and regional rail, is a family of transportation modes with a broad range of service, operational, and cost characteristics. Consequently, these modes may be used efficiently for various conditions. As a result of numerous technological and operational innovations of rail systems during the last two decades, rail transit can be highly automated, reliable, and comfortable and can operate with minimal environmental intrusion. Although several U.S. systems (e.g., Lindenwold Line and Bay Area Rapid Transit) have some advanced features, general knowledge and understanding of rail systems in this country lag behind those of some western European countries and Japan. Based on a comparison of the population characteristics of selected European and U.S. cities, this paper shows that, among cities with similar population size and density, European cities generally have a much greater application of rail transit. Despite extensive research into new technologies, no new mode has emerged with performance and cost characteristics superior or comparable to rail technology. Thus, to achieve more efficient and economical transit systems, information about rail modes must be increased and these modes must be included among the alternatives considered in transit planning.

31 130427 REPORT ON THE FEASIBILITY OF A TRANSIT SYSTEM TRRAMM. This report is a summary of the main conclusions of a study into the feasibility, planning and implementation of a public transportation system for airport and regional service between Montreal and Mirabel in the early 1980's. The proposals submitted in this document are part of a series of steps undertaken by the Quebec and Canadian governments following the federal government's decision to build the new Montreal International Airport at Ste. Scholastique (now Mirabel), 55 kilometres (35) miles from downtown Montreal. /RTAC/

31 130428 MIRABEL. This publication is comprised of a number of papers dealing with Mirabel Airport, problems, impact and future. Each paper has been written by a separate specialist in the field. The topics covered include: Mirabel as the nerve centre of international air transport in Canada, the long walks to the planes, buses in use now but a rapid transit system is coming, the land, the impact, cargo handling, the airport's perimeter as the Industrial Park and the future of Mirabel. Pictures, maps, charts and diagrams are included. /RTAC/

31 130858 RESERVED BUS LANES IN DALLAS, TEXAS. In March 1974, the City of Dallas implemented a reserved bus lane strategy on two major thoroughfares. This information was collected in order to evaluate the impact of this strategy on public transportation, vehicular traffic, and other parameters. This paper: (1) Examines the evaluation methodology; and (2) the results and conclusions of the study. The statistical evaluation is accomplished by collecting before and after data and using the Student's t-test to determine whether or not there is a significant difference. It was found that the bus lane strategy was beneficial in that it has no negative impacts on any parameter and it does have positive effects on some parameters.

Cox, M (Dallas Traffic Control Department, Texas) *ASCE Journal of Transportation Engineering* Proceeding Vol. 101 No. TE4, ASCE #11720, Nov. 1975, pp 691-706, 5 Fig., 11 Tab., 5 Ref., 2 App.

31 130987 URBAN EXPRESS BUS AND RAILROAD PERFORMANCE. The relative performance of traditional local transport modes with a proposed investment in a commuter railroad or in express bus operations was appraised by a computer simulation which determined travel time, waiting time, walking time and monetary costs involved for each mode for complete trips from a suburban area to the central

business district four miles away. In this rather narrow situation the commuter railroad is completely dominated in cost and time performance by express bus systems. If the distance between the suburban and downtown areas were increased, relative performance by buses would decline. The author suggests the express bus must be considered as a rail alternative and in any commuter system an integrated downtown distribution with several stops can greatly enhance system performance.

31 131161 PLANNING DESIGNING AND CONSTRUCTING AIRPORTS IN MEXICO. In the design and planning of airports, Mexico gives primary consideration to the maintenance and operating costs of the proposed facility. The airport is considered an assembly of systems, with the total capacity being not the sum of the individual capacities, but the capacity of that system that has the least capacity. The five systems of the airport, each of which affects capacity, are the air space, the taxiways and aeronautical portion of the apron, the terminal complex formed by the airside and landside of the apron, the access road, and the installation (facilities, mechanical installation, baggage delivery belts). It has been the goal in Mexico to coordinate these systems in such a manner that they can grow separately, depending on demand. So far this appears to be accomplishing Mexico's objectives in regard to meeting airside and landside capacity.

Dovali, F (Ministry of Public Works, Mexico) *Transportation Research Board Special Reports* No. 159, 1975, pp 68-71; Proceedings of a conference held in Tampa, Florida, April 28-May 2, 1975, and sponsored by the Transportation Systems Center and Federal Aviation Administration, U.S. Department of Transportation.; ORDER FROM: TRB Publications Off

31 131167 PROVIDING AIRPORT LANDSIDE CAPACITY. The capacity of the airport landside (which is the entire airport except runways, taxiways, and parking aprons) generally has not been determined by any set of criteria. Acceptable criteria have had reasonable use in determining capacity requirements for that portion of landside that comprises passenger terminal, cargo terminal, on-airport roadway systems, and automobile parking. Among factors that have contributed to unsatisfactory landside capacity conditions are (a) lack of appropriate business and economic factors; (b) failure to consider landside as a whole and to establish priority of use for available land; (c) unreliability of forecasting; (d) absence of economic justification and cost parameters that result in burdensome costs and do not correlate useful life and investment amortization; (e) escalation of "gamesmanship" and acrimony between airport managements and airline representatives; and (f) lack of nontechnical criteria sufficiently comprehensive to provide coverage of pertinent areas of

consideration, including geographical location priorities, economic justifications, effective costing, reasonable forecasting, fixing of responsibilities, and management objectives. /Author/

31 131318 PUBLIC TRANSPORTATION IN JAPAN: CONTRASTS AND CONCLUSIONS. Emphasis on the rail mode in Japan is examined. The Japanese National Railways is a dominant factor in both the intercity and commuter passenger services. Japan has subways in seven urban areas, several of which are also served by privately owned suburban railways. The author discusses ticketing, service and control, and travel habits of the Japanese. Convenience, comfort, safety and dependability of trains are seen as a reason for the popularity of public transport in Japan.

31 131552 PARK-AND-RIDE FACILITIES PRELIMINARY PLANNING GUIDELINES.

This report presents a preliminary evaluation of park-and-ride facilities. A literature review was conducted and, from this, characteristics of park-and-ride service in the United States were documented. Also, each Texas city providing park-and-ride service was surveyed, and the existing or projected park-and-ride operations in five Texas cities are documented. Based on the review of these data, preliminary guidelines that can be used in planning park-and-ride facilities are discussed.

31 131716 AN EVALUATION OF A DOWNTOWN CIRCULATOR BUS SERVICE.

A circulator service in Kansas City, Missouri is described, the need for such a service in a downtown area is discussed, and the Kansas City service is evaluated. The Dime-A-Time circulator service was introduced in Kansas City on a single route and designed to move people throughout the downtown area. Two new routes were introduced later in the year and bus headways were changed to 7 minutes in the 8:00 a.m. to 5:00 p.m. period. An initial free service promotion period was subsidized by an organization of downtown business interests. Arguments in favor of a downtown circulator service are briefly reviewed and possible alternatives to such a service are outlined. The study indicates that cost is only one element in Dime-A-Time decision making; revenue and costs together must control decisions. The lowest-cost method of providing downtown circulator service is by offering a low zone fare on regular route transit buses. Comments are made on the disadvantages of such a downtown service, and the opinion is expressed that a downtown circulator service provides a significant improvement in transit service at modest cost.

31 132293 EVALUATION OF ORGANISED BUS PLATOONING IN AN URBAN AREA-RESULTS OF AN EXPERIMENT IN ROCHESTER, NEW YORK. This paper discusses the results of an experiment involving organized platooning of buses to facilitate flow through a central business district during peak hours. The mechanisation used in the "real world" environment of Rochester, N.Y., is described. It was found that when the input of buses exceeded the output flow of buses the system could handle 100 bus/h using three-bus platoons. The speed of the buses (including entry waiting time and passenger boarding time) was 3.7 km/h (2.3 mile/h). Computer simulations demonstrate that four-bus platoons given traffic signal priority could facilitate flows of 126 bus/h. In surveying bus patrons the attitudes toward the system were positive in that 79 per cent perceived the advance information provided by the system as "helpful". (A) /TRRL/

31 132303 ASSESSING BUS LANE BENEFITS. The increasing cost of fuel and congestion in town centres have caused greater attention to be paid to the role of public transport in urban areas. This has led to the development of bus-lanes which are simple to design and quick to implement. The article considers the use of traffic management in the design of bus lanes and the benefits that may be gained from their use. Bus stops must be located with care on both with-flow and contra-flow systems to avoid the use of bus-lanes by other road users. Barriers should be used where fast moving buses near to the kerb are an increased danger to pedestrians; existing crossings should be replaced by pelican crossings. Benefits from bus priority measures are difficult to assess, but it was estimated that 77 per cent of the savings in London were in passenger-time, 14 per cent in over-time and 8 per cent in operating costs. Bus-lanes are not the complete solution to public transport problems in towns, and by themselves are not sufficient to supply an attractive alternative to private transport. /TRRL/

31 132333 PUBLIC TRANSPORT IN URBAN AREAS IN SWEDEN [KOLLEKTIVTRAFIK I TAETORT]. The aim was to study the possibilities of improving the conditions of public urban traffic and propose measures and forms of planning aimed at promoting the improvement. The report is based on a number of expert reports and data from model and test urban areas in Sweden. It is stressed that A national economical approach should be adopted as a basis for future decisions aiming at improving public urban transport. It is shown that town building in many places leads to an increased standard difference between car travel and public transport. The resources of the individual should be considered

in traffic planning. The organizational and administrative forms of planning and management of the traffic system are dealt with. Proposals are discussed regarding changes in legislation. Organizational, technical and economic measures are suggested. It is suggested that counties help representatives of public transport to effect town planning at an early stage, and that counties make a traffic plan for public transport. An increased government support for investments in public transport is suggested. Improvements in the existing public transport are suggested. R&D needs are described. This report is in two parts. /TRRL/ [Swedish]

31 133635 THE INTERCHANGE PROBLEM IN PUBLIC TRANSPORT [Omstigningsproblematiken]. Travel in a large area such as the Stockholm region exhibits great variations. Public transport must either cover a very great number of routes, or travellers must accept interchanges between routes. Only the latter solution is practicable. The most economical system is based on feeder buses which take travellers to rail or tube stations. Evaluations suggest that the discomfort of an interchange is considered, on average, to be equivalent in sacrifice to an extra journey of 8 minutes. In the Swedish climate, provision of waiting rooms is essential. This is possible on rail and tube stations, but not at bus stops. Shelters at these and covered ways between bus stops, and between stations and stops, must be provided. Traffic safety is enhanced by the provision of bridges and underpasses, but this creates difficulties for the handicapped and for people with prams. Another way is the provision of signals or routing of passenger flows, but this may increase waiting times. Outlying areas have parking spaces adjacent to rail or tube stations. More may be needed if restrictions are introduced on cars in inner Stockholm, but this may result in fewer passengers for buses. /TRRL/ [Swedish]

31 133736 THE TILBURG-PEOPLE ON BIKES [Tilburgers op de fiets]. Announcing the 1976 budget the Dutch minister of transport introduced two so-called demonstration projects, especially concerning bicycles and mopeds. In Tilburg, an industrial town in the south of the country with about 155,000 inhabitants, a special east-west right of way will be established for exclusive use by these two means of transport, which are very popular in Holland. As the Dutch government endeavours to restrict car usage in favour of public transport and bicycles further investigations should be made into the choice pattern of road users. The article describes the various aspects of the Tilburg plan, which will have to be completed in 1976. /TRRL/ [Dutch]

31 134026 TRAM AND BUS PRIORITY AT ROAD CROSSINGS. PART 1: MOTIVES AND DEVELOPMENT. Methods are discussed which ensure adequate priority for trams and buses at intersections without imposing noticeable aggregate (the sum of the individual delays to every vehicle using an intersection; its magnitud is a measure of the "impact" of that intersection on the traffic flow) prime losses for other traffic. Examples in Belgium and England are described where the priority facility is not built into conventional traffic light regulated crossings, and ordinary traffic lights are used to secure a clear passage across what would otherwise be an unregulated crossing. Operations in Powell Street, San Francisco, and plough-operated switches in conduits in London are also described. Various aspects of priority and aggregate delay are considered, and it is noted that although considerable time savings are possible for public transport vehicles at most crossings, considerably better results for public transportation may be achieved if a slight increase in the aggregate delay to other traffic is permitted. The detection of approaching public transport vehicles by a loop mechanism, and a system that allows specific identification of vehicles are described.

Van Dam, F *Modern Tramway and Rapid Transit Review* Vol. 39 No. 457, Jan. 1976, pp 1-8, 1 App.

31 134058 A NEW ORBIT FOR GLASGOW'S VETERAN UNDERGROUND. The article describes the projected modernisation of the Glasgow underground system where 18M is to be spent on work to be completed by July 1978. This work includes rebuilding five stations with flank platforms, and installing ramps to the surface at the Broomload depot. Bored piling will be installed to provide permanent ground support around the new or enlarged chambers. Eleven of the fifteen stations are to become interchanges with bus or British rail transport. The old permanent way is to be removed and replaced with continuously welded track laid on precast concrete slab sleepers later infilled with in-situ precast concrete. Modern cabling and signalling will also be installed. Work will start on the outer of the twin tunnels and should be completed by

autumn 1977 when traffic will be switched and the track relaid in the inner tunnel. The present rolling stock, which has been used since the opening in 1896, will be replaced by thirty-three new power cars ordered from Metro-Cammell, Birmingham. Each car is designed for automatic operation responding to track signals accommodating 36 seated and 54 standing passengers. /TRRL/

31 134229 SELECTION OF URBAN TRANSIT SYSTEMS IN CITIES WITH LESS THAN 500,000 POPULATION. In this paper, a procedure is described for the evaluation and choice of urban transit systems in cities with less than 500,000 population. Three major objectives, which satisfy the desires of three groups (the users, the operator, and the community) are considered in the analysis. The purpose of the study is to search for and identify a proposal which provides maximum effectiveness for the three groups. Since there is usually a definite budget assigned to the urban transit system, the capital costs of the chosen proposal should also fall within the limits of the budget. (A) /TRRL/

31 134254 TRAFFIC ENGINEERING MEASURES IN FAVOUR OF PUBLIC TRANSPORT. MEASUREMENTS OF BUS JOURNEY TIME IN KARLSTAD [Trafiktek-niska aatgaerder till foermaan foer kollektivtrafiken. Maetningar av bussars framkomlighet i Karlstad]. This report examines the effect of road alignment on bus journey times, and concludes that irregularities give rise to variations in these. The effects of unsatisfactory alignment on bus passengers should be investigated. In present traffic conditions, bus mobility can be enhanced by the provision of separate bus lanes. The report examines the different ways in which these can be made available. It is shown that bus lanes enable public transport to attain higher speeds and better regularity, as long as the traffic load is below capacity. With the traffic signal strategies used at present, buses are generally delayed at signals by 10-20% of total journey time in metropolitan areas. This delay depends on the number of signals along the route but also on the time of day, the synchronisation of signals, etc. By proper planning and cooperation between the road authority and the bus undertaking, delays at signals can be reduced by passive or active priority measures. Passive measures are the provision of separate bus lanes and phasing of signals, while active measures entail the provision of detector units on buses which actuate the signals. /TRRL/ [Swedish]

31 134257 BUS DEMONSTRATION PROJECT. SUMMARY REPORT NO. 7, THE E3 ROUTE. THE SELECTIVE APPLICATION OF PARKING RESTRICTIONS ALONG A BUS ROUTE. This report describes a project which took place in the London boroughs of Ealing and Hounslow. The purpose of the scheme was to test the improvement in bus operation that could be achieved by removing parking at critical locations along a bus route. The project consisted of the introduction of parking restrictions at those points along the e3 bus route where congestion was causing delays and fatigue to drivers. At points where parking controls already existed, enforcement was increased. The roadway at two junctions was widened so that buses could turn more easily. The performance of the bus service was monitored and changes in terms of journey times and reliability are described alongside the effectiveness of the parking restrictions. Bus drivers were also interviewed during the project and their attitudes and opinions are reported. A computer simulation program for use as a management tool to predict the effect of a proposed change on the service was developed and evaluated. The conclusions which can be drawn from this work are listed towards the end of the report and a short appendix, amplifying some additional work on the reliability of the bus service over different sections of the route, is also included. The assessment of the project indicated that as a result of the reduced parking fewer buses now take an excessive time to complete the route and there has been a small improvement in bus reliability. There was some evidence that bus running times were the most variable on those sections of the route which are on the approach to junctions with major roads and that some action will have to be taken on these sections if further improvements are to be obtained. Bus stop clearways or 'bus cages' proved to be effective in preventing long term parking at bus stops but some possible changes to them have been highlighted. This project was not ideally suited for fully testing the value of computer simulation as a management tool but much useful experience has been gained on this technique. /TRRL/

31 134303 ALL CHANGE AT BRADFORD INTERCHANGE. The construction of the Bradford bus/rail interchange is described. The requirement was for a complex in the city centre which would combine the new railway station with a bus terminus both using the same facilities. The plan also included a garage and workshop for local bus services, housing for British rail staff and an eight storey office building for various uses. Facilities including shops, refreshments and underfloor heating are provided for passengers awaiting buses and trains. A number of ground problems were encountered which made alterations to the original design necessary and details are given. Other delays included serious materials shortages, three-day week, and a change in client, but it is expected that the interchange will be completed by the summer of 1976. /TRRL/

31 134399 SPEEDBUS PROGRESSES AT A SNAIL'S PACE. This article describes the bus priority measures which have been officially approved by the Greater London Council Transport Committee and will be implemented over the next three years between Parliament Hill (Camden) and Peckham Rye (Lewisham). On the southbound side three will be 11 with-flow bus lanes, two of them double-width, and six contra-flow lanes. Northbound buses will use 18 or 19 with-flow lanes, and either one or two contra-flow. There will be approximately a dozen new pelican crossings, some new signal systems and bus-only right turns, and a large number of one-way schemes. The Tottenham Court road changes alone will mean some 28 revisions of the traffic management orders. One result of the scheme will be the closure of London's prime shopping and sightseeing streets to all traffic except buses. Costs are quoted together with some operational problems. /TRRL/

31 134673 PREFERENTIAL LANES FOR HIGH-OCCUPANCY VEHICLES. The efforts are described and the results are presented of projects experimenting with preferential freeway lanes for high-occupancy vehicles (buses and carpools). The projects are designed to determine if such measures can, indeed, promote traffic flow, increase reliance on bus transit, encourage carpools, better serve the needs of the transit dependent, improve air quality and conserve energy. The San Bernardino Freeway Express Busway, the Marine County Bus Lanes, and the San Diego Busway are described, and the details are outlined of the trip purpose and frequency, economic and time savings, the vehicle miles saved, the effects on traffic and user reaction, violations, safety, and cost effectiveness. The combination bus and carpool projects at the San Francisco-Oakland Bay Bridge, the toll free lanes on the San Mateo-Hayward and Dumbarton Bridges, and preferential lanes in other freeways are reviewed. The results of the study indicate that properly-planned preferential treatment facilities can increase the people-carrying capacity of existing highways; decrease travel times for users; promote efficient bus operations and schedule reliability which, in turn, encourages patronage; and reduce individual commuting costs. Such preferential treatment can also provide better transportation for the transit dependent, be an aid to improving air quality and help in energy conservations.

31 134682 PASSENGER BEHAVIOR STUDIES FOR AUTOMATIC TRANSIT SYSTEMS. This paper reports on part of the coordinated Minitram research program in the United Kingdom being carried out by various groups under the direction of the Transport and Road Research Laboratory. The section of work discussed relates to tests carried out in full-scale simulations of passenger behaviour on vehicles and stations to determine the effects on dwell and clearance times of changes in station and vehicle configuration, door sizes and opening times, and directional barriers. The tests were carried out

with passengers stratified into commuters, non-commuters, and handicapped populations.

31 135204 A MODEL FOR SNCF TRAFFIC FORECASTS FOR THE PARIS SUBURBS [Un modele d'affectation pour des previsions de trafic SNCF de la banlieue parisienne]. A mathematical model for a study of commuter traffic in the Paris area is outlined here. The model is applied on a repetitive basis with fixed values, e.g. behaviour of commuters, journey time, etc., and the level of saturation, and the various routes taken are adjusted according to expressions of quantity. The model takes account of geographical zones, the present situation and possible developments; it can be used for planning purposes (investments, preparation of transport plans). [French]

31 135405 AIRPORT USER TRAFFIC CHARACTERISTICS FOR GROUND TRANSPORTATION PLANNING. This report which is intended as a reference and guide for traffic engineers and others dealing with airport ground transportation, covers key traffic characteristics of air passengers, airport employees and air cargo, and examines aspects of airport access. The work which is intended to serve as a basis for more comprehensive studies of current design practices and supply input for development of improved analytic and design procedures, highlights significant data concerning airport user characteristics and considers resultant demands for ground transportation and terminal facilities. Some of the most significant findings relate to: the annual growth forecast for air travel; the variation in the proportion of "through" and "transfer" air passengers (and corresponding the variation in ground transport demand); transport to airport; passenger-related trips; air-cargo generated traffic; rail rapid transit airport access; transport by mass transit; airport highway access capacity; airport public parking; and on-airport transit systems on exclusive rights of way.

31 136423 PEDESTRIAN/BICYCLE FACILITIES FOR SAN FRANCISCO BAY AREA RAPID TRANSIT OPERATIONS. In addition to the pedestrian-orientation which was planned, designed and built into the Bart-system, increasing emphasis is being placed on accommodating the cyclists. Where possible, close-in bicycle parking is under the surveillance of the information-attendant. Recommendations have been made for the relocation of racks for security reasons at certain stations. Bicycle racks are provided free of charge at 27 stations, with rental lockers at 7 of them. Recommendations are given to provide secure and effective bicycle rack parking. /TRRL/

31 136425 A COMPARISON OF TRANSPORT IN TOKYO AND NEW YORK-COLOQUIA ON THE CITY. The article is a summary of the main conclusions of A conference held in New York in May 1975. In many respects the problems are similar but a larger proportion of people use public transport in Japan. Railway and subway transport is used in Tokyo, the motor vehicle is more popular in New York. Less urban land is used for streets in Tokyo. The emphasis of countermeasures introduced in both cities recently has shifted from providing better facilities to controlling and limiting access. Measures being implemented or considered include restrictions on parking, the introduction of bus lanes, the giving of preferential treatment to pedestrians and the introduction of tolls to congested areas. Environmental effects of road traffic are of great concern in both cities, car and truck effluents are greater in New York than in Tokyo. The fundamental difference between the two cities is that in Tokyo the government discourages further employment in the central area, in New York the government is concerned about the loss of employment in the centre and does not promote company relocation. /TRRL/

31 136443 PLANNING FOR FULTON ARCADE. Fulton arcade, a covered pedestrian transitway in Brooklyn, is not an isolated planning concept or project. It exists in the context of the problems of a specific locality with A particular history and experience in planning and development. The Fulton arcade plan will create a two-lane two-way transitway 24 feet wide in Fulton street for buses and emergency vehicles only. Other traffic will be rerouted. Up to 64 buses will travel in each direction during the peak hour. A major feature will be a free standing Plexiglas and steel frame canopy system. It will be designed to provide protection from severe weather for shoppers and bus users. /TRRL/

31 136695 BALTIMORE TRANSPORTATION CENTER. CONCEPT STUDY. The report established the basic justification for preserving the Baltimore Rail Station as the nucleus in an intermodal transportation center. The proposed transportation center will provide an interface for high-speed intercity rail service, intercity and regional motorcoach service, regional commuter rail service, rapid transit service, local bus service, helicopter service, and the automobile. Two concepts of the intermodal facility are illustrated in this report for further consideration: concept one provides a total comprehensive solution to an expanded transportation center; concept two modifies the direction of concept one by providing a less expensive solution for an expanded complex.

31 136912 THE SHIRLEY HIGHWAY EXPRESS BUS-ON-FREEWAY DEMONSTRATION PROJECT/A STUDY OF PARK-AND-RIDING [Interim rept. no. 6]. The market for fixed route transit operations is not limited to travelers within walking distance of transit stops. This was demonstrated by the Shirley Highway Express-Bus-on-Freeway Project as project promoted park-and-ride operations led to sizable increases in bus patronage: Park-and-riders, commuters who traveled by auto to a bus stop and then by bus to work, greatly expanded the market for the fixed route bus service in the Shirley Highway Corridor area. This report presents results of a study of the successful park-and-ride operation within the Shirley Highway Corridor area: suburban fringe parking lots coupled with the high speed buses of the Shirley Highway Express-Bus-on-Freeway Project. Demographic characteristics of the park-and-riders as well as characteristics of their present park-and-ride and previous commute trips are examined. Factors important in the commuters' decisions to park-and-ride are identified. The report also describes the survey procedures used in the study.

31 137423 CITY OF NAPA LOCAL NEEDS AND PLANNING STUDY. The transit objectives of the city of Napa, California, as defined in this report, are: (1) To increase the transit mobility of all persons, including those especially dependent on transit--the poor, the handicapped, the young and senior citizens; (2) to increase transit service, particularly to the downtown area where most trips converge and to South Napa where many work and school trips converge; (3) to promote transit as a more important factor in achieving an improved environment, and a generally better community in which to live; and (4) to insure that Napa Transit System complements the transportation systems existing and envisioned for the County and Region. The primary goal of this particular study is to design a transit system which meets the transit objectives as stated above. Chapters address data collection, evaluation criteria, three alternatives, evaluation and recommendations, and implementation. System requirements and phasing over five years are discussed.

Voorhees (Alan M.), and Associates, Inc., Berkeley, Calif.*Urban Mass Transportation, Administration, Washington, D.C., (UMTA-CA-09-0025) UMTA-CA-09-0025-74-1, May 1974, 147p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-255451/7ST

31 137455 THE POTENTIAL RELATIONSHIP OF THE BICYCLE TO MASS TRANSIT SYSTEMS. The studies executed by the Denver planning office and the regional transportation district clearly show a significant number of present bicycle commuters and a still larger percentage of potential bicycle commuters if properly designed bikeways and parking facilities are made available. The bicycle is a legitimate and practical addition to a balanced transportation system with no negative consequences. Bicycle riding is not only beneficial to our environment but also for the commuter himself. The bicycle is a clean, efficient, economical alternative means of transportation for commuters living within a five mile radius of their employment destination. With the completion of the PRT-system and the upgrading of the existing bus systems, the bicycle can play a new role as a feeder mode to these more rapid forms of transport. The combination of the bicycle with mass transit modes is realistic and practical. Proper bicycle facility planning that is sensitive to the bicyclist's need will encourage more people to enjoy their journey to work. /TRRL/

Wolfe, FL (Denver Regional Council of Governments); International Federation of Pedestrian Assoc 1975, 20 pp, 10 Fig., 2 Tab., 4 Phot.; ACKNOWLEDGMENT: Institute for Road Safety Research, TRRL (IRRD 218619)

31 137456 BICYCLE PLANNING AT THE LOCAL LEVEL. THE LONDON EXPERIENCE. Bicycle use and bicycle planning in London are examined. The main thesis is that the level of use is now extremely low, at about 2% of all journeys, and that one factor which has contributed to the decline of bicycle use is the activity of transport planners and highway engineers. If this decline is to be halted, this will depend on numerous small and inexpensive works on and off the highway. Recommendations are given for bicycle use in London. A programme of bicycle-orientated improvements to the road network should be started, consisting of: (1) positive signing of existing cycle facilities, combined with protection of existing bicycle facilities, where appropriate, from abuse by other motor vehicles; (2) ensuring that bicycle movement is facilitated, or at least, not discouraged, through existing, or newly created environmental areas. /TRRL/

31 137515 RECENT DEVELOPMENTS IN URBAN TRANSPORTATION. A LOOK AT NEW TRANSPORT COUNTERMEASURES IN JAPAN. The article describes measures being taken in Japan to conserve energy and curtail pollution. These countermeasures are aimed at reducing transport energy use, automobile exhaust pollution, and traffic volumes. Public transport is being reviewed, and new transport technologies are being examined. The author explains the background that led to the setting up of emission standards and describes the political significance. Tokyo police have introduced measures to control truck and motorcycle noise. New forms of bus transit schemes are being evaluated; these include zone and demand bus schemes, residential demand buses, and rapid transit streetcars. Mention is made of research into computer

controlled vehicle systems and a dual-mode bus scheme. Walking is being encouraged by the construction of 'pedestrianised streets'. /TRRL/

31 137533 A SET COVERING APPROACH TO BUS STOP LOCATION. This paper considers the problem of locating bus stops in the context of a set covering problem. Zero-one integer programming models are suggested for use in the location of bus stops on new routes and for use in the location of express bus stops on current routes. The models may be used to locate the minimum number of (express) bus stops required to ensure that no passenger need walk more than a specified distance to reach an (express) bus stop. A modified version of the model is presented which enables the router to locate a specified number of (express) bus stops in such a manner that the total distance walked by all boarders is minimized. /TRRL/

31 137783 THE PERFORMANCE OF BUS BAYS. The report compares three options for bus bays at an urban bus stop: (I) the provision of the standard design of Ministry of Transport (doe) bay; (II) the provision of a novel and deeper asymmetric bay; (III) no bus bay i.e. a roadside bus stop. An experiment was undertaken at a site on a 30 ft road in Peterborough where each type of bay was established and observed in turn. A film analysis gave bus manoeuvre details and delays, and traffic flows were also recorded. These observations gave times of buses to enter, unload, load and leave the bay in each case and the relationship of exit times to traffic flow. Record was also made of times to go through a standard length of road with and without the bus present. The results were used in a cost-benefit-analysis exercise which took into account the costs of construction and the values of time of passengers, crews, and occupants of passing vehicles which had been obstructed. The views of bus crews were obtained by interviews. The conclusions are that the deeper, asymmetric bay gave rise to greater difficulties in the exit manoeuvre, and hence greater delays, than did the standard bay which in turn was worse in these respects than having no bay at all. It is also concluded that if a bus bay is used it should be as long and shallow as feasible. /TRRL/

31 137785 MERSEYSIDE INTERCHANGE EXPERIMENTS. PASSENGER TRANSPORT INTERCHANGES ON MERSEYSIDE. DEMONSTRATION PROGRAMME RESULTS AND CONCLUSIONS. This report describes a programme of 28 experiments carried out in the Merseyside area from late 1971 to mid-1973. The purposes of these experiments were to gain experience in the setting up and running of improved car parking facilities at railway stations and bus services to stations to provide a complete service for commuters to central Liverpool, to assess public response to these services and to evaluate their potential benefit to the area as a whole. The parking improvements consisted of the provision of 300 new car parking spaces and reducing or removing parking charges at seven suburban railway stations. The bus/rail services included special new bus routes, some modification of existing bus services to provide better train connections and the issue of combined bus/rail tickets. The car/rail experiments were adjudged generally successful in that they resulted in a net gain to the public transport purse, one of the conclusions was that free car parks should be constructed or extended at stations more than four miles from the centre of Liverpool. The conclusions on the bus/rail experiments are more complex. Their value is that they should lead to lower running costs by the modification or elimination of duplicate through bus services and the results show that the experimental services have proved sufficiently popular for this to be possible. However, much depends on whether existing through bus services can, in fact, be modified in view of their use for intermediate, non-central area journeys. The report therefore recommends a further study in which interchange bus services are planned throughout an entire corridor, so that the full scope for operating economies can be thoroughly explored. Apart from this, the report lays down guidelines for planning and operating interchange bus services. /Author/TRRL/

31 138149 TRAVEL PATTERNS ON A NEW REGIONAL RAPID TRANSIT SYSTEM: CLUES FROM THE EARLY STAGES OF OPERATIONS ON BART. This paper reports on some of the traffic patterns that developed on the Bay Area Rapid Transit (BART) System from November 1973 to August 1974, when only portions of the BART network were open to traffic. Data from fare gates at stations, counts on trains, transfer tickets, and highway traffic counts were compared to BART estimates made in 1971. Indications are that BART will attract far fewer short trips (less than 6 miles or 10 km) in San Francisco and Oakland than had been anticipated. Short trips in some outer areas with less surface transit and trips greater than 10 miles (16 km) long may have been underestimated. This suggests that the forecast inaccurately evaluated submodal split between rail and bus transit over short distances and may have weighted cost differentials too highly for long trips. On peak shopping days, BART attracts shoppers to downtown areas and to regional shopping centers near BART stations, BART is quite successful in attracting those who commute to industrial and commercial areas and to universities outside downtown areas who use feeder buses at their trip ends. In one corridor BART appears to have caused an increase in total transit use, partly by diverting travelers from the automobile and partly by generating new trips. When a surface transit system in BART territory ceases to operate, some additional short trips are made on BART, but there is a loss of longer trips that used feeder buses.

31 138961 THE BUS IN URBAN SWEDEN. Policies carried out in Sweden, reflecting extensive bus priority measures and a relatively low fare structure, are intended to offer all social groups the opportunity to travel in a manner least disturbing to the environment. The greater Stockholm Urban Transport Authority has introduced an integrated transport system in which suburban bus services provide local services and also connect with city-centre rail links. Similarly, in Gothenburg, buses connect with a tramway network so eliminating the need for buses in the city centre. In a move towards direct bus connections, transport authorities have introduced limited-stop services linking housing areas with industrial centres directly. Extensive bus priority

measures in Swedish cities are designed to allow the passage of buses with as little traffic conflict as possible. In conclusion, it is recognised that the introduction of progressive policies has resulted in a higher level of service and a marked increase in passengers carried. /TRRL/

31 138989 URBAN PUBLIC TRANSPORT. In predicting the future of public transport over the next 25 years the author identifies the five main factors which will affect transport development and the quality of life in general. These are: (a) increased urbanisation; (b) growing environmental awareness; (c) financial constraints; (d) the energy crisis and (e) new technology. The history of public transport over the last 25 years is examined and the reason for the decline up to the late 1960s identified. Future public transport is examined on two counts, systems and organisation. It is not felt that personalised rapid transit or "people movers" will play any significant part in the public transport network up to the end of the century but that the emphasis should be placed on development of appropriate bus and rail systems, coupled with the increasing use of electric traction and the provision of more priorities in highway networks. Greater detail is given on the integrated transport system based on bus and metro now being built in Tyne and Wear Counties. As regards organisation there is an anomaly between some public transport being publicly-owned locally while the rest of it is virtually publicly-owned on a national basis. There is a need for more logical control of what is very much a local facility and regional transport organisation is called for. For abstracts of other papers to the 1975 National Conference of the Institution of Highway Engineers, see IRRD abstract nos 220234-38. /TRRL/

31 139037 COMPUTER AIDED ROUTE-BOUND TRANSPORT PLANNING (Planering av Linjetrafik med Datorns Hjälp). Since the route-bound transport systems are labour intensive, planning must be made more efficient. Factors to be taken into account are present and expected travel patterns, desirable travelling standard, existing installations, town plans, available finance, overall economy in planning, first costs and operation. In an interface system developed by Volvo, (1) route network and traffic density are proposed; (2) this is evaluated by computer in view of travel pattern; (3) modifications are made accordingly; (4) new evaluation is made, etc. a description is given of methods available for analysis of travel patterns and service details. The print-outs contain, for each route, running times and passenger density between stops, service density and capacity in each direction; for each pair of routes, number and location of interchanges; for each stop, numbers getting on and off, etc; for each route, summaries of traffic density, loading and costs; for each pair of areas, number of journeys and travelling standard; for each area, number and standard of journeys starting or finishing in area; histograms for

journey times and lengths; summaries of travelling standard, traffic density, loading, productivity and costs. Extreme values are pinpointed. To make for ease of understanding, selected results can be presented graphically. /TRRL/ [Swedish]

31 139219 DESIGN AND CONTROL OF FREEWAY OFF-RAMP TERMINALS. This report presents the results of a comprehensive review and assessment of design and operating practices used at freeway exit-ramp terminals, especially terminals with surface streets. Information is presented on such matters as compatibility of design elements, traffic control device applications, impact of access to adjacent development, accommodation of pedestrians and bicycles within the interchange area, safety, capacity, wrong-way movements, and provisions for public transportation vehicles. Research needs are pointed out.

31 139241 PROBLEMS IN INTEGRATING BICYCLE TRAVEL INTO THE URBAN TRANSPORTATION PLANNING PROCESS. With bicycle sales increasing rapidly and with attitudes that regard the bicycle as a toy declining, bicycle travel must be integrated into the urban transportation planning process. The bicycle is being recognized more and more as a viable means of urban transportation, but rational planning for the bicycle requires detailed

information concerning the nature of intraurban bicycle travel, information that currently does not exist for U.S. cities. This paper uses detailed travel data gathered recently in Sweden to demonstrate that bicycle travel closely resembles motor vehicle travel. The data show that, when bicycle ownership is high and when planners treat the bicycle as a viable means of transportation, the bike is used extensively in daily travel for a variety of trip purposes. In planning for bicycle facilities in U.S. cities, transportation planners must recognize that viewing the bicycle primarily as a recreational vehicle will not meet the needs of most cyclists. The bicycle must be integrated into the urban transportation planning process like any other urban transportation mode. /Author/

31 139356 URBAN AND SUBURBAN RAILWAYS. This report describes and discusses the current situation and technical characteristics of different types of railways. The railway network is defined, and the importance of diagonal lines running through the city is pointed out. The standards for walking distances, travelling time, frequencies, interchange facilities and feeder lines are formulated. The planning is described of tramways, surface suburban railways and metro systems with particular attention to track arrangement and layout. Characteristic solutions are examined for network and curvature, and the details are described of the underground and surface parts of the lines. Stations with 3 and 4 tracks are discussed, as are double-tracked stations with 3 platforms. The suburban rapid transit operated by the state railways is discussed, and data for calculating the capacity of platforms, stairs, escalators and passages are compiled. Unconventional systems of urban transportation, namely, cars on pneumatic tire wheels, suspension systems, the Alweg type and cab taxis are also discussed. Examples from urban and suburban railways in a series of towns and conurbations are quoted.

31 139832 SERVICE POLICY FOR SURFACE PUBLIC TRANSPORTATION. This Service Policy which is intended to guide the operation and improvement of all conventional bus, trackless trolley and surface streetcar services within the Massachusetts Bay Transportation Authority (MBTA), will eventually be integrated into a comprehensive policy covering surface transit, rapid transit and commuter rail operations as well as specialized transport services for special markets. The policy presented here covers MBTA services as well as private carrier and community based services. Prospective uses of the policy are listed, and the state and federal laws which provide the legal basis and impetus for this statement are summarized. Service goals and objectives are set forth, and the standards against which services will be evaluated are described. These standards relate to service design, operating performance, and economic/social/ environ-

mental standards. Planning and evaluation procedures are described which are based on community involvement, and cost-effectiveness. Service warrants are described which are used to answer questions relating to discontinuation of operation, the assumption of responsibility for operation of a service that is currently being provided by a private enterprise, and the turning over of a MBTA service to private enterprise. Procedures are also presented for amendment of the policy statement which will keep it responsive to the environment.

31 141103 EXTENSION OF THE PICCADILLY LINE FROM HOUNSLOW WEST TO HEATHROW CENTRAL. The paper gives a history of events leading up to the authorization of the construction of the extension. Three separate contracts were involved, and a description of the design and method of construction in each case is given. The paper discusses the reasons for adopting a particular method of construction, and comments on problems encountered on each of the three contracts and the effectiveness of the various measures taken to overcome them. The particular difficulties of working under an operational airfield are detailed.

31 141258 BUS PRIORITY SYSTEMS. Information is presented on the various ways being used in other countries as well as the U.S. of giving priority treatment to buses and carpools. The types of bus priority considered include with flow bus lanes, contra-flow bus lanes, reserved bus lanes on freeways (sometimes reversible for tidal flow operation). Priority access to freeways and other facilities (eg. toll booths) and bus only streets, busways (segregated roads for buses only), priority at traffic signals (eg. adjustment of signal phasing to ease passage for buses etc.) other priority measures including traffic regulations giving priority to buses, etc, and comprehensive schemes incorporating bus priority with town and traffic planning measures. The recommendations to emerge from the study stress the movement of people rather than vehicles by freeing buses from the effects of congestion. Recommendations are presented regarding the bus priority and passenger time and operating costs, the effective utilization of road space, the integration of bus priority with town and transport planning, and the assessment of priority schemes.

31 141302 LA VILLE DE QUEBEC REVIVING PUBLIC TRANSIT. The government of Quebec set up a special commission in 1966 to study the transportation needs of the city of Quebec. For years public transit had been operated by seven private companies. The study established a transit commission (QUCTC) that would provide unified transit on a cost shared basis. In 1970-71, the routes, vehicles, and manpower were consolidated, and a new fare structure was created. Political and labor battles

characterized the first few years of the commission, and the city of Quebec showed a ridership loss between 1970 and 1974. A 1972 survey showed that public transit was accounting for only 1 percent of the total daily trips. This and other studies brought about improved service and route changes. There has always been opponents of public transit in Quebec, and when a large operating deficit resulted, there were more complaints. Besides the lack of adequate financing, there were complaints about such things as lack of bus shelters and bus priority schemes. In 1974, the Province of Quebec finally granted the commission a \$900,000 subsidy. Plans for future improvement of the QUCTC's service include intermodal planning, streetcars, and light rail transit. It appears that a new attitude is developing toward public transit. Priority must be accorded it in the future since continued emphasis on highways will only destroy cities and bring pollution. To be successful, public transit must be useful, and the QUCTC has many improvements lying ahead.

Transit Canada Magazine Vol. 12 No. 4, Aug. 1976, pp 6-17, Figs., Tabs., Photos.

31 141530 DETERMINATION OF ACCESS TIMES TO RAIL RAPID TRANSIT STATIONS WITHIN THE CITY OF CHICAGO. This paper addresses the question of access mode and travel time to rapid transit stations within the City of Chicago. An analysis of an existing disaggregate data set was undertaken to determine: (1) the distance from a rapid station at which people walk, as opposed to ride the bus, to the station; and (2) the travel time in both unfactored and equivalent time (with unequal weightings of trip components) by the bus for people traveling a given distance. An indifference distance of one-half mile was determined, and models which express travel time, in both unfactored and equivalent time, as a function of distance developed.

31 141554 WHERE TRANSIT WORKS: URBAN DENSITIES FOR PUBLIC TRANSPORTATION. A summary of a two year study addresses the problem of increasing the mobility of those who cannot drive, strengthening urban centers and reducing their need for highways, reducing pollution, and conserving energy. The study demonstrates that only changes in the nation's urban development pattern will effectively solve these problems. The study further addresses the question of the pattern of location and density of support, required for transit in areas of new urban facilities and housing; also, the various types of transit service which can be supported, and at what cost. Land-use policies are correlated with an analysis of the following individual modes of transportation: Dial-a-bus; light guideway transit; express buses; rapid transit systems; light rail systems; and commuter rail.

31 141662 SAMPLE SIZE DETERMINATION FOR TRAVEL TIME AND DELAY STUDIES. Based on the central-limit theorem, sample means of travel times are assumed to have a normal distribution, regardless of the actual distribution of the population of travel times along a study route. Using this assumption, the techniques of statistical quality control are applied to provide a procedure for sample size determination. This procedure is applicable for both the license-plate and the test car techniques; it is also used for estimation of sample sizes for travel time and delay studies that involve either general travel conditions for all vehicles along a study route, or for only public transportation vehicles on scheduled routes.

31 141684 SKIP-STOP OPERATION: HIGH SPEED WITH GOOD AREA COVERAGE. Increase of transit speeds is one of the most effective ways for increasing the attractiveness of transit for urban travel. For longer trips, particularly where there is a competing freeway, the requirement for speed is rather high. With frequent stations, high operating speeds cannot be achieved. This article describes the main alternative solutions to this problem and then focuses on the skip-stop operation, presenting a methodology for its analysis and evaluation. The article refers to rail services, but the basic aspects of the problem are common for any technology. Light rail and bus services for which skip-stop service could be considered could use the methodology developed.

31 141685 METROPOLITAN TRANSPORTATION IN TOKYO. After three decades of rapid population growth, Tokyo's metropolitan area seems to be stabilizing. However the opportunity to implement positive policies to solve housing and transportation problems has been lost and travel congestion is a fact of life. The decline in population and decrease in employment are in part a result of inadequate regional planning. The article describes modal split, the role of rapid transit and commuter trains, and the role and control of motor transportation are discussed. One area studied is dispersion of population beyond the present metropolitan area, utilizing ultra-high-speed trains for commuter services.

31 142044 EXCLUSIVE BUS LANE EXPERIMENT. A study was made in Baltimore to assess the impact of an exclusive bus lane on traffic. The site of the route was a two-directional urban arterial with a two-lane width in each direction. Four test cars were used for the evaluation, and observers were stationed on the buses. The data collection process was divided into four phases and included both peak and off-peak periods. Data indicated that for both a A.M. and P.M. peak, on both the summer and winter schedules, the exclusive bus lane and more detrimental than beneficial to automobile travel. The difference between bus and automobile to bus usage cannot be expected as a result of exclusive bus lanes. The ultimate conclusion of the study is that the imposition of such lanes does not improve transit operations and will increase emissions and congestion. In order to verify the conclusions, statistical tests were made which correlated with the results.

31 142136 A STUDY OF TRAVEL-TIMES OF BUSES IN THE CENTRE OF A LARGE PROVINCIAL CITY. A study is presented of the effects on the operation of part of an urban bus system resulting from changes in operating conditions. Such changes include the introduction of a city centre bus lane, a route alteration, and the replacement of several sets of traffic lights by mini-roundabouts. Mean running times and variability of running times on various sections of route before and after these changes are compared for different periods of the day, using data collected by on-bus observers. The results and their possible interpretation are discussed. Considering these results, and the results of a limited survey carried out later by stationary observers and involving large numbers of observations, various limitations in design and execution of the study are pointed out. Based on the experience gained, several recommendations are made for the conduct of future similar studies. (A) /TRRL/ Charlesworth, JA ; Newcastle-Upon-Tyne University, England Monograph Torg Paper 15, Feb. 1976, 28 pp, 7 Fig., 9 Tab., 7 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 220723); ORDER FROM: 7605343

31 142955 BUS-CARPOOL FWY LANES IN SAN FRANCISCO AREA. Operational characteristics of four types of relatively low cost preferential treatment for high occupancy vehicles are described. They include a contraflow bus lane, a with-flow bus lane, a with-flow bus-car-pool lane, and preferential access to a metered freeway. The projects are described in terms of their physical configuration, safety experience, violation experience, and enforcement experience. All are practical treatments and a choice of a particular type depends on traffic characteristics, types of bus service, and freeway configurations.

31 143018 A TRANSIT CONCEPT FOR PINELLAS COUNTY. The report examines the transit needs in Pinellas County, Florida. It deals with local and County-wide transit operating concepts, demand prediction, system sizing and costing, financing and system management. It is concerned with transit needs over the five-year period from 1974 through 1978, and defines the equipment and facilities that will be required during each of these years. The focus of the study is on the definitions and evaluation of broad transit system concepts for the County. Estimates are generated for the number and types of transit vehicles that will be required, the supporting facilities needed, the total and equivalent annual capital investment and operating costs that will be incurred, and probable levels of transit revenue.

31 143204 TEXAS MASS TRANSPORTATION COMMISSION FINAL REPORT [Final rept]. Three programs were organized--administration, planning, and development. Each program is explained in the report. The following accomplishments are among those cited--the 1975-1990 Texas Transit Development Plan provided the foundation for the comprehensive master plan for public mass transportation development in Texas; establishment of the agency newsletter, Texas Transit Topics, allowed for improved communication channels between the TMTC and the state, Federal, and local political subdivisions, transit operators and interested private citizens; the Third Annual Transit Conference was held March 10 and 11, 1975 in Austin; and, statewide transit operating statistics were aggregated and analyzed for CY 1975, and were then published in the first such report on Texas' total transit operation.

Texas Mass Transportation Commission., Austin.*Urban Mass Transportation Administration., Washington, D.C., (UMTA-TX-09-8001) UMTA-TX-09-8001-75-2, June 1975, 14p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-256285/8ST

31 143207 TEXAS TRANSIT OPERATIONS (1974) (STATISTICS AND ANALYSIS). Charged with the responsibility to develop and plan for urban transit in Texas, the Texas Mass Transportation Commission (TMTC) began gathering operational information early in 1974. Tables present data on the number of transit passengers in 1975, statewide operating statistics, finances, calculated indicators for transit, financial assistance to Texas from UMTA, estimated effect of employee strikes on transit, statewide transit ridership for 1973 and 1974, estimated growth of statewide transit ridership, calculated transit indicators for urbanized areas in Texas, and transit passengers and vehicle miles per capita in Texas urbanized areas (1974). The distribution of statewide transit characteristics, 1974 transit patronage by quarter and city category, and the effect of 1974 strikes on statewide transit ridership trends are represented on graphs. General conclusions are given.

31 143208 BART (BAY AREA RAPID TRANSIT) MULTI-MODAL TERMINAL PLAN, CITY OF WALNUT CREEK, CALIFORNIA. As a basis for evaluating alternative designs to correct the deficiencies of the existing station and to deal with demands from anticipated changes, the following goals were developed: Maximize the value of the public investment in the BART system and encourage use of the system by maintaining and improving the accessibility of the station to all modes of transportation; conserve fuel and reduce pollution by encouraging use of public feeder transit service to the BART station; improve patron comfort and safety in the station area; encourage development in the station area that will relate to and enhance the value of the BART station as a multi-modal transportation terminal.

Duncan and Jones, Sanders Associates, Incorporated, Metropolitan Transportation Commission, Urban Mass Transportation Administration, D.C., (UMTA-CA-09-0025) UMTA-CA-09-0025-74-2, Mar. 1974, 102 pp; Prepared in cooperation with Bay Area Rapid District, Oakland, Calif., and Metropolitan Transportation Commission, Berkeley, Calif.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-256312/0ST

31 143255 NEW JERSEY PUBLIC TRANSPORTATION STUDY. PHASE A. IT-09-0023 TS F110 (7350). IMMEDIATE ACTION PLAN. The study examined the existing public transportation characteristics and following extensive analysis the Immediate Action Plan recommends appropriate action for the preservation and extension of bus services. The study recommendations are designed to lead to improved coordination, operation and regulation of essential bus services in New Jersey and will guide the most effective use of state and federal assistance for the bus industry.

Mass Transportation Administration, (UMTA-IT-09-0023) UMTA-IT-09-0023-74-3, Mar. 1974, 227 pp; Prepared in cooperation with New Jersey Dept. of Community Affairs, Trenton, Tri-State Regional Planning Commission, New York, and Delaware Valley Regional Planning Commission, Philadelphia, Pa.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-255641/3ST

31 143262 IMPACT OF ARTERIAL BUS PRIORITY TREATMENTS ON BUS OPERATING COSTS. A study was conducted to ascertain whether or not an arterial bus priority treatment affects the cost of bus operations. Arterial priority treatments were evaluated for the effectiveness of operations within the Central Business District. Bus operating costs affected by the benefits of an arterial priority treatment were discussed. A case study using the Benning Line of the Washington Metropolitan Area Transit Auth. Metrobus System was then undertaken to illustrate the impact of the arterial priority treatment upon bus operating costs. The results indicate a potential for significant savings in bus operating costs. Briefly, the results show an annual savings of approximately \$8,800 due to the implementation of a priority treatment along one mile of an arterial in downtown Washington, D.C. This compared to an arterial priority treatment capital cost of about \$10,000 per mile.

31 144016 COMMUNITY MONITORING. The environment project's community monitoring program served as a source for substantive findings on response to impacts, and as an aid in overall research design. It functioned through a variety of non-random, qualitative techniques to gain information on the general nature of community concerns for and responses to BART. Also, it provided a base for verification that all major physical impacts, at least those perceived by persons affected, were being studied. Additionally, it provided indications of the kinds of questions, language and direction the Phase 2 survey of response to impact should employ for the most meaningful results.

31 144077 TALK IS CHEAPER. Telecommuting, moving the work to the worker, may have considerable impact on the planning of the cities of the future. It is particularly suited to industries primarily engaged in the collection, storage and manipulation of information. The decentralization decision of a major insurance company in Los Angeles provided a practical illustration of the concept. Productivity increased at satellite offices. The effect this could have on mass transportation systems is discussed.

31 144208 CITY OF WINNIPEG PUBLIC TRANSIT STUDY. APPENDIX A BACKGROUND MATERIAL. The City's adopted policy on public transit states that "the City supports the principle of emphasizing the role of public transport for the movement of persons to and from the downtown area and other centres which attract large concentrations of people." Therefore, the major areas of employment concentration were identified, and this report discusses the mode of travel to the major employment areas including the existing transit travel speeds to downtown, modal the other major employment areas.

31 144209 CITY OF WINNIPEG PUBLIC TRANSIT STUDY. PROGRESS REPORT-5 YEAR PROGRAM. Prior to the development of an improved system of public transportation for the City, studies were carried out to investigate the operational characteristics and utilization (or lack thereof) of the present system. As a result of these studies, the administration developed a 5 year plan for the improvement of public transit service for the City of Winnipeg. This report comments on the progress of the 5 year plan following the Guidelines and policy statements in developing plans for the growth and provision of related services for the City of Winnipeg.

31 144356 BUS PRIORITY AT TRAFFIC SIGNALS. The recent increase in the importance of public transportation and the enlarging deficits that have accompanied growing patronage have led to many attempts to increase the speed and efficiency of bus operations. One measure, priority to buses at traffic signals, has been discussed at great length but implemented in only a few instances. The author looks at the advantages and disadvantages of two such systems, Real Time and Fixed Time Bus Priority.

31 144445 THE METRO IN MOSCOW. The historical background to the Moscow Metro is briefly reviewed, route characteristics are discussed, and observations are made on the operational and financial management of the system. Comments are made relating to cars and train scheduling, automated operations, and the interface between the metro and surface feeders and distributors. The major elements of the transportation plans for the city is examined with special reference to system expansion, planning criteria, and implementation, and the similarities of problems at the technical and professional level between large cities of the Soviet Union and the

United States is noted. The Moscow system is a series of diagonals that cross the city core. The longest radial line is 30.4 kilometers in length with a total trip time of 41 minutes 50 seconds. Of particular interest is the circle line that ties all of them together. In time of technological progress, the most interesting is the newest radial line which is equipped with automatic controls.

31 145319 PUBLIC TRANSPORT BY BUS INSIDE AND OUTSIDE BUILT-UP AREAS [Ipenbaar busvervoer buiten en binnen de bebouwde kom]. Inside built-up areas priority regulations for public transport are already of frequent occurrence. The space for traffic outside built-up areas is now also becoming crowded, and priority regulations for public bus transport are appearing. Regulations which can be used, the space necessary and the benefits which arise are discussed. /TRRL/ [Dutch]

31 145331 PARAMETRIC ACCESS NETWORK MODEL. Parametric models are calibrated for the access portions of rail and bus trips. The models are designed to predict average zonal travel times as a function of the transportation system, zone size, and volume-related characteristics of a zone. The calibrated models are access walking, driving, and bus-riding time for rail trips and walking time to a stop for bus trips. Corresponding models are developed for the within-zone variance of the access time. These models provide input to the existing travel demand forecasting process by systematizing the way in which the access times are currently obtained for network coding. The importance of these values for travel forecasting has been repeatedly demonstrated in the past. These models also enable the use of large zones to help simplifying and speed up the transportation plan analysis and evaluation process. The predictive accuracy of the final models is evaluated in terms of standard indexes of forecasting accuracy. The results show that the coefficients of determination are high and that the coefficients of variation are low for all the models. Thus, the models should find an immediate use in transportation planning. /Author/

31 145537 URBAN CORRIDOR DEMONSTRATION PROGRAM, MANHATTAN CBD-NORTH JERSEY CORRIDOR. EVALUATION OF FRINGE PARKING. The fringe parking program in New Jersey is used as a means of transferring and diverting auto users to transit on the periphery to the Manhattan CBD. Its effectiveness as a system can be measured in that 5300 parking spaces with occupancy of 77 percent of capacity can reduce commuting vehicle miles of travel by 40 million annually. Over the past 20 years a fringe parking system for auto-bus transfers has grown and expanded away from the CBD following the path of urban emigration. The six

park-and-ride facilities examined in this report range from those immediately adjacent to the Manhattan CBD to as far away as 36 miles. The facilities consist of Port Authority Bus Terminal and parking lots in New Jersey at Weehawken, North Bergen, Ridgefield, East Brunswick, and Willowbrook.

31 145580 TRANSIT DEVELOPMENT PROGRAM FOR THE LOWER PENINSULA AREA OF VIRGINIA. VOLUME I. MAIN REPORT. This program is a detailed analysis and five-year operations plan for mass transit in the Lower Peninsula area of Virginia which includes James City County, York County, Williamsburg, Newport News, Poquoson, and Hampton. The report examines the characteristics and adequacy of existing transit service and community attitudes toward public transportation. A recommended transit system is outlined, describing route alignments and frequency of service; the capital investment needed to sustain the system is defined; the five-year revenue/cost implications of the program are described. In addition, a marketing program aimed at making transit more attractive to all residents is defined. Finally, a plan for activities required to monitor, maintain and update the Transit Development Program is set forth.

31 146444 THE BUS IN THE URBAN TRAFFIC NETWORK [BUSSEN I STADENS TRAFIKNAET]. This report is intended primarily for local authorities, and illustrates the demands which physical planning may have to satisfy with regard to bus transport. The report begins with a brief description of the present state and development of bus transport. The chapters on planning describe how the design and location of new urban areas can be adapted to bus route layout, and the advantages and drawbacks of bus traffic

on different types of streets are also discussed. Detailed design of streets is considered, and examples are given of the design of intersections, bus stops and turning places. The chapter on laws and regulations includes current regulations for bus transport and the development controls which are relevant to the planning of urban bus traffic, etc. The report ends with an example of the procedure employed in planning a bus route network, which describes how alternative networks or routes can be compared and evaluated. This chapter also discusses how provision can be made for future bus routes when development plans are drawn up. /TRRL/ [Swedish]

31 146446 OPTIMISATION OF BUS TRAFFIC: SOME PROBLEMS AND METHODS [Optimering av linjetrafik-naagra problem och metoder]. This article describes computer programs used for the analysis of public transport networks. It is possible, for instance, to minimise the number of interchanges and the number of vehicles. Service frequency can be optimised, as well as utilisation of vehicles and drivers for a given timetable. The various computerised methods are used in combination for the overall optimisation of a public transport system. /TRRL/ [Swedish]

Hasselstroem, D (Volvo (AB)) *Svensk Lokalfabrik* Analytic No. 4, 1976, pp 2-4, 5 Fig., 3 Tab.; ACKNOWLEDGMENT: National Swedish Road & Traffic Research Institute (IRRD 222433), TRRL .

31 146448 IS THE BUS A TRAFFIC HAZARD? [AER BUSSEN TRAFIKFARLIG?]. The risks of being killed or seriously injured are 10 times as great for car passengers as for bus passengers, and 60-150 times as great for pedestrians as for bus passengers. If lighter injuries are also included, corresponding figures are 5-15 and 10-50 respectively. If the whole journey from door to door is considered, it is found that the proportion of accidents for cars and buses is far greater. According to a survey, it is about 5 times as dangerous to travel by public transport as by car. This is due to the inclusion of accidents on the way to and from bus stops, such as falling, which are not included in official accident statistics. Traffic safety would be enhanced by shortening and improving routes to bus stops. Since cars are involved in far more accidents in which other road users are injured than buses, a reduction in car journeys and an increase in public transport journeys would improve traffic safety. /TRRL/ [Swedish]

31 147044 COURSES ES 251-252-TRANSPORTATION, PROJECT E. TOPICS ON AIRPORT ACCESS IN THE WASHINGTON METROPOLITAN AREA, 1976. This document contains four articles concerned with planning and engineering concepts related to airport access. Section A analyzes the impact of the

Washington National Airport Metro Stop on the entire system. Section B presents a staged recommendation for providing access to Dulles airport, employing several modes. Section C surveys the state-of-the-art of rapid rail vehicles and examines them for their applicability to airport access in the Washington Metropolitan Area. Section D presents three approaches to solving the problem of providing pedestrian access between National Airport Metro Stop and the Airport itself. The design parameters and costs of each component of the system are explored in brief, and recommendations for staging are coordinated with estimated demand.

31 147384 SURVEY OF GROUND TRANSPORTATION PATTERNS AT THE DALLAS/FORT WORTH REGIONAL AIRPORT. PART I. DESCRIPTION OF STUDY. A survey of ground transportation at the Dallas/Fort Worth Regional Airport was conducted to obtain data for calibrating models of airport trip generation, at the airport. Due to the special nature of the data required for this purpose, significant modifications had to be made to the usual procedures of conducting access surveys described in previous studies. A separate survey was made of each of the three principal components of ground traffic at the airport: (1) air passengers and visitors riding in automobiles; (2) air passengers and visitors riding on public transportation (Surtran); and (3) airport employees. In addition, counts of passengers and vehicles were obtained for use in determining and expanding the sample. Detailed descriptions of the instruments and procedures used in each type of survey are contained in the report.

31 147488 THE DEVELOPMENT OF LOCAL TRANSPORT INTERCHANGES. The article describes the use of interchange demonstration schemes on Merseyside to plan interchange development in West Yorkshire. Results, from the initial experiments in Merseyside which ended in 1973, show that improved feeder bus services to suburban stations attracted over 600 additional daily bus/rail journeys in each direction. Improved or free station car parks are also shown to be successful in attracting more passengers. Questionnaire studies revealed that passengers regarded reliability as the most important factor. The studies confirmed that the concept of local interchange facilities is only practical from distances between about 4 and 10 miles from the city centre. The two studies show how interchange development differs according to the functions and characteristics of the local rail services. The author suggests that savings in overall operating

costs could only be achieved in conurbations by restructuring the public transport system around the interchange concept. The advantages of rail systems outside conurbations must be extended to those beyond walking distance of their local station to give maximum utilization of their services. /TRRL/

31 147920 PRIORITY OF PEDESTRIANS AND PUBLIC TRANSPORT BY COMPUTER CONTROLLED SIGNALIZATION [Prioritering av fatgaengare och kollektiv trafik genom datastyrd signalreglering]. Tests were made on computer control of traffic lights with the special aim of improving pedestrian and bus mobility without appreciably reducing mobility of other traffic. The tests compared relay-controlled central equipment using traffic-controlled programmes with computer controlled equipment. In relay control detectors at signal approaches report intensity, whereupon central equipment selects the appropriate programme. Some local control can also be incorporated. When signals are controlled by computer, the same programmes are used, but selection logic is different. Increased local control incorporating improvements for pedestrians was also tested. Tests were also made on giving priority to buses. The green period for pedestrians increased by 15-40% at some crossings, and bus waiting times during low traffic periods were cut by half. In the relay system the decision functions are located at the crossings, and the central control equipment has only a coordinatory function. This can lead to conflicting decisions. In computer control the local units are simple and only perform orders from the central equipment which receives information from detectors and optimises control over the whole area covered. In computer control the main costs lie in central equipment and cables, in relay control in the local control apparatus. /TRRL/ [Swedish]

31 147966 PEDESTRIAN TRANSPORTATION IN CITIES OF DEVELOPED AND DEVELOPING COUNTRIES. The paper calls for an essential reevaluation of transport planning methodologies and techniques to introduce non-motorized transport as a major component of a three-mode transport system (private transport, public transport, non-motorized transport) and to be carried throughout the transport analysis sequence from data acquisition to transport strategic planning and finally to preparation of short-term traffic improvement schemes. It is suggested that the overall goal of non-motorized transport planning be the increase of the desirability of these forms of transport in order to reduce energy consumption and to improve environmental qualities. Specific planning objectives of non-motorized transport planning should be: increased safety, improvement of network continuity and connection with the public transport system, capacity upgrading, enhanced desirability

through higher levels of service, and better urban design strategies promoting land use mixes around urban activity centers. /TRRL/

31 147970 BIKEWAY PLANNING, THE NEW YORK EXPERIENCE. Multi-related factors prerequisite to a viable bikeway development program must be innovative, creative, imaginative, while being cognizant and responsive to related human factors and funding availability. Within the bikeway development process, there are two major dimensions considered (1) the human dimension and (2) the retooling technology dimension. In New York a three stage bikeway planning program is being developed: (1) upgrade existing bikeway facilities, (2) connect existing bikeway facilities into a system, and (3) include bikeway facilities, as part of new federal transportation program. /TRRL/

31 147971 THE THEORY OF VELOUROUTE DESIGN. The purpose of this paper is to constitute the design and construction of bicycle routes as a pure art or science. That is, to enhance its use as a function in the development of the art and practice of bicycling. To differentiate clearly from the generally accepted concept of bikeways, a new term, called "veloroutes", is defined. Veloroutes, meaning swift roads, can be defined as those bicycle routes which are especially designed to incorporate all the knowledge of the principles of the art and science of bicycling. If the objective of bicycling is to go further, faster with less energy, then the objective of veloroute design would be a facility design in which the energy to cover a given distance by bicycle would be an established minimum. /TRRL/

31 148218 TRANSPORTATION SYSTEM MANAGEMENT IN PERSPECTIVE. Transportation System Management (TSM) is a planning concept which views existing streets and highways, rail trackage, parking and pedestrian facilities and transportation vehicles-private and public-as elements of a single urban transportation system. The development of the concept has been guided by certain considerations: the need to make better and more efficient use of existing transportation facilities; the focus of attention on operational strategies so that benefits can be realized from transportation programs; the promotion of a more rational organization of public transportation and a more intelligent and socially responsible use of the private automobile. Current achievements such as increasing the people-carrying capacity of highways are briefly reviewed.

31 148239 PATH PASSENGER SURVEY 1974. The results are summarized here of a survey of the travel characteristics of the New Jersey boarding passengers of the Port Authority Trans-Hudson (PATH) system (a rail rapid system which connects downtown Manhattan with certain New Jersey communities). Both rail transference and local boarders were considered in the study. Details are given of the passenger volumes, origins and destinations, station to station movements, trip characteristics, passenger characteristics, and characteristics at individual stations. The studies revealed such aspects as: on a typical weekday 75,630 passengers boarded PATH at 7 New Jersey stations. Forty seven percent of the riders took a railroad to the PATH station; three out of 4 disembarkers walked to their final destination; the trips were predominately work-related; and nearly 60% of the passengers began using PATH before 1971, and 24% before 1963.

31 148259 MEDIUM CAPACITY TRANSIT SYSTEM ALTERNATIVES FOR THE LOS ANGELES REGION. A study of medium capacity transit system alternatives was carried out for the Southern California Rapid Transit District (SCRTD). The study provided SCRTD with information needed to complement earlier studies which dealt with conventional rail and bus alternatives. It was concluded that, on balance, a light rail vehicle system constituted a viable option for rapid transit service on some corridors in the Los Angeles Metropolitan Area. For a variety of reasons, an automated small vehicle group rapid transit (GRT) system does not appear to be well-suited for immediate adoption.

31 148671 MEASURING THE ECONOMIC VALUE OF EXERCISE IN LABOR-INTENSIVE URBAN TRANSPORTATION SYSTEMS (ABRIDGMENT). Recent studies show that labor-intensive transportation modes such as bicycling and walking play an essential role in providing needed exercise in an otherwise sedentary society. Transportation planners have not incorporated the value of exercise in benefit-cost analyses partly because of the measurement difficulties. The present analysis attacks these problems by: 1) Ranging the value of the health benefits of threshold exercise by a 0 to 80 percent reduction in premature coronary heart disease (CHD), mortality, and morbidity; and 2) Ranging the economic benefits of reducing CHD based on the following methods: (a) the present value per 1-h exercise session of \$0 to \$2.30, and (b) the consumer surplus value of bicycling exercise, which ranged from 35 to 78 cents/km (56 cents to \$1.25/mile) for a sample of university students. These data show that the exercise benefits compose one of the major sources of benefits for bicycle and pedestrian systems. Computer simulated techniques for decision making (or benefit-cost analysis) under uncertainty can compare these (plus other) ranges of benefits with ranges of costs for bicycling facilities to generate distributions of probable benefit-cost ratios.

31 148727 GOLDEN GATE COORDINATED SYSTEM: COMMUTING BY LAND AND BY SEA. This paper describes the growing automobile congestion within the Golden Gate Corridor and reviews an alternative means of public transportation through the use of buses and ferries. The paper outlines the planning and design criteria used in the selection of an optimum vessel and related terminal facilities. Three new Spaulding Class 165 foot, 750 passenger, vessels are presently under construction. These vessels will be all aluminum with a 25 knot power package consisting of gas turbine engines and waterjet pumps. Two modern marine passenger terminals have also been designed, with construction of one already completed. /GMRL/

Kowleski, SM (Golden Gate Bridge, Highway and Transport District) ; Society of Automotive Engineers SAE #760625, Aug. 1976, 5 pp; This paper was presented at the West Coast Meeting, August 9-12, 1976.

31 149065 OPTIMUM BUS-STOP SPACING. The article considers the results of manipulating two models constructed to describe the effect of bus-stop spacing on the generalised cost of a bus passenger's journey and on the total community cost of providing an urban bus service. Optimisation functions are derived by differentiation. Data representing typical urban bus operating conditions for both the peak and off-peak periods are used in the optimisation functions. Sensitivity analysis identifies those variables which significantly affect the optimum conditions. The optimum values for bus stop spacing appear to be between 50 and 200 metres, which are considerably less than presently found on most urban bus routes. Variables found to be the most important in optimising generalised costs in the peak period are: the trip generation rate, the bus boarding time of passengers and the frequency of service. In the off-peak the most important variable is the maximum speed attained by buses. (A) /TRRL/ [French]

31 149159 LOCATING AND SIZING PARK-RIDE LOTS WITH INTERACTIVE COMPUTER GRAPHS. Two alternative methods for conducting a preliminary analysis of the problem of locating and sizing park-ride lots for an urban bus transit system are examined. These alternative methods are tested using a large and complex street network representing the northern half of the City of Seattle, Washington. Four design criteria are identified and an overall measure of system performance is devised. The problem is to determine the size and location of three park-ride lots that will maximize the performance of the system. The first method utilizes a computing system called LOCATOR II in an interactive graphic mode. In an experimental setting, five students use LOCATOR II to locate three park-ride lots and their solutions are found to exhibit a very high average level of performance. The second method does not involve a direct interaction with the computing system but does use LOCATOR II in a batch mode. Several students participate in three rounds of the batch mode experiment and the performance of their designs is somewhat poorer than the designs found in the interactive graphics experiment. Overall, the experimental results show that relatively inexperienced persons can find a high performance design for a reasonably complex problem quickly and inexpensively. These designs can provide a good starting point for the detailed consideration of many of the other aspects of the problem of providing a high performance bus transit service in an urban area. /Author/

31 149377 JOINT USE OF RAILWAY FACILITIES BY FREIGHT AND METROPOLITAN TRANSIT SERVICES. The use of existing railway trackage by prospective metropolitan rail transit services involves a much lower construction cost than required when the public transportation services are to be operated on new trackage, even when the new rail transit trackage occupies the right-of-way on which the existing trackage is situated. Several operational problems associated with joint usage of existing railway trackage on the San Francisco Peninsula by both freight and public transportation services are identified. The procedures that are suggested for their resolution could be applied in other metropolitan areas as well.

31 149393 ACCESSIBILITY TO A RAIL NETWORK FOR SHORT AND MEDIUM DISTANCE TRAVEL: RESULTS AND EXPERIENCES IN THE TURIN BUILT-UP AREA. The article demonstrates a method of calculation for assessing, under certain conditions, improved accessibility to a rail network, following a series of technical measures to improve the level of service of the network in question. Accessibility, in this case, is regarded as a form of seeking the maximum distance from the access station, with effect from which the passenger wishing to reach a certain destination point will no longer find it an advantage to utilize the railroad.

31 149500 COMPUTERIZED TRANSIT NETWORK DEVELOPMENT MANUAL FOR THE STATE OF RHODE ISLAND. The actual mapping is described as well as the coding, building and calibrating of a computerized transit network using UTPS (UMTA Transportation Planning System—a battery of computer programs distributed by the Urban Mass Transportation Administration) procedures. The study area and mapping is briefly described. Mapping was followed by centroid location and the tying of centroid connectors to the bus routes. The bus routes were all node numbered. Details are outlined of the link data, line data, routes and modes, as well as the building of the transit networks using the program UNET. Transit network paths were then built using program UPATH. The loadings of the network with transit trip was accomplished by using program ULOAD. Appendices provide information on the traffic zone and external centroid numbering system, and codes for municipality, transit company, mode and CBD areas.

31 149941 SPECTRA, A PUBLIC TRANSPORT SYSTEM FOR TOWNS AND REGIONAL AREAS (PART 1) [Spectra, openbaar vervoersysteem voor stad en streek]. Because of the discrepancy between the admitted value of public transport of good quality and the degree to which modern public transport can in fact meet

today's expectation patterns the Dutch firms Daf-Holding and Ogem, together with the Netherlands railways, developed a new concept for transport in towns and regional areas called Spectra. The system is based on a considerable acceleration of trunk services by means of trams or (trolley)-buses with an average speed of 30 km/h, and halting every 800-1000 metres. Radiating from these stops of special design, small vehicles run frequently into the very heart of the residential areas, permitting a maximum interchange time of only two minutes at the connecting points of the two systems. /TRRL/ [Dutch]

31 150449 THE BICYCLE IN THE URBAN TRAFFIC NETWORK. The purpose of the report is to present the current state-of-the-art of bicycle traffic planning and thereby assemble a body of information which can provide a basis for improving conditions for bicycle traffic. The report is primarily aided at the municipal bodies. The following major topics are examined in this report: The current situation and problems of bicycle traffic; planning for bicycle traffic; design and construction of an urban route network; classification scheme for intersections; laws and regulations; and, technical design. The importance of the connection between bicycle traffic planning and community planning is emphasized. In order to take into account the demands of bicycle traffic in physical planning, a comprehensive inventory is often required to clarify the current situation and problems of bicycle traffic. It is also essential that goals for bicycle traffic be specified.

Kjellin, B (K-Konsult) ; Institute of Transportation Engineers, Inc Proceeding 1976, pp 88-93, 15 Fig., 1 Phot.; Proceedings of the 46th Annual Meeting, Baltimore, Maryland, August 15-19, 1976.

31 150467 INFORMATION EXCHANGE ON TRANSIT ISSUES. This report provides an overview of major issues involved in the compilation and dissemination of experience on transit issues. The increasing deficit and added complexity of transit options open make sharing of transit information even more critical. Participants in the sharing process can include federal agencies, regional planning bodies, and general-purpose and functional program officials of state, county, and local government. Mechanisms open include direct consultation, tailored documents and seminars, needs determination exercises, special user mechanisms, training courses, and demonstrations. A list of general considerations for the design of information exchange programs is also included.

31 151950 THE CASES FOR AND AGAINST BUS-CARPOOL LANES IN PENNSYLVANIA. This study presents a summary of the analysis and evaluation of exclusive bus-carpool lanes on several Philadelphia and Pittsburgh, Pennsylvania, expressways and arterials. The study was initiated by a November 1973, promulgation from the Environmental Protection Agency regarding final Transportation Control Strategies for Philadelphia and Pittsburgh. The paper presents a summary of the analysis of the traffic operational and safety problems associated with exclusive lane operations. The major difficulties with implementation, as well as advantages and disadvantages of the bus-carpool lanes are identified and discussed. Major conclusions of the analyses and recommendations for each corridor analyzed are presented also. Some of the major difficulties and disadvantages of bus-carpool lanes identified include: the reduction of overall capacity of the expressways; removal of business parking within abutting local municipalities; decreased travel speeds for nonexclusive lane operation resulting in increased air pollution, accidents, etc.; large diversion of nonexclusive vehicles to alternate arterial routes causing increased congestion; hazardous weaving operations; difficulty in policy enforcement of exclusive lane; large capital expenditures for minimal or no benefit; undesirable diversion from parallel rail routes if carpool service is improved; and increased potential for accidents. Some of the major advantages of exclusive bus-carpool lanes identified include: high volume occupancy vehicles are given priority and are able to expedite travel; auto trips are eliminated and people are diverted to buses and carpools with a resulting reduction in the number of vehicles in the CBD; provision of a direct connection to the CBD from various suburbs; travel times for exclusive vehicles may be reduced in certain corridors; and reduced fuel consumption due to the reduction in vehicles traveling into the CBD. /Author/

31 152882 VANCOUVER'S ANSWER TO THE RUSH HOUR-BURRARD BEAVER AND BURRARD OTTER. A description is given of the Burrard Beaver and the Burrard Otter, the first two of a series of catamaran waterbus passenger ferries for service on Vancouver's Burrard Inlet. The double-ended vessels, designed by Case Existological Laboratories, allow maximum capacity for a given length and good resistance to heel without the need to turn round at the terminals. The ferries have six pairs

of power-operated doors port and starboard and the time taken to embark a full load of passengers is minimal.

31 152914 OPTIMAL NETWORK GEOMETRY. Suppose that we are given a hypothetical origin-destination table of trips (but no network); we know the costs (per mile) of building various facilities and the cost (per mile) of travel per trip as a function of the flow and the facility type. For any assignment procedure for assigning trips to routes, we wish to select a network of various facilities which will accommodate the o-d flows and minimize the sum of construction cost plus travel cost. If the assignment principle is to minimize total travel cost (for any given network), the choice of the optimal network can be formulated as a programming problem abstractly of the same form as the usual assignment problem, except that the objective function is not convex, in fact it is (in some sense) approximately concave. As a result of this concavity, which is due to an economy of scale in construction, one finds that most idealized problems with high degrees of symmetry in the o-d table lead to optimal networks that do not display the symmetries of the o-d table. In particular, for an o-d table invariant to 90 degrees rotations, a square grid of roads or transit lines is, generally, the most expensive network as compared with other rectangular grids. /TRRL/

31 154045 EVALUATION OF RAIL RAPID TRANSIT AND EXPRESS BUS SERVICE IN THE URBAN COMMUTER MARKET. The study analyzes and evaluates public transportation alternatives for serving the commuter market. The two main alternatives, rail rapid transit and integrated express bus service, are analyzed from the standpoint of full costs (both supplier and user time costs). User time costs of the two alternatives are roughly equal; however, the supplier costs of the integrated bus service are much lower than those of rail rapid transit. Quantitative data on fuel consumption and emissions are presented, and the effects of political, regulatory, and institutional constraints are discussed.

31 155477 THE APPLICATION OF LOCATION MODELS TO OFF-AIRPORT TERMINALS. This paper attempts to extend the approach proposed by Kanafani to optimize travel time savings obtainable from terminals located in an idealized linear city and to apply the resulting models to a case study. Only the

location problem is dealt with in this paper and, for that, only travel-time savings obtained by connecting the terminal to the airport with an exclusive mass transit system are considered. The models developed here are intended to assist in the design of such a system by responding to the following questions: At what speed should the transit links connecting the airport and the terminals be operated? What is a good location for each terminal? Need we be concerned with precise terminal locations as long as they are reasonable? If the terminals are located on the basis of a particular link speed, will the locations still be good if the link speed is changed? Must we be concerned with possible future expansion of the number of terminals in the system when making present locational decisions? How many terminals should there be in an off-airport terminal system? A model strategy using idealized representations of the off-airport terminal systems and the cities they serve was adopted. A small number of variables are considered and some continuum approximations that permit the use of simple differential calculus in arriving at optimal locations are adopted. The advantage of this approach is that the influence of each factor considered in the model is readily discernible. The disadvantage is that the model is inevitably a highly stylized representation of any practical case to which it is applied. In the model the assumption is made that benefits accrue only as time savings to users and that the amount of time spent at a terminal is the same for each user. It is also assumed that a terminal may be located anywhere within the city, that the speed of travel on the system transit links is uniform, that the link routes must follow the orientation of the city transportation route network, and that the speed of travel on this city network is also uniform.

31 155533 DULLES AIRPORT RAPID TRANSIT. STUDY. The papers collected in this volume explore various aspects of the feasibility of a high-speed transit service between downtown Washington, D.C. and Dulles Airport, with the following objectives and constraints: (a) Travel Time and interfacing should be such as to give Dulles a level of accessibility comparable to that of National. (b) Longitudinal accelerations should not exceed about 0.1g, and sensed transversal accelerations should be minimal. (c) The guideway must be enclosed, to protect the vehicle from flying objects, from vandalism, and from the elements, and to shield the environment from noise. (d) Adverse environmental impacts of the system along its entire route must be minimized. (e) The system should lend itself to some utilization for cargo movement. (f) Interference between passenger and cargo movements at the airport should be minimized. The route selected is one that utilizes, for the most part, existing rights of way, and the calculated velocity schedule provides a 10-minute total travel time.

31 155548 RAPID TRANSIT AND THE PUBLIC INTEREST: A CASE STUDY OF THE SAN FRANCISCO PENINSULA. The original BART system was developed to encourage land development, but advertised to the public as a means of reducing auto congestion. During the construction of BART, its administration has been unable to successfully control costs or respond effectively to criticism or to local concerns. The methods used to subsidize BART (sales and property tax) are considered to be among the most regressive taxes. BART expansion on the Peninsula was conceived in order to facilitate BART extension to the San Francisco Airport. While serious questions remain to be answered before BART is extended to the airport, even more problems exist in the current plan to extend BART to Palo Alto. The San Mateo County Transit Development Project which studied transit improvements on the Peninsula eliminated the possibility of exploring options other than BART extension and then failed in its attempts to involve citizen participation. The resulting plan was developed to maximize its development potential, which would result in the destruction of low-income housing and small businesses along the system's path. New development would reverse a zero population growth trend in San Mateo county. The cost of BART in San Mateo county is not only underestimated, but cannot be met even given the most optimistic predictions of federal assistance. BART expansion to Palo Alto could not be completed before 1984. Present plans would result in abandonment of Southern Pacific service south of BART, thereby reducing transit service in Santa Clara County.

31 155556 A MASS TRANSIT MAN LOOKS AT THE FUTURE OF AIRPORT ACCESS. Alternatives to the private automobile are discussed and the advantages of buses and aircraft are considered. The advantage of using any system of public transportation is noted and the potential for reducing the trend towards permanent public subsidy is pointed out. Comments are made on the fixed guideway system, and the principal advantage of buses and aircraft over other means of airport access is that little or no new construction is required to occur. Where additional facilities are needed, such as downtown terminals or facilities at outlying airports, the additional construction is limited to the terminals itself and much of the work could be supported by the airlines which use the facility. An advantage of using any system of public transportation, is the distribution of the traffic load associated with well-wishes and welcomes. The promotion of adequate economical public transportation to the airport is urged.

31 155601 AIRPORT ACCESS AND CIRCULATION. Factors associated with environmental constraints in airport systems planning have led to an emphasis on airport ground access and intra-airport transit planning. The choice between highways and mass transit and the advantages

and disadvantages of each are considered. Rapid transit links which are unable to generate patronage are discussed with reference to the airport rapid transit connector in Cleveland, Ohio. A program to construct a TACV system between Dallas and Fort Worth connecting both cities with the new regional airport is noted. In Houston, private developers have built 4 satellite terminals on major transportation corridors in the metropolitan area. Transit service between the airport and the terminals is provided on 30-minute headways during 11 hours of the days. A number of innovative intra-airport circulation systems have been developed to shuttle passengers between remote parking areas and terminal buildings. The system operating in Tampa airport which is comparable to the system under development at the Seattle-Tacoma International Airport is described. A pace setter in airport development is the Houston International's underground transit system to connect the ground access parking facilities with 2 satellite terminals. The system provides service on 2-minute headways to 6 stations through the terminal area. The AIR-TRANS system at Dallas/Fort Worth airport is also described.

31 155664 A REVIEW OF TECHNIQUES FOR ESTIMATING AIRPORT LANDSIDE CAPACITY. Methods of analyzing capacity and delay are categorized (rules of thumb, analytical models, simulation models) and discussed with special reference to the elements and sub-elements (runway, taxiway, gates, terminal, curb, roadway, parking lots) of the airport system. Simulation methods of a proprietary nature tailored to a specific airport are used on taxiway, and terminal building elements. These methods which require good data inputs and are difficult to validate, do not estimate capacity but show how facilities might operate under predicted future usage or layout changes. Airport master plans which show a phased expansion of both the landside and airside for the airport, should contain estimates of the capacity of all of the landside elements for these various phases.

31 155677 GROUND TRANSPORTATION TO AIRPORTS. The subject of ground transportation to and at major air carrier airports has attracted much attention of transportation planners and airport authorities. In spite of many interesting studies few, if any, new or innovative airport access systems have been developed. There are various modes available for the transportation of people and goods to and from airports and within the airport terminal complex. Presently, the most widely used vehicle for airport travel in the United States is the private automobile. However, energy and resource constraints may very well, in the long range future, improve the viability of public transportation and rapid transit facilities as a means of airport access. The

optimum ground transportation system for a particular airport will depend primarily on characteristics of the airport market area and of air travelers, an airport layout and on the type and level of ground and air transportation services offered. Modern planning practices once the programs of federal agencies favor into-modal approaches to the solution of transportation problems. They will ultimately result in better utilization of advanced public transportation systems by people and goods for airport and air service access.

31 155707 PIPE-A NEW AIRPORT CONCEPT. At the heart of the new concept pipe is a simple, closed viaduct, a kind of traffic ring, round which all the important airport functions are grouped. The key word PIPE is intended to indicate that everything—passengers, aircraft crews, personnel, baggage, freight, supplies, waste etc.—converges on or diverges from this ring on several levels, by either conventional or automated transport systems. It is stressed that the system could be applied both the new airports and to airports that are being remodelled. All activities could be planned step by step. In the final account a reduction of at least 20 per cent could be expected in operating costs and capital expenditure. The concept involves better technical cooperation between the airlines, with the object of maintaining special services on a joint basis and thus saving personnel, time and money. All the basic elements would be treated in the same way, the various aircraft types, runways and taxiways, aprons and aircraft parking areas, passenger and freight terminal, control tower, air crew building, maintenance and personnel facilities, workshops, security and emergency systems, access roads and car parks. The apron is rectangular in shape and contains no areas that are difficult to use. Its size depends on aircraft movements on the ground, not on peculiar terminal shapes. Aircraft, grouped by categories, are all parked noise-in along the PIPE, with bridge connections. All separate aprons, taxiways or duplicate handling equipment. When the airport has a parallel runway system, the PIPE ring encloses all the elements. With other runway configurations the passenger terminal and car park lie outside the ring. Since there is today no justification for locating the freight terminal away from the passenger terminal, this building is situated within the operations area, at the point where wide-body aircraft dock. An internal transit system links all points of the operations area with one another. On the airside, taxiways laid out in a double ring, with one-way traffic, make for simple, safe aircraft movements. The grouping of aircraft into size categories reduces the amount of specialized ground operations personnel and the technical services required. And because all equipment is also centralized by sector, aircraft turn-around times should be shorter. A reduction in capital expenditure is obtained primarily by providing a single-level terminal building which can be extended step by step in the form of small modules. Costly baggage conveyor systems would be unnecessary. The apron could manage with a minimum of concrete area. Since the

airbridges are used only for specific aircraft types, considerable savings could also be made in this area. Another advantage of the linear aircraft positioning is to be found in the simpler fuelling and airfield lighting installations.

31 155761 THE CUSTOMER AND THE SURFACE PHASE OF AIR TRANSPORT. The ground aspects of air travel are considered along with the ground handling of air freight, the surface phase of air transport from the customer's point of view, questions of surface access to the airport, airport transit systems, airport ground speed, the balance of time and cost, the rationalization of ground services, and the relations between the airport and the charter passenger. Attention is also given to a user's analysis of airline ground problems, the interface problem as it affects the customer, the analysis and control of departing and arriving aircraft, and the organization of international airports.

31 155762 RAIL ACCESS TO MAJOR AIRPORTS. One of the most difficult problems faced by major airports in the future is likely to be the provision of adequate surface access and the interface with other transport systems. In this paper the need is examined to the increasingly to public transport to meet the requirements of surface transport in the future. It is shown that rail links have both attractions and drawbacks. The general worldwide aspects of the surface transport problem are illustrated by a discussion of the piccadilly underground extension to be opened in 1977 to the Heathrow Airport.

31 155910 MAPLIN-PLANNING ASPECTS AND THEIR INFLUENCE ON AIRPORT DESIGN. The paper deals first with the specific problems that are a direct outcome of the site choice, in particular the problems of access to the airport. Land-use planning for the reclaimed site is discussed, including the way in which the airport will develop in stages to its ultimate four runway configuration. The strategic planning of the terminal zone is dealt with in some detail, in particular the influence that rail access will have on the development of passenger facilities and vice versa. Inter-terminal movements and other communication requirements are discussed, showing how an integrated public transport system serving the airport link to principal areas of new urbanization and the seaport create both an opportunity and a challenge for the future.

31 155925 AIR PASSENGER TERMINAL PLANNING AND DESIGN. The primary function of a terminal is the transfer of passengers and their baggage between aircraft and ground transportation. Methods for planning and design of such terminals are discussed in this paper. Studies are now being made in Canada and elsewhere, considering airport access and passenger procedures as an integrated sequence of events from the home or office to the aircraft for departing and vice versa for arriving. Such considerations introduce the possibilities of off-site terminals or "in-city terminals", at which some passenger procedures could be conducted, with transit systems then accessing the terminal at the airport and the aircraft. Off-site terminals integrated with transit systems are also discussed.

31 155927 SEA-TAC INTERNATIONAL AIRPORT: SITE CONSTRAINTS DETERMINE TRANSIT SYSTEM AND STATION DESIGN. An airport is a system of elements all interacting on one another at various levels. It is not a service of discrete elements assembled on one site. The terminal design evolves from an analysis of the many aspects of passenger demand, site conditions, parking conditions, airline and other operational requirements, etc., and recognition of the extent to which these forces interact. This paper discusses the site constraints and physical requirements of the transit system as they interacted with the other airport requirements in the shaping of the design of the terminal area facilities and in the process shaped the transit system and station themselves.

31 156091 TRANSIT OPERATING STRATEGIES AND LEVELS OF SERVICE. This paper discusses strategies of transit operation, differentiating between the all-day service function and the peak-hour operations of providing traffic and parking relief. A general mode split formula in which the disutility of the car is equated to the disutility of transit is used to evaluate the relevant factors in the individual choice of transit mode. Various types of networks are examined. For cities with low densities of development the timed transfer system is shown to give maximum destination opportunity. The concept of levels of service is discussed from the point of view of the passenger. It is recommended that levels of service be studied in greater depth so that these factors could also be considered. /Author/

31 156095 PARK-AND-RIDE IN THE SHIRLEY HIGHWAY CORRIDOR. The market for fixed-route transit operations is not limited to travelers living within walking distance of transit stops. As demonstrated by the Shirley Highway Express-Bus-on-Freeway Project, well-planned park-and-ride operations can lead to sizeable increases in bus patronage. Park-and-riders, commuters who travel by automobile to a bus stop and then by bus to work, greatly expanded the market for the fixed-route bus service in the Shirley Highway corridor. After briefly describing the park-and-ride arrangements in this suburban corridor, this paper presents the results of an investigation of the perceptions and mode choice influences of the park-and-riders at two new lots. On-board surveys were used to determine the importance of 12 factors in the commuter's decision to switch from automobile to park-and-ride bus service. The users' subjective satisfaction assessments for these factors and their reported travel-time and costs savings (or losses) were also obtained. These results suggest that several factors in addition to time and cost should be considered in planning park-and-ride facilities. /Author/

31 156112 SPECIAL TRANSIT NEEDS PROGRAM IN THE DENVER METROPOLITAN AREA. The special transportation needs of people within Denver's Regional Transportation District who have limited mobility are being served by a program that includes special equipment for the handicapped, special midday shopper service for the elderly, and a plan to make regular service more accessible to these groups. The special equipment for vehicles that provide subscription service to handicapped patrons includes wheelchair lifts, lower-step entry, side destination signing, and several other special features. The needs of the elderly are met in part by special midday shopper service on a weekly schedule. A program to make the entire fleet of buses more accessible by retrofitting certain items, such as extendable steps, grabrails, and side destination signing, is under evaluation. The entire special-needs program is continually being reviewed, modified, and upgraded. /Author/

31 156139 BICYCLES FOR TRANSPORTATION. Surveys of travel characteristics for the surrounding areas of Chicago and Minneapolis/St. Paul, were conducted to determine the differences in commuting time and distances between the bicycle and the car. Although the bicycle averaged an extra 15 minutes to travel the 6.9 miles, average enroute times and door-to-door times differed more widely for the motorist than the cyclist. It is argued that the time spent

warming up the engine, locating a parking place at one's destination, and the walking distance to work could easily consume the motorists' 15 minute advantage. The author concludes that although the car provides a degree of freedom over mass transit, the bicyclist enjoys a further degree of freedom over the driver such as the freedom to travel a variety of routes, freedom from slow moving traffic on backups, and greater range of speeds to choose from.

31 156451 THE BRADFORD BUS STUDY 2. THE RESULTS: ROLE OF BUSES, ROUTING AND COSTING. Buses play an important role in Bradford, and on a typical weekday some 300000 passenger journeys are made in the greater Bradford area. The average passenger travels about 3 km and is aboard a bus for about nine minutes. The object of the study is to examine public transport services in the Bradford area and to consider how the bus services might be improved to provide reliable and attractive services more directly related to travel needs, with particular regard to the distribution of passengers in and adjacent to the central area. In discussing the results of this study the author places emphasis on the three main functions of the bus system--commercial, social and civic, and discusses the influence that the opening (early 1977) of the new Bradford transport interchange will have on rerouting. This interchange, located on the south side of the city centre, is described. It comprises a railway station, a bus station with six platforms and some 70 stands, and a bus depot. The costing of bus operations is reviewed against the background of the movement from a break-even position in the early 1970's to a 1.7 M deficit in 1974-75. The three main components of operating costs are described as crew costs, direct costs (fuel, oil, tyres etc.) and other costs such as management, vehicle maintenance, inspectors, etc. Each of these components is discussed in detail, and recommendations made concerning operational routines which it is suggested could facilitate updating and development of basic cost and revenue models. /TRRL/

31 157236 JAPAN'S URBAN TRANSPORTATION SYSTEM IN THE MAJOR TRANSPORT SPHERES. The urban areas in Japan have undergone rapid changes in the last two and one-half decades. At the same time, the urban transportation system has been faced with numerous problems which need to be solved urgently. This paper presents the development stage and

problems in the three largest metropolitan areas, designated as transport spheres, in Japan. Japan's problems in urban transportation are similar to those of most Western nations with regard to such issues as rapid urbanization, growth in travel, increasing auto ownership, growing transit operating deficits, rising wages and air pollution. The differences are the large modal split of transit from automobile trips, major expansion of the rail transit network, and the large number of transit operators in each urban area in Japan. In addition, governmental policies to help solve the urban transport problems are briefly described. In order to make the policies effective, coordination among government agencies is required. The establishment of a unified government agency is regarded as the first priority in dealing with the urban transport problem. It is expected that the government will offer bold new countermeasures to cope with urban transportation problems.

31 157255 A TRANSIT PLANNING METHODOLOGY FOR SMALL CITIES. This article, which describes a conceptual systems approach framework, describes the type and range of transit most effective in a small city and outlines a regression model which can be a starting point for ridership estimation. The transit system must possess flexibility and capability of expansion to accommodate the additional ridership which will be generated after a period of operation. Travel forecasts and continuous monitoring of the operation are essential. A route selection process is discussed and comments are made on scheduling. The fare structure and fare plans are considered and it is noted that they should be: demand oriented, logical and based on rational criteria, easy to remember, simple and preferably with a unistructure, and with minimum or preferably no transfer charge. Factors affecting the fleet size determination are discussed. Practical aspects of transit planning methodology are reviewed, and the use of a successive overlay technique for examining proposed route configuration is outlined. Selection of the final transit system is based on the evaluation of various elements such as fleet size, vehicle mix, scheduling, fare structure, and fare plans as well as economic analysis. Community goals are also important to the evaluation process.

31 157274 BICYCLES AND MASS TRANSIT. Bicycle parking facilities presently supplied by transit agencies in the U.S. and Canada are reviewed. Two aspects of the parking problem are discussed: storage, and protection from theft, vandalism and weather. Three basic types of facilities are currently supplied by transit systems: bicycle rack, hitching post, and the key-operated locker. The most common type of facility is the rack. Racks offered by the Lindenwold Line (Philadelphia-New Jersey), the Shaker Heights Rapid Transit System (Ohio), and the Toronto Transit Commission are discussed. The hitching post (steel or wood post with a 4-to 5-foot case

hardened steel chain) shows great promise. BART has installed 232 single and 610 double hitching posts. Similar facilities offered by MARTA and the Oregon State Highway Division are described. Lockers (fiberglass or steel made in a wedge shape) are offered by the Port Authority Transit Corporation and BART. Lockers offer protection from theft and vandalism. Some agencies (New Jersey-New York Path system and BART) are experimenting with allowing cyclists to bring their bicycles onboard the transit vehicle.

31 157420 PROJECT CONCERNING THE REINTRODUCTION OF TRAMWAYS IN THE CENTRAL BUSINESS DISTRICT IN SYDNEY [Project de tramway pour le centre d'affaires de sydney]. The last tramway ran in Sydney in 1961. It was replaced by diesel-engined buses. However the bus network has many disadvantages and a project is afoot to reintroduce tramways in the town. It is planned to do so in Pitt Street, a commercial street which would become a tramway/pedestrian precinct. It is envisaged that 20 tramways, two being reserve vehicles, would replace 45 buses and would do the return journey through Sydney in 28 minutes. /TRRL/

31 157488 A SURVEY AND REVIEW OF THE EXETER-BARNSTABLE RAILWAY SERVICE. The report is based on a survey of the Exeter-Barnstable railway line and shows that feeder-line traffic to an inter-city network can be sufficient to justify its retention. It is shown that revenue generated over the inter-city network as a result of the existence of such feeder-lines is often in excess of the operating loss assigned to the minor route. The study illustrates the dangers of passenger revenue reduction resulting from short-term cost savings being enforced in the form of local rail service closures. Recommendations are made for improvement of rural public transport services by retiming bus services to provide connections with train services. Suggestions are also made concerning the management and planning of a possible coach replacement for the feeder-line should the railway link be closed. /TRRL/

31 157836 PARKING REVENUE CONTROL. This report which describes some of the fundamentals of equipment and procedures in planning a new parking facility or establishing a good system of control in an existing one, also covers parking meter revenue security and control. The basic elements of revenue control are listed, and general security concepts are noted. The operation of the ticket issue machine is described. The induction loop detector, treadles, the rubber road tube (for secondary locations), parking gates,

time clocks, master clock, fee indicator, and differential counters are also described. Audit procedures are discussed, and the planning of revenue control systems for airport, event parking, and retail/business parking is outlined. Comments are made with regard to security, vandalism, meter housing, the coin collection system, parking meter standard, maintenance, the keeping of records, and surveillance.

31 157895 PLANNING CONSIDERATIONS FOR ALTERNATIVE TRANSIT ROUTE STRUCTURES. Planners wishing to achieve higher overall transit ridership should develop route structures oriented to larger and increasing segments of the spectrum of travel within a region rather than on those focusing on travel to the central business district. Examples are quoted in support of this theory. Network design configurations oriented to this objective include the grid and timed transfer system concepts. These multidestination systems with a significantly smaller deficit per passenger trip can theoretically attract more passengers than alternative radical systems. Models are used to illustrate four routing schemes: the radial method designed to connect all points in a metropolitan area with the downtown; the ubiquitous method; the grid method; and time transfer system which relies on schedules connections between routes and does not require the grid system's frequent service on most routes. The relative passenger appeal of the different systems, the relative costs, and the related land use considerations are discussed.

31 158296 OPTIMIZATION MODEL FOR DETERMINING HEADWAYS FOR TRANSIT ROUTES. The paper presents a technique for determining headways for transit routes. Based on an optimization approach, a chance constrained programming model is developed. The scope of using vehicles of different sizes and operating costs is built into the model, which attempts to minimize the total operating cost. The uncertainty associated with demand forecasts is expressed as a chance constraint that specifies the desired level of reliability with respect to the satisfaction of demand. The model also includes a constraint related to the management policy regarding the minimum service to be provided on a transit route. The deterministic equivalent of the model is solved by linear programming and its application is demonstrated with an example problem.

31 158703 ANNUAL REPORT, 1976 [Rept. for 1 Jan-31 Dec 76]. The document contains highlights of the year's accomplishments on: opening of Metro's first 4.6 miles, rerouting bus service to serve Rhode Island Avenue Station, opening of Gallery Place Station in December 1976, improvements in bus maintenance, renovations of garages, installation of two-way radios in all buses. 145 new buses were received from Flexible and placed in service to replace buses 14 years old or older. At the end of the year, the cost of building Metro had risen to \$5 billion. U.S. Urban Mass Transportation Administrator Robert Patricelli directed that certain Metro routes be analysed anew to determine if changes in circumstances made changes in plans, such as substitution of buses, or other transit service, advisable.

31 158941 PUBLIC TRANSPORTATION: PROBLEMS AND OPPORTUNITIES. The report is a collection of papers on urban transportation solutions that have been tried or are being proposed in North American cities and the specific urban transportation problems which they address. It is designed as a general overview on public transportation issues. The first article examines deficiencies in existing systems, relative use of urban transportation modes, characteristics of transit riders, the peaking problem, and categories of alternatives for improvement. Three other articles examine options for meeting urban

transportation needs: rail rapid transit, bus rapid transit, and para-transit. Emphasis is placed on defining the role in urban transportation each option can play and on summarizing system experiences with them.

31 158981 BART IMPACTS ON HIGHWAY TRAFFIC AND TRANSIT RIDERSHIP. The 71-mile Bay Area Rapid Transit (BART) System, serving San Francisco, Oakland, Berkeley, and their suburbs, is the first regional-scale rapid transit system to open in the United States in over 50 years. This report is one of a series assessing the impacts of BART on transportation and travel in the Bay Area. The report documents what changes in aggregate highway traffic volumes, traffic congestion, bus ridership, and bus services have taken place in the four years since BART started service; and assesses the extent to which these changes may be attributable to BART. 31 159353 MASS TRANSIT DEVELOPMENT FOR SMALL URBAN AREAS: A CASE STUDY, TOMPKINS COUNTY, NEW YORK. REPORT ON SECOND YEAR. The report presents the results of the second-year effort within a three-year research project to develop a transportation planning methodology for small urban areas concerned with the provision of public transportation service. This phase of the research concentrates on problems of access to health services, transportation service for the disadvantaged, potential coordination and integration of existing transportation systems, alternative systems designs and their evaluation, and suitable marketing and monitoring programs for public transportation service in small urban areas. This effort, will culminate in the preparation of a transit planning manual suitable for use by the transportation planner in small to medium-size urban areas.

31 159597 IMPROVING PEDESTRIAN ACCESS TO TRAIN PLATFORMS AT GRAND CENTRAL TERMINAL. A technical study of the feasibility of providing northern access for train passengers to the upper and lower level platform at Grand Central Terminal in Manhattan is reported. At present, access is available at the southern ends of the platforms only. The purposes of the study were to identify (a) the functions of Grand Central Terminal, (b) the best location for northern access pedestrian facilities, (c) the passageway widths required to handle peak volumes, and (d) the impacts of the recommended design on the movement of people and trains. Four types of surveys, an on-board rail passenger survey; a pedestrian interview survey; pedestrian volume counts; and special studies on pedestrian walking speeds; platform and train discharge times, and the number of encumbered persons, were conducted. Grand Central Terminal functions as an intermodal transfer facility, a link in the midtown pedestrian network, a commercial center, and an extension of the subway stations. The recommended improvement concept includes two east-west and two north-south passageways to serve both the upper and lower level platforms. The impacts of 25 and 50 percent increases in passengers on the widths required for the proposed passageways were estimated, based on evaluation criteria related to congestion, walking distances, travel times, railroad operations, handicapped persons, orientation, and capital and operating costs.

31 159601 MEASURING SERVICE DELIVERED BY TRANSPORTATION TERMINALS. A procedure for deriving an index of the adequacy of a design to provide a particular service is introduced and applied to the evaluation of passenger transportation terminal designs. The concept of the service rendered by a transportation terminal or facility is defined as the rendering of assistance to the users of the facility to satisfy their needs and purposes. The index presented here takes account of all the movements of a passenger from the moment of arrival at the terminal to his departure. All of the design features and impacts on service flow and organization are reflected in the index. The index combines all these occurrences in a logically and intuitively satisfactory way that may be tested against user valuations and refined until index

and valuations consistently agree. The determination of the ratio of number active and number helped, and the calculation of the index of service is detailed.

31 159784 PEDESTRIANISATION-THE PRINCIPLES AND PRACTICE. This paper discusses pedestrian areas created as a result of restricting vehicle access in previously all-purpose trafficked streets to certain times of the day. There are three main elements in the creation of pedestrian-dominated areas: strategic transportation, tactical traffic management and detailed design. The city of Leeds is used as an example to describe how problems of congestion caused by commuter and business traffic can be eased by a modal transfer from car to bus, achieving a more efficient use of highway capacity and space. However, buses and their services must be made more attractive. The recently completed scheme in Wakefield is given as an example of the form of traffic management often required before pedestrian-dominated areas can be created. A complete assessment of traffic conditions was needed. The author discusses factors deciding which order should be used to implement the pedestrianisation. All interested bodies should be consulted before any decisions are made. Details are given of several types of construction of paved areas that can be used. Future developments are indicated. /TRRL/

31 162972 THE RAILROAD AND THE CITY...A TECHNOLOGICAL AND URBANISTIC HISTORY OF CINCINNATI. This study assumes three stages in the evolution of the city with respect to urban circulation; they are, the horse-and-pedestrian phase, the railroad phase and the automotive phase. This book looks at the second phase in which technology was to become the primary determinant of the particular urban form and growth configuration that characterize the modern industrial city; and the railroad was to play a crucial and decisive role in this development. The very plan and network of the rails, the physical and geographical position of the tracks on the land and in the area came to dictate the surrounding urban fabric and the pattern of land use. Though the general history of the railway industry has been extensively treated, railroad technology has received only scant attention from serious historians. The role of civil engineering as it has applied specifically to railroads in the construction of right-of-ways, tracks, bridges, tunnels, sheds and towers, has been largely ignored.

31 163023 GEOGRAPHICAL PATTERNS OF RESIDENCE AND WORKPLACE SEPARATION. This paper analyzes the geographic patterns of residence and workplace separation in Knoxville, Tennessee that were determined from the implementation of a comprehensive computerized car-pool program. The information necessary to match individuals who have the same travel routes was found to be an excellent source of untapped geographic data. A complete sample of the commuting public was obtained by an employer-based survey procedure and machine-readable survey forms. A computer-mapping program was used to graphically portray the degree of residential work-force concentration in several disparate firms. These data were used to identify clusters of employees who had similar travel patterns that were sufficient to support a proposed van-pool system. Because the degree of labor-force dispersion varies among the firms analyzed, a policy toward plant location and mass transportation is developed. A tax structure is proposed that would penalize firms that contribute significantly to the costs to the community for congestion, pollution, and energy consumption. Similarly, firms that attempt to reduce the total vehicle-kilometers traveled by their employees are rewarded. Reductions can be induced by either relocating a plant or developing a successful ride-sharing program. /Author/

31 163173 PASSENGER REQUIREMENTS AT INTERCHANGES. Two aspects of interchanges are important to the passenger. The time spent there-transfer time and the standard of amenity within the interchange. Transfer time can be split into three sections: walk time, wait time and service time (ticket purchase, information collection etc.). Attitudinal studies have demonstrated that the passenger values wait time to be approximately 2.5 times in-vehicle time, walk time to be 1.5 times in-vehicle time and service time to have a similar value as in-vehicle time. An important reason for these high valuations is that the time spent in these activities is perceived by the passenger to be greater than the actual time involved. The disincentive of interchange can be reduced by minimising actual transfer times. Provision of a high standard of amenity may reduce the perceived nuisance of interchange. A pleasant interchange environment is also important in helping to create a favourable image for public transport. /Author/TRRL/

31 163877 MERSEYRAIL: LINK AND LOOP IN OPERATION. Brief details are given of the new Merseyrail link and loop underground railway system. British Rail's proposals envisaged the extension of the Mersey/Wirral lines in a loop under Liverpool city centre and the southerly extension of the existing Southport/Ormskirk lines under the city to link exchange and central stations. The effect of these two relatively simple underground lines would be to knit a number of unrelated radial routes together to form a basic integrated rapid-transit system with much improved interchange facilities. The loop and link lines are being brought into full use in stages during 1977. To achieve the north-south link the lines from Southport/Ormskirk have been diverted north of the exchange terminal into a new double track tunnel, through a station at Moorfields, providing an interchange with the loop, to continue into central low level station. Future plans for further extensions to the system are described. /TRRL/

31 163970 METRO TRAVEL INTERCHANGE, BRADFORD. Bradford City Interchange brings into one area all the out of town bus services, over 50 per cent of the local services, and all the railway services (except for services to Ilkley and Keighley). The development follows from decisions made by the City Council and British railway, and the planning considerations, architectural considerations and the provision of facilities within the interchange are described in this article. The interchange, as described, includes an underground car park for 48 cars; a bus station with six passenger islands and an overall roof, providing up to 62 bus stands of which 25

are for two buses each; a railway station with four passenger platforms, travel centre, red star parcel facilities and rail lost property; a coach park; a bus depot and maintenance workshops for 180 buses; offices and ancillary accommodation; a passenger concourse with associated amenities. In an appraisal of the facilities provided the author presents background information on the history of the development, which was completed at a cost of 16M and which is now owned and run by Metro, West Yorkshire's passenger transport executive. Details are provided on element costs, finishes and fittings, services, and the contractors involved in the construction of the project. /TRRL/

31 164150 IMPROVING STREET PUBLIC TRANSPORT--SOME POSSIBLE SOLUTIONS. The services provided by trams and buses are currently being adversely affected by increasing motor traffic congestion. The attractiveness of the service to passengers is reduced as traffic delays cause uneven headways and reduced travel speeds. Significant increases in public transport operating costs also occur. The extent of these delays, the various causes and effects, particularly in terms of 'pairing' and 'bunching' of vehicles, are discussed. Various means by which improvements could be brought about are discussed in terms of costs, effectiveness and impact on other road users. Particular reference is made to measures which have been implemented or investigated in Melbourne. /TRRL/

31 164268 OPTIMUM AIRPORT TERMINAL LAYOUT PLANNING. This paper reports on the development of an heuristic algorithm for designing airport terminal layouts. Current practice of generating layouts depends heavily on past designs and intuition. No formal design method exists. This algorithm was devised to assist the designer quantitatively. The airport terminal is represented by a set of four types of components connected by a set of links. The components in turn are represented by equations of circles which are manipulated in accordance with the principles of analytic geometry. The result is a physical layout of each floor of the terminal building. Each layout is optimal in that total passenger movement is minimized.(a) /TRRL/

31 165567 BICYCLE FACILITIES FOR AUSTRALIAN CAPITAL CITIES. A case for providing bicycle facilities to encourage cycling can be made in terms of: transport efficiency, equity, amenity and reduction in cyclists road accident trauma. Facilities are currently inadequate for both safe movement and secure storage, thus deterring the greater use of bicycles. A low cost solution, to the provision of facilities for movement, is to base the network on existing quiet residential streets. To develop a continuous network however, it would be necessary to 'breach' discontinuities such as public reserves and private property with bike path easements. Bicycle networks should be developed to serve local travel to schools, work places, recreation facilities, shop and public transport terminals with secure storage facilities provided at these activity centres. Preliminary costing indicates that the proposed system of routes, paths and storage facilities, would cost just over \$77 million. Operating cost savings that would accrue to current private motor vehicle users alone, predicted to transfer from car to bicycle for some short local trips, is calculated at just over \$44 million per year. Accordingly it is concluded that a strong case exists for public investment in bicycle facilities. /Author/TRRL/

31 165568 BUS PRIORITY PLANNING IN ADELAIDE. A review is made of some features which can be used to improve the capacity of the urban road transport system, particularly during peak periods, to carry larger volumes of people, with only small capital investments. The review considers work done in Adelaide on ways of

improving bus operations in that city. Features which are expected to reduce the length and variance of bus travel times, such as traffic signal modifications and reserved lanes are described and discussed. /TRRL/

Bray, DJ (South Australia Department of Transport) ; Victoria Ministry of Transport, Australia Proceeding May 1977, 15 pp, 2 Fig., Refs.; Proceeding of the 3rd Annual Meeting of the Australian Transport Research Forum--"Getting the Best Use From the Transport Infrastructure" Melbourne, Australia, May 24-25, 1977.; ACKNOWLEDGMENT: TRRL (IRRD 227889), Australian Road Research Board

31 165576 PEDESTRIAN NETWORK IN THE ADELAIDE CORE AREA. A major step in providing a pedestrian network throughout the Adelaide core area occurred when Rundle street was converted to a pedestrian mall last October. This had the effect of creating a pedestrian precinct of 14 hectares in the most highly developed part of the city. Although detailed studies aimed at converting Rundle street to a mall were only commenced in 1972 the project was the logical outcome of a series of other studies, dealing largely with transportation and parking, which began in the early 1960'S. The policies developed and the action taken as a result of the studies are described. In brief the policies have been directed towards improving the accessibility of the core area. This has resulted in a unique and extensive off street parking system which is now a fundamental component of the pedestrian precinct. The priorities for extending the pedestrian network throughout the core area have been established and are described. /TRRL/

31 165686 ON DAVIDSON'S FLOW RATE-TRAVEL TIME RELATIONSHIP. Davidson's flow rate-travel time relationship has often been cited as a simple and convenient model for traffic flows on urban roads. However, only limited quantitative application of the model has been reported. One possible explanation for this observation could be the apparent difficulty in obtaining values for the model parameters. This paper gives a method for the simultaneous analytical determination of least squares estimates of the parameters. The method yields a surprisingly simple result. An application of Davidson's relationship to a short section of arterial road with centre tram lines, and containing a tram stop, is described. This application yields results which support a common assumption that the traffic capacity of an arterial road with trams is significantly less than an equivalent arterial road without trams. Under 'clearway' conditions, a maximum possible one-way flow rate of about 2600 veh/h is suggested for the arterial road shared by trams and motor vehicles. The test section studied was a single carriageway road, pavement width 13.4 M, and had centre tram lines. /Author/TRRL/

31 165737 BUS/CARPOOL LANES ROUTE 101 MARIN COUNTY EVALUATION REPORT, DECEMBER 1974-DECEMBER 1976. This report evaluates the operation of the High Occupancy Vehicle (HOV) lanes on Route 101 between the Richardson Bay Bridge and Greenbrae in Marin County. It covers the operation of the HOV lanes while operated as exclusive bus lanes only as lanes reserved for buses and carpools of three or more occupants. The report discusses the HOV lanes impact on travel, modal shift, highway operation, bus transit operation, safety, air quality, energy consumption, and public reaction to the HOV lanes. /FHWA/

31 165805 EVALUATION OF ALTERNATIVE CONCEPTS FOR PRIORITY USE OF URBAN FREEWAYS IN TEXAS. This report presents an evaluation of priority techniques for Texas freeways, including exclusive lanes, contraflow reserved lanes, concurrent flow reserved lanes, priority entry and priority treatment on frontage roads. A literature review was conducted, and from this, characteristics of priority techniques on U. S. freeways were documented. Based on analysis of these data, an evaluation of techniques was made for Texas freeways. /Author/

31 167193 THE POTENTIAL FOR HELICOPTER PASSENGER SERVICE IN MAJOR URBAN AREAS. An interurban helicopter cost model having the capability of selecting an efficient helicopter network for a given city in terms of service and total operating costs was developed. This model which is based upon the relationship between total and direct operating costs and the number of block hours of helicopter operation is compiled in terms of a computer program which simulates the operation of an intracity helicopter fleet over a given network. When applied to specific urban areas, the model produces results in terms of a break-even air passenger market penetration rate, which is the percent of the air travelers in each of those areas that must patronize the helicopter network to make it break even commercially. A total of twenty major metropolitan areas are analyzed and are ranked initially according to cost per seat mile and then according to break-even penetration rate.

31 167308 SUMMARY REPORT: WORKSHOP ON VEHICLE RIDE QUALITY HELD AT WILLIAMSBURG, VIRGINIA ON AUGUST 13-15, 1975. The workshops were conducted to review the information presented at the 1975 Ride Quality Symposium held during August 11-12, and to assess the state of the art in ride quality as surmised by various workshop participants. The proceedings are organized according to the main topics discussed by the four workshop groups: accomplishments in ride quality research, needs of the transportation community, ride quality research techniques, and ride and environment control techniques. In addition, an appendix on scaling techniques and a list of workshop participants are included.

31 167336 URBAN CORRIDOR DEMONSTRATION PROGRAM. CORRIDOR EVALUATION [Final rept.]. Manhattan CBD-North Jersey Corridorwide Improvements have been significant. Over the course of the Urban Corridor Demonstration Program in the Manhattan CBD-North Jersey Corridor millions of vehicle miles have been saved per year by fringe parking, 25-37 million passenger hours per year have been saved by the exclusive bus lane, and approximately 625,000 passengers annually enjoy a more direct and faster trip into the CBD because of the bus reroutes. Other projects include I-495 bus priority traffic management system, Route 3 BPTMS and traffic control demonstrations, and automatic bus identification. Coordination among numerous agencies was involved with each project. Fringe parking, exclusive bus lanes, and the rerouting of buses in Midtown Manhattan CBD to better distribute travelers to and from the Port Authority Bus Terminal amounted to a successful experiment in bus passenger carrying effectiveness.

31 168058 SEA-BUS UNJAMS VANCOUVER'S TRAFFIC. An innovative high-speed ferry system that links the city of Vancouver to the residential area of North Vancouver to the north across Burrard Inlet is taking motorists off jammed city streets and freeing commuter buses to work in other sections of the metropolitan area. This successful project showed that Canadian consumers would use public conveyances if the services were attractive. The design of the vessels and terminals follows rapid transit principles in order that passengers may board and alight quickly. Because the ferries are faster than the bus for many North Vancouver residents, a certain number of transit vehicles have been reassigned to improve local bus services and provide additional bridge services where needed. The relation of the waterborne system with the bus system and the planned development of the entire Vancouver transportation pattern have been carefully thought out. The integrated bus and ferry transit services were planned by a tripartite group consisting of the British Columbia Hydro, the Municipal Affairs and Housing Department, and the Greater Vancouver Regional District. Based on the one-way trip, present projections for one year after service start-up are for 7,500 passengers to be carried on a typical weekday, at a peak-period frequency of 10 minutes. This represents about one-seventh of the ultimate system capacity. During the two hour peak period, the ferry can transport 1,500 people, the equivalent of 1,000 automobiles carrying 1.5 travelers each.

31 168072 ROLE OF SIMULATION MODELS IN THE TRANSIT-STATION DESIGN PROCESS. This paper summarizes the ways in which a transit-station simulation model could be developed to function as a more integral part of the design process. It examines in detail the interface of the user with the model. Specific problems dealing with network and spatial representation are discussed, and the model output is matched with the information needs of the designer at the appropriate stages in the design process. The paper concludes with a discussion of the cost-effectiveness of station-simulation models. /Author/

31 168904 TRAVEL IN THE BART SERVICE AREA. BART, the 71-mile Bay Area Rapid Transit System, serving San Francisco, Oakland,

Berkeley, and their suburbs, is the first regional-scale rapid transit system to open in the United States in over 50 years. This report is one of a series assessing the impacts of BART on transportation and travel in the Bay Area. The report analyzes the results of two travel surveys: (1) the May 1976 BART Passenger Profile Survey, an on-route self-completion questionnaire survey of 8,000 BART riders, and (2) the BART Impact Program May 1975 Areawide Travel Survey, a telephone interview survey of 1,000 individuals in the BART service area. The report presents information on the socioeconomic characteristics of BART, bus, and automobile travelers, the purposes and other characteristics of their trips, and the shares of areawide travel carried by the modes.

31 169193 MONITORING THE EFFECTS OF THE DALLAS/FORT WORTH REGIONAL AIRPORT. VOLUME I. GROUND TRANSPORTATION IMPACTS. The report presents new conceptual and methodological approaches to developing models to interrelate airline schedules, airport-based employee work-shift schedules, and airport access ground traffic volumes in any time period for a given report. The results of a survey of ground travel at the Dallas/Fort Worth Regional Airport are presented and analyzed. Specific ground transportation impacts of the installation of this relatively new airport are assessed. Models are described which (1) express volumes of automobiles carrying airline passengers and visitors as a function of airline schedules and (2) transform existing or future employee work-shift schedules into estimates of incoming and outgoing employee vehicle volumes in any time interval. Preliminary research toward the development of a model to estimate public transit passenger volumes as a function of airline passenger volumes is also described.

31 170264 THE FORGOTTEN RESOURCE..-URBAN WATERBORNE TRANSPORTATION. This paper proposes a system, including high-speed ferries, feeder barges and satellite terminals, which would be integrated into the existing transportation patterns and result in many benefits at a relatively low cost. Making use of right-of-ways, which would require practically no cost to establish and maintain, the ferries could provide many time-saving shortcuts for the public. Also commuters could travel in more pleasant, less crowded surroundings. These ferries, in some instances, could be used to relieve the pressure on existing transportation systems, and thereby ease the need for costly expansions. Cargo movements between the major marine terminals and strategically located, satellite terminals could reduce the truck traffic through the cities by using self-propelled barges, or barge tows, to deliver cargo (preferably containerized). Trucking of the cargo could then be confined to the local regions served by the satellite terminals. Besides the cost saving features, other benefits of using these waterways would include reductions of city traffic, accidents, road maintenance, air pollution and possibly hijackings. These benefits should not be overlooked in planning urban transportation systems.

31 170266 THE ROLE OF WATERBORNE TRANSIT IN THE NEW YORK METROPOLITAN AREA. Provides an estimate of what the author's company believes is needed to provide adequate commuter and recreational transportation between the North Jersey Coast and Lower Manhattan. With the present congested highways, the only reasonable alternative lies in the waterways. A current analysis indicates the need for an overall integration of ferry services so as to meet the weekly and seasonal variations in passenger travel patterns with the minimum capital investment. The economic realities of the current times compel an examination of the most cost effective means of waterborne transportation. Rather than employ high energy consumers such as SES and hydrofoils, it is believed that semi-planing displacement hull offer the best solution. Currently in the planning stage is the design of a 30 mph semi-planing catamaran ferry with a capacity of 1500 passengers. An alternate, more conventional design of equal capacity and speed based on the Nickum & Spaulding GOLDEN GATE high speed water-jet commuter boats is a serious candidate. In the future, consideration should be given to ferry boats that can handle up to 10,000 passengers and travel at a speed of 20 miles per hour. Some of the conceptual designs are presented so that one can

get a better picture of the types of ferries that the studies have produced to date.

31 170267 SEABUS. The passenger-catamarans "Burrard Otter" and "Burrard Beaver" are the focal point of an integrated land-marine transportation link across Burrard Inlet, British Columbia. The water route is 1.75 nautical miles and links North Vancouver, a bedroom community with some industry, to Vancouver, the business center of British Columbia. The surrounding population is approximately 1,179,000. The official population of North Vancouver is 60,000, and the population of Vancouver is 500,000. The North Vancouver marine terminal is also a land bus interchange, while the Vancouver side forms a land bus pick-up up-drop off point only. The Seabus system includes, besides an operating organization of 65 people; two 400-passenger ferries, two floating flow-through terminals, each of which is "E" shaped with two slips, an administration-maintenance building, and maintenance and overhaul berths. The system has been designed to expand to a total of 8 ferries when required. Average usage per day is approximately 14,000 with the expected morning and afternoon peaks and an unexpected evening peak. These usage figures are based on two months of initial service which commenced on June 17, 1977. A private ferry operation closed down 19 years previously and the cross inlet traffic has been handled by two bridges until this point in time. Design of the system and hardware, by Case Existological Laboratories Ltd., began in October of 1974. Operation of the system began 32 months later. Seven contracts worth \$35,000,000, and the organizing and training of the personnel occurred during this intense 32-month period. Even more interesting during this period was a radical change of government half way through the design and construction phase and three months of construction strikes. Public acceptance has been excellent, and an attractive marine option to the automobile has been firmly established in the North Vancouver-Vancouver area.

Case, JN (Case Existological Laboratories Limited) ; American Society of Civil Engineers Proceeding 1977; Proceedings of Second International Waterborne Transportation Conference, October 5-7, 1977, New York City. 31 170270 TUG AND BARGE COMBINATIONS FOR MARINE PASSENGER TRANSPORTATION. The development of large scale recreation complexes on the nation's waterfronts portends a return to waterborne transit as a means of access. In the New York City Metropolitan Region, Gateway, Liberty Park and the Palisades Interstate Park systems exemplify these sizable recreation/open space resources with waterborne Transit potential. Reinforcing the concept of barges for passenger transporta-

tion is the emergence of new technology barge/tug linkage systems. At least five or six of these systems have a direct application to passenger movement. Because of the relative slow speed (10-15 knots), the barge/tug system is acceptable for recreation trips; but not for journey to work. Cost savings are achievable over comparable sized conventional self-propelled excursion boats. Cost savings are estimated in the magnitude of 20% for operating costs and 12% for capital costs. Scenarios have been prepared for a fleet of 3 tugs and 4 barges providing transit capacity of some 10,000 daily person trips. Regulatory, safety, operating and capital cost estimates and a host of other considerations and criteria point to the use of barge/tug combinations for large scale waterborne access. The paper recommends that this concept be demonstrated.

Phraner, SD (Tri-State Regional Planning Commission); American Society of Civil Engineers Proceeding 1977; Proceedings of Second International Waterborne Transportation Conference, October 5-7, 1977, New York City. 31 170272 JETFOILS. The JETFOIL is a second generation hydrofoil which employs gas turbine driven waterjets for propulsion, fully submerged hydrofoils to develop lift, and an automatic stabilization and control system to produce an excellent ride quality in rough water. In commercial passenger service throughout the world, the JETFOILS have carried two million passengers approximately 100 million passenger miles reliably and dependably. Passenger acceptance of the wide body comfort, smooth ride and cruise speed of 50 miles an hour has been extremely high and load factors have continued to increase. The JETFOIL is environmentally clean, it is quiet and it can be used in congested areas safely and without imposing itself in any way on other users of the marine environment either pleasure or commercial. The primary emphasis of this presentation is to describe the in-service experience of this relatively new and highly advanced marine vehicle and to show how the craft could be used in Metropolitan transit operations. Several specific analyses of operations presently under consideration are shown and the economic aspects discussed. The presentation also deals with some of the key technical considerations which are likely to determine the economic viability of any advanced marine system and therefore determine the ultimate success or failure of the system. (Extensive use was made of films and slides.)

Shultz, WM; American Society of Civil Engineers Proceeding 1977; Proceedings of Second International Waterborne Transportation Conference, October 5-7, 1977, New York City. 31 170276 FERRY BUS/TRANSIT SYSTEM. The presentation describes the growing automobile congestion within the Golden Gate Corridor, which is located across the Golden Gate bridge to the north of San Francisco, and reviews the innovative approach undertaken by the Golden

Gate Bridge, Highway and Transportation District to solve the problem with a mass transit system consisting of a combination of ferries and buses. A brief review is given of the planning and design criteria used in the selection of vessel type and related terminal facilities. Three new high-speed, 165-foot, 750-passenger, vessels are presently in operation between San Francisco and central Marin County. These vessels are of aluminum construction, with a 28-knot power package consisting of gas turbine engines coupled to water jet pumps. Two new modern marine passenger terminals are also discussed, one of which is now in operation, and the other to be completed in the Spring of 1978.

31 170277 HOVERMARINES--THE DEVELOPMENT AND STATUS OF THE HM.2 AND HM.5. The paper describes the development of the sidewall hovercraft or surface effect ship as a commercial high-speed passenger hoverferry or "Hovermarine". Early work in the U.K. and U.S. is traced to the introduction in 1968 of the first Hovermarine--the 60 passenger HM.2. That prototype craft with limited sea state capacity developed through eight years of passenger service and two distinct "model changeovers" into the current 84-92 passenger Mark 4 waterbus with greatly improved passenger comfort and system reliability, while maintaining the initially conceived high-speed operational efficiency. This HM.2 development in increased payload, extended sea state capability and improved ride quality is reviewed and quantified. The now standard 40 mph HM.2 has an 18,000 disposable load capability which lends itself readily to roles other than pure passenger carrying. Designs using the standard hull but configured for crew boat, survey and firefighting missions are presented. The 200 million in-service passenger miles experience gained on the 28 ton HM.2 served as the principal development background to the 220 passenger, 80 ton HM.5 Hovermarine, the prototype of which is now in construction. The characteristics of the HM.5 are presented, and the Hovermarine series craft are reviewed on basic parametric terms with other types of high-speed marine vehicles. This review extends the Hovermarine concept to the 500 ton region. Hovermarines are finally discussed in regard to their capability as "waterbuses" in alleviating the currently favored, but tremendously expensive land-based roadway and fixed guideway solutions to the U.S. mass transit problem in spite of the fact that waterways serving most large cities remain underutilized.

Davison, EF (Hovermarine Corporation); American Society of Civil Engineers Proceeding 1977 Proceedings of Second International Waterborne Transportation Conference, October 5-7, 1977, New York City. Available April, 1978, approximately 750 pages, Cost: to ASCE members \$15.00; non-members \$30.00.; ACKNOWLEDGMENT: ASCE; ORDER FROM: ASCE

31 170786 THE ECONOMICS OF WATER TRANSPORTATION FOR SOUTH SHORE WORK TRIP COMMUTERS TO BOSTON. In this paper an economic analysis is undertaken to examine the feasibility of utilizing two-HM. 2 Hoverferry(s) or an S-120 displacement vessel in order to satisfy the travel demand of work trip commuters between Hingham and Boston, Mass. Level-of-service, system costs, cost and demand curves, financing arrangements and potential risks are discussed. It is indicated that the implementation of either one of the watercraft solely for work trip commuters to Boston is a high risk venture.

Curtis, F (Queen's University, Canada); American Society of Civil Engineers Proceeding 1977 Proceedings of Second International Waterborne Transportation Conference, October 5-7, 1977, New York City. 31 170794 WATERBORNE TRANSPORTATION FOR RECREATION. Waterborne transport is often environmentally preferable to other travel modes. Such systems are becoming necessary because use of surface transit, especially the private auto, is being discouraged in many seashore recreation areas including the Fire Island National Seashore. A recently completed transportation study of ferry transport to Fire Island from alternative embarkation points on Long Island is discussed. Three public recreation areas are to be developed on Fire Island for 5,000 daily visitors. Existing ferry service will be expanded requiring the acquisition of mainland property for visitor parking, reception facilities, and ferry loading docks. Several sites along the shoreline were identified and evaluated for possible use. The primary criteria in the final site selection were environmental suitability and public acceptance. Alternative vessel types were considered but environmental constraints suggested moderate-sized, slow-speed conventional hull crafts. Round-trip costs per passenger are estimated to be \$1.60 to \$3.75, depending on the route, for the most cost-effective system. The National Park Service is now finalizing the plan and will soon initiate its development.

31 170800 SES PROGRAMS, CIVILIAN APPLICATION. Waterborne transportation has long played an important role in the United States. It has not, however, taken advantage of technical advancements achieved in the past 20 years in the development of amphibious air cushion vehicles (ACV) and surface effect ships (SES). These craft employ the air cushion principle where a volume of pressurized air is contained beneath the structure of a craft and the water surface thereby reducing resistance, improving ride quality and passenger comfort, and enabling higher speed. The amphibious fully-skirted air cushion vehicles have evolved in both England and the United States. The United States, how-

ever, has clearly led in the development of the partially-skirted, solid-sidewall surface effect ship, primarily oriented to military requirements. This paper examines the implications of this type vessel for civil applications. The fundamental characteristics of SESs are examined in comparison to planing hulls and hydrofoils. Those characteristics of the SES that should be of interest to owners and operators are reviewed and commented upon. Specific performance capabilities of SES boats of 65, 85, 110, and 133 feet are presented, as well as discussions regarding the associated machinery. Fundamental information regarding hull material selection for SESs is also presented.

31 170836 GENERATION OF 1995 INTRA-URBAN PERSON TRAVEL DEMAND FOR AIR CARRIER AIRPORTS. A brief outline of a method for the long term estimation of the total number of ground journeys generated by a major airport is presented. Ground trips made by airline passengers and by associated staff necessary to service the airport are both included. The method is applied in the article to forecasts for the years 1985 and 1995 for two airports in the Chicago area--Midway and O'Hare. Such a method can be used in planning future highway and mass transit provision for airports as part of a total transportation system for an urban area.

31 170878 THE SANTA MONICA FREEWAY DIAMOND LANES VOLUME I: SUMMARY. The Santa Monica Freeway Diamond Lanes, a pair of concurrent-flow preferential lanes for buses and carpools linking the City of Santa Monica, California, with the Los Angeles CBD, operated amid much controversy for 21 weeks until the U.S. District Court halted the project. The project marked the first time preferential lanes had been created by taking busy freeway lanes out of existing service and dedicating them to the exclusive use of high-occupancy vehicles. This report which summarizes the findings of the official evaluation of the project, addresses a broad range of project impacts in the following major areas: Traffic speeds and travel times; traffic volumes and carpool information; bus operations and ridership-safety and enforcement; energy and air quality; and public attitudes and response. Analysis shows that the project succeeded in increasing carpool ridership by 65% and the increased bus service accompanying the Diamond Lanes caused bus ridership to more than triple. Nonetheless, energy savings and air quality improvements were insignificant, freeway accidents increased significantly, noncarpoolers lost far more time than carpools gained, and a

heated public outcry developed which has delayed the implementation of other preferential treatment projects in S. California.

31 173690 A STUDY OF GENERAL AVIATION IN THE SOUTH EAST OF ENGLAND. The purpose of this study was to collect facts concerning general aviation (GA) in the South East, to present forecasts of potential demand arising within the study area in the period 1985, and to review these forecasts in the light of volume and type of ground facilities available to general aviation users. The report analyses the demand for GA facilities, the rational of recreational and business flying, the need of the user, the available facilities, and future prospects. The report indicates that both exclusive business and air taxi operations are likely to continue to grow; fuel price increases are not expected to have a major effect on this particular type of flying; and, some growth is forecast for third level services and other fixed wing GA operations. It is noted that although the requirements of the different users vary considerably, there is still a shared use of certain facilities. Finally a comparison is made between the magnitude of precast demand and the size and capacity in aviation terms of the 67 airfields classified in this report showing which airfield, could in principle accept the different classes of traffic.

31 174509 FAA AVIATION FORECASTS. FISCAL YEARS 1978-1989. This report contains the fiscal years 1978 to 1989 Federal Aviation Administration (FAA) forecasts of aviation activity and measures of workload at FAA facilities. These include airports with FAA control towers, air route traffic control centers, and flight service stations. Detailed forecasts were made for the four major users of the national aviation system: air carriers, air taxi, general aviation and the military. This report also contains for the first time a specific forecast for commuter airlines. The forecasts have been prepared to meet the budget and manpower planning needs of the constituent units of FAA and to provide information that can be used by state and local authorities, by the aviation industry and the general public. The overall outlook throughout the forecast period is for moderate economic growth, declining unemployment, and decreasing inflation. Based on these assumptions, aviation activity is forecast to increase by Fiscal Year 1982 by 29 percent at towered airports, 32 percent at air route traffic control centers and 49 percent in flight services performed. The corresponding percentage increases for Fiscal Year 1989 are 49, 64 and 104, respectively. General aviation and air

taxi (including commuters) will account for most of the growth in activity at FAA facilities. (Author)

31 174673 SAN BERNARDINO FREEWAY EXPRESS BUSWAY EVALUATION OF MIXED-MODE OPERATIONS INTERIM REPORT-STAGE 1. The report evaluates mixed mode operations on the San Bernardino Freeway Express Busway. Carpools having three or more occupants, and vanpools began sharing the Busway with buses in October 1976. Preliminary findings for the first eight months of operation using the easterly seven mile segment of the Busway are documented. Carpool volumes have grown to about 900 cars per peak four hour period and have an observed occupancy of 3.3 persons per car, or about 3000 daily carpools. Bus ridership has not been noticeably affected, and total person-volumes over the 4-hour peak now slightly exceed the average volume on one adjacent freeway lane. During the one-hour peak, it is about double the person-volume and is still well below capacity. About 30 percent of carpools surveyed felt that their carpool formed because the busway opened for carpool use.

31 175894 URBAN TRAVEL DEMAND FORECASTING PROJECT PHASE I FINAL REPORT SERIES, VOLUME V. DEMAND MODEL ESTIMATION AND VALIDATION. The project attempts to provide transportation engineers and planners with the information necessary to select and use policy-oriented disaggregate behavioral travel demand models, and to assess the applicability and limits of specific alternative models. This volume is devoted to the investigations of demand, forming the core of this project. Data are collected on a sample of individual commuters in the San Francisco Bay Area before the initiation of Bay Area Rapid

Transit (BART) service. BART patronage is predicted from demand models fitted to the pre-BART data. The predictions are compared with actual BART patronage, using a second survey taken after BART was in service. Attention is concentrated on work mode-choice. These studies demonstrate disaggregate travel demand forecasting to be a practical policy analysis tool. The limitations of the current generation of these models are spelled out, and suggest that considerable care is needed in their application to new mode forecasting, and in transferring models across populations.

31 176768 PARKING GARAGE PLANNING AND OPERATION. This monograph discusses parking structure planning, functional design, and operation. Emphasis is placed on current parking garage practice; however, trends are noted and parking issues are overviewed in national perspective. An attempt is made to show how parking garage, design, and operation relate to people and the urban environment. Chapter II discusses the role of parking in the total urban transportation system as it relates the growing concern over social and environmental consequences, and energy conservation implications in urban motor travel. It also outlines the key studies and analyses relating to identifying needs, evaluating usage, and determining feasibility. Chapter III presents planning and development guides, design factors, and general parameters. Chapters IV and V deal with the functional design of parking garages and alternative types of interfloor travel systems, while Chapter VI present pedestrian considerations. Operational practices are related in Chapter VII to economic efficiency and characteristics of demand.

31 178516 BICYCLES IN MARYLAND: LEGAL ISSUES. The purpose of this report is to examine the inadequacies in the existing state laws as they affect the growing number of people owning and using bicycles for transportation. Issues in the areas of bicycle operation, bikeway and bicycle facility construction and maintenance, and bicycle registration are discussed. This report is intended to supplement and support the work of the Citizens Bicycle Study Committee which was organized for the purpose of reviewing bicycle concerns and making recommendations to the General Assembly. The report notes that legislative and policy reform can do much to promote bicycle use. By providing more bikeways and parking facilities, making provisions for cyclists in mass transit stations and on mass transit vehicles, revising inadequate rules of the road, and improving bikeway construction standards and maintenance, legislation can be used not only to improve conditions for present cyclists, but also to encourage others to begin cycling or to cycle more often.

31 178734 NARITA: CONTROVERSIAL OPENING ONLY THE START OF DIFFICULTIES. Besides the physically violent opposition from extremist groups that has delayed its opening for years, Tokyo's new international airport faces other problems as well, and, in fact, serves as an admonition to others on the need for long-term planning in the construction of major termini. Narita is extremely far from the city it serves (It is second only to Sao Paulo International in this respect), being 40 miles from downtown Tokyo and relatively inaccessible. The only means of public transport to the airport from Tokyo are a train to Narita City followed by a 20 minute bus ride or a direct bus route which can take anywhere from 70 minutes to an hour and one half. Furthermore, there is local opposition to a proposed fuel pipeline from Chiba, thus leaving Narita's ever having a suitable fuel supply system in doubt. Among the problems regarding flight operations at Narita is that of restricted air space, what with its being surrounded by three major facilities (Haneda Airport plus two air force bases-one American, one Japanese). It is feared that the intricate procedures required in such a complex environment could lead to pilot error, especially by foreign crews. Although most international flights currently at Haneda will move to Narita, the airport will be obliged to limit the number of flights far below its capacity because of fuel supply, air space, and curfew problems. Narita has also come under fire from the airlines for its high landing fees and its severely limiting the number of additional airlines that can use the airport.

31 178746 A STUDY OF PASSENGER TRANSFER FACILITIES (ABRIDGMENT). Throughout the country, a considerable effort is being made to improve public transit. However, one element of the total transit system which has not been studied at any level of detail and which has not improved to any great extent is the passenger transfer facility. The success of transit is going to depend on improvements made to all segments of the system, including safe, convenient transfer facilities. This study includes an inventory of facilities in some larger communities in New England, and a classification of facilities by size of area served and extent of system. According to an attitude survey, transit operators see a need for improved transfer facilities, minimized transfer times, and provision of shelters. The survey showed that pulsating systems had the highest number of transfers, averaging 27 percent; while transfers on non-pulsating systems generally averaged about 6 percent. The study concludes that transfer facilities must be improved to make transit more efficient and to encourage usage. /Author/

31 178756 SOUTHEAST EXPRESSWAY RESERVED LANE FOR BUSES AND CARPOOLS. The northbound left lane of the heavily congested Expressway was reserved on a voluntary, unenforced basis, for buses and 3-or-more-occupant carpools during the morning peak period 6:30-9:30 A.M. This was Phase 1 of an effort to raise the vehicle occupancy of the highest volume roadway in Massachusetts in anticipation of several years of reconstruction of all bridge decks on and over the Expressway. Phase 2 of Reserved Lane operation began by carrying the Reserved Lane through a three-lane construction bottleneck and detour at its northern end. In Phase 3, the 3-or-more-occupant per vehicle requirement was enforced. The operation of the voluntary lane in Phase 1 increased carpooling on the Expressway by 38 and 72 percent in the 3 hour A.M. peak period and peak hour respectively. In the peak hour, 184 more people were carried in 429 fewer vehicles. Fifty percent of the peak hour persons using the Expressway during Phase 2 were carried in the free flowing Reserved Lane. The entire Expressway operated in Phases 1 and 2 with less congestion than before, no increase in accidents and no measurable impact on alternate surface street traffic attributable to the Lane itself. During the Phase 1 peak period, over 50 percent of the reduction in autos on the Expressway was accounted for by increased vehicle occupancy on the Expressway itself. Rail transit ridership in the corridor increased. Indicating the complementarity of alternative high occupancy modes in a high volume corridor. Express bus ridership increased only slightly. During the only two weeks of operation of Phase 3, travel times in the general-purpose lanes increased and varied from day to day. Despite continually increasing shifts to alternate modes the public outcry and concern of public officials regarding the deteriorated travel conditions in the general-purpose travel lanes led to a decision to terminate the project after two weeks of enforced

operation. Phase 3 results are presented in the paper, but are not felt to represent equilibrium results. /Author/

31 178770 EVALUATION OF ALTERNATIVE TRAFFIC OPERATIONS PLANS FOR THE COMMUTER LANES ON SHIRLEY HIGHWAY IN VIRGINIA. The report presents the results of a study to evaluate the impact of an exclusive reversible roadway for preferential treatment of high occupancy vehicles. The objective of the study was to evaluate and document the impacts of implementing operational changes on the Shirley Highway express lanes on the transportation system in Northern Virginia. The study documented the magnitude of the changes which have occurred to the number of persons using the express lanes, the impact on the use of the regular lanes, vehicular and person miles of travel, and occupancy levels of both bus and auto. It was determined that the provision of an exclusive roadway for use by high occupancy vehicles has proved to be a successful incentive for formation of carpools and vanpools; the high minimum size carpool (4 or more) has not proven to be a drawback in the increased use of carpools; and when there is demonstrated time savings, users of the facility will be attracted from zones outside the normal corridor area.

31 179071 TRAFFIC OPERATIONS IMPROVEMENTS TO MANAGE AND CONTROL THE FLOW OF VEHICLES. The conclusions of this workshop are as follows: Long-range (20-year) transportation planning is clearly necessary; however, those long-range plans must be flexible and subject to change since frequently they do not deal adequately with local transportation operations, funding cannot be secured to implement them, and transportation modes, methods, and attitudes change because of fluctuations in the economy, environmental concerns, and development. TSM does not mean that everybody travels by transit but that all forms of transportation are integrated to obtain optimum efficiency within the public right-of-way provided. TSM should not become overly complicated and cannot be tied up in red tape; Federal administrative requirements for acquiring and accounting of funds may render TSM inefficient and even impossible to accomplish. MPOs that are not properly structured should not approve federally funded programs. In some instances, the state department of transportation may provide more efficient transportation system programming, planning, and implementation in those states that are primarily nonurbanized. Lastly,

MPOs should not be given responsibility for implementing transportation programs. Instead, they should solicit and incorporate the recommendations of those who are responsible for transportation system operation.

31 179072 PREFERENTIAL TREATMENT FOR TRANSIT AND OTHER HIGH-OCCUPANCY VEHICLES. The workshop noted the critical importance of law enforcement, cooperation and compliance when implementing bus or carpool preferential lanes. Primarily because of safety considerations, a major current issue is whether to permit car pools in contraflow, high-occupancy vehicle lanes. Participants thought that carpools could be admitted to contraflow lanes on a permit basis, thus allowing some type of screening and education for potential operators in the lane. If there is no shoulder or buffer lane available for use as a breakdown area, then carpools, even with permit should not be admitted to contraflow lanes. Successful implementation of high-occupancy vehicle lanes is dependent on a carefully planned public information and education program. Preferential treatments should be used to develop new transit ridership in predominantly automobile-dominant territories as well as maintain existing ridership in areas where transit services are already established. It is noted that a preferential treatment that can be readily seen by motorists has a greater potential for automobile-to-transit diversion than a treatment that improves transit travel but is not too visible. The consensus of the workshop was that special facilities for high-occupancy vehicles should be considered for all highway-widening projects, particularly those that are radially oriented.

Goodman, L (Port Authority of New York and New Jersey) *Transportation Research Board Special Report* No. 172, 1977, pp 7-8; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

31 179073 MANAGEMENT AND CONTROL OF PARKING. Workshop discussion centered on an example of some problems that are encountered when attempts to manage parking are undertaken. An example is given that illustrates the pragmatic problems that urban areas face in seeking to gain some control over previously unchecked and unplanned parking construction. It is noted that dramatic changes in parking pricing and availability simply are not feasible in the majority of urban areas where sufficient

alternatives to single-occupancy vehicle travel are missing. The following solutions were explored as a means of achieving some controls over parking: Reserving some of the excess supply of convenient CBD parking for carpools; appeal to major employers to provide car-pooling and van-pooling services; and improved transit services, especially express service in the peak periods. A more long range solution involves changing present zoning laws which require a minimum number of parking per unit of development, to a zoning law that would place a maximum ceiling on the number of parking spaces per unit of development. Management of parking under TSM is transportation planning, and it should be a part of any regulation that purports to influence noncapital transportation improvements.

Twomey, EJ (Environmental Protection Agency) *Transportation Research Board Special Report* No. 172, 1977, pp 8-9; From TRB Special Report No. 172, Transportation System Management, proceedings of a conference held November 7-10, 1976, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration and the Federal Highway Administration of the U.S. DOT in cooperation with the Institute of Transportation Engineers.; ORDER FROM: TRB Publications Off

31 179086 PREFERENTIAL TREATMENT FOR HIGH-OCCUPANCY VEHICLES. Preferential treatment for buses and car pools is one of the transportation system management actions that can be applied in many areas to promote shifts by commuters from low-occupancy automobiles to carpools and buses. Although the concept is relatively new, the experience gained from projects undertaken in many cities with diverse conditions has shown that it does work. Dramatic results have been achieved on I-95 in northern Virginia where two bus and car-pool lanes handle 17,000 persons/lane during the peak hour with space capacity. There are many different ways that buses and car pools can be given preferential treatment depending on the type of highway facility. Traffic flow models are available to facilitate the simulation of various alternatives strategies, and projects are eligible for Federal Highway Administration and Urban Mass Transportation Administration program funds. With the increased attention on TSM and the expression of it in the transportation improvement programs, traffic engineering, transit operating, and enforcement agencies must work cooperatively with metropolitan planning organizations to develop and implement more preferential treatment projects. /Author/

31 179181 CYCLISTS GET THEIR OWN WAY IN BEDFORD. The author describes the cycle network envisaged by the bedford urban

transportation study which proposes 24 km of cycle/pedestrian track, 15 km of cycle priority route and 19 signal-controlled crossings. The need for the system was proved by analysis of home interview survey data and figures are given. Various types of cycle priority routes are examined and interaction with pedestrians and buses briefly discussed. The use of signal-controlled crossings is explained and details are given of track widths, construction, lighting and carriage-way marking. Recommendations are made for the provision of parking and areas for further investigation outlined. /TRRL/

Snelson, P *Surveyor - Public Authority Technology* Vol. 150 No. 4457, Nov. 1977, pp 15-16, 2 Fig., 2 Tab., 1 Phot., 4 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-232514)

31 179387 COORDINATING GROUND TRANSPORTATION--AN AIRPORT MANAGER'S VIEW. The coordination of ground transportation at a major airport includes such things as making a determination of the types of airport ground transportation to be provided to the public as well as a determination of the interface between the categories of ground transportation, the selection of ground transportation operators, and the type of operation best suited to the particular airport or community involved. Most airport ground transportation systems include taxis, limousines, and buses. In addition, most airports will have a variety of special types of transportation that include wheelchair vans, ambulances, hotel and motel courtesy cars, car rentals, and speciality buses. It is noted that the interface between these categories must receive special attention if the public is to receive proper service from each of them. The selection of ground transportation operators by bid or negotiation is discussed. Problem areas such as labor disputes level of service, and competing modes are also discussed. Solutions to these problems are made easier for the airport authority if there is only one responsible ground transportation operator. An effective coordination of airport ground transportation services cannot be accomplished without a close and cooperative relationship between the airport operator and the ground transportation operator. A poor relationship is to the disadvantage of both as well as to the public which is being served and must be avoided at all costs.

Wagener, LE *Airport Management Journal* Vol. 3 No. 2, July 1978, pp 21-23; ACKNOWLEDGMENT: Airport Management Journal; ORDER FROM: American Association of Airport Executives, 2029 K Street, NW, Washington, D.C., 20006

31 179390 AIRPORTS GROUND ACCESS: TRAFFIC MANAGEMENT CONCEPTS. This article presents a traffic management technique that would charge the motorists who enter the airport to pickup or discharge passengers. These motorists who use the airport roadways add to the overall traffic volume within the airport thereby contributing to traffic congestion during peak periods. The airport access fee would eliminate the movement of "thru" traffic which uses the airport roadways as a "short-cut" or to by pass traffic congestion or nearby arterial highways. This access toll operation is presently being used at such airports as Dallas-Fort Worth and at Naples, Florida. Several airports levy a user

charge on taxis by means of a coin-operated gate at the entrances to the taxi holding lots. The access charge, it is noted, should be a uniform toll. The toll is an untapped source of revenue for the airport agencies and could be used for needed improvements such as increasing the capacity of the internal roadways for better traffic circulation, and to offset increases in fees for other airport services. This toll could be used as a traffic management toll in terms of pricing, subsidize remote parking and shuttle bus operations, and as a revenue source to offset the escalating operating expenses of airport operations in general and the maintenance of ground transportation facilities in particular.

31 179823 MASS TRANSIT IN ATLANTA. Three major aspects of Atlanta's rapid transit system are examined: A description of the MARTA system and how it will differ from San Francisco's BART and Washington, D.C.'s Metro systems. The anticipated impact of the new transit system on traffic patterns and the metropolitan area's urban structure and the problems which transportation engineers will face in coping with construction detours. MARTA varies from other transit systems in a number of technical aspects and also reflects differences in operating philosophy, local economics and engineering preferences. Atlanta's train control will be flexible, permitting trains to be operated manually or automatically. A control computer will monitor the movement of every train on the network. MARTA's communication system will carry a continuous flow of train traffic information to the control complex, another will monitor every electrical operating device on the transit system. Telephones will be available for emergency maintenance, and administration. Closed-circuit television and a public address system in stations will also be included. The MARTA transit plan is expected to curb the "urban sprawl" by tying the entire region together by means of a dominant public transportation system and concentrating future high-rise housing and commercial development along MARTA lines. In an effort to increase transit ridership, MARTA has increased its service, increased the number of buses, and lowered its fares. During the next few years, construction of the system will require the closing of 200 streets and 60 of the closures require affected cities to plan new traffic patterns and manage traffic flows that are still unpredictable.

31 180375 OPTIMAL PARAMETERS FOR A COORDINATED RAIL AND BUS TRANSIT SYSTEM. To formulate a mathematical model of the system it is assumed that a radiocentric regional highway network centered at the central business district exists. Railroad lines are assumed to be radial. The demand for public transit is assumed to be deterministic and to vary slowly with location. The optimization is accomplished mainly by the use of basic calculus in conjunction with continuum approximations of certain discrete parameters. Approximate, but simple and explicit, formulations for the optimal railroad interstation spacings, feeder-bus zone boundary and train headways are determined.

31 181333 COMPUTER-ASSISTED TRAFFIC ENGINEERING USING ASSIGNMENT, OPTIMAL SIGNAL SETTING, AND MODAL SPLIT. Methods of traffic assignment, traffic signal setting, and modal split analysis are combined in a set of computer-assisted traffic engineering programs. The system optimization and user optimization traffic assignments are described. Travel time functions are presented for freeways, freeway entrance ramps, and signalized streets. Both single-vehicle and multiple-vehicle class (cars, car pools, and buses) formulations are described. Energy optimization is treated, and gasoline consumption functions for cars and buses are shown. Modal split analysis is described and integrated with the assignments so that the effect of favoring buses and car pools with 'diamond lanes' can be measured. The procedures are described and numerical examples are presented. It is concluded that this approach to traffic engineering is practical and computer programs can be written to analyze major parts of the traffic networks of U.S. cities.

31 181401 EXPERIMENTAL FIELD TEST OF THE MODEL ICE CREAM TRUCK ORDINANCE IN DETROIT. The Model Ice Cream Truck Ordinance (MICTO) is a legal countermeasure designed to prevent child pedestrian accidents from occurring near ice cream trucks. Among other things, the MICTO requires motorists to stop before passing an ice cream truck displaying the special swing arm and flashing lights which must be actuated when the truck is stopped to vend. The MICTO was enacted by the city of Detroit on 12 May 1976 and became fully effective on 10 June 1976. A two year field test of the safety-effectiveness of the MICTO was conducted. Results for 1976 show that radar measured average motorist speed abreast of vending ice cream trucks was reduced from 28.10 mph before the MICTO to 15.65 mph after the MICTO--a 44% reduction. During the 1 July-31 October 1976 period, vendor-related child pedestrian accidents were reduced from a prior three year average of 19.67 before the MICTO to 9 after the MICTO--a 54% reduction. In 1977 average motorist speed at the truck continued at a reduced level of 15.79 mph. However, vendor related child pedestrian accidents were lowered from a 1973-75 pre-MICTO average of 48.67 to 11 in 1977--a 77% reduction.

31 182023 A MODAL SPLIT MODEL FOR HIGH DENSITY URBAN CORRIDORS. The objective of the study was to develop a modal split model that would be relatively simple, require little lead time, use readily available data, and be sensitive to policy alternatives. The model is designed to contribute to the evaluation of such policy options as station closing, new route alternatives, addition of park and ride facilities, skip stop policies, and increasing capacity. This study produces modal split models specifically for high density urban corridors. In a two stage process splits are established between the automobile and public transportation, and then bus and rapid transit. The aggregate, trip interchange models are calibrated using weighted least squares, with modal disutility functions, service characteristics, and trip end densities as independent variables. The background for the modeling procedure is established by producing a multitude of computer generated maps displaying the modal split patterns and by graphing the socioeconomic correlates of modal split in the Chicago area. Special attention was given to a thorough application of the model to Howard Corridor with Chicago Transit Authority rail rapid transit service. The application estimated the effects of closing selected peak period reverse commuting platforms to expedite service. In the process the model was improved.

31 182666 TOWARD CRITERIA IN THE DEVELOPMENT OF URBAN TRANSPORTATION SYSTEMS. Improved criteria are necessary to aid in determining awards of federal funds for metropolitan transit projects. Commuting is the main use for public transit. Thus a primary objective of an urban transit system

should be to provide a flexible and balanced set of options to the workers in the metropolitan area for their journey to work. This paper discusses various facets of an appropriate balance among the three modes: rapid rail, bus, and automobile. Three cities are selected for further analysis: Baltimore, Kansas city, and Phoenix. These cities represent different stages in economic-transportation development, and also present different spatial patterns of residence and employment. The applicability of rapid rail transit to each city is examined in view of central city worker concentration and recent trends.(a) /TRRL/

31 182786 CHARACTERISTICS OF JOURNEYS IN URBAN AREAS; PARKING IN TOWN CENTRES [Caracteristiques des déplacements en milieu urbain; Stationnement dans les zones centrales]. This study completes a series of door-to-door enquiries carried out in sixteen French towns concerning journeys in the course of an average weekday. The report, which is concerned only with parking in town centres, is intended for the estimation of the demand for parking at peak hour. The sections of the report deal successively with the following points: study of the general characteristics of parking in the town centre (mean duration, distribution according to motives for parking); estimation of the parking density at peak hour. /TRRL/ [French]

31 183410 THE BICYCLE PLANNING BOOK. Based on a survey of practical options to suit local conditions, the book is intended to help local authorities to provide better facilities for cyclists in towns. In recognition of the role that the bicycle might play in transport policy, UK local authorities have been requested to submit plans for cycling facilities in their 1978-79 transport policies and programmes. The following chapters discuss the subject: (1) background; (2) bicycle usage; (3) bicycle safety; (4) bicycle law; (5) the state of bicycle planning abroad; (6) current provisions for cycling in the UK; and, (7) designing bicycle facilities. /TRRL/

31 183459 PEDESTRIAN AND PUBLIC TRANSPORT PRIORITY TESTS BY USING COMPUTER CONTROLLED TRAFFIC SIGNALS [Prov med prioritering av fotgaengare och Kollektiv trafik genom datastyrd signalreglering]. During these tests the signal control strategies were partly directed towards transferring the rest capacity for vehicular traffic to pedestrian traffic and partly to improving the level of service for public transport through bus priority. Comparison tests were made between central equipment controlled by relays and computers. The relay system has its decision functions for traffic control decentralized to apparatus in the junctions and the central control equipment only coordinates information. The computer system has a central control equipment both co-ordinating information and controlling the local apparatus in the junctions. For the evaluation of the control methods, waiting times for vehicular traffic, green times for pedestrians, level of service for buses and journey times were measured in peak and low volume traffic. Improvements were noticed for pedestrians both in peak and low volume traffic and for public transport in low volume traffic for the computer system. These improvements could be obtained for the relay system by making some modifications and complementary measures. /TRRL/ [Swedish]

31 183689 BUS SERVICE IN SMALL TOWNS. A study is made of fixed route bus services operating in towns with populations in the range 5,000 to 30,000. Analysis of eight such services is carried out to identify and, where possible, quantify those factors which favour their operation. The study was undertaken to assess the potential for and advisability of extending this type of operation to other small towns. Quantitative assessment of the study services is based on the assumed objective of maximising the number of bus passengers, subject to financial constraint. The implications of this objective are analysed and it is thought to be compatible with the corporate aim of a public transport undertaking and the social aim of a local authority. It is concluded that, although in general such services are not profitable, their provision can be well justified provided that the selection of the town and the service design take sufficient account of the factors discussed. /Author/

31 184217 SURVEY OF GROUND TRANSPORTATION AT THE DALLAS-FORT WORTH REGIONAL AIRPORT (ABRIDGMENT). Three types of trips (those made by air passengers and visitors in private vehicles, those made on public transportation, and those made by employees) were investigated separately for the purposes of this survey, conducted on May 16 and 20, 1975. Data on private travel was obtained from roadside interviews conducted on outgoing lanes of the airport access roads, and passengers on the express bus service to the airport were given a questionnaire upon boarding, while the employee survey questionnaires were distributed via the employers. The over-all survey revealed

that the express bus service accounted for 4.2 percent of person trips but only 0.8 percent of the vehicular traffic due to the higher occupancy rates of buses. When employees (whose use of private vehicles account for 96.3 percent of their person trips) are excluded, it was found that the express bus service accounts for 10.9 percent of the air passenger trips and that all public transportation modes account for 25.7 percent of air passenger trips. The other 74.3 percent of air passenger trips were made via private vehicles. As a result of this project it is recommended that future travel surveys of this type meticulously screen survey forms for possible confusing formulations and give adequate attention to the recruiting, training, scheduling, and supervision of survey staff, with consideration, where feasible, of rotating staff among various tasks as to alleviate monotony and enhance efficiency.

31 184472 STEVENAGE NEW TOWN-ENGLAND. Stevenage was established as a new town in 1946 to assist the problems of London by providing a location for industry and workers wishing to move out of the city. The town is expected to grow to a population of about 90000 by 1990. The centre is broadly divided into two distinct parts by a north-south distributor road. To the east are the shops and stores, and to the west the offices and entertainment buildings. The shopping area is one of the earliest comprehensive pedestrian centres. Attention is paid in this paper to access, peripheral roads, service roads, car parks, cycle and pedestrian links, pedestrian aspects and the critical location of shopping car parks. /TRRL/

31 184542 POSSIBILITIES FOR DEVELOPING FREEDOM FOR CYCLING IN SAFETY IN ESTABLISHED TOWNS AND CITIES. In seeking the optimum mix of travel modes it is necessary to consider a wide range of values in addition to environment, congestion, pollution and noise. Mobility, safety, freedom, health and convenience should be promoted and the cost of roads, cycleways, footways, crossings, vehicles, fuel and casualties should be considered. It seems probable that a larger proportion of cyclists, pedestrians and public transportation would prove economical and would reduce materially the volume of traffic and still accomplish the same journeys. Possibilities for developing freedom for

cycling in safety are presented. /TRRL/ 234836.

31 185593 PROFILES OF SCHEDULED AIR CARRIER DEPARTURE AND ARRIVAL OPERATIONS FOR TOP 100 U.S. AIRPORTS. This report provides data on total scheduled air carrier operations by hour of the day for Friday, August 5, 1977, for the top 100 airports within the 50 states, the District of Columbia, and Puerto Rico. The selection of the top 100 airports was based on the rank order of the number of air carrier passenger enplanements in domestic and international service in 1973. Two graphs are provided for each airport which visually depict (1) total number of arrivals and departures by hour, and (2) total aircraft operations by hour, detailed by the following types of service: Domestic trunk Pax, Local service Pax, Air taxi Pax, International Pax (U.S. and Foreign Flag), and All-cargo Operations. These profiles provide a clear visual presentation of aircraft operations at major airports for use in analyzing changes in workload throughout the day, for comparing and noting different hourly traffic patterns among these airports, and for establishing a base for readily identifying changes in traffic patterns over time.

31 186117 ON THE DEVELOPMENT OF A THEORY OF TRAVELER ATTITUDE-BEHAVIOR INTERRELATIONSHIPS: VOLUME II. THEORETICAL AND EMPIRICAL FINDINGS. The second volume of this final report presents conceptual and empirical findings which support the development of a theory of traveler attitude-behavior interrelationships. Such a theory will be useful in the design of transport systems and operating policies which satisfy passenger requirements. A brief consideration of theoretical concepts precedes the review of the empirical methodology. The structure of traveler attitude-behavior interrelationships is examined for two transport modes, buses and carpools, over three different datasets. Among the major findings are that traveler attitudes influence behavior toward transport alternatives and that traveler attitudes and behavior mutually affect each other. Various theoretical extensions of this work are described. A new quantitative procedure for assessing differences between travel market segments is developed and implemented. The relevance of the modeling orientation to transport system design and policy analysis is noted. Some implications of the modeling approach for data collection efforts are also noted.

31 186707 BICYCLE STRATEGIES TO REDUCE AIR POLLUTION. EPA, the Department of Transportation (DOT) and Housing and Urban Development (HUD) are all seeking to

integrate the transportation/air quality planning and implementation required by the Clean Air Act into existing planning and programming procedures. Now is the time for bicycle activists, bicycle planners, transportation planners, and transportation engineers, to get bicycle programs into the planning process. One of the major plans is the three C's plan, The Continuing, Comprehensive transportation planning process carried on Cooperatively by states and local communities. Administered by DOT the three C's process includes the Unified Work Program, Transportation Plan which includes Transportation System Management (TSM) and the Transportation Improvement Program (TIP) and its annual elements. The report presents a preliminary list of elements to be included in a comprehensive bicycle plan and some alternative approaches. Included is a listing of cognizant personnel responsible for coordinating strategies for reducing pollution by use of bicycles.

31 186843 FAA AVIATION FORECASTS FISCAL YEARS 1979-1990. This Federal Aviation Administration (FAA) report contains the official FAA forecasts of domestic aviation activity for Fiscal Years 1979 through 1990. It presents forecasts of aviation activity levels at FAA towered airports, air route traffic control centers, and flight service stations, as well as forecasts of aviation activity for air carriers, air taxis, general aviation, and the military--the four major users of the National Aviation System (NAS). In addition, this report presents the complete FAA aviation forecasting system, and describes the FAA's ongoing initiative to improve the decision-making utility of that system for the overall aviation community. It focuses on the FAA's interpretation of commentary received from the community, and on the agency's response to that commentary. (Author)

31 186871 SAN FRANCISCO MUNI TRANSPORTATION PLANNING OPERATIONS AND MARKETING STUDY. The report provides an overview of extensive inventories and evaluations of Municipal Railway (MUNI) services, and principal features of a recommended short-term improvement plan and program. The main thrust of the recommendations is aimed at more efficient use of existing public transportation resources. Recommendations include comprehensive modifications of MUNI routes and headways; a transit priority street program to facilitate transit vehicle movement on congested streets; an extension of the J streetcar line to improve operating efficiency; site plans and design criteria for a new bus maintenance facility needed to reduce operating costs; a set of basic goals, standards and criteria for MUNI service; and various management actions which would improve the quality of service. The work described represents only the first of several phases of a complete planning, operations and marketing program. (Color illustrations reproduced in black and white)

31 188003 BICYCLE FACILITIES IN THE NETHERLANDS. In the Netherlands of the present there are 250 cars, 150 mopeds and 500 bicycles per 1000 inhabitants. Despite a decline in the use of bicycle and moped, about 30 to 35% of trips are still made on these two modes of transport. To improve the relative safety of cyclists and moped-riders, efforts are being made to keep them separate from automobiles. This has led to the large-scale construction of separate paths for use by both cyclists and moped-riders. The position of dominance currently held by the private car in the Netherlands has created a number of problems particularly in the cities. The larger cities are now obliged to draw up a traffic management scheme in which encouragement has to be given to the use of the bicycle and moped as an alternative to the car, particularly for home-work and home-school traffic. One way of doing this is to expand the facilities that have always existed. Other methods are to construct special high-quality bicycle and moped routes from the residential areas to the city centres. Two demonstration routes have now been built and an extensive study program set up to examine the effects the two routes have.

31 188013 OPERATIONAL TRANSIT PLANNING. EXPERIENCES IN OPORTO, PORTUGAL. In Oporto a sample of urban transportation problems typical for developed and developing countries is encountered. The paper shows that successful transit planning is contingent on three conditions: integration of all public agencies involved in transit problems such as city and regional authorities, public work department, bus and light-rail operators, and traffic police; permanent training of technical staff and information of users; an operational planning methodology for finding short-term improvements with low-cost investments. The methodology is based on a man-computer interactive process as a novel approach which allows transit operators to optimally match the supply of transit services to traveller demands.

31 188014 PROBLEMS DERIVED FROM OPERATING THE METRO IN SANTIAGO. This paper deals with the problems arisen once a section of the Metropolitan Rapid Transit System was put into operation, the provisions adopted to

solve them and the proposed general treatments. These problems are grouped into circulation problems, parking problems, and other problems. Circulation problems refer to congestion in the area of Salvador Station of the Metro system, and end of the section under operation which is working as a terminal-station due to car users' arrivals to commute and to the establishment of feeding lines. With regard to parking problems, there has been a control system based upon parking cards. With reference to other problems, emphasis has been placed on the need of realizing simultaneously the eastbound extension of the Metro (its construction was considered to be realized some years later) and on the opening of the new roadway under construction.

Alvarez, LE ; Institute of Transportation Engineers 1977, pp 197-205; Compendium of Technical Papers of the 47th Annual Meeting of the Institute of Transportation Engineers at the Fourth World Transportation Engineers Conference, Mexico City, October 2-6, 1977.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

31 188175 EVALUATION OF THE NW 7TH AVENUE EXPRESS BUS AND BUS PRIORITY SYSTEMS. REPORT 1. This report presents a summary of the evaluation of Phase I of the I-95/NW 7th Avenue Bus/Car Pool Systems Demonstration Project in Miami. The twenty-six month Phase I evaluation consisted of evaluation of several techniques for providing express buses with a priority service on an urban arterial street. Four bus priority systems were implemented and evaluated on NW 7th Avenue in Miami. These systems were: buses with traffic signal preemption capability in mixed mode operation; buses with traffic signal preemption capability in a reversible exclusive bus lane; buses in the exclusive lane with traffic signal progression; and buses with traffic signal preemption capability in the exclusive lane with traffic signal progression. For the traffic pattern and geometric configuration on NW 7th Avenue, it was found that the travel times for both buses and autos were reduced under each of the priority treatments. Auto accident rates were unaffected but the provision of the exclusive bus lane introduced some problems with bus accidents. Buses moved up to 25% of the passengers and represented less than 2% of the vehicles in the traffic stream. The express bus system achieved a modal split of 8.6% of the potential trips. Several inefficiencies in the transit system reduced the economic viability of the transit service. The report presents summaries of all of the studies that were conducted and presents a comprehensive economic viability analysis. /Author/

31 188767 AN INTRODUCTION TO AIRLINE ECONOMICS. This is a plain-English text that covers the entire range of airline economics. Topics include: the structure of the airline industry; government regulation of routes rates,

and services; entry and exit; marketing problems; air cargo economics; airports as a factor; financing; rate theory; labor relations; charters; air taxis and commuter lines; and the peculiar political complexities of international services. Foreign airlines that service the U.S. are also considered. Special sections on controversial issues examine the deregulation of airlines and their diversification into non-aviation fields. Geared to readers who may have only an elementary knowledge of economics, the text uses current airline problems to illustrate elementary economic theory pertinent to airlines. An appendix includes Titles I, II, IV, VIII, and X of the Federal Aviation Act of 1958, as amended through November 9, 1977.

31 188772 ARIZONA STATE AIRPORT SYSTEM PLAN. TECHNICAL SUPPLEMENT. This Technical Supplement is part of the Arizona State Airport System Plan and provides a variety of information on the 59 airports included on the Primary State Airport System. These airports include five air carrier airports, two commuter airports, six reliever airports, and forty-six general aviation airports. Three types of information are presented in this Technical Supplement: (1) description of airport facilities, (2) description of associated communities, and (3) airport improvement needs. The description of each associated community includes information on weather, economic activities, total population, transportation services, and taxes. A list of potential improvement needs for each airport was derived through the application of development standards, comparisons of airport capacity and forecasts, an analysis of preservation needs, and a review of airport master plans and the five-year Airport Development Programs. The cost of the improvements were then calculated and reviewed for accuracy by local airport sponsors. These improvements were identified for the short term (1979-1983), intermediate term (1984-1990), and long term (1991-2000) plan periods. Needs considered include: Runways; Taxiways; Hangars and aircraft parking facilities; Lighting; Navigational aids; Airport services; Parking facilities; and Land acquisition.

31 188821 VEHICLE WAITING TIMES AT FERRY TERMINALS. The B.C. Ferry Corporation is most interested in the time spent at ferry terminals by vehicles waiting times. Knowledge of vehicle waiting times provides a direct measure of the quality of service. Understanding the patterns and variations in waiting times provides important information for evaluating operating alternatives such as different sailing schedules. This study was undertaken to measure a representative sample of Route #1 and #2 vehicle waiting times at the four major terminals oper-

ated by the B.C. Ferry Corporation and to analyze them with a view to identifying underlying patterns, relationships and variations. Specific objectives were to determine: average waiting times of Route #1 and #2 vehicles at each of the four major terminals for a sample of days reflecting different traffic conditions; differences in waiting times at different times of the day and for different types of vehicles; variations in waiting times and the nature of the underlying statistical distributions; relationships which may exist between waiting times and other variables and which may be useful for estimating waiting times in future; whether it is possible to monitor waiting times on an on-going basis using a mechanical traffic recorder.

31 188822 THE BRITISH COLUMBIA FERRIES--A STUDY OF 1977 SUMMER TRAFFIC BETWEEN VANCOUVER ISLAND AND THE LOWER MAINLAND. This is a study to determine who uses the British Columbia Ferry service between Vancouver Island and the British Columbia Mainland, where they come from, where they are bound, and the purposes for which they travel. Information was gathered from all types of ferry users--those who came in private vehicles, those who came by bus, and those who came as foot passengers. The study made use of questionnaires which were distributed to the ferry users on the two main ferry routes: Route 1-Tsawwassen-Swartz Bay (Victoria); Route 2-Horseshoe Bay-Departure Bay (Nanaimo). The primary purpose of the study was to develop a data base which would provide such information as the numbers of people traveling, their origin and destination, purpose of the trip, duration of their stay, type of accommodation, and reasons for choosing one route rather than the other. The report summarizes the general findings and analyzes some of the relationships between the different types of users and their responses to various questions. Some suggestions for further analysis are also made.

31 188825 GULF ISLAND FERRY PASSENGER SURVEY. The British Columbia Ferry Corporation conducts periodic surveys of ferry passengers to obtain information on travel patterns and user characteristics which is essential for planning purposes. In the summer of 1977, surveys of ferry passengers were carried out on the two major routes between the Lower Mainland and Vancouver Island by the Centre for Transportation Studies at the University of British Columbia. In February, 1978, a winter survey of ferry passengers was conducted on these routes and the Gulf Island routes by B.C. Research. The present survey was undertaken to obtain comparable information on the summer travel patterns and characteristics of ferry passengers on the Gulf Island routes.

31 188826 B.C. FERRY ROUTE STUDY--FINAL REPORT. The B.C. Ferry Route Study involved two tasks: Data Analysis and Route Choice Model Development. Part one of this report presents the Data Analysis and Part two presents the Route Choice Model. The Data Analysis consisted of (1) removing bias from the August 1973 and May 1974 data, (2) reducing the origin/destination areas, (3) various origin/destination cross tabulations, (4) reviewing the extended questionnaire data, and (5) review and refine the travel time estimates. The Route Choice Model Development involved developing a choice model based on the August 1973 data concerning choices which have been made and applying the

model to proposed new route combinations. The development of a curve fitting model (Model 1) was required. A model based on variance of perceptions of travel time (Model 2) was also developed. The results of both parts of this study are to provide background material for another study. No interpretation of the meaning of the results was desired.

31 188979 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT. UMTA PROJECT EVALUATION SERIES. PHASE I (REPORTS I-1 TO I-9). The UMTA Project Evaluation Series evaluates a three and a half year demonstration project in Miami, Florida, established in 1973 to develop more efficient people-moving capabilities in the I-95/NW 7th Avenue corridor. Phase I of this project involved the implementation and evaluation of several bus priority techniques on NW 7th Avenue; Phase II involved the implementation and evaluation of a reserved bus car pool lane in each direction of Interstate 95 (I-95). Phase I of this evaluation project consists of nine separate reports: Report I-1 "Evaluation of the NW 7th Avenue Express Bus System and Bus Priority Systems"; Report I-2 "Effects of NW/7th Avenue Bus Priority Systems on Bus Travel Times and Schedule Variability"; Report I-3 "Changes in Transit Operational Characteristics on the NW 7th Avenue Express Bus System"; Report I-4 "Modal Shift Achieved on the NW 7th Avenue Express Bus System"; Report I-5 "Effect of the Park'n'Ride Facility on Usage of the NW 7th Avenue Express Bus System"; Report I-6 "Effects of NW 7th Avenue Traffic Stream Flow and Passenger Movements"; Report I-7 "Evaluation of Characteristics of Users and Non-Users of the NW 7th Avenue Express Bus/Car Pool System"; Report I-8 "Effect of Bus Priority Systems Operation on Performance of Traffic Signal Control Equipment on NW 7th Avenue"; and Report I-9 "Economic Viability of the NW 7th Avenue Express Bus Operation." /UMTA/

31 189349 A COMPARATIVE ANALYSIS OF RESULTS FROM THREE RECENT NON-SEPARATED CONCURRENT-FLOW HIGH OCCUPANCY FREEWAY LANE PROJECTS: BOSTON, SANTA MONICA AND MIAMI. In order to move more people in fewer vehicles with limited capital investment, priorities for High Occupancy Vehicles (HOV) have been developed and implemented over the past several years. This study focuses on one of the options of HOV: non-separated concurrent-flow high occupancy freeway lanes. One freeway lane with an average occupancy of 1.3 persons per car can carry 2600 persons per hour. When the occupancy is increased to 4 persons, the hourly person rises to 8000. However, the idealized outcomes have not been realized by reserved lane projects. Through a comparative analysis of results of the three most recent concurrent-flow projects: the Southeast Expressway in Boston, I-95 in Miami, and the Santa Monica Freeway in Los Angeles, this paper attempts to develop a better understanding of the issues that surround the reserved lane concept. These sites were chosen because they represent recent experiments with the concept and because of their substantial differences. The issues addressed in this report are: (1) changes in travel times on the freeways and in transit level of service; (2) modal shift to carpooling and transit; (3) capital and operating costs; (4) changes in accidents and incidents, violation rates, and enforcement; (5) the public's attitude towards the reserved lane concept, the effect of advertising and media, and the role of politics; and (6) the design and operating environment appropriate to the concept. The three projects met with differing degrees of success and failure, and those in Boston and Los Angeles have been terminated. Carpooling increased by about 70 percent and travel times for those using the lanes decreased. There were several weaknesses in the concept, which are discussed in the report. The study presents recommendations for future HOV priority projects. A Listing of References is contained herein. /UMTA/

31 189406 LIGHTWEIGHT BICYCLES OR MOTORCYCLES: SPECIFIC CHARACTER OF THIS MEANS OF TRANSPORT [Les deux-routes legers: specificite de ce moyen de transport]. The author deals with the specific character of the users who are of an extremely diverse nature, ranging from children and adolescents who are not of age and do not have the financial resources to own a car, to people to whom the bicycle or motorcycle constitutes a basic element in their mode of life. On the other hand, there is the question of the specific character of the uses: urban journeys, for door-to-door transport, for use in areas where houses are spread over a large area as a replacement for public transport, for the service of equipment.

The author discusses the specific behaviour character and the specific character of accidents. Finally problems of safety and the satisfaction which users may attain from this mode of transport are discussed. /TRRL/ [French]

31 192230 WORK TRAVEL SURVEY METHODS AND FINDINGS (1977). BART, the 71-mile Bay Area Rapid Transit System, serving San Francisco, Oakland, Berkeley, and their suburbs, is the first regional-scale rapid transit system to open in the United States in over 50 years. This report is one of a series assessing the impacts of BART on transportation and travel in the Bay Area. It describes the methods and results of a survey of 8,400 persons employed in the areas most accessible by BART. The sample represents 506,000 daily work trips to the survey area. A novel sampling design was used in which self-completion questionnaires were distributed to workers at their workplaces. Detailed information was obtained on the travel mode choices available to workers, the characteristics of their journey-to-work alternatives, and the reasons for their mode choices. BART's share of journey-to-work trips into the survey area from residences in the primary BART service areas is

18%; bus, 16%; and automobile, 66%. The BART share varies greatly for specific origin-to-destination corridors and trip lengths; BART's highest share is for long-distance commute trips to downtown areas. Of all trips from residences in the primary service area, respondents considered 40% to be possible by BART; BART presently carries about 40% of these possible trips, which suggests a high potential for increased patronage. Typically, relative travel times and reliability of service are among the most important determinants of travelers' mode choices.

31 193346 DULLES INTERNATIONAL AIRPORT ACCESS STUDY. An attempt has been made to study the feasibility of a demonstration program to improve the accessibility of Dulles International Airport through operational and capital improvements to the existing public mass transit system. The program proposed to meet this objective has two phases: a non-capital intensive, immediate action program to be implemented within one year; and a longer range capital intensive demonstration program to be implemented by 1980 and capable of satisfying the 1985 travel demand. The study is also designed to evaluate the potential for improving commuter travel within the Dulles-Washington, D.C., corridor through the use of the airport's mass transit access system, right-of-way, and/or vehicles. An immediate action program and a longer range demonstration program were also developed to carry out this objective.

31 193539 URBAN CONGESTION SURVEY 1976: TRAFFIC FLOWS AND SPEEDS IN EIGHT TOWNS AND FIVE COMMUNITIES. In 1976, the Local Transportation and Roads Directorate of the Department of Transport organised a survey of journey speeds and flows on all main roads in the principal cities of five conurbations outside London (population range 300,000 to 1,100,000) and in eight towns (population range 80,000 to 560,000). The study was similar to those undertaken in 1963 (eight towns only), 1967 and 1971 to monitor long term trends in urban traffic characteristics. TRRL undertook the analysis of the survey results and this report outlines the survey techniques used, and presents summaries of measurements made

during the weekday daytime offpeak and peak periods. In 1976 the overall mean flow in the conurbation towns was 1360 pcu/h in the off-peak, rising to 1915 pcu/h in the peak. The flows were about 15 per cent higher than those observed during the same periods in the eight towns (1165 pcu/h and 1635 pcu/h respectively). Speeds in the conurbation towns as a whole (38.0 km/h, off-peak, and 33.7 km/h, peak) were on average 4 km/h higher than the corresponding eight towns' speeds. In the central areas, off-peak and peak traffic flows in the two groups were similar (about 1380 pcu/h and 1735 pcu/h respectively), as was the mean peak speed of around 20.6 km/h. The eight towns' average off-peak speed (25 km/h) was about 4 km/h higher than the conurbation value. Since the surveys began there has been very little growth in overall traffic flows, but a dramatic reduction has occurred in street parking on the main roads, particularly during off-peak periods in the central areas, where the parking density is now on average only about one third of what it was in 1967. Average speeds have shown a slow but steady increase, no doubt related to the reduction in parking and to other traffic management schemes. /Author/

31 194195 ACCESS TO HOSPITALS: A LITERATURE REVIEW. Literature has been examined from the fields of transport, town planning and medical care, to determine the current pattern of hospital accessibility and the expected trends in hospital access and location. Staff and visitors comprise more than two-thirds of all those who travel to hospitals. Car and bus are the modes most often used for the hospital journey. The relative numbers of different users and the modal split vary according to the size and type of hospital and its catchment area. Inhabitants of rural areas experience travel difficulties because of long distances to hospital and poor public transport. Large hospitals which serve large catchment populations are likely to aggravate such difficulties. Other access problems are long journey times and high costs, where users do not have a car available; this deters some people (particularly visitors) from travelling. The future change in the hospital stock is likely to be limited; the potential for improvements in hospital access therefore lies in transport provision rather than in locational changes. Points suggested in the literature for further attention include the use of wider criteria for deciding hospital transport provision, improved coordination of existing public and hospi-

tal transport, and additional subsidy for certain travellers, when resources permit. /Author/

31 194402 ARTIFICIAL ROAD HUMPS ON BUS ROUTES [Verkeersdrempels in busroutes]. In recent years artificial road humps have been introduced in an increasing number of municipalities within built-up areas, with the purpose of decreasing the speed of traffic. In some cases these road humps are built on roads which are bus routes. The Rotterdam Bus Company has made a study of the reaction of the bus when riding over such a road hump and its influence on the passenger; the technical state of the vehicle (maintenance) and the exploitation costs. The main result of the study is that road humps in roads which are bus routes are not acceptable. /TRRL/ [Dutch]

Openbaar Vervoer Vol. 11 No. 10, Oct. 1978, pp 296-297, 1 Phot. ACKNOWLEDGMENT: TRRL (IRRD 238542), Institute for Road Safety Research

31 195514 PARKING IN THE CITY [Parkeren in de stad]. The aim of the study was to show the gaps in knowledge as regards the influence of the presence of absence of parking facilities on the functions of the town centres, and in particular the relation between the offer of parking facilities and the setting up of enterprises, shops and dwellings. The passenger flows which use the available parking infrastructure in a pre-war city have an essential effect on the functions of this area. Hindrances of these flows by a shortage of a parking infrastructure lead to consequences for the functions of the city, even if alternative transport modes are available and even if other transport modes are accepted for journeys into that area. /TRRL/ [Dutch]

31 196130 US COMMUTER OPERATIONS CLIMATE CHANGING. Matters of concern to the commuter airline managements are discussed, and include the changed market place with the larger airlines tussling for a competitive edge, and the means of financing new aircraft and funding training and paperwork. Other areas of government and congressional concern are the implementation of joint fare schedules with certificated carriers, the development of subsidy and loan programs, formulation of new commuter aircraft certification rules, and the smooth transition of the industry into new FAR part 135 operating rules covering commuter and air taxi operations. Despite all problems, the US commuter airlines are expecting soaring growth this year and will probably be the fastest-growing segment of the total national air transportation system.

31 196280 CONTRAFLOW BUS PRIORITY LANE PERFORMANCE: A CASE STUDY. Analysis of the performance of a 1-mile (1.7-km)

contraflow bus lane in downtown Tel Aviv, Israel, showed that, compared to with-flow lanes, the contraflow lane demonstrated more reliable bus travel times and faster travel speeds during peak and off-peak hours. Improvements in reliability were identified using the coefficient of variation of travel times, the standard deviation of headways, and the pattern of travel-time change on successive bus runs during the peak period. An investigation of sources of delay showed that traffic-signal settings could be revised to provide significant travel-time reductions. Opportunities to improve contraflow service by limiting access to this lane by vehicles other than buses were also identified.

31 196595 ROLE OF PARKING IN TRANSPORTATION SYSTEM MANAGEMENT. The appropriateness is examined of including parking management strategies in the transportation system management (short-range) component of the transportation plan for an urban region. The probable effects of parking management schemes are described and evaluated with respect to short-range objectives to determine the compatibility between the two. A definition that applies to the total set of parking management options is given and tested against the results of a survey of 173 cities in the United States and a review of the literature. Parking-control strategies can be divided on various bases: (a) whether they are supply-or cost-related controls, (b) whether they are intended to reduce automobile travel in selected areas or to make the highway more efficient, or (c) whether they can be implemented within the short-range element or the long-range component of the transportation plan. Considerable public, political, and business opposition to restrictions on parking in urban areas was found. Public support for parking controls that alter travel behaviour must be developed gradually in association with areawide planning objectives. The majority of the parking measures were found to be long-range planning elements rather than transportation system management components. /Authors/

31 196697 ARTERIAL BUS LANE WARRANTS. This note reviews and extends a set of recently developed bus priority lane warrants, for use under Australian conditions. The role of warrants in the pre-evaluation planning of priority schemes and current trends toward allowing car pools to use arterial priority facilities are also noted. It has been demonstrated in many countries that under certain conditions, priority lanes can cost-effectively yield significant benefits and improve urban mobility, particularly during peak periods. However, such lanes should be viewed in the context of a wide range of transport and related options (e.g. Keyani and Putnam,

1977) which attempt to manage travel demand, optimise transport system supply and generally make more efficient use of existing transport infrastructure. /TRRL/

31 197334 PRIORITY TREATMENT FOR HIGH OCCUPANCY VEHICLES IN THE UNITED STATES: A REVIEW OF RECENT AND FORTHCOMING PROJECTS. The purposes of the report are to: (1) describe recent High Occupancy Vehicle (HOV) preferential projects in the United States; (2) summarize the results of these projects and draw implications; and (3) outline projects which are to be implemented over the next few years. The report describes each of the following approaches to preferential treatment: non-separated concurrent-flow freeway HOV lanes; contra-flow freeway lanes; metered-ramp bypass lanes and exclusive ramps; physically separated priority lanes; express bus service and park-and-ride lots; lanes on arterials and Central Business District (CBD) streets reserved for buses; bus priority signal systems on arterials and CBD streets; transit malls; and auto restricted zones. During the late 1960's and early 1970's, a variety of priority treatments were attempted. Both capital intensive projects and non-capital intensive projects were implemented during this period. By the middle of the 1970's, thinking within the transportation planning community had moved away from the costly capital intensive priority treatments that require extensive new construction to the more operationally oriented traffic management schemes that use existing facilities in a more efficient manner. Except for the non-separated concurrent flow projects, other non-capital intensive priority treatments on freeways have fared well. Nearly every HOV priority treatment on freeways has involved the use of new or expanded express bus service and the opening of new park-and-ride lots. Arterial and CBD street bus lanes have been implemented in many cities, transit malls have grown in popularity, and four auto restricted zones are to be built during the next few years.

31 197341 PREFERENTIAL BUS LANES ON URBAN ARTERIALS, SELECTED STUDIES ON THEIR FEASIBILITY AND PERFORMANCE. The study seeks to identify possible impacts of priority techniques for buses on the different interest groups that may be affected. The discussion herein deals not only with those auto and transit travelers who directly use the road, but also with such groups as adjacent commercial interests and other land uses which may be affected by high-occupancy vehicle lanes (HOVL). The use of preferential bus lanes within urbanized areas has expanded tremendously over the past ten years under the combined focus of environmental concern, energy conservation, TSM requirements, and related transportation

factors. To assist in the evaluation of such schemes and associated transit decisions, three separate studies, each of which deals with either some general aspect of HOVL operations or with the potential implementation of a preferential lane in a specific location, was performed: (1) a survey of North American cities to determine methods used to assess the need for and the effectiveness and impacts of preferential bus lanes; (2) an analysis of a with-flow curb bus lane on Forty-second Street in Midtown Manhattan; and (3) a study of the causes of traffic delays for express buses in Midtown Manhattan, and the effectiveness of various methods (including existing and proposed bus lanes) in alleviating these problems. The city survey highlights the lack of analyses performed especially in economic impact areas. The Manhattan Studies show how some delays are unavoidable, but the combination of revised parking policies, bus lane identification systems and related actions could improve the situation considerably.

31 197601 AN ANALYSIS OF THE FINANCIAL IMPACTS OF NON-CAPITAL ALTERNATIVES AT THE LARGE AIR TRANSPORTATION HUBS OF THE UNITED STATES. Because demands on the airport usually exceed existing capacity during a few periods of the day, investment to expand hub capacity is clearly an investment to accommodate these peaks in demand. Demands on airport capacity appear to be more highly peaked than necessary because of this ineffective allocation of costs. Because the peaks are higher, the investment requirement will be perceived to be higher. Also, the composition of demand, i.e., the mixture of air carrier, air commuter and general aviation, seems to consist of more general aviation than would be expected during peak periods. Planning investment for the large hubs requires prediction of future airport costs under alternate capacity expansion possibilities and then selecting the best course of action from among these alternatives. Alternative policies that alter the demand for capacity during peak periods seem to be ignored. Accomplishments of this analysis consist of: Application of a methodology for airport planning that explicitly deals with alternatives that alter the demand for airport capacity; Estimation of the costs of peak and non-peak period airport use by air carriers, air commuters and general aviation; Assessment of the financial impact of maintaining high demand peaks on investment in airport facilities at the large air transportation hubs of the U.S.; and Assessment of the costs imposed by private general aviation upon the air carrier sector at the large hubs.

Smith, DG Maxfield, DP Fromovitz, S ; Office of the Secretary of Transportation DOT/P-5010.9, Feb. 1977, 90 p.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-296305/6ST

31 198210 BALTIMORE REGION BIKEWAYS, A DRAFT PLAN. The recent growth in bicycling has created a need to develop bikeways and other bicycle support facilities in the Baltimore region. Agencies and jurisdictions

within the region initially responded to this need by developing bikeway facilities on an individual basis. However, it soon became apparent that a more coordinated approach was necessary for effective bikeway planning. A regional bikeway study was initiated in September 1975 as part of the region's Unified Transportation Planning Program, and the study facilitated the development of the regional bikeways plan. The plan consists of a system of priority and future routes for Baltimore City, Anne Arundel County, Baltimore County and Harford County. The routes are designed to be continuous between jurisdictions and to provide a truly regional system. A set of guidelines for bikeway design and construction and recommendations for developing bicycle support facilities are also included.

31 198296 ENFORCEMENT REQUIREMENTS FOR HIGH-OCCUPANCY VEHICLE FACILITIES. Enforcement of high-occupancy vehicle (HOV) traffic restrictions forms an integral and sometimes critical element of HOV preferential treatment projects. This research (1) reviewed enforcement on HOV facilities, (2) identified effective HOV enforcement techniques, (3) developed model legislation for effective HOV enforcement and (4) prepared HOV enforcement guidelines. This report presents the findings of this research. Sixteen projects in the United States encompassing each type of freeway and arterial treatment, were visited to gain in-depth operational and enforcement data on each project. These projects exhibited varying enforcement programs, deficiencies and performance levels. Enforcement guidelines have been prepared for each type of freeway and arterial priority treatment of high-occupancy vehicles. In order to improve enforcement of HOV facilities, innovative techniques-involving photographic instrumentation, mailing of citations, tandem (team) patrol and para-professional officers-have been identified within the context of this research. For these innovative enforcement techniques to be effective, a compatible legal environment is necessary. This research conducted a legal review of six prominent legal issues posed by these techniques. Model legislation is drafted to provide the proper legal environment for effective HOV enforcement.

31 199002 MARKET STREET WEST TRANSPORTATION STUDY. The study investigated current transit service and usage patterns. Results revealed the need for improved transit access west of 18th Street. Several alternative transit improvement proposals were developed to meet this need. After a two-stage analysis of the various transit proposals, the Study concluded that a new rapid transit station should be built to serve Market

Street West on the Market/Frankford Line between the existing stations at 15th and 30th Streets. Various improvements to the subway-surface system, which is the only rail line that now penetrates the portion of the Study Area west of 18th Street, were also recommended.

31 260128 TRAFFIC LIGHTS FOR PUBLIC TRANSPORT [Verkeerslichten Voor Openbaar Vervoer]. In this article a proposal is made for the introduction of a uniform traffic light for controlling tram/bus traffic on junctions. A specification of requirements is given. Attention is also paid to application and performance of this traffic light. /Author/ [Dutch]

Grotenhuis, DHA JM (Openbare Werken) *Verkeers-techniek* Vol. 24 No. 4, Apr. 1973, pp 178-182, 4 Fig., 1 Phot.; ACKNOWLEDGMENT: TRRL (IRRD 206045)

31 260129 INFLUENCE OF TRAFFIC ENGINEERING AND ORGANIZATIONAL MEASURES ON THE DEMAND FOR PUBLIC TRANSPORT [Verkeers-technische en Organisatorische Maatregelen Op de Vraag naar Openbaar vervoer]. As the first stage in the realization of "Lijnen Voor Morgen-Amsterdam" (routes for tomorrow-Amsterdam) in October 1971 the Public Transport Network Osdorp-Central Station has been radically altered. The article describes results of before-and after-inquiries into the demand for public transport in the relevant area. In one year the number of daily personal trips between Osdorp and Central Station V.V. increased by 66%. This growth can be fully ascribed to the measures taken. Between 12:00 and 16:00 p.m. the rise even reached 80%. [Dutch]

Smidt, BR (Gemeente Vervoerbedrijf) *Verkeers-techniek* Vol. 24 No. 4, Apr. 1973, pp 172-176, 5 Fig., 5 Tab.; ACKNOWLEDGMENT: TRRL (IRRD 206044)

31 260130 CLEAR THE WAY FOR PUBLIC TRANSPORT [Rium de Baan Voor Het Openbaar Vervoer]. Since October 1971 in Amsterdam trams on Route 1 are given priority through junctions in a so called flexible traffic control system. In April 1972 an inquiry was made into the difference in loss of time for tramways operation in this system and in a conventional fixed control system. Under similar conditions on the different sections the average loss of time per junction decreased by more than 60%, the average journey speed increased by about 80%. (The gross running speed even by almost 100%.) The dispersion in running times was reduced to almost one third and the disadvantageous effect on other traffic was restricted to a minimum. It was calculated that the application of flexible traffic control to the rest of the route will reduce the running time by an average of 8.5 minute. This is equal to a saving in the required number of trams

of three or four, or HFL 350,000-HFL 500,000 a year. [Dutch]

31 260185 SUBURBANIZATION AND ITS IMPLICATIONS FOR URBAN TRANSPORTATION SYSTEM. The urban fringe in major metropolitan areas is changing in character, evolving from low density residential communities clustering around a well-defined central city to a collection of regional subcenters. These centers, generally linked by belt or arterial highways, may include concentrations of malls, high-rise office buildings, industrial parks, and apartment complexes. Many functions formerly served by the center city have migrated to the suburbs, resulting in the evolution of a multi-nucleated city form, with more diffuse travel patterns, and more trips in which one end is in low density suburbs and the other in a high density activity center. Cars are poor at the high density ends of the trip. Fixed route buses are poor at the low density end. The only alternative is a mix of systems: good low density systems (car, taxi, or other demand responsive), interfacing at some point with less land hungry systems that are good for high density traffic (PRT, bus, rail). Each element must be selected for and tailored to the area or neighborhood it serves, interfacing pleasantly and efficiently with other elements to provide good connectivity throughout the urban region.

31 260196 A PRELIMINARY ANALYSIS OF THE EFFECTS OF THE DALLAS/FORT WORTH REGIONAL AIRPORT ON SURFACE TRANSPORTATION AND LAND USE. This report examines some of the effects of the Dallas/Fort Worth Regional Airport upon the regional transportation system and upon land use in Denton, Dallas and Tarrant Counties. The study period extends from 1969 to 1985. The role of the new regional airport plays in the extension of the regional highway network and its effect upon public transit is examined in the first part of the paper; in the second part, the impact of the airport on industrial commercial and residential development is studied. Land use projects, land values and zoning restrictions in the airport environs are discussed. The paper concludes that the Dallas/Forth Worth Regional Airport has had and will continue to have substantial effects on the study area's urban and political development. /Author/

Wolfe, HP, Research Associate, Bureau of Business Research; Texas University, Austin Draft Rpt. DOT-OS-30093 111-3, Apr. 1974, 39 pp, 6 Fig., 6 Tab., 106 Ref.; Prepared for U.S. Department of Transportation.

31 260221 OPTIMIZING TRANSPORTATION FACILITY ARRANGEMENTS. This study is intended to develop an evaluation procedure for optimizing transportation facility arrangements for a given urban environment.

Economic models for balancing intermodal and interzonal travel are formulated for determining the desirability of transportation systems. A cost function incorporating various transportation facility characteristics is derived to indicate the level of service provided by specific transportation arrangements. The best arrangement for a set of alternatives being evaluated is assumed to be the one offering the lowest total community transportation costs. A computerized process, labeled TRANSFARE (Transportation Facility Arrangement Evaluation), is developed to permit easy application of the transportation facility evaluation. A sample urban transportation network is tested to illustrate how this computer model is practical in actual applications. The developed method applies only to a specialized auto-bus urban transportation system.

31 260287 PUBLIC TRANSPORT ON TYNESIDE. A PLAN FOR THE PEOPLE. This report describes and explains the steps taken by the passenger transport executive since its formation in 1969 towards the realization of a plan for the development of public transport. Based on the Tyne-wear plan, commitment has been made to rapid transit on Tyneside, a government grant of 75, has been secured, and the parliamentary bill has received royal assent. After an outline of the inherited transport situation, the role of public transport is discussed. Prime requirements are (I) access to centers of activity, (II) access to population, (III) direct alignments. Although rapid transit will form the backbone of public transport in the area, buses will continue to provide the greater part of total movement; the existing street system and bus services will be re-organized to integrate bus and transit services, and to give priority and privileged passage to buses where necessary. Investment for 1971-84 is planned to divide 62:38 between highways and public transport; none of this will be in new technology systems. The planned rapid transit system, benefiting from London transport expertise and continental experience of urban tramways, is fully described. Emphasis is laid on the research into marketing, publicity and fares policy carried out by the executive. The proposed investment in rapid transit is 65.5 million (at January 1972 prices). Construction will be spread over six years and must begin in earnest in 1974. The development of a modern public transport system is seen as crucial if the north east of Britain is not to become an economic backwater of the new Europe. /TRRL/

31 260308 BUS PRIORITY IN GREATER LONDON. This article reviews the techniques used by the Greater London Council to provide an efficient bus service in Central London. A critical examination of the use of bus lanes and traffic signal priority is given. It is concluded that the cautious policy adopted by the GLC of selecting very short bus lanes such that other traffic is unaffected is likely to produce only a very insignificant benefit to public transport users. The only way to gain a significant benefit in journey time for buses would be to allocate about 25% of roadscape in Central London to a comprehensive system of bus lanes. /TRRL/

31 260398 PASSENGER TRANSPORT INTERCHANGES-THEORY PRACTICE ON MERSEYSIDE. BUS/RAIL and CAR/RAIL interchanges offer prospects of more competitive and viable public transport systems, at the same time relieving congestion in city centers. In the absence of practical experience in this country outside London, before committing heavy investment on these concepts, the Merseyside Passenger Transport Authority has initiated a demonstration program of interchange experiments. The article briefly reviews the Prima Facie Case for interchanges and discusses the factors considered and techniques adopted by MPTA consultants in selecting and designing the experiments. Altogether eight BUS/RAIL and eight CAR/RAIL schemes were planned, to be introduced in 33 sequential phases. Implementation during 1972/73 is discussed and practical problems encountered are highlighted. /Author/

31 260792 AIRPORT AND AIR SERVICES ACCESS. The problems of airport and air service access are discussed. Airport access, primarily an urban transportation system problem, is investigated using data obtained from the Cleveland-Hopkins Airport Access Study and other surveys. The nature of airport access and of

passenger behavior with regard to it is studied to determine what governmental policies might be appropriate. Airport access is a subset of air service access; attention to problems of the latter can improve service for the air passenger. The study investigates two aspects of the air service access problem: air network configuration and the use of satellite airports. Using aggregate delay time as a measure of effectiveness, the most efficient network appears to be one in which traffic is concentrated, reducing network connectivity. Satellite or reliever fields will be used significantly by air carriers with some form of governmental control.

31 261397 ELEVEN-MILE BUSWAY WILL SERVE LOS ANGELES REGION. The California Department of Transportation (CALTRANS) has come up with a handful of different solutions to the problem of moving people, not just moving cars. These include constructing the 11 mile, two lane San Bernardino Freeway Busway, car pool lanes on the Oakland Bay Bridge, a reverse or "contraflow" lane in Marin County north of the Golden Gate Bridge, and a car pool ramp on the San Diego Freeway near Long Beach. Details of these projects and experiments are included here as well as CALTRANS's philosophy: where a group of cities is as inter-laced as the Los Angeles area, with people going in all directions, using the existing highway and freeway networks, and giving a priority to buses on that network is the only way to provide anything for anywhere near an economical price, as well as in a reasonable time.

31 261539 A TRANSIT IMPROVEMENT PLAN FOR THE CITY OF MERIDIAN, MISSISSIPPI. The area encompassed by this report is the City of Meridian, Mississippi and its immediate environs. The purposes of the study were: (1) to evaluate the transit operation, make recommendations for service improvements, and identify financial needs (both operating and capital) in the short-term future; and (2) to examine alternative transit ownership and management options available to the city. The first phase of the study was designed to evaluate transit requirements for the next 5 year period and develop appropriate service improvements. The thrust of this phase was to analyze the operation of the Meridian City Lines, including financial status, maintenance facilities, equipment requirements, and bus routes and schedules. The second phase was directed to the future ownership and operation of the bus company. While it had been recognized that transit should become a publicly-operated service, there were several alternative structures for public management. The main segments of the report deal with the aspects of existing transit operations such as fares, public attitude surveys, the immediate action program, public involvement and program development. Tables and figures complement the text.

31 262101 RAPID TRANSIT IN FRENCH PROVINCIAL CITIES. So far only two cities in France have followed the pattern set by Paris in building a full-scale rubber-tired metro, but systems based on PRT technology are being considered in several places. SNCF's regional metro in Lorraine could well be the pattern for similar operations elsewhere, particularly in the Lille area where conventional suburban rail tramway and the automated VAL system cover the range of options for a unified metro.

Railway Gazette International Vol. 130 No. 7, July 1974, pp 273-276

31 262169 LOS ANGELES: WILL TRACKS BE BACK? The Los Angeles region of California is heavily reliant on automobiles. This article discusses the battles that have been going on to create a rapid transit system for the area. A delicate balance must be struck: a rapid transit system plan has to be extensive enough to be politically popular but not large enough to scare away Federal support. The discussion also touches on jurisdictional problems, as there are 78 cities within the county that must all cooperate in some kind of a system. The benefit cost analysis of rail versus bus transit and the advocates of each in the federal agencies and industry are crucial parts of the decision making process. The one point of agreement is that Los Angeles has a severe transportation problem and something must be done about it.

Kizzia, T *Railway Age* Vol. 175 No. 11, June 1974, pp 30-41, 3 Phot.

31 262170 ANALYSIS AND EVALUATION OF INTERMODAL TRANSFER. This methodology to quantitatively evaluate intermodal transfer delay time presents an analytical tool that will evaluate candidate alternative terminal configurations in terms of pedestrian related performance. The use of computerized modeling methods for the analysis of pedestrian flow represents an efficient technique for the solution of pedestrian related problems. The use of such techniques can assure the decision-maker that available resources are efficiently used in providing necessary public transportation services. This method of analysis is applicable to the evaluation and analysis of configurations developed by the variation of any system component(s) or the terminal plan.

31 262364 PARK AND RIDE: A RISING TIDE. Examples of successfully operating fringe parking lots for commuter Park/Ride bus and train passengers are examined. Experience has indicated that potential locations should be large enough to provide between 500 and 1,000 car spaces to insure economical operation of buses during peak hours. Commuters' parking and walking habits have been surveyed and criteria are included here to ensure safety and continued usage of these lots. Communications between riders and management of the lots and between riders and vehicle operators are features which enhance patronage.

Frost, M. *Public Works* Vol. 105 No. 9, Sept. 1974, pp 82-84

31 262508 TRANSIT IN THE U.S. AND TEXAS: PAST, PRESENT, AND FUTURE. The results are presented of a study of transit systems in the U.S. and Texas. Historical data are analyzed and factors contributing to the decline of transit are identified. Present and future needs in Texas are also identified. The characteristics of rail-rapid-transit and bus-rapid-transit systems are compared and their applicability to Texas cities is evaluated. Increasing fares, deteriorating service, increasing incomes, increasing automobile ownership, and decreasing population densities are seen as the reasons for the decline of transit. The current and future role of transit systems are categorized (into groups: public transportation, mass transportation, and circulation within concentrated developments) and discussed. The study concludes that some form of mass transportation is needed to supplement the automobile based urban transportation system in several Texas cities. Yet, none of the modes of mass transportation are directly applicable to low-density urban development characteristic of Texas cities. A relative study of rail-rapid-transit systems and bus-rapid-transit systems (relative costs, urban forms of Texan cities, types of mass transit service needed) indicates that bus-rapid-transit systems would be the more applicable.

Holder, RW ; Texas Transportation Institute, (2-8-72-143) Res. Rpt. #143-1, Mar. 1973, 57 pp, 15 Fig., 11 Tab., 38 Ref., 2 App.; Sponsored by Texas Highway Department. Presented at the Western Association of State Highway and Transportation Officials Conference, June 1974.

31 262608 PUBLIC TRANSPORT-C.M.B. ROUTE STUDIES-ROUTE INVENTORY AND CHARACTERISTICS-ROUTE NO. 7B. This report is one of a series which considers the level of service provided by the Franchised Public Bus Companies in Hong Kong. It surveys the routing, bus stop location and usage, and journey times of CMB route no. 7B. The 7 mile route is between Central and Wong Chuk Hang Estate Termini. Data were collected over a 16-hour period. One observer boarded every bus leaving either terminus and one observer was stationed at each terminus. Their detailed results are tabulated. Photographs of all bus stops are included and their location shown on a route plan. The findings of the survey are listed. Actual bus departures averaged 71% of scheduled departures. The average passenger trip length was 4.7 miles. The lowest journey speed was 5.6 m/hr, and the longest journey time was 38.4 minutes. Daily passenger volumes were 2348 in the Central to Wong Chuk Hank direction and 2219 in the

opposite direction. The average hourly occupancy exceeded 100% in two cases. Central terminus had the longest hourly layover time of 58.5 minutes. The survey concludes that a high proportion of commuters use this route causing over-loading of buses at peak times. A revised schedule of services is suggested. /TRRL/

31 262609 PUBLIC TRANSPORT-C.M.B. ROUTE STUDIES-ROUTE INVENTORY. This report is one of a series which consider the level of service provided by the Franchised Public Bus Companies in Hong Kong. It surveys the routing, bus stop location and usage, and journey times of CMB route No. 1. The 3.5 mile route is between Happy Valley and Cleverly Street Termini. Data were collected over a 16 hour period. One observer boarded every third bus leaving either terminus and one observer was stationed at each terminus. Their detailed results are tabulated. Photographs of all bus stops are included and their location shown on a route plan. The findings of the survey are listed. Actual bus departures were 54% of scheduled departures. The average passenger trip length was 2 miles, and the lowest journey speed was 3m/hr and the longest journey time was 29.9 minutes. Daily passenger volumes were 4092 in the Happy Valley to Cleverly Street direction and 5413 in the opposite direction. The average hourly occupancy exceeded 90% between 09.00 and 10.00. Cleverly Street Terminus had the longest hourly layover time of 44.1 minutes. The survey concludes that adherence to the official schedule was unsatisfactory. It suggests improvements to the location and spacing of bus stops. /TRRL/

31 262615 PUBLIC TRANSPORT-C.M.B. ROUTE STUDIES-ROUTE INVENTORY & CHARACTERISTICS-ROUTE NO. 3. This report is one of a series which consider the level of service provided by the Franchised Public Bus Companies in Hong Kong. It surveys the routing, bus stop location and usage, and journey times of CMB route no. 3. The 3.5 mile route is between Cleverly Street and Pokfield Road Termini. Data were collected over a 16 hour period. One observer boarded every third bus leaving either terminus and one observer was stationed at each terminus. Their detailed results are tabulated. Photographs of all bus stops are included and their location shown on a route plan. The findings of the survey are listed. Actual bus departures averaged 52% of scheduled departures. The average passenger trip length was 1.8 miles, the lowest journey speed was 2.6 m/hr and the longest journey time was 37.2 minutes. Daily passenger volumes were 6870 in the Cleverly Street to Pokfield Road direction and 6287 in the opposite direction. The average hourly occupancy exceeded 90% between 07.00 and 08.00. Cleverly Street terminus had the longest hourly layover time-43.4 minutes. The survey concludes that adherence to the official schedule was poor and that during peak hours buses traveled below

walking speed along two streets. The need for shelters at some bus stops is indicated. /TRRL/ Leung, YM ; China Motor Bus, Limited R&D Rpt. No. 132, Tech Paper No. 132, Nov. 1973, 35 pp, 3 Fig., 8 Tab., Photos.; ACKNOWLEDGMENT: TRRL (IRRD 209613)

31 262845 PARHAM EXPRESS BUS PROJECT. This project was initiated to determine whether commuters would use a fringe parking lot and ride express buses to their jobs in downtown Richmond. On the basis of a feasibility study, a parking lot was constructed and bus service provided. Today, hundreds of suburbanities make the one-dollar, 22-mile round trip on workdays, making a success of the undertaking, which will be repeated to other Virginia cities. /Author/

Corder, RG *Traffic Engineering* Vol. 44 No. 12, Sept. 1974, pp 14-17

31 262984 A REVIEW OF OPERATIONAL URBAN TRANSPORTATION PLANNING MODELS. Peat, Marwick, Mitchell & Co. (PMM & CO) study compares and evaluates operational or near operational urban transportation planning models to determine their purposes, effectiveness, scope, and cost. This report provides summaries and detailed descriptions of models suitable for a variety of analytical purposes. The categories of urban transportation planning models reviewed by PMM&Co. were demand, network, cost-benefit/impact, and land use. The classification of models into these categories is useful for a systematic presentation. A model may, however, fall into more than one classification, and all models interact with each other in the urban transportation planning process. The models reviewed are therefore discussed in two ways: the body of the report considers their interrelationships, and Appendixes A through D review the models individually. It was concluded that current urban transportation planning techniques usually require an extensive data base, coding of detailed networks, and use of a costly set of computer programs. Approximately 70 percent of urban planning funds are devoted to data and model preparation, with less than 20 percent devoted to plan evaluation and testing. Because of the onerous nature of the techniques, the analysis of an urban transportation plan requires from 12 to 24 calendar months. It was concluded that the most meaningful direction for analytical technique development would be to emphasize sketch planning models requiring less computational expenditure or data base development than current models. This would allow a faster analysis "turnaround" time, resulting in a planning procedure which is more responsive to issues and problems. More resources could then be apportioned to exploring and evaluating a large number of alternatives. PMM&Co. made the following recommendations: (1) An aggregate, instead of detailed, modeling approach would place less demand on excessive data bases or the coding of detailed networks, and in general would cut down on the analysis resources devoted to model preparation, (2) An interactive planning technique, such as use of graphic terminals, on which the aggregate models could be implemented, promises to be a far more effective means to interface between the analyst, the model, and the decision-maker than the batch-processing systems currently used. Examples of these ap-

proaches can be found in the development of the TRANS Model and the UMTA (Urban Mass Transportation Administration) Transportation Planning System, both of which are reviewed in this report.

Chen, Y ; Peat, Marwick, Mitchell and Company Final Rpt. DOT-TSC-496, Apr. 1973, 242 pp, 8 Fig., 7 Tab., Refs., 5 App.; Prepared For Department of Transportation, Transportation Systems Center, Transportation Systems Concept Directorate, 55 Broadway, Cambridge, Massachusetts 02142; ORDER FROM: NTIS, Repr. PC, Microfiche; P.B. 222109

31 263759 BUS PRIORITY MEASURES IN SHEFFIELD AND OSLO. The public transport policies in Sheffield, England and Oslo, Norway are compared, and the bus priority schemes proposed and implemented in the two cities are examined. The traffic problems encountered in the two cities differ slightly (in relation to their shapes and land use patterns) but the "traffic symptoms" are similar. The bus operation is at times very difficult and the buses suffer severe delays (5-15 minutes) at peak periods. The means of resolution of these problems, however, differ according to the transportation policy adopted and the differences in the grant system. In both cities the political attitude is against costly highway schemes. Several bus priority measures which have been introduced in Sheffield (in the last 3 years) are described, and particularly, a comprehensive scheme to improve the services in the central business district. The Oslo City Council plan to use the existing street network in the central area and differentiation of the street network according to the type of mode is described. A study was made of door to door public transport and the results are discussed particularly in relation to private car transport. Measures are indicated that can improve bus transport. Details are given of the town structure and transport facilities and of the priority measures in the two cities.

Granquist, TE ; Sheffield District Council, England #Q3, July 1974, 13 pp, 4 Fig., 1 Tab., 1 App.; Presented at PTRC Summer Annual Meeting, Warwick, England, 8-12 July 1974.

31 263760 THE BITTERNE BUS PRIORITY TRAFFIC MANAGEMENT SCHEME. A bus demonstration project is described which is aimed at increasing the attractiveness of public transport without necessarily increasing delays to general traffic. General traffic which formerly queued in the morning peak period on a radial route leading into the City of Southampton (Hampshire, England) and choked it, is now contained in side roads and approaches, and metered on to the main route by traffic signals, at a rate which is matched to traffic conditions at critical bottle necks. The level of existing and predicted congestion on the main route is determined by a small computer using information received from queue and volume detectors situated along the 3.25 mile route. Buses are afforded priority access on to the main route by the use of full-time and part-time 'bus only' streets and inbound turns which allow the bus services to bypass the general traffic queueing in the side roads. The conditions prior to the implementation of the scheme are described and details are given of the scheme and the bus priority control

aspects. The estimated benefits and the implementation of the scheme are discussed.

31 263776 CAR COMMUTER RESTRAINT IN NOTTINGHAM. This paper describes a zone and collar traffic control experiment scheduled to go into effect in Nottingham, England in mid-1975. "Zone control" signals would regulate the traffic leaving a "traffic zone" when necessary, so buses are not impeded on the surrounding and nearby main traffic routes. Buses and emergency vehicles would leave zones without delay as peak period "bus only" roads, bus lanes or bus detectors would be provided. The Collar Controls-completely encircling the two-and-one-half-mile wide inner city area-would limit the traffic entering this area so that traffic already within the area would flow freely without the need for "bus lanes." At the collar control signals, buses and emergency vehicles would have a reserved lane to enable them to pass the other traffic queueing in the outside lane. Queueing delays of two to seven minutes are anticipated which should discourage most "through" traffic. Park and ride sites at the approaches to the inner city area outside the traffic collar, will be served by buses at ten-minute intervals during the commuter peak periods.

31 263956 FIVE-YEAR TRANSIT DEVELOPMENT PROGRAM FOR NORTHERN KENTUCKY. After a lengthy history of declining ridership, the Cincinnati, Newport and Covington Transportation Company (the Green Line) gave notice that transit service in Northern Kentucky would be permanently withdrawn on Nov. 4, 1972. In anticipation of the Green Line closure, The Transit Authority of Northern Kentucky (TANK) was created to assume responsibility for providing publicly owned mass transit in the area, subject to voter approval. This study presents an updated five-year transit development program specifically for TANK. The impact that loss of transit service in Northern Kentucky would have is also evaluated. Among the TANK improvements were that: all Green Line routes would continue to be operated, many with more frequent service; service to Cincinnati CBD would be improved by a downtown shuttle bus; and demand-actuated routing (dial-a-bus) would provide better service levels in several areas. Furthermore, a two zone fare system would be instituted and reduced fares would be available for school children and senior citizens. All intra-systems transfers would be free. Program costs are discussed. Figures and table complement the text. Appendices are "Bus Stop Shelter Location" and "1971 Valuation of Cincinnati, Newport and Covington Transportation Company (The Green Line)."

31 264622 SIMULATION OF URBAN BUS OPERATION ON SIGNALIZED ARTERIALS. The purpose of this study was to develop a simulation model that represents urban bus operation on signalized arterial streets. The model is to be used as an evaluation tool in the formulation of new schemes to improve bus service in urban areas. To pave the way for the development of such a model, two basic relationships in urban bus systems were investigated. They respectively involve: (1) the time required to load and unload a certain number of passengers and (2) the bus speed and acceleration characteristics. The model developed was named "SUB" (Simulation of Urban Buses) and its program written in FORTRAN language. Traffic is simulated on the model by groups of vehicles that are processed at constant time intervals. Buses, on the other hand, are represented individually and processed only when significant events occur. The model has been calibrated in Washington, D.C. verified and subjected to sensitivity tests. It has been validated by comparing its results with real-life data and its usefulness has been demonstrated by applying the model to predict the effect of an exclusive bus lane.

31 265303 BART/TRAILS, BICYCLING-RIDING-HIKING. This report contains the findings of a study conducted to improve bicycle commuter accessibility to the Bay Area Rapid Transit (BART) system, and to create recreational trails deriving from the system. There are many factors in favor of promoting more bicycle and recreational trails, among them environmental concerns, energy conservation, relief of traffic congestion, physical exercise, and economic savings. The several chapters of the report focus on such topics as the background for the study, pilot studies in other areas, transporting bicycles on BART, and the question of funding. It is recom-

mended that local communities take the initiative in planning demonstration projects to determine the needs of the users before implementing any plans for commuter bikeways and recreational trails. Included with the report are a schematic bicycle plan and a schematic riding/hiking plan.

31 265305 EVALUATION OF PASSENGER SERVICE TIMES FOR STREET TRANSIT SYSTEMS. The time required for passengers to board and alight from transit vehicles can play a significant role in the determination of realistic transit schedules and berth requirements for intermodal transfer facilities. This paper investigates the effects on passenger service time of various vehicles, different methods of fare collection, combinations of boarding and alighting through the front and rear doors, and time. The method of least squares is used to analyze and develop equations to predict passenger service time when the number of passengers boarding and alighting is known. Peak-period service time requirements were similar for a.m. and p.m. The exact-fare method of fare collection provided for faster passenger service times than did the conventional cash-and-change method. Trolleybuses with double doors had faster service times than did those with single doors. In addition, intercity passenger service times were found to be greater than those for local transit service.

31 265314 BUS ROUTES IN NEW HOUSING AREAS. Separate streets for buses can in many cases considerably improve public transport in new peripheral housing areas. A working group consisting of experts in the fields of hygiene, acoustics, medicine and traffic has helped produce this inventory of the problems of streets for buses in central locations. The report describes the different types of bus routes to be found and examines the consequences of any rerouting of traffic.

31 265475 THE REMOTE AIRPORT: A STUDY OF ACCESS FEASIBILITY. The present airport to city center distances are stated for those airports that are 22.5 km (14 miles) or more from city centers, and the travel times required for access and average speeds at peak and off-peak hours are reported. It is then pointed out that pressures for increased capacity are forcing location of new airports at increasing distances from cities, and the term "remote airport" is defined as those at distances in the range of 40 km to 80 km (25 miles to 50 miles). The need for a means of access that will not require excessive travel time is recognized, and costs of two modes of STOL aircraft from downtown STOLports, and rail rapid transit, are analyzed and compared to capital and operating costs.

31 265498 BUS PRIORITY IN INNER LONDON: 2. THE INNER LONDON BUS PRIORITY MODEL. AN OUTLINE IS GIVEN OF THE MODEL USED IN A STUDY INSTITUTED BY THE GREATER LONDON COUNCIL TO EXAMINE THE WAYS IN WHICH BUS LANES AND BUS-ONLY STREETS MIGHT BEST BE DEPLOYED IN INNER LONDON. THE MODEL WAS DEVELOPED TO ESTIMATE IN MONEY TERMS THE TIME AND DISTANCE CHANGES ACCORDING TO A STRATEGY OF PRIORITIES AND TO EMPHASIZE SOME OF ITS MORE NOTICABLE ASPECTS. THE MODEL WAS DESIGNED TO EVALUATE BOTH THE LOCALIZED EFFECTS AND THE MORE FAR-REACHING EFFECTS OF BUS PRIORITY MEASURES. THE OUTPUT OF THE MODEL FOR EACH TEST STRATEGY INCLUDED PLOTS OF LOCATIONS WHERE SPEED OF TRAFFIC WAS CHANGED BY THE STRATEGY AND WHERE QUEUES FORM. IT ALSO GAVE STANDARD PARAMETERS SUCH AS VEHICLE-HOURS, VEHICLE OCCUPANT HOURS, VEHICLE KILOMETRES, QUEUE LENGTHS AND AVERAGE SPEEDS FOR BUSES AND NON BUS TRAFFIC TOGETHER WITH BENEFITS TO BUSES, COMMERCIAL VEHICLES AND CARS EXPRESSED IN FINANCIAL TERMS. FURTHER DETAILS ARE GIVEN OF THE STRUCTURE OF THE DATA BASE WHICH CONSISTS OF 19 BASIC DATA ELEMENTS AND 28 TRAFFIC FLOW DATA, THE LINK TIME CALCULATIONS WHICH INCLUDE FIGURES SHOWING THE EFFECT OF CHANGING SATURATION FLOW AND CHANGING AREA OF QUEUED TRAFFIC UNITS ON THE AVERAGE NETWORK SPEED. THE TRIP MATRIX PRODUCTION AND THE UNLOADING/ RELOADING PROCESS, AND THE ECONOMIC EVALUATION. IT IS CONCLUDED THAT ALTHOUGH THE MODEL HAS SOME (INEVITABLE) WEAKNESSES IN DETAIL, ITS EVALUATIONS HAVE BEEN HELPFUL IN FORMULATING POLICIES RELATING TO THE PRESENT PROGRAMME OF INNER LONDON BUS LANES, AND IN A STUDY OF SUPPLEMENTARY LICENSING. THE FIRST PART OF THIS ARTICLE APPEARED IN *TRAFFIC ENG CONTROL*, 1974-02/03, 15 (10/11), P480.

31 267006 A TRANSIT DEVELOPMENT PROGRAM FOR MANCHESTER. The primary objective of this study is to develop for the Manchester, New Hampshire urban area, a five-year transit development program which meets the public transportation needs, especially those of the transit-dependent, and which is

consistent with the goals and values of the residents in the area. A summary of the current status of public transportation and analysis of Manchester Transit's regular service on a route-by-route basis are presented. On-board passenger survey, community interviews and an appraisal of the transit system are discussed. There is an investigation of alternative forms of transit system ownership and management which are available to Manchester and a summary of pertinent state legislation. Included among alternatives are regular route service alternatives, school bus alternatives, and special transportation service alternatives. Examination of an alternative citywide demand-responsive system is included in one of the appendices. In discussion of recommended transit development program, details include a description of routes and services, program capital requirements, program implementation schedule, five-year cost-revenue forecasts, marketing plan, maintenance plan and the program monitoring plan. Tables, figures and maps are numerous. Appendices also include passenger survey methodology, Manchester population and income distributions and forecasted operating statistics.

31 267012 PLANNING MODE SELECTION AND ECONOMIC FEASIBILITY REPORT-CHARLOTTE-HENRIETTA TRANSIT CORRIDOR-VOLUME I-PLANNING AND PRELIMINARY MODE SELECTION. The purpose of this report is to provide the necessary documentation by which an evaluation may be made of the economic and technical feasibility of the proposed Charlotte-Henrietta Rapid Transit System in Rochester, New York. The Charlotte-Henrietta Corridor is unique in that the proposed right-of-way is predominantly along existing railroad lines, thus minimizing the problems of land acquisition, relocation of residences and businesses, and the interference with existing transportation systems during construction or after implementation. The rapid transit system is also being designed to permit the continuance of existing freight service during nighttime operations without interference to passenger operations. Presented are an analysis of present conditions, the determination of future transit requirements and an initial analysis of alternative transportation systems. Requirements for rapid transit are based on population projections, employment projections, existing land use, proposed land use plans, patronage projections and resultant service characteristics. The three alternative rapid transit modes which best satisfy all of the criteria established for Rochester were the grade separated conventional rail, light rail and busway system. Appendices include description of existing railroad lines, models and projections, initial transit system design and a theoretical concept for obtaining qualitative measures of mode effectiveness. Figures, tables, maps and photographs are numerous.

31 267017 MODE CHOICE AND THE SHIRLEY HIGHWAY EXPERIMENT. The Shirley Highway Bus-on-Freeway Demonstration Project represents a major part of the UMTA and FHA effort to test different technologies and system configurations in order to better serve the nation's transportation needs. The Shirley Highway Corridor, extending from suburban Northern Virginia to downtown Washington, D.C., is a 150 square mile area containing about 550,000 people. This project was designed to provide commuters with fast and reliable peak-period bus service to the 3 major employment areas of downtown D.C., Pentagon and the Northern Virginia Crystal City Complex. Elements are: (1) the busway, including exclusive land on Shirley Highway and bus-priority lanes in D.C.; (2) a bus transit operation with new buses, routes and schedules; (3) residential fringe parking facilities for bus riders. The objectives of this report are: (1) to determine and isolate those factors which influence the switch from auto to bus ridership, their relative importance and how they combine to produce the bus market share; (2) to see how the first objective could be satisfied in a fashion that would allow results to be generalized to other areas. Among products of the study are a new modal choice or market share model which has significant behavioral advantages over its predecessors and an analysis of data collected during the Shirley Highway Bus-on-Freeway Demonstration Project. Conclusions and recommendations for future research are offered. A bibliography is included.

31 267020 A SHORT-RANGE TRANSIT DEVELOPMENT STUDY TECHNICAL MEMORANDA. These memoranda provide background and supporting information pertaining, among other things, to the existing transit system in the Tuscaloosa, Alabama urban area. The procedures and assumptions used in the development of performance indices and other data contained in the final report are identified. Peak-period directional passenger counts showing present patronage trends are discussed and a table presented showing transfer volume on the existing system. Also presented is the analysis and evaluation procedure used to develop the proposed transit system as described in the final report. Parameters and constraints unique to Tuscaloosa which influenced route selection are outlined and alternatives analyzed. A description of typical route scheduling envisioned for the recommended system is included. A table is presented showing transit travel times, including transfer wait times. Financial evaluation memorandum contains information pertaining to the procedures and estimates used in determining and analyzing the financial circumstances of the Tuscaloosa County Parking and Transit Authority. It is intended that this memorandum provide the basis for the Authority to contrast and modify, if necessary, revenue and expenditure estimates for the recommended five-year program. Tables and maps complement the text.

31 300100 WHAT CAN BE DONE WITH THE ROAD AND TRAFFIC CONDITIONS TO IMPROVE THE WORKING CONDITIONS OF BUSES [Hva kan gjoeres med vei-Og Trafikkforholdene for aa bedre bussens arbeidsvilkkaar]. To evaluate the quality of working conditions for buses in relation to the road and traffic conditions, three criteria are usually considered: journey time (especially relative journey time compared to use of own car on the same distance), regularity and comfort/safety. In accordance with these three evaluation criteria there are three groups who evaluate the individual factors differently with reference to themselves. These three groups are: bus companies, passengers and bus drivers. All these factors have been included in a common matrix and possible improvements in the working conditions for buses are considered in relation to the different factors of the matrix. /TRRL/ [Norwegian]

31 300110 APPLICATION OF OPTIMAL SUBSET SELECTION TO PROBLEMS OF DESIGN AND SCHEDULING IN URBAN TRANSPORTATION NETWORKS. The paper describes some possibilities for modifying the optimal transport network algorithm developed by Boyce, Farhi and Weischel in a way that makes it applicable to some practical problems of network planning. The modifications, which have been tested with respect to their effect on the efficiency of the algorithm, include the introduction of asymmetrical demand structures, the integration of an existing network, the lexico-minimization of a dynamic objective function, and the consideration of constraints related to interdependencies between candidate links. Two small network problems and one medium-sized problem (61 nodes, 104 links, 16 candidates) have been computed; the results support the hypothesis that the algorithm may be applied to produce approximate solutions to problems of practical dimensions within a reasonable range of time. /TRRL/

31 300191 THE ENVIRONMENTAL IMPACT OF BUS PRIORITY SIGNALS. The changing nature of urban transport planning brought about by environmental, social and financial constraints has resulted in the emergence of transport system management (tsm) as an accepted planning philosophy. Of the many techniques which may be regarded as tsm schemes, one, the priority treatment of certain classes of vehicle, has received particular attention. This paper will concentrate on one type of priority scheme-active bus priority signals and will examine the energy and air pollution impacts of such a scheme. On the basis of the results of a

demonstration project in Melbourne, it will be shown that, contrary to previous speculation, such a priority scheme does not have immediate environmental advantages. The implications of this finding will then be discussed in the light of overall evaluation of the scheme, mode choice impacts of the scheme and the extension of the priority scheme to encompass a route of bus priority intersections. /Author/TRRL/

31 300212 THE EFFECTS OF DIVIDING A CROSS-TOWN BUS ROUTE INTO TWO RADIAL ROUTES. This report describes the effects of the division of a cross-town bus route in Chatham into a pair of radial routes with new termini at the centre, using the same resources. Two surveys were conducted to monitor bus timekeeping and headways, one just before the reorganisation and the other two months afterwards. In addition, the boarding and alighting points of passengers were obtained as well as their reactions to the reorganisation. The revision resulted in a significant improvement in timekeeping on both the new radial routes, especially in the evening peak. Similarly, headways were made more regular. For the passengers who used the previous route for cross-town journeys (approximately 11 per cent of the total), there was a deterioration in service as regards cost, journey time and convenience. For the operator, the two new routes were easier to manage and marginally cheaper in bus mileage. Because of technical reasons discussed in the report it was not possible to make a reliable assessment of the net effect of the change on patronage and revenue. /Author/TRRL/

31 300323 MANAGING THE EVOLUTION OF EXISTING TRANSPORT SYSTEMS. Transport planning, particularly in urban areas, can be no longer seen as a purely technical process which sets about seeing definitive solutions to major movement problems. Basically, all the arguments reduce to the fact that transport planning and decision-making in built-up areas is controversial. Transport planning has to be carried out within the context of the current social, political and institutional climates; it cannot be seen and treated as an "external" technical/analytical process. What is probably the key issue facing the planner is how to come to grips with this situation, how to ensure the successful development of his transport proposals. The way to do this is to view transport planning as an evolutionary process which emphasises continual improvement upon the existing situation, rather than necessarily aiming at revolutionary solutions to dramatic problems. /TRRL/

31 300569 NOTES ON THE COORDINATION BETWEEN PUBLIC TRANSPORT SYSTEMS IN METROPOLITAN AREAS [Appunti sul coordinamento tra sistemi di trasporto pubblico nelle aree metropolitane]. With the rapid expansion of the urban areas and the development of road transport, the transport networks have undergone nonprogrammed evolutions, which have led to the impoverishing of the level of service and to congestion. This has made necessary a reexamination of traffic currents with origin-destination surveys, which have permitted the passage to models of integrated networks, with the support of integrated tariffs and common tariffs. When the metropolitan network cannot be extended for reasons of economy and amount of traffic, the necessity arises of envisioning tramway lines with high-speed vehicles, which must cover prevalently protected itineraries. 31 300708 MOREHEAD, KENTUCKY, SCHOOL BUS DEMONSTRATION PROJECT. Recent public policy has demonstrated increased concern for the effectiveness of existing transportation systems as a cost-efficient alternative to major capital expenditures. One such program in Kentucky uses a single school bus to provide transit service in the community of Morehead. A 36-passenger school bus operates hourly along a 12.1-km (7.5-mile) route from 8:30 p.m. on weekdays and from 9:30 a.m. to 2:30 p.m. on Saturdays. Service is provided to Morehead State University, several public housing projects, the central business district, a principal manufacturing house, and the hospital. The one-way fare is \$0.25. The Kentucky Department of Transportation, the Rowan County Board of Education, and the city of Morehead all share in the management of the project. Net operating costs during the 12-month demonstration period are shared between the department of transportation and the city of Morehead (75-25 percent, respectively). To date, farebox revenues have equaled 8.78 percent of the total operating costs. Initial patronage during the first 5 months of the demonstration program was low, increased drastically during severe winter weather, and moderated somewhat when warmer weather arrived. Weekday patronage averages 33.6 persons/d and Saturday patronage averages 16.8 persons/d. /Author/

31 300972 CO-ORDINATION OF JOURNEYS TO WORK [Samordning av arbetsresor. En studie av pendlingen till kaernsjukhuset i Skoevde (kss) samt foerslag till atgaerder for effektivisering]. The purpose of this study is to seek ways to facilitate work trips for commuters employed at the regional hospital in Skoevde. The choice of the study object was motivated by the distribution of work hours at the hospital. The study deals only with employees who have to travel more than 10 km to work (25 percent of the total of 900 employed). Ninety percent of the commuters live in or close to 16 different communities along 8 so-called transport channels, and travel to work by private car. Some conclusions of the study: better utilization and increased competitiveness of the public transport system can be achieved by coordinating the work-hours for the various categories of personnel employed at the hospital, and also with those of other places of work in the neighbourhood. Also, small time table changes, extension and alterations of existing routes are factors of importance for improving the quality of the public transport system. [Swedish]

31 301072 DETERMINATION OF PRIORITIES FOR INCREMENTAL DEVELOPMENT OF THE MARTA SYSTEM. The Urban Mass Transportation Administration has recently established a policy for the incremental development of fixed-guideway transit systems. This policy necessitates the evaluation of system components and the subsequent assignment of priorities to system components. The Metropolitan Atlanta Rapid Transit Authority undertook a comparative analysis study to determine the most appropriate order of construction for its "referendum" rail system. This paper reviews the study methodologies and final results. The referendum system, excluding that currently under construction, was divided into 13 operational segments (11 rail and two busway). Analytical information was compiled for each segment, including expected patronage, estimated construction and operating costs, annual revenue, travel time, and various nonquantifiable data. Three criteria were employed in the evaluation of segments: cost efficiency, travel utility, and an index representing nonquantifiable factors. The study was performed in a series of iterative analyses based on sequential decisions. The following conclusions are made: (a) the concept of iterative analysis provides a reasonable method for determination of system extension priorities, (b) the analyses were sensitive to differences among segments, (c) wide variations of effectiveness were found among segments, and (d) the incremental development policy may adversely affect the ability of local areas to obtain local support for mass transit plans. /Author/

31 301308 NETWORK PLANNING FOR LIGHT-RAIL TRANSIT. A common problem in the approach to light-rail transit (LRT) planning is the development and testing of less than optimal networks. This problem arises from an incomplete understanding of the application of the mode and of the opportunities inherent in its application. This paper describes how unique characteristics of LRT can be exploited by developing networks to make better use of the mode. Guidelines for network development are described and illustrated by examples. A distinction is made between techniques applicable specifically to LRT and those applicable to other transit modes. The concept of tuning a network (to match the level of investment to patronage and other benefits on a segment-by-segment basis) is presented, together with a discussion of the advantages of retaining as many future options as possible in long-range transit planning. /Author/

31 301316 TRAFFIC ENGINEERING FOR LIGHT-RAIL TRANSIT. The development of safe and operationally effective designs for at-grade interactions and crossings for light-rail transit (LRT) is an issue central to the future deployment of the mode. This paper describes a design approach based on the performance characteristics of light-rail vehicles (LRVs) and the application of conventional traffic engineering hardware and design practice. At-grade operation of LRT introduces potential conflicts with motor vehicles and pedestrians at intersections, in streets between intersections, and at mid-block crossings. These conflicts are a source of delay and accidents for LRVs. Application of the appropriate conflict-control techniques must consider that modern LRVs have performance characteristics essentially similar to those of transit buses. There are four strategies available to the traffic engineer to eliminate or control points of conflict among LRVs, motor vehicles, and pedestrians: at-grade separation of traffic flows in space, vertical separation of traffic flows in space, separation of traffic flows in time, and reduction in the number of traffic approaches. /Author/

Korve, HW (De Leuw, Cather and Company) *Transportation Research Board Special Report Conf Paper* No. 182, 1978, pp 107-115, 11 Fig., 2 Ref.; This paper appeared in TRB Special Report No. 182, Light-Rail Transit: Planning and Technology.; ORDER FROM: TRB Publications Off

31 301326 MOTOR VEHICLE AND PEDESTRIAN INTERFACE WITH LIGHT-RAIL TRANSIT. This session focussed on the problem of finding the space within which to develop a surface-level light-rail transit (LRT) system. The

primary and secondary arterials of many cities which no longer have as much through traffic as they used to, seem likely candidates for future LRT systems. The question of how LRT lines could be placed into arterial or other roads of limited width was discussed. LRT can provide a low-cost solution to the need for providing for greater capacity in the face of the negative aspects of increasing the width of existing transport networks. LRT also provides the best potential for obtaining surface level linear parks. The substitution of grass or other materials for the usual ballast-and-gravel or dirt-track foundation was also discussed. Other topics covered include the implementation of LRT operations in existing streets particularly in cities that no longer have street railway operations or that promote LRT, standards for grade separation of LRT at principal perpendicular avenues and arterials, criteria for crossing of LRT Lines by pedestrians and motor vehicles, the use of European tramway and light-rail standards, the protection of level crossings, driver education for making left-turns in cities with new LRT systems, feeder busses to LRT terminals and intermediate stops, the institutional and regulatory aspects of joint LRT-railway operation, and the problem of the elderly and handicapped patrons.

31 301327 INTERMODAL INTEGRATION. Intermodal integration is important to light-rail transit (LRT) which must be one part of a family of modes that serves an urban area. Such integration is successful in situations in which there is ease of transfer, compatibility in scheduling, carefully designed and located facilities, and a fare structure that supports transfer. The layout and functions of transit systems in metropolitan areas were discussed at the workshop. The negative consumer connotation associated with transfers, and the importance of pricing in making transfers acceptable are discussed, as well as the idea of time as a factor in choosing whether or not to take advantage of a transfer. It is noted that in Europe one mode is selected to serve a particular travel desire and other modes are coordinated with it. In the U.S., however, bus and rail usually compete, the damaging competition being the result of organizational in-fighting. Sophisticated ways of constructing incentives within the marketplace for coordination and cooperation between competing operators is lacking in the U.S. The growth of federal programs that subsidize operations should encourage such cooperation.

31 301891 DERBYSHIRE COUNTY COUNCIL PUBLIC TRANSPORT PLAN 1979-80 TO 1983-84. This is Derbyshire County Council's first public transport plan relating to the period April 1979 to March 1984. It concentrates on the first year but sets a framework of policies and objectives for the whole period. The basis of the plan is as follows: (1) the need for public transport; (2) the policies to meet those needs; (3) the resources required to put the policies into practice; (4) the services which will be provided as a result. The main focus of the plan is on bus routes within the county and thus deals with fares, subsidies and the future of existing services. The next major emphasis is on the provision of transport for school children of social service clients. Reference is made to provision of railway and coach services and to unconventional forms of transport for certain localities in particular. The plan also deals with facilities e.g. bus stations and shelters, needed to support the services. /TRRL/

31 301962 PROVISIONS FOR REGIONAL PUBLIC TRANSPORT STOPPING PLACES [Haltevoorzieningen voor het openbaar streekvervoer]. The aim of the government and the transport companies to promote public transport is dependent on a decrease of the disadvantages of public transport. The promotion needs a punctual schedule, journey time, and good accessibility together with easily recognizable stopping places. The accommodation at stopping places needs to be such that a passenger has protection from rain and wind and can get information. The possibilities of combination with other public provisions can be a help. In the reconstruction of residential areas or the planning of new areas these aspects of public transport must be considered. Several designs of public stops and shelters are presented. /TRRL/ [Dutch]

31 301965 PUBLIC TRANSPORT PLAN 1979/80. In this first edition of the public transport plan the Essex County Council has restated its specific policies relating to the provision and maintenance of public transport services and infrastructure. The plan is concerned primarily with passenger transport but also includes some mention of rail freight facilities. Part 1 covers present and future transport needs, and considers the economic and social significance of public transport as well as transport generally by road, rail, ferry and to school. An assessment is made of future requirements. Problems affecting the whole county and particular areas are considered in Part 2 and a description of the objectives of the plan are given in Part 3. Part 4 is concerned with the county's policies related to the transport needs already considered in Part 1. The proposed implementation of the plan is discussed in Part 5. Information on various transport services etc is contained in appendices. /TRRL/

31 301966 PUBLIC TRANSPORT PLAN 1979-80. This is Buckinghamshire County Council's first public transport plan, relating to the period April 1979 to March 1984 in general and the first year in particular. The report reviews the requirements of the Transport Act 1978 regarding the duties of non-metropolitan county councils respecting public transport services. The county's public transport needs are considered, and the financial and legal framework for the provision of stage carriage bus services is presented. These services are considered in detail for South Buckinghamshire, Milton Keynes and Aylesbury Vale. A description is given of railway services in the county, and of secondary road-based services e.g. express coaches. The county's policy and obligations regarding school transport are presented, and consideration is given to the role of unconventional services. The results are recorded of a number of experimental transport services e.g. dial-a-bus and post buses. Mention is made of various travel concession schemes which have been tried in the county. /TRRL/

31 302255 SIMPLIFIED AIDS FOR TRANSPORTATION ANALYSIS: TRANSIT ROUTE EVALUATION. VOLUME 4. This is one of a series of six reports describing simplified aids to improve transportation decisions without resorting to computers or extensive data collection. The analytical aid presented in this report provides one method for evaluating individual transit routes for a fixed-route, fixed-schedule urban transit system. Individual transit system routes are evaluated semiannually, based on a comparison of nine performance factors with established route standards set for each factor. Input data used in the evaluation are recorded on a semiannual basis, and scores are computed for each of the nine performance factors for each route according to an evaluation score algorithm. Scores are then added for each route, and routes are ranked by their total evaluation score. The results of the evaluation are used as the basis for route refinement and modification decisions. The report points out that the evaluation procedure is best applied in systems whose overall ridership is growing. Stable or declining ridership conditions would not be satisfactorily treated by this procedure. Also, because the intent of this report is to provide a simplified analysis aid, modifications, embellishments, and improvements to the suggested procedure are encouraged if local data or previous analyses suggest more appropriate methods. 31 302587 WEST YORKSHIRE TRANSPORTATION STUDIES. 4. APPLICATION OF THE APPROACH AND TECHNIQUES TO LEEDS. This is the fourth in a series of papers which discusses aspects of the West Yorkshire Transportation Studies. The paper outlines the process, adopted for the development of the recommended plan, describes the identification of transport problems and gives some details of the various elements of the plan. The importance attached to the various types of problems was largely dictated by considerations of the county-wide plan. Short term (up to 1985) and medium term (from the mid-1980s to the mid-1990s) design periods were considered. The primary problem in Leeds was the accessibility to workplaces, especially at peak periods. The strategy was aimed at improving this situation through proposals which would increase safety and improve the environment. The rigorous analysis of the various transport issues in conjunction with more conventional interpretation of transportation model output led to a clearly defined set of problems. The approach of testing a series of elements in the system to determine the roles they might play in development of the final plan. The resulting plan, capable of phased implementation, relies upon a balanced development of the existing transport system in Leeds. (TRRL)

31 302869 SOME ASPECTS OF THE DESIGN OF THE PUBLIC TRANSPORT SYSTEM IN SANTIAGO [Algunos aspectos de diseño en el sistema de locomoción colectiva de Santiago]. A study is made of a wide range of factors including street dimensions, height of a footboard of a bus, structure of the routes of different bus-lines, laws and regulations which govern vehicular and pedestrian traffic inside the city, and so on. Particular attention is paid to the consciousness of users, of design problems and to the level of interaction between public in general and elements composing the public transport system of Santiago. A series of ideas is developed, leading to the following statements: "the attitude of the population towards design is a good indicator of the level of socio-economic development of that population"; (2) the degree to which interaction between different agents of design-activity (user, producer, designer and government), influences level and speed of socio-economic development. 31 303058 THE MORNING TRANSIT LANE FROM BALGOWAH TO NEUTRAL BAY; REPORT ON LONG TERM TRENDS AND RE-EVALUATION OF INITIAL PERFORMANCE. On the 25th November, 1974 a transit lane was introduced along Sydney Road, Manly Road, Spit Road and Military Road, which forms a continuous route (Spit Bridge Route) between Balgowlah and Cremorne. The kerbside lane was reserved for use by specified vehicles: omnibuses, vehicles carrying three or more persons, taxi cabs, motor cycles, hire cars and vehicles turning left at or before the next intersection. The transit lane has since been extended at each end. Major surveys of car and bus travel times, traffic volumes and occupancies were carried out by the department of motor transport in one week of: October, 1974; (before the transit lane was introduced); March, 1975 and October, 1975. The n.r.m.a. Collected car travel time data for one week of: March, 1974 to 1978; August, 1975 to

1977; and October, 1975 to 1978. The October, 1978 study included counts of car and bus travel times, traffic volumes and occupancies to assess long term trends. /TRRL/

31 303197 OPERATING COSTS AND PERFORMANCE OF AMERICAN PUBLIC TRANSIT SYSTEMS. The escalation of operating costs is threatening the existing level of transit service in the U. S. Over the last two decades, lengthening passenger trips, as a result of suburbanization and lower development densities, have been a major factor influencing increasing costs per passenger. Over the past decade, the cost of operating transit service has risen 148%. Since operating revenues have not kept pace with costs, transit subsidies have grown even more rapidly than operating costs. Factors that have been involved in the rapid rise of operating costs are outlined. A summary is presented of approaches which could be used to help control costs.

31 303471 SOME ISSUES RELATING TO THE OPTIMAL DESIGN OF BUS ROUTES. The paper presents a discussion of some issues relating to the design of minimum cost bus routes serving a multiple origin-multiple destination trip distribution. It is shown that the objective function (total cost) is a nonconvex function of the assignment; the higher the demand for trips on a route, the better is the service that one can provide. One consequence of this is that a square grid of straight line bus routes is not likely to be an optimal geometry even under highly idealized conditions. "Good" geometries are more likely to focus routes onto a single street and past a common junction.

31 303499 BUS NETWORK PLANNING: TRANSEPT APPRAISAL. This report is an appraisal of the "Bus Network Planning Workshop" held at the Australian Road Research Board, Melbourne, 25-27th October 1978. Traditional, fixed-route public transport systems (rail, bus, tram) are experiencing increased operating difficulties in most major urban areas in Australia.

lia. There is need for these systems to more effectively and efficiently match the demands for urban person travel and analytical techniques are being sought to aid in the processes of planning and operating fixed-route public transport systems. An appraisal of the bus network planning package, TRANSEPT, has been undertaken to assess its potential for application in Australia. This report documents the appraisal procedure and material, presents the findings, and indicates several directions for development in road public transport planning aids. The appraisal was structured around a two day workshop for public transport planners, managers and researchers. The workshop format proved to be an effective means of obtaining a first order feel for TRANSEPT and for considering bus planning needs in Australia. It indicated that TRANSEPT could aid bus planning in Australia, but that more comprehensive tests in an actual case study would be required to adapt the package to local conditions. The appraisal also identified an urgent need for more flexible, interactive techniques to aid the planning and management of bus transport services in Australia. (TRRL)

31 303932 PREDICTION OF EFFECTS OF BUS-PRIORITY SCHEMES BY USING COMPUTER SIMULATION TECHNIQUES. This paper describes a computer program that predicts the effect of bus-priority measures applied to an urban highway network. The program predicts the travel times of buses and other vehicles along a highway network that has different types of intersection controls, with or without bus-priority schemes in operation. The paper describes how the program will allow transportation planners to assess the likely effects of proposed priority measures from a comparison of travel times through a complex highway system

by use of a model that computes the journey times of buses and other vehicles over a network that is composed of highway links that have priority, roundabout, or signal control at the intersections. The model follows the progress of each bus along a given route as it repeats the cycle from one bus stop to the next for various traffic conditions. Details of the master computer program and the associated subroutines are given together with details of validation studies carried out on the outer ring road of the city of Bradford. To demonstrate the practical use of the program details are given of the effect of bus-priority schemes on average delay, queue lengths, and bus travel times for the following highway and traffic situations: (a) priority intersections where the nearside lane of the minor road is allocated to buses for different traffic flow conditions and different lengths of priority lanes, (b) signalized intersections that have two or three approach lanes where the nearside lane of one approach road is allocated to buses for different traffic flow conditions and different lengths of priority lane, and (c) a 2-km length of bus route, which includes three signalized intersections and eight bus stops for differing traffic volumes and proportions of buses in the traffic flow. Details of the program output are given to demonstrate that the simulation model is flexible enough to study any particular section of a highway that may incorporate bus priority.

31 303934 IMPACT OF SHORT-TERM SERVICE CHANGES ON URBAN BUS TRANSIT PERFORMANCE. This paper examines the impact on a fixed route of small changes in three operational policy variables: frequency, number of bus stops, and fare. Analytical expressions are developed that trace the impact of each variable on various other system variables, which leads to an assessment of changes in selected measures of efficiency and effectiveness. The application of the methodology is demonstrated by a case study of a selected bus route in a medium-sized Indiana city. Three specific options are evaluated in terms of alternative frequency, number of stops, and fare policies. Since none of the options was actually implemented, the paper reports only on a theoretical analysis of the changes that might be expected under each option. The results indicate that significant improvements are possible in most of the efficiency and effectiveness measures under all three options examined. The technique does not require and extensive amount of data or calibration effort; instead it relies on information generally available from the records of a transit company and reasonable assumptions where necessary.

Bhandari, AS (Dares Salaam University, Tanzania) Sinha, KC (Purdue University) *Transportation Research Record* No. 718, 1979, pp 12-18, 3 Fig., 3 Tab., 8 Ref.; This paper appeared in TRB Research Record No. 718, Bus and Rural Transit.; ORDER FROM: TRB Publications Off

31 303937 EVALUATION OF THE GREENWOOD DRIVE FRINGE PARKING FACILITY (ABRIDGMENT). This paper describes a study that was conducted to determine why the service from the park-and-ride lot on Greenwood Drive in Portsmouth, Va. failed to attract more riders than it did. Also, it describes a procedural method proposed by Wester and Demetsky to assist transit planners in developing park-and-ride facilities. The methodology is based on the analysis of population, service and urban development characteristics of park-and-ride operations in Richmond and Virginia Beach; and it also estimates the demand for the bus service. The application of the methodology to the planning of the express bus and fringe parking transit to the Greenwood Drive service reveals that the low levels of patronage that have been experienced could have been expected. When the Greenwood Drive service was planned, the completed subscription bus service was not properly considered. Thus, it was concluded that the methodology improves the general capability for developing successful park-and-ride transit operations. The following observations were made regarding the future potential of the Greenwood Drive lot service to attract riders: the competitive subscription bus service clearly dominates the market for transit to the NOB-NAS; the site is somewhat isolated from the local neighborhood; the service should have been advertised continually and more directional signs should have been provided on local roads, and the lot design is adequate, but better maintenance and security are desirable.

31 303938 BUS ROUTE ANALYSIS MODEL (BRAM) SUMMARY REPORT. This describes the bus route analysis model (BRAM), a computer system that was developed to design bus routes. The computer program uses an iterative process to test various route configurations and to minimize the number of routes, the distance traveled, and the total travel time within constraints established by the parameters of maximum riding time and average speed of the bus. In the active mode BRAM designs bus routes by first dividing the district into a number of pie-shaped sectors, which are preselected by the planner, and then designing a route within each sector. Bus stops are first assigned to a sector by location and are then assigned to a route. A theoretical loop curve that represents an ideal route is used to form the routes. Bus stops are assigned to the route based on distance from the ideal curve and other constraints (such as bus capacity and student travel time). In order to test feasibility the routes are then subjected to a modeling procedure to determine travel time and travel distance. Through an iterative process various configurations of routes are tested until the best configuration is determined. BRAM is user oriented. A user's procedure manual describes the procedures for data collection and completion of coding forms, which are then keypunched. Support personnel input the data to the computer program and also establish the various parameters and constraints used. The printout is then sent back to the school district,

where the routes are plotted and analyzed. The computer program also includes a management information system that can summarize daily statistics and print out monthly reports on the bus system. These reports provide information on the buses, routes, employees, and related costs. BRAM provides a design tool that can quickly investigate route alternatives for school buses or other fixed-route transit systems.

31 303953 LIGHT RAIL TRANSIT AND BUS INTEGRATION IN EDMONTON (ABRIDGMENT). This paper discusses the appropriateness of light rail transit (LRT) and bus integration as a public transportation option in Edmonton. Three transportation options were considered: a northeast freeway option that would require 70 buses during peak periods; including express services for the corridor; an all-bus option that would require use of 150 buses during peak periods, including express services through the central area of the city; and an integrated bus-LRT option that would require 75 buses during peak periods to serve mainly as feeders and cross-city services, together with 14 LRT cars on the northeast line. An integrated option means that the LRT line is part of the transit network but uses a different technology. It was concluded that the LRT-bus system has proved able to handle the existing transit patronage and has attracted additional riders, notwithstanding the introduction of transfers. The conversion from express buses to feeder buses-LRT has been accepted as an attractive alternative. The integrated system has also shown its worth during special events at the Coliseum, Exhibition grounds, and Stadium; however, a system capable of carrying 5,400 people an hour in one direction cannot be expected to fill a stadium of 46,000 people. The disadvantage of the LRT system is that it does not serve two major trip destinations--the government center and the university--without a second transfer. A fully valid solution probably requires a more complete system.

Bakker, JJ (Alberta University, Canada) *Transportation Research Record* No. 719, 1979, pp 45-47, 2 Fig., 3 Ref.; This paper appeared in TRB Research Record No. 719, Transit Development.; ORDER FROM: TRB Publications Off

31 303954 PROVIDING COORDINATED TRANSIT SERVICES BY USING A TRANSIT-FUNCTIONAL CLASSIFICATION. This paper describes a planning concept used in providing coordinated bus and rail service to a suburban county of the Washington, D.C., metropolitan area. This concept, which is that of a functional classification of transit services, is analogous to that long in use for highways. Four transit service classes are defined: transitway, regional, collector, and community. Like the highway classification, the transit classification has universal applicability to all metropolitan areas, although it is more easily illustrated in large areas. The transit-functional classification con-

cept, used by Montgomery County, Maryland, as a network planning tool, was found to be particularly useful in planning a comprehensive restructuring of county bus services that provide coordinated services to the first part of Washington's Metrorail system extending into the suburbs. The county planning department has also used the transit-functional classification concept as a policy-planning tool in carrying out a fiscal impact analysis for a growth policy study and in transit financial planning and intergovernmental responsibilities for transit operations.

31 304533 LEVEL-OF-SERVICE CONCEPTS IN URBAN PUBLIC TRANSPORTATION. The study examines the level-of-service concept as it might be applied to public transportation services. It describes proposed definitions of public transportation level of service based on both system and rider attributes. The variation in public transportation quality as viewed by various user market segments is examined, and the sensitivity or demand elasticity to the various factors constituting 'level of service' is then made. Finally, a proposed study methodology to evaluate the increased level of service provided to user groups in line with their perceived measures of service quality is outlined.

31 304694 ANALYZING THE FREQ3CP FREEWAY OPERATIONS SIMULATION MODEL. The report is intended to more thoroughly describe the FREQ3CP freeway simulation and priority ramp control computer program and its application on Interstate Highway 10 West in Houston, Texas. A procedure for obtaining the freeway and ramp traffic operations data (speeds and volumes) is described along with the presentation of the traffic data in its computer program compatible form. The calibrated computer program model of the peak period freeway traffic operations for both the AM inbound and PM outbound directions is obtained when the simulation program results approximate the field measured traffic data. The background information for the implementation of an economic analysis computer program was collected, updated and structured. Travel time, vehicle operating and accident cost were selected to be implemented along with fuel consumption and pollution emission data for Texas facilities.

31 305206 COMPARISON OF TRANSPORTATION STRATEGIES: LONG RANGE IMPLICATIONS. SPECIAL REPORT NO. 6. The report discusses the range of impacts that could be expected by combining various strategies (e.g. carpooling, rapid transit) to reduce traffic demand, fuel consumption and auto emissions. The analysis is designed to identify limits as to what the projected range of impact would be for the maximum and minimum efforts which could be implemented for each strategy. It is also designed to evaluate combinations of strategies, and to identify those strategies which complement each other.

31 305315 FIVE METHODS OF CHANGING FIXED-TIME TRAFFIC SIGNAL PLANS. In many towns, traffic is controlled by signals which are co-ordinated together on fixed-time plans. The plans are derived to suit the average traffic flows which are expected to occur during a particular time period. Since average traffic flows vary with time, it is common practice to derive a number of plans for different times of the day. This report examines what happens during the changeover from one fixed time plan to another. Five methods of changing plan are described. For each method, the average additional delay experienced by each vehicle in the network is given. The two best methods caused an additional delay of 14 seconds per vehicle in the network. The other methods tested caused an additional delay of at least 36 seconds per vehicle. (Copyright (c) Crown Copyright 1979.)

31 305352 STRONGER FEDERAL DIRECTION NEEDED TO PROMOTE BETTER USE OF PRESENT URBAN TRANSPORTATION SYSTEMS. In 1975, the Federal Highway Administration and the Urban Mass Transportation Administration jointly issued regulations requiring urban areas to develop short-range transportation plans aimed at making better use of present urban transportation systems. The regulations, however, have not been as effective as they could have been because the two Federal

agencies have not administered the regulations consistently, urban areas have not been able to institute planning processes that result in unified plans, and projects that have the most potential for improving the efficiency of existing transportation systems have not been widely adopted. The Secretary of Transportation needs to strengthen Federal administration of the regulations.

31 305421 GUIDELINES FOR USING OPERATING CHARACTERISTICS IN THE EVALUATION OF PUBLIC TRANSIT SERVICE.

This report is an introduction to transit service evaluation and its application to transit systems such as those of upstate New York. The intent of the report is to serve as a basis for legislative decision-making concerning public transit services. The concept of transit evaluation in terms of level of service is discussed in detail. The state of the art in research and practice is studied. The theory of transportation evaluation is examined along with several of the important issues involved such as transit operating subsidy. The main purpose of the report is to present and discuss a comprehensive set of service characteristics which should be considered in bus transit evaluation. The application of an evaluation methodology is discussed and an example is given to clarify the concepts. The report proposes guidelines which explain how the New York State Legislature and other agencies should become involved in the implementation of a transit evaluation system. Some of the difficult issues which may arise are mentioned as well as measures that could be taken to abate these problems.

31 305441 URBAN TRAVEL DEMAND FORECASTING PROJECT FINAL REPORT SERIES, VOLUME VII. AGGREGATION METHODS AND TESTS.

Data for the study from a survey of 771 workers drawn from about half of the San Francisco Bay Area evaluates travel patterns to determine accuracy of quantitative predictions. The choice attribute variables (travel times, costs, etc.) are from highly individualized trip simulations. Presented are two new aggregation methods. The first determines which variables contribute the bulk of aggregation error in a particular setting as a basis for selective disaggregate data collection. A minority of variables can be corrected for aggregation error and they vary with the scale of aggregation. The second method, the utility classification method, has much greater computation efficiency and more systematic implementation criteria than the by-variable-value classification method. Recommendations are made on which aggregation and data collection methods should be used for several planning categories. The report identifies the effort necessary to achieve accurate aggregated predictions for traditional segmented sys-

tems and recommends prediction frameworks better matched to planning needs, data resources, and aggregation requirements.

31 305542 NORTHWEST INDIANA TRANSIT SYSTEM PROGRAM. No abstract available.

Barton-Aschman Associates, Incorporated, Urban Mass Transportation Administration 3 Volumes, 1977, 335 p.; Set includes Phase I, Phase II and Phase III Reports as RRIIS 23 305543, PB 80-111206, RRIIS 23 305544, PB 80-111214 and RRIIS 23 305545, PB 80-111222; Bulletin 8002.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-111198

31 305543 NORTHWEST INDIANA TRANSIT SYSTEM PROGRAM. PHASE I REPORT: EXISTING TRANSIT SYSTEM CHARACTERISTICS AND DEMAND ANALYSIS.

The Northwestern Indiana Regional Planning Commission (NIRPC) had a Transit System Program (TSP) prepared. This TSP is intended to serve as a basic reference for future transit planning. As such, it is being used to develop the transit improvement program (TIP) for the region and serve as the transit element of the transportation systems management (TSM) program. The goal of the study was to prepare a five-year capital improvement and noncapital intensive program for mass transportation that is consistent with the goals and policies of NIRPC, with Urban Mass Transit Administration requirements, and with accepted transit engineering/planning practices, and also responsive to local needs and desires. The transit system program is being coordinated with other regional plans and developed with the understanding that it should be updated annually. The study is completed in three phases with a separate report issued at the conclusion of each phase: Phase 1-Existing Transit System Characteristics and Demand Analysis; Phase 2-Plan Development; Phase 3-Five-Year Transit Improvement Recommendations. This report summarizes the work completed in Phase 1 of the study. This work included extensive data collection. It included discussions with, and obtaining operating statistics from the existing transit operators; interviews with representatives of special interest groups; a survey of current transit riders; and the assembly and review of all pertinent planning data. The data was then analyzed to review the operation of existing transit service and identify shortcomings, determine existing and unfilled demand for public transportation, and to identify key problems and issues relating to mass transportation in Lake and Porter Counties.

31 305544 NORTHWEST INDIANA TRANSIT SYSTEM PROGRAM. PHASE II REPORT: PLAN DEVELOPMENT.

Phase II of the study of the Northwest Indiana Transit System program shows the development and evaluation of alternative transit service concepts. Based on local and regional transit goals and objectives, specific criteria to be used in the formal evaluation process were identified. A wide range of alternative service concepts that would meet the existing and unfilled demand for public transportation in the region were tested. The most promising of these were then developed in sufficient detail for evaluation and public review. Based on the results of the formal evaluation and comments received during the public review, a recommended program--incorporating the best components of the various alternatives and appropriate for the estimated funding available--was then selected. The Phase II report serves as the technical basis for the detailing of the recommended Program in Phase III.

Prepared for Northwestern Indiana Regional Planning Commission, Highland. Also available in set of 3 reports PC E11, PB80-111198.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-111214

31 305545 NORTHWEST INDIANA TRANSIT SYSTEM PROGRAM. PHASE III REPORT: FIVE-YEAR TRANSIT IMPROVEMENT RECOMMENDATIONS.

The report is the third phase of a three part transit development program for Lake and Porter Counties, Indiana. This report presents the technical details needed to implement the transit program as recommended in Phase II of the study. The transit system recommended for Northwest Indiana consists of four elements: a regional bus route system, commuter service, express service, and service for the elderly and handicapped. The report discusses financial requirements, sources of assistance and suggests administrative structure for operation of the service.

31 305839 DEVELOPMENT OF AN URBAN PEAK-HOUR TRAFFIC MODEL BASED ON THE 1970 CENSUS AND CONCURRENT GROUND COUNTS, PHASE II.

The application of the 1970 Census Urban Transportation Planning Package (UTPP) for the development of a peak hour model was attempted. A peak hour model as a function of the UTPP file was not developed. The major reason for not developing a model was that the research methodology is highly dependent on other sources of data and models. It is argued that the research effort was unsuccessful because of the reliance on other data sources especially the need for origin destination information from a survey. An additional effort in this research was to impact and to evaluate

transportation related questions in the 1980 Census instrument.

31 307710 DEVELOPMENT OF CONGESTED AREAS BY MEANS OF PUBLIC PASSENGER TRANSPORT [Erschliessung von Verdichtungsraeumen Durch den Oeffentlichen Personennahverkehr]. After some introductory definitions and a description of the traffic situation in congested areas, the author establishes the necessity for more rapid developments in transportation. Interdisciplinary studies are required which would take into account the traffic-related, sociological and economic premises and which would have as their goal a co-ordinated total regional concept. Making use of the requirements of the OEPNV, considered from the viewpoints of the user, the operator and the community at large, certain fundamental considerations are identified in relation to the provision of rail-bound and non-rail-bound local transportation. Finally, alternative solutions and possibilities for improvement of transportation services in congested areas of large conurbations and in moderately congested areas are presented, and proposed for further research. /TRRL/ [German]

31 307765 PUBLIC TRANSPORT PLAN 1980/81. This is the second edition of the County Council's Pt Plan, and is arranged as follows: part 1-needs: present and future. This covers road passenger transport, school and rail transport, ferries, and the consultation process. Part 2-problems. These are issues concerning all types of transport affecting the county as a whole and certain areas in particular. Part 3-objectives. This part presents the overall strategy and future role of public transport. Part 4-policies. These concern the various transport modes, their compatibility with broader transportation policies, and the need for flexibility. Information on the financing of road, rail and school transport is presented, together with the possible rationalisation of some

services. The infrastructure of the transport system is considered, e.g passenger interchanges and bus shelters. The implementation of the public transport policy is covered in part 5. This includes annual expenditure and the financial programme for 1980-85. Details are given of the county policy towards individual operators such as British rail and London transport. The section concludes by considering transport within the district council areas and those of the neighbouring county councils. Travel data is summarised in the appendices. /TRRL/

31 307889 KENT COUNTY COUNCIL. PUBLIC TRANSPORT PLAN 1980-81. PRELIMINARY DRAFT FOR CONSULTATION ONLY. In this report a summary is given of the major tasks to be undertaken over the next five years. The responsibilities of the County Council towards public transport are presented, in the light of traffic acts and regulations, and a description given of existing public transport services in Kent. The objectives and policy of the local authority to satisfy transport demand is included. Details are given of a 5-year development plan for bus and rail services covering urban, inter urban and rural areas. A fares policy for the same period is presented. The financial performance of local bus operators is examined, together with school transport and the rail network in the county. Transport within the district councils' areas are considered. (TRRL)

31 307958 A SET OF METHODS IN TRANSPORTATION NETWORK SYNTHESIS AND ANALYSIS. The article discusses the problem of modifying a transportation network in order to meet an existing demand. A set of procedures were applied to the replanning of a medium-size town bus network in a number of case studies. The chosen approach, which is the result of five years research applied to ten towns in France, is described and results are presented and discussed for two cases. (TRRL)

31 308105 THE (R) EVOLUTION OF A REGIONAL ROADS PROGRAM FOR VANCOUVER. The Greater Vancouver Regional District has prepared a 5-year Regional Roads Program which would advise on planning, priority setting and financing for major arterial streets throughout the region. The program seeks to preserve transportation corridors by including them in the Official Regional Plan, determines region-wide priorities for improvements to regionally significant roads, and proposes sources of financing for a regional improvement program. The program identified designation criteria to define a network of regionally significant roads. The program collected transportation data from which current arterial road deficiencies and future needs were identified. Municipal and provincial plans and capital budgets for arterial road con-

struction were compiled and compared against both current deficiencies and future needs. The Program is currently assessing future arterial plans in meeting existing deficiencies for future needs from a region-wide perspective. This process will be complemented by an independent estimate of future roads needs based on a forecasting of urban development trends and various rapid transit options. transit options.

Hamilton, GD (De Leuw Cather Canada Limited) Glover, RS Spaeth, JD (Greater Vancouver Regional District, Canada); Roads and Transportation Association of Canada Preprint 1979, pp 23-44, 5 Fig., 3 Tab., 3 Ref.; Annual Conference Preprints.

31 308125 A NOTE ON BUS ROUTE EXTENSIONS. This paper investigates the circumstances under which bus route extensions can be viable. Ten recent route extensions in Albany and Rochester, New York are examined with respect to ridership generated, length and frequency of service, type and size of the new population served, and additional operating cost. The extensions included extensions to new residential and industrial sites, reverse commute services, and services to major employment sites. A simple revenue/cost ratio for bus route extensions is used to compare the results. Confirming conventional wisdom, the paper concludes that route extensions which are (a) short, (b) serve a dense area of concentrated employment or residences, and (c) do not increase main-route headway, are the most likely to be successful. 31 308522 THE DESIGN OF BUS-RAIL TRANSIT FACILITIES. The reasons for integrating bus and rail services are given and the physical aspects of station design, and the operational integration relevant to design are considered. The special aspects of bus/light rail integration are also discussed. The article emphasizes the need for integration of different modes of transit, especially bus and rapid transit. The elimination of transfer charges will help in the area of fare coordination. Schedules can also be coordinated without any capital investment and could lead to operating cost savings. Any short-term loss in revenue will be made up by

increasing patronage. Efficient station design can follow. Existing rapid transit systems should improve amenities at the transfer point. A major improvement would be to add direct (bus-to-paid area) transfer areas and common fare collection systems. New systems such as those in Atlanta, Miami, Baltimore, Buffalo and Washington, D.C., should give top priority to bus/rail coordination.
